Instructional Materials in Weather & Climate

Below are the CLN "Theme Pages" which focus on specific topics within Weather and Climate. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Air Quality Theme Page
- Clouds Theme Page
- El NiñoTheme Page
- Blizzards & SnowTheme Page
- Floods Theme Page
- Global Warming/Climate Change Theme Page
- Hurricanes Theme Page
- LightningTheme Page
- Ozone Depletion Theme Page
- TornadoesTheme Page
- Water Quality Theme Page

General Weather and Climate Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Weather and Climate. Please read our disclaimer.

- AskERIC Lesson Plans - Science: Earth Science

  There are a number of lessons on weather within this general earth science collection.

- Bizarre Stuff You Can Make In Your Kitchen

  This site is an ever growing warehouse of the kinds of projects some of the more demented of us tried as young people, collecting in one place many of the classic, simple science projects that have become part of the collective lore of amateur science. It is a sort of warped semi-scientific cookbook of tricks, gimmicks, and pointless experimentation, concoctions, and devices, using, for the most part, things found around the house. These are the classics. Strange goo, radios made from rusty razor blades, crystal gardens... amateur mad scientist stuff. If you happen to learn something in the process, consider yourself a better person for it.

- Earth and Space Science

  About 10 brief lesson plans in weather for elementary level students from CanTeach.

- Especially Elementary

  Three lessons on weather for elementary students.

- Forecasting

  This instructional unit is part of the "Science With OAR" web site developed by the University of South Alabama. It consists of explanatory sections on weather forecasting, student activity assignments, and links to other sites where students can collect the data to answer the questions.

- Gathering Weather Information

  A six day teaching unit in which students gather weather data from the internet and use them to predict weather patterns.

- How the Weatherworks: Activities, Experiments and Investigations

  Four activities that can be used to study the sky and clouds.

- National Geographic.com

  Use the keyword search engine on this home page of the National Geographic.com web site to retrieve weather/climate resources from their database (keyword = "climate" will produce more hits, but try keyword = "weather" as well). Caution: not all of the lesson plans may be what you're looking for and you'll get more than just lesson plans with the keyword search.

- [The] Sky's the Limit

  Each month, IBM provides a new set of Internet activities focused around a specific theme for a targeted range of grade levels. This link is to a unit in which grade 5-9 students use the Internet to research clouds, rainbows, and other weather related phenomena found in the sky.

- Understanding World Climates

  A two week teaching unit for grade 5 students who start by learning the basic reference points and grids used on the earth and end with a beginning knowledge of world climates. Student activities include mapping reference points and climate zones, constructing climographs, solving climograph locations' mysteries, constructing rainfall isolines, and writing and illustrating mini notebooks of the controls of climate.

- Weather

  This page within Houghton Mifflin's Education Place Web Site has four extension activities for primary students: Tracking Local Weather, Measuring Rainfall, Wind Direction, and Wind Observation.

- [The] Weather Dude

  A weather page especially for kids, parents and teachers from Seattle's KSTW-TV. There are links to explanations of weather terminology, links to teacher/parent resource materials on weather and other sciences, and links to resource materials where kids can learn more about weather and other sciences.

- WeatherEye

- Weather/Meteoroloy

  The Nebraska Earth Science Education Network (NESEN) has collected about 30 lesson plans , organized by age groups, in meteorology from NESEN teachers.

- Weather: The Final Front

  Here's a meta-list of links to pages of weather activities/lessons designed for K-12 students and teachers by a Northern Ontario Consortium. Their categories of weather lessons include: air, atmosphere, climate, interpreting the weather, precipitation, water cycle, and weather in general.

- Weather Here and There

  A six lesson integrated weather unit incorporating Internet interaction and collaborative problem solving for students in Grades 4-6 (Math, Science, Geography, and Language arts).

- Weather or Not: Here I Come

  The New Jersey Networking Infrastructure in Education Project provides this lesson plan in which students collect data for weather and marine reports.

- [The] Weather Unit

  This interdisciplinary Weather Unit, intended for students in Grades 2-4, has lessons and activities that can be implemented in various subjects (math, science, reading & writing, social studies, geography, art, music, drama, physical education).

Top of Page

Note : The sites listed above all have lesson plans/activities for the Weather teacher. For other resources in this subject area (e.g., instructional materials in General Science, Life Science, or Physical Science), or for curricular content and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Air Quality Theme Page

CLN Theme Pages

Below are the CLN "Theme Pages" that support the study of Air Quality. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) that will help teachers provide instruction in this theme.

- Global Warming/Climate Change
- Ozone Depletion

Air Quality Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Air Quality. Please read our disclaimer.

- Acid Rain

  In this interdisciplinary Web research project, junior high students use the Web to research information in the field of a chosen specialist, compile and analyse the data, meet with each other, and then write a report on their findings. The basic questions that they address are: What is acid rain? How does it affect the environment (and us)? Where does it come from?How can it be prevented or minimized? They may choose to be a specialist in chemistry, economics, history, environment, health, or politics/government. Each specialist is given a set of Web links to begin the research.

- Acid Rain Program

  A comprehensive site from the U.S. Environmental Protection Agency with information about acid rain. The following list of links to their site are particularly relevant to students.

  - Acid Rain: A Student's Sourcebook (A unit on acid rain that has background information, descriptions of the causes and effects of acid rain, solutions about what can be done, and experiments with activities.)
  - Effects of Acid Rain This page provide more information on how acid rain effects our environment.

- Air Junk

  Here's an activity for children to make airborne junk collectors and collect air samples. Some background information is also provided.

- Air Pollution

A site established for European schools and designed for younger students, it explores the following seven areas of concern for air pollution: Acid Rain, Domestic Smoke, Smog, The Greenhouse Effect, Particulates, Radionuclides, and Ozone Layer Depletion. Included with each page is a link to a glossary for words used while discussing air pollution.

- Air Quality

Greater Vancouver Regional District publishes a large collection of information concerning the air quality for Fraser Valley and Vancouver area. The links are identified as particularly important air quality concerns and their principles can be applied to areas in the world.

- Air Quality Lesson Plans and Data

The Texas Natural Resource Conservation Commission provides a number of lessons and activities for educators who wish to teach K-12 students about air quality. Lesson plans are provided on such topics as acid rain, air pressure, ozone, plants, oxygen, and pollution control.

- Air Quality Research Branch (Clean Air)

As part of Environment Canada, the menu on this page will link you to air quality information as it is impacted by the following air pollution concerns: acidifying emissions, persistent organic pollutants (POPs), hazardous air pollutants, smog, stratospheric ozone depletion, and climate change. In addition, there is a link with a focus on the Arctic because scientist are finding that the Arctic is the ultimate resting place for many air pollutants.

- Automobiles and Light Trucks

The U.S. Environmental Protection Agency publishes information about the impact of automobiles and air quality that includes carbon monoxide, ozone, emissions and tips on how you can help to reduce air pollution with your car.

- Health and Air Quality - Let's Talk About Air

Educational materials on air quality, indoor air quality, and pollution.

- Educational Resources for Students and Teachers

Lesson plans, activities, and fact sheets on air quality from the Louisiana Department of Environmental Quality.

- Environmental Priority - Clean Air

A page by Environment Canada that explains what causes air pollution, why we should be concerned and what is being done to protect our air.

- It's Your Health

The depletion of our ozone layer has a serious impact on future generations from the dangers of being exposed to the sun's ultraviolet rays (UV rays). The information on this page describes how UV rays can cause sunburn, premature skin aging, cataracts and skin cancer, and even weaken the immune system.

- Indoor Air Quality (IAQ)

Studies have indicated that indoor air pollution can have significant effects on human health.

This site investigates a number of the factors causing us to experiences greater exposure to indoor air pollution than in past decades. Many of these factors have to do with construction techniques and materials used in modern buildings. This site presents information on three environments that affect us: l arge buildings, homes and residences, and schools.

- [The] Kyoto Protocol: Challenges and Opportunities

  Documents in this site explain the historic agreement from December 1997 Kyoto Protocol that commits the developed countries to reduce their greenhouse gas emissions to acceptable levels. It identifies a number of issues raised by different countries and the reduction conditions Canada agreed to.

- Microbiological Contamination of Residential Indoor Air

  Here's information about how humid or damp conditions in the home promote the growth of bacteria, mold and dust mites. Also you'll find how these organisms can contribute to poor indoor air quality and how they can cause health problems.

- Project A.I.R.E.

  A.I.R.E. (Air Information Resources for Educators) was designed as a source of resources for K-12 teachers on air pollution issues. It includes warm-up exercises, lessons, and additional reading information - all saved in PDF format.

- Smile Program Biology Index

  Teachers participating in the SMILE (Science and Mathematics Initiative for Learning Enhancement) summer session programs each create a single concept lesson plan. This database has a few lessons on air quality in their section on Environmental Studies and Ecology. Caution: Since there is a wide number of authors who have contributed to the database, the detail and quality of the lesson plans will vary.

- Smog and Your Health

  You can read about how smog has become the term given to the chemical "soup" that is often visible as a brownish yellow haze over urban areas. Formed from motor vehicle and industrial pollution, smog is potentially hazardous to human health by seriously affecting the respiratory system.

- Urban Smog

  Environment Canada publishes information about what smog is, how to know you are in it, the effect on your health, and what can be done about it. The following link is designed with the younger student in mind.

  - Smog: Let's Clear the Air (A page with similar information as the site, but written for students.)

- Unified Air Toxics Website: Basic Facts

  The basic facts on this page include: What are Toxic Air Pollutants? What are the Effects of Toxic Air Pollutants? Which Pollutants are Considered Toxic? and How are Toxic Pollutants Released into the Atmosphere? In addition, there are links to further information on health risks associated with air pollution.

- What's Riding the Wind in Your Community?

  Yet another resource from the US Environmental Protection Agency. This is a one week teaching unit for students in Grades 5-8 in which they collect air samples and analyze them.

- Workplace Air Quality

  Information defining what "Indoor Air Pollution" is and the effects on our health from many of the pollutants that could be in the air. Some of the pollutants listed (along with their effects) include: tobacco smoke, formaldehyde, volatile organic compounds, microorganisms, asbestos, carbon monoxide and more. In addition, there is a checklist to test your environment and what you can do improve your indoor air quality.

Top of Page

Note: The sites listed above will serve as a source of curricular content in the study of Air Quality. For other resources in Social Studies (Environment) (e.g., curricular content in Biomes, Endangered Species, or Hazardous Waste Disposal), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Clouds Theme Page

This "Theme Page" has links to two types of resources related to the study of clouds. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. Please read our disclaimer.

- ## All About Clouds

  USA Today has a series of hyper-linked articles on clouds. Topics covered include: types of clouds, interrelationships between stability and clouds, and how clouds influence weather.

- ## AskERIC Lesson Plans: Meteorology

  The above link is to AskEric's Meteorology page where you'll find plenty of lessons about the weather if you wish to browse/search their site yourself. Or, use the links below to go directly to some lesson plans specifically about on clouds.

  - Cloud Types A lesson plan for Grade 5 students. Students will be able to identigy and describe four different cloud types (cirrus, stratus, cumulonimbus, and cumulus).
  - Clouds A multidisciplinary lesson for grdes 4-6 that not only teaches them about clouds but can encourage abstract thinking, writing and painting.
  - Weather Forecasting Grade 6-8 students learn abaout basic cloud formations in this unit on forecasting weather.

- ## [The] Cloud Case

  WeatherEye, a public service of KGAN presents this interactive lesson for grades 5 to 8 students (teacher's guide).

- ## Cloud Formation

  A lab experiment through which students can determine how clouds are formed.

- ## Cloud Gallery

  This site provides different photographs of clouds that students may download, use, and/or adapt as they wish.

- ## Clouds and Precipitation

  From the University of Illinois: "The purpose of this module is to introduce a number of cloud classifications, different types of precipitation, and the mechanisms responsible for producing them."

- ## Clouds: One Key to Foretelling the Weather

  This tutorial from Environment Canada gives brief explanations on how various types of clouds are formed as well as pictures of sixteen types.

- How the Weatherworks: Activities, Experiments and Investigations

  Activities that can be used to study the shape and color of clouds.

- PSC Meteorology Program Cloud Boutique

  A general cloud reference source with detailed pictures.

- [A] Review of Theoretical and Observational Studies in Cloud and Precipitation Physics: 1991-1994

  The content at this site is presented at a somewhat advanced level but it should be appropriate for high school students. Topics include: various types of clouds; electrification of clouds; clouds as components in the global climate system ; possible influence of cloud condensation on climate; acid rain and cloud chemistry, and more.

- Tips for Painting Clouds

  Just what a teacher needs for a multi-disciplinary unit on clouds.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Clouds. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

El Niño Theme Page

This "Theme Page" has links to two types of information related to the study of El Niño. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. Please read our disclaimer.

- El Niño

  An instructional module from the University of Illinois which introduces El Niño, describes the conditions responsible for its occurrence, and outlines the impact it has on the rest of the world (e.g., weather, economy). Also provided are data on non-El Niño years, sea-surface temperature plots, detection and prediction information.

- El Nino: Canadian Effects

  Learn about the effect of El Nina on all of Canada or specific Canadian regions.

- [The] El Niño

  The Institute of Ocean Sciences (IOS) of Fisheries and Oceans Canada provides this British Columbia resource. Included is information on: An Historical Sketch; What is the effect of El Niño on B.C. coastal waters? Brief notes on the biological impacts; How does El Niño work? How does this affect higher latitudes? El Niño forecasting - how are we doing? The Current Situation.

- El Niño and La Nina

  "USA Today" sponsors this site which provides not only general background information articles but also links to current news stories about El Niño's impact around the world.

- El Nino or El No-no

  In this Web Quest, students learn more about El Nino and La Nina Cycles by collecting and analyzing data and sharing their findings in a speculation paper.

- El Niño Loss Reduction Center

  The US Federal Emergency Management Agency provides wide ranging information on the potential disruptive effects of El Niño.

- El Niño Versus Non-El Niño Years

  A lesson plan for students in grades 9-12 in which they compare and contrast El Niño data. Note: the actual data are not provided as part of this lesson plan but they should be available from other sites on this web page.

- El Niño:Understanding and Predicting via Our Current Technology

  An on-line course for students in grades 9-12. In addition to basic information about El Niño, there are links to research information and other El Niño sites, access to earth science data, and connections to Earth scientists and Earth science teachers.

- El Niño/Southern Oscillation (ENSO) Information

The National Oceanic and Atmospheric Administration (NOAA) provides: What happens during an "El Niño"? A 3-D animation of the tropical Pacific ocean during a simulated ENSO cycle; What are the effects of ENSO on climate? What is the current state of El Niño? Some differences between recent El Niño events; What is the state of the current climate? What are the forecasts for El Niño? Resources for teachers.

- Exploring the Environment: El Nino

This module is part of "Exploring the Environment"[a] (ETE) from NASA's Classroom of the Future[a]. In ETE, high school students are faced with a real life problem and their goal is to use problem solving skills and internet based data (e.g., remotely sensed satellite images) to propose and defend a solution. A Teacher's Guide is available. This link is to the ETE home page since it gives the easiest access to necessary introductory and teacher information. To access the El Nino module, click on "Modules and Activities" and then "El Nino".

- National Oceanic and Atmospheric Administration (NOAA)

This US government site has answers to frequently asked questions, information on impacts of El Niño, forecasts, and access to related data.

- Science with Noaa Research: El Nino

An instructional module from the University of Illinois which introduces El Niño, describes the conditions responsible for its occurrence, and outlines the impact it has on the rest of the world (e.g., weather, economy). Also provided are data on non-El Niño years, sea-surface temperature plots, detection and prediction information.

- Tracking El Nino

This Nova Online Web Site explores different aspects of El Nino including an Anatomy of El Nino, Chasing El Nino and and El Nino's Reach. You can also read a correspondent's dispatches on El Nino for a PBS/Online Adventure.

Top of Page

Note: The sites listed above will serve as a source of information about El Niño. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Blizzards and Snow Theme Page

CLN Theme Pages

Below are the CLN "Theme Pages" that supplement the study of blizzards and snow. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans), which will help teachers provide instruction in this theme.

- Antarctic Theme Page
- Arctic Theme Page
- Glaciers Theme Page
- **Natural Disasters**
  - Avalanches Theme Page
  - Earthquakes Theme Page
  - Floods Theme Page
  - Hurricanes Theme Page
  - Tornadoes Theme Page
  - Tsunamis Theme Page
  - Volcanoes Theme Page

General Blizzard and Snow Resources

Here are a number of links to other Internet resources that contain information and/or other links related to blizzards and snow. Please read our disclaimer.

- Blizzard Attack

  In this interactive lesson, grade 7-12 students make a fictitious journey between two cities during adverse weather conditions, and learn some of the basic skills needed to stay safe during winter storms. A teacher's guide is available.

- Building an Igloo

  Even if you're not interested in actually building an igloo, this site will explain how its construction can keep people warm in severe weather conditions.

- Don't Be Too Flaky

  An activity in which students measure the density of water, ice, and snow.

- ## Ice and Snow

  Dragonfly Magazine has four articles about snow where kids can learn about the Antarctica and making an igloo, learn why ice floats and is slippery, read interesting facts about snow, or make a virtual flake.

- ## In Praise of Snow

  This lengthy article in the Atlantic Monthly is an intellectual study of snow - for high school students only.

- ## All About Snow

  If you want to know why snow is white, or why forecasting snow can be so difficult, this is the site for you. Learn the difference between a blizzard and a squall, or find out what graupel is in theGlossary page. Check the snow Gallery for some historic photos of blizzards and snow from the National Weather Service.

- ## Mad Scientist Network

  Use this search engine to find all the Mad Scientist Network files on "snow", and you'll find over 150 questions about snow that students have asked and had answered. The answers tend to be brief, but the sheer quantity of information available in the files is worthwhile.

- ## **Minnetonka Elementary Science Center**

  - Snow/Water/Ice A lesson plan in which K-1 students learn to identify two properties of snow.
  - Snowman Unit Grade 2-3 lesson plan in which students make a snowman, write a descriptive paragraph about making it, and then perform a variety of mathematical measurements on it.
  - So Much Snow Grade 4-5 students explore how much water results from the melting of two litres of snow.

- ## **National Snow and Ice Data Center**

  - [The] Blizzards of 1996 The site explains what a blizzard is, why they're dangerous, and why there was so much snow in the 1996 blizzards.
  - Have Snow Shovel, Will Travel A web document giving historical descriptions of snow/blizzards in the U.S. - including how the settlers coped, a history of snow removal efforts, famous snowstorms, snowiest cities in the US, and blizzard safety.
  - Questions and Answers about Snow
  - Snow Fact Sheet
  - Snow Glossary

- ## Precipitation: Online Meteorology Guide

  An explanation of the varying atmospheric conditions that produce hail, freezing rain, sleet, and snow.

- ## Snow

Students can learn about the basics of snow, snow art, and how to build a snow castle.

- ## Snow Activities

  There are lots of elementary teaching resources offered by this home schooling family. Included are suggestions for snow-based activities within science, art, literature, and food.

- ## Snowbound

  The Grade 7 Natural Disasters Project provides a brief description of blizzards along with a wind chill chart.

- ## Snow Flake Designs

  - Ben & Jerry's Happy Holiday Paper Snowflakes Instructions for making three paper snow flake designs.
  - How to Make Paper Snowflakes General instructions for making paper snow flakes with different designs.
  - Snowflake Detailed instructions.
  - Snowflake Designer Design your own snowflake using this interactive Shockwave plug-in.
  - Snowflakes Instructions for making five paper snow flake designs.

- ## Snow Flake Imagery

  - Electron Microscopy Unit Snow Images of snow crystals made from a low temperature scanning electron microscope.

- ## Snow School

  Spring Brook Manufacturing, a snowshoe company, offers a collection of lesson plans/units on snow. Be sure to see their selection of lesson plans and ideas for teaching PE in the snow (e.g., Pass the Snowball, Human Sled Pull, Orienteering, Raid the Snow Fort). For outdoor education information on how plants and animals live in snowy conditions, check out the link to the Glacier National Park Environmental Education Guide. There are also a couple of experiments with snow - some of which are their own and some from other sites that are already on this Theme Page.

- ## Snowtastic Snow

  Here's a Web Quest Junior contestant with lots of information about snow. Elementary students can read about the ice age (history), learn about hypothermia (PE&Health), learn more about the science of snow, play games, or engage in a couple of activities.

- ## TrackStar

  TrackStar is an online interface that allows instructors to create lessons for students by sequencing existing instructional content in various Websites within a lesson. Students explore one topic at a particular location within one Website, then move on to the next topic at another Website. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the Websites beyond the designated instructional content are also possible.

This link is to their search page from where a keyword search on "snow" will produce numerous hits. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding Websites, sequencing the tours) will vary widely within the TrackStar collection.

- Winter

  Suggestions for some primary level winter activities that include literature sources, bulletin board ideas, science activities, and crafts.

- Winter Storms

  A unit on winter storms, complete with interactive components: weather maker, and winter storm timeline.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Blizzards and Snow. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu, which will give you access to educational resources in all of our subjects.

Previous Screen

Floods Theme Page

Below are the CLN "Theme Pages" which supplement the study of floods. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- **Natural Disasters**
  - Avalanches Theme Page
  - Blizzards Theme Page
  - Earthquakes Theme Page
  - Hurricanes Theme Page
  - Tornadoes Theme Page
  - Tsunamis Theme Page
  - Volcanoes Theme Page
- Water Quality Theme Page

General Floods Resources

Here are a number of links to other Internet resources which contain information and/or other links related to floods. Please read our disclaimer.

- Flood Hazard Management

  The BC Ministry of Water, Land and Air Protection provides various information about flooding in BC including: flood hazard management, floodplain mapping, emergency response (e.g., sandbag dike construction), picture images.

- Dartmouth Flood Observatory

  Dartmouth College in the US uses remote sensing technology as a tool for early detection, mapping, measurement, and analysis of world-wide extreme flood events. In addition to downloadable satellite images, there is a register of international large river flooding for the last several years in their site.

- FEMA for Kids

  The U.S. Federal Emergency Management Agency has developed this site so that young students can learn about various disasters, what to do during and before them, and what causes them. The site also includes activities (games, quizzes, challenges), a library of resources (e.g., pictures), and resources for parents and teachers.

- Flash Flood

Here's an interactive lesson for students in grades 3-10 about flash floods and other types of floods. Topics include identifying different types of floods, preparing for a flood, flood watches and warnings. A teacher's guide is included as are a student assignment and quiz.

- Flood!

This web site is a companion to a Nova program on the flooding of the upper Mississippi flood plain in 1993. Students can read how people dealt with the deluge and learn the benefits of a flood. A teacher's guide is available.

- Floods: How Can Water be Powerful Enought to Move a House?

Newton's Apple, a public television production, provides student activities so that they can better understand floods and their control.

- Floods: What To Do Before and After

Advice from the Canadian Mortgage and Housing Corporation on the precautions one can take before a flood and what one can do afterwards to repair damages.

- Flood Stories From Around the World

Story legends about floods organized by region of the world.

- Just Doing My Job

In this site, grade 6-10 students can learn how satellite images were used to help flood evacuations during a 1993 US flood. In addition to the story, the site contains student activities and a teacher's guide. There is also a link to another NASA site in which students engage in activities to learn more about remote sensing technology.

- Manitoba Flood Information

This is the Government of Manitoba's Flood web site. In addition to announcements about current potential flooding, it has information about the flood of 97 as well. Included are facts and figures of the flood, photographs, personal health and safety guidelines, guidelines for what to do when returning to flooded out residences, and advice on avoiding scams.

- Red River Diary

The virtual diary of a free lance writer and photographer who chronicled the Red River flood of 1997 (North Dakota and Manitoba) while it was happening. Read their observations and view their pictures as they provided web coverage of the flood.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Floods. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu, which will give you access to educational resources in all of our subjects.

Previous Screen

Global Warming/Climate Change Theme Page

Below are the CLN "Theme Pages" which support the study of Global Warming/Climate Change. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Air Quality
- Ozone Depletion

Global Warming/Climate Change Resources

This "Theme Page" has links to two types of resources related to the study of global warming / climate change. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. Please read our disclaimer.

- Encyclopedia of the Atmospheric Environment

  Published online in 2000, the "Encyclopedia of the Atmospheric Environment" is a clever two-level encyclopedia about climate, global warming, weather, and related topics for grades 9 to 12 students.

- Environmental Change Education/Outreach Program

  The Nebraska Earth Science Education Network (NESEN) has collected over a dozen lesson plans in climate change from NESEN teachers participating in two workshops. Look in the 1997 and 1998 workshop sections for the lesson plans.

- Explorer: Global Warming

  A downloadable lesson plan complete with overhead masters (in pdf format) for students in grades 3-9. "This lesson plan covers the major greenhouse gases, human activities that contribute to the change of the Earth's atmosphere, and why there is a concern about climate changes. Also addressed are strategies for dealing with potential global warming and the major contributors to global warming. The possible effect of a global warming on forests, agriculture, health, wildlife, and the oceans are addressed."

- **[The] Franklin Institute Science Museum**
  - Bringing the Greehouse Effect Down to Earth In this lab activity, high school students compare the amount of Carbon Dioxide in four different sources of gases.

- [The] Greenhouse Effect in a Jar An elementary/junior high experiment that will serve as an introduction to the greenhouse effect. Skills include observing and recording data, use of a control, drawing conclusions from results, and use of a model.

Global Change

This teaching unit from the United States Geological Survey is intended for students in grades 4-6 although some activities can be used with older or younger students. The unit consists of an introduction and many activities. Each activity has background material, an experiment, suggestions for further reading and extensions.

Global Climate Change

Environment Canada provides answers to the questions: "What is climate change?" "What is Canada doing?" "How will climate change affect you?" and "What can you do?" There are other useful resources within or linked to this site - we've provided direct links below.

- Government of Canada: Global Climate Change This site has been designed specifically to inform Canadians about climate change, how it affects our environment, and what the Canadian government is doing about it. In addition to these sections, be sure to check out the Resource Room as well as the Activity Room.
- [A] Primer on Climate Change Indepth information on the issue of climate change, its impacts, and measures we can explore to reduce greenhouse gas emissions.

Global Climate Change Student Guide

The online textbook "Global Climate Change Student Guide" is an authoritative Web resource for upper-grade and college Environmental Science students.

Global Warming: Focus on the Future

There are four sections to this site. In "It is happening" students can get the historical perspective on global warming as well as information on what the issue is. There are also articles describing impacts, discussions of solutions, and games/puzzles for students.

Global Warming Unit

This teaching unit from LETSNet (Learning Exchange for Teachers and Students through the Internet) consists of five lessons designed for middle school and high school students.

Greenhouse Warming: Fact, Hypothesis, or Myth?

A look at the validity of the Greenhouse Warming Theory.

National Environmental Indicator Series - Climate Change

Environmental indicators are selected key statistics, which represent or summarize a significant aspect of the state of the environment, natural resource sustainability, and related human activities. This site provides information about the climate change issues such as: Carbon dioxide intensity, Global atmospheric concentration of green house and more.

National Forum on Climate Change: Proceedings

These proceedings are the records of a series of meetings which brought together a citizens' panel of 25 respected Canadians in a National Forum on Climate Change in 1998. The panel heard a full range of expert opinion and examined all aspects to the topic objectively. The information is arranged in a series of meeting minutes and, as such, access to the reports is somewhat cumbersome.

- ## NASA fact sheets

  NASA Fact Sheets are produced in an effort to educate the general public on the major issues and natural phenomena that scientists will be studying using data provided by the Earth Observing System. These files are in PDF format.

- ## Sierra Club of Canada: Climate Change

  This site provides a view on climate change from the perspective of a Canadian environmental protection group. In addition to basic information on global warming, there are research reports, data summaries, and announcements.

- ## Skepticism Net: Global Warming

  A meta-list of links to resources on the web which dispute or question the claims of global warming.

- ## Still Waiting for Greenhouse

  The introduction to this web site describes itself thusly: "This website demonstrates what many climate scientists know to be exaggerated claims and political propaganda about`Global Warming', based on unscientific (mostly computer model) evidence. The observed evidence indicates that little or no global warming is happening and little should be expected. "

- ## TrackStar

  TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

  This link is to their search page from where a keyword search on "global and warming" will produce numerous hits. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

- ## **United Nations Framework Convention on Climate Change**

  - Beginner's Guide to the Convention A description of environmental problems that the world is facing and what we are doing about it through the Convention.
  - Climate Change Information Kit Thirty fact sheets (also in downloadable format) which cover: Understanding of the Climate System; Facing the Consequences; The Climate Change Convention; Limiting Greenhouse Gas Emissions; and Facts and

Figures.

- [The] Convention and the Kyoto Protocol Full text of the protocol along with information on the status of its implementation.
- Country Information Snapshots of action taken by a large number of countries to meet their domestic and international climate change commitments.

Note: The sites listed above will serve as a source of curricular content in Global Warming/Climate Change. For other resources in Social Studies -Environment (e.g., curricular content, lesson plans, and theme pages), click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Hurricanes Theme Page

Below are the CLN "Theme Pages" which supplement the study of hurricanes. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- **Natural Disasters**
  - Avalanches Theme Page
  - Blizzards Theme Page
  - Earthquakes Theme Page
  - Floods Theme Page
  - Tornadoes Theme Page
  - Tsunamis Theme Page
  - Volcanoes Theme Page

General Hurricanes Resources

Here are a number of links to other Internet resources which contain information and/or other links related to hurricanes. Please read our disclaimer.

- 1901-1996 U.S. Landfalling Hurricanes

  A collection of GIF maps that display the locations where and when hurricanes hit the US coastline bordering with the Atlantic Ocean and Gulf of Mexico . Each map is organized by decade and each hurricane is colour coded according to its degree of severity.

- Canadian Hurricane Centre

  Environment Canada, Atlantic Region, monitors all hurricane activity along the Atlantic Seaboard. If hurricane activity appears to threaten Eastern Canada, the Centre will inform the region's residents of potentially damaging weather conditions and provide tracking information and services.

- Counting on the Havoc of Hurricanes

  In this lesson plan, grade 6-12 students use a NY Times article as a starting point to "define and classify all the different ways in which numbers are used in forecasting and coping with the effects of a hurricane. They then conduct research to compare and contrast these numbers as they apply to Hurricane Floyd and other recent hurricanes. Finally, they graph their findings."

- Create an Art Object Depicting a Hurricane

  A practical art lesson plan for any elementary classroom. It can be used with younger students to encourage them to draw representations of hurricanes. This lesson can be easily expanded for older student to include some hurricane research.

- Exploring the Environment: Severe Weather: Hurricanes

This module is part of "Exploring the Environment"[a] (ETE) from NASA's Classroom of the Future[a]. In ETE, high school students are faced with a real life problem and their goal is to use problem solving skills and internet-based data (e.g., remotely sensed satellite images) to propose and defend a solution. A Teacher's Guide is available. This link is to the ETE home page since it gives the easiest access to necessary introductory and teacher information. To access the hurricanes module, click on "Modules and Activities" and then "Hurricanes". The challenge students will have is to use the history of Hurricane Andrew (1992) to track, analyze and predict the course of a new hurricane that may threaten North America this school year.

- Handle a Hurricane

In this StormSmart lesson from WICS NewsChannel 20, high school students assume the role of a mayor of a city threatened by an approaching hurricane and needing to make a decision whether to evacuate the city. They read news reports about the storm, memos from staff advising the mayor on whether or not to evacuate, and basic information about hurricanes before announcing their decision.

- [The] Heat is On! Creating Weather Emergency Guides in the Science Classroom

In this lesson plan, grade 6-12 students research severe weather conditions common to their geographic location and create weather emergency guides for extreme weather conditions such as tornadoes, floods, blizzards, thunderstorms and hurricanes. They use a New York Times article as a starting point for their explorations.

- Hurricane!

Use this link to download the .pdf file for a primary level, 10 lesson unit on hurricanes. Students learn report writing skills while studying the weather of the Caribbean islands, hurricanes, and hurricane preparation.

- Hurricane Centre

Current news from a Florida media outlet. In addition, they have information on hurricane tracking, names, and terms. There are extensive sections providing advice to residents on how to prepare for hurricanes. For example, there are hints on: checking your roof, how to find a safe place to hide, building plywood shutters, getting a survival kit organized, what to do with your pet, and much more. A collection of maps is available in different formats for downloading, printing and use on-line to help you track storm and hurricane activities. Also, check out "Hurricanes in History" for brief historical summaries of hurricane events off the US Atlantic coastline, starting with Columbus in 1495.

- Hurricane Disaster Service

The American Red Cross provides extensive information about hurricane preparation and how to stay safe during a hurricane. Information includes on-line resources and downloadable PDF documents.

- Hurricane: Storm Science

  Designed for elementary students, the materials in this site include explanations, diagrams/images, stories, activities, and downloadable materials. Contents cover the following topics: What is a hurricane like? How do hurricanes work? What happens when a storm comes? What paths do hurricanes take? Has anyone else been in a disaster?

- Hurricanes

  Supported by the University of Illinois, this site describes several introductory hurricanes characteristics and issues including: What hurricanes are; How they get their names; What affects their development; and, How to rate their destruction with the Saffir-Simpson Scale. Advanced hurricane information is available after accessing these introductory pages.

- Hurricanes

  This instructional unit is part of the "Science With OAR" web site developed by the University of South Alabama. It consists of explanatory sections on hurricanes, student activity assignments, and links to other external hurricane sites where students can collect the data to answer the questions.

- Hurricanes

  The U.S. Federal Emergency Management Agency sponsors this "FEMA for Kids" site on hurricanes. Students can read information specially developed for them on classification, historical events, naming conventions, origins, disaster scales, and hurricane hunters. The site includes a number of student activities as well.

- Hurricanes Spark a Storm of Classroom Activity

  Education World provides activities and Internet connections to engage students of all ages in a study of hurricanes.

- Hurricane Trailhead

  This is the starting point for a virtual field trip on hurricanes from Tramline. Experts in the subject have selected a number of web sites on hurricanes and arranged them in a sequence to tell a story for students to follow. Students can move from one web stop in the field trip to the next with ample opportunity to explore within the individual web site as they wish. However, since their web browser page has been split into an inner part (showing that stop in the field trip) and an outer part (giving navigational tools to go through the entire field trip), they can always return to their "tram" and go to the next stop. To be effective, teachers would have to ensure that student browsing through the field trip sites was purposeful. Teacher guides can be printed.

- Hurricane Watch

  Internet-based activities related to hurricanes for students across the subjects and across the grades from Education World.

- Images/Movies of Hurricanes and Special Events

  More than 500 satellite photos of hurricanes, tropical storms and typhoons starting from

1968. These photos, collected by National Climatic Data Center, are categorized by year. The collection includes the following types: colour, radar, infrared and MPEG movies.

- ## National Hurricane Center - Tropical Prediction Center

  The Tropical Prediction Center is located in Miami, Florida and works cooperatively with the National Weather Service to track and monitor hurricane and storm activity off the US Atlantic coast. A comprehensive site for information regarding current and past hurricane activity.

- ## Tracking A Hurricane

  A lesson plan designed for students in grade 9-12 who are familiar with trigonometric conversion formulas from rectangular to polar and back again.

- ## TrackStar

  TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

  This link is to their search page from where a keyword search on "hurricanes" will produce numerous hits. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

- ## Weather Eye

  We were successful in finding a site of weather instructional materials for teachers. The following links will take you directly to lessons for the grade range listed.

  - Cadet Section 20 weather related lessons for grade 2-8. One of the lessons is for hurricanes, the others could be modified to include hurricane activity.
  - Expert Section Six extensive lessons suitable for Grade 6-12. Most the lessons are designed for role play situations. For example, in the lesson "Handle a Hurricane", students take the role as "Mayor" and must make decisions regarding the town's safety as the hurricane approaches.

- ## [The] Wrath of Hurricane Mitch

  In this lesson plan, grade 6-12 students "investigate how hurricanes and other natural disasters can devastate the elements of the infrastructure of a country, as well as the lives of its people. Students then work in committees, each focused on one element of a country's infrastructure, to analyze the existing infrastructure problems in Honduras caused by Hurricane Mitch, devise possible solutions for these problems, and assess how each aspect of a country's infrastructure is interdependent to the others. Students also determine how lesser developed countries and developed countries differ in times of catastrophe." They use a New York Times article as a starting point for their explorations.

Note: The sites listed above will serve as a source of curricular content in Hurricanes. For other resources in Weather (e.g., curricular content), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Lightning Theme Page

Below are the CLN "Theme Pages" which support the study of electricity-related concepts such as Lightning. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Electricity (Concepts) Theme Page
- Electronics (Circuitry) Theme Page
- Magnetism Theme Page

General Lightning Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Lightning. Please read our disclaimer.

- Bright Light Fright

  View this section of the Franklin Institute (what would be more appropriate?) for information on the history and science of lightning. They also have a piece on lightning detection.

- Design a Lightening Calculator

  In this activity, students will learn how to predict lightening distances and discover why light travels faster than sound.

- Fire Weather

  The Alberta Ministry of Environmental Protection collects data on lightning strikes within the province and makes them available from this site both cumulatively and daily. They also describe their lightning detection system.

- Frequently Asked Questions about Lightning

  From Kerry Anderson of the Canadian Forest Service in Edmonton

- Human Voltage: What Happens When People and Lightning Converge?

  A readable news article from NASA that describes the incidence and impact of lightning strikes on the human body.

- Kids' Lightning Information and Safety

  Developed by a lightning strike victim, this site offers kids' information on lightning and lightning safety. Sabrina writes, "it really hurts when you are struck by lightning and I want to help other kids to learn more about lightning safety. I want to share what I have learned with you. I think that the more you know, the safer you can be."

- Lightning

  This instructional unit is part of the "Science With OAR" web site developed by the University of South Alabama. It consists of explanatory sections on lightning, student activity assignments, and links to other external lightning sites where students can collect the data to answer the questions.

- Lightning and Atmospheric Electricity Research at the GHCC

  Don't let the name scare you away from this NASA site. For a sound introduction to lightning (history, basics, safety, etc.) check out their "Lightning Primer." Then, to learn more about how NASA's space program is involved, read their section on Space Research and Observations.

- Lightening in a Jar

  Students create lightening in a clear plastic jar with a light bulb.

- [The] Lightning Page

  A very comprehensive site that contains basic explanatory information as well as photo and sound files. A lengthy index lists such sections as survivors, FAQs, myths, strike maps, safety and more. Note this site is actively sponsored by Christian Internet Services (CIS).

- Lightning Photography

  Over 150 photographs by Michael Bath.

- Lightning Photography

  Over 75 photographs of lightning strikes by Dave 'stormguy' Crowley. He also offers photography and safety tips.

- Personal Lightning Safety

  The Lightning Safety Institute offers advice on personal protection in outdoor recreational events, parks, swimming pools, boats, and in general. They also have other useful information.

- Severe Storms: Online Meteorology Guide

  Dangers, types and components of thunderstorms.

- Sparks and Lightning

  An article explaining sparks, lighting and conductive plasma.

- [The] Strike

  This site has pictures of what the owner advertises as the "closest 12 stroke lightning strike ever caught on video" as well as background information on the event. Included are also other pictures from professional stormchasers and links to related sites.

- ## Strike One

  This link is to an archive of over 25 lightning strike pictures taken by Michael Fewings whose goal is to combine artistry with lightning. See also his "current" photographs from this page and his tips on how to "avoid" being struck.

- ## Thunderstorms

  The U.S. Federal Emergency Management Agency sponsors this "FEMA for Kids" site on thunderstorms/lightning. Children can read information specially developed for them on terminology, what lightning is, what if someone is hit by lightning, facts and fiction, photos, things to know, and what one might feel in a disaster.

- ## TrackStar

  TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

  This link is to their search page from where a keyword search on "lightning or thunder or storm" will produce numerous hits. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

- ## Weather Eye: Lightning

  Student tutorials, experiments with static electricity, an interactive safety section, and a quiz for grades 5-9.

Note: The sites listed above will serve as a source of information about Lightning. For other resources in Sciences (e.g., curricular content in Earth, Life or Physical sciences, etc), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Ozone Depletion Theme Page

Below are the CLN "Theme Pages" which support the study of Ozone Depletion. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Air Quality
- Global Warming/Climate Change
- Reduce, Reuse, Recycle Theme Page

Ozone Depletion Resources

This "Theme Page" has links to resources related to the study of the Ozone Depletion. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. Please read our disclaimer.

- Air Quality Lesson Plans and Data

  The Texas Natural Resource Conservation Commission provides a number of lessons and activities for educators who wish to teach K-12 students about air quality. Lesson plans are provided on such topics as acid rain, air pressure, ozone, plants & oxygen and pollution control.

- [The] Earth Times

  An on-line magazine, Earth Times offers current and past news stories with a focus on the environmental issues, sustainable development concerns, population and current affairs. The Earth Times is the only independent international nonpartisan newspaper focusing on environment and economic development, and such interrelated concerns of the international system as human rights, population, trade, and women's and children's rights. Its mission is primarily to inform and educate audiences about the pressing issues of interdependence in which the environment plays a central role. Present and back issues are available for browsing or searching.

- Exploring the Environment: UV Menace

  This module is part of "Exploring the Environment" (ETE) from NASA's Classroom of the Future. In ETE, high school students are faced with a real life problem and their goal is to use problem solving skills and internet based data (e.g., remotely sensed satellite images) to propose and defend a solution. A Teacher's Guide is available. This link is to the ETE home page since it gives the easiest access to necessary introductory and teacher information. To access the ozone module, click on "Modules and Activities" and then "UV Menace."

Fact Sheet: Health and Environmental Effects of Ground-Level Ozone

Ground-Level ozone is the primary ingredient of smog. This page explains in an easy to read format the following topics:

- Why are We Concerned about Ground-Level Ozone?
- Who is Most at Risk from Exposure to Ground-Level Ozone?
- How does Ground-Level Ozone Harm the Environment?
- What Improvement Would Result from EPA's New Standards?
- Background: What is Ground-level Ozone?

(The) Greenhouse Effect

Written for Elementary and Middle school students, to learn about the "The Greenhouse Effect" and "The Ozone Layer".

Ground-Level Ozone

Created for the State of Texas, this page describes the two types of ozone, how it is formed and some of the problems related to each type.

Ozone

Nasa's Observatorium presents an article on ozone for students in grades 9-12 which presents the effects of ozone depletion on the Earth, discusses the formation and destruction of ozone, and summarizes the history and the politics of the Montreal Protocol. There's also a teacher's guide with suggested student activities, but you'll have to read through the article to find it.

The Science of Ozone Depletion

Be sure to check out Effects of Ozone Depletion, Ozone Depletion and Environmental Effects, UV-B Radiation: How to protect yourself.

[The] Ozone Hole Tour

From the University of Cambridge's Centre for Atmospheric Science, this tour begins with an introduction including a history of the issue and proceeds to a description of recent discoveries in the Antartic. The third part of the tour examines the science beyond the issue - what are the ingredients that make ozone loss occur? The final segment summarizes current research.

Stratospheric Ozone

From this comprehensive Environment Canada site, you can learn about ozone depletion, health and environmental impacts, the Canadian Ozone Layer Protection Programs, Canadian data, and international efforts. There's also a special Kid Zone which has these resources especially designed for young students.

- Healthy Living with Sunshine
- Ozone Guarding Our Earth
- [The] Ozone Layer: What's Going On Up There?

Top of Page

Note: The sites listed above will serve as a source of curricular content in Ozone Depletion. For other resources in Social Studies - Environment (e.g., curricular content), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Tornadoes Theme Page

Below are the CLN "Theme Pages" which supplement the study of tornadoes. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- **Natural Disasters**
  - Avalanches Theme Page
  - Blizzards Theme Page
  - Earthquakes Theme Page
  - Floods Theme Page
  - Hurricanes Theme Page
  - Tsunamis Theme Page
  - Volcanoes Theme Page

General Tornadoes Resources

Here are a number of links to other Internet resources which contain information and/or other links related to tornadoes. Please read our disclaimer.

- (A) Comprehensive Glossary of Weather Terms for Storm Spotters

  This glossary contains weather-related terms that may be either heard or used by severe local storm spotters or spotter groups.

- EarthWatch Weather On Demand

  A graphic intensive site showing satellite and radar weather pictures for North America. At this page, you can choose detailed, current weather images of Canada. The StormWatch button at the top of the page is for the US only.

- [The] Fujita Scale

  "The Fujita Scale (also known as the Fujita-Pearson Scale) is used to rate the intensity of a tornado by examining the damage caused by the tornado after it has passed over a man-made structure." The page also has many links to tornado resources.

- [The] Heat is On! Creating Weather Emergency Guides in the Science Classroom

  In this lesson plan, grade 6-12 students research severe weather conditions common to their geographic location and create weather emergency guides for extreme weather conditions such as tornadoes, floods, blizzards, thunderstorms and hurricanes. They use a New York

Times article as a starting point for their explorations.

- Kansas Tornado Chasers

  The purpose of this site is to educate the public, spotters, and chasers of the subject of tornadoes. The site includes tornado history, photos, videos, forecasts, nowcasts, preparation, and much more. Check out their kidspage and safety links.

- Severe Weather Related Sites

  A meta-list of sites related to severe weather.

- Tornadoes

  Part of Scientific American's site, this page has descriptive information about Supercells, Tornado Chasing, Signature of a Vortex, Spinning Up, and Touchdown.

- Tornadoes

  This instructional unit is part of the "Science With OAR" web site developed by the University of South Alabama. It consists of explanatory sections on tornadoes, student activity assignments, and links to other external tornado sites where students can collect the data to answer the questions.

- Tornadoes: Going Around in Circles

  Sponsored by the National Institute for Science Education, this site provides answers the following questions: What are tornadoes?; Where does a twister get all that energy?; How to protect yourself when a tornado is close?; and How does a twister affect the natural landscape? Get the answers to these questions, then take the "twisted test".

- Tornado in a Bottle

  A lesson plan for grades 3-5 that lets them create a vortex in a bottle.

- Tornado Information Index

  A meta-list of sites from USA Today. It has links to resources on tornado safety, tornado science, tornado research, tornado chasing and more....

- (The) Tornado Project On-line

  A page of resources from a small group who collects, compiles and makes tornado information available. This site specializes in tornado myth, tornado oddities, personal experiences, tornado chasing, tornado safety, and tornadoes from the past.

- Tornado Trailhead

  This is the starting point for a virtual field trip on tornadoes from Tramline. Experts in the subject have selected a number of web sites on tornadoes and arranged them in a sequence to tell a story for students to follow. Students can move from one web stop in the field trip to the next with ample opportunity to explore within the individual web site as they wish. However, since their web browser page has been split into an inner part (showing that stop in the field trip) and an outer part (giving navigational tools to go through the entire field trip), they can always return to their "tram" and go to the next stop. To be effective, teachers would have to ensure that student browsing through the field trip sites was purposeful.

Teacher guides can be printed.

- [The] TORRO Tornado Intensity Scale

  This Scale is used to categorize windspeeds in tornadoes. From the following list, learn about the criteria used to rate the tornado's windspeed: viewing the damage caused, engineering analysis of the damage caused, Doppler radar, photogrammetric analysis, and direct measurement.

- TrackStar

  TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

  This link is to their search page from where a keyword search on "tornadoes" will produce numerous hits. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

- Vortex

  Grades 4-10 lesson plan using 2 - 2 litre bottles to create a tornado in a bottle.

- Vortex: Unraveling the Secrets

  The story of an expanding tornado and its resulting consequences are set in a story plot similar to a mystery novel. The authors begin the mystery with a description of some of the events and facts. Then they lead the reader through information that helps them understand and possibly solve why the tornado occurred. There are two versions available, Java enhanced (slow downloading) and low band width.

- (The) Weather Unit

  A weather unit complete with many primary class lesson plans integrated into all subjects areas.

- What is a Tornado?

  A detailed essay describing various characteristics of tornadoes with accompanying photos. Part of its purpose is to dispell misconceptions about tornadoes.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Tornadoes. For other resources in Weather (e.g., curricular content), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Water Quality Theme Page

Here are a number of links to Internet sites which contain information and/or other links related to the specific theme of water quality. Please read our disclaimer.

- ## [The] Daybook

  From this searchable database of lessons plans, we gathered together the following intermediate grade lesson plans into one location for your convenience:

  - Water Unit: Adhesion: Part 1 of 6 Introduces students to the property of adhesion.
  - Water Unit: Physical Properties: Part 2 of 6 Introduces students to the physical properties of water by having them guide water droplets around a race course outlined on a piece of wax paper.
  - Water Unit: Surface Tension: Part 3 of 6 This unit introduces students to the physical properties of surface tension on water by floating a needle on it.
  - Water Unit: Surface Tension: Part 4 of 6 Students demonstrate surface-tension by dropping pennies into a full glass of water and watching as the water begins to form above the glass.
  - Water Unit: Cohesion: Part 5 of 6 This lesson introduces students to the property of cohesion - the way water likes to stick together. Students are asked to visualize and draw water droplets.
  - Water Unit: The Uses of Water: Part 6 of 6 This final activity involves the students in categorizing the uses of water. They are asked to collect and chart data about the different uses of water in their home.

- ## Eliminating Microorganisms from Water

  An activity, designed by the Chlorine Chemistry Council (CCC), in which students create water samples with microorganisms, examine the sample, and then remove the organisms.

- ## Fundamentals of Physical Geography

  Although this online textbook from Michael Pidwirny, Okanagan University College, is intended for postsecondary students studying introductory physical geography, much of it may be applicable for high school students as well. Contents include over two hundred pages of information, more than three hundred 2-D and animated graphics, an interactive glossary of terms, a study guide, links to other Internet resources, and a search engine. See the Table of Contents to directly access the Hydrology section.

- ## Educating Young People About Water

  The following three links allow you to download PDF files that describe and explain a comprehensive community based water education program.

  - A Guide to Program Planning and Evaluation This first section "walks program planners through the steps in setting up and evaluating a youth water education program- bringing together the key components that can lead to an effective, sustainable program."

- A Guide to Unique Programming Strategies The second part "tells the story of 37 program coordinators from around the country. Discover how they integrate community water education issues and youth development needs into unique program designs."
- A Guide to Goals and Resources This section "provides the program coordinator with 100 water education curricula summaries, environmental education topics and goals, and multimedia resources."

Environment Canada's Freshwater Web Site

Here's a comprehensive Canadian site designed with educators and students in mind. Most content has been written for grade 6-12 students with learning materials available for grade K-12 teachers. From the home page, be sure to check out: The Management of Water (covers topics like water modeling, water pollution, water quality, water use...); The Nature of Water (covers information on ecosystems, ground water, properties of water...); Teacher's Corner (free learning aids ad teaching materials); Water and Culture (articles on water and Canadian identity).

Environmental Priority-Clean Water

A page by Environment Canada that explains what causes water pollution, why we should be concerned, and what is being done to protect our water.

Exploring the Environment: Water Quality

This module is part of "Exploring the Environment"ª (ETE) from NASA's Classroom of the Futureª. In ETE, high school students are faced with a real life problem and their goal is to use problem solving skills and internet-based data (e.g., remotely sensed satellite images) to propose and defend a solution. A Teacher's Guide is available. This link is to the ETE home page since it gives the easiest access to necessary introductory and teacher information. To access the water quality module, click on "Modules and Activities" and then "Water Quality".

Floods Theme Page

This CLN theme page provide curricular and instructional resources on the associated topic of floods.

Groundwater in British Columbia

The Ministry of Lands, Parks and Housing of British Columbia maintains a meta-list of links to information and resources relating to groundwater in the Province.

Groundwater Remediation Project

Supported by the National Water Research Institute, this site has information on Canadian groundwater resources including PDF reports on various issues, links to other groundwater sites, and groundwater education.

Hydrologic Cycle

Nasa's Observatorium presents an article explaining the five processes which make up the hydrologic cycle (condensation, precipitation, infiltration, runoff, and evapotranspiration). A quiz and a word search activity are provided as well.

- [The] Incredible Journey

A lesson plan for upper elementary students that uses the roll of a die to simulate the movement of water within the water cycle.

- Lifewater Canada

Extensive information is available regarding a vast array of water pump construction, water collection, water storage, water quality testing and treatment, and effective sanitation. The focus of the information, assembled by a Christian Organization, is to aid Third World countries in improving and developing healthy water sources.

- Liquid Assets

This unit has four lessons on the water cycle, water use, measuring water quality, and water pollution for intermediate/junior high students. Lessons include suggested learning activities that teachers can incorporate with their own ideas.

- Oil, Water, and Chocolate Mousse

The purpose of this Environment Canada site is to provide information about the impact of oil spills. Some topics include: When Oil Spills, Prevention is the Best Cure, Always Be Prepared, What Can I Do To Help? and more.

- Project Wet: Lesson Plans

The Project WET Curriculum and Activity Guide is an interdisciplinary water education program developed for teachers of kindergarten through grade 12. It contains a range of water education concepts and multidisciplinary activities.

- Properties of Water

A lesson plan for K-8 biology teachers on the properties of water. The language level of the content will probably be too high for students to use directly.

- Smile Program Biology Index

Teachers participating in the SMILE (Science and Mathematics Initiative for Learning Enhancement) summer session programs each create a single concept lesson plan. This database has a few lessons on water quality in their section on Environmental Studies and Ecology. Caution: Since there is a wide number of authors who have contributed to the database, the detail and quality of the lesson plans will vary.

- TrackStar

TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

This link is to their search page from where a keyword search on "water" will produce numerous hits. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

- U.S. Environmental Protection Agency: Curriculum: Water

  This page contains links to a variety of curriculum resources on water for students as well as links to student activities.

- Utahlink - Teacher Resource Book

  Over 30 science lesson plans from Utah State that are designed for elementary aged students. You can browse through their set of science resources above, or we've made direct links to four below which focus on water and how it interacts in our environment.

  - Activity # 1 - Ground Water Students create a model for the percolation of water through the soil and observe the filtering process achieved as water enters a sample of ground water. Students are challenged to create a more effective system.
  - Activity # 2 - Water Sheds and Basins A mountain of soil is observed as water is sprinkled and then poured down the valley.
  - Activity # 3 - Water Cycle Terrarium Students make a terrarium out of two-liter pop bottles and observe the water cycle in action.
  - It's Raining in the School An introduction to the concept of the water cycle containing demonstrations on condensation, precipitation and accumulation.

- Wastewater System

  Greater Vancouver Regional District site provides a range of information describing a number of wastewater issues that apply to many cities and towns. The following three links identify common wastewater issues and answers:

- Water

  Over 10 lesson plans/suggested activities for studying water that span grades K-12.

- Water - Facts and Tips

  Health Canada published this page of general information on drinking water and some general tips on water conservation.

- Water Myths and Realities

  This page provides answers to many questions concerning water quality, water sources, and impacts on your health.

- Water Quality Resources

  About 8 lesson plans, activities, and fact sheets on water quality from the Louisiana Department of Environmental Quality. You'll need to scroll down the page to find the links.

- Water Science for Schools

  The U.S. Geological Survey offers a wide range of water science information about water and its uses, its special characteristics and its availability on earth. Included with this information are activities, questions and answers, pictures, maps, data tables and links to further resources.

- Wastershed Game

  Students simulate the role of a manager of a watershed, making decisions in response to issues and then seeing the consequences of those decisions.

- Water, Water Everywhere

  A research project designed for elementary students. Students will gather precipitation levels from two sides of the Cascade Mountains, enter information into spreadsheets, create graphs of the data and discuss the implications of their results.

- Water, Water Everywhere, Nor Any Drop to Drink

  In this lesson plan, grade 6-12 students "investigate the importance of water historically and in their daily lives and examine the nature of water as a limited resource. Students work in groups to research technological systems that have aimed to use water in the most productive ways, evaluate those systems, and create "How It Works" posters of those systems that incorporate their research." They use a New York Times article as a starting point for their explorations.

- Water What-ifs

  This site has a number of lesson plans related to exploring the characteristics of water. Although the site is designed for Delaware and North Carolina teachers, the information and lessons are comprehensive and transferable. Lessons are suitable for both middle and high school students, encourage inquiry and collaboration into the investigation of water quality, and explore the following content areas: pH, temperature, dissolved oxygen, nitrates/phosphates, and macroinvertebrate surveys.

Top of Page

Note: The sites listed above will serve as a source of curricular content in the Water Quality. For other resources in Social Studies - Environment (e.g., curricular content in Biomes, Endangered Species, or Hazardous Waste Disposal), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

How the Weatherworks

Activities, Experiments and Investigations

Welcome to our ***Activities, Experiments and Investigations*** index page. These are a sampling of some of our favorite "things" to do in studying about the weather. The listing is far from complete, but it should give you a good idea about how we use weather as a bridge to multi-disciplinary education.

Many of these activities, experiments and investigations are from our published materials (this link takes you to our web store). You are free to use the activities in your classroom. Should you wish to use any of these in any other way, please contact How The Weatherworks™...for permission. THANKS!

Finally, this page has been coded to appear in either Arial or Helvetica font for easier reading. If you do not have either of these fonts installed on your system, the Netscape or Internet Explorer default font should operate. If you encounter any problems reading this page, please contact How The Weatherworks™...

- **NEPHELOCOCCYGIA**
  This activity involves looking for shapes in the clouds. There's also a great interactive language arts activity.
- **SKY WINDOWS**
  What color is the sky or the clouds? Check it out using this "unique" weather instrument. You'll never look at the clouds in the same way again.
- **NOAA WEATHER SATELLITES**
  The National Oceanic and Atmospheric Administration (NOAA), the parent agency of the National Weather Service, launched a new geostationary

weather satellite April 24, 1997 and another May 3, 2000. Weather satellites are a great way to study clouds and cloud patterns from above. HOW THE WEATHERWORKS will be publishing a set of four weather satellite posters in the Fall of 2003.

- **More activities to be posted in the future -- Please come back and check out the latest additions.**

BASIC OVERVIEW OF UNIT

WEATHER HERE AND THERE is an integrated weather unit which incorporates interaction with the Internet and hands-on collaborative, problem solving activites for students in grades four through six. This unit is divided into six lessons. The lessons integrate math, science, geography, and language arts in the process of teaching and learning about weather phenomena. Students will become involved in collaborative problem solving using e-mail as well as through joining projects offered via the Internet. *The Global Education Project* will help students see the relevance of science by interacting with scientists and other students across the world, as they collaborate in the study of weather in their environment.

The first three lessons focus on learning basic meteorological concepts about weather elements, how to take measurements using appropriate weather instruments, and recognizing basic weather trends and patterns.

The last three lessons focus on studying weather maps and applying the knowledge and experience about weather to associate weather trends and patterns in the process of making accurate forecasts. The unit culminates with a weather broadcast of a twenty-four hour forecast presented by students and focusing on a network of weather stations in the United States created by the students.

ACID RAIN

Welcome to this research study on acid rain. You may choose to be a specialist in one of the areas listed below. You may research information in your field, compile data, analyze the data, and then meet with others in your group for their input. You will then write a report on this topic. You may write about information you discovered, and creative ideas about any aspect of this topic.

TEACHER'S PAGE

Click on the subject of your choice:

- CHEMISTRY
- ECONOMICS
- HISTORY
- ENVIRONMENT
- HEALTH
- POLITICS/GOVERNMENT

CHEMISTRY

You have chosen to be a chemist. Your job will be be to find out the chemical make-up and properties of acid rain. Some questions you may want to answer are:

- What is an acid?
- What chemicals make rain into "acid rain", and how?
- Where do the chemicals come from?
- What do the chemicals do to the environment?

click here for resources
click here for Acid Rain ABCs
click here for some great general information
click here for information about pH

click here for reference material on cloud chemistry

click here to read about an artist's solution

Back to the top

ECONOMICS

You have chosen to be an economist. Your job will be to find out effects of acid rain on the world economy. Some questions you may want to answer are:

- What is the world trend in the problem of acid rain?
- What economies are hardest hit, and how?
- What is the estimated cost, in dollars, to economies by acid rain?
- What is the estimated cost of preventing acid rain, or any solutions?

click here for some solutions
click here for information about cost of acid rain
click here for information about Bush's Clean Air Act (one view)

Back to the top

HISTORY

You have chosen to be a historian. Your job will be to find out how acid rain has evolved through history in cause and effect. Some questions you may want to answer are:

- Has acid rain or other pollution always been a problem?
- When did acid rain begin to be a problem?
- What are the main contributors (in historical evolution)that cause this problem?
- Are there any lessons to be learned from history?

click here for information about the Mayan Pyramids and acid rain
click here for general information sites
click here for Timework Page
click here for information about the Industrial Revolution
click here to see how volcanoes have produced acid rain through history
click here for more information about acid rain in history

Back to the top

ENVIRONMENT

You have chosen to be an Environmentalist. Your job will be to find out how acid rain effects the environment, water, air, soil, plants or animals. Some questions you may want to answer:

- What does acid rain do to living or non-living things?
- What places are especially vulnerable to acid rain?
- What are the causes of acid rain?
- What are possible preventions or solutions to the problem of acid rain?

click here for effects of acid rain on terrestial habitats
Back to the top

HEALTH

You have chosen to be a researcher in the field of human health. Your job will be to find out possible connections between acid rain and health problems. Some possible questions you may want to answer are:

- How does acid rain affect living things(plants and animals)?
- What non-living things are affected?
- How can human health be affected directly or indirectly?
- How does one reconcile the importance of technology versus human health?

click here for information
click here for government information on acid rain
click here for information on acid rain's effects on human health
click here for information on effects of acid rain on drinking water

Back to the top

POLITICS

You have chosen to be a politician. Your job will be to find out what problems are associated with acid rain, and if these problems could be controlled by legislation, and if so, how this could be done. Some questions you may want to consider are:

- Can one legislate in a fair manner?
- How would you go about it?
- What are the social and economic implications of such legislation?
- How would you deal with what is ethical and moral versus what is popular, as an elected representative. Is what is popular always right, or is what is right always popular?

Monitoring

US - Canada

Acid Rain Program

The overall goal of the Acid Rain Program is to achieve significant environmental and public health benefits through reductions in emissions of sulfur dioxide (SO2) and nitrogen oxides (NOx), the primary causes of acid rain. To achieve this goal at the lowest cost to society, the program employs both traditional and innovative, market-based approaches for controlling air pollution. In addition, the program encourages energy efficiency and pollution prevention.

Acid Rain

En Español

Acid rain is a serious environmental problem that affects large parts of the US and Canada. This section of the Web site provides information about acid rain's causes and effects, how we measure acid rain, and what is being done to solve the problem.

- What is acid rain and what causes it?
- How do we measure acid rain?
- What are acid rain's effects?
- How do we reduce acid rain?
- Science Experiments
- Learning Activities
- Glossary

- Acid Rain Program Progress Report

- Nitrogen: Multiple and Regional Impacts

- Lesson plans for K-12 from the Texas Natural Resource Conservation Commission EXIT disclaimer

Note: If you're looking for the Student Sourcebook, you've found it! We've combined it with other materials, updated and expanded the information, and reformatted it to cover a broader range of topics.. This page links to all of the information in the original Sourcebook; in many cases, it uses the same text as the Sourcebook.

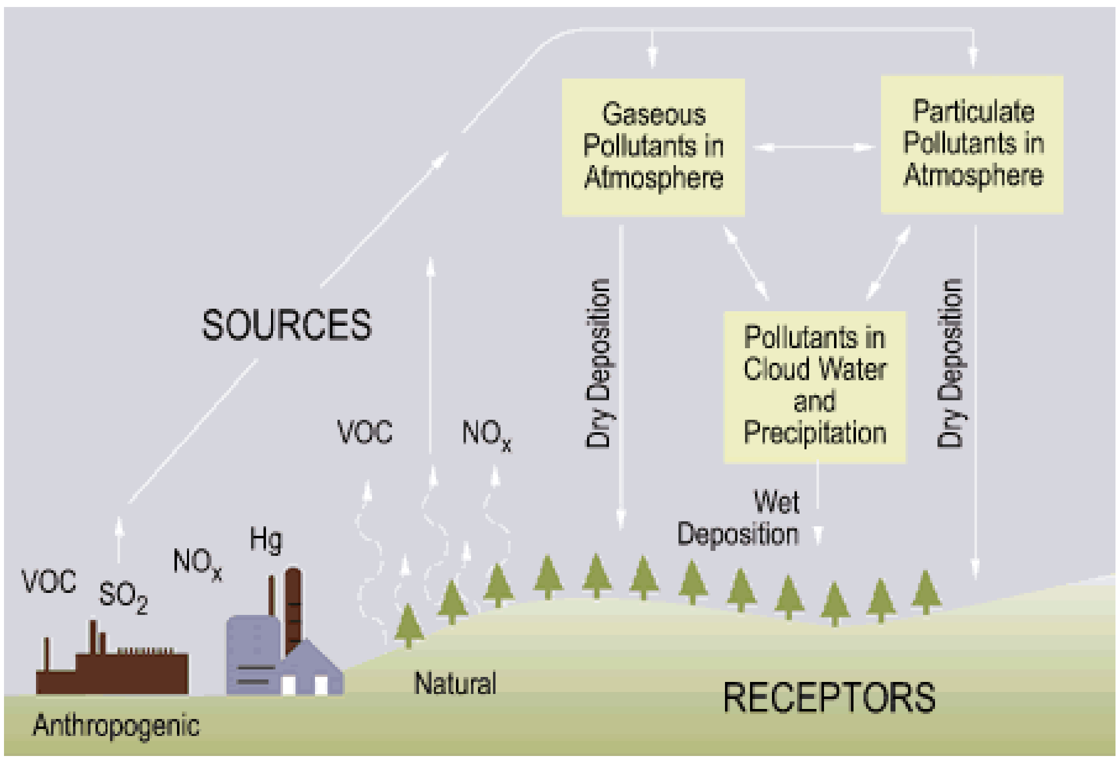
What is Acid Rain and What Causes It?

"Acid rain" is a broad term used to describe several ways that acids fall out of the atmosphere. A more precise term is acid deposition, which has two parts: wet and dry.

Wet deposition refers to acidic rain, fog, and snow. As this acidic water flows over and through the ground, it affects a variety of plants and animals. The strength of the effects depend on many factors, including how acidic the water is, the chemistry and buffering capacity of the soils involved, and the types of fish, trees, and other living things that rely on the water.

Dry deposition refers to acidic gases and particles. About half of the acidity in the atmosphere falls back to earth through dry deposition. The wind blows these acidic particles and gases onto buildings, cars, homes, and trees. Dry deposited gases and particles can also be washed from trees and other surfaces by rainstorms. When that happens, the runoff water adds those acids to the acid rain, making the combination more acidic than the falling rain alone.

Prevailing winds blow the compounds that cause both wet and dry acid deposition across state and national borders, and sometimes over hundreds of miles.



Scientists discovered, and have confirmed, that sulfur dioxide (SO2) and nitrogen oxides (NOx) are the primary causes of acid rain. In the US, About 2/3 of all SO2 and 1/4 of all NOx comes from electric power generation that relies on burning fossil fuels like coal.

Acid rain occurs when these gases react in the atmosphere with water, oxygen, and other chemicals to form various acidic compounds. Sunlight increases the rate of most of these reactions. The result is a mild solution of sulfuric acid and nitric acid.

How Do We Measure Acid Rain?

Acid rain is measured using a scale called "pH." The lower a substance's pH, the more acidic it is. See the pH page for more information.

Pure water has a pH of 7.0. Normal rain is slightly acidic because carbon dioxide dissolves into it, so it has a pH of about 5.5. As of the year 2000, the most acidic rain falling in the US has a pH of about 4.3.

Acid rain's pH, and the chemicals that cause acid rain, are monitored by two networks, both supported by EPA. The National Atmospheric Deposition Program measures wet deposition, and its Web site EXIT disclaimer features maps of rainfall pH (follow the link to the isopleth maps) and other important precipitation chemistry measurements.

The Clean Air Status and Trends Network (CASTNET) measures dry deposition. Its Web site features information about the data it collects, the measuring sites, and the kinds of equipment it uses.

What Are Acid Rain's Effects?

Acid deposition has a variety of effects, including damage to forests and soils, fish and other living things, materials, and human health. Acid rain also reduces how far and how clearly we can see through the air, an effect called visibility reduction. The acid rain effects section provides more details on each of these.

How Do We Reduce Acid Rain?

- What society can do
- What individuals can do
- What EPA is doing
  EPA's Acid Rain Program limits, or "caps," sulfur dioxide (SO2) emissions from power plants at 8.95 million tons annually, allows those plants to trade SO2 allowances, and reduces nitrogen oxide emission rates.

Experiments & Activities for Students

The experiments page provides detailed instructions and suggestions for classroom activities.

Glossary

The Clean Air Market Programs glossary includes many terms related to acid rain.

Acid Rain

Smog/Ozone Transport

Regional Haze

Climate Change

Students and Teachers

Acid Rain Students Site

Effects of Acid Rain

Acid rain causes acidification of lakes and streams and contributes to damage of trees at high elevations (for example, red spruce trees above 2,000 feet) and many sensitive forest soils. In addition, acid rain accelerates the decay of building materials and paints, including irreplaceable buildings, statues,and sculptures that are part of our nation's cultural heritage. Prior to falling to the earth, SO2 and NOx gases and their particulate matter derivatives, sulfates and nitrates, contribute to visibility degradation and harm public health.

The links below provide more detailed information on each of these effects.

- Surface waters (e.g., lakes and streams) and animals living in them
- Forests
- Automotive Coatings (e.g., car paint)
- Materials
- Visibility
- Human Health

CAP 2000 (Compliance Assurance Program)

- On March 16, 2004, the EPA Administrator signed a proposed regulation that instructs automotive manufacturers how to conduct the durability procedures used to predict the useful life emissions of new vehicles. This rulemaking fulfills a court mandate issued on October 22, 2002, by the United States Court of Appeals for the District of

Columbia Circuit that ordered EPA to issue new emissions durability regulations. The following documents relate to the durability proposed rulemaking. Please note that the Preamble and Regulations have not yet been published in the Federal Register, and are subject to editorial changes by the Federal Register office.

- On August 23, 2001 the Administrator issued a denial to the Ethyl Corporation's request to reconsider the CAP 2000 regulation. The Administrator has also denied two other Ethyl petitions to reconsider a Heavy Duty gasoline rule and an OBD/IM rule. The denial document and the cover letter from the Administrator to Kevin Fast, Counsel for Ethyl Corp. are available below:

  - Cover Letter [58K PDF]
  - EPA Response Document to Ethyl Petitions [116K PDF] [178K WPD]

  These and other documents relating to this petition may also be found at EPA's Air Docket #A-96-50, Room M-1500 (mail code 6102), 401 M St. SW, Washington, D.C. 20460. The docket is open from 8:30 a.m. until 5:30 p.m. weekdays. The docket may also be reached by telephone at (202) 260-7548. As provided in 40 CFR Part 2, a reasonable fee may be charged by EPA for photocopying.

- On December 17, 1999, EPA published a Federal Register Notice extending the comment period for accepting comments on the Ethyl petition regarding CAP 2000 to January 14, 2000.
- On November 5, 1999, EPA published a notice in the Federal Register [HTML] requesting comments on the Ethyl petition to reconsider the CAP 2000 regulation. Comments must be submitted by December 20, 1999 to EPA's Air Docket number A-96-50, Room M-1500, 401 M Street SW, Washington DC 20460.
- Petition for Reconsideration of the CAP 2000 Rule [601K PDF]. This petition was filed before EPA Administrator Carol Browner by the Ethyl Corporation in August, 1999. Other documents relating to this petition may be found at EPA's Air Docket #A-96-50, Room M-1500 (mail code 6102), 401 M St. SW, Washington, DC 20460. The docket is open from 8:30 a.m. until 5:30 p.m. weekdays. The docket may also be reached by telephone at (202) 260-7548. As provided in 40 CFR part 2, a reasonable fee may be charged by EPA for photocopying.
- CAP 2000 Final Rule was published in the Federal register on May 4, 1999.
    - Fact Sheet (March 1999,

EPA420-F-99-005)[13K PDF]

LET'S TALK ABOUT HEALTH AND AIR QUALITY

Canadians are becoming increasingly aware of and concerned about the future health of the environment, and in particular the quality of the air. Although some hazardous contaminants in the air, such as lead, have declined in recent years, others remain and continue to become more problematic. Canada is a large industrialized country, responsible for the release of a variety of pollutants into the air. In addition to this, certain areas of Canada are located downwind of industrialized areas of the U.S., with resultant higher levels of pollution. Despite this, Canadians enjoy good air quality when compared to many other countries.

However, evidence gathered over the last ten years has increased concerns about the health effects of air pollutants. As a result governments and the public have increasingly focussed on this area.

- The Quality of our Air
- Major Air Pollutants
- Smog
- Acid Rain
- Climate Change

The Quality of our Air

Air is a mixture of gases that surrounds the earth and makes up our atmosphere. Pure air consists of 21% oxygen and 78% nitrogen by volume, plus traces of other substance and gases both natural and anthropogen (man-made). The air that we breathe may actually contain thousands of chemical and biological substances. Many of these are pollutants such as: ground-level ozone (O_3), total suspended particulate (TSP), fine particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) or particles less than 10 microns in diameter (PM_{10}), sulphur dioxide (SO_2), carbon monoxide (CO), nitrogen oxides (NOx), volatile organic compounds (VOCs), sulphate (SO_4), and nitrates (NO_3).

The most commonly measured outdoor air pollutants in Canada include ground-level ozone, particulate matter, carbon monoxide, sulphur dioxide and nitrogen oxides. These substances are the principal ingredients or precursors of smog, and some also contribute to acid rain.

Additional air pollutants of concern include toxic metals (lead, mercury, cadmium, manganese, etc.), and compounds such as benzene, formaldehyde, polychlorinated biphenyl's (PCBs), dioxins, and other persistent organic compounds.

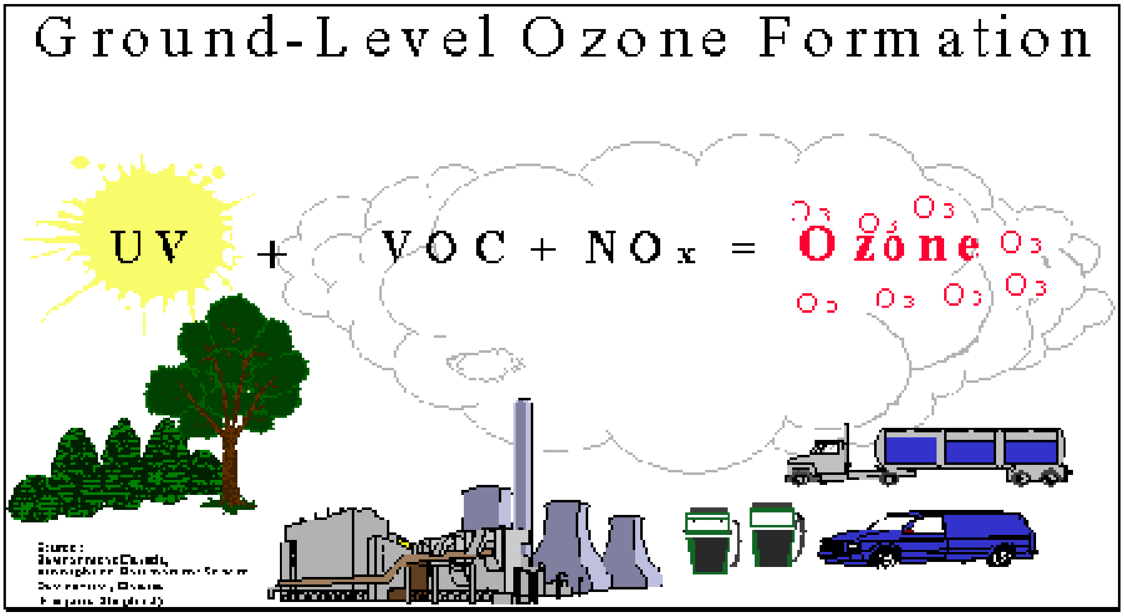
Major Air Pollutants

Outdoor air contaminants come from both natural and human sources. Natural sources include smoke from forest fires, wind-blown dust from soil and volcanoes, bacteria, fungi and chemicals released by plants and animals. However, air pollution is primarily associated with everyday human activities. Pollutants are released by motor vehicles, industrial processes (pulp and paper mills, ore smelters, petroleum refineries, power generating stations and incinerators), and the burning of fossil fuels such as gas, oil, coal and wood.

Air pollutants can be carried thousands of miles across borders and oceans or from one urban area to another. This phenomenon is common around the world and is referred to as "long-range atmospheric transport" or "transboundary pollution".

- Ground-level ozone (O_3)
- Nitrogen Oxides (NOx)
- Volatile Organic Compounds (VOCs)
- Sulphur Dioxide (SO_2)
- Carbon Monoxide (CO)
- Airborne particles (PM)
- Other contaminants

Ground-level ozone (O_3)



Ozone is a naturally occurring gas in the lower atmosphere that increases in concentration when volatile organic compounds (VOCs) and nitrogen oxides (NOx) react in the presence of sunlight and stagnant air. High levels of ground-level ozone often occur during hot summer days in or downwind of heavily populated areas, where sources emit the necessary VOCs and NOx to produce ozone.

Ground-level ozone, a primary component of smog, differs markedly from the protective blanket of ozone high above the earth (also known as the 'ozone layer' or 'stratospheric' ozone), which acts to shield the Earth's surface from intense ultraviolet radiation produced by the sun.

Ground-level ozone has been linked with a broad spectrum of human health effects. Because of its reactivity, ozone can injure biological tissues and cells. Exposure to ground-level ozone for even short periods at relatively low concentrations has been found to significantly reduce lung function in healthy people during periods of exercise. This decrease in lung function is generally accompanied by other symptoms including tightness of the chest, pain and difficulty breathing, coughing and wheezing. The data on health effects of ozone have been examined in human epidemiological studies and exposure to ozone has been associated with mortality, hospital admissions, emergency department visits, and other adverse health effects.

Nitrogen Oxides (NOx)

Nitrogen oxides include a number of gases that are composed of oxygen and nitrogen. In the presence of sunlight these substances can transform into acidic air pollutants such as nitrate particles. The combustion of fuel for transportation, home, and industrial use accounts for approximately 94% of the emissions of nitrogen oxides produced by human activities in Canada. The nitrogen oxides family of gases can be transported long distances in our atmosphere. Nitrogen oxides play a key role in the formation of smog (ground-level ozone). At elevated levels, NOx can impair lung function, irritate the respiratory system and, at very high levels, make breathing difficult, especially for people who already suffer form asthma or bronchitis.

Volatile Organic Compounds (VOCs)

Volatile organic compounds are a group of carbon-containing compounds that tend to evaporate quickly at ordinary temperatures. VOCs are present in our atmosphere at very low levels. Generally, VOCs are found in higher concentrations indoors than outdoors. VOCs can react with nitrogen oxides to form ground-level ozone. Thousands of natural and synthetic chemicals are VOCs, including benzene which is a natural component of crude oil and petroleum products. Some VOCs are carcinogenic, such as formaldehyde and benzene, and some are irritants as a group of precursors to ozone.

Sulphur dioxide (SO_2)

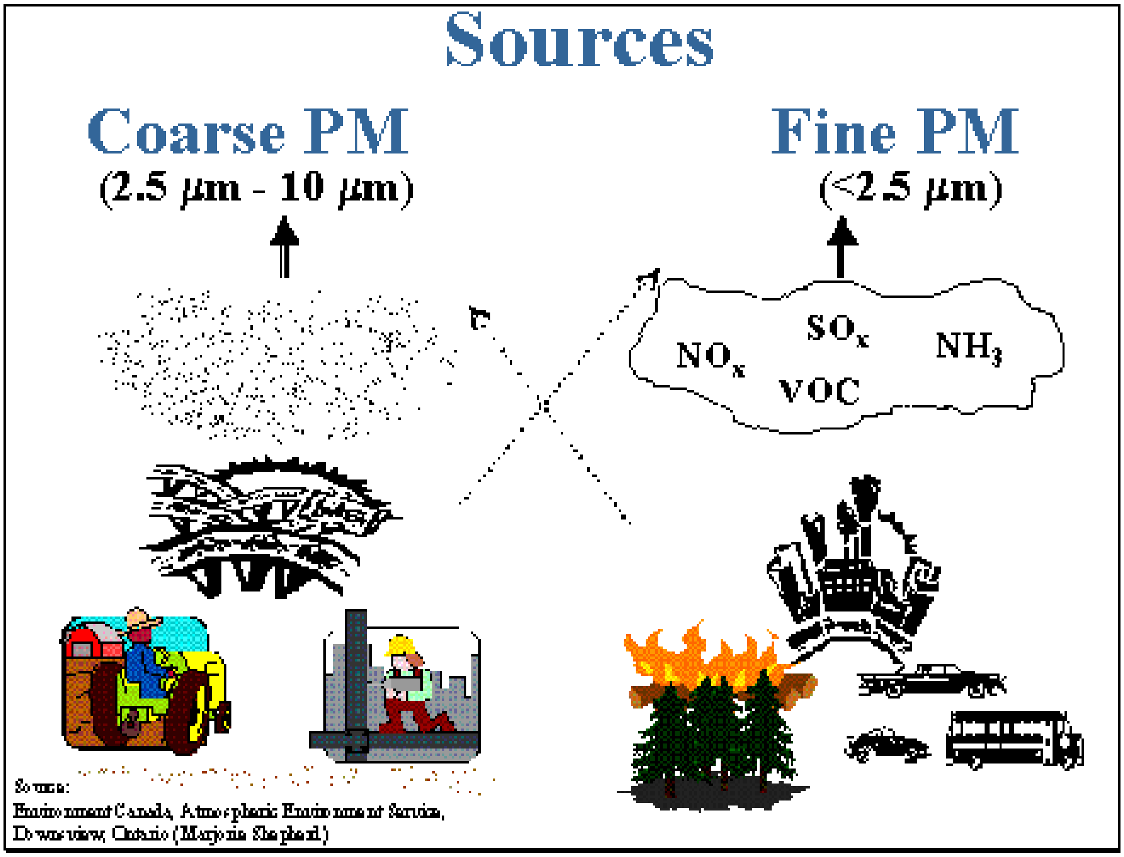
SO_2 is a naturally occurring substance that becomes problematic at higher concentrations. Like nitrogen oxides, sulphur dioxide is produced primarily by industrial processes and fuel combustion. SO_2 can be chemically transformed in the atmosphere in the presence of other chemicals and sunlight to form acidic pollutants such as sulfuric acid and sulphates. SO_2 is a common air pollutant found in outdoor environments. SO_2 can cause breathing problems in people with asthma, but at relatively high levels of exposure. There is some evidence that exposure to elevated SO_2 levels may increase hospital admissions and premature deaths.

Carbon Monoxide (CO)

The principal human source of CO is from fuel combustion, primarily vehicles. CO concentrations are much higher in urban areas due to the number of human sources, although this gas is also released by natural sources such as volcanoes and forest fires. It is an odourless gas which when inhaled, reduces our body's ability to use oxygen. Health effects associated with relatively low-level, short-term exposure to CO include decreased athletic performance and aggravated cardiac symptoms. At the levels typically found in large cities, CO may increase hospital admissions for cardiac diseases, and there is also evidence of an association with premature deaths.

For more information regarding relevant issues, see the Meteorological Service of Canada (Environment Canada)

Airborne particles



Airborne particles are known as 'particulate matter (PM)'or simply 'particles'. These particles are very small solids and/or liquids that are produced by a variety of natural and man-made sources. Airborne particles vary widely in their chemical composition and size.

The size of particles may range from 0.005 µm to 100 µ m in diameter. The suspended portion (total suspended particulates or TSP i.e. found floating in air) is generally less than 40 µm. PM_{10} are particles that are 10 µm or less in diameter. PM_{10} are split into two portions; coarse particles ($PM_{2.5-10}$) and fine particles ($PM_{2.5}$). $PM_{2.5}$ are particles of 2.5 µm or less in diameter. The finer particles pose the greatest threat to human health because they can travel deepest into the lungs. Particles are also an important component of smog. Short-term exposure to airborne particles at the levels typically found in urban areas in North America is associated with a variety of adverse effects. Particulates can irritate the eyes, nose and throat and cause coughing, breathing difficulties, reduced lung function and an increased use of asthma medication. Exposure to particulates is also associated with an increase in the number of emergency department visits, an increase in hospitalizations of people with cardiac and respiratory disease and in premature mortality.

Other air contaminants

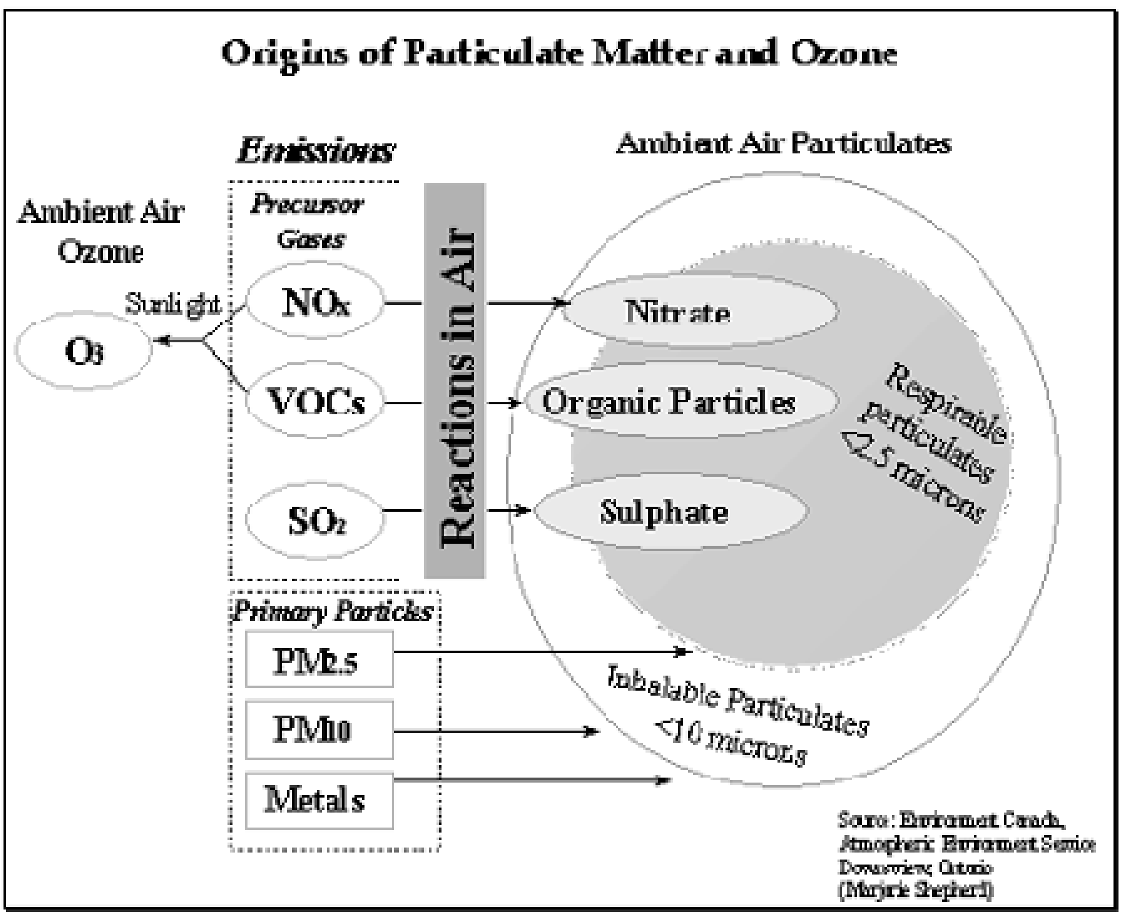
A variety of other contaminants can be found in our air such as hydrogen sulphide (H_2S), total reduced sulphur (TRS) compounds, toxic metals (cadmium, chromium, nickel, manganese), formaldehyde, polychlorinated biphenyls (PCBs), dioxins, and other persistent organic pollutants (POPs). Each is released by human sources and associated with direct effects on human health.

Smog

The term smog was first used to describe the combination of smoke and fog in the atmosphere. In recent years it has become the term given to the chemical soup that is often visible as a yellow-brown haze that hangs over many cities on calm summer days. Smog is a mixture of airborne chemicals which originate from or are produced by motor vehicle and industrial pollution.

A major component of smog is ground-level ozone (O_3), which is formed when two main pollutants, nitrogen oxides (NOx) and volatile organic compounds (VOCs) react in sunlight and stagnant air. Airborne particles such as fine particles or sulphates are also an important component of smog. Because smog formation depends on heat and sunlight, smog generally peaks in late afternoon and early evening. Smog is most obvious in large cities, although suburban and rural communities are not spared. The Windsor-Quebec corridor, the Atlantic provinces and the Lower Fraser Valley in British Columbia have the most smog episodes in Canada.

Breathing in smog has adverse and varied consequences for human health with the cardio-respiratory system being the main target of concern. Wherever its location and whether visible or not, smog is hazardous to human health.



For more information on smog issues, consult the Clean Air website from

Environment Canada

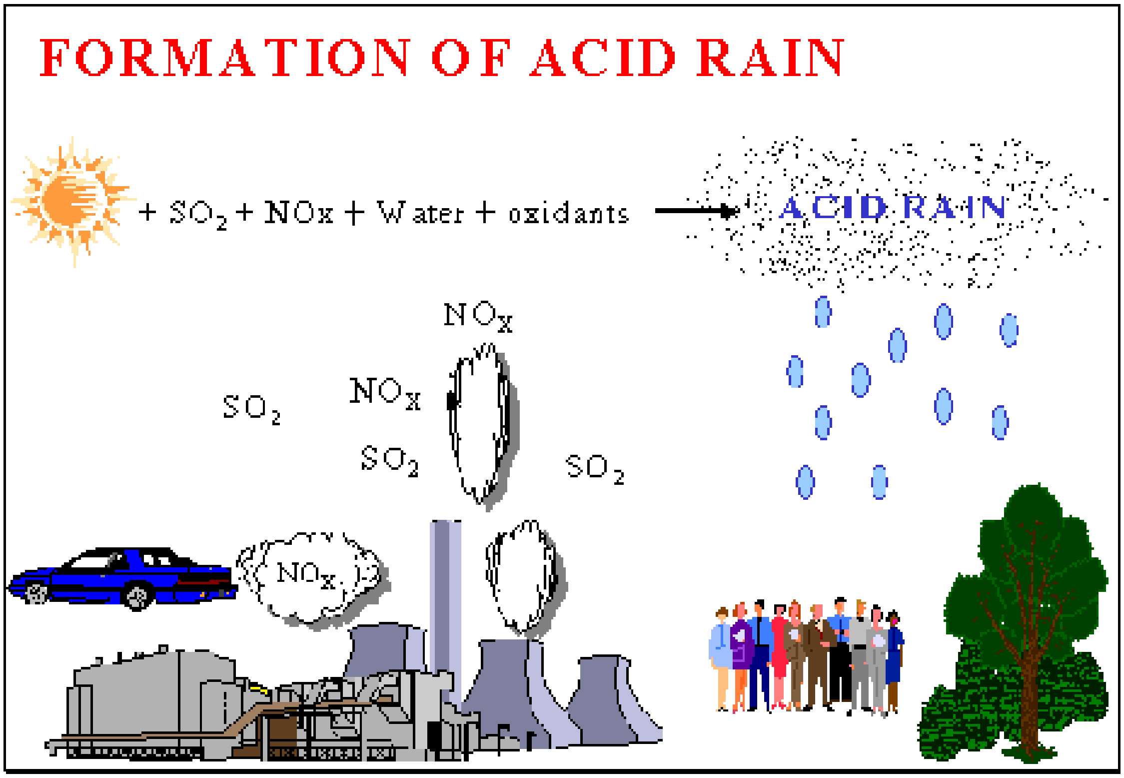
- Smog - It's Your Health
- OMA-Smog

Acid Rain

Air pollution from the burning of fossil fuels is the major cause of acid rain. Acid rain is the popular name for precipitation acidified by atmosphere pollutants. Acid rain is caused by pollutants such as nitrogen oxides (NOx) and sulphur dioxide (SO_2), which in the atmosphere are converted chemically to nitric acid and sulphuric acid. Diluted forms of these two acids fall to earth as rain, or snow.



More than 90% of the NOx and SO_2 emissions occuring in North America are due to human activities. Acidic pollutants may be transported over great distances by winds and weather systems. It is estimated that more than 50% of the acid rain falling in Southern Ontario and the Atlantic region come from U.S. sources.

Acid rain can affect lakes, forests, materials such as buildings and cars and human health. The health concerns related to acid rain are derived primarily from the precursors SO_2 and NOx. In the air SO_2 can react with water and other chemicals to form very fine particles. NOx is a precursor of ozone and particles.

- Environment Canada
- EPA-Acid Rain Program

Climate Change

Human activities are affecting the Earth's atmosphere in ways we have never experienced before. The emissions of greenhouse gases into the atmosphere have increased at a rapid rate during the past few decades and the large scale combustion of fossil fuels is currently one of the biggest contributing factors affecting this kind of change. The principal greenhouse gases are:

- Carbon dioxide (CO_2)
- Methane (CH_4)
- Chlorofluorocarbons (CFCs)
- Nitrous oxide (NOx)
- Ozone (O_3)

These gases have the ability to absorb infrared radiation from the sun and to trap this energy. The trapping of this heat is known as the greenhouse effect, which results in a global warming of the atmosphere with various impacts on Earth. Each of these greenhouse gases has unique sources and characteristics. Carbon dioxide is the most common greenhouse gas and is responsible for about half of the atmospheric heat retained by greenhouse gases. The effects of global climate change include more frequent heat waves, unstable weather systems, violent and more frequent weather events (storms, hurricanes, floods), threats to food and water supplies, change in vector-borne disease distributions, among other things. The implications for human health are enormous.

Consult the Climate Change and Health Office for more information on the health effects of climate change

The National Year of Clean Water (YOCW) is a celebration of thirty years with the Federal Clean Water Act (CWA). The Clean Water Act was enacted by Congress and signed into law by President Nixon in October 1972. Since that time, tremendous strides have been made in the area of water quality improvement throughout Louisiana and the Nation. For more information on the Year of Clean Water please visit the National YOCW Website at http://www.yearofcleanwater.org/. Keep checking this location for more information on what's been done in the past thirty years to improve Louisiana's water quality, what's currently being done, and what's in store for this years celebration. For more information regarding the Year of Clean Water in Louisiana please contact Al Hindrichs.

ASTHMA

Asthma afflicts about 20 million Americans, including 6.3 million children. Since 1980, the biggest growth in asthma cases has been in children under five. In 2000 there were nearly 2 million emergency room visits and nearly half a million hospitalizations due to asthma, at a cost of almost $2 billion, and causing 14 million school days missed each year.

"All of us face a variety of risks to our health as we go about our day-to-day lives. Driving in cars, flying in planes, engaging in recreational activities, and being exposed to environmental pollutants all pose varying degrees of risk. Some risks are simply unavoidable. Some we choose to accept because to do otherwise would restrict our ability to lead our lives the way we want. And some are risks we might decide to avoid if we had the opportunity to make informed choices. Indoor air pollution is one risk that you can do something about."

"The Inside Story: A Guide to Indoor Air Quality"

[Interagency Committee on IAQ (CIAQ)]

[IAQ TOOLS FOR SCHOOLS]

Twenty percent of the U.S. population, nearly 55 million people, spend their days in our elementary and secondary schools. In the mid-1990s, studies show that 1 in 5 of our nation's 110,000 schools reported unsatisfactory indoor air quality, and 1 in 4 schools reported ventilation -- which impacts indoor air quality -- as unsatisfactory. Students are at greater risk because of the hours spent in school facilities and because children are especially susceptible to pollutants. [Read More...]

The 5th Annual *Indoor Air Quality Tools for Schools* National Symposium is December 2-4, 2004 at the Grand

[Building Air Quality Guidance]

Hyatt Hotel in Washington, DC.

MOLDS Molds are part of the natural environment. Molds reproduce by means of tiny spores; the spores are invisible to the naked eye and float through outdoor and indoor air. Mold may begin growing indoors when mold spores land on surfaces that are wet. There are many types of mold, and none of them will grow without water or moisture. Read More...

RADON You can't see radon, you can't smell it or taste it, but it may be a problem in your home. Radon is estimated to cause many thousands of deaths each year. That's because when you breathe air containing radon, you can get lung cancer. In fact, the

Surgeon General has warned that radon is the second leading cause of lung cancer in the United States today.

SMOKE-FREE HOMES

Secondhand smoke affects everyone, but children are especially vulnerable because they are still growing and developing. EPA has created a national Smoke-free Home Pledge Initiative to motivate parents to protect their children.
Read More...

Take the Smoke-free Home Pledge Today!

The Partnership for Clean Indoor Air, was launched at the World Summit on Sustainable Development in Johannesburg to address the increased environmental health risk faced by more than 2 billion people in the developing world who burn traditional biomass fuels indoors for cooking and heating. According to the World Health Organization, their increased exposure results in an estimated 2 million premature deaths each year, largely among women and children.

Air Quality

1. **Project A.I.R.E.**

   Project A.I.R.E (Air Information Resources for Educators) was developed by EPA to focus the attention of elementary, junior high, and high school students on air pollution issues. The units in this package encourage students to think more critically and creatively about air pollution problems and the alternatives for resolving them. Topics covered include: air quality, rainforests, radon, the creation of environmental laws, the greenhouse effect and ozone.

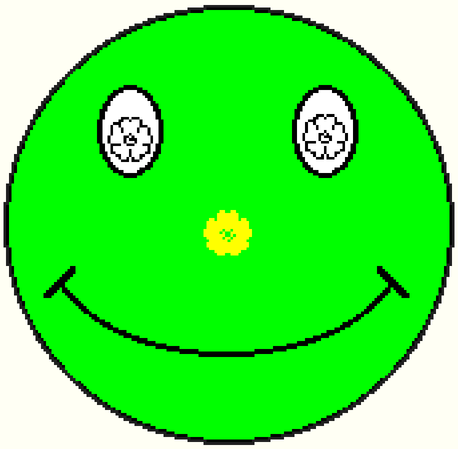
SMILE PROGRAM BIOLOGY INDEX

The SMILE website is hosted by the Illinois Institute of Technology



The following is a collection of almost 200 single concept lessons. These lessons may be freely copied and used in a classroom but they remain the copyright property of the author(s) and the directors of the SMILE program.

The Biology lessons are divided into the following categories: Anatomy & Physiology, Zoology, Botany, Microbiology, Genetics, Environmental Studies and Ecology, Biochemistry, General Biology and Miscellaneous.

Anatomy & Physiology

- Gathering data about respiration by Charles Buzek - John Spry School
- Production of Sound by Valvasti Williams Jr. - Perkins Bass Elementary School
- Feely Balloons by Winnie Koo - Ravenswood School
- Investigating the Nervous System by Barbara J. Baker - Doolittle West Primary
- What Happens When You Eat? by Kelly Ludwig - Lincoln-Way High School
- Taste, Smell, Touch by Rocenetta Jacobs - Roswell B. Mason Elementary School
- Name That Taste by Gracie L. Jones - Charles Carroll Elementary
- Breathing Is Essential to Life by Dianne Mehlinger - Arthur Libby School
- Sound and hearing by Cecile Savage - John Farren School
- Bones, Bones, and More Bones by Juliette Walker - Crown Community Academy
- An Introduction to the Senses by Therese R. Tobecksen - St. Andrew the Apostle
- Making and Using a Gel Person to Teach Human Anatomy by Kelly Ludwig - Lincoln-Way High School
- Give Me A Hand, I'm "Thumb-body" Special by Ranada L. Johnson - Horace Mann Elementary
- Measuring Work by Cynthia Clemons - John Palmer
- Exploring the Left and Right Sides of the Brain by Kathleen Hall - Goethe School
- Immunity and Disease by Gregory Carter - William King Elementary

- Healthy Colon with Good Digestion and Fiber by Lenora Jean Black - Parkmanor School
- Ears and Hearing by Angelica Wright - Robert Fulton
- Staying Young with Vitamin E by Kelly Ludwig - Lincoln-Way High School
- Rubber Egg by Angel Lee Gilbert - Douglass Middle Academy
- Learning the Bones and Muscles of the Head and Face by Charles T. Buzek - John Spry School
- Straight from the Heart by Cheryl L. Trammell - Delano Elementary School
- Respiratory System by Mona Turner - Delano Elementary School
- Mechanism of Vision by Celestine Miller Jeffreys - Beethoven School
- Movement Across the Membrane (Diffusion) by Kelly Ludwig - Lincoln-Way High School
- The Five Senses by Ollie L. Jamison - Delano Elementary School
- Cervical Vertebrae by Angel Lee Gilbert - Douglass Middle Academy
- Da I's Have It: A Fun Look At The Eye by Ann Fultz - Charles Holden Elementary
- Learning the Dissecting Planes by Charles T. Buzek - John Spry School
- Some Activities For Teaching the Mechanics of Vision by Charles T. Buzek - John Spry School
- Inhalation and Exhalation by Kelly Ludwig - Lincoln-Way High School
- Fingerprints--2 mini-teaches and a game by Russ Osantowski - Carter Elementary
- MuscleMania by Celestine Miller Jeffreys - Beethoven Academic Center
- Breathe In, Breath Out by JoAnn Brooks-Williams - Overton Elementary
- Listen To Your Heart Beat by Lula Carey - Overton School
- Internal Anatomy: A Fun Look At The Digestive System by Ann Fultz - Charles Holden Elementary
- Aspects of Individual Human Blood Pressure by Ora Newman - Fulton Elementary School
- Reliability Of Your Visual Sense by William M. Gordon - Parkman Elementary School
- How Air Moves In and Out of the Lung by Dorothy Anthony - Luella Elementary
- The Senses: Hearing and Sight by Vincent McEnerney - Peck Elementary
- The Investigation Of The Taste Buds by Ola Jean McGehee - Yale Elementary
- How the Body's Immune System Responds to a Virus by Margaret Mikel - Robert Fulton Elementary School
- The Female Reproductive Organs by Glenda Faye Rowe - John P. Altgeld
- The Sense Of Touch by Louise R. Wooten - Henry Clay Elementary
- The Tongue...A Sense of Taste by Dores H. Cook - Myra Bradwell School
- What is blood and how it circulates in and out of the heart by Merry Jelks - A.C. Powell Elementary School
- Skeletal System And External Body Development Of A Full Term Fetus by Joi Lewis

- The Adverse Effects of Birth Control on the Female Anatomy by Deneen Signator - D.S. Wentworth
- The Brain Reflex System And How It Works by Bobbitt, Ruby - Chalmers Elementary School
- Using Your Senses by Daniels, Elizabeth A. - Collins High School
- The Human Ear by Kall, Maureen
- How Do Toxins Affect the Human Body? by Hale, Patricia - Nansen Elementary School
- Cardiorespiratory Fitness by O'Malley, Paul - Senn Metro Academy
- What's Covering You? and Why? by Weathersby, Dorothy - Sherwood School
- To Have Or Not To Have Oxygen (Part I - Fermentation) by West, Anna - DuSable High School
- The Bone Connection by Artis, Emma - Emmet School
- Nutrition by Gilmore, Marie - Raster School
- Genetic Variations in Hand Span Size by Richard Chilton - Chicago Vocational High School
- Comparison of Respired Air Volume by Matthew F. Mendyk - Steinmetz High School
- The Eye and Color Images by Lacy Grigsby - Paul Robeson High School

---

Zoology

- Embryology: From Egg To Chick by Ben Butler Jr. - Laura Ward
- Be A "Peder-Reader" - A Discovery Activity by Lilla E. Green - Hartigan Community Arts Specialty
- Cool Coral Reefs by Frana L. Allen - Skinner School
- Sea Activities by Pedro Rodriguez - Bateman School
- Animals: Here and Now by Marvin W. Bragg - John Hope Community Academy
- Insect Classification by Mushtaq Ali Khawaja - Bateman
- Bernoulli's Principle and Winged Flight by Ben Stark - Illinois Institute of Technology
- Teeth Identification in Omnivores, Herbivores and Carnivores by Allen Nelson - John P. Altgeld
- Insects: Grasshoppers by Wanda Williamson-Johnson - Crown Community Academy
- Insect Inquiries by Allen Nelson - John P. Altgeld
- Wonderful Worms by Judith Lessin - Rogers Elementary School
- Know Your Cousins - Monotremas, Marsupials, and Placentals by Wilma Haynes - Ruggles School
- A Fish Tale by Frances A. Henry - John Whistler School

- Bird Beaks by Katherine Hill - Helen J. McCorkle
- Sharks by Myrtie Bryan - Martha Ruggles
- Dinosaurs---Read All About Them! by Roberta Fried - Douglass Math and Science Academy
- Making Your Dog Your Best Friend by Patricia Guthrie - May Community Academy
- Testing Fats in Food by Patricia A. Banks - Rosa L. Parks Middle School
- Toothpick Worms by Judy Hobson - TAMS
- The Earthworm by Carolyn Matthews - Curie High School
- The Amazing Starfish by Doris Agbefe - South Shore Community Academy High School
- A Guinea Pig Makes An Excellent Classroom Pet by Curtis Brasfield - Horace Mann

Smog and Your Health

The Issue

Smog can cause damage to your heart and lungs - even when you can't see or smell it in the air around you.

Background

When we hear the word smog, many of us picture the chemical "soup" that often appears as a brownish-yellow haze over cities. But smog isn't always visible. It's a mixture of air pollutants, including gases and particles that are too small to see. Smog often begins in big cities, but smog levels can be just as high or higher in rural and suburban areas.

We all need to protect our health against potential damage from smog.

Types and Sources of Air Pollution

The scientists who study smog are most concerned about the following types of air pollution:

Type:	Particulate Matter - or PM. This is the name given to microscopic particles that pollute the air. They vary in size and chemical make-up.
Sources:	Industrial and vehicle emissions, road dust, agriculture, construction and wood burning.
Type:	Ground-level Ozone. This gas is the result of a chemical reaction when certain pollutants are combined in the presence of sunlight. Ground-level ozone shouldn't be confused with the ozone layer in the sky, which protects us from ultraviolet radiation.
Sources:	Ground-level ozone comes mostly from burning fossil fuels for transportation and industry. Ozone levels peak between noon and 6 p.m. during the summer months.

- Smog
- Ultraviolet Radiation
- Vermiculite Insulation Containing Asbestos
- Wood Smoke
- Food
- Lifestyles
- Medical
- Products
- Complete list
- Subscribe
- Sign up as a distributor

There is also concern about:

Type:	Sulphur dioxide
Sources:	Coal-fired power plants and non-iron ore smelters

Type:	Carbon monoxide
Sources:	Mostly from burning carbon fuels (e.g. motor vehicle exhaust)

Potential Health Effects

Since smog is a mixture of air pollutants, its impact on your health will depend on a number of things, including:

- The levels and types of pollutants in the air
- Your age and general state of health
- The influence of weather
- How long you are exposed
- Where you live

Smog can irritate your eyes, nose and throat. Or it can worsen existing heart and lung problems. In exceptional cases it may result in an early death.

The people most at risk are those who suffer from heart and lung problems. Many of these problems are more common in seniors, making them more likely to experience the negative effects of air pollution. Children can be more sensitive to the effects of air pollution because their respiratory systems are still developing and they tend to have an active lifestyle. Even healthy young adults breathe less well on days when the air is heavily polluted.

The health effects of ground-level ozone and particulate matter (PM) is also cause for concern. Some studies suggest that long-term regular exposure to PM can increase your risk of early death and perhaps lung cancer. Studies on ozone show that once it gets into your lungs, it can continue to cause damage even when you feel fine. This is why the federal government, including Health Canada, is working to reduce the risks to your health.

Areas of particular concern for ozone in Canada are:

- The Windsor-Quebec City corridor (Ontario and Quebec)
- The Lower Fraser Valley (British Columbia)
- The Southern Atlantic region

Minimize Your Risk

To reduce your exposure to smog and its potential health effects:

- Check the Air Quality index in your community, especially during "smog season" from April to September. Tailor your activities accordingly.
- Avoid or reduce strenuous outdoor activities when smog levels are high,

especially during the afternoon when ground-level ozone reaches its peak. Choose indoor activities instead.
- Avoid or reduce exercising near areas of heavy traffic, especially during rush hour.
- If you have a heart or lung condition, talk to your health care professional about additional ways to protect your health when smog levels are high.

To help reduce the overall levels of smog in the air:

- When possible, use public transportation instead of your car. You could also walk or ride your bicycle, as long as smog levels are not too high.
- Look for alternatives to gas-powered machines and vehicles. Try a rowboat or sailboat instead of a motorboat or a push-type lawnmower instead of one that runs on gasoline.
- Consider fuel efficiency when you buy a vehicle. Keep all vehicles well maintained.
- Reduce energy use in your home. Learn more about alternative energy resources.
- Do not burn leaves, branches or other yard wastes.
- Consider joining a citizens' committee to advocate for cleaner air in your community.
- Spend time talking with your children about the importance of a sustainable lifestyle.

Health Canada's Role

Health Canada's research on the health effects of smog played a role in the development of Canada-Wide Standards for particulate matter and ground-level ozone. Adopted in June 2000, these standards are an important step in reducing the effects of smog on our health.

Health Canada will continue to study the effects of short and long-term exposure to smog-producing pollutants. These studies will lead to more standards and guidelines to help protect Canadians against the effects of smog.

Activity: What's "Riding the Wind" in Your Community?

Ever wonder what's floating in the air? Did you know that wind-blown particles, we can easily, see range in size from approximately 20 to 100 microns. To give you an idea of just how large these particles are, a human hair is approximately 70 microns in diameter. Since the movement of these wind-blown particles is more horizontal than vertical, it might surprise you that a good collecting surface is a vertical plane. Sticky paper wrapped around a jar can be used as a sample collector and will work well to capture the particles. By making your own sample collector you will discover what actually floats in our air, determine what the sources of these particles might be, and learn which direction the particles come from.

Subjects: Science, Mathematics

Grade Level: 5-8

Time: 1 class period to set up, 1 class period to analyze sample collection should take about 1-week

OBJECTIVES

As a result of participating in this activity, you will be able to:

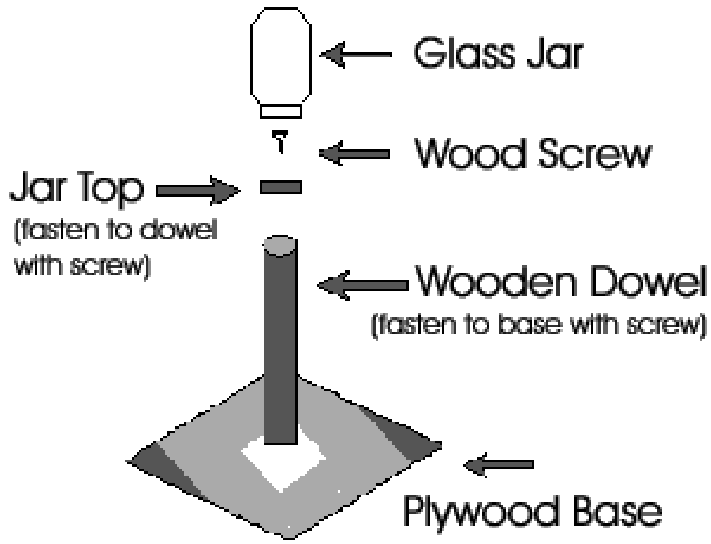
1. determine a measure of the number of larger particles in the air which are carried on the wind,

2. determine the approximate direction these particles are coming from, and

3. consider sources of particles sampled during this activity.

MATERIALS

- Small glass or plastic jar with a lid. Several jars that fit the same lid will allow for the collection of several samples.
- Plywood base (approximately 24" x 24")
- Wooden dowel (approximately 3" diameter, 30" long)
- 2 Wood screws
- Compass
- Spray can of quick drying clear lacquer.
- Double sided tape, or contact paper.

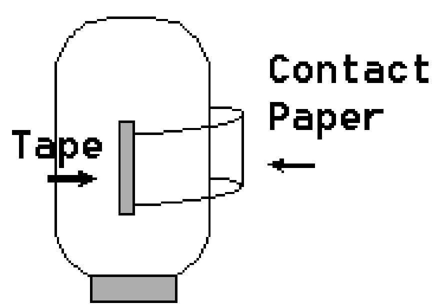


PROCEDURE

1. Assemble the sample collection stand as indicated in the picture to the right.

2. Place the stand for holding the glass jar, on a flat and safe area of the school grounds or roof. Try to keep the sampler as far away from obstructions as possible.

3. Wrap one strip of double sided tape around the jar. If using contact paper be sure that the sticky side is facing away from the jar. Fasten one edge to the jar with tape and be sure that the edges overlap and stick together so that the paper will stay on the jar. Mark the exposed edge as North.



4. Screw the jar onto the cap on the stand and use a compass to be sure that the edge marked "North" is facing North.

5. Leave the jar exposed for seven days. Then spray the paper with the lacquer to fix the particles collected and to avoid having additional particles adhere to the paper.

6. After the lacquer dries, remove the tape or contact paper from the sampler and

divide it into eight equal parts. One section of the strip will represent each direction i.e., North, Northeast, East, etc. Label each section.

7. Lay the tape on the table and estimate the percent of particle coverage for each section. Use the table below to record your estimates.

Direction	N	NW	W	SW	S	SE	E	NE
Estimated Coverage								

8. Graph the data from your table using the blank graph on the next page. For the purpose of your graph, 2 cm = 10% coverage. Your sample site will be at the center of the graph. For an example of how to interpret your data, review the attached sample data table and graph.

9. When your graph is finished, you should be able to look at it and start to form simplified ideas regarding from what general direction particulate matter, and possibly other pollutants that affect your community, come.

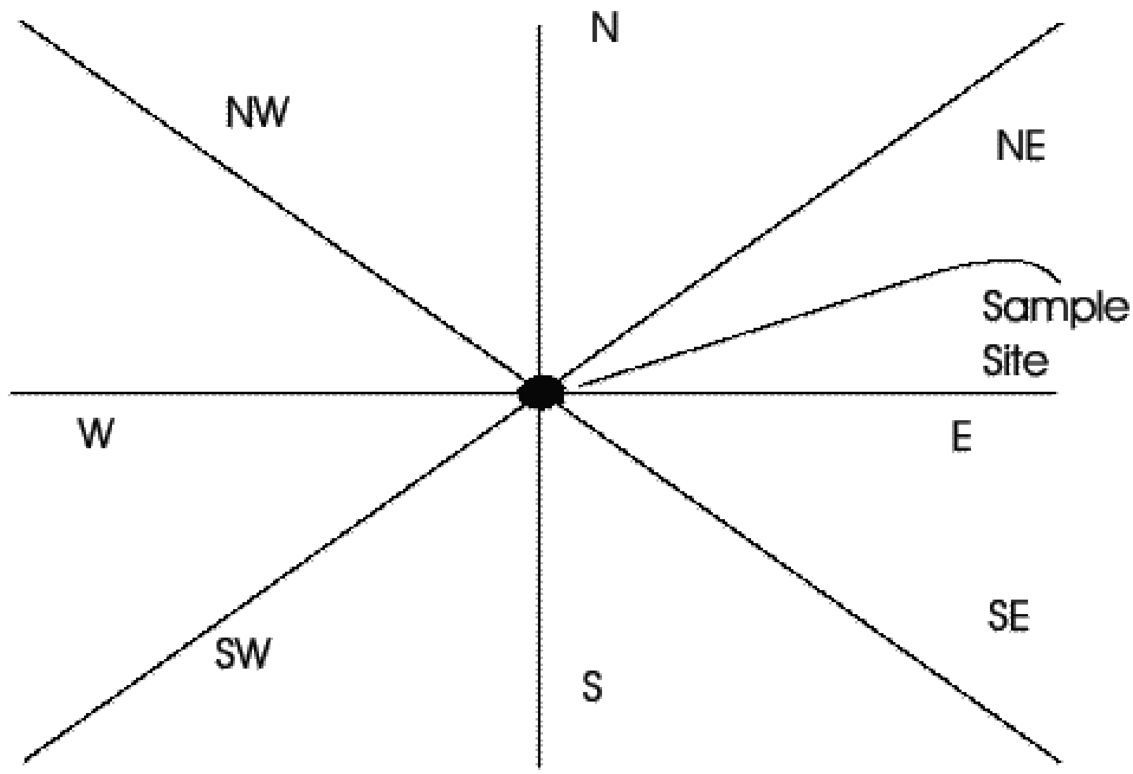
After finishing your graphs, be prepared to discuss the following:

1. From what direction did most of the particulate matter appear to come?

2. What do you think the source of the material is?

Possible answers: Nearby dirt driveway, farm activity, metropolitan area, etc.

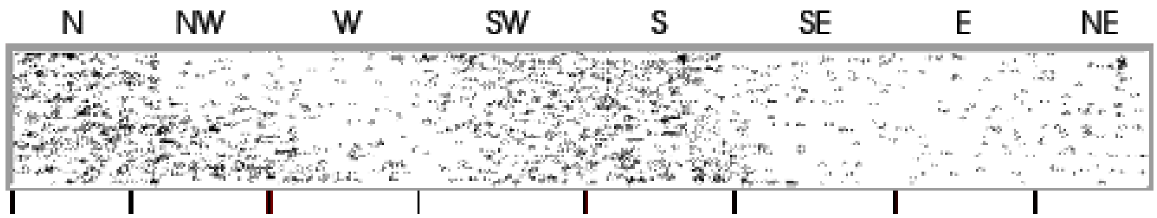
What's "Riding the Wind" in Your Community?



Data Collection Site ______________________

Data Collection Dates ______________________

Sample Data Table & Graph



For example we estimate the strip above is covered as indicated in the table below.

Direction	N	NW	W	SW	S	SE	E	NE
Estimated Coverage	25%	10%	5%	15%	25%	10%	5%	5%

Start with the estimated particle coverage that came from the north, 25%. Since 2 cm on the graph represents 10% coverage, a 5 cm line will represent 25%. Draw a bar north extending 5 cm from the center of your graph. A 2 cm bar should extend towards the northwest, and so on.

Workplace

The building you work in is another indoor environment that can have air quality problems. Indoor air quality (IAQ) at the office or workplace is subject to much of the same IAQ problems at home. Building materials, carpets, cleaning products, tobacco smoke and ventilation share the same IAQ challenges as the home. However, some IAQ problems such as scents and fragrances, automobile exhaust, cleaning solvents, and manufacturing activities can be more common at the workplace.

Why should you care about IAQ at work?

As an employee, your health may be at risk from poor IAQ at work. Poor IAQ can exacerbate allergies and asthma, cause eye, nose and throat irritation, or can result in fatigue, nausea or illness. The health effects of these symptoms can lead to poor work performance and productivity, as well as your own well being. In the long-term, these symptoms could also lead to sickness, missed work and loss of income.

As an employer, it's your responsibility to ensure a safe and healthy work environment. Poor IAQ can impact the health of your employees and result in increased absenteeism, reduced productivity, and potential safety hazards. Increased health claims from IAQ related impacts or illnesses can be avoided. Talk to your employees today about their air quality concerns. The table below list some examples of IAQ problems in the workplace.

In the Office

FAIRE Début

- Pressed-wood office furniture and carpet can be a source of formaldehyde
- Poor ventilation can exacerbate asthma and allergies
- Exposure to tobacco smoke is a proven health risk for everyone and can be a serious health threat to employees with asthma
- Personal care and cleaning products often contain many volatile organic compounds (VOC's) and chemical compounds

At the factory

- Open doors around the loading dock allows engine emissions inside the workplace
- Emissions from gas and propane forklifts can cause nausea, fatigue and illness
- Manufacturing often requires chemicals and solvents in the production process
- Cleaning products used for some industrial activities can be quite harsh or toxic

The good news is that you can do something right now to improve the IAQ at your workplace. To learn more, please download our Indoor Air Pollution in the Office (PDF).

Understanding Clouds and fog

Clouds are usually the most obvious feature of the sky. They both reflect weather patterns and play a role in what the weather does. The links below take you to a great deal of information about clouds.

Locations of clouds

- Low-level clouds: (generally found below 6,500 feet, or 2,000 meters) Low-level clouds are usually composed of liquid water droplets, but they can have snow and ice crystals in cold weather
- Mid-level clouds: (generally found between 6,500 and 23,000 feet, or 2,000 and 7,000 meters) Most mid-level clouds are composed of liquid water droplets during summer and a liquid droplet-ice crystal mix during winter. Mid-level cloud names are preceded by an "alto" prefix.
- High-level clouds: (generally found above 20,000 feet, or 6,000 meters) High-level clouds are composed of ice crystals and tend to be very thin and wispy. High-level cloud names are preceded by a "cirro" index

Names represent different kinds of clouds

- Stratus clouds are a uniform gray and usually cover most of the sky.
- Cirrus clouds are thin and high in the sky.
- Cumulus clouds are lumpy and can stretch high into the sky.
- Thunderstorms are cumulus clouds, sometimes called "thunderheads."
- Mammatus clouds have pouches that hang down.

Different kinds of fog, where fog forms

- Fog, how to forecast when it's possible
- Advection fog forms when humid air flows over cold ground or water.
- Radiation fog forms on generally clear, cool nights.
- Steam fog forms over water, often in the fall.

- [Overnight rain] can enhance fog that forms in the morning.
- **Precipitation fog** forms when rain or snow falls.. As precipitation falls into drier air below the cloud, the liquid drops or ice crystals evaporate or sublimate directly into water vapor. The water vapor increases the moisture content of the air while cooling the air. This often saturates the air below the cloud and allows fog to form.
- **Upslope fog** is very common along large hills and mountains. It forms when winds blow up the side of a hill or mountain, which cools the air.
- **Valley fog** forms in mountain valleys during winter and can be more than 1,500 feet thick. Often, the winter sun is not strong enough to evaporate the fog during the day. When the air cools again the following night, the fog often becomes thicker, which makes it even harder for the sun to burn it off the following day. These fogs can last for several days until strong winds blow the moist air out of the valley. The tendency for cool, dense air to pool at the bottom of valleys also enhances valley fog.

The Cloud Case: TEACHER'S GUIDE

The Cloud Case is an interactive online lesson about how clouds form through the principles of condensation and evaporation. The lesson is written around an experiment that the student can perform, or can watch being performed, that will illustrate the ideas of the lesson.

Grade Level:

This lesson has been designed for grades 5 - 8.
It is designed to take 30 minutes to read through and complete. Performing the experiment will take longer.

Overview:

This lesson teaches how clouds form and how air pressure and air temperature affect their formation. The lesson is delivered in the story of Mike Breezy, Air Detective, who tries to solve the "The Cloud Case". His friend, Professor Less, gives both Mike and the students the facts about clouds. An experiment follows the story that gives students the chance to see the principles demonstrated they have just read about. Finally, there is a simple quiz to give students a chance to review what they have learned.

The Experiment:
The purpose of the experiment is to demonstrate the role temperature plays in cloud formation. A sample atmosphere is created using a plastic bottle filled with water. By squeezing the bottle, you can change the temperature of the air inside. When the air temperature is decreased, a cloud is created inside the bottle.

NOTE: This experiment should be performed under adult supervision because it involves the handling of matches.

Materials:
a large clear plastic bottle with cap
a measuring cup
cold and hot water
matches

Procedure
#1: Pour 1/3 cup of cold tap water into a clear plastic bottle and place cap on it. Shake the bottle for 30 seconds and then set it on your table.

#2: Squeeze the bottle and then release the pressure. Repeat this process several times.

In this step you are saturating the atmosphere inside the bottle. By squeezing the bottle, you increase the air pressure inside the bottle, which increases the air temperature. With the air heated, more water moves into the air, saturating it. When you release the pressure on the bottle, you decrease the air pressure. This lowers the air temperature and causes condensation in the bottle. These are the principles that will allow you to create a cloud in the next step.

#3: Remove the cap from the bottle and light a match. Hold the match over the mouth of the bottle. Quickly squeeze the bottle to extinguish the match; then slowly release the pressure to draw smoke into the bottle. Replace and tighten the cap. Repeat Step #2.

In this step, a cloud should have formed above the water inside the bottle. As in Step #2, squeezing the bottle forced condensation inside the bottle. Now that you have added smoke into the bottle, the water has something to condense upon. The condensed water forms the small cloud inside the bottle.

#4: Rinse the bottle thoroughly and pour 1/3 cup of hot tap water into it. Shake the bottle for 30 seconds and place it on your table.

#5: Squeeze the bottle and then release the pressure. Repeat this process several times. Then repeat Step #3, extinguishing a match over the mouth of the bottle and drawing the smoke inside. Then repeat Step #2 again, squeezing and releasing the bottle to create a cloud.

In this step, a bigger cloud should form in the bottle. This is because of the hot water has heated the atmosphere inside the bottle, so it is able to hold more water than before. So when condensation is forced inside the bottle, more water condenses and a larger cloud forms.

The Quiz:
At the end of the Cloud Case is an online quiz that students can take, with questions about facts covered in the Cloud Case. The quiz is graded online and results are sent by e-mail to their teacher.

Lesson Objectives:

To teach students about condensation and evaporation.
To have them involved in an experiment that will reinforce what they learn about condensation & evaporation.

Topic: Cloud Formation

Grade Level: Fourth

Concept: Cloud formation results when warm, humid air rises and cools, causing the water vapor in the air to condense and form clouds.

Teacher Materials:

--a large jar

--a plastic bag of ice that will fit over the jar opening

--a pitcher of warm water

--1 sheet of black paper

--flashlight

--matches

Student Materials:

--pen and paper to record observations

Optional Extension Student Materials:

--more jars, bags of ice, black paper, flashlights, and warm water

--collected dust

--flour

--sand

--cedar shavings

--any other particulate materials

--white construction paper

--newspaper

--crayons

Teacher Background Information:

Sunlight causes water to evaporate into the atmosphere. This air containing the water vapor is heated at the surface of the earth and rises. As it rises, it cools and the water vapor condenses on some form of particulate matter such as dust, ash, or smoke to form clouds.

Management Strategies:

This activity would be most appropriately done with small groups so that all students can view the cloud formation in the jar. Other class members could be working on researching the different types of clouds, drawing and labeling these clouds, researching and drawing the water cycle, working on a forecast for the rest of the day based on the clouds in the sky, etc. The activity itself should not take more than 10 to 15 minutes. For safety reasons, students should not be allowed to handle the matches. Also, students need to be careful around the glass jars. Much of the following procedure will vary, depending on students' reactions, comments, and levels of understanding.

Procedure:

1. Ask students what some of the different types of clouds are, what they are made of, and ask the focus question, how do you think clouds form? The responses to this question could be written on the board to return to later.

2. Tell the students that we are going to perform a simulation of the forming of a cloud. Take out the jar and have one of the students tape the black piece of paper onto one side of the jar. Ask another student to pour the warm water into the jar until it is one third full.

3. Light a match and hold it in the jar for a few seconds and then drop it in. At this point, have a student quickly cover the jar with the bag of ice.

4. Have another student (or teacher) shine the flashlight on the jar while they record their observations.

5. Now the students will explore what happened. The following questions can be used to help the class learn about what was happening:

--What did you see in the jar? (a cloud)

--Where did the cloud come from? (the water in the bottom of the jar)

--How did the warm water effect the cloud formation? (caused the water

to evaporate and warmed the air, causing it to rise)

--What did the ice cubes do to help the clouds form? (cooled the air [made

the water vapor condense]).

--What role did the match and its smoke play in the cloud formation?

(gave the water something to condense or grab on to)

--Now what would you tell me a cloud is made of? (small water droplets)

--Ask someone to describe the process of cloud formation from what they

just learned.

Assessment/Evaluation:

As a learning activity in itself, assessment is not really needed, but an option for assessment would be to have students draw a picture of how the cloud formed in the jar. In addition, the products of the following extension activities could be assessed.

Extension/Integration:

As an application of what they learned, each student could draw a picture of how a real cloud would form, and what effects the warm earth and the cool air in the mountains would have. The process could be repeated by students without using the match or with dust, flour, sand, cedar shavings, or other particulate materials to see if the cloud would still form. As an art activity, students could construct different types of clouds by cutting two sheets of construction paper simultaneously and stapling them part of the way together. Then they can be filled with newspaper and decorated.

For a math activity, students could record the clouds they see for a couple of weeks and graph how many days they saw each type of cloud. A language arts activity that could be used is to have students write weather reports and then present them to the class. Students could also write poems about clouds or stories from a cloud's point of view, discussing what type of cloud it is and what kind of weather it would bring.

A cloud is a visible aggregate of tiny water droplets and/or ice crystals suspended in the atmosphere and can exist in a variety of shapes and sizes. Some clouds are accompanied by precipitation; rain, snow, hail, sleet, even freezing rain. The purpose of this module is to introduce a number of cloud classifications, different types of precipitation, and the mechanisms responsible for producing them. The Clouds and Precipitation module has been organized into the following sections:

Sections

Last Update: 07/21/97

Development
The importance of rising motion and the mechanisms responsible for lifting the air.

Cloud Types
High, middle and low-level clouds, vertically developed clouds, plus some less common cloud types.

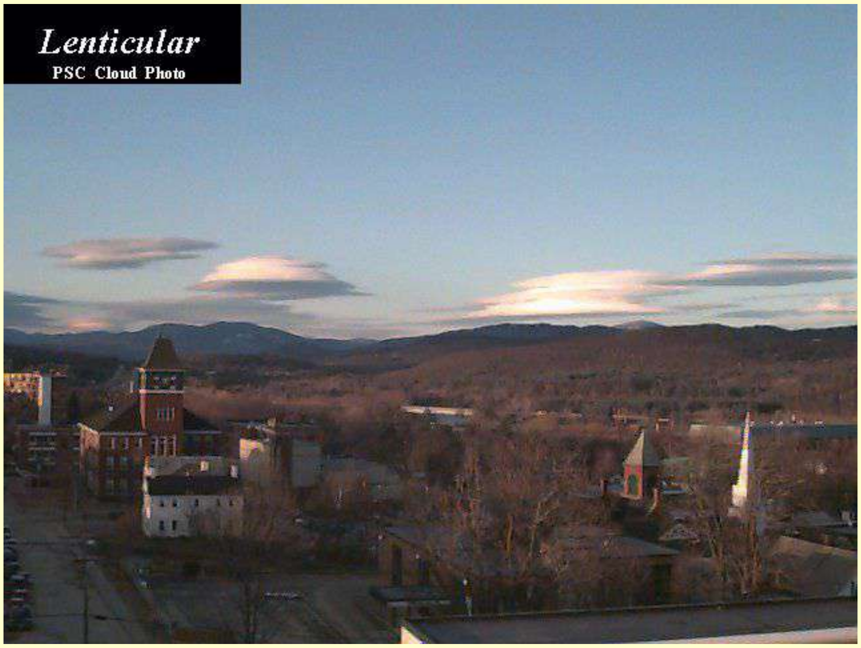
Precipitation
Rain, snow, hail, sleet and freezing rain.

Acknowledgments
Those who contributed to the development of this module.

The navigation menu (left) for this module is called "Clouds, Precipitation" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Advection

Development



Lenticular Clouds over Plymouth, NH

Plymouth State University Meteorology Program Cloud Boutique

The Plymouth State Meteorology Program has developed this server to provide explanations of and access to detailed pictures of some basic cloud forms. The cloud images are relatively large (640x480) in order to show detailed structure and features. All of these pictures were taken in the local area around Plymouth, New Hampshire and most from the weather observation deck on the roof of the Boyd Science Center on the Plymouth State campus. Clouds can move and change shape quickly as indicated in this 30 minute time-lapse mpeg video loop. The purpose of this "boutique" is to provide a general cloud reference and is not intended to provide an all-inclusive list. Images will be added to or changed as opportunities permit.

Cloud Classification

Clouds are generally classified based on characteristics, such as, altitude, appearance, or origin. Altitude distinctions apply to those clouds that fit in various layers of the atmosphere as follows:

- high clouds - have bases above 18,000 feet
- middle clouds - have bases between 7,000 and 18,000 feet
- low clouds - have bases below 7,000 feet
- fog - cloud in contact with the ground
- multi-level clouds... vertically thick spanning multiple layers
- orographic clouds - distinct clouds that form via interaction between wind and mountainous terrain features

In appearance, clouds may be thick or thin, have well defined edges or be very diffuse, appear hairlike, cellular, towering, or in sheets, and be associated with fair weather or precipitation. Most clouds owe their existence to upward vertical motion of air, hence they are often associated with weather producing phenomena, such as fronts, troughs, and low pressure systems. However, topography can also help move air upwards and produce clouds.

Cloud Descriptions and Pictures

This section provides verbal descriptions and pictures of clouds that have been observed in this area. Because of their size, these images have been stored in JPG format. To view a picture, click on the appropriate cloud name or other highlighted text.

High Clouds are primarily composed of ice crystals and include the following:

- Cirrus are high altitude wispy clouds. They are usually quite thin and often have a hairlike or filament type of appearance. The curled up ends as depicted in this picture are very common features.
- Cirrocumulus are high clouds that have a distinct patchy and/or wavelike appearance, such as, in our patchwork cirrocumulus photo, composed of many individual cloud elements, or in our wavy cirrocumulus photo with its banded linear structure. These features are common to all types of cumuloform clouds.
- Cirrostratus are high clouds that usually blanket the sky in ill-defined sheets. These clouds are usually optically thin and the sun and moon can usually shine some light through. Like other stratiform clouds, one usually can't detect distinct cells or sharp features. This picture shows the sun shining through a gray, diffuse cirrostratus overcast.

Middle clouds have many similarities to the cumuloform and stratiform high clouds. Since they are closer to a groundbased observer, the cumuloform elements in particular appear larger than their high cloud counterparts. They can contain ice crystals and/or water droplets and may occasionally be associated with some light precipitation.

- Altocumulus have distinct cloud elements and are either in a patchy, scattered distribution or can appear in linear bands. The altocumulus in this photo by Jay Shafer consists of a number of individual cloud elements. Jay also took this beautiful sunset photo of altocumulus clouds.
- Altostratus have a more uniform and diffuse coverage where it is difficult to detect individual elements or features. In this picture, a few altocumulus clouds in the foreground precede a more uniform deck (see arrow) of altostratus.

Low clouds are most often composed of water droplets, but can have ice crystals in colder climates. Some of these clouds can develop into the multi-level clouds and can go through various phases, such as, a morning stratus deck turning into late morning stratocumulus, then early afternoon cumulus, and vertical development into cumulonimbus which can produce heavy rain and possible lightning and thunder.

- Cumulus are usually puffy and often have very distinct edges and usually a noticeable vertical development. They often have a poporn-like appearance. Cells can be rather isolated or they can be grouped together in clusters as shown in this photo. The main cumulus cloud pictured in this view was nearly overhead, so the vertical extent is hidden from view. However, since the sun is on the other side of the cloud, its thickness is evident from the negligible amount of light passing through its center.
- Stratocumulus can be widely scattered (as depicted in this photo, but are usually concentrated closer together in clusters or layers and have very little vertical development. This photo of a stratocumulus layer from above was taken by Jay Shafer, a Plymouth State meteorology graduate, from Mt. Washington. Jay also went down to a lower elevation and took another photo providing a closeup, side view of a stratocumulus cloud in this deck. These relatively flat clouds usually lack the sharp edges and "popcorn" appearance of most normal cumulus clouds.
- Stratus are usually the lowest of the low clouds. Stratus often appear as an overcast deck (as shown), but can be scattered. The individual cloud elements have very ill-defined edges compared to most low cumuloform clouds (e.g. cumulus and stratocumulus).
- Fog can be considered as a low stratus cloud in contact with the ground. When the fog lifts, it usually becomes true stratus. This photo shows fog over the Pemigewasset River basin with clear skies elsewhere.

Multi-layer clouds are the heavy precipitation producers. The depth of these clouds give precipitation hydrometeors a better environment to develop and grow.

- Nimbostratus are often included in many texts as low clouds, but here they are considered multi-layer clouds because their vertical extent often goes well into the middle cloud region and these clouds often have even taller cumulonimbus clouds embedded within them. The clouds are very dark, usually overcast, and are associated with large areas of continuous precipitation. If it's a gray and rainy day as shown in this photo, the sky most will most likely be filled with nimbostratus clouds.
- Cumulonimbus, as shown in this photo (with cumulus in the foreground), are the clouds that can produce lightning, thunder, heavy rains, hail, strong winds, and tornadoes. They are the tallest of all clouds that can span all cloud layers and extend above 60,000 feet. They usually have large anvil-shaped tops (as shown) which form because of the stronger winds at those higher levels of the atmosphere. This first "cb" picture was taken by Plymouth State student Bill Schmitz from an airplane outside of the New York City area--note the three smaller turrets developing. Another picture shows a view from the ground of a cumulonimbus with a base at around 3,000 feet and vertical development upward to around 30,000 feet - small compared to most thunderstorms which are associated with really severe weather. Sometimes, strong cumulonimbus clouds can have appendages protruding from the base of the cloud, which are called "mammatus" clouds because they resemble the mammary glands of mammals. They indicate that the atmosphere is quite unstable and can also be an indicator of impending severe weather. The picture of mammatus clouds, shown here, was taken by Mark Gibbas, a Plymouth State meteorology alumnus, at Acadia National Park.

Orographic clouds, as the name implies, are produced by the flow of air interacting with mountainous terrain.

- Cap clouds form when air containing water vapor is uplifted on the windward slide of the slope and reaches saturation producing liquid water cloud droplets and a cloud which can "cap" the summit. The spectacular picture was provided by Michael Nahmias and shows the cap cloud shrouded summit of Mt. Ranier.
- Lenticular clouds are lens-shaped clouds that can result from strong wind flow over rugged terrain. At the time of this photo, the winds were blowing around 30-40 mph from right to left, forming several lenticular clouds. Sometimes they stack up like pancakes in multiple layers as are several depicted in this first photo. The strong flow produces a distinct up and down wavelike pattern on the lee side of the mountain or large hill and the lenticular clouds tend to form at the peaks of these waves. They sometimes are very round and the edges are so well defined that they resemble flying saucers. This close up sequence shows a large lenticular cloud at various stages of illumination as the sun moved lower on the horizon and lit the cloud from below. Another lenticular cloud can be seen in the background of the last frame of the sequence. These photos were taken on January 25, 1999 in Plymouth, NH, by James D. Rufo, a Plymouth State meteorology graduate. Mrs. Lorraine Brown of Bristol NH captured this same cloud formation from about 20-25 miles further away in these pictures. Lenticular clouds are often placed into the middle cloud category since they are most common at those altitudes. Plymouth State meteorology graduate, Jay Shafer, has also provided some stunning additional lenticular pictures taken around the White Mountain region of New Hampshire.

Another "specialty" cloud is one that can develop due to Kelvin-Helmholtz (K-H) instability waves and subharmonic resonance with other waves in the atmosphere. This can result in an intertwined or spiral cloud pattern as shown in this picture, which was also taken by James D. Rufo. H-H instability is the result of strong wind shear. K-H clouds that form in early stages can resemble well-organized waves that appear to be breaking like ocean waves.

Another type of cloud can be formed from the vapor contained in the exhaust of a jet engine of an airplane when they are flying at high enough altitudes where cold temperatures cause the vapor to turn into ice crystals like cirrus clouds. These clouds are called "contrails" (short for "condensation trails") and look like lines in the sky. The photo shows two contrails. The one on the lower right was formed by a jet that flew a few minutes ahead of the jet which formed the contrail in the center. The newer contrail is narrower and hasn't had the chance to diffuse like the older one.

Tips for Painting Clouds

---

tttrains' Home Page | World of DCC | Train Shops | Modeler's Corner | Showcase | What's New?

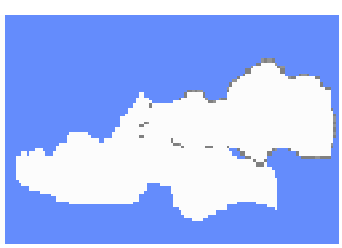
Skies and Cloud Stenciling

Here are some tips and ideas that I have taught in clinics and to other modeling friends. This technique takes practice and perseverance. I have stenciled with sponge application, spray application and of course, dry brush, but nothing beats spray for speed.

I have used large stencils with children for murals, posters , and scenery for plays, projects, and art work.

Stenciling has the benefit of immediate success. Once the painter realizes the needs of a dry bush and a little amount of paint, success usually follows. It is always best to practice on large cardboard, poster, or a wall that you are willing to repaint.

Creating distance or a quick lesson in perspective!



Smaller objects appear further away
Overlapped objects appear behind
Objects in the distance have softer edges
Objects in the distance appear grayer

Lower objects seem further away
Higher objects appear closer

Supplies:

Oak tag stencils see: Walther's catalogue, New London Industries : or for the do it-yourselfer make your own stencils. The nice thing about homemade is that your cloud shapes are not on somebody else's backdrop.

Spray Paint (Krylon Variety) Flat White, Light Gray
Latex Gloves
Protective mask- breathing type
Eye goggles

Making Stencils:

1. Take slides of desired weather conditions, sharp clear edges of clouds are best
2. Project slides onto wall.
3. Hold (length wise)oak tag (at least 12x18 sheets or bigger) against wall and trace random edges of clouds
4. Cut with sharp knife, razor, or embroidery scissors
5. The result is two stencils
6. Produce 8-10 different stencils for best results

Preparation:

1. Sand, spackle, or fill gouges, resand with finer grade paper, and prime two coats
2. Paint two coats
   - I use Sherwin William's #SW1787 Baby Blue or Sherwin William's #BM 33-4 Universe Blue, which is a more intense blue than Baby Blue. Any other good quality latex is fine, but avoid greenish blues or purplish blues
3. Decide what type of clouds: stratus, cumulus- this will somewhat be determined by your stencils
4. Decide what type of weather a (i.e. arid desert will have more intense blue with less horizon haze, but urban areas will have smog and haze.

Procedure:

1. VENTILATE THE ROOM!!!!!
2. Faintly sketch in main clouds

3. How to use stencils
    - Hold by the straight edge
    - Float the stencil above the surface
4. Change stencils often
5. Never spray near the side edge
6. Change position of stencils between blasts of paint: clouds will appear 3-D with the different layers of paint
7. For the tops of clouds- hold the stencil 1/2 inch away from wall, giving a sharp edge
8. For the bottoms of the clouds-hold stencil 1-2 inches away from wall, giving a soft fuzzy edge
9. Begin with the small horizon clouds: these multiple horizon clouds will receive overspray from the clouds above them, thereby creating atmospheric haze

---

Helpful Hints:

1. Keep clouds random and uneven
2. Atmospheric haze is valuable in creating the feel of distance, the haze should be gradual from intense blue to bluish white at the horizon. This happens automatically from the overspray, just as long as you start at the bottom of your back drop.
3. Decrease cloud size from top to bottom of backdrop
4. Use paint sparingly
5. Overlap edges (especially in the lower areas)
6. Stencil interior edges inside the larger clouds
7. PRACTICE, PRACTICE, PRACTICE
8. For modules, have partial clouds go off the ends of your backdrop or show just the bottom of an overhead cloud

From a reader! Dan Crockett

My layout room is 12'6" x 33'4" and I have three walls painted with clouds on intense blue sky (that's what we have in the west). I used the stencil idea with Krylon spray for the clouds, but for the darker clouds, I found that Krylon Aluminum is very effective and realistic--much more so than the use of gray. Of course, one must use it lightly.

Also, always paint the sky and clouds before painting mountains or buildings in order to get a three dimensional effect. Don't be afraid of the sky and clouds coming through. The mountains and buildings will hide them just as they do in real life.

Finally, eastern mountains have much more haze than western mountains. Use a white, LIGHT overspray to simulate the haze and give the effect of mountains in the distance.

1.

Cautions or some common mistakes:

1. Clouds are too solid from too much paint, the best way to keep clouds airy is with short bursts of spray and keep moving the stencil to the next area
2. Use light gray very lightly, only on the underside of your darkest cloud, apply gray first then apply white, the use of inclement weather can be very effective.
3. Never spray near the straight edges of a stencil, it is impossible to remove that hard white edge, if this mistake happens, the easiest solution is to repaint over the goof with your sky blue.
4. Watch out for repeated shapes, the human eye quickly picks up on identical forms and lines, avoid this by changing stencils and having a large number of stencils, let them dry and flip them for more variety of shape
5. Try your best not to hit the recently sprayed paint with your stencil, fingers, hat bill, etc. It's best to spray in a small area, say 18 inches or so, then move on, to return to the dry area and add more clouds higher on the backdrop

Good Luck with your stenciling efforts!

Periodically, the flourishing fish populations commonly found off the west coast of Peru South America are replaced by the sight of dead fish littering the water and beaches. Unusual weather conditions occur around the globe as jet streams, storm tracks and monsoons are shifted. Such disarray is caused by a warm current of water that appears every three to seven years in the eastern Pacific Ocean called El Niño. This module introduces El Niño, conditions are responsible for its occurrence, plus the impact it has on the rest of the world. The El Niño instructional module has been organized into the following sections:

Sections

Last Update: 04/28/98

Definition

Introduces El Niño, when El Niño events have been recorded and how it compares to La Niña.

'97-'98 Event

Provides a brief insight into the most recent El Niño event.

Upwelling

Introduces upwelling, the thermocline and how they impact local sea life populations.

Non-El Niño Years

Typical oceanic and atmospheric conditions that exist in the tropical Pacific when no El Niño is present..

El Niño Events

Conditions that lead to an El Niño event and how El Niño influences upwelling processes, tropical rainfall and local fish populations.

Sea Surface Temperatures
El Niño visualized through sea surface temperature anomaly plots.

Impacts on Weather
The influence of El Niño on weather conditions worldwide.

Economic Impacts
Reduction in local fish populations, which in turn affect local industry and market prices worldwide.

Detection and Prediction
Methods and resources used by NOAA for detecting and predicting the presence of El Niño.

Acknowledgments
Those who contributed to the development of this module.

The navigation menu (left) for this module is called "El Nino" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

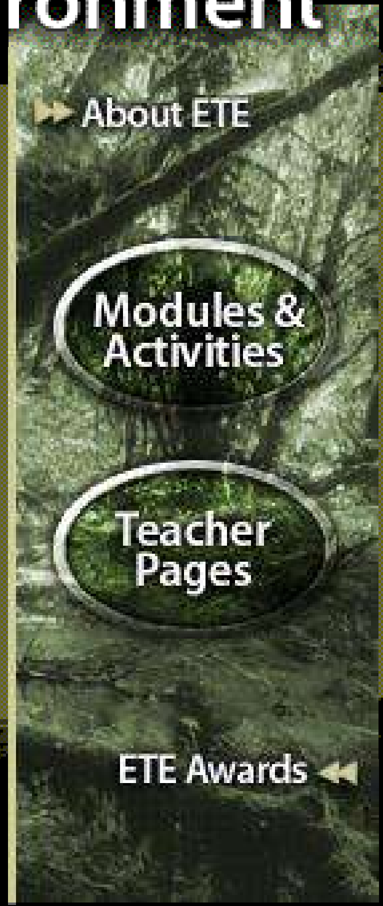
Exploring the Environment®



The U.S. Environmental Protection Agency estimates that 10 percent of the world's coral reef population has already been damaged, and a much higher percentage is threatened. Exploring the Environment's new coral reefs module takes a comprehensive look at this real danger to Earth's biodiversity and why it should concern us. Check out the Modules and Activities section for this look at coral reefs along with many other real-life environmental issues.

Attention, teachers, we need your help! We would like you and your students to provide feedback on ways to improve the Exploring the Environment® web site. Your evaluation will be based on the teaching approaches you already use for Exploring the Environment. To find out more, e-mail researchcf@cet.edu.

Welcome

This site is a joint effort of the NOAA Research and the College of Education at the University of South Alabama (USA). The goal of the site is to provide middle school science students and teachers with research and investigation experiences using on-line resources.

What is NOAA Research?

NOAA Research is an organization of the United States Government. To find out more about the important role of NOAA Research, click on NOAA Research INTRO.

To use this site as it is designed, click on TECH INFO. From this area you can download needed software and the Student Activity Books that complement the on-line science lessons.

What's in this site?

To view a short description of the parts of the site and the educators who developed it, click on OVERVIEW.

For Teachers

Click on the Apple icon at any time to download teaching materials for each topic. This information includes lesson objectives, interdisciplinary uses, NSTA and AAAS standards, and teacher preparation material.

Arctic Theme Page

This "Theme Page" has links to two types of resources related to the study of Arctic. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) that will help teachers provide instruction in this theme. Please read our disclaimer.

- Animals of the Arctic

  This ThinkQuest Junior site has good articles on a dozen animals found in the arctic.
- Antarctic Theme Page

  See this CLN theme page for resources on polar studies - but with a focus on the Antarctic.
- Archaeology in Arctic North America

  An overview of some archaeology research recently undertaken in the north. The focus of the research is to understand the origins and migration of different Inuit-Eskimo groups. The site also reports on the unique challenges of conducting the research in Canada's High Arctic regions.
- About Arctic Animals

  Over a dozen links to sites with information about animals living in the arctic region.
- Arctic Circle

  A comprehensive site presenting many concerns from Alaska's north. It offers information on aspects of Alaska's Natural Resources, History and Culture, Social Equity and Environmental Justice plus much more.
- Arctic Explorer

  The Surface Heat Budget of the Arctic Ocean - Joint Ocean Ice Studies (SHEBA-JOIS) is a special project to gather information helping scientists understand how arctic air, sea, and ice interact to affect the global environment and to understand arctic ecosystems.
  - Arctic Life Small descriptions for Arctic Wolves, Polar Bears, Musk Oxen, Gulls and Walrus.
  - Photograph Gallery See photos of the Science Village, the icebreaker, and the icy airstrip.
  - Polar Bear Fact Sheet Provides an overview of the issues regarding the Polar Bear's life cycle.
  - Quiz
    Try the on-line quiz about Arctic issues.
  - Ship to Shore: A Personal Story Read the logs kept by one of the Department of Fisheries scientists working on the project.

- [Arctic Studies Centre]

The Smithsonian's Arctic Studies Center is dedicated to the study of northern peoples, their history and environment and offers a variety of virtual exhibits.

- Arctic Wildlife Portfolio

"Biologist Doug Siegel-Causey shares his knowledge and special insights about this icy world and it's [sic] inhabitants." The site is divided into the following sections:

  - Arctic Wildlife Glossary More than 10 Arctic terms defined.
  - Birds Includes pages for: Albatross, Bald Eagle, Peregrine Falcon, Ptarmigan, Puffin, and Snowy Owl.
  - Mammals Information on: Arctic Fox, Caribou and Reindeer, Lemming, Musk Ox.
  - Polar Pairs A Java based game of concentration using pictures of Arctic wildlife for students to match.
  - Sea Mammals Links to: Beluga Whale, Orca, Polar Bear, Sea Otter, Seals, Walrus

- Biome Investigation

Students use science process and research skills to investigate the six biomes of the world. These activities are designed to enhance an integrated unit on biomes through the use of visual resources.

- Canadian Museum of Civilization: First Peoples Hall and Archeology Hall

Some of the features of this site include: Native People, Emergence, the Haida, and Inuit 3D, which requires downloading a Virtual Reality plug-in.

- Conservation of Arctic Flora and Fauna (CAFF)

CAFF is a cooperative environmental protection program adopted by Canada, Denmark/Greenland, Finland, Iceland, Norway, Russia, Sweden and the United States Scientific documents on habitat and species conservation. Their goals are to protect, conserve and restore the Arctic environment, conserve Arctic flora and fauna, and address the special role of the indigenous people of the Arctic in pursuit of these goals. Note: the scientific documents within the site would not be appropriate for younger students.

- Naming the Islands of Canada's Arctic

Discover how each of the northern Arctic islands received their names.

- Not Alone on the Ice

Intermediate/junior high students test the insulating properties of various materials while designing a South Pole research station in this 10 period teaching unit from the National Science Foundation. Although Antarctica is the focus, the content should be generalizable to polar regions in general.

- Nunatsiaq News

The Nunatsiaq News web site features the Nunavut and Nunavik editions of Nunatsiaq News, all rolled into one.

- Polar Connections: Exploring the World's Natural Laboratories

  Elementary/junior high students assume the role of polar researchers in this collection of teaching/learning activities from the National Science Foundation.

- Polar Continental Shelf Project

  This site from Natural Resources Canada has links to Animals, Plants, Humans, Geography, a Photo Gallery, and an interactive Quiz to text your knowledge.

- [The] Siberian Arctic

  Through this lesson plan from National Geographic, high school students will learn about: the habitats of northwestern Siberia; reindeer and their role in biodiversity; oil and natural gas reserves and the environmental consequences of tapping these resources; and threatened regions elsewhere in the Arctic.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Arctic study. For other resources in Socials Studies (e.g., curricular content), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu, which will give you access to educational resources in all of our subjects.

Previous Screen

Glaciers Theme Page

Here are a number of links to Internet sites which contain information and/or other links related to the specific theme of glaciers. Please read our disclaimer.

- ## Fundamentals of Physical Geography

  Although this online textbook from Michael Pidwirny, Okanagan University College, is intended for postsecondary students studying introductory physical geography, much of it may be applicable for high school students as well. Contents include over two hundred pages of information, more than three hundred 2-D and animated graphics, an interactive glossary of terms, a study guide, links to other Internet resources, and a search engine. See the Table of Contents to directly access the Geomorphology section with several chapters on glaciation.

- ## Glacial Features of North Dakota

  A site with illustrated descriptions of a number of glacial features in North Dakota. These include: End Moraine, Erratic, Esker, Ice Thrust Mass, Ice-walled Lake, Kame, Meltwater Channel, Outwash, and Till.

- ## Glacier

  Glacial geologists from Rice University designed and developed this page. It has information about what a glacier is and descriptions about some special features of ice. These features about ice include its shape, size, movement landscapes, environments and age.

- ## Glaciers (The Cryosphere)

  National Snow and Ice Data Center (NSIDC) menu has links to definitions for what a glacier is, how they move, how they are formed, what the components are, and more.

- ## Glaciers (Snowtastic Snow)

  Part of a Think Quest Junior (TQJ) project, this page describes several characteristics of glaciers. It describes how a glacier is formed, how a glacier moves, the size of a glacier, and the life that depends on glaciers.

- ## Glaciers and Glaciation

  From the U.S. Geological Survey Cascades Volcano Observatory, this page has links to descriptions of Glaciers, Ice Sheets, Glacier Hazards and Glacier Outburst Floods. In addition, there are four links to information about Mount Rainer and Mount Hood glaciers and glaciation.

- ## Glaciers and the Glacial Ages

  Focused on Vermont, U.S.A., the information on this page investigates what glaciers are, the physical effects from glaciers, when do Ice Ages occur, and when did the last glacial age end.

Ice Ages

Illinois State Museum presents information about the North American continental glaciers. They provide answers to the following questions: What are Ice Ages?, When did Ice Ages occur?, and Why do Ice Ages occur?.

Ice Ages and Glaciation

Geology instructors from Hartwick College has posted the following four links to help support their geology students. It presents illustrated descriptions of glacial features from around New York.

- Ice Ages and Glaciations This page illustrates how to gather evidence about the glacial period.
- Ice Ages and Glaciations Part II Shows how the motion of ice creates characteristic landforms.
- Ice Ages and Glaciations Part III An example a U-shaped valley and discussion of the impact of a piece of ice detaching from the glacier as it retreats.
- Ice Ages and Glaciations Part IV Illustrated information about what causes an ice age.

Illustrated Glossary of Alpine Glacial Landforms

As part of a university course in geology, this glossary has illustrations that are divided into the following three glacial categories: Erosional Landforms, Depositional Landforms, and Ice Features.

Recipe for a Small Glacier

As a class demonstration, teachers can use ice cream, some chocolate cookies and marshmallow syrup to imitate how a glacier moves (oozes).

[The] Retreat of Glaciers in the Midwestern U.S.

Animated illustrations and five maps are used to show retreating glaciers in North American from 18 000 to 6 000 years ago. An MPEG video is also available if your browser can support it.

Top of Page

Note: The sites listed above will serve as a source of curricular content glaciers. For other resources in science (e.g., curricular content in Earth Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Avalanches Theme Page

CLN Theme Pages

Below are the CLN "Theme Pages" that supplement the study of avalanches. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Glaciers Theme Page
- **Natural Disasters**
  - Blizzards and Snow Theme Page
  - Earthquakes Theme Page
  - Floods Theme Page
  - Hurricanes Theme Page
  - Tornadoes Theme Page
  - Tsunamis Theme Page
  - Volcanoes Theme Page

General Avalanche Resources

Here are a number of links to other Internet resources that contain information and/or other links related to avalanches. Please read our disclaimer.

- Avalanche Articles

  A series of articles from Colorado Firstrax Webzine. Titles include: Early Season Avalanche Notes; Identifying Weak Layers In A Snow Pit; Avalanche Beacons and Their Use; Traveling In Avalanche Terrain; Anatomy of A Slab Avalanche; Snow Block Analysis: A Better Way...The Stuff Block Test; Spring Avalanches; and What To Do If Caught In An Avalanche
- Avalanche Awareness

  A primer on avalanches from the National Snow and Ice Data Center in Colorado.
- Avalanche Awareness

  A tutorial on avalanches from the Manti-La Sal Avalanche Center in Utah.
- Avalanche Beware

  A series of articles from the Canadian Ski Patrol Association on the Discover the Rockies

Website. Titles include: Recognizing Avalanche Terrain; Could the Snow Slide? Safe Travel; Nature's Billboards; The Human Factor in Avalanches; When Travelling In Avalanche Terrain; Avalanche Rescue - What to Do; and The Avalanche Danger Scale.

- Avalanche Defense Page

  Avalanche defensive systems (active and passive) and "zoning" are described.

- Avalanche Dogs

  A wide range of information on avalanche dogs is available at this site, including how dogs are selected and trained, a dog behavior policy, and links to other sites on search and rescue (SAR).

- Cyberspace Snow and Avalanche Center

  This site serves as a metalist of links to educational resources on avalanches. Some links are to their own documents and others are to external resources. Categories of information include: Basic Information; Snow Stability and Snow Testing; Avalanche Dogs, and Miscellaneous Topics.

- Avalanche

  Avalanche lesson plan for grade 6-8 students.

- Nova Online: Avalanche

  Information on the making of a PBS special that aired in 1997. Check out in particular the sections titled "Elements of a Slide" and "Snow Sense" for basic background information on avalanches. There's a teachers' guide available if you wish to purchase a copy of the video.

- Westside Avalanche Network

  A wide range of information on avalanches is available at this site. Use the home page link above or go directly to some of their educationally relevant information below.

  - Avalanche Accidents Several years of statistics for Canada and the U.S. on avalanche fatalities and close calls.
  - Moonstone Snow and Avalanche Library Access to papers that contain information about snow and avalanches. Some of these papers form the basis of current avalanche education courses.
  - Picture Page Avalanche pictures in jpeg form.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Avalanches. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu, which will give you access to educational resources in all of our subjects.

Earthquakes Theme Page

Below are the CLN "Theme Pages" which may supplement the study of earthquakes. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- **Natural Disasters**
  - Avalanches Theme Page
  - Blizzards Theme Page
  - Floods Theme Page
  - Hurricanes Theme Page
  - Tornadoes Theme Page
  - Tsunamis Theme Page
  - Volcanoes Theme Page

General Earthquake Resources

This "Theme Page" has links to two types of resources related to the study of earthquakes. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. Please read our disclaimer.

- ## [The] ABC's of Plate Tectonics

  "A broad analysis of the basic principles that should apply to the movements of plates, some new hypotheses about how they apply to convection and landform formation, and some expected scenarios for differing tectonic events."

- ## Big Trouble in Earthquake Country

  In this four day unit plan, high school students use on-line data to hypothesize what would happen to life and property from earthquakes of various magnitudes. They then develop strategies to minimize damage and loss of life in their home town area.

- ## Canadian National Earthquake Hazards Program

  Lots of information on Canadian earthquakes, including reports of recent earthquakes in or near Canada, maps, and plots of seismograph network recordings. In addition, there are links to reports on specific earthquakes, regional reports, and Q&A files. An archive of seismographical data is also found at this site.

- ## Candy Quakes

  In this lesson plan, grade 8 students use candy bars, gum, and licorice sticks to learn how deformational forces affect the earth's crust. It's probably safe to say that this unique lesson will energize your students - both before and afterwards.

- Earthforce in the Crust

  The Franklin Institute Science Musuem provides a brief description of plate tectonics followed by a well defined set of external links to earthquake resources. Headings include: Current Quakings, Plate Tectonics, Earthquake Science, Teacher Lessons, Interactives, History, and Preparedness.

- Earthquake Information

  The United States Geological Survey site contains a meta list of links to latest quake information (maps and lists), information on hazards and preparedness, earthquake FAQs and information, and links to other resources.

- Earthquakes

  The U.S. Federal Emergency Management Agency sponsors this "FEMA for Kids" site on earthquakes. There are over 10 lessons/activities specially designed for children.

- Earth's Interior & Plate Tectonics

  An instructional document divided into section on "The Earth's Interior " and "The Lithosphere & Plate Tectonics" (Oceanic Lithosphere, Continental Lithosphere) and "Plate Tectonics").

- Encarta Online: Eye on Earthquakes

  In the process of developing their own TV News Shows, grade 4-9 students learn about the history of earthquakes, the formation of continents, and earthquake measurement and prediction.

- Every Place has its Faults

  An explanation, complete with animation, on the four basic types of faults.

- Faults, A Model of Three Faults

  Grade 7-12 students use a model of the earth's surface to learn about fault movements in this lesson plan from the USGS.

- The Great 1906 Earthquake and Fire

  From the Museum of the City of San Francisco, this Website explores the earthquake of 1906 through photographs, eyewitness accounts, newspaper clippings and reports from departments and organizations of the time. You can also find information on the 1989 San Francisco earthquake.

- ISU's Earthquake Home Page

  This site at Indiana State University lists the date, time, and shows the ticker-tape for the most recent earthquakes.

- Musical Plates

  In this multidisciplinary project, elementary grade students can learn about earthquakes through activities that use real time earthquake data as well as language art activities that look at how earthquakes affect our lives. There is also a teacher's area to assist educators in implementing this project in their classroom.

- ## National Earthquake Information Center

  This US site provides information on current earthquakes and earthquakes in general as well as links to other information sources.

- ## New York Times Learning Network

  These lesson plans use New York Times articles as a starting point.

  - Admidst the Rubble of Ruined Cities In this lesson plan, grade 6-12 students develop an understanding of the impact an earthquake could have on a country by developing and proposing solutions to rebuild Columbia's infrastructure in the wake of the January 25, 1999 earthquake.
  - National Tragedy, Global Response Grade 6-12 students "explore how different people on local, national and international levels respond to a destructive natural disaster and the needs of its victims and how various facets of the media cover such an event, focusing specifically on the earthquake that devastated Turkey on August 17, 1999."
  - Outreach in the Aftermath Grade 6-12 students "investigate the many types of aid needed to help Turkey recover and rebuild in the wake of the earthquake that devastated a large portion of the country on August 17, 1999. "

- ## Origami Activities

  An activity from the New Mexico Bureau of Mines and Mineral Resources, students can make a hexaflexagon with earthquake-education themes.

- ## Pacific Geoscience Centre, National Earthquakes Hazard Program

  Along with current earthquake information for Western Canada, there are a number of educational resources for teachers including All about Earthquakes: Frequently Asked Questions, This Day in Earthquake History, and Earthquakes in Eastern and Western Canada.

- ## Plate Tectonics

  Nasa's Observatorium presents an article on plate tectonics for students in grades 6-9 which presents the theory of plate tectonics in easy-to-understand concepts. There's also a teacher's guide, but you'll have to read through the article to find it.

- ## The Restless Planet: Earthquakes

  This PBS online site (based on the Savage Earth series) explores earthquakes through the article: "Earth: All Stressed Out." For more information, check out the three sidebars: Learning from Earthquakes, Quake Prediction, and Build Smart, Not Hard. The site has Flash and QuickTime animations.

- ## Shake, Rattle, and Roll

Two hands-on teaching activities for elementary/junior high students from the National Science Foundation. In the first, students explore structural design by constructing buildings that can withstand simulated earthquakes. They then design a series of experiments to explore the relationship between type of groundand the degree of damage a building is likely to sustain.

- Surfing for Earthquakes and Volcanoes

  In this week long lesson plan, middle school students research earthquakes and volcanoes on the Internet. Topics include: continental plate boundaries; interaction between plate boundaries; causes of earthquakes and volcanoes; and the comparison of the formation of Olympus Mons on Mars and the Hawaiian volcanic chain.

- Surfing the Internet for Earthquake Data

  This site is a meta-list of links to sites where seismic information of one kind or another is available.

- TrackStar

  TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

  This link is to their search page from where a keyword search on "earthquake" will produce numerous hits. Caution #1: Many (most?) of the web sites that these lessons access will already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

- **UNR Seismological Laboratory**

  The Nevada Seismological Laboratory at the University of Nevada, Reno has prepared six documents containing explanations, maps, and illustrations for the following earthquake topics.

  - Earth's Interior
  - Earthquake Effects
  - [The] Modified Mercalli Scale of Earthquake Intensity
  - Plate Tectonics, The Causes of Earthquakes
  - Seismic Deformation
  - What is Richter Magnitude?

- [The] Virtual Times: Recent Earthquakes & Active Volcanoes

  Maps and figures of recent earthquakes.

Note: The sites listed above will serve as a source of curricular content in Earthquakes. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Tsunamis Theme Page

Below are the CLN "Theme Pages" which supplement the study of tsunamis. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- ### Natural Disasters
  - Avalanches Theme Page
  - Blizzards Theme Page
  - Earthquakes Theme Page
  - Floods Theme Page
  - Hurricanes Theme Page
  - Tornadoes Theme Page
  - Volcanoes Theme Page

General Tsunamis Resources

Here are a number of links to other Internet resources which contain information and/or other links related to tsunamis. Please read our disclaimer.

- ### Activity Search

  Here are two lesson plans at the Houghton Mifflin Activity Search site that will help students understand tsunamis better.
  - Let's Make Waves Children use wind to create waves and marbles to model energy moving through water.
  - Monster Waves Students construct a tabletop village to visualize the relative height and effects of tsunamis.
- ### British Columbia Provincial Emergency Program

  The BC Provincial Emergency Program is the agency responsible for maintaining awareness, preparedness, and the response and recovery programs that are designed to reduce the human and financial costs of emergencies and disasters in BC. Included in the site is an online version of BC Tsunami Warning Plan, as well as general and BC specific information.
- ### Sensing Tsunami

  In this one day lesson plan, grade 9-12 students will develop a model for tsunami detection that incorporates remote sensing technology, will access data at remote sensing site via the

Internet, and will use the computer to prepare and archive a presentation of their final report.

- Tsunami: The Big Wave

  Nasa's Observatorium offers informational resources for students to explain what a tsunami is, the physics behind the wave, warning systems, what to do when they hit, and casualties data. A quiz and word search activity are also provided.

- Tsunami!: The WWW Tsunami Information Resource

  General information on tsunamis including near real-time tsunami informational bulletins, explanations of how a tsunami is generated and how it propogates, their effect on humans, how you can protect yourself, and a description of the Tsunami warning system. There is also survey and research information.

- Tsunami Database

  The National Geophysical Data Center's searchable database of recent and historical tsunamis.

- [The] Tsunami Page of Dr. George P.C.

  A very comprehensive site on tsunamis by Dr. George Pararas-Carayannis. In addition to general information, there are sections on Impact on Society; Mechanism, Propagation, and Terminal Effects of Tsunami; Historical Tsunami Database; Tsunami bibliographies; Warning Systems; and Real Time and Long Term Tsunami Prediction and Evaluation. Warning: The design of the main menu page incorporates small font size and questionable colour combinations which make the page very difficult to read. The lower pages are not quite as bad, but you may wish to override font and colour preferences with your own. Also, as this is a Geocities site, you will have to endure intermittent forced interruptions from their promotional advertising. If you can put up with these problems, the content in the site is worthwhile.

- Tsunami: The Great Wave

  An online brochure liberally sprinkled with pictures. Topics include: general information, causes of tsunamis, warning centres, warning dissemination, facts, and what you should do.

- Tsunami Warning

  Intended for elementary students, this online booklet contains 30 sequential pages of artwork and story. Caution: you may encounter slow downloads.

- Understanding Waves

  This lesson plan will give Grade 3-5 students a basic understanding of the physical properties of waves in general.

- Waves of Destruction: Tsunamis

  This web site is a companion piece to the PBS series on the Savage Earth but it can stand alone as well. Included is information on how tsunamis are formed and what makes them dangerous. There are also explanatory pictures and animation.

- Westcoast and Alaska Tsunami Warning Centre

This centre serves as the regional Tsunami Warning Center for Alaska, BC, Washington, Oregon, and California. Their web site contains recent press releases/advisories, information on recent tsunamis, an explanation of the physics of tsunamis, a list of safety rules, and a selection of pictures.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Tsunamis. Volcanoes Theme Page

Below are the CLN "Theme Pages" that supplement the study of volcanoes. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans), which will help teachers provide instruction in this theme.

- **Natural Disasters**
  - Avalanches Theme Page
  - Blizzards Theme Page
  - Earthquakes Theme Page
  - Floods Theme Page
  - Hurricanes Theme Page
  - Tornadoes Theme Page
  - Tsunamis Theme Page

General Volcanoes Resources

Here are a number of links to other Internet resources that contain information and/or other links related to volcanoes. Please read our disclaimer.

- Earth's Active Volcanoes

  Location, updates, images, and information on active volcanoes in the world, by geographic region.

- [The] Electronic Volcano

  A meta-list of links to volcano Websites.

- Exploring Planets in the Classroom:Volcanology

  Five hands-on activities that are provided in classroom-ready pages for both teachers and students for exploring volcanology.

- Exploring the Environment: Volcanoes

  This module is part of "Exploring the Environment" (ETE) from NASA's Classroom of the Future. In ETE, high school students are faced with a real life problem, and their goal is to use problem-solving skills and internet-based data (e.g., remotely sensed satellite images) to propose and defend a solution. A Teacher's Guide is available. This link is to the ETE home page since it gives the easiest access to necessary introductory and teacher information. To access the volcanoes module, click on "Modules and Activities" and then "Volcanoes." Students will have four situations from which to choose.

- Global Vulcanism Program

From the Smithsonian Institution, the GVP "seeks better understanding of all volcanoes through documenting their eruptions--small as well as large--during the past 10,000 years." Check out their monthly Bulletin of the Global Volcanism Network (and archives) for on going eruption reports from local observers. Access names (and in some cases eruption reports) on volcanoes thought to have been active in the last 10,000 years, either geographically or alphabetically.

- Link-to-Learn Classroom Activities

Link-to-Learn contains classroom activities (or lesson plans) that involve students' use of the Internet. This link is to their index of activities, that is organized by grade level. There are a number of lesson plans about volcanoes in their Science section.

- Michigan Technological University Volcanoes Page

Michigan Tech's Volcanoes Page provides information about volcanoes to the public. Amongst these pages you will find information about current global volcanic activity, research in remote sensing of volcanoes and their eruptive products, hazard mitigation, "Decade Volcanoes", links to government agencies and research instititions, and even some volcano humour.

- Rock My World

A three-week teaching unit from the Core Knowledge Website for Grade 4 students that covers volcanoes as well as the composition of the earth, earthquakes, mountain building, Earth's surface changes, and rocks. Plenty of suggested student activities are provided within the unit.

- Stromboli Online

Stromboli is a continuously active stratovolcano situated in the Aeolian Islands between Sicily and the Italian mainland. In addition to basic information on the volcano (e.g., eruptive history, geography, maps, etc.), the site offers several virtual tours of the mountain with options for additional side trips along the way.

- Surfing for Earthquakes and Volcanoes

In this week-long lesson plan, middle school students research earthquakes and volcanoes on the Internet. Topics include: continental plate boundaries; interaction between plate boundaries; causes of earthquakes and volcanoes; and the comparison of the formation of Olympus Mons on Mars and the Hawaiian volcanic chain.

- TrackStar

TrackStar is an online interface that allows instructors to create lessons for students by sequencing existing instructional content in various Websites within a lesson. Students explore one topic at a particular location within one Website, then move on to the next topic at another Website. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the Websites beyond the designated instructional content is also possible.

This link is to their search page from where a keyword search on "volcano" will produce numerous hits. Caution #1: Many (most?) of the Websites that these lessons access will already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding Websites, sequencing the tours) will vary widely within the TrackStar collection.

United States Geological Survey

There are quite a number of resources on volcanoes within this USGS.

- Cascades Volcano Observatory
- Monitoring Active Volcanoes
- Volcanoes (on-line edition)
- Volcanoes:
- Volcanoes of the United States
- Volcano FAQs

[The] Volcanic Home Page

News, photographs, and animations of volcanoes and volcanic action are at the top of this page, but there's much more, including an extensive metalist of links to other volcano Websites, organized alphabetically.

Volcanoes

The U.S. Federal Emergency Management Agency sponsors this "FEMA for Kids" site on volcanoes. Children can learn about volcano facts, Mount St. Helens, Pele the Volcano Goddess, and disaster intensity scales.

Volcanoes and Global Climate Change

A NASA document providing information on Volcanoes and Global Cooling, Volcanoes and Ozone Depletion, and Monitoring the Effects of Volcanoes.

Volcanoes Online

A 1998 Think Quest winner, this site offers a comprehensive introduction to volcanoes and plate tectonics. In addition to explanations about the concepts, students can search their database of volcanoes or play learning games. Teachers have access to a small selection of lesson plans.

[The] Volcano Information Center

Information about volcanoes is provided by topic, including features of volcanoes, volcanic eruptions, and volcanic hazards. There are also links to other Websites for data not included with the VIC.

Volcano Trailhead aka : Tramline Volcano Field Trip

This is the starting point for a virtual field trip on volcanoes from Tramline. Experts in the subject have selected a number of Websites on volcanoes and arranged them in a sequence to tell a story for students to follow. Students can move from one Web stop in the field trip to the next with ample opportunity to explore within the individual Website as they wish. However, since their Web browser page has been split into an inner part (showing that stop in the field trip) and an outer part (giving navigational tools to go through the entire field trip), they can always return to their "tram" and go to the next stop. To be effective, teachers would have to ensure that student browsing through the field trip sites was purposeful. Teacher guides can be printed.

Volcano World

VolcanoWorld brings modern and near real time volcano information to specific target audiences and other users of the Internet. VolcanoWorld draws extensively on remote sensing images (AVHRR, Landsat TM, Magellan, Gloria, etc.) and other data collections. Value has been added to this data by relating each image to geologic processes, and by encouraging users to analyze images with provided algorithms. VolcanoWorld offers a number of lessons and activities, which students and teachers may find helpful in their quest to learn more about volanoes.

Blizzard Attack!

Will you get there from here?

You are about to come face to face with a major winter storm, one that could bring you lasting memories. The kind of storm that you'll one day say to your grandchildren, "I remember that big storm...and **boy was it radical!"** Well you get the point.

Even though the experts have been tracking the storm inch by inch, as with all winter weather conditions, some unexpected and frightening changes may await you on your journey. Good luck and have a safe trip!

- Your Mission

Igloo Builders Guide

Building an igloo is easy and fun. And the igloo is a great place to spend the night on a small 'expedition' in the mountains. Much warmer than a tent, and can be built just about anywhere. Building an igloo will take somewhere between 3 and 6 hours, depending on your previous experience and level of ambition...
This page is a small guide on building an igloo.

 Norsk versjon her.

The photos are from somewhere north-west of Hallingskarvet, Hardangervidda, Norway, and were taken in March 1992.

Equipment

The only tool needed in addition to a snow spade is a saw. A special snow saw is recommended, but a carpenter's saw will do (as seen in the pictures). A machete or small axe is handy for moulding the snow blocks, but not necessary (use your ski instead - less to carry).

Step 1: Find a suitable spot

A hard field of snow is required to build an igloo - hard enough to make solid snow blocks. Even if the top layer of snow is soft, hard snow can usually be found underneath. Use your sticks to make a circle, marking the base of the dome. The snow depth should be at least 1m where the igloo is placed. Don't make it too big, or you're into trouble later. This igloo is for 2-3 persons.

Step 2: Prepare the snow blocks

The snow blocks are prepared with the saw. They should be solid enough to be carried horisontal without breaking by their own weight. Large blocks are used at the base of the dome, smaller ones at the top. A thickness of 15-30cm is good. The blocks can be made extra strong by setting them up to harden in the wind.

Step 3: The building starts

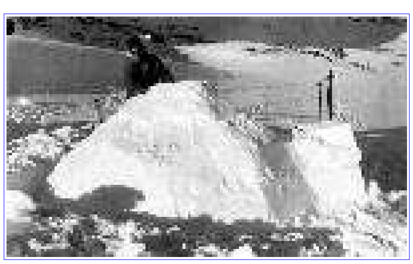
The edges of each snow block should be smoothed and angeled correctly to make a strong bond to the adjacent blocks. A ski with its tip placed in the centre of the igloo is a perfect tool for this. There will always be some (or maybe a lot of) cracks between blocks, but that is fixed later. It is very important that the bottom row of snow blocks are placed aslant, otherwise you are building a tower...

A full cricle of snow blocks has been built. Ideally, the blocks should be placed in a spiral. This will make the building easier. Note the entrance. It is made of two vertical placed blocks pointing outwards with a solid block on top to make a small roof. It might look tiny, but a lot of snow is dug out later. At this stage you might want to lower the floor inside the igloo. This way you can get 10-30cm of extra headroom!

The dome is starting to form. Keep removing the snow that is piling up inside. It is a lot easier to throw it out of an open dome than to shovel it out the entrance afterwards.

If everything is done right, the dome will not collapse because the blocks are supporting each other. But in some critical situations, you might want to use a stick inside to support the topmost blocks until the dome is closed. The last few blocks are moved into the igloo through the entrance and lifted up. There might be need of two persons inside at this stage.

Step 4: Finishing the igloo



The igloo is closed! Not a perfect dome, but good enough. Now it is time to fill all those cracks with snow. (The really big cracks are filled with small blocks of snow.) Then the inside of the igloo must be smoothed. This is done by hand (your gloves get very wet, bring extra pair!). If the inside of the dome is one, smooth surface, there will be no dripping of water at all. When the smoothing of the inside is done and all the snow has been shoveled out, it is time to finish the entrance. An L-shaped entrance is a good solution, and will prevent any snow from blowing in. First dig an L with an depth of 1m (or more), then cover it with a square 'roof' made of snow blocks. Or you can just keep the entrance simple, as shown in the image.

Its finished! This is the inside. Note how the entrance is dug deep enough to allow almost standing height (Ronny with the spade). The cold air will flow into this hollow, which function as a cold sink. *NOTE! When using a stove in the igloo, make sure the ventilation is adequate!* During cooking small holes will melt in the roof, letting fresh air in. A small ventilation hole in the roof is recommended. Always keep the entrance open. The floor should be covered with some kind of camping mattresses, Therm-a-rest or similar is a good choice. Candles can be used as light source, cut a small niche for the candle, with sufficient space above it to avoid snow melting.

Time to say goodnight (Geir in the sleeping bag). Note how the ceiling is smoothed. Even after an hours worth of cooking, there is no dripping. Actually, during the night the water that has melted will freeze again between the blocks, making the igloo stronger than ever. Next morning you might be able to stand on top of the igloo!

Well, this is it. Please excuse my spelling. If you have any comments or suggestions, mail to gedra@hate.spam.start.no Note! Remove "hate.spam." from mail address before sending.

Participants of the igloo building project:

- Ronny Finnema (master constructor)
- Geir Drange (photography, digging...)
- Anonymous (digging, carrying...)

Actually, we spent two nights in this igloo.

back home

Science Rules!

Don't Be Too Flaky

Summary: The density of water, ice, and snow aren't the same even though all three are composed of H_2O. In this experiment we'll measure the relative densities of these three substances. After you're done you can submit your results to us and they will appear here on our web site along with data contributed by other students all over the world!

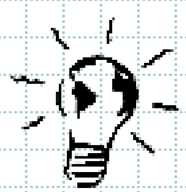
I. JUST THE FACTS

Snowflakes are formed by the freezing of water vapor in the air. Layers of snowflakes on a surface, such as the ground, are simply called snow. Snow is mostly a combination of snowflakes and air. The amount of air that snow contains affects its volume (the amount of space it takes up). When snow melts, the trapped air is released. Thus, the volume of snow is greater than the volume of the liquid water it forms when melted. Not all snow is the same, and snow is not the only form of frozen water. Ice, sleet, and hail are also mostly a combination of frozen water and air. Let's compare the properties of ice and snow around the world, and at the South Pole.

Note: if a non-metric measuring cup is used for this activity, fluid ounces can be converted to milliliters using this relationship: 1 fluid ounce = 30ml. However, strictly speaking 1 fluid ounce = 29.573730ml, but we will use the approximation of 30ml= 1 fluid ounce for this activity. Whole number estimates of other relationships between metric and English measurements are also used, such as 1 quart = 1 liter, thus 1 cup =250 ml.

II. DON'T GET HURT / WATCH OUT!

Although snow and ice are very common materials, caution should be taken to prevent possible frostbite or cuts on the hand from jagged edges of ice that may be mixed with the snow. If you use kitchen utensils in the lab, be careful to make sure that they do not come in contact with materials that will contaminate them and make them unsafe to use with food.

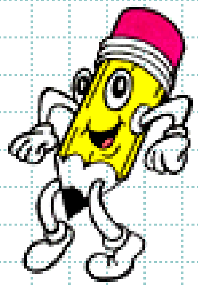


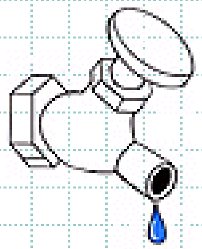
III. WHAT'S UP?

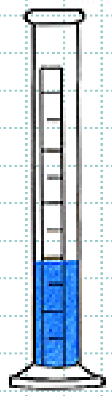
How does the volume of snow compare to the volume of liquid water that the melted snow forms?

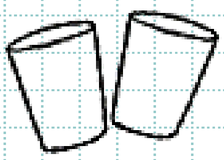
IV. WHAT DO YOU THINK?

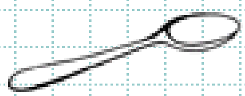
Make a guess about the amount of water you think a cup of snow will form when melted. Half as much? One-third as much? How much?

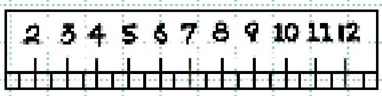












V. STUFF

- pencil
- ruler
- 1 sheet of paper
- permanent marker
- three (3) 10-oz (~300ml) clear plastic drinking cups (We suggest using 10 oz. clear plastic picnic cups that come from the same package, although other size cups will work. You need three because we will be finding average values)
- tap water
- volume measuring device (graduated cylinder or metric measuring cup 750 ml (3 cups) snow (use shaved ice, crushed ice or accumulation of frost from a home freezer as alternatives if snow is not available.)
- spoon

VI. JUST DO IT

1. Use the pencil and ruler to prepare a data table on the paper similar to the one in Scoreboard below.
2. Near the bottom edge of each cup, use the pen to label the cups A, B, and C.
3. Put 250ml (1 cup) of unpacked snow into each cup. Use the spoon to help remove the snow from the cup, but take care not to press the snow flakes together.
4. Record the volume of the snow, which should equal 250ml (1 cup), where you found it (your town, city, or locale), and a description of the snow (i.e. 3 day old snow) in the data table.
5. Draw a line and mark the snow level with an S (for snow) on each cup (all 3 should be the same).
6. Set the cups on a table indoors and allow the snow to melt.
7. When all of the snow has melted mark the water level on all three cups Sw (for snow water).
8. Pour the water from cup A into your measuring device. Record the volume of the water in the data table.
9. Determine the ratio between the volume of the snow and the volume of the water. Do this by writing a fraction with water volume as the denominator and snow volume as the numerator (ratio = Volume Snow/VolumeWater). Express the answer as a decimal by dividing the denominator into the numerator. Record the answer. (Note: the answer tells you how many time greater the snow volume is than the volume of the melted water it forms.)
10. Repeat steps 6,7 & 8 for cups B & C.
11. Determine the average ratio and record. Do this by adding the ratios and dividing by 3.

VII. SCORE BOARD

Create a table like the one below and record your data.

SNOW / WATER DATA TABLE-1

Snow Sample Location_____________________________

Description_______________________________________

SAMPLE	VOLUME (ml)		RATIO
	snow	water	snow/water
A			
B			
C			

Average Volume ratio snow/water = ______________

VIII. DO YOU SEE WHAT I SEE?

Submit the results of your experiment to us! As we collect data from students around the world we'll post the results here. To contribute your data simply fill in the blanks below and hit the "Submit" button.

Your Name: [ ]

Email Address: [ ]

Snow Sample Location: [My Town]

Description: [ ]

Average ratio snow / water: [ ]

[Send my data to Janice & Randy!] [Clear form]

Check out data already submitted. Inspect the data and answer the following questions:

1. How do your results compare with those from other areas?
2. If there is a difference, what could contribute to the difference?

IX. EXTENSIONS

If the snow were fresh would the results be different than if it were old? If you are in an area where conditions allow, wait for a new snowfall and repeat the experiment. First use fresh snow, and then repeat again using snow that has been on the ground several days (the longer the better); or repeat multiple times with a different sample every day. Prepare and record your data in a chart similar to the one shown here.

SAMPLE	VOLUME (ml)		RATIO
	snow	water	snow/water
Day 1			
Day 2			

Day 3			
Day 4			

Average Volume ratio snow/water = ______________

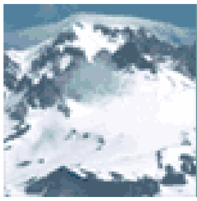
THE CRYOSPHERE WHERE THE WORLD IS FROZEN



All About Snow

Q & A Facts Glossary Gallery More snow links

All About Snow brings you, well, everything about snow.

Q & A answers the snow questions we receive. If you want to know why snow is white, or why forecasting snow can be so difficult, this is the section for you.

Facts brings together interesting bits of information we have come across in answering questions.

Use our Glossary to learn the difference between a blizzard and a squall, or to find out what graupel is.

The Snow Gallery contains historic photos of blizzards and snow from the National Weather Service.

Our Have Snow Shovel, Will Travel brochure chronicles snow removal activities in the United States.

Avalanche Awareness answers ten common questions about avalanches. The Blizzards of 1996 also answers questions, provides weather maps and images, and includes links to other notable storms. Have Snow Shovel, Will Travel describes how we have dealt with snowstorms in cities in the United States since the 1700's. Snow in the News lists the latest links to news site stories about snow.

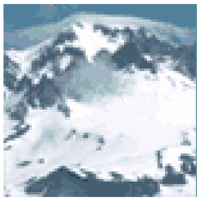
The Blizzards of 1996 was produced in cooperation with the Network Montana Project (Montana State University) "Storm Tracking" curriculum development project. NSIDC compiled information on the blizzards and winter storms of 1996, including a selection of satellite images and surface maps for each of the storm events.



Have Snow Shovel, Will Travel

Introduction

Snowstorms have historically plagued many states, notoriously those located in the Northeast and Midwest. Winter storms occur all over the country, but the "Snowbelt," stretching across the Great Lakes from Minnesota to Maine, receives the brunt of winter storms. Just as the first settlers on New England's shores struggled to survive the brutal snowstorms, so do the inhabitants of today's metropolises. Cities such as Buffalo, New York City, Milwaukee and Detroit experience snowfalls that strand residents in snow deep enough at times to be measured in feet rather than inches. Following on the heels of a severe storm in 1993, the recent paralysis experienced along the East Coast during the storms of January 1996 provides an all-too perfect example of the effect extreme winter weather can have on the nation's cities.

Officially, the National Weather Service defines a blizzard as large amounts of falling OR blowing snow with winds in excess of 35 mph and visibility of less than 1/4 of a mile for an extended period of time (greater than 3 hours). German settlers in Iowa originally coined the word blizzard, coming from the word *blitzartig*, meaning "lightning-like." European pioneers and settlers were astounded by the severity of the winters in the New World. Although accustomed to snow in their homelands, they were newly confronted with driving winds and freezing temperatures characteristic of Snowbelt regions.

Old World Settlers Combat New World Snow

Early East Coast settlements received their share of blustery storms and were battered by a series of harsh winters. Not only was the snowfall deep, but the weather was extremely cold, often freezing the bay around Boston and rivers to south as well. However, most travel was by foot, so many early storm fatalities occurred when coastal ships were caught in winter gales. Perhaps the most pressing problems for new settlers entailed shortages of wood and coal for heating homes.

As the towns grew and established routes for travel and postal service, several storms in the early

1700's rendered the roads impassable and hindered communications. A 1717 storm dumped three to four feet of snow, which in some places drifted to 25 feet. The journey from New York to Boston was almost impossible; the single successful post runner abandoned horseback for snowshoes. For over a hundred years, this storm was known as "The Great Snow." Other, less severe, snowstorms followed over the years, accompanied by the usual winter hardships. In 1741, frozen waterways and harbors resulted from a severe and very cold snowstorm, curtailing shipments along the East Coast for over a month.

Photograph of a horse drawn sleigh taken on March 18, 1888, during the Great Blizzard. (Courtesy of the Historic National Weather Service Collection.) Larger version (43k).

Although severe weather hindered commerce, residents learned from their experiences. City residents began stockpiling firewood and other supplies in advance of winter disasters. For those who couldn't afford enough wood or coal to warm their homes through the winters, several charities came to their aid. To improve travel, horse carts and coaches were installed with ski-like runners in wintertime, which were better able to handle snowy conditions than wheels. Of course, parties of revelers often took advantage of the snowy roads and ice-covered rivers, which proved excellent for sleigh rides.

Weather-watchers in rural areas and cities kept wary eyes on temperature and air pressure, and provided a climatological record as well as weather diaries for future reference. Beginning in the 1820s, they sent records to the Smithsonian Institution where the various reports were collected in an attempt to analyze and forecast weather. Reports were also relayed to the public via newspapers and telegraph dispatches.

As populations grew and commerce needs expanded, wintertime blizzards began to present more critical problems to city dwellers who relied on frequent deliveries of food and supplies. In severe winters, intercity roads and railways were often blocked for weeks at a time. Ice-jammed waterways prohibited coastal shipments as well. Fire hazards became a worsening problem, due not only to increased congestion of stoves and fireplaces, but also due sometimes to the extremely low temperatures that froze water in the tanks and hoses of the firefighting equipment.

Early Attempts at Snow Control and Removal

Early attempts at snow control simply involved citizens going into the streets to level the drifts for sleigh traffic. Ordinances in many cities required homeowners to clear their sidewalks of snow, but snow removal was not yet practiced on a citywide basis. In order for residents to travel by carriage, or for merchants to receive goods (and customers), they were responsible for clearing their own streets. Snow shovelers were frequently hire to do this for them. As a result, wintertime travel in the early 1800s was still mostly by foot.

As the 1800s progressed, new buildings and new technologies were put to the test by severe winter storms. Heavy, wet snow collapsed roofs and suspension bridges. Gale-force winds mangled telegraph and electrical lines and downed poles, increasing the threat of electrocution and electrically-sparked fires. Cities like Milwaukee, Chicago and New York responded to these new problems, enacting new codes to ensure that buildings could withstand the combined forces of snow and wind. Public officials and residents alike called for putting existing and future telegraph wires underground to avoid further safety hazards.

The Scoop on Snow Plows

Enterprising inventors were issued the first patents for snow plows in the 1840s, but several years passed before the plow designs were put to use. One of the first mentions of snow plow use comes from Milwaukee in 1862. The plow was attached to a cart pulled by a team of horses through the snow-clogged streets. Over the next several years, horse-drawn plows gained popularity and came into use in many other Northeastern cities. Intercity steam trains, having made their appearance several years earlier, now puffed and whistled their way through heavy drifts with giant plows attached to their front ends. Salt was used in a few cities, but was strongly protested because it ruined the streets for sleighing and damaged the shoes and clothing of pedestrians. However, the invention of the snow plow initiated widespread snow removal efforts in cities and also created a basis for municipal responsibility in snow removal.

Plows were a boon to city dwellers, enabling winter transportation to recover more rapidly from storms than in previous years. However, this solution was accompanied by a new round of problems, some of which remain with us today. Plowing cleared the main streets for traffic, but effectively blocked the side roads and sidewalks with huge, uneven mounds of compacted snow. Businessmen and townsfolk initially hailed the success of the plow, but later complained and even brought lawsuits against the plowing companies. Merchants claimed that their storefronts were completely blocked with mounds of plowed snow, making them inaccessible to their customers, and pedestrians bemoaned trying to negotiate the huge mounds which often obstructed the sidewalks. Sleigh drivers also found fault with the plowing system because of the ruts and uneven surfaces it created.

New York and other cities responded in several ways. They hired horse-drawn carts and shovelers to work in conjunction with the plows, hauling away the plowed snow and dumping it into rivers. This not only cleared the mounds of snow, but provided thousands of temporary jobs throughout the winter season. In an effort to curtail the use of salt, which many still protested, streets and icy bridges were coated with sand instead. To appease all sides, New York in the 1880s built elevated steam railways along the major routes of the city, high enough that they would not be affected by the drifts. Still in operation today, these elevated tracks proved very successful, and carried travelers through all but a few of the most severe storms. Prior to the invention of the subway, the elevated trains were often the only transport service available in storms that halted all ground travel.

The Blizzard of 1888

In spite of these advances in their struggle against snow, the notorious "Blizzard of 1888" literally paralyzed the Northeast after three days of snow, wind and freezing temperatures. Two-and-a-half to four feet of snow fell, and drifts were reported to cover entire first stories of buildings. Carts and carriages in the streets were abandoned and buried by snow as drivers realized the futility of their endeavors. Schools, city railroads and public offices were closed, and even New York's elevated railways were victim to the mounting drifts. A mile's worth of passenger trains headed for New York were trapped for two days in drifts exceeding 20 feet. Tragically, over 400 people lost their lives in this storm.

Following the 1888 blizzard, cities recognized the need for more organized snow removal and looked for ways to avoid some problems altogether. Previously, city officials often waited until storms were nearly over to begin snow removal, but now realized that taking action during the first stages of a storm produced better results and more rapidly cleared roads. To combat the snow more effectively, cities were divided into sections and assigned to plow drivers. Increased numbers of plows cleared the streets with more efficiency. Driven by the ferocity of that blizzard, city officials were also more determined to bury communication wires and create alternative methods of transportation, such as trains and subways, that wouldn't be hindered by drifting snow.

The Great Blizzard of March 12, 1888. New York, New York. (Courtesy of the Historic National Weather Service Collection.) Larger version (43k).

Steam trains were fairly effective at clearing their own tracks when equipped with plows. However, for shorter inner-city transport, cities tried electric trolleys with plows, which proved to be unsuccessful. Several northeastern cities had long toyed with the idea of underground railways, but in the wake of the blizzard, it was an idea whose time had come. Boston installed the first stretch of subway tracks in 1899. New York followed with its own subway five years later, and both cities extended their lines significantly over time.

Snowstorms in the Wild West

Cleared train tracks in the Sierra Nevada at Emigrant Gap, California, after a snow storm in 1917. (Courtesy of the Historic National Weather Service Collection.) Larger version (36k).

While some of the snowiest places in the West were (and still are) in remote, relatively uninhabited places, there were incidents of travelers getting caught in winter storms, often with grim consequences. In October 1846, at the beginning of what is still considered to be a record snow season, George Donner, leading a group across the Truckee Pass, just north of Tahoe City, California was surprised by an early winter blizzard. Within eight days, forty-foot drifts had accumulated, trapping the group in the mountains. They weren't rescued until April 1847, and by then only 47 of the initial 87 remained alive amid reports of cannibalism. In winter 1873, Alferd Packer and several other gold seekers trekked into the San Juan Mountains of southern Colorado. Trapped in severe winter weather, months later, only Packer returned. When the bodies of the remaining men were found, evidence indicated that they had been cannibalized by Packer, for which he was tried and convicted.

Although the sparsely populated West was not as drastically affected as the eastern metropolises, the western states also received a fair share of winter storms. In the western part of the country railroads provided a significant source of transportation especially for the mountain mining industries. Subways and elevated rails were just not practical for the vast plains and mountain passes, so steam trains battled drifts with giant rotary plows, plowing snow and blowing it away at the same time. Ranchers erected snow fences, which protected roads and prevented snow from drifting too high on their property. The burgeoning population centers of the West, such as Denver, Salt Lake City, and Seattle, soon acquired snow removal equipment to battle the winter storms. However, they were often able to rely on the sun or mild weather to melt heavy snowfalls, as they still do today.

Planes, Lanes, and Automobiles

Motorization swept the country with amazing speed in the early 20th century, leading to motorized dump trucks and plows as early as 1913. Many cities rushed to motorize their snow removal fleets, abandoning most of their horse-drawn carts. In conjunction with the new trucks, cities began to use Caterpillar tractors equipped with plow blades. To haul the snow away, they used steam shovels, cranes, and railway flatcars to get the snow off the streets and dumped into the rivers. In spite of the technological advances, manual shovelers also continued to be hired as part of the winter work force.

Another motorized invention, the Barber-Green snowloader, was successfully tried in Chicago in 1920, and several cities purchased snowloaders that same winter. The snowloader was an ingenious contraption. Riding on tractor treads, it was equipped with a giant scoop and a conveyor belt. As the snow was plowed, it was forced up the scoop, caught by the conveyor belt which carried it up and away from the street into a chute at the top where it was dropped into a dump truck parked underneath. It effectively made snow removal easier and more effective for the cities by making the process much less labor and time intensive.

Early aviation development also advanced the snow removal technology. Runways needed to be kept especially clear, prompting the first small airports to find solutions. Salt was effective only on ice and light snowfalls, and plowing mounds of heavy snow was time-consuming. To combat the snow even before it hit the ground, snow fences were constructed on the windward sides of the runways, effectively trapping snow and preventing it from blowing onto the runways. Light snow dustings were simpler to control.

New fleets of dump trucks and tractor plows were very expensive for cities to purchase and maintain, but the amount of revenue lost if the streets were not cleared was by far more expensive than snow removal equipment. As cities and businesses provided urban populations with a wide variety of goods and services on a daily basis, they were struck a financial blow when a large snowfall debilitated transportation and prohibited customers from reaching them.

New Winter Problems for Cities

It was in fact the popularity of the motorcar that would create a whole new set of problems for snow removal crews. By 1925, over seventeen million cars were registered, vastly increasing the demand for dry, safe streets. As motorcars took to the streets in force, public safety demanded snow removal efforts even for snowfalls less than four inches. Due to increased dependence on the automobile, not only main thoroughfares needed clearing, but residential streets as well. Scenic snowfalls once reminiscent of winter merrymaking became unbearable, and the freezing weather once welcomed by sleigh parties create hazardous driving conditions. Automobile accidents were rapidly rising due to weather-related conditions.

An aerial view of an expressway in Chicago, paralyzed after a blizzard, January 26-27, 1967. (Courtesy of the Historical National Weather Service Collection.) Larger version (44k).

Slick layers of ice left behind by snow plowing, renewed demands for salt and sand use. No longer concerned about protests, city public works officials used salt by the ton to ease road conditions, and also experimented with cinders and sand. Motorized salt spreaders became the primary tool in fighting snowy roads, and businesses and private citizens as well used tons of salt to keep driveways, sidewalks and access routes clear of snow and ice. However, several cities in the Great

Lakes region were unable to use salt due to the extremely frigid weather that rendered salt almost ineffective. In any city, while salt works well on icy roads or minimal snowfall, it does little good against deep snow.

Parked and abandoned vehicles posed the other great problem faced by snow removal crews. Urban streets now provided parking places, which in winter months hampered snowplowing efforts. Desperately needing to clear the streets, plows ended up packing huge, compacted drifts against parked cars, forcing unwary owners to dig them out. Realizing there was a conflict, city ordinances were created, banning overnight parking for certain city areas, or posting signs marking snow plow routes, where parking would be banned when plows were in use. Many of these ordinances are still in effect throughout major cities, increasing the efficiency and thoroughness of plowing efforts.

Along highways, severe blizzards stranded motorists who often abandoned their vehicles, creating nightmares for plowing crews who tried to clear around lumps of snow-covered cars. Conceding defeat, snow removal efforts in this case were (and still are) forced to tip their hats to Mother Nature. Today, winter weather still catches commuters unprepared, and inevitably highways become littered with stalled and abandoned cars during blizzards. As in the storm of 1996 that paralyzed the East Coast, several states have required federal assistance from time to time, in the form of financial aid and the aid of National Guard troops to clear streets and help remove cars from highways.

Snowy Challenges and New Technology

Well after automobile use had become widespread, shopping centers, office parks and industrial centers saw the need for private snow removal equipment of their own to clear parking lots for their employees and customers. This created a market for smaller, customized equipment, and spurred technology to develop more specialized functions. Smaller plows and snow blowers were also in growing demand by private residents who sought to escape the rigors of the old-fashioned snow shovel.

In 1959, space technology entered the snow removal effort, and satellites observed and relayed climate and weather conditions, allowing for more accurate storm forecasting. While attempts at forecasting had been made earlier through weather-watchers using telegraphs, phones, and radios to communicate, this system could not be relied on with nearly as much accuracy. Cities were able to brace themselves in advance for severe winter weather and prepare for snow removal efforts. Also, increased use of media such as radio and television helped keep the public aware of impeding hazardous situations. Most of us realize how critical this has proven in our own lives, as many of us have been able to change or curtail our plans due to televised weather forecasts warning us of incoming storms, potential snowfall amounts, temperatures and wind chill factors.

As snow removal efforts progressed, protests against salt renewed, supported both by environmentalists and motorists whose cars were being corroded by years of heavy winter salt use. Environmental experts discovered in the late 1960s that salt use was corroding cars, damaging roadside plant life, polluting water supplies (including drinking water supplies), and killing fish in streams. Motorists were weary of repairing car corrosion after each winter, and road crews were discovering that salt was corrosive to roads and bridges as well. Improved salt spreaders resulted from these finds, using more efficient spreading gauges.

Recent Wintertime Problems

Heavy winds and blowing snow wreak havoc on traffic and roads. A truck with a snow plow attachment clears a road in this photograph from November 10, 1998. (Courtesy of the National Renewable Energy Laboratory and the Department of Energy. Photograph by David Parsons.) Larger version (32k).

Within the past twenty years, cities have been met with new problems, often results of solutions to previous problems. For instance, weather reports conveniently forewarn people of incoming storms and deep-freezes. Unfortunately, this often leads to careless judgments; thinking they can outrun a storm, people become stranded at stores or in traffic when the blizzard hits in force. Not only is this frustrating for those wishing to get home, but the resulting traffic jams also impede plowing efforts. Several cities have needed to call states of emergency, and restrict driving to only emergency cases.

One of the less obvious problems faced by cities is the high cost of snow removal. For instance, costs in Montreal, Canada, exceed sixty million dollars per season. There, up to two thousand workers operate vehicles and spread salt to clear the streets. While each city will vary in what type of equipment and what it needs to spend, snow removal has become a large factor in annual city budgets. Cities like Denver and Salt Lake can rely on sunshine to melt the piles of snow left along the sides of streets after plowing. Northeastern and Snowbelt cities, however, need to account for not only plowing and salting, but hauling the snow away since it may not melt rapidly enough. On top of this, each season brings new surprises; a winter with mild temperatures and little snowfall may be followed by a winter with several severe snowstorms.

Another recent problem is that of driver carelessness. Drivers should take extra precautions when driving in each new storm, even after roads have been salted or plowed. In congested city traffic defensive driving becomes critical during inclement weather. While four wheel drive vehicles have received criticism for the false sense of security they provide, they have become a necessity for mountain residents, offering better traction and handling on snow-packed roads. Motorists need to be completely aware of road conditions (icy, slushy, snowpacked, etc.). They should keep in mind any possible hazards and plan in advance for them. Motorists need to choose alternate routes when inclement weather makes normal routes treacherous and leave enough time to account for slower driving speeds and possible traffic jams. Carrying sacks of sand or kitty litter comes in handy to spread on slick spots. Those living in remote areas might want to keep spare equipment in their car or truck, such as shovels, flashlight, matches, blankets, spare clothes, food and water, in the event of becoming stranded in a storm.

Safety in Snowstorms

You may not be able to avoid living in a snowstorm prone region, but there are ways you can avoid becoming a victim of blizzards and winter storms. Stay inside if you are home, and except for emergencies, don't leave until the storm has abated. Deaths are often caused indirectly by storms, due to traffic accidents and hypothermia (caused by overexposure to cold weather). While shoveling snow, be sure to take frequent breaks. This will not only help your sore muscles, but may also prevent any chance of a heart attack, which can be triggered by rigorous shoveling. It is ideal to stock your house even before winter begins, with non-perishable food, medicine, bottled water, baby items, wood, batteries, matches and candles. Blizzards are notorious for defying weather forecasts and arriving early, so don't wait until the day or morning before a blizzard is expected to strike to stock up on essential supplies.

If you are caught in a storm and your vehicle is immobilized, remain in or near your car or truck unless you can see a source of help. You may want to get out and clear the exhaust pipe to prevent possibility of carbon monoxide poisoning. Also, set flares, tie a bright piece of cloth to the antenna, or raise the hood of your car to make yourself visible and increase your chance for rescue. Once you have done this, get back in your vehicle and remain inside. Crack a window for ventilation. Turn on the engine for ten or fifteen minutes every hour for heat, and try to keep your blood circulating by exercising from time to time, moving arms, legs, fingers and toes.

The Blizzard of 1996

In January, the "Blizzard of 1996" hit the southeastern states and worked its way up to the northeastern states, claiming over 100 lives and forcing nine northeastern and southern states to declare a state of emergency. Snowfall amounts ranged from one to four feet, with Virginia and West Virginia hit the hardest. Several states made nonemergency driving illegal, and most major airports were closed for at least a day or two, canceling thousands of flights.

A week later, while many cities were still digging out, two new storms struck the Eastern Seaboard, bringing up to a foot of additional snow. Around New York City, a church roof and two store roofs collapsed from the added weight of the new snow. For several days afterwards, many travelers were forced to trudge long distances through hip-deep snow to get to subway and train stations, as not all roads had been adequately cleared for busses or cars.

Approximate state snowfall amounts

Virginia	48 inches
West Virginia	43 inches
Maryland	33 inches
Pennsylvania	30 inches
New Jersey	28 inches
New York	28 inches
Connecticut	27 inches
Kentucky	27 inches
North Carolina	25 inches
District of Columbia	24 inches
Ohio	17 inches
Massachusetts	17 inches
Georgia	12 inches

City snowfall records

Philadelphia, PA	30 inches
Newark, NJ	28 inches
New York, NY	20 inches
Charleston, WV	19 inches
Cincinnati, OH	14 inches

Please see our Blizzard of 1996 pages.

Mother Nature continues to best our human endeavors. A 1958 New York report stated that rain was falling on the ground, yet guards were making snowballs atop the 1150 foot Empire State Building. The winter of 1977 proved especially harsh worldwide. In Buffalo, New York, snow drifts were so compacted by wind that plow blades broke trying to clear them, and halfway across the world in Japan, record heavy snows collapsed over 200 roofs. Arctic weather dipped to the southernmost part of the United States in 1985, blanketing San Antonio with 13 inches of snow, and dusting several other southern cities with snow as well. On March 13, 1993, the "White Hurricane" pummeled the entire eastern seaboard, resulting in 92 deaths. Syracuse and Boston broke snowfall records that year, and New York city struggled with snow and ice for two weeks after the storm. No doubt the Blizzard of '96 will top records across the Northeast once again. And, as recent pleas for snow shovelers testify, the good old-fashioned snow shovel continues to be one of the most effective, time-honored tool for digging out our nation's cities.

The Snowiest Cities in the Country

Snowbelt cities dominate the list, but others, such as Denver, Salt Lake City, Omaha and Seattle also receive significant amounts of snowfall. Buffalo maintains the all-time high for snowfall in a single season, holding the record at 199 inches, all of which accumulated during the 1976/77 winter. Rochester, New York, comes in second, with 161 inches in a season, and Portland, Maine, comes in third with 141 inches in a single season. These three cities also carry some of the highest monthly totals in snowfall as well. The recent Blizzard of 1996 may help topple a few seasonal snowfall records.

Paradise Inn, Mount Rainier, Washington. During the winter of 1916-1917, 789.5 inches of snow fell at Paradise Inn. When this photo was taken, in March 1917, the snow was 27 feet deep. (Courtesy of Historic National Weather Service Collection.) Larger version (35k).

In the Midwest and West, Salt Lake City, Utah, Anchorage, Alaska, and Denver, Colorado, have each received around a 100 inches or more in their record high seasons. These record highs are for cities only; however, remote mountain areas and smaller towns have received higher snowfall amounts. Paradise Ranger Station in Washington State has received over 1000 inches (or 85 feet) of snow in a single season. Sites along the Rocky Mountains and Sierra Nevada Mountains also receive between 400 and 800 inches (or 33 to 66 feet) in a season.

Some Notable Snowstorms

February and March 1717: "The Great Snow of 1717" blanketed New England in a series of four storms, leaving nearly four feet on the ground and drifts up to 25 feet high.

January 1772: "The Washington and Jefferson Snowstorm" is so named because it trapped both men at their homes with snow up to three feet deep throughout Maryland and Virginia.

December 1778: Named after the Revolutionary War troops stationed in Rhode Island, drifts were reported to be 15 feet high after this storm.

November 1798: "The Long Storm" went down in history as the snowiest on record for that month. Stretching from Maryland to Maine, up to a foot-and-a-half of snow coated the region.

December 1811: A powerful storm buffeted New York City, Long Island, and southern New England, accompanied by gale-force winds and destructive tides that severely damaged many ships and harbors.

January 1857: "The Cold Storm" produced severe blizzard conditions along much of the eastern seaboard. Temperatures fell below 9 below zero Fahrenheit, and snowfalls were between one and two feet deep.

March 1888: The "Blizzard of '88" produced temperatures plummeting well below zero degrees Fahrenheit, ravaging gusts of wind and deep snow drifts that stranded several cities, leaving them without transportation or communication. New York City suffered the most damage, particularly to its harbor areas.

November 1898: The "Portland Storm" was named after the ship that sank off the coast of Cape Cod, the S.S. Portland. High winds and moderately heavy snows accompanied the storm.

January 1922: The "Knickerbocker Storm" dumped over two feet of heavy snow on Washington D.C. causing the roof of the Knickerbocker Theatre to collapse, killing nearly 100 people.

December 1947: A post-Christmas storm caught New York residents by surprise, dropping two feet of snow in 24 hours.

January 1967: A series of record-breaking storms battered the west coast of Lake Michigan, hitting Chicago the hardest, shutting nearly everything down. Looting of the unattended stores became rampant, and it took the city over two weeks to clear the major highways and roads.

February 1969: New York City became trapped under a foot-and-a-half of snow. Commuters became stranded in their cars, schools closed, and travelers were stuck at airports, which were also forced to close. To make matters worse, many of the snow plows had become buried by snow in their storage lots and had to be dug out before they could be used. The city and outlying suburbs were forced to hire 10,000 shovelers and workers to clear the streets.

February 1977: Ontario, Canada and western New York state were slammed by a storm that killed 28 people and shut down the city of

Buffalo for over a week. Highways were clogged with thousands of stranded vehicles, and people became trapped at schools, stores and offices, where they were forced to spend the night because they could not make it home through the blizzard.

March 1993: The "Blizzard of the Century" ravaged the southern mid-Atlantic states from Alabama to Massachusetts, accompanied in other states by severe weather disturbances such as tornadoes, thunderstorms, and floods. Snow fell at rates between an inch and two inches an hour in some areas, and many locations experienced record-breaking snowfalls and record snow depths.

Even states in the southern part of the United States can get significant amounts of snow. This photo was taken in Bull Shoals, Arkansas, after the Blizzard of '93. (Courtesy of the Historic National Weather Service Collection. Photography by Elizabeth A. Hobbs.) Larger version (40k).

January 1996: The Blizzard of 1996 was responsible for over 100 deaths and brought much of the eastern United States to a complete halt. Schools, offices and airports were closed for several days in some areas as roads were impassable. Compounding problems, two subsequent storms blasted the same areas within the following week-and-a-half.

Snow Facts

- Snow continues to challenge weather experts across the country. It is still very difficult to predict and is surprisingly hard to measure once it has fallen.
- Based on National Weather Service records for 1961 through 1990, Rochester, New York averages 94 inches of snow annually and is the snowiest large city in the United States. Rochester has a population more than 200,000 and annual municipal snow-removal budget of $3.7 million (1995 figures).
- Buffalo, New York, is a close runner-up in terms of U.S. large cities with the most snow. A 39-inch snowfall in 24 hours in early December 1995 cost the city nearly $5 million for snow removal.
- Almost 187 inches of snow fell in seven days on Thompson Pass, Alaska in February, 1953, according to the [National Snowfall and Snow Depth Extremes Table](#) provided by the [National Climatic Data Center](#).
- Each year an average of 105 snow-producing storms affect the continental United States. A typical storm will have a snow-producing lifetime of two to five days and will bring snow to portions of several states.
- In the early 1900s, skiers created their own terminology to describe types of snow, including the terms "fluffy snow," "powder snow," and "sticky snow." Later, the terminology expanded to include descriptive terms such as "champagne powder," "corduroy," and "mashed potatoes."

- Fresh snow is an excellent insulator. Ten inches of fresh snow with a density of 0.07 inches, seven percent water, is approximately equal to a six-inch-layer of fiberglass insulation with an insulation R-value of R-18.

- Practically every location in the United States has seen snowfall. Even most portions of southern Florida have seen a few snow flurries.

- Snow kills hundreds of people in the United States each year. The primary snow-related deaths are from traffic accidents, overexertion, and exposure, but deaths from avalanches have been steadily increasing.

- The greatest snowfall officially reported at the Phoenix, Arizona National Weather Service Office was one inch. That occurred twice. The first time was January 20, 1933. It happened again four years later on the same date.

- In the western United States, mountain snow pack contributes up to 75 percent of all year-round surface water supplies.

- The commonly used ten-to-one ratio of snowfall to water content is a myth for much of the United States. This ration varies from as low as 100-to-one to as high as about three-to-one depending on the meteorological conditions associated with the snowfall.

- Nationwide, the average snowfall amount per day when snow falls is about two inches, but in some mountain areas of the West, an average of seven inches per snow day is observed.

All About Snow

Q & A Facts Glossary Gallery More snow links

Snow Glossary

ablation	the process of being removed. Snow ablation usually refers to removal by melting
accretion	growth of precipitation particles by collision of ice crystals with supercooled liquid droplets which freeze on impact
blizzard	winds of at least 35 miles per hour along with considerable falling and/or blowing snow reducing visibility to less than one-quarter mile for a period of at least three hours. (xtremely cold temperatures often are associated with dangerous blizzard conditions, but are not a formal part of the modern definition.)
climatology	the science and study of climate; the aggregate of all weather conditions at a point over a long period of time
condensation	the process in which water vapor becomes liquid
dendrite	hexagonal ice crystals with complex and often fernlike branches.
depth hoar	large (one to several millimeters in diameter), cohesionless, coarse, faceted snow crystals which result from the presence of strong temperature gradients within the snowpack
evaporation (water)	the physical process in which liquid water changes into a gas
firn	rounded, well-bonded snow that is older than one year

graupel	snowflakes that become rounded pellets due to riming. Typical sizes are two to five millimeters in diameter (0.1 to 0.2 inches). Graupel is sometimes mistaken for hail.
metamorphism	changes in the structure and texture of snow grains which results from variations in temperature, migration of liquid water and water vapor, and pressure within the snow cover
precipitation	the accumulated depth of rain or drizzle and also the melted water content of snow or other forms of frozen precipitation, including hail
polycrystal	a snowflake composed of many individual ice crystals
rime	a deposit of ice formed when supercooled water droplets freeze on contact with an object
saturation vapor pressure (water)	the maximum amount of water vapor necessary to keep moist air in equilibrium with a surface of pure water. This is the maximum water vapor the air can hold for any given combination of temperature and pressure
snowboard	a solid, flat, white material, such as painted plywood, approximately two feet on each side, that is laid on the ground or on the surface of the snow by weather observers to obtain more accurate measurements of snowfall and water content
snow core	a sample of snow, either just the freshly fallen snow or the combined old and new snow on the ground, obtained by pushing a cylinder down through the snow layer and extracting it
snowbursts	very intense showers of snow, often of short duration, that greatly restrict visibility and produce periods of rapid snow accumulation
snow density	the mass of snow per unit volume which is equal to the water content of snow divided by its depth
snowfall	the depth of new snow that has accumulated since the previous day or since the previous observation
snow depth	the combined total depth of both old and new snow on the ground
snowflake	a cluster of ice crystals that falls from a cloud
snow flurries	snow that falls for short durations and which often changes in intensity. Flurries usually produce little accumulation

snow load	the downward force on an object or structure caused by the weight of accumulated snow
snow water equivalent	the water content obtained from melting
snowpack	the total snow and ice on the ground, including both new snow and the previous snow and ice which has not melted
snow squall	a brief, but intense fall of snow that greatly reduces visibility and which is often accompanied by strong winds
sublimation	the process in which ice changes directly to water vapor without melting, but also in meteorology the opposite process in which water vapor is transformed to ice (also called deposition)
supercooled	the condition when a liquid remains in the liquid state even through its temperature is below its freezing point
supersaturation	the condition which occurs in the atmosphere when the relative humidity is greater than 100 percent
surface hoar	the deposition (sublimation) of ice crystals on a surface which occurs when the temperature of the surface is colder than the air above and colder than the frost point of that air
vapor pressure	the pressure exerted by water vapor molecules in a given volume of air

When cloud particles become too heavy to remain suspended in the air, they fall to the earth as precipitation. Precipitation occurs in a variety of forms; hail, rain, freezing rain, sleet or snow. This portion of the Clouds and Precipitation module focuses on precipitation and has been organized into the following sections.

Sections

Latest Update: 07/21/97

Rain and Hail
Atmospheric conditions that lead to the development of rain and hail.

Freezing Rain
A detailed look at freezing rain, associated dangers and the conditions that lead to its development.

Sleet
Atmospheric conditions that lead to the development of sleet.

Snow
Atmospheric conditions that lead to the development of snow.

Acknowledgments
Those who contributed to the Precipitation sections of the Clouds and Precipitation module.

The navigation menu (left) for this section is called "Precipitation" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

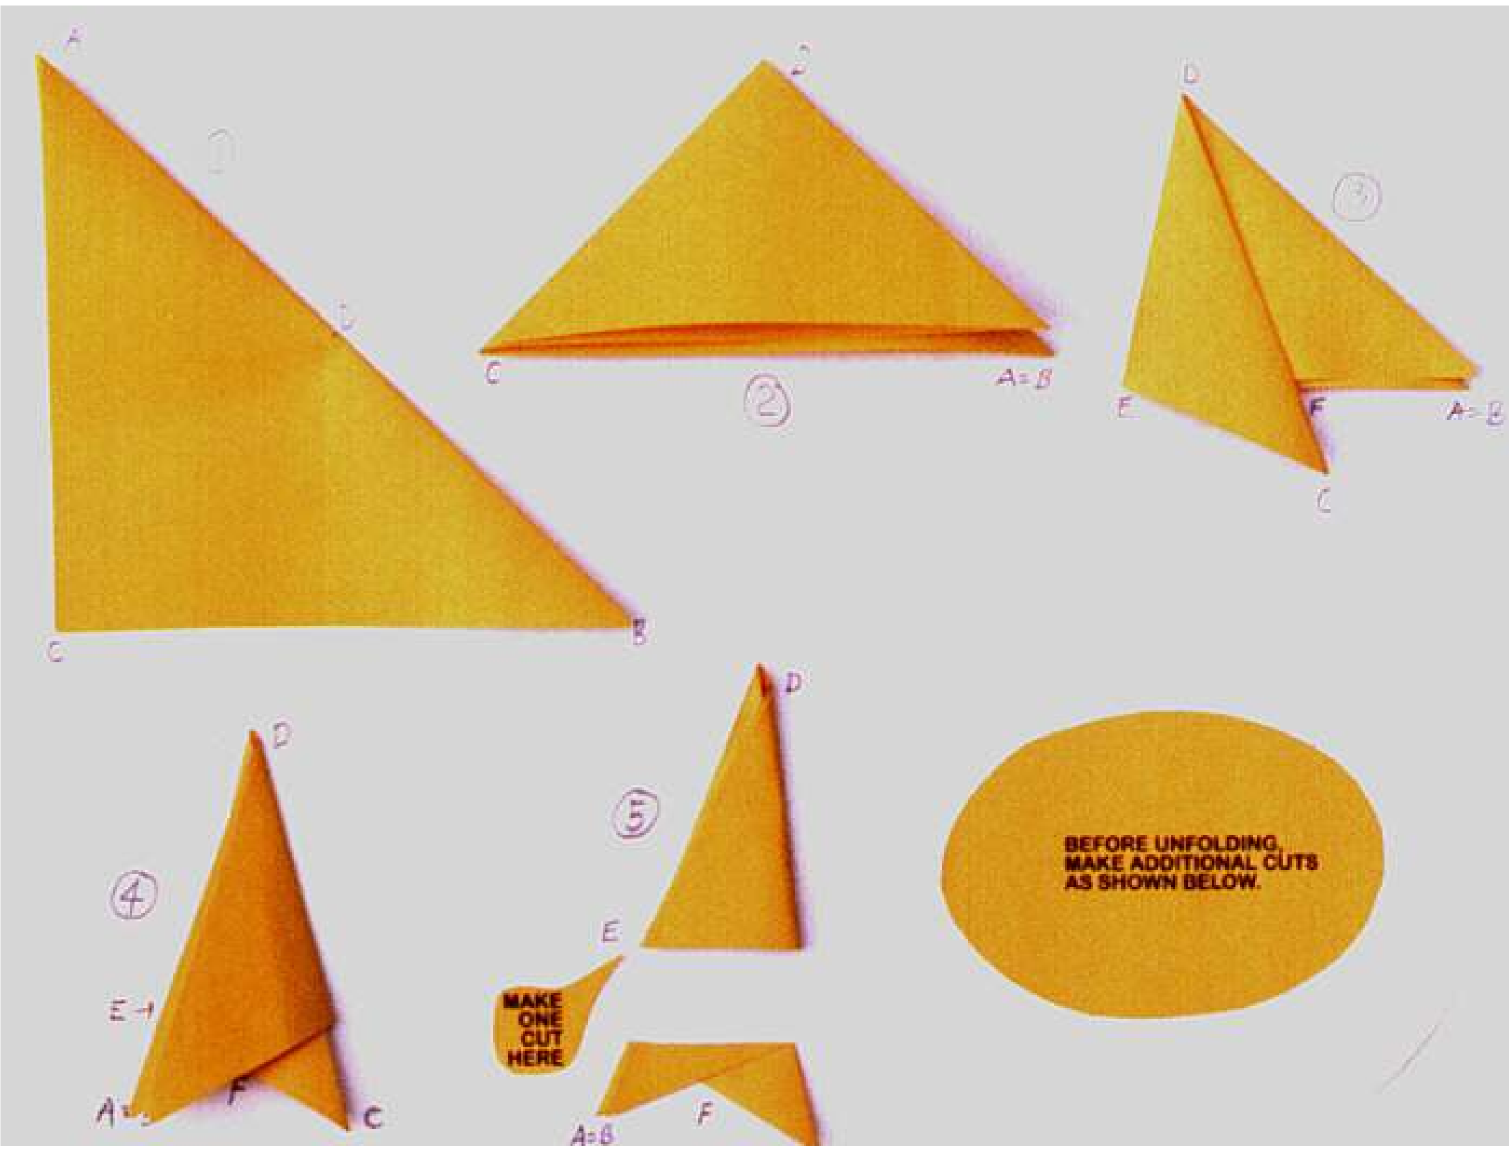
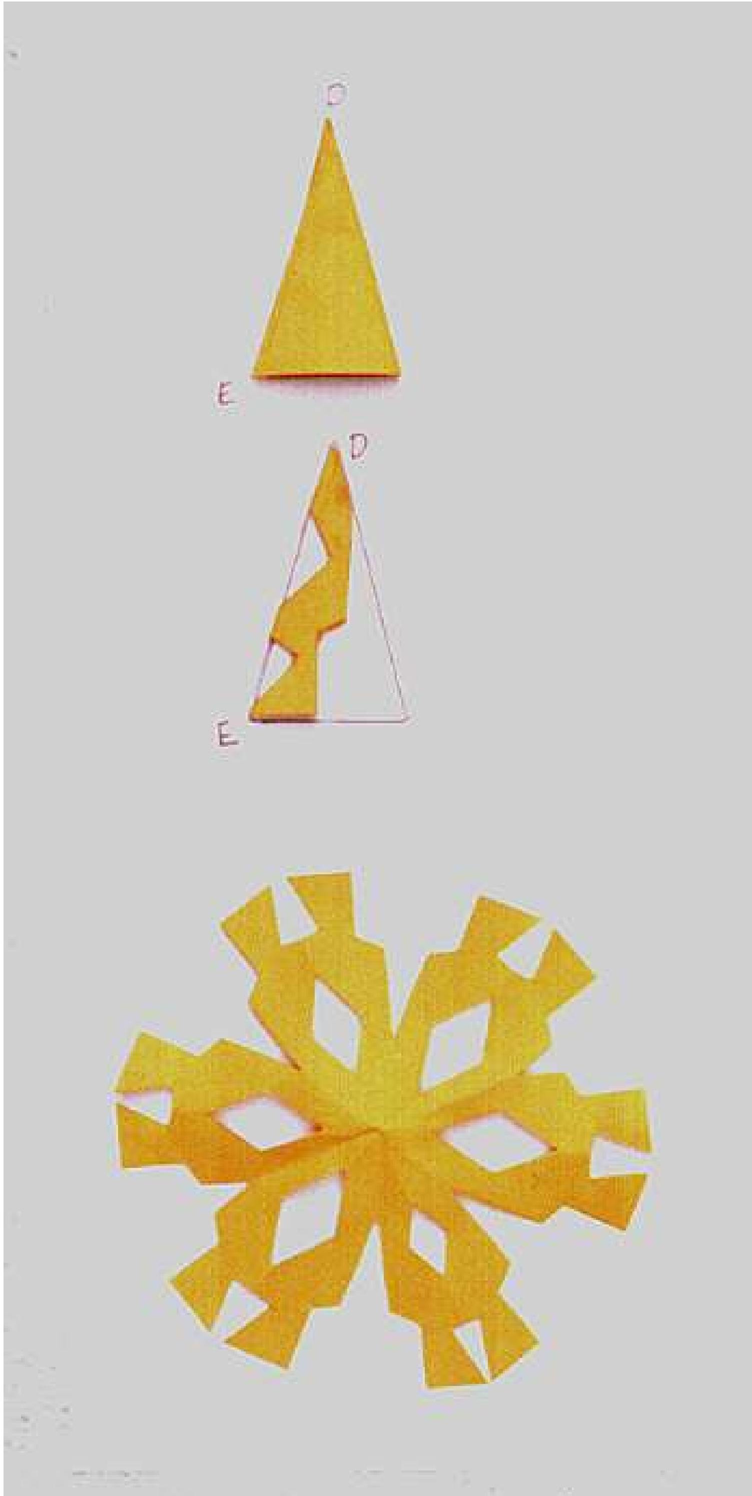
Paper Snowflakes

Below is a diagram of the first five steps to make a paper snowflake. (If you have made the [6 - Point Star - Paper Relief] these are the same five steps except in the last step the cut is made as shown below.) Begin with a square sheet of paper and in the first step, fold it on the diagonal. Continue through the other steps.

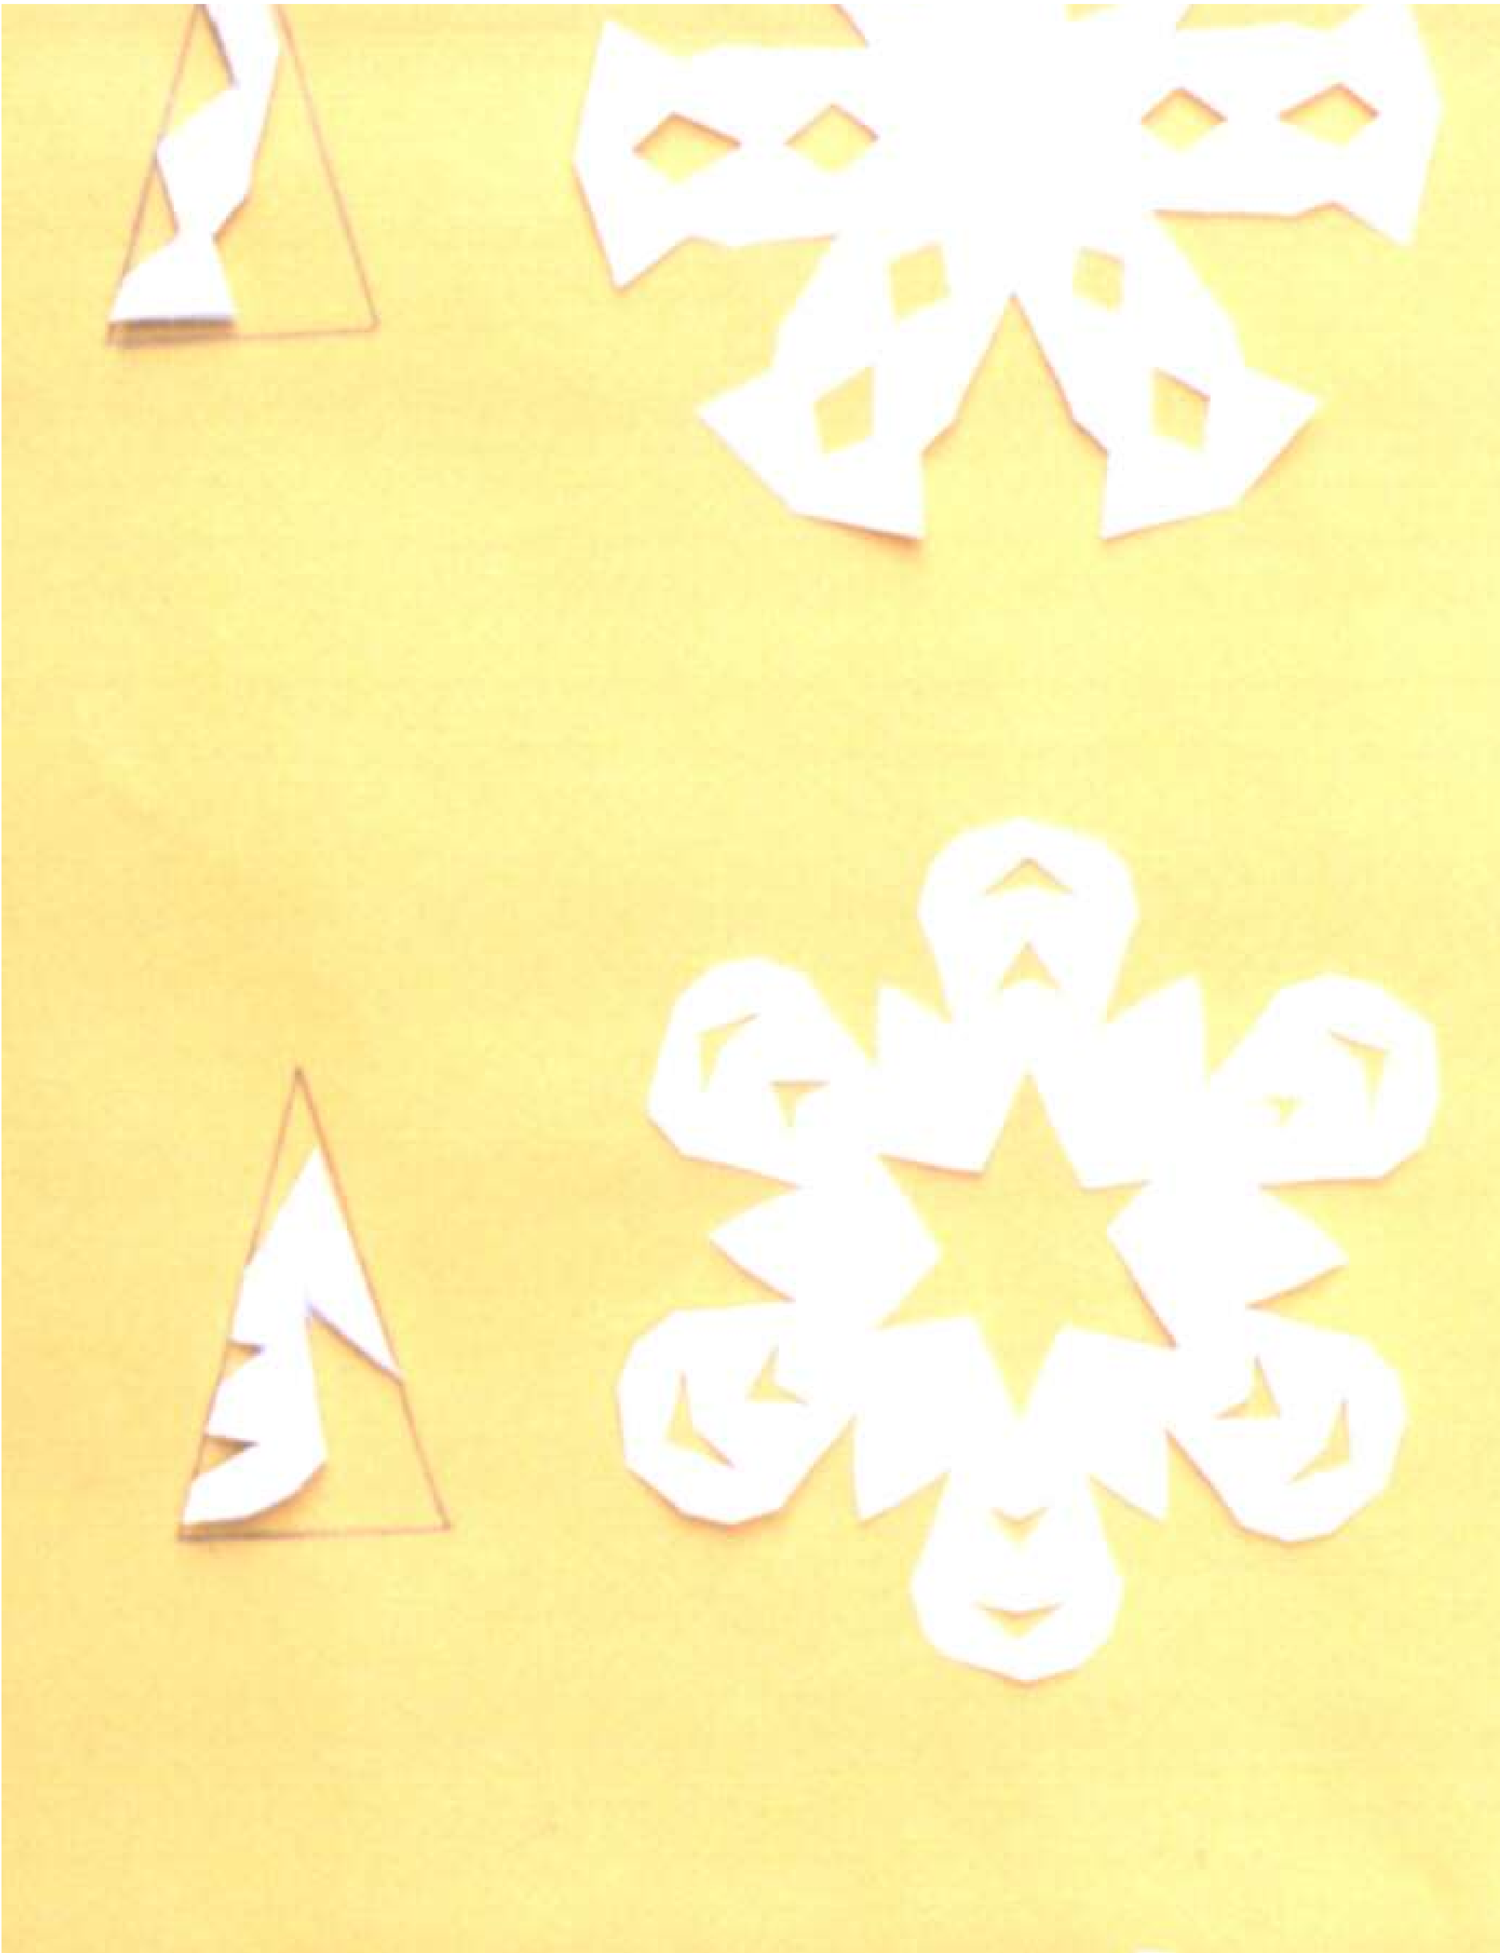


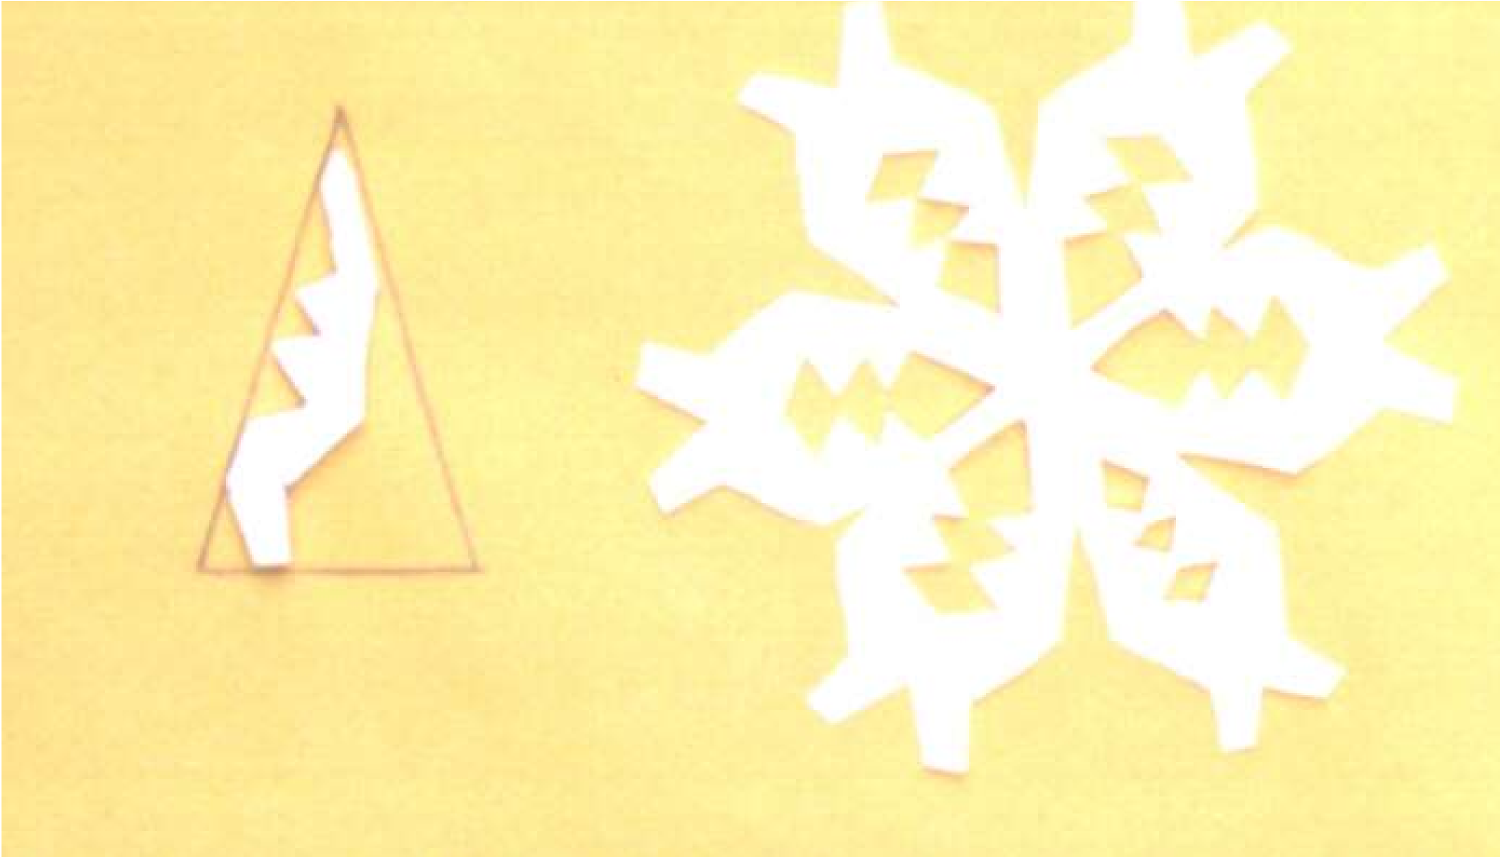


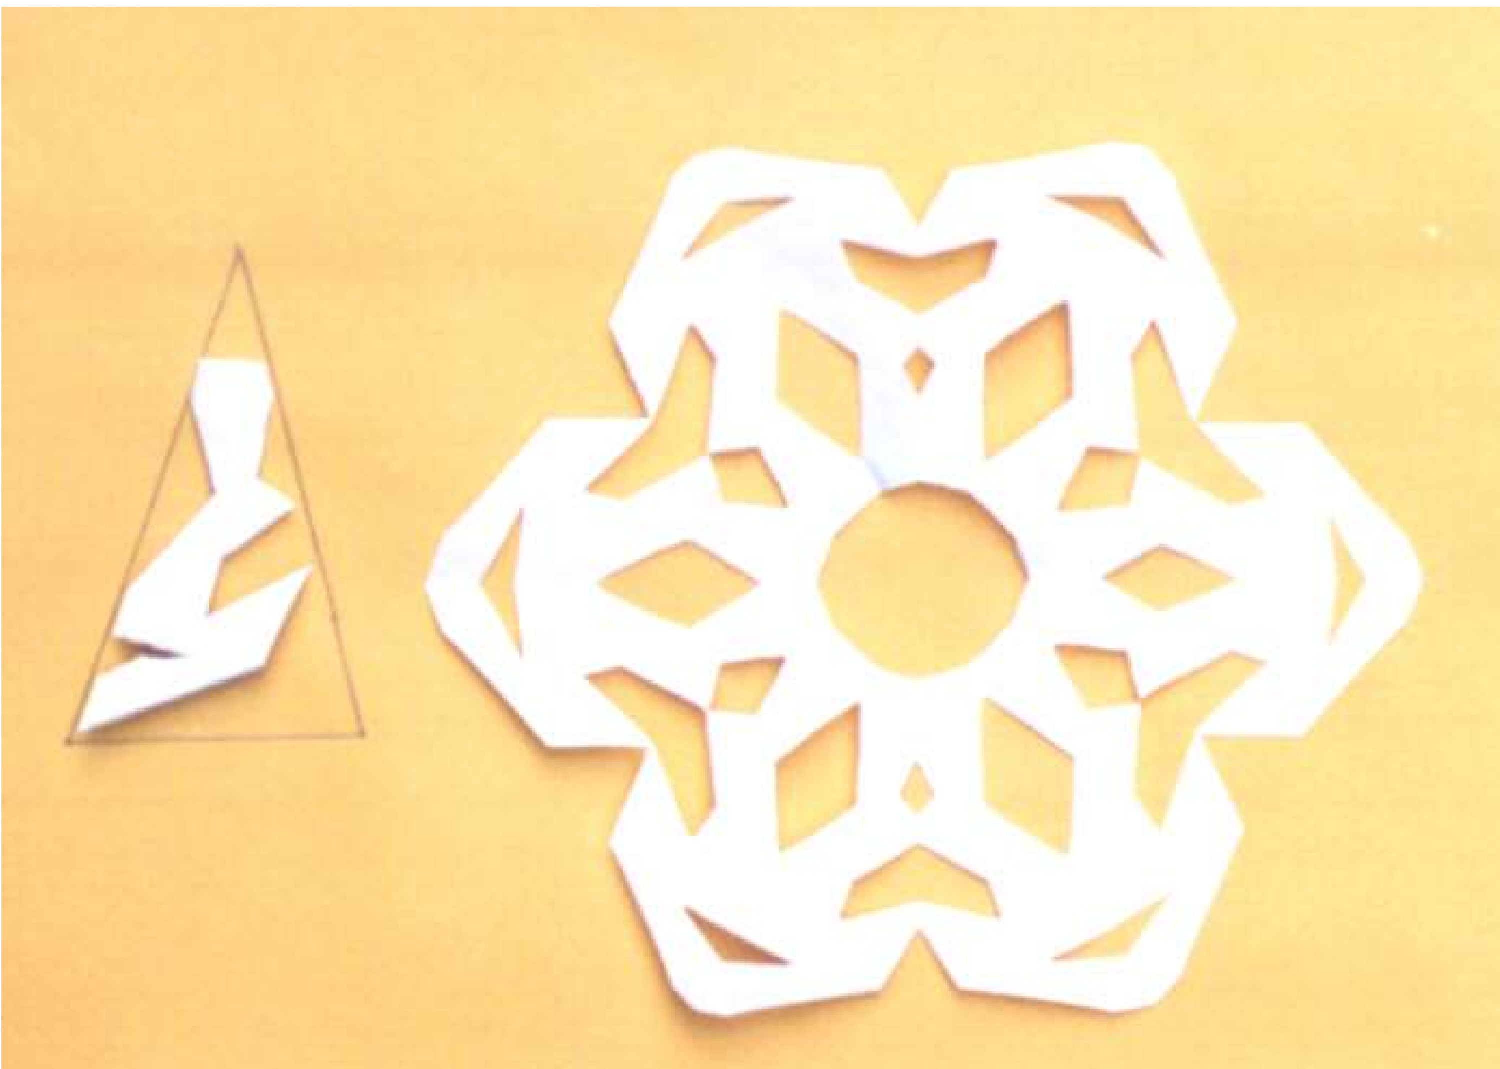
When making additional cuts for the snowflakes, the point E forms the 6 points of the star or snowflake and the point D forms the center of the star or snowflake. (If you choose to cut off D, a hole will be in the center. If you choose to cut off E, the tips will have more points!)

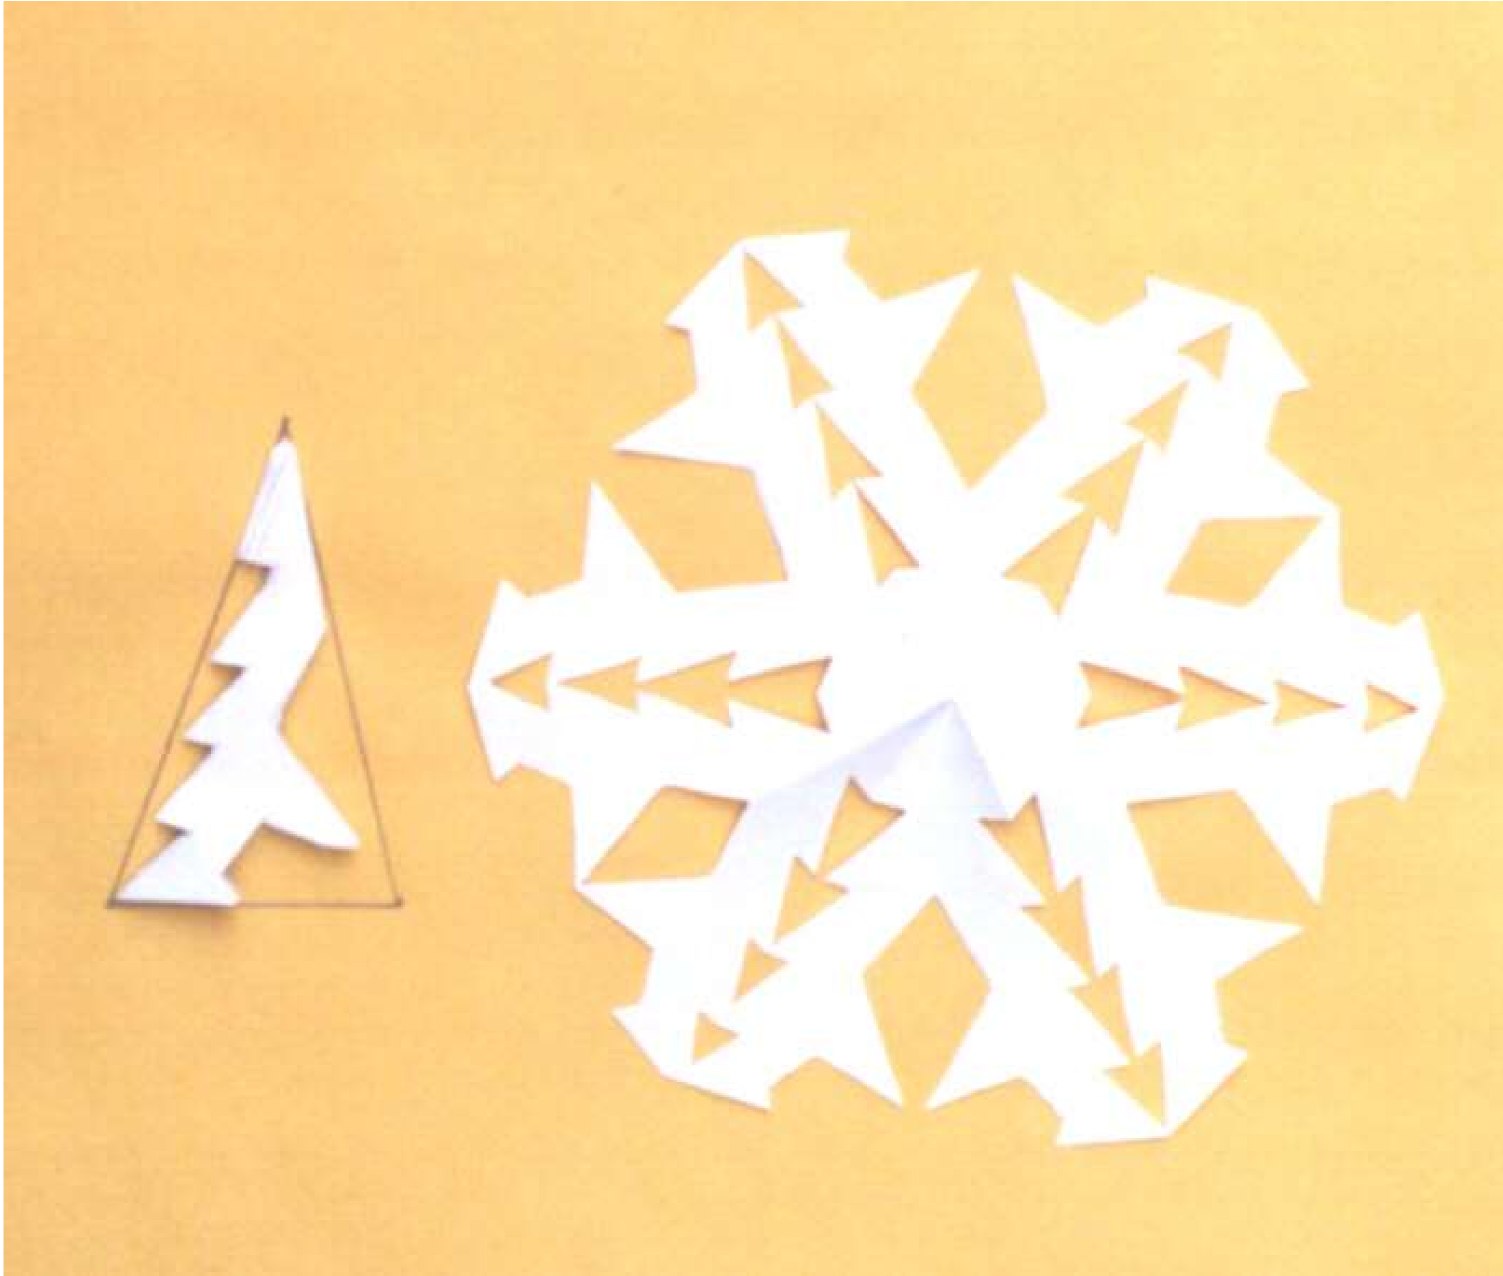
Make cuts leaving a 'path' from E to D. Then open to reveal snowflake. The snowflake can be flattened or made into a relief by folding the 12 creases from the center, alternating in and out (as shown with the 6 point star).

Shown below are different snowflakes made from different cuts.









Priced square sheets of variety paper lately? We have, and so we offer, inexpensively, 100 square sheets of various brilliant colors that are available. The sizes are square and range from 7 " x 7 " to 4 " x 4 " and 20 pound paper with some card stock. Only $5 postpaid. (Tennessee residents add 9.25% sales tax.)

Also, we offer 150+ sheets of white paper squares - at least 50 sheets each of 4x4 inches, 5x5 inches, and 6x6 inches - $5.00.

Send check to:

Maddy and Maverick, 6418 Point Pleasant Rd, Hixson, TN 37343

100% guaranteed satisfaction or we will refund your money. Just return the items within 30 days.

Need a compass with no sharp points. Draw circles from 1/4 " to 10 " diameter with new flat compass. $1.80 postpaid. 2 for $2.50 postpaid. (Tennessee residents add 9.25% sales tax.)

Click here for more information and pictures on this Safe-t Compass. School & Group discounts for large orders available. Other products available such as a compass/protractor/ruler combination.

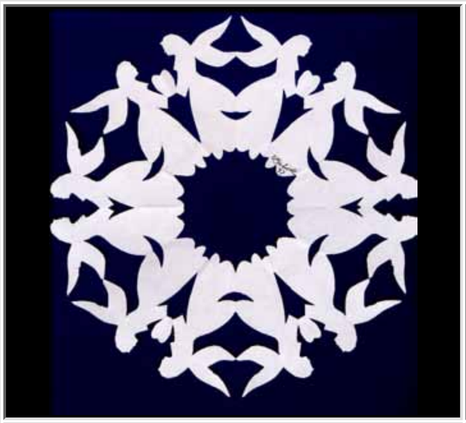
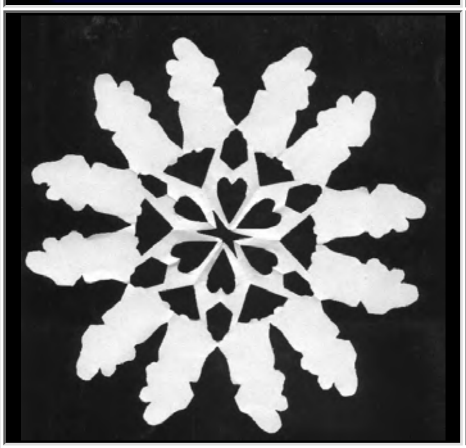
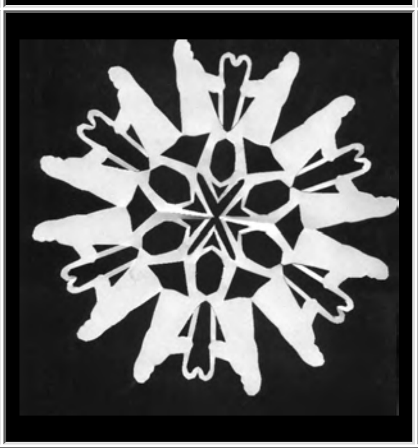
SNOWFLAKES

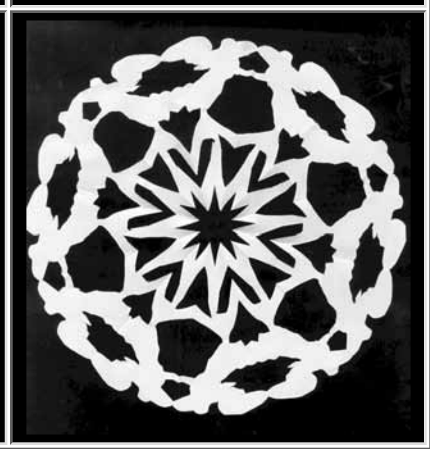
Yes, the kind you cut with scissors. Take a look at what I've done! From a distance they look like snowflakes, but can you see the image within them? Select the snowflake you would like to see actual size and in detail (except the ones on black which I haven't made an extra link for.) I have just uploaded more snowflakes for my friends on tkdnet. However, on that page, I can't show you each image in larger format (my server says I don't have enough room!) For the unusual, check out my ratite snowflakes (thanks to Myra)!

Seasonal Snowflakes: See if you can guess what each flake represents.



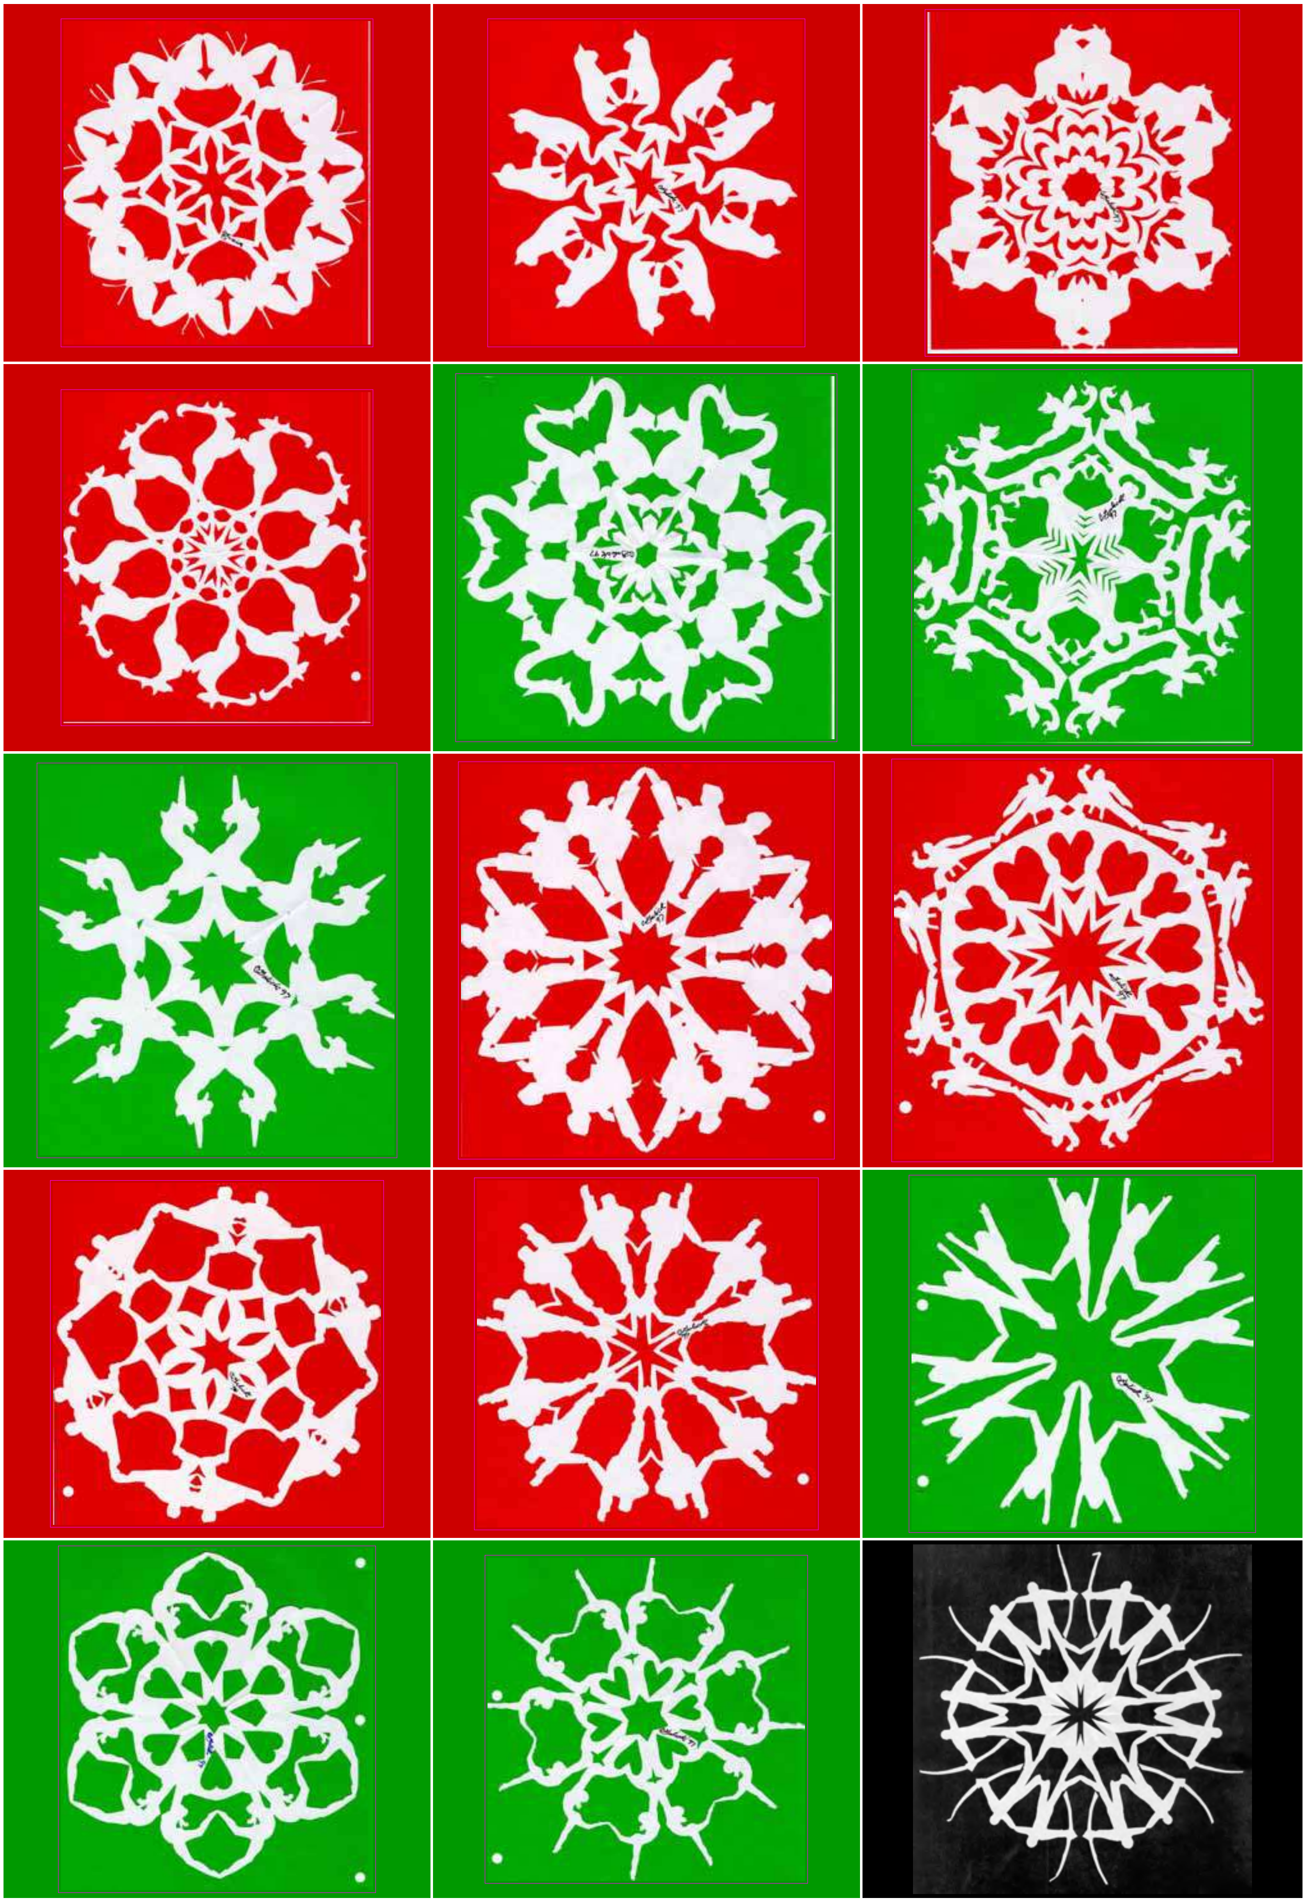


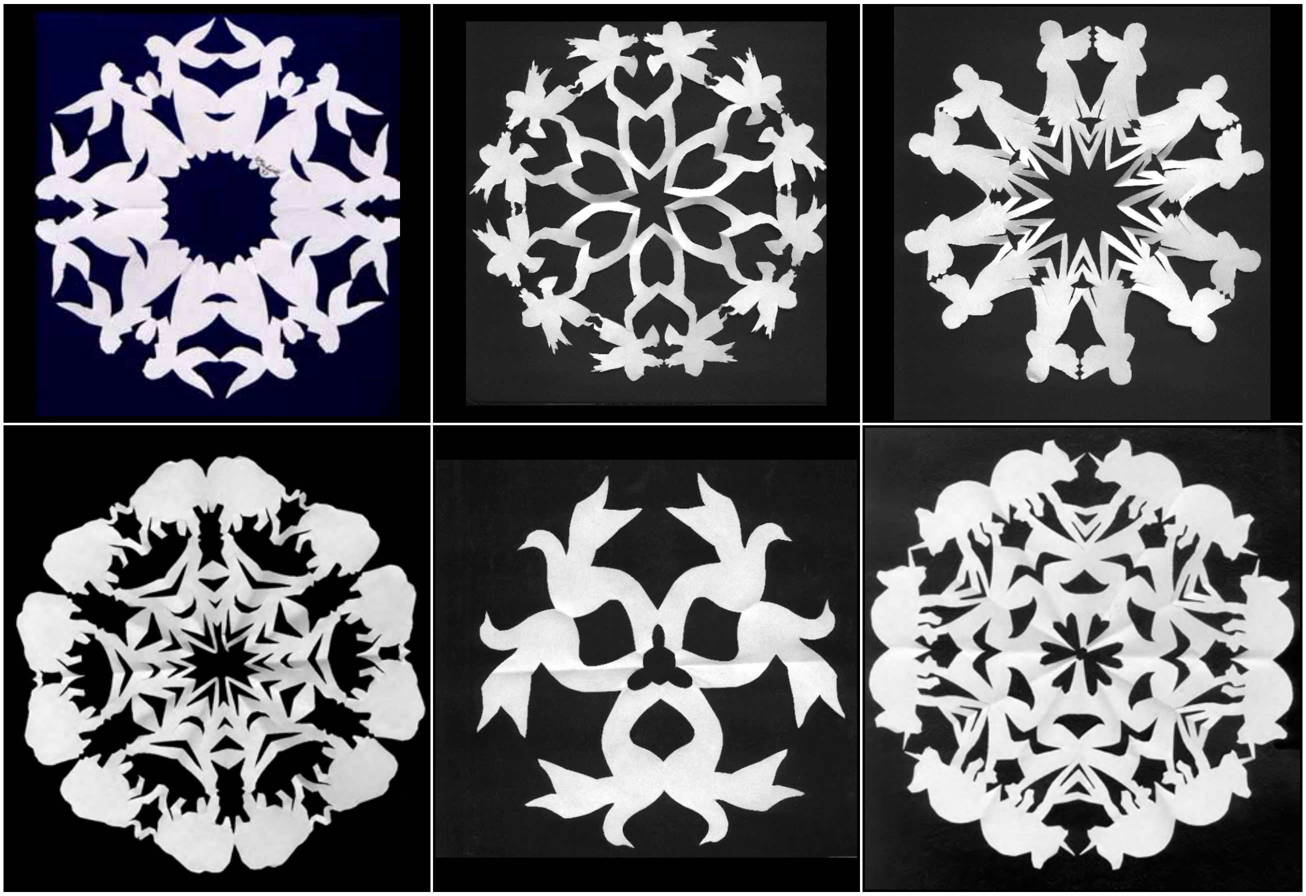




At this location, you can see how I do it, how I go from photo to snowflake.

Here are instructions on how to make your own snowflakes. I can also provide you with patterns if you're having problems with the instructions (there is a small cost). You can email me at SnowCuts@netscape.net or cgulick@tvi.cc.nm.us.



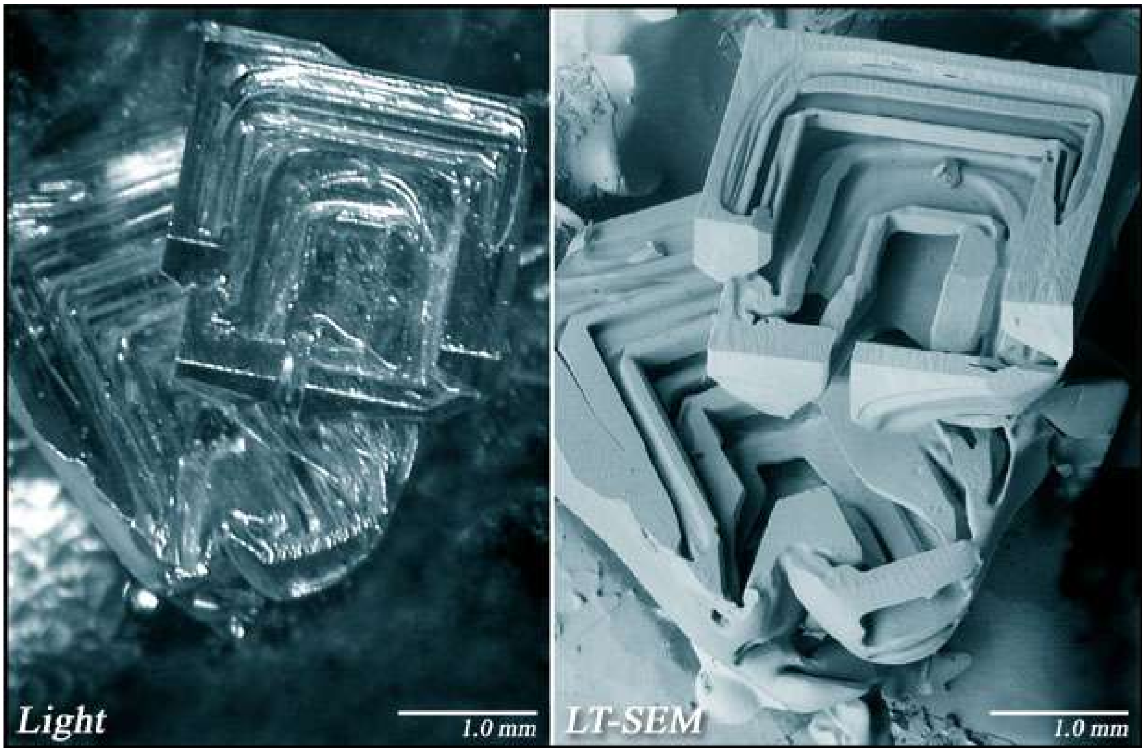


Aren't snowflakes pretty! If you choose the 'Copy to Clipboard' option you can then paste the image of your snowflake in a word processor or graphics program (then you can print from there!).

This was done by Raman Pfaff. If you would like more information, please contact me at pfaff@explorescience.com

Electron Microscopy Unit Snow Page

You will be automatically transferred to the new EMU pages in a few seconds



The following images were obtained using a Low Temperature Scanning Electron Microscope (LT-SEM) that is located in the Beltsville Agricultural Research Center in the Electron Microscopy Unit, Bld. 177-B, Beltsville Maryland 20705. Information gained from studying the structure of snow is vital to several areas of science as well as to activities that affect our daily lives and is only one of several agricultural research projects that are currently being pursued in this research unit.

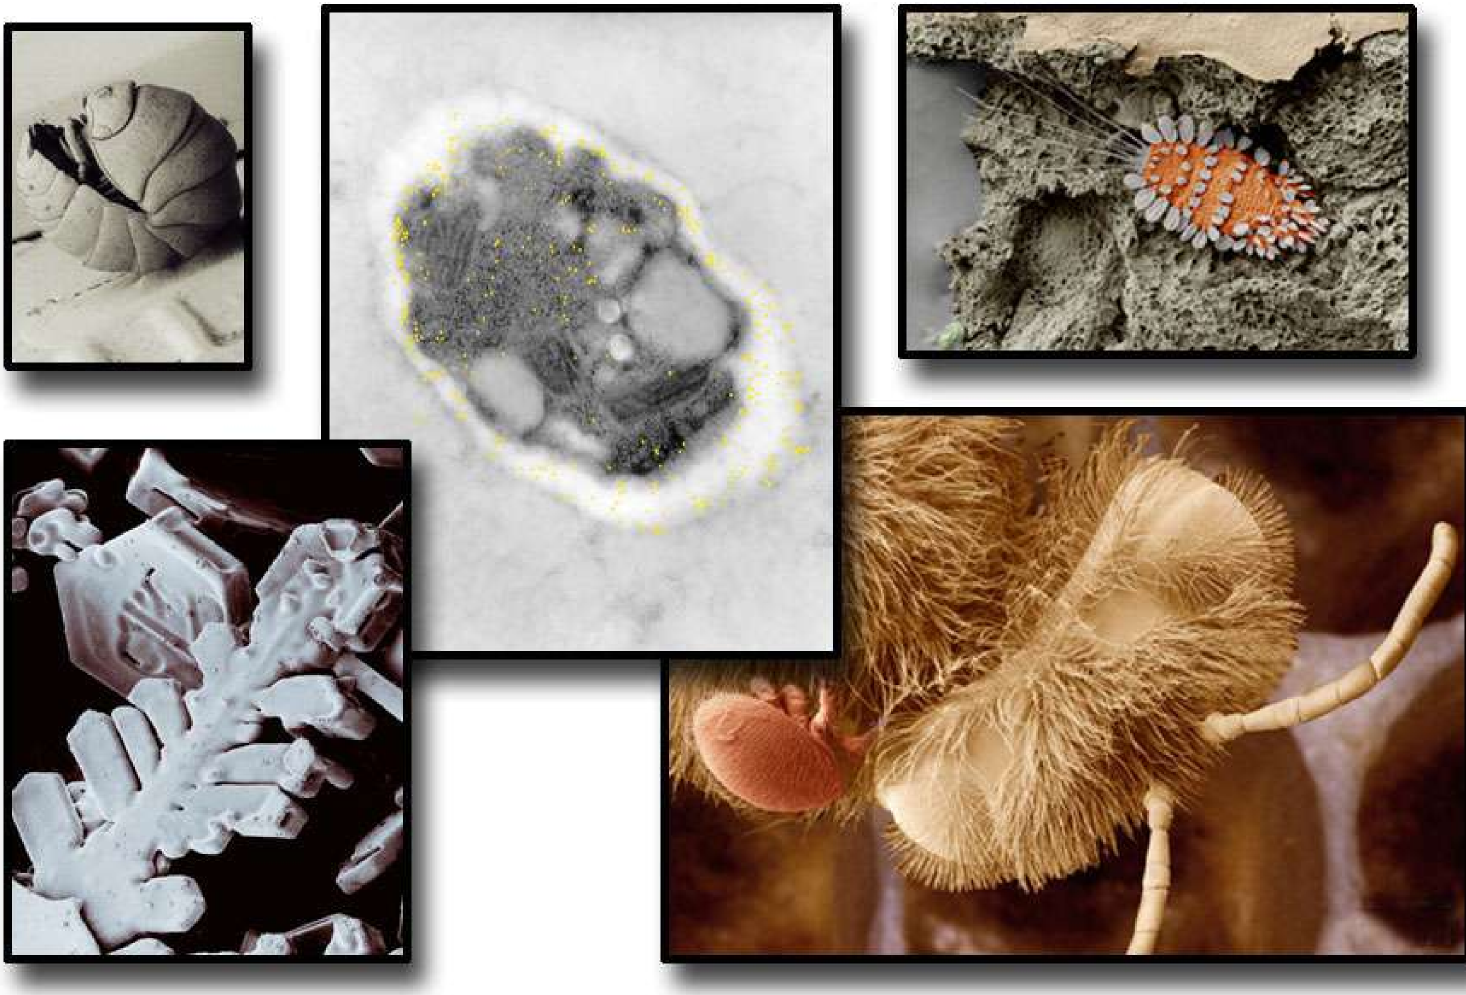
Beltsville Electron Microscopy Unit Page



The Electron Microscope Unit provides collaborative assistance for BARC scientists to use high resolution imaging for their research programs. The Electron Microscope Unit is equipped with state of the art scanning and transmission electron microscopes. The scanning electron microscope includes a cryo-stage that permits the imaging of fast frozen materials that allows an investigator to obtain images of the surface of biological and physical materials unaltered by preparative procedures. Images on web sites of snow crystals and the detail of nearly microscopic mites shows the great power of resolution inherent in this technique. The Electron Microscope Unit also possesses a high-resolution transmission microscope that is used to obtain detailed structural information from very thin sections of plastic embedded material. Subcellular structures of 0.01 um or less are easily imaged and when this approach is combined with antibody labeling it can provide not only structural but also compositional information. All of the microscopes of the Electron Microscope Unit are in the process of being outfitted with digital cameras eliminating the need for darkroom work and permitting any collaborating investigator to use images generated to prepare figures for manuscripts and grants. This will facilitate the submission of manuscripts and grant applications online that is now required by many journals and some grant agencies. There is no charge to collaborating management units to work with Electron Microscope Unit for short-term projects. For projects that might involve a long-term commitments or that might dominate the staff's, time then the Electron Microscope Unit will provide training and facilities for a member of the collaborator's staff. The Unit functions as a Beltsville Area facility and is funded by a service CRIS. Beltsville scientists who wish to use the Unit should discuss their prospective project with the appropriate member of the Unit's staff, **Eric Erbe**:, specialist in scanning electron microscopy, **Charles Murphy**:, specialist in transmission electron microscopy or **Christopher Pooley**:, specialist in digital imaging and computer techniques.
Examples of projects that Electron Microscope Unit has undertaken are shown in the following web links;

WEATHER WATCH Winter Storms HOME 12-20"

Teacher's Guide Grades 3–8

Winter storms are among nature's most impressive weather spectacles. The combination of heavy snow, freezing rain, and high winds can totally disrupt modern civilization: closing down airports and roads, creating power outages, and downing telephone lines. In Winter Storm, students learn about the many ingredients and processes that go into the creation of a winter storm; experiment with creating a winter storm of their own with our Interactive Weather Maker; and discover historical winter storm patterns with our Winter Storm timeline. From January 22 to February 28, students submitted questions to our weather expert, meteorologist Jeffrey Master. These questions and answers are available online.

This project can be used in conjunction with the Weather Reporters project to augment students' proficiency with winter storms by providing hands-on lesson plans on collecting weather data in the field. Visit the Lesson Planning Suggestions section of this teacher's guide for suggestions.

Several assessment components are embedded in this lesson plan. Skill labels Skill Focus, highlight activities that address specific target skills. Targeted skills are listed in Learning Objectives. An Activity Assessment Rubric assesses student proficiency with the Ask Our Weather Expert activity. Visit the quiz page for a review and comprehension quiz on winter storm terminology.

Scholastic's Online Activities are designed to support the teaching of standards-based skills. While participating in the "Winter Storm" project, students become proficient with several of these skills. Each skill below is linked to its point of use in the Teacher's Guide.

In the course of participating in the Winter Storm project, students will:
1. Identify characteristics of weather phenomena.
2. Use Web tools to access information.
3. Analyze and interpret information to construct reasonable explanations from direct and indirect evidence.
4. Craft informed questions.
5. Use Web-based technology to communicate.

All About Winter Storms
In this introduction to winter storms, students learn about the different weather elements that contribute to major cold-weather events like blizzards and ice storms. The Winter Weather Terminology page helps students become familiar with such common but often-misunderstood terms as "wind chill" and "lake effect," make distinctions between such concepts as "winter storm warnings" and "winter advisories," and more. A Wind Chill Factor chart gives at-a-glance translations of what temperatures feel like when they are affected by this weather phenomenon.

Interactive Weather Maker
What would it be like to be a real weather person —not just someone who reports the weather, but someone who can actually control it? Using our Interactive Weather Maker (free Flash plug-in required), students turn a sunny day into a windy day, or create a rainy day, and if they create the correct conditions, students can make a blizzard — complete with a whiteout!

Winter Storm Timeline
People love to tell stories about weather, and how the storm they remember was the worst one ever! Using this interactive timeline (free Flash plug-in required), students explore famous winter storms throughout American history.

Ask Our Weather Expert
Dr. Jeffery Master, Director of Meteorology for the Weather Underground Web site, answered questions about winter storms and other weather phenomena submitted by students. These questions and answers are available online.

Project Introduction (2–3 Days)
Skill Focus Discuss winter storms that are brewing in your area or that students have learned about through the news. Ask students to relate what kinds of phenomena are typical of winter storms. Write these on the chalkboard.

Set aside time for groups of students to take turns reading "All About Winter Storms." If you have a computer lab, students should read this section individually. Then guide students to read the Winter Weather Terminology page. You may wish to distribute printouts of both of these pages.

Return to the earlier discussion on students' background knowledge of winter storms. Ask them to talk about what new knowledge they have gained, such as "Is there anything you've learned that refutes what you used to think about how winter storms develop?" Have students discuss responses in class and write them in their journals.

Scholastic Weather Reporters (ongoing)
You may wish to supplement students' knowledge of weather by weaving together activities from the "Winter Storms" project with the Scholastic Weather Reporters project. Inform students that they will learn more about local weather by taking weather samples in their area. Use the Weather Lab for a field activity in which students collect data on precipitation and other Winter Storm phenomena. Visit the Weather Reporters Teacher's Guide for an in-depth lesson plan on this subject.

Winter Storm Timeline (3–4 days)
Skill Focus Assign this activity to students at any time throughout

their work on this project. If you have a limited number of terminals, create a time schedule for individual students to visit the timeline. Encourage students to revisit the timeline as often as time allows.

Interactive Weather Maker (2–3 days)
Skill Focus Once all students have had time to experiment with the tool, set aside time for small-group or whole-class discussion for students to share their observations.

You may wish to collect data on local weather at this time. Guide students to the Scholastic Weather Reporters project. Have student groups read about making weather tools to collect weather data. Focus on tools that reflect the weather conditions in your area. Suggest that each group follow directions to make a version of one or more of the tools. Have students collect data using the tools on a daily basis, and post their results online. View the Teacher's Guide for the Weather Reporters project for other ideas on sharing and analyzing weather data.

Ask Our Weather Expert (2 days)
Introduce meteorologist Dr. Jeffrey Masters, and have students read his biography. Then Skill Focus ask students to develop two questions about winter storms, their Weather Reporters experiments, or weather in general that they would like Dr. Masters to answer.

Skill Focus Meet with students to review their questions, and make final revisions.

Have students read through the questions and answers to see if their questions were answered. If their questions have not been answered, have groups of students read them aloud and discuss possible responses.

Terminology Quiz
Distribute the Winter Storm Project Test for a formal assessment of terminology related to winter storms. The Project Test offers students exposure to standardized tests. There is a proscriptive tip before the test, written for students that advises on test-taking strategies.

NATIONAL STANDARDS CORRELATIONS

This project aids students in meeting national standards in several curriculum areas.

Math
National Council for Teachers of Mathematics:

- selects and uses appropriate instruments and technology to measure in real-world situations
- generalizes a pattern, relation or function to explain how a change in one quantity results in a change in another
- analyzes real-world data to recognize relationships using graphic models generated by technology

Reading Language Arts
International Reading Association (IRA) and the National Council of Teachers of English (NCTE)

- collects data, facts, and ideas

- uses knowledge from oral, written, and electronic sources
- compares, synthesizes, interprets, and analyzes information from different sources
- selects, organizes, and categorizes information using a wide variety of strategies
- relates new information to prior knowledge and experience
- uses text features that make information accessible and usable
- establishes authoritative stance on a subject
- develops information using facts and details · analyzes interprets, and evaluates information, ideas, organization, and language from text
- listens attentively to others and builds on others' ideas in discussions

Science
National Science Teachers Association:

- plans and implements investigative procedures
- uses equipment and technology
- collects data by observing and measuring
- analyzes and interprets information to construct reasonable explanations from direct and indirect evidence
- communicates valid conclusions
- constructs graphic structures of information using tools including computers to organize, examine, and evaluate data
- analyzes and reviews scientific explanations
- represents the natural world using models and identifies their limitations

Technology
Technology Foundation Standards for Students:

- use technology tools to enhance learning, increase productivity, and promote creativity
- use technology tools to collaborate, publish, and interact with peers, experts, and other audiences
- use a variety of media and formats to communicate information and ideas effectively to multiple audiences
- use technology to locate, evaluate, and collect information from a variety of sources
- use technology tools to process data and report results
- employ technology in the development of strategies for solving problems in the real world

History (Grades 3–8)
Challenge students to write a profile of a winter storm or other extreme local weather phenomena.

Math/Geography (Grades 3–8)
Ask students to create a map of a winter storm using information they've learned from "All About Winter Storms." Students should use a map of the United States with labels for *air mass, cold front,* and the area around which the winter storm will begin. Students can use the printable map of the United States to display their work.

Vocabulary (Grades 3–8)
Have students write definitions for winter terms discussed in the project on index cards. Students can quiz each other about the definitions in small groups.

Writing Process (Grades 3–8)
Ask students to write a short expository paragraph discussing new information they discovered about winter storms from Dr. Masters' interview and the "Winter Storm Project." Pair up students to peer edit one another's expository paragraphs.

For information on books, Web sites, Scholastic products, and other related resources, please visit Scholastic Recommends.

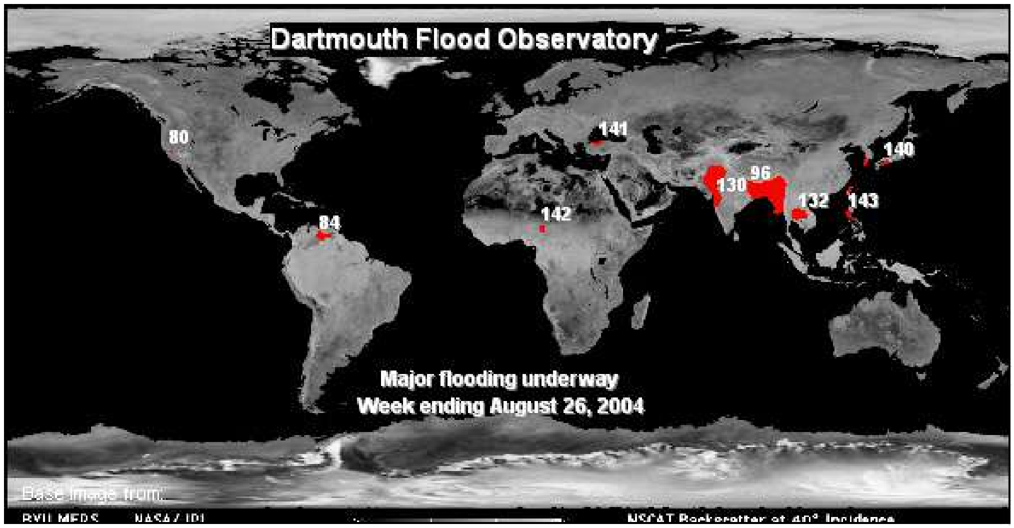
- Flood Detection Tools
- Explanation of Data Products
- Sample Images and Maps
- Staff
- Publications

The Observatory detects, maps, measures, and analyzes extreme flood events world-wide using satellite remote sensing. We use microwave and optical satellite imaging of selected river reaches to detect overbank flood and extreme low flow conditions. We also provide yearly catalogs, large-scale maps, and images of river floods, from 1985 to the present, and are developing methods for obtaining globally-consistent measurements of these events. As the archive of reliable data grows, it is increasingly possible to predict where and when major flooding will occur.



You can find here:

- Rapid Response Inundation Maps of large floods (example). These are useful to disaster responders. Locate the flood of interest in the Active Archive of Large Floods.
- Displays showing river flow status, world-wide. Regional versions are available, and global summaries are also presented as part of a "Sensor Web" effort that is to eventually link different satellite sysems.
- Estimates of stage and discharge along some rivers and streams on a repeating basis (go to Global Hydrographic Array homepage, version 2 reaches).
- The long-term history of flooding observed from space; compiled as a World Atlas of Flood Hazard.
- A comprehensive archive of large flood events, 1985 to the present, associated descriptive statistics, and downloadable files..

Federal Emergency Management Agency

FLASH FLOOD!

Floods are the most common and widespread of all weather-related natural disasters. Most communities in the United States have experienced flooding after spring rains, heavy thunderstorms, or winter snow thaws. Floods have enough power to change the course of rivers and bury houses in mud. And flash floods are the most dangerous kind of floods, because they combine the destructive power of a flood with incredible speed and unpredictability. Learn more about the force of flash floods when you read through this lesson.

About Floods explains the difference between an ordinary flood and a flash flood. You can also visit other web sites that have pictures of flood damage.

Flood Types explains the different types of floods besides flash floods, and has a quiz that lets you pick the right flood.

Flood Prep can get you prepared for a flood, with links to explain and help you prepare disaster plans and survival kits.

Safety Rules is where you'll find out what you should and should NOT do during a flash flood.

The **Flood Quiz** is a review of the information in this lesson as an online quiz, with your results given to you instantly.

Flood Watch will let you search the Web for flash flood warnings. You can record what you find on your own weather map.

The **Teacher's Guide** is for teachers who want to read about the lesson plan and objectives for the Flash Flood! lesson.

Click on the Flash Flood! logo on any page to return here.

FLOODS

What to do before and after

Beyond the human toll taken in lives and suffering, flood damage costs Canadian taxpayers millions of dollars annually.

Though governments at every level work to reduce the risk of floods, the first line of defence always rests with the individual. Each of us has a responsibility to protect our homes and families to the greatest extent possible. By planning ahead and taking sensible precautions, you can do your part to minimize flood damage.

Flood threats to particular areas can usually be forecast in a number of ways:

- by constant evaluation of rising water tables that result from heavy rain
- through surveys of snow conditions in river drainage basins
- by meteorological observations and forecasts.

Flash or sudden flooding, in which warning time is extremely limited, can result from other causes such as earthquakes, tsunamis or tidal waves, hurricanes. violent storms or bursting of dams.

In all cases, local government authorities try to keep residents informed of developments in areas most likely to be affected by flooding. Regular media advisories will recommend actions people should take to limit or prevent disaster. As the need arises, more detailed instructions by municipal or provincial authorities will be given.

Flood: Just Doing My Job

Activities|Age/Grade|Facts|Fun|Links|Objectives|Questions|Quiz|Related Topics|Summary|Vocabulary

Want to read about Flood: Just Doing My Job?
*Article will open in a new window.

Summary of Article

This article describes how satellite images were used to help evacuation procedures in the Midwestern flood of 1993. Torrential rains caused the waters of the Mississippi, Missouri, and Illinois Rivers and their tributaries to overflow their banks, causing massive flooding in the towns and cities on these rivers. The article focuses on the work of one man, Lee Blackmore. Lee was an image analyst and GIS specialist with the St. Louis Community Development Agency (CDA). He used satellite images to help officials in evacuation procedures in the business district affected by the flooding River Des Peres. This article focuses on his efforts.

Back to top

Suggested Age/Grade Levels

Age Level: 11 - 16
Grade Level: 6th grade - 10th grade

Related Topics:

Geography

Discuss with students the communities along the Illinois, Mississippi, and Missouri Rivers.

History

St. Louis, at one time, was a very large city. It was the gateway to the West and played a large part in the Lewis and Clark expedition. Discuss this expedition and the significance of this large city on the banks of the Mississippi with your class.

Back to top

Objectives

After studying the article, students should be able to:

- Discuss how satellite imagery was used to evacuate parts of South St. Louis.

Back to top

Classroom Activities

Please check out our Eyes in the Sky article. This is designed as a classroom activity and includes the same photos of the 1993 St. Louis flooding as Flood: Just Doing My Job. Students will be able to analyze and interpret photos of the flood and of fires at Yellowstone National Park.

Back to top

Questions for Discussion

Q: How did Lee use the satellite images to help in the evacuation procedures?
A: Lee used the satellite images to produce a map that would show which buildings were in immediate danger of flooding. First, he took data depicting streets and properties, or plats. Next, he added the locations of buildings. Finally, the current boundaries of the floodwaters were extracted from the Thematic Mapper (TM) data and added to the map.

Q: Can you think of other circumstances where satellite images could be used to help save lives and property?
A: A forest fire is one circumstance in which satellite images could be used to help save lives and property.

Quiz

Click here for a Flood quiz.
*Please use your browser's back button to return to the Flood teacher's guide.

Back to top

Just the Facts

Using satellite imagery, an electronically superimposed digital map was created showing parcels, building locations, and the normal boundaries of the River Des Peres. The resulting map clearly showed the St. Louis police where to concentrate their evacuation efforts.

Vocabulary

Thematic Mapper (TM): instruments carried on Landsat and other satellites which measure the amount of energy reflected and emitted in several discrete portions, or bands, of the electromagnetic (EM) spectrum. Various visible and infrared bands were chosen to measure reflected and emitted energy in areas of the spectrum that correspond to known responses of the target materials (for example, specific characteristics of land, vegetation, water, rocks, and temperature).

For more complete information on the TM, please check out the Observatorium's article on
Landsat's Thematic Mapping Bands.

Hi, welcome to my site! My name is Tina and I still live with my parents in Miami, USA
I made this site to let you guys know that you can meet me on the internet.
I'm single and I'd love to show you my tight body on my webcam for free but
I don't want any kids to see me naked so please verify your age before.

My webcam is almost always on, even if I'm not there, you may find my sister online or look at me while I'm sleeping :) You will also have access to a huge archive of my past shows!

My webcam has sound too! You will be able to listen to me while you type in the chat box to interact. You will find lots of cute girls when you become a member but I'm very jealous and I will do whatever is your fantasy to please you. I can play with a dildo, invite my friend or sister to play...anything ;)

Now, you only need to **click here and fill out the form** to verify that you are an adult and you will see my webcam! It takes only 2 minutes and it's free! I can't wait to see you there.

Disclaimer: Me, my sister and all members/users on this site are 18+ years of age.

Bringing The Greenhouse Effect Down To Earth

Grade Level: 9-12

Purpose: To compare the amount of Carbon Dioxide (CO2) in four different sources of gases.

Materials:

(Enough for each team of two or four students)
5 vials or test tubes
A graduated cylinder
A funnel straw
A marble-size piece of modeling clay
4 different colored balloons
4 twist-ties
A narrow-necked bottle (the neck should be narrow enough for a balloon to fit over it)
A dropping bottle of bromthymol blue indicator solution
A dropping bottle of dilute household ammonia (1 part ammonia to 50 parts distilled water)
100 mL vinegar
5 mL baking soda
Safety goggles for wear at all times

Teacher's Lab Notes:

The students will be filling balloons with pure carbon dioxide, exhaled air, and ambient air. For safety reasons, you should fill the balloons with automobile exhaust. You should wear thick gloves to protect your hands from being burned. Fill the balloons in an open area and when a slight breeze is blowing to keep the exhaust gases away from your face. Place a balloon over the narrow end of a metal funnel and place the wide end of the funnel over the exhaust pipe of a running car. When inflated, the balloons should be about 7.5 cm in diameter. It may be easier to overinflate the balloon and then let a little gas escape. Twist and tie the balloon. Repeat the procedure with the same color balloon until you have one for each lab group.

The ambient air solution in vial A will not turn yellow. The level of CO2 in ambient air is too low to affect bromthymol blue.

Students will need around 60 drops of the diluted ammonia to neutralize the solution in vial D (vinegar-baking soda reaction). The other two vials should require between 7 and 40 drops. Caution students to add the drops slowly and shake solutions between drops so they can get a careful record of when the color changes back to the same color blue as the control.

Since the students will have to add a relatively large amount of ammonia to the solution in vial D, the color of this sample may be affected by dilution. To equalize this effect, you can have students add some water to the other samples to make the volume in each sample equal. This is easiest to do if sample D is titrated last.

Lab Procedure:

1. Add 15 mL of water and 10 drops of bromthymol blue indicator solution to each vial or test tube. Label the vials A, B, C, D, and Control.

2. Fill each balloon until it has a 7.5 diameter.
Sample A (Ambient Air) - Use a tire pump to inflate the balloon to the required diameter. Twist the rubber neck of the balloon and fasten it shut with a twist tie. The tie should be at least 1 cm from the opening of the balloon. Record the color of the balloon used for this sample.
Sample B (Human Exhalation) - Have one team member blow up a balloon to the required diameter. Twist and tie the balloon, and record balloon color.
Sample C (Automobile Exhaust) - Your teacher will supply you with this balloon. Record the color.
Sample D (Nearly pure CO2) - Put 100 mL of vinegar in the narrow-necked bottle. Using a funnel, add 5 mL of baking soda. Let the

mixture bubble for 3 seconds to drive the air out, then slip the balloon over the neck of the bottle. Inflate the balloon to the proper diameter. Twist, tie, and record the color.

3. Soften the clay and wrap it around one end of the straw to make a small airtight collar that will fit into the neck of a balloon. The collar should look like a cone with the straw in its middle, and should be large enough to plug the neck of the balloon.

4. Pick up Balloon A. Keeping the tie on it, slip the balloon's neck over the clay collar and hold it against the collar to make an airtight seal. Place the other end of the straw into the vial of water and bromthymol blue labelled A. Have another partner remove the tie on the balloon and slowly untwist the balloon. Keeping the neck of the balloon pinched to control the flow of gas, gently squeeze the balloon so the gas slowly bubbles through the solution.

5. Repeat the same procedure with the other balloons and their respective vials. In some cases, the bromthymol blue solution will change color, from blue to yellow, indicating the presence of carbonic acid formed from CO2.

6. Analyze each of the samples by titrating them with drops of dilute ammonia. Ammonia neutralizes the carbonic acid. The bromthymol blue will return to a blue color when all the acid has reacted. Add drops of ammonia to each of the samples that turned yellow, carefully counting the number of drops needed until they are about the same color as your control. Record the results.

Post Lab Discussion:

Make a chart on the board to pool each group's results. Ask the students which samples had the most and the least carbon dioxide. Why didn't the ambient air sample not turn yellow? (The test isn't sensitive enough to detect low concentrations of CO2.) Carbon dioxide is a natural part of our atmosphere, but too much CO2 could make the Earth warmer through an increased greenhouse effect. Why is automobile exhaust a concern? What ways could you reduce the amount of CO2 you create? How could a city reduce the amount of CO2 they emit? What's more important, to develop and adapt cars with a new fuel that's safe for the environment or to improve public transportation systems? What alternative power sources could be used with cars? (Solar, electric, methanol.) Why might it be difficult for the public to start using an alternative source? (Car industry not mass-producing new cars, expense of buying new car, less power/speed than gas- powered car.)

This activity is used with the permission of Climate Protection Institute. CTI publishes "Greenhouse Gazette" and other programs. To receive more information about CTI and other activities, write and tell them what grade you teach at 5833 Balmoral Dr., Oakland, CA 94619. This activity appeared in The Science Teacher, May 1989.

The Greenhouse Effect In A Jar

Grade Level: K - 8

This simple experiment serves as an introduction to the greenhouse effect. Students can see for themselves the effects of a greenhouse, and relate this understanding to what occurs in our atmosphere.

Objectives:

1. Help students understand the greenhouse effect as a physical phenomenon.

2. Use simple experimentation techniques including: observing and recording data, use of a control, drawing conclusions from results, use of a model.

Materials:

For every group of (about) four students:

2 Small thermometers
1 Jar or other see-through container
1 Clock or watch
1 Copy of the worksheet
Sunlamp or access to a sunny area to perform the experiment

Method:

Group the students and distribute the materials. Each group should place their thermometers a few inches apart under the sunlamp or in direct sunlight.

Wait about three minutes so the thermometers will be giving accurate readings, and then have the students record the temperature readings on both thermometers as well as the time.

Each group should now place their jar over one of their thermometers, taking care that the jar does not cast a shadow over the uncovered one. If the thermometers are too large to remain horizontal inside the jars, it is fine to stand them against an inner side. Every minute, for ten minutes, the students should record the readings of both thermometers.

Explanation

The air over the exposed thermometer is constantly changing, and as it gets warm it is replaced by cooler air. Because the air in the jar cannot circulate to the rest of the room, this air stays in the sunlight and gets warmer and warmer. A similar trapping of heat happens in the Earth's atmosphere. Sunlight passes through the atmosphere and warms the Earth's surface. The heat radiating from the surface is trapped by greenhouse gasses. Without an atmosphere, the Earth's temperature would average about 0F. This warming due to heat-trapping gasses is called the "Greenhouse Effect." Both the atmosphere and the jar allow light to enter, but then trap that energy when it is converted to heat. They work differently, however, because the jar keeps in the heated air, while the greenhouse gasses absorb radiative heat.

Going Further:

Students can graph their data. To simulate global warming, the experiment can be done using two jars, one filled with air and the other with carbon dioxide.

The Greenhouse Effect

Instructions

1) Place the two thermometers in the sunlight for a few minutes to let them get warm.

2) Record the readings of both thermometers at the top of the columns.

3) Record the time next to the starting temperatures and place the jar over thermometer #1.

4) Every minute, record the readings of both thermometers without disturbing them.

Global Change Research

Earth Surface Dynamics

The earth's surface does not exist in a static, unchanging "natural" condition interrupted only by the work of humans, but instead it is a dynamic system of which humans are a part. Knowledge about changes to the Earth's surface and the underlying processes that induce them has enormous impact on how society responds to these changes and, ultimately, the cost of responding to change. USGS Global Change Research activities strive to achieve a whole-system understanding of the interrelationships among earth surface processes, ecological systems, and human activities. Activities of the program focus on documenting, analyzing, and modeling the character of past and present environments and the geological, biological, hydrological, and geochemical processes involved in environmental change so that future environmental changes and impacts can be anticipated.

Electronic Visualization

Unit

Global Warming Unit

On this page:

- **Grade level:** Middle School, High School
- **Subject Area:** Science and Language Arts

Unit Description

Many people are concerned about the possibility that the earth is getting warmer and the effects this change might have on the earth's ecosystem. This unit includes classroom activities to help students understand global warming and its possible effects on human beings. Lessons in the unit provide students with opportunities to study global climate changes, discuss and debate the current arguments for and against global warming and the Greenhouse Effect, investigate the possibility of global warming and the Greenhouse Effect, and present their findings in the form of research reports.

Objectives

Students will:

- Learn about changes in global weather patterns and climate over long periods of time.
- Study and debate the possibility of a Greenhouse Effect and its impact on the earth.
- Use the Greenhouse Effect Visualizer to understand possible greenhouse effect changes.
- Present their findings to the school (and others) by creating global warming reports and presenting them at an earth day event.
- Learn to use the Internet as a resource for research.

Materials and Resources

In developing our lessons and activities, we made some assumptions about the hardware and software that would be available in the classroom for teachers who visit the LETSNet Website. We assume that teachers using our Internet-based lessons or activities have a computer (PC or Macintosh) with the necessary hardware components (mouse, keyboard, and monitor) as well as software (operating system, TCP/IP software, networking or dial-up software, e-mail and a World Wide Web client program, preferably Netscape, but perhaps Mosaic or Lynx). In the section below, we specify any "special" hardware or software requirements for a lesson or activity (in addition to those described above) and the level of Internet access required to do the activity.

1. **Special hardware requirements:** None.
2. **Special software requirements:** None.
3. **Internet access:** Medium-speed (28,000 BPS via modem), or High-speed (greater than 1 MBPS via network). It should be noted that medium and high speed connections are preferable for viewing Web pages on the Internet.

Unit Lesson Plans

1. Lesson One: Introduction to Global Warming. This lesson uses traditional and on-line resources to introduce students to basic information on global climate and atmospheric changes over time.
2. Lesson Two: The Greenhouse Effect Debate. Students discuss and debate the possibility of a Greenhouse Effect and its possible impact on the earth.
3. Lesson Three: The Greenhouse Effect Visualizer. Students work in groups using the Greenhouse Effect Visualizer, and other available on-line visualization tools, to study global climate changes looking for evidence for and against global warming and the Greenhouse Effect.
4. Lesson Four: Writing and Editing a Research Report on Global Warming.

Following their research, students write and peer edit reports on global warming and the Greenhouse Effect. Students are encouraged to read and make suggestions for improving reports of students who adopt different positions on global warming.

5. Lesson Five: Presentation to the School. Following the first four lessons, a special school earth day is planned where students present their research reports, along with any other associated products (models, diagrams, Web-pages, etc.) to the rest of the class and school.

Relation to Standards

The Global Warming unit contains activities that encourage and support student learning about science, especially weather and global patterns. In developing these lessons, we have considered the science standards of the National Academy of Sciences and the American Association for the Advancement of Science. The Global Warming Unit also supports classroom activities in the area of language arts that conform to standards in writing and editing.

One Computer versus Many

The plans for this unit are tailored to fit teaching situations where students have access to several computers with an Internet connection. To accommodate classrooms that do not have access to a computer lab with full Internet connections, students can work in research groups to explore Internet sites and conduct their research.

If you have only one computer with Internet access, you may choose to do one of the following:

- If you have the technology, you may hook-up the computer to a TV monitor or LCD projector. This will allow the whole class to see sites in the preliminary stages when students are exploring sites created by other children.
- You may choose to have students rotate through computer with Internet access in groups.
- You may also download files from the Internet and save them to a disk. Then transfer Netscape [http://home.netscape.com] onto your other computers. Now you can transfer the files you down-loaded and saved to a disk to the other non-internet computers to view with Netscape. This will not allow students to explore the pages with hyper-links, but they will be able to access and view the information by opening each file with Netscape.

Past program of the NRTEE

National Forum on Climate Change

The National Round Table brought together a citizens panel of 25 respected, objective Canadians in a National Forum on Climate Change. Endorsed by the Prime Minister, the Forum was intended to assist Canadians to better understand the climate change issue and all its implications.

The Forum s panellists were selected from a stratified random sample of Order of Canada recipients   accomplished Canadians who have been recognized for their outstanding service to Canada in such areas as community voluntarism, philanthropy, visual arts, sports, education, health care and business. The Forum was unique, precisely because it was unbiased and began with no predetermined views on the potential impact of climate change, or on the most appropriate response for Canada. This panel of citizens was provided with the full range of expert opinion and knowledge and examined all sides of the climate change debate.

The National Forum on Climate Change presented a Declaration to the Prime Minister, all levels of government, and Canadians as a whole in June 1998. In terms of key messages, the Forum members were clear: on the balance of evidence, and in the face of scientific and economic uncertainty, the time for action is now.

Climate Change

Climate change has arrived. Through erratic weather patterns, forest fires and glacier melt we are already experiencing the effects of climate change. Worse, the process of climate change, based on the levels of greenhouse gases we have already put in the atmosphere, is likely to increase the severity and frequency of severe weather events. If we allow levels of greenhouse gases to continue to rise, the disasters of today will be dwarfed by future catastrophic impacts.

Clearly, one of humanity's principal challenges in this century will be to stop climate change. To do this, we must drastically reduce our greenhouse gas emissions (GHG) – gases such as carbon monoxide, methane and nitrous oxide that trap heat in the atmosphere, raising global temperature and thereby spurring climate change.

Humans have become addicted to burning fossil fuels for energy, a principal cause of human-generated greenhouse gas emissions. The ongoing assault on the world's forests through burning and cutting is also a significant source of carbon dioxide emissions. Worse still, the clearing of the forests eliminates their ability to absorb carbon from the atmosphere, compounding the concentration of greenhouse gases in the atmosphere still more.

As early as the 1970s, scientists began to warn that humanity's ever-increasing production of greenhouse gas emissions would change the Earth's climate. In 1992, the world's leaders began to heed their warnings at the Rio Summit when Canada and 186 other countries signed the United Nations - Framework Convention on Climate Change. Signatory countries agreed to a long-term objective to "stabilize GHG concentrations in the atmosphere."

By ratifying the Kyoto Protocol on December 17, 2002, Canada committed to lowering its greenhouse gas emissions to 6% below 1990 levels by 2012.

But Kyoto is only the first step. Stabilizing atmospheric concentrations of greenhouse gas emissions will require a reduction in global emissions of at least 50% below 1990 levels.

The Sierra Club of Canada believes that our common future depends on making the transition to a low-carbon. energy efficient society. We work to ensure that Canada meets and surpasses and Kyoto goals. All countries, including Canada, must shift support from big, centralised and polluting energy sources, such as fossil fuels and nuclear power, to renewable energies and energy efficiency programs.

Over the long-term, Sierra Club of Canada's goal is to build broad public support for the transition to a low-carbon energy efficient society.

Kyoto Report Card

One year after ratifying the Kyoto Protocol the question is still asked: “Can Canada meet its Kyoto commitments?” The answer is resoundingly, “YES”. To make our targets in 2010, the federal government in 2004 should declare a long-term goal to reduce Canada’s total greenhouse gas emissions by 50% by 2030.

Separating the Science from the Science Fiction

Lighting the Way: The Sierra Club's Look at First Steps Toward a Clean Energy Future

The energy-delivery system in North America is in trouble, and the harmful effects of this are being felt today in the form of health problems, environmental damage, and a system that doesn’t meet today’s needs. The Sierra Club U.S. and Sierra Club Canada have surveyed energy programs and found that each of the states and provinces in the northeast United States and Atlantic Canada has taken some useful steps that serve as examples of opportunities for all.

Sierra Club of Canada launches CAFE Canada Campaign!

As part of our ongoing work to ensure that the federal government makes good on its promise to implement the Kyoto Protocol, the Sierra Club of Canada is launching the CAFE Canada Campaign to persuade the federal government to follow through on its commitment to improve the fuel efficiency of cars and trucks by 25%.

Kyoto Forests? Fast-Growing Plantations are *Not* the Answer

There is increasing interest in meeting some portion of Canada’s Kyoto commitment through “afforestation”, or creating new forests for the purposes of sequestering carbon emissions. In particular, some are pressing for government programs to support the establishment of plantations of fast-growing species. However many experts have expressed strong skepticism about the advisability of such a scheme, citing a number of concerns.

The Kyoto Debate: Separating rhetoric from reality

by Elizabeth May, December 2002

America’s Gas Tank: The High Cost of Canada’s Oil and Gas Export Strategy

A report by the Natural Resources Defense Council and the Sierra Club of Canada, October 2002 *(pdf file, 660K)*

Over the past decade, surging demand from the United States for Canadian fossil fuels has coincided with deregulation of the energy industry and increasing control of Canadian energy companies by U.S. interests. The resulting oil and gas free-for-all in Canada is causing profound environmental problems, all in the service of turning Canada into America’s gas tank.

Global Warming

If some environmentalists are to be believed, we are on the verge of massive global climate change which will see a significant rise in sea levels, chaotic weather patterns, and catastrophic droughts all caused by small increase in global average temperature.

This site provides links to resources skeptical of those sort of doomsday scenarios. The articles linked to here are written by a wide variety of people, from scientists to laypeople, and their inclusion here should not be read as an endorsement of their positions.

Just as when dealing with things coming out of the environmentalist camp, you need to use your brain and decide for yourself to what extent global warming poses a threat to humanity.

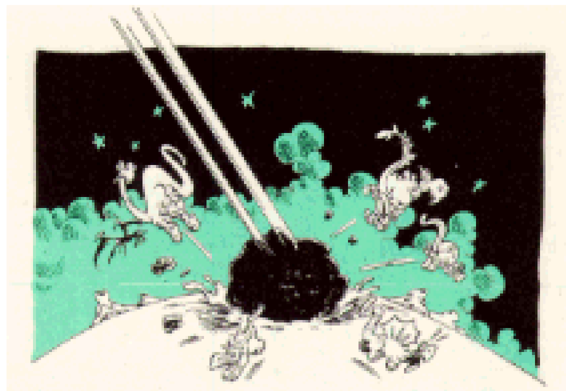
BEGINNERS GUIDE TO THE CONVENTION

Understanding Climate Change:
A Beginner's Guide to the UN Framework Convention

Introduction: A giant asteroid could hit the earth! Something else could happen! The global temperature could rise! Wake up!

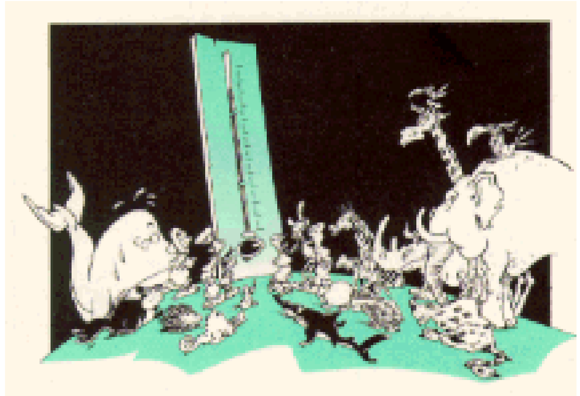


The 1990s have been a time of international soul- searching about the environment. What are we doing to our planet? More and more, we are realising that the Industrial Revolution has changed forever the relationship between humanity and nature. There is real concern that by the middle or the end of the next century human activities will have changed the basic conditions that have allowed life to thrive on earth.

The 1992 **United Nations Framework Convention on Climate Change** is one of a series of recent agreements through which countries around the world are banding together to meet this challenge. Other treaties deal with such matters as pollution of the oceans, expanding deserts, damage to the ozone layer, and the rapid extinction of plant and animal species. The Climate Change Convention focuses on something particularly disturbing: we are changing the way energy from the sun interacts with and escapes from our planet's atmosphere. By doing that, we risk altering the global climate. Among the expected consequences are an increase in the average temperature of the earth's surface and shifts in world-wide weather patterns. Other -- unforeseen -- effects cannot be ruled out.

We have a few problems to face up to.

Problem No. 1 (the big problem): Scientists see a real risk that the climate will change rapidly and dramatically over the coming decades and centuries. Can we handle it?



A giant asteroid did hit the earth -- about 65 million years ago. Splat. Scientists speculate that the collision threw so much dust into the atmosphere that the world was dark for three years. Sunlight was greatly reduced, so many plants could not grow, temperatures fell, the food chain collapsed, and many species, including the largest ever to walk the earth, died off.

That, at least, is the prevailing theory of why the dinosaurs became extinct. Even those who weren't actually hit by the asteroid paid the ultimate price.

The catastrophe that befell the dinosaurs is only one illustration, if dramatic, of how changes in climate can make or break a species.

According to another theory, human beings evolved when a drying trend some 10 million years ago was followed around three million years ago by a sharp drop in world temperature. The ape-like higher primates in the Great Rift Valley of Africa were used to sheltering in trees, but, under this long-term climate shift, the trees were replaced with grassland. The 'apes' found themselves on an empty plain much colder and drier than what they were used to, and extremely vulnerable to predators.

Extinction was a real possibility, and the primates appear to have responded with two evolutionary jumps -- first to creatures who could walk upright over long distances, with hands free for carrying children and food; and then to creatures with much larger brains, who used tools and were omnivorous (could eat both plants and meat). This second, large-brained creature is generally considered to be the first human.

Shifts in climate have shaped human destiny ever since, and people have largely responded by adapting, migrating, and growing smarter. During a later series of ice ages, sea levels dropped and humans moved across land bridges from Asia to the Americas and the Pacific islands. Many subsequent migrations, many innovations, many catastrophes have followed. Some can be traced to smaller climatic fluctuations, such as a few decades or centuries of slightly higher or lower temperatures, or extended droughts. Best known is the Little Ice Age that struck Europe in the early Middle Ages, bringing famines, uprisings, and the withdrawal of northern colonies in Iceland and Greenland. People have suffered under the whims of climate for millennia, responding with their wits, unable to influence these large events.

Until now. Ironically, we humans have been so remarkably successful as a species that we may have backed ourselves into a corner. Our numbers have grown to the point where we have less room for large-scale migration should a major climate shift call for it. And the products of our large brains -- our industries, transport, and other activities -- have led to something unheard of in the past. Previously the global climate changed human beings. Now human beings seem to be changing the global climate. The results are uncertain, but if current predictions prove correct, the climatic changes over the coming century will be larger than any since the dawn of human civilisation.

The principal change to date is in the earth's atmosphere. The giant asteroid that felled the dinosaurs threw large clouds of dust into the air, but we are causing something just as profound if more subtle. We have changed, and are continuing to change, the balance of gases that form the atmosphere. This is especially true of such key "greenhouse gases" as carbon dioxide (CO2), methane (CH4), and nitrous oxide (N2O). (Water vapour is the most important greenhouse gas, but human activities do not affect it directly.) These naturally occurring gases make up less than one tenth of one per cent of the total atmosphere, which consists mostly of oxygen (21 per cent) and nitrogen (78 per cent). But greenhouse gases are vital because they act like a blanket around the earth. Without this natural blanket the earth's surface would be some 30 C colder than it is today.

The problem is that human activity is making the blanket "thicker". For example, when we burn coal, oil, and natural gas we spew huge amounts of carbon dioxide into the air. When we destroy forests the carbon stored in the trees escapes to the atmosphere. Other basic activities, such as raising cattle and planting rice, emit methane, nitrous oxide, and other greenhouse gases. If emissions continue to grow at current rates, it is almost certain that atmospheric levels of carbon dioxide will double from pre-industrial levels during the 21st century. If no steps are taken to slow greenhouse gas emissions, it is quite possible that levels will triple by the year 2100.

The most direct result, says the scientific consensus, is likely to be a "global warming" of 1.5 to 4.5 C over the next 100 years. That is in addition to an apparent temperature increase of half a degree Centigrade since the pre-industrial period before 1850, at least some of which may be due to past greenhouse gas emissions.

Just how this would affect us is hard to predict because the global climate is a very complicated system. If one key aspect -- such as the average global temperature -- is altered, the ramifications ripple outward. Uncertain effects pile onto uncertain effects. For example, wind and rainfall patterns that have prevailed for hundreds or thousands of years, and on which millions of people depend, may change. Sea-levels may rise and threaten islands and low-lying coastal areas. In a world that is increasingly crowded and under stress -- a world that has enough problems already -- these extra pressures could lead directly to more famines and other catastrophes.

While scientists are scrambling to understand more clearly the effects of our greenhouse gas emissions, countries around the globe recently joined together to confront the problem.

How the Convention responds

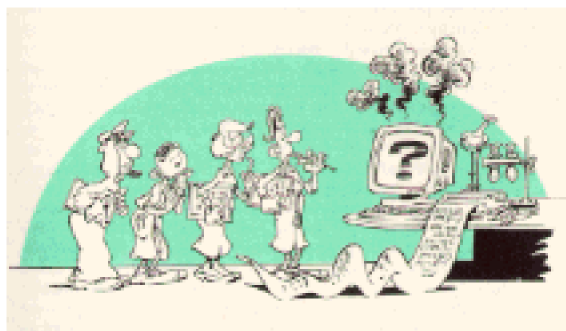
-- It recognises that there is a problem. That's a significant step. It is not easy for the nations of the world to agree on a common course of action, especially one that tackles a problem whose consequences are uncertain and which will be more important for our grandchildren than for the present generation. Still, the Convention was negotiated and signed by 165 states in a little over two years, and over 100 have already ratified and so are legally bound by it. The treaty took effect on 21 March 1994.

-- It sets an "ultimate objective" of stabilising "greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic (human-induced) interference with the climate system." The objective does not specify what these concentrations should be, only that they be at a level that is not dangerous. This acknowledges that there is currently no scientific certainty about what a dangerous level would be. Scientists believe it will take about another decade (and the next generation of supercomputers) before today's uncertainties (or many of them) are significantly reduced. The Convention's objective thus remains meaningful no matter how the science evolves.

-- It directs that "such a level should be achieved within a time-frame sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner." This highlights the main concerns about food production -- probably the most climate-sensitive human activity -- and economic development. It also suggests (as most climatologists believe) that some change is inevitable and that adaptive as well as preventive measures are called for.

Again, this leaves room for interpretation in the light of scientific findings and the trade-offs and risks that the global community is willing to accept.

Problem No. 2: If the consequences of a problem are uncertain, do you ignore the problem or do you do something about it anyway?



Climate change is a threat to mankind. But no one is certain about its future effects or their severity. Responding to the threat is expected to be expensive, complicated, and difficult. There is even some disagreement over whether any problem exists at all: while many people worry that the effects will be extremely serious, others argue that scientists cannot prove that what they suspect will happen will actually happen. In addition, it is not clear who (in the various regions of the world) will suffer most. Yet if the nations of the world wait until the consequences and victims are clear, it will probably be too late to act. What should we do?

The truth is that in most scientific circles the issue is no longer whether or not climate change is a potentially serious problem. Rather, it is how the problem will develop, what its effects will be, and how these effects can best be detected. Computer models of something as complicated as the planet's climate system are not far enough advanced yet to give clear and unambiguous answers. Nevertheless, while the when, where, and how remain uncertain, the big picture painted by these climate models cries out for attention.

For example:

-- Regional rain patterns may change. At the global level, the evapo-transpiration cycle is expected to speed up. This means that it would rain more, but the rain would evaporate faster, leaving soils drier during critical parts of the growing season. New or worsening droughts, especially in poorer countries, could reduce supplies of clean, fresh water to the point where there are major threats to public health. Because they still lack confidence in regional scenarios, scientists are uncertain about which areas of the world risk becoming wetter and which drier. But with global water resources already under severe strain from rapid population growth and expanding economic activity, the danger is clear.

-- Climate and agricultural zones may shift towards the poles. In the mid-latitude regions the shift is expected to be 200 to 300 kilometres for every degree Celsius of warming. Increased summer dryness may reduce mid- latitude crop yields by 10 to 30 per cent, and it is possible that today's leading grain-producing areas (such as the Great Plains of the United States) would experience more frequent droughts and heat waves. The poleward edges of the mid-latitude agricultural zones -- northern Canada, Scandinavia, Russia, and Japan in the northern hemisphere, and southern Chile and Argentina in the southern hemisphere -- might benefit from higher temperatures. However, in some areas rugged terrain and poor soil would prevent these countries from compensating for reduced yields in today's more productive areas. -

- Melting glaciers and the thermal expansion of sea water may raise sea levels, threatening low-lying coastal areas and small islands.

The global mean sea level has already risen by around 15 centimetres during the past century, and global warming is expected to cause a further rise of about 18 cm by the year 2030. If the current trend in greenhouse gas emissions continues, the rise could amount to 65 cm above current levels by the year 2100. The most vulnerable land would be the unprotected, densely populated coastal regions of some of the world's poorest countries. Bangladesh, whose coast is already prone to devastating floods, would be a likely victim, as would many small island states such as the Maldives.

These scenarios are alarming enough to raise concern, but too uncertain to enable governments to make many specific decisions about what to do. The picture is fuzzy. Some governments, beleaguered by other problems and responsibilities and bills to pay, understandably are tempted to do nothing at all. Maybe the threat will go away. Or someone else will deal with it. Maybe another giant asteroid will hit the earth. Who knows?

How the Convention responds

-- It establishes a framework and a process for agreeing to specific actions -- later. The diplomats who wrote the Framework Convention on Climate Change saw it as a launching pad for potential further action in the future. They recognised that it would not be possible in the year 1992 for the world's governments to agree on a detailed blueprint for tackling climate change. But by establishing a framework of general principles and institutions, and by setting up a process through which governments can meet regularly, they got things started.

A key benefit of this approach is that it allows countries to begin discussing an issue even before they all fully agree that it is, in fact, a problem. Even sceptical countries feel it is worthwhile participating. (Or, to put it another way, they'd feel uneasy about being left out.) This creates legitimacy for the issue, and a sort of international peer pressure to take the subject seriously.

The Convention is designed to allow countries to weaken or strengthen the treaty in response to new scientific developments. For example, they can agree to take more specific actions (such as reducing emissions of greenhouse gases by a certain amount) by adopting "amendments" or "protocols" to the Convention.

The treaty promotes action in spite of uncertainty on the basis of a recent development in international law and diplomacy called the "precautionary principle." Under traditional international law, an activity generally has not been restricted or prohibited unless a direct causal link between the activity and a particular damage can be shown. But many environmental problems, such as damage to the ozone layer and pollution of the oceans, cannot be confronted if final proof of cause and effect is required. In response, the international community has gradually come to accept the precautionary principle, under which activities that threaten serious or irreversible damage can be restricted or even prohibited before there is absolute scientific certainty about their effects.

-- The Convention takes preliminary steps that clearly make sense for the time being. Countries ratifying the Convention -- called "Parties to the Convention" in diplomatic jargon -- agree to take climate change into account in such matters as agriculture, energy, natural resources, and activities involving sea-coasts. They agree to develop national programmes to slow climate change. The Convention encourages them to share technology and to cooperate in other ways to reduce greenhouse gas emissions, especially from energy, transport, industry, agriculture, forestry, and waste management, which together produce nearly all greenhouse gas emissions attributable to human activity.

-- The Convention encourages scientific research on climate change. It calls for data gathering, research, and climate observation, and it creates a "subsidiary body" for "scientific and technological advice" to help governments decide what to do next. Each country that is a Party to the Convention must also develop a greenhouse gas "inventory" listing its national sources (such as factories and transport) and "sinks" (forests and other natural ecosystems that absorb greenhouse gases from the atmosphere). These inventories will have to be updated regularly and made public. The information they provide on which activities emit how much of each gas will be essential for monitoring changes in emissions and determining the effects of measures taken to control emissions.

Problem No. 3: It's not fair.

If a giant asteroid hits the earth, that's nobody's fault. The same cannot be said for global warming.

There is a fundamental unfairness to the climate change problem that chafes at the already uneasy relations between the rich and poor nations of the world. Countries with high standards of living are mostly (if unwittingly) responsible for the rise in greenhouse gases. These early industrialisers -- Europe, North America, Japan, and a few others -- created their wealth in part by pumping into the atmosphere vast amounts of greenhouse gases long before the likely consequences were understood. Developing countries now fear being told that they should curtail their own fledgling industrial activities -- that the atmosphere's safety margin is all used up.

Because energy-related emissions are the leading cause of climate change, there will be growing pressure on all countries to reduce the amounts of coal and oil they use. There also will be pressure (and incentives) to adopt advanced technologies so that less damage is inflicted in the future. Buying such technologies can be costly.

Countries in the early stages of industrialisation -- countries struggling hard to give their citizens better lives -- don't want these additional burdens. Economic development is difficult enough already. If they agreed to cut back on burning the fossil fuels that are the cheapest, most convenient, and most useful for industry, how could they make any progress?

There are other injustices to the climate change problem. The countries to suffer the most if the predicted consequences come about -- if agricultural zones shift or sea levels rise or rainfall patterns change -- will probably be in the developing world. These nations simply do not have the scientific or economic resources, or the social safety nets, to cope with disruptions in climate. Also, in many of these countries rapid population growth has pushed many millions of people onto marginal land -- the sort of land that can change most drastically due to variations in climate.

How the Convention responds

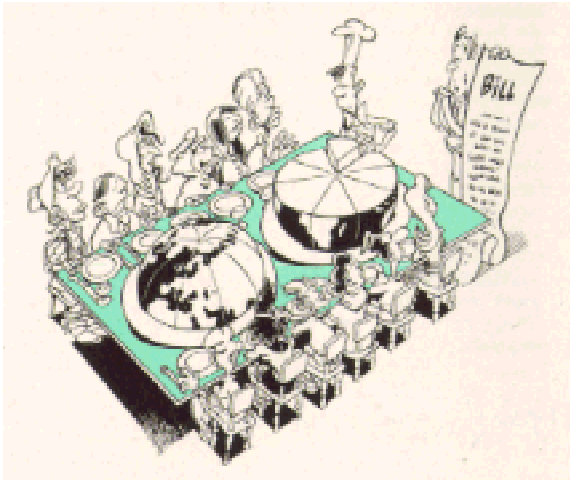
-- It puts the lion's share of the responsibility for battling climate change -- and the lion's share of the bill -- on the rich countries. The Convention notes that the largest share of historical and current emissions originates in developed countries. Its first basic principle is that these countries should take the lead in combating climate change and its adverse impacts. Specific commitments in the treaty relating to financial and technological transfers apply only to the 24 developed countries belonging to the Organisation for Economic Cooperation and Development (OECD -- excepting Mexico, which joined the OECD in 1994). They agree to support climate change activities in developing countries by providing financial support above and beyond any financial assistance they already provide to these countries.

Specific commitments concerning efforts to limit greenhouse gas emissions and enhance natural sinks apply to the OECD countries as well as to 12 "economies in transition" (Central and Eastern Europe and the former Soviet Union). Although negotiations left the treaty language less than clear, it is generally accepted that the OECD and transition countries should at a minimum seek to return by the year 2000 to the greenhouse gas emission levels they had in 1990.

-- The Convention recognises that poorer nations have a right to economic development. It notes that the share of global emissions of greenhouse gases originating in developing countries will grow as these countries expand their industries to improve social and economic conditions for their citizens.

-- It acknowledges the vulnerability of poorer countries to the effects of climate change. One of the Convention's basic principles is that the specific needs and circumstances of developing countries should be given "full consideration" in any actions taken. This applies in particular to those whose fragile ecosystems are highly vulnerable to the impacts of climate change. The Convention also recognises that states which depend on income from coal and oil would face difficulties if energy demand changes.

Problem No. 4: If the whole world starts consuming more and living the good life, can the planet stand the strain?



As the human population continues to grow, the demands human beings place on the environment increase. The demands are becoming all the greater because these rapidly increasing numbers of people also want to live better lives. More and better food, more and cleaner water, more electricity, refrigerators, automobiles, houses and apartments, land on which to put houses and apartments . . .

Already there are severe problems supplying enough fresh water to the world's billions. Burgeoning populations are draining the water from rivers and lakes, and vast underground aquifers are steadily being depleted. What will people do when these natural "tanks" are empty? There are also problems growing and distributing enough food -- widespread hunger in many parts of the world attests to that. There are other danger signals. The global fish harvest has declined sharply; as large as the oceans are, the most valuable species have been effectively fished out.

Global warming is a particularly ominous example of humanity's insatiable appetite for natural resources. During the last century we have dug up and burned massive stores of coal, oil, and natural gas that took millions of years to accumulate. Our ability to burn up fossil fuels at a rate that is much, much faster than the rate at which they were created has upset the natural balance of the carbon cycle. The threat of climate change arises because one of the only ways the atmosphere -- also a natural resource -- can respond to the vast quantities of carbon being liberated from beneath the earth's surface is to warm up.

Meanwhile, human expectations are not tapering off. They are increasing. The countries of the industrialised "North" have 20 per cent of the world's people but use about 80 per cent of the world's resources. By global standards, they live extremely well. It's nice living the good life, but if everyone consumed as much as the North Americans and Western Europeans consume -- and billions of people aspire to do just that -- there probably would not be enough clean water and other vital natural resources to go around. How will we meet these growing expectations when the world is already under so much stress?

How the Convention responds

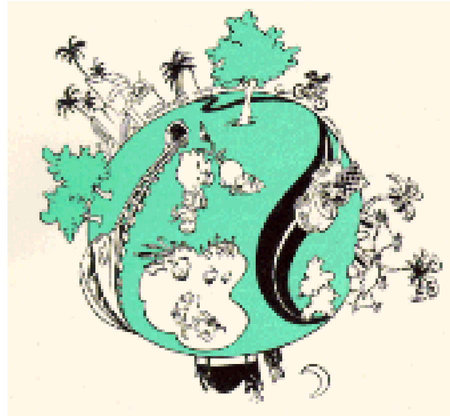
-- It supports the concept of "sustainable development." Somehow, mankind must learn how to alleviate poverty for huge and growing numbers of people without destroying the natural environment on which all human life depends. Somehow a way has to be found to develop economically in a fashion that is sustainable over a long period of time. The buzzword for this challenge among environmentalists and international bureaucrats is "sustainable development". The trick will be to find methods for living well while using critical natural resources at a rate no faster than that at which they are replaced. Unfortunately, the international community is a lot farther along in defining the problems posed by sustainable development than it is in figuring out how to solve them.

-- The Convention calls for developing and sharing environmentally sound technologies and know-how. Technology will clearly play a major role in dealing with climate change. If we can find practical ways to use cleaner sources of energy, such as solar power, we can reduce the consumption of coal and oil. Technology can make industrial processes more efficient, water purification more viable, and agriculture more productive for the same amount of resources invested. Such technology must be made widely available -- it must somehow be shared by richer and more scientifically advanced countries with poorer countries that have great need of it.

-- The Convention emphasises the need to educate people about climate change. Today's children and future generations must learn to look at the world in a different way than it has been looked at by most people during the 20th century. This is both an old and a new idea. Many (but not all!) pre-industrial cultures lived in balance with nature. Now scientific research is telling us to do much the same thing. Economic development is no longer a case of "bigger is better" -- bigger cars, bigger houses, bigger harvests of fish, bigger doses of oil and coal. We must no longer think of human progress as a matter of imposing ourselves on the natural environment. The world -- the climate and all living things -- is a closed system; what we do has consequences that eventually come back to affect us. Tomorrow's children -- and today's adults, for that matter -- will have to learn to think about the effects of their actions on the climate. When they make decisions as members of governments and businesses, and as they go about their private lives, they will have to take the climate into account.

In other words, human behaviour will have to change -- probably the sooner the better. But such things are difficult to prescribe and predict. There is, for example, the matter of what sacrifices might have to be made by everyone for the good of the global climate. That leads to...

Problem No. 5: Who has the energy, time, or money left to deal with climate change, when we have so many other problems?



A valid point.

How the Convention responds

-- It starts slowly. It doesn't make too many demands (or requests) for the time being. But stay tuned. The Framework Convention on Climate Change is a general treaty with just a few specific requirements. More and bigger requirements may come later, in the form of amendments and protocols. This will happen as scientific understanding of climate change becomes clearer and as the countries of the world, already suffering from a case of "disaster fatigue", adjust to the idea that they have yet another crisis to face and pay for. War, famine, AIDS, the ozone "hole", acid rain, the loss of ecosystems and species ... Thinking about these problems, people could be forgiven for wondering if they should throw in the towel.

We can't give up, of course. And while the Convention cannot claim to have the issue all sorted out, it does make a start. Things are beginning to happen. Developed countries are making national plans with the aim of returning their greenhouse gas emissions to 1990 levels by the year 2000 -- thereby reversing the historical trend of ever-increasing emissions. Countries that have ratified the treaty are beginning to gather data on their emissions and on the present climate. More and more, people and governments are talking and thinking about climate change.

What happens next? Step by step, national governments committed to controlling their emissions must begin tightening emissions standards and requiring more replanting of trees; some countries are already working on such standards. Local and urban governments -- which often have direct responsibility for transport, housing, waste management, and other greenhouse gas-emitting sectors of the economy -- have a role, too. They can start designing and building better public transport systems, for example, and creating incentives for people to use them rather than private automobiles. They should tighten construction codes so that new houses and office buildings can be heated or cooled with less fuel. Meanwhile, industrial companies need to start shifting to new technologies that use fossil fuels and raw materials more efficiently. Wherever possible they should switch to renewable energy sources such as wind and solar power. They should also redesign products such as refrigerators, automobiles, cement mixes, and fertilisers so that they produce lower greenhouse gas emissions. Farmers should look to technologies and methods that reduce the methane emitted by livestock and rice fields. Individual citizens, too, must cut their use of fossil fuels -- take public transport more often, switch off the lights in empty rooms -- and be less wasteful of all natural resources.

It may seem naive to expect behavioural changes of this magnitude. But the potential for more responsible behaviour on behalf of the climate is nevertheless there. It is possible that as time passes and more is known about the threats posed by climate change, such responses will seem a lot less naive and a lot more vital to humanity's well-being.

-- The Convention is based on sharing the burdens of coping with climate change. This is important. The atmosphere is a shared resource, part of the "global commons". The treaty tries to make sure that any sacrifices made in protecting this resource will be shared fairly among countries -- in accordance with their "common but differentiated responsibilities and respective capabilities and their social and economic conditions". This means, the participating countries hope, that whatever ultimately has to be done will be done by enough participants to make the benefits worth the sacrifices. It is easier to sacrifice towards the common good when you are sure everyone else is pitching in.

Conclusion: Into the 21st century and beyond Climate change would have lasting consequences. One giant asteroid came along 65 million years ago, and that was it for the dinosaurs.

In facing up to man-made climate change, human beings are going to have to think in terms of decades and centuries. The job is just beginning. Many of the effects of climate shifts will not be apparent for two or three generations. In the future, everyone may be hearing about -- and living with -- this problem.

The Framework Convention takes this into account. It is aimed at the next century as much as at this one. It establishes institutions to support efforts to carry out long-term commitments and to monitor long-term efforts to minimise -- and adjust to -- climate change. The Conference of the Parties, in which all states that have ratified the treaty are represented, is the Convention's supreme body. It meets for the first time in March 1995 and on a yearly basis thereafter. It will promote and review the implementation of the Convention and, if appropriate, strengthen it. The Conference of Parties will be assisted by two subsidiary bodies, one for scientific and technological advice and the other for implementation. The Conference of Parties may also make additional arrangements in the future to help support the needs of the Convention.

The treaty also reflects a reasonable view about how the world will function politically in the future, and assumptions about how problems can best be solved over the next century. It is based on a cooperative rather than a confrontational approach -- it assumes that countries can successfully tackle problems such as climate change only if they work together as a team. And it is designed to work well in a multi-polar world in which many countries have influence and the power to apply peer pressure to persuade others to uphold their obligations.

How can we strike a balance with the environmental conditions that allow us to exist in the first place? That is a question humankind has largely ignored up to now, at its peril. From here on it is a challenge we probably will have to face as long as our species exists.

BOX: What is the greenhouse effect?

In the long term, the earth must shed energy into space at the same rate at which it absorbs energy from the sun. Solar energy arrives in the form of short-wavelength radiation. Some of this radiation is reflected away by the earth's surface and atmosphere. Most of it, however, passes straight through the atmosphere to warm the earth's surface. The earth gets rid of this energy (sends it back out into space) in the form of long- wavelength, infra-red radiation.

Most of the infra-red radiation emitted upwards by the earth's surface is absorbed in the atmosphere by water vapour, carbon dioxide, and the other naturally occurring "greenhouse gases". These gases prevent energy from passing directly from the surface out into space. Instead, many interacting processes (including radiation, air currents, evaporation, cloud-formation, and rainfall) transport the energy high into the atmosphere. From there it can radiate into space. This slower, more indirect process is fortunate for us, because if the surface of the earth could radiate energy into space unhindered, the earth would be a cold, lifeless place -- a bleak and barren planet rather like Mars.

By increasing the atmosphere's ability to absorb infra-red energy, our greenhouse gas emissions are disturbing the way the climate maintains this balance between incoming and outgoing energy. A doubling of the concentration of long-lived greenhouse gases (which is projected to occur early in the next century) would, if nothing else changed, reduce the rate at which the planet can shed energy into space by about 2 per cent. Energy cannot simply accumulate. The climate somehow will have to adjust to get rid of the extra energy -- and while 2 per cent may not sound like much, over the entire earth that amounts to trapping the energy content of some 3 million tons of oil every minute.

Scientists point out that we are altering the energy "engine" that drives the climate system. Something has to change to absorb the shock.

THE CONVENTION AND KYOTO PROTOCOL

The United Nations Framework Convention on Climate Change
Guide Books

Text of the Convention

(pdf) English Arabic Français Deutsch Russian Español

(html) English as a single document , or by Articles

Status of Signatories & Ratification of the Convention

The text of the Convention was adopted at the United Nations Headquarters, New York on the 9 May 1992; it was open for signature at the Rio de Janeiro from 4 to 14 June 1992, and thereafter at the United Nations Headquarters, New York, from 20 June 1992 to 19 June 1993. By that date the Convention had received 166 signatures. The Convention entered into force on 21 March 1994. Those States that have not signed the Convention may accede to it at any time.

For those States that ratify, accept or approve the Convention or accede thereto after the date of entry into force, the Convention shall enter into force on the ninetieth day after the date of the deposit by such State of its instrument of ratification, acceptance, approval or accession.

The list below contains the latest information concerning dates of signature and ratification received from the Secretary-General of the United Nations, as Depository of the Convention. The dates in the column entitled "date of ratification" are those of the receipt of the instrument of ratification **(R)**, acceptance **(At)**, approval **(Ap)** or accession **(Ac).**
(For an explanation of these legal terms, please follow this link)

List of Signatories & Ratification of the Convention (Parties in chronological order (pdf) as of 24 May 2004. The Convention currently has received 189 instruments of ratification.

The Kyoto Protocol
The Kyoto "thermometer": measuring progress toward entry in to force

Kyoto Protocol Introduction text

Text of the Kyoto Protocol

(pdf) English Arabic Chinese Français Russian Español

(html) English

Status of the Kyoto Protocol

The text of the Protocol to the UNFCCC was adopted at the third session of the Conference of the Parties to the UNFCCC in Kyoto, Japan, on 11 December 1997; it was open for signature from 16 March 1998 to 15 March 1999 at United Nations Headquarters, New York. By that date the Protocol had received 84 signatures. Those Parties that have not yet signed the Kyoto Protocol may accede to it at any time.

The Protocol is subject to ratification, acceptance, approval or accession by Parties to the Convention. It shall enter into force on the ninetieth day after the date on which not less than 55 Parties to the Convention, incorporating Annex I Parties which accounted in total for at least 55 % of the total carbon dioxide emissions for 1990 from that group, have deposited their instruments of ratification, acceptance, approval or accession.

The list below contains the latest information concerning dates of signature and ratification received from the Secretary-General of the United Nations, as Depository of the Kyoto Protocol. The dates in the column entitled "date of ratification" are those

of the receipt of the instrument of ratification **(R)**, acceptance **(At)**, approval **(Ap)** or accession **(Ac).**
(For an explanation of these legal terms, please follow this link)

List of Signatories & Ratification to the Kyoto Protocol, Parties in alphabetical order (pdf) as at 29 July 2004, 84 Parties have signed and 124 Parties have ratified or acceded to the Kyoto Protocol.

Welcome to the Canadian Hurricane Centre web site. Located in downtown Dartmouth, Nova Scotia; the hurricane centre specializes in providing information to Canadians on storms of tropical origin that affect Canada or its territorial waters. On this web site you will find the latest hurricane forecasts, hurricane storm summaries, along with a wide range of information related to the science of hurricanes.

Our Headlines Summer 2004

Hurricane Juan
Click here to read the Hurricane Juan special reports

Atlantic Hurricane Season 2004 Outlook

Once again experts around the world are predicting an above normal level of tropical cyclones in the Atlantic Ocean this year. This will make seven years in a row for a forecast of above-normal activity...and those forecasts have seldom been wrong. Learn More...

A Climatology of Hurricanes for Canada: Improving Our Awareness of the Threat

Here are some samples from the full climatology report that will be released later summer 2004. The full report will be produced on CD with more general pertinent information made available on this Web site.

2003 Tropical Cyclones Season Summary

A complete listing and summary of all the major tropical cyclones that occured in the Atlantic Ocean during the 2003 storm season.

Hurricane Juan

At 12:10 a.m. ADT, Monday September 29, 2003, Hurricane Juan made landfall in Nova Scotia as one of most powerful and damaging hurricanes to ever affect Canada. In response to the large demand for information, Environment Canada has created a comprehensive Hurricane Juan web site summarizing all aspects of the hurricane. The web site is updated regularly with new articles, summaries, maps, and photos.

Storm Links

- Hurricane and Tropical Storm Watches and Warnings- These bulletins (when issued) are located near the top of the weather warnings page.
- Hurricane Information Statements - A technical discussion of the storms tracked by the Canadian Hurricane Centre.
- Hurricane Track Information - Online map of the storms tracked by the Canadian Hurricane Centre.
- Latest Satellite Photo
- Latest Radar Image
- National Hurricane Center (U.S.)

Coming Summer 2004

The Canadian Hurricane Centre web site is currently being updated in time for the start of the 2004 Atlantic hurricane season. We are very excited about some of the new sections under construction as they will provide quality in depth information and new services for our web users.

Here is a preview of what is coming:

- GIS based hurricane track archive
- Hurricane products for handheld devices (cellphones/pda's).
- Hurricane alert email subscription service
- Remembering Hurricane Hazel 50 years later.

Counting on the Havoc of Hurricanes

Comparing Statistics of Hurricane Floyd to Other Recent Hurricanes: A Math Lesson

Author(s)
Katherine Schulten, The New York Times Learning Network
Alison Zimbalist, The New York Times Learning Network

Grades: 6-8, 9-12
Subjects: Mathematics, Science
Interdisciplinary Connections

Overview of Lesson Plan: In this lesson, students define and classify all the different ways in which numbers are used in forecasting and coping with the effects of a hurricane. They then conduct research to compare and contrast these numbers as they apply to Hurricane Floyd and other recent hurricanes. Finally, they graph their findings.
Review the Academic Content Standards related to this lesson.

Suggested Time Allowance: 1 hour

Objectives:
Students will:
1. List and define all the ways numbers are used in predicting and preparing for a hurricane, weathering it, and handling its aftermath.
2. Examine how Hurricane Floyd has affected the Eastern Coastal United States by reading "Hurricane Aims at Coast of Carolinas."
3. Classify hurricane-related numbers into statistical categories.
4. Research to find statistics as they apply to Hurricane Floyd and another recent hurricane.
5. Compare and contrast hurricanes by graphing statistical information.
6. Apply understanding of the use of mathematics with regards to hurricanes to continue to track Hurricane Floyd and other hurricanes this season.

Resources / Materials:
-pens/pencils
-classroom blackboard
-paper
-copy of "Hurricane Aims at Coast of Carolinas"
-computers with Internet access
-research materials about hurricanes (including textbooks, newspapers, and other weather references)
-graph paper (several sheets per student)

Activities / Procedures:
1. WARM-UP/DO-NOW: Ask the class to brainstorm as a group all the ways they can think of in which numbers might be used in describing hurricanes. (These include predicting, tracking, observing, and assessing hurricanes, as well as in coping with their aftermath. For example, measurement of different aspects of weather conditions like barometric pressure, wind, and rain; storm surveillance and assessment including things like size, speed, location, force, and path; and costs in

terms of deaths and injuries, populations, infrastructures, and businesses affected, as well as money allotted for clean-up.) Write all of students' ideas on the board.

2. As a class, read "Hurricane Aims at Coast of Carolinas." Students should circle any use of numbers they find as they read to add to the list on the board. Focus on the following questions for discussion:
a. Where has Hurricane Floyd already hit, and what have been the damages thus far?
b. How large and strong is Hurricane Floyd?
c. Where do storm-trackers anticipate Hurricane Floyd will hit, and when?
d. How have people taken precautions to protect themselves from this storm?
e. What different relief organizations are getting involved in helping those areas that have been and are anticipated to be hardest hit by this storm, and what are these organizations doing?
f. How has the government reacted to the hurricane?
g. How are different people reacting to the hurricane?
h. How does this hurricane compare to other large hurricanes in the recent past?

3. Have the class look again at the list they created on the board and categorize these numbers into different statistical areas (costs, population, sizes, etc.). This may be done individually or in small groups, but before moving on to the next step, categories should be shared and agreed upon as a whole class.

4. Divide the class into pairs and have each pair use the Internet and any other available classroom resources to find all the statistics they can about Hurricane Floyd and one other recent hurricane (for example, Hurricanes Andrew, Hugo, and Mitch). Try to assign a different hurricane to group with.

5. Have each pair create a series of graphs that show how Hurricane Floyd compares statistically to the other recent hurricane they have researched. Graphs should be posted around the room and statistics should be compared.

6. WRAP-UP/HOMEWORK: Students use their understanding of the mathematics involved in hurricane tracking by observing the path of Hurricane Floyd and comparing it to the predictions meteorologists made earlier. Students should create an ongoing list of statistics about this hurricane and create new graphs to track the damage of this storm.

Further Questions for Discussion:
--What is a hurricane and how does it differ from other types of storms?
--How do hurricanes form?
--How are hurricanes forecasted, and what surveillance methods are used to watch the progress of hurricanes?
--How can an area prepare for a hurricane?
--What aspects of a country's infrastructure may be affected by a hurricane or other natural disaster?
--What industries might be affected by major weather disasters?
--What government services offer financial help to areas affected by weather disasters? What other services can offer aid?
--Why do people often hesitate to leave an area where a hurricane is predicted to hit?

Evaluation / Assessment:
Students will be evaluated based on their participation in class discussions, thorough research, and creation of comparative graphs.

Vocabulary:
evacuation, emergency, widespread, hurricane, enormous, shelters, exodus, coastal, disrupted, estimated, congestion, incompetence, inundated, pier, predicted, saturated, ominous, abandoned, swells, facade, exterior, cyclones, ruinous, erosion

Extension Activities:
1. Create a chart that illustrates and explains each stage in the life-cycle of a hurricane.

2. Research the instruments meteorologists use to forecast and track hurricanes, then create a chart that explains how they do this.

3. Compile a series of statistics that chart the extreme weather conditions in the area where you live (for example, the most and least rain or snow, highest winds, lowest and highest temperatures, etc.).

4. Graph a comparison of Hurricane Floyd's devastation with that of the worst recent weather emergency or natural disaster in your own area.

5. Visit a local weather center and observe and interview meteorologists at work.

6. Continue to track hurricanes during the rest of this hurricane season using the statistical categories your class defined in this lesson. Post your findings on a class bulletin board.

7. Organize a community aid drive for the victims of Hurricane Floyd. Contact local relief agencies for support or to volunteer to participate in community efforts.

Interdisciplinary Connections:
American History**-** Hurricane Floyd has resulted in one of the most extensive evacuations ever conducted in the United States. Research other evacuations and compare and contrast them to this one. Have we learned from the past in improving the way such evacuations are conducted?
-Research other natural disasters on the scale of Hurricane Floyd to learn how relief organizations and government programs assisted the victims and helped to rebuild the land and communities.

Civics/Social Studies**-** Imagine that you are the mayor of a small coastal town directly in the path of Hurricane Floyd. What can you do insure the safety of your citizens as well as contain costs as much as possible? Brainstorm a list of possible solutions to this problem, and rank them in terms of what you would do first, second, third, etc.

Geography- Investigate how hurricanes and other natural disasters can devastate the elements of the infrastructure of an area, as well as the lives of its people by keeping a log of how Hurricane Floyd affects the areas it hits. Students can work in groups, each focusing on one aspect of the infrastructure (commerce/trade; food supply; health care/disease; communication/roads; shelter; and power) and making a list of problems you read about in this area. Then, each group should propose solutions to aid the devastation of these areas of the infrastructure.

Language Arts**-** Write a reflective essay about your reactions to Hurricane Floyd, perhaps prompted by photographs from the newspaper.
-Write an essay about the worst weather you have ever experienced, or write fictional stories imagining reactions to a natural disaster like Hurricane Floyd. (As models students might want to read other accounts, fictional or true, of such experiences. Chapter 18 of Zora Neale Hurston's novel Their Eyes Were Watching God, for example, tells the story of several characters fleeing a hurricane on foot.)

Media Studies**-** What are all the different aspects of this natural disaster that a newspaper must cover? Imagine that you are the editor of your local paper and must assign stories on the hurricane. What aspects should your paper cover, and why? Make a list, then check your local paper over the next several days to see how close your ideas were to what the paper actually covered.

Other Information on the Web
Florida Division of Emergency Management: Hurricane Floyd (http://www.dca.state.fl.us/eoc/) offers the latest situation reports and other information.

Hurricane Floyd Web Cams (http://www.earthcam.com/floyd/) show continuously updated live views from around the hurricane zone.

The National Weather Service (http://www.nws.noaa.gov/om/hurrbro.htm) provides current official weather warnings, observations, and forecasts.

The National Hurricane Center (http://www.nhc.noaa.gov/) maintains a continuous watch on tropical cyclones over the Atlantic, Caribbean, Gulf of Mexico, and the Eastern Pacific from May 15 through November 30, and issues watches, warnings, forecasts, and analyses of hazardous weather conditions in the tropics.

Hurricane and Storm Tracking, Atlantic and Pacific Oceans (http://hurricane.terrapin.com/) posts current advisories, bulletins, strike probabilities, storm positions, and animated storm movement plots.

Are You Ready for a Hurricane? (http://www.redcross.org/disaster/safety/hurrican.html) is advice from the American Red Cross on what to do in the event of a hurricane threat.

Hurricane: Storm Science (http://www.miamisci.org/hurricane) helps you understand hurricanes from the inside out, including survivors' stories, making a weather station, and contributing your own natural disaster stories to the Healing Quilt.

The American Red Cross (http://www.redcross.org) is a humanitarian organization that has helped over 30 million people each year prevent, prepare for and cope with emergencies.

Academic Content Standards:

This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8
Mathematics Standard 1- Uses a variety of strategies in the problem-solving process. Benchmarks: Represents problem situations in and translates among oral, written, concrete, pictorial, and graphical forms; Understands the role of written symbols in representing mathematical ideas and the use of precise language in conjunction with the special symbols of mathematics
Connect to State Standard
Mathematics Standard 4- Understands and applies basic and advanced properties of the concepts of measurement. Benchmarks: Understands the basic concept of rate as a measure; Solves problems involving units of measurement and converts answers to a larger or smaller unit within the same system; Understands the concepts of precision and significant digits as they relate to measurement; Selects and uses appropriate units and tools, depending on degree of accuracy required, to find measurements for real-world problems.
Connect to State Standard
Mathematics Standard 6- Understands and applies basic and advanced concepts of statistics and data analysis. Benchmarks: Understands basic characteristics of measures of central tendency; Understands the basic concepts of center and dispersion of data; Reads and interprets data in charts, tables, plots, and graphs; Uses data and statistical measures for a variety of purposes; Organizes and displays data using tables, graphs, frequency distributions, and plots; Understands that the same set of data can be represented using a variety of tables, graphs, and symbols and that different modes of representation often convey different messages
Connect to State Standard
Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows factors that can impact the Earth's climate; Knows the processes involved in the water cycle.
Connect to State Standard

Grades 9-12
Mathematics Standard 1- Uses a variety of strategies in the problem-solving process. Benchmarks: Uses formal mathematical language and notation to represent ideas, to demonstrate relationships within and among representation systems, and to formulate generalizations; Understands the components of mathematical modeling

Connect to State Standard

Mathematics Standard 4- Understands and applies basic and advanced properties of the concepts of measurement. Benchmarks: Solves problems involving rate as a measure; Understands the concepts of absolute and relative errors in measurement; Selects and uses an appropriate direct or indirect method of measurement in a given situation; Solves real-world problems involving three-dimensional measures

Connect to State Standard

Mathematics Standard 6- Understands and applies basic and advanced concepts of statistics and data analysis. Benchmarks: Selects and uses the best method of representing and describing a set of data; Understands measures of central tendency and variability and their applications to specific situations

Connect to State Standard

Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows that weather and climate involve the transfer of energy in and out of the atmosphere; Knows how winds and ocean currents are produced on Earth's surface

Connect to State Standard

Create an Art Object Depicting a Hurricane

Topic: Hurricanes

Grade Level: Third and Fourth

To the Teacher: This is a good extension for the lesson on hurricanes. After watching the short movies, the students will complete an art project. This activity comes from the unit Hurricanes and Tropical Storms. You will want to look at some of the connecting sites. The movies are a QuickTime application.

Source: Athena/Weather, WeatherEye is a public service of KGAN and is sponsored by Central Iowa Power Cooperative (CIPCO). The Athena project is a collaboration between SAIC, the Washington State Office of the Superintendent of Public Instruction, and the school districts of Seattle, Bellevue, Lake Washington, and Northshore.

http://weathereye.kgan.com/expert/hurricane/

About Athena:
(http://inspire.ospi.wednet.edu:8001/curric/weather/storms/index.html)
Athena engages students in observing phenomena using remote-sensed data to construct knowledge about the world. Data sets and instructional pieces are related to oceans, the atmosphere, Earth resources, and space/astronomy. Real-time data is used where possible. The material is intended for direct use by students with appropriate assistance from teachers. The goal of Athena is to enhance the K-12 science curriculum, and facilitate use of the powerful computational tools in classrooms networked to the Web.

Scientists and educators work together developing instructional material for K-12 science teaching based on data acquired via Internet. The materials include data sets with appropriate explanation, student activities, and teacher background information support for eighteen pilot sites in Seattle area classrooms. We support the pilot classes with onsite visits and e-mail, solicit feedback, and continue writing material in light of the classroom experience.

This project fills a need by making scientific data accessible to students in an understandable form. It does this by involving educators in planning and writing and piloting the material in classrooms. It provides a template for lessons and a model for collaboration between schools, business, and the government.

This site presents a senario of a town expecting a hurricane and connects to several other sites that have activities or weather related resources, such as the weather channel.

The Activity: The students will watch the movies of hurricane Andrew. They will be asked to watch carefully for any shapes that make you feel movement of the hurricane. What colors did you observe? Were the colors related to the shapes in any way? The student will draw a picture of a hurricane and color it. Where in your environment will you see these shapes? The students will add the shapes that look like movement into their journals. The students may be asked to make another art project that depicts the movement of the hurricane.

Correlation: The following learning and performance objectives correlate to this activity, and support Ohio proficiency test outcomes. You may use them to tailor this activity to your local curricular objectives and goals. Dayton Ohio Public Schools: This activity is suggested as an extension for Activities 21 and 22 on pages 52 to 55 in the *Rain or Shine...Here It Comes!* booklet for the fourth grade.

Ohio Proficiency Test in Science Learning Outcomes Correlation (4th Grade)

Strand II - Physical Science

11. Identify characteristics of a simple physical change.

Grade Level	Scientific Inquiry	Scientific Knowledge	Conditions for Learning Science	Applications for Learning Science	Performance Objectives
4	10, 11	2, 8, 11	13, 14		5
3	11	4, 7	10		2, 5

American Geological Institute Content Standards-Essential Questions 3-6: How does the weather change? How do we know when weather changes? How can we measure changing weather conditions? What can we learn from weather records?

National Science Education Standard- Grades K-4. Standard A: Use data to construct a reasonable explanation. Communicate investigations and explanations. Standard B: Properties of objects and materials. Position and motion of objects.

RETURN TO ACTIVITIES PAGE

Handle A Hurricane!

Students Become Mayors

Overview:

Students take the role of mayor of the city of Pensacola Beach, Florida. Hurricane Opal is developing/approaching in the Gulf of Mexico. The students must decide whether or not to order a forced evacuation of the city.

Students read actual news reports about the storm. They then read "memos" from city staff members, taking various positions on the evacuation. The students review basic information about hurricanes. Finally, students "announce" their evacuation decision by filling out a "press release."

Grade levels: 7-12
Prerequisites: None, but basic study of hurricanes would be helpful.
Time needed to complete: 60 to 90 minutes.

Lesson Objectives:

- Learn about hurricanes.
- Learn about the potential dangers to coastal towns.
- Use decision making skills.
- Use writing to explain a decision and answer questions about hurricanes.

Assignment:

- Decide whether or not to evacuate residents, based on facts about the hurricane and the town.
- Write an explanation of the decision, using the form included in the exercise.
NOTE: Teachers should print out this form in advance for the students. This form will be completed by hand and submitted to the teacher for grading.

Grading Suggestions/Answer Key:

- Based on responses to "press release" test sheet.
- Judged on using complete sentences and by any other writing standards that are appropriate for the students' grade level.

- Based on including appropriate facts to answer the questions.
- **Answer key is available by clicking here.**
  (Answer key section is password protected. If you have not registered, click here for information.)

Subjects: Health, Science
Interdisciplinary Connections

Overview of Lesson Plan: In this lesson, students research various types of severe weather conditions common to their geographic location and create weather emergency guides. Students work in groups to develop guides for extreme weather conditions such as heat waves, tornadoes, floods, and storms, focusing on understanding the formation of these types of weather conditions, forecast and surveillance methods, preparation, and safety procedures in the event of an emergency.
Review the Academic Content Standards related to this lesson.

Suggested Time Allowance: 45 minutes

Objectives:
Students will:
1. Recall situations in which they were caught in severe weather, and analyze how they felt during and after this situation.
2. Examine heat-related illnesses, focusing on their symptoms and treatments, by reading and discussing "The Right Moves, When Heat Can Kill."
3. Explore various extreme weather conditions common to their geographic location, researching the formation of these types of weather conditions, forecast and surveillance methods, preparation, and safety procedures in the event of an emergency.
4. Develop weather emergency guides for the types of extreme weather studied, to be distributed throughout the school or community in the appropriate seasons.

Resources / Materials:
-student journals
-pens/pencils
-paper
-classroom blackboard
-copies of "The Right Moves, When Heat Can Kill" (one per student)
-weather resources (science textbooks, encyclopedias, weather books, Internet access)

Activities / Procedures:
1. WARM-UP/ DO-NOW: Students respond to the following in their journals (written on the board prior to class): Think about a time when you were trapped in terrible weather (a blizzard, a heat wave, a thunderstorm, a tornado, a flood, a hurricane, or any other type of storm). Recall how you felt during and after this situation. How does the uncontrollable aspect of these situations affect how people feel when they are involved in them? Students should be encouraged to share their responses. Students then discuss what they have heard from news sources lately about heat waves and the destruction that they cause.

2. Read and discuss "The Right Moves, When Heat Can Kill," focusing on the following questions:
a. How are high temperatures dangerous to the human body?
b. What causes sunburn, and how can one treat it?
c. What causes heat cramps, and how can they be treated?
d. How can one tell the difference between heat exhaustion and heatstroke or sunstroke? In what ways are their treatments very different, and why?
e. What do you think people can do to prevent succumbing to these types of heat-related illnesses?
f. What other weather conditions can bring about health problems?

3. As a class, list on the board the different extreme weather conditions that occur in your area (heat waves, tornadoes, flash floods, winter storms, hurricanes, severe thunderstorms, floods, etc.). Then, divide students into as many small groups as there are extreme weather conditions listed on the board. Explain to students that they will be researching their weather conditions and then creating weather emergency guides. Using all available classroom resources, students should answer the following (listed on the board for easier student reference):
--What is the "definition" of this type of extreme weather?
--How does this type of weather form?
--What geographical locations are prone to this type of weather, and why?
--What methods are used to forecast this type of weather, and how do they work?
--What surveillance methods are used to track this type of weather, and how do they work?
--How can one prepare for this type of weather emergency?
--What should one do in the event of this weather emergency?

4. WRAP-UP/HOMEWORK: After groups have finished their research, each group develops a weather emergency guide for the extreme weather studied. Guides should be no longer than four pieces of paper (two pages front-and-back) so that they can be easily duplicated and distributed. Guides must answer all research questions, should provide interesting illustrations (such as pictures and charts), and should be easy to understand. Guides can then be reproduced on colored paper and distributed throughout the school or community in the appropriate seasons of the year when this weather is likely to occur.

Further Questions for Discussion:
--What is a heat wave?
--What weather conditions cause extreme heat?
--How do people often put themselves in danger in extreme heat conditions?
--What elements of a city's infrastructure are affected in the event of a heat wave?
--How can one prepare for a heat wave?
--What severe weather conditions occur in your community every year, and how do people usually prepare for these conditions?

Evaluation / Assessment:
Students will be evaluated based on written journal response, participation in class discussions, group research on a type of severe weather, and well-designed and thorough weather emergency guide on the severe weather researched.

Vocabulary:
taxing, symptoms, dissipate, excess, humid, sterile, spasms, clammy, unconsciousness, summon, fatal

Extension Activities:
1. Research when warnings are officially issued for different extreme weather conditions. What is the difference between a "watch" and a "warning," and what specific weather conditions are classified in each category?

2. Create a handout about water and energy conservation tips that are effective in periods of extreme heat.

3. Design an Internet scavenger hunt about heat waves, finding different Web sites that relate to this weather condition and jotting down one question that can be answered by each Web site you find. Then, challenge a family member or friend to answer your questions about heat waves by using your Internet scavenger hunt.

4. Create a "How It Works" poster or display that explains how the human body regulates its temperature. You might want to create similar displays for different animals.

5. Invite a meteorologist from a local television station to speak to your class about weather tracking and what one should do in various emergency weather situations.

6. Research what supplies you should have on hand in the event of severe weather situations and create a supply kit for your family.

7. Develop an emergency guide for your family, including maps to help your family escape or protect themselves in the event of different emergencies (such as flood, tornado, hurricane, and fire). Be sure that you review this information with all members of your family.

8. Conduct a heat safety inventory of your home, itemizing products and items that you own and need to be safe in conditions of extreme heat.

Interdisciplinary Connections:
Geography/Mathematics- Map and graph weather patterns (temperature, precipitation, fronts, etc.) over the next month or the rest of the season for your state, region or country.

Mathematics- Track statistical data on past and present heat waves (area of land affected, total dollar amount of damages, temperature, statistics about victims, location comparisons, etc.) on charts or graphs.

Social Studies
-Investigate the different government services that warn people about impending weather systems and that offer aid to victims of weather disasters.
-Explore how various elements of a city's infrastructure (commerce/trade, food supply, health care, communication/roads, shelter, power supply) are affected by extreme weather conditions (such as heat waves) or natural disasters.

Teaching with The Times- Over the course of one or two weeks, collect and create a collage of headlines, graphs, maps and photos from The New York Times that relate to extreme weather conditions currently happening around the world. Then, analyze how and why these weather conditions are affecting the "victims" of them differently.

Other Information on the Web
The National Weather Service (http://www.nws.noaa.gov/) provides current official weather warnings, observations, and forecasts.

American Red Cross: Heat Waves (http://www.redcross.org/disaster/safety/heat.html) discusses what a heat wave is, what to do to protect yourself, and how to recognize and treat heat-related health emergencies.

Weather Channel Encyclopedia: Heat Wave (http://www.weather.com/breaking_weather/encyclopedia/heat/) teaches about extreme heat safety, heat climatology, forecasting heat, historical heat waves, the UV index, and droughts.

Academic Content Standards:
McREL This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8

Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows factors that can impact the Earth's climate; Knows the processes involved in the water cycle
Health Standard 2- Knows environmental and external factors that affect individual and community health. Benchmarks: Knows cultural beliefs, socioeconomic considerations, and other environmental factors within a community that influence the health of its members; Understands how various messages from the media, technology, and other sources impact health practices
Health Standard 7- Knows how to maintain and promote personal health. Benchmarks: Knows personal health strengths and risks; Knows how positive health practices and appropriate health care can help to reduce health risks; Knows strategies and skills that are used to attain personal health goals; Understands how changing information, abilities, priorities, and responsibilities influence personal health goals
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmark: Knows the consequences of a specific physical process operating on Earth's surface
Benchmarks: Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows the ways in which human systems develop in response to conditions in the physical environment; Knows how the physical environment affects life in different regions; Knows the ways people take aspects of the environment into account when deciding on locations for human activities; Knows the effects of natural hazards on human systems in different regions of the United States and the world; Knows the ways in which humans prepare for natural hazards
Language Arts Standard 4- Gathers and uses information for research purposes. Benchmarks: Uses a variety of resource materials to gather information for research topics; Determines the appropriateness of an information source for a research topic

Grades 9-12
Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows that weather and climate involve the transfer of energy in and out of the atmosphere; Knows how winds and ocean currents are produced on the Earth's surface
Health Standard 2- Knows environmental and external factors that affect individual and community health. Benchmarks: Understands how the environment influences the health of the community; Understands how the prevention and control of health problems are influenced by research and medical advances
Health Standard 7- Knows how to maintain and promote personal health. Benchmarks: Knows how personal behaviors relate to health and well-being and how these behaviors can be modified if necessary to promote achievement of health goals throughout life; Understands the short- and long-term consequences of safe, risky, and harmful behaviors; Understands how personal health needs change during the life cycle
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Understands the distribution of different types of climate that are produced by such processes as air-mass circulation, temperature, and moisture; Understands the effects of different physical cycles on the physical environment of Earth; Understands how physical systems are dynamic and interactive; Understands how physical processes affect different regions of the United States and the world
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Understands how people who live in naturally hazardous regions adapt to their environments; Knows factors that affect people's attitudes, perceptions, and responses toward natural hazards
Language Arts Standard 4- Gathers and uses information for research purposes. Benchmarks: Uses a variety of news sources to gather information for research topics; Determines the validity and reliability of primary and secondary source information and usesinformation accordingly in reporting on a research topic

HURRICANE HEADQUARTERS

Keep your eye on Hurricane Frances

A well-organized Hurricane Frances was aiming in the general direction of South Florida on Sunday, threatening to grow into a dreaded Category 5 system. Hurricane officials are appealing to residents to make preparations now.

125,000 lose power as Gaston slops ashore in South Carolina (6:13 PM)

Fly through a 3-D Hurricane!
added (1/08/1999)

Requires a VRML player/plugin. See bottom of page for a recommended one.

Interact with Atlantic hurricanes from 1950-2003!!

Hurricanes are cyclones that develop over the warm tropical oceans and have sustained winds in excess of 64 knots (74 miles/hour). These storms are capable of producing dangerous winds, torrential rains and flooding, all of which may result in tremendous property damage and loss of life in coastal populations. One memorable storm was Hurricane Andrew (pictured above), which was responsible for at least 50 deaths and more than $30 billion in property damage. The purpose of this module is to introduce hurricanes and their associated features, to show where hurricanes develop, and to explain the atmospheric conditions necessary for hurricane development. The Hurricane module has been organized into the following sections:

Sections

Last Update: 09/16/99

The navigation menu (left) for this module is called "Hurricanes" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Hurricanes are severe tropical storms that form in the southern Atlantic Ocean, Caribbean Sea, Gulf of Mexico, and in the eastern Pacific Ocean. Hurricanes gather heat and energy through contact with warm ocean waters. Evaporation from the seawater increases their power.

Hurricanes rotate in a counter-clockwise direction around an "eye." Hurricanes have winds at least 74 miles per hour. When they come onto land, the heavy rain, strong winds and heavy waves can damage buildings, trees and cars. The heavy waves are called a storm surge. Storm surges are very dangerous and a major reason why you MUST stay away from the ocean during a hurricane warning or hurricane.

Federal Emergency Management Agency

LESSON PLANNING ARTICLE

Hurricanes Spark a Storm of Classroom Activity!

Hurricane season is here! Use some of these activities and Internet connections to engage students of all ages in a study of these powerful and frightening storms.

Hurricane season has begun! Last week, two of the seasons biggest hurricanes hit. Fabian pounded Bermuda and Henri paid an unwelcome visit to the Florida Gulf Coast.

So what will the balance of the hurricane season be like? The outlook is not good. Colorado State University's hurricane expert, William Gray, said in his forecast that this year he expects above-average hurricane activity, including 14 named storms.

"It appears that we have left the period of lessened hurricane activity and it is possible we could be seeing a basic change in the long-term global circulation patterns," Gray said. "This change could result in increased hurricane activity, perhaps somewhat similar to the very active period of the mid-1940s to the late 1960s."

Officially, the Atlantic "hurricane season" lasts from June 1 to November 30. In an "average" hurricane season, meteorologists track 9.3 tropical storms, 5.8 hurricanes, and 2.1 major hurricanes.

HURRICANE CLASSROOM ACTIVITIES

You and your students can follow this year's hurricane activity. On the Internet, you'll be deluged with hurricane-related sites; I've highlighted a few below in the Tracking Hurricanes on the Internet section. Immediately following is a handful of activities that you might include in a hurricane lesson plan or that you might use to supplement a current-events discussion of "hurricane season."

ABC Order. Each year, hurricane names are assigned in alphabetical order. The list of names is recycled every six years. The names of 2003's North Atlantic hurricanes are listed below out of sequence. Invite students to put the list in alphabetical order. (For younger students, you might narrow the list to the first ten (A-J) named hurricanes of the season.)
Danny, Isabel, Fabian, Sam, Wanda, Bill, Mindy, Victor, Odette, Erika, Henri, Ana, Rose, Peter, Kate, Grace, Teresa, Juan, Nicholas, Claudette, Larry. (Note: No hurricane names are assigned for the letters Q, U, X, Y, and Z.)

Click here for a complete list of Eastern Pacific hurricanes.

Read aloud. *Hurricanes: Earth's Mightiest Storms by Patricia Lauber (Scholastic)*. Not just another book about "big weather," this is an amazing work that uses narrative very effectively in weaving the story of these powerful storms. Clearly written and relevant text is combined with impressive photographs and informative maps and illustrations that further enhance this excellent work. (Recommendation source: *Science and Children*, March 1997.)

Hands-On Science. Static electricity is stored in rain clouds. When a cloud is so full of static electricity that there's no room for any more, a spark might leap from the cloud. That spark is called "lightning"! Your students can demonstrate the effects of static electricity. Invite them to try the following simple experiment. (Note: This experiment works best when the weather is dry.)

Help

1. Tear up a sheet of paper into tiny little pieces.
2. Invite students to use a comb to comb their hair. Or rub the comb on a piece of wool or fur.
3. Then hold the comb over the tiny paper pieces.
4. What happens? Why does it happen?

Research. Invite students to learn more about hurricanes. Pose the following questions and see who is the first to come up with the correct answers to all the questions. (You might use this activity as a cooperative group activity.)

1. What's the difference between a hurricane, a cyclone, and a typhoon? *(They are all the same kind of storm but hurricanes develop in the Atlantic Ocean, cyclones develop in the Indian Ocean, and typhoons develop in the China Sea.)*
2. What is the origin of the word "hurricane"? *(The word "hurricane" came from the Mayan culture of Central America. The Mayans called their storm god "Hunraken.")*

Critical thinking:

1. What do you notice about the names of hurricanes? *(Use the list that students created in the ABC Order activity above.)*
2. What special sequence do you see in those names? *(The names alternate between male and female names; in 2003 the list starts off with a female name, so in 2004 the list will begin with a male name.)*

Science: The Water Cycle. Discuss and draw a simple illustration on a board or chart to demonstrate to students the steps of the water cycle: (1.) Energy from the sun changes water to water vapor. (2.) Water vapor rises. It cools and condenses to form clouds. (3.) Winds blow the clouds over land. (4.) Clouds meet cool air, and rain or snow falls to the ground. (5.) Most of the water returns to large lakes and oceans. Next, invite students to demonstrate the water cycle:

1. Fill a large, glass bottle or jar half full of water.
2. Cover the jar with plastic wrap and secure the plastic wrap in place with an elastic.
3. Place the jar in a sunny window.
4. Observe for a few hours. What happens? Why did it happen? *(Water drops form on the underside of the plastic wrap. Energy from the sun turned the water into water vapor (evaporation) which caused water drops to form (condensation) on the plastic wrap.)*

Invite students to compare what happened in the jar to the way the water cycle works? Talk about ways they might speed up the process of evaporation and condensation? How would that compare to a hurricane?

Graphing. Invite students to create bar graphs using weather data.*
For younger students: More hurricanes strike in September than in any other month. Make a bar graph to show how many hurricanes have struck each month.

June	12 hurricanes
July	16 hurricanes
August	40 hurricanes
September	61 hurricanes
October	23 hurricanes
November	6 hurricanes

(Data shows totals for 1900-94.)

For older students: The number of deaths caused by hurricanes has dropped dramatically since the turn of the century. Invite students to use the data below *to draw a bar graph that will show this trend.*

1900-1909	8,100 deaths
1910-1919	1,050 deaths
1920-1929	2,130 deaths
1930-1939	1,050 deaths
1940-1949	220 deaths
1950-1959	750 deaths
1960-1969	570 deaths
1970-1979	226 deaths
1980-1989	161 deaths

* Data source: USA Today.

Art. Invite students to create a cartoon to illustrate the following joke:

Why don't weather forecasters tell each other jokes?
(Answer: They don't want to laugh up a storm!)

Geography. Follow the course the next hurricane of the season takes. Invite students to track the hurricane for themselves on their own copies of a U.S. map. They should label cities/towns that are along the hurricane's path and the date and time when the hurricane hit those locations.

TRACKING HURRICANES ON THE INTERNET

You might appoint a "hurricane tracking team" or you might assign individual students or small groups to track some of the following sites for hurricane information.

- Children, Stress, and Natural Disasters-A Guide for Teachers This site includes classroom activities for helping children prepare for, survive, and deal with a natural disaster such as a hurricane. (Click here for Education World's detailed Site Review of this site.)
- Hurricane: Storm Science Learn how storms happen, all about tracking storms, how to make a weather station, and more on this site from (appropriately) the Miami Museum of Science.
- Natural Disasters Around the World Another feature of the site created for the Miami Museum of Science.
- CNN's Weather Story Page Check out CNN's weather page for the latest forecasts, weather maps, allergy report, and news from the storm center.
- USA Today's Weather Click on the yellow WEATHER button in the masthead of USA Today's main page for today's temperature map, top weather news, and lots more.
- The Weather Channel's weather.com This site includes weather headlines and a search engine that allows you to check weather for a particular city or state. Maps, safety tips, and much more.
- Storm 2003 Detailed maps (Storm97 Tracker) show the current position of a hurricane. Excellent, clear maps will help show precise location, wind speeds, and more.
- Kids as Global Scientists Join with students around the world as they engage in a real-time, inquiry-based weather curriculum in 1997. Or pull up the Fall '96 curriculum with activities for all ages.
- National Hurricane Center Tropical Prediction Center A good place to go

for current advisories, reviews of 1995 and 1996 hurricanes, and historical storm data (e.g., deadliest, most expensive, most intense storms).

Field Trip List

Hurricane Field Trip

Trailhead | Teacher's Resources | Start Field Trip

A hurricane is a type of tropical cyclone that sustains winds of 74 miles per hour and greater. Hurricanes occur in the tropical regions of the world in 7 distinct basins, and are called **Hurricanes** in the Carribean, Atlantic, Gulf of Mexico, and eastern Pacific, **Typhoons** in the western Pacific, and **Cyclones** in the Indian Ocean. A hurricane "watch" is issued when the threat of storm conditions is expected between 24-36 hours. A "warning" is issued when the storm is expected within 24 hours or less.

Objectives

- Students will learn what a hurricane is, and how and where they are formed.
- Students will learn how to prepare for a hurricane and what to do in the event of a storm.
- Students will be taken to some of the best hurricane resources available on the Web where they can research and retrieve all kinds of storm data including historical storms, careers, tracking instruments, current weather maps, and much more.

See our Awards

Concepts

1. What conditions are necessary to create a hurricane?
2. Where do hurricanes occur?
3. When is hurricane season?
4. What is the difference between a tropical cyclone and a hurricane?
5. How is the strength of a hurricane measured?
6. Where do hurricanes get their names?

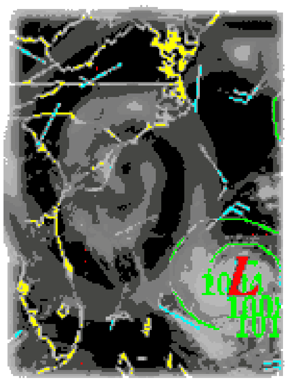
LESSON PLANNING ARTICLE

Hurricane Watch!

To your students, September probably means new friends, new books, and new and exciting adventures. But to meteorologists, September signifies an adventure of another kind. It's the peak month of the Atlantic hurricane season. This week, Education World brings the two together, providing activities designed to help your students understand this powerful force of nature.



Most residents of the United States will never experience a hurricane first hand. But all will hear, at some time in their lives, news reports about the destruction caused by one of these violent storms. Just what are hurricanes? How do they form? Who do they affect? What damage do they cause? The information and activities below will help you answer those questions, as well as provide some exciting additions to your curriculum.

WHAT'S IN A NAME?

Hurricane is, in fact, just one name for the kind of storm scientists refer to as a strong tropical cyclone. When the same kind of storm occurs in the eastern Pacific Ocean, it's called a *typhoon*. In the southwest Pacific Ocean and the Indian Ocean, the storms are called *cyclones*.

Tropical cyclones develop when thunderstorms form over ocean water that has reached a temperature of about 80 degrees Fahrenheit. The conditions required for tropical cyclones, or Hurricanes, to develop occur most often in late summer and early fall. An average of nine named tropical storms develop each year in the Atlantic basin, six of which become hurricanes. Of those, two are likely to become intense hurricanes and cause extensive damage.

The following activities will help your students understand hurricanes and appreciate their power and consequences. The activities are grouped under two headings, Hurricane Activities for All Students and Hurricane Activities for Upper Elementary Students and Above.

HURRICANE ACTIVITIES FOR ALL STUDENTS

Language arts -- alphabetical order. Provide students with a scrambled list of World-Wide Tropical Cyclone Names from this year's hurricane season and have them put the names in alphabetical order. Which letters do not have an associated hurricane name? You might want to explain that tropical storm names are assigned by the World Meteorological Organization.

More language arts -- alphabetical order. Ask students to work in small groups to create their own alphabetical list of names they'd attach to hurricanes -- if they were responsible for naming them!

Science -- make a weather station. Encourage younger students to visit Making a Weather Station and help them follow the directions to create a classroom weather station.

Geography -- track a hurricane. Provide students with a Tracking Map and invite them to track the path of a current storm or a storm from a previous year.

Math -- solve word problems. Encourage students to visit Disaster Math and solve the problems. For very young students, use these word problems as a guide to creating your own.

Hands-on science -- making lightning. Lightning is caused by static electricity stored in rain clouds. When the clouds have too much stored static electricity, a spark results --- lightning! Students can demo how lightning is formed by tearing a small square of paper into tiny, confetti-like pieces. Mext, take a comb and hold it near the confetti. Nothing happens. Then they can briskly run the comb through their hair. Hold the "charged" comb over the confetti. What happens? You can't see the static electricity you've created but you can see its results. In what other ways can you create static electricity?

Math -- make a graph. Hurricanes cause millions of dollars in damages each year. Invite students to create a bar or picture graph to show the costs of hurricane damage over the decades. Data is provided below. (Data source: *USA Today*)

1920s	$2 billion
1930s	$4 billion
1940s	$4 billion
1950s	$11 billion
1960s	$17 billion
1970s	$17 billion
1980s	$15 billion

Home connection -- health and safety. Print copies of the Hurricane Kit Checklist and send a copy home with each student. Have students include a letter explaining specific concerns they have regarding storms and encourage them to discuss both their concerns and the checklists with their families.

Hands-on science -- demonstrate the water cycle. Use this experiment to demonstrate the water cycle. (The sun changes water to water vapor, which rises, cools, and condenses to form clouds. Then cool air meets the clouds, creating rain, sleet, or snow.) Have students fill jars half-full of water. Cover the jar openings with plastic wrap and use rubber bands to seal. Place the jars on a sunny windowsill. Ask: What happened? Why? What signs did you see of condensation? evaporation? How does this experiment demonstrate the water cycle?

Art/Language arts -- create a class joke book. Invite each student to create a humorous picture to illustrate this joke: Why won't weather forecasters tell each other jokes?
They don't want to laugh up a storm! Choose the best illustration of this joke to be the cover of a class joke book. Then invite each student to choose a favorite riddle or joke to illustrate and to add to the class joke book.

Games -- challenge a computer. Invite students to explore probability as they play the Water, Wind, and Earth game against the computer.

HURRICANE ACTIVITIES FOR UPPER ELEMENTARY STUDENTS AND ABOVE

Geography -- read a world map. Encourage students to visit Tropical Storm Tracks and explore the areas listed to find current tropical storms. On a world map, help students locate the seven areas where tropical storms occur and ask them to identify countries that might be affected by storms in each of those areas. Students might also determine, for each area, whether storms there are called typhoons, cyclones, or hurricanes.

Science -- create a chart. Encourage students to go to Davis Weather Instruments' Virtual Weather Station and explore the company's VantagePro product. Help students create a chart of the data provided for several different weather situations. Then ask them to hypothesize about the correlation between wind-chill temperature and wind speed, humidity level and rainfall amounts, and so on. Have students record weather information given for their area for a week or two and then test their hypotheses.

Social studies -- write a press release. Encourage older students to complete the Handle a Hurricane lesson plan, at which they will learn about hurricanes, explore social factors, and decide whether to evacuate Pensacola Beach, Florida, as a hurricane approaches.

Writing -- create a newspaper. Arrange students into groups and provide each group with a list of Retiring Names of the Worst Hurricanes. Ask each group to choose from the list a hurricane that affected the United States, research the hurricane, and then create a newspaper about it. Encourage students to name their newspapers appropriately based on the hurricane's path, to accurately represent costs according to the actual year in which the hurricane occurred, and to include graphics, advertisements, and cartoons that reflect the concerns of area residents.

Art -- create a diorama. Arrange students into five groups and assign each group a hurricane category, from 1 to 5. Then have students create a hurricane of the assigned category. You might want to explain that a Category 2 hurricane has 10 times the destructive power of a Category 1 hurricane, a Category 3 hurricane has 50 times the destructive power of a Category 1 hurricane, a Category 4 has 100 times the power, and a Category 5 has 250 times the destructive power. Then ask each group to create a diorama showing the damage to a building that might result from their hurricane.

Geography -- learning latitude and longitude. Introduce the Interactive Tracking Map. Then have students explore another Interactive Tracking Map and click **Quick Plot** to practice plotting their own coordinates. Then provide students with a map of the United States or the world, give them several sets of coordinates, and ask them to find the locations on the map.

Science -- take a quiz. Encourage students to take the quizzes at Test Your Hurricane IQ, Hurricane Quiz, or Hurricane Quiz. For ESL students, see the ESL Hurricane Quiz.

Math -- calculate inflation. Ask students to go to Stormfax Weather Services, click **Hurricanes**, then **United States Hurricane Statistics** (1900-1997), scroll down to U.S. Hurricane Statistics: 1990-1997, and explore both **Top 25 Costliest /actual $$** and **Top 25 Costliest /adjusted $$**. Then have students calculate the rate of inflation between each hurricane and 1997.

TRACKING A HURRICANE

LESSON TITLE: Tracking a Hurricane
COURSE/GRADE LEVEL: Precalculus/Trigonometry
MATH TOPICS USED: Plotting Rectangular and Polar Coordinates
PURPOSE: to integrate the use of the Internet into instruction of Precalculus topics
REQUIRED MATERIALS:

pencils,

rectangular and polar coordinate graph paper,

graphing calculator,

hurricane tracking charts,

storm coordinate data charts,

list of weather and hurricane URLs

BACKGROUND INFORMATION:

The students should be familiar with the trigonometric conversion formulas from rectangular to polar form and back again. They should also have rectangular coordinate and polar coordinate graph paper, and be familiar with the definitions of latitude and longitude.

LESSON PROCEDURE:

Distribute storm coordinate data charts, hurricane tracking charts, and graph paper (if necessary). Hurricane Coordinates

The students will plot the hurricane coordinates given in the data chart on their rectangular coordinate graphing paper.

The students will convert one set of the coordinates from the hurricane data chart into polar coordinate form, and plot this on their polar coordinate graph paper. This reference point will act as "the eye" of the hurricane on your graph map.

We will use these coordinates to calculate the wind velocities at various distances away from the eye, given the wind velocity nearest the eye.

The Wrath of Hurricane Mitch

Devastating a Country's People and Infrastructure: A Social Studies Lesson Plan

Author(s)
Alison Zimbalist, The New York Times Learning Network

Grades: 6-8, 9-12
Subjects: Current Events, Geography, Social Studies
Interdisciplinary Connections

Overview of Lesson Plan: In this lesson, students investigate how hurricanes and other natural disasters can devastate the elements of the infrastructure of a country, as well as the lives of its people. Students then work in committees, each focused on one element of a country's infrastructure, to analyze the existing infrastructure problems in Honduras caused by Hurricane Mitch, devise possible solutions for these problems, and assess how each aspect of a country's infrastructure is interdependent to the others. Students also determine how lesser developed countries and developed countries differ in times of catastrophe.
Review the Academic Content Standards related to this lesson.

Suggested Time Allowance: 1 hour

Objectives:
Students will:
1. Brainstorm how different aspects of a country's infrastructure would be affected by massive flooding.
2. Compare the land, resources, populations, and economies of Honduras and the United States to analyze how a hurricane or other natural disaster would affect the basic infrastructures of those countries differently.
3. Read and discuss "Relief Effort in Honduras in Dire Need of Resources."
4. Work in committees focusing on a specific aspect of the infrastructure of Honduras to analyze the country's existing problems caused by Hurricane Mitch, devise possible solutions for these problems, and assess how each aspect of the infrastructure is interdependent to the others.
5. Present their committee's ideas and discuss how the Honduran government may begin rebuilding their country.
6. Write a reflective journal about how the many elements of a country's infrastructure are intertwined and how and why natural disasters are handled differently in lesser developed countries than they are in developed countries.

Resources / Materials:
-classroom blackboard
-pens/pencils
-student journals
-paper
-copies of "Honduras" from the Encarta Online Concise Encyclopedia (http://encarta.msn.com) (one per student)
-large world map or globe
-copies of "Relief Effort In Honduras Needs Help, Officials Say" (one per student)

Activities / Procedures:
1. WARM-UP/ DO-NOW: Students are asked to imagine that there is an enormous flood covering an entire country in several feet of water. The class then brainstorms about how the flood may affect the following aspects of the infrastructure of that country: commerce/trade, food supply, health care/disease prevention, communication/roads, shelter, power supply. The teacher writes student responses on the board in columns (a column labeled "commerce/ trade," a column labeled "food supply," and so on.) The teacher then tells students that today they will be investigating how these aspects of life in Honduras have been devastated by Hurricane Mitch in recent weeks.

2. Students receive copies of the article on Honduras from the Encarta Online Concise Encyclopedia. A student should read the Introduction, Land and Resources, Population, and Economy sections aloud, and the class should discuss the corresponding questions below:
a. Introduction/Land and Resources: Find Honduras on a large world map or a globe. What aspects of Honduras's geography may induce massive flooding in the event of a hurricane? Compare the total area of Honduras to that of the United States (9,629,047 sq. km, or 3,717,796 sq. mi.) How might the size of a country affect the proportion of the population and geographic area subject to devastation and in need of aid in the event of a hurricane or other natural disaster?
b. Population: The population of the United States is 267,954,767 (according to a 1997 estimate). How many people per square mile is this? (approximately 72). How many people per square mile live in Honduras? (approximately 132) How do these numbers affect the potential impact of a major hurricane in Honduras compared with the United States? The Encarta article states that about 55% of the population of Honduras lives in rural areas. How might those people be affected differently by a hurricane than those living in urban areas?
c. Economy: What are the principle goods that sustain the economy in Honduras, and how would these industries be affected by major hurricanes and floods?

3. Read and discuss "Relief Effort in Honduras in Dire Need of Resources," focusing on the following questions:
a. The official death toll in Honduras was, at the time this article was printed, 362. The estimated death toll, however, was projected to be at least 5,000. Why would there be such great disparity in these numbers?
b. Using the article for reference, discuss how the following aspects of Honduras' capital city of Tegucigalpa are affected by Hurricane Mitch and the mudslides and flooding it is causing, and the impact of this devastation: roads and bridges, housing, factories, hospitals, prisons, food supplies, sewer systems, potable water.
c. Why are military officials having difficulty rescuing people in remote areas? What types of equipment do they lack?
d. How is the fact that Hurricane Mitch is hovering over bodies of water, rather than land, affecting the amount of rainfall being dropped on Honduras?
e. What type of "help from abroad" do Hondurans need to survive this catastrophe?

4. Divide students into six groups, one for each of these areas: commerce/trade, food supply, health care/disease, communication/roads, shelter, and power. Tell each group that it is a committee established to deal with a specific area of the infrastructure of Honduras being affected by the devastation caused by Hurricane Mitch. Each group must discuss and take notes on their answers to three questions:
--What problems exist in your specific area of the infrastructure of Honduras due to the devastation caused by Hurricane Mitch?
--What solutions can your committee propose to attempt to solve these problems?
--How does your committee's area relate to each of the other areas of the infrastructure of Honduras?
Groups should refer to the notes written on the board from the first activity, the Encarta article on Honduras, and the New York Times article for assistance.

5. Each committee presents its group's ideas to the class. After all committees have presented, wrap up the discussion by asking students how they think the government of Honduras will work towards rebuilding these aspects of the country.

6. WRAP-UP/ HOMEWORK: In their journals, students write a reflective response to the lesson. How are different aspects of a country's infrastructure intricately intertwined? What are some of the essential differences between how hurricanes and other natural disasters affect lesser developed countries (like Honduras) and developed countries (like the United States)? Why do these differences exist?

Further Questions for Discussion:
--What is a hurricane, and how does it differ from other types of storms?
--How do hurricanes form?
--What areas are often hit by hurricanes, and why are these locations prime targets because of their geographical features?
--How are hurricanes forecasted, and what surveillance methods are used to watch the progress of hurricanes?
--How can people prepare for a hurricane?
--What government services are available in the United States to help areas affected by weather disasters?
--What other forms of aid do those affected by weather disasters in the U.S. receive?
--Why are people often reluctant to leave an area where a hurricane is predicted to hit?
--What aspects of a country's infrastructure may be affected by a hurricane or other natural disaster?
--How might the size of a country affect the proportion of the population and geographic area subject to devastation and in need of aid in the event of a hurricane or other natural disaster?
--How might people living in a rural area be affected differently by a hurricane from those living in urban areas?
--What industries might be affected by major hurricanes and floods?
--How do the various elements of a country's infrastructure affect the other elements of that country's infrastructure?
--In what ways can governments rebuild their countries following a natural disaster?
-- What are some of the essential differences between how hurricanes and other natural disasters affect lesser developed countries (like Honduras) and developed countries (like the United States), and why do these differences exist?

Evaluation / Assessment:
Students will be evaluated based on participation in class brainstorm and discussion activities, participation in small group committees, and reflective journal responses.

Vocabulary:
meager, catastrophic, torrential, remote, relentless, impoverished, inundated, debris, evacuate, potable, havoc, abroad

Extension Activities:
1. Students can learn about floods and hurricanes that devastated portions of the United States (the 1993 floods in the Midwest, Hurricane Andrew, Hurricane Hugo) and research the methods that were used to rebuild these areas. Students should also compare resources available in the United States to those currently available in Honduras.

2. Students can research other types of natural disasters (e.g., volcanoes, earthquakes, tornadoes, tsunamis, forest fires, blizzards, droughts), focusing on how these disasters are predicted, how one can protect oneself in these disasters, and famous examples of these disasters.

3. Students can learn about how the geography of an area influences frequent flooding, mudslides, and other water-related destruction.

4. Students can search the Internet for the Web sites of organizations that assist flood and hurricane victims in the United States and worldwide.

5. Students can keep an on-going scrapbook of newspaper articles about the floods in Honduras or about the devastation caused by Hurricane Mitch. Each article

should be clipped and taped to a notebook page, and students should summarize and offer opinions of the articles.

6. Students can keep a photojournalism notebook of news photographs of the floods in Honduras or of the destruction caused by Hurricane Mitch. The class can also devote a bulletin board to photos and news clippings following this disaster and the relief efforts being put in place.

7. Students can organize a community aid drive for the victims of the floods in Honduras and other countries affected by Hurricane Mitch. Students can contact local relief organizations for support or to volunteer to participate in community efforts.

Interdisciplinary Connections:
American History: Students can research natural disasters that occurred in the United States and the relief organizations and government programs that assisted the victims and helped to rebuild the land and the communities.

Global History: Students can learn about the country of Honduras, focusing on its government, economy, and culture.

Language Arts: Students can write a reflective essay about their reactions to the devastation caused by Hurricane Mitch. As a prompt, students may want to select photographs from the newspaper and respond to those specific images.

Mathematics: Students can create a chart comparing the economies, population, size, and other statistics about the United States and Honduras. What resources might the United States have that Honduras does not? What do these statistics demonstrate about potential differences in aid for natural disaster victims?

Media Studies- Students can assess how the media is covering Hurricane Mitch by keeping a daily log of news reports from television, radio, or a newspaper. How are these media covering the same event differently? If Spanish television news shows or newspapers are available in your part of the country, how are these media presenting the news about Hurricane Mitch? What similarities and differences exist?

Science- Students can study the "science" of hurricanes. Students can also research diseases that develop due to polluted water supplies (cholera, Bubonic plague, etc.).

Technology- Students can learn about different meteorological equipment that assists in measuring and tracking hurricanes and other storm systems.

Academic Content Standards:

MCREL This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the

Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8
Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows factors that can impact the Earth's climate; Knows the processes involved in the water cycle
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmark: Knows the consequences of a specific physical process operating on Earth's surface
Geography Standard 12- Understands the patterns of human settlement and their causes. Benchmarks: Knows the similarities and differences in various settlement patterns of the world; Knows ways in which both the landscape and society change as a consequence of shifting from a dispersed to a concentrated settlement form (e.g., a larger marketplace, the need for an agricultural surplus to provide for the urban population, the loss of some rural workers as people decide to move into the city, changes in the transportation system);
Knows the internal spatial structures of cities (e.g., the concentric zone model and the sector model of cities; the impact of different transportation systems on the spatial arrangement of business, industry, and residence in a city)
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows the ways in which human systems develop in response to conditions in the physical environment; Knows how the physical environment affects life in different regions; Knows the ways people take aspects of the environment into account when deciding on locations for human activities; Knows the effects of natural hazards on human systems in different regions of the United States and the world; Knows the ways in which humans prepare for natural hazards

Grades 9-12
Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows that weather and climate involve the transfer of energy in and out of the atmosphere; Knows how winds and ocean currents are produced on the Earth's surface
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Understands the distribution of different types of climate that are produced by such processes as air-mass circulation, temperature, and moisture; Understands the effects of different physical cycles on the physical environment of Earth; Understands how physical systems are dynamic and interactive; Understands how physical processes affect different regions of the United States and the world
Geography Standard 12- Understands the patterns of human settlement and their causes. Benchmarks: Knows the shape of cities in the United States and factors that influence urban morphology (e.g., transportation routes, physical barriers, zoning regulations); Knows the similarities and differences in settlement characteristics of economically developing and developed nations (characteristics of cities; residential and transportation patterns; travel distance to schools, shopping areas, and health care facilities); Knows the consequences of factors such as population changes or the arrival/departure of a major industry or business on the settlement patterns of an area (e.g., stress on infrastructure, problems of public safety and fire protection, crisis in delivering school and medical services)
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Understands how people who live in naturally hazardous regions adapt to their environments; Knows factors that affect people's attitudes, perceptions, and responses toward natural hazards

Curricular Resources in Weather and Climate

Below are the CLN "Theme Pages" which focus on specific topics within Weather and Climate. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Air Quality Theme Page
- Blizzards and Snow Theme Page
- Clouds Theme Page
- El NiñoTheme Page
- Floods Theme Page
- Global Warming/Climate Change Theme Page
- HurricanesTheme Page
- LightningTheme Page
- Ozone Depletion Theme Page
- TornadoesTheme Page
- Water Quality Theme Page

General Weather/Climate Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Weather/Climate. Please read our disclaimer.

- About Rainbows

  Answers to various questions about rainbows for older students, including: What is a rainbow? Where is the sun when you see a rainbow? What makes the bow? What makes the colors in the rainbow? What makes a double rainbow? and more...

- Ask an Expert: Weather

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Weather may be found in our "All Subjects" section at the top of the page, the "Science" section, as well as the general "Reference" section.

- [Athena Curriculum: Weather]

Athena has used geophysical and other data sets acquired via the Internet to prepare curricular units on weather. Included are instructional materials, links to education programs, and resource materials (e.g., maps).

- [The] Atmosphere: A Delicate Situation

This site contains information and links which allow students to learn about the fundamental principles of the atmosphere, for example its composition and structure. Student activities are included as well.

- Bad Meteorology

Detailed explanations of the faulty reasoning behind commonly taught misinformation about weather (e.g. formation of clouds, shape of raindrows, greenhouse effect, and rotation of draining water-Coriolis effect).

- Earth and Environmental Science

The U.S. Geological Survey maintains a meta-list of links to resources on Climate.

- Exploring the Environment: Weather or Not

This module is part of "Exploring the Environment"[a] (ETE) from NASA's Classroom of the Future[a]. In ETE, high school students are faced with a real life problem and their goal is to use problem solving skills and internet based data (e.g., remotely sensed satellite images) to propose and defend a solution. A Teacher's Guide is available. This link is to the ETE home page since it gives the easiest access to necessary introductory and teacher information. To access the weather module, click on "Modules and Activities" and then "Weather or Not."

- Forecasting

This interactive lesson, designed for grades 2-6, explains modern forecasting techniques, contains an online quiz, and provides an activities page that encourages students to practice the forecasting tricks they have learned and to observe the weather.

- Fundamentals of Physical Geography

Although this online textbook from Michael Pidwirny, Okanagan University College, is intended for postsecondary students studying introductory physical geography, much of it may be applicable for high school students as well. Contents include over two hundred pages of information, more than three hundred 2-D and animated graphics, an interactive glossary of terms, a study guide, links to other Internet resources, and a search engine. See the Table of Contents to directly access such sections as Meteorology and Climatology, Hydrology, Biogeography and Ecology, Geology, and Geomorphology.

- [The] OnlineGuides

Formerly known as the "Guide to Meteorology" and/or "The Daily Planet", these resources from the Department of Atmospheric Sciences at the University of Illinois contain instructional resources on meteorology, remote sensing, and reading and interpreting weather maps. They also have a section titled "Projects and Activities" with curriculum aids for teachers.

- [Severe Weather]

  Here, students will be able to obtain information on severe storms, tornadoes and hurricanes as well as pursue links to other severe weather sites.

- [UM Weather]

  Another metalist of links to weather related sites, but the categorization of those links from the University of Michigan is somewhat unique. In addition to the standard categories of links to weather forecasting sites (including Canada as a separate category), you'll find links to site that have radar/satellite imagery, tropical weather, weather maps, and weather software.

- [[The] Weather Dude]

  A weather page especially for kids, parents and teachers from Seattle's KSTW-TV. There are links to explanations of weather terminology, links to teacher/parent resource materials on weather and other sciences, and links to resource materials where kids can learn more about weather and other sciences.

- [WeatherOffice (Environment Canada)]

  A clickable map with locations around Canada, United States, or the World leads to local weather forecasts. Unfortunately, the site is limited to use by frames-based browsers. Canadian weather forecasts and current conditions are also available at this other, less sophisticated Environment Canada site.

- [Weather: The Final Front]

  Here's a meta-list of links to pages of weather resources designed for K-12 students and teachers by a Northern Ontario Consortium. Their categories of weather resources (each with extensive set of links) include: air, atmosphere, climate, interpreting the weather, precipitation, water cycle, and weather in general.

- [World Climate Data]

  Links to weather stations around the worlds are found in abundance at this site. You can find climate data by country, by placename or by WMO name. Note that the data are on climate, not on current weather conditions.

- [WWW Virtual Library: Meteorology]

  Here's a meta-list of links to meteorological sites, organized by data index, geographical index and server type.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Weather/Climate. For other resources in this subject area (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Electricity (Concepts) Theme Page

Below are the CLN "Theme Pages" that support the study of electricity and magnetism. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans), which will help teachers provide instruction in this theme.

- Electronics (Circuitry) Theme Page
- Lightning Theme Page
- Magnetism Theme Page

General Electricity Resources

Here are a number of links to other Internet resources that contain information and/or other links related to the concepts of electricity. Please read our disclaimer.

- AC/DC what's the Difference

  A PBS website that uses animation and simple explanations as an introduction to the principles of electricity.

- Articles on "Electricity"

  The author of this site has many articles that describe and discuss a number of interesting electricity related concepts. Some of the articles present information on topics such as: common misconceptions of electricity, what is electricity, lightning, static electricity, and more. Also included on this page are plans for more than fifteen simple electrical devices.

- AskERIC Lesson Plans: Physical Sciences

  The link is to AskEric's Physical Science page, if you wish to browse/search their site yourself. Or, use the links below to go directly to some lesson plans specifically about electricity/magnetism.

  - Attracting Balloons Static electricity for intermediate students.
  - Brown Bag Science This lesson plan, designed for grade 1-5 students, will help learners investigate and understand the concept of electricity. Students draw and construct simple circuits using the vocabulary associated with electricity.
  - Static Electricity Intermediate students use an inquiry method to learn about static electricity.

- [The] Atoms Family

  Designed for K-8 students, this site uses the "The Adams Family" characters as metaphors. For broad topics related to electricity including: kinetic and potential energy; atoms and matter; conservation and energy transfer; and light, waves and particles. The following link is direct to their pages on electricity.

- Frankenstein's Lightning Laboratory Here's a page on electrical safety and two electricity experiments.)

- ## Bizarre Stuff You Can Make In Your Kitchen

This site is an ever growing warehouse of the kinds of projects some of the more demented of us tried as young people, collecting in one place many of the classic, simple science projects that have become part of the collective lore of amateur science. It is a sort of warped semi-scientific cookbook of tricks, gimmicks, and pointless experimentation, concoctions, and devices, using, for the most part, things found around the house. These are the classics. Strange goo, radios made from rusty razor blades, crystal gardens... amateur mad scientist stuff. If you happen to learn something in the process, consider yourself a better person for it.

- ## [The] Electric Pickle

By using electricity in an experiment, this site shows the "how to and why" the phenomenon of the glowing pickle occurs.

- ## Electricity and Magnetism

More than a dozen experiments on electricity and magnetism designed for intermediate students.

- ## Elements of AC Electricity

A collection of tutorials presenting a wide range of topics in electricity. These topics include: AC Waveform, Inductance, Inductor Circuits, Direct-Current RL Circuits, Inductive Reactance, and many more.

- ## Just For Kids

This site has information about electricity and safety, energy and water experiment, games, and links to other exciting Websites.

- ## Physical Science Activity Manual

This Manual contains 34 hands-on activities that can be downloaded in either MAC (MS WORD) or Windows (WordPerfect) versions. Individual chapters may be downloaded by clicking the appropriate version beside the title.

- ## Learning About Renewable Energy

Consumer Energy Information Fact Sheet; a complete dissertation from the U.S. Dept. of Energy about renewable energy sources. The site has a glossary and links to other sites for more information.

- ## Power Failure

In this lesson plan, grade 5 students learn about the importance of electricity to societies in the world by using the Internet to collect data from keypals.

- ## Project PHYSLab

Project PHYSLab has a collection of high school physics labs (including some for Electricity) developed by participants in an annual, three-week workshop. This link is to the home page of the project. From there, enter "Labs Available Online" to find the labs. Since each of these is done by a different teacher, the quality of the lab and the detail associated with it will vary.

- Science Lab

Here's a collection of science experiments that explore various physics concepts within the oil industry. Experiments have a teacher's guide and can be related to informational articles within the site's "Science Watch." Electricity-related experiments are Building an Electrical Logging Tool and the Electrical Resistivity of Materials.

- Smile Program Physics Index

Teachers participating in the SMILE (Science and Mathematics Initiative for Learning Enhancement) summer session programs each create a single concept lesson plan. This database has over 30 lesson plans in their section on Electricity and Magnetism. Caution: Since there is a wide number of authors who have contributed to the database, the detail and quality of the lesson plans will vary.

- Snacks about Electricity

"Snacks" from the Exploratorium are miniature science exhibits that teachers can make using common, inexpensive, easily available materials. This page has about a dozen activities/experiments on electricity.

- Static Electricity Page

A Website full of projects, articles and forums about static electricity.

- Theater of Electricity

Using a Van de Graaff generator as a source of electricity, the site has a number of pages demonstrating some of the behavior of electricity. The generator creates static electricity and is studied in different experiments simulating lightning. After viewing the site, you can interact with a lightning safety quiz. The following link is to the site's collection of lesson activities.

  - Activities to Explore Static Electricity More than five comprehensive lesson activities and a page of background information for teachers.

- Virtual Labs and Simulations

Here's a collection of links to sites on the Web that have computerized simulations of physics principles that allow students to see a visual demonstration of a scientific concept, often in animated form. In addition, the student may be given the opportunity to manipulate one or more variables underlying the concept and then witness the changes. There are about 30 labs/simulations in electricity. Labs cover topics in Ohm's law, circuits, Kirchhoff, resistors, measurement, charge, force, field, and more.

- "Watt's" on Your Mind

Help Dr. Frank N. Stein bring the monster to life by having students participate in the interactive game. A great site for elementary grades about wasting energy.

- [Watts Up With the Heat?]

In this lesson plan, grade 6-12 students "create a variety of simple, series, and parallel electrical circuits to illustrate how electricity flows through different types of basic circuits and to understand the practical applications of these types of circuits. Students then apply their knowledge of electrical circuits to the loss of power in the midst of July 1999's heat wave, determining how electrical power systems fail in extreme heat, how "load shedding" is used to reduce strain on power sources, and how power outages can be prevented in the future." They use a New York Times article as a starting point for their explorations.

- [What is Static Electricity?]

Static electricity is described in terms of atoms, electrical charges, conservation of charge, and Coulomb's Law. Designed with middle and high-school students in mind, the "I CAN READ" section is for students with low reading skills. The page includes four hands-on projects teachers can try with their students.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Electricity (Concepts). For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu, which will give you access to educational resources in all of our subjects.

Electronics (Circuitry) Theme Page

Below are the CLN "Theme Pages" which support the study of electricity and electronics CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Electricity (Concepts) Theme Page

General Electronics (Circuitry) Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Electronics. Please read our disclaimer.

- Basic Electronics

  Electronics author John Adams aims this site at those who seek basic electronics knowledge with minimal theory.

- Bowden's Hobby Circuits

  More than 60 electronic circuit designs for hobbyist or student. Most circuits can be built with common components purchased locally. Also, the site has links to other hobby electronic sites and electronic related software.

- Electronics: An Online Guide For Beginners

  Basic concepts of electronic theory are introduced. The site introduces breadboard, soldering, discusses series and parallel circuits, and provides schematic diagrams for various electronic projects.

- How to Become An Antenna Guru

  A page describing what an antenna is in terms of its transmission line, impedance, radiation pattern, polarization and arrays. The author includes many illustrations along with descriptions.

- Iguana Labs

  A collection of tutorials for the beginner, intermediate and advanced learner. Information includes basic concepts and components, determining resistor values by reading its colour codes, using breadboards, Ohm's Law, LEDs, transistors and multimeters.

- Interfacing the PC

  A tutorial that teaches you how to connect anything electronic to your PC using common interfaces such as the Serial and Parallel Ports.

- Internet Guide to Electronics

The author of this site states it is designed for beginners. Some of the content includes basic topics like: Circuits, Voltage, Current, Resistance, Ohm's Law, Ohm's Calculations and much more.

- The Transistor

  Lucent Technologies, which used to be AT&T Bell Labs, hosts this site about the development of the transistor and how it works.

- Tomi Engdahl's Electronics Info Page

  A meta-list of electronic related sites. The author has an organized, comprehensive list of links to electronic and PC hardware, many supporting documents and a few dozen circuit schematics.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Electronics (Circuitry). Bright Light Fright

One of the most powerful forces in nature, lightning was once magical, mysterious, and misunderstood. Historically, myth and legend accounted for lightning with stories of angry gods and heroes. Today, meteorologists uses lightning as a tool for analyzing and forecasting the intensity and movement of thunderstorms. While lightning is still a little mysterious, meteorologists now understand it and know how to prepare for it. Of course, every once in a while lightning does still put on a magic show.

To understand a little of lightning's magic, take a look at **Lightning History**, **Lightning Science**, and **Lightning Detection**.

Human Voltage

What happens when people and lightning converge

June 18, 1999: Either lightning is attracted to testosterone, or men spend an inordinate amount of time outdoors swinging metal objects about. Men are struck by lightning four times more often than women.

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

According to a study entitled "Demographics of U.S. Lightning Casualties and Damages from 1959 - 1994," by Ronald L. Holle and Raúl E. López of the National Severe Storms Laboratory and E. Brian Curran of the National Weather Service, males account for 84% of lightning fatalities and 82% of injuries.

Men can take comfort in the fact that the actual number of deaths and injuries from lightning strikes has decreased in the past 35 years. Holle's team attributes 30 percent of the decrease in lightning deaths to improved forecasts and warnings, better lightning awareness, more substantial buildings, and socioeconomic changes. They attribute an additional 40 percent to improved medical care and communications.

The National Weather Service publication *Storm Data* recorded 3,239 deaths and 9,818 injuries from lightning strikes between 1959 and 1994. Only flash floods and river floods cause more weather-related deaths. But according to Dr. Elisabeth Gourbière of the Electricité de France, Service des Etudes Médicales, only 20 percent of lightning victims are immediately struck dead. Still, many doctors do not fully understand how to treat the injuries of the other 80 percent

Recent Headlines

October 27: Leonids in the Crystal Ball
October 26: Chandra Spies Structure of Huge X-Ray Jets
October 25: Postmortems in the Sky

of lightning victims who survive a strike.

Says Gourbière, "The pathology of lightning, or keraunopathy, is known only to a few specialists."

Most doctors are more familiar with electrical shocks, such as those received by industrial workers when they have an accidental run-in with high-voltage equipment. But lightning injuries are not the same as electrical shocks. For one thing, the contact voltage of a typical industrial electrical shock is 20 to 63 kilovolts, while a lightning strike delivers about 300 kilovolts.

Industrial shocks rarely last longer than half a second (500 milliseconds) because a circuit breaker opens or the person is thrown far from the live conductor. Lightning strikes have an even shorter duration, only lasting up to a few milliseconds. Most of the current from a lightning strike passes over the surface of the body in a process called "external flashover."

Both industrial shocks and lightning strikes result in deep burns at point of contact - for industry the points of contact are usually on the upper limbs, hands and wrists, while for lightning they are mostly on the head, neck and shoulders. Industrial shock victims sometimes exhibit deep tissue destruction along the entire current path, while lightning victims’ burns seem to center at the entry and exit points. Both industrial shock and lightning victims may be injured from falling down or being thrown, and the leading cause of immediate death for both is cardiac or cardiopulmonary arrest.

If you survive a shock, you still have to deal with the consequences of the electrical burns. Industrial shock burns can lead to kidney failure, infection, muscle and tissue damage, or amputation. Lightning burns are exceptionally life threatening (see box at the end of this story).

Right: High voltage electrical equipment can cause severe shocks and burns slightly similar to those from lightning strikes.

Gourbière says that 70 percent of lightning survivors experience residual effects, most commonly affecting the brain (neuropsychiatric, vision and hearing). These effects can develop slowly, only becoming apparent much later.

Feel the Burn

If you'd like to experience a lightning strike, go golfing one Sunday in July around 4 p.m. If you're really determined, be sure you do it in Florida.

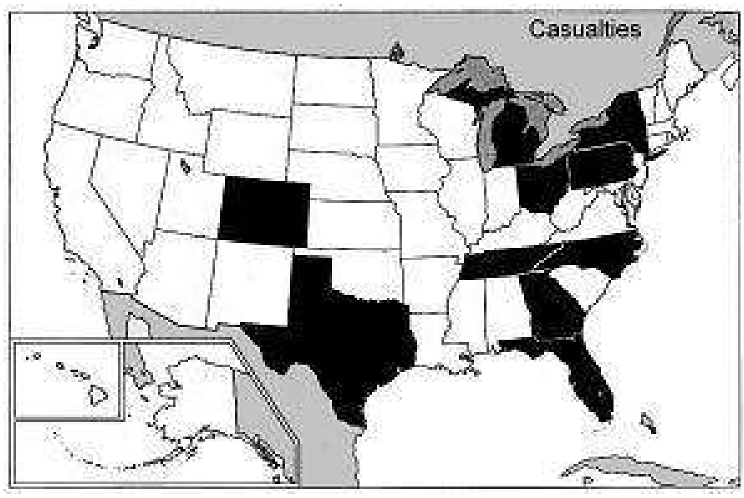
Florida has twice as many lightning casualties (deaths and injuries combined) as any other state. Most lightning casualties occur in the afternoon - two-thirds between noon and 4 p.m. local standard time with a casualties maximum at 4. Sunday has 24% more deaths than other days, followed by Wednesday. Lightning reports reach their peak in July.

Many lightning victims had been walking in an open field or swimming before they were struck. Other lightning victims had been holding metal objects such as golf clubs, fishing rods, hay forks, or umbrellas. But even those not holding metal objects are as likely to be struck by lightning as a bronze statue of the same size.

When you hear thunder, you are already within the range where the next ground flash may occur. N. Kitagawa of Central Lightning Protection, Inc. and A. Sugita and S. Takahashi of Franklin Japan determined the average intervals between lightning strikes in order to estimate how much time someone has to seek shelter. Their news is far from encouraging.

"It is concluded that there exists no safe time interval during which a human is free from direct strikes," they wrote.

In an area with a radius of 500 meters (1,640 ft), most of the intervals between lightning strikes range from 0 to 600 seconds, with a maximum frequency of 40 seconds.



Right: The top ten states in number of lightning casualties (deaths and injuries combined). Florida leads the list, with twice as many casualties as any other state. Other states represented are Georgia, Tennessee, North Carolina, New York, Pennsylvania, Ohio, Michigan, Colorado and Texas.

To avoid being struck by lightning, you should seek shelter when you hear even the faintest thunder. Some of the best places to take refuge are enclosed buildings, or cars and buses (but don't touch the metal!). In case there are no safe spaces nearby, bend into a crouching position until there is a break in the storm.

National Severe Storms Laboratory
NASA's Global Hydrology and Climatology Center - Lightning and atmospheric electricity research.

Isolated trees, telephone booths, and open structures like gazebos or porches make poor lightning shelters. If there is a tall object nearby, move as far away as possible - at least 2 meters (7 ft). Standing next to tall isolated objects like poles or towers makes you vulnerable to secondary discharges coming off those objects.

The mechanism for how towers attract lightning is not really understood. But scientists have known for a long time that towers attract more lightning than the undisturbed ground nearby.

The tale of a family in North Carolina clearly illustrates how towers can concentrate lightning strikes. In 1998, a 42 meter (138 ft) tall water tower was erected near Murfreesboro, NC. This tower was about 45 meters away from a farmhouse that was situated on a one acre plot in a large open area of farmland. The family had lived in the farmhouse for the past 10 years, and they had never experienced any lightning damage. After the tower was erected, 5 separate discharges near the house occurred over a period of 5 months, causing the deaths of 2 trees, a fire in electrical equipment, complete destruction of all phone wiring, and damage to electrical fixtures.

Right: Lightning flirts with a 335-ft tall radio tower. Credit: Jeffrey K. Herzer/Missouri State Highway Patrol Communications Division.

Lightning damages have been on the increase in the past 35 years. Holle's team attributes most of this increase to population growth. *Storm Data* recorded 19,814 property-damage reports due to lightning in the United States from 1959-1994. Pennsylvania has the largest number of damage reports, while the highest rates of damage reports weighted by population are on the plains from North Dakota and Oklahoma.

According to Richard Kithil of the National Lightning Safety Institute, most reports of the economic impact of lightning are contradictory and underreported. The National Weather Service *Storm Data* figures place the most recent yearly losses at $35 million, but the process by which this figure is tabulated is open to error. *Storm Data* collects much of its severe weather information from newspaper reports. If an incident is not reported in the paper or is overlooked by the *Storm Data* reviewer, it may not get into the publication's statistical base.

Kithil conducted his own study based on insurance reports and other sources that keep track of weather damages, and he came up with a much larger figure for the annual cost of lightning strikes.

"It seems reasonable to estimate that there may be $4 to 5 billion in lightning costs and losses each year in the US," said Kithil.

There are currently several different methods used to keep track of lightning strikes, but none of them can be considered perfect. Medical reports, for instance, sometimes report "burns" as the primary cause of death, with lightning listed as a secondary effect. Despite such instances of underreporting, the methods used in the United States to track lightning strikes are considered to be the best available.

"We work with people from other countries who wish they had what we have," said Holle.

Humans versus Lightning

To stand against the deep dread-bolted thunder?
In the most terrible and nimble stroke
Of quick, cross lightning?
(Wm. Shakespeare, "King Lear", Act 4, Scene 7)

Right: Photo Credit: Australian Severe Weather/Michael Bath

In the contest between people and lightning, lightning wins. Although lightning rarely strikes more than one person at a time, over the course of a year the damages, deaths and injuries add up to make lightning a serious threat. By studying the outcome of human-lightning encounters, scientists hope to find more ways to prevent such meetings from occurring in the first place.

Most Typical Disorders Associated with Lightning Strikes

(from "Lightning Injuries to Humans in France" by Dr. Elisabeth Gourbière of the Electricité de France, Service des Etudes Médicales)

Lightning deaths (~20%)
-Asystole/Ventricular fibrillation
-Inhibition of brainstem respiratory centers
-Multi-system failure (delayed death)

Cardio-pulmonary injuries
-Arrhythmias - Arterial pressure changes
-Electrocardiographic changes
-Myocardial damages (infarction)
-Cardiac dysfunction
-Pulmonary edema - Respiratory distress syndrome

Neurologic/psychiatric injuries
-Loss of consciousness/coma
-Amnesia/Anxiety/Confusion/Aphasia/Seizures
-Electroencephalographic abnormalities
-Brain/Cerebellum damages
-Numbness/Weakness in limbs/Partial or complete (but temporary) paralysis
-Neuropathy/Pain syndromes
-Spinal cord injury/Parkinsonism

-Sleep and memory disorders/Concentration disturbances/Irritability/Depression/Various other disturbances such as headaches, tiring easily, lightning storm phobia, etc.
-Post traumatic Stress Disorder

Burns and Cutaneous marking
-Small, deep entry/exit points (typical)
-Contact, metal chain heating (typical)
-Superficial linear
-Flash
-Lichtenberg figures (arborescent, fern-like markings):pathognomonic(on trunk, arms, shoulders)

Clothing, shoes
-Exploded off, torn off, shredded, singed…

Blunt traumas (explosion)
-Contusion, internal hemorrhage (brain, lungs, liver, intestine…)
-(rarely) Fractures (skull, cervical spinal column, extremities…)

Auditory and ocular injuries
-Tympanic membrane ruptured (typical)
-Deafness/Tinnitus/Vertigo
-Transient blindness/Photophobia-Conjunctivitis - Corneal damage
-Retinal abnormalities (macular hole) - optic neuritis
-Cataract

"Lightning injuries are varied and take many different forms. The most dangerous (and possibly fatal) immediate complications are cardiovascular and neurologic. It must be kept in mind that only immediate and effective cardiorespiratory resuscitation (started by rescuers), followed as soon as possible by emergency medical treatment, can save victims who are in cardiopulmonary arrest, or avert the serious consequences of cerebral hypoxia. Some victims remain in a coma despite intensive resuscitation and die of secondary causes including hemorrhages and multiple lesions (encephalic, cardiac, pulmonary, intra-abdominal)."

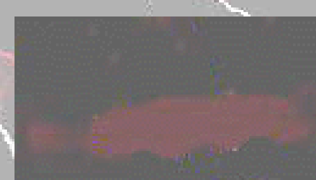
KIDS' LIGHTNING INFORMATION AND SAFETY

by Sabrina



Featured in *Jack and Jill, Chemecology, American Girl, Kid City* and the Franklin Institute's exhibit: *The Powers of Nature*.

-- Please Help with my web site's address change: --
If you were refered to this web site by a friend, school, museum, organization, library, weather person, etc., and were given the old "azstarnet" address, please tell them about the new web address:

www.kidslightning.info
(www.lightningsafety.info will also work)
Thanks very much, Sabrina.

WHY I MADE THIS WEB SITE.

Please read my lightning introduction page
or ma page d'introduction sur la foudre traduite en français.

Also, I am looking for people who would be willing to help translate this web page into other languages in order to share this information with kids around the world. If you or someone you know can help with this, please send an e-mail message. Lightning stories from other kids are now in English, Spanish and Swahili, the Introduction can be read in French and parts of the web site will also soon be in Chinese.

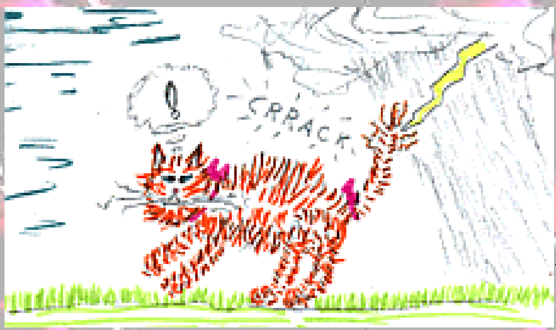
WHAT IS LIGHTNING?

Lightning is a big charge of electricity that can reach from clouds to the ground or to other clouds. It can start fires and it is strong enough to hurt or kill people. Lightning also helps nature by putting nitrogen in the ground for plants to use.

IS LIGHTNING REALLY DANGEROUS?

There are thousands of lightning strikes every day. Scientists think that lightning hits somewhere on the earth about 100 times every second. More people are killed by lightning than by any other kind of storm, including hurricanes and tornadoes. Every year, about 100 people are killed by lightning in the United States and also about 100 people in Europe. In the whole world, lightning kills more than 1,000 people in a year, maybe many more. A lot more people are hurt by lightning than are killed by it and many of those who live are hurt very badly.

What does it feel like to be hit by lightning?



To me, it felt like when your foot falls asleep, but much stronger. The pain after the strike lasted about an hour. My dad says that he felt as if he had both of his hands and arms stuck in electrical wall sockets. His feet and legs hurt and tingled for about half an hour afterward. My mom says that it felt as if someone hit her on her feet with a sledge hammer. But we were very lucky. Lightning knocks many people to the ground, some are burned and some people are unconscious after they are struck.

Many kids weren't as lucky as I was. A girl named Elizabeth, in North Carolina, was camping with other kids when they were hit by lightning. Ashlie, in California, was hit after she got off the school bus. Maria Cristina, lives in Colombia. She was hit when she was playing. You can read their stories if you click on Kids' Stories. Thanks to Maria Cristina and her family, you can also read the stories in Spanish. Gracias a María Cristina y a su familia también puedes leer estas historias en español. Historias de niños en Español. Thanks also to Kim of Kenya for making some of the kid's stories available in Swahili

Grownups have also sent me stories that can teach us about lightning. Grownups' Stories. Also, animals are sometimes hit by lightning. Kids who love horses will want to read Horse Story but be careful, it is a sad story.

WHERE CAN LIGHTNING STRIKE?

Lightning can strike almost anywhere. I think that my family and I were struck because we did not understand that many people are struck before and after the rain falls.

I have learned that lightning can strike as far as 10 miles away from a storm. In fact, scientists are now pretty sure that it can strike 15 or more miles away from a cloud. So, if there is blue sky above you and it is not raining, you still might not be safe if you can see or hear a storm in the distance. Lightning can strike anywhere in a big circle around the where the rain is falling. Click on this link to see DRAWINGS and a PHOTO of what I mean on my Flash to Bang page.

There is also what is called "dry lightning." That is when lightning strikes from a cloud that is not making rain. Dry lightning often causes forest fires because there is no rain to stop a fire from spreading.

NOTE: When you follow the links on this page to other pages or web sites, you can return to the exact place that you left from on this page by clicking on your browser's back arrow. Also, if you came to my web site by following a link from another web site, your browser's back arrow can return you to that site. If your back arrow doesn't work, you may be trapped in a frame. In that case, try clicking here.

Global Atmospherics is a company that detects lightning and has a computer map that can show each spot in the United States where lightning struck today. This kind of map helps airplane pilots stay away from thunder storms. Their web site has information about lightning science and safety at http://www.glatmos.com/lightinfo/lightinfo.html. To find some really cool lightning maps, go to http://www.lightningstorm.com. Lightning strikes many parts of the world. Check in your country to see if lightning maps are available.

HOW CAN YOU TELL HOW FAR AWAY A STORM IS?

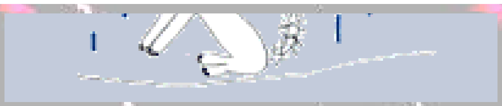
You can tell how far away lightning struck by counting seconds between the flash and the thunder. Every 5 seconds equals one mile, so if you count 10 seconds until you hear the thunder, the lightning flash was 2 miles away. This is shown on my Flash to Bang page.

Can you ever tell when lightning may be about to strike?

Sometimes you can feel when lightning might be about to strike. Try holding your arm very close to the front of a color TV screen that is turned on and see how it feels. Look at the hair standing up on your arm. If you are in or near a storm and you feel this way, then you know that you may be in danger. Lightning could strike any second.

Use the lightning safety links below to learn what to do if this

happens. They tell about shelters and the "lightning crouch" which was formerly called the "lightning safety position." Also, see my Lightning Crouch page.



WHEN YOU ARE CAUGHT IN A STORM, WHAT CAN YOU DO?

Please click on the lightning safety links below to find answers to this question.

WHAT KINDS OF SHELTERS ARE THERE?

Houses, buildings and cars (not convertibles) can give shelter. Please read the lightning safety links for details.

LIGHTNING SAFETY AT HOME.

What's cool about a thunderstorm when you are at home? If someone says that it is "bath time" or "time to do the dishes," you can say "No way! Its not safe!" You should stay away from windows, water faucets, pipes and electrical outlets.

What's not cool about a thunder storm is that if you are talking to your best friend on the phone and lightning is close by, you have to say to your friend: "I'm sorry, but I have to hang up now because lightning is close by."

When there is a storm, do not answer the phone because people can be struck by lightning through the phone. Electricity can go from the phone through your ear and into your brain. Many people (kids too) have been injured while talking on the phone during storms.

If you are playing outside and lightning strikes near by, you should go into a house, a building or a car (convertables are not safe). If you are in a car, be sure that the windows are rolled up. If you can count 20 seconds or less between the lightning and the thunder, the lightning was 4 miles away and the storm is close enough to hurt you. Remember that lightning can strike 10 miles away from a storm. You should decide with your parents how close to a storm is too close for you to be without shelter. Read the lightning safety links about this.

Swimming is not cool when there is a thunder storm around.

LIGHTNING SAFETY AT SCHOOL.

Sometimes, kids have special lightning safety problems because they can't always make their own safety choices. Lightning injuries don't happen very often so many people don't think of lightning as a real danger.

If you are on a sport team and there is a thunderstorm during a game or a practice, what should you do? Should you tell your coach or the person in charge, that the team should get off the field? If the coach says its just a little rain or thunder and not to worry about it, should you leave anyway and take shelter? This is a serious question. You could get kicked

off the team if you leave, but your life is more important than the game. In 1998, a whole soccer team (with 11 players) was killed by lightning in Congo and in 1999, a whole football team was injured by lightning in Colorado. My advice is to talk about this question with your parents and with your coach and team, *before* the season begins. You can also share the lightning scientists' links on this page with your school so they can find professional advice.

I received an e-mail from the mother of a girl who was very badly injured by lightning just after she got off the school bus during a thunderstorm. Should the driver have kept her on the bus until the storm was over? I think that this is a question that parents and schools should talk about too.

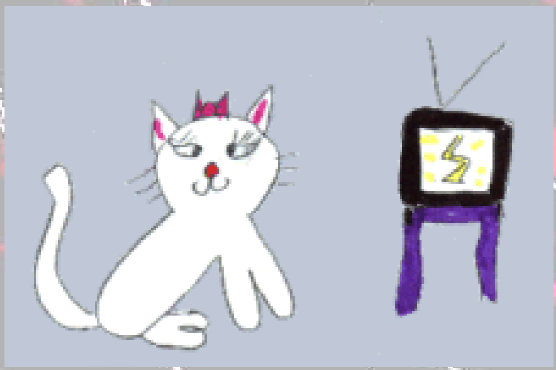
IF THUNDERSTORMS SCARE YOU (they do me):

It is ok to be scared of lightning and thunder because lightning is very dangerous and thunder makes a big noise which is very scary, at least it is to me.

Once you are in a safe place, you can take your mind off the storm by playing games, singing songs, telling stories, reading books, or (my mom says) doing your homework. My friend Deanna and I like to think of angels bowling and their strikes causing thunder. This is a good time to practice math by counting seconds between flashes and booms or crackles to guess how far away the storm is. Lightning crackles are very close and very scary to me.

I've seen some neat TV shows about lightning, tornadoes and hurricanes.

- ***Savage Skies* on PBS**
- **Nova's *Lightning* on PBS**



I like PBS. I ask my friends to ask their parents to help PBS and to write to their Congressmen about it.

Libraries have lots of books about lightning and storms. These are some books that I like:

Weather **by Howard E. Smith, Jr. and Illustrated by Jeffrey K. Bedrick. Doubleday, New York. 1990. It is about different kinds of storms like tornadoes, hurricanes, lightning and hail and has really great drawings of them.**

Flash, Crash, Rumble and Roll **by Franklyn M. Branley with pictures by Barbara and Ed Emberley - Thomas Y. Crowell, New York 1985. It tells a lot about weather and how it works in a way that kids can understand.**

.

Links to other lightning sites on the web.

Some of these links have neat stuff for kids and some are for you to read with your parents.

LIGHTNING SAFETY INFORMATION

For up to date information by lightning scientists, see the
Recomendations by the Lightning Safety Group,
American Meteorological Society Conference in Phoenix, Arizona.
This is a great place to find professional answers to many lightning safety questions.
I think schools should read and use this. You can also find it on web sites by Dr. Cooper, National Severe Storms Laboratory, Global Atmospherics, and others.

The National Weather Service lightning safety site is a good lightning safety reference site.

National Lightning Safety Institute (NLSI) Homepage (http://www.lightningsafety.com/). This site tells about safety for people, buildings, and other interesting things. It also has a section on Personal Lightning Safety Tips. I think that you should read this with your parents and share it with your teachers and your friends. Also, look at: http://www.lightningsafety.com/nlsi_pls.html

Chuck Doswell at the National Severe Storms Laboratory in Norman, Oklahoma gives advice about lightning safety and camping: http://www.cimms.ou.edu/~doswell/tstm_camping_safety.html

Lightning Safety Rules from the Oahu Civil Defense Agency.

People all over the world have to think about lightning safety. This link goes to Zambia in Africa and tells about lightning and computer safety.

Lightning Telephone Danger report from Australia.

USA Today has a lightning information index at: http://206.251.19.76/weather/wlightn0.htm

OTHER LIGHTNING AND STORM INFORMATION

Ron Holle is a meteorologist, formerly with the National Severe Storms Laboratory. He is currently with Vaisala (formerly Global Atmospherics) which does real time tracking of

lightning www.vaisala.com andwww.lightningstorm.com. Ron is an expert on lightning and lightning awareness. He helps me make sure that the information on my web page is correct. The Franklin Institute and the Theatre of Electricity have interesting lightning pages and links. The Franklin Institute pages show different kinds of lightning and tell about what causes it.

If you can, go see The Powers of Nature exhibit. It opened at the Franklin Institute in Philadelphia in 1998 and is traveling around the country. I saw it in Philadelphia and it is really cool. You can learn about thunderstorms, hurricanes, tornadoes, earthquakes, volcanos and real storm chasers. Other museums on the Powers of Nature schedule are: Los Angeles, California Museum of Science - October, 1998; Columbus, OH, COSI - April, 1999; Ft. Worth, Museum of Science & History - October, 1999; St. Paul, Museum of Science - April, 2000; Boston, Museum of Science - October, 2000; Chicago, Museum of Science & Industry - April 2001; and then back to the Franklin Institute - October, 2001.

Check out FEMA's (Federal Emergency Management Agency) Disaster Connection: Kids to Kids for disaster related stories by other kids. FEMA's site has a lot of useful information about all kinds of disasters. [www.fema.gov/kids/k2k_sch1.htm] Vaisala (formerly Global Atmospherics) knows when lightning hits anywhere in the United States. Their web site has some free stuff and links to other lightning sites. Lynne Shumaker, who works there, showed me the things that they work on and helped me to understand more about lightning. You can see a lightning map at www.lightningstorm.com

Scientists at New Mexico Tech do a different kind of lightning mapping, in 3D.
It is sort of like they can "look" at a storm from above and from two sides: http://ibis.nmt.edu/nmt_lms/index.html. They can put maps together and make movies. To see a moving tornado storm, look at: http://ibis.nmt.edu/nmt_lms/tornado.html. It takes almost forever to download, but then it's really fun to watch. NASA's Lightning Primer and Lightning Detection from Space. If you have homework about lightning, this is a good place to start. It tells about what lightning is, history, space and lots of other things.

The National Weather Service in Melbourne, Florida (Lightning Information Center) has great lightning pages. http://www.srh.noaa.gov/mlb/ltgcenter/ltgmain.html

A short Explanation of Lightning by the Oahu Civil Defense Agency.

My dad thinks that Red Sprites and Blue Jets are cool (he says mysterious because very little is known about them). People study them at the University of Alaska, New Mexico Tech, Stanford University (where my friend Emily's dad works) and other places. We first heard about them on PBS Nova. These links tell about red sprites, elves and blue jets and they have photo and movie links for them:
New Mexico Tech (photos and movies) - http://ibis.nmt.edu/sprites/sprites.html;
a good red sprite photo - http://www.sai.msu.su/apod/ap951111.html;
FMA Research on red sprites - (photo and links) - http://www.FMA-Research.com/;
Stanford University (research links) - http://www-star.stanford.edu/~vlf/.
An amateur astronomer in Arizona took pictures of red sprites with his video camera: http://shutter.vet.ohio-state.edu/astronomy/sprites/index.htm.

If you are interested in lightning, red sprites, elves, storms and tornados, then you might also be interested in other planets, stars and galaxies. Scientists at Project SETI (at the University of California) are using a giant radio telescope to search the universe for radio

signals produced by intelligent life in other parts of the cosmos. One problem is that the job is so big that they need help with processing the data. Did you know that you can help Project SETI with your home and school computers? This might make a great science project. The Project SETI@home web site will tell you all about this and let you sign up to help look for ET and other space aliens, if you want to. You can find it at http://setiathome.ssl.berkeley.edu and I've put a link to SETI@home at the bottom of this web page.

COOL LIGHTNING PICTURES AND WEATHER INFORMATION

Chuck Doswell has a page about <"http://www.cimms.ou.edu/~doswell/ltgph.html"> Lightning Photography. He let me use one of his pictures for the the background on this page. He also tells how to take lightning pictures.

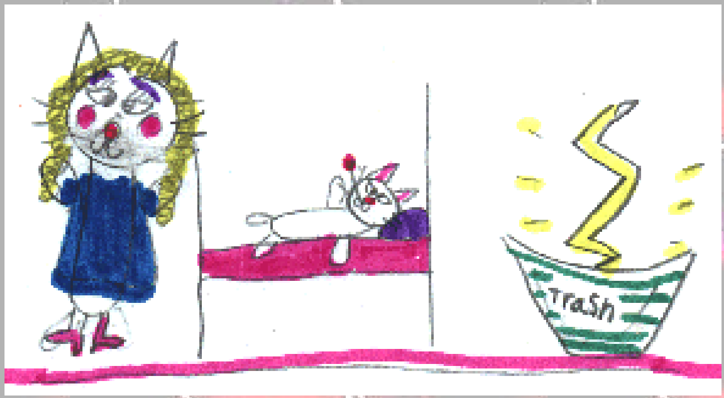
Daniel Robinson's Lightning Page has pictures, experiments, links to maps and lots of other stuff (http://wvlightning.com/gallery.html).

On Nova, I saw people shooting rockets into the sky to cause lightning. James Mathis' pages show Triggered Lightning and other lightning photos.

The Lighthouse page has Satellite and Radar picture maps for many parts of the world. You can see where the big storms are happening.

You can find links to web sites about weather and many other subjects for students and teachers at Studyweb (http://www.studyweb.com).

PEOPLE WHO CAN HELP YOU IF YOU HAVE BEEN HIT BY LIGHTNING



Mary Ann Cooper, M.D. is at the University of Illinois at Chicago and does medical treatment for people who have been hit by lightning. She has been helping me to not be so scared of loud thunder. Her homepage has many lightning medical and safety links and is a very good place to find information about lightning.

Margaret Primeau, Ph.D. does psychotherapy for people who are very scared of lightning because they were hit by it. She is at the Loyola University Medical Center, Department of Psychiatry. Her phone number is 708/216-3272 and her fax number is: 708/216-5885.

Lightning Strike and Electrical Shock Victims, International
c/o Steve Marshburn, Sr.
214 Canterbury Road
Jacksonville, NC 28540-5307
Telephone and Fax Number: (910) 346-4708

These people have all been hit by lightning or had bad electric shocks. Some people are hurt very badly. The people in this group try to help each other.

I would like to get e-mail from other kids who have been hit by lightning. Also, please write to me about other lightning links, books and TV programs that should go on this web page.

My e-mail address is information@kidslightning.info. Please forgive me if I'm not always able to answer, but it's hard for me to keep up with the letters plus my homework and music practice.

Thank you for visiting my web site. Please come again because I'm always adding new things about lightning. Please let me know if you find any links or URLs to other sites on this page that do not work.

SPECIAL THANKS

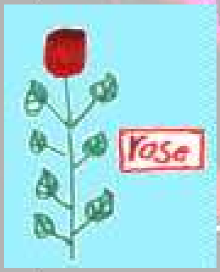
Thank you to Dr. Mary Ann Cooper of the University of Illinois Hospital, Lynne Shumaker of Global Atmospherics, Ron Holle, Chuck Doswell and Raul Lopez of the National Severe Storms Laboratory, Ken Howard and Al Moller of the National Oceanic and Atmospheric Administration, and Dr. Margaret Primeau at the Chicago Medical School. They have helped me learn about lightning and let me use information, links, maps and pictures. Mark Taylor helped with programming questions and animation. And thank you Elizabeth Anne, Ashlie and Georgiana for letting me use your stories.

I am grateful to María Cristina and her family from Bogata who are translating parts of my web site into Spanish and to Kim and Joas from Kenya and Tanzania, who are translating my web site into Kiswahili. My thanks also go to Dr. Elisabeth Gourbière for helping to translate this web site into French so French speaking children will also be able to learn about lightning safety. She lives in France and does research on lightning injury and safety.

Thanks also to the many people who have sent me link updates, comments and suggestions for this web site.

DEDICATION

This web site is dedicated in memory of my aunt Rosemary and also to my grandmother and grandfather who are very special to me.



SOME NON-LIGHTNING THINGS

- Keep your computer virus safe. -
Update and run your antivirus program at least once a week.
Also, use a firewall.

Project SETI@home

You can help scientists listen for ET (extra terrestrials or space aliens).
"SETI" means Search for Extraterrestrial Intelligence.
Click on this link to learn all about SETI@home. It is fun and free.

Remember that you can use your browser back arrow to return to my lightning safety page again.

If you or your class want to learn about ancient Egypt or African wildlife in Zambia and Zimbabwe, these links will take you to information about videos of these countries.

You have probably guessed that cats are my favorite animal. Here is a link to a neat web page with really cute cat animations (they have one about dogs too). It is all about cats and how to get to know them and take care of them. This site is run by volunteers who have a pet shelter and adoption service. They keep animals until homes are found for them. http://www.azstarnet.com/public/nonprofit/fair/catwise.htm

Back to my lightning introduction page.

Lightning & Atmospheric Electricity Research at the GHCC

NOTICE: Version 4.1 of LIS data is now available. More information.

Within the Global Hydrology and Climate Center (GHCC), there is a group of researchers, mostly scientists and engineers, who collectively form the GHCC Lightning Team. As part of their research activities, the members of this team have been investigating the causes and effects of lightning as well as analyzing a wide variety of atmospheric measurements related to thunderstorms.

One of the primary objectives of this group is to determine the relationship between the electrical characteristics of storms and precipitation, convection, and severe weather. In order to achieve this objective, the GHCC Lightning Team has designed, constructed and deployed numerous types of ground based, airborne, and space based sensors used to detect lightning and characterize the electrical behavior of thunderstorms. The data collected by the GHCC Lightning Team is routinely shared with scientists around the globe, resulting in numerous advancements in the field of Atmospheric Science.

Global Lightning Image

A Lightning Primer

A historical essay on lightning research. This primer describes the characteristics of lightning and provides information on recent activities in lightning research.

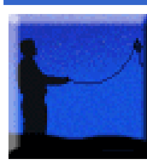
Dataset Information

Access to data from the Lightning Team's experiments, information about the data, and links to other sources of lightning data.

Space Research & Observations

*Learn about **LIS**, **OTD**, **LMS**, and other space based lightning detection instruments designed, built, and maintained by the Lightning Team.*

Field Campaigns & Ground Validation



An overview of field programs in which the Lightning Team has participated, including a description of some of the instruments that were used.

File Cabinet & Bookshelf

Documents, reports, press releases, and an assortment of other information related to our research activities.

Top Story

August 29, 2004 - *Active Weather Alert*

Stormy Saturday night

FRAMETOWN, WV - The skies along the Interstate 79 corridor were dominated by explosive thunderstorms overnight into Sunday morning. Most of the state experienced multiple thunderstorms during the overnight hours - and with brilliant, loud and close lightning, strong winds and torrential downpours, staying asleep wasn't easy. *Left: Lightning along I-79 on Sunday morning.*

Recent Headlines

[Full Archive]

On TV: **August 10: Severe storms pound state**

CHARLESTON, WV - Severe thunderstorms charged across the state on August 10, with large hail, strong winds, heavy rain and frequent lightning. Hail up to the size of quarters was reported in many locations. Street flooding was also a problem as heavy rains inundated the area. *Right: Lightning lights up the sky in Dunbar, WV in one of several strong storms to affect the area on August 10.*
[Full Story]

On TV: **July 29: Fog brings low visibilites**

CHARLESTON, WV - Dense fog was widespread across parts of the state on Thursday morning. While the warm rivers kept valleys somewhat clear, driving anywhere else was tricky due to the reduced visibilites. At Yeager Airport, planes taking off were completely obscured from view. *Left: Dense fog hangs over Charleston, from wvlightning.com video on **The Weather Channel** on July 29.*
[Full Story]

On TV: **July 25: Sunday evening downpours**

HUNTINGTON, WV - After a quiet Sunday afternoon, storms rolled into the Charleston-Huntington metro areas after dark. Heavy rain and lightning arrived first in Huntington around 11PM, and later in the Charleston area after midnight. The storms are the first sign of an active weather pattern that will affect the area again on Monday. *Right: Lightning explodes in the sky over the Cabell County courthouse in Huntington, from wvlightning.com video on **The Weather Channel** on July 25.*
[Full Story]

On TV: **July 22: Summer storms make a comeback**

SOUTH CHARLESTON, WV - After an over two-week period of mostly dry weather, two rounds of storms and heavy rain affected the Mountain State on Thursday. The first batch of storms lasted much of the afternoon and brought up to 2 inches of rain to parts of the region. Minor flooding was reported in several locations. Later in the evening, a second round of storms with a display of frequent lightning affected western and southern parts of the state. *Right: Lightning fills the sky above Route 119 near Alum Creek, south of Charleston.*

So who are these 'storm chasers'?

So what's with the storm chasers? Are they high-risk adrenaline junkies? Is the hobby of chasing tornadoes a dangerous 'extreme sport'? What about all these newspaper articles that say chasers are 'tornado tourists' that block roads, celebrate destruction, and cause havoc in storm-ravaged towns? We're bringing you 'the rest of the story': Most storm chasers are responsible, safety-oriented and helping keep communites safe during severe weather. Read about what storm chasing, and the people who make up the hobby, are really like in our Storm Chasing FAQ.
[Full Story]

PROFILES: Meet storm chasers from around the world in the Storm Chaser Database

On TV: **July 10: Saturday storms blanket state**

LIBERTY, WV - Thunderstorms covered West Virginia on Saturday, affecting almost every county in the Mountain State. Many locations, such as Kanawha and Putnam Counties, endured two or three storms before the day was over. Flash flooding was reported in various locations across Kentucky, Ohio and West Virginia. *Right: A truck drives through floodwaters on Allens Fork Road on Saturday, from wvlightning.com video on **The Weather Channel** on July 10.* [Full Story]

2004: Year of the photogenic tornado

GREAT PLAINS USA - Most storm chasers regard the 2004 Plains storm season, which peaked in late May and came to a close last month, as one of the best ever for breathtaking, picture-perfect tornadoes over the open prairies. Our trip to Tornado Alley this year yielded an incredible twelve tornado intercepts in four states. Come along for the ride with our 2004 season recap, a daily chase logbook with photographs and video documenting four weeks of following the big storms on the open Plains.
[Chase logbook, photos and video]

July 6: Storms rumble across Appalachia

CHARLESTON, WV - Lightning and thunder kept many residents of Kentucky and West Virginia awake on Tuesday night. More thunderstorms, some possibly severe, may affect the same locations on Wednesday.

National Lightning Safety Institute
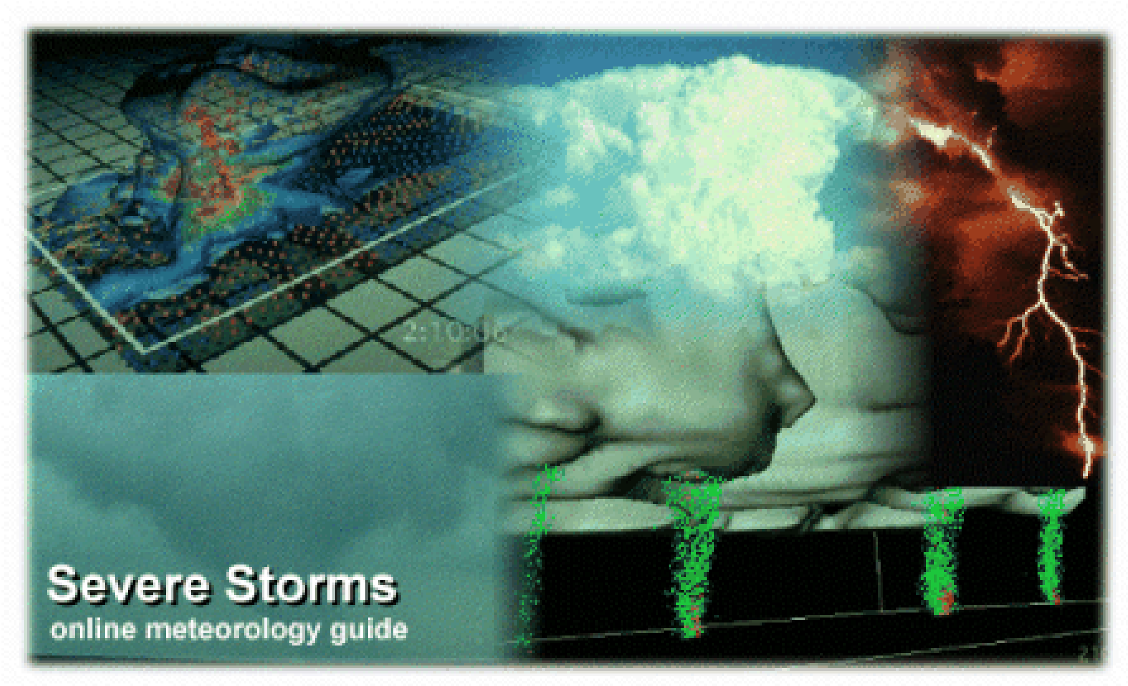
Providing expert training and consulting for lightning problems



Graphic developed by: Dan Bramer

The Severe Storms Module is a combination of two elements. The first is the NOAA Severe Storms Spotters Guide. The second is a section recently added to discuss the efforts and results of modeling severe storms. The Severe Storms Spotters Guide contains supplemental instructional resources and a program designed to familiarize meteorologists and advanced severe storm spotters with the basic "building blocks" of convective storm structure. The focus of the training series is the development of a thunderstorm "spectrum" and a discussion of the physical characteristics and severe weather potential of the various storm types in the spectrum.

Sections

Last Update:05/15/99

Dangers of Thunderstorms
Includes: lightning, floods, hail, winds and tornadoes.

Types of Thunderstorms
Single cells, multicell clusters, multicell lines (squall lines) and supercells.

Components of Thunderstorms
Updrafts and downdrafts, outflow phenomena, wall clouds and the effects of wind shear on thunderstorm development.

Tornadoes
Tornadoes, cyclic storms and low-level flow fields associated with tornadic thunderstorms.

Modeling
Supercells, squall lines, and other phenomena recreated inside computers for the benefit of forecasting and understanding.

Acknowledgments
Those who contributed to the development of this module.

The critical role of atmospheric dynamics and thermodynamics in determination of storm type is stressed. We will take a close look at the storms themselves; from the small, summer storms capable of producing dangerous "microbursts" to the large "supercell" storms which spawn destructive tornadoes.

The navigation menu (left) for this module is called "Severe Storms" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Dangers of T-storms

Sparks and Lightning

(C)1996 William Beaty

While attempting to explain sparks and lightning to some friends, I realized that I didn't have a good gut-level understanding of them myself. As usual, my lack of understanding was an attractive irritant, like a pimple that one can't help picking at. And so over many months I kept noticing concepts that could be applied to explanations of sparks. Here's what I've come up with.

To get a good understanding of sparks, you need to encounter their behavior in detail. One way to do this would be to magnify a small spark, but sparks happen so quickly that interesting behavior can't be seen, so in addition to magnifying it, we'd have to slow it down somehow. Here's a better idea: speed yourself up instead. Imagine that you've been exposed to Tholosian water from 'Old Trek.' This is the substance which causes you to live many times faster than normal. (TV-show science fiction trivia experts will recall the appearance of a similar drug on The Wild Wild West as well!) And then, instead of magnifying a tiny spark, let's go outside during a storm and look at the behavior of an already-large spark. Except for its size, the strange behavior of lightning is very similar to the behavior of tiny sparks.

So, we're standing outside in the time-frozen world of a raging thunderstorm viewed from our 1000X perceptual acceleration. The trees and bushes around us are thrashing frozenly in the stopped wind, and a few torn shingles flying from the nearby roof hang in the air nearby. Higher up we see a tangled, branching network of dimly glowing wiggly purple lines which look something like a tree root. And like a root, all the tips of the branches are lengthening. But this can't be lightning, it's dim and purple, not bright blue-white.

One branch-tip is about a hundred feet up from where we're standing. We can see that the wiggly line isn't moving, it's only growing at its tip. It takes a tortuous, kinky path as it lengthens, and occasionally a new branch starts growing from the side of the main one at a spot where there is a particularly sharp bend. Then we notice something else: everything on the ground is starting to glow. Bits of dim purple fire are popping into existence on the tops of bushes, the edges of the roof of the nearby house, the tips of the rooftop TV antenna, on the ends of all the tree branches, and even on the flying pieces of roof shingles. As the exploring finger of dim purple lightning comes downward, the purple "fire" on all the objects becomes more and more intense. If you hold your hand in front of you, the tips of all your fingers spout dim purple fire as well.

Now the dim purple lightning from above is about thirty feet away, and the downward growth of its tip seems to be speeding up. Then something really disturbing happens. One of the purple flames coming from your fingers has suddenly started growing upward as a narrow wiggly violet line! You pull your hand down, but it's too late, the streamer of purple stays attached and grows upward fast, it's two feet long by now. You notice that this purple streamer from your hand isn't the only one, there are now jagged purple lines growing upwards from many places which formerly had the little "St. Elmo's Fire" flames. There's a ten foot streamer coming from the tree, another from the bush, and a couple from the roof of the house and the TV antenna. They appear to be moving towards the incoming lightning strike. There are even several coming from the wind-blown shingles, but some of these are extending downwards towards the ground while others grow upwards. The one from you're hand isn't winning, it apparently had a late start, and the streamers coming from the tree and the shingles are really shooting upwards now ahead of all the others. And the downwards-growing streamer from the shingles has touched the ground and is spreading out into a small disk of purple rootlets on the surface of the ground.

Finally the upward-growing streamer from the shingles approaches the lightning streamer coming from above. The two growing branch-tips race together, and just before they meet they split into several separate branches which all connect. And NOW it suddenly looks like lightning, because the entire streamer from the shingles is glowing brighter and brighter. The little disk of purple filaments where it touches the ground is now several feet across and looks like blazing blue-white tree roots. The whole thing is far too bright to look at, and it's getting brighter still. And something is happening to you. Your fingers hurt, the muscles in your arm are tensing by themselves, and you feel yourself blacking out. As you lose consciousness, you note that the short, dead-end streamer from your hand is still jutting upwards into the air, glowing bright blue, though nowhere near as brightly as the streamer from the shingles.

What the heck was all that?! Lightning struck an object hanging in the air?! Well, sort of, since the shingles somehow launched their own lightning. And how could lightning be coming from objects on the ground, and from your hand? Why were you knocked unconscious even though you didn't get struck directly by the main bolt? And isn't lightning supposed to travel at the speed of light? 1000 times speedup is nothing compared to lightspeed, so why did we see the lightning as a bunch of slowly-growing filaments?

There are some mental tricks you can use to understand some of what went on above. Number one: realize that lightning is not made of electricity. "Lightning is electricity" is a false concept which stands in your way of understanding, and you need to get rid of it before you can figure out what's going on. The long purple filaments which extended through the air are not electricity, they are actually made of air. They are nitrogen and oxygen which has been converted into plasma. Plasma is vaguely like fire, but it is not necessarily hot. When air is converted to plasma, the electrons of the gas atoms are knocked off the atoms and become able to flow along through the air. Plasma is a conductor, so it's not too wrong to think of purple plasma filaments as being like wires made of conductive air.

Another mental trick: when you take a conductive object, a metal bar for example, and hold it in a strong electric field, flame-like "St. Elmo's Fire" sprouts from the ends of the bar. The "fire" is nitrogen/oxygen plasma. And plasma itself IS a conductive object. So, if an electric field is strong enough, and if a tiny bit of air is somehow converted into plasma, it's as if your conductive rod has grown little conductive pieces on its ends. And next, the "sharp" parts of the plasma globs will themselves sprout extra bits of plasma. And so your metal rod has started "lengthening itself" via fingers of air-plasma. The air can "catch fire" with an outbreak of plasma which grows and grows, with more air turning to plasma as the rods of plasma grow more plasma on their tips.

The plasma takes a particular form: long thin twisty rods. This occurs because "St. Elmo's Fire" always starts on the sharpest part of an object, and the sharpest part of a rod is the end of the rod. And so a pre- existing rod of plasma will grow more plasma on its tips and lengthen itself. This self-forming plasma conductor is vaguely like a motorized metal antenna on a car which extends upwards. But the plasma-antenna can lengthen itself continuously as long as it's tip is still in a strong electrostatic field.

If the twisted plasma rod should make a sharp bend as it grows, the bend can behave as a sharp point and more plasma fingers can take off from the bend. In this way a lengthening plasma streamer develops branches as it goes. Growing plasma doesn't just form twisted rods, it often forms trees, it forms entire complicated systems of rootlets which advance and spread. Whether it forms trees or straight unbent paths depends on the shape of the e-field. in the space around it. A parallel e-field will allow tree-shapes to grow. A spreading, radial-shaped field will tend to force one plasma finger to grow faster than all the others, resulting in a needle-straight spark.

Since plasma is a conductor, what do you think would happen if a piece of air-plasma were to connect itself between two highly-charged objects having opposite charge? ZAP! The opposite charges would be shorted out. An enormous electric current would exist for a moment. This is what happens during a lightning strike, or during the tinyest spark. Long filaments of air-plasma within the clouds extend and explore downwards towards the ground and upwards into the charged raindrops. A system of fine plasma-rootlets develops which connects most of the raindrops to the main conductive plasma tree structure. When the conductive plasma touches the ground, it discharges both the charge on itself and the charge on the the huge number of electrically charged raindrops. The large momentary electric current makes the dim purple plasma explode with light and sound.

So, what about lightning and the speed of light? Why can we see lightning "strike" across the clouds, yet light itself moves so fast that we never see moving light beams? Why can we sometimes see sparks jump from object to object? This is because the growing motion of lightning and sparks is actually the growth of plasma filaments. It is not a movement of light. Lightning can "strike" slow or fast depending on how fast the plasma filament tips are extending themselves. In very large Tesla Coil systems, the giant sparks can lengthen VERY slowly, a human can sometimes outrun them.

In the speed-up story at the top of this page, how come there were plasma filaments appearing on the ground and growing upwards? And why did the wind-blown shingles send plasma filaments both up AND down? This is hard to explain without going into detail about electric fields and atoms. But here's a similar question: suppose you squeeze a clod of dirt between your thumb and forefinger until it cracks. Would you expect the crack to start at your thumb, or at your finger? Or might it start from a small spot in the dirt and grow outwards in two directions at once? In truth, applying force to the dirtball can cause a crack to start ANYWHERE within the dirt.

Cracks tend to start at defects, and a similar thing is true with lightning and sparks. An invisible field of electric force, if applied to air, can cause plasma filaments to burst into existence anywhere in the part of the air where the field exists. When lightning is advancing towards the ground, there is a strong electric field all through the air around the plasma branch and in the space above the surface of the earth. This strong field can trigger new plasma filaments to grow anywhere. Of course its main effect is to make the main lightning filament lengthen and grow downwards. But those blowing shingles represented a "defect" in the air, they distort the invisible electrostatic field in the air and strengthened it near the shingles, just as a bubble in stressed glass can distort the mechanical forces and initiate a crack in the glass. The electric field present throughout the air caused two plasma dendrites to take off from the shingle and "strike" simultaneously upwards and downwards. The defect in the air caused the air to "crack" electrically, the crack being made of 3D plasma filaments.

The same thing happens when aircraft fly between oppositely charged parts of a thunderstorm: the plane acts as a triggering defect in the air, and plasma fingers launch themselves from two spots on the airplane. Flying a plane near a thunderstorm is like poking a highly-stressed windowpane with a nail: the cracks start where the nail touches. Yes, that's right, research has shown that aircraft rarely are struck by lightning, instead the aircraft themselves do the striking, since the plasma starts on the wingtips and zips outwards, striking the clouds.

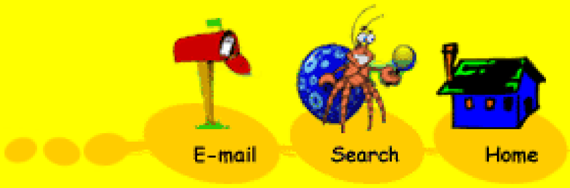
Thunderstorms



[» Disaster from a Kid's Point of View]

[» Professor B's Thunder & Lightning Secrets]

[» Important Terms]

[» Sabrina's Lightning Safety]

[» What is Lightning?]

[» If Someone is Hit by Lightning]

[» Lightning Fact and Fiction]

While thunder won't hurt you - lightning will! So it's important to pay attention when you hear thunder. Thunderstorms happen in every state and every thunderstorm has lightning. Lightning can strike people and buildings and is very dangerous.

Thunderstorms affect small areas when compared with hurricanes and winter storms. The typical thunderstorm is 15 miles in diameter and lasts an average of 30 minutes. Nearly 1,800 thunderstorms are happening at any moment around the world.

Despite their small size, all thunderstorms are dangerous. Every thunderstorm produces lightning, which kills more people each year than tornadoes. Heavy rain from thunderstorms can lead to flash flooding. Strong winds, hail, and tornadoes are also dangers associated with some thunderstorms. You can estimate how many miles away a storm is by counting the number of seconds between the flash of lightning and the clap of thunder. Divide the number of seconds by five to get the distance in miles. The lightning is seen before the thunder is heard because light travels faster than sound. (Of course, get safe shelter first, before you take the time to count the seconds!)

Thunderstorms need three things:

- Moisture - to form clouds and rain.
- Unstable Air - relatively warm air that can rise rapidly.
- Lift - fronts, sea breezes and mountains are capable of lifting air to help form thunderstorms.

Thunderstorms are most likely to occur in the spring and summer months and during the afternoon and evening hours but they can occur year-round and at all hours of the day or night. Along the Gulf Coast and across the southeastern and western states, most thunderstorms occur during the afternoon. Thunderstorms often occur in the late afternoon and at night in the Plains states. Thunder and lightning can sometimes even come with snowstorm! During the blizzard of March 1993, lightning resulted in power outages near Washington, D.C.

FEMA for Kids

Federal Emergency Management Agency

LIGHTNING

INTRODUCTION

Lightning is a powerful part of Earth's weather. A single bolt of lightning is hotter than the sun. And in the time it takes to blink, lightning can strike the ground five times. You can learn about these facts and more when you read through this lesson all about one of the most destructive forces of nature.

Choose from the following pages:

Static Electricity explains why you sometimes get shocked when you touch things, and explores the mysterious connection between static electricity and lightning.

STATIC ELECTRICITY

The Big Spark explains lightning, showing how tiny cloud particles help produce a huge electrical charge.

THE BIG SPARK

Thunder is a section about thunder, naturally. Find out why lightning causes thunder, and how you can use thunder to tell how far you are from the lightning bolt.

THUNDER

The **Safety** section covers lightning safety, from tips on how to avoid being struck to an interactive page where you can choose the best shelter.

SAFETY

Experiments has a bunch of experiments with static electricity, since lightning is too dangerous to experiment with. They're still fun, but they won't fry you.

EXPERIMENTS

The Quiz is a test to challenge your knowledge about lightning and thunder. You can take it online, and get an instant grade.

THE QUIZ

The **Teacher's Guide** is for educators who want an overview of this lesson, the lesson objectives, and more.

TEACHER'S GUIDE

Reduce, Reuse, Recycle Theme Page

Here are a number of links to Internet sites which contain information and/or other links related to the specific theme of Recycling. Please read our disclaimer.

- ## Access Excellence
  - Ecology of the Dump Three activities concerning solid waste management. One lasts one week, another several months, and there is a follow up activity suitble for both.
  - Waste Management There are four activities in this teaching unit in which students investigate household trash, biodegradability, packaging, and recycling.
- ## Ask Eric Lesson Plans - Pollution and Recycling

  This lesson focuses on three types of pollution and how students can work together to cycle..
- ## Composting in Schools

  Menu selections include: Why Composting? Teacher's Page (lesson plans, activities, teacher forum); Ideas for Student Research Projects; Compost Quiz; Science and Engineering (explaining the science and engineering behind composting; includes experiments); Composting Indoors; Composting Outdoors; Weird and Unusual Composting; and, Frequently Asked Questions.
- ## Hazardous Waste Disposal Theme Page

  This CLN theme page has resources for both students and teachers on the topic of hazardous waste disposal. Many of these will provide background information that will be useful to students researching recycling issues.
- ## [The] Imagination Factory

  You'll find creative ways to recycle by engaging your students in art projects/activities that make use of a ready source of inexpensive art supplies - namely your trash. Be sure to look in their "Previous Art Activities" for an archive of their suggestions - organized into 10 categories: Drawing, Sculpture, Painting, Holidays, Printmaking, Fiber Arts, Collage, Marbling, General Information, and Crafts.
- ## Lesson Plans

  Eleven lesson plans in recycling for students in grades 1-7 from the Texas Natural Resource Conservation Commission (TNRCC). In addition, there are three lessons on composting from the Texas A&M University.
- ## Recycle

  Instructions for an educational card game for students aged 8 - 12 in which they become familiarized with the various recyclable items that are normally discarded in the garbage.
- ## Recycling Lesson Plans

Eight lesson plans for students in K-12 from the Pennsylvania Department of Environmental Protection. They illustrate a variety of recycling concepts, including the creation and collection of waste, developing attitudes against littering, recycling as an alternative to disposal, and learning about the costs of disposal.

- [Reduce, Reuse, Recycle]

  The main objective of this teaching unit is to change students' personal behavior through awareness. The lesson plan includes helpful background information, links to resources, student activities, and lecture notes. Grades 1 - 12.

- [RotWeb]

  Everything you wanted to know about composting. Check out their "Teacher Resources" for student handouts, activities, and other resources.

- [Smile Program Biology Index]

  Teachers participating in the SMILE (Science and Mathematics Initiative for Learning Enhancement) summer session programs each create a single concept lesson plan. This database has a few lessons on recycling in their section on Environmental Studies and Ecology. Caution: Since there is a wide number of authors who have contributed to the database, the detail and quality of the lesson plans will vary.

- [Solid Waste and Recycling]

  A five lesson unit plan by Bernita Robinson. There are activities/lessons focused on litter, paper recycling, solid waste, canned pencils, and plain plane.

- [Throwing It All Away]

  In this lesson plan, grade 6-12 students use a NY Times article as a starting point to "investigate what happens to commonly used items and products once they are thrown away or sent to be recycled, analyzing and understanding the relationship between a product's ingredients and its effects on the environment and on the health of the living things on Earth."

- [To Recycle or Not To Recycle]

  In this webquest, elementary students conduct research on the pros and cons of a mandatory recycling program and present their views to other members of a committee.

- [United States Environmental Protection Agency]

  This comprehensive site from the U.S. Environmental Protection Agency has resources targeted for both students and teachers.

  - [The] Consumer's Handbook for Reducing Solid Waste Practical steps that families can take to reduce the amount and toxicity of garbage.
  - HAZ-ED: Classroom Activities for Understanding Hazardous Waste Teacher resources include downloadable PDF files that offer warm up exercises, activities, fact flashes, and a glossary.
  - Recycle City Students learn about the three R's by touring various sections of

"Recycle City" and seeing how the various organizations and citizens reduce, reuse, and recyle. There's also a "Dumptown game" where students can play the role of a city manager who has been hired to start programs that encourage Dumptown's citizens and businesses to recycle and reduce waste all the while remaining within a budget of course. An Activities section contains suggestions for using the site within the classroom.

- Wastes: Kids Page Online activities for students.
- Waste No Words A crossword puzzle activity.

Water Recycling

Learn how waste water in North Carolina is purified by recycling it a natural way.

Top of Page

Note: The sites listed above will serve as a source of content in Recycling. For other resources in Social Studies - Environment(e.g., curricular content in Biomes, Endangered Species, or Hazardous Waste Disposal), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Health and Environmental Effects of Ground-Level Ozone

United States Environmental Protection Agency
Office of Air & Radiation
Office of Air Quality Planning & Standards

FACT SHEET

July 17, 1997

HEALTH AND ENVIRONMENTAL EFFECTS OF GROUND-LEVEL OZONE

Why are We Concerned about Ground-Level Ozone?

- Ozone is the prime ingredient of smog in our cities and other areas of the country. Though it occurs naturally in the stratosphere to provide a protective layer high above the earth, at ground-level it is the prime ingredient of smog.
- When inhaled, even at very low levels, ozone can:
  - cause acute respiratory problems;
  - aggravate asthma;
  - cause significant temporary decreases in lung capacity of 15 to over 20 percent in some healthy adults;
  - cause inflammation of lung tissue;
  - lead to hospital admissions and emergency room visits [10 to 20 percent of all summertime respiratory-related hospital visits in the northeastern U.S. are associated with ozone pollution]; and
  - impair the body's immune system defenses, making people more

susceptible to respiratory illnesses, including bronchitis and pneumonia.

Who is Most at Risk from Exposure to Ground-Level Ozone?

- Children are most at risk from exposure to ozone:
  - The average adult breathes 13,000 liters of air per day. Children breathe even more air per pound of body weight than adults.
  - Because children's respiratory systems are still developing, they are more susceptible than adults to environmental threats.
  - Ground-level ozone is a summertime problem. Children are outside playing and exercising during the summer months at summer camps, playgrounds, neighborhood parks and in backyards.
- Asthmatics and Asthmatic Children:
  - Asthma is a growing threat to children and adults. Children make up 25 percent of the population and comprise 40 percent of the asthma cases.
  - Fourteen Americans die every day from asthma, a rate three times greater than just 20 years ago. African-Americans die at a rate six times that of Caucasians.
  - For asthmatics having an attack, the pathways of the lungs become so narrow that breathing becomes akin to sucking a thick milk shake through a straw.
  - Ozone can aggravate asthma, causing more asthma attacks, increased use of medication, more medical treatment and more visits to hospital emergency clinics.
- Healthy Adults:
  - Even moderately exercising healthy adults can experience 15 to over 20 percent reductions in lung function from exposure to low levels of ozone over several hours.
  - Damage to lung tissue may be caused by repeated exposures to ozone -- something like repeated sunburns of the lungs -- and this could result in a reduced quality of life as people age. Results of animal studies indicate that repeated exposure to high levels of ozone for several months or more can produce permanent structural damage in the lungs.
  - Among those most at risk to ozone are people who are outdoors and moderately exercising during the summer months. This includes construction workers and other outdoor workers.

How does Ground-Level Ozone Harm the Environment?

- Ground-level ozone interferes with the ability of plants to produce and store food, so that growth, reproduction and overall plant health are compromised.
- By weakening sensitive vegetation, ozone makes plants more susceptible to disease, pests, and environmental stresses.
- Ground-level ozone has been shown to reduce agricultural yields for many economically important crops (e.g., soybeans, kidney beans, wheat, cotton).

- The effects of ground-level ozone on long-lived species such as trees are believed to add up over many years so that whole forests or ecosystems can be affected. For example, ozone can adversely impact ecological functions such as water movement, mineral nutrient cycling, and habitats for various animal and plant species.
- Ground-level ozone can kill or damage leaves so that they fall off the plants too soon or become spotted or brown. These effects can significantly decrease the natural beauty of an area, such as in national parks and recreation areas.
- One of the key components of ozone, nitrogen oxides, contributes to fish kills and algae blooms in sensitive waterways, such as the Chesapeake Bay.

What Improvement Would Result from EPA's New Standards?

EPA's new ozone standards will provide increased protection beyond that provided by the previous standard from the following effects:

- Reduced risk of significant decreases (15% to over 20%) in children's lung functions (such as difficulty in breathing or shortness of breath), approximately 1 million fewer incidences each year, which can limit a healthy child's activities or result in increased medication use, or medical treatment, for children with asthma
- Reduced risk of moderate to severe respiratory symptoms in children, hundreds of thousands of fewer incidences each year of symptoms such as aggravated coughing and difficult or painful breathing
- Reduced risk of hospital admissions and emergency room visits for respiratory causes, thousands fewer admissions and visits for individuals with asthma
- Reduced risks of more frequent childhood illnesses and more subtle effects such as repeated inflammation of the lung, impairment of the lung's natural defense mechanisms, increased susceptibility to respiratory infection, and irreversible changes in lung structure. Such risks can lead to chronic respiratory illnesses such as emphysema and chronic bronchitis later in life and/or premature aging of the lungs
- Reduce the yield loss of major agricultural crops, such as soybeans and wheat, and commercial forests by almost $500,000,000.

Background: What is Ground-level Ozone?

- Ozone is not emitted directly into the air, but is formed by gases called nitrogen oxides (NOx) and volatile organic compounds (VOCs) that in the presence of heat and sunlight react to form ozone. Ground-level ozone forms readily in the atmosphere, usually during hot weather.
- NOx is emitted from motor vehicles, power plants and other sources of combustion. VOCs are emitted from a variety of sources, including motor vehicles, chemical plants, refineries, factories, consumer and commercial products, and other industrial sources.
- Changing weather patterns contribute to yearly differences in ozone concentrations from city to city. Also, ozone and the pollutants that cause ozone can be carried to an area from pollution sources located hundreds of miles upwind.

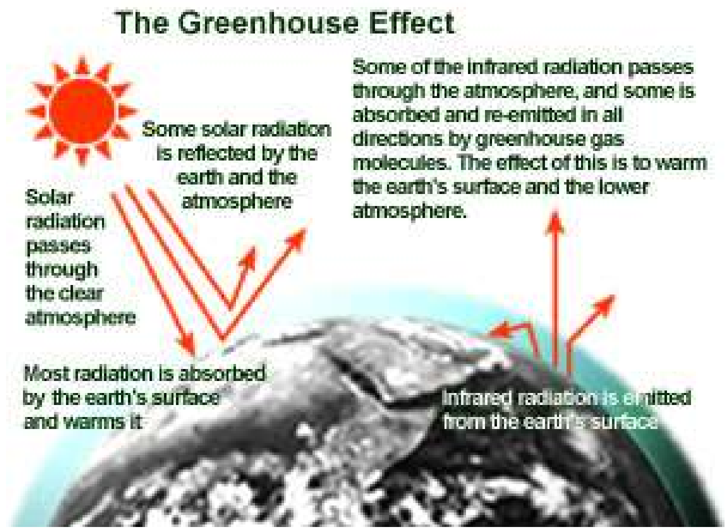
Greenhouse Effect...

The greenhouse effect is the rise in temperature that the Earth experiences because certain gases in the atmosphere (water vapor, carbon dioxide, nitrous oxide, and methane, for example) trap energy from the sun. Without these gases, heat would escape back into space and Earth's average temperature would be about 60ºF colder. Because of how they warm our world, these gases are referred to as greenhouse gases.

Have you ever seen a greenhouse? Most greenhouses look like a small glass house. Greenhouses are used to grow plants, especially in the winter. Greenhouses work by trapping heat from the sun. The glass panels of the greenhouse let in light but keep heat from escaping. This causes the greenhouse to heat up, much like the inside of a car parked in sunlight, and keeps the plants warm enough to live in the winter.

The Earth's atmosphere is all around us. It is the air that we breathe. Greenhouse gases in the atmosphere behave much like the glass panes in a greenhouse. Sunlight enters the Earth's atmosphere, passing through the blanket of greenhouse gases. As it reaches the Earth's surface, land, water, and biosphere absorb the sunlight's energy. Once absorbed, this energy is sent back into the atmosphere. Some of the energy passes back into space, but much of it remains trapped in the atmosphere by the greenhouse gases, causing our world to heat up.



(D)

The greenhouse effect is important. Without the greenhouse effect, the Earth would not be warm enough for humans to live. But if the greenhouse effect becomes stronger, it could make the Earth warmer than usual. Even a little extra warming may cause problems for humans, plants, and animals.

See an animation of how enhancing the greenhouse effect likely contributes to global warming. *(Macromedia Flash* EXIT disclaimer *Version 5 or higher plug-in required)*

Ozone

What is Ozone?

Ozone is a form of oxygen with three atoms, instead of the usual two atoms. It is a photochemical oxidant and, at ground level, is the main component of smog. Ozone is not emitted directly into the air but is formed through chemical reactions between natural and man-made emissions of volatile organic compounds (VOCs) and nitrogen oxides in the presence of sunlight. These gaseous compounds mix like a thin soup in the ambient, or outdoor, air, and when they interact with sunlight, ozone is formed. Sources of these pollutants include automobiles, gas-powered motors, refineries, chemical manufacturing plants, solvents used in dry cleaners and paint shops, and wherever natural gas, gasoline, diesel fuel, kerosene, and oil are combusted.

Ozone pollution is the periodic increase in the concentration of ozone in the ambient air, the natural air that surrounds us. It is mainly a daytime problem during summer months because warm temperatures play a role in its formation. When temperatures are high, sunshine is strong, and winds are weak, ozone can accumulate to unhealthful levels.

Ground-level ozone is the most prevalent air pollutant in Texas and the nation. Ozone is often one of several pollutants that make up "smog," which you may recognize as the reddish-brown haze that forms when air quality is particularly poor. But because ozone itself is colorless, the air can look clear even when high ozone concentrations are present.

Ozone Is a Health Hazard

The biggest concern with high ozone concentration is the damage it causes to human health, vegetation, and to many common materials we use.

High concentrations of ozone can cause shortness of breath, coughing, wheezing, headaches, nausea, eye and throat irritation, and lung damage. People who suffer from lung diseases like bronchitis, pneumonia, emphysema, asthma, and colds have even more trouble breathing when the air is polluted. These effects can be worse in anyone who spends significant periods of time exercising or working outdoors.

Children often play outside for long periods during the summer. Their lungs are still developing, and they breathe more rapidly and inhale more air pollution per pound of body weight than adults. On days when ozone levels are high, these factors put children at increased risk for respiratory problems.

Adults breathe more than 10,000 times each day. During exercise or strenuous work, we breathe more often and draw air more deeply into the lungs. When we exercise heavily, we may increase our intake of air by as much as 10 times our level at rest. The interaction between air pollution and exercise is so strong that health scientists typically use exercising volunteers in their research.

Materials damaged by ozone include rubber, nylon, plastics, dyes, and paints. Also, many food crops are damaged by ground-level ozone each year.

Ozone levels are considered by the U.S. Environmental Protection Agency (EPA) to be "unhealthful" and exceed the National Ambient Air Quality Standard when they are measured at 125 parts per billion (ppb) or higher under the one-hour standard or at 85 ppb or higher under the eight-hour standard. When a single monitoring site has exceeded the one-hour standard on more than three days in three years, the EPA classifies the surrounding county or metropolitan area as not attaining the ozone standard, or "nonattainment" for ozone. Those areas in "attainment" of the one-hour standard are required to meet the eight-hour standard of a three-year average of the fourth-highest daily maximum eight-hour concentration measured at each site not to be at or exceed 85 ppb.

Status of Texas Metropolitan Areas (One-Hour Standard)

- Houston/Galveston/Brazoria - Nonattainment
- Dallas/Ft. Worth - Nonattainment (Collin, Dallas, Denton, and Tarrant counties)
- El Paso - Nonattainment
- Beaumont/Port Arthur - Nonattainment
- Austin - Attainment
- San Antonio - Attainment
- Corpus Christi - Flexible Attainment
- Tyler/Longview/Marshall - Flexible Attainment

The EPA will announce the attainment/nonattainment status of Texas' metropolitan areas under the eight-hour standard in 2000.

What Can We Do About It?

The TNRCC has developed the Ozone Action Days Program to help the citizens of Texas understand the ozone problem and do their part in preventing ozone formation. The agency forecasts days when conditions are likely to be favorable for ozone formation. The program asks people to take voluntary action on those days to prevent exceedances of the National Ambient Air Quality Standards for ozone.

Since automobiles are the main culprit in ozone formation in Texas, we should try to limit our driving on Ozone Action Days. Actions like car pooling, riding the bus, riding a bicycle, consolidating errands, and avoiding rush hour add up to less pollution.

There are a number of voluntary steps that individuals, businesses, and industry can take to limit their pollutant emissions on Ozone Action Days.

Ozone Readings in Texas

The TNRCC collects daily ozone measurements at several monitors across the state. Peak ozone concentrations found yesterday in the state's major metropolitan areas are available as well as daily peaks since January 1, 1998. Today's peak ozone concentrations are also available. These concentrations are used in determining if the National Ambient Air Quality Standard has been exceeded.

The Air Quality Index (AQI), formerly known as the Pollution Standard Index (PSI), is derived from air pollutant measurements and is used to determine an AQI rating of "Good," "Moderate," or "Unhealthful." Because ozone measurements are usually higher in Texas than those of other air pollutants, the AQI is normally based on ozone levels.

Historical Trend

Major metropolitan areas of Texas have experienced a steady decline in ozone levels over the past 20 years due to factors such as the production of reformulated gasoline and better automobile emission controls. Levels in 1987 contradicted the overall downward trend as a result of a heat wave present during that season. A similar heat wave in 1995 caused ozone levels to be higher than the trend would suggest.

NOAA Technical Memorandum NWS SR-145

A COMPREHENSIVE GLOSSARY OF WEATHER TERMS FOR STORM SPOTTERS

Michael Branick
NOAA/WFO Norman

Contents

Introduction to the First Edition

This glossary contains weather-related terms that may be either heard or used by severe local storm spotters or spotter groups. Its purposes are 1) to achieve some level of standardization in the definitions of the terms that are used, and 2) provide a reference from which the meanings of any terms, especially the lesser-used ones, can be found. The idea is to allow smooth and effective communication between storm spotters and forecasters, and vice versa. This is an important necessity within the severe weather warning program. Despite advances in warning and forecasting techniques (e.g., Doppler radar), the human eye will always be a vital part of any effective warning system. *Storm spotters are, and always will be, an indispensable part of the severe local storm warning program.*

A complete list of terms probably is impossible to arrive at, but this list is as comprehensive as possible. Certainly it is not necessary for every spotter to know the meaning of *every* term contained herein. In this sense, the glossary serves as a reference. In fact, many of the terms may never be heard at all; they are included here just in case, someday, they are. (By the way, inclusion of a term in this glossary does *not* give license to use it freely in radio or phone communication. Use of technical terms should be kept to a minimum.) But there are some terms for which the meanings are both important and specific. The important ones are preceded by asterisks; all spotters should be familiar with the definitions of these terms before taking an active role in any spotter group.

I have written the definitions in what hopefully passes as "layman's terms." They are written to be easily understood by the storm spotter, regardless of his or her meteorological background. At times I have sacrificed technical purity for simplicity, and the result may prompt a few moans from the technical purists. So be it; this glossary wasn't written for them. Many of the terms are so closely interrelated, though, that it becomes necessary to "cross-reference;" that is, to use one or more terms in the definition of another. In this glossary, all terms that are hyperlinked within a definition are terms that are defined themselves elsewhere.

The glossary is a culmination of an effort which began in the spring of 1991. Many individuals with considerable experience in severe storm research and storm spotting (or chasing) contributed to the glossary. Because of the many comments offered by these individuals, there was disagreement on the descriptions of some terms. Those terms that were identified as such as being somewhat more controversial are handled in the text by inclusion of a second paragraph in the description, which discusses any cautions or controversy regarding the use of the term.

One last word: Storm spotting is vital, but also can be very dangerous. *No one should attempt storm spotting without first obtaining the proper training!* This glossary in itself is not to be considered sufficient training material to qualify oneself as a spotter. Further training, usually provided by the National Weather Service, must be obtained through local agencies (usually Emergency Management) before one can be certified as a storm spotter. There is also something to be said for the so-called storm chasers, who chase storms mainly for the thrill of it (and as such are *not* spotters). Chasers of all levels of background and experience will no doubt find this glossary useful or at least interesting. But while I commend their enthusiasm, I must emphasize that the glossary does *not* condone storm chasing as a leisure activity - especially for the unprepared. Proper training and foreknowledge of the dangers are required of everyone who meets face to face with severe thunderstorms - regardless of the reason for the encounter.

Michael L. Branick
National Weather Service, Experimental Forecast Facility
Norman, Oklahoma
June 1992

Introduction to the Second Edition

Based on feedback since its introduction, the "Spotter Glossary" (as this glossary has come to be known) has achieved considerable popularity among spotters - at least in the southern Plains region of "Tornado Alley." In this region, spotters actively seek as much information as possible when assessing severe weather potential on a given day. The information available often includes products which contain technical terms which are more esoteric to operational meteorology, and less familiar to those who do not pursue meteorology as a living. Examples include forecast discussions issued by local National Weather Service offices, and convective outlooks and discussions issued by the Storm Prediction Center (SPC, formerly known as SELS/NSSFC).

The question arises as to just how far one should go into the technical realm of operational meteorology when compiling a glossary like this for storm spotters. The dilemma is thus: The spotters' thirst for knowledge is admirable, but how much of the technical jargon *really* needs to be understood by spotters in the field?

I certainly do not want to turn the glossary into a meteorological textbook for spotters (or anyone else). That is not its purpose. Spotters have a vital role in the warning program, as do forecasters. And while interaction between them is an absolute necessity, one must be careful not to allow the two functions to overlap so much that we end up with spotters routinely generating their own forecasts and disregarding those made by the forecasters. That is not the spotter's function; spotting is.

On the other hand, I applaud the spotters who demonstrate a genuine interest in understanding the atmosphere that they are trained to observe. If they are interested in understanding what the forecaster is talking about when he/she refers to, say, "isentropic lift" or a "right-rear quad of an upper jet max", then they should have a place to find at least a general description of the unfamiliar terms. This is preferable to saying, "you don't need to know that." And those who are "turned off" by the technical jargon need not look into it further.

I have attempted to "strike a happy medium" by adding a number of meteorological terms and phrases to this edition, accompanied by general definitions. New terms to this addition, many of which were added at the suggestion of spotters, are listed below. They at least should help the spotter to understand a little more about why a particular feature is important to severe weather forecasting. Those who wish to pursue a particular issue beyond what is covered in this glossary are directed to the local library or the nearest university meteorology department.

Note that a similar dilemma arose in the first edition, regarding the inclusion of "slang" terms that are used most often by storm chasers. Again I distinguish between chasers and spotters - the former tending to observe storms for their own gratification, the latter tending to do so more for the needs of the community. The "slang" dilemma continues, but as with the first edition I have gone ahead and included many slang terms that I consider appropriate for spotter use. That means that terms like "Caprock delight" (which may be anything *but* a delight to residents in the path of one) will not be found herein, but that slang terms that are more-or-less universally accepted, such as "bear's cage" or "anvil crawlers," probably will appear.

Finally, modernization of the National Weather Service requires a few updates. NMC now is NCEP; SELS now is SPC. The Eta and RUC models are now here. And NEXRAD is no longer the NEXt-generation weather RADar, but is here now. The latest changes have been incorporated accordingly into the glossary.

Mike Branick

List of words added in the second edition

Glossary

Quick Alpha Access:
A | B | C | D | E | F | G | H | I | J | K | L | M | N | O | P | Q | R | S | T | U | V | W | X | Y | Z

-A-

AC - Convective outlook issued by the SPC. Abbreviation for **A**nticipated **C**onvection; the term originates from the header coding [ACUS1] of the transmitted product. See SWODY1, SWODY2.

ACCAS (usually pronounced ACK-kis) - **A**lto**C**umulus **CAS**tellanus; mid-level clouds (bases generally 8 to 15 thousand feet), of which at least a fraction of their upper parts show cumulus-type development. These clouds often are taller than they are wide, giving them a turret-shaped appearance. ACCAS clouds are a sign of instability aloft, and may precede the rapid development of thunderstorms.

Accessory Cloud - A cloud which is dependent on a larger cloud system for development and continuance. Roll clouds, shelf clouds, and wall clouds are examples of accessory clouds.

Advection - Transport of an atmospheric property by the wind. See cold advection, moisture advection, warm advection.

Air-mass Thunderstorm - Generally, a thunderstorm not associated with a front or other type of synoptic-scale forcing mechanism. Air mass thunderstorms typically are associated with warm, humid air in the summer months; they develop during the afternoon in response to insolation, and dissipate rather quickly after sunset. They generally are less likely to be severe than other types of thunderstorms, but they still are capable of producing downbursts, brief heavy rain, and (in extreme cases) hail over 3/4 inch in diameter. See popcorn convection.

Since all thunderstorms are associated with some type of forcing mechanism, synoptic-scale or otherwise, the existence of true air-mass thunderstorms is debatable. Therefore the term is somewhat controversial and should be used with discretion.

Algorithm - A computer program (or set of programs) which is designed to systematically solve a certain kind of problem. WSR-88D radars (NEXRAD) employ algorithms to analyze radar data and automatically determine storm motion, probability of hail, VIL, accumulated rainfall, and several other parameters.

Anticyclonic Rotation - Rotation in the opposite sense as the Earth's rotation, i.e., clockwise in the Northern Hemisphere as would be seen from above. The opposite of cyclonic rotation.

Anvil - The flat, spreading top of a Cb (cumulonimbus), often shaped like an anvil. Thunderstorm anvils may spread hundreds of miles downwind from the thunderstorm itself, and sometimes may spread upwind (see back-sheared anvil).

Anvil Crawler - [Slang], a lightning discharge occurring within the anvil of a thunderstorm, characterized by one or more channels that appear to crawl along the underside of the anvil. They typically appear during the weakening or dissipating stage of the parent thunderstorm, or during an active MCS.

Anvil Dome - A large overshooting top or penetrating top.

Anvil Rollover - [Slang], a circular or semicircular lip of clouds along the underside of the upwind part of a back-sheared anvil, indicating rapid expansion of the anvil. See cumuliform anvil, knuckles, mushroom.

Anvil Zits - [Slang], frequent (often continuous or nearly continuous), localized lightning discharges occurring from within a thunderstorm anvil.

AP - Anomalous Propagation. Radar term for false (non-precipitation) echoes resulting from nonstandard propagation of the radar beam under certain atmospheric conditions.

Approaching (severe levels) - A thunderstorm which contains winds of 35 to 49 knots (40 to 57 mph), or hail 1/2 inch or larger but less than 3/4 inch in diameter. See severe thunderstorm.

Arcus - A low, horizontal cloud formation associated with the leading edge of thunderstorm outflow (i.e., the gust front). Roll clouds and shelf clouds both are types of arcus clouds.

AVN - AViatioN model; one of the operational forecast models run at NCEP. The AVN is run four times daily, at 0000, 0600, 1200, and 1800 GMT. As of fall 1996, forecast output was available operationally out to 120 hours only from the 0000 and 1200 runs. At 0600 and 1800, the model is run only out to 72 hours.

-B-

Back-building Thunderstorm - A thunderstorm in which new development takes place on the upwind side (usually the west or southwest side), such that the storm seems to remain stationary or propagate in a backward direction.

Backing Winds - Winds which shift in a counterclockwise direction with time at a given location (e.g. from southerly to southeasterly), or change direction in a counterclockwise sense with height (e.g. westerly at the surface but becoming more southerly aloft). The opposite of veering winds.

In storm spotting, a backing wind usually refers to the turning of a south or southwest surface wind with time to a more east or southeasterly direction. Backing of the surface wind can increase the potential for tornado development by increasing the directional shear at low levels.

Back-sheared Anvil - [Slang], a thunderstorm anvil which spreads upwind, against the flow aloft. A back-sheared anvil often implies a very strong updraft and a high severe weather potential. (See Fig. 7, supercell.)

Barber Pole - [Slang], a thunderstorm updraft with a visual appearance including cloud striations that are curved in a manner similar to the stripes of a barber pole. The structure typically is most pronounced on the leading edge of the updraft, while drier air from the rear flank downdraft often erodes the clouds on the trailing side of the updraft.

Baroclinic Zone - A region in which a temperature gradient exists on a constant pressure surface. Baroclinic zones are favored areas for strengthening and weakening systems; barotropic systems, on the other hand, do not exhibit significant changes in intensity. Also, wind shear is characteristic of a baroclinic zone.

Barotropic System - A weather system in which temperature and pressure surfaces are coincident, i.e., temperature is uniform (no temperature gradient) on a constant pressure surface. Barotropic systems are characterized by a lack of wind shear, and thus are generally unfavorable areas for severe thunderstorm development. See baroclinic zone.

Usually, in operational meteorology, references to barotropic systems refer to *equivalent* barotropic systems - systems in which temperature gradients exist, but are parallel to height gradients on a constant pressure surface. In such systems, height contours and isotherms are parallel everywhere, and winds do not change direction with height.

As a rule, a true equivalent barotropic system can never be achieved in the real atmosphere. While some systems (such as closed lows or cutoff lows) may reach a state that is close to equivalent barotropic, the term barotropic system usually is used in a relative sense to describe systems that are really only close to being equivalent barotropic, i.e., isotherms and height contours are nearly parallel everywhere and directional wind shear is weak.

Bear's Cage - [Slang], a region of storm-scale rotation, in a thunderstorm, which is wrapped in heavy precipitation. This area often coincides with a radar hook echo and/or mesocyclone, especially one associated with an HP storm.

The term reflects the danger involved in observing such an area visually, which must be done at close range in low visibility.

Beaver('s) Tail - [Slang], a particular type of inflow band with a relatively broad, flat appearance suggestive of a beaver's tail. It is attached to a supercell's general updraft and is oriented roughly parallel to the pseudo-warm front, i.e., usually east to west or southeast to northwest. As with any inflow band, cloud elements move toward the updraft, i.e., toward the west or northwest. Its size and shape change as the strength of the inflow changes. See also inflow stinger.

Spotters should note the distinction between a beaver tail and a tail cloud. A "true" tail cloud typically is attached to the wall cloud and has a cloud base at about the same level as the wall cloud itself. A beaver tail, on the other hand, is not attached to the wall cloud and has a cloud base at about the same height as the updraft base (which by definition is higher than the wall cloud). Unlike the beaver tail, the tail cloud forms from air that is flowing from the storm's main precipitation cascade region (or outflow region). Thus, it can be oriented at a large angle to the pseudo-warm front.

Blue Watch (or Blue Box) - [Slang], a severe thunderstorm watch.

Boundary Layer - In general, a layer of air adjacent to a bounding surface. Specifically, the term most often refers to the *planetary boundary layer*, which is the layer within which the effects of friction are significant. For the earth, this layer is considered to be roughly the lowest one or two kilometers of the atmosphere. It is within this layer that temperatures are most strongly affected by daytime insolation and nighttime radiational cooling, and winds are affected by friction with the earth's surface. The effects of friction die out gradually with height, so the "top" of this layer cannot be defined exactly.

There is a thin layer immediately above the earth's surface known as the *surface boundary layer* (or simply the surface layer). This layer is only a part of the planetary boundary layer, and represents the layer within which friction effects are more or less constant throughout (as opposed to decreasing with height, as they do above it). The surface boundary layer is roughly 10 meters thick, but again the exact depth is indeterminate. Like friction, the effects of insolation and radiational cooling are strongest within this layer.

Bow Echo - A radar echo which is linear but bent outward in a bow shape (Fig. 1). Damaging straight-line winds often occur near the "crest" or center of a bow echo. Areas of circulation also can develop at either end of a bow echo, which sometimes can lead to tornado formation - especially in the left (usually northern) end, where the circulation exhibits cyclonic rotation.

Box (or Watch Box) - [Slang], a severe thunderstorm or tornado watch. See blue box, red box.

BRN - See Bulk Richardson Number.

Bubble High - A mesoscale area of high pressure, typically associated with cooler air from the rainy downdraft area of a thunderstorm or a complex of thunderstorms. A gust front or outflow boundary separates a bubble high from the surrounding air.

Bulk Richardson Number (or BRN) - A non-dimensional number relating vertical stability and vertical shear (generally, stability divided by shear). High values indicate unstable and/or weakly-sheared environments; low values indicate weak instability and/or strong vertical shear. Generally, values in the range of around 50 to 100 suggest environmental conditions favorable for supercell development.

Bust - [Slang], an inaccurate forecast or an unsuccessful storm chase; usually a situation in which thunderstorms or severe weather are expected, but do not occur.

BWER - **B**ounded **W**eak **E**cho **R**egion. (Also known as a vault.) Radar signature within a thunderstorm characterized by a local minimum in radar reflectivity at low levels which extends upward into, and is surrounded by, higher reflectivities aloft (Fig. 2). This feature is associated with a strong updraft and is almost always found in the inflow region of a thunderstorm. It cannot be seen visually. See WER.

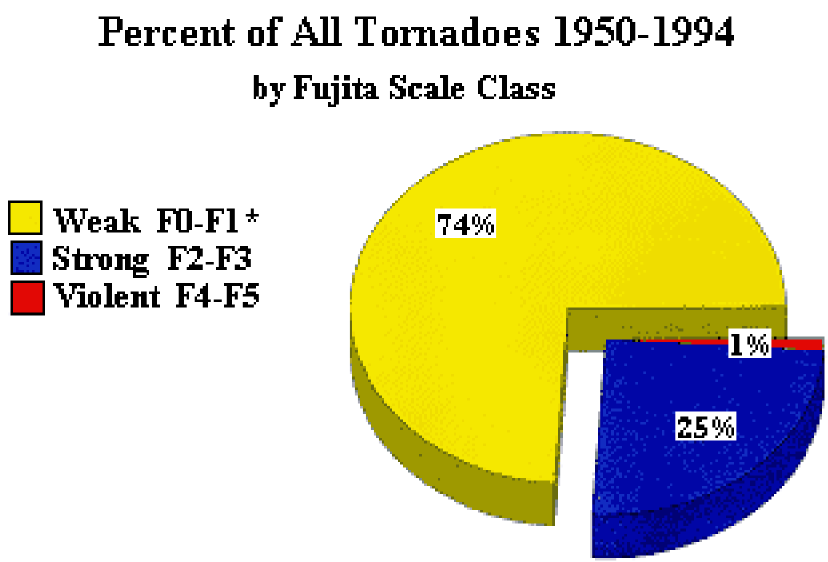
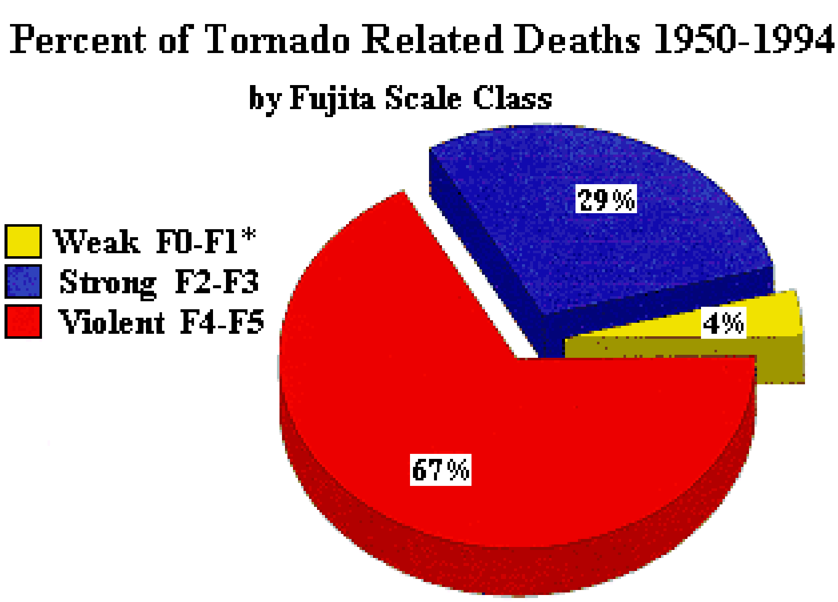
The Fujita Scale

The Fujita Scale is used to rate the intensity of a tornado by examining the damage caused by the tornado after it has passed over a man-made structure.



The **"Percentage of All Tornadoes 1950-1994" pie chart** reveals that the vast majority of tornadoes are either weak or do damage that can only be attributed to a weak tornado. Only a small percentage of tornadoes can be correctly classed as violent. Such a chart became possible only after the acceptance of the Fujita Scale as the official classification system for tornado damage. It is quite possible that an even higher percentage of all tornadoes are weak. Each year the National Weather Service documents about 1000 tornado touchdowns in the United States. There is evidence that 1000 or more additional weak tornadoes may occur each year and go completely undocumented.



The **"Percentage of Tornado-Related Deaths 1950-1994" pie chart** shows that while violent tornadoes are few in number, they cause a very high percentage of tornado-related deaths. The Tornado Project has analyzed data prior to 1950, and found that the percentage of deaths from violent tornadoes was even greater in the past. This is because the death tolls prior to the introduction of the forecasting/awareness programs were enormous: 695

dead(Missouri-Illinois-Indiana, March 18, 1925); 317 dead(Natchez, Mississippi, May 7, 1840);.255 dead(St. Louis, Missouri and East St. Louis, Illinois, May 27, 1896); 216 dead(Tupelo, Mississippi, April 5, 1936); 203 dead(Gainesville, GA, April 6, 1936). In more recent times, no single tornado has killed more than 50 people since 1971.

The Fujita Scale(also known as the Fujita-Pearson Scale) may not be a perfect system for linking damage to wind speed, but it had distinct advantages over what had gone on before its inception. And it was simple enough to use in daily practice without involving much additional expenditure of time or money. From a practical point of view, it is doubtful that any other system would have found its way into widespread accepted use, even to this day. The entire premise of estimating wind speeds from damage to non-engineered structures is very subjective and is difficult to defend from various meteorological perspectives. Nothing less than the combined influence and and prestige of the late Professor Fujita and Allen Pearson, director of NSSFC(National Severe Storm Forecast Center) in 1971 could have brought this much needed system into widespread use. The FPP scale rates the intensity of the tornado, and measured both the path length and the path width. The Fujita part of the scale is as follows:

The Fujita Scale

F-Scale Number	Intensity Phrase	Wind Speed	Type of Damage Done
F0	Gale tornado	40-72 mph	Some damage to chimneys; breaks branches off trees; pushes over shallow-rooted trees; damages sign boards.

F1	**Moderate tornado**	**73-112 mph**	**The lower limit is the beginning of hurricane wind speed; peels surface off roofs; mobile homes pushed off foundations or overturned; moving autos pushed off the roads; attached garages may be destroyed.**
F2	**Significant tornado**	**113-157 mph**	**Considerable damage. Roofs torn off frame houses; mobile homes demolished; boxcars pushed over; large trees snapped or uprooted; light object missiles generated.**
F3	**Severe tornado**	**158-206 mph**	**Roof and some walls torn off well constructed houses; trains overturned; most trees in fores uprooted**
F4	**Devastating tornado**	**207-260 mph**	**Well-constructed houses leveled; structures with weak foundations blown off some distance; cars thrown and large missiles generated.**

F5	**Incredible tornado**	**261-318 mph**	**Strong frame houses lifted off foundations and carried considerable distances to disintegrate; automobile sized missiles fly through the air in excess of 100 meters; trees debarked; steel re-inforced concrete structures badly damaged.**
F6	**Inconceivable tornado**	**319-379 mph**	**These winds are very unlikely. The small area of damage they might produce would probably not be recognizable along with the mess produced by F4 and F5 wind that would surround the F6 winds. Missiles, such as cars and refrigerators would do serious secondary damage that could not be directly identified as F6 damage. If this level is ever achieved, evidence for it might only be found in some manner of ground swirl pattern, for it may never be identifiable through engineering studies**

A key point to remember is this: ***the size of a tornado is not necessarily an indication of its intensity.*** Large tornadoes ***can*** be weak, and small tornadoes ***can*** be violent. A good example of a relatively "small" tornado would be the Pampa, Texas tornado of 1995, which can be seen in Tornado Video Classics III. This tornado is pictured on the right side of the slipcase, shown here.

Notice the debris in the air. Eyewitnesses to this tornado claim to have seen as many as 6 vehicles in the air at the same time when it passed over a parking lot. Another consideration is the stage in the life cycle of the tornado. A "small" tornado may have been larger, and is at the "shrinking" stage of its life cycle, like the Tracy, Minnesota tornado on one of our posters, and also our logo, seen on the navigation bar to the left if you are using our frames. Large tornadoes can also be strong and small tornadoes can be weak. The Fujita Scale is based on ***damage***, not the appearance of the funnel. Storm spotters, storm chasers and other weather observers often try to estimate the intensity of a tornado when they are in the field, basing their judgement on the rotational speed and amount of debris being generated as well as the width. However, the official estimate is made ***after*** the tornado has passed. Personnel from the National Weather Service office that issued the warning survey the site to determine the F-Scale rating. Sometimes they call in experts from out of the area. Aerial surveys are occasionally done after violent tornadoes to determine the exact damage track. Insurance companies may also call in wind engineers to do their own evaluations, but the official rating is set by the NWS. A few of the things they all look for are:

- attachment of the walls and floor to the foundation of the building
- attachment of the roof to the rafters and walls
- whether or not there are steel reinforcing rods in concrete or cinder block walls
- whether there is mortar between the cinder blocks

After the NWS office does the survey, the official rating is recorded, and eventually posted at the SPC site. If it is a killer tornado we also post the rating on our site with the description of the event, and on our "all tornadoes" page. The NWS office may also write up a more extensive report, which may or may not be posted on the web. A good example of such a report would be the one done on the Florida tornadoes of March, 1998.

The Fujita Scale is very subjective, and varies according to how experienced the surveyor is. We have many readers who have tried to do their own "surveys" of tornado damage when storms have occurred in their area. However, the less experienced the surveyor is, the more likely he/she is to be awed by the damage, and the more likely they are to give it a high rating. Brian Smith of the Omaha, Nebraska area NWS office, a former student of Dr. Fujita and an expert frequently brought in to do site surveys, tells of hearing about a tee-shirt with the words "F-3 My Foot" printed on it.

Media hype and inexperience with tornado damage also plays a **big** part in exaggerated F-Scale claims seen on television or in the paper. A reporter may see a collapsed concrete block home and be very impressed, never noticing that there was no mortar between the blocks. They may be aghast to see a park whose trees have been leveled, but not know that the species had very shallow roots, planted in soil that was soft and soggy from torrential rains, and thus easily toppled. They may see a roof that had been blown a quarter of a mile from its house, and not know that the roof was attached to the house with only a few nails, and when lofted into the air, acted as a "sail." They may see a light post that is bent at a 30 degree angle and think that it must have taken a 600 mph wind to do that, not knowing that a van had been blown into the pole, bending it, then been towed off to help clear the streets. For some of the media, the exaggerations make for a better story than the actual facts. Fortunately, they often make up for this by printing helpful stories about aid available and inspirational human interest stories.

As if doing a site survey of a track is not difficult enough, tornadic storms may also be accompanied by complex combinations of strong downbursts and other straight line winds. Separating tornado damage from other wind damage makes for a daunting, difficult task for even the most experienced surveyor.

The Seymour, Texas, tornado of April 10, 1979 is a prime example of a tornado that is destined to be misjudged on the Fujita Scale. This spectacular funnel was probably capable of F4 damage, had it passed through a town. It produced only telephone pole and tree damage, and thus could be rated no higher than F2 damage. The Seymour tornado was in the same family as the devastating Wichita Falls, Texas tornado, which remains as of this writing, the most damaging in US history. Video of this tornado is used in the Fujita Scale segment of Tornado Video Classics II

Professor Fujita continued his work until his death at the age of 78. Mr. Pearson is semi-retired, and is very active on the web.

We recently created four new color posters showing tornadoes of various intensities and identifying their F-Scale ratings. They can be viewed here.

NEW!

Is this a record setting year? It could be!

Welcome to the Tornado Project Online! We are a small company that gathers, compiles, and makes tornado information available to weather enthusiasts, the meteorological community and emergency management officials in the form of tornado books, posters, and videos. There are many sites with tornado data, so we are giving the subject a little different twist, with tornado myths, tornado oddities, personal experiences, tornado chasing, tornado safety, and tornadoes in the past as well as more recent tornadoes. We will be adding new pages and have some unique ideas planned during the next few months, so come back often and check us out. You'll be glad you blew in!

If you want to use frames, you will get more reliable results by using the navigation panel on the left.

Tornado Field Trip

Trailhead Teacher's Resources Start Field Trip

Do you recall the tornado in "The Wizard of Oz" that takes Dorothy's house and transplants it to the land of Oz? Well we don't know of any tornadoes that have picked something up and moved it to Oz, but we do know that tornadoes can have unbelievable strength and that trucks and houses *have* been picked up and placed elsewhere. In this field trip students will learn about the conditions that allow tornadoes to form, where these windstorms occur, how they're measured, myths about tornadoes, and how to prepare.

Objectives

- Students will learn about how tornadoes are formed.
- Students will be taken to Web sites where they can research various types of information about tornadoes.

See our Awards

Concepts

1. What conditions allow a tornado to form?
2. Where do most tornadoes occur?
3. What are the typical windspeeds of a tornado?
4. What types of destruction do tornadoes cause?
5. What are some of the strangest occurances tornadoes have caused?
6. How long does a typical tornado last?
7. How far do tornadoes travel during a storm?

Terms To Learn

air pressure
condensation
cumulonimbus cloud
Fujita scale
front
funnel cloud
mesocyclone
Tornado Alley
twister
updraft
wall cloud

Vortex

Whirling water creates a tornado in a bottle.

Fluids

Water forms a spiraling, funnel-shaped vortex as it drains from a 2-liter soda bottle. A simple connector device allows the water to drain into a second bottle. The whole assembly can then be inverted and the process repeated.

materials

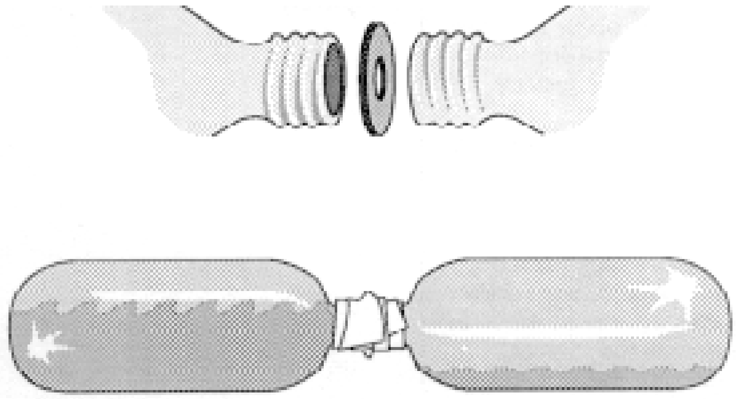
✔ **Two 2-liter soda bottles.**

✔ **A Tornado Tube™** plastic connector (available from science museums, science stores, novelty stores, and some scientific supply companies). Or you can make your own using a washer with a 3/8 inch (9.5 mm) hole and electrical tape.

✔ **Optional:** A small dropper bottle of food coloring and/or bits of paper.

assembly

(5 minutes or less with the Tornado Tube™; 15 minutes or less with the washer and electrical tape)



Fill one of the soda bottles about two-thirds full of water. For effect, you can add a little food coloring or paper bits to the water. Screw the bottles onto both ends of the plastic connector. (CAUTION: Do not screw the connector on too tightly!) Or tape the bottles together with the washer between them.

to do and notice

(15 minutes or more)

Place the two bottles on a table with the filled bottle on top. Watch the water slowly drip down into the lower bottle as air simultaneously bubbles up into the top bottle. The flow of water may come to a complete stop.

With the filled bottle on top, rapidly rotate the bottles in a circle a few times. Place the assembly on a table. Observe the formation of a funnel-shaped *vortex* as the bottle drains.

Notice the shape of the vortex. Also, notice the flow of the water as it empties into the lower bottle.

You can make the vortex with a single bottle by twirling the bottle and holding it over a water basin or the ground to drain, but you lose the water and have to refill the bottle each time you use it.

what's going on?

When the water is not rotating, *surface tension* creates a skinlike layer of water across the small hole in the center of the connector.

If the top bottle is full, the water can push out a bulge in this surface to form a bulbous drop, which then drips into the lower bottle. As water drops into the lower bottle, the pressure in the lower bottle builds until air bubbles are forced into the upper bottle. The pressure that the water exerts on the surface in the connector decreases as the water level in the upper bottle drops. When the water level and pressure drop low enough, the water surface can hold back the water and stop the flow completely.

If you spin the bottles around a few times, the water in the upper bottle starts rotating. As the water drains into the lower bottle, a vortex forms. The water is pulled down and forced toward the drain hole in the center by gravity. If we ignore the small friction forces, the *angular momentum* of the water stays the same as it moves inward. This means that the speed of the water around the center increases as it approaches the center of the bottle. (This is the same reason that the speed of rotating ice skaters increases when they pull in their arms.)

To make water move in a circle, forces called *centripetal forces* must act on the water. These "center pulling" forces are provided by a combination of air pressure, water pressure, and gravity.

You can tell where the centripetal forces are greater by looking at the slope of the water. Where the water is steeper, such as at the bottom of the vortex, the centripetal force on the water is greater. Water moving with higher speeds and in smaller radius curves requires larger forces. The water at the bottom of the vortex is doing just this, and so the wall of the vortex is steepest at the bottom. (Think about race cars: Racetracks have steeper banks on high-speed, sharp corners to hold the cars in their circular paths around the track.)

The hole in the vortex allows air from the lower bottle to flow easily into the upper bottle. This enables the upper bottle to drain smoothly and completely.

etcetera

Vortices occur in nature in many forms: Tornadoes, whirlpools, weather systems, galaxies, etc.

The essence of a vortex is that objects are drawn together toward the center, then miss!

Spiral waves form in the water surface of the vortex. These waves appear to move in slow motion as they travel upward through the downward flowing water.

The Exploratorium's Vortex exhibit was created by artist Douglas Hollis. Related Snacks are Momentum Machine and Spinning Blackboard.

What is a tornado?

Charles A. Doswell III

Cooperative Institute for Mesoscale Meteorological Studies*

Norman, OK

***Disclaimer:** This essay has not been reviewed by the scientific community and, therefore, can be said to be represent nothing more than a collection of my opinions. It certainly does not have (and I have not sought) the imprimatur of anyone in my official chain of command, and doesn't represent the position of NSSL. My intent in making these opinions available is to discuss some issues and perhaps to stimulate discussion and thought at the same time. Therefore, feedback is welcomed: you can e-mail me at: cdoswell@hoth.gcn.ou.edu.

Last update: **01 October 2001**

What's new: Accounted for the revised Glossary definitions of tornado and waterspout, plus a few minor changes.

---

1. Misconceptions

The most widely-accepted definition of a tornado can be found in, among other sources, the *Glossary of Meteorology (Huschke 1959):*

> **Tornado** -- A violently rotating column of air, pendant from a **cumulonimbus** cloud, and nearly always observable as a "funnel cloud" or **tuba**.

Curiously, this definition says nothing about that rotating column being in contact with the surface. Perhaps the next edition of the Glossary will correct this oversight.

Update (01 Oct 2001): In fact, this definition *has* been corrected in the new *Glossary* (Glickman 2000):

> **Tornado** -- 1. A violently rotating column of air, in

> contact with the ground, either pendant from a **cumuliform** cloud or underneath a cumuliform cloud, and often (but not always) visible as a **funnel cloud**.

There is no definition of a tornado that has been extensively peer-reviewed.[4]

A brief digression:

I want to take a moment to gripe about the word **touchdown** in association with tornadoes. I believe that "touchdown" is inappropriate to describe the actual process of tornadic winds commencing at the surface. There is nothing coming down, in the sense that a solid tube would fall out of the sky. What actually goes on when a vortex is present in the atmosphere is that the vortex either (a) is already present at the surface, or (b) wraps around itself, like a smoke ring. If you find this confusing, please see my Vorticity Primer, where this concept is described in some detail. The laws of Fluid dynamics tell us that (a) and (b) are the **only** two options. As noted elswhere [in *formal* form, here], the intense part of the vortex **can** build downward, but this is not the same as a tornado descending. What is actually happening is that the vortex at the surface increases its intensity (and decreasing its scale at the same time) to tornadic proportions, eventually producing winds capable of tornadic damage ... but the vortex itself is almost certainly already in contact with the ground. Strictly speaking, "the vortex" should not be equated to "the tornado," since the vortex can be present but with non-damaging windspeeds. Prior to the commencement of damaging winds at the ground, the surface vortex is weak and spread out ... as it intensifies, the winds increase and the size of the circulation contracts. The vortex also can intensify upward (as we think happens in the tornadoes that are called "landspouts" - see below). Rather than "touchdown" I would prefer to consider the observed process of the commencement of tornadic winds at the surface to be one of "spin-up" ... I hasten to add that "up" in this context does **not** imply ascent, but rather an increase of spin intensity.

Perhaps some of you have seen some video of two funnel clouds that are seen at cloud base ... with time, the vortices curl toward each other and seem to "connect" ... what is happening there is a vortex that wraps around itself, just like a smoke ring. Since air is a fluid, it obeys the laws of fluid dynamics, which include this "law" of vortices (that they either form loops or they end only on a solid surface). NSSL has a photo showing this phenomenon of a vortex ring (see photo #3 in the NSEA Photo Gallery). These have been given the name "bowtie funnels" by some storm chasers.

During our chase in 1989, my partner (Al Moller) and I happened to drive right under a strongly rotating towering cumulus. As it passed overhead, our surface winds changed from southeasterly, to easterly, to northeasterly, to northerly, to northwesterly, to westerly, to southwesterly, all in within a minute or two! At no time were the winds more than 10-15 knots. We experienced a surface vortex of near-tornadic **size** but not of tornadic **intensity**! [an F-(minus)1 tornado?] Later on, this rotating cloud produced a tornado.

The observed "descent" of cloud to form the funnel-shaped cloud of a tornado is also not associated with true descent. As the vortex intensifies, its central pressure falls. When the pressure is reduced to that which permits condensation of water vapor into cloud material, the funnel-shaped cloud appears. It often appears to descend for perhaps two distinct reasons: 1) Near cloud base, the pressure doesn't have to fall as far for the air in the vortex to reach condensation as it does further down, or 2) The circulation intensity is actually increasing downward. We do not know the actual distribution of pressure in tornadoes, of course, and the tornadic pressure field may have many complexities. However, it is unlikely that clouds from above are descending to create the funnel-shaped cloud ... generally, **descent dissipates clouds**. Of course, it could be that descent in the core of a two-celled vortex *might* produce a funnel-shaped cloud simply by pulling down cloud matter in a way that evaporation of the cloud droplets is relatively slow along the axis and relatively faster along the margins, resulting in a tapered funnel. Someday, perhaps we can get some answers ... .

The public at large has many misconceptions about tornadoes, a notable one being that unless the condensation cloud associated with that rotating column of air is touching the surface, it is not a tornado. This is manifestly untrue, as many storm chasers realize fully. Since it is the **wind** associated with the rotating air column that does the damage, it is the moving air (wind) and **not the cloud** that constitutes the tornado. Many tornadoes have been observed (Fig. 1 is but one of countless examples) that do not have condensation funnels all the way to the surface, but which clearly are in contact with the ground. It is quite possible for the circulation to be more or less completely invisible for at least some portion of the life cycle of the event. In the case of waterspouts (see below), this is frequently the case, but such events also occur in the dusty, dry mid-continental plains (Fig. 2). Chasers may refer to these events with such slang terms as "dust bowls" or "dirt-daubers."

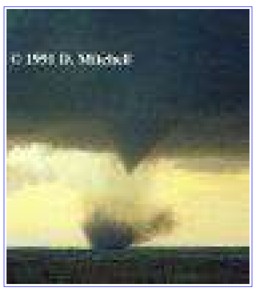

Fig. 1. Example of a tornado where the funnel does not reach the surface, on 15 May 1991, near Laverne, Oklahoma [photo ©1991 DeWayne Mitchell, used by permission].

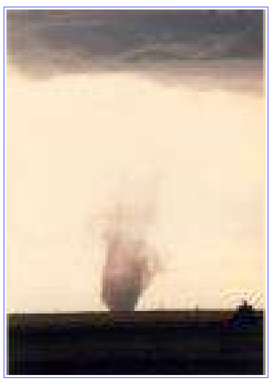

Fig. 2 Example of a tornado with no visible funnel, on 02 July 1987, near Denver, Colorado [photo

©1987 Bill Gallus, used by permission].

When the visible funnel does not reach the surface, silly reports of a "funnel cloud accompanied by wind damage" can occur, or such absurdities are reported as "The funnel only reached treetop level" or whatever. We probably will find it difficult ever to convince the public as a whole that a tornado is *wind* and not the funnel cloud. Hopefully, no self-respecting meteorologist would do anything to perpetuate such misconceptions. Also, storm chasers who believe this could get into a lot of trouble, quickly! By the way, "tornado on the ground" is redundant, since to **be** a tornado, the damaging winds have to be present at the surface at that time.

Many strong-to-violent tornadoes include a phase where the tornado appears as a truncated cone funnel (not reaching the surface) with occasional rope-like multiple vortices beneath it (e.g., the Xenia, Ohio tornado of 03 April 1974 or the Binger, Oklahoma tornado of 22 May 1981, Fig. 3). Lay persons might have considerable difficulty recognizing this for what it is, since it does not look like a "funnel-shaped cloud." Such an appearance, however, does **not** imply that one is in fact dealing with a strong-to-violent tornado ... **a tornado's appearance is not a reliable indicator of its intensity**, chaser lore notwithstanding.

Fig. 3. Binger, Oklahoma tornado of 22 May 1981, showing a truncated cone funnel with multiple vortices. [NSSL photo by Erik Rasmussen],

Among chasers, it is a common assumption that if a funnel cloud extends halfway or more to the ground from cloud base, there almost certainly is a tornadic circulation at the surface. This may or may not be true in any specific instance ... it probably is more right than wrong. For official purposes, however, such a "storm chaser's rule" is not a legitimate assumption; by definition, one must confirm the existence of a damaging circulation at the surface before the event can legitimately be called a tornado. If such a confirmation cannot be made, the event must be considered to be a funnel cloud or a "possible" tornado.

Recent research, some connected with the VORTEX program, has made it clear that vortical flows are often present at the surface, even without any visible funnel cloud. If a condensation funnel is present that does not "touch" the surface, some sort of "circulation" [10] is virtually certain to be present, but it may not be sufficient to raise debris. In the absence of debris, it is hard to know if the situation has become tornadic or not. I'll return to this later.

2. Waterspouts, landspouts, and ...?

Having mentioned waterspouts, this raises another topic. There is a special name for a tornado moving over the water: a waterspout. Why do we not have special names for tornadoes moving over sand (sandspout?), or asphalt (tarmacnado?), or mobile homes (manufacturnado?), or eucalyptus trees (gumswirl?)? Is it a waterspout if the water is fresh water rather than sea water? Does it become a waterspout if it moves over a lake? What about a pond? How about encountering a swimming pool or perhaps a puddle? How big does a body of water have to be to create a waterspout from a tornado? What about when crossing a river? A creek? A dry streambed? Would this last example be a "dry waterspout"? I am engaging deliberately in *reductio ad adsurdum* here because **I do not believe there is any scientific distinction of consequence between a waterspout and a tornado**!

In the new *Glossary*, in fact, the *definition* of a waterspout is now:

> **Waterspout** -- 1. In general, a **tornado** over a body of water. 2. In its most common form, a nonsupercell tornado over water.

For years, people believed that waterspouts were a distinctly different phenomenon, uniquely associated with tropical and subtropical convection that might not even qualify as cumulonimbus clouds. Of course, some "authorities" knew of the annoying problem of supercells over water; recognition of this produced the abominable term: "tornadic waterspout." Of late, it has been observed that phenomena quite comparable to waterspouts arise over the land, leading to another dubious term (that I have used!): "landspout" (by analogy, a "waterspoutic tornado"?). In my opinion, *all these terms refer to the same phenomenon*: an intense vortex associated with deep moist convection. Thus, I must quibble with the standard definition for its exclusion of convective vortices that happen with clouds not meeting the criteria to be cumulonimbi (e.g., those without glaciation at the cloud top).

I am proposing the following definition:

> **Tornado --** A vortex extending upward from the surface at least as far as cloud base (with that cloud base associated with deep moist convection), that is intense enough at the surface to do damage should be considered a tornado.

This is without regard to

- the underlying surface,
- the existence/non-existence of a condensation cloud from cloud base to the surface,
- the depth of the moist convective cloud,
- the presence/absence of ice in the upper reaches of the convective cloud,
- the occurrence/non-occurrence of lightning within the convective cloud, or even
- the intensity of the phenomenon beyond some lower threshold.

My broadened definition is designed to ignore what I consider to be incidental aspects of the situation. I believe that the physical process giving rise to an intense vortex is not associated with any of these coincidental issues and so the labeling of the real vortices that occur should not depend on them. It also excludes any phenomena not associated with deep moist convection, such as dust devils or "mountainadoes," and avoids making artificial and scientifically unjustified distinctions between "spouts" and tornadoes.[5]

I hasten to add that I do **not** believe that the physical processes giving rise to tornadoes are all the same. It appears that tornadoes arise in many different ways, and perhaps different process can be associated with the tornado at different times in its life cycle. Moreover, not all tornadoes associated with a given moist convective cloud arise via the same processes (see Doswell and Burgess 1993). Some of the relatively intense vortices associated with a convective storm probably should **not** be considered tornadoes; e.g., circulations not extending to the surface, and true gustnadoes (see below), assuming we can identify them as such. There is a fair amount of anecdotal evidence for non-tornadic intense vortices in association with convection (see Moller et al. 1974; Cooley 1978; Doswell 1985; Bluestein 1988; Doswell and Burgess 1993; Bluestein 1994), but not much hard information about the processes giving birth to these vortices.

At present, we are more or less content to classify tornadoes according to whether or not they occur with supercells. In the future, it may become scientifically useful to sub-classify tornadoes even further, as we learn more about how real events occur (as opposed to, say, events in our computer simulations!). If we must classify, then it seems to me that we should do so on the basis of physical processes and not be concerned with superficial aspects of the events. We are far enough along in our understanding of tornadoes that we ought to be able to move at levels deeper than the surface now.

3. Taxonomy problems [6]

Now, I wish to move into much more speculative and uncharted territory. For a tornado such as the famous Union City, Oklahoma tornado of 24 May 1973 (hereinafter referred to as "UC"), the life cycle of the event can be reasonably clear and understandable. The early stages with a rotating wall cloud give way to the development of a funnel cloud, then damage at the surface begins, followed by the descent of the funnel cloud to the ground. The width of the funnel increases to some maximum, and then begins to shrink, finally reaching a rope-like dissipation. The documentation for the UC event is extensive (see Brown 1976) and it might even be considered protoypical for many purposes. There is relatively little ambiguity in such events; there obviously is only the one tornadic vortex and its visual evolution can be inferred without much error from looking afterward at the evidence along the path. The UC damage path, surveyed extensively immediately after the storm, matches the visual images quite nicely. The visible funnel was more or less continuous until dissipation. The damage path coincides quite nicely with the visible vortex evolution. During dissipation, the visible funnel disappeared, but a clear debris cloud was still present for a few seconds longer at the surface.

All tornadoes are not this simple, however. The reality of tornadic events comprises a range of visible aspects that at times can be confusing and defies simple classification schemes. Multiple vortices introduce some complications. The UC event did not exhibit any obvious multi-vortex phase, but many tornadoes do. To some extent, the multi-vortex phenomenon is relatively well understood; the formal scientific literature on the subject (e.g., Snow 1978; Rotunno 1982; Gall 1985; Lewellen 1993) is fairly extensive. Whereas vortices like the UC event are "stable" in the sense that their visual aspect changes only slowly with time, other vortices are not so stable. The classic video from a helicopter in Minneapolis on 18 July 1986 illustrates the erratic, rapidly-changing visual structure of tornadoes having persistent multi-vortex behavior. Looked at from the perspective of a post-storm damage survey, however, the damage path in such a case might give a much more continuous "picture" of the event. Whereas the visual images are changing rapidly, the damaging winds at the surface can be more or less continuous, so if we did not have the video with which to compare, our damage survey might conclude with little doubt that a single tornado was involved, even though eyewitness accounts might well seem to contradict that rather vigorously. As scientists, we might smugly dismiss those eyewitness accounts with the observation that it probably was a multi-vortex event. For the Minneapolis event, all is well with such a dismissal; when visual evidence is present, perhaps we can afford to be smug. In the absence of visual documentation, I am rather less inclined to heap scorn on eyewitness accounts of odd behavior. I wasn't there, so I can't be certain what the eyewitnesses saw! [1]

After the 08 June 1974 tornado outbreak in Oklahoma and Kansas, I saw some 8 mm film (this was prior to the video age!) footage of a remarkable tornadic evolution; I believe it was a tornado near Luther, OK. I have been unable to relocate that footage, unfortunately. My memory of the film is that a quite distinct tornado (somewhat reminiscent of the UC funnel in shape, but with a lower cloud base) was moving along seemingly in a relatively stable fashion, when it seemed to dissipate suddenly and another similar funnel appeared rapidly right next to where the original funnel had been, all within about a second or two. The rapidity with which this remarkable transformation occurred was amazing to me. It seemed rather obvious to me that this visual record would almost certainly be the only clue that such an event occurred; now that record appears to be gone or at least unlocatable. The proximity of the two funnels virtually guaranteed that the damage path, as surveyed, would be viewed as continuous. Thus, if there were some slight offset in the damage path associated with the dissipation of one funnel and the development of the next, it almost certainly would not be evident to those doing a damage survey. To my knowledge, the tornado is classified as a single event. Perhaps this is a proper classification; perhaps this was simply a brief visual manifestation of a transient episode in the life of a single tornado. I raise the point simply because of the possible implications of that sudden transition.

Another, somewhat similar, episode has been documented by Davies et al. (1994) for the Hesston, Kansas tornado of 13 March 1990. In the Hesston storm, the visible funnel seemed to dissipate rapidly and re-form near the axis where it had been earlier but with a substantially smaller diameter, all within a brief time span. The question was asked, but not answered: Was this all a single tornado or could it be viewed as the dissipation of one tornado, followed by the nearly immediate development of another? Again, apparent continuity of the damage seems to leave this particular instance reasonably well-defined as a single event. Is it possible to conceive of such an event with a somewhat longer time span between the dissipation of one funnel and the development of another? I certainly have no trouble imagining something of that sort happening, such that a superficial examination of the damage path still might not detect such a gap. Not all damage surveys involve a thorough analysis of the path from start to end, both from the ground and from the air. Moreover, there might be several ways in which the illusion of a continuous damage track would appear even with a reasonably thorough survey. How big a gap in the path is enough to start considering the events to be separate? This brings me to the following discussion:

4. Do tornadoes "skip"? [7]

By the way, in most of my experience, tornadoes do not skip. Rather, they may weaken or intensify and thereby create gaps in the damage, but their continuity is relatively high. I have not heard a lot of storm chasers discussing how the tornadoes they observe "bounce" and "skip" across country. Gaps in the damage path can arise because (a) there is nothing to damage, or (b) the circulation has weakened to the extent that no evidence of the tornado's passage is left. Should we consider the latter to signify that the tornado "skipped" or "lifted" during an otherwise continuous track? Even more radically, would we say the cessation in damage constituted a cessation of the tornado? In many such cases, it is clear from film or video that a visible funnel and even a dust and debris whirl (albeit perhaps only small debris) is continuous even though "damage" is not occurring. In such a case, the damage path would give erroneous input to the classification of the event, often leading to the notion of "skipping" as a means of avoiding having each gap in an otherwise linear path represent a gap between individual tornadoes.

In footnote #7 (above), I proposed the following, slightly modified definition of a tornado:

> **Tornado --** A vortex extending upward from the surface at least as far as cloud base (with that cloud base associated with deep moist convection), that is intense enough at the surface to do damage at one or more points along its path, should be considered a tornado.

In some of these cases, it certainly can be argued that these are transient, superficial fluctuations in what might well be interpreted properly as a single event. A continuous, more or less linear damage path would be a compelling argument in favor of such an interpretation. However, the existence of multiple vortices, now a commonly-accepted variant of tornadic behavior, raises some troubling issues.

Furthermore, I have specifically *avoided* defining the windspeed at which "damage" begins (or ends!). The current windspeeds provided in the Fujita scale [see here (item #B.11) and here] indicate that F0 damage begins at 40 mph. That is not even a wind strong enough to qualify for a "severe" thunderstorm by operational standards (58 mph)! However, a 40 mph wind certainly would raise surface dust in, for example, many parts of West Texas! An observer must see "debris" at the surface if an event is to be considered a tornado, but this requirement is pretty nebulous. The ability to raise debris is, in a very real sense, dependent on the underlying surface and the conditions preceding the event. It's harder to raise dust on a muddy field than a dry one. We are unlikely ever to be able to obtain windspeed measurements associated with the surface circulations in real time (i.e., as an observer watches the event), so it seems fruitless to establish windspeed criteria in the definition. The only value it might have would be in the abstract, or for the unforeseen future, where it *might* someday be possible to get detailed windspeed measurements. If I were pressed to provide a threshold, I'd say that the minimum tornadic windspeed should be 58 mph (50 kts or about 25 m s^{-1}), which is the current threshold used for "straightline" winds in thunderstorms.

For clearly damaging tornadoes with prominent condensation funnels, etc., there is little ambiguity. It's only on the margins of the definition that we have problems (although that seems to be a common problem with *any* definition, as this essay, overall, is suggesting). The ambiguity of what winds are capable of producing "damage" clearly feeds into the problem of "skipping" tornadoes, of course.

Let me digress for a moment, to establish some more background.

5. Another brief digression

Atmospheric vortices form a spectrum, in my opinion, with no clear boundaries **kinematically** between events. That is, atmospheric flow can be organized into vortices of essentially **any** size. The fact that there are **preferred** sizes often reflects the existence of the dominance of some physical instability that has a characteristic scale length (e.g., baroclinic instability). Thus, vortices can be classified according to the **physical processes** that give them birth, but there is no compelling reason for classifying vortices solely on the basis of their **size**. Hence, the boundaries among events have an obvious tendency to be quite "fuzzy." We think we know, for instance, the characteristic scale size of an extratropical cyclone. We also know that cyclonic storms exist which we consider to be "distinct" in some way (typically size is a factor in making such distinctions) from extratropical cyclones; polar lows or tropical cyclones to name two. Nevertheless, there are times when polar lows or even tropical cyclones seem to have a decidedly baroclinic aspect and one can get into intense arguments about where any particular event fits in a taxonomy of cyclones. It seems that even on synoptic scales, there is room for debate over classifications.

If we put a particular event into a particular bin, we tend to apply a set of default assumptions about the character of such an event. This can be the source for considerable confusion at times, as I have tried to indicate in a comment about a particular classification scheme (Doswell 1991). Classification does not seem to be a very important aspect of science to some, but it affects the way we view the real world. In effect, putting an event into a "bin" seems to imply all sorts of things about that event which may not be valid for the particular instance.

6. Possibilities and observations

Having put up with this preamble, indulge me for a bit more. I am going to describe a pot pourri of events that (a) I have witnessed directly in storm chasing, or (b) have had described to me (perhaps with images) by fellow storm chasers, (c) I have seen in film and video of events, or (d) are reasonable extrapolations of things unobserved but which *could* be observed and yet not be documented as such.

a. Mesocyclones[2]. A characteristic of mesocyclones is that they represent a perturbation flow that is roughly the same size as the updraft region of a cumulonimbus. Although cumulonimbus clouds do not cover a huge range of sizes, neither are they all the same size. Thus, mesocyclones almost necessarily have a range of sizes, mostly on the order of a few km in diameter; as opposed to a few tens of km in diameter or a few hundred m in diameter. Moreover, mesocyclones have a range of intensities, with the intensity usually measured in terms of shear or vorticity. Arguably, another measure of intensity could be the **maximum** windspeed anywhere within the mesocyclonic circulation (the boundaries of which might be a bit tough to define, if pressed). Some mesocyclones, perhaps even some on the lower end of the size range, could easily be associated with windspeed maxima in a range where damage would result if they interact with the surface. Such an event, if it occurs in the real world, meets the definition of a tornado I quoted earlier! That is, it is a violently rotating column of air in association with a deep convective cloud and is in contact with the surface of the earth. Such events could even have cloud material right down to the surface in the right environment, manifesting themselves as a wide tornado.

b. Multiple-vortex mesocyclones. Gene Moore (a reasonably well-known and highly respected storm chaser) once showed me photographs of an amazing event he witnessed in the Texas Panhandle. It involved a large rotating wall cloud, apparently several km in diameter. From time to time, a funnel cloud would form, producing what appeared to be a slender, ropy tornado around the periphery of this wall cloud. The funnel cloud typically would extend to the surface briefly and then dissipate, to be followed a few minutes thereafter by another such event elsewhere on the wall cloud's periphery. Apparently, this went on for some time. Is each such event an individual tornado, or are they simply vortices embedded within a single multi-vortex tornado with intensity fluctuations? If one were to look at the damage carefully, it is not entirely clear that a single damage path would be involved. The damage might appear to be quite chaotic, given the vagaries of the associated events and the likelihood of a damaging event interacting with something (trees and structures are pretty sparse in the Texas panhandle) to mark the event. Short streaks of damage might have various orientations and could appear rather erratic. Without visual documentation, it might be possible to do a damage survey and conclude that what had happened was a series of microbursts. A rather well-respected survey team (which will remain anonymous) overflew the track of a documented tornado on 10 April 1979 near Seymour, Texas and concluded it was a downburst, so I have reason to believe that a damage survey is not necessarily definitive!

Given a mesocyclone, who is to say that they are all dynamically stable, slowly-evolving phenomena? A mesocyclone might well manifest the same multi-vortex complexity that virtually all vortices exhibit, resulting in a miniature tornado "outbreak" of a sort (as described by Snow and Agee 1975). Suppose there was a fairly regular production of such events associated with a moving storm, at intervals in space and time. Such a case would appear as a tornado "family" associated with a traveling supercell (the Fargo events of 20 June 1957 are the prototypical example, as documented by Fujita 1960). For such a case we have universally chosen to accept them as separate tornadoes, but it might be argued that they really are simply manifestations of a single event: a long-lived mesocyclone with embedded multiple vortices. How might one draw the line here? Is it so hard to imagine situations where classification might prove troublesome? What about a small, intense mesocyclone in a high-humidity environment? Such an event might have a nearly continuous lowering and spotty damage, with subvortices that could be considered tornadoes or tornado cyclones. How large (small) and intense (weak) can a tornado (tornado cyclone, mesocyclone) be? Where do *you* propose to put the dividing lines between tornado-tornado cyclone-mesocyclone?

c. Large, multiple-vortex events. I have seen video (in Tornado Video Classics III) of another amazing event in the Texas Panhandle, near Lazbuddie on 10 May 1991. This event apparently involved a relatively large tornado (on the order of a UC funnel) at the center of a ring of smaller tornadic vortices. The central funnel was more persistent than the surrounding ones, with several funnel clouds in contact with the surface simultaneously from time to time. Is each funnel in such an event a single tornado, or is the whole collection simply a manifestation of a single tornadic event, with multiple vortices? Is it one tornado within a multivortex mesocyclone? How does one classify such a mess? Presumably, these are rare events, but exactly how many tornadoes should be recorded for that event?

d. Tornado cyclones. During the Pampa, Texas tornado I was privileged to witness on 08 June 1995, a fascinating evolution occurred. The tornado I will call the "first" tornado began as a ragged, rotating lowering that produced several brief episodes of dust whirls and small debris at the surface, apparently out in open country southeast of Pampa. During that same time, low-level, multiple-vortex funnels appeared and then disappeared within a few seconds on several occasions. Following this, the tornado seemed to become very disorganized, with a new area of rotation developing as a clear slot wrapped around a truncated, cone-shaped funnel near where the original rotation became disorganized. This second area evolved into a very "stable" tornado. As this was happening, another funnel was developing to the northeast of the event we were watching, which I will call the "third" tornado. The interaction of these two cyclones was odd in that the second tornado (southwest of the developing third tornado the whole time) initially moved westward, then northward, and finally northeastward, whereas the third tornado (developing rapidly as the second one was dissipating) apparently moved mainly northward. Was the first series of brief debris whirls and occasional multiple-vortex funnels (without a complete connection to cloud base) a separate event from the event that finally moved through western Pampa? Or was it all a single tornado? Were there two mesocyclones or were we seeing separate "tornado cyclones" within a single mesocyclone? Perhaps the data available will permit answers .. but perhaps not. In most cases, of course, high-resolution data and videotapes of the event would not be available. These details are simply lost for most events.

e. Other wierd things. It is plausible to believe that gustnadoes can develop into tornadoes (see below); there are at least some indications [e.g., from Erik Rasmussen in some personal communications] that a true dust devil could, as well! Essentially, there are many ways to produce an intense vortex from a preexisting, nontornadic vortex. Since there's a lot we don't know or understand, if we look carefully, we may continue to find examples that don't fit our nice, clean hypotheses.[8]

The events I have been describing above and others, some mentioned in the reviewed literature (Doswell and Burgess 1993, Davies et al. 1994, Forbes and Wakimoto 1983, etc.) and some not, all make me concerned for what we have recorded as tornadoes in the historical record. For example, insofar as that record is concerned, the Tri-State tornado is a single tornado event. As already discussed elsewhere (Doswell and Burgess 1988), there is room for debate about whether or not this actually was a single event. Continuity of the damage path is, as I have suggested, not entirely convincing that a single tornado was involved. Of course, I am even questioning whether a tornado "family" of the sort that **might** be involved with the Tri-State event is really more than one event. In other words, I am not taking a dogmatic position here ... I am willing and eager to consider other views, but what concerns me is that (a) we have the debate, and (b) we reach some consensus about how to record the real events.

7. Struggling toward a definition

The growth of scientific understanding about tornadoes does not mean that clarity of insight follows immediately. As noted, I feel somewhat concerned about our concepts of tornadogenesis. A tornado (as I am fond of saying), irrespective of the details of the definition, is not an **object**; it is a **process**. That is, the wind field that we define to be the tornado exists as a result of, and evolves in response to, other processes. Observationally, it seems that vortices of this intensity are produced virtually exclusively in association with deep moist convection. There surely are dust devils (dry convective vortices) that attain damaging proportions but they are uncommon and we know essentially nothing about their distribution. Since the strongest dust devils probably occur in arid regions of extremely sparse population, our ignorance of such events is large.

Within the range of vortices associated with deep moist convection, I suspect that a lot of different processes can produce vortices in convective clouds, very few of which affect the surface. There is some limited mention of such events in the literature (Moller et al. 1974; Cooley 1978; Doswell 1985 [p. 107]; Bluestein 1988; Doswell and Burgess 1993; Bluestein 1994; etc.). For example, Cooley's paper is the only mention of "cold air funnels" in the refereed journals. At times, I have heard of funnels being tagged by forecasters as "cold air funnels" in situations quite radically different from the prototype described by Cooley and discussed briefly in Doswell and Burgess (1993). An erroneous classification of such vortices might be prompted by a perceived need to "explain" surprise observations of funnels, but it probably does more harm than good to provide a *bad* explanation. Unfortunately, science can offer little more than speculation about the origins of these non-tornadic vortices (e.g., Bluestein 1994). It is conceivable that some tiny percentage of these minor events (examples shown in Fig. 4 and Fig. 5) could produce damaging winds at the surface, but I have no way of knowing what that percentage might be, nor by what processes such vortices might come to reach damaging intensity at the surface, to say nothing of their origins.

Fig. 4. Example of a non-tornadic vortex seen on the northwest flank of the UC storm on 24 May 1973 [photo ©1973 by Chuck Doswell], as discussed in Moller et al. 1974.

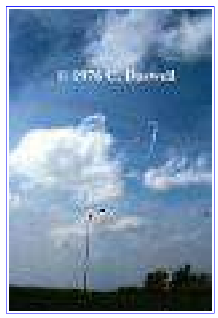

Fig. 5. Example of a non-tornadic vortex associated with a dissipating cumulus cloud on 13 April 1976, near Shamrock, Texas [photo ©1976 by Chuck Doswell]. These are sometimes referred to by chasers as "horseshoe" funnels.

Events that we might reasonably call tornadoes appear to be associated with:

- the mesocyclone (in supercells),
- low-level boundaries produced by the convective storm,
- low-level boundaries *not* produced by the convection but which interact with the convection.

As noted in Davies-Jones and Brooks (1993) and discussed in another essay of mine, the issue with a tornado is to get the high vorticity near to the surface. It appears that processes associated with the mesocyclone and low-level boundaries are likely candidates for obtaining tornadic vorticity at the surface. I note that a supercell (in my opinion) need only have a mesocyclonic circulation meeting certain criteria (see Doswell 1996) to qualify as a supercell and that the mesocyclone need not be present at low levels. (Other views exist; see, e.g., Droegemeier et al. 1996.) Low-level mesocyclones are apparently the result of different processes than those that produce mid-level mesocyclones (see Brooks et al. 1994). At this time, it is unclear what percentage of low-level mesocyclones produce tornadoes, but apparently fewer than 50 percent of those storms having mesocyclones at any level produce tornadoes. [Note added on 26 June

`1998: this percentage might be as low as 10 percent!]`

In the case of "landspouts," it seems that pre-existing vortices along pre-existing low-level boundaries might "explain" tornadogenesis. With those tornadoes that seem to form aloft and descend (the TVS - see Trapp and Davies-Jones 1996), the story may be complex dynamically, and involve an interaction between the updraft and its own rain-cooled outflow. It also could be that real events involve a complex mixture of all three processes [(a)-(c), above] at times. Whatever we find out about these processes in the real world, it almost certainly is going to be the case that there is no single path to a tornado, even when we restrict our attention to those events that are clearly and unambiguously tornadoes (*Including* landspouts ... **landspouts are tornadoes**, by any reasonable definition of a tornado. Like the waterspout, I'd prefer not having a specific term for this kind of event, since it only seems to create confusion.). Not all significant tornadoes are the same, even though their flow fields might end up looking alike ... a vortex after all, has a certain characteristic kinematic structure irrespective of the processes that produced it.

8. What to do with "gustnadoes"?

There is another class of events that has caused a large amount of heartburn: **gustnadoes**. Observations indicate clearly that relatively weak, short-lived vortices can form along the leading edge of an outflow boundary. The mechanism(s) by which such vortices form? No one really knows. Hence, almost anything I can say about these events is pure speculation. We have no detailed Doppler radar observations of them; we have no numerical simulations of them; we have virtually no validated knowledge. All we have is anecdotal evidence from storm chasing and some analogies with things seen in laboratory simulations (Idso 1975). The visual appearances of true gustnadoes (as opposed to tornadoes along a gust front, which are manifestly different phenomena) indicate they are shallow (perhaps 10-100 m deep) with no apparent connection to any process happening at cloud base or above (Fig. 6). When they arise, which I believe to be frequently, they occur in "swarms" such that there may be several in existence at the same time along the same gust front, forming and dissipating within no more than a few minutes and probably having only weak wind perturbations. Superimposed on a damaging gust front (i.e., a downburst), they might represent local concentrations of damage. Superimposed on a non-damaging gust front, they might be manifest as isolated damage events in an otherwise benign situation. My guess is that typically, they represent only a minor perturbation of essentially no significance, except in very rare examples.

Fig. 6. One of several gustnado events near Welch, Texas on 23 May 1982 [photo ©1982 by Chuck

Doswell].

I have some anecdotal evidence that a gustnado can evolve into a true tornado [Dave Blanchard, personal communication], but such an evolution is almost certainly rare. Whereas some true tornadoes might initially resemble a gustnado at the start, **I certainly would find it easy to deny gustnadoes (as I have defined them) the status of true tornadoes**. Unfortunately, it may be hard to train folks to be able to distinguish them from other vortices occurring in conjunction with deep, moist convection. I certainly have encountered a lot of different notions about gustnadoes, even among meteorologists, much less the lay public. There seems to be a disturbing trend to refer to all tornadoes occurring on a gust front as "gustnadoes" whereas I have tried, apparently without success, to confine the term to the *shallow* vortices on gust fronts that seem not to extend as far as cloud base. Moreover, even with 20+ years of chasing behind me, I still am encountering things I haven't seen before. What about the person experiencing something like this for the first time? If that person is confused and has a hard time sorting out what he/she experienced, I think they can be forgiven. But we need not assume that the public is congenitally stupid, either. Some people can report quite accurately what they saw, but they describe it in inappropriate terms (e.g., a tornado with multiple vortices becomes several tornadoes merging into one)

There is a lot we don't know about what happens along seemingly boring, 2-dimensional gust fronts! Perhaps gust fronts are prone to dynamical instabilities on a variety of scales, some of which remain small (gustnadoes), some of which are large and persistent enough ("misoscale" eddies) to become a bona fide tornado. There might be a whole spectrum of structures along gust fronts, many of which do not attain "tornadic" proportions (however we might choose to define a tornado). If that is the case, then it might be quite difficult to anticipate when a gust front would produce damaging vortices, from gustnadoes on up to and including what would unambiguously be called tornadoes. The topic of what might happen along gust fronts was written about by Idso (1974; 1975) in a very speculative vein, but little of substance has been done with the topic.

9. Cold air funnels

This topic never seems to go away for long, so I suppose I should say just a *little* more about cold air funnels. There is not much about them in the literature ... the only published paper about them of which I am aware is that by Cooley (1978) and it offers relatively little insight. Doswell and Burgess (1993) have discussed them, but not in depth, because little of depth can be said. They occur in association with convective clouds (that may have little or no thunder) developing within cold pools aloft, in environments with relatively little vertical wind shear. These should be distinguished from tornadoes with low-topped supercells (that typically arise in environments that may be notably cold aloft, but with considerable vertical wind shear) and from "landspout"-type events (that have relatively little vertical wind shear, but are not tied to cold pools aloft). Cold air funnels are *not* items for urgent study because of their lack of associated damage and casualties ... we have other things to worry about that really do damage and create casualties. In my experience, many events are labeled inappropriately as "cold air funnels" even when they are not associated directly with cold pools aloft, simply because the events are unexplained (as noted in section 7, above). If one of these should happen to do surface damage, then I see it as a tornado ... plain and simple.

10. Horizontal homogeneity?

If we admit that pre-existing boundaries often interact with the convection and that the interaction might be very important in tornadogenesis, the picture becomes quite complex, perhaps intimidatingly so. Sometimes the interaction seems to favor tornadogenesis, while at other times, it seems to preclude tornadogenesis. Not every boundary with which a storm might interact is the same. Nor does the interaction have to follow precisely the same course every time even when the boundaries are nearly identical; perhaps there are many factors (age of the storm, its movement relative to the boundary, its orientation relative to the boundary, etc.) that could alter the course of the interaction. In this arena, we are abysmally ignorant at the moment. We have only very rudimentary knowledge of these interactions. It appears that boundaries of all sorts exist in abundance in "clear" air and may only show up occasionally on satellites as cloud lines. Some of them appear on high-sensitivity radars (like the WSR-88D) but we know next to nothing about them ... their origins, structure, and evolution are open topics for speculation, especially operationally.

There is evidence to suggest that even supercells on "synoptically evident" tornado outbreak days do not necessarily produce tornadoes via some self-contained "cascade" process. Davies et al (1994) suggested that the Hesston tornado family may have involved an interaction with a pre-existing boundary. Jim Purdom has been saying similar things for years (e.g., Purdom and Sinclair 1988) about many storms on outbreak days. At this point, the numerical storm simulations (virtually all initiated with horizontally homogeneous initial conditions) suggest that such interactions are not necessary. Nevertheless, **real** storms have a disturbing proclivity to produce tornadoes in association with interactions involving pre-existing horizontal inhomogeneities. It might be that we simply cannot understand tornadogenesis properly without including inhomogeneous initial conditions in our numerical simulations; see my essay on post-VORTEX thoughts. Given the bewildering nature of such interactions with the variety of boundaries that seem to be showing up in our new, high-resolution observations, it is going to be a challenging time to follow the thread of tornadogenesis. It could be some time before we can establish common characteristics and begin to see order in the apparent chaos. It seems to me that in order to accomplish that future orderly synthesis, we are ill-served by a taxonomy (classification scheme) that fails to distinguish tornadoes by the relevant physical processes.

11. A tornado database

Unfortunately, since we do not **know** (in a completely satisfactory way, at least) what are the relevant physical processes, we are caught in a bit of a "Catch-22" conundrum: to understand tornadoes, we need a proper classification ... but to develop a proper classification, we need to understand tornadoes! I am confident we eventually can work our way out of this seeming paradox, but it will involve small incremental steps, first learning something about tornadoes and then applying that to the classification. Perhaps the prior classifications cannot be salvaged without information about particular events that, if we ever had it, has been lost over time. The tornado data base should be modified regularly to contain the information needed to classify the events as best we know how at any given time. Keeping continuity with the past is of little value if by doing so we miss the chance to gain a better understanding. Better to change the record-keeping frequently as we develop better understanding .. we always can "degrade" high-quality data to look like low-quality data if consistency is the goal, but the reverse usually is not possible. My colleague, Erik Rasmussen has proposed an interesting idea for a new database for folks to consider.

The day of having a simple collection of "tornado events" ought to be put behind us soon, if we are ever to gain a deeper understanding of the processes. We must expand our data base to include information about the storm that produced the event: was it a supercell (using whatever definition we can arrive at as a consensus)? Was it a developing cloud or was it a mature storm? Was it interacting with a detectable boundary? What is (are) the source(s) for information about the event? If assessments are quantitative, what data were used and how were thresholds defined? If assessments are subjective, what is their factual basis? And so on.[3] We also must begin to make some sort of distinctions among tornadoes, perhaps gropingly at first. Is the tornado "stable" in the visual sense I have described? Are there any gaps or irregularities in the damage path and what is the nature of those irregularities? Was the tornado pendant from a wall cloud? What was the location of the event relative to the mesocyclone, if a mesocyclone was associated with the storm (and what is the operative definition of a mesocyclone?)? Does the event fit any of the recognized categories of convective vortices (whatever those categories might be at the time)? Did it have any distinctive characteristics (e.g., no visible funnel, multiple vortices, smooth and laminar, ragged and turbulent, very wide, dramatic changes in its characteristics during its life cycle, etc.)?

I realize fully that this is asking for a **lot** of information relative to where we are now. However, it seems to me that a "tornado database" that does not ask for a lot of information about tornadoes is not going to have much to offer, except perhaps to actuaries for the insurance companies, who aren't concerned with scientific subtleties.

12. Recognition of tornadic damage

Neil Stuart (presently at the Wakefield, VA office of the National Weather Service) has raised some interesting points via e-mail correspondence. In some cases, there is very strong horizontal wind shear in storms (even tropical cyclones) ... the wind speeds associated with such wind shear can attain damaging values and so create damage paths. Obviously, this is true for thunderstorms, since they produce strong outflows (often called downbursts). Along the flanks of a downburst, strong horizontal gradients of the wind can be found, and such shears can be associated with substantial vorticity (both cyclonic and anticyclonic). In theory, such "sheets" of horizontal wind shear are unstable and should "roll up" (Fig. 7) into a series of discrete vortices; in the process, the shear line's vorticity (originally spread out along the line) becomes concentrated into a number of vortices.

 Fig.7

Fig. 7. A schematic look at the "roll up" of a vortex sheet, where the shear line at the surface reflects a vertical *sheet* of vorticity. In (a), the vorticity (stippling) is spread out along the shear line; in (b) and (c), the vorticity becomes increasingly concentrated into discrete vorticity centers as the roll up proceeds. In this example, the sense of the vorticity is associated with a clockwise vortex, but the argument is independent of the sign of the vorticity.

Thus, if strong vorticity spread out along a line is present at some moment, it is likely that it will break down into a string of separate vorticity centers. This might have relevance for the origin of gustnadoes, and has been proposed for tornadoes as well (although tornadoes are more complex because it seems not all tornadoes develop in the same way). However, the notion that high vorticity tends to evolve into compact centers rather than being strung out along a line is relevant.

As discussed in my vorticity primer, the issue of whether or not a vortex (i.e., a compact region of vorticity) produces a closed flow depends in part on the reference frame. If a moderately intense vorticity center is moving relatively rapidly, the ground-relative flow may not be a closed vortex. In fact, many weak to moderate tornadoes that move rapidly have damaging winds only on one side of the vortex. This produces a damage path that contains little or no direct evidence of rotation ... all the damage may appear to be coming from more or less the same direction. This can lead some investigators to conclude that the event was not a tornado, but rather a microburst. The giveaway, however, is the existence of a *long, narrow damage path* . As the center of high vorticity moves along, it creates a narrow swath of damage.

If the damage is done by a moving center of high vorticity, resulting in a damage path that is narrow relative to its length, I am inclined to call it a tornado (or a gustnado, depending on the circumstances). I am not inclined to reject the tornado hypothesis simply because the damage is unidirectional, for reasons just given. That is, it is not obvious to me that the flow *must* be closed in a ground-relative sense for the event to be considered a tornado. If there are Doppler radar data, the *storm-relative* framework often will show a fair amount of symmetry in a vortex flow, even if the ground-relative flow is highly asymmetric.

A downburst (or microburst) creates a difluent damage path, because the winds are forced to spread apart as they interact with the solid ground ... the resulting divergence creates a fan-shaped damage region that may start out concentrated but rapidly spreads out and weakens. This is quite different from the damage produced by a concentrated vorticity center moving along.

On the other hand, people often are heard saying that such things as twisted trees, street signs, and other "indicators of rotation" imply that an event was a tornado. The scale of rotation in tornadoes is on the order of hundreds of meters, generally. A twisted tree can arise from purely straight-line winds if the tree's resistance to the wind is not symmetric, for example ... that is, the tree yields to the wind in a asymmetric fashion. Those doing damage surveys need to be aware of this all-too-common misunderstanding of the scale of tornadic vorticity; it usually is much larger than the structures and objects that are damaged, so *on the scale of the structures* , the damaging winds are "straight."[9]

13. Observational Meteorology

As a final footnote to all of this, it seems to me that VORTEX has underscored the relevance and value of observational programs. We have seen enough from the observations to cast real doubt on most of what we thought we knew. There have been those who considered the theory and numerical simulations to be so far advanced that observations could serve only to confirm the theoretical and numerical findings. In my opinion, VORTEX has invalidated this view, as described in my other VORTEX-related essay; the observations have shown the inadequacies and shortcomings of these approaches quite clearly. Moreover, the new data sets are revealing a host of new phenomena about which we know virtually nothing. The relevance of these new phenomena to tornadogenesis has yet to be shown, but it should be noted that we cannot rule them out *a priori* as important factors, either. It appears that observational meteorology is in need of some support; shutting down our observational programs in favor of theory and numerical simulations would be a scientific tragedy (and travesty!!) for us all. Theory, modeling, and observations each have their own roles to play in science, and we cannot do without any one of them. Observational meteorology has been given far too little attention and value over the past two decades. Decreasing budgets have resulted in a disproportionate share of the burden has falling on observational facilities. I believe that VORTEX contains a message: the community should recognize that theory and modeling are not by themselves sufficient to carry our science.

Acknowledgments I appreciate the helpful input and information provided by my colleagues, Dr. Harold Brooks and Mr. Greg Stumpf. I also am grateful for feedback on the various versions of this essay by: Dr. Jeff Trapp, Dr. Dave Blanchard, Mr. Roger Edwards, Mr. Neil Stuart, Jim Means, and Mr. Billy Williams. I appreciate the permission to display copyrighted images by Dr. William Gallus and Mr. Dewayne Mitchell; please respect their copyright protection by not using those images without their expressed permission. Thanks also to Ken Howard for loaning me a slide scanner when I needed it.

Eliminating Microorganisms from Water

Adding chlorine to drinking water has virtually eliminated waterborne diseases such as cholera in North America by destroying disease-causing microorganisms. You can safely and easily demonstrate how chlorine protects public health by removing microscopic life from a water culture that you create.

Materials

- Tap or fresh water (untreated water will yield more microorganisms)
- Wide-mouth glass vessel that holds about a quart of water (e.g., Mason jar) and several smaller glass vessels
- Container and heat source to boil water Handful of dry hay or straw (dry, untreated grass will do)
- Microscope (minimum 100 power)
- Glass slides
- Liquid laundry bleach (5.25% sodium hypochlorite)
- Measuring cup
- Eyedropper
- Plastic stirrer
- Thin rubber gloves
- Safety goggles or glasses
- Paper towels

Safety

Wear rubber gloves during the experiment. Do not allow culture to contact your body (people with cuts should not touch the culture).

Follow all label directions on bleach (it will bleach clothing).

Keep hands away from face during the experiment. Wear safety goggles/glasses when handling the bleach.

Thoroughly clean all equipment, gloves and hands when finished

Dispose of the culture in the toilet. Dispose of bleach solution in sink followed by a five-minute flush with cold water, and dispose of other materials in a clean trash bag.

Procedure

1. Boil about one quart of water (tap or freshwater) for two minutes, let cool to room temperature, and pour into a thoroughly clean, wide-mouth glass vessel.

Put a handful of dry hay, straw or grass into the vessel and set it aside in a darkened place at room temperature for seven to nine days. You are creating a water culture that will teem with microscopic life.

2. After the wait, place a glass slide on the microscope and use the eyedropper to put a drop of the water culture on the slide. (Place a cover slip on the water culture drop). You and your students will be able to view many microscopic life forms, including protozoa (amoebas, parameciums) and nematodes (microscopic worms) moving around. These are the same types of organisms which live in surface waters and are removed during the water-chlorination process. In fact, certain protozoa are responsible for amoebic dysentery and giardia, which are common illnesses associated with water that is not properly chlorinated. Use several slides to sample water and view life forms from different parts of the culture.

3. Now pour about one cup (eight ounces) of the water culture (being careful not to spill) into another clean container. Make up a solution of one part bleach to nine parts water in another container. After stirring the solution and rinsing the eyedropper, place about 20 drops of bleach solution into the cup of water culture; stir the water culture/bleach solution and let sit for about one minute. Thoroughly rinse the eyedropper in tap water and examine several drops of the bleach-treated culture. You should see no animals still alive in the water.

Suggestion

Arrange a field trip for your class to the local water treatment facility to learn where tap water comes from and why water disinfection and source water protection are important. Discuss tradeoffs involved (e.g., disinfection by-products vs. microbial contamination).

Instructor's Notes

If microscopes are not available, use pond water and add chemical fertilizer and set in direct sunlight, allowing eutrophication to take place.

PhysicalGeography.net | WELCOME

Welcome to PhysicalGeography.net

PhysicalGeography.net is an educational web portal that focuses on a specific area knowledge known as **Physical Geography**. Physical Geography is a sub-discipline of two much larger fields of study - Geography and Earth Sciences. The main purpose of Physical Geography is to explain the spatial characteristics of the various natural phenomena that exist in Earth's hydrosphere, biosphere, atmosphere, and lithosphere.

Another great online learning resource dealing with Physical Geography has been created by Michael Ritter of University of Wisconsin - Stevens Point. This online textbook is called **The Physical Environment: An Introduction to Physical Geography**. I highly recommend it.

If you would like to learn more about how **PhysicalGeography.net** is structured please select the "**About**" link above.

I hope you enjoy the site!

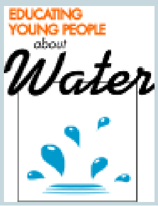
Educating Young People About Water

Home | History | Links | Contact us

Search for curricula | Order EYPAW guides

- Evaluate or plan a program
- Work with local experts
- Choose from over 150 water-related curricula
- The curricula review process



Educating Young People About Water (EYPAW) guides and water curricula database provide assistance for developing a community-based, youth water education program. These resources target youth and link educators to key community members to build partnerships to meet common water education goals. EYPAW materials will help you:

- Choose water curricula appropriate for learners.
- Plan and evaluate a water education program in relation to a local water issue.
- Work in partnership with local experts.
- Improve youth's ability to manage and protect water.

This page is maintained by the Environmental Resources Center, University of Wisconsin-Madison.

GROUND WATER

NEW Ground Water Protection Regulation (GWPR)

- Backgrounder (HTML)
- Regulation (PDF: 37 pages / 3.72 MB)

The GWPR deals with aspects of well construction that significantly enhance ground water protection i.e., installing effective surface seals around wells, securely capping and floodproofing wells, and permanently closing unused wells to protect ground water quality. The GWPR also establishes the qualifications for well drillers and well pump installers and provides for a provincial registry of those possessing the qualifications.

NEW Guide to Using the BC Aquifer Classification Maps for the Protection and Management of Ground Water

PDF: 54 pages / 1.4 MB

This guide is designed to help readers interpret and use the aquifer classification maps produced by the Ministry of Water, Land and Air Protection.

NEW Linking Water Science to Policy: Ground Water Quality
(CCME site)
A workshop sponsored by the Canadian Council of Ministers of the Environment.

PDF: 69 pages

Fact Sheets about Ground Water Quality
These seven fact sheets provide general information on total and faecal coliform bacteria; nitrate; arsenic; fluoride; sodium; iron and manganese; and hardness and their main occurrence in the province.

Frequently Asked Questions (FAQs): Water Wells ... and Well Water Quality

Canadian Framework for Collaboration on Ground Water

its development for social and economic benefits. See also Practical Information on Ground Water Development.

Aquifers and Water Wells in BC
This interface to ground water aquifers and water well locations is under development, and now replaces other methods of delivering ground water data to the public, consultants and water well drillers. Hard copies of water well location mapping are no longer available, as this service has been replaced by Aquifers and Water Wells in BC.

Current Ground Water Conditions in British Columbia: through selected observation wells.

Below are links to two historical guidelines documents for construction, testing, maintenance, alteration and closure of wells in British Columbia. When the Ground Water Protection Regulation (GWPR) takes effect, the standards in the GWPR will supersede the guidelines in these historical documents. The two historical guidelines documents may still be useful, particularly for items which the GWPR currently does not cover. Where there are any differences between the standards in the GWPR and the guidelines in the historical documents, those outlined in the GWPR take precedence.

DRAFT Code of Practice for Construction, Testing, Maintenance and Closure of Wells

Guidelines for Minimum Standards in Water Well Construction

The Well Drilling Data Capture System
(Ground water Data Management, Version 1b)
The Well Drilling Data Capture System has been designed to provide water well drillers with an easy to use customizable database that is compatible with the database systems used. This system was developed with the cooperation and assistance of the British Columbia Ground water Association.

With this system, water well drillers will be able to organize and maintain their own water well data, print water well records for customers, and export data selected by the driller to the WELL database. Minimum system requirements are a personal computer capable of running the Windows 95/98/NT operating system.

It's true, the water we use today has been around for hundreds of millions of years, and the amount available probably hasn't changed very much. Water moves around the world, changes forms, is taken in by plants and animals, but never really disappears. It "travels" in a large, continuous cycle. We call this the Hydrologic Cycle (**"hydro"** means water).

The Incredible Journey

(NOTE: In the printed version of the book, on page 161, this activity is found in a two color, three column format.

- **Grade Level:**
  Upper Elementary, Middle School
- **Subject Areas:**
  Earth Science
- **Duration:**
  Preparation time: 50 minutes
  Activity time: two 50-minute periods
- **Setting:**
  A large room or playing field
- **Skills:**
  Organizing (mapping); Analyzing (identifying components and relationships); Interpreting (describing)
- **Charting the Course:**
  Other water cycle activities include "Water Models" and "Imagine!" In-depth investigations of how water moves can supplement this activity: condensing and evaporating ("Water Models"), filtering through soil ("Get the Ground Water Picture"), traveling over Earth's surface ("Branching Out!"), and moving through the atmosphere ("Piece It Together").
- **Vocabulary:**
  condensation, evaporation, electromagnetic forces

Where will the water you drink this morning be tomorrow?

Summary
With a roll of the die, students simulate the movement of water within the water cycle.

Objectives
Students will:

- describe the movement of water within the water cycle.
- identify the states of water as it moves through the water cycle.

Materials

- *9 large pieces of paper*
- *Copies of* ***Water Cycle Table*** (optional)
- *Marking pens*

- *9 boxes, about 6 inches (15 cm) on a side* (Boxes are used to make dice for the game. Gift boxes used for coffee mugs are a good size or inquire at your local mailing outlet. There will be one die [or box] per station of the water cycle. [To increase the pace of the game, use more boxes at each station, especially at the clouds and ocean stations.] The labels for the sides of the die are located in the *Water Cycle Table* These labels represent the options for pathways that water can follow. Explanations for the labels are provided. For younger students, use pictures. Another option is to use a spinner. It is necessary to design a spinner for each station.)
- *A bell, whistle, buzzer, or some sound maker*

Making Connections
When children think of the water cycle, they often imagine a circle of water, flowing from a stream to an ocean, evaporating to the clouds, raining down on a mountaintop, and flowing back into a stream. Role-playing a water molecule helps students to conceptualize the water cycle as more than a predictable two-dimensional path.

Background
While water does circulate from one point of state to another in the water cycle, the paths it can take are variable.

Heat energy directly influences the rate of motion of water molecules (refer to the activity "Molecules in Motion"). When the motion of the molecule increases because of an increase in heat energy, water will change from solid to liquid to gas. With each change in state, physical movement from one location to another usually follows. Glaciers melt to pools which overflow to streams, where water may evaporate into the atmosphere.

Gravity further influences the ability of water to travel over, under, and above Earth's surface. Water as a solid, liquid, or gas has mass and is subject to gravitational force. Snow on mountaintops melts and descends through watersheds to the oceans of the world.

One of the most visible states in which water moves is the liquid form. Water is seen flowing in streams and rivers and tumbling in ocean waves. Water travels slowly underground, seeping and filtering through particles of soil and pores within rocks.

Although unseen, water's most dramatic movements take place during its gaseous phase. Water is constantly evaporating, changing from a liquid to a gas. As a vapor, it can travel through the atmosphere over Earth's surface. In fact, water vapor surrounds us all the time. Where it condenses and returns to Earth depends upon loss of heat energy, gravity, and the structure of Earth's surface.

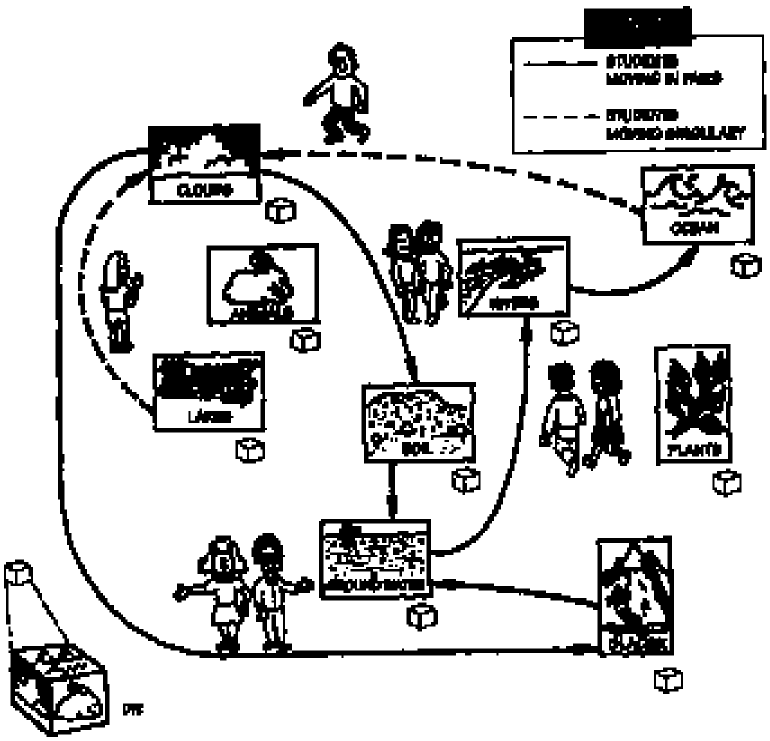
Water condensation can be seen as dew on plants or water droplets on the outside of a glass of cold water. In clouds, water molecules collect on tiny dust particles. Eventually, the water droplets become too heavy and gravity pulls the water to Earth.

Living organisms also help move water. Humans and other animals carry water within their bodies, transporting it from one location to another. Water is either directly consumed by animals or is removed from foods during digestion. Water is excreted as a liquid or leaves as a gas, usually through respiration. When water is present on the skin of an animal (for example, as perspiration), evaporation may occur.

The greatest movers of water among living organisms are plants. The roots of plants absorb water. Some of this water is used within the body of the plant, but most of it travels up through the plant to the leaf surface. When water reaches the leaves, it is exposed to the air and the sun's energy and is easily evaporated. This process is called transpiration.

All these processes work together to move water around, through and over Earth.

Using station illustrations, create a one page graphic on which students record their movements during the Incredible Journey



Procedure

Warm Up

Ask students to identify the different places water can go as it moves through and around Earth. Write their responses on the board.

The Activity

1. Tell students that they are going to become water molecules moving through the water cycle.

2. Categorize the places water can move through into nine stations: Clouds, Plants, Animals, Rivers, Oceans, lakes, Ground Water, Soil, and Glaciers. Write these names on large pieces of papers and put them in locations around the room or yard. (Students may illustrate station labels.)

3. Assign an even number of students to each station. (The cloud station can have an uneven number.) Have students identify the different places water can go from their station in the water cycle. Discuss the conditions that cause the water to move. Explain that water movement depends on energy from the sun, electromagnetic energy, and gravity. Sometimes water will not go anywhere. After students have come up with lists, have each group share their work. The die for each station can be handed to that group and they can check to se if they covered all the places water can go. The Water Cycle Table provides an explanation of water movements from each station.

4. Students should discuss the form in which water moves from one location to another. Most of the movement from one station to another will take place when water is in its liquid form. However, any time water moves to the clouds, it is in the form of water vapor, with molecules moving rapidly and apart from each other.

5. Tell students they will be demonstrating water's movement from one location to another. When they move as liquid water, they will move in pairs, representing many water molecules together in a water drop. When they move to the clouds (evaporate), they will separate from their partners and move alone as individual water molecules. When water rains from the

clouds (condenses), the students will grab a partner and move to the next location.

6. In this game, a roll of the die determines where water will go. Students line up behind the die at their station. (At the cloud station they will line up in single file; at the rest of the stations they should line up in pairs.) students roll the die and go to the location indicated by the label facing up. If they roll stay, they move to the back of the line.

When students arrive at the next station, they get in line. When they reach the front of the line, they roll the die and move to the next station (or proceed to the back of the line if they roll *stay*).

In the clouds, students roll the die individually, but if they leave the clouds they grab a partner (the person immediately behind them) and move to the next station; the partner does not roll the die.

7. Students should keep track of their movements. This can be done by having them keep a journal or notepad to record each move they make, including *stays*. Students may record their journeys by leaving behind personal stickers at each station. Another approach has half the class play the game while the other half watches. Onlookers can be assigned to track the movements of their classmates. In the next round the onlookers will play the game, and the other half of the class can record their movements.

8. Tell students the game will begin and end with the sound of a bell (or buzzer or whistle). Begin the game!

***Wrap Up and Action* Have students use their travel records to write stories about the places water has been. They should include a description of what conditions were necessary for water to move to each location and the state water was in as it moved. Discuss any *cycling* that took place (that is, if any students returned to the same station). Provide students with a location (e.g., parking lot, stream, glacier, or one from the human body-bladder) and have them identify ways water can move to and from that site. Have them identify the states of the water.**

Have older students teach "The Incredible Journey" to younger students.

Assessment
Have students:

- **role-play water as it moves through the water cycle (step 8).**
- **identify the states water is in while moving through the water cycle (step 4 and *Wrap Up*).**
- **write a story describing the movement of water (*Wrap Up*).**

Extensions
Have students compare the movement of water during different seasons and at different locations around the globe. They can adapt the game (change the faces of the die, add alternative stations, etc.) to represent these different conditions or locations.

Have students investigate how water becomes polluted and is cleaned as it moves through the water cycle. For instance, it might pick up contaminants as it travels through the soil, which

are then left behind as water evaporates at the surface. Challenge students to adapt "The Incredible Journey" to include these processes. For example, rolled-up pieces of masking tape can represent pollutants and be stuck to students as they travel to the soil station. Some materials will be filtered out as the water moves to the lake. Show this by having students rub their arms to slough off some tape. If they roll *clouds*, they remove all the tape; when water evaporates it leaves pollutants behind.

Helping rural poor obtain safe water

Parlez-vous Français?

Can YOU Make A Safe Drinking Water Supply?

Test Your Drilling & Handpump Knowledge!

Who are we? Lifewater is a non-profit group training Nationals to drill safe drinking water wells and build handpumps. Resources include a 100-page **water well drilling & hand pumps tutorial**!

What is the problem? We exist because nearly 1 billion people do not have reliable supplies of safe drinking water.

What is our strategy? We provide local organizations with the training & equipment they need to meet their need for safe water.

What is Lifewater doing? We solve easy problems first, empower committed communities & work **where need is greatest**.

Thank-you! All that has been accomplished is due to generous donors who have sponsored new safe drinking water supplies.

View Well Records & Village Pictures on-line!

- **Wells in Liberia**
- **Wells in Nigeria**

How can I help? Everyone in Lifewater Canada is an unpaid volunteer. Behind every successful water system is a multitude of small tasks. Many hands make for a light load .. We need YOU!!

Liquid Assets - Our Water Resources

Objectives

- To understand the relationships among water quality, water pollution, personal lifestyle, and the ecological health of the Lake Pontchartrain Basin.
- To develop an awareness of water resources and water quality.
- To understand the differences between point and non-point source pollution.

Multiple Intelligences Learning Activities

- *Verbal/Linguistic:* Write reflective journal entries on the impact of your personal lifestyles on the Lake Pontchartrain Basin or other nearby body of water. Write an essay or a poem about the water cycle.
- *Logical/Mathematical:* Calculate the amount of water used by your families per day and complete a chart on agricultural runoff.
- *Visual/Spatial:* Design posters of ways in which water is wasted and conserved. Construct signs for the "Water Cycle Walk".

- *Bodily/Kinesthetic & Musical/Rhythmic:* Step through the paces of the water cycle to musical accompaniment, stopping to explain the processes and products along the way. Make a "thunderstorm".

- *Interpersonal:* Brainstorm lists of ways in which water is wasted or conserved. Construct lists of things that affect water quality in the Lake Pontchartrain Basin.

- *Intrapersonal:* Write reflective journal entries on your personal impact on water quality in the Lake Pontchartrain Basin. Develop you own mini action plan.

Lessons

1. Water Cycle Lesson

2. Water Use

3. Measuring Water Quality

4. Water Pollution

Our Mission

To Reach Children, Parents, Educators, and Communities of the World with Water Education

Project WET (Water Education for Teachers) is a nonprofit water education program and publisher for educators and young people ages 5-18. The program facilitates and promotes awareness, appreciation, knowledge, and stewardship of water resources through the dissemination of classroom-ready teaching aids and the establishment of internationally sponsored Project WET programs.

Audience & Background. These are NOT interactive, on-line lessons, but rather may be printed for use with **prospective and practicing K - 8 teachers**. (*NOTE: before printing these pages, go to the "Page Setup" option in Netscape and set the header to show page numbers. Also, we recommend setting Palatino as your proportional font in your General Preferences*). The underlying Instructional Philosophy is constructivist and should be reviewed before using these lessons. The lessons are designed to produce conceptual change and address some common alternative conceptions. Many of these lessons can be adapted for use in **elementary school classrooms**. Relevant Benchmarks from the American Association for the Advancement of Science (AAAS) are given at the end of the lesson. These national standards indicate the grade levels at which these ideas should be taught. Each lesson has six parts, including a biology lesson, knowledge mapping exercise, and glossary for students and for teachers, a teachers' guide for both the biology lesson and knowledge mapping exercise, and a table of persistent alternative ideas.

Water Related Lessons

Choose a lesson to view.

Title	Author(s)	Description	Implementation Hints
Elementary Level			
Rainforest Deforestation and the Water Cycle	ANGIE CARGILL, Shawna Steward	Students will use data and technology to develop an understanding of the relationship between deforestation of rain forests, the water cycle, and their daily lives.	No
Water Around Us	LORRAINE ETHERTON,	Students create a collage of human land use activities around an image of the Missouri River. Demonstration of Water Cycle and Properties of Water	No
Drip...Drop...Raindrops	SUSAN M FRACK, SCOTT PRICKETT	demonstrate the steps of evaporation, cloud formation, and precipitation within the water cycle. make and demonstrate how to use a hygrometer to record daily humidity. describe how rain, snow, and sleet form. show how to use a rain gauge to record daily precipitation.	No
Model of a Well	MARIANNE BONNEMIER,	Demonstrate the relationship of groundwater to wells.	No
Celebrate the Earth! - An Earth Week Unit	Michelle Garnett, Jessica Stoller	This unit was developed to help kindergarten students understand the concept of Earth Day using developmentally appropriate, hands-on activities, along with stories, songs and writing opportunities.	No
Middle Level			
History of Irrigation and Its Effects in Greeley County 1950-1999	POLLA HARTLEY, JOAN MCMANAMAN	This project will look at the affect that increased irrigation has had on a certain area, Greeley County, for the past 50 years. We will be looking over data for several different agricultural factors. These factors include number of irrigation wells registered in the county, number of irrigated acres, amount of corn production, price of corn, and cropland evaluation. We will also be looking	No

		at the climate data, temperature, precipitation and humidity, for the given period. Students will choose one of the above sets of data and prepare a report on their chosen topic, relating their topic to the increase of wells in the county.	
Dendritic River System	JOHN NIEMOTH,	This lab is an open ended lab with the ability to graph other drainage systems after making modifications to fit the desired drainage pattern.	No
Water Filtration	KIMBERLY FLESSNER,	Each group will design a water filtration system and present to the class, why they picked their design.	No
How Do Weather Conditions and Lunar Cycles Affect Fishing Success?	MARK SKILES,	Participating students will learn how to use weather measuring devices to record and study weather conditions at different locations, during different times. After much data collection, participating students will attempt to draw conclusions about the relationship between weather conditions, lunar cycle and fishing success.	No
Water Cycle	KIMBERLY FLESSNER,	To see how water is purified when it evaporates during the water cycle	No
Water Table	MARY LOU ALFIERI,	Become familiar with the term water table. Recognize the water table as one of the contributing factors in the existence of streams, swamps, and lakes in Nebraska.	No
Water Quality of Streams	MARK SKILES,	During this long-term research project, you will be studying and monitoring the water chemistry and quality of a local stream or river. Various tests will be done on a regular schedule to evaluate if water quality fluctuates throughout time or remains constant.	No
Water Flow Through Local Soils	LIZ SNYDER,	Determine the relationship between particle size and rate of water flow through soil. Suggest other variables that affect water flow through a soil.	No
Evidence for Trends in Climate Change	Danelle Schuh-Philippe, Suse Riddle	The purpose of this unit is to allow 8th grade Earth Science students to experience processes by which evidence is gathered about climate change over time. The students will be supported intheir science research and data collection by activities in their math class. With information gathered, students will then uses various techniques to assess trends in climate change.	No

Understanding Groundwater and the Effects of Pollution	Kerry Sievert, Valerie Lewis	Students evaluate population growth and increat pollution which results. The purpose and structure of landfills are studied. Groundwater is investigated. Students witness the effects of pollution on our water sup0ply through simulated activities and demonstrations	No
pHresh Air: Hits You in the Pocketbook	Lucinda Massey, Laura Krzysiak	pHresh Air: Hits You In The Pocketbook is an integrated unit of study focusing on the local effects of global air pollution. Students will study the causes and effects of acid rain, sources and locations of polluters in Wisconsin, and the effects of weather events on the movement of polluted emissions. Students will also study the Clean Air Act of 1994 and governmental programs to enforce and encourage compliance. Students will further study the proposed creation of the Chicago Energy Exchange as a vehicle for encouraging compliance.	No
Secondary Level			
Hard as a Rock	PAMELA GALUS, REBECCA L KADEL	A 2-week lab oriented activity that begins to show the relationship among human activities, rocks and soil formation.	Not Yet
Storage, Use, Pollution & Clean-Up	ROSEANNE WILLIBY,	An introduction to the storage, uses, pollution, and cleanup of water.	No
Recognizing Our Dynamic Wetlands	ROSEANNE WILLIBY,	Construct two wetlands: one with constant drainage and one that maintains a well-saturated soil. Maintain the wetlands for two weeks (minimum) and observe daily the soil, plant life, water level, and animal life if desired.	Yes
Flood Cycles 30/100 or Somewhere In-between	GREGORY PAUL PAVLIK,	Goal: To research flood history on a Nebraska river and to see if past precipitation records could be used for future predictions. Objective: Use current on-line references and Climprob to research a Nebraska river's flood history.	No
Permeabilty of Materials	Al MUSSEN,	Demonstrate the apparent difference of the permeability of various earth materials.	No
Flood Control	MARK SKILES,	This activity will help you understand (1) why dams have been built in Nebraska to create reservoirs, (2) what factors must be considered when building a dam and (3) how to design and build a dam yourself!	No

The Worm Wonderland: A Long Term Observational Science Project	Bob Feurer,	You have been working on observational techniques and the tools which help you make observations. This project is one which will give you reasons to use those skills already learned and will cause you to learn other new ones as well.	No
The Nebraska Brochure	Bob Feurer,	The primary goal of this activity is for students to discuss and decide what features of the state are and are not related to Nebraska earth science as they are doing their research and to then create a brochure which conveys their discoveries and decisions to the rest of the class.	No
Hydrology Investigation	Dana Krejcarek, Jessie Good	In this unit, students will be introduced to the GLOBE program and work specifcally with hydrology activities. GLOBE is an environmental program where students,teachers and scientist are able to share information. Students will gain an understanding of the importance owf water quality	No
Cross Level			
Water Cycle Mania	Lisa Overkamp, MARY LOU ALFIERI	Water Cycle and the effects of chemicals on the water system	Not Yet
What's up? Come On Down	James Servais, Sharon Rychter	Our unit is an interdisciplinary, cross-age study of weather involving first and ninth graders. Our goal is not only to teach and to actively engage our students in the subject content but to instill a love of learning and scientific inquiry through "hands-on/minds-on" experiences.	No

Water Science for Schools is USGS Water-Resources Investigations Report 98-4086

Water, Water Everywhere

Grade Level: Primary
Subject Area: Science
Essential Skills and Strategies:

Student creates and interprets graphs. Student shows appropriate connections within mathematics. Student communicates finds using appropriate mathematical terminology. Student observes and describes the physical properties of water. Student reads different materials for a variety of purposes. Student writes in a variety of forms for different audiences and purposes. Student understands and uses the steps of the writing process. Student selects and uses appropriate tools for measurement.

Materials: Needed: Computers with Internet access. Word processing program for report. Spreadsheet and graphing software. Scanner and printer to copy hydrological cycle picture.

Web sites used with the lesson:
1. National Oceanic and Atmospheric Administration: http://www.noaa.gov
2. Athena:
http://inspire.ospi.wednet.edu:8001/curric/weather/graphing/precip.html

Step One: Problem or Question
Students will compare the daily precipitation levels for two cities in the state of Washington (one on each side of the Cascade Mountains). Which city will receive the largest amount of precipitation? What geological features might impact which side of the state receives more precipitation? In addition, how does the hydrological cycle function and how is it impacted by geological features of the state?

Step Two: Getting Organized
With your teams get some background information about the hydrological cycle. Use of the following web site will assist you:
http://inspire.ospi.wednetedu:8001/curric/weather/graphing/precip.html.

Step Three: Gathering Information

Students will use links to get daily precipitation levels. Students will enter information on hand drawn spreadsheets for each of the two cities (your own and the city you are studying).

Step Four: Sorting and Analyzing Information
At the end of a one month period, students should ask and be able to answer the following question: Which of the two cities had the greatest amount of precipitation? Students will use the precipitation information off of their spreadsheet to create bar graphs for comparisons.

Step Five: Creating the Answer or Solving the Problem
Students will create by hand two separate spreadsheets (one for each city) and enter daily precipitation levels (Monday through Friday). Students will then create two separate spreadsheets on the computer and record daily precipitation levels for each city and save to a disk. At the end of the one month recording period, students will use the completed spreadsheet to create a bar graph of the precipitation levels by hand and then on the computer using their computer generated spreadsheets. Students will draw a picture of the hydrological cycle to be scanned, printed, and used as a report cover after students have inserted it into a document and titled it. Students will then report which city received the most rain and why. Students will explain the hydrological cycle and the Cascades impact on the amount of precipitation that falls on each side of the mountains.

Step Six: Evaluation
Evaluation of student work will be based on a class generated rubrics that will include some form of sharing, of the project, with the class.

Tuesday, December 8, 1998

Water, Water, Everywhere, Nor Any Drop to Drink

Water as a Limited Resource and the Technologies Created to Attempt to Best Use It

Author(s)
Alison Zimbalist, The New York Times Learning Network

Grades: 6-8, 9-12
Subjects: Geography, Science, Technology
Interdisciplinary Connections

Overview of Lesson Plan: In this lesson, students investigate the importance of water historically and in their daily lives and examine the nature of water as a limited resource. Students work in groups to research technological systems that have aimed to use water in the most productive ways, evaluate those systems, and create 'How It Works' posters of those systems that incorporate their research.
Review the Academic Content Standards related to this lesson.

Suggested Time Allowance: 45 minutes, plus homework

Objectives:
Students will:
1. List the various uses of water and discuss why water is a limited resource; review the water cycle and the environmental factors that determine which resources can be renewable.
2. Read and discuss "Water: Pushing the Limits of an Irreplaceable Resource."
3. Work in small groups to research dams, irrigation systems, aqueducts, pipelines, water purification systems, and sanitation systems.
4. Create a "How It Works" poster about their group's researched water system technology; present their work to the class.

Resources / Materials:
-paper
-pens/pencils
-classroom blackboard
-copies of "Water: Pushing the Limits of an Irreplaceable Resource" (one per student)
-science textbooks, encyclopedias, other print resources, and Internet access
-six large sheets of poster board
-markers

Activities / Procedures:
1. WARM-UP/ DO-NOW: In the first five minutes of class, each student lists all of the possible uses of water that come to his or her mind. Students then share their answers, and the teacher writes responses on the board. Then, discuss why water is a limited resource, reviewing the water cycle and the environmental factors that determine which resources can be renewable.

2. Read and discuss "Water: Pushing the Limits of an Irreplaceable Resource," focusing on the following questions:
a. According to the article, how were the earth and its geographic features formed?

b. As a class, create a graph illustrating the statistics discussed in paragraph 4. Why is the total amount of available, renewable freshwater difficult to measure?
c. How have technology and urbanization affected water usage? What different uses of water arise in an industrial area compared to an agricultural area?
d. What natural disasters are related to water, and how can these disasters affect humans?
e. How has human use of water biologically and geographically changed the earth?
f. Discuss the following quotation: "Because of the capacity for renewal, some experts believe there is probably enough water to meet burgeoning humanity's basic drinking, cooking, and sanitation needs for some time. That is the theory. In reality, more than a billion people do not have access to clean drinking water now."
g. Why would countries "run out of water in the future if they insist on producing their own food"? How does the presence of water relate to the wealth of a country?
h. What is irrigation, and why do some experts believe that "some dry areas will not be able to serve both the needs of farming and those of the ballooning cities" in the future?
i. How has water been a "source of conflict between regions, cultures, and countries," and why?
j. How is the use of water affected by growing population rates?
k. In what ways have developed countries begun using water more efficiently, and why were some of these changes made?
l. What is a dam, and why would environmentalists argue against them?
m. How is global warming expected to affect the earth's water?

3. Divide students into six groups. Assign each group one of the following technologies discussed in the article: dams, irrigation systems, aqueducts, pipelines, water purification systems, sanitation systems. Each group then researches their technology, using science textbooks, encyclopedias, other print resources, and the Internet to answer the following questions:
--When was this technology developed, and what problems was it designed to solve?
--How has this technology changed since its inception?
--How does this technology work? How does water travel through this system?
--How is the water in this system returned to be used again?
--How does this system contribute to environmental problems?
--What improvements could be made to this system?

4. WRAP-UP/ HOMEWORK: Groups conclude their research, if necessary. Each group then develops a "How It Works" poster about their technology. Posters should include:
--a detailed drawing of the technology system, accompanied by an explanation of how water travels through the system (a series of arrows can help with the visual aspect of this explanation)
--answers to the research questions, either in separate paragraphs or incorporated into the illustration of the system
In a future class, groups should present and explain their posters.

Further Questions for Discussion:
--Why should humans care about protecting the earth?
--What are ways in which humans pollute the land, sky, and water?
--Why do humans pollute the earth?
--What are ways in which humans can protect the environment?
--What role has technology played in both damaging and protecting our environment?
--How have technology and urbanization affected water usage?
--What different uses of water arise in an industrial area compared to an agricultural area?
--What natural disasters are related to water, and how can these disasters affect humans?
--How has human use of water biologically and geographically changed the earth?
--How does the presence of water relate to the wealth of a country?
--How is the use of water affected by growing population rates?
--In what ways have developed countries begun using water more efficiently, and

why were some of these changes made?

Evaluation / Assessment:
Students will be evaluated based on participation in class discussions, group research work, and group "How It Works" poster about their technology system.

Vocabulary:
ascendant, nascent, vaporized, aquifers, renewable, replenished, precipitation, finite, indispensable, elixir, accessible, diverted, appropriated, ecosystems, corseting, sluices, biosphere, sanitation, vagaries, siphoned, aqueduct, pipeline, runoff

Extension Activities:
1. Demonstrate the water cycle by creating a land mass and a water system in a margarine tub or similar container, covering it tightly with plastic wrap, and placing it under a heat lamp. Over the course of a few days, students will be able to note evaporation, condensation, and precipitation.

2. Study the impact of global warming on the earth's water supply.

3. Visit your town's local water works or treatment plant, or invite a guest speaker to visit your class. Students can create displays of how the plant works.

4. Learn about wetlands and the consequences of draining them. The National Audubon Society (http://www.audubon.org) is involved in preventing these efforts.

5. Research differences in life forms that live in saltwater and freshwater.

6. Develop strategies for conserving water in our daily lives.

7. Research pollutants and other environmental hazards that threaten the earth and its ecosystems (e.g., acid rain, deforestation, desertification, global warming, chloroflourocarbons, anoxia).

8. Learn about different views of how the earth and its features were formed, both scientific theories and mythological or religious ideas.

Interdisciplinary Connections:
American History- Learn about dam systems that are being removed to accommodate aquatic ecosystems across the United States.

Current Events- Locate news articles about or research recent floods, hurricanes, and tsunamis. Many Web sites contain photos, footage, data, and survivors' stories from these events.

Fine Arts- Locate songs that discuss pollution and the depletion of natural resources. Present the lyrics to the class. A good starting point is the Musicians United for Songs In the Classroom (M.U.S.I.C.) Web site, found at (http://www.wpe.com/~musici).

Global History
-Research "historic" uses of water (such as the 1938 destruction of dikes on the Yellow River to destroy part of a Japanese army invading China).
-Learn about water systems in developing countries and the special health and environmental issues raised there.
-Research some of the conflicts mentioned in the article that were caused by water resources.

Health
-Research pollutants found in water and how they can affect public health.
-Learn about water's role in sustaining human life, from individual cells to whole systems of the human body.

Language Arts- Read and analyze flood myths from a wide variety of ancient cultures.

Mathematics- Keep track of your city's daily precipitation (usually available in the local newspaper or on the local news) and illustrate it graphically.

Other Information on the Web

The International Water Management Institute's World Water and Climate Atlas (http://www.iwmi.org) is a growing collection of data products and analytical tools focused on climate and water resources. Examples of what can be done with the Atlas include: identify areas suitable for rainfed agriculture, provide inputs for hydrologic modeling of river basins, extract climate inputs for crop modeling, and help project water supply and demand globally, nationally, and by river basins.

3-D Atlas (http://www.3datlas.com) offers research information on maps, culture, the natural world, climate, and human impact (as well as other categories), and allows you to search for information on specific countries.

Web sites dedicated to saving the environment:
--Environmental Defense Fund: (http://www.edf.org)
--National Audubon Society: (http://www.audubon.org)
--World Wildlife Fund: (http://www.worldwildlife.org)
--The Nature Conservancy: (http://www.tnc.org)
--Sierra Club: (http://www.sierraclub.org)
--Students Environment Action Coalition: (http://www.seac.org)
--Defenders of Wildlife: (http://www.defenders.org)

Academic Content Standards:

McREL This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8
Science Standard 1- Understands basic features of the Earth. Benchmarks: Knows the processes involved in the water cycle and their effects on climatic patterns; Knows the properties that make water an essential component of the Earth system
Geography Standard 14- Understands how human actions modify the physical environment. Benchmarks: Understands the environmental consequences of people changing the physical environment; Understands the ways in which human-induced changes in the physical environment in one place can cause changes in other places; Understands the ways in which technology influences the human capacity to modify the physical environment; Understands the environmental consequences of both the unintended and intended outcomes of major technological changes in human history
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows the ways in which human systems develop in response to conditions in the physical environment; Knows how the physical environment affects life in different regions; Knows the ways people take aspects of the environment into account when deciding on locations for human activities; Understands relationships between population density and environmental quality
Geography Standard 16- Understands the changes that occur in the meaning, use, distribution and importance of resources. Benchmarks: Understands the reasons for conflicting viewpoints regarding how resources should be used; Knows strategies for wise management and use of renewable, flow, and nonrenewable resources; Knows world patterns of resource distribution and utilization; Understands the consequences of the use of resources in the contemporary world; Understands the role of technology in resource acquisition and use, and its impact on the environment; Understands how energy resources contribute to the development and functioning of human societies; Understands how the development and widespread use of alternative energy sources (e.g., solar, wind, thermal) might have an impact on societies (in terms of, e.g., air and water quality, existing energy

industries, and current manufacturing practices)
Geography Standard 18- Understands global development and environmental issues. Benchmarks: Understands how the interaction between physical and human systems affects current conditions on Earth; Understands the possible impact that present conditions and patterns of consumption, production and population growth might have on the future spatial organization of Earth
Technology Standard 3- Understands the relationships among science, technology, society, and the individual. Benchmarks: Knows that science cannot answer all questions and technology cannot solve all human problems or meet all human needs; Knows ways in which technology has influenced the course of history; Knows that technology and science are reciprocal; Knows ways in which technology and society influence one another

Grades 9-12
Science Standard 1- Understands basic features of the Earth. Benchmark: Knows how life is adapted to conditions on the Earth
Geography Standard 14- Understands how human actions modify the physical environment. Benchmarks: Understands the global impacts of human changes in the physical environment; Knows how people's changing attitudes toward the environment have led to landscape changes
Geography Standard 15- Understands how physical systems affect human systems. Benchmark: Knows changes in the physical environment that have reduced the capacity of the environment to support human activity
Geography Standard 16- Understands the changes that occur in the meaning, use, distribution and importance of resources. Benchmarks: Understands programs and positions related to the use of resources on a local to global scale; Understands the impact of policy decisions regarding the use of resources in different regions of the world; Knows isues related to the reuse and recycling of resources
Geography Standard 18- Understands global development and environmental issues. Benchmarks: Understands why policies should be designed to guide the use and management of Earth's resources and to reflect multiple points of view; Understands contemporary issues in terms of Earth's physical and human
Technology Standard 3- Understands the relationships among science, technology, society, and the individual. Benchmarks: Knows that science and technology are pursued for different purposes; Knows examples of advanced and emerging technologies

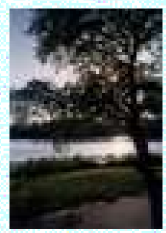
- Collaborative Projects and Data Sets

Water What-ifs

Introduction to Water What-ifs

Water What-ifs is a web site for encouraging inquiry investigations of water quality in North Carolina and Delaware. It is dedicated to the students of these two fine states. The following links will introduce you to the watersheds of your state!

- Surf your watershed in Delaware!
- Surf your watershed in North Carolina!
- Find the latitude and longitude of your location!



The following water quality parameters will be addressed at this site. Three lessons are provided for each parameter to help teachers create a water quality unit to be used in conjunction with the water quality testing program.

pH

temperature

dissolved oxygen

nitrates/phosphates

macroinvertebrate surveys

The purpose of water quality testing is to monitor specific parameters in bodies of water on the earth. Changes in these parameters may be detrimental to the organisms in and around the water source. Many factors

- [Info on Available Grants]
- [National Science Standards]
- [North Carolina Science Curriculum]
- [Delaware Science Standards]
- [Water What-ifs Workshop Photos]

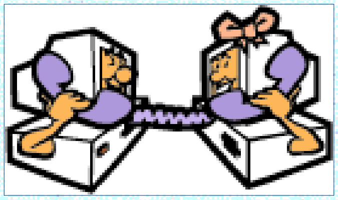
Water Quality Data

- Submit water quality data (password needed)
- Look at NC Data
- Look at Delaware Data
- Using Collected Data for Inquiry Lessons

can affect the quality of the water in a ecosystem including discharges of industrial or agricultural wastes.

Field observations and measurements allow us to look for links between land use and its effects on water quality. By collecting and analyzing data from a local source we can approach a community situation in a way very similar to the approach used by practicing scientists.

Water Quality Forum (password needed)



The Water Quality forum allows interaction and discussions on investigations of water quality. Please try to post to the forum once each week to help form an on-going dialogue.

Please note! The use of this site is being monitored for educational research purposes. Data collected from the use of this site may be included in published research. We encourage teachers to participate by visiting the Teacher Tutorial.

Asteroids, Comets, and Meteors Theme Page

This "Theme Page" has links to two types of resources related to the study of asteroids, comets and meteors. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. Please read our disclaimer.

- ## Asteroid and Comet Impact Hazards

  "Although the annual probability of the Earth being struck by a large asteroid or comet is extremely small, the consequences of such a collision are so catastrophic that it is prudent to assess the nature of the threat and prepare to deal with it." This NASA site provides basic information about such possibilities including government reports and FAQs about impacts, asteroids and comets.

- ## Build Your Own Comet

  Advice and a recipe for building a six inch comet. The site also provides basic information about comets.

- ## Constellation Prizes

  In this lesson plan, grade 6-12 students "learn about meteors, meteorites, and comets by reading and discussing a related New York Times article about the Leonid meteor showers and the methods that scientists are using to learn from these meteors. Students then create and observe a comet in their classroom."

- ## Database of Terrestrial Impact Structures

  Natural Resources Canada provides world maps identifying crater locations. Regional maps also offer links additional information about the craters. Be sure to look at the paper "Impact Cratering on Earth" for crater information, morphology, identification and hazards although the writing is at somewhat of an advanced level.

- ## Explore Zone

  EZ provides general information followed by a page with collections of news stories about the latest innovations, coolest discoveries and hottest events in world of science. Although not written specifically for kids, the articles provide information written appropriately for them

  - Asteroid Science
  - Comet Science
  - Meteor Science

- ## Impact Craters

A lesson for junior high students from NASA on impact craters. Topics include an explanation of impact craters, pseudocrates, and impact craters in other parts of the solar systems. The question of whether or not we are in danger is also addressed. A teacher's guide is available but doesn't appear to be linked from the student lesson site.

- ## Meteorite and Impacts Advisory Committee (MIAC)

Three topics are discussed in this Canadian Space Agency site: meteorites, fireballs, and impact structures. General information about each is provided and there are some specific Canadian references as well.

- ## Meteors

This lesson from Newton's Apple introduces meteors and provides an activity where students can learn more about craters and what made them.

- ## Sky and Telescope

The online version of the 58 year old magazine.

  - Asteroids Brief, general information about asteroids combined with related articles on hunting asteroids and seeing asteroids.
  - Comets General information about comets plus related articles on comet observing as well as specific comets.
  - Meteor Page General information about meteors as well as links to related articles on planning a meteor watch, observing meteors, meteors that changed the world, and information about specific meteor showers.

- ## Small Comets

Learn more about the theory that millions of small comets strike the earth yearly and break up into water vapour. Some scientists believe that they are the source of water in Earth's oceans and atmosphere. Be sure to read the sections "The Original Discovery","Your Questions Answered", and "Latest News".

- ## Solar System Collisions

Students are able to manipulate four variables (target, projectile composition, projectile diameter, and projectile velocity) to determine how they affect the impact of a collision of an asteroid or a comet on a solar body.

- ## StarChild: The Solar System

StarChild is a comprehensive NASA site developed for elementary students. The above link is to their "Level 1" menu page on the solar system where you will find links to their sections on The Asteroid Belt, Comets, and Meteoroids. Each of these sections provides a brief introduction with all terms defined in a gloasary, a comprehension question, and a probing question. All pages come in two reading levels and can be printed.

- ## StarDust

Launched in February 99, StarDust is a NASA mission that will fly close to a comet and bring cometary material back to Earth. Their web site has: mission description, status reports, and details (e.g., scientific objectives, flight plans); explanations about comets; comet history; description of the spacecraft; overview and discussion of the scientific concepts involved in the mission; photos and images; and an education page with activities and a teacher guide.

TrackStar

TrackStar is an online interface which allows instructors to create lessons for students by sequencing existing instructional content in various web sites within a lesson. Students explore one topic at a particular location within one web site then move on to the next topic at another web site. The list of topics remains visible throughout the lesson so that students can remain on track. Explorations of the web sites beyond the designated instructional content are also possible.

This link is to their search page from where a keyword search on "asteroids or comets or meteors" will produce over a dozen hits. Note however that many of these hits will have the study of asteroids etc. as only a part of their overall lesson. Caution #1: Many of the web sites that these lessons access may already be on this CLN page - it's the creation of lesson objectives and the sequencing of the tours through the sites that make the lesson potentially useful to your students. Caution #2: The quality of the lessons (e.g., definining objectives, finding web sites, sequencing the tours) will vary widely within the TrackStar collection.

Views of the Solar System: Table of Contents

This site has sections covering a wide range of solar system topics. It can be difficult to find all of the good resources on the site since they do not appear to be all interlinked. Your best bet is to use this table of contents to browse through the asteroid, comet and meteor sections. You'll find introductions about each type of body, information about specific examples, images, explanations of various scientific phenomena, and a number of classroom activities.

[The] Why Files

- Asteroids Answers to the following questions: What can they do? Will they obliterate Earth? How are asteroids found? Did asteroids deliver life? What are they made of?
- Comets Information is organized under the following headings: Comet fiction; Comet facts; Do-it-yourself comet; Extrasolar what? Where do they come from? Could a comet crash into the Earth? Are they trying to tell us something? Are we listening?

Top of Page

Note: The sites listed above will serve as a source of curricular content in Asteroids, Comets and Meteors. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Curricular Resources in Astronomy

Here are a number of links to Internet sites which contain information and/or other links related to Astronomy. Please read our disclaimer.

- ## Amazing Space

  The Space Telescope Science Institute - the organization responsible for the scientific operation of the Hubble Space Telescope - hired teachers to develop a collection of K-12 web-based interactive astronomy lessons complete with student activities and teacher guides. There are several different units with topics on: Black Holes, Galaxies, Stars, the Solar System, Telescopes, Hubble Space Telescope.

- ## Ask an Expert: Astronomy

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Astronomy may be found in our "All Subjects" section at the top of the page, the "Science" section, as well as the general "Reference" section.

- ## [An] Astronomy Course for Students Using the Internet

  An Internet-based course on astronomy that should be adaptable to most age and interest levels.

- ## Astronomy Education Resources

  Here's a meta-list of links to educational astronomy sites with descriptions.

- ## Astronomy WWW Resources

  This meta-list has categories of astronomical services, like general collections, e-zines, specialized areas, and servers around the world.

- ## Athena Curriculum: Space and Astronomy

  Athena has used geophysical and other data sets acquired via the Internet to prepare curricular units on space and astronomy.

- ## BC's Pacific Space Centre

  The on-line location of BC's H.R. Macmillan Planetarium and Gordon Macmillan Southam Observatory. Increase your awareness about the space center's different program offerings, and find out about the forecast for the night skies for the upcoming month.

- ## Bradford Robotic Telescope

  At this site you can control a remote and fully automated 46 cm telescope connected to the Web. Just register (it's free) with this telescope, located high on the moors in West Yorkshire, England and ask it to look at absolutely anything in the Northern night sky. It decides when the conditions are good enough to make observations, then posts the documentation, results, and photo of your job.

- ## Comets and Meteor Showers

The "Comet" segment of this site contains accurate positions of each currently visible comet, on-line star charts, photographs and information on interesting historical comets. In the "Meteor" segment, information on meteor showers is divided by month with information provided on each shower.

- Eric's Treasure Troves of Science

Extensive on-line encyclopedias of math and science. Included are encyclopedias on Astronomy, Scientific Biography, Scientific Books, and Rocketry. Each section is browsable alphabetically or searchable by keyword. Entries have a concise explanation as well as cross links which can be quite extensive.

- Expanding Universe: A Classified Search Tool for Amateur Astronomy

Here's a meta-list of links to astronomy www sites, but with a difference. It uses a modified Dewey Decimal System to organize the links.

- Mission to Mars

The content of this ThinkQuest 1997 award winning site covers the history of Mars, man's fascination with it, and our exploratory missions. There's lots of information in the pages in the 'Mars Academy' or students can learn about the planet through an interactive mission simulation in which they design and execute a mission probe.

- NASA Education Internet Links

Links to the multitude of NASA educational resources.

- National Air and Space Museum (Smithsonian Institution)

Take a 'Virtual Tour' of this museum.

- Outer Orbit

This site has a number of curricular resources for students and teachers, including: Space Chat (talk with professionals); Ask an Astronomer (question and answer service); Today in Space (look through a telescope or link to an online magazine/newspaper); Mission Mars (information about this project); International Space Station (keep up to date with what's happening); and links to other space related sites.

- Rader's Interactive Space Exploration Center

Instructional units on a range of topics within five major astronomical sections: Universe, Galaxies, Stars, Solar System, and Explore. Generally, each topic is presented within one or two screen pages.

- Science for the Millenium

This virtual exposition from the National Center for Supercomputing Applications (NCSA) has a number of very extensive exhibits for astronomy students and teachers. Movies and sound enhance the site but are not absolutely necessary.

  - Cosmos in a Computer Learn more about cosmology - the study of the universe as a whole. Topics include: How did the universe begin? How did it come to be in its present state? What can the universe's present structure tell us about its evolution and ultimate fate? Why are computers essential to understanding the universe? What does it take to compute the cosmos? There are also lots of scientific animations.

- Spacetime Wrinkles Questions addressed in this exhibit are: Who was Einstein? What is gravity? What are black holes and gravitational waves? Where might black holes lurk? How can we "see" them? What does it take to study black holes? What happens if you disturb a black hole? What happens when two black holes collide? Will Einstein's theory of gravitation continue to prevail in decades to come?
- Whispers for the Cosmos Learn more about how radio astronomers use computers to analyze huge amounts of data in an attempt to answer questions such as: Is space really empty? What lies between the stars? Can molecules, including those we're made out of, form in space? How are stars born? What determines the shapes of galaxies?

SEGway

The Science Education Gateway provides Earth and Space Science curricula produced by teachers in collaboration with SEGway partners (e.g., NASA, Science Museums). Lessons, activities and self-guided tutorials are categorized under "Space Science", "Sun/Earth", and "Solar System." (Note: you may find some of the same lessons in the web sites of its partners.)

StarChild

Designed for children, this site has two difficulty levels of content on the Solar System, the Universe, and Space Stuff. Within each area, there is a set of student activities that children can perform online.

Students for the Exploration and Development of Space (SEDS)

This site contains information about SEDS and about space science in general for students at the high school or university level interested in forwarding the cause of space exploration and development.

Views of the Solar System

Views of the Solar System contains images and information about the Sun, planets, moons, comets, asteroids, and meteoroids. There are over 220 pages of information and 950 images.

[The] Whole Mars Catalog

Information about Mars as well as Mars Missions.

Windows to the Universe

Funded by NASA, this site contains Earth and Space Science documents, including images, movies, animations, and data sets, targeted for elementary, middle school and high school students. Documents provide not only scientific content, but also information about the artistic, historical, and cultural connections between science and our lives. Teacher resources include classroom activities and educational links.

Note: The sites listed above will serve as a source of curricular content in Astronomy. For other resources in this subject area (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Curricular Resources in Geology

Below are the CLN "Theme Pages" which focus on specific topics within Geology. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Air Quality Theme Page
- Avalanches Theme Page
- **Biomes Theme Pages**
  - Antarctic Theme Page
  - Arctic Theme Page
  - Drylands/Deserts Theme Page
  - Temperate Forests Theme Page
  - Tropical Rainforests Theme Page
  - Wetlands Theme Page
- Earthquakes Theme Page
- Floods Theme Page
- Glaciers Theme Page
- Oceanography Theme Page
- Rocks, Minerals, and Mining Theme Page
- Tsunamis Theme Page
- Volcanoes Theme Page
- Water Quality Theme Page

General Geology Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Geology. Please read our disclaimer.

- Ask an Expert: Geology

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Geology may be found in our "All Subjects" section at the top of the page, the "Science" section, as well as the general "Reference" section.

- ## Athena Curriculum

  Athena has used geophysical and other data sets acquired via the Internet to prepare curricular units on oceans and earth resources.

- ## Earth and Sky

  Earth and Sky" is a radio program where popular science topics are discussed at a level that's appropriate for non-scientists. The transcripts for each current week are available online (formerly via gopher and now on the World Wide Web). As part of the service, you can submit your own questions and you can browse the scripts from previous shows.

- ## Fundamentals of Physical Geography

  Although this online textbook from Michael Pidwirny, Okanagan University College, is intended for postsecondary students studying introductory physical geography, much of it may be applicable for high school students as well. Contents include over two hundred pages of information, more than three hundred 2-D and animated graphics, an interactive glossary of terms, a study guide, links to other Internet resources, and a search engine. See the Table of Contents to directly access such sections as Meteorology and Climatology, Hydrology, Biogeography and Ecology, Geology, and Geomorphology.

- ## **New York State Regents Examinations**

  The N.Y. State Regents Examinations are a set of subject-based standardized tests for N.Y. high school students. Here are two resources, from different organizations, that can help teachers and students prepare for these or other similar standardized exams.

  - New York State Education Department Download PDF formatted copies of recent Regents Examinations and answer keys from this page.
  - Regents Exams Prep Centre: Earth Science The Prep Centre, developed by Oswego County high school teachers, is intended to help Grade 12 teachers and students prepare for the N.Y. Regents Exams. Teachers can access sets of sample questions that are organized by subject and then by topic. Alternatively, students can attempt the questions, view the correct answer, or follow a link to a tutorial on the curricular content in the question if they need assistance.

- ## Pointers to Earth System Science Educational Resources

  Pennylvania State University provides a meta-list of links to on-line Earth System Science Education resources, categorized under headings such as "Earth Science", "Environment", "Weather", "Geography", "Teacher Resources" and "Kids (K-12)."

- ## RiverResource

  Students will be able to find resources on rivers in general as well as some specific rivers. Although that section of the site is predominantly American, some Canadian rivers are included.

- ## Schlumberger: Science Watch

Learn more about the oil industry with these articles provided by Schlumberger: 1) Nuclear Magnetic Resonance Six Miles Deep: 2) Physics in the Oil Industry; 3) Drilling Fluid: Lifeblood of the Well; 4) CyberGeologist; 5) The JOIDES Resolution; and 6)The Making of Oil Plankton to Production.

- ## SEGway

  The Science Education Gateway provides Earth and Space Science curricula produced by teachers in collaboration with SEGway partners (e.g., NASA, Science Museums). Lessons, activities and self-guided tutorials are categorized under "Space Science", "Sun/Earth", and "Solar System." (Note: you may find some of the same lessons in the web sites of its partners.)

- ## United States Geological Survey

  The USGS provides a variety of resources for earth science students and teachers.

  - Earth and Environmental Science A meta-list of Earth and Environmental Science Internet resources categorized under such topics as "Earth Science", "Earthquake", "Environment", "Hydrology", "Oceanography" and "Volcanology."
  - Teaching in the Learning Web Lessons and activities in two earth science categories: Changing World and Earth Hazards. There is also a unit on maps.
  - Water Science for Schools High school and middle school students can learn about the basics of water, Earth's water, special topics (e.g., acid rain, water quality issues), and US water use. There also are some interactive sections, FAQs, and links to other sites.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Geology. For other resources in this subject area (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Curricular Resources in Paleontology

Here are a number of links to Internet sites which contain information and/or other links related to paleontology. Please read our disclaimer

- Ask an Expert: Paleontology

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Paleontology may be found in our "All Subjects" section at the top of the page, the "Science" section (see General Science), as well as the general "Reference" section.

- Dinosaur Theme Page

  This CLN "Theme Page" has links to two types of resources related to the study of dinosaurs. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- [The] Field Museum: Online Exhibits

  The Field Museum of Natural History (Chicago) has a number of online exhibits that will be of interest to paleontology students. Check out "Sue on the Web" for a T.Rex exhibit and "Life Over Time" for information about dinosaurs in general.

- Paleontology without Walls

  Take a 'Virtual Tour' of this University of California museum. Their "On-line Exhibits" contain large amounts of information on paleontology, searchable by phylogeny, geology or evolutionary theory as your paradigm.

- PaleoWorld

  The goal of the developers of this site is to further the interest and understanding of the flora and fauna that have existed over the past 650 million years. Information is organized by geological period (the site is still under development). Students will be able to learn about any existing animals and plants, get a reconstruction of the paleogeography of the continents, and read a description of what the Earth was like at the time.

- Set in Stone

  This paleontology site has background information about paleontology in general as well as fossils and dinosaurs in specific. There is also a series of classroom activities for students.

- Strange Science: The Rocky Road to Modern Paleontology and Biology

  Today's knowledge about biology and paleontology is often taken for granted. This web site uses historical paintings and images to demonstrate some of the weird ideas that scientists and scholars in these subjects previously held.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Paleontology. For other resources in this subject area (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Curricular Resources in General Science

Below are the CLN "Theme Pages" which focus on specific topics within General Science. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme. We have many other, more specific, Theme Pages. You'll find a list at our Science Menu Page

- Inventors and Inventions Theme Page
- Science Fair Theme Page

General Science Resource

Here are a number of links to other Internet resources which contain information and/or other links related to General Science. Please read our disclaimer.

- Ask an Expert: General Science

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on General Science may be found in our "All Subjects" section at the top of the page, the "Science" section, as well as the general "Reference" section.

- AskERIC

  "ERIC" stands for the "Educational Resources Information Center" - a U.S. federally funded national information system that provides a variety of services and products. "AskERIC", the Internet-based equivalent, contains two major components which may be of interest to Science teachers: (1) the AskERIC Q&A service enables teachers to send a message requesting educational information. The Center staff will search the ERIC databases and respond within 48 hours. (2) The AskERIC Virtual Library contains hundreds of lesson plans, access to the ERIC database and ERIC Digests, topical guides to Internet Resources, and archives of education-related listservs.

- Athena Curriculum

  This web site provides curricular and resource material using geophysical and other data sets acquired via Internet. At the time of viewing, they had four folders of resources: Oceans, Weather and Atmosphere, Earth Resources, and Space & Astronomy. A folder might have links to curricular resource materials (e.g., data, other WWW sites) as well as instructional materials for the teacher and/or student.

- BC's Science World

  Access information about BC's Science World programs and events, membership, history, and helpful hints to plan your school trip.

- Brainium

Here's a made-in-BC multimedia educational resource that combines electronic games with other interactive resources such as an online science magazine, conferencing, virtual chat sessions, web site and software reviews, and an on-line, animated episodic show called BugZone. A teacher resource area will assist teachers in integrating Branium resources in the grade 4-8 science curriculum. Note: BC teachers and students can access Branium through a province wide license, but they must first go through a registration process. Note also that the technology in this site will require use of an advanced browser.

- Celebrating Science and Technology Week

This page was developed by Mike Silverton of Nanaimo School District for the 1996 Science and Technology Week. The resources available from this site should be useful to BC students and teachers at any time.

- Cornell Theory Center Math and Science Gateway

This Gateway provides a meta-list of links to resources in mathematics and science for educators and students in grades 9-12.

- Eisenhower National Clearinghouse for Mathematics and Science Education

The Eisenhower National Clearinghouse for Mathematics and Science Education (ENC) provides information about all types of instructional resources including books, videos, software, CD-ROMs, kits, and online resources. The Digital Curriculum Laboratory (DCL), ENC's online component, is a comprehensive Internet site for math and science education. It is designed to assist teachers in locating instructional and other educational resources. The DCL includes links to Internet resources for science and math teaching as well as the ENC Catalog of Curriculum Resources.

- ERIC Clearinghouse for Science, Mathematics, and Environmental Education

This ERIC Clearinghouse provides educational materials, services and coursework to parents, educators, students and others interested in Science. Specific resources include lesson plans, research summaries (Digests), electronic publications, indexed journals and information about scientific organizations.

- Evidence: The True Witness

Explore the field of forensic science in this ThinkQuest 98 entry. Learn about the fundamentals of the science in the reference section, test your knowledge of the science by collecting evidence and trying to solve a simulated crime, or learn about potential careers in this field. Note that advanced technology is needed to access sections of the site.

- Explorer Data Base

The explorer is an on-line database by which educational resources in mathematics and science (instructional software, lab activities, lesson plans) can be contributed, organized, or delivered.

- [Great Canadian Scientists Online]

  This site contains the short biographies of about 20 famous Canadian scientists. There are about 100 other Canadian scientists which are profiled briefly. In addition, students can email science questions directly to Canadian Scientists.

- [Jason Project]

  This site provides a link to the current Jason Project hosted by the Jason Foundation for Education. "Jason Projects" enable teachers and students to participate in an electronic field trip hosted by scientists engaged in global explorations.

- [[The] Mad Scientist Network]

  Here's a Web-based "Ask a Scientist" forum for teachers and students. Questions can be posted in any one of 24 science areas and a scientist will answer them. There's also a browsable and searchable question/answer archive.

- [Measure 4 Measure]

  This is a meta-list of about 100 links to site which will perform calculations/estimates for you. Categories include: Science/Math (e.g., measurement conversions); Health (e.g., calorie counter); Finance (e.g., compound interest); and Miscellaneous.

- [Minnetonka Elementary Science Center]

  The Science Center is a warehouse-type resource centre for Minnetonka School District teachers. Some of the information on this web site pertain only to the operations of that center. However, there are other electronic resources which will be useful to any elementary science teacher, including lesson plans (organized by grade levels) and teacher tools (e.g., practical suggestions on science fairs).

- [Recurring Science Misconceptions in K-6 Textbooks]

  Explanations of over 25 commonly believed misconceptions about scientific principles.

- [SciEd: Science and Mathematics Education Resources]

  This site is a meta-list of links to educational science resources, organized by subject. It also includes documents such as "History of Science", "Ethics in Science", and "Skepticism and Pseudoscience".

- [ScienceDaily]

  The site developers describe their site as follows: "Each day, ScienceDaily will bring you breaking news about the latest discoveries and research projects in everything from astrophysics to zoology.... ScienceDaily also offers the best collection of hotlinks to the coolest science sites on the World Wide Web, as well as weekly updates e-mailed directly to you."

- [Science Hobbyist]

  Here's a site aimed at the amateur scientist. This page includes links to scientific newsgroups, sites, and useful scientific information. It also specializes in linking to science demos, 'wierd science' sites, science museums and home schooling information.

- [Science Links]

  This SchoolNet page contains links to: "Images of Canada" (learn about satellite imagery); "National Pollutant Release Inventory (a database on major sources of environment pollutants); and "Canadian National Earthquake Hazards Program" (earthquake records).

- [ScienceWeb]

  ScienceWeb is a science and technology information service that focuses on Canadian activities. Included within the site are: a resource guide to Canadian post secondary institutions; information on science internet projects that K-12 kids can get involved with; a teachers helping teachers corner; and, links to scientific institutions, clubs and non-profit societies.

- [The] Why Files

  "The Why Files, a project of the National Institute for Science Education, is an electronic exploration of the science behind the news. Twice a month, we'll bring you a new feature on the science (and math, engineering, and technology) of everyday life. Our boundaries are broad -- from outer space to cellular biology, from dinosaurs and dragon lizards to the statistics of political polling."

- Yahoo's Catalog for Science

  A very large list of science links, organized by subject area.

- You Can

  Beakman and Jax provide lots of science-related information, pictures, interactive demos, and experiments/activities for kids.

Top of Page

Note: The sites listed above will serve as a source of curricular content in General Science. For other resources in this subject area (e.g., curricular content in Earth Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Curricular Resources in Life Science

Below are the CLN "Theme Pages" which focus on specific topics within Life Science. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- **Biomes Theme Pages**
  - Arctic/Antarctic Theme Page
  - Drylands/Deserts Theme Page
  - Temperate Forests Theme Page
  - Tropical Rainforests Theme Page
  - Wetlands Theme Page
- Endangered Species Theme Page
- Gardening for Kids Theme Page
- Genetics/Biotechnology Theme Page
- Gerbils-Hamster Theme Page
- **[The] Human Body's SensesTheme Pages**
  - Hearing Theme Page
  - Sight Theme Page
  - Smell Theme Page
  - Taste Theme Page
  - Touch Theme Page
- **[The] Human Body's Systems Theme Pages**
  - Brain/Nervous System Theme Page
  - Circulatory System Theme Page
  - Digestive System Theme Page
  - Muscular System Theme Page
  - Respiratory System Theme Page
  - Skeletal System Theme Page
- Oceanography Theme Page

General Life Sciences Resources

Here are a number of links to Internet sites which contain information and/or other links related to Life Sciences. Please read our disclaimer.

For resources on the **Environment**, please see the our curriculum pages on Social Studies

- ## Ask an Expert: Life Sciences

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Life Sciences may be found in our "All Subjects" section at the top of the page, the "Science" section, as well as the general "Reference" section.

- ## AskERIC

  "ERIC" stands for the "Educational Resources Information Center" - a U.S. federally funded national information system that provides a variety of services and products. "AskERIC", the Internet-based equivalent, contains two major components which may be of interest to Science teachers: (1) the AskERIC Q&A service enables teachers to send a message requesting educational information. The Center staff will search the ERIC databases and respond within 48 hours. (2) The AskERIC Virtual Library contains hundreds of lesson plans, access to the ERIC database and ERIC Digests, topical guides to Internet Resources, and archives of education-related listservs.

- ## Biological Timing Online Science Experiment

  K-8 students can participate in two scientific experiments focusing on the concepts of biological clocks by viewing and downloading actual experiments as they are collected at the University of Viriginia. They can then analyse the data, form hypotheses, suggest variables for new experiments, and share conclusions with other students and scientists. Teachers can download background materials.

- ## Biology4Kids

  A site on the basics of Biology with information in the form of text and diagrams on cell structure and function, the chemistry of biology, and how the world of biology is studied, and cell structure and function.

- ## [The] Biology Project

  A wide range of tutorials and online problem sets designed for high school and university biology students by the University of Arizona. Content coverage includes: Biochemistry; Cell Biology; Chemicals & Human Health; Developmental Biology; Human Biology; Immunology; Mendelian Genetics and Molecular Biology.

- ## bioSurf

  Like a biology textbook, this site is organized into units and then into chapters. However, the content in each chapter is a series of links to external web sites which provide the explanatory content. In some cases, these links are to traditional web sites; however, others are to high tech sites where students options range from watching multimedia presentations to manipulating the content (e.g., explore a cell).

- [Birds: A Virtual Exhibition]

  The Royal British Columbia Museum is pleased to bring its collection of bird calls, images and top scientific information to the public through the creation of the Grace Bell Collection Web site. This website is part of a series of "Virtual Exhibits" on Canadian birds being created by museums across Canada, through partnership with the Canadian Heritage Information Network (or CHIN).

- [Bridge: Biology]

  A meta list of links to Biology web sites. Annotated links are organized within approximately 30 categories organized under one of two main headings - Organisms or Habitats.

- [Cell Intelligence]

  Are cells intelligent? In this web site, this question is explored through two lines of reasoning that are explained by text and graphics.

- [Cells Alive]

  A collection of animated gifs and Quick Time Videos of cells of the immune system, bacteria, and parasites. Note: Graphical browser and QT readers required.

- [[The] Froggy Page]

  Everything you wanted your students to know about frogs, including pictures, sounds, tales, songs, scientific information and jokes.

- [From the Ground Up]

  There are five lessons in this teachers' guide on food, agriculture and sustainable development: history of agriculture and description of sustainable development, soil, agriculture and chemicals, the real cost of food, and everything's connected. Available for downloading are lessons, background essays, and worksheets.

- [Fundamentals of Physical Geography]

  Although this online textbook from Michael Pidwirny, Okanagan University College, is intended for postsecondary students studying introductory physical geography, much of it may be applicable for high school students as well. Contents include over two hundred pages of information, more than three hundred 2-D and animated graphics, an interactive glossary of terms, a study guide, links to other Internet resources, and a search engine. See the Table of Contents to directly access such sections as Meteorology and Climatology, Hydrology, Biogeography and Ecology, Geology, and Geomorphology.

- [[A] Future for the Grizzly]

  The B.C. Ministry of Environment, Lands and Parks and 'Orca Bay' (a sports and entertainment information service) have put together a Grizzly Bear web site with an educational focus. You can learn facts about where and how these bears live, find out about the environmental issues that have an impact on them, learn what to do if you should ever encounter one in the wild, investigate the BC Government's Strategy for Preservation and even "ask Dr. Grizz" if you have additional questions.

- Great Plant Escape

  The Great Plant Escape consists of six lessons designed to introduce 4th and 5th grade students to plant science and increase their understanding of how foods grow. The lessons include multidisciplinary activities (math, science, language arts, social studies, music and art).

- Heart Preview Gallery

  This site provides a virtual tour of the human heart. The user can select "things to see" (e.g., movies, diagrams, x-ray images), "things to do" (on-line activities), "things to hear" (beats, murmurs), "things to learn" (teacher resources, activities), and "places to go" (other heart-related sites on the Internet).

- Hidden Killers: Deadly Viruses

  There are four main sections to this web quest site on viruses: Virus Basics (general information); Human Defenses (how our body fights viruses); Virus Profiles (includes histories of some specific viruses); Military (bio-weapons). You'll also find recent news, a conference on viruses, vocabulary, games, and a feature article - all on viruses of course.

- Interactive Frog Dissection

  The Interactive Frog Dissection was designed for use in high school biology classrooms. The intent of this program was for it to be a valuable preparation tool or even a useful substitute for laboratory dissection.

- Microbe Zoo

  Descriptions and explanations of how microbes live in dirt, food, space, animals, and water.

- Multimedia Medical Reference Library

  Geared for medical students, physicians and patients, this site is an incredible reference tool. You'll find a vast amount of information about physical and mental health, diagnoses, medications, nutrition and more.

- Nanoworld Image Gallery

  Microscopic images from the University of Queensland that can be viewed and/or downloaded. Topics include: blood, cellular ultrastructure, digestion, hair, insects, materials, microbes and diseases, parasites, plankton, pollen and spores, reproduction-animals, reproduction-plants, tissues-animals, tissues-plants, and more.

- **New York State Regents Examinations**

  The N.Y. State Regents Examinations are a set of subject-based standardized tests for N.Y. high school students. Here are two resources, from different organizations, that can help teachers and students prepare for these or other similar standardized exams.

  - New York State Education Department Download PDF formatted copies of recent Regents Examinations and answer keys from this page.
  - Regents Exams Prep Centre: Biology The Prep Centre, developed by Oswego County

high school teachers, is intended to help Grade 12 teachers and students prepare for the N.Y. Regents Exams. Teachers can access sets of sample questions that are organized by subject and then by topic. Alternatively, students can attempt the questions, view the correct answer, or follow a link to a tutorial on the curricular content in the question if they need assistance.

- Noah: The Animal Search Engine

  If you're looking for web sites on animals, you can use "Noah" a search engine dedicated to finding such resources.

- [An] On-Line Biology Book

  Modified lectures for freshman-level biology.

- Strange Science: The Rocky Road to Modern Paleontology and Biology

  Today's knowledge about biology and paleontology is often taken for granted. This web site uses historical paintings and images to demonstrate some of the weird ideas that scientists and scholars in these subjects previously held.

- Virtual Frog Dissection Kit

  Disect a frog online! Includes the Virtual Frog Builder game to test your knowledge of frog anatomy.

- [The] Visible Human Project

  Information from the Visible Human Project has been put on the web by the U.S. National Library of Medicine. The project provides anatomically detailed, three-dimensional representations of the human body.

- Worm World

  Advertised as "the yuckiest site on the Internet", Worm World has lots of information for kids about worms. Included are "worms as recyclers", an art gallery, the body parts of a worm, sounds of worms, jokes about worms, and more.

- WWW Virtual Library: Ecology, Biodiversity and the Environment

  A meta-list of links to sites.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Life Science. For other resources in this subject area (e.g., curricular content in Earth Science, General Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Curricular Resources in Chemistry

Here are a number of links to Internet sites which contain information and/or other links related to Chemistry. Please read our disclaimer.

- Active Learning in Chemistry Education (ALICE)

  Course materials that can be used by high school students/teachers interested in pursuing independent study. There are 29 chapters in the program - each with reading materials, questions to answer, problems to solve, and many laboratory activities to perform. The course material is free upon request and can be printed, photocopied, and given to students one chapter at a time. Caution: This is a Geocities site with intrusive advertising.

- [The] Analytical Chemistry Springboard

  A meta-list of links to sites related to analytical chemistry.

- Ask an Expert: Chemistry

  CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Chemistry may be found in our "All Subjects" section at the top of the page, the "Science" section (see General Science), as well as the general "Reference" section.

- [The] Biology Project

  Tutorials and online problem sets designed for high school and university biology students by the University of Arizona. Their biochemistry section covers the following topics: basic chemistry, metabolism, enzymes, energy, & catalysis, large molecules, photosynthesis, molecular structure, pH & pKa, and clinical correlates of pH. See also their unit on Chemicals and Human Health

- Chem101

  This WebQuest winner has an online textbook covering seven units (Back to the Basics, Advanced Basics, Chemical Bonding, Periodic Table, Thermodynamics, Solubility & Redox Reactions, and Equilibrium & Acids). Each unit is itself broken down further into sections. There is also a set of 21 chemical labs that students can perform. In some cases the authors provide lab question sheets, which if answered, reveal correct answers. There are also videos showing the lab results in some cases. Caution: navigation through the online textbook is hindered by a reliance on non-descriptive headings however there is a search engine if you wish to go directly to a topic.

- Chem4Kids

  A site on the basics of Chemistry with information in the form of text and diagrams on matter, atoms, elements, reactions and how math is used in chemistry.

- ChemFinder.Com

  A chemical compound database that allows searches to be conducted by chemical name, formula, molecular weight, or CAS Registry Number. These are included in the search results as well as data on melting point, boiling point, evaporation rate, flash point, specific gravity, vapor density, and water solubility. Search results also provide synonyms of the compound as well as a generous set of links to additional information about it on the web. This is a free service but the owners may impose limitations on access if there is excessive use from an address (e.g., a single user or the firewall address serving multi users).

- Chemical Bonding

A unit of study on chemical bonding which includes explanations, lab activities, demonstrations and discussions.

- Chemistry Functions

Students can use this web site to do molar conversions or balance equations. Caution: some instruction in how to use the site may be necessary.

- Chemistry Tutor

Explanations are organized within the following headings: Introduction to Chemistry, Reactions, Grams/Moles Converters, Equations & More, Lab Safety, the Periodic Table. In addition, there is an Ideal Gas Calculator, a Celsius/Fahrenheit Converter, an interactive question & answer page, and links to other pages, including for teachers.

- Chemist's Art Gallery

Contains visualizations and animations of chemistry done at the host site as well as elsewhere on the Internet.

- [The] Chem Team: A Tutorial for High School Chemistry

Study resources for High School and Advanced-Placement Chemistry students.

- CHEMystery

Here's a virtual chemistry textbook written for high school students.

- Department of Chemistry: Educational Aplets

These Java aplets allow students to explore scientific principles through virtual simulations. At the time of review there were six topics: molecules, kinetics, thermodynamics, atmosphere, quantum mechanics, and polymers.

- Eric's Treasure Troves of Science

Extensive on-line encyclopedias of math and science. Included are encyclopedias on the following subjects: Chemistry, Scientific Biography, and Scientific Books. Each section is browsable alphabetically or searchable by keyword. Entries have a concise explanation as well as cross links which can be quite extensive.

- General Chemistry Online

Articles, an ask an expert service, self guided tutorials, and randomly generated quizzes/drills on specific topics are available at this site. Be sure to also check out their collection of links to other chemistry resources on the web.

- Mark's Chemistry Tutor

Explanations of the following concepts: Significant Figures; Dimensional Analysis; The

Mole; Stoichiometry; Limiting Reagent;Aqueous Chemistry; Some Common Types of Reactions; Oxidation Numbers; Redox Equations; Heat and Enthalpy; Quantum Numbers; Electron Configuration; Lewis Dot Structures; and VSEPR.

MathMol (Mathematics and Molecules)

MathMol can provide teachers and students with information about the rapidly growing fields of molecular modeling. It includes multimedia components, a 3 D library of molecular images, a MathMol tutorial for K-12 math or science classroom, on-line activities, and water experiments.

Molecule of the Month

This site has a set of links (one added each month) to information about specific, interesting molecules. At the time of review, there were in excess of 30 links.

New York State Regents Examinations

The N.Y. State Regents Examinations are a set of subject-based standardized tests for N.Y. high school students. Here are two resources, from different organizations, that can help teachers and students prepare for these or other similar standardized exams.

- New York State Education Department Download PDF formatted copies of recent Regents Examinations and answer keys from this page.
- Regents Exams Prep Centre: Chemistry The Prep Centre, developed by Oswego County high school teachers, is intended to help Grade 12 teachers and students prepare for the N.Y. Regents Exams. Teachers can access sets of sample questions that are organized by subject and then by topic. Alternatively, students can attempt the questions, view the correct answer, or follow a link to a tutorial on the curricular content in the question if they need assistance.

Oxidation/Reduction

Explanations, exercises and examples of oxidation and reduction concepts.

Ozone to Oilspills

Students from a Princeton University chemistry class have constructed environmental science lessons for middle school students. Topics are chosen from a wide range of environmental issues that lend themselves to chemical explanation. Each unit consists of a series of student lessons/activities. Lesson plans for the teacher are also included. To date, two Princeton classes have been involved and have created two separate projects.

- Spring, 97
  Lessons on Brown fields, Global Warming, Lead, Waste Management, Transportation, and Water Pollution.
- Spring, 98 Lessons on: Energy Production and Utilization, Materials and Recycling, Atmosphere and Air Pollution, Water Pollution and Resources, Food and Toxic Substances.

Periodic Tables Theme Page

This CLN theme page has a small collection of Internet versions of the periodic table. Each provides unique resources in addition to basic information about the elements.

- Physical Science Activity Manual

  This Manual contains 34 hands-on Chemistry & Physics activities that can be downloaded in either MAC (MS WORD) or Windows (Wordperfect) versions. The manual is neither a lab manual nor a series of lesson plans. Rather, it provides the teacher with background information and a collection of student-centered activities which s/he can adapt to local conditions.

- Science Hypermedia Index

  This site can serve as an encyclopedia of Physical Science terms and concepts.

- Virtual Laboratory: Ideal Gas Laws

  Students are able to run three virtual experiments in which they control the action of a piston in a pressure chamber which is filled with an ideal gas. The gas is defined by four states: Temperature, Volume or Density, Pressure, and Molecular Weight.

- Wilton High School Tutorials and Other Things

  Tutorials on about 20 topics in high school chemistry including Stoichiometry, Primary Properties, Oxidation, Balancing Equations, Lewis Dot Structures, Acids and Bases, and more.

- World Wide Web Virtual Library: Chemistry

  This meta-list has links to academic and profit/not for profit institutions; gopher, ftp, and chemistry newsgroups, and world wide announcments in the chemistry field.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Chemistry. For other resources in this subject area (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Curricular Resources in Physics

Below are the CLN "Theme Pages" which focus on specific topics within Physics. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Bubbles Theme Page
- Electricity (Concepts) Theme Page
- Electronics (Circuitry) Theme Page
- Hot Air Balloons
- Kites
- Magnetism
- Paper Airplanes
- Periodic Tables Theme Page
- Sound

General Physics Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Physics. Please read our disclaimer.

- About Rainbows

  Answers to various questions about rainbows for older students, including: What is a rainbow? Where is the sun when you see a rainbow? What makes the bow? What makes the colors in the rainbow? What makes a double rainbow? and more...

- Amusement Park Physics

  Tell your students that they're going to be learning about conversion of potential energy to kinetic energy, the balance of motion and force, Newton's Third Law of Motion, Galileo's study of falling objects, and the interaction of gravity and weightlessness and you'll receive blank stares. But, you'll get a different reaction if you announce that in their next unit they'll be learning about Amusement Park roller coasters, carousels, bumper cars, free fall and the pendulum rides. Each ride at the site has a brief description of the physics underlying it, an activity or extension (e.g., students design their own rollercoaster), and related links where students can learn more.

- Ask an Expert: Physics

CLN's "Ask an Expert" page has about 100 links to specialists in the field who can serve as a valuable source of curricular expertise for both students and teachers. Questions/answers on Physics may be found in our "All Subjects" section at the top of the page, the "Science" section, as well as the general "Reference" section.

- Energy Matters

  This Think Quest 98 award winning site provides information to students about the different methods of energy production currently in use or in research. In addition, it discusses the history of energy's influence on man, presents how energy is currently being used, and introduces energy from a physics point of view. There's also an interactive game and public message board at the site.

- Eric's Treasure Troves of Science

  Extensive on-line encyclopedias of math and science. Included are encyclopedias on the following subjects: Physics, Scientific Biography, Scientific Books, and Rocketry. Each section is browsable alphabetically or searchable by keyword. Entries have a concise explanation as well as cross links which can be quite extensive.

- How Stuff Works

  This site contains explanations on "how stuff works" for a wide range of objects that we see and use everyday. Categories that are covered include: engines and motors, electronics, around the house, things you see in public, basic technologies, computers and the Internet, digital technology, automotive, current news, food, your body, and miscellaneous. An index and a search engine make it easy to find what you're looking for. Articles are written reasonably clearly and there are plenty of images and pictures to assist in the explanation, but teachers should note that the language level and the use of terminology may put them beyond the ability of younger or beginning science students to understand on their own.

- Index of Educational Documents

  This site can serve as an encyclopedia of Physical Science terms and concepts.

- [The] K-8 Aeronautics Internet Textbook

  This site has a complete text on aeronautics available in various reading levels, lesson plans and activities to help students understand the concepts, and a set of exercises and resources which link the concepts to other subjects (math, language, social studies, performing arts and literature).

- Optics for Kids

  A quick look at some optical basics.

- Physical Science Activity Manual

  This Manual contains 34 hands-on Chemistry & Physics activities that can be downloaded in either MAC (MS WORD) or Windows (Wordperfect) versions. The manual is neither a lab manual nor a series of lesson plans. Rather, it provides the teacher with background information and a collection of student-centered activities which s/he can adapt to local conditions.

- [The] Physics Classroom

Here's a comprehensive set of on-line high school physics tutorials consisting of units, lessons, and sublessons. Contents cover Kinematics, Newton's Laws, Vectors, Momentum, Work, Energy, Power, Circular Motion, Satellite Motion, Einstein's Theory of Special Relativity, Static Electricity, Current Electricity, Waves, Sound Waves, Music, Light Waves,Color, Reflection/Refraction, and the Ray Model of Light. Units contain problems for students to check their knowledge and animated GIFs to teach concepts. In addition to these tutorials, sets of resources that support teaching/learning the concepts can be accessed directly by type, for example: GIF animations and QuickTime movies, problem sets, quizzes, student activities, lab sheets, and projects.

- Physics Internet Resources

Here's a meta-list with links to WWW, Gopher and FTP sites, physics news from around the world, paths to high energy physics sites around the world, astronomy, and even job announcements and conference news round out this site.

- Physics Online

Peter Vogel of Notre Dame Secondary School in Vancouver has developed a site for BC students and teachers. Included are current and back issues of "Physics News" a weekly collection of physics news, tips and strategies for taking scholarship examinations, and various other columns. There are also links to other WWW Physics sites.

- Virtual Labs and Simulations

Here's a collection of links to sites on the web that have computerized simulations of physics principles that allow students to see a visual demonstration of a scientific concept, often in animated form. In addition, the student may be given the opportunity to manipulate one or more variables underlying the concept and then witness the changes. There are close to 300 labs/simulations in senior high physics. Category headings include: Mechanics, Momentum, Rotational Mechanics, Machines, Measurement Tools, Fluid Physics, Electricity, Thermodynamics, Simple Harmonic Motion, Wave Phenomena, Light, Color, Geometric Optics, Astrophysics, and Nuclear.

- [A] Walk Through Time

Here's an illustrated history of time measurment.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Physics. Previous Screen

Instructional Materials in Astronomy

Here are a number of links to other Internet resources which contain information and/or other links related to Astronomy. Please read our disclaimer.

- ## AskERIC Lesson Plans - Science: Space Science

  Over 25 lesson plans covering various grade ranges in K-12.

- ## Astronomy Activities

  Over 10 ready-made astronomy lesson plans for teachers of grades kindergarten through high school. The lessons utilized materials that are found in almost every classroom.

- ## Astronomy Lessons

  Over 25 lessons plans, organized by grade level, from the Southeastern Michigan Math-Science Learning Coalition.

- ## Astronomy with a Stick

  Teaching activities for elementary and middle school students intended to help them understand how the relationships between the Sun and the Earth affect changes in daylight hours. The site has three teaching units, each made up of several student activities that can be conducted during daylight hours.

- ## Counting the Stars

  A lesson plan for teaching students a practical technique for counting the stars.

- ## Earth System Science Community (ESSC)

  ESSC is an ongoing NASA funded project with the goal of building an on-line Earth Science curriculum so that teachers and students can investigate the Earth system quickly, easily, and inexpensively. Visit this site for more information about the project as well for the curricula that have been completed.

- ## Encarta Lesson Collection: Astronomy

  Select "Science" and then "Astronomy" on their Lesson Collection Page to find about a dozen lesson plans in this subject.

- ## Exploring Planets in the Classroom

  More than 25 hands-on science activities are provided in classroom-ready pages for both teachers and students for exploring Earth, the planets, geology, and space sciences.

- ## Internet Activities

  Each month, IBM provides a new set of Internet activities focused around a specific theme for a targeted range of grade levels. A number of astronomy units are available. A teacher's guide is included for each topic.

- ## Life in the Universe Curriculum Sample Lessons

  These SETI (Search for Extraterrestrial Intelligence) lessons take advantage of the intense interest that young students have in the existence of extraterrestrial life to motivate their studies of science and other subjects.

- ## NASA Rocket Classroom Activities

  Activities using simple and inexpensive materials that can be used within a science unit about rockets.

- ## New York Times Learning Network

  A variety of Astronomy lesson plans for students in grades 6-12 which use a New York Times article as a starting point.

- ## Outer Orbit

  This site has two distinct sets of instructional materials that teachers will find useful. From their main menu, click on "Lesson Plans" for over 50 such resources, many of which can be used within a multidisciplinary approach. Or, click "In the Classroom" for ideas and examples of what other teachers are doing to bring astronomy into the technology classroom.

- ## Reaching for the Red Planet

  An outline of a 6-8 week course for grade 4-6 students that includes teacher guides, student assignments and experiments, and recommended web resources. The theme of the unit is planning a Mars colony.

- ## Space and Astronomy for Kids: Build an Astronomy Model

  A page of links to sites on the web that have plans for various types of spacecraft models from About.com.

- ## [The] Sun: Power Plant of the Solar System

  This module from the New Jersey Networking Infrastructure in Education Project introduces students to the Sun and its interaction with the Earth. As part of the unit, students use real time data supplied by the Internet to confirm scientists' findings or to come up with their own conclusions.

- ## UC Berkeley Centre forEUV Astrophysics Education Program

  The main attraction in this site for the classroom teacher will be the lesson plans and K12 activities on Earth and Space Science that have been collected. Topics covered by the lessons include: The Electromagnetic Spectrum, Satellite Communications, Satellite Dishes, Constellations and the Zodiac, Solar System Objects, Earthquakes, and More!

Top of Page

Note : The sites listed above all have lesson plans/activities for the Astronomy classroom teacher. For other resources in this subject area (e.g., instructional materials in General Science, Life Science, or Physical Science), or for curricular content and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Instructional Materials in Geology

Below are the CLN "Theme Pages" which focus on specific topics within Geology. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Air Quality Theme Page
- Avalanches Theme Page
- **Biomes Theme Pages**
  - Antarctic Theme Page
  - Arctic Theme Page
  - Drylands/Deserts Theme Page
  - Temperate Forests Theme Page
  - Tropical Rainforests Theme Page
  - Wetlands Theme Page
- Earthquakes Theme Page
- Floods Theme Page
- Glaciers Theme Page
- Oceanography Theme Page
- Rocks, Minerals, and Mining Theme Page
- Tsunamis Theme Page
- Volcanoes Theme Page
- Water Quality Theme Page

General Geology Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Earth Science. Please read our disclaimer.

- AskERIC Lesson Plans - Science: Earth Science

  There are a number of lessons on geology/earth science within this collection.
- Earth Science Lessons

Over 150 lessons plans, organized by grade level, from the Southeastern Michigan Math-Science Learning Coalition.

- ## Earth Science Lesson Plans

  This University of Cincinnati collection of earth science lesson plans is organized under seven categories: The Earth as a Planet; The Whole Earth; Weather and Climate; Rocks, Minerals and Sediments; Streams, Groundwater, Glaciers and Erosion; Fossils and Earth's History; and Earthscience/Environment. Note that only a few of these lessons are their own; most originate from other organizations such as Big Sky Telegraph, Nebraska, etc. As such, you may find lessons that you've already seen from other links on this CLN page. However, visiting this site is worthwhile because of the size of the collection.

- ## Encarta Lesson Collection: Earth Science

  Select "Science" and then "Earth Science" on their Lesson Collection Page to find over a dozen lesson plans in this subject.

- ## Geology Lesson Plans

  The Nebraska Earth Science Education Network (NESEN) has collected about 25 lesson plans in geology from NESEN teachers.

- ## Grade 12 Provincial Examinations

  Full information on the BC Grade 12 provincial examinations, including exam timetables, exam results, holistic scoring guides, reports to schools and general information. Select "Examinations and Keys (Grade 12 Provincial)" to download previous exams.

- ## Integrated Resource Packages (IRPs)

  These Integrated Resource Packages (IRPs) provide some of the basic information that teachers will require to implement the BC Ministry of Education Science curricula in K-12.

  - Earth Science 11 and Geology 12
  - Science K-7
  - Science 8-10

- ## New York State Regents Examinations

  The N.Y. State Regents Examinations are a set of subject-based standardized tests for N.Y. high school students. Here are two resources, from different organizations, that can help teachers and students prepare for these or other similar standardized exams.

  - New York State Education Department Download PDF formatted copies of recent Regents Examinations and answer keys from this page.
  - Regents Exams Prep Centre: Earth Science The Prep Centre, developed by Oswego County high school teachers, is intended to help Grade 12 teachers and students prepare for the N.Y. Regents Exams. Teachers can access sets of sample questions that are organized by subject and then by topic. Alternatively, students can attempt the questions, view the correct answer, or follow a link to a tutorial on the curricular

content in the question if they need assistance.

- [Project Primary]

  Professors and primary teachers have collaborated to produce a set of hands-on activities for the teaching of science. This link goes directly to their section on geology.

- [Science Lab]

  Here's a collection of science experiments that explore various geological concepts within the oil industry. Experiments have a teacher's guide and can be related to informational articles within the site's "Science Watch." Geological topics include collecting data from bore holes, viscosity, buoyancy of drilling fluid, and rock absorbency.

- [Teaching in the Learning Web]

  These educational resources can be used in a multidisciplinary classroom to teach earth science concepts. Included are activities for teaching global change, an interdisciplinary set of materials for grade 7-12 students to learn about maps, and observations for students to learn about faults.

Top of Page

Note : The sites listed above all have lesson plans/activities for the Geology classroom teacher. For other resources in this subject area (e.g., instructional materials in General Science, Life Science, or Physical Science), or for curricular content and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Instructional Materials in Paleontology

Below are the CLN "Theme Pages" which focus on specific topics within Paleontology. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Dinosaur Theme Page

General Paleontology Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Paleontology. Please read our disclaimer.

- **Access Excellence**

  The following lesson plans on fossils are available in the Access Excellence collection.

  - Fossil Hunt Elementary students gain an understanding of the problem/puzzle solving aspects to putting together a fossil record by having to reconstruct a torn-up paperback book.
  - Paleoanthropology High school students engage in four classroom activities to better understand practical aspects to the study of Paleoanthropology.

- AskERIC Lesson Plans - Science: Natural History

  Six lesson plans on dinosaurs and fossils.

- Earth Science Lesson Plans

  This University of Cincinnati collection has several lesson plans on fossils. There's one lesson at the very top of the page and then a series of links further down under the heading "Fossils and Earth's History."

- Fossils

  In this lesson plan, middle school students simulate what paleontologists do when they discover, excavate and identify a fossil.

- Grade 4 Science Core Unit: Fossils and Rocks

  Within this curriculum guide from Saskatchewan Education, a unit on fossils gives students "another perspective of geologic time, allowing them to examine evidence of plants and animals which existed on the Earth a long time ago."

- Learning from the Fossil Record

  Over 30 sets of cross curricular K-12 classroom learning activities from the Museum of Paleontology at the University of California (Berkeley). In addition to the activities, there is a matrix tying the activities to grades/subjects, as geological time scale, academic articles, and advice on how to tap into the paleontology resources on the WWW.

- No Bones About It

  In this lesson plan, grade 6-12 students use a NY Times article as a starting point to "act as paleontologists, examining pictures of dinosaur skeletons and applying their knowledge of the relationship between skeletal features and survival to create "Paleontology Reports" about their perceptions of the lives of these creatures."

- Set in Stone

  This paleontology site has a number of instructional materials for the teacher. Suggestions for classroom activities can be found in the section titled "For the Classroom."

Top of Page

Note : The sites listed above all have lesson plans/activities for the Paleontology classroom teacher. For other resources in this subject area (e.g., instructional materials in General Science, Life Science, or Physical Science), or for curricular content and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

Instructional Materials in General Science

The WWW sites linked to from this page provide practical assistance for Science teachers wanting to use the Internet as part of their classroom planning/instruction. Some of the sites listed below could be classified as "general science" while others are included on this page because they have resources in more than one of the major science categories (earth and space science, life science, or physical science). Please read our disclaimer.

- ## Academy Curricular Exchange: Science
  - Grades K-5
  - Grades 6-8
  - Grades 9-12

  Science mini lesson plans from Academy One/Columbia Education Center.

- ## Activity Search: Science

  Houghton Mifflin's Education Place Activity Search gives teachers access to a wide number of K-12 traditional (i.e., not Internet) activities. It is possible to search for activities by curriculum areas and/or grade levels, or browse the activities by themes.

- ## Applied Technology Projects

  Lesson plans for over 20 projects for K-7 students in which students learn to apply science linked to BC Curriculum Guides. This site is part of a larger site (Mr. G's Applied Technology Site) that has been developed by Paul Grey of Coal Tyee Elementary School in Nanaimo, B.C.

- ## AskERIC Lesson Plans - Science

  Numerous lesson plans in Agriculture, Biological and Life Sciences, Careers, Earth science, General Science, History, Instructional Issues, Natural History, Physical Sciences, Process Skills, Space Sciences and Technology covering various grade ranges in K-12.

- ## Athena Curriculum

  This web site provides curricular and resource material using geophysical and other data sets acquired via Internet. Included are four folders of resources: Oceans, Weather and Atmosphere, Earth Resources, and Space & Astronomy. A folder might have links to curricular resource materials (e.g., data, other WWW sites) as well as instructional materials for the teacher and/or student.

- ## Barbara's Lesson Plans in Science

  4 science lesson plans for students from K-12.

- ## Bizarre Stuff You Can Make In Your Kitchen

  This site is an ever growing warehouse of the kinds of projects some of the more demented of us tried as young people, collecting in one place many of the classic, simple science projects that have become part of the collective lore of amateur science. It is a sort of warped semi-scientific cookbook of tricks, gimmicks, and pointless experimentation, concoctions, and devices, using, for the most part, things found around the house. These are the classics. Strange goo, radios made from rusty razor blades, crystal gardens... amateur mad scientist stuff. If you happen to learn something in the process, consider yourself a better person for it.

- Cardboard Cognition

A collection of card and board games organized by subject and grade levels (K-College).

- Discover Learning Daybook

From BC Tel and in partnership with CUEBC, the Daybook is a searchable database of BC teacher deveveloped lesson plans. Search by keyword or enter "Science" for over 80 lesson plans in this subject.

- Do It Yourself

Although this part of the CBC4Kids site is really intended for kids, the language and/or concepts in these sections may be too difficult for the target audience to grasp on their own. However, the set of simple experiments using home materials are a good source of demonstrations for teachers. Accompanying each experiment is an introduction and extension information which teachers could adapt for student use as necessary.

- Eduzone: Science and Technology Curriculum K-12

Model daily lesson plans for each of the grades from K-12.

- Encarta Lesson Collection: Science

Select "Science" on their Lesson Collection Page to find about 50 diverse lesson plans in this subject.

- ERIC Clearinghouse for Science, Mathematics, and Environmental Education: Lesson Plans in Science

The ERIC Clearinghouse serves as a metalist of links to Science lesson plans. Some of those lesson plans are already linked to directly from CLN, but there are others that may prove useful.

- Explorer Data Base: Science

The Explorer is a collection of educational resources (instructional software, lab activities, lesson plans ...) for K-12 mathematics and science education." These resources are browsable within broad topic folders or within a curricular framework, or alternatively, you can use a search engine. Several thousand scientific resources are included.

- Fun Experiments

The Southeastern Michigan Math-Science Learning Coalition presents lessons in Science. These can be viewed by subject area or by age of target audience.

- Georgia College EduNet Lesson Plans: Science

Lesson plans on pin-hole cameras and the solar system.

- Healthy School Environment

This interdisciplinary unit will engage middle/junior high school students in participatory science, examination of multi-causal reasons for particular situations, data collection, data organization and data analysis as they conduct field research into the quality of their school environment. The teaching unit is fully developed with lesson plans, assessment guidelines, samples of student work, resource materials, and Internet links. During the project, students will investigate a wide range of school environment issues, including air quality, drinking water quality, temperature, radon levels, carbon dioxide levels, carbon monoxide levels, oxygen levels, formaldehyde content, air flow, illumination, and relative humidity. This is more than a science unit. The teacher developers have integrated the activities to be part of the Social Studies, English, Science, and Math classes in an eight week study.

Helping Your Child Learn Science

This online book was developed by the US Department of Education for parents. However teachers may find the suggestions for interesting children in science useful in the classroom as well. Included in the book are activities for the home and for the community.

Information Technology Lesson Plans Database

This database contains over a hundred lesson plans designed and tested by BC educators for teachers in gradesK-10. The lesson plans integrate Information Technology concepts within traditional subject areas. Use the search engine to find the lessons for a particular subject area. The engine will also allow you to search by grade level, setting (e.g., classroom, lab), time to complete the level, and expertise level.

Integrated Resource Packages (IRPs)

These Integrated Resource Packages (IRPs) provide some of the basic information that teachers will require to implement the BC Ministry of Education Science curricula in K-12.

- Resource Sciences 11 and 12 (Forests)
- Science K-7
- Science 8-10
- Science and Technology 11

Integrating Mathematics, Science and Language

A series of multidisciplinary units (math, science, language arts) for K-3 students from SEDL. Included in each unit is an overview and background information for the teacher, lessons and links to associated web sites on dinosaurs. Units include: K (Five Senses, Spiders, Dinosaurs); Grade 1 (Plants and Seeds, The Human Body, Good Health); Grade 2 (Oceans, Weather, Sun and Stars); Grade 3 (Matter, Sound, Simple Machines).

Inventors and Inventions Theme Page

This CLN "Theme Page" has links to two types of resources related to the study of inventors and inventions. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Knowledge Integration Environment (KIE) Curriculum

Funded by the National Science Foundation and Pacific Bell, this curriculum section contains individual and group projects in K-12 science.

- Kodak Lesson Plans: Science

More than 30 lesson plans on Science, all of which use photography in some respect.

- Learning for a Sustainable Future (LSF): Classroom Activities

Learning for a Sustainable Future is a Pan-Canadian nonprofit organization whose mandate is to work with educators from across Canada to integrate the concepts and principles of sustainable development into the curricula at all grade levels. The above link is to their page of classroom activities.

- Learning Space (LS) Science: WWW Research Lessons

One of the ways to integrate the Internet into your classroom is by using it as a source of current curricular information. Having students conduct research on the WWW is an effective and relevant learning activity but teachers may feel at a loss as to what kind of questions students should be given to research. This site contains over 30 examples of science research questions (organized by grade levels) which pose motivating, genuine problems or open-ended real life problems whose solutions and answers are not easily found. In addition, there is a step-by-step guide to creating your own research questions.

- Lesson Plans for Middle School Science from Goose Hollar

Lesson topics available at this site include: "Surface tension on coins", "What if you ever quit growing?", "How much skin is on the human body?", "The airfoil airplane", and more.

- Lesson Plans for Technology

This site has a database of over 200 technology-based lesson plans developed by Florida educators. Known as T'NT (Technology 'Nformation for Teachers), the site can be searched by grade level, subject, or key word. Lessons allow subject area teachers to incorporate technology within business, computing, fine arts, guidance/health (including safety), language arts, math, science, and social studies subject areas.

- LETSNet: Science Units

LETSNet (Learning Exchange for Teachers and Students through the Internet) is designed to help teachers understand the web and find ways to make effective use of web resources in the classroom. This link is to their Science lesson plans section containing about 10 teaching units or student activities.

- Minnetonka Elementary Science Center

The Science Center is a warehouse-type resource centre for Minnetonka School District teachers. Some of the information on this web site pertain only to the operations of that center. However, there are other electronic resources which will be useful to any elementary science teacher, including lesson plans (organized by grade levels) and teacher tools (e.g., practical suggestions on science fairs).

- MSTI Elementary Lesson Plan Outlines

  Elementary school lessons exploring plants and animals.

- Optical Illusions

  Over 25 examples of optical illusions that teachers can use to stimulate discussion and interest.

- Primary Resources: Science

  Science worksheets, activities and resources for the primary teacher. Some resources are viewed online and others are in PDF format.

- Project Primary

  Professors and primary teachers have collaborated to produce a set of hands-on activities for the teaching of science organized under the headings of botony, chemisty, geology, physics, and zoology. There is also a report on the constructivist perspective on teaching science and the importance of activities within that.

- Reeko's Mad Scientist Lab

  A wide selection of graded (easy, intermediate, advanced) science experiments suitable for the home or classroom. You can link to a sampling from the right side of this home page but be sure to look at the left side panel as well. The button labelled "experiments" will lead you to more than 30 experiements sortable by subject or difficulty level. Also, the home page's left side panel has direct links to about 10 other experiments.

- Science

  This is a meta-list of links to other sites which contain lessons plans, instructional materials, and other materials.

- Science Fair Theme Page

  This CLN "Theme Page" has links to information that will help both students and teachers interested in participating/managing a science fair.

- Science Lesson Plans

  This link will take you directly to a sub-list of links to about 30 science lesson plans. The sector is part of a larger list called "The Lesson Plans Page." The lessons aren't particularly well described so you may waste some time exploring and the ads can be a nuisance; however the direct links to actual lesson plans are probably worth it.

- Science Resource Center

  Labs, demonstrations, and lessons that science teachers can access in Chemistry, Life Science, and Physics.

- Science Tracks

  ScienceTracks contains science activities that teachers, parents, scientists and other role models can do with children at school or at home.

- [Snacks by Subject]

  The Exploratorium offers student activities/experiments in a wide number of scientific topics.

- [Spreadsheets]

  Contributions of spreadsheet ideas for enhancing science instruction.

- [Teachers Helping Teachers: Science]

  The Teachers Helping Teachers web site is a collection of lesson plans submitted by practicing teachers. New lessons are added to a cumulative Science file throughout the school year so be prepared for some long downloads.

- [Teaching Ideas for Primary Teachers]

  Looking for ideas, activities or worksheets for elementary students? You'll find a variety at this site organized under the subject heading of Science. You'll also find a feature titled "Time-Fillers". This is a collection of short activities which can be used within a number of subject areas to fill a few spare moments during the day.

- [Unmixed Messages]

  Unmixed Messages contains samples of hands-on, gender-equitable science activities to captivate girls and boys with science.

- [Whelmers]

  "Whelmers" are science activities and demonstrations that "whelm" students (as opposed to overwhelming them). They are activities that will spark their curiosity - activities that will catch, for a moment at least, the eye and mind of even the most indifferent student. Each month this site provides 5 new whelmers from a book by Steven L. Jacobs.

- [wNet School]

  wNetStation, a public television station in New York, hosts a web site designed for K-12 teachers which contains Internet-based lessons for core science curriculum topics. Student and teacher guides are included with each lesson. At the time of review, the site contained lessons on alcohol addiction, genes, the walrus, cloning, buffaloes and wolves, migration, ants, black holes, water cycle, and space shuttle astronauts.

- [You Can]

  Beakman and Jax provide experiments/activities for kids which teachers can apply to elementary science classrooms.

Top of Page

Note: The sites listed above all have lesson plans/activities for the General Science classroom teacher. For other resources in this subject area (e.g., instructional materials in Earth Science, Life Science, or Physical Science), or for curricular content and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

General Life Science Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Life Science. Please read our disclaimer.

- ## Access Excellence

  This web site provides a collection of biology-related activities and classroom projects developed by teachers. Topics include: allergies, animal phyla, bioethics problems, DNA, endangered species, ethanol production from corn, infectious disease, nutrition, and transgenic plants. In addition, it provides a vehicle for putting teachers in touch with colleagues and scientists for discussions about teaching biology and new developments in the field. Note: "Teachers First" has grouped the lessons in the Access Excellence collection by topic for easier reference. All links are directly to the Access Excellence site.

- ## AskERIC Lesson Plans - Science: Biological and Life Science

  Over 75 lesson plans covering various grade ranges in K-12.

- ## Biology Activities

  Seven biology activities suitable for high school students from Flinn Scientific. Topics are: bones, DNA, respiration/photosynthesis, cells, predator/prey, enzymes, and bacteria.

- ## Biology Lessons

  Over 175 lessons plans, organized by grade level, from the Southeastern Michigan Math-Science Learning Coalition.

- ## Biology Lessons for Prospective and Practicing Teachers

  Lessons requiring simple materials for teaching biology to elementary students.

- ## **Core Knowledge Lesson Plans**

  - Animal Classifications An 11 day unit on the difference between invertebrates and vertebrates as well as an in depth study of the classes of vertebrates. Primary classes explore the basic characteristics of birds, fish, mammals, reptiles, and amphibians.
  - Life Cycles An exploration of the circles of life that surround us daily for primary students. The three week unit examines the four basic steps in the life cycle and reproduction in plants and animals.
  - Life Cycle Study: From Egg to Chick Embryology is the focus of this 4 week unit for primary students who are actively involved in hatching and caring for baby chicks. The life cycles of frogs, moths, and butterflies are also included in the unit.
  - [The] Not So SImple Facts About Simple Organisms Three kingdoms of simple organisms (Monera, Protista, and Fungi) are the focus of study in this 25-30 hour intermediate level unit.

- ## Encarta Lesson Collection: Biological and Life Sciences

  Select "Science" and then "Biological and Life Sciences" on their Lesson Collection Page to find about fifty lesson plans in this subject. Subset collections of this subject (Biology; Botony) are also available.

- ## From the Ground Up

  There are five lessons in this teachers' guide on food, agriculture and sustainable development: history of agriculture and description of sustainable development, soil, agriculture and chemicals, the real cost of food, and everything's connected. Available for downloading are lessons, background essays, and worksheets.

- ## Grade 12 Provincial Examinations

  Full information on the BC Grade 12 provincial examinations, including copies of previous exams and their keys (e.g., Biology), exam timetables, exam results, holistic scoring guides, reports to schools and general information.

- ## Integrated Resource Packages (IRPs)

  These Integrated Resource Packages (IRPs) provide some of the basic information that teachers will require to implement the BC Ministry of Education Science curricula in K-12.

  - Biology 11 and 12
  - Science K-7
  - Science 8-10

- ## Integrating Mathematics, Science and Language

  A series of multidisciplinary units (math, science, language arts) for K-3 students from SEDL. Included in each unit is an overview and background information for the teacher, lessons and links to associated web sites on dinosaurs. Units include: K (Five Senses, Spiders, Dinosaurs); Grade 1 (Plants and Seeds, The Human Body, Good Health); Grade 2 (Oceans, Weather, Sun and Stars); Grade 3 (Matter, Sound, Simple Machines).

- ## Internet Lesson Plans

  Each month, IBM provides a new set of Internet activities focused around a specific theme for a targeted range of grade levels. Life Science topics that have been developed include: Animals (Grades 4-8); Gardening; (Grades 2-5); Forestry and trees (Grades 5-8); Exploring insects and spiders (Grades K-2, 3-5); and, Zoo animals (Grades 1-3). A teacher's guide is included for each topic.

- ## Life Science

  Over 20 brief lesson plans in life science for elementary level students from CanTeach.

- ## New York State Regents Examinations

  The N.Y. State Regents Examinations are a set of subject-based standardized tests for N.Y. high school students. Here are two resources, from different organizations, that can help teachers and students prepare for these or other similar standardized exams.

  - New York State Education Department Download PDF formatted copies of recent Regents Examinations and answer keys from this page.
  - Regents Exams Prep Centre: Biology The Prep Centre, developed by Oswego County high school teachers, is intended to help Grade 12 teachers and students prepare for

the N.Y. Regents Exams. Teachers can access sets of sample questions that are organized by subject and then by topic. Alternatively, students can attempt the questions, view the correct answer, or follow a link to a tutorial on the curricular content in the question if they need assistance.

- New York Times Learning Network

  A variety of Life Sciences lesson plans for students in grades 6-12 which use a New York Times article as a starting point.

- Project Primary

  Professors and primary teachers have collaborated to produce a set of hands-on activities for the teaching of science organized under the headings of botony, chemisty, geology, physics, and zoology. There is also a report on the constructivist perspective on teaching science and the importance of activities within that.

- Science Resource Center

  The Science Resource Center is a web site where science teachers can share ideas. Life Science teachers can access demonstrations, laboratory investigations, teaching tips, and exams from two selections on the main menu (Life Science and Biology II).

- Smile Program Biology Index

  Teachers participating in the SMILE (Science and Mathematics Initiative for Learning Enhancement) summer session programs each create a single concept lesson plan. This database has close to 200 lesson plans organized under the following headings: Anatomy & Physiology, Biochemistry, Biology, Botany, Environmental Studies and Ecology, General, Genetics, Microbiology, Zoology, and Miscellaneous. Caution: Since there is a wide number of authors who have contributed to the database, the detail and quality of the lesson plans will vary.

- Snacks about Life Science

  The Exploratorium offers these activities/experiments to demonstrate life science concepts.

- [The] World Wide Biome Project

  Teachers may wish to use this project to provide students with: 1) a standard method of investigating the biomes in which they live; 2) a way of publishing their scientific findings on the World Wide Web for others to view; 3) a site where they can obtain comparative data from other biomes around the world; and 4) a chance to integrate computer skills with ecological sampling skills.

Top of Page

Note: The sites listed above all have lesson plans/activities for the Life Sciences classroom teacher. Arctic Wildlife Portfolio

Tufted Puffin
Photo © Eric Hoberg

Click on a tab to open the portfolio and learn about the animals of the Arctic! Biologist Doug Siegel-Causey shares his knowledge and special insights about this icy world and it's inhabitants.

Are you as smart as an Arctic Fox? Do you have a good memory? To find out, play **Polar Pairs** now.

Meet 19th Century explorer and naturalist **Edward Nelson**.

Spruce up your Arctic vocabulary. Check out the **Glossary**.

From the Editors: We know full well that there are many other animals in the Arctic! If we've missed your favorite, drop us a line... but don't say "penguins." You'll have to travel to Antarctica to see those! We hope to add to this portfolio with new sections including Native perspectives as well as sections on fish, insects and a set of lesson plans for educators. If you would like to submit lesson plans please let us know. Our thanks go out to Douglas Siegel-Causey, Robert Hoffman, William Fitzhugh, Steven Loring and Eric Hoberg.

Arctic Wildlife Glossary

adaptation - the process of changes in a living organism that help it adjust to the conditions of the environment, making it easier for animals to obtain food or shelter, or protect offspring.

arctic - the area lying above 66 ½ degrees North latitude that includes the Arctic Ocean and lies between North America and Russia.

camouflage - markings or coloration that help disguise an animal so it is less visible to predators or prey.

dominance - the species of plant or animal that exerts the most influence on the community because of its quantity or strength; the ruling animal.

mammal - a class of animals that have backbones, are warm-blooded, breath air, and whose females have milk-secreting glands for feeding their young. There are 19 orders and over 5,000 species of mammals, ranging from the 2 inch shrew to the 100 foot whale.

migration - the movement of animals, fish and birds in search of food or shelter, often on an annual basis according to the seasons.

pack ice - an area of floating islands of ice that form floes a few feet wide to ice islands miles across. These islands drift in the center of the Arctic Ocean and occasionally drift South as far as Newfoundland.

permafrost - any soil in the arctic regions in which temperatures below freezing have existed continuously for a long time.

predator - animals who live by hunting and preying on other animals for their own food supply.

tree line - (also called timber line) the point on mountain or high elevations beyond which no trees grow. The line varies depending on latitude, climate and soil conditions. Also northern boundary of boreal forest.

tundra - a treeless, level or gently rolling plain of the arctic region. It has a marshy surface where mosses, lichens and low shrubs grow with mucky soil and permafrost underneath.

Polar Pairs

Match up the animals and learn all about their habits and habitat. It might get a little chilly, so keep your nose warm!

(requires a Java enabled browser)

Home | Arctic Wildlife Portfolio

Game by Objective Consulting, Inc. and S2N Media, Inc.

How to Play

Click on the game pieces. Try to match two pictures of the same animal and make a **Polar Pair**! Match the whole board and you win!

Bald Eagle
These "eagle-eyed" birds showed early fishermen where the salmon were swimming.

Polar Bear
These fierce white giants can weigh as much as a car, but you wouldn’t want to ride one.

Caribou
Newborns of these animals can run when they are only 90 minutes old.

Puffin
Flying underwater is no challenge for these hydro-dynamic travelers.

Arctic Fox
This foxy predator trades its blue-grey summer coat for a white one in winter.

Beluga Whale
These sea canaries are real head turners. They use sound to find their prey.

Seal
If your toes pointed backwards like these sea mammals, you might prefer sliding on ice, too.

Walrus
The size of their tusks tells who’s the boss among these sea mammals.

You Won!

Play again and try to beat your best or learn more about these animals and their habitats in the Arctic Wildlife Portfolio!

OTHER FEATURES

Legends of Our Times: Native Ranching and Rodeo Life on the Plains and Plateau

This exhibition portrays Native People's involvement in ranching, rodeo and industries related to this lifestyle. It explores the relationship Native People have had with the horse, dog, buffalo, coyote and deer and their transition to becoming cowboys, ranchers and rodeo participants.

From Time Immemorial: Tsimshian Prehistory

European scientific knowledge and Native oral history are woven together in this exhibition to tell the story of the Tsimshian people, who have occupied Canada's north Pacific Coast for over 5,000 years.

Wave Eaters: Native Watercraft in Canada

The watercraft developed by Canada's First Peoples are respected and admired throughout the world for their performance and beauty. This exhibition showcases some of the fine pieces in the Canadian Museum of Civilization's collection and highlights the creativity and skill of Indian and Inuit boat-builders.

Storytelling: The Art of Knowledge

This exhibition illuminates the diversity of, and importance of sharing, narratives in six Native communities: Algonquin, Inuit, Mi'kmaq, Métis-Cree, Nisga'a and Abenaki.

Armed forces win narrow victory over Nunavut weather

"You can have the best equipment in the world but you can't defeat it"

GREG YOUNGER-LEWIS

The Canadian armed forces came to the Arctic and got what they were looking for - a challenge.

Soldiers participating in Operation Narwhal, the joint military exercise between navy, army and the air force in Panniqtuuq, stumbled through a difficult two weeks around the Cumberland Peninsula, plagued by weather bad enough to ground multi-million-dollar helicopters, and cause two soldiers to get lost in the fog.

Geoguide/nenets
Classroom Ideas: Ninth-Twelfth Grade
brought to you by nationalgeographic.com and Compaq

The Siberian Arctic

OVERVIEW

Each spring groups of Nenets migrate with their reindeer herds from the shelter of the northern forests, the taiga, to the treeless tundra of Russia's Yamal Peninsula 200 miles (312 kilometers) beyond. Their homeland encompasses fragile ecosystems threatened by overgrazing reindeer and the tapping of oil and natural gas reserves.

Have your students explore the ecosystems of northwestern Siberia by studying the region's geography, climate, flora and fauna, and by identifying its food chains. Have them analyze the role reindeer play in this region. Familiarize your students with the threats to the region's biodiversity. Ask your students if other regions of the Arctic are facing the same threats and what is being done to remedy inherent problems.

Connections to the curriculum: natural science, biology, ecology, geography

Connections to the National Geography Standards:

Standard 8: "The characteristics and spatial distribution of ecosystems on Earth's surface"

Standard 13: "How forces of cooperation and conflict among people influence the division and control of Earth's surface"

Standard 16: "The changes that occur in the meaning, use, distribution, and importance of resources"

Standard 18: "How to apply geography to interpret the present and plan for the future"

Time: Three hours or more depending on the depth of your students' research

Materials required are

- copies of the March 1998 NATIONAL GEOGRAPHIC article "Nenets: Surviving on the Siberian Tundra";
- atlases and/or physical maps highlighting vegetation and land use;
- computers with Internet access, if available, for students to review Geoguide/nenets photographs and other sites on Nenets culture (See Resources & Links);
- library for reference materials including books, periodicals, and CD ROMs.

Purpose:

Challenge students to learn about ecosystems and threats to biodiversity.

Students will learn about

- habitats of northwestern Siberia;
- reindeer and their role in biodiversity;
- oil and natural gas reserves and the environmental consequences of tapping these resources;
- threatened regions elsewhere in the Arctic.

SUGGESTED PROCEDURE
Opening:

Assign students to four groups to research the topics: **habitats of northwestern Siberia**, **reindeer**, **oil and natural gas**, and **other threatened regions of the Arctic**. Students can be subdivided into smaller teams with each group investigating the questions listed below. (If students don't have access to the Internet or your library doesn't have sufficient resources about northwestern Siberia, have students study similar Arctic regions in Alaska, Canada, or Scandinavia.)

Development:

Have your students address the following questions as they research their topics.

For habitats of northwestern Siberia:
What is the geography and climate of northwestern Siberia?
What are the habitats and individual ecosystems in this region?
How does climate and geography relate to its natural resources?
What is tundra and taiga?
What is the region's flora and fauna?
What are the growing seasons of the flora?
How long does it take for trees and lichen to grow?
What are the region's food chains?
Where do reindeer fit in the food chain?

For reindeer:
What is the difference between caribou and reindeer?
What do reindeer eat?
Where do reindeer migrate in winter? In summer?
What is the life-cycle of the reindeer?
Is there an overpopulation of reindeer on the tundra?
What are the consequences of overgrazing?

For oil and natural gas:
Where are oil and natural gas deposits in the Yamal?
How is oil and natural gas located?
How are these resources tapped and developed?
How is the environment affected by oil and gas development?
What impact does this development have on reindeer herding and the Nenets way of life?

For threatened regions elsewhere in the Arctic:
What other areas of the world are affected by these issues?
What are people doing to resolve controversies about how natural resources should be used? What are the opposing viewpoints?

As students do their research they may find it helpful to check not only our Resources & Links, but the following related Web sites:

Alaska Department Fish and Game Wildlife Notebook Series
(http://www.state.ak.us/local/akpages/FISH.GAME/notebook/notehome.htm)

(http://reindeer.salrm.alaska.edu./index.htm)

Main characteristics of 30 European Landscapes
(http://www.tpesp.es/informe/HTMNF/CH8DOS/TAB0801.HTM)

Beverly and Qamanirjuaq Caribou Management Board
(http://www.arctic-caribou.com/index.html)

The Woodland Caribou: Threatened with Extinction in Canada's Western Provinces
(http://www.afternet.com/~teal/scaribou.html)

Alaska’s Cold Desert
(http://www.blm.gov/education/arctic/arctic.html)

Gas development in Northwest Siberia
(http://www.lib.uconn.edu/ArcticCircle/NatResources/gasdev.html)

Closing:

Teams should report back to their groups. Each group should then appoint a spokesperson to give a brief summary of the group's findings to the entire class. After presentations are made, hold a debate about the use of natural resources on the Yamal. Students should elect a moderator, an environmentalist, oil company executive, government official, Nenets leader. Assign an "advisory board" to each speaker to help him or her prepare for the debate. Use the material from the beginning of the lesson plan to help with supporting arguments.

Suggested Student Assessment

- Have students diagram food chains.
- Groups of students can make a map of the world's Arctic areas and highlight where oil and natural gas reserves are located. Using keys, students can locate areas around the Arctic where these natural resources have been exploited and where the habitats have been severely harmed. Students can make a bar graph to accompany the map naming the exploited regions involved and their approximate acreage.
- Have students write an essay in the form of a short letter to a newspaper editor about environmental threats affecting their region of the country. The letters should be succinct.

Extending the Lesson:

Have students explore habitats close to where they live. Have them study the ecosystems in these habitats. What are the food chains? Are there threats to biodiversity? Are there native peoples in these regions? If so, are their traditional ways of life threatened by development?

Rick Frederic of Nikiski Middle-High School, in Nikiski, Alaska, contributed classroom ideas for this Geoguide.

BIBLIOGRAPHY
POLAR RESOURCES

Ice sheets have existed on Earth for half of the last one billion years! In the last million and a half years, geologists believe that the ice sheets have expanded to twice the size of today, and then shrunk, more than 20 times!

What causes ice sheets to expand and contract? Are the present ice sheets growing or shrinking? How will global warming impact the ice sheets? How do the ice sheets impact the global system? Glacial geologists study the present glacial environment to understand "ice ages" of the past. Come and explore the ever-changing nature of the glacial setting; the ice, the changes it creates in the landscape, and its response to changes in the environment!

data projects research news the cryosphere

THE CRYOSPHERE WHERE THE WORLD IS FROZEN

The Cryosphere

The Cryosphere

WHERE THE WORLD IS FROZEN

The word **"cryosphere"** originates from the greek word ***kryos***, meaning frost or icy cold. The cryosphere is the portion of the Earth's surface where water is in a solid form, usually snow or ice. This includes sea ice, freshwater ice, snow, glaciers, and frozen ground (or permafrost).

Cold Facts: Earth's Snow, Ice, and Frozen Soils

Snow

Glaciers

Permafrost

Sea Ice

Cryospheric Trends

Snow
Seasonal snow cover, the largest component of the cryosphere, covers up to 33 percent of the Earth's total land surface. About 98 percent of the total seasonal snow cover is located in the Northern Hemisphere. Although snowdrifts and avalanches often pose hazards to humans, snow also provides much of the world's water. For example, snowfall accounts for 60 to 70 percent of annual precipitation in the U.S. Sierra Nevada and Rocky Mountains, and is later released as water during spring snow melt and river runoff.

Glaciers
Glaciers and ice sheets cover about 10 percent of the Earth's land area. Glaciers, large, thickened masses of ice, accumulate from snowfall over long periods of time. When these ice masses reach a critical thickness, they begin to

All About the Cryosphere
NSIDC EDUCATIONAL SITES

State of the Cryosphere
A scientific synopsis of the cryosphere and climate change. Includes visual snapshots of cryospheric data.

All About Glaciers

move, or flow. A body of ice that covers a large area of land and flows outward in all directions is called an ice cap or ice sheet. Ice caps form in high mountain summit and plateau regions. Two ice sheets exist on Earth now, one in Greenland and one in Antarctica. All continents except Australia bear ice in the form of mountain glaciers, ice sheets, or ice caps. Today, glaciers and ice sheets store about 75 percent of the world's freshwater.

Permafrost

Nearly 24 percent of the exposed land of the Northern Hemisphere contains permafrost. Permafrost prevails over tundra regions and in the Siberian boreal forest. Extensive regions also undergo seasonal freezing and thawing. Because the melting of frozen ground produces unstable surfaces, understanding permafrost is important to civil engineering and architecture in cold regions. Freezing and thawing processes also have a significant impact on ecosystem diversity and productivity.

Sea Ice

Floating ice includes sea ice and frozen lake and river water. Sea ice typically covers 14 to 16 million square kilometers of the Arctic Ocean, and 17 to 20 million square kilometers of the Southern Ocean around Antarctica, during their respective winter seasons. The seasonal cycle of sea ice extent influences both human activities and biological habitats. Many polar mammals, such as penguins, polar bears, and seals, depend entirely on sea ice for habitat. Shipping companies must time navigation activities to coincide with periods of low sea ice concentration.

Since snow and sea ice can influence global climate, and glaciers and ice sheets directly affect sea level, the role of the cryosphere within the global climate system should not be underestimated.

Cryosphere FAQ

Cryospheric Trends

Because much of the cryosphere occurs in generally remote locations, taking measurements in the field can be both difficult and dangerous. Fortunately, the last several decades have seen the development of increasingly sophisticated satellite technology that has enabled researchers to monitor the cryosphere on a routine basis. In recent years, scientists have discovered striking trends. Satellite data indicate that during the past 30 years, annual snow cover in the Northern Hemisphere and Arctic sea ice extent have decreased at a rate of about 3 percent per decade.

Are these changes part of a natural cycle of climate variability? Or are they a result of human influences on the climate system? These questions underscore the critical need for more cryospheric data and research. For more information, see the State of the Cryosphere.

Charlotte, The Vermont Whale

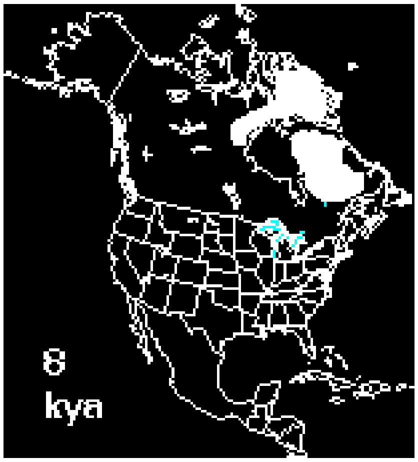
Glaciers and the Glacial Ages

The landscape of Vermont, as well as the landscape of much of northern North America, Europe and Russia has been profoundly affected by glaciation over the last 1.5 million years.

- What are glaciers? How do they form?
- What are the physical effects of glaciers? Can these effects be seen here in Vermont?
- How frequently do Ice Ages occur?
- When did the last glacial age end? Will glaciers again advance over North America?

Wesley.Wright@uvm.edu and HOWEDY@aol.com
last update April 09, 1996 WAW

Ice Ages



When most people hear the words **Ice Age**, they think of glaciers covering much of North America and Eurasia, animals like mammoths and saber-toothed cats, and Cro-Magnon people painting cave walls. These things come to mind because the words "Ice Age" often refer to the last time that glaciers extended over a large portion of the Earth's surface. The ISM online exhibit The Midwestern U.S. 16,000 Years Ago provides more information on this glaciation in the Midwestern U.S.

The amount of ice on the Earth's surface has varied greatly through time. For example, the extent of ice in North America has changed dramatically since the height of the last glacial advance 20,000 years ago.

During most of the last 1 billion years the globe had no permanent ice. However, sometimes large areas of the globe were covered with vast ice sheets. These times are known as ice ages.

To begin to understand ice ages we must answer the following questions:

- What are Ice Ages?
- When did Ice Ages occur?
- Why do Ice Ages occur?

About this exhibit

Illustrated Glossary of Alpine Glacial Landforms

This module is part of the Virtual Geography Department Project and has been prepared for the Physical Geography Working Group of the project. These materials may be used for study, research, and education, but please credit the author and source: Karen A. Lemke, University of Wisconsin-Stevens Point, and The Virtual Geography Department Project. Linda Freeman, College of the Siskiyous, contributed to earlier versions of this module.

This module has been classroom tested. To make suggestions and corrections, please contact Karen A. Lemke at klemke@uwsp.edu.

Abstract

This module presents basic definitions and examples of common alpine glacial landforms discussed in introductory level university physical geography, geology and earth science courses. Examples are provided as photographs with accompanying topographic maps. The module provides short descriptions of the landforms and identifying features to look for. The combination of photographs and topographic maps should enable users to identify other examples of these features either in photographs, on topographic maps, or in real life. Following the Illustrated Glossary, is an exercise on alpine glacial landform identification so that students may apply what they have learned from reading the glossary.

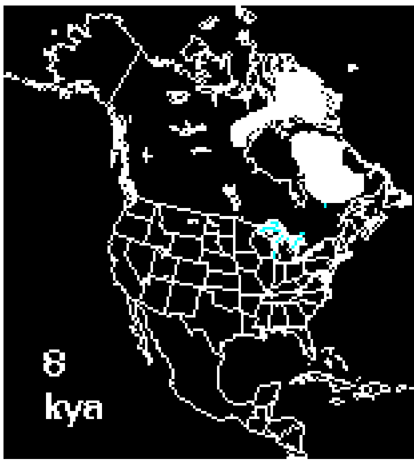
The Retreat of Glaciers in the Midwestern U.S.

18,000 to 6,000 Years Ago



The map shown above is a looping GIF animation of the retreat of glaciers in North America from the last glacial maximum at 18,000 years ago. If your browser supports this type of images, you will see the glacial extent changing on the map.

If your browser does not support this type of animation, you can download an MPEG video showing the retreat or view five maps showing the glacial extent through time.

Both the animations and maps are based on Dyke and Prest (1987).

> *NOTE: the MPEG video is about 216kb* and was created by the ISM GIS Laboratory.

For more information, see our list of other avalanche sites

1. Why avalanche awareness?

Mountains attract climbers, skiers and tourists who scramble up and down the slopes, hoping to conquer peaks, each in their own way. Yet, to do this they must enter the timeless haunt of avalanches.

For centuries, mountain dwellers and travelers have had to reckon with the deadly forces of snowy torrents descending with lightning speed down mountainsides. Researchers and experts are making progress in detection, prevention and safety measures, but avalanches still take their deadly toll throughout the world.

Each year, avalanches claim more than 150 lives worldwide, a number that has been increasing over the past few decades. Thousands more are caught in avalanches, partly buried or injured. Everyone from snowmobilers to skiers to highway motorists are caught in the "White Death." Most are fortunate enough to survive.

This is meant to be a brief guide about the basics of avalanche awareness and safety. For more in depth information, several sources are listed under "More avalanche resources" in the last section of these pages. They are all well-written, highly recommended publications by knowledgeable avalanche and backcountry experts.

For avalanche classes or instruction, contact a local outdoor equipment store or ski area.

2. Who gets caught in avalanches?

What is the profile of a typical United States avalanche victim? According to the Colorado Avalanche Information Center, 89 percent of victims are men, most victims are between the ages of 20-29 (although the average victim age is 31), and three-quarters of victims are experienced backcountry recreationists (who are more likely to enter risky situations).

Climbers, backcountry skiers, and snowmobilers are by far the most likely to be involved in avalanches. For a breakdown of activities in relation to avalanche deaths, see the national statistics compiled by the Colorado Avalanche Information Center.

One of the major reasons for increasing avalanche fatalities is the boom in mountain industries and recreation. Skiing, hiking and other winter sports draw millions of people to the mountains. To support these activities, more roads, buildings, and towns are forced into avalanche prone areas.

Backcountry recreationists are most likely to trigger avalanches as they cross hazardous terrain. Non-recreational deaths (such as highway motorists or mountain residents) are often caused when a naturally released avalanche buries buildings or highways.

3. When and where avalanches happen

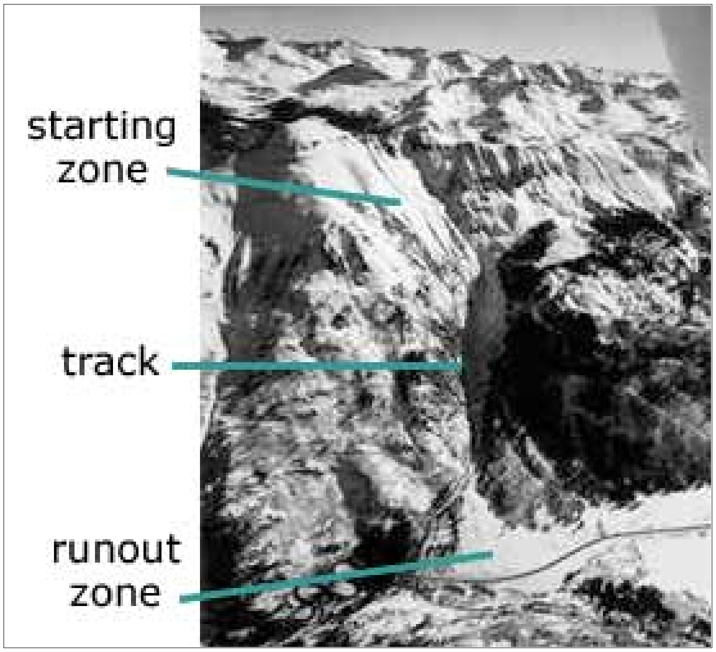
Although avalanches can occur on any slope given the right conditions, in the United States certain times of the year and certain locations are naturally more dangerous than others. Wintertime, particularly from December to April, is when most avalanches will "run" (slide down a slope). However, avalanche fatalities have been recorded for every month of the year.

The highest number of fatalities occurs in January, February and March, when the snowfall amounts are highest in most mountain areas. A significant number of deaths occur in May and June, demonstrating the hidden danger behind spring snows and the melting season that catches many recreationists off-guard. During the summer months, it is often climbers who are caught in avalanches.

In the United States, 514 avalanche fatalities have been reported in 15 states from 1950 to 1997. Colorado has the infamous reputation for being home to about one third of those deaths. Western states account for the majority of fatalities. Northeastern states experience relatively few avalanches in comparison. Arizona's single avalanche death was an out-of-bounds snowboarder killed in 1995. For more information, see the statistics compiled by the Colorado Avalanche Information Center.

While expertise is not a guarantee that you won't be caught in an avalanche, it does provide some basic knowledge about how to avoid avalanche areas, what types of weather and terrain signs to watch for, and what to do if you are caught in an avalanche - all information that may save you or other members of your party.

4. Anatomy of an avalanche



The three parts of an avalanche path: starting zone, track, and runout zone. (Photograph courtesy of Betsy Armstrong.)

All that is necessary for an avalanche is a mass of snow and a slope for it to slide down. For example, have you ever noticed the snowpack on a car windshield after a snowfall? While the temperature is cold, the snow sticks to the surface and doesn't slide off. After temperatures warm up a little, however, the snow will "sluff," or slide, down the front of the windshield, often in small slabs. This is an avalanche on a miniature scale.

Of course, mountain avalanches are much larger and the conditions that cause them are more complex. A large avalanche in North America might release 300,000 cubic yards of snow. That's the equivalent of 20 football fields filled 10 feet deep with snow. However, such large avalanches are often naturally released. Skiers and recreationists are usually caught in smaller, but often more deadly avalanches.

Slab avalanches are the most common and most deadly avalanches, where layers of a snowpack fail and slide down the slope. Since 1950, 235 people in the U.S. have been killed in slab avalanches. Hard slab avalanches involve large blocks of snow and debris sliding down a slope. In soft slab avalanches, the snow breaks up in smaller blocks as it falls.

An avalanche has three main parts. The **starting zone** is the most volatile area of a slope, where unstable snow can fracture from the surrounding snowcover and begin to slide. Typical starting zones are higher up on slopes, including the areas beneath cornices and "bowls" on mountainsides. However, given the right conditions, snow can fracture at any point on the slope.

The **avalanche track** is the path or channel that an avalanche follows as it goes downhill. When crossing terrain, be aware of any slopes that look like avalanche "chutes." Large vertical swaths of trees missing from a slope or chute-like clearings are often signs that large avalanches run frequently there, creating their own tracks. There may also be a large pile-up of snow and debris at the bottom of the slope, indicating that avalanches have run.

The **runout zone** is where the snow and debris finally come to a stop. Similarly, this is also the location of the deposition zone, where the snow and debris pile the highest. Although underlying terrain variations, such as gullies or small boulders, can create conditions that will bury a person further up the slope during an avalanche, the deposition zone is where a victim will most likely be buried.

5. Avalanche factors: what conditions cause an avalanche?

Several factors may affect the likelihood of an avalanche, including weather, temperature, slope steepness, slope orientation (whether the slope is facing north or south), wind direction, terrain, vegetation, and general snowpack conditions. Different combinations of these factors can create low, moderate or extreme avalanche conditions.

Keep in mind that some of these conditions, such as temperature and snowpack, can change on a daily or even hourly basis. This necessitates constant vigilance of your immediate surroundings while doing any wintertime backcountry travel. The route you chose may be safe when you begin, but may become dangerous if conditions change dramatically throughout the day.

While this may seem like a lot of work, once you understand factors that can cause avalanches, most of these signals require simple observation to evaluate your surroundings as they change. Simply ask yourself, when are conditions sufficient to cause a mass of snow to slide down a slope?

The following factors often occur in combination to produce an avalanche, but if a slope is unstable in any way, it may take only the weight of one skier to set off an avalanche. The more foresight you have about conditions and situations to avoid the safer your outing will be.

Weather

Avalanches are most likely to run either during or immediately after a storm where there has been significant snowfall. The 24 hours following a heavy snowstorm are the most critical. Consequently, it becomes important to be aware of current weather conditions as well as the conditions from the previous couple of days. Temperature, wind, and snowfall amount during storms can create fatal avalanche conditions during your outing. If there has been heavy snowfall the day or night before your trip, it may be wise to postpone the trip in order to avoid the increased avalanche danger.

Snowfall

Recent snowfall puts extra stress on the existing snowpack, especially if it does not adequately bond to the pre-existing surface layer. The extra weight of new snow alone can cause a slab to break off and fall down the slope, particularly in storm-induced avalanches. Snowfall amounts of one foot or more (frequent in mountainous areas) create the most hazardous situations, producing avalanches that are often large enough to block highways and cause major destruction. Amounts of six to twelve inches pose some threat, particularly to skiers and recreationists. Amounts less than six inches seldom produce avalanches.

Temperature

Because snow is a good insulator, small temperature changes do not have as much effect on snowpack as larger or longer changes do. For instance, shadows from the sun crossing the snow surface throughout the day will not significantly change snowpack stability. Changes that last several hours or days, such as a warm front moving through, can gradually increase temperatures that cause melting within the snowpack. This can seriously weaken some of the upper layers of snow, creating increased avalanche potential, particularly in combination with other factors.

When temperatures rise above freezing during the daytime and drop back down again at night, melting and re-freezing occurs, which can stabilize the snowpack. This is particularly common during the springtime. When temperatures stay below freezing, especially below zero degrees Fahrenheit, the snowpack may remain relatively unstable.

Wind direction

Wind scouring snow off of the windward side of the peak and depositing it on the leeward side. (Photograph courtesy of Richard Armstrong.)

Wind usually blows up one side of a slope or mountain (the windward side), and down the other (the leeward side). Blowing up the windward slope, wind will "scour" snow off the surface, carry it over the summit, and deposit it on the leeward side. What this does is pack snow unevenly on the leeward side, making it more prone to avalanche. A cornice or icy overhang at the top of a mountain or ridge is a telltale sign of wind scouring. It is safer to travel on the back, or windward side of such a slope, where the snow layer is thinner and wind-packed.

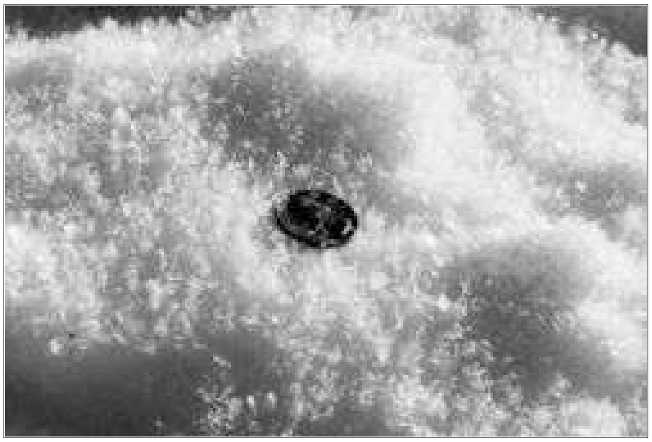
Although it seems like a small amount because the snow may look light and powdery, the weight can add up significantly and can be a critical factor if a slope is already unstable. In the Northern Hemisphere, storms generally move from west to east. Consequently, the leeward slopes are most often the northeast, east, and southeast facing slopes. These slopes become easily wind-loaded and will more readily avalanche. Many ski areas are built on slopes with these orientations and must use prevention measures to counteract the natural avalanche conditions that build up on these slopes.

Snowpack conditions

Perhaps the most significant factor (but not the only one) is how the snowpack has developed over the season. We only see the surface and maybe the top few layers of snow, but it can be layers of snow several feet deep that may ultimately determine whether the slope will fail.

Understanding the history of snowpack for that season can reveal several clues about slope stability. The snowpack as a whole may change not only during the course of the winter season, but throughout the course of a single day, due to changing weather and temperature conditions. This is why constant awareness and frequent slope testing are necessary.

Snowpack conditions are extremely important because many layers of snow build up over the winter season. Each layer is built up under different weather conditions and will bond differently to the subsequent layers. Snowflakes, or snow crystals, within the snowpack eventually become more rounded due to melting/re-freezing and settlement. This metamorphism allows them to compress and (generally) form stronger bonds.



A new layer of surface hoar on the snow. Note the quarter for scale. (Photograph courtesy of K. Williams.)

In between snows, the temperature may rise and melt the exposed surface layers, which when they re-freeze create a smoother, less stable surface for the next snowfall. Failure is much more likely to occur during or after the next few snowfalls. Rain between snows creates a slicker surface as well, and can weaken the bonds between snow layers. On the other hand, light snowfalls and consistently cold temperatures help strengthen the snowpack and make it more resistant to avalanche. Weak layers deep in the snowpack can cause avalanches even if the surface layers are strong or well bonded.

A type of snow called **depth hoar** (a course, grainy form of snow crystal) is often the culprit behind avalanches. Because of its granular structure, similar to dry sand, depth hoar bonds poorly and creates a very weak layer in the snowpack. Unfortunately, the weather conditions necessary to produce depth hoar most often occur very early in the season, and these weak layers are buried under subsequent snows. All too often, deeper depth hoar layers are discovered only after an avalanche has swept off the overlying layers.

Slope angle

Most avalanches occur on slopes between 30 and 45 degrees, but can occur on any slope angles given the right conditions. Very wet snow will be well lubricated with water, meaning it might avalanche on a slope of only 10 to 25 degrees. Very dry or granular snow will most likely avalanche on a slope close to the 22 degree angle of repose. Compacted, well-bonded layers create a snowpack that can cling to steeper slopes until a weak layer is created.

You can measure the slope angle with an inclinometer, or you can "eyeball" it by dangling a ski pole by the strap and estimating the angle. Of course, you may want to practice before using this technique in the backcountry to be sure of your accuracy. Be aware that a single slope can have varying degrees of steepness across its face, depending on the terrain. You may start out on a gentle 25 degree angle, but as you cross, the slope may steepen significantly enough to become an avalanche hazard.

Slope orientation

Although avalanches will run on slopes facing any direction, most avalanches run on slopes facing north, east, and northeast (also the slope directions that most ski areas are located on). Because the sun is at such a low angle, particularly during the winter, a colder and deeper snowpack develops. Slopes that are under shadow throughout most of the day are suspect because the snowpack remains cooler, without much of the melting and bonding that can make the snow layers stronger.

Remember also that certain slope orientations are much more affected by wind-loading, particularly northeast, east, and southeast (similar to the orientations mentioned above). If you are not already familiar with the terrain, taking a compass along would be a good idea. Alternatively, if you know where you are going ahead of time, you could potentially plan your route in such a way as to avoid suspect slope orientations, especially if other potential avalanche factors exist.

Terrain

Paying attention to where you are in the grand scheme of things can offer clues about avalanche likelihood. Bowls and gullies are suspect at any time, regardless of other conditions. Snow can accumulate deeply and quickly in these areas, increasing the possibility of an avalanche. Even if you can see that an avalanche has already run, be wary. Avalanches can fall in a "piecemeal" fashion, where one avalanche will run and leave the rest of the slope weakened, and the slightest provocation can cause subsequent avalanches on that same slope. Smaller depressions or shallow gullies in the mountainside can also be hazardous. During an avalanche, these "terrain traps" serve as accumulation points for snow and debris in which a victim could be buried.

Crossing steep slopes where you may trigger the avalanche yourself should be done cautiously. In contrast, as you cross a valley floor you may also be caught in an avalanche triggered naturally on the steep slope above you. Therefore, during hazardous conditions minimize the amount of time traveling beneath avalanche starting zones and never camp in a potential avalanche runout zone. Even a small avalanche starting high on the slope can carry down large amounts of snow onto and across the valley floor. Remember to keep an eye out for obvious avalanche chutes, where avalanches occur more frequently.

Vegetation

On a snow-covered slope, heavily forested areas are much safer than open spaces, but don't assume that any vegetation at all will be protective. Lone trees, bushes, or large rocks on a mountainside can sometimes weaken the stability of the snowpack. A fracture line (the break-off point for an avalanche) may run from a lone tree to a rock to another tree. Also, during avalanches, trees and rocks catch debris and cause excessive snow pile-up, as well as provide lethal obstacles for anyone caught in an avalanche.

Tree line, above which conditions become too harsh for trees to grow, also plays a significant role in avalanche areas. Many avalanches start above the tree line, making high-elevation mountains especially risky. Although forests help stabilize the snowpack, if an avalanche starts above tree line, it can cut its own path, or chute, through the trees below. Likewise, where there is a swath of trees missing from a forested mountainside (and it's not a ski run), there are probably frequent avalanches running down that particular chute.

Smooth surfaces, such as a rock face or grassy slope, may cause avalanches during the spring melting season. On the other hand, if the vegetation is very low-lying, such as tree stumps or shrubs, it can become buried underneath the first few snows and be relatively ineffective at anchoring the upper layers of the snowpack.

6. How to determine if the snowpack is safe

There are several ways to gauge snowpack stability. Keep any eye out for any cracks shooting across the surface, or small slabs shearing off. These are signs of weakened snowpack. Also, listen for "hollow" or "whumping" noises as you walk or ski. This indicates that there is a weaker layer underneath, leaving the surface layer more prone to collapse. Careful, continuous observations throughout your trip can reveal natural clues, but other more reliable measurements, such as snow pits and shear tests, will help you predict more accurately how stable or unstable the snowpack is.

Snowpits

Digging a snowpit reveals more about the snowpack structure than is visible from the surface. Making a snowpit requires a little more practice and experience, but it is quickly accomplished with a portable shovel. The most effective snowpits should be dug near potential avalanche starting zones, but without putting you or other members of your party at risk. With a shovel, dig a hole four to five feet deep and about three feet wide. Smoothen the uphill wall until it is vertical and you can see the different layers of snow. By pressing your hand against each layer to feel its hardness, you can determine whether there are weak layers.

Shear tests

Once you have dug the pit, a shear test is fairly easy. From the vertical, uphill wall, separate a column of snow without pulling it free from the wall. Insert a shovel at the back (uphill side) of the column and gently pull on the handle. If weak layers pull loose quite easily, the snowpack is very unstable. If it takes a few tugs on the handle before any layers pull loose, the snowpack is slightly unstable. If you really have to pry hard on the handle to loosen any layers, the slope is relatively stable, although caution should still be used at all times.

When conducting these tests throughout the day, pay attention to the slope angle. Layers that seem strong on a 30-degree slope may be much weaker on a steeper slope. Also, remember that the shear test relies on the pull of a shovel, not the weight of a person. You can test this by standing or jumping on the uphill edge of the snowpit (the "banzai jump" test), but only if you already know the snowpack is stable after conducting a shear test and if this presents no risk of injury or of triggering an avalanche.

Snowpit and shear tests should be conducted frequently during your outing, especially if you are crossing several different slopes or types of terrain. Some experts perform them dozens of times a day. While this may seem a bit time-consuming at first, experience will speed the process. More importantly, it is a fairly simple and accurate measure you can make which may save your life.

7. Avalanche gear

Ideally, avoiding avalanches in the first place is much easier than trying to survive one. Avalanche safety begins even before you begin your travel. In addition to keeping an eye out for weather and terrain conditions, there are steps you can take ahead of time to help you or other members of your party if you are caught in an avalanche.

Proper equipment can be a critical factor in rescue efforts. Avalanches kill in two ways. A victim will either endure fatal trauma (collisions with rocks or trees) during an avalanche, or will suffocate after they are buried by snow. While trauma deaths occur before rescue can take place, the more common suffocation deaths are often tragic because with the proper equipment and expertise, they can be avoided.

Portable shovels made of plastic and aluminum are lightweight and compact enough that they can be carried in a pack. Digging with a shovel, as opposed to using hands or ski poles, can dramatically decrease the time it takes to dig out a victim. Digging by hand takes an average of 45 minutes to dig out one square meter of snow. Using a shovel to dig out the same amount of snow takes less than ten minutes.

Collapsible probes or ski-pole probes are also easy to carry along. Collapsible probes usually consist of two-foot lengths of tubular steel that join together to make a probe ten to twelve feet long. Ski-pole probes are made so that grips and baskets can be removed. The two poles can then be joined together to form a probe. Probing is essential to finding a buried victim if there are no visible clues on the surface.

Avalanche beacons (transceivers) are the most commonly used rescue device, and are standard equipment for ski-area patrollers and heli-ski operators. When properly used, they provide the fastest way of locating a victim. When a victim is buried, the transceiver will emit a frequency that other transceivers can home in on. However, it is critical to have the transceiver set to "transmit" during your outing. When trying to locate a buried victim, rescuers will then switch their transceivers to "receive" to locate the signal. Unfortunately, avalanche deaths have occurred due to the fact that the victims had their transceiver switched to "receive" rather than "transmit." Consequently, rescuers could not locate them in time.

Remember that more than one transceiver unit is required. A transceiver will not help locate a victim who is not also wearing one. Likewise, a victim with a transmitting beacon may not be found unless someone else has a transceiver to pick up that signal.

Using beacons requires practice. Homing in on a buried signal involves moving in increasingly smaller circles around the area of the signal. When purchasing a unit, learn how to use it properly, and practice using it frequently. Make sure those in your party carrying transceivers understand how to use them.

Time is of the essence. Carrying this equipment may mean the difference between life and death for someone buried in an avalanche. Statistics show that most survivors are dug out within 15 to 30 minutes. For victims buried longer than 30 minutes, survival chances decrease drastically. In fact, U.S. statistics show that victims buried longer than 45 minutes rarely survive. Depth of burial is also a factor in surviving, but even if a victim is near the surface, the length of time it takes to locate them and dig them out can still be the critical factor.

8. Tips for avalanche survival

Before crossing a slope where there is any possibility of an avalanche, fasten all your clothing securely to keep out snow. Loosen your pack so that you can slip out of it with ease and remove your ski pole straps. Make sure that your avalanche beacon is on and switched to "transmit" rather than "receive." Cross the slope one at a time to minimize danger.

If you are caught in an avalanche

Yell and let go of ski poles and get out of your pack to make yourself lighter. Use "swimming" motions, thrusting upward to try to stay near the surface of the snow. When avalanches come to a stop and debris begins to pile up, the snow can set as hard as cement. Unless you are on the surface and your hands are free, it is almost impossible to dig yourself out. If you are fortunate enough to end up near the surface (or at least know which direction it is), try to stick out an arm or a leg so that rescuers can find you quickly.

If you are in over your head (not near the surface), try to maintain an air pocket in front of your face using your hands and arms, punching into the snow. When an avalanche finally stops, you will have from one to three seconds before the snow sets. Many avalanche deaths are caused by suffocation, so creating an air space is one of the most critical things you can do. Also, take a deep breath to expand your chest and hold it; otherwise, you may not be able to breathe after the snow sets. To preserve air space, yell or make noise only when rescuers are near you. Snow is such a good insulator they probably will not hear you until they are practically on top of you.

Above all, do not panic. Keeping your breathing steady will help preserve your air space and extend your survival chances. If you remain calm, your body will be better able to conserve energy.

Rescuing a victim

Try to watch the victim as they are carried down the slope, paying particular attention to the point you last saw them. After the avalanche appears to have finished and settled, wait a minute or two and observe the slope carefully to make sure there is no further avalanche danger. If some danger does still exist, post one member of your party in a safe location away from the avalanche path to alert you if another avalanche falls.

When traveling with a large party, you may want to send someone for help immediately while the rest of you search. If you are the only survivor, do a quick visual search. If you don't see any visual clues, and you don't have transceivers, then go for help.

Begin looking for clues on the surface (a hand or foot, piece of clothing, ski pole, etc.), beginning with the point where they were last seen. As you move down the slope, kick over any large chunks of snow that may reveal clues. Since equipment and items of clothing may be pulled away from a victim during an avalanche, they may not indicate their exact location, but can help determine the direction the avalanche carried them. Mark these spots as you come across them. Be sure that all rescuers leave their packs, extra clothing, etc., away from the search area so as not to clutter or confuse search efforts.

Once the victim is found, it is critical to unbury them as quickly as possible. Survival chances decrease rapidly depending on how long a victim remains buried. Treat them for any injuries, shock, or hypothermia if necessary.

If you lost sight of the victim early during the avalanche, or if there are no visible clues on the surface, mark where the victim was last seen. Look at the path of the snow and try to imagine where they might have ended up. For those wearing avalanche transceivers, switch them to "receive" and try to locate a signal.

For those using probes, begin at the point the victim was last seen at. Or if you have a good idea of where they were buried, begin in that area. Stand in a straight line across the slope, standing shoulder to shoulder. Repeatedly insert the probes as you move down slope in a line. Pay particular attention to shallow depressions in the slope and the uphill sides of rocks and trees, since these are terrain traps where they may have been buried.

It may be necessary to probe certain areas more than once if you don't locate the victim the first time around, but this takes more time and decreases the victim's chances for survival. Similar to using transceivers, this method of rescue is much more effective if those involved have experience or have practiced finding buried victims using probes.

After searching for clues, or using transceivers and/or probes, still does not reveal the location of the victim, it may be time to rely on outside help. Nearby ski resorts will be staffed with personnel experienced to handle these situations. They will have equipment to locate the victims and dig them out (if your party did not bring shovels or probes), and they may also have avalanche dogs that can help find victims. Ski area patrollers will also have first aid equipment, but unfortunately, by the time they can usually reach out-of-bounds avalanche accidents, too much time has elapsed to save the victim.

9. Avalanche Danger Scale

American and European avalanche danger scales rate avalanche hazard similarly with the exception of using slightly different colors. The differences are noted below.

LOW

Green in both American and European scales:

- Snowpack is generally stable.
- Only isolated areas of instability.
- Backcountry travel is fairly safe.
- Natural or human-triggered avalanches unlikely.

MODERATE

Yellow in both American and European scales:

- Some areas of instability.
- Natural avalanches unlikely; human-triggered avalanches possible.
- Backcountry travel possible with caution.

CONSIDERABLE

Orange in American scale, Ochre in European scale:

- Unstable areas probable.
- Natural avalanches possible; human-triggered avalanches probable.
- Backcountry travel possible with extreme caution.

HIGH

Red in American scale, Orange in European scale:

- Unstable areas highly likely on various slopes and aspects.
- Natural and human-triggered avalanches highly likely.
- Backcountry travelers should avoid steep slopes and wind-loaded slopes.

EXTREME

Black in American scale, Red in European scale:

- Extremely unstable layers in snowpack.
- Natural and human-triggered avalanches are certain.
- Large destructive avalanches probable.

- Backcountry travelers should avoid any steeply angled terrain or known avalanche areas.

10. Avalanche quick checks

Following is a list of quick checks you can make throughout the day:

1. What have the weather conditions been over the past few days? Recent heavy snows?
2. Can you observe any wind loading on the slopes?
3. Do you have a good sense of the snowpack? Have you performed any snowpit or shear tests?
4. Have you noticed many fracture lines, heard "whumping" or cracking sounds, or hollow noises in the snowpack?
5. Are you keeping an eye on the orientation and steepness of the slopes as you cross them?
6. Are you lingering in gullies, bowls, or valleys?
7. Noticed any recent avalanche activity on other slopes similar to the one you are on?
8. If a slope looks suspect, are there alternative routes?

Extra precautions to take

1. If there is no alternative to crossing a suspect slope, do so one person at a time to minimize risk.
2. When descending or ascending a slope, try to stay as far to the sides of a potential avalanche chute as possible to decrease your chances of being caught if an avalanche runs.
3. Be aware of the condition of those in your party. If someone is tired, hungry, or cold they may not be using their best judgement.
4. Remain constantly aware of changing weather or temperature conditions, particularly if your outing will last more than a few hours.
5. Consider avalanche rescue equipment, such as beacons, ski-pole probes, and collapsible shovels, as a necessary part of your backcountry gear.

...Avalanche Awareness...

Try this for avalanche awareness information in German or Italian (as well as English).

Why Worry About Avalanches?

Snow avalanches are a natural process, occurring perhaps 1,000,000 times per year, world-wide. They are one way for snow on an incline to adjust to the pull of gravity. The vast majority of these slides are not a problem, because an avalanche, in and of itself, is not a hazard. A person (or a person's stuff) has to get involved in order for there to be a problem.

What happens if you get caught in an avalanche?

So, who gets caught in avalanches?

The fact is, that avalanches don't drop from the peaks onto the heads of unsuspecting innocents with the unpredictability of a plummeting meteorite. 95% of people who are caught in avalanches are caught by a slide that was triggered by themself or a member of their party.

I think this is good news! If it is our behavior that is creating the hazard, then we can change our behavior to avoid problems.

Avalanche Characteristics

There are many different types of avalanches, but the one that worries us the most is the "slab" avalanche, in which a mass of cohesive snow releases as a unit. This type of avalanche is usually easily recognized by it's distinct crown and flanks (click for a diagram of the nomenclature associated with avalanches).

Slab and other avalanches can be hard or soft, wet or dry and can be triggered naturally or artificially.

Spotting Avalanche Hazard: The Avalanche Triangle

Some place have avalanches: Switzerland's Alps, Utah's LaSals, Nepal's Himalayas. Some places don't: South Viet Nam, the Mile-High Stadium, your living room (the distinctions are not always so obvious, unfortunately).

Why is this?

Avalanches are formed by a combination of 3 things that together are known as the "Avalanche Triangle". These 3 ingredients may be present in one location but absent 10 feet away. The 3 legs of the triangle are Snowpack, Terrain and Weather.

Detecting Instability

There are many tip-offs to the presence of a potential avalanche, including surface clues and active stability tests. You should never trust a single information source--stability evaluation is an ongoing process!

Route Selection & Self-Rescue

The easiest way to rescue yourself is to not get into trouble in the first place.

The best philosophy I can convey about how to avoid problems is the **Principle of the 3 Red Flags** , which states that most accidents are not the result of an unavoidable "karmic-cannonball", but rather are the predictable outcome of a series of related events. The trick to the Principle of the Three Red Flags is to recognize when these events are beginning to stack up and work against you. To do this, you must simply learn to notice the insignificant little details that are the ingredients of significant problems.

Always carry rescue equipment and know how to use it--then pretend you don't have any. Don't get caught in the trap of letting the fact that you are carrying extra gear force you into more dangerous decisions. It's sort of like driving on the freeway: we'd all be a lot kinder and gentler if the driver's seat were lashed to the front bumper instead of encased in a padded steel cocoon.

Use safe route-finding and travel techniques. And remember: if a member of your party is buried by an avalanche, their only real chance of survival is if you rescue them--don't go for help unless you're *sure* they're dead, because they will be by the time you get back with the cavalry.

Putting All The Pieces Together

A question we often get asked is "How do you forecast?". Here are a selection of views and differing methods to help you piece together the Avalanche Triangle which always contains you--the human--as its center piece.

Avalanche Forecasting - A Modern Synthesis by Ed La Chapelle, 1965.
Snow Avalanches: Their Characteristics, Forecasting and Control by Edward R. LaChapelle,1962.
Avalanche Hazard Evaluation Field Checklist by Doug Fesler and Jill Fredston.
How I Forecast for the Back Country by Rod Newcomb.
Safe Skiing - Stop Light Metaphor by Brad Meiklejohn.
Rules Of Thumb by Ron Perla.
Open Book Questions - to encourage reading the ABC's of Avalanche Safety, by Ed LaChapelle.

More Information

You can spend as much time as you wish studying avalanches. I promise that you won't run out of study options--avalanches are not very well understood, the truth be told.

- Frequently Asked Questions about avalanches;

- Upcoming avalanche education in your area;
- Find avalanche study materials here, at the best source of avalanche publication and video reviews and on-line ordering;
- Check the avalanche glossary for explanations of bizarre avalanche terminology;
- Snow and avalanche graduate degree programs in the U.S. and Canada;
- The databases at CRREL and NSIDC reference just about all the research ever done in the field of snow and avalanches, and the Natural Disaster Database Search Engine will never route you to some dippy hockey fan's page when you search with the keyword "avalanche".
- Snow research and snow crystal links.

Other Avalanche-Related Web Sites

- Avalanche.org (West-Wide Avalanche Network) is a grab-bag of useful avalanche information, including avalanche accident statistics, links to avalanche advisories all over the western US, weather links, remote weather telemetry data, an avalanche library and much, much more.
- The Utah Avalanche Center has a new site with links to all the avalanche forecasts in the state.
- Avalanche advisories for mountains outside of Utah.
- E-zines:
  - Firstrax is a Web magazine about Colorado backcountry sports that includes snowpack information pertinent to the La Sals.
  - Couloir Magazine is a great on-line source of information useful for backcountry sports.
  - Mountain Zone is by far the slickest backcountry e-magazine. Look for numerous articles about avalanche awareness topics, avalanche fatalities of the rich and famous, and other mountaineering info.

This site designed and maintained by Faerthen Felix at the Manti-La Sal Avalanche Center.

AVALANCHE

DEFENSE PAGE

Created for GE 404, aka, Natural Hazards

under the supervision of Bill Rose

AVALANCHE DEFENSE STRUCTURES AND TECHNIQUES?
The purpose of Avalanche defense is to reduce or eliminate the hazard from potentially destructive Avalanches. Just like there is more than one way to skin a cat, there is also more than one way to keep yourself or others from being squashed by an Avalanche. The purpose of this page is to inform you, the general public, a little about what defensive techniques are out there and how they work.

The majority of defensive systems can be divided into two main groups, active and passive systems. These two options are listed below, along with perhaps the most obvious way to prevent Avalanche damage, that being zoning.

Along with those options there are some links to other Avalanche oriented pages, just in case you were looking for other information about Avalanches, you should be able to find anything you need on the pages listed. Thanks for visitiing this site and let me know what you think! -RHS

- ACTIVE TECHNIQUES -For those who want to rock!

- PASSIVE TECHNIQUES -For those who want to kick back and watch the show.

- ZONING -For those that don't want to deal with Avalanches at all.

- OTHER AVALANCHE LINKS -Some great pages ranging from Avalanche directories to home sites for companies that manufacture Avalance defense structures. Be sure to check these links out!

- MY SOURCES -If you are looking for some extra credit reading material, or really want to know a lot about Avalanche defense and related structures, take a peek at these books!

If you have ANY questions, comments, or ideas pertaining to this page, please email me. My name is Hardy Sawall and I am the joker in charge of this page. Let me know what you think!

Avalanche!

Grade level: 6-8 | Subject: Weather | Duration: Two class periods

Lesson Plan Sections

Objectives | Materials | Procedures | Adaptations | Discussion Questions | Evaluation | Extensions | Suggested Readings | Links | Vocabulary | Academic Standards | Credit

Printable Version in Rich Text Format

Objectives

Students will understand the following:

1. Friction between snow or rocks and the underlying ground holds the snow or rocks in place on a slope, preventing avalanches and landslides.
2. In order for an avalanche or landslide to occur, friction must be overcome.
3. Substances that overcome friction, causing avalanches and landslides, are called *lubricants;* they include water, ice, and sand.
4. Lubricants make the underlying surface slippery and provide a cushion for snow or rocks to move over.
5. The flatter or rounder the dry lubricant, the more slippery it makes the underlying surface.

Materials

Provide the following materials for each group:

- Old textbook
- Plastic bag
- Half-meter piece of wood about 30 centimeters wide
- Meterstick
- Newspaper
- Tape
- Talcum powder
- Sand
- Pebbles
- Marbles

Procedures

1. Ask your students if they can define the terms *avalanche* and *landslide*. Make sure they understand that in an avalanche deep snow that has been lying on a slope breaks free from the underlying surface and crashes down the slope; a landslide is a similar phenomenon, involving rocks instead of snow. Students should know that both are potentially destructive and dangerous.
2. Ask students to think about the possible causes of an avalanche or landslide. Start them off by asking them to imagine a steep mountainside covered with snow. For weeks, the snow remains on the mountainside without moving. Then, one day, an avalanche occurs. Something must have changed, since things that are stationary do not begin to move for no reason at all. What changes could have caused the avalanche?
3. Tell your students that they are going to perform an experiment that might help them answer the question or confirm the answers that they have formulated. Then divide the class into groups to carry out the experiment.
4. Distribute materials to each group.
5. Have students fold up the newspaper and tape it to the floor to catch any debris.
6. Instruct students to place the piece of wood flat on the floor on top of the paper, and then stand the meterstick with the 0 end down at one end of the board.
7. Next, students should place the book on the board near the meterstick.
8. One student can then slowly lift the end of the board, causing the board to slope, until the book begins to slip.
9. Another student in the group should record the height of the board at the moment the book began slipping down the slope.
10. Have students repeat the experiment after putting talcum powder, then sand, then pebbles, then marbles beneath the book, each time recording the height of the board when the book begins to slip.
11. Discuss with the class the results of the experiment. Can students explain why the book began to slip with the end of the board at a lower level when talcum or other substances were added?
12. Explain that friction between the board and the book held the book in place. The added substances acted as *lubricants,* reducing the friction.
13. Have each student write a paragraph speculating as to what each lubricant used in the experiment may represent in nature. What if the lubricant were water or ice? How would water accumulate under a thick layer of snow on a mountain? They should conclude their paragraphs by telling what they think could have caused the avalanche they imagined before performing the experiment.

Back to Top

Adaptations

Adaptations for Older Students:
Have students research the causes of avalanches and how avalanches can be predicted.

Back to Top

Discussion Questions

1. Create a convincing argument for building at least one type of avalanche safeguard for your town. Assume the simplest plan will cost the town one million dollars and there is no money set aside for a project of this magnitude.
2. Develop a plan for how the town will fund construction of the safeguard and share it with the group.
3. Decide who will pay for safeguards around homes outside the central district.
4. After careful discussion, formulate a master plan that seems fair and benefits the majority of the residents.
5. Compare the three types of snow avalanches.
6. Brainstorm and share possible ways people could protect themselves from rock avalanches and pyroclastic flows.

Back to Top

Evaluation

You can evaluate your students on their reports using the following three-point rubric:

- **Three points:** reasoning carefully thought out; paragraph well organized and error-free
- **Two points:** adequate reasoning; paragraph lacking in organization with some errors
- **One point:** careless reasoning; paragraph lacking in organization with numerous errors

You can ask your students to contribute to the assessment rubric by determining criteria for persuasive reasoning.

Back to Top

Extensions

Ski Our Mountain, Safest Around
Have students imagine that they manage a ski resort where avalanche barriers around chalets have recently been constructed. Their assignment is to create an illustrated brochure emphasizing safety to lure potential skiers to the resort.

Make a Break
Have your students make their own landslide/avalanche barriers. They will need a piece of wood or thick cardboard to represent a slope, thin pieces of wood for designing barriers, and a pair of dice or game pieces to represent buildings. They can use sand to represent snow or rocks. Instruct students to research avalanche barriers on the Internet and then design barriers of their own. They should place the dice about halfway down the slope without taping or gluing them; then tape or glue different types of barriers on the uphill side of the dice. Have students pour sand down the slope and observe the effects of the barriers, reinforcing them as necessary. Students should evaluate their designs, identifying those that work best, and then compare them with others to choose the best overall design.

Suggested Reading

Snow Avalanche Hazards and Mitigation in the United States [online book]
National Research Council Commission on Engineering and Technical Systems, 1996
The publisher, the National Academy Press of the National Academy of Sciences, offers full online text with excellent digital imagery of avalanche phenomena.
http://www.nap.edu/readingroom/records/0309043352.html

The Avalanche Handbook
David McClung and Peter Schaerer, Mountaineers, 1993
The intended use of this handbook is a safety manual for hikers and other visitors/dwellers in mountainous regions. From it, much can be learned about the characteristics and behavior of avalanches, in addition to appropriate safety precautions.

“Avalanche!”
Patty Sullivan, Alaska, March 1997
Tom Abell has been buried by avalanches twice. The first time he survived by luck, the second time he was prepared with a homing device.

Vocabulary

Click on any of the vocabulary words below to hear them pronounced and used in a sentence.

powder avalanche

Definition: A mass of loosely packed snow that begins with a piece of falling rock or ice.
Context: The largest and most destructive is a powder avalanche. A piece of falling ice or rock starts a mass of loose snow sliding down the mountain.

wet avalanche

Definition: A flow of snow, ice, rock, and other material that occurs as a result of thawing.
Context: The second type is a wet avalanche. These occur mostly late in the snow season when the snowpack is deep and the thaw is just beginning.

slab avalanche

Definition: A mass of snow, ice and possibly other material caused when a large slab of snow breaks free from the layers beneath.
Context: A slab avalanche is most deadly. The weight of a skier is enough to break a slab away from the layers beneath.

cornice

Definition: An overhanging mass of snow, ice, or rock usually on a ridge.
Context: Wind can also blow snow into a huge, dense drift or cornice on the crest of a ridge.

pyroclastic flow

Definition: A flow of hot gases, soot, and lava formed by volcanic action.
Context: This gray cloud is one of the most lethal forms of avalanche in the world. It comes out of an erupting volcano. It’s called a pyroclastic flow.

rock avalanche

Definition: A mass of boulders, rocks, and other material that slides down an incline riding on a layer of smaller rocks.
Context: Rock avalanches are the strangest of nature’s forces. Giant boulders “float” on tons of solid rock.

Academic Standards

This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

Grade level: 6-8
Subject area: science
Standard:
Understands basic Earth processes.
Benchmarks:
Knows how land forms are created through a combination of constructive and destructive forces (e.g., constructive forces such as crustal deformation, volcanic eruptions, and deposition of sediment; destructive forces such as weathering and erosion).

Grade level: 6-8
Subject area: science
Standard:
Understands basic Earth processes.
Benchmarks:
Knows factors that can impact the Earth's climate (e.g., changes in the composition of the atmosphere; changes in ocean temperature; geological shifts such as meteor impacts, the advance or retreat of glaciers, or a series of volcanic eruptions).

Grade level: 6-8
Subject area: science
Standard:
Understands basic concepts about the structure and properties of matter.
Benchmarks:
Knows that atoms often combine to form a molecule (or crystal), the smallest particle of a substance that retains its properties.

Grade level: 6-8
Subject area: science
Standard:
Understands the nature of scientific inquiry.
Benchmarks:
Establishes relationships based on evidence and logical argument (e.g., provides causes for effects).

Grade level: 6-8
Subject area: science
Standard:
Understands the nature of scientific inquiry.
Benchmarks:
Knows that scientific inquiry includes evaluating results of scientific investigations, experiments, observations, theoretical and mathematical models, and explanations proposed by other scientists (e.g., reviewing experimental procedures, examining evidence, identifying faulty reasoning, identifying statements that go beyond the evidence, suggesting alternative explanations).

Grade level: 6-8
Subject area: science
Standard:
Understands the nature of scientific inquiry.
Benchmarks:
Knows possible outcomes of scientific investigations (e.g., some may result in new ideas and phenomena for study; some may generate new methods or procedures for an investigation; some may result in the development of new technologies to improve the collection of data; some may lead to new investigations).

Grade level: 9-12
Subject area: science
Standard:

Understands the nature of scientific inquiry.
Benchmarks:
Understands the use of hypotheses in science (e.g., selecting and narrowing the focus of data, determining additional data to be gathered; guiding the interpretation of data).

Grade level: 9-12
Subject area: science
Standard:
Understands the nature of scientific inquiry.
Benchmarks:
Designs and conducts scientific investigations by formulating testable hypotheses; identifying and clarifying the method, controls, and variables; organizing and displaying data; revising methods and explanations; presenting the results; and receiving critical response from others.

11-15-1998	Lima Peaks area south of Dillon	1	MT	US	OTHER	1 Hunter caught, buried and killed
11-14-1998	Yoho National Park	1	BC	CANADA	OTHER	6 hikers caught, some injured, 1 fatality
11-13-1998	Kokanee Glacier Provincial Park	1	BC	CANADA	SKI	6 caught in 2 seperate avalanches, 1 missing and presumed drowned
11-07-1998	Mt. Baldy, Little Cottonwood Canyon	1	UT	US	SNOWBOARD	5 Snowboarders caught, 1 killed, 1 seriously injured

1997-98 US & CANADA, AVALANCHE FATALITIES & CLOSE CALLS

Total North American Avalanche Fatalities for the 1997-98 season: 46

* Indirectly related avalanche fatalities

Date	Place	Fatalities	Details
11-June	Mount Rainier, WA	1	12 climbers caught, 5 injured, 1 killed
31-May	Mount Hood, OR	1	4 climbers caught, 3 injured, 1 killed
17-May	Jasper, AB	1	1 snowboarder caught and buried and killed
26-April	Denali NP, AK	1	1 snowmobiler caught and buried and killed
23-April	Provo Canyon, UT		1 hiker caught twice, long rides, very lucky
22-April	Teton NP, WY		1 snowboarder caught, injured, buried
20-April	Watson Lake, Yukon	1	Teacher doing forest research caught and killed
20-April	Thompson Pass, AK	1	2 Heli-skiers caught, 1 killed

19-April	Berthoud Pass, CO	1	2 snowboarders injured, 1 died later from injuries
1-April	St. Marys Glacier,CO	1	2 climbers caught, 1 buried and killed
29-March	Silverton, CO		Cabin destroyed with man inside
26-March	Scotch Bonnett Peak, MT		1 snowmobiler caught and buried
8-March	Aspen, CO	1	1 out of bounds skier, caught, buried, and killed
7-March	Little Cottonwood Canyon, UT		7 cars, and 1 bus caught, 6 people injured, 1 seriously
7-March	High Eastern Artic, Canada	1	Unknown
1-March	Berthoud Pass, CO	1	2 caught,1 backcountry skier, 1 snowboarder buried and killed
26-Feb	Little Cottonwood Canyon, UT		2 cars, caught, 2 people injured
22-Feb	Mormon Hills, ID	1	1 snowmobiler caught, buried and killed
11-Feb	Donner Pass, CA	1	1 snowboarder caught, buried and killed
1-Feb	Barkerville, B.C.	1	1 snowmobiler caught, buried and killed
31-Jan	Grandview, AK		9 train coal cars caught, 3 coal cars derailed
29-Jan	Big Moutain, MT		1 skier caught and buried
25-Jan	Merritt, BC	1	1 skier caught, buried and killed
24-Jan	Inspiration Pass, MT	1	1 snowmobiler caught, buried and killed
21-Jan	Lizard Head Pass, CO	1	1 snowboarder caught, buried and killed
19-Jan	Cooke City, MT	3	3 snowmobilers caught, buried and killed
18-Jan	Blewett Pass, WA	1	1 snowmobiler caught, buried and killed
18-Jan	Sage Peak, MT	1	1 snowmobiler caught, buried and killed
18-Jan	Spring Canyon, UT	1	1 snowmobiler caught, buried and killed
17-Jan	Pleasant Creek, UT	1	1 snowmobiler caught, buried and killed
16-Jan	Elk Meadows, UT		8 Boy Scouts caught, 4 fully buried, 4 partly buried
15-Jan	Sun Valley, ID		1 skier caught and buried
12-Jan	Solitude, UT		1 skier caught, buried and injured
11-Jan	Encampment, WY	1	1 snowmobiler caught, buried and killed
11-Jan	Rock Creek, MT		1 snowmobiler caught, buried and very lucky
11-Jan	Little Cottonwood Canyon, UT	4*	1 skier caught, buried and injured, killed during evacuation in helicopter crash along with 3 air crew members
10-Jan	Norns Creek, BC	1	1 snowmobiler caught, buried and killed

3-Jan	Island Park, ID	1	1 snowmobiler presumed caught, buried and killed
3-Jan	Mission Mountains, MT	1	1 snowshoer caught, buried and killed
3-Jan	Shadow Lake, MT	1	3 or 4 snowmobilers caught, buried and 1 killed
3-Jan	Island Park, ID	1	1 snowmobiler caught, buried and killed
2-Jan	Kokanee Glacier, BC	6	6 skiers caught, buried and killed
2-Jan	New Denver, BC	2	2 skiers caught, buried and killed
2-Jan	Elliot Lake, BC	1	4 snowmobilers caught, buried and 1 killed
30-Dec	Guanella Pass, CO	1	1 snowshoer caught, buried and killed
29-Dec	Thompson Pass, AK		2 skiers caught, 1 fully and 1 partly buried
21-Dec	Hasler Flats, BC	1	3 snowmobilers caught, buried and 1 killed
29-Nov	Canmore, Alberta	4	4 hikers caught, buried and killed
24-Nov	Crow Pass, AK	1	1 hiker caught, buried and killed
22-Nov	Tony Grove, UT		2 snowboarders caught, 1 fully and 1 partly buried
9-Nov	Hatcher Pass, AK	1	2 snowboarders caught, 1 buried and killed

1996-97 US & CANADA, AVALANCHE FATALITIES & CLOSE CALLS

Total North American Avalanche Fatalities for the 1996-97 season: 35

Date	Place	Fatalities	Details
9-July	Mt Robson, BC	1	5 climbers caught, 1 buried and killed
5-July	Gladstone Peak, CO	1	2 climbers caught, 1 injured, 1 partly buried and killed
11-April	near Gakona Glacier , Alaska	1	1 snowmobiler buried killed
31-March	near Atlin BC	2	3 heliskiers caught and buried 2 killed
30-March	Lange Creek, near Golden, BC	1	1 snowmobiler buried killed
22-March	Selkirk Moutains, BC	2	2 heliskiers buried and killed
11-March	Castle Creek (Aspen), CO		1 snowboarder caught, buried and injured
9-March	Millville Peak near Logan, UT		3 skiers caught, 1 buried and injured, 1 Dog killed
9-March	Coquihalla Summit, BC	1	1 snowboarder buried and killed
8-March	Sundance Mtn near Priest Lake, ID	1	1 snowmobiler buried killed
3-March	Red Lodge Mountain, MT		1 out of bounds skier caught, injured, & buried
3-March	Yellowstone NP, WY	2	2 skiers buried and killed
21-Feb	Jackson, MT	1	1 snowmobiler killed

12-Feb	Cypress Bowl, BC	1	1 snowboarder caught, survived slide, killed by fall
2-Feb	Lange Creek, near Golden BC	1	1 snowmobiler buried and killed
1-Feb	Black Butte, MT		1 snowmobiler buried
1-Feb	West Mountain, near Casacade Idaho	1	1 snowmobiler buried and killed
25-Jan	Big Cottonwood Canyon, UT		1 snowshoer caught, buried 6' deep for more than 1.5 hours, no injuries!
25-Jan	Bridal Veil Falls, Provo Canyon, UT	1	1 ice climber killed, 1 injured
17-Jan	Resurrection Pass, AK	1	1 hiker buried and killed
13-Jan	Monashee Mtns., BC	2	3 heliskiers buried and injured, 2 killed
11-Jan	Logan, UT	3	3 skiers buried and killed
11-Jan	Little Cottonwood Canyon, UT		Numerous vehicles buried and smashed, some with occupants, several pedestrians buried. 4000 skiers spend the night.
11-Jan	near Montpelier, ID	1	1 snowmobiler buried and killed
29-Dec	St. Elmo, CO		2 snowshoers caught, 1 buried and injured
28-Dec	Mt. Index, WA	3	3 Climbers buried and killed
27-Dec	Jackson Hole, WY		1 car knocked off road, no injuries
26-Dec	Flagstaff Peak, UT	1	***Photos*** 1 snowboarder buried and killed
23-Dec	Chair Peak, WA	2	2 Climbers buried and killed
17-Dec	Spearhead Mtns, BC	3	3 heli-skiers buried and killed
12-Dec	Yoho NP, Alberta	1	1 skier buried and killed
7-Dec	Current Creek Peak, UT		1 snowmobiler buried, close call
7-Dec	Bountiful Peak, UT	1	***Photos*** 3 snowmobilers buried and 1 killed
6-Dec	Providence Lake, UT		1 snowmobiler buried, close call
11-Nov	Bridger Bowl, MT		1 skier caught, partially buried, and injured
9-Nov	Berthoud Pass, CO		1 snowboarder buried and injured (broken leg)

Summary of Alaskan Avalanches for 1996-97 Courtesy of the Alaskan Mountain Safety Center

1995-96 US AVALANCHE FATALITIES

Date	Place	Details
22-June	Mount Hunter, AK	2 climbers caught and killed
12-June	Mount St. Elias, AK	4 climbers caught and buried in their tent; 1 climber buried outside and killed
13-May	Mount Hunter, AK	2 climbers caught and killed
27-Mar	Maybird Gulch, UT	1 backcountry skier killed (slide for life)
24-Mar	Mt. Washington, NH	2 backcountry skiers (or hikers)buried and killed
9-Mar	W. Yellowstone, MT	1 snowmobiler buried and killed
4-Mar	East Vail Chutes, CO	1 out-of-bounds skier buried & killed
25-Feb	W. Yellowstone, MT	1 snowmobiler buried and killed
21-Feb	Vail, CO	1 resident buried and killed (roof avalanche)
18-Feb	Delta Range, AK	3 climbers buried and killed
11-Feb	Mission Mtns., MT	1 snowmobiler buried and killed
10-Feb	Sun Valley, ID	1 heli-ski guide buried and killed
10-Feb	Salt Mtn Range, WY	1 snowmobiler buried and killed
4-Feb	Arapaho Basin, CO	1 out-of-bounds snowboarder buried & killed
4-Feb	Taos, NM	1 backcountry skier buried and killed
3-Feb	Cottonwood Pass, CO	1 snowmobiler buried and killed
2-Feb	Solitude, UT	1 ski patroller buried and killed
27-Jan	Pyramid Pk, CO	1 climber buried and killed
23-Jan	Aspen, CO	1 backcountry skier buried and killed
21-Jan	Snowy Range, WY	1 backcountry skier buried and killed
14-Jan	Jackson Hole, WY	1 heli-skier buried and killed
5-Jan	Galena Pass, ID	2 snowboarders buried and killed
5-Jan	Mt. Washington, NH	1 hiker buried and killed
31-Dec	Vail Pass, CO	1 snowboarder buried and killed

Welcome to the Backcountry Access Library Project. This is a cooperative project between Backcountry Access and the WestWide Avalanche Network. The goal of the Library is to provide easy access to all types of papers that contain information about snow and avalanches. With the support avalanche.org has received from Backcountry Access, many more articles have been posted to the Library. Be sure to check out select articles from The Avalanche Review. This is a publication that is supported and operated by the American Avalanche Association and its members.

PLEASE remember, this is only a starting point for avalanche education.
It is not intended to provide adequate information for you to start making decisions for yourself and others in avalanche terrain.
We encourage you to click here >and pursue additional avalanche education from your local resources.

About the Library

The Library is divided up into different categories. Some papers are very basic, while others provide scientific content on the subject. Many of the papers are over forty years old, but are included because their content provides an important history. Much of the information in these older papers, create the foundation that avalanche educators, mountain travelers, and avalanche professionals use today.

- Avalanche Review New (Select Articles from the AAA newspaper)
- Slab Avalanches
- Avalanche Control

File Name	Size	Date Posted	Decription
looking down looking up lucky fellow scotts saw	58k 45k 68k 96k	2-26-04	Mike Baker was caught and partially buried on a snowmobile while climbing a small hill at Copper Creek, Lincoln, MT on 3/2/02. His friends dug him out.
Navajopk.jpg	85k	2-26-04	Avalanche on Navajo Peak, Chelan County, Washington where one snowmobiler was killed on 12/17/03. Avalanche started around the 6800 foot level and ended at about the 5400 foot level. Bill Quistorf Snohomish County Search and Rescue
avalanche.lg.18.2.9.mov	2.8meg (large)	10-1-03	KELLOGG, Idaho Snowmobilers Neal Houn and Greg Lanja out run a 20-foot wall of snow in full view of a friend's video camera.
lamongie1.jpg lamongie2.jpg lamongie3.jpg	44k 43K 54k	10-1-03	This is what happens when you build a chalet in the path of an avalanche. The chalet belonged to a local mayor who, quite sensibly, rented it to tourists. The Pyrenees had a very snowy winter which resulted in this chalet, plus several cars, being shunted down the mountainside by a slide at the start of February 2003. No-one was in the chalet at the time but two people in the car-park below were buried but rescued without much harm by the local piste patrol and mountain police. It is the second time a chalet has been hit at this location. David George
StAnton.jpg	53k	4-3-03	I was watching these 3 guys climbing to the top of the next valley to ski to Stuben, in the Austrian Alps. This resort is on the back side of St.Anton. The avalanche released 5-10 seconds before the photo was taken. Matt Jackson Norwich, England

Shames Start .jpg Shames Dep.jpg	43k 53K	4-3-03	Here are some photos of Path #2 which affects Shames Mountain Ski Area access road in Terrace, BC. The avalanche was initiated by helicopter control. It produced a size 3.5 avalanche that blocked the road. Steve Brushey

An Introduction to

The ABC's of Plate Tectonics

by Donald L. Blanchard

Earth Sciences Home Page

Contents:

Introduction:

The Theory of Continental Drift has had a long and turbulent history since it was first proposed by Alfred Wegener in 1910. Vigorously challenged yet widely ignored, the theory languished for half a century, primarily due to its lack of a plausible mechanism to support the proposed drift. With the discovery of sea-floor spreading in the late 1950's and early 60's, the idea was reinvigorated, this time as the Theory of Plate Tectonics.

Plate tectonics is now almost universally accepted, its mechanisms plausible and to a degree demonstrable. However, many details of the mechanism are yet to be worked out, and many theories involving various details of plate tectonics rest on some questionable assumptions. This set of pages attempts to define some of the basic principles of the mechanism, and to examine their effect on the creation of landforms.

What follows is NOT a summary of the current thinking about plate tectonics and its mechanisms; rather, many new, and probably highly controversial, ideas are presented for consideration. What IS presented is a broad analysis of the basic principles that should apply to the movements of plates, some new hypotheses about how they apply to convection and landform formation, and some expected scenarios for differing tectonic events.

For those unfamiliar with the theory of plate tectonics, a separate page - The Basics of Plate Tectonics - is provided. This summary offers a brief condensation of the basic principles of Plate Tectonics. A much more comprehensive explanation of Plate Tectonics can be found on the USGS Web Site.

| Lesson #1: Buoyancy and Floating Continents |

This file last updated on December 1, 1999.

EARTHFORCE
in the crust

Go outside, find a flat piece of ground, and stand perfectly still. You won't be able to notice it, but the ground beneath your feet is moving. Imagine that you are balancing on a raft on a pond, gently drifting. If you live on the North American continent, the ground beneath you is one giant raft drifting westward very slowly, about 2.5 centimeters (one inch) per year. Get a ruler and think about that. Imagine that you move just one inch during an entire year. That seems pretty slow, but, considering the size of the continent, the force of that movement can be huge. If a bicycle moved an inch and bumped into you, it wouldn't really hurt. If a car moved an inch and bumped into you, it might make a bruise. If a school bus moved an inch, the bump might break a bone. If a tractor trailer bumped into you, you'd notice.

Scientists think that the entire crust of the Earth is broken into big pieces called plates. All of the plates are drifting on the liquid molten magma of the mantle beneath the crust. Even though they're drifting very slowly, when they bump into each other, the force is huge. People who live near the edges of a plate notice the bumping. Most often, the earth beneath them quakes and shakes as the plates bump and rub.

Scientists call this action plate tectonics. Over millions of years, plate tectonics has changed the appearance of the Earth's crust. Besides the crustal plates drifting and moving to different locations, the pushing and pulling between plates causes mountains and valleys to form. Scientists think that, long ago, the crustal plate of India collided with the huge crustal plate of Asia to form the Himalayas, the highest mountains in the world. While crustal rock is solid, it does have some elastic properties. With enough force and heat, rock can bend and change shape. When the two plates bumped into each other, rock along the edges pushed upward. Even today, scientists think that the Indian plate is still colliding with the Asian plate, moving about five centimeters (two inches) per year, and causing the highest mountains to rise even higher.

Most of the plates meet under the oceans where the force of their pushing and pulling may sometimes not even be noticed. Some plates, like the Indian and Asian plates, meet on dry land. The Himalayan mountains were formed when the two plates pushed together. The Pacific and North America plates also meet on dry land. These two giant crustal plates are not pushing together, however. They are scraping against each other. The Pacific plate is drifting Northward, scraping along the edge of the North American plate. The result of this tremendous force is the San Andreas fault, which cuts vertically through the state of California for nearly 1,125 kilometers (700 miles).

Scientists think that the San Andreas fault may be one hundred million years old. The crack in the crust between the plates is at least thirty-two kilometers (twenty miles) deep. For many years, scientists have used the fault to study the crustal plates, properties of rock, and the core of the Earth.

The San Andreas fault is a dangerous laboratory, however. In some places, the force of the plate scraping has broken roads, relocated streams, and lowered mountains. The biggest danger, of course, is from the quaking. The crustal plates are pushing and pulling causing motion. The mantle beneath the crust is pushing and pulling causing motion. All of that force builds up energy. When the energy gets released, the crust vibrates.

Each month, scientists observe several small earthquakes along the San Andreas fault. Most of them are barely noticeable. Once in a while, however, the energy really builds and releases a tremendous vibration.

Earthquakes are a natural part of the Earth's geology and are not necessarily dangerous. In the past 150 years, a tiny blip in the lifespan of the fault, Americans have moved to California and built structures near the fault. During that time, many lives have been lost due to quakes along the fault. In 1906, for example, the crust vibrated strongly for forty-five seconds. In the history of the fault, the 1906 quake was minor. However, in nearby San Francisco, a young city was destroyed. Five hundred people died—not from the quake, but from the falling buildings and raging fires that resulted. Buildings tumbled to the ground, breaking streets below. Woodstoves and oil lamps ignited the rubble. The city burned for three days.

In spite of the destruction and potential for future earthquakes, the citizens of San Francisco stayed and rebuilt their city. Today, buildings are "earthquake- resistant." Emergency procedures are ready and waiting. Yet, in 1989, another quake rocked San Francisco, killing sixty- two people, destroying buildings, and igniting fires across the city. Clearly, there is no way to be prepared completely for violent vibrations in the crust.

Learn where the earth quakes most often so that you know the greatest danger zones. Everyday, the **EARTHFORCE** is quaking somewhere. Browse these websites daily to see where.

Earthquakes are the shaking, rolling or sudden shock of the earth’s surface. Earthquakes happen along "fault lines" in the earth’s crust. Earthquakes can be felt over large areas although they usually last less than one minute. Earthquakes cannot be predicted -- although scientists are working on it!

Most of the time, you will notice an earthquake by the gentle shaking of the ground. You may notice hanging plants swaying or objects wobbling on shelves. Sometimes you may hear a low rumbling noise or feel a sharp jolt. A survivor of the 1906 earthquake in San Francisco said the sensation was like riding a bicycle down a long flight of stairs.

The intensity of an earthquake can be measured. One measurement is called the Richter scale. Earthquakes below 4.0 on the Richter scale usually do not cause damage, and earthquakes below 2.0 usually can’t be felt. Earthquakes over 5.0 on the scale can cause damage. A magnitude 6.0 earthquake is considered strong and a magnitude 7.0 is a major earthquake. The Northridge Earthquake, which hit Southern California in 1994, was magnitude 6.7.

Earthquakes are sometimes called temblors, quakes, shakers or seismic activity. The most important thing to remember during an earthquake is to DROP, COVER and HOLD ON. So remember to DROP to the floor and get under something for COVER and HOLD ON during the shaking.

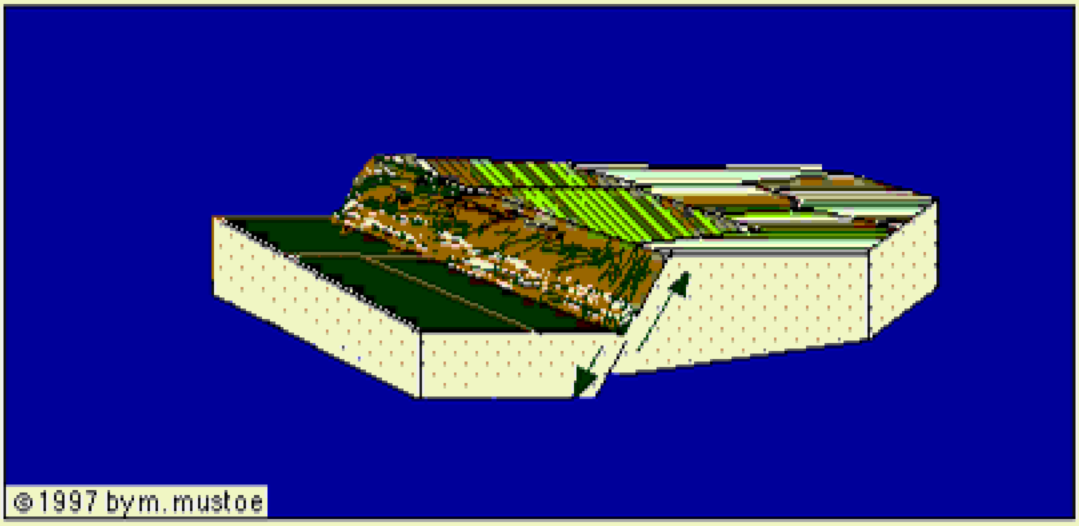
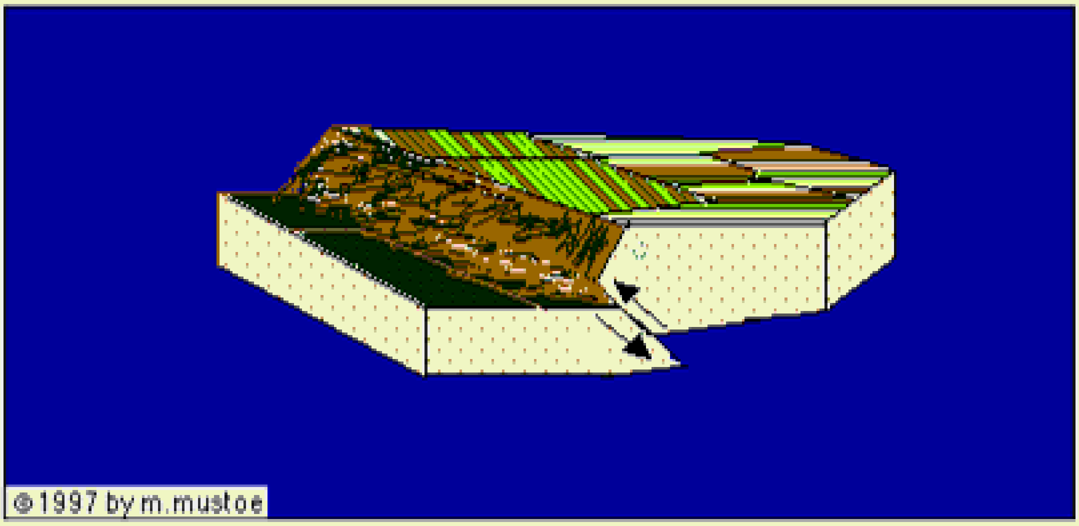
The Four BASIC Types Of Faults

(This does not include growth faults)



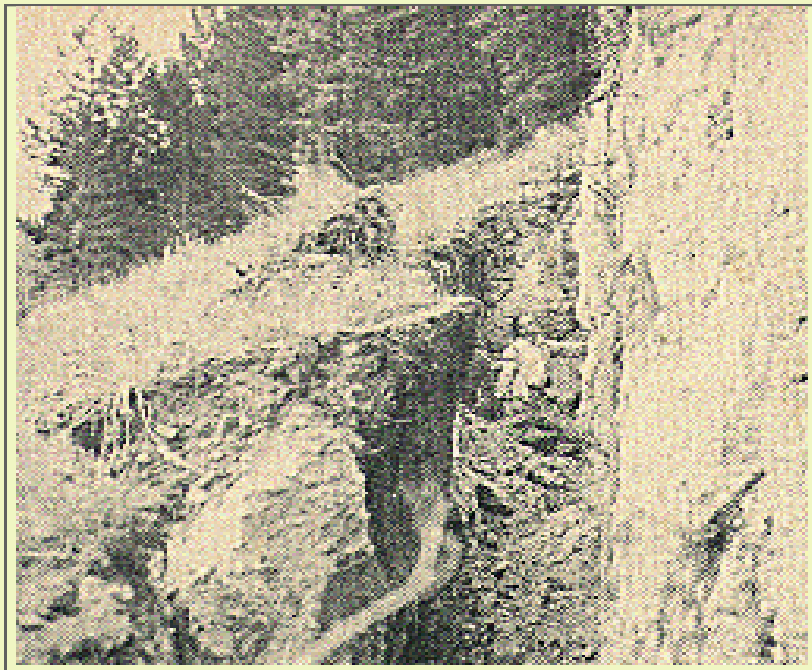
The Normal Fault

The normal fault is not necessarily normal in the sense that it is common....because.... it is not the most common of faults. However what is normal about them is that their movement tends to follow the gravitational pull on the fault blocks involved. The fault plane on the normal fault is generally very steep. In a normal fault the two involved blocks are (by gravity) pulling away from one another causing one of the fault blocks to slip upward and the other downward with respect to the fault plane (it is hard to determine whether both or just one block has moved.). The exposed upward block forms a cliff-like feature known as a fault scarp. A scarp may range from a few to hundreds of meters in height and their length may continue for 300 or more kilometers (around 200 miles).



The Reverse Fault

The reverse fault is a normal fault except the general movement of the fault blocks is toward each other, not away from each other as in the normal fault. This forms a thrust fault type expression on the surface with material overlaying other material.



USGS Photo

The night of 17 August marks the aniversary of a little talked about yet profoundly significant earthquake known as the Hebgen Lake, or Montana-Yellowstone Eartquake. The event took place in 1959 in a remote...but well visited region around West Yellowstone, Montana. On that night nearly 18,000 campers and park personnel, felt a shock that had originated ten miles below the suface in the vicinity of the Madison River Canyon. As a result of that intensity 7.1 earthquake, 43 million cubic yards of rock slid as a block into the Madison Canyon daming up the Madison River, below Hebgen Dam. The lake basin behind Hebgen dam tilted with the south side rising and the north side dropping. This caused a seische...a lake tsunami...that crested the dam four times and kept the lake in motion for nearly 11 hours. At Yellowstone Park, hot springs and geysers, that had never been known to erupt before erupted. The shock wave was felt in an area of 500,000 sqaure miles. It caused wells to fluxuate in Texas and and as far away as Hawaii and Puerto Rico. Nine people lost their lives and 19 were listed as missing in this event. The image above shows a fault scarp where the block was thrown down at one end of the valley. Displacement here was about 20 feet and ran hundreds of feet long.

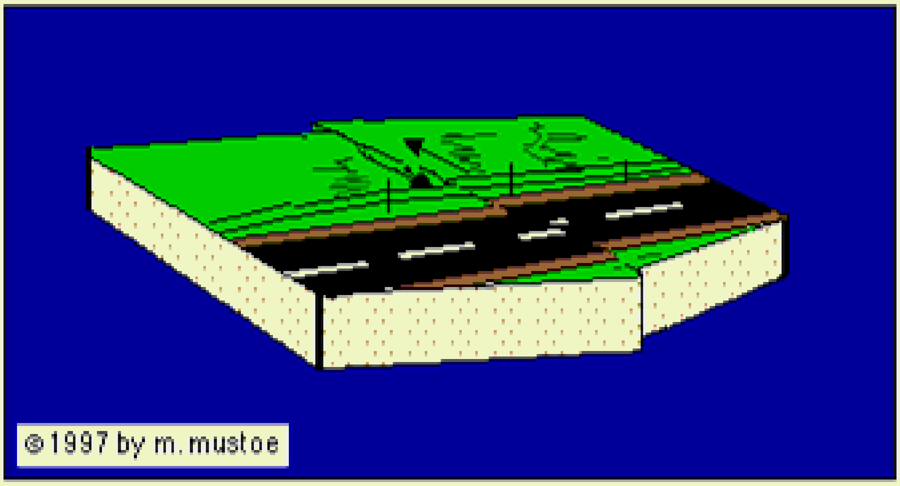
New fault scarps along Hebgen Lake, Montana. About 20 feet displacement. This area covered the main road. U.S.F.S. Photo

---

The Initial Stages Of Landforms

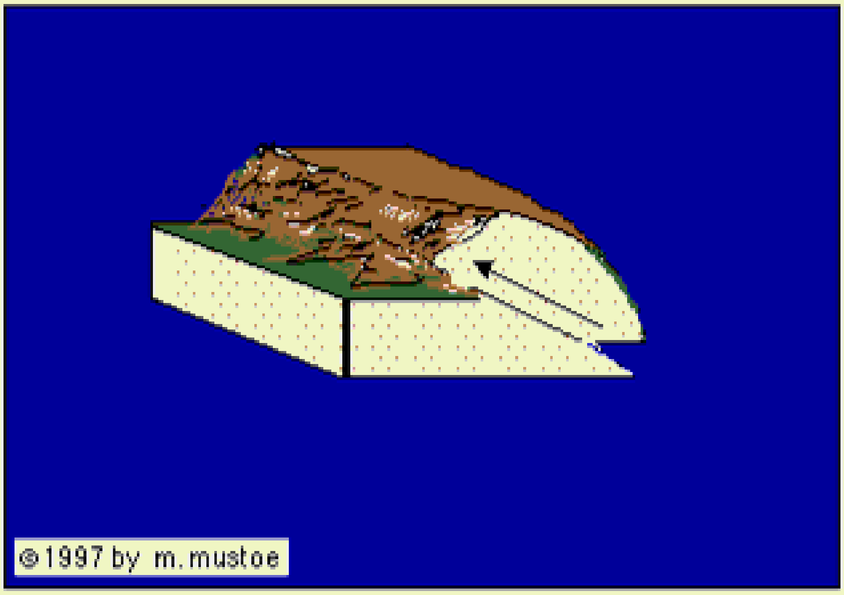
The phrase "initial stage" means the beginning stages of a landform. Click here for a look at a graben and horst system.

Two More Fault Types



Transcurrent Fault (Strike-Slip Fault)

Probably the most well known and well studied fault is the transcurrent (strike-slip) fault known as the San Andreas fault of California. This fault marks the margin line between the Pacific and North American Plates. Movement on a strike strip fault is generally horizontal. On the surface, scarps form as hills crossing the fault zone are torn apart by movement over time. Actually anything crossing this fault zone is either slowly torn apart, or offset. Rivers crossing the fault line are called offset streams and are classic signatures of fault activity along the San Andreas. These faults can be very long, the San Andreas is nearly 600 miles long.



Thrust Fault

In the 1994 Northridge, California event, a deep thrust fault located about 18 km under the city of Los Angeles produced an eartquake that registered a magnitude of 6.7. When thrust faults are exposed on the surface overburnden material lies over the main block. They are normally associated with areas of folded surfaces and or mountaineous regions. The dip angles of thrust faults are normally not as steep as a normal fault. Chief Mountain, in Montana (one of the places we look at using the USGS quads in the principles of geography class) is an example of a thrust mountain.

A Model of Three Faults

*This packet is only available online.

Background

One of the most frightening and destructive phenomena of nature is a severe earthquake and its terrible aftereffects. An earthquake is a sudden movement of the Earth, caused by the abrupt release of strain that has accumulated over a long time. For hundreds of millions of years, the forces of plate tectonics have shaped the Earth as the huge plates that form the Earth's surface slowly move over, under and past each other. Sometimes the movement is gradual. At other times, the plates are locked together, unable to release the accumulating energy. When the accumulated energy grows strong enough, the plates break free. If the earthquake occurs in a populated area, it may cause many deaths and injuries and extensive property damage.

Today we are challenging the assumption that earthquakes must present an uncontrollable and unforecastable hazard to life and property. Scientists have begun to estimate the locations and likelihoods of future damaging earthquakes. Sites of greatest hazard are being identified, and designing structures that will withstand the effects of earthquakes.

Back to top

Materials and Instructions

Objective

Students will observe fault movements on a model of the earth's surface.

Time Needed

1 or 2 Class periods

Materials Needed

- Physiographic map of the world
- Per group
- Crayons or colored pencils
- Scissors
- Tape or glue
- Metric ruler
- Construction paper

DEPARTMENTAL EVENTS

Upcoming Events and Field Trips

Thursday October 9, 2003 - Mausel Open - Terre Haute, IN
Dust off your clubs and put on a party hat, it's time for the Mausel Open!
Golf Event --- Mark's Par Three @3pm
Cookout --- The Mausel's @ 5:30pm

October 12-18, 2003 - National Earth Science Week - Terre Haute, IN
The Earth Science Club will be hosting several events for Earth Science Week.

GEOGRAPHY

GEOLOGY

Upcoming Events & Field Trips:

October 16-17, 2003 - Indiana Academy of Science Fall Meeting - Anderson University, Anderson, IN

November 2-5, 2003 - GSA National Meeting - Seattle, Wa
A number of our geology undergraduate and graduate students will be presenting posters at the national Geological Society of America (GSA) meeting in Seattle this November.

TBA - Mineralogy - Chicago, IL
Dr. Brake will be taking the Mineralogy class this semester to the Field Museum in Chicago.

TBA - Sedimentology/Stratigraphy - Missouri
Dr. Dutta and his Sed/Strat students will be going to Missouri in November 2003.

Past Events and Field Trips:

September 13, 2003 - GGA Pitch-in Dinner - Hawthorn Park, TH
There will be a pitch-in dinner for students and faculty in the Geography, Geology, and Anthropology Department from 3:00 to 6:00PM. More information is available at the GGA office (x2444).

April 19, 2003 - 7th Annual William A. Dando Graduate & Undergraduate Research Showcase - ISU

September 20, 2003 - San Diego Research Cruise - San Diego, CA
Two geology undergraduates went to San Diego to participate in a 24 hour research cruise. They were joined by students and faculty from the University of San Diego as well as graduate students from Scripps Institution of Oceanography.

April 12th, 2003- Paleontology/Historical Geology - Madison, IN

Dr. Brake and Dr. Rathburn and around 25 students journeyed to southern Indiana to look at a famous Paleozoic fossil deposit in Madison, IN. In addition, the main falls at Clifty Falls State Park was visited as well.

March 16-22, 2003 - Igneous and Metamorphic Petrology - New Mexico and Texas
Dr. Dreher and four petrology students ventured out to Bandalier National Monument near Los Alamos, NM. Also visited were Carlsbad Caverns and the Quadalupe Mountains in northern Texas.

ANTHROPOLOGY

Last modified: May 14, 2004

Musical Plates

A Study of Earthquakes and Plate Tectonics

Earthquakes, a scientific and physical phenomenon, affect our lives in many ways. In this project, students use Real-Time earthquake and volcano data from the Internet to explore the relationship between earthquakes, plate tectonics, and volcanoes.

Students will:

- Use Real-Time data to solve a problem.
- Study the correlation between earthquakes and tectonic plates.
- Determine whether or not there is a relationship between volcanoes and plate boundaries.

***Musical Plates* is recommended for upper elementary, middle school and high school students (ages 11-18).**

Our site is best viewed at a resolution of 800 X 600 or greater
Click HERE for instructions on how to check or change your monitor's resolution

This project is developed and managed by the Center for Innovation in Engineering and Science Education (CIESE) which is located at Stevens Institute of Technology in Hoboken, NJ. You can learn more about this and many other CIESE sponsored Internet-based educational activities by visiting http://www.k12science.org
The language arts component was developed by the Bank Street College of Education working in collaboration with CIESE staff.

Earthquake Information for the World

Who We Are

National Earthquake Information Center

The mission of the National Earthquake Information Center (NEIC) is to rapidly determine location and size of all destructive earthquakes worldwide and to immediately disseminate this information to concerned national and international agencies, scientists, and the general public. As World Data Center for Seismology, Denver, the NEIC compiles and maintains an extensive, global seismic database on earthquake parameters and their effects that serves as a solid foundation for basic and applied earth science research.

Amidst the Rubble of Ruined Cities

Proposing Methods to Rebuild Colombia's Infrastructure in the Wake of a Major Earthquake

Author(s)
Alisan Zimbalist, The New York Times Learning Network

Grades: 6-8, 9-12
Subjects: Current Events, Geography, Social Studies
Interdisciplinary Connections

Overview of Lesson Plan: This lesson is designed to promote an understanding of how a natural disaster, specifically an earthquake, can devastate the essential aspects of a country's infrastructure. Students will work in committees to develop and propose solutions to rebuild various elements of Colombia's infrastructure in the wake of the January 25, 1999 earthquake, as well as compare and contrast the earthquake's affects on Colombia to the 1994 earthquake in Los Angeles.
Review the Academic Content Standards related to this lesson.

Suggested Time Allowance: 45 minutes

Objectives:
Students will:
1. Brainstorm how different aspects of a country's infrastructure would be affected by a major earthquake.
2. Assess the damage caused by the January 25, 1999, earthquake in Colombia through reading and discussing "Colombians Sift Rubble as Earthquake Toll Rises."
3. Analyze, in committees, specific aspects of Colombia's present infrastructure problems caused by the recent earthquake, devise possible solutions for these problems, and assess how each aspect of a country's infrastructure is interdependent with the others.
4. Present their committee's ideas and project ways in which the Colombian government may begin rebuilding their country.
5. Compare and contrast the featured article to an article recounting the effects of the 1994 earthquake in Los Angeles, California, by writing a reflective journal.

Resources / Materials:
-classroom blackboard
-student journals
-pens/ pencils
-paper
-copies of "Colombians Shift Rubble as Earthquake Toll Rises" (one per student)
-map of Colombia
-copies of "Awaiting Quake Aid, and Riot Aid, Too" (one per student)

Activities / Procedures:
1. WARM-UP/ DO-NOW: Students are asked to imagine that there is an enormous earthquake that devastates a major city in their state or country. The class then brainstorms about how the earthquake may affect the following aspects of the infrastructure of that country: commerce/trade, food supply, health care/disease prevention, communication/roads, shelter, power supply. The teacher writes

student responses on the board in columns (a column labeled "commerce/ trade," a column labeled "food supply," and so on). The teacher then tells students that today they will be investigating how these aspects of life in Colombia have been devastated by the earthquake that shook the country on January 25, 1999.

2. Read and discuss "Colombians Sift Rubble as Earthquake Toll Rises," focusing on the questions below. On a map of Colombia, point out the different cities that are mentioned in the article to give students a better sense of location.
a. What details provided in this article illustrate the sense of total destruction caused by January 25, 1999’s earthquake in Colombia?
b. What evidence of panic and chaos among the Colombian people is provided in the article?
c. Refer to the six elements of infrastructure discussed in the previous activity. (These should still be on the board.) How is each of these elements described in the article? What evidence is there of the destruction of each of these elements of the infrastructure of Colombia and of individual cities?
d. What aid, both from other areas of Colombia and from foreign countries, is being offered to those affected by the earthquake? What hope does this aid offer? What destruction can this aid not "buy back"?
e. How are government officials and leaders reacting to the devastation caused by the earthquake?
f. Much of the article focuses on the buildings destroyed by the earthquake. How does this physical destruction relate to the effects on the aspects of the infrastructure of the Colombian cities affected and to the effects on the people of this country?
g. What hope does the description of rescue teams and their successes offer?
h. Why is the Richter scale measurement significant in the case of this earthquake?

3. Divide students into six groups, one for each of these areas: commerce/trade, food supply, health care/disease, communication/roads, shelter, and power. Tell each group that it is a committee established to deal with a specific area of the infrastructure of Colombia being affected by the devastation caused by the recent earthquake. Each group must discuss and take notes on their answers to three questions:
--What problems exist in your specific area of the infrastructure of Colombia due to the devastation caused by the January 25, 1999, earthquake?
--What solutions can your committee propose to attempt to solve these problems?
--How does your committee's area relate to each of the other areas of the infrastructure of Colombia?
Groups should refer to the notes written on the board from the first activity and the New York Times article for assistance.

4. In round-table fashion, each committee presents its group's ideas to the class. After all committees have presented, wrap up the discussion by asking students how they think the government of Colombia will work towards rebuilding these aspects of the country.

5. WRAP-UP/ HOMEWORK: Students read "Awaiting Quake Aid, and Riot Aid, Too," a January 27, 1994, New York Times article recounting the effects of the major earthquake that shook the Los Angeles, California, area in the beginning of that year. In their journals, students write a reflective response to the article in comparison to the article read in class about the earthquake in Colombia. What are some of the essential differences between how earthquakes and other natural disasters affect lesser developed countries (like Colombia) and developed countries (like the United States)? Why do these differences exist? How is the damage noted in the Los Angeles article similar to and different from the damage noted in the Colombia article, and why? Students should share their responses in a future class.

Further Questions for Discussion:
--What areas are often hit by earthquakes, and why are these locations prime earthquake zones because of their geographical features?
--How are earthquakes forecasted, and what surveillance methods are used to watch the progress and aftershocks of earthquakes?
--How can people prepare for an earthquake?

--What forms of aid do those affected by natural disasters in the U.S. and in other countries receive? What hope does this aid offer? What destruction can this aid not "buy back"?
--What aspects of a country's infrastructure may be affected by an earthquake or other natural disaster?
--How might the size of a country affect the proportion of the population and geographic area subject to devastation and in need of aid in the event of a earthquake or other natural disaster?
--How might people living in a rural area be affected differently by a earthquake from those living in urban areas?
--What industries might be affected by major earthquakes, and why?
--How do the various elements of a country's infrastructure affect the other elements of that country's infrastructure?
--In what ways can governments rebuild their countries following a natural disaster?
--What are some of the essential differences between how earthquakes and other natural disasters affect lesser developed countries (like Colombia) and developed countries (like the United States), and why do these differences exist?

Evaluation / Assessment:
Students will be evaluated based on participation in class discussions, thoughtful participation in infrastructure "committees" and in presentation of decisions, and written journal response comparing and contrasting the effects of the earthquake in Colombia to the 1994 earthquake in Los Angeles.

Vocabulary:
accounting, surpass, devastated, epicenter, aftershock, rubble, mayhem, rendered, uninhabitable, coveted, commodity, airlifted, epidemics, ombudsman, chaos, uprising, teetering, precarious, casualties, endemic, intact, seismological

Extension Activities:
1. Diagram an earthquake timeline, noting major quakes in each continent over the past 100 years.

2. Create a map showing earthquake zones. The map may include information about where major earthquakes have struck, such as dates, financial impacts, and death tolls.

3. Search the Internet for the Web sites of organizations that assist earthquake victims in the United States and worldwide.

4. Maintain an on-going scrapbook of newspaper articles about the earthquake in Colombia. Each article should be clipped and taped to a notebook page, and students should summarize and offer opinions of the articles.

5. Organize a community aid drive for the victims of the earthquake in Colombia. Students can contact local relief organizations for support or to volunteer to participate in community efforts.

6. Learn about seismology. What prediction methods and technologies are used? How does one "track" an earthquake and its aftershocks?

7. Research other types of natural disasters (e.g., volcanoes, floods, tornadoes, tsunamis, forest fires, blizzards, droughts), focusing on how these disasters are predicted, how one can protect oneself in these disasters, and famous examples of these disasters.

Interdisciplinary Connections:
American History- Research natural disasters that have occurred in the United States and the relief organizations and government programs that assisted the victims and helped to rebuild the land and the communities. Students should also compare resources available in the United States to those currently available in Colombia.

Global History
-Learn about the country of Colombia, focusing on its government, economy, and culture.

-Investigate earthquakes that devastated other countries and research the methods that were used to rebuild these areas.

Language Arts
-Share personal experiences with natural disasters.
-Write a persuasive essay defending or refuting one country's offering of natural disaster relief to other countries.

Journalism- Maintain a photojournalism notebook of news photographs of the earthquake in Colombia. The class can also devote a bulletin board to photos and news clippings following this disaster and the relief efforts being put in place.

Mathematics:
-Create a chart comparing the economies, population, size, and other statistics about the United States and Colombia. What resources might the United States have that Colombia does not? What do these statistics demonstrate about potential differences in aid for natural disaster victims?
-Graph the frequency of major earthquakes in different countries.
-Explore logarithms by comparing the Richter and Mercalli scales, used in measuring the intensity of earthquakes.

Media Studies- Assess how the media is covering the earthquake in Colombia by keeping a daily log of news reports from television, radio, or a newspaper. How are these media covering the same event differently? If Spanish television news shows or newspapers are available in your part of the country, how are these media presenting the news about Colombia? What similarities and differences exist?

Science- Create "How It Works" posters for earthquakes, illustrating how each of the three classes of earthquakes (tectonic, volcanic, and artificially produced) are caused.

Technology- Explore how seismographs and other earthquake-tracking technologies work.

Teaching with The Times- Find articles related to the earthquake in Colombia in other sections of the newspaper, such as Business, Editorial, and Op-Ed. How do writings in these areas of the paper present information and express ideas differently?

Other Information on the Web

Earthquake Bulletin: Colombia (http://wwwneic.cr.usgs.gov/neis/bulletin/990125224018.HTML) provides data and schematics of the January 25, 1999 quake in Colombia.

National Earthquake Information Center (http://wwwneic.cr.usgs.gov/current_seismicity.shtml), from the United States Geological Survey, includes earthquake bulletins, an explanation of earthquake parameters, and maps that show recent earthquakes.

The World-Wide Earthquake Locator (http://www.geo.ed.ac.uk/quakes/quakes.html) provides basic information about earthquakes within hours of their taking place.

DisasterRelief.org (http://www.disasterrelief.org) discusses worldwide disaster aid and information.

Academic Content Standards:

McREL This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8

Geography Standard 4- Understands the physical and human characteristics of place. Benchmarks: Knows the physical characteristics of places (e.g., soils, landforms, vegetation, wildlife, climate, natural hazards); Knows how technology shapes the human and physical characteristics of places (e.g., satellite dishes, computers, road construction); Knows the causes and effects of changes in a place over time

Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Knows the major processes that shape patterns in the physical environment; Knows the consequences of a specific physical process operating on Earth's surface

Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows the ways in which human systems develop in response to conditions in the physical environment; Knows how the physical environment affects life in different regions; Knows the effects of natural hazards on human systems in different regions of the United States and the world; Knows the ways in which humans prepare for natural hazards

Science Standard 2- Understands basic Earth processes. Benchmarks: Knows processes involved in the rock cycle; Knows that the Earth's crust is divided into plates that move at extremely slow rates in response to movements in the mantle; Knows how land forms are created through a combination of constructive and destructive forces

Grades 9-12

Geography Standard 4- Understands the physical and human characteristics of place. Benchmarks: Knows how social, cultural, and economic processes shape the features of places (e.g., resource use, belief systems, modes of transportation and communication; major technological changes such as the agricultural and industrial revolutions; population growth and urbanization); Understands why places have specific physical and human characteristics in different parts of the world (e.g., the effects of climatic and tectonic processes, settlement and migration patterns, site and situation components); Knows the locational advantages and disadvantages of using places for different activities based on their physical characteristics

Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Understands how physical systems are dynamic and interactive; Understands how physical processes affect different regions of the United States and the world

Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows changes in the physical environment that have reduced the capacity of the environment to support human activity; Understands how people who live in naturally hazardous regions adapt to their environments; Knows factors that affect people's attitudes, perceptions, and responses toward natural hazards

Science Standard 2- Understands basic Earth processes. Benchmarks: Knows that throughout the rock cycle (e.g., formation, weathering, sedimentation, reformation), the total amount of material stays the same as its form changes; Understands the concept of plate tectonics; Knows effects of the movement of crustal plates

National Tragedy, Global Response

Examining the Local, National and International Effects On and Responses To the Earthquake in Turkey

Author(s)
[Alison Zimbalist, The New York Times Learning Network](#)

Grades: 6-8, 9-12
Subjects: Current Events, Geography, Media Studies, Social Studies
[Interdisciplinary Connections](#)

Overview of Lesson Plan: In this lesson, students explore how different people on local, national and international levels respond to a destructive natural disaster and the needs of its victims and how various facets of the media cover such an event, focusing specifically on the earthquake that devastated Turkey on August 17, 1999.
Review the [Academic Content Standards](#) related to this lesson.

Suggested Time Allowance: 45 minutes- 1 hour

Objectives:
Students will:
1. Determine all those in addition to the victims who are affected when a natural disaster devastates a country and develop an awareness of the different ways people and institutions are affected; categorize the responses on their lists as local, national and international.
2. Examine early news reports about the August 17, 1999 earthquake in Turkey by reading and discussing "Thousands Killed or Injured as a Huge Quake Rocks Turkey."
3. Develop a list of questions for each category (local, national and international) that students hope to be able to answer using news articles from various media sources.
4. Select a news source and obtain and obtain information from it that relates to the earthquake in Turkey; respond to the questions for each category as developed in class with information from this source; share information with the class in an ongoing media timeline project of this event.

Resources / Materials:
-student journals
-pens/pencils
-paper
-classroom blackboard
-copies of "Thousands Killed or Injured as a Huge Quake Rocks Turkey" (one per student)
-three long sheets of butcher paper, or several pieces of white poster board
-markers

Activities / Procedures:
1. WARM-UP/DO-NOW: Students respond to the following question (written on the board prior to class): "When a natural disaster devastates a country (such as the August 17, 1999 earthquake in Turkey), who is affected, directly and indirectly, and in what different ways are they affected?" While students are responding to the question, create three columns on the board, heading each column with one of the

following terms: Local, National, International. After five to ten minutes of writing, ask students to look at the columns on the board and to explain what each of these headings means in the context of this question. Then, ask students to categorize their responses to the journal question, first by explaining who is affected on a local level, then who is affected on a national level, and finally who is affected on an international level. Write down all student responses in the appropriate categories. Do not erase the board; these categories and responses will be referred to in a later activity.

2. Read and discuss "Thousands Killed or Injured as a Huge Quake Rocks Turkey," focusing on the following questions:
a. What details provided in this article convey to the reader a sense of the massive destruction to life and property caused by August 17, 1999's earthquake in Turkey? What statistics support the descriptions?
b. What examples are given of personal tragedy and loss?
c. What physical destruction is described in the article? What continued effects will this destruction have on essential systems and services (such as food supply, commerce, health care, communication, roads, shelter, and power supply) in the foreseeable future?
d. What are rescue teams doing at this point?
e. What kinds of assistance is being offered to those affected by the earthquake, both from within Turkey and from other countries? What remedies does this aid hope to offer? What destruction can this aid not "buy back"?
f. Refer to three categories of people affected by this disaster as discussed in the previous activity (These should still be on the board.). What evidence is presented in the article that points to the responses of people on the local, national and international levels?
g. Why is the Richter scale measurement significant in the case of this earthquake?

3. Explain to students that they will each be choosing one specific media source (a newspaper, a broadcast, cable or radio news program, or an Internet news site) that will provide ongoing coverage of the effects of the earthquake in Turkey and especially the responses of the local and world community. Return to the categories on the board, and as a class, develop a list of questions pertaining to each category that students hope to be able to answer using these media sources. Some questions should get at information, such as "Which countries were first to respond? What kind of aid was offered by different countries? Which were services? What kind? Which were money? How much?". Other questions might seek to understand deeper issues. For example, "What were the responses of countries that have been historic enemies of Turkey? Why do some countries offer money, while others offer services?" Facilitate the discussion when students brainstorm to ensure that a broad range of questions will be asked. Be sure that students write down all of the questions on a piece of paper, in their journals or in their class notebooks, as these questions will help them focus in on these ideas when examining the news.

4. WRAP-UP/HOMEWORK: Ask each student to select a different news source prior to leaving class. This news source must be one to which the student will have access on a daily basis over the course of the weeks following the earthquake. Some suggestions for media sources:
--national and local newspapers
--online newspapers (two Turkish newspapers that students may want to use are Turkish Daily News, found at (http://www.turkishdailynews.com/FrTDN/latest/heads.htm) and Milliyet, found at (http://www.milliyet.com.tr/e/))
--popular online newswires and news services (The Associated Press at (http://www.ap.org); Reuters at (http://www.reuters.com); the BBC at (http://www.bbc.co.uk/home/today); ITN at (http://www.itn.co.uk); CNN at (http://www.cnn.com); MSNBC at (http://www.msnbc.com))
Students should fold a paper into three columns, labeling each as labeled in class (Local, National, International). Students should select an item from their news source, and take notes in the appropriate columns based on their items, referring to

the questions developed in class as a guide and trying to answer as many questions as possible. Before students return to class the next day, post a triple time-line on wide butcher paper. The timeline should be set up with three parallel lines from left to right, so that students can record local, national and international responses to the disaster as they unfold over a period of time. In class, students should share the information learned from their articles by category, adding it to the appropriate time-line in brightly colored markers, dating each entry so that it is clear when this information was gathered. Add a brief citation to each with the student's name and the media source. As the week continues (or weeks, depending on how long you want students to work on this project), add to these time-lines of media coverage of the earthquake and its effects by following the same procedure. On a daily basis, and at the conclusion of the project, evaluate how news media differ in what, when and how information is presented, as well as how the local, national and international communities are responding to this disaster.

Further Questions for Discussion:

--What areas are often affected by earthquakes, and what is it about their locations that makes them places where earthquakes are more likely than in other places?
--Why would someone live in an area that they know is likely to sustain damage from a natural disaster such as an earthquake?
--How are earthquakes predicted, and what surveillance methods are used to watch the progress and aftershocks of earthquakes?
--How can people prepare for an earthquake?
--What forms of aid do those affected by natural disasters receive? What remedies does this aid offer? What destruction can this aid not "buy back"?
--Who determines how much aid a country will receive in the event of a natural disaster?
--Who determines how much aid a country will give to another country, and what are the considerations in making such a decision?
--What factors affect how quickly a country responds to a crisis of this sort in another country?
--What aspects of a country's infrastructure may be affected by an earthquake or other natural disaster?
--How might the size of a country affect its ability to respond to a disaster?
--How might the state of economic and technical development affect a country's response to a disaster within its borders?
--How might the political and economic systems affect a country's response to a disaster within its borders?
--How might people living in a rural area be affected differently by an earthquake from those living in urban areas?
--What industries might be affected by major earthquakes, and why?
--In what ways can governments rebuild their countries following a natural disaster?
--How can someone your age help victims of earthquakes and other natural disasters that happen in foreign countries?
--Should nations put aside their differences when one of the countries is suffering from a natural disaster? When have countries that are not allies responded to one another in this way? Do you behave this way when someone who you are not friends with or dislike needs help that you can offer?

Evaluation / Assessment:

Students' learning will be assessed based on written journal response, participation in class discussions and brainstorming exercises, and thoughtful and thorough news article analyses regarding the aftermath of the August 17, 1999 earthquake in Turkey.

Vocabulary:

archipelago, magnitude, seismologists, wreckage, debris, aftershocks, scenarios, slip-shod, Parliament

Extension Activities:

1. Examine the theory of plate tectonics and the way in which this theory explains how earthquakes are concentrated in specific areas on the Earth's surface. The National Earthquake Information Center offers this information online at (http://wwwneic.cr.usgs.gov/neis/plate_tectonics/rift_man.html). You might also

want to examine the effects that the Earth's plates have on volcanoes and tsunamis.

2. Work in small groups, each focusing on a facet of the infrastructure of a country (e.g., commerce/trade, food supply, health care/disease, communication/roads, shelter, and power) Each group serves as a "committee" established to deal with a specific area of the infrastructure of Turkey being affected by the devastation caused by the recent earthquake. Groups must discuss and take notes on their answers to three questions:
--What problems exist in your specific area of the infrastructure of Turkey due to the devastation caused by the August 17, 1999, earthquake?
--What solutions can your committee propose to attempt to solve these problems?
--How does your committee's area relate to each of the other areas of the infrastructure of Turkey?
Groups should then meet together and discuss how to rebuild the elements of the nation's infrastructure damaged or destroyed in the earthquake.

3. Diagram an illustrated earthquake timeline, noting major quakes in each continent over the past 100 years.

4. Create a three-dimensional map that shows earthquake zones. The map may also include information about where major earthquakes have struck, such as dates, Richter scale readings, death tolls and economic impacts.

5. Determine what actions students can take to support the victims of the earthquake in Turkey, and then organize an event or program to do so. Students can contact local relief organizations for support or volunteer to participate in community efforts.

6. Experiment with how the physical structure of buildings can be designed to be more earthquake-proof. Newton's Apple provides an excellent online lesson and activity that you can do at home (http://ericir.syr.edu/Projects/Newton/12/Lessons/earthquk.html).

7. Learn about seismology. What prediction methods and technologies are used? How does one "track" an earthquake and its aftershocks? Try building your own seismograph following the directions provided at (http://cse.ssl.berkeley.edu/lessons/indiv/davis/hs/Seismograph.html).

8. Find out the sensitivity of your area to natural or other large scale environmental disasters by researching the natural or commercial history of the place where you live. Then, create a disaster safety guide that discusses precautions you can take to best protect yourself and your home if disaster occurs, what to do in the case of an emergency, and the organizations that may be able to offer aid to your community.

9. Research other types of natural disasters (e.g., volcanoes, floods, tornadoes, tsunamis, forest fires, blizzards, droughts), focusing on how these disasters are predicted, how one can protect oneself during these disasters, and famous examples of these disasters.

Interdisciplinary Connections:
American History- Research natural disasters that have occurred in the United States and the relief organizations and government programs that assisted the victims and helped to rebuild the land and the communities. Students should also compare resources available in the United States to those currently available in Turkey.

Foreign Language**-** Obtain newspapers written in the language of study that include coverage of the earthquake in Turkey. Translate headlines, articles and captions. Then, write a news story in this foreign language covering the recent details of this event. Be sure to include a provocative and informative headline.

Global History
-Learn about the country of Turkey, focusing on its government, economy, and culture.
-Investigate earthquakes that devastated other countries and research the methods that were used to rebuild these areas.

Health- Investigate the health issues that can arise when a city or country is devastated by a natural disaster. Then, search the Internet for the Web sites of organizations that assist earthquake victims in the United States and worldwide. What are the missions of these various organizations? In what current efforts is each organization involved? How can someone your age lend a hand in helping the victims of earthquakes?

Language Arts
-Share personal experiences with extraordinary natural occurrences.
-Write a persuasive essay defending or refuting one country's offer of natural disaster relief to other countries.
-Compare and contrast earthquake accounts. Famous Earthquake Accounts (http://www.crustal.ucsb.edu/ics/understanding/) provide such accounts written by Mark Twain, Jack London, Charles Darwin and John Muir.

Journalism- Collect news photographs of the earthquake in Turkey. Assess the value of these photos in relaying news in ways that the written word may be unable to do.

Mathematics:
-Create a chart comparing the economies, population, size, and other statistics about the United States and Turkey. What resources might the United States have that Turkey does not? What do these statistics demonstrate about potential differences in aid for natural disaster victims?
-Graph the frequency of major earthquakes in different countries.
-Explore logarithms by comparing the Richter and Mercalli scales, used in measuring the intensity of earthquakes.

Science- Create "How It Works" posters or tabletop demonstrations about earthquakes, illustrating how each of the three classes of earthquakes (tectonic, volcanic, and artificially produced) are caused.

Technology- Explore how seismographs and other earthquake-tracking technologies work.

Other Information on the Web

National Earthquake Information Center (http://wwwneic.cr.usgs.gov/current_seismicity.shtml) from the United States Geological Survey includes earthquake bulletins, an explanation of earthquake parameters, and maps that show recent earthquakes.

The World-Wide Earthquake Locator (http://www.geo.ed.ac.uk/quakes/quakes.html) provides basic information about earthquakes within hours of their taking place.

Infoplease Spotlight: Earthquakes 101 (http://www.infoplease.com/spot/earthquake1.html) is an encyclopedia-like resource that includes links to information about key words and concepts, pages of earthquake statistics, information on seismology and a disaster quiz.

DisasterRelief.org (http://www.disasterrelief.org) discusses worldwide disaster aid.

Savage Earth: All Stressed Out (http://www.pbs.org/wnet/savageearth/earthquakes/index.html) is the companion site to the PBS program, with animations and explanations of why and how earthquakes happen.

The Museum of the City of San Francisco (http://www.sfmuseum.org/) provides a wide variety of documentation of all forms regarding the great earthquake and fire of 1906 and the 1989 San Francisco earthquake.

Academic Content Standards:

McREL This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8
Geography Standard 4- Understands the physical and human characteristics of place. Benchmarks: Knows the physical characteristics of places; Knows how technology shapes the human and physical characteristics of places; Knows the causes and effects of changes in a place over time
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Knows the major processes that shape patterns in the physical environment; Knows the consequences of a specific physical process operating on Earth's surface
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows the ways in which human systems develop in response to conditions in the physical environment; Knows how the physical environment affects life in different regions; Knows the effects of natural hazards on human systems in different regions of the United States and the world; Knows the ways in which humans prepare for natural hazards
Language Arts Standard 7- Demonstrates competence in the general skills and strategies for reading a variety of informational texts. Benchmarks: Applies reading skills and strategies to a variety of informational texts; Summarizes and paraphrases complex, explicit hierarchic structures in informational texts; Uses new information to adjust and extend personal knowledge base; Draws conclusions and makes inferences based on explicit and implicit information in texts

Grades 9-12
Geography Standard 4- Understands the physical and human characteristics of place. Benchmarks: Knows how social, cultural, and economic processes shape the features of places; Understands why places have specific physical and human characteristics in different parts of the world; Knows the locational advantages and disadvantages of using places for different activities based on their physical characteristics
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Understands how physical systems are dynamic and interactive; Understands how physical processes affect different regions of the United States and the world
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows changes in the physical environment that have reduced the capacity of the environment to support human activity; Understands how people who live in naturally hazardous regions adapt to their environments; Knows factors that affect people's attitudes, perceptions, and responses toward natural hazards
Language Arts Standard 7- Demonstrates competence in the general skills and strategies for reading a variety of informational texts. Benchmarks: Applies reading skills and strategies to a variety of informational texts; Summarizes and paraphrases complex, implicit hierarchic structures in informational texts, including the relationships among the concepts and details in those structures; Uses new information from texts to clarify or refine understanding of academic concepts; Evaluates the clarity and accuracy of information

Turk Minister Criticizes Government's Response to Quake
By STEPHEN KINZER

(Go to Article.)

Wednesday, August 25, 1999

Outreach in the Aftermath

Understanding the Importance of Providing Aid to Victims of Natural Disasters

Author(s)
Alison Zimbalist, The New York Times Learning Network

Grades: 6-8, 9-12
Subjects: Current Events, Geography, Language Arts, Social Studies
Interdisciplinary Connections

Overview of Lesson Plan: In this lesson, students investigate the many types of aid needed to help Turkey recover and rebuild in the wake of the earthquake that devastated a large portion of the country on August 17, 1999. Students then create a plan for a fundraiser or project that they can do to offer assistance to the victims of this disaster.

Review the Academic Content Standards related to this lesson.

Suggested Time Allowance: 1 hour

Objectives:
Students will:
1. Brainstorm how different aspects of a city's infrastructure would be affected by a very destructive natural disaster; analyze the types of aid that would help rebuild in the wake of this disaster, as well as whose responsibility it is to give such aid.
2. Examine how the Turkish government has responded to the August 17, 1999 earthquake there and understand differing reactions about this response by reading and discussing "Turk Minister Criticizes Government's Response to Quake."
3. List the many types of aid from which Turkey could benefit in the wake of the earthquake; determine which of these types of aid the students in your class could offer; develop a basic plan for a project that they could actually organize and execute in order to provide aid to the victims of this earthquake.
4. Express whether they feel that it is important to participate in an international aid project like the one organized in class and predict how they would respond if a friend asked what someone their age can do to help victims of natural disasters in other countries.

Resources / Materials:
-pens/pencils
-paper
-classroom blackboard
-copies of "Turk Minister Criticizes Government's Response to Quake" (one per student)

Activities / Procedures:
1. WARM-UP/DO-NOW: Prior to class, arrange desks into groups of three or four, and write the following scenario on the board for students to respond to as a group upon entering class (one student in each group should act as the secretary and write down the group's responses): Your city has been hit with one of the worst (insert a natural disaster that may occur in your city, such as tornado, blizzard, flood, hurricane, earthquake, etc.)s it has ever seen. When you come out of your home, you realize that this disaster has wreaked total havoc as far as your eyes can see.

How do you expect the following aspects of the infrastructure of your city to have been affected by this disaster?: commerce/trade, food supply, health care/disease prevention, communication/roads, shelter, power supply. How will your city be able to rebuild? Who might offer aid to you, and in what form might that aid be given? After ten to fifteen minutes, ask a spokesperson from each group to share their responses. Then discuss in what ways, if at all, the government of a country that is suffering in the aftermath of a natural disaster should lend aid to the citizens. Who else do students think has a responsibility to offer aid in these events?

2. As a class, read and discuss "Turk Minister Criticizes Government's Response to Quake," focusing on the following questions:
a. What did Tourism Minister Erkan Mumcu mean by referring to the response of Turkey's government to the August 17, 1999 earthquake as "'a declaration of bankruptcy for the Turkish political and economic system'"? What did Mr. Mumcu mean when he said that "'lying under the ruins is the Turkish political and administrative system'?
b. What is Mr. Yasar's argument with regards to the Government's poor response to the earthquake?
c. What steps did President Demirel say the Government would take to better strengthen Turkey for the possibility of future earthquakes? What was unusual, on a personal level, about his statement?
d. What did the news commentator quoted in the article mean by saying that "'the millennium came to Turkey a year before other countries'"?
e. Why has Health Minister Osman Durmus been so heavily criticized in the wake of the earthquake?
f. What is the purpose of including the story of Ismail Cimen's discovery and rescue in this article?
g. How is the Turkish military helping the victims of the earthquake?
h. How are other countries aiding the victims?
i. What health issues have arisen in Turkey because of the earthquake, and how are they being handled?

3. Brainstorm on the board the many types of aid from which Turkey could benefit in the wake of the August 17, 1999 earthquake, keeping in mind the aspects of infrastructure examined in the initial classroom exercise. Then, determine which of these types of aid the students in your class could offer, and circle them on the board. Tell students that they will now be developing a basic plan for a project that they could actually organize and execute in order to provide aid to the victims of this earthquake. (The simpler the plan, the more likely students will want to carry it out.) First, vote on which kind of aid they would want to provide (financial, clothes, first aid supplies, etc.). Once this is decided, discuss the following questions regarding the planning and execution of this fundraiser or project, and ask students to take notes of the class's responses to them:
--How will you raise funds or gather the materials you are collecting for this project?
--For how long (weeks, months) do you want this collection to occur?
--What adults will need to help you with this project, and how?
--What other students will need to help you with this project, and how?
--Where will this fundraiser or collection of items take place, and why is this location a good choice? Who will you need to contact about making arrangements to use this place?
--What materials will you need for this project? (What you will be selling, as well as other equipment such as a table or posters explaining the project?)
--How and where will you advertise this fundraiser or project?
--What is the name of the fundraiser or project?
--Where will you send the money raised or items gathered through the project?
With your help as the sponsor of this project, students may want to put there plan into action. Future class periods and after-school sessions can be devoted to making sure that this plan works and that students will be successful in raising money or collecting items that will be sent to the victims of the earthquake in Turkey.

4. WRAP-UP/HOMEWORK: In their journals, students respond to the following

questions: Do you feel that it is important for you to participate in an international aid project like the one organized in class, and why? If a friend asked you what someone your age can do to help victims of natural disasters in other countries, what would you say?

Further Questions for Discussion:

--What areas are often affected by earthquakes, and what is it about their locations that makes them places where earthquakes are more likely than in other places?
--Why would someone live in an area that they know is likely to sustain damage from a natural disaster such as an earthquake?
--How are earthquakes predicted, and what surveillance methods are used to watch the progress and aftershocks of earthquakes?
--How can people prepare for an earthquake?
--What forms of aid do those affected by natural disasters receive? What remedies does this aid offer? What destruction can this aid not "buy back"?
--Who determines how much aid a country will receive in the event of a natural disaster?
--Who determines how much aid a country will give to another country, and what are the considerations in making such a decision?
--What factors affect how quickly a country responds to a crisis of this sort in another country?
--How might the size of a country affect its ability to respond to a disaster?
--How might the state of economic and technical development affect a country's response to a disaster within its borders?
--How might the political and economic systems affect a country's response to a disaster within its borders?
--How might people living in a rural area be affected differently by an earthquake from those living in urban areas?
--What industries might be affected by major earthquakes, and why?
--In what ways can governments rebuild their countries following a natural disaster?
--Should nations put aside their differences when one of the countries is suffering from a natural disaster? What are some examples of countries that are not allies responding to one another in this way? Do you behave this way when someone who you are not friends with or dislike needs help that you can offer?

Evaluation / Assessment:

Students will be evaluated based on thoughtful participation in small group work, participation in class discussions, and written journal response reflecting on the importance of giving aid to victims of natural disasters.

Vocabulary:

bankruptcy, defensive, ideological, chastened, seismologists, infallible, customary, faltering, infuriated, elite, ridiculed, sanitary, dehydrate, epidemic, provision, commemoration

Extension Activities:

1. Follow the news about the earthquake in Turkey on a daily basis, creating a scrapbook or collage of articles, headlines and photographs from The New York Times or other newspapers. What efforts are being made each day to rescue the victims of this earthquake? What new information comes to light, and how are various people at the local, national and international levels reacting to this disaster as Turkey begins the slow process of rebuilding its demolished areas?

2. Work in small groups, each focusing on a facet of the infrastructure of a country (e.g., commerce/trade, food supply, health care/disease, communication/roads, shelter, and power). Each group serves as a "committee" established to deal with a specific area of the infrastructure of Turkey being affected by the devastation caused by the recent earthquake. Groups must discuss and take notes on their answers to three questions:
--What problems exist in your specific area of the infrastructure of Turkey due to the devastation caused by the August 17, 1999, earthquake?
--What solutions can your committee propose to attempt to solve these problems?
--How does your committee's area relate to each of the other areas of the infrastructure of Turkey?

Groups should then meet together and discuss how to rebuild the elements of the nation's infrastructure damaged or destroyed in the earthquake.

3. Diagram an illustrated earthquake timeline, noting major quakes in each continent over the past 100 years. Then, research the methods that were used to rebuild these areas.

4. Create a three-dimensional map that shows earthquake zones. The map may also include information about where major earthquakes have struck, such as dates, Richter scale readings, death tolls and economic impacts.

5. Research an organization or agency that is assisting the victims of the earthquake in Turkey. When, where, and why was the organization founded? Who was the founder? What services did the organization originally provide, and what does the organization do now?

6. Experiment with how the physical structure of buildings can be designed to be more earthquake-proof. Newton's Apple provides an excellent online lesson and activity that you can do at home (http://ericir.syr.edu/Projects/Newton/12/Lessons/earthquk.html).

7. Find out the sensitivity of your area to natural or other large scale environmental disasters by researching the natural or commercial history of the place where you live. Then, create a disaster safety guide that discusses precautions you can take to best protect yourself and your home if disaster occurs, what to do in the case of an emergency, and the organizations that may be able to offer aid to your community.

8. Learn about the country of Turkey, focusing on its government, economy, and culture.

Interdisciplinary Connections:
American History- Research natural disasters that have occurred in the United States and the relief organizations and government programs that assisted the victims and helped to rebuild the land and the communities. Students should also compare resources available in the United States to those currently available in Turkey.

Foreign Language- Obtain newspapers written in the language of study that include coverage of the earthquake in Turkey. Translate headlines, articles and captions. Then, write a news story in this foreign language covering the recent details of this event. Be sure to include a provocative and informative headline.

Health- Investigate the health issues that can arise when a city or country is devastated by a natural disaster. Then, search the Internet for the Web sites of organizations that assist earthquake victims in the United States and worldwide. What are the missions of these various organizations? In what current efforts is each organization involved? How can someone your age lend a hand in helping the victims of earthquakes?

Language Arts- Compare and contrast earthquake accounts. Famous Earthquake Accounts (http://www.crustal.ucsb.edu/ics/understanding/) provide such accounts written by Mark Twain, Jack London, Charles Darwin and John Muir. The Museum of the City of San Francisco (http://www.sfmuseum.org/) provides a wide variety of documentation of all forms regarding the great earthquake and fire of 1906 and the 1989 San Francisco earthquake.

Journalism- Collect news photographs of the earthquake in Turkey. Assess the value of these photos in relaying news in ways that the written word may be unable to do.

Mathematics:
-Create a chart comparing the economies, population, size, and other statistics about the United States and Turkey. What resources might the United States have that Turkey does not? What do these statistics demonstrate about potential differences in aid for natural disaster victims?
-Graph the frequency of major earthquakes in different countries.

-Explore logarithms by comparing the Richter and Mercalli scales, used in measuring the intensity of earthquakes.

Science- Create "How It Works" posters or tabletop demonstrations about earthquakes, illustrating how each of the three classes of earthquakes (tectonic, volcanic, and artificially produced) are caused.

Technology- Explore how seismographs and other earthquake-tracking technologies work. Try building your own seismograph following the directions provided at (http://cse.ssl.berkeley.edu/lessons/indiv/davis/hs/Seismograph.html).

Other Information on the Web

Earthquakes: The Sudden Killer (http://www.policy.com/news/dbrief/dbriefarc309.asp) is a briefing from Policy.com on the quake that hit Turkey, including information on international aid efforts and on preventing quake damage.

ReliefWeb: Turkey Earthquake (http://wwwnotes.reliefweb.int/) is a collection of news stories and official announcements on the quake and relief efforts.

National Earthquake Information Center (http://wwwneic.cr.usgs.gov/current_seismicity.shtml) from the United States Geological Survey includes earthquake bulletins, an explanation of earthquake parameters, and maps that show recent earthquakes.

Infoplease Spotlight: Earthquakes 101 (http://www.infoplease.com/spot/earthquake1.html) is an encyclopedia-like resource that includes links to information about key words and concepts, pages of earthquake statistics, information on seismology and a disaster quiz.

DisasterRelief.org (http://www.disasterrelief.org) discusses worldwide disaster aid.

Savage Earth: All Stressed Out (http://www.pbs.org/wnet/savageearth/earthquakes/index.html) is the companion site to the PBS program, with animations and explanations of why and how earthquakes happen.

Academic Content Standards:

McREL **This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.**

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8
Geography Standard 4- Understands the physical and human characteristics of place. Benchmarks: Knows the physical characteristics of places; Knows how technology shapes the human and physical characteristics of places; Knows the causes and effects of changes in a place over time
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Knows the major processes that shape patterns in the physical environment; Knows the consequences of a specific physical process operating on Earth's surface
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows the ways in which human systems develop in response to conditions in the physical environment; Knows how the physical environment affects life in different regions; Knows the effects of natural hazards on human systems in different regions of the United States and the world; Knows the ways in which humans prepare for natural hazards
Language Arts Standard 8- Demonstrates competence in speaking and listening as tools for learning. Benchmarks: Plays a variety of roles in group discussions; Asks

questions to seek elaboration and clarification of ideas

Grades 9-12
Geography Standard 4- Understands the physical and human characteristics of place. Benchmarks: Knows how social, cultural, and economic processes shape the features of places; Understands why places have specific physical and human characteristics in different parts of the world; Knows the locational advantages and disadvantages of using places for different activities based on their physical characteristics
Geography Standard 7- Knows the physical processes that shape patterns on Earth's surface. Benchmarks: Understands how physical systems are dynamic and interactive; Understands how physical processes affect different regions of the United States and the world
Geography Standard 15- Understands how physical systems affect human systems. Benchmarks: Knows changes in the physical environment that have reduced the capacity of the environment to support human activity; Understands how people who live in naturally hazardous regions adapt to their environments; Knows factors that affect people's attitudes, perceptions, and responses toward natural hazards
Language Arts Standard 8- Demonstrates competence in speaking and listening as tools for learning. Benchmark: Asks questions as a way to broaden and enrich classroom discussions

Origami Activities

Basic geometric forms such as cubes, octahedra, rhombohedra, and tetrahedra may be made by folding flat paper or envelopes, both reasonably priced starting materials. These may be used to help visualize solid forms in crystallography and mineralogy and numbers of them may be used to create unit cells. Tetrahedra in particular are easy to make by folding and cutting small envelopes. Tetrahedra may be linked to build silicate and carbonate crystal models.

A ring of six tetrahedra may be linked along two sides of each to form a hexaflexagon (Spillhaus, 1985). Spillhaus and the GeoLearning Corporation have produced hexaflexagons with illustrated geographic, geologic, and astronomic themes on each side printed on stiff paper. These models are also reasonably priced and require assembly.

As an alternative, we have combined the rapid production of tetrahedra from envelopes with various geological themes printed in color on hexagons to produce customized hexaflexagons covering the topics of earthquakes, plate tectonics, and geology of New Mexico.

To make your own hexaflexagon with earthquake-education themes, you'll need to do three things:

- First, read the instructions and make six paper tetrahedra.
- Second, download graphics files containing earthquake-education illustrations.
- Third, follow the instructions to combine the tetrahedra and the illustrations into your own hexaflexagon.

Earth: All Stressed Out

by Daniel Pendick

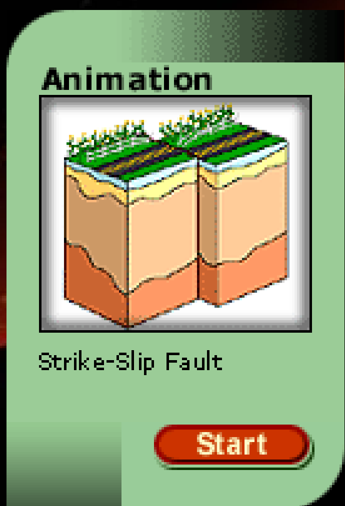
To experience the drama of plate tectonics -- the jostling of the giant plates that carry continents and oceans -- try this experiment: Sit in a comfortable chair, hold your hand out, and watch your fingernails grow. That's about the average speed of a tectonic plate. But wait around long enough, and even the tortoise crawl of plate tectonics will have dramatic and deadly consequences. Though plate tectonics is a global phenomenon and virtually invisible to us in our daily lives, it introduces enormous stresses in the crust where we live. From time to time, stressed-out crust releases the stress in sudden fits: earthquakes.

More frequently than time to time, actually. If you imagine the Earth as a giant bell, it's ringing with earthquakes every second of the day -- from the many imperceptible clinks of microquakes to the deafening gong of very occasional but "great" earthquakes (those of magnitude 8.0 or greater). The U.S. Geological Survey estimates that several million temblors, most undetectable, happen every day.

The great earthquake of 1906 devastated San Francisco, killing 700.

Most earthquakes happen near the boundaries of tectonic plates, both where the plates spread apart and where they crunch or grind together (although large temblors also strike from time to time in the normally stable interior of continents). Along plate boundaries, the brittle outer part of the Earth fractures along faults. As plates move, blocks of crust shift along the faults. The infamous San Andreas fault is not a single crack where the North American and Pacific plates slide past each other. It's the largest of a thicket of faults that collectively absorb the motion of the plates.

There are various kinds of faults that do the day-to-day dirty work of plate tectonics. The San Andreas is a "strike-slip" fault. (See animation below.) Along this seam, the plates slide past each other like cars traveling opposite directions on a highway. The other major family of faults are called "dip-slip" faults. (See animation below.) On these, blocks of crust either push together or pull apart, with one block sliding either up or down a sloped fault plane. The fault that let loose the 1994 Northridge earthquake was a dip-slip fault, at which a block of crust slid up the shallow ramp of another.



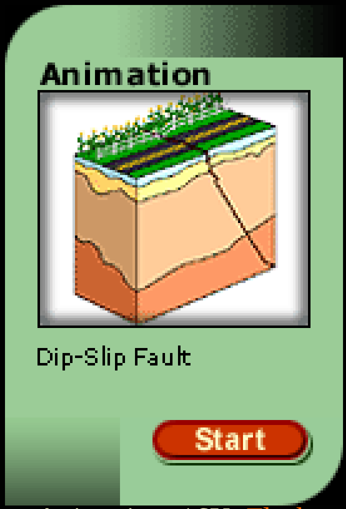
Flash animation, 20K.
You will need the free Flash plug-in
to view this animation.

Stress builds up in fault zones when crustal blocks stick together. In fact, faults are stuck, or "locked," most of the time, although some also show slow, barely detectable slippage called "aseismic creep." The important distinction for people between the different kinds of slip has to do with that word, seismic, from the Greek for "shaking." Fault creep is aseismic (that is, not seismic) because it doesn't generate vibrations in the crust called seismic waves. But when a fault is stuck, the rocks on either side of it store the building stresses until a critical limit is reached, and the rocks move suddenly along the fault, releasing the stresses like a spring uncoiling. This pumps seismic waves into the surrounding rock. (See Earthquake! animation, 5K. You will need the free Flash plug-in to view this animation.)

Seismic energy travels through the crust in the form of waves. There are two basic kinds of seismic waves: body waves and surface waves. Body waves travel outward in all directions, including downward, from the quake's focus -- that is, the particular spot where the fault first began to rupture. Surface waves, by contrast, are confined to the upper few hundred miles of the crust. They travel parallel to the surface, like ripples on the surface of a pond. They are also slower than body waves.

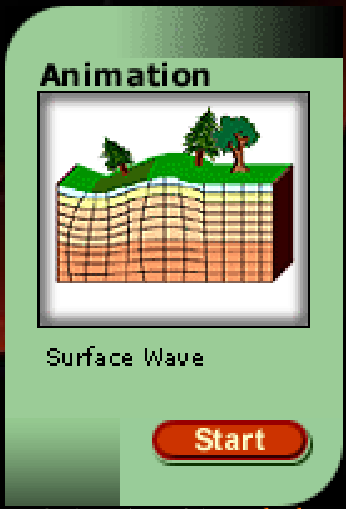
Following an earthquake, the body waves strike first. The fastest kind are the primary waves, or P-waves. (See animation below.) People often report a sound like a train just before they feel a quake, which is the P-wave moving as an acoustic wave in the air. Then the secondary, or S-waves, arrive. (See animation below.)

A person in a building perceives the arrival of S-waves as a sudden powerful jolt, as if a giant has pounded his fist down on the roof. Finally, the surface waves strike. In very strong earthquakes, the up-and-down and back-and-forth motions caused by surface waves can make the ground appear to roll like the surface of the ocean, and can literally topple buildings over. (See animation below.)

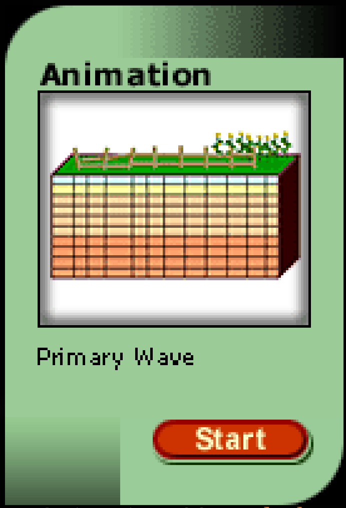


Animation, 16K. Flash required.

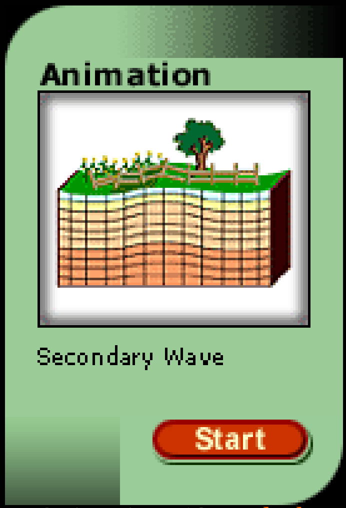
Seismologists have developed various ways to measure the strength of earthquakes. The first and most well-known is the Richter magnitude scale, developed earlier this century by California seismologist Charles Richter. The calculation of Richter magnitude is based on the maximum strength of the vibrations (measured by a seismograph) and the distance of the instrument from the epicenter of the earthquake. The Richter scale is logarithmic, which means that each increase in magnitude indicates a tenfold increase in the strength of the quake. A magnitude-6.0 earthquake, for instance, is ten times stronger than a magnitude-5.0. In terms of the energy released, the differences are even greater. A magnitude-6.0 earthquake releases 32 times the seismic energy as a magnitude-5.0.



Animation, 21K. Flash required.



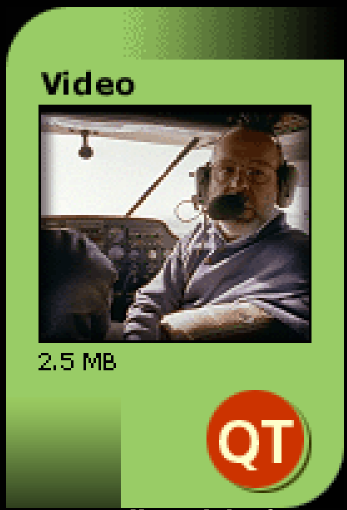
Animation, 22K. Flash required.



Animation, 13K. Flash required.

But Richter magnitude is only accurate for earthquakes up to about 310 miles (500 kilometers) from the instrument that detects it. Seismologists have developed other magnitude scales based on measurements of body waves or surface waves. But these, too, are not accurate for all earthquakes. Body-wave magnitudes, for example, aren't accurate for very strong earthquakes. Another system has come into wide use, called "moment magnitude," which takes into account the actual area of fault ruptured and gives a more consistent measure of earthquake size across the spectrum -- from minor jiggles to devastating jolts.

Seismic waves weaken with increasing distance. All things being equal, the strongest groundshaking occurs at the epicenter of the quake -- the point on the surface directly above the focus of the earthquake. (The focus can be a few miles below the ground or, more rarely, as deep as 435 miles. Beyond that depth, rocks are too hot and malleable to store strain, and they simply deform, like a block of soft clay.) In the most powerful earthquakes, groundshaking can actually exceed the acceleration of gravity and toss boulders into the air, as happened during the great Assam (India) earthquake of 1897.



You will need the free QuickTime (2.0 or above) plug-in to view this movie.
The 1989 Loma Prieta quake.

Groundshaking is not the only hazard people face during earthquakes. They can also trigger landslides. In 1692, the town of Port Royal, Jamaica, slid into the sea and came to rest 50 feet below the surface. Marine sediment quickly entombed the town, turning it into an undersea Pompeii: In 1959, archaeologists found a pot of turtle soup in one buried home, still sitting in its copper kettle. During quakes, blocks of crust also shift along fault lines, either horizontally or vertically. During the 1906 San Francisco earthquake, the west side of the San Andreas fault slid 21 feet northward. During the 1964 Alaska quake, some points on dry land rose nearly 40 feet and parts of the seafloor dropped 50 feet.

Another hazard is liquefaction. This happens when loose, moist soil or sand is shaken so hard that individual grains separate, turning the earth into a soft, fluid slurry that can swallow entire buildings. And ground motions in regions of soft sediment are drastically amplified relative to surrounding areas, so that much greater earthquake damage results, such as that in the Marina District of San Francisco following the 1906 and Loma Prieta (1989) earthquakes. The port zone of Kobe, Japan, was also damaged severely by liquefaction during the 1995 earthquake.

Though some scientists dream of discovering warning signals that would allow the evacuation of a city just before a large earthquake, the focus of earthquake preparation today is on making sure that buildings and other structures are engineered to withstand the maximum likely shaking without collapsing completely. So, if it's not possible to prevent earthquakes or flee from them, there's still hope of minimizing the death and destruction they visit on the cities of a restless and jittery planet.

SHAKE, RATTLE AND ROLL

Designing for Adversity

A building is conceived

when designed, born

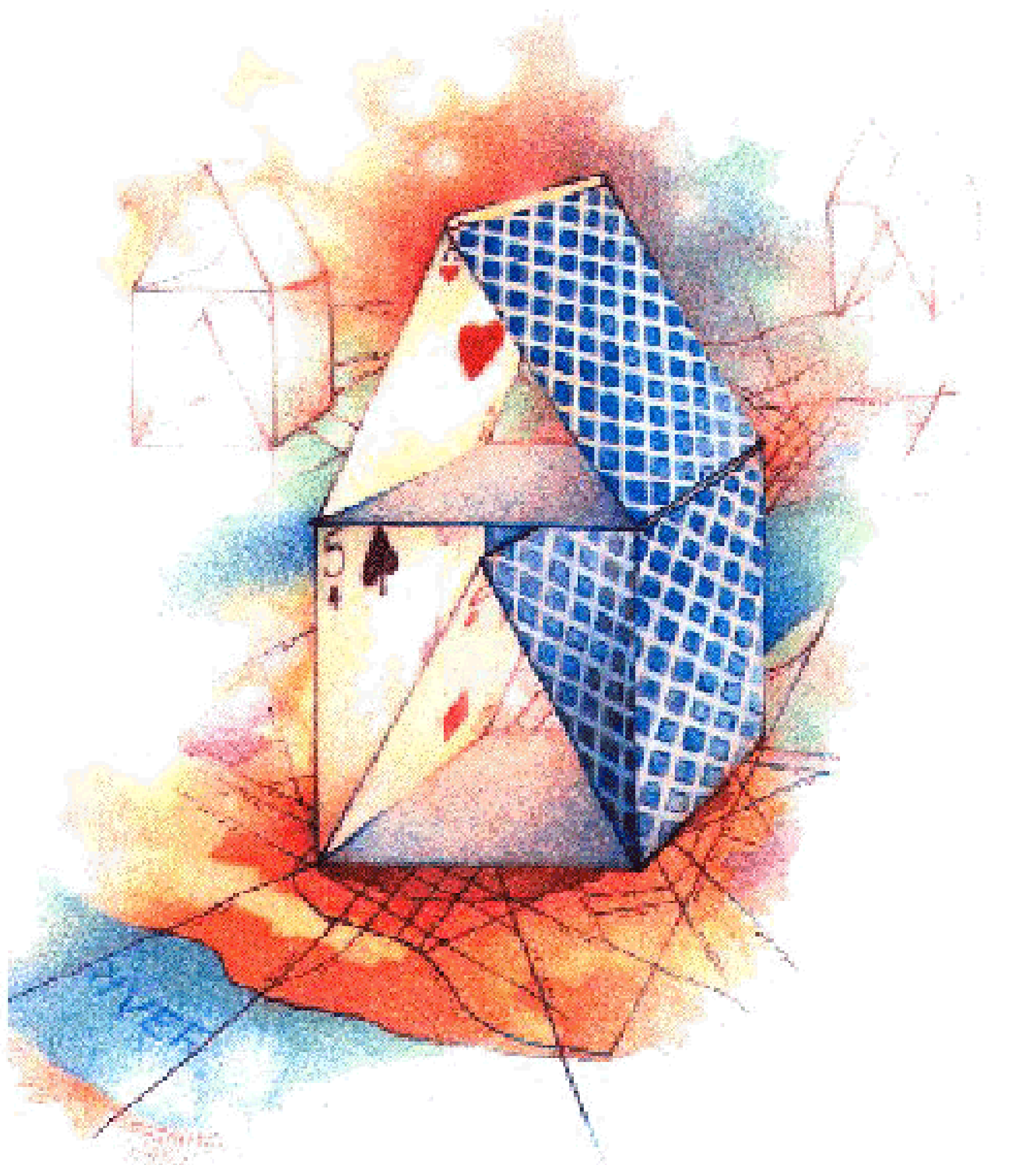
when built, alive while

standing, and dead

from old age or

unexpected accident.

--Mario Salvadori



Youngsters explore basic principles of structural design and material strength to discover effective ways to construct buildings that can withstand earthquakes. They then design a series of experiments to explore the relationship between the type of ground a structure is built on and the degree of damage it is likely to sustain in an earthquake.

Suggested Age Level: 8 through 15

SKILLS

- Observing
- Designing Fair Tests
- Comparing
- Inferring
- Predicting
- Interpreting Data
- Recording Data
- Map Reading

- Risk Assessment

SUBJECT AREAS

- Geology
- Design and Technology
- Physics
- Geography

ESTIMATED TIME

- Activity 1. Three 45-minute Sessions
- Activity 2. One 60-minute Session

Background Activity 1 Activity 2 Home and Community Connection

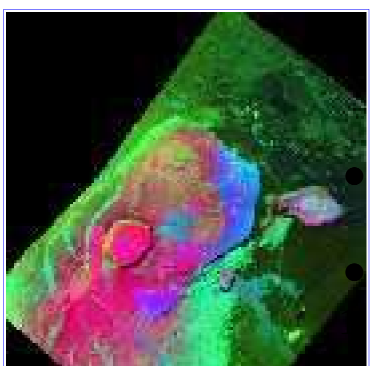
Design Connections Table of Contents SHAKE, RATTLE & ROLL

CONNECTIONS DESIGN THROUGH SCIENCE AND TECHNOLOGY

Surfing for Earthquakes and Volcanoes

by Patty Coe and Michael Merrick

- **Grade Levels:** 6 through 8
- **Time Requirements:**
  - Approx. **2-3 hours** Prep Time and **5 40-minute periods** Class Time (depending on computer experience and knowledge of Earth Sciences)
- **Student Pre-requisites:**
  1. Mapping skills, including latitude/longitude, scale and distance.
  2. Internet research skills.
  3. Knowledge of the theory of continental drift and plate boundary interactions.
- **Topics Covered by This Lesson:** Surfing the Internet; Volcanoes; Earthquakes; Plate Tectonics



- **Brief Overview:** Students use the Internet to research data on earthquakes and volcanoes and plot locations to determine continental plate boundaries. Extensions include interpretation of interaction between plate boundaries, causes of earthquakes and volcanoes, and the comparison of the formation of Olympus Mons on Mars and the Hawaiian volcanic chain.
- **Unit Features:** This lesson contains tailored worksheets and uses unique Internet images and information.
- **Materials:**
  1. Computer with access to WWW and printer.
  2. Worksheets (Masters included)

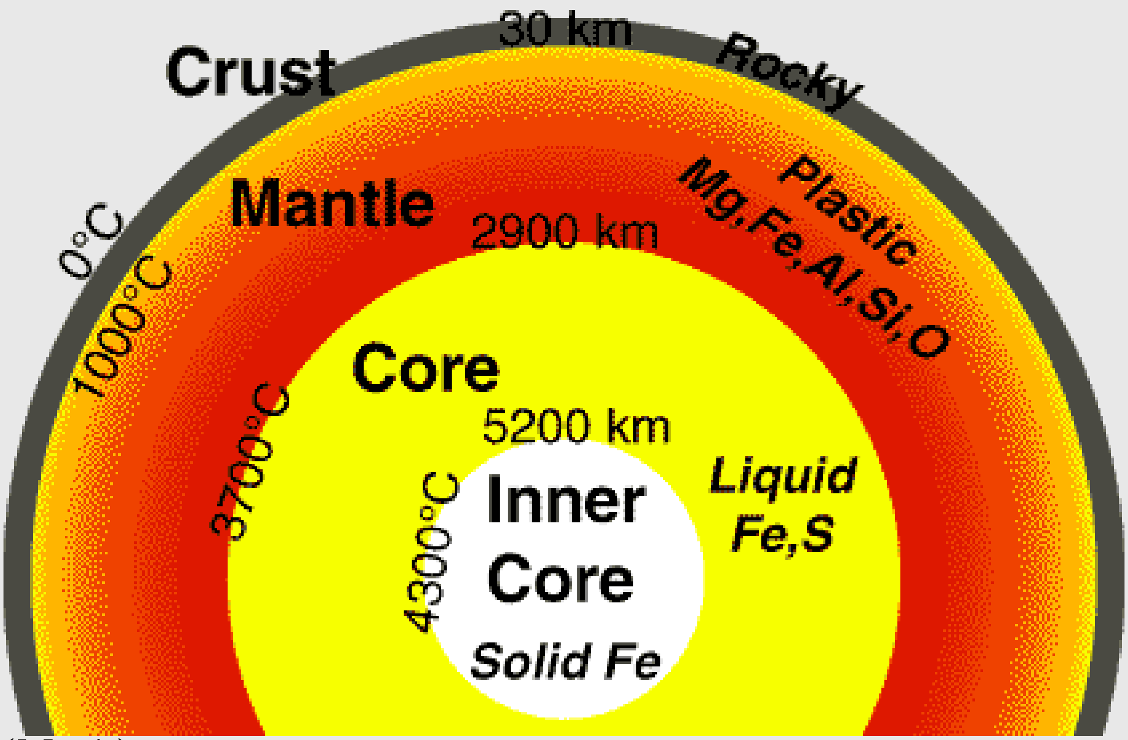
Earth's Interior

More about earthquakes | Nevada Seismological Lab | Nevada earthquakes | Univ. of Nevada, Reno

Five billion years ago the Earth was formed in a massive conglomeration and bombardment of **meteorites** and **comets**. The immense amount of heat energy released by the high-velocity bombardment melted the entire planet, and it is still cooling off today. Denser materials like iron (Fe) from the meteroites sank into the core of the Earth, while lighter **silicates** (Si), other oxygen (O) compounds, and water from comets rose near the surface.



(J. Louie)

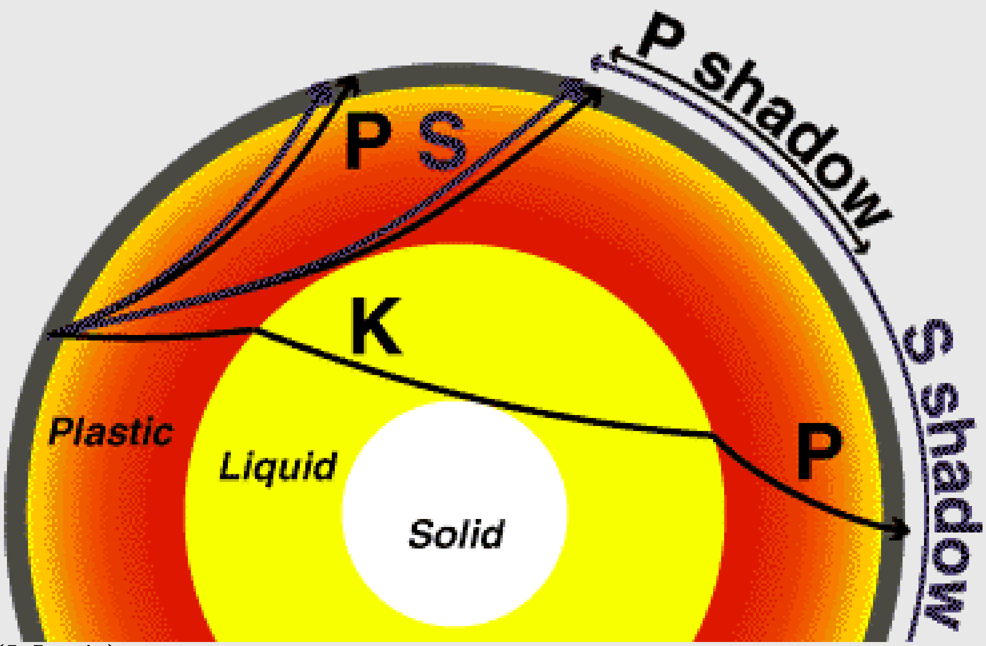
The earth is divided into four main layers: the **inner core, outer core, mantle**, and **crust**. The core is composed mostly of iron (Fe) and is so hot that the outer core is **molten**, with about 10% sulphur (S). The inner core is under such extreme **pressure** that it remains solid. Most of the Earth's mass is in the mantle, which is composed of iron (Fe), magnesium (Mg), aluminum (Al), silicon (Si), and oxygen (O) **silicate** compounds. At over 1000 degrees C, the mantle is solid but can deform slowly in a **plastic** manner. The crust is much thinner than any of the other layers, and is composed of the least dense calcium (Ca) and sodium (Na) aluminum-silicate minerals. Being relatively cold, the crust is rocky and **brittle**, so it can fracture in **earthquakes**.

Exploring the Earth's Core

How was the Earth's core dicovered? Recordings of seismic waves from earthquakes gave the first clue. Seismic waves will bend and reflect at the interfaces between different materials, just like the prism below **refracts** and scatters light waves at its faces.

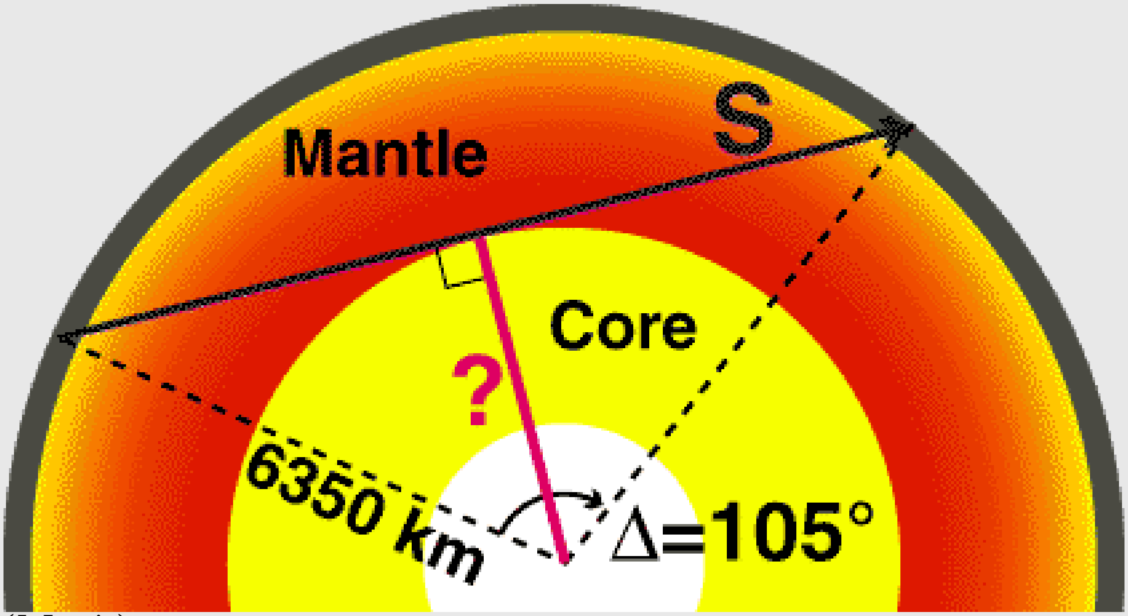
(original image from the Exploratorium; used by permission)

In addition, the two types of seismic wave behave differently, depending on the material. Compressional **P waves** will travel and refract through both **fluid** and solid materials. Shear **S waves**, however, cannot travel through fluids like air or water. Fluids cannot support the side-to-side particle motion that makes S waves.



(J. Louie)

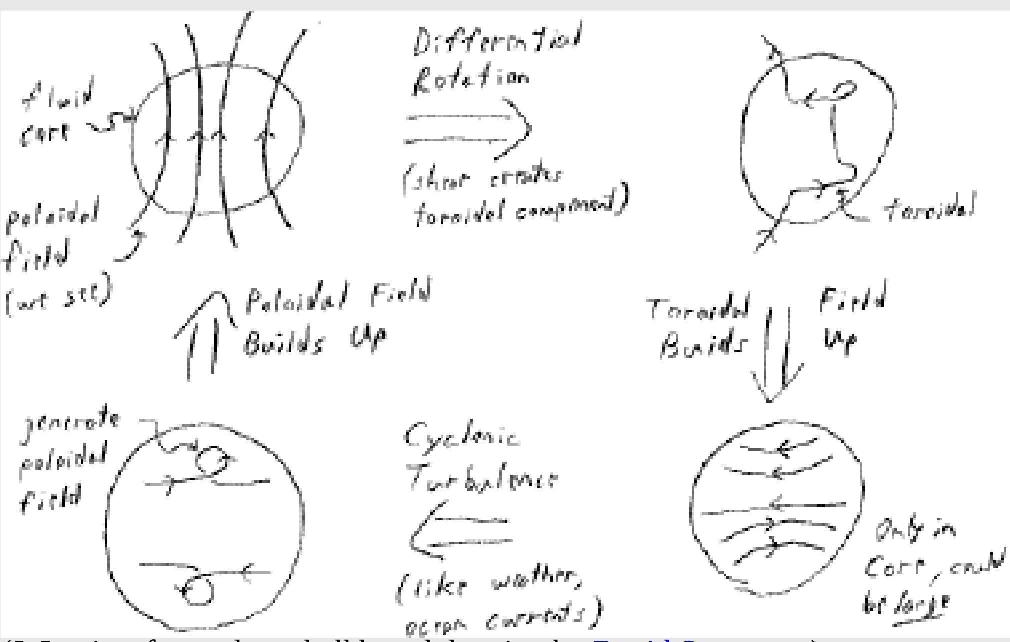
Seismologists noticed that records from an earthquake made around the world changed radically once the event was more than a certain distance away, about 105 degrees in terms of the angle between the earthquake and the seismograph at the center of the earth. After 105 degrees the waves disappeared almost completely, at least until the slow **surface waves** would arrive from over the horizon. The area beyond 105 degrees distance forms a **shadow zone**. At larger distances, some P waves would arrive, but still no S waves. The Earth has to have a molten, fluid core to explain the lack of S waves in the shadow zone, and the bending of P waves to form their shadow zone.



(J. Louie)

You can get a rough estimate of the size of the Earth's core by simply assuming that the last S wave, before the shadow zone starts at 105 degrees, travels in a straight line. Knowing that the Earth has a radius of about 6350 km, you have a right triangle where the cosine of half of 105 degrees equals the radius of the core divided by the radius of the earth.

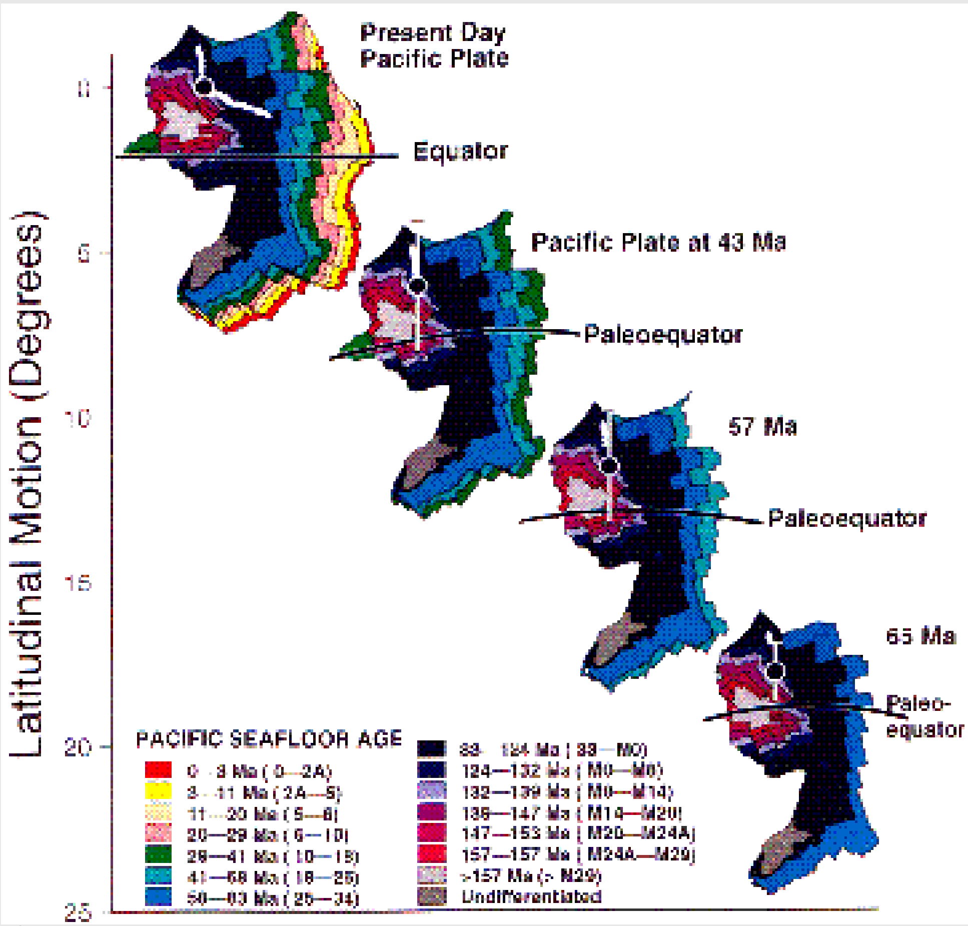
The fact that the Earth has a **magnetic field** is an idependent piece of evidence for a molten, liquid core. A compass magnet aligns with the magnetic field anywhere on the Earth, but other bodies like the Moon and Mars have no magnetic field. The earth cannot be a large **permanent magnet**, since magnetic minerals lose their magnetism when they are hotter than about 500 degrees C. Almost all of the earth is hotter, and the only other way to make a magnetic field is with a circulating **electric current**. Circulation and **convection** of **electrically conductive** molten iron in the Earth's outer core produces the magnetic field. To make the magnetic field, the convection must be relatively rapid (much faster than it is in the plastic mantle), so the core must be fluid.



(J. Louie, after a class chalkboard drawing by David Stevenson)

Because the Earth's magnetic field arises in the unstable patterns of fluid flow in the core, it changes direction at irregular intervals. In recent geologic history it may have switched direction about every 20,000 years. Any kind of geologic deposit (e.g.: lava flows, layered muds) put down over time will thus have different layers magnetized in opposing directions, recording the magnetic field direction as it was when the layer solidified. Geophysicists can measure the changes in direction to make a **magnetostratigraphy** for the deposit.

At oceanic **spreading centers** new ocean floor is being created constantly and slowly moved away from the rift. The farther the rock is from the rift, the older it is, and it will also show the **magnetic reversals** like a tape recording.

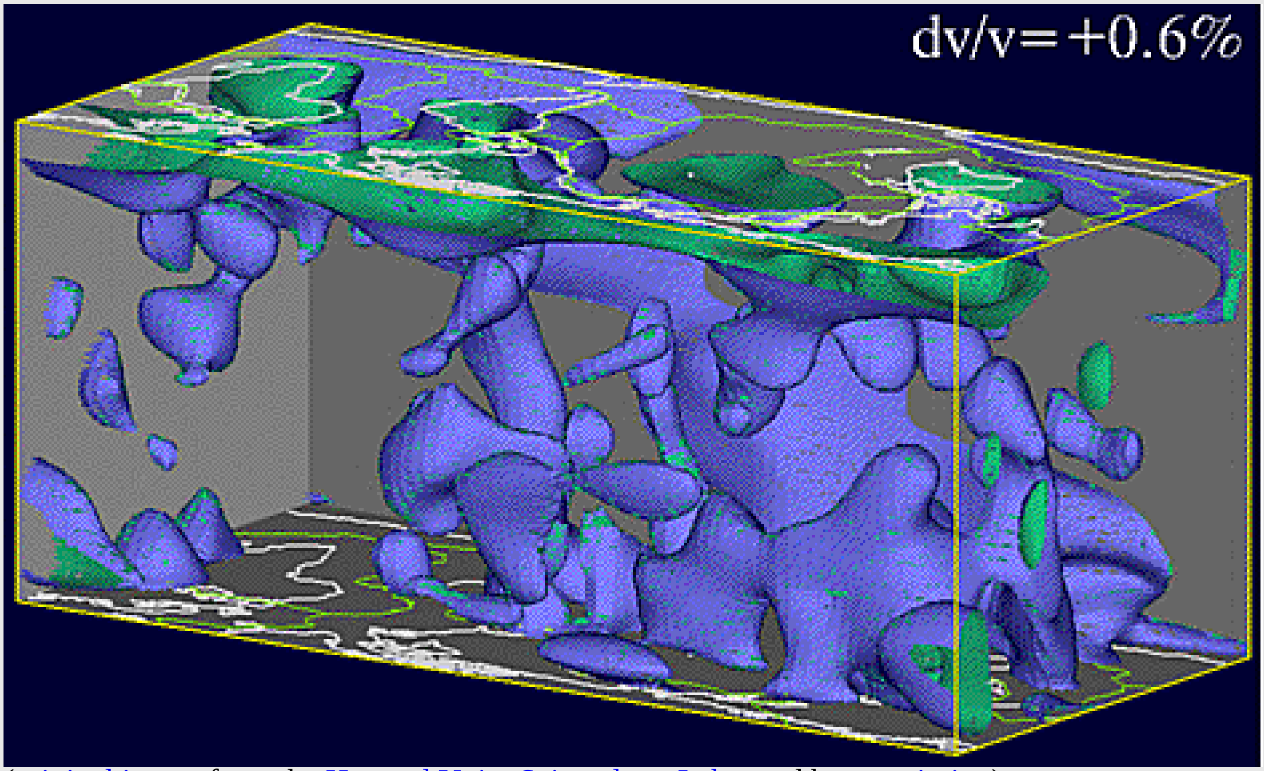


(from [Acton and Petronotis, *EOS*, 1994]; [Amer. Geophys. Union])

This map of the **Pacific Plate** at various stages of geologic history could be constructed from the tape recording. Such maps show how the [tectonic plates] have re-arranged themselves over the last 200 million years.

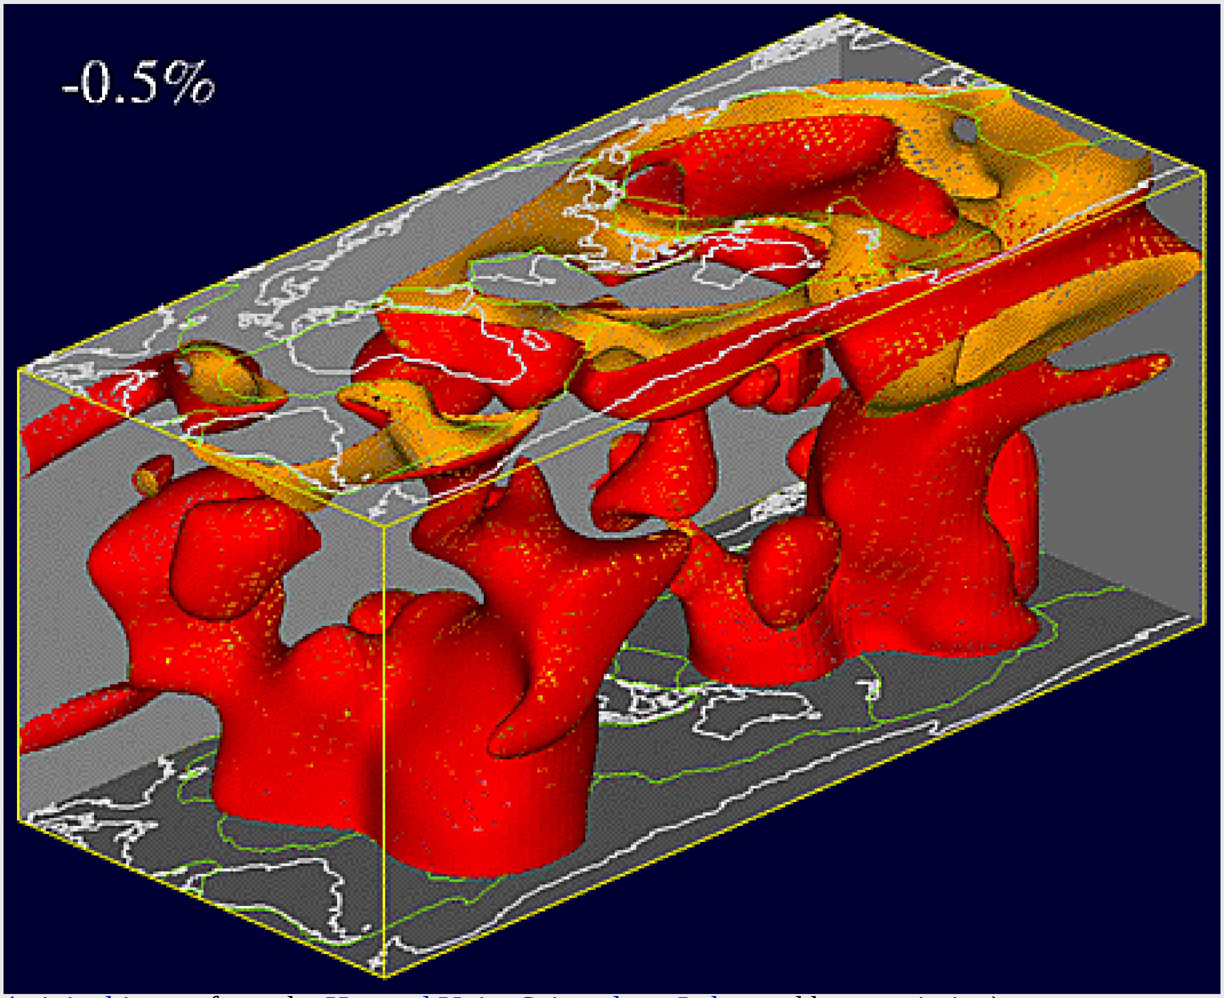
Exploring the Earth's Mantle

Convection and the release of heat from the Earth's core drives further convection to release heat from the mantle. Convection in the mantle drives [plate tectonic] motions of the sea floor and continents. It is possible to use P waves and S waves traveling through the mantle from earthquakes to map out this convection, much like a hospital CAT scan can map out bones and organs with x-rays.



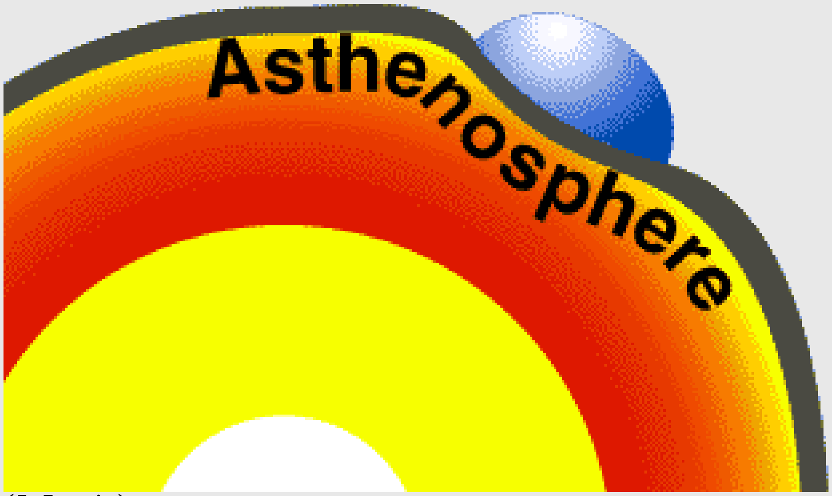
(original image from the Harvard Univ. Seismology Lab; used by permission)

In this view of a flattened-out mantle from the northwest, the blue blobs show where colder, denser material is sinking into the mantle. Near the surface, most of the colder material is in the ancient roots of continental **cratons**. **Subducting slabs** of oceanic **lithosphere** also appear, being recycled into the mantle from oceanic **trenches**.



(original image from the Harvard Univ. Seismology Lab; used by permission)

In this view from the southwest the red blobs are warmer plumes of less dense material, rising principally into the ocean-ridge spreading centers. A huge plume seems to be feeding spreading at the East Pacific Rise directly from the core. Most of the heat being released from the earth's interior emerges at the fast-spreading East Pacific Rise.

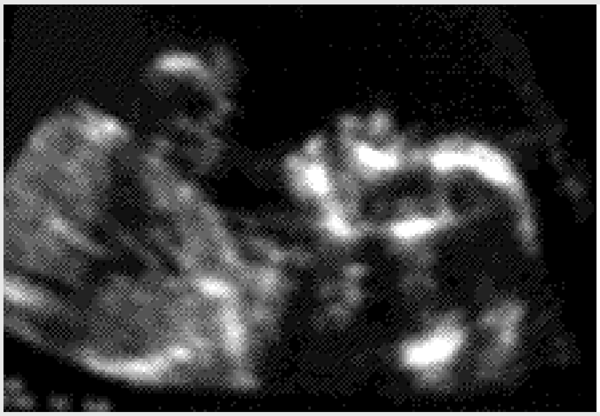


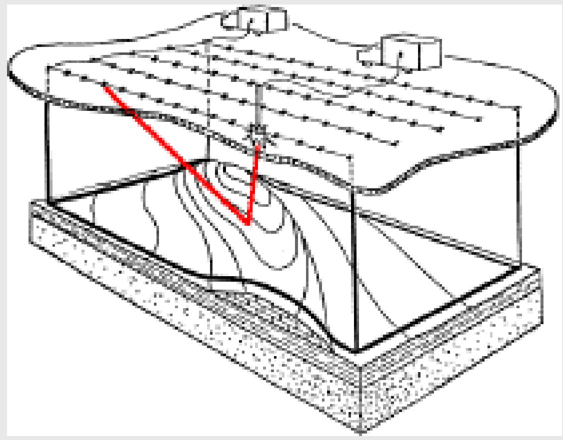
(J. Louie)

The part of the mantle near the crust, about 50-100 km down, is especially soft and plastic, and is called the **asthenosphere**. The mantle and crust above are cool enough to be tough and elastic, and are known as the **lithosphere**. A heavy load on the crust, like an **ice cap**, large glacial lake, or mountain range, can bend the lithosphere down into the asthenosphere, which can flow out of the way. The load will sink until it is supported by **buoyancy**. If an ice cap melts or lake dries up due to climatic changes, or a mountain range erodes away, the lithosphere will buoyantly rise back up over thousands of years. This is the process of **isostatic rebound**.

Exploring the Earth's Crust

The nearby crust of the Earth can be explored in great detail with echo-sounding techniques, a kind of acoustic radar. These methods give images in cross section very similar to hospital **sonograms**:

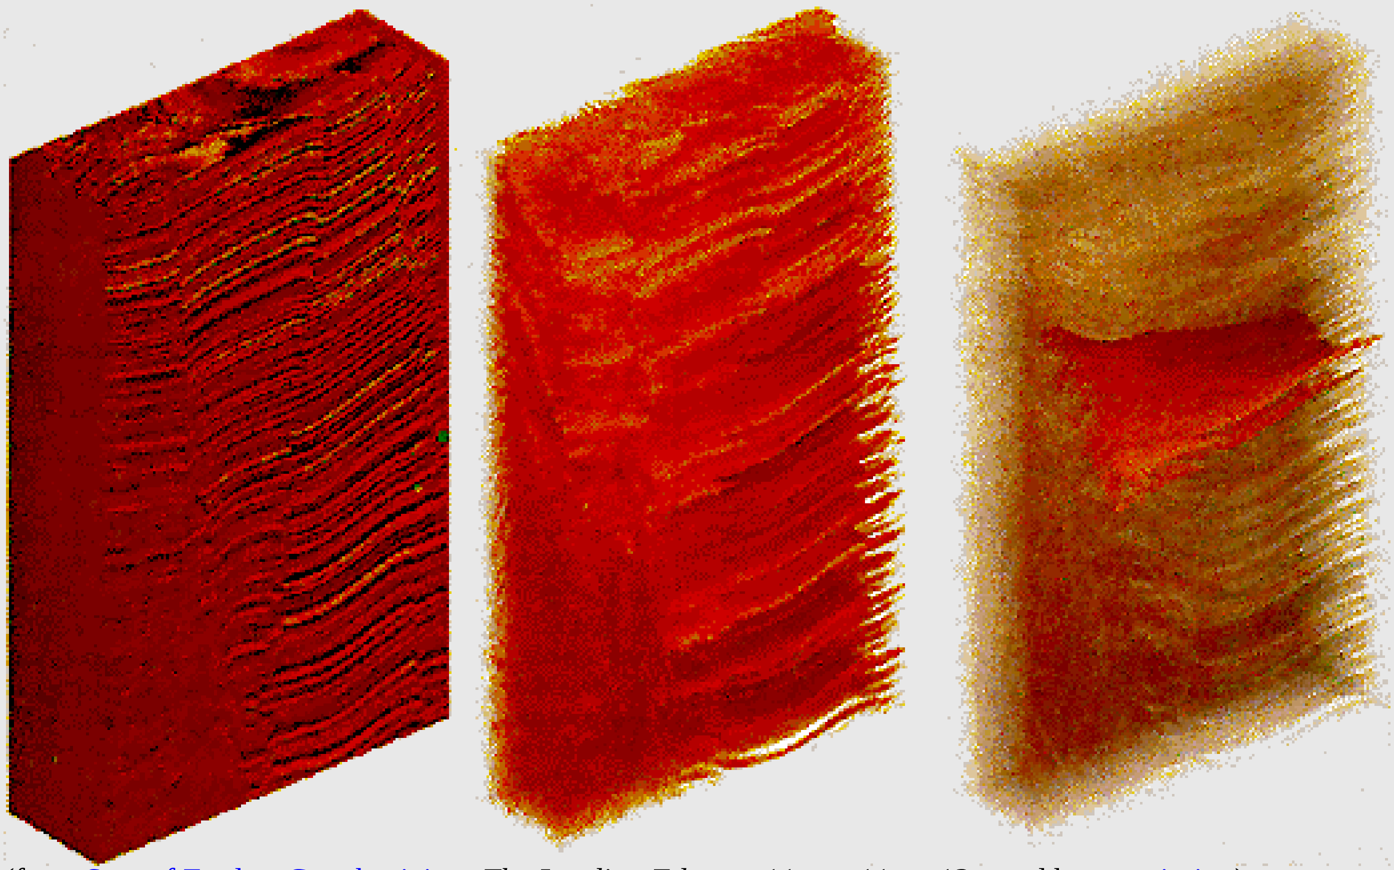




(J. Louie; M. Hewitt, Soc. of Explor. Geophysicists)

A sonogram in the crust is called a **seismic reflection** section. Seismic waves from small explosions or thumper trucks send back echoes from rock layers many kilometers down that arrays of **seismograph** instruments can pick up.

Seismic reflection sections can show blocks of the crust in great detail. Individual layers can be studied for their potential to hold oil, gas, or water; to conduct contaminants from a dump site; or to describe their geologic origin and history.

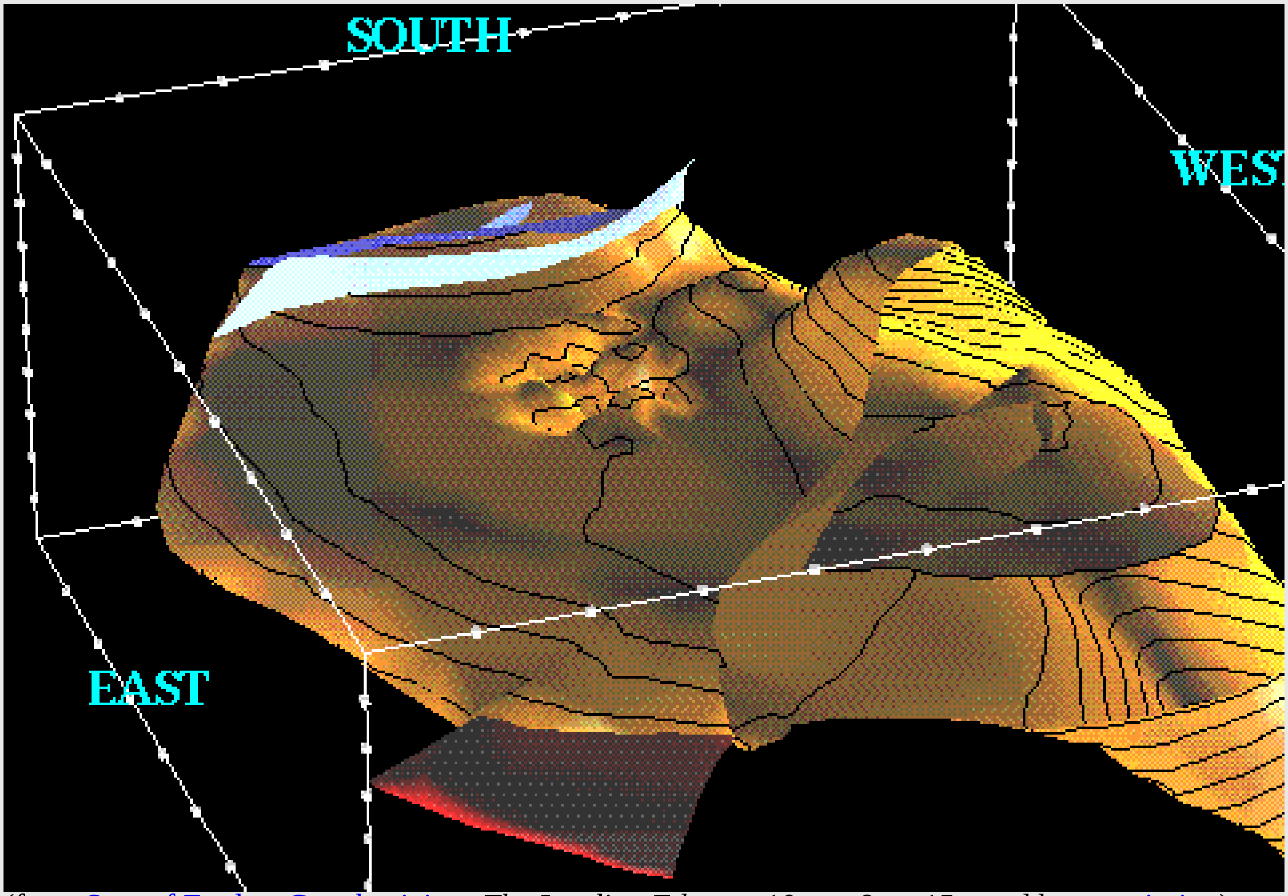


(from Soc. of Explor. Geophysicists, *The Leading Edge*, *v. 11*, no. 11, p. 13; used by permission)

This study of one layer maps out an ancient network of sandy **stream channels**, much like the modern channels of the Laramie River, right. Such buried channels can yield oil or gas easily if seismic reflection work can pinpoint their locations.

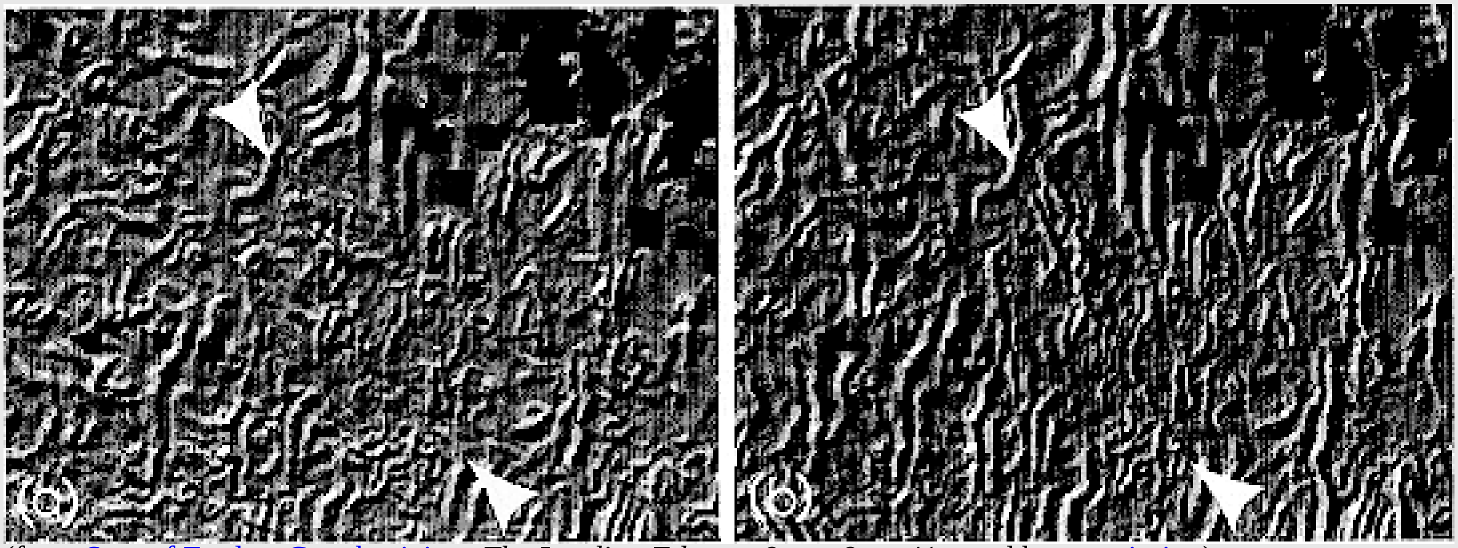
(from Soc. of Explor. Geophysicists, *The Leading Edge, v. 12*, no. 6, p. 683; *v. 11*, no. 8, p. 13; used by permission)

Development geophysicists can build detailed models of complex structures having many different formations deformed by all types of faults and folds. With these details they can plan the extraction of oil, gas, coal, or other minerals. They can also predict how **ground water** may flow through an area, and find the most efficient strategies to clean up contamination.



(from Soc. of Explor. Geophysicists, *The Leading Edge, v. 10*, no. 8, p. 15; used by permission)

Geophysicists can also make maps of other physical properties that rocks show over an area. **Gravitational pull, magnetic field strength, electrical conductivity, radioactivity**, and **spectral reflectance** are all properties that may be used to detect particular rock formations of economic or geologic interest, even if they are buried below the surface.

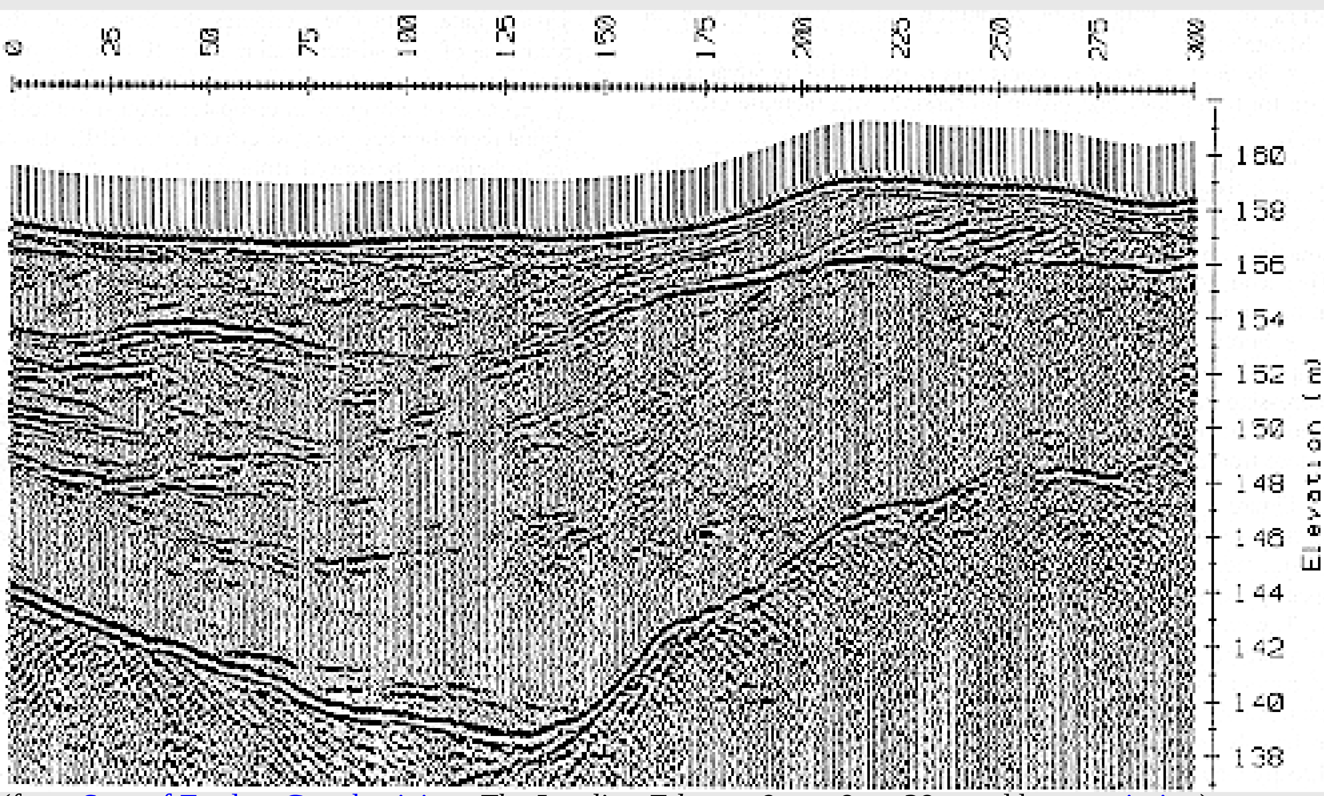


(from [Soc. of Explor. Geophysicists](), *The Leading Edge, v. 9*, no. 9, p. 41; used by [permission]())

The maps above are derived from maps of magnetic field strength in a part of Nevada. Computerized artificial illumination from the right direction reveals a subtle **lineament** in the image. A buried, slightly magnetized **dike** could contain gold ores.

Engineering and Environmental Assessments

Very high-resolution geophysical methods can help geologists wishing to make detailed environmental or engineering studies of rock masses near the surface. Such seismic reflection studies require sources of waves no more powerful than a hammer blow.



(from [Soc. of Explor. Geophysicists](), *The Leading Edge, v. 9*, no. 9, p. 39; used by [permission]())

The image above is the output of a **ground-probing radar**, which is very good at locating buried pipes, cavities, fractures, and metallic objects. Here it reveals the detailed structure of a soil layer only 20 m thick, showing channels likely to collect contaminated ground water.

J. Louie, 10 Oct. 1996

More about earthquakes | Nevada Seismological Lab | Nevada earthquakes | Univ. of Nevada, Reno

---

Earthquake Effects

The effects of any earthquake depend on a number of widely varying factors. These factors are all of:

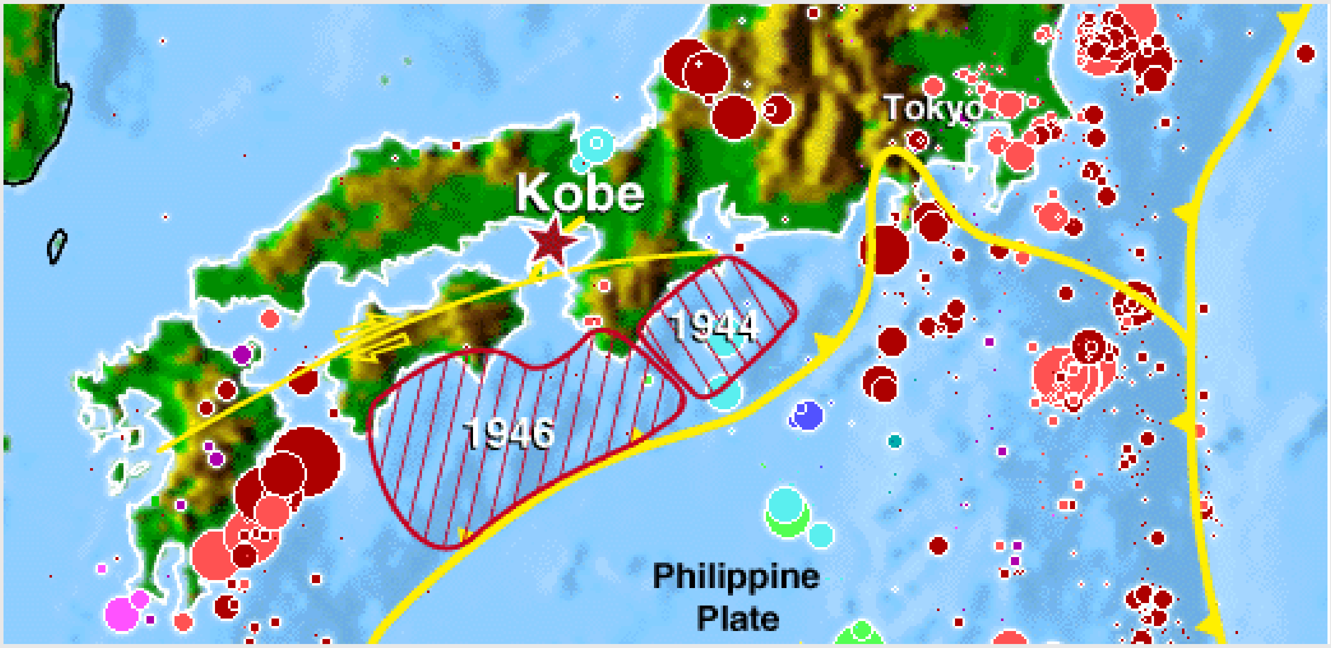
- **Intrinsic** to the earthquake - its magnitude, type, location, or depth;
- **Geologic** conditions where effects are felt - distance from the event, path of the seismic waves, types of soil, water saturation of soil; and
- **Societal** conditions reacting to the earthquake - quality of construction, preparedness of populace, or time of day (e.g.: rush hour).

One can count the number of deaths caused by large earthquakes to compare the results of all these disparate factors in combination. The Oct. 17, 1989 **Loma Prieta** earthquake occurred in the least-populated area of the generally urban San Francisco peninsula. Construction standards in the area are relatively high, and the populace relatively prepared. However, soft, highly-saturated soils near San Francisco Bay caused some spectacular failures of large highway structures unusually far away from the event. Even though it was rush hour, many fewer cars were on the roads due to the start of the opening game of the World Series, being played locally. Thus deaths were limited to about 75.

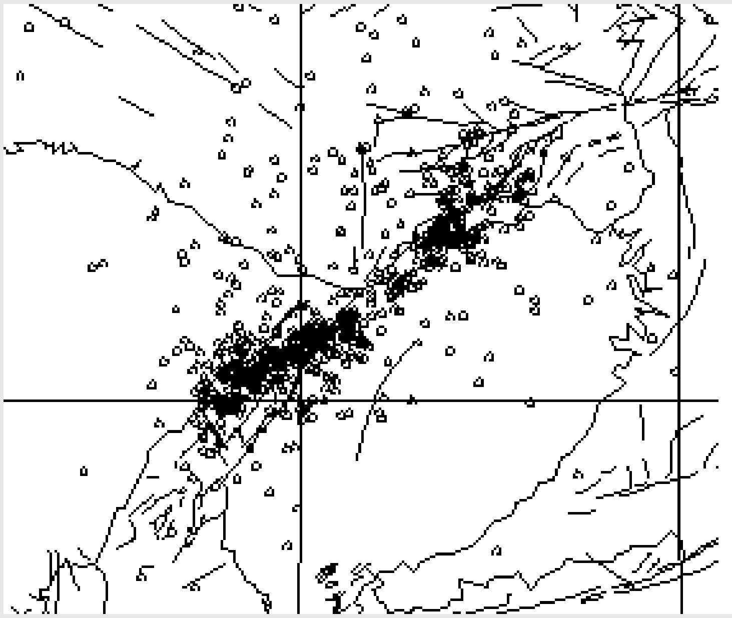
On the other hand, the same year an earthquake of nearly identical energy struck the war-torn country of **Armenia**, between Russia and Turkey. It was located much closer to the major cities of the region, where poorly-engineered houses of unreinforced concrete collapsed on their occupants during the night. The number of fatalities passed 25,000.

Jan. 17, 1995 Hyogo-Ken Nanbu Earthquake

The worst earthquake catastrophe in years occurred on western Honshu Island early this year. More than 5000 people perished in southern Hyogo prefecture, most in the city of Kobe, Japan's most important port. The loss of so many lives, in a country where so much effort had been made to prepare for earthquakes, shocked observers worldwide. However, the magnitude of this catastrophe is probably due to a terrible coincidence of a few simple seismological and societal factors, which may become clear in the photos below.



(from the USGS) Kobe is located farther than many other cities in Japan from the dangerous intersection of three tectonic plates: the Pacific, Eurasian, and Philippine. This **triple junction** is a junction of three compressive **subduction zones**. The red-hatched areas above are the parts of the subduction fault that had aleady broken in great earthquakes in 1944 and 1946. Kobe is also somewhat off the **Median Tectonic Line**, a zone of **strike-slip** faults.



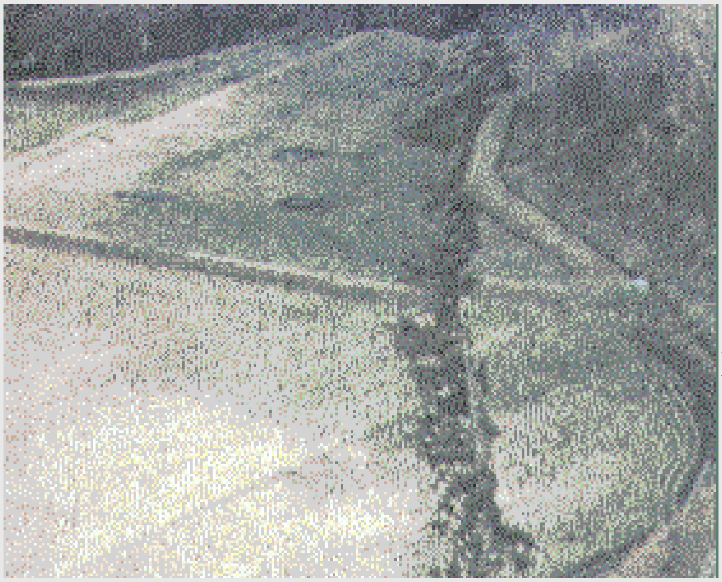
(from the Earthquake Research Institute, Tokyo) This map shows the **epicenters** of the earthquake's **aftershocks** within the first two days afterward. Decades of observation show that the most reliable way to locate the fault that broke in any earthquake is to observe where aftershocks are concentrated. This map shows that the earthquake fault obliquely cut the north side of Awaji Island, and cossed the bay to run along the Honshu coast directly below the city of Kobe. Probably the most important coincidence leading to the mass casualties was this ``direct hit" of the city by such a large faulting event. There was no intervening distance to mitigate the effects. The **Northridge** area of Los Angeles suffered a similar coincidence in January 17, 1994.

Direct Effects

There are two classes of earthquake effects: **direct**, and **secondary**. Direct effects are solely those related to the deformation of the ground near the earthquake fault itself. Thus direct effects are limited to the area of the exposed fault **rupture**. Many earthquake faults (such as at Northridge) never break the surface, ruling out direct effects. In the Hyogo-Ken Nanbu event, surface rupture of the fault was observed only in a rural area of Awaji Island, with displacements of up to 3 meters. Few structures were near enough the fault to be damaged by the displacement, although underground utilities, fences, and irrigation ditches were cut. Rice paddies were thrown far out of level.

(taken by the Geographical Survey Institute of Japan; used by permission.)

Aerial view of the fault rupture on northern Awaji Island, taken on January 18th, the day after the event. From left to right along the rupture, a **landslide** from the rupture covers a road; a fault **scarp** across a rice paddy; a **right-lateral** offset in a dirt road (inset); and three more pointers to the scarp. Note how little damage there apparently is to homes even very close to the fault.

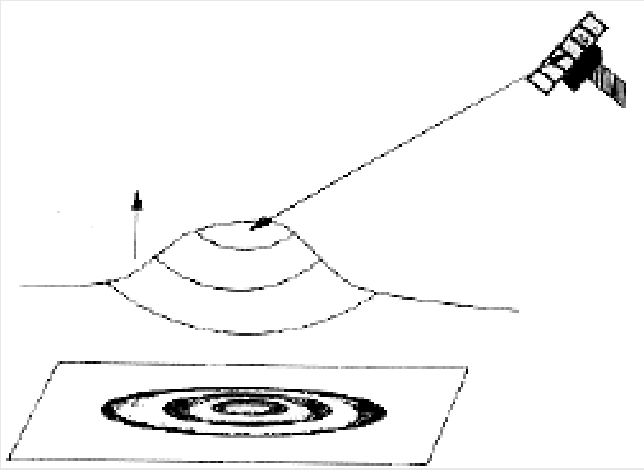


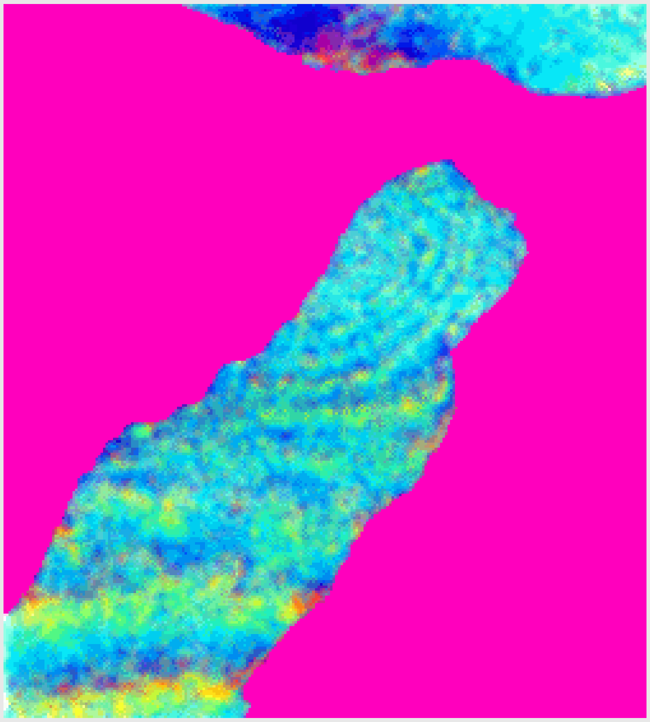
(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

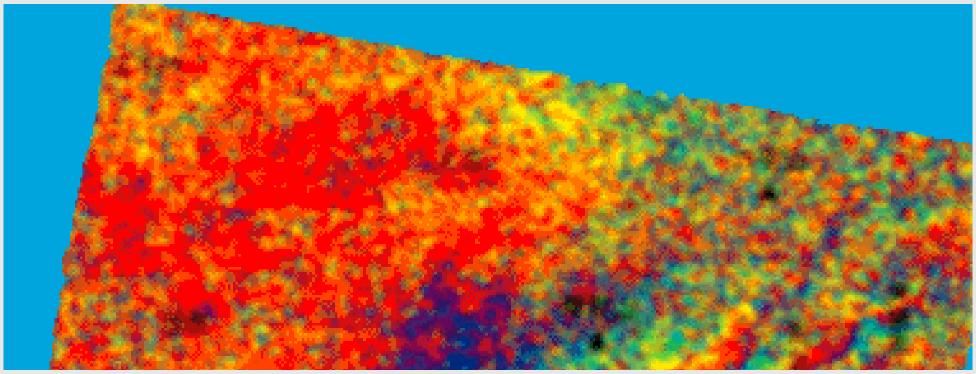
View along the fault **scarp** on Awaji Island. The section of rice paddy to the right has been uplifted by more than one meter. Note the cut road in the foreground. It is often possible to measure the displacement and length of the exposed fault rupture to estimate the **slip** and **area** of the subsurface fault, providing an independent estimate of the earthquake's magnitude.

Photo from the Japanese edition of Newsweek showing the fault scarp. Note the horizontal as well as vertical offset shown by the dike in the rice field. Well-built structures often escape major damage even so close to a seismogenic fault.

Elastic rebound, the permanent deformation of the ground due to the fault rupture, will extend many kilometers from the fault itself, and is often measurable even where the rupture itself remains buried. In the past **geodesists** have had to make painstaking and expensive surveys, visiting hundreds of field sites, to measure deformation of an area struck by an earthquake.

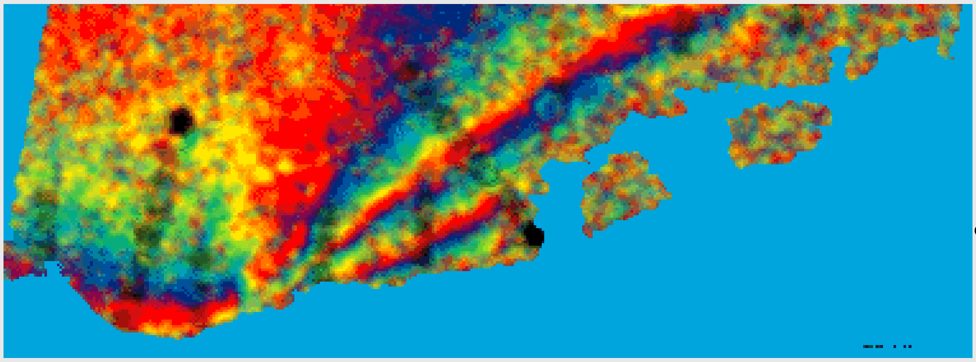






(analyzed by the Geographical Survey Institute of Japan and the National Space Development Agency of Japan; used by permission.)

Lately **planetary geophysicists** have developed a quick way to make a map image of deformation

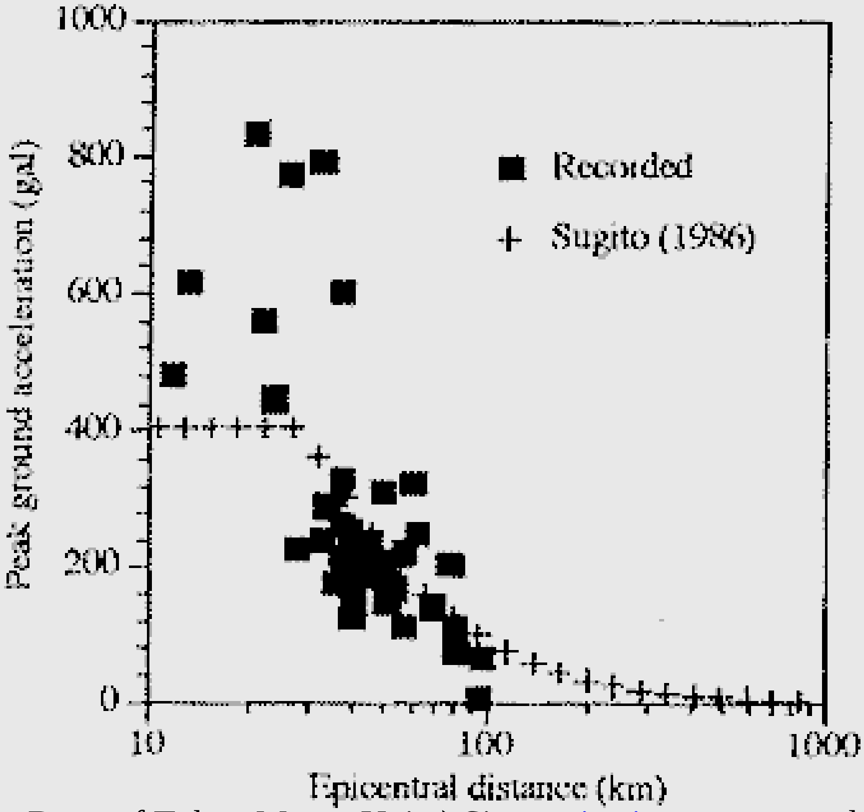


using satellite **radar interferometry**. They compare satellite microwave-radar images of a region taken before and after the event. Any area displaced toward or away from the spacecraft's positions will form an **interference pattern**, tracing out contours of equal displacement. The map image above of Awaji Island shows eight or more colored interference fringe lines approaching the fault, at 11 cm of vertical displacement per fringe contour, demonstrating almost 1 meter of uplift by the earthquake. At left, two fringes parallel the coast through the city of Kobe, showing about 20 cm of displacement across the city from the buried fault.

Secondary Effects

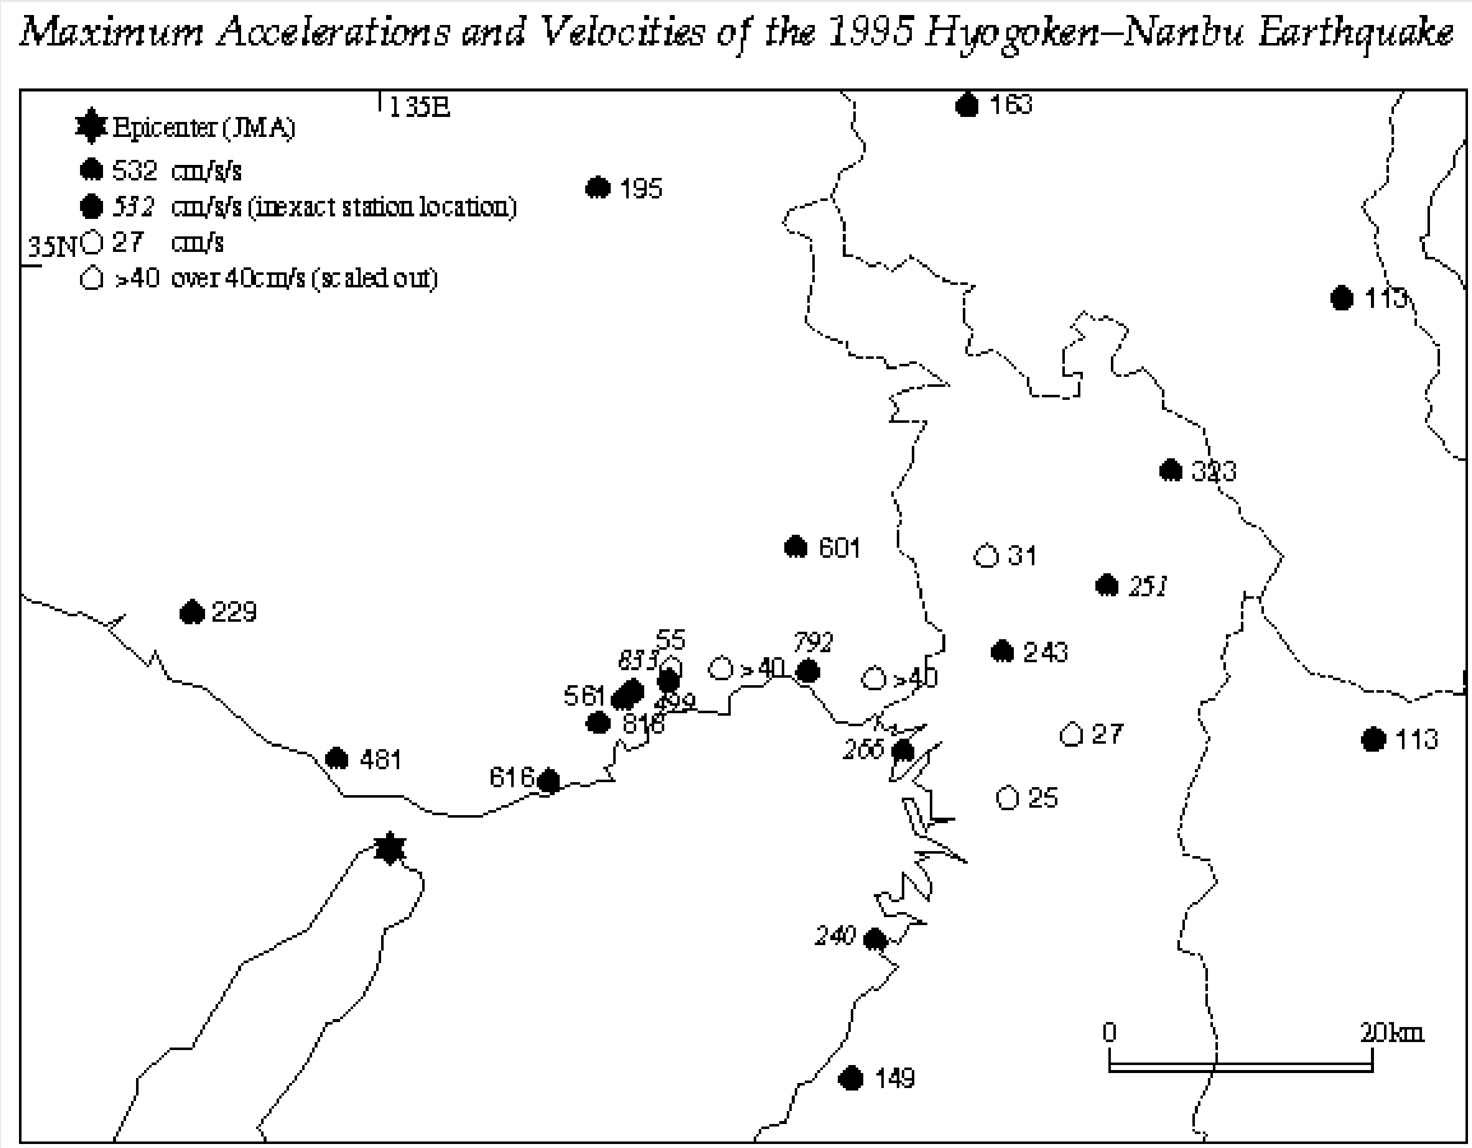
Most of the damage done by earthquakes is due to their **secondary effects**, those not directly caused by fault movement, but resulting instead from the propagation of seismic waves away from the fault rupture. Secondary effects result from the very temporary passage of seismic waves, but can occur over very large regions, causing wide-spread damage. Such effects include: **seismic shaking; landslides; liquefaction; fissuring; settlement;** and the **triggering of aftershocks and additional earthquakes**.

Seismic Shaking

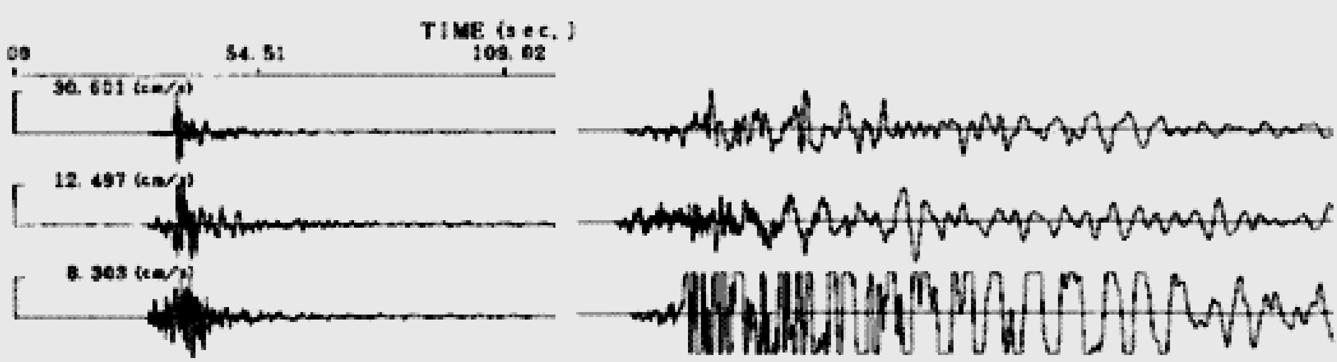


(from the Architecture Dept. of Tokyo Metro. Univ.) Since seismic waves spread out from their source just like ripples on a pond, they get weaker the farther you get from the earthquake. The **ground**

acceleration versus distance plot at left shows this effect near Kobe. An acceleration of 1000 gal for seismic waves in the ground would be equal to the acceleration of gravity; so if it acted straight up it would be able to throw any object into the air. These accelerations are mostly from side-to-side, so even at only 50% of the acceleration of gravity are capable of toppling anything standing. Note that the recorded acceleraction can vary by a factor of two or three, especially near the fault.



(compiled by the Earthquake Research Institute, Tokyo) The great differences in secondary effects even between adjacent localities is shown by this map of instrumentally-recorded ground accelerations and velocities. Although the measurements do fall with distance from the epicenter, adjacent sites can vary by more than 50%. Such variation is usually caused by variation in the soil conditions.



(from the Architecture Dept. of Tokyo Metro. Univ.) The seismograms above were recoded at two different sites near Kobe. On the left are three records of the sharp pulse, lasting less than 15 s, recorded at a station founded in relatively **solid rock**. On the right are three records of the strong and extended shaking, lasting two or even three minutes, at sites near the coast having **soft, thick, water-saturated soils**. The geological conditions right at a particular site play a crucial role in the strength, and length, of seismic shaking that can be experienced there. In all earthquakes, low-lying areas having soft, water-saturated soils experience by far the most damage.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Since most seismic shaking is side-to-side, a shaken structure will undergo **shear** as this house front in Kobe did. **Shear** is the bending of right angles to other angles. As it is much more difficult to shear a triangle than a rectangle, effective seismic design requires triangular bracing for shear strength.

(from Kobe University) This wooden house collapsed during the seismic shaking. It is likely that its heavy roof of ceramic tile created more shear force than its wood frame was built to resist. Tile roofs are popular in Japan.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Behind this completely collapsed wood-frame house is a house of reinforced concrete that suffered no structural damage. The number of wood versus masonry buildings that collapsed in Kobe astonished most observers, as wood-frame structures are usually thought to be much better at resisting shear forces. Possibly the concrete house was better-designed and stronger even for its greater weight. The proportionally heavier tile roofs on wooden houses also might have been a factor.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Another anomaly was the large number of about 20-year-old high rise buildings that collapsed at the fifth floor. The older version of the code they were built under allowed a weaker superstructure beginning at the fifth floor.

(from Kobe Univ.) This photo demonstrates the extreme danger of being in the street during seismic shaking. Signs, windows, and the entire fronts of buildings collapsed into the street. During an earthquake, it is usually much safer to find shelter under strong furniture inside than to run out of a building. Exit carefully after the shaking stops.

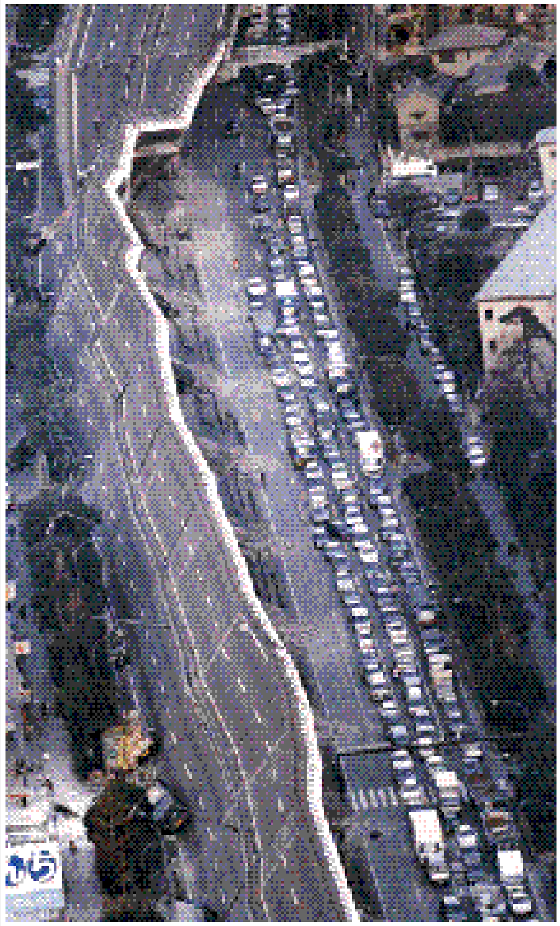
Effects on Lifelines

Debris choking streets was just one of the coincidences that made this earthquake so deadly. Almost all utilities, roadways, railways, the port, and other **lifelines** to the city center suffered severe damage, greatly delaying rescue efforts. Most lifelines in Kobe were constructed 20-30 years ago, before the most modern construction standards were put into practice.

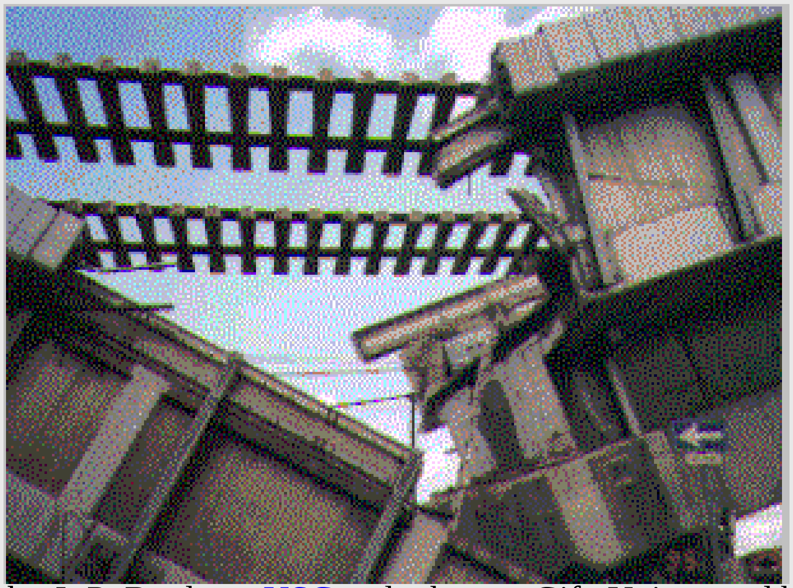
(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)
This elevated highway formed an **inverted pendulum** that the supporting columns were not able to restrain under shear during seismic shaking.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

The columns above show a failure typical of somewhat older reinforced concrete structures throughout the world. The vertical steel rods can hold the weight of the structure just fine when that weight is exerted straight down, as usual. During seismic shaking much more steel wound around the rods horizontally can keep the column from breaking apart under the shear forces. Stronger columns are more expensive to build.



(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission; and from Japanese TV) Large sections of the main Hanshin Expressway toppled over. This was particularly likely where the road crossed areas of softer, wetter ground, where the shaking was stronger and lasted longer.



(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Many elevated structures were simply pulled apart by differential movements, here leaving the welded rails and ties suspended.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Below one intersection a subway station collapsed, leaving the road above to sink unpredictably for months until it could be excavated.

Fire

The destruction of lifelines and utilities made it impossible for firefighters to reach fires started by broken gas lines. Large sections of the city burned, greatly contributing to the loss of life.

(from the Univ. of Texas)

Most of the destruction of San Francisco from the 1906 earthquake was also due to fire. The city installed an entirely independent water system for firefighting, with its own reservoirs. The 1989 earthquake broke a firefighting water main near the Mission Street Post Office, draining the entire system in less than 15 minutes. Fortunately most damage and fires were confined to low-lying districts of the city near the Bay, and fireboats were available to pump bay water as much as one mile inland. Only a few blocks were lost.

Liquefaction

One of the reasons that areas of soft, water-saturated soil are hazardous is their potential to **liquefy** during strong seismic shaking. The shaking can suspend sand grains in waterlogged soil so that they loose contact and friction with other grains. Soil in a state of liquefaction has no strength and cannot bear any load.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Commonly a soil layer on the side of a hill will liquefy during seismic shaking and flow as a landslide or mudflow, as above.

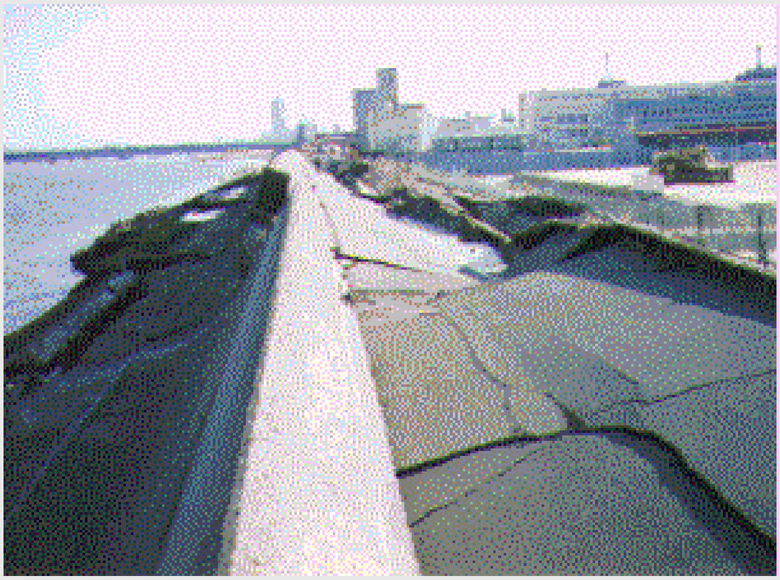
(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

A liquefied sand layer can shoot to the surface through cracks, forming a **sandblow** or **sandboil**, and depositing a characteristic lens of sand on the ground with a volcano-like vent in the center. With all the material in the layer forced to the surface, the surrounding area sinks unevenly.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

Entire levees, dams, and other water-saturated embankments can liquefy and flow apart during strong shaking.

(from Kobe Univ.) Buildings founded on liquefied ground will lean or topple.



(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

The Kobe port, having been constructed on two artificial islands made of relatively loose fill, and always water saturated, suffered widespread liquefaction and settlement, and was incapacitated for two months. Shipping was disrupted worldwide.

(from a report by J.-P. Bardet at USC and others at Gifu Univ.; used by permission)

On the port islands settlement was so pervasive that any structure built on deep pilings, like this elevated roadway, appeared to have risen a full meter. The world's longest suspension bridge, under construction but having such foundations, was hardly damaged at all.

Previous: Richter Magnitude --- Next: Earthquake Intensity

The Modified Mercalli Scale of Earthquake Intensity

In seismology a scale of seismic **intensity** is a way of measuring or rating the *effects* of an earthquake at different sites. The **Modified Mercalli Intensity Scale is commonly used in the United States by seismologists seeking information on the severity of earthquake effects. Intensity ratings are expressed as Roman numerals between I at the low end and XII at the high end.**

The Intensity Scale differs from the Richter Magnitude Scale in that the effects of any one earthquake vary greatly from place to place, so there may be many Intensity values (e.g.: IV, VII) measured from one earthquake. Each earthquake, on the other hand, should have just one Magnitude, although the several methods of estimating it will yield slightly different values (e.g.: 6.1, 6.3).

Ratings of earthquake effects are based on the following relatively subjective scale of descriptions:

Modified Mercalli Intensity Scale

from FEMA

I. People do not feel any Earth movement.

II. A few people might notice movement if they are at rest and/or on the upper floors of tall buildings.

III. Many people indoors feel movement. Hanging objects swing back and forth. People outdoors might not realize that an earthquake is occurring.

IV. Most people indoors feel movement. Hanging objects swing. Dishes, windows, and doors rattle. The earthquake feels like a heavy truck hitting the walls. A few people outdoors may feel movement. Parked cars rock.

V. Almost everyone feels movement. Sleeping people are awakened. Doors swing open or close. Dishes are broken. Pictures on the wall move. Small objects move or are turned over. Trees might shake. Liquids might spill out of open containers.

VI. Everyone feels movement. People have trouble walking. Objects fall from shelves. Pictures fall off walls. Furniture moves. Plaster in walls might crack. Trees and bushes shake. Damage is slight in poorly built buildings. No structural damage.

VII. People have difficulty standing. Drivers feel their cars shaking. Some furniture breaks. Loose bricks fall from buildings. Damage is slight to moderate in well-built buildings; considerable in poorly built buildings.

VIII. Drivers have trouble steering. Houses that are not bolted down might shift on their foundations. Tall structures such as towers and chimneys might twist and fall. Well-built buildings suffer slight damage. Poorly built structures suffer

severe damage. Tree branches break. Hillsides might crack if the ground is wet. Water levels in wells might change.

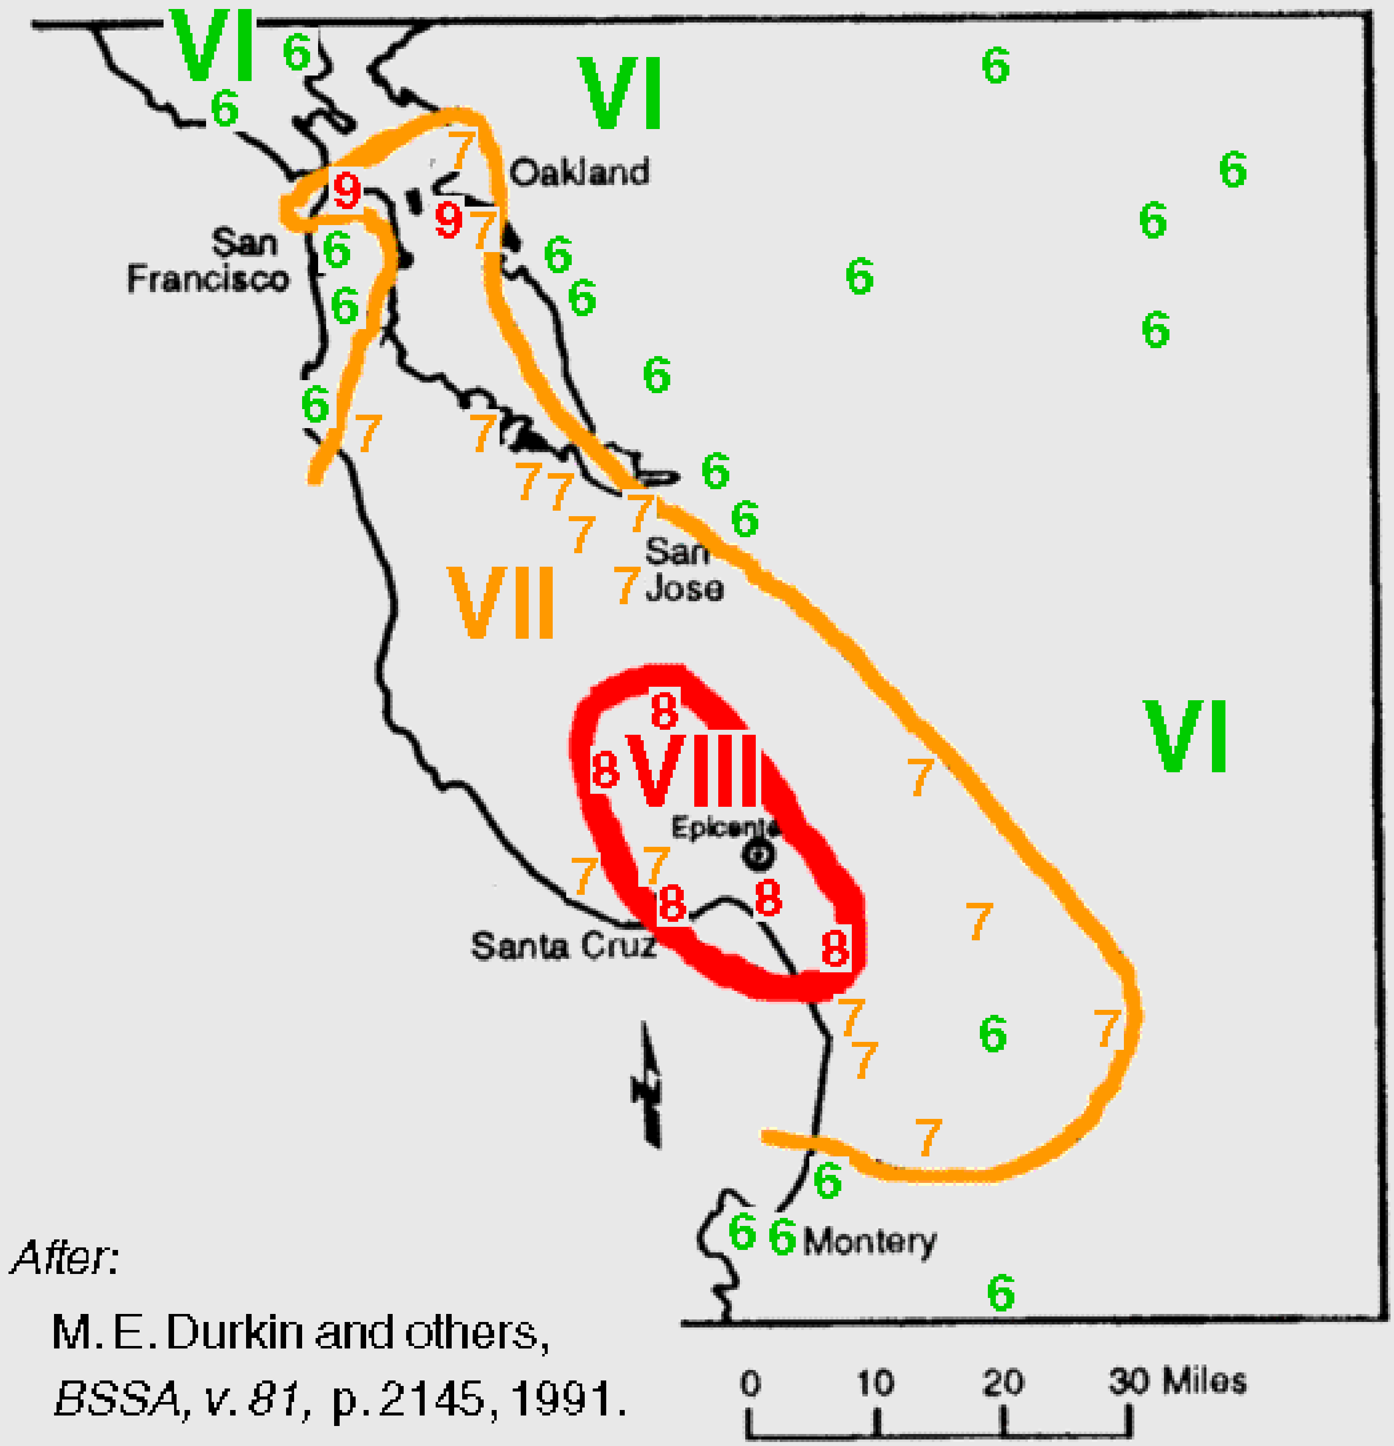
IX. Well-built buildings suffer considerable damage. Houses that are not bolted down move off their foundations. Some underground pipes are broken. The ground cracks. Reservoirs suffer serious damage.

X. Most buildings and their foundations are destroyed. Some bridges are destroyed. Dams are seriously damaged. Large landslides occur. Water is thrown on the banks of canals, rivers, lakes. The ground cracks in large areas. Railroad tracks are bent slightly.

XI. Most buildings collapse. Some bridges are destroyed. Large cracks appear in the ground. Underground pipelines are destroyed. Railroad tracks are badly bent.

XII. Almost everything is destroyed. Objects are thrown into the air. The ground moves in waves or ripples. Large amounts of rock may move.

As you can see from the list above, rating the Intensity of an earthquake's effects does not require any instrumental measurements. Thus seismologists can use newspaper accounts, diaries, and other historical records to make intensity ratings of past earthquakes, for which there are no instrumental recordings. Such research helps promote our understanding of the earthquake history of a region, and estimate future hazards.



This map plots the Mercalli Intensity ratings of localities near the Oct. 17, 1989 Loma Prieta (World Series) earthquake. It is called an *isoseismal* map, as one draws contour lines to enclose locations having higher intensities. Intensities typically increase close to an earthquake's epicenter, allowing seismologists to interpret maps such as this for the general location of historical earthquakes.

Note the locations of unusually high intensities (up to IX) far north of the earthquake's epicenter, near San Francisco Bay. During this earthquake, soft and water-saturated soils near the Bay amplified the effects of the shaking. The amplified shaking, together with soil liquefaction effects, caused some well-built structures to collapse and yielded the intensity IX rating at those locations.

It is also possible to estimate the Magnitude of an earthquake from the area of the map enclosed by isoseismal contours of certain intensities. Such estimates are, however, a subject of research and require verification.

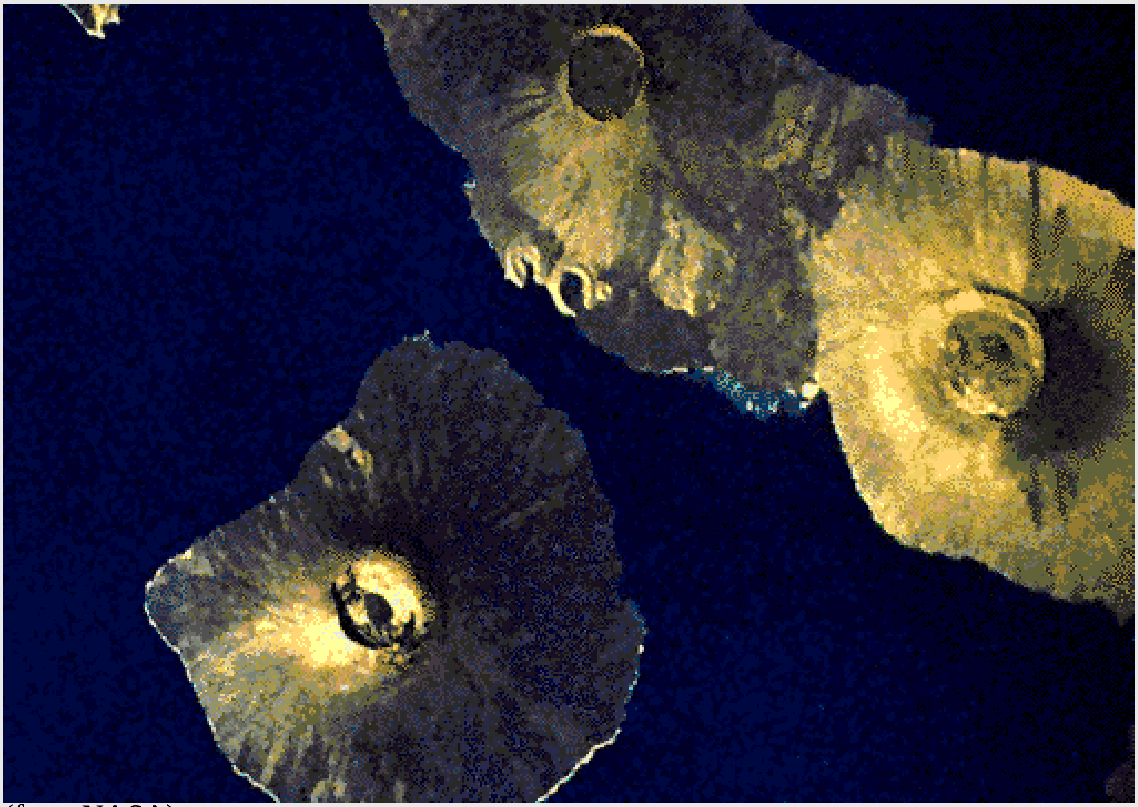
Plate Tectonics, the Cause of Earthquakes

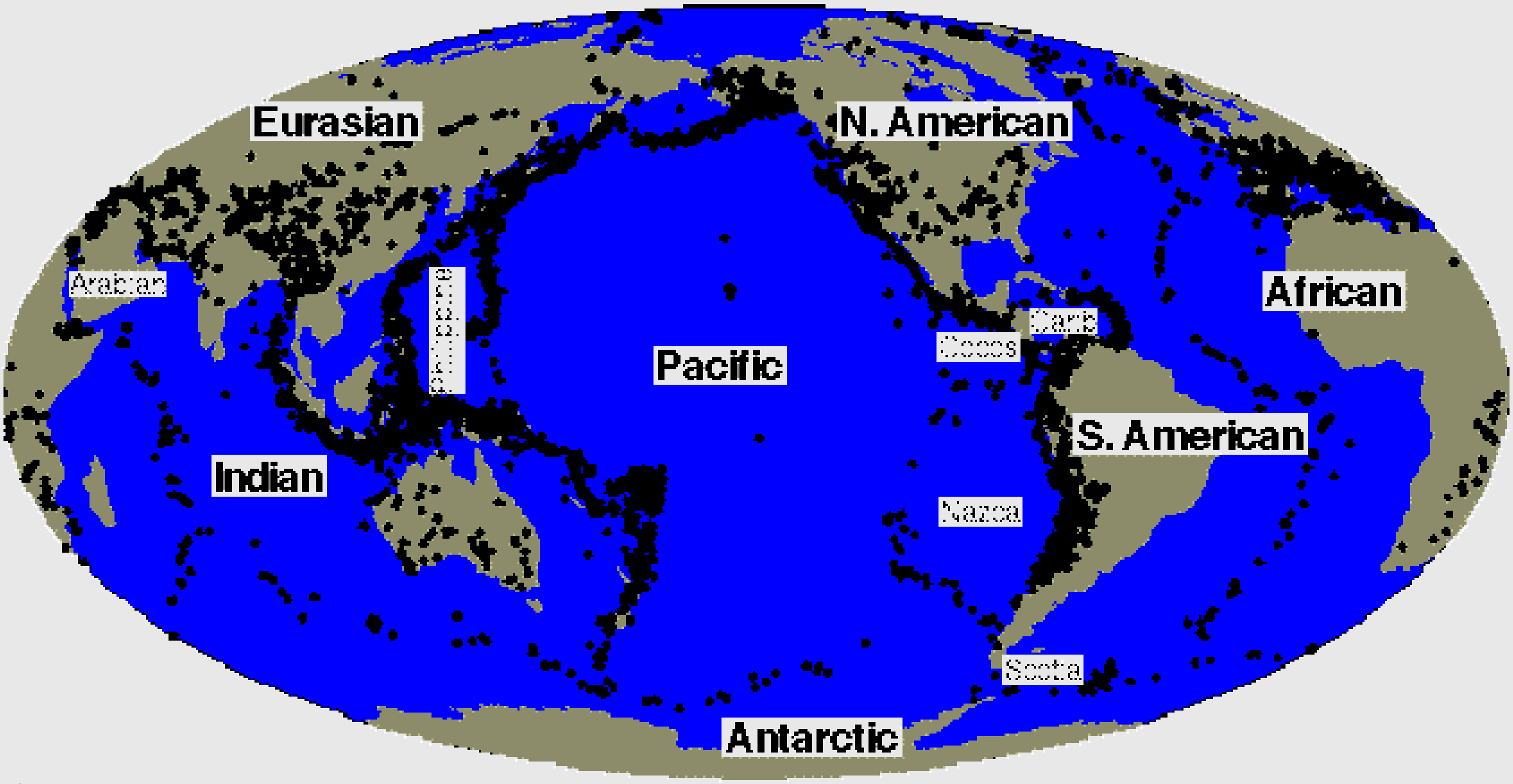
The plates consist of an outer layer of the Earth, the **lithosphere**, which is cool enough to behave as a more or less rigid shell. Occasionally the hot **asthenosphere** of the Earth finds a weak place in the lithosphere to rise buoyantly as a plume, or hotspot. The satellite image below shows the volcanic islands of the Galapagos hotspot.



(from NASA)

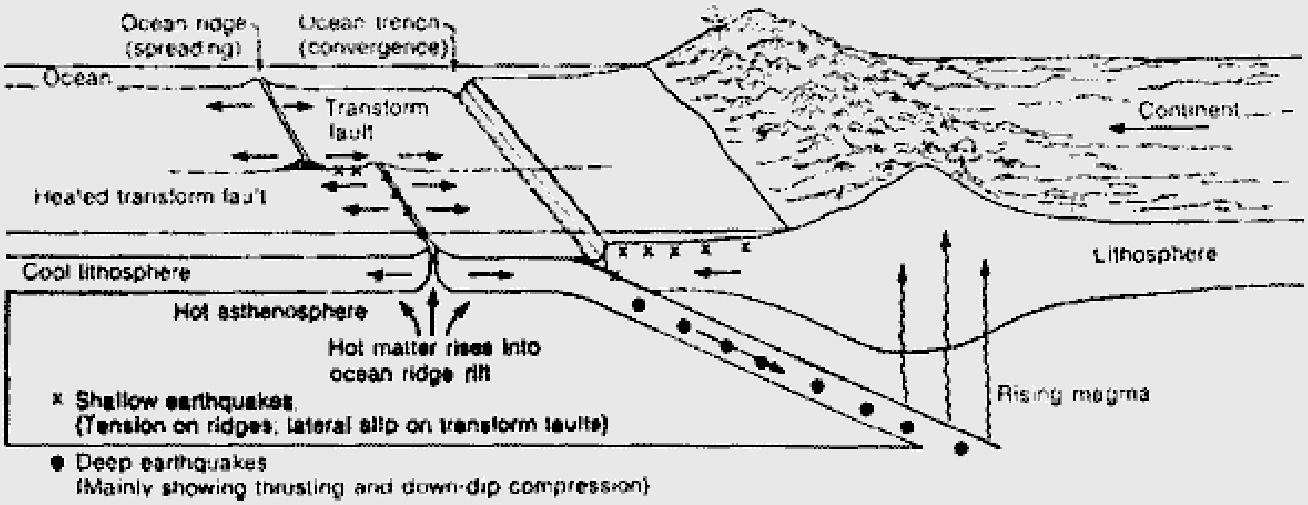
Only lithosphere has the strength and the brittle behavior to fracture in an earthquake.

The map below locates earthquakes around the globe. They are not evenly distributed; the boundaries between the plates grind against each other, producing most earthquakes. So the lines of earthquakes help define the plates:



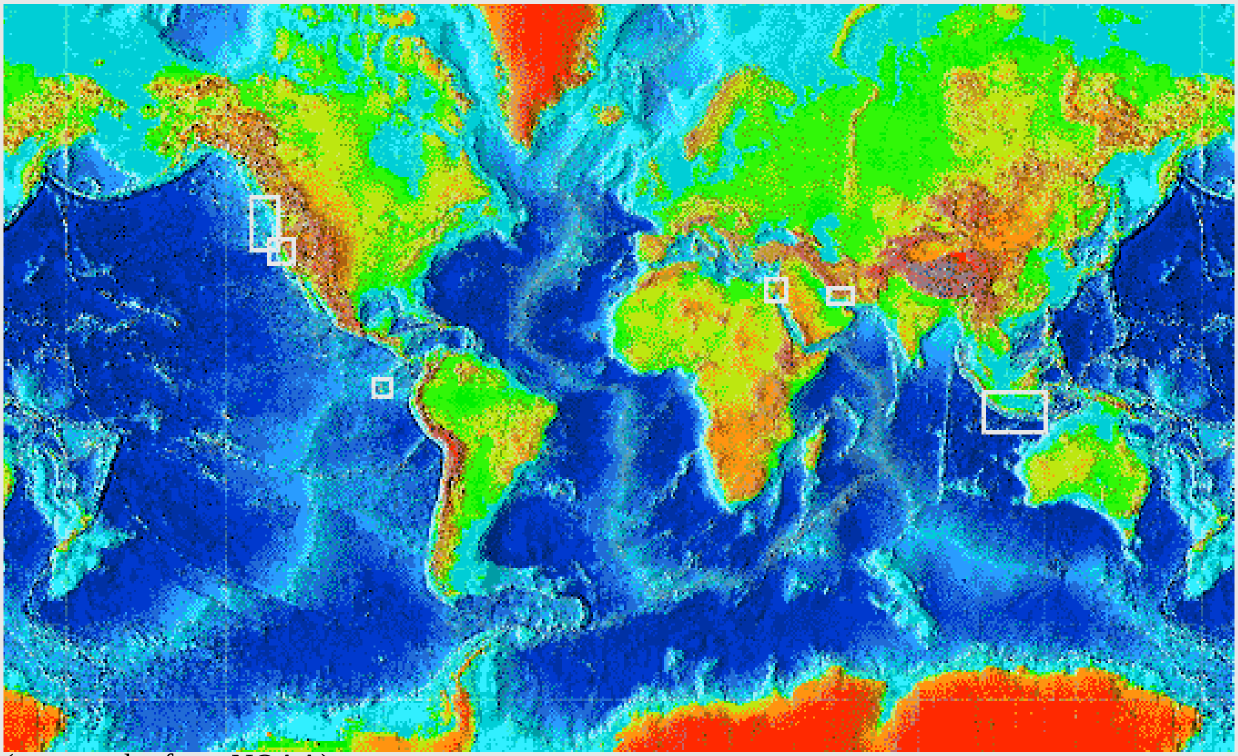
(from the USGS)

In cross section, the Earth releases its internal heat by convecting, or boiling much like a pot of pudding on the stove. Hot asthenospheric mantle rises to the surface and spreads laterally, transporting oceans and continents as on a slow conveyor belt. The speed of this motion is a few centimeters per year, about as fast as your fingernails grow. The new lithosphere, created at the ocean spreading centers, cools as it ages and eventually becomes dense enough to sink back into the mantle. The subducted crust releases water to form volcanic island chains above, and after a few hundred million years will be heated and recycled back to the spreading centers.

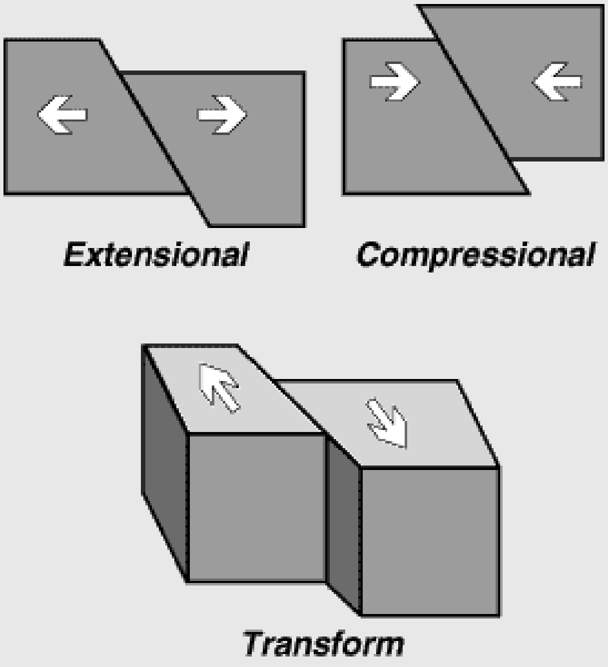


Earthquake occurrence in different plate tectonic settings:

The map below of Earth's solid surface shows many of the features caused by plate tectonics. The oceanic ridges are the asthenospheric spreading centers, creating new oceanic crust. Subduction zones appear as deep oceanic trenches. Most of the continental mountain belts occur where plates are pressing against one another. The white squares locate examples given here of the different tectonic and earthquake environments.



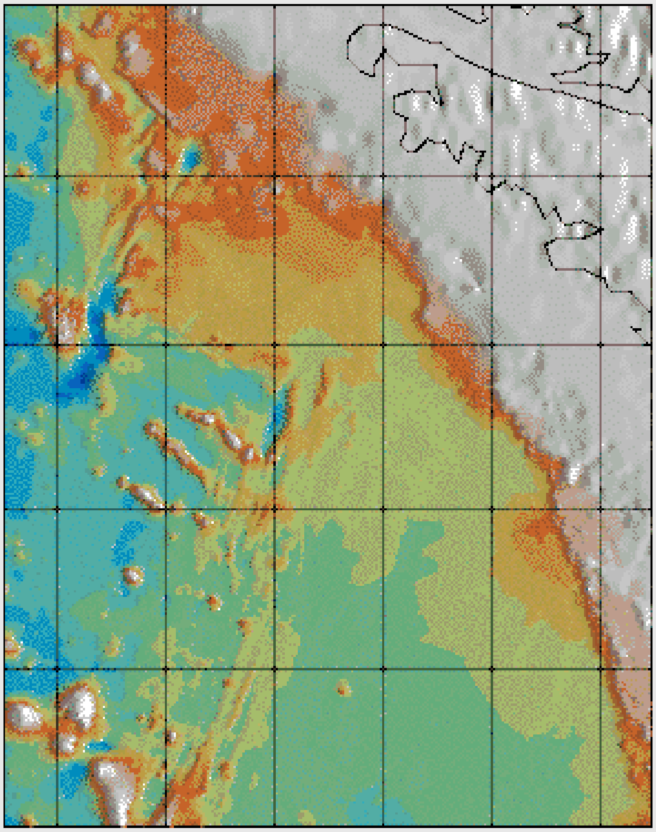
(topography from NOAA)

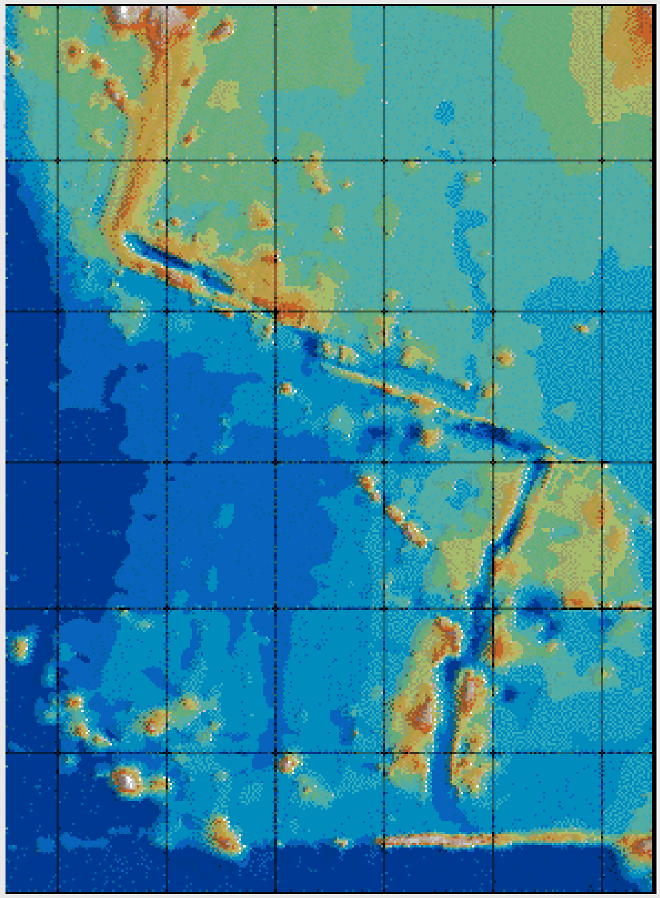


There are three main plate tectonic environments: **extensional, transform, and compressional**. Plate boundaries in different localities are subject to different inter-plate stresses, producing these three types of earthquakes. Each type has its own special hazards.

At spreading ridges, or similar *extensional* boundaries, earthquakes are shallow, aligned strictly along the axis of spreading, and show an extensional mechanism. Earthquakes in extensional environments tend to be smaller than magnitude 8. (Click here for an explanation of earthquake magnitude).

A close-up topographic picture of the Juan de Fuca spreading ridge, offshore of the Pacific Northwest, shows the turned-up edges of the spreading center. As crust moves away from the ridge it cools and sinks. The lateral offsets in the ridge are joined by transform faults.



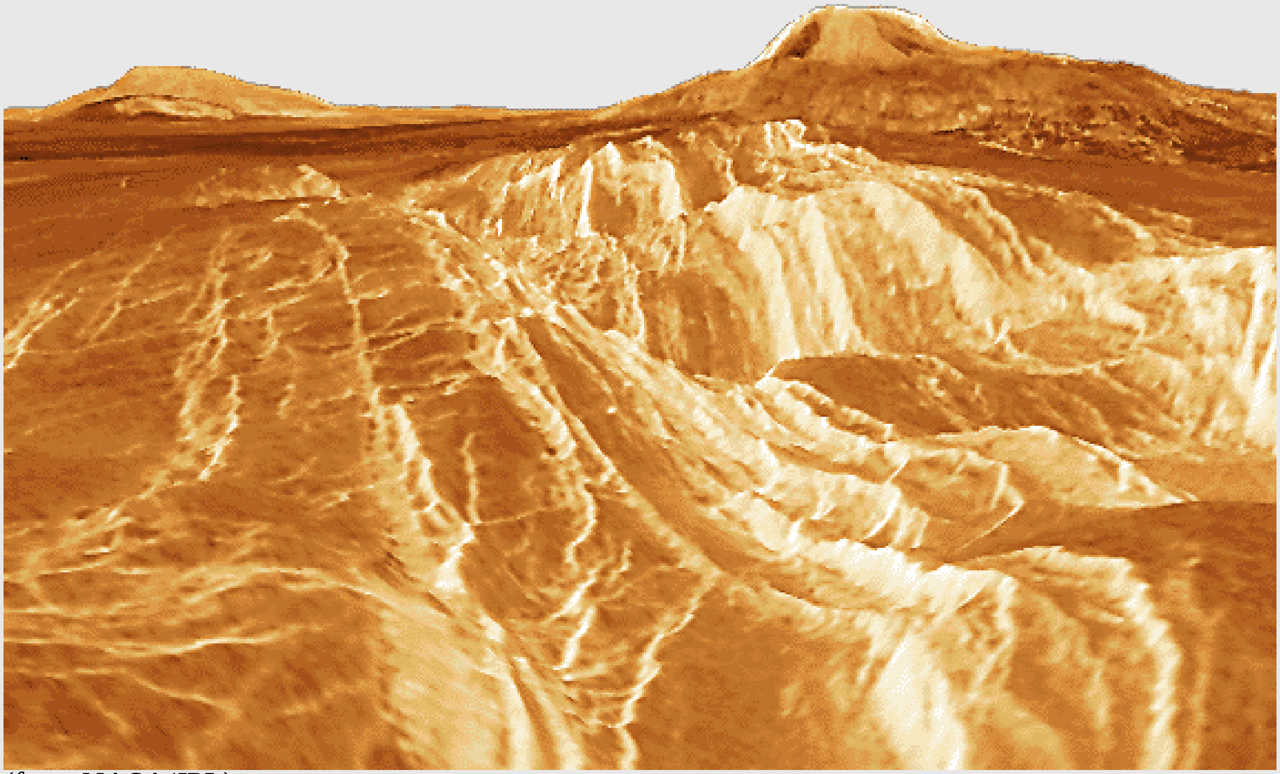


(from RIDGE, LDEO/Columbia Univ.)

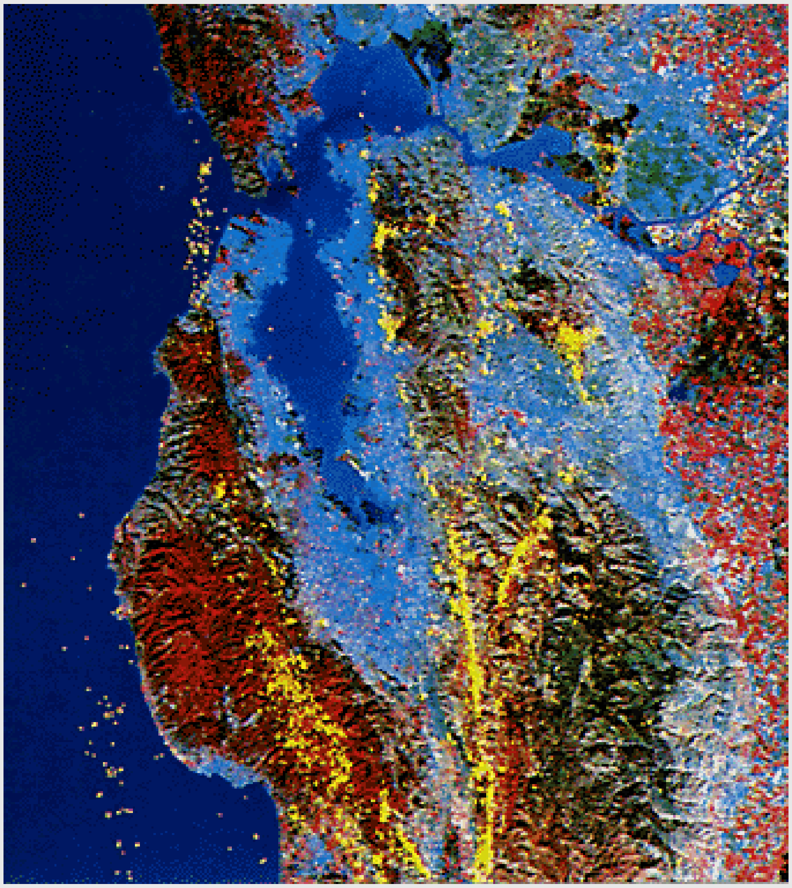
A satellite view of the Sinai shows two arms of the Red Sea spreading ridge, exposed on land.

(from NASA)

Extensional ridges exist elsewhere in the solar system, although they never attain the globe-encircling extent the oceanic ridges have on Earth. This synthetic perspective of a large volcano on Venus is looking up the large rift on its flank.



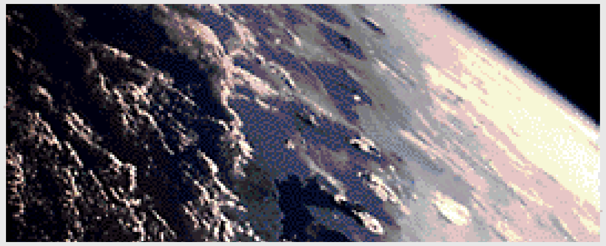
(from NASA/JPL)



(from the USGS)

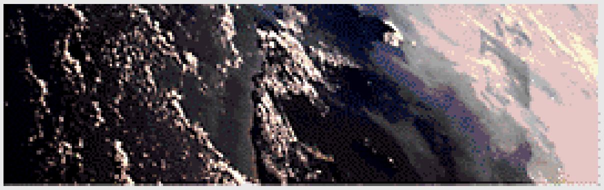
At *transforms*, earthquakes are shallow, running as deep as 25 km; mechanisms indicate strike-slip motion. Transforms tend to have earthquakes smaller than magnitude 8.5.

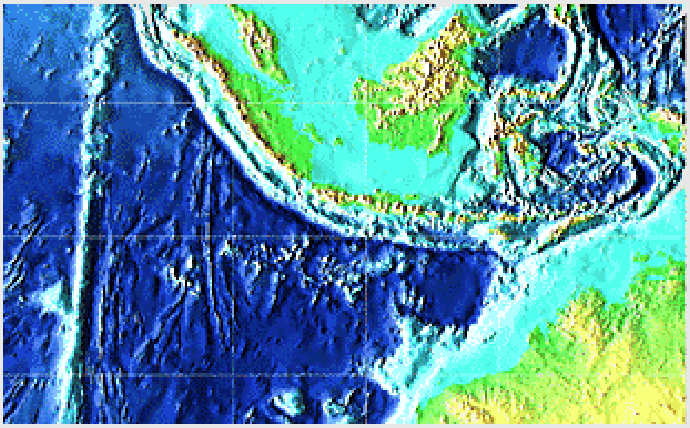
The San Andreas fault in California is a nearby example of a transform, separating the Pacific from the North American plate. At transforms the plates mostly slide past each other laterally, producing less sinking or lifing of the ground than extensional or compressional environments. The yellow dots below locate earthquakes along strands of this fault system in the San Francisco Bay area.



(from NASA/JSC; topography from NOAA)

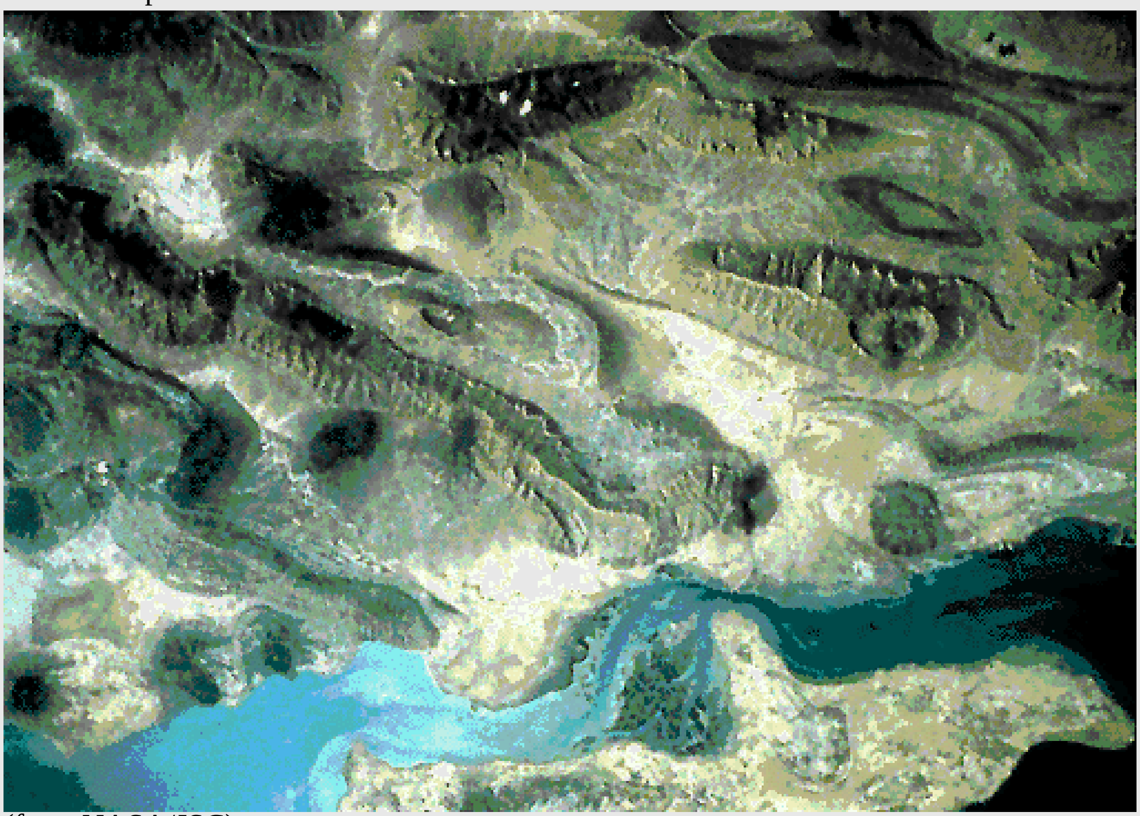
At *compressional* boundaries, earthquakes are found in several settings ranging from the very near surface to several hundred kilometers depth, since the coldness of the subducting plate permits brittle failure down to as much as 700 km. Compressional boundaries host Earth's largest quakes, with some events on subduction zones in Alaska and Chile having exceeded magnitude 9.





This oblique orbital view looking east over Indonesia shows the clouded tops of the chain of large volcanoes. The topography below shows the Indian plate, streaked by hotspot traces and healed transforms, subducting at the Javan Trench.

Sometimes continental sections of plates collide; both are too light for subduction to occur. The satellite image below shows the bent and rippled rock layers of the Zagros Mountains in southern Iran, where the Arabian plate is impacting the Iranian plate.



(from NASA/JSC)

Nevada has a complex plate-tectonic environment, dominated by a combination of extensional and transform motions. The Great Basin shares some features with the great Tibetan and Anatolian plateaus. All three have large areas of high elevation, and show varying amounts of rifting and extension distributed across the regions. This is unlike oceanic spreading centers, where rifting is concentrated narrowly along the plate boundary. The numerous north-south mountain ranges that dominate the landscape from Reno to Salt Lake City are the consequence of substantial east-west extension, in which the total extension may be as much as a factor of two over the past 20 million years.

(Topo map from the Lamont-Doherty Earth Observatory of Columbia Univ.; motions added from published GPS results.)

The extension seems to be most active at the eastern and western margins of the region, i.e. the mountain fronts running near Salt Lake City and Reno. The western Great Basin also has a significant component of shearing motion superimposed on this rifting. This is part of the Pacific - North America plate motion. The total motion is about 5 cm/year. Of this, about 4 cm/yr takes place on the San Andreas fault system near the California coast, and the remainder, about 1 cm/year, occurs east of the Sierra Nevada mountains, in a zone geologists know as the Walker Lane.

As a result, Nevada hosts hundreds of active extensional faults, and several significant transform fault zones as well. While not as actively or rapidly deforming as the plate boundary in California, Nevada has earthquakes over much larger areas. While some regions in California, such as the western Sierra Nevada, appear to be isolated from earthquake activity, earthquakes have occurred everywhere in Nevada.

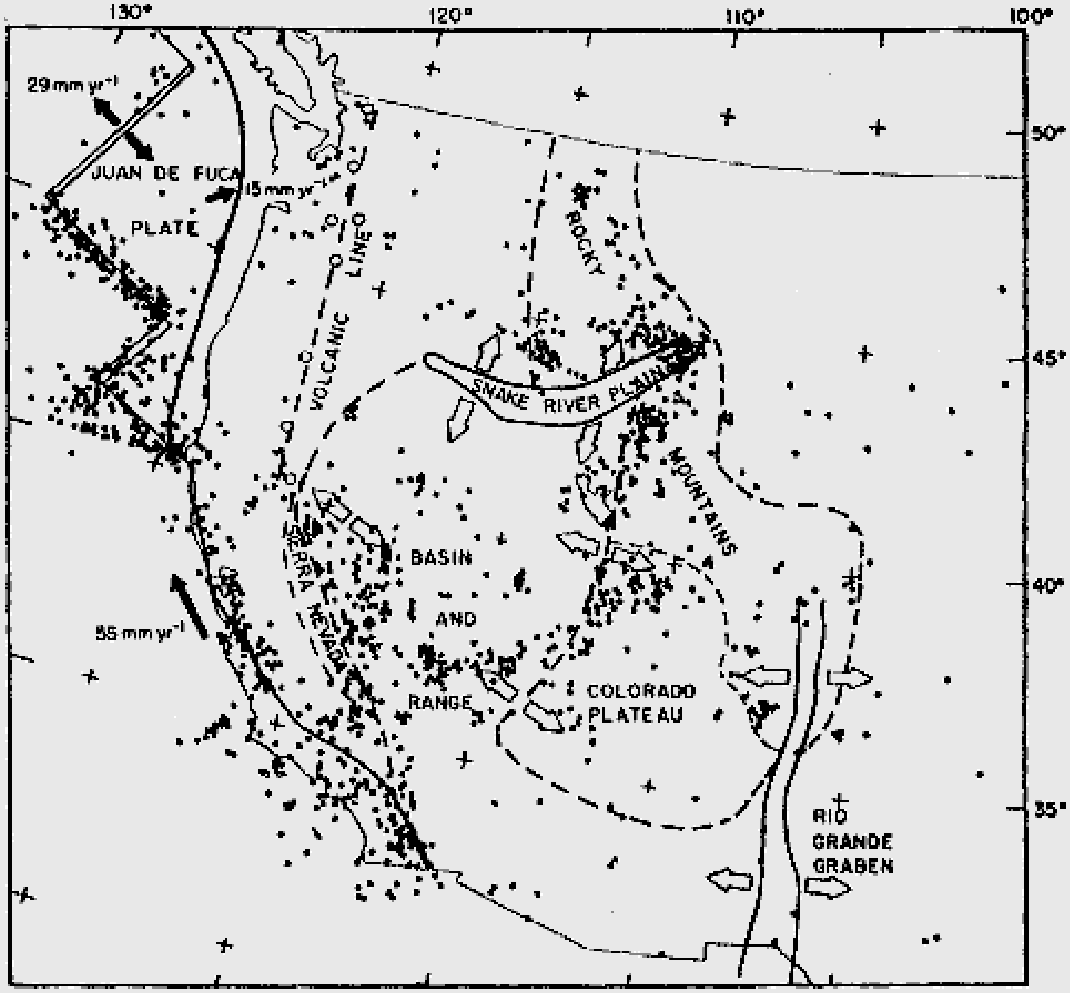


Figure 1-58 Distribution of seismicity in the geological provinces of the western United States (stars). Solid arrows give relative plate velocities; open arrows give stress directions inferred from seismic focal mechanism studies.

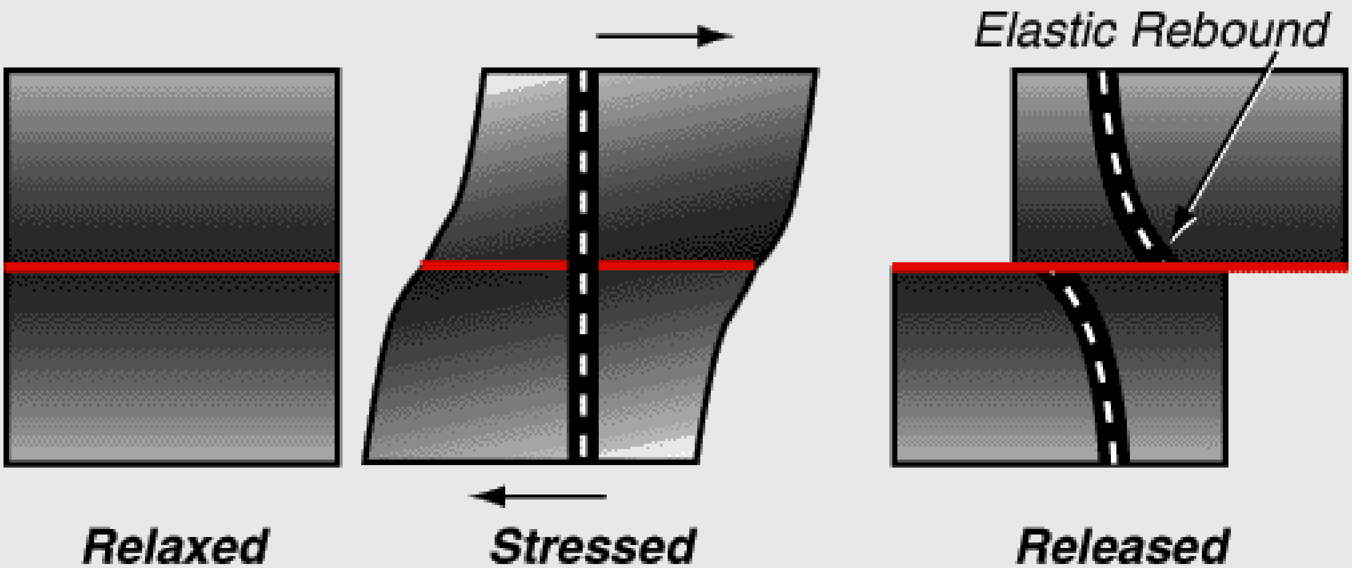
Next Lecture: Seismic Waves

More information About Earthquakes

Seismic Deformation

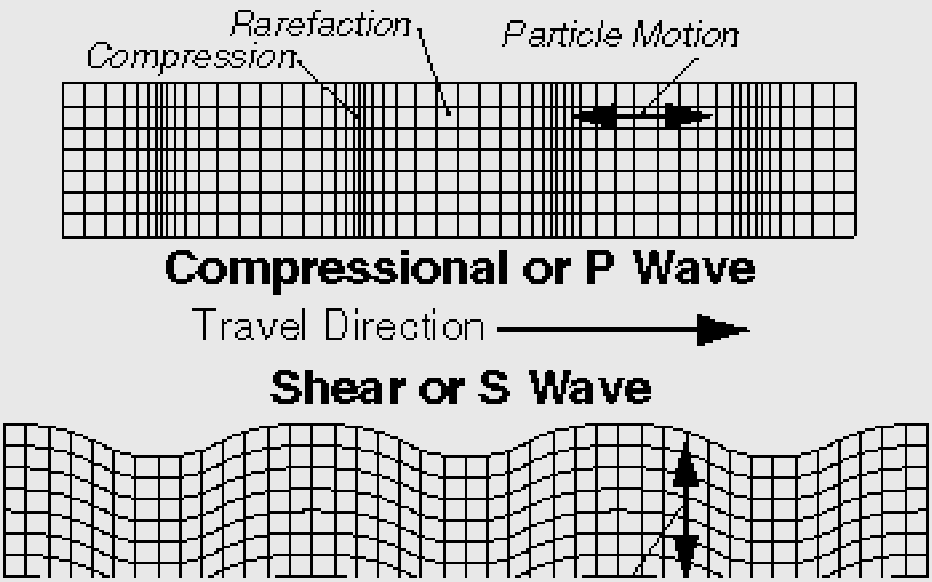
When an earthquake fault ruptures, it causes two types of deformation: **static**; and **dynamic**. Static deformation is the permanent displacement of the ground due to the event. The **earthquake cycle** progresses from a fault that is not under stress, to a stressed fault as the plate tectonic motions driving the fault slowly proceed, to rupture during an earthquake and a newly-relaxed but deformed state.



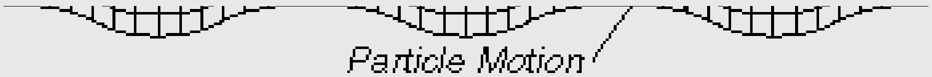
Typically, someone will build a straight reference line such as a road, railroad, pole line, or fence line across the fault while it is in the pre-rupture stressed state. After the earthquake, the formerly stright line is distorted into a shape having increasing displacement near the fault, a process known as **elastic rebound**.

Seismic Waves

The second type of deformation, dynamic motions, are essentially sound waves radiated from the earthquake as it ruptures. While most of the plate-tectonic energy driving fault ruptures is taken up by static deformation, up to 10% may dissipate immediately in the form of **seismic waves**.



The mechanical properties of the rocks that seismic waves travel through quickly organize the waves into two types. Compressional waves, also known as primary or P waves, travel fastest, at speeds between 1.5 and 8 kilometers per second in the Earth's crust. Shear waves, also known as secondary or S waves, travel more slowly, usually at 60% to 70% of the speed of P waves.

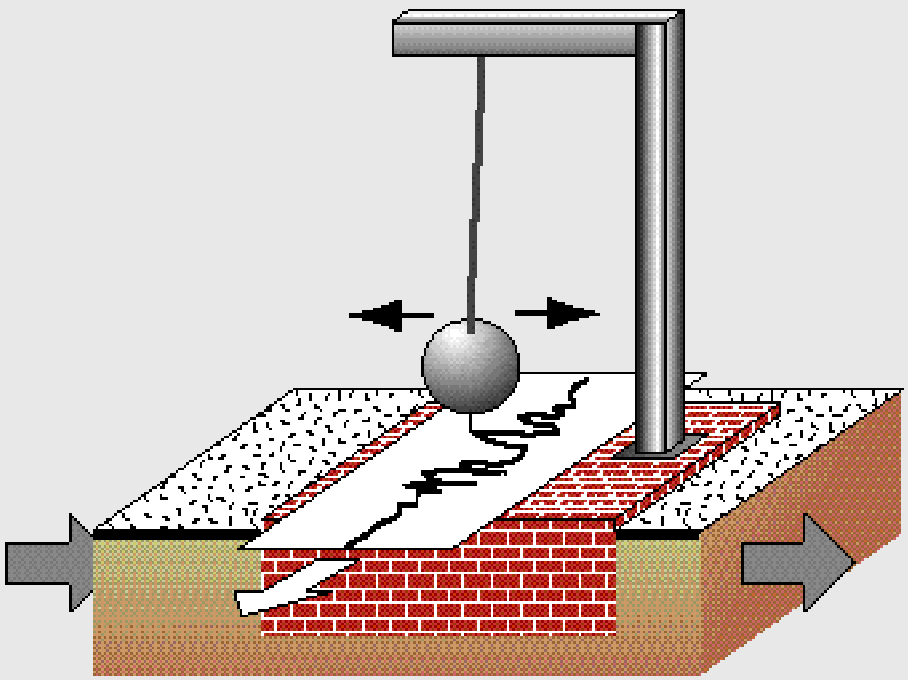


P waves shake the ground in the direction they are propagating, while S waves shake perpendicularly or **transverse** to the direction of propagation.

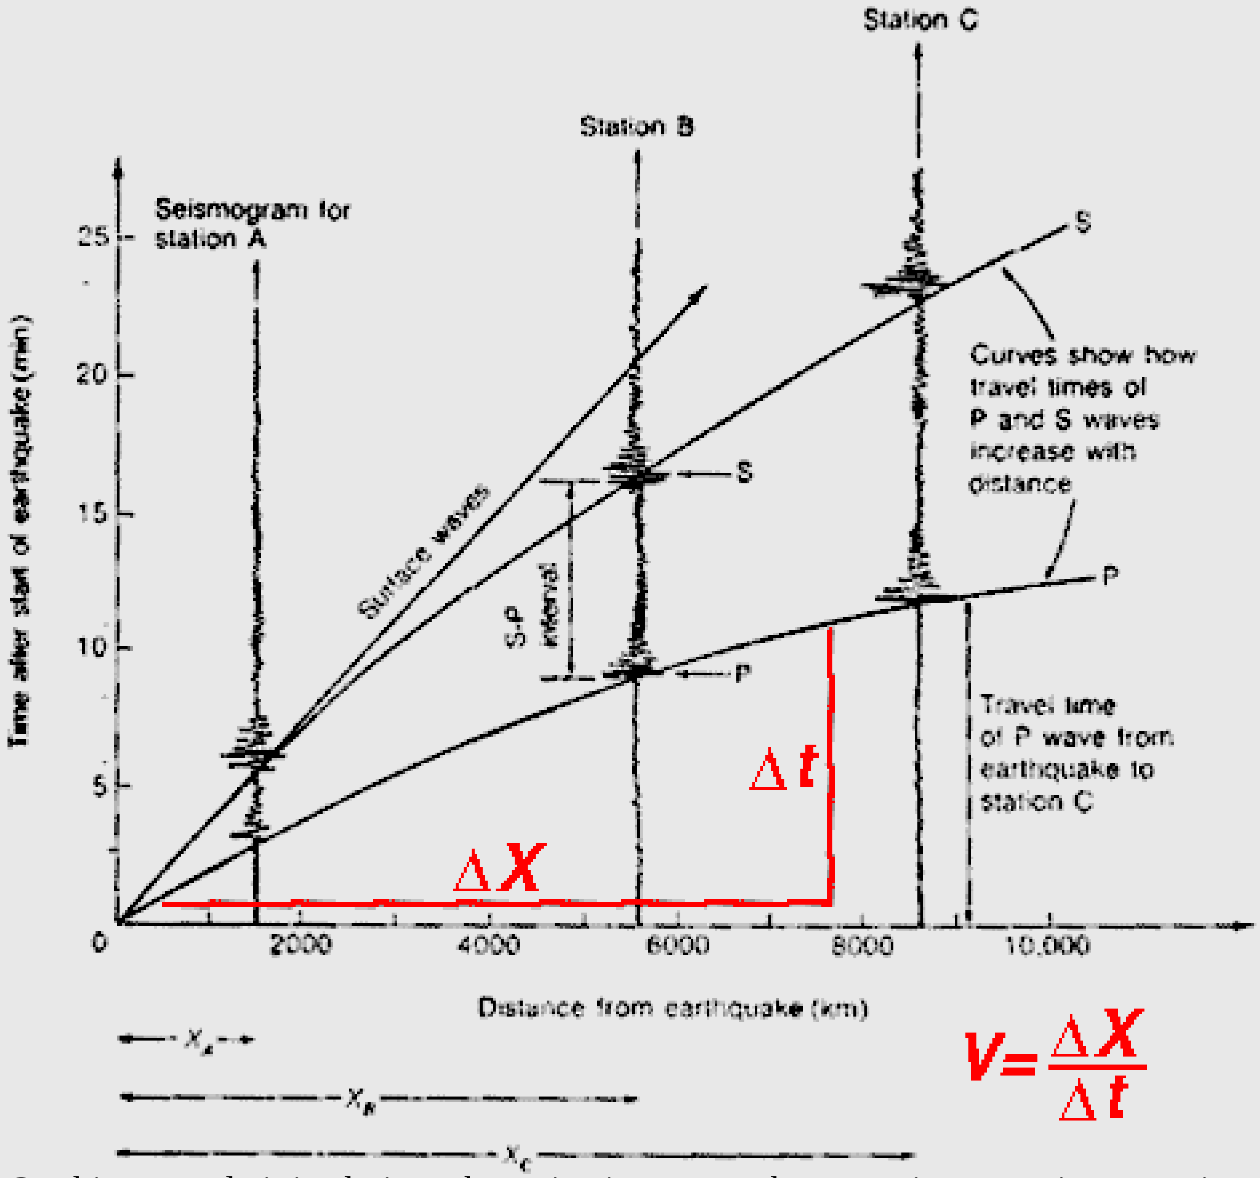
Although wave speeds vary by a factor of ten or more in the Earth, the ratio between the average speeds of a P wave and of its following S wave is quite constant. This fact enables seismologists to simply time the delay between the arrival of the P wave and the arrival of the S wave to get a quick and reasonably accurate estimate of the distance of the earthquake from the observation station. Just multiply the S-minus-P (S-P) time, in seconds, by the factor 8 km/s to get the approximate distance in kilometers.

The dynamic, transient seismic waves from any substantial earthquake will propagate all around and entirely through the Earth. Given a sensitive enough detector, it is possible to record the seismic waves from even minor events occurring anywhere in the world at any other location on the globe. Nuclear test-ban treaties in effect today rely on our ability to detect a nuclear explosion anywhere equivalent to an earthquake as small as Richter Magnitude 3.5.

Seismographs and Seismograms



Sensitive **seismographs** are the principal tool of scientists who study earthquakes. Thousands of seismograph stations are in operation throughout the world, and instruments have been transported to the Moon, Mars, and Venus. Fundamentally, a seismograph is a simple pendulum. When the ground shakes, the base and frame of the instrument move with it, but intertia keeps the pendulum bob in place. It will then appear to move, relative to the shaking ground. As it moves it records the pendulum displacements as they change with time, tracing out a record called a **seismogram**.
One seismograph station, having three different pendulums sensitive to the north-south, east-west, and vertical motions of the ground, will record seismograms that allow scientists to estimate the distance, direction, Richter Magnitude, and type of faulting of the earthquake. Seismologists use **networks** of seismograph stations to determine the location of an earthquake, and better estimate its other parameters. It is often revealing to examine seismograms recorded at a range of distances from an earthquake:



On this example it is obvious that seismic waves take more time to arrive at stations that are farther away. The average velocity of the wave is just the slope of the line connecting arrivals, or the change in distance divided by the change in time. Variations in such slopes reveal variations in the seismic velocities of rocks. Note the secondary S-wave arrivals that have larger amplitudes than the first P waves, and connect at a smaller slope.

While the actual frequencies of seismic waves are below the range of human hearing, it is possible to speed up a recorded seismogram to hear it. You can click on this earthquake recording to hear a seismogram from the 1992 Landers earthquake in southern California, recorded near Mammoth Lakes in an active volcanic caldera by the USGS. The original record, 800 seconds long, has been speeded up 80 times so that you hear it all within 10 seconds.

75 kb u-law; 149 kb WAV; 75 kb Quicktime

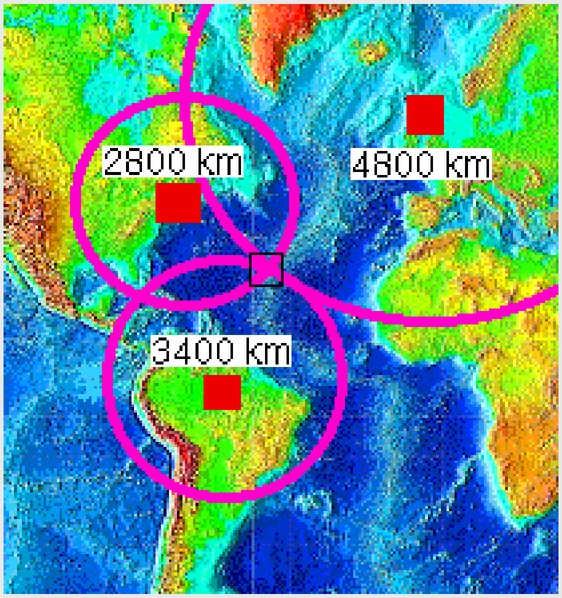
The clicks at the beginning of the recording are the sharp, high-frequency P waves, followed by the rushing sound of the drawn-out, lower-frequency S waves. This recording is also interesting because of the small, local earthquakes within the Mammoth caldera that sound like gunshots. The passage of the S wave from the magnitude 7.2 Landers event through the caldera actually triggered a sequence of small earthquakes there. The triggered earthquakes are similar to a burst of creaks and pops you hear from your house frame after a strong blast of wind. Landers triggered earthquakes up to magnitude 5.5 throughout eastern California and Nevada, and in calderas as far away as Yellowstone.

Listen to more earthquakes with:

- John Louie's *The Sound of Seismic* (MP3s)
- Andy Michael and Dennis Ross's *Listening to Earthquakes* (WAVs)

Locating Earthquakes

The pricipal use of seismograph networks is to **locate** earthquakes. Although it is possible to infer a general location for an event from the records of a single station, it is most accurate to use three or more stations. Locating the source of any earthquake is important, of course, in assessing the damage that the event may have caused, and in relating the earthquake to its geologic setting.



Given a single seismic station, the seismogram records will yield a measurement of the S-P time, and thus the distance between the station and the event. Multiply the seconds of S-P time by 8 km/s for the kilometers of distance. Drawing a circle on a map around the station's location, with a radius equal to the distance, shows all possible locations for the event. With the S-P time from a second station, the circle around that station will narrow the possible locations down to two points. It is only with a third station's S-P time that you can draw a third circle that should identify which of the two previous possible points is the real one:

This example uses stations in Boston, Edinborough, and Manaus. With the distances shown, all three circles can intersect only at a single point on the Mid-Atlantic Ridge spreading center.

Previous: Plate Tectonics --- Next: Richter Magnitude

What is Richter Magnitude?

Short answer:

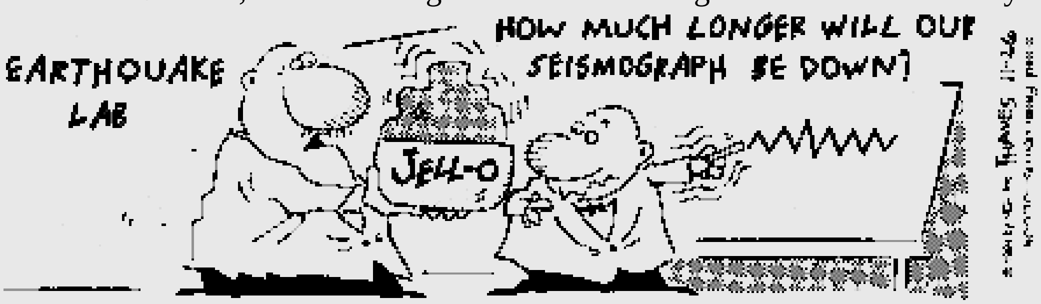
Seismologists use a **Magnitude** scale to express the seismic energy released by each earthquake. Here are the typical effects of earthquakes in various magnitude ranges:

Earthquake Severity

Richter Magnitudes	Earthquake Effects
Less than 3.5	Generally not felt, but recorded.
3.5-5.4	Often felt, but rarely causes damage.
Under 6.0	At most slight damage to well-designed buildings. Can cause major damage to poorly constructed buildings over small regions.
6.1-6.9	Can be destructive in areas up to about 100 kilometers across where people live.
7.0-7.9	Major earthquake. Can cause serious damage over larger areas.
8 or greater	Great earthquake. Can cause serious damage in areas several hundred kilometers across.

Although each earthquake has a unique **Magnitude**, its effects will vary greatly according to distance, ground conditions, construction standards, and other factors. Seismologists use a different Mercalli **Intensity** Scale to express the variable effects of an earthquake.

Each earthquake has a unique amount of energy, but magnitude values given by different seismological observatories for an event may vary. Depending on the size, nature, and location of an earthquake, seismologists use several different methods to estimate magnitude. The uncertainty in an estimate of the magnitude is about plus or minus 0.3 units, and seismologists often revise magnitude estimates as they obtain and analyze additional data.

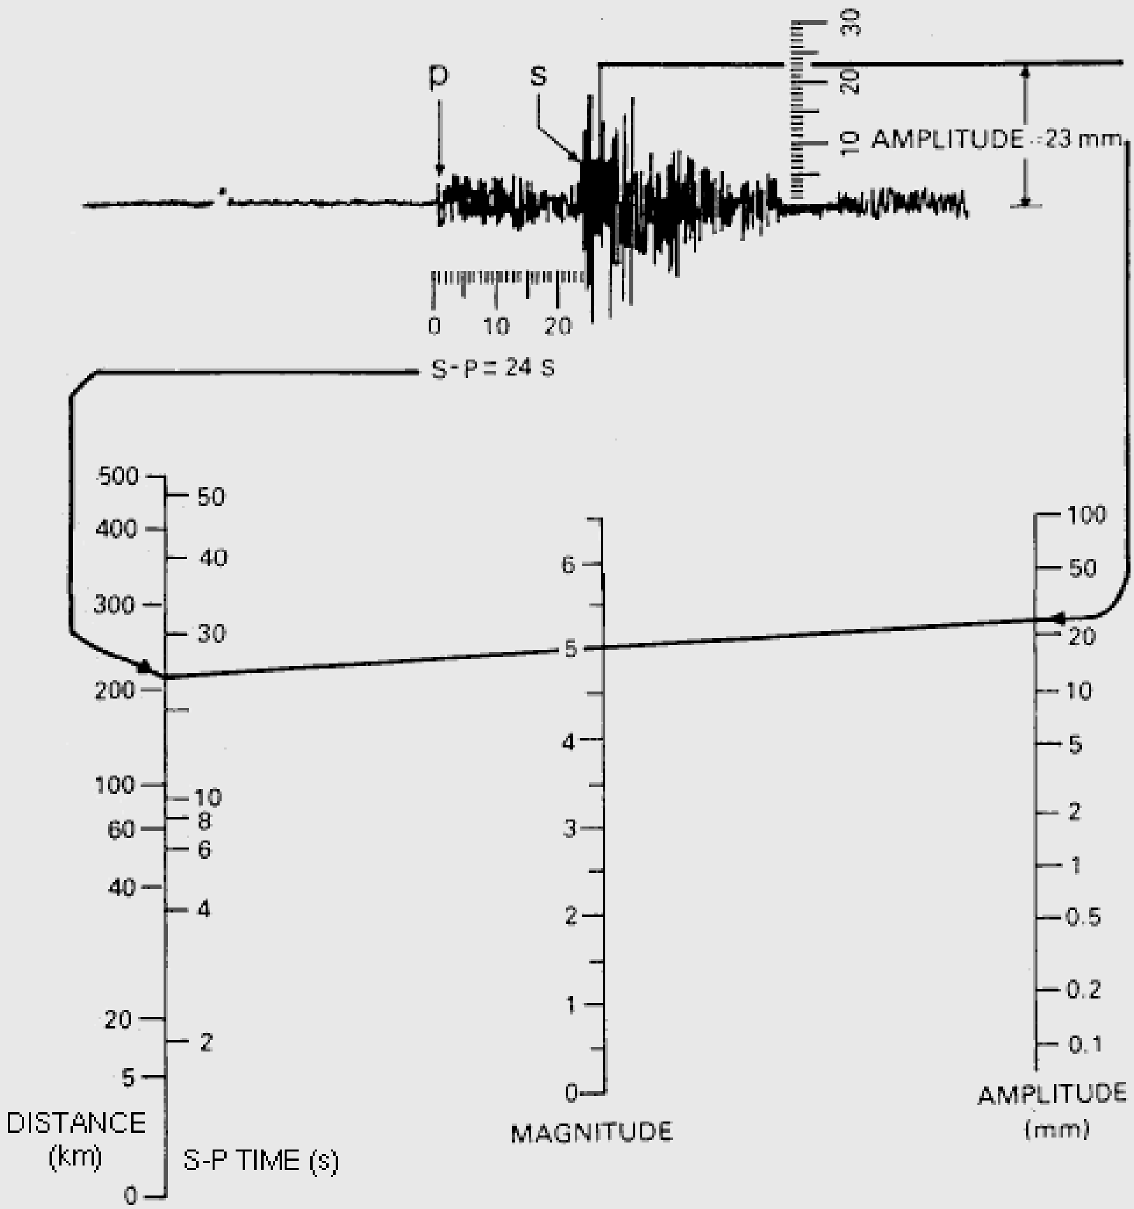


Long answer:

One of **Dr. Charles F. Richter**'s most valuable contributions was to recognize that the **seismic waves** radiated by all earthquakes can provide good estimates of their magnitudes. You can read about seismic waves by clicking here. He collected the recordings of seismic waves from a large number of earthquakes, and developed a calibrated system of measuring them for magnitude.

Richter showed that, the larger the intrinsic energy of the earthquake, the larger the **amplitude** of ground motion at a given distance. He calibrated his scale of magnitudes using measured maximum amplitudes of shear waves on seismometers particularly sensitive to shear waves with periods of about one second. The records had to be obtained from a specific kind of instrument, called a **Wood-Anderson seismograph**. Although his work was originally calibrated only for these specific seismometers, and only for earthquakes in southern California, seismologists have developed scale factors to extend Richter's magnitude scale to many other types of measurements on all types of seismometers, all over the world. In fact, magnitude estimates have been made for thousands of Moon-quakes and for two quakes on Mars.

The diagram below demonstrates how to use Richter's original method to measure a seismogram for a magnitude estimate in Southern California:



The scales in the diagram above form a **nomogram** that allows you to do the mathematical computation quickly by eye. The equation for Richter Magnitude is:

$$M_L = \log_{10}A(mm) + (Distance\ correction\ factor)$$

Here *A* is the amplitude, in millimeters, measured directly from the photographic paper record of the **Wood-Anderson** seismometer, a special type of instrument. The *distance factor* comes from a table that can be found in Richter's (1958) book *Elementary Seismology*. The equation behind this nomogram, used by Richter in Southern California, is:

$$M = \log_{10}A(mm) + 3\log_{10}[8\Delta t(s)] - 2.92$$

Thus after you measure the wave amplitude you have to take its **logarithm**, and scale it according to the distance of the seismometer from the earthquake, estimated by the S-P time difference. The S-P time, in seconds, makes Δt.

Click here to learn more about the mathematical logarithm.

Seismologists will try to get a separate magnitude estimate from every seismograph station that records the earthquake, and then average them. This accounts for the usual spread of around 0.2 magnitude units that you see reported from different seismological labs right after an earthquake. Each lab is averaging in different stations that they have access to. It may be several days before different organizations will come to a consensus on what was the best magnitude estimate.

Seismic Moment:

Seismologists have more recently developed a standard magnitude scale that is completely independent of the type of instrument. It is called the **moment magnitude**, and it comes from the **seismic moment**.

To get an idea of the seismic moment, we go back to the elementary physics concept of torque. A torque is a force that changes the angular momentum of a system. It is defined as the force times the distance from the center of rotation. Earthquakes are caused by internal torques, from the interactions of different blocks of the earth on opposite sides of faults. After some rather complicated mathematics, it can be shown that the moment of an earthquake is simply expressed by:

$$(Moment) = (Rock\ Rigidity) \times (Fault\ Area) \times (Slip\ Distance)$$

$$M_0 = \mu A d$$

$$(dyne\text{-}cm) = \left[\frac{dyne}{\cancel{cm^2}}\right] \times (\cancel{cm^2}) \times (cm)$$

The formula above, for the **moment** of an earthquake, is fundamental to seismologists' understanding of how dangerous faults of a certain size can be.

Now, let's imagine a chunk of rock on a lab bench, the rigidity, or resistance to shearing, of the rock is a **pressure** in the neighborhood of a few hundred billion dynes per square centimeter. (Scientific notation makes this easier to write.) The **pressure** acts over an **area** to produce a force, and you can see that the cm-squared units cancel. Now if we guess that the distance the two parts grind together before they fly apart is about a centimeter, then we can calculate the moment, in dyne-cm:

$$M_0 = (3\times10^{11}\ \frac{dyne}{\cancel{cm^2}})(10\ \cancel{cm})(10\ \cancel{cm})(1\ cm)$$

$$M_0 = (3\times10^{11})(10^2)(dyne-cm)$$

$$M_0 = 3\times10^{13}\ dyne-cm$$

Again it is helpful to use scientific notation, since a dyne-cm is really a puny amount of moment.

Now let's consider a second case, the Sept. 12, 1994 Double Spring Flat earthquake, which occurred about 25 km southeast of Gardnerville. The first thing we have to do, since we're working in centimeters, is figure out how to convert the 15 kilometer length and 10 km depth of that fault to centimeters. We know that 100 thousand centimeters equal one kilometer, so we can write that equation and divide both sides by "km" to get a factor equal to one.

$$1\ km = 10^5\ cm \qquad\qquad 1 = \frac{10^5\ cm}{km}$$

Of course we can multiply anything by one without changing it, so we use it to cancel the kilometer units and put in the right centimeter units:

$$M_0 = (3\times10^{11}\ \frac{dyne}{\cancel{cm^2}})(10\ \cancel{km})\left[\frac{10^5\ \cancel{cm}}{\cancel{km}}\right](15\ \cancel{km})\left[\frac{10^5\ \cancel{cm}}{\cancel{km}}\right](30\ cm)$$

$$M_0 = 1.1\times10^{25}\ dyne-cm$$

Of course this result needs scientific notation even more desperately. We can see that this earthquake, the largest in Nevada in 28 years, had two times ten raised to the twelfth power, or 2 trillion, times as much moment as breaking the rock on the lab table.

There is a standard way to convert a seismic moment to a **magnitude**. The equation is:

$$M_w = \frac{2}{3}\left[\log_{10} M_0\ (dyne-cm) - 16.0\right]$$

Now let's use this equation (meant for energies expressed in dyne-cm units) to estimate the **magnitude** of the tiny earthquake we can make on a lab table:

$$M_0 = 3\times10^{13}\ dyne-cm$$

$$M_w = \frac{2}{3}\left[\log_{10}(3\times10^{13} dyne-cm) - 16.0\right]$$

$$M_w = \frac{2}{3}\left[\sim13.5 - 16.0\right]$$

$$M_w \sim \frac{2}{3}(-2.5)$$

$$M_w \sim -1.7$$

Negative magnitudes are allowed on Richter's scale, although such earthquakes are certainly very small.

Next let's take the energy we found for the Double Spring Flat earthquake and estimate its magnitude:

$$M_0 = 1.4\times10^{25}$$

$$M_w = \frac{2}{3}\left[\log_{10}(1.4\times10^{25}\,dyne-cm) - 16.0\right]$$

$$M_w = \frac{2}{3}\left[\sim25.2 - 16.0\right]$$

$$M_w \sim \frac{2}{3}(9.2)$$

$$M_w \sim 6.1$$

The magnitude 6.1 value we get is about equal to the magnitude reported by the UNR Seismological Lab, and by other observers.

Seismic Energy:

Both the magnitude and the seismic moment are related to the amount of energy that is radiated by an earthquake. Richter, working with **Dr. Beno Gutenberg**, early on developed a relationship between magnitude and energy. Their relationship is:

$$\log E_S = 11.8 + 1.5M$$

giving the energy E_S in **erg**s from the magnitude M. Note that E_S is not the total ``intrinsic" energy of the earthquake, transferred from sources such as gravitational energy or to sinks such as heat energy. It is only the amount radiated from the earthquake as seismic waves, which ought to be a small fraction of the total energy transfered during the earthquake process.

More recently, **Dr. Hiroo Kanamori** came up with a relationship between seismic moment and seismic wave energy. It gives:

$$Energy = (Moment)/20{,}000$$

For this moment is in units of dyne-cm, and energy is in units of ergs. dyne-cm and ergs are unit equivalents, but have different physical meaning.

Let's take a look at the seismic wave energy yielded by our two examples, in comparison to that of a number of earthquakes and other phenomena. For this we'll use a larger unit of energy, the seismic energy yield of quantities of the explosive TNT (We assume one ounce of TNT exploded below ground yields 640 million ergs of seismic wave energy):

Richter Magnitude	TNT for Seismic Energy Yield	Example (approximate)
-1.5	6 ounces	Breaking a rock on a lab table
1.0	30 pounds	Large Blast at a Construction Site
1.5	320 pounds	
2.0	1 ton	Large Quarry or Mine Blast
2.5	4.6 tons	
3.0	29 tons	

3.5	73 tons	
4.0	1,000 tons	Small Nuclear Weapon
4.5	5,100 tons	Average Tornado (total energy)
5.0	32,000 tons	
5.5	80,000 tons	Little Skull Mtn., NV Quake, 1992
6.0	1 million tons	Double Spring Flat, NV Quake, 1994
6.5	5 million tons	Northridge, CA Quake, 1994
7.0	32 million tons	Hyogo-Ken Nanbu, Japan Quake, 1995; Largest Thermonuclear Weapon
7.5	160 million tons	Landers, CA Quake, 1992
8.0	1 billion tons	San Francisco, CA Quake, 1906
8.5	5 billion tons	Anchorage, AK Quake, 1964
9.0	32 billion tons	Chilean Quake, 1960
10.0	1 trillion tons	(San-Andreas type fault circling Earth)
12.0	160 trillion tons	(Fault Earth in half through center, OR Earth's daily receipt of solar energy)

---

160 trillion tons of dynamite is a frightening yield of energy. Consider, however, that the Earth receives that amount in **sunlight** every day.

Practical ways of estimating magnitude

Most seismologists prefer to use the seismic moment to estimate earthquake magnitudes. Finding an earthquake fault's length, depth, and its slip can take several days, weeks, or even months after a big earthquake. Geologists' mapping of the earthquake's fault breaks, or seismologists' plotting of the spatial distribution of aftershocks, can give these parameters after a substantial effort. But some large earthquakes, and most small earthquakes, show neither surface fault breaks nor enough aftershocks to estimate magnitudes the way we have above. However, seismologists have developed ways to estimate the seismic moment directly from seismograms using computer processing methods. The Centroid Moment Tensor Project at Harvard University has been routinely estimating moments of large earthquakes around the world by seismogram inversion since 1982.

Another measure of an earthquake

Seismologists use a separate method to estimate the **effects** of an earthquake, called its **intensity**. **Intensity** should not be confused with **magnitude**. Although each earthquake has a single magnitude value, its effects will vary from place to place, and there will be many different intensity estimates. You can read about the Mercalli Intensity Scale, one popular way to characterize earthquake effects.

Let's Make Waves

Science Activity

Background
Many children hold misconceptions about the nature of water waves. One common misconception is that waves are generated from within the water. Although that may appear to be true, most waves -- and certainly the waves most children see -- are actually generated by wind. As wind travels across the water's surface, it pushes against the water and energy in the wind is absorbed by the water.

Another common misconception is that as a wave moves the water itself moves with the wave. In fact, a wave is the movement of energy through water. The water moves up and down, but not sideways in the direction of the wave's motion. The energy from wind moves in the direction of the wind. The energy moves from water molecule to water molecule, making each molecule move in a small circle. When one molecule bangs into its neighboring molecule, energy transfers to that neighboring molecule.

The most effective way to help children replace a misconception is to give them an experience that directly challenges it. In this simple set of activities children use wind to create waves and use marbles to model energy moving through water.

WHAT YOU'LL NEED

- 1 large, flat pan, about 4 or 5 inches deep, for each group (dishpans or larger)
- 1 electric table fan or paper fan for each group
- buckets or jugs for filling the pans with water
- food dye (optional)
- 5 large marbles or ball bearings for each group

WHAT TO DO

1. Ask the class what causes waves. Discuss their ideas.
2. Put the pans on tables and fill each pan with 2-3 inches of water.
3. Divide students into as many groups as you have pans and put each group around a pan.
4. About 1 foot from each pan (on a narrow side), place an electric fan or have a student hold a paper fan facing the pan.
5. Ask students to predict what will happen when the fan blows across the water's surface. After students have made predictions, let each fan blow at a low speed.
6. Have students report the results. Were there waves? Did the water bunch up at the far end of the pan? Did the water slosh out of the pan? Then speed up the fans and have students report again. Make sure students don't run fans so quickly that water sloshes out of the pans. (It might slosh out with the fan at high speed because the energy in the waves can't transfer into the pan's wall readily.)

7. Discuss with the class the connection between the wind and the waves. Ask students to guess why the water didn't bunch up at the far end of each pan.
8. Give each group a set of 5 marbles. Have students place 4 of the marbles on a table, lined up in a row with each marble touching its neighbors. Ask students to predict what will happen if the fifth marble is gently rolled at the marble at one end of the row. After students have made predictions, have one student in each group roll the fifth marble. The marble at the far end of the row will roll away and the others will not move. Have students repeat the experiment several times.
9. Discuss the idea that the energy in the rolling marble went into the marble it hit, and from that marble to the next, until the energy reached the last marble. The energy made that marble roll away. Wave energy moves through water the same way.
10. Bring the students together for a wrap-up discussion. Ask them what causes waves. Discuss their answers, relating the answers to the wave experiment. Ask them if water moves sideways inside a wave, or if the water stays in one place while the wave moves through it. Discuss the answers, relating the answers to the wave experiment and to the marble experiment.

Monster Waves

Science/Math Activity

In this activity, students will build a tabletop village and use it to visualize the relative height and affects of gigantic waves called tsunamis.

WHAT YOU NEED

- Tremors Behind Tsunamis (print and copy)
- A map of the world
- Small cardboard gift boxes or oak tag
- Construction paper
- Tape or glue
- Colored markers

WHAT TO DO

1. Read Tremors Behind Tsunamis to give students background on tsunamis and where they are likely to occur. Some students may to wish look in additional sources for more information on the topic.
2. Explain to students that the class will be making a replica of a seaside fishing village or port city to help them visualize the massive size of tsunamis and the destruction they can cause.
3. Divide students into small groups, having each group build a different section of the village or city. Encourage students to decide, as a class, which group will make buildings, land area, tsunami, etc.
4. Suggest that students make some buildings more than one story high. Later the class can decide how high a story would be in actual height.
5. When groups are done, have them assemble the village or city. Before placing the tsunami, they should speculate how high a tsunami wave would reach in the model.
6. Have students use the model to discuss what the tsunami would do to the village or city, the affect on the people who live there, and what could be done to prepare for future tsunamis.

TEACHING OPTIONS

- Have students write a newspaper article giving geographic reasons why your community would probably never experience a tsunami or might experience one.
- Traditional Japanese ideas about the source of gigantic waves that periodically come ashore and wreck Japanese coastal villages are found in the book *The Big Wave* by Pearl S. Buck. Have students read the book and discuss what the villagers believed caused the big wave. Encourage them to support their ideas with quotes that explain the attitudes of the villagers toward the overwhelming catastrophes they experienced from killer waves from the sea.

TSUNAMI THE BIG WAVE

April Fools' Day 1946. A day for tricks and fun everywhere...everywhere but Hilo, Hawaii, that is. It was 7:00 a.m. and as the fishermen were getting the last of their early morning catch, the sea decided to play a trick on them. Suddenly the ocean rushed out, leaving fish and boats stranded on bare sand. The fishermen, quite aware of the impending danger, rushed to shore to warn the town of the approaching disaster.

On July 10, 1958, an earthquake triggered a landslide, which created a wave that wiped out trees 1,700 feet up a hillside on the opposite side of Lituya Bay, Alaska.

Within minutes a wave that had traveled 2,500 miles from the Aleutian Islands in Alaska came crashing into Hilo. It killed one hundred fifty-nine people and caused millions of dollars in damages. The wave that destroyed Hilo is one of the most powerful and most feared natural disasters of all: the tsunami!

Tsunami: the Great Waves

Presented by

U.S. Department of Commerce
National Oceanic and Atmospheric Administration
National Weather Service
Intergovernmerntal Oceanographic Commission
International Tsunami Information Center

The purpose of this brochure is to increase awareness and knowledge of tsunamis. Please share what you learn; knowing the right information may save your life and the lives of those you love.

The phenomenon we call "tsunami" (soo-NAH-mee) is a series of traveling ocean waves of extremely long length generated by disturbances associated primarily with earthquakes occurring below or near the ocean floor. Underwater volcanic eruptions and landslides can also generate tsunamis. In the deep ocean, their length from wave crest to wave crest may be a hundred miles or more but with a wave height of only a few feet or less. They cannot be felt aboard ships nor can they be seen from the air in the open ocean. In deep water, the waves may reach speeds exceeding 500 miles per hour.

Tsunamis are a threat to life and property to anyone living near the ocean. For example, in 1992 and 1993 over 2,000 people were killed by tsunamis occurring in Nicaragua, Indonesia and Japan. Property damage was nearly one billion dollars. The 1960 Chile Earthquake generated a Pacific-wide tsunami that caused widespread death and destruction in Chile, Hawaii, Japan and other areas in the Pacific. Large tsunamis have been known to rise over 100 feet, while tsunamis 10 to 20 feet high can be very destructive and cause many deaths and injuries.

The Tsunami Warning System (TWS) in the Pacific, comprised of 26 participating international Member States, monitors seismological and tidal stations throughout the Pacific Basin. The System evaluates potentially tsunamigenic earthquakes and disseminates tsunami warning information. The Pacific Tsunami Warning Center (PTWC) is the operational center of the Pacific

TWS. Located in Honolulu, Hawaii, PTWC provides tsunami warning information to national authorities in the Pacific Basin.

Surf's Up!

Hell's Crust: Our Everchanging Planet

The Restless Planet: Earthquakes

Out of the Inferno: Volcanoes

Waves of Destruction: Tsunamis

Surf's Up!

by Daniel Pendick

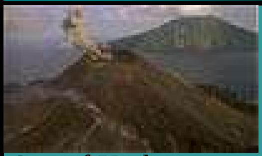
Though it's true that tsunamis are ocean waves, calling them by the same name as the ordinary wind-driven variety is a bit like referring to firecrackers and atomic warheads both as "explosives." Triggered by volcanic eruptions, landslides, earthquakes, and even impacts by asteroids or comets, a tsunami represents a vast volume of seawater in motion -- the source of its destructive power.

The Japanese characters for tsunami mean "harbor wave," and many people commonly refer to them as tidal waves, but in reality tsunamis have little to do with tides. They are creatures of the open ocean, trains of giant waves that can travel for thousands of miles across the sea and still pack enough energy to smash towns and drown the unwary.

A tsunami generated in the Aleutian Islands struck Hawaii in 1946.

Toss a stone in a pond and you create a series of concentric ripples. A tsunami is just like those ripples, except the disturbance that sets them in motion is of a much greater magnitude. Undersea landslides and the collapse of oceanic islands into the sea make tsunamis. Volcanic eruptions can also do it. In fact, the most deadly tsunami in recorded history followed the eruption and virtual obliteration of Indonesia's Krakatoa Volcano in 1883. An estimated 36,000 people died as a result of the eruption, the majority of them from the tsunamis.

Click on picture below to see full-size image.



Son of Krakatoa.

Tsunami debris.

Impacts by comets or asteroids can also generate giant tsunamis. No one has actually witnessed such an event, except perhaps in films like DEEP IMPACT. But computer simulations show that the giant tsunamis unleashed by Hollywood special effects wizards -- large enough to swamp the Manhattan skyline -- are possible and have almost certainly happened in the distant past. Scientists at the Los Alamos National Laboratory in New Mexico calculated that if an asteroid three miles across hit the middle of the Atlantic Ocean, the tsunami would swamp the upper East Coast as far inland as the Appalachian Mountains and drown the coasts of France and Portugal.

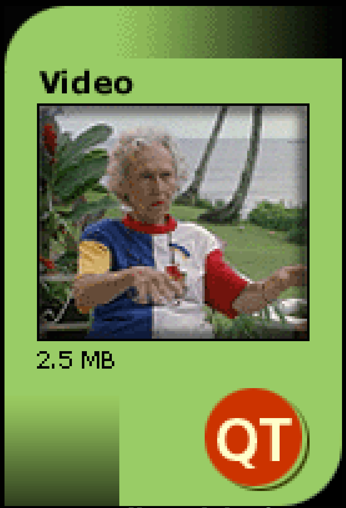
But by far the most frequent tsunami-maker is the buckling of the seafloor caused by an undersea earthquake. Tsunami earthquakes happen at subduction zones, places where drifting plates that make up Earth's outer shell, or lithosphere, converge, and the heavier oceanic plate dips below the lighter continents. There are subduction zones off Chile, Nicaragua, Mexico, and Indonesia that have generated killer tsunamis in the past decade. In the Pacific, there were 17 tsunamis from 1992 to 1996, and they took nearly 1,700 lives.

As a plate plunges down into Earth's interior, it moves in fits and starts -- sticking for awhile, then slipping. When it's stuck against the edge of a continental plate, stresses build up. When the locked zone gives way, parts of the seafloor may snap upward like a diver's springboard as the tension is released; other areas may sink downward. In the instant after the quake, the shape of the sea surface mirrors the contours of the seafloor below. But, just as quickly, gravity acts to return the sea surface to its original shape. As the rumpled sea flattens out, ripples race outward. A tsunami is born. (See Tsunami Attack animation, 17K. You will need the free Flash plug-in to view this animation.)

On the open ocean, tsunami waves approach speeds of 500 mph, almost fast enough to keep pace with a jetliner. But gazing out the window of a 747, you wouldn't be able to pick it out from the wind-driven swells. In deep water, the waves spread out and hunch down, with hundreds of miles between crests that may be just a few feet high. A passenger on a passing ship would scarcely detect their passing. But in fact the tsunami crest is just the very tip of a vast mass of water in motion. Though wind-driven waves and swells are confined to a shallow layer near the ocean surface, a tsunami extends thousands of feet deep into the ocean.

Because the momentum of the waves is so great, a tsunami can travel great distances with little loss of energy. The 1960 earthquake off the coast of Chile generated a tsunami that had enough force to kill 150 people in Japan after a journey of 22 hours and 10,000 miles. The waves from a trans-Pacific tsunami can reverberate back and forth across the ocean for days, making it jiggle like a planetary-scale pan of Jell-O.

As the waves in the tsunami reach shore, they slow down due to the shallowing sea floor, and the loss in speed is often accompanied by a dramatic increase in wave height. The waves scrunch together like the ribs of an accordion and heave upward. Depending on the geometry of the seafloor warping that first generated the waves, tsunami attacks can take different forms. In certain cases, the sea can seem at first to draw a breath and empty harbors, leaving fish flopping on the mud. This sometimes draws the curious to the shoreline and to their deaths, since the withdrawing of the sea is inevitably followed by the arrival of the crest of a tsunami wave. Tsunamis also flood in suddenly without warning. Tsunami waves usually don't curve over and break, like Hawaiian surf waves. Survivors of tsunami attacks describe them as dark "walls" of water. Impelled by the mass of water behind them, the waves bulldoze onto the shore and inundate the coast, snapping trees like twigs, toppling stone walls and lighthouses, and smashing houses and buildings into kindling.



You will need the free QuickTime (2.0 or above) plug-in to view this movie.
Tsunami survivor.

The contours of the seafloor and coastline have a profound influence on the height of the waves -- sometimes with surprising and dangerous results. During the 1993 tsunami attack on Okushiri, Japan, the wave "runup" on the coast averaged about 15 to 20 meters (50 - 65 feet). But in one particular spot, the waves pushed into a V-shaped valley open to the sea, concentrating the water in a tighter and tighter space. In the end, the water ran up to 32 meters (90 feet) above sea level, about the height of an 8-story office building.

THE ELECTRONIC VOLCANO

Edited by:
Barbara DeFelice, Physical Sciences Librarian, Kresge Library,
D. Randall Spydell, Dept. of Earth Sciences
Richard E. Stoiber, Dept. Earth Sciences
Dartmouth College, Hanover NH 03755, USA

Mt St. Helens, from the U.S. Geological Survey Digital Data Series (DDS-8).

INTRODUCTION

The Electronic Volcano is a window into the world of information on active volcanoes. From here you can find many types of materials on active volcanoes worldwide, such as maps, photographs and full texts of dissertations and a few elusive documents. The Electronic Volcano will guide you to resources in libraries or resources on other information servers

THE ELECTRONIC VOLCANO -- Introductory material in Chinese
DER ELEKTRONISCHE VULKAN -- Introductory material in German
EL VOLCAN ELECTRONICO -- Introductory material in Spanish
IL VULCANO ELETTRONICO -- Introductory material in Italian
LE VOLCAN ELECTRONIQUE -- Introductory material in French
THE ELECTRONIC VOLCANO -- Introductory material in Russian

We are grateful to the many who have assisted us.

DEDICATION

The Electronic Volcano was created in memory of volcanologists, friends, from Colombia, France, Papua New Guinea, Russia, United Kingdom and United States of America who have died on volcanoes.

VOLCANO LISTSERV

Subscribe to the e-mail list VOLCANO%ASUACAD.BITNET to get updates on volcanic activitiy from observatories around the world. Researchers share lists of reprints of their articles on this e-list. Newsletters are posted, such as the Hawaii Volcano Watch and the Global Volcanism Newsletter. Some major journal publishers periodically list the contents of their journals here.

CONTENTS OF THE ELECTRONIC VOLCANO

The casual browser is invited to sample the Electronic Volcano:

See the picture by Katia Krafft Pele Dancing. Find out about the latest eruptions of the Mexcan volcano Popocatepetl. Read an eyewitness account of the birth of Paricutin Volcano in Mexico in 1943.

Benjamin Franklin may have been the first person to consider the effect of volcanic eruptions on weather. Read his 1784 paper.

See a volcanic eruption from under the sea as pictured on a postage stamp.

A. CATALOGS OF ACTIVE VOLCANOES

Valuable sources of descriptive information and references to the literature. Selected ones are listed; check with your library for availability.

B. DATASETS FOR LITERATURE CITATIONS RELATIVE TO ACTIVE VOLCANOES

C. ELECTRONIC VERSIONS OF TEXT MATERIAL

Includes a few of the more elusive items relative to active volcanoes. Listed by author, title, subject

D. JOURNALS WHICH INCLUDE ARTICLES ON ACTIVE VOLCANOES

A list of the major journals concentrating on volcanological research, not including journals such as Science and Nature that cover volcanism as well as many other topics. Some volcanological observatory bulletins are in this list. Each title has a list of libraries holding at least some issues. TABLES OF CONTENTS OF JOURNALS

E. VISUAL INFORMATION

Photo, radar, videotape and cinematic coverage of active volcanoes

F. MAPS OF ACTIVE VOLCANOES

Topographic Maps -- Geologic Maps -- Volcanic Hazard Maps

G. VOLCANIC OBSERVATORIES AND INSTITUTIONS

H. THESES RELATIVE TO ACTIVE VOLCANISM

Theses for which there are Abstracts and/or some excerpts. Listed by Author

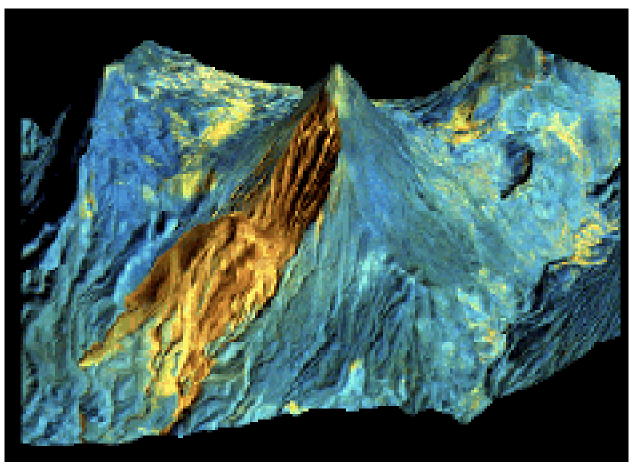
Welcome to the Michigan Technological University Volcanoes Page

Sponsored by the Keweenaw Volcano Observatory.
Michigan Tech

Houghton, MI USA



Our Purpose:

A primary focus of volcanology is to provide scientific and educational information that can lead to hazard mitigation. **Michigan Tech's Volcanoes Page** aims to provide information about volcanoes to the public and to complement other informational sites on the web. We started this site when there were almost no other volcano sites--now there are lots, and many of them have far more resources. So we now aim to fill in spots that aren't covered elsewhere. Send your suggestions!

What is a volcano?

We could say a volcano is a liquid rock plumbing system which extends from several 10's of kilometers depth to the earth's surface, and includes the near vent deposits of eruptions. Is this a good definition? Is this a volcano? How about this? Or this?

Volcanic Hazards Mitigation

Volcanic Cloud Hazards to Aviation - This page aims to provide information about how volcanic ash clouds affect aircraft, and how to avoid this hazard.

Volcanoes and People Scientists are not communication experts. This page is a first step at building communcation between scientists and teachers, with a goal of mitigating natural hazards.

Basic Guide to Volcanic Hazards prepared by Colleen M. Riley, MTU Volcanoes are beneficial to humans living on or near them. They produce fertile soil, and provide valuable minerals, water reservoirs, geothermal resources, and scenic beauty. But volcanoes can be very dangerous. Where can a person go to be safe from an erupting volcano? What types of volcanic hazards might they face? These questions are difficult to answer because there are many types of volcanic eruptions which produce different types of volcanic hazards.

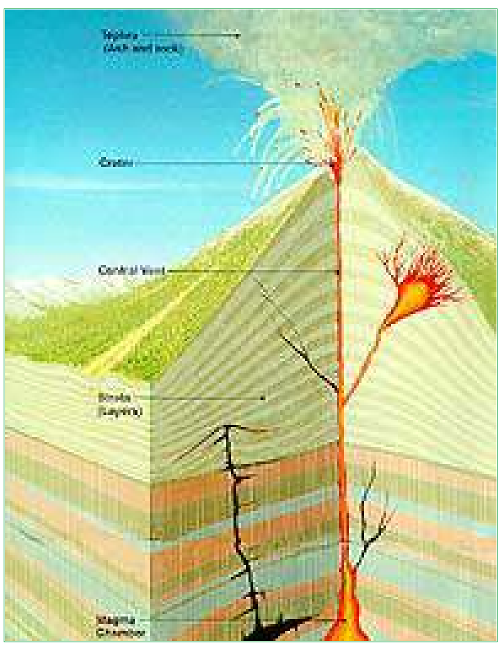
VOLCANOES!

Introduction (grades 4 - 8)

*This packet is only available online.
(From VOLCANOES! Poster. All the images are clickable for larger view.)



(Left: Poster Fig. 1)

Volcanic eruptions are among the Earth's most powerful and destructive forces. Imagine hearing a volcano erupt thousands of miles away. Imagine looking through binoculars and seeing the top of a mountain collapse. Imagine discovering an ancient Roman city that had been buried in volcanic ash.

Volcanoes are also creative forces. The Earth's first oceans and atmosphere formed from the gases given off by volcanoes. In turn, oceans and an atmosphere created the environment that made life possible on our planet. Volcanoes have also shaped the Earth's landscape. Many of our mountains, islands, and plains have been built by volcanic eruptions.

Why Do Volcanoes Erupt?

Deep within the Earth it is so hot that some rocks slowly melt and become a thick flowing substance called **magma**. Because it is lighter than the solid rock around it, magma rises and collects in magma chambers. Eventually some of the magma pushes through **vents** and **fissures** in the Earth's surface. A volcanic eruption occurs! Magma that has erupted is called **lava**.

Some volcanic eruptions are explosive and others are not. How explosive an eruption is depends on how runny or sticky the magma is. If magma is thin and runny, gases can escape easily from it. When this type of magma erupts, it flows out of the volcano. Lava flows rarely kill people, because they move slowly enough for people to get out of their way. Lava flows, however, can cause considerable destruction to buildings in their path.

If magma is thick and sticky, gases cannot escape easily. Pressure builds up until the gases escape violently and explode. In this type of eruption, the magma blasts into the

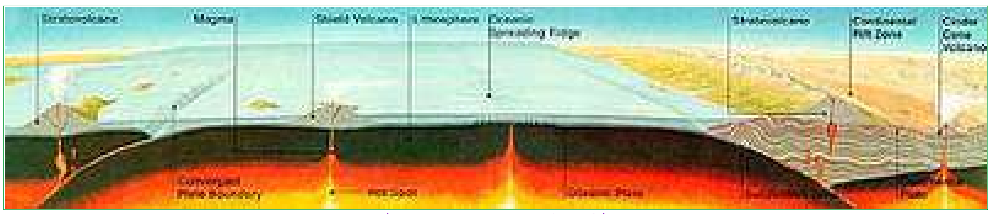
air and breaks apart into pieces called **tephra**. Tephra can range in size from tiny particles of **ash** to house-size boulders.

Explosive volcanic eruptions can be dangerous and deadly. They can blast out clouds of hot tephra from the side or top of a volcano. These fiery clouds race down mountainsides destroying almost everything in their path. Ash erupted into the sky falls back to Earth like powdery snow, but snow that won't melt. If thick enough, blankets of ash can suffocate plants, animals, and humans. When hot volcanic materials mix with water from streams or melted snow and ice, mudflows form. Mudflows have buried entire communities located near erupting volcanoes.

Because there may be hundreds or thousands of years between volcanic eruptions, people may not be aware of a volcano's dangers. When Mount St. Helens in the State of Washington erupted in 1980, it had not erupted for 123 years. Most people thought Mount St. Helens was a beautiful, peaceful mountain and not a dangerous volcano.

Where Do Volcanoes Erupt?



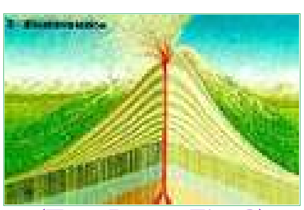
(Top: Poster Fig. 2)

Volcanoes occur because the Earth's **crust** is broken into plates that resemble a jigsaw puzzle. There are 16 major plates. These rigid plates float on a softer layer of rock in the Earth's **mantle**. As the plates move about they push together or pull apart. Most volcanoes occur near the edges of plates.

When plates push together, one plate slides beneath the other. This is a **subduction zone**. When the plunging plate gets deep enough inside the **mantle**, some of the rock on the overlying plate melts and forms magma that can move upward and erupt at the Earth's surface. At **rift zones**, plates are moving apart and magma comes to the surface and erupts. Some volcanoes occur in the middle of plates at areas called **hotspots** - places where magma melts through the plate and erupts.

Why Do Volcanoes Grow?

Volcanoes grow because of repeated eruptions. There are three main kinds, or shapes, of volcanoes based on the type of materials they erupt.



(Top: Poster Fig. 3)

Ecosystems
Natural Resources

Stratovolcanoes build from eruptions of lava and tephra that pile up in layers, or strata, much like layers of cake and frosting. These volcanoes form symmetrical cones with steep sides.

Cinder cones build from erupting lava that breaks into small pieces as it blasts into the air. As the lava pieces fall back to the ground, they cool and harden into cinders that pile up around the volcano's vent. Cinder cones are very small cone-shaped volcanoes.

Shield volcanoes form from eruptions of flowing lava. The lava spreads out and builds up volcanoes with broad, gently sloping sides. The shape resembles a warrior's shield.

Mount St. Helens!

On May 18, 1980, Mount St. Helens violently erupted. For 2 months the volcano showed signs that it was waking up from its 123-year sleep. Earthquakes beneath the mountain increased. Steam and ash erupted. And a "bulge" grew on the mountain's steep north side. All these warning signs signaled that magma was moving upward inside the volcano.

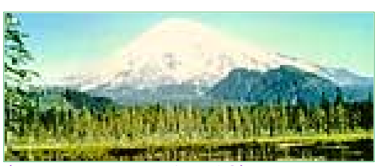
(Top: Poster Fig. 6, 7, 8, and 9)

The First 35 Seconds

On the morning of the eruption, Gary Rosenquist was camped about 36 kilometers (11 miles) from the summit of Mount St. Helens. Another camper was looking through binoculars and noticed that the upper right side of the volcano looked "fuzzy." He shouted that the "mountain was going." Rosenquist began taking photographs. An earthquake that occurred beneath the volcano shook loose the "bulge" on the mountain's steep north side. Rock and ice slide down the mountain. Then the mountain exploded gases, magma, and water laterally out the side where the "bulge" had been. The explosion hurled hot rock and ash at hurricane speeds. Ash and steam erupted vertically from the volcano's crater and continued for 9 hours.

The Mountain Blows its Top

Volcanic eruptions alter the surface of the Earth's **lithosphere**, the hard, outermost shell of the Earth.



(Top: Poster Fig. 10)

Many eruptions have built Mount St. Helens' beautiful cone shape. The May 18, 1980, eruption, however, dramatically changed the volcano's size and shape. It tore off the mountain's top and blasted a giant crater in its side.

(Top: Poster Fig. 11)

Smaller eruptions have continued since 1980. Mostly occurring on the bottom of the volcano's crater, each eruption squeezes up thick, pasty lava and sometimes spews out tephra. In photograph number 11, look for the dome that has formed inside the crater. Slowly, the volcano is rebuilding itself into its former shape.

Up in the Air

(Top: Poster Fig. 12)

Volcanoes erupt materials into the **atmosphere**, the gases and water vapor that surround the Earth.

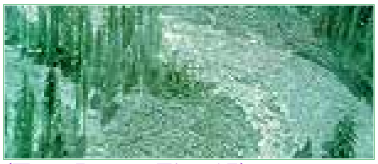
(Top: Poster Fig. 13)

The eruption blasted ash and gases into the atmosphere. Winds carried ash great distances. The ash-covered truck shown here was parked 19 kilometers (12 miles) from Mount St. Helens. Two men who were camped nearby died, suffocating from hot volcanic ash. They were two of 57 known fatalities.

(Top: Poster Fig. 14)

In Yakima, a city in eastern Washington, ash began to fall about an hour after the eruption. It became so dark that lights were turned on all day. Face masks were necessary when people went outside. It took 10 weeks to haul away the ash from Yakima's streets, sidewalks, and roofs.

Water, Rock, and Mud



(Top: Poster Fig. 15)

The **hydrosphere** - the liquid water on and under the Earth's surface - can make volcanic eruptions more dangerous.

(Top: Poster Fig. 16)

Before the May 18, 1980, eruption, the streams on Mount St. Helens were crystal clear. After the eruption, streams were choked with rock and mud. When water mixed with rock and mud, it created volcanic mudflows (also called lahars) that were able to move down the volcano's slopes. On the steepest slopes, the mudflows traveled up to 144 kilometers per hour (90 miles per hour). Some of the mudflows were as high as a six-storied building!

Fire and Ice

(Top: Poster Fig. 17)

Ice and snow - the part of the Earth system called the **cryosphere** - can melt during a volcanic eruption.

(Top: Poster Fig. 18)

Snow and ice-capped volcanoes like Mount St. Helens are especially dangerous if they erupt. Much of the water in Mount St. Helens' mudflows came from snow and ice melted by the heat of the eruption. These mudflows were as thick as wet cement and able to carry along almost anything that they picked up. Eyewitnesses reported seeing mudflows carry everything from farm animals to a fully loaded logging truck. Fortunately, when the mudlfow hit, no one was in the bus pictured here.

Death and Recovery

The Earth's **biosphere** - the realm of all living things - is affected during a volcanic eruption.

(Top: Poster Fig. 19)

The force of the eruption on Mount St. Helens blew down giant trees like they were match sticks. Almost all of the animals that lived in these forests were killed as well. Birds were particularly hard hit. Some birds survived the eruption but died later because the insects and plants they ate had died.

(Top: Poster Fig. 20)

Surprisingly, some plants and animals did survive. Plants sprouted from roots that survived even though the plants' tops had been sheared off. Animals such as gophers and ants survived in their underground homes. Within a few weeks of the eruption deer, elk, and other animals moved in from nearby areas to take advantage of the new plants that were sprouting.

Volcano FAQs

Compiled by the
Geologic Inquiries Group

1. Could a volcanic eruption occur in my area?

Map showing volcanoes *(North and Central American Volcanoes)*
Frequency of eruptions in hazard areas

2. What causes volcanic activity?

The nature of volcanoes
Plate Tectonics, Hot Spots, Ring of Fire

3. I understand that an extinct volcano exists near my home in the eastern US. Should I be concerned?

No. Through plate tectonics, the eastern U.S. has been isolated from the global tectonic features, tectonic plate boundaries and hot spots in the mantle, that cause volcanic activity. So, new volcanic activity is not possible now or in the near future. If you wait around several hundred million years, maybe...

Remnants of past volcanism are found in most areas of the earth, even where volcanoes have not erupted in hundreds of millions of years. They are very common.

4. What hazards are associated with volcanic activity?

General
Debris Flows
Aviation

5. Does a relationship exist between volcanoes and earthquakes?

Earthquakes as a volcanic process
Global distribution

6a. Are volcanic eruptions weather related?

Volcanic lightning
Can rain cause volcanic eruptions?

6b. Do volcanic eruptions affect the climate?

7. What are the warning signs of an eruption and how do we monitor them?

8. Who monitors volcanoes in the US / World? How are people warned?
   - US Volcano Observatories
   - Worldwide monitoring

9. Can we predict volcanic eruptions?

10. Why can't we control volcanic eruptions by diverting lava?

11. What is the U.S. Geological Survey doing to mitigate volcanic hazards?

12. Volcano Statistics
    - How many active volcanoes exist?
    - Is volcanic activity increasing worldwide?

13. How can I prepare for a volcanic eruption?

14. How are volcanoes beneficial to people?

15. How can I become a volcanologist?

[» Volcano Watch: Mapping New Lava]

[» Volcano Facts]

[» Mount St. Helens]

[» Pele: The Volcano Goddess]

[» Disaster Intensity Scales]

[» Water, Wind and Earth Game]

A volcano is a mountain that opens downward to a pool of molten rock below the surface of the earth. When pressure builds up, eruptions occur. Gases and rock shoot up through the opening and spill over or fill the air with lava fragments. Eruptions can cause lateral blasts, lava flows, hot ash flows, mudslides, avalanches, falling ash and floods. Volcano eruptions have been known to knock down entire forests. An erupting volcano can trigger tsunamis, flashfloods, earthquakes, mudflows and rockfalls.

Active volcanoes in the U.S. are found mainly in Hawaii, Alaska, California, Oregon and Washington. The greatest chance of eruptions near areas where many people live is in Hawaii and Alaska. The danger area around a volcano covers about a 20-mile radius. In May 18, 1980, Mount St. Helens erupted in Washington state. It killed 58 people and caused more than $1 billion in property damage.

Fresh volcanic ash, made of pulverized rock, can be harsh, acidic, gritty, glassy and smelly. The ash can cause damage to the lungs of older people, babies and people with respiratory problems.

Volcanoes and Global Climate Change

Volcanoes and Global Cooling

Volcanic gases are thought to be responsible for the global cooling that has sometimes been observed for a few years after a major eruption. The amount and global extent of the cooling depend on the force of the eruption, the amount of particular gases emitted, and, perhaps, on the location of the volcano with respect to the world's global atmospheric circulation patterns. When large masses of gases from the eruption reach the stratosphere, they can produce a large, widespread cooling effect. As a prime example, the effects of Mount Pinatubo, which erupted in June 1991, may have lasted a few years, serving to offset temporarily the predicted greenhouse warming effect.

Figure 1 illustrates that as volcanoes erupt, they blast huge clouds into the atmosphere. These clouds are made up of particles and gases, including sulfur dioxide. Millions of tons of sulfur dioxide gas can reach the stratosphere from a major eruption. There, the sulfur

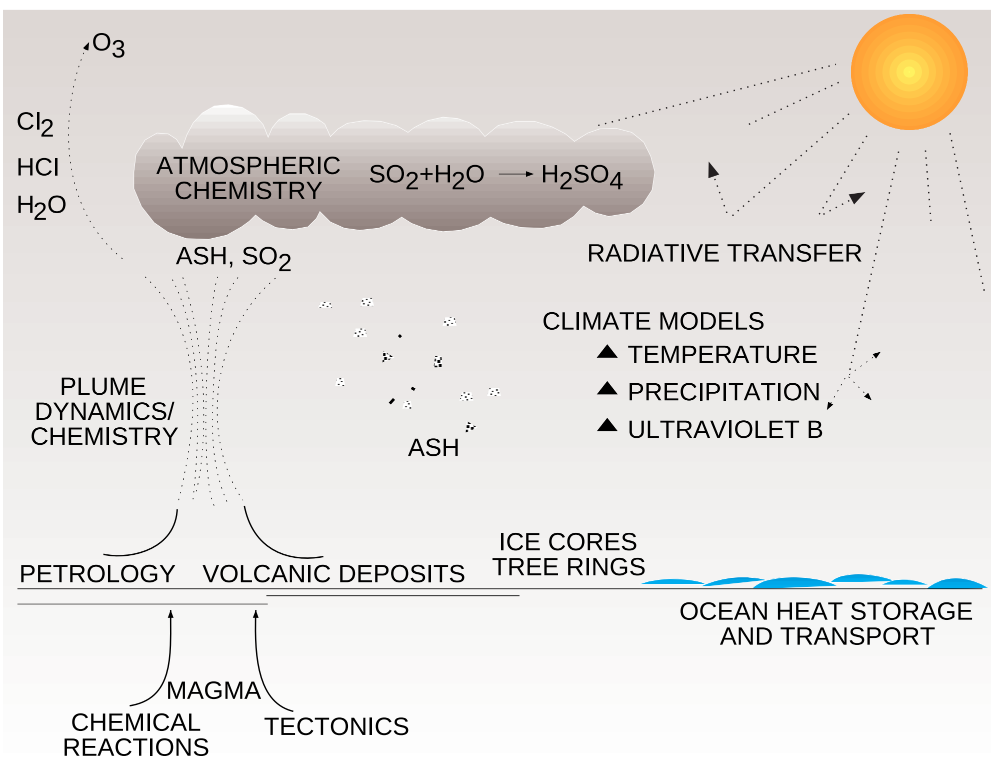

Figure 1. Volcanism studies are an important aspect of climate research (see chemistry glossary).

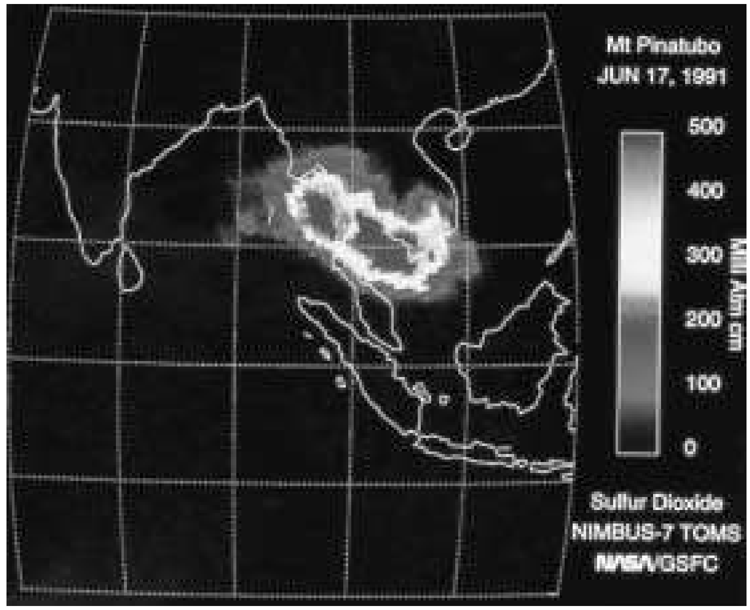
dioxide converts to tiny persistent sulfuric acid (sulfate) particles, referred to as aerosols. These sulfate particles reflect energy coming from sun, thereby decreasing the amount of sunlight reaching and heating the Earth's surface.

Short term global cooling often has been linked with some major volcanic eruptions. The year 1816 has been referred to as “the year without a summer.” It was a time of significant weather-related disruption in New England and in Western Europe with killing summer frosts in the United States and Canada. These strange phenomena were attributed to a major eruption of the Tambora volcano in 1815 in Indonesia. The volcano threw sulfur dioxide gas into the stratosphere, and the aerosol layer that formed led to brilliant sunsets seen around the world for several years.

But, not all volcanic eruptions, not even all *large* volcanic eruptions, produce global-scale cooling. Mount Agung in 1963 apparently caused a considerable decrease in temperatures around much of the world, whereas El Chichón in 1982 seemed to have little effect, perhaps because of its different location or because of the El Niño that occurred the same year. (See NASA Facts NF-211.) El Niño is a Pacific Ocean phenomenon, but it causes worldwide weather variations that may have acted to cancel out the effect of the El Chichón eruption.

Volcanoes and Ozone Depletion

Another possible effect of a volcanic eruption is the destruction of stratospheric ozone. Researchers now are suggesting that aerosol particles containing sulfuric acid from volcanic emissions may contribute to ozone loss. When chlorine compounds resulting from the breakup of chlorofluorocarbons (CFCs) in the stratosphere are present, the sulfate particles may serve to convert them into more-active



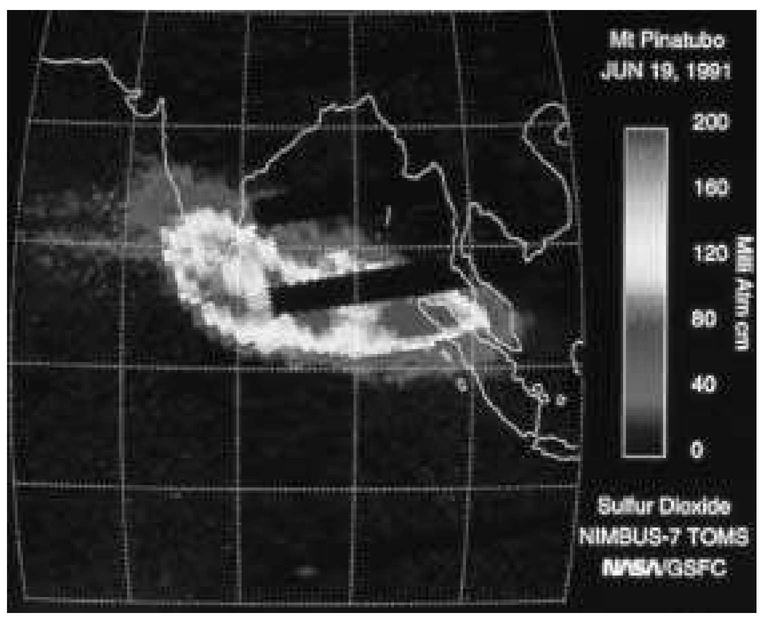


Figure 2. Images from NIMBUS-7: TOMS—June 17 (Top) and 19 (Bottom), 1991, showing the spread of sulfur dioxide from the Mt. Pinatubo eruption. The “gray scale” indicates the thickness the sulfur dioxide cloud layer would have had if it were obseved at standard surface conditions of temperature and pressure.

forms that may cause more-rapid ozone depletion. (See NASA Facts NF-198.)

Monitoring the Effects of Volcanoes

Space-based instruments are the only practical way to observe large and transitory volcanic eruption clouds. NASA's Total Ozone Mapping Spectrometer (TOMS) instruments have contributed significantly to our knowledge of the total amount of sulfur dioxide emitted into the atmosphere in the course of major volcanic eruptions. Figure 2 shows TOMS images of sulfur dioxide spreading across the Indian Ocean region following the eruption of Mount Pinatubo. Several weeks later the sulfur dioxide had spread around the world as observed by the Microwave Limb Sounder (MLS) instrument on NASA's Upper Atmosphere Research Satellite (UARS) (see Figure 3).

In addition to detecting the sulfur dioxide from Mount Pinatubo, TOMS has made similar observations of more than 100 volcanic events, including a major eruption from the Cerro Hudson volcano in Chile in 1991. TOMS instruments were launched on a Nimbus-7 spacecraft in 1978; a Russian Meteor-3 spacecraft in 1991; and on the Earth Probe and the Japanese Advanced Earth Observing System (ADEOS) platforms in 1996. A TOMS instrument is also scheduled to fly on a Russian-3M satellite in 2000.

Data from the Stratospheric Aerosol and Gas Experiment (SAGE II) instrument on NASA's Earth Radiation Budget Satellite (ERBS) have shown that during the first five months after the Mount Pinatubo eruption, the optical depth of the stratospheric aerosol increased up to 100 times in certain locations. Optical depth is a general measure of the capacity of a region of the atmosphere to prevent the passage of visible light through it. Greater optical depths mean greater blockage of the light. In this case, the increased optical depth means that considerably less of the sun's energy can get through the cloud to warm the Earth's surface. An advanced SAGE III instrument, which will make similar observations, is scheduled to be launched on a Russian Meteor-3M spacecraft in the second half of 1998.

A few years after an eruption most of the aerosol clouds will have decayed so that their effects on radiation will become negligible.

Observations of the effects of Mt. Pinatubo aerosols on global climate have been used to validate scientists' understanding of climate change and our ability to predict future climate. Researchers at NASA's Goddard

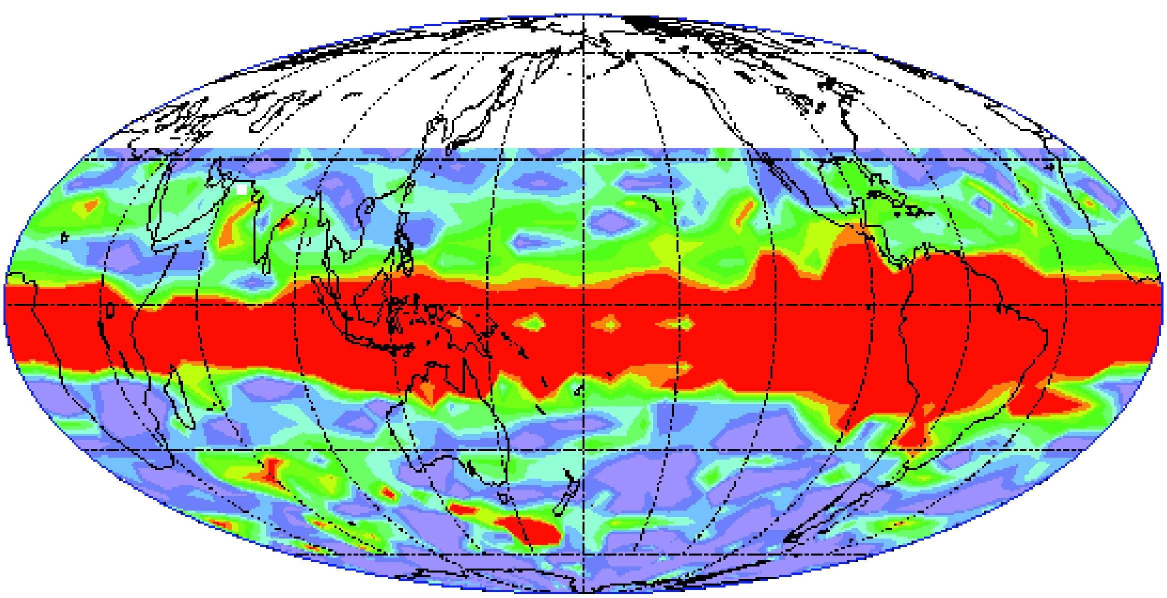

Figure 3. Images from the UARS satellite—sulfur dioxide cloud from Mt. Pinatubo on September 23, 1991, after dispersal around the world.

Institute for Space Studies in New York city have applied their general circulation model of Earth's climate to the problem. They have reported success in correctly predicting many of the effects of the sulfate aerosols from Mount Pinatubo's eruption on lowering global temperatures.

NASA Missions to Study Volcanoes

Some of NASA's past and present missions that contribute to the study of volcanoes are listed in the accompanying table. Included in the table is the Earth Observing System (EOS), the key element of NASA's Earth Science Enterprise. The first launch in the series of EOS satellites is scheduled to take place in 1998.

The High Resolution Infrared Radiometer (HRIR), first flown on NASA's Nimbus-1 satellite in 1964, has been used to observe both active and dormant volcanoes. On Nimbus-2, HRIR recorded energy changes from the volcanic activity on Surtsey, Iceland in 1966. The Multispectral Scanner (MSS) and Thematic Mapper (TM) instruments on the Landsat satellites have provided a long series of images of volcanic activity, such as venting, volcanic ash falls, and lava flows.

The EOS program will incorporate a series of satellites that will carry advanced instruments to provide a highly-accurate, self-consistent, and long-term data base of many aspects of Earth's atmosphere, land, and ocean characteristics. The information gained from this major effort to study Earth phenomena will expand our knowledge of the interactions of volcanoes with Earth's climate.

Glossary of Chemistry

Cl_2	*chlorine molecule*
HCl	*hydrogen chloride*
H_2O	*water*
O_3	*ozone*
H_2SO_4	*sulfuric acid*
SO_2	*sulfur dioxide*

Earth Science Enterprise

Selected Missions Related to the Study of Volcanoes

Mission	Launch	Scientific Objective
Nimbus Series	1964-1978	Observe thermal emissions from active and dormant volcanoes (beginning with Nimbus-1 HRIR) Observe stratospheric sulfur dioxide (beginning with TOMS in 1978)
Landsat Series	1972-1998	High-spatial-resolution imagery of volcanic activity
TOMS/Meteor-3 TOMS/Earth Probe TOMS/ADEOS TOMS/Meteor-3M	1991 1996 1996 2000	Observe stratospheric sulfur dioxide and volcanic ash
SAGE III/ERBS SAGE III/Meteor-3M	1984 1998	Measure changes in stratospheric aerosol optical depth and the resulting changes in Earth's radiation budget due to volcanic emissions
Earth Observing System (EOS)	1998-	Observe Ozone Observe stratospheric sulfur dioxide Measure changes in stratospheric aerosol optical depth and changes in the radiation budget due to volcanic emissions Measure thermal anomalies due to volcanoes

Comments/Questions?

What is a rainbow?

Author Donald Ahrens in his text *Meteorology Today* describes a rainbow as "one of the most spectacular light shows observed on earth". Indeed the traditional rainbow is sunlight spread out into its spectrum of colors and diverted to the eye of the observer by water droplets. The "bow" part of the word describes the fact that the rainbow is a group of nearly circular arcs of color all having a common center.

Where is the sun when you see a rainbow?

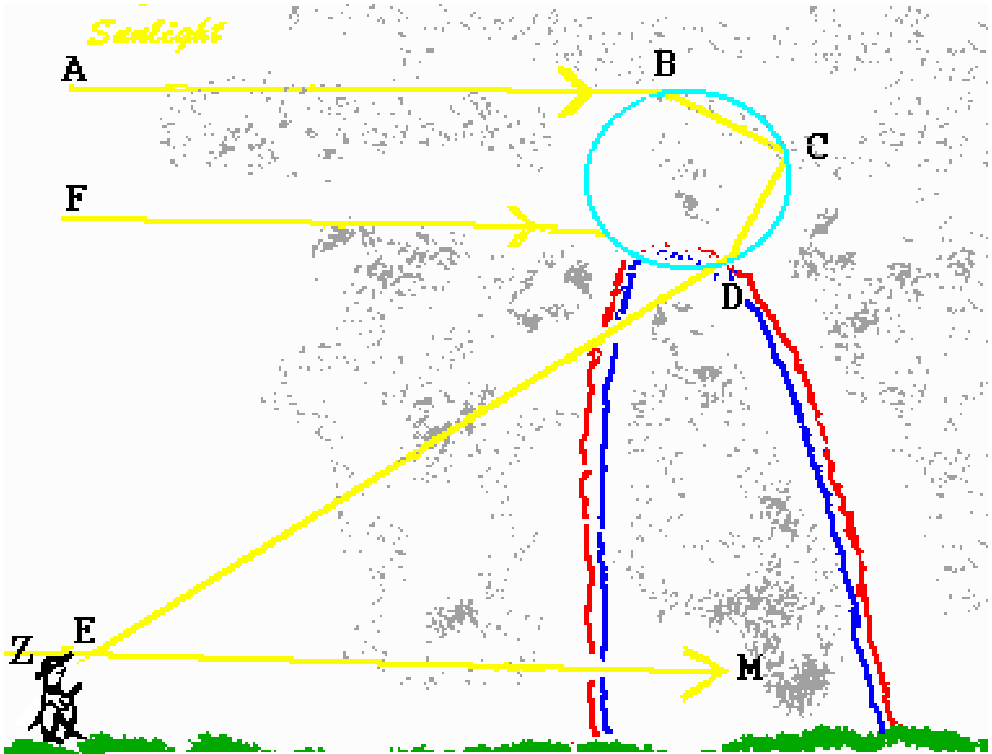
This is a good question to start thinking about the physical process that gives rise to a rainbow. Most people have never noticed that the sun is always behind you when you face a rainbow, and that the center of the circular arc of the rainbow is in the direction opposite to that of the sun. The rain, of course, is in the direction of the rainbow.

What makes the bow?

A question like this calls for a proper physical answer. We will discuss the formation of a rainbow by raindrops. It is a problem in optics that was first clearly discussed by Rene Descartes in 1637. An interesting historical account of this is to be found in Carl Boyer's book, *The Rainbow From Myth to Mathematics*. Descartes simplified the study of the rainbow by reducing it to a study of one water droplet and how it interacts with light falling upon it.

He writes:*"Considering that this bow appears not only in the sky, but also in the air near us, whenever there are drops of water illuminated by the sun, as we can see in certain fountains, I readily decided that it arose only from the way in which the rays of light act on these drops and* *pass from them to our eyes. Further, knowing that the drops are round, as has been formerly proved, and seeing that whether they are larger or smaller, the appearance of the bow is not changed in any way, I had the idea of making a very large one, so that I could examine it better.*

Descarte describes how he held up a large sphere in the sunlight and looked at the sunlight reflected in it. He wrote "*I found that if the sunlight came, for example, from the part of the sky*



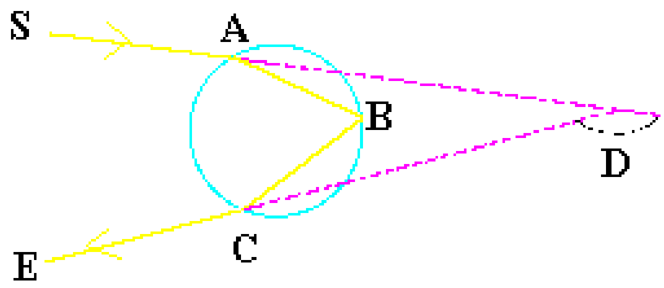
from Descartes"Discours de la Methode", 1637

which is marked AFZ

and my eye was at the point E, when I put the globe in position BCD, its part D appeared all red, and much more brilliant than the rest of it; and that whether I approached it or receded from it, or put it on my right or my left, or even turned it round about my head, provided that the line DE always made an angle of about forty-two degrees with the line EM, which we are to think of as drawn from the center of the sun to the eye, the part D appeared always similarly red; but that as soon as I made this angle DEM even a little larger, the red color disappeared; and if I made the angle a little smaller, the color did not disappear all at once, but divided itself first as if into two parts, less brilliant, and in which I could see yellow, blue, and other colors ... When I examined more particularly, in the globe BCD, what it was which made the part D appear red, I found that it was the rays of the sun which, coming from A to B, bend on entering the water at the point B, and to pass to C, where they are reflected to D, and bending there again as they pass out of the water, proceed to the point ".

This quotation illustrates how the shape of the rainbow is explained. To simplify the analysis, consider the path of a ray of monochromatic light through a single spherical raindrop. Imagine how light is refracted as it enters the raindrop, then how it is reflected by the internal, curved, mirror-like surface of the raindrop, and finally how it is refracted as it emerges from the drop. If we then apply the results for a single raindrop to a whole collection of raindrops in the sky, we can visualize the shape of the bow.

The traditional diagram to illustrate this is shown here as adapted from Humphreys, *Physics of the*



Air. It represents the path of one light ray incident on a water droplet from the direction SA. As the light beam enters the surface of the drop at A, it is bent (refracted) a little and strikes the inside wall of the drop at B, where it is reflected back to C. As it emerges from the drop it is refracted (bent) again into the direction CE. The angle D represents a measure of the deviation of the emergent ray from its original direction. Descartes calculated this deviation for a ray of red light to be about 180 - 42 or 138 degrees.

The ray drawn here is significant because it represents the ray that has the smallest angle of deviation of all the rays incident upon the raindrop. It is called the *Descarte* or *rainbow ray* and much of the sunlight as it is refracted and reflected through the raindrop is focused along this ray. Thus the reflected light is diffuse and weaker except near the direction of this rainbow ray. **It is this concentration of rays near the minimum deviation that gives rise to the arc of rainbow.**

The sun is so far away that we can, to a good approximation, assume that sunlight can be represented by a set of parallel rays all falling on the water globule and being refracted, reflected internally, and refracted again on emergence from the droplet in a manner like the figure. Descartes writes

I took my pen and made an accurate calculation of the paths of the rays which fall on the different points of a globe of water to determine at which angles, after two refractions and one or two reflections they will come to the eye, and I then found that after one reflection and two refractions there are ***many more rays*** *which can be seen at an angle of from forty-one to forty-two degrees than at any smaller angle; and that there are none which can be seen at a larger angle"* (the angle he is referring to is 180 - D).

A typical raindrop is spherical and therefore its effect on sunlight is symmetrical about an axis through the center of the drop and the source of light (in this case the sun). Because of this symmetry, the two-dimensional illustration of the figure serves us well and the complete picture can be visualized by rotating the two dimensional illustration about the axis of symmetry. The symmetry of the focusing effect of each drop is such that whenever we view a raindrop along the line of sight defined by the *rainbow ray*, we will see a bright spot of reflected/refracted sunlight. Referring to the figure, we see that the *rainbow ray* for red light makes an angle of 42 degrees between the direction of the incident sunlight and the line of sight. Therefore, as long as the raindrop is viewed along a line of sight that makes this angle with the direction of incident light, we will see a brightening. The rainbow is thus a circle of angular radius 42 degrees, centered on the antisolar point, as shown schematically here.

We don't see a full circle because the earth gets in the way. The lower the sun is to the horizon, the more of the circle we see -right at sunset, we would see a full semicircle of the rainbow with the top of the arch 42 degrees above the horizon. The higher the sun is in the sky, the smaller is the arch of the rainbow above the horizon.

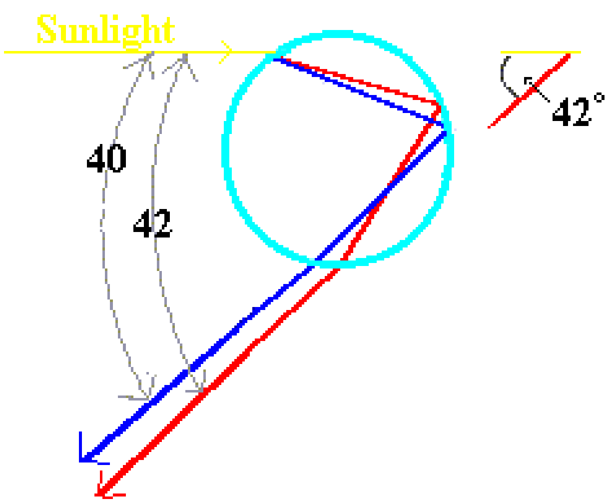
What makes the colors in the rainbow?

The traditional description of the rainbow is that it is made up of seven colors - red, orange, yellow, green, blue, indigo, and violet. Actually, the rainbow is a whole continuum of colors from red to violet and even beyond the colors that the eye can see.

The colors of the rainbow arise from two basic facts:

- Sunlight is made up of the whole range of colors that the eye can detect. The range of sunlight colors, *when combined*, looks white to the eye. This property of sunlight was first demonstrated by Sir Isaac Newton in 1666.
- Light of different colors is refracted by different amounts when it passes from one medium (air, for example) into another (water or glass, for example).

Descartes and Willebrord Snell had determined how a ray of light is bent, or refracted, as it traverses regions of different densities, such as air and water. When the light paths through a raindrop are traced for red and blue light, one finds that the angle of deviation is different for the two colors because blue light is bent or refracted more than is the red light.



This implies that when we see a rainbow and its band of colors we are looking at light refracted and reflected from *different raindrops*, some viewed at an angle of 42 degrees; some, at an angle of 40 degrees, and some in between. This is illustrated in this drawing, adapted from Johnson's *Physical Meteorology*. This rainbow of two colors would have a width of almost 2 degrees (about four times larger than the angular size as the full moon). Note that even though blue light is refracted more than red light in a single drop, we see the blue light on the inner part of the arc because we are looking along a different line of sight that has a smaller angle (40 degrees) for the blue.

Ana excellent laboratory exercise on the mathematics of rainbows is here, and F. K. Hwang has produced a fine Java Aplet illustrating this refraction, and Nigel Greenwood has written a program that operates in MS Excel that illustrates the way the angles change as a function of the sun's angle.

Ben Lanterman has made available several beautiful photographs of rainbows on the web.

What makes a double rainbow?

Sometimes we see two rainbows at once, what causes this? We have followed the path of a ray of sunlight as it enters and is reflected inside the raindrop. But not all of the energy of the ray escapes the raindrop after it is reflected once. A part of the ray is reflected again and travels along inside the drop to emerge from the drop. The rainbow we normally see is called the **primary** rainbow and is produced by one internal reflection; the **secondary** rainbow arises from two internal reflections and the rays exit the drop at an angle of 50 degrees° rather than the 42°degrees for the red primary bow. Blue light emerges at an even larger angle of 53 degrees°. his effect produces a secondary rainbow that has its colors reversed compared to the primary, as illustrated in the drawing, adapted from the Science Universe Series *Sight, Light, and Color*.

It is possible for light to be reflected more than twice within a raindrop, and one can calculate where the higher order rainbows might be seen; but these are never seen in normal circumstances.

Why is the sky brighter inside a rainbow?

Notice the contrast between the sky inside the arc and outside it. When one studies the refraction of sunlight on a raindrop one finds that there are many rays emerging at angles smaller than the *rainbow ray*, but essentially no light from single internal reflections at angles greater than this ray. Thus there is a lot of light within the bow, and very little beyond it. Because this light is a mix of all the rainbow colors, it is white. In the case of the secondary rainbow, the *rainbow ray* is the smallest angle and there are many rays emerging at angles greater than this one. Therefore the two bows combine to define a dark region between them - called Alexander's Dark Band, in honor of Alexander of Aphrodisias who discussed it some 1800 years ago!

What are Supernumerary Arcs?

In some rainbows, faint arcs just inside and near the top of the primary bow can be seen. These are called supernumerary arcs and were explained by Thomas Young in 1804 as arising from the interference of light along certain rays within the drop. Young's work had a profound influence on theories of the physical nature of light and his studies of the rainbow were a fundamental element of this. Young interpreted light in terms of it being a wave of some sort and that when two rays are scattered in the same direction within a raindrop, they may interfere with each other. Depending on how the rays mesh together, the interference can be constructive, in which case the rays produce a brightening, or destructive, in which case there is a reduction in brightness. This phenomenon is clearly described in Nussenzveig's article "The Theory of the Rainbow" in which he writes: *"At angles very close to the rainbow angle the two paths through the droplet differ only slightly, and so the two rays interfere constructively. As the angle increases, the two rays follow paths of substantially different lengths. When the difference equals half of the wavelength, the interference is completely destructive; at still greater angles the beams reinforce again. The result is a periodic variation in the intensity of the scattered light, a series of alternately bright and dark bands."*

Mikolaj and Pawel Sawicki have posted several beautiful photographs of rainbows showing these arcs.

The "purity" of the colors of the rainbow depends on the size of the raindrops. Large drops (diameters of a few millimeters) give bright rainbows with well defined colors; small droplets (diameters of about 0.01 mm) produce rainbows of overlapping colors that appear nearly white. And remember that the models that predict a rainbow arc all assume spherical shapes for raindrops.

There is never a single size for water drops in rain but a mixture of many sizes and shapes. This results in a composite rainbow. Raindrops generally don't "grow" to radii larger than about 0.5 cm without breaking up because of collisions with other raindrops, although occasionally drops a few millimeters larger in radius have been observed when there are very few drops (and so few collisions between the drops) in a rainstorm. Bill Livingston suggests: " If you are brave enough, look up during a thunder shower at the falling drops. Some may hit your eye (or glasses), but this is not fatal. You will actually see that the drops are distorted and are oscillating."

It is the surface tension of water that moulds raindrops into spherical shapes, if no other forces are acting on them. But as a drop falls in the air, the 'drag' causes a distortion in its shape, making it somewhat flattened. Deviations from a spherical shape have been measured by suspending drops in the air stream of a vertical wind tunnel (Pruppacher and Beard, 1970, and Pruppacher and Pitter, 1971). Small drops of radius less than 140 microns (0.014 cm) remain spherical, but as the size of the drop increases, the flattening becomes noticeable. For drops with a radius near 0.14 cm, the height/width ratio is 0.85. This flattening increases for larger drops.

Spherical drops produce symmetrical rainbows, but rainbows seen when the sun is near the horizon are often observed to be brighter at their sides, the vertical part, than at their top. Alistair Fraser has explained this phenomenon as resulting from the complex mixture of size and shape of the raindrops. The reflection and refraction of light from a flattened water droplet is not symmetrical. For a flattened drop, some of the rainbow ray is lost at top and bottom of the drop. Therefore, we see the rays from these flattened drops only as we view them horizontally; thus the rainbow produced by the large drops is is bright at its base. Near the top of the arc only small spherical drops produce the fainter rainbow.

What does a rainbow look like through dark glasses?

This is a "trick" question because the answer depends on whether or not your glasses are Polaroid. When light is reflected at certain angles it becomes polarized (discussed again quite well in Nussenzveig's article), and it has been found that the *rainbow angle* is close to that angle of reflection at which incident, unpolarized light (sunlight) is almost completely polarized. So if you look at a rainbow with Polaroid sunglasses and rotate the lenses around the line of sight, part of the rainbow will disappear!

Other Questions about the Rainbow

Humphreys (Physics of the Air, p. 478) discusses several "popular" questions about the rainbow:

- "What is the rainbow's distance?" It is nearby or far away, according to where the raindrops are, extending from the closest to the farthest illuminated drops along the elements of the rainbow cone.

- Why is the rainbow so frequently seen during summer and so seldom during winter?" To see a rainbow, one has to have rain and sunshine. In the winter, water droplets freeze into ice particles that do not produce a rainbow but scatter light in other very interesting patterns.
- "Why are rainbows so rarely seen at noon?" Remember that the center of the rainbow's circle is opposite the sun so that it is as far below the level of the observer as the sun is above it.
- "Do two people ever see the same rainbow?" Humphreys points out that "since the rainbow is a special distribution of colors (produced in a particular way) with reference to a definite point - the eye of the observer - and as no single distribution can be the same for two separate points, it follows that two observers do not, and cannot, see the same rainbow." In fact, each eye sees its own rainbow!!
  Of course, a camera lens will record an image of a rainbow which can then be seen my many people! (thanks to Tom and Rachel Ludovise for pointing this out!)
- "Can the same rainbow be seen by reflection as seen directly?" On the basis of the arguments given in the preceding question, bows appropriate for two different points are produced by different drops; hence, a bow seen by reflection is not the same as the one seen directly".

What are Reflection Rainbows?

A reflection rainbow is defined as one produced by the reflection of the source of incident light (usually the sun). Photographs of them are perhaps the most impressive of rainbow photographs. The reflected rainbow may be considered as a combination of two rainbows produced by sunlight coming from two different directions - one directly from the sun, the other from the reflected image of the sun. The angles are quite different and therefore the elevation of the rainbow arcs will be correspondingly different. This is illustrated in a diagram adapted from Greenler"s *Rainbows, Halos, and Glories*. The rainbow produced by sunlight reflected from the water is higher in the sky than is the one produced by direct sunlight.

What is a Lunar Rainbow?

A full moon is bright enough to have its light refracted by raindrops just as is the case for the sun. Moonlight is much fainter, of course, so the lunar rainbow is not nearly as bright as one produced by sunlight. Lunar rainbows have infrequently been observed since the time of Aristotle or before. A graphic description of one was writen by Dr. Mikkelson.

Rainbows and Proverbs

There is a delightful book by Humphreys entitled *Weather Proverbs and Paradoxes*. In it, he discusses the meteorological justifications of some proverbs associated with rainbows, such as "Rainbow at night, shepherd's delight;Rainbow in morning, shepherds take warning,"If there be a rainbow in the eve,It will rain and leave; But if there be a rainbow in the morrow It will neither lend nor borrow", and Rainbow to windward, foul fall the day; Rainbow to leeward, damp runs away."

The meteorological discussion Humphreys presents is appropriate for the northern temperate zones that have a prevailing wind, and also for a normal diurnal change in the weather.

Experiments

William Livingston, a solar astronomer who has also specialized in atmospheric optical phenomena suggests the following: "Try a hose spray yourself. As you produce a fine spray supernumeraries up to order three become nicely visible. "Try to estimate the size of these drops compared to a raindrop. ..."Another thing to try. View a water droplet on a leaf close-up - an inch from your eye. At the *rainbow angle* you may catch a nice bit of color!"

In Minnaert's excellent book *Light and Colour in the Open Air* you can find a number of experiments on how to study the nature of rainbows. Here is an illustration of one of his suggestions. Other demonstration projects are listed here .

Meg Beal, while a seventh-grader, prepared a science fair project that illustrated the nature of rainbows. The Beal family provided a photograph (1MB) of her excellent demonstration.

For those wanting to try to demonstrate the nature of a rainbow in a classroom, here are examples.

An informative tutorial on optics can be found here.

I am indebted to William C. Livingston, astronomer at the National Optical Astronomy Observatory in Tucson Arizona for his expert assistance in preparing this paper, and to Seth Sharpless for his critical reading of the manuscript. Charles A. Knight, an expert on rain at the National Center for Atmospheric Physics, provided valuable guidance on the interesting properties of raindrops.

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Meteorology

Click on the symbol for its explanation.

This material is dedicated to teachers who wish to get it right.

By bad meteorology, I do not mean bad weather.

This page is about intellectual disasters, not weather disasters.

*T*his page is prepared by Alistair B. Fraser who retains copyright to the material (unless otherwise acknowledged). However, as the object of the material is educational --- to replace bad science with good science --- the material can be freely used for non-commercial purposes, with the proviso that any use of Fraser's images must be credited with © Alistair B. Fraser, and any quotations must bear attribution.

*S*uggestions of ideas which might be beneficial to include on this page can be sent to me at alistair@fraser.cc . Also, please send me critical comments on any stupidities that I inadvertently introduce.

*T*he *Bad Science* and *Bad Meteorology* pages have been cited by over 3000 other web pages, and in books, magazines, and on TV.

Examples of Bad Meteorology:

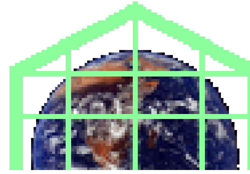
The reason clouds form when air cools is that cold air cannot hold as much water vapor as warm air.

*W*ash your hands of this emetic explanation .

Raindrops are shaped like teardrops.

*W*eep over this artistic licentiousness .

The greenhouse effect is caused when gasses in the atmosphere behave as a blanket and trap radiation which is then reradiated to the earth.



*R*eject this explanation as nothing but hot air .

The water in a sink (or toilet) rotates one way as it drains in the northern hemisphere and the other way in the southern hemisphere. Called the Coriolis Effect, it is caused by the rotation of the earth.

*T*his nonsense deserves to be flushed .

The Bad Meteorology FAQ

Proffering Garbage as Gems

- *T*he results of a *Badness Survey* .

Welcome to the WW2010 Online Guides, the next evolution phase of our web-based instructional resources. Formerly known as the Guide to Meteorology, we are expanding these resources beyond the scope of meteorology to other disciplines like climate, remote sensing and global change. We will attempt to present these topics not as individual sciences, but as integral components of a much larger system, learning about the planet on which we live. Available Online Guides include:

Guides

Last Update: 09/02/99

Meteorology
Instructional modules that introduce topics in meteorology from fronts to El Niño.

Remote Sensing
Instructional modules that introduce remote sensing technologies and their applications in meteorology.

Reading and Interpreting Weather Maps
Instructional resources that provide valuable information for the correct interpretation of weather products accessible (or soon to be accessible) from WW2010.

Projects & Activities
Curriculum aids that provide teachers with a blueprint for integrating web-based educational resources into the classroom.

The Online Guides use multimedia technology and the dynamic capabilities of the web. These resources incorporate text, colorful diagrams, animations, computer simulations, audio and video to introduce topics and concepts for a wide variety of disciplines. Selected pages link to (or will soon link to) current weather products, allowing the user to apply what the user has learned to real-time weather data. The Online Guides are an important component of the WW2010 Hybrid Multimedia Environment. Not only are they a part of this web server, but they are also (or will soon be) available for local access via educational CD-ROM.

The target audience for the Online Guides is high school and undergraduate level students. However, these resources have been used by instructors throughout K-12, undergraduate and graduate level education. Contents of the Online Guides were developed by graduate students and faculty through our efforts in the Collaborative Visualization Project (CoVis), which was funded by the National Science Foundation. These resources have been reviewed by faculty and scientists at the University of Illinois and the Illinois State Water Survey. Many of these resources were tested in a classroom environment and have been modified based upon teacher and student feedback.

The navigation menu (left) for this resource is called "Online Guides" and the available guides are listed as menu items, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

UM Weather

Connecting You To The World Of Weather

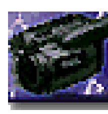
Welcome to **UM Weather**, the Internet's premier source of weather information since 1994. Providing access to thousands of forecasts, images, and the Net's largest collection of weather links, UM Weather is the most comprehensive and up-to-date source of weather data on the Web. UM Weather is brought to you by the Department of Atmospheric, Oceanic and Space Sciences at the University of Michigan.

FastForecast...Enter a city, state, country, zip code, or station code for the current National Weather Service forecast:

[ ] Get It Reset

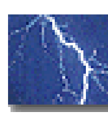
Examples: "NY", "Albany", "11234", "ALB", or "France"

WeatherSites
The list that made us famous. Nearly three hundred WWW, gopher, telnet, and FTP weather sites -- the most comprehensive weather index on the Internet.

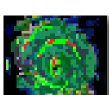


WeatherCams
Live and daily pictures of weather conditions at over 700 locations around North America.

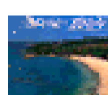
USA Weather
City-by-city forecasts, conditions, warnings, and weather graphics for each of the fifty states.



Canada Weather
Regional forecasts, advisories, conditions, and reports for each of the Canadian Provinces and Territories.

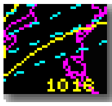


Radar and Satellite
Point-and-click access to the Internet's best Nexrad and color satellite imagery.

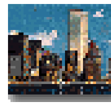


Tropical Weather
The Net's most comprhensive collection of tropical storm-related links, including National Hurricane Center reports and incredible graphics.

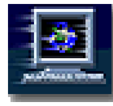
[Ski Weather](#)
Snow conditions and mountain-specific weather reports directly from the National Weather Service.



[WeatherMaps](#)
The Net's best surface and upper air analyses, including temperature maps, regional weather plots, and jet stream maps.



[Travel Cities Weather](#)
Nexrad radar, color satellite photos, climate information, forecasts, and conditions for thirty popular destinations nationwide.



[Weather Software](#)
The Internet's only weather software archive, providing access to over two dozen of the best weather applications for Macs and PCs.

UM Weather pages have been visited over **689209100** times. Last modified: June 30, 2004.

Environment Canada's World Wide Web Site.

WorldClimate

What the weather is *normally* like for tens of thousands of places worldwide!

City or town name: [ ] Search

Enter the name of the **CITY** above. Don't enter a country or state name. If you are not sure of the spelling, enter just the first few letters of the name. **For foreign cities, try entering the name in the local language, for example *Venezia* for Venice.**

Popular cities: London - Berlin - Rome - New York - Toronto - Sydney - Moskva (Moscow) - Tokyo - Beijing - Baghdad - San Francisco Bay Area - Cairo - Bangkok - Lima - Orlando - Calcutta (Kolkata) - Cape Town - Lagos

WorldClimate.com contains over 85,000 records of world climate data (historical weather averages) from a wide range of sources. See about worldclimate for details and instructions. **At present, all placenames and COUNTRIES are shown with the names they had *at the time the data was recorded.* I am well aware many, especially in eastern Europe, have changed country since!** Please also read the frequently asked questions.

NEWS

(updated 2004-Mar-12):

This site has been essentially unchanged since it was first written in 1996.

A totally rewritten new version, with **much** more data and improved searching options (by current country/state etc) is under development. It also has corrected placenames and countries. This will be online soon.

WorldClimate

 Web Design and Programming by Robert Hoare. Frequently Asked Questions. Created 1 Aug 1996. Latest Update (minor changes) 12 sep 2003. v261

Magnetism Theme Page

Below are the CLN "Theme Pages" which support the study of electricity and magnetism. CLN's theme pages are collections of useful Internet educational resources within a narrow curricular topic and contain links to two types of information. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are links to instructional materials (lesson plans) which will help teachers provide instruction in this theme.

- Electricity (Concepts) Theme Page
- Electronics (Circuitry) Theme Page
- Lightning Theme Page

General Magnetism Resources

Here are a number of links to other Internet resources which contain information and/or other links related to Magnetism. Please read our disclaimer.

- **AskERIC Lesson Plans: Physical Sciences**

  The above link is to AskEric's Physical Science page if you wish to browse/search their site yourself. Or, use the links below to go directly to two lesson plans specifically about magnetism.

  - Magnetic Fields and Bermuda Triangles High school students can use this activity to learn how to map a magnetic field and to find how magnetic fields can combine to form a complex resultant field.
  - Magnets An introduction to magnets for primary students.

- **Electricity and Magnetism**

  More than a dozen experiments on electricity and magnetism designed for intermediate students. There are about five experiments on magnetism.

- **Electricity and Magnetism**

  The basic concepts of electricity and magnetism are illustrated through the use of animation. (Shockwave required) Students are introduced to static charge, moving charge, voltage, resistance, and current. Magnetism and how it relates to electricity is also presented.

- **Gallery of Electromagnetic Personalities**

  Biographical vignettes of scientists who made significant contributions to the study of electromagnetism.

- **How An Electromagnet Works**

  An explanation about the concepts underlying electromagnetism created for kids and complete with diagrams. A few experiments are also suggested.

- [MagLev: A Physics Viewpoint]

MagLev (magnetic levitation) technology is the concept underlying research into the use of magnets to propel trains. This site presents the basic principles of the concepts which should be understandable by high school students.

- MagLev Technology

The Argonne Community of Teachers Network offers a downloadable Teacher's Handbook with student activities on magnetism and electromagnetism. The site also has links to other MagLev web sites.

- Magnetism

Here's a lesson on magnetism complete with a mini quiz, homework exercises, and a test.

- Magnetism, Electricity and Health Reform

An overview of the use of electricity and magnetism in the treatment of disease.

- Magnet Man

All sorts of experiments with magnets from the very basic to magnets interacting with other magnets, magnets and conductors, and magnetic levitation.

- National Museum of Science and Technology

This Canadian museum is not easily browsed; however, a search of the site using the keyword "magnet" turned up a number of hits that may be useful to the classroom teacher. Use the button above to search the site yourself for this or similar terms. Below are direct links to three of the best resources.

  - Background Information for Magnets
  - Lesson Plan Ideas - Magnets
  - Student Activities

- Physical Science Activity Manual

This Manual contains hands-on Chemistry & Physics activities that can be downloaded in either MAC (MS WORD) or Windows (Wordperfect) versions. The manual is neither a lab manual nor a series of lesson plans. Rather, it provides the teacher with background information and a collection of student-centered activities which s/he can adapt to local conditions. There are two documents dealing with magnetism and electromagnetism.

- Project PHYSLab

Project PHYSLab has a collection of high school physics labs (including some on Magnetism) developed by participants in an annual, three week workshop. This link is to the home page of the project. From there, enter "Labs Available Online" to find the labs. Since each of these is done by a different teacher, the quality of the lab and the detail associated with it will vary.

- Science Toys You Can Make With Your Kids

The author of this online book describes a variety of science toys that can be constructed and then goes on to explain the concepts behind the toys. Two chapters in the book are dedicated to magnetism and electromagnetism. Teachers could use these ideas for demonstrations and/or student activities.

- Smile Program Physics Index

  Teachers participating in the SMILE (Science and Mathematics Initiative for Learning Enhancement) summer session programs each create a single concept lesson plan. This database has over 30 lesson plans in their section on Electricity and Magnetism. Caution: Since there is a wide number of authors who have contributed to the database, the detail and quality of the lesson plans will vary.

- Snacks about Magnetism

  "Snacks" from the Exploratorium are miniature science exhibit that teachers can make using common, inexpensive, easily available materials. This page leads to about a dozen activities/experiments to demonstrate magnetism concepts.

Top of Page

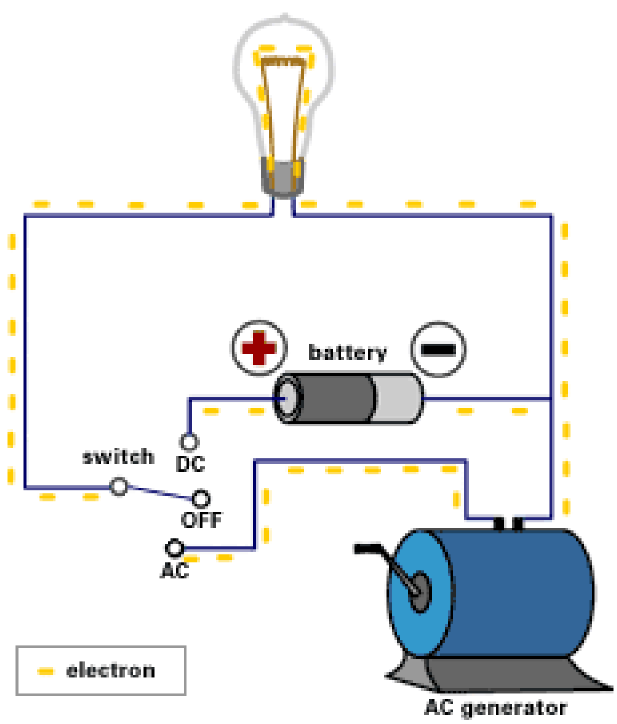
Note: The sites listed above will serve as a source of curricular content in Magnetism. For other resources in Science (e.g., curricular content in Earth Science, General Science, Life Science, or Physical Science), or for lesson plans and theme pages, click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

Previous Screen

AC/DC: What's the Difference?

In 1887 direct current (DC) was king. At that time there were 121 Edison power stations scattered across the United States delivering DC electricity to its customers. But DC had a great limitation -- namely, that power plants could only send DC electricity about a mile before the electricity began to lose power. So when George Westinghouse introduced his system based on high-voltage alternating current (AC), which could carry electricity hundreds of miles with little loss of power, people naturally took notice. A "battle of the currents" ensued. In the end, Westinghouse's AC prevailed.

But this special feature isn't about the two electrical systems and how they worked. Rather, it's a simple explanation that shows the difference between AC and DC.



To find out more about alternating and direct current, what exactly an electric current is, and two ways that the currents can be produced, check out the interaction to the left and the pages that follow.

- DC (Direct Current)
- OFF
- AC (Alternating Current)

ARTICLES ABOUT "ELECTRICITY"

New Explanations, Alternate Mental Toolkit

William J. Beaty
Electrical Engineer, U. of Washington

Jump down to Build-it Projects.

What Is "Electricity?"
There is a simple answer to this question. Really. Not the one you expect, though.

Electricity FAQ (Frequently-asked Questions)
Browse these Frequently Asked Questions, or submit a new one.

Barriers to Understanding Electricity
Twenty misconceptions which prevented me from understanding simple electrical science as a student. Maybe they cause trouble for you as well?

Electricity mistakes and 'nitpicking'
My encounters with elementary-school electricity, and how I started my "electricity debunking" articles.

"Static" sparks
Doorknob sparks and zapping yourself on the car door... and people who suffer from an "electric shock" disease.

Explaining "electricity" visually
A simple classroom activity using red and green plastic sheets. Here's a way to visualize Electric Current, "Static", and the electric charge which creates both.

Right Angle Circuitry
Do Lenz' Law and the Right Hand rule still work... after you've been turned INSIDE OUT by that Evil Grey Fog?

Tesla's Big Mistake
Why did physicists deride Nikola Tesla? What was really going on in Tesla's mind? Some insights...

What is Voltage?
What the heck is VOLTAGE? What the *HECK* is voltage? Charles Fort said that when investigating a circle you can start at any point.

Where does EM energy flow in a circuit?
The schematic of a flashlight looks simple, but only because the electromagnetic energy flow is invisible.

Sparks and Lighting
What would lightning look like if we could slow it down?

How is "static" different from "current?"

Not the usual answer found in most textbooks!

What is the relation between Watts, Ohms, Amps, and Volts?
Trying to tie it all together. Ohm's law and electrical energy.

Electricity is not a form of energy
How can so many textbooks and encyclopedias make a major mistake?

J.C. Maxwell quotes
Maxwell says that electricity is not energy.

"Static Electric" misconceptions
A list of things which gave me a warped view of Electrostatics. Once I recognized their existence, I was able to fight free of them.

Sticky Electrostatics
Use sticky tape to demonstrate the behavior of electric charge.

The "Electricity" Map
How are batteries different than static cling? Perhaps this diagram will "generate" some insights.

Which way does 'electricity' flow?
The direction of the current. Charge really flows from negative to positive, right? RIGHT???

Speed of "Electricity"?
Everyone is sure that charges flow in wires at nearly the speed of light. All the books say so, and that many books can't be wrong, can they? Ah, but science is not settled by voting.

"Acoustimagnetoelectricism"
A long rant about sound, work and electrical energy

Capacitor complaints
Why I never really understood capacitors...

How transistors REALLY work
Problems with traditional transistor explanations...

Why three prongs?
Why do wall outlets have three holes? "Grounding" and safety.

LED explanation
How are Light Emitting Diodes like thermocouples and solar cells?

Are Amperes "Fundamental?"
Everyone learns about "Amps" but never remembers what a "Coulomb" is. This is totally backwards.

Flowing "static electricity."
If "static electricity" could flow along, would the world end? Maybe not...

Discussing Electrical Energy
I'm always getting into flamewars about this stuff...

How *should* we teach "electricity?"
Doing something, rather than just whining. ;)

Why "Electricity" is Impossible to Understand
Gigantic collection of thoughts on learning-barriers in electrical education.

Triboelectric Series
If a cat gets trapped in a clothes dryer full of nylon pantyhose, which way do the electrons flow?

Electricity educational links collection
Part of my Electronics Hobbyist page.

ELECTRONICS HOBBYIST
A whole large pageful of links for the electronics freak. Online discussion groups, schematic and project archives, etc.

Electrical Devices

Electrostatic Loudspeakers
by Mark Rehorst. No magnets, no magnetism, they use voltage-force. Almost like wiggling the air itself.

Ultra-simple Electric Generator
Spin the magnet, light a bulb. The complement to the "Beakman Motor". Challenge: make the one run the other.

Ridiculously sensitive charge detector
Build this simple circuit and detect miniscule levels of electric charge at large distances. Befuddle onlookers with the the "mysterious voice commands" trick by holding it and scuffing your shoes on a rug.

The Duluc Drypile
A "battery" with so many cells that Electrostatic effects appear.

3D E-field viewing bottle
Actually SEE invisible electrostatic fields and magnetic fields by harnessing the amazing powers of Baby Oil.

Dangerous experiments with a big capacitor bank
Nobody died from simply reading this. But stay away from actually performing any of these demos.

Acid/Base Goldenrod secret
Use a battery to draw red lines on wet yellow paper

ELECTROSTATIC GENERATOR, Kelvin's Thunderstorm"
An electrostatic generator based on dribbling water. Also see the INLINE VERSION

VandeGraaff Generators
Instructions for having fun with 500,000 volts, including plans sources, FAQ, debug...

MAGLEV CRADLE
Lifts a bar magnet from below. Use this to perpetrate a Room Temperature Superconductor hoax?

ELECTROSTATIC MOTOR made from plastic pop bottles.
Who says "static electricity" must remain static, or that it's useless and feeble?

ELECTROSTATIC GENERATOR, a simple one
A simple device which can be used to power the pop-bottle motor.

Hints for electrostatic device construction
Building 500,000 volt devices in your basement? Avoid these pitfalls.

Solving Humidity Problems
Egor! Activate the Dehumidifier Array!

ARRAY ELECTROMETER
Build this and SEE electrostatic fields!

VISIBLE CURRENT
This device makes the flowing charges visible in wires. Wouldn't "electricity" be easier to understand if you could SEE it moving?

Plasma Globe with no vacuum pump The Radio Shack "Eye of the Storm" device would be REALLY impressive if it didn't need that glass globe...

Incredibly easy way to make a 100-amp cable. Around the world, the physics teachers look at this and say "Doh!"

Rotating disk device makes e-fields visible
Idea for dangerous whirling mechanisms which reveal invisible field patterns.

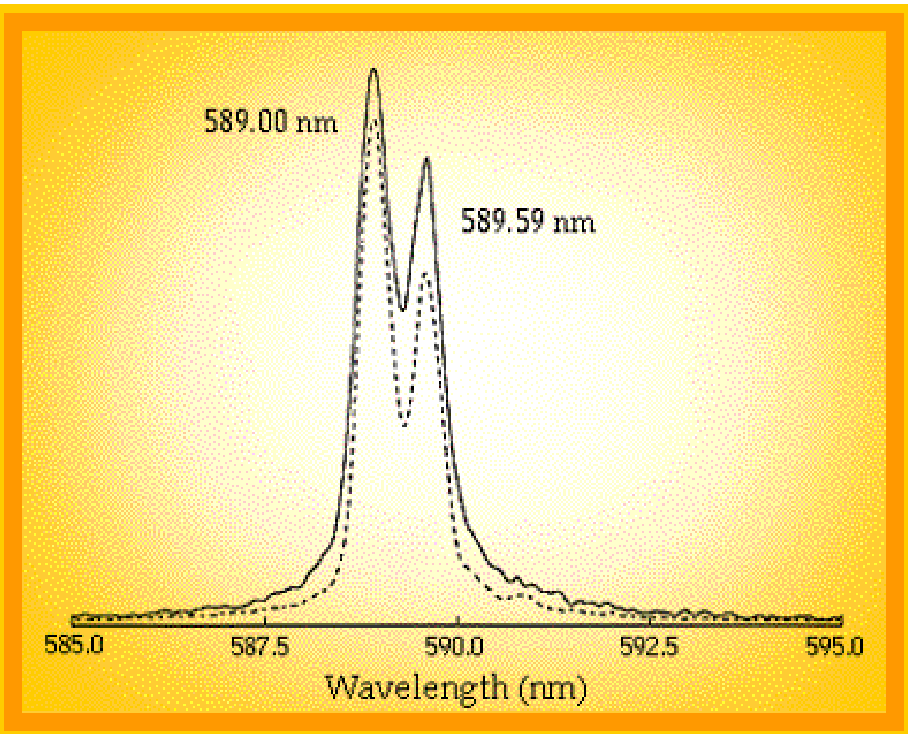
Home Page for Electric Pickle

See what happens when you overload your pickle? Why would someone plug a dill pickle into electricity in the first place? A credible story comes from Steve Jacobs, a science educator, creator of the Jake's Attic TV show, and consultant to Mr. Wizard. According to Mr. Jacobs, while attending a garden party during a teacher's conference someone mentioned how they used to cook food in their college dorm with raw electricity (hot plates were either banned or unavailable). Someone at the party then suggested that the host allow a few electrical experiments to various things found around the kitchen. Apparently, glowing dill pickles were the only exciting discovery.

Jacobs worked up the trick for Don Herbert (Mr. Wizard) to perform on The Tonight Show with Johnny Carson on January 24, 1990. On that show Mr. Wizard said he wasn't exactly sure why the pickle glowed yellow when electrocuted. A Discover Chemistry Challenge! Yours truly (J. R. Appling) saw that show and the next morning did an experiment to prove that it is the sodium in the pickle that gives the characteristic yellow glow.



The experiment was performed by taking a visible light spectrum of the glowing pickle, using a Jarrell-Ash spectrograph with a diode array detector. A fiber-optic probe was used to channel the yellow glow to the spectrograph. A calibration spectrum was taken of a sodium chloride flame test. The emission spectra of the two are identical as you can see in the figure (the dashed line is the NaCl flame test, and the solid line is the glowing pickle).

This pair of emission lines at 589.00 nm and 589.59 nm is a characteristic of sodium emission, called the sodium D line doublet. Josef Fraunhofer observed these lines in the emission spectrum of the sun, somewhere around 1817. We know now that it is due specifically to an electronic transition of sodium atoms in the gas phase.

The pickle conducts electricity due to the vinegar (acetic acid) and sodium chloride salt used to make it. Sodium ions in the pickle liquid attach electrons from the flowing current. These ions are neutralized electrically, forming excited sodium atoms in two different excited electronic states (hence the emission doublet).

$$\mathrm{Na}^{+}(aq) + e^{-} \rightarrow \mathrm{Na}^{*}(g)\left[{}^{2}\mathrm{P}_{1/2}\ {}^{2}\mathrm{P}_{3/2}\right] \rightarrow \mathrm{Na}\,(g)\left[{}^{2}\mathrm{S}_{1/2}\right]$$

Because of the heat and sparks and general pandemonium around the electrodes stuck in the pickle, these sodium atoms are in the gas phase. They emit yellow light as they relax to the ground state. The explanation of the phenomenon was first published by J. R. Appling, F. J. Yonke, R. A. Edgington, and S. L. Jacobs as "Sodium D Line Emission from Pickles" in *The Journal of Chemical Education*, vol. 70, no. 3, p. 250 (1993).

Scot Morris published a description of the Electric Pickle in the Games column of *Omni* magazine. He also appeared in the May 13, 1991 edition of *The San Diego Union* newspaper holding an electrocuting pickle by its tail. Penn and Teller also published a description of the Electric Pickle in their book "Penn and Teller's How To Play With Your Food."

Links
Here are some interesting links for the Electric Pickle:

- Organic Illumination Systems. Those wacky guys at Digital published a report.
- Lori's Chemistry Page. Good pictures of flame tests and a movie of the pickle doing its thing. She doesn't give us credit, and gets the citation to the paper wrong, but hey, she's got the movie (868K) and we don't.
- Bizzare Stuff. A short description, nice site for kookie stuff.

Other relevant links:

- Atoms. The Discover Chemistry topic on Light is in the Atoms section.
- Light. More about light on the Discover Chemistry Light and Energy page.
- Bioluminescence. Learn about light emitted from biological things on the Discover Chemistry Bioluminescence page.
- Kitchen Chemistry. More fun things to do in the kitchen, some less dangerous than the Electric Pickle.

ELECTRICITY AND MAGNETISM

TABLE OF CONTENTS

This is a series of experiments about electricity and magnetism that was designed for use in the fourth grade.

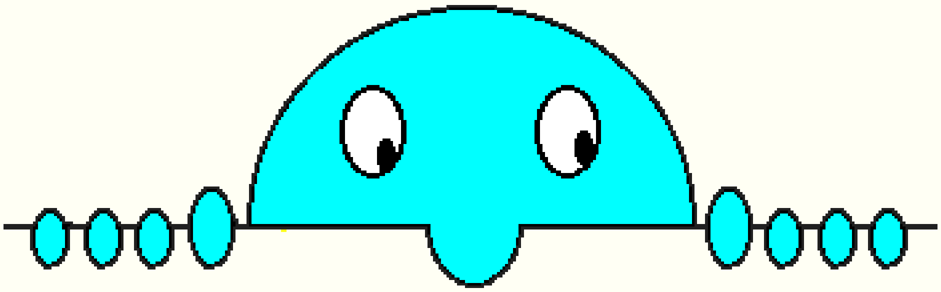
SMILE PROGRAM PHYSICS INDEX

The SMILE website is hosted by the Illinois Institute of Technology



The following is a collection of almost 200 single concept lessons. These lessons may be freely copied and used in a classroom but they remain the copyright property of the author(s) and the directors of the SMILE program.

The Physics lessons are divided into the following categories: Matter, Mechanics, Fluids, Electricity & Magnetism, Waves, Sound and Optics, and Miscellaneous.

Matter

- Introduction to the Periodic Table by Estellvenia Sanders - Chicago Vocational
- Tempting Temperatures by Marjorie Fields - Ella Flagg Young
- Air: Demonstrating Its Presence and Effects by Porter Johnson - Illinois Institute of Technology
- Density by Marilyn Martello - Clinton
- Air Movement by Lisa C. Ingram - Frederick Douglass Middle Academy
- Gases Lighter and Heavier than Air by Bonnie Anderson - Libby School Annex
- States of Matter by Kathleen Moore - O. W. Holmes
- Temperature by Jackie Baker - Crown Community Academy
- Exploring the Properties of Matter in the Preschool by Lorraine Watt - Brian Piccolo Elementary School
- The Air Out There by Gladys Allen - Louis Wirth Experimental School
- Comparing Densities of Different Liquids by Elaine Messal - Henry Clay Elementary
- The Three States Of Matter by Sharon R. West - Edward Hurley
- Solids, liquids and gases by Donna Armstrong - Frazier Elementary
- Density in Relation to Float and Sink by Carolyn C. Roberson-Ellis - Morton Career Academy

Mechanics

- Gravity Lesson by Leticia Rodriguez - Ferdinand W. Peck
- The Great Tin Race by Bernina L. Norton - Abbott School

- Tops by Sandra Tucker - Crown Fine Arts Academy
- Periodic Motion - The Pendulum by Deborah Lojkutz - Joliet West High School
- Inertia by Peter Insley - Retired
- Rockets by Rochelle Ingram - Delano School
- Weightlessness by Cynthia D'Souza - De La Salle Institute
- Simple Machines by Bonnie Anderson - Libby School Annex
- Vectors by Eileen Wild - Retired
- Inertia by Maeola Walker - Chicago Board of Education
- Torque by Larry L. Smart - Helen Hefferan Elem.School
- Give Me Energy by April Luehmann - Zion Lutheran School
- Newton's Third Law of Motion by John E. McCoy - Douglass Math and Science Academy
- Pendulums by John J. Miller - Maine East High School
- Bouncing Balls by Porter W. Johnson - Illinois Institute of Technology
- Friction - What a Drag by John J. Miller - Maine East High School
- Momentum Conserved by Savannah Walker - Mason School
- Momentum And Colliding Spheres by Robert Watkins - Beethoven Elementary School
- Straight Line Motion with a Stomper by Ann Brandon - Joliet West High School
- Periodic Motion - The Pendulum by Deborah Lojkutz - Joliet West High School
- Why Use Seat Belts? by Larry Brandon - Thornwood High School
- Reaction Time by Roy Coleman - Morgan Park High School
- Projectile Motion by Jan Dudzik - Riverside-Brookfield High School
- Sports in Physics: Measuring Velocity in a Mini-Olympics by Marion T. Hill - Disney Magnet School
- So You Want to Hit a Home Run? by Karlene Joseph - Walther Lutheran High School
- Center of Gravity by Minnie E. Bounds - Dyett Middle School
- Friction by Kathleen Cummings Dominguez - Sabin Magnet
- Circular Motion: by Jan Dudzik - Whitney Young H.S.
- Rolling Spheres on Inclined Planes by Kenneth Guzik - O.A. Thorp Scholastic Academy
- Orbital Motion by Eleanor Kopsian - Franklin E. Frazier
- Positioning the Fulcrum in Class One Levers by Janis Gary Sullivan - A. O. Sexton School
- Action and Reaction by Mitzie Wilkins - Enrico Fermi Elementary School
- Rotational Inertia by Corla Jean Wilson-Hawkins - Bethune Elementary School
- Projectile Motion (or You Bet Your Grade) by Roy Coleman - Morgan Park High School

- Friction by Jim Szeszol - Mendel Catholic High School

Fluids

- The Bernoulli Effect - Conceptually by Earl Zwicker - Illinois Institute of Technology
- Surface Tension by Pamela S. Moy - Morgan Park High School
- Compared to What? Comparing the Density of Different Liquids by Camille Gales - Coles Elementary School
- Buoyancy: What will float and what will sink by Suzzanne' O'Quinn - Phillips Alternative High School
- Air Pressure by Brian Cagle - John W. Cook
- Buoyant Force by Thomas J. Billups - Delano Elementary
- Do You Sink or Float? by Jackie Baker - Crown Community Academy
- Bernoulli Effect by Michael McIntosh - Whitney M. Young Magnet High School
- Bubbleology Mickey Mouse Style by Paula Z. Jones - Black Magnet
- Pressure in Fluids by Porter W Johnson - Illinois Institute of Technology
- Surface Tension by Lisa C. Ingram - Frederick Douglass Middle Academy
- Displacement by Thomas J. Billups - Delano Elementary
- Sinking And Floating by Tunya Alexander - Frank L. Gillespie School
- The Unmixables: Investigating Immiscible Liquids by Joyce Cohen - Shakespeare-Elementary School
- Surface Tension by Amina Grant - Shakespeare
- Viscosity by Gale Hunter - Dyett Middle School
- Does AIR Really Exist? by Elyse Futterman - Bernard Zell Anshe Emet Day School
- Air Pressure by Gloria Heard - Willams Carter
- Air Pressure by Allen, George - Austin Community Academy
- The Pressure Of A Liquid by Bradley, Patricia - John Hope Community Academy
- Liquid Conductors by Perry, Jean M. - Oakton Elementary School
- Liquid Pressure by Johnson, Leon - D. H. Williams Elementary School
- Bathtub Physics - Density, Buoyancy and Flotation by Russell, Renee - South Shore High School
- How To Make Water Run Uphill by Edgar Boyd, Dorothy Foreman and Earnest Garrison

---

Electricity & Magnetism

- Fish and Clip by Winnie Koo - Ravenswood School
- Series and Parallel Circuits by Janet M. Sheard - West School
- Simple Circuitry and series circuit by Stephen W. Ha - James Ward School
- About Magnets by Barbara J. Baker - Doolittle West School
- Magnet Muscles by Deborah Barnes - Robert H. Lawrence School
- Electrostatics by Alyce Glauner- Community Academy
- Electrostatics by Jan Dudzik - Riverside Brookfield High School
- Batteries and Bulbs by Beverly Gregor - Oglesby School
- Electromagnets by Shirley Porter-Cesair - Charles R. Henderson
- Electromagnets by Tanya English - O'Keeffe Elementary School
- Electrostatics by John J. Miller - Maine East High School
- Introduction To Magnets by Sheila McKinnon - Sherman School
- Electricity by Tanya English - O'Keeffe Elementary School
- Electricity by Julian Levey - Teachers Acad. for Math and Science
- Resistances In Series And Parallel Circuits by Austin E. Barnett - Bogan High School
- Magnets, Electromagnets & Fields of Force by John J. Czerwiec - Kenwood Academy

How Smart Are You About Electricity,

- Batteries And Conductors? by Lorraine Epps - Douglass Math and Science Academy
- Introduction to Elementary Circuits by Michael D. Jackson - W.H. Carter
- Electricity by Marie McCadd - Coles Elementary School
- Magnets, Electromagnets, and Motors by Lynne Nolan - Naperville Central High School
- Magnets by Hoi Huynh - Clemente Community Academy
- Exploring Series and Parallel Circuits by Pamela Schneider - Luther East High School
- Magnets by Mina Valenzuela - O. A. Thorp Scholastic Academy
- Electron Current Flow by Greg Zipprich - Bloom Trail High School
- Conductors and Insulators by Leona Williams - Cregier Vocational High School
- Ohm's Law by Anderson, Herbert D. - Hermann Raster Elementary School
- Electric Currents and Circuits by Williams, Claudette - Dever Elementary School
- Magnetism by Gilmore, Marie - Raster School
- What Is Electricity by Oldenburg, Albert - Lindblom Tech High School
- The Millikan L'Eggs Experiment by Coleman, Roy - Morgan Park High School
- Electrochemistry by Allen, Donna L. - Bowen High School
- Electric and Magnetic Fields by Garrison, Earnest S. - Schurz H.S.

- Current-Carrying Coils In Magnetic Fields by Landato, Janet - St. Viator High School
- Coulomb's Law by Austin A.Winther - Paul Robeson High School

The Exploratorium Science Snacks

Snacks about Electricity

Electricity

Snack name	Description
Charge and Carry	Store up an electric charge, then make sparks.
Circles of Magnetism I	You can make a magnetic field that's stronger than the earth's!
Circles of Magnetism IV	Two parallel, current-carrying wires exert forces on each other.
Eddy Currents	A magnet falls more slowly through a metallic tube than it does through a nonmetallic tube.
Electrical Fleas	Start your own electric flea circus!
Electroscope	What's your (electrical) sign?
Hand Battery	Your skin and two different metals create a battery
Magnetic Pendulums	Copper coils become electromagnetic swings.
Magnetic Suction	This experiment shows how your doorbell works.
Motor Effect	A magnet exerts a force on a current-carrying wire.

Short Circuit	What happens when you blow a fuse?
Stripped Down Motor	As motors go, this is about as simple as it gets.

Virtual Labs & Simulations

****** Great Web Sites for Interactive Learning ******
Established: Dec. 27, 1999

Who Visits this Site?

Virtual Physics Simulations

To view some of the simulation and programs on this site you must have the Macromedia Shockwave Plug-in and/or Adobe Acrobat Reader.

This page is a collection of links to sites on the web that have computerized simulations of physics principles. These might be in the form of a Java Applet, a Shockwave demonstration or an Activity Worksheet, but the basic purpose is the same in all cases: to allow students to see a visual demonstration of a scientific concept, often in animated form. In addition, the student may be given the opportunity to manipulate one or more variables underlying the concept and then witness the changes.

"In the matter of physics, the first lessons should contain nothing but what is experimental and interesting to see. A pretty experiment is in itself often more valuable than twenty formulae extracted from our minds."
- Albert Einstein

Watts Up with the Heat

Building and Understanding Basic Electrical Circuits and Their Practical Applications

Author(s)
[Alison Zimbalist, The New York Times Learning Network]

Grades: 6-8, 9-12
Subjects: Science, Technology
[Interdisciplinary Connections]

Overview of Lesson Plan: In this lesson, students create a variety of simple, series and parallel electrical circuits to illustrate how electricity flows through different types of basic circuits and to understand the practical applications of these types of circuits. Students then apply their knowledge of electrical circuits to the loss of power in the midst of July 1999's heat wave, determining how electrical power systems fail in extreme heat, how 'load shedding' is used to reduce strain on power sources, and how power outages can be prevented in the future.
Review the [Academic Content Standards] related to this lesson.

Suggested Time Allowance: 45 minutes- 1 hour

Objectives:
Students will:
1. Apply their understanding of electricity to create a simple circuit.
2. Apply their understanding of electricity to create a simple circuit with a switch; understand the practical applications of this type of circuit.
3. Determine how added voltage increases the intensity of light from a light bulb; create a simple circuit using two batteries; predict and compare the results of this circuit to the previously-created simple circuits; understand the practical application of this circuit.
4. Apply their understanding of electricity to create a series circuit; predict and compare the results of this circuit to the simple circuits created; understand the practical application of this type of circuit.
5. Apply their understanding of electricity to create a parallel circuit; predict and compare the results of this circuit to the simple and series circuits created; understand the practical application of this type of circuit.
6. Apply their understanding of electricity and electrical circuits to determine how electrical power systems fail in extreme heat, how "load shedding" is used to reduce strain on power sources, and defend ways in which power outages can be prevented in the future.

Resources / Materials:
FOR EACH PAIR OR GROUP OF THREE STUDENTS, prepare a paper bag that contains the following items (all can be purchased cheaply at an electronics store):
-Two C or D batteries (1.5 volts)
-Two battery holders
-One single pole knife switch
-Six pieces of insulated copper wire (6"-8" pieces with the ends stripped of insulation)
-Three flashlight bulbs

Have extra batteries and light bulbs on hand in the event that they should run out.
Additional materials:
-student journals or lab books
-paper
-pens/pencils
-classroom blackboard
-copies of "Heat Sets Records, Claims Lives and Strains Utilities" (one per student)

Activities / Procedures:
NOTE TO TEACHERS: In this activity, students create simple, parallel and series circuits. Please review lab safety rules with students prior to conducting these experiments. You should also create sample circuits prior to class so that you are familiar with what each circuit should look like when built by your students. A physical science textbook should have illustrations of these circuits.

1. WARM-UP/DO-NOW: Prior to class, write the following sentence on the board: You have five minutes to use a battery, a battery holder, a light bulb and two wires to make the light bulb light up. As students arrive in the classroom, divide them into pairs or small groups and give each group a bag containing the batteries, battery holders, light bulbs and wire. Students then follow the directions on the board and create simple circuits. Walk around the room to monitor student progress. After the five minutes are up, ask students the following questions:
--What made the light bulb light up? Where does the electricity come from, and where does it go?
--Why are the ends of each wire exposed and the rest of the wire covered by an insulating coating? (Explain that the metal wire serves as a conductor of electricity.) What other items conduct electricity?
--What happens when a wire is disconnected? (The circuit is broken.)
Explain that this type of circuit is called a simple circuit. Ask students to draw and label their simple circuit in their journal or lab book.

2. Tell students to add the switch in their bag to the simple circuit they just created. How does the switch work? Why doesn't the electricity "jump" over the switch when it is turned off? Where in their homes do students use similar circuits? Students draw and label their simple circuit with the switch under their previous illustration.

3. Now, ask students to create a simple circuit using two batteries, two battery holders, three wires and a light bulb. How do their results differ from the previous simple circuits, and why? Students draw and label this simple circuit under their previous illustration.

4. Ask students to use two batteries, three light bulbs, and five wires to make all three light bulbs light up. (The middle light bulb should be connected to the two outer bulbs and not to a battery.) How do their results differ from the simple circuits that they have already created, and why? What do students think would happen if one bulb was loosened, and why? Students should then loosen a bulb to see that none of the bulbs will work. Where in their homes do students have similar circuits (e.g., strings of lights)? Explain that this is called a series circuit, and ask why this name is appropriate. Tell students to draw and label this circuit under their illustrations of the simple circuits.

5. Tell students that their last challenge is to use one battery, one battery holder, four wires and two light bulbs to light the two bulbs. Instruct students to not connect the light bulbs to each other with a wire. How does electricity flow through this circuit? How does the brightness of each of the two light bulbs compare to the brightness that they saw in the simple circuits and in the series circuit, and why? What do students think would happen if one bulb was loosened, and why? Students should then loosen a bulb to see that the other bulb will remain lit. How does this bulb's brightness compare to the brightness of the two bulbs? What would happen if there were hundreds of bulbs in this circuit connected to this initial battery? What would happen if a switch were placed between each light bulb and the battery? Where in their homes do students have similar circuits (e.g., several appliances connected to one outlet)? Explain that this is called a parallel

circuit, and ask why this name is appropriate. Tell students to draw and label this circuit under their illustration of the series circuit.

6. WRAP-UP/DO-NOW: Students read the article "Heat Sets Records, Claims Lives and Strains Utilities" and answer the following questions in their journals:
--Why did the power system fail in New York and other areas of the United States?
--What type of circuit (simple, series, or parallel) connects electrical power plants to the homes that it serves? Draw an illustration.
--What is "load shedding," and how does it function given this type of electrical circuit?
--Given what you know about electricity and different types of circuits, how can power outages be avoided in the future, particularly in heat waves such as the one described in the article?

Further Questions for Discussion:
--How does electrical power travel from the generating plant to your home?
--What can cause a power outage?
--Why do blackouts so often occur in extreme weather conditions?
--What elements of a household are affected when electrical power is lost?
--What elements of a city's infrastructure are affected in the event of a blackout?
--In what ways can power outages, both in the home and on a larger scale, be prevented?
--How can a person adequately prepare for a blackout?
--How does electricity affect your daily life? How would you accomplish everyday tasks without it?
--What is the importance of energy conservation?
--What alternative forms of energy exist, and what are their benefits and drawbacks?

Evaluation / Assessment:
Students will be evaluated based on the creation of various basic electrical circuits, detailed illustrations of circuits, participation in class discussions, and final written journal response.

Vocabulary:
maddening, overload, fuses, fatalities, conserve, hyperthermia, transformers, arced, circuits, reserves, voltage, strenuous, consumption, meteorologists, compressing, descends, pleas, commercial, residential, prolonged, blackouts

Extension Activities:
1. Further your knowledge of electricity with fun, easy experiments that you can conduct at home (with an adult's help). Check out the variety of experiments available on the Internet, including ProTeacher's Electricity Experiments (http://www.proteacher.com/110016.shtml) and electricity lesson plans from Rutger's University (http://www.physics.rutgers.edu/hex/visit/lesson/lesson_links1.html#ele7).

2. Create an Internet scavenger hunt about heat waves, finding different Web sites that relate to this weather condition and jotting down one question that can be answered by each Web site you find. Then, challenge a family member or friend to answer your questions about heat waves by using your Internet scavenger hunt.

3. Create a "How It Works" poster that explains how transformers, power generators, air conditioners or fans work.

4. Develop a guide to electrical safety, energy conservation, or how electricity works geared toward students your age or younger.

5. Research alternative energy sources and the benefits and drawbacks of each. Create a visual display about one or several of these sources to display in your classroom.

6. Conduct an electricity survey of your home. Create a list of electrical appliances in your home and how much energy they use, learn what items in your home are powered by an energy source other than electricity, and examine your electricity bill to see how much electricity you use in a month compared to the monthly average of your area.

7. Tour your local electrical power plant to learn about how electricity travels to your home.

8. Create a chart that defines and compares various energy and power units, such as horsepower, joules, watts, kilowatts, therms, tons and BTUs. Be sure to include what items each unit powers, as well as how these units of energy got their names.

Interdisciplinary Connections:

Geography/Mathematics- Map and graph weather patterns (temperature, precipitation, fronts, etc.) over the next month or the rest of the season for your state, region or country.

Health- Learn about heat-related illnesses. Then, create a heat safety guide to be used as a reference by your family, class, or school health clinic.

Language Arts- Write a short story beginning with the sentence, "It was the hottest day of the year, and our electricity was out."

Social Studies- Investigate how various elements of a city's infrastructure (commerce/trade, food supply, health care, communication/roads, shelter, power supply) are affected by extreme weather conditions (such as heat waves) or natural disasters.

Other Information on the Web

American Red Cross: Heat Waves (http://www.redcross.org/disaster/safety/heat.html) discusses what a heat wave is, what to do to protect yourself, and how to recognize and treat heat-related health emergencies.

Weather Channel Encyclopedia: Heat Wave (http://www.weather.com/breaking_weather/encyclopedia/heat/) teaches about extreme heat safety, heat climatology, forecasting heat, historical heat waves, the UV index, and droughts.

BrainPop: Electricity (http://www.brainpop.com/electric/) is a fun site about electricity that offers a movie, a quiz, experiments, and much more.

Electricity and Magnetism (http://ippex.pppl.gov/ippex/module_4/) teaches the basic concepts behind these two topics.

The Atoms Family (http://www.miamisci.org/af/sln/) is an information-packed site from the Miami Museum of Science, where you can learn about different types of energy, the properties of light, electricity, atoms, and fuel conservation.

Theater of Electricity (http://www.mos.org/sln/toe/toe.html) offers great info on electricity and the huge Van de Graaff generator at the Boston Museum of Science.

Academic Content Standards:

This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8

Technology Standard 3- Understands the relationships among science, technology, society, and the individual. Benchmarks: Knows that scientific inquiry and technological design have similarities and differences; Knows that science cannot answer all questions and technology cannot solve all human problems or meet all human needs; Knows ways in which technology has influenced the course of history; Knows that technology and science are reciprocal; Knows ways in which technology and society influence one another

Science Standard 13- Knows the kinds of forces that exist between objects and within atoms. Benchmarks: Knows that just as electric currents can produce magnetic forces, magnets can cause electric currents
Science Standard 15- Understands the nature of scientific inquiry. Benchmarks: Knows that there is no fixed procedure called "the scientific method," but that investigations involve systematic observations, carefully collected, relevant evidence, logical reasoning, and some imagination in developing hypotheses and explanations; Designs and conducts a scientific investigation; Uses appropriate tools (including computer hardware and software) and techniques to gather, analyze, and interpret scientific data; Establishes relationships based on evidence and logical argument; Understands the nature of scientific explanations; Knows that scientific inquiry includes evaluating results of scientific investigations, experiments, observations, theoretical and mathematical models, and explanations proposed by other scientists
Science Standard 16- Understands the scientific enterprise. Benchmarks: Knows various settings in which scientists and engineers may work; Knows ways in which science and society influence one another

Grades 9-12
Technology Standard 3- Understands the relationships among science, technology, society, and the individual. Benchmarks: Knows that science and technology are pursued for different purposes; Knows that mathematics, creativity, logic, and originality are all needed to improve technology; Identifies the role of technology in a variety of careers
Science Standard 13- Knows the kinds of forces that exist between objects and within atoms. Benchmarks: Knows how different kinds of materials respond to electric forces; Knows that materials that contain equal proportions of positive and negative charges are electrically neutral, but a very small excess or deficit of negative charges in a material produces noticeable electric forces; Knows that magnetic forces are very closely related to electric forces and can be thought of as different aspects of a single electromagnetic force (moving electric charges produce magnetic forces and moving magnets produce electric forces)-the interplay of these forces is the basis for electric motors, generators, radio, television, and many other modern technologies; Knows that electromagnetic forces exist within and between atoms
Science Standard 15- Understands the nature of scientific inquiry. Benchmarks: Understands the use of hypotheses in science; Designs and conducts scientific investigations by formulating testable hypotheses, identifying and clarifying the method, controls, and variables; organizing and displaying data; revising methods and explanations; presenting the results; and receiving critical response from others; Knows that a wide range of natural occurrences may be observed to discern patterns when conditions of an investigation cannot be controlled; Knows that conceptual principles and knowledge guide scientific inquiries; historical and current scientific knowledge influence the design and interpretation of investigations and the evaluation of proposed explanations made by other scientists
Science Standard 16- Understands the scientific enterprise. Benchmarks: Knows that throughout history, diverse cultures have developed scientific ideas and solved human problems through technology; Knows tht science and technology are essential social enterprises, but alone they can only indicate what can happen, not what should happen

WHAT IS STATIC ELECTRICITY?

by

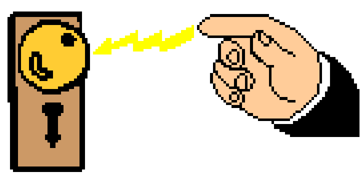
SCIENCE MADE SIMPLE

Science Made Simple / Science Subjects / Science in the News / Measurement Conversions

PO Box 503, Voorhees, NJ 08043

INDEX: What is Static Electricity? --- I Can Read --- Projects
Learn More About: Triboelectric Series, Coulomb's Law

You walk across the rug, reach for the doorknob and..........ZAP!!! You get a shock.



Or, you come inside from the cold, pull off your hat and......BOING!!! All your hair stands on end. What is going on here? And why does it only happen in the winter?

The answer is:

STATIC ELECTRICITY

To understand what static electricity is, we have to learn a little bit about the nature of matter. Or in other words, what is all the stuff around us made of?

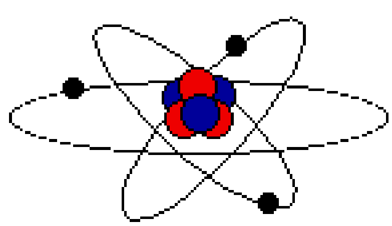
EVERYTHING IS MADE OF ATOMS

Imagine a pure gold ring. Divide it in half and give one of the halves away. Keep dividing and dividing and dividing. Soon you will have a piece so small you will not be able to see it without a microscope. It may be very, very small, but it is still a piece of gold. If you could keep dividing it into smaller and smaller pieces, you would finally get to the smallest piece of gold possible. It is called an atom. If you divided it into smaller pieces, it would no longer be gold.

Everything around us is made of atoms. Scientists so far have found only 115 different kinds of atoms. Everything you see is made of different combinations of these atoms.

PARTS OF AN ATOM

So what are atoms made of? In the middle of each atom is a "nucleus." The nucleus contains two kinds of tiny particles, called protons and neutrons. Orbiting around the nucleus are even smaller particles called electrons. The 115 kinds of atoms are different from each other because they have different numbers of protons, neutrons and electrons.



It is useful to think of a model of the atom as similar to the solar system. The nucleus is in the center of the atom, like the sun in the center of the solar system. The electrons orbit around the nucleus like the planets around the sun. Just like in the solar system, the nucleus is large compared to the electrons. The atom is mostly empty space. And the electrons are very far away from the nucleus. While this model is not completely accurate, we can use it to help us understand static electricity.

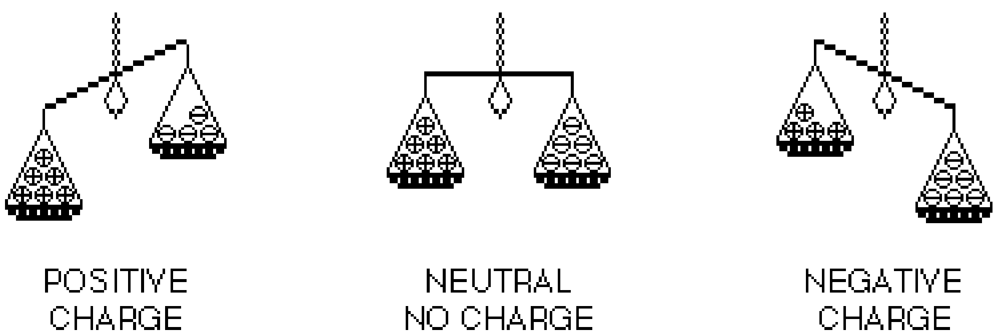
(Note: A more accurate model would show the electrons moving in 3- dimensional volumes with different shapes, called orbitals. This may be discussed in a future issue.)

ELECTRICAL CHARGES

Protons, neutrons and electrons are very different from each other. They have their own properties, or characteristics. One of these properties is called an electrical charge. Protons have what we call a "positive" (+) charge. Electrons have a "negative" (-) charge. Neutrons have no charge, they are neutral. The charge of one proton is equal in strength to the charge of one electron. When the number of protons in an atom equals the number of electrons, the atom itself has no overall charge, it is neutral.

ELECTRONS CAN MOVE

The protons and neutrons in the nucleus are held together very tightly. Normally the nucleus does not change. But some of the outer electrons are held very loosely. They can move from one atom to another. An atom that looses electrons has more positive charges (protons) than negative charges (electrons). It is positively charged. An atom that gains electrons has more negative than positive particles. It has a negative charge. A charged atom is called an "ion."



Some materials hold their electrons very tightly. Electrons do not move through them very well. These things are called insulators. Plastic, cloth, glass and dry air are good insulators. Other materials have some loosely held electrons, which move through them very easily. These are called conductors. Most metals are good conductors.

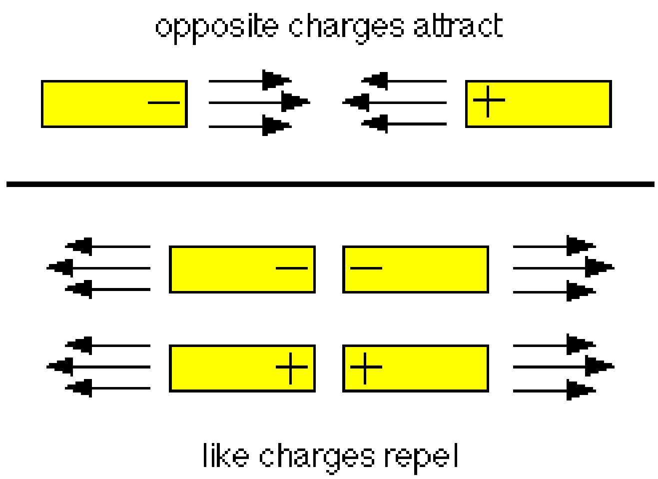
How can we move electrons from one place to another? One very common way is to rub two objects together. If they are made of different materials, and are both insulators, electrons may be transferred (or moved) from one to the other. The more rubbing, the more electrons move, and the larger the charges built up. (Scientists believe that it is not the rubbing or friction that causes electrons to move. It is simply the contact between two different materials. Rubbing just increases the contact area between them.)

Static electricity is the imbalance of

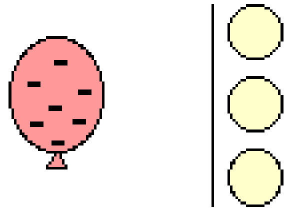
positive and negative charges.

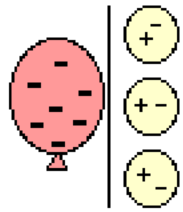
OPPOSITES ATTRACT

Now, positive and negative charges behave in interesting ways. Did you ever hear the saying that opposites attract? Well, it's true. Two things with opposite, or different charges (a positive and a negative) will attract, or pull towards each other. Things with the same charge (two positives or two negatives) will repel, or push away from each other.



A charged object will also attract something that is neutral. Think about how you can make a balloon stick to the wall. If you charge a balloon by rubbing it on your hair, it picks up extra electrons and has a negative charge. Holding it near a neutral object will make the charges in that object move. If it is a conductor, many electrons move easily to the other side, as far from the balloon as possible. If it is an insulator, the electrons in the atoms and molecules can only move very slightly to one side, away from the balloon. In either case, there are more positive charges closer to the negative balloon. Opposites attract. The balloon sticks. (At least until the electrons on the balloon slowly leak off.) It works the same way for neutral and positively charged objects.





So what does all this have to do with shocks? Or hair full of static? When you take off your wool hat, it rubs against your hair. Electrons move from your hair to the hat. Now each of the hairs has the same positive charge. Remember, things with the same charge repel each other. So the hairs try to get as far from each other as possible. The farthest they can get is by standing up and away from the others. Bad hair day!

As you walk across a carpet, electrons move from the rug to you. Now you have extra electrons. Touch a door knob and ZAP! The door knob is a conductor. The electrons move from you to the knob. You get a shock.

We usually only notice static electricity in the winter when the air is very dry. During the summer, the air is more humid. The water in the air helps electrons move off you more quickly, so you can not build up as big a charge.

LEARN MORE ABOUT: STATIC ELECTRICITY

TRIBOELECTRIC SERIES

When we rub two different materials together, which becomes positively charged and which becomes negative? Scientists have ranked materials in order of their ability to hold or give up electrons. This ranking is called the triboelectric series. A list of some common materials is shown here. Under ideal conditions, if two materials are rubbed together, the one higher on the list should give up electrons and become positively charged. You can experiment with things on this list for yourself

TRIBOELECTRIC SERIES

your hand
glass
your hair
nylon
wool
fur
silk
paper
cotton
hard rubber
polyester
polyvinylchloride plastic

CONSERVATION OF CHARGE

When we charge something with static electricity, no electrons are made or destroyed. No new protons appear or disappear. Electrons are just moved from one place to another. The net, or total, electric charge stays the same. This is called the principle of conservation of charge.

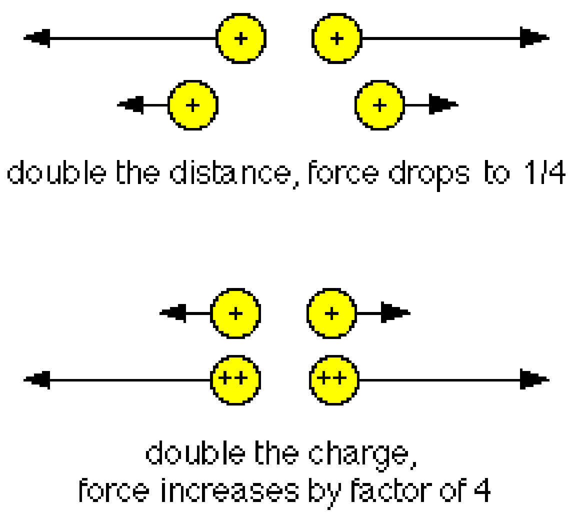
COULOMB'S LAW

Charged objects create an invisible electric force field around themselves. The strength of this field depends on many things, including the amount of charge, distance involved, and shape of the objects. This can become very complicated. We can simplify things by working with "point sources" of charge. Point sources are charged objects which are much, much smaller than the distance between them.

Charles Coulomb first described electric field strengths in the 1780's. He found that for point charges, the electrical force varies directly with the product of the charges. In other words, the greater the charges, the stronger the field. And the field varies inversely with the square of the distance between the charges. This means that the greater the distance, the weaker the force becomes. This can be written as the formula:

F = k (q1 X q2) / d**2

where q is the charge, and d is the distance between the charges. K is the proportionality constant, and depends on the material separating the charges.



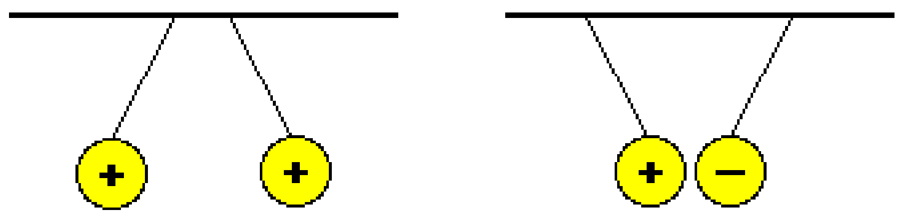
I CAN READ

What is Static Electricity?

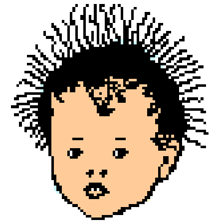
Everything we see is made up of tiny little parts called atoms. The atoms are made of even smaller parts. These are called protons, electrons and neutrons. They are very different from each other in many ways. One way they are different is their "charge." Protons have a positive (+) charge. Electrons have a negative (-) charge. Neutrons have no charge.

Usually, atoms have the same number of electrons and protons. Then the atom has no charge, it is "neutral." But if you rub things together, electrons can move from one atom to another. Some atoms get extra electrons. They have a negative charge. Other atoms lose electrons. They have a positive charge. When charges are separated like this, it is called static electricity.

If two things have different charges, they attract, or pull towards each other. If two things have the same charge, they repel, or push away from each other.



So, why does your hair stand up after you take your hat off? When you pull your hat off, it rubs against your hair. Electrons move from your hair to the hat. Now each of the hairs has the same positive charge. Things with the same charge repel each other. So the hairs try to move away from each other. The farthest they can get is to stand up and away from all the other hairs.



If you walk across a carpet, electrons move from the rug to you. Now you have extra electrons. Touch a door knob and ZAP! The electrons move from you to the knob. You get a shock.

PROJECTS TO DO TOGETHER

SAFETY NOTE: Please read all instructions completely before starting. Observe all safety precautions.

Tip: Try to use the part of the charged object that has the biggest charge (the part that was rubbed the most) when doing these experiments. Also, Projects 1-3 work best on dry days.

PROJECT 1 - Swinging cereal

What you need:

a hard rubber or plastic comb, or a balloon

thread, small pieces of dry cereal (O-shapes, or puffed rice of wheat)

What to do:

1. Tie a piece of the cereal to one end of a 12 inch piece of thread. Find a place to attach the other end so that the cereal does not hang close to anything else. (You can tape the thread to the edge of a table but check with your parents first.)
2. Wash the comb to remove any oils and dry it well.

3. Charge the comb by running it through long, dry hair several times, or vigorously rub the comb on a wool sweater.
4. Slowly bring the comb near the cereal. It will swing to touch the comb. Hold it still until the cereal jumps away by itself.
5. Now try to touch the comb to the cereal again. It will move away as the comb approaches.
6. This project can also be done by substituting a balloon for the comb.

What Happened: Combing your hair moved electrons from your hair to the comb. The comb had a negative charge. The neutral cereal was attracted to it. When they touched, electrons slowly moved from the comb to the cereal. Now both objects had the same negative charge, and the cereal was repelled.

PROJECT 2 - Bending water

What you need:

a hard rubber or plastic comb, or a balloon

a sink and water faucet.

What to do:

1. Turn on the faucet so that the water runs out in a small, steady stream, about 1/8 inch thick.
2. Charge the comb by running it through long, dry hair several times or rub it vigorously on a sweater.
3. Slowly bring the comb near the water and watch the water "bend."
4. This project can also be done with a balloon.

What happened: The neutral water was attracted to the charged comb, and moved towards it.

PROJECT 3 - Light a light bulb with a balloon

You Need:

hard rubber comb or balloon

a dark room

fluorescent light bulb (not an incandescent bulb)

SAFETY NOTE: DO NOT USE ELECTRICITY FROM A WALL OUTLET FOR THIS EXPERIMENT. Handle the glass light bulb with care to avoid breakage. The bulb can be wrapped in sticky, transparent tape to reduce the chance of injury if it does break.

What to do:

1. Take the light bulb and comb into the dark room.

2. Charge the comb on your hair or sweater. Make sure to build up a lot of charge for this experiment.
3. Touch the charged part of the comb to the light bulb and watch very carefully. You should be able to see small sparks. Experiment with touching different parts of the bulb.

What happened: When the charged comb touched the bulb, electrons moved from it to the bulb, causing the small sparks of light inside. In normal operation, the electrons to light the bulb come from the electrical power lines through a wire in the end of the tube. (Fluorescent and incandescent light bulbs will be discussed in a future issue.)

PROJECT 4 - Static in the Summer

What you need:

a balloon, and a watch or clock

What you do:

1. Rub the balloon on your hair or sweater. Stick it to a wall and time how long it stays before falling down.
2. Repeat step (1) in the bathroom, just after someone has taken a hot, steamy shower.

What happened: In the bathroom, water in the air and on the walls helped move electrons away from the balloon more quickly. In the summer, the air is more humid, and static electricity does not build up as much as during the winter, when the air is very dry.

.

Bowden's Hobby Circuits

A small collection of electronic circuits for the hobbyist or student. Site includes over 100 circuit diagrams, links to related sites, commercial kits and projects, newsgroups and educational areas. Most of the circuits can be built with common components available from Radio Shack or salvaged from scrap electronic equipment. Most all of the circuits have been built and tested and believed to perform as described, however possible mistakes may be found.

Additions and Corrections (12/04/03)

Digital/Computer

- 16 Bit PC Serial Port Receiver (CMOS)
- 24 bit ISA card Installs into your computer. Parts, plans, schematics and programmng available. Also may be purchased as a kit.
- 32 Bit Serial Receiver (57.6 K Baud TTL & CMOS)
- Parallel Port Relay Interface Circuit
- Reading Data From The Parallel Port
- 1 Second Time Base From Crystal Osc.
- 32.768 KHz Oscillator Using A Common Watch Crystal
- Digital Electronic Lock

Telephone Circuits

- Use Old Telephones as Intercom

Power Circuits

- Simple Variable Voltage Source
- LM317 Variable Voltage Regulator
- LM317 Regulator With Pass Transistor

LED Circuits

Miscellaneous

- LED Battery Condition Indicator
- 8 Stage LED VU Meter
- Battery Equal Charge Indicator
- IR Remote Control Tester
- AC Line Powered LEDs
- LED Traffic Lights

Analog / RF Circuits

- LED Decibel Meter
- Whistle On - Whistle Off
- Long Loopstick AM Radio Antenna
- Micro Power AM Broadcast Transmitter
- FM Beacon Transmitter (88-108 MHz)
- Op-Amp Basics - The text information for the basic Op-Amp operation, 2nd order filters and bandpass filters was obtained in part from the paper back book "Design of Active Filters, With Experiments" by Howard M. Berlin, 1977. The book is out of print but possibly can be found at used book stores, or through Amazon.com
- Active 2nd Order Filters
- Bandpass Filter (Single Op-Amp)
- Low Power Op-Amp - Audio Amp (Intercom)
- Crystal Radio Circuits
- Touch Activated Lamp
- Game Show Who's First Indicator Lights
- Salt Water Battery
- Transistor, Diode, IC outlines

Circuits Controlling Relays

- Push Button Relay Toggle Circuit With One Transistor
- CMOS Toggle Flip Flop Using Push Button (CD4013)
- CMOS Toggle Flip Flop Using Laser Pointer
- 555 Timer Monostable Circuit Using Pushbutton
- Generating a Delayed Pulse With a dual 555 Timer
- Light Activated Relay (toggled)
- Photo Electric Street Light
- Power-On Time Delay Relay Circuit
- Power-Off Time Delay Relay Circuit
- Electronic Thermostat Relay Circuit
- AC Line Current Detector
- Pinewood Derby Finish Line Lights
- Pinewood Derby Finish Line Using a Computer - Scores times and places.
- Controlling relays with logic voltages
- ....

- Simple Op-Amp Radio
- Low Frequency Sinewave Generator
- 3 Transistor Audio Amp (50 milliwatt)
- RC Notch Filter (Twin T)
- Analog Milliamp Meter Used as Voltmeter

Java Script Calculators

Resistor Color Code Calculator - Graphical resistor color code calculator by Danny Goodman. Uses pulldown menus and a realistic picture of a resistor.
Another Resistor Color Code Calculator - This one uses check boxes instead of pulldown menus and also calculates the equivalent value of two resistors in parallel. My own creation.
Ohm's Law Calculator - Java Script to solve Ohm's Law for Voltage, Current, Resistance and Power. Enter any two unknowns and solve for the other two.
Voltage Divider Calculator - Solves voltage, current, and power dissipation problems for two element resistive voltage dividers.
L or C Reactance Calculator - Java Script to calculate capacitive or inductive reactance and resonant frequency. For ideal devices only, resistance not included.
Allen Newman's Impedance Calculator - Solves passive series RLC networks, for reactance, impedance and phase angle.
RC Time Calculator - Java Script to solve R and C values for given values of time or instantaneous voltages.
RL Time Calculator - Java Script to solve R and L values for given values of time or instantaneous current.
555 Timer - Frequency and Time Interval Calculator - Calculates positive and negative time intervals for the 555 timer based on R and C values. Also contains descriptions and operation of each input and output of the timer and schematics for the two basic modes of operation (monostable

or "one-shot" and astable or "rectangular wave oscillator"). Also contains a pictorial diagram of the timer connected as a LED flasher and a table of connections for the 556 timer (dual 555 timer).
LED Series Resistor Calculator - Finds the series resistance needed for various series LED combinations and supply voltages.
The Electronics Calculator Website - Several calculators for Ohm's law, capacitor or inductor impedance, tuned circuits and RC time constants.
Several JavaScript Calculators by John Owen. - Audio op-amp filter, Op-amp circuit, Decibels, Zener Diodes and more...
Gregorian Calendar - Displays any month from Oct 1582 forward.

Ecology of the Dump

Judith Brown and Randyll Warehime
1991 Woodrow Wilson Biology Institute

Introduction:

Waste management is becoming a serious problem for land-scarce communities. It is essential that students understand that what we bury does not all disappear and that there is a real need for recycling. The following are three activities concerning solid waste management. You may choose between a short-term activity (one week) or a long-term activity (several months). The follow-up activity is suitable for both.

Resources:

Rathje, William L., Once and future landfills, **National Geographic**, Volume 175, No. 5 (May 1991), pp 116-134.

Short Term Activity:
A Dump in a Petri Dish

Objectives:

At the end of this activity students should:

- Determine which types of garbage are biodegradable and which are nonbiodegradable.

Background:

The disposal of solid waste materials has become a serous problem for many communities. A common means of disposing garbage is to layer it with dirt in a landfill. Landfills are reaching capacity levels or are already filled in many parts of the country. Because we have a mounting volume of garbage being produced, new methods of disposal are needed. When developing these new methods, scientists must take into account both the effect on the environment and the cost of technology.

Materials per lab group:

4 Petri dishes, wax pencil, tape, garden soil, dropper, water, samples of garbage which could include paper, vegetable or fruit pieces, meat, bones and Styrofoam.

Procedure:

1. Label the bottom of 4 Petri dishes from #1 to 4. Write your name and the date on each dish. Section the bottom of the dish into 3 sections using a wax pencil.
2. Gather 12 small samples of garbage. Cut the samples into 2 centimeter squares.
3. Put three samples in each Petri dish - one in each section.
4. Record the nature of the sample materials in each dish. Indicate the size, color, texture, odor and any other features you think are important. Predict how each of the samples will look after one week.
5. Cover the sample materials with garden soil. Use a dropper to add enough water to make the soil moist but not soggy.
6. Tape the lid onto each dish and keep at room temperature.
7. After one week, examine the dishes and record any changes in the color, odor, texture, size of the samples.

Extensions:

1. Some landfills are sealed causing them to become an anaerobic environment. In order to simulate these conditions and demonstrate the effect of anaerobic environment on degradation rates, the following activity could be tried.

   An anaerobic environment can be devised by putting the Petri dishes with the garbage samples inside a bell jar with a burning votive candle inside. Place a set of the Petri dishes containing the garbage samples and soil inside the bell jar. Tape the jar closed. Leave for a week. Compare the amount of degradation in an aerobic environment to the anaerobic environment.
2. For one full day, collect the garbage and trash from your house. Divide this into five plastic bags. Bag 1 - glass jars and bottles, Bag 2 - aluminum cans, Bag 3 - plastic containers, Bag 4 - paper goods, Bag 5 - wet garbage. Use a bathroom scale to find the mass of each bag. Using this data, predict the quantity of garbage your family will produce in one week, one month and one year.

Long-Term Activity:
Rubbish In, Rubbish Out?

Objectives:

At the end of this activity students should:

- Have further practiced measuring skills, hypothesizing, taking data, and writing a lab report.
- Have worked cooperatively to test a hypothesis.
- Have observed the relative biodegradability of metal, plastic, and paper products.

Background:

I use this as a beginning-of-the-year and end-of-the-year activity . While observing different materials' relative biodegradability and practicing measurement skills, hypothesizing, taking data, and writing a laboratory report, students cooperate to share data but are individually accountable for their lab report, which is the major focus of this exercise. Because the decomposition takes several months, I have students turn in a preliminary lab report at the end of a beginning-of-the-year unit on scientific method and then turn in a final report towards the end of the year. The preliminary lab report is a draft, so that the end-of-year lab report is a final, revised product of which they can be proud .

While most substances decompose slightly, all paper products rapidly decompose. Regular paper is completely gone when I dig up the packages four months later.

Materials:

Plastic screening (2 pieces/student), string, some type of non-biodegradable label (Styrofoam, dymo label tape), balance, rubbish (supplied by students).

Procedure:

1. Discuss the process of biodegradation and which materials might be biodegradable and which might not.
2. In groups, determine what materials to test for biodegradability. I suggest that one person in the group choose a type of plastic, another a paper product, another a metal, etc., to get a variety of materials that can be compared. Then hypothesize about what you expect to happen and why. A prediction of the percent you expect to decompose

and a deduction would be appropriate.

3. Each group member brings 10 pieces of the selected rubbish from home or the campus.
4. Weigh 5 pieces of your type of rubbish (e.g., 5 similar-sized pieces of aluminum can). Although each piece could be weighed individually and an average calculated, since some materials will readily decompose it is better to just weigh all five pieces together for a total weight. This is the control group. Similarly, weigh the experimental group.
5. Wrap your control and experimental groups of rubbish each in a different piece of plastic screen, tie them with string, and attach a label (one that doesn't decompose, e.g., Styrofoam or metal). Screen allows water and insects to do their work but keeps the rubbish together so that it can be retrieved.
6. Share data with your group so that you can compare a variety of materials. Turn in a preliminary lab report.
7. The experimental rubbish packets are buried for several months about six inches deep. Make sure you mark the burial site. The control packets are kept in the room.
8. Rubbish packets are dug up. Weigh the contents of both packets then share your results with your group (which is like a reunion, since groups have been changed several times during the year). Then turn in a final lab report.

Extensions:

Posters, letters to the editor can be made urging the use of biodegradable products, particularly in packaging.

Follow-Up Activity:
Where did all the paper go?

Objectives:

At the end of this activity students should:

- Understand that there is a natural enzyme system in the soil which is capable of biodegrading some of the wastes of today's society.

Background:

Students are often surprised to find that the paper in their garbage samples from the above labs has disappeared. There is a cellulose degrading bacteria present in the soil which is responsible for this. A simpler model which demonstrates this process is to isolate starch degrading bacteria from the soil using starch agar plates.

Materials:

Soil, sterile distilled water, soluble starch, nutrient agar, 20 Petri dishes, spreading loop, Bunsen burner, gram iodine

Preparation:

To make starch agar:

- Add 2.0 g of soluble starch to 400 ml of distilled water.
- Add 9.2 g. of nutrient agar and autoclave 15 minutes at 120oC. This will make 20 plates.

To make Gram's Iodine:

- Add 1.0 ml of iodine and 2.0 g of Kl to 100 ml of distilled water.
- OR use Lugol's iodine, 3.0 ml in 100 ml of distilled water.

Procedure:

1. Weigh out 1 gram of soil and add this to 99 ml of sterile distilled water. Dilute this further by removing 1 ml of this mixture and adding it to another bottle which contains 9ml of sterile distilled water. Mix by swirling.
2. Remove 0.1 ml of this mixture and put on a Petri dish containing starch and agar. Spread this mixture evenly around the plate using the sterile spreading loops.
3. Turn the plates over and leave overnight.
4. The next day, examine the plate to see if clear areas are developing in the starch agar. If clear areas are seen, flood the plate with the iodine mixture. Pour off the excess iodine after 1 minute. The starch will stain blue. The starch digesting bacterial colonies will have a brown halo around them where the starch has been consumed by the bacteria.
5. Leave the plates another 24 hours and restain. The cleared areas will have increased dramatically.

Student Analysis:

1. Draw the pattern of colonies on your plate.
2. What does each colony represent?
3. What is the clear area on the plate?
4. Explain why the plates containing starch are effective in isolating starch-degrading

bacteria.

5. What enzyme do starch-degrading bacteria degrade?
6. How could this method be used to isolate oil-degrading bacteria?
7. Summarize this lab experience and include possible applications of this procedure to help clean up the environment.

Safety:

Wear goggles while working with iodine.

Waste Management

Frances Vandervoort, Philip Nelson, and Carolyn Hayes
1991 Woodrow Wilson Biology Institute

Objectives

The purpose of this unit is to make students aware of the amount of trash they generate, the problems that result, and possible solutions. Students will investigate household trash, biodegradability, packaging, and recycling. After completing these activities, many students will show interest in these and other local environmental issues. This interest often translates into the type of involvement needed to solve modern problems.

Background

These activities can be used to introduce the study of land use and resource management. They are an appropriate prologue to developing an understanding of issues involving energy and ecological management.

Activity 1. Analysis of Household Trash

Materials

- Household trash
- Rubber aprons
- Old clothes (long pants)
- Gloves

- Safety goggles
- Large sealable plastic bags
- Plastic garbage bags
- Tongs (crucible, if possible)
- Bathroom scale
- Disposable breathing mask

Procedure

1. Assign ten or more students to collect and separate the trash generated by their families over the period of two days. Specify that they include only household refuse. Yard, construction, or chemical wastes are not permitted for safety reasons. Separate bags will be required for plastics, metals, glass, food waste, and miscellaneous. Food waste should placed in large sealable plastic bags. All other materials should be kept in tied trash bags. Precautions must be taken to avoid spillage during transport and handling.
2. On the day of the lab, collections should be delivered to a common site. The best site would be a paved area next to a large school refuse bin.
3. Students should record the mass of each bag. Find the total mass in each category, and the average mass produced per person in each category. After this, dispose of the food waste bags and the miscellaneous bags without opening them. They may represent a health hazard.
4. Open the remaining bags and subdivide their contents. Separate piles of paper can include craft, colored, newsprint, glossy, miscellaneous, and stationery. A separate pile should contain cardboard. Similar divisions can be made to separate different types of metals, plastics (look at the recycling number at the bottom of plastic containers), and colors of glass. Record the mass of each pile. Calculate the mass generated by each person and use this to estimate the total amount of each substance thrown away in your community. After classification, recycle materials that can be recycled and dispose of the rest.

   Note: Activities listed to this point are suitable for all levels of students. The following activities are suitable for higher achieving students.
5. Divide the class into research groups. Each group will be responsible for gathering information and articles from periodicals relating to one or more of the refuse categories. Topics for articles should include possibilities and problems involving reuse, recycling, composting, incineration, landfill, or other solutions pertaining to a particular type of refuse. Primary concerns of cost, safety, environmental impact, and energy requirements should be kept in mind. The Readers' Guide to Periodic Literature may be one of the best sources of current information for general readers.
6. Each group should make a recommendation for dealing with their category of refuse. This should be based on their own research.
7. The entire group can formulate a plan for dealing with their community's household

trash. Plans should include means of paying for the plan. It should also address whether the material should be sorted. In other words, should it be sorted by the persons generating it, or should be sorted in a central collection facility?

8. Have each student submit a report about the activity for evaluation by class and teacher. Additional activities may include assigning students to examine disposal problems not addressed by the group. This may include chemical waste, nuclear waste, tires, medical waste. In other words, should it be sorted by the persons generating it, or should be sorted in a central collection facility?
9. Have each student submit a report about the activity for evaluation by class and teacher. Additional activities may include assigning students to examine disposal problems not addressed by the group. This may include chemical waste, nuclear waste, tires, medical waste, yard waste, motor oil, batteries, etc.
10. Students may choose to present the results of these studies to local governmental officials and media.

Activity 2. What is Biodegradability?

1. Ask students to bring about 4 cups (approximately one liter) of garden or other soil from an outdoor area. Ask them to bring objects and materials from home that they consider biodegradable or non-biodegradable. Substances may be small pieces of fruit, bread, meat, plastic, paper or cardboard, charcoal, etc.. etc. The soil is then placed in a metal tray or bread pan. The soil should be at least 7 cm deep (2 1/2 inches). Divide the pan into 6 areas, and bury a small piece (about 1 cc) of material in each area. Place a plant label or ice cream stick in each area, telling what material is buried there.

   Every other day for two weeks, dig up the substance and describe its appearance, smell, etc. How has it changed? Why? What materials show little or no change? Why not?

   (Note: This is a modification of a BSCS Green Version experiment used successfully for many years in high school classrooms.
2. Ask students to conduct a survey of their neighborhood supermarkets. Find out if the markets provide information about packaging, biodegradability, and toxicity.
3. Ask students to learn about local landfill and waste treatment practices. This can be done by library research, interviewing government officials, and obtaining information from community action groups and service organizations.
4. Ask students to interview people who work in various waste management fields. This can include employees of solid waste management companies, sanitary engineers, landfill operators, or managers of recycling companies. Local, state and federal regulatory agency employees, and elected government official could also be interviewed.

Activity 3 - Pick The Best Package

Objectives:

1. Students will be able to distinguish between different types of packaging.
2. Students will be able to determine whether packaging can be recycled or not.

Student Handout

Give the students a copy of this survey sheet at the beginning of class and after 10-15 minutes begin discussing their choices using the answer key given.

When you go shopping, if all other considerations are equal, pick a product wrapped in the least amount of packaging. Given the following list try and classify them according to the ratings listed.

- a check ( ) means the item can be reused or recycled
- a zero (0) means it can be incinerated or landfilled
- a minus (-) means it cannot be disposed of easily and should be avoided if at all possible.

Kind of Package	Grocery Store Item	Rating
No packaging or natural package	Melons, pineapples, fruits	
Returnable glass bottles	Milk bottles, soda and beer bottles with deposit returns	
Reusable Containers	Cookie and cracker tins, heavy-duty plastic plates on which some microwave dinners are packaged	
Uncoated paper	Bags of candy, cookies, chips, and other snacks	
Uncoated cardboard	Cereal boxes, detergent boxes, dessert mix boxes	
All-steel cans	Many canned fruits and "veggies"	
All-aluminum cans	Beverage containers	
Steel cans with aluminum tops	Pull-top cans	
Glass bottles with twist-off tops	Soft drinks	
Wax paper	Liners in cake boxes	
Cellophane, plastics	Windows in paper boxes and plastic bags	

Coated paper	Paper milk and juice cartons	
PVC	Clear plastic bottles and plastic wrap	
Aluminum-foil-based containers	Foil-lined boxes and bags	
Collapsible metal tubes	Toothpaste, hand cream	
Metal and plastic pumps	Toothpaste pumps	
Aerosol cans	Toiletries, deodorants, hairsprays, insecticides	

Answers for the Teacher:

Kind of Package	Rating
No packaging	check +
Returnable glass bottles	check
Reusable containers	check
Uncoated paper	0
Uncoated cardboard	0
All-steel cans	0
All-aluminum cans	check
Steel cans with aluminum tops	0
Glass bottles with twist-off tops	check
Wax paper	0
Cellophane, plastics	0
Coated paper	0
PVC	-
Aluminum-foil-based containers	-
Collapsible metal tubes	-
Metal and plastic pumps	-
Aerosol cans	-

Reference:

Save Our Planet - Diane MacEachern; Dell Publishing 1990.

Activity 4 - Reduce, Reuse, Recycle

Materials:

Have students bring in examples of various packages that were presented in the "Pick the Best Package" activity.

Suggestions:

1. soda containers - aluminum, plastic, returnable
2. shampoo bottles - plastic (no. 1,2, others), glass
3. potato chips - cardboard can, cellophane bag, foil bag
4. ketchup - glass, plastic
5. vegetables - fresh, frozen, canned
6. cookies - boxed, bagged, blister packed
7. juice - frozen concentrate, glass and plastic bottle
8. eggs - styrofoam or cardboard carton
9. hair spray - aerosol can, plastic pump can
10. laundry supplies - box, boxed concentrate, plastic
11. toys - cardboard, cellophane, blister packed
12. margarine - plastic tub or squeeze bottle, cardboard box with foil.

Procedure:

1. Rate each package on its ability to be recycled.
2. Identify which types of packages are being recycled in your community. Then describe the steps involved in recycling each type of package. (Note: This may require some outside research.)
3. Identify the best type of packaging for each product based on the recycling capabilities of your community.
4. Students should make suggestions on how to reduce the use of non-recyclable products in your community

Waste Management "Grabbers"

"Grabbers", used to generate interest in solid waste management, could include the following:

1. Arouse students' interest in this issue by asking them such questions as: (1) How many automobiles are junked in the United States eash year? (Ans. 7 million), and (2) Which NFL stadium is built on garbage (sanitary landfill). (Ans. Mile High Stadium in Denver, Colorado).
2. Give students a medium-sized plastic bag. Ask them to attach it to their belt or bookbag, and put into it every bit of waste they generate (except food waste) for a 24 hour period. At the end of that period, weigh and examine it. Does it come from overpackaging? Is there anything that the student didn't really need? What is the difference between needs and wants?
3. Give the students information about amounts, including volume and mass, of garbage generated by the average American each day. Use this amount to show how much land is needed to hold that amount, and then consider the environmental consequences of the large volume of waste generated in the United States.

Hazardous Wastes Disposal Theme Page

This "Theme Page" has links to two types of resources related to the study of Disposal of Hazardous Wastes. Students and teachers will find curricular resources (information, content...) to help them learn about this topic. In addition, there are also links to instructional materials which will help teachers provide instruction in this theme. Please read our disclaimer.

- Basel Action Network (BAN)

  BAN is "an international network of activists seeking to put an end to the export and dumping of hazardous wastes from rich industrialized countries to poorer, less-industrialized countries." Their site contains information about the Basel Convention (an international treaty to end the most abusive forms of hazardous wastes trade), background information, status of what countries have signed the agreement, a library of letters and briefing papers, and a set of related links.

- Basel Convention on the Control of Transboundary Movement of Hazardous Wastes and their Disposal

  The Basel Convention is the response of the international community to the problems caused by the annual world-wide production of tonnes of wastes. This global environmental treaty regulates the transboundary movements of such wastes and obliges parties to the convention to manage and dispose of the wastes in an environmentally sound manner. This link is to the United Nations Secretariat which manages the convention.

- [The] Biology Project: Chemicals and Human Health

  Tutorials and online problem sets designed for high school and university students from the University of Arizona. Content coverage includes: the effect of metals on the kidneys and on kidney cells, fundamental principles of toxicology, lung toxicology, and environmental tobacco smoke and lung development .

- Disposal of Household Hazardous Materials

  A fact sheet outlining three steps that should be followed before disposing of household hazardous materials.

- Energy Wise Options for State and Local Governments

  Chapter 3 in this online book addresses Waste Reduction.

- Garbage: How Can My Community Reduce Waste: Hazardous Waste

  Sections on definitions, who's responsible, a knowledge test, and solutions to the issue are presented by The Annenberg/CPB Project.

- [The] Global Waste Trade

  Links to documents on the trade in hazardous wastes organized by continent/country.

- ## [Hazardous Waste: Alternatives]

  A list of non-toxic or less-toxic products that can be used as alternatives to hazardous household chemicals.

- ## [Hazardous Waste Cleanup Information]

  This site contains information about innovative treatment technology as well as programs, organizations, publications and other tools.

- ## [Hazardous Waste Trade]

  A paper from the International Institute for Sustainable Development describing the trade in hazardous wastes and the associated issues.

- ## [Reduce, Reuse, Recycle Theme Page]

  This CLN Theme Page will complement the research that students and teachers are conducting on hazardous waste. Lots of lessons and lesson plans.

- ## [ToxFAQs]

  These FAQs from the Agency for Toxic Substances and Disease Registry (ATSDR) are summaries about hazardous substances. They provide answers to questions about exposure to hazardous substances found around hazardous waste sites and the effects of exposure on human health. The FAQ sheets are organized alphabetically by chemical and a search engine is also available.

- ## [Toxicology: An Environmental Education Unit for Secondary Schools and Communities]

  From the Alberta Environmental Protection and the Canadian Network of Toxicology Centres, this seven lesson unit starts with an introduction to toxicology, moves on to toxicology topics of interest, and ends with a case study on toxic effects and water.

- ## **United States Environmental Protection Agency**

  This comprehensive site from the U.S. Environmental Protection Agency has resources targeted for both students and teachers.

  - [The] Consumer's Handbook for Reducing Solid Waste Practical steps that families can take to reduce the amount and toxicity of garbage.
  - HAZ-ED: Classroom Activities for Understanding Hazardous Waste Teacher resources include downloadable PDF files that offer warm up exercises, activities, fact flashes, and a glossary.
  - Municipal Solid Waste Factbook An electronic reference on household waste management practices. Lots of facts to pull out - note these data will be U.S. based.
  - Office of Solid Wastes Online activities for students.
  - Recycle City Students learn about the three R's by touring various sections of "Recycle City" and seeing how the various organizations and citizens reduce, reuse, and recyle. There's also a "Dumptown game" where students can play the role of a city manager who has been hired to start programs that encourage Dumptown's

citizens and businesses to recycle and reduce waste all the while remaining within a budget of course. An Activities section contains suggestions for using the site within the classroom.

- Waste No Words A crossword puzzle activity.

Top of Page

Note: The sites listed above will serve as a source of curricular content in Disposal of Hazardous Wastes. For other resources in Social Studies - Environment (e.g., curricular content, lesson plans, and theme pages), click the "previous screen" button below. Or, click here if you wish to return directly to the CLN menu which will give you access to educational resources in all of our subjects.

The Imagination Factory is located in Columbus, Indiana, an American city famous for its modern architecture and preserved older buildings. People come here from all over the world to see and study our architecture. Most of them are adults, but kids can find lots of buildings, sculpture, and other great things to see, too. Click A Kid's Columbus to take a virtual tour.

We are dedicated to making learning fun and preserving the precious gift of imagination. Please e-mail us at kidatart@kid-at-art.com with your comments and suggestions.

Sponsored, in part, by the Bartholomew County Solid Waste Management District.

The Imagination Factory graphic was created by Susan M. Brackney, author of The Lost Soul Companion, The Not-So-Lost-Soul Companion, and The Insatiable Gardener's Guide.

Lesson Plans

Lesson Plan # 1 Purpose: To show students what happens to the trash they throw away.

Lesson Plan # 2 Purpose: To show students the potential hazardous effects of common household products

Lesson Plan # 3 Pupose: To show students alternatives to household products that are not as hazardous to the environment.

Lesson Plan # 4 Purpose: To show students that reusing items decreases waste.

Lesson Plan # 5 Purpose: To show students how different types of paper will affect the quality of recycled paper.

Lesson Plan #6 Biodegradability Capsule (2nd & 3rd grades)

Lesson Plan #7 Fireplace Logs From Newspapers (1st - 6th)

Lesson Plan#8 Is Your School a Dumping Ground? (5th)

Lesson Plan#9 Junk Art (Kindergarten)

Lesson Plan#10 Making a Mini-Landfill (4th - 6th)

Lesson Plan#11 Paper Capers (4th - 6th)

Lesson #12 Best ever compost activity for (4th-6th). The objective is to learn about composting.

Lesson #13 How hot is my compost? For (7th-8th) The objective is to study the dynamics of heat in the composting process.

Lesson #14 Composting: a great, rotten idea (7th-8th). The objective is to have students investigate the pros and cons of composting.

Lesson #15 Where should it go? Recycle, Compost? Incinerater? Lansfill? (K-3rd) The objective of this lesson is to understand that solutions to garbage disposal problems are varied and complex.

Cornell's information on composting for teachers and students

Recycle

by Charles Hoskowicz

Charles is a senior programmer/analyst for a San Diego-based computer software firm. He enjoys tennis, running, Tai Chi, bridge, chess, and movies.

Instructional Objective After playing the *Recycle* card game three or more times, players will be able to name all the recyclable items used in the *Recycle* card game.

Learners/Context The *Recycle* card game is designed for ages 8 - 12.

It would be used as part of a class on Ecology. The teacher or facilitator would introduce the idea of recycling, the value of such a practice, and how each and every individual needs to take responsibility for recycling all they can. After the introduction, the card game could be used to familiarize the students with the various items that are normally discarded in the garbage which, however, could be recycled. After playing the game several times, the teacher or facilitator would debrief the students to find out how many items they remember from the game. Incorporated into the debriefing stage, the teacher could talk about how each item is recycled and what effect not recycling that item has on the environment.

Rationale The card game is a fun way to familiarize young people with recyclable items. It heightens awareness by exposing the students to different recyclable materials. It also reinforces the concept of value in recycling by awarding points for accumulating a set of matching cards, and setting an arbitrary point total as the means for determining the winner. The hidden message here is that you are a winner if you recycle. Even for the non-winners there is the association of points for recycling as they get to claim their points at the end of each hand. (More about that in the rules.)

Rules The *Recycle* game is played like Fish. Fish is a game where players ask each other for cards that they need to make 2, 3, or 4 of a kind. If the other players do not have the card in question, the person has to go "Fish" for the card from the remaining undealt cards in the middle of the table. Once three or four of the same value cards are obtained, the cards can be claimed by laying them down face up on the table. The first person to get rid of all their cards wins that hand.

The difference in the *Recycle* game is that points are awarded for laying down 3 or 4 of the same recyclable. Score is kept and a winner is determined by being the first person to reach a certain number of points.

The Players The game can be played with two to four players.

The Dealer The first person to deal is determined by one person shuffling the deck and, starting with the person to the left, turning over one card or each person until a Mother Earth card is turned over. That is the first person to deal. The next person to deal will be the player to the left, and so on.

The Deal The dealer shuffles the cards and begins giving out one card at a time (face down) to each player until everyone has seven cards. The remaining cards are put in the center of table face down. This is where players will go to draw more cards if no one has the card asked for.

The Play Each player should arrange their hands by putting all the matching recyclables together. Play starts with the first person to the left of the dealer asking the other players: "Does anyone have any Newspapers (or any other recyclable) to recycle?" Any player having one or more of that card must give the card to the asker. (A player may NOT ask for a Mother Earth or a Toxic Waste card.) Each player who does not have the card asked for should respond: "No, check the garbage pile." When none of the other players have the requested card, the asker must go the remaining undealt cards to pick a card. Then the next person asks for a card, and so forth.

When a player gets 3 or 4 of one recyclable, they can lay them down only while it is their turn. A player's turn begins when the previous player is either forced to pick from the undealt cards or signals that they don't want to make a lay down. When only 3 of a kind are laid down by a player, anyone holding the fourth card of that kind may lay it down in front of themselves and claim points for it. See "The Score" below. The Mother Earth cards can be used as wild cards. Only one (1) Mother Earth card can be used with two (2) of a kind to make three (3) of a kind, or with three (3) of a kind to make four (4) of a kind. You cannot use two (2) Mother Earth cards with two (2) recyclables to make four of a kind. However, anyone having the matching recyclable card may exchange it for the Mother Earth card in the laydown.

Mother Earth cards can also be used to "neutralize" Toxic Waste cards. Toxic Waste cards are not desirable cards to have. The only way to get rid of a Toxic Waste card is by "neutralizing" it with one (1) Mother Earth card. The player must then pick two (2) cards from the pile to replace the two cards used in "neutralizing" the Toxic Waste. Again, however, any other player with a Toxic Waste card can exchange it for the Mother Earth card when it is their turn without having to pick another card from the pile.

Once a player has gone out, the other players can make laydowns of their own provided they have three (3) or four (4) of a kind. They can also make plays on the person who has gone out by playing a matching card on any of the first person to go out groupings. Mother Earth cards may only be used to complete a grouping, or neutralize a toxic waste card, by the person laying down a grouping. It may not be used to complete a grouping of someone else's laydown.

The Score Players **score** points for the following:

* 15 points for each three (3) of a kind

* 20 points for each four (4) of a kind

* 5 points for each single card played on an opponent's laydown.

Players **lose** points for the following:

* 5 points for each recyclable left in the hand.

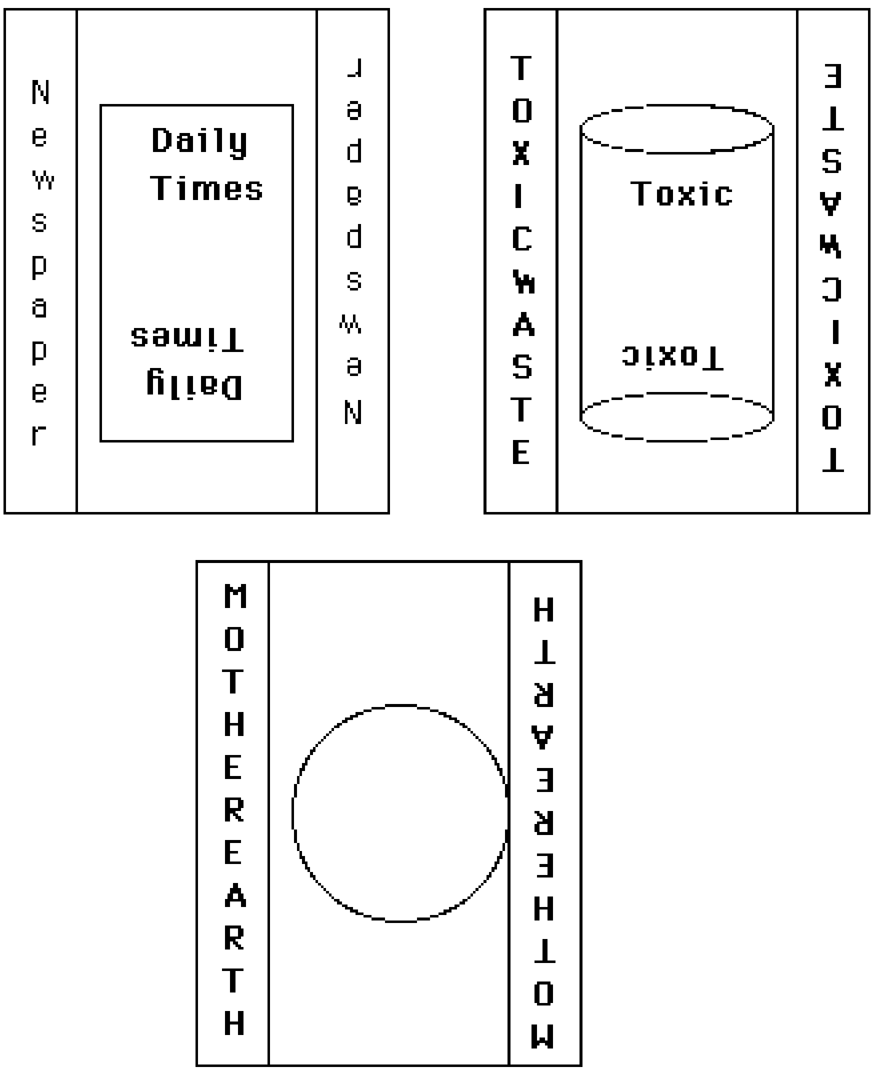
* 10 points for each Mother Earth card left in the hand.

* 25 points for each Toxic Waste card that has not been neutralized

* Players get 0 points for Toxic Waste laydowns.

The Winner The first person to reach 500 or more points is the winner. If more than one person reaches or goes over 500 points, the person with the most points wins.

Card Design



Deck Design The deck consists of 52 cards. There are four of each type of recyclables: Newspaper, Cans, Glass, Metal, Magazines, Plastic, Styrofoam, Junk Mail, Rubber, Computer Paper, and Used Car Oil for a total of 44 cards, plus four (4) Mother Earth and four (4) Toxic Waste cards.

Design Process First I thought about what the subject matter would be. After settling in on recycling, I began evaluating possible formats: rummy, solitaire, etc. I chose a rummy format because it seemed to me to be the best way get the message across: Collect, save, and reclaim recyclable materials.

The idea of the Toxic Waste card came a little later in the design processes. I was looking to bring in an avoidance factor into the game, something that would heighten interest. I struggled a bit on how a person would be able to get rid of the Toxic Waste card. I hit on the idea about a Mother Earth card that would serve as a neutralizer to the Toxic Waste card. Then the idea about using Mother Earth cards as a wild card seemed to fit right in. But there was still the problem of not giving people ample opportunity to neutralize the Toxic Waste card. That's when the idea came to allow anyone, when it was their turn, to exchange a matching recyclable for the Mother Earth card in anyone's played cards. This works because it adds some strategy to the game.

I 'm not sure that any ideas were actually thrown out, but rather it appeared to be a process of refining ideas that happened to come up. For example, the Toxic Waste card idea. I wanted to use the concept, but then I became concerned that the player could get one, or more, and not be able to get rid of them. So I thought about it. Getting three or four Toxic Waste cards might not give the players enough opportunity to discard them, especially since they could not ask for them. So when I came up with the Mother Earth card idea, it increased the likelihood of completing a grouping. But then I thought, what if the person only gets one Toxic Waste card? How can it be discarded? I came up with the idea of a one for one neutralizing scheme. This gave all players a chance to get rid of the Toxic Waste card and put a Mother Earth card out on the board where it could be traded for a Toxic Waste card. This seemed to be enough ways to get rid of the Toxic Waste card.

Recycling Lesson Plans

Department of Environmental Protection

The following lesson plans were prepared Carl Hursh by the Bureau of Land Recycling and Waste Management to illustrate a variety of recycling concepts for grades Kindergarten through 12. Each lesson plan is marked for its intended grade level.

Site Navigation

LESSON PLAN:

Reduce, Reuse, Recycle

by Marva M. Ledwith
Wheatley High School
Houston, Texas

Objectives

- To define reduce, reuse, recycle
- To list materials that can be reduced, reused, recycled
- To become aware of how reducing, reusing and recycling effects our environment
- To list ways to reduce, reuse, recycle
- To make a personal plan of action to reduce, reuse, recycle **Internet Resources**

Examples of How to Reduce, Reuse, Recycle A Household Recycling and Action Guide. This is a guide of ways to reduce, reuse, recycle in plan no-nonsense terms.

How the 3 R's (Reduce, Reuse, Recycle) Can Effect our Environment Project 2050 - Save Earth. Gives an idea of how life would be with everyone involved in the 3R's and other environmentally sound activities.

Text Resources
Bernstein, Leonard and others (1996). Environmental science. Ecology and human impact. Menlo Park: Addison-Wesley Publishing Company.

Definitions

- **reduce - to use less**
- **reuse - to put again into service without changing**
- **recycle - to put again into service with changing**

Materials to Reduce, Reuse, Recycle

Student Activity:

Have the students list as many materials as they know of that are either reduced, reused and/or recycled. This can be a group activity. Encourage all ideas and discuss the ones that may be a little "too" original.

Lecture Notes:

There are several materials that are now being recycled. Paper is one of the easiest but each time it is recycled, the cellulose fibers in the paper shorten and weaken, reducing the quality of the paper. Some minerals can be recycled such as glass and aluminum. Junked cars are recycled. Many other metals are also recycled such as silver from photographic film and x-rays, copper from car radiators and telephone and utility cables, lead from car batteries, and zinc from plumbing materials. Other materials being recycled are motor oil and plastic.

How the 3 R's Effect Our Environment

Student Activity:

Have the students brainstorm how they think all our recycling and other efforts impact our environment. Do they think it is a waste of time? It is worth it? Does it really save our planet? etc.....

Lecture Notes:

When aluminum is recycled instead of refining 'new' aluminum, water and air pollution is decreased as well as consumption of energy. The recycling of motor oil keeps several toxic substances such as lead, cadmium, arsenic and benzene from polluting our land and air, not to mention the consumption of energy that is reduced in this process to clean as opposed to refining. The 3 R's reduce the amount of waste produced and the resulting disposal problems. They are also less polluting, cheaper and more energy-efficient than taking new material from the environment.

Ways to Reduce, Reuse, Recycle

Student Activity:

Have the students brainstorm on how they can reduce, reuse, recycle. Make sure they are very specific in how they would accomplish their desired activity to save the environment. Have them include individual as well as community activities.

Lecture Notes:

There are several ways of imposing the 3 R's. One is certainly to buy products made from recycled materials which completes the recycling circle. Another way which is most popular is to recycle/reuse paper, plastic, glass and other items through curbside recycling pickup or centers designated for that purpose. Repair items like appliances so that the garbage in landfills will be reduced.

A Personal Plan of Action

Student Activity:

Have students copy the following table and complete. This should be started in class but completed at home so students may involve other family members.

Activity	1	2	3	4
Description				
Target Date				
Impact

My Personal Plan of Action- 3 R's

Solid Waste and Recycling

by Bernita Robinson

Lesson I - Litter Activity:

Introduction: Litter, especially paper, is our greatest source of waste.

Objectives: Students will:
-discover how much waste is generated in class
-offer some solutions to cutting down on waste in class

Time Allotment: several days to a week

Materials: Litter activity sheet, large bins to collect litter

Advanced Preparation: None

Procedure:
Prior to lesson the students will apply the KW (prior knowledge and what they want to know) of the KWL method.
-Introduce the lesson
-Class will do hands-on activity and discuss results connecting lesson to everyday examples.

Summary:
Have the students apply the L (what they have learned) of the KWL method.

Safety: No hazards.

Clean-Up: Recycle as much as possible

Home Activity:
Have students discuss the lesson with someone at home.

Lesson Assessment:
Based on participation in activity and what they have learned (L).

Additional Activities:
Students will create sculptures, jewelry and collages (sort and disinfect litter first). All art projects in solid waste and recycling lessons will be presented in a school wide art exhibit.

Lesson II - Paper Recycling Activity

Introduction: Paper is our greatest source of waste. We can cut down on paper waste by recycling our paper waste.

Objectives: Students will:
-Learn how to recycle newspaper waste

Time Allotment: 2 days

Materials: old newspaper, starch, beater or blender, large bowl, screen to hold paper fiber, sheet of plastic, block of wood, paper recycling activity sheet

Advanced Preparation:
-Collect old newspaper

Procedure:
-Prior to lesson the students will apply the KW (prior knowledge and what they want to learn) of the KWL method.
-Introduce the lesson.
-Class will do hands-on activity and discuss results connecting lesson to everyday examples.

Summary:
Have the students apply the L (what they learned) of the KWL method.

Safety: Make sure the students' clothes are covered with plastic or aprons.

Clean-Up: None.

Home Activity:
Have students discuss the lesson with someone at home.

Lesson Assessment:
Based on participation in activity and what they have learned (L).

Additional Activities:
Students may want to include leaves or other flat objects on their paper fibers.

Lesson III - Main Kinds of Solid Waste

Introduction:
Solid waste is a very serious problem. Americans throw away valuable waste products which can be recycled and used again. There are other kinds of solid wastes which help to destroy our environment.

Objectives: Students will:
-discover some of the main kinds of solid waste
-offer solutions to some of the solid waste problems

Time Allotment: 40 minutes

Materials: Main kinds of solid waste, activity sheet, pencil

Advanced Preparation: None

Procedure:
Prior to lesson the students will apply the KW (prior knowledge and what they want to know) of the KWL method.
-Introduce the lesson
-Class will do hands-on activity and discuss results connecting lesson to everyday examples.

Summary:
Have the students apply the L (what they have learned) of the KWL method.

Safety: No hazards.

Clean-Up: None.

Home Activity: Have students discuss the lesson with someone at home.

Lesson Assessment:
Based on completion of activity and what they have learned (L).

Additional Activities:
Students may wish to recycle cans, plastics and glass.

Lesson IV - Canned Pencils

Objective: Students will :
-recycle cans using various "waste" materials

Time Allotment: 30 minutes

Materials:
-old cans with clean edges, fabric scraps, old magazine pictures, glue, scissors, string and ruler for measuring distance around can and length of can, canned pencil direction sheet.

Advanced Preparation:
Have students bring in materials prior to activity.

Procedure:
Prior to lesson the students will apply the KW (prior knowledge and what they want to know) of the KWL method.

-Introduce the lesson
-Class will do hands-on activity and discuss results connecting lesson to everyday examples.

Summary:
Have the students apply the L (what they have learned) of the KWL method.

Safety: Remind students to only bring in cans with clean edges.

Clean-Up : None

Home Activity:
Have students discuss the lesson with someone at home.

Lesson Assessment:
Based on completion of activity and what they have learned (L).

Additional Activities:
Students may make several more to sell or give as gifts.

Lesson V - Plain Plane

Introduction:
One solution to cutting down on waste is to recycle. We have an abundance of plastic waste which cannot be recycled into the earth. Our landfills are few and are filling up fast.

Objectives: Students will:
-learn how to recycle materials that we ordinarily "throw away".
-find economical ways to make toys

Time Allotment: 1 week (30 mins./day)

Materials:
-plastic bottle with top, kitchen, 3 plastic tops (same size), 2 pipe cleaners, large plastic lids, 1 brass fastener, Plain Plane direction sheet.

Advanced Preparation:
Have students bring in materials prior to activity.

Procedure:
-Prior to lesson the students will apply the KW (prior knowledge and what they want to learn) of the KWL method.
-Introduce the lesson.
-Class will do hands-on activity and discuss results connecting lesson to everyday examples.

Summary:

Have the students apply the L (what they learned) of the KWL method.

Safety: Teachers may have to solicit parent volunteers because scissors are sharp.

Clean-Up: None.

Home Activity:
Have students discuss the lesson with someone at home.

Lesson Assessment:
Based on participation in activity and what they have learned (L).

Additional Activities:
Students may wish to decorate their planes. Students will have a recycled art display for the entire school.

Throwing It All Away?

Investigating What Happens to Our Trash and Recyclable Items, and the Related Environmental Effects

Author(s)
[Alison Zimbalist, The New York Times Learning Network](#)

Grades: 6-8, 9-12
Subjects: Geography, Science
[Interdisciplinary Connections](#)

Overview of Lesson Plan: In this lesson, students investigate what happens to commonly used items and products once they are thrown away or sent to be recycled, analyzing and understanding the relationship between a product's ingredients and its effects on the environment and on the health of the living things on Earth.
Review the [Academic Content Standards](#) related to this lesson.

Suggested Time Allowance: 45 minutes- 1 hour

Objectives:
Students will:
1. Categorize what in their classroom is biodegradable, not biodegradable, reusable and recyclable; share thoughts on how a product's "ingredients" relate to the environment and to health.
2. Explore how toys containing toxins are being remade with environmental and health issues in mind by reading and discussing "Barbie and Other Toys to Go on an Oil-Free Diet."
3. Investigate, in pairs or small groups, what happens to a commonly used item once it is thrown away or sent to be recycled, including the environmental effects of this process and its results.
4. Create an illustrated flowchart or diagram demonstrating their research findings.

Resources / Materials:
-student journals
-paper
-pens/pencils
-classroom blackboard
-copies of "Barbie and Other Toys to Go on an Oil-Free Diet" (one per student)
-computers with Internet access (one per pair or small group)

Activities / Procedures:
1. WARM-UP/DO-NOW: Prior to students' arriving in class, write the following instructions on the board for students to respond to in the first few minutes of class: "Divide a piece of paper in your journal into fourths. Label each section with one of the following titles: Biodegradable, Not Biodegradable, Reusable, Recyclable. Then, look around the classroom and place as many objects as you can into these

categories. (Many objects will be able to fit into more than one category.)" After a few minutes, ask students to share their work with the class. Students may challenge others' responses and defend their ideas. Explain to students that today they will be exploring what happens to items once they are thrown into a trashcan or recycle bin, as well as examining the importance of what a product is made of in relation to the future of the environment and to the health of humans, plants and wildlife. Ask students to share their thoughts on how a product's "ingredients" relate to the environment and to health.

2. As a class, read and discuss "Barbie and Other Toys to Go on an Oil-Free Diet," focusing on the following questions:
a. Why is Barbie now not "environmentally correct," and what is being done to fix this? Why is this significant in the toy business and other industries?
b. What is polyvinyl chloride (PVC), and what risks does this chemical pose on the environment and on humans?
c. If "toys with polyvinyl chloride are safe for children of all ages," why is Mattel changing the type of plastic used in their toys?
d. What are phthalates, and what danger do they pose?
e. What types of items often contain phthalates, and why?
f. What did the National Environmental Trust find when it tested 17 kinds of bathtub and squeeze toys? How did the industry respond to these results? Do any responses surprise you, and why?
g. Why didn't the Consumer Product Safety Commission order a ban on the toxic chemical DINP?

3. Divide students into pairs or small groups of three, and assign each pair an item commonly thrown away or recycled (suggested items: rubber tires, newspapers, aluminum cans, computer components, old toys, paint, household cleaners, aerosol cans, glass, Styrofoam, scrap metal, old wood furniture). Explain to students that they will be researching what happens to their assigned items once they are thrown away or sent to be recycled, including the environmental effects of this process and its results. Each group should use the Internet to answer the following research questions about their item (written on the board for easier student access):
--Is your item biodegradable, and if so, how long does it take to fully decompose? (may be a range of time rather than an exact amount of time)
--Is your item recyclable in any way, and if so, how can it be recycled?
--Trace in chronological order what happens to your item once it is thrown away or sent to be recycled. What people are involved at different stages? Where does it go? How is the item "treated" in different places? Follow your product through to its final destination.
--What specific regulations are imposed on the disposal or recycling of this item?
--What are the environmental consequences, both positive and negative, of disposing of this item?

4. WRAP-UP/HOMEWORK: After each group completes their research, they should create an illustrated flowchart or diagram demonstrating what happens to their assigned item once it is thrown away or sent to be recycled, including the environmental effects of this process and its results. Posters should be presented and displayed in a future class.

Further Questions for Discussion:
--What does "biodegradable" mean, and what types of things are biodegradable?
--What does the phrase "Reduce, Reuse, Recycle" mean to you, and how does this phrase relate to the environment?
--In what ways do you "reduce, reuse and recycle"?
--Do you think that toys should come with product warnings and ingredients labels? Why or why not?
--What responsibilities do toy manufacturers have in labeling their products with warnings if they include an age range on their toys?
--What individual responsibility does each person have in protecting the earth?
--In what ways has an increase in technology affected our views about the importance of maintaining the earth's environment and the living things on the planet?
--Should recycling and composting be required by law? Why or why not?

Evaluation / Assessment:
Students will be evaluated based on initial journal response, participation in class discussions, group research on what happens to a product once has been used, and illustrated flowchart stemming from research.

Vocabulary:
petroleum, controversy, advocacy, ecosystems, phthalates, concentrations, carcinogen, ingest, preliminary

Extension Activities:
1. Define qualities that are linked to hazardous chemicals (including toxic, corrosive, reactive, flammable). Then, look through the chemical-based products in your home (look in your garage, kitchen, and bathroom) and chart what products possess these qualities. Create a one-page guide for your family that explains what these qualities mean, the types of products in your home that are dangerous, and what you should do if you spill, splash or ingest any of these chemicals, including important phone numbers to call for help. Post this guide on your refrigerator or other visible and appropriate place in your home.

2. Research how you can reduce, reuse and recycle in your daily life, and create a "Guide to the Three 'R's" geared towards how kids can make a difference in this way.

3. Examine how different types of plastics are made, their ingredients and their uses, including polyvinyl chloride-based plastics and plant-and-vegetable-based plastics.

4. Explore the toxins listed in the article (including petroleum, lead, cadmium and phthalates). What products contain these ingredients, and why? Where do these toxins come from? What are their benefits and hazards? What are the effects of these toxins on the human body, as well as on the environment?

5. Learn about different types of common toxins and their effects on the environment. Investigate wildlife contaminants (endocrine disrupters), persistent organic pollutants (POPs), and agriculture pollution, among others. Why are these toxins used, and what are their effects? What substitutions for these toxins are being used to ensure a healthier environment? What companies and organizations are helping in the fight against toxic chemicals on earth and in the atmosphere?

6. Conduct biodegradability experiments by composting in a small area outside of your school and monitoring what happens to the compost over time. Explore the science behind decomposition and the benefits of composting. Search the Web for how to create and maintain your own compost area.

7. Examine what carcinogens are and how they affect the human body. Learn about their sources and the regulations of these cancer-causing agents. What everyday products contain carcinogens? What danger do they pose, according to studies on them? Why are these products used if they have such dangerous effects?

8. Study how toxic chemicals and the use and disposal of non-biodegradable products affect different ecosystems. Select one ecosystem for in-depth ecological study, and propose solutions for the protection of this ecosystem.

9. Explore the environmental impact of landfills. Learn about landfills in your area, regulations imposed on them, and their expected ecological impact over time.

Interdisciplinary Connections:
Economics/Civics
-Examine the economic incentives that a toy company might have in changing their products to be more environmentally safe, as well as incentives they may have to not change such products.
-Learn about the field of "consumer safety" and the many influences that this field has on our daily consumption and product use.

Fine Arts- Create a piece of art, constructed entirely of recyclable materials, that addresses the theme of "Reduce, Reuse, Recycle."

Global History- Learn about the European Community and other country alliances that work together with regards to environmental and other concerns. What products are banned in different countries, and why? What processes must be followed to ban products? Create a map indicating your findings.

Health- Trace the effects of lead and other toxic chemicals on the human body.

Language Arts- Use the Internet to research different advocacy groups that campaign against vinyl plastics. Then, write letters to these groups that address questions that you have about the issues discussed in the article.

Mathematics- Chart statistics from the past ten to twenty years regarding recycling, landfill size, and monies involved in recycling, or create a chart examining the amount of time that it takes for different products to biodegrade.

Media Studies- Create a "Reduce, Reuse, Recycle" poster campaign geared to how students in your school can help out, and post your creations. Be sure to include statistics and other facts in each poster.

Other Information on the Web

Mattel, Inc. (http://www.mattel.com/) designs, manufactures, markets and distributes a variety of toy products on a worldwide basis.

Toys Manufacturers of America (http://www.toy-tma.org/index.html) helps enable the toy industry to freely create and market safe, fun products worldwide while recognizing its responsibilities to the well-being of children.

National Environmental Trust (http://www.igc.apc.org/eic/) functions as the resource for several major public education campaigns about environmental issues. Through a network of grassroots organizers around the country, and with attention-getting advertisements, reports, and press events, they get the word out about the importance of many environmental issues, including guarding the community's right to know about toxic chemicals.

Consumer Product Safety Commission (http://www.cpsc.gov/) is the federal regulatory agency that protects the public against unreasonable risks of injuries and deaths associated with consumer products.

Greenpeace (http://www.greenpeaceusa.org/) offers specials on climate, forests, oceans, and toxins, including Greenpeace's actions to preserve these elements of the earth, as well as a Kids' Clubhouse (located under the heading "Green.") The site also offers a report on Mattel's decision to make Barbie "environmentally correct" (http://www.greenpeaceusa.org/features/mattel.htm).

Academic Content Standards:

This lesson plan may be used to address the academic standards listed below. These standards are drawn from Content Knowledge: A Compendium of Standards and Benchmarks for K-12 Education: 2nd Edition and have been provided courtesy of the Mid-continent Research for Education and Learning in Aurora, Colorado.

In addition, this lesson plan may be used to address the academic standards of a specific state. Links are provided where available from each McREL standard to the Achieve website containing state standards for over 40 states. The state standards are from Achieve's National Standards Clearinghouse and have been provided courtesy of Achieve, Inc. in Cambridge Massachusetts and Washington, DC.

Grades 6-8

Science Standard 8- Understands the cycling of matter and flow of energy through the living environment. Benchmark: Knows how matter is recycled within ecosystems

Connect to State Standard

Science Standard 16- Understands the scientific enterprise. Benchmarks: Knows that the work of science requires a variety of human abilities, qualities, and habits of mind; Knows various settings in which scientists and engineers may work; Understands ethics associated with scientific study; Knows ways in which science and society influence one another

Connect to State Standard

Geography Standard 14- Understands how human actions modify the physical

environment. Benchmarks: Understands the ways in which human-induced changes in the physical environment in one place can cause changes in other places; Understands the ways in which technology influences the human capacity to modify the physical environment; Understands the environmental consequences of both the unintended and intended outcomes of major technological changes in human history
Connect to State Standard
Geography Standard 16- Understands the changes that occur in the meaning, use, distribution and importance of resources. Benchmarks: Understands the reasons for conflicting viewpoints regarding how resources should be used; Knows strategies for wise management and use of renewable, flow, and nonrenewable resources; Understands the role of technology in resource acquisition and use, and its impact on the environment
Connect to State Standard
Geography Standard 18- Understands global development and environmental issues. Benchmarks: Understands how the interaction between physical and human systems affects current conditions on Earth; Knows how the quality of environments in large cities can be improved
Connect to State Standard

Grades 9-12
Science Standard 8- Understands the cycling of matter and flow of energy through the living environment. Benchmark: Knows that as matter and energy flow through different levels of organization in living systems and between living systems and the physical environment, chemical elements are recombined in different ways
Connect to State Standard
Science Standard 16- Understands the scientific enterprise. Benchmarks: Understands the ethical traditions associated with the scientific enterprise and that scientists who violate these traditions are censored by their peers; Understands that science involves different types of work in many different disciplines
Connect to State Standard
Geography Standard 14- Understands how human actions modify the physical environment. Benchmarks: Understands the role of humans in decreasing the diversity of flora and fauna in a region; Understands the global impacts of human changes in the physical environment
Connect to State Standard
Geography Standard 16- Understands the changes that occur in the meaning, use, distribution and importance of resources. Benchmarks: Understands the impact of policy decisions regarding the use of resources in different regions of the world; Knows issues related to the reuse and recycling of resources
Connect to State Standard
Geography Standard 18- Understands global development and environmental issues. Benchmarks: Understands why policies should be designed to guide the use and management of Earth's resources and to reflect multiple points of view; Understands contemporary issues in terms of Earth's physical and human systems
Connect to State Standard

To Recycle or Not to Recycle

A WebQuest By Deb DeFouw

Introduction:

The local town council is trying to decide whether or not to implement a mandatory recycling program. The purpose of this program is to reduce the amount of waste at the local landfill. The program would require both residents and businesses to separate their waste into garbage and material that is recyclable. Some residents and businesses are opposed to this ordinance because they do not want to have to take the time to separate their garbage. But, our local environmentalists are telling us that we are adding to much pollution to our community. They believe that if we don't act soon, we will not only be suffering from land pollution, but water and air pollution as the garbage seeps into our rivers. Members of our local council as well as some city planners are very concerned about the costs of implementing such a project. Many of the local residents are worried that they may have to incur a tax increase in order to fund this project.

Summer Travel Tips

More Americans than ever are hitting the road this summer. Conserving fuel is increasingly important to our environment and, with higher gas prices at the pump, our wallets as well. Drivers can take a number of steps to minimize trips to the fuel pump and to protect the air we breathe: drive wisely; maintain your car; plan trips in advance; and don t top off your gas tank.

Clean Air Rules of 2004

The Clean Air Rules are a suite of actions that will dramatically improve America's air quality. Three of the rules specifically address the transport of pollution across state borders. These rules provide national tools to achieve significant improvement in air quality and the associated benefits of improved health, longevity and quality of life for all Americans.

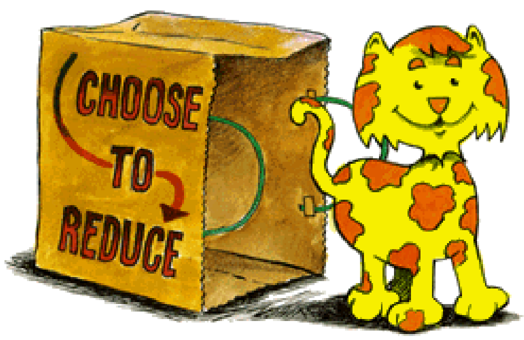
Emergencies

Spills or releases of oil or chemicals should be reported immediately to the EPA Spill Hotline: 800-424-8802.

The Consumer's Handbook for Reducing Solid Waste



The Cat's Out of the Bag! This site describes how people can help solve a growing problem...garbage!

Individual consumers can help alleviate America's mounting trash problem by making environmentally aware decisions about everyday things like shopping and caring for the lawn. Like the story that says that cats have nine lives, so do many of the items we use every day.

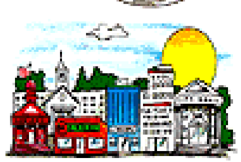
Reusing products is just one way to cut down on what we throw away. This web site outlines many practical steps to reduce the amount and toxicity of garbage. These aren't the only steps that can be taken to reduce waste, but they're a good start.

The Problem Is Too Much Trash

Learn why trash has become a major problem today.

Source Reduction: A Basic Solution

Source reduction is waste prevention: less waste means less of a waste problem.
Get the facts.



Making Source Reduction Work

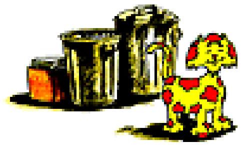
Learn what we can do to prevent solid waste build-up, and read about a few success stories.

The Four Basic Principles

Find out what it means to reduce, reuse, recycle and respond.

The Twelve Tips

You can start reducing waste right now.
Twelve easy-to-follow tips for waste prevention.



Conclusion

So what have we learned?

HAZ-ED - Classroom Activities for Understanding Hazardous Waste

Hazed materials can be used as part of a larger curriculum, as special stand-alone activities, or on an occasional basis to teach students about hazardous waste issues. Hazed is a compilation of interdisciplinary activities that focus on the often complicated and sometimes controversial scientific, technical, and policy issues related to hazardous waste sites and Superfund. It is designed to help students develop skills in critical thinking, problem solving, and decision making. It also increases environmental awareness and encourages an environmental ethic in students.

The Table of Contents can be utilized in sequential order, or the Introduction further defines the components of the materials which will enable teachers to design their own organization for the Hazed activities. The materials focus on grades ranging 7th through 12th, the Warm-Ups and Activities specifically list the appropriate grade level. All materials listed are linked to a PDF format in addition to the web enabled format.

About PDF

Table of Contents

- **Foreword**—This includes an Introduction, Instructional Goals, and detailed instructions on how to use the Hazed material. **[PDF format, 11 pages, 127KB]**

- **Warm Up Exercises**—The Warm-Ups focus on developing and understanding some basic concepts related to hazardous waste.

- **Activities**—The Activities build on the Warm-ups, although they can stand alone. Students examine issues related to hazardous waste and site cleanup.

- **Fact Flashes**—The Fact Flashes are a set of fact sheets that provide the foundation of information on which the Warm-ups and Activities are built.
- **Glossary**—The Glossary defines many of the terms and concepts students will encounter in the exercises and activities. **[PDF format, 10 pages, 27KB]**
- **Suggested Reading**—A list of abstracted Suggested Readings provides both educators and students with additional information. **[PDF format, 8 pages, 146KB]**
- **Contacts and Resources**—This page provides a variety of information, including key phone numbers and Internet addresses. **[PDF format, 4 pages, 209KB]**
- **This Is Superfund Brochure —** This is a stand-alone document that describes the Superfund Program. **[PDF format, 8 pages, 524KB]**
- **Bibliography**—This page lists resources used in preparing the Haz-Ed materials. **[PDF format, 2 pages, 48KB]**

Warm-Up Exercises

1. **Defining Hazardous Waste:** Students define and explore the relationship between hazardous substances and hazardous waste. Grade level 7-10 **[PDF format, 4 pages, 145KB]**
2. **EPA's Superfund Program:** Students learn about the goals of the Federal Superfund Program and how these goals are achieved. Grade level 7-12 **[PDF format, 10 pages, 282KB]**
3. **The Numbers Game:** Students gain an appreciation for the part-per-million and part-per-billion units used to measure contaminant concentrations in the environment. Grade level 10-12 **[PDF format, 10 pages, 266KB]**
4. **Risk Concepts:** Students explore the meaning of risk through a simple exercise in probability. Grade level 7-10 **[PDF**

format, 6 pages, 421KB]

5. **Hazardous Waste Issues in the News:** Students conduct research to collect news media reports on local and national hazardous waste issues. Grade level 7-12 **[PDF format, 10 pages, 236KB]**

6. **What is an Aquifer?:** Students build a simple model of an aquifer to study the relationship of groundwater and surface water and explore the ways contaminants are spread through water. Grade level 7-9 **[PDF format, 4 pages, 128KB]**

Back to top

Activities

1. **Waste: Where Does It Come From? Where Does It Go?:** Students identify and locate on a map the potential sources of hazardous waste in their neighborhood or community. Grade level 9-12 **[PDF format, 4 pages, 152KB]**

2. **Examining a Hazardous Waste Site:** Students begin to understand how Superfund sites are created. Grade level 9-12 **[PDF format, 8 pages, 196KB]**

3. **Companion to Superfund-the Resource Conservation and Recovery Act (RCRA) Program:** Students explore the nation's program for properly managing and disposing of hazardous and nonhazardous waste in the United States. Grade level 9-12 **[PDF format, 6 pages, 218KB]**

4. **Dealing with Chemical Emergencies:** Students discover how Federal, state, and local authorities respond to chemical emergencies under Superfund and other laws. Grade level 7-12 **[PDF format, 6 pages, 207KB]**

5. **How Hazardous Substances Affect People:** Students gain an appreciation for how scientists determine the human health effects of hazardous substances. Grade level 7-10 **[PDF format, 5 pages, 234KB]**

6. **Examining the Effects of Pollution on Ecosystems:** Students learn that hazardous waste may have far-reaching impacts on ecosystems that are not-always easy to identify. Grade level 10-12 **[PDF format, 16 pages, 588KB]**

7. **Identifying Risks at a Superfund Site:** Students begin to understand the types of risks found at Superfund sites and how these risks are identified and assessed. Grade level 7-12 **[PDF format, 8 pages, 313KB]**

8. **Hazardous Waste Cleanup Methods:** Students explore some of the reasoning involved in choosing technologies for cleaning up hazardous waste sites. Grade level 9-12 **[PDF format, 4 pages, 122KB]**

9. **Making Decisions About Hazardous Waste Cleanup:** Students assume roles and act out a situation that illustrates the process of decision making during cleanup of a Superfund site. Grade level 9-12 **[PDF format, 18 pages, 951KB]**

10. **Pollution Prevention:** Students discover what can be done to reduce the amount of solid and hazardous wastes that must be disposed of and managed safely. Grade level 7-12 **[PDF format, 8 pages, 366KB]**

11. **What the Community Can Do:** Students learn how the U.S. Environmental Protection Agency involves communities near Superfund sites in the cleanup process, and the types of activities communities can use to influence how hazardous waste sites are cleaned up. Grade level 7-12 **[PDF format, 6 pages, 149KB]**

12. **Federal and State Laws on Hazardous Waste:** Students will become familiar with how laws affecting hazardous waste are developed, enacted, implemented, and enforced. Grade level 7-12 **[PDF format, 8 pages, 258KB]**

13. **Creating the Future:** Students create and write scenarios for the future related to hazardous waste pollution. Grade level 7-12 **[PDF format, 4 pages, 138KB]**

Back to top

Fact Flashes

1. **Hazardous Substances and Hazardous Waste:** Students learn how chemicals affect our everyday lives. **[PDF format, 1 page, 345KB]**

2. **The Superfund Cleanup Program:** Students learns how EPA deals with abandoned, accidentally spilled, or illegally dumped hazardous substances from the past. **[PDF format, 4 pages, 264KB]**

3. **Flowing Railroad Hazardous Waste Sites:** Students learn how a Railroad yard became a 25-acre waste site. **[PDF format, 6 pages, 343KB]**

4. **Flowing Railroad Site Investigation Results:** Students learns how EPA investigated this site and what the results were. **[PDF format, 2 pages, 235KB]**

5. **Groundwater :**Students learns what groundwater is, how it is contaminates, and how it is cleaned. **[PDF(a) format, 3 pages, 344KB] [PDF(b) format, 3 pages, 271KB]]**

6. **Resource Conservation and Recovery Act (RCRA):** Students gain an understanding of RCRA and how it works. **[PDF format, 4 pages, 295KB]**

7. **Pollution Prevention:** Students learns numerous ways to prevent pollution. **[PDF version, 4 pages, 238KB]**

8. **Common Cleanup Methods:** Students learn how effective various methods of cleanup are and why they are used. **[PDF version, 6 pages, 326KB]**

9. **Common Contaminants:** Students learn about common contaminants, where they are found, and how they can affect human health. **[PDF version, 18 pages, 246KB]**

10. **Superfund Community Involvement Program:** Students understand why community involvement is essential in all Superfund actions taken by EPA. **[PDF version, 4 pages, 249KB]**

11. **Other Major Environmental Laws:** Students study a series of environmental laws and how they work together to protect our health, our environment, and our future. **[PDF version, 4 pages, 254KB]**

HOW TO PLAY:

Read the clue. Find the number on the puzzle that matches that clue. Using your mouse, click inside of the first block for that clue and type a letter. Tab or click inside of the next block until you have completed the entire word.

CHECKING YOUR ANSWERS:
To check your answer, simply click on the number button that matches your clue.

Good Luck!

Across

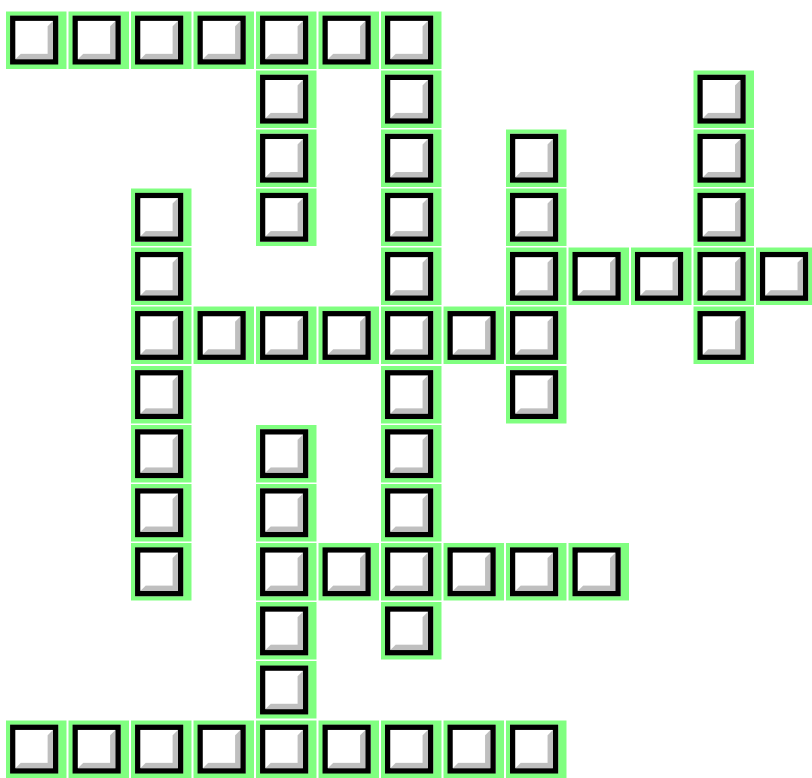
1. A product can be considered __________ when it lasts a long time.

7. To use something again for the same purpose or a new purpose.

8. What a pile of decayed food scrapps, leaves and grass turn into.

10. You can ________ old toys to needy children instead of throwing them away.

11. Comes in disposable and rechargeable varieties.



Clear

Down

2. If you buy one large bag of potato chips instead of five small bags, you are buying in ______.

3. Your world, surroundings, and source of life and health.

4. Many items found in your ________ can be recycled into valuable new products.

5. Fossil fuels, such as coal, oil, and natural gas that are used to manufacture products and heat our homes, come from the ________.

6. To collect used materials to make into new products rather than throwing them away.

9. To decrease the amount of trash you throw away.

cleaning water the way nature does

Explore an ecological wastewater recycling system in [Chatham County, North Carolina], at the former Triangle School.

Wastewater is cleaned for reclamation and reuse using constructed wetlands, and a greenhouse containing soil filters and an aquatic ecosystem. This is the first on-site treatment facility of its kind in North Carolina which not only purifies water and reclaims nutrients, but also reuses water, and therefore RECYCLES WATER. Nutrients from the wastewater are captured to be used later as fertilizer for landscape plants.

The Triangle School Wastewater Treatment Facility was designed by a team headed by Halford House at North

First Nations History Theme Page

This "Theme Page" has links to curricular resources (information, content...) to help students/teachers learn about the History of First Nations People. Please read our disclaimer.

- ## BC Ministry of Aboriginal Affairs: Historical References

  A brief summary of British Columbia's history as it touches upon Aboriginal affairs.

- ## Canada-Indian Treaties

  This section of the National Atlas Information Service provides maps showing areas covered by treaties from pre-Confederation to 1923. A table gives details of treaties, including parties involved. The map is at scale 1:7 500 000.

- ## Canada's Native Peoples

  This is Volume II of the Canada Heirloom Series containing eight chapters, each giving a history of Native Groups within a region of Canada. Chapter cover the history of Aboriginal life in Cape Breton, St. Lawrence Lowlands, Woodland, Plains, NWT/Yukon/BC, Arctic, Metis, and Northwest Coast.

- ## Canadian Museum of Civilization: First Peoples Hall/Archeology Hall

  Over a dozen exhibits on the history and culture of First People in Canada including the Arctic.

- ## Explorers Theme Page

  This page contains some resources that look at the exploration of the New World from the First Nations' perspective.

- ## First Nations Histories

  This site has histories of approximately 240 tribes (from first contact to 1900). Although the tribes will be primarily from the U.S., First Nations from Canada and Mexico that had important roles (Huron, Micmac, Assiniboine, etc.) will be included. Documents on tribes has information in the following categories: location, population, names, language, sub-nations, villages and bands, current groups, culture, and history.

- ## First Nations Territories of the Pacific Northwest

  This subsection of "The Northwest Connection," a Website focusing on Native art, provides a condensed history of the Northwest Coastal people with an emphasis on their cultural history.

- ## A Historical Look at Canada & B.C.'s Relationship With First Nations

  A brief timeline of major events in BC with a First Nations impact.

- ## [A] History of the Northwest Coast

  A collection of excerpts from journals during the European/Indian contact period on the NW

Coast.

- [Hudson's Bay Digital Collection]

  Images of the Hudson's Bay Company's museum collection donated to the Manitoba Museum of Man and Nature. Resources are organized within Ten categories, including Inuit, Aboriginal, and Metis cultures.

- [Information about Innu History and Culture]

  About fifty articles/resources on the history of the Innu (formerly known as Montagnais or Naskapi) of eastern Quebec and Labrador.

- [Masks Theme Page]

  These CLN Theme Page has a number of links on the First Nations' use of masks. See in particular, Masks.org, Richard Hunt, and the U'Mista Cultural Centre Potlatch Collection.

- [Native American History Resources on the Internet]

  A meta-list of links to Websites/resources dealing with Aboriginal history. Note: many of the meta-list's sites that would be of interest to Canadian students are already present on this theme page.

- [Native Soldiers, Foreign Battlefields: The Wartime Contribution of Canada's First Peoples]

  In producing this publication, Veterans Affairs Canada hopes that Canadians, particularly those who are learning about Canadian history in the classroom, will gain a better understanding of the contribution of Aboriginal veterans to this nation's wartime response.

- [Nisga'a History]

  A document summarizing the history of the Nisga'a of the Nass River valley in Northwest BC.

- [North: Landscape of the Imagination]

  The National Library has drawn on its collection of books, magazines, manuscripts and music to reveal the North of the artist. The collection...lends itself naturally to the retelling of one strand of northern history - the North as experienced and recreated through the imagination of its artist.Click the button above to browse through the entire site, or go directly to the historical resources below. Each of these resources has links to other relevant National Library historical documents.

  - Pre-contact: Before 1500
  - Early History: 1500 to 1900

BUILD YOUR OWN COMET

Active Learning Exercises in Planetary and Solar Astronomy

Copyright 1996
National Optical Astronomy Observatories
Volume 2, Number 1

INTRODUCTION

This exercise was presented as part of a NASA IDEA grant titled *Active Learning Exercises in Planetary and Solar Astronomy for K-3 Students*. NOAO astronomers worked with students and teachers of the Satori School in Tucson, AZ, to present eight topics in the elementary classrooms. This writeup is intended to be a resource for other astronomers venturing into classrooms. It describes our experiences presenting the classic "Build Your Own Comet" exercise and includes additional facts about comets that might be useful to astronomers who don't specialize in this field.

For more information on this module, or others developed through this program, contact the NOAO Educational Outreach Office at outreach@noao.edu.

DESCRIPTION:

This was the second of four presentations made to students on the topic of planetary astronomy. It was the most exciting and talked about of the presentations, but care has to be taken to minimize misconceptions. This activity is useful and fun for all grade levels, with the presentation tailored to the age and interest of the students. In each class, the expected learning outcomes included:

- the composition of comets
- why comets have a tail
- the size of comets

Depending on the age of the students and the teacher's comfort level with the materials, students can also be expected to understand:

- the process of sublimation (going from a solid phase directly to a gas phase)
- the orbits of comets
- the differences in comets, asteroids, and meteoroids
- the concepts of radiation pressure and solar wind, and why a comet's tail is always pointing away from the sun (anti-sunward).

To demonstrate these concepts, we started with an interactive slide show of comet images with lots of questions and discussion. In our discussion, we compared and contrasted planetary orbits and the orbits of comets. After students understood something about cometary orbits, they could draw conclusions about why we see a given comet only once over a period of many years. We then compared the size and composition of asteroids, planets, and comets. In our slide show, students were encouraged to observe the comet tail in each picture. We had the students hypothesize as to why comets have tails and why the tails get longer as the comet approaches the sun in its orbit. We then had each class create a "comet" from pans of materials. Students worked in groups of four, with one adult per group.

Safety: Students will be working with dry ice and ammonia. Both of these materials must be handled responsibly. Depending on the age group you are working with, you need to decide if the students can pour the ammonia and work with the dry ice themselves. If each student has a pair of rubber gloves, the danger of dry ice burns is minimized. For younger students, an adult should be in charge of the ammonia to minimize risks.

We used a comet recipe developed by Dr. Dennis Schatz of the Pacific Science Center, found in the Project ASTRO Universe at Your Fingertips Resource Book, which is available from the Astronomical Society of the Pacific. The recipe is also available on-line from the K-12 Educational Outreach Activities link on the NOAO Home Page.

The original recipe, as given on the last page of this brochure, makes a 6 inch comet. We had good results cutting all ingredients in half, making the final comets smaller in size and easier for the elementary students to handle. It worked best when each student had their own pair of rubber gloves. The recipe was pretty reliable: if the comet didn’t compact well enough, just adding a bit more water and squeezing harder always made it come together. We also displayed a poster board whole-language recipe card for the students to follow along as the groups assembled their comets.

Most real comets have a much higher ratio of "dirt" than the student comets. Halley's Comet has about 50% dirt. Because of the high dirt content, comets are very dark and absorb a lot of light. The students' comets will not be dark because this recipe does not work well with the higher ratio of dirt.

The most common misconception was that real comets contained Karo syrup, the ingredient used in Dr. Schatz’s recipe to represent organic materials. Although it was pointed out that Karo Syrup only represented the sort of molecules found in comet nuclei, post-testing showed several students misunderstood this point. Next time, we would pour the syrup out of an intermediate container, rather than pouring it directly out of the bottle in view of the students.

COMET FACTS:

These facts about comets are contributed by NOAO/NASA Scientist, and IDEA Grant participant, Dr. Nalin Samarasinha.

A comet consists of the following parts:

- **nucleus** - a comet's distinct center
- **coma -** a hazy cloud of gas and dust that surrounds the nucleus (The comet head consists of both the nucleus and coma.)
- **tail -** the coma, pushed by radiation pressure and solar wind away from the nucleus

Ices in the nucleus of a real comet sublimate as they approach the sun. The gas and dust released during this process form the coma. Solar radiation pressure pushes the dust away from the sun forming a dust tail, while solar wind (and associated magnetic field lines) causes the cometary ions to form a plasma tail. The tail of a comet will always be anti-sunward (away from the sun), not opposite the direction of comet motion. The gasses produced during the demonstration are representative of sublimation, going from a solid state directly to a gas phase (state), Students can discuss the three phases of matter: solid, liquid, gas, and the changes between these states.

According to the *"Catalogue of Cometary Orbits 1993"* there were least 855 individual comets observed until that year, with 174 of them being short period comets, that is, periodic comets with periods less than 200 years. Comet Halley and Comet Encke are examples of short period comets. Comet Halley has a period of 76 years.

The following physical properties of comet nuclei are based mainly on observations of periodic comets:

- Typical albedo (the fraction of incident sunlight that is reflected back is few percent. That is, comets are dark and good absorbers of light. Therefore, the surface of a typical short-period cometary nucleus most probably consists of a dark mantel (crust) made up of dust grains with few active areas (vents). The outgassing is mainly confined to these active areas. (Note: Do not confuse the surface mantel of the comets with the refractory organic mantels of the dust grains; crust may be a better word for the cometary mantels).
- Typical radii are of few kilometers (Halley is relatively large at about 5.2 km). Chiron has a radius of about 90 km and is currently the largest known comet.
- Comets are not round, they are elongated (e.g., peanut shaped). Further, they are not smooth. Just like the students' samples, comets are rough and have vents where the gasses escape.
- Indications for density imply less than 1 gram/cm3. Note that density is never

measured directly, but inferred based on mass estimates derived from non-gravitational forces caused by sublimation.

Chemical composition of the nucleus by number, based on coma observations:

- H_2O ice is the main component (80-90%). CO ice is next with 7-15%. The other major parent molecules include CO_2, CH_4, NH_3, N_2, H_2CO (formaldehyde), and HCN.

Ultimately, all of a comet's light comes from the sun, either from the scattering of radiated sunlight by dust particles or the reemission of absorbed sunlight by gas molecules as fluorescence.

The corn syrup in the recipe is representative of organic compounds found in comets. Organics are carbon based molecules, molecules which are common to all known forms of life.

The coma of bright comets extends well over 100,000 km. The Hydrogen coma extends well over 1,000,000 km from the nucleus. The coma can be approximated as spherical. Typical speeds of molecules in the coma exceed 1 km/sec. Also, a cometary coma is thinner than the best vacuum we can produce on earth (except when very close to the cometary nucleus).

Outgassing rates: For Halley, each orbit, it sheds about 1 meter of its surface. The peak production of water near the perihelion is about 30,000,000 grams/sec (30 tons per sec). Also, the outgassing gas carries dust grains with it (For Halley, the dust to gas ratio is about 1; for other comets it can be easily differ by factors of a few or even by an order of magnitude).

ACKNOWLEDGMENTS:

Support for this work was provided by NASA through Grant number ED-90020.01-94A from the Space Telescope Science Institute, which is operated by the Association of Universities for Research in Astronomy, Inc., under NASA contract NAS5-26555. This work was carried out through the Educational Outreach Office of the National Optical Astronomy Observatories (NOAO). NOAO is based in Tucson, AZ, and operates facilities for ground-based astronomical research including Kitt Peak National Observatory near Tucson, the National Solar Observatory, with facilities on Kitt Peak and on Sacramento Peak in New Mexico, and the Cerro Tololo Inter-American Observatory in Chile. NOAO is operated by the Association of Universities for Research in Astronomy, Inc., under agreement with the National Science Foundation. This brochure was produced in February, 1996, by the NOAO Educational Outreach Office, P.O. Box 26732, Tucson, AZ, 85726.

About the Regional Geophysics Section (RGS)

Aeromagnetic and gravity data are the nucleus of Regional Geophysics' activities. New data is acquired and standardized to the national data bases, and customized products (digital and paper) are distributed. Analytical methods for the enhanced application of magnetic and gravity data are developed and the data is applied to the resolution of geoscience problems.

The ability to map the third dimension, to determine structure and rock type at depth, makes geophysics, and specifically magnetic and gravity data, fundamental to our advancing knowledge of the Earth.

Programs

Data Coverage

Programs

The key components of the section are:

- Aeromagnetic Surveys - current projects and acquisition standards.
- Geophysical Applications - analytical methods and geoscience applications.
- Geophysical Data Centre - aeromagnetic and gravity data sales.

Data Coverage

For information on **Aeromagnetic and Gravity** data coverage and how to order maps and data :

- consult the Geophysical Data Centre's Catalogue of Products and Services.

Asteroids

Although some might call them the "vermin" of the solar system, asteroids are rocky little worlds that are just as fascinating and mysterious as many of their larger planetary cousins.

[Student's Asteroid Project Wins Intel Award]

A high-school junior studying asteroids has won the country's most prestegious science fair award.

[Hunting Asteroids From Your Backyard]

You can discover an asteroid tonight. Digital technology and the CCD revolution have given amateurs the ability to do it. Here's how.

[Asteroid Hunters Receive Grants]

In July, 2002, five amateur astronomers specializing in the observation and early detection of Earth-crossing asteroids and comets were each awarded Shoemaker Grants.

[The Benson Prize]

If saving the Earth from destruction isn't enough incentive to find near-Earth asteroids, there's a prize for the amateur who discovers one.

Comets

Of all celestial objects, comets have a very special mystique. Bright ones are rare but on any given night at least one comet is likely to be within reach of moderate amateur telescopes.

The Solar System

Listen

What is the solar system? It is our Sun and everything that travels around it. Our solar system is elliptical in shape. That means it is shaped like an egg. The Sun is in the center of the solar system. Our solar system is always in motion. Nine known planets and their moons, along with comets, asteroids, and other space objects orbit the Sun. The Sun is the biggest object in our solar system. It contains more than 99% of the solar system's mass. Astronomers think the solar system is more than 4 billion years old.

ASTEROIDS

Meet the asteroids
What can they do?
Will they obliterate Earth?
How are asteroids found?
Did asteroids deliver life?
What are they made of?
What about comets?
Asteroids in orbit

Coming soon -- the ultimate extinction machines?

4 NOV 1998 Credit the blasted-from-space movies Deep Impact and Armageddon. Or blame the one-day scare from March, 1998, when headlines warned that a beefy asteroid **could** zoom within 30,000 kilometers of Earth -- or even sledgehammer our tender green planet -- in 2028.

Within a day, egg-bespattered astronomers used 1990 data to issue a revised estimate. It's safe to say that the asteroid will miss us by a good 600,000 kilometers -- about twice the distance of the moon.

From the movie "Armageddon". ©1998, Touchstone Pictures.

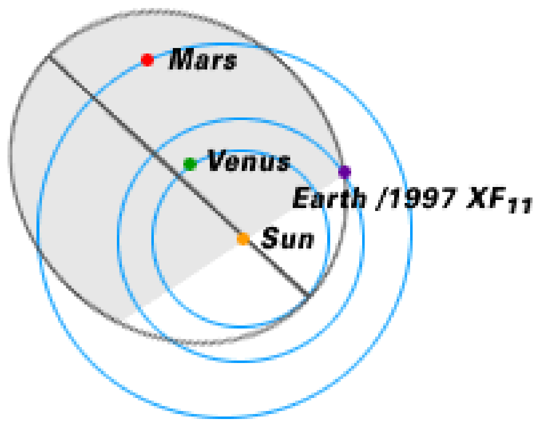
Still, the confluence of events has put The Why Files in an asteroidal frame of mind. Nobody knows the destruction that would result from a collision with one of these sub-planetary objects, but the evidence points to sudden, catastrophic and global damage. You could say it's pretty amazing that 1998 turned out to be a boom year for asteroids. Unlike planets, these misshapen agglomerations of rock and debris are not named for ancient gods. Instead they must answer to clunky handles like "1997 YF11" or "1998 ML14").

Asteroids are also far punier than planets: Ceres, the largest, is about 1,000 kilometers in diameter, but most are under a kilometer across. Most asteroids orbit between Mars and Jupiter, crashing into each other in a silent version of 3-D bumper cars that slowly grinds them to bits.

Puny but potent

Occasionally, an asteroid's orbit becomes more egg-shaped. As the orbit grows more elliptical, it eventually may begin crossing Earth's orbit and become subject to a collision with Earth.

Here's the orbit of the "killer" asteroid 1997 XF11. Once predicted to pass perilously close to Earth in 2028, current estimates give us at least 600,000 kilometers leeway. Courtesy of the Minor Planet Center, Harvard-Smithsonian Center for Astrophysics.



Small bits -- ranging up to maybe pebble size, may become the meteors that brighten our night sky. It's the rarer hunks that are more than 1 kilometer across that spawn doomsday scenarios and Hollywood thrillers.

The glare of attention on asteroids has also helped spark a flood of research on the link between asteroids and meteors, on why they leave the asteroid belt, and whether certain asteroids are masquerading as comets.

It's a sure sign of Halloween. So let's squelch the preamble and check out the rocks from the dawn of time. We satisfied our obsession with asteroids with information gathered at the October, 1998, meeting of the American Astronomical Society's Division for Planetary Sciences, conveniently held in Why-Files-ville -- Madison, Wis.

How bad can an **asteroid impact** get?

Disposal Of Household Hazardous Materials

CDFS-102

Joe E. Heimlich

One of the most controversial subjects of our time is hazardous waste. Where it goes has been central to many long legal battles. Often, people forget that every household contributes to hazardous waste.

Individually, the waste that is hazardous may seem insignificant, but in the aggregate....Picture, for example, a city of 50,000; if every household contributes an average of five gallons of hazardous material to the solid waste stream each year, there would be over 250,000 gallons of waste each year which would convert to roughly 41 1/3 tons of hazardous waste per year. Whether cleansers, paints, batteries, or motor oil, household hazardous waste should be of grave concern to all citizens.

Each person has options available to them for reducing their dependency on hazardous materials, using less, and careful disposal. This fact sheet will briefly discuss the current "best" means of disposing of household hazardous waste.

Step One: Read the Label

Some hazardous materials indicate proper disposal techniques on their labels. Unfortunately, these are in a minority and some of the containers that do indicate disposal techniques fail to go far enough. If disposal directions are not present on the label of a material known to be hazardous, the label will indicate contents, solubility, or corrosive/reactive potential through the warnings or cautions on the container.

These warnings could include the following:

- "Wear gloves" is a sign of corrosive or dermally toxic substances.
- "Do not store near heat or open flame" suggests ignitability.
- "Do not store near..." indicates reactive qualities of the material.
- "Use only in well ventilated room" is used for toxic fumes and reactive chemicals.

These and similar clues on the label will present a wise consumer with information necessary for proper disposal of the material.

An important note: Even when a container is "empty," it is rarely "empty" of all chemicals. There is some liquid that the pump won't spray and there is nearly always chemical residual on the sides and bottom of the container. Careful attention to disposal is imperative.

Step Two: Use and Reuse as Much as Possible

Often, there's just that "little bit" left over from a job and it does not seem to be enough to bother saving. What to do? **Attempt to use all of any hazardous material.** If you don't need it, perhaps a neighbor might.

Some solvents and cleaners (like paint thinner) can be reused--store the cleaner in a covered jar and when the paint has settled, strain and reuse (see below for the disposal of the sludge).

Some hazardous materials are recyclable; motor oil and fuel oils are often collected by service stations for filtering and reuse. Although the complete use of a product is wise, give leftover products to others only if the material is in its original container with the label intact. Any "precautionary" information that may have accompanied the container should also be given to the new user.

Step Three: Select Disposal Approach

- First and foremost, never burn or dump any hazardous wastes on the ground.
- Do not dispose of any hazardous material "down the sink" unless you are sure it can safely be disposed into the sewer system. "Down the sink" includes letting hazardous materials run down the sewer system (draining an auto's oil into the gutter system or excessive water runoff from a pesticide treated yard) or down the toilet. If you have a septic tank, additional care must be taken.
- Avoid burying any containers or leftover chemicals.
- Do not mix hazardous wastes and do not collect containers and chemicals to dispose of them at one time.
- Solidify any liquid wastes. This involves using an absorbent material (sawdust, kitty litter, paper towels, rags) to soak up a liquid hazardous material. Do not solidify more than one chemical at a time. Using gloves, sweep or dispose of the material into a plastic bag, and then dispose of with other household garbage.
- Use this same process with any "empty" container other than an aerosol container. It is often good to "open" a non- aerosol container with wire cutters or scissors and air-dry; wearing gloves, swab the inside before disposal. Dispose of the rags or paper towels after they have aired outside.
- Latex paint can be solidified by exposing the paint to air. When dried, the paint and container

can be disposed with household refuse. Wrap empty containers in several layers of newspaper prior to disposal. This prevents environmental contamination and reactive potential.

- With aerosol cans, turn the container upside down and depress spray button, with nozzle facing paper toweling, rags or any absorbent surface. When the spray has lost pressure, wrap the can in several layers of newspaper and dispose with household refuse.
- Some cleansers can be poured down a drain. If you have a septic tank, drain disposal should nearly always be avoided. If cleansers are designed to be used with water in a home or in sinks, showers, toilet bowls, and tubs, the material is probably drain disposable. Let the water run, rinse the container and slowly pour the water/chemical down the drain. Allow the water to continue running after the chemical is gone. Allow the container to air dry (or swab with paper towels), wrap in newspaper and dispose in household refuse.
- Antifreeze can be flushed down the toilet if connected to a sewer system.
- Pesticides, herbicides, oil paints, paint cleaners, and oil and transmission fluids should never be flushed into a water system or disposed of on ground or put into household refuse.
- Automobile batteries should never be added to a home's garbage. Some communities have hazardous waste material collection systems for some of these wastes.

In many cases, disposal is difficult at best and the preferred solution is to

1. use an alternative material
2. recycle where possible (oil and batteries) or
3. use the material completely, then solidify residual and dispose of the container as described above.

In our society, hazardous waste is guaranteed. We use many chemicals daily at home, at play, and at work. Wise purchase, use, storage and disposal of necessary chemicals can greatly reduce the negative environmental impact of these chemicals. Finding effective alternatives to their use avoids the creation of hazardous wastes from the home.

Keith L. Smith, Associate Vice President for Ag. Adm. and Director, OSU Extension.

Welcome. This is the Internet home of the Basel Action Network (BAN), an international network of activists seeking to prevent the globalization of the toxic chemical crisis.

BAN is based in Seattle, USA and conducts **both domestic (US) and international programs to halt *toxic trade*** -- a ugly form of trade in toxic wastes, toxic products and toxic technologies, that are exported from rich to poorer countries.

At the same time we work proactively in both the United States and around the world, to ensure national self-sufficiency in waste management through ***clean production*** and ***toxics use reductions*** and in support of the principle of ***global environmental justice*** -- where no peoples or environments are disproportionately poisoned and polluted due to the dictates of unbridled market forces and trade.

The name Basel Action Network refers to an international treaty known as the Basel Convention. In 1994, a unique coalition of developing countries, environmental groups and European countries succeeded in achieving within that Convention, the Basel Ban -- a decision to end the most abusive forms of hazardous waste trade. In 1995, the Basel Ban was turned into a proposed amendment which when ratified (see Deposit Box) by the requisite number of Parties will enter into force and will become international law.

Unfortunately, very powerful governments and business organizations are still trying to overturn, circumvent or undermine the full ratification and implementation of the Basel Ban and in general seek to achieve a "free trade" in toxic wastes. The countries and organizations that pose the greatest threat to the Basel Ban are listed in our Hall of Shame. Because the United States is the only developed country in the world that fails to control or prohibit toxic trade and has failed to ratify the Basel Convention, our work in the United States is of paramount importance.

BAN works to counter the regressive efforts of these few countries and to once and for all close the sad chapter of toxic colonialism. We serve as a ***campaigning organization***, an ***investigative and research body***, a ***political advocacy group***, and as the ***definitive clearing house*** for information on toxic trade. In fulfillment of these goals, BAN seeks your activist (Join Us!) and economic support (Support Us).

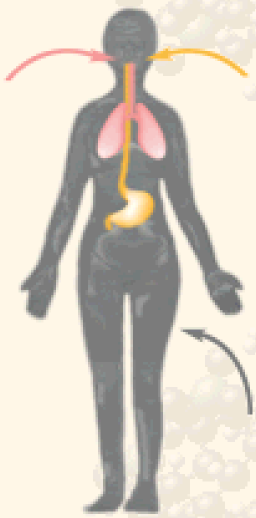
The Biology Project Home > **Chemicals & Human Health**

ACTIVITIES

Environmental Tobacco Smoke and Lung Development
Analyze scientific data to learn how second-hand smoke affects lung development and human health.

PROBLEM SETS & TUTORIALS



Kidneys and Metals Explore the world of renal toxicology, and learn the effect of metals on the kidneys and on kidney cells.

Toxicology Discover ways chemicals can affect human health and develop an understading of fundamental principles of toxicology.

Lung Toxicology Review the basics of lung anatomy and function and learn about toxicology in the lungs, diseases of the lungs, and environmental tobacco smoke.

WWW RESOURCES

The Southwest Environmental Health Sciences Center has supporting materials for the Chemicals and Human Health site and lots of other environmental health activities and curricula.

Hydroville The good citizens of Hydroville need you to help them solve their environmental health problems. A website developed by the Hydroville Curriculum Project at Oregon State University.

Project Greenskate at the University of Washington, is a project that involves students in investigating potential health concerns surrounding the hypothetical development of a city park on a former industrial site contaminated with certain common environmental pollutants.

Arizona Poison and Drug Information Center is a resource for information on natural and human-made poisonous chemicals.

The National Institute of Environmental Health Sciences **:**
Kids' Page has lots of fun activities for kids including games, brainteasers, and current hot topics in environmental health sciences.

Teacher Support has information and curricula for teachers.

INTRODUCTION
SOLID WASTE
HAZARDOUS WASTE
SEWAGE
GLOBAL EFFORTS
THE FUTURE
RELATED RESOURCES

Hazardous Waste

Hazardous waste presents immediate or long-term risks to humans, animals, plants, or the environment. It requires special handling for detoxification or safe disposal. In the U.S., hazardous waste is legally defined as any discarded solid or liquid that

- contains one or more of 39 carcinogenic, mutagenic, or teratogenic compounds at levels that exceed established limits (includingmany solvents, pesticides, and paint strippers);
- catches fire easily (such as gasoline, paints, and solvents);
- is reactive or unstable enough to explode or release toxic fumes (including acids, bases, ammonia, and chlorine bleach); or
- is capable of corroding metal containers such as tanks, drums, and barrels (such as industrial cleaning agents and oven and drain cleaners).

TEST YOUR KNOWLEDGE ABOUT HAZARDOUS WASTE IN YOUR HOME

Who's Responsible?
Businesses such as metal finishers, gas stations, auto repair shops, dry cleaners, and photo developers produce many toxic waste products. These by-products include sulfuric acid, heavy metals found in batteries, and silver-bearing waste, which comes from photo finishers, printers, hospitals, schools, dentists, doctors, and veterinarians. Heavy metals, solvents, and contaminated wastewater result from paint manufacturing. Photo processing also creates organic chemicals, chromium compounds, phosphates, and ammonium compounds. Even cyanide can be a by-product, resulting from electroplating and other surface-treatment processes.

If you think industry is the only source of hazardous waste, you may be surprised. There is hazardous household waste as well. For example, do you use any of the following items?*

automotive products, such as gasoline, antifreeze, and batteries
oil-based paints and thinners
pool chemicals
pesticides, herbicides, and other garden products
household cleaning products

* There are nontoxic alternatives to many of these products that, when disposed of, do not constitute hazardous waste. Check with a local "green consumer" organization or find out more in the related resources section of this exhibit.

GLOBAL WASTE TRADE

Waste elimination, reduction, and recycling programs are undermined by nations who manage waste by exporting it to other countries. It is particularly alarming to note that some nations who are promoting Zero Waste goals, are also exporting their waste to other countries.

See: SAMPLE LETTER

U.S. FOREIGN WASTE IMPORTS:

Since 1997, the 50 states and Washington, D.C., imported 48 million tons more waste than they exported, according to data in Biocycle managzine, an industry publication. This waste appears to be coming from outside of the United States.

Under U.S. law, there is no general prohibition against the import of hazardous or non-hazardous waste from other countries, or the export of waste to other countries. European countries, Canada, Mexico, and Puerto Rico are some of the countries that export waste to the U.S.

Only hazardous waste is tracked by the EPA. Non-hazardous waste import data is not reported.

TOTALS OF STATE WASTE IMPORTS & EXPORTS:

Year	Waste Imports (tons)	- minus Exports	= Foreign Waste?
1997	21,319,000	- 13,977,000	= 7,342,000
1998	32,837,370	- 14,899,090	= 17,938,280
1999	38,901,100	- 16,090,000	= 22,811,100
Totals	93,057,470	- 44,966,090	= 48,091,380

The annual total "imported" waste by states minus the total "exported" waste by states, appears to be the amount of imported foreign "municipal" waste. This does not include other types of foreign waste imports.

Data source: BIOCYCLE , April 1998, 1999, 2000

Table: ZWA

Only Congressman Paul E. Gillmor (R) from Ohio has offered legislation to stop foreign waste imports. The following proposed legislation addresses the issue of foreign waste imports, but not waste exports: See: LEGISLATION - HR 379 IH (search 'THOMAS' for legislation) / 106th CONGRESS / 1st Session / H. R. 379 / To permit States to prohibit the disposal of solid waste imported from other nations./ IN THE HOUSE OF REPRESENTATIVES / January 19, 1999 / Mr. GILLMOR introduced the following bill; which was referred to the Committee on Commerce.

UNITED STATES

NEWS! **8/18/2000: TOXIC WASTE FROM MEXICO ON THE RISE (source: SolidWaste.com) Toxic waste produced in Mexico by assembly plants along the border (maquiladoras) and shipped to the United States for disposal has increased 300% in the past two years, said environmental protection officials from both nations in a meeting in El Paso, TXon Thursday.**

- **U.S. Waste Statistics**
- **BAN - Toxic Trade News:**

  June 9, 1999 - BAN.org - News Release: PLAN TO SHIP ASIAN TOXIC WASTE INTO IDAHO VIA PUGET SOUND DENOUNCED - SEATTLE, USA, -- Environmental groups today denounced a plan to import over 7,000 tons of mercury contaminated toxic waste via the ports of Tacoma or Seattle to a dumpsite in Idaho. The toxic waste produced by Taiwan plastics manufacturer Formosa Plastics Group (FPG) created an international scandal when it was illegally dumped in Cambodia late last year. To date the controversial waste has been rejected by communities in Taiwan, Cambodia, California and Nevada for environmental and health reasons. Environmentalists maintain that the toxic waste should remain in Taiwan to be treated and stored there on FPG company property.

VIDEO: Michael Thomas Productions The Ash Barge Odyssey (Year 2000)--The remaining 3000 tons of Philadelphia's incinerated ash, which was removed from a beach in Gonaives, Haiti where it was dumped 10 years ago, is now holed-up in a hopper barge in the St. Lucie Canal in Stuart, Florida. A 14-year saga still remains unresolved for the people of Haiti, the residents of Florida and the city of Philadelphia.

Basel Convention **(The United Nations Environment Programme (UNEP)) - "The Convention is the response of the international community to the problems caused by the annual world-wide production ....of wastes, which are hazardous to people or the environment..." United Nations Environment Programme, Geneva**

Origins of the Convention - In the late 1980s, a tightening of environmental regulations in industrialized countries led to a dramatic rise in the cost of hazardous waste disposal. Searching for cheaper ways to get rid of the wastes, "toxic traders" began shipping hazardous waste to developing countries and to Eastern Europe. When this activity was revealed, international outrage led to the drafting and adoption of the Basel Convention.

During its first Decade (1989-1999), the Convention was principally devoted to setting up a framework for controlling the "transboundary" movements of hazardous wastes, that is, the movement of hazardous wastes across international frontiers. It also developed the criteria for "environmentally sound management". A Control System, based on prior written notification, was also put into place.

During The Next Decade (2000-2010), the Convention will build on this framework by emphasizing full implementation and enforcement of treaty commitments. The other area of focus will be the minimization of hazardous waste generation. Recognizing that the long-term solution to the stockpiling of hazardous wastes is a reduction in the generation of those wastes - both in terms of quantity and hazardousness - Ministers meeting in December of 1999 set out guidelines for the Convention's activities during the Next Decade.

(Date)

(Legislator's Name and Address)

Dear (Senator/Congressman) ______________:

Please prohibit the import of foreign waste and export of domestic waste for the purpose of disposal.

Since 1997, the 50 states and Washington, D.C., imported 48 million tons more waste than they exported, according to data in Biocycle managzine, an industry publication. This waste appears to be coming from outside of the United States.

Under U.S. law, there is no general prohibition against the import of hazardous or non-hazardous waste from other countries, or the export of waste to other countries. European countries, Canada, Mexico, and Puerto Rico are some of the countries that export waste to the U.S.

Only hazardous waste is tracked by the EPA. Non-hazardous waste import data is not reported.

In August 2000, Solid Waste Online reported, "Toxic waste produced in Mexico by assembly plants along the border (maquiladoras) and shipped to the United States for disposal has increased 300% in the past two years."

In 1999, U.S. environmental groups stopped a plan to import over 7,000 tons of mercury contaminated toxic waste via the ports of Tacoma or Seattle to a dumpsite in Idaho. The toxic waste produced by Taiwan plastics manufacturer Formosa Plastics Group.

The situation is out-of-control. We need immediate legislative action to stop this outrage. Thank you for your time and attention.

Respectfully yours,

(Signature)

ITRC Phytotechnologies Classroom Training: September 28-29, New Orleans, Louisiana

The Phytotechnologies training brings regulators to learn, alongside environmental consultants, latest applications of phytotechnologies in remediation and waste management. The curriculum focuses on application and teaches systems design using hands-on team problem solving, case studies, and evening homework. All lecture topics are based on a series of case studies. The instructors, all with abundant field experience, describe advantages of using phytotechnologies plus the technical and regulatory shortcomings of the current understanding. Each day includes a session designed to discuss issues the regulated and regulatory community have experienced or would anticipate in the future. We intend to use the results to reduce or eliminate regulatory issues acting as barriers to safe development of phytotechnologies.

ToxFAQs"

Frequently Asked Questions About Contaminants Found at Hazardous Waste Sites

---

About ToxFAQs"

The ATSDR ToxFAQs" is a series of summaries about hazardous substances developed by the ATSDR Division of Toxicology. Information for this series is excerpted from the ATSDR Toxicological Profiles and Public Health Statements. Each fact sheet serves as a quick and easy to understand guide. Answers are provided to the most frequently asked questions (FAQs) about exposure to hazardous substances found around hazardous waste sites and the effects of exposure on human health.

Each ToxFAQs" is available in both the standard HTML format below or in the PDF format which provides the familiar two page print version widely used at community meetings and distributed via our mailing list. This PDF format requires Adobe Acrobat Reader EXIT, which can be downloaded free from the Adobe web site.

Where can I get more information?

You can get further information on our web site about all the ATSDR Toxicological Profiles and how they are developed. You can also get a longer version of these ToxFAQs" , called the Public Health Statements, from the Public Health Statements home page as well as from each of the ToxFAQs" links below.

What else can ATSDR do?

ATSDR can tell you where to find occupational and environmental health clinics. Specialists in these clinics can recognize, evaluate, and treat illnesses resulting from exposure to hazardous substances. You can also contact your community or state health or environmental quality department if you have any more questions or concerns.

How do I contact ATSDR?

Conclusion

It's far better to reduce the toxicity and amount of solid waste in the first place than to cope with it after it has been created. Through source reduction, recycling, and composting, many environmental benefits and cost savings can be realized. Just remember the four "Rs"...

 **REDUCE** the amount of trash discarded.

 **REUSE** containers and products.

 **RECYCLE** - use recycled materials, and compost.

 **RESPOND** to the solid waste dilemma by reconsidering waste-producing activities and by expressing preferences for less waste.

Foreword

HAZ-ED
Classroom Activities for Understanding Hazardous Waste

One out of four Americans lives within four miles of a Superfund hazardous waste site. There are Superfund sites and many other hazardous waste sites in every state. Every community generates hazardous waste.

The Federal Superfund Program, administered by the U.S. Environmental Protection Agency (EPA), investigates and cleans up hazardous waste sites throughout the United States. Part of this program is devoted to informing the public and involving them in the . process of cleaning up hazardous waste sites from beginning to end. Haz-Ed was developed to assist EPA's efforts. Haz-Ed assists educators in teaching 7th through 12th grade students about hazardous waste, environmental issues surrounding site cleanup, and the Federal government's Superfund Program.

Haz-Ed can be used as part of a larger curriculum, as special stand-alone activities, or on an occasional basis to teach students about hazardous waste issues. Haz-Ed is a compilation of interdisciplinary activities that focus on the often complicated and sometimes controversial scientific, technical, and policy issues related to hazardous waste sites and Superfund. It is designed to help students develop skills in critical thinking, problem solving, and decision making. It also increases environmental awareness and encourages an environmental ethic in students.

EPA hopes Haz-Ed will be beneficial to you in your efforts to educate your students about the environment and the environmental concerns we all share. If you have any questions concerning Haz-Ed or the Superfund Program, please contact Jean Farrell of Superfund's Community Involvement and Outreach Center, at 703-603-9055.

Introduction

Ten million children under the age of 12 live within 4 miles of a Superfund site. The following education materials were developed to focus the attention of 7th through 12th grade students on hazardous waste, environmental issues surrounding hazardous waste sites, and the Federal government's Superfund Program. The units in this package are designed to help students think critically and creatively about hazardous waste pollution problems and some, alternatives for resolving them. The units are interdisciplinary, with a particular focus on classroom interaction and real-world applicability. They are readily usable in schools with a team-teaching or theme approach. The materials are designed for use in a range of subject areas. A table showing the related subject areas for all units is provided at the end of this Introduction for quick reference.

The Haz-Ed materials focus on laws passed by the United States Congress and implemented through regulatory programs directed by Federal agencies, primarily the U.S. Environmental Protection Agency. These are Federal laws and programs that apply to the entire nation. Each state also has a system of environmental laws and state agencies to implement them. Even some local governments have acted to deal with environmental issues through legislation.

although beyond the scope of this document, information about state and local activities can be very useful to you.

Instructional Goals

The units are designed to fulfill four primary instructional goals. Each unit is hands-on and interactive, giving students practice in:

- Collecting, analyzing, and interpreting data in experiments that illustrate the impact of hazardous waste pollution
- Clarifying value systems—their own and those of others—that impact how we perceive and treat the environment
- Analyzing how economics, laws, politics, technology, and other factors contribute to hazardous waste pollution and the process of dealing with it
- Assessing alternatives for resolving hazardous waste pollution problems.

  Students must gain an understanding of the scientific and technical concepts related to the environment, and see that these concepts are useful and applicable in the world. To show the relevance and utility of the concepts and skills underlying these activities beyond the classroom, many of the units challenge students to extrapolate real world applications from the information presented.

What This Package Contains

The package includes 6 **Warm-up Exercises**, 13 **Activities**, and 11 **Fact Flashes**. These units focus on the most important hazardous waste and site cleanup issues in a simple, straightforward style. Many of them can be completed in one class period, but some require two class periods or portions of several classes over a specified period of time. The number of class periods required for each lesson was determined based on an average class period of 45 minutes. These are estimates and are provided only as a guide. The actual time required will depend on the grade level and the skill level of the students in the class.

Pieces can be used alone or in various combinations to accommodate the needs of individual classes and grade levels. Some educators, for example, may choose to conduct several Warm-ups and Activities in sequence over an entire semester. Complementary units are referenced in each Warm-Up and Activity.

Several lessons begin with homework assignments to prepare students for the exercise. Most units call for explanations or presentations by teachers, but several also involve presentations from students and facilitated discussions led by teachers.

Fact Flashes

The **Fact Flashes** are a set of fact sheets that provide the foundation of information on which the Warm-Ups and. Activities are built. The Fact Flashes stand alone and can be used to supplement your lessons in a number of ways.

Warm-Up Exercises

The **Warm-Ups** focus on developing and understanding some basic concepts related to hazardous waste. These exercises are designed to be presented by classroom educators in series or as preparation for related Activities.

Activities

The **Activities** build on the Warm-ups, although they can stand alone. Students examine issues related to hazardous waste and site cleanup. The Activities are designed for presentation by classroom educators. Since some of the Activities take more than one class period, however, educators may wish to consider sharing the delivery with an invited guest, such as an EPA Superfund staff member or an employee of the state government's hazardous waste cleanup program.

Appended Materials

At the end of this document you will find several resources and supplements that can assist you in making the most of Haz-Ed or support your independent activities. The **Glossary** defines many of the terms and concepts students will encounter in the exercises and activities. You may consider providing your students with a copy for their general reference.

A list of abstracted **Suggested Readings** provides both educators and students with additional information. The list is keyed for grade level and provides references to the most relevant exercises and activities.

A list of **Contacts and Resources** provides a variety of information, including key phone 'numbers and Internet addresses.

A brochure, **This Is Superfund**, is a stand-alone document that describes the Superfund Program. It can be used in the classroom and the community.

Finally, the **Bibliography** lists resources used in preparing the Haz-Ed materials.

How To Use This Package

These materials are intended as resources. Educators should feel free to make adjustments in the material to fit in with topics and concepts the class may already be studying or to address topics of particular importance to students in a given geographic area. Also, we encourage educators to use their knowledge of the make-up of the community to add texture to the lessons and reinforce students' in-classroom work. Educators are reminded to consider economic and cultural sensitivities in using the materials that involve living creatures or procuring materials.

How educators and guest presenters deliver these lessons is all-important. Helping students think critically about the world around them and their role in preserving the environment underlies all the materials. Many of the activities involve technical vocabulary and concepts, and instructors may need to spend extra time defining terms and providing background. Accelerated students may not have a problem, but others may. Grade levels listed in the materials are only suggestions; select and adapt these materials to your students' abilities and needs. Feel free to copy these materials and share them with other educators.

Purpose explains what the student will know or be able to do following this activity.

Duration estimates the time needed for the lesson. The actual time required will depend on the grade level and the skill level of the students in the class.

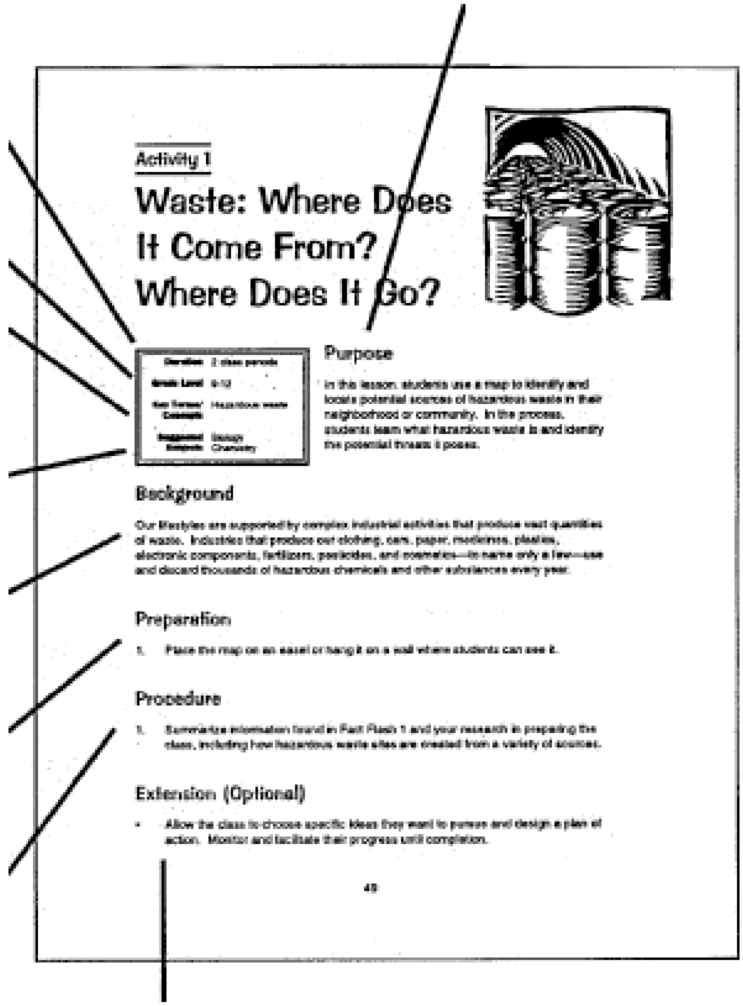
Grade Level indicates the target grade levels for this unit.

Key Terms/Concepts shows terms students will encounter in the unit (defined in the Glossary section of the package).

Suggested Subjects are the scholastic subject areas to which the lesson is related.

Background contains basic facts and context information for the educator's use.

Preparation provides a list of materials and steps the educator should complete prior to class.



Activity 1

Waste: Where Does It Come From? Where Does It Go?

Duration	2 class periods
Grade Level	9-12
Key Terms/Concepts	Hazardous waste
Suggested Subjects	Biology Chemistry

Purpose

In this lesson, students use a map to identify and locate potential sources of hazardous waste in their neighborhood or community. In the process, students learn what hazardous waste is and identify the potential threats it poses.

Background

Our lifestyles are supported by complex industrial activities that produce vast quantities of waste. Industries that produce our clothing, cars, paper, medicines, plastics, electronic components, fertilizers, pesticides, and cosmetics—to name only a few—use and discard thousands of hazardous chemicals and other substances every year.

Preparation

1. Place the map on an easel or hang it on a wall where students can see it.

Procedure

1. Summarize information found in Fact Flash 1 and your research in preparing the class, including how hazardous waste sites are created from a variety of sources.

Extension (Optional)

- Allow the class to choose specific ideas they want to pursue and design a plan of action. Monitor and facilitate their progress until completion.

49

Procedure sets out step-by-step instructions for executing the lesson. Wherever appropriate, this section includes questions the educator should ask or anticipate from the students, student worksheets, and answer keys.

Extension (Optional) offers ideas for carrying the lesson further by suggesting follow-up, extra-credit activities, or ways to expand participation beyond the classroom.

Most units provide questions to stimulate student discussion, but few have a single, “right” answer. These questions are intended to draw on the students’ abilities to identify. various options, Strategies, and reasons in arriving at their answers. Educators can ask students to describe how they arrived at a particular answer and encourage them to compare their answers and approaches with those used by other students to answer the same question. Where there may be several answers to the same question, challenge students to explore why answers are different and how to determine which, if any, are correct. This approach helps students develop critical thinking skills in a stimulating, noncompetitive environment.

Discussion

Due to difficulties in using external discussion lists, James set up a forum for teachers to discuss ideas and share resources. We hope you find this a useful resource. Alternatively, click on one of the links below to go directly to that general topic area:

- Primary
- Intermediate
- ECE
- French

CanTeach

Elementary Resources | Links | Discussion Lists | Submit | About Us

This is where you can submit lesson plans and other resources.

If you want to submit a link, try here.

Submit A Resource

Please note: This is a place to ***submit*** your lesson plans, not send us requests. Unfortunately, due to time constraints, we are unable to fill specific requests.

Your name : [ ]

E-mail : [ ]
(will only be used to contact you if a problem arises)

Into which sections do you think your lesson would best fit?

- ☐ English Language Arts
- ☐ Physical Education
- ☐ Math
- ☐ Science
- ☐ Technology Education
- ☐ Personal Planning
- ☐ Social Studies
- ☐ Fine Arts
- ☐ Information
- ☐ Related Ed Issues
- ☐ Special Events
- ☐ Songs and Poems
- ☐ Funtime Games
- ☐ First Nations

Cut and paste your lesson into the form:

Lesson Grade Level(s):

☐ Any ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7 ☐ 8 ☐ 9 ☐ 10 ☐ 11 ☐ 12

About Us

CanTeach was created to assist teachers in finding and using resources online. Although this site has resources which all educators will find useful, we have attempted to place emphasis on lesson plans, resources, & links which have a Canadian focus since there is a need for such materials on the web.

The resources are broken up into two categories. There is a section of **Elementary Resources** which consists of lesson plans and resources, as well as a section of annotated **Links**. With your input these sections will grow to reflect the needs of all educators.

The **Links** section does not intentionally reflect any of our views, although we have tried to avoid overtly commercial sites when possible.

CanTeach looks forward to providing educators with a valuable, extensive resources base. We rely on your help to share lesson plans, link suggestions, and other resources which will aid educators around the world. Please use our Submit form to let us know about your resources.

If you want to contact us about the site, please email us. **note that due to time constraints we do not field requests for specific resources.**

Science

- Life Science
- Physical Science
- Earth and Space Science

Constellations

Suggested Grades K-3

Objective Students will examine present constellation patterns as well as create their own.

Materials

- The Glow-In-The-Dark Planetarium Book Annie Ingle, ISBN: 0-679-84367-1, $7.50
- Sticky stars
- Black construction paper
- Flashlight
-  

  Two sample sheets of constellations for handouts. Click for a printable, full-page view. Press the 'back' button on your browser to return to this page.

Method

- Shut off classroom lights and cover/close windows
- Turn on flashlight and read The Glow-In-The-Dark Planetarium Book
- Turn off flashlight when finished each page to "reveal" constellations
- When completed book, turn on lights (obviously!) and hand out examples of constellations
- Get children to copy a few with sticky stars on black construction paper (might need glue for stars to stick properly)
- Ask children to create their own constellations
- Older grades may want to attach a story to their constellation for display

Graphing Constellation

Suggested Grades 3+

Objective Students will practice their graphing skills by following specific coordinates to recreate constellations. This activity will strengthen students' skills of visual perception, observation, and recording, and will give them a visual representation of a few constellations.

Materials

- graph paper
- photocopy of the following graphing coordinates:
  - **Ursa Major:** (M,37); (Q,34); (R,34); (U,33); (W,35); (Z,32); (X,30).
  - **Ursa Minor:** (R,17); (O,18); (N,20); (M,22); (K,22); (L,25); (N,25).
  - **Draco:** (B,33); (C,30); (E,32); (D,34); (B,24); (C,22); (F,24); (G,22); (G,28); (G,30); (I,31); (N,30); (R,27); (U,27).
  - **Cepheus:** (G,6); (E,10); (I,12); (J,8); (O,11).
  - **Cassiopeia:** (L,1); (K,4); (O,4); (S,5); (R,2).
- drawing paper

Method

- Hand out the coordinates to each student and have them transfer them onto graph paper.
- Then have students transfer the constellations on the graphs to drawing paper.
- Extension: Ask students to design their own constellations through graphing coordinates. Share the coordinates with classmates and have them draw the coordinates out.

Additional Resources **Internet Resources**

Star Child

Star Journey

Bradford Robotic Telescope Observatory

The Constellation and Their Stars

Alternative Snowflakes

Suggested Grades K-2

Objective Children will discover how snowflakes in nature are really formed, and recreate this process with paper and glue

Materials

- White paper
- Scissors
- Glue

Method

- Explain that snowflakes are created by water vapours bumping into tiny dust particles, which changes the vapour into an ice-crystal ("sublimation"). This ice crystal then grows by bumping into other vapour molecules. When it becomes heavy enough, it falls to the ground as a snowflake.
- Play "Snowflake Game": Split children into two groups- water vapour and dust particles. Children drift around slowly and quietly, and when they bump into the opposite (w.vapour or dust particle) they join hands. Once this occurs, these pairs drift and the process repeats itself until the whole class is joined to form a snowflake. (Note: I made the mistake of playing this in the classroom- Noisy! and lack of space.)
- Making snowflakes: Children first cut out a circle from white paper (water vapour), then rip and/or cut tiny pieces of paper (dust particles) to be glued onto the circle.
- You may want to have all the snowflakes join to display as one BIG snowflake!

Additional Resources **Books**

Snow, John Bianchi and Frank B. Edwards, Pub. Bungalow Books, 1992, ISBN: 0-921285-09-4, $7.95

Cloud Watching

Suggested Grades 3+

Objective Students will examine, identify, and record cumulus, cumulonimbus, cirrus, and stratus cloud formations.

Materials

- drawing utensils
- drawing paper

Method

- Teach students the names and the characteristics of the various cloud formations.

Cumulus -heaped clouds with flat bases and catle-like tops.

Cumulonimbus -anvil-topped cumulus bringing thunder and rain.

Cirrus -white feathery lines or bands at great height.

Stratus -layer clouds usually smooth and dark.

- Set out a time of the day when the class can go out and do a cloud observation and drawing daily (about 15 minutes).
- During this time ask students to draw, colour in, and try to identify the cloud formations that they see.
- Gather as a class and ask students to share their guesses and their reasons for them.
- As a class make a calculated guess at the type of cloud that was seen the most.
- Eventually each student will have drawings of many variations of these cloud formations.
- **Note:**You may want to include predicting the weather by observing cloud formations.

The Sound of Rain

Suggested Grades K+

Objective Students will cooperate to make the sound of rain.

Method

- Begin by gathering students in a circle (preferably not on carpet) and explaining and practicing how each of the sounds are made. **Wind** is created by rubbing your hands in a circular motion on the floor. **Small rain drops** are made with the fingertips striking the floor softly, then a little harder. Finally comes the **heavy rain**, made by all the fingers on each hand hitting the floor quickly together.
- Place students into three groups (wind, small rain drops, heavy rain). Have each sound group mixed together, rather than in seperate groups.
- Each group is responsible for their sound. Signal to the students when their group should join in (ie. wind first, then small rain drops). Each group should continue to make their sound even after another sound joins in.
- Variation: Divide class into four groups: hand rubbers, one finger clappers, four finger clappers, and thigh clappers.

Weather Around the World

Suggested Grades 5+

Objective Students will learn a few key weather terminology and a variety of climates through examining and recording weather characteristics in a variety of communities around the world.

Materials

- newspapers with daily weather forecasts of cities all over the world OR weather internet sites (see below)
- graph paper
- markers

Method

- Have each student pick a city that they would like to do their weather project on.
- Explain to students the following weather terms:
  - **Humidity**- a measure of the water vapor content of the air, also known as relative humidity.
  - **Temperature**- the degree of hotness or coldness measured bu a thermometer.
  - **Pressure**- the force of the atmoshphere, also known as barometric pressure and is measured in kilopascals.
  - **Visibility**- the distance one can see horizontally.
- Every day (best to do it at the same time of day)students check the newspaper or the internet and record their city's weather, looking specifically for the terms listed above.
- After two weeks of recording, have students graph their results for each weather term.
- Compare them with others in the class. What are some reasons for differences?
- Variation: Pick only a few cities to examine and graph the results on big class graphs (one for each term that you would like to be covered). Pick a different colour for each city and then compare them with eachother.

Additional Resources **Internet Resources**

The Weather Office
Weather data provided by Environment Canada.

Making a Rain Stick

Suggested Grades 2+

Objective Students will make a rain stick which will allow them to recreate and betterh understand the sound of rain in a rainforest.

Materials

Per Rain Stick:

- 1 cardboard tube
- 30 stickpins
- cellophane tape
- 1 cup of rice
- wrapping paper and/or paints to decorate it

Method

- Stick in the pins pins through the cardboard tube in 5 rows with 6 pins in each row.
- Put a strip of tape around each row to hold pins in place.
- Tape one end of the tube shut.
- Pour in the rice.
- Tape the other end of the tube shut.
- Decorate the rain stick by covering it with wrapping paper or paint it.
- To recreate the sound of ran, tip the rain stick slowly.

Additional Resources

Internet Resources

Rainforest Action Network Organization

Rainforest Alliance

Earth Found

The Virtual Rainforest

Measuring Rain With a Rain Catcher

Suggested Grades 6+

Objective Students will make a rain catcher and examine and graph rain levels within one month to calculate the average percipitation at their home.

Materials

- marbles or rocks for bottom of rain catcher
- ruler
- plastic bottle
- scissors
- extra fine point marker
- tape
- water
- graphing paper

Method

- Have students cut the top off the bottle so that the width is the same as the base.
- Tape a ruler on the side of the bottle and using an extra point permanent marker, mark off each centimetre (millimetre if your class can handle it).
- Put some marbles or rocks at the bottom of the bottle (this will prevent the rain catcher from tipping or blowing away). Turn the top upside down and tape it inside the bottle.
- Pour some water into the bottle to the first marking, so that everyone starts at the same level.
- Tell children to place their rain catcher in a not so busy area in their yard at home. Ask them to check their rain catcher every morning. When there is some water in it, record the level and bring it to school. (dump the water out so a new recording can be made the next morning). At school, have the children record their rain level with the day's date on their own graph.
- After a month of recording, add up all of the rain levels and figure out the average precipitation.
- Extension: Compare the average precipitations with those around the world (use the internet or look in climate atlases).

Additional Resources **Internet Resources**

Weather Office

Acid Rain & Plants

Suggested Grades Any

Objective Students will observe and learn about the effects of high acidity on vegetation.

Materials

- grass growing in four seperate trays (plant grass seeds in soil on meat trays or something similar about two weeks in advance)
- distilled or bottled water
- tap water
- a mixture of 1 part weak orange juice and 4 parts water
- a mixture of equal parts of vinegar and water.
- recording sheets

Method

- When grass has grown enough to see that it is in fact grass begin watering each tray with their own type of liquid every day.
  tray 1: distilled or bottled water
  tray 2: tap water
  tray 3: orange juice water
  tray 4: vinegar water
- Every day have students record their observations of each tray by drawing how the grass looks and/or writing key words.
- After noticeable effects have occured have a class discussion on what happened to each tray of grass and why. The tray that was watered with the vinegar water should have fared the worst.
- Then move the discussion to how acid rain is similar to the orange juice and the vinegar water. Discuss what will happen if we let acid rain to continue to form and ways to prevent it from falling on our plants and us.

Where Does the Wind Come From?

Suggested Grades 2+

Objective Students will be introduced to the effects that heat has on creating wind.

Materials

- lamp, with lampshade taken off
- talcum powder
- pencil
- piece of paper
- scissors

Method

Part One

- Turn on the lamp, and let it heat up a bit.
- Sprinkle some talcum powder just above the bulb. What happens? What might be some reasons?
(The heat from the light bulb warms the air around it. As the heat rises, it takes the talcum powder with it. In real life, as the sun heats the air just above it also heat up. This hot air expands and becomes lighter; that's why it rises. Cold air moves in the now warm air's place, and this movement of air is wind.)

Part Two

- Cut a spiral out of the piece of paper
- Carefully balance the spiral on the point of a pencil. Don't make a hole in the spiral.
- Turn on the lamp, and let it heat up a bit.
- Hold the pencil with the spiral just above the bulb. What happens? What are some reasons for this?
(The spiral should spin because of the same reason that the talcum powder rose. The air around the bulb is heated and rises through the spiral, which causes it to spin.)

A Variety of Ways to Make a Windsock

Wire Hangar Windsock

Clip the curved part off of a hangar. Form the remaining wire into a circle. Take tissue paper cut into strips 1 inch by desired length(12-18 inches). Wrap one end of the tissue paper around the wire and glue. Continue all the way around. Depending on how you want to hang them, you can use fishing wire or string and hand from ceiling, etc.

Construction Paper Windsock

Roll a sheet of construction paper into a large tube and staple or glue it. Then glue tissue paper strips to hang off of it.

Paper Bag Windsock

Take a white paper bag and decorated it with markers and crayons. Then, cut a whole in the bottom of the bag. Tied string to each side of the whole in the bottom. They glued crepe paper of many different colors around the rim of the bag.

Tissue Roll Windsock

Cover toilet tissue rolls with construction paper. Then glue strips of crepe paper around one

Air Takes Space

Suggested Grades 2+

Objective This demonstration will show students that air takes space.

Materials

- 3 or 4 pop bottles
- 3 or 4 balloons

Method

- Begin by asking students if a balloon can be blown up inside bottle.
- Have a few students come up, push a deflated balloon into one of the bottles and stretch the open end of the balloon over the bottles mouth (you may need to help).
- Ask each of them to try blowing the balloon up (you may want to have some extra bottles handy as to prevent .
- Once every student has had a try, have a discussion on some reasons why the balloon would not blow up.
- (Air takes up space and that is why the balloon would not blow up.)

Air Takes Space #2

Suggested Grades 2+

Objective This demonstration will show students that air takes space.

Materials

- a glass
- a piece of paper towel
- a sink full of water

Method

- Stuff the piece of paper towel in the bottom of the glass so that it will not fall out when you flip it upside down.
- Ask students whether or not they think you can plunge the glass all they way into the sink of water without getting the paper towel wet?
- Hold the glass upside down and plunge it into the sink.
- Hold the glass under water for about 10 second and then slowly and steadily lift the glass up, making sure not to tilt it at all.
- Pull out the dry piece of paper towel and show it to the students.
- Have a class discussion on some possible reasons of why the piece of paper towel stayed dry.
- (The air filled the glass up and that is why water couldn't get in it.)

Air Takes Space #3

Contributed by Bonnie Fulgham

Suggested Grades 1-3

Objective This demonstration, will show students that air takes space.

Materials

- glass jar
- styrofoam packing peanut
- clear basin of water (glass bowl or aquarium)

Method

- Float the packing peanut on the surface of the water.
- Ask students what will happen if you place the jar upside down over the peanut in the water.
- Place the jar over the peanut and push straight down into the water. The peanut will be pushed to the bottom of the water.
- You can combine this with putting paper toweling in the bottom of the jar as both with show the same thing.
- The air in the jar kept water from entering the jar (toweling stayed dry) and pushed the peanut before it to the bottom of the basin.

Rock Collecting

Suggested Grades 2-4

Objective Students will practice classifying rocks in the categories sedimentary, igneous, and metamorphic.

Materials

- plastic jars that students can easily carry with them
- 4 large pieces of paper per student
- markers
- examples of sedimentary, igneous, and metamorphic rocks (real, pictures in books, and/or pictures from internet: see below)

Method

- Explain to students the major classification system for rocks.
  Sedimentary: Rocks formed by the layering of sediment.
  Igneous Rocks: Rocks produced by the crystallization of molten lava.
  Metamorphic Rocks: Rocks originating from a previously existing rock that is subjected to high temperature (but not enough to melt it) high pressure, and chemicals.
  Show them examples of these rocks.
- Hand out a jar/pail to each student. Ask students to collect as many different types of rocks that they can. (can search outside of school time, or set aside times during school). Give students about two weeks.
- At the end of this time have students bring their collections to school.
- Hand out 4 large pieces of paper to each student and have them label them sedimentary rocks, igneous rocks, metamorphic rocks, and not sure.
- Explain the different categories again and display the examples.
- Ask students to try to categorize all of the rocks that they collected.
- When done, have the class view their classmates' collections and help eachother with the rocks that others were not able to classify.
- Have each student count the number of rocks that they collected in each category. On small pieces of paper, write down the number rocks collected for each category. Tape these labels on the side of the jar.
- Let students keep their jars as permanent collections.
- Extension: Have student use rock classification guidebooks or those on the sites below to identify the names of some of rocks they found.

Additional Resources **Internet Resources**

The Mineral Gallery
Includes pictures of many different rocks and minerals.

Smithsonian Gem and Mineral Collection
Pictures and descriptions of many gems and minerals.

Making Fossils

Suggested Grades K+

Objective Students will better understand how fossils are created by making their own.

Materials

- plaster of paris
- paper plates
- objects to make impressions of (leaves, shells, twigs, grass, flowers, etc.)
- paint (optional)

Method

- Explain to students about fossilization.
  Fossilization: The preservation of the remains or an imprint of a living organism in a geological structure.
- Pour out plaster of paris into the paper plates. (you might want to do this ahead of time).
- Have students pressing items into the plaster of paris and lifting them up right away to make impressions.
- Explain to students that normally, fossils are created when the object decomposes.
- Let plaster dry.
- Paint if you would like. Try using different coloured paint for each impression.
- Variation:Wrap a plaster of paris ball around a small plastic object (eg: toy for birthday bags like dinosaurs, spiders, etc.). Crack the ball carefully and you should see an impression of the object in the plaster.

Metamorphic Rock: Melting Rocks

Suggested Grades K-3

Objective Students will observe and gain a better understading of the metamorphosing power of heat.

Materials

- 2 cups mini-marshmallows
- 1 cup choc chips
- smooth peanut butter
- waxed paper
- hot plate
- mixing bowl
- mixing spoon

Method

- Mix mini-marshmallows and chocolate chips in a bowl. Add just enough peanut butter so so the mixture clumps together.
- Ask each student to grab a handful of the mixture and make a rock.
- Place "rocks" on waxed paper. Explain to students that right now, the rocks resemble sedimentary rocks. The marshmallows and the chocolate chips could be seen as sediments and the peanut butter could be seen as a mineral that sticks the sediments together.
- Place a few of the "rocks" on the pan and heat them over low heat. When the marshmallows melt, give each student a spoonful of the new "rocks".
- Explain to the students that these new rocks resemble metamorphic rock. The sedimentary rock changed its form and structure because of the heat.

Earthquakes

Suggested Grades 4+

Objective

- Students will understand what is an earthquake.
- Students will know which area is an in high risk.
- Students will know what damage the earthquake will cause.
- Students will know the earthquake safety principles.
- Students will practice these strategies and familiarize with them.

Materials

- a computer with internet access

Method

- The teacher will show some life earthquake pictures to the students, and ask them to share their feelings about the earthquake.
- Why do we have an earthquake? What cause an earthquake? The teacher will use a power point to show a material from the web site,"A Child's View of Earthquake Facts and Feelings". Based on children's drawings explain what cause an earthquake.
  -Earthquake ABC
- Fact and fiction: Group students into three small groups, and provide each group a worksheet from the web site. Using this worksheet to let students practice and discuss their knowledge about the earthquake. After sharing the correct answers, the teacher will give some feedback to students and make sure they get a correct idea.
  -FEMA: Earthquakes Facts and Fiction
- How do we know the earthquake? Using the material from the web site presents the knowledge: we can't predict the earthquake. The teacher should explain the reason why the earthquake can't be predicted. Then, the teacher will group students and provide them how to get information from the internet. During this time, using the following questions to guide students to find some information that they might not know. Which area has the highest frequency of earthquake in the world? Which area has the lowest Frequency of earthquake in the world? Which state is in high risk in America?
  -FEMA for Kids: Earthquake Risk States
  -Virtual Times: Recent Earthquakes around the World
  -NEIC: QUD Earthquake Bulletin
- What damage do the earthquakes cause? What is the biggest earthquake in the history?
  -Discovery Online: Earthquakes
  -FEMA: History of Big Earthquakes
- Because the damage caused by the earthquakes is so huge, knowing some survival strategies is very important. Using three real earthquake situations asks students to find solutions. Group students into three groups, and use

problem-solving strategy to ask them to brainstorm how to do some preparation before, during and after the earthquake. Students share their suggestions and the teacher show students the website to see the information from exports. Finally, the teacher will help students to organize some safety principles.
-Astro News: Preparing for an Earthquake
-FEMA: Earthquake Preparedness

- Role-playing: based on stories from newspapers' reports, students will practice their findings about the safety strategies.

Internet Resources Since the websites presented here are mostly American based, here are a few earthquake sites that are Canadian based:

Canadian National Earthquakes Hazard Program

Earthquake Preparedness

Earthquakes in Canada?

---

www.CanTeach.ca

Earthquakes

Earthquakes: Facts and Fiction

✗ Fiction: Earthquakes usually happen in the morning.
✓ Fact: Earthquakes happen in both the day and the night. There is no pattern.

✗ Fiction: There is such a thing as "earthquake weather."
✓ Fact: There is no connection between earthquakes and weather. Remember, earthquakes happen deep in the earth, far away from the weather!

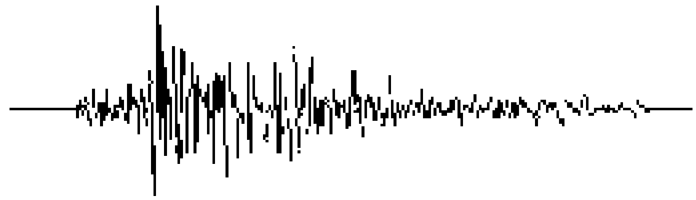
✗ Fiction: Earthquakes are on the increase.
✓ Fact: It may seem like we're having more earthquakes because there are more reporting stations, but the truth is we're not.

✗ Fiction: We can prevent earthquakes from happening.
✓ Fact: No. You can protect yourself by doing things to secure buildings, like your home, but earthquakes can't be prevented -- or predicted.

Information courtesy of the U.S. Geological Survey

EARTHQUAKE

ABC

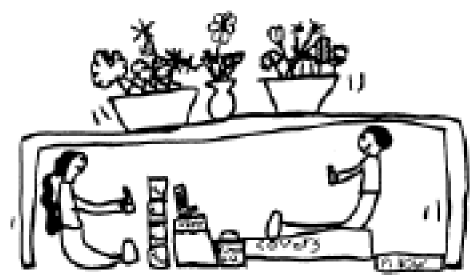


A Child's View of Earthquake Facts and Feelings

With a Parent's Guide to Earthquakes by Dr. Lucy Jones, USGS

Select A Section!

- An Introduction
- The Children's Book
- The Parent's Guide
- Guide for Teachers



(Optimized for Netscape 2.0 or equivalent) Comments Welcome!

Preface

***"An earthquake is the way the Earth relieves its stress by transferring it to the people who live on it."* – on a door at Santa Monica College**

Large earthquakes are a source of stress to all of us who live through them and children are no exception – but to the children of Paula Rao's 2nd and 3rd grade class in Pasadena, California, the Northridge earthquake of January 17, 1994 was the source of more than stress – it was a real-life example of our most recent school project.

Dr. Lucy Jones, a seismologist with the U. S. Geological Survey, is a parent of one of the students in the class and had been coming to give weekly earth science lessons. Our most exciting lesson was when a film crew from the Discovery series of the ABC television network filmed a 2 hour lesson with Dr. Jones that was used in their special program, "Earthquakes: The Terrifying Truth." The big earthquake hit only three days later!

The Northridge earthquake was a special opportunity to live our lessons. Although Dr. Jones's visits were curtailed for the next 2 months, we continued our studies to better understand what we had experienced. When it was time to share what we had learned with our parents, we decided to use an alphabet book format as a way organizing our information. The children generated lists of words they associated with earthquakes and sorted them into three groups: fact words, feeling words, and preparedness words. Each child selected words to illustrate and define. Later the text was typed, pictures were pasted up and a copy was bound for each child to take home. This edition is a copy of that first book.

A Parent's Guide to Earthquakes

Dr. Lucy Jones, U. S. Geological Survey

Pasadena, CA

As background for the adults who are sharing this book with their children, we are providing a scientist's definition of the technical terms in out Earthquake ABC.

Aftershocks Large earthquakes hardly ever occur alone. When one earthquake happens, we usually see another at a nearby location. To talk about this phenomenon, seismologists coined three terms: “foreshock,” “mainshock,” and “aftershock.” In any cluster of earthquakes, the one with the largest magnitude is called the mainshock; anything before it is called a foreshock and anything after it is called an aftershock.

The fault that moves in the mainshock experiences a great redistribution of the stress on it during the mainshock and it is that disrupted surface that produces most of the aftershocks. Sometimes the change in stress in the mainshock is great enough to trigger aftershocks on nearby faults. However, the stress change dies off quickly with distance from the fault so we rarely see aftershocks more than a few kilometers from the main fault. As a rule of thumb, we say that aftershocks are other earthquakes triggered at a distance from the mainshock fault no greater than the length of that fault.

The length of the fault scales with the magnitude of the mainshock (see Fault) and so do the aftershocks. The aftershock zone of a magnitude 5 mainshock will be under 5 miles across, that of a magnitude 6.5 will be about 20 miles across, while that of magnitude 8 mainshock might be over 200 miles long. Bigger earthquakes have more and larger aftershocks. As the magnitude of the mainshock increases, the magnitude of the largest aftershock, on average, increases as well.

The question is often asked, “How many aftershocks will there be?” On average, for each magnitude 5 aftershock in a sequence, we will see 10 magnitude 4 aftershocks, 100 magnitude 3 aftershocks, 1000 magnitude 2 aftershocks, etc. The relative number of small to large aftershocks does not appear to change with time. In general, an earthquake large enough to cause damage will produce several felt aftershocks within the first hour. The rate of aftershocks dies off quickly with time so even the second day will have many less aftershocks than the first.

We call an earthquake an aftershock as long as the rate at which earthquakes are occurring in that region is greater than the rate we saw before the mainshock. How long that will be depends on the size of the mainshock (bigger earthquakes have a higher rate of aftershocks so it stays above background longer) and how active the region was before the mainshock (if it was quiet, aftershocks stay noticeable longer.)

EARTHQUAKE ABC

Guide For Elementary School Teachers

by Paula Rao

This book is appropriate to use with children of all ages. How you share it will depend on the age of the child, the setting, and your personal way of responding to books. You may wish to skip around informally or you may choose to read straight through and return to favorite parts for discussion. This guide suggests possible ways to use the book in a classroom setting. It would be useful to peruse the glossary (A Parent's Guide to Earthquakes) to gain some background before you read the book to the class; then you could add bits of appropriate information when you pause to discuss children's questions or comments. The bullets below indicate questions or challenges you might pose to your students. You will need to decide which are appropriate for the students you teach.

BEFORE YOU READ

- Read or paraphrase the portion of the preface that tells why this book was written.
- Does this book remind you of any projects you've done before?
- What are some words you think of when you hear the word "earthquake"? (Record student responses.)

AFTER THE FIRST READING

- Do you feel any differently about earthquakes after reading this book?
- What surprised you most?
- What question would you like to ask the author/artist of (a chosen page) in this book?

EXPLORING FURTHER

- The children who made this book tried to include science, feeling, and preparedness words. In which group would (your chosen word) be? Can you sort other words into these three categories?
- What do you know about this word that the author didn't say? What else would you write if you were the author of this page?
- Pick an earthquake science word to research and write about.
- Make a model of one of the science words. See Baker: Make it Work! Earth for useful ideas on modeling several concepts in this book. Refer also to "Jello" in the glossary.
- Pick a feeling word to explore through poetry. See Stolz: Storm in the Night for beautiful descriptions of natural forces at work.
- Make a list of preparedness plans that you learned from these pages to share with your

family.

- Make your own drawing for one of these words. (Indicate a page) Do you agree or disagree? Why? How would you rewrite that entry?
- If you chose a topic to make an ABC book about, what would it be?

Your Assignment

How far will you drive?

You are about to drive through a major winter storm. Your mission is to travel safely through the storm. You will rely on weather updates from local radio and your special notebook-computer called *WeatherPad*. Your goals are:

- Stay safe.
- Reach your destination

At the end of your journey, you will be asked to write an essay. You will be asked to defend the decisions you make during your trip! Your "grade" for this exercise will be determined by how your journey ends up and how you could have improved upon your results.

Take a new identity

You will make the trip as someone else! We are about to assign you a new identity. Your objective is to stay safe or get to your destination safely given your newly chosen identity. You will need to make your decisions based on that person's age, experience, destination, and mode of transportation.

You are in command and are responsible for your decisions. Your "grade" for this exercise will be determined by how your journey ends up and how you could have improved upon your results.

Skills

This lesson will challenge you to:

- Analyze information presented to you in several forms.
- Understand winter storm terms and weather information.
- Make good decisions.
- Use your writing skills.

While traveling in a car, we have to make many choices, decisions that help us make a safe trip. There are also consequences for making uninformed or poor decisions.

We are counting on you to stay safe! Don’t let us down!

Next: Sources of Weather Information

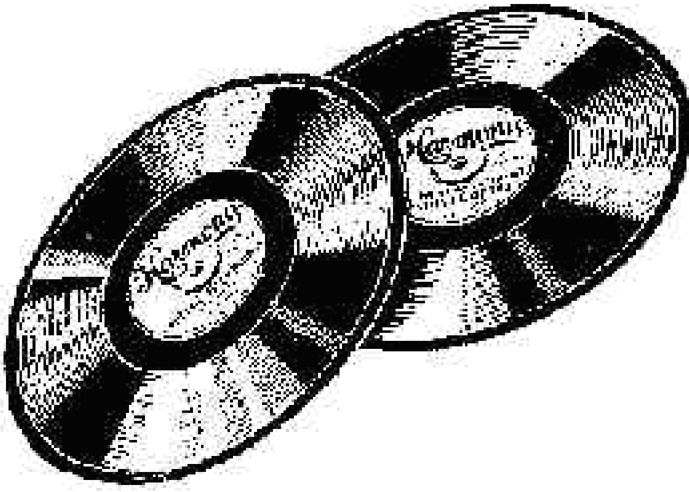
"Blizzard Attack" created and maintained by Meteorologist Roger Evans

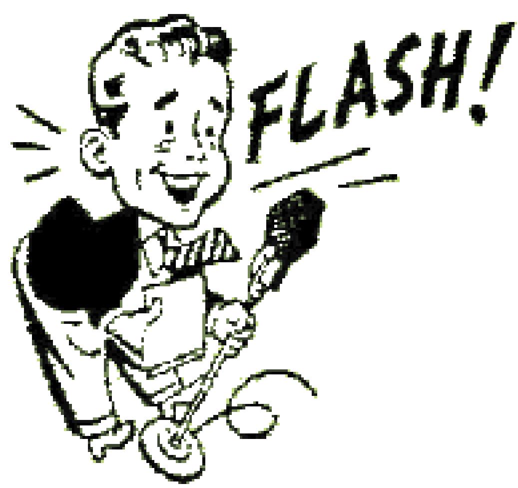


KDUH and WeatherPad

Your sources of travel information

Weather conditions will be changing as you travel through this storm. You will, of course, have to make decisions based on what you see, but you will also have some other information.

KDUH: "Home of Power Rock-and-Roll"
You will get some information from a local radio disc-jockey on your favorite radio station *KDUH*. *KDUH* stands for K- *Dynamite-Ultra-Hype* Rock-and-Roll.



KDUH…."Home of POWER Rock and Roll" has been the station of choice for many years and today is no different. *Dim Bulb* is the jockey of record for the day and night. You expect that Dim and the staff of KDUH will keep you safe during the storm and guide you to your destination.

But to be on the safe side, you have packed the car with your WeatherPad notebook computer for all of the latest information. It is hooked to a cellular phone so you can always get the latest data.

The WeatherPad relays up-to-the-minute weather reports for your area.

You’ll be able to track the conditions of the storm along your trip.

- Are you ready to drive through a winter storm?
- Do you understand winter storms well enough to plan ahead and adjust your plans as you receive more information?
- Can you stay safe from this and all winter storms that threaten your safety?

Next: Meet your "new self."

Winter Storms

Why are they so dangerous?

Winter storms are dangerous because they produce a variety of life and property threatening conditions! Winter storms vary in duration and severity.

As the picture on the left shows, the scenes we see after most winter storms are often beautiful. During storms, the variety of conditions that are present often times are quite dangerous.

The Dangers of Winter Storms

1. Snow and heavy snow

Snow is dangerous to travelers since it causes the road to become slippery. One of the more dangerous times during winter storms is when the road initially becomes snow covered. A thin layer of snow offers less traction than an inch or more. When traveling during a falling snow, remember to be especially careful when the road is first covered with snow. Snow often leads to other problems which will be described below.

2. Rain or freezing rain

Freezing rain is extremely dangerous to travelers since it coats roadways with ice. This reduces the friction or "grabbing ability" that tires normally need to keep a car attached to the road. When you drive on ice, you are no longer on the road!

3. Sleet and snow pellets

Sleet and snow pellets often occur during major Winter storms when the atmosphere is near freezing on the eastern edge of the storm. Usually this is a sign of a "large and dangerous" storm which will have strong winds and colder weather following.

4. Wind and blowing snow

One of the major dangers of winter storms is wind. Wind transports moisture into the storm at the surface and aloft which allows the storm to intensify and continue unabated.

Wind can also create life-threatening conditions. Wind driven snow can cause "white-out" conditions which reduce visibility so much that motorists can not see the road or other vehicles traveling on the road. White-out conditions occur most often with major storms that produce a drier, more powdery snow.

If you encounter white-out conditions, you should reduce your speed considerably until conditions improve or find a safe place to pull off of the road and remain there until the storm ends. A safe place is one that does not obstruct traffic, like a parking lot of a filling station.

Wind driven snow can also result in drifting snow. Snow drifts can close roads when large enough, but there are other hidden dangers in snow drifts. While driving at normal speeds in a vehicle and suddenly plowing through snowdrift, you may lose control of your vehicle. To avoid this, always reduce your speed enough that you can make it through the snow while not losing control. This is not an easy task to master, even for experienced drivers.

5. Dangerously cold temperatures:

It's a fact of winter that the weather is cold. Add to that Arctic cold during or immediately following a snowstorm and you have a recipe for "life-threatening" conditions. Cold weather and wind combine during the Winter months to "rob our bodies of heat and moisture".

It is important to monitor the conditions at hand during a Winter storm, but even more important to know well ahead of time what to expect once the storm has passed. It is then that the extremely cold weather usually sets into a region! If you become stuck in a Winter storm because the weather is adverse, then you need to know that the weather following it may be just as dangerous.

Blizzards: The worst winter storms
A blizzard is a storm which contains heavy snowfall, strong winds, and cold temperatures. The combination of these elements creates blinding snow with near zero visibility, deep drifts, and life-threatening wind chill values.

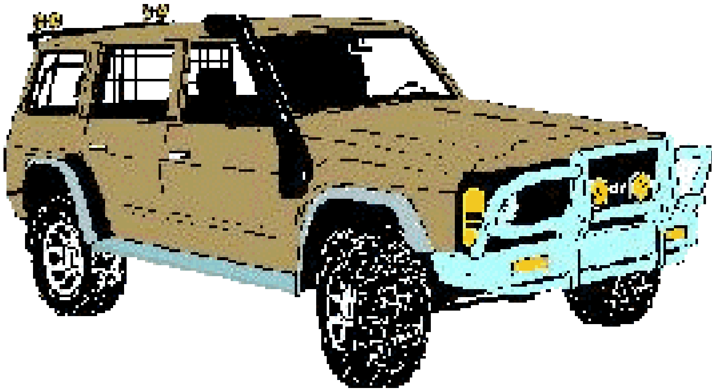
Persons should never venture out in blizzards, nor should they continue to travel if a storm is upgraded to a blizzard. You should seek shelter, any safe shelter, immediately. A safe shelter is a public place such as a motel or restaurant if you are on the road, or your home, school, or business if you are already there.

In a blizzard, winds are 35 mph or greater and visibility is reduced to less than 1/4 mile by falling snow and blowing snow.

Next: Hit the Road and Have a Safe Trip

Blizzard Attack Main Page • Expert Main Page

"Blizzard Attack" created by Meteorologist Roger Evans



Gas Up and Get Going!

It's 1 p.m. and you're leaving home!

Well, you need to get on the road to make it to Iowa City by 5 p.m. With your truck now full of gas, you head out of Charles City at 1:15 p.m.

So far the weather seems to be holding up quite well, although it has started to snow a little bit. You are really excited about visiting James today for his birthday and as the miles are racked up, the weather doesn't seem to be that big of a deal.

As you continue to day dream about tonight's celebration, you

unconsciously flip on the radio and hit the select button to ***KDUH, Home of Power Rock and Roll!***

Hey, Hey, Rock and Roller's....

"Blizzard Attack" created by Meteorologist Roger Evans

Teachers' Guide!

Blizzard Attack!

I. Grade Level and Time Requirements

- This exercise has been developed for grades 7 through 12.
- Blizzard Attack will take between 1 to 2 hours to complete.
- Blizzard Attack may be done by a single student or in groups.

II. Introduction

This weather exercise has been designed to cover some of the basic skills needed to stay safe during winter storms. The same principles apply to any region of the country.

The lesson takes the form of a fictitious journey between two cities on a day when the weather is expected to be adverse. Students assume an identity, in this case Grandma Brown, who is planning on visiting her grandson for his birthday. Grandma Brown is a real trooper when it comes to life and weather. She is determined to make it to to her destination, regardless of the conditions outside.

As the students live the life of Grandma Brown for their journey, they encounter an increasingly "hostile weather environment" as a winter storm quickly becomes a blizzard over the state. The students are directed to stay safe during their trip and/or reach their destination.

Along the way, they are given updates on the weather from two sources: a radio disc-jockey named Dim Bulb, and from a 21st century notebook computer, called WeatherPad. These two sources of information combined with newly learned knowledge of winter storms, some common sense, and the student's ability to "put themselves in Grandma Brown's shoes" will allow the students an opportunity to explore a mock-storm in the making.

More importantly, it will also develop or extend their ability to think critically during adverse weather situations and understand the risks involved when traveling in the winter months in areas where winter winter can claim lives.

As you follow the story line, you will notice a humorous approach to the characters that make up the **"Blizzard Attack"** education module. This was done for two reasons. First, staring at a computer screen for any length of time can become very dull unless there is something to propel us forward. Thus, humor has been used as this vehicle. Secondly, the target audience made up mostly of students is more likely to respond to this approach, since the lesson exhibits an interactive game-like posture.

The hope of the author is that both adults and students can find it entertaining and informative.

III. Lesson Objectives

After the exercise has been completed, the student should be able to:

- Better understand the dangers of winter storms.

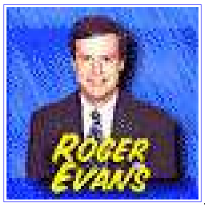
- Better identify current and future hazardous weather conditions based on current weather information that is received.

- Think critically through a weather situation and make intelligent decisions
  based on the reliability of that weather information.

- Better understand the personal responsibility for one's decisions during adverse winter weather and the consequences that may follow.

- Defend his/her choice for continuing or ending the journey at hand with concrete explanations, clear and intelligent writing skills, and proper use of the English language.

Assignment and Grading the Exercise (Teachers' only)



About the Author: Roger Evans is the Chief-Meteorologist at KGAN News Channel 2 in Cedar Rapids, Iowa. He graduated from the University of Wisconsin-Madison with a Master's Degree in Meteorology and has been forecasting weather in eastern Iowa since 1987. If you have questions about this lesson, please feel free to contact Roger Evans

Glossary of Winter Weather Terms!

Be Prepared for the Upcoming Winter Season!

---

1. **Snow and heavy snow:** If the word snow is heard during a weather forecast or weather report, it means that continuous snow is falling or expected to fall. Heavy snow is used to describe conditions when snowfalls will add up to 6 more inches in a 12 hour period or 8 inches or more in a 24 hour period.

Snow is dangerous to travelers since it causes the road to become slippery. One of the more dangerous times during Winter storms is when the road initially becomes snow covered. A thin layer of snow offers less traction than an inch or more. When traveling during a falling snow, remember to be especially careful when the road is first covered with snow. Snow often leads to other problems which will be described below.

2. **Thundersnow:** Major winter storms sometimes contain "thundersnow". Thundersnow is caused by vigorous clouds within the storm. Similar to thundershowers, thundersnow produces precipitation quickly and in greater amounts. It is common for locations to receive between 2 to 4 inches of snow per hour while thundersnow is occurring.

3. **Rain or freezing rain:** Though rain is more commonly associated with fall and summer storms, large and complex Winter storms often contain a mixture of elements. Depending on where you are in relation to the storm, you may receive rain, freezing rain, or snow. Sometimes you can receive all three from one storm and occasionally one or two types of precipitation may fall at the same time. This can complicate not only the forecast, but how likely it is for travelers to get through the storm!

Freezing rain will occur when the air aloft is warm enough for snow to melt into rain as it falls towards the surface. Once it hits the surface which needs to be below 32 degrees Fahrenheit, it will freeze on contact. Since ice is less dense than water, a half an inch of rain that freezes on contact, will actually lead to more than a half an inch of ice on the ground.

Freezing rain is extremely dangerous to travelers since it coats roadways with ice. This reduces the friction or "grabbing ability" that tires normally need to keep a car attached to the road. When you drive on ice, you are no longer on the road!

4. Sleet and Snow pellets: Sleet and snow pellets form when the atmosphere is near freezing (32 degrees Fahrenheit) at about 5000 feet.

Sleet forms when snow melts near 5000 feet but refreezes before it hits the ground. This forms the common sleet or "ice pellet" that can hit your windows with such force that you often think that someone is throwing sand your way.

Snow pellets or "graupel" are formed when falling snowflakes are *partially melted* as they travel downward toward the ground. Upon close examination, one can usually see the remnants of the parent snowflake that was melted to form the snow pellet.

Sleet and snow pellets often occur during major Winter storms when the atmosphere is near freezing on the eastern edge of the storm. Usually this is a sign of a "large and dangerous" storm which will have strong winds and colder weather following.

5. Wind and blowing snow: One of the major dangers of Winter storms is wind. Wind transports moisture into the storm at the surface and aloft which allows the storm to intensify and continue unabated.

Wind can also create life-threatening conditions. Wind driven snow can cause "white-out" conditions which reduce visibility so much that motorists can not see the road or other vehicles traveling on the road. White-out conditions occur most often with major storms that produce a drier, more powdery snow. If you encounter white-out conditions, you should reduce your speed considerably until conditions improve or find a safe place to pull off of the road and remain there until the storm ends. A *safe place* is one that does not obstruct traffic, like a parking lot of a filling station.

Wind driven snow can also result in drifting snow. Snow drifts can close roads when large enough, but there are other hidden dangers in snow drifts. While driving at normal speeds in a vehicle and suddenly plowing through snowdrift, you may lose control of your vehicle. To avoid this, always reduce your speed enough that you can make it through the snow while not losing control. This is not an easy task to master, even for experienced drivers.

6. Dangerously cold temperatures: It's a fact of Winter that the weather is cold. Add to that Arctic cold during or immediately following a snowstorm and you have a recipe for "life-threatening" conditions. Cold weather and wind combine during the Winter months to "rob our bodies of heat and moisture".

This condition we call *wind chill* which is an attempt to estimate the effects of wind and cold temperatures on the human body. The heat loss that occurs is more pronounced when the wind is faster or the temperature is lower. The longer you are exposed to conditions of extreme cold, the more likely you will fatigue and put yourself in danger of losing your life.

It is important to monitor the conditions at hand during a Winter storm, but even more important to know well ahead of time what to expect once the storm has passed. It is then that the extremely cold weather usually sets into a region! If you become stuck in a Winter storm because the weather is adverse, then you need to know that the weather following it may be just as dangerous.

Common Weather Forecast Terms:

1. **Winter Storm Outlook:** Hazardous Winter weather *may* develop in 2 to 4 days into the future. A "Winter Storm Outlook" is issued when there is a possibility of a dangerous Winter storm 2 to 4 days from the time that the outlook is issued.

2. **Winter Storm Watch:** Hazardous winter weather *may* develop in a few days (one to two days into the future). A "Winter Storm Watch" is issued to provide information to those who need considerable lead time to prepare for winter weather. A "Winter Storm Watch" does not mean that a storm will hit an area, but the likelihood is high enough that people in the watch area should be aware of the possibility of adverse winter weather.

3. **Winter Storm Warning:** Severe weather conditions are imminent or are already occurring. "Winter Storm Warnings" are issued for ice, heavy snow, excessive snow and blowing snow and/or life threatening wind chills.

4. **Winter Weather Advisory:** Winter weather conditions are expected to cause significant inconvenience which may be hazardous. If caution is exercised, the weather conditions present should not lead to life-threatening circumstances. Winter weather advisories may be issued for conditions which include snow, freezing drizzle, blowing snow, and hazardous wind chills.

5. **Blizzard Warning:** The most dangerous type of winter storm. Snow and strong winds are combined which produce a blinding snow with visibility often near "zero". White-out conditions, deep snow drifts, and life threatening wind chills often accompany a blizzard. You should seek refuge from the storm immediately, or not go outside! In a blizzard, winds are 35 mph or greater and visibility reduced to less than 1/4 mile with snow and blowing snow.

6. **Freezing Rain Advisory:** A "Freezing Rain Advisory" is issued when significant icing is expected to occur over a period of hours. Though not always life-threatening, these conditions often lead to property damage in the form of automobile accidents and minor fender benders.

7. **Wind Chill Advisory:** Wind chill values are expected to cold enough to produce frostbite if precautions are not taken. The combined effect of the wind and low air

temperature speed up heat loss from the body. Wind chill values are reported when the temperature is less than 35 degrees and the wind speed is at least 5 mph. Wind chill advisories are issued when wind chill values are expected to reach 35 degrees below zero or less for an extended period of time.

8. **Wind Chill Warning** Wind chill values are expected to cold enough to produce life-threatening conditions. Persons who venture out of doors during a "Wind Chill Warning" may experience frost bite and other cold-related symptoms in a matter of minutes, even if properly clothed for normal Winter conditions. "Wind Chill Warnings" are usually issued when wind chill values are expected to be colder than 50 below zero for an extended period of time.

Winter Weather Safety Rules!

How to stay safe this winter!

---

1. Dressing for cold weather:

- Wear several layers of loose fitting, lightweight clothing.
- Wear mittens instead of gloves. Wear a hat.
- Remember that entrapped, insulating air, warmed by body heat is the best protection from the cold.

2. Avoid Overexertion:

- The strain from cold temperatures and heavy labor such as shoveling, pushing a car, or walking in deep snow may cause a heart attack in older and less physically fit individuals.

3. Winterize Your Vehicle Early:

- Be prepared against the first blast of winter. Avoid automobile gas line freeze ups by keeping your tank greater than half full at all times.
- Make sure that your car has adequate antifreeze.
- Make sure that your tires have good traction and are inflated to the right pressure.
- Make sure that your heater and defroster work properly.
- Make sure that your battery is not more than 3 years old and that it can carry a full charge.
- Make sure that you have a good ice scraper.

4. Carry a Winter-Survival Safety Kit in your vehicle:

- Bring along blankets and a bright piece of cloth to tie on your antenna if you become stranded.
- Flashlight with spare batteries.
- Extra change of clothing to keep dry.

- Non-perishable foods such as candy bars, canned goods, or high calorie food like Power Bars.
- A can and waterproof matches (used to melt snow for drinking water).
- A compass, shovel and sand, tow rope, and jumper cables.

5. Before traveling:

- Check the latest forecast from KGAN. at KGAN Current Weather!
- Check the latest road conditions before you head out into Winter weather.
- Let someone know where you are going and when you think you will reach your destination.

6. If you become stranded in your vehicle during a Winter storm:

- Stay in your car, truck, or minivan.
- Run the engine at 10 minute intervals for heat.
- Maintain proper ventilation by making sure the exhaust pipe is not plugged.
- Leave the windows open slightly to avoid carbon monoxide poisoning.
- Make yourself visible to rescuers. Tie a bright cloth to your antenna or door handle.
- Turn on the dome light at night, but only when running the engine.

7. At home, do the following before Winter becomes a reality:

- Have your furnace checked before you need to use it.
- Seal any windows that you suspect allow cold air into the house with caulking or plastic.
- Include a home safety kit that includes extra non-perishable food, medicine, and a battery operated radio.
- Keep a flashlight and extra batteries handy.
- Keep candles and matches handy for extended periods of electrical loss.

8. If you lose heat in your home:

- Seal off any unused rooms by stuffing towels or rags in the cracks under the door.
- Cover the windows with blankets or sheets at night if you have some extras available.
- Use only devices that are designed for heating indoors during as emergency heat source and handle all safety precautions.

9. Install and test smoke alarms in your home:

- Have fire extinguishers checked to combat an accidental fire due to the use of alternative heat sources.

Feel free to **print this out** and keep it handy all winter long!

To return to your current position in "Blizzard Attack", go to the menu bar and either choose the back arrow located in the far upper left hand corner of the browser window, or click on the "GO" menu and choose "Back".

Welcome To CIPCO

Welcome to Central Iowa Power Cooperative's (CIPCO) web site. We encourage you to explore the various areas of the site to learn more about CIPCO's commitment to service, product value, and resource development. CIPCO is active in the growth and development of the communities it serves.

CIPCO RECEIVES $101.6 MILLION FEDERAL LOAN GUARANTEE

Central Iowa Power Cooperative received approval of a federal loan guarantee through the U.S. Department of Agriculture (USDA) Rural Development's utilities program in the amount of $101.6 million to finance an ownership interest in the new Council Bluffs #4 (CB#4) electric generation plant. The loan guarantee will allow CIPCO to borrow money to secure long-term debt from the Federal Financing Bank at interest rates slightly above the federal treasury rate.

"This investment in new generation represents the first major addition to our generation portfolio since the early 80's. Council Bluffs #4 will help us ensure the availability of capacity and energy to serve our member systems," said Dennis Murdock, CEO of CIPCO.

CIPCO's ownership share of CB #4 will equal 8%. The new unit is a 790 megawatt coal-fired generating plant that will be fueled with low-sulfur Western coal and will be equipped with the latest environmental controls. Not only will CB #4 generate clean energy, it also promises to provide reliability of supply and price stability and will support our continued initiatives of economic development. Construction began in September 2003 and the plant is scheduled to be operational in May 2007.

Central Iowa Power Cooperative is a consumer-owned, not-for-profit cooperative that generates and transmits power to its 13 member systems. CIPCO is headquartered in Cedar Rapids, Iowa and serves 260,000 Iowans in 58 of the 99 counties through our member systems.

In addition to the Council Bluffs investment in new generation, CIPCO is committed to other investments and upgrades to the existing generation fleet, additions to its transmission plant and reconstruction of the older portions of its transmission network. It is expected that these capital additions will nearly double our existing investments in utility plant assets by 2014.

April 19th Tornado Outbreak

contributors to case study development

Below is a list of those who contributed to the development of the April 19th Tornado Outbreak case study in the WW2010 Case Study Archive. We greatly appreciate the efforts of those who contributed to the development of this case study.

WW2010 Personnel:

Steven E. Hall - Developer and Content Editor - Developed original-version of this online case study. Responsible for new layout, organization, cross linking of helper pages and construction of animations. Implemented text and graphics modifications as recommended by the Content Reviewers.

Bruce Lee - Content Reviewer - Edited module text and diagrams for scientific accuracy. Also provided narrative text for images captured from the chase.

Brian Jewett - Data Management - Collected and archived all weather data that is accessible from this case study.

Selected Images and Photographs:

For resources not developed by the University of Illinois, DAS/UIUC has been granted permission to display these resources for educational purposes only, on a non-profit basis. Images may be viewed directly from the CD-ROM or the WW2010 web site (http://ww2010.atmos.uiuc.edu/). Credit is given to the resource owner in attached captions. Copyright is wholly retained by the owner. Please contact the copyright owners directly for any situation involving the use of images outside of the web server and this CD-ROM. We would like to thank the following for permission to use their photographs and images in the WW2010 web server.

NEW! Online ordering is now available!

The Weather World 2010 CD-ROM's are back!!!
If you would like to learn more about the CD-ROM, please read below. If you would like to order, either click here to order online by credit card or click here for a printable order form.

The Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) would like to announce the release of the 2nd edition of the Weather World 2010 (WW2010) Educational CD-ROM. This resource is being constructed to provide local access to the high-graphics version our entire collection of Internet-based educational resources developed through our participation in NSF's Collaborative Visualization Project (CoVis). Most of these resources are currently available in the Online Guides.

New to the 2nd Edition of the WW2010 CD-ROM:
As seen on the web

- A Completely new Hurricane instructional module filled with new graphics and movies.
- New Modeling section to the Severe Storms instructional module including movies, animations, research results, and online access to streaming video.
- New pages in the Forces and Winds instructional module.
- Updates to the Satellite and Light & Optics instructional modules.

- New pages describing WW2010 Current weather products.
- Plus many other updates and revisions to other instructional modules and background pages.

Features of the CD-ROM will include:

INSTRUCTIONAL MODULES - that use multimedia and the flexible nature of the web to enhance the impact of educational resources. These modules introduce and explain fundamental topics in Meteorology (Pressure, Severe Storms, El Niño, Forecasting etc.), Remote Sensing (Radars and Satellites) and how some of these aspects fit into the Hydrologic Cycle.
NOTE: The only resources found online and not on the CD-ROM are the Tropical Cyclone tracker and 3-D VRML Hurricane. They will still be accessible online from the CD-ROM.

ARCHIVED WEATHER DATA - and case studies of memorable weather events like Hurricane Andrew, Storm of the Century and the April 19, 1996 Illinois Tornado Outbreak. Each case contains relevant weather images, storm histories, photographs and eye-witness accounts.

STUDENT PROJECTS & ACTIVITIES - (complete with answer keys) that provide teachers with a meaningful way of integrating the data and instructional resources into the classroom.

REAL-TIME WEATHER DATA - will also be accessible from selected pages of the CD-ROM to allow the user to apply what they've learned to current weather conditions. These pages will link to relevant weather products accessible through our WW2010 web server.

EFFICIENT NAVIGATION - that allows users to move between hundreds of pages with only a few clicks and return easily.

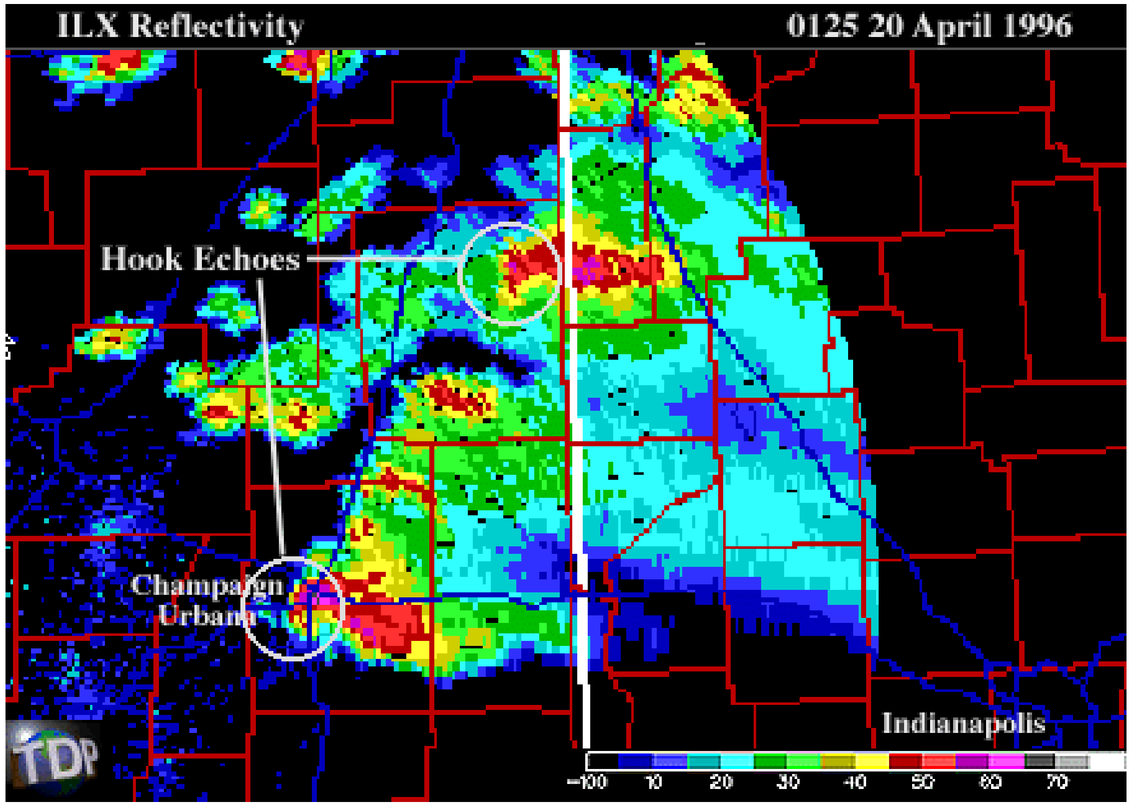
These resources will be accessible from the CD-ROM by using any standard web browser and the interface will be nearly identical to their online counterparts. Therefore the same CD-ROM can be used on a Macintosh or an PC.

Click here to order online with a credit card or for other payment options using a printable order form, click here!

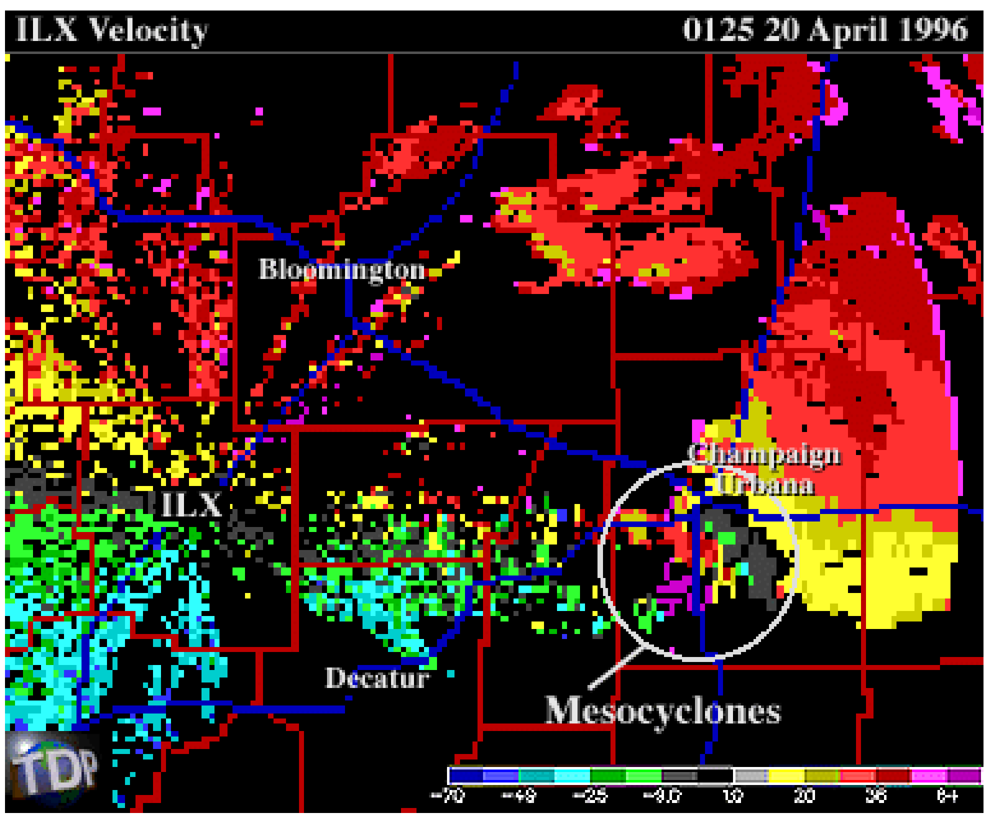
If you have any questions or comments, please contact us at
ww2010@atmos.uiuc.edu

Urbana, Illinois Tornado

nexrad close-ups



8:24pm CDT (4/19/96) - The Champaign sirens had been activated. The ILX reflectivity panel at the time indicated a pair of hook echoes attached to supercells moving through East-Central Illinois.



Multiple mesocyclones were passing through the Champaign/Urbana area.

October 25, 1999
Multimedia Educational CD-ROM

Go to our popular current weather products section. Just select 'current weather' from the menubar at left from any page to access them.

Our multimedia educational CD-ROM is **now available**.

Popular Features:

- Hurricanes
- Clouds and Precipitation
- El Niño

Developed by the Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC), WW2010 (the weather world 2010 project) is a WWW framework for integrating current and archived weather data with multimedia instructional resources using new and innovative technologies.

To ensure the greatest possible accuracy of our instructional resources, all materials have been reviewed and edited by professors and scientists from the Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) and the Illinois State Water Survey.

Welcome to the first collection of CoVis-WW2010 student projects and activities in the atmospheric sciences. These resources were developed through our participation in NSF's Collaborative Visualization (CoVis) project which supports project-based learning of the sciences for grade levels 9-12. These resources have already been implemented in a number of CoVis classrooms and have been modified based upon student and teacher feedback. The Projects and Activities have been organized into the following secitions.

Activities

Last Update: 08/01/97

Open-Ended Projects

Two units: case study of a winter storm and learning how to forecast.

Classroom Activities

Short, structured activities on a variety of topics in meteorology.

Teacher Guides

Assessment tools for teachers.

The materials have been broken down into four primary groups. Open-Ended Projects involve working with real-time and archived weather data to solve a specific problem. Classroom Activities provide a structured environment for learning about a variety of topics in meteorology. These activities may require up to 90 minutes of classtime to complete. Teacher guides for each activity have also been provided.

The navigation menu (left) for this module is called "Online Curriculum" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Units of Temperature

from fahrenheit to celsius to kelvin and back

Degrees **Fahrenheit**, (developed in the early 1700's by G. Daniel Fahrenheit), are used to record surface temperature measurements by meteorologists in the United States. However, since most of the rest of the world uses degrees **Celsius** (developed in the 18th Century), it is important to be able to convert from units of degrees Fahrenheit to degrees Celsius:

Fahrenheit to Celsius:

$$^{\circ}C = (^{\circ}F - 32) / 1.8$$

Kelvin is another unit of temperature that is very handy for many scientific calculations, since it begins at **absolute zero**, meaning it has no negative numbers. (Note...the word "degrees" is NOT used with Kelvin.) The way to convert from degrees Celsius to Kelvin is:

Celsius to Kelvin:

$$K = {}^{\circ}C + 273.$$

The three different temperature scales have been placed side-by-side in the chart below for comparison.

Temperature Scales

Fahrenheit	Celsius	Kelvin	
212	100	373	Boiling point of water at sea-level
194	90	363	
176	80	353	
158	70	343	
140	60	333	
122	50	323	
104	40	313	
86	30	303	
68	20	293	Average room temperature
50	10	283	
32	0	273	Melting (freezing) point of ice (water) at sea-level
14	-10	263	
-4	-20	253	
-22	-30	243	
-40	-40	233	
-58	-50	223	
-76	-60	213	
-94	-70	203	
-112	-80	193	-89°C (-129 °F) Lowest recorded temperature. Vostok, Antarctica July, 1983
-130	-90	183	
-148	-100	173

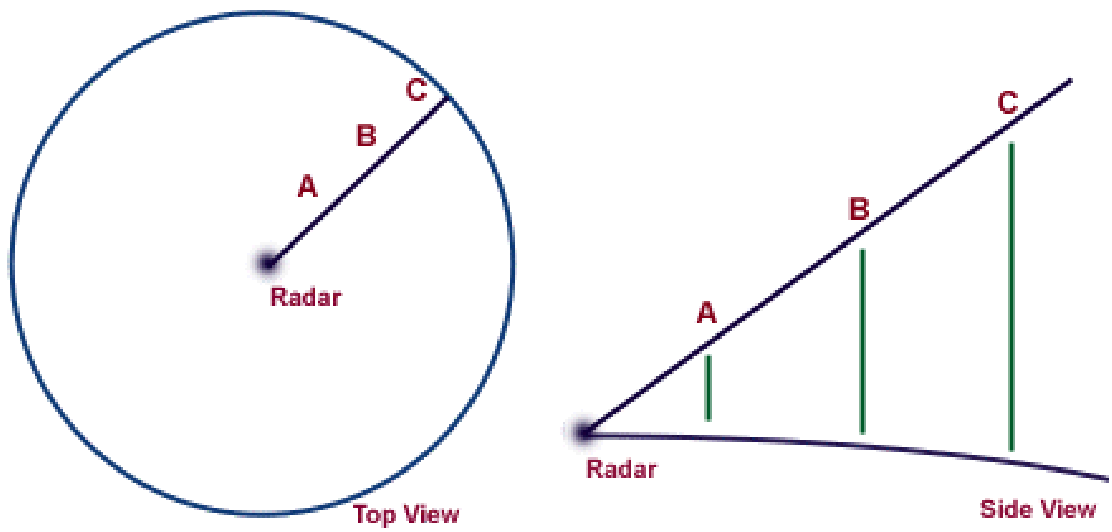
Surface Obs

Interpreting Doppler Radar Velocities

speed shear wind patterns

To understand Doppler radial velocity patterns, one first has to consider the geometry of a radar scan. Normally the radar beam is pointed at an elevation angle greater than zero so that the beam, as it moves away from the radar, moves higher and higher above the surface of the earth. Because of this geometry, radar returns originating from targets near the radar represent the low-level wind field, while returns from distant targets represent the wind field at higher levels.



On a radar PPI display, the distance away from the radar at the center of the display represents both a change in horizontal distance and a change in vertical distance. To determine the wind field at a particular elevation above the radar, one must examine the radial velocities on a ring at a fixed distance from the radar. The exact elevation represented by a particular ring depends upon the elevation angle of the radar beam.

In the examples below, idealized Doppler radial velocity patterns were constructed with a computer assuming simple vertical wind field patterns. These simplified radial velocity patterns can help us understand the more complicated patterns that are associated with storm motions. Doppler velocity patterns (right) correspond to vertical wind profiles (left), where the wind barbs indicate wind speed and direction from the ground up to 24,000 feet. Negative Doppler velocities (blue-green) are toward the radar and positive (yellow-red) are away. The radar location is at the center of the display.

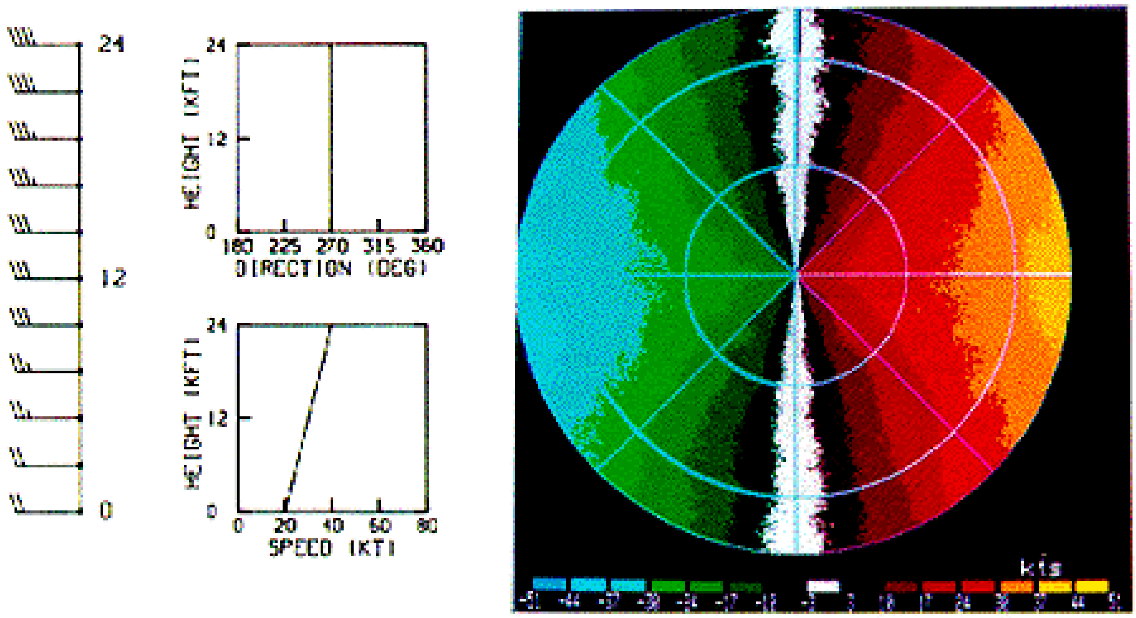


Image by: [Brown & Wood]

For this first example, wind direction is constant with height, but wind speed increases from 20 knots at the ground to 40 knots at 24,000 feet. Note on the radial velocity field that the maximum inbound velocity is to the west and maximum outbound to the east while to the north and south the radar measures zero radial velocity. This is because the winds are perpendicular to the radar beam when viewed to the north or south.

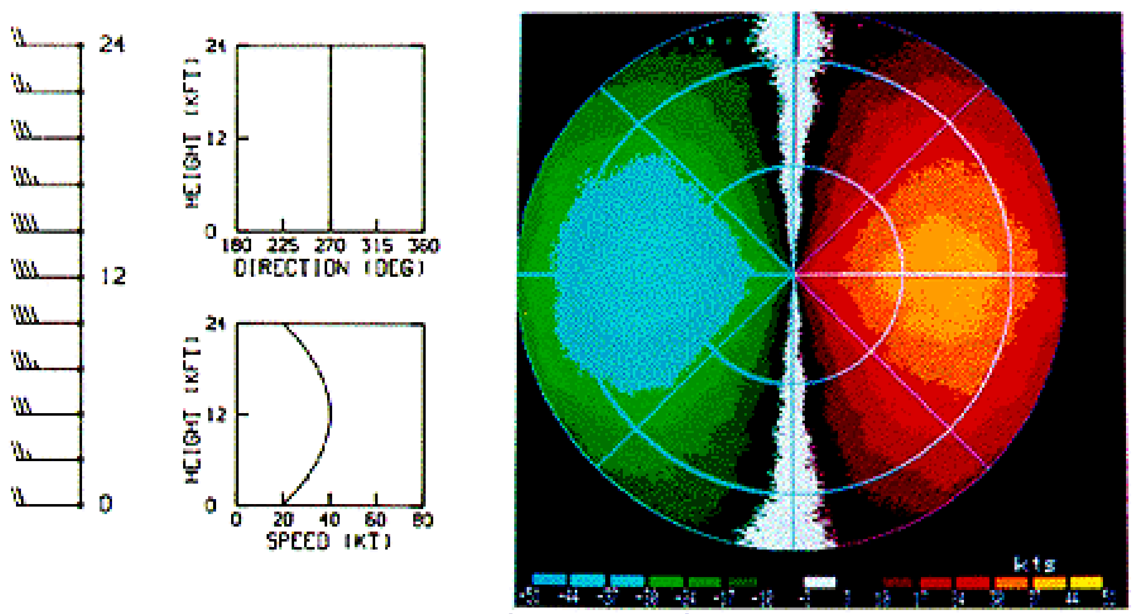

Image by: Brown & Wood

In the second example, the winds increase from 20 to 40 knots between zero and 12,000 feet and then decrease again to 20 knots at 24,000 feet. The wind direction again is constant. The radar beam intersects the 12,000 foot level along a ring half-way across the radar display. This is where we see the maximum inbound and outbound velocities.

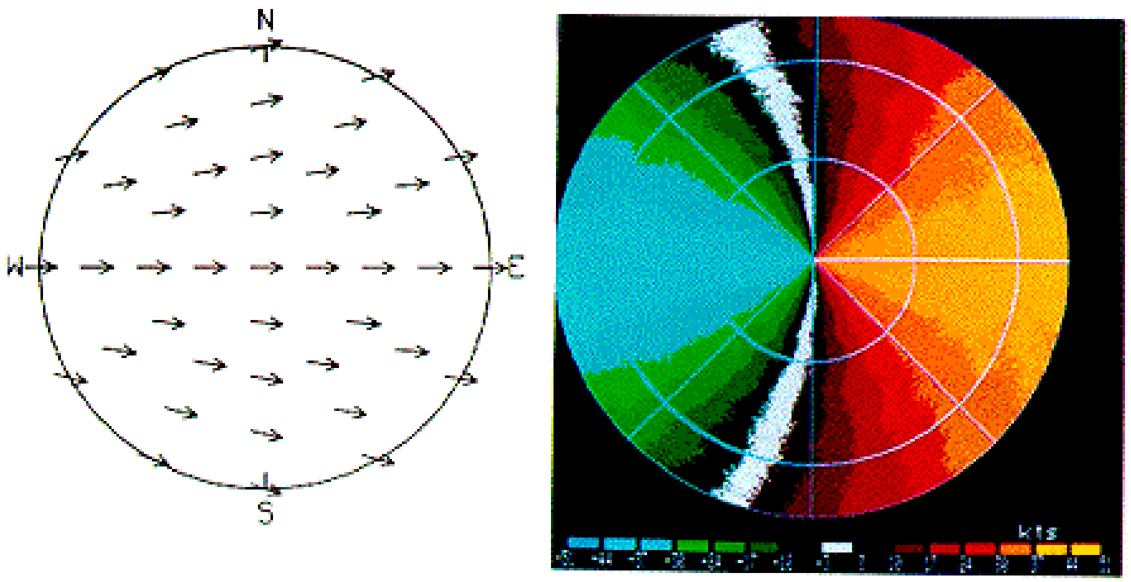

Image by: [Brown & Wood]()

In the third example, we see a wind field which changes direction from north to south but has a constant speed at all heights. The zero radial velocity line now bends so that it is everywhere perpendicular to the wind field. The maximum [radial velocities]() are observed where the radar beam points directly toward or away from the wind direction.

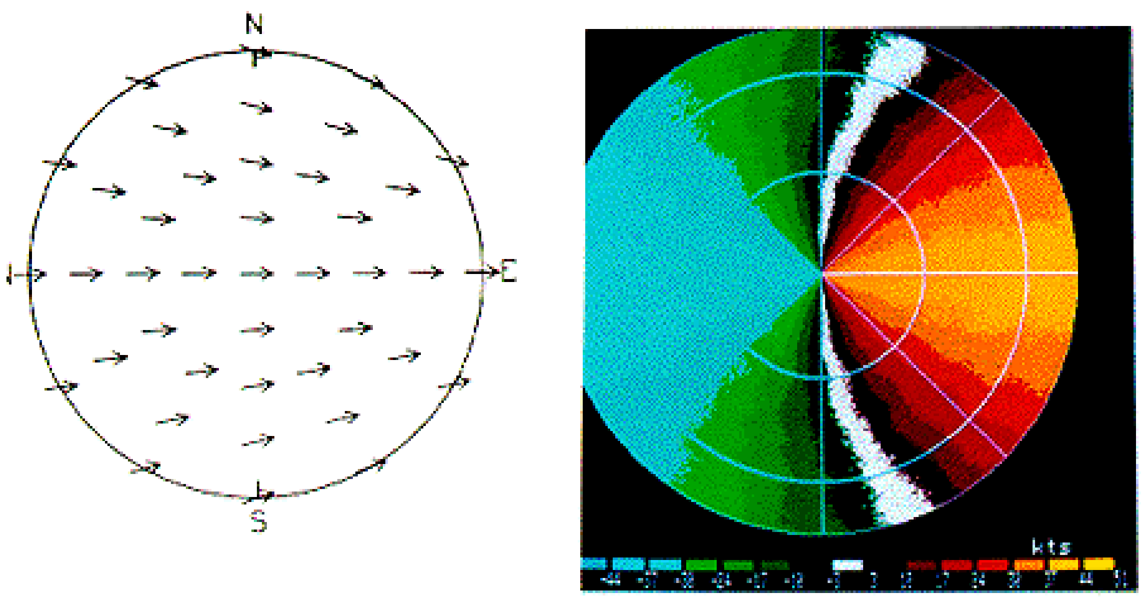

Image by: [Brown & Wood]()

In our fourth example, we see the same effect but in this case, the flow is confluent instead of difluent.

Imagery

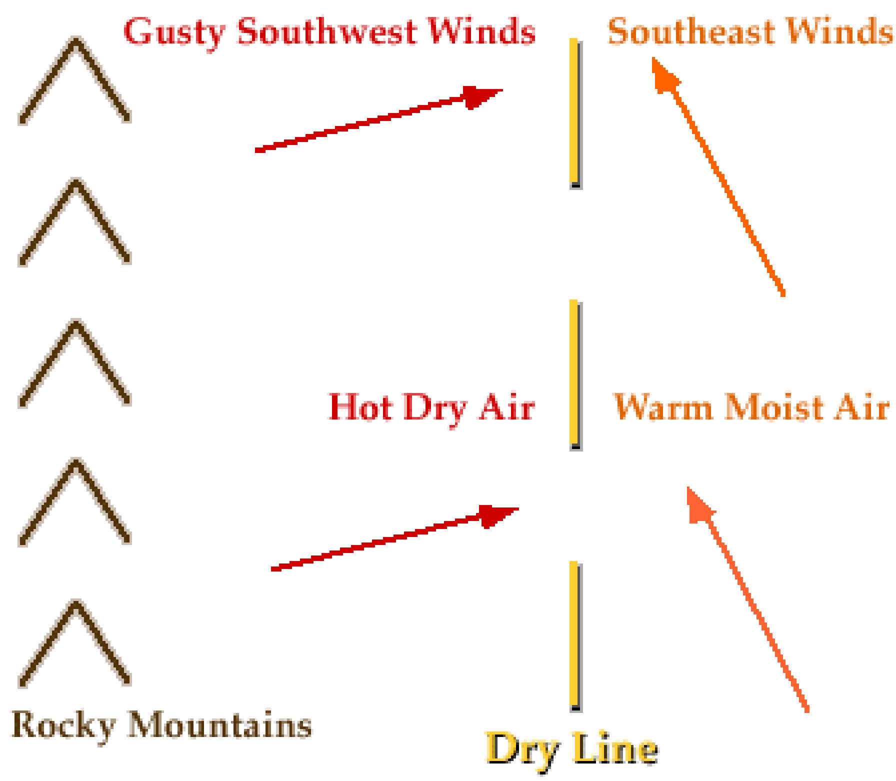
directional shear

Dry Line

a moisture boundary

Forecast Tip:
If a dryline is approaching your region, predict that air will be much drier after the boundary moves through. Storms are possible as the dryline approaches. The temperature may rise after the dryline passes through, since dry air heats up more quickly than moist air.

A dryline is a boundary that separates a moist air mass from a dry air mass. A dryline is also called a **Dew Point Front**. Sharp changes in dew point temperature can be found across a dryline (sometimes 9 degrees **Celsius** per kilometer). Drylines are most commonly found just east of the Rocky Mountains, separating a warm, moist air mass to the east from a hot, dry air mass to the west (see diagram below).



States like Texas, New Mexico, Oklahoma, Kansas, and Nebraska frequently experience drylines in the spring and summer, while east of the Mississippi River, drylines are extremely rare. The dryline is represented on surface maps by a dashed yellow line (see example below).

Dew points east of the dryline shown above range from the upper 50's to low 70's, with winds from the southeast. West of the dryline, dew points are much lower, in the 20's and 30's, which is almost 50 degrees less than those found east of the dryline.

Air temperature ahead of the dryline is generally in the 70's and 80's. Behind the dryline, temperatures are hotter, ranging from the mid 80's to mid 90's. The drier air behind the dryline lifts the moist air ahead of it as it advances, which could lead to the development of thunderstorms along and ahead of the dryline in a manner similar to how thunderstorms develop along cold fronts.

Temperatures

A Developing Supercell Intensifies

precipitation and winds intensify, rotation develops

This was initially a small supercell, looking west from about 8 miles, that packed a very intense rotating updraft. The rain curtains extending beneath the storm base were rotating, and looked very much like the rain areas we have seen under HP supercell bases. Once again, note the vaulted appearance on the north (right) side of the updraft. The storm was producing baseball size hail at this time, and a low-pitched, subtle, and continuous roaring sound was heard. Storm chasers have heard this a number of times, particularly close to LP storms, and attribute it to hailfall.

Photograph by: Moller

Below is a northward view of the storm's main precipitation area. It has the nearly transparent look of an LP storm. The radar echo at this time showed a relatively small VIP 4 storm, although a small radar pendant was present. A VIP 4 with baseball hail! Indeed, it seemed to have mainly LP characteristics, except for the rotating rain curtains wrapping around the updraft base.

Photograph by: Moller

At this time and location, just west of Archer City, Texas, east surface winds were blowing into the supercell at 25 to 30 MPH. We are very close in position to the pseudo-warm front, separating cool outflow coming from this precipitation area to the north from warm air to the south...

Midlatitude Cyclones

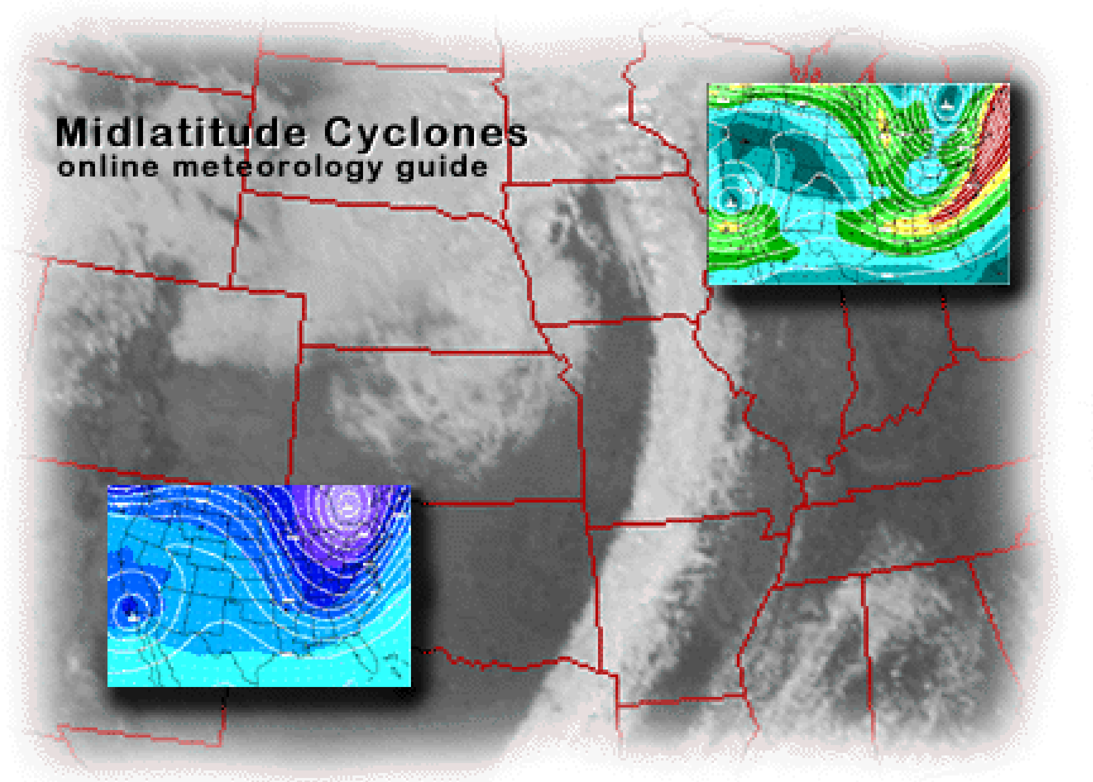
bringing weather change



Graphic by: Ed Mlodzik

Midlatitude cyclones are the cause of most of the stormy weather in the United States, espeically during the winter season. Understanding the structure and evolution of midlatitude cyclones is crucial for predicting significant weather phenomena such as blizzards, flooding rains, and severe weather.

A midlatitude cyclone is an area of low pressure located between 30 degrees and 60 degrees latitude. Since the continental United States is located in this latitude belt, these cyclones impact the weather in the U.S.

This instructional module introduces the most important features of midlatitude cyclones. The module is divided into the following sections:

Sections

Last Update: 08/22/97

The navigation menu (left) for this module is called "Midlatitude Cyclones" and the menu items are arranged in a recommended sequence, beginning with this introduction. Diffraction of Light

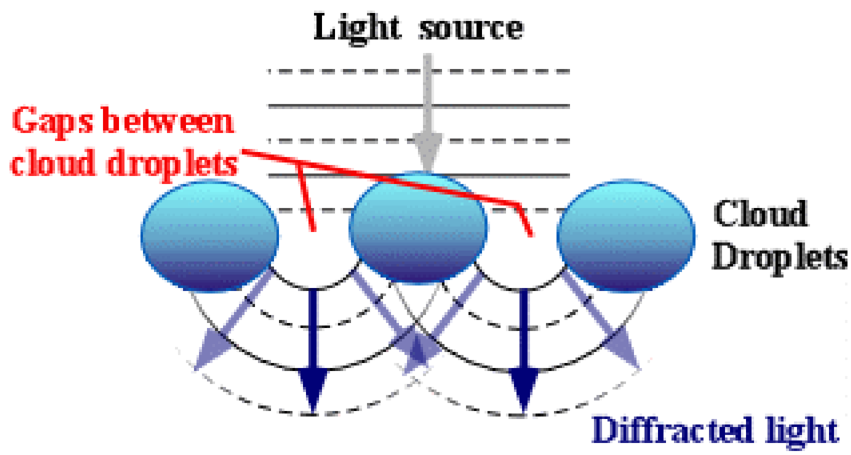
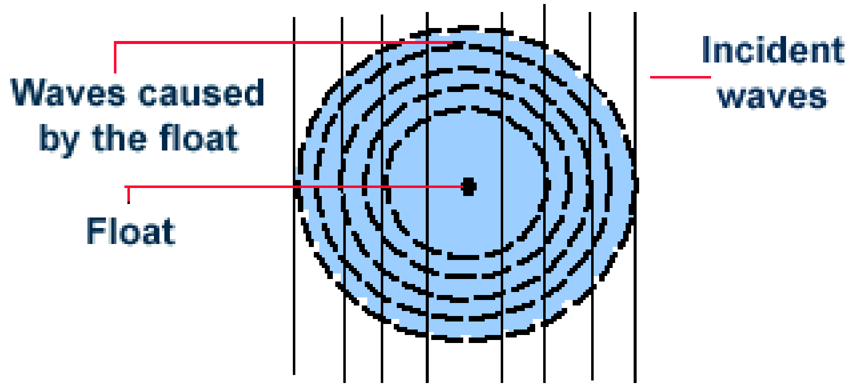
light bending around an object

Diffraction is the slight bending of light as it passes around the edge of an object. The amount of bending depends on the relative size of the wavelength of light to the size of the opening. If the opening is much larger than the light's wavelength, the bending will be almost unnoticeable. However, if the two are closer in size or equal, the amount of bending is considerable, and easily seen with the naked eye.



In the atmosphere, diffracted light is actually bent around atmospheric particles -- most commonly, the atmospheric particles are tiny water droplets found in clouds. Diffracted light can produce fringes of light, dark or colored bands. An optical effect that results from the diffraction of light is the silver lining sometimes found around the edges of clouds or coronas surrounding the sun or moon. The illustration above shows how light (from either the sun or the moon) is bent around small droplets in the cloud.

Optical effects resulting from diffraction are produced through the interference of light waves. To visualize this, imagine light waves as water waves. If water waves were incident upon a float residing on the water surface, the float would bounce up and down in response to the incident waves, producing waves of its own. As these waves spread outward in all directions from the float, they interact with other water waves. If the crests of two waves combine, an amplified wave is produced (constructive interference). However, if a crest of one wave and a trough of another wave combine, they cancel each other out to produce no vertical displacement (destructive interference).



This concept also applies to light waves. When sunlight (or moonlight) encounters a cloud droplet, light waves are altered and interact with one another in a similar manner as the water waves described above. If there is constructive interference, (the crests of two light waves combining), the light will appear brighter. If there is destructive interference, (the trough of one light wave meeting the crest of another), the light will either appear darker or disappear entirely.

Convergence Associated With Cyclones

extra-tropical and tropical cyclones

Both extra-tropical and tropical cyclones, like this hurricane, can cause air to rise. This type of lifting is different from the lifting produced along frontal boundaries.

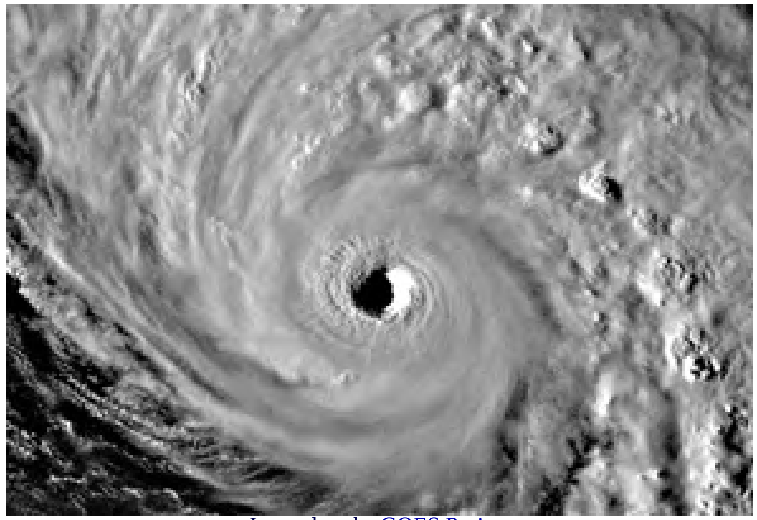

Image by: the GOES Project

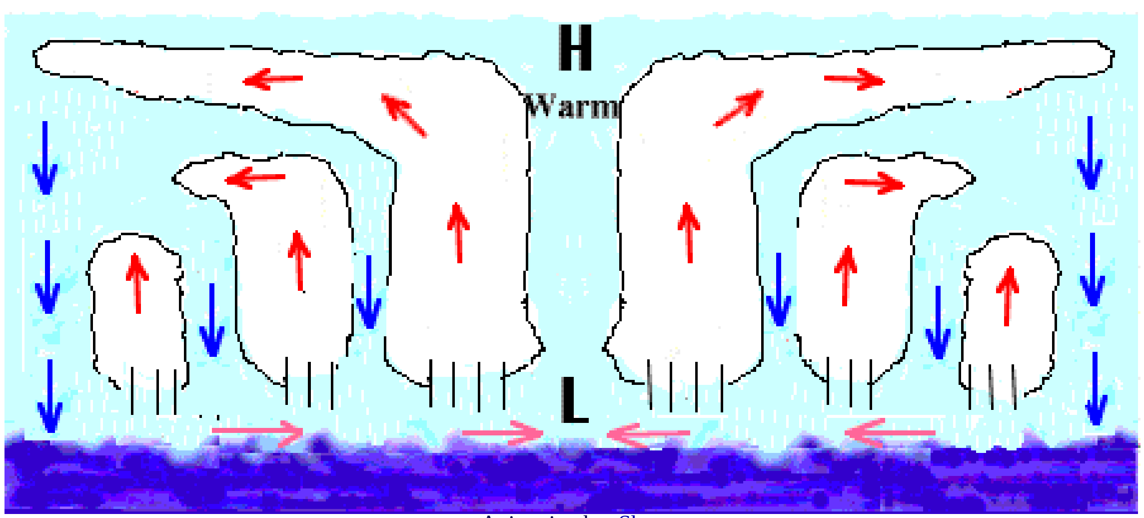
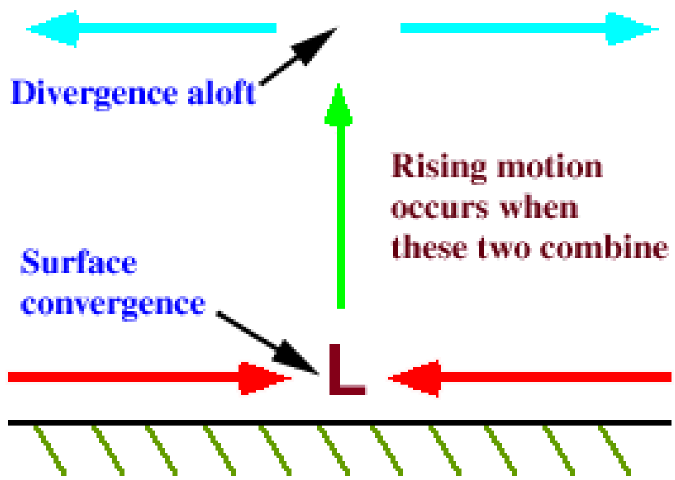
In hurricanes, condensation occurs through a process known as CISK (Convective Instability of the Second Kind). We will demonstrate CISK by referring to the animated cross-section through a mature hurricane given below. In CISK, surface convergence (pink horizontal arrows) causes rising motion around a surface cyclone (labeled as "L"). The air cools as it rises (red vertical arrows) and condensation occurs, which releases latent heat into the atmosphere. This heating causes air to expand, creating an area of high pressure aloft. The force resulting from the established pressure gradient causes air to diverge at upper levels (red horizontal arrows).



Animation by: Shao

Since pressure is a measure of the weight of the air above a unit area, removal of air at upper levels subsequently reduces pressure at the surface. A further reduction in surface pressure leads to increasing convergence (due to an intensified pressure gradient), which further intensifies the rising motion, latent heat release, and so on. Despite the absence of fronts, a tremendous amount of lifting occurs in hurricanes, with intense condensation leading to the development of deep clouds and heavy rainfall.

In extra-tropical cyclones, surface winds are deflected by friction towards the center of the low pressure system (red "L" below).

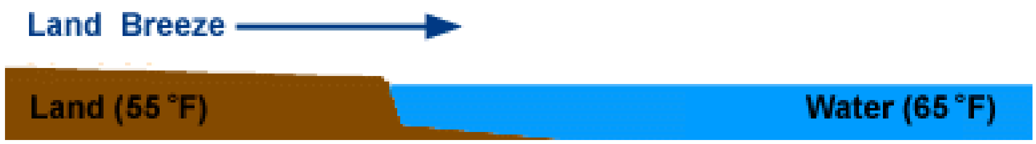


Coupled with divergence aloft, (blue arrows), surface convergence (red arrows) can generate rising motion (green arrow) that leads to the condensation of water vapor.

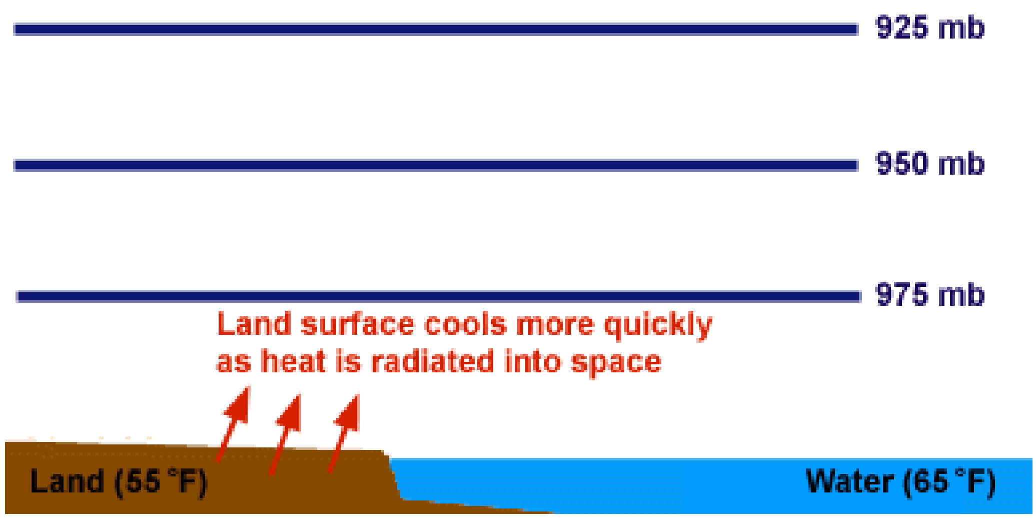
Land Breezes

begin with the cooling of low-level air

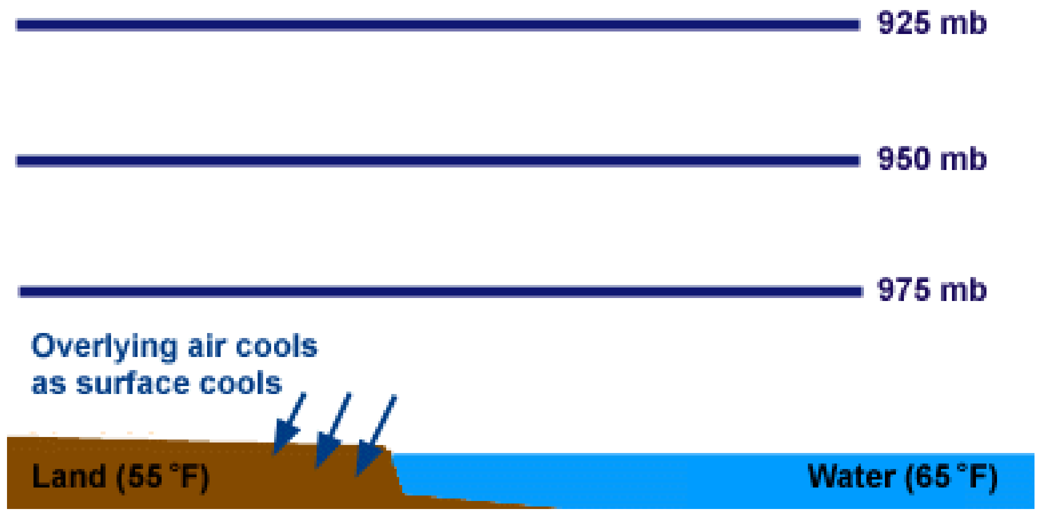
On clear, calm evenings, temperature differences between a body of water and neighboring land produce a cool wind that blows offshore. This wind is called a "land breeze". Land breezes are strongest along the immediate coastline but weaken considerably further inland.



Land-breeze circulations can occur at any time of year, but are most common during the fall and winter seasons when water temperatures are still fairly warm and nights are cool.



On clear and calm evenings, the earth's surface cools by radiating (giving off) heat back into space, and this results in a cooling of the immediately overlying air.



Since the air over land cools more rapidly than the air over water, a temperature difference is established, with cooler air present over land and relatively warmer air located over water.

Sea Breezes

onshore flow aloft

El Niño

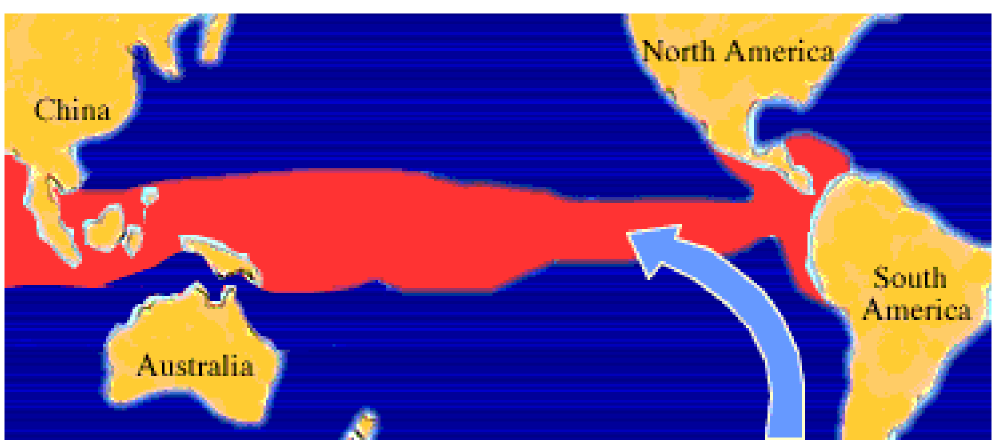
a warm current of water

El Niño (Spanish name for the male child), initially referred to a weak, warm current appearing annually around Christmas time along the coast of Ecuador and Peru and lasting only a few weeks to a month or more. Every three to seven years, an El Niño event may last for many months, having significant economic and atmospheric consequences worldwide. During the past forty years, ten of these major El Niño events have been recorded, the worst of which occurred in 1997-1998. Previous to this, the El Niño event in 1982-1983 was the strongest. Some of the El Niño events have persisted more than one year.

El Niño Years			
1902-1903	1905-1906	1911-1912	1914-1915
1918-1919	1923-1924	1925-1926	1930-1931
1932-1933	1939-1940	1941-1942	1951-1952
1953-1954	1957-1958	1965-1966	1969-1970
1972-1973	1976-1977	1982-1983	1986-1987
1991-1992	1994-1995	1997-1998	

Selected text from: CPC ENSO Main Page

In the tropical Pacific, trade winds generally drive the surface waters westward. The surface water becomes progressively warmer going westward because of its longer exposure to solar heating. El Niño is observed when the easterly trade winds weaken, allowing warmer waters of the western Pacific to migrate eastward and eventually reach the South American Coast (shown in orange). The cool nutrient-rich sea water normally found along the coast of Peru is replaced by warmer water depleted of nutrients, resulting in a dramatic reduction in marine fish and plant life.



Animation by: Shao

In contrast to El Niño, La Niña (female child) refers to an anomaly of unusually cold sea surface temperatures found in the eastern tropical Pacific. La Niña occurs roughly half as often as El Niño.

Cold Front

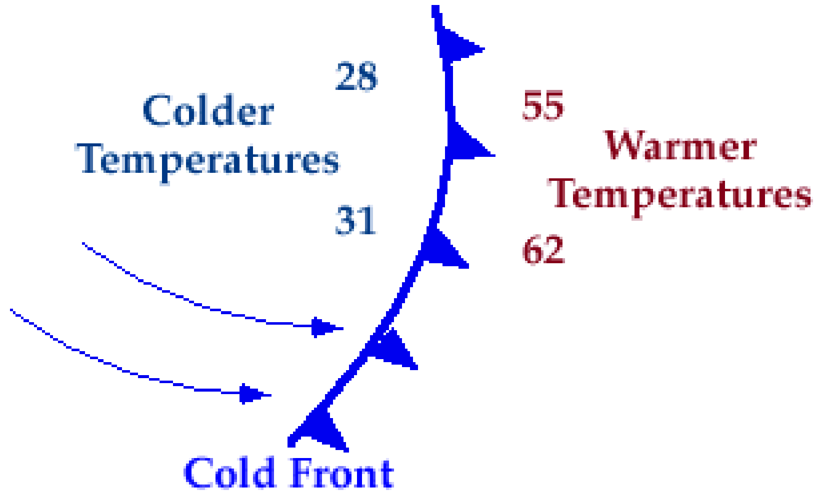
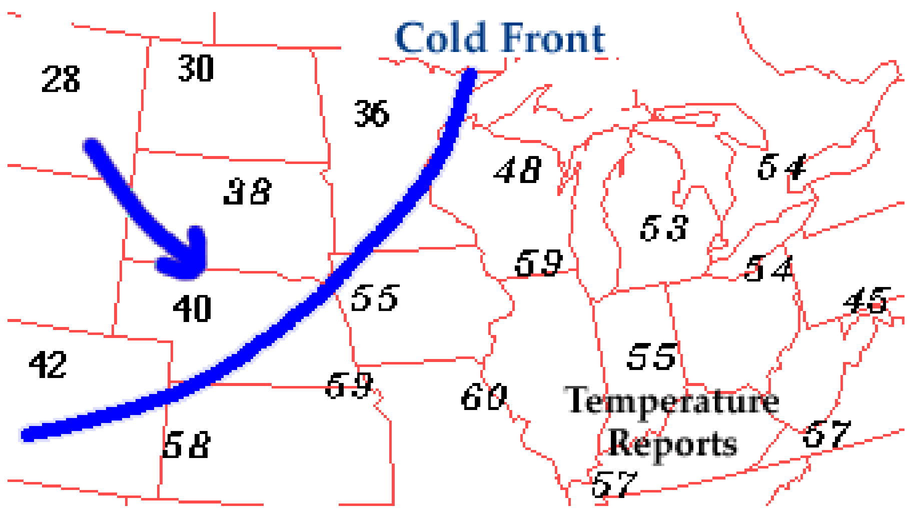
transition zone from warm air to cold air

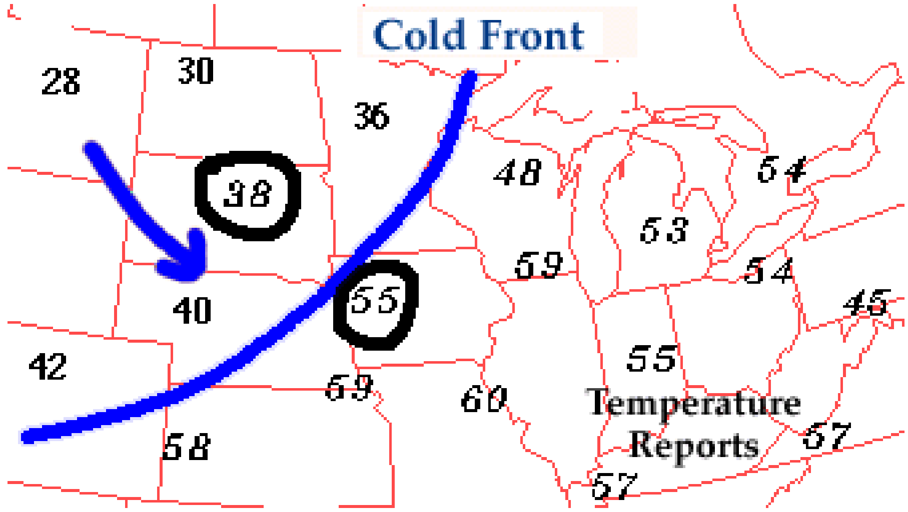
A cold front is defined as the transition zone where a cold air mass is replacing a warmer air mass. Cold fronts generally move from northwest to southeast. The air behind a cold front is noticeably colder and drier than the air ahead of it. When a cold front passes through, temperatures can drop more than 15 degrees within the first hour.



Symbolically, a cold front is represented by a solid line with triangles along the front pointing towards the warmer air and in the direction of movement. On colored weather maps, a cold front is drawn with a solid blue line.



There is typically a noticeable temperature change from one side of a cold front to the other. In the map of surface temperatures below, the station east of the front reported a temperature of 55 degrees Fahrenheit while a short distance behind the front, the temperature decreased to 38 degrees. An abrupt temperature change over a short distance is a good indicator that a front is located somewhere in between.



If colder air is replacing warmer air, then the front should be analyzed as a cold front. On the other hand, if warmer air is replacing cold air, then the front should be analyzed as a warm front. Common characteristics associated with cold fronts have been listed in the table below.

	Before Passing	**While Passing**	**After Passing**
Winds	south-southwest	gusty; shifting	west-northwest
Temperature	warm	sudden drop	steadily dropping
Pressure	falling steadily	minimum, then sharp rise	rising steadily
Clouds	increasing: Ci, Cs and Cb	Cb	Cu
Precipitation	short period of showers	heavy rains, sometimes with hail, thunder and lightning	showers then clearing
Visibility	fair to poor in haze	poor, followed by improving	good, except in showers
Dew Point	high; remains steady	sharp drop	lowering

Table adapted from: Ahrens, (1994)

The Online Meteorology Guide is a collection of web-based instructional modules that use multimedia technology and the dynamic capabilities of the web. These resources incorporate text, colorful diagrams, animations, computer simulations, audio and video to introduce fundamental concepts in the atmospheric sciences. Selected pages link to (or will soon link to) relevant classroom activities and current weather products to reinforce topics discussed in the modules and allow the user to apply what has been learned to real-time weather data. Available modules include:

Modules

Last Update: 09/02/99

Light and Optics
The interaction between light and atmospheric particles and the colorful optical effects that result.

Clouds and Precipitation
Cloud classifications and the processes by which clouds and precipitation develop.

Forces and Winds
Forces that influence the flow of air and how they interact to produce wind.

Air Masses and Fronts
The most common types of air masses and fronts, plus a look at the different types of advection.

Weather Forecasting
General forecasting methods, important surface features, plus forecasting tips for different scenarios.

Severe Storms

The online version of NOAA's Severe Storm Spotters Guide. Investigates the different types of thunderstorms, their associated components, plus an in depth look at tornadoes.

Hurricanes
The anatomy of hurricanes, how they develop and why they are so dangerous.

El Niño
Why El Niño develops and the global impact it has on weather patterns and economics.

Hydrologic Cycle
The circulation and conservation of the earth's water.

The target audience for the Online Meteorology Guide is high school and undergraduate level students. However, these resources have been used by instructors throughout K-12, undergraduate and graduate level education. Contents of the Online Meteorology Guide were developed by graduate students and faculty through our efforts in the Collaborative Visualization Project (CoVis), which was funded by the National Science Foundation. These resources have been reviewed by faculty and scientists at the University of Illinois and the Illinois State Water Survey. Many of these resources were tested in a classroom environment and have been modified based upon teacher and student feedback.

The navigation menu (left) for this module is called "Meteorology" and the available modules are listed as menu items, beginning with this introduction. Click on the menu item of interest to go to that particular module. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

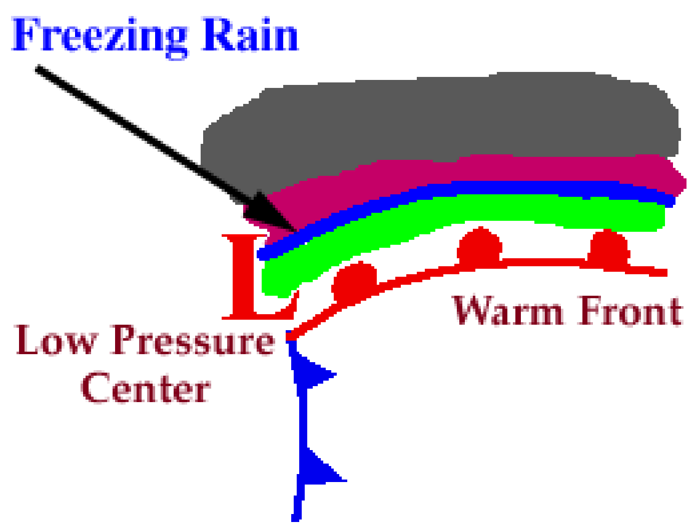
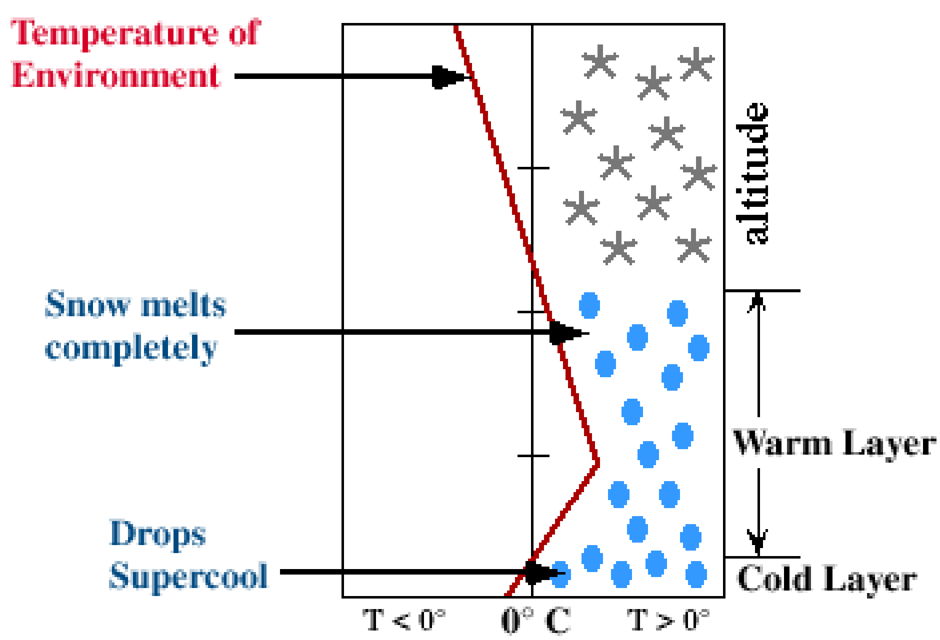
Freezing Rain

supercooled droplets freezing on impact

Ice storms can be the most devastating of winter weather phenomena and are often the cause of automobile accidents, power outages and personal injury. Ice storms result from the accumulation of freezing rain, which is rain that becomes supercooled and freezes upon impact with cold surfaces. Freezing rain is most commonly found in a narrow band on the cold side of a warm front, where surface temperatures are at or just below freezing.



The diagram below shows a typical temperature profile for freezing rain with the red line indicating the atmosphere's temperature at any given altitude. The vertical line in the center of the diagram is the freezing line. Temperatures to the left of this line are below freezing, while temperatures to the right are above freezing.



Freezing rain develops as falling snow encounters a layer of warm air deep enough for the snow to completely melt and become rain. As the rain continues to fall, it passes through a thin layer of cold air just above the surface and cools to a temperature below freezing. However, the drops themselves do not freeze, a phenomena called supercooling (or forming "supercooled drops"). When the supercooled drops strike the frozen ground (power lines, or tree branches), they instantly freeze, forming a thin film of ice, hence freezing rain.

the University of Illinois at Urbana-Champaign.

Cirrus Clouds

thin and wispy

The most common form of high-level clouds are thin and often wispy cirrus clouds. Typically found at heights greater than 20,000 feet (6,000 meters), cirrus clouds are composed of ice crystals that originate from the freezing of supercooled water droplets. Cirrus generally occur in fair weather and point in the direction of air movement at their elevation.

Cirrus can form from almost any cloud that has undergone glaciation and can be observed in a variety of shapes and sizes. Possibilities range from the "finger-like" appearance of cirrus fall streaks to the uniform texture of more extensive cirrus clouds associated with an approaching warm front.

Photograph by: Holle

Fall streaks form when snowflakes and ice crystals fall from cirrus clouds. The change in wind with height and how quickly these ice crystals fall determine the shapes and sizes the fall streaks attain. Since ice crystals fall much more slowly than raindrops, fall streaks tend to be stretched out horizontally as well as vertically. Cirrus streaks may be nearly straight, shaped like a comma, or seemingly all tangled together.

Similar to fall streaks is virga, which appears as streamers suspended in the air beneath the base of precipitating clouds. Virga develops when precipitation falls through a layer of dry air and evaporates before reaching the ground.

Relative Humidity

indicates how moist the air is

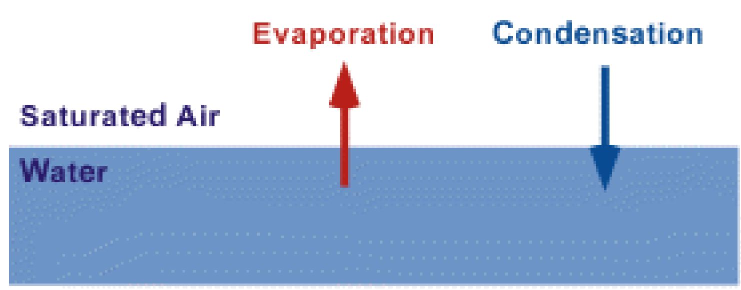
Relative humidity may be defined as the ratio of the water vapor density (mass per unit volume) to the saturation water vapor density, usually expressed in percent:

$$\textbf{Relative Humidity (RH)} = \frac{\text{(Actual Vapor Density)}}{\text{(Saturation Vapor Density)}} \times 100\%$$

Relative humidity is also approximately the ratio of the actual to the saturation vapor pressure.

$$\textbf{RH} = \frac{\text{(Actual Vapor Pressure)}}{\text{(Saturation Vapor Pressure)}} \times 100\%$$

Actual vapor pressure is a measurement of the amount of water vapor in a volume of air and increases as the amount of water vapor increases. Air that attains its saturation vapor pressure has established an equilibrium with a flat surface of water. That means, an equal number of water molecules are evaporating from the surface of the water into the air as are condensing from the air back into the water.



Saturation vapor pressure is a unique function of temperature as given in the table below. Each temperature in the table may be interpreted as a dew point temperature, because as the ground cools, dew will begin to form at the temperature corresponding to the vapor pressure in this table.

(C) Temp (F)	Sat Vapor Prs (mb)	(C) Temp (F)	Sat Vapor Prs (mb)

-18	00	1.5	18	65	21.0
-15	05	1.9	21	70	25.0
-12	10	2.4	24	75	29.6
-09	15	3.0	27	80	35.0
-07	20	3.7	29	85	41.0
-04	25	4.6	32	90	48.1
-01	30	5.6	35	95	56.2
02	35	6.9	38	100	65.6
04	40	8.4	41	105	76.2
07	45	10.2	43	110	87.8
10	50	12.3	46	115	101.4
13	55	14.8	49	120	116.8
16	60	17.7	52	125	134.2

Chart adapted from: Ahrens

For example, if the water vapor pressure in the air is 10.2 millibars (mb), dew will form when the ground reaches 45 degrees Fahrenheit (F). The relative humidity for air containing 10.2 mb of water vapor is simply 100% times 10.2 mb divided by the saturation vapor pressure at the actual temperature. For example, at 70 F the saturation vapor pressure is 25 mb, so the relative humidity would be

RH = 100% X (10.21 / 25.0) = 41%

Graphic by: Yiqi Shao

A cloud is a visible aggregate of tiny water droplets and/or ice crystals suspended in the atmosphere and can exist in a variety of shapes and sizes. Some clouds are accompanied by precipitation; rain, snow, hail, sleet, even freezing rain. The purpose of this module is to introduce a number of cloud classifications, different types of precipitation, and the mechanisms responsible for producing them. The Clouds and Precipitation module has been organized into the following sections:

Sections

Last Update: 07/21/97

Development
The importance of rising motion and the mechanisms responsible for lifting the air.

Cloud Types
High, middle and low-level clouds, vertically developed clouds, plus some less common cloud types.

Precipitation
Rain, snow, hail, sleet and freezing rain.

Acknowledgments
Those who contributed to the development of this module.

The navigation menu (left) for this module is called "Clouds, Precipitation" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

contributors to module development

WW2010 Personnel (Clouds):

Steven E. Hall - Content Developer and Editor - Scanned in slides, constructed original text and diagrams. Responsible for new layout, organization and cross linking of helper pages. Implemented text and graphics modifications as recommended by the Content Reviewers.

John Walsh - Content Reviewer - Professor of Atmospheric Sciences who edited module text and diagrams for scientific accuracy.

Ken Beard - Content Reviewer - Professor of Atmospheric Sciences who edited module text and diagrams for scientific accuracy.

Mythili Sridhar - Graphics Assistant- Graphically enhanced previous version of this module.

Yiqi Shao - HTML Programmer and Graphics Assistant - Helped with the integration of this module into the WW2010 format and constructed home page graphic.

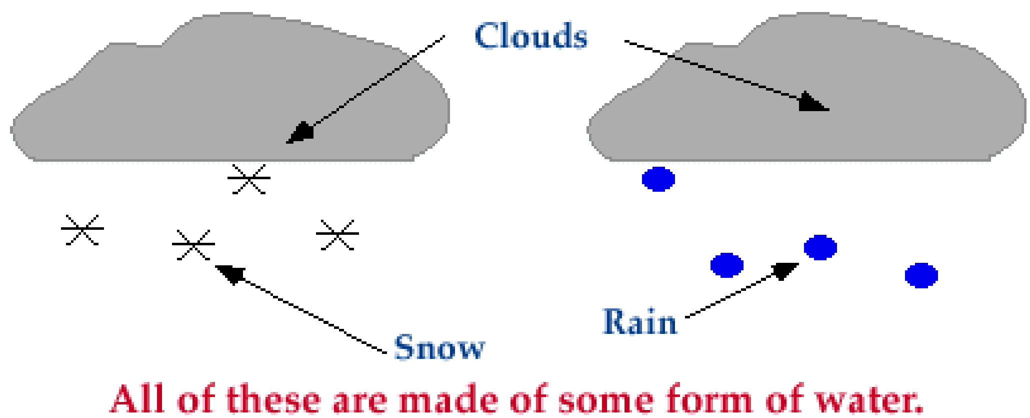
The States of Water

solid, liquid, gas

Water is known to exist in three different states; as a solid, liquid or gas.

Clouds, snow, and rain are all made of up of some form of water. A cloud is comprised of tiny water droplets and/or ice crystals, a snowflake is an aggregate of many ice crystals, and rain is just liquid water.



Water existing as a gas is called water vapor. When referring to the amount of moisture in the air, we are actually referring to the amount of water vapor. If the air is described as "moist", that means the air contains large amounts of water vapor. Common sources of moisture for the United States are the warm moist air masses that flow northward from the Gulf of Mexico and western Atlantic Ocean as well as the moist Pacific air masses brought onshore by the westerlies.

As cyclones move eastward from the Rocky Mountains, southerly winds ahead of these storm systems transport the warm moist air northward. Moisture is a necessary ingredient for the production of clouds and precipitation.

Cloud Types

common cloud classifications

Clouds are classified into a system that uses Latin words to describe the appearance of clouds as seen by an observer on the ground. The table below summarizes the four principal components of this classification system (Ahrens, 1994).

Latin Root	Translation	Example
cumulus	heap	fair weather cumulus
stratus	layer	altostratus
cirrus	curl of hair	cirrus
nimbus	rain	cumulonimbus

Further classification identifies clouds by height of cloud base. For example, cloud names containing the prefix "cirr-", as in cirrus clouds, are located at high levels while cloud names with the prefix "alto-", as in altostratus, are found at middle levels. This module introduces several cloud groups. The first three groups are identified based upon their height above the ground. The fourth group consists of vertically developed clouds, while the final group consists of a collection of miscellaneous cloud types.

Photograph by: Knupp

High-Level Clouds

High-level clouds form above 20,000 feet (6,000 meters) and since the temperatures are so cold at such high elevations, these clouds are primarily composed of ice crystals. High-level clouds are typically thin and white in appearance, but can appear in a magnificent array of colors when the sun is low on the horizon.

Photograph by: Holle

Mid-Level Clouds

The bases of mid-level clouds typically appear between 6,500 to 20,000 feet (2,000 to 6,000 meters). Because of their lower altitudes, they are composed primarily of water droplets, however, they can also be composed of ice crystals when temperatures are cold enough.

Low-level Clouds

- Low clouds are of mostly composed of water droplets since their bases generally lie below 6,500 feet (2,000 meters). However, when temperatures are cold enough, these clouds may also contain ice particles and snow.

Photograph by: Holle

Vertically Developed Clouds

Probably the most familiar of the classified clouds is the cumulus cloud. Generated most commonly through either thermal convection or frontal lifting, these clouds can grow to heights in excess of 39,000 feet (12,000 meters), releasing incredible amounts of energy through the condensation of water vapor within the cloud itself.

Photograph by: Holle

Other Cloud Types

Finally, we will introduce a collection of miscellaneous cloud types which do not fit into the previous four groups.

Classifications

Last Update: 07/09/97

High-Level Clouds
Cloud types include: cirrus and cirrostratus.

Mid-Level Clouds
Cloud types include: altocumulus, altostratus.

Low-Level Clouds
Cloud types include: nimbostratus and stratocumulus.

Clouds with Vertical Development
Cloud types include: fair weather cumulus and cumulonimbus.

Other Cloud Types
Cloud types include: contrails, billow clouds,

mammatus, orographic and pileus clouds.

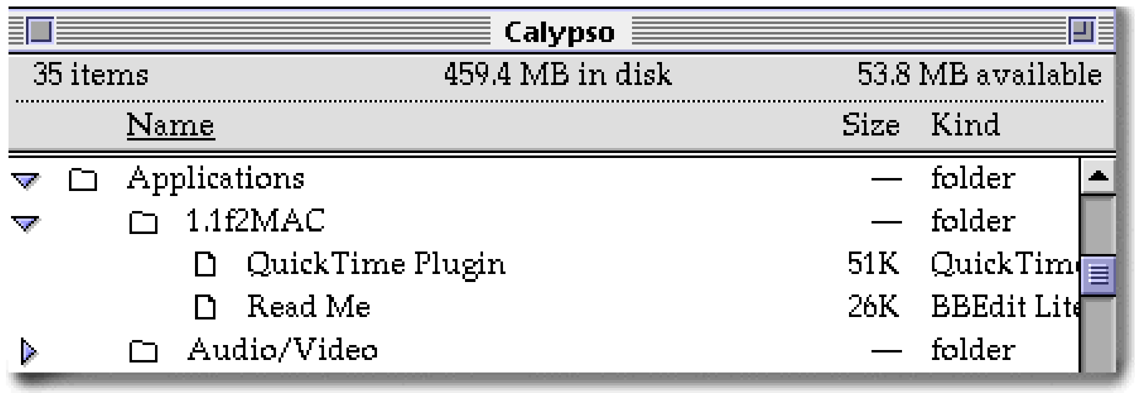
Navigating WW2010

menus and submenus

One of the unique features of WW2010 is the navigation bar along the left side of each page. Each menu resembles a folder on your computer desktop. A folder contains certain items which may either be individual files or additional subfolders, like in the image below.



For each menu, there is a corresponding menu title and the available items in that particular menu are listed below. Your current location within each menu is either highlighted in yellow or indicated by a small red arrow. (The indicator used depends upon the user interface and the web browser being used). In this case, the item "ww2010 user's guide" of the top menu called "Prerelease Info" is marked. This item opens a submenu titled "WW2010 User's Guide" and the item "core technologies" is marked. Then the item "Core Technologies" also contains a submenu of topics and so forth.

About WW2010

information and insights

Welcome...

Thank you for your interest and welcome to WW2010 (Weather World 2010), our evolving earth sciences web server. WW2010 strives to integrate real time and archived data with instructional resources using new and innovative technologies.

This purpose of this section is to introduce some of the new concepts and features that make up WW2010, the philosophies behind their development and how to use them. The WW2010 User's Guide is now available to provide a history of WW2010 plus valuable insights into key components of the web server, namely the content resources and core technologies.

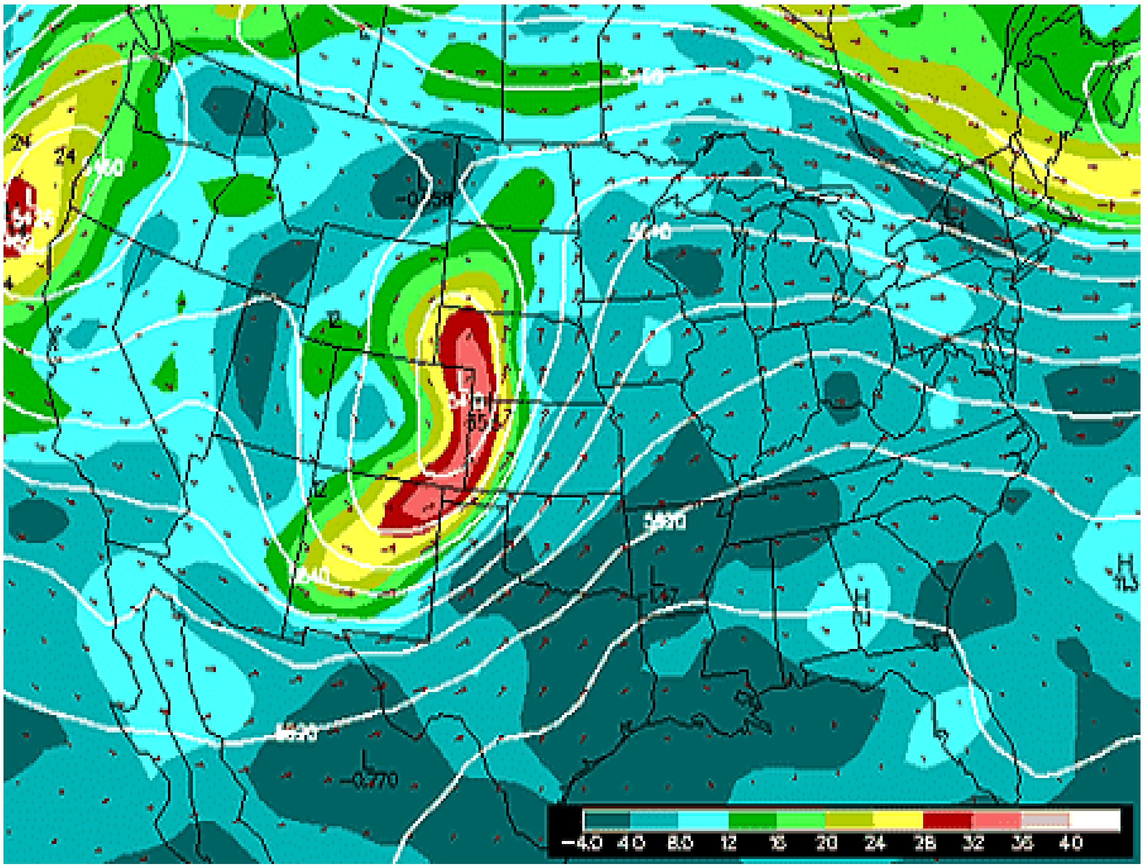
Vorticity Advection

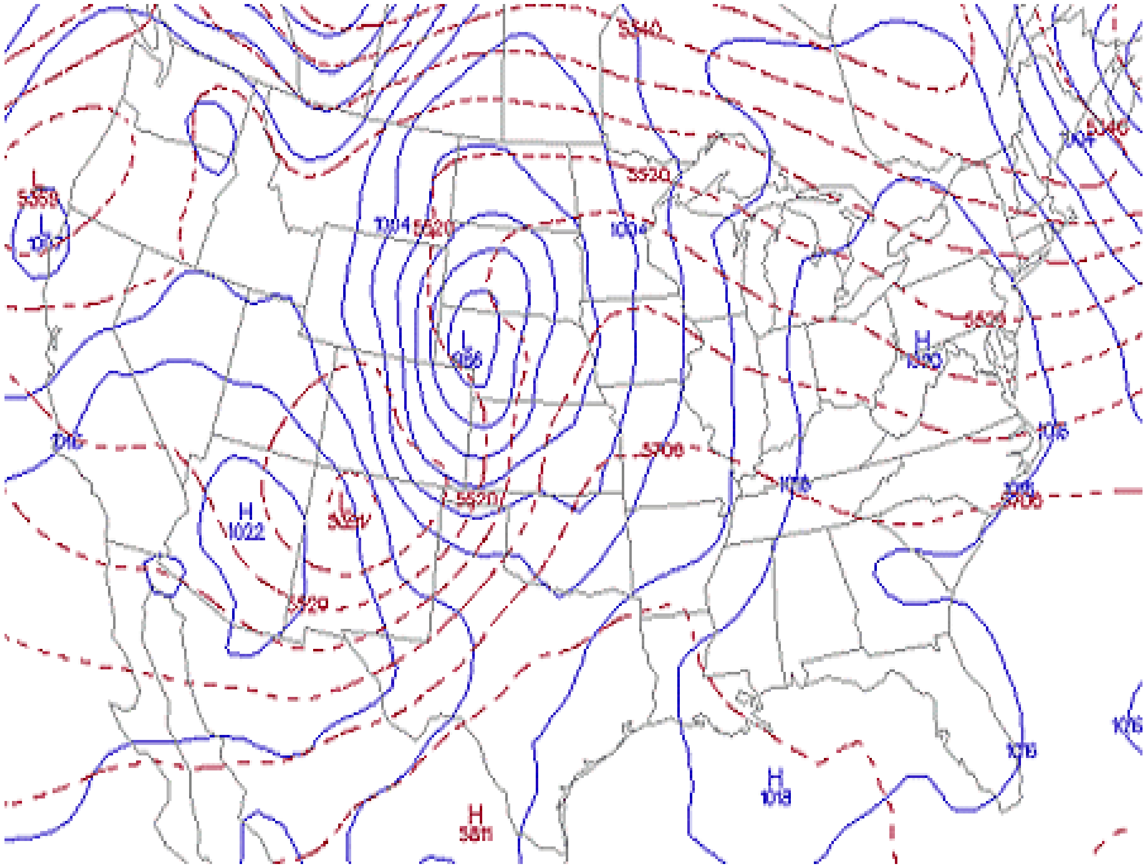
leads to rising/falling pressures at the surface

Vorticity is the localized rotation of the air. Air that rotates counterclockwise, such as in cyclones and troughs, is said to have positive vorticity. Clockwise rotating air, such as in high pressure systems and ridges, has negative vorticity. The advection of vorticity at high levels will result in a response at the surface which will attempt to offset the effects of the advection. More specifically, vorticity advection is indicative of rising motion/falling pressures at the surface. For example, look at this 500 mb map for 12Z, October 29, 1995.



Now look at these two maps of surface pressure (solid lines) from 12Z October 29,1995 and 0Z October 30,1995.

.



Notice how the surface low has deepened in the area of strong vorticity advection.

Hybrid Multimedia Educational CD-ROM

WW2010 (the weather world 2010 project)

The Weather World 2010 CD-ROM's are back!!!
If you would like to learn more about the CD-ROM, please read below. If you would like to order, click here for a printable order form.

The Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) would like to announce the release of the 2nd edition of the Weather World 2010 (WW2010) Educational CD-ROM. This resource is being constructed to provide local access to the high-graphics version our entire collection of Internet-based educational resources developed through our participation in NSF's Collaborative Visualization Project (CoVis). Most of these resources are currently available in the Online Guides.

New to the 2nd Edition of the WW2010 CD-ROM:
As seen on the web

- A Completely new Hurricane instructional module filled with new graphics and movies.
- New Modeling section to the Severe Storms instructional module including movies, animations, research results, and online access to streaming video.
- New pages in the Forces and Winds instructional module.
- Updates to the Satellite and Light & Optics instructional modules.
- New pages describing WW2010 Current weather products.
- Plus many other updates and revisions to other instructional modules

and background pages.

Features of the CD-ROM will include:

INSTRUCTIONAL MODULES - that use multimedia and the flexible nature of the web to enhance the impact of educational resources. These modules introduce and explain fundamental topics in Meteorology (Pressure, Severe Storms, El Niño, Forecasting etc.), Remote Sensing (Radars and Satellites) and how some of these aspects fit into the Hydrologic Cycle.
NOTE: The only resources found online and not on the CD-ROM are the Tropical Cyclone tracker and 3-D VRML Hurricane. They will still be accessible online from the CD-ROM.

ARCHIVED WEATHER DATA - and case studies of memorable weather events like Hurricane Andrew, Storm of the Century and the April 19, 1996 Illinois Tornado Outbreak. Each case contains relevant weather images, storm histories, photographs and eye-witness accounts.

STUDENT PROJECTS & ACTIVITIES - (complete with answer keys) that provide teachers with a meaningful way of integrating the data and instructional resources into the classroom.

REAL-TIME WEATHER DATA - will also be accessible from selected pages of the CD-ROM to allow the user to apply what they've learned to current weather conditions. These pages will link to relevant weather products accessible through our WW2010 web server.

EFFICIENT NAVIGATION - that allows users to move between hundreds of pages with only a few clicks and return easily.

These resources will be accessible from the CD-ROM by using any standard web browser and the interface will be nearly identical to their online counterparts. Therefore the same CD-ROM can be used on a Macintosh or an PC.

For a printable order form, click here!

If you have any questions or comments, please contact us at **ww2010@atmos.uiuc.edu**

Acknowledgments

developers

Daniel Bramer

Multimedia Specialist/Webmaster - Developed and edited instructional modules and diagrams. Responsible for editing "About WW2010" section including obtaining copyright permissions. Assisted System Manager in creating the final version of the Weather World 2010 Current Weather Products and the format and appearance adjustments to the WW2010 Educational CD-ROM.

David Wojtowicz

System Manager/Resource Programmer - Developed the underlying software infrastructure for the server including the AutoTree menu/navigation system. Maintains the machines that it runs on. Created and developed the Weather World 2010 Current Weather Products and their generation system.

Steven E. Hall

UIUC Covis Project Coordinator - Developed or edited instructional resources, text diagrams and curriculum. Responsible for web server layout and appearance, graphic design and the integration of the instructional resources into the new framework.

Principal Investigators

Bob Wilhelmson - Acting Department Head and Professor of Atmospheric Sciences.

Mohan Ramamurthy - Associate Professor of Atmospheric Sciences

---

Content Reviewers

DAS Students and Staff

Alex Brown - did the prototype design and HTML programming for constructing the text base navigation menus.

Bill Chapman - developed the early prototype of The Weather Visualizer

- a related product.

Paul Dekker - developed the original radar meteorology instructional module, graduated from this department in 1996.

Tom Grzelak - contributed to labeling of weather products and generation of multiple panel forecast images, received M.S. from this department in 1995.

Adam Houston - responsible for cover photograph for the CD-ROM.

Brian Jewett - took part in early developer meetings, developed several of the current weather products, developed simulations used in the Severe Storms instructional module.

Alan Liu - developed images for the El Niño instructional module, graduated from this department in 1997.

Geoff Manikin - constructed the Weather Forecasting instructional module, graduated from this department in 1995.

Norene McGhiey - transcribed text to the NOAA Severe Storms Spotters Guide, contributed to the April 19th Tornado Outbreak case study, and the Precipitation portion of the Clouds and Precipitation module.

Ed Mlodzik - constructed pages in the weather forecasting and midlatitude cyclones instructional modules, edited the Precipitation portion of the Clouds and Precipitation instructional module, took part in early developer meetings, helped prototype current weather products, graduated from this department in 1998.

Noah Nigg - developed the Virtual Reality Learning Tool for exploring hurricane Opal (VRML) for the Hurricane instructional Module

Scott Olthoff - constructed the Freezing Rain portion of the Clouds and Precipitation instructional module, prototyped current weather products, and took part in early developer meetings, graduated from this department in 1998.

Joel Plutchak - Java developer for current weather products, (e.g., The Interactive Weather Report and The Weather Visualizer), post-produced videos for the Hurricane instructional module.

Glen Romine - edited the Hurricanes instructional module.

Bruce Rose - constructed the Veteran's Day Snowstorm case study and took part in early developer meetings.

Crystal Shaw - helped with performance testing of WW2010, developed VRML scenes for the Severe Storms instructional module.

Yiqi Shao - constructed the Satellite Meteorology, El Niño, and the original Hurricanes instructional modules, plus the graphics design for a number of pages in the instructional modules.

Mythili Sridhar - constructed the original optics guide, the first online version of NOAA's Severe Storm Spotters Guide, graphically enhanced several modules, and prepared the CD-ROM for publication.

Ron Steve - constructed pages on the Forces and Winds instructional module, graduated from this department in 1996.

Vlad Tokarskiy - early Java developer (developed The Weather Animator) - a related product.

Jeff Van Dorn - constructed pages on the Air Masses and Fronts instructional module, responsible for cover photograph on 1st edition CD-ROM, graduated from this department in 1998.

Dave Werth - constructed pages on the Air Masses and Fronts instructional module, graduated from this department in 1997.

Kevin Wuebbles - helped transfer of old instructional modules to the new format.

NEW! Online ordering is now available!

The Weather World 2010 CD-ROM's are back!!!
If you would like to learn more about the CD-ROM, please read below. If you would like to order, either click here to order online by credit card or click here for a printable order form.

The Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) would like to announce the release of the 2nd edition of the Weather World 2010 (WW2010) Educational CD-ROM. This resource is being constructed to provide local access to the high-graphics version our entire collection of Internet-based educational resources developed through our participation in NSF's Collaborative Visualization Project (CoVis). Most of these resources are currently available in the Online Guides.

New to the 2nd Edition of the WW2010 CD-ROM:
As seen on the web

- A Completely new Hurricane instructional module filled with new graphics and movies.
- New Modeling section to the Severe Storms instructional module including movies, animations, research results, and online access to streaming video.
- New pages in the Forces and Winds instructional module.
- Updates to the Satellite and Light & Optics instructional modules.
- New pages describing WW2010 Current weather products.
- Plus many other updates and revisions to other instructional modules and background pages.

Features of the CD-ROM will include:

INSTRUCTIONAL MODULES - that use multimedia and the flexible nature of the web to enhance the impact of educational resources. These modules introduce and explain fundamental topics in Meteorology (Pressure, Severe Storms, El Niño, Forecasting etc.), Remote Sensing (Radars and Satellites) and how some of these aspects fit into the Hydrologic Cycle.
NOTE: The only resources found online and not on the CD-ROM are the Tropical Cyclone tracker and 3-D VRML Hurricane. They will still be accessible online from the CD-ROM.

ARCHIVED WEATHER DATA - and case studies of memorable weather events like Hurricane Andrew, Storm of the Century and the April 19, 1996 Illinois Tornado Outbreak. Each case contains relevant weather images, storm histories, photographs and eye-witness accounts.

STUDENT PROJECTS & ACTIVITIES - (complete with answer keys) that provide teachers with a meaningful way of integrating the data and instructional resources into the classroom.

REAL-TIME WEATHER DATA - will also be accessible from selected pages of the CD-ROM to allow the user to apply what they've learned to current weather conditions. These pages will link to relevant weather products accessible through our WW2010 web server.

EFFICIENT NAVIGATION - that allows users to move between hundreds of pages with only a few clicks and return easily.

These resources will be accessible from the CD-ROM by using any standard web browser and the interface will be nearly identical to their online counterparts. Therefore the same CD-ROM can be used on a Macintosh or an PC.

Click here to order online with a credit card or for other payment options using a printable order form, click here!

If you have any questions or comments, please contact us at **ww2010@atmos.uiuc.edu**

April 19th Tornado Outbreak

contributors to case study development

Below is a list of those who contributed to the development of the April 19th Tornado Outbreak case study in the WW2010 Case Study Archive. We greatly appreciate the efforts of those who contributed to the development of this case study.

WW2010 Personnel:
Steven E. Hall - Developer and Content Editor - Developed original-version of this online case study. Responsible for new layout, organization, cross linking of helper pages and construction of animations. Implemented text and graphics modifications as recommended by the Content Reviewers.

Bruce Lee - Content Reviewer - Edited module text and diagrams for scientific accuracy. Also provided narrative text for images captured from the chase.

Brian Jewett - Data Management - Collected and archived all weather data that is accessible from this case study.

Selected Images and Photographs:
For resources not developed by the University of Illinois, DAS/UIUC has been granted permission to display these resources for educational purposes only, on a non-profit basis. Images may be viewed directly from the CD-ROM or the WW2010 web site (http://ww2010.atmos.uiuc.edu/). Credit is given to the resource owner in attached captions. Copyright is wholly retained by the owner. Please contact the copyright owners directly for any situation involving the use of images outside of the web server and this CD-ROM. We would like to thank the following for permission to use their photographs and images in the WW2010 web server.

Video footage and stills from storm chase:
Tom Grzelak, Tim Shy, Brian Jewett, Gwen Jewett, and Bruce Lee.

Damage photographs from Ogden, IL:
Norene McGhiey - mcghiey@atmos.uiuc.edu

Graphic by: Steven E. Hall

Welcome to the WW2010 Online Guides, the next evolution phase of our web-based instructional resources. Formerly known as the Guide to Meteorology, we are expanding these resources beyond the scope of meteorology to other disciplines like climate, remote sensing and global change. We will attempt to present these topics not as individual sciences, but as integral components of a much larger system, learning about the planet on which we live. Available Online Guides include:

Guides

Last Update: 09/02/99

Meteorology
Instructional modules that introduce topics in meteorology from fronts to El Niño.

Remote Sensing
Instructional modules that introduce remote sensing technologies and their applications in meteorology.

Reading and Interpreting Weather Maps
Instructional resources that provide valuable information for the correct interpretation of weather products accessible (or soon to be accessible) from WW2010.

Projects & Activities
Curriculum aids that provide teachers with a blueprint for integrating web-based educational resources into the classroom.

The Online Guides use multimedia technology and the dynamic capabilities of the web. These resources incorporate text, colorful diagrams, animations, computer simulations, audio and video to introduce topics and concepts for a wide variety of disciplines. Selected pages link to (or will soon link to) current weather products, allowing the user to apply what the user has learned to real-time weather data. The Online Guides are an important component of the WW2010 Hybrid Multimedia Environment. Not only are they a part of this web server, but they are also (or will soon be) available for local access via educational CD-ROM.

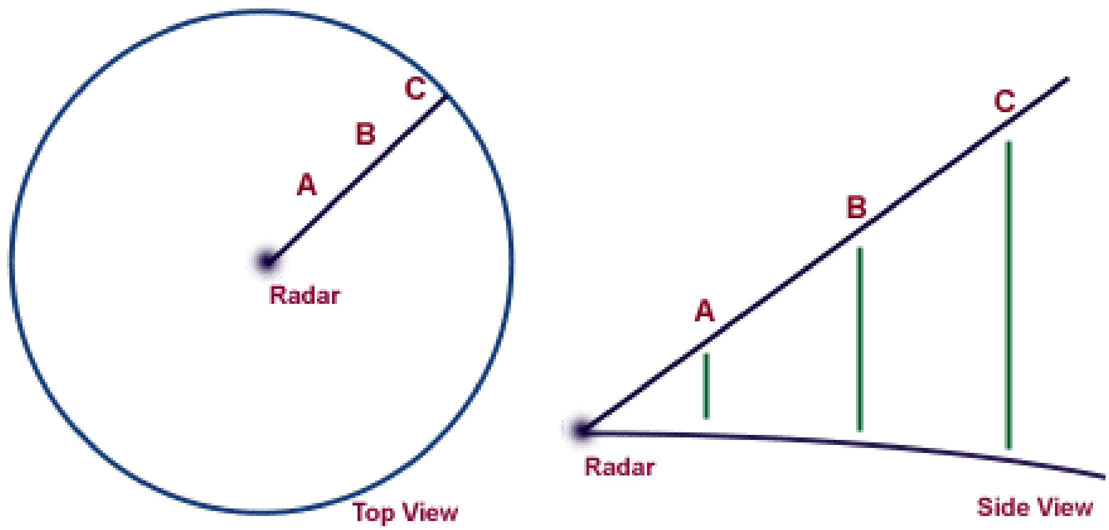
The target audience for the Online Guides is high school and undergraduate level students. However, these resources have been used by instructors throughout K-12, undergraduate and graduate level education. Contents of the Online Guides were developed by graduate students and faculty through our efforts in the Collaborative Visualization Project (CoVis), which was funded by the National Science Foundation. These resources have been reviewed by faculty and scientists at the University of Illinois and the Illinois State Water Survey. Many of these resources were tested in a classroom environment and have been modified based upon teacher and student feedback.

The navigation menu (left) for this resource is called "Online Guides" and the available guides are listed as menu items, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Interpreting Doppler Radar Velocities

speed shear wind patterns

To understand Doppler radial velocity patterns, one first has to consider the geometry of a radar scan. Normally the radar beam is pointed at an elevation angle greater than zero so that the beam, as it moves away from the radar, moves higher and higher above the surface of the earth. Because of this geometry, radar returns originating from targets near the radar represent the low-level wind field, while returns from distant targets represent the wind field at higher levels.



On a radar PPI display, the distance away from the radar at the center of the display represents both a change in horizontal distance and a change in vertical distance. To determine the wind field at a particular elevation above the radar, one must examine the radial velocities on a ring at a fixed distance from the radar. The exact elevation represented by a particular ring depends upon the elevation angle of the radar beam.

In the examples below, idealized Doppler radial velocity patterns were constructed with a computer assuming simple vertical wind field patterns. These simplified radial velocity patterns can help us understand the more complicated patterns that are associated with storm motions. Doppler velocity patterns (right) correspond to vertical wind profiles (left), where the wind barbs indicate wind speed and direction from the ground up to 24,000 feet. Negative Doppler velocities (blue-green) are toward the radar and positive (yellow-red) are away. The radar location is at the center of the display.

[Image: wind direction constant with height (35K)]

Image by: Brown & Wood

For this first example, wind direction is constant with height, but wind speed increases from 20 knots at the ground to 40 knots at 24,000 feet. Note on the

graphicstext

radial velocity field that the maximum inbound velocity is to the west and maximum outbound to the east while to the north and south the radar measures zero radial velocity. This is because the winds are perpendicular to the radar beam when viewed to the north or south.

[Image: maximum speed at mid levels (32K)]

Image by: Brown & Wood

In the second example, the winds increase from 20 to 40 knots between zero and 12,000 feet and then decrease again to 20 knots at 24,000 feet. The wind direction again is constant. The radar beam intersects the 12,000 foot level along a ring half-way across the radar display. This is where we see the maximum inbound and outbound velocities.

[Image: difluent wind flow (29K)]

Image by: Brown & Wood

In the third example, we see a wind field which changes direction from north to south but has a constant speed at all heights. The zero radial velocity line now bends so that it is everywhere perpendicular to the wind field. The maximum radial velocities are observed where the radar beam points directly toward or away from the wind direction.

[Image: confluent wind flow (30K)]

Image by: Brown & Wood

In our fourth example, we see the same effect but in this case, the flow is confluent instead of difluent.

Units of Temperature

from fahrenheit to celsius to kelvin and back

Degrees **Fahrenheit**, (developed in the early 1700's by G. Daniel Fahrenheit), are used to record surface temperature measurements by meteorologists in the United States. However, since most of the rest of the world uses degrees **Celsius** (developed in the 18th Century), it is important to be able to convert from units of degrees Fahrenheit to degrees Celsius:

Fahrenheit to Celsius:

$$^{\circ}C = (^{\circ}F - 32) / 1.8$$

Kelvin is another unit of temperature that is very handy for many scientific calculations, since it begins at **absolute zero**, meaning it has no negative numbers. (Note...the word "degrees" is NOT used with Kelvin.) The way to convert from degrees Celsius to Kelvin is:

[Image:]

The three different temperature scales have been placed side-by-side in the chart below for comparison.

.

Temperature Scales

Fahrenheit	Celsius	Kelvin	
212	100	373	Boiling point of water at sea-level

Projects, Activities

introduction
open-ended projects
classroom activities
teacher guides

User Interface

graphicstext

[Image: curriculum image menu (72K)]

Welcome to the first collection of CoVis-WW2010 student projects and activities in the atmospheric sciences. These resources were developed through our participation in NSF's Collaborative Visualization (CoVis) project which supports project-based learning of the sciences for grade levels 9-12. These resources have already been implemented in a number of CoVis classrooms and have been modified based upon student and teacher feedback. The Projects and Activities have been organized into the following secitions.

Activities

Last Update: 08/01/97

Open-Ended Projects
Two units: case study of a winter storm and learning how to forecast.

Classroom Activities
Short, structured activities on a variety of topics in meteorology.

Teacher Guides
Assessment tools for teachers.

.

The materials have been broken down into four primary groups. Open-Ended Projects involve working with real-time and archived weather data to solve a specific problem. Classroom Activities provide a structured environment for learning about a variety of topics in meteorology. These activities may require up to 90 minutes of classtime to complete. Teacher guides for each activity have also been provided.

The navigation menu (left) for this module is called "Online Curriculum" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Upper Air Obs

Open-Ended Projects

[Image: home image (62K)]
Graphic by: Steven E. Hall

The Online Meteorology Guide is a collection of web-based instructional modules that use multimedia technology and the dynamic capabilities of the web. These resources incorporate text, colorful diagrams, animations, computer simulations, audio and video to introduce fundamental concepts in the atmospheric sciences. Selected pages link to (or will soon link to) relevant classroom activities and current weather products to reinforce topics discussed in the modules and allow the user to apply what has been learned to real-time weather data. Available modules include:

Modules

Last Update: 09/02/99

Light and Optics
The interaction between light and atmospheric particles and the colorful optical effects that result.

Clouds and Precipitation
Cloud classifications and the processes by which clouds and precipitation develop.

Forces and Winds
Forces that influence the flow of air and how they interact to produce wind.

Air Masses and Fronts
The most common types of air masses and fronts, plus a look at the different types of advection.

Weather Forecasting
General forecasting methods, important surface features, plus forecasting tips for different scenarios.

Severe Storms
The online version of NOAA's Severe Storm Spotters Guide. Investigates the different types of thunderstorms, their associated components, plus an in depth look at tornadoes.

Hurricanes
The anatomy of hurricanes, how they develop and why they are so dangerous.

El Niño
Why El Niño develops and the global impact it has on weather patterns and economics.

Hydrologic Cycle

The circulation and conservation of the earth's water.

The target audience for the Online Meteorology Guide is high school and undergraduate level students. However, these resources have been used by instructors throughout K-12, undergraduate and graduate level education. Contents of the Online Meteorology Guide were developed by graduate students and faculty through our efforts in the Collaborative Visualization Project (CoVis), which was funded by the National Science Foundation. These resources have been reviewed by faculty and scientists at the University of Illinois and the Illinois State Water Survey. Many of these resources were tested in a classroom environment and have been modified based upon teacher and student feedback.

The navigation menu (left) for this module is called "Meteorology" and the available modules are listed as menu items, beginning with this introduction. Click on the menu item of interest to go to that particular module. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

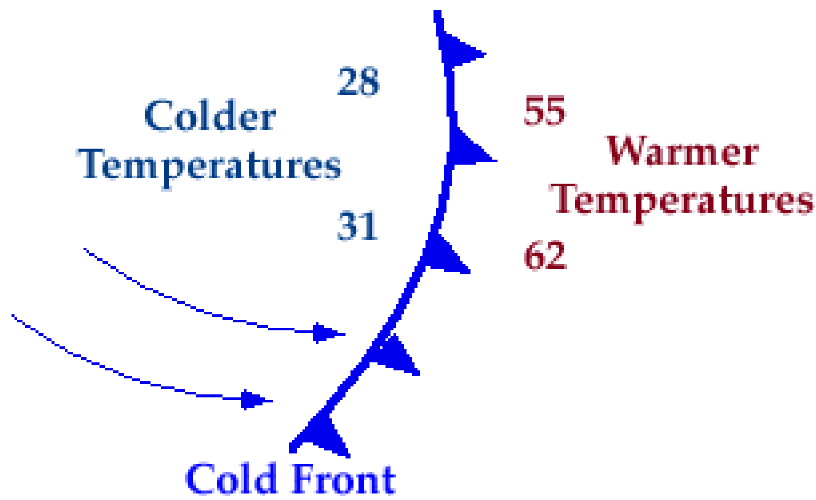
Online Guides

Air Masses, Fronts

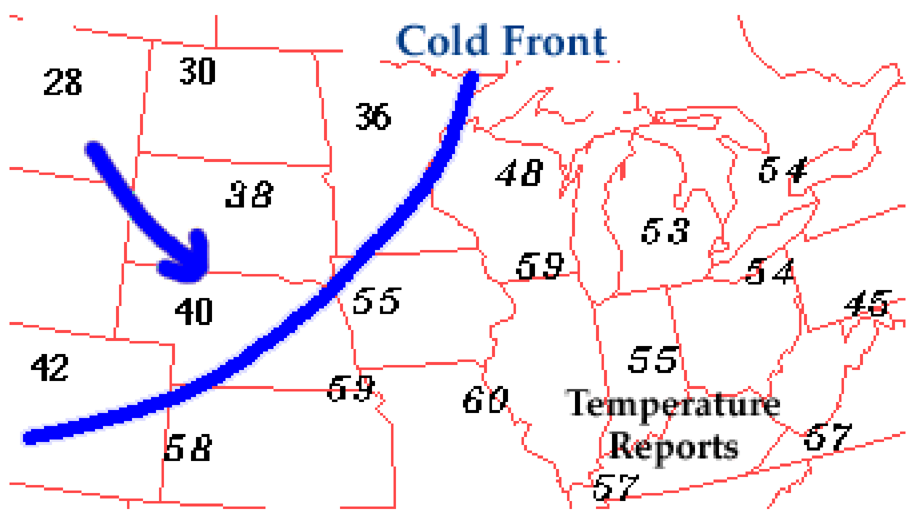
Cold Front

transition zone from warm air to cold air

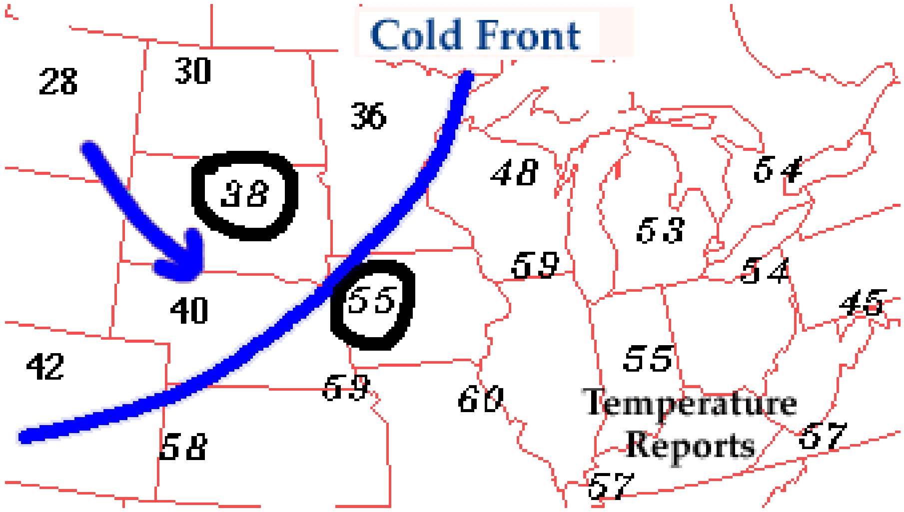
A cold front is defined as the transition zone where a cold air mass is replacing a warmer air mass. Cold fronts generally move from northwest to southeast. The air behind a cold front is noticeably colder and drier than the air ahead of it. When a cold front passes through, temperatures can drop more than 15 degrees within the first hour.



Symbolically, a cold front is represented by a solid line with triangles along the front pointing towards the warmer air and in the direction of movement. On colored weather maps, a cold front is drawn with a solid blue line.



There is typically a noticeable temperature change from one side of a cold front to the other. In the map of surface temperatures below, the station east of the front reported a temperature of 55 degrees Fahrenheit while a short distance behind the front, the temperature decreased to 38 degrees. An abrupt temperature change over a short distance is a good indicator that a front is located somewhere in between.



If colder air is replacing warmer air, then the front should be analyzed as a cold front. On the other hand, if warmer air is replacing cold air, then the front should be analyzed as a warm front. Common characteristics associated with cold fronts have been listed in the table below.

	Before Passing	While Passing	After Passing
Winds	south-southwest	gusty; shifting	west-northwest
Temperature	warm	sudden drop	steadily dropping
Pressure	falling steadily	minimum, then sharp rise	rising steadily
Clouds	increasing: Ci, Cs and Cb	Cb	Cu
Precipitation	short period of showers	heavy rains, sometimes with hail, thunder and lightning	showers then clearing
Visibility	fair to poor in haze	poor, followed by improving	good, except in showers
Dew Point	high; remains steady	sharp drop	lowering

Table adapted from: Ahrens, (1994)

Fronts

wind shift

El Niño

a warm current of water

El Niño (Spanish name for the male child), initially referred to a weak, warm current appearing annually around Christmas time along the coast of Ecuador and Peru and lasting only a few weeks to a month or more. Every three to seven years, an El Niño event may last for many months, having significant economic and atmospheric consequences worldwide. During the past forty years, ten of these major El Niño events have been recorded, the worst of which occurred in 1997-1998. Previous to this, the El Niño event in 1982-1983 was the strongest. Some of the El Niño events have persisted more than one year.

El Niño Years			
1902-1903	1905-1906	1911-1912	1914-1915
1918-1919	1923-1924	1925-1926	1930-1931
1932-1933	1939-1940	1941-1942	1951-1952
1953-1954	1957-1958	1965-1966	1969-1970
1972-1973	1976-1977	1982-1983	1986-1987
1991-1992	1994-1995	1997-1998	

Selected text from: CPC ENSO Main Page

In the tropical Pacific, trade winds generally drive the surface waters westward. The surface water becomes progressively warmer going westward because of its longer exposure to solar heating. El Niño is observed when the easterly trade winds weaken, allowing warmer waters of the western Pacific to migrate eastward and eventually reach the South American Coast (shown in orange). The cool nutrient-rich sea water normally found along the coast of Peru is replaced by warmer water depleted of nutrients, resulting in a dramatic reduction in marine fish and plant life.

[Image: animation of El Niño current (77K)]

Animation by: Shao

In contrast to El Niño, La Niña (female child) refers to an anomaly of unusually cold sea surface temperatures found in the eastern tropical Pacific. La Niña occurs roughly half as often as El Niño.

La Niña Years

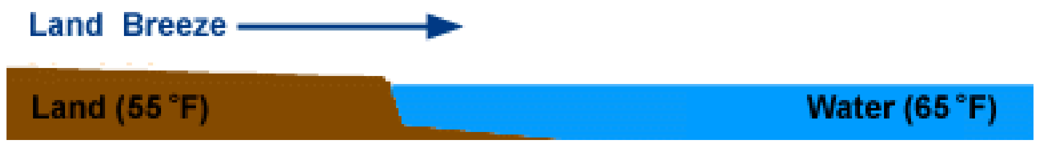
introduction

'97-'98 event

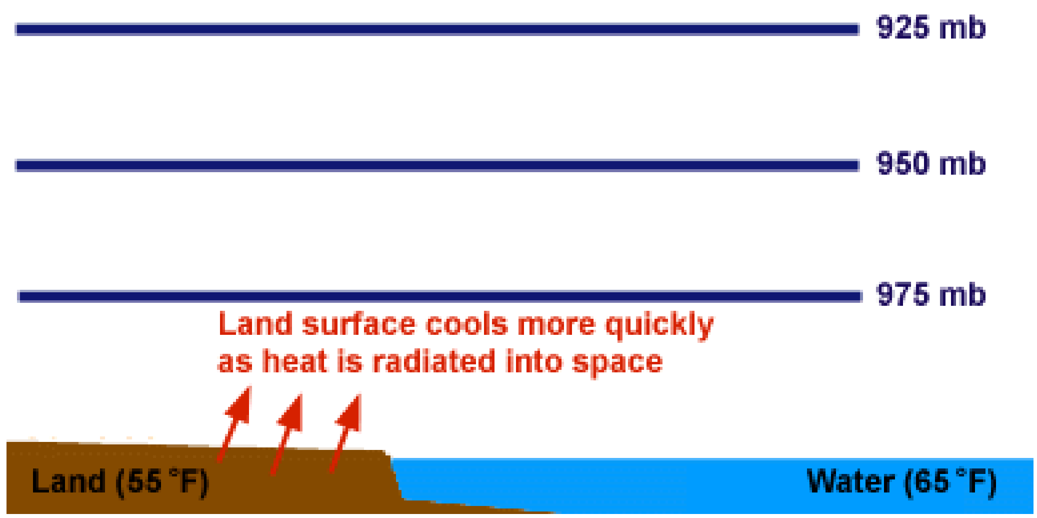
Land Breezes

begin with the cooling of low-level air

On clear, calm evenings, temperature differences between a body of water and neighboring land produce a cool wind that blows offshore. This wind is called a "land breeze". Land breezes are strongest along the immediate coastline but weaken considerably further inland.



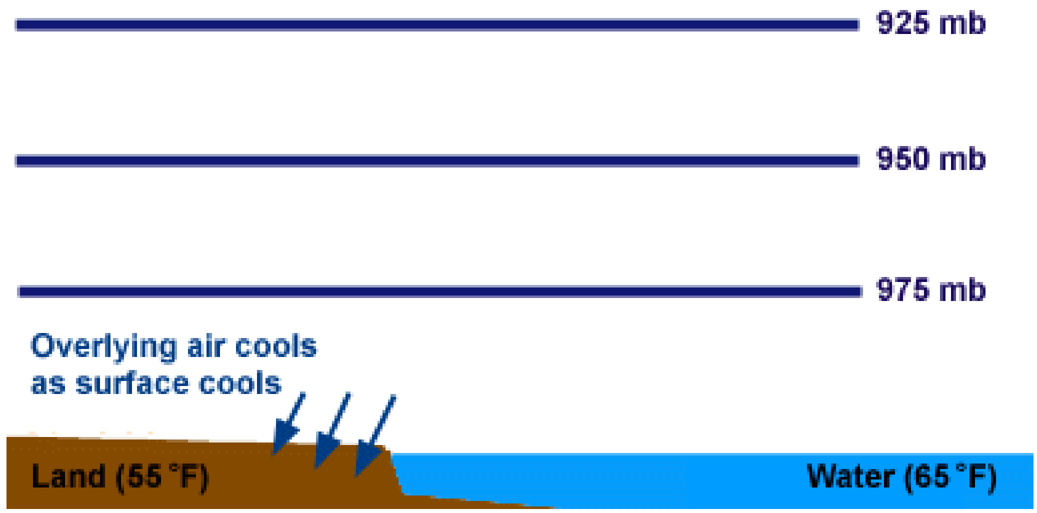
Land-breeze circulations can occur at any time of year, but are most common during the fall and winter seasons when water temperatures are still fairly warm and nights are cool.



- On clear and calm evenings, the earth's surface cools by radiating (giving off) heat back into space, and this results in a cooling of the immediately overlying air.

Land Breezes

User Interface



Since the air over land cools more rapidly than the air over water, a temperature difference is established, with cooler air present over land and relatively warmer air located over water.

Fly through a 3-D Hurricane!
added (1/08/1999)

Requires a VRML player/plugin. See bottom of page for a recommended one.

Interact with Atlantic hurricanes from 1950-2003!!

Hurricanes are cyclones that develop over the warm tropical oceans and have sustained winds in excess of 64 knots (74 miles/hour). These storms are capable of producing dangerous winds, torrential rains and flooding, all of which may result in tremendous property damage and loss of life in coastal populations. One memorable storm was Hurricane Andrew (pictured above), which was responsible for at least 50 deaths and more than $30 billion in property damage. The purpose of this module is to introduce hurricanes and their associated features, to show where hurricanes develop, and to explain the atmospheric conditions necessary for hurricane development. The Hurricane module has been organized into the following sections:

Sections

Last Update: 09/16/99

Definition and Growth
Defines a hurricane and shows the regions and mechanics of hurricane development.

Stages of Development
The different stages of development from depression to hurricane.

Structure of a Hurricane
Discusses the structure of different parts of hurricanes.

Explore a 3-D Hurricane
View a hurricane in a 3 dimensional VRML world generated by a computer model. Requires a VRML player/plugin. See bottom of page for a recommended one.

Movement
The influence of global winds on the movement of hurricanes.

Satellites and Hurricane Hunters
Discusses the tools and means meteorologists use to observe and track hurricanes.

Preparations
Includes a list of matters to consider if you are threatened by a hurricane.

Damage and Destruction
Destructive features associated with hurricanes, plus the Saffir-Simpson Scale for classifying damage potential.

Hurricane Tracks
Track Atlantic Hurricanes interactively from 1950 to 2003.

User Interface

graphics text

How They Are Named

The different names given to hurricane-like storms in different parts of the world.

Global Activity

Discusses the regions of the Earth where tropical cyclones can be found.

El Niño

See how El Niño appears to affect hurricane activity.

Acknowledgments

Those who contributed to the development of this module.

The navigation menu (left) for this module is called "Hurricanes" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). Land Breezes

Growth Processes

Convergence Associated With Cyclones

extra-tropical and tropical cyclones

Both extra-tropical and tropical cyclones, like this hurricane, can cause air to rise. This type of lifting is different from the lifting produced along frontal boundaries.

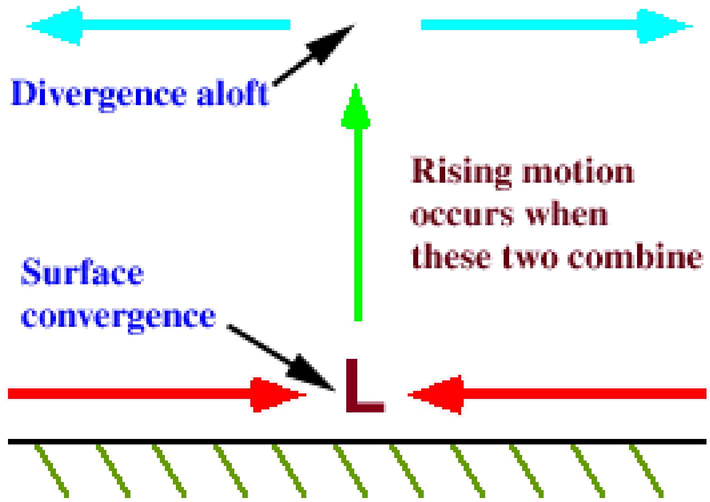
[Image: hurricane picture (68K)]
Image by: the GOES Project

In hurricanes, condensation occurs through a process known as CISK (Convective Instability of the Second Kind). We will demonstrate CISK by referring to the animated cross-section through a mature hurricane given below. In CISK, surface convergence (pink horizontal arrows) causes rising motion around a surface cyclone (labeled as "L"). The air cools as it rises (red vertical arrows) and condensation occurs, which releases latent heat into the atmosphere. This heating causes air to expand, creating an area of high pressure aloft. The force resulting from the established pressure gradient causes air to diverge at upper levels (red horizontal arrows).

[Image: hurricane (25K)]
Animation by: Shao

Since pressure is a measure of the weight of the air above a unit area, removal of air at upper levels subsequently reduces pressure at the surface. A further reduction in surface pressure leads to increasing convergence (due to an intensified pressure gradient), which further intensifies the rising motion, latent heat release, and so on. Despite the absence of fronts, a tremendous amount of lifting occurs in hurricanes, with intense condensation leading to the development of deep clouds and heavy rainfall.

In extra-tropical cyclones, surface winds are deflected by friction towards the center of the low pressure system (red "L" below).



Coupled with divergence aloft, (blue arrows), surface convergence (red arrows) can generate rising motion (green arrow) that leads to the condensation of water vapor.

---

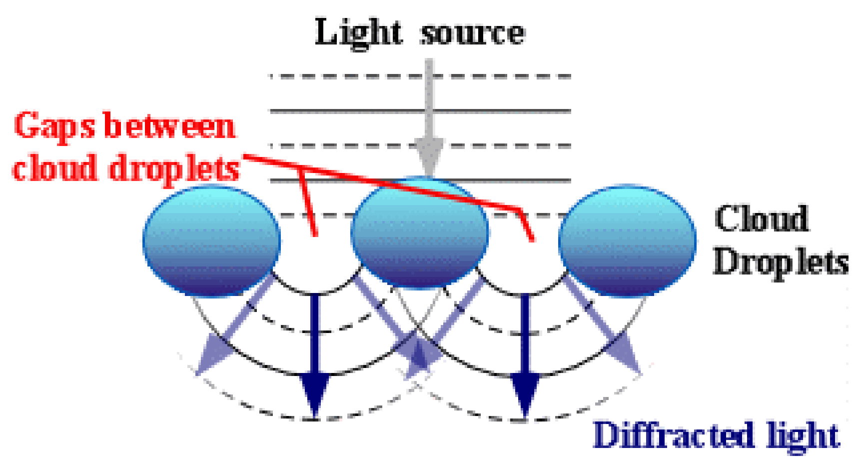
convection

fronts

Diffraction of Light

light bending around an object

Diffraction is the slight bending of light as it passes around the edge of an object. The amount of bending depends on the relative size of the wavelength of light to the size of the opening. If the opening is much larger than the light's wavelength, the bending will be almost unnoticeable. However, if the two are closer in size or equal, the amount of bending is considerable, and easily seen with the naked eye.



In the atmosphere, diffracted light is actually bent around atmospheric particles -- most commonly, the atmospheric particles are tiny water droplets found in clouds. Diffracted light can produce fringes of light, dark or colored bands. An optical effect that results from the diffraction of light is the silver lining sometimes found around the edges of clouds or coronas surrounding the sun or moon. The illustration above shows how light (from either the sun or the moon) is bent around small droplets in the cloud.

Optical effects resulting from diffraction are produced through the interference of light waves. To visualize this, imagine light waves as water waves. If water waves were incident upon a float residing on the water surface, the float would bounce up and down in response to the incident waves, producing waves of its own. As these waves spread outward in all directions from the float, they interact with other water waves. If the crests of two waves combine, an amplified wave is produced (constructive interference). However, if a crest of one wave and a trough of another wave combine, they cancel each other out to produce no vertical displacement (destructive interference).

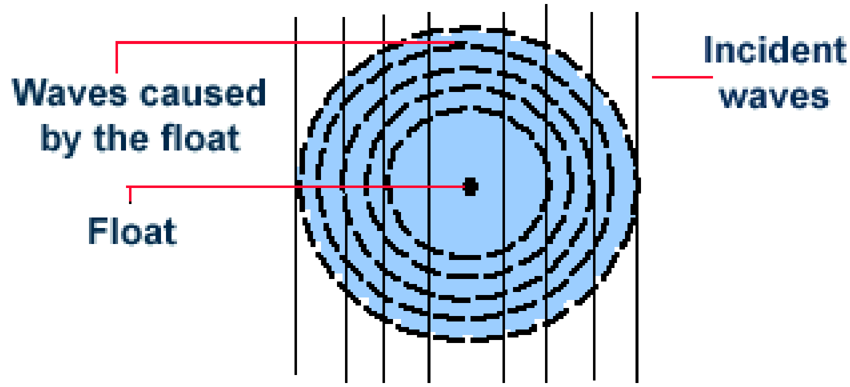
water droplets

mechanisms

reflection
scattering
refraction
diffraction

User Interface

graphicstext



This concept also applies to light waves. When sunlight (or moonlight) encounters a cloud droplet, light waves are altered and interact with one another in a similar manner as the water waves described above. If there is constructive interference, (the crests of two light waves combining), the light will appear brighter. If there is destructive interference, (the trough of one light wave meeting the crest of another), the light will either appear darker or disappear entirely.

Midlatitude cyclones are the cause of most of the stormy weather in the United States, espeically during the winter season. Understanding the structure and evolution of midlatitude cyclones is crucial for predicting significant weather phenomena such as blizzards, flooding rains, and severe weather.

A midlatitude cyclone is an area of low pressure located between 30 degrees and 60 degrees latitude. Since the continental United States is located in this latitude belt, these cyclones impact the weather in the U.S.

This instructional module introduces the most important features of midlatitude cyclones. The module is divided into the following sections:

Sections

Last Update: 08/22/97

Definition of a Cyclone
The general structure of a cyclone and associated air masses and fronts is discussed.

Winds Associated With a Cyclone
A cyclone can be located simply using the wind barbs.

Air Masses and Cyclones
The movement of air masses associated with cyclone is discussed.

Cyclones on Satellite Images
A midlatitude cyclone looks very distinct on a satellite image.

Upper Air Features
Cyclones develop as a result of upper air features discussed in this section, included troughs, wave amplification, and jet streaks.

Acknowledgements
Those who contributed to the development of this module.

The navigation menu (left) for this module is called "Midlatitude Cyclones" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). A Developing Supercell Intensifies

precipitation and winds intensify, rotation develops

This was initially a small supercell, looking west from about 8 miles, that packed a very intense rotating updraft. The rain curtains extending beneath the storm base were rotating, and looked very much like the rain areas we have seen under HP supercell bases. Once again, note the vaulted appearance on the north (right) side of the updraft. The storm was producing baseball size hail at this time, and a low-pitched, subtle, and continuous roaring sound was heard. Storm chasers have heard this a number of times, particularly close to LP storms, and attribute it to hailfall.

[Image: hail producing storm (59K)]

Photograph by: Moller

Below is a northward view of the storm's main precipitation area. It has the nearly transparent look of an LP storm. The radar echo at this time showed a relatively small VIP 4 storm, although a small radar pendant was present. A VIP 4 with baseball hail! Indeed, it seemed to have mainly LP characteristics, except for the rotating rain curtains wrapping around the updraft base.

[Image: evolved into an lp storm (56K)]

Photograph by: Moller

At this time and location, just west of Archer City, Texas, east surface winds were blowing into the supercell at 25 to 30 MPH. We are very close in position to the pseudo-warm front, separating cool outflow coming from this precipitation area to the north from warm air to the south...

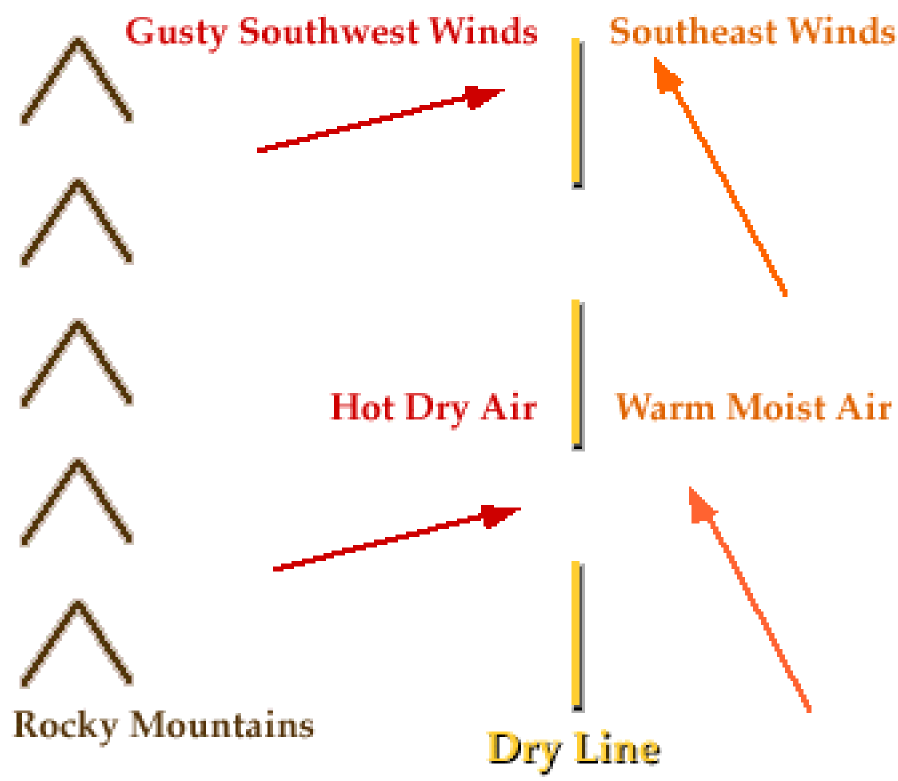
temperatures

Dry Line

a moisture boundary

Forecast Tip:
If a dryline is approaching your region, predict that air will be much drier after the boundary moves through. Storms are possible as the dryline approaches. The temperature may rise after the dryline passes through, since dry air heats up more quickly than moist air.

A dryline is a boundary that separates a moist air mass from a dry air mass. A dryline is also called a **Dew Point Front**. Sharp changes in dew point temperature can be found across a dryline (sometimes 9 degrees **Celsius** per kilometer). Drylines are most commonly found just east of the Rocky Mountains, separating a warm, moist air mass to the east from a hot, dry air mass to the west (see diagram below).



States like Texas, New Mexico, Oklahoma, Kansas, and Nebraska frequently experience drylines in the spring and summer, while east of the Mississippi River, drylines are extremely rare. The dryline is represented on surface maps by a dashed yellow line (see example below).

[Image: dry line on weather map (24K)]

Dew points east of the dryline shown above range from the upper 50's to low 70's, with winds from the southeast. West of the dryline, dew points are much lower, in the 20's and 30's, which is almost 50 degrees less than those found east of the dryline.

Air temperature ahead of the dryline is generally in the 70's and 80's. Behind the dryline, temperatures are hotter, ranging from the mid 80's to mid 90's. The drier air behind the dryline lifts the moist air ahead of it as it advances, which could lead to the development of thunderstorms along and ahead of the dryline in a manner similar to how thunderstorms develop along cold fronts.

Temperatures

Relative Humidity

indicates how moist the air is

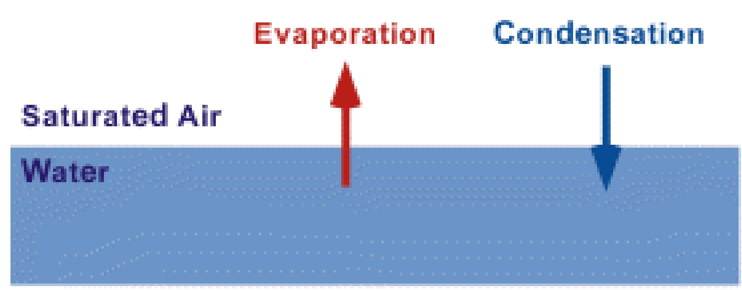
Relative humidity may be defined as the ratio of the water vapor density (mass per unit volume) to the saturation water vapor density, usually expressed in percent:

$$\textbf{Relative Humidity (RH)} = \frac{\text{(Actual Vapor Density)}}{\text{(Saturation Vapor Density)}} \times 100\%$$

Relative humidity is also approximately the ratio of the actual to the saturation vapor pressure.

$$\textbf{RH} = \frac{\text{(Actual Vapor Pressure)}}{\text{(Saturation Vapor Pressure)}} \times 100\%$$

Actual vapor pressure is a measurement of the amount of water vapor in a volume of air and increases as the amount of water vapor increases. Air that attains its saturation vapor pressure has established an equilibrium with a flat surface of water. That means, an equal number of water molecules are evaporating from the surface of the water into the air as are condensing from the air back into the water.



Saturation vapor pressure is a unique function of temperature as given in the table below. Each temperature in the table may be interpreted as a dew point temperature, because as the ground cools, dew will begin to form at the temperature corresponding to the vapor pressure in this table.

Chart adapted from: Ahrens

For example, if the water vapor pressure in the air is 10.2 millibars (mb), dew will form when the ground reaches 45 degrees Fahrenheit (F). The relative humidity for air containing 10.2 mb of water vapor is simply 100% times 10.2 mb divided by the saturation vapor pressure at the actual temperature. For example, at 70 F the saturation vapor pressure is 25 mb, so the relative humidity would be

RH = 100% X (10.21 / 25.0) = 41%

Clouds, Precipitation

introduction
development
cloud types

Cirrus Clouds

thin and wispy

The most common form of high-level clouds are thin and often wispy cirrus clouds. Typically found at heights greater than 20,000 feet (6,000 meters), cirrus clouds are composed of ice crystals that originate from the freezing of supercooled water droplets. Cirrus generally occur in fair weather and point in the direction of air movement at their elevation.

[Image: more cirrus clouds (76K)]

Cirrus can form from almost any cloud that has undergone glaciation and can be observed in a variety of shapes and sizes. Possibilities range from the "finger-like" appearance of cirrus fall streaks to the uniform texture of more extensive cirrus clouds associated with an approaching warm front.

[Image: cirrus fall streaks (83K)]

Photograph by: Holle

Fall streaks form when snowflakes and ice crystals fall from cirrus clouds. The change in wind with height and how quickly these ice crystals fall determine the shapes and sizes the fall streaks attain. Since ice crystals fall much more slowly than raindrops, fall streaks tend to be stretched out horizontally as well as vertically. Cirrus streaks may be nearly straight, shaped like a comma, or seemingly all tangled together.

Similar to fall streaks is virga, which appears as streamers suspended in the air beneath the base of precipitating clouds. Virga develops when precipitation falls through a layer of dry air and evaporates before reaching the ground.

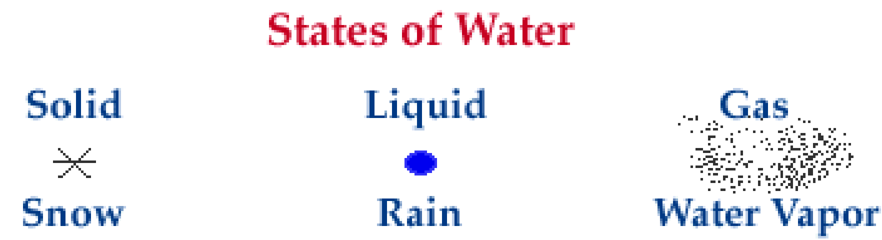
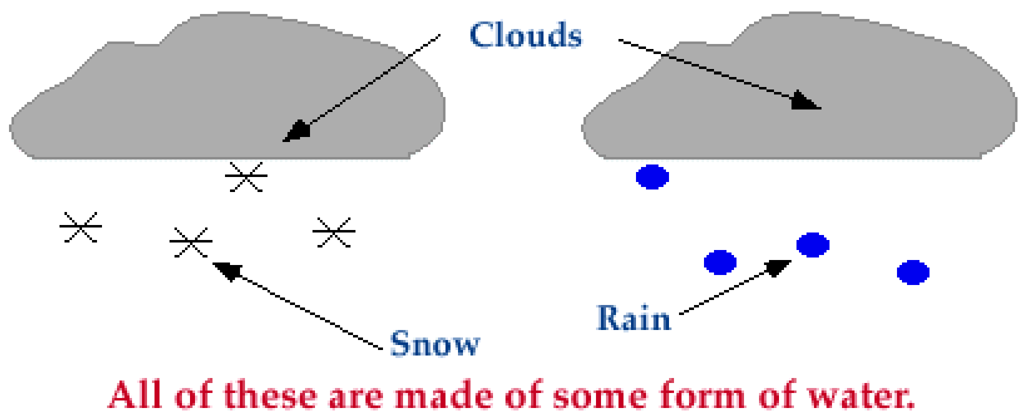
The States of Water

solid, liquid, gas

Water is known to exist in three different states; as a solid, liquid or gas.

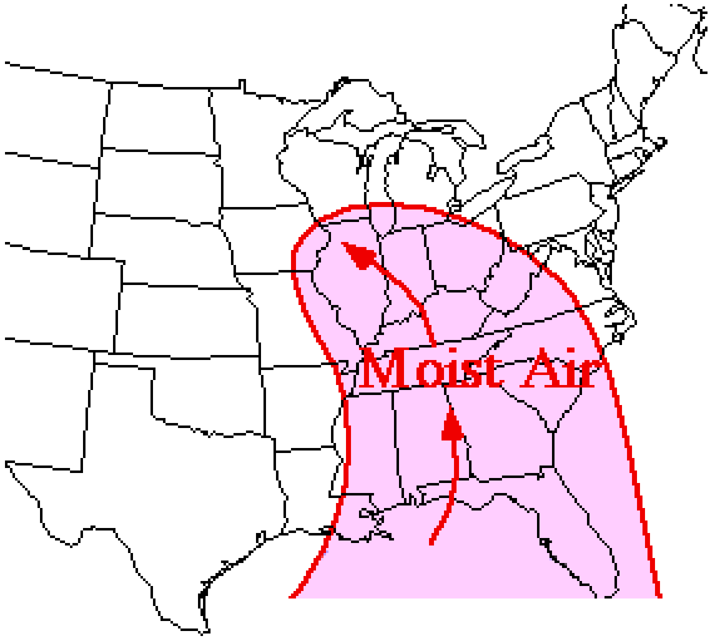


Clouds, snow, and rain are all made of up of some form of water. A cloud is comprised of tiny water droplets and/or ice crystals, a snowflake is an aggregate of many ice crystals, and rain is just liquid water.



Water existing as a gas is called water vapor. When referring to the amount of moisture in the air, we are actually referring to the amount of water vapor. If the air is described as "moist", that means the air contains large amounts of water vapor. Common sources of moisture for the United States are the warm moist air masses that flow northward from the Gulf of Mexico and western Atlantic Ocean as well as the moist Pacific air masses brought onshore by the westerlies.

As cyclones move eastward from the Rocky Mountains, southerly winds ahead of these storm systems transport the warm moist air northward. Moisture is a necessary ingredient for the production of clouds and precipitation.



Clounds, Precipitation

relative humidity

Cloud Types

common cloud classifications

Clouds are classified into a system that uses Latin words to describe the appearance of clouds as seen by an observer on the ground. The table below summarizes the four principal components of this classification system (Ahrens, 1994).

Latin Root	Translation	Example
cumulus	heap	fair weather cumulus
stratus	layer	altostratus
cirrus	curl of hair	cirrus
nimbus	rain	cumulonimbus

Further classification identifies clouds by height of cloud base. For example, cloud names containing the prefix "cirr-", as in cirrus clouds, are located at high levels while cloud names with the prefix "alto-", as in altostratus, are found at middle levels. This module introduces several cloud groups. The first three groups are identified based upon their height above the ground. The fourth group consists of vertically developed clouds, while the final group consists of a collection of miscellaneous cloud types.

[Image: thickening cirrus and cirrostratus at sunset (65K)]
Photograph by: Knupp

High-Level Clouds

High-level clouds form above 20,000 feet (6,000 meters) and since the temperatures are so cold at such high elevations, these clouds are primarily composed of ice crystals. High-level clouds are typically thin and white in appearance, but can appear in a magnificent array of colors when the sun is low on the horizon.

[Image: puffy altocumulus clouds (87K)]
Photograph by: Holle

Mid-Level Clouds

The bases of mid-level clouds typically appear between 6,500 to 20,000 feet (2,000 to 6,000 meters). Because of their lower altitudes, they are composed primarily of water droplets, however, they can also be composed of ice crystals when temperatures are cold enough.

- **Low-level Clouds**

Low clouds are of mostly composed of water droplets since their bases

precipitation

Cloud Types

introduction

graphicstext

generally lie below 6,500 feet (2,000 meters). However, when temperatures are cold enough, these clouds may also contain ice particles and snow.

[Image: nimbostratus clouds (80K)]
Photograph by: Holle

Vertically Developed Clouds

Probably the most familiar of the classified clouds is the cumulus cloud. Generated most commonly through either thermal convection or frontal lifting, these clouds can grow to heights in excess of 39,000 feet (12,000 meters), releasing incredible amounts of energy through the condensation of water vapor within the cloud itself.

[Image: approaching cumulonimbus clouds at sunset (69K)]
Photograph by: Holle

Other Cloud Types

Finally, we will introduce a collection of miscellaneous cloud types which do not fit into the previous four groups.

Classifications

Last Update: 07/09/97

High-Level Clouds
Cloud types include: cirrus and cirrostratus.

Mid-Level Clouds
Cloud types include: altocumulus, altostratus.

Low-Level Clouds
Cloud types include: nimbostratus and stratocumulus.

Clouds with Vertical Development
Cloud types include: fair weather cumulus and cumulonimbus.

Other Cloud Types
Cloud types include: contrails, billow clouds, mammatus, orographic and pileus clouds.

Development

High-Level Clouds

[Image: home graphic (104K)]

Photograph by: Norene McGhiey

When cloud particles become too heavy to remain suspended in the air, they fall to the earth as precipitation. Precipitation occurs in a variety of forms; hail, rain, freezing rain, sleet or snow. This portion of the Clouds and Precipitation module focuses on precipitation and has been organized into the following sections.

Sections

Latest Update: 07/21/97

Rain and Hail
Atmospheric conditions that lead to the development of rain and hail.

Freezing Rain
A detailed look at freezing rain, associated dangers and the conditions that lead to its development.

Sleet
Atmospheric conditions that lead to the development of sleet.

Snow
Atmospheric conditions that lead to the development of snow.

Acknowledgments
Those who contributed to the Precipitation sections of the Clouds and Precipitation module.

The navigation menu (left) for this section is called "Precipitation" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Multiple Interfaces

different interfaces for different connectivity

[Image: graphics interface example (31K)]
Graphics Interface

In light of all this, we made it a high priority of WW2010 to not only be able to accommodate the high-bandwidth connections with lots of slick and fancy looking pages...

but not to forget that most people are accessing our resources through much slower connections. That is why each and every page is available in both a "graphics" or "text" based interface. In "text" mode, only very small inline images are downloaded.

[Image: text interface example (21K)]
Text Interface

A graphics-based and text-based example of the same page is shown here and the type of page that appears is controlled by the blue "User Interface" menu (left). The complete graphical representation of each page is obtained by clicking on "graphics", while in the "text" mode, are replaced by text links to these images.

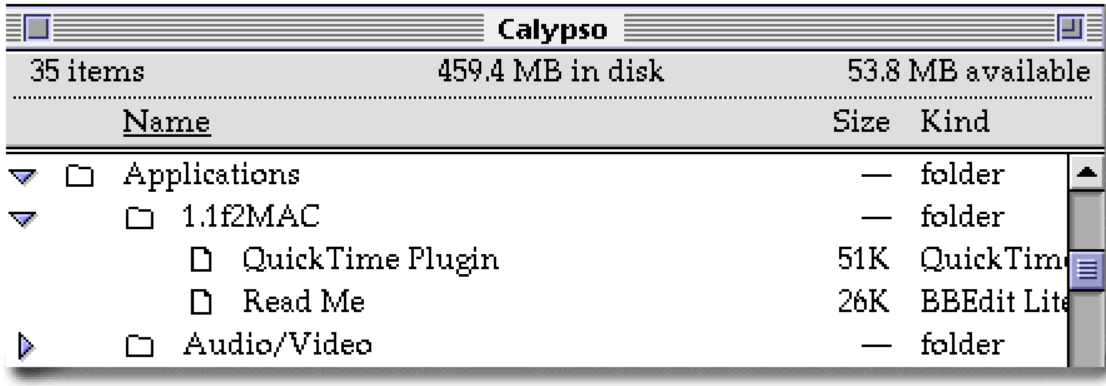
Navigating WW2010

menus and submenus

One of the unique features of WW2010 is the navigation bar along the left side of each page. Each menu resembles a folder on your computer desktop. A folder contains certain items which may either be individual files or additional subfolders, like in the image below.



For each menu, there is a corresponding menu title and the available items in that particular menu are listed below. Your current location within each menu is either highlighted in yellow or indicated by a small red arrow. (The indicator used depends upon the user interface and the web browser being used). In this case, the item "ww2010 user's guide" of the top menu called "Prerelease Info" is marked. This item opens a submenu titled "WW2010 User's Guide" and the item "core technologies" is marked. Then the item "Core Technologies" also contains a submenu of topics and so forth.

About WW2010

information and insights

[Image: (23K)]

Thank you for your interest and welcome to WW2010 (Weather World 2010), our evolving earth sciences web server. WW2010 strives to integrate real time and archived data with instructional resources using new and innovative technologies.

. This purpose of this section is to introduce some of the new concepts and features that make up WW2010, the philosophies behind their development and how to use them. The WW2010 User's Guide is now available to provide a history of WW2010 plus valuable insights into key components of the web server, namely the content resources and core technologies.

advection

Vorticity Advection

leads to rising/falling pressures at the surface

Vorticity is the localized rotation of the air. Air that rotates counterclockwise, such as in cyclones and troughs, is said to have positive vorticity. Clockwise rotating air, such as in high pressure systems and ridges, has negative vorticity. The advection of vorticity at high levels will result in a response at the surface which will attempt to offset the effects of the advection. More specifically, vorticity advection is indicative of rising motion/falling pressures at the surface. For example, look at this 500 mb map for 12Z, October 29, 1995.

[Image: 500 mb heights and vorticity (112K)]

Now look at these two maps of surface pressure (solid lines) from 12Z October 29,1995 and 0Z October 30,1995.

[Image: surface pressure and temperature (54K)]

Notice how the surface low has deepened in the area of strong vorticity advection.

Hybrid Multimedia Educational CD-ROM

WW2010 (the weather world 2010 project)

[Image: CD-ROM logo (73K)]

The Weather World 2010 CD-ROM's are back!!!
If you would like to learn more about the CD-ROM, please read below.
If you would like to order, click here for a printable order form.

The Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) would like to announce the release of the 2nd edition of the Weather World 2010 (WW2010) Educational CD-ROM. This resource is being constructed to provide local access to the high-graphics version our entire collection of Internet-based educational resources developed through our participation in NSF's Collaborative Visualization Project (CoVis). Most of these resources are currently available in the Online Guides.

New to the 2nd Edition of the WW2010 CD-ROM:
As seen on the web

- A Completely new Hurricane instructional module filled with new graphics and movies.
- New Modeling section to the Severe Storms instructional module including movies, animations, research results, and online access to streaming video.
- New pages in the Forces and Winds instructional module.
- Updates to the Satellite and Light & Optics instructional modules.
- New pages describing WW2010 Current weather products.
- Plus many other updates and revisions to other instructional modules and background pages.

Features of the CD-ROM will include:

INSTRUCTIONAL MODULES - that use multimedia and the flexible nature of the web to enhance the impact of educational resources. These modules introduce and explain fundamental topics in Meteorology (Pressure, Severe Storms, El Niño, Forecasting etc.), Remote Sensing (Radars and Satellites) and how some of these aspects fit into the Hydrologic Cycle.
NOTE: The only resources found online and not on the CD-ROM are the Tropical Cyclone tracker and 3-D VRML Hurricane. They will still be accessible online from the CD-ROM.

ARCHIVED WEATHER DATA - and case studies of memorable weather events like Hurricane Andrew, Storm of the Century and the

April 19, 1996 Illinois Tornado Outbreak. Each case contains relevant weather images, storm histories, photographs and eye-witness accounts.

STUDENT PROJECTS & ACTIVITIES - (complete with answer keys) that provide teachers with a meaningful way of integrating the data and instructional resources into the classroom.

REAL-TIME WEATHER DATA - will also be accessible from selected pages of the CD-ROM to allow the user to apply what they've learned to current weather conditions. These pages will link to relevant weather products accessible through our WW2010 web server.

EFFICIENT NAVIGATION - that allows users to move between hundreds of pages with only a few clicks and return easily.

These resources will be accessible from the CD-ROM by using any standard web browser and the interface will be nearly identical to their online counterparts. Therefore the same CD-ROM can be used on a Macintosh or an PC.

For a printable order form, click here!

If you have any questions or comments, please contact us at **ww2010@atmos.uiuc.edu**

Acknowledgments

developers

Daniel Bramer

Multimedia Specialist/Webmaster - Developed and edited instructional modules and diagrams. Responsible for editing "About WW2010" section including obtaining copyright permissions. Assisted System Manager in creating the final version of the Weather World 2010 Current Weather Products and the format and appearance adjustments to the WW2010 Educational CD-ROM.

David Wojtowicz

System Manager/Resource Programmer - Developed the underlying software infrastructure for the server including the AutoTree menu/navigation system. Maintains the machines that it runs on. Created and developed the Weather World 2010 Current Weather Products and their generation system.

Steven E. Hall

UIUC Covis Project Coordinator - Developed or edited instructional resources, text diagrams and curriculum. Responsible for web server layout and appearance, graphic design and the integration of the instructional resources into the new framework.

Principal Investigators

Bob Wilhelmson - Acting Department Head and Professor of Atmospheric Sciences.

Mohan Ramamurthy - Associate Professor of Atmospheric Sciences

---

Content Reviewers

DAS Students and Staff

Alex Brown - did the prototype design and HTML programming for constructing the text base navigation menus.

Bill Chapman - developed the early prototype of The Weather

Visualizer - a related product.

Paul Dekker - developed the original radar meteorology instructional module, graduated from this department in 1996.

Tom Grzelak - contributed to labeling of weather products and generation of multiple panel forecast images, received M.S. from this department in 1995.

Adam Houston - responsible for cover photograph for the CD-ROM.

Brian Jewett - took part in early developer meetings, developed several of the current weather products, developed simulations used in the Severe Storms instructional module.

Alan Liu - developed images for the El Niño instructional module, graduated from this department in 1997.

Geoff Manikin - constructed the Weather Forecasting instructional module, graduated from this department in 1995.

Norene McGhiey - transcribed text to the NOAA Severe Storms Spotters Guide, contributed to the April 19th Tornado Outbreak case study, and the Precipitation portion of the Clouds and Precipitation module.

Ed Mlodzik - constructed pages in the weather forecasting and midlatitude cyclones instructional modules, edited the Precipitation portion of the Clouds and Precipitation instructional module, took part in early developer meetings, helped prototype current weather products, graduated from this department in 1998.

Noah Nigg - developed the Virtual Reality Learning Tool for exploring hurricane Opal (VRML) for the Hurricane instructional Module

Scott Olthoff - constructed the Freezing Rain portion of the Clouds and Precipitation instructional module, prototyped current weather products, and took part in early developer meetings, graduated from this department in 1998.

Joel Plutchak - Java developer for current weather products, (e.g., The Interactive Weather Report and The Weather Visualizer), post-produced videos for the Hurricane instructional module.

Glen Romine - edited the Hurricanes instructional module.

Bruce Rose - constructed the Veteran's Day Snowstorm case study and took part in early developer meetings.

Crystal Shaw - helped with performance testing of WW2010, developed VRML scenes for the Severe Storms instructional module.

Yiqi Shao - constructed the Satellite Meteorology, El Niño, and the original Hurricanes instructional modules, plus the graphics design for a number of pages in the instructional modules.

Mythili Sridhar - constructed the original optics guide, the first online version of NOAA's Severe Storm Spotters Guide, graphically enhanced several modules, and prepared the CD-ROM for publication.

Ron Steve - constructed pages on the Forces and Winds instructional module, graduated from this department in 1996.

Vlad Tokarskiy - early Java developer (developed The Weather Animator) - a related product.

Jeff Van Dorn - constructed pages on the Air Masses and Fronts instructional module, responsible for cover photograph on 1st edition CD-ROM, graduated from this department in 1998.

Dave Werth - constructed pages on the Air Masses and Fronts instructional module, graduated from this department in 1997.

Kevin Wuebbles - helped transfer of old instructional modules to the new format.

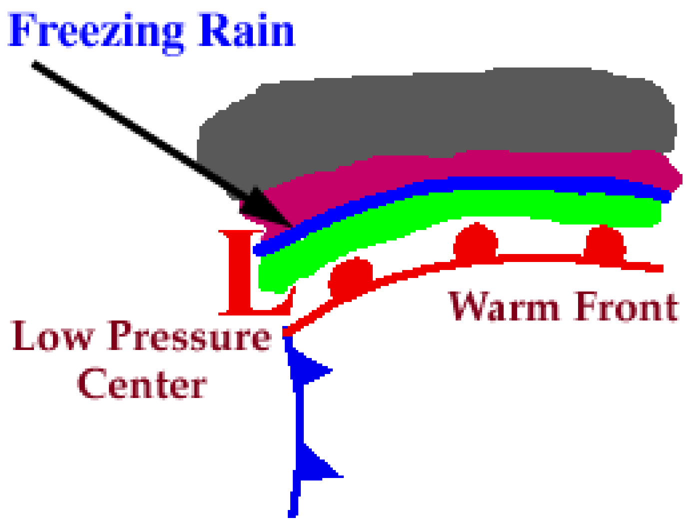
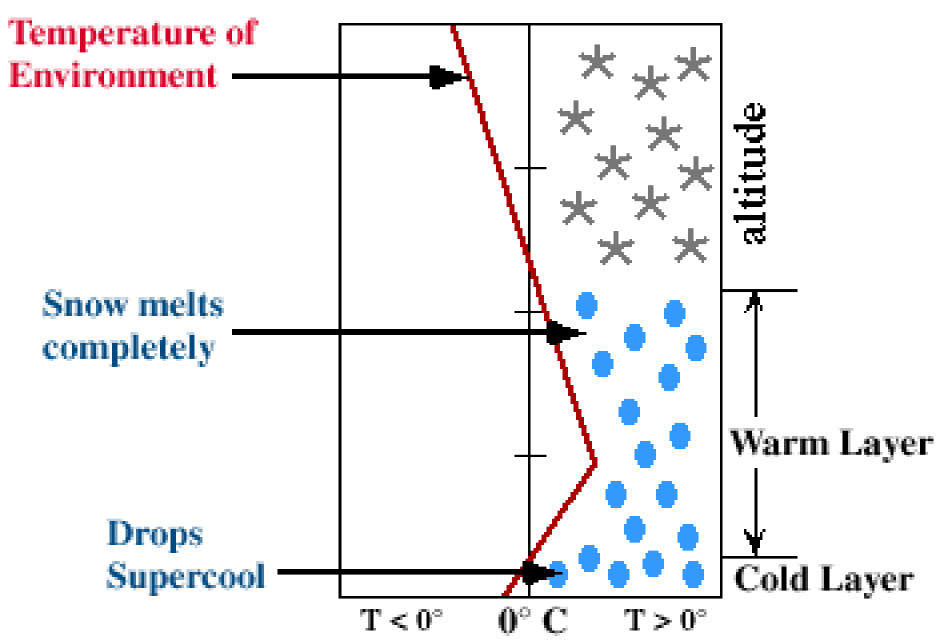
Freezing Rain

supercooled droplets freezing on impact

Ice storms can be the most devastating of winter weather phenomena and are often the cause of automobile accidents, power outages and personal injury. Ice storms result from the accumulation of freezing rain, which is rain that becomes supercooled and freezes upon impact with cold surfaces. Freezing rain is most commonly found in a narrow band on the cold side of a warm front, where surface temperatures are at or just below freezing.



The diagram below shows a typical temperature profile for freezing rain with the red line indicating the atmosphere's temperature at any given altitude. The vertical line in the center of the diagram is the freezing line. Temperatures to the left of this line are below freezing, while temperatures to the right are above freezing.



Freezing rain develops as falling snow encounters a layer of warm air deep enough for the snow to completely melt and become rain. As the rain continues to fall, it passes through a thin layer of cold air just above the surface and cools to a temperature below freezing. However, the drops themselves do not freeze, a phenomena called supercooling (or forming "supercooled drops"). When the supercooled drops strike the frozen ground (power lines, or tree branches), they instantly freeze, forming a thin film of ice, hence freezing rain.

Open-Ended Projects

introduction
superstorm '93
trusting the forecast

User Interface

graphicstext

[Image: projects image menu (56K)]

The fundamental philosophy behind the CoVis Project is to help kids learn science by doing projects, as opposed to the traditional learning out of textbooks. Part of this includes the integration of new and innovative technologies (like the Internet) into the classroom. To do this, we have developed two project units which provide teachers with a vehicle for using the Internet in a meaningful way to help kids learn science.

Projects

Last Update: 08/01/97

SuperStorm '93
This project investigates key weather processes and phenomena associated with a potent winter storm.

Trusting the Forecast
This project provides students with first hand experience in weather forecasting and all the issues a meteorologist must consider when issuing a forecast.

Two projects have been constructed, a Case Study of SuperStorm '93, a famous midlatitude cyclone that paralyzed the eastern third of the United States in March of 1993, and Trusting the Forecast, where students actually make forecasts on a regular basis to gain a full appreciation for all the preparation involved in making an accurate forecast. These units have been designed to take up to three weeks of class time in order to complete.

The navigation menu (left) for this module is called "Open-Ended Projects" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Projects, Activities

SuperStorm '93

[Image: main logo for student activities (47K)]
Graphic by: Steven E. Hall

The following classroom activities introduce a variety of fundamental topics in meteorology. All necessary data and instructional resources are accessible from each activity. In addition, each activity is accompanied by a corresponding teacher guide (or answer key). Up to 90 minutes of classroom time may be needed to complete each activity.

Activities

Last Update: 07/12/97

Pressure
Atmospheric pressure, high and low pressure centers, and the pressure gradient force.

Air Masses
Characteristics of air masses that commonly influence weather in the U.S. and how to identify them on weather maps.

Precipitation Along Fronts
The development of precipitation along warm fronts and cold fronts.

Midlatitude Cyclones
Anatomy of midlatitude cyclones and how to identify them on weather maps.

Coordinated Universal Time (UTC)
Converting back and forth between local time and UTC.

Surface Observation Symbols
Interpreting meteorological data from observation symbols displayed on weather maps.

Current Weather Symbols
Interpreting common weather symbols found on weather maps.

Forecasting Temperatures
Influences of cloud cover, wind, snow cover and advection on forecasting temperatures.

Forecasting Precipitation
Useful indicators for predicting the development of precipitation.

The navigation menu (left) for this module is called "Classroom Activities" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web

Multiple Interfaces

different interfaces for different connectivity

[Image: graphics interface example (31K)]
Graphics Interface

In light of all this, we made it a high priority of WW2010 to not only be able to accommodate the high-bandwidth connections with lots of slick and fancy looking pages...

but not to forget that most people are accessing our resources through much slower connections. That is why each and every page is available in both a "graphics" or "text" based interface. In "text" mode, only very small inline images are downloaded.

[Image: text interface example (21K)]
Text Interface

A graphics-based and text-based example of the same page is shown here and the type of page that appears is controlled by the blue "User Interface" menu (left). The complete graphical representation of each page is obtained by clicking on "graphics", while in the "text" mode, are replaced by text links to these images.

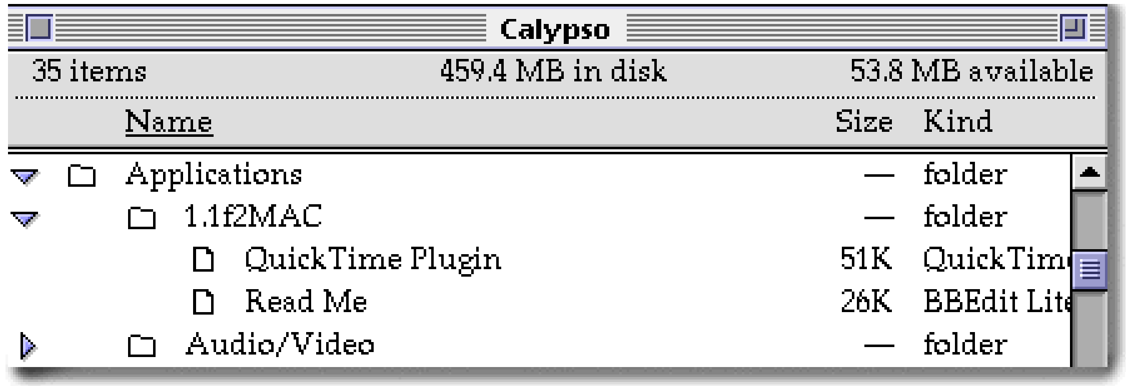
Navigating WW2010

menus and submenus

One of the unique features of WW2010 is the navigation bar along the left side of each page. Each menu resembles a folder on your computer desktop. A folder contains certain items which may either be individual files or additional subfolders, like in the image below.



For each menu, there is a corresponding menu title and the available items in that particular menu are listed below. Your current location within each menu is either highlighted in yellow or indicated by a small red arrow. (The indicator used depends upon the user interface and the web browser being used). In this case, the item "ww2010 user's guide" of the top menu called "Prerelease Info" is marked. This item opens a submenu titled "WW2010 User's Guide" and the item "core technologies" is marked. Then the item "Core Technologies" also contains a submenu of topics and so forth.

About WW2010

information and insights

[Image: (23K)]

Thank you for your interest and welcome to WW2010 (Weather World 2010), our evolving earth sciences web server. WW2010 strives to integrate real time and archived data with instructional resources using new and innovative technologies.

This purpose of this section is to introduce some of the new concepts and features that make up WW2010, the philosophies behind their development and how to use them. The WW2010 User's Guide is now available to provide a history of WW2010 plus valuable insights into key components of the web server, namely the content resources and core technologies.

300 mb Winds and Heights

eta model forecast

[Image: (22K)]

Latest ETA Model 12 HR Forecast Panel

300 mb forecasted fields for geopotential height, wind speed and wind vectors. 300 mb charts depict conditions in the upper troposphere (roughly 9000 meters) where most of the weather producing phenomena occur, otherwise known as the jet stream level.

Geopotential height approximates the actual height of a pressure surface above mean sea-level and is represented by the solid white contours. The geopotential height field is given in meters with an interval of 120 meters between height lines. The 300 mb height field encircling the globe consists of a series of troughs and ridges, which are the upper air counterparts of surface cyclones and anticyclones. The distance from trough to trough (or ridge to ridge) is known as a longwave. Embedded within the longwaves are shortwaves, which are smaller disturbances often responsible for triggering surface cyclone development.

Wind vectors provide information about wind direction and wind speed and are drawn here as tiny red arrows. Wind vectors point towards the direction in which the wind is blowing and the longer the wind vector, the stronger the wind. The unit of magnitude for wind speed as depicted by the wind vectors is meters per second.

Wind speed is represented by the color filled regions and the intensity is indicated by the color code located in the lower left corner of the forecast panel. Wind speeds are given in knots with an interval of 20 knots between wind speed contours, also called isotachs. Wind speeds of less than 60 knots are represented by shades of blue while winds exceeding 120 knots are depicted in shades of red.

This information is useful in locating the jet stream, a narrow band of relatively strong winds encircling the earth in the upper troposphere. Wind speed maxima embedded within the jet stream, called jet streaks, are localized regions of high atmospheric energy that play a vital role in the development of surface low pressure centers. The closer together the height contours, the stronger the wind speed, which is why jet streaks are found where height contours are packed closely together.

Hybrid Multimedia Educational CD-ROM

WW2010 (the weather world 2010 project)

[Image: CD-ROM logo (73K)]

The Weather World 2010 CD-ROM's are back!!!
If you would like to learn more about the CD-ROM, please read below.
If you would like to order, click here for a printable order form.

The Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) would like to announce the release of the 2nd edition of the Weather World 2010 (WW2010) Educational CD-ROM. This resource is being constructed to provide local access to the high-graphics version our entire collection of Internet-based educational resources developed through our participation in NSF's Collaborative Visualization Project (CoVis). Most of these resources are currently available in the Online Guides.

New to the 2nd Edition of the WW2010 CD-ROM:
As seen on the web

- A Completely new Hurricane instructional module filled with new graphics and movies.
- New Modeling section to the Severe Storms instructional module including movies, animations, research results, and online access to streaming video.
- New pages in the Forces and Winds instructional module.
- Updates to the Satellite and Light & Optics instructional modules.
- New pages describing WW2010 Current weather products.
- Plus many other updates and revisions to other instructional modules and background pages.

Features of the CD-ROM will include:

INSTRUCTIONAL MODULES - that use multimedia and the flexible nature of the web to enhance the impact of educational resources. These modules introduce and explain fundamental topics in Meteorology (Pressure, Severe Storms, El Niño, Forecasting etc.), Remote Sensing (Radars and Satellites) and how some of these aspects fit into the Hydrologic Cycle.
NOTE: The only resources found online and not on the CD-ROM are the Tropical Cyclone tracker and 3-D VRML Hurricane. They will still be accessible online from the CD-ROM.

ARCHIVED WEATHER DATA - and case studies of memorable weather events like Hurricane Andrew, Storm of the Century and the

April 19, 1996 Illinois Tornado Outbreak. Each case contains relevant weather images, storm histories, photographs and eye-witness accounts.

STUDENT PROJECTS & ACTIVITIES - (complete with answer keys) that provide teachers with a meaningful way of integrating the data and instructional resources into the classroom.

REAL-TIME WEATHER DATA - will also be accessible from selected pages of the CD-ROM to allow the user to apply what they've learned to current weather conditions. These pages will link to relevant weather products accessible through our WW2010 web server.

EFFICIENT NAVIGATION - that allows users to move between hundreds of pages with only a few clicks and return easily.

These resources will be accessible from the CD-ROM by using any standard web browser and the interface will be nearly identical to their online counterparts. Therefore the same CD-ROM can be used on a Macintosh or an PC.

For a printable order form, click here!

If you have any questions or comments, please contact us at **ww2010@atmos.uiuc.edu**

Light, Optics

introduction
mechanisms
air, dust, haze
ice crystals

[Image: welcome banner (96K)]
Graphic by: Yiqi Shao

Rainbows, sunsets and halos; a spectacular display of colors and visuals in the sky called "atmospheric optics". As sunlight (or moonlight) enters the atmosphere, it is either absorbed, reflected, scattered, refracted or diffracted by atmospheric particles or air molecules. These processes, individually or in combination, are responsible for producing most optical effects. This module investigates these particle-light interactions and the assortment of optical effects they produce. The Light and Optics module has been organized into the following sections:

Sections

Last Update: 08/26/99

Mechanisms
Particle/Molecule-light interactions responsible for creating optical effects. These interactions include: reflection, scattering, refraction and diffraction.

Air, Dust, Haze
Optical effects resulting from the interaction of light with air, dust and haze particles. These effects include: crepuscular rays, blue skies, blue haze and sunsets.

Ice Crystals
Optical effects resulting from the interaction of light with ice crystals. These effects include: sundogs, sun pillars and halos.

Water Droplets
Optical effects resulting from the interaction of light with water droplets. These effects include: cloud iridescence, rainbows and a silver lining along the edge of clouds.

Acknowledgments
Those who contributed to the development of this module.

The type of optical effect that results greatly depends upon the type of particles the light encounters and on the wavelength of the light. For this reason, the optical effects discussed in this module have been grouped according to the following classifications of atmospheric particles: air, dust and haze, ice crystals, and water droplets.

The navigation menu (left) for this module is called "Light, Optics" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled by the blue "User Interface" menu (located beneath the black navigation menus). Graphic by: Yiqi Shao

The weight of the air above an object exerts a force per unit area upon that object and this force is called pressure. Variations in pressure lead to the development of winds, which in turn influence our daily weather. The purpose of this module is to introduce pressure, how it changes with height and the importance of high and low pressure systems. In addition, this module introduces the pressure gradient and Coriolis forces and their role in generating wind. Local wind systems such as land breezes and sea breezes will also be introduced. The Forces and Winds module has been organized into the following sections:

Air Masses, Fronts

- introduction
- air masses
- fronts
- advection

[Image: fronts welcome image (24K)]

Graphic by: Yiqi Shao

The purpose of this module is to introduce air masses, where they originate from and how they are modified. Clashing air masses in the middle latitudes spark interesting weather events and the boundaries separating these air masses are known as fronts. This module examines fronts, with detailed explanations about cold fronts and warm fronts. Finally, different types of advection are introduced; temperature, moisture and voriticity advection. The Air Masses and Fronts module has been organized into the following sections:

Sections

Last Update: 07/27/97

Air Masses

Air masses that commonly influence weather in the United States.

Fronts

Boundaries separating air masses. Includes warm fronts, cold fronts, occluded and stationary fronts and dry lines.

Advection

Introduces advection and describes the differences between warm and cold advection.

Acknowledgments

[Image: Weather Forecasting Banner (48K)]

Graphic developed by: Dan Bramer

"Look for hazy skies with afternoon thunderstorms and a high of 95 degrees." Weather forecasts, such as this one, provide critical information about the weather to come. In severe weather situations, short-term forecasts and warnings can help save lives and protect property. It is vital that weather forecasts be as accurate as possible because so many people depend upon them. This module introduces forecast methods and the numerous factors one must consider when attempting to make an accurate forecast. The Weather Forecasting module has been organized into the following sections:

Sections

Last Update: 07/21/97

Forecasting Methods
Different forecasting methods for different weather scenarios.

Surface Features
Important surface features to consider when making a forecast.

Forecasting Temperatures
Factors to consider when forecasting day and nighttime temperatures.

Forecasting Precipitation
Factors to consider when forecasting precipitation.

Acknowledgments
Those who contributed to the development of this module.

The navigation menu (left) for this module is called "Weather Forecasting" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

---

precipitation

User Interface

graphics text

[Image: severe weather home page image (95K)]
Graphic developed by: Dan Bramer

The Severe Storms Module is a combination of two elements. The first is the NOAA Severe Storms Spotters Guide. The second is a section recently added to discuss the efforts and results of modeling severe storms. The Severe Storms Spotters Guide contains supplemental instructional resources and a program designed to familiarize meteorologists and advanced severe storm spotters with the basic "building blocks" of convective storm structure. The focus of the training series is the development of a thunderstorm "spectrum" and a discussion of the physical characteristics and severe weather potential of the various storm types in the spectrum.

Sections

Last Update:05/15/99

Dangers of Thunderstorms
Includes: lightning, floods, hail, winds and tornadoes.

Types of Thunderstorms
Single cells, multicell clusters, multicell lines (squall lines) and supercells.

Components of Thunderstorms
Updrafts and downdrafts, outflow phenomena, wall clouds and the effects of wind shear on thunderstorm development.

Tornadoes
Tornadoes, cyclic storms and low-level flow fields associated with tornadic thunderstorms.

Modeling
Supercells, squall lines, and other phenomena recreated inside computers for the benefit of forecasting and understanding.

Acknowledgments
Those who contributed to the development of this module.

The critical role of atmospheric dynamics and thermodynamics in determination of storm type is stressed. We will take a close look at the storms themselves; from the small, summer storms capable of producing dangerous "microbursts" to the large "supercell" storms which spawn destructive tornadoes.

The navigation menu (left) for this module is called "Severe Storms" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in

Dangers of T-storms

[Image: home page image (61K)]
Graphic by: Yiqi Shao

Periodically, the flourishing fish populations commonly found off the west coast of Peru South America are replaced by the sight of dead fish littering the water and beaches. Unusual weather conditions occur around the globe as jet streams, storm tracks and monsoons are shifted. Such disarray is caused by a warm current of water that appears every three to seven years in the eastern Pacific Ocean called El Niño. This module introduces El Niño, conditions are responsible for its occurrence, plus the impact it has on the rest of the world. The El Niño instructional module has been organized into the following sections:

Sections

Last Update: 04/28/98

Definition
Introduces El Niño, when El Niño events have been recorded and how it compares to La Niña.

'97-'98 Event
Provides a brief insight into the most recent El Niño event.

Upwelling
Introduces upwelling, the thermocline and how they impact local sea life populations.

Non-El Niño Years
Typical oceanic and atmospheric conditions that exist in the tropical Pacific when no El Niño is present..

El Niño Events
Conditions that lead to an El Niño event and how El Niño influences upwelling processes, tropical rainfall and local fish populations.

Sea Surface Temperatures
El Niño visualized through sea surface temperature anomaly plots.

Impacts on Weather
The influence of El Niño on weather conditions worldwide.

Economic Impacts
Reduction in local fish populations, which in turn affect local industry and market prices worldwide.

Detection and Prediction
Methods and resources used by NOAA for detecting and

User Interface

graphics text

predicting the presence of El Niño.

Acknowledgments
Those who contributed to the development of this module.

The navigation menu (left) for this module is called "El Nino" and the menu items are arranged in a recommended sequence, beginning with this introduction. In addition, this entire web server is accessible in both "graphics" and "text"-based modes, a feature controlled from the blue "User Interface" menu (located beneath the black navigation menus). More information about the user interface options, the navigation system, or WW2010 in general is accessible from About This Server.

Precipitation

definition

[Image: Hydrologic Graphic (76K)]
Graphic by: Dan Bramer

Water is the source of all life on earth. The distribution of water, however, is quite varied; many locations have plenty of it while others have very little. Water exists on earth as a solid (ice), liquid or gas (water vapor). Oceans, rivers, clouds, and rain, all of which contain water, are in a frequent state of change (surface water evaporates, cloud water precipitates, rainfall infiltrates the ground, etc.). However, the total amount of the earth's water does not change. The circulation and conservation of earth's water is called the "hydrologic cycle". The Hydrologic Cycle module has been organized into the following sections:

Sections

Last Update: 07/21/97

The Earth's Water Budget
The distribution of water among the oceans, land and atmosphere.

Evaporation
The transformation of water from a liquid into a gas, a process which humidifies the atmosphere.

Condensation
The transformation of water from a gas into a liquid, and the processes that lead to condensation.

Transport
The movement of water through the atmosphere.

Precipitation
The transfer of water from the atmosphere to land. Rain, snow, hail, sleet, and freezing rain are discussed.

Groundwater
Water located below ground and how it returns to the surface.

Transpiration
Transfer of water to the atmosphere by plants and vegetation.

Runoff
Rivers, lakes, and streams transport water from land to the oceans. Too much rainfall can cause excess runoff, or flooding.

Summary and Example

A brief encapsulation of the hydrologic cycle, plus an example of the hydrologic cycle at work.

Acknowledgments
Those who contributed to the development of this module.

Multiple Interfaces

different interfaces for different connectivity

[Image: graphics interface example (31K)]
Graphics Interface

In light of all this, we made it a high priority of WW2010 to not only be able to accommodate the high-bandwidth connections with lots of slick and fancy looking pages...

but not to forget that most people are accessing our resources through much slower connections. That is why each and every page is available in both a "graphics" or "text" based interface. In "text" mode, only very small inline images are downloaded.

[Image: text interface example (21K)]
Text Interface

A graphics-based and text-based example of the same page is shown here and the type of page that appears is controlled by the blue "User Interface" menu (left). The complete graphical representation of each page is obtained by clicking on "graphics", while in the "text" mode, are replaced by text links to these images.

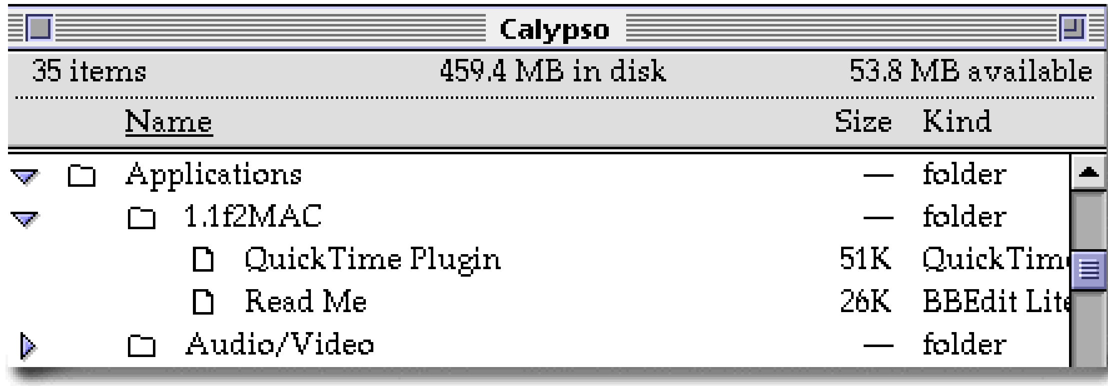
Navigating WW2010

menus and submenus

One of the unique features of WW2010 is the navigation bar along the left side of each page. Each menu resembles a folder on your computer desktop. A folder contains certain items which may either be individual files or additional subfolders, like in the image below.



For each menu, there is a corresponding menu title and the available items in that particular menu are listed below. Your current location within each menu is either highlighted in yellow or indicated by a small red arrow. (The indicator used depends upon the user interface and the web browser being used). In this case, the item "ww2010 user's guide" of the top menu called "Prerelease Info" is marked. This item opens a submenu titled "WW2010 User's Guide" and the item "core technologies" is marked. Then the item "Core Technologies" also contains a submenu of topics and so forth.

About WW2010

information and insights

[Image: (23K)]

Thank you for your interest and welcome to WW2010 (Weather World 2010), our evolving earth sciences web server. WW2010 strives to integrate real time and archived data with instructional resources using new and innovative technologies.

. This purpose of this section is to introduce some of the new concepts and features that make up WW2010, the philosophies behind their development and how to use them. The WW2010 User's Guide is now available to provide a history of WW2010 plus valuable insights into key components of the web server, namely the content resources and core technologies.

Hybrid Multimedia Educational CD-ROM

WW2010 (the weather world 2010 project)

[Image: CD-ROM logo (73K)]

The Weather World 2010 CD-ROM's are back!!!
If you would like to learn more about the CD-ROM, please read below. If you would like to order, click here for a printable order form.

The Department of Atmospheric Sciences (DAS) at the University of Illinois Urbana-Champaign (UIUC) would like to announce the release of the 2nd edition of the Weather World 2010 (WW2010) Educational CD-ROM. This resource is being constructed to provide local access to the high-graphics version our entire collection of Internet-based educational resources developed through our participation in NSF's Collaborative Visualization Project (CoVis). Most of these resources are currently available in the Online Guides.

New to the 2nd Edition of the WW2010 CD-ROM:
As seen on the web

- A Completely new Hurricane instructional module filled with new graphics and movies.
- New Modeling section to the Severe Storms instructional module including movies, animations, research results, and online access to streaming video.
- New pages in the Forces and Winds instructional module.
- Updates to the Satellite and Light & Optics instructional modules.
- New pages describing WW2010 Current weather products.
- Plus many other updates and revisions to other instructional modules and background pages.

Features of the CD-ROM will include:

INSTRUCTIONAL MODULES - that use multimedia and the flexible nature of the web to enhance the impact of educational resources. These modules introduce and explain fundamental topics in Meteorology (Pressure, Severe Storms, El Niño, Forecasting etc.), Remote Sensing (Radars and Satellites) and how some of these aspects fit into the Hydrologic Cycle.
NOTE: The only resources found online and not on the CD-ROM are the Tropical Cyclone tracker and 3-D VRML Hurricane. They will still be accessible online from the CD-ROM.

ARCHIVED WEATHER DATA - and case studies of memorable weather events like Hurricane Andrew, Storm of the Century and the

April 19, 1996 Illinois Tornado Outbreak. Each case contains relevant weather images, storm histories, photographs and eye-witness accounts.

STUDENT PROJECTS & ACTIVITIES - (complete with answer keys) that provide teachers with a meaningful way of integrating the data and instructional resources into the classroom.

REAL-TIME WEATHER DATA - will also be accessible from selected pages of the CD-ROM to allow the user to apply what they've learned to current weather conditions. These pages will link to relevant weather products accessible through our WW2010 web server.

EFFICIENT NAVIGATION - that allows users to move between hundreds of pages with only a few clicks and return easily.

These resources will be accessible from the CD-ROM by using any standard web browser and the interface will be nearly identical to their online counterparts. Therefore the same CD-ROM can be used on a Macintosh or an PC.

For a printable order form, click here!

If you have any questions or comments, please contact us at **ww2010@atmos.uiuc.edu**

August 6, 2004

- We are pleased to announce that EPA has published a final rule revising Subpart GG of 40 CFR Part 60, which simplifies emissions monitoring, testing and reporting for combustion turbines that are simultaneously regulated under Part 60 and 40 CFR Part 75. This rule, published on July 8, 2004 (See 69 FR pp. 41346-41364) , represents the completion of the Turbine Initiative effort, which the Agency undertook in response to concerns from the regulated community. The Turbine Initiative helps resolving testing and reporting inconsistencies and redundancies between Part 60 and Part 75, improves the cost-effectiveness of monitoring, and simplifies the process of determining compliance. The Office of Air Quality Planning and Standards (OAQPS) and the Clean Air Markets Division (CAMD) worked together on this Initiative to ensure a high level of harmony between both regulations. For questions or comments, contact Jaime Pagan of OAQPS at 919-541-5340 and either Ruben Deza of CAMD at 202-343-9364 or Bob Vollaro of CAMD at 202-343-9116.

June 21, 2004

- MDC Version 4.2.48 .The current version of MDC is Version 4.2.48, revised as of June 15, 2004. This version of MDC supersedes MDC version 4.2.46 which was previously posted in March, 2004. EPA is releasing this version of MDC to provide a less stringent QA Status Evaluation (in MDC Hourly) for linearity checks of both ranges of dual range analyzer components (e.g., NOXA, SO2A, SO2H, SO2L, etc.) to make sure false errors are not generated. New logic has been added to handle the alternate specification for low-flow RATAs. MDC v4.2.48 also includes minor fixes to problems that were reported in the previous version. The changes and fixes are detailed in the Release Notes document.

- New section of MDC CAMD Export Files has been added to provide access to the current monitoring plan and quality assurance test data stored in the CAMD's MDC database.

June 15, 2004

- Presentations from the June 10, 2004, NOx SIP Call Monitoring and Reporting Workshop are now available.

- The Clean Air Markets Division is currently writing documents to PDF using Adobe Acrobat **Version 6.0**. If you are having problems opening PFD documents, you may need to upgrade to a current version. Free Upgrade to Adobe Acrobat 6.0 EXIT disclaimer

April 29, 2004

- EPA 2003 Blind Audit of Protocol Calibration Gases for CEMS. This link is to three self explanatory tables (1) Cal Gas Audit Pass Fail Summary; (2) Cal Gas Audit Detailed Results; and (3) Cal Gas Audit Failure Rate by Reference Standard. It is important to read the footnotes on the tables.

- Presentations for the Milwaukee, WI, workshop added to the website

April 16, 2004

- **NEW!!** The Clean Air Markets Division is happy to announce the addition of the States and Regions area of our website! This area is intended to provide to our web users a place where all information specific to states and regions can be found. This page can also be accessed through the Doing Business with Us area of the CAMD website.

March 16, 2004

- MDC Version 4.2.46 . The current version of MDC is Version 4.2.46, revised as of March 15, 2004. This version of MDC supersedes MDC version 4.1.42 which was previously posted in December, 2003. This new version is being released to provide **significant changes** to the QA Status Evaluation portion of MDC Hourly. Unlike previous versions, it does not rely on RTs 697, 698 or 699 to determine test deadline extensions or test exemptions due to non-QA operating quarters, linearity exemptions due to low span values, or grace period extensions. This version also **checks the linearity status of both ranges of dual range analyzer components** (e.g., NOXA, SO2A etc) to make sure required tests were performed. MDC v4.2.46 also includes minor fixes to problems that were reported in the previous version. The changes and fixes are detailed in the Release Notes document.

March 16, 2004

- Summary of 2003 EPA Audit of Protocol Gases

- 2004 Compliance for the NOx Budget Program

- The Clean Air Markets Division is currently writing documents to PDF using Adobe Acrobat Version 5.0. If you are having problems opening PFD documents, you may need to upgrade to version 5.0. Free Upgrade to Adobe Acrobat 5.0 EXIT disclaimer

February 2, 2004

- A revised spreadsheet for **Rectangular Duct Wall Effects** is now posted at the same web address as the original. The revised version corrects three small technical, not substantive errors in the originally posted spreadsheet. The first problem was that the ln() function was used instead of the exp() function in the roughness calculation. The second problem was that a "<" instead of a ">" was used in one of the conditional statements required by 8.4.2(b). And, the third problem did not allow the 8.4.1 option to be calculated for smaller ducts. Also, a brief CTM-041 calculations instruction document is now available.

December 18, 2003

- Rectangular Duct Wall Effects . EPA is allowing the use of an optional rectangular duct wall effects conditional test method (CTM-041) for source personnel that perform flow monitor relative accuracy testing in a rectangular stack or duct.

December 15, 2003

- MDC Version 4.1.42 . The current version of MDC is Version 4.1.42, revised as of December 15, 2003. This version of MDC supersedes MDC version 4.1(.36) which was previously posted in August, 2003. This new version is being released specifically to support the use of an optional wall effects conditional test method (CTM_041) for facilities that perform flow RATAs in rectangular stacks or ducts. It also includes minor fixes to problems that were reported in the previous version. These fixes are detailed in the Release Notes document, If you do not need the changes to support rectangular ducts and you have not encountered any of the problems described in the release notes, you do not need to upgrade to this version of MDC.

Effects of Acid Rain

Acid rain causes acidification of lakes and streams and contributes to damage of trees at high elevations (for example, red spruce trees above 2,000 feet) and many sensitive forest soils. In addition, acid rain accelerates the decay of building materials and paints, including irreplaceable buildings, statues,and sculptures that are part of our nation's cultural heritage. Prior to falling to the earth, SO2 and NOx gases and their particulate matter derivatives, sulfates and nitrates, contribute to visibility degradation and harm public health.

The links below provide more detailed information on each of these effects.

- Surface waters (e.g., lakes and streams) and animals living in them
- Forests
- Automotive Coatings (e.g., car paint)
- Materials
- Visibility
- Human Health

Acid Rain Students Site

Acid Rain Kids Site

Welcome to the Clean Air Markets Web site.

Clean air markets programs include various market-based regulatory programs designed to improve air quality. The most well-known of these programs is EPA's Acid Rain Program, which has the overall goal of achieving environmental and public health benefits through reductions in emissions of sulfur dioxide (SO_2) and nitrogen oxides (NO_x)—compounds produced by fossil fuel combustion that adversely affect air quality, the environment, and public health. In addition to information on the Acid Rain Program, you will also find information at this site on other programs that employ cap-and-trade mechanisms.

- Recent Additions

Environmental Issues

EPA's Clean Air Market Programs address several environmental issues using emissions caps and allowance trading. This section of the site provides information about each, especially scientific details.

- Acid Rain
  Acid deposition, or acid rain as it is commonly known, occurs when emissions of sulfur dioxide (SO2) and oxides of nitrogen (NOx) react in the atmosphere with water, oxygen, and oxidants to form various acidic compounds. These compounds then fall to the earth in either dry form (such as gas and particles) or wet form (such as rain, snow, and fog). Prevailing winds transport the compounds hundreds of miles, across state lines and national borders.
- Smog / Ozone Transport
  Smog is a brownish haze that usually appears over cities in summertime. Smog can make breathing difficult for some people, and it also can impair visibility. The main component of smog is ground-level ozone, a gas that is created when NOx reacts with other chemicals in the air, especially in the presence of strong sunlight. NOx can travel long distances before reacting to form ozone, creating regional problems instead of just affecting the local area where it is emitted.
- Regional Haze
  Regional haze is the visibility impairment that occurs when particles and gases in the atmosphere, including sulfates and nitrates, scatter and absorb light. The pollutants that are associated with acid rain are the same ones that reduce visibility. Visibility tends to vary by season and geography because it is also affected by the angle of the sunlight and the level of humidity. High relative humidity heightens pollution's effects on visibility because particles, such as sulfates, accumulate water and grow to a size at which they scatter more light, creating haze.
- Climate Change
  According to scientists, the Earth's surface has risen in temperature by about 1 degree Fahrenheit in the past century. There is increasing

evidence that certain human activities are contributing to this change in temperature through activities that increase the levels of greenhouse gases, primarily carbon dioxide, methane, and nitrous oxide, in the atmosphere. Greenhouse gases trap heat that would normally escape back into the atmosphere, thus increasing the Earth's natural greenhouse effect and increasing temperature over time. To learn more about greenhouse gasses, view the Greenhouse Gas Inventory

Smog / Regional Transport of Ozone

Smog is the brownish haze that pollutes our air, particularly over cities in the summertime. Smog can make it difficult for some people to breathe and it greatly reduces how far we can see through the air.

The primary component of smog is ozone, a gas that is created when nitrogen oxides (NOx) react with other chemicals in the atmosphere, especially in strong sunlight. NOx is produced whenever we burn something, such as coal in a power plant or gasoline in a car's engine.

Like sulfur dioxide, NOx can travel large distances before reacting to form ozone. For that reason, it creates regional pollution problems, rather than simply affecting the local area where it is emitted. EPA has taken several steps to reduce NOx emissions, including the Acid Rain Program and NOx allowance trading programs.

For more information about ozone and its effects, including maps of ozone concentrations, see EPA's AIRNOW Web site.

Acid Rain
Smog/Ozone Transport
Regional Haze
Climate Change
Students and Teachers

Acid Rain Students Site

Regional Haze/Particulate Matter

Regional haze is the "dirty-looking" air that prevents us from seeing clearly or very far through the air. It especially affects our enjoyment of national parks, such as the Grand Canyon and the Great Smoky Mountains. Sulfate particles, formed by the reaction of sulfur dioxide (SO2) from power plants and other sources in the atmosphere, account for 50 to 70 percent of the visibility reduction in the eastern part of the United States. Both sulfate and nitrate particles (resulting from nitrogen oxides emissions) affect visibility in the western U.S.

The Acid Rain Program is expected to improve the visual range in the eastern U.S. by 30 percent by cutting SO2 emissions from electric utilities by 50% from 1980 levels. Based on a study of the value national park visitors place on visibility, the visual range improvements expected at national parks in the eastern United States due to the Acid Rain Program's SO2 reductions will be worth over a billion dollars annually by the year 2010. In the western part of the United States, nitrates and carbon also play roles, but sulfates have been implicated as an important source of visibility impairment in many of the Colorado River Plateau national parks, including the Grand Canyon, Canyonlands, and Bryce Canyon.

Visit EPA's visibility Web site for information about EPA's other efforts to reduce regional haze.

Acid Rain Students Site

Climate Change

The Earth's climate is predicted to change because human activities are altering the chemical composition of the atmosphere through the buildup of greenhouse gases - primarily carbon dioxide, methane, and nitrous oxide. The heat-trapping property of these gases is undisputed. Although uncertainty exists about exactly how earth's climate responds to these gases, global temperatures are rising. Visit EPA's global warming website for more information about climate change.

EPA prepares a national inventory of United States greenhouse gas emissions each year for submission under the United Nations Framework Convention on Climate Change. The Clean Air Markets Division coordinates the development of this inventory and leads the inter-agency greenhouse gas inventory team. Visit EPA's national greenhouse gas inventory website.

Acid Deposition Data

Acid deposition takes two forms:

- Wet Deposition
  - monitored by the National Atmospheric Deposition Program EXIT EPA
  - occurs when sulfur dioxide and nitrogen oxides react in the atmosphere with water vapor
  - returns to earth as acidic water
  - commonly referred to as "acid rain"
  - also includes acid snow and acid fog
  - data are used to produce maps, called isopleth maps, that show pH and other chemical characteristics of rainfall
  - ranges from 40 - 80 % of total deposition

- Dry Deposition
  - monitored by the Clean Air Status & Trends Network (CASTNET)
  - occurs when sulfur dioxide and nitrogen oxides react, but not with water
  - settles out of the atmosphere as particles or gases
  - not as well understood as wet deposition
  - ranges from 20 - 60 % of total deposition

Total deposition is what causes environmental effects, so it is important to understand both wet and dry deposition. NADP and CASTNET provide vital information for both scientific understanding and policy evaluation and decision making. The networks' home pages, linked above, provide much more detail about their structure, quality control, and results.

Programs and Regulations

EPA's Clean Air Market Programs include several regulatory programs designed to address a variety of environmental issues. The regulations are available, along with accompanying guidance. In addition, information is provided about the US-Canada Air Quality Agreement and other international programs that use cap and trade concepts.

- Acid Rain Program
  Reductions in sulfur dioxide (SO2) & nitrogen oxides, trading of SO2 allowances
- NOx Trading Programs
  - Summary table - quick description of the different programs
  - Ozone Transport Commission (OTC) NOx Budget Program
  - NOx State Implementation Plan (SIP) Call
- Monitoring Guidance (for all programs)
- Reporting Emissions (for all programs)
- Forms for All Programs
- Compliance Reports (for all programs)
- US - Greenhouse Gas Inventory
- US - Canada Air Quality Agreement
- The Latest Update of EPA Modeling Applications (v.2.1)Using The Integrated Planning Model (IPM)
  IPM is a key analytical tool in evaluating the economic and environmental impacts of environmental programs on the electric power

sector.

Effects of Acid Rain: Lakes & Streams

The ecological effects of acid rain are most clearly seen in the aquatic, or water, environments, such as streams, lakes, and marshes. Acid rain flows to streams, lakes, and marshes after falling on forests, fields, buildings, and roads. Acid rain also falls directly on aquatic habitats. Most lakes and streams have a pH between 6 and 8, although some lakes are naturally acidic even without the effects of acid rain. Acid rain primarily affects sensitive bodies of water, which are located in watersheds whose soils have a limited ability to neutralize acidic compounds (called "buffering capacity"). Lakes and streams become acidic (pH value goes down) when the water itself and its surrounding soil cannot buffer the acid rain enough to neutralize it. In areas where buffering capacity is low, acid rain also releases aluminum from soils into lakes and streams; aluminum is highly toxic to many species of aquatic organisms.

Where Does Acid Rain Affect Lakes and Streams?

Many lakes and streams examined in a National Surface Water Survey (NSWS) suffer from chronic acidity, a condition in which water has a constant low pH level. The survey investigated the effects of acidic deposition in over 1,000 lakes larger than 10 acres and in thousands of miles of streams believed to be sensitive to acidification. Of the lakes and streams surveyed, acid rain caused acidity in 75 percent of the acidic lakes and about 50 percent of the acidic streams. Several regions in the U.S. were identified as containing many of the surface waters sensitive to acidification. They include the Adirondacks and Catskill Mountains in New York state, the mid-Appalachian highlands along the east coast, the upper Midwest, and mountainous areas of the Western United States. In areas like the Northeastern United States, where soil buffering capacity is poor, some lakes now have a pH value of less than 5. One of the most acidic lakes reported is Little Echo Pond in Franklin, New York. Little Echo Pond has a pH of 4.2.

Acidification is also a problem in lakes that were not surveyed in federal research projects. For example, although lakes smaller than 10 acres were not included in the NSWS, there are from one to four times as many of these small lakes as there are larger lakes. In the Adirondacks, the percentage of acidic lakes is significantly higher when it includes smaller lakes.

Streams flowing over soil with low buffering capacity are as susceptible to damage from acid rain as lakes. Approximately 580 of the streams in the Mid-Atlantic Coastal Plain are acidic primarily due to acidic deposition. In the New Jersey Pine Barrens, for example, over 90 percent of the streams are acidic, which is the highest rate of acidic streams in the nation. Over 1,350 of the streams in the Mid-Atlantic Highlands (mid-Appalachia) are acidic, primarily due to acidic deposition.

The acidification problem in both the United States and Canada grows in magnitude if "episodic acidification" is taken into account. Episodic acidification refers to brief periods during which pH levels decrease due to runoff from melting snow or heavy downpours. Lakes and streams in many areas throughout the United States are sensitive to episodic acidification. In the Mid-Appalachians, the Mid-Atlantic Coastal Plain, and the Adirondack Mountains, many additional lakes and streams become temporarily acidic during storms and spring snowmelt. For example, approximately 70 percent of sensitive lakes in the Adirondacks are at risk of episodic acidification. This amount is over three times the amount of chronically acidic lakes. In the mid-Appalachians, approximately 30 percent of sensitive streams are likely to become acidic during an episode. This level is seven times the number of chronically acidic streams in that area. Episodic acidification can cause "fish kills."

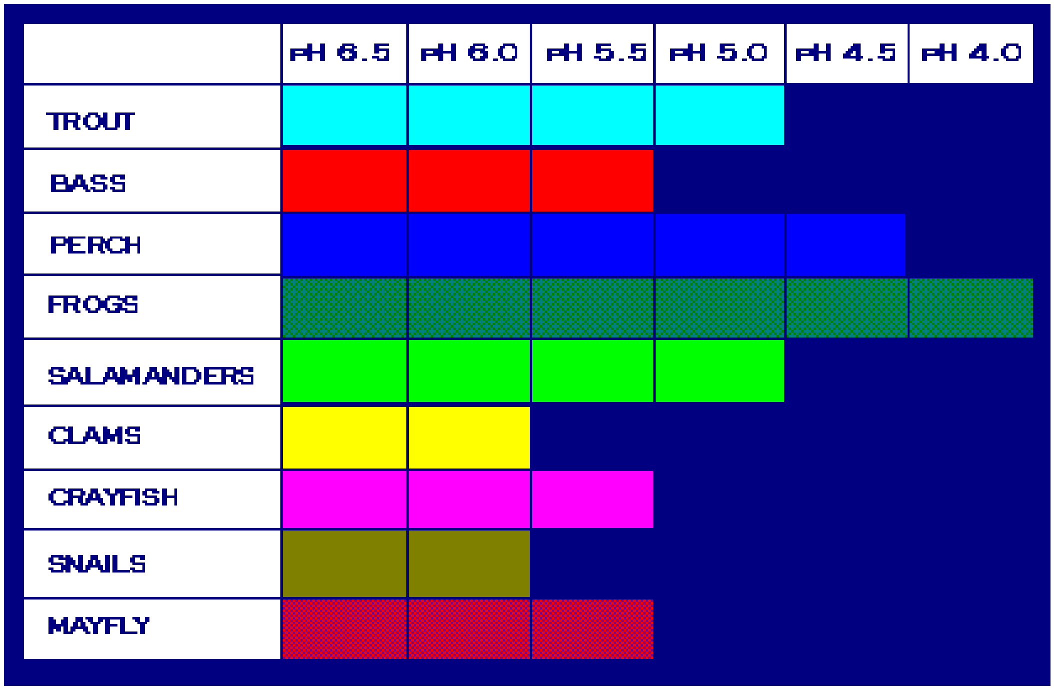
Emissions from U.S. sources also contribute to acidic deposition in eastern Canada, where the soil is very similar to the soil of the Adirondack Mountains, and the lakes are consequently extremely vulnerable to chronic acidification problems. The Canadian government has estimated that 14,000 lakes in eastern Canada are acidic.

How Does Acid Rain Affect Fish and Other Aquatic Organisms?

Acid rain causes a cascade of effects that harm or kill individual fish, reduce fish population numbers, completely eliminate fish species from a waterbody, and decrease biodiversity. As acid rain flows through soils in a watershed, aluminum is released from soils into the lakes and streams located in that watershed. So, as pH in a lake or stream decreases, aluminum levels increase.

Both low pH and increased aluminum levels are directly toxic to fish. In addition, low pH and increased aluminum levels cause chronic stress that may not kill individual fish, but leads to lower body weight and smaller size and makes fish less able to compete for food and habitat.

Some types of plants and animals are able to tolerate acidic waters. Others, however, are acid-sensitive and will be lost as the pH declines. Generally, the young of most species are more sensitive to environmental conditions than adults. At pH 5, most fish eggs cannot hatch. At lower pH levels, some adult fish die. Some acid lakes have no fish. The chart below shows that not all fish, shellfish, or the insects that they eat can tolerate the same amount of acid; for example, frogs can tolerate water that is more acidic (has lower pH) than trout.



How Does Acid Rain Affect Ecosystems?

Together, biological organisms and the environment in which they live are called an ecosystem. The plants and animals living within an ecosystem are highly interdependent. For example, frogs may tolerate relatively high levels of acidity, but if they eat insects like the mayfly, they may be affected because part of their food supply may disappear. Because of the connections between the many fish, plants, and other organisms living in an aquatic ecosystem, changes in pH or aluminum levels affect biodiversity as well. Thus, as lakes and streams become more acidic, the numbers and types of fish and other aquatic plants and animals that live in these waters decrease.

What is the Role of Nitrogen in Acid Rain and other Environmental Problems?

The impact of nitrogen on surface waters is also critical. Nitrogen plays a significant role in episodic acidification and new research recognizes the importance of nitrogen in long-term chronic acidification as well. Furthermore, the adverse impact of atmospheric nitrogen deposition on estuaries and near-coastal water bodies is significant. Scientists estimate that from 10-45 percent of the nitrogen produced by various human activities that reaches estuaries and coastal ecosystems is transported and deposited via the atmosphere. For example, about 30 percent of the nitrogen in the Chesapeake Bay comes from atmospheric deposition. Nitrogen is an important factor in causing eutrophication (oxygen depletion) of water bodies. The symptoms of eutrophication include blooms of algae (both toxic and non-toxic), declines in the health of fish and shellfish, loss of seagrass beds and coral reefs, and ecological changes in food webs. According to the National Oceanic and Atmospheric Administration, these conditions are common in many of our nation's coastal ecosystems. These ecological changes impact human populations by changing the availability of seafood and creating a risk of consuming contaminated fish or shellfish, reducing our ability to use and enjoy our coastal ecosystems, and causing economic impact on people who rely on healthy coastal ecosystems, such as fishermen and those who cater to tourists.

How is the Acid Rain Program Addressing These Issues?

Acid rain control will produce significant benefits in terms of lowered surface water acidity. If acidic deposition levels were to remain constant over the next 50 years (the time frame used for projection models), the acidification rate of lakes in the Adirondack Mountains that are larger than 10 acres would rise by 50 percent or more. Scientists predict, however, that the decrease in SO2 emissions required by the Acid Rain Program will significantly reduce acidification due to atmospheric sulfur. Without the reductions in SO2 emissions, the proportions of acidic aquatic ecosystems would remain high or dramatically worsen.

Effects of Acid Rain: Forests

Over the years, scientists, foresters, and others have watched some forests grow more slowly without knowing why. The trees in these forests do not grow as quickly at a healthy pace. Leaves and needles turn brown and fall off when they should be green and healthy. In extreme cases, individual trees or entire areas of the forest simply die off without an obvious reason.

Researchers now know that acid rain causes slower growth, injury, or death of forests. Acid rain has been implicated in forest and soil degradation in many areas of the eastern United States, particularly high elevation forests of the Appalachian Mountains from Maine to Georgia that include areas such as the Shenandoah and Great Smoky Mountain National Parks. Of course, acid rain is not the only cause of such conditions. Other things that add stress, such as air pollutants, insects, disease, drought, or very cold weather also harm trees and plants. In most cases, in fact, the impacts of acid rain on trees occur due to the combined effects of acid rain and these other environmental stressors. After many years of collecting information on the chemistry and biology of forests, researchers are beginning to understand how acid rain works on the forest soil, trees, and other plants.

- Acid Rain on the Forest Floor
- How Acid Rain Harms Trees
- How Acid Rain Affects Other Plants

Acid Rain on the Forest Floor

A spring shower in the forest washes leaves and falls through the trees to the forest floor below. Some trickles over the ground and runs into a stream, river, or lake, and some of the water soaks into the soil. That soil may neutralize some or all of the acidity of the acid rainwater. This ability is called buffering capacity, and without it, soils become more acidic. Differences in soil buffering capacity are an important reason why some areas that receive acid rain show a lot of damage, while other areas that receive about the same amount of acid rain do not appear to be harmed at all. The ability of forest soils to resist, or buffer, acidity depends on the thickness and composition of the soil, as well as the type of bedrock beneath the forest floor. Midwestern states like Nebraska and Indiana have soils that are well buffered. Places in the mountainous northeast, like New York's Adirondack and Catskill Mountains, have thin soils with low buffering capacity.

How Acid Rain Harms Trees

Acid rain does not usually kill trees directly. Instead, it is more likely to weaken trees by damaging their leaves, limiting the nutrients available to them, or exposing them to toxic substances slowly released from the soil. Quite often, injury or death of trees is a result of these effects of acid rain in combination with one or more additional threats.

Scientists know that acidic water dissolves the nutrients and helpful minerals in the soil and then washes them away before trees and other plants can use them to grow. At the same time, acid rain causes the release of substances that are toxic to trees and plants, such as aluminum, into the soil. Scientists believe that this combination of loss of soil nutrients and increase of toxic aluminum may be one way that acid rain harms trees. Such substances also wash away in the runoff and are carried into streams, rivers, and lakes. More of these substances are released from the soil when the rainfall is more acidic.

However, trees can be damaged by acid rain even if the soil is well buffered. Forests in high mountain regions often are exposed to greater amounts of acid than other forests because they tend to be surrounded by acidic clouds and fog that are more acidic than rainfall. Scientists believe that when leaves are frequently bathed in this acid fog, essential nutrients in their leaves and needles are stripped away. This loss of nutrients in their foliage makes trees more susceptible to damage by other environmental factors, particularly cold winter weather.

How Acid Rain Affects Other Plants

Acid rain can harm other plants in the same way it harms trees. Although damaged by other air pollutants such as ground level ozone, food crops are not usually seriously affected because farmers frequently add fertilizers to the soil to replace nutrients that have washed away. They may also add crushed limestone to the soil. Limestone is an alkaline material and increases the ability of the soil to act as a buffer against acidity.

The Effects of Acid Rain on Automotive Coatings

Over the past two decades, there have been numerous reports of damage to automotive paints and other coatings. The reported damage typically occurs on horizontal surfaces and appears as irregularly shaped, permanently etched areas. The damage can best be detected under fluorescent lamps, can be most easily observed on dark colored vehicles, and appears to occur after evaporation of a moisture droplet. In addition, some evidence suggests damage occurs most frequently on freshly painted vehicles. Usually the damage is permanent; once it has occurred, the only solution is to repaint.

The general consensus within the auto industry is that the damage is caused by some form of environmental fallout. "Environmental fallout," a term widely used in the auto and coatings industries, refers to damage caused by air pollution (e.g., acid rain), decaying insects, bird droppings, pollen, and tree sap. The results of laboratory experiments and at least one field study have demonstrated that acid rain can scar automotive coatings. Furthermore, chemical analyses of the damaged areas of some exposed test panels showed elevated levels of sulfate, implicating acid rain.

The popular term "acid rain" refers to both wet and dry deposition of acidic pollutants that may damage material surfaces, including auto finishes. These pollutants, which are released when coal and other fossil fuels are burned, react with water vapor and oxidants in the atmosphere and are chemically transformed into sulfuric and nitric acids. The acidic compounds then may fall to earth as rain, snow, fog, or may join dry particles and fall as dry deposition. Automotive coatings may be damaged by all forms of acid rain, including dry deposition, especially when dry acidic deposition is mixed with dew or rain. However, it has been difficult to quantify the specific contribution of acid rain to paint finish damage relative to damage caused by other forms of environmental fallout, by the improper application of paint or by deficient paint formulations. According to coating experts, trained specialists can differentiate between the various forms of damage, but the best way of determining the cause of chemically induced damage is to conduct a detailed, chemical analysis of the damaged area.

Because evaporation of acidic moisture appears to be a key element in the damage, any steps taken to eliminate its occurrence on freshly painted vehicles may alleviate the problem. The steps include frequent washing followed by hand drying, covering the vehicle during precipitation events, and use of one of the protective coatings currently on the market that claim to protect the original finish. (However, data on the performance of these coatings are not yet sufficient.)

The auto and coatings industries are fully aware of the potential damage and are actively pursuing the development of coatings that are more resistant to environmental fallout, including acid rain. The problem is not a universal one-- it does not affect all coatings or all vehicles even in geographic areas known to be subject to acid rain-- which suggests that technology exists to protect against this damage. Until that technology is implemented to protect all vehicles or until acid deposition is adequately reduced, frequent washing and drying and covering the vehicle appear to be the best methods for consumers who wish to minimize acid rain damage.

Effects of Acid Rain: Materials

Acid rain and the dry deposition of acidic particles contribute to the corrosion of metals (such as bronze) and the deterioration of paint and stone (such as marble and limestone). These effects seriously reduce the value to society of buildings, bridges, cultural objects (such as statues, monuments, and tombstones), and cars.

Dry deposition of acidic compounds can also dirty buildings and other structures, leading to increased maintenance costs. To reduce damage to automotive paint caused by acid rain and acidic dry deposition, some manufacturers use acid-resistant paints, at an average cost of $5 for each new vehicle (or a total of $61 million per year for all new cars and trucks sold in the U.S.) The Acid Rain Program will reduce damage to materials by limiting SO2 emissions. The benefits of the Acid Rain Program are measured, in part, by the costs now paid to repair or prevent damage--the costs of repairing buildings and bridges, using acid-resistant paints on new vehicles, plus the value that society places on the details of a statue lost forever to acid rain.

To observe the effects of acid rain on marble and limestone, two building materials commonly used in monuments, ancient buildings, and in many modern structures:

- Place a piece of chalk in a bowl with white vinegar.
- Place another piece in a bowl of tap water.
- Leave the dishes overnight.

  The next day, see if you can tell which piece of chalk is more worn away.

This experiment with chalk allows you to see the effect of acid rain on marble and limestone because chalk is made of calcium carbonate, a compound occurring in rocks, such as marble and limestone, and in animal bones, shells, and teeth.

Effects of Acid Rain: Visibility Reduction

Sulfates and nitrates that form in the atmosphere from sulfur dioxide (SO2) and nitrogen oxides (NOx) emissions contribute to visibility impairment, meaning we can't see as far or as clearly through the air. Sulfate particles account for 50 to 70 percent of the visibility reduction in the eastern part of the United States, affecting our enjoyment of national parks, such as the Shenandoah and the Great Smoky Mountains. The Acid Rain Program is expected to improve the visual range in the eastern U.S. by 30 percent. Based on a study of the value national park visitors place on visibility, the visual range improvements expected at national parks of the eastern United States due to the Acid Rain Program's SO2 reductions will be worth over a billion dollars annually by the year 2010. In the western part of the United States, nitrates and carbon also play roles, but sulfates have been implicated as an important source of visibility impairment in many of the Colorado River Plateau national parks, including the Grand Canyon, Canyonlands, and Bryce Canyon.

Effects of Acid Rain: Human Health

Acid rain looks, feels, and tastes just like clean rain. The harm to people from acid rain is not direct. Walking in acid rain, or even swimming in an acid lake, is no more dangerous than walking or swimming in clean water. However, the pollutants that cause acid rain (sulfur dioxide (SO2) and nitrogen oxides (NOx)) also damage human health. These gases interact in the atmosphere to form fine sulfate and nitrate particles that can be transported long distances by winds and inhaled deep into people's lungs. Fine particles can also penetrate indoors. Many scientific studies have identified a relationship between elevated levels of fine particles and increased illness and premature death from heart and lung disorders, such as asthma and bronchitis.

Based on health concerns, SO2 and NOx have historically been regulated under the Clean Air Act, including the Acid Rain Program. In the eastern United States, sulfate aerosols make up about 25 percent of fine particles.By lowering SO2 and NOx emissions from power generation, the Acid Rain Program will reduce the levels of fine sulfate and nitrate particles and so reduce the incidence and the severity of these health problems.asthma and bronchitis. When fully implemented by the year 2010, the public health benefits of the Acid Rain Program are estimated to be valued at $50 billion annually, due to decreased mortality, hospital admissions, and emergency room visits.

Decreases in nitrogen oxide emissions are also expected to have a beneficial impact on human health by reducing the nitrogen oxides available to react with volatile organic compounds and form ozone. Ozone impacts on human health include a number of morbidity and mortality risks associated with lung inflammation, including asthma and emphysema.

Acid Deposition Monitoring

Environmental Issues

Glossary

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

A

acid deposition

The process by which acidic particles, gases, and precipitation leave the atmosphere. More commonly referred to as acid rain, acid deposition has two components: wet and dry deposition.

acid rain

The result of sulfur dioxide (SO2) and nitrogen oxides (NOx) reacting in the atmosphere with water and returning to earth as rain, fog, or snow. Broadly used to include both wet and dry deposition. The acid rain page provides a great deal of information about this issue.

Al

Aluminum; a metal that is toxic to trees and fish

allowance

A tradeable permit to emit a specific amount of a pollutant. For example, under the Acid Rain Program, one allowance permits the emissions of one ton of sulfur dioxide (SO2).

anions

Negatively charged molecule such as sulfate (SO4(2-)) and nitrate (NO3-). In combination with hydrogen (H+), these molecules act as strong acids.

acid neutralizing capacity (ANC)

A measure of the ability for water or soil to neutralize added acids. This is done by the reaction of hydrogen ions with inorganic or organic bases such as bicarbonate (HCO3-) or organic ions.

acidification

Refers to reducing something's pH, making it more acidic;

also means the loss of ANC.

adsorb

To take up and hold (a gas, liquid, or dissolved substance) in a thin layer of molecules on the surface of a solid substance.

Back to top

B

buffering capacity

The resistance of water or soil to changes in pH.

base cations

Positively charged ions such as magnesium, sodium, potassium, and calcium that increase pH of water (make it less acidic) when released to solution through mineral weathering and exchange reactions.

Back to top

C

Ca(2+)

Calcium; a base cation that helps to reduce acidification

chronic acidification

Generally refers to surface waters that remain acidified (ANC<0) regardless of variations in hydrologic conditions (precipitation, stream flow, etc.).

Back to top

D

deposition

The processes by which chemical constituents move from the atmosphere to the earth's surface. These processes include precipitation (wet deposition, such as rain or cloud fog), as well as particle and gas deposition (dry deposition).

dose response functions

The relationship between the effects (response) on an organism or system and the amount (dose) of some material to which the organism/system is exposed.

dry deposition

The settling of gases and particles out of the atmosphere. Dry deposition is a component of acid deposition, more commonly referred to as acid rain.

Back to top

E

eutrophication

A reduction in the amount of oxygen dissolved in water. The symptoms of eutrophication include blooms of algae (both toxic and non-toxic), declines in the health of fish and shellfish, loss of seagrass beds and coral reefs, and ecological changes in food webs.

Back to top

F

Back to top

G

Back to top

H

Back to top

I

Back to top

J

Back to top

K

Back to top

L

leaching

Process by which water removes chemicals from soil through chemical reactions and the downward movement of water.

Back to top

M

Mg(2+)

Magnesium; a base cation that helps to reduce acidification

mineral weathering

The physical and chemical breakdown of rocks that releases ions such as calcium and aluminum.

MW

Megawatt; a unit for describing how much electricity a power plant can generate. The Acid Rain Program includes virtually all units in the US that can generate over 25 MW.

Back to top

N

nitrogen fixation

The process in which bacteria convert biologically unusable nitrogen gas (N2) into biologically usable ammonia (NH3) and nitrates (NO3-).

nitrogen oxides (NOx)

A group of gases that cause acid rain and other environmental problems, such as smog and eutrophication of coastal waters. Burning fossil fuels, such as coal and gasoline, releases NOx into the atmosphere. Various programs are reducing NOx emissions, including the Acid Rain Program and NOx cap and trade programs.

Back to top

O

Back to top

P

pH

A scale that denotes how acidic or basic a substance is. Pure water has a pH of 7.0 and is neither acidic nor basic. For more information, see the pH page.

precipitation
