   S: If three points are collinear, any one of the three points is between the other two.
3) E: The intersection of two lines creates four angles.
   S: The intersection of two great circles creates eight angles.
4) E: If two lines are parallel to a given line, they are parallel to each other.
   S: There exist no parallel lines.

Performance Assessment:

1) Individual responses when matching corresponding terms.
2) Group discussion and presentation of corresponding statements.
3) Group discussion and presentation **or** individual write-up of conjecture reached in follow-up activity.

Conclusions:

Depends on particular content chosen. In general, they should conclude that most, but not all, terms and properties in Euclidean geometry have counterparts in spherical geometry. More advanced students may be asked to discover properties unique to spherical geometry.

Return to Mathematics Index

Geometry Distance of Triangles using a Protractor

Eileen Lally
13801 Kit Lane
Lemont IL 60439
(630) 257-9389

A. Philip Randolph Magnet School
7316 South Hoyne Avenue
Chicago IL 60636
(773) 535-9015

Objectives:

Students in the 7th grade are to learn how to use the protractor to measure angles, and use this ability to solve a problem involving distance.

Materials Needed:

Protractors for each student
Rulers and meter sticks
Straws and clay

Strategy:

PART ONE

1. Identify the vocabulary: ray, angle, vertex, unit of measure, protractor
2. Demonstrate or review how to use the protractor.
3. Draw a 60cm line labeled AB on the board. Instruct students to draw a 6cm line labeled ab on paper.
4. At point A/a make a 35º and at point B/b make a 60º. Make sure that the rays are extended until they cross. Label that point C.
5. Compare the triangles (the one on the board and the one on paper). These triangles are similar.
6. Present the question: What is the distance of the line segment AC without leaving your desk?
7. Set up the ratio: line AB over line ab = X (AC) over line ac.
8. Now measure the line AC and compare the result with the calculated answer. Use the formula: Actual measurement minus Calculated measurement divided by Actual to obtain the margin of error.

PART TWO

1. Upon a large table, mark two points A and B and determine the distance (AB) between them.

2. Use the protractor to determine the measure of angle BAC. Likewise, determine the measure of angle ABC.

3. We now attempt to determine X, the distance (AC) from the point A to the Point C. Make a model (as described in Part 1) keeping the angles found but reduce the size of line segment ab. Set up the ratio: Line AB over line ab = X (AC) over line ac.

4. To verify, measure the distance from point A to point C. Compare with the calculated answer. Use the formula: Actual measurement minus Calculated measurement divided by Actual to obtain the margin of error.

Performance Assessment:

A similar problem like part two can be used as a performance assessment. The students are to answer the following question. What is the length of line AC?

Conclusion:

Knowing two angles and the distance between them, you can find the distance of the point that completes the triangle. This can be done by making a smaller model to help calculate the answer.

Circles - Diameter, Circumference, Radius and the Discovery of Pi

Kathleen Ryan
10409 S. Springfield
Chicago IL 60655
(773) 238-1554

Randolph Magnet School
7316 S. Hoyne
Chicago IL 60636
(773) 535-9015

Objective:

This seventh grade math lesson is designed to help students identify and measure the diameter, circumference, and radius of a circle.
The students should discover the approximate value of pi through the relationship between the diameter and circumference.

Materials Needed:

Various size circles, meter sticks, metric tape measures, rulers, scissors Scotch tape, drywall tape, calculators, and table worksheet.

Strategy:

1. Identify the diameter, circumference, and radius of a circle.
2. Demonstrate for the students how to measure the diameter and circumference on a circle. Explain that radius is half of the diameter.
3. Six various size circles are labeled A-F. Include many samples of the same size circles.
4. Working in pairs or in groups have the students record the diameter and radius of each circle using a ruler, tape measure, or meter stick using centimeters. This information is recorded on a table worksheet.
5. The students then measure the circumference using drywall tape. The drywall tape is placed around the perimeter of the circle and marked with a pencil and then cut. The drywall tape is then measured on a ruler, tape measure, or meter stick. The circumference is recorded on the table worksheet.
6. After the students have recorded the information for circles A-F, ask the students if they see a relationship between the diameter and circumference.
7. Divide the circumference by the diameter for each circle.
8. Discuss the results of circumference divided by diameter.
9. Compare the class' results with the standard value of pi(3.14159265...). Write the symbol for pi (p) on the chalkboard.

Performance Assessment:

The students will measure the diameter of a record album or another circular object (other than the previously used circles) and predict the circumference. The students will then measure the circumference of another circular object and predict the diameter.

Conclusion:

The students should have a clear understanding of the relationship between circumference and diameter and be able to apply this knowledge to similar situations.

How To Measure Area

Levi Johnson
480 N. Mc Clurg Ct
Chicago IL 60611

James Otis
525 N. Armour
Chicago IL
(773) 534-6576

Objective:

The seventh graders will demonstrate an understanding of square units.

Materials Needed:

twelve inch rulers, floor space in the room at least 4 feet by 12 feet, rectangular objects

Strategy:

Have an individual demonstrate the amount of space covered on the floor in one square foot. The student will take four twelve inch rulers placing them tip to tip to form a square. The measured space is a square foot. Ask the class how many individuals can stand in the square foot region. They will immediately discover the answer.

Now designate a larger square region of the floor. Ask the class to determine the number of students required to fill the space (i.e., by standing within it). Have the students make connecting squares within the region. They continue to make squares with one foot sides until each person has his or her own square. At this point they have proved for themselves the answer to the above question.

Additional application is needed to get a full and thorough insight into area. Give each student several surfaces to measure the area of. The teacher should determine the particular units to use. In my own lessons, measurements are done using either the English or metric system. Whenever a student arrives at the probable answer, he or she comes to me and asks for a piece of drywall tape the exact size required to cover the area. It should be noted that the teacher may use any kind of material suitable for covering the surface. Some of these activities can be done as individual or group projects. When the activity is complete students will have valid evidence of the concept of area.

Performance Assessment:

Any student who gets the correct measurement of the area of all the objects, solves the problem mathematically, and is able to explain in writing what went on receives a grade of A. A grade of B will be earned by students who know the mathematics and can almost fully explain what took place in written form or words. A grade of C will be earned by those who measure accurately, can do most but not all of the mathematics and can give reasonable explanations about what took place. Anyone else will have to repeat the exercise.

Performance Assessment:

Students will each measure several smaller items to find the area in square inches. As they complete measurements, they come to me to request that many square inches of drywall tape. Then they will cut the material into one inch squares to place on the object. If their measurements and mathematics are correct, and they cut the paper right, they should not be under nor over in the amount of tape.

Conclusion:

After following these directions and procedures to arrive at an answer, students should have discovered a good deal about area.

Return to Mathematics Index

An Introduction to Pi and the Area of a Circle

Edwina R. Justice
10641 South Lowe Ave.
Chicago IL 60628

Gunsaulus Scholastic Academy
4420 South Sacramento Ave.
Chicago IL 60632
(312) 535-7215

Objectives (Staff):

* Demonstrate a phenomenological approach to teaching mathematics
* Inspire others to use the approach

Objectives (Grades 5-7):

* Observe and discuss the relationship between circumference & diameter and how that relationship, called pi, is used in the formula for the area of a circle.

Materials:

round container lids with varying circumferences
4-column math table (label: **circumference**, **diameter**, **c/d**, & **lid** #)
graph (label - horizontal axis: diameter; vertical axis: circumference)
small circle drawn on centimeter grid
small circles
metric tape measures
calculators
glue

Recommended Strategy:

* Count square centimeters inside circle and estimate the area.
* Draw a square outside the circle. Calculate the area of the square.
* Draw a square inside the circle. Calculate the area of the square.
* Estimate the area of the circle by relating it to areas of the outer and inner circles.
* Cut a small circle into 16 equal pie-shaped pieces. Arrange these pieces to form a parallelogram and glue them on centimeter grid.
* Calculate the area of the parallelogram made with the pie-shaped pieces.
* Measure circumference and diameter of lids and record on 4-column math table.
* Divide circumference by diameter and record.
* Plot ordered pairs (diameter, circumference).
* Discuss graph.

* Discuss results of C/D.

* Roll large lid or trundle wheel on board and mark circumference. Show how diameter relates to it.

* Show how the area of the parallelogram, made from 16 pieces, is equal to (pi)r^2:

Area = base x height	Note: c/d = (pi)
= 1/2 circumference x radius	c = (pi) x d
= 1/2 [(pi) x 2r] r	d = 2 x r
= (pi)r^2	c = (pi) x 2r

* Use formula to calculate area of initial circle. Compare to estimates.

* Estimate areas of other circles and then calculate actual areas and compare to estimates.

Performance Assessment:

This is an introductory lesson. It is not necessary to assess usage of area of circle formula at this time.

Ask the following question:

"What mathematical relationship does pi represent?"

Students should write responses on paper. Collect, read, and assign a rating to each.

Expected responses:

The circumference of a circle is 3.14 times its diameter. This relationship is called pi.

Pi represents the circumference of a circle divided by its diameter.

Pi = c/d.

Return to Mathematics Index

Area and Perimeter

Monica Starks
10052 S. LaSalle
Chicago IL 60628
(312) 535-0990

John Fiske Elementary
6145 S. Ingleside
Chicago IL 60637
(312) 535-0990

Objectives:

This lesson is designed for the intermediate grade levels. Upon completion of the lesson students should be able to:

* use with accuracy this unit of measurement
* differentiate between area and perimeter
* compute the area and perimeter of an object

Materials:

* posterboard cut in squares, rectangles and triangles
* rulers
* scissors
* a bolt of lace trim
* velcro and magnets
* skin area worksheet-See references
* 3x5 index cards
* worksheets with geometric shapes using various units of measurement to calculate area and perimeter.

Recommended Strategy:

* Ask opening questions:
  When do we use the measurement of area?
  When do we use the measurement of perimeter?
  How would you measure a shape to trim it in lace?
* Do worksheet on area and perimeter on the overhead as the students work at their seats.
* Distribute and explain skin area worksheets then pair off students.
* Students will complete and turn in the skin area worksheets.
* Distribute materials for perimeter activity.
* Ask students how they would measure the shape of the picture frame to trim it.
* Students will use their rulers to find the perimeter of their shapes.
* Perimeter calculations are put on 3x5 index cards.
* Students will use their ruler to cut the length of lace from the bolt.
* Students will glue the lace on the perimeter of the shape.
* Place the velcro or magnet on the back of the picture frame or a cake can be placed on the rectangular shape.
* Ask the closing questions:
  You want to tile your kitchen floor. Which measurement do you use?
  You want to fence in your garden. Which measurement do you use?
  Students will record their answers on the 3x5 index cards.

Performance Assessment:

If the lace frames the perimeter of the shape without overlapping then the perimeter was calculated correctly. Check answers to the closing questions on the index cards. Also, check the calculations on the skin area worksheets.

Shapes (Geometric)

Violet M. Nash
7417 South Wabash
Chicago IL 60619-1625

Spencer Math and Science Academy
214 North Lavergne
Chicago IL 60644
(312) 534-6150

Objectives:

Students will be able to illustrate various geometric shapes such as a triangle, square, and rectangle on a one inch square grid using pennies. Designed for second grade.
Students will be able to demonstrate how to make a one dimensional vest using butcher block paper and various fabrics. Designed for seven and eight grades.

Materials Needed:

Ten pennies per student
One inch square grid (8"x10" sheet of paper)
One square yard of butcher block paper per student
Markers
One yard of fabric (various widths or lengths) per student
Scissors
Clear tape
Scratch paper
Neon paper
Shape packet-square (2"x2"), rectangle (3"x5"), and triangle (6")

Strategy:

Demonstrate to class, using a 20"x20" sheet of paper, how to cut a round, square, scallop, or triangle shape neckline. Cut the paper in half to form two rectangles. Explain to class that they are going to be a designer and creatively style their own vest. Show drawings of several designs to class.

Activities:

1. Give each student ten pennies and a grid sheet
2. Using pennies and grid sheet, instruct students to illustrate the shape of a triangle, square, and rectangle
3. Allow students to select a partner and give each person a sheet of butcher block paper and a piece of fabric
4. Have students select a partner (approximately the same height) and give them a marker, scissors, a shape packet (cut from neon paper), and tape
5. Tape paper to wall and with marker trace outline of partner's body from the waist up
6. Students are to create their own custom design vest and tape to butcher block paper

Return to Mathematics Index

Shapes (Geometric)

Violet M. Nash
7417 South Wabash
Chicago IL 60619-1625
(312) 994-8731

Spencer Math and Science Academy
214 North Lavergne
Chicago IL 60644
(312) 534-6150

Objective:

The student will be able to identify geometric shapes using colors and math problems. Designed for second grade.

Materials Needed:

Magic Marker (black or navy)
Neon Construction Paper (five colors)
Index Cards
Magnetic Tape
Scissors
Name and Diagram of eight geometric shapes:
   Circle
   Square
   Diamond
   Rectangle
   Triangle
   Hexagon
   Octagon
   Pentagon

Strategy:

Cut out each of the above shapes in five different colors (40 shapes).
Cut one extra set of shapes with the proper name that correctly identifies that shape and use for demonstration.
Write primary math problems (using four operations) on index cards, select four exact answers per problem, and tape a card to back side of neon paper.
Using magnetic tape, scatter 40 designs and attach to magnetic board.
Divide class into two equal teams, one captain per team, and designate playing area for each team.
Place demonstration shapes beside (for reference) scattered shapes.

Activity:

Alternate one player from each team to call the color and shape (e.g. yellow hexagon and blue pentagon) and the captain of that player's team will turn the cards over to show math problems. Player must state the problems and the answers. If the answers are a match (e.g. 5+5=10 and 20-10=10), that player continues to play until no match is made. As the first player moves to the end of their team's line, play begins with the next person in line on the opposite team. Points may be assigned by giving a number value for every match obtained. The team with the highest number of matches or the most points is the winner.

Return to Mathematics Index

Measurements: Inches

Joyce McCoy
8454 South Kingston Ave.
Chicago IL 60617
(312) 768-5950

Spencer Math & Science Academy
214 North Lavergne Avenue
Chicago IL 60644
(312) 534-6150

Objectives:

This lesson is designed for the primary grades.

Solve problems involving measurement using information taken from various items measured.

Students will be able to measure to the nearest inch.

Students will be able to identify the length and width of rectangles.

Students will be able to write simple addition problems.

Students will be able to perform simple addition of two one-digit numbers.

Materials Needed:

wooden blocks of various sizes (squares and rectangles)
empty boxes of various sizes
12-inch ruler
tape measure
chalkboard
chalk
Word list: ruler, tape measure, block, square, rectangle, box, sum, add, addition, wide, width, length, height, measurement, plus, equal, close, closest, long, longest, large, largest, short, shortest, tall, tallest, results

Strategies:

Using a 12-inch ruler, there should be no results over 12. The purpose of measuring items is to link the concept level and the symbolic level. Measurements can be linked with addition. Display a 12-inch ruler and have students identify it. Explain that an inch is a customary unit used to measure length and width. Stress that the distance between numbers on an inch ruler is 1 inch. Ask: How do you measure with an inch ruler? (Line up the left end of an object with the left end of the ruler and see how long the object is.) Work independent with several students. Point out that about how many means measuring to the nearest inch, not to the exact inch.

Procedure:

One student can come to the front of the room and measure the length and width of an item. The teacher or student will write both of the numbers on the chalkboard. The two numbers are written as an addition problem. The same student will write the correct answer on the chalkboard. If student is unable to add the problem, the student will use the unifix cubes to find their answer.

The student can use the tape measure to measure the length and width at the same time to check an answer. Have enough items so that each child can participate.

Extension:

Students can write the ten problems down on a piece of paper. Use number skills to observe the associative and commutative properties of addition. Example: 3+4=7 and 4+3=7. Students can make a written record of their combinations using all ten problems.

Return to Mathematics Index

Getting To Know You

Kathy Koval
6651 South Keeler
Chicago IL 60629
(312) 582-7832

Randolph School
7316 South Hoyne
Chicago IL 60636
(312) 535-9015

Objectives:

This lesson can be easily adapted for all grade levels. Upon completion of this lesson, the students will be able to do the following:
-Use a ruler and measure accurately to the nearest inch.
-Draw and label properly different graphs (line, pie, bar, pictograph)
-Estimate/record measurement on number line using intervals.
-Collect data and analyze

Materials:

-Tape measures
-ribbon (one per child)
-post-its (two per child)
-scissors

Strategy:

Students work with a partner for this activity. You may want to have tape measures already pretaped to a wall. Some taped in a horizontal fashion to help assist measurement in arm span. Others taped in a vertical manner to assist the measurement of height.

-One student measures his/her partners arm span (finger tip to finger tip).
-Record this information on a post it.
-Measure partners height. Record information on same post-it.
-Cut a piece of ribbon to the height of partner.
-Use second post-it and record height only in large print.
-Switch roles of partners.
-After students are finished with measurements, students are to hang their ribbon on the wall according to height. The ribbons should hang from smallest to largest. Students should also identify their ribbon with their post-it that states their height in large print. (You may want to have cards with measurements already established in intervals of six inches to help assist students in finding "their" place on the classroom number line).
-When all students are finished, the teacher can help students use the information to graph.
-Demonstrate to students that all graphs need a title and x and y axes.

Graphing

Bar graph
(Use graph paper on overhead) Have students suggest title for graph. Now fill in information on x axis (height). Write in measurements from smallest to largest. The y axis will represent the number of people. Show students how to fill in bar graph as they complete a copy at their seat.

Pictograph
Create title and the x and y axis with the students.
Have students draw a long rectangle, square, or short rectangle on their post-it (the one with arm span and height measurements). This shape should represent their body shape.

Long rectangle	height > arm span
Perfect square	height = arm span
Short rectangle	height < arm span

Call students up by rows to place their post-its on the pictograph according to body shape.

Pie graph
Remind students that a pie graph represents the class as a whole, each section represents one student. Have a pie graph already sectioned according to the number of students in the class. Color code body shapes with a color chart.
Example: perfect square = blue
long rectangle = red
short rectangle= yellow

Have a student come up and color the pie graph accordingly.
You may want to glue this circular graph onto a large sheet of paper and write all of the necessary information on the sheet (title, color code).

Performance Assessment:

Students would decide what topics, ideas they would like to graph in class. (Types of pets owned, favorite tv show, sport, game, etc, number of siblings.) Students can break into pairs and interview or write a short questionaire for their classmates to complete. Students would have a time frame to gather information and then come up with a graph that would best portray the information gathered. Students would need to decide what type of graph would best meet their needs. Display graphs around the room and discuss information.

Enhancement:
Ask students how you sectioned off the pie graph so that each section has the same size. Introduce a protractor and the measurement of a circle is 360 degrees. Give students a paper plate and protractor and have them work in groups of 5. Tell them to evenly divide the paper plate into 5 equal pieces and draw their favorite pizza topping on their section.

Return to Mathematics Index

Inch by Inch and Centimeter by Centimeter Extravaganza

Pamela J. Bates-Hines
1719 E. 83rd Place
Chicago IL 60617
(312) 731-0368

Ninos Heroes Academy
8344 S. Commercial Ave.
Chicago IL 60617
(312) 535-6694

Objectives:

Kindergarten-Primary
* Students will be able to measure one inch to a yard.
* Students will be able to measure one centimeter to a meter.
* Students will be able to compare and contrast standard to non-standard units of measurement.

Materials Needed:

12 inch rulers
36 inch yard sticks
30 centimeter rulers
meter sticks
measuring tapes/centimeters and inches
graph paper/centimeters
graph paper/inches
finger or tempera paint
string
ditto copies of a 12 inch ruler
ditto copies of a 30 centimeter ruler
paper-made flowers
transparent tape
chalk
poster or bulletin board
colored markers
manipulatives
scissors
glue
candy Twizzlers

Strategy:

Ask questions to enhance metacognition and elicit meaningful responses:
How do we know that the Sears Towers is the tallest building in the city of Chicago?
How do we measure things?

Make two marks approximately 12 feet apart on the floor or ground.
Have students pace, walk, skip, hop (by student choice) from one mark to the other.

Discuss with the students to elicit that we could measure people, places, and things to determine lengths, width, and height.

Distribute 12 inch rulers.
Distribute copies of a 12 inch ruler.

Have students compare and contrast the paper copy to the actual ruler.
Precut or have able students cut 12 1-inch squares.
Have students align paper square inches above the copied ruler.
Have students compare and contrast paper square inches to the copied ruler.
Have students recognize that there are 12 inches in a foot.
Have students glue the square inches above the copied ruler.
Then have the students press a thumb in a container of fingerpaint and make thumbprints under the copied ruler.
Have students compare and contrast how many of their thumbprints it took to equal one foot.
Have students make the conclusion that this is one foot of thumbprints.

Additional Activities:
AA-1 Distribute copies of 30 centimeter ruler.
Have students compare and contrast centimeter ruler to copied ruler.
Have students compare and contrast centimeters to inches on the ruler and copies of the rulers.
Have students measure candy Twizzlers and make a record of the length in centimeters.
AA-2 Have students use rulers to measure four sided geometric objects.
AA-3 Distribute manipulatives to the students.
Have students determine in inches and centimeters how many manipulatives it takes to cover the length of 12 inches and/or 30 centimeters.
AA-4 Predraw or mark lines of different lengths on the ground or floor. Group students and have them measure and record lengths.
AA-5 Distribute copies of inch or centimeter graph paper.
Have students make handprint or footprint on the graph paper.
Then have students count the squares of area.
AA-6 Have students form partners.
Distribute two pieces of string to each group.
Direct students to measure the length of each other's arm with the string.
Have students measure the string with 1-inch squares .
Then have students attach their string to a paper flower with their names and lengths on them.

Performance Assessments:

AA-1 Have students tell or write the number of centimeters in the length of the candy.
AA-2 Have students tell or write the measurements of each side of the geometric objects.
AA-3 Have students tell or write how many manipulatives they had to use to measure 12 in. and or cm.
AA-4 Have students tell or write how many in. or cm. the lines measured.
AA-5 Have students record the number of in. or cm. in the lengths of their hand or foot.
AA-6 Make a board displaying the students' flowers showing in. and cm. scales. Have students graph 5 students' flower measurements on a pictograph.

Return to Mathematics Index

Interior Design

Sally Hill
1538 N. LeClaire Ave
Chicago IL 60651-1573
(312) 637-2199

Horatio May Community Academy
512 N. LaVergne
Chicago IL 60644
(312) 534-6140

Objective:

This lesson is designed for intermediate grades 4-6. The students will be able calculate area and perimeter in inches.

Materials Needed:

* 4 Cardboard Walls (approximate size 36X50)

* Scissors

* Glue or glue sticks

* Wall paper or wrapping paper

* Measuring utensils (measuring tape, ruler, yard stick)

* Writing Utensil (pen/pencil)

* Play money

Strategy:

The teacher will supply 4 walls of identical sizes from a large cardboard box which will represent each direction, (North, South, East and West). The walls will have a minimum of 1 opening with a geometric shape to show a window, door, clothes hook, wall vent, enclosed bookcase, etc. The students will be divided into 4 groups and instructed to cover their wall. Each group will be given $50 and the materials needed to complete their wall.

A store will be set up where the students can purchase wall paper. The students must determine the amount needed and compute tax on their purchase. The students will determine the best buy via purchasing paper from pre-cut rolls or by the foot.

The students will calculate the area to be covered by finding the total area of the wall in inches and subtracting the area of the opening. Using the $50, each group will purchase wall paper based on their calculations. After purchasing the paper, the students will transfer the wall measurements to the paper, cut, and cover the wall. (The student will problem solve when determining the best way to cover the wall with the paper allowing for the doors, windows, etc).

Each group will also be asked to determine the amount of border needed to cover the top of the room. (They will multiply the width of their wall by 4). All completed walls will be put together (matching directions) and wall border will be applied in a continual piece based on the amount computed by the groups.

Return to Mathematics Index

Maximizing and Minimizing the Area of Rectangles Given a Fixed Perimeter

Tim Amrein
330 W. 25th Place
Chicago IL 60616

Franklin Fine Arts Center
225 Evergreen St.
Chicago IL 60660
(312) 534-8510

Objectives:

Grade Levels 5-8. (This activity can be simplified for younger, less mathematically mature students. Numerous extensions can be added for more advanced students.)

(1) Students will analyze and solve problems in which rectangles with identical perimeters are compared to maximize or minimize area.
(2) Students will analyze problems by collecting data and searching for patterns and generalizable relationships.
(3) Students will represent problem situations with models.
(4) Students will analyze fixed perimeter problems using x,y coordinate graphing.
(5) Students will find fixed perimeter rectangles with maximized or minimized area using qualitative and quantitative analysis.

Materials Needed:

(1) A fixed length of ribbon, or string, which will be used to represent a fixed length of fencing
(2) Paper or cardboard rectangles of given, fixed perimeter
(3) Tiles, ceramic or paper
(4) Inch tiles (tiles with 1 sq. in. area)
(5) Scientific calculators
(6) Graph paper
(7) Handouts with problems involving fixed perimeter and, if students have prior experience with it, fixed area.

Optional materials:
(1) Fixed lengths of actual fencing

Strategy:

(1) Students will be given 3 paper rectangles with identical perimeters (such as 5 in. by 25 in., 10 in. by 20 in., and 15 in. by 15 in.) They will additionally be given 5 in. tiles (square tiles whose sides are each 25 sq. in.) Give the following instructions and questions: (1) Use your ruler to find the perimeter of each rectangle. (b) What do these rectangles have in common? (c) Which rectangle requires the most tiles to completely cover it? (d) Which rectangle requires the fewest tiles to completely cover it? (Students will work in pairs)
(2) Next, the students will be presented with this problem, "You have a plot of land and a dog. Your dog has run away a couple of times and often runs on your neighbors' property. You decide to fence in a rectangular section of your land so that your dog doesn't run away but has room to play. You have 72 feet of fencing. You want each side of the rectangular "pen" to be a whole number in length. Your goal is to allow your dog the maximum amount

of space to run around and play. Design the rectangle that achieves this goal." The students will model this problem using a length of string or ribbon 72 cm. long. Students are to experiment with at least 5 different rectangles. They are to record the dimensions (bottom edge, side edge, perimeter, area) for each of their fence models. We will then discuss the fact that, geometrically speaking, we are maximizing area given fixed perimeter. (Students will work in pairs or in groups of four)

(3) Next, the students will be presented with these two problems:
   (i) "You run a business that puts on banquets. For one small banquet, you need to seat 12 people. You construct your banquet tables from small square tables (which individually seat 1 person on each side). Each small table costs your company $1 per day (for rental or moving). Your banquet tables are always rectangular.
      (a) What are the dimensions of the table that will seat these 12 people most cheaply?
      (b) What are the dimensions of the table that would seat the 12 people in the most expensive way possible?
   (ii) The same basic problem will be repeated for a banquet in which 24 people need to be seated.

   For both of these problems, charts will be compiled in which the dimensions (bottom edge, side edge, perimeter, and area) are recorded for all possible perimeter of 12 and perimeter of 24 rectangles.
   Fixed perimeter coordinate graphs will be completed recording the bottom edge and area ordered pairs (separate graphs for P = 12 and P = 24).
   The shape of these graphs and the information they give will be discussed. (The points can be connected to form parabolas. The area optimizing square and the two area minimizing rectangles will be evident on the parabolic curve.) (Students will work in pairs or groups of 4)

(4) Similar problems to the first 3 will be given. The students will be allowed to use models for some. For some problems they will not use models.
   Use of the perimeter and area formulas will be discussed. Use of the calculator (the squaring key, for example) will be discussed.
   Students may be asked to devise some of their own problems applying these concepts to realistic situations. (Students will work individually.)

(5) If the students have experience with fixed area, varying perimeters problems, this problem type will be further explored.

Performance Assessment:

Students will be given a problem (such as a fencing or border problem) involving fixed perimeter and maximization and/or minimization of area. The problem may involve finding an efficient way of doing something. (Prices of tile per square unit of tile may be given, for example.) Students will be asked to solve the problem, using models and various forms of analysis. Graph paper, tiles, string, rulers, etc. will be provided. Students are to give their solution mathematically, pictorial, and in a paragraph. A rubric for evaluation will be devised. Understanding of the topic (the generalizable relationships) and logical structure of the explanation will be the central concern of the rubric.

Conclusions:

I have used this activity and variations of this activity with 6th and 7th graders (and will probably use a version of it with fifth graders next year). It is an excellent problem for developing problem solving ability. Students learn to model, analyze, and represent problems in numerous ways. The problem also necessitates the search for patterns and the discovery of rules and relationships, which are vital elements of mathematics at all levels.

Phenomenological Pizza

Robert Foote
4022 N. Monticello
Chicago IL 60618
(312) 604-8825

Disney Magnet School
4140 N. Marine Drive
Chicago IL 60613
(312) 534-5844

Objective:

Students will draw a circle using string and a ruler.
Students will determine areas of different size circles.
Students will determine area of a sector of a circle.
Students will find how many two topping pizzas can be made using 14 toppings.
Students will determine cost per square inch.

Materials Needed:

*markers
*cardboard or posterboard
*funnel
*pizza menus
*string
*paper plate
*rulers
*6 inch circle

Strategy:

Ask what the shape of a pizza is. Hold up the six inch circle and explain that this circle is the size of a six inch personal pan pizza. Then hold up the paper plate and tell them it is nine and one half inches. Then pass out pizza menus and ask students for the sizes of pizzas indicated on the menus. After students name the different pizza sizes, ask them how these sizes are determined. They should recognize that these are the diameters of the pizza. Next, have each student using the cardboard, string, and a ruler draw a circle the size of the pizza diameters. Have them draw over the circles in marker. Bring each of the pizzas up to the board and display them. Next, find the area of each size pizza. Compare the prices to the areas and determine the price per square inch. Have students determine which size is the best buy. Next ask students how they would find the area of a slice of a pizza. Cut a piece out of the paper plate and measure the angle of the sector and then using the angle find the area of the slice of pizza. For example, 60 degrees would be one-sixth of the area of the circle. Finally, give the students the menus again and have them enumerate all the pizza toppings mentioned in the flyer. Then have them find all the two topping pizzas they can make using those toppings.

Performance Assessment:

As a performance assessment for this lesson, you could cut out several different slices of pizza and have students find the area. You could give them another menu and determine the difference in price and you could also have them construct circles of different sizes.

An Introduction To Volume

Linda James Woods
12056 S. Justine
Chicago IL 60643
(312) 928-7479

Harold Washington Elementary School
9130 So. University Avenue
Chicago IL 60619
(312) 535-6225

Objectives:

This mini teach is designed for grades 3 to 5.

L To count volume in cubic units
L To multiply to find volume
L To estimate volume
L To write a multiplication sentence to find the volume
L To discover volume of different containers
L To make a cost analysis of different brands of popping corn
L To learn the definition of volume

Materials Needed:

L Connecting cubes or base ten blocks
L Rectangular containers similar in size
L Potting soil
L Cubic rulers
L Work sheets
L Three different brands of unpopped popping corn
L Air popcorn popper
L Bowls or bags for popcorn
L Calculators

Recommended Strategy:

Activity 1-Volume Measurement

Students should work in groups of four.
Place several rectangular containers similar in size on the table. Each container should be numbered. Have one student put the containers in order of total volume. Ask the class if it is correct. Each group should write down the order they think the containers should be in. Write each group's answer on board. Divide containers among groups to measure volume. The group that wins gets the point or prize.

Each group will have one clear rectangular container. Have the students use base ten blocks to estimate the volume of their container by making a model of the container. Each group will then put their model inside the container to check their estimation. The group which comes the closest to the correct volume wins the prize.

Using these same clear containers, tell the students they will fill flower pots with soil. Give each group a rectangular flower pot or box and a ruler. They are to measure the flower pot/box to get the volume. They must write a number sentence. Write each number sentence on the board. Each group will then use soil to fill their flower pot to check measurement. The group which comes the closest to the correct volume wins. You can give them seeds to plant and observe the growth.

Activity 2-Volume Value

Have three different brands of popping corn available to the class. A large range in prices (one economy, one moderately priced and one expensive) will give the experiment more impact. Assign students to groups of three or four and ask them to design an experiment that will determine which popping corn is the best value by comparing the cost of eight ounces of unpopped corn with the volume of the popped corn. Discuss each group's method with your class. Carry out the experiments with the class. Students must show work and formulas they used. They should answer the following questions: Is there a difference in brands? If so, which brand is the best value? Why is this a better buy? Are there other factors you want to consider besides price per unit? If so, what are they?

Performance Assessment:

- L Students should use base ten blocks to design their own rectangular prism.
- L They will make a drawing of the solid figure with accurately labeled dimensions.
- L They will state volume.

Conclusion:

Students will be able to learn how to estimate volume using the phenomenological approach as well as participate in a hands on activity to calculate volume. Once skill is learned, students will be able to apply to real life situations.

Measurement of Volume

Richard Murray
1800 Euclid
Berwyn IL 60402
(708) 795-4729

Gage Park High School
5630 South Rockwell
Chicago IL 60629
(312) 535-9230

Objectives:

This mini teach is for middle school and high school students. It can be adapted for younger children as a demo.

Students will be able to measure the volume of a clear container. Students will be able to use a stop watch. Students will be able to estimate the volume of a container using proportions.

Materials Needed:

Clear jars, glass or plastic, enough of them so that every group of students will have two containers to measure. Enough sand to fill the largest container. Measuring bowl and cup marked in milliliters; candles and matches; stop watches for each group.

Strategy:

What was expected was a linear relationship between the burning of oxygen in the jar and volume of air that it contained. If it is linear it will be predictable. Knowing how long it takes to extinguish a candle for a certain volume you should be able to predict either the volume and or the time to extinguish a candle for another container.

The students will time how long a candle will stay lit when a jar is placed over the candle. The student will measure the volume of the jar by filling it with sand and using the measuring bowl or cup to find out how much sand is in the jar in terms of the metric system.

Students will then time how long a candle will stay lit in a much larger container. Knowing the previous data regarding volume and time and now knowing the time for this new jar the student should now be able to predict the volume of the second jar. The prediction is developed through proportions. The ratios that make up the proportion are: volume is to time as second volume is to second time. Restating the problem, the proportion will look like: **volume in ml/time to extinguish the candle = unknown volume of the new jar/time to extinguish the second candle.**

Solving the proportion the student will have the predicted volume. To verify the prediction the student will measure the volume of the second container using sand. The student will determine how close the prediction is to the actual measurement.

Performance Assessment:

The linear relationship that was expected was not produced by this procedure. It was not established that there is linear relationship. The predictions for the larger jar were off. If the time was measured for the larger jar then predicted volume was larger then the actual measured volume. If the volume of the larger container was measured then the predicted time differed greatly from the actual time.

Sources of error are pressing the stop watch (timing errors), the candle is not burning at a constant rate, a larger flame burns oxygen at a greater rate; errors using the measurement bowl; the jars need time to refill with oxygen, if you try to repeat the timing of the burning candle too soon the results will vary as much as 4 to 5 seconds.

It was a good lesson in measuring, timing and gathering data. But it did not support the hypothesis. Because the hypothesis is not supported then it creates a problem for the students. The expectation is that the goal should be achieve and it wasn't. This is a problem that will need to be addressed with the students.

Things that could be tried to improve the results are: work with larger volumes such as storage cases instead of jars; the candle be replaced with a source that burns consistently such as of oil with a wick.

Volume and Surface Area

Charlotte Goldwater
5015 S Blackstone
Chicago IL 60645
(312) 535-1409

Kenwood Academy
5015 S. Blackstone
Chicago IL 60645
(312) 535-1409

Objective:

The main objective is to understand the difference between surface area and volume. This activity is appropriate for grades one through twelve.

Materials Needed:

1. Paint brushes
2. Water color paint
3. Boxes of sugar cubes (198 in each box)
4. Cup with some water
5. Cake baked in a rectangular or square pan
6. One can of frosting
7. Plastics knives
8. Plastic rulers
9. A roll of wax paper
10. Little plastics zip-lock bags

Strategy:

For the appropriate level, give students a handout with different sized drawings of rectangular prisms or cubes. Have students construct these shapes using sugar cubes. Sugar cubes are one-half inch cubes. Students then count the cubes. This is the volume. Students can practice drawings three dimensional solids made up of cubes.

Give students pictures of solids constructed of cubes that are not rectangular prisms. Discuss the cubes that are "hidden".

You can put a little Elmers glue to hold these solids together. Now paint or use a marker to color or paint all of the outside surfaces. The students count the number of squares they have painted. This is surface area.

Have students come up one at at time and cut a "cube" of cake 1x2x2 or 1x1x2. Give each student a plastic knife. Let them frost the cake so that they can experience surface area. Have them try to get it on all sides.

Performance Assessment:

Depending on the level of the students or class you can evaluate the class through oral participation or in written follow up activities.

Return to Mathematics Index

"An Introduction to Area and Perimeter"

Edwina R. Justice
10641 South Lowe Ave.
Chicago IL 60628
(312) 468-3376

Gunsaulus Scholastic Academy
4420 South Sacramento Ave.
Chicago IL 60632
(312) 535-7215

Objectives (Staff):

Demonstrate a phenomenological approach to teaching mathematics

Inspire others to use the approach

Objectives (Grades 4-7):

Form rectangles by using tiles

Measure area and perimeter by counting

Measure and record area and perimeter

Describe dimensions of rectangles

Discover and apply rules for measuring area and perimeter

Measure rectangles using transparent grids and determine area and perimeter

Observe patterns formed by rectangles with constant area or perimeter

Materials Needed:

inch grids centimeter grids scissors

worksheets with tables for recording area and perimeter

Recommended Strategy:

Cut 24 thirty-six inch tiles

Use tiles to make rectangles

Count tables (area) and number of people who can sit at the table (perimeter)

Show all rectangles on grid with area equal to 12 square cm.

Discuss dimensions

Introduce appropriate mathematical vocabulary

Order rectangles from largest to smallest perimeter

Compare shapes of rectangles with area equal to 12 square cm.

Record dimensions, area, and perimeter

Apply rules for finding area and perimeter

Measure rectangles of various sizes by using transparent inch grids

Record dimensions, area and perimeter

Show all rectangles with area equal to 24 square cm.

Record dimensions, area, and perimeter

Demonstrate pattern formed by rectangles with constant area

Show all rectangles with perimeter equal to 24 cm.

Record dimensions, area, and perimeter

Demonstrate pattern formed by rectangles with constant perimeter

Performance Assessment:

Draw representations of two gardens with the same area, but with different dimensions. Fencing materials must be purchased. Which garden will cost less money? Explain your answer.

Return to Mathematics Index

An Introduction to Estimation and Measurements

Christeen Brown
1704 W. Marquette Rd
Chicago IL 60636
(312) 471-2627

Robert Fulton Elementary
5300 S. Hermitage St
Chicago IL 60609
(312) 535-9000

Objectives:

This lesson is designed for grade levels 3-5
Upon completion of the lesson, the students should be able to:
- Convert ounces to pounds
- Measure liquids
- Describe measurements in sizes
- Measure volumes
- Understand the importance of knowing and using the measurements
- Observe shapes and sizes in measurements
- Discover and apply rules for measuring liquids

Materials:

- Several containers of various sizes and shapes (vases, bottles, bowls or cups)
- Measuring utensils (teaspoon, tablespoon, measuring cups)
- Pancake mix
- Spatula
- Hot plate
- Funnel
- Liquid (water)
- Syrup (optional)

Recommended Strategy:

- Estimate the arrangement of containers in order from least to greatest.
- Use the 1 cup measurement tool to fill each container. Count the amount of full 1 cup measurements each container will hold without any of the liquid spilling over.
- Record the amount of cups each container will hold.
- Discuss whether the original arrangement was accurate.
- Introduce the known measurements.
- Order the containers from smallest to largest (If original estimate was out of order).
- Compare estimated answer to actual answers.
- Demonstrate the use of measurements by reading directions on a pancake box.
- Compare a pancake made of mix and water being measured accurately versus one with mix and water just estimated.

Performance Assessment:

Demonstrate your use of measurements by cooking the mixture. Observe the surface of the pancakes and taste the pancakes. Discuss any differences discovered between the two types of mixes. Record the consistency of both mixes. Discuss any changes in the two pancakes after they are cooked. Enjoy the project!
This project is best used first thing in the morning.

Return to Mathematics Index

Circumferences, Diameters, and Radii

Dwayne Belle
9646 S. Wentworth
Chicago IL 60628
(312) 928-6473

Fuller School
4212 S. St. Lawrence
Chicago IL 60628
(312) 535-1688

Objectives:

Students will be able to measure circumferences in inches.
Students will be able to compute radii and diameters, given different circumferences.

Materials Needed:

-blackboard
-notebook paper
-signs
-tape measures
-cans

Strategy:

The strategy will incorporate cooperative learning, and direct teaching techniques. The direct teaching method explains the objectives and how to measure the circumference in inches and compute the radii and diameters. Cooperative learning encourages the students to interact to formulate the correct answers.

Direct teaching techniques: A short lecture is given on how to measure the circumference in inches and compute the radii and diameters.

Cooperative Learning: Students will form three groups. Each group will be given a tape measure and cans. Each group will try and determine which can has the largest circumference, radii and diameter. Students will compute and compare their data. Next, students will be go to five workstations to measure the circumference and compute the radius and diameter of a light pole and four different size trees.

Performance Assessment:

Students will be given twenty objects to compute their circumferences after measuring the diameters and radii.

Return to Mathematics Index

Measuring in Inches and Centimeters

Debra Thomas
4853 W. Monroe St.
Chicago IL 60644

Douglass Math and Science Academy
543 N. Waller St.
Chicago IL 60644
(312)534-6176

Objective:

To teach 6th grade students how to measure in inches and centimeters.

Materials Needed:

Paper clips, straws, yarn, 1" cubes, centimeter cubes, rulers, tagboard and scissors.

Strategy:

The students will measure common and familiar objects using both the 1" cubes and centimeter cubes.
The students will then use the 1" cubes to make a 12" ruler and the centimeter cubes to make a 31 centimeter ruler.
The students will then measure common objects using both the inch ruler and the centimeter ruler.
Students will convert from inches to centimeters and from centimeters to inches.

Performance Assessment:

Students will be assessed on how well they make their rulers.
Students will be assessed on how accurate their measurements are as compared to those made with an actual ruler.

Return to Mathematics Index

Estimation

Iona Greenfield
9748 S. Sangamon
Chicago IL 60643
(312)239-6731

Carnegie Elementary School
1414 E. 61st Street
Chicago IL 60637
(312)535-0350

Objectives:

This lesson is designed for Kindergarten and First Grade.

Solve problems by guessing and checking.

Identify length by using informal units to estimate.

Guess the number of peas in a pod and write an addition and subtraction sentence for the number of peas in the pod.

Materials Needed:

Construction paper	Ribbon	Peas
Scissors	Bubble gum	Scrap paper
Pencils	Blocks	Gummy bears

Strategy:

Students will draw around foot on construction paper to make foot prints. Then they will cut them out. Students will measure using informal units.

Students will cut a piece of ribbon to their approximate head size. They will check by using tape measure to compare actual size and approximate size.

Guess the number of bubble gums in a jar. Check by counting.

The students will guess the number of peas in a pod and write an addition and subtraction sentence for the number of peas in a pod. Check by using counters (cubes or gummy bears).

Conclusions:

These activities can be implemented to solve problems by guessing and checking using non-standard units and standard units of measurement. This approach gives students hands on experience to solve problems.

Return to Mathematics Index

Measurement of Objects Using Similar Triangles in The Plane

John Gabrielson
16801 Haven Ave
Orland Hills IL 60477
(708)349-2095

Chicago H. S. for Agri. Science
3807 W. 111th Street
Chicago IL 60655
(312)535-2500

Objectives:

The students in the high school geometry class will apply the use of similar triangles to a sight tool in order to measure the distance between, or height of large objects such as buildings or trees.

Materials Needed:

(Dimensions used can be adjusted for own use)
1/2 inch plastic tubing cut into 2' length for sight tube
1" x 2" x 4' wood base and arm
29cm x 33cm cardboard squares
30cm string cord
Washer weight
Bolt with wing nut and locking washer
Copy of centimeter ruler
Long tape measure

Strategy:

Construction of this measuring tool involves fastening two 1" x 2" x 4' boards with bolt wing nut and locking washer placed together approximately one inch from the end of both boards. This will form the one arm and the base of the tool.

The 30cm string cord with a washer weight is attached to upper left hand corner of the 29cm x 33cm card. This card with weighted cord is attached over the head of the bolt of the measuring tool at the edge of the joined stick. A sight tube is glued onto the arm above the attached card at the top corner edge of the joined stick. This forms the top upper corner of the measuring tool. Leveling the measuring tool will set the position where the weighted cord crosses the bottom of the card in a position exactly even with the position of its attachment to the top corner of the card. This will help determine where the zero position of the copy of the centimeter ruler should be glued.

An angle of elevation will be formed by looking through the sight tube. The top of an object observed will form the local point. This is point b of the triangle. A line can be imagined across from the eye of the observer to the object observed. On this object point c can be named. The eye of the observer forms point a. A large triangle has been formed by the thought process of connecting the points from the eye of the observer, to the top of the object observed, to the eye level on the object, back to the observer.

A second triangle similar to the above triangle will be formed onto the cardboard card attached to the measuring devise. When the measuring devise is elevated the cord will move across the centimeter ruler glued at the bottom of the card. When the cord stops moving, it will provide the measurement of a side. Label this crossing, point e. Point d can be named at the top of the where the cord is attached. Point f can be named at the bottom corner of the card where the card forms a right triangle. Segment df will be the side of the card and the other side of the small triangle segment ef will be the measurement along the centimeter ruler.

In order to solve these similar triangles the observers will have to know either the height of the object to find the distance or the distance to the object to find the height. One then can set up the equality:

$$\frac{bc}{ef} = \frac{ac}{df}$$

.

Having three knowns, two on the card, and one from the triangle of the object observed, one can solve the problem.

The teacher will use this tool in a lesson to instruct students about similar triangles. The students can be taught the concept of similar triangles using a proportional growth pattern of triangles. This can be followed by instructional use of the tool. The students are then to be brought outside and begin the actual computation of similar triangles by using the measuring tool.

Performance Assessment:

The students can be evaluated in groups. Collection of group work will reveal how accurately the measurements were taken. Correct mathematics can also be checked. The scores given can then be recorded and individuals will be given a group grade.

Return to Mathematics Index

Travel Triangles

Sarah Barrett
315 Marengo
Forest Park IL 60130
(708)771-0051

Mars Hill School
5916 West Lake Street
Chicago IL 60644
(312)287-0019

Objectives:

This presentation can be adapted for intermediate and upper grades. Students will review and demonstrate an understanding of the three kinds of angles (by degrees). Triangles and related quadrilaterals will be explored and their areas found with cut-outs, rearranging parts, etc., to discover and then apply pertinent formulae. A few days to two weeks of classes will be needed.

Materials:

Students need a protractor, straight edge, compass, a few sheets of construction or plain paper, a few poster board pieces at least 8" by 10", and scissors. The teacher supplies brightly colored pre-cut triangles large enough for display, (at least one of each kind), a tailor's measuring tape, a carpenter's rule, tape to post models and student made figures on the wall or chalkboard, and a supply of construction paper to demonstrate the folding and cutting of triangles from squares and rectangles.

Strategy:

These steps may be adapted as appropriate for various groups.

1. Review acute, obtuse and right angles by having students model each with hand and arm formations. List terms with $>90^o$, $<90^o$, or equal to 90^o and label a diagram of each on the chalkboard.

2. Fold a rectangular sheet of paper in half diagonally while asking what kind of triangles are formed. Have the students do the same folding of their paper and finger-trace the right angles and then each of the other kinds of angles. Measure the angles with protractors, name and label the degrees on each, and draw and label each kind in their personal class notes. (Everything important goes into class notes.) Post the models described in "Materials" and as many student samples as practical.

3. Have the students recall how to find the area of rectangles and squares, and find the area of a sheet of paper, the end of which will then be folded up to obtain a square. Cut or tear off the excess. Next find the area of the square. Then fold it diagonally to see what kind of triangles result. Compare them to those found in step 2 after measuring and labeling their angles as well. Cut out the triangles and shift them around until a rhombus is formed. Do the same with the triangles formed inside the rectangle to form a parallelogram. Post the models for this so that students can see how and why the area of both the rectangle and parallelogram formed with the same triangles is equal, and found using the same formula, i.e., L x W = area. Find the area of the parallelogram and rhombus and compare with the rectangle and square areas.

All the above figures can be shaped with both the tailor's measuring tape and with a carpenter's rule for additional visualizing. Students can do the manipulations described above easily with these tools. Use masking tape to affix the measuring tape to a chalkboard temporarily to demonstrate with it. The carpenter's rule has the advantage of rigid segments so that it can also be used to show polygons with more and more sides up to a duodecagon, and to elicit the observation that the more sides on a polygon the more closely it approaches the circle.

4. Return to the triangles found within the rectangle and square. After having found the quadrilateral areas, ask students how the area of the triangles they found inside (step 3) can be found. (Half of the rectangle or square they are in.) Then help them express the formula: b x h divided by 2. Use this to find areas of several examples, (supplied on worksheets for additional practice). To find the area of non-right angle triangles, the altitude, or height must be given, or measured. If it is not already drawn, show students how to draw a perpendicular from the base to the apex using protractors. Extend the base on obtuse triangles. The perpendicular, i.e., altitude needed will fall outside the triangle. It is critical that students see this and practice it. Using the cut out triangles from step 3 provides the initial experience for the isosceles and scalene triangles. Be sure to cut some examples of obtuse triangles as well, for this purpose.

5. Have the students use a circle provided on a worksheet, or draw their own with a compass, at least 6 or 7 inches in diameter. Use a protractor to trisect the circumference, marking a point at each 120 degrees, then connect them with straight line segments, to produce an inscribed equilateral triangle. Post a few precut display models and student done samples. Have the students measure and label angles, sides, and find the area.

To do the mini-projects below with best results, use thick enough paperboard. Two options:

a) Have students find the midpoints of the equilateral's sides and connect them producing another triangle within. How many equilaterals result? Cut the sides of the "outer" triangles and fold the inner sides so that the interior triangle becomes the base when the vertices of the outside triangles are pulled up to form a pyramid;

b) Mark the centerpoint of a circle, then trisecting points on the circumference of a circle at least 8 inches in diameter. Draw line segments from the centerpoint to the three marked points. Cut alongside the segments from the circumference in to about half a inch from the center leaving about a quarter inch on each side of the lines, curving as one approaches the center to continue alongside the next line. Three equidistant spokes of a "wheel" about a half inch wide should result. Hold it upright by one spoke and toss. Instant boomerang!

Optional, but a favorite, is a set of portable triangles constructed with wood slats. Vertices are formed by attaching ends to each other with bolts which allow the angles to be changed, but which will retain a set position with slight tightening. For a surprise effect, attach an additional slat to one of the triangles to form a rectangle or square. Push the top over to form a parallelogram or rhombus with the same set of slats.

Performance Assessment:

All the following may be evaluated for assigning grades.

Students will make personal kits of the four kinds of triangles, cut them out, with protractor measured angles labelled, and will construct a mini-project which will work as intended only if work assigned has been correctly completed. Pre-printed centimeter grid worksheets may be used to diagram and find areas of triangles as directed. These can be used for further practice, and to assess students' comprehension of the concepts acquired and applied in the activities below, along with observations of their performance during the activities.

Return to Mathematics Index

Measurement-What is it?

Claudy E. Chapman
9351 S. Woodlawn
Chicago IL 60619
(312) 768-5518

Hartigan School
8 W. Root St.
Chicago IL 60609
(312) 535-1460

Objectives:

The objective of this lesson is 4 fold.
Students will learn:

1. Practical reasons for measurement,
2. The use of various tools for measurement,
3. How and why those tools might be chosen and/or designed,
4. The need for uniformity and agreement on definitions of measurement.

Materials needed:

The materials for this lesson may vary depending on what you want to measure. For the purposes of the mini-teach I made a cut out of the following.

* Shoe
* House
* Train
* Pencil

In addition you will need index cards.

Strategy:

Demonstration-(time limit 10 minutes)

The teacher asks for a volunteer from the class to be a guinea pig in an experiment.
The class is then told we are going to measure this student.
Before we can do that, we must ask four very important questions.

1. "What do we want to measure?"
2. "How shall we do it?"
3. "When will we know that we have done it?"
4. "What tools shall we use to measure with?"

The last question put to the class will be
"Why did you pick that tool?"

Hands On Experience-(time limit 15 to 20 minutes)

The class is broken up into teams. Each team consists of the following:

* Speaker (Reporter)- Reports the results of the team to the entire class.
* Recorder- Records the decisions and the results of the team and how those decisions were reached. The Recorder also records how the group interprets their instructions.
* Motivator- Encourages the team forward with positive affirmations and settles disputes among the members of the team. The Motivator also makes sure that everyone is doing their job.

* Engineer- Directs the method and use of the measuring tool based on the instructions of the Speaker. Only the Engineer may measure and handle the measuring tool.
* Inspectors- Check the work of the engineer and the recorder.

From each group, the Speaker draws from a stack of index cards what their team is to measure. From another stack of index cards, the Engineer draws the type of tool their team must use.

Each team must find the area, perimeter and/or volume of their object.

The team must agree on

* the procedure used to measure the object,
* the final result and definition of parts (i.e., lengths, widths, etc.).

Review Team results-(time limit 15 minutes)

Each teams measurements are recorded and compared to the measurements of that item in feet and inches or meters. The measurement tools are then compared to conventional measuring tools. Observations are made on the differences and similarities between the design and function of the tools.

Performance Assessment:

Students are graded on:

1. their participation in the discussions;
2. their ability to determine the area and perimeters of objects;
   a) using standard measurement tools
   b) using standard measurement language
   c) using standard units of measurement
3. their ability to apply their prior knowledge to solving measurement problems when non-standard resources are substituted for traditional tools and definitions.

Students should be able to apply the rules of measurement, using various tools and types of units of measures and know which tools and measurements are applicable for appropriate applications.

Finding the Sum of the Exterior and Interior Angles of a Polygon

David Drymiller
10115 S. Oakley
Chicago IL 60643
(312) 233-7902

Morgan Park High School
1744 W. Pryor Ave.
Chicago IL 60643
(312) 535-2550

Objectives:

To find the sum of the interior angles and the sum of the exterior angles of any polygon.
To review linear measurement to the nearest sixteenth of an inch and angle measurement to the nearest degree.
To construct a polygon and its exterior angles given the number of sides.

Materials needed:

For each group of four students the following is needed:
a yardstick or meterstick,
a large demonstration type protractor,
chalk and instruction data record sheet.

For each student the following is needed:
ruler, protractor.

Strategy:

Each group draws a large 7, 8, 9, 10, 11 or 12 sided polygon on the floor or sidewalk with unequal sides. Measure each interior angle of the polygon to the nearest degree and record the results. Measure the length of each side and record the results. Find the sum of the interior angles of the polygon and record the answer. Extend each side of the polygon forming an exterior angle at each vertex. Measure each angle to the nearest degree and record the result. Find the sum of the exterior angles of the polygon and record the result.

As a class, review the fact that the sum of the interior angles of a triangle is 180. Divide 4, 5, 6, 7, 8, 9, 10, 11, and 12 sided polygons into triangles showing the sum of the interior angles is 2x180, 3x180,..., 10x180, respectively. Generalize to the sum of the interior angles of a n sided polygon is (n-2)180. Draw a 7 sided polygon and its exterior angles and label the angles. Mark one end of the meterstick and place its center on the first vertex, slide the center along the side of the polygon to the next vertex, continue until arriving back at the starting vertex. The path of the marked end of the meter stick is a circle. Generalize to the sum of the exterior angles of a polygon is 360. Each student draws a 3, 4, 5, 6, 7, or 8 sided polygon and its exterior angles to the edge of the paper. Mark an arc on each exterior angle and cut each out. Place all of the vertices of the exteriors angles together forming a circle. Generalize to the sum of the exterior angles of a polygon is 360.

Follow the above activity with an octagonal work sheet having the students record the measure of each angle and side on the figure. Place the sum of the interior angles in the center of the octagon. Tape the octagon onto a second sheet. Draw the exterior angles of the octagon on the second sheet and record each measure on the angle. Place the sum of the exterior angles on the bottom of the second sheet.

Forming, Measuring and Labeling Angles

Essie Lee May
8518 S. Exchange Ave.
Chicago IL 60617
(312) 221-4123

May Community Academy
512 N. LaVergne
Chicago IL 60644
(312) 535-4325

Objective:

Students will be able to form angles, measure angles and label angles.

Materials Needed:

1. protractor
2. angle patterns
3. apparatus for forming angles

Strategy:

Forming Angles

1. Provide each student with items needed (see materials needed)
2. Explain the vocabulary words: point, ray, line segment, vertex, and angles
3. Demonstrate how to form angles
4. Observeration by students

Measuring Angles

1. Explain the purpose of a protractor
2. Demonstrate how to place the protractor on the angle on the student's paper
3. Explain how to read the number scale on the protractor
4. Explain that angles are measured in degrees

Labeling Angles

1. Explain that angles are commonly labeled by using letters but they can also be labeled by using numbers
2. Explain that an angle is labeled with three letters, but it can also be labeled with one letter only or with one number only
3. Show the symbol for an angle
4. Explain which of the three letters or which of the three numbers should be placed on the vertex
5. Demonstrate how to label the angle
6. The students will practice measuring, forming and labeling angles

Return to Mathematics Index

What's My Area?

Karen L. Mickel
6800 S. Cornell #3C
Chicago IL 60649
(312) 493-1585

William Carter Elementary School
5740 S. Michigan Avenue
Chicago IL 60637
(312) 535-0860

Objectives:

To cover an area with uniform tiles and count the number of tiles needed.
To recognize rectangles, triangles and squares.
To review basic colors.

Materials needed:

One inch multi-color square tiles
Rectangular tiles
Triangular tiles
Worksheet with different-sized shapes

Strategy:

Each student will be given some square tiles. The students will find a space on the floor to play with their tiles. After the children have played with the tiles, tell them it is time to learn about area. Distribute papers with different-sized shapes. Tell children to cover the shapes completely with their tiles. After the shapes are covered, ask how many tiles did it take to cover the shapes. Repeat the procedure with rectangular and triangular tiles.

After the first concept has been taught you may introduce a new way of finding area. You may give the students different square patterns. Some patterns may require the students to use rectangular and triangular shapes.

As a follow-up activity, the students can make up their own worksheet with different-sized shapes. They would trade worksheets with one of their group members. The group member would use square tile, rectangular tiles and triangular tiles to cover the shapes on the worksheet.

Repeat this lesson until concept is mastered.

Return to Mathematics Index

Geometry and the Geoboard

Jacqueline Darling
1733 E. 84th Street
Chicago IL 60617
312-375-2987

Simmye Anderson Community Academy
6315 S. Claremont Avenue
Chicago IL 60625
312-535-9070

Objective(s):

The 6th grade student will be able to:

1. Discover the fun of using the geoboards as they learn many mathematical concepts.
2. Visualize the concepts of squares, rectangles, triangles and polygons.
3. Explore line segments, areas, and perimeters.
4. Demonstrate the phenomenological approach in learning geometry.
5. Understand the multicultural aspect of geometry and the geoboard.

Materials:

Geoboard
Geobands
Dot paper
Overhead projector (optional)
Activity sheets

Strategy:

Discuss with the students the origin and the various types of geoboards (square and circle). Issue the geoboards and the geobands to each student. Let the students explore different shapes on their own. Elicit from the student ways the geoboard can be used to explore different geometric shapes.
Introduce dot paper to the students. Use the overhead projector to show the relationship between the geoboard and the dot paper.
Explain the coordinates on the geoboard and let the students find points.
Show what one square unit is on the geoboard.
Give example of a line segment on the geoboard. Let the students practice making line segments, horizontally, vertically, diagonally, and shortest to the longest.

Activity 1.
Locate the circled points on your geoboard. Name them. (On the overhead projector select points to circle.)

Activity 2.
The game Tic Tac Toe is an appealing way to introduce a coordinate system for graphing. Start with a five by five array of dots on the chalkboard. The plastic geoboard for the over-head projector works well for this activity.
Ask a student to name two numbers. Ask another student to name two numbers. Mark one team's points with X's and the other teams's with O's. Three in a row wins. Teams take turns giving you pairs of numbers. If a pair is given that does not fit on the graph, that turn is lost. If a pair is called and that dot has already been marked, that turn is lost.

After playing this game a few times, change the rules so that it takes four in a row to win.

Activity 3.
Make the figures shown on the overhead projector on your geoboard. (Display and label various polygons A, B, C, etc. and let A have an area of 6 square units). Copy on dot paper.

Activity 4.
Using the activity sheets you made in Activity 3, find the areas of the polygons.
The geoboard is not needed for this activity.
Count the squares in example (a). How many do you see? The number of squares in the figure is called the area of the figure. The area of the figure in example (a) is 6. Notice we have put the 6 inside the figure. Write the correct area inside of each of the other figures.

Performance Assessment:

In the previous activity you were to make different figures on your geoboard with different areas. Now, see how many figures you can make on your geoboard, all of which have an area of **six** square units. This larger number allows much more variety. Be sure to check the area on your geoboard and sketch it. Remember, by different we mean different size and shapes. (You will need to distribute dot paper.)

Conclusions:

Geoboards enable us to count units of area of geometric figures.

An Introduction to Angles

Samuel A. Anoma
133 Huntingwood Road
Matteson, IL 60443
708-720-0735

Hyde Park Career Academy
6220 South Stony Island
Chicago, IL 60637
312-535-0880

Objectives:

The students will be able to name, classify, identify and measure angles.

Materials Needed:

1) Thin wooden sticks 10" x 1/2"
2) Protractors
3) Papers
4) Pencils

Recommended Strategy:

1) Give each student three sticks, a protractor, a paper and a pencil. Let each student put the paper on his or her desk. Then take one of the sticks and put it on the paper horizontally. Take a second stick and join it to the first stick vertically at the left endpoint. The two sticks join together to form a pattern. The two sticks represent two rays having the same endpoint. The stick put horizontally represents a ray going indefinitely to the right while the stick joined to it vertically represents a ray going upward indefinitely. The two rays with the same endpoint form an **angle**. The rays are the sides of the angle. The common endpoint is the vertex of the angle. The angle formed in this pattern is known as a **right angle**.

Protractors are used to measure angles. The units used in measuring angles are degrees, minutes and seconds. In geometry, we usually use degrees; in the above case, **the degree measure of a right angle is 90**.

2) Let the stick that is horizontal remain in the same position. Now rotate the other stick clockwise. Another pattern is formed. Let the students draw it and measure the angle formed. **The sticks form an acute angle whose measure in degrees is greater than 0 and less than 90**.

3) With the horizontal stick in the same position, rotate the second stick to the left passing through the vertical position. Let the students draw the pattern and measure the angle. **The sticks form an obtuse angle whose measure is greater than 90 and less than 180 degrees**.

4) With the horizontal stick still unmoved, rotate the second stick to the left until it is in the same straight line with the horizontal stick. Let the students draw the pattern formed and measure it. **The sticks form a straight angle whose measure is 180 degrees**.

5) Now that the two sticks are in the same straight line, let the first stick remain in its position but move the other stick further in a counter-clockwise direction towards the horizontal stick. This forms another pattern. Let the students draw and measure it. **This is a reflex angle whose measure is greater than 180 and less than 360 degrees**.

6) Join the two sticks together in a straight line. Then join the third stick to them at the endpoint where the two sticks meet. Let the students draw the pattern and measure the angles formed. **The three sticks form adjacent angles whose sum is 180 degrees**.

Conclusion:

Discuss with the students the fact that angles are a part of their daily lives. Streets and buildings are constructed using angles. Airplanes take off on angles. Installation of revolving doors involve the use of angles. The military bombers fire at angles. This experiment gives students a visual appreciation of geometric vocabulary. They can experiment at home with pieces of spaghetti. As homework, let the students classify the different angles in their classroom and environment.

Use A Chair To Teach Math

Laura B. Reed
14541 Vine
Harvey, IL 60426
708-333-3236

Rosa L. Parks
14700 Robey
Dixmoor, IL 60426
708-371-9575

Objective(s):

The student will learn some basic operations of math by measuring a chair.

Materials needed:

Folding chair or desk chair, desk, tape measure, paper, graph paper and a box.

Strategy:

Place a folding chair or desk chair on top of a desk so all students can see.

Have students measure the various parts of a chair. (back, legs, seat, height, width, etc.)

All students should make a list of these measurements for their personal use later on.

After measuring the chair, ask the class for answers to questions like the following: What size box would it take to mail the chair? Could two chairs fit in the same box? How many chairs could fit in this room? What area of space does the chair occupy per floor space? These questions should also serve to motivate students to think up questions of their own.

Give each student a sheet of graph paper and pencil and ask them to plan a drawing of the chair. Then give them a second piece of graph paper and ask them to make a second drawing. This time half the size of the first one. How many chair lengths in one mile (5280ft)? Solicit additional math questions from the students. Allow time for the students to discuss problems that exist; for example: "It depends which way the chair is turned!"

Have students use the measurement to find answers to the question asked and list the operation used. Make sure the students make or find a box for the chairs to fit in for mailing.

Return to Mathematics Index

Measurement (cup, pt, qt, gal)

JoAnn Campbell
1630 N. Moody
Chicago, IL 60639

Leslie Lewis School
1431 N. Leamington
Chicago, IL 60651
312-804-3060

Objective:

Fifth grade students will be able to rename measurements with cups, pints, quarts, and gallons and to choose appropriate units of capacity.

Materials needed:

Materials needed are per group.

Two 8-oz cups
Four 1-qt containers
Two 1-pt cartons
One 1-gal jug filled with water

Optional: funnel for easy pouring

Strategy:

Divide the class into small groups and provide them with a lab sheet like the one below. Have each group fill out a lab sheet.

Capacity Lab Sheet

1. Pour 4 quarts from the gallon.
 Q. How many quarts make a gallon?
 A.

2. Pour 1 quart into the pint containers.
 Q. How many pints make a quart?
 A.

3. Pour 1 pint into the cups.
 Q. How many cups make a pint?
 A.

Additional questions:

How many cups are there in 1 quart?
How many pints are there in 1 gallon?
How many cups are there in 4 pints?

*NOTE: To rename larger units with smaller units, you can multiply.

To rename smaller units with larger units, you can divide.

Return to Mathematics Index

Measurements In The Metric System

Christine Fair
1842 South Kildare Ave.
Chicago, Il. 60623
312-762-5091

Farragut Career Academy
2345 South Christiana
Chicago, Il. 60623
312-542-3000

Objectives:

Given teacher guidance the third grade students should be able to:
1. Estimate, then measure to the nearest inch.
2. Estimate, then measure to the nearest centimeter.

Materials:

A worksheet on unmarked rulers
Meter sticks
Scissors
Stapler
Tape measures
Items to be measured

Strategy:

This mini teach is directed toward 3rd grade students who will learn about centimeters, decimeters, and meters. They will learn a centimeter is smaller than a meter. It is used to measure small things. They will understand that another name for 100 centimeters is one meter. One decimeter is equal to ten centimeters. One meter is equal to 100 centimeters. The student will understand that each number line marks off one centimeter. The teacher will emphasize the fact that before reading a ruler, make sure that they measure from left to right. Students will use the meter stick to demonstrate that 100 centimeters equal 1 meter. The students will measure their hands, feet, the width of a desk, the height of a textbook and the length of a pencil. They will walk around the classroom to list items and estimate their length. Then the students will measure and record the exact length of each object.

Return to Mathematics Index

The Area of a Circle (Version 2.0)

Edwina R. Justice
10641 South Lowe Ave.
Chicago, Illinois 60628
312-468-3376

Gunsaulus Academy
4420 South Sacramento Ave.
Chicago, Illinois 60632
312-650-7215

Objectives (Staff):

Demonstrate a phenomenological approach to teaching mathematics.

Inspire others to use the approach.

Objectives (Grade 8):

Review areas of plane figures.

Determine the relationship between the circumference and diameter of a circle.

Show the geometric representation of the area of a circle as the shape of a parallelogram.

Derive and use the formula for computing the area of a circle.

Participate in group activity.

Materials:

Tape measures
Round container lids with varying circumference measurements
Paper circles (equal circumferences)
Paper circles with varying circumference measurements
Centimeter grids

Transparencies:

Table with 4 columns labeled - lid number, circumference, diameter, and circumference/diameter

Graph: Label x-axis as diameter and y-axis as circumference

Several blank transparencies

Worksheet:

Draw four circles of unequal radii on a cm. grid

Recommended Strategy:

Form small groups and measure circumference and diameter of several lids.

Divide circumference by diameter for each lid.

Record data on table (transparency).

Graph ordered pairs (diameter, circumference).

Discuss constant (pi) that results when circumference is divided by diameter.

Cut paper circles with equal circumferences into 16 equal pie-shaped pieces.

Arrange 16 pieces (on cm. grid) to form a parallelogram.

Calculate area of parallelogram.

Label base of parallelogram as 1/2c and height as r.

Review c = (pi)d   c = 2(pi)r.

Show that area of the parallelogram is 1/2(2pi*r)r or pir^2.

Use A = pi*r^2 to calculate area of whole circle.

Compare area of parallelogram to formula calculations.

Use A = pi*r^2 to calculate areas of 4 circles (worksheet).

Cut circles into 1/16's and form parallelograms.

Calculate areas and compare to formula calculations.

Extension:

Make a cylinder and show how the surface area is the total areas of two circles (the ends) and one rectangle (the side).

Return to Mathematics Index

"The Surface Area of a Cylinder" (Version 2.0)

Justice, Edwina
10641 South Lowe Avenue
Chicago, IL 60628
1-312-468-3376

Gunsaulus Academy
1-312-650-7215

Introductory Comments:

This is a description of a phenomenological approach presentation. It is an extension of a mini-teach, "The Area of a Circle" (1986) and a PA, "The Surface Area of a Cylinder" (1988). A problem-solving situation, which requires the use of the two concepts, was formulated.

Objectives:

1) Use a phenomenological approach to problem-solving.
2) Apply concepts to problem-solving situation.
3) Participate in group activity.

Materials:

Measuring tapes
Tape (masking or scotch)
Round container lids (different circumferences)
Paper circles (equal circumferences)
Construction paper
Rectangles with different dimensions (measure of base should be equal to measure of circumference of a corresponding lid)

Worksheet:
Cut two circles with equal diameters and one rectangle from cm. grid paper. Measure of base of rectangle should correspond to measure of circumference of one circle. These figures should be used to make a worksheet which can be distributed to each student.

Recommended Strategy:

Form small groups and measure circumference and diameter of several lids.

Divide circumference by diameter for each lid.

Discuss constant (pi) that results when circumference is divided by diameter.

Use paper circles to show A = pi(r^2). (This procedure is explained in SMILE, 1986.)

Calculate areas of figures on worksheet.

Cut figures and make a cylinder.

Relate areas of plane figures to surface area of resulting cylinder.

Use rectangles and lids to make several other cylinders.

Calculate the surface areas of the cylinders (Use area of each rectangle plus two times area of corresponding lid).

Discuss related equations:

Area of rectangle section of cylinder = base * height
or
circumference of lid * height

Circumference = pi(d)
= 2(pi)r

Diameter = 2r

Diameter = c/pi

Develop formula for surface area of cylinder:

$$\text{Area} = (2(\pi)r^2) + (2(\pi)rh)$$

Review use of 2 as a constant in equation:

2(pi)r^2 (two represents two circles)
2(pi)rh (two represents two radii or one diameter)

Solve problem:

Two rectangular sheets 20 cm. by 24 cm. and 15 cm. by 30 cm. are to be rolled to form cylinders. What is the height and diameter of the cylinder with maximum surface area that can be formed using either of these sheets?

Construct the cylinder with maximum surface area (with lids).

Report results to class.

Return to Mathematics Index

SIMILARITY

Kee, Natalia
14814 Ridgewood Dr.
Oak Forest, IL 60452
1-708-535-2837

Harlan Community Academy H.S.
1-312-821-2800

OBJECTIVES

Discover the factor of proportionality in similar polygons and to relate this factor to the perimeters and areas of similar polygons.

APPARATUS NEEDED

Overhead projector, rulers for each student, protractors for each student, handouts of printed polygons (these are to be measured by each student).

RECOMMENDED STRATEGY

Students will measure each side and each angle of the polygons on the handouts. They will compare their measurements with the overhead projection of these polygons and derive a factor of proportionality between each corresponding pair of sides and angles of the two figures being compared. They will measure the angles of their polygons and compare these measurements with the corresponding angles of the projected similar polygon. (Discovery: the angles retain their same measure in both figures-theirs and the overhead's).

This process can be used with different pairs of polygons to establish a factor of proportionality in their perimeters and areas. Students should discover that this factor remains constant in similar polygons and is squared when determining areas of similar polygons.

Example:Ratio of two similar polygons' corresponding sides is 1/3.

```
   Perimeters of each polygon are: 2,4,2,4 = 2+4+2+4 = 12 units
                                       3(2+4+2+4) = 36 units

 Areas of each polygon are: length x width = area in square units
                                 2 x 4     = 8 square units
                               3(2)x 3(4)  = 72 square units
```

Return to Mathematics Index

POLYGONS MADE TO ORDER

Malone, Loretta
2440-186th St.
Lansing, IL 60438

Washington High School
1-312-646-4860

OBJECTIVES

1. To construct a regular polygon inscribed in a circle by using isosceles triangles with vertex angles at the center of the circle and legs as radii.

2. To determine the values of the vertex angles (central angles), the values of the base angles, the values of the inscribed angles, and the sum of the angles of any regular polygon.

3. To allow the students to discover that as the number of sides of a polygon increases, the polygon appears to look like a circle.

EQUIPMENT AND MATERIAL

1. Compass
2. Protractor
3. Straight edge
4. Worksheets
5. Overhead Projector and projector pens
6. Colored transparencies with regular polygons

RECOMMENDED STRATEGY

A. Review the concepts of triangles and circles.
   1. Isosceles triangle
   2. Base angles and vertex angle
   3. Circle
   4. Radius
   5. Chord

B. Draw the circle.

C. Construct an equilateral triangle inscribed in a circle.
Find the value of a vertex angle by dividing 360 by 3. Draw a radius and construct the vertex angle using the value. Construct the remaining two congruent angles using radii as sides. Connect the chords. (three isosceles triangles are constructed.) Place the value of the central angle on worksheet 1.

D. Calculate the values of the base angles.
Find the values of the base angle by subtracting the value of the measure of the central angle from 180, then divide that value by 2. Place the value on worksheet 2.

E. Increase the number of sides in a regular polygon.
Construct a square inscribed in a circle. Use four radii by constructing four congruent central angles. (360/4) Draw the chords (bases) formed by the isosceles triangles. Place the value of the new central angle on worksheet 1. Place the value

of the new base angle on worksheet 2.

F. Continue to increase the number of sides (5,6,7,8,...12,...) in the regular polygon.

Find the value of each new central angle and notice the decrease. Find the value of the new base angles and notice the increase.

G. Find the sum of the base angles of any regular polygon.

Use the number of isosceles triangles constructed inside the circle. Find the sum of the base angles.(worksheet 2) Multiply that number by the number of sides of the polygon. Place the new value in worksheet 3.

Students can easily learn to understand what a regular polygon is. They will begin to notice the values of the angles; i.e., the decrease in the central angles and the increase of the inscribed angles. Students will start to question what is the largest regular polygon.

Worksheet 1: The values of the central angles for each different polygon
Worksheet 2: The values of the base angles in each set of isosceles triangles
Worksheet 3: The sum of the measures of the angles in any regular polygon

Return to Mathematics Index

PROPERTIES OF QUADRILATERALS

Olson, Margaret A.
1455 N. Sandburg Terrace #1504
Chicago, Illinois 60610
1-312-787-4284

Morgan Park High School
1-312-881-5050

OBJECTIVES

1. Students will discover the names and definitions of different kinds of quadrilaterals.
2. Students will discover the properties of quadrilaterals.
3. Students will learn to apply the correct property to each different kind of quadrilateral.

EQUIPMENT AND MATERIALS NEEDED

Overhead Projector, transparencies, and projector pens; Rulers; Protractors; Colored acetate plastic models of quadrilaterals for overhead; Colored plastic models of quadrilaterals for placement on wall chart; Tape for hanging chart; Large wall or blackboard chart with list of all properties of quadrilaterals; and Material to tack models on wall chart.

RECOMMENDED STRATEGY

Using the overhead projector, place quadrilaterals on the acetate until the students have discovered the names of all the different kinds of quadrilaterals.

Do a review of vocabulary to be sure that all words in the properties are understood, and at the same time develop the definitions of the quadrilaterals.

Develop a list of the facts that are true about some or all of the different quadrilaterals. These facts or properties are displayed on a wall chart that is hung on the blackboard.

Then the class is grouped into teams, and each team will be given a set of plastic models of quadrilaterals. The teams are to discuss and measure until they discover the properties that belong to their quadrilaterals. Students will be given a printout with the list of all the properties. After a period of time, one member of each team will go to the chart and place the models on a property that they possess. NO MORE THAN ONE KIND OF QUADRILATERAL ON EACH PROPERTY!

When finished the team representative should report to the teacher. When all the teams have completed the placement, an acetate with the answers will be placed on the overhead screen, and the accuracy of answers will be checked. The team that completed first and has the highest accuracy is the winner.

For homework, the students will have to complete a sheet listing all the properties that belong to each different kind of quadrilateral.

Return to Mathematics Index

Singleton, Earl M. III Daniel Hale Williamss851 W. 53rd Pl.Chicago, IL 6060_91-312-285-77600 **Objectives** 1) Students will be able to identify the names of angles formed when parallel lines are intersected by a transversal. 2) Students will be able to identify the measurement of angles formed when parallel lines are intersected by a transversal. **Equipment and Materials** Overhead Projectorr One plastic overlayy Three transparenciess **Materials**: Crayonss Four page worksheett **Recommended Strategies** Pass out the four page worksheet which contains the vocabulary and three other pages with parallel lines intersected by a transversal. Begin the lesson by showing the parallel lines on the overhead projector. "What are these lines?" "What are other examples of parallel lines in this room?" Have a student define parallel lines. Next, show the illustration of the parallel lines intersected by a transversal on the overhead projector. "What is created when a transversal intersects the parallel line?" -- angles. Have the class turn to the second sheet and identify adjacent, supplementary, and straight angles -- all of which equal 180 degrees. Have them color code the straight angle green and place a green arch over the straight angle to illustrate a semicircle. Call on two students to come up. Position them side by side, and ask the class the following question: What would you call neighbors who, lived right next to each other on the same side of the street? They would be next door neighbors and in math we call them adjacent angles. They share a common ray and vertex. Next, have the class turn to the third page of the worksheet and label the top of the page corresponding angles. Begin to identify congruent corresponding angles and color code each pair of corresponding angles a different color. They will have four different pairs of corresponding angles -- each pair having a different color. Proceed to the fourth page and have the class label this page alternate exterior and alternate interior angles. Again, have them color code each pair of angles. Solicit the definition of interior and exterior. Place a group of students in a circle and put one person in the middle of the circle. The teacher should stand outside of the circle. Ask questions about the relationship of the teacher to the person on the inside of the circle. This activity will help reinforce the concept of interior/exterior relationship. In order to further develop the concept of alternate, have the person on the inside of the circle alternate jumping up and down with the teacher. Go to the board to illustrate alternate exterior and interior angles. Lead them to discover that they are alternate exterior angles because they are on the opposite side of the transversal and on the outside of the parallel lines. Continue by demonstrating that alternate interior angles are on the inside of the parallel lines and on alternate sides of the transversal. After reviewing all the terms, assign a measurement to one of the angles and have the class determine the measurement of the other angles and justify their answer.

The Surface Area of a Cylinder

Justice, Edwina
10641 South Lowe Avenue
Chicago, Illinois 60628
468-3376

Gunsaulus Academy
650-7215

Introductory Comments:

This is a description of a phenomenological approach presentation. It is an extension of a mini-teach, "The Area of a Circle", presented in the Summer of 1986.

Objectives:

A. To relate the areas of one rectangle and two circles to the total surface area of a cylinder.
B. To relate the circumference of a circle to the base of the rectangular section of a cylinder.
C. To review the area of a circle.

Apparatus Needed:

A. Round container lids with varying circumferences
B. Rectangles, cut from flexible material, with bases corresponding to the circumferences of the lids. Allow one inch for overlapping the ends. Mark this one inch space.
C. Circles cut to match the sizes of the lids.
D. Measuring instruments.
E. Tape

Recommended Strategy:

This lesson has been designed for groups. The format of the group report should include a topic, figures (labeled appropriately), procedure and conclusions. Materials should be distributed only when needed. The recommended order of activities is listed below.

A. Review concepts from "The Area of a Circle"
   1. circumference
   2. diameter
   3. c/d = pi   c = pi*d
   4. pi is approximately 3.14 or 22/7
   5. c = 2pi*r

B. Calculate the area of the rectangle
   1. Label base, height
   2. Measure and compute area using A = bh

C. Make circular form
   1. Overlap the ends of the rectangle and tape them together
   2. Place the form on the corresponding lid
   3. Discuss the apparent shape

D. Relate the base of the rectangle to the circumference of the lid

E. Place second circle on top of the form and discuss results

F. Remove second circle and tape

G. Label base as circumference

H. Calculate area of rectangle using C = pi*d for the base of the rectangle

I. Compare the results of the two computations of the area of the rectangle

J. Calculate the area of two circles

K. Add the area of the two circles to the area of the rectangle

L. Write group report

This series of activities has been designed to guide students to an understanding of the components of the cylinder surface area formula. As students proceed with the construction of the cylinder, they should relate its form to the flat surfaces of a rectangle and two circles. The area of the two circles can be computed by multiplying pi times radius squared and that quantity times 2. In the surface area formula the process appears as $2pi*r^2$. The use of the lid and a second circle which is the same size as the lid should be related to the use of the constant 2 in this part of the formula. The different processes for computing the area of the rectangle should be related to 2pi*r*h. Discussion of the constant 2 in this part of the formula may be made at the time c = pi*d is used to compute the area of the rectangle. It is necessary for students to relate 2 radii to one diameter.

Soap Film Models

Pintozzi, Joan
7200 Grand
Downers Grove, Il. 60516
964-4216

Curie Metro. H.S.
838-5040

Objectives:

1. Encourage students to conjecture
2. Introduce concept of minimum path and minimum surface area
3. Practice measurement of line segments and angles

Apparatus Needed:

1. Four inch square plastic models
2. Polygon models
3. Soap bubble liquid
4. Overhead projector
5. Clear shallow container to hold models on overhead
6. Rulers
7. Protractors
8. Worksheets with configurations of points like the plastic models

Recommended Strategy:

1. Have students draw line segments on the worksheets, to indicate their estimate of the shortest path joining the points in the configuration
2. Dip models into soap liquid
3. Show results on overhead projector
4. Encourage students to estimate and to discover patterns
5. Measure segments and angles drawn on worksheets and compare estimates to experimental results
6. Summarize

Return to Mathematics Index

Primary Geometry

Pitra, Barbara
4879 N. Kilpatrick
Chicago, Illinois 60630
282-9659

Marconi Community Academy
854-2810

Objectives:

The children will name, identify and categorize the geometric shapes (triangle, square and rectangle) by the number and length of the sides.

The students will identify triangles, squares and rectangles in their environment.

Through observation, comparison and manipulation the children will construct pictures, shapes and patterns with the triangle and square.

Using game formats the students will gain practice in recognizing and naming geometric shapes.

Apparatus needed:

1. various sized plexiglas triangles, squares and rectangles with magnetic tape applied to the backs of the shapes so they will stick to the blackboard
2. 20 triangles and squares made of plexiglas or paper (2" on a side)
3. a ditto of triangles and squares for each child (2" on a side)
4. glue
5. scissors
6. overhead projector
7. "Color and Shape Bingo" by Trend Co.
8. 1 deck "I have ....who has...." cards

Recommended strategy:

This presentation is appropriate for use with primary children. Using the plexiglas shapes the students will discuss similarities and differences as well as various ways in which the objects could be categorized. Elicit from the children that a triangle has 3 sides, a square has 4 equal sides and a rectangle has 2 long sides and 2 short sides. On the blackboard make a category heading for each shape and have several students go to the board and place the magnetic shapes under the correct heading. Review names and characteristics of each shape.

Why did you place that object there?
What are the characteristics of that shape?
What is your shape called?

Ask the children to name these geometric shapes as they identify them in the classroom and their environment.

The children will cut out squares and triangles from ditto sheets in several different colors. All of the new shapes and patterns that will be constructed will be shown on the overhead projector. This will help the child who has difficulty seeing patterns or because of poor eye-hand coordination. Shapes must not overlap or cover other shapes. They must line up evenly. Ask the students to show that: squares can make bigger squares, squares can make rectangles, triangles can make bigger triangles, triangles can make hexagons but our triangles cannot make squares or rectangles (we didn't have right angles). Allow the students to experiment with color and shape in making new figures, shapes and patterns. Demonstrate some of the creations on the overhead. After the class has had adequate time to experiment, request that they glue their "favorite" on to a piece of manila paper.

Play Trend Co.'s "Color and Shape Bingo" or make a bingo game. The "I have ... who has ..." card game is teacher made. It consists of a deck of cards, one for each student. The cards may be used to drill many topics. For example, the child reads his card, "I have a red square, who has a blue rectangle." The child who has the blue rectangle then reads his card, etc. The last card read is the winner.

Proving Pi

Williams, Gwendolyn D.
P.O. Box 19182
Chicago, Il 60619-0182
(312) 363-2195

Paul Robeson High School
(312) 723-1700

Objectives:
To show the ratio of pi by revolving a circle one complete time.
The students will learn why the ratio is true.
To allow the students to do the same independent of the teacher's help.

Apparatus needed:
You need: Two random size pieces of plexiglass.
One screw (long enough to pass through all thickness of the pieces you use)
One pair of nuts to hold the screw in place.
One aluminum channel no longer than four feet.

Recommended Strategy:
To make the circle, cut either piece first. Draw a circle on the paper covering of the plexiglass or cut random tangents to a squared piece until it is it is somewhat round. Drill a hole at the center of the piece large enough to put your screw through. Finding the center should not be a problem. Once the "round" piece is ready, sand out the rough spots. Find a thick piece of wood that you can nail the circle to . After nailing the circle to the wood, go to the sander and rotate the plexiglass until the rough spots are gone. Draw an arrow from the center to the edge of the circle (a radius). The second piece will be used for the handle and the spacers. Cut three pieces, two of the same length and long enough to extend from the center of the circle to the outside and the other about one inch shorter. The first two pieces should be wide enough to fit comfortably in your hand as they will be used to guide the circle through the channel. The third piece will be used for spacers. Drill the same size hole near the end of the two pieces to be used for the handle and two holes four inches apart in the piece to be used for spacers. **Do not cut before the holes are drilled**. At this point get help from the shop manager to assist in putting the final product together. If it is not obvious, the spacers should be cut to fit one under each handle and flush against the circle to reduce friction when rotating. Use other scrap pieces to space the edge of the handle that will be held in your hand. Sand all edges. Use the glue to hold the spacers in place at the edge of the handle. For the classroom demo, the aluminum channel will be placed on the desk or table. Stand the circle on its side, arrow down and perpendicular to the channel. Mark the origin with a pencil on the channel. Make a complete rotation of

the circle. At the end of this rotation, mark the channel again. To find this length, do either of two things. Lay the circle on the channel end over end from the origin to the end of the length at which time the measure is obvious. Or lay the circle between perpendiculars for as many times as it takes to cover this length. In either case, the measure should be 3.14159... or a number very close to that.

THE SOLAR SYSTEM

Fred J. Schaal

Lane Tech High School
Addison & Western
Chicago, IL 60613
1-312-880-8100 Math Dept.

Objectives:

Make use of concentric circles and angles (in excess of 180 degrees) to construct a sketch of the naked-eye-visible planets of the Solar System. (What this amounts to is polar coordinates, but I do not mention it.)

Materials:

Graph paper, compass, protractor, and table of astronomical data: heliocentric longitude, in counter-clockwise degrees, and the semi-major axis (radius, for practical purposes) of the orbit, in astronomical units, for the planets Venus, Mars, Earth, Jupiter and Saturn.

Strategies:

Draw concentric circles on the board--one for each planet's radius (semi-major axis). Plot the position of each planet on its respective circle. Explain how the figure indicates if, where and when a given planet will be visible on the date in question.

A FEW NOTES:

The source for the heliocentric coordinates is the current issue of **Astronomy Magazine**--July 86--for all but the planet earth. (How strange!) To get this terrestrial data I phoned the Adler Planetarium. It is necessary to interpolate between dates to find the coordinate for Mars.

The source for the lengths of the semi-major axes (radii) of the orbits of the planets is an old astronomy book from college, but any almanac or general-information-type book should suffice.

Using standard, generic, drug-store, (quarter inch per side of a square) graph paper, a scale of two units per astronomical unit is good. The Sun is placed 16 units over and 7 units down from the upper left corner: the longer edge is horizontal. (It just so happens that for the date in question most of the planets lie in the bottom half of the concentric circle system. This means that only halves of the big circles--Saturn and Jupiter--have to be drawn--the bottom halves. This allows for a larger scale for the whole sketch. All of the circles for Venus, Earth and Mars can and should be drawn.) A ray is drawn due East, (to the right, parallel to the long edge of the graph paper), from the Sun, to serve as both a distance scale and an angle reference. The direction of the ray is zero degrees of heliocentric longitude. (Technically it points towards the Vernal Equinox.) Each planet's position is found by moving counter clockwise about the proper circle from this reference ray.

Explaining visibility is beyond the scope of a one page write-up of this mini-teach. With some thought, it should become obvious to anyone but the most casual observer.

How Many Regular Polyhedrons Are There In This or Any Universe?

Lawrence E Freeman
Kenwood Academy
5015 Blackstone Avenue
Chicago, IL 60615
1-312-536-8850 (school main)

Background

The idea of "regularity" is a very old one in geometry. It dates back to the ancient Greek mathematicians/philosophers. (See, for example, Plato's theory of "ideals"). Regular polygons are thus convex polygons whose vertex angles are all equal (or congruent) and whose sides are likewise all congruent.

The first geometry textbook, Euclid's Elements, assumed convexity without mention of that concept. We shall take convexity in its intuitive sense. Convex polygons have a very neat property: Take any vertex and draw all possible diagonals within the polygon. This process subdivides the polygon of n sides into n-2 non-overlapping triangles. Since a triangle's three vertex angles have a sum of 180 degrees, an n-sided convex polygon's n vertices must have an angle sum of 180(n-2) degrees. Now, if our n-sided polygon is also regular, each of its n congruent vertex angles must have a measure of one-nth of this angle sum.

Expressing this fact for several regular polygons we obtain the following data:

Number of Sides	Degree measure of any vertex angle
3	60 degrees
4	90
5	108
6	120

Note that as the number of sides increases, the degree measure of a vertex angle does likewise. (Thought experiment for the thoughtful reader: The exterior angles of a convex polygon become smaller as the number of sides increases, but what do you suppose happens to the sum of all the exterior angles of a convex polygon, regular or not? Can you prove or disprove your hunch? Try it!)

Regular Polyhedrons

A polyhedron is a "solid" three-dimensional figure analogous to the two-dimensional polygon discussed above. Polyhedrons have vertices, edges, and faces which to Euclid had dimensions of zero, one, and two respectively. If a polyhedron has faces which are regular and congruent polygons -- all of them -- and if at each vertex exactly the same number of faces meet, then we have a"regular" polyhedron. The question is, "exactly how many such 'critters' are there?" Obviously the number is infinite if size is considered, so we shall eliminate that consideration and ask merely how many "truly" different regular polyhedrons can exist.

More nomenclature is needed (Sorry). In two-dimensional plane geometry, angles are just angles, but in three dimensions life gets more complicated: When two planes intersect, they intersect in a line. Pick any point on such a line of intersection (edge) and in each plane construct a line perpendicular to the line of intersection. The angle between these two perpendiculars is the "DIHEDRAL ANGLE" of the two intersecting planes. In regular polyhedrons these dihedral angles are all equal (congruent). Computation of their measure can get quite

2
complicated, but isn't essential for this project.

At each vertex (point or corner) of our polyhedron there is a solid or TRIHEDRAL angle. How such angles are measured -- if indeed that concept even applies -- isn't known to this writer. What is clear is that a trihedral angle must be the meeting point of three or more planes --faces -- of the polyhedron. And recall that all faces are congruent polygons having congruent vertex angles according to the above-mentioned table and formula.

Let us examine how trihedral angles can be made: Assemble three or more polygons so that they meet along common sides with one common vertex. If the sum of the vertex angles is less than 360 degrees, then there is a gap between the outer, unmatched edges. Closing up that gap by joining the two unmatched edges yields a trihedral angle. Working with regular polygons makes our job of analysis possible.... We will start with the simplest regular polygon, the equilateral triangle, manufacture all possible trihedral angles from just that unit, and then move up as far as needed to the point where the angle sum equals or exceeds 360 degrees.

This last statement is the key to the proof (solution or answer to the initial question). If the angle sum equals 360, then there will be no gap to be closed. In such a situation, the trihedral angle degenerates to a plane instead of a "bulge", and a polyhedron can't exist. Should more regular polygons be added to the assembly, they will OVERLAP, and such a "creature" would have a negative gap. It CERTAINLY can't be folded to produce a trihedral angle.

Three, four, or five equilateral triangles can thus fit around a trihedral angle. These are the vertices of the regular tetrahedron, octahedron, or icosahedron respectively. We may be certain that no other regular polyhedra can exist having equilateral triangles for faces.

Next, move up to the regular quadrilateral -- the square. At least three squares must comprise this trihedral angle; and that is all for the square because if a fourth square is added to the assembly, the angle sum is exactly 360 degrees. The only regular polyhedron having squares as faces is the best-known, the cube. The count is now four regular polyhedra; onward....

The regular pentagon has five sides, and each vertex angle has measure of 108 degrees. Three regular pentagons attached as before yield 324 degrees and a gap of only 36 degrees. When this small gap is closed we obtain a vertex (trihedral) angle of the last possible regular polyhedron, the celebrated regular dodecahedron of twelve faces.

Our task is now over because one must next try to construct trihedral angles out of regular hexagons, regular heptagons, and regular polygons of greater numbers of sides (each with a correspondingly greater vertex angle measure). Three regular hexagons have a vertex angle sum of exactly 360 degrees, and they won't fold into a trihedral angle because there is no gap. The angle sum of three vertex angles of a regular heptahedron is greater than 360 degrees. three vertex angles of a regular heptahedron is greater than 360 degrees, so nomertex angles of a regular heptahedron is greater than 360 degrees. more regular polygons need be examined.

To sum up, there are only five possible regular polyhedra. Period.

This ended the matter for the ancients. Until about two hundred years ago that is. Then it was noticed that no one had ever explicitly called for CONVEX

polyhedra. Johannes Kepler and later Poinsot found it possible to add to the roster of regular polyhedra by creation of "dimpled" and/or stellated regular
3
polyhedra. The additional regular polyhedra won't be discussed in this report, but information about them may be found in the Bibliography.

Here is a summary of the five convex regular polyhedra:

Reg. Polyhedron	Number of Faces	Number of Vertices	Number of Edges
Tetrahedron	4 T's*	4	6
Cube	6 S's*	8	12
Octahedron	8 T's	6	12
Dodecahedron	12 P's*	20	30
Icosahedron	20 T's	12	30

*: T = Equilateral triangle; S = Square; P = Regular Pentagon

Notice two things about this table: First, in every case the numbers of faces, vertices and edges satisfy the Euler formula, F + V = E + 2.(Look up a proof of this sometime). Secondly, from the spacing of the table note that the numbers of faces and vertices interchange between Cube and Octahedron and between Dodecahedron and Icosahedron. Such relationships lead to study of the topic of "duality," basic to advanced Euclidean geometry and also virtually the foundation of "projective geometry" (an advanced extension of geometry).

If wire models having transparent faces are made of each of these polyhedra, of appropriate "size," then each of the pair of duals will so fit inside of each other that a vertex of one will lie at the center of a face of the other of the dual pair.

Wenninger, Magnus, "Polyhedron Models". London: Cambridge University Press, 1971.

(end of bibliography section. what follows was once typed onto the disk, i thought, but doesn't seem to be here, now that i want it...... ##&$)^^^^12345678) SO I WASTED TIME RETYPING THE GOD DAMNED STUFF!

OBJECTIVES

To demonstrate a simple to prove but surprising fact of elementary geometry.

To illustrate one method of mathematical (logical) proof -- Cauchy's celebrated method of cases in which all possibilities are studied one-by-one.

To create a climate in which student, teacher or both can extend their knowledge by framing additional conjectures (plausible hypotheses) worthy of investigation.

MATERIALS

Tag board, cutting instrument (scissors, "Xacto" knife or single-edge razor
4
blade), and paste or (preferred) "Scotch" brand "Magic Transparent Tape."

Models of completed polyhedra, each relevant trihedral angle, and student sets of the latter to be folded, handled, and examined.

STRATEGIES

For the basic theorem ("How Many...?"), employ the Cauchy method of cases to illustrate the virtue of patience. Hands-on work completes the proof almost faultlessly, very convincingly, and (surprise!) theoretically correct.

Class brainstorming ought to then produce a host of additional conjectures in the realm of efficient coloring of faces, dualism, wire models, best approximation of a sphere, measurement of dihedral angles, computation of the measures of such angles, the "Euler formula" and its spookiness, etc.

Finally, even highly competitive, high achievers soon see the virtue of cooperation in the manufacture of their own models of trihedral angles, entire polyhedra, stellations, and coloring schemes. The smarter the student, the quicker the realization that mass production saves time and labor.

THE AREA OF A CIRCLE

Edwina R. Justice
Gunsaulus Academy
4420 S. Sacramento St.
Chicago, IL 60632
1-312-523-1061

OBJECTIVE:

To see the relationship between circumference and diameter and how that relationship, called pi, is used in the formula for the area of a circle.

MATERIALS:

A. Round container lids with varying circumferences
B. Metric tape measures
C. One graph for wall (label horizontal axis as DIAMETER and vertical axis as CIRCUMFERENCE)
D. One chart with four columns for wall (label CIRCUMFERENCE, DIAMETER, C/D, and Lid #)
E. Graphics
   1. Small square inscribed in a circle inscribed in a larger square
   2. Small hexagon inscribed in a circle inscribed in a larger hexagon
   3. Circle cut into 16 equal pie-shaped pieces and arranged to form a parallelogram

STRATEGIES:

A. Assign group activities
   1. Make a chart, on paper, similar to the wall chart.
   2. Measure C and D to nearest mm.
   3. Calculate C/D and record information on group chart.
   4. Plot points on large wall graph.
   5. Record information on large wall chart.
   6. Calculate group average for C/D.
B. Discuss results on graph. Points appear to lie on a straight line.
C. Establish C/D = pi and C = pi(D)
D. Review other area formulas:
   1. Area of square = s**2
   2. Area of rectangle = bh
   3. Area of parallelogram = bh
   4. Area of triangle = 1/2 (bh)
E. Compare apparent area of small square inscribed in a circle with apparent area of larger square circumscribed about circle with apparent area of circle:
   Area of sm. sq. (2*r**2) < Area of circle < Area of lge. sq. (4*r**2)
F. Compare areas of small and large hexagons, one inscribed in the circle, the other circumscribed about the circle. Relate to apparent area of circle. Discuss how an increase in the number of sides of the inscribed and circumscribed figures approaches the shape and area of the circle.
G. Show how the area of the parallelogram, made from 16 pieces of the circle is equal to pi(r**2):

```
A = bh
  = 1/2 (C) (r)
  = 1/2 (pi*2r) (r)
  = pi (r) (r)
  = pi (r**2)
```

H. Discuss values on wall chart. Calculate average. Compare average with actual value of pi.

I. Calculate area of circle using pi formula. Relate to figures in graphics.

Barbara P. Lorde - Crispus Attucks Academy

M&M MATH

Barbara P. Lorde
3530 S. King Drive
CHICAGO IL 60653
(312) 791-0338

Crispus Attucks Academy
3813 S. Dearborn
CHICAGO IL 60609
(773) 535-1270

Objective(s):

This lesson is designed to introduce math at the kindergarten level. All students should be able to:

1. Learn basic colors
2. Sort according to colors
3. Count 1 through 10

Materials Needed:

For a class of thirty students you will need the following:

30 small bags of M&MS
30 coffee filters
30 papers with colors red, blue, orange, brown, yellow, and green written in squares.

Strategy:

Have students guess how many M&M'S are in the bag.
Open bag of candy and put candy into coffee filter.
Sort all M&M's into sets by colors using the color sheet.
Name each color and count each set.
Once activity is finish have students put M&M's back into their coffee filters.
Ask students to put two M&M in their mouth.
Have students count how many are left.
Eat two more. How many M&M'S do you have left?

Performance Assessment:

Each student will be orally assessed on colors, sorting, and counting 1-10.

Conclusions:

The students should be able to name various colors.
Sort according to colors and count 1-10.

Return to Mathematics Index

Using Symmetry to Create A Community Quilt

Beverly Brown
8206 South Homan Ave
Chicago IL 60652
(312) 776-3778

Hedges West
4951 South Seeley Street
Chicago IL 60609
(312) 535-7360

Objectives:

This mini-teach is designed for **4th grade through 12th grade** with appropriate modification for the upper grades. Students will learn about line symmetry and reflectional symmetry. Students will also utilize this knowledge by working cooperatively to make a community quilt. Students will make a quilt with four lines of symmetry.

Materials Needed:

Give one set to each group

1. Quilt patch (3 x 3 - nine 2" squares plus a one-half inch border) Activity Sheet 22
2. Hole puncher
3. Yarn
4. Crayons
5. Scissors
6. Quilt-Pattern Shapes (Activity Sheet 25) (This sheet includes several different size of triangles, squares, rectangles, and other shapes that students can cut out and trace onto their quilt patch)

Strategy:

Symmetry can be seen all around you. Symmetry exists when an object or figure can be divided along a line (line of symmetry) and each resulting image (on each side of the line of symmetry) coincides or is reflective.

1. Give each student a sheet of paper. Student should fold paper in half and cut out a valentine. Open the valentine and draw a line on the fold. This is your line of symmetry.

2. Use different figures to practice vertical, horizontal, and diagonal symmetry.

3. The quilt your class will make will have 16 patches. Each patch is composed of 9 squares (3 by 3 square). The entire quilt will have four lines of symmetry. (You may decide to have one or two lines of symmetry depending on your class.)

4. Students will work in groups to color the patches. When each group has finished, holes should be punched on each side of the quilt patch. Yarn should be used to weave in and out of the holes to connect the patches in a 4 by 4 design.

5. Use strips of crepe paper to create a ruffle around your quilt. Pleat the paper and glue or staple it around the border.

Performance Assessment:

The expected results is that the quilt will be symmetrical according to your directions. For younger students, you may want them to have one or two lines of symmetry. Students should be able to show the line(s) of symmetry and explain why their patch is symmetrical.

Reference:

Everyday Mathematics Journal II, **Everyday Learning Corporation, 1995, Activity** Sheet 22 and Activity Sheet 25.

This is a rough sample for the 16 patch quilt. Remember that each quilt patch has 9 squares.

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

In order for this quilt to be symmetric about a vertical axis, the following quilt pairs must be reflective: (1,4), (5,8), (9,12), (13,16), (2,3), (6,7), (10,11), (14,15)

In order for this quilt to be symmetric about a horizontal axis the following quilt pairs must be reflective: (1,13), (2,14), (3,15), (4,16), (5,9), (6,10), (7,11), (8,12)

In order for this quilt to have **4 lines of symmetry**, the following quilt sets must be reflective: (1,4,13,16), (2,3,5,8,9,12,14,15), (6,7,10,11).

Sorting and Analyzing

Vickie Townsend
8247 S. Washtenaw
Chicago IL 60652

Crown Fine Arts Community Academy
2128 S. St. Louis
Chicago IL 60623
(312) 535-1680

Objectives:

1. After the lesson the students will be able to sort, compare and analyze. This lesson can be appropriate for all levels.

2. The students will explore, observe and examine concrete objects while sorting, comparing and analyzing.

3. The students will be able to recognize a bar graph.

Materials Needed:

1. Each student will receive a sheet with a month on it and 8 cakes drawn on it; a paint brush; red, yellow and blue paint.
2. Each student will receive 2 Post-it-Notes, crayons, sorting sheets, and a questions and answer sheet.
3. Each group of 4 students will receive one 2.07 oz. package of Starburst candy and one 16 oz. bag of Starburst candy.
4. The students will receive tape, a cup of water per group of 4 students and paper towels.

Strategy:

The students will answer the question "How can we find out how many student's birthdays in each month?" The students will offer suggestions as to how to solve this problem. The students will decorate their sheet with the month and the cakes on them. They will use the primary colors and mix them to create different colors. They will get a piece of tape and tape each month in order on the bulletin board. Each student will then write their name on one Post-it-Note and write their birthday on the other Post-it Note. When they are finished they will put the Post-it-Notes under the month in which their birthday falls.

They will notice the common characteristic of birthdays in the same month
They will realize that sorting means putting things in groups of like items.

They will notice the bar graph that is produced on the bulletin board and answer questions such as the following:

1. Which month has the most birthdays?
2. Which month has the least birthdays?
3. Are there more birthdays in January than December?
4. What is the total number of birthdays in February and March?
5. What is the total number of birthdays in September and October?

The students will then hold up the 2.07 oz. package of Starburst. They will open it and count the number of candies. They will estimate how many candies are in the 16 oz. bag of Starburst. They will count them to see if they are correct. They will use the sorting sheet to create a bar graph showing how many candies of yellow, red, pink and orange they have? They will answer questions such as the following:

1. How many yellow candies are there?
2. How many red candies are there?
3. How many pink candies are there?
4. How many orange candies are there?
5. Which color has the most candies?
6. Which color has the least?
7. How many red and yellow candies?
8. How many pink and orange candies?
9. How many yellow and red candies?

The students must then divide the amount of candy evenly so that each student has an equal amount.

Performance Assessment:

The students must complete the Sorting Question and Answer sheet with at least 80% correct.

Return to Mathematics Index

Sorting Through Life!

Barbette Flennoy
P.O. Box 146784
Chicago IL 60614
(312) 477-7707

Joseph Stockton
4420 N. Beacon
Chicago IL 60613
(312) 534-2450

Objectives:

The goal of this lesson is to teach students how to sort objects by recognizing their attributes and if possible, relate them to life. This lesson can be used for kindergarten students.

Materials Needed:

- -refrigerator magnets
- -sea shells
- -attri-cubes
- -nuts (variety)
- -color blocks
- -buttons
- -counting bears
- -marbles
- -old jewelry
- -hair accessories

Strategy:

The above listed items can be used in more than one lesson. In other words, if you select marbles on one day, you can use nuts another day. It really depends on what type of teaching style you prefer or the amount of materials you have. Basically, I enjoy using this as a rotational lesson. Kindergarten students are very capable of doing this lesson in groups and working at a center that has been prepared for them. The teacher can work with the students in small groups. I prefer two to four students in a group.

Begin by placing the objects or items at the center where the students will be working. If you are going to work in small groups, give the students a few minutes to explore the items/objects. Ask the students if they can give the items a name. **Example** - The items you have decided to use are the sea shells. Ask the students questions. What are these? Have you ever seen them before? Where? What do you think of when you see them? This gives the students a chance to call on their experiences in order to relate to the project. Next, have the students look over the different types of shells and put them into groups by shape, color, texture, etc. Next, have the students count the total number of groups. They may even come up with groups that you have not thought about. Basically, this is the way that I work with the students because of the amount of materials I have access to in my room.

Performance Assessment:

Since this lesson is geared towards a kindergarten level, I like to use a check or a minus to reflect whether they understand or not. In most Chicago schools at this time, the standard kindergarten assessment consists of a + (good), / (needs work), and a .(dot-not developed).

One of the best ways to assess a student is to use other materials that he/she has not used. By doing this, it is possible to see if they can transfer or apply what they have studied.

Conclusions:

This is one of my favorite lessons and I use a variety of objects which is incorporated into a unit on attributes. The children love working with all of the different items. It gives them a chance to explore, internalize, grasp, and relate to the subject. It can really enhance the students' mathematical and socializing skills.

Number Patterns in Pascal's Triangle

Ulysses Harrison
8435 S. Wood St
Chicago IL 60620
(312)239-6333

Dunbar Vocational High School
3000 S. King Drive
Chicago IL 60616
(312)534-9000

Objectives:

This lesson is designed to enable students at grade 5 or higher to recognize the integers, rows and columns that comprise Pascal's Triangle.

The main objective of the lesson is to enable students to reproduce the first eleven rows of Pascal's Triangle by recalling number patterns given in the lesson without having to look again at the original triangle.

Materials Needed:

Overhead projector
Overhead projection transparency film containing Pascal's Triangle
Overhead projection transparency film containing only blank cells
One photocopy of Pascal's Triangle for each student
One photocopy of blank cells (to reproduce the triangle) for each student

Strategy:

Inform the students that the rows and columns of integers that make up the triangle known as "Pascal's Triangle" contain many number patterns that they can easily recognize and duplicate after participation in this lesson. Begin the lesson by displaying the following rows and columns of numbers via the overhead projector.

```
                         1
                       1   1
                     1   2   1
                   1   3   3   1
                 1   4   6   4   1
               1   5  10  10   5   1
             1   6  15  20  15   6   1
           1   7  21  35  35  21   7   1
         1   8  28  56  70  56  28   8   1
       1   9  36  84 126 126  84  36   9   1
     1  10  45 120 210 252 210 120  45  10   1
```

Point out to the students that each row in the triangle begins and ends with the integer 1. After the students show an adequate indication that they recognize this first pattern, show them that the numbers in alternating rows form columns that must be lined up under each other as the triangle is expanded one number per row of integers. Finally, show the students that the sum of each two successive integers in the row above it is equal to the integer in the row below it and centered between the two integers. The students can then use this information and duplicate Pascal's Triangle on the photocopy of blank cells provided for the purpose of each student duplicating the triangle following the lesson.

Performance Assessment:

Monitor the responses of the students in the class as you point out the above patterns to them and have them tell you what integers will follow in the rows of Pascal's Triangle. Use the blank cells photocopy for each student to make his/her triangle after the lesson without referring back to the original triangle. Quickly collect and correct each student's duplicate triangle. Demonstrate and explain again how to add two consecutive integers to find the integers in the succeeding rows of the triangle if more than three students did not correctly provide all the integers on the photocopy. Issue new copies of the blank cells to those students who did not perfectly duplicate the triangle. Have these students write out the process that produced their incorrect integers and resubmit a second completed copy of the triangle.

Conclusion:

Students can be shown how to identify some of the patterns in Pascal's Triangle and duplicate the triangle in a single lesson. They can then be encouraged to look for some of the many other patterns that exist in the triangle.

Return to Mathematics Index

Visuals Patterns in Pascal's Triangle

Ulysses Harrison
8435 South Wood Street
Chicago IL 60620
(312) 239-6333

Dunbar Vocational High School
3000 South King Drive
Chicago IL 60616
(312) 534-9000

Objectives:

1. To use a phenomenological approach to impress upon students the many visual patterns and number patterns that are present in the sequence of numbers that make up Pascal's Triangle.

2. To convince students that they are able to construct Pascal's Triangle on their own without use of notes after the conclusion of this presentation.

3. To encourage students to explore on their own patterns that exist in Pascal's Triangle, but which they were previously unaware.

Materials Needed:

Overhead Projector
Three (3) prepared overhead displays of Pascal's Triangle: one (1) display with all the numbers included, one (1) display with numbers included in the first 4 rows only, and one (1) display with no numbers included in any of the elements.

Presentation:

1. Introduce Pascal's Triangle by showing the completed triangle on the overhead. Explain to class that there are many beautiful patterns in Pascal's Triangle of which they are unaware. Challenge class with promise that each of them can reproduce all the numbers seen in his triangle that is displayed on the screen after this presentation.

2. Remove the display of the completed Pascal Triangle and replace it with the triangle that has four (4) lines completed. Explain that the outer numbers are all "1's" and the inner numbers are always the sum of the two numbers immediately above them. Armed with this information, each student should now be able to complete the numbers in a Pascal Triangle of any size. Call on various students to supply the values for the various numbers in the partially completed triangle that is displayed.

3. Project the blank pattern of Pascal's Triangle on the screen and call on various students to supply the numbers that make up each cell of the triangle. When it becomes apparent that students are confident of their abilities to complete the numbers in each cell of any Pascal Triangle, proceed to point out some of the many number patterns and visual patterns contained in Pascal's Triangle.

Conclusion:

One of the first patterns that can be pointed out is the sum of the numbers of any diagonal. The sum of elements of any diagonal is the number immediately below the last number of the diagonal. Another easily seen pattern is the sum of the rows for any row in Pascal's Triangle. For any row, the sum of the numbers in that row is 2 raised to the exponent of that row. The sum of all the elements of of any number of rows is 2 raised to 1 more than the number of the row, then subtract 1.

Pascal's Triangle also contains the "triangular numbers":

$$T_n = 1/2(n)(n+1)$$

and the Fibonacci numbers. Isaac Newton, in his "binomial theorem", proved that entries in the Pascal Triangle represent coefficients in the expansion of $(x+y)^n$, where n is any counting number.

To Classify Beans And Peas

Gwendolyn Williams
2229 East 70th Street
Chicago IL 60649
(312) 955-0899

Adam Clayton Powell
7530 South Shore Drive
Chicago IL 60649
(312) 535-6651

Objectives:

The students will be able to record information on their bar graph and interpret the information given. To identify five different kinds of beans and three different kinds of peas.

Materials needed:

- ruler
- data sheet
- paper plate
- bag of mixed beans and peas
- pre-labeled bar graph sheet
- box of crayons or markers

Strategy:

Divide the children in groups of four. Ask the children to sort the beans by size or shape to get a feel for grouping. Hand out graph sheets and have each group record their results. Make a bar graph with the whole class and put the beans or peas on it according to type. Use the following questions in a class group discussion:

1. What does it mean to observe something?
2. What does grouping mean?
3. What does it mean to record something?
4. How many different kinds of beans or peas were in your bag?
5. Which bean or pea did you have more of?
6. Which bean or pea did you have the least of?
7. How many beans and peas did you have in all?
8. What are the differences between beans and peas?
9. Which two beans or peas did you have equal amounts of?
10. What is the difference between the largest amount of beans or peas and the least amount of beans or peas?

Conclusions:

The students will realize that the skills they have acquired will be useful in many areas besides mathematics. Other disciplines that utilize graphs are science, geography, economics, and computers.

Chess Math

Louis C. Jackson
P.O.Box 19286
Chicago, Il 60619
708 841-6096

Lincoln Elementary School
141st. Honore
Dixmoor, Il 60426
708 596-4160

Objective:

Students will be able to reinforce their knowledge of angles by becoming chess pieces on a floor chess board.

Materials needed:

Chess game, masking tape, twine string, rulers or yard stick, poster board or tag board, scissors, black markers and a hole puncher.

Strategy:

Prior to the class session, the teacher should mark off a large chess board on the floor of the classroom with masking tape (A chess board has 64 equal squares with half black and half white).

Each chess piece should be cut from the poster board and marked to identify two kings, two queens, four bishops, four knights, four rooks and sixteen pawns. One king, one queen, two bishops, two knights, two rooks and eight pawns will be designated as black and the other half will be designated as white pieces.

Holes should be punched in the sides of each piece near the top to put the string through, so that the pieces can be placed around the neck of each person involved in the game of Chessmath.

The legal moves that each piece is allowed to execute must also be printed on the pieces of poster boards.

The game begins with designated players stationed on proper squares. The queen must be on her color. The moves will be called by the teacher. After each move the player must call out the angle that was made and the degree of that angle. The player will look on the piece around his neck and try to move accordingly. Points will be given to players according to the degrees they make.

Conclusion:

This lesson has reinforced the knowledge of angles and their values via Chessmath.

Return to Mathematics Index

TESSELLATIONS: An Application Of Simple Regular Polygons

Mary Racky
10638 S. Talman
Chicago, Il. 60655

Kenwood
5015 S. Blackstone
Chicago, Il. 60615
312-535-1409

Objective:

The students will develop basic skills making and identifying homogeneous tessellations, both regular and semiregular.

Materials needed:

One overhead projector,
One transparency of tessellation patterns with vertices marked and polygon name listed below,
One set of overhead transparency pens,
Two - four small plastic bingo chips,
One set of plastic regular polygon shapes made from a tessellation pattern consisting of 10 equilateral triangles, 6 squares, 4 octagons, 4 duodecagons,
One set of construction paper regular polygon shapes for each student in the class made from the same tessellation pattern as the plastic overhead polygons,
One set of 6 to 8 construction paper circles of diameter 1 inch in a color to contrast with the floor of the room being used.

Strategy:

The first phase consists of various groups with a large surface for a working space taking about 5 minutes to "investigate" the contents of an envelope containing regular polygon shapes to see what they are and what they can do.

The second phase consists of students working with their own polygon pieces to develop a pattern they can illustrate is repetitive using only one polygon shape. Volunteers should display their results using the plastic display pieces for the overhead. Then conclusion number one is presented by introducing regular homogeneous tessellations from their discoveries.

The third phase consists of combinations of regular polygons being used to develop various 2 polygon semiregular tessellations. These can be illustrated with the use of the plastic polygon pieces for the overhead machine. This should be a somewhat limited display with emphasis on replication for tessellations. Then conclusion number two is presented by identifying semi-regular homogeneous tessellations from their discoveries.

The fourth phase consists of a summary of discoveries made to this point concerning requirements for tessellations gleaned from the previous experiments.

The fifth phase consists of combinations of regular polygons created by students using 3 polygons in each pattern. It is "hoped" that a student will attempt to use an octagon surrounded by an alternating pattern of squares and 3 triangles. If not presented and no equivalent is presented, the octagon should be suggested for continued experimentation until such a pattern is found which contains "holes" or gaps between the consecutive polygons. This will lead to a discussion of the last condition necessary for a tessellation concerning the sum of the angles at the vertex of the tessellation.

The sixth phase consists of a brief discussion of the patterns of 4 squares on the floor outlined with paper tape and having one of the contrasting circles at the common vertex of the 4 squares. This should conclude with the summary of the use of the circle pattern of rotation (360 degrees) at the common vertex to determine true/false tessellation.

The seventh phase consists of a return to the above mentioned octagon pattern, 8-3-3-4, displayed on a chalk board. Continue with this display by inserting the degrees of the angles at the common vertex, 135-60-60-90, to prove this pattern is not a valid tessellation. A reinforcement should be done using previous tessellation patterns displayed on the overhead. An overhead pen or one of the small bingo chips can be used to mark the common vertex while students compute the total degrees found by rotating in a circle about the common vertex.

The eighth and last phase consists of a brief introduction to the more artistic type of tessellations from the regular polygons with ideas concerning the "nesting" of patterns necessary to develop a tessellation. It is possible to consider this an optional phase of unit one since it might also be considered phase one of unit two on tessellations.

References:

Rather than list all the materials used in bibliography form, I would suggest that the person interested in creating such a project obtain the catalogue from Creative Publications. Investigate the many materials available including the overhead projector polygon pieces and wooden polygon pieces which could be used as an alternative to the paper pattern pieces I indicated I used.

Return to Mathematics Index

Logic and Reasoning

Pearline Scott
7436 S. Euclid Parkway
Chicago, Il 60649
312-493-9406

Greeley School
832 W. Sheridan Road
Chicago, Il 60613
312-534-5800

Objectives:

The student will use logic and reasoning strategies to classify blocks by their attributes.

The student will be able to recognize one, two and three attribute differences.

The student will use Venn diagrams to form sets and show their intersection.

The student will use the attribute blocks to form ratios.

Materials needed:

Attribute blocks: The blocks used in this lesson may be commercial or teacher made, with these attributes:
Color-red, yellow and blue
Shape-square, circle, hexagon, rectangle and triangle
Size-small and large
Thickness- thick and thin
loops, color chalk and worksheets

Strategy:

1. The students will work in cooperative groups. First let the students examine the blocks, freely playing with them. Direct the students to classify blocks by their attributes: color, shape, size and thickness.

2. Ask the group to place one block on the center of the table and find all blocks that differ by one, two and three attributes.

3. Use the loops to form sets in a Venn diagram. Example: in one loop place a set of triangles and in another loop place a set of blue blocks. Students will notice that these sets must overlap, forming the intersecting set of blue triangles.

4. Write ratios to show the comparison of two sets of attribute blocks. Example: write the number of red circles to the total number of circles, thus forming a ratio.

Conclusion:

The students will use logic and reasoning strategies to process information and solve problems.

Return to Mathematics Index

Tower of Hanoi

Paul Eubanks
16206 Emerald
Harvey, Illinois 60426
708-339-8136

Washington High School
3535 E. 114th Street
Chicago, Illinois 60617
312-646-4860

Objectives:

(For grades 6 through 12)
1. To discover a pattern.
2. To evaluate an exponential expression.

Materials:

Tower of Hanoi puzzle and circular discs of various sizes.

Procedure:

Pass out five circular discs of different sizes to each student. Have each student draw three large circles on a sheet of paper. Then have them place the largest disc in one of the circles as you place the largest disc of the puzzle on one of the three pegs (towers). Explain the rules of the puzzle as follows. The object is to move all the discs from one tower (one circle) to another tower (another circle). Only one disc can be moved at a time and a larger disc can never be placed on top of a smaller one. The discs should be moved from one tower to another in the least number of moves.

With one disc it only takes one move to place that disc on another tower (circle). Next have the students place the two largest discs in any circle. Have the students try to move the two discs to another circle. Ask them to tell how many moves it took. It will take three moves. Place the smaller disc in either open circle. Then move the larger disc to the other open circle. Finally place the smaller disc on top of the larger disc. Now have the students place the three largest discs in any circle. Allow the students some time to try to move the three discs to another circle. This will take at least seven moves. Move the top two discs to another circle in three moves as explained above. Next move the largest disc to the open circle. Then use three moves to get the two smaller discs on top of the largest disc. Now have the students place the four largest discs in any circle and try to move them to another circle. This will take at least 15 moves. It will take seven moves to move the top three discs to another circle as we just did with three discs in a circle. After moving the top three discs, the largest disc is moved to the open circle. Next the other three discs must be moved on top of this largest disc. This will take seven more moves, however, the first move is crucial. When moving an odd number of discs, you must move the first disc to the circle (tower) that you want all the discs to end up on. When moving an even number of discs you must move the first disc to the circle that you do not want the discs to end up on. At this point you should have the students notice how the number of moves increased, i.e., 1, 3, 7 and 15. Have the students look for a pattern and predict the number of moves for five discs. The number is 31. Give the students a few minutes to see if anyone can come up with the formula - which is $M = 2^n - 1$ where M is the number of moves and n is the number of discs. If no one comes up with the formula give it to them and have them verify it for n equal to 1, 2, 3, 4, and 5. Next have them use the formula to find out the number of moves for 6, 7, 8, and 10 discs. Finally tell them about the legend that a monk has 64 discs on a tower and he moves one every second. When he has moved all the discs the world will end. Have them estimate how long this would be.

Use a calculator to evaluate $2^{64} - 1$. The answer is approximately 589,942,417,400 years.

Return to Mathematics Index

Logic

M. Elaine Granger
9938 S. Calhoun
Chicago, Illinois 60617

Irvin C. Mollison
4415 S. Dr. Martin Luther King Jr. Drive
Chicago, Illinois 60616
312-285-3289

Objective:

The sixth through eighth grade students will be able to:

1) Understand word problems by use of reasoning techniques
2) Identify the validity or non-validity of the problems
3) Discern which factors are needed for problem resolution
4) Use deduction strategies for problem resolution

Materials:

All materials listed are for an entire class

Overhead projector
worksheets and charts
coins (pennies & dimes)
box of toothpicks
plastic shapes (triangle, rectangle, parallelogram, & square)
forty buttons
a medium size box

Strategies:

1 a. Work in teams of three to four students
Distribute the plastic shapes
Explain to the students that there is a set time limit
Arrange shapes into required pattern(s)
Work cooperatively in teams

b. Work individually to solve another pattern puzzle

c. Have 6 to 12 students work independently while others are working in teams to solve another pattern puzzle

2. Define the word logic

3. Illustrate a logical sequence

4. Illustrate an illogical sequence

5 a. Discuss how logic can be used in daily lifestyles

b. Discuss how logic can be used to solve word problems

6 a. Distribute 12 toothpicks to each student
Place toothpicks into geometric shapes drawn on the chalkboard

Remove the required number of toothpicks to form new shapes

b. Ask students to explain what they did
Organize the steps taken into a logical process

7. Have students preview the handout sheets
Ask students what they think they will need to do
Discuss ways to solve similar problems
Have students find the solutions
Work individually and in teams (as time permits)

8. Distribute the coins to each set of teams
Review problem with students
Have students find the solutions
Explore and discuss whether more than one solution is possible

9. As a follow up to this lesson have students make up word problems
Exchange problems and work in teams for solutions

Conclusion:

Students should feel more comfortable with establishing a process for solving word problems. Teachers should solicit and generate all kinds of questioning about the use of reasoning, elimination, and deduction to solve word problems. The overall process should be both informative and enjoyable.

Return to Mathematics Index

Counting Triangles

Mamie P. Scott
9715 South Woodlawn
Chicago, Illinois 60628
312-221-7874

Coles School
8440 South Phillips
Chicago, Illinois 60617
312-933-6550

Objectives:

The sixth grade student will:

1. Organize, summarize, and record information.
2. Discover a rule or formula that will find the total number of triangles in a figure.

Equipment and Materials:

1. Overhead projector, transparencies, and marker.

2. Transparency displaying one large triangle divided into six small triangles. Make a 1-part triangle, a 2-part triangle and a 3-part triangle to be used as overlays on the large triangle.

3. Teacher-prepared worksheet with six triangles arranged in numerical order from 1 to 6. Each triangle should be equally divided to represent the number to be counted.

Recommended Strategies:

A. Establish a meaningful definition of a triangle.
B. Form small groups and distribute worksheets.
C. Use overhead projector to demonstrate how to establish a counting arrangement by writing a letter name starting clockwise in the triangle (a, b, c, d, e, f). Name all 1-part triangles, name all 2-part triangles and name all 3-part triangles.
D. Summarize by organizing all the data into one table like this:

Triangle Table

Type of triangle	Listing by letter	Number of triangles
1-part	a, b, c, d, e, f	6
2-part	bc, ed, af,	3
3-part	abc, bcd, cde, fed afe, fab	6
6-part	abcdef	1
	Total number of triangles	16

E. Use the second worksheet to count total number of triangles numbered 1-6. In counting the triangles, a pattern should be discovered by students. The pattern is that the total number of triangles is the sum of all counting numbers from 1 to the number of small triangles in the figure.
Example: A triangle equally divided into three small triangles is:

1 + 2 + 3 = 6

Evaluation:

Provide additional opportunities for reinforcement of this concept by using worksheets.

Using Diagrams in Problem Solutions

Angel L. Torres
1910 North Albany Ave.
Chicago, Illinois 60647
312-235-5525

Peabody School
1444 West Augusta Blvd.
Chicago, Illinois 60622
312-292-5073

Objectives:

Grade Level 7-8
1- Use of tables, graphs, and diagrams to obtain information.
2- Construction of tables, graphs, and diagrams to collect data.

Material:

Mimeographed papers containing graphs, tables, and diagrams.

Strategy:

Presenting a drawing to the class, students will have the opportunity to observe and study how certain data could be obtained by reading tables, or graphs. (bar graphs and line graphs)

Providing a real situation students will construct their own tables and graphs containing the correct information.

Making use of Venn Diagrams the teacher will lead the student to read them and then make their own to solve any given problem.

Formula Determination

Odom, Clark
1927 W 163rd
Markham, IL 60426

Collins H.S.
1-312-542-3500

Objective

1) Student will learn to determine the number of degrees in any convex polygon.

Equipment and Material

Overhead Projector
Geo-Boards
Rubber Bands

Recommended Strategies

Remind the students that the sum of the three interior angles of every triangle has a measure of 180 degrees.

Establish a meaningful definition of a polygon. A polygon is a many sided closed geometric figure.

Using the overhead projector have a transparent geo-board on the overhead projector. Demonstrate the shapes of various polygons by stretching rubber bands around the nails. Take another rubber band stretch it from one vertex to another non adjacent vertex. This is to determine the number of triangles formed. Repeat this operation with various sided polygons. The students will be recording their findings on a chart. A sample chart is below. Prepare a sample chart to pass to each student constituting of data each student should make an attempt to actively collect.

Chart

No of Sides	**Triangles Formed**	**No of Degrees in each Triangle**
----------	------------	----------
----------	------------	----------
---------	------------	----------
.	.	.

After each student has collected the data, he should be able to derive the formula (N - 2)180 which is the desired goal.

Analyze this formula for the student to illustrate how this is used to determined the number of degrees in any polygon with (N) number of sides by the number of triangles that was formed with the geo-boards and rubber bands.

CLASSIFICATION

Wilburn, Delores B.
11755 South Justine Street
Chicago, IL 60643
1-312-568-1771

Shakespeare School
1-312-753-6260

Objectives

1. Motivate students to understand classification.
2. Decision-making and how certain objects relate to the number system.
3. Learn the meanings of words used to express mathematical ideas.

Materials

Bag of groceries

Recommended Strategies

1. Teach counting ideas or skill to be applied in activities.
2. The number system is a method of arranging units into groups so that quantities may be comprehended easily, and then used in computation with accuracy.
3. Teach and build meaning for abstract mathematical ideas that are concrete and representative activities.
4. Teach basic facts.
   a. order
   b. sequencing
   c. arrangement
   d. rearrangement
   e. sorting.

This activity enhances decision making and classification the student will have to think where does cucumbers belong? How about cereal? How about mayonnaise? What about tuna fish? By answering these questions, your students will be forming foods-that-belong-in-certain place group. Some foods are similar, like orange juice and grapefruit. Some are different like hamburger and ice cream. But they have something in common when it comes to classifying groceries.

As each food group is put away you can ask how many items were put in the refrigerator? Cabinet? Closet? This is how counting began.

Return to Mathematics Index

Learning by Logic - Total Surface Area

Boyd, Carolyne
510 Barrington Court
University Park, IL 60466
534-6486

Bennett Elementary
821-2680

Objectives:

1. The student will calculate the area of plane surfaces using the formulas for the area of a square, rectangle and triangle.
2. The student will develop the formula for calculating the total surface area of two geometric solids, the cube and rectangular prism.
3. The student will calculate the total surface area of cubes and rectangular prisms.
4. The student will apply concepts to determine the total surface area of a variety of classroom and household materials.

Apparatus Needed

geoboard
rubber bands
overhead projector
transparency film (clear, green, yellow)
markers
small boxes from household materials
yardstick
shoebox kit consisting of:
 plastic pieces of various sizes (poster board may be used)
  4 squares
  4 rectangles
 centimeter grid paper
 centimeter grid ruler
 pencils
 wooden cube*
 wooden rectangular prism*
 construction paper
 small boxes from household products
 small plastic ziplock bags
 paper
 duplicated sheets
 scissors
 tape

* milk cartons can be used to construct a cube or rectangular prism

Recommended Strategy

Using a geoboard and overhead projector, lead students in a discussion of square units. Develop the concept that squares are quadrilaterals with four equal sides, opposite sides parallel and each angle measuring 90 degrees. Develop the concept that rectangles are quadrilaterals with opposite sides parallel and each angle measures 90 degrees, the opposite sides are of equal length. Develop the concept that a triangle is one-half of a quadrilateral.

Write formulas for each geometric figure discussed:

Square........ $A = s \times s$ or $A = s^2$
Rectangle..... $A = l \times w$
Triangle...... $A = 1/2\ (b \times h)$

Students will work in groups of four or five. Each group will receive a kit containing the above listed materials. Students will take from a plastic bag varied pieces of plastic. Examine each and look for similarities that would allow the pieces to be grouped. Next arrange them into similar stacks. Draw them onto the centimeter grid paper, arranging from largest to smallest. Be sure to begin each figure even with a line on the grid paper. Calculate the area of each plane figure, using the three formulas listed on the board.

Given a duplicated sheet containing a variety of shapes, students are asked to divide and conquer. Determine the surface area of the eight planar shapes. The student will find the area of each planar region by adding the sum of the areas of its parts.

Given a cube and rectangular prism, each student will wrap the geometric solid, to develop the concept that surface area means to surround. Draw straight lines, cut out the six sections. Tape the sections to a sheet of paper, look for similarities. Develop a method for determining the total surface area of the cube. Do the same for the rectangular prism. Use this information to develop a formula for finding the Total Surface Area of a cube and rectangular prism.

The Total Surface Area of the cube is equal to the sum of the area of six equal sides:

Cube....................T. S. A. = $6\ (s \times s)$ or $6\ s^2$

The Total Surface Area of the rectangular prism is equal to the sum of six surfaces........

the front and back... $(h \times l)$
both ends............ $(h \times w)$
top and bottom..... ..$(w \times l)$

Rectangular Prism.......T. S. A. = $2\ (h \times l) + 2\ (h \times w) + 2\ (w \times l)$

or....T. S. A. = $2\ [\ (hl) + (hw) + (wl)\ ]$

Use the formulas developed to determine the T. S. A. of other cubes, rectangular prisms, a paper house, the floor and ceiling of the classroom, the painted surfaces of the classroom, household items and drawings on a worksheet. A centimeter ruler and yardstick are provided for convenience. Calculators may be used for this activity. Make sure each answer contains the appropriate unit squared.

Mathematics/Physics

Laws of Probability: Mutually Exclusive–vs–Mutually Inclusive Draws or Playing the Odd's

Mikail A. Siddiq
360 E. 87th Place
CHICAGO IL 60619
(773)- 723-6977 or 660-8563

Raymond School
3663 So. Wabash
CHICAGO IL 60653
(773)-535-1745

Objectives:

I want my students to learn the difference between a mutually exclusive and a mutually inclusive draw and the resulting effect. This presentation could be used for students from grades 8 thru 16 with relative ease.

Material(s):

The materials used for this presentation are for a class size approximately of 25 students. They will need the following materials:

Five (5) to Ten (10)	Decks of playing cards
Five (5) to Ten (10)	Sets of Dice
25 or More	Lottery playing cards of various games:

Example: Big Game, Lotto, and Little Lotto.

Strategy:

To show the students how to cut down the odds or reduce the probabilities of losing by using Fractions and Decimals to show the better odds or probabilities**.**

Performance Assessment:

The performance assessment is to see if the students understood the use of fractions and decimals to increase their changes of winning. If they actually put this strategy to use and become successful at using it, then the money they win will be their grading rubric.

Conclusions:

This presentation was not intended to influence people to gamble. It was intended to show you how the Gaming Industry, which is Government Regulated, uses fractions and decimals to cut down their chances of losing.

References:

The terms mutually exclusive and mutually inclusive and their definitions were taken from the following book: Book 2 – Modern Algebra and Trigonometry structure and method, Revised Edition, Dolciani, Berman, Wooton.

Probability

Ana Timbers
1340 West Irving Park
Chicago IL 60613
(773) 429-1531

Stockton
4420 North Beacon
Chicago IL 60640
(773) 535-2450

Objective:

To observe the relationship between theoretical probability and experimental results. This activity would work with a seventh grade class. However, students in grades sixth and eighth grade would enjoy this activity.

Materials Needed:

A. glue, notepad, ruler, pens, scissors, 2 sheets of different-colored poster board, large sheet of graph paper
B. 6 blue marbles, 4 red marbles, and 2 yellow marbles

Strategy:

Using the coins students will be able to realize probability is useful in our daily life. Probability helps us understand the world around us and organize information in ways that make it easier to comprehend.

1. Students will insert 6 blue marbles, 4 red marbles, and 2 yellow marbles into a small bag.
2. Each student will reach into the bag 40 times and chart how many times marbles of each color were selected.
3. Using graph paper students will record their findings.
4. Students will compare the relationship between the theoretical probability and the actual results of our experiment.
5. 6/12 (1/2), 4/12 (1/3), 2/12 (1/6), are the theoretical probabilities of selecting at random, respectively, each of the three colors.

Performance Assessment:

I will use a grading rubric for this lesson. This rubric contains the Chicago Public Schools' Curriculum Framework Statements.

Conclusions:

Students will be able to identify the phenomenological approach to mathematics. The theoretical probabilities should be observed in the results of our experiment.

Probability of Childhood Games

Robert Foote
6743 W. Irving Park Road
Chicago IL 60634-2222

Disney Magnet School
4140 N. Marine Drive
Chicago IL 60613
(312) 534-5844

Objective:

Students will find probability of several different events theoretically and experimentally. This lesson is intended for junior high students.

Materials Needed:

1. 5 or 6 spinners evenly divided into 6 colors.
2. Three-color spinner divided into a half and two quarters.
3. A bag of fifteen marbles (five of one color, four of another, etc.).
4. A set of dice and a Monopoly board.

Strategy:

Students in groups will migrate from one station to another during the period with about ten minutes given to each task. Each group should have a recorder to write down the results of each experiment.

The following is a description of each experiment and what to do for each:

Experiment 1: The four color spinner experiment involves a spinner for each participant and the participants will spin the spinner twenty times and record on which color the spinner landed.

Experiment 2: The six color spinner follows the same procedure as the four color spinner of Experiment 1. A total of twenty spins per group is again suggested.

Experiment 3: When I did this experiment as my mini-teach, I used a unique spinner. The spinner with marbles is a spinner from the game **The Magnificent Race**, a favorite game of my childhood. Unfortunately, the game is no longer being made. However, you can simulate the results using a bag of marbles with five of one color, four of another, three of a third, two of a fourth and one of a fifth. This will give you a total of 15 marbles. Have each group draw a marble from the bag, replace it, and draw again until they have drawn a total of twenty times. Record the results.

Experiment 4: The Monopoly board task is for students to determine which space on the Monopoly board is landed on the most. To do this, starting at Go, roll the dice and record where on the board the player would land. Continue doing this starting at Go each time until the dice have been rolled twenty times.

After students have finished all the experiments and recorded them, the next step is to compare the experimental probability from the results of the experiment to the theoretical probability. The theoretical probability can be determined for each of the experiments in this way:

Experiment 1: This spinner is broken up into one half and two fourths, so theoretically, the probability for landing in each of the spaces should be one half, one fourth, and one fourth. This means that theoretically the spinner should land in the half space half the time and so on.

Experiment 2: This spinner has evenly divided spaces, so theoretically the spinner should land in each space the same number of times. This may or may not happen in reality. You need a whole lot of trials to match the theoretical probability.

Experiment 3: This spinner holds a a total of fifteen marbles with more of some marbles than others so the theoretical probability depends on the number of marbles of each color. The theoretical probability is the number of marbles of a particular color over the total number of marbles. For example, if you have five marbles of one color, the probability of that color being picked is five over fifteen.

Experiment 4: The Monopoly experiment is rooted in the classic probability experiment of rolling two dice. Students can make a chart to determine which rolls come up more frequently than others and then match the rolls to the spaces on the Monopoly board. The most common roll should be seven.

After the groups have finished with their individual experiments, compile the data for each experiment from all the groups. You should find that the compiled data of the entire class should be closer to the theoretical probability than the data of the individual groups.

Probability

Sandy Reed
2457 E. 93rd St.
Chicago IL 60617
(312) 375-6487

Robert Fulton School
5300 S. Hermitage
Chicago IL 60609
(312) 535-9000

Objective:

The students in grade levels 5-8 will learn, discover, explore and tabulate a table of the number of times a specific event can occur. In this activity, students consider the results of two types of events. One involves repeated sampling with replacement; the other, without replacement. In the first case, the events are independent; in the second case, they are dependent.

Materials Needed:

Groups of two will need:
1. 3 Paper bags
2. Penny or any coin
3. 3 sets of five chips numbered 1, 2, 3, 4, 5
4. Paper/Pencil

Strategy:

1. The class will be divided into groups of two. Each group will be given 3 paper bags. In one bag labeled A, there will be 5 chips numbered 1-5 and a penny. In the second bag labeled A, there will be 5 chips numbered 1-5. In the third bag labeled B, there will be 5 chips numbered 1-5.
2. One person in each group will be asked to remove the penny from the bag labeled A and place the three bags to the side. One person in each group will look at the penny to determine the total number of sides of that penny.
3. After determining the number of sides of a penny, the group will flip the penny once to determine the likelihood of getting a head.
4. The instructor will write the definition of probability and the formula for probability.
5. The group will flip the coin twice and write a table of the total number of outcomes that can occur when flipping a coin twice while the instructor writes the table on the overhead projector. The instructor will show the students how to write the table in a uniformed pattern. For example, HH, HT, TT, TH, beginning with the heads as starting the pattern.
6. The student will use their probability formula to determine that P=1/2x1/2=1/4 with each 1/2 being each flip (2 flips) and the probability of flipping two heads is 1 out of 4 or 1/4.
7. The group will flip the coin 3 times and determine the table of 3 flips using their own pattern and also, write the probability of 3 flips.
8. The group will then place the two bags labeled A on their desk and place the penny to the side. The student will need to determine the table for all of the total possible outcomes that can occur from drawing 5 chips in each of the two bags and replacing the chips. The group will take turns drawing 2 chips (1 chip from one bag and 1 chip from the other bag) and writing down the results. The group will continue to replace the chips in the bag after the 2 chips are drawn. The group will need to determine that there are 25 total possible outcomes that can occur with replacement in independent

sampling.

9. The group will then place the one bag labeled B, draw 2 times, and write down the results of the first and second draw. The group will not replace the chip from the first draw in the bag. For example, if the first draw was a 2, the 2 would not be replaced in the bag. The student will need to determine the table for all the total possible outcomes that can occur from drawing 5 chips from one bag and not replacing the chip from the first draw. The group will need to determine that there are only 20 total possible outcomes that can occur without replacement in dependent sampling.

Phenomenological Probability

Robert Foote
4022 N. Monticello
Chicago IL 60618
(312) 604-8825

Disney Magnet School
4140 N. Marine Drive
Chicago IL 60613
(312) 534-5844

Objective:

Students will find the difference between theoretical and experimental probability in three different experiments. This mini-teach is designed for junior high students.

Materials Needed:

* A pair of dice for each student
* Ten or more colored marbles and a spinner (or bag)
* A standard deck of 52 cards.

Strategy:

Set up three stations with the materials mentioned above at each station. Give students about twenty minutes for each activity. Blow a whistle or clap between each activity and then have groups switch activities. The following is a description of each activity:

1. Rolling Two Dice: Have each student roll two dice 20 times and record each sum. When the experiment is completed, have each student come up with a group probability by combining the individual experiments. Experimental probability is the number of times a sum is rolled divided by the number of rolls (20).

2. Marbles in a Spinner: For this experiment, I used a spinner that allowed one marble to land in a space on the spinner. You may do the same experiment without the spinner using a bag and having students pick a marble out of the bag 20 times. Make sure you have different color marbles of different amounts so you have different probabilities for each color. Compute experimental probability by keeping track of how many of each color are picked or land in the spinner. Experimental probability here is the number of the color picked divided by the total marbles picked.

3. Card Trick: Have each student in the group pick a card from the deck, shuffle the cards and pick another card five times. The student will pick a total of five cards. To determine experimental probability, find the desired outcome such as number of face cards, over the total numbers of cards drawn.

After all the experiments are performed and experimental probabilities are found, compare them to the theoretical probabilities of each experiment. You may determine how close the two are as fractions, decimals, and percents.

Performance Assessment:

An easy performance assessment of this lesson would be to use the same experiments with slight modifications such as adding one die,more marbles,or changing the card events. You can thus assess student understanding of probability using the experiments and have them compute them on their own by writing up their own calculations from the experiment and comparing them to the theoretical probability.

Mean, Median, Mode, etc.

Charlotte Goldwater
2908 W. Sherwin
Chicago IL 60645
(312)465-8449

Kenwood Academy
5015 S. Blackstone
Chicago IL 60615
(312)535-1409

Objectives:

The main objective of this mini-teach is to have students in grades four to twelve generate their own data and then analyze their information.

Some of the ideas that could be taught are:

- mean, mode, and median
- histogram
- bar graph
- probability
- circle graph

Materials Needed:

- A piece of ribbon or rope that is at least 20 inches long
- A package of post-its or a bunch of little squares of paper about 1.5"x1.5" or 2" x 2"
- A roll of masking tape
- A classroom set of M&M candy bags
- A wall or blackboard
- A calculator

Strategy:

Hold up a piece of rope or string. Have the students write down the length of this rope or ribbon on their piece of paper. Then have a number line on the board. Have the students come up to the board and place their estimates on the board with their post-its on the number line.

Depending on the level of the students, you could teach or introduce an appropriate lesson on analyzing the data from a simple bar graph, quartiles, box and whiskers, outliers, to standard deviation.

This demonstration could also be done by guessing the number of M&M's in a cup. The results would be similar.

Lower grade students could do circle graphs of the contents of individual bags.

Performance Assessment:

I can tell how much students have mastered these concepts through a discussion or a written evaluation.

Paper Toss Shootout

Edwina R. Justice
10641 South Lowe Ave.
Chicago IL 60628
(312) 468-3376

Gunsaulus Scholastic Academy
4420 South Sacramento Ave.
Chicago IL 60632
(312) 535-7215

Objectives:

Demonstrate a phenomenological approach to teaching mathematics.

Inspire others to use the approach.

Objectives (Grade 8):

Use class data to calculate percentages.

Participate in group activity.

Relate activity to NBA stats.

Calculate select percentages for NBA Finals data.

Materials:

waste baskets
liners for baskets
official "paper toss" paper
NBA data worksheet

Recommended Strategy:

Place baskets 8-9 ft. from marked foul line.

Select groups.

Throw paper ball at basket three times per person for practice.

Throw paper ball at basket ten times per person.

Record number of hits per person within the group.

List names and number of hits on board.

Calculate individual and team percentages for ten shots.

Review or demonstrate how to calculate percentage for eight shots.

Throw paper balls at basket eight times per person.

Calculate individual and team percentages for eight shots.

Combine number of hits per person for ten shots and eight shots and calculate individual and team percentages for eighteen shots.

Determine highest individual and team percentages.

Calculate field goal and free throw percentages for NBA Finals.

1993 NBA FINALS

MICHAEL JORDAN

	Minutes	Field Goals	FG Attempts	FG Percent- age	Free Throws	FT Attempts	FT Percent- age	Total Points
Game 1	43	14	28		3	4		31

Statistics of Mars*

Wilhelm L. Lilly
1629 East Hyde Park Blvd.
Chicago IL 60615

Kenwood Academy
5015 S. Blackstone Ave.
Chicago IL 60615
(312) 535-1409

Objective(s):

To use a realistic situation as a means of collecting data.
To group, display, and interpret information by sorting and arranging data to construct frequency graphs.
To display and interpret measures of central tendencies.

Materials needed:

3 oz. paper cups
Bags of SKITTLES and/or M&M's (*candies of Mars, Inc.)
Worksheet: Color Sorting Table
Graph sheets: Pictograph, Bar Chart, Pie Chart
Worksheet: Mean, Mode, Median

Strategy:

Put students into cooperative groups and give each group a bag of SKITTLES and/or M&M's, five 3oz. paper cups, and a Color Sorting Table worksheet.
Sort and count the SKITTLES by color and fill in the worksheet.
Have each group construct a different type of graph (e.g., pictograph, bar, pie, etc.).
A Reporter from each group will explain their graph, ease of construction and information displayed. Also, have the reporter fill in their group data on a master Color Sorting Table provided on chalkboard.
Have each group select one color to find the mean, mode, and median for the numbers on the master Table.
Compare the results with the proportions reported by Mars for the five colors: Red - 20%; Purple - 30%; Green - 20%; Yellow - 20%; Orange - 10%.
Predict the proportion of each color for an unopened bag.
Have each group do an oral presentation of their results.

Averaging

Sharon Thomas
7222 S. Honore St.
Chicago, Illinois 60636

Emmanuel Christian School
8301 S. Damen Ave.
Chicago, Illinois 60620
312-239-6829

Objectives:

This lesson is appropriate for sixth graders.
1. Student will be able to identify the range.
2. Student will be able to recognize the score that occurs most frequently in the distribution.
3. Student will be able to locate the middle point in the distribution.
4. Student will be able to find the average of a given set of numbers.

Materials:

Calculators
Group (4 students)
Index cards
Measuring tapes
Test papers

Recommended Strategy:

1. Write Test results on the chalkboard.
2. Give a brief introduction about the importance of the "Measures of Central Tendency".
3. Introduce the terms RANGE, MODE, MEDIAN and MEAN.
4. Distribute the Test results.
5. Subtract the lowest score from the highest score.
6. Find the score that occurs most frequently in the distribution.
7. Arrange data in numerical order. Locate the middle point in the distribution. For an even number of scores, there will be two middle numbers. Add these numbers and then divide by two.
8. Find the sum of the scores and then divide by the number of scores.

Activities:

1. Divide students into groups. Each must find the RANGE and MEAN of
   a) heights
   b) distance from home to school
   c) time spent watching TV
   d) students in the class
   e) sit ups done weekly

2. Games
   a) BOWL-A-RAMA. Each bowler has an average of 90 at the end of the sixth game.Students have to complete the chart to show each bowler's score in the 6th game.
   b) One student is selected from each group and is given a card

with a distribution of numbers to find the MEAN, MEDIAN and MODE. The winner chosen is the student with the same number for each MEASURE of CENTRAL TENDENCY.

PROBABILITY

Turner, Emily
921 Patricia Lane
Crete, IL 60417

Joplin Elementary School
1-312-962-4625

Objectives

The student will:

1) Understand the concept of probability and the basic probability formula.
2) Will be able to predict the possible outcomes of an event.

Materials

Six golf balls:	Paper plates
3 yellow	Plastic lids
2 white	Paper fasteners
1 orange	Colored marker

Recommended Strategies

Review the definition of probability. Use golf balls to demonstrate the basic probability formula, which is, the probability of an event is the fraction of the total number of outcomes that cause that event to occur. For example, if there are 3 yellow golf balls, 2 white, and 1 orange, what is the total possible outcome or set of choices that can be selected? (6) What is the probability of selecting a yellow ball? (3/6) A white ball? (2/6) An orange one? (1/6)

The number wheel, which is made by using a paper plate, a piece of plastic for the pointer, and a paper fastener, can be used to demonstrate the probability of a particular outcome after a number of trials. It can also be used to show the probability ratio, the number of outcomes, the ratio of outcomes to trials, and the percent of outcomes to trials for each number on the wheel.

To further enhance the learning of the above objectives, the student can complete an experiment at home which involves tossing a coin fifty times. The same information that was found using the number wheel can be found in the coin experiment.

Return to Mathematics Index

Probability

Moss, Laura Willis
9628 South Peoria Street
Chicago, Illinois 60643

South Shore Community Academy
312-933-8180

Objectives:

The students will derive a general formula for the probability of a given event given each possible outcome is equally likely.

Apparatus Needed:

6 dice
30 colored balls (1 each of five different colors)
6 coins
6 paper plate holders
6 plastic cups
6 paper bags
19 ping pong balls (numbered from 0 to 18)

Recommended strategy:

The students were told they had an opportunity to win a prize in today's class by playing the lottery. They were to pick a 3 digit number, a 4 digit number (repeats are allowed) and a combination of 4 numbers from 1 to 18 (no number could be chosen twice).

The students were divided into groups of 3 or 4. Each group received a paper bag containing 1 die, 5 colored balls (1 of each color-blue, green, yellow, orange and pink), 1 coin, 1 paper plate holder and 1 plastic cup. Each group had to conduct three experiments.

1. Flip the coin 50 times into the paper plate holder, record the results (heads or tails).
2. Pull a ball from the bag, record its color, replace the ball and repeat this process a total of 50 times.
3. Use the cup to shake the die. Roll the die into the paper plate holder. Record the result and repeat the process 60 times.

As a class the data from each experiment was collected. The students were asked questions such as: Were the results of each experiment what you would have expected? What would you expect if we were to repeat the process 1000 times? 10,000 times? 10,000,000 times?

The class then generated the formula for the probability of an event P(E)

P(E) = **number of favorable outcomes**
number of possible outcomes

Then the class discussed whether or not the formula will tell us exactly what will happen for a given event. More examples were discussed.

The "lottery" ended the lesson. Students with a knowledge of permutations and combinations can calculate the probability of each event.

$$P(\text{3 digit number}) = \frac{1}{10^3} = \frac{1}{1000}$$

$$P(\text{4 digit number}) = \frac{1}{10^4} = \frac{1}{10{,}000}$$

$$P(\text{4 number from 1 to 18}) = \frac{\mathbf{1}}{\frac{\mathbf{18!}}{14!4!}} = \frac{\mathbf{1}}{3060}$$

Return to Mathematics Index

MODELING PERMUTATION GROUP

Mary Margaret Nee
Von Stueben Science Center
5039 N. Kimball Ave.
Chicago, IL 60625
1-312-588-2370

Objectives:

Throughout this unit the students are: to construct equilateral triangles on cardboard; to develop the transformation concept with a one to one correspondence; to generate the rotation and reflection table; and to deduce from the model the abstract axioms of a group.

Behavioral Objectives:

The students will achieve practical knowledge of abstract concept of a group and will verify this through testing with a desired goal of 85% success.

Materials:

- A Overhead Projector
    1. Large Plastic Model
        - a. equilateral triangle with circumscribed circle
        - b. square with circumscribed circle
    2. Transparencies
        - a. Transformation
        - b. Rotation and Reflection Table
        - c. Algebraic axioms for a Group
- B Each Student needs
    1. Paper with a reference circle
    2. Cardboard Equilateral triangle
    3. Cardboard Square

Strategy:

A Background

There are many subject areas in Mathematics which would be enriched with this presentation. This should be introduced to a class where student cooperation has been well established. The teacher must be extremely careful to instruct the class in the correct way of formulating the transformations.

B Activity Outline

1. pass out model triangles to students
2. label the triangles in a clockwise way A,B,C,
3. model transformations on the overhead
4. discover individually the finite elements under the definition
5. create table of rotations and reflections
6. observe patterns within the table
7. name these patterns or laws
8. define algebraicly the group
9. verify the model with its laws as a group

C General Plan

With the large equilateral triangle on the overhead demonstrate the concepts of rotation and reflection. Then allow the student to discover all finite possibilities.

Once the elements are named start gnerating the table with the six elements. From the observed data verify that closure, identity element, inverse for each

element and the associative axions or laws hold for the newly created table. Continue to extend the binary operation to three elements by using the associative
2
law and then to any number of elements operating together.

Show on the overhead the list of definitions for an abstract group. Again affirm that the patterns created by the transformations of the equilateral triangle form a set of elements which is well structured set of axioms with the the binary operations of the transformation necessary for a group

D. Overhead Transparencies

1. One to One transformation of Vertices

Name of Vertex — Transformed to Position held by former Vertex

A goes to B
B " " C
C " " A call this R1

A goes to C
B " " A
C " " B call this R2

A goes to A
B " " B

A goes to A
B " " C
C " " B call this ra

A goes to C
B " " B
C " " A call this rb

A goes to B
B " " A
C " " C call this rc

2. Table of Rotations and Reflections of a Equilateral Triangle

"O"	R1	R2	R3	ra	rb	rc
R1]	R2	R3	R1	rc	ra	rb
R2]	R3	R1	R2	rb	rc	ra
R3]	R1	R2	R3	ra	rb	rc
ra]	rc	rb	ra	R3	R1	R2
rb]	ra	rc	rb	R2	R3	R1
rc]	rb	ra	rc	R1	R2	R3

3. Definitions

A. Group "G" is a set of elements (a,b,c,d,e,...) and a binary operation called product "O" such that the following axioms hold:

1. Closure: Form every ordered pair a,b of elements of G the product a"O"b = c exists

3

and c is an elements of G.

2. Associative Law: (a"O"b)"O"c = a"O"(b"O"c)

3. Existence of Unity of the Identity element
An element "E" such that a"O"E = E"O"a =a for every a an element of G

4. Existence of Inverse of any element
For every a of G there exists any element a^{-1} of G such that a^{-1}"O"a = a"O"a^{-1} =E

B. Dihedral Group

The one to one mappings of a set onto itself which preserves a property usually form a group.

Symmetries of a geometric figure are of this kind. These are the congruent(distance-preserving) mappings of the figure onto itself.

The symmetries of a regular polygon of sides larger than or equal to 3 form a group called a Dihedral Groups of order 2n.

It can be shown within these dihedral groups that

$(Ri)^n$ =E where E is the identity element and i = 1,2,3,..(9n-1)

$(ra)^2$ =E , $(rb)^2$ =E, $(rc)^2$ =E or for any reflection of the dihedral group squared

Boomerang

Wilhelm L. Lilly
1629 E. Hyde Park Blvd.
Chicago IL 60615

Kenwood Academy High School
5015 S. Blackstone Ave.
Chicago IL 60615
(312) 535-1409

Objectives:

This lesson can be effectively used with grades 4-12.
* Estimation of angles in degrees.
* Estimation of distances in feet or meters.
* Data collection and histogram analysis.
* (optional) Study gyroscopic precession and aerodynamics.

Materials Needed:

* Two 12-inch rulers (shatter-resistant) per group/student.
* Rubber bands and/or strong tape.
* Protractor per group/student.
* TI-81/82 per group.
* Data collection sheet per group.
* Two skewers or sticks with marker flags per group.
* One yard or meter stick per group.

Recommended Strategy:

Have students form groups of two. Discuss with students how a boomerang is designed to return when thrown (Australia and geography can be included). Show how to make a boomerang by crossing two rulers and holding them together with crisscross rubber bands or tape. Demonstrate how a boomerang is thrown over-hand like a baseball. Show arm positions as: straight-up/vertical (zero-degrees); shifted to the side (30-degrees); shifted to the side (60-degrees); and shifted to the side/horizontal (90-degrees). Distribute two rulers, rubber bands or tape, protractor, yard/or meter stick, two skewer markers, and a data collection sheet to each group. After each group has made their "X" shaped boomerang, explain that each group must measure and mark a distance of 20 yards as a throwing range. Each student will have three throws in each of the arm-shifted positions: 0, 30, 60, and 90 degrees. Their group partner will record the estimated maximum distance reached for each throw and did it return or not. Take the students outside and assist them with the activity/data collection.

When the data collection sheets are complete return inside and use the data to create a histogram for angles thrown and distance reached. TI81/82 calculators can be used to assist students in making histograms and analysis of data. Have each group explain their histogram and their conclusions regarding whether or not angle thrown effects the flight of their boomerang. Other factors such as wing profile, air resistance, force thrown can be discussed. Lesson can be extended by introducing the concept of gyroscopic precession, which is the physics principle causing a boomerang to return (possible library assignment).

Return to Mathematics Index

How Much is a Million?

Sharon Simmons
2951 South King Dr #613
Chicago IL 60619

Joseph Stockton Elementary
4420 North Beacon
Chicago IL 60640
(312) 842-2125

Objective:

This lesson is designed for Grades 7-8. Students will estimate how much a million of something weighs.

Materials Needed:

Five boxes of cereal (box of cereal with total weight removed), calculators, scale, and measuring cups.

Strategy:

*****Write information on board: Cap'N Crunch cereal has been contracted to deliver a million pieces of cereal to the Olympic Village. Your job is to determine how many boxes of Cap'N Crunch equals a million, how much it will weigh and how much it will cost to send the boxes to the Olympic Village.
*****Write on board the cost of shipping per ounce or gram.
*****Divide the students into groups of four.
*****Distribute a box of cereal, calculator and measuring cup to each group.
*****Place scales on table.
*****Each group adds data to chart on board.
*****Formula: Determine the total weight of the cereal.
*****Weigh and count a small portion of the cereal.
*****Multiply the # of pieces by the total weight in the box.
*****Divide one million by the # of pieces. This will give the # of boxes.
*****Multiply the weight of one box by the total number of boxes.
*****Multiply the total number of boxes by the shipping costs.

Performance Assessment:

The students should be able to determine the answer by using skills that were previously taught: estimation and measurement.

Return to Mathematics Index

Rocket High

Elizabeth Kelly
3701 N. Kenmore Avenue
Chicago IL 60613

Pilsen Community Academy
1420 W. 17th Street
Chicago IL 60607
(312) 535-7675

Objective:

Students will reinforce their measurement skills. Students will manipulate a launcher to create specific angles. Students will be introduced to the concept of tangents. This is for the 7th and 8th grades.

Materials:

Each group of four students will need:
-A water rocket and a pump.
-Launchers to rest the rockets against.
-Protractors to measure the angles at the launch site.
-A tape measure.

Strategy:

1. Students will determine what angle will launch water rockets to the highest altitude. Students will use the tangents of angles to determine the height. The angles to be used are 30, 45, 60, 75, and 90. Students will launch the rockets at the five different angles listed above. Use two ounces of water for each launch and pump 15 times.
2. Students will measure the distance from the launch site to the spot where the rocket is at it's highest altitude.
3. Students will record this data. Example: 30 degrees, 14 ft.
4. Students will then find the altitude by using the formula tangent of the angle = opposite/adjacent. Example: tan 30=x/distance from launch site to highest altitude.

Performance Assessment:

Students will turn in their finished data sheet. Observations of the students will be noted during the experiments to determine their use and understanding of a protractor. Students will need to use data from a chart and record accurate data in order to complete their data sheet.

Conclusion:

For the purpose of this experiment, air resistance and wind will be ignored. Students will learn that the rockets will reach the highest altitude when the rockets are shot from the higher degree of angles.

Making Ice Cream

Vickie Townsend
8247 S. Washtenaw
Chicago IL 60652

Crown Fine Arts Community Academy
2128 S. St. Louis
Chicago IL 60623
(312) 535-1680

Objectives:

This lesson is for grade levels 5th through 8th.

1. After the lesson the students will be able change a recipe to arrive at the amount of each ingredient needed to serve a given number of people.
2. The students will explore, observe, examine, measure and mix the ingredients provided.
3. The students will convert metric units to the English units of measurement.

Materials Needed:

Zip-Lock Freezer Plastic Bag (27 cm x 28 cm)
Zip-Lock Freezer Plastic Bag (18 cm x 20.3 cm)
Ice (enough to fill the larger bag half full)
Salt (90 ml or 90 g)
Spoons (enough for the members in your group)
Towel or Newspaper

Strategy:

The students will solve the following problem by changing it to the English units of measurement.
This recipe makes four servings of ice cream. This recipe serves eight.
Ingredients:

125 ml milk	Change to:
15 g sugar	Change to:
1.2 ml Vanilla	Change to:

Fill large Zip-Lock Freezer bag half full of ice.
Measure liquid and dry ingredients.
Combine milk, sugar, and vanilla in small Zip-Lock Freezer bag.
Seal--squeezing out all the air.
Place the small sealed bag containing the milk mixture into the large bag containing the ice.
Add salt to the ice.
Seal again, squeezing out all the air.
Wrap the bags in a towel or several layers of newspaper.
Roll, or shake back and forth, until mixture reaches a thick ice cream appearance.
Enjoy.

Performance Assessment:

The students must change a different recipe from the metric units of measurement to the English units of measurement. Then they must double the recipe.

Games Using Multiplication

Amaechi Onyeali
6901 So. Ogelsby
Chicago IL 60649
(312) 324-0069

Carter Elementary
5740 So. Michigan
Chicago IL 60637
(312) 535-0860

Objectives:

Students will play two games that will reinforce their multiplication facts as well as their addition skills.

Materials Needed:

1) three or four games of dominoes
2) paper and pencil
3) 24 paper cups

Strategy:

First ask students to give a definition of the word multiplication. After all responses have been put on the board, write down the following definition: multiplication is a short way of adding or counting equal numbers. Place eight cups on your desk, 3 in one pile and 5 in another. Ask one student to come up and count the number of cups. Then ask them to explain how they counted them. Next, take one cup from the pile of 5 cups and put it in the pile with 3, making 2 equal piles of 4. Explain that there are two ways of counting these cups; by adding, or by multiplying 4*2. If you put up two more piles of cups with four cups in each, you could count them or simply multiply 4*4. Explain what each number stands for. Add two more piles of four cups and show how multiplication is quicker and shorter. Have someone count the number of shoes in the class by counting, and have someone calculate it by multiplying.

Next have students take out a piece of paper and a pen. Have them make a square grid on their paper by drawing three vertical lines equal distances apart inside the grid. Then draw four horizontal lines inside the grid. Show that you can count or multiply to find out how many boxes there are. Have students fill in each box with a number between 0-81. This game is called math bingo. The teacher will call out factors for which students are to determine whether they have the product. If they do, they are to write the factors in the appropriate box. The first person to get four across or five down is the winner. The winner calls out the next group of factors.

The next game is called dominoes. In this game students may lay dominoes only with the same number next to each other. For example, a domino displaying a 1-6 may only be played with a domino displaying a 1 or a 6. The 6 would have to touch the 6 or the 1 would have to touch the 1. Scoring is done by calculating the number of points on the outside. If the number of points on the outside add up to a number that is a multiple of five, that player receives that amount of points. Students must call out the points on the board when they play a domino, whether it is a multiple of five or not. The first person to 150 is the winner. Students should be put in groups of 5 or 6. They will take 5 or 4 dominoes respectively without showing anyone. The person with the 6-6 domino plays first. The first person to get rid of their dominoes wins the hand. All remaining dominoes are added up and rounded to the nearest 5 and given to the winner's total.

Performance Assessment:

Students will be given a short timed quiz which will require them to use their addition and multiplication skills.

Return to Mathematics Index

Napier's Rods

Irene Santos
1291 West 4th Street
Hobart IN 46342
(219)942-1736

Alexander Graham School
74 West 45th Street
Chicago IL 60609
(312)535-1315

Objectives:

Reinforce multiplication facts.
Examine Napier's Rods in relationship to multiplication.
Enhance students ability to understand place value.

Materials Needed:

Napier's grid sheet *
Tongue depressors or popsicle sticks (11 per student)
Scissors
White glue

Recommended Strategy:

Place simple multiplication problems on the board using one digit multiplier and one digit multiplican. Have the students come up to the board to work out the problems. As a group check answers.

Introduce Napier's Rods as a device related to multiplication.

Pass out the materials.

Cut the grids into vertical strips.
Glue these to the sticks, thus making "rods".
Cover one side only on the sticks.

To see how the rods work, find 3 x 46 by placing, side by side, these rods: INDX, 4, and 6. You should have 3, 1 over 2, 1 over 8.
Add these numbers diagonally making sure to add the numbers within their columns. So, 3 x 46 = 1 3 8

These rods also will work for multiple-digit factors. You probably will have to write down each partial product as you work.

Performance Assessment:

Evaluation will consist of correct products and checking to make sure rods are properly lined up so that diagonal adding keeps digits in proper place value column.

Math Activities With Simple Equipment, Dr. John L. Ginther.
Book can be found in the file cabinet in the math room.

Return to Mathematics Index

"The Golden Rectangle"

Edwina R. Justice
10641 South Lowe Ave.
Chicago IL 60628
(312)468-3376

Gunsaulus Academy
4420 South Sacramento Ave.
Chicago IL 60632
(312)535-7215

Objectives (Staff):

Demonstrate a phenomenological approach to teaching mathematics.

Inspire others to use the approach.

Present new (to most participants) concepts.

Reinforce skills.

Objectives (Grades 6-8):

Measure using metric units.

Calculate averages.

Compare and round decimals.

Use calculators.

Examine Fibonacci Sequence and Golden Ratio relationship.

Relate mathematics to real-life situations.

Materials:

Measure in advance and select items whose sides are in the approximate ratio of 1:1.6.

file cards (assorted sizes)	envelopes	charge plates	photos
greeting cards (assorted sizes)	invitations	pamphlets	books
graph paper			

Recommended Strategy:

Measure items and calculate the ratio of longer side divided by shorter side.

List quotients on the chalkboard and discuss similarities.

Calculate average.

Measure height and the distance from the top of the head to the middle finger tip with arm extended to one side and calculate the ratio of the two measurements.

Calculate group average.

Compare the ratio of body measurements to the ratio of measured items.

Determine a pattern and complete the sequence:

1, 1, 2, 3, 5, 8, 13, 21, ...
(Additional numbers are optional.)

Calculate the ratio of two successive numbers:

1/1, 2/1, 3/2, 5/3, 8/5, 13/8, 21/13

(The ratio 21/13 equals 1.6154 rounded to the nearest ten-thousandth and represents the ratio of the sides of a golden rectangle.)

Compare the ratio of a golden rectangle to ratios of body proportions and selected items.

Measure sections of layouts in magazines and newspapers and relate to golden rectangle.

Make spirals.

Look for golden rectangles at school, home, and other places.

Performance Assessment:

Groups should look for five pictures or sections of magazines whose dimensions appear to represent the sides of a golden rectangle. Measure and record length and width and calculate the ratio of the sides (to the nearest hundredth). Determine the average for the five items. The teacher should compare the groups' results to the golden rectangle ratio.

Return to Mathematics Index

Paper Folding to Make Cubes

Koshy Kanicherilnalil
6217 South McVicker
Chicago IL 60638
(312) 586-4356

Chicago Public Schools
1819 West Pershing Road
Chicago IL 60609
(312) 535-7615

Objectives:

Students will examine patterns of figures composed of six-squares and predict which of the twenty presented could be folded to make a cube. Then students will fold large-scale patterns of these figures to confirm their hunches. This exercise will develop the student's ability to visualize three-dimensional objects from two-dimensional patterns.

Materials:

Overhead projector transparencies of the pattern sheet and the record sheets; printed copies of the same sheets, one for each student; scissors, marking pens, etc. Construction or other extra-heavy weight paper to make multiple-quantities of the patterns, made with ruler, protractor, X-Acto knife and ball point pen.

Strategy:

Group students into cooperative learning teams of three or four. Ask each team to close their eyes and visualize a "cube." Is it a box? Are the sides (faces) identical or different? Is the box ("cube") open or closed? Can they name any everyday objects which have cubical shape?

Then distribute the pattern and record sheets to each team. Have them decide if a pattern will fold into a cube. Mark answers on the record sheets. Teams will report their conclusions to the teacher who will enter results on the transparency.

Finally, distribute sets of the large-scale cut out patterns to each team and ask them to fold each to make a cube. As the pattern numbers will match the printed pattern sheet, the team will be able to compare, discuss and perhaps revise their original judgements regarding foldability.

With better or older classes, this unit may be extended by asking the class if they are familiar with games played with cubes. Many will respond, "Dice" or "Craps." Enter a discussion of how the faces are numbered on such a game piece: Opposite faces are numbered to add to seven. Then distribute a third page to each team containing just the successful folding patterns with only a few of the faces numbered. The team is to consult and decide upon the numbers to be entered on the blank faces to make legal dice.

Acknowledgement:

Mr. Larry Freeman, of Kenwood Academy, my group's mentor and also a member of the SMILE staff in the Summer of 1993 has been of great help in making available his personal library materials and in offering many helpful suggestions for this project's development.

Integer: Tic-Tac-Toe Four In A Row!

Conchita A. Little
2058 West 108th Place
Chicago IL 60643
(312) 779-5035

Terrell School
5410 South State Street
Chicago IL 60609
(312) 535-1490

Objective:

To use a phenomenological approach to the introduction of integers using a coordinate plane and ordered pairs.

Materials needed:

Chalkboard, color chalk, coordinate grid (drawn on the chalkboard), numberline, and a large visual thermometer. Maps are optional.

Strategy:

Discuss integers as a subset of the real numbers, including zero (0), positive (+) and negative (-) whole numbers.
Ask students to tell other real world uses for integers besides the thermometer.
Introduce a numberline; allow students to count in a positive, then in a negative direction starting at the origin zero (0).
Discuss with students the meaning of integers.
Locate a few integers on the numberline.
Emphasize positive and negative numbers.
Place a coordinate grid on the chalkboard.
Explain the coordinate plane, using the numberline as a basis.
Locate points on the coordinate plane first moving horizontally, then moving vertically.
Tell students the points found on the coordinates are called ordered pairs.
Use the game of tic-tac-toe four in a row to give students practice in locating coordinates using integers.

Conclusion:

Teams were chosen to play tic-tac-toe four in a row on the coordinate plane. Each team used a strategy to get four coordinates in a row either horizontally, vertically or diagonally. Team members located the ordered pairs successfully to win the game. The use of quadrants II, III and IV was encouraged.

Fractions and Paper Folding

Bill Wagner
5332 S. Austin Ave.
Chicago IL 60638
(312) 582-6052

Hyde Park Career Academy
6220 S. Stony Island
Chicago Il 60637
(312) 535-0880

Objectives:

The student will be able to develop the concept and properties of fractions using paper folding (origami).

Materials needed:

Each individual in a class should have the following:
1 ruler (in both english and metric units)
paper squares of varying sizes (at least 1 - 4 inch by 4 inch square)
1 sheet of directions

Strategy:

1. Taking the 4x4 square first, the student shall locate the midpoint of each side by folding the square in half. Next, fold in each of the corners of the square so that the vertices of the square meet in the center of the square.

2. Start a discussion about the new shape(s) by asking the following questions:
   1. What new shape(s) have been formed?
   2. How does the area of the new shape(s) compare to the area of the old shape?

3. Answering the first question, students may see triangles (the folded sides), squares (the final shape), and even other shapes depending upon the accuracy of the folds. The second question will show the relationship between the original shape and the new shape(s) formed. The students should be able to see that the four flaps cover the new square and, therefore, each flap is 1/4 of the new square. Also by either observation or by geometric proof, the students should be able to see that the new square has an area equal to half of the original square. Your level of vocabulary and mathematical concepts should be adjusted according to grade level.

4. Taking the vertex of the folded flap, fold the flap back so that the vertex now touches the midpoint of the outer edge of the new square.

5. Asking the same two questions you started with, start a new discussion. Students may see some new shapes, such as trapezoids, have now been added to the mix. Draw their attention to the new shape inside of the second square. Hopefully, they will now see a new, even smaller square. Have the students try to find the area of the smallest square. If they have trouble, show that four of the new little tabs formed by the last fold will cover the smallest square. Then demonstrate how many of these little tabs it takes to cover the second square (16). Therefore, the area of the smallest square must be 4/16 ths of the second square. Since four of the smaller tabs equal one of the larger tabs, 4/16 = 1/4 and the area of smallest square equals 1/4 th of the second square. You may choose to go further and demonstrate how the smallest square

is 1/8 th of the original square.

6. With an advanced group, you can even introduce irrationals by looking at the lengths of sides of the squares produced and using the Pythagorean theorem to determine their value.

7. Finally, fold the smallest tabs back under, producing a small picture frame which the students can now use to frame the picture of their choice. The above steps can be repeated with different sizes of squares to show that the above fractions (ratios) are constant and to produce different sizes of picture frames.

Performance Assessment:

K-3 Students will be able to fold any square piece of paper, following the instructions on the direction sheet, into a picture frame for the picture of their choice.
4-6 Students will be able to find the areas of the resulting figures created by the paper folding and determine what fractional part of the whole square is represented by the new sections created.
7-10 Students will be able to do all of the above plus name the shapes created and use the Pythagorean formula to find the dimensions of the new shapes.

Number Up

Ernestine Bickham
7000 South Shore Drive #11A
Chicago, Il 60649
312-288-8801

Maria Saucedo Magnet School
2850 W. 24th Blvd.
Chicago, Il 60623
312-534-1770

Objectives:

Using a deck of cards, the seventh and eighth grade student will be able to practice:

1. Addition, subtraction, multiplication and division of whole numbers.
2. Order of operations.

Materials needed:

Decks of cards with all face cards removed.
Chips of cards with ( ), +, -, *, / for the players to place between cards.

Strategy:

OBJECT OF THE GAME: To be the first player to use his/her 5 cards and the order of operations to attain the given value.

RULES:
1. No picture cards are used. Aces = 1. All other cards are face value.
2. To determine the dealer each player draws a card from the deck. High card determines the dealer. The dealer goes first and play proceeds to the left. The next deal also proceeds to the left.
3. The player with the most points wins. All winning hands must be proved verbally and visually.
4. Deal 5 cards to each player.
5. The dealer then places a card face up in the middle of the playing surface.
6. Each player may use any or all operations (addition, subtraction, multiplication, division). Parentheses can be used.
7. Using the 5 cards and the above operations, each player tries to attain the value of the card that was placed in the middle of the playing surface.
8. The first player to attain the desired value and state his/her equation and answer verbally wins 1 point.
9. The player(s) with the most points at the end of 5 games wins.

EXAMPLE: Desired value = 8 Cards dealt: 9,2,3,2,5
A winning combination: 2 * (2 * 3) + 5 - 9 = 8

Suggested variations: Use poker chips (blue, red, white) as points.
First person to attain the given value gets a blue chip, the second, a red and the third a white. You may give a value to each chip, blue being the highest, then red and white.

Math Game Using A Tic-Tac-Toe Board

Gertrude Franklin
4131 West 21st Place
Chicago, Illinois 60623

William Penn
1616 S. Avers
Chicago, Illinois 60623
312-535-3665

Objectives:

To introduce three mathematical operations -- addition, subtraction and multiplication -- by using Tic-Tac-Toe methodology

To introduce a new method in using the Tic-Tac-Toe grid.

To present a new method in problem solving.

Materials Needed:

Pencils
Overhead projector
Pieces of paper for computation
Handouts of sample math problems

Recommended Strategy:

The teacher will write some math problems on the board to be explained to the students.

Students will complete problems in computation on the Tic-Tac-Toe board or on paper. The student giving the first correct answer will get a point. The points will be totaled at the end of the game.

Place nine students in a square resembling a Tic-Tac-Toe board.

Scores will be kept on a Tic-Tac-Toe board by an "O" or an "X." The team scores by making a straight line of 3 O's or 3 X's.

The O's will compete against the X's.

If the answer is incorrect, the problem will go to the next team for a correct answer.

Players will rotate until all have had a chance to participate. Blank Tic-Tac-Toe symbols are given to students to create new problems.

The overhead projector will be used to introduce problems in finding the missing numbers. For example, a blank square in the Tic-Tac-Toe grid would require the answer 15 to the problem "How much is 3 times 5?" These problems will be shown one at a time to give students a chance to get the right answer or to ask questions about solving the problem.

Conclusion:

Students were introduced to Tic-Tac-Toe problems in addition, subtraction and multiplication and in finding the missing number.

The Moebius Strip

Arnita Newton
4800 Chicago Beach Drive
Chicago IL 60615
312-548-1446

Kenwood Academy
5015 Blackstone Avenue
Chicago IL 60615
312-535-1350

Objective:

To investigate mathematical patterns using the Moebius Strip.

Materials Needed:

Strips of paper 10 inches long and 2 inches wide. Adding machine tape, construction paper or graph paper. Allow 10 strips for each student. Markers or colored pencils optional. Students will also need Scotch "Magic" tape and scissors.

Strategy:

Students are asked to examine their strips of paper to determine that each strip has two edges and two sides. Students are told to make a loop, turn one end over (in a half-twist) and tape the ends together. Make a second loop without twisting.

Students are asked to draw a lengthwise line in the center of each strip, continuing until they reach their starting point. Students will report all of their observations.

Students will note that their pencils never crossed over the edge. This surface does not have a top and a bottom or a front and a back. Instruct students to cut the Moebius strip along the line they drew. Ask students, "What did you get, how many sides does it have, how many half-twists does it have?"

Students are asked to make another Moebius strip and cut along a path that is about one-third of the distance from one edge to the other. Describe the results. Other Moebius strips may be constructed in the same way, cutting one-fourth of the way in and cutting one-sixth of the way in. Students are asked to describe their results after cutting each strip.

Students are encouraged to investigate strips with different numbers of half-twists, cutting each strip down the middle as they did with the first Moebius strip.

Make a Moebius strip and draw lines to divide it in thirds lengthwise. Shade the middle third. Cut along the edge of the shaded third. Describe your results.

Conclusion:

The Moebius Strip is an interesting topological figure. The investigation also provides a good exercise in having students derive a generalization from their empirical observations.

Return to Mathematics Index

Fraperdec*

Connie Taylor
11352 South Prairie
Chicago, IL 60628
312-468-3178

Holy Angels School
545 East Oakwood Boulevard
Chicago, IL 60628
312-624-0727

Objectives:

To enrich and further develop skills in conversion and sequencing of fractions, decimals and percentages, both in each individual set and in cross sets.

Materials Needed:

55 blank playing cards or oak tag cut to size
3 fine tip markers (different colors)

Strategy:

1 Divide cards into 4 stacks: 25 cards, 14 cards, 14 cards, 2 cards.
2 For the stack of 25, mark each card in the way playing cards are marked for each family of the following fractions using one of the markers:
1, 2, 3, 4, 5, 10.
Example: 4 family: **1**, **2**, **3**, **4** over 4 4 4 4   5 family **1**, **2**, **3**, **4**, **5** over 5 5 5 5 5
You should have all 25 card marked. Remember, 1 family member per card.
3 Take a stack of 14 cards and, using another color of marker, mark the cards like playing cards for the following decimals:
.1, .2, .25, .3, .33, .4, .5, .6, .66, .7, .75, .8, .9, 1.0
4 Take the last stack of cards and using the third color of marker, mark the cards like playing cards for the following percentages:
10%, 20%, 25%, 30%, 33 1/3%, 40%, 50%, 60%, 66 2/3%, 70%, 75%, 80%, 90%, 100%.
5 Mark the last 2 cards FRAPERDEC using all 3 markers. These are wild cards.
6 **RULES**
- a This game is for two to four players
- b "Dealer" will shuffle and deal out cards to players. Each player should have 5 cards. Remaining cards are placed face down in the middle of the playing area in a stack. Play starts to the left of the dealer.
- c First player picks top card. If it is useful to the player, he keeps it and tosses one he doesn't need face up on the playing area.
- d The next player picks a card either from the top of the deck or may pick up the card tossed away by the previous player if he can use it. This player then tosses away a card and so the game continues.
- e The first player, on HIS TURN, to have all 5 cards in equivalents or sequenced wins.

WINNING HANDS
- a PAIR Two equivalents in a set or cross set (2 equiv. frac., dec., per. same set or mix 'n' match. Ex.: 1/2, 2/4 same....1/2, 50% mix)
- b TRIO Three equivalents OR sequences in a set or mix 'n' match. Ex.: 1/4, 2/4, 3/4 OR 1/4, 50%, .75 OR 4/10, 2/5, 40%. The possibilities are numerous!
- c HIGH All five cards are equivalent or sequenced.

POINTS

PAIR 10 pts
TRIO 20 pts
HIGH 50 pts

PLAYERS left holding cards receive only half of point value for pairs or trios left in the hand. Unmatched cards are -5 points each.

DEFINITIONS:

SET: Number family, i.e., fraction family, decimal family, percentage family.
CROSS SET: Mixed families.
EQUIVALENTS: Members of different families and/or family members having equal values.
SEQUENCE: Ordered numbers whether from differing families or family members.

Conclusion:

As students become proficient at playing this game they find that their mental ability to convert and sequence fractions, decimals and percentages, either in sets or cross sets is speedy and correct.

INSTRUCTION SHEETS FOR TWO MORE COMPLEX VERSIONS OF THIS GAME ALSO AVAILABLE: SUPER FRAPERDEC and SUPER DUPER FRAPERDEC.

Return to Mathematics Index

How To Use An Abacus

William Gordon
9700 S. Oakley Avenue
Chicago, Illinois 60643
312-233-5809

John Hope Academy
5515 S. Lowe
Chicago, Illinois 60621
312-962-2760

Objectives:

The students will be able to:

1. Demonstrate the properties and operations of a number system
2. Develop an understanding of the commutative, associative and distributive properties of the mechanics of the abacus
3. To understand the place value of whole numbers using an abacus

Materials:

Chinese Abacus (Suan Pan or Soo Pain)

Strategy:

A typical Chinese abacus consists of columns of beads. A crossbar separates the beads. Each column has two beads above the crossbar and five beads below it. Each upper bead represents five units and each lower bead equals one unit.

The first column on the right is the ones' column; the second column is the tens' column; the third column is the hundreds'; the fourth column is the thousands'; and so on. The ones' column represents numbers from one to nine. Each bead below the crossbar has a value of one (1) and each bead above the crossbar has a value of five ones (5). The tens' column represents numbers from 10 to 90. Each bead below the crossbar has a value of ten (10). The beads above the crossbar has a value of fifty (50). The hundreds' column represents numbers from 100 to 900. Each lower bead equals 1 hundred (100) and each upper bead equals 5 hundred (500).

To place a number on the abacus, move beads to the crossbar. When beads are moved away from the crossbar, they are cancelled. This means a lower bead is cancelled when it is lowered from the crossbar and an upper bead is cancelled when it is raised from the crossbar.

To place the number 3,684 on the abacus, raise 3 of the lower beads in the thousands' column. Then lower one upper bead and raise one lower bead in the hundreds' column to represent 6 hundreds. Next, lower one upper bead and raise three lower beads in the tens' column to show the 8 tens. Finally, in the ones' column, raise four lower beads for the 4 ones. Now the abacus shows 3,684.

Return to Mathematics Index

A FIBONACCI PRIMER

Freeman, Larry
1956 West Hood Avenue
Chicago IL 60660-2217
1-312-262-1840

Kenwood Academy
1-312-536-8850

Objectives

1) To share knowledge about an interesting but obscure facet of recreational mathematics which is accessable and interesting to junior and senior HS math students.

2) To challenge teachers and students alike to discover and perhaps prove many interesting properties of the Fibonacci sequence and its unexpected relationship with the geometry of the regular pentagon and with the theory of limits.

Equipment and Materials

Writing implements; hand calculator (scientific preferred); accurate millimeter scale.

Teacher-prepared worksheets to calculate and display up to twenty elements of the classical Fibonacci Sequence ("CF") and several varieties of generalized Fibonacci-like sequences ("GS").

Teacher-prepared worksheets with several regular pentagons -- complete with all diagonals -- and with all vertices and intersections of diagonals labeled.

Recommended Strategies

Provide a **brief** explanation of who Leonardo of Pisa was, his dates and place in math history -- the rabbit problem is optional. Use proper terminology which means subscripting: We denote specific terms of GS with subscripts. The i-th term of CF is written as F_i. In CF, the first two terms are always $F_1 = 1$, $F_2 = 1$.

The basic rule for any Fibonacci or Fibonacci-like sequence is that every term is the sum of the two previous terms. In our symbols, $F_{i+2} = F_i + F_{i+1}$, is an element of the set of positive whole numbers: 1, 2, 3, ... The ith term of CF is abbreviated as F_i; the first term of CF is F_1. The expression "F_{n+3}" means the "n + 3rd" term of the F-sequence.

The Fibonacci sequence and its properties are generally considered part of recreational mathematics, a category of math generally ignored by the math "establishment." **But** teachers know that play ought to precede serious study; so this is perhaps a powerful reason to include F in our teaching! It is rich in non-trivial arithmetic practice, calculator practice and problems, and in algebraic applications. Fibonacci connects with Geometry -- even Pythagorean Triples -- and probability. The ratios of successive terms of F dramatically illustrate oscillating series and the question of convergence of infinite series (calculus).

On the worksheet with the regular pentagons, carefully draw the diagonals with a sharp pencil. Measure lengths of sides, diagonals and segments of diagonals to the nearest millimeter. Keep a neat record of your measurements. Check your results against GS or CF. If they don't fit, can you devise a way to make them fit? Compute ratios of consecutive lengths, larger to smaller. What can be discovered here?

Thought Starters on Fibonacci

Write the first twenty terms of CF. Here are some questions to answer as you scan this list:

1) Are odd or even terms more numerous? What **is** the ratio of odd to even terms? Will this continue forever? Why?

2) F_{12} = 144 and 144 = 12^2. There are no other perfect squares among the Fibonaccis, but this wasn't proved until 1963. Can you find a perfect number or two among the F's?

3) Add the first n F_i's. What is special about the sum? Is **it** a member of F? Where is it? What should the formula be?

4) If I want to know the value of a large F_i such as F_{307}, is there a shortcut or **must** I list all 306 terms of F? There is a shortcut -- get your calculator out:

Let x = 0.5 + 0.5 sqrt 5 and y = 0.5 - 0.5 sqrt5

Then $F_n = (x^n - y^n)$/sqrt 5 "sqrt" = "square root of"

5) What is the sum of the first n **odd** F_i? Proof (not hard).....

6) Examine your answer to (1). Recompute your list of F_i using different values for F_1 and F_2. What do you now find for the ratio of odds to evens? Is there a general rule working here? State it.

7) Divide F_{i+1} by F_i for every entry in your list of F_i. As i increases, what happens to the sequence of quotients? Try this for another FS (one with different first and second terms). Compare your result with the famed "golden ratio."

8) Can you "massage" the Pascal Triangle and get the Fibonacci Sequence out of it? Now we can expect a relationship between Fibonacci, binomial coefficients and probability theory!!!

\+ + + + + + + + + + +

Those who would like a list of readings/references on this fascinating topic are invited to contact me for one. Non illegitimus carborundum, y'all.

{Dedicated to Roy and Dianne Coleman by a stubborn, reluctant student.}

Return to Mathematics Index

Geometric designs in the game of "Life".

Byrne, Willaim
618 W. Roscoe
Chicago, Il. 60657

Martin Luther King H.S.
536-8680

Objective:

To predict and discover patterns generated in the game of "Life".

Apparatus Needed

Large checkerboards (one per two students) and flat counters or checkers of three different colors.

Recommended Strategy:

The game of "Life" is a fantastic solitaire pastime because of its analogy to the rise, fall and alteration of societies of living organisms. The dramatic patterns can be seen using a computer. The game was invented by John Conway, a University of Cambridge mathematician, in 1967.

To play the game, start with a configuration of counters near the center of the board. The rules of the games are as follows: (1) **Survivals**: every counter with two or three neighbors survives for the next generation. (2)**Deaths**: Each counter with four or more neighbors dies (is removed) from overpopulation. Every counter with one neighbor or none dies from isolation. (3)**Births**: Every empty cell adjacent to exactly three neighbors- no more, no fewer - is a birth cell. A counter is placed on it for the next generation.

The following procedure can be use to play the game. (1) Start with a pattern of white counters. (2) Locate all counters that will die. Place a red counter on top of each one. (3) Locate all vacant cells where a birth will occur. (It is important to understand that births and deaths occur simultaneously and only white counters contribute to births). Place a blue counter on each birth cell. Next remove all deaths (piles of two) and replace blue counters with white "adult" counters. This is the next generation.

One must be very careful in checking for births and deaths; mistakes are easy to make. Start with all possible arrangements of three counters. (There are five distinct ways.) Some patterns die out in a few generations, while some become stable- no births or deaths- while some simple patterns go on for several hundred generations before dying or becoming stable.

Return to Mathematics Index

Paper Pool

Williams, Barbara
9522 S. Yale Avenue
Chicago, Il 60628
568-7688

Cook Elementary School
962-2915

Objectives:

Students will: recognize rectangles whose sides have the same ratio; use the concept of common factor to find rectangles with the smallest area having a given ratio of sides; practice organizing data and looking for patterns; use the concept of common factor and a parity check to predict the behavior of a ball on a pool table; final corner; number of hits.

Apparatus Needed:

Students will need a ruler or straight edge and a pencil for this activity. Worksheets used in this activity are taken from the Middle School Math Project, "The Mouse and the Elephant" book, published by Addison-Wesley Publishing Company, 1986. Paper Pool is an application of many concepts: factors, multiples, rectangles and the relationship of being relatively prime. Before seeing how to apply these concepts, students must gather and organize data, then search for patterns.

Recommended Strategy:

Paper Pool is played with an imaginary ball being hit from the lower left-hand corner marked A, at a 45 degree angle. A ball hit in this way will bounce off the sides at a 45 degree angle. Also, if a grid is placed on the table, the ball always traverses on diagonals of the squares of the grid. Students first learn how to predict the pocket into which a ball will fall and the number of hits as the ball crosses the table. Students further develop their analytical skills by investigating the number of squares crossed. All three relations depend upon the lengths of the sides of the pool tables.

Return to Mathematics Index

Graphing Game

Lalagos, Thomas
633 So. Elgin
Forest Park, IL 60130
771-7845

Hyde Park Career Academy
947-7180

Objective:

To introduce the graphing of ordered pairs on the cartesian plane.

Materials:

A cartesian graph that goes from -4 to 4 on both axes. The axes should be **thick** lines with arrows facing in the positive direction. The other lines on the graph should be lighter than the axes. Horizontal lines should be a different color than the vertical lines, but it is not necessary. **Do not label anything.** No X-axis, no Y-axis, no numbers on the axes.

Strategy:

Divide the class in teams (if possible no more than 4 teams with no more than 7 students per team). Assuming that you have 4 teams, take 4 sheets of paper write the group symbol assigned to each team on top of their paper and ask them to list the names of their team on that paper. You may want to use X, O, /\, #, for the four different symbols. After the students have written their names on their team paper, collect the papers, write the 4 symbols on the board and list the members of each team under their symbol. Leave enough space between the team columns on the board so that you can insert checks to keep track of who is up next when you play the game. **Directions to students:** The object of this game is to get four of your symbols in a row, (next to each other) horizontally, vertically, or diagonally. At the same time you may wish to prevent the other teams from getting four of their symbols in a row. All teams start off with 20 points. When a team gets four in a row, 4 points are added to its score, but the other three teams get one point subtracted from their score. To get your symbol on the graph choose a pair of numbers from the set that is on the board {-4,-3,-2,-1, 0, 1, 2, 3, 4, }. You may use any pair of numbers from this set including using the same number twice. Once I call on you and you give me a pair of numbers, **you must watch how I move on the graph. I will not explain.** Once you give me both numbers of the pair you cannot change your mind, but it's O.K. to change your mind after saying the first number. If the point described by the pair of numbers that you give me is already occupied, you lose your turn. Remember, the pair of numbers that you give me are directions on how to move and I will follow those directions. Team members may help each other, but only the person that I call on can give me the pair of numbers. You cannot tell another team what to do. Teams and/or individuals will have points taken off if they don't play by the rules. Further directions to the teacher: Put a check on the board after the student's name once they have taken their turn. Since the number of students on each team will not always be the same, it will help you keep track of who is next on that team when it is that team's turn to play again. Two possible ways to end the game:

A) Once a team has four symbols in a row erase everything and start over.

B) Once a team has 4 symbols in a row erase only those four symbols and continue playing the game.

Either way the game will end when the bell rings.

There are several variations of this game and you may wish to develop your own.

Return to Mathematics Index

Geometric Bingo

Lawrence, Anne
4815 W. Ohio Street
Chicago, Illinois 60644
378-0376

Wells Community Academy
942-2580

Objectives:

Learners in grades 7-10 will be able to name and identify the names of 20 geometric shapes.

Students will derive the properties of various geometric figures as questions are formulated to distinguish the shapes.

Apparatus Needed:

Geometric Bingo game card, envelope of geometric chips for each player. Overhead projector and transparent game card with transparent chips. Teacher must prepare game materials as follows: Game cards can be made from construction paper and can be laminated for repeated use. Each board should be 5x5, or contain 25 one-inch square spaces. Label the four corners on the board "FREE"and add one of the following terms under the word "FREE": point, line, line segment, and ray. Cut at least twenty-one two centimeter square chips for each student and place these in envelopes for them. Each chip should have a picture of one of the two-dimensional geometric shapes commonly called a plane. Consult the glossary of any geometry textbook for a list of terms for geometric figures.

Recommended Strategy:

Supply one game card for each player. Each card should have twenty-one spaces or places with the geometric names that correspond to each of the chips in the envelope. Names should be typed onto adhesive labels and entered onto the game board in a random fashion.

Prepare an overhead transparency of the game card and chips for purposes of explanation, discussion and calling the game.

Directions: Introduce this activity by treating the entire class as the opponent. Use the transparency on the overhead projection as the display board. Students work individually or as teams. Teacher explains that the FREE space names--"point","ray","line","line segment"--are givens which help us understand the descriptions of the twenty shapes that make up the game. Players should then be directed to look at the center FREE space and instructed to take the chip from their envelopes that has the stick-on tag. Players earn this center FREE by writing a description of their body size or dimension. The student chooses a term from an arbitrary list of personal sizes that can be written on the chalk-board,i.e., compact, midsize, fullsize, sleek; or, obelisk, rotund, statuesque, etc. Student selects and writes his/her body type on the tagged chip and attaches it to the back of the game board over the center FREE space. This part of the introduction is mainly motivational; thus, it is optional. The game proceeds as follows:

l. Caller draws a figure from the envelope containing the cut-up game chips and matches it with the form on the display board. Students are then encouraged to pronounce the name of the shape, locate the figure among their game pieces, and place it in the appropriate place on the board.

2. The goal is to have players formulate a series of questions or opinions regarding properties of the figures as they attempt to bingo.

3. Examples of valid questions are as follows:
"Is your figure a plane?"
"Does your figure have diagonals?"
"Is this figure a basic Sesame Street shape?"
"Does this figure contain one pair of parallel sides?"

Scoring: Players win by getting bingo horizontally, vertically, or diagonally. Players game chips may be left on the board after each game until all shapes have been called on the display board.

Conclusion: As students play "Geometric Bingo" they are actively thinking about the commonalities and differences exhibited by the figures and the strategical value of the questions they ask. The game can be modified to include various skills throughout a geometry course.

Return to Mathematics Index

Mathematics/Physics

What Does Greatest Common Factor Mean to Me?

Stephen Ha
3752 South Wallace Street
CHICAGO IL 60609
773-247-3727

Lloyd Elementary School
2103 North Lamon Avenue
CHICAGO IL 60639
773-534-3070

-

Objective(s):

What are the factors of a given integer.

Materials:

Materials for four groups

- Four 250ml graduated cylinders, four 100ml graduated cylinders, six containers of different size with pre-marked volume on each of them.

Strategy:

The teacher will first show the concept of factors through **modeling**. Then the students will do an activity that will help them understand further the concept of common factors and greatest common factor.

Modeling by teacher

(1) Choose a pre-marked container and tell students the objective is to fill the container with water up **exactly** to the mark by using a graduated cylinder. However, the cylinder must carry the same amount of water, the “basic unit,” each time water is added.

For example, if the volume of the container is 300ml, a “based unit” of either 20ml, 30ml, 40ml, and so on, can be used to see which one can **exactly** fill up 300ml of water into the container (Choose a few volunteers to fill up the same container with different “basic units”).

(2) Ask students why not all “basic units” being chosen can be used to fill the container **exactly** up to the mark. Explain the concept of factors after the discussion.

Student Activity

(1) Each group will use the cylinders being provided to fill a container up with water by choosing a “basic unit” they believe that can carry out the task.

(2) Record the "based unit" being used and fill out the related information in the following table.

(3) Repeat step (1) and (2) for 5 trials.

Volume in ml.	"Basic unit" in ml.	Number of repetitions	(Exact?) Success / failure
Container #1 Volume =			
Container #2 Volume =			
Container #3 Volume =			
Container #4 Volume =			
Container #5 Volume =			

Performance Assessment:

(1) What is the most efficient way to do this activity?

(2) In what way does it make a difference?

Through the discussion of the above questions, students will find out and understand the concept of common factors and greatest common factor.

Conclusions:

The concept of greatest common factor is a useful tool in some real life applications. For example, if the above activity turns into a competition, those who know the concept of greatest common factor will have a better chance to win the contest. Another example can be such as what is the most efficient way to give an exact change of 50 cents? Two quarters? Five dimes? Ten nickels? Or so forth.

Winnie Koo - Ravenswood School

Learning with Links

Winnie Koo
3752 S Wallace Street
CHICAGO IL 60616
(773) 247-3727

Ravenswood School
4332 North Paulina
CHICAGO IL 60613
(773) 534-5525

Objective(s):

Discuss and demonstrate the meaning of counting, measuring, and estimating of objects.

Materials Needed:

Four boxes of plastic links of different colors.

Strategy:

Using handson activities to help students understand the concept of counting, measuring, and estimating.

Activity of Counting

(1) Explain and demonstrate the meaning of "counting" (write the word "counting" on the board) using example such as money, fingers, or furniture inside the classroom, etc.

(2) Show students what a link is (write down the word "link" on the board) and ask a few students to come up counting certain amount of links on the tables to see if the students know how to count. For example, ask the students to count 5 links, 10 links, 15 links, and so forth.

(3) Ask students if they still have any question on how to count. If they still have question, repeat step 1 and 2 with different examples until they all understand the concept of counting.

Activity of Measurement

(1) Separate students into groups and distribute a box of links for each group.

(2) Demonstrate to students how to put the links together to form a longer link.

(3) Ask each group to form links of different number such as links of 5, 7, 10, and so forth, to see if they have any trouble in doing it.

(4) Tell students we can use these links for "measurement" (Write the work "measurement" on the board) and tell them the word "measurement" means how long or how wide something is. Show students some examples until they understand the meaning of measurement.

(5) Distribute the handout to each group.

(6) Ask each group to turn to page 1 of the handout and ask who can tell what is going on in the first picture (listen to the response, give praises to those whose answers are correct).

(7) Tell students the name of the boy in the picture is Julio and Julio's arm is 12 links long. Have students construct a length of 12 links to see how long is Julio's arm.

(8) Repeat step 7 with the rest of the picture on page 1 and 2.

(9) Now ask students of each group to measure two of their body parts and to put down the data on the sheet, including a picture of the body part they measure.

(10) Pick some students to report the result.

Activity of Estimation

(1) Write down the word "estimation" on the board and tell students the next activity is about estimation. Tell students that we can also measure things in a different way called estimation. But estimation is different in a way that it does not tell the exact measurement of a thing. What it means is that estimation is a way to guess how long or how much is a thing.

(2) Ask for a volunteer.

(3) Take out a pen or a pencil. Ask the student how many links does it take to find out the length of the pen or pencil.

(4) After the student gave the answer, ask him or her use the links to find out the exact length of it. Then ask the student how many link(s) of his/her answer is/are off from the actual answer. The student's answer should be closed to the exact answer. This example tells what it means by estimation.

(5) Do the estimation activity on the handout.

Performance Assessment:

Through the activities and by working on the work papers, students will be assessed how much they have learned from the lesson.

Conclusions:

Students should have a solid understand of the concept of counting, measuring, and estimating.

Mattie Drane - Crown Academy School

Fractions

Mattie Drane
2114 W. 66th
CHICAGO IL 60636

Crown Academy School
2128 S. St. Louis
CHICAGO IL 60623
(773) 534-1680

Objective(s):

Identify the numerator and denominator of a fraction. (Grade 1-4)

Materials Needed:

Crayons or markers, construction paper, Dominoes, M&M Candy, fruits, toothpicks, large bowl, paper cups, papers, pencils, paper towels, plastic knife

Strategy:1 Emphasize that the down number, (denominator) tells how many fair shares are in the whole object and that the top number, (numerator) tells how many of the shares are being talked about.

Strategy:2 First have each student study a blank sheet of paper. Ask, "How many folds have you made?" Next have each student fold his/her paper in half, then unfold it. Ask students how many folds they made, how many fair shares they have and what each fair share is called. Have students write 1/2 on each fair share. Then have each student fold a second sheet of paper twice to create four equal shares. Prompt students to tell that they made two folds and have four fair shares that are each called one-fourth. Then give students oral directions for coloring their papers such as "Color one-fourth red, two-fourths blue, and one-fourth yellow." If desired, have students turn these papers over and repeat the sequence, this time create your own fair shares.

Strategy:3 Give each of several small student groups a handful of dominoes. Explain that each domino features a set of dots that has been divided into two parts. Instruct each student to draw each of his/her group's dominoes on a sheet of drawing paper. (Students can trace the domino shapes, then draw the dots.) Below each domino, have each student write the two fractions that describe the domino's dot arrangements. If desired, challenge students to add each pair of fractions-to make a whole!

Strategy:4 Give each student 12 M&M candies. Have each student identify the fractional part of his/her set represented by each color of candy. To extend the lesson, have students eat a portion of their candies, then repeat the activity using their net sets.

Strategy:5 Have each student bring one fruit item to school. While students observe, cut each piece of fruit into fractional parts. For example, an apple could be cut into halves, quarters, and eighths. Or a banana could be cut into thirds, sixths, and twelfths. Have students identify the fractional parts as they are formed. Mix the fruit pieces together in a large bowl; then serve the fruit salad in paper cups. Have students use toothpicks as their eating utensils.

Performance Assessment:

1. Questions & answers
2. Teacher observation
3. Students will create their fair shares

Conclusions:

80% of the students received basic knowledge of fractions.

Mathematics/Physics

Data Collection -Primary Poster

Amelia D. Witherspoon
8239 South Carpenter
Chicago IL 60620
(773) 874 - 3970

New Concept
7825 South Ellis
Chicago IL 60619
(773) 651 - 9599

Objective(s):

Students will learn how to collect, graph and analyze data.

Materials Needed:

pencils, markers or crayons, chart paper, scratch paper

Strategy:

Students will take their scratch paper and select a question that they are interested in finding information about, such as *What is your favorite food?* Then students choose three items that their classmates will have to choose from; for example, *1)pizza, 2) hot dog, 3) nachos*. With some instruction on data collection, students in groups, survey the other students on their question using tally marks. After students have collected their data, students take the chart paper and fold it into four equal parts. At the top of the paper, the students turn their question into an incomplete sentence. For example, *My favorite food is…* On the top, left fourth of the paper, the student draws the three items. The top, right fourth, the student has a small chart with each item listed with the tally marks beside them under the appropriate category. You might want to have a preprinted chart ready. The bottom, left side of the paper will contain an actual line graph. You might want to have this graph preprinted especially for the younger children. The last area of the poster becomes five questions that the students create by observing his/her collected data. For example, *How many students liked nachos?* or *How many more students liked pizza than hot dogs?* The questions are not to be answered.

Project Extension: After the projects are completed, students might exchange their posters with their classmates to be answered.

Generic Example Of Primary Poster:

Title...	
Three Pictures of Selected Items	Chart with Tally Marks From Survey

Line Graph	Five Student Generated Questions

Performance Assessment:

The final poster/presentation should display four skilled areas. For each correct section, the student should receive 25 points for each section.

Project Extension: Each question answered correctly should receive 20 points.

Mathematics/Physics

How do You Stack Up? Revisited

Robert Foote
6743 W. Irving Park
Chicago IL 60634
Footeach@aol.com

Walt Disney Magnet School
4140 N. Marine Drive
Chicago IL 60613
(773) 534-5844

Objective(s):

- Students will estimate the number of pennies, nickels, dimes and quarters in plastic bags.
- Students will build stacks of each type of coin.
- Students will find the thickness of a penny, nickel, dime and quarter after measuring their stacks.
- Students will measure to the nearest millimeter using a ruler.
- Students will determine how many coins of each type will fit in tubes of different lengths.

Materials Needed:

Approximately 100 of each type of coin, quarter, nickel, dime and penny. (Save up your pocket change for about 3 months and it should be enough.)
4 large plastic bags to put the coins in
4 different size tubes to fit each type of coin
Calculators
Chalk
Rulers

Strategy:

As a an introductory activity, keep the coins in the plastic bags spread out and have the class guess which bag has the most coins. (You will have counted the coins already so you know the answer.) Give the student with the correct answer a small prize such as a Susan B. Anthony dollar coin.

Next, divide the class into four groups – call them the pennies, nickels, dimes, and quarters groups. Have each group stack their coins in piles so they can measure the height of each pile. After they measure each pile, have them record the height of each pile and how many of each coin are in the pile on the board. Then ask "How can we find the thickness of just one of each of these coins?" The students should answer "Divide the height of the stack by the number of coins." Have them do the calculations and then record the thickness of each coin on the board and compare answers. If there is a large discrepancy in the answers, an error in measurement or in calculation could have occurred. Ask them to compare their answers to the government determined thickness published by our government and printed here:

Penny 1.57 mm
Nickel 1.98 mm
Dime 1.35 mm
Quarter 1.75 mm

Have them find the average of their calculated thickness values for each kind of coin for the final activity. Collect the bags of coins from the students. Then, pass out a tube to each group. Using a ruler and a calculator only, each group should tell you how many coins are needed to fill the tube. After they tell you their calculated answer, give them that number of actual of coins to see if their answers agree. If they do match, great! If they do not, perhaps an error was made. If the difference is only 1 or 2 coins, that is okay too.

Performance Assessment:

A wonderful way to assess the students' understanding of this concept is to ask them to imagine a stack of coins $1000 high. How many nickels, pennies quarters, and dimes would that be? How tall would each stack be in mm, cm and m? Then give the following statistics as a comparison: a basketball player is 2m tall, the ceiling of most buildings is 4m, the height of a ten story building is 40m, and the height of Sears Tower is 440m. How tall would each of these things be in nickels, dimes, quarters, and pennies?

Mathematics/Physics

Measuring for Cookies

Sally J Hill	Roberto Clemente Community Academy
1538 N LeClaire Avenue	1147 N Western Avenue
Chicago IL 60651	Chicago IL 60622
(773) 637-2199	(773) 534-4037

Objective(s):

- The students will measure ingredients using standard and metric measuring utensils.
- The students will read envelope contents and follow directions in sequential order.
- The students will make a batch of chocolate chip cookies.

Materials Needed:

Sanitizing wash	Measuring cups and spoons (Standard and metric)
Towel	Cooling rack
Apron	Toaster oven
Hair net	Mixer
Mixing bowls	Baking sheet
Spatula	Timer
Spoons	Pot Holder

Ingredients:

Baking soda	Brown sugar
Butter	Chocolate chip morsels
Flour	Salt
Shortening	Sugar
Vanilla flavoring	

Strategy:

The class will divide into two groups. Each group will choose a leader, who will be the only person allowed to communicate with the teacher. This usually encourages students to work together and to try different ways to complete their tasks. The teacher informs the class that each group will be making a batch of chocolate chip cookies. The teacher stresses the importance of good hygiene and sanitation, and makes sure that each student washes his/her hands. *(All ingredients, toaster oven, timer, and cooking/baking utensils are assembled and laid out on a table.)* The group leaders will receive a packet containing labeled envelopes that identify the ingredients and the amounts to be measured out. Each group will receive instructions that outline the sequence in which the measured ingredients are combined and who should actually do the mixing, baking, etc. The leader will have the only copy of the complete recipe. The leader will then distribute the envelopes to the group members and observe to make sure they are following the directions given. (Group A will use the standard measurements and group B will use the metric measurements.)

Performance Assessment:

This activity is being conducted in a way to help students to see clearly the importance of making accurate measurements and following directions. Once students determine that cookies are being made, this motivates the students and they usually will verify the accurate measurement of ingredients by other group members. After the cookies bake, the teacher will examine the cookies for texture, size, shape, crispness, softness, etc. This will lead into a discussion in which the students estimate what caused the cookie to be soft, crisp, etc. The students will also engage in a discussion in which they would identify the measuring utensil used and explain the importance of accurate measuring, estimating, and following directions. I would also have the students to complete an observation sheet on this lab experience and identify alternate measuring utensils they could substitute. While the cookies were baking, we would discuss the measuring utensils used for particular ingredients and reducing or increasing recipes.

Ratio, Percent & Proportions

Rosalyn Winston
7447 South Shore Drive
Chicago IL 60649
(773) 978-5730

Walt Disney Magnet School
4140 N. Marine Drive
Chicago IL 60613
(773) 534-5846

Objectives:

To write fractions as percents for seventh graders.
To find the percent of a number.
To find percents using proportions.
To calculate the weight of objects (beads) in grams given specific percents.
To verify the weight of objects (beads) on a scale in grams in cooperative learning groups.

Materials Needed:

calculators
electronic scale measures in grams and ounces
clear plastic liter bottle
clear containers for each cooperative learning group
multi-colored chalk or overhead transparency markers
containers to hold objects
beads of various colors

Strategy:

"The phenomenological approach to mathematical instruction asks a question which requires the use of mathematics to answer it. The question must be based on a physical entity present for observation and use the mathematical processes you are teaching at the time. The answer to the question must be verifiable by direct observation."

How much will the beads that each person has weigh? Four cooperative group members are sitting around a pile of beads weighing 237 ounces. The first person takes 4 beads from the pile, the second person takes 3 beads, the third person takes 2 beads; the fourth person takes 1 bead from the pile. They continue the process until all the beads are gone. Each person now holds a percent (10%, 20%, 30% or 40%) of the original pile.

Each cooperative math group will do their calculations first.

The total weight of all the beads is 237 grams. The first student should have 130 grams. 40% of 237 is 130.00 grams. The second person should have 30% of 237 grams or 71.10 grams. The third person should have 30% of 237 grams or 47.4 grams. The fourth person should have 23.7 grams or 10% of 237 grams.

Check each individual's calculations.
Verify each individual's beads weight on the electronic scale.

Performance Assessment:

Give the cooperative math groups different bags of beads to calculate weight with the same percentages 40%, 30%, 20%,10% or, give them new percentages to investigate.

Return to Mathematics Index

MISSION: POSSIBLE

Mary Terhune
6115 W. 94th St. (Apt. C8)
Oak Lawn IL 60453
(708) 430-4157

Rachel Carson School
5516 S. Maplewood
Chicago IL 60629
(312) 535-9222

Objectives:

- **Grades 5-8**
- Students will covert scaled directions in inches to actual measurements in feet.
- Students will correctly measure distances on an outdoor path.
- Students will enlarge a section of a map 5:1.

Materials Needed:

- scaled directions (one set per group)
- calculators (one per group)
- tape measures (one per group)
- "microchips" (one per group)
- map of IIT campus (one per group)
- 8 1/2 x 11 paper (one sheet per group)
- rulers (one per group)
- colored pencils

Strategy:

Divide students into groups of four or five.

Tell students they are on a **mission**: In order to be hired as spies for an upcoming project, they must successfully complete the following task before it self-destructs in 50 minutes!

1. Students are given four directions scaled in inches.
2. Students convert these directions into actual measurements by using proportions.
3. Students measure the actual distances on an outside path that leads to a hidden "microchip".
4. Students exchange their "microchip" for a map of the IIT campus.
5. Students enlarge a section of the map 5:1.
6. Students plot their path on the enlarged map.

Performance Assessment:

Students enlarge a section of an IIT map 5:1, and then plot their path taken to find the "microchip".

Students compare their maps to a master map, and are graded according to accuracy.

Dream Home Mathematics

Dennis W. Montgomery
941 W. Carmen Ave, Apt 306
Chicago IL 60640
(312) 275-0631

Lyman Trumbull Academy
5200 N. Ashland
Chicago IL 60640
(312) 534-2430

Objectives:

This lesson-game is designed for grade levels 5-12.
Students should be able to:

* Use basic math to determine affordability of a home based on a given income.
* Add, subtract, multiply, and divide, as required.
* Calculate decimal placement for currency, percentages and interest.
* Use a calculator.
* Estimate affordability based on income, prior to computation.
* Investigate different careers and their salary ranges.
* Understand and calculate percentage, interest rates.
* Understand gross income.
* Calculate and understand taxes, withholdings and deductions.
* Calculate net income.
* Understand and compute the expense and cost concept.

Materials:

* Careers catalog/magazine with salaries
* Copies of newspaper classified section
* Calculators
* Pencil/pen
* Construction paper (approx. 11 X 12)
* Play money (optional for variation with banker)
* House plans with price (magazine's with house plans or create your own)
* Glue
* Scissors
* 3" x 5" index cards

Recommended Strategy:

* Review lessons on computing percentages, interest, decimals and division.
* Review a range of home prices and designs.
* Review/teach the use of a calculator to compute interest, percentages, add, multiply, divide and subtract taxes, deductions, and expenses.
* Skipping one space, number ten 3 x 5 cards 1 to 3. Head the card "**CAREERS**. Use the following format:

```
|             CAREERS              |
|                                  |
|1. Career:  Doctor                |
|                                  |  3 x 5 card
|2. Annual Salary:  $250,000.00    |
|                                  |
|3. Added Expenses: Child support  |
| $1,000 or Child's College payment|
| $2,700 per month (add to F)      |
```

  Career card info may be obtained from a "Careers" catalog/magazine or create your own (keep it realistic). Create real life "added expenses" =< $5,000 per month.
* Using any magazine, newspaper or both, the teacher or students cut out various

home plans (preferably with a picture) and glue each one to a sheet of construction paper, numbering each and giving it a bold heading of "DREAM HOME". Use the price listed in the newspaper, magazines or create your own. In bold numbers, at the bottom of the construction paper, place the price of the home. If you create your own, be realistic.

* Collect the career cards and the dream home sheets (in 2 stacks).
* Distribute one career card and one dream home sheet to each group.
* Create a data collection sheet in the following manner and order:

DREAM HOME MATH DATA COLLECTION: Can I afford to buy this home?

What is your occupation and annual salary?________________________________
Compute your monthly income (x/12) A.______________
What is the cost of your home on "DREAM HOME CARD"? (y) B.______________
Compute tax & payroll deductions (33% of A.) C.______________
Compute loan payment (mortgage) & interest (9% of y)/12 D.______________
Compute monthly property tax (10% of y)/12 E.______________
Utilities, car payment, food & one child is your fixed monthly expense of $1,000 plus (+) the added expense from your career card F.______________
Compute total debt by adding lines C. and F. G.______________
Subtract line G. from line A. for net income H.______________
Add lines D. and E. for total home/mortgage cost I.______________
Subtract line I. from line H. for cash remainder (+/-) J.______________

If line J. has a positive(+) cash remainder, congratulations, you can afford to buy the home, go to the banker or loan officer for amount shown on line B. Each month you must pay the bank/loan company amount shown on line I.

If line J. has a negative(-) cash remainder, I'm sorry, the home you have selected cost too much for the amount of net income you have after subtracting your total debt on line G. You don't make enough money to buy this particular home and have such large debts. Try a less expensive home.

/ **=** Divide/Division
x **=** Annual Gross Salary/Income
y **=** Cost of Dream Home

* Compare and graph home cost to net income/salaries, expenses/debt between students.
* Explore various careers and their salary ranges to teach affordability.
* Explore difference between rentals and home purchases and how basic math is used to provide an answer for; "Can I Afford to buy this home?"

Performance Assessment:

Students should compare the cost of buying a home and renting. Math calculations on data collection sheet will be checked for accuracy. Students at a later lesson, use their parents income and rent/mortgage to determine homes they can afford.

Note:

Any variations to "DREAM HOME MATH" should consider age and grade level. and pictures if possible. This exercise reinforces five (5) primary math functions and introduces the student to one of the most valuable lessons of life, simplicity of math in buying a home.

Return to Mathematics Index

Temperature

Patricia A. Calloway
8228 South La Salle St.
Chicago IL 60620

Spencer Math and Science Academy
214 North Lavergne
Chicago IL 60644
(312) 534-6150

Objectives:

1. To read temperature on a Celsius thermometer

2. To read and interpret bar graphs

Materials Needed:

1. Celsius thermometers
2. art papers
3. pencils
4. scissors
5. seasonal clothing
6. cups
7. large container of ice
8. large container of hot water

Strategy:

Students will do a quick review on counting numbers by twos, and ordering numbers from least to greatest.

Instructor will lead a discussion on weather conditions for each season. Have the class make a list of words that describe these seasonal conditions. Examples include hot, cold, icy, mild, scorching, cool, chilly and so on.

Display the thermometer. Move the indicator to show room temperature. (20^oC), a winter day (0^oC).

Explain that a thermometer is similar to a vertical number line. Show that each mark on the thermometer stands for 2 degrees or counting by twos.

Point out different temperatures for each season. Summer 30^oC, Fall 12^oC, Winter 4^oC, and Spring 24^oC.

Have each group draw pictures of clothing they would wear if temperature were 35^oC, 14^oC, and 22^oC.

Review reading temperatures using the Celsius thermometer. Discuss week's temperatures.

Make a bar graph using the given temperatures for the past week.

Homework: collect the daily temperature reports from the newspaper or television.

Return to Mathematics Index

Sales Tax

Allen Batts, Jr.
663 E 84th St.
Chicago IL 60619
(312) 224-7047

Jane A. Neil School
8555 S Michigan Ave.
Chicago IL 60619
(312) 535-3000

Objectives:

This lesson is design for grade level 6-8
Upon completion of the lesson, the students should be able to:
* Find out what percent of sales tax is changed when purchasing merchandise or food by dividing the price by the sales tax.
* Understand the differences of sales tax on merchandise and food.

Materials:

* Store catalogs (eg. J. C. Penny, Spiegel, Montgomery Wards, Sears, Venture, K Mart, Carson Pirie Scott.)
* Store Receipts
* A chart made out similar to a receipt: Titled in one column Items and in the other column Price. At the bottom Price column should be Subtotal, Tax and Total.

Recommended Strategy:

* Introduce to the students that they have a certain amount of items to to purchase 5-10 items.
* Explain to the class, they are given $500.00 to spend and the one who comes closet to spending $500.00 will receive a prize.
* Write down items, the page you picked the item from and write down the price. Be as specific as possible.
* Divide the class into groups of two or three. Each member will get to purchase at least $160.00 maximum. Out of the 5-10 items purchased, you must include a discount.
* Each group will be given a store name and their neighbor store will check for errors.
* After everything is checked the store that has an error will be given a consequence. The store who finds the error or that individual will be rewarded.

Performance Assessment:

Discuss with class the different taxes in each state (Wisconsin, Michigan, Ohio and Illinois). Observe the errors and prices of stores in each state and find which group came closet to $500.00 and issue out prizes. This project best used in the morning.

Return to Mathematics Index

Money Matters

Barbette Flennoy
P. O. Box 146784
Chicago IL 60614
(312) 477-7707

Joseph Stockton
4420 N. Beacon
Chicago IL 60613
(312) 534-2450

Objectives:

The goal of this lesson is to introduce the students to different countries' money and the United States monetary value of a penny, a nickel, a dime, and a quarter. This lesson can be used for primary and intermediate students.

Materials Needed:

-World Map
-Globe
-Play-Doh/Clay (4 different colors)
-Attri-Cubes
-Colored Markers/Crayons
-Legos
-Butcher Block Paper (white/brown)
-Plastic Clay Tools/Cookie Cutters
-Play Food (milk, eggs, beans, etc.)
-Building Blocks
-White/Manilla Construction Papers
-Styrofoam Trays (10)

Strategy:

Using the materials listed above, a marvelous dimension of the world of money can be revealed. Most of the time primary students lack an understanding of money and how it works. This lesson gives students a chance to recognize that there is very little that can be done without money.

Begin the lesson by writing the names of the following on the blackboard or an easel:

Algeria (Dinar)
Austria (Schilling)
India (rupee)
Italy (lira)
Spain (peseta)
United States (dollar)
Argentina (Peso)
France (franc)
Israel (pound)
Japan (yen)
Germany (duetch marc)

Introduce the students to the names of the countries first. If your students have prior knowledge of the countries, ask them what kinds of things they think about when they hear the names. Use the world map and the globe to show where the countries are located. Associate the countries name with their monetary value. It is not necessary to go into great detail unless you wish.

Ask the students a series of questions about money. **Example**-What do you need to get a lollipop from the store? What do you have to have to get a car? Why? Where did your parents get your bicycle? How did they get it? There may be a variety of answers which should all lead back to money.

Next, separate the students into three groups. One group will be the "Money Factory". The second group will be the "Construction Workers". The third group will be the "Grocery Store".

Each of the groups are responsible for a project. The first group has the responsibility of making money. They are to use four different colors of clay to create coins with the value of one cent, five cents, ten cents, and a quarter (red clay coins can be pennies, blue can be nickels, etc.). Next, instruct the students to make five groups of twenty so that there are at least 100 coins for each value. Finally, they need to place a sample on a board where the rest of the class can see them.

The second group is responsible for building the grocery store and the money factory. They should use the legos, blocks, and/or attri-cubes for their project. Have the students count the number of pieces (if this is a kindergarten group, they may need assistance). Now the students should give four of the colors that they use, values of a penny, a nickel, a dime, and a quarter. Finally, they should tabulate the total cost of each project and write it down.

The third group is responsible for setting up the grocery store. Using the crayons, butcher block paper, play food, and construction paper, they can begin to set up a store. They can make a list of forty food items, draw pictures of twenty items, make "for sale" signs, and give each item a price which is not more in value than twenty-five cents.

Now, you are ready to move to the second stage of the lesson. The money factory group should set aside twenty coins and divide the rest among themselves. They should take the money that they set aside and go and pay for/on their factory at the construction workers site. Next, they should go to the grocery store and buy some food.

The grocery store group should have one or two cashiers and someone to bag the groceries (this is a fantasy/pretend store so do not worry about them having enough play food for everyone). While the store is in action, one of the group members can go to the construction workers and pay for/on the store.

Finally, the construction workers can close shop and go to the grocery store with their money.

Conclusions:

Basically, there are many ways to expand the lesson. Discuss what was taking place. This is a whole language lesson that incorporates many things. The community workers, grocery store, the treasury, foreign countries, foreign currency, etc. It is possible to take this to higher levels if you wish and it shows that "money matters".

Return to Mathematics Index

Budgeting Money

Yolanda Smith
543 N. Waller
Chicago IL 60644
(312) 534-6174

Douglass Math and Science Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

Students will be able to understand how to budget a monthly income.

Students will develop basic math techniques integrated with reading and social studies skills.

Students will be able to search employment within the want ad section of a newspaper.

Students will be able to understand the difference between a necessity and a want.

* This lesson is designed for grade levels 6-8

Materials Needed:

Budget Sheets

Newspaper (renting and job section)

Play Money

Short Story (optional)

Toy Cars (prices listed)

Toy Houses

Strategy:

This lesson is designed for each child or group. Have students decide on a occupation from a newspaper want ad. Ask questions concerning needs and wants in their lives with the cost. Make a list on the board of a monthly expense. Divide yearly salary into 12 months. Children will receive a month's salary in play money and spend it while budgeting and planning.

* Start lesson with a word problem.

Nancy wants to go to summer camp for 3 weeks. Each week costs $76.00. She has saved $232.00. Does she have enough money to go for 3 weeks?

* Allow each group or child to demonstrate their answer.
  Children can use play money, blackboard or paper.

Performance Assessment:

Teacher observation and completion of the budget worksheet. Students must be able to budget a monthly salary.

Return to Mathematics Index

Converting Celsius To Fahrenheit

Amaechi Onyeali
6901 So. Ogelsby
Chicago IL 60649
(312) 324-0069

Carter Elementary
5740 So. Michigan
Chicago IL 60637
(312) 535-0860

Objectives:

1. As a result of the lesson students will be able to solve multiple step equations involving addition, multiplication, and division.
2. As a result of the lesson students will be able to convert a known temperature in celsius to an equal temperature in fahrenheit.
3. As a result of the lesson students will be able to accurately read a thermometer in degrees celsius.

Materials Needed:

1. 6 thermometers in degrees celsius
2. 1 cup of hot water
3. 1 cup of regular water
4. 1 thermometer in degrees fahrenheit
5. calculators for each student

Strategy:

I opened my lesson with a short story. The story talks about me driving to my doctors office on a hot summer day trying to figure out if the temperature had reached 100 degrees fahrenheit. As I drove around all I could see were temperature readings on banks in degrees celsius. Eventually I arrived at my doctor's office. As we talked about the weather we both began to wonder what the temperature was outside. I told him that the bank signs all showed 39 degrees celsius. However, a temperature in celsius does not really tell us if it is 100 degrees fahrenheit. Thus we have created a problem that we need to solve. Is 39 degrees celsius about 100 degrees fahrenheit?

Now you can present the formula developed by Anders Celsius in 1742. The formula says that if you know a temperature in degrees celsius you can convert it into degrees fahrenheit by: $F=9/5(C)+32$. To check and see if this formula works, we will convert the known temperatures at which water freezes, 0 degrees celsius, and at which water boils, 100 degrees celsius. They should convert to 32 and 212 degrees fahrenheit respectively. Students will then convert 10 celsius temperatures to fahrenheit in their cooperative learning groups. Remember to follow your order of operations when solving these problems. Have students go to the board and explain their answers.

Introduce students to the 6 different stations. Each station has a thermometer in degrees celsius. Station 1 is outside, station 2 is in the back of the room, station 3 in the front of the room, station 4 in the hallway, station 5 in a cup of hot water, and station 6 is in a cup of regular water. Ask students to predict which station is the hottest. Then list them from hottest to coldest.

Now allow students to travel to each station and record the temperatures at the stations in degrees celsius. While waiting to go to the next station, students will convert temperatures to degrees fahrenheit. After all groups have been to each station confirm whether or not everyone has the same answer. Then see how many people made the right prediction. After checking predictions and answers use your fahrenheit thermometer to check the temperature of the hot and regular water. You should come out with fairly accurate numbers.

To close this lesson you can take a briefcase with a three digit combination and place it in front of the class. Tell them that you forgot the combination, but you remember that you set it on a day when it was ___ degrees celsius. If they can convert this temperature to degrees fahrenheit, they will have the combination. Let students work in their groups and come up with their answer. Give each group a try.

Performance Assessment:

1. Students will read the temperature of 6 different thermometers in degrees celsius.
2. Students will convert 6 temperatures in degrees celsius to degrees fahrenheit by using a formula.
3. Students will solve multiple step equations involving addition, multiplication, and division.

Return to Mathematics Index

Percents

Albert Michael
4903 W. Winnemac Ave
Chicago IL 60630
(312) 282-9780

Robert Fulton Elementary School
5300 S. Hermitage
Chicago IL 60609
(312) 535-9000

Objectives (Grades 3-5):

Rename ratios, decimals, and fractions as percents.

Change ratios into percents.

Weigh items on a scale.

Multiply decimals.

Use math skills to solve problems.

Materials Needed:

cardboard paper, cut-out multi-colored bars, base-ten grids,

scale, scissors, glue, pennies, beads (necklaces)

Strategies:

Tell students that percents, fractions, and decimals are also numbers. They are different ways of writing how much of something. They are names for the same quantity.

Have students record all answers on a large chart in fractions and/or decimals.

Define the meaning of the word **cent** and **per cent**. Then introduce words that contain the prefix **cent** in them such as **century, centimeter, centipede, centennial, centigrade**. Ask students to write these words at least three times.

Ask each group to place a number of pennies on a base ten grid (not exceeding 30) and ask them to read that in the form of a ratio, then write that as a percent, a fraction, and a decimal.

Distribute bead necklaces of different colors and ask students to count the beads and write their answers next to the corresponding colors. Then ask them to add all the beads up and write the total (and all answers) on the chart under the correct column.

Next ask the students to find the percent of beads in each necklace from the total. Remind them that the percents should total a hundred.

Now send one student from each group to weigh the necklace on the scale and have them record the weight on the chart. Add total weight of the beads and then find the percent of each.

Tell the students that it costs a manufacturer a certain amount of money to produce one bead. Write these amounts on the chart. Then ask to find total manufacturer's cost.

Write store prices per necklace on the chart. Let them find the profit the store makes and find the profit as a percent of the cost.

Have students look at the store price column and calculate the amount of sales tax.

Add the amount of sales tax to the store price. That would be the cost to the consumer.

Have students find examples of percents from newspapers and magazine ads, cut them, and paste them on a piece of construction paper. Have them display their work.

Performance Assessment:

Ask students to come up with seven or eight titles of Disney Classics. Have them vote on their favorite movie and then find the percent of student votes each title received. Construct a chart using multi-colored bar graphs to show those percents.

Return to Mathematics Index

Uncorking Work Problems

David Drymiller
10115 S. Oakley
Chicago IL 60643
(312) 233-7902

Marie Sklodowska Curie Metro H.S.
4959 S. Archer Ave.
Chicago IL 60632
(312) 535-2120

Objectives:

To solve problems about work, using the formula work = rate x time.
To solve equations containing rational expressions.
To strengthen basic skills learned in Algebra.

Materials Needed:

A large clear plastic bottle with 3 different sized holes drilled in the bottom
3 corks to fill the holes
A plastic storage crate
A plastic container that fits into the storage crate
A plastic funnel
Stopwatches
A pliers
Rags to wipe up spills
Saran wrap
food coloring
colored strips of paper

Strategy:

The students perform the following demonstration for their classmates under the direction of the classroom teacher. No prior knowledge of the activity is needed by the students.

Have the students fill the bottle with water and place it on the crate. Place the container in the crate to catch the water when the bottle is drained. Place one colored strip of paper near the top of the bottle, but below the water level. The other strip should be placed on the bottle near, but not exactly at, the bottom. Add food coloring to the water to make the event easier to see. Place a piece of Saran wrap on the top of the bottle to form a seal. Using the pliers, remove the smallest cork. Remove the Saran wrap and start the stopwatches when the water level reaches the top of the first colored strip. Stop the stopwatches when the water level reaches the top of the second colored strip. Recork and refill the bottle. Record the time it takes to empty the bottle using the smallest hole. (I got 127 seconds.)

Again drain the bottle as before but pull the middle sized cork and record the results. (I got 65 seconds.)

Now ask the question, "How long does it take to drain the bottle if both the smallest and middle sized corks are pulled?"

The formula, Work = Rate x Time is introduced and our discussion leads to the following chart, equation and prediction for the time.

	Rate	x	Time	=	Work
Smallest Hole	1/127		127		1
Middle Size	1/65		65		1
Both Together	1/t		t		1

$$\frac{1}{127} + \frac{1}{65} = \frac{1}{t}$$
$$65t + 127t = 65(127)$$
$$270t = 65(127)$$
$$t = 43 \text{ sec.}$$

Again drain the bottle by pulling both the small and middle sized corks and record the result. (I got 43 seconds---Perfection!)

A variation of the above can be obtained by first draining the bottle by uncorking the middle and largest holes and predicting the time needed to drain the bottle using just the largest hole. Here some error might appear in the timing of the event.

Mass and Weight in the Metric System

Janet L. Powe
8231 Jeffery Blvd.
Chicago IL 60617

Harold Washington Elem.
9130 University
Chicago IL 60619
(312)655-6225

Objectives:

To choose the most reasonable metric unit of mass.
To work in a group to weigh objects in the metric system.
To solve problems using milligrams, grams, and kilograms.

Materials:

Simple balance scale
Set of gram weights
Everyday objects to be weighed in grams, milligrams, and kilograms

Strategy:

For each group have students weigh and record the mass of various objects.
Compare the weights of objects by holding gram weights in one hand and the object in the other hand.
Work in a group and decide which measure should be used for each object.
Estimate weights before measuring on scales.
Calculate students weight in kilograms.
Use mini-scale to measure in milligrams.

Performance Assessment:

Students will be able to estimate whether to measure objects in milligrams, grams, or kilograms.
Students will be able to use balance scale to determine weights of objects for lesson in g, mg, and kg.
Students will be able to identify metric-unit relationships.
Comparison of student results with teacher results will be the final assessment of the lesson.

Return to Mathematics Index

Uniform-Motion Problems: Just Playing With Cars

David Drymiller
10115 S. Oakley
Chicago IL 60643
(312)233-7902

Morgan Park High School
1744 W. Pryor
Chicago IL 60643
(312)535-2550

Objectives:

To solve uniform motion word problems using rate X time = distance.
To practice measuring in the metric and English systems.

Materials Needed:

At least two battery operated cars with constant velocity,
Measuring tape with both English and metric systems at least 50 feet or 15 meters, meter and yard sticks,
Stop Watches at least two or more if possible,
masking tape

Strategy:

The students perform the following demonstration for their classmates under the direction of the classroom teacher. No prior knowledge of the activity is needed by the students.

First, with masking tape mark the starting and finishing lines for calculating velocity over a fixed distance. (I used 800 cm.) Find the time needed for each car to transverse the fixed distance. Record the time and distance on the blackboard and then calculate the velocity of each car.
(25 cm/sec and 36 cm/sec)

Now introduce the first type of Uniform-Motion Problem, "If the cars are place back to back and travel at the same time in opposite directions, when will they be 1000 cm apart?". Explain the problem first as the cars are placed on the floor back to back and run off in opposite directions. Next use the standard associated pictures and charts for this type of problem, write the equation and solve it in the usual manner.

$$25t + 36t = 1000$$
$$61t = 1000$$
$$t = 16.39$$

Place the cars back to back on the floor and let them run for 16.4 secs. and measure the distance between the two cars. (It should work. I got 1020 cm.)

Now introduce the second type of Uniform-Motion Problem, "If the two cars are 750 cms apart and they each travel towards each other at the same time, when and where will the two cars meet?". Set the cars on opposite sides of the room and let them run into each other as you begin your explanation. Again use the standard associated pictures and charts for this type of problem, write the

equation and solve it in the usual manner.

$$25t + 36t = 750 \qquad (12.29)(25) = 307.25 \text{ cm}$$
$$61t = 750$$
$$t = 12.29$$

They should collide in approximately 12 secs, 307 cm from where the slower car starts. Mark that spot on the floor. Place the cars 750 cms apart and run them at each other. (I missed by 6 cm.)

Performance Assessment:

With two faster cars mark the starting and finishing lines for calculating the velocity over a fixed distance. (I used 20 yards.) Also mark two starting lines on opposite ends of the hallway. (65 yards) In teams of 3 or 4, the students find the velocities, make the associated picture and chart, write the equation and solve it in the usual manner, and mark the spot in the hall where the two cars will collide. (This is competition at its best.)

Return to Mathematics Index

Estimating and Counting Money

Omega L. Minor-Clark
P.O. Box 608247
Chicago IL 60660

R. Nathaniel Dett Elementary School
2306 W. Maypole
Chicago IL 60612
(312)534-7160

Objectives:

The purpose of this lesson is to review estimating and rounding to the nearest dollar as well as gain skills and practice in counting money. The students will define the meaning of estimate and rounding. The students will gain experience in estimating sums and products.

Materials Needed:

Toy cash register, game sheets, identification cards, play money, and Jewel Food Store adds.

Strategy:

The students will play "Estimate the Cost" - a game similar to tic-tac-toe. At the top of this game sheet are pictures of six different items with the price tags attached. There are two game boards on the page (Game 1 & 2). Each board contains nine boxes with various dollar amounts in each. The students will select two items. Next they will round the prices to estimate the cost. The cost will be located on the game board and marked with an X or an O. Three marks in a line wins. Next the students will play "Estimate It". This game follows the same rules, however, there will be four items in each line as opposed to three items in each line in the first game played. The final game will be "Estimate a Meal". In this game, the students will be divided into groups of four. One student will be given a "breakfast" card to wear, another student will be given a "lunch" card to wear, and the third student will be given a "dinner" card to wear. Another student will wear a "cashier" card. The students with the "meal" cards will use Jewel Food Store adds to select four to six items for their particular meal. Next, the students will estimate the cost of their meal (individually), go to the "Cash Machine" and make a withdrawal using play money. Following this, the students will then go to the Jewel Food Store and make their purchases. They will be given a total by the "cashier". At this time the students will pay the cashier using the play money. The cashier will then give the students their change by counting aloud. The students will then count the change they received.

The counting of the change is the concluding activity.

Performance Assessment:

The teacher will evaluate the students as they estimate, count money and make correct change using play money.

Return to Mathematics Index

Estimation

Theresa W. Akpan
400 E. 33rd Street
Chicago IL 60616

Wells Community Academy
936 N. Ashland Ave.
Chicago IL 60622
(312) 534-7010

Objective(s): **Grade level: 5th through 8th**

- The students will be able to estimate numbers of objects by sampling.

- The students will be able to contrast and compare sampling with guessing.

Materials Needed:

	bag of Baby lima beans
	box of Creamettes Marcaroni
4 oz.	containers with lids plastic (Clear)
12-inch	trays
	color markers and crayola chalk
12-inch	rulers
36-inch	poster
1	overhead Projector
	pre-labeled broken-line graphing paper with transparencies

Strategy:

Have the students:

. divide class into groups of four
. guess a full container of Baby Lima Beans & Macaroni
. select dual roles: estimator, recorder, checker, and reporter/Grapher
. record the number of guesses on data sheet and broken-line graph
. use one scoop, marker, ruler, 4 oz full container with lid, and tray
. take one scoop for estimate from 4 oz container of Baby Lima Beans & Marcaroni
. estimate count for full container
. check the number Baby Lima Beans & Marcaroni count
. report the result of guesses and sampling to the class
. use the transparency sheet for broken-line graph on the overhead projector
. discuss the high and low points of guesses, sample, and estimate count on the graph to the class

Conclusions:

Students will learn to:

- estimate by taking a sample
- make a broken-line graph to analyze data
- improve cooperative learning skills by role playing

Return to Mathematics Index

Using A Round-O-Meter To Estimate

Kathleen M.K. Pidrak
16409 Prairie Ave.
South Holland IL 60473
(708) 331-6406

Edward H. White
1137 W. 122 St.
Chicago IL 60643
(312) 535-5672

Objectives:

The student will demonstrate knowledge of rounding numbers to the nearest dollar or nearest dime.

Materials needed:

scissors	string	tape	pencil
Round-O-Meter	worksheet	Round It Game	overhead
Overhead School Store		paper base ten blocks	
graph for base ten blocks			

Strategy:

1. Introduce several items that students would need to purchase for school. Write the items and their cost on the board. Talk about how we need to round to get an idea of how much money we need.
2. Using paper copies of the base ten blocks on a graph show if a number falls above or below the half mark. If we are closer to the first number we round down, if we are closer to the second number we round up. For our lesson we will let 1 flat represent a dollar, one rod represent a dime and one unit represent a penny. Demonstrate several of the items that the students mentioned. Pass out individual pieces of the base ten papers and a graph so the students can try this for themselves.
3. A Round-O-Meter is an instrument that we will make to show us which direction to round. The Round-O-Meter is a piece of paper about the size of a ruler. Attach a piece of string to the center of the Round-O-Meter, one end is folded into an arrow. Write the numbers 1, 2, 3, 4, 0 on the end of the strip with the arrow. Write the numbers 5, 6, 7, 8, 9, on the other end of the paper. When you hold the Round-O-Meter by the string and put a paper clip on the number you are looking at, the arrow will go up or down. This will show the children which direction to round.
4. After the children use their Round-O-Meter several times to prove to themselves that it will work there is a follow up worksheet that they can use to reinforce their new skill.

Conclusions:

Showing the children that one number is closer to another is very beneficial in that they can easily figure which direction to round. The Round-O-Meter serves as a reminder and is something that they can keep at their desk.

Return to Mathematics Index

Flight Angles Of Inclination

Marie C. Smith
4240 N. Clarendon
Chicago IL 60613
(312) 929-7608

Anthony Overton Elementary School
221 E. 49th St.
Chicago IL 60615
(312) 535-1430

Objectives:

The students will:

1. Observe the flight of a glider.
2. Measure the distance flown from a given point.
3. Analyze the effect of a change of angle of inclination on the launch/flight of sling launched gliders.
4. Collect data on distance flown when glider is launched from two different angle-ramps.
5. Record and communicate test results to the class by use of a horizontal bar chart for students to generalize conclusions from data. The effect of angles and comparison of their size/measure will be given by students.

Materials needed:

Glider
Trundle wheel
Yard stick
Ramp
Airplane Flight Chart
Hinged Angle

Strategy:

1. Explain that airplanes have engines and gliders do not.
2. Use a chart to demonstrate angles of flight for airplanes.
3. Demonstrate how to launch glider from ramp, use trundle wheel and record data.
4. Divide the class into four groups. Distribute a glider, trundle wheel, yardstick, an angled ramp, and data collection sheet to each group.
5. Proceed to a launch site (outside, weather permitting).
6. Launch gliders, measure distance traveled, and record results.
7. Students will assume the following roles:
   Pilot-to launch glider from ramp
   Navigator-uses trundle wheel to measure distance traveled
   Air Traffic Controller- assist in location of straight line distance of flight and checks trundle wheel reading
   Flight Attendant- stabilizes ramp and records data.
8. Each student assumes each role once and ramps should be exchanged by each pair of groups.
9. Return to class, discuss and analyze data using a pictograph.

Return to Mathematics Index

Money Sense

Marie Bijou Wong
1220 East 50th St.
Chicago IL 60615
(312) 538-4055

Joseph Warren Elementary School
9239 South Jeffery Boulevard
Chicago IL 60617
(312) 535-6625

Objectives:

1. To identify and know the value of quarters, dimes, nickels, and pennies.
2. To use a variety of coins to show the value of a dollar.
3. To count the exact amount of purchase.

Materials:

ziplock bags, paper, pencils, paper coins, plastic coins, plastic store fronts, doll clothing, markers, books, folders, clay, cars, crayons, kites, coloring and activity books, glue, paint, puzzles, cars, candy, cookies, canned goods, cereal, scissors, sidewalk chalk, posterboard, store signs, and any items of interest to your class

Strategy:

1. Identify penny, nickel, dime, and quarter.
2. Give value of each coin.
3. Count to a dollar using:
   a. nickels; b. dimes; c. quarters; d. various combinations of denominations
4. Instruct students to come to the front of the room to observe the items which are for sale. They are to choose as many items as they can for the amount of money they have on the shopping spree work sheet without going over the amount.
5. Have a student from each money group ($ .49, $ .60, $ .75, $ .83, and $1.00) come to the chalkboard to list the items they chose and discuss the reasons for their choices.
6. Tell students to come to the class store to purchase one item and take the item back to their desk. They must be able to count the exact amount of the item.

Conclusion:

Use of these activities should familiarize students with counting various combinations of denominations of coins to a dollar.

Evaluation:

Give quiz consisting of ten problems which will demonstrate the student's ability to count various amounts of money less than or equal to a dollar.

Return to Mathematics Index

Percents: (An application to real life problems)

Lucille H. Chambers
18853 Center St.
Homewood IL 60430
708-799-4536

Trumbull School
5200 N. Ashland
Chicago IL 60640
312-534-2430

Objective: (Grade 7)

The students will be able to find a percent of a number by multiplying by a fraction or a decimal equivalent to that percent.

Materials Needed:

One overhead projector, transparencies (4), calculators, play money, construction paper, poster boards, pencils and a variety of items to sell at the General Store.

Recommended Strategy:

Review with the students how to write a percent as a fraction and as a decimal. Use a circle graph with expenditures. Have the students guess what percent of the circle represents each of the expenditures. Discuss with the students how to calculate a bill for a restaurant meal. They should know about the local tax and tipping customs in the area. Let's call this activity 'Purchasing Power Buying Smart'. Have each student bring a menu or create one. The group will cooperate by choosing one menu they will use for the activity. Create a restaurant atmosphere on one side of the room and a general store on the other side of the room.

Procedure:

Divide the class into groups of five and give each student a menu. Each member of the group will have an opportunity to order whatever they desire from the menu. Assign one student to play the role of waitperson to write down the orders for the group. Have each student calculate the bill for his or her fantasy meal (use a calculator for the food and the tax total). Another student may figure out the tip. The waitperson will then collect all bills in the group and make a final tally to present to the cashier. After the fantasy meal, students have a job to do at the General Store. They will compute the discount prices on selected items to be sold on the following day.

Performance Assessment:

Choose a group of three students. The first student will write a percent of a number. The second student will solve it by using a proportion. The third student will solve it by using an equation. Students take turns in all three roles.

Multicultural Connections:

Student should know that the ancient Egyptians invented proportional scale drawing. In Egypt and Babylonia taxation was based on proportion. A given measure of wheat was the required tax for every one hundred cattle.

Conclusion:

This activity was fun as well as cooperative learning. Students used hands-on methods to calculate sale tax, find discounts and sale prices using percent. Students will use this knowledge to solve problems of applying percent in everyday situations.

Return to Mathematics Index

Real Numbers in the Real World

Ulysses Harrison
8435 South Wood Street
Chicago IL 60620
312-239-6333

Dunbar Vocational High School
3100 South King Drive
Chicago IL 60616
312-534-9000

Objectives:

Students will be able to group the set, R, of real numbers into two different sets: $R > 0$, $R < 0$.

Students will be able to use parentheses to change the order in which exponentiation, multiplication, division, addition and subtraction are performed by using the TI-34 calculator.

Students will be able to work problems throughout the set of real numbers using the TI-34 calculator without preference for positive numbers.

Materials Needed:

Set of TI-34 Calculators--one for each student.

Strategy:

Inform the students that the real number system consists of natural numbers, whole numbers, integers, rational numbers, and irrational numbers. Students must be able to comfortably use the whole set of real numbers to perform the mathematics operations in order to be successful at working problems in the real world. Give example problems that include numbers in the subsets of the real number system initially. Have students work these problems on the calculator. Finally, include problems that involve all the real numbers and all the operations. Have students work these problems on the calculator. Emphasize to students that the calculator is only a tool for them to use. The students must know the operations of mathematics for the calculator to correctly perform the arithmetic. This allows the students more time to learn and become comfortable in applying principles of mathematics to problems and opportunities they encounter in the real world.

Performance Assessment:

a. Give students a set of 20 problems that include parentheses, exponents, multiplication, division, addition and subtraction.
b. Have students work the set of problems without the use of calculators.
c. Have students use the calculator to work the same set of problems.
d. Compare the scores on the two sets of problems.
e. Have students discuss advantages and disadvantages of using calculators in class.

Multicultural Application:

Calculators and real numbers can be used efficiently by all cultures. Wise use of the calculator as a tool can expedite mastery of new subjects and material in mathematics.

Return to Mathematics Index

Manipulating Formulae...Using Recipes To Understand

Nancy Ressler
1632 S. Prospect Ave.
Park Ridge IL 60068
708-823-5524

Oakton
1600 E. Golf Rd.
Des Plaines Il 60016
708-635-1968

Objectives:

1. The student will write recipe amount changes to any given increase or decrease.
2. The student will be able to fill in missing data for any given situation.
3. The student will understand the importance of formula applications to everyday life.
4. The student will develop a tentative understanding of writing and using formulae.

Materials Needed:

Recipes (multicultural, family, commercial), Formula worksheets, Sugar, Unsweetened lemonade.
The class will be divided into groups of four, with the desks of the students in each group facing each other.

Strategy:

This mini-teach is directed toward any grade level in order to introduce and give a foundation to the importance of formulae and their accuracy. To understand the step by step method of transferring and transposing amounts and variables on paper, students will use their recipe addition and multiplication skills by first attempting to make something (lemonade) without a formula -and tasting it- then using a recipe for the lemonade -and tasting it again. From this stage, paper and pencil work will occur with baking or cooking recipes, scientific formulae and finally word problems.

Students will rearrange their desks to form groups. Four problem situations and a performance assessment will be given to each member of each group, one situation at a time. Group discussion of each situation will be approximately five minutes. Only after the first situation will the class come back together to discuss their set of directions. One student from each group will read their directions as another follows along on the chalk board (or transparency on the overhead) evaluating and checking that the adjusted amounts work. If other groups have the same amounts of substitution we will move on. Otherwise we will discuss the variety of ways of increasing or decreasing formula amounts. The students will regroup and discuss the remaining situations which will be given to them in five minute intervals. Again, as a class we will discuss their outcomes.

The next activity will allow the students the creativity of making a formula "fit" any event or incident. After five minutes a class discussion will be held.

A final phenomenological application word problem will be given. The students will read and work the problem together.

Lastly, a rubric will be given evaluating the activity which required working a formula (any type which "fits" the activity or incident).

Performance Assessment:

Scoring Rubric

DEMONSTRATED COMPETENCE 5 POINTS
- -includes clear and concise mathematics
- -demonstrates an understanding of the concept
- -applies the formula
- -presents a clear connection to the formula and the situation by explaining the variables and what they represent
- -evaluates why the answer makes sense

SAME AS FOR 5 POINTS OMITS **ANY** ONE OF THE ABOVE POINTS 4 POINTS

SATISFACTORY RESPONSE 3 POINTS
- -includes "some" mathematical approach, no matter how embryonic
- -presents a connection to the attempted formula and the situation by "making sense"
- -evaluates or discusses what kind of answer should result

INADEQUATE RESPONSE 2 POINTS
- -discussion is not understandable from the writing
- -discussion is inaccurate
- -lacks any connection of variables and situation

NO ATTEMPT WHATSOEVER 1 POINT

Return to Mathematics Index

Problem Solving Using Percentages

Thelma A. Rex
8324 South Langley Avenue
Chicago IL 60619
312-783-6514

Rosa L. Parks Middle School
147th and Robey Avenue
Harvey IL 60426
708-371-9575

Objectives:

The student will be able to recognize the three basic types of Percentage Problems.

The student will be able to:

1. Find what percent one number is of another.
2. Find a percentage of a number.
3. Find a number when the percent is known.

Materials Needed:

1-16 oz bag of plain M&M's; 19-4oz bags of M&M's; 19 plastic bags;
1 black marker and 19 pencils; 19 student folders with plain writing paper;
l9 M&M Math handouts and 19 calculators: Overhead projector.

Strategy:

All of the students are given a folder with a small plastic bag and one small bag of plain M&M's. The students are asked to guess how many M&M's are in the bag. They are asked to put their M&M's into sets by color and write the number of M&M's they have in each set. They are also asked to use > or < or =, to show the relationship between these sets. Students put l5 M&M's in front of them. Then they are asked various questions, for example, how many piles of fours can you make? What is left?

The teacher demonstrates three types of word problems on the board to find percents by using ratio and proportion. The overhead projector is used to illustrate the same problems, but in a different way. For example:

a. The student is given the following information;

1. the number of red M&M's in the small bag.
2. the total number of M&M's in the small bag.
3. the total number of M&M's in the big bag.

The student is asked to find the number of red M&M's in the big bag.

b. A bicycle is on sale with a coupon for 25% off which is a $l5.00 savings. How much is the bicycle without the coupon?

c. A set of stereo speakers is priced at $125.00. The sales tax is 8%. What will be the total price of the speakers?

d. In a photo, Carlos measures 8 centimeters. He is actually 56 inches tall. In the photo his brother, Juan, measures 7 centimeters. How tall is Juan?

Performance Assessment:

The students will be given a post-test. The students will be able to tell how many M&M's are in the big bag as compared to their small bag of M&M's. Students already know that there are 88 red M&M's in the big bag and that there are a total of 527 M&M's in the big bag.

Multicultural Aspects:

Percent comes from the Latin phrase per centum, which may be translated by the hundred, to the hundred, for each hundred. The symbol for percent is %. Thus, 85% means the ratio 85 to 100 or 85/100. Percent is used for mathematical calculations throughout the world in everyday living regardless of nationality.

Return to Mathematics Index

Whole Language Approach in Solving Word Problems

Barbara Thomas
8023 South Rhodes Ave.
Chicago IL 60619
312-651-4778

Langston Hughes School
226 W. 104th Street
Chicago IL 60628
312-535-5075

Objectives:

To formulate addition and subtraction problems of whole numbers. To relate everyday language to mathematics meaningfully. To use problem-solving approaches to investigate and understand mathematical content. To identify point of view in a selection.

Materials needed:

1. **The Real Story of the Three Little Pigs** by Jon Scieszka
2. **The Three Little Pigs** by Paul Galdone
3. Math vocabulary cards for words such as the following:
   altogether   in all   many more
   each   left   total
4. Reading vocabulary cards for the following words:
   Al   blow   brick   cake   granny   house   jail
   Magic   Michael   newspaper   Sean   stick   straw
5. Crayons
6. Pencils
7. Plus and minus cards for every child
8. Head bands for three pigs (pink) and one wolf (brown)
9. Ditto to make equations
10. Objects to represent story problems (books, balls, pencils)

Strategy:

This presentation is appropriate for use with primary children. The teacher will review the story of the **The Three Little Pigs**. After discussion, the teacher will call four students to represent the characters of the story. The teacher will have students answers questions from a card listing age, favorite toy and food and how much money each character has. Using the characters the teacher will review the story and make up story problems and answer them.

Read **The True Story of the 3 Little Pigs.** Ask appropriate questions about the story. Give the pretest. Give story problems orally having the students put the correct answer only on the test. After the pretest, the teacher will go over the story problems using role playing with the students. Explain to the students that we must find a better way to solve story problems.

Introduce the math vocabulary words. Tell them that each word has a correct operation. Example: "in all" means to add (+) or "many more" means to subtract (-). Pass out the + and - cards. As you say a story problem, have students hold up the correct card. You may also have students make up story problems orally. Another student will give the answer.

Performance Assessment:

Tell the students that you forgot to tell them that they must decide who is telling the truth, the pig or the wolf. They must write some sentences telling who they believe and why. Also draw a picture.

Finally the students will write story problems using the above math vocabulary words.

Multicultural:

Students should know that many people contributed to the development of modern arithmetic and the origins of arithmetic are international.

Conclusion:

The student will be able to identify key words in solving addition and subtraction word problems.
The student will be able to identify point of view in a selection.

Effective Use of Living Space

William L. Brown
4800 South Lake Park #2409
Chgo., Il. 60615
(312)-548-3679

Parkside Community Academy
6938 South East End
Chgo., Il. 60649
(312)-535-0940 or 0941

Objectives:

Students will be able to measure the area of a room.
Students will be able to measure various objects in this room.
Students will be able to place scale model furniture in a room and determine the area occupied.
Students will be able to calculate the percentage of space used.

Materials needed:

Students will need a yardstick, scissors, glue, scrap paper, quad paper and pencil.

Strategy:

Students will use the yardstick and measure the length and width of the room, table, teacher's desk and cabinets.

Instructor will pass out sheets of paper containing shapes resembling living room furniture that has been drawn to scale. The students will place certain pieces on the quad paper and measure the area occupied by the furniture.

Students will determine the amount of the space used and compare it to the total amount of space available and calculate percentage.

Conclusions:

Students will find that they are able to place furniture in a room with the use of scale model drawings.

Students' understanding of length, width and area will be reinforced.

Students will find that the actual amount of space they can effectively use will be less than fifty per cent.

Return to Mathematics Index

Making Predictions

Lucille Chambers
18853 Center Ave.
Homewood, IL. 60430
708-799-4536

Lyman Trumbull School
5200 N. Ashland Ave.
Chicago, Il. 60640
312-534-2430

Objectives:

This outside activity will help students at any level learn to classify and make predictions and will teach students about ecology and plant life at the same time.

Materials Needed:

Clothesline wire (cut to 88 3/4 inches in lengths)
Paper and pencil
Masking tape
Twine

Strategy:

Discuss with students that their school grounds and neighborhood parks can be the perfect setting for a math lesson. Let's call this activity "Hoop It Up".

MAKE THE HOOP:
1) Cut five pieces of wire 88 3/4 inches long. (Add an extra inch for overlap.)
2) Bend the wires to make hoops.
3) Tape the wire together.
4) Cut ten pieces of twine.
5) String two lengths of twine across each circle to make four quadrants. (A hoop this size will represent about 1/10,000th of an acre. There are 43,560 square feet in an acre and 1/10,000th of this is 4.356 square feet, which is the area within the hoop.)

Directions:

Divide the class into groups of five and give each group a hoop.
Take the class outside on the school grounds or to a park and have the students toss their hoop onto the ground.
One student should stand beside each quadrant and the fifth should stand near the hoop with paper and pencil to record the information.
Have each student count the number of things he/she finds within their quadrant.
The students will count plants, insects, rocks and other non-living things.
Students will relate each item that they count to the group secretary.
Upon returning to the classroom ask students to classify their objects in three groups: plant, insect or mineral.
Question: Which group found the most objects in each category?
Students will predict how many of one item, plants for instance, would be found in a whole acre.
To do this each group should total the number of plants in its four quadrants.
The hoop represents 1/10,000th of an acre. The groups must, therefore, multiply their totals by 10,000 (Primary children will need assistance in doing the math operations).
Compare the groups' totals. Question: Are the totals similar?

If not, discuss why the groups got different results.
Were some parts of the ground more lush than others?
A more accurate prediction can be made by following these steps:

1) Add the total number of plants found in all groups.
2) Divide by the number of groups and multiply the quotient by 10,000.

Have the students perform this operation and make similar predictions with other objects on the list.

Return to Mathematics Index

Estimation Contest

Sandra A. King-Bryson
14757 S. Langley
Dolton, Il. 60419
(708) 849-6138

Saucedo Magnet School
2850 W. 24th. Blvd.
Chicago, Il. 60623
(312) 534-1770

Objective:

Students will gain a more concrete understanding of the subtle difference between a guess and an estimate.

Materials Needed:

Large box of Cheerios or other similar cereal
32 oz. or 48 oz. container (translucent or transparent)
Cups for each student or group of students (an odd size cup will offer the greatest challenge, i.e. 6.8 oz. or 7 oz.)
Paper plates
Paper and pencil

Strategy:

Estimation is a powerful mathematical idea to be used both in solving problems and in checking the reasonableness of results. When the student wants to know about how long it will take to earn enough babysitting money to buy a new bicycle he or she can estimate the answer. Estimation should be used to solve problems for which exact answers are inappropriate and to check computation results.

We all make estimates everyday. How long will it take you to walk to school, how much food should I put on my plate for dinner, how many times will Mother call me before she comes to look for me, etc.?

The Estimation Contest is a fun and easy way to allow the students to make "educated guesses".

1) Fill the large container (32 or 48 oz.) with the Cheerios or similar cereal. Try to use only whole pieces, not broken ones. Count the number of pieces.

2) Write the number of pieces and put this information in a safe place. (Do not put this information on the container).

3) Give each child, or group, a paper plate, a cup, paper and pencil. Tell the students the capacity of the cup (7 oz., 8 oz., etc.). Tell the capacity of the large container.

4) Give each child more than enough cereal bits to fill their cup.

5) Ask students to estimate the number of cereal bits in the large container. They may use whatever measuring devices they think will help them get the best estimate.

Example: You have a 48 oz. container filled with Cheerios and the students are given a 6 oz. cup:

$$\frac{\textbf{VOLUME OF CONTAINER}}{\text{VOLUME OF CUP}} = \text{number of 6oz. cups required to fill the large container}$$

Therefore: $$\frac{\textbf{48 oz.}}{\text{6 oz.}} = \text{\# of 6oz. cups required to fill large container}$$

The number would be 8

8 cups X 223 cereal bits in a cup = 1,784 cereal bits in the 48 oz. container

Questions:

1. How could you make your estimate more accurate?

2. Given a weighing apparatus, could you estimate the weight of the cereal bits in the large container?

Extension:

Show children the difference between a guess and an estimate. Set up several guessing stations in your classroom. One might be guessing the length of a piece of rope, another might be guessing the amount of popcorn kernels in a container, another might be guessing the amount of liquid in a container, etc. Point out to the students that when they guess they really aren't basing the guess on any factual information. Explain that an estimate is based on some amount of knowledge or facts that can be obtained.

Finding Area and Perimeter in a Miniature House Using Standardized Units

June Muhammad
8513 S. Kingston
Chicago, Ill 60617
(312) 721-5845

Park Manor
7037 S. Rhodes
Chicago, Ill 60637
(312) 535-3070

Objectives:

Finding area and perimeter in a miniature house using standardized units of measurements.
Students are able to conserve and understand that the length of an object remains the same regardless of the changes that occur in its position.
Students experience hands on measurement in finding perimeters, width and length.

Materials needed:

Glue
Staple gun
Corrugated small size furniture
One box for each house
One chair for each house
Thread
Utility knife for teacher only
Measuring tape
Felt for covering furniture
Sample carpet pieces
Masking tape
Medium heavy white tag board for tile
One television for each house
Cotton for stuffing felt pillows
Index cards
Pencils
Scissors
Rulers
Stars

Strategy:

Children are separated into groups of four students. Each group is given a medium size box. Two students are to measure the walls and two are to measure the floor area. These measurements are double checked by other team members for accuracy. The measurements are given to the "General Merchant" storekeeper.

If these measurements don't agree with the storekeeper's measurements, then the students need to rethink the formula for finding area and perimeter. No goods such as carpet, wallcovering, glue, brushes or masking tape will be exchanged for incorrect measurements. Students who measure accurately the first time receive a star on the far end of an index card or next to their measurements. (Please allow a small margin for error.)

As an added bonus, students will receive free furnishings.

Furnishings: Corrugated television sets, couches, felt pillows, chairs, tables and felt area rugs.

Conclusions:

This activity is a cooperative effort as well as cooperative learning. Students will marvel at the successful outcomes of finding area and perimeters upon completion of their miniature house. We can also assume that students will internalize the formula of width times length for area and addition for perimeter by doing this hands on activity.

Return to Mathematics Index

Ratios and Proportions

Mamie P. Scott
9715 South Woodlawn
Chicago, Il. 60628
312-221-7874

Edward Coles Elementary School
8440 South Phillips
Chicago, Il. 60617
312-535-6650

Objectives:

The seventh grade student will:

Review ratios and proportions.

Determine the relationship between individual height and reach.

Find equal ratios.

Solve word problems using ratios by trial and error.

Practice finding pictorial expressions of fractions to decode a message.

Materials:

Measuring tapes or string
Chart paper
Construction paper (red, to make 15 Red beans; white, to make 15 Black-eyed peas; and green, to make 15 Lima beans)
Worksheet with pictorial expressions of fractions

Recommended Strategies:

. Form small groups of three or four students.
. Distribute measuring tape or string to each group.
. Use the tape or string to measure and compare height to reach.
. Record results on chart paper in this order:

Tall-Rectangle	Perfect-Square	Short-Rectangle

If the height > reach, record name under "tall-rectangle"
If the height < reach, record name under "short-rectangle"
If the height = reach, record name under "perfect-square"

. Students whose names are in the "Perfect-Square" column will be the Chef Cook to make the "Three Bean Salads" for the first activity.
. Distribute beans randomly (one per student).
. Write salad recipe on the chalkboard.
. Call a Chef Cook to read and make the first salad by selecting beans (students) from any group.

Each salad contains Red beans, Lima beans and Black-eyed peas

#1 This salad contains:
4 Red beans
1/2 as many Black-eyed peas as Red beans
10 beans in all

#2 This salad contains:
2 Lima beans
Twice as many Red beans as Lima beans
10 beans in all

#3 This salad contains:
An equal number of Red beans and Black-eyed peas
5 more Lima beans than Red beans
No more than 20 beans

. Groups should be encouraged to make up 3 different salads and continue the activity.

. Next, distribute worksheet to each student with fraction message:

Students will solve problems, analyze which of the coded solutions would best fit and, by substitution of the lettered answer, be able to decode the message.

. Discuss the message.

Draining the Swimming Pool

William Byrne
4960 Marine Drive
Chicago, Il. 60640
312-271-4037

Martin Luther King
4445 S. Drexel
Chicago, Il. 60653
312-536-8680

Objectives:

For 9th and 10th grade

1. To determine the time needed to drain a quantity of water using tubes of different inside diameters (I.D.)

2. To determine the time needed to drain a quantity of water using two tubes at the same time, contrast this with the theoretical values and give explanations for the differences.

Materials needed:

Stopwatch, 3 one gallon jugs, two plastic tubes about 3 feet long of different inside diameter, plastic tray, water pails, hand calculators.

Strategy:

On a table place 3 one gallon jugs filled with water. Ask the class to estimate how long it will take to drain one jug using a plastic tube of 1/4" I.D. Show them this tube. Then, using the siphon method, drain one of the jugs using the tube. This will be timed by someone in the class using the stopwatch. Next, find the time according to the formula - $V = (2gh)^{1/2}At$. Ask someone in the Physics department about using this formula. Find "t" using the formula. Discuss differences from the experimental value. Go through the same process using the 1/2" tube. Again find the experimental value and the theoretical value and discuss the differences. Finally, using the third jug of water and both tubes, find out how long it takes to drain the jug of water. Then compare this time with the value given by the algebraic formula for the problem.

Conclusions:

Discuss differences between theory and experiment. How could the two values be brought closer together in this experiment? Discuss the role of friction.

Return to Mathematics Index

Sales Tax and Discounts

Denise Folk
12332 S. Elizabeth
Calumet Park, ILL 60643

Richard E. Byrd Academy
363 W. Hill
Chicago, ILL 60610
312-280-4000

Objectives:

The sixth through eighth grade students will be able to:
1. Discover that sales tax is an additional charge on products purchased.
2. Compute sales tax on different items using register tapes.
3. Discover that discount means to take a certain amount off the price of something.
4. Discuss that even if you take the discount off the purchase price of an item, you still have to pay sales tax.

Materials needed:

All materials listed are for an entire class.
1. Calculators
2. Various register receipts from different stores
3. Play money
4. Dice
5. Sales tax table
6. Practice worksheets on sales tax and discounts
7. Sample newspaper and catalog ads
8. Discount signs made up or signs discarded from retail stores

Recommended Strategy:

1. Have students collect sales receipts from different retail and grocery stores ahead of time for this lesson.
2. Four students can pretend to gamble with dice and money to introduce the lesson.
3. Stop the game at any point you deem necessary and let the winner know that even though he or she won there will be a tax on their winnings.
4. From above activity you can elicit the definition of taxes from your students.
5. Use sample grocery store receipt duplicated on a poster board to illustrate sales tax, coupons taken off, amount tendered, change. Make sure they understand that sales tax is an additional charge on purchases made imposed by the government.
6. Discuss the fact that there are different rates of sales tax for food and nonfood items and also that the tax varies from state to state.
7. Review how to change percents to decimals in order to multiply.
8. Let students use calculators to compute totals from receipts brought in for lesson. Also, let them practice computing sales tax for each purchase.
9. Students can also practice finding sales tax by using food sections of a newspaper to shop for their family and then compute the sales tax to be charged.
10. The day following this lesson you can introduce discount,define it and the fact that it varies from the regular price.

11. Use catalogs, newspaper ads and any other materials that you find to illustrate discounts.
12. After you go over with students the examples above you can give them worksheets to provide practice with discounts.
13. Students can bring in different items to mark a price on and to practice taking a percent off.
14. As a follow up to these lessons you can take the students to stores and let them actually shop, compute the sales tax and also find the discount.

Return to Mathematics Index

Mixture Problems

Alphonso Kennedy
10134 S Peoria St.
Chicago, Ill. 60643
312-239-4317

Lindblom Tech. H. S.
6130 S Wolcott Ave.
Chicago, Ill. 60636
312-471-8700

Objective:

Ninth grade students will be able to write the equation and solve mixture problems.

Equipment and Materials:

1. Overhead Projector
2. 100 red and 100 yellow beads for each group of 4 students
3. 1 container for each group
4. 1 calculator for each group
5. 5 small cups for each group

Recommended Strategies:

1. Students will count out 4 cups of beads that are 40% red (a cup contains 15 beads) and place the beads in a container.
2. Students will count out 2 cups of beads that are 80% red and add this mixture to the container until the beads in the container are 50% red.
3. Students will complete the following table.

Original Mixture (Percent)(Amount)	Add (Percent)(Amount)		New Mixture (percent)(Amount)
________________	________________	=	________________

4. Students will solve the next two problems by repeating the steps above.
   a. Change 8 cups of beads that are 50% red to 60% red by adding 100% red beads.
   b. Change 4 cups that are 20% red to 15% red by adding yellow beads.
5. Student will solve additional problems by letting x = amount added.

Return to Mathematics Index

An Introduction to Percent

Kenneth Surdell
685 S. York Rd.
Elmhurst, Ill. 60126
312-804-3060

Lewis School
1431 N. Leamington
Chicago, Ill. 60651
312-804-3060

Objectives:

Fifth grade students will develop a basic understanding that percent is a comparison of some number to 100.
Pupils will convert fractions to percent, percent to decimals and vice versa with a minimum of 90% accuracy.

Materials:

Per team: 2 sheets of $1cm^2$ graph paper; 2 pairs of scissors;
1 sheet of 100 squares. marked with 12% "A's". 16% "B's", 18% "C's",
5% "D's", 3% "E's", 8% "F's", 13% "G's" and 25% "H's".

Strategy:

Develop the idea that percent is a comparison of some number to 100 which can be written in the form of x with the sign % or x%. Think of the symbol % to be a distortion of the 100 in a ratio of x:100. The ratio of 20 to 100 is 20 percent or 20% and this is the same as 20 hundredths or 0.20. Therefore, 20 parts per hundred can be renamed as 20/100, 20% or 0.20.
Show 50/100 as .50 as 50%. Follow up with 75/100, 30/100, 10/100, etc. Have pupils rename other ratios of 100 as percent and decimal.
We know that 50/100 = 1/2, 75/100 = 3/4, 20/100 = 1/5 therefore we can show that 1/2 is 50%, 3/4 is 75% and 1/5 is 20%.
To convert fractions whose denominator is something other than 100, you must first rename the fraction with a denominator of 100.

Divide the students into teams of 3 or four. Have one student in each team cut a 10cm by 10cm square off a graph sheet. Count the number of sq. cm. in the square. There are 100 sq. cm. On chalkboard write this value as **100/100 = 100%**. Point out that 100% is **all** of the squares or 100 squares.
Cut a second 10 by 10 square. Compare it with the first. They're equal. Now cut this second sheet in half. Count the number of square cm. in each half. There are 50. On the chalkboard show this as **50/100 = 50%**. Since 50/100 is half of the 100 original squares we can say that 50/100 = 1/2 which also equals 50%.
Follow the above sequence and have the students cut out 25, 20, 10, 1 squares. Compare them to the original 100, write them as fractions of a hundred and convert the fraction to percent.

Use the graph sheet marked with letters "A" to "H". Count the number of "A's". Write as a fraction of 100 (12/100). Convert to percent (12%). Continue the same procedure with the other letters.
Have teams make up a letter sheet of their own, exchange with other teams and determine the percent of each of the letters.
Pupils should be able to convert percent to a fraction with a denominator of 100 and rename the fraction as a decimal.

Return to Mathematics Index

Solving Word Problems

Barbara Trotter
7724 South Green
Chicago, Illinois 60620
312-994-7242

O.A. Thorp Scholastic Academy
6024 West Warrick
Chicago, Illinois 60634
312-974-8440

Objectives:

(Intermediate and upper grades.)
To Teach intermediate students several different techniques for solving Word Problems.

Materials needed:

Overhead projector, the three different strategies dittos, and Bingo manipulatives for the culminating exercise.

Strategies:

Demonstrate and explain why it is important to study word problems. Show by examples that word problems are found in all subjects including Social Studies, Science, Language Arts, and every day life. Present and demonstrate the three different strategies, as you would in the classroom. The strategies are:

Determining the procedure, finding the clue words, changing the problem to a number sentence, getting the inverse of the problem, make a good estimation and solving the problem.

Finding the characters, setting, plot, problem, and the resolve or solution.

Get an understanding of the problem, which includes who, what, how many or much, planning a solution and finding the answer.

Conclusion:

The students will not be expected to use all of the strategies or even all of one, but to determine what will work for them and use that one.

Evaluation:

To determine if the students have assimilated the concepts, they will play Word Problem Bingo. The word problems will be projected on the overhead and the answers will be on the individual game cards. The first one to get four consecutive numbers in any direction, wins.

Return to Mathematics Index

PROBLEM SOLVING: STEPS AND STRATEGIES

Barrett, Sarah G.
428 S. Taylor Ave.
Oak Park, IL 60302
1-708-386-7501

Mars Hill School
1-312-287-0025

Objectives

To learn, or reinforce problem solving skills using these steps: l) Read and re-read the problem,at least three times. 2) Restate (list) the "facts" given, and rephrase the question. What information is needed? Is there extra information included? What's missing? Would a diagram, drawing, chart, or graph help? Organize what is known and what is needed. 3) Predict, estimate the answer, within a reasonable range. How does the problem connect with concepts, facts, already acquired? 4) Select a strategy or combination of them. 5) Work the strategy to solve the problem. 6) Check the solution in terms of the question. Does it make sense? Can it be demonstrated, extended, or applied further?

Materials

Several examples of problems on handout sheets
Manipulatives as needed for individual problems:a cube,cards or counters for constructing an array, or for categorizing, (e.g. a packet of stamps of various issues and denominations,plus envelopes)

Strategies (to try)

1) Recognizing Patterns.
2) Simplify, substitute, reduce, round off...make it manageable.
3) Experiment, model, visualize.
4) Estimate: guess and test.
5) Organized Listing.
6) Deduction.
7) Algebra, Geometry skills.
8) Working Backwards: when the outcome is known and the initial conditions are needed.

Procedure: Discuss briefly what a "problem" is, (v. practice exercises); work through a few together with students modeling, e.g., form a human hexagon for #3 below.

Some sample problems are on accompanying handouts needed for illustration. Here are a few not needing a graphic to present.

1) To earn spending money, Roy bought some Indian Head pennies at 6 for $l0, then sold them at 4 for $10. His profit was $50. How many pennies did he buy and sell?

2) Find a number that when multiplied by 81 or divided into 6,561 gives the same answer.

3) Six students in Mrs. Collins' Math l0 class were seated around a hexagonal table.

The places have numbers in order beginning with one. At what number is the student sitting opposite number four?

4) On a cube, the three faces showing have numbers 42, 43, 46. All the faces are consecutive. What is the sum of the numbers on all the faces of the cube?

5) The mortar between bricks in a wall is mixed with one part lime, one part cement, five parts sand, and three parts water. How much lime is needed if 20 ounces of sand are to be used?

A few ideas to develop critical thinking:

Four colors to fill in the cells on a hexagon grid sheet. No color can be contiguous to itself. Have partners take turns on the same sheet after individuals find doing this easy.

Triangle Tic Tac Toe

Students construct various patterns, designs, plane figures with tiles or counters, then show what they have done to the class, reviewing properties of figures,etc.

Use found objects to illustrate plane and solid geometric ideas, distance, position, and related problems.

Return to Mathematics Index

Time

Davenport, Gracie
11526 S. Bishop
Chicago, Illinois 60643

Spalding School
1-312-997-3600

Objective

1) Physically Handicapped (EMH) students will learn to tell time using a number chart.
2) Students will demonstrate their ability to tell time by using a clock.
3) Students will use this skill to follow a daily schedule.

Equipment and Materials

Paper Plates
Rounded Paper Fasteners
4 sheets of black construction paper
Pages 3 and 12 from System 80 Activity Book
Clock Faces
Number Chart (1-60)

Recommended Strategies

These students learned to count from 1 to 60. Emphasis was placed on numbers that are multiples of 5. These same numbers were placed on the chalkboard in numerical order. Demonstration of this skill was evaluated when the students learned to count by 5 using the Rote Method and placing the missing numbers in the square on the number sheet.

The second strategy lesson began with questions-"**How many of you can tell time? Who would like to learn to tell time?**" The students agreed that since they had learned to count up to 60 and to count by 5s up to 60, then it was now time to learn to tell time. Before the students could actually learn to tell time they had to make their own clocks. Each child was given a paper plate with a clock face pasted in the center. Multiples of 5s were written on the paper plate counterclockwise. These numbers are about half the size of the numbers on the clock. One short hand, one long hand and a round head paper fastener was given to each student. The students attached the hands to the clock.

The third lesson began by asking the students,"**How are these hands different?**" The students agreed that one was long and one was short. I explained to them that the short hand is the hour hand and it tells us what hour we are in. The long hand is the minute hand and it tells us how many minutes we are past the hour. The students were shown 3, 6, and 5 0'clock. I explained to them that there are two ways to write the same time. One way is with numbers only and the other way is with numbers and words. I wrote the following on the chalk board.

3:00	10:00	5:00	7:00
3 o'clock	10 o'clock	5 o'clock	7 o'clock

Two students were asked to come to the front of the room and face the class. I asked one student to show me 2:00 in the morning and the other student to show me 2:00 in the afternoon. The class agreed that the clocks looked the same. However, at 2:00 in the morning, they would be sleeping and at 2:00 in the afternoon they would be in school. I explained to them that 2:00 in the morning was written 2:00 A.M. and 2:00 in the afternoon was written 2:00 P.M. The students were asked to do page 3 to demonstrate how well they have learned to tell time to the hour.

I began strategy five by telling the students that today we are going to learn how to use the minute hand. I told the class that the smaller number on the paper plate was for the minute hand or large hand only. I wrote 7:45 on the chalkboard. The students were told to show that time on their clocks. I explained to the class that the short hand should be on 7 and the long hand should be on 45. Several other times were elicited from the class, such as the time that they went to bed, ate lunch and woke up. In order to demonstrate their ability as to how well this skill was mastered the students were asked to complete page 12 from their math books.

Return to Mathematics Index

Problem Solving

McCree, Marilyn
9143 So. Cregier
Chicago, IL 60617
1-312-221-9118

District 12
1-312-838-5120

Objective

The student will be able to solve word problems using addition, subtraction, multiplication or division.

Equipment and Materials

A play Grocery Store
Pencils
Paper
Magazines
Scissors
Pointer
Money
Ruler
Cash Register
Newspaper Ads

Recommended Strategy:

Discuss with your class when we solve problems in real life. We must decide what information we need in order to answer the question that is asked. Frequently we have a lot of information that we do not need and sometimes we do not have the information that we do need. Discuss different things we see and buy when we go to the grocery store. Set up a real grocery store in your classroom, attach prices to them. Have a student select three or four items for purchase. Have student give the total price of all items. Ask student how much change they would receive from $5. Ask student how much change they would receive from $10.I would extend the activity described above and ask student what they would buy for $5. Could they buy one of each item? two or more items? Have the students use grocery ads from the newspapers. Specify an amount of money they might have, say $20. Check several items and have them compute the total price and determine how much money they would have left. The student should make up word problems to exchange with other students. Give students card with number "Headlines" on them and have students make up word problems to go with them.

Ex. (75 + 65 + 35 = _____).

Procedures:

1. Read the problem carefully.
2. Picture in your mind what is happening.
3. What information is given.
4. What is the question?
5. Decide what arithmetic you will use. Do the arithmetic.
6. Answer the question.

RATIOS

Murray, Richard
1800 Euclid
1-312-471-8630

Gage Park High School
Berwyn, Ill 60402

Objectives:

The students are to examine models and compare their lengths numerically. The students will measure the models and will then calculate the length of the real size base on knowing what the scale of the model is.

Apparatus needed:

What is needed is models of real objects that are familiar to the student. I used models of the Space Shuttle (three models of different sizes) and "Matchbox" cars. This product has the scale written on the bottom of the car.

Recommended Strategy:

What I did was display the three models of the Space Shuttle. I asked questions about how to describe the models. I accept all answers but what I am looking for is a mathematical description such as "twice as large", "three times as big". I talked about numerical descriptions and how to write comparisons as ratios. I would take the ratio and write it in the form where the numerator is 1. I would then talk about scales and what they mean. What does it mean that 1 inch is to 88 inches.I would take the model of the car and knowing the scale of the model, project how big the car would be in reality. The students would then pace off the actual length, by counting the tiles on the floor in the classroom. Review with the students that the scale may be written in metric and not English units. The difference is that a scale based on metric system if it is written in English Units will result in a real figure that is much larger than the actual vehicle could be. The students need to have an understanding of what the actual size of the real object is. Most students know how large a car is, whereas they might not know what the actual size of a railroad engine is and its actual length.

Return to Mathematics Index

Learning ratios and proportions through scale drawings.

Laskey, Erwin
1503 Lita
Deerfield Il. 60015
459-9898

Eugene Field School
508-4030

Objectives:

To understand that a ratio is a comparison between two numbers.

To understand that a proportion is an equivalent relation between two ratios.

To understand that scale drawings are ratios.

Given the ratios, the children will be able to make a scale drawing of the classroom.

Apparatus Needed:

1/4" and 1/2" graph paper
yardsticks
a variety of large wall maps

Recommended Strategy:

Introduction:

Write the word **scale** and discuss different types of scales including those used for weight, temperature, and maps. Allow the children to come up with as many ideas as possible and write them on the board. Tell the children that you will be discussing scales on a map and that scales are **ratios**. To explain ratios, draw a set of 3 triangles and 4 squares. Explain that this is a ratio of three triangles to four squares which can be written as 3 to 4, 3:4, or 3/4. Give other examples of ratios then use the map as the final example. Discuss the map ratio which is the scale of the map. Ask how the ratio affects the size of the map. What would happen if the ratio were different? Try to show maps with other ratios.

Activity:

Divide the children into teams so that each team has a surface area to measure including the floor and the walls but not the ceiling. Each team must have two dimensions and be able to change the dimensions of the room in order to draw it on the 1/4" graph paper scale. It might be wise to demonstrate this before the teams begin working. When each team has completed, have them cut out their surface leaving 1/2" edges around all sides except that which is adjacent to the ceiling. Tape the walls and floors together creating a room model. The children might want to do furniture to scale given enough time. You might also include blackboards, bulletin boards, and wall outlets. Have the children repeat this procedure with 1/2" graph paper. Compare the difference between the two models and discuss the idea of proportion. Carrying the activity one step further convert the measurements of the room to metric and do the activity on centimeter paper.

Extended activities:

Using the different models, discuss volume of the room and whether or not the metric would be the same as or different from the standard measure. Use salt or sand to do volume measurements.

Have the children make an enlargement of a candy wrapper showing that a scale drawing can help to enlarge as well as make smaller. Divide the candy wrapper into 1/4" grids and then divide a large piece of white art paper into 3/4" or 1" grids. Have the children fill in one grid at a time using colored markers the same way it is done on the wrapper. Do the details first then the larger areas that might be all the same color. An M & M box is a good example of an easy object to work on.

Spaces, a book located in the SMILE math library, has another set of activities similar to the room scale drawing. It includes 2 cm graph paper and an activity to design a scale model veterinarian's office with an equipment list and their measurements. It's meant to be Xeroxed. (NOTE: As of 8/2000 **Spaces** by Peter Parnall was still available from amazon.com - ISBN 1562943367)

Problem Solving

Rogers, Patricia
6642 S. Michigan Ave.
Chicago, Illinois 60637
994-0983

Edward Hartigan
548-1811

Objectives:

Demonstrate some common ways problems can be solved
List some basic steps in problem solving
Suggest some useful strategies for solving word problems

Apparatus Needed:

Practice exercise sheet (Using Parts and Wholes with Word Problems) or a teacher-made ditto of word problems with multiple-choice answers. The choices should be listed as Add, Subtract, Multiply, and Divide.

Pencil

Recommended Strategy:

```
                  W          P
            --------------------------
 not        |           |            |
equal       |     +     |     -      |
            |           |            |
            --------------------------
            |           |     .      |
equal       |     X     |   -----    |
            |           |     .      |
            --------------------------
```

For each word problem, draw a decision square on the practice sheet of paper. A decision square is a square divided into four sections with one of the four operational signs in each section. See diagram above.

SAMPLE EXERCISE

Jill's hive contained 5 lbs. of honey. She removed 3 lbs. to sell. How many pounds of honey did she have left?

First, find the question the problem is asking. Then decide whether it is asking for a whole (W) or for a part of something (P). "How many pounds of honey did she have left?" is the question. It is asking for the part that is left after 3lbs. have been removed.

Next, using the information in the problem, determine whether the groups are "unequal" or "equal" in value to each other. Since, five pounds and three pounds are unequal amounts, the groups are unequal. Circle "P" and "Unequal" on the decision box. Put your index finger on the "P". Place your thumb on the word unequal. Move your finger down the square and your thumb across until they meet. In the case of this problem, subtraction is the operation that should be used to solve this problem.

Words such as "in all," "final," "total," and "together" indicate that whole values are being used. Words like "have left," and "have then" indicate that part values are being used. The word "each" suggest equal groups. When the numbers or quantities are different, unequal groups are present. Circle the word "subtract" on the answer sheet.

Part 2 of this strategy is to use the numbers and the correct operation from the decision box to solve the problem numerically. In this case 5-3=2. This activity is recommended for use in grades 6-9, however, it can be simplified for lower grades or to meet the needs of the individual.

Return to Mathematics Index

Ratio and Proportions

Trotter, Barbara
7724 South Green Street
Chicago, Illinois 60620
488-4254

Ole A. Thorp
545-0169

Objectives

To read and write proportions
To identify the means and extremes of a proportion
To solve proportions
To solve problems using proportions
To make a scale drawing

Material Needed:

Overhead projector, transparencies, chalkboard, various samplings of appropriate materials, including worksheets, and scale drawings.

Procedure:

The teacher will open the session with a daily review of changing fractions to decimal and decimals to percents, from 1/1 to 1/5. The teacher will review the vocabulary (ratios, proportions, means, extremes, and scale drawings). Students will give definitions in their own words with an example. Teacher will then give several examples of ratios, soliciting verbal responses with examples from the class. This step is then repeated with proportions, extremes, and the mean. To determine if students have mastered the above concepts, they will complete a worksheet. The teacher will assign various students to do the even numbered problems at the board and those students seated will do the odd numbers. The class will orally discuss the problems and answers. The teacher will then give the class a model drawing of a house and boat. The house will be increased by a 1 to 3 ratio, and then decreased by a 3 to 2 ratio. The boat model will be increased by a 1 to 2.5 ratio. The teacher will then close the session with the verbal drill.

From Hypothesis To Conclusion...Reading Maps To Understand Proofs

Blaszak, Maryann
3250 S. Carpenter St.
Chicago, Illinois 60608
312-376-5455

South Shore Community Academy
312-933-8180

Objectives:

1. The student will write directions to any given situation using a map.
2. The student will be able to fill in missing data for any given situation.
3. The student will understand the importance of diagrams while writing proofs.
4. The student will develop a tentative understanding of writing proofs.

Materials:

Maps and transparencies of:

1. CTA Bus Routes
2. State of Illinois
3. Chicago Distance Classic
4. Washington, D.C.

Strategy:

This mini teach is directed toward 10th grade students who will soon begin to write two column proofs. To understand the step by step method in writing a proof, students will use their map reading skills to give directions to various places of interest in cities like Chicago and Washington D.C. and also other places of interest in Illinois.

Students will rearrange their desks to form groups, each group containing four members. Four situations with maps will be given to each group, one situation at a time, in which they will write out the necessary directions. Group discussion of each situation will be approximately five minutes. Only after the first situation will the class come back together to discuss their set of directions. One student from each group will read their directions as I follow along on a map on the overhead projector. If other groups have the same directions we will move on. Otherwise, we will discuss the variety of ways a person can reach the same destination. The students will regroup and discuss the remaining situations which will be given to them in five minute intervals. Again, as a class we will discuss their outcomes.

Next activity the groups will work together filling in missing directions to a given situation. After five minutes, a class discussion will be held.

Lastly, together we will write a geometric proof. Emphasize the statements and reasons of a proof must contain any of the following:

1. a given

```
2. a postulate
3. a theorem
4. a definition.
```

Return to Mathematics Index

Triangulation

Brandon, Ann M.W.
1544 Edgewood
Chicago Heights, IL 60411
756-2635

Oak Forest High School
687-0500

Objectives:
The student will learn the basics of how to perform and calculate triangulation

Materials:
1 small pizza box; 1 soda straw; 1 paper protractor; 1 straight pin, large head; some centimeter tape; some string; a stapler or masking tape; some super glue ("Krazy"); and 1 washer.

Strategy:
MAKE THE BOX: 1) Put box together as manufacturer intended. 2) Bend top backwards, at top crease. Staple under box, forming open end. 3) Fold side flaps up and staple near back (closed) end. 4) Punch hole in center of back (closed end), near bottom. 5) Glue protractor on inside bottom -- center protractor on eye hole. 6) Tie string to pin and eye hole. Length of string should be longer than half the length of the box. 7) Glue string to pin. 8) Stretch string and pin to sides of box, and mark on each side.

```
        |                  |
        |                  |
      A |                  | B
        |\                /|
        | \              / |
        |  \            /  |
        |   \          /   |
        |    \        /    |
        |     \      /     |
        |      \    /      |
        |       \  /       |
        |        \/        |
        --------------------
                 E
```

9) Place centimeter tape from mark to mark. 10) Cut out side flaps back to centimeter tape, fold the remaining inside flaps around and tuck into back. 11) Measure the perpendicular distance from eye hole to tape and record this on the box. 12) Tape (glue) straw along back edge of box.

You need a baseline laid out in meters (or feet, or any unit -- even sidewalk squares). "Permanent" Magic Marker used on the sidewalk will disappear in less than 1 month.

Stand at some location on the baseline. (Record this location number.) Hold box level with hole in front of your eye, and edge parallel to baseline. Look toward object and place the pin in your line of sight. (You see pin and object in line with each other.) Record the number (on the cm tape) which is under the string. (Scale number 1.) Move a good distance along the baseline and repeat the sighting. (Location 2, scale 2).

Subtract the locations (=D Baseline) and the scales (=D Scale). The distance to the object =

$$\frac{\text{D Baseline}}{\text{D Scale}} \times \text{Length to tape}$$

Why does this work? We are making use of two "facts": 1) light goes in straight lines; and 2) similar triangles have proportional dimensions. So:

$$\frac{\text{D Scale}}{\text{Len to tape}} = \frac{\text{D Baseline}}{\text{Distance to object}}$$

The first triangle (the small one on the box) has a base along the tape (= D Scale) and an altitude (length to tape). The second triangle has a base along the baseline (= D Baseline) and an altitude (= distance to object sighted).

NOTE: It is not necessary that these be acute triangles. Obtuse triangles work just as well. You will be finding the distance, D, perpendicular to the baseline.

You will need a table of tangents. You may call for such a table or make one for yourself.

Return to Mathematics Index

CUISENAIRE RODS AND MATH

Linda Easter

Dewitt Clinton Elementary School
6110 N. Fairfield
Chicago, IL 60615
1-312-743-232

OBJECTIVES:

1) To familiarize students with the history, development and philosophy of the Cuisenaire Rods.
2) To have students be able to find the least common multiple of several given numbers using cuisenaire rods.
3) To reinforce previously taught math skills by using cuisenaire rod games, puzzles and or activities.

MATERIALS:

1) Booklet with identifying information for each rod - color name, size and centimeter graph paper - for each person.
2) One set of cuisenaire rods for every two people.
3) Blank paper for making tables, keeping scores etc. - for each person.
4) A blank game board made from cardboard to help stabilize paper game boards while playing the various games - for each person.
5) Booklet of games - includes duplicated game boards and directions - for each person.
6) Overhead projector masters of each game in game booklet.
7) Overhead projector master of definitions used in lessons.
8) One set of overhead projector cuisenaire rods.

STRATEGY:

1) What? Explain to students that they are going to learn a new way to use the rods, but before doing so they will review some rod skills taught previously and use the rods to discover some things which will help them with the new skill to be taught.

2) Definitions: Trains - the result of putting rods together end to end (resembles how trains are hooked up). Other words defined during lesson are: least common multiple (L.C.M.), and multiple.

3) Concepts to be reviewed: a) Color names for each rod length. b) Letter symbols for each rod length. c) Showing basic addition, subtraction, multiplication and division using the rods. d) Writing simple equations with variables - using rods. e) Showing and naming fractional parts with the rods.

4) Patterns - Discovery game/activity The challenge - Students must find/discover all the trains equal in length to a particular color rod. These trains are the patterns for a particular color rod. The students must also write the equations for each pattern. There are 4 patterns for the green rod (g=g, w+r=g, r+w=g, and 3w=g) but the patterns become increasingly more difficult when you use longer rods. There are 512 patterns for the orange rod. Note: for an advanced student you may challenge them to predict how many patterns each rod will have and come up with a formula to get the results.

5) Finding the Least Common Multiple (L.C.M.) Students will use skills taught in prior lessons and the review session to begin learning about the L.C.M.. At the end of the lesson the student will be able to find the L.C.M. of 4 given numbers. Students will be told to make a purple train from a given number of rods and match it with the equivalent number of dark green rods. They will then find out what the length of these two trains is in white rods. The students will be asked to record their results on a table and look for patterns. The students should notice

that "the first time these two trains meet they are the same length as 12 rods. They should also notice that they meet again when they are the same length as 24, 2
36, 48,......whites. These are the common multiples of the two rods. Since the train of length 12 is the smallest common multiple it is called the least common multiple". Note: At the end of the lesson students will be allowed to play cuisenaire games from the game booklets given to them. The degree of difficulty of each game varies from simple to very complex. Many math and thinking skills are used and reinforced while playing these games.

6) Additional strategies, suggestions etc. from critique - none given.

Activities used for these lessons are from the Student Activity Cards kit for cuisenaire rods by Patricia Davidson, Arlene Fair and Grace Galton.

Mathematics/Physics

Introduction To The Number Line

Sheila Alexander
6144 S. King Dr.
CHICAGO IL 60637
(773) 324-8107

Manley School
2935 W. Polk St.
CHICAGO IL 60612
(773) 534-6900

Objectives:

The students will learn how to add and subtract using the number line with positive and negative numbers. The lesson is designed for third through ninth grades.

Materials:

Magnets that stick to the board.

Strategy:

First draw the positive side of the number line on the board. Point out the following; **0** is neither positive nor negative, a positive number is greater than **0**, and positive numbers are to the right of **0**. Begin by giving sample problems such as **(8 + 1 = 9)** to solve using the number line. Place the first magnet under the number eight, and then explain that the plus sign is telling you to move in the positive direction once, then place the second magnet where you ended, and that would be your answer (**9**). Show several examples with simple problems such as the one above. Make sure everybody understands this technique before moving on.

We can also show how to subtract using the positive number line **(8 - 1**), tell me what number should I place the magnet under? "Eight " Why? Because that is the first number in the problem, then explain that the subtraction sign means to take something away, therefore we need to move back one space to the number (**7**), and that would be our answer. We can now give the following rule: when adding two positive integers, the answer will be positive.

At this point draw the other half of the number line on the board, this side of the number line is for the negative numbers. The important points regarding the negative numbers are; **0** is neither positive nor negative, a negative number is less than **0**, and the negative numbers are to the left of zero. I would proceed by giving examples of adding with negative numbers. For example:

$$^{-}7 + {}^{-}2 = {}^{-}9$$

Place the first magnet under the number seven (negative), then explain that the plus sign is telling us to add two more negative integers, move two steps to the left of the number seven and that will give you the correct answer (**-9**). Give more examples of problems using negative numbers. The rule that applies here is: <u>when adding two negative integers the answer will be negative</u>.

There is one more piece to this puzzle and that is learning to subtract using unlike signs (positive and negative). For example:

$$\mathbf{7 - {}^{-}2 = 7 + 2 = 9.}$$

The rule is: <u>do the opposite of the sign number and change everything to posi</u>tive. The sign number is the second number in the problem **(-2)**; therefore we would change the subtraction sign to an addition sign and change the negative two **(-2)** to a positive two **(+2)**. You could also answer this problem using the number line.

We would begin at the number seven (place the magnet under the number), the subtraction sign is telling us to move two steps towards the origin (which is zero) but our sign number is telling us to do the opposite of that, move two steps further away from the origin beginning at the number seven **(+7)**, and that is how we arrived at the number **(+9)** for our answer.

-

<u>Performance Assessment</u>:

I will have the class solve several problems using the number line. They will answer the problems on their papers and on the board.

<u>Conclusion</u>:

When you move in the negative direction on the number line, it does not mean that you are going backwards, but simply that you have changed direction.

Mathematics/Physics

Extending Our Knowledge of Place Value

Angie Morris
8141 S. Crandon
Chicago IL 60617
(773) 768-5813

Burnham School
906 E. 96th St.
Chicago IL 60617
(773) 535-6530

Objective(s):

This lesson is designed to reinforce the knowledge of place value for first and second graders. The objective is to strengthen the knowledge the student has of place value by using their auditory, visual, and/or kinesthetic learning styles. Use numbers 10-99 only.

Materials Needed:

Two students paired

Place value mats

Base 10 sticks

Ones cubes

Chalkboard/chalk

Strategy:

Kinesthetic learner: Pair students into twos. To count by tens have each child hold up five fingers on their right hand. One student merges his five fingers with his partners five fingers, then they hold them high up in the air. Tell them 5+5=10. [Explain that every time you hold up ten of anything this is called a set]. A set in place value will "only" contain 10 of whatever you are talking about.] Use this for numbers 10-19 only. Then call out any number between 11-19. The ones numbers are shown by using the left-over fingers. Example: The number 17 is called by the teacher. The students merge their right hand together to show one set of tens. One student will hold up 5 fingers and the other student will hold up 2 fingers. Have the students to hold up their merged hand and say 10. The student holding up 5 fingers should then say 11,12,13,14,15, and the other student says 16,17. Call 2-4 more numbers for reinforcement. Then call 20 and see if they hold up 2 sets of hands. To make this more challenging, call up 2 sets of students. Call out a number between 20-40.The number is 27. This time choose the way in which you make 7. Two students hold up 2 sets of tens while the 2nd set of students show the number 7. This time one student will hold up 4 fingers while the other student holds up 3 fingers. Continue in this manner.

Visual learner: Pair students into twos. Pass out place value mats, base 10 sticks, and ones cubes. This will be already placed in a quart sized baggies – 9 base 10 sticks, 9 ones cubes, and 1 place value mat. (A place value mat is a piece of paper with a line drawn vertically in the middle of the paper and the heading in the right column saying ones and the heading in the other column saying tens.) Hold up a base 10 stick and explain that this is a set-1 set of tens. Now, have them hold up 3 base 10 sticks. Tell them that this is 3 sets of tens. Have them count by tens and tell you how many sets of tens there are. They must be placed in the tens column. Call out several numbers in this manner so the student can get familiar with the word sets. Any of the ones cubes should be placed in the ones column. Clear your mat each time you call a new number.

Auditory learner: Pair students into twos. Follow the directions above for either of the learners listed. As you verbally give instructions have this student tell you what they are doing while they demonstrate it. Everything this learner does should be a show- and- tell. When you call a number out loud this student should be able to tell you what number is in the ones column and what number is in the tens column. The number is 59. Ask the student (always start with the ones column first) what number is in the ones column and what number is in the tens column. If any student has problems at this point, write the number on the board and draw a line between the 5 and 9. If the student still has trouble comprehending the concept, then write the word "ones" in the ones column and write the word "tens" in the tens column. Now ask the student what number is in the ones column and what number is in the tens column.

Performance Assessment:

The student will be able to: a.) hold up an adequate amount of fingers or b.) write the proper place value for a number or c.) tell you verbally how many tens and ones in a given number or d.) tell you how many sets of tens in a given number. The rubric is to successfully answer 2 out of 3 correctly using either methods a.) or b.) or c.) or d.)

Early Intervention Program-Teachers Edition

Mathematics/Physics

Filling the Glass (Water, Air, and Fractions)

William R. Colson
425 W. Surf #817
Chicago IL 60657
(773) 871-4890

Morgan Park High School
1744 W. Pryor Ave.
Chicago IL 60643
(773) 535-2550

Objective(s):

Appropriate for elementary-grade students who have a beginning knowledge of fractions and measuring. Students will associate the physical act of measuring a fraction of a given amount of water with the arithmetic operations involved. Each group will use a different method of measuring, and compare/contrast the associated equations with those produced by other groups. The lesson is intended to integrate science and mathematics.

Materials Needed:

Class:

(Note: All glassware must be transparent.)

2 identical straight-sided, flat-bottomed glasses (e.g., "Tom Collins"-style), 2 identical sloped- or curved-sided glasses (e.g., "rocks" or champagne glasses), 12 identical plastic glasses (any style), 2 graduated cylinders, 2 graduated beakers, 1 meter stick or 12-inch ruler, 1 roll masking tape (optional), 1 marking pen (optional), 1 balance-beam scale with weights, at least 3 liters of water (if water source is not handy), 1 clear glass bowl, 1 chalkboard/whiteboard/overhead projector (for the sake of brevity, we will refer to this as the "board").

Each group:

1 calculator, pens/pencils and paper for each member.

Strategy:

Divide class into groups of 3 or 4 members each and distribute group materials. Place class materials together on a table accessible and visible to all, and close to chalkboard/whiteboard/overhead projector. Begin by filling one of the straight-sided glasses with water. Ask the class to describe the glass using the words "full" and/or "empty." Ask them to do the same with the other straight-sided glass (at this point, it is better to do this silently on their own paper, since we are not ready to discuss this yet). Now call up one group and challenge them to move half the water from the first glass into the second. Most will simply pour back and forth until the water in both glasses is at the same level. If they start to reach for the measuring devices, ask them to explain the procedure they had in mind, discuss its merits, and challenge them to do it instead without measuring devices. Once this is done, discuss the concept of taking half of something and write "1/2 of a glass of water" on the board. Once again, ask the class to describe (on paper) the two glasses using "full" and/or "empty."

Now empty one of the glasses and challenge another group to move half the water from the other glass into it, this time using the ruler. Most will measure along the side of the glass to the level of the water and calculate half of that length (some may wish to use the masking tape and marker to mark levels). Point this out and ask someone from the group to write an equation on the board that describes what they just did. When they have written "1/2 X (measured length) = (result), ask them what the measure of a full glass would be. Some will go back and measure, others may say, "Just multiply by two," or something to that effect. Once again, have them represent this mathematically on the board. For the last time, ask the class to describe (on paper) the two glasses using "full" or "empty." Set aside the glass with water in it for later.

Send all students back to their seats and go to the board. Point to the original phrase and ask which of the things they wrote could replace the words "of" and "a glass of water." Is this an equation? (No). Referring to the various things on the board, and adding others as you go, guide them through an introduction to multiplying fractions times fractions and fractions times whole numbers.

Replace the glasses with a sloped- or curved-sided pair. Call up a third group and challenge them to fill one glass half-full of water. If they do so by pouring back and forth, point out that the resulting level may not be where they might have expected, and discuss why. Then ask them to perform the same task using the balance-beam (if this was their first instinct, do the water-level discussion when they finish). Would the ruler have worked this time? (No). Ask them to represent the procedure mathematically on the board, using the previous examples as a guide. Then, as before, empty the water from one glass and ask them to transfer half the water from the other glass into it. Once again, ask them to represent the procedure mathematically on the board.

Send this group back and call up the fourth group. Have them repeat the above procedure with either the graduated cylinders or beakers, explaining the reasons for their choice. When they have finished (including the math), send them back and engage in a general discussion about choosing most appropriate forms of measurement (eyeballing, length, weight, volume, etc.) as well as measurement tools.

As a wrap-up, take out the two straight–sided glasses and fill one with water. Ask the class how they responded when asked to describe it as "full" or "empty." Do the same with the other glass. Most will have said, "empty" for this one. Fill the glass bowl, upend the glass in it, and ask, "If the glass is empty, what is keeping the water out?" When they say, "air," talk about the importance of being specific (full of what?), relating to the fractions and equations on the board (1/2 of what quantity?). You may also want to discuss when it is and is not appropriate to treat fractions as abstractions, or describe Empedocles experiment confirming air as a substance (a good account may be found in the book Who's Afraid of Schroedinger's Cat?).

Performance Assessment:

Group assessment should be made on basis of cooperation and success in involving and communicating with the rest of the class. You may also want to consider success in mathematically describing their experimental activities. Individual assessment should be based on participation in group and whole-class discussion and activities.

References:

Who's Afraid of Schroedinger's Cat? (paperback published in 1998; sorry, I don't remember the author or publisher).

Mathematics/ Physics

Having Fun Working With Fractions

Brian Cagle
10005 S. Aberdeen St.
Chicago IL 60643
(773) 445- 9347

John W. Cook
8150 S. Bishop St.
Chicago IL 60620
(773) 535- 3315

Objective(s):

Model each addition and subtraction example by shading parts of each region

Divide a word into appropriate fractional parts

Pay attention to details in instruction relating to " first", " last", "second", etc.

Analyze clues and decode the message

Use standard algorithms for addition, subtraction, multiplication, and division of fractions

Materials Needed:

15 12 in. by 12 in. Dry Erase Boards (If not applicable you may have the students section off the chalkboard into square regions)

1 Dry erase markers (two different colors)

1 Ruler

1 Game Board (Pre-made)

1 Pair of dice

5 Game pieces

1 Calculator

1 Mars candy bar

Strategy:

Station #1 "Fractional Parts"

Students will use their dry erase boards to model five problems using addition and subtraction of fractions from off the board by shading parts of each region. Using one of the color markers to shade the parts. (See section for materials needed.)

Station #2 "Mars Fraction Hunt"

Students will write the appropriate parts of the words on the line to form a new word. When the message is complete, the first student to decode the message will be rewarded with a Mars candy bar. Ex.) The first half of food + the last quarter of door and the answer will be the first half of fo/od = fo and the last quarter of doo/r = r makes the new word for.

Station #3 "Mir Mission To Mars Game Using Fractions"

Teacher will create a board game making a path from Earth to Mars using around 30 to 40 spaces between the two planets. The teacher will use index cards for the three decks needed for the game. The first deck will be called "Danger" these cards are used to make the players either lose a turn, go back to Earth, or go back a specific amount of spaces. The second deck will be called "Warp Drive 1" consisting of problems where the players will have to answer easier problems consisting of addition, subtraction, multiplication, and division of fractions. The third deck will be called "Warp Drive 2" which will be made up of more difficult problems using fractions. This game is designed to be use as a cumulative activity on the students understanding of addition, subtraction, multiplication, and division of fractions. It is intended for 6, 7, and 8 graders but can be modified for the lower grades by changing the difficulty of the questions on the cards to fit your specific grade level.

Directions:

1.) Each player rolls the dice to determine who goes first. The person with the highest number goes first, the play continues clockwise.

2.) The first player takes a card from either Warp Drive 1 stack or the Warp Drive 2 stack of cards.

3.) If the player answers the question/problem correctly, he/she will then roll the dice.

4.) The number rolled is the number of spaces the player may advance on the board.

5.) If the player answers the question incorrectly, they do not move, nor do they roll the dice.

6.) If a player lands on "Danger", he/she must take a card from the "Danger" stack and follow the instructions written on it.

7.) Play continues until all players have landed on Mars. The first one to reach Mars is the winner!!

Performance Assessment:

Ongoing assessment throughout the game based on the students' ability to answer a percentage of questions correctly.

Number Addition Race

Janice Schaults
10323 S. Bell Ave.
Chicago IL 60643
(773) 239-6308

Randolph Magnet School
7316 S. Hoyne
Chicago IL 60636
(773) 535-9015

Objective:

This lesson is designed to help students with addition.
Students will solve word problems relevant to their experiences that involve addition.
Students will participate in a game involving addition using the phenomenological approach.

Materials:

Dry wall tape (available at hardware stores)
Paper and pencil - scissors
Metric ruler - meter stick
Random number generator - dice or spinners

Strategy:

Divide students into groups of four. Each group will need the materials listed above. Long tables or six to eight desks arranged into a rectangle make the play area. Two students on one side of the table compete with two students on the opposite side of the table. The first pair of students generate the first number for an addition problem. Write the addend on paper. The second pair of students will use a meter stick to measure the addend in centimeters on the drywall tape. Write the measurement on the drywall tape. The first pair of students will generate a second addend and write the number under the previous addend. The second pair of students will measure this amount on the same strip of drywall tape adjacent to the first measurement. Write the measurement on the drywall tape. The first pair of students adds the addends to find the sum while the second pair cuts the drywall tape and measures the total length of the strip. THE MEASURE OF THE DRYWALL TAPE SHOULD EQUAL THE SUM OF THE ADDENDS. If the drywall strip is measured correctly and the addition problem is correct, then the first pair of students receives the strip (tape drywall strip to the table starting at the edge of the table). Play continues with the second pair of students generating the addends for the addition problem and the other students measuring the addends on the drywall tape. The first pair of students to line the length of the table with the drywall tape is the winner. This activity can be adapted to practice fractions and decimals.

Performance Assessment:

Students verify the addition problem by measuring the addends on the drywall tape and matching the total length of the drywall with the sum of the addition problem. If the students made a mistake in addition the other side will keep the drywall measurement and tape it to their side of the table. Students will lose a turn if they incorrectly measure the drywall tape.

Acknowledgement:

David Drymiller, a member of the SMILE staff has been very helpful with his expertise and sharing his own personal materials.

Lesson for Multiplying and Dividing Fractions with Post It Notes

Robert Foote
6743 W. Irving Park Road
Chicago IL 60634-2222
footeach@aol.com

Disney Magnet School
4140 N. Marine Drive
Chicago IL 60613
(773)534-5844

Objectives:

Students will use postit notes to measure various dimensions of rectangles to nearest fraction of an inch. This lesson is intended for seventh grade. Students will divide fractions to predict the number of postits needed to meet the length and width of the rectangles.

Materials Needed:

3 by 3 inch postit notes
1 1/2 by 2 inch postit notes
different sized rectangular shaped paper
rulers and yardsticks

Strategy:

Show students a piece of 8 1/2 by 11 inch piece of paper. Ask students how many postit notes it would take to meet the length and width of the piece of paper of each size. Explain the algorithm for dividing fractions to see mathematically how many 3 by 3 postits will fit and how many 1 1/2 by 2 will fit. To illustrate this, divide 8 1/2 by 3. You get 2 5/6. Take the 3 by 3 postit notes and place them along the 8 1/2 side of the paper. Carefully cut the overlapping part of the last postit note. Measure the part remaining on the paper and it should be close to 5/6 of 3 or 2 1/2. Measure the part you cut and it should be 1/2. Do the same procedure with the other dimension of the 8 1/2 by 11 paper by dividing 11 by 3. Place the postit notes along the 11 inch side and verify the math. Then do the same with 1 1/2 by 2 inch post it notes. After finishing this demonstration, pass out two different size rectangular sheets of paper and have students measure the sides. Working in groups, have students determine mathematically how many of each kind of postit notes it would take to cover both dimensions of both sheets. The students, after doing the math, will then tell you how many postit notes they need. Give them exactly what they ask for and have them cut out the fractional part of the post it note they need by measuring it first. Display the student's work on the board and discuss strategies for finding the answer and ways the answer could go wrong. Precise measurement is very important for accurate results.

Performance Assessment:

This activity in itself is a wonderful performance assessment. You may modify the sizes of the rectangles or simply use straight lines.

Adding Mixed Numbers with Unlike Denominators

Camille Gales
2901 S. Michigan Ave.
Chicago IL 60616

Edward Coles Elementary School
8441 S. Yates Blvd.
Chicago IL 60617
(773) 535-6550

Objective:

This is a seventh grade activity designed to provide students with practice in adding mixed fractions with unlike denominators.

Materials:

tape measures; water soluble marking pens; 12 inch rulers; teacher made block letters of equal height but widths containing fractional parts including 1/16, 1/8, 1/4, 1/3, 1/2 (or any fractional part that can be measured by using a 12 inch ruler); long strips of fadeless paper or a roll of drywall tape; scissors; glue

Strategy:

Review addition with mixed numbers, first at the board, then at the desk using individual worksheets. When seatwork is complete pair the students. Using a tape measure, each student will measure distance from his/her wrist to the tip of the longest finger. Make a dot, with the marker, at that spot on the wrist where the measurement began. Record the distance. Next, measure the distance from the spot on the wrist to the inside fold in the arm where the forearm and upper arm meet. Put a dot on that spot in the fold. Record that distance. Measure the distance from the inside fold in the arm to the shoulder joint. Record it. Sum the three measurements. Measure the distance from the shoulder joint to the inside fold in the arm. Compare the added length to the measured length.

In the second activity students will select the precut letters to form such things as school name, first name or nickname. Students will measure the width of each letter, allocate 1/4 of an inch space between each letter, and then add all letter widths and spaces. Once the students have calculated the width of letters and spaces they will cut fadeless paper or drywall tape to equal the width of the calculated letters and spaces. Paste the letters onto the fadeless paper or drywall tape.

Performance Assessment:

In the first activity, if the students have measured and added correctly, the sum of the three measurements should equal the distance measured from shoulder joint to finger tip. In the second activity, the length of the fadeless paper or drywall tape should be equal to the sum of the letters and spaces. Both activities are self checking.

Grading Rubric

If the error in measurement is within 1/4 of an inch a grade of A should be awarded. If the error in measurement is within 1/2 of an inch a grade of B should be awarded. If the error in measurement is within 1 inch a grade of C should be awarded. If the error in measurement is within 1 1/2 of an inch a grade of D should be awarded. If the error in measurement is greater the activity should be redone.

Conclusions:

This activity enables the student to put math concepts to practical use. It also motivates the student to measure correctly. Finally, the self-checking mechanism makes the activities easy to grade.

Return to Mathematics Index

Multiplication

Virginia Muhammad
9148 S. Justine
Chicago IL 60620
(773) 779-2332

John Hope Community Academy
5515 S. Lowe
Chicago IL 60621
(773) 535-3160

Objective:

Perform basic computations using the operation multiplication.
Use the operation to evaluate expressions involving whole numbers and decimals.

Materials Needed:

Electronic Scale - Measurement of grams and ounces
6-8 Manipulatives of different weights - ex. small foam circles, rubber bands, paper clips, dimes, beans, small craft beads.
Charts to enter weights

Strategy:

We began by reviewing some multiplication facts. We defined factors, products, multiplying by one and two digit factors. A basic review of multiplication of decimals would be helpful to the students. We began by writing the weights of one of each of the manipulatives to be weighed. For example 1 rubber band weighs 0.7 grams. The student will be given a list of numbers to then multiply and calculate the different weights. For example: what is the weight of 6 rubber bands 10,17, 51 etc. The student would then weigh the number of rubber bands on the electronic scale to see if their calculations were correct. The weight of 27 rubber bands multiplied out manually would be 27 times 0.7 =18.9. The weight of 27 rubber bands on the electronic scale is 18.8. There will always be some difference in the weights, the bands are not exactly uniform.

Performance Assessment:

Evaluation would consist of comparing the results of the manual multiplication to the weights from the electronic scale. This would be the case for each of the manipulatives. If the students multiplication is correct the comparisons should be close.

Conclusions:

The items being weighed are in grams and ounces. It is advised that a number of the items be weighed together and divided by that number to get an accurate account of the weight of one item.

Return to Mathematics Index

Putting the Pieces Together (Making a Fractional Quilt)

Demetria E. McKnight
510 W. Winneconna Pkwy
Chicago IL 60620
(312) 783-7345

Bateman Elementary School
4220 N. Richmond
Chicago IL 60618
(312) 534-5055

Objectives:

* Demonstrate a phenomenological approach to teaching fractions.

* This lesson is designed to motivate students to develop a sense of equivalent fractions.

* To explore addition of fractions with unlike denominators.

* Students will be able to divide a whole number into specified equal parts.

Materials Needed:

(1) 1 large cardboard backing that will accommodate approx. (20) 9"x12" poster boards or felt

(2) 20 multicolor 9"x12" poster boards or multicolor felt

(3) glue or needles and thread (depending if you are gluing or sewing your quilt)

(4) scissors

(5) sturdy backing for each 9"x12" poster board

(6) paper clips/straight pens (optional)

(7) (20) 3.5" blocks of paper (small swatches)

Strategy:

Students are given small paper swatches with a designated number on the back. Each student is required to cut their 9"x12" poster board into blocks or horizontal equal fractional pieces that will represent the number on their swatch, i.e., if the number is 6, the students will cut their 9"x12" poster board into 6 equal parts. The paper must be positioned, so that the cut is held in the 9 inch position. Label each piece 1/6.

Challenge students to use their rulers or any measureable tool to cut their strips or blocks into equal amount of pieces, that represents the number on their swatch. Forbid folding the paper. Encourage students to cut their paper into blocks and/or strips.

Group students according to the number on the back of their small swatch.
Recommended grouping:

2	3	4	5	6
4	6	8	10	12

```
                              |   8  |  9  | 12  | 15 |  18 |
                              |  10  | 12  | 16  | 20 |  24 |
```

Assemble students into groups of 4's. Students will compile their pieces into one pile. Students will take turns picking pieces from the pile. Students will combine their fractional pieces, adding their fractions, and making sure that when all of their pieces are in place, their 9"x12" replica will equal one whole. For example, if a student select the following pieces; 1/4, 1/16, 1/16, 1/16, 1/16, 1/16, 1/8, 1/8 add.

$$\frac{1}{4} = \frac{10}{40}$$

$$\frac{5}{10} = \frac{20}{40}$$

$$\frac{2}{8} = \frac{10}{40}$$

$$\frac{40}{40} = 1$$

Each group will make up to four different configurations (patterns). Students will paste their design on a sturdy 9"x12" poster board, for the backing. If felt is used, allow students to sew the pieces together, or have them glue the pieces on the 9"x12" sturdy poster board.

Collect all finished quilt pieces. Place each 9"x12" on large canvas or whatever you are using to display your quilt. Remember you will need a canvas that will accommodate approximately (20) 9"x12" poster boards.

Return to Mathematics Index

"Factors"

Edwina R. Justice
10641 South Lowe Ave.
Chicago IL 60628
(312) 468-3376

Gunsaulus Scholastic Academy
4420 South Sacramento Ave.
Chicago IL 60632
(312) 535-7215

Objectives:

Demonstrate a phenomenological approach to teaching mathematics

Inspire others to use the approach

Objectives (Grades 5-7):

Show and record groups formed by using pennies

Define factor, product, prime, and composite

Write related number sentences

Find the factors of whole numbers

Classify numbers as prime or composite

Identify abundant, deficient, and perfect numbers

Materials Needed:

paper coins (actual coins??)

worksheet for analyzing first moves

Recommended Strategy:

Ask: "How many ways can you make change for $1.00 using only groups of the same coin?"

```
Expected responses:  1 group of 100 pennies
                    20 groups of nickels
                    10 groups of dimes
                     4 groups of quarters
                     2 groups of half-dollars
```

"How many ways can you make equal groups of 100 pennies?"

```
Expected responses:  1 group  of 100 pennies
                     2 groups of  50 pennies
                     4 groups of  25 pennies
                    10 groups of  10 pennies
                    20 groups of   5 pennies
```

Discuss similarities in responses to both questions

Show one penny - Write "1 group of 1 = 1"

Show two pennies - Write "1 group of 2 = 2"

Show three pennies - Write "1 group of 3 = 3"

Show four pennies - Write "1 group of 4 = 4"

Show two groups of two pennies - Write "2 groups of 2 = 4"

Show and record all equal groups for 5 to 12 pennies

Write number sentences: 1 x 1 = 1; 1 x 2 = 2; 1 x 3 = 3; 1 x 4 = 4;
2 x 2 = 4; 1 x 5 = 5; 1 x 6 = 6; 2 x 3 = 6;
... 1 x 12 = 12; 2 x 6 = 12; 3 x 4 = 12

Define factor and product

Analyze number of factors for products 1 - 12

Identify and define prime and composite numbers for products 1 - 20

Play "Factor Game" - List the numbers 1 - 36 as a 6 x 6 grid. Circle a number. Students draw a box around each proper factor of the number. Students select a number and draw a box around it. Teacher circles proper factors of the number. Continue process until no moves are possible. Add the teacher's and students' numbers. The highest total wins.

Analyze first moves for the factor game - List the factors for numbers 1 - 36. Compare the sum of the proper factors to each number.

Define abundant, deficient, and perfect numbers

Performance Assessment:

Select a two-digit number greater than 50.
Identify its factors.
Write related number sentences using the factors and the number.
Explain why the number is prime or composite.

Return to Mathematics Index

Place Value

Dwayne Belle
9646 S. Wentworth
Chicago IL 60628
(312) 928-6473

Fuller School
4212 S. St. Lawrence
Chicago IL 60628
(312) 535-1688

Objectives:

Students will be able to identify the value of numerals through 10 digit numerals.

Materials Needed:

-blackboard
-chalk
-notebook paper
-monopoly money
-prizes

Strategy:

The strategy will incorporate cooperative learning, direct teaching techniques and a phenomenological approach to mathematics. The direct teaching method explains the objectives and how to identify the value of numerals through ten digit numerals. Cooperative learning encourages the students to interact to formulate the correct answers. The Phenomenological approach challenges the students' problem-solving skills.

Direct teaching techniques: A short lecture is given on how to identify the values of numerals through ten digit numerals underlined. Students will have to identify the place value of the numerals (20 problems); for example, 6,**4**56. The digit which is underlined is located in the hundreds column. A short lecture is given to the class on how place value is used in America. The class will participate in an auction. Each student is given ones, tens, twenties, fifties, and hundreds. The last step involves the students bidding on prizes. The highest bidder wins the prize. The winner must explain accurately what column each digit represents.

Cooperative Learning/Phenomenological Approach: The students will form two groups and will be given one numeral from 0-9. The place value will be called orally. The students must line up in direct place value order holding their numerals; for example, the instructor calls out the number four hundred and twenty six. The first three students who line up in order from right to left using ones, tens, and hundreds wins. The first student holds the number six. The second student holds the number two, which represents the tens column. The third student holds the number four, which represents the hundreds column.

Performance Assessment:

Students will be able to identify place values of the underlined number from ones to the millions (20 examples on a worksheet).
Students will be able to form numbers from ones to millions using cards.

Return to Mathematics Index

Percentages

Emma Taylor
5006 W. Concord Pl.
Chicago IL 60639
(312)622-3340

Douglass Math and Science Academy
543 North Waller
Chicago IL 60644
(312)534-6176

Objectives:

To introduce 5th and 6th grade students to percents.
To demonstrate to students how to change fractions to decimals.
To show students how to change decimals to percents.

Materials Needed:

Colored tape, pencils and worksheets.

Strategy:

This lesson will consist of 100 squares that will be measured within one classroom. The students will also be broken up into different groups so they can measure the section of the science lab independently. The students will give the total number of floor tiles counted to a recorder in each group so that each group can find the percentage of each area in the science lab.

Performance Assessment:

The students will be able to recognize a certain percentage, to convert the fraction into a percent, and percent into a decimal.
Students will be given worksheets, so they can determine the ratio of each given fraction and vice-versa.

Return to Mathematics Index

Counting and Place Value

Carole Gills
535 West 87th Street
Chicago IL 60620
(312)994-1592

Edward Coles School
8440 S. Phillips
Chicago IL 60617
(312)535-6550

Objective:

The objective of this lesson is to give first grade students a concrete understanding of place value by providing concrete opportunities to use place value to practice counting, adding and subtracting using a phenomenological approach.

Materials Needed:

- interlocking cubes
- bell
- place value boards
- number flips
- small and medium sized containers
- containers of various objects:
  - pencils
  - Pokeno chips
  - beans
  - straws
- strips of adding machine paper

Strategy:

Review numbers 0-9 and have the students practice counting various objects in the classroom from 1 to 9. Leave the numbers on the board where the students can see them.

Give each student a place value board. The board may be constructed of poster board or construction paper. The left side of the place value board (referred to as the PVB in the remainder of this paper) is blue. The right side is white.

Explain how to read the PVB. Ask the students what is on the board. When they respond that there is nothing on the board, ask them the number word for nothing. After they say "zero" tell them to read the board zero and zero, which means that there is nothing on the left (blue) side of the PVB and nothing on the right (white) side. Remind the students that we will read the PVB the same way we read a book, that is, from left to right.

Next show the students the bell. The ringing of the bell one time means add one cube to the PVB. We always place a single cube on the right side of the PVB. This side of the board is called the ones' column. Have students practice adding a cube each time the bell rings. Have them read their boards each time a cube is placed on the board. When they have nine cubes on the white side of their boards, explain that ONLY 9 cubes can go in that column. Ring the bell and ask students what they will do now. Help them come to the conclusion that they will put the cubes on the blue side of the PVB after they interlock them. These 10 cubes make up one ten. Tens are placed on the blue side of the board which is called the tens' column.

Continue the procedure of ringing the bell, allowing students to add cubes and read their boards until they appear comfortable with the routine. Next, introduce the connecting step. Students will use number flips to show the number symbol that corresponds with the number of objects shown on the board.

It goes like this: Teacher: (rings bell one time)
Student: (adds one cube)
Teacher: "Flip" (indicating to flip to correct number)
Student: (flips to correct number symbol)
Teacher: "Read"
Student: "Zero tens and one"

After the students add to 9 tens and 9 ones, they can practice subtracting the cubes in the same manner described above. When no single cubes are available the students will use a ten from the blue side of the PVB, take it apart to subtract a single cube and leave the nine remaining cubes on the white side of their PVB.

The final step involves recording what has been practiced. Give each student a strip of adding machine paper that has been folded in half vertically. Clear the boards and start the adding procedure again. After the students add, flip, and read, have one student at a time put a PVB on the floor showing the number that was constructed. The boards should line up from top to bottom. After every student has had the opportunity to put a PVB on the floor, show them how to write the numbers that show on their boards. Copy the numbers showing on the boards on the strips of paper, putting the ones on the right side of the fold and the tens on the left, and underline each number as follows: **00**, **01**, **02** and so on.

To extend the concept of place value, give the students many different concrete objects to count on the PVB. For example, beans can be used instead of inter-locking cubes. Each time ten beans are counted, they can be placed in a small container before placing them in the tens' column. Eventually the 10 small cups filled with 10 beans will be placed in a medium sized container and put in a third column called the hundreds' column. Two overlapping PVBs will provide this third column. Instead of cubes and beans, students may practice with Pokeno chips, straws, pencils, coins and many other objects.

Performance Assessment:

Students will be able to demonstrate, on a PVB, numbers up to 9 tens and 9 ones successfully. They will be able to read and/or write the numbers from 00 to 99, indicating that 1 ten and 1 is the same as eleven, 1 ten and 2 is the same as twelve, etc.

Conclusions:

The procedure described can be extended to the hundreds, thousands, etc. for higher grade levels. It can also be helpful in working with money concepts.

Ratio and Proportion

Valesta Cobbs
6020 S. Harper Ave. Apt. 1N
Chicago IL 60637
(312)667-0487

John Fiske Elementary School
6145 S. Ingleside Ave.
Chicago IL 60637
(312)535-0990

Objectives:

The students will use the phenomenological approach to complete the activities, calculate ratios and proportions and compare and contrast group data with class data.

Materials Needed:

Four 16 oz. bags of candy
Rice (2 different amounts of the same brand)
Cereal (2 different amounts of the same brand)
Tuna (2 different amounts of the same brand)
Canned Corn (2 different amounts of the same brand)
Gum (2 different amounts of the same brand)
Canned beans (2 different amounts of the same brand)
6 sets of 10 ratio cards with easily identifiable items to be compared (For example: girls to boys)
Timer

Strategy:

Review the definition of a ratio. Ask the students to write the number of vowel letters and consonant letters in their name as a ratio of vowels to consonants on a sheet of paper. Ask three or four students to come to the board and write their name and the ratio of vowels to consonants.

Divide the class into groups of five. Give each group ten ratio cards. Explain the directions and set the timer for five minutes. After the elapsed time, tell the students to stop. Ask one student from each group to write the group data on the board. Have the students line up on opposite sides of the room according to the ratio. For example, if the students identify the ratio of boys to girls, then the girls will line up in the front of the room and the boys will line up in the back of the room. Have one student count the number of boys and girls and check the answer on the board to make sure that it corresponds to the numbers counted.

Review the definition of proportion. Give each group a bag containing at least 10 pieces of candy. Clearly mark or label the price of the bag of candy. Ask the students to find the cost of one piece of candy. Have a student from each group record the group data on the board. Ask a member of each group to orally state the unit price of one piece of candy in the bag of the group. Ask the class to determine if the data written on the board is correct.

Give each group two different amounts of the same product. Ask the students to determine the cost of one ounce of each product and the best buy. Select one member of each group to write the group data on the board. Ask a member of each group to explain the data written on the board for that group. Have the class check the data written on the board.

Performance Assessment:

Give each group two different amounts of another product. Ask the group to determine the cost of one ounce of the product and the best buy.

Introduction to Fractions Using Cuisenaire Rods

Gwendolyn M. Manson
871 Campus Avenue
Matteson IL 60443
(708) 503-0249

Benjamin Banneker
6656 S. Normal
Chicago IL 60621
(312) 535-3020

Objective(s): Grade 5

(1) Students will visually "see" and manipulate fractions with Cuisenaire Rods staircase to develop concept and fractional relationships.
(2) Students will learn numerical values of rods and relate them to color and length.
(3) Students will use varied approaches to discovering new fractional relationships that answer the "why" in fractions and lessen "the only one way" hazard.
(4) Students will write a problem-solving story that is interest-based but also demonstrates basic understanding of fractions and vocabulary usage.
(5) Students will relate fractions in a relevant way to their culture.

Materials Needed:

(1) Cuisenaire Rods - One set per student
(2) Overhead Projector - Class
(3) Overhead Cuisenaire Rods - 1 set per class
(4) Acetate Sheets - 6 per class
(5) Grease Pens - Two per class
(6) Poster Boards - One per five groups
(7) Magic Markers - One per five groups
(8) Worksheets (2) - Two per student

Strategy:

(1) Display objects and discuss why fractions are important and needed in real-life situations, i.e. sewing, fabric measurement, money, recipes, telling time, body measurements, etc.
(2) Students will work in cooperative groups (A-E) and build a rod staircase.
(3) Students will explore, examine and learn the colors, lengths and numerical value of each rod.
(4) Students and teacher work together using the Overhead Projector with Cuisenaire Rods to develop and write fractional equivalents and relationships.
(5) Learners will make values of ten using each of the colored rods.
(6) Students will do multiples of the white, red and light green rods.
(7) Display an orange rod and show that it takes two yellow rods to make an orange rod. Write in the following manner:
O = 2 Yellow
1/2 O = Y
(8) Do the same with the Red (R), Dark Green (D), and Brown (N) which are multiples of two.
(9) Students discover the multiples of three, i.e. E=3G read as Blue

equals three Green, 1/3 E=G.

(10) Students will do a self checking worksheet to answer a Cuisenaire Rod riddle.

(11) Students will form cooperative groups (A-E) to write a mathematical story for a specific combination of Cuisenaire Rods displayed on the Overhead Projector.

Measuring Mixed Numbers

Karen Trout
1864 S. Hamlin
Chicago IL 60623
(312) 521-0052

Sumner Math and Science Academy
4320 W. 5th Avenue
Chicago IL 60624
(312) 534-6730

Objectives:

Grade 5

- -Students will discover the need and every day use of mixed numbers.
- -Students will measure different lengths to the nearest fraction of an inch.
- -Students will review the equivalent values of fractions (for example: 2/4=1/2).
- -Students will review how to come up with the common denominator and why.
- -Students will add mixed numbers phenominologically and then algorithmically.

Materials Needed:

- -1 pair of scissors per student
- -1 ruler per student
- -5 pieces of tape per student
- -1 worksheet per student
- -1 piece of scratch paper per student
- -Construction paper of different colors
- -Large clear container with graduated cups
- -Measuring cup set
- -Bucket full of milky water (mix in a little corn starch)

Strategy:

1. Before class, use your construction paper to make a couple sets of fraction bar charts (be sure to include whole, halves, fourths, eighths, and sixteenths). Use different colors for each different fraction length, and make your pieces board size.
2. If you have a large container that does not have graduated cups, just place a strip of tape down one side of the container, then pour a cup of water in at a time and mark the level for each cup on the piece of tape.
3. Create a worksheet that has about 4 different problems similar to the example below. Draw different length bars that the students will have to measure individually, cut out, connect, and then remeasure as a whole unit. They will only be measuring the length of these rectangles or bars which should be at various lengths between 1/2 an inch and 5 inches. This is a sketchy example of what one problem would look like:

Measure these lengths as accurately as you can, then cut them out, tape them together and remeasure the length of these two together:

```
`ffffffffffffffffffffffffp            `ffffffffffffffp
w                        w            w              w
w                        w      +     w              w   =
w                        w            w              w
afffffffffffffffffffffffq             affffffffffffffq
```

4. Begin the class with this question: "Pretend you are a zookeeper and your responsibility is to feed the baby animals their formula each day. The baby porcupine eats 2 1/2 cups of formula, the baby seal eats 5 1/4 cups, and the baby ape eats 7 3/4 cups. How much baby formula do you need to make to feed all three of the baby animals?"

5. Allow the class time to reflect on the problem and then explain that they are going to need to understand how to add mixed numbers in order to solve this problem. Demonstrate for them briefly on the board how they are going to use the worksheet. They are to measure the length of each bar and write that length inside the figure. Then they are to cut out each bar and connect them with tape onto the piece of scratch paper they have been given. They should now have a longer bar which they are to measure and write down the total length of the two bars combined.

6. When they have completed this worksheet go back and compare some of their answers. Then using the fraction pieces which you will have taped up on the board, show them the different lengths. If they measured 3 1/2 inches for one bar, show them 3 1/2 in fraction pieces. If their second bar was 1 1/4 inches long, then show them 1 1/4 in fractions. Demonstrate for them how to add those two fractions of different denominators (1/4 and 1/2) by replacing the 1/2 fraction piece with two 1/4 pieces and finding their length to remain the same. Using the fraction pieces, continue to visualize for them how we come up with a common denominator when adding fractions of unlike denominators.

7. When you feel they have grasped this concept, you then go back to your original question about feeding the baby animals. This time have them find the common denominator between 1/2 and 1/4 and then add their mixed numbers together to get the total amount of baby formula needed.

8. Finally, to prove whether or not the answer they got on the baby formula was correct, have someone come up and measure out the amount of cups fed each baby animal. Have them take the milky water (water and a little corn starch) out of the bucket and carefully pour it into your graduated, clear container. The amount of formula that is now in the container should be the same as the amount of cups the class came up with on paper.

Conclusion:

The students visualize adding mixed numbers physically by adding different lengths together to the nearest fraction of an inch and by adding cups together. Then they discover the simplified algorithmic process which reduces the amount of work they need to do. However now they also understand why they need to add mixed numbers and what mixed numbers are. In conclusion, their performance should improve greatly as they comprehend the usefulness of these skills and what it is that they are actually doing when they come up with a common denominator and add their mixed numbers together.

A "New Set of Numbers" (An Introduction of Integers)

Barbara Barlow
10533 S. Sangamon
Chicago IL 60643
312-779-5726

Caldwell School
8546 S. Cregier
Chicago IL 60617
312-535-6666

Objective:

Students of the sixth grade will be able to add and subtract positive and negative integers. Incidentally, negative numbers were invented by the Chinese.

Materials Needed:

Group of fifteen students
Numbers with positive signs (written on construction paper)
Numbers with negative signs (written on construction paper)
A large zero (written on construction paper)

Two paper bags (one labeled positive and one labeled negative) with directions inside which tell the students what to do on the number line. Some examples are:

Take 3 negative steps	Add negative 3
Take 5 positive steps	Subtract positive 4

Strategies:

Review of number line on chalkboard:
Number line will be made, using students as the numbers. Students to the right of the zero will be called positive integers and all students to the left of the zero will be called negative integers. The distance from the zero to the next point (going in either direction) will be called the "unit distance." Each student will tell how many units they are from zero. The students will now receive their signed numbers written on construction paper.
The "additive inverse" concept will now be introduced and explained. The students will then find their additive inverse.
Students will move a given number of units (to the left or to the right) to represent the process of adding and subtracting integers. They will then name their new value.
Students will now pull directions from a bag and each take turns moving in the given direction; Ex: Take 2 positive steps.
Students will be given a sheet of problems to practice adding and subtracting integers.

Performance Assessment:

Students will solve a puzzle by adding and subtracting integers.

Conclusion:

After presenting this lesson, students will have a greater understanding of integers and the concept of positive and negative numbers. They will also know how to add and subtract integers.

Return to Mathematics Index

Primary Understanding and Use of Place Value

Eleanor Brzozowski
5335 W. George Street
Chicago IL 60641
312-685-9080

Hanson Park School
5411 W. Fullerton Avenue
Chicago IL 60639
312-534-3100

Objectives:

1. To give students an awareness of some of the peoples that have contributed to the development of modern arithmetic. (Number systems)
2. To help students gain a better understanding of our base 10 number system and its application to real life problems.
3. To increase a student's ability to add and subtract two numbers having as many as three digits and involving renaming in the ones place and in the tens place.

Materials Needed:

Place Value board
Base ten blocks
Chip-trading boards
Chips (4 colors)
Dice
Activity sheets
Number Wheel Response Cards (Optional)
Multicultural materials

Strategy:

1. Discuss with the children some of the number systems used by other peoples such as the Romans, Egyptians and Mayas. Roman Numerals contain a symbol for one (I), five (V), ten (X), fifty (L), one hundred (C), five hundred (D) and one thousand (M). It lacks a symbol for zero and place value. Explain that Egyptian numerals are base ten as are our Hindu-Arabic numerals and are additive. The Egyptian numerials are usually written from right to left, do not use place value and the symbols used to write their numbers are called hieroglyphics. Mayan numerals are base 20, with place value and a zero place-holder. The increasing powers of 20 go up vertically instead of horizontally.

2. Put two Roman numerals on the board such as CX (110) and XLV (45). Ask children, "How did the Romans add?" As they see the problems encountered in doing this, lead the discussion to an explanation of our base 10 system and its advantages, the 10 symbols used are called digits (0, 1, 2, 3, 4, 5, 6, 7, 8, 9) and how the groupings by tens form a place value system. It is, therefore, possible to represent any number using only the ten basic symbols (digits). The position of each digit in the numeral determines the value of that digit. This makes the task of doing arithmetic operations much easier than in systems like the Romans or Egyptians.

3. Using a place-value chart showing ones, tens, hundreds and thousands, model with base ten blocks four problems -- the addition of two 3 digit numbers with and without regrouping and two subtraction problems up to 3 digits with and without regrouping. At the same time of modeling and solving the problems, have a student at the board showing abstractly what is being done as it is being modeled. This will enable the student to transfer what he sees concretely to the abstract. Be sure to stress that the largest digit each place value can have is a nine and that exchanges must be made for numbers larger than nine.

4. Give students experience in renaming or making exchanges by playing "Chip Trading". Give each student a playing board made from 8 x 11 inch manila paper marked in four vertical columns. At the top of the left-hand column, paste a small rectangular piece of black construction paper, red at the top of the next column, then blue and white. Cut out circles of these same colors and use for chips -- white representing ones, blue representing tens, red representing hundreds, and black thousands.

Children play in groups of two to four. Each player throws the dice in turn and always takes the number of white chips corresponding to the sum of the numbers shown on the dice. Using 10 as the number (or base) for making exchanges, whenever a player has 10 or more chips of one color, a trade must be made. (10 whites are traded for 1 blue; 10 blue for 1 red; 10 red for 1 black). The first player to obtain a red chip (when playing to 100) or a black chip (when playing to 1000) is the winner.

Variation: Use other numbers as rates of exchanges such as 2, 3, 5, 8, etc..

5. Provide students with appropriate activity sheets for reinforcing addition and subtraction skills presented in lesson.

Performance Assessment:

Children will be given three problems, one orally and two written, to assess how well the objectives of the lesson were met.

A. Oral:

Students will write two 3-digit numbers from clues given orally by the teacher and then find the sum. Example: In the first number, the ones' digit is 5. The tens' digit is l more than the ones' digit. The hundreds' digit is 2 more than the tens' digit. The second number has 4 ones. The tens' digit equals the number of boys in the class. The hundreds' digit is the number of feet a chicken has.

B. Written:

(1) Write a question that can be answered using the information in the story. Then find the answer.

Mary swam 567 meters at the indoor pool today. Yesterday she swam 498 meters.

(2) Write a story problem that you can solve using this number sentence: 459 + 64 = ?

Additional Activities:

1. Cooperative Problem Solving -- In groups of four, give each group an envelope with four papers in it. Each paper states the problem with a different clue on it. The group discusses the problem and the four clues. The first group that solves the problem and can explain how the solution was obtained wins. Example: Problem: How many seeds are in the sunflower? Clue 1: The number uses the digits 2, 7, and 8, not in that order. Clue 2: The 2 is not in the ones' place. Each digit is used once. Clue 3: The 7 is not in the hundreds' place. Clue 4: The 2 is not in the hundreds' place.

2. Rolling-the-Cube -- On a piece of paper, students make three short lines and directly below that three more short lines in preparation for adding two 3 digit numbers. A cube or die is rolled. The number appearing on the cube is put on one of the six blanks. The cube or die is rolled again and the second number is placed in one of the remaining blanks. The process is repeated until all six blanks are filled in. The two numbers are then added, and the student

with the largest sum is the winner.

3. Find-Hide-Show -- Give students a "Number Wheel Response Card" (Open Court Publishing Co.). State a number to make on their cards. After they find the number, they "hide" the card by their chest and when the teacher says "show", they hold up their card. Teachers can easily identify students having an understanding of place value and those needing additional help.

Extension:

To provide students with experiences in regrouping larger numbers, make a three dimensional mat called the "Daily Depositor" with places up to one million. Have the class predict whether they can accumulate one million dollars by the year's end if each day the class receives the number of $100 bills for the date of the month. For example, on the third of the month $300 is put into the Depositor and on the 27th of the month $2700 is added to the Depositor. The accumulation occurs throughout the years so there is experience with large numbers and regrouping (hundreds in the early months and thousands in the later months). Use play money from a game such as Life.

Return to Mathematics Index

Introduction To Equivalent Fractions

Rose Cartwright
1120 West 110th Place
Chicago IL 60643
312-779-6696

Lyman Trumbull School
5200 North Ashland Avenue
Chicago IL 60640
312-534-2340

Objective:

To examine the part-whole relationship of numbers and to compare one fraction to another in order to discover their equalities.

Materials Needed:

adding machine tape
crayons
paper
fraction puzzle pieces
masking tape

Strategies:

Each student will take a strip of adding machine tape that is 24 inches long. They will measure the crown of their head. Each tape will be labeled as halves, thirds, fourths, etc. These tapes will also be marked showing their fractional parts. Certain colors identify fractional parts--such as red marks 1/2, blue marks 1/3, orange marks 1/4, etc. After the measurements have been taken, each student will place his/her tape on the chalkboard with masking tape. From observation, students can clearly see that all of the red marks are aligned, as well as all of the other colored marks, that divide each strip into equal parts.

After the students have compared the strips and have noticed the relationships, they will begin a paper folding exercise that helps to develop the concept of how two fourths of the whole strip is equal to one half of the same strip. To do this, fold a sheet of paper in half then color that half sheet of paper. The students will open the paper to the full sheet and they can see that one half of the paper is colored. The students will continue to fold the paper into fourths, and as they unfold the paper, they can see that not only have they folded the paper into four equal parts, but that half of the paper is the same space shaded as the two out of four parts. The students will continue to fold the paper into eighths and sixteenths. They will continue using thirds, fifths, etc. The students will then use fraction puzzle pieces to create a square made of equal fraction pieces. Once a square has been completed, students can turn the puzzle pieces over to see the numeric value of each fraction and discover that the fractions that make up the square are equal to each other.

Performance Assessment:

Given twelve separate squares on a sheet of paper, the students will change regions that have been divided in half into regions of fourths, eighths and sixteenths. Regions that have been divided into thirds, will be changed into sixths and twelfths. As an added discussion, students will be able to see, looking at their original strips, how many students have the same or equal head band sizes.

Fickled Fractions

Elizabeth Chambers
2638 E. 92nd St.
Chicago IL 60617
312-721-2799

Keller Gifted Magnet Center
3020 W. 108th St.
Chicago IL 60655
312-535-2636

Objective: (Grades 4-8)

To review the ways in which fractions are made real in our world
To show the relationship of cross multiplication and equivalent fractions
To reinforce fraction skills

Materials Needed:

Measuring tape
Pencil
Crayons
Construction paper
Equivalent fraction strips
Ditto of a boy and girl doll

Recommended Strategy:

This lesson has been designed to enrich the students understanding of fractions after they have completed the study of fractions. Now we will attempt to show that fractions indeed have a place in the real world.
The students have learned to add, subtract, multiply, and divide fractions.
They also know how to:

- -change mixed numbers to improper fractions.
- -reduce fractions to lowest terms.
- -change fractions to a decimal; to a percent; to a ratio.
- -find the LCM and GCF.
- -solve or make equivalent fractions.

The students will have a discussion about why fractions are so important and why students find understanding fractions so difficult. How can we make fractions real to them? Following the discussion, the students will do various activities:

- -Label a doll that represents the students measurements. (students will add, subtract, multiply, divide, and reduce fractions using their body measurements.)
- -Use a calendar in order to do an activity that is a lead-in to cross multiplication and proportions.
- -Play an equivalent fraction game to reinforce problem solving techniques.

Performance Assessment:

Students will set up a proportion in order to solve word problems.

Multicultural Connections:

The proportion property was recognized by the early Hindus as an arithmetic rule. In the Seventh Century it was called the **rule of three** and was stated in words in the style of the times. Merchants regarded the rule highly and used it widely as a mechanical procedure without explanation. Prior to the Nineteenth Century the ability to use the rule of three was a mark of mathematical literacy. This explains cross multiplication and also how to find an unknown in solving proportions. Ex. a/b = c/d therefore aKd = bKc

Return to Mathematics Index

Addition and Subtraction of Signed Numbers

David Drymiller
10115 S. Oakley
Chicago IL 60643
312-233-7902

Morgan Park High School
1744 W. Pryor
Chicago IL 60643
312-535-2550

Objective(s):

To master the addition and subtraction of signed numbers.
To recognize linear equations of the form x + a = b and their solutions.

Multicultural aspects:

Cities of the world including London, Peking, Moscow, Cairo, and Berlin are referred to in the Performance Assessment.

Materials needed:

For a class of 28: 3 paper lunchbags and 100 pennies

Strategy:

Ask the students to bring some pennies (no more than 10) with them to class the next day. Number the bags 1, 2 and 3 then place in each bag 18, 21 and 23 pennies respectively. In 3 groups (2 rows per group) have 1/2 the students place pennies into the group's bag and 1/2 take out pennies from their group's bag. (Make sure the amounts put in and taken out vary.) Have the students record the number of pennies they put in or took out.

Questions for the group to answer within the next 10 minutes: Are there more or less pennies in the bag? How many more or less? Next have each group count the number of pennies in their bag and answer the question. How many pennies were placed in the bag before class began?

Have a member from each group explain how they got their answers to the class while you point out that putting in pennies equals a **POSITIVE** number and taking out pennies equals a **NEGATIVE** number. Explain that they had to add or subtract positive and negative numbers to answer the questions. Also the number of pennies placed in the paper bag before class began served as the variable **X**, and they had to solve a simple linear equation to get the last answer.

The above activity leads to the following examples:

put in 8	and	put in 5	equals	put in 13
8	+	5	=	13
put in 7	and	take out 9	equals	take out 2
7	+	-9	=	-2
take out 4	and	take out 7	equals	take out 11
-4	+	-7	=	-11
take out 8	and	put in 11	equals	put in 3

-8	+	11	=	3

At this point a discussion of simplification of signs is needed.

5 = +5 the + sign is superfluous, so discard it.

- - = +, - - - = + - = -, - - - - = + + = +,

This may be visualized by using construction paper strips 1" by 6" as negative signs; join 2 negative signs together with a paper clip to make a positive sign.

For any addition or subtraction problem only one sign is necessary between each number in order to know what to do. +8 + - 7 -(-9) - +5 = 8 - 7 + 9 - 5

Now the class is ready to do problems in class and for homework in order to master the addition and subtraction of signed numbers.

Performance Assessment:

In the game of Civilization the population of a city must be content or happy in order to produce any goods. Given the facts that

A HAPPY PERSON	is worth	+7 points.
A CONTENT PERSON		0 points.
AN ANGRY PERSON		-4 points.
A HOSTILE PERSON		-10 points.

Given a city with 30 persons determine if the city is producing any goods. If the city is not producing, how many more happy persons does the city need to start producing? If producing, how many more angry or hostile persons will stop the city from producing?

Note: A city is represented by 30 circle faces on one sheet each drawn to show the 4 possible attitudes of its citizens.

Conclusions:

Positive and Negative Numbers are appropriate in any situation where opposites are present.

Evaluation:

A simple quiz with 9 nine-point problems with the above Performance Assessment for nineteen points.

Rubric:	19 points	Correct answer and notices and uses the multiplication of signed numbers.
	16 points	Correct answer presented clearly in complete sentences.
	13 points	Correct answer use of repeated addition and subtraction work shown neatly .
	10 points	Incorrect answer, correct method shown but error in addition or subtraction.

```
5 points   Incorrect method or no method shown but correct answer
           without supporting arguments.
0 points   Incorrect answer - No answer - and invalid arguments.
```

Working with Cuisenaire Rods In Mathematics

Willis Grace
7840 S. Ridgeland Ave.
Chicago IL 60649

O. A. Thorp Academy
6024 W. Warwick Ave.
Chicago IL 60634
312-534-3640

Objective:

Fourth Grade students will learn the numerical value of each underlined letter of the standard Rod Code and develop systematic usage for building new units.

Materials Needed:

A set of Cuisenaire Rods for each student or groups of two
Construction Paper
Scissors
Transparencies
Overhead Projector

Strategy:

In order to effectively develop good skills for working with common denominators, students must first strengthen and reinforce their basic skills. These basic skills encompass such concepts as addition, subtraction, multiplication and division of whole numbers which form a foundation for fractions. The materials used reinforce concepts further by providing students with concrete examples of the skills that they practice.

Performance Assessment:

a. Given Cuisenaire Rods, introduced to strategies, and ample performance time, students will utilize the activity card, "Finding One."

b. The students will answer 5 out of 7 questions correctly while playing "Finding One."

c. The students will demonstrate whole fractions (reduced) using Cuisenaire Rods.

d. The students will demonstrate equivalent fractions using Cuisenaire Rods.

e. The students will discuss length, color, and shape of Cuisenaire Rods.

Multicultural Aspects:

Cuisenaire Rods were discovered in Thuin, Belgium over forty years ago by George Cuisenaire and are now recognized as a basic learning tool all over the world.

Return to Mathematics Index

The Generation Of Fractions

June Muhammad
8513 S. Kingston
Chicago IL 60617
312-721-5845

Park Manor School
7037 S. Rhodes
Chicago IL 60637
312-535-3070

Objectives:

To use a unique multiplication grid to help students realize that simple fractions (reduced fractions) may have many appearances, but have the same value.
To help students learn how to factor each denominator completely.

Materials needed:

Group of four students	Four 5 x 8 1/2 white tag boards
Ruler	Red construction paper for apples
Glue	Green construction paper for trees
Masking tape	Brown construction paper for tree trunks
Black marker	Make grids for multiplication tables

Strategy:

Students will select fractions written on cut out apples from a bag.
To begin use only even number fractions.
Example: The fraction 12/24 is selected by the students. Students look at the multiples of two column, and then count down to 12 grids in the multiples of two. The students stop on the sixth grid. Ask students to record where have counted. The students' final fraction should be 1/2. Remind the students that they must change multiples when the selected fractions can be further reduced.
The fraction 3/6 requires that they leave the multiples of two.
Students can visualize reduced terms and the final simple term. When odd fractions are selected students can compare how each fraction is divided by one and itself.

Performance Assessment:

Students write five higher term fractions for one simplified fraction.
Teacher observes and records results.
All higher terms and reduced fractions are hung on the tree.
Odd fractions are hung on a crab apple tree.

Multicultural Aspect:

Fractions were invented by the Ancient Egyptians.

Conclusions:

This activity may be used for small or large groups of students.

Return to Mathematics Index

A Method of Front-End Arithmetic

Eddie Newton
4800 S. Lake Shore Drive
Chicago IL 606l5

Carver Area High School
l3l00 S. Doty Avenue
Chicago IL 60627
312-535-5250

Objectives:

Grades 3-l2

Upon completion of the Front-End Mathematics lesson, students will be able to:

a. Transfer computational fatigue from the most significant to the least significant columns.

b. Eliminate carry-overs and their errors.

c. Use one or more of the fundamental laws of commutation, association and distribution, and the concepts of place value and regrouping.

Multicultural Aspects:

Many peoples contributed to the development of the modern system of numerals. Any society that uses Arabic numerals can use the Front-End Method of Arithmetic for calculating.

Materials Needed:

Notebook Paper for a class of 20 students.
Pencils for the class.
Twenty store receipts from supermarkets.

Strategy:

Students will be given four shopping lists and asked to estimate the number of $20 bills needed to purchase the items on each list. Calculators are not allowed.

Students will be asked to add the figures on the list to obtain the exact totals.

Students will be taught the Front-End Method of Arithmetic.

Students will recalculate the shopping lists using front-end arithmetic without calculators.

Example of front-end addition:

```
$37.55
 63.86
 97.23
  8.98
```

```
l8
 25.
  2.4
   .22
l-7.62
l0
207.62
```

The numbers are lined up as usual in their proper vertical columns. The first column is totalled and the subtotal, 3+6+9=18, written in its proper place under the line. At this stage we already know that the final sum will exceed $l80. The second column is summed, its subtotal, 7+3+7+8=25, is written in its proper place under the line. The first two subtotals add up to $205, a second approximation to the final answer. The third column subtotal, 24, is again written in its proper place under the line. The first three subtotals give the partial sum $207.4, a third approximation to the final answer. The fourth column subtotal, 22, is again written in its proper place under the line. Added to the previous partial sum, it yields the final answer $207.62.

Performance Assessment:

Students will be given a post-test consisting of ten front-end addition problems using supermarket receipts. Students will be expected to use this new method to compute the problems with l00% accuracy.

Conclusions:

Front-end arithmetic provides an interesting variation for and supplement to, the classical rear-end approach. Students are able to add columns of figures without carrying. This method has real-world application to consumer mathematics.

Money: Demonstrating Coin Values up to $1.00

Camille Gales
2901 S. Michigan Ave.
Chicago, Il. 60616
312-842-0936

Coles Elementary School
8440 S. Phillips Ave.
Chicago, Il. 60617
312-535-6550

Objective:

Students will use a variety of coins to make change up to the value of a dollar. (Lower Primary)

Materials:

large paper coins, coin paper money, real coins (100 pennies, 2 half dollars, 3 quarters, 5 dimes, 5 nickels per student), one sandwich bag for each student, 3x5 index cards on which are written coin values to be used (for example: show $0.25; show $0.25 use only one nickel; show $0.25 use no nickels), 81/2 x 11 boards on which are written the words "Put It Here".

Strategy:

1. Teacher attaches large paper coins to strips of paper and places the strips at various places along the floor. Teacher selects the sum of coins from one of the strips. Students find the strip whose coin value matches that sum.

2. Teacher places the above assortment of coins in the sandwich bags and distributes them such that each student has one bag.
   a. Students sort the coins by value.
   b. Students select one coin from each pile and arrange them in a column by size from largest to smallest.
   c. Students select another coin from each pile. Beside each coin use pennies to demonstrate the value of each coin.
   d. Students arrange second set of coins in a column by value from largest to smallest.
   e. Students compare and contrast both columns of coins.

3. Teacher reads cards. Students place that coin value on their desks.

4. Game (4 to 6 people): Caller reads cards. Players place coins equal to that value on the "Put It Here" board. The first player to place the correct amount on the board wins the point. The first player to accumulate 5 points wins the game and becomes the new caller.

Conclusion:

Use of these activities should familiarize students with individual coin values and assist them in learning to make change.

Return to Mathematics Index

"How Divine Is My Proportion?"

Edwina R. Justice
10641 South Lowe Ave.
Chicago, Illinois 60628
(312) 468-3376

Gunsaulus Scholastic Academy
4420 South Sacramento Ave.
Chicago, Illinois 60632
(312) 535-7215

Objectives (Staff):

Demonstrate a phenomenological approach to teaching mathematics.

Inspire others to use the approach.

Objectives (Grade 8):

Relate the ratio of successive numbers in the Fibonacci Sequence to the "divine proportion".

Compare approximate golden rectangles to human body proportions.

Materials:

Measure in advance and select items whose sides are in the approximate ratio of 1:1.6.

file cards (assorted sizes)	envelopes	charge plates	photos
greeting cards (assorted sizes)	invitations	pamphlets	books

Recommended Strategy:

Measure items and calculate the ratio of longest side divided by shortest side.

List quotients on the chalkboard and discuss similarities.

Measure the height and the distance from the top of the head to the middle finger tip with an arm extended to one side. Calculate the ratio of the two measurements.

Compare the ratio of body measurements to the results obtained from other items.

Determine a pattern and complete a number sequence:

1, 1, 2, 3, 5, 8, 13, 21, ...
(Additional numbers are optional.)

Calculate the ratio of two successive numbers:

1/1, 2/1, 3/2, 5/3, 8/5, 13/8, 21/13

(The ratio 21/13 equals 1.6154 rounded to the nearest ten-thousandth and represents the ratio of the sides of a golden rectangle.)

Compare the quotient of a golden rectangle ratio to ratios of selected items and body proportions.

Students should look for golden rectangles and divine proportion measurements at school, home and other places.

Equivalent Fractions

Gertrude Lockett
15148 Oak St.
Dolton, Il. 60419
708-849-1577

Emmanuel Christian School
8301 S. Damen Ave.
Chicago, Il. 60620
312-239-6829

Objectives:

Given teacher guidance the fourth grade students will be able to:

1. Visualize and comprehend the relative values of fractions by making physical representations.
2. Use fractional parts of a "whole".
3. Recognize relative sizes and equivalent fractions.

Materials needed:

All materials listed are for an entire class.

- Ruler
- Pencil
- Scissors
- Strips of 3" x 18" construction paper
- Number cube (die) labeled with fractions

Strategy:

Take five strips of different color construction paper.
With your students, compare the strips to be sure they are all the same length.
Talk about the fact that the strips each represent "one whole" and the students will be cutting some into fractional parts.
Label one strip "one whole".
Take another strip and fold it carefully in half. Open it and count. Label each part 1/2 and cut on the fold line.
Take another strip and fold in half two times. Open and count the sections. Label each part 1/4 and then cut them apart.
Take another strip. Fold it in half three times. How many sections will there be this time? Open and count. Label each part 1/8 and cut them apart.
Continue with the last strip. Fold four times. This time the students will get 1/l6 for each section. Label each part 1/l6.
Students will measure and discuss using fractional parts of a whole.
Making a physical model of fractions provides reinforcement for understanding the relative values of fractions.

Follow Up Activity:

Divide the students into 4 to 6 groups. Start with one whole strip in front of each student. One student from each group will take a turn rolling the die. Take the strip which represents the fraction shown on the cube and place it on the whole strip. For example, if the fractional part 1/4 is rolled, place the 1/4 strip on the whole strip and continue rolling the die until the whole strip is covered. The first player to cover their whole strip wins.

Conclusion:

This is a good activity to help students in using fractional parts equivalent to a "whole" and aiding them in recognizing comparable sizes and equivalent fractions.

Division For Third Graders

Savannah Walker
2510 East 83rd Street
Chicago, Ill. 60617

Mason School
4217 W. 18th Street
Chicago, Ill. 60623
312-534-1530

Objective:

To use measurement to demonstrate division.

Materials needed:

a meter stick
a ball of cord
a pair of scissors

Strategy:

Seat the class in pairs. Have one student measure and the other cut.

1. Measure and cut a piece of cord 110 cm long.
2. Start at one end of the cord and cut pieces that are 8 cm long. Cut as many pieces as possible. Measure carefully.
3. Count the number of 8 cm pieces you have cut.
4. Measure the piece that is left over. It should measure 6 cm.

Repeat the process for other lengths of string.

Conclusion:

110 / 8 = 13 r6.

Evaluation:

For each division sentence, make and complete a table showing:

1. Length of single piece
2. Length of single pieces to be cut from single piece
3. Number of exact-size pieces that can be cut from single piece
4. Size of left-over piece (the remainder)
5. Division sentence (Give the division sentence this represents)

Repeat for the other examples.

Return to Mathematics Index

Prime and Composite Numbers

Charlotte Goldwater
2908 West Sherwin
Chicago, Illinois 60645
312-465-8449

Kenwood Academy
5015 S. Blackstone
Chicago, Illinois 60645
312-536-8909

Objective:

The main objective is to have a systematic method of deciding if a number is prime or not. This project is geared to fifth through ninth grades.

Materials Needed:

Large translucent container filled with water
Roll of masking tape
Pennies
Any permanent marker
Pencil
One or two vis-a-vis non-permanent markers
Three charts of numbers 1-100 on transparencies
A classroom set of the same chart on paper
A classroom set of an empty 10x10 grid
An overhead projector

Strategy:

The mini-teach is directed toward fifth through ninth grades. You give students the definitions of prime and composite numbers. You allow students systematically to go through the numbers crossing out or eliminating multiples of two, multiples of three, multiples of five, multiples of seven, etc. You continue until you reach the square root of the last number you are testing. When you are done, the remaining numbers are prime. Have students make a list of the numbers. For effect cut out the numbers from 1 to 100 from an acetate copy of a Sieve of Eratosthenes. Put them on the overhead projector. Take a pencil with a loop of masking tape and systematically remove the composite numbers. The remaining numbers are primes.

Take fifty to one hundred pieces of masking tape, each about one inch in size. Fold them in half so that the sticky side is together. In half of them, put a penny. With your permanent marker, write the prime numbers on the pieces of tape that have no pennies. Write the composite numbers on the pieces of tape that have pennies inside them. Throw these numbers into a container of water. The composite numbers will sink, and the prime numbers will float. You can have the number 1 off to the side.

Take an empty 10x10 grid. In row six column five, place the number 11. Then begin wrapping the numbers 12 through 110 around 11 in a clockwise fashion. You will find many primes on the right diagonal of the line of numbers.

Return to Mathematics Index

A Fictional History of Place Value

Bette B. Jarrow
6634 N. Artesian Ave.
Chicago, Il. 60645
312-764-5544

Goudy Elementary
5120 N. Winthrop Ave.
Chicago, Il. 60645
312-989-5080

Objective:

When presented with a two or three digit number the child will be able to rename it in several different ways including expanded form. The child will also be able to perform addition and subtraction of two and three digit numbers with the application of regrouping and the use of zero as a place holder.

Materials Needed:

Disks cut from construction paper with correct markings, done in marker, and backed with small flexible sticky backed magnets (necessary ONLY if your black board is magnetic). Small disks with markings can be used as hand outs so that the children can work in pairs after the initial explanation has been made. A sense of the ridiculous and the ability to present it with a straight face.

Strategy:

Once upon a time ... in the days when cave men huddled about their fires. It occurred that a piece of meat fell into the fire. By the time he was able to stab it out of the coals he had discovered cooked meat and shish-ka-bobs. As his enjoyment of cooked meat grew he realized that by keeping 'cave-cows' he was able to always have meat and demonstrate wealth by being able to provide that meat to his family when ever desired.

Each day the cows would be allowed out of the cave to graze. Each evening they would be herded back into the cave so that they were not stolen or attacked and killed.

A system of checking every cow as she entered or left was necessary to be sure that they all returned. A 'one-to-one' correspondence was developed and soon our brave rancher was counting his cows by matching one cow with one pebble. If, at the end of a day when the cows returned, there was an extra pebble the rancher knew that he was missing a cow. If there was a cow with no pebble to match, then he knew he had an extra cow.

Time has passed and we see our hero at the local cave bar with a pouch of small pebbles. He brags to his friends about how many 'cows' he has. As he opens his bag and shows a series of pebbles, each representing a single cow, there occurs the typical comparison of my "ugh" pebbles more than your "ughh" pebbles. Spoken numeral names have not yet been developed.

As evolution occurs we see that our cave man has tired of carrying about all those little pebbles. Because of his great powers of observation he would use that which he saw every day, his fingers, as a basis or **base** for his numbering. And soon a "group of fingers" of pebbles (we'll call it ten) became one stone.

> In our terms: one group of fingers or one stone
> and three extra pebbles became one group of the
> base and three extra or 1 ten and 3 extra = 13

But I modernize too quickly. While at the bar our young genius has found that it is not always convenient to carry that bag with him at all times. He must have a method of notation. His notation would be representative of his pebbles and stones.

```
     And so:  each finger  --->   a little pebble ---> o
              a group of fingers -->  a stone   --->   (*)
      Two stones  --->  (*) (*)    and a hand of pebbles --->  ooooo
      A cave cow had a cave calf ---> o  extra.

Now the addition problem:      (*) (*)    ooooo    2 groups of 10 and 5 extra
                           +       (*)       oo    1 group of  10 and 2 extra
                           (*) (*) (*)    ooooo    3 groups of 10 and 7 extra
                                             oo         (or) 37
```

```
Every time a "group of fingers" of stones appeared, it was traded in for a
larger rock or:  oooooor= (*)        And so we experience the first
                 oooooot                recorded history of carrying.

          (*) (*) (*)   ooooo
       +                 oooo                 39       3 tens and 9 extra
              (*) (*)    oooo               + 24       2 tens and 4 extra

   (*) (*) (*) (*) (*)   oooooor=(*)                   5 tens and 13 extra (or)
                         oooooot              63         6 tens and 3 extra
                           ooo
```

-- -

```
And the subtraction problem:  (*) (*) (*)      oo    3 groups of 10 and 2 extra
                        -             (*)   ooooo
                                               oo    1 group  of 10 and 7 extra
           Translates to:
                                   (*) (*)   ooooo
                                             ooooo
                                                oo   2 groups of 10 and 12 extra
                         -             (*)   ooooo
                                                oo   1 group  of 10 and 7 extra
                                       (*)   ooooo   1 group  of 10 and 5 extra
                                                          (or) 15

A one-to-one-correspondence for cancelling becomes obvious and so:
        (*) (*) (*) (*)   ooooo
                              o         46          4 tens and 6 extra
       -        (*) (*)   ooooo
                            ooo        -28          2 tens and 8 extra
         Translates to:                 18
            (*) (*) (*)   ooooo                     3 tens and 16 extra
                          ooooo
                          ooooo
                              o
      -         (*) (*)   ooooo                     2 tens and 8 extra
                            ooo
                    (*)   ooooo                     1 ten  and 8 extra
                            ooo                        (or)  18
```

Return to Mathematics Index

Fundamentals of Multiplication

Carl D. Mason
3625 So. lake Park
Chicago, Illinois 6065
312-538-8133

Suder School
2022 W. Washington
Chicago, Illinois
312-997-3885

Objectives:

I will introduce third graders to the fundamentals of multiplication

(1) How multiplication is a quicker and neater form of addition

(2) How numbers in multiplication are placed into groups (or sets)

(3) How students within the classroom can simulate the concept of groups and (sets) to construct the visual effect of multiplication by way of forming groups of (2's) (3's) and (4's)

Materials:

cuisenaire blocks.

papers folded in half, thirds and forth

prop used to show an example of groups, pairs or sets

Teacher's Strategies:

Students will learn to add numbers and objects but the count will be equal in numbers and amounts

Students will learn with repeat addition that the larger your sum the longer and tedious your operation

Students will learn that addition is a slow type of multiplication
ex. 3 groups of 2's is 2+2+2=6

Students will reverse the order of 3 groups of 2's to 2 groups of 3 both operations will equal 6 as a product

Students will learn to put problems into simple word problems - ex. If 2 stamps cost 3 cents each how much will they cost? 2 groups of 3 is the same as 3+3=6. Six is your answer.

Classroom Projects:

Students will take 3 sheets of paper that have lines dividing it into halves, thirds and quarters. Horizontal lines interval of one inch from top to bottom.

Students will fold all 3 sheets along the fold lines.

Students will be given a problem 3 groups of 2's. The student will then take the paper folded in halves and then the student is to tear 3 groups of the horizontal lines so that they hold 3 strips the students will now count each fold which should equal 6.

Students will work cooperatively in groups of 3's.

Conclusion:

This program is design as an introduction of multiplication for third graders. I feel that the strips of papers can be another option for the teacher so that the class does not become to "cut an dry".

Return to Mathematics Index

Place Value

Ceopal Porter
22425 York Court 3F
Richton Park, Il. 60471
708-748-3702

Dr. Ralph J. Bunche
164th Park Avenue
Markham, Il. 60426
708-333-6625

Objectives:

The second grade students will:

1. Know the place value of the ones and the tens.
2. Know how many ones are in one ten.
3. Be able to write numbers using more than one place value.

Materials:

Cuisenaire rods, counting sticks, place value charts, and an overhead projector.

Strategies:

Tell the students to count the sticks as you hold up the sticks in front of the class. Once the ten sticks have been counted, put a rubber band around them. Have the students count four more sticks. Ask the students, "How many sticks am I holding?" "How many tens are there?" "How many ones?" Do several more examples using the counting sticks.

Present the cuisenaire rods to the students. Place on the overhead projector one orange rod and ten white rods. Tell the students that you want them to count the white rods as you place them on top of the orange rod. Ask the students, "How many white rods does it take to make one orange rod?" Then, say to the students, "We're going to call the orange rod the ten rod and the white rod the one rod." Draw on the board a place value chart. Then have a student come to the front of the class and place two orange rods and six white rods on the overhead projector. Ask, "How many rods are placed on the projector?" Once the answer is given, ask "How many ten's rods are there?" Write that answer in the ten's place on the place value chart. Next ask, "How many one's are there?" Write that answer in the one's place on the place value chart. Do several more examples.

Give each student a place value chart. Tell the students to place the correct number of rods on their chart in the correct position as you give them a number. Do several more examples using the cuisenaire rods.

For more practice give the students a worksheet concerned with the place value of the tens and the ones.

Return to Mathematics Index

Austin, Sarah Mary Bethun
5331 W. Gladys Avenue
Chicago, IL 6064
1-312-378-2186

Objectives

1) Students will learn that each part will be equal to its counterpart or parts.
2) Students will learn that all combined parts will equal one whole.
3) Students will learn that any shape can equally be divided into parts.
4) Students will learn to draw shapes and separate them into equal parts and write them in fractional form.

Equipment and Materials

Overhead Projector
Plastic Overlays and Transparencies
Pies, Knives, Apples, Cubes, Paper shapes shaded in 1/2's, 1/3's, and 1/4's
Plastic shapes

Recommended Strategy

1) Show the students models of shapes.
2) Have students name the shapes.
3) Have students cut the shapes into parts.
4) Have students switch around the parts.
5) Show the student that each part must be the same size, or equal to each other.
6) Use phrases like: is equal to, or the same as.

Evaluation

Have the student cut a pie in equal parts, and name the part they receive to eat.

Return to Mathematics Index

Fraction Message

Harper, Charles
2000 South 9th Avenue
Maywood, IL 60153
1-312-344-2844

Goldblatt Elementary School
1-312-638-7768

Objective

The student will be able to find pictorial representations of fractions and decode messages.

Equipment and Materials

Overhead projector	Transparencies	Typing paper
	Colored markers	Compass
	Cellophane tape	Protractor

Worksheet:

Prepare a worksheet using fractional statements that when solved, the student will get a letter (alphabet) which will be used in a code to solve the message. Example: "3 hrs. to a day"; "6 months to a year"; and "3 dimes to $.80." This information is placed in chart form with a space above each statement for a letter of the alphabet. When the statement is solved, the letter is filled in for that space. All the spaces are worked and filled in with the correct letter forming a code which will give a command for the student to carry out.

Transparencies:

Prepare transparencies which will show fractional parts of a circle. Color code each fractional part. A color can be used for all fractions showing thirds, fourths, and fifths. With typing paper, design the code by placing the letters (alphabets) in the lower corners and the fractional names in the upper right corner. Place the typing sheet behind the transparency and attach the top corners with tape.

Recommended Strategies

Review fractions by using the prepared transparencies. Remind the students that the numerator (number above the line) represents the sections used or shaded. The denominator (number below the line) represents the total number of equal parts of the circle. Discuss all transparencies and place them so that they can be viewed with the codes visible in a line. Distribute the worksheets in a pack or individually. Have the students solve each statement and identify the answer in the coded section near the top. The letter corresponding to the answer should be written above the statement. When finished, the student will read and act out the message. Allow time to decode and act out the message. Discuss any spelling errors. Make sure the entire class knows the correct answer before moving to the next message.

IDENTIFICATION OF EQUIVALENT FRACTIONS
MODIFIED RUMMY - CARD GAME

Jarrow, Bette B.
6634 N. Artesian Ave.
Chicago, IL 60645
1-312-764-5544

Goudy School
1-312-989-5080

OBJECTIVES

1) The students will interpret the meaning of a fraction.
2) The students will identify the fractional representation for "one whole".
3) The students will recognize the renamed fraction after it has been increased or reduced.
4) The students will apply these skills in a "card game".

Materials

A deck of 52 fraction cards
3 x 5 index cards cut in half to form 3 x 2 1/2.
There are 13 sets of equivalent fractions.

2/4	3/6	4/8	8/16	1/5	2/10	3/15	4/20
2/6	3/9	4/12	6/18	5/8	10/16	15/24	20/32
4/6	6/9	8/12	10/15	1/9	2/18	3/27	4/36
1/4	2/8	3/12	4/16	2/5	4/10	6/15	8/20
3/4	6/8	9/12	12/16	3/8	6/16	9/24	12/32
1/8	2/16	3/24	4/32	3/5	6/10	9/15	12/20
			1/6	2/12	3/18	4/24	

Cards should be labeled in alternating corners.

```
 ____________
|6/10        |
|            |
|            |
|            |
|            |
|            |
|            |
|            |
|            |
|            |
|_______ 0l/9|
```

METHOD OF PLAY

Two to four players. Cards are dealt one at a time in a clockwise manner such that each player gets seven cards. The deck is placed in the center and a single card is turned up as a waste pile. Play continues around the group as in traditional rummy (taking a card and making a discard.) The object is to get a group of either three or four cards that have the same equivalent and three or four cards with the same denominator.

```
  ________
 |1/4  ___|____
 |    |2/8  ___|_____
 |    |    |3/12  ___|____

Introducing Powers and Models.I

Barrett, Sarah
428 S. Taylor Ave.
Oak Park, IL 60302
386-7501

Mars Hill School
287-0025
5916 W Lake Street
Chicago, Il 60619

Objectives:

(Adaptable to grades 4-10)
-To discover how to square numbers; that squares are areas; the meaning of terms: Exponent, to the power of, etc.
-To visualize "to the powers of" 2, and 3, using a plane grid and a series of models of geometric shapes, of plane figures, then of solids; to see the relationships and certain properties of various geometric figures.
-To construct models after handling a series of models, and drawing them, to be able to describe squares, rectangles, cubes, triangles, triangular pyramids, tetrahedrons, hexagons, prisms, dodecagons, et al.
-To enjoy manipulating puzzle pieces to form some of the above shapes and figures by the correct assembly of pre-cut parts, to develop and reinforce concepts absorbed, as well as visualization and creativity in spatial relations.

Apparatus Needed: (Materials for chalkboard need to be adapted.)

Overhead Projector, acetate sheet with square centimeter grid pre-drawn on it, colored marker pens, clear plastic protractor, several pre-cut clear or translucent squares, rectangles, right triangles, (at least two with the same side measurements as the square and cube to be overlaid on the acetate sheet grid, and pairs of right triangles with differing sides which can be matched to form squares or rectangles when their right angles are placed in opposition), equilateral and isosceles triangles with which to form trapezoids, rhombi, parallelograms, hexagons, etc. and three dimensional figures, e.g. cubes, pyramids, tetrahedrons, etc.

Scissors, tape, and grid (graph paper or same unit grid sheets used on the overhead) to distribute to students, with and without patterns for models to be cut and assembled.

(Optional: Precut enough small right triangles to give each student one to keep.)

Game pieces and pre-cut puzzle sets, e.g., the Pythagorean rectangle, the square within a square, the dodecagon.

Recommended Strategy

Factoring Squares: to illustrate the power of 2 and that squares are areas.

On the overhead projector lay out a grid sheet. Number across the top and down the left side (x and y axis) to the same ending number. Beginning with square 1, ask students for the products of each number on the x axis across the top multiplied by its match down the y axis. Fill in the intersecting squares, or if pre-done, expose each using a cover sheet until the entire series of squares is complete. Outline the right and bottom perpendicular boundaries of each square thus produced with bright markers. Have students count at least the first few squares enclosed by each, to verify and visualize the meaning of area, (factors multiplied or squared).

As the diagonal bisecting each square develops down the grid, produced by filling in the products, ask students to identify it: the hypotenuse of the right triangles simultaneously produced.

Elicit observations of students about the intervals between the products of the factors squared. (Odd numbers; at higher grade levels, possible algebraic formulae to be derived, ...$y = mx + b$...). Write all valid statements on chalkboard, in addition to the "square facts," and terms illustrated, e.g. $3 \times 3 = 9, = 3^2$.

Collect the grids in sets of four and arrange them into the Cartesian Quadrants to display on a bulletin or window.

Models of precut squares can be positioned on the grid sheet on the overhead. Overlay right triangles bisecting the square diagonally. Derive the relationships of their angles and sides and their respective areas. Overlay examples of congruities and similarities. Move along in the same way with the cube model made by assembling six of the same squares used to start. Relate and show the other figures and shapes listed above, and others as desired. Follow this by identifying then distributing the models among the students to manipulate, draw, and tell/write observations about, as well as name. Be sure to reinforce by writing names, terms, observations on the chalkboard, and by repeated questions. Ask students to explain, demonstrate, show their model-making, and to assemble the puzzle parts named above.

Math Technique in Multiplication and Division of Fractions

Garth, Frieda
4850 Lake Park Avenue
Chicago, Illinois 60615
924-0217

Farragut Career Academy
762-2421

Instructional Objectives:

1. To multiply fractions by whole numbers and fractions.
2. To divide fractions by whole numbers and fractions.

Review Objective:

To review unit concepts and skills.

Apparatus Needed:

2-Poster Boards (size 22" x 28") divided in three parts: center square (8"x 8"); second section (9" x 7 1/2") from center point of the poster; third section (out side spaces) (5 x 3 1/2") from second section. Center square is used for placing different numbers as the whole number or mixed fractions. The second sections are used for fractions. The third sections (outside spaces) are used for one or two answers. Black marker, ruler, magnetic tape and nine (9) squares (8"x8") with numbers from 2, 3, etc. The fractions were placed in the second section with a black marker before laminating, which was done at the Bd. of Ed., 3th floor west.

Recommended Strategy:

This mini teach is directed toward learning disabled students, but this is a problem common to all students. To understand the basic concepts of fractions, demonstrate step-by-step procedures to be used in this lesson. Teacher will use center square of the posterboard, placing a whole number in the center. Fractions are on the second section of posterboard and the third section of the posterboard will be used to compute student answers. Example 8 x 3/4 = 6; 8 x 1/6 = 1 1/3. Posterboards will be attached to blackboard with magnetic tape. These steps (multiplication or division) may be repeated more than once, because there are eight fractions on each board and a different whole number can be used as often as needed. Students will note that their answers can be found simply by multiplying whole number by numerator, then divide by the denominator to get the product. Teacher will introduce concept of dividing fractions with second posterboard in the same method, step-by step procedures in dividing fractions. Give the numerators and denominators colors, like red for numerators and green for the denominators. Students can see the interchanging of numerator and denominator, which is called the reciprocal of the fraction. Example, the reciprocal of 3/4 is 4/3. Have the students complete the exercises, this can be used to provide stimulation and practice.

This step may be repeated more than once, because there are eight fractions on each board and use a different whole number, if you so desire. Have the student to note that answers could be found simply by multiplying whole number by numerator, then dividing by the denominator to get the product.

Return to Mathematics Index

Introduction to Fractions on the Numberline

Jones, Claudia R.
7541 So. Crandon Avenue
Chicago, Illinois 60649
375-8261

Crane High School
997-3750

Objectives

Students often have trouble (for any number of reasons) reading fractional parts of an inch on a ruler. They also have difficulty dealing meaningfully with the typical numberline because it does not readily lend itself to the students being able to recognize fractional parts or mixed numbers in correct ordering or sequencing. Using color-cued fraction strips in conjunction with color-cued numberlines and color-cued denominators, along with other manipulatives, the students will be able to use the numberline to:

1. Correctly order and sequence fractions;
2. Compare, add, and subtract fractions;
3. Change mixed numbers to improper fractions;
4. Change improper fractions to mixed numbers;
5. Find a fractional number between any two fractional numbers.

Apparatus Needed

Color-cued fraction strips (whole, halves, fourths). Numberlines, color-cued (four different sizes), with color-cued denominators. Above items drawn on white posterboard and laminated. Magnetic tape, transparency sheets(4), rulers, overhead projector, projector pens, markers and worksheets.

Recommended Strategy

The teacher will discuss some of the difficulties students are having when working with fractions, such as: their inability to write or name the points correctly on a typical numberline (here teacher shows the drawing of a typical numberline). The teacher will also display an example of positive and negative rational numbers being used on the numberline, using the overhead projector. Students will be given color-cued fraction strips to develop basic fraction concepts and correct sequencing. Once they are familiar with the use of the fraction strips, they will work with those fraction strips on the numberline, which will also be color-cued for an easier transition. For this lesson we will use only four segments of fraction strips on the numberline (wholes, halves, and fourths). Students will review the following terms: fraction, improper fractions, equivalent fractions, and mixed numbers. A worksheet will be given on the use of equivalent fractions to reinforce learning.

The students will practice again with the color-cued fraction strips to further develop basic fraction concepts and correct sequencing. Also, they will use the color-cued fraction strips above the numberline which will provide immediate reference to the concrete and because of the visual cueing, they will be able to proceed comfortably with other work on the numberline.

With concrete examples and demonstrations by the teacher of how the numberline can be used to find an infinite number of fractional numbers, shown on the overhead projector, the students will be able to:

1. Write a coordinate for each dot on a given numberline;
2 Correctly order and sequence fractions on the numberline;
3. Express improper fractions as mixed numbers;
4. Change a mixed number to an improper fraction;
5. Find fractional numbers between any two fractional numbers where

$$\frac{a + b}{2}$$

Students will be given worksheets that parallel, step-by-step, what is being demonstrated by the teacher on the overhead projector and the blackboard.

Use of the color-cued fraction strips and color-cued numberline will help those students who are having problems find answers to some of their more difficult problems when using fractions on the number line.

Return to Mathematics Index

Equivalent Fractions

Williams, Flora
4837 W. Hirsch
Chicago, Illinois 60651
921-5537

O. A. Thorp
545-0169

Objective:

Students will be able to recognize fractions of equal value and that name the same amount (number).

Materials:

Paper strips, circles, scissors, paper

Recommended Strategy

Have students fold strips to show halves, fourths, and eighths. Next have students cut circles to show thirds, sixths, and ninths. Students will then tell fractions that name the same amount by taking the fraction strips and measuring. Teacher will ask questions like, "How many of the parts on a fourths strip are the same or equal to one half"? Have students work in small groups to find equivalent fractions given by the teacher. Students will take circles, cut sections and match equivalent fractions.

Give students worksheets with strips and let students shade areas to show equivalent fractions. To reinforce fractions, let students play Fraction Bingo. Fraction Bingo is played by giving each student a game card. A game card has ten squares and each square has a fraction. A student may cover a square when the fraction in that square is called or an equivalent fraction is called. The regular rules of bingo apply thereafter. Another game that can be used is Fraction Rummy. Teacher will prepare 40 cards (index cards are very useful) by writing either a fraction or an equivalent fraction picture on each card. Each of two to four players is given seven cards; the rest are placed in a stack faced down. Turn one card face up. A player may take the card that is face up or a card from the stack. Every time a card is matched, a player may lay the pair down. The object is for one player to play all of his or her cards.

Return to Mathematics Index

Introducing Powers And Models.II

Barrett, Sarah
428 S. Taylor Ave.
Oak Park, IL 60302
386-7501

Mars Hill School
287-0025
5916 W Lake Street
Chicago, Il 60619

Objectives:

Additional Activity: Multiplication Rummy

A card game to practice rapid calculation and increase the acuity of excellent students.

Encourages initiatives to create variations of this game, as long as rules are fair and consistent.

Apparatus (Materials) Needed

A pack of index cards (both sides blank are best), cut in half, i.e. 2 1/2 x 3 inches, markers to number the cards.

Recommended Strategy

Choose the times table products and factors to be practiced, and mark each number on one card. Include at least 50 in total, for 2 to 5 players, double all numbers for a double deck for 6 to 8 players, the maximum to play together. Have students make more decks for more groups. Operation cards may be included for a game in which more than one operation can be used.

Deal one card at a time, until all players have five each. The top card of the center pile is turned up next to it.

The first player left of the dealer begins by taking a card, either the one turned up already or the top of the center pile. He looks for a true statement to lay out on the board, (the table) from the cards he holds, e.g. 7, 8, 56. If he has a true combination, he calls out the equation while laying down cards for all to see and agree. He then puts these in his personal "book" (or pile), to be totaled at the end. One card is discarded, placed on top of the turned up one next to the center pile, at each turn. If a player makes no statement, he is still to pick the top card, and discard with each turn. Play continues until either the center deck is finished, or one player has used all his cards to lay out statements. Winner may be the one to go out first, or the one with the highest total by adding his personal book, pack.

Individual students may be assigned (rewarded) the task of designing the backs of a game deck.

Return to Mathematics Index

Understanding Fractions

Bradley, Florida
4850 S. Lake Park
Chicago, Illinois 60615
538-7348

Hartigan
548-1811

Objective:

Students will be able to recognize and understand equal fractions in relationship to a whole unit.

Materials Needed:

Construction Paper (cut into strips of equal widths and lengths)
Paper clips
Pen (preferably black)
Cookbooks (for recipes)
Patterns (for sewing)
Scissors
Various fruits (cut into fractional parts, which may be shared with the students at the end of this activity)

Recommended Strategy:

Discuss with the students the fact that fractions are a part of their daily lives. Elicit from the students some of these areas. The students should tell you of such fractions as related to cooking, sewing, money, food, etc. Have samples of foods, vegetables, patterns, cookbooks, etc. divided into fractional parts. Give the students an opportunity to touch and discuss these items. Depending on the level of the students, you may want to stop the lesson at this point until another day. If you are going to continue, proceed in the following manner.

Using assorted sheets of construction paper, cut each sheet into strips of equal widths and lengths. Your first strip will represent a whole unit. With a paper clip, make a bundle of strips of various colors for each student. Have the students lay the first strip out on their desk. The first strip will remain a whole unit. Tell the students this strip will represent a whole unit. The second strip will be folded into two equal parts (one-half, 1/2). At this point, have the students compare 1/2 strip with the whole strip. How many halves make a whole? Elicit from the students the correct response and discussion of the meaning of one half. The next strip should be folded into three equal parts (one-third, 1/3). Be sure to give the students an opportunity to experiment with the folding. Some of them may need help. Have the students compare 1/3 strip to the whole strip. How many thirds make a whole unit? Give the students an opportunity to compare and discuss. Have the students compare 1/2 and 1/3 strips. Which is the largest, 1/2 or 1/3? Be sure to allow the students time to compare and discuss. As you allow the students to fold each strip, be sure to have them draw lines to show the divisions of each part of the strip. The students should also be allowed to write the fractional names on each part. Proceed in this manner until you have reached 1/6. At this point you should stop with the folding. If there is enough time let the students compare the fractional parts they have made and see if they can make other fractional parts(i.e. fold 1/2 in half to get 1/4, fold the 1/4 in half to get 1/8, fold the 1/5 in half to get 1/10, etc). This lesson can be continued for several days depending upon the level of your class. You may use this folding activity to show other mathematical operations.

Return to Mathematics Index

Odometers and the Place Value Chart

Bronson-Cochran, Donna
2921 S. Michigan
Chicago, Illinois 60616
(312) 225-4146

George B. Swift
(312) 989-3795

Objectives:
To add decimals with the use of the odometer; To place given numbers on the place value chart; To add numbers to the millionths on the calculator.

Apparatus needed:
Place value chart, calculators, overhead projector, projection calculator, lightweight cardboard, cutting instrument (scissors and single-edge razor blades), masking tape or scotch tape, pencils, straight edge and markers.

Strategies:
Students will begin to make odometers by cutting five rectangular shaped holes out of a piece of lightweight cardboard. Another long strip of card board can be taped to the back at each end of the strip. Now students are to make narrow strips (one strip for each hole cut) with the digits 0 through 9 written on them, spaced at even intervals. These are then looped behind the cardboard strip on the large card. The digits should then be able to show through the windows. Students can locate the decimal point to show tenths, then label the "odometer" to indicate kilometers.

To add 58.2 km and 63.9 km, one first registers 58.2 on the odometer, then turns the tenths loop nine units. When a zero is reached in the tenths window, the ones are increased by 1 just as an odometer in a car would function. The student works successively from right to left, increasing the ones column by 3, and tens column by 6, remembering that when a zero is reached in a column it should trigger an increase in the column to the left. Students should practice several problems using the odometer.

Activities
For this activity you will need a place value chart. The chart could be purchased or you could make one yourself. If you decide to make the chart it can be extended to include as many decimal places as you need. You will have many examples of number like sixty-seven and four thousand two hundred fifty-one millionth, seventy and one hundred twenty-twenty-three thousandths. Each number will be written on a card and the students should be able to place them correctly on the place value chart.

Another activity that could be used is working with the projection calculator. Students should use their calculators to add decimals.
Example 258.009878 + 009.787 + 89.1949 +.78
You will do the same problem using the projection calculator and the overhead projector.

Return to Mathematics Index

Basic Mathematical Operations Using Mathtiles

Jones, Claudia R.
7541 S. Crandon Ave.
Chicago, Il 60649
(312) 375-8261

Farragut Career Academy
(312) 762-2421

Objectives:

Using a concrete model, MATHTILES--

1. The students will be able to do addition-
2. The students will be able to do subtraction-
3. The students will be able to do division-
4. The students will be able to do multiplication-

of whole numbers, which will enable them to develop better math skills with the use of these manipulative materials.

Apparatus Needed:

Six (6) sizes of MATHTILES, which includes the following sizes -- Unit tiles or 1-tile (1x1); 5-tile (1x5); 10-tile (1x10); 25-tile (5x5); 50-tile (5x10); 100-tile (10x10). One display board, MATHTILES Manual, Overhead projector, magnetic tape, posterboard, transparency sheets, pen to use with the overhead projector, and Labsheets for addition, subtraction, multiplication and division.

The six sizes of Arithmetic Tiles used as visual aids in my Mini-Teach were cut out of plexiglass in the lab. The posterboard was laminated at 1819 W. Pershing and then I used a scale of 1/2 inch to an inch to cut out the manipulatives that were used by the class to do the mathematical operations on the labsheets.

Recommended Strategy:

The class will begin with an explanation by the teacher of the kinds, values and uses for the MATHTILES in the classroom. Students will learn that MATHTILES are manipulative learning materials designed to be used in Arithmetic and Algebra and that they can be used at many levels, second grade through high school.

There are two kinds of tiles: the Arithmetic Tiles which consist of all the rectangles which can be built with sides measuring either 1, 5, or 10; and the Algebra Tiles which includes all the rectangles whose sides are either 1 or X, where X is not a whole multiple of 1. The Algebra Tiles will not be used in this lesson since we are doing the basic mathematical operations of addition, subtraction, multiplication and division.

The six sizes of Arithmetic Tiles in the set are used to represent whole numbers. The value of an Arithmetic Tile is the number of unit tiles needed to cover it. For example: The 1-tile or unit is (1x1); 5-tile is (1x5); 10-tile is (1x10); 25-tile is (5x5); 50-tile is (5x10); 100-tile is (10x10). At this point, the teacher will display the different sizes of tiles on the blackboard and also pass out a sheet showing the tiles and the value of each.

Discussion will continue and the teacher will describe the different things that you can do with MATHTILES, such as: Finding the value of groups of Arithmetic Tiles; Predetermining values; Trading groups of tiles to solve problems; Computing addition, subtraction, division, and multiplication.

The teacher, with students helping, will do samples of each of MATHTILES basic operations on the overhead projector; also an explanation will be given at each stage of the operations on the procedure to follow while working with the MATHTILES. For example: when trading tiles, students will be made aware of the restrictions that permit trading only between groups of tiles that have the same value. You can trade a 5-unit tile with a 5-tile when needed, just as you exchange 5 pennies for a nickel.

Procedures:

ADDITION--when adding, represent each number to be added by a group of tiles. Then combine these groups into one group. The combined groups of tiles then represents the sum.

SUBTRACTION--when subtracting, only set out tiles to represent the first number in the problem. Then take away tiles representing the second number. The group of tiles remaining is the answer.

DIVISION--when dividing, display the product on the surface of the display board and the known factor along the vertical edge of the board. Then use the tiles on the board's surface to build a rectangle having one dimension as indicated by the tiles along the edge. Then we place additional tiles along the horizontal edge of the board to measure the rectangle's second dimension. This length is our missing factor. Division problems are computed using the MATHTILES Board.

MULTIPLICATION--multiplication problems are done on the MATHTILES Display Board. The two numbers to be multiplied are shown by placing tiles in the grooves along the left and bottom sides of the board. Then a rectangle with these dimensions is built on the flat surface of the board using additional tiles. The area of this rectangle is the product of the two numbers to be multiplied.

Throughout the lesson and at each step, students will be given Labsheets to do the computations for practice. Students will work at their own pace since it is not necessary that every problem on the Labsheets be done.

Complete Classroom Sets with 180 reproducible labsheets is available from--Key Curriculum Press
1150 65th Street
Emeryville CA 94608
(888) 877-7240

Adding Integers

Thomas, John Charles
4539 S. Oakenwald
Chicago, Illinois 60653
(312) 924-2640

N. F. Simeon Voc. H. S.
962-2800

Objectives:

1. The students will be able to add integers.
2. The students will be able to subtract integers.
3. The students will be able to define:
    - A. Additive inverse
    - B. Identity element of addition
    - C. Associative property of addition
    - D. Addend
    - E. Sum
    - F. Magnitude
4. The student will be able to follow oral directions.
5. The student will be able to add and subtract integers without using the adding machine.
6. The students will be able to write a definition for adding integers and one for subtracting integers.

Apparatus Needed:

1. Poster board. (11" x 14")
2. Cut strips of paper from the poster board of a pre-determined length and width.
3. A ruler or a straightedge.
4. Pencils.
5. Felt tip pens to write the numerals on the adding machine.

Recommended Strategy:

I will tell each class that we are going to make an adding machine. We will make a machine out of paper. This machine will add certain combinations of integers. (Note: The extent of the combinations depends on the length of the scales on the "Addend" number lines.) Let's get the show on the road. I will give each student a strip of paper and a ruler. The paper has three lines on one side. Turn that side face up. We are going to divide each line into two equal parts. (Note: Give oral instructions as well as visual instructions for dividing the line into two equal parts.) Ask the students to put a tick mark," - ", at the midpoint of each line. Tell students to put a zero besides each tick mark on the lines. (Note: Turn rulers to the metric side.) Put a tick mark one cm (centimeter) apart on the line in the middle. Put a tick mark two cm apart for each of the other two lines. (Note: Check the students' papers for accuracy.) We are ready to write the numerals on the **adding machine**. Count upward using positive integers for each tick mark. Count downward using negative integers for each tick mark. (Note: Check papers for errors.)

Now, let's label the lines. Write the word, "SUM," over the line in the middle. Write the word, "ADDEND," over each of the other two lines. You have just made an **adding machine**.

Write "ADDEND + ADDEND = SUM" on the board or overhead projector to explain adding two integers. Write any combination similar to the one below.

+6 + (+4) = +10
+6 + (-4) = +2
-6 + (+4) = -2
-6 + (-4) = -10

Ask the students to connect the "ADDENDS" with their ruler or straightedge to verify the answers. (Note: If the same combinations are used, the students will, hopefully, intuitively determine a definition for adding or subtracting integers.)

Write "SUM - ADDEND = ADDEND" on the board to explain subtraction. Write several combinations similar to the one below.

+8 - (+5) = +3
+8 - (-5) = +13
-8 - (+5) = -13
-8 - (-5) = -3

The students can verify the answers by connecting the "SUM" and the "ADDEND" with a straightedge.

This approach has worked for me in the past.

Locating Rational Numbers On the Number Line

Winebrenner, William
4722 N. Winthrop Av.
Chicago, Il. 60640

Dunbar Vocational
567-5400

Objective:

1: The learner will use the name RATIONAL NUMBER when referring to locations on the number line.
2: The learner will write rational numbers as the ratio of two integers.
3: The learner will convert each rational number to a mixed number.
4: The learner will divide any given length into n equal parts.

Apparatus Needed:
Number line, straight edge, compass, pencil, paper.

Recommended Strategy:
Once the student is comfortable with the concept that integers, positive and negative, can be located on the number line, proceed to identifying all rational numbers as a ratio of two integers. If the rational number is an improper fraction, convert it into a mixed number. It will then become obvious between which two integers is this rational number. For fractional parts of the next integer, such as divisions of 5ths or 7ths, for example, the problem is how to divide the line segment into n equal parts. This lesson is about how to locate the rational number on the number line which is a fractional part of the next integer.

1. Teach the student that to divide any given length into n equal parts write the fractional part in the form a/b where a and b are positive integers (a rational number).

2. Change improper fractions to mixed numbers so that a/b = k+(m/n) where k is a positive number and the fraction m/n is converted to lowest terms.

3. Divide the line segment between k and the k+1 position into n equal parts, which can always be done by straight edge and compass construction, by marking off n equal parts on a **y-axis** and marking off the length of the line segment on the **x-axis**. The two axis do not even have to be at right angles to each other. Connect the last nth position with a straight line to the end of the line segment on the **x-axis** and proceed to construct n similar triangles. You will see that the line segment is now divided into n equal parts.

4 .Physically place this divided line segment on k and k+1 of the number line and count off m divisions. This is the location of the

a/b rational number.

5. For negative rational numbers teach the same strategy and instruct the student that this rational number is on the left side of the zero number.

CONTINUED FRACTIONS WITH A CALCULATOR

Fred J. Schaal
Lane Tech High School
Addison & Western
Chicago, IL 60613
1-312-880-8100

Objectives:
To learn how to evaluate Continued Fractions by taking many reciprocals with a calculator.

Materials:
Paper, pencil and a hand calculator--preferable a freebie-from-the-bank-four-banger type.

Strategies:
Use the definition of a Continued Fraction to generate various examples. Try to predict the value of the current fraction in the light of previous work. Keep it very experimental. Should interest wane, give several examples of rational numbers expressed as Continued Fractions. Should even this become boring, give the expression for tan z as a Continued Fraction and try it out for several values of z in radian measure. (I doubt that either of these alternatives will be necessary in a single class of 40 minutes.)

A FEW NOTES:
I initially encountered Continued Fractions (henceforth C.F.) as problems from the contests that our Lane-Tech-math teams enter. I began to play around with them just to see what would happen. They are fun this way.**This is the phenomenological way I want to present them in this mini-teach.**
This mini-teach on C.F. has driven me to the library for a look at several math dictionaries. Most of the 7 or 8 that I found discuss Continued Fractions. Some tell you more than you would ever want to know.
Barnes and Noble's **Dictionary of Mathematics**--1972, Millington and Millinton--defines a continued fraction as "an integer and a fraction, the denominator of which is also an integer and a fraction, etc." **This definition is the springboard for my lesson.**
Simon and Schuster's **The Universal Encyclopedia of Mathematics**--1969--states that:"Every rational number a/b (a, b positive integers) can be developed as a continued fraction." This idea is beyond the original scope of my mini-teach, but if I get stuck I shall try several examples. Recall my strategies above.
Also from the above source I found these lines: "Irrational numbers can be developed as infinite continued fractions. Conversely every infinite continued fraction in an irrational number." I shall not get to these ideas in this introductory mini-teach, but they could be dealt with in a future class, should sufficient interest arise.
In MIT Press's **Encyclopedic Dictionary of Mathematics**, written by the Mathematics Society of Japan, I found an expansion of tan z as a continued fraction with powers of z in the denominators. A trig-conscious class could try several values of z (in radians) just to see if it works.

Mathematics/Physics

Collecting Data and Graphing

John Ramsey, Jr.
5831 W. Augusta, Apt. 2
CHICAGO IL 60651
(773) 378-7647

Morton Career Academy
431 N. Troy Street
CHICAGO IL 60612
(773) 534-6791

Objectives:

This is a multi-level lesson:

- To count the number of different colored cubes.
- To work in pairs cooperatively.
- To construct a graph using various data and where to plot it.
- To see the relationship of student's arm span versus height.
- To learn to use the meter stick.
- To compare data with their friends.

Materials:

2 cm. sq. interlocking cubes, graph sheets, crayons, rulers, and meter sticks.

Strategy:

- To count the colored cubes and see who has more or less of each color (Comparing).
- To sort or group the cubes by colors.
- To graph your results onto the graph paper.
- To work in pairs to measure arm span and height.
- To record your results in centimeters and inches.
- To compare your results with the rest of the class.

Performance Assessment:

To check the student's understanding of this experience with measuring arm span versus height, let the students measure each other with the meter stick. Graph another classroom with the same age as your class, to compare data. Draw conclusions can be learned form both experiments.

Conclusions:

The students will be able to become familiar with these two experiments. Also, they will learn to graph using the data they have collected and how to use a meter stick.

Chandra E. Price - Burnham Inclusive Academy

Environmental Graphing/Eco Graphs

Chandra E. Price
10516 S. Woods St.
CHICAGO IL 60643

Burnham Inclusive Academy
1903 E. 96th St.
CHICAGO IL 60617
(773) 535-6530

Objective(s):

Grade levels 2nd through 4th
Duration: 1 week

Students will be able to:
1. define what a graph is
2. use vocabulary words associated with graphs
3. note how graphing is a part of our everyday lives

Materials Needed:

List vocabulary words associated with graphing ---hypothesis, control, graph, prediction, set, relationships greater than (<), less than (>), equal (=), percent and symbol (%), average, data, compare, centimeter grid, fractions, grid, balance, mass, paper, pencil chalk, raisin bread, M & M, crayons, birthday hots, graph paper, magnifying glasses, paper clips, scissors, masking tape and dittos.

Strategy:

Activity-1 Bar/Human Graph...Students will be introduced to bar and human graphs by way of an individual and group activity. They will work in groups of three and circulate around the room and report back to the group how many people were born in what month of the year. They will use data tables with the months of the year and a place to record students names. Next, the students will make birthday hats (Note: create their own hat), and make a human graph. Finally, they will go back and record their data on their data sheets. (Note: Data will be recorded on a teacher made graph chart which can be displayed either on the blackboard, overhead or floor).

Activity-2 HOW MANY RAISINS ARE IN RAISIN BREAD?....Students will be introduced to the term estimation. Using everyday items, such as raisin bread they will estimate and use the actual results of their findings. This will also allow them to sort, compare, record and eat their results.

Activity-3 YOU GOT THE BLUES?.....Students will get added reinforcement of the term estimation by using M & M's or Skittles to see if one color of the candy is more prevalent than another. This will be done when students are given individual bags of M & M's or Skittles to actually see for themselves. They must sort, compare and count colors. Then, they will group the colors, note how many of each color their are and record their findings. (Note: Depending on the age level students will solve problems of greater or less than, and /or percent.) They will again see how graphing relates to our lives.

Activity-4 Spinning Ghosts?????? The students will be able to hypothesize which Ghost will spin. Students will obtain four paper clips and five ghost patterns. They will number (1-5) and cut out the patterns, and place one of the paper clips on different locations of 4 of 5 ghosts. The remaining ghost that doesn't have a paper clip will be the control. The questions for the students will be what causes the ghost to spin? (Note: Students need to diagram each ghost and location of the paper clip on a separate sheet of paper). Using their numbered GHOSTS they are to place their findings on a wall chart.

Performance Assessment:

1. oral assessment of each activity. (informally)
2. written evaluation of objectives and key concepts.
   (multiple choice and essay)
3. Tape recording of lesson.
4. Video of lesson

Conclusions:

With 80% accuracy, the students will be able to explain orally how graphs affect our every day life.

Frana Allen - SKinner School

The Ups and Downs of Graphing

Frana Allen
4747 South Kenwood
CHICAGO IL 60615

Skinner School
111 South Throop
CHICAGO IL 60607
(773) 534-7790

Objective(s):

The students (grades 4 through 8) will be able to: distinguish between qualitative and quantitative experiments, define manipulated, responding and controlled variables, graphing, horizontal and manipulating axis, extrapolation and interpolation.

Materials Needed:

Individual Activity: graph paper, colored pencils, pencil and paper, a transparent ruler

Strategy:

For the teacher: (Teacher's language is important don't let it hang YOU up....Have fun with this, MY KIDS DID!) Teachers.....This is an introduction to the quantitative approach to science that I feel is easy to learn. I remind the students through visual aides the difference between quantitative and qualitative approach to science graphing. Note: It is imperative that the students are ready to graduate from bar graphs to point graphs. I explain to the students that the point graph replaces the bar with a dot or point at the center of the top of the bar. Using the chalkboard, I have the students write the definitions of the terms they will use in doing the experiment. Graphing is fun.....but, there are certain facts one must keep in mind when doing graphing...I remind the students that all the data points are not going to fit perfectly; however, we must really try to fit them perfectly. We must fit a straight line through the area of the data points. It should be noted that if they do obtain data points that do not fit a straight line, it is due to the problems in obtaining the data, unsteady hand, and or a poor read. To assure a good fit, also, known as the best fit line, remind the students that they should make as many points on the graph as possible.(At least 3). When students look at the data points on a graph to draw a conclusion it is called, interpolation. Sometimes experiments require students to make a prediction beyond the last data the last data point this is called extrapolation.

It is important that the students know that in this experiment they will be counting in centimeters (cm).

Part 2

BOUNCING BALL EXPERIMENT

Materials:
Cooperative Groups of 3---2 meter sticks, 1 tennis ball, 1 super ball, strip

of masking tape, 1 additional sheet of graph paper. Note: This is one group set up.

Procedure:
1. Remember each students should have a job
   Recorder, materials gatherer, director, experimentor, etc.
2. Go over the vocabulary used in the experiment
3. Go over the expectations you want each student and group of students to do
4. Read the procedure with the students
5. If you find it necessary, demonstrate the set up

Performance Assessment:

Bouncing Balls Data Sheet
Label drawing of experiment. Note: H1 is the release height and H2 the bounce height. Label H1 and H2 in your drawing.
1. Which is manipulated variable?
2. Which is the responding variable?
3. What variables are held fixed during the experiment?
4. Why is it a good idea to carry out at least three trails for each value of H1?
5. Why did you take an average numerical value H2?

......Graphing....................

Note: You are going to plot the averages of the tennis ball and the super ball on the same graph. Use colored pencils to identify the ball i.e. green for tennis ball and blue for tennis ball.
Work together and use your notes...................

Answer the following questions:
1. On which axis (horizontal or vertical) did you plot the manipulated variable?
2. On which axis (horizontal or vertical) did you plot the responding variable?
3. Did you plot your data according to the sequence (H2, H1) or (H1,H2)?
4. Is (O,O) a data point?_________________Why?_________________________

Conclusions:

The students will be able to answer the following questions with 80% accuracy.

Bouncing Ball Experiment
1. What type of experiment was this?
2. Is the type of ball qualitative or quantitative?
3. What are the two main variables on this experiment?

Using the graph you just did.........answer the questions 1-4
1. If the release height of the tennis ball is 60 cm, what is the rebound height?
   Did you use interpolation or extrapolation?
2. If the release height of the tennis ball is 160 cm, what is the rebound height?
   Did you use interpolation or extrapolation?
   Check your prediction experimentally. Was your answer approximately correct?

3. If the tennis ball rebounds to a height of 140 cm, from what height was it released?
   Did you use interpolation or extrapolation?
4. If the release height of the super ball is one meter, what is the rebound height?
   Did you use interpolation or extrapolation?

Jamal Brown - Daniel Hale Williams

Teaching Arithmetic and Math Concepts To Headstarters

Jamal Brown
5208 S. Ingleside
CHICAGO IL 60615
(312) 358-7521

Daniel Hale Williams
2710 S. Dearborn
CHICAGO IL 60616
(773) 534-9226

Objectives:

To help students recognize numbers, compare sizes of objects, and recognize one-to-one correspondence. The students will learn to recognize numbers 1 to 5 as they are named. They will also be able to count up to 5 and place items into groups of one to three as directed. In addition, students will compare objects by size (eg,small, medium, large). These activities are designed for three year old Headstarters at Daniel Hale Williams Elementary School.

Materials Needed:

Blocks
Paper Sticks
String and Beads
Tongue depressors
Construction Paper
Glue
Trays
Puzzles
Story Book

These materials are modeled by the teacher and used by the students in learning centers. The centers are occupied by three children. We will have three learning centers. One center contains blocks. Center two contains puzzles and the third center is the library in which the teacher will read a counting oriented story.

Strategy:

The children will learn through discovery. The teacher will model each exercise by describing what a block is, its color, and the number of blocks that they will use. Next, the teacher will provide string and beads to continue the process. Children will volunteer to discover numbers, counting and the comparing of blocks by size. These activities will strengthen their gross motor skills. Furthermore, the students will glue paper sticks to construction paper under the direction and instruction of the teacher. This exercise will show that the children can interact socially with one another as well understand the basic concept of one-to-one correspondence. Finally, the Assistant will read the storybook to the class; the story contains numbers and objects that relates to placing items into groups. These tasks are helpful in the development of better cognitive skills for children.

Performance Assessment:

Students will perform each task appropriately after the teacher's demonstration. Formally, the children are assessed after 45 days of repeated and consistent exposure to the math concepts. Informally, the teacher is observing each child to evaluate the child's performance on a daily basis. These observations are ultimately declared to a federal agency of the government.

Conclusion:

Students have gained a thorough and basic knowledge of number recognition, one-to-one correspondence, and comparing objects by size.

Shirley Hatcher - Daniel Hale Williams

Watermelon Graphing

Shirley Hatcher
400 East 33rd Street
CHICAGO IL 60616

Daniel Hale Williams
2710 South Dearborn
CHICAGO IL 60616
(773) 534-9226

Objective(s):

To familiarize primary students with graphing using a bar graph. Identify the parts of watermelon seeds and other seeds. Increase the students vocabulary by using the proper names and common names which refer to the parts of the seeds. To understand further the functions of parts of the seed.

Materials Needed:

Graphing paper, butcher paper, pencils, markers, index cards, and whole watermelon and various seeds (peanuts, lima beans, broad beans, etc.)

Strategy

The teacher will slice a whole watermelon. Then the teacher will divide the students into four groups. Then students will, in aggregate, eat the whole watermelon and estimate how many seeds are in the watermelon. Next the students will get into four groups and count the seeds and calculate the total number of seeds in the entire watermelon. The teacher will cut open a watermelon seed as well as other types of seeds. Other useful seeds are lima bean, peanut, and broad bean. The parts of the seed, which is an embryonic plant, will then be observed, both with the naked eye and with the aid of magnifying glasses. These parts are the hypocotyl, the embryonic stem; the epicotyl, the embryonic leaves; the radicle, the embryonic root; and the cotyledon(s), parts of the seed that serve as a food store for the germinating seed and will be the first leaves of the new plant.

Performance Assessment:

The students should be evaluated on the basis of how accurately they count seeds and complete the graph. They can also be tested on their understanding of the parts of the seed and the function of each part.

Conclusions:

It may also be of interest to contrast fruits that produce single seeds (like peaches) and many seeds (like watermelons). The class can also discuss how seeds and fruits develop from flowers.

History Of Our Solar System on a Time Line

Richard Murray
1800 Euclid
Berwyn IL 60402
(708) 795-4729

Gage Park High School
5630 South Rockwell
Chicago IL 60629
(312) 535-9230

Objectives:

The Students will be able to use ratios to make scale models.

Materials needed:

Tape measure or a length of rope, masking tape and a marker or chalk. A space where distance can be measured in a straight line (like a hallway or a sidewalk). A calculator should be used for all calculations.

Strategy:

In the classroom you discuss with your students what a billion years mean. Develop the idea with the students that they need to compare a billion years to something they are familiar with. Suggest that they compare the 4.5 billion years the Earth has been around to 100 feet or 100 meters.

Draw a line on the board and tell the students that this line will represent the start of the Earth to present time. Ask the students where on this line did the dinosaurs exist. Most students will make choices around the midpoint. Note the students choices on the board, come back to these estimates after the students have done the calculation and have plotted points on the 100 foot (meter) line.

Discuss with the class that ratios are comparison of two numbers. Ratios can be written as a fraction. The comparison that is being made is that of Distance over Time; that is, 100 feet (100 meters) over 4,500 million years. Pass out a sheet that has various geological time periods listed. For example the Paleocene period was 65 million years ago. Set up the proportion 100/4500= x/65. When this proportion has been solved for "x", what has been solved is where 65 million would be positioned on the 100 foot line. "x" represents a distance on the time line.

Some examples of times to find would be 200 million years ago. The proportion to write is 100/4500 = x/200. The answer will be 4.44. This means that 200 million years ago will be 4.44 feet from the end of the line that represents present time. Homo Sapiens appears on Earth 350,000 years ago, where will this date appear on this time line? Set up the following proportion 100/4500 = x/0.35. The answer is .0077 of a foot. Mankind's appearance on Earth cannot be measured within a framework of a 100 foot line. If you want man's time on Earth to be represented by one inch of a line, then the proportion you need to set up to determine the length of the line is 1/0.35 = x/4500. The line would have to be 12857 inches long or 1071 feet long (about a quarter of a mile).

Time Periods:
Cambrain period 550 My (Million years) ago. This period is known for the earliest fossils including trilobites.
Ordovician period 500 My ago. The early evolution of fishes.

Triassic period 250 My ago. The rise of the dinosaurs.
Jurassic period 210 My ago. This is the dinosaur heyday.
Cretaceous period 150 My ago. The decline of the dinosaur reign.

Have the students calculate where geological time periods would exist on the time line and have them mark these on the line. Have them write about what they discovered in doing this exercise.

Performance Assessment:

Direct observation of the students setting up the ratios and getting the right value and the plotting of the value on the line.

Have the students draw a 30 centimeter line. This line will represent an amount of time (the last fifty years, last 2000 years...) have the students place dates on the line.

Another ratio problem that the students could do to see if they got the connection between ratios and drawing-to-scale is creating a model of the Sun and planets. If the sun's diameter is compared to 10 feet, what are the sizes of other planets?

Graphing Speed

Yolanda Smith
543 N. Waller
Chicago IL 60644
(312) 534-6174

Douglass Math and Science Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

Students will be able to understand how to graph information.

Students will be able to graph a running exercise.

Students will be able to identify the horizontal axis and vertical axis.

Students will be able to compile information to make a graph.

* This lesson is designed for grade levels 3-5

Materials Needed:

Poster Boards

Markers

Stop Watches

Jogging Wear

Gym Shoes

Strategy:

This lesson is designed for each child or group. Students will go outside or in the hallway. Student will list activities in three categories: running, walking, and jogging. Students will use stop watches to time each other. After children have recorded data have them graph each time on poster boards.

* Children can decide on the distance.

* Start lesson with a graph.

Yolanda ran 3 miles in 1 hour, Christeen ran 4 miles in 2 hours and Bob ran 5 miles in 3 hours.

* Allow each group or child to demonstrate their answer.
  Children can use blackboard or paper

Performance Assessment:

Teacher observation and completion of the graph on the poster board.

Kenwood Academy
5015 S. Blackstone
Chicago IL 60645
(312) 535-1409

Objective:

The objective of this lesson is to analyze the contents of a bag of M&Ms mathematically. This activity is appropriate for grades one through twelve.

Materials Needed:

One bag of M&Ms peanuts or plain, per student
One small plastic sandwich bag per student
One handout with a circle and a 6x8 grid
Several boxes of crayons
A protractor for each student

Strategy:

Have the students count or tally the number of each color. On the grid, put the appropriate labels on the bottom and left. Make a bar graph coloring a square for each M&M using a similar color.

Do a mean, mode, and median analysis of the candy.

Have students prepare the percentages of each color by dividing the total number of each color by the total number of the contents of the bag. Calculate the number of degrees this would represent. Multiply the percent of each color by 360 degrees.

Use a protractor to measure the number of degrees this represents. Divide the circle accordingly. Color the circle using the same color as candy being represented.

Have the students share their numbers. Compare them. Save this data for comparisons with future classes results.

Performance Assessment:

Depending on the level of the students or class you can evaluate the class through oral participation or in written follow up activities.

Return to Mathematics Index

An Introduction to Data Reading and Computations

Christeen Brown
1704 W. Marquette Rd
Chicago IL 60636
(312) 471-2627

Robert Fulton Elementary
5300 S. Hermitage St
Chicago IL 60609
(312) 535-9000

Objectives:

This lesson is designed for grade levels 3-5

Upon completion of the lesson, the students should be able to:

- Identify data on the horizontal (x) axis and vertical (y) axis
- Read numbered pounds on a weight scale
- Estimate pounds upon sight before given known weight
- Identify actual weight
- Understand the importance of controlling body weight
- Observe fat, calorie, sugar and sodium intake of certain foods compared with the daily recommended allowances
- Discover and apply rules of computations for determining how much weight to gain, lose or retain
- Design their own data chart

Materials Needed:

- Nutritional Facts brochures of several fast food restaurants
- Bathroom scale
- Calculator (optional)
- Paper
- Writing tools

Recommended Strategy:

- Have students guess the weight of their classmates
- Have students weigh themselves on the scale
- Create a data chart (guessed weight compared to actual weight)
- Choose a routine menu from three of the different fast food restaurant brochures
- Locate the items on the data chart and list the calorie, sugar, fat and sodium intake of each of the chosen items
- Compare the compiled data of a regular menu to the daily recommended allowances
- Decide whether their is a need to lose, gain or maintain weight according to findings after computing totals of data

Performance Assessment:

Demonstrate a usage of how to control weight using basic computation of data chart readings. Incorporate this activity into becoming healthy the mathematical way.

This project is best used in teaching Fitness the mathematical way.

Return to Mathematics Index

Counting And Graphing

Vernita Smith	Mahalia Jackson Elementary School
214 Glen Ellyn Rd.	917 West 88th Street
Bloomingdale IL 60108	Chicago IL 60620
(708) 582-7809	(312) 535-3341

Objectives:

This mini-teach has been designed for first and second graders. You may alter it in any way to accommodate your grade level. The main objective is to introduce counting and graphing to students in a phenomenological manner. After completion of this lesson students should feel very comfortable with counting from one to twenty-five. In addition, they will become familiar with two types of graphs: the pie graph and the bar graph.

Materials Needed:

Average size classroom of 20-25 students.

1. Crayons
2. Scissors
3. 2x2-Circles
4. Two 16 oz. bags of Skittles
5. Rulers-one for each student
6. Tape measure
7. Height chart

Strategy:

Start out by asking students if they have ever eaten Skittles before? (Answers will vary.) Then have the students name the five different colors of Skittles. List them on the chalkboard. Pass out the circles and let the students tell you what shape they have. Ask how many Skittles do you think will fit on the circle? (Answers will vary.) Ten will fit. Have them try it and record their answers on the pie graph. The pie graph is divided into ten sections. Student should color the graph according to the colors they actually have on their circle. If a student has 3 reds, (color 3 slices red) 2 yellows, (color 2 slices yellow), etc. Then they can record their answers in a fraction, i.e. 3/10, 2/10, 6/10. Do the same procedure with the rulers. Have students tell you how many Skittles will fit across a ruler. Twenty-four will fit. They will then fill out the bar graph according to the colors they have. If students have 7 greens (color 7 bars green), 10 oranges (color 10 bars orange), etc. Lastly, they will guess how tall they are in Skittles. Have each student stand near the height chart and have them record their answers. Each foot will be equal to 24 Skittles. Therefore, if the student is 3 feet tall, he/she is 72 Skittles tall.

Performance Assessment:

When lesson is completed ask students if they enjoyed the activity. Then let them tell you why. (Answers will vary.) From the pie and bar chart you can see the percentage of colors which showed up the most and the least. With the height chart you can determine who is the shortest person and the tallest person in the classroom.

Locating IIT Using Ordered Pairs

Diane Yvette Branch
10723 So. Wentworth
Chicago IL 60628
(312) 821-1266

Harold Washington Elementary School
9130 So. University
Chicago IL 60619
(312) 535-6225

Objectives:

(Grade 6)

* To plot and locate ordered pairs in a coordinate plane.

* To understand how to read and create a map.

Materials Needed:

Illinois State Map
Transparencies of a grid
Plane paper grids
Ruler
Unlined paper
Pencils
Map of IIT campus
Overhead projector

Strategy:

Activity I

This activity is best performed if students are seated in rows and seats.

Given a starting point, have each student tell where they are seated. They are to describe their location from a given starting point without using numbers.

Let them discover that they will need at least two numbers to describe their location.

The teacher will plot each child's location on the blackboard. While introducing what a grid is, the teacher will describe the horizontal and vertical axes. The teacher will substitute these names with rows and seats.

Teacher will display a map of a town or city. Discuss how to find locations. Point out that the map is on a grid. Ask students: "What are the four main directions? How is the map divided? Why?" and "How can you find a location?"

Students will be given a map of Illinois and asked to identify locations, given only the ordered pairs.

Students will be given street locations of the map of Chicago and asked to plot the ordered pairs on a coordinate grid.

Activity II

Students will create a map of IIT campus, listing the buildings and their corresponding coordinate pairs. They will create this map using a ruler, plain paper, and a transparency grid.

Performance Assessment:

Students will create a map of their neighborhood on a grid. The map should list all main locations with their ordered pairs.

Conclusions:

Students will understand that the order in an ordered pair refers to directions from the starting point. Students will know that a map is on a grid and grids make it easier to give and follow directions.

Collecting Data and Graphing

John Ramsey, Jr.
1635 N. Linder
Chicago IL 60639

Teacher's Acad. For Math and Science
10 West 35th Street
Chicago IL 60616
(312)808-0100

Objectives:

This is a multi-level lesson.
(A) To see the relationship of student's arm span versus height.
(B) To compare data with their classmates.
(C) To construct a graph using various data and where to plot it.
(D) To work in pairs cooperatively.
(E) To learn to use the meter stick.
(F) To count the number of different colored cubes.

Materials Needed:

2 cm. sq. interlocking cubes, meter sticks, rulers, graph sheets and crayons

Strategy:

(A) To work in pairs to measure arm span and height.
(B) To count the colored cubes and see who has more or less of each color (Comparing).

Performance Assessment:

To check the students' understanding of this experiment with measuring arm span versus height, let the students measure each other with the meter stick.
Graph another classroom with the same age as your class, to compare data.
Drawing conclusions can be learned from both experiments.

Conclusions:

The students will be able to become familiar with these two experiments.
Also, they will learn to graph using the data they have collected and how to use a meter stick.

Return to Mathematics Index

Apples A Peel To Me

Olga Moreno
1610 N Springfield
Chicago IL 60647

Horace Greeley School
832 W Sheridan Rd
Chicago IL 60613
(312)534-5800

Objectives:

For kindergarten and first grade.

1) Students will learn about two different types of graphs:
   a) Real Graphs: using manipulatives and real objects to make a graph.
   b) Representational Graphs: using pictures of real objects to make a graph.
2) Students will learn about the different varieties of apples.
3) Students will learn to gather, record and interpret data.

Materials:

1) Apples, red, yellow and green ones, different amounts of each color.
2) Red, yellow and green crayons for each child, scissors for each child.
3) One copy of the student apple graph sheet for each child.
4) One copy of the apple pictures for each student.
5) Knives, napkins and paper plates.

Strategy:

The classroom teacher will prepare the classroom graphs in advance. Use one graph with the real apples and another graph with the student's preference picture after tasting the apples. This graph will give information about the children's favorite apple choices.

Activity One: Children will guess how many apples there are in the bowl. After they guess the students and teacher will count the apples as the teacher removes them from the bowl or bag. Then the students are asked to sort the apples by color and place them on the floor graph. (discuss graph)

Activity Two: The students are given individual graphs and asked to color in the boxes to match the floor graph. The classroom teacher can remove the apples one by one from the graph as the children are instructed to color in the boxes as she removes the apples. (discuss individual graphs)

Activity Three: The students will taste the three different varieties of apples and asked to pick the apple they like best. Students are given the apple pictures and they will color the picture to correspond to their apple preference. They will write their name on the picture, cut it out and place it on the representational graph. (discuss the graph)

Key Questions:

What words can we think of to describe apples? As a topic opener children can close their eyes and pretend they have an apple in their hands and think about a word to describe their apple.

What is different about these apples? What is the same?

What can we learn from our graphs?

What did we learn from our graphs?

What information is not given in our graphs?

What other things can we do with apples?

Performance Assessment:

Evaluate concepts mastered by class discussion and participation.
Individual evaluation of children's work.

History Of Our Solar System on a Time Line

Richard Murray
1800 Euclid
Berwyn IL 60402
(708)795-4729

Gage Park High School
5630 South Rockwell
Chicago IL 60629
(312)535-9230

Objectives:

The Students will be able to use ratios.

Materials Needed:

Tape measure or a length of rope, Masking tape and a marker or chalk. A space that has a 100 feet in a straight line (like a hall way or a sidewalk). A calculator should be used for all calculations.

Strategy:

In the class room you discuss with your students the concept of what does a billion years mean. Develop the idea with the students that they need to compare a billion years to something that they are familiar with. Suggest that they compare 4.5 billion years that the Earth has been around to a 100 feet length. Draw a line on the board and tell the students that this line will represent the start of the Earth to present time. Ask the students where on this line did the dinosaurs exist. Most students will make choices around the midpoint. Note the students choices on the board, come back to these estimates after the students have done the calculation and have plotted points.

Discuss with the class that ratios are comparison of two numbers. Ratios can be written as fractions. The comparison that is being made is that of Distance over Time, that is 100 feet over 4,500 million years. Pass out a sheet that has various geological time periods listed. For example the Paleocene period was 65 million years ago. Set up the proportion 100/4500= x/65. When this proportion has been solved for "x", what has been solve is where 65 million will be position on the 100 foot line. "x" represents a distance on the time line.

Some examples of times to find would be 200 million years ago. The proportion to write is 100/4500 = x/200. The answer will be 4.44. This means that 200 million years ago will be 4.44 feet from the end of the line that represents present time. Homo Sapiens appears on Earth 350,000 years ago, where will this date appear on this time line. Set up the following proportion 100/4500 = x/.35. The answer is .0077 of a foot. Mankind's appearance on Earth cannot be measured within a framework of a 100 foot line. If you want the appearances of man to be represented by one inch of a line, then the proportion you need to set up to determine the length of the line is 1/.35 = x/4500. The line would have to be 12857 inches long or 1071 feet long.

Time Periods:
Cambrain period 550 My (million Years) ago. This period is known for the earliest fossils including trilobites.
Ordovician period 500 My ago. The early evolution of fishes.
Triassic period 250 My ago. The rise of the dinosaurs.
Jurassic period 210 My ago. This is the dinosaur heyday.

Cretaceous period 150 My ago. The climax of the dinosaur reign.

Have the students calculate where geological time periods would exist on the time line and have them mark these on line. Have them write about what they discovered in doing this exercise.

Performance Assessment:

Direct observation of the students setting up the ratios and getting the right value and the plotting of the value on the line.

Have the students draw a 30 centimeter line. This line will represent an amount of time (the last fifty years, last 2000 years...). Have the students place dates on the line.

Another ratio problem that the students could do to see if they got the connection between ratio's and drawing to scale is creating a model of the Sun and planets. If the Sun's diameter is compared to 10 feet, what is the heights of other planets.

Return to Mathematics Index

Locating Points Using Cartesian Coordinates

Mercedes Rodriguez
2201 N. La Crosse Ave.
Chicago IL 60639
312-745-6809

Clemente Community Academy H. S.
1147 N. Western Ave.
Chicago IL 60622
312- 534-4000

Objectives:

1. To give the coordinates of a point.
2. To plot a point, given it's coordinates.
3. To use the coordinate system in locating places on the map.

Materials Needed:

Rulers
Chicago City Maps
Graph Paper
Multicultural Handout (Rene Descartes)
Activity Sheets

Strategy:

1. The teacher will ask the students questions concerning how they give directions to get from one place to another. After discussion and finding different responses, pass out Chicago City maps so they show some paths on the map. The teacher will ask the students which important directions they need (N, S, E, W).

2. Introduce the Cartesian Plane by drawing two number lines on the board intersecting at zero. Explain information concerning the Cartesian Plane (origin, positives and negatives, quadrants, etc.). Discuss the term **ordered pair**.

3. The teacher will assist the students in locating points on the plane, by giving some examples on the board.

4. The students will give the coordinates of points on the plane.

5. The students will plot points on the plane.

6. Given three vertices of a rectangle, students will find the coordinates of the fourth vertex.

7. Make two groups play coordinates Tic-Tac-Toe on the board. The rules of the game follow the regular Tic-Tac-Toe rules, except that one group must get four points in a line.

Performance Assessment:

Draw a map of your neighborhood showing places such as schools, churches, post office, etc. In giving directions, apply the skills learned about coordinates. (Hint: one block = one unit, and N, S, E, W imply positive and negative directions).

Return to Mathematics Index

Getting the Goods on Graphing

Velma Elois Rouse
8542 S. Elizabeth St.
Chicago IL 60620
312-723-7077

DeWitt Clinton
6110 N. Fairfield Av.
Chicago IL 60659
312-534-2025

Objectives:

To graph ordered pairs in the coordinate plane
To identify ordered pairs in the coordinate plane
To write the coordinates of points shown on a plane
To create designs or pictures using ordered pairs

Materials needed:

Graph paper (3 or more sheets per student)
Rulers (1 per student)
Pencils (1 per student)
Overhead projector
Overhead projector transparencies
Maps (2 per student)

Strategy:

Give each student a map that has the index and grid markings removed. Instruct the students to locate certain points. After a brief span of time, distribute the maps with indexes and all markings in place. Again, instruct the students to locate certain points. Lead the students to discover the usefulness of grids.

Distribute graph paper. Have the students construct a coordinate plane. Demonstrate on the overhead projector. Label the axes, stressing that the horizontal axis is x and the vertical axis is y. Explain the point of origin and the negative and positive x and y locations. Allow sufficient time for students to practice locating points and naming coordinates.

Have the students locate ordered pairs on their graph paper and connect the points in order. Plan for the connected points to form a geometric figure.

Prepare in advance a different set of ordered pairs for each student. Plan for the resulting figures to coincide with a current event, holiday, or school program. Display the finished graphs in a prominent place.

Performance Assessment:

Each student will create his or her own picture or design on graph paper and write the ordered pairs. The ordered pairs will then be given to other students. The student who created the design will be expected to correctly write ordered pairs that will duplicate the design. The student who graphs the ordered pairs will be expected to correctly duplicate the design. Both of these performances should be completed with 95% accuracy.

Conclusion:

The students will realize that the skills they have acquired will be useful in many areas besides mathematics. Other disciplines that utilize graphs are science, geography, economics, and computers. With the use of and interest in computers continuing to grow, students will be made aware of a career choice in computer-aided design (C.A.D.).

Multicultural Statement:

Africans invented rectangular coordinates by 2650 B.C. and used them to make scale drawings and star-clocks in ancient Egypt.

Return to Mathematics Index

Introduction to Curve Stitching - Line Designs

Wilhelm L. Lilly
1629 E. Hyde Park Blvd.
Chicago, IL 60615

Kenwood Academy
5015 S. Blackstone Ave.
Chicago, IL 60615
(312) 535-1409

Objectives:

To develop the students' awareness that straight line segments can produce the illusion of a curve.

To develop the students' ability to recognize and describe number patterns.

To experience the beauty of mathematics and to introduce geometric fundamentals.

Materials needed:

1/8" hardboard squares approx. 10" x 10" (or 24cm x 24cm) for each student.
1/8" hardboard figures (equilateral triangle, regular pentagon, regular hexagon, circle) one shape for each student.
11" pieces of brightly colored yarn (approx. 25 pieces per figure).
Overhead projector transparencies of suggested designs for each figure.
Plastic demonstration figure (optional).
Observation worksheets - one per student.

Strategy:

Obtain the 1/8" hardboard at a major hardware store. Hardboard usually comes in 4ft. x 12ft. sheets. However, most stores can section it for more convenient transport. A shop teacher or student/parent can assist with cutting 10" x 10" squares if power tools present an area of difficulty. Tracing large regular polygonal shapes on the hardboard with pencil will make cutting simpler.

Once the shapes are cut, measure and mark each side so as to obtain 8, 10, 12 or 15 divisions as you desire. Each mark will then need to be notched with a saw to create a 1/4" slit.

Line designs are formed by connecting sequences of notches with yarn pulled taut as a line segment. The basic pattern is to connect equally-spaced notches along the two adjacent sides of a square:

```
 8 |-
 7 |-                    (1) Divide each side into an equal number of
 6 |-                        segments, notch and number them.
 5 |-
 4 |-                    (2) Connect notch "8" on the vertical with
 3 |-                        notch "1" on the horizontal.
 2 |-
 1 |-                    (3) Connect notch "7" on the vertical with
    -+-+-+-+-+-+-+-+-+-      notch "2" on the horizontal and so on
     1 2 3 4 5 6 7 8         until all pairs of notches whose sum is
                             9 are connected.
```

A greater number of notches on the side of the square will result in a design which is higher in density but has the same curve. The numbering of the notches can be varied to create different number patterns or can be used to discuss the Cartesian Coordinate System. Another variation is to use a rectangle and divide each side into the same number of equal parts.

An effective approach to teaching this lesson could include using cooperative learning groups of two. The teacher would demonstrate the line segment connection (a few segments) on a model at the overhead projector, discussing number patterns, if desired. One student from each group can then obtain their "notched" square and yarn bundle. Squares should be notched on all sides to allow each student to complete their own line design. Once the squares are completed and discussed, each group can obtain a second polygonal shape for creative experimentation. Suggested designs can be shown on the overhead projector or copies made to hand out with the polygonal shapes.

Conclusions:

While the mathematical concepts built into this lesson are important, it is equally important that students see that mathematics underlies much of the design and art of our modern culture. Students find much joy in expressing their creativity through these line designs. Since few prerequisite skills are required, students who have failed in previous mathematical activities find success and recognition on par with or above high achievers.

Dale Seymour, Linda Silvey and Joyce Snider. LINE DESIGNS. Palo Alto, Calif.: Creative Publications, 1974.

Return to Mathematics Index

Junk Food Math

Sharon Ross
7231 N. Ridge
Chicago, Illinois 60645
Phone (unlisted)

DeWitt Clinton School
6110 N. Fairfield
Chicago, Illinois 60659
312-508-4025

Objective:

The main objective of this miniteach is to teach 3rd through 4th grade students estimation and introduce percentage.

Materials:

For each student:

- one zip-lock bag containing 75 randomly chosen Skittles candies and 5 small paper cups

- classroom set of centimeter grids for graphing results

- worksheet prescribed with a circle in which 75 Skittles can be placed

- worksheet with directions

- box of 8 crayons

Recommended Strategy:

. Distribute zip-lock bags containing Skittles and paper cups.

. Take out paper cups.

. Estimate amount of each color Skittles.

. Record estimated numbers.

. Count all Skittles and record total.

. Place Skittles by color into paper cups.

. Count Skittles by color and record actual amount of each color.

. Compare sets of candies by color using the less than, greater than, and equal signs.

. On centimeter grid, list colors along horizontal axis.

. On centimeter grid, list numbers from 0 to 25 along vertical axis.

. With corresponding color crayon, color bar graphs to represent the number of each color candy found in the sample.

- Use formula:

  $$\frac{\textbf{Color Number}}{\text{Total Number}} \times 100$$, to calculate the percent of each color.

- On prescribed circle worksheet, form a pie-shaped wedge out of the predominant color.

- Next to the preceding wedge, form another pie-shaped wedge out of the next most frequently occurring color.

- Continue making pie-shaped wedges until all colors are used and the circle is filled.

- Label each pie slice with the percentage number which it represents.

- The "Junk Food Pie" may then either be eaten by the student or the pieces may be glued to the paper to keep a permanent record of the results.

Return to Mathematics Index

ROTATIONS

Nash, Susan
6234 N. Francisco
Chicago, IL 60659
1-312-508-5562
Lake View High School
1-312-880-8140

OBJECTIVES

The student will:
1. Define rotation as the composite of two reflections over intersecting lines.
2. Identify rotation images of a figure.
3. Recognize and apply the properties of rotation.

EQUIPMENT AND MATERIALS

Rotogram
Overhead projector
Markers for overhead
Transparencies of figures showing reflection, translation, and rotation.

RECOMMENDED STRATEGIES

Demonstrate and review concept and properties of reflection and translation. a) There is a one-to-one correspondence between points in a plane and their reflection through a given line. b) Reflections of a set of points through a line preserves co-linearity, distance, and angle measure. c) Line reflection changes the orientation of a figure. d) Translation preserves orientation of a figure.

Introduce rotation as a composite of two reflections across intersecting lines. Show this using transparencies, rotogram, coins, and other objects available to you. Emphasize that since rotations are composites of reflections; the properties are similar to reflections and translations.

Provide additional opportunities for reinforcement of concepts using worksheets.

Return to Mathematics Index

Graphing Equations From Software

Webb, James
3461 Maryland St.
Gary, In. 46409
(219)884-2422

Harlan H.S.
821-2800

Objectives:

1) TO REINFORCE PREVIOUSLY LEARNED EQUATION GRAPHING SKILLS.
2) TO DEVELOP NEW STRATEGIES --OTHER THAN MEMORIZING EQUATIONS--FOR EQUATION GRAPHING.

Apparatus Needed:

1) AN IBM-PC OR COMPATIBLE COMPUTER,
2) AN OVERHEAD PROJECTOR,
3) A VISUAL APPARATUS FOR PROJECTING THE COMPUTER'S CRT IMAGE THROUGH THE OVERHEAD TO THE SCREEN,
4) THE SOFTWARE 'GREEN GLOBS'.

Recommended Strategies:

Students should observe the demonstration of 'Green Globs' by the teacher as he/she takes them through each segment of the software. They should be encouraged to plot their own equations using 'Equation Plotter' and watch the graph pattern change as they discover what happens if they multiply the equation by two, three or 'n'; or what happens if they add, subtract or divide the equation by some number.

The students should separate into small groups to develop their skills with 'Linear Graphing.' They should be encouraged to look at the answer when they are stuck rather than resort to memorized formulas. The idea is to develop their own new strategies in determining line equations.

The students should be encouraged to improve their scores when playing the games 'Green Globs' and 'Tracker.' The games should be self-motivating. The student's proficiency with graphs should improve radically as their game improves.

Return to Mathematics Index

Mathematics/Physics

The Cuisenaire Four-Pan Algebra Balance: Limitations and Suggestions

Bill Colson
425 W. Surf #817
CHICAGO IL 60657
(773) 871-4890

Morgan Park High School
1744 W. Pryor Ave.
CHICAGO IL 60643
(773) 535-2550

Objective(s):

Many teachers use a physical or metaphorical balance in presenting the performance of equivalent operations on both sides of an equation. The design of the Cuisenaire balance (see illustration) facilitates the teaching of these and other algebraic properties using both positive and negative numbers. The purpose of this lesson was: (1) to expose middle- and high-school teachers to its use as described in the manufacturer's instructions, (2) to explore with them any problems or limitations, and (3) to brainstorm, discuss, and evaluate ways to use the balance in the teaching of other concepts or properties.

Materials:

- 1 traditional two-pan balance
- 1 or more Cuisenaire Four-Pan Algebra Balance(s)
- Chips and canisters (included in kit)
- Instruction booklet (included in kit)
- Sample problems

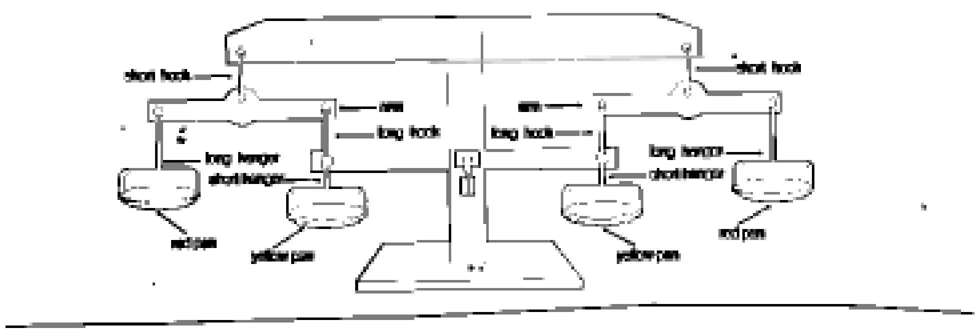
Strategy:

The lesson began with an interactive discussion regarding the intuitive connection between equations and balance. Participants shared ways they had incorporated this concept in their own teaching. Some had used an actual scale, and they were asked to model this using a two-pan balance. They were then given a simple problem involving addition or subtraction of a negative term, and asked to model it using the same balance. It quickly became obvious that this was not possible without rearrangement of terms and use of the "subtraction = adding the opposite" rule (or its converse), contradicting the introductory nature of the lesson.

Participants then watched as the Four-Pan Balance was put together, and commented on the differences from a traditional balance. In particular, the upper beam is fixed; from each end, a short arm is attached through its middle, with a pan hanging from each end of the arm. This would create two individual balances, except that the inner pan of each is further connected to a long arm passing through the perpendicular shaft containing the balance indicator. The effect is to make all four pans interdependent at all times.

Next, it was explained that the inner pans would represent positive values and the outer pans, negative. The terms of an equation are represented by putting the appropriate number of chips in each pan. Variables are represented by canisters, which are filled ahead of time with the number of chips corresponding to the solution, less one (to account for the weight of the canister). Using examples from the instruction manual, operations such as adding opposites, adding and subtraction of integers, and solving linear equations were modeled.

Finally, participants were encouraged to suggest problems and ways to use the balance in their solution. They were also asked to experiment with properties or problem-types not demonstrated in the manual, and to note any difficulties, either practical or conceptual.



Performance Assessment:

Participants were given random assignments from a list of problems and properties to demonstrate on the balance, some of which were expected to be impractical, if not impossible. They were asked to explain their strategy, and comment on any advantages or limitations they saw to using the balance as opposed to another method.

Conclusions:

Participants were excited about being able to extend the concept of balance to equations containing both positive and negative numbers. The Four-Pan Balance seemed especially appropriate for exhibiting the Zero Property (a + -a = 0), addition or subtraction of two numbers, and solution of simple linear equations (those not requiring combination of like terms). Some pointed out possible confusion once the canisters are introduced: having to allow for their weight takes away (albeit slightly) from the conceptual simplicity. Also, space on the pans and numbers of chips and canisters limited the demonstrations to problems containing small integers. This was not a problem as long as the object was to demonstrate basic properties, rather than to solve problems. Also, it was felt that merely watching the instructor demonstrate was not nearly as effective as actually doing it themselves. This raised the question of how many balances it would be necessary to purchase per class for it to be a worthwhile investment.

The general conclusion of the participants was that they would be enthusiastic about using the Balance to introduce algebraic concepts, if they could afford a class set. However, they would be impractical to use in routine problem solving after the introductory period. This was not seen as a major drawback, since the objective of a lesson should be to master the concept, not the use of the teaching tool. The Balances can be brought back out when introducing the Multiplication and Division Properties of Equality, and even combined when solving systems of equations, but they should not be used on a daily basis in the way we use calculators, for example.

Sorting Pennies, A Wagering Activity for Algebra 1

David Drymiller
10115 S. Oakley
Chicago IL 60643
(312) 233-7902

Marie Sklodowska Curie Metro H.S.
4959 S. Archer Ave.
Chicago IL 60632
(312) 535-2120

Objectives:

To abstract the idea of a line.
To introduce other methods of solving simultaneous equation besides graphing.
To develop problem solving skills.

Materials Needed:

A scale able to read (to the nearest tenth of a gram) up to 400 grams
at least 1,000 pennies
a plastic cup to hold pennies on the scale
numbered plastic ziplock bags 1 through 8
16 index cards, 2 per ziplock bag

Strategy:

The following instructions are directed to the instructor:

Place the 1,000 pennies in a large pile on the front desk along with the scale, the plastic cup and the ziplock bags. Divide the class into 8 groups. From each group have one member come up and take a handful of pennies. Weigh and record the amount 'W'. Place the weighed pennies in the corresponding ziplock bag and give the group member the instructions to separate the pennies into two groups: 1981 and before 'B', 1983 and after 'A'. They are to record the number of each kind of penny on one of the index cards provided and keep it from your view. On the other index card, they are to write the total number of pennies in the bag 'T'. Place this second index card and all pennies in the plastic bag and return to front desk. As the bags are returned record the number of pennies and calculate the predicted number of pennies for 1982 and before for each group. When all the pennies have been returned and the calculations finished, announce that through the miracle of algebra you know how many of each type they have sorted with a margin of error of plus or minus two pennies. (I find a small wager, if possible, with each group enlivens the activity). Collect your winnings and explain to the class why you won.

Pennies for 1981 and before weigh 3.1 grams
Pennies for 1983 and after weigh 2.5 grams
(Note: avoid 1982 pennies because the mint produced some of each.)

	Number	Weight	Total Weight
1981 and before	B	3.1	3.1B
1983 and after	A	2.5	2.5A
before and after	T		W

Which gives us the equations:

$$3.1B + 2.5A = W$$
$$B + A = T$$

The problem becomes just finding the intersection of two lines.

Solving by Substitution: $A = T - B$

$$3.1B + 2.5(T - B) = W$$
$$3.1B + 2.5T - 2.5B = W$$
$$0.6B + 2.5T = W$$
$$- 2.5T = - 2.5T$$
$$0.6B = W - 2.5T$$
$$B = (W - 2.5T) / 0.6$$

I use this activity after I have taught the graphing of two lines and finding their intersection but before other methods of finding the solution of systems of equations. This is an introductory lesson that abstracts the intersection of two lines to find a solution.

Trigonometric Functions

Lesia Smith
9510 S. Vanderpoel
Chicago IL 60643
(312) 881-3669

Michael M. Byrne School
5329 S. Oak Park
Chicago IL 60608
(312) 535-2170

Objectives:

To define and demonstrate the six trigonometric functions
To facilitate using the three most frequently used trigonometric functions

Materials Needed:

Pythagorean Theorem Model Overhead
Overhead Projector
Overhead TI81 Graphing Calculator
TI81 Graphing Calculator/Individual
Spaghetti (12 pieces for each individual) four 3, 4 and 5 cm lengths/each
Glue
Centimeter Grid/Individual
Compass and Protractor

Strategy:

1. Discuss the Pythagorean Theorem
2. Demonstrate the Pythagorean Theorem using spaghetti
3. Calculate 6 word problems demonstrating the Pythagorean Theorem
4. Discuss the trigonometric functions
5. Calculate the same 6 word problems demonstrating the trigonometric functions
6. Discuss how the trigonometric table is formed
7. Graph the sine and cosine functions
8. Demonstrate the plotting of sine, cosine and tangent on the graphing calculator
9. Discuss how the answers obtained using the Pythagorean Theorem and the trigonometric functions compare
10. Demonstrate a Real Life Problem by measuring the height of the wall in the room using the tangent function

Conclusion:

1. The Pythagorean Theorem gives us the third side of a right triangle when two sides are given. The trigonometric functions give all sides and angles of a right triangle when one side and one of the acute angles are given. It was demonstrated to the class how to find the three sides of a triangle when two sides are given. This was done by using the Pythagorean Theorem and the trigonometric functions.
2. Trigonometry allows calculation of the measures of angles in a triangle when the length of certain sides are known. While we studied right triangles, trigonometry can also be applied to arbitrary triangles.

Equalities And Inequalities

Perry Lemon
10024 S. Eggleston
Chicago, IL. 60628
(312)-238-4532

Shoop School
1460 W. 112th Street
Chicago, IL. 60643
(312)-535-2715

Objectives:

1. to involve students in discovery
2. to teach partitioning and equivalency
3. to teach the order of fractions

Materials needed:

Overhead projector (teacher)
Tower of bars (class)
Rulers (class)
Markers: Bingo chips, candy, etc. (class)
Activity cards (one per group of three)

Strategy:

The tower of bars is a model for fractions. The whole bar at the top represents the unit 1 and the bars below it illustrate fractions with denominators from 2 through 12. Various fractions can be illustrated by placing markers on the tower of bars, such as three markers on the seventh bars to represent 3/7 and so on.

Place a transparency of the tower of bars on a overhead projector. Discuss numerator and denominator using tower of bars. Stress the number of equal parts determine the denominator and the numerator tells how many equal parts are being considered. Divide class into groups of three. Each individual will have a copy of the tower of bars, a ruler or straight edge and markers. One student will have the responsibility of demonstrating the model by placing markers on the overhead projector. Another would write the fraction on the chalkboard and the third student would lead discussion of observations and/or explanations regarding the model. Activity card 1, for example, would be a practice to reinforce the part-whole interpretation of a fraction, such as, 3/5 indicates that a whole has been partitioned into 5 equal parts and 3 of those are being considered.

Equalities: every second row on the tower of bars has a line down the center. That is, a line appears down the center of the halves bar, the fourths bar, the sixths bar and so on. It may be helpful to color these lines on a transparency. On another activity card students would place a ruler on the line down the center and use markers to show the patterns on every second line. Then, write the fractions seen using the equal sign. The corresponding numerical pattern is 1/2 = 2/4 = 3/6 = ... Every third row has vertical lines that line up with those on the thirds bar. These lines can be colored a second color. Similar observations can be made for every fourth bar, every fifth bar and so on. The corresponding numerical patterns are 1/3 = 2/6 = 3/9 = 4/12 ... and 2/3 = 4/6 = 6/9 = 8/12.

To help see the equality pattern, markers can be placed on bars and a ruler or the edge of a piece of paper can be used to match up vertical lines. Additional activity cards can be devised to make this discovery.

Inequalities: The first part of each bar as you move down the left side of tower of bars represent a unit fraction and these parts become smaller and smaller. Similarly, looking down the right side of the tower of bars shows that 1/2 < 2/3 < 3/4 < 4/5 .... These fractions get closer and closer to one. Activity cards can be devised to show this and other patterns of inequalities.

The lesson may be concluded by summarizing concepts discovered from the use of the activity cards and the vocabulary review. Suggested terms are: numerator, denominator, equivalent fractions, unit fractions; symbols: < is less than, > is greater than, = is equal to.

Draining The Swimming Pool

Byrne, William
4960 Marine Drive
Chicago, IL 60640
1-312-271-4037

Martin Luther King H.S.
1-312-536-8680

Objectives:

To do some experiments that suggest a way to solve the general work problem:

If A can do a job in X hours and B can do the same job in Y hours, how long will it take A and B working together to complete the job?

More specifically, if one pipe can drain a swimming pool in 4 hours and another pipe can drain the pool in 7 hours, how long will it take to drain the pool using the two pipes together?

Apparatus Needed:

Plastic container holding 2 or 3 liters, several plastic tubes of different inside diameter (eg. 1/2", 1/4", 3/16") each about 4 feet long, stopwatch or clock with second hand, several pails for holding water.

Transparencies

Use overhead to show fractional parts of container drained in a given number of seconds.

Recommended Strategy:

The equation given in textbooks to solve the swimming pool problem is usually stated as X/4 + X/7 = 1. It is not immediately obvious why this formula works or how it was derived. The following is a strategy for leading up to the formula.

Determine the number of seconds or minutes it takes to drain the same amount of water from the plastic container using each of the plastic tubes separately. You can ask for student volunteers, one to hold a tube and another to siphon the water. Students at their desks can use the clock to determine the times. Have the students write down the times next to the i.d. of the tubes. Many questions can be raised along the way. For example what is the relationship between the i.d. of the tube and the draining time for that tube? If the radius of the tube is doubled what happens to the inside area of the tube, the amount of water it will carry and thus the draining time? Make estimates and then test them using the appropriate tube. An important question is what fraction of the container is drained by one or more tubes in 1 sec. Suppose the draining times for two tubes are 25 and 40 sec. Then in 1 sec., (1/25 + 1/40) of the container will be drained. Ask the students to find a proportion using this idea. Hopefully after a few minutes working in groups they will come up with this proportion: (1/25 + 1/40) / 1 sec = 1 / X sec , where X is the time to drain using two tubes at the same time. Now choose two tubes, do the experiment and see if the time you get agrees with the solution you get using the equation. The equation given at the beginning follows from the proportion.

Inequalities

Butler, Ben Jr.
518 E. 42nd St.
Chicago, IL 60653-2716
1-312-268-3947 or 285-8625

Gage Park High School
1-312-471-8630

Objectives

Students will learn how to transform inequalities and find their sets.

Apparatus Needed:

Math balance, and two rings connected to several rubber bands.

Recommended Strategies

The procedure starts out with a discussion on the usefulness of numbers. It should be pointed out that a number is a very abstract concept and we talk about them in solution sets. Its usefulness can be reflected on a number line to indicate quality and operation.

In the sciences, positive and negative numbers can be used in connection with temperature readings, linear forces, clockwise and counterclockwise motion, positive and negative charges of electricity, acceleration and deceleration, etc.

In the directional sense they are useful in indicating north and south, east and west, above and below sea level, left and right, and up and down.

The stock market uses them to show changes in prices. They are used in everyday statistics to indicate changes such as the increase and decrease in the cost of living,and to show deviation from the normal - as in weather reports. Statistics in sports and scoring of games often require the use of signed numbers.

This particular math model is constructed by dividing a horizontal bar into equal parts. A point of division is taken as the starting point or origin and labeled zero. Each point to the right of the zero is labeled with a positive number: +1 representing the first unit, +2 the second unit etc. Every point to the left of zero is labeled with a negative number beginning with -1. There is a hook at each point to help identify the number.

To emphasize the ideas of oppositeness, position and direction, students realize that the direct value of a number is its absolute value along with the element of direction.

Now we work with examples. We add on the number line until we are able to perform the operation readily.

Next I asked what happens when each member of an inequality is **multiplied** by a nonzero number? Multiplication by a positive whole number is presented as repeated addition. Multiplication with negative numbers are motivated by algebraic laws.

Finally, we motivated the method for solving linear inequalities.

LINEAR EQUATIONS

Ennis, Beatrix U.
645 Westmoreland Drive
Vernon Hills, IL 60061
1-708-816-0921

Senn Academy High School
1-312-989-3565

OBJECTIVES

1. Students will emulate the steps in solving linear equations by means of a manipulative.
2. Students will be able to transfer the operations performed on the manipulatives in equation form.

EQUIPMENT AND MATERIALS NEEDED

Overhead Projector/Marker
Twenty-five Black Squares (Overhead Set)
Twenty-five Clear Squares (Overhead Set)
Ten Black Circles (Overhead Set)
Ten Clear Circles (Overhead Set)
Thirty cubes and ten dixie cups of same color (Classroom Set)
Thirty cubes and ten dixie cups of a different color (Classroom Set)
Classroom set of "Work Area Sheets"
One balance scale

RECOMMENDED STRATEGY

Using the overhead, present a short set of notes with a definition and interpretation of an equation. Ask the students to distinguish between given examples of an expression and an equation. Using the overhead black and clear squares (which represent unit integers) and black and clear circles (which represent unit variables) create an equation. Present the two rules: 1) In order to remove a clear square (negative integer) you must add a black square (positive integer). Stress that the colors are opposite. 2) The same number of color squares must be added to **both sides**. Stress balance. For example the equation $x + 6 = -2$ with manipulatives would be solved in the following manner. A black circle and six black squares would represent $x + 6$ and two clear square would represent -2. Step 1) Add six clear squares to the left side (stress opposite). 2) Add six clear squares to the right side (stress balance). 3) Write an equation of steps one and two. ($x + 6 - 6 = -2 - 6$) 4) Eliminate the squares on left side. 5) Combine the squares on the right side. 6) Write an equation of the results of steps four and five. 7) Results: One black circle equals ten clear squares, or $x = -10$. Present several examples on the overhead.
Ask the students what would happen if they did not add the opposite to **both** sides. Use the balance scale to demonstrate the results. Then give the students their own set of manipulatives and have them solve equations.

Return to Mathematics Index

Algebraic Addition

Junievicz, Alex
3317 S. Halsted St.
Chicago, Illinois 60608
927-6266

Kelly H.S.
650-5900

Objective

To re-invent the wheel in a manner so that there is:

1. Transfer from other knowledge of the student;
2. Minimal relationship to previous math;
3. Conventions of Minus used in business.

To get the student to realize the rules of signs without the turn-off that he/she may have gotten previously.

Apparatus Needed:

Play money
Play IOU's
Dice One red, and one black for each student

Procedure

Before class give several students the play money, and IOUs. After attendance take a loan from one of the students and have that student take a loan from another.

On the overhead list each student's holdings. Have the beginning balance and the transactions using the brackets to stand for negative--(but using the terms owned, and owed, the accountants use debits as +[owned] and ( ) for -[Owed]--By having the students borrow from each other to give the teacher the money there will be a negative number--the student owes more money. A sub objective could be to balance the student's own check book.

For practice problems have the students make their own by rolling the dice. The black being + and the red being -. Thus they will have random problems especially suited for the slower student since the numbers will be less than 7, and not zero. This can later lead to some motivation for statistics and surely will delight some of the gamblers in the class.

Conclusion

Since this approach was thought of in the SMILE program and not tested in the actual classroom I am presenting it as an alternative for the slower classes, possibly a support class. I have used the text book method, then, for the students still having trouble, passed out the rules to rote memorize, and, while working with the individual student invoked a loan approach (borrow, and "paid" so as to end up with money owed). Maybe starting with this approach we can work around the students' inconsistency of minus, and negative.

Return to Mathematics Index

Simplifying Equations of the Form ax+b=cx+d

Wagner, William F.
5332 S. Austin
Chicago, Illinois 60638
582-6052

Hyde Park Career Academy
947-7233

Objective(s):

(1) Students will be able to solve equations of the form ax+b=cx+d.

(2) Students will be able to visualize the concept of "balancing" an equation.

Apparatus Needed:

Balance scale (easily obtainable if you have an understanding and cooperative science department)
Assorted weights (I adapted a box of Cuisenaire rods)
Yard stick (optional)
Small stuffed animal or soft rubber toy (optional)
Assorted "unknowns" (any objects that are of an unknown weight but can be weighed as a combination of rods)

Recommended Strategy

As a link between this lesson and previous lessons, I started with a review of the four basic types of equations, i.e. equations that can be solved by adding, subtracting, multiplying or dividing. I differentiate between the four types so that the students can remember them more easily by associating them with the four basic operations. Others have argued that there is only two or three basic types. I leave the final decision up to you.

After this short review and discussion of methods for solving these types of equations, we show a more complicated equation of the ax+b=cx+d form and ask the students for suggestions on how to solve it based on present knowledge. After students have had an opportunity to give input on the solution, we demonstrate how equations can be displayed using a balance scale.

Balance Scale Demonstration:

Using the Cuisenaire rods, set up a situation you know is equal. For example, 4 light green rods with 4 white cubes weighs the same as 2 light green with 10 white cubes. Place these different combinations on opposite sides of the balance scale and watch as the scale balances (experimenting before is highly recommended to avoid an embarassing situation). Then ask the students what would happen if you started to remove pieces from different sides, (Desired response: the balance is upset). Next ask the students, "What should I do to put the balance back?" (Desired response: Whatever you did to the first side, now do to the other). Continue in this manner until the following situation is reached: 2 light green rods are balancing 6 white cubes. Now say, "If 2 green rods balance 6 white rods, what would happen if I took out half of the green rods?" (Desired response: Balance upset). Next say, "What should I do to restore the balance?" (Desired response: Take out half the white cubes). Upon doing this, the solution is now evident: 1 light green rod equals 3 white rods. Try this again with different combinations of rods (Again, experiment beforehand). As you go through each step, write on the board what the situation on the scale is, but in equation form, i.e. 4 light green with 4 white cubes balances 2 light green with 10 white cubes would become 4g+4=2g+10.

After a few attempts, show that they are merely doing the same manipulations that they did on the basic 4 types with the following conditions: Adding or subtracting is done first with multiplication or division done last, each step should make the problem simpler than before and the ultimate end is to have all the unknowns on one side and all the constants on the other. Once this condition is met, the final step is to multiply or divide by some constant.

This demonstration can be made more dynamic by allowing individual students to try their hand at the manipulations to produce equivalent situations. Other objects may be used as unknowns as students experiment to find other true statements.

At the end of the lesson and as a taste of what is to come, I might use the yard stick and the stuffed animal to set up a situation to demonstrate inequalities. Place the yard stick so that half is on the desk (Use the stuffed animal as a weight by placing it on the end of the yardstick on the desk) and the other half off the desk. Then proceed to strike the free end of the yardstick sending the stuffed animal flying (experiment beforehand to be certain that the yardstick is strong enough and the stuffed animal light enough to make the flight). I then ask, just as the bell rings, "Why did the animal fly?". Without answering, class is dismissed and as they are leaving I tell them we will be discussing what they saw in our next class, which will be on inequalities.

Return to Mathematics Index

Rules of Sign Change

Zuger, Joel P.
1351 West Catalpa Avenue
Chicago, Illinois 60640
334-2514

Chicago Metro High School
280-2020

Objectives:

1. This is aimed at 7th and 8th grades as well as pre-algebra and 1st year algebra students.
2. Understand the operation of plus and minus signs during arithmetic operations.

Apparatus Needed:

1. **Number Line Materials**
   1.1 Number lines for each student printed across the whole paper. The lines must be spaced far enough apart so bingo markers cover only one line at a time.
   1.2 Need translucent bingo markers, maybe 5-10 per student.
   1.3 Need one acetate sheet with a number line to work with an overhead projector.
2. **Function Machine**
   2.1 Cardboard or wood cutout representing a machine, titled **"Function Machine"**. It can be as elaborate or as simple as you wish to construct it.
   2.2 Strips of cardboard or other material one of which will go into the machine from the top the other will come out from the side.
   2.3 Crank on the machine which is either functional (pulling through the top strip and pushing out the bottom strip) or turned just for show
3. **Keep It or Give It Game**
   3.1 Two dice, each of a different color.
   3.2 Sheet of equations, probably about 100 with positive and negative numbers with addition and multiplication operations.

Recommended Strategy:

1. **Number line strategy** - shows positive and negative numbers as directions on the line, negative left, positive right. Explain the difference between negative numbers and subtraction, i.e. a bill for $8.00 is a negative number, it is money owed and you do not have; getting $10.00 and paying $8.00 to satisfy the bill is subtraction, transferring money you have leaving yourself with $2.00.
   Experiment with the number line using an overhead (with the students working on their own number line papers). I.e. move 10(right) move -5(left) all should be on 5(positive side of the number line). Continue with a few more examples to show direction, and how to use it. **Note:** use a couple of examples of subtracting negative numbers, using reversal of direction for subtraction, so negative numbers subtracted will move in a positive direction.
   Experiment with multiplication using the number line, also show a consistent pattern on the board so two methods reinforce sign

rules.

Example:

The products show a difference of 4 at each succeeding multiplication.

| 4·4=16|,
| 3·4=12|,
| 2·4= 8|,
| 1·4= 4|,
| 0·4= 0|,
|-1·4=-4|,
|-2·4=-8|;

To show negative times negative is positive use pattern of:
use the number line using direction to show results. The reason for using more than one bingo marker is to show the pattern on the number line.

| 3·(-4)=-12|,
| 2·(-4)= -8|,
| 1·(-4)= -4|,
| 0·(-4)= 0|,
|-1·(-4)= 4|,
|-2·(-4)= 8|;

It is recommended the 1st number represent the multiple of the 2nd number, i.e. 3x4 means 4+4+4 not 3+3+3+3. Even though multiplication is commutative, it will be easier, in algebra, to show that 5w is 5 times w, meaning w+w+w+w+w.

2. **Function Machine** - This is used as reinforcement to calculate with both positive and negative numbers. A strip of cardboard is marked off with

| 1 | 2 | 3 | 4 | 5 | etc.| and this is fed into the input of the machine (which is cardboard or wood, etc. painted or marked to be a machine), the 1 being fed in first. There is a 2nd cardboard which is the output for example;

| 2 | 4 | 6 | 8 | 10 | etc.|

which the students have to guess, after seeing one or two examples, at what the output will be and what function is making this output, this case is input times 2. Make different strips for input and output. The function can be as complicated as (input - 3) times -2.

3. **Keep It or Give It Away Game** - This is used as reinforcement for the operations of positive and negative numbers. The class can be divided into 6-groups. Each group starts off with 50-points. The team reaching 100-points first wins. A paper with 100+ equations on it, with the first 6 equations numbered 1-6. Teams go in order, team number 1 starting. Two dice used, each of a different color. One die determines what team will get the equation if the original team gives it away. The other determines which equation is solved. After an equation is used the next equation on the list (other than the original 6) will replace used equation. The team tossing the dice has 10-seconds to decide to keep the equation or give it away (teams want positive results and give away negative results). The team getting it has 30-seconds to give the correct answer. The evaluation of the equation are the points involved, i.e. 8·(6-3)·(-1), result is -24 points. If it was 4th on the list the next equation goes into the 4th slot, etc. If the original team rolls 4 on the give dice then team 4 gets the equation if the original team: 1) runs out of time, and result is positive 2) wants to give it away; or 3) wants it but gives the

wrong evaluation and result is positive; else the original team gets the points. Any other rules or changes can be made. Gear the rules and the equations to the level of the class, it should be enjoyable as well as educational.

Note: - The students should not be rushed to give instant answers. Perhaps count 3-seconds before allowing any student to answer.

Using the Balance

Davis, Marie
532 Canyon Trail
Carol Stream, IL 60188
653-2247

Marconi Community Academy
854-2810

Objectives:

Given an equal arm balance the learner will determine the mass of an object by comparing it with the mass of objects whose mass in grams is known.

Given graph paper the learner will construct a bar graph.

Apparatus needed:

Overhead projector {Optional}
1 equal arm balance {Commercial or homemade}
3 objects of different masses
5 small washers { 2 g }
5 medium-size washers { 5 g }
5 large washers { 9 g }
graph paper
modeling clay { 15 g }
Lab worksheet

Recommended strategy:

The overhead projector was used to review the following vocabulary:

variable	balance
manipulated variable	mass
responding variable	

A graph was constructed on the transparency to review these terms:

interpolation	vertical axis	plot
extrapolation	horizontal axis	

The lab worksheet contained the procedures to follow, a Data Sheet which included space for a labeled drawing of the experiment, Tables 1 and 2, and comprehension questions.

PROCEDURES;

1. Make sure the arms are balanced before measuring each object.
2. Place one object in the left pan of the equal arm balance. Place any number or combination of washers in the right pan until the

two pans are level, or balanced. When the two arms balance, the mass of the object is the same as the total mass of all the washers.

3. Record the name of the object under **Type of Object** on Table 1 on the Data Sheet.
4. Count the number of washers used and record them under the correct headings on Table 1.
5. Multiply the number of 2 g washers by 2, the number of 5 g washers by 5, and the number of 9 g washers by 9.
6. Add the three answers together and record the sum under **Total Mass, TM**.
7. Repeat the same procedures or steps with the other two objects.
8. Construct a bar graph.
9. Complete the comprehension questions on the Data Sheet.

Sample Data Sheet

Questions: Which is the manipulated variable? Which is the responding variable? On which axis (horizontal or vertical) did you plot the manipulated variable?

Table 1

Type of Object	Standard Masses (g)			Total Mass, TM
	2 g	**5 g**	**9 g**	**(g)**

Shape a piece of clay into a cube. Balance the clay cube with washers on the equal arm balance. Record the measurement on Table 2. Then mash clay into a disk. Make prediction about the mass of the clay disk. Determine the mass of the clay disk. Record the measurement. Repeat the procedure for a clay sphere.

Table 2

Shape of Clay	**Standard Masses (g)**	**Total Mass, TM**

Questions: Does the mass of the clay depend upon its shape? A mound of clay has a mass of l6 g. What would be its mass when the clay is shaped like a bar of soap? If the clay soap bar was cut in half, what would be the mass of each half?

This is just one of many experiments the students in grades 3-8 can do to determine the mass of objects. The lab work can be modified to satisfy the needs of students and teachers. For teachers who teach all subjects this activity integrates science, math, language arts, and art.

Multiplying and Factoring Polynomials Using Algebra Tiles

Marshall, Regina
4219 W. 21st
Chicago, IL 60623
762-4450

Curie Metro High School
838-4050

Objectives:

To eliminate the frustration and anxiety involved with Multiplying and Factoring polynomials through the usage of Algebra Tiles. Upon achieving this, accuracy in the operations will be reach.

Apparatus needed:

1) Algebra Tiles
2) Math-Tiles display board
3) A collection of students labsheets

Recommended strategy:

Math is a frightening subject to most people. I feel that it can be due to an infinite amount of reasons, but the one reason cited most is the fact that it is a precise science. Either you have the right answer or the wrong answer. Thus most individuals tend to steer clear as much as possible away from it. Having knowledge of the above mentioned fact I would start out by playing a game called "The Rectangle game." In brief, you give the students a random number of blue, red, and yellow tiles. Then give the following instructions "make the largest rectangle you can using only these tiles." In some instances you may need to add these clarifications to the directions: (1) All tiles must lie flat on the board; (2) Only one layer of tiles is allowed; and (3) the rectangle must be entirely filled in. Once they have experimented and experienced this game they are expected to develop a strategy for rapidly arranging the tiles to create the largest possible rectangle. (For us, "the largest" means largest in area.) Using this meaning, the largest rectangle will always be the one that leaves the least amount of "left-over tiles."

After the students have been stimulated by playing "The Rectangle game," I would then proceed to give the tiles names that are associated with their area. The correlation will be geometrically displayed on a poster board. Once the students have received the naming of the tiles, I would then proceed with my introduction to the multiplication of polynomials. It is extremely important that they can visually see the process of putting the factors to be multiplied on the outer vertical and horizontal space provided with the simulated Mathtiles display board given to them, and how to create the rectangle in the innermost space. It must be emphasized that the length and width are determined by the factors on the outer horizontal and vertical spaces. Also, when creating the rectangle in the innermost space, use the strategy develop with "The Rectangle game." Once you have given the students a sufficient amount of time to make the innermost rectangle, list what particular tiles were used. Show the actual problem that they did on the board making sure they understand the procedure for doing this. I would then make sure that I do a wide variety of problems to make the students analyze their results. A labsheet parallel with the topic of multiplying polynomials will then be pass out.

Having sufficiently motivated the students to get involve, I would then proceed to show the students how to factor polynomials using this truly wonderful manipulative. It's in factoring polynomials that the mathtiles will perhaps provide you with the greatest rewards. The tiles make factoring so easy that difficult problems turn into simple puzzle-type exercises. In fact, the students will see that "The Rectangle game" was actually an exercise in factoring second-degree polynomials. Hopefully, with the usage of manipulative students will in time began to understand and accept math without all of the fear that has been associated with it throughout the years.

Vision Props of Signed Numbers

McMiller, Mable
9300 South Bishop
Chicago, Illinois 60620
445-2011

South Shore High School
933-8190

Objectives:

1. By titrating with an acid and an alkaline solution, students will understand that an acid added to an alkaline can become neutralized and by adding more acid, the alkaline solution can become acid.
2. After demonstrating the titration of an acid and an alkaline solution, students will perceive that the pH factor, a measure of acidity, neutrality, or alkalinity of a liquid or a solid in relation to their own bodies.
3. Students will gain an understanding of the titration experiment by using the abstract pH factor color charts and transferring the positions to signed numbers (positive or negative numbers).
4. By using the abstract tube for their number lines, students will become aware of the importance of the number line and usage of signed numbers.

Apparatus Needed:

Two 500 ml beakers
Four 200 ml flasks
Four eyedroppers
1M of NaOH (Sodium Hydroxide)
1M of HCl (Hydrochloric acid)
One bottle of litmus paper (blue)
One bottle of litmus paper (red)
One bottle of antacid
One box of baking soda
One bottle of wide range pH 3.0 to 11.0 of phenolphthalein
Six 17cm x 21cm of acrylic glass, colors--red, orange, yellow, green, clear, and blue.
One long tube about 270 centimeters long and 6 3/4 inch in diameter
Two red plastic book covers and two blue plastic covers

Recommended Strategy:

Be prepared to encourage students to see how the phenolphthalein has the property of turning blue in NaOH (Sodium Hydroxide) and turning red in HCl (Hydrocloric acid), and adding HCl drop by drop with stirring to the sodium Hydroxide will become colorless. An alkali neutralizes of an acid to water and salt solution.

1. Pour 1M of NaOH into a 500 ml beaker, and pour 1M of HCl into a 500 ml beaker. Pour from the 500 ml beaker of NaOH into a 200 ml flask

about 100 ml, and two or three drops of the phenolphthalein into the 200 ml flask of NaOH.

2. Repeat the same for HCl.
3. Take out a blue litmus paper, drop a little of HCl from the 200 ml flask. The red color shows that hydrochloric acid is an acid. Take out a red litmus paper. Drop a little of NaOH from the 200 ml flask. The blue color shows that sodium hydroxide is an alkali.
4. Have the students to take a blue litmus paper and a red litmus paper, placed under their tongue. If the red color shows from the blue litmus paper of a pale pink color, they are somewhat acidity. if the blue color shows from the red litmus paper of a pale blue color, they are somewhat alkali.
5. Add HCl (hydrochloric acid) from the 200 ml flask where the drops of phenolphthalein was added to the solution, drop by drop with stirring to the 200 ml flask of sodium hydroxide where the few drops of phenolphthalein was added to the solution. When the sodium hydroxide becomes colorless, the reaction has neutralized. When the sodium hydroxide becomes red, the reaction is completed.
6. Pour NaOH (sodium hydroxide) from the 500 ml into another flask. Add two or three drops of phenolphthalein. Add sodium hydroxide from the flask drop by drop with stirring to the hydrochloric solution from the 200 ml flask. When the hydrochloric acid becomes colorless, the reaction has become neutralized. When the hydrochloric acid becomes blue, the reaction is completed.
7. Pour HCl from the 500 ml beaker into another flask. Add two or three drops of phenolphthalein. Add two - four teaspoons of an antacid that have aluminum hydroxide and magnesium hydroxide, both are alkali solutions, to the HCl in the flask. The hydrochloric acid becomes white, the reaction has become neutralized.
8. Pour HCl from the 500 ml beaker into another flask. Add two or three drops of phenolphthalein. Add l/2 teaspoon of baking soda (sodium bicarbonate), a source of alkali, to the HCl in the flask. The hydrochloric acid or HCl becomes a clear lime color.
9. Divorce chemistry and explain to students that the concentration of hydrogen ions in a water solution is normally a matter of importance for the hydrogen ion is responsible for all acid properties and that includes us. The concentration of hydroxide ions will be basic or alkali. In mathematical form it is pH = log 1/(H+) and pOH = log 1/(OH-). The pH is the logarithm of the reciprocal of the molar concentration of the hydrogen ion and the pOH is the hydroxide ion.
10. Take the two red plastic book covers and measure the amount needed to put inside the tube (about 6 1/4 inches wide) glue the edges with acrylic glue.
ll. Take the two blue covers and repeat the above.
12. Cut acrylic glass 17.5 x 21cm of red, orange, yellow, green, clear, and blue for a pH chart.
13. Demonstrate how to use the mathemathical approach for signed numbers using the tube. Let red represent positive numbers and

blue represent negative numbers.

l4. Place chart on chalkboard--magnetic strips can be used to hold acrylic chart. Students can select a color from the pH range to represent the continuum of signed numbers.

If more information is needed on the use of " Vision Props" of signed numbers, this author can be reached after 6:00 P.M.

Positive and Negative Numbers

Siegel, Lincoln R.
6750 N. Ashland
Chicago, Illinois
262-58I7

Cregier High School
Seely and Damen
997-3690

Objectives:

Students should be able (after concrete examples are shown) to realize that zero is not the lowest number used in mathematics or real life, that there are NEGATIVE numbers and how to use them.

Materials Needed:

Acetate paper
Pointer
Screen
Light (for screen)
Various colored crayons

Strategy:

By using the number line (vertically) and the "team" method to introduce adding and theory AND a practical method of performing subtraction involving any possibility (or combination), it is hoped that students will feel at ease with negative numbers even though they will continue to prefer positive numbers and concepts in their daily life. (The number line method is familiar to math teachers; the "team" method is merely a grouping of all positive numbers together under a plus sign and doing the same to the negative numbers under a minus sign, determining which sign has the bigger total, and applying this sign to the difference of the two "teams." Subtraction will involve the teacher emphasizing it is NEGATIVE adding, using positive and negative minuends and subtrahends, demonstrating the difficulty of finding the exact differences in many cases. As a result the teacher will by example demonstrate that subtracting is negative adding by inquiring of the class if they do not see that giving a student a negative sum of money is not the same as taking that very sum away. The method of changing any subtrahend's sign to the opposite sign, and treating the result as an adding problem will give the correct answer to the subtraction problem. It will be mentioned, also, that the changing of signs should occur on the side to allow the teacher to see the original problem. Three of the four possible combinations will be done in this manner. Finally the method will be shown to work on two POSITIVE numbers, thereby recalling a simple second grade problem to reassure students that changing the method of subtraction does not violate what they have already learned.)

Positive-Negative Charge Model For Integers

Williams, Barbara
6521 S. University Avenue
Chicago, Illinois 60637
684-7458

J. N. Thorp School
955-8950

Objective:

To represent operations on integers with positive and negative charges.

Materials:

Overhead projector, drawing of an empty beaker on an acetate, bingo chips (two colors needed).

Procedure:

The "positive-negative" model was used to represent addition and subtraction, however, this model can also be extended to represent division and multiplication.

To use this model the blue chips represent negative charges. The red chips represent positive charges. The beaker represented on the acetate will be used to combine the charges. We are not concerned with individual charges, but with collection of charges in the beaker. Therefore, an empty jar would have a collective charge of zero. If the jar contains an equal number of blue and red chips, the charge is also zero. Three positive (red) chips and three negative (blue) chips form a 1:1 correspondence and they therefore cancel each other. The collective charge of the beaker is zero.

Addition

Ex. 1. +3+(4)=+7

Place three red chips in the beaker, add four red chips. The collective charge is now a positive seven.

Ex. 2. -5+(2)=-3

Place five blue chips in the beaker then add two red chips. Match a blue and and red chip 1:1 until two sets of zeroes are matched. Remove the matched chips from the beaker. There are now three blue chips remaining in the beaker. The collective charge is now represented by as negative three. The answer -3 represented by the three blue chips.

Subtraction

Ex. 3. -2-(+7)

Place two blue chips in the beaker. We now must create +7. Add zeroes (seven red chips and seven blue chips), to the beaker. The collective charge is -2. Now, remove the seven positive (red) charges. Only blue (negative) chips remain. Your answer is represented by the nine blue chips that remain.

Multiplication and division can be similarly represented.

A COMPLETE MODEL FOR OPERATIONS ON INTEGERS by Michael Battista
Arithmetic Teacher, May 1983.

THE SINE FUNCTION

Ronald G. Sienkiewicz
Prosser Vocational High School
Chicago, IL 60639
1-312-637-5556

Objectives:

To familiarize the students with the concept of the sine function by defining, by graphing, by computer generating, by using a "shop created" blackboard sine wave generator, and by presenting examples of natural phenomena which result in sine wave motion.

Materials:

1) a plexiglass sine wave generator; 2) blackboard and chalk; 3) a computer and CRT with appropriate software; 4) a handout containing computer generated sine graphs, a table of values of the sine function from 0 to 90, a pictorial definition of the sine function, a copy from a Physics textbook of a section explaining periodic and oscillating motion.

Strategies:

In teaching this concept, I began by talking about an elementary example of a wave i.e. an ocean wave with its attendant amplitude and periodicity. I then changed models and demonstrated a sine wave on the chalkboard by using a shop-created sine wave generator. Here, I was able to be somewhat more mathematical by relating the height of any angle to movement on the Y-axis and lateral distance as movement on the X-axis. This lead to a formal mathematical definition of the sine function. Next, I graphed the function Y=sin X. I did this by using values of 90, 180, 270, & 360 degrees (quadrantal angles). Using these values, I showed that the value of the function oscillates between 1, 0, & -1. In the same context, I showed how any intermediate angle, plugged into the equation, will likewise be a point of the same graph. The values for the intermediate angles were obtained from the table of values provided in the handout.

Following this, I went to the computer. Writing an equation on the chalkboard and asking the students to predict its graph, I was able to quickly and efficiently run through several variations of the sine function without the tediousness of using the chalkboard. Incidentally, although it might be considered of marginal relevance, we did review the programming that created these graphs. Next, I discussed the phenomena of the sine wave in nature. The handout contained a copy of a section of a Physics text book dealing with oscillations and periodic movement. The significant idea here, being that this type of motion (the movement of a pendulum and the motion of a mass at the end of a spring-natural phenomena) will always be mathematically expressed in terms of sines and cosines.

Thus, my presentation was concluded. I intended to make an interdisciplinary presentation on sine waves. In this way, I hope that I have given the students a multidimensional and hopefully memorable view of the nature and meaning of the sine wave.

Visual Structure of Postulates and Axioms in Algebraic Operations

Sanford Olshan

Roosevelt High School
Chicago, IL

Objectives:

To reinforce and retain the use of axioms and postulates in various proofs and linear transformations of equations.

To have student build a physical model of the game of "PRUFF" either as a card game or as a board game.

Materials:

Approximately 40 cards listing postulates, axioms, and definitions as taken from your text book. It is a good idea to put examples of each either below or on the back of each card. Make up about 25 problem cards with current problems from your text answer should be placed on back. Try to avoid problems that require paper to solve. About 20 cards which have proofs on left hand side you show statements and the reasons are placed on the back of card.

You may use these cards either as a Card Game as they are or design a Board Game as you will find in description of game.

Strategy:

From the beginning of the semester student must place each definition, axiom, postulate, or property on a card the size of, or smaller than an index card. These cards are to be called P-Cards. Each card should have examples describing the Axiom or Postulate on the back of the card. During the sixth week or at the end of third chapter we are ready to begin playing the game. The instructor writes out ten or more proofs or solved equations giving the reasons on the back. The students separate into groups of about 2 to 6 in each. They each take 5 cards and try to find the reasons for the proof statement. If they have one they place it on the table and look for a second, If they do not have any they pick a card from their deck and the turn goes to the next person. The person with the least cards after the time allotted is the winner.

To play the Board Game "PRUFF" you make another set of cards called problem cards, these are selected from current problems in the text. Each player selects a marker and rolls the die to see who goes first. Highest roll shakes die and moves marker that number of squares. He can either land on a problem or a pruff. If it is a pruff, he looks at the top statement on the Proof Card if he has a reason he places P-card on table and looks for second reason. If he does not have p-card to fit reason he draws one from deck thus completing his turn. When one lands on problem card she selects top problem and tries to solve it. If she can she discards one p-card from hand. If it is incorrect she must take a p-card from deck.

If you are sent to Cage you must skip one turn after you roll the die you follow the alternate path. Follow path until the end. When you reach the end without any 'P'cards, You Win!!! If you have one "P" card, go to start to continue play (you do not have to take any new cards!) If you have 2 or more cards in your hand, return to start, take five additional "P" cards and continue playing until someone wins! (no cards at the end, or least cards when time is called.) Note:"The problems can be written in different degree of difficulty so that the students may be of various math levels.

INTRODUCTION TO SOLVING EQUATIONS

Mary Lynn Bochenek
Central Junior High
17248 S. 67th Ave.
Tinley Park, IL 60477
1-708-532-1771

OBJECTIVE:

To arrive at an equation of the form X = [ ] in which the variable is isolated and the solution is then obvious through use of equivalent equations.

MATERIALS:

- -film cans (with appropriate weights inside and labeled)
- -balance scales (at least 2)
- -cards with equations written on them
- -handouts (equations to solve, twelve ball problem, the hundred artisans, and various others)
- -overhead projector
- -card with equal symbol and not equal symbol

STRATEGIES:

Each film can weighs approximately 5 grams so I let that be my 1. A individual film can with cover is approximately 7 grams so I filled each can with sand, nails, money, etc. to have 10 grams be a 2, 15 grams be a 3, etc. I let x = 4, y =3, z =8, w = 15 and v = 2 for my equations. You also need cans labeled 3x-2, 2y, x-1, z-2, 3x, 5y, z/2, w/3 and 2y+1.

Equations used v=v, 2+3=5, y+4=7, 6=2+x, 4-1=3, x-1<>x, x-1=3, 6=z-2, 2*3=6, 3x=12, 15=5y, 6/3=2, z/2=4, 5=w/3, 2y+1=7 and 3x-2=10.

Prior knowledge: variables and expressions, order of operations, evaluating expressions, properties of operations and inverse operations.

Discussion at beginning:

Solving equations: "The basic idea is to find out what x is. The catch is, that as soon as you do, they change it to something else!"

Equal symbol states that two expressions name exactly the same number. An equation is a number sentence which states that two expressions are equal. Therefore, an equation must have an equal symbol. We discussed a not equal to symbol and defined a variable as a symbol, usually a letter, that can represent any number. Remember when the solution of an equation is found, it must be checked. Symmetric property states that x-4=9 is the same as 9=x-4 and commutative property states that 113 + x is the same as x+ 113.

I will use the pan-balance scale to demonstrate how to solve simple equations incorporating the concepts of our properties and inverse operations. Each step is an equivalent equation that is easier to solve. Although the equation changes in the process, the solution remains the same. In your last step, the equation is so simple that it tells you the solution.

Okay, let's start with our first equation v=v. I demonstrated on a balance scale how any number equals itself. Also that if I add the same number to both sides of the balance scale, I will have an equivalent equation. Then we proved 2+3=5 on the scale. Now two equations with variables are solved and checked. Discussion of what we did should lead to the Subtraction Property of Equality which states that subtracting the same number from both sides of an equation does not change the equality. For all real nos. a, b, and c, if a=b, then a-c=b-c.

Our fourth equation 4-1=3 lead to a discussion of subtraction on the balance scale. We must break 4 down to 3+1 and then take 1 away or we can add 1 to both

sides. On the scale I showed that x-1 is not equal to x. In order to equate them I must add 1 to x-1. Therefore, I know that x-1+1=x. Our next equation x-1=3
2
uses the concept from the last equation that we must add 1 to both sides, then substitute x for x-1+1 to reach our goal x=4. Have a student volunteer to demonstrate that 6=z-2. This leads to a discussion of the Addition Property of Equality which states that adding the same number to both sides of an equation does not change the equality. For all real nos. a, b, and c, if a=b, then a+c=b+c.

On to multiplication: 2*3=6 means 2 groups of 3 or 3 groups of 2. Both of these need to be demonstrated. Therefore, 3x=12 means 3 groups of x = 12 so 3 x's need to be shown equal to 3x and then substituted for 3x can. Now take away equals and you are left with x=4. Make sure you check your answer. Have a student demonstrate the next equation. This leads to the Division Property of Equality: dividing both sides of an equation by the same nonzero number does not change the equality. For all real nos. a, b, and c, with c<>0, if a=b, then a/c=b/c.

Now for division: 6/3=2 is our first equation. If we break 6 up into 3 groups, each one will be a 2. For z/2=4, we need to show they are equal and then show that z/2 + z/2 = z but z/2 + z/2 = 4 + 4. Showing this on the scale leads to z=8. Have a student demonstrate 5=w/3. This leads to the Multiplication Property of Equality: Multiplying both sides of an equation by the same nonzero number does not change the equality. For all real nos. a, b, and c, with c<>o, if a=b, then ca=cb.

Finally we tried to solve 2y+1=7 on the scale using the concepts that we had learned in previous problems. Break 7 into 6+1, then subtract 1 from both sides; break 2y into y+y and 6 into 3+3, then take away equals to have y=3. Lastly, 3x-2=10.

Students should now be given the handouts and solve the equations using the methods learned and the scales if needed. When finished with their equations they need to try the Twelve Balls problem from the handout. This can be tried and demonstrated on the balance scale. The other problems from the handouts should be discussed in later sessions.

Return to Mathematics Index

ORDER OF OPERATIONS

Bernice E. Holloway
Bellwood School District #88
1801 N. 36th Avenue
Stone Park, IL 60165
1-708-344-9344

OBJECTIVES:

- -to use grouping symbols and the standard order of operations to simplify numerical expressions.
- -to use the order of operations to evaluate variable expressions.
- -to use the calculator and computer to solve numerical expressions.

MATERIALS:

- -computers
- -calculators(generic brand)
- -paper
- -pencils
- -chalk
- -chalkboard
- -eraser
- -banners(computer printouts)
- -handout

STRATEGIES:

A. To bring out the comparison of punctuation marks in a sentence with grouping symbols in a numerical expression (signs with the expressions Robin Lee Travis and I love computers;Slow Children Playing;Save Rags and Waste Paper.), ask if students can explain why the banners are ambiguous.

INFO
Without commas, the sentence Robin Lee Travis and I love computers, implies that two people love computers. Depending on where commas are inserted, the sentence can state that three or four people love computers.

Sample Activities:

1) ask students to simplify 10+2*3-1 to get as many different answers as they can (use calculators and computers to compare answers).
2) discuss the need for a standard order of performing operations so that there is no ambiguity about the value of such expressions.
3) discuss the steps of the standard order of operations and show how they would be used to simplify the expression above.

10+2*3-1	
10+6-1	multiplication
16-1	addition (from left to right)
15	subtraction (from left to right)

4) show how parentheses could be used to give different meanings to the same expression.

```
(10+2)x3-1      (10+2)x(3-1)
   12 x3-1         12 x 2
     36 -1           24
      35
```

INFO

In expressions with more than one operation, grouping symbols such as parentheses or division bars are often used to indicate the order in which to do the operations. These grouping symbols can change the meaning of an expression, just as commas or other punctuation marks can change the meaning of a sentence. Whenever the order of operation is not indicated by grouping symbols, there is a standard order of operations to be followed.(Do exponents, multiplication/division, addition/subtraction from left to right.)

In mathematics, more than in some other forms of written expression, ambiguity must be eliminated. Otherwise, different people may assign different meanings to the same symbols, and communication is faulty. Ambiguity is eliminated using grouping symbols and the order of operations rule.

In examples #1 and #2, the expressions do not have grouping symbols, the standard order of operations is used.

```
#1    13-4x2-3        #2   2x3^2-4
      13-4x2-3             2x3^2-4
      13- 8 -3             2x 9 -4
         5-3                18-4
          2                   14
```

In examples #3 and #4, notice that the two expressions have the same numbers and the same operations, but the results are different because of grouping symbols.(Do operations within parentheses, exponents, multiplication/division, addition or subtraction from left to right.)

```
#3   (8+5)x3          #4  8+(5x3)
     (8+5)x3              8+(5x3)
      13x3                8+15
       39                   23
```

B. To give additional practice using the correct order of operations, have students:
   1) replace the variable in each row or column to make a true equation in puzzle #1 (see handout).
   2) write the operations sign (+,-,x,/) in each row or column to make a true equation in puzzle #2 (see handout).

C. To check progress of students have them complete the Grouping Symbols-Review (see handout and below).

IV. COMMENTS/INFO.
The use of the calculator is so common to us that we tend to take

certain things for granted...only with the wide use of personal computers are we being forced to reevaluate the function, the appropriate use, and the correct method(s) of teaching students certain mathematical concepts using both machines.

3

It should be pointed out to students that people communicate with computers by using programs. Programs tell the computer what to do. However, it is not always necessary for a person to be able to write a program in order to use a computer. Programs can be written in such a way that an operator can use them by answering a series of questions that are written into the program. Nevertheless, the best way to learn what a computer can and cannot do is to learn a little about programming.

To program arithmetic calculations in BASIC, you use the following symbols:

+	addition
-	subtraction
*	multiplication
/	division
( )	parentheses
^	raised to a power(exponent)

BASIC follows the order of operations. Sample BASIC program:

```
10 PRINT 21*34+35/7
20 END
RUN
719 (answer)
```

Grouping Symbol-Review

Select each answer from the choices in parentheses. Write the answer in the blank.

1) ab means a______________b. (plus, divided by, times)

2) $\frac{a}{b}$ means a______________b. (plus, divided by, times)

3) a____________b means a is not equal to b. (=,<>,.)

4) Parentheses are an example of a ______________.(grouping symbol, value, variable)

Simplify each expression with the calculator. Translate each expression into BASIC. Use the computer to check answers.(Remember to type PRINT before the numerical expression.)

5) 7+(12-3)_____________________

6) $\frac{(18-3)}{(3+2)}$ ____________

7) (7x3)-(5x4)__________________

8) 10-(3+4)___________

9) 24- (63/(6+3))_______________

10) $\frac{36/12+6}{8-5}$____________

11) 15-5x2+8/4__________________

12) 20(12-8)-30/(10+5)___________

Simplify the expression on each side of the ----?----.
Make a true statement by replacing the ? with the symbol = or <>. Check your answers using the computer.(If the computer prints 1, your answer is true; if your answer is false, the computer will print 0.) Remember the numerical expressions must be in BASIC.

```
13) 16+3   ?   9+3 _______          14) (8-3x2)   ?   (8-3)x2_________

COMMUTATIVE, ASSOCIATIVE AND DISTRIBUTIVE PROPERTIES

James E. Breashears
Robeson High School
6835 S. Normal
Chicago, IL 60621
1-312-723-1700

OBJECTIVES:

1) To compute expressions like (56 + a) + 4 and (50 * 7) * 2;
2) To identify the commutative and associative properties;
3) To rewrite expressions by using the distributive property;

MATERIALS:

1) chalk
2) blackboard
3) electroboard
4) response sheets
5) pencils

STRATEGIES:

1) Class discussion of understanding of terms commute, associate and distribute.
2) Class discussion of dictionary meaning of terms commute, associate and distribute.
3) Teacher blackboard demonstration of mathematical application of terms commutative, associative and distributive properties.
4) Teacher demonstration of electroboard.
5) Three-student-teams demonstration of electroboard.
6) Class participation with response sheets.

It's About Time

Vernita Smith
214 Glen Ellyn Rd.
Bloomingdale IL 60108
(708) 582-7809

Mahalia Jackson Elementary School
917 West 88th Street
Chicago IL 60620
(312) 535-3341

Objectives:

This mini-teach has been designed for first and second graders. You may alter it in any way to accommodate your grade level. The main objective is to tell time to the hour on an analog clock and how to compare more and less time.

Materials Needed:

Average size classroom of 20-25 students.

1. Analog Clocks
2. Puzzle Clocks
3. 6-Rings and 4-Cones
4. Stop Watches
5. Beads and String
6. Scissors
7. Box of Connecting Cubes
8. Box of Attri-Cubes
9. 2 Transparent Cups
10. Tape
11. Large and Small Spoons
12. Star and Square Shapes

Strategy:

Start out by asking students what time they got up this morning (answers will vary). Write times on the board, and explain each time on the hour. Pass out the analog clocks and explain the parts and their functions. Then call out a series of different times to the hour. Have students show you the correct time on their analog clocks. Ask students how long they think it will take to put together a puzzle clock. Let them give you a time. Group students in pairs, one student can use the stop watch and the other student can put the puzzle together. Record the estimated time and the actual time. Repeat the same procedure using beads and string. Have students string 30 beads then record the estimated time and actual time. To compare more and less time, have students cut out a simple shape (square) and a complex shape (star). Let them tell you which will take more or less time to cut. Record the results. Then have them fill 2 3/4 cups of water (use tape on cup for visual limitation) using a small spoon for one cup and a large spoon for the other cup. Record estimated time and actual time. Take boxes of connecting cubes and attri-cubes, and have students empty the boxes (one at a time) then replace cubes 2 at a time. Record the estimated time and the actual time. Stay in groups for ring tossing. This activity is timed at 20 seconds per student. Line-up the cones one after the other, about 8 inches apart. Let students toss the rings for points (green-6 points, blue-4 points, and yellow-2 points). When the 20 seconds is up the student with the most points should be rewarded.

Performance Assessment:

When lesson is completed ask students if they enjoyed the activities. Then let them tell you why (answers will vary). At this time students should have an understanding of time to the hour. They should be able to relate school time, lunch time, and bed time to their real life situations. In addition, they will be able to compare more and less time. Example: Putting on shoes with laces or putting on slippers. It will take more time to put on shoes with laces.

Return to Mathematics Index

Multiplication and Areas

Albert Michael
4903 W. Winnemac Ave
Chicago IL 60630
(312) 282-9780

Robert Fulton Elementary School
5300 S. Hermitage
Chicago IL 60609
(312) 535-9000

Objectives (Grades 3-5):

To learn two-digit multiplication using math facts.

To find areas of rectangles and squares.

To review addition and subtraction facts.

To be able to fill an order of items of equal and different prices and quantities.

Materials Needed:

rulers, stamps (new and/or used, singles and sheets of different denominations and sizes), magazine ads stamps (from the Ed McMahon $10,000,000 Sweepstakes), stamp order catalogues, play money (dollars and change), transparent grids and Lego platforms with different numbers of squares and dots, scissors, order forms

Strategies:

Show the students 3x4, 4x5, 6x4 square grids, or various sizes of Lego platforms and ask them to count the squares and the dots one at a time. Next, show them large size grids and Lego platforms and have them count the dots individually. Tell them to count the number of squares or dots in one row across and another row down and multiply the two numbers. Point out that it is much easier and faster to count the total by this method. Demonstrate this on the board.

Distribute 3x3, 4x3, and 4x4 sheets of stamps. Ask the students to find the total area of each sheet and then find how much each sheet costs. Ask how much would you pay if each sheet costs 4 times the face value. Have one student from each group be the stamp dealer from whom the children can buy stamps.

Pass out sheets of different denominations, sizes, and quantities. Ask the students to find the area of one stamp and then the area of the whole sheet. Next, find the total price of each sheet.

Distribute single, square stamps, preferably used, each attached to a piece of cardboard paper for easy manipulation and protection from being mutilated. Find the area of each stamp and then determine how many stamps would fit in an area of 24x24 sq. cm., 28x28 sq. cm., and 35x35 sq. cm., for example. You may want to reverse all activities to look like this one.

Here is an **example** for another activity:
Suppose you spilled some liquid on one of the sheets that you treasure very much and you are willing to pay any reasonable price to replace it. The sheet has 40 stamps of 22 cents each. The dealer asks for an extra 15 cents per stamp over the face value. Find out how much you would pay per stamp, then for the

sheet. Also calculate the profit the dealer made.

Distribute sheets of different quantities. Ask students to find the face value of each sheet by multiplying the price of one stamp by the number of stamps in the sheets. Look for current prices in the catalogues and decide how much each sheet would cost today. Next, find the area for one stamp and then for the whole sheet.

Notes: All the above activities may be used for the fifth grade for teaching division. First, ask to find the area of the whole sheet and then the area of a single stamp.

The same activities may be used to teach social studies. Ask questions about the event or person the commemorative stamp was issued for.

Performance Assessment:

Pass out the sheets of magazine ads stamps. Choose a denomination and write it down on the lower right hand of each stamp. Find the area for one stamp and then for the whole sheet. A dealer offers you 68% of the face value. Calculate your loss if you decide to sell.

Pass out copies of order forms and ask them to order as many sheets or single stamps as they want and write them in the proper columns in the form. Find out the total of the order. Add sales tax and shipping and handling charges.

Write on the board the years in which the rate of first class mail went up in one column, and the rate increase in another at random. Ask students to arrange them chronologically. Next, ask them to make a line or a bar graph to show the rate hike. Then have them calculate the percentage of the increase each time it occurred.

Zone Out!

Willie Mae Wilson
8824 S. Parnell Ave.
Chicago IL 60620
(312)488-7483

Hartigan Elementary School
8 W. Root Street
Chicago IL 60609
(312)535-1560

Objective:

This lesson is designed for grades K-3. To review previously taught concepts of time, hours and 1/2 hours. To help children with the concept of the four different standard time zones in the 48 states.

Materials Needed:

Collect in advance the following items:

Judy clocks	paper plates	wht. paper	U.S.A. map
scissors	crayons	fasteners	black and red construction paper

Strategy:

1. Review telling time by demonstration and then let class review on their own with individual Judy clocks.
2. Make paper plate analog clocks.
3. Discuss the four standard time zones on U.S.A. map.
4. Give the students a teaser question: "My friend in New York called her grandfather in California. It was 8:00 a.m. and she woke him up! How can that be?" Discuss why they think she woke him up.
5. Let children share their own experiences with time zones; for example going to visit relatives in California and seeing a TV announcement that a show will be on at "8:00 p.m. eastern 7:00 p.m. central and 5:00 p.m. pacific time."
6. Show using map why the time zones are different. Practice with students to be sure they understand the different zones. Give them a time in the eastern time zone and get them to line up across the room in the other three time zones. Change the time and place new students in different spots to review.

Performance Assessment:

Step six of my strategy is the first way I will be able to assess my students. I can tell how much students have mastered this concept through a discussion and an individual performance evaluation.

Return to Mathematics Index

Elapsed Time

Bernice Joyce Henry
3638 Blackstone Av.
Markham IL 60426
(708) 331-0878

Edward H. White
1136 W. 122nd. St.
Chicago IL 60643
(312) 535-5671/2

Objectives:

Student will calculate elapsed time, given beginning and ending time.
Student will state the time using a.m. and/or p.m.

Materials needed:

Model demonstration clock (for teacher use)
U.S. map
Time line
Paper plates (for the third grade class)
Poster board cards (5" x 5")
Fasteners
Scissors

Strategy:

I. Teacher will introduce and discuss elapsed time using a typical school day after eliciting activities and the exact time they take place from the students between the hours of 9:00a.m. and 2:30p.m.

II. Students will individually construct an analog clock; teacher and helpers will assist.

III. Introduce the problem: Student entered a contest and has won an all expense paid trip to participate in M.C. Hammers' Annual Youth Camp held in San Antonio, Texas. However, he/she must check in at the M.C. Ranch before noon tomorrow.

IV. List things to be done before leaving and time intervals.

Shopping	begins:	2:45p.m.
Packing		7:05p.m.
Cab ride to bus station		9:00p.m.
Luxury charter bus ride from Illinois to Texas		10:15p.m.
Bus arrival time in San Antonio		9:35a.m.
Limousine arrival time at M.C. Ranch	ends:	10:30a.m.

V. Demonstrate, discuss and teach using the given problem and list of the things to be done. Use the individual time intervals for teacher demonstration and student hands-on activity showing the actual revolutions on the clocks. Elicit correct responses from the students and place on the chalkboard. Upon completion of list, students are to determine total elapsed time. Point out next day arrival.

VI. Total time and next day arrival time prompts introduction of a.m. and p.m. through the use of a time line and the scheduled activities given earlier by the students. Give meanings and relationship to day and night and to the clock. Class will determine if arrival time is a.m. or p.m. after a brief discussion.

VII. Introduce small group activity: Each student in the group will select a time being sure to indicate whether a.m. or p.m. Helpers will record given times on the sheet entitled Hours and Minutes. Each group will determine elapsed time intervals on their worksheets using their clocks and their a.m./p.m. cards. Allow one member from each group to utilize the time line as a means of verifying the time and whether it's a.m. or p.m.

VIII. Pass out worksheets entitled "Time" and also "Telling Time to the Minute" as a follow-up lesson or practice.

Telling Time in Different Time Zone

Borita Khim
4926 N. Drake
Chicago IL 60625

Stockton Elementary School
4420 N. Beacon
Chicago IL 60640
(312) 534-2450

Objective:

To have the 4th grade students learn to tell time in different time zones.

Materials:

Paper plates, fasteners, crayons, scissors, pencils, pens, markers, 2 different colors of construction paper, digital and standard face clocks, transparency of time zone map and time zone maps for class, funtac, envelopes and card boards.

Strategy:

1. Discuss with the students the importance of knowing the time in different places so that people can communicate with each other without having time conflict.

2. Show students a standard clock

3. Have students make their own clocks out of the paper plates.

4. Show students the map of the U.S.A. that shows the various time zones. Show time zone map transparency which explains time zone divisions. Read the time on the map with students and discuss the time in different parts of the U.S.A. Give students the map of the U.S.A. that shows the various time zones.

5. Have students turn their clocks to the current time and ask students if the current time in California is the same as the time in Chicago. Wait for students to respond. Ask questions about various time zones.

6. Group students into six groups. Each group represents a different time zone (Hawaii, Alaska, Pacific, Mountain, Central, and Eastern).

7. Instruct groups to turn their clocks to a specific time in any time zone and have all groups adjust the time to their particular time zones. Then ask them if their time is behind or ahead of the specific time given. Ask questions on various time zones and have groups change zones.

8. Give each group an envelope that contains four state labels. Have the group find the states and the time zones. One of the group members places the labels on the map of the states and tells the time zone and the difference from the time in the Central time zone.

9. Give each group a card board that has two clocks on the top, one indicates the Chicago time and the other one is blank with the word Hawaii on the top. Below the clocks there are questions which ask students to look at the Chicago time and find the Hawaii time and describe what boys and girls would

be doing in both states at that time.

Area, Arithmetic and Algebra

Larry Freeman
1956 West Hood Avenue
Chicago IL 60660-2253
(312) 262-1840

Kenwood Academy
5015 South Blackstone Avenue
Chicago IL 60615
(312) 535-1409

Objectives:

To show how area of rectangles and squares can motivate the learning of multiplication rules for certain binomials, specifically:

$$(x + y)^2 = x^2 + 2xy + y^2$$

$$(x + y)(x - y) = x^2 - y^2$$

To show those teaching upper-grade math and high school first year math how their students can perform arithmetic based on these identities.

To show by paper folding several applications of the "distributive law" of multiplication over addition/subtraction.

Materials:

Cardboard demonstration set for the teacher (with magnetic tape backing) and printed sets of squares and rectangles for students to examine and re-arrange at their desks. Prepare packets of pre-cut squares and rectangles, one for each student.

Student materials should be prepared on centimeter-ruled paper; two cm = one unit. (In this fashion, area can be checked by simply counting squares). The entire square will measure 16 x 16 units, with heavy horizontal and vertical lines partitioning it into an 8 x 8, 4 x 4, and two 8 x 4 rectangles. All measurements start from the lower-left hand corner of the large square. Enter dimensions on every edge; in the interior of each rectangle should appear "Area = ______________ square units".

Two of each square will be needed for each student packet: one left whole and one cut along the heavy lines into the four rectangles. The teacher will need a similar set of materials, very much enlarged and made of heavier paper ("tagboard" is ideal). In addition, prepare a set of the four cut rectangles very much enlarged. They must be on heavier still cardboard and backed with magnetic strip material to adhere to typical metallic base chalkboards. The teacher's uncut square should be pre-folded along the heavy vertical and horizontal lines.

Strategy:

Review the area formula for a rectangle. Immediately have students remove the four small rectangles and arrange them to form a large square. How many different arrangements can they find -- rotations and reflections are "different" in this case? Sketch each arrangement in a student's notebook. Find the area of every large square by adding up areas of the four components. Encourage students to confirm this identity:

$(a + b)^2 = a^2 + 2ab + b^2$ [a = 8 and b = 4]

Challenge: Using as many of the small pieces as needed, ask students to create a rectangle whose measurements are 8 x 16. Sketch the arrangement they discovered, and, as before, try to discover and sketch as many different arrangements as possible. Calculate the total area by adding the components. The student will note that all but the small square were used in the second rectangle:

So 8 X 16 = 128 which also equals $12^2 - 4^2$ [144 - 16 = 128].

The teacher should duplicate these arrangements with the large magnetized rectangles on the chalkboard. The algebraic identity here demonstrated is:

$(x - y)(x + y) = x^2 - y^2$. [Here x = 12 and y = 4].

Second challenge: Have students take the larger square from their packet and fold it along the vertical line. The left side is now a rectangle whose measurements are 8 x 12. But it consists of two rectangles: 4 x 8 and 8 x 8. Thus they have shown that 8 X 12 = 8 X 4 + 8 X 8. So they have proved that

8 X 12 = 8(4 + 8) [an illustration of the distributive law]

Third challenge: With new teacher-made packets -- identical to the originals **except** that variable names replace numerals for dimensions. Another difference: These paper rectangles should not have centimeter ruling. Now the student should follow every step above using variables instead of numerals. The writing of the appropriate identities is left as an exercise for the teacher; answers available from the writer.

Performance Assessment:

While students are working on this project, either individually or in pairs, the teacher circulates, assesses performance visually and gives hints, commendations or other encouragements (via adroit questions). Later, notebooks themselves will be graded for completeness and accuracy. Ultimately knowledge will be "assessed" via customary pencil and paper tests. [Ruth Mitchell-type global assessment techniques do not seem cost effective for this unit.]

References and credits:

This unit was inspired by a conference table discussion with Porter Johnson. In fact none of these techniques is really new; they are frequently re-discovered in many different places at widely different times by creative teachers inspired to improve textbook versions of "the method."

Multicultural Dimensions:

Geometry is not the exclusive possession of any culture in any historical era ancient or modern. All peoples who had concerns with land and its measurement or with calendars developed appropriate geometrical principles. Similarly with arithmetic: Counting and rudimentary computing were known to all peoples, ancient or modern, no matter what geographical location. None was limited by "culture" in matters of commerce; rather our current awareness or ignorance is a function of the available historical record and its readability. It is pointless to try to ascribe primacy or originality to any cultural group.

Algebra was a European inheritance which came most directly from the Mediterranean Moorish (Muslim/Islamic) civilizations. They, in turn certainly drew from the ancient Greek, Hindu and African civilizations. Every civilization refines and improves what it inherits.

Tony's Tiger BITES

Maudestine McLeary
8556 S. Dorchester
Chicago, Illinois 60619
312-962-2760

John Hope
5515 S. Lowe
Chicago, Illinois 60620
312-962-2760

Objective:

Given a recipe the student will be able to make equivalent fractions, follow directions and complete the recipe.

Materials:

recipe for Tony's Tiger Bites
microwave oven
13x9x2-inch pan
4-quart mixing bowl
spatula
waxed paper if needed

Strategy:

Using the list of ingredients in the given recipe the student will calculate the amount needed to make twice the recipe, 3 times the recipe, 1/2 of the recipe and 1/4 of the recipe.

Activities:

1. review multiplication and division of fractions
2. make equivalent fractions 3x, 2x, 1/2, and 1/4 of the recipe
3. review kitchen safety rules
4. follow recipe to serve 32 Tony's Tiger Bites
5. ENJOY FINISHED PRODUCT

1 10-ounce package (about 40) regular marshmallows
1/2 cup margarine
1/3 cup peanut butter
7 1/2 cups or one 10-ounce package Kellogg's Frosted Flakes cereal

1. In a 4-quart microwavable bowl, melt marshmallows and margarine on High for 3 minutes, stirring halfway through cooking.
2. Stir in peanut butter until mixture is smooth. Add Kellogg's Frosted Flakes cereal, stirring until well coated.
3. Using a buttered spatula or waxed paper, press mixture into a lightly greased 13x9x2-inch pan. Cut into 1 1/2x2-inch bars.

Note: Use fresh marshmallows for best results.

Range-Top Method: Melt margarine in large saucepan over low heat. Add marshmallows and stir until completely melted. Remove from heat. Follow steps 2 and 3 above.

Follow up activity will be to check the nutritional value and percentage of U.S.

Recommended Daily Allowances.

Properties of Numbers

Steinfelds, Leon
22 W 223 Juniper Drive
Medinah, Il 60157
893-3252

King High School
536-8680

Objectives:

To contrast the "mean" behavior of 0, 1, 2 and regular numbers. Numbers will be likened to students.

Apparatus Needed:

Memory
chalk board, chalk.

Recommended Strategy:

Numbers 0, 1 and 2 will be regarded as "dissident" students. 0 will act as "murderer" in multiplication, but will not even touch numbers when addition or subtraction is required. To divide by 0 creates "mission impossible". 1 does not like division and multiplication. It is invisible as a coefficient or exponent (like Dracula). 2 hides only once in radical (square root). Zero is the only lonely number. The others walk in pairs on a number line as twins. Some numbers, like square root of 2, 5, 7..., cannot be written even in one hundred years, but one knows their location on the number line.

Return to Mathematics Index

Make-and-Take: Staff Development

Pintozzi, Joan
7200 Grand
Downers Grove, Il. 60516
964-4216

Curie Metro. H.S.
838-5040

Objectives:

1. Demonstrate some materials which can be used to provide a phenomenological approach to math
2. Show how to construct the materials

Apparatus Needed:

1. Manila file folders or paper
2. Acetate sheets for overhead projector
3. Sewing snaps
4. Paper circle
5. Handout on curves of constant width
6. Wooden model of wagon with Rouleaux triangles for wheels
7. Plastic cube
8. Colored rubber bands

Recommended Strategy:

1. Demonstrate Materials: suggest uses
2. Explain how to make demonstration models for the overhead using manila folders, acetate sheets and sewing snaps.
3. Use wooden wagon model and clear container of liquid to show that the strange looking wheels work very well
4. Fold the paper circle to create many different polygons and solid figures and to study their properties

An Introduction To Sets

Belton, John P.
220 North Grant
Hinsdale, Il., 60521
323-1126

Jones Metro. H. S.
347-7500

Objective:

The student(s) will recognize the symbol for set and will demonstrate the rules of set.

Materials Needed:

A random sample of materials, some of which have a common factor (color, shape, type of material, weight - mass, or other physical property).

Procedure:

The teacher (or students) will provide individual items. The student is asked to list the characteristics, or properties of the object. He (or she) is then asked to compare his list with a fellow student's list to make a master list. This step may be repeated more than once depending on the size of the class, and the comprehension of the student(s) regarding the categorizing, or classification process. The teacher may ask for a volunteer to put his list on the board for purposes of comparison, and illustration. The teacher will then introduce the term and notation for set, and will establish the rules for inclusion or exclusion from a particular set. Following a demonstration, new materials (or objects) will be introduced and used by the student to test his (or her) understanding. Abstract symbols are now introduced with further demonstration and testing by teacher and student.

Discovering New Units

Jenkins, Kay
3445 S. Rhodes Av. #900
Chicago, Il. 60616
James Shields Elementary School
523-6097

Objective:

With frequent work with Cuisenaire Rods the students will develop a systematic usage for creating new units or in finding a common denominator, in use with the skills for adding and subtracting unlike denominators.

Apparatus needed:

A set of Cuisenaire rods for each student or groups of two.

Recommended strategy:

Before students can develop a system for determining common denominators, a Hierarchy of Skills must be accomplished. The student must develop an understanding of basic concepts metacognitively. The goal is to use our entire mathematical schema. The desired sequence is:

1. they must know the meaning of addition and subtraction
2. they must master all basic concepts (addition, subtraction, multiplication and division)
3. they must understand common fractions as related to physical models (fraction strips, shapes divided into parts, number lines)
4. they must be familiar with prime and composite numbers (use of a Hundreds chart is helpful)
5. they should be able to add and subtract common fractions or like denominators

Children upon completion of these skills can develop the knowledge that equivalent fractions will yield a common denominator.

Children can be led to discover the relationship between numerical values of the rods and multiples that can be derived, thus leading them to the goal of developing new units not included in rods, i.e., 12, 15, 18, 21, etc.

Activities:

Review common fractions in everyday use. (Show each fraction with your rods.) 1. What fractional part is a stick of butter to a whole package? (After each question students will display the appropriate fraction with any color combination.) 2. I have six eggs. What fractional part of the carton do I have? 3. In a mixture of equal portions, we need 1 part Hydrogen and 1 part Chloride. What is the fraction to name each part? 4. Marci's father was asked to design a playroom for 3 and 4 year olds. The room needs areas for play-rest-music-and lunch. The room should be divided into how many equal parts? Write the fraction; show the fraction. What color rods did you use to show each fraction above? Did everyone use the same colors each time? (No.) This begins the development of alternative color combinations.

With work children can be led to include their knowledge of multiples of the set of counting numbers, as well as their multiplication facts or tables of factors (2x3=6; 5x2=10; 3x3=9, etc.).

To add fractions with uncommon denominators such as 1/3 + 5/6 our denominators need to contain the same unit. My unit needs to be at least 6 lengths long. Ask for a relationship between the numbers 3 and 6. Children can readily equate 3x2=6. Display a dark green rod, make a train of white rods as long as the dark green unit rod. How many white rods did you use? What color rod is 1/3 of dark green? Red, yes. How many red rods did you use? Show one red rod and five white rods. What is the answer? You can't tell immediately because we need to change everything to one color before we can combine the two, so we now need to trade our red rod in for how many white rods? (2). Now we can add them together. What is your answer? (7/6 is correct, write on board). We call 7/6 an improper fraction because the numerator is greater than the denominator, therefore we need to trade up now, I'm trading six white rods in for one dark green rod. What fraction is left? Students can easily see the answer to this question as 1/6 and the answer to the problem as a mixed number of 1 1/6.

Conclusion:

Problems of this nature can be explored by the teacher with the student's furthering their understanding of the idea of trading up and down to find common denominators. This same procedure should be followed with mixed numbers for adding or subtracting. Children should be given the opportunity to develop their own strategies for finding a common denominator. A list of 5 to 10 problems with unlike denominators can now be placed on the board for their further investigation with the teacher giving aid wherever necessary.

PLAY BALL

Roslyn N. Matthews
South Shore High School
7527 S. Constance
Chicago, IL 60649
1-312-933-8180

OBJECTIVES:

1) Given the White Sox averages, compute the batting averages and earned run averages.
2) Given general dimensions of the playing field and some equipment, change to the metric system.
3) To find the diagonal distance from 3rd base to 1st base.
4) To find the diagonal distance from 40 ft behind 3rd base to 1st base.

MATERIALS:

1) overhead projector
2) prepared transparencies
3) White Sox average sheet from the Chicago Sun-Times (7-16-86)
4) picture of a baseball field
5) blackboard
6) baseball
7) bat
8) calculators
9) an official baseball rules handbook

STRATEGIES:

Does anyone know the nation's oldest active major league ballpark?

Comiskey Park

Fine-----Let's Play Ball

The league President appoints an official statistician to maintain an accumulative record of all the batting, fielding, running, and pitch-ing records for each player. This morning we are going to complete an abbreviated average table. This table was obtained from Wednesday's Sun-Times--July 16, 1986. (Figure 2)

Batting averages = **Hits** / A.B. The percentage of times that a player gets a hit.

The headings for each column will be explained. The formula will be emphasized and the students will now compute the batting averages of the names listed on their table.

Earned Run Averages = (ER/IP)9 The average number of runs a pitcher allows his opponents to score.

The headings for each column will be explained. The formula will be emphasized and the students will now compute the earned run averages.

Certain dimensions are given of the playing field and equipment. (Figure 3) Change standard units to the metric system.

Using the baseball field: Find the distance from 3rd base to 1st.

Draw the distance. Compute.

Pythagorean Theorem OR 45-45-90 Rt Triangle

$d^2 = 90^2 + 90^2$ Leg times the sq rt of 2

d = 127.28 ft. d = 127.28 ft.

The left fielder catches a bouncing ball 40 ft. behind the 3rd base. How far would the out-fielder have to throw the ball. Draw the distance. Compute

Pythagorean Theorem

$d^2 = 130^2 + 90^2$

d = 158.11 ft.

BRAINTEASER

There are 100 seats available at the baseball game. These seats may be divided in proportion to men, women, and children. However, the cost of the tickets for these seats must equal exactly $100. The cost for a man is $5.00, for a woman $2.00, and for a child $.10. Determine the number of men's, women's, and children's ticket to purchase.

USING VARIABLES AND RATIOS TO GET YOU IN THE RIGHT GEAR

GEORGE K. SMITH

DUNBAR VHS
3000 SO. KING DRIVE
CHICAGO, IL 60616
1-312-567-5400

OBJECTIVES:

1) To apply the concepts of variable and ratio in everyday situations. 2) To determine the gear ratios and gears for a 12-speed bicycle. 3) To write a computer program which will determine gears using the bubble sort technique

MATERIALS:

1) Overhead projector and transparency sheets
2) Blackboard and colored chalk
3) Erasable laminated memo pads
4) 12-speed bicycle and bicycle mount
5) Handout explaining gear ratio

STRATEGY AND PROCEDURE:

The session will begin with a brief review of the hierarchy of arithmetic operations. Students will first give examples of various hierarchies (army, gov't, school,...). To remember the order of operations the students will use the mnemonic device PEDS (Parentheses, Exponents, Division/ Multiplication, Subtraction/Addition).

The overhead projector will then be used to show the students a short program in PSEUDO-BASIC. They will use the hierarchy to determine the output of this program. The program will motivate a discussion of the concept of a variable. The laminated pad will be used to see how once a value for a variable is replaced , that value forever disappears. The program is as follows:

```
 10  READ X
 20  Y=3+4*X-2
 30  PRINT X,Y
 40  IF X<>0 THEN 20
 99  END
110  DATA   4,-2,3,0
```

Two practical examples of ratios will then be given. The first will be a baseball player's hits per at-bats. The second the # of records sold per records sent at Honky-Tonk Hick Records in Marengo. For both variable and ratio I want the examples to motivate definitions from the students.

We will then turn to an application of variables and ratios. A student will mount a 12-speed bicycle in front of class and try to determine the various gears by shifting and judging the tension. The rest of the students will determine the gears by using:

$$\text{gear ratio} = \frac{\text{\# of teeth on chainwheel}}{\text{\# of teeth on freewheel}}$$

This will be abbreviated using the variables g=c/f. Two diagrams of the chainwheel, freewheel, and their relationship will be drawn on the board: one to show the gears as determined by the student on the bicycle, and the second to be used by the other students who determined the gear ratios. The lower the gear

ratio, the lower the gear. A handout will be distributed clarifying these concepts.
2

The results of the cyclist will then be compared with that of the students who computed the gears mathematically. Any differences which may appear will be discussed and accounted for (cyclist error in judging tension, old chain which has stretched, wear on chainwheel and freewheel, etc). Finally, a computer program will be distributed which determines gear ratios and gears using the bubble-sort technique.

DEFINITIONS: **variable**- a symbol (usually letter) used to represent an unknown #

ratio- a quotient a/b comparing two elements, where b<>0

bubble sort- a programming technique where data is stored from "lowest" to "highest" or vice-versa

PSEUDO-BASIC- a simplified version of BASIC for students not familiar with programming languages

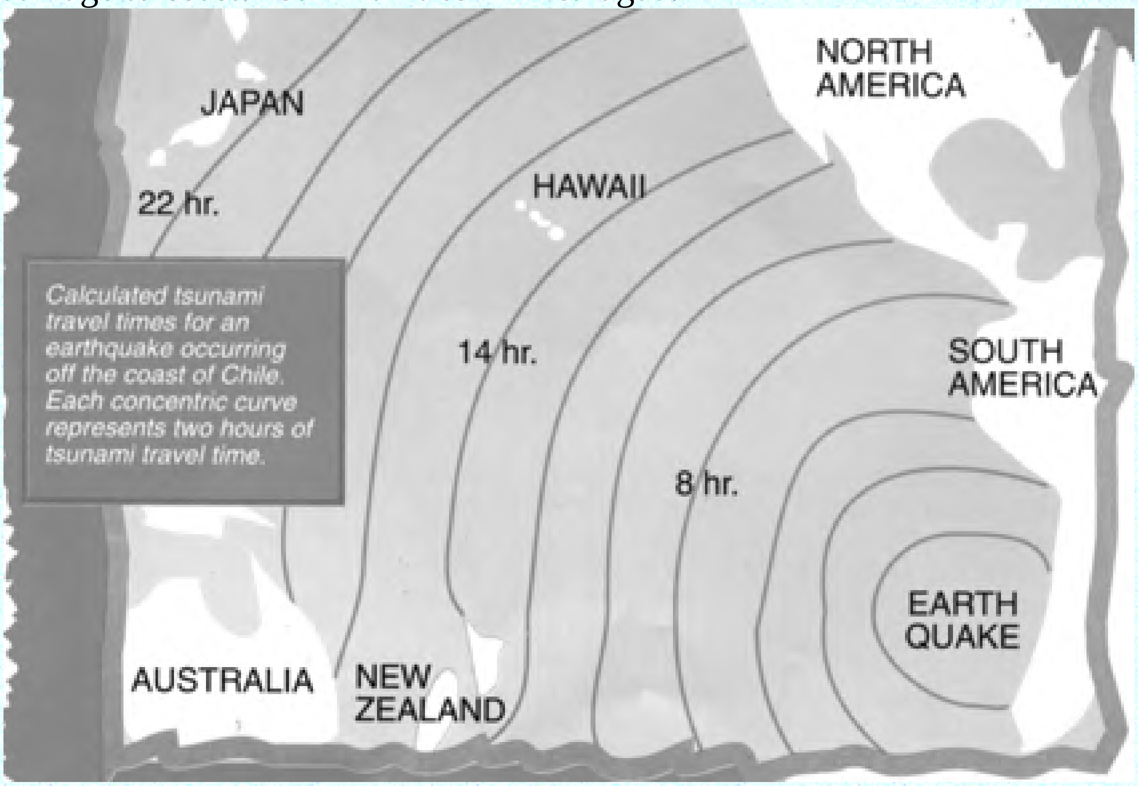
What Cause Tsunamis?

Tsunamis, also called seismic sea waves or, incorrectly, tidal waves, generally are caused by earthquakes, less commonly by submarine landslides, infrequently by submarine volcanic eruptions and very rarely by a large meteorite impact in the ocean. Submarine volcanic eruptions have the potential to produce truly awesome tsunami waves. The Great Krakatau Volcanic Eruption of 1883 generated giant waves reaching heights of 125 feet above sea-level, killing thousands of people and wiping out numerous coastal villages.

The 1992 Nicaragua tsunami may have been the result of a "slow" earthquake comprised of very long-period movement occurring beneath the sea floor. This earthquake generated a devastating tsunami with localized damage to coastal communities in Nicaragua.



Not all earthquakes generate tsunamis. To generate tsunamis, earthquakes must occur underneath or near the ocean, be large and create movements in the sea floor. All oceanic regions of the world can experience tsunamis, but in the Pacific Ocean there is a much more frequent occurrence of large, destructive tsunamis because of the many large earthquakes along the margins of the Pacific Ocean.

Ring of Fire

About two-thirds of the earth is covered by the waters of the four oceans. The Pacific Ocean is the world's largest, covering more than one third of the total surface area of our planet. The Pacific Ocean is surrounded by a series of mountain chains, deep ocean trenches and island arcs, sometimes called a "ring of fire." The great size of the Pacific Ocean and the large earthquakes associated with the "ring of fire" combine to produce deadly tsunamis.

In less than a day, these tsunamis can travel from one side of the Pacific to the other. However, people living near areas where large earthquakes occur may find that the tsunami waves will reach their shores within minutes of the earthquake. For these reasons, the tsunami threat to many areas (Alaska, the Philippines, Japan or the U.S. West Coast) can be immediate (for tsunamis from nearby earthquakes taking only a few minutes to reach coastal areas) or less urgent (for tsunamis from distant earthquakes taking from 3 to 22 hours to reach coastal areas).

Earth and Earthquakes

The continents and sea floor that cover the earth's surface are part of a world-wide system of plates that are in motion. These motions are very slow, only an inch or two per year. Earthquakes occur where the edges of plates run into one another. Such edges are called fault lines or faults. Sometimes the forces along faults can build-up over long periods of time so that when the rocks finally break an earthquake occurs. Examples of features produced by forces released along plate edge faults are the Andes Mountains in South America (on land) and the Aleutian Trench near Alaska (under water). When powerful, rapid faulting occurs underneath or near the ocean, a large earthquake is produced and, possibly, a tsunami.

The deep ocean trenches off the coasts of Alaska, the Kuril Islands, Russia,, and South America are well known for their violent underwater earthquakes and as the source area for destructive Pacific-wide tsunamis.

The tsunami generating process is more complicated than a sudden push against the column of ocean water. The earthquake's magnitude and depth, water depth in the region of tsunami generation, the amount of vertical motion of the sea floor, the velocity of such motion, whether there is coincident slumping of sediments and the efficiency with which energy is transferred from the earth's crust to ocean water are all part of the generation mechanism.

Return to Tsunami, The Great Wave

Tsunamis on the Move

Wave Height and Water Depth

In the open ocean a tsunami is less than a few feet high at the surface, but its wave height increases rapidly in shallow water. Tsunamis wave energy extends from the surface to the bottom in the deepest waters. As the tsunami attacks the coastline, the wave energy is compressed into a much shorter distance creating destructive, live-threatening waves.

In the deep ocean, destructive tsunamis can be small--often only a few feet or less in height--and cannot be seen nor can they be felt by ships. But, as the tsunami reaches shallower coastal waters, wave height can increase rapidly. Sometimes, coastal waters are drawn out into the ocean just before the tsunami strikes. When this occurs, more shoreline may be exposed than even at the lowest tide. This major withdrawal of the sea should be taken as a warning of the tsunami waves that will follow.

Pacific-Wide and Local Tsunamis

The last large tsunami that caused widespread death and destruction throughout the Pacific was generated by an earthquake located off the coast of Chile in 1960. It caused loss of life and property damage not only along the Chile coast but in Hawaii and as far away as Japan. The Great Alaskan Earthquake of 1964 produced deadly tsunami waves in Alaska, Oregon and California.

In July 1993, a tsunami generated in the Sea of Japan killed over 120 peoples in Japan. Damage also occurred in Korea and Russia but not in other countries since the tsunami wave energy was confined within the Sea of Japan. The 1993 Sea of Japan tsunami is known as a "local event" since its impact was confined to the nearby regional area in the proximity of the earthquake that generated the tsunami. For people living along the northwestern coast of Japan, the tsunami waves followed the earthquake within a few minutes.

Local tsunamis also occurred in Nicaragua (1992), Indonesia (1992, 1994) and the Philippines (1994) killing thousands of people. Scientific studies indicate that local tsunamis generated off the northern California, Oregon and Washington coast can arrive within five to 30 minutes after the earthquake is felt.

How Fast?

Where the ocean is over 20,000 feet deep, unnoticed tsunami waves can travel at the speed of a commercial jet plane, nearly 600 miles per hour. They can move from one side of the Pacific Ocean to the other in less than a day. This great speed makes it important to be aware of the tsunami as soon as it is generated. Scientists can predict when a tsunami will arrive since the speed of the waves varies with the square root of the water depth. Tsunamis travel much slower in shallower coastal waters where their wave heights begin to increase dramatically.

How Big?

Offshore and coastal features can determine the size and impact of tsunami waves. Reefs, bays, entrances to rivers, undersea features and the slop of the beach all help to modify the tsunami as it attacks the coastline. When the tsunami reaches the coast and moves inland, the water level can rise many feet. In extreme cases, water level has risen to more than 50 feet for tsunamis of distant origin and over 100 feet for tsunami waves generated near the earthquake's epicenter. The first wave may not be the largest in the series of waves. One coastal community may see no damaging wave activity while in another community destructive waves can be large and violent. The flooding can extend inland by 1000 feet or more, covering large expanses of land with water and debris.

How Frequent?

Since scientists cannot predict when earthquakes will occur, they cannot determine exactly when a tsunami will be generated. However, by looking at past historical tsunamis, scientists know where tsunamis are most likely to be generated. Past tsunami height measurements are useful in predicting future tsunami impact and flooding limits at specific coastal locations and communities. Historical tsunami research may prove helpful in analyzing the frequency of occurrence of tsunamis and their relationship to large earthquakes.

Return to Tsunami, The Great Wave

Tsunami Warning Centers

As part of an international cooperative effort to save lives and protect property, the National Oceanic & Atmospheric Administration's (NOAA) National Weather Service operates two tsunami warning centers. The Alaska Tsunami Warning Center (ATWC) in Palmer, Alaska, serves as the regional Tsunami Warning Center for Alaska, British Columbia, Washington, Oregon and California.

The Pacific Tsunami Warning Center (PTWC) in Ewa Beach, Hawaii, serves as the regional Tsunami Warning Center for Hawaii and as a national/international warning center for tsunamis that pose a Pacific-wide threat. This international warning effort became a formal arrangement in 1965 when PTWC assumed the international warning responsibilities of the Pacific Tsunami Warning System (PTWS). The PTWS is comprised of 26 international Member States that are organized as the International Coordination Group for the Tsunami Warning System in the Pacific. Many Member States countries operate national tsunami warning centers, providing warning services for their local area.

The objective of the PTWS is to detect, locate and determine the magnitude of potentially tsunamigenic earthquakes occurring in the Pacific Basin or its immediate margins. Earthquake information is provided by seismic stations operated by PTWC, ATWC, the U.S. Geological Survey's National Earthquake Information Center and international sources. If the location and magnitude of an earthquake meet the known criteria for generation of a tsunami, a tsunami warning is issued to warn of an imminent tsunami hazard.

The warning includes predicted tsunami arrival times at selected coastal communities within the geographic area defined by the maximum distance the tsunami could travel in a few hours. A tsunami watch with additional predicted tsunami arrival times is issued for a geographic area defined by the distance the tsunami could travel in a subsequent time period.

Seismic and Water Level Stations of the Pacific Tsunami Warning System

If a significant tsunami is detected by sea-level monitoring instrumentation, the tsunami warning is extended to the entire Pacific Basin. Sea-level (or tidal) information is provided by NOAA's National Ocean Service, PTWC, ATWC, university monitoring networks and the other participating nations of the PTWS. The International Tsunami Information Center, part of the Intergovernmental Oceanographic Commission, monitors and evaluates the performance and effectiveness of the Pacific Tsunami Warning System. This effort encourages the most effective data collection, data analysis, tsunami impact assessment and warning dissemination to all TWS participants.

Tsunami watches, warning, and information bulletins are disseminated to appropriate emergency officials and the general public by a variety of communication methods.

Return to Tsunami, The Great Wave

Warning Dissemination Research Activities

Warning Dissemination

- Tsunami watch, warning and information bulletins issued by PTWC and ATWC are disseminated to local, state, national and international users as well as the media. These users, in turn, disseminate the tsunami information to the public, generally over commercial radio and television channels.
- The NOAA Weather Radio system, based on a large number of VHF transmitter sites, provides direct broadcast of tsunami information to the public.
- The U.S. Coast Guard also broadcasts urgent marine warnings and related tsunami information to coastal users equipped with medium frequency (MF) and very high frequency (VHF) marine radios.
- Local authorities and emergency managers are responsible for formulating and executing evacuation plans for areas under a tsunami warning. The public should stay-tuned to the local media for evacuation orders should tsunami warning be issued. And, the public should NOT RETURN to low lying areas until the tsunami threat has passed and the "all clear" is announced by the local authorities.

Tsunami Research Activities

With the broad availability of relatively inexpensive yet powerful computers and desk-top workstations, there is growing interest and activity in tsunami research. Using the latest in computer technology, scientists are able to numerically model tsunami generation, open ocean propagation and coastal runup. Recent advances in the technology have led to improved propagation and runup models.

Sub-surface pressure sensors, able to measure tsunamis in the open ocean, are providing important data on the propagation of tsunamis in deep water. Unfortunately, the mechanism of tsunami generation is not well understood.

Seismologists, studying the dynamics of earthquakes, are formulating new methods to analyze earthquake motion and the amount of energy released. Where the traditional Richter (surface wave) magnitude of earthquakes is not accurate above 7.5, the seismic moment is designed to better define the amount of energy released and the potential for tsunami generation. It is hoped that this relationship between seismic moment and the potential for tsunami generation can be refined so that the near-real time analysis of earthquakes can be performed for tsunami warning purposes.

Tsunami inundation models, defining the extent of coastal flooding, are an integral aspect of tsunami hazard and preparedness planning. Using worst case inundation scenarios, these models are critical to defining evacuation zones and routes so that coastal communities can be evacuated quickly when a tsunami warning has been issued. NOAA's Pacific Marine Environmental Laboratory is taking a lead role in developing tsunami inundation maps for coastal communities in Alaska, California, Hawaii, Oregon and Washington states.

In the area of improved tsunami wave detection instrumentation, recording systems comprised of sub-surface pressure sensors have been tested over the last decade off the Alaska and Oregon coasts. These pressure sensors, located on the sea floor, have successfully measured tsunami wave amplitudes in the open ocean. The final step in developing a deep water tsunami wave detection system for warning purposes brings together the collection of the pressure data and its subsequent rapid, reliable telemetry to the shore-based warning center. Open ocean tsunami wave detection systems using satellite or radio telemetry are being tested off the California coast.

Return to Tsunami, The Great Wave

What You Should Do

The Facts

- Tsunamis that strike coastal location in the Pacific Ocean Basin are most always caused by earthquakes. These earthquakes might occur far away or near where you live.
- Some tsunamis can be very large. In coastal areas their height can be as great as 30 feet or more (100 feet in extreme cases), and they can move inland several hundred feet.
- All low lying coastal areas can be struck by tsunamis.
- A tsunami consists of a series of waves. Often the first wave may not be the largest. The danger from a tsunami can last for several hours after the arrival of the first wave.
- Tsunamis can move faster than a person can run.
- Sometimes a tsunami causes the water near shore to recede, exposing the ocean floor. The force of some tsunamis is enormous. Large rocks weighing several tons along with boats and other debris can be moved inland hundreds of feet by the tsunami wave activity. Homes and other buildings are destroyed. All this material and water move with great force and can kill or injure people.
- Tsunamis can occur at any time, day or night.
- Tsunamis can travel up rivers and streams that lead to the ocean.

What You Should Do

Be aware of tsunami facts. This knowledge could save your life! Share this knowledge with your relatives and friends. It could save their lives!

- If you are in school and you hear there is a tsunami warning, you should follow the advice of teachers and other school personnel.
- If you are at home and hear there is a tsunami warning, you should make sure you entire family is aware of the warning. Your family should evacuate your house if you live in a tsunami evacuation. Move in an orderly, calm and safe manner to the evacuation site or to any safe place outside your evacuation zone. Follow the advice of local emergency and law enforcement authorities.
- If you are at the beach or near the ocean and you feel the earth shake, move immediately to

higher ground. DO NOT wait for a tsunami warning to be announced. Stay away from rivers and streams that lead to the ocean as you would stay away from the beach and ocean if there is a tsunami. A regional tsunami from a local earthquake could strike some areas before a tsunami warning could be announced.

- Tsunamis generated in distant locations will generally give people enough time to move to higher ground. For locally generated tsunamis, where you might feel the ground shake, you may only have a few minutes to move to higher ground.
- High, multi-story, reinforced concrete hotels are located in many low-lying coastal areas. The upper floors of these hotels can provide a safe place to find refuge should there be a tsunami warning and you cannot move quickly inland to higher ground. Local Civil Defense procedures may, however, not allow this type of evacuation in your area. Homes and small buildings located in low lying coastal areas are not designed to withstand tsunami impacts. Do not stay in these structures should there be a tsunami warning.
- Offshore reefs and shallow areas may help break the force of tsunami waves, but large and dangerous waves can still be threat to coastal residents in these areas. Staying away fro all low-lying coastal areas is the safest advice when there is a tsunami warning.

If You Are on a Boat or Ship

- Since tsunami wave activity is imperceptible in the open ocean, do not return to port if you are at sea and a tsunami warning has been issued for your area. Tsunamis can cause rapid changes in water level and unpredictable dangerous currents in harbors and ports.
- If there is time to move your boat or ship from port to deep water (after you know a tsunami warning has been issued), you should weigh the following considerations:
    - Most large harbors and ports are under the control of a harbor authority and/or a vessel traffic system. These authorities direct operations during periods of increased readiness (should a tsunami be expected), including the forced movement of vessels if deemed necessary. Keep in contact with the authorities should a forced movement of vessels be directed.
    - Smaller ports may not be under the control of a harbor authority. If you are aware there is a tsunami warning and you have time to move your vessel to deep water, then you may want to do so in an orderly manner, in consideration of other vessels. Owners of small boats may find it safest to leave their boat at the pier and physically move to higher ground, particularly in the event of a locally generated tsunami. Concurrent severe weather conditions (rough seas outside of safe harbor) could present a greater hazardous situation to small boats, so physically moving yourself to higher ground may be the only option.
    - Damaging wave activity and unpredictable currents can effect harbors for a period of time following the initial tsunami impact on the coast. Contact the harbor authority before returning to port making sure to verify that conditions in the harbor are safe for navigation and berthing.

As dangerous as tsunamis are, they do not happen very often. You should not let this natural hazard diminish your enjoyment of the beach and ocean. But, if you think a tsunami may be coming, the ground shakes under your feet or you hear there is a warning, tell your relatives and friends, and ***move quickly to higher ground***.

Online Orders?

1. **I can't get to the the 'checkout' page. What's wrong?**
2. **How do I get back to the online data I ordered?**
3. **When I try to get back to my data I get a 'page not found' error. What is wrong?**
4. **I haven't received the data I ordered online. Will it be delivered in the mail?**
5. **The data I ordered is not complete. Will the data be updated?**
6. **The data I ordered is just a bunch of numbers. What's wrong?**
7. **I can't view the publication I ordered. What's wrong?**
8. **How do I print the data?**
9. **The data I received is not what I wanted. How do I get a credit?**
10. **How do I get a receipt for my online order?**

11. How do I order certified copies of the data contained in my online order?

---

1. **I can't get to the the 'checkout' page. What's wrong?**
This is most likely a firewall issue on your end. You will need to have your system administrator remove the restrictions from port 443.

To explain further: On the Internet, port often refers to a number that is part of a URL, appearing after a colon (:) right after the domain name. Every service on an Internet server listens on a particular port number on that server. Typically, the nonsecure server instance is on port 80, which is the default port for http:// connections; and the secure server instance is on port 443, which is the default port for https:// connections. The 's' in the https://prefix identifies it as SSL, port 443, unless otherwise noted. Since these port numbers are the standard defaults, the port number does not need to be displayed within the URL. For more information on the Secure Socket Layer (SSL) technology see the **Security Issues** section.

2. **How do I get back to the online data I ordered?**
The URL for an online order's **Online Data Retrieval** page is presented on the Order Receipt page when the order is originally placed and again provided in the confirmation email. If you did not 'Bookmark'/'Add to Favorites' the Online Data Retrieval Page for your order and do not have the confirmation email, you can use the **Check Order Status** feature to have this link emailed to you again. When the Order Status page is returned to your screen, click on
EMAIL ME MY ORDER URL
The email is sent to the email address that was specified when the order was placed.

3. **When I try to get back to my data I get a 'page not found' error. What is wrong?**
Several things could be causing the problem. If you are trying to return to the Online Data Retrieval page and are typing the url into your browser, it is most likely a typing error. We strongly recommend you copy and paste the url from the confirmation email. This avoids any typing mistakes. Once you have the Online Data Retrieval page on your screen, we also suggest you 'Add to Favorites'/'Bookmark' this page for future reference.

If you have ordered a PDF file or a Digital ASCII product, these files are deleted from our server after 11 days. IF it has been more than 11 days and you click on a link to your data, you will get an error such as 'page not found'.

If neither of these appear to be the problem, please email nndc.weborder@noaa.gov or call Customer Service at **828-271-4800, ext 3100** for further assistance.

4. **I haven't received the data I ordered online. Will it be delivered in the mail?**
If you have your order number, you may check the status of your order on the Order Status page. If you ordered data to be delivered online, the data was delivered online as soon as the order was submitted to NCDC. After clicking on
Click Here to Submit Order to NNDC
an Online Order Receipt page was returned to the screen with the following statement:
**** YOUR ONLINE DATAFILE ORDER IS READY. PLEASE CLICK HERE ****
(https://ols.nndc.noaa.gov/olstorehtml/2094124307070011310.html)

The URL (web address) provided is the location of the Online Data Retrieval page for the order. This is the page with the links to the data. You may follow the steps for How do I get back to the online data I ordered? to get to the data. If you ordered ASCII data from the Climate Data Online system or PDF files (publications), these data are only available for 11 days after purchase. After 11 days, the files are deleted from our server.

5. **The data I ordered is not complete. Will the data be updated?**
If you ordered one of the **Form Generated Products** (Unedited Local Climatological Data, Surface

Weather Observations, COOP/Record of Climatological Observations, or Annual Climatological Summary) your access will always allow you to see the latest data available. The database is updated 3 times a week. Your access to the data is not removed. You should check back regularly for the most recent updates.

If you ordered **ASCII Data Files** (Surface Summary of the Day-TD3200/3210, Surface Data, Monthly U.S.-TD3220, Precipitation Data, Hourly - TD3240, Precipitation Data, or 15-Minute -TD3260, Surface Data, Monthly Global - TD 3500), a **View Inventory** link is provided after making the station/element/date selection and PRIOR to submitting the order. This is provided to assist the user in deciding if the order should be placed should any of the requested data not be available. For more information on ASCII files see the help for **Digital ASCII Files**.

6. **The data I ordered is just a bunch of numbers. What's wrong?**

   You have most likely ordered a Digital product. These data are delivered in an ASCII text file. For more information on ASCII files see the help for **Digital ASCII Files**.

7. **I can't view the publication I ordered. What's wrong?**

   Publications are provided in PDF (Portable Document Format) and you will need to have downloaded and installed Adobe's free Acrobat Reader software in order to view/download the publication. When you click on the link the Adobe software will open and the publication will open within Adobe if your PC has the file association created between .pdf files and Adobe Reader software. If you get an error message, either you have the wrong version of Adobe (must be 4.0 or higher) or the file association does not exist. You can right-click on the link, use 'save as'/'save target as' from the shortcut menu and save the file to disk. Open the Adobe software, then open the file from where it was saved.

8. **How do I print the data I ordered?**

   If you are printing one of the **Form Generated Products** (Unedited Local Climatological Data, Surface Weather Observations, COOP/Record of Climatological Observations, or Annual Climatological Summary) make sure your printer is set to print landscape. Then use the File, Print option from your browsers menu bar. Digital data provided in an ASCII file format is best suited for downloading into a database or importing into a spreadsheet application. If you must print the data, import into a spreadsheet application and print from there. For more information on ASCII files see the help for **Digital ASCII Files**.

9. **The data I received is not what I wanted. How do I get a credit?**

   As stated on the Order Summary page presented prior to submitting an order:

   "NOTE! You have ordered Online data, which means that you will be able to access a link to your datafiles soon after your order is placed.
   Please take note of the link to these datafiles on the Order Receipt screen.
   It is NNDC policy to NOT provide refunds for online data ordered via the Online Store.

   Exceptions to this policy are made in certain cases such as errors in processing of the order, missing data, etc. If you feel the problem with your order justifies a credit, please email nndc.weborder@noaa.gov or call Customer Service at **828-271-4800, ext 3100**. Please have your order number and the exact nature of the problem. If a valid problem exists, the order will be voided and a credit issued to the credit card.

10. **How do I get a receipt for my online order?**

    An Online Order Receipt page is presented on the screen once your order is submitted and processed through the online store. If you did not print this page for your records, you can regenerate the page by clicking on the "Regenrate my web order receipt page" button on your Online Data Retrieval page. If you do not have your online data retrieval page marked, see How do I get back to the online data I ordered?

    The NCDC DOES NOT keep paper copies of receipts for online orders.

11. **How do I order certified copies of the data contained in my online order?**

Certified copies of the Unedited Surface Weather Observations, Unedited Local Climatological Data, Edited Local Climatological Data-Online, COOP/Record of Climatological Observations, and the NCEP Weather Charts are now available through the online store. You must first purchase one of these products through the online store. On the Online Data Retrieval page for the order, click on

Order Certified Copies of Data Contained in this Order

A new order will be created - you will only be charged the certification fee for the new order. For more information and instructions, refer to the ONLINE ORDERING OF CERTIFIED DATA!!! portion of the Ordering NCDC Data & Products web page.

Subscriptions

1. **How do I access my subscription?**
2. **I have forgotten my username and password. How can I find out what it is?**
3. **How do I renew my existing online subscription?**
4. **I would like an online subscription but do not have a credit card. Is there another option?**
5. **I subscribed to the wrong product. How can I change it to the correct one?**
6. **I already receive a subscription in the mail. May I access this data online also?**
7. **I can't open any of the .gz files. What do I need to do?**

---

1. **How do I access my subscription?**

   Subscription access is allowed through the Subscription Login page. You must have a user name and password to access the subscription data.

2. **I have forgotten my username and password. How can I find out what it is?**

   If you have forgotten your UserId/Password combination, please access our USERID/PASSWORD lookup system. If you wish to change your Password (User ID's can NOT be changed) or are still experiencing problems, please call our Customer Service Branch at **(828) 271-4800, ext 3100** Monday-Friday 8:00-4:00 EST.

3. **How do I renew my existing online subscription?**

   To renew an existing online subscription you will need to purchase the product(s)/site(s) again through the main Subscription Page in the online store. There is a link to this page in the Subscription Notification email and on the 'List of Stations Subscribed to-' page each time you access your subscription. You may renew a subscription at any time. If the same email address is used as was used on the original subscription, you will **NOT** be asked to enter a user name/password combination. The system will automatically add one year to the existing subscription's expiration date.

4. **I would like an online subscription but do not have a credit card. Is there another option?**

   We prefer that you purchase your subscription by using our Online Store and pay by either VISA, Master Card, American Express or Discover. If none of these options is available, we will accept a check or money order for the purchase of an online subscription product only. There are two separate subscription order forms, the Form Data Subscription Order Form (PDF) is to be used when ordering either the Unedited Local Climatological Data, Coop Data/Record of Climatological Observations, Surface Weather Observations, or Annual Climatological Data Summary subscriptions. The Edited Local Climatological Data Subscription form (PDF) is to be used when ordering the Edited Local Climatological Data publication subscription. Either form must be completed and included with your payment. Failure to enter the required fields on the form or to include the form with your payment will result in processing delays. Please mail to:

   National Climatic Data Center
   151 Patton Avenue
   Customer Services Branch

Asheville, North Carolina 28802

5. **I subscribed to the wrong product/site. How can I change it to the correct one?**

   If you wish to change your subscription product/site you must contact Customer Service at **828-271-4800, ext 3100**.

6. **I already receive a subscription in the mail. May I access this data online also?**

   The offline subscription is a completely separate item from the online subscription access. If the dollar amount remaining in the current mailed subscription is sufficient, it may be changed to the online access. The correct Subscription Access Form must be completed and sent to the NCDC. Please contact the subscription department at **828-271-4800, ext 3169** for more information.

7. **I can't open any of the .gz files. What do I need to do?**

   To save the files, simply right-click on the filename, choose Save As/Save Target As from the shortcut menu and save to disk. You can then uncompress these files using WinZip (Microsoft Windows/NT environment) or standard UNIX gunzip/tar. After uncompressing these files, you will be able to read these into a spreadsheet such as Microsoft Excel (specify delimited by comma) or any standard database application. See the Downloading or Uncompressing Files help for more information.

Free Access

Free access to NNDC and NCDC data is granted to certain users. Please read the revised **Online Data Access Policy** to see if you may be one of these users.

Free Access is granted using reverse domain lookup. If the domain of the PC being used resolves back to our system as a designated free user you will be allowed access into the data files. Your network administrator will need to verify that the PC being used to access our system resolves to a domain name and not just an IP address. A **Listing of REMOTE Environment variables** script can be run from your browser and the output from this will indicate the REMOTE_ADDR (ip address) and REMOTE_HOST (domain name) for the PC. The "remote_host" address will tell exactly how the PC or workstation being used is "seen" from the outside and by NCDC. For example, if your email address ends in .edu, but "remote_host" says something else, your domain is not resolving to .edu. Show this to your system administrator, who should then be able to correct the problem on your end.

*** IMPORTANT ACCESS INFORMATION ***
There are two types of data that can be accessed free for certain users: Publications and 'Form Generated' products.

PUBLICATIONS: The publications must be accessed through the **NCDC Document Library**. To access these you can click on the title of the publication. If your domain resolves correctly access will be allowed.
FORM GENERATED PRODUCTS: Access to the data products **Unedited Local Climatological Data**, **COOP/Record of Climatological Observations**, **Surface Weather Observations**, **Annual Climatological Summary**, and the digital ASCII files from the **Climate Data Online System (CDO)** is granted through the online store. Although access is through the store, if the domain resolves correctly you should never see this button:

Add to Shopping Cart

Instead, you will be provided links to access the data you have selected.

Digital ASCII Files

Orders placed through the Climate Data Online system for any of the digital products such as Surface Summary of the Day-TD3200/3210, Surface Data, Monthly U.S.-TD3220, Precipitation Data, Hourly - TD3240, Precipitation Data, or 15-Minute -TD3260, Surface Data, Monthly Global - TD 3500 are delivered as **ASCII Data Files**. **You will need to download these files as soon as possible. They are deleted from our server after 11 days.**

The Online Data Retrieval page for these orders presents two links for each product: (please note the links below are only samples to aid in the help process):

Links to Form Data are Below:
Your Climate Data Online file CDO00115917 will be available at http://www5.ncdc.noaa.gov/prod/cdohtml/CDO341888428.html

The **CDO00115917** link provides a Request Summary:

Selected Meteorological Element(s): 'PRCP'	**Date Range** (Year / Month): 1999/01 to 2000/04
	Selected Output Format: Comma Delimited, without station name
	Selected Output Media: FTP
	Total Data Rows Available: 16 - View Inventory
	Output File Size (bytes): 9576
	Price: $10.00

The **http://www5.ncdc.noaa.gov/prod/cdohtml/CDO341888428.html** link is the data access page:

File Contents	Access URL	File Size (bytes)
SOD - Surface Data, Daily - US & some non-US	http://ftp.ncdc.noaa.gov/pub/upload/795257568dat.txt	9576
SOD - Surface Data, Daily - US & some non-US - inventory	http://ftp.ncdc.noaa.gov/pub/upload/617309570inv.txt	355
Station List	http://ftp.ncdc.noaa.gov/pub/upload/305084229stn.txt	503
SOD - Surface Data, Daily - US & some non-US format documentation	http://www5.ncdc.noaa.gov/cdo/soddoc.txt	

The 1st link (...dat.txt) is the data.
The 2nd link (...inv.txt) is the inventory.
The 3rd link (...stn.txt) is the station list.
The 4th link (...doc.txt) is the documentation.
Please note that most digital dataset documentaion is also available here.

The documentation is very important for interpreting the data file. Users of these data usually download the data into an existing database or spreadsheet application. There are both documentation and data samples available to the user from the point a particular digital dataset is selected. These are available throughout the pages in the on-line store. Once the station(s)/element(s) are selected, an inventory is provided showing what is available based on those selections. This is provided to assist the customer in deciding if the order should be placed should any of the requested data not be available. The Dataset Documentation is also available in several places throughout the on-line store and here. The documentation describes the placement of the elements within the file and also describes the allowed values and codes. For more information please visit the HELP page for the NCDC Climate Data Online system.

SPECIAL NOTE: If you receive a **"Server not Responding"** error after choosing the station(s) and period of record, it is probably due to slow query time to build the inventory page. You should limit the selection of stations, period of record, or elements until able to get to the next page and the browser does not time out. Some queries for a large chunk of data may take an hour or more to process. Files are only provided if the compressed size is <40 megabytes. if the filesize is > 5 megabytes, then the file is compressed using tar and gzip. You may download the file by right-clicking on the filename, 'save as' to your local machine. After downloading the file, unzip the file by using either WinZip in a windows environment or using gunzip/tar in a unix environment. See the Downloading or Uncompressing Files help for more information.

Security Issues

1. **I'm not sure about putting my credit card on the web. How secure is your site?**
2. **Your site wants to set a 'cookie' on my machine. What is this?**

---

1. **I'm not sure about putting my credit card on the web. How secure is your site?**

   The online store is very secure and we have hundreds of users placing orders every day. The Checkout page and subsequent pages from the online store are sent using a Verisign Digital Id which incorporates **Secure Sockets Layer (SSL) technology**, which is the industry-standard protocol for secure, Web-based communications. This basically means that all pages from the Checkout page onward in the Online Store are sent encrypted across the internet so that if the data, as it travels from point to point, is viewed, it would be unreadable. The SSL technology is the algorithm that encrypts the data and the 'trust' that we are NCDC to you, the customer, as you transmit your credit card. The encrypted credit card data when it arrives to us on our web server is ONLY unencrypted by that server and cannot be unencrypted by any other machine in the world! To further explain this visit the Verisign web site.

2. **Your site wants to set a 'cookie' on my machine. What is this?**

   A "cookie" is a small amount of information that a web site copies to your hard disk. Cookies are used extensively throughout most web sites (especially e-business sites) for relating shopping cart entries to specific machines. Since the web is a stateless entity, we need a method to track items that may be added to an individual's shopping cart. Cookies are the method that is used to accomplish this. The cookie that NNDC and NCDC set consists of a random number that identifies only the machine, **not any personal information about the individual**. The cookies set by NNDC & NCDC are deleted immediately after the items are purchased or within 10 days which ever is less. No historical database is maintained. You can find an explanation of cookies and their intent at the Cookies 101 web site. If you wish to order data through the online store at the discounted price, your PC must be set to accept cookies. Otherwise, you may contact NCDC for other ordering options.

Downloading or Uncompressing Files?

Some of our files are large and require that we compress them to save our disk space and your time in transferring them to your site. Because of this fact, you will need special software to uncompress these files. This softwareis public domain software and you may download it to your PC or Workstation free of charge.

It is impossible to document the usage and syntax of all of these utilites, however, several of these do have a link to a document explaining their usage and syntax in detail.

Further questions about compressing/uncompressing files may be addressed to ncdc.webmaster@noaa.gov.

Climate of 2003
Atlantic Hurricane Season

National Oceanic Atmospheric Administration Logo

National Climatic Data Center, Last updated - 12 December 2003

Seasonal Summary

As of December 12th, 16 named storms developed in 2003, which is well above the 1944-1996 average of 9.8, but consistent with a marked increase in the annual number of tropical systems since the mid 1990s (1995-2002 average = 13.3). Seven of the named storms were classified as hurricanes and three of those (Fabian, Isabel and Kate) were 'major' (category three or higher on the Saffir-Simpson scale). Two named storms (Odette and Peter) formed after the traditional end of the hurricane season (November 30th). This is the first year since 1887 in which two named storms are known to have formed in December. Tropical Storm Ana formed approximately six weeks before the beginning of the season on April 21st. This is also the first Atlantic storm on record in the month of April. With the development of Tropical Storm Peter in December, 2003 became the longest tropical cyclone season since 1952 when the first tropical storm formed on February 2nd and the last one dissipated on October 28th, according to the NOAA's National Hurricane Center.

Both Isabel and Fabian were very long-lived and instense storms in 2003 and there were five additional tropical depressions which did not reach tropical storm strength. Six storms impacted the coast of the United States. Tropical Storm Bill came ashore in Louisiana in late June and Hurricane Claudette made landfall as a category one hurricane in Texas in July. Tropical Storm Erika brought tropical storm conditions to South Texas though it actually came ashore in Mexico in August. Tropical Storm Grace also affected Texas in late August and Tropical Storm Henri made landfall as a tropical depression in September bringing as much as 10 inches of rain to west-central Florida. By far the largest impact in the United States from this summer's Atlantic storms was from Hurricane Isabel in September. Isabel came ashore in North Carolina as a category 2 hurricane and brought torrential rain and tropical storm force winds to a large area of the mid Atlantic coast. However, Isabel reached category 5 in the Atlantic, the first storm to do so since Hurricane Mitch in 1998. Additionally, Hurricane Juan maintained category 2 strength as it came ashore in Nova Scotia in September becoming the strongest hurricane to impact Halifax in modern history.

There were no tropical storms in November, but two formed in December:

Click Here for a satellite image of TS Odette

larger image

Tropical Storm Odette formed in the Caribbean Sea on December 4th - the first tropical storm on record to have formed in the Caribbean Sea in December. Odette moved Northeastward while strengthening slightly to a maximum intensity of 55 knots, before coming ashore over the Dominican Republic on December 6th. Odette dumped up to 7 inches of rain before moving off the northeast and merging with a cold front moving off the coast of the United States.

Tropical Storm Peter formed on December 9th in the eastern Atlantic and initially moved southwest and south over warmer waters. Peter then intensified rapidly to a maximum intensity of 60 knots (just below hurricane strength) while moving north. However, Peter just as rapidly deteriorated to become a tropical depression on December 10th.

Click Here for a satellite image of Tropical Storm Peter

larger image

October

Four named tropical systems, including one major hurricane occurred in October, compared to a long-term average of approximately one tropical storm and one hurricane for the month. Major Hurricane Kate formed in September and completed its lifecycle during October becoming 'major' during the early part of the month, and tropical storms Larry, Mindy and Nicholas also formed during October 2003.

Click Here for a satellite image of Hurricane Kate

larger image

Hurricane Kate strengthened at the beginning of October after forming in the central Atlantic on September 25th. Maximum windspeeds of 125 mph were reached on October 4th while the hurricane was located about 640 miles east of Bermuda. Kate began to weaken over the next several days as it moved north and west and lost its tropical characteristics several hundred miles east-northeast of Newfoundland on October 8th. Still a powerful extratropical storm, Kate continued across the north Atlantic until it merged with a low pressure system close to Norway a couple of days later.

Tropical Storm Larry developed in the southern Gulf of Mexico on the 1st and trekked slowly southward into the Bay of Campeche, making landfall just east of Coatzacoalcos, Mexico on the 5th with maximum sustained winds near 85 km/hr (45 knots or 50 mph). Larry brought heavy rain to areas of Tabasco and Veracruz states, and prompted the temporary closure of two oil export ports of Dos Bocas and Pajaritos (Reuters).

larger image

September

Tropical Storm Henri developed in the eastern Gulf of Mexico on the 3rd and weakened into a tropical depression before crossing Florida on the 6th. The effects of Henri were minimal, with some localized heavy rain (up to 10 inches in west-central Florida) and gusty winds. Henri dissipated by the 8th.

Hurricane Isabel:

A tropical wave moving off the shore of Africa developed into Tropical Storm Isabel in the far eastern Atlantic, near the Cape Verde Islands on September 6th, 2003. The next day, as it moved west-northwestward, Isabel developed an eye and reached hurricane strength on the 7th. Conditions were very favorable for Isabel's continued development with warm sea surface temperatures ahead of it, low shear and an impressive outflow pattern from the storm. Rapid intensification occurred over the next several days and Isabel became a category 5 hurricane on the 11th. Isabel weakened slightly on the 13th, but did not weaken considerably until overnight on the 15th/16th when westerly shear began to affect the storm. Isabel decreased in strength to a category 2 storm, and eventually came ashore along North Carolina's Outer Banks on September 18th with sustained winds of approximately 85 knots - a minimal category 2 storm.

Hurricane Isabel

larger image

Hurricane Isabel

larger image

Preliminary estimates of Isabel's precipitation indicate that interior Virginia bore the brunt of the rainfall from Hurricane Isabel. The rainfall from Isabel did not lead to widespread flooding throughout North Carolina and Virginia. However, the unusually high precipitation totals in the months that preceded Hurricane Isabel resulted in very wet soils, and the combination of the wet conditions and strong winds associated with the storm led to downed trees and power outages for millions of people in the mid-Atlantic and Northeast. Most of the flooding associated with storm occurred at the coastal margin. Hurricane force winds and a storm surge of as much as 7-10 feet associated with Isabel led to a great deal of destruction at Cape Hatteras, NC, as well as along coastal Virginia and Maryland. Preliminary estimates suggest that 38 people died as a result of Isabel.

A comparison between Isabel and 2 other major mid-Atlantic hurricanes of recent years is also available.

Hurricane Juan initially appeared to be subtropical in nature, but after forming approximately 295 miles southeast of Bermuda on September 25th, it moved to the north-northwest and was classified as fully tropical. Maximum windspeeds of 105 mph (91 kts) were reached on the 27th as Juan continued to move northward and made landfall in Nova Scotia, near Halifax the following day with somewhat weaker windspeeds. Juan was a category 2 hurricane at landfall - the strongest storm to hit Halifax in its modern history. Eight deaths have been attributed to Juan.

Satellite image of Hurricane Juan

larger image

Hurricane Kate began as a tropical wave approximately 900 miles west-southwest of the Cape Verde Islands on September 25th. The system became a tropical storm on the 27th. Briefly reaching hurricane strength on the 29th, by the end of the month Kate was located about 600 miles southwest of the Azores. More information on Kate can be found in the October section.

August

Hurricane Fabian was the only hurricane to develop during the month of August, though in total, there were four tropical systems that formed during the month. Fabian was the first 'major' hurricane of the season (category three or higher on the Saffir simpson scale), and eventually reached category four strength. The storm was a 'Cape Verde hurricane' developing on August 27th about 370 miles (596 km) west of the Cape Verde Islands. Tropical storm strength was reached on the 28th and Fabian became a hurricane on the 29th, reaching 'major hurricane' status on the 30th. Fabian reached category four strength on the 31st, but did not reach maximum windspeeds of 125 kts (144 mph, 231 kph) until September 1st. As the storm recurved in the western Atlantic, hurricane warnings were issued for the island of Bermuda and Fabian's eye passed very slightly to the west of the island on the afternoon of September 5th. Four deaths in Bermuda were directly blamed on the storm.

Satellite image of Hurricane Fabian

larger image

Other named tropical systems in August were Erika and Grace, with short-lived Tropical Depression #9 also developing in the eastern Caribbean. TD #9 developed on August 21st from a fast-moving tropical wave. The depression dissipated south of Hispaniola the following day after moving west-northwestward.

Tropical Storm Grace developed at the end of August from a tropical wave which traveled across Mexico's Yucatan Peninsula and into the southeastern Gulf of Mexico on the 29th. The storm never became very organized, but was of tropical storm strength by the time it made landfall at Port O' Connor, Texas on August 31st with maximum sustained winds near 65 km/hr (35 knots or 40 mph). Heavy rainfall was the primary impact of Grace, with 50-130 mm (2-5 inches) common along parts of the Texas Gulf Coast.

Click Here for a satellite image of Tropical Storm Grace near the Texas coast on August 31, 2003

larger image

Satellite image of Tropical Storm Erika south of Brownsville, TX on August 16, 2003

larger image

Tropical Storm Erika developed in the eastern Gulf of Mexico on the 14th and crossed into northern Mexico about 45 miles (70 km) southeast of Brownsville, TX in the United States on the 16th. Maximum sustained winds at the time of landfall were near 60 kts (110 km/hr or 70 mph). No significant damage or flooding was reported in south Texas, although trees were downed and roof damage occurred along the coast of northern Mexico (Associated Press).

July

Hurricane Claudette

larger image

Tropical Storm Claudette developed in the central Caribbean Sea on July 8th about 415 miles (670 km) east-southeast of Kingston, Jamaica. The storm strengthened and moved rapidly across the Caribbean Sea during the following 24 hours. Claudette maintained strength and moved west and then northwest before weakening as it entered the Gulf of Mexico, clipping the Yucatan coast of Mexico. It then moved very slowly through the Gulf of Mexico over the weekend of the 12th and 13th while gradually strengthening to reach category 1 hurricane strength late on July 14th. **The first Atlantic hurricane of the season,** Hurricane Claudette finally made landfall on the morning of July 15th around Port O'Connor, Texas, with maximum sustained winds at around 75 mph (120 kph/65 kts).

The storm left two Texas residents dead and thousands without power along the central Texas coast before being downgraded to a tropical depression on the 16th. However, Claudette also brought welcome moisture to parts of Texas and the Southwest which had been dry.

Hurricane Danny began east of Bermuda as Tropical Depression #5 on July 16th and rapidly developed into a tropical storm later the same day. While posing no threat to land, Danny moved northward and then northeastward and became the second hurricane of the season on July 18th. Hurricane Danny weakened back to tropical storm status on the 19th as it tracked east-southeast across the North Atlantic.

Tropical Storm Danny

larger image

Tropical Depressions #6 and #7 also formed during July, but neither one was long-lived. TD #6 formed on the 19th and degenerated into a tropical wave by the 21st. Some thunderstorm activity was observed over the Lesser Antilles as a result of this system. TD #7 formed on July 25 and came ashore in Georgia on the 26th. Sustained winds were at 30 mph (48 kph/26 kts) at landfall and 2-3 inches (51-76 mm) of rain fell in parts of Georgia and South Carolina from the tropical system.

June

Tropical Storm Bill rapidly developed in the Gulf of Mexico on Sunday June the 29th and came ashore in Southeastern Louisiana on Monday June 30th with sustained winds of 60 mph (97 kph/52 kts). Thousands of homes in Louisiana lost power during the storm and damaging rainfall amounts associated with Bill and its remnants caused flooding in states throughout the Southeast. At least 8 inches (203 mm)of rain fell in Pascagoula, Mississippi (on the border with Alabama) though rainfall and tornadoes also caused problems into Mississippi, Alabama, Tennessee, Georgia, North Carolina and Virginia. For further information on tropical systems affecting the Southeast U.S., go to the Southeast Regional Climate Center

Tropical Storm Bill

larger image

Tropical Depression #2 also formed in the Atlantic on June 10, but rapidly degenerated into a tropical wave just one day later. However, it is only the third tropical cyclone to form east of the Lesser Antilles in June since 1967, according to the NOAA's National Hurricane Center.

Pre-Season

Tropical Storm Ana

larger image

The first tropical storm of the year, named Ana (shown left), formed more than five weeks before the official start of the hurricane season in 2003. The Atlantic hurricane season officially begins on June 1st, but a sub-tropical storm developed on April 20th and became a tropical storm on the 22nd. Maximum sustained winds reached 50 mph (80 km/hr, 45 knots) and the storm dissipated on the 23rd without nearing land. While tropical storms can form throughout the year in the North Atlantic, they are comparatively rare between the beginning of December and the end of May. Ana was the earliest storm of the Atlantic hurricane season since 1978 and the only tropical storm on record ever to have formed in April in the Atlantic Basin. According to NOAA's National Hurricane Center, the season's earliest Atlantic hurricane ever recorded was on March 7th, 1908, while the latest was on December 31st, 1954, which persisted into January 1955.

About the National Snow and Ice Data Center

OUR MISSION

"NSIDC/WDC will make fundamental contributions to cryospheric science and will excel in managing data and disseminating information in order to advance understanding of the Earth system."

NSIDC is part of the University of Colorado Cooperative Institute for Research in Environmental Sciences, and is affiliated with the National Oceanic and Atmospheric Administration National Geophysical Data Center through a cooperative agreement. NSIDC serves as one of eight Distributed Active Archive Centers funded by the National Aeronautics and Space Administration to archive and distribute data from NASA's past and current satellites and field measurement programs. NSIDC also supports the National Science Foundation through the Arctic System Science Data Coordination Center and the Antarctic Glaciological Data Center.

Established by NOAA as a national information and referral center in support of polar and cryospheric research, NSIDC archives and distributes digital and analog snow and ice data. We also maintain information about snow cover, avalanches, glaciers, ice sheets, freshwater ice, sea ice, ground ice, permafrost, atmospheric ice, paleoglaciology, and ice cores.

NSIDC publishes reports and a quarterly newsletter, and creates and distributes data products on CD-ROM and other media. It also holds a large library collection of monographs, technical reports, and journals.

Additional information is available in the NSIDC Annual Report, 2001 (PDF file, ~2.1 MB)

Data Products & Services

The NSIDC DAAC will not be able to process orders for AMSR-E, GLAS, MODIS, or NISE data for an extended period of time on Tuesday, 31 August from 9:00 a.m. to 3:00 p.m. U.S. Mountain Standard Time, because of system maintenance. We apologize for any inconvenience this may cause.

Note: AMSR-E, ICESat/GLAS, MODIS, and NISE data are normally unavailable for ordering on Tuesdays, 9:00 a.m. to 12:00 p.m. U.S. Mountain Standard Time, because of system maintenance.

The National Snow and Ice Data Center offers hundreds of data products and services to researchers, commercial applications users, and others worldwide, most often at no cost, thanks to the generosity of our data providers.

Projects at NSIDC

Data Centers and Programs

IARC Frozen Ground Data Center. The International Arctic Research Center and the National Science Foundation funds the Frozen Ground Data Center at NSIDC, a cooperative project of the World Data Center for Glaciology at Boulder, the International Arctic Research Center (IARC), and the International Permafrost Association (IPA). The Frozen Ground Data Center identifies, archives, documents, and distributes data related to permafrost and seasonally frozen ground.

NASA Distributed Active Archive Center. NSIDC is one of eight Distributed Active Archive Centers (DAACs) that participate in NASA's Earth Observing System Data and Information System (EOSDIS). The DAACs process, archive, document, and distribute data from NASA's past and current Earth science research satellites and field measurement programs.

NOAA at NSIDC. The National Oceanic and Atmospheric Administration (NOAA) provides support for management of NOAA data sets at NSIDC, and has funded many of NSIDC's data rescue activities.

NSF Arctic System Science Data Coordination Center. Funded by the National Science Foundation's Office of Polar Programs, the Arctic System Science (ARCSS) Data Coordination Center at NSIDC is the permanent data archive for all components of the ARCSS Program.

NSF Antarctic Glaciological Data Center. The National Science Foundation's Office of Polar Programs funds the U.S. Antarctic Glaciological Data Center (AGDC) at NSIDC to archive and distribute Antarctic glaciological and cryospheric system data collected by the U.S. Antarctic Program.

NSF U.S. Antarctic Data Coordination Center. The National Science Foundation's Office of Polar Programs funds

Data Projects

Advanced Microwave Scanning Radiometer - Earth Observing System (AMSR-E)

Cold Land Processes Experiment (CLPX)

Environmental Working Group (EWG)

Greenland Ice Sheet Project 2 (GISP2)

Global Digital Sea Ice Data Bank (GDSIDB)

Global Land Ice Measurements from Space (GLIMS)

Human Dimensions of the Arctic System (HARC)

Ice, Cloud, and land Elevation Satellite/Geoscience Laser Altimeter System (ICESat)

International Ice Charting Working Group (IICWG)

Land/Atmosphere/Ice Interactions (LAII)

Moderate Resolution Imaging Spectroradiometer (MODIS)

NSIDC to function as the U.S. Antarctic Data Coordination Center. The Antarctic Data Coordination Center identifies existing Antarctic data sets, locates points of contact, prepares data descriptions, and coordinates their submittal to the Antarctic Master Directory (AMD) and the Global Change Master Directory (GCMD).

World Data Center for Glaciology, Boulder. The World Data Center for Glaciology, maintained at NSIDC through a cooperative agreement between NOAA and the Cooperative Institute for Research in Environmental Sciences (CIRES), is one of three international World Data Centers focusing on cryospheric and polar processes.

Ocean/Atmosphere/Ice Interactions (OAII)

Program for Arctic Regional Climate Assessment (PARCA)

Paleoenvironmental Arctic Science (PARCS)

Polar Pathfinders

Radarsat Antarctic Mapping Project (RAMP)

NSIDC Researchers

Researchers at NSIDC investigate the dynamics of Antarctic ice shelves, new techniques for the remote sensing of snow and freeze/thaw cycle of soils, the role of snow in hydrologic modeling, linkages between changes in sea ice extent and weather patterns, large-scale shifts in polar climate, river and lake ice, and the distribution and characteristics of seasonally and permanently frozen ground.

In-house scientific expertise helps NSIDC improve the quality of research data sets and respond quickly to inquiries on snow and ice topics from the general public. Scientists pursue their work as part of the CIRES Cryospheric and Polar Process Division, University of Colorado, Boulder. National agencies fund research through the peer review proposal process. Please direct all requests for information and data products, including general questions about the cryosphere, to NSIDC User Services (nsidc@nsidc.org).

RESEARCHER	RESEARCH SNAPSHOTS
Roger Barry • NSIDC Director • CIRES Fellow • CU Distinguished Professor • CU Geography Faculty	Climate-cryosphere interactions; arctic and mountain climate; climate change; snow and ice data as climate indicators. Current focus on soil temperature trends in Russia. A Regional, Integrated Monitoring System for the Hydrology of the Pan-Arctic Land Mass
Todd Arbetter	Sea ice modeling; polar oceanography and ocean modeling; polar meteorology and atmospheric modeling; coupled regional climate modeling of areas within the Arctic and Antarctic; assimilation of observed sea ice motion in standalone and coupled sea ice models; study of Arctic and Antarctic polynyas using regional climate models

Richard Armstrong

Remote sensing of snow and frozen ground; passive microwave satellite remote sensing, calibration, and validation; physical and mechanical properties of snow; snow avalanches; evaluation of snow cover fluctuations and glacier mass and extent as indicators of climate change; development of scientific data sets to support snow and ice research.

Passive Microwave Snow Cover Algorithm Intercomparison and Validation

Investigation of the Seasonal Freeze/Thaw Cycle of Soils in the GEWEX American Prediction Program Regions

A Regional, Integrated Monitoring System for the Hydrology of the Pan-Arctic Land Mass

Andy Barrett

Western USA water resources; hydrology of mountain and upland drainage basins; use of remotely sensed data in applied hydrologic modeling; hydrologic modeling; hydroclimatology; glaciology; glacier hydrology.

NASA Southwest Regional Earth Science Applications Center

Regional Assessment of Water, Climate and Society in the Interior Western United States -- Development of Operational Hydrologic Forecasting Capabilities

Florence Fetterer

Sea ice, applications-oriented remote sensing, data rescue, data set development. Serves as NSIDC's NOAA liaison and program manager.

Sea Ice Index and Archives

Sea Ice Surface Characteristics from High Resolution Reconnaissance Imagery

Oliver W. Frauenfeld

Cryosphere-climate interactions; large-scale atmospheric circulation response to high-latitude forcing; freeze-thaw cycle in seasonally frozen ground and permafrost regions; active layer processes; Northern Hemisphere circumpolar vortex variability; atmospheric teleconnections; climate change; quantitative methods; ocean-atmosphere interactions.

Jim Maslanik

Sea ice-ocean-atmosphere interactions; arctic regional climatic change; remote sensing of ice, ocean, and land conditions; regional modeling of sea ice and climate; satellite algorithm validation; development of unpiloted aerial vehicles for high-latitude climate research.

Sea Ice Variability in the Beaufort and Chukchi Seas: Processes and Prediction

Improving the Simulation of Sea Ice Lead Conditions and Turbulent Fluxes Using RGPS Products and Merged RADARSAT, AVHRR and MODIS Data

Walt Meier

Remote sensing of sea ice from visible, infrared, and active/passive microwave sensors; focus is on passive-microwave sea ice concentration and sea ice motion products; develops data assimilation methods to combine sea ice observations with sea ice and coupled models.

Thomas H. Painter

Multispectral and hyperspectral remote sensing of snow, spatially distributed snowmelt modeling, measurement and modeling of the directional reflectance of snow, remote sensing of desertification processes, and robotic instrumentation. Current research on remote sensing products for the NASA/NWS Cold Land Processes Experiment and the hydrologic and radiative effects of deposited dust to alpine snowfields.

Multi-Resolution Snow Products for the Hydrologic Sciences

Ted Scambos

Remote sensing of ice sheets, glaciology, Antarctica, global change in the polar regions, extraterrestrial ice, history of the exploration of Antarctica.

Characteristics of Snow Megadunes on the East Antarctic Plateau

Improvement of the Greenland DEM Using Photoclinometry

Greg Scharfen

Remote sensing of snow cover, sea ice and glaciers. Serves as NSIDC's project manager for the MODIS snow and ice products, GLIMS glacier database, and NSF Antarctic data management projects.

Mark Serreze

Large-scale hydroclimatology of the Arctic, including patterns of precipitation and evaporation; variability in the synoptic scale circulation in the Arctic, including characteristics of cyclone development and decay; atmosphere-sea ice interactions; validation of numerical weather prediction output, especially from atmospheric reanalysis products.

A Regional, Integrated Monitoring System for the Hydrology of the

Pan-Arctic Land Mass

Regional Assessment of Water, Climate and Society in the Interior Western United States -- Development of Operational Hydrologic Forecasting Capabilities

Andrew Slater

Land surface modeling, specializing in cold-regions processes such as snow and frozen ground; land-atmosphere interactions; large-scale, high-latitude hydrology; remote sensing of snow; develops data assimilation techniques for land surface and hydrologic models; hydrologic forecasting.

A Land Surface Model Hind-Cast for the Terrestrial Arctic Drainage System

Julienne Stroeve

Remote sensing of snow and ice; optical, thermal and passive microwave remote sensing; radiative transfer modeling; cryosphere-climate interactions; Greenland climate studies; development of scientific data sets for cryospheric research.

Evaluation and Error Assessment of Operational Passive Microwave Sea Ice Algorithms

Tingjun Zhang

Seasonally and perennially frozen ground, snow and ice; cryosphere-climate interactions; heat and mass transfer in porous media; numerical modeling of soil freezing and thawing processes, ground thermal regime, lake ice, talik formation under thaw lakes; synoptic-scale snowmelt at high latitudes; application of satellite remote sensing data (passive microwave, SAR, and AVHRR) to study snow, near-surface soil freeze/thaw status, and northern phenomena.

Investigation of the Seasonal Freeze/Thaw Cycle of Soils in the GEWEX American Prediction Program Regions

A Regional, Integrated Monitoring System for the Hydrology of the Pan-Arctic Land Mass

GRADUATE STUDENT	RESEARCH INTEREST	ADVISORS
Anton Seimon	Social and environmental consequences of climate change in mountainous regions. Current work relates rapid ecological response to ongoing deglaciation and anthropogenic factors in high alpine zones of the Peruvian Andes. Previously worked as research meteorologist investigating mesoscale phenomena in extratropical cyclones and lightning in tornadic thunderstorms.	Roger Barry
Eileen McKim	Cryosphere-climate interactions, climate variability/climate change, land surface interactions with the climate system. Current focus on U.S. Western Water Resources; snow-monsoon relationships, variability in the North American Monsoon System.	Roger Barry

19 JUNE 2004

Another Record Minimum for Sea Ice Cover in the Arctic Ocean?

Is the Arctic in for another record low sea ice year? It is starting to look like it.

The recently released June 2004 ice extent and concentration are much lower than normal, indicating that annual minimum ice extent and concentration, which occurs in September, is likely to be well below normal. If so, this would be the third year in a row with substantial below-normal ice conditions in the Arctic, an unprecedented event in the 30+ year record of satellite observations of Arctic sea ice.

"The Day After Tomorrow"

The motion picture *The Day After Tomorrow* may leave many viewers with questions about climate change. In the movie, recent events on Earth s ice sheets and hypothetical future events based on what is known about how climate, oceans, and ice sheets interact, are woven into an exciting but fictitious story about a future climate disaster. The kind of disaster portrayed in the movie is impossible, but the patterns described by the movie have a distant basis in real concepts being discussed by climate scientists, oceanographers, and glaciologists.

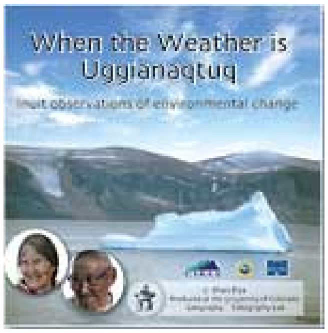
When the Weather is Uggianaqtuq: Inuit Observations of Environmental Change



NSIDC and the Arctic System Science (ARCSS) Data Coordination Center have released a new multi-media, interactive CD, entitled "When the Weather is Uggianaqtuq: Inuit Observations of Environmental Change." Uggianaqtuq (pronounced OOG-gi-a-nak-took) is a North Baffin Inuktitut word that means to behave unexpectedly, or in an unfamiliar way. From the perspective of many Inuit in the Arctic, the weather has been uggianaqtuq in recent years. In this CD, Inuit from two communities in Nunavut, Canada (Baker Lake and Clyde River), share their observations and perspectives on recent environmental changes. Maps, text, photos, video and music are integrated to help illustrate the changes Inuit have observed in their environment and the impacts on their livelihoods.

The CD, authored by Shari Fox Gearheard, is available free of charge. To read more about the project or to order a copy of the CD, please visit the product web site.

NSIDC Director Roger Barry named Distinguished Professor

Roger Barry, director of the National Snow and Ice Data Center for the past 27 years, was named Distinguished Professor by the University of Colorado Board of Regents. The designation of distinguished professor is bestowed on members of the university faculty "who have distinguished themselves as exemplary teachers, scholars and public servants and who are individuals having extraordinary international importance and recognition." President Elizabeth Hoffman and Chancellor Richard Byyny praised Barry's work, recognizing his research in the climates of arctic and alpine environments as well as his contributions to NSIDC. Read more about Barry's accomplishments in the Colorado Daily, the University of Colorado press release, and Our Director.

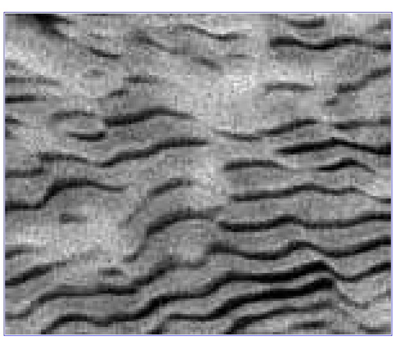
Sastrugi snow formation in Colorado. Sastrugi are ridges of snow formed when wind erodes and drifts the snow. (Photograph courtesy of Ken Knowles, National Snow and Ice Data Center, University of Colorado, Boulder.) Larger version (30k).



Extensive snow dunes wrinkle the surface of large parts of East and West Antarctica. The dunes are up to 100 kilometers long and separated by 2 to 4 kilometers, but the height is only a few meters. Comparison of modern satellite images with pictures acquired four decades earlier shows that the dunes are nearly motionless. The dunes are unique in that they appear not to be formed by normal wind depositon, but rather by ablation due to wave patterns set up in katabatic winds. The linear pattern is due to backscatter variations associated with grain-size changes across dunes. Larger version (38k).

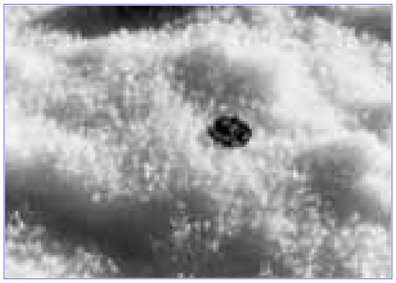
Heavy winds and blowing snow wreak havoc on traffic and roads. A truck with a snow plow attachment clears a road in this photograph from November 10, 1998. (Courtesy of the National Renewable Energy Laboratory and the Department of Energy. Photograph by David Parsons.) Larger version (32k).

A district heating system keeps a sidewalk dry after a snowfall, unlike the sidewalk beyond, which is not heated by the system. In Klamath Falls, Oregon, a geothermal district heating system keeps the sidewalks clear and dry at the Basin Transit station after a snowfall. The trees are protected with Styrofoam insulation to keep them from budding in the winter during system operation. The district heating system melts snow on more than 50,000 square feet of sidewalks and crosswalks. Snowmelt tubing in slurry was installed under the sidewalks in 1995 as part of the city's district heating system, which was constructed in 1981 to heat 14 government buildings, including the county museum, fire station, post office, city hall, library, courthouse, and jail. The system has now expanded to include non-government buildings, such as churches and small businesses, for a total of around 26 buildings. No date. (Courtesy of the National Renewable Energy Laboratory and the Department of Energy. Photograph by the Geo-Heat Center.) Larger version (35k).

Avalanche related photographs

An avalanche in motion. (Photograph courtesy of Richard Armstrong, National Snow and Ice Data Center.) Larger version (30k).

The three parts of an avalanche path: starting zone, track, and runout zone. (Photograph courtesy of Betsy Armstrong.) Larger version (37k).



A new layer of surface hoar on the snow. Note the quarter for scale. (Photograph courtesy of K. Williams.) Larger version (33k).

Q & A Facts Glossary Gallery More snow links

Questions and Answers about Snow

How big can snowflakes get?

Snowflakes are agglomerates of many snow crystals. Most snowflakes are less than one-half inch across. Under certain conditions, usually requiring near-freezing temperatures, light winds, and unstable, convective atmospheric conditions, much larger and irregular flakes close to two inches across in the longest dimension can form. No routine measure of snowflake dimensions are taken, so the exact answer is not known.

See also the NOAA Question of the Month: How do snow flakes form into so many uniquely different shapes?

Why is snow white?

Visible sunlight is white. Most natural materials absorb some sunlight which gives them their color. Snow, however, reflects most of the sunlight. The complex structure of snow crystals results in countless tiny surfaces from which visible light is efficiently reflected. What little sunlight is absorbed by snow is absorbed uniformly over the wavelengths of visible light thus giving snow its white appearance.

What causes the blue color that sometimes appears in snow and ice?

Generally, snow and ice present us with a uniformly white face. This is because most all of the visible light striking the snow or ice surface is reflected back without any particular preference for a single color within the visible spectrum. The situation is different for that portion of the light which is not reflected but penetrates or is transmitted into the snow. As this light travels into the snow or ice, the ice grains scatter a large amount of light. If the light is to travel over any distance it must survive many such scattering events, that is it must keep scattering and not be absorbed. The observer sees the light coming back from the near surface layers (mm to cm) after it has been scattered or bounced off other snow grains only a few times and it still appears white. However, the absorption is preferential. More red light is absorbed compared to blue. Not much more, but enough that over a considerable distance, say a meter or more, photons emerging from the snow layer tend to be made up of more blue light than red light. Typical examples are poking a hole in the snow and looking down into the hole to see blue light or the blue color associated with the depths of crevasses in glaciers. In each case the blue light is the product of a relatively long travel path through the snow or ice. So the spectral selection is related to absorption, and not reflection as is sometimes thought. In simplest of terms, think of the ice or snow layer as a filter. If it is only a centimeter thick, all the light makes it through, but if it is a meter thick, mostly blue light makes it through.

Source: NSIDC researcher, Richard Armstrong. For a complete treatment of this subject, see Bohren, C. F. 1983. Colors of snow, frozen waterfalls, and icebergs. *J. Opt. Soc. Am.* 73(12):1646-1652.

Is it ever too cold to snow?

No, it can snow even at incredibly cold temperatures as long as there is some source of moisture and some way to lift or cool the air. It is true, however, that most heavy snowfalls occur with relatively warm air temperatures near the ground - typically 15°F or warmer since air can hold more water vapor at warmer temperatures.

Does snow always get fluffier as temperatures get colder?

No. Studies in the Rocky Mountains have shown that the fluffiest, lowest density (0.01 - 0.05) snows typically fall with light winds and temperatures near 15°F. At colder temperatures, the crystal structure and size change. At very cold temperatures (near and below 0°F) crystals tend to be smaller so that they pack more closely together as they accumulate producing snow that may have a density (water-to-snow ratio) of 0.10 or more.

Is it true that there is one inch of water in every ten inches of snow that falls?

The water content of snow is more variable than most people realize. While many snows that fall at temperatures close to 32oF and snows accompanied by strong winds do contain approximately one inch of water per ten inches of snowfall, the ratio is not generally accurate. Ten inches of fresh snow can contain as little as 0.10 inches of water up to 4 inches depending on crystal structure, wind speed, temperature, and other factors. The majority of U.S. snows fall with a water-to-snow ratio of between 0.04 and 0.10.

Why is snow a good insulator?

Fresh, undisturbed snow is composed of a high percentage of air trapped among the lattice structure of the accumulated snow crystals. Since the air can barely move, heat transfer is greatly reduced. Fresh, uncompacted snow typically is 90-95 percent trapped air.

How much snow falls where I live?

Sioux City, Iowa receives approximately 30 inches in an average year with roughly six inches falling each month from December through March. To check snowfall amounts for your area of the United States, see the average snowfall total table for hundreds of American cities and towns (provided by the National Climatic Data Center).

How much snow has fallen in a single day? Seven days? A month?

For snowfall amounts in the United States, see the National Snowfall and Snow Depth Extremes Table provided by the National Climatic Data Center.

Is snow edible?

Clean snow is certainly edible. Snow in urban areas may contain pollutants that one should not eat but they would probably be in such low concentrations that it might not matter. Still, eating snow should be restricted to "wilderness" areas. Sometimes snow contains algae which gives it a red color. This snow can be eaten and some say it actually tastes "good" but we have never tried it.

Why is snow colder in deeper spots?	Snow is not necessarily colder in deeper spots. The temperature at the surface of the snow is controlled by the air temperature. The colder the air above the colder will be the snow layers near the surface, say within the top 12 to 18 inches. The snow near the ground in deeper snowpacks however is warmer because it is close to the warm ground. The ground is warm because the heat stored in the ground over the summer is slow to leave the ground because snow is a good "insulator," just like the insulation in the ceiling of your house, and thus slows the flow of heat from the warm ground to the cold air above.
Why is snow deep in spots and not others?	At the local scale, say from your backyard to the size of your neighborhood or town, this would be mainly due to wind during and after the storm and melting due to sun after the storm. At the larger scale, say the state of MN, it would also depend on the storm track -- were you in the middle of the storm track or at the edges where less snow fell?
Why do more icicles form on the south sides of buildings?	Icicles form as the result of cycles of melting and freezing. Typically this cycle will occur more often on the south sides of buildings, melting in the day and freezing at night, whereas on the north sides, without the benefit of the warmth of the sun, melting does not occur as often.
What is a Nor'easter?	According to the Weather Glossary at weather.com, a Nor'easter is a cyclonic storm that occurs off the east coast of North America is notorious for producing heavy snow, rain, and waves that crash onto Atlantic beaches. For a more detailed answer to this question, see the NOAA Question of the Month: What is a Nor'easter or Northeast Winter Storm?.
Why do weather forecasters seem to have so much trouble forecasting snow?	Snow forecasts are better than they used to be and they continue to improve, but snow forecasting remains one of the more difficult challenges for meteorologists. One reason is that for many of the more intense snows, the heaviest snow amounts fall in surprisingly narrow bands that are on a smaller scale than observing networks and forecast zones. Also, extremely small temperature differences that define the boundary line between rain and snow make night-and-day differences in snow forecasts. This is part of the fun and frustration that makes snow forecasting so interesting.

What is a winter weather watch? warning? advisory?

NOAA's National Weather Service issues Winter Storm Outlooks when forecasters believe there is a good chance of a major winter storm. A Winter Storm Watch is issued to alert the public to the possibility of a blizzard, heavy snow, heavy freezing rain or heavy sleet. Winter Storm Warnings are issued when a hazardous winter weather event is imminent or occurring, and is considered a threat to life and property. Finally, a Winter Weather Advisory is issued for accumulations of snow, freezing rain, freezing drizzle and sleet that will cause significant inconveniences and, if caution is not exercised, could lead to life-threatening situations.

For a more detailed answer to this question, see the NOAA Question of the Month: Winter Weather Watches, Warnings and Advisories - What do they all mean?

What is the difference between snow, sleet, hail, and other forms of precipitation?

For definitions of sleet, snow, snowflakes, snow flurries, snow grains, snow pellets, hail, soft hail, and other forms of precipitation, see the precipitation definitions in USA TODAY's Weather Book.

Can there be thunder and lightning with a snow storm?

Thunder and lightning can be associated with snowstorms but they are rare and occur more often near the coast.

For a more detailed answer, see The New York Times Learning Network's Thunder Snow. For a more technical explanation, see the NOAA/National Severe Storms Laboratory's paper titled, Thunderstorms observed at surface temperatures below freezing across North America.

Does snow change how sound waves travel?

Yes, when the ground has a thick layer of fresh, fluffy snow, sound waves are readily absorbed at the surface of the snow. However, the snow surface can become smooth and hard as it ages or if there have been strong winds. Then the snow surface will actually help reflect sound waves. Sounds may seem clearer and travel farther under these circumstances.

Why does snow crunch when you step on it? At what temperature does it crunch?

Snow is made of ice crystals. Ice crystals have six points. One snowflake can consist of multiple crystals. There are gaps between the points of a crystal that are empty, except for air. When snow falls to the ground, air is trapped inside of that layer of snow. You have probably noticed that when snow is stepped on, it gets compressed. The air gets pushed out of the snow. The sound you hear could be the sound of the ice crystals as they break. Try it with ice cubes. They make a crunching sound when they are broken.

Also, on a sunny day, the surface layer of snow can melt, due to thermal heating. When the sun goes down and temperatures drop, that top layer refreezes into a thin crust of ice. If you step on it, you are breaking that top crust, resulting in a "crunching" sound.

The crunching sound is less related to temperature and more related to the structure of the snow. The older the snow, the more compacted and icy it becomes.

Source: NSIDC researcher, Richard Armstrong, April 2002

What is lake effect snow?

According to the Weather Glossary at weather.com, lake effect snow is "snow showers that are created when cold dry air passes over a large warmer lake, such as one of the Great Lakes, and picks up moisture and heat."

For a more detailed answer to this question, see the NOAA Question of the Month: What is Lake Effect Snow?

See also NSIDC's list of lake effect snow sites.

Is snow a mineral?

Snow is crystals of frozen water, i.e., ice. The definition of a mineral that I studied is this:

> A mineral is a naturally occurring homogeneous solid, inorganically formed, with a definite chemical composition and an ordered atomic arrangement.

Based on that definition, I'm sure you can determine that ice is a mineral. Ice has a definite chemical composition (H20). It is naturally occuring given a temperature below 0 deg C. It is homogeneous (of one material), formed inorganically, and has an ordered atomic structure (hydrogen and oxygen atoms bonding in a specific manner).

Source: Betsy Sheffield, NSIDC User Services, November 2002

Can it snow in warmer weather? Is snow dependent on temperature or dew point?

"*I live in Michigan and the today's weather forecast calls for 33 degrees and snow. How does it snow in warmer weather, above freezing? Is snow dependent on temperature or dew point?*"

Temperatures do need to be at or below freezing (0 Celsius or 32 Fahrenheit) for snow to form. It is possible for this forecast, however, that temperatures in the atmosphere, where snow forms, were colder than at the surface. It is then possible for snow to fall when surface temperature is above freezing, although the snow will probably be relatively moist, and it may melt. Alternatively, the snow will bring cooler temperatures to the surface, and it will accumulate.

Source: Kate Daniels, NSIDC User Services, February 2003

Shake with the Quake

Once upon a time there was a little boy named Leonard. One night, as he was lying in his bed, his whole room began to shake. And then it rattled. And then it started to roll.

This experience scared Leonard very much because he had never been in an earthquake before. And even after the earthquake had stopped he was still very afraid because he wasn't sure what he was supposed to do.

Leonard thought tremendously hard and tried to imagine what he could do. But he just couldn't quite think of it. He thought so hard that he began to get extremely tired. He got so tired that he could hardly keep his head off the pillow. And finally he fell asleep.

That night, in his dreams, Leonard imagined that he was back in that earthquake. But this time he wasn't as scared because he knew what to do! Three experts from the Institute of Emergency Preparedness had come into the bedroom of his dreams and had taught Leonard what to do whenever there is an earthquake. They were Leonard's own very special "Earthquake Buddies." This is what they taught him:

The Northridge Earthquake

On January 17, 1994, the people around Northridge, California, were awakened early in the morning by a large earthquake. The quake struck at 4:31 a.m. and had a magnitude of 6.7, according to the U.S. Geological Survey. The fault responsible for the earthquake ran underneath the San Fernando Valley and had been unknown before the Northridge Earthquake.

The quake was felt for 2,000 square miles in Los Angeles, Orange and Ventura counties. There were nearly 15,000 aftershocks following the main earthquake. The earthquake killed 57 people and injured nearly 12,000 people. The damage was extensive, damaging about 100,000 houses and businesses. Parking garages collaped and some apartment buildings were reduced to rubble. The earthquake caused more than $40 billion in damage.

The area was declared a federal disaster by President Clinton and hundreds of workers from FEMA were deployed to Southern California to help the communities there recover. More than 600,000 individuals applied for state and federal disaster assistance, and FEMA spent millions of federal money helping the area recover.

The Northridge Earthquake was the largest earthquake to hit a Southern Californian city since 1971. It was the 11th largest earthquake to be recorded in California since 1769.

History of Big Earthquakes

Northridge, California (20 miles from Los Angeles)
January 17, 1994
4:31 a.m.
Magnitude: 6.7
Deaths: 57
Injuries: 9,000
Property Damage: $15 billion

Loma Prieta Earthquake (south of San Francisco)
October 17, 1989
5:04 p.m.
Magnitude: 6.9
Length of time: 15 seconds
Deaths: 62
Injuries: 3,757
Property Damage: More than $6 billion

Coalinga, CA
May 2, 1983
Magnitude: 6.4
Deaths: 0
Injuries: 47
Property damage: $31 million

San Francisco, CA
April 18, 1906
5:12 a.m.
Magnitude: 8.25
Length of time: 40 seconds
Deaths: 700 to 2,500 people
Note: The "Great San Francisco Earthquake" is one of the strongest ever recorded in North America. Much of the city was destroyed by the strong shaking, which toppled buildings, and by the fires that followed.

Earthquakes

Tasty Quake Activity

Sometimes it’s hard to understand how the earth can move, and why earthquakes damage buildings. This activity will show you how waves will travel to damage buildings. Afterward, you can have dessert!

Materials you will need:
One metal pan of prepared gelatin dessert (recipe below)
Sugar cubes or dominoes
Plastic wrap
Cups and spoons for serving and eating dessert

Ask your parent or another adult to help with this recipe:

Recipe for gelatin dessert:
Two (6 oz) boxes of red or purple gelatin dessert
Two one-serving envelopes of unflavored gelatin
Four cups of boiling water
Four cups of cold water
One 9 X 12 METAL baking pan

Empty the gelatin dessert and the unflavored gelatin into the baking pan. Add the boiling water and stir until all the powder is dissolved. Add the cold water and mix. Chill in the refrigerator for at least three hours or until set.

When rocks break in the earth’s crust they release energy in the form of waves -- waves that can go through rock and dirt. Gently tap the side of the gelatin pan. You will see waves traveling through the gelatin. This is what an earthquake wave is like when it goes through the earth. Tap the pan harder and see how the waves become bigger.

Now cover the top of the gelatin with plastic wrap (make sure the wrap is right on top and touching the gelatin). Use sugar cubes or dominoes to make "buildings" on the gelatin. What do you think will happen when you tap on the pan to cause "earthquake" waves through the gelatin? Try it. What happened? Make the buildings again and tap the pan harder or softer than the first time. Did something different happen? You can do this over and over. When you're done, take off the plastic wrap and have a gelatin snack!

Disaster Math

A small earthquake hit Northern California on a Tuesday afternoon. It was felt by people in three cities: Los Manos (population 3,482), Mount Good (population 4,210) and Meganville (872). How many people felt the earthquake?

- ○ 5,684 people
- ○ 8,564 people
- ○ 8,654 people
- ○ 8,546 people

The news said that Bigburg also felt the quake. Its population is 2,998. Now how many people felt the quake?

- ○ 11,562 people
- ○ 10,690 people
- ○ 10,989 people
- ○ 7,773 people

Suppose that it takes two straps each 25 inches long to strap a water heater to the wall to keep it from falling over during an earthquake. There are 420 homes in Los Manos. If every single home in Los Manos strapped their water heater to the wall, how many inches of strap would it take?

- ○ 1,200 inches
- ○ 50 inches
- ○ 420 inches
- ○ 21,000 inches

If you convert those inches into feet, how many feet would it take?

- ○ 12 feet
- ○ 21,012 feet
- ○ 1,750 feet
- ○ 252,000 feet

Pretend that in the first earthquake 10 homes were slightly damaged; in the second 50 homes were slightly damaged and in the third earthquake 30 homes were slightly damaged. What is the average number of homes damaged in the earthquakes?

- ○ 11
- ○ 30
- ○ 35

Intensity Scales

- Hurricanes - The Saffir Simpson Scale
- Tornadoes - The Fujita Scale
- Earthquakes - The Modified Mercalli Scale & The Richter Scale
- Volcanic Eruptions - The Volcanic Explosivity Index

Hurricanes - The Saffir Simpson Scale

Category	Category Description	Level Of Damage
1	Wind Speed: 74 - 95 MPH Storm Surge: 4 - 5 Feet Above Normal	Primary damaged to unanchored mobile homes, shrubbery, and trees. Some coastal road flooding and minor pier damage. Little damage to building structures.
2	Wind Speed: 96 - 110 MPH Storm Surge: 6 - 8 Feet Above Normal	Considerable damage to mobile homes, piers, and vegetation. Coastal and low-lying escape routes flood 2 - 4 hours before arrival of hurricane center. Buildings sustaiin roofing material, door, and window damage. Small craft in unprotected moorings break moorings.
3	Wind Speed: 111 - 130 MPH Storm Surge: 9 - 12 Feet Above Normal	Mobile homes destroyed. Some structural damage to small homes and utility buildings. Flooding near coast destroys smaller structures; larger structures damaged by floating debris. Terrain continously lower than 5 feet. ASL may be flooded up to 6 miles inland.
4	Wind Speed: 131 - 155 MPH Storm Surge: 13 - 18 Feet Above Normal	Extensive curtainwall failures with some complete roof structure failture on small residences. Major erosion of beaches. Major damage to lower floors of structures near the shore. Terrain continously lower than 10 feet. ASL may flood (and require mass evacuations) up to 6 miles inland.
5	Wind Speed: Over 155 MPH Storm Surge: Over 18 Feet Above Normal	Complete road failure on many homes and industrial buildings. Some complete building failures. Major damage to lower floors of all structures located less than 15 feet ASL and within 500 yards of the shoreline. Massive evacuation of low ground residential areas may be required.

[Back to Top]

Tornadoes - The Fujita Scale

Category	Category Description	Level Of Damage
F-0	Gale Tornado 40 - 72 MPH	Chimneys damaged; branches broken off trees; shallow-rooted trees uprooted; sign boards damaged.
F-1	Moderate Tornado 73 - 112 MPH	Roof surfaces peeled off; mobile homes pushed off foundations or overturned; moving autos pushed off roads.
F-2	Significant Tornado 113 - 157 MPH	Roofs torn off frame houses; mobile homes demolished; box cars pushed over; large trees snapped or uprooted; light-object projectiles generated.
F-3	Severe Tornado 158 - 206 MPH	Roofs and some walls torn off well-constructed houses; trains overturned; most trees in forest uprooted; heavy cars lifted off the ground and thrown.

F-4	Devastating Tornado 207 - 260 MPH	Well-constructed houses leveled; structures with weak foundations relocated; cars thrown and large projectiles generated.
F-5	Incredible Tornado 261 - 318 MPH	Strong frame houses lifted off foundations and carried considerable distance to disintegrate; automobile-sized projectiles hurtle through the air in excess of 100 yards; trees debarked; other incredible phenomena expected.

[Back to Top]

Earthquakes - The Modified Mercalli Scale & The Richter Scale

The Modified Mercalli Scale		Level Of Damage	The Richter Scale
1-4	Instrumental to Moderate	No damage.	</= 4.3
5	Rather Strong	Damage negligible. Small, unstable objects displaced or upset; some dishes and glass ware broken.	4.4 - 4.8
6	Strong	Damage slight. Windows, dishes, glassware broken. Furniture moved or overturned. Weak plaster and masonry cracked.	4.9 - 5.4
7	Very Strong	Damage slight-moderate in well-built structures; considerable in poorly-built structures. Furniture and weak chimneys broken. Masonry damaged. Loose bricks, tiles, plaster, and stones will fall.	5.5 - 6.1
8	Destructive	Structure damage considerable, particularly to poorly built structures. Chimneys, monuments, towers, elevated tanks may fail. Frame houses moved. Trees damaged. Cracks in wet ground and steep slopes.	6.2 - 6.5
9	Ruinous	Structural damage severe; some will collapse. General damage to foundations. Serious damage to reservoirs. Underground pipes broken. Conspicuous cracks in ground; liquefaction.	6.6 - 6.9
10	Disastrous	Most masonry and frame structures/foundations destroyed. Some well-built wooden structures and bridges destroyed. Serious damage to dams, dikes, embankments. Sand and mud shifting on beaches and flat land.	7.0 - 7.3
11	Very Disastrous	Few or no masonry structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipelines completely out of service. Rails bent. Widespread earth slumps and landslides.	7.4 - 8.1
12	Catastrophic	Damage nearly total. Large rock masses displaces. Lines of sight and level distorted.	> 8.1

Earthquakes

Earthquake Legends

Different cultures around the world have attempted to explain earthquakes in different ways. Here are some legends about what makes the ground shake!

1. India: The Earth is held up by four elephants that stand on the back of a turtle. The turtle is balanced on top of a cobra. When any of these animals move, the Earth trembles and shakes.

2. Assam (Between Bangladesh and China): There is a race of people living inside the Earth. From time to time, they shake the ground to find out if anyone is still living on the surface. When children feel a quake, they should shout "Alive, Alive!" so the people inside the Earth will know they are there and stop shaking.

3. Mexico: El Diablo, the devil, makes giant rips in the Earth from the inside. He and his devilish friends use the cracks when they want to come and stir up trouble on Earth.

4. Siberia: The Earth rests on a sled driven by a god named Tuli. The dogs who pull the sled have fleas. When they stop to scratch, the Earth shakes.

5. Japan: A great catfish, or namazu, lies curled up under the sea, with the islands of Japan resting on his back. A demigod, or daimyojin, holds a heavy stone over his head to keep him from moving. Once in a while, though, the daimyojin is distracted, the namazu moves, and the Earth trembles.

6. Mozambique: The Earth is a living creature, and it has the same kinds of problems people have. Sometimes, it gets sick with fever and chills and we can feel its shaking.

7. Greece: According to Aristotle, and also to William Shakespeare in a play called Henry IV, strong, wild winds are trapped and held in caverns under the ground. They struggle to escape, and earthquakes are the result of their struggle.

8. Belgium: When people on Earth are very, very sinful, God sends an angry angel to strike the air that surrounds our planet. The blows produce a musical tone that is felt on the Earth as a series of shocks.

9. American Indian: Once a Chickasaw chief was in love with a Choctaw princess. He was young and handsome, but he had a twisted foot, so his people called him Reelfoot. When the princess' father refused to give Reelfoot his daughter's hand, the chief and his friends kidnapped her and began to celebrate their marriage. The Great Spirit was angry and stomped his foot. The shock caused the Mississippi River to overflow its banks and drown the entire wedding party. (Reelfoot Lake, on the Tennessee side of the Mississippi River, was formed as a result of the New Madrid earthquake of 1812.)

10. West Africa: The Earth is a flat disk, held up on one side by an enormous mountain and on the other by a giant. The giant's wife holds up the sky. The Earth trembles when he stops to hug her.

11. India: Seven serpents share the task of guarding the seven sections of the lowest heaven. The seven of them also take turns holding up the Earth. When one finishes its turn and another moves into place, people on the Earth may feel a jolt.

12. Latvia: A god named Drebkuhls carries the Earth in his arms as he walks through the heavens. When he's having a bad day, he might handle his burden a little roughly. Then the Earth will feel the shaking.

13. Colombia: When the Earth was first made, it rested firmly on three large beams of wood. But one day the god Chibchacum decided that it would be fun to see the plain of Bogota underwater. He flooded the land, and for his punishment he is forced to

carry the world on his shoulders. Sometimes he's angry and stomps, shaking the Earth.

14. Scandinavia: The god Loki is being punished for the murder of his brother, Baldur. He is tied to a rock in an underground cave. Above his face is a serpent dripping poison, which Loki's sister catches in a bowl. From time to time, she has to go away to empty the bowl. Then the poison falls on Loki's face. He twists and wiggles to avoid it, and the ground shakes up above him.

15. New Zealand: Mother Earth has a child within her womb, the young god Ru. When he stretches and kicks as babies do, he causes earthquakes.

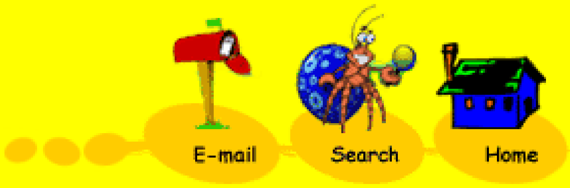
16. East Africa: A giant fish carries a stone on his back. A cow stands on a stone, balancing the Earth on one of her horns. From time to time, her neck begins to ache, and she tosses the globe from one horn to the other.

17. Central America: The square Earth is held up at its four corners by four gods. When they decide the Earth is becoming overpopulated, they tip it to get rid of surplus people.

18. Romania: The world rests on the divine pillars of faith, hope and charity. When the deeds of human beings make one of the pillars weak, the Earth shakes.

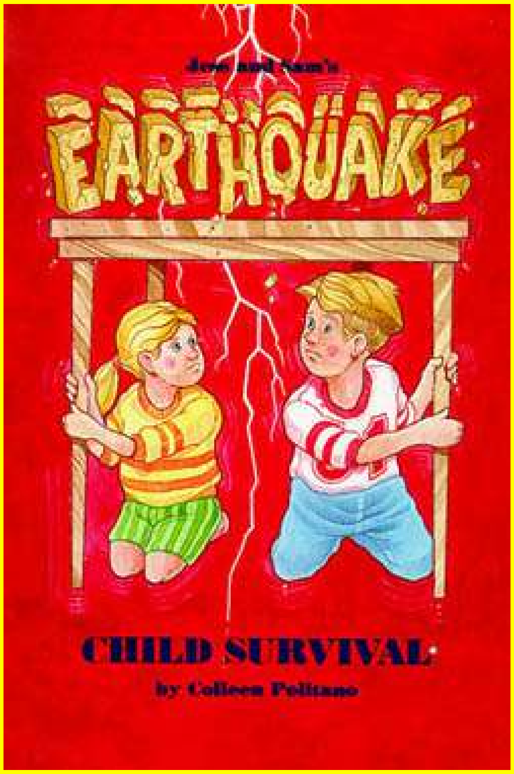
19. West Africa: A giant carries the Earth on his head. All the plants that grow on the Earth are his hair, and people and animals are the insects that crawl through his hair. He usually sits and faces the east, but once in a while he turns to the west and then back to the east, with a jolt that is felt as an earthquake.

FEMA for Kids — Federal Emergency Management Agency



Jess and Sam's Earthquake Activities

An earthquake has shaken their town. Some buildings were damaged, some roads had to be closed, and electricity, water and telephones were disrupted. It was a scary time for Jess and Sam. In the end, they were OK - and they learned a lot about what to do before, during and after an earthquake.



You can learn some of the things Sam and Jess discovered through these experiments. (Reprinted with permission.)

- Experiment #1
- Experiment #2
- Experiment #3

You can read their whole story in Jess and Sam's Earthquake by Colleen Politano, published by Porthole Press Ltd., Canada, and available to buy at Amazon.com.

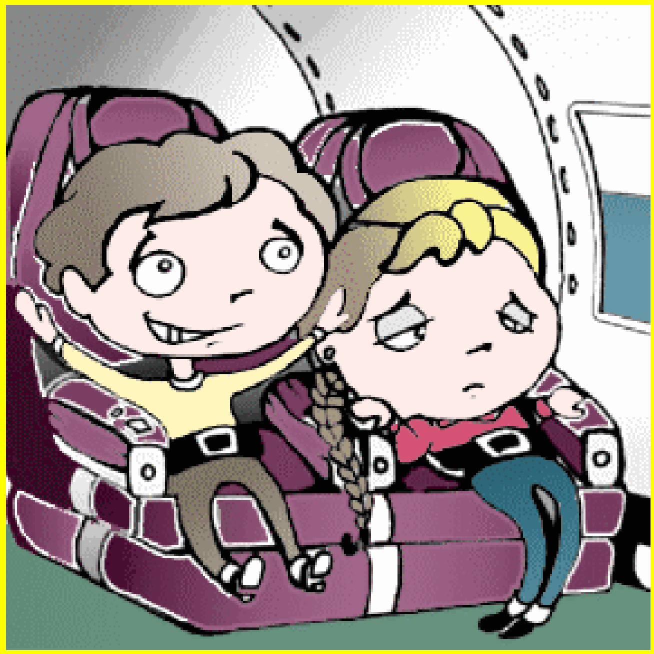
The Shaky Vacation

The twins thought visiting Southern California during their summer vacation was a great idea. Their Uncle James lived there and they could visit the ocean.

Audio

"We can see movie stars in Hollywood and visit amusement parks, too," shouted Julia.

"Let's go!" Robbie jumped up and down with excitement. Their Mom and Dad smiled and said they'd make the plans.



Two weeks later, they were all on a plane to Los Angeles, which Julia didn't like much, but which Robbie thought was "as fun as a rollercoaster."

Their Uncle James picked them up from the airport and took them straight to his house, since they were so tired.

"Take a nap," he said, "Then I'll show you around."

"We don't take naps," said Julia, even as her eyes closed. The twins slept for a few hours and then awoke, ready to explore. Their parents had gone to the ocean and they were glad to be with Uncle James by themselves.

Things to Know

Earthquakes

- If you are indoors during an earthquake, keep calm and take cover under a heavy table or desk. Stay away from glass, windows or anything that could fall, like a bookcase.
- If you are outdoors, move away from buildings, street lights and utility wires.
- If you are in a crowded public place, do NOT rush for the doors. Everyone will be doing that. Instead, take cover under something heavy and stay away from things that could fall on you. Stay calm. Do not get in an elevator during an earthquake!
- After an earthquake, be prepared for after shocks. After shocks are follow-up earthquakes that are usually smaller than the first one. They are dangerous because they can cause things that are weakened in the first earthquake to fall down.
- If you are home and you smell gas or hear a hissing or blowing sound, open a window and get out of the building right away. It may mean that a gas line in your house has been broken. Tell your parent or another adult.
- Make sure you are wearing shoes after an earthquake. There may be broken glass on the ground and inside your home.
- If you are scared, share your fears with an adult. Earthquakes can be scary, but remember -- they only last a few seconds.

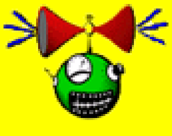
The Turtle Tale

A Native American Legend

In order to listen to the audio file on this page, Real Audio Player is required. Download the free version of Real Player.



Long, long ago, before there were people, there was hardly anything in the world but water. One day, Great Spirit looked down from heaven. He decided to make a beautiful land. But where could he begin? All he saw was water. Then he spotted a giant turtle. Great Spirit decided to make the beautiful land on the turtle's back.

But one turtle was not big enough. The land that the Great Spirit wanted to make was very large. So he called out, "Turtle, hurry and find your six brothers."

Turtle swam away to find them. It took her a whole day to find the first. It took another day to find the next. After six days, Turtle had found her six brothers. "Come," she said. "The Great Spirit wants us."

Great Spirit called down. "Turtles! Form a line, all of you -- head to tail, north to south. Umm -- you have three on the south, please move a little to the east. Hmmm. Yes, that's just right. What a beautiful land you turtles will make! Now listen! It is a great honor to carry this beautiful land on your backs. So you must not move!"

The turtles stayed very still. Great Spirit took some straw from his supply in the sky. He spread it out on the turtle's backs. Then he took some soil and patted it down on top of the straw.

Great Spirit cleaned his hands on a fluffy white cloud. Then he went to work, shaping mountains and valleys and lakes and rivers. When he was finished, he looked at the beautiful land he had made. Great Spirit was very pleased. But soon trouble began. The giant turtles grew restless. They wanted to stretch their legs.

"I want to swim east," said one.

"I want to swim west, with the setting sun," said another.

The turtles began to argue. They could not agree which way to move. One day, four of the turtles began to swim east. The others began to swim west. The Earth shook! It cracked with a loud noise. But after a minute, the shaking stopped. The turtles had to stop moving because the land on their backs was so heavy. They had only been able to swim a little way from each other. When they saw that they could not swim away, they stopped arguing and made up.

Every once in a while, though, the turtles argue again. Each time they do, the Earth shakes!

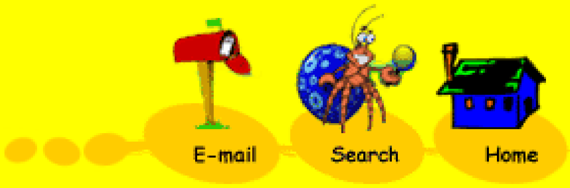
Pets and Disasters



Disasters like hurricanes, tornadoes and floods don't just affect you -- they also affect your pets. And your pets depend on you for their safety. There are many ways to be "Pet Prepared," but you must think ahead and start planning NOW. Your local Humane Society or your veterinarian can help you. During a disaster, if you see an injured or stranded animal that needs help, tell your parent or adult to contact your local animal control officer or animal shelter. Remember, even if you don't have to evacuate, your pet may be stressed or upset and will need extra attention.

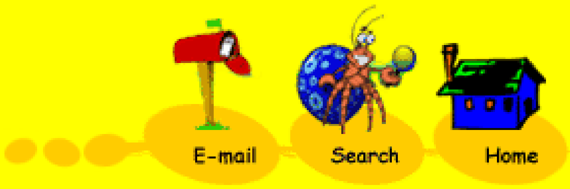
How Do You Rescue a Horse?

Protect Your Home from Disaster



Disasters happen. There is not much we can do about that. But there are things we can do to protect our homes and reduce the risk that they will be damaged. Reducing the risk is called "mitigation." Although some mitigation is very expensive and complicated -- like moving your home to a different piece of land that is higher or away from a river -- some things are easy. Here are some things you and your family can do to mitigate:

» Click Here For Mitigation Photos

Floods

- Don’t put valuable items and appliances in the basement where they are more likely to be flooded.
- Power and water don’t mix! Have the main breaker or fuse box and the utility meters raised above the flood level for your area. That way, if your home floods, water won’t damage your utilities.
- Buy flood insurance. To learn more about flood insurance, have your parent call 1-800-427-4661.

Hurricanes and Tornadoes

- Don’t lose your roof to high winds! Have hurricane straps installed to keep the roof attached to the walls.
- Use storm shutters to protect windows and glass. Use them when severe weather is coming. The storm shutters protect against flying debris like tree trunks or other things carried by strong winds.

Earthquakes

- Bolt or strap cupboards and bookcases to the walls and keep heavy objects on the lower shelves so they don’t fall on people.
- Strap your water heater to a nearby wall. This will keep your gas water heater from falling on someone or starting a fire from a broken gas main.
- Have your home bolted to the foundation. Anchor bolts cost as little as $2 each. They should be installed every six feet on the outer edges of your house.

Wild Fires

- Create a safety zone around the house that separates your home from plants and bushes that can burn easily. Clear dead brush and grass from your property. It will act as fuel for a fire.
- Keep branches around your home free of dead or dying wood or moss.
- Put tile or flame-retardant shingles on your roof instead of wood shakes or standard shingles. This will cut the chance that burning debris in the air will catch your roof on fire.

Canine Heroes

Since 1989, FEMA has coordinated an Urban Search and Rescue system. This system has 27 teams, funded by FEMA, which are located in many different states. These teams are specially trained and equipped to find people who are trapped by a structural collapse. The collapse might be caused by a hurricane, earthquake or explosion.

Each task force can be activated in an emergency and can arrive at the disaster within hours. Each team has 62 specialists, including medical personnel, structural engineers - and search specialists. The search specialists include canine specialists - highly trained and certified dogs that know how to safely go into collapsed structures and how to systematically search an area. They know how to locate trapped people and then how to let their trainer know what they have found. These very special dogs work hard and save lives. They are constantly training to keep up their skills. They usually live with their trainers and ride in helicopters, boats and airplanes in order to get to their job fast. They are real Canine Heroes!

Click here for thumbnails of the Canine Heroes trading cards. New cards will be posted periodically. Visit back often and collect the whole set!

Volcano Watch: Mapping New Lava

Geologists everywhere like to study rocks in the field, but few of them get to map rocks that are still molten and on the move. In Hawaii, scientists with the U.S. Geological Survey map the new lava flows erupted from Kilauea Volcano to determine their extent and volume.

Mapping also helps to keep track of how fast flows are advancing toward areas where people live. In the past three years, the way scientists map lava has undergone a revolution. Instead of trying to figure out a flow's location and then mark it on paper maps or aerial photographs, scientists now map with portable GPS (Global Positioning System) receivers.

These devices receive the radio waves from global positioning system satellites to determine the position of the receiver on the Earth's surface. Portable receivers record positions to within 15 feet, which is well suited for lava-flow maps.

To map flows, scientists walk around them as near their edges as possible, noting their characteristics and position. With GPS receivers, the position is recorded by pushing a button, and the data are recorded in the computerized memory of the device. Back in the office, scientists download the coordinates and connect the dots, so to speak. The result is an outline of the lava flow.

It's easy to distinguish the margin of a new flow where it laps against substantially older flows. New flow is a shiny, silvery gray color, because none of its glass, which forms most of the rock, has altered chemically or physically. If the flow is less than a week old, scientists may feel substantial heat as we approach it or step onto it. Shimmering heat waves in the air above a recent lava flow may give it away, too.

If the mapping doesn't begin until the flow is cool, it can be more difficult to recognize new flow from old flows. Scientists will look for other clues, including burned trees or brush, ash from the burned vegetation and subtle differences in color. Scientists say that the law flows begin to revegetate quickly - meaning plants return to the area. Even near flows only a few months old, tiny ferns can be seen sprouting where moisture collects.

Volcano Facts

More than 80 percent of the earth's surface is volcanic in origin. The sea floor and some mountains were formed by countless volcanic eruptions. Gaseous emissions from volcano formed the earth's atmosphere.

The May 18, 1980 eruption of Mount St. Helens in the Cascade Range of Washington State happened after more than 100 years of dormancy (a time when the volcano was "asleep.") When the volcano erupted, it took the lives of 58 people and caused $1.2 billion in damage.

The 1992 eruption of Mount Pinatubo in the Philippines Islands caused 342 deaths and more than 250,000 people had to be evacuated.

There are more than 500 active volcanoes in the world. More than half of these volcanoes are part of the "Ring of Fire," a region that encircles the Pacific Ocean.

The rock debris carried by a lateral blast of Mount St. Helens traveled as fast as 250 miles per hour.

Crater Lake in Oregon formed from a high volcano that lost its top after a series of tremendous explosions about 6,600 years ago.

FEMA for Kids

Federal Emergency Management Agency

Volcanoes

Mount St. Helens

Mount St. Helens is located in southwestern Washington State, about 50 miles northeast of Portland, Oregon. It is in the Cascade Range of mountain. It was named in 1792 in honor of the Baron St. Helens. American Indians of the Pacific Northwest called it "Louwala-Clough" or "smoking mountain." The volcano was active in the mid-1800s, but most people in this century did not see it as a menace. In fact, the mountain was snow-covered and very beautiful. The forest on it and around the base was filled with wildlife. At the base of the volcano was Spirit Lake, a clear mountain lake that was very good for fishing and boating.

In the spring of 1980, everything changed. First, there was a series of earthquakes and then came one or maybe two thunderous explosions. Mount St. Helens began to spew forth ash and steam. Two craters formed on the volcano and there were avalanches of snow and ice, darkened by ash. Over the next two months, the volcano continued to be active, simmering almost like a pot boiling on a stove. Then on May 18, 1980, the volcano suddenly erupted. Part of the volcano collapsed and became a huge landslide that eventually covered an area of about 24 square miles. There was also a release of pent-up pressure form within the volcano. There was a huge blast of rock, ash and hot gases that devastated an area of about 230 square miles north of the volcano. To the south, the devastated area was much less. Scientists have calculated the blast started at about 220 miles per hour but increased to about 670 miles per hour. The blast was heard as far away as Montana, Idaho, Canada and California.

The eruption cost 57 lives and many injuries. Many buildings were buried and more than 200 houses and cabins were destroyed. Many tens of thousands of acres of prime forest, as well as recreational sites, roads and trails were destroyed or heavily damaged. More than 185 miles of highway and roads were destroyed or extensively damaged. Four billion board feet of timber was damaged or destroyed and many animals, including dear, elk and bear were killed. Many small animals, such as rodents, frogs and crawfish managed to survive because they were below ground level or water surface. While the ash destroyed many crops in the area, the ash may provide beneficial chemical nutrients to the soil in the future.

Volcanoes

Pele - Tale Of The Volcano Goddess

The Native Hawaiians knew all about volcanoes. According to them, volcanic eruptions were caused by Pele, the beautiful but tempestuous Goddess of Volcanoes. Pele had frequent moments of anger, which brought about eruptions. She was both honored and feared. She could cause earthquakes by stamping her feet or volcanic eruptions and fiery lava by digging with her Pa'oa, her magic stick.

Pele had a long and bitter argument with her older sister, Namakaokahai. The fight ended up forming the Hawaiian Islands.

First, Pele used her magic stick on Kauai, but she was attacked by her older sister and left for dead. Pele recovered and fled to Oahu, where she dug several "fire pits," including the crater we now called Diamond Head, in Honolulu. After that, Pele left her mark on the island of Molokai before traveling further southeast to Maui and creating the Haleakala Volcano. By then, Namakaokahai, Pele's older sister, realized she was still alive and she went to Maui to do battle. After a terrific fight, Namakaokahai again believed that she had killed her younger sister. But Pele was still alive and she was busy working at the Mauna Loa Volcano, on the big island of Hawaii. Finally, Namakaokahai realized that she could never crush her sister's indomitable spirit and she gave up the struggle. Pele dug her final and eternal fire pit, Halemaumau Crater, at the summit of Kilauea Volcano. She is said to live there to this day.

Information courtesy of the U.S. Geological Survey/Department of the Interior.

Things to Know

Volcanoes

Do not visit the volcano site. You could be killed by a sudden explosion. Public officials may tell you where it is safe to view.

If there is ash in the air, avoid being downwind from the volcano. A building offers good shelter from volcanic ash, but not from lava flows or rocks. If ash is falling, stay indoors unless there is a danger of the roof collapsing. Close doors, windows and all ventilation in the house. Cover your nose and mouth to avoid breathing ash.

Be aware of flying rocks and mudflows. Mudflows can move faster than you can walk or run.

If you live near a volcano, you should have an evacuation plan. Know what route you will take if you must evacuate and have a back-up route, too. Also, if you live near a volcano it is good to have a pair of goggles and a throw-away breathing mask for each member of your household.

After an eruption, if you have ash on your roof, clear it away as soon as you can. The ash is heavy and could cause the roof to collapse.

Every family should have a Disaster Supply Kit in their home. The kit will help you and your family during a disaster. In a hurricane or earthquake, for example, you might be without electricity and the water supply may be polluted. In a heavy winter storm or flood, you may not be able to leave your house for a few days. In times like this, you will need to rely on yourself. Your disaster supply kit will make it easier. Remember, your family will probably never need to use your disaster supply kit, but it's always better to be prepared.

Above is a picture of a Disaster Supply Kit. It is best if these items are kept in a plastic tub or kept together in a cabinet so they will be easy to find. Click on the items in the box to learn more about the supplies you'll need and why they are important!

Help

Resources For FEMA Web Site Users

Viewer Privacy and Security Notice

Introduction

1. This World Wide Web (WWW) site is provided as a public service by the Federal Emergency Management Agency, FEMA.

2. Information presented on this FEMA WWW site is considered public information and may be distributed or copied. Use of appropriate byline/photo/image credits is requested.

Information collected and stored automatically

1. The information we learn about you from your visit to our website depends upon what functions you perform when visiting our site.

2. For site management, information is collected for statistical purposes. This government computer system uses software programs to create summary statistics, which are used for such purposes as assessing what information is of most and least interest, determining technical design specifications, and identifying system performance or problem areas.

3. If you do nothing during your visit but browse through the website, read pages, or download information, we will gather and store certain information about your visit automatically. This information does not identify you personally. We automatically collect and store the following information about your visit:

- The Internet domain (for example, "xcompany.com" if you use a private Internet access account, or "yourschool.edu" if you connect from a university's domain) and IP address (an IP address is a number that is automatically assigned to your computer whenever you are surfing the Web) from which you access our website;
- The type of browser and operating system used to access our site;
- The date and time you access our site;
- The pages you visit; and
- If you linked to the FEMA website from another website, the address of that website.

  We use this information to help us make our site more useful to visitors -- to learn about the number of visitors to our site and the types of technology our visitors use. We do not track or record information about individuals and their visits.

Cookies:

1. The only cookies FEMA uses on its web are those that allow several complex software

user-driven applications to work correctly. For instance, our online ordering services (for publications of the U.S. Fire Administration and for the FEMA Flood Map Store) allow users to "shop" through the catalog. As a user goes through and checks off a series of publications, each transaction is a separate "signal" sent between their computer and ours. In order to maintain a complete record of the total order, the FEMA server sends a cookie to identify that user's order. The only information collected is related to that particular publication order and this information is NOT retained once the order is sent.

- This is the state of technology on the Web. There currently exist no non-cookie applications for this multi-order function.

Please be assured that FEMA's use of cookie technology is NOT a covert attempt to either collect or analyze information on Internet users.

Information Collected from E-mails and Web Forms

If you identify yourself by sending an E-mail or using Web Forms:

- You also may decide to send us personally-identifying information, for example, in an electronic mail message containing a complaint or compliment. We use personally-identifying information from viewers in various ways to further the usefulness and accuracy of the information contained on our Web site or to add new sections and services. Visit Feedback, http://www.fema.gov/feedback/, to learn what can happen to the information you provide us when you send us e-mail.
- ***We want to be very clear: We will not obtain personally-identifying information about you when you visit our site, unless you choose to provide such information to us.***

Security and Intrusion Detection

1. For site security purposes and to ensure that this service remains available to all users, this government computer system employs software programs to monitor host and network traffic to identify unauthorized attempts to upload or change information, or otherwise cause damage.

2. Except for authorized law enforcement investigations, no other attempts are made to identify individual users or their usage habits. Raw data logs are used for no other purposes and are scheduled for regular destruction in accordance with National Archives and Records Administration guidelines.

3. Unauthorized attempts to upload information or change information on this service are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and the National Information Infrastructure Protection Act."

Privacy Statement Relating to System Of Records

The FEMA Flood Map Store provides dissemination of FEMA's flood map and insurance products for an associated fee. The following relate to the purchase of FEMA flood related products.

E-Commerce Privacy Statement

1. Personal information submitted by a user in a comment or question via phone, fax, or e-mail is not distributed to parties outside of the FEMA Flood Map Store.

2. Only information submitted through the FEMA Flood Map Store ordering process is protected. Please do NOT include credit card information in E-mail. The open nature of Internet E-mail prevents FEMA from protecting information provided in E-mail.

3. Using commercially available services for security and credit card transactions, the FEMA Flood Map Store ensures that only authorized personnel view credit card numbers that are submitted through the FEMA Flood Map Store.

4. Personal information that is supplied by a user when submitting an order via the FEMA Flood Map Store, phone, fax, or e-mail is used for fulfilling that order. This information may be used to notify customers of new products that may be of interest to them.

5. Where identifying information is asked, it is used only for responding to users' comments or questions and is not made available for other purposes.

6. To assist users in finding official Government information, we provide links to other Web

sites. Once users have left *the FEMA Flood Map Store* and entered another site, they are subject to the privacy policy of that site.

7. As noted above, session (temporary) cookies, not permanent cookies, are used to facilitate the on line ordering process.

Map Service Center Encryption Statement

The FEMA Flood Map Store utilizes industry standard Secure Socket Layer, SSL, encryption in conjunction with freely available web browsers. The SSL technology ensures private, secure transactions for customers who submit electronic orders by credit card through the FEMA Flood Map Store.

Disaster From A Kid's Point Of View

By Maggie, age 13

I live in Arkansas, as you know we had a terrible ice storm, and my family lost a lot of things. We had no power for two weeks and my family had no house! We are very thankful for the Red Cross, they brought food to everyone (my mom and I helped deliver every day). Since we had no house and no insurance on our "broken" home, we called FEMA. My mom was the fist to call, from our area, and we received money for our house and a place to stay until we got a new house. I would like to thank you and the entire FEMA team because if it wasn't for you I could not be sitting here in my own room typing you this letter of thanks!

FEMA for Kids

Fill in the blanks, using the words from the drop down boxes below. There are rhyming words below each blank to help you. Good luck.

1. If you are indoors, stay inside until the storm ______ .

(glasses)

2. Don't use the ______ . Telephone lines conduct electricity.

(loan)

3. Don't take a ______ . Water can also carry an electric charge if lightning strikes near your home.

(power)

4. If you are outdoors, try to get to a safe shelter quickly. Move away from ______ things like trees, towers, fences, and telephone/power lines. They can attract lightning.

(ball)

5. If you are stuck outside and surrounded by trees, take shelter under the ______ trees.

(porter)

6. If you are outside in an open area go to a ______ lying place like a ditch or a valley.

(snow)

7. Stay away from ______ objects! They can attract lightning.

(petal)

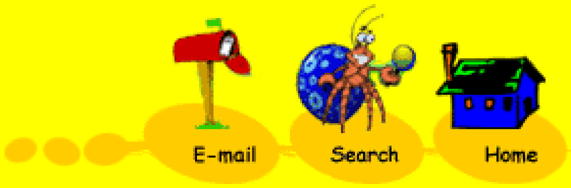
8. Make yourself ______ by crouching down and putting your hands on your knees.

(fall)

Submit your answers

Important Terms | What is Lightning? | If Someone is Hit by Lightning | Lightning Fact and Fiction

Thunderstorms



Important Terms

A severe thunderstorm watch is issued by the National Weather Service when the weather conditions are such that a severe thunderstorm is likely to develop. (A severe thunderstorm has winds at least 58 miles per hour or hail at least three-fourths of an inch in diameter.) When you hear a thunderstorm watch, go to a safe place right away and listen to the radio or television for more information.

A severe thunderstorm warning is issued when a severe thunderstorm has been sighted or indicated by weather radar. A warning is more severe than a watch. If you are not already in a safe place, get there at once! Listen to a battery-operated radio or television and wait for the "all clear."

Lightning Safety By Sabrina

Hello, my name is Sabrina. I was hit by lightning, while taking a hike in the Grand Canyon. Believe me being hit by lightning is not fun! I want you to know how to protect yourself from lightning, so here are some basic lightning safety tips that can help you to be safer.

Outdoor Lightning Safety Tips

1. The very first thing to do is to make a lightning safety plan with your parents or your group and follow it.

2. Before going on a long hike be sure to check the weather forecast for the day.

3. When hiking: assign one person to look for big puffy clouds, that might be coming your way or growing. Have another person be in charge of spotting possible shelters all along the way in case you need them on the way back. A third person should watch and listen for lightning and thunder. (See "Flash to Bang" below) another person should be in charge of deciding when it is time to go back.

4. If you are caught in a thunderstorm, try to find a low place to stay in until the storm is over.

5. If you cannot find a shelter, get in to the "lightning safety position," squat down near the ground with your heels touching and put your hands over your ears. See Position Drawing.

6. Do not go under a tree for shelter because if you do the lightning could hit the tree and travel under the ground or "splash" from the tree and hit you.

7. If you are playing out side and get caught in a thunderstorm go into a nearby building or enclosed car (with the windows rolled up).

Indoor Lightning Safety Tips

1. During a thunderstorm, stay away from anything that is metal (yes, even the refrigerator) because lightning can come into the house through wires and pipes.

2. When there is a thunderstorm outside do not stand near the windows.

3. Don't take a shower or bath when there is a thunderstorm.

4. Never use the phone during a thunderstorm and if the phone rings don't answer it. Because lightning could hit the phone line and travel though the line and zap you though the phone. Some people have died that way.
   Portable phones aren't connected to wires, but lightning could still cause a loud "pop" that could hurt your ear.

5. A metal Franklin stove/fireplace with a metal chimney could also provide a path for lightning to enter your house.

Things To Watch Out For

1. If you are outside and you can hear thunder, then the storm is close enough to be dangerous.

2. If you and a friend are outside someplace, and you see your friend's hair start to stand up, you are in danger! You could also feel prickles on your skin. The reason that you are in danger is that a lightning charge is building up somewhere very close by. Lightning may strike any second and you could be hit by lightning and be badly injured or killed.

What To Do If Someone Is Hit By Lightning

1. It is not dangerous to touch someone who has just been hit by lightning.

2. If someone is hit by lightning and there is still thunder take the person to a near by shelter (a building or car).

3. Once the person is in a safe place, send for help.

4. If the person is not breathing, CPR must be done immediately.

What Are Safe Shelters, And What Are Not Safe Shelters?

1. Buildings or cars (not convertibles and be sure that windows are closed) are the safest place to be during a thunderstorm. If there is not a building or car near you, a ditch, ravine or a deep cavern might be safer than being out in the open.

2. Standing under a tree is not a safe place to be in a thunderstorm. It may keep the rain off you but if lightning hits the tree, it might kill you.

3. You may have heard that if you can't find a shelter, you should lie down flat on your stomach. Well, doing that is not safe at all! If lightning hits someplace near you and travels through the ground, it could enter your whole body and electrocute you. Instead get into the lightning safety position.

What To Do If You Are On A Sport Team?

If you are on a sport team and there is a thunderstorm during a game, what should you do? Should you tell your coach or the person in charge, that the team should get off the field? If the coach says it is just a little rain and not to worry about it, should you leave anyway and take shelter? This is a serious question. You could get kicked off the team if you leave, but your life is more important than the game. In 1999, a whole soccer team was killed by lightning in Africa and a whole football team was injured by lightning in Colorado. My advice is to discuss this question with your parents and with your coach and team before the season begins. On my website you can find links to lightning scientists and find professional advice.

"Flash To Bang"

"Flash to bang" is a way to measure how far away the lightning strike was. The sound of thunder can go one mile in five seconds. So if you see the lightning strike and hear the thunder ten seconds ten seconds later, you know the lightning was two miles away. Scientists say that if you are less than six miles away, you are in the high danger zone. Scientists know that lightning can strike several miles away from a storm cloud.

See my website for more information.

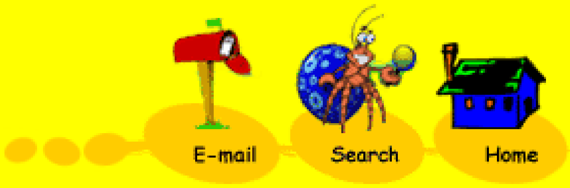
Federal Emergency Management Agency

Thunderstorms



What Is Lightning?

The action of rising and descending air within a thunderstorm separates positive and negative charges. Water and ice particles also affect the distribution of electrical charge. Lightning results from the buildup and discharge of electrical energy between positively and negatively charged areas. Most lightning occurs within the cloud or between the cloud and ground.

The average flash of lightning could turn on a 100-watt light bulb for more than 3 months. The air near a lightning strike is hotter than the surface of the sun! The rapid heating and cooling of air near the lightning channel causes a shock wave that results in thunder.

Your chances of being struck by lightning are estimated to be 1 in 600,000 but those chances can be reduced by following safety rules. Most lightning deaths and injuries occur when people are caught outdoors, and most happen in the summer. Many fires in the western United States and Alaska are started by lightning. In the past 10 years, more than 15,000 fires have been started by lightning.

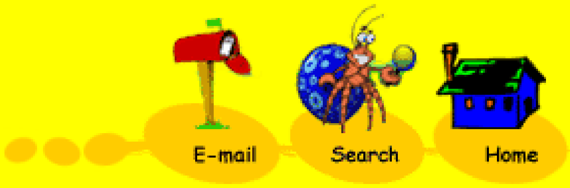
Thunderstorms



If Someone Is Hit By Lightning

People who have been struck by lightning are safe to handle - they don't carry an electrical charge.

Call for help. Get someone to dial 9-1-1.

Being struck by lightning can cause burns or nervous system damage, broken bones and loss of hearing and eyesight. It is a very serious emergency.

If you know how, give first aid. If you know how and the person has stopped breathing, begin rescue breathing. If their heart has stopped beating, and you know how, give CPR.

Thunderstorms

Lightning Fact And Fiction

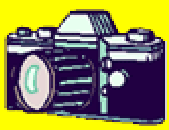
Fiction: Lightning never strikes the same place twice.
Fact: Lightning has "favorite" sites that it may hit many times during one storm.

Fiction: If it is not raining, then there is no danger from lightning.
Fact: Lightning often strikes outside of heavy rain and may occur as far as 10 miles away from any rainfall.

Fiction: The rubber soles of shoes or rubber tires on a car will protect you from being struck by lightning.
Fact: Rubber-soled shoes and rubber tires provide NO protection from lightning. However, the steel frame of a hard-topped vehicle provides increased protection if you are not touching metal. Although you may be injured if lightning strikes your car, you are much safer inside a vehicle than outside.

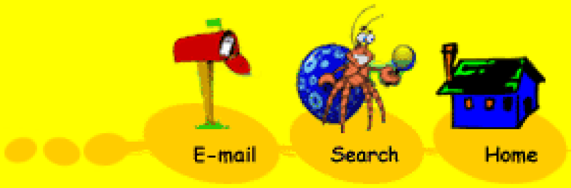
Fiction: People struck by lightning carry an electrical charge and should not be touched.
Fact: Lightning-strike victims carry no electrical charge and should be attended to immediately.

Fiction: "Heat lightning" occurs after very hot summer days and poses no threat.
Fact: What is referred to as "heat lightning" is actually lightning from a thunderstorm too far away for thunder to be heard. However, the storm may be moving in your direction!



[Important Terms | What is Lightning? | If Someone is Hit by Lightning | Lightning Fact and Fiction]

Thunderstorms



Things To Know

When a storm is coming, look for darkening skies, flashes of light or increasing wind. Listen for the sound of thunder. If you can hear thunder, you are close enough to the storm to be struck by lightning. Go to safe shelter immediately. Find shelter in a building or car. Keep car windows closed and avoid convertibles.

Telephone lines and metal pipes can conduct electricity. Unplug appliances, avoid using the telephone or any electrical appliances. (Leaving electrical lights on, however, does not increase the chances of your home being struck by lightning.)

Don't take a bath or shower.

Turn off the air conditioner. Power surges from lightning can overload the compressor and damage the air conditioner!

Draw blinds and shades over windows. If windows break due to objects being blown by the wind of a storm, then the shades will prevent glass from shattering into your home.

If you are caught outside during a thunderstorm, you must act immediately:

If you are in the woods, take shelter under the shorter trees.

If you are boating or swimming, get to land and find shelter right away!

If you can go to a low-lying, open place away from trees, poles or metal objects. Make sure the place you pick is not subject to flooding.

Become a very small target! Squat low to the ground. Place your hands on your knees with your head between them. Make yourself the smallest target possible.

Do not lie flat on the ground - this will make you a larger target!

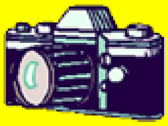
What You Might Feel in a Disaster



Photos

Disasters can happen. They often happen quickly and without warning, and they can be scary for you and your parents. For example, you may have to leave your home and you may not be able to go to school. You may not be able to sleep in your own bed and things may be confusing for awhile. There are **SIX** important things to remember:

Federal Emergency Management Agency

NOAA Weather Radio

Get The News About Your Weather - With A NOAA Weather Radio

Did you know there is a radio that broadcasts National Weather Service warnings and watches 24 hours a day - and warns you with an alarm of dangerous weather? It's true. It's called the NOAA Weather Radio network, and it's provided as a public service by the Department of Commerce's National Oceanic and Atmospheric Administration.

The NOAA Weather Radio network has more than 480 stations in the 50 states and in Puerto Rico, the U.S. Virgin Islands and U.S. Pacific Territories.

How does the radio work? National Weather Service forecasters provide routine weather programming all the time to help you plan. The radios also send out a special alarm tone to alert you to a life-threatening situation. Why is that important? Sometimes, weather can turn deadly very fast. Tornadoes are the best example. Tornadoes may strike when people are sleeping or unaware of the forecast. Tornadoes can be deadly if people cannot seek an appropriate shelter - like a basement or a in-house safe room. With the NOAA Weather Radio, you will be alerted to dangerous weather with time to take shelter.

NOAA Weather Radios broadcast more than just warning about natural hazards. They also broadcast warnings and information and technological disasters, such as chemical releases or oil spills.

Every house should have a NOAA Weather Radio - just the way all houses should have a smoke detector. They can be purchased at stores that sell electronics. Most run on batteries or have battery back-up. Be sure to take it with you when you travel or are out boating or camping.

Be weather-safe. Have a NOAA Weather Radio!

What is the abbreviation for the Federal Emergency Management Agency?

- ○ FEA
- ○ FEMA
- ○ FMEA
- ○ USA.GOV

What is an Executive Branch agency?

- ○ A federal government agency that reports to the President
- ○ A federal government agency that reports to an executive
- ○ A federal government agency that works with trees

The Federal Emergency Management Agency helps people BEFORE, DURING, and AFTER a disaster.

- ○ True
- ○ False

Choose one thing that the Federal Emergency Management Agency DOES NOT do to help people.

- ○ Helps people find a place to stay after a disaster
- ○ Helps people repair their homes
- ○ Works with city officials to fix public buildings that are damaged
- ○ Teaches kids how to swim
- ○ Teaches people how to prepare and make their homes safer
- ○ Trains firefighters and emergency workers
- ○ Runs a flood insurance program

Hurricanes

The History Of Hurricanes

Scientists have only been studying hurricanes only for about 100 years. But there is evidence of hurricanes occurring long in the past. For example, geologists (scientists who study the earth) believe that layers of sediment in a lake in Alabama was brought there by a hurricane in the Gulf of Mexico as long as 3,000 years ago! There is also evidence in Florida of hurricanes more than 1,000 years ago.

One of the first human records of hurricanes appears in Mayan hieroglyphics. The Mayans also practiced a kind of mitigation and risk reduction by building their major settlements away from the hurricane-prone coastline. In fact, it is the Mayan word "Hurakan" that became our word "hurricane." Hurakan was the name of one of their gods, who, they believed, blew his breath across the water and brought forth dry land. Later, Carib Indians gave the name "Hurican" to one of their gods of evil.

Many storms left important marks on history. In 1565, a hurricane scattered a French fleet of war ships and allowed the Spanish to capture a French fort in what is now Florida. In 1609, a fleet of ships carrying settlers from England to Virginia was struck by a hurricane. Some of the ships were damaged and part of the fleet grounded on Bermuda, an island nation in the Atlantic. These passengers became the first people to live on Bermuda. In 1640, a hurricane partially destroyed a large Dutch fleet that was poised to attack Cuba.

There were a number of particularly severe hurricanes as the U.S. went from the 1800s to the 1900s. Hurricanes hit Louisiana, South Carolina and Georgia in 1893 and killed as many as 4,000 people. In 1900, a famous Texas hurricane killed more than 8,000 people and was a Category 4 storm.

As forecasting improved communities were no longer surprised by hurricanes and could take measures to evacuate ahead of the storm. While destruction still continues, the number of deaths in hurricanes had dropped significantly.

Hurricanes

Why Can't We Stop Hurricanes?

One of the most commonly asked questions is why we don't try to stop hurricanes from forming or to disrupt them once they do form. It doesn't sound too hard, does it? Well, so far researchers have found it's impossible to do. The federal government, through the National Oceanic and Atmospheric Administration (NOAA) tried various inventions to weaken hurricanes, but gave up in the 1960s. The weather systems that make up hurricanes are too large to affect. Now NOAA researchers focus on trying to better understand how hurricanes form and move.

In 1955, Congress funded the National Hurricane Research Project to conduct research into these dangerous storm systems. In 1960, researchers acquired two DC6 airplanes to use just for hurricane research. Improved computers and the regular flights of the "Hurricane Hunter" planes helped meteorologists (scientists who study weather) to learn more and more about hurricanes. Over time, the forecasts and project "track" of hurricanes has gotten more and more accurate.

Some of the successes achieved by NOAA researchers include:

Studying the success of a Stepped-Frequency Microwave Radiometer, carried aboard a Hurricane Hunter plane, to map a hurricane.

Designing satellite-based modems for transmitting information from the Hurricane Hunter plans to computers on the ground to speed up the transfer of the data.

Improving forecasting so that the future track of hurricanes is more accurate - very important to knowing where a hurricane will hit and if a particular community needs to evacuate.

Developing a "Global Positioning System Dropwindsonde" to take measurements in the inner core of hurricanes to improve analysis and forecasts.

Information courtesy of the Hurricane Research Division of the Atlantic Oceanographic and Meteorological Laboratory/NOAA

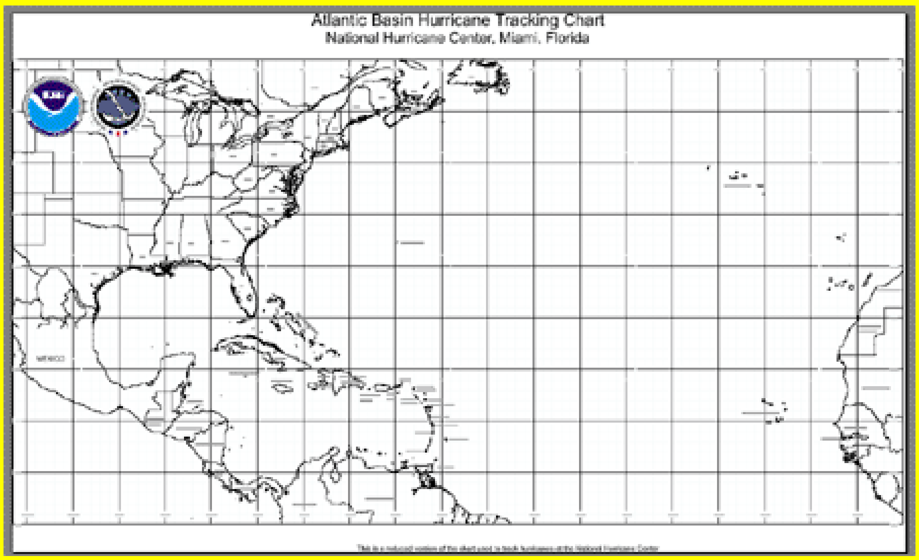
How To Track A Hurricane

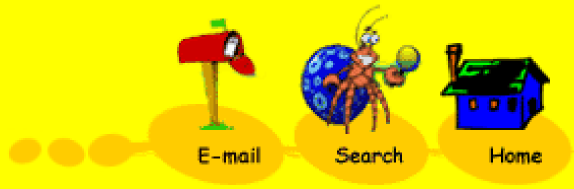
The National Hurricane Center, which is part of the National Weather Service and the National Oceanic and Atmospheric Administration, tracks tropical storms and hurricanes.

Hurricane watches and warnings are issued when the storms get close to the U.S. You can track the progress of storms by listening to the coordinates given by your television meteorologists. Or you can regularly check on http://www.nhc.noaa.gov/ for the latest longitude and latitude locations issued by the National Hurricane Center.

You can print out this tracking map or download the Tracking Map PDF (906 KB) to make your own tracking maps. (You will need the Adobe Acrobat Reader) Where do you think the storms will go?



Hurricanes



Hurricane Classification

Hurricanes are classified into five categories, based on their wind speeds and potential to cause damage.

- Category One -- Winds 74-95 miles per hour
- Category Two -- Winds 96-110 miles per hour
- Category Three -- Winds 111-130 miles per hour
- Category Four -- Winds 131-155 miles per hour
- Category Five -- Winds greater than 155 miles per hour

In the U.S., the official hurricane season is from June 1 to November 30, but hurricanes can happen any time of the year. Hurricanes are named by the National Weather Service. Some past hurricanes have been named: Opal, Andrew, Marilyn, Hugo and Fran.

Important terms to know:

Hurricane Watch -- A hurricane is possible within 36 hours. Stay tuned to the radio and television for more information. The Hurricane Center is tracking the storm and trying to predict where it may come ashore.

Hurricane Warning -- A hurricane is expected within 24 hours. You may be told to evacuate. You and your family should begin making preparations to evacuate. If your area is having an evacuation, remember to take your Disaster Supply Kit. Do not forget to make plans for your pets if you must evacuate.

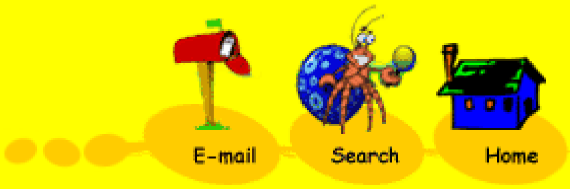
Hurricanes



A History Of Big Hurricanes

Hurricane Carla: This hurricane hit on September 10, 1961. It struck the Texas coast. About 500,000 people were evacuated from the area. Winds near the center of the hurricane were estimated at 150 miles per hour. Damage was about $2 billion (adjusted to 1990 dollars) and 46 people died.

Hurricane Betsy: This hurricane hit on September 8, 1965. It hit Florida first and then turned and hit the Louisiana coast. A total of 75 people lost their lives. The hurricane had winds as high as 160 miles per hour. In 1990 dollars, Betsy caused $6.5 billion of damage -- making it the third most costly hurricane in the U.S.

Hurricane Camille: This hurricane began on August 17, 1969. It was a Category 5 hurricane -- the most powerful rating, with winds as high as 200 miles per hour. The hurricane hit the U.S. Gulf Coast, but also caused flooding in Virginia. About 250 people died because of the hurricane and the flooding. It was the fifth most costly disaster in U.S. history, with damage of $5.2 billion (in 1990 dollars).

Hurricane Celia: This hurricane hit Texas on August 3, 1970 and caused $1.6 billion in damage (in 1990 dollars). Very high winds damaged an airport and demolished a nearby mobile home park, fortunately, only 11 people died.

Hurricane Gilbert: This hurricane hit on September 16, 1988. It was a Category 5 hurricane with winds as high as 160 miles per hour. It went through Jamaica, over the Yucatan peninsula of Mexico and came to the U.S. (Texas and Oklahoma) as a heavy rain storm. Damage in Mexico was many billions of dollars, and 318 people died.

Hurricane Andrew: This hurricane hit on August 24, 1992 in southern Florida. It then turned and hit Louisiana. More than a million people had to leave the area due to the storm. Heavy rains and tornadoes were part of the hurricane’s destructive power. Andrew was the most expensive hurricane in the history of the U.S.

Hurricane Floyd: This hurricane, which struck in September 1999, brought so much rain that 13 states were issued federal disaster declarations -- more declarations for a single event than ever before. More than $500 million of federal money was spent on helping states recover. North Carolina was hit the hardest of any state.

Hurricane Classification

Hurricanes

Hurricane Names

All hurricanes are given names. Why is that? To help us identify storms and track them as they move across the ocean. Remember, there can be more than one hurricane at a time and without naming them, we could get confused and which storm we're talking about.

For hundreds of year, hurricanes in the West Indies were named after the particular saint's day on which the hurricane occurred. An Australian meteorologist began giving women's names to tropical storms before the end of the 19th century. In 1953, the U.S. National Weather Service, which is the federal agency that tracks hurricanes and issues warnings and watches, began using female names for storms.

In 1979, both women and men's names were used. One name for each letter of the alphabet is selected, except for Q, U and Z. For Atlantic Ocean hurricanes, the names may be French, Spanish or English, since these are the major languages bordering the Atlantic Ocean where the storm occur.

So who decides what names are used each year? The World Meteorological Organization uses six lists in rotation. The same lists are reused every six years. The only time a new name is added is if a hurricane is very deadly or costly. Then the name is retired and a new name is chosen.

- Atlantic Hurricane Names
- Pacific Hurricane Names
- Retired Hurricane Names

Hurricane Cartoons

"Ow! I have something in my eye!"

Caption: OW! I have something in my eye! Don't you hate those pesky Hurricane Hunter planes? © 1996 Katie Sullivan

Special planes called "Hurricane Hunters" fly into hurricanes to gather valuable information. The people on the airplanes belong to the Air Force Reserve. In the eye of the hurricane, they can measure wind speed, air pressure and the structure of the storm.

More Cartoons

Bio: Weather enthusiast Katie Sullivan is the artist behind this collection of cartoon and explanations. The Wisconsin high school senior has yet to experience a hurricane firsthand, but has been fascinated by these awesome storms since 1991. Hoping to become a tropical meteorologist and novelist, Katie's interests include writing, drawing, postcard collecting, computers, and, of course, weather.

Federal Emergency Management Agency

Disaster Math

Hurricane A has winds that are moving at 124 miles per hour on Sunday. On Monday, Hurricane A''s winds have slowed down and are only going 94 miles per hour. What is the difference in the speed of the winds from Sunday to Monday?

- 218 miles per hour
- 30 miles per hour
- 1,000 miles per hour
- 1 miles per hour

Tropical storms officially become hurricanes when they reach 74 miles per hour. Tropical Storm Z currently has winds of 59 miles per hour. How much do the winds of Tropical Storm Z need to speed up in order for the storm to become a hurricane?

- 133 miles per hour
- 13 miles per hour
- 15 miles per hour
- 51 miles per hour

Hurricanes can cause storm surge - when the water of the ocean rises much higher than usual. Storm surge is very dangerous, and can sweep away homes that are built right along the beach. In the town of Palm Nut Beach, the homes along the water are built on stilts that are 8 1/2 feet high. If the storm surge is 6 1/4 feet high, how much space is there between the homes and the water?

- 2 1/4 feet
- 5 feet
- 10 feet
- 1 1/4 feet

Pretend that the storm surge is 10 1/2 feet. How much of the house would be under water?

- 5 feet
- 1 foot
- 22 feet
- 2 feet

There is a hurricane warning for the coast and three towns might have to evacuate: Palm Nut Beach (population 3,451), Femaville (population 1,256)

and Sandgate (population 7,436). What is the total number of people who might have to evacuate from these three towns?

- 12,143 people
- 1,243 people
- 14,123 people
- 21,431 people

There are 1,200 houses in Palm Nut Beach. The town has been told to prepare for a hurricane by storing water. Each household is told to store 12 gallons of water. How many gallons of water will the town store?

- 4,000 gallons
- 14,400 gallons
- 12 gallons
- 1,200 gallons

Hurricane Hunters

It is hard to imagine, but a group of pilots called The Hurricane Hunters actually fly directly into hurricanes! The 53rd Weather Reconnaissance Squadron, known at the Hurricane Hunters, are part of the Air Force Reserve. They fly right into the eye of the hurricane to get information on the hurricane. This information is used by the National Hurricane Center to make predictions about the size, strength and future path of the hurricane. This information, in turn, is used by local officials who need to make decisions about possible evacuations of areas that might be at risk for the hurricane.

The Hurricane Hunters use WC-130 aircraft on their weather missions. The planes have a six-person crew that includes the aircraft commander, co-pilot, flight engineer, navigator, weather officer and a dropsonde system operator. The dropsonde system operator releases the dropsonde - a weather-sensing canister attached to a small parachute. This canister radios back to the aircraft information on the temperature, humidity, pressure and winds inside the storm. The weather information is processed aboard the aircraft and transmitted by satellite to the National Hurricane Center.

The first mission to check a new hurricane is flown at a low-level altitude, generally between 500 and 1,500 feet. Later, as the storm builds in strength, the flights are at higher altitudes. The planes fly right into the storm - not above it! The ride can get pretty bumpy as the area around the eye is usually surrounded by a solid ring of thunderstorms called the eyewall. Sometimes the clouds and rain are so thick the aircraft's wings are barely visible to the crew.

Hurricanes

The Story Of Mary Ann And Hurricane Camille

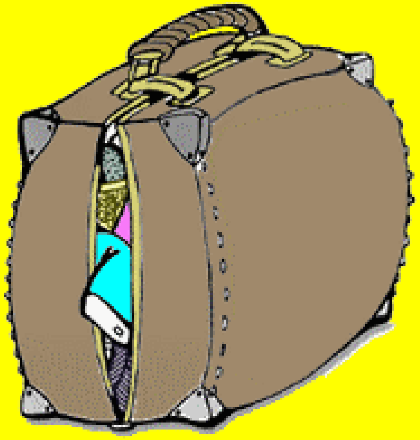
Mary Ann lived near the Gulf of Mexico in 1969 when Hurricane Camille struck her three-story apartment building. Mary Ann was one of 24 people who didn't leave the Richelieu Apartments when they were warned. When the storm surge hit, the building began to creak and the windows broke out. Water started flooding in and was all over the apartment in a matter of two minutes - and the apartment was on the second floor!

In about five minutes, Mary Ann's bed was floating half way to the ceiling. As the building began to fall apart, Mary Ann floated out of the window and grabbed onto a sofa pillow that came by. She became tangled in wires and debris. It was dark, but Mary Ann saw the building come down all around her. The wind was awful. It reached 234 miles per hour during Hurricane Camille. Mary Ann continued to hold onto anything she could-furniture, tree limbs and parts of houses and buildings. The winds and waves were so strong that every time Mary Ann grabbed hold of something it would be ripped from her hands. She kept getting hit by the wreckage and was bloody from head to toe from the nails in the boards. This went on for 12 hours before Mary Ann was found 4 ½ miles from her house. She was taken to a hospital where she stayed for three weeks.

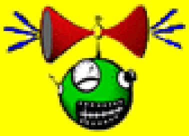
Today, Mary Ann is grown up. She still lives in Mississippi. She tells her story over and over so people will listen when they're told to evacuate.

Hurricanes

- Listen to a radio or television for weather updates and stay in touch with your neighbors about evacuation orders.
- Plan a place to meet your family in case you are separated during a disaster. Choose a friend or relative out of state for your family members to call to say they are OK.
- Assemble your disaster supplies kit. Store extra water now! Check to make sure you have enough food.
- Storm shutters are the best protection for windows. If your house does not have them, help an adult board up windows with 5/8" marine plywood. Tape does NOT prevent windows from breaking!
- Bring in outside furniture. An adult should remove roof antennas, if they can do so safely.
- Help an adult shut off your utilities -- water, electricity and gas.
- Make sure there is gas in the car and you are ready to evacuate immediately, if you are told to do so.
- If you don't need to evacuate, be sure to STAY INDOORS during a hurricane. You could be hit by flying objects. Don't be fooled if there is a pause in the wind. It could be the eye of the storm, and the winds will come again.
- Avoid using the phone except for an emergency so the phone lines can stay open for others.
- If you do evacuate, do NOT go back home until local officials say it is safe.
- Hurricanes can be very scary. If you are scared, be sure to talk to someone about it.



It's Hurricane Season



Audio

Julia and Robbie's mother sighed as she packed the last of their clothes. She pushed down on the suitcase to make it close and she snapped the latch.

"I'm almost afraid to plan a vacation," she said. "You two *are* Double Trouble."

"Don't be mad at us," Julia pleaded.

"It wasn't our fault there was an earthquake when we visited Uncle James," said Robbie. He was eating a peanut butter sandwich and he talked with his mouth full. Julia giggled.

"And it wasn't our fault that the Acorn River flooded when we visited Grandma," said Julia.

"Of course it wasn't your fault and I'm not mad," their mother said. She leaned down and wiped the crumbs from Robbie's mouth. "But everywhere you go something seems to happen."

Julia nodded. She knew it was true. In addition to the earthquake and the flood, a tornado had nearly hit their town.

"But this time will be different," said Julia.

"I can't wait to see what Florida looks like," said Robbie.

It was a long drive to Florida and their father kept them busy by asking them hurricane questions. The twins had studied hurricanes at school.

Inondations

Que faire avant et après ?

Outre le triste bilan en vies et en souffrances humaines, les dommages causés par les inondations coûtent aux contribuables canadiens des millions de dollars par année.

Les divers ordres de gouvernement s'appliquent à réduire les risques d'inondations, mais la sécurité personnelle repose d'abord et avant tout sur les épaules de l'individu. Il incombe à chacun de nous de tout mettre en oeuvre pour protéger les membres de notre famille et notre demeure. Vous pouvez faire votre part pour réduire les dommages causés par les inondations; il suffit de planifier en conséquence et de prendre quelques sages précautions.

Il y a plus d'une façon de prévoir les dangers d'inondations qui menacent certaines régions, notamment :

- la surveillance de la crue des eaux à la suite de pluies abondantes;
- l'étude de l'enneigement dans les bassins versants des rivières;
- les observations et les prévisions météorologiques.

Les crues-éclair, ou soudaines, qui ne laissent que très peu de temps pour avertir la population, peuvent également être causées par des tremblements de terre, des tsunamis, ou raz de marée, des ouragans, des tempêtes ou des ruptures de barrages.

Dans toutes ces circonstances, les autorités locales tenteront de renseigner la population sur l'évolution de la situation dans les régions les plus susceptibles d'être inondées. Des bulletins d'information apporteront régulièrement des précisions sur les mesures que les gens doivent prendre pour limiter ou prévenir le désastre. Au besoin, les autorités municipales ou provinciales donneront des directives plus précises.

Contact Us

If you are unable to find information you need on the Web site, please contact the appropriate department or division of CMHC. Please carefully review the selections below, to ensure your question is directed to the correct department.

Frequently Asked Questions — the answer to your question may be just a click away

Ordering Publications

National Office — main address, administration contact numbers, location map

Regional Offices — addresses, contact numbers and maps for locations across Canada

Assisted Housing — information on financial assistance and social housing programs

CMHC International — information for Canadian exporters, and about CMHC services to other countries

Market Analysts — for data, statistics and analysis about housing markets across Canada

Mortgage Loan Insurance — contacts across Canada. For information related to your own mortgage, you should first contact your lender.

Canadian Housing Information Centre — for research and library services focused on housing.

General Inquiries — if unable to identify a contact above. Please review the FAQs section before submitting.

The Home Buyers Plan allows you to withdraw money from your RRSPs to build or buy a home. For questions, contact a Canada Revenue Agency service office.

Webmaster — to submit problems reports or comments related to the functioning of the Web site. Program or product related questions should be submitted to the correct department from the list above.

Step Through the Life-Cycle of Your Home

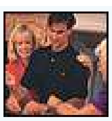
FLASH ANIMATION

Over your lifetime, your needs and preferences will change. From finding the right home to making renovations, CMHC can help make sure your home grows with you. Explore the possibilities!

Canada Mortgage and Housing Corporation

"Sunsnine on the water looks so lovely"

This line from John Denver's popular song of 1974 fits right in with relaxed mid-summer days, but when that water is in your basement, it's anything but lovely. Learn how to prevent basement flooding with our new fact sheet, and if you have suffered from flooding, click here for advice. Speaking of summer, take a look at how you can personally contribute to a cooler planet, by reducing energy consumption. If you're spending your summer getting ready to move, we can help with that, and also with making healthy choices in your next, or current house. Enjoy the rest of summer with CMHC's help.



Renovating Your Kitchen

The kitchen is often the most used room in the house and kitchen renovations typically have the highest financial payback. Conduct a pre-renovation inspection and prioritize the most desirable features for your new kitchen.

FEATURED EVENT:

Seabird Island First Nation Sustainable Community Demonstration Project Tours

Sep. 16

CMHC's newest flagship publication, the Canadian Housing Observer, presents a comprehensive overview of Canadian housing conditions, trends and key factors behind them.

[Repairing or Replacing Roof Finishes]

Regular maintenance and periodic roof inspections will identify problems before they cause costly damage to your home. Learn about the key factors that will determine whether you should repair or replace your roof.

[Measuring Humidity in Your Home]

We need humidity for our comfort and health. But too much or too little humidity can produce a host of difficulties for householders.

[Landscape Guide for Canadian Homes]

Perhaps the ultimate landscape book for Canadian homeowners — learn about low-maintenance gardens and lawns, water conservation, natural pest control methods, even how to hire a landscape contractor.

[Water Damage, Mold, and House Insurance]

When homeowners have flooding damage due to a plumbing leak or a summer storm, this document will instruct them on how to deal with the insurance company and how to hire a restoration contractor.

[Choosing a Dehumidifier]

Air that is too damp can cause condensation on windows, water damage to materials, mold and even wood rot. Choose the right dehumidifier to regulate the humidity in your home.

Just Doing My Job

The Mississippi Flood of 93.

Lee Blackmore was finally enjoying an early morning cup of coffee when the phone rang. A young image analyst and GIS specialist with the St. Louis Community Development Agency (CDA), he had finally managed to grab a few hours of sleep after nearly two days in front of his computer producing maps and images of the flooded Mississippi River. On the phone was an emergency coordinator from the police department. "Lee," the voice said, "we need your help."

Just Doing My Job

The Mississippi Flood Of 93

1. Lee Blackmore worked for which of the following agencies?

- ◯ CDC
- ◯ IRS
- ◯ CNBC
- ◯ Army Corps of Engineers

2. According to the article, during the spring and summer of 1993, which of the following rivers did NOT flood?

- ◯ Mississippi
- ◯ Missouri
- ◯ Colorado
- ◯ Illinois

3. Which type of image was used by Blackmore to locate areas in danger of flooding?

- ◯ Camera photographs
- ◯ Satellite images
- ◯ Video images
- ◯ Graphic images

4. Why didn't the police want to evacuate everyone from the area?

- ◯ They were too lazy.
- ◯ There wasn't enough time.
- ◯ They didn't have the budget or resources.
- ◯ Both b and c.

5. How did Lee Blackmore and the CDC decide who was in the most danger?

- ◯ They drew names from a hat.
- ◯ They electronically superimposed a digital map of the river boundaries on a map showing streets and buildings.
- ◯ They consulted a psychic.
- ◯ They never really knew, they just did their best guessing.

Landsat's Thematic Mapper Bands

The multispectral remote sensing instruments carried on the Landsat and other satellites measure the amount of energy reflected and emitted in several discrete portions, or bands, of the EM spectrum. The various visible and infrared bands were chosen to measure reflected and emitted energy in areas of the spectrum that correspond to known responses of the target materials. These include specific characteristics of land, vegetation, water, rocks, and temperature.

NASA'S OBSERVATORIUM TEACHER'S GUIDES

Welcome to the Observatorium's teacher's guides. We realize how busy teachers can get, and we know that with all the information on the Web it can be hard to read the articles and apply them to the classroom. Therefore, we've decided to give teachers a helping hand.

A teacher's guide has been developed to accompany each article in the Observatorium. These guides are very basic, providing teachers with a start in the right direction. We encourage educators to print the guides and use them in the classroom or at home. Happy teaching!

A Swift Look at the Biggest Explosions in the Universe

NASA Selects a Mission to rapidly locate gamma-ray burst sources

Oct. 29, 1999: The story of gamma-ray bursts is becoming like the biography of a film star who hits the jackpot after years of bit parts. Bursts were discovered in the late 1960s by nuclear test detection satellites. Until the 1980s they were monitored by instruments that were piggybacked on satellites designed for other missions.

By then the mystery had led NASA, in 1978, to select the the Burst and Transient Source Experiment (BATSE) as one of four instruments aboard the Compton Gamma Ray Observatory (launched in 1991). BATSE was envisioned as a fire alarm that would notify the other instruments on the observatory to help scientists settle this nagging little mystery.

Right: Artist's concept of the Swift satellite observing a burst. Credit: NASA/Goddard.

In this role, BATSE wins as "best supporting actor" by showing that bursts are perhaps the most violent explosions we can observe in the universe. This has swept up the astrophysics community. More than 3,200 professional papers have been written about bursts, says Dr. Kevin Hurley of the University of California at Berkeley, and papers are being published at the rate of 1.3 per day, faster than bursts are recorded.

As with any star that has made good, the next step is his or her own starring role. That comes in 2003 with the planned launch of Swift. Breaking with NASA tradition, the name isn't an acronym. It describes how quickly the spacecraft is designed to swing around and put an array of telescopes on target and capture bursts before they fade.

Swift will carry three instruments, the Burst Alert Telescope (BAT), an X-Ray Telescope (XRT), and an Ultraviolet/Optical Telescope (UVOT).

The primary mission is quite simple, said Dr. Neil Gehrels, the principal investigator at NASA's Goddard Space Flight Center. He described Swift in the last session (Instrumentation) of the 5th Huntsville Gamma Ray Burst Symposium held in Huntsville, Ala., last week.

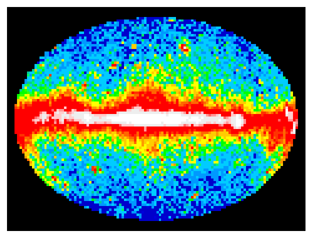
Recent Headlines

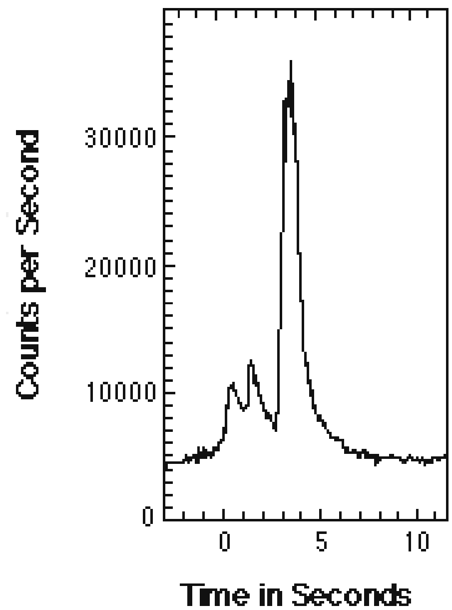
December 3: Mars Polar Lander nears touchdown

December 2: What next, Leonids?

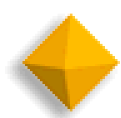
November 30: Polar Lander Mission Overview

November 30: Learning how to make a clean sweep in space





This animation illustrates why bursts are so hard to localize; they come and go like lightning bolts. By the time you're aware that something had happened, it's too late to turn and look at the flash; you can only listen to the echo. (The burster is superimposed on a galactic gamma-ray image.)

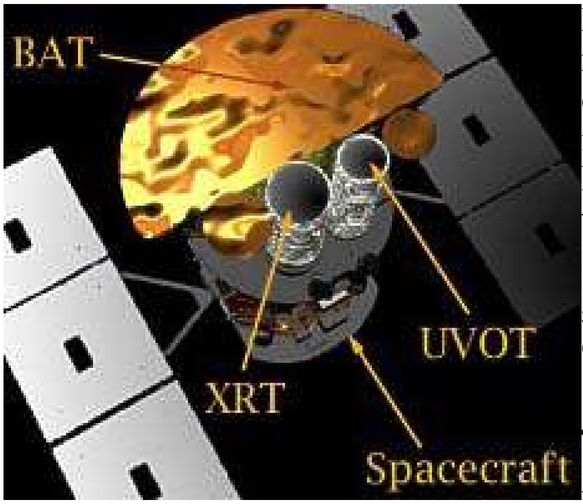


To catch a gamma-ray burst in the act, you need to have instruments already pointed in the right direction. BATSE does this with eight detector modules arranged like the faces of an octahedron so it looks in all directions at once. Its main drawback is resolution; BATSE cannot provide precise locations. Swift will sacrifice all-sky coverage for greater precision. By looking at a large slice of sky with a high-resolution detector, it will provide burst locations fine enough to aim its optical and X-ray telescopes. Credits: NASA/Marshall (left) and NASA/Goddard.

"We know that long bursts are associated with faint galaxies at least halfway to the edge of the known universe," Gehrels said. "But what we don't know is, what are the physical origins of bursts? What are their progenitors [the stars that become bursts] and what is the physics that goes on inside?"

Swift's three instruments will help answer those questions.

First, BAT will detect the onset of a gamma-ray burst. Unlike BATSE, which has eight modules that view the entire sky (other than what the Earth blocks), BAT will view a smaller fraction of the sky. It will comprise a special kind of pinhole camera called a coded aperture mask placed in front of a large solid-state detector. This will let BAT calculate a burst's location to within a few arc-minutes (a fraction of the Moon's apparent diameter and much finer than BATSE can do).



Next, the spacecraft swings to aim the XRT and UVOT in the neighborhood of the burst. The XRT is based on a proven design for Spectrum X, a Russian/European/U.S. mission, set for launch in 2003. It is sensitive to X-rays in the 0.2 to 10 kilo-electron volt (keV) range and has a 24 arc-minute field of view, slightly smaller than the Moon's apparent diameter.

Left: The XRT and UVOT will be coaligned on the Swift spacecraft, while BAT covers a much larger field of view. The entire spacecraft will turn when BAT detects a burst. Credit: NASA/Goddard.

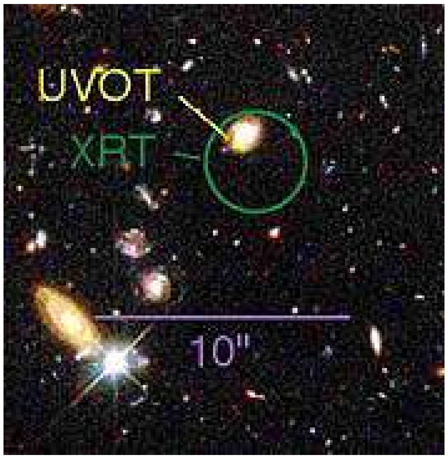
The UVOT, derived from the optical telescope that Europe's X-ray Multi-Mirror Mission satellite (XMM) will carry, has a 30 cm (12 in.) primary mirror, equivalent to a 4-meter (13.2 ft) telescope on the ground, Gehrels said. It will have a 17 arc-minute field of view (slightly more than half the apparent diameter of the Moon) and sensitivity from 170 nm (ultraviolet) down to 650 nm (deep red).

Using the two telescopes, scientists should be able to locate bursts to within 0.3 arc-seconds, and to tell whether the burst has an optical transient that should be the target of follow-up observations by larger observatories in orbit or on Earth.

While waiting for bursts to go off, Swift will map the sky at high x-ray energies. This hasn't been done since the first High Energy Astronomy Observatory (HEAO-1), which orbited during 1977-79. BAT will be 50 times more sensitive that HEAO-1's Hard X-Ray/Low Energy Gamma Ray Experiment, so it will provide more detailed maps that will help observers find new targets for the Chandra X-ray Observatory and XMM.

Web Links
Swift project at NASA/Goddard describes the spacecraft and its mission. HETE-II, the High Energy Transient Explorer project at MIT Super-LOTIS homepage at Clemson University. And, of course, BATSE, the instrument that has taught us so much about bursts.

This mapping mission will require some patience, though, since Swift will automatically chase a burst as soon as one is detected.



Another break from NASA tradition, Gehrels explained, is that Swift's burst data will be made available as soon as they come through since time is of the essence in burst observations. Within 10 seconds, Swift should have a 10 arc-minute determination of a burst's location. In less than three minutes, it will have an X-ray or optical determination to less than an arc-second. And that will allow follow-up observations, in the weeks and months that follow, with large observatories like the Hubble Space Telescope that require much more planning to repoint.

Right: The relative fields of view of Swift's two telescopes are overlaid on a segment of the Hubble deep-field image. Swift will provide locations refined enough for Hubble and other high-power telescopes to study bursts in detail. Credit: NASA/Goddard.

And beyond that? After a lead role, most stars look for a blockbuster role. In this case, it will be the Next Generation Gamma-Ray Burst Observatory.

"We want NASA to begin to form a group within this next year to study the mission requirements" for what would come after Swift, said Dr. Gerald Fishman, principal investigator for BATSE at NASA's Marshall Space Flight Center.

"Swift serves as a pathfinder" for the next-generation instrument, Fishman said. "We won't firm up plans until it makes its observations" since those could change the requirements. The design is so distant for now that the next-generation telescope might comprise several spacecraft operating together, and almost certainly will operate interactively with advanced missions like the Gamma-Ray Large Space telescope (GLAST) planned for launch in 2005.

The next-generation instrument would also be used in concert with major observatories on Earth and in orbit.

"This mission is seen primarily as a NASA facility," Fishman continued, "designed by the entire NASA community and used by the science community. Although NASA would play a lead role, it is expected to have international support."

Fishman said scientists are also looking at a new operational model that would involve the National Science Foundation as a full partner rather than having the observatory operated and funded primarily by and for NASA. NSF operates many of the United States' ground-based observatories.

"Since the science is something of interest to both agencies" - ground-based observatories often seek optical counterparts for bursts - "it should be funded by both agencies," Fishman said.

Since Swift won't start chasing bursts until 2003, the Next Generation Gamma-Ray Burst Observatory won't even be designed until around 2005 for launch in 2010 or later.

Left: Engineers at MIT prepare HETE-II for launch. Credit: MIT

Meanwhile, other instruments are helping keep gamma-ray bursts in the limelight. The High-Energy Transient Explorer (HETE-II; the first failed to reach orbit in 1998) is set for launch on Jan. 23. It has a smaller detector than Swift and will only stare at a section of sky away from the sun, so it will detect only 30 or so bursts a year. But HETE-II also has ultraviolet and X-ray instruments that will provide a refined location to help larger telescopes target bursts for follow-up observations.

Right: A Clemson University student examines the primary mirror for Super-LOTIS. Credit: Clemson University.

Chasing those locations will be Super LOTIS, built from an old 60 cm (24-in) reflector telescope provided by the Lick Observatory. Super LOTIS - the Livermore Optical Transient Imaging System built by Lawrence Livermore National Laboratory - has been in tests since "first light" on Feb. 25, 1999.

In addition to looking at night for optical afterglows of gamma-ray bursts, it is programmed to record burst triggers that happen during the day and then try to locate their afterglows at night. Super LOTIS is scheduled to be relocated from Lawrence Livermore to the Kitt Peak National Observatory near Tucson, Arizona where observing conditions are better.

1999 GRB Symposium series

Oct 29: A Swift Look at the Biggest Explosions in the Universe Spurred by the thousands of gamma-ray bursts recorded over the last three decades, NASA is planning missions dedicated to discovering the causes of what had been an oddity and now has become a primary mystery.

Oct 25: Postmortems in the Sky To say they are ghoulish may be going too far, but like ghouls those studying Gamma Ray Bursts gleefully seek the moldering remains, and never see the living victim. But they are very much interested in both the victim and the cause.

Oct 21: Dodging pitfalls in the hunt for the cause of gamma-ray bursts Scientists discuss how to avoid making mistakes while searching for the solution to a big astrophysical mystery - What causes gamma-ray bursts?

Oct 20: Outbursts Result in Controversy Scientists have different ideas to explain the behavior of Soft Gamma Repeaters (SGRs).

Oct 18: After three decades of study, gamma-ray bursts still mystify Science@NASA caught up with Dr. Gerald Fishman for an interview about bursts and the symposium.

Oct 11: Gamma-ray bursts to take center stage at international meeting More than 200 astronomers will gather to talk about gamma-ray bursts, one of the most mysterious and increasingly watched-for phenomena in the universe.

Leonids in the Crystal Ball

Most experts agree that 1999 is a likely year for a Leonids meteor storm.

October 27, 1999: Imagine tuning in to the local TV weather report and hearing this from the weatherman:

"Good evening space weather lovers! Last night Earth was hit by a high-pressure solar wind stream. It's expected to persist for 3 or 4 more days producing a 50% chance of mid-latitude aurora. But the big news today is the 1999 Leonid meteor shower. Experts are predicting a big storm on November 18th with up to 100,000 shooting stars per hour. Of course, we could be off by a couple of years. The storm might hit in 2001 instead. Or maybe not at all! Hey, if predicting these things were easy we wouldn't need experts!"

Right: Lorenzo Lovato captured this stunning picture of a -10 magnitude Leonid fireball on November 17, 1998 from Monteromano, Italy. He used Fuji 800 film with a 16 mm f/2.8 lens for an exposure time of 15 minutes. Copyright 1998, Lorenzo Lovato, all rights reserved.

One day, space weather forecasts like this could be commonplace. As our society comes to rely on satellites, cell phones, and other space-age gadgets, forecasting solar storms and meteor showers can be just as important as knowing the chances of rain tomorrow. Three weeks from now we may be treated to a very visible reminder of space weather when the Leonid meteor shower strikes on November 18, 1999.

What's the probability of significant meteoroid precipitation? That's what stargazers and satellite operators everywhere would love to know.

Most experts would agree that predicting the Leonids can be tricky. To understand why it's helpful to know the difference between a "meteor shower" and a "meteor storm." Simply put, meteor showers are small and meteor storms are big. Meteor showers produce a few to a few hundred shooting stars per hour. Meteor storms produce a few thousand to a few hundred thousand meteors per hour. A meteor storm, like a total solar eclipse, ranks as one of Nature's rarest and most beautiful wonders.

A Leonid meteor *shower* happens every year around November 17 when Earth passes close to the orbit of comet Tempel-Tuttle. Usually not much happens. The Earth plows through a diffuse cloud of old comet dust that shares Tempel-Tuttle's orbit, and the debris burns up harmlessly in Earth's atmosphere. A typical Leonid meteor shower consists of a meager 10 to 20 shooting stars per hour.

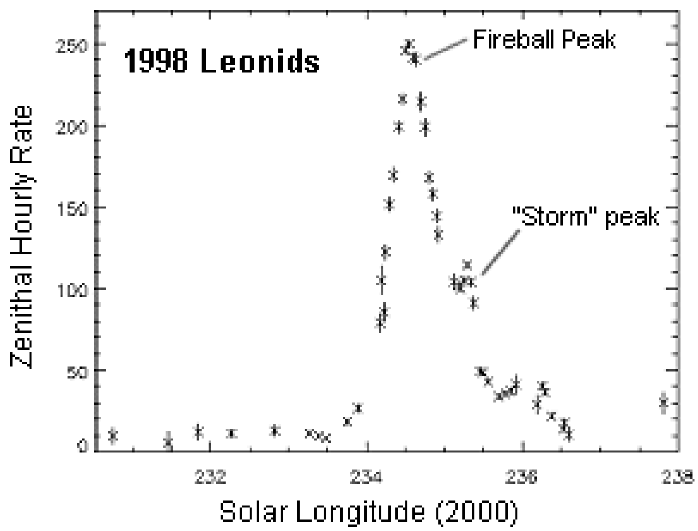
Parents and Educators: Please visit Thursday's Classroom for lesson plans and activities related to this story.

Every 33 years something special happens. Comet Tempel-Tuttle swings through the inner solar system and brings a dense cloud of debris with it. For 3 or 4 years after its passage the Leonids can be very active. In 1966 for instance, over 100,000 meteors per hour were seen from parts of North America.

Curiously, there isn't a full-fledged storm every time Tempel-Tuttle passes by. Sometimes there's simply a stronger-than-average shower. Sometimes nothing happens at all!

Will there be a storm in 1999? (Probably, yes.)

Tempel-Tuttle visited the inner solar system most recently in late 1997 and early 1998. The subsequent Leonids display, in Nov. 1998, was marvelous as observers all over the world were treated to a dazzling display of fireballs (shooting stars with magnitudes brighter than -3). Nevertheless, the 1998 Leonids were a shower, not a storm. The maximum rate of meteors last year was about 250 per hour. Scientists have learned that if Earth crosses the orbit of Tempel-Tuttle *too soon* after the comets passage, then there is no storm, just a strong shower. Apparently that's what happened in 1998. In recent history no Leonid storm has ever occurred less than 300 days after Tempel-Tuttle passed by Earth's orbit. In 1998, Earth followed the comet to the orbit-crossing point by only 257 days [ref].



The period of maximum activity during the 1998 Leonid shower took place about 12 hours before the earth crossed Tempel-Tuttle's orbital plane. The early activity caught many observers by surprise, but it was business as usual for the unpredictable Leonids. Rainer Arlt of the International Meteor Organization noted that while the maximum activity came early, there was a secondary maximum when the Earth passed the comet's orbit (see left). This pattern is similar to that observed in 1965, the year that preceded the great Leonids storm of 1966. In his report, Bulletin 13 of the International Leonid Watch: The 1998 Leonid Meteor Shower, Arlt wrote:

> *[T]he radar, visual, and photographic records of the 1965 Leonids indicate an activity profile which resembles that of the 1998 Leonids. Even the low population index seems comparable. Judging from these phenomenological facts, we may expect 1999 to show a similar shape of activity as in 1966. The actual maximum meteor numbers are hardly predictable.* [ref].

Above: 1998 Leonids activity based on visual records from 217 observers who saw more than 47,000 Leonids in 858 observing hours. The vertical axis is the "zenithal hourly rate" of visual meteors, or the hourly rate of meteors an observer would witness under ideal conditions with the meteors appearing directly overhead. The horizontal axis is the solar longitude of Earth, and may also be regarded as time increasing from left to right. The "Fireball peak" corresponds to the impressive fireball display of Nov. 17, 1998. The smaller "Storm peak" occurred approximately 12 hours later just as Earth was crossing the orbital plane of Tempel-Tuttle. Credit: The International Meteor Organization.

If the 1999 Leonids are anything like the 1966 storm, stargazers are definitely in for a treat. The 1966 event was, predictably, somewhat unexpected. The comet had passed by Earth's orbit in 1965, so astronomers were aware that something might happen. But, judging by the paucity of the 1899 and 1932 showers, it was widely thought that the orbit of the debris stream had been deflected so much by gravitational encounters with other planets (mainly Jupiter) that a close encounter with Earth's orbit was no longer possible. The best predictions suggested a strong shower over Western Europe with 100 or so meteors per hour.

Instead, there was an stunning display of shooting stars over western North America. This recollection by James Young at JPL's Table Mountain Observatory in California gives a sense of what the storm was like:

> *"This very noteworthy [1966] meteor shower was nearly missed altogether... There were 2-5 meteors seen every second as we scrambled to set up the only two cameras we had, as no real preparations had been made for any observations or photography. The shower was expected to occur over the European continent.*
>
> *The shower peaked around 4 a.m., with some 50 meteors falling per second. We all felt like we needed to put on 'hard hats'! The sky was absolutely full of meteors...a sight never imagined ... and never seen since! To further understand the sheer intensity of this event, we blinked our eyes open for the same time we normally blink them closed, and saw the entire sky full of streaks ... everywhere!"*

The 1966 return of the Leonids was one of the greatest displays in history, with a maximum rate of 2400 meteors per minute or 144,000 per hour.

Joe Rao, a Leonids expert who lectures at New York's Hayden Planetarium, also advocates 1999 as possibly the best year for a storm during this 33 year cycle. Writing for Sky &Telescope he says:

> *Based on what happened last November, I will venture a prediction. If a meteor storm is to take place at all, 1999 would appear to be the most likely year for it to happen. But even if this year's Leonids are richer in number, observers should not expect the same high proportion of fireballs that were seen in 1998. Instead, a more even mix of bright and faint meteors is likely.* [ref]

Rao bases his argument on historical precedent and the Earth-comet geometry. During the seven most recent Leonid storms when Earth crossed Tempel-Tuttle's orbit soon after the comet, the average distance between the comet and Earth was 0.0068 astronomical unit. The average number of days between the comet's passage and the Earth's arrival at the plane of the comet's orbit was 602.8 days. With the 1999 values of 0.0080 AU and 622.5 days, Rao says we ought to be in a prime position to see significant, if not storm-level, activity.

Rao is also a meteorologist for News 12 Westchester, which seems a suitable occupation for predicting meteor showers.

Recent Headlines

December 3: Mars Polar Lander nears touchdown

December 2: What next, Leonids?

November 30: Polar Lander Mission Overview

November 30: Learning how to make a clean sweep in space

In 1999, the Earth will pass nearly three times as far from the comet's orbital path as it did in 1966 and more than six times farther than it did during the great storm of 1833. If the peak of the Leonids arrives exactly when the Earth passes through the comet's orbital plane, Donald Yeomans of JPL gives 01:48 UT on November 18, 1999 as the most likely time for the 1999 maximum [ref]. That would make Europe and West Africa the best places to watch the show. However, Leonid meteor showers frequently arrive much earlier or later than predicted, so any place on the globe could be favored.

If the peak of the Leonids occurs over Europe or the Atlantic Ocean, then observers in the USA could be in for an unusual treat. The Leonid radiant would just be rising over North America at the time. In the eastern US sky watchers would see a large number of earth-grazing meteors skimming horizontally through the upper atmosphere. "Earth grazers" are typically long and dramatic, streaking far across the sky.

To look or not to look, that is the question

> *All sorts of conjectures were made by all sorts of people ... We may learn of this that, when*

men are in a high state of excitement, their testimony must be taken with many grains of allowance.

From a first-hand account of the 1833 Leonid Meteor Shower. by Elder Samuel Rogers

Most experts agree that 1999 is the most likely year for a Leonids meteor storm during the current 33 year cycle. However, if 1999 turns out to be a disappointment, don't despair! There are other studies that suggest 2000, 2001 or even 2002 could be better years. The Leonids are simply hard to forecast.

If 1999 is the year, when should you look? Most experts predict that the Leonids peak will occur between 0100 and 0400 Universal Time on November 18th. However, it is important to remember that such predictions are always uncertain. The 1998 Leonid fireball display occurred nearly 16 hours before the predicted maximum! No matter where on Earth you live, the morning of November 18 will probably be the best time to look for Leonids in 1999. This is true even if morning where you live occurs much earlier or later than 0100-0400 UT.

Conventional wisdom says that meteor observing is always best between midnight and dawn local time on the date of the shower (November 18 in this case). For a shower or storm like the Leonids that might be relatively brief, it is best to start watching no later than midnight. In fact, when the author of this story went outside last year at midnight to view the 1998 Leonids, the shower was already well underway! With this in mind you may decide it's a good idea to begin observing even earlier, say, 10 p.m. on November 17.

In the coming weeks Science@NASA will post more stories about the Leonids with observing tips for meteor watching with the naked eye, video cameras and other types of recording devices. One thing seems sure, no matter where you live: The Leonids are coming and, on Nov 18, 1999 the place to be is outside, looking up!

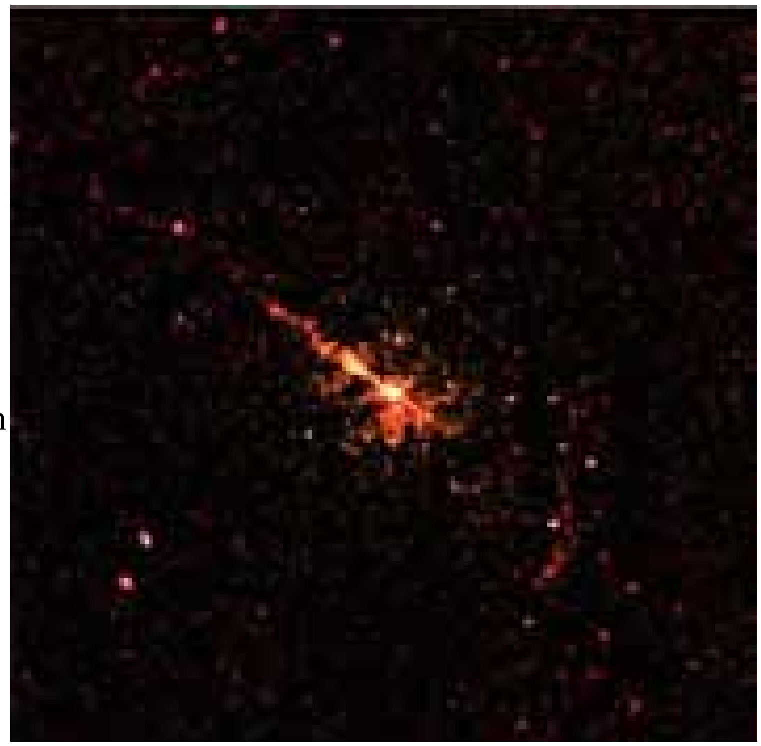
Chandra Spies Structure of Huge X-Ray Jets

Extended X-Ray Jet in Nearby Galaxy Reveals Energy Source

BASED ON A NASA/MSFC PRESS RELEASE

October 26, 1999: NASA's Chandra X-ray Observatory has made an extraordinary image of Centaurus A, a nearby galaxy noted for its explosive activity. The image shows X-ray jets erupting from the center of the galaxy over a distance of 25,000 light years. Also detected are a group of X-ray sources clustered around the nucleus, which is believed to harbor a supermassive black hole. The X-ray jets and the cluster of sources may be a byproduct of a titanic collision between galaxies several hundred million years ago.



Right: Centaurus A as viewed from the Chandra X-Ray Observatory shows two x-ray jets extending from a galactic center thought to be home to a huge black hole at the center. The image links to a 540x533-pixel, 138 KB JPG. Or, click here for a 2250x2221-pixel, 3.6MB TIFF. Image credit: NASA and Chandra Science Center

"This image is great," said Dr. Ethan Schreier of the Space Telescope Science Institute, "For twenty years we have been trying to understand what produced the X rays seen in the Centaurus A jet. Now we at last know that the X-ray emission is produced by extremely high energy electrons spiraling around a magnetic field." Schreier explained that the length and shape of the X-ray jet pinned down the source of the radiation. The entire length of the X-ray jet is comparable to the diameter of the Milky Way Galaxy.

Other features of the image excite scientists. "Besides the jets, one of the first things I noticed about the image was the new population of sources in the center of the galaxy," said Dr. Christine Jones from the Harvard-Smithsonian Center for Astrophysics. "They are grouped in a sphere around the nucleus, which must be telling us something very fundamental about how the galaxy, and the supermassive black hole in the center, were formed."

Above: Centaurus A as viewed in four different spectra. The brilliant jet so visible in the x-ray is perpendicular to the apparent plane of the galaxy in visible or infrared. See the Chandra X-Ray Observatory Center's *What Do These Images Tell Us* page for more information.

Astronomers have accumulated evidence with optical and infrared telescopes that Centaurus A collided with a small spiral galaxy several hundred million years ago. This collision is believed to have triggered a burst of star formation and supplied gas to fuel the activity of the central black hole.

According to Dr. Giuseppina Fabbiano, of Harvard-Smithsonian, "The Chandra image is like having a whole new laboratory to work in. Now we can see the main jet, the counter jet, and the extension of the jets beyond the galaxy. It is gorgeous in the detail it reveals," she said.

Dr. Allyn Tennnant of NASA's Marshall Space Flight Center agreed. "It's incredible, being able to see all that structure in the jet," he said. "We have one fine X-ray telescope."

Indeed at a distance of eleven million light years from Earth, Centaurus A has long been a favorite target of astronomers because it is the nearest example of a class of galaxies called active galaxies. Active galaxies are noted for their explosive activity, which is presumed to be due to a supermassive black hole in their center. The energy output due to the huge central black hole can in many cases affect the appearance of the entire galaxy.

The Chandra X-ray image of Centaurus A, made with the High Resolution Camera, shows a bright source in the nucleus of the galaxy at the location of the suspected supermassive black hole. The bright jet extending out from the nucleus to the upper left is due to explosive activity around the black hole that ejects matter at high speeds from the vicinity of the black hole. A "counter jet" extending to the lower right can also be seen. This jet is probably pointing away from us, which accounts for its faint appearance.

One of the most intriguing features of supermassive black holes is that they do not suck up all the matter that falls within their sphere of influence. Some of the matter falls inexorably toward the black hole, and some explodes away from the black hole in high-energy jets that move at near the speed of light. The presence of bright X-ray jets in the Chandra image means that electric fields are continually accelerating electrons to extremely high energies over enormous distances. Exactly how this happens is a major puzzle that Chandra may help to solve.

Dr. Stephen Murray of the Harvard-Smithsonian Center for Astrophysics is the principal investigator for the High Resolution Camera. NASA's Marshall Space Flight Center in Huntsville, AL, manages the Chandra program. TRW, Inc., Redondo Beach, CA, is the prime contractor for the spacecraft. The Smithsonian's Chandra X-ray Center controls science and flight operations from Cambridge, MA.

Postmortems in the Sky

Gamma Ray Bursts are part of the evidence, but what is the cause?

October 25, 1999: While it's not quite Halloween, a radio astronomer struck that chord when he described astrophysicists' fascination with gamma-ray bursts.

"We're interested in dead and dying things," said Dr. Dale Frail of the National Radio Astronomy Observatory in Socorro, N.M. "Our highest ambition is to know who that dying thing is."

Frail spoke during the third day of the week-long Fifth biennial Huntsville Gamma Ray Burst Symposium. Gamma-ray bursts are mysterious flashes of high-energy radiation that come from the edge of the observable universe. Since their discovery by gamma-ray detectors designed to watch for nuclear weapons tests in space, scientists have tried to find counterparts in other parts of the spectrum so they might figure out what causes the bursts.

Astrophysicists engage in "forensic science," Frail said, when they study gamma-ray bursts because they look at the remains without having ever seen the victim alive. Frail works in radio astronomy, the end of the spectrum that comes into play when the "corpse is cold and still," volunteered one member of the audience. By comparison, scientists using instruments like the Burst and Transient Source Experiment (BATSE) are "interested in hearing the death rattle," Frail joked.

The death rattles as detected in various parts of the electromagnetic spectrum are all anyone can examine so far in the bid to uncover what causes such horrible deaths out at the edges of the known universe.

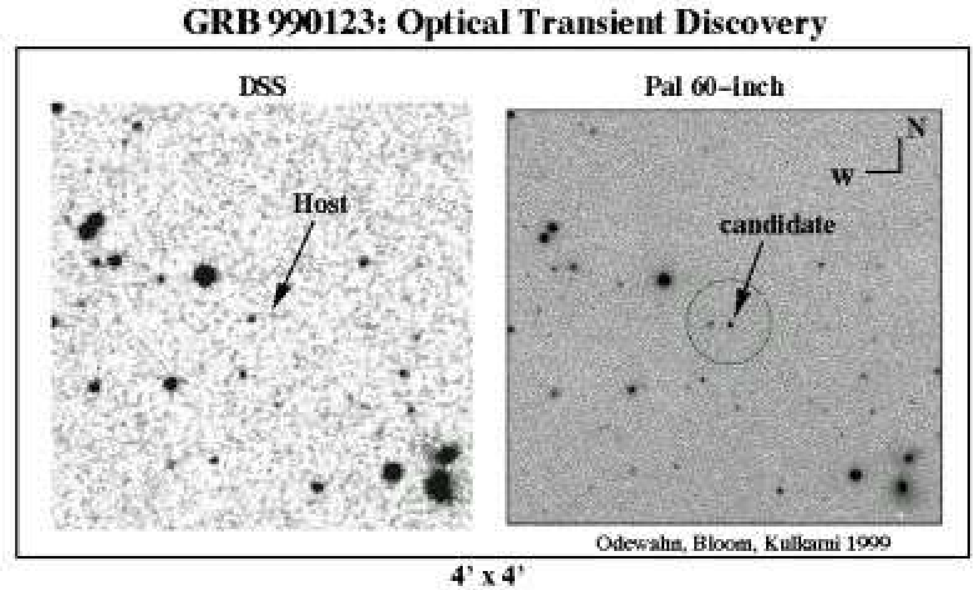
November 30: Learning how to make a clean sweep in space

The death rattle and last gasp are mostly what scientists have to go on since it's impossible to bring major observatories to bear on a burst as it occurs, and far too much to hope that a telescope will be observing something when a burst happens to go off nearby. While BATSE and a few other instruments can record the gamma-ray flash of a burst, the rest of the astronomy community have to work with the afterglow - if a counterpart is found in other parts of the spectrum - which can last hours or a year.



Left: These are the discovery images of the optical afterglow emission from GRB 990123. The left panel shows the star field as it appeared prior to the explosive gamma-ray burst. A faint galaxy, indicated with an arrow, was originally proposed to contain the gamma-ray burst source. Now, however, the galaxy is thought to be in the foreground. The right panel shows the optical emission, observed about 4 hours after the gamma-ray burst on January 23, dominating the light from the faint galaxy. Credit: Dr. Stephen Odewahn/Caltech-NRAO-CARA GRB Collaboration.

Frail believes that radio emissions from the afterglow provide unique information on the burst environment and the burst progenitor itself. Using the radio telescopes in Socorro and other institutions, he has looked for radio counterparts in bursts where optical or X-ray counterparts were found. In some cases, they were seen in radio and X-rays, but not visible light.

"I believe that we are seeing a class of events that are optically dark (because) they are obscured by dust in the areas where the gamma-ray bursts exploded," he said. The observations have provided a powerful test of models of fireballs that expand outward from bursts.

Afterglows are also seen in visible and near-visible wavelengths and continue to be among the most valued because they help scientists in trying to locate the hosts of bursts. A total of 14 have been observed with the Hubble Space Telescope and point very strongly to a home for bursts.

"In every case, the gamma-ray burst is right on top of the stellar field," said Dr. Andrew Fruchter of the Space Telescope Science Institute in Baltimore. "It is not in the open where you find gaps" between galaxies near the edge of the observable universe.

Further, many of the bursts are associated with blue galaxies, which are observed to have high rates of star birth.

"All of these things are consistent with star formation," Fruchter said.

In many cases, the optical afterglow components are barely visible to Hubble, despite its incredible light gathering power. GRB 970228 (the numbers are the date of the burst) is the landmark sighting because it was the first optical component to be captured in visible light. When Hubble was able to look at it some weeks later, scientists saw "a small smudge in the sky," a dwarf galaxy with the fading embers of the burst.

Gamma-ray Bursters cross the 'Line of Death' - Oct. 13, 1998. A study of gamma-ray burst spectra shows one more thing that these mysterious, cosmological gamma-ray bursts are not. Blast from the past: the latest clue in solving the gamma-ray burst mystery (May 6, 1998). Gamma-ray burst identification earns top prize (Jan. 12, 1998) Twinkle, twinkle, massive fireball - reports from the 4th Huntsville Gamma-ray Burst Symposium (Sept. 17, 1997) Discovery may be "smoking gun" in gamma-ray mystery (March 31, 1997).

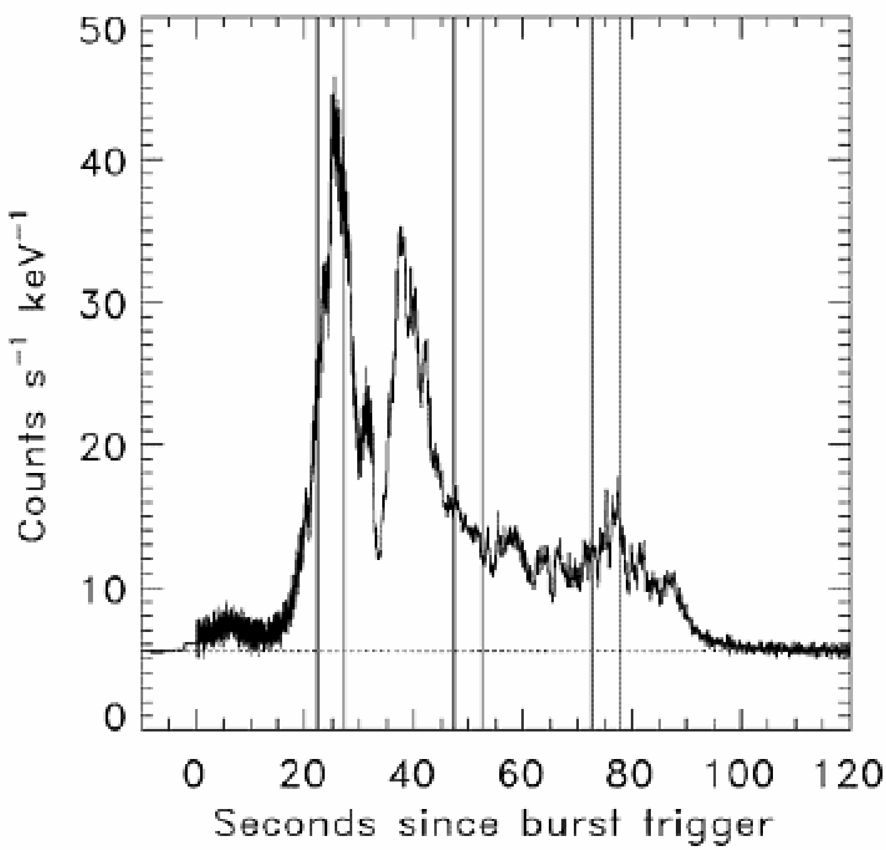
In several cases, Hubble's resolution and its ability to distinguish colors have allowed scientists to pick out burst afterglows and barely observable host galaxies. Fruchter described one irregular galaxy as "having the morphology of a train wreck."

Back in the radio end of the spectrum, Dr. Shri Kulkarni of the California Institute of Technology outlined evidence from radio astronomy and other fields that support two leading theories of what causes bursts. One is that two neutron stars coalesce to form a black hole, the other is that a massive supernova or "collapsar" explodes and also forms a black hole.

"It's like when people discovered supernovae," Kulkarni said. "People didn't know what they were, but eventually they figured it out." Supernovae now are known to be massive stars that blow themselves out with a great fury after a short but brilliant life.

Kulkarni said that there is "strong indirect evidence connecting [bursts] to massive stars in dusty hosts or with dust along the line of sight."

Whatever the cause, it is followed by an intense blast wave as the materials move outward from the source through interstellar space. But even then scientists are still puzzling over exactly what they are seeing. Dr. Titus Galama, who recently joined CalTech after a long stay at the University of Amsterdam, described the different spectra recorded for the famous burst of Jan. 23, 1999 (GRB 990123). The Robotic Optical Transient Search Experiment (ROTSE) caught this burst in optical wavelengths within seconds of its detection by BATSE.



The burst was brilliant enough that had it been in the nearby M31 galaxy in Andromeda, it would have appeared as bright as the full moon. But despite having ROTSE and BATSE data that overlap in time, "there is no simple relationship between ROTSE's observations and BATSE." Galama said. He showed a graph with data from both instruments. The ends of data lines from BATSE and ROTSE did not point towards each other to indicate that one was a continuation of the other.

Left: This figure shows the how the brightness in gamma rays, as observed with BATSE, varied during GRB 990123. The three intervals marked by vertical lines indicate the times during which ROTSE obtained its first three visible images. Credit: Dr. Michael Briggs, NASA/Marshall.

"The prompt optical emission is not a simple extrapolation of the BATSE data to lower wavelengths," Galama said, "so we conclude that ROTSE and BATSE are seeing different components."

He suggested that BATSE sees gamma rays produced by internal shock waves as the exploding gas interacts with itself. The optical or visible part is caused by the external shock wave blazing forward through space and ramming into whatever dust and gas are there. Since that material can vary: some regions like the Coal Sack Nebula are so dense that the absorb light from stars and galaxies behind them, others are empty "superbubbles" swept clean by previous star explosions.

Finally, a late afterglow appears in gamma rays as the external shock wave causes reverse shocks within the expanding explosion. This appears in gamma rays as a smooth tail whose high spot early in the blast is masked by the blast itself.

But again in the spirit of Halloween, gamma-ray bursts can wear different masks, and not every one follows this basic model.

"To a first order," Galama concluded, "we have excellent agreement with the fireball model. But we have some oddities to investigate."

1999 GRB Symposium series

Oct 25: Postmortems in the Sky To say they are ghoulish may be going too far, but like ghouls those studying Gamma Ray Bursts gleefully seek the moldering remains, and never see the living victim. But they are very much interested in both the victim and the cause.

Now Updated - I haven't gotten to all the old link addy's yet but I've gotten quite a few checked out and corrected. Plus some new links.

Lightning Strike Survivor's Resource Page

Welcome to The Lightning Strike Survivor's Resource Page.

My name is Christine Fram. I am a survivor of a lightning strike. On August 6,1997 I was struck by lightning while on the job. I live in Vancouver, British Columbia, Canada.

In Canada, every year lightning kills about seven people and seriously injures 60 to 70 others.

I created this page to provide a way to contact other survivors, and for education, to make available accurate information and links to resources that can help us educate ourselves, our doctors, our famillies and our friends.

ESSENTIAL LIGHTNING LINKS

My goal is to make this an effective page of Lightning Survivor Resources and to provide an on-line email based support list, where survivors and anyone whose life has been altered by a lightning strike can share, inform, help and support one another. Do you know: 500-600 people a year are struck by lightning in North America? 70% of those people survive.

THE LIGHTNING STRIKE SURVIVOR'S ON-LINE EMAIL SUPPORT LIST

The Lightning Strike Survivor List (LSSL) is an on-line email support group whose members have been affected by Lightning. This includes: survivors, survivors families, caregivers, doctors, People involved in safety issues, and many more. People who want to help and people who need/want to share with others who understand because they've been there.

Do you need a way to communicate with people who know exactly what you're going through and want to offer their emotional support? Are you someone who wants to share your experience, strength and hope?

Some survivors have said it has helped end feelings of loneliness and isolation, others have said it has helped them create hope and goodness from sadness and injury.

My mission for the LSSL is to encourage survivors to help each other by sharing the resources (health, medical, insurance, LS&ESSI etc.) they have found during their journey towards recovery and by sharing their own experiences and feelings.

I invite you to join the Lightning Strike Survivor's List.

It's easy to do. Just enter your email address in the form below and click join. The subscription will have to be approved by a list manager (either myself or Becky). When we receive the subscription request, you will be sent a brief email asking if you understand what the list is. This is just to prevent subscriptions from people who mistakenly subscribe. It is not meant in any way to qualify or disqualify anyone from joining.

More lightning news from inside hurricanes and tornadoes

News shorts from the Atmospheric Electricity Conference

June 16, 1999

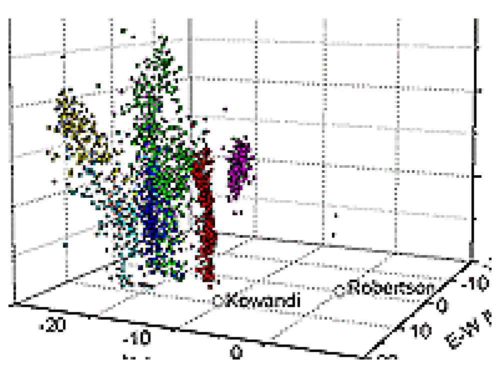
One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

Interference makes for 3D images

Several research teams are developing instruments that allow them to make three-dimensional maps of lightning structure within a storm. One method is to use multiple receivers to measure differences in the arrival times of the radio impulses. Zen Kawasaki of Osaka University in Japan has developed a method that uses differences in the phases of the radio waves as they arrive.

Kawasaki employs two wide-band interferometers. These are radio receivers with four antennas and electronics arranged so the arriving radio waves interfere with each other. This allows the receiver to calculate the direction of the radio pulse coming from a lightning stroke. With two stations set up about 23 km (13.8 mi) from each other, a researcher can determine the origin of a radio pulse.

The two methods are complementary. Paul Khreibel at New Mexico Institute of Mining Technology said his time-of-arrival system is better for three-dimensional and total activity studies, while interferometers like Kawasaki's are better for studying electrification channels within storms.



Kawasaki explained that the interferometers allowed his team to reconstruct the lightning leader's progression as it moved through the cloud before releasing a negatively charged cloud-to-ground flash. He found that the first leader moved at about 100 km/s (about 223,000 mph), but subsequent leaders blasted through at 10,000 km/s (more than 2 million mph).

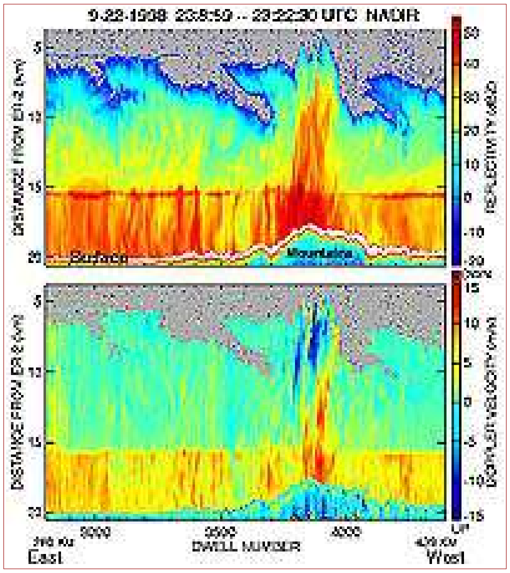
Left: A 3D plot of lightning during a storm, Nov. 20, 1996, over northwest Australia. Links to 512x384-pixel, 26KB GIF. Credit: Osaka University.

"We can clearly get three-dimensional images of the lightning leader," Kawasaki said.

Kawasaki and his researchers tested the system in two field campaigns during the monsoon season in late summer 1996, 1997, and 1998 off Darwin, Australia.

Kawasaki said his team is working on a more sensitive narrow-band interferometer, too. The current narrow-band system has a sensitivity of 1 microsecond (1 million per second). The narrow-band model being developed will take even faster samples, once every 10 nanoseconds (100 million per second).

"With the narrow-band interferometer, we can see positively charged cloud-to-ground flashes," Kawasaki said. "But, they are the negative leader activity."



Hurricane lightning is muted

A hurricane research campaign in 1998 showed that hurricanes typically don't produce much lightning, but sometimes they can.

"What we want to know is why," said Monte Bateman of the Universities Space Research Association. "Some longtime hurricane pilots have reported that when a hurricane does produce lightning, intensification often follows."

Left: Doppler radar on the ER-2 showed an intense updraft as hurricane Georges moved over the island of Hispaniola. Credit: NASA. Links to 126KB jpeg image.

Recent Headlines

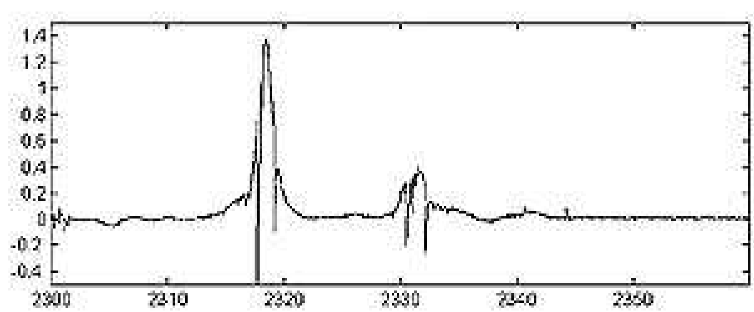
November 30: Polar Lander Mission Overview
November 30: Learning how to make a clean sweep in space

The third Convection and Moisture Experiment (CAMEX 3) in August and September 1998 focused a number of ground, airborne, and satellite instruments on hurricane activities in the western Atlantic Ocean, the Gulf of Mexico and on thunderstorms over Florida. One of the tools used in the campaign was the high-altitude ER-2 reconnaissance aircraft, equipped with eight lightning detectors among other instruments.

The ER-2 recorded only a few lightning flashes as it flew over the eye of hurricane Bonnie on Aug. 26.

Hurricane Georges was a different matter when it waded ashore and battered the island of Hispaniola on Sept. 22. Georges showed "nearly continuous lightning, in and around the eye," Bateman said. In addition, the ER-2 pilot reported seeing about one blue jet every minute for 30 minutes when he was flying over the hurricane. Blue jets are fascinating electrical events that rise from the cloud tops into the upper atmosphere. Their cause is not yet known.



Right: The lightning sensor instruments on the ER-2 showed only modest lightning activity as the aircraft made two passes near the eye of hurricane Georges. Still, this was much more active than what was seen in hurricane Bonnie over the ocean. Credit: NASA

Bateman said that the increased lightning around Georges' eye probably was due to air forced upward - called orographic forcing - when the hurricane hit the mountains. He added that the pilot reported the eye of the hurricane was stacked like a wedding cake over the mountain, rather than being the depressed structure normally seen over the oceans.

As impressive as the difference was, it is muted compared to a normal Florida thunderstorm. Bateman also showed a graph of an Aug. 15 storm that the ER-2 studied. Georges' lightning activity was about 10 times less than the lightning activity in a typical thunderstorm.

Getting up close and almost too personal with a tornado

Sign up for our EXPRESS SCIENCE NEWS delivery

Putting instruments in a tornado's path is far more exciting than what movie viewers saw depicted in the hit movie "Twister."

"We were only a few minutes ahead of it," explained Steve Hunyady, an instrumentation engineer at New Mexico Institute of Mining Technology, as he described dropping eight "turtles" outside Allison, Texas, as an F4 tornado approached on June 8, 1995.

The turtles are less attractive than the gold ornaments the actors released into a tornado in the movie. That level of miniaturization is a few years away. But Hunyady said that the turtles were able to provide valuable data about the electric fields around a tornado. Scientists would like to know what happens inside, since observers have reported some lightning and frequent electrical glows inside the vortex.

Each turtle weighs 60 pounds and can be held in place with spikes and lead weights, although when the Allison F4 was bearing down - "We were only a few minutes ahead of it" - the New Mexico Tech team just placed them on the roadside and hurried on to the next position.

"We built them strong so they could be lofted," which wind tunnel tests predicted would happen, but "we've never seen one move yet."

Each turtle contains an electric field meter, a pressure sensor in a small snorkel, a thermometer, and a clock, plus a small computer to store eight hours worth of data.

Fortune was with the researchers that day and the F4 moved almost exactly between two of the turtles. To the researchers surprise, they saw the electric field dipped, and no lightning as recorded.

Hunyady said that lack of electrical activity may be due to lofted debris reducing the electric field, or possibly to increased conductivity inside the tornado itself.

Soaking in atmospheric electricity

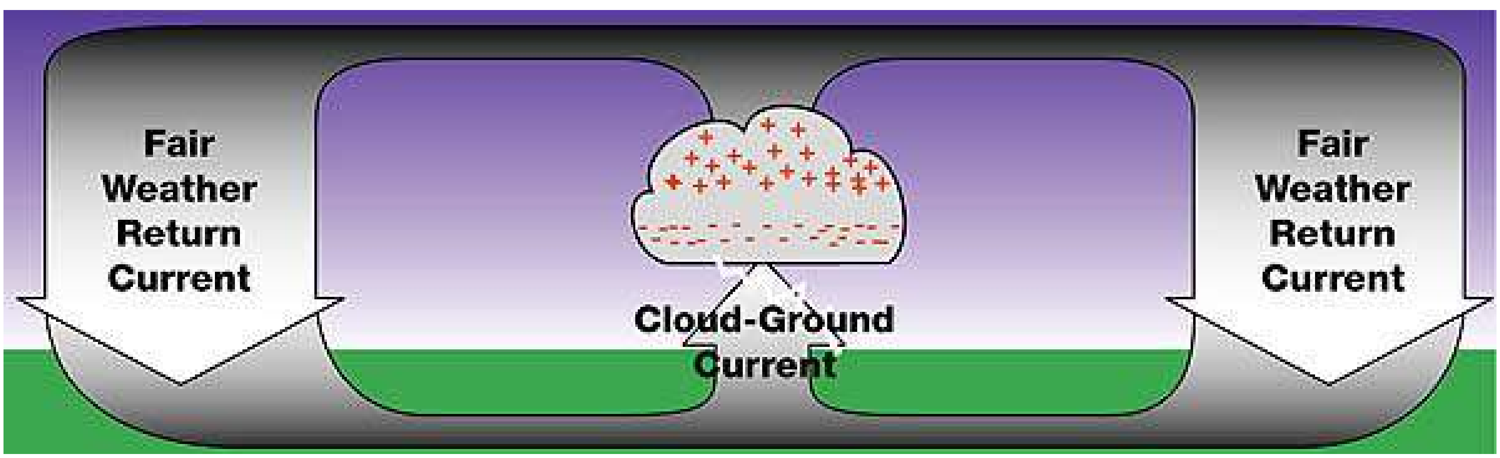
'Fair weather' measurements important to understanding thunderstorms

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

June 15, 1999: While experts advise you to stay indoors to avoid lightning, few will tell you that you can't escape it altogether. In fact you're soaking in the return path for all the thunderstorms taking place across the world. Fortunately, the voltage is modest and the current is almost nothing, so the effect is almost impossible to measure.

"Fair weather electricity deals with the electric field and the electrical current in the atmosphere, and the conductivity of the air," explained Dr. Lothar Ruhnke of Airborne Research Associates in Weston, Mass. He recently retired from the Naval Research Laboratory but continues "doing research for fun."

The discovery of the fair weather circuit followed Ben Franklin's demonstration that lightning is caused by electricity. (Would-be experimenters take heed: Old Ben was exceptionally lucky. Others replicating his experiment have been killed, so don't try it.) Later experimenters showed that clear, calm air carries an electrical current which, it turns out is the return path for the electrical display we know as lightning.



Above: Diagram shows fair weather "circuit," showing normal potential between the ground and atmosphere. credit: NASA/MSFC (Dooling)

Its importance is noted by the title of the International Conference on Atmospheric Electricity. Much of it has focused on lightning and its effects. Thursday morning's session, co-chaired by Ruhnke, however, dealt with fair weather electricity.

Atmospheric electricity is like a massive photographic flash. An electrical charge is built up, a switch is closed, and electrons barge across a gas, ionizing it and producing light. But a flash is a complete circuit. In the case of the Earth, Ruhnke explained, the atmosphere completes the circuit.

Thunderstorm charge generation happens inside clouds. Current flows out of the tops of clouds - blue jets and red sprites may play a role - and connects with the upper atmosphere and the ionosphere. Ultimately, the current returns to Earth through the clear atmosphere. Because it's diffused over most of the globe, it's also quite weak at any given point.

"All three values are very difficult to measure," Ruhnke said. The current is 10^{-12} amps per square meter - "almost nothing." The field is about 100 volts per meter, meaning that the electric potential increases by about 200 volts from the ground to the top of Michael Jordan's head when he's standing still. Finally, air is an excellent insulator, so its conductivity is close to zero.

November 30: Learning how to make a clean sweep in space

"Because of all this, you don't feel anything," Ruhnke said. Even though you're standing in an electric field, your hair does not stand on end. (If you were outdoors, and it did, it would mean you're about to be hit by lightning, so tuck into a tight crouch right away.)

"When you measure the fair weather electric field, you're measuring the effects of all the thunderstorms on the Earth," he said.

But it's not evenly felt. Ruhnke said that scientists once thought the effect was evenly spread across the planet, so a measurement in Tokyo was as good as one in Kansas. It turns out that local turbulence, winds, and other fluctuations also cause small variations in the fair weather electric field.

"It's a great challenge to sort out local variations and sources from thunderstorms," Ruhnke continued. "If you could separate these effects, you could monitor the total thunderstorm activity locally."

Such a measure is important to various environmental studies, including the production of nitrous oxides (NO_x), so the relative natural and industrial

contributions can be measured.

Another is global warming. Ruhnke noted that Ralph Markson, a colleague at Airborne Research, examined 45 years of fair weather data taken by balloons from the surface of the Earth to the stratosphere. One of the factors that affects the existence of thunderstorms in the atmosphere is temperature.

"If there is any global warming, you should see an increase in thunderstorms and the electric field," Ruhnke said. "Markson sees no changes in the ionospheric potential." Because of variations in instruments, the growth of cities, and other effects, Ruhnke said that direct measures of global warming are quite difficult.

"People are looking for indirect methods," he continued "The fair weather field is one."

Left: Thunderstorm at sunset near Abilene, Texas, May 17, 1978. Even without lightning, there's electricity in the air, although it's so weak that scientists have difficulty measuring it. (NOAA)

The fair weather field also becomes a sensor for air pollution, he noted, because aerosols - droplets and dust particles - attract and effectively neutralize ions.

He has recorded the difference in the air of Greenland and Antarctica where, 30 years ago, it was "nearly perfect" as shown by its ion content. "Now the air is fairly polluted around the globe."

In 1996, the first-ever coordinated simultaneous measurements were made for two days over Darwin, Australia, and Weston, Mass., - opposite sides of the world - to demonstrate that a single reliable measurement can be globally representative.

Ruhnke noted that fair weather conditions also are affected by the magnetosphere in the polar regions where the Earth's magnetic field leaves the upper atmosphere exposed to space. While many people have tried to link solar activity to terrestrial weather, he noted that no conclusive link has been found.

Lightning position in storm may circle strongest updrafts

New finding could help in predicting hail, tornadoes

June 11, 1999: While lightning is one of the most dangerous aspects of severe storms, it appears that inside the storm lightning itself avoids the most violent regions. This finding has implications for tracking where tornadoes are likely to form and where large hail may fall.

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

"This can be a monitor of severe storm intensity, another tool to monitor when storms might produce tornadoes or hail," said James Dye, a researcher at the National Center for Atmospheric Research in Boulder, Colorado. Dye spoke this week at the International Conference on Atmospheric Electricity.

Above: Time-lapse photography captures multiple cloud-to-ground lightning strokes During a night thunderstorm over Norman, Oklahoma, March, 1978. (C. Clark, NOAA)

Lightning has long been associated with convection in storms. At a simple level, the charging mechanism is similar to shuffling across the carpet on a cold winter day, then touching a door knob. The friction between your feet and the rug builds a static electric charge that you carry until you touch something grounded. Inside thunderstorms, the mechanism which separates charges is collisions between growing snow pellets and numerous ice particles.

Recent Headlines
December 3: Mars Polar Lander nears touchdown
December 2: What next, Leonids?
November 30: Polar Lander Mission Overview
November 30: Learning how to make a clean sweep in space

But storms still conceal a number of surprises in many elaborations and variations on that simple description. Dye said that scientists now are learning that the most energetic storms are prolific sources of intracloud lightning. Intracloud lightning, though obscured by the clouds, may provide another tool for monitoring severe storms.

Dye's findings come from the Stratospheric-Tropospheric Experiment: Radiation,

Aerosols and Ozone (STERAO) Deep Convection experiment in northeast Colorado in June and July 1996. He used data from a French radio interferometer that collected five hours of uninterrupted observations of the locations of lightning within two major electrical storms, and from Doppler radar that shows wind direction and speed within a storm. Combining the two data sets showed where lightning was relative to updrafts and downdrafts.

Left, Above: The main reflector for a Doppler radar, one of the principal tools for peering inside severe storms. (NSSL/NOAA)

"It seems that lightning channels themselves are not in the most intense updrafts," Dye explained, "but in the weaker updrafts and downdrafts." This would seem to go against expectation. But while the lightning avoided the updraft cores, it became more frequent around the cores as the storm grew stronger.

Dye said that storms with updrafts at speeds less than 5 meters/second (about 11 mph) produce little or no lightning. Storms with updrafts of 10 to 20 meters/second (22 to 44 mph) might have flash rates of 5 to 20 strikes per minute. At more than 40 meters/second (90 mph or more), things get busy and the flash rate goes to 1 per second or more.

Dye says no one knows sure why, but the answer probably lies in the microphysics of ice and hail formation, the separation of charges as these bodies grow and move past each other, and how they are transported inside the storms by vertical and horizontal winds.

The French interferometer is one of several systems that have been developed in recent years to give scientists an inside view of lightning in storms. Cloud-to-ground strikes across the United States can be recorded by the National Lightning Detection Network. But intracloud strikes in local storms can be recorded only by the Lightning Detection and Ranging system at Kennedy Space Center and the Lightning Mapping System at the New Mexico Institute of Mining and Technology. Also, when they are overhead at the right time the Lightning Imaging Sensor and the Optical Transient Detector, both in orbit, can count lightning from above the clouds.

An exciting addition to this new suite of research tools would be a satellite-borne Lightning Mapping Sensor, under study at the Global Hydrology and Climate Center, that would observe the Earth continually from geostationary orbit.

"This would provide much more information in terms of intracloud strikes," he said. "It could be an additional forecasting and nowcasting tool" for meteorologists watching severe storms.

Dye cautioned that his and other results are not conclusive yet, but "they're highly suggestive and promising, but we have more work to do."

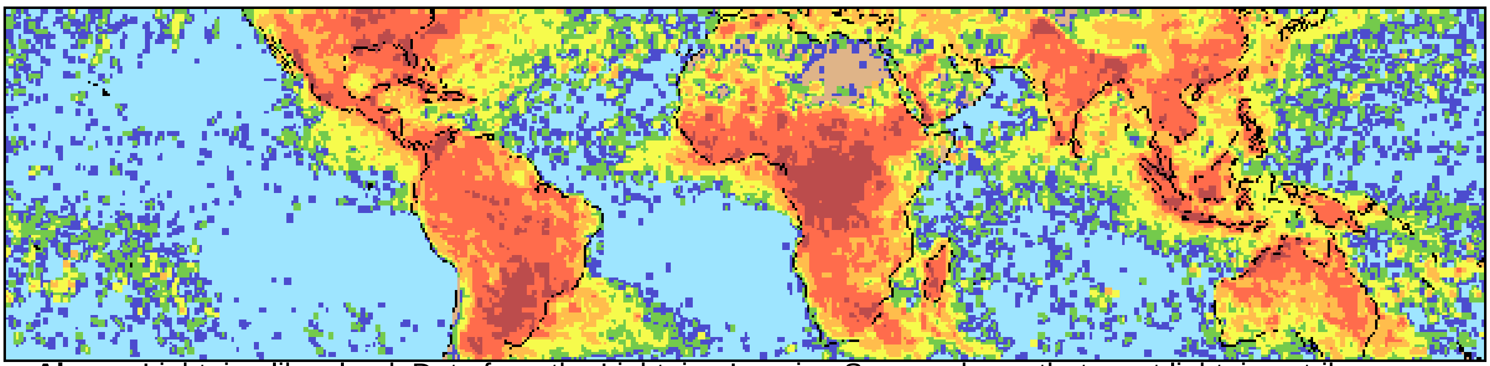
Lightning follows the Sun

Space imaging team discovers unexpected preferences

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

June 10, 1999: Lightning not only likes land, it follows the sun, and may even change its schedule to follow the El Niño/Southern Oscillation phenomenon.

"We've been watching the global distribution and established a picture of how it changes as a function of time of day, season, and even from year to year," said Dr. Hugh Christian of the Global Hydrology and Climate Center in Huntsville, Alabama. Christian is the principal investigator for the Lightning Imaging Sensor (LIS) on the Tropical Rainfall Measuring Mission, and its predecessor, the Optical Transient Detector (OTD) on Microlab 1.

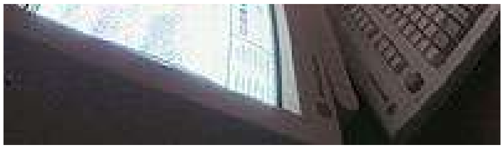


Above: Lightning likes land: Data from the Lightning Imaging Sensor shows that most lightning strikes occur over land where the ground can warm the air more effectively. This map covers the latitudes 35 deg. N to 35 deg S overflown by the Tropical Rainfall Measuring Mission carrying the LIS. Links to 937x224-pixel, 37KB GIF. (NASA/GHCC)

They provide a view of lightning from above the cloud tops, thus revealing the large percentage of cloud-to-cloud and intracloud flashes that cannot be seen from the ground. LIS and OTD both register the time of a lightning flash and its location within the instrument's field of view. This is then overlaid with weather pictures and other data so scientists can track the locations and frequency of lightning and how it corresponds with other weather phenomena.

Since their launches - OTD four years ago and LIS 18 months ago - Christian and his team have generated several maps showing global lightning patterns.

Left: At the Global Hydrology and Climate Center in Huntsville, Ala., Hugh Christian (foreground), Steve Goodman and Richard Blakeslee (background) monitor data from the Lightning Imaging Sensor aboard the Tropical Rainfall Measuring Mission. (NASA)



"Can we use lighting to monitor global change?" Christian said the team asked itself. "It does look like lightning is sensitive to changing weather patterns that evolve from year to year."

The first of these patterns to emerge was the discovery that lightning is more common in storms over land than over oceans. "It's probably a consequence of enhanced convection from increased warming over land." The LIS team announced its initial findings in 1998. Today, Christian will present expanded findings that buttress their claim.

Recent Headlines

December 3: Mars Polar Lander nears touchdown

December 2: What next, Leonids?

November 30: Polar Lander Mission Overview

November 30: Learning how to make a clean sweep in space

The team has also found that lightning prefers afternoons.

"Over land, we see tremendous diurnal changes, a strong peak in lightning in the afternoon over land," Christian continued. "Over water we see very little variation. We believe it's due to the land absorbing heat and causing strong convection. On the other hand, water can store a lot more heat, and releases it slowly."

Lightning patterns also vary from one season to the next.

"We see tremendous variations in extratropical regions," meaning areas north or south of the tropics of Cancer and Capricorn. "You see lightning activity truly following the sun. As summer in the northern hemisphere progresses, you see lightning moving farther north," Christian continued. "You see a similar pattern in the southern hemisphere, but not so pronounced because there isn't as much land outside the tropics."

Variations show up even from one year to the next. Christian said that data still being analyzed show hints that lightning patterns are influenced by El Niño and La Niña, a complementary variation in sea surface temperatures in the Pacific Ocean west of Peru. While this might be expected since El Niño can cause droughts and monsoon-like conditions, Christian said it also shows that global lightning patterns may be one way to take the pulse of the planet's weather trends.

It most certainly can be used on a small-scale, short-term basis to monitor the progress of storms.

"We can use lightning to monitor and study storms, including severe thunderstorms," Christian explained, since the lightning can only be generated by convection within a cloud system. "It's tightly coupled with the dynamics and physics of the storm. We use it to monitor its evolution and life."

As successful as OTD and LIS have been - and are expected to be over the next 1 year and 6 years (respectively) that they are expected to continue operating - they can only be used in research. Their view is limited to a small area directly under their satellites, so global or even regional monitoring is impossible.

To fill that role, Christian and his team are studying designs for a Lightning Mapping Sensor that would be placed aboard geostationary weather satellites. From 35,680 km (22,300 mi) up, the sensor could track severe activity and enhance meteorologists' warning capabilities.

Spirits of Another Sort

Thunderstorms Generate Elusive and Mysterious Sprites

June 10, 1999: For centuries, man has been transfixed by the spectacular lightning displays of thunderstorms. But after all those years of gazing at the sky, we never realized there was an equally amazing light show going on above the clouds.

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

In our own century, pilots reported seeing strange lights in the sky above thunderstorms. Low-light cameras on board airplanes and the Space Shuttle have recently made possible the documentation of sprites - quick red flashes of light that appear above storm clouds.

Dr. Dave Sentman of the University of Alaska, Fairbanks is one among a small group of researchers who have been studying these mysterious bursts of colored light. Although no one is sure what sprites really are or what causes them, these scientists have learned that sprites contain a great deal of energy.

"Although we're not yet certain, we suspect that the energies from sprites may be sufficient to drive some novel chemical reactions," said Sentman. "The region of the atmosphere where sprites appear typically doesn't contain a lot of energy, so the energy introduced from a sprite could do some really interesting things."

For instance, there is some speculation that sprites may create nitric oxide (NO) in the upper atmosphere. Nitric oxide destroys ozone, so sprites may have some impact on the Earth's protective ozone layer.

Left: A red sprite with blue tendrils extending downwards. Sprites are emitted near the tops of thunderclouds and reach up into the ionosphere (40-95 km range). Credit: University of Alaska, Fairbanks.

Sentman speculated on potential sprite-generated chemical reactions at the International Conference for Atmospheric Electricity. He's hoping to entice atmospheric chemists to look at sprites and their electro-chemical byproducts. Sentman also discussed the "energy budget" of sprites, which includes the electromagnetic emissions that sprites may give off and how that energy dissipates over time. Discovered because of their visible light emissions, sprites may also give off heat (infrared) and other forms of energy.

Night Sprite Flight

Last summer, Sentman and other scientists flew above the cloud cover at night to search for sprites. Scientists from the University of Alaska cooperated with the Air Force, the Naval Research Lab and NASA on this joint flight campaign. The scientific team looked at sprite emissions ranging from ultraviolet to visible to infrared. They also looked for gravity wave interactions, carbon dioxide emissions, and nitric oxide production. Using two ground stations - one in Colorado and one in Wyoming - scientists were able to triangulate sprites for stereoscopic views.

"We flew for a two week period during moon-down," said Sentman, referring to a time period when the moon is not in the night sky. "The moon is so bright, if you get it in the field of view it can burn out low-light cameras."

The brightness of sprites is about 500 to 1,000 kiloRayleighs. The cones in the retina, which see color, can barely perceive this light level. Because the more sensitive, achromatic rods of the eye permit night vision, they can see this low light level more easily. Rods are more numerous than cones in the periphery of the retina, so you can see sprites best when you're not looking directly at them.

But because Sentman was so close to the sprites, he saw them head on. To him, the sprites were as bright as the aurora borealis (the Northern Lights).

Left: The wispy colored lights of the aurora borealis are somewhat similar in appearance to sprites.

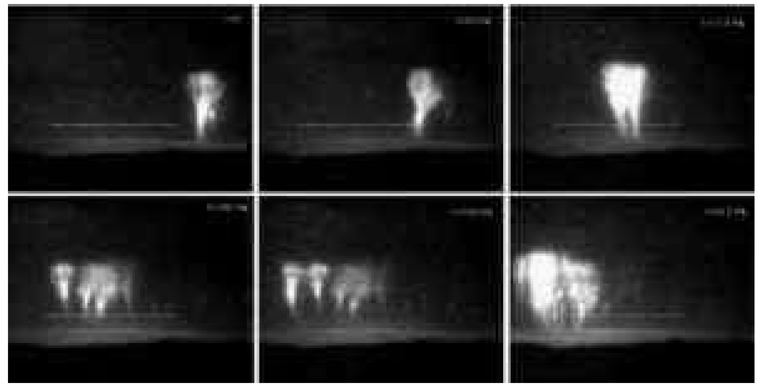
"Although younger members of the crew saw the sprite's red color, they all looked white to me," said Sentman with a rueful grin.

Sprites are brief - lasting only 3 to 10 milliseconds - and that makes them difficult to study. They are not a constant and predictable phenomena, so scientists are never sure exactly when and where sprites will appear above the storm clouds.

"Sometimes you go an entire night without seeing one - you're intently looking at the instruments all night, and you get nothing," said Sentman. "Other nights, you can see hundreds over a period of several hours. We don't know why one storm will spawn so many, while another storm remains barren."

Sentman named the phenomena "sprites" to reflect their eerie, ghost-like qualities and fleeting, elusive natures. Inspired by Shakespeare, Sentman decided on the name one wintery night over pie and coffee in a cabin near Fairbanks.

Through the house give gathering light,
By the dead and drowsy fire:
Every elf and fairy sprite
Hop as light as bird from brier;
And this ditty, after me,
Sing, and dance it trippingly.
- Wm. Shakespeare, "A Midsummer Night's Dream," Act 5, Scene 1.



Right: Time-elapsed photography shows sprites "dance" across the horizon. Credit: University of Alaska, Fairbanks.

Said Sentman, "I think William Shakespeare would have approved, if he had known of their existence."

How to Look for Sprites
(from The UAF website)

For observing sprites, it must be completely dark (not twilight) and your eyes must be dark-adapted. If you can see the Milky Way, your eyes have adapted enough to see sprites.

You need to have a clear view above a thunderstorm. Generally, this means the thunderstorm activity must be on the horizon, without any other clouds to obstruct your view. The best viewing distance from the storm is 200 to 300 km (100-200 miles). At these distances sprites will rise to a vertical distance of 10-20 degrees; 2 to 4 times the separation of the pointer stars in the Big Dipper.

Fix your gaze on the space above an active thunderstorm. To avoid being distracted by underlying lightning activity, you may want to use a piece of paper to block out the area below the clouds.

Left: Black & white images of multiple sprites seen in October, 1997. Credit: New Mexico Tech/NASA.

The bright lights of a city or cloud illumination from lightning may prevent you from seeing sprites.

Sprites are brief - only 3 to 10 milliseconds. They occur too quickly to follow with the eyes, but their vertical structure and red color may be perceived.

Patience will be rewarded. If the right kind of storm is present and one's viewing geometry is favorable, there is a greater likelihood of seeing a sprite than of seeing a shooting star.

If you DO see a sprite (or any other kind of optical emission above a thunderstorm) please report it!

Getting a solid view of lightning

New Mexico team develops system to depict lightning in three dimensions

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

June 9, 1999: The bolt snakes out of the cloud, traces a jagged path left or right across the sky, and touches the ground. Or does it?

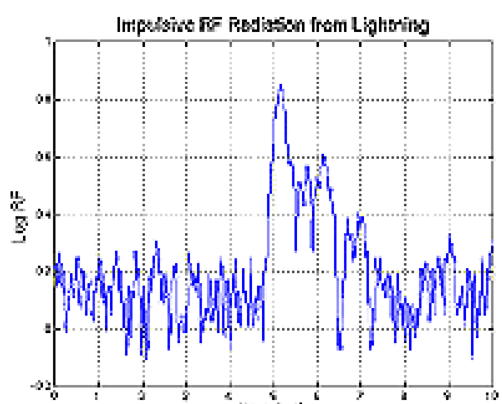
For most of us observing lightning - from a safe distance or inside a building - a lightning bolt is a flat, two-dimensional creature painted against a distant backdrop. But as researchers have shown over the last three decades, lightning has a complex shape that may let scientist pry a few secrets from a storm - including where a tornado might form.

Left: Just a bolt straight down? Is it pointing towards the viewer, or away? And what about the big ones that get away, the cloud-to-cloud flashes that are not seen on the ground? Credit: NOAA

A number of techniques have been developed over the years to look at the 3-D structure," said William Rison of the New Mexico Institute of Mining and Technology in Socorro, N.M. Rison works with Paul Krehbiel who talks today about "3-D Lightning Mapping and Observations" at the International Atmospheric Electricity Conference in Guntersville.

"The primary method is time of arrival of the radio signal," Rison continued. Besides a blinding flash of visible light, a lightning bolt also emits a distinct pulse of radio noise. The background crackle you hear on AM radio is the sound of distant lightning.

If several radio receivers are set up to record the radio pulse with precision timing, then the location of the pulse origin can be backtracked with a little math. It's similar to the principle used in navigating by satellite where several satellite broadcast the same timing signal and are heard, at different times (depending on distance) by a receiver.



Right: A typical radio waveform for a lightning bolt. The large peak is what scientists want to record. The lower peaks are noise, some caused by lightning from distant storms. Links to 556x413-pixel, 9KB GIF. Credit: New Mexico Tech.

The time of arrival method was pioneered in the 1960s by David Proctor of South Africa using VHF radio receivers. His work was laborious, with the data being collated and analyzed by hand.

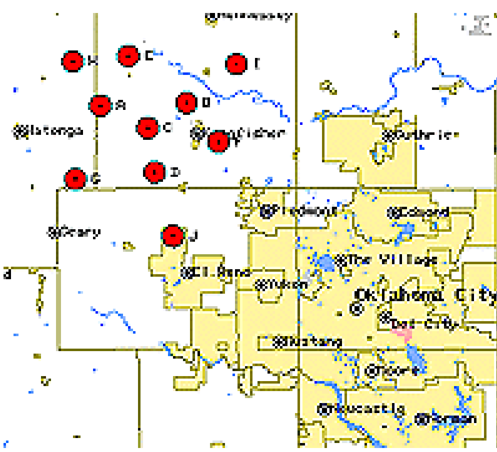
In the 1970s and '80s, the technique was expanded by Carl Lennon and Launa Maier at NASA's Kennedy Space Center who developed a real-time system linked by microwave relays. This lets meteorologists tell launch directors if an electrical storm is too close for a safe launch. It's also optimized for Florida thunderstorms that are different in structure from what is seen in the central United States, and the microwave relays are bulky and difficult to move for studies in different areas.

Above: Negative leaders - lightning moving upward from negatively to positively charged regions in a cloud - are readily detected by radio techniques. Positive leaders are rarely observed. What sometimes appears to be a positive leader is actually an inverted cloud where the negative charges are at the top and positive charges are below. A negative step leader in a cloud-to-ground strike is not impulsive but continuous, making it difficult to detect by time-of-arrival methods. Credit: NASA/Marshall

By adapting a number of new technologies, Krehbiel and his colleagues have developed a Lightning Mapping System that can provide real-time 3-D images of lightning as storms develop.

Sign up for our EXPRESS SCIENCE NEWS delivery

Rison said the system comprises 10 automated ground stations, each with a radio receiver, a precision clock developed for satellite navigation receivers, a signal processor to extract and time-tag just the lightning pulse, and tape recorder. In two field campaigns, the network was set up northwest of Oklahoma City in June 1998 and outside Socorro in August 1998. It is scheduled for another campaign in New Mexico in the summer of 1999 and the Nebraska-Kansas-Colorado area the summer of 2000.



Left: Red dots mark where the Lightning Mapping System receivers were positioned outside Oklahoma City for field tests. Norman, Okla., home of the National Sever Storms Laboratory, is in the lower right corner of this map. Links to 800x600-pixel, 24KB GIF. Credit: New Mexico Tech.

After a storm, the data tapes are collected and sent to Krehbiel's team. They then produce 3-D plots showing a lightning bolt's trip through a storm.

"This gives you, with a few qualifications, the full flash," Rison said. The principal qualification is that the system is most sensitive to negative streamers, discharges in which a stream of electrons burrows its way through the air to a positively charged area.

Time of arrival techniques locate impulsive radio emissions. This happens most often with negative leaders propagating into negative charge regions. It does not locate positive leaders into negative charge regions because the positive leaders do not radiate strongly. It often does not locate negative stripped leaders of cloud-to-ground lightning. These radiate strongly but are continuous, not impulsive.

As the lightning streaks across the sky, it ionizes new points in the air. In effect, the transmitter is moving through the sky, sending a new signal from each point. Each is recorded and, when the storm is reconstructed in a computer, becomes an individual point in a three-dimensional grid. The points are color coded to help the human eye follow a bolt's path across the sky. The positional accuracy is best when the storm is close to the array of receivers, but is still good out to ranges of 250 km (155 mi).

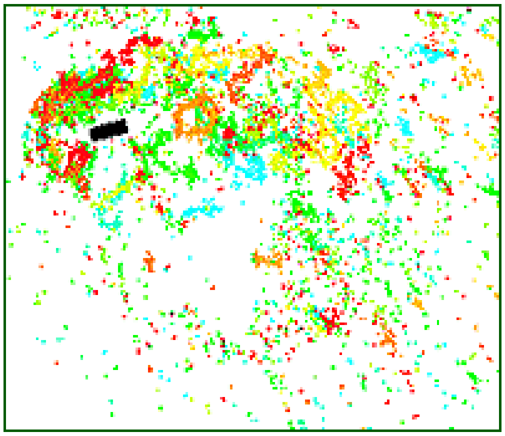
The data plots also can be used to show where lightning occurs most often within a storm, matching lightning activity to storm structure, including convection.

The results are impressive and highly promising, Rison said.

"The initial discharge goes up," he said, describing one bolt recorded during a July 11, 1998, storm. The negative charge was at about 6 km altitude, and the positive charge was at 9 to 10 km. When discharge occurred when electric potential between the two regions became great enough to ionize a channel through air and become as conductive as a metal wire.

"Once that channel is established, then the discharge continued in the horizontal direction," he said. The upper charge center expanded east-west, and the lower center expanded north-south. Like snowflakes, each bolt is unique. "It depends on the structure of the cloud."

Storms also are unique. While some spit lightning at a seemingly leisurely pace, others are like hailstones hitting the roof. One supercell storm outside Oklahoma City fired almost nonstop.



Right: The black patch in this plot of lightning indicates that path of a tornado that formed in Oklahoma on June 13, 1998. The Lightning Mapping System did not see the tornado itself, but shows lightning snaking around the strong convective core that spawned the twister. Links to 570x720-pixel, 40KB GIF. Credit: New Mexico Tech.

"There was no time without lightning," Rison said. "The data are very amorphous. It just fills the plot and appears to be continuous. There's no gap in between. It's a real challenge to sort out. You can see tendrils, but not the start of one discharge and the start of another. That hasn't been seen before."

On the other hand, the Lightning Mapping System has recorded storms with apparent dead zones, where almost no lightning appears. But these are not hurricane-like eyes of the storm.

"That's a region of a very strong updraft moving at about 100 to 160 km/h (60-100 mph), vertically," Rison said. Storm watchers observed "a very high turret penetrating to the stratosphere." A little lightning does appear at extreme altitudes.

"We see clear evidence of an updraft," he continued. "We see continued discharging that has to be explained somehow." In this case, no tornado appeared. But Rison and his team have seen lightning dead spots where tornadoes did appear.

"The lightning wraps itself around the area where the tornado formed," he said. "This is where a hook echo forms on radar."

Left: Another portion of the June 13, 1998, storm shows an "eye" that isn't - it's a strongly convective core where only sparse lightning (blue circle) occurs, and that's at the top of the core, as seen in the cross-section at right. Links to 570x720-pixel, 64KB GIF Credit: New Mexico Tech.

Radar is the tool that is needed now to complement studies with the Lightning Mapping System. Observations with two or more Doppler radar units would provide three-dimensional data on wind speed and direction.

New Mexico Tech is talking with the Global Hydrology and Climate Center in Huntsville about establishing a system in Huntsville, and with the Federal Aviation Administration, National Severe Storms Laboratory, and Global Atmospheric Inc., about setting up a prototype unit at the Dallas-Forth Worth Airport.

VOLCANOES

By *Robert I. Tilling*

[Text with graphics]

Volcanoes destroy and volcanoes create. The catastrophic eruption of Mount St. Helens on May 18, 1980, made clear the awesome destructive power of a volcano. Yet, over a time span longer than human memory and record, volcanoes have played a key role in forming and modifying the planet upon which we live. More than 80 percent of the Earth's surface--above and below sea level--is of volcanic origin. Gaseous emissions from volcanic vents over hundreds of millions of years formed the Earth's earliest oceans and atmosphere, which supplied the ingredients vital to evolve and sustain life. Over geologic eons, countless volcanic eruptions have produced mountains, plateaus, and plains, which subsequent erosion and weathering have sculpted into majestic landscapes and formed fertile soils.

Ironically, these volcanic soils and inviting terranes have attracted, and continue to attract, people to live on the flanks of volcanoes. Thus, as population density increases in regions of active or potentially active volcanoes, mankind must become increasingly aware of the hazards and learn not to "crowd" the volcanoes. People living in the shadow of volcanoes must live in harmony with them and expect, and should plan for, periodic violent unleashings of their pent-up energy.

This booklet presents a generalized summary of the nature, workings, products, and hazards of the common types of volcanoes around the world, along with a brief introduction to the techniques of volcano monitoring and research.

On August 24, A.D. 79, Vesuvius Volcano suddenly exploded and destroyed the Roman cities of Pompeii and Herculaneum. Although Vesuvius had shown stir-rings of life when a succession`of earthquakes in A.D. 63 caused some damage, it had been literally quiet for hundreds of years and was considered "extinct." Its surface and crater were green and covered with vegetation, so the eruption was totally unexpected. Yet in a few hours, hot volcanic ash and dust buried the two cities so thoroughly that their ruins were not uncovered for nearly 1,700 years, when the discovery of an outer wall in 1748 started a period of modern archeology. Vesuvius has continued its activity intermittently ever since A.D 79 with numerous minor eruptions and several major eruptions occurring in 1631, 1794, 1872, 1906 and in 1944 in the midst of the Italian campaign of World War II.

In the United States on March 27, 1980, Mount St. Helens Volcano in the Cascade Range, southwestern Washington, reawakened after more than a century of dormancy and provided a dramatic and tragic reminder that there are active volcanoes in the "lower 48" States as well as in Hawaii and Alaska.The catastrophic eruption of Mount St. Helens on May 18, 1980, and related mudflows and flooding caused significant loss of life (57 dead or missing) and property damage over $1.2 billion). Mount St. Helens is expected to remain intermittently active for months or years, possibly even decades.

The word volcano comes from the little island of Vulcano in the Mediterranean Sea off Sicily. Centuries ago, the people living in this area believed that Vulcano was the chimney of the forge of Vulcan--the blacksmith of the Roman gods. They thought that the hot lava fragments and clouds of dust erupting from Vulcano came from Vulcan's forge as he beat out thunderbolts for Jupiter, king of the gods, and weapons for Mars, the god of war. In Polynesia the people attributed eruptive activity to the beautiful but wrathful Pele, Goddess of Volcanoes, whenever she was angry or spiteful. Today we know that volcanic eruptions are not super natural but can be studied and interpreted by scientists.

The Nature of Volcanoes

[Back to TOP]

Volcanoes are mountains but they are very different from other mountains. They are not formed by folding and crumpling but by uplift and erosion. Instead, volcanoes are built by the accumulation of their own eruptive products--lava, bombs (crusted over ash flows, and tephra (airborne ash and dust). A volcano is most commonly a conical hill or mountain built around a vent that connects with reservoirs of molten rock below the surface of the Earth . The term *volcano* also refers to the opening or vent through which the molten rock and associated gases are expelled.

Driven by buoyancy and gas pressure the molten rock, which is lighter than the surrounding solid rock forces its way upward and may ultimately break though zones of weaknesses in the Earth's crust. If so, an eruption begins, and the molten rock may pour from the vent as non-explosive lava flows, or if may shoot violently into the air as dense clouds of lava fragments. Larger fragments fall back around the vent, and accumulations of fall-back fragments may move downslope as ash flows under the force of gravity. Some of the finer ejected materiaIs may be carried by the wind only to fall to the ground many miles away. The finest ash particles may be injected miles into the atmosphere and carried many times around the world by stratospheric winds before settling out.

Molten rock below the surface of the Earth that rises in volcanic vents is known as *magma*, but after it erupts from a volcano it is called *lava*. Originating many tens of miles beneath the ground, the ascending magma commonly contains some crystals, fragments of surrounding (unmelted) rocks, and dissolved gases, but it is primarily a liquid composed principally of oxygen, silicon, aluminum, iron, magnesium, calcium, sodium, potassium, titanium, and manganese. Magmas also contain many other chemical elements in trace quantities. Upon cooling, the liquid magma may precipitate crystals of various minerals until solidification is complete to form an *igneous* or *magmatic* rock.

The diagram below shows that heat concentrated in the Earth's upper *mantle* raises temperatures sufficiently to melt the rock locally by fusing the materials with the lowest melting temperatures, resulting in small, isolated blobs of magma. These blobs then collect, rise through conduits and fractures, and some ultimately may re-collect in larger pockets or reservoirs ("holding tanks") a few miles beneath the Earth's surface. Mounting pressure within the reservoir may drive the magma further upward through structurally weak zones to erupt as lava at the surface. In a continental environment, magmas are generated in the Earth's crust as well as at varying depths in the upper mantle. The variety of molten rocks in the crust, plus the possibility of mixing with molten materials from the underlying mantle, leads to the production of magmas with widely different chemical compositions.

If magmas cool rapidly, as might be expected near or on the Earth's surface, they solidify to form igneous rocks that are finely crystalline or glassy with few crystals. Accordingly, lavas, which of course are very rapidly cooled, form volcanic rocks typically characterized by a small percentage of crystals or fragments set in a matrix of *glass* (quenched or super-cooled magma) or finer grained crystalline materials. If magmas never breach the surface to erupt and remain deep underground, they cool much more slowly and thus allow ample time to sustain crystal precipitation and growth, resulting in the formation of coarser grained, nearly completely crystalline, igneous rocks. Subsequent to final crystallization and solidification, such rocks can be exhumed by erosion many thousands or millions of years later and be exposed as large bodies of so-called *granitic* rocks, as, for example, those spectacularly displayed in Yosemite National Park and other parts of the majestic Sierra Nevada mountains of California.

Lava is red hot when it pours or blasts out of a vent but soon changes to dark red, gray, black, or some other color as it cools and solidifies. Very hot, gas-rich lava containing abundant iron and magnesium is fluid and flows like hot tar, whereas cooler, gas-poor lava high in silicon, sodium, and potassium flows sluggishly, like thick honey in some cases or in others like pasty, blocky masses.

All magmas contain dissolved gases, and as they rise to the surface to erupt, the confining pressures are reduced and the dissolved gases are liberated either quietly or explosively. If the lava is a thin fluid (not viscous), the gases may escape easily. But if the lava is thick and pasty (highly viscous), the gases will not move freely but will build up tremendous pressure, and ultimately escape with explosive violence. Gases in lava may be compared with the gas in a bottle of a carbonated soft drink. If you put your thumb over the top of the bottle and shake it vigorously, the gas separates from the drink and forms bubbles. When you remove your thumb abruptly, there is a miniature explosion of gas and liquid. The gases in lava behave in somewhat the same way. Their sudden expansion causes the terrible explosions that throw out great masses of solid rock as well as lava, dust, and ashes.

The violent separation of gas from lava may produce rock froth called *pumice*. Some of this froth is so light--because of the many gas bubbles--that it floats on water. In many eruptions, the froth is shattered explosively into small fragments that are hurled high into the air in the form of volcanic cinders (red or black), volcanic ash (commonly tan or gray), and volcanic dust.

Principal Types of Volcanoes

[Back to TOP]

Geologists generally group volcanoes into four main kinds--cinder cones, composite volcanoes, shield volcanoes, and lava domes.

Cinder cones

Cinder cones are the simplest type of volcano. They are built from particles and blobs of congealed lava ejected from a single vent. As the gas-charged lava is blown violently into the air, it breaks into small fragments that solidify and fall as *cinders* around the vent to form a circular or oval cone. Most cinder cones have a bowl-shaped *crater* at the summit and rarely rise more than a thousand feet or so above their surroundings. Cinder cones are numerous in western North America as well as throughout other volcanic terrains of the world.

In 1943 a cinder cone started growing on a farm near the village of Parícutin in Mexico. Explosive eruptions caused by gas rapidly expanding and escaping from molten lava formed cinders that fell back around the vent, building up the cone to a height of 1,200 feet. The last explosive eruption left a funnel-shaped crater at the top of the cone. After the excess gases had largely dissipated, the molten rock quietly poured out on the surrounding surface of the cone and moved downslope as lava flows. This order of events--eruption, formation of cone and crater, lava flow--is a common sequence in the formation of cinder cones.

During 9 years of activity, Parícutin built a prominent cone, covered about 100 square miles with ashes, and destroyed the town of San Juan. Geologists from many parts of the world studied Parícutin during its lifetime and learned a great deal about volcanism, its products, and the modification of a volcanic landform by erosion.

Composite volcanoes

Some of the Earth's grandest mountains are *composite* volcanoes--sometimes called *stratovolcanoes*. They are typically steep-sided, symmetrical cones of large dimension built of alternating layers of lava flows, volcanic ash, cinders, blocks, and bombs and may rise as much as 8,000 feet above their bases. Some of the most conspicuous and beautiful mountains in the world are composite volcanoes, including Mount Fuji in Japan, Mount Cotopaxi in Ecuador, Mount Shasta in California, Mount Hood in Oregon, and Mount St. Helens and Mount Rainier in Washington.

Most composite volcanoes have a crater at the summit which contains a central vent or a clustered group of vents. Lavas either flow through breaks in the crater wall or issue from fissures on the flanks of the cone. Lava, solidified within the fissures, forms dikes that act as ribs which greatly strengthen the cone.

The essential feature of a composite volcano is a conduit system through which magma from a reservoir deep in the Earth's crust rises to the surface. The volcano is built up by the accumulation of material erupted through the conduit and increases in size as lava, cinders, ash, etc., are added to its slopes.

When a composite volcano becomes dormant, erosion begins to destroy the cone. As the cone is stripped away, the hardened magma filling the conduit (the volcanic plug) and fissures (the dikes) becomes exposed, and it too is slowly reduced by erosion. Finally, all that remains is the plug and dike complex projecting above the land surface--a telltale remnant of the vanished volcano.

An interesting variation of a composite volcano can be seen at Crater Lake in Oregon. From what geologists can interpret of its past, a high volcano--called Mount Mazama- probably similar in appearance to present-day Mount Rainier was once located at this spot. Following a series of tremendous explosions about 6,800 years ago, the volcano lost its top. Enormous volumes of volcanic ash and dust were expelled and swept down the slopes as ash flows and avalanches. These large-volume explosions rapidly drained the lava beneath the mountain and weakened the upper part. The top then collapsed to form a large depression, which later filled with water and is now completely occupied by beautiful Crater Lake. A last gasp of eruptions produced a small cinder cone, which rises above the water surface as Wizard Island near the rim of the lake. Depressions such as Crater Lake, formed by collapse of volcanoes, are known as *calderas*. They are usually large, steep-walled, basin-shaped depressions formed by the collapse of a large area over, and around, a volcanic vent or vents. Calderas range in form and size from roughly circular depressions 1 to 15 miles in diameter to huge elongated depressions as much as 60 miles long.

Shield volcanoes

Shield volcanoes, the third type of volcano, are built almost entirely of fluid lava flows. Flow after flow pours out in all directions from a central summit vent, or group of vents, building a broad, gently sloping cone of flat, domical shape, with a profile much like that of a warrior's shield. They are built up slowly by the accretion of thousands of highly fluid lava flows called basalt lava that spread widely over great distances, and then cool as thin, gently dipping sheets. Lavas also commonly erupt from vents along fractures (rift zones) that develop on the flanks of the cone. Some of the largest volcanoes in the world are shield volcanoes. In northern California and Oregon, many shield volcanoes have diameters of 3 or 4 miles and heights of 1,500 to 2,000 feet. The Hawaiian Islands are composed of linear chains of these volcanoes including Kilauea and Mauna Loa on the island of Hawaii-- two of the world's most active volcanoes. The floor of the ocean is more than 15,000 feet deep at the bases of the islands. As Mauna Loa, the largest of the shield volcanoes (and also the world's largest active volcano), projects 13,677 feet above sea level, its top is over 28,000 feet above the deep ocean floor.

In some eruptions, basaltic lava pours out quietly from long fissures instead of central vents and floods the surrounding countryside with lava flow upon lava flow, forming broad plateaus. Lava plateaus of this type can be seen in Iceland, southeastern Washington, eastern Oregon, and southern Idaho. Along the Snake River in Idaho, and the Columbia River in Washington and Oregon, these lava flows are beautifully exposed and measure more than a mile in total thickness.

Lava domes

Volcanic or lava domes are formed by relatively small, bulbous masses of lava too viscous to flow any great distance; consequently, on extrusion, the lava piles over and around its vent. A dome grows largely by expansion from within. As it grows its outer surface cools and hardens, then shatters, spilling loose fragments down its sides. Some domes form craggy knobs or spines over the volcanic vent, whereas others form short, steep-sided lava flows known as "coulees." Volcanic domes commonly occur within the craters or on the flanks of large composite volcanoes. The nearly circular Novarupta Dome that formed during the 1912 eruption of Katmai Volcano, Alaska, measures 800 feet across and 200 feet high. The internal structure of this dome--defined by layering of lava fanning upward and outward from the center--indicates that it grew largely by expansion from within. Mont Pelée in Martinique, Lesser Antilles, and Lassen Peak and Mono domes in California are examples of lava domes. An extremely destructive eruption accompanied the growth of a dome at Mont Pelée in 1902. The coastal town of St. Pierre, about 4 miles downslope to the south, was demolished and nearly 30,000 inhabitants were killed by an incandescent, high-velocity ash flow and associated hot gases and volcanic dust.

Only two men survived; one because he was in a poorly ventilated, dungeon-like jail cell and the other who somehow made his way safely through the burning city.

Other Volcanic Structures

[Back to TOP]

Plugs (necks)

Congealed magma, along with fragmental volcanic and wallrock materials, can be preserved in the feeding conduits of a volcano upon cessation of activity. These preserved rocks form crudely cylindrical masses, from which project radiating dikes; they may be visualized as the fossil remains of the innards of a volcano (the so-called "volcanic plumbing system") and are referred to as volcanic *plugs* or *necks*. The igneous material in a plug may have a range of composition similar to that of associated lavas or ash, but may also include fragments and blocks of denser, coarser grained rocks-- higher in iron and magnesium, lower in silicon--thought to be samples of the Earth's deep crust or upper mantle plucked and transported by the ascending magma. Many plugs and necks are largely or wholly composed of fragmental volcanic material and of fragments of wallrock, which can be of any type. Plugs that bear a particularly strong imprint of explosive eruption of highly gas-charged magma are called *diatremes* or *tuff-breccia*.

Volcanic plugs are believed to overlie a body of magma which could be either still largely liquid or completely solid depending on the state of activity of the volcano. Plugs are known, or postulated, to be commonly funnel shaped and to taper downward into bodies increasingly elliptical in plan or elongated to dike-like forms. Typically, volcanic plugs and necks tend to be more resistant to erosion than their enclosing rock formations. Thus, after the volcano becomes inactive and deeply eroded, the exhumed plug may stand up in bold relief as an irregular, columnar structure. One of the best known and most spectacular diatremes in the United States is Ship Rock in New Mexico, which towers some 1,700 feet above the more deeply eroded surrounding plains. Volcanic plugs, including diatremes, are found elsewhere in the western United States and also in Germany, South Africa, Tanzania, and Siberia.

Maars

Also called "tuff cones," *maars* are shallow, flat-floored craters that scientists interpret have formed above diatremes as a result of a violent expansion of magmatic gas or steam; deep erosion of a maar presumably would expose a diatreme. Maars range in size from 200 to 6,500 feet across and from 30 to 650 feet deep, and most are commonly filled with water to form natural lakes. Most maars have low rims composed of a mixture of loose fragments of volcanic rock and rocks torn from the walls of the diatreme.

Maars occur in the western United States, in the Eifel region of Germany, and in other geologically young volcanic regions of the world. An excellent example of a maar is Zuni Salt Lake in New Mexico, a shallow saline lake that occupies a flat-floored crater about 6,500 feet across and 400 feet deep. Its low rim is composed of loose pieces of basaltic lava and wallrocks (sandstone, shale, limestone) of the underlying diatreme, as well as random chunks of ancient crystalline rocks blasted upward from great depths.

Nonvolcanic craters

Some well-exposed, nearly circular areas of intensely deformed sedimentary rocks, in which a central vent-like feature is surrounded by a ring-shaped depression, resemble volcanic structures in gross form. As no clear evidence of volcanic origin could be found in or near these structures, scientists initially described them as "cryptovolcanic," a term now rarely used. Recent studies have shown that not all craters are of volcanic origin. Impact craters, formed by collisions with the Earth of large meteorites, asteroids, or comets, share with volcanoes the imprints of violent origin, as evidenced by severe disruption, and even local melting, of rock. Fragments of meteorites or chemically detectable traces of extraterrestrial materials and indications of strong forces acting from above, rather than from below, distinguish impact from volcanic features.

Other possible explanations for these nonvolcanic craters include subsurface salt-dome intrusion (and subsequent dissolution and collapse caused by subsurface limestone dissolution and/or ground-water withdrawal; and collapse related to melting of glacial ice. An impressive example of an impact structure is Meteor Crater, Ariz., which is visited by thousands of tourists each year. This impact crater, 4,000 feet in diameter and 600 feet deep, was formed in the geologic past (probably 30,00050,000 years before present) by a meteorite striking the Earth at a speed of many thousands of miles per hour.

In addition to Meteor Crater, very fresh, morphologically distinct, impact craters are found at three sites near Odessa, Tex., as well as 10 or 12 other locations in the world. Of the more deeply eroded, less obvious, postulated impact structures, there are about ten well-established sites in the United States and perhaps 80 or ~0 elsewhere in the world.

Types of Volcanic Eruptions

[Back to TOP]

During an episode of activity, a volcano commonly displays a distinctive pattern of behavior. Some mild eruptions merely discharge steam and other gases, whereas other eruptions quietly extrude quantities of lava. The most spectacular eruptions consist of violent explosions that blast great clouds of gas-laden debris into the atmosphere.

The type of volcanic eruption Is often labeled with the name of a well-known volcano where characteristic behavior is similar--hence the use of such terms as "Strombolian," "Vulcanian," "Vesuvian," "Pelean," "Hawaiian," and others. Some volcanoes may exhibit only one characteristic type of eruption during an interval of activity--others may display an entire sequence of types.

In a Strombolian-type eruption observed during the 1965 activity of Irazu Volcano in Costa Rica, huge clots of molten lava burst from the summit crater to form luminous arcs through the sky. Collecting on the flanks of the cone, lava clots combined to stream down the slopes in fiery rivulets.

In contrast, the eruptive activity of Parícutin Volcano in 1947 demonstrated a "Vulcanian"-type eruption, in which a dense cloud of ash-laden gas explodes from the crater and rises high above the peak. Steaming ash forms a whitish cloud near the upper level of the cone.

In a "Vesuvian" eruption, as typified by the eruption of Mount Vesuvius in Italy in A.D. 79, great quantities of ash-laden gas are violently discharged to form cauliflower-shaped cloud high above the volcano.

In a "Peléan" or "Nuée Ardente (glowing cloud) eruption, such as occurred on the Mayon Volcano in the Philippines in 1968, a large quantity of gas, dust, ash, and incandescent lava fragments are blown out of a central crater, fall back, and form tongue-like, glowing avalanches that move downslope at velocities as great as 100 miles per hour. Such eruptive activity can cause great destruction and loss of life if it occurs in populated areas, as demonstrated by the devastation of St. Pierre during the 1902 eruption of Mont Pelée on Martinique, Lesser Antilles.

"Hawaiian" eruptions may occur along fissures or fractures that serve as linear vents, such as during the eruption of Mauna Loa Volcano in Hawaii in 1950; or they may occur at a central vent such as during the 1959 eruption in Kilauea Iki Crater of Kilauea Volcano, Hawaii. In fissure-type eruptions, molten, incandescent lava spurts from a fissure on the volcano's rift zone and feeds lava streams that flow downslope. In central-vent eruptions, a fountain of fiery lava spurts to a height of several hundred feet or more. Such lava may collect in old pit craters to form lava lakes, or form cones, or feed radiating flows.

"Phreatic" (or steam-blast) eruptions are driven by explosive expanding steam resulting from cold ground or surface water coming into contact with hot rock or magma. The distinguishing feature of phreatic explosions is that they only blast out fragments of preexisting solid rock from the volcanic conduit; no new magma is erupted. Phreatic activity is generally weak, but can be quite violent in some cases, such as the 1965 eruption of Taal Volcano, Philippines, and the 1975-76 activity at La Soufrière, Guadeloupe (Lesser Antilles).

The most powerful eruptions are called "plinian" and involve the explosive ejection of relatively viscous lava. Large plinian eruptions--such as during 18 May 1980 at Mount St. Helens or, more recently, during 15 June 1991 at Pinatubo in the Philippines--can send ash and volcanic gas tens of miles into the air. The resulting ash fallout can affect large areas hundreds of miles downwind. Fast-moving deadly pyroclastic flows ("nuées ardentes") are also commonly associated with plinian eruptions.

Submarine Volcanoes

[Back to TOP]

Submarine volcanoes and volcanic vents are common features on certain zones of the ocean floor. Some are active at the present time and, in shallow water, disclose their presence by blasting steam and rock-debris high above the surface of the sea. Many others lie at such great depths that the tremendous weight of the water above them results in high, confining pressure and prevents the formation and explosive release of steam and gases. Even very large, deep-water eruptions may not disturb the ocean surface.

The unlimited supply of water surrounding submarine volcanoes can cause them to behave differently from volcanoes on land. Violent, steam-blast eruptions take place when sea water pours into active shallow submarine vents. Lava, erupting onto a shallow sea floor or flowing into the sea from land, may cool so rapidly that it shatters into sand and rubble. The result is the production of huge amounts of fragmental volcanic debris. The famous "black sand" beaches of Hawaii were created virtually instantaneously by the violent interaction between hot lava and sea water. On the other hand, recent observations made from deep-diving submersibles have shown that some submarine eruptions produce flows and other volcanic structures remarkably similar to those formed on land. Recent studies have revealed the presence of spectacular, high temperature hydrothermal plumes and vents (called "smokers") along some parts of the mid-oceanic volcanic rift systems. However, to date, no direct observation has been made of a deep submarine eruption In progress.

During an explosive submarine eruption in the shallow open ocean, enormous piles of debris are built up around the active volcanic vent. Ocean currents rework the debris in shallow water, while other debris slumps from the upper part of the cone and flows into deep water along the sea floor. Fine debris and ash in the eruptive plume are scattered over a wide area in airborne clouds. Coarse debris in the same eruptive plume rains into the sea and settles on the flanks of the cone. Pumice from the eruption floats on the water and drifts with the ocean currents over a large area.

Geysers, Fumaroles, and Hot Springs

[Back to TOP]

Geysers, fumaroles (also called *solfataras*), and hot springs are generally found in regions of young volcanic activity. Surface water percolates downward through the rocks below the Earth's surface to high-temperature regions surrounding a magma reservoir, either active or recently solidified but still hot. There the water is heated, becomes less dense, and rises back to the surface along fissures and cracks. Sometimes these features are called "dying volcanoes" because they seem to represent the last stage of volcanic activity as the magma, at depth, cools and hardens.

Erupting geysers provide spectacular displays of underground energy suddenly unleashed, but their mechanisms are not completely understood. Large amounts of hot water are presumed to fill underground cavities. The water, upon further heating, is violently ejected when a portion of it suddenly flashes into steam. This cycle can be repeated with remarkable regularity, as for example, at Old Faithful Geyser in Yellowstone National Park, which erupts on an average of about once every 65 minutes.

Fumaroles, which emit mixtures of steam and other gases, are fed by conduits that pass through the water table before reaching the surface of the ground. Hydrogen sulfide (H2S), one of the typical gases issuing from fumaroles, readily oxidizes to sulfuric acid and native sulfur. This accounts for the intense chemical activity and brightly colored rocks in many thermal areas.

Hot springs occur in many thermal areas where the surface of the Earth intersects the water table. The temperature and rate of discharge of hot springs depend on factors such as the rate at which water circulates through the system of underground channelways, the amount of heat supplied at depth, and the extent of dilution of the heated water by cool ground water near the surface.

Volcano Environments

[Back to TOP]

There are more than 500 active volcanoes (those that have erupted at least once within recorded history) in the world--50 of which are in the United States (Hawaii, Alaska, Washington, Oregon, and California)--although many more are hidden under the seas. Most active volcanoes are strung like beads along, or near, the margins of the continents, and more than half en circle the Pacific Ocean as a "Ring of Fire."

Many volcanoes are in and around the Mediterranean Sea. Mount Etna in Sicily is the largest and hiqhest of these mountains. Italy's Vesuvius is the only active volcano on the European mainland. Near the island of Vulcano, the volcano Stromboli has been in a state of nearly continuous, mild eruption since early Roman times. At night, sailors in the Mediterranean can see the glow from the fiery molten material that is hurled into the air. Very appropriately, Stromboli has been called "the lighthouse of the Mediterranean.

Some volcanoes crown island areas lying near the continents, and others form chains of islands in the deep ocean basins. Volcanoes tend to cluster along narrow mountainous belts where folding and fracturing of the rocks provide channelways to the surface for the escape of magma. Significantly, major earthquakes also occur along these belts, indicating that volcanism and seismic activity are often closely related, responding to the same dynamic Earth forces.

In a typical "island-arc" environment, volcanoes lie along the crest of an arcuate, crustal ridge bounded on its convex side by a deep oceanic trench. The granite or granitelike layer of the continental crust extends beneath the ridge to the vicinity of the trench. Basaltic magmas, generated in the mantle beneath the ridge, rise along fractures through the granitic layer. These magmas commonly will be modified or changed in composition during passage through the granitic layer and erupt on the surface to form volcanoes built largely of nonbasaltic rocks.

In a typical "oceanic" environment, volcanoes are alined along the crest of a broad ridge that marks an active fracture system in the oceanic crust. Basaltic magmas, generated in the upper mantle beneath the ridge, rise along fractures through the basaltic layer. Because the granitic crustal layer is absent, the magmas are not appreciably modified or changed in composition and they erupt on the surface to form basaltic volcanoes.

In the typical "continental" environment, volcanoes are located unstable, mountainous belts that have thick roots of granite or granitelike rock. Magmas, generated near the base of the mountain root, rise slowly or intermittently along fractures in the crust. During passage through the granitic layer, magmas are commonly modified or changed in composition and erupt on the surface to form volcanoes constructed of nonbasaltic rocks.

Plate-Tectonics Theory

[Back to TOP]

According to the now generally accepted "plate-tectonics" theory, scientists believe that the Earth's surface is broken into a number of shifting slabs or plates, which average about 50 miles in thickness. These plates move relative to one another above a hotter, deeper, more mobile zone at average rates as great as a few inches per year. Most of the world's active volcanoes are located along or near the boundaries between shifting plates and are called "plate-boundary" volcanoes. However, some active volcanoes are not associated with plate boundaries, and many of these so-called "intra-plate" volcanoes form roughly linear chains in the interior of some oceanic plates. The Hawaiian Islands provide perhaps the best example of an "intra-plate" volcanic chain, developed by the northwest-moving Pacific plate passing over an inferred "hot spot" that initiates the magma-generation and volcano formation process. The peripheral areas of the Pacific Ocean Basin, containing the boundaries of several plates, are dotted by many active volcanoes that form the so-called "Ring of Fire." The "Ring" provides excellent examples of "plate boundary" volcanoes, including Mount St. Helens.

The accompanying figure shows the boundaries of lithosphere plates that are presently active. The double lines indicate zones of spreading from which plates are moving apart. The lines with barbs show zones of underthrusting (subduction), where one plate is sliding beneath another. The barbs on the lines indicate the overriding plate. The single line defines a strike-slip fault along which plates are sliding horizontally past one another. The stippled areas indicate a part of a continent, exclusive of that along a plate boundary, which is undergoing active extensional, compressional, or strike-slip faulting.

Extraterrestrial Volcanism

[Back to TOP]

Volcanoes and volcanism are not restricted to the planet Earth. M \anned and unmanned planetary explorations, beginning in the late 1960's, have furnished graphic evidence of past volcanism and its products on the Moon, Mars, Venus and other planetary bodies. Many pounds of volcanic rocks were collected by astronauts during the various Apollo lunar landing missions. Only a small fraction of these samples have been subjected to exhaustive study by scientists. The bulk of the material is stored under controlled-environment conditions at NASA's Lunar Receiving Laboratory in Houston, Tex., for future study by scientists.

From the 1976-1979 Viking mission, scientists have been able to study the volcanoes on Mars, and their studies are very revealing when compared with those of volcanoes on Earth. For example, Martian and Hawaiian volcanoes closely resemble each other in form. Both are shield volcanoes, have gently sloping flanks, large multiple collapse pits at their centers, and appear to be built of fluid lavas that have left numerous flow features on their flanks. The most obvious difference between the two is size. The Martian shields are enormous. They can grow to over 17 miles in height and more than 350 miles across, in contrast to a maximum height of about 6 miles and width of 74 miles for the Hawaiian shields.

Voyager-2 spacecraft images taken of lo, a moon of Jupiter, captured volcanoes in the actual process of eruption. The volcanic plumes shown on the image rise some 60 to 100 miles above the surface of the moon. Thus, active volcanism is taking place, at present, on at least one planetary body in addition to our Earth.

Volcano Monitoring and Research

[Back to TOP]

It has been said that the science of "volcanology" originated with the accurate descriptions of the eruption of Vesuvius in A.D. 79 contained in two letters from Pliny the Younger to the Roman historian Tacitus. Pliny's letters also described the death of his uncle, Pliny the Elder, who was killed in the eruption. Actually, however, it was not until the 19th century that serious scientific inquiry into volcanic phenomena flourished as part of the general revolution in the physical and life sciences, including the new science of "geology." In 1847, an observatory was established on the flanks of Vesuvius, upslope from the site of Herculaneum, for the more or less continuous recording of the activity of the volcano that destroyed the city in A.D. 79. Still, through the first decade of the 20th century, the study of volcanoes by and large continued to be of an expeditionary nature, generally undertaken after the eruption had begun or the activity had ceased.

Perhaps "modern" volcanology began in 1912, when Thomas A. Jaggar, Head of the Geology Department of the Massachusetts Institute of Technology, founded the Hawaiian Volcano

Observatory (HVO), located on the rim of Kilauea's caldera. Initially supported by an association of Honolulu businessmen, HVO began to conduct systematic and continuous monitoring of seismic activity preceding, accompanying, and following eruptions, as well as a wide variety of other geological, geophysical, and geochemical observations and investigations. Between 1919 and 1948, HVO was administered by various Federal agencies (National Weather Service, U.S. Geological Survey, and National Park Service), and since 1948 it has been operated continuously by the Geological Survey as part of its Volcano Hazards Program. The more than 75 years of comprehensive investigations by HVO and other scientists in Hawaii have added substantially to our understanding of the eruptive mechanisms of Kilauea and Mauna Loa, two of the world's most active volcanoes. Moreover, the Hawaiian Volcano Observatory pioneered and refined most of the commonly used volcano-monitoring techniques presently employed by other observatories monitoring active volcanoes elsewhere, principally in Indonesia, Italy, Japan, Latin America, New Zealand, Lesser Antilles (Caribbean), Philippines, and Kamchatka (U .S.S.R.).

What does "volcano monitoring" actually involve? Basically, it is the keeping of a detailed "diary" of the changes--visible and invisible--in a volcano and its surroundings. Between eruptions, visible changes of importance to the scientists would include marked increase or decrease of steaming from known vents; emergence of new steaming areas; development of new ground cracks or widening of old ones; unusual or inexplicable withering of plant life; changes in the color of mineral deposits encrusting fumaroles; and any other directly observable, and often measurable, feature that might reflect a change in the state of the volcano. Of course, the "diary" keeping during eruptive activity presents additional tasks. Wherever and whenever they can do so safely, scientists document, in words and on film, the course of the eruption in detail; make temperature measurements of lava and gas; collect the eruptive products and gases for subsequent laboratory analysis; measure the heights of lava fountains or ash plumes; gage the flow rate of ash ejection or lava flows; and carry out other necessary observations and measurements to fully document and characterize the eruption. For each eruption, such documentation and data collection and analysis provide another building block in constructing a model of the characteristic behavior of a given volcano or type of eruption.

Volcano monitoring also involves the recording and analysis of volcanic phenomena not visible to the human eye, but measurable by precise and sophisticated instruments. These phenomena include ground movements, earthquakes (particularly those too small to be felt by people), variations in gas compositions, and deviations in local electrical and magnetic fields that respond to pressure and stresses caused by the subterranean magma movements.

Some common methods used to study invisible, volcano-related phenomena are based on:

1. Measurement of changes in the shape of the volcano-- volcanoes gradually swell or "inflate" in building up to an eruption because of the influx of magma into the volcano's reservoir or "plumbing system"; with the onset of eruption, pressure is immediately relieved and the volcano rapidly shrinks or "deflates." A wide variety of instruments, including precise spirit-levels, electronic "tiltmeters, and electronic-laser beam instruments, can measure changes in the slope or "tilt" of the volcano or in vertical and horizontal distances with a precision of only a few parts in a million.

2. Precise determination of the location and magnitude of earthquakes by a well-designed

seismic network--as the volcano inflates by the rise of magma, the enclosing rocks are deformed to the breaking point to accommodate magma movement. When the rock ultimately fails to permit continued magma ascent, earthquakes result. By carefully mapping out the variations with time in the locations and depths of earthquake foci, scientists in effect can track the subsurface movement of magma, horizontally and vertically.

3. Measurement of changes in volcanic-gas composition and in magnetic field--the rise of magma high into the volcanic edifice may allow some of the associated gases to escape along fractures, thereby causing the composition of the gases (measured at the surface) to differ from that usually measured when the volcano is quiescent and the magma is too deep to allow gas to escape. Changes in the Earth's magnetic field have been noted preceding and accompanying some eruptions, and such changes are believed to reflect temperature effects and/or the content of magnetic minerals in the magma.

Recording historic eruptions and modern volcano-monitoring in themselves are insufficient to fully determine the characteristic behavior of a volcano, because a time record of such information, though perhaps long in human terms, is much too short in geologic terms to permit reliable predictions of possible future behavior. A comprehensive investigation of any volcano must also include the careful, systematic mapping of the nature, volume, and distribution of the products of prehistoric eruptions, as well as the determination of their ages by modern isotopic and other dating methods. Research on the volcano's geologic past extends the data base for refined estimates of the recurrence intervals of active versus dormant periods in the history of the volcano. With such information in hand, scientists can construct so-called "volcanic hazards" maps that delineate the zones of greatest risk around the volcano and that designate which zones are particularly susceptible to certain types of volcanic hazards (lava flows, ash fall, toxic gases, mudflows and associated flooding, etc.).

A strikingly successful example of volcano research and volcanic hazard assessment was the 1978 publication (Bulletin 1383-C) by two Geological Survey scientists, Dwight Crandell and Donal Mullineaux, who concluded that Mount St. Helens was the Cascade volcano most frequently active in the past 4,500 years and the one most likely to reawaken to erupt, "...perhaps before the end of this century." Their prediction came true when Mount St. Helens rumbled back to life in March of 1980. Intermittent explosions of ash and steam and periodic formation of short-lived lava domes continued throughout the decade. Analysis of the volcano's past behavior indicates that this kind of eruptive activity may continue for years or decades, but another catastrophic eruption like that of May 18, 1980, is unlikely to occur soon.

On 18 May 1982, the U.S. Geological Survey (USGS) formally dedicated the David A. Johnston Cascades Volcano Observatory (CVO) in Vancouver, Washington, in memory of the Survey volcanologist killed two years earlier. This facility--a sister observatory to the Hawaiian Volcano Observatory-- facilitates the increased monitoring and research on not only Mount St. Helens but also the other volcanoes of the Cascade Range of the Pacific Northwest. More recently, in cooperation with the State of Alaska, the USGS established the Alaska Volcano Observatory in March 1988. The work being done at these volcano observatories provides important comparisons and contrasts between the behavior of the generally non-explosive Hawaiian shield volcanoes and that of the generally explosive composite volcanoes of the Cascade and Alaskan Peninsula-Aleutian chains.

Volcanoes and People

[Back to TOP]

Volcanoes both harass and help mankind. As dramatically demonstrated by the catastrophic eruption of Mount St. Helens on May 1980 and of Pinatubo in June 1991, volcanoes can wreak havoc and devastation in the short term. The types of volcanic and associated hazards are not described in this booklet but treated in several of the publications listed in **Suggested Reading**. However, it should be emphasized that the short-term hazards posed by volcanoes are balanced by benefits of volcanism and related processes over geologic time. Volcanic materials ultimately break down to form some of the most fertile soils on Earth, cultivation of which fostered and sustained civilizations. People use volcanic products as construction materials, as abrasive and cleaning agents, and as raw materials for many chemical and industrial uses. The internal heat associated with some young volcanic systems has been harnessed to produce geothermal energy. For example, the electrical energy generated from The Geysers geothermal field in northern California can meet the present power consumption of the city of San Francisco.

The challenge to scientists involved with volcano research is to mitigate the short-term adverse impacts of eruptions, so that society may continue to enjoy the long-term benefits of volcanism. They must continue to improve the capability for predicting eruptions and to provide decision makers and the general public with the best possible information on high-risk volcanoes for sound decisions on land-use planning and public safety. Geoscientists still do not fully understand how volcanoes really work, but considerable advances have been made in recent decades. An improved understanding of volcanic phenomena provides important clues to the Earth's past, present, and possibly its future.

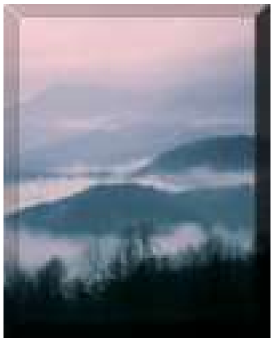
GIP 2A-E. Ride the Rockies
http://pubs.usgs.gov/gip/2004/02/

Geology highlights along the Ride The Rockies 2004 route.

General-Interest Publications [Online]

Acid Rain and Our Nation's Capital
http://pubs.usgs.gov/gip/acidrain/

This booklet focuses on acid rain and its impact on our Nation's capital. Rain in Washington, D.C., has an average acidity of 4.2, about as acid as a carbonated drink and more than ten times as acid as clean, unpolluted rain. This booklet will define acid rain, explain what effects it has on marble and limestone buildings, and show, on a walking tour, some of the places in our Nation's capital where you can see the impact of acid precipitation.



Birth of the Mountains: The Geologic Story of the Southern Appalachian Mountains
http://pubs.usgs.gov/gip/birth/

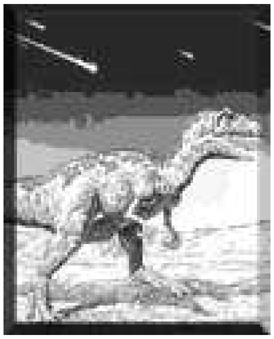
The Southern Appalachian Mountain region is known worldwide for its great beauty and biological diversity. Why does this area have such beautiful scenery and such a diversity of plants and animals? How do the mountains, and the rocks and minerals of which they are made, affect the lives of people? How do people affect the mountains? To address these questions, we need to understand what took place millions of years ago and how these geologic events have influenced the landscape, climate, soils, and living things we see today.

Building Stones of Our Nation's Capital
http://pubs.usgs.gov/gip/stones/

The buildings of our Nation's Capital have been constructed with rocks from quarries throughout the United States and many distant lands. Each building shows important features of various stones and the geologic environment in which they were formed. This booklet describes the source and appearance of many of the stones used in building Washington, D.C. A map and a walking tour guide are included to help you discover Washington's building stones on your own.

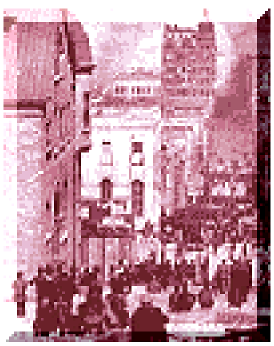
Deserts: Geology and Resources
http://pubs.usgs.gov/gip/deserts/

Approximately one-third of the Earth's land surface is desert, arid land with meager rainfall that supports only sparse vegetation and a limited population of people and animals. Deserts--stark, sometimes mysterious worlds--have been portrayed as fascinating environments of adventure and exploration from narratives such as that of Lawrence of Arabia to movies such as "Dune."



Dinosaurs: Facts and Fiction
http://pubs.usgs.gov/gip/dinosaurs/

Few subjects in the Earth sciences are as fascinating to the public as dinosaurs. The study of dinosaurs stretches our imaginations, gives us new perspectives on time and space, and invites us to discover worlds very different from our modern Earth.



Earthquakes
http://pubs.usgs.gov/gip/earthq1/

One of the most frightening and destructive phenomena of nature is a severe earthquake and its terrible aftereffects. If the earthquake occurs in a populated area, it may cause many deaths and injuries and extensive property damage. Today we are challenging the assumption that earthquakes must present an uncontrollable and unpredictable hazard to life and property. Scientists have begun to estimate the locations and likelihoods of future damaging earthquakes. Sites of greatest hazard are being identified, and definite progress is being made in designing structures that will withstand the effects of earthquakes.

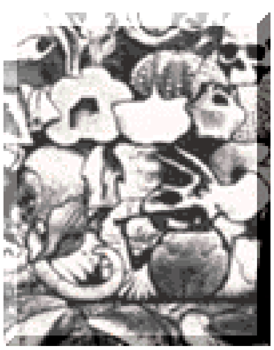
[Eruptions of Hawaiian Volcanoes: Past, Present, and Future](http://pubs.usgs.gov/gip/hawaii/)
http://pubs.usgs.gov/gip/hawaii/

Viewing an erupting volcano is a memorable experience, one that has inspired fear, superstition, worship, curiosity, and fascination throughout the history of mankind. In modern times, volcanic phenomena have attracted intense scientific interest, because they provide the key to understanding processes that have created and shaped more than 80 percent of the Earth's surface. The active Hawaiian volcanoes have received special attention worldwide because of their frequent spectacular eruptions, which can be viewed and studied with relative ease and safety.

[Eruptions of Mount St. Helens: Past, Present, and Future](http://pubs.usgs.gov/publications/msh/)
http://pubs.usgs.gov/publications/msh/

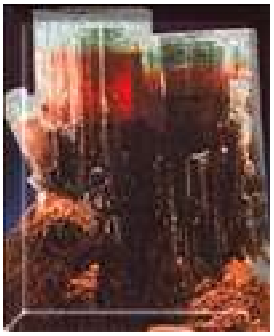
May 18, 1980. On that fateful day, Mount St. Helens Volcano in Washington exploded violently after 2 months of intense earthquake activity and intermittent, relatively weak eruptions, causing the worst volcanic disaster in the recorded history of the United States. The cataclysmic eruption and related events on May 18 rank among the most significant geologic events in the United States during the 20th century.



Fossils, Rocks, and Time

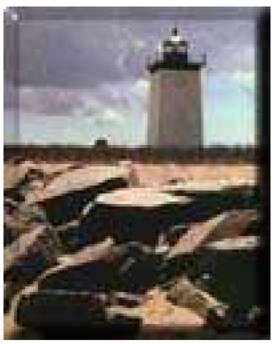
http://pubs.usgs.gov/gip/fossils/

Fossils are the recognizable remains of past life on Earth and are fundamental to the geologic time scale. To tell the age of most layered rocks, scientists study the fossils these rocks contain. Fossils provide important evidence to help determine what happened in Earth history and when it happened.



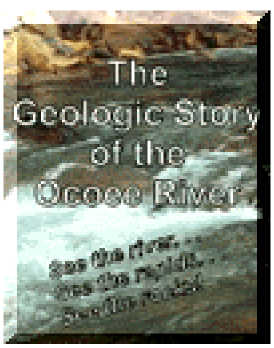
Gemstones
http://minerals.usgs.gov/minerals/pubs/commodity/gemstones/sp14-95/

An overview of the production of specific U.S. gemstones



The Geologic History of Cape Cod, Massachusetts
http://pubs.usgs.gov/gip/capecod/

Cape Cod, a sandy peninsula built mostly during the ice age, juts into the Atlantic Ocean like a crooked arm. Geologists are interested in Cape Cod because it was formed, by glaciers, very recently in terms of geologic time and because the shore is ever changing as the Cape adjusts to the rising sea.



The Geologic Story of the Ocoee River

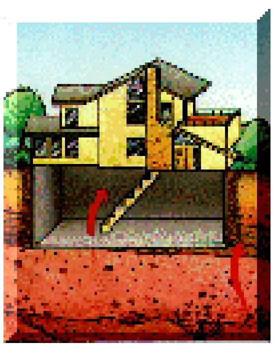
http://pubs.usgs.gov/gip/ocoee2/

Over millions of years, the Ocoee River has cut a steep, winding channel into a mountainside of hard rock. As you travel through the Ocoee River Gorge along US Highway 64 in the scenic Cherokee National Forest of southeastern Tennessee, take some time to look at the rocks along the way.

Companion brochure: Geology of the Ocoee Whitewater Center, Cherokee National Forest
http://pubs.usgs.gov/gip/ocoee/

Geologic Time
http://pubs.usgs.gov/gip/geotime/

The Earth is very old -- 4.5 billion years or more -- according to recent estimates. This vast span of time, called geologic time by earth scientists, is difficult to comprehend in the familiar time units of months and years, or even centuries. How then do scientists reckon geologic time, and why do they believe the Earth is so old? A great part of the secret of the Earth's age is locked up in its rocks, and our centuries-old search for the key led to the beginning and nourished the growth of geologic science.

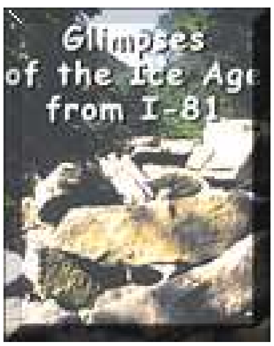


The Geology of Radon
http://energy.cr.usgs.gov/radon/georadon.html

High levels of indoor radon are found in every state. We know from medical and environmental studies that radon can be a health risk, primarily as a cause of lung cancer. Radon comes from the soil, rock, and water around us. Because levels of radon vary from place to place, and because houses differ in their vulnerability to radon, it is important that all homes be measured for radon. These pages present important geological information about radon; how it forms, the kinds of rocks and soils it comes from, and how it moves through the ground or is carried by water into buildings, and explains the way geologists estimate the radon potential of an area.

Glaciers: Clues to Future Climate
http://pubs.usgs.gov/gip/glaciers/

A glacier is a large mass of ice having its genesis on land and represents a multiyear surplus of snowfall over snowmelt. At the present time, perennial ice covers about 10 percent of the land areas of the Earth. Although glaciers are generally thought of as polar entities, they also are found in mountainous areas throughout the world, on all continents except Australia, and even at or near the Equator on high mountains in Africa and South America.



Glimpses of the Ice Age from I-81
http://pubs.usgs.gov/gip/i81/

Travelers on Interstate Highway 81 can see remnants of the Ice Age on the mountains between Strasburg and Harrisonburg, Virginia. Scattered along the miles of green, forested mountains are many gray patches without any forests. These treeless patches, or openings, in the steep mountain forests are block fields -- geologic features that owe their origin to the Ice Age.

Gold
http://pubs.usgs.gov/gip/gold/

Through the ages, men and women have cherished gold, and many have had a compelling desire to amass great quantities of it -- so compelling a desire, in fact, that the frantic need to seek and hoard gold has been aptly named "gold fever." Gold was among the first metals to be mined because it commonly occurs in its native form -- that is, not combined with other elements -- because it is beautiful and imperishable, and because exquisite objects can be made from it.

TEXT ONLY [NO GRAPHICS]
http://pubs.usgs.gov/gip/prospect1/goldgip.html

The Great Ice Age
http://pubs.usgs.gov/gip/ice_age/

The Great Ice Age, a recent chapter in the Earth's history, was a period of recurring widespread glaciations. Mountain glaciers formed on all continents, the icecaps of Antarctica and Greenland were more extensive and thicker than today, and vast glaciers, in places as much as several thousand feet thick, spread across North America and Eurasia.

The Interior of the Earth
http://pubs.usgs.gov/gip/interior/

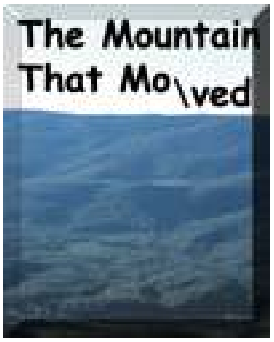
Three centuries ago, Sir Isaac Newton determined that the average density of the Earth is twice that of surface rocks and that the Earth's interior therefore must be composed of much denser material. Our knowledge of what's inside the Earth has improved immensely since Newton's time, but his estimate of the density remains essentially unchanged. This brochure presents current information on what makes up the interior of our planet.

[Man Against Volcano: The Eruption on Heimaey, Vestmannaeyjar, Iceland](http://pubs.usgs.gov/gip/heimaey/)
http://pubs.usgs.gov/gip/heimaey/

One of the most destructive volcanic eruptions in the history of Iceland began in the early morning of January 23,1973, near the country's premier fishing port, the town of Vestmannaeyjar, on Heimaey, the only inhabited isle in the Vestmannaeyjar volcanic archipelago. This booklet discusses the impact of the 1973 volcanic eruption of Eldfell on the island of Heimaey. Before the eruption was over, approximately one-third of the town of Vestmannaeyjer had been obliterated, but, more importantly, the potential damage probably was reduced by the spraying of seawater onto the advancing lava f!ows, causing them to be slowed, stopped, or diverted from the undamaged portion of the town.

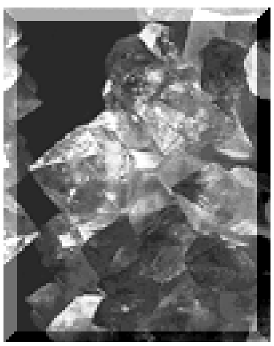
Monitoring Active Volcanoes
http://pubs.usgs.gov/gip/monitor/

Centuries ago, the Romans attributed volcanic and related phenomena (including earthquakes) mainly to the movement of wind imprisoned inside the Earth rushing violently to the surface. Today, scientists know that volcanic eruptions occur when buoyant magma (molten rock) that formed deep in the Earth ascends to the surface and ultimately is ejected upon release of gas pressure. With precise instruments and refined data analysis, it is now possible to track the subsurface movements of magma by monitoring the earthquakes and measuring the ground changes that accompany such movements.



[The Mountain That Moved
http://pubs.usgs.gov/gip/mountain/](http://pubs.usgs.gov/gip/mountain/)

Prehistoric, giant landslides in Montgomery and Craig Counties, Va., in the Blacksburg/Wythe Ranger Districts of the Jefferson National Forest, are the largest known landslides in eastern North America and are among the largest in the world. One of the landslides is more than 3 miles long! The ancient, giant landslides extend for more than 20 miles along the eastern slope of Sinking Creek Mountain. Enormous slabs of rock ranging from about 0.2 to more than 1.5 square miles in size broke loose and slid downslope under the influence of gravity. The movement of some slides may have been slow, but the movement of others was probably sudden and catastrophic.



[Natural Gemstones
http://pubs.usgs.gov/gip/gemstones/](http://pubs.usgs.gov/gip/gemstones/)

A natural gemstone is a mineral, stone, or organic matter that can be cut and polished or otherwise treated for use as jewelry or other ornament. A precious gemstone has beauty, durability, and rarity, whereas a semiprecious gemstone has only one or two of these qualities. A gem is a gemstone that has been cut and polished.

Our Changing Continents

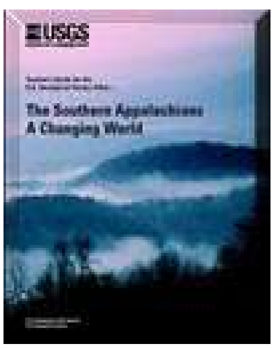
http://pubs.usgs.gov/gip/continents/

Where were the land areas and oceans of the North American Continent 1 million years ago, compared to their present locations? Was North America always about the same size and shape that it is today? To answer these questions, geologists must interpret the clues they find preserved in the rocks.

The San Andreas Fault
http://pubs.usgs.gov/gip/earthq3/

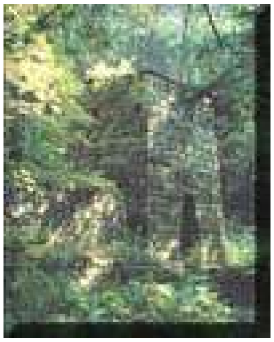
Scientists have learned that the Earth's crust is fractured into a series of "plates" that have been moving very slowly over the Earth's surface for millions of years. Two of these moving plates meet in western California; the boundary between them is the San Andreas fault.

TEXT ONLY [NO GRAPHICS]
http://pubs.usgs.gov/gip/earthq3/safaultgip.html



***The Southern Appalachians: A Changing World* Teacher's Guide**
http://pubs.usgs.gov/gip/so_app/

The video *The Southern Appalachians: A Changing World* describes the Southern Appalachian Mountains and how the geologic events that took place millions of years ago influenced the landscape, climate, soils, and living things that can be seen there today. Spanning a vast area from Virginia to Georgia, the Southern Appalachians are some of the oldest mountains on Earth. Molded and shaped over eons by volcanism, erosion, glaciation, and other geologic forces, these mountains are known worldwide for their unusual beauty and rich biological diversity. This teacher's guide summarizes the video and includes 17 suggested activities and discussion topics to enhance viewing.



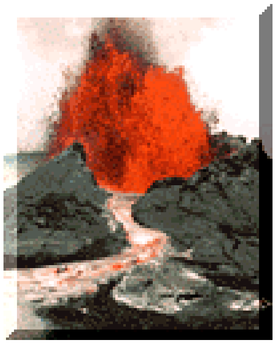
Silent Reminders
http://pubs.usgs.gov/gip/silent/

The iron industry played a vital role in the industrialization of the United States and in the development of the U.S. economy and society. Much of the early history of the iron industry took place in Virginia. The remains of 11 iron furnaces and nearby mines in the George Washington and Jefferson National Forests in Virginia and West Virginia are silent reminders of a time when iron mines and furnaces operated along a belt that extended through the Appalachian Mountains from New York State to Alabama.

The Severity of an Earthquake
http://pubs.usgs.gov/gip/earthq4/severitygip.html

Earthquakes are the result of forces deep within the Earth's interior that continuously affect the surface of the Earth. The energy from these forces is stored in a variety of ways within the rocks. When this energy is released suddenly, for example by shearing movements along faults in the crust of the Earth, an earthquake results. The severity of an earthquake can be expressed in terms of both intensity and magnitude. However, the two terms are quite different, and they are often confused.

TEXT ONLY [NO GRAPHICS]
http://pubs.usgs.gov/gip/earthq4/severity_text.html



Volcanic and Seismic Hazards on the Island of Hawaii
http://pubs.usgs.gov/gip/hazards/

The eruptions of volcanoes often have direct, dramatic effects on the lives of people and on their property. People who live on or near active volcanoes can benefit greatly from clear, scientific information about the volcanic and seismic hazards of the area. This booklet provides such information for the residents of Hawaii so they may effectively deal with the special geologic hazards of the island.

Volcanoes
http://pubs.usgs.gov/gip/volc/

This booklet presents a generalized summary of the nature, workings, products, and hazards of the common types of volcanoes around the world, along with a brief introduction to the techniques of volcano monitoring and research.

TEXT ONLY [NO GRAPHICS]
http://pubs.usgs.gov/gip/volc/text.html

Volcanoes of the United States

http://pubs.usgs.gov/gip/volcus/

The United States ranks third, behind Indonesia and Japan, in the number of historically active volcanoes (that is, those for which we have written accounts of eruptions). In addition, about 10 percent of the more than 1,500 volcanoes that have erupted in the past 10,000 years are located in the United States. Most of these volcanoes are found in the Aleutian Islands, the Alaska Peninsula, the Hawaiian Islands, and the Cascade Range of the Pacific Northwest; the remainder are widely distributed in the western part of the Nation. A few U.S. volcanoes have produced some of the largest and most dangerous types of eruptions in this century, while several others have threatened to erupt.

TEXT ONLY [NO GRAPHICS]
http://pubs.usgs.gov/gip/volcus/ustext.html

TEXT-ONLY [NO GRAPHICS] GENERAL INTEREST PUBLICATIONS

Collecting Rocks
http://pubs.usgs.gov/gip/collect1/collectgip.html

The Earth is made of rock, from the tallest mountains to the floor of the deepest ocean. Thousands of different types of rocks and minerals have been found on Earth. By studying how rocks form and change, scientists have built a solid understanding of the Earth we live on and its long history.

Plain Geology
http://pubs.usgs.gov/gip/plain.html

More than 50 years ago former Director George Otis Smith recognized that scientific reports are often couched in words and phrases that are understandable only to other scientists, engineers, or technicians. His plea for "Plain Geology" was a classic, just as applicable now as it was in 1921. It is herewith reprinted to make it generally available.

Prospecting for Gold in the United States
http://pubs.usgs.gov/gip/prospect2/prospectgip.html

Anyone who pans for gold hopes to be rewarded by the glitter of colors in the fine material collected in the bottom of the pan. Although the exercise and outdoor activity experienced in prospecting are rewarding, there are few thrills comparable to finding gold. Even an assay report showing an appreciable content of gold in a sample obtained from a lode deposit is exciting. The would-be prospector hoping for financial gain, however, should carefully consider all the pertinent facts before deciding on a prospecting venture.

Monitoring Active Volcanoes

By Robert I. Tilling

Lava fountains, approximately 100 meters high, play at the vent during the September 1977 eruption of Kilauea Volcano. New lava flows and downed trees in foreground. (Photo by Boone Morrison.)

COVER PHOTOGRAPH: Scientist measures 350-meter-high fountain during March 1983 eruption at Kilauea Volcano, Hawaii.

Geologist records data at Redoubt Volcano, Alaska, while operating a Correlation Spectrometer (COSPEC), to measure the amount of sulfur dioxide in volcanic plumes.

This on-line edition contains the text from the original book in its entirety. Some figures have been modified to enhance legibility at screen resolutions.

The printed version of this publication is one of a series of general interest publications prepared by the U.S. Geological Survey to provide information about the earth sciences, natural resources, and the environment. The Learning Web

Volcanoes!: Introduction

(For grades 4-8)

*This packet is only available online.

Volcanic eruptions are among the Earth's most powerful and destructive forces. Imagine hearing a volcano erupt thousands of miles away. Imagine looking through binoculars and seeing the top of a mountain collapse. Imagine discovering an ancient Roman city that had been buried in volcanic ash.

Volcanoes are also creative forces. The Earth's first oceans and atmosphere formed from the gases given off by volcanoes. In turn, oceans and an atmosphere created the environment that made life possible on our planet. Volcanoes have also shaped the Earth's landscape. Many of our mountains, islands, and plains have been built by volcanic eruptions. (View Poster Figure 1)

Why Do Volcanoes Erupt?

Deep within the Earth it is so hot that some rocks slowly melt and become a thick flowing substance called **magma**. Because it is lighter than the solid rock around it, magma rises and collects in magma chambers. Eventually some of the magma pushes through **vents** and **fissures** in the Earth's surface. A volcanic eruption occurs! Magma that has erupted is called **lava**.

Some volcanic eruptions are explosive and others are not. How explosive an eruption is depends on how runny or sticky the magma is. If magma is thin and runny, gases can escape easily from it. When this type of magma erupts, it flows out of the volcano. Lava flows rarely kill people, because they move slowly enough for people to get out of

their way. Lava flows, however, can cause considerable destruction to buildings in their path.

If magma is thick and sticky, gases cannot escape easily. Pressure builds up until the gases escape violently and explode. In this type of eruption, the magma blasts into the air and breaks apart into pieces called **tephra**. Tephra can range in size from tiny particles of **ash** to house-size boulders.

Explosive volcanic eruptions can be dangerous and deadly. They can blast out clouds of hot tephra from the side or top of a volcano. These fiery clouds race down mountainsides destroying almost everything in their path. Ash erupted into the sky falls back to Earth like powdery snow, but snow that won't melt. If thick enough, blankets of ash can suffocate plants, animals, and humans. When hot volcanic materials mix with water from streams or melted snow and ice, mudflows form. Mudflows have buried entire communities located near erupting volcanoes.

Because there may be hundreds or thousands of years between volcanic eruptions, people may not be aware of a volcano's dangers. When Mount St. Helens in the State of Washington erupted in 1980, it had not erupted for 123 years. Most people thought Mount St. Helens was a beautiful, peaceful mountain and not a dangerous volcano.

Where Do Volcanoes Erupt?

Volcanoes occur because the Earth's **crust** is broken into plates that resemble a jigsaw puzzle. There are 16 major plates. These rigid plates float on a softer layer of rock in the Earth's **mantle**. As the plates move about they push together or pull apart. Most volcanoes occur near the edges of plates. (View Poster Figure 2)

When plates push together, one plate slides beneath the other. This is a **subduction zone**. When the plunging plate gets deep enough inside the **mantle**, some of the rock on the overlying plate melts and forms magma that can move upward and erupt at the Earth's surface. At **rift zones**, plates are moving apart and magma comes to the surface and erupts. Some volcanoes occur in the middle of plates at areas called **hotspots** - places where magma melts through the plate and erupts.

Why Do Volcanoes Grow?

Volcanoes grow because of repeated eruptions. There are three main kinds, or shapes, of volcanoes based on the type of materials they erupt.

Stratovolcanoes build from eruptions of lava and tephra that pile up in layers, or strata, much like layers of cake and frosting. These volcanoes form symmetrical cones with steep sides. (View Poster Figure 3)

Cinder cones build from erupting lava that breaks into small pieces as it blasts into the air. As the lava pieces fall back to the ground, they cool and harden into cinders that pile up around the volcano's vent. Cinder cones are very small cone-shaped volcanoes. (View Poster Figure 4)

Shield volcanoes form from eruptions of flowing lava. The lava spreads out and builds up volcanoes with broad, gently sloping sides. The shape resembles a warrior's shield. (View Poster Figure 5)

Mount St. Helens!

On May 18, 1980, Mount St. Helens violently erupted. For 2 months the volcano showed signs that it was waking up from its 123-year sleep. Earthquakes beneath the mountain increased. Steam and ash erupted. And a "bulge" grew on the mountain's steep north side. All these warning signs signaled that magma was moving upward inside the volcano. (View Poster Figure 6, 7, 8, & 9)

The First 35 Seconds

On the morning of the eruption, Gary Rosenquist was camped about 36 kilometers (11 miles) from the summit of Mount St. Helens. Another camper was looking through binoculars and noticed that the upper right side of the volcano looked "fuzzy." He shouted that the "mountain was going." Rosenquist began taking photographs.

An earthquake that occurred beneath the volcano shook loose the "bulge" on the mountain's steep north side. Rock and ice slide down the mountain. Then the mountain exploded gases, magma, and water laterally out the side where the "bulge" had been. The explosion hurled hot rock and ash at hurricane speeds. Ash and steam erupted vertically from the volcano's crater and continued for 9 hours.

The Mountain Blows its Top

Volcanic eruptions alter the surface of the Earth's **lithosphere**, the hard, outermost shell of the Earth.

Many eruptions have built Mount St. Helens' beautiful cone shape. The May 18, 1980, eruption, however, dramatically changed the volcano's size and shape. It tore off the mountain's top and blasted a giant crater in its side.

Smaller eruptions have continued since 1980. Mostly occurring on the bottom of the volcano's crater, each eruption squeezes up thick, pasty lava and sometimes spews out tephra. In photograph number 11, look for the dome that has formed inside the crater. Slowly, the volcano is rebuilding itself into its former shape.

(View Poster Figure 10 and Poster Figure 11)

Up in the Air

Volcanoes erupt materials into the **atmosphere**, the gases and water vapor that surround the Earth.

The eruption blasted ash and gases into the atmosphere. Winds carried ash great distances. The ash-covered truck shown here (Link to Poster Figure 12) was parked 19 kilometers (12 miles) from Mount St. Helens. Two men who were camped nearby died, suffocating from hot volcanic ash. They were two of 57 known fatalities.

In Yakima, a city in eastern Washington, ash began to fall about an hour after the eruption. It became so dark that lights were turned on all day. (View Poster Figure 13.) Face masks were necessary when people went outside. (View Poster Figure 14)It took 10 weeks to haul away the ash from Yakima's streets, sidewalks, and roofs.

Water, Rock, and Mud

The **hydrosphere** - the liquid water on and under the Earth's surface - can make volcanic eruptions more dangerous.

Before the May 18, 1980, eruption, the streams on Mount St. Helens were crystal clear. After the eruption, streams were choked with rock and mud. When water mixed with rock and mud, it created volcanic mudflows (also called lahars) that were able to move down the volcano's slopes. On the steepest slopes, the mudflows traveled up to 144 kilometers per hour (90 miles per hour). Some of the mudflows were as high as a six-storied building!

(View Poster Figure 15 and Poster Figure 16)

Fire and Ice

Ice and snow - the part of the Earth system called the **cryosphere** - can melt during a volcanic eruption.

Snow and ice-capped volcanoes like Mount St. Helens are especially dangerous if they erupt. Much of the water in Mount St. Helens' mudflows came from snow and ice melted by the heat of the eruption. These mudflows were as thick as wet cement and able to carry along almost anything that they picked up. Eyewitnesses reported seeing mudflows carry everything from farm animals to a fully loaded logging truck. Fortunately, when the mudlfow hit, no one was in the bus pictured here.

(View Poster Figure 17 and Poster Figure 18)

Death and Recovery

The Earth's **biosphere** - the realm of all living things - is affected during a volcanic eruption.

The force of the eruption on Mount St. Helens blew down giant trees like they were match sticks. Almost all of the animals that lived in these forests were killed as well. Birds were particularly hard hit. Some birds survived the eruption but died later because the insects and plants they ate had died.

Surprisingly, some plants and animals did survive. Plants sprouted from roots that survived even though the plants' tops had been sheared off. Animals such as gophers and ants survived in their underground homes. Within a few weeks of the eruption deer, elk, and other animals moved in from nearby areas to take advantage of the new plants that were sprouting.

Lesson Plans and Activities

Changing World

The Earth is a time machine that has been changing throughout its 4.5 billion-year history. Tree rings, past climates, rocks, and caves all tell the story of change.

Working with Maps

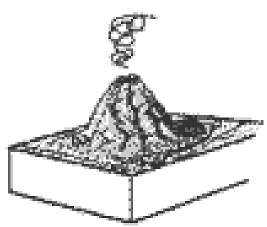
Maps of the Earth are illustrations of how we think of our planet. Throughout our history, explorers and scientists have tried to answer the questions "where are we?" and "Where are we going?"

Paper Models

Not unlike origami, paper models are fun to make, and provide three-dimensional views of earth events and phenomena. By printing out these models, cutting, pasting, and coloring, you'll soon have works of art--and science!

Go!

Volcanoes!



This model is intended to help students and others visualize a stratovolcano (inside and out) and to learn some of the terms used by geologists to describe it.

Educational Materials

As the Nation's largest water, earth, biological science, and civilian mapping agency, the U.S. Geological Survey (USGS) provides some of this science information as educational material. The product line includes a variety of teaching packets, booklets, posters, fact sheets, and CD-ROMs. Described below are products designed for K-12 teachers.

Go!

Helping Your Child Learn Geography

This 32-page booklet, published in cooperation with the U.S. Department of Education and the National Geographic Society, is designed to help parents stir childrens curiosity about geography. The activities can also be used in the classroom.

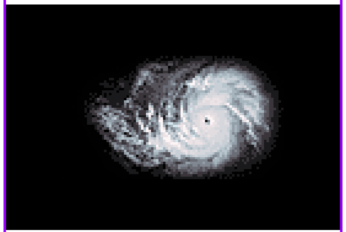
Earth Hazards



As a dynamic planet, the Earth has many hazards. Some of these hazards are from earthquakes and volcanic eruptions. Find out why the Earth is so restless.

Earthquake Effects

By studying the animation and the paper model, students will come to understand that earthquakes result from faulting in the Earth and that the potential consequences of earthquakes are numerous and serious.

LIFE SCIENCE

Changing World Lessons		Grades
	Exploring Caves, an interdisciplinary set of materials for K-3, covers at least five scientific disciplines: earth science, hydrology, mapping, biology, and anthropology. This unit aims at helping teachers to sort and organize the most important ideas in this rich scientific area. *This packet is only available online.	K-3
	In Mud Fossils, K-3 students are invited to explore and observe real fossils and then make their own fossils using mud and found objects. *This packet is only available online.	K-3
	This packet is appropriate for grades 4-6. It covers four themes: time, change, natural cycles, and the Earth as home. Includes a two-sided color poster, teacher guide, and three activities. Each activity includes background material, an experiment, three lesson plans, and suggestions for further reading. *This packet is only available online.	4-6

	Land and People: Finding a Balance is an environmental study project that engages high school students in studying ecosystems resource issues. The project focuses on the interaction between people and the environment in three regions on the United States: Cape Cod, Los Angeles, and the Everglades.	7-12
	In Geologic Age, students (grade 7-12) investigate radioactivity as a tool for measuring geologic time and how geologists use this information to determine the absolute age of rocks or minerals. *This packet is only available online.	7-12

GEOGRAPHY		
Working With Maps Lessons		**Grades**
	This teaching packet is appropriate for grades K-3. Students will learn basic concepts for visualizing objects from different perspectives and how to understand and use maps. The lessons center on a story about a little girl named Nikki who visits an imaginary amusement park. Nikki goes up in an unplanned balloon ride that gives her, and the students, different views of the park. *This packet is only available online.	K-3
	This teaching packet is for grades 5-8 and is organized around geographic themes: location, place, relationships, movement, and regions. A map is a picture of a place. Different maps show different information. No one map can show everything. Students will compare shaded relief maps, road maps, and topographic maps *This packet is only available online.	5-8
	Exploring Maps is an interdisciplinary set of materials on mapping for grades 7-12. Students will learn basic mapmaking and map-reading skills and will see how maps can answer fundamental geographic questions: "Where am I?" "What else is here?" "Where am I going?" *This packet is only available online.	7-12

EARTH SCIENCE

Earth Hazards Lessons		Grades
	In Volcanoes!, an interdisciplinary set of materials for grades 4-8, students will explore questions such as "What is a volcano?" "Where do volcanoes come from?" and "Can scientists forecast volcanic eruptions?" *This packet is only available online.	4-8
	Students will observe fault movements on a model of the earth's surface. *This packet is only available online.	7-12

Lesson 6: Volcanoes and People

fig. 1

Mount Ranier

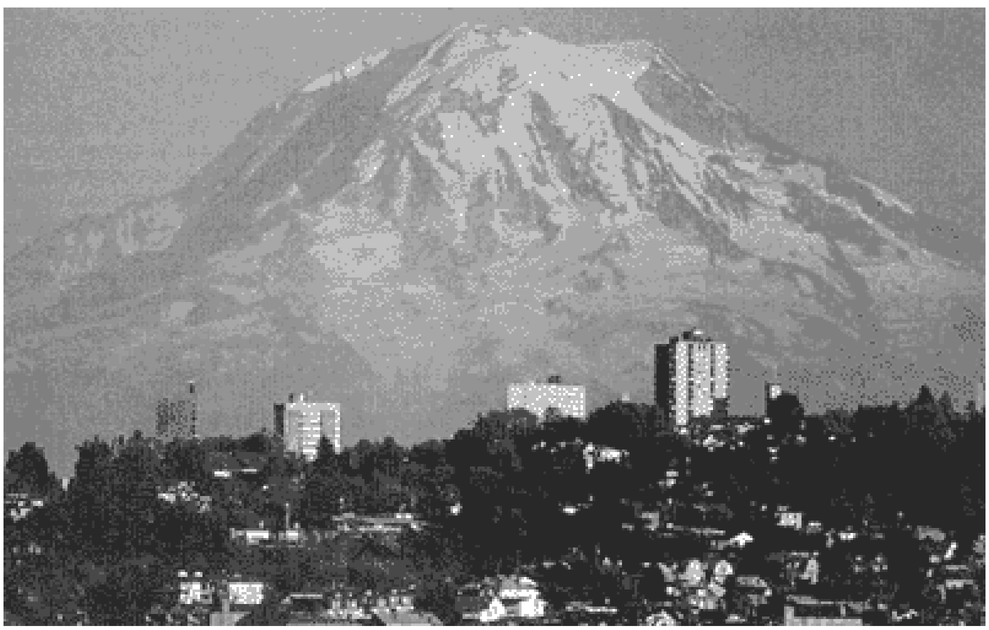

Fig 1: Snow-capped Mount Rainier rises behind Tacoma, Washington, Although Mount Rainier has not erupted in the past years, scientists consider it one of the most hazardous volcanoes in the Cascade Range.

Relative to other types of natural disasters, such as earthquakes, floods, hurricanes, and tornados, volcanic eruptions occur infrequently. Of the 1,500 active volcanoes on land, approximately 50-60 erupt each year. Approximately 1 million people have been killed by volcanic eruptions during the past 2,000 year.

- Activity 1
- Activity 2

Back to Top

United States Has Many Active Volcanoes

Because many of the most hazardous volcanoes have not erupted during recent historic times, people erroneously consider them extinct. For Mount St. Helens, more than a century had elapsed since a major eruption; most people were not aware of its dangers. Mount St. Helens is one of more than 65 active or potentially active volcanoes in the continental United States, Alaska, and Hawaii. Only Indonesia and Japan have more!

Scientists of the U.S. Geological Survey continue to monitor Mount St. Helens and other volcanoes in the Cascade Range. They know from its past eruptive history that many of Mount St. Helens' eruptions have occurred in concentrated periods of time lasting decades or even centuries. For example, one eruptive phase began in 1480 and lasted for about 300 years. Based on that history, scientists anticipate that Mount St. Helens will continue to erupt episodically for decades to come before it returns to a dormant stage.

The eruption of Mount St. Helens served as a reminder that other dormant volcanoes can come to life again. Mount Shasta in Northern California, for example, probably last erupted in 1786. On a geological time scale, this very recent volcanic activity suggests that magma is still present beneath the volcano. On average, it has erupted once every 300 years over the past 3,500 years. The chance is 1 in 25 to 30 that it will erupt in any one decade and 1 in 3 or 4 within a person's lifetime.

Back to Top

Forecasting Future Eruptions

Scientists have improved their ability to predict the time of a volcanic eruption, but estimating the size and style of an eruption remains a difficult challenge. Despite this challenge, scientists try to assess the potential consequences of a future eruption by reconstructing a volcano's history, which includes the pattern, magnitude, and frequency of its past eruptions. The principal means of developing this history is by mapping and dating the different types of volcanic materials that have been deposited by previous eruptions. Assembled into volcanic hazards maps, this information is vital for communities in volcanically active areas to use for land use and emergency preparedness planning. Knowing a volcano's past is crucial to forecasting its future behavior.

Fig 2: Cascade Eruptions Chart. Eruptions in the Cascades have occurred at an average rate of one to two per century during the last 4,000 years. Four of those eruptions would have caused considerable damage and loss of life if they had occurred today without warning.

Back to Top

Benefits Often Overlooked

Because of the destructive nature of a volcanic eruption, we tend to overlook a volcano's benefits. Magma circulates and deposits many valuable elements, such as gold, silver, zinc, sulfur, and copper. Magma heats ground water systems that can be tapped to produce geothermal power. This heated ground water can also result in geysers and hot springs. Volcanoes are also responsible for some of the world's most fertile soils. And volcanoes continuously bring materials from inside the Earth to the surface—recycling on a grand scale.

Lesson 5: Death and Recovery

fig. 1

"This is It!"

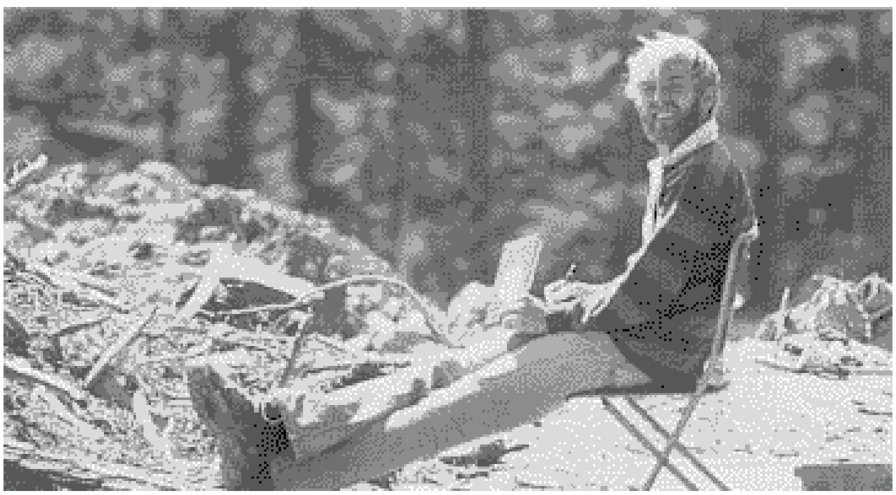

Fig 1: David A Johnston, USGS volcanologist, was monitoring Mount St. Helens on a ridge north of the volcano. At 8:30 a.m. on May 18, 1980, he made his last radio transmission: "Vancouver, Vancouver, this is it." No trace of him or his equipmenthas ever been found.

- Activity 1
- Activity 2

Back to Top

The Impact on Plants

Devastation in the wake of the avalanche was equally dramatic, although a few individual plants did survive, sprouting from root fragments that had been swept along on the surface of the debris. Plant survival in the path of the mudflows was likewise sparse. In addition, ashfall, which blanketed the forest to the northeast, smothered small plants and retarded the growth of larger ones.

The force of the lateral blast from Mount St. Helens' north flank blew down or snapped off trees within a radius of 25 kilometers (15 miles) north of the eruption site. At a distance of 25 kilometers (15 miles) from the blast, the force was no longer powerful enough to mow down trees, but it remained hot enough to kill the trees in its path. Ironically, some of the trees killed were old-growth Douglas firs 200 to 500 years old, which had survived previous eruptions.

Back to Top

The Impact on Animals

In the area affected by the blast, almost all wildlife vanished. Animals living above ground in the blast zone had no protection. Birds were particularly hard hit. Even those birds that survived the initial blast and avalanche died because the insects and plants they ate had perished. Insects were heavily affected, particularly by volcanic ash: the insects suffocated because ash clogged their body pores, or they dehydrated because glass-like ash abraded the cuticle that helps them retain moisture. Fewer than one-half of the small mammals species thought to have been living near Mount St. Helens were known to have survived. The death toll was nearly 7,000 large game animals, including deer, elk, and bear. The eruption severely damaged 26 lakes, killing an estimated 11 million fish, as well as incalculable numbers of fresh-water invertebrates. The loss of human lives was 57.

Back to Top

Some Organisms Survived

The most surprising discovery following the eruption, however, was that many organisms survived in what appeared to be a lifeless gray landscape. In particular, plants sprouted in areas that had been protected under a snow cover and along stream banks and hillsides where erosion thinned ash deposits. Within a month, fireweed appeared from roots that had survived even though the tops of the plants were sheared off. Animals such as gophers and ants survived in their subterranean homes, while lake-dwelling frogs and salamanders escaped the blast under a protective cover of late winter ice.

Back to Top

The Recovery

Three years after the eruption, biologists had identified the recovery of more than 90 percent of the preeruption species of plants. Many plants owed their lives to gophers. These burrowing animals acted like garden tillers, by bringing the existing soil to the surface and mixing it with nutrient-rich volcanic ash deposited by the May 18, 1980, eruption. As the gophers dug, they also brought seeds, bulbs, and root fragments up to the surface where they could begin to grow. The "tilled" soil was also far more likely to trap seeds blowing across its surface.

Lesson 4: Fire, Rock, and Water

Mount St. Helens 2 years before its cataclysmic eruption. When the volcano exploded on May 18, 1980, huge volumes of snow and ice quickly melted and contributed to devastating floods and mudflows.

As hot volcanic debris melted snow and glacier ice on the upper slopes of Mount St. Helens, mudflows - fast-moving mixtures of volcanic debris and water - developed within minutes of the beginning of the May 18 eruption. By 10:10 a.m. Pacific Daylight Time, a **mudflow** had traveled 43 kilometers (27 miles) downstream in the South Fork Toutle River valley. And before the day ended, nearly all the streams that had their sources on Mount St. Helens were affected by mudflows.

Fortunately, the major mudflow took hours to reach populated areas, giving people time to evacuate. As a result, only a few deaths were attributable to mudflows. Volcanic mudflows are also called **lahars**, a term borrowed from Indonesia, where mudflows are a major volcanic hazard.

- Activity 1
- Activity 2

Back to Top

Mudflows' Destructive Force

The largest and most destructive mudflow came down the valley of the North Fork of the Toutle River. It originated from the hot debris from the avalanche, lateral blast, and ash falls that had been deposited in the upper part of the river valley during the first few minutes of the eruption. By afternoon, water from melting snow and glacial ice, and

from within the debris itself began to flow. The mudflow steamed with hot volcanic materials (**pyroclastic debris**). Thick, like freshly mixed cement, the mudflow enveloped almost anything that it picked up along its path. Eyewitnesses reported seeing everything from ice chunks to a fully loaded logging truck in the flowing mixture. As debris, mud, and fallen trees choked the Toutle River, the river overflowed its banks and flooded, cresting at 6.4 meters (21 feet) above its normal stage.

Back to Top

Snow and Ice Compound Dangers

Mudflows are particular hazards at snow-capped volcanoes such as Mount St. Helens. Even small eruptions of hot volcanic material can very quickly melt large volumes of snow and ice. The resulting surge of water erodes and mixes with volcanic rock to become mudflows. For example, the 1985 eruption of Nevada del Ruiz in Colombia was a very small eruption - ejecting only about 3 percent as much magma as Mount St. Helens - yet it generated high-volume mudflows because of the presence of snow and glacial ice on the volcano. The mudflows that swept down from Nevada del Ruiz buried the town of Armero, killing more than 23,000 people. Nevada del Ruiz, like Mount St. Helens, has snow and ice year round at its highest elevations.

Back to Top

The Risk of Mudflows Continues

Even without a major eruption, mudflows and floods remain potential hazards of Mount St. Helens. As a result of the May 18, 1980, eruption, huge volumes of volcanic debris dammed preexisting streams. Because these dammed streams are composed of loose materials, they are structurally weak. If the dams fail, mudflows and floods can occur. Loose volcanic debris on steep slopes is also vulnerable to flowing during or after heavy rainfalls. The risk of mudflows and floods is greatest on Mount St. Helens during the winter months when precipitation is heaviest and the snowpack is thickest.

Lesson 3: Up in the Air

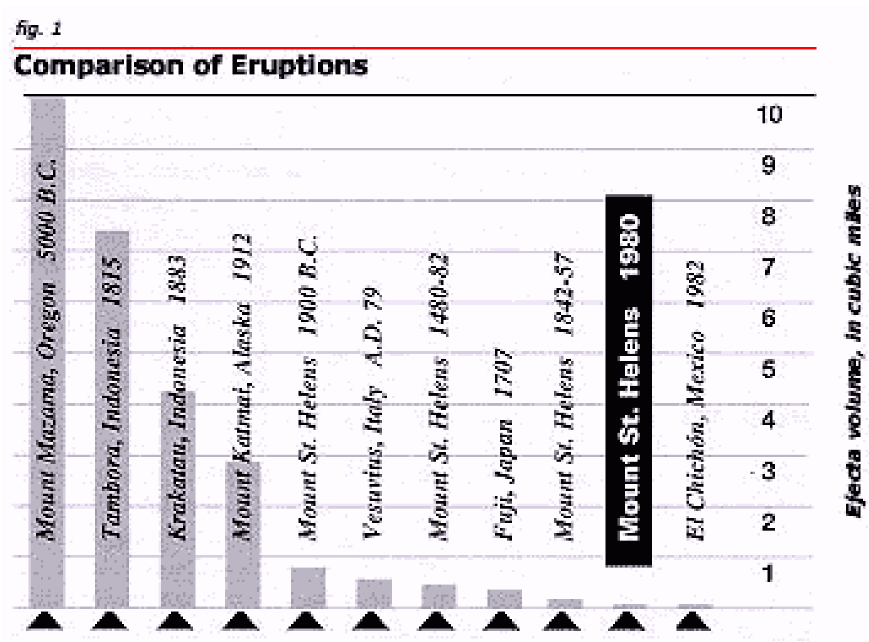

Fig 1: The volume of ash ejected during an eruption is one factor in measuring the size of an eruption. Note that the May 18 volume was less than several earlier eruptions of Mount St. Helens and considerably less than eruptions of other volcanoes.

In less than 10 minutes after the onset of the cataclysmic eruption of Mount St. Helens, a column of **tephra**, steam, **aerosols**, and gases reached an altitude of 19 kilometers (12 miles). Although the largest fragments of tephra fell back to the ground close to the volcano, the smallest fragments, ash and dust, were carried eastward by the **prevailing winds**. Five days after the eruption, monitoring instruments in New England detected ash from Mount St. Helens. Some of the ash eventually circled the globe and the smallest fragments and aerosols remained suspended for years in the **stratosphere**.

- Activity 1
- Activity 2

Back to Top

Day Becomes Night

Moving at an average speed of 95 kilometers per hour (60 miles per hour), the ash cloud reached Yakima, Wash., by 9:45 a.m. Pacific Daylight Time and Spokane, Wash., about 2 hours later. In Yakima, a city of 51,000, day became night. Automobile and street lights remained on for the rest of the day as the eruption continued for more than 9 hours. Ash as fine as talcum powder clogged engine air filters and choked people - face masks or handkerchiefs were a necessity for those who ventured out of doors.

Ash blanketed the ground like snow, but snow that would not melt. Residents shoveled and bulldozed ash from streets, sidewalks, and roofs; an estimated 600,000 tons of ash were removed from the city. It took 10 weeks to haul it away!

Back to Top

Volcanic Ash's Deadly Effects

Ash fall, however, is more than an inconvenience. It can be lethal to plants, wildlife, and humans. Swirling particles of ash in the atmosphere generated lightning, which in turn ignited hundreds of forest fires near the volcano. Autopsies revealed that most of the human deaths in the blast area resulted from asphyxiation, from inhaling hot volcanic ash during the first few minutes of the eruption.

As the ash settled to the ground, it also took its toll. Eastern Washington became known as the "ash belt" where many farm crops were destroyed in areas of thick accumulation. Volcanic ash can also affect aircraft operations. Jet engines are susceptible to damage: the volcanic ash coats and melts turbine blades, often causing the engines to stall.

Back to Top

Impact on Climate

Volcanic eruptions can also affect climate and weather patterns. Mount St. Helens' 1980 eruptions did not have a significant effect on global climate, but the 1982 eruption of El Chichòn in Mexico, for example, had measurable effects. El Chichòn's magma was much richer in sulfur than Mount St. Helens'. As a result, the Mexican volcano produced sulfuric acid aerosols (a fine mist of particles) that formed a layer of haze in the stratosphere. This haze, which can remain in the atmosphere for years, reflects the sun's radiation and reduces surface temperatures. For example, more than a year after the April 1815 eruption of Indonesia's Tambora volcano, its effects were felt. In the northeastern United States, 1816 was so cold that snow fell in some New England States in June and July. It was known in New England as the "year without a summer."

Back to Top

How Much Ash Fell?

In comparison to other historic eruptions, the volume of ash fall from the 1980 eruption of Mount St. Helens was relatively small (fig. 1). The eruption of Tambora ejected 150 times more ash than Mount St. Helens in 1980. And ash ejected by Mount Mazama (now Crater Lake), located about 125 kilometers (200 miles) south of Mount St. Helens, was even greater than Tambora. The 1980 eruption of Mount St. Helens was only an inkling of the destructive potential of a volcanic eruption.

Lesson 2: Creators and Destroyers

On May 18, 1980, Mount St. Helens erupted violently. At 8:32 a.m. Pacific Daylight Time, a magnitude 5.1 earthquake occurred about a mile beneath the volcano, triggering a catastrophic series of events that transformed Mount St. Helens' picturesque mountain landscape into a gray wasteland.

- Activity 1
- Activity 2

Back to Top

The Catastrophic Eruption

The earthquake shook the walls of the volcano's summit crater and triggered many small rock avalanches.Within seconds, a huge slab of the volcano's north flank began to slide, and small dark clouds billowed out of the base of the slide. Plumes of steam and ash also rose from the volcano's crater. As the avalanche of rock and ice raced down the mountain's north flank at more than 250 kilometers per hour (155 miles per hour), a massive explosion blasted out of the north side of the volcano. This **lateral blast** became a fearsome torrent of ash and rock that outraced the avalanche. Probably no more than 20 to 30 seconds had elapsed since the triggering earthquake!

Back to Top

The Eruption Was No Surprise

The eruption of Mount St. Helens was not a surprise. For nearly 2 months, scientists had been monitoring changes at Mount St. Helens. For a volcano to erupt, magma must move to the Earth's surface. Increased earthquake activity, eruptions of steam and ash, and changes in the shape of the surface of the volcano all signal that magma is on the move toward the surface.

Inside the volcano, the solid rock that surrounds the molten rock often cracks from the increased pressure and causes earthquakes. Between March 20 and May 18, more than 10,000 earthquakes were recorded beneath Mount St. Helens. The largest of these were felt by people living near the volcano. In addition to recording the discrete jolts characteristic of earthquakes, **seismographs** also detected continuous rhythmic vibrations called **harmonic tremors**. These numerous small earthquakes were further evidence that magma was moving within the volcano.

As magma made room for itself inside the volcano's cone, the surface of the volcano swelled, or inflated. By early April, Mount St. Helens' north flank began to visibly bulge and crack. The bulge grew 2 to 3 meters (7 to 9 feet) a day and it moved outwards about 150 meters (450 feet) in 2 months.

When the 5.1 magnitude earthquake shook Mount St. Helens on May 18, 1980, the bulge collapsed. The resulting avalanche was the largest **volcanic avalanche** recorded in historical times. In turn, the sudden removal of masses of rock and ice by the avalanches triggered an explosive eruption of steam trapped in cracks and voids in the volcano and of gases dissolved in the magma. Unleashed by the abrupt release of pressure, magma, rock, ash, aerosols, and gases exploded from within the volcano's north flank.

Back to Top

The Mountain is Transformed

In a few minutes, Mount St. Helens' symmetrical cone was transformed. It was 400 meters (1,312 feet) shorter and a gaping crater was gouged into its north side. An avalanche of rock, ash, ice, water, and fallen trees flowed as far as 9 kilometers (15 miles) down the valley of the North Fork Toutle River. Debris dumped into Spirit Lake raised the lakebed by more than 940 meters (295 feet). The lake's cool, crystal-clear waters became a black stew of rocks, mud, and floating trees. Gone were 70 percent of the **glaciers** that had crowned the volcano, melted by the heat of the eruption or carried away by the fast-moving avalanche. Towering forests with trees up to 45 meters (150 feet) were flattened and strewn like match sticks in the wake of the lateral blast and debris-laden avalanche.

Back to Top

Eruptions Continue

Between May 18, 1980, and October 1995, Mount St. Helens has had at least 21 eruptions of magma and dozens of smaller gas explosions. All of the volcanic activity has taken place in the bottom of the crater created by the May 18, 1980, eruption. There Mount St. Helens is rebuilding itself. During each eruption, new lava squeezes up and pushes aside old material from the surface of the **dome**. The volcanic activity that began in 1980 is not yet over.

VOLCANOES!

Introduction | Teacher's Guide | Download PDF

Grades 4-8 | Lessons: | 1 | 2 | 3 | 4 | 5 | 6

Lesson 1: Windows Into the Earth

Until the spring of 1980, most people thought of Mount St. Helens as a serene, snow-capped mountain and not as a lethal **volcano**. The mountain had given little evidence that it posed a hazard for more than a century—long time in human terms but a blink of an eye in terms of the mountain's 50,000-year geologic history. A series of earthquakes that began in mid-March of 1980 sounded the alarm that Mount St. Helens was awakening from its sleep. In other words, Mount St. Helens, which had been **dormant**, became **active** and likely to erupt. Its catastrophic eruption 2 months later was a reminder that a fiery world lies beneath the Earth's surface.

- Activity 1
- Activity 2

Back to Top

Why Volcanoes Occur

The roots of Mount St. Helen's are 110 to 330 kilometers (70 to 200 miles) below the Earth's surface. Here in the Earth's **mantle** (fig. 1) temperatures are hot enough to melt rock and form a thick, flowing substance called **magma**. Lighter than the solid rock that surrounds it, magma is buoyant much like a cork in water; being buoyant, it rises.

As the magma rises, some of it collects in large reservoirs, or magma chambers (poster fig.1) that fuel volcanoes. As the rising magma nears the Earth's surface, pressure decreases, which causes the gases in the magma to expand. This expansion propels the magma through openings in the Earth's surface: a volcanic eruption occurs. Once magma is erupted, it is called **lava**.

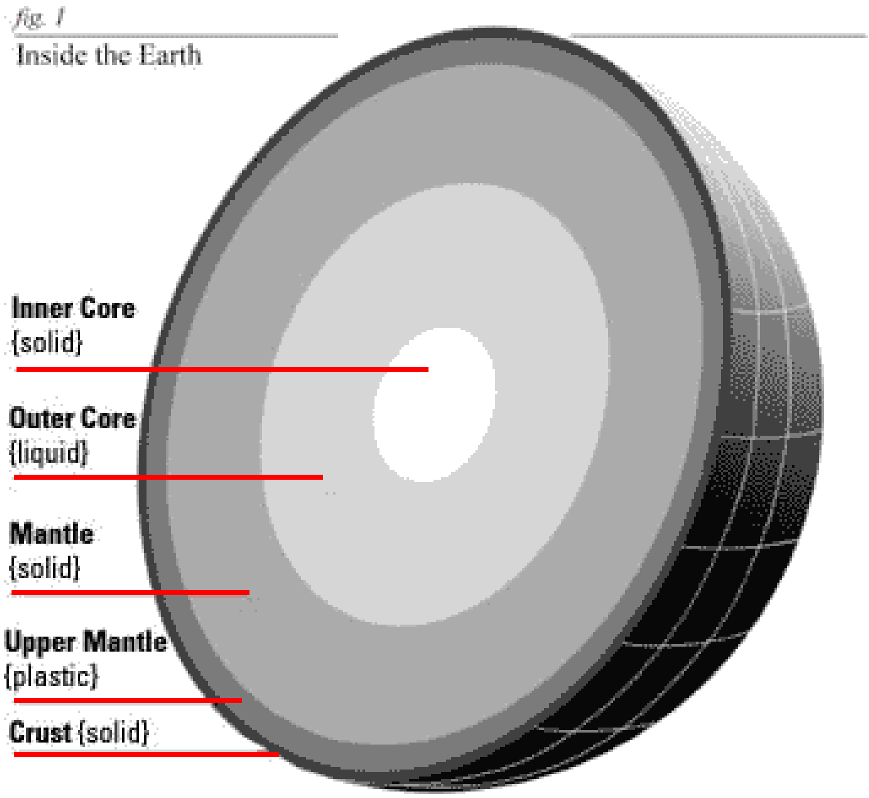

Fig 1: Magma is generated in the Earth's lithosphere, which is made up of the the crust and upper mantle.

Back to Top

Where Volcanoes Occur

Volcanic eruptions occur only in certain places and do not occur randomly. That's because the Earth's outermost shell - the **lithosphere** - is broken into a series of slabs known as **lithospheric** or **tectonic plates**. These plates are rigid, but they float on the hotter, softer layer in the Earth's mantle. (poster fig. 2) As the plates move about, they spread apart, collide, or slide past each other. Volcanoes occur most frequently at plate boundaries.

Some volcanoes, like those that form the Hawaiian Islands, occur in the interior of plates at areas called **hot spots**. (poster fig. 2) Although most of the active volcanoes we see on land occur where plates collide, the greatest number of the Earth's volcanoes are hidden from view, occurring on the ocean floor along **spreading ridges**.

Mount St. Helens is typical of more than 80 percent of the volcanoes that have formed on land. Known as **subduction zone** volcanoes, they occur along the edges of continents where one plate dives, or subducts, beneath a second plate. (fig. 2). When the subducting plate reaches about 100 kilometers (60 miles) into the Earth's hot mantle, it triggers partial melting of the overlying plate and forms new magma. Some of the magma rises and erupts as volcanoes.

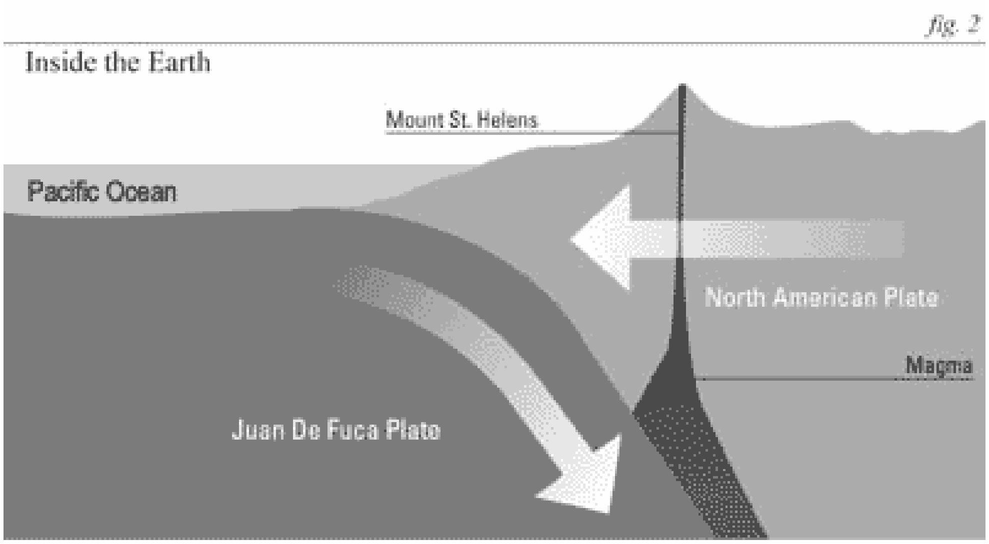

Fig 2: About 240 kilometers (150 miles) west of the northwest coast of the United States, the Joan De Fuca Plage plunges beneath the North American Plate. Mount St. Helen is among the volcanoes that have formed as a result.

Back to Top

Why Some Volcanoes Erupt

Some volcanoes, like Mount St. Helens, tend to be explosive when they erupt, whereas others, like Hawaii's Kilauea, tend to be effusive (loosely flowing) and nonexplosive. How explosive an eruption is depends on the magma's chemical composition and gas content, which in turn affect the magma's stickiness, or **viscosity**.

All magma contains gases that escape as the magma travels to the Earth's surface. If magma is fluid (as is Kilauea's), gases can escape relatively rapidly. As a result, lava flows instead of exploding during an eruption. If magma is viscous (as is Mount St. Helens), the gases cannot escape easily; pressure builds inside the magma until the gases sometimes escape violently.

In an explosive eruption, the sudden expansion of gases blasts magma into airborne fragments called **tephra**, which can range in size from fine particles of ash to giant boulders. After the initial explosive phase of the eruption, however, quieter lava flows can follow. In both explosive and nonexplosive (effusive) eruptions, volcanic gases, including water vapor, are released into the atmosphere.

Back to Top

Three Types of Volcanoes

Repeated volcanic eruptions build volcanic mountains of three basic types, or shapes, depending on the nature of the materials deposited by the eruption.

Shield volcanoes (poster fig. 5), such as Kilauea, form by effusive eruptions of **fluid lava**. Lava flow upon lava flow slowly builds a broad, gently sloping volcanic shape that resembles a warrior's shield.

Stratovolcanoes (poster fig.3), such as Mount St. Helens, build from both explosive and effusive eruptions. **Layers of tephra** alternating with layers of viscous lava flows create steep-sided, often symmetrical cones that we think of as the classic volcano shape. In his log of the Lewis and Clark Expedition, William Clark wrote: "Mount St. Helens is perhaps the greatest pinnacle in America."

The smallest volcanoes, **cinder cones** (poster fig. 4), such as Sunset Crater in Arizona, form primarily from explosive eruptions of lava. Blown violently into the air, the erupting lava **breaks apart into fragments called cinders**. The fallen cinders accumulate into a cone around the volcano's central vent. Cinder cones can form on the flanks of shield and stratovolcanoes.

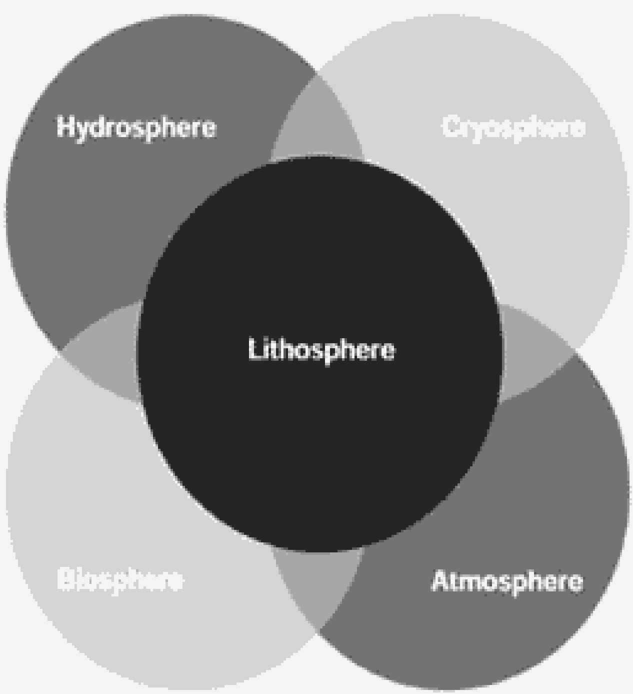
VOLCANOES!

Teacher's Guide and Lessons

Volcanoes is an interdisciplinary set of materials for grades 4-8. Through the story of the 1980 eruption of Mount St. Helens, students will answer fundamental questions about **volcanoes**: "What is a volcano?" "Where do volcanoes occur and why?" "What are the effects of volcanoes on the Earth system?" "What are the risks and the benefits of living near volcanoes?" "Can scientists forecast volcanic eruptions?"

fig. 1

The Earth's Systems



The Earth is a system comprising interactive components.

This teaching packet reflects the goals of the National Science Education Standards developed by the National Research Council. These standards recommend that middle school students be able to understand the Earth as a system. By learning about volcanoes, students will understand that the Earth comprises interacting components, or subsystems: the **geosphere** and the **biosphere**. In turn the geosphere comprises the lithosphere, the atmosphere, the hydrosphere, and the cryosphere. (fig. 1) These lessons show how the eruption of Mount St. Helens affected all of the Earth's subsystems.

Although volcanoes is an earth science subject, the activities in this packet incorporate a number of related subjects, including other sciences, social studies, language arts, and mathematics.

Contents of the online version of the VOLCANOES! teaching packet include:

- Information from the two-sided color poster
- Teaching guide (with glossary and bibliography)
- Six lesson plans with timed activities (activity sheets in PDF format)
- Evaluation sheet

About the poster

(See Introduction page.)

The attractive VOLCANOES! poster is now for sale, call 1-888-ASK-USGS for more information. The poster is a key visual aid for many of the activities. Side 1 is a dramatic photograph of Mount St. Helens erupting on May 18, 1980. Side 2 is a series of photographs and illustrations annotated with text written for student readers. The section titled "Volcanoes" is a basic introduction to volcanoes and volcanic eruptions. The section titled "Mount St. Helens" tells the story of the May 18, 1980, eruption of Mount St. Helens and the effect the eruption had on each of the components of the Earth system. All poster information is available, where appropriate, on this online edition of VOLCANOES!.

Each photograph and diagram has a number. When lessons refer to specific photographs and illustrations, they are referenced as "poster fig." followed by the number of the photograph or diagram.

A Photo Gallery of Florida's Big Bend Tidal Wetlands
Photo gallery of the Gulf of Mexico Tidal Wetlands research project at the USGS Center for Coastal Geology, St. Petersburg, Florida

Virtual Field Trip
Take a virtual field trip to that area along the west-central Florida coast.

Earthquake Hazards Program
Provide and apply relevant earthquake science information and knowledge.

Kids' Earthquake Glossary

Aerial Photographic Gallery
Find aerial photos and landstat images of places, space, hazardous locations, and weather.

Global Environment Outlook 2000
Read reports on what had happened to our environment in year 2000. Report is also available in multiple languages.

Pachamama: Our Earth - Our Future
Teach kids to learn to establish a personal relationship with our Mother, the Earth, and to care for her in the same way that we do for our friends and family.

Earthshots
Earthshots is a collection of Landsat images and text, designed to show environmental changes and to introduce remote sensing.

Coal Country
This kids' education software teaches children the basics about coal. Downloadable online.

Earth Surface Dynamics
Source for ground-based and remotely sensed earth-science data and information used by global-change researchers; assesses of the potential effects of global change on society.

Climatic Impacts
Climatic variability can potentially affect the ecosystems, landscape, water resources, and society of the Southwest. Papers in this section examine aspects of these potential impacts.

National Seismic Hazard Mapping Program
View seismic map images.

Debris-Flow Hazards in the United States
Learn what causes debris flow and how it affects us.

Reducing the Risk From Geomagnetic Hazards
This factsheet describes how and why magnetic storms occur.

Activities to Explore Acid Rain and Building Stones
This 38-page report provides 12 activities for students to explore the effects of acid rain on building stones.

Selected References on Fossils and Paleontology
List of publications, visual, audio, and educational materials.

Information on Fossils and Fossil Collecting
Contains links to information about fossils.

Selected References On Rocks, Minerals, And Gemstones
A list of publications, audios, visuals, and educational materials.

Bedrock Geology and Photo Gallery
Learn about metamorphic sedimentary rocks and see photos.

Geologic Images
Contains images of rocks, fossils, sinkholes, landscapes, and maps.

Paleontology at USGS
Learn about the different types of fossils, how they lived, and how they are used to answer important questions about the world we inhabit.

Books & Other Publications
These pages contain listings of online USGS books, reports, and pamphlets.

Geologic Information
Geologic and mineral resource surveys and mapping for the Department of the Interior.

USGS Geology in Parks
Learn geology basics from touring the national parks.

How Vulnerable Are Seattle Area Lifelines?
Lifelines, such as roads and electrical lines, and earthquake hazards in the greater Seattle area.

The Western Earth Surface Processes Team
Provide the geologic information required to understand the interactions among humans, plants, animals, air, water, soil, and rock on the Earth's surface region.

Surviving a Tsunami—Lessons from Chile, Hawaii, and Japan
This booklet informs how tsunami occurs and draws strategies from survival stories. Only available in PDF.

Table-Top Earthquakes
A demonstration of seismology for teachers and students that can be used to expand lessons in earth science, physics, math, social studies, and geography.

How to Build a Model Illustrating Sea-Floor Spreading and Subduction
Science project for students.

Significant Floods in the United States During the 20th Century
Contains a list of significant floods in the U.S. during the 20th century, plus types of floods.

Landslides
Learn the basics of landslides and recent landslide events.

Landslide Images
View photos of landslides.

Features That May Indicate Catastrophic Landslide Movement
How to watch out for possibilities of landslides.

Scientists in Action
News about careers in the natural sciences -- from mapping the planets to sampling the ocean floor, from protecting wildlife to forecasting volcanic eruption.s

Media for Science
Photo collections of maps, natural disasters, and activities at the USGS.

Coastal and Marine Geology Program
Contains abundant information about coasts, beaches, storms, and marine life.

Earth Science Photographs
Search for rocks, minerals, national parks, monuments, and other geologic images from the photo archive of the USGS.

Understanding Our PlanetThrough Chemistry
USGS site shows how chemists and geologists use analytical chemistry to study Earth.

Mineral Resources Program
Information on the occurrence, quality, quantity, and availability of mineral resources

Minerals Information
Statistics and information on the worldwide supply, demand, and flow of minerals and materials essential to the U.S. economy, the national security, and protection of the environment.

Gemstones
An overview of production of gemstones in the U.S.

Fun Facts About Rocks and Minerals
Contains interesting information on daily use of minerals and rocks.

Panoramic Photographs of Glacier National Park
Gallery of panoramic photographs taken from fire lookout stations in Glacier National Park, Montana during the 1930's.

Landslide Hazards in Glacial Lake Clays - Tully Valley, New York
This factsheet describes the landslide hazard at Tully Valley, New York.

Acid Rain and Our Nation's Capital: A Guide to Effects on Buildings and Monuments
Defines acid rain, explains what effects it has on marble and limestone buildings, and shows through a walking tour some of the places in our Nation's capital where you can see the impact of acid precipitation.

Collecting Rocks
Learn about different types of rocks and how to identify and collect them.

Our Changing Continent
Compares the geological changes of the continent of North America through the ages.

Deserts: Geology and Resources
Describes various types of desert; including extraterrestrial deserts, illustrates various desert features and eolian (wind) processes, and discusses the use of remote sensing in studying deserts and the process of desertification.

Dinosaurs: Facts and Fiction
Do you ever ask "Where did dinosaurs live?" and "Why did dinosaurs grow so big?" Find out here and more!

Earthquakes
This 20-page booklet explains the nature and causes of earthquakes. Describes techniques used to detect, record, measure, and predict seismic disturbances.

The San Andreas Fault
This 17-page booklet defines the San Andreas Fault and also discusses earthquake magnitude and intensity.

The Severity of an Earthquake
Earthquakes are the result of forces deep within the Earth's interior that continuously affect the surface of the Earth. The energy from these forces is stored in a variety of ways within the rocks.

Fossils, Rocks, and Time
USGS publication on the Earth's geologic history.

Natural Gemstones
Basic information about gemstones.

Geologic Time
USGS publication on the Earth's geologic time.

Glaciers: Clues to Future Climate
The relationships between glaciers and climate changes.

Eruptions of Hawaiian Volcanoes: Past, Present, and Future
The volcanic history of the Hawaiian Islands with dramatic, color photographs and diagrams and informative text on Hawaiis active shield volcanoes, Mauna Loa and Kilauea.

Volcanic and Seismic Hazards on the Island of Hawaii
This booklet provides information for the residents of Hawaii so they may effectively deal with the special geologic hazards of the island.

Man Against Volcano: The Eruption on Heimaey, Vestmannaeyjar, Iceland
This 28-page booklet discusses the impact of the 1973 volcanic eruption of Eldfell on the island of Heimaey. (In PDF format.)

Glimpses of the Ice Age from I-81
Know about block fields -- a geologic feature that originated from the Ice Age.

The Great Ice Age
Learn about a period of recurring widespread glaciations on earth. (In PDF format.)

The Interior of the Earth
Understand Earth's structure and composition.

Monitoring Active Volcanos
How scientists track volcanic movements.

The Mountain That Moved
Brochure about several largest landslides in the world. (In PDF format.)

The Geologic Story of the Ocoee River
The geologic story of the rocks exposed along the Ocoee River in Polk County, east Tennessee.

Plain Geology
Article on communicating effectively the results of geologic work to the public in a way that can be understood and used.

Gold
History and basics of gold.

Prospecting for Gold in the United States
Report.

Building Stones of Our Nation's Capital
Describes the source and appearance of many of the stones used in building Washington, D.C.

Volcanoes of the United States
This 44-page booklet describes the principal volcanoes in Hawaii, Alaska, and the Cascades Mountain Range that have erupted during the last few hundred years. Also summarizes recent events at active calderas in California and Wyoming.

Fire and Mud: Eruptions and Lahars of Mount Pinatubo, Philippines
Know all about the eruption history, impacts of the eruption, rocks, and lahars of Mount Pinatubo, Philippines.

Eruptions of Mount St. Helens: Past, Present, and Future
Highlights the eruptive history of this composite volcano, reviews its activity since its awakening in 1980, and speculates about its behavior in the future.

Eruptions of Mount St. Helens: Past, Present, & Future
Highlights the eruptive history of this Mount St. Helens.

This Dynamic Earth: The Story of Plate Tectonics
This colorfully illustrated 77-page booklet complements the "This Dynamic Planet"

poster and describes in detail the various aspects of plate tectonics.

Exploring Earthquakes: Online Glossary

USGS by State
Find geological, biologcial, mineral, and water information; also maps and streamflow of each State of U.S.

The Geology of Radon
Present information about radon, how it forms, where it comes from, how it moves, and how to estimate its amount in an area.

South Florida Information Access
Provides geological and biological information for the South Florida region.

South Florida Virtual Tour
View beautiful habitat, plants, and animals of South Florida.

A Tapestry of Time and Terrain
View earth surfaces through digital collage of geology and topography maps.

TerraWeb for Kids
Satellite and sonar images, remote-sensing education, and activities for kids!

USGS Volcano Hazards Program
A comprehensive overview of the U.S. Geological

Description of Program Videos
A list of videos produced by USGS

Photo Glossary of Volcano Terms
A picture speaks a thousand words. Learn volcano terms with images and photos.

Cascades Volcano Observatory
Focuses on hazards, activity, history, and monitoring of volcanoes, with emphasis on volcanoes of the Western United States.

Volcano and Hydrologic Hazards, Features, and Terminology
Contains detailed background info and photos of volcanic features and terms.

Current Volcanic Activity
Contains a list of sites with real-time volcano monitoring.

Photo Archives of Volcanoes
Numerous photos of various volcanoes, live images, eruption features, volcanic monitoring equipments, and more...

VolcanoCams Around the World
"Live" views of volcanoes from around the world, including Europe and Japan.

Ask-a-Geologist
Get your geological questions answered by geologists

Coastal and Marine Geology: Education & Outreach
Links to classroom activities and other education information.

Tsunamis and Earthquakes
General information on how earthquakes generate tsunamis and summaries of tsunami research using animations and VRML models

Floods and Flood Plains
Contains general background information on floods.

Hazards Fact Sheets
Documentations and reports of natural disasters.

The Chesapeake Bay Bolide: Modern Consequences of an Ancient Cataclysm
Find out about bolides, or extraterrestrial bodies, and the impacts they have on earth.

Geologic History of Cape Cod, Massachusetts
History and animals of Cape Cod, from the Great Ice Age to today.

Geologic History of Cape Cod, Massachusetts
Describes the glacial formation of Cape Cod, Massachusetts, and the ever-changing shore as the Cape adjusts to the rising sea.

USGS Teacher's Guide to the San Francisco Bay Area Map
Teaching guide to describe the gravity and magnetic fields of the Bay area; discusses how earth scientists use gravity and magnetism to "see" beneath surface of the Earth.

Karst Topography
Illustrates, through computer animation and a paper model, why caves develop in limestone.

Glaciers
Informative page on how glaciers grow and various types. Contains a gallery of illustrations and photos.

What Are Volcano Hazards?
Understand how volcanoes endanger us.

Popular Beach Disappears Underwater in Huge Coastal Landslide
Fact sheet documents how a landslide happened.

Earthquake ABC: A Child's View of Earthquake Facts and Feelings
A pictorial glossary for young kids with a complementary parents guide.

Agate Fossil Beds
Produced by National Park Service's Division of Publication, this book provides a glimpse of that time, long before the arrival of man, when now-extinct creatures roamed the land which we know today as Nebraska.

Effects of Fire in the Northern Great Plains
A literature review concerning fire effects on the grassland biome of the Northern Great Plains, with special emphasis on the use of fire for wildlife management.

Wetland Science Lesson Plans
Provides lesson plans that focus upon topics ranging from wetlands science to microscopy to graphing calculators.

Making a World of Difference
Records recent USGS contributions to the Nation.

GeoMedia
An earth-science educational tool for students between the ages of 10 and 14.

Earthquakes and Other Natural Hazards
Learn about earthquakes and other hazards and find out how to prepare for these hazards.

USGS Hurricanes and Coastal Storm Websites
Links to USGS sites that are related to hurricanes and storms.

Picturing Science
A collection of photographs that creates six tours that focus on different aspects of science and include: Magnificent Waterways, Phenomenal Landscapes, Wonderful Wildlife, Changing Worlds, Earth Scientists, and Popular Products.

Science Challenge Questions and Answers
A collection of 196 questions and answers addressing earth and planetary science topics.

Student Employment Web Site
Information about the USGS and its programs, student employment options, major occupations and their qualifications, salaries, benefits, career fair tips and interviewing techniques are located on the USGS Student Employment Web Site.

Hazards
Links to various hazards reports, including earthquake, volcanoes, flood, landslides, wildfire, wildlife diseases, geomagnetism, and coastal storms and tsunamis.

Wildland Fire Research
Find out how wildland fire affects the environment.

Fire Ecology Research
To restore more normal fire dynamics to a particular region, managers need to know how fire has historically affected the local system, and how it functions today. See research reports here.

Flagstaff Field Center
Reports of various geoscience studies.

Geologic animations
Animations include plate tectonics, gas, oil, and more.

Park Geology Teacher's Features
Teaching geology with national park examples.

Park Geology Tour of National Parks
Learn geology through online tour of national parks.

Windows to the Universe
Fun and intriguing site about the earth and space sciences.

Geologic Photo Search

Search photos of national parks.

A Model of Sea-Floor Spreading Teacher's Guide
Make a paper model illustrating the concept of sea-floor spreading.

Playtime for Kids
Connects to a bunch of exciting online games!

Earth Science Classroom Activities
Classroom activities on geology-related subjects for grades k-3.

The Fragile Fringe
Lesson plans and activities to teach students about wetlands.

More Than Skin Deep
A teacher's guide to caves.

NOAA Photo Library
Contains a vast variety of pictures from animals to landscape, the Arctic to China, space to ocean, historical art to satellite images and more.

Photo Library of National Oceanic and Atmospheric Administration
Find photos and images of wildlife, environment, fishery, landscape, ships, space, weather, and much more!

New Millennium Observatory Education Page
Features a curriculum for high school and middle school students based on the daily reports from expedictions at sea and NeMo results.

The EarthPulse Center
Interactive learning tool for earthquake location, magnitude, distribution and forecasting.

Science NetLinks
Connects to a library of online lessons.

Glacier National Park
Take an electronic field trip to the crown jewel of the Rockies.

Museum of Paleontology
Learn about fossils and earth history through background information and collection of fossils. Contains activities for both the classroom and students.

Learning From the Fossil Record
Fun education site about paleontology and earth-science.

Science Activities
Science activities for teachers and students. Topics include earth science, bioscience, physcial science, computers, and more.

Franklin Institute Earth Science Resources
Links page to abundant geology resources onlines.

Photo Gallery of Mount St. Helens
View over 190 photos of Mount St. Helens' landscape and wildlife before and after

eruption.

Wired Antarctica
Learn about the people doing research in Antarctica, what it's like there and how their research is important. Learn also how glaciers work in a series of lesson plans.

GLOBE: Global Learning and Observations to Benefit the Environments Education Program
Teachers and students -- help scientists by sending your scientific data and observations to their data archive.

Geostationary Satellite Server
NOAA's real-time satellite weather images.

IRIS Education and Outreach
Geology education page for teachers self learners.

Mineralogical Society of America
Contain articles on mineralogy and activities for kids.

Collector's Corner
See how and where you can collect rocks.

Official State Geologic Symbols
Find out your state rock, mineral, gem, and fossil, and learn more about them.

Mineralogy 4 Kids
Learn about minerals and play games.

Ask-A-Mineralogist
A forum where real mineralogists answer your questions.

E-cards of Natural Disasters
Send e-cards on images of volcanoes, earthquakes, tsunamis, and landslides.

World-Wide Tropical Cyclone Names
What's in a name? Find out the reserved names for hurricanes and typhoons.

National Hurricane Center: Tropical Prediction Center
Contains recent and historical storm information, weather forecast, maps, and satellite images.

National Oceans and Atmosphere Administration Homepage
Come here to learn about global weather, oceans, fisheries, and view real-time information.

American Geological Insititute Education
Produce innovative inquiry-based curriculum for K-12 earth science education.

Athena, Earth and Space Science
K-12 education page for teachers and students.

Bureau of Land Management
The Bureau of Land Management administers 264 million acres of public lands containing natural, historical, cultural, recreational, and economic resources.

Geo Mysteries with Rex, the Dino Detective
Fun and interactive geologic site for kids.

Post Card Tours of National Parks
View national parks from post card images.

Photo Library Resources
Link to various image galleries from the Department of Interior.

Earth Science Activities
Contains classroom activities including creating a model of the Earth's interior, identifying minerals, and more.

Kids Game Page
Have a blast with FEMA's online games, stories, and hands-on activities!

Earthforce
Informative site about forces that cause eruptions, quakes, and floods.

A Teacher's Guide to the Geology of Hawaii Volcanoes National Park
Contains information and classroom activities about plate tectonics, volcanoes, hot spots, mantles, lava, and more.

SCEC Earthquake Education Module
Site for high school- and undergraduate-level students. Contains info, graphics, and activities that explain how earthquakes happen.

Tectonic Plates Education Module
Contains information, animations, and student activities about tectonic movements of the Earth's surface.

Image Gallery from the U.S. Fish and Wildlife Service
Find images of fishes, wildlife, duck stamps, landscapes, and more.

This Planet Really Rocks
Know all the basics about rocks and rock collecting.

Echo the Bat
Understand light, remote sensing, and biodiversity.

Global Change Master Directory
A comprehensive directory of information about global change, such as global warming.

Earth from Space: Astronauts' Views of the Home Planet
Search photos taken from space from a database of over 375,000 images.

U.S. Department of the Interior, U.S. Geological Survey, Reston, VA, USA

Earthquakes Volcanoes Floods Landslides Storms Fire

Understanding the mechanisms of natural events, such as earthquakes, volcanic eruptions, landslides, and floods, is important for the United States and the world at large. Natural disasters have cost the U.S. alone 50 billion dollars in recent years. By better understanding why natural events occur, we can plan and manage in ways that will lessen the severity of these hazards. Through scientific research, earth science educational programs, and societal planning and preparedness, not only will the damaging effects of natural hazards be reduced, but we will better understand the Earth on which we live.

- Abstract from USGS Water Education Posters

Looking at water, you might think that it's the most simple thing around. Pure water is colorless, odorless, and tasteless. But it's not at all simple and plain and it is vital for all life on Earth. Where there is water there is life, and where water is scarce, life has to struggle.

Water Use

Water truly is a resource that gets used and used for everything. The same water can be utilized many times.

From the mountains, the river flows through a reservoir and past urban, rural, and industrial settings. Water is available from surface sources, such as rivers, ponds, and lakes, and from ground-water sources called aquifers.

Recreation, hydroelectric power generation, nature's needs, and transportation are instream uses, which means that the water remains in the river. Consequently, very little water is consumed. The water can be reused farther downstream. Mining, public supply, commercial, domestic, wastewater-treatment, agriculture, thermoelectric power generation, and industrial are offstream uses, which means that the water is withdrawn from a source such as the river or ground. But only a part of the water withdrawn is actually consumed, so the remaining part is returned to the river or ground and can be used again. Different offstream uses consume different proportions of the water they withdraw.

Water Quality

What is water quality? To some people, water quality may suggest only "clean" water for drinking, swimming, and fishing. But to the farmer or manufacturer, water quality may have an entirely different meaning. One of the most important issues concerning the quality of water is how that water will be used. Water that is perfectly fine for irrigation might not be suitable for drinking or swimming.

The quality of water can change as it flows over the land surface as rivers, streams, lakes, or ponds (surface water), or under the land surface (ground-water). Because surface and ground waters are interconnected in some areas, changes in the quality of surface water can affect the quality of the area's ground-water, and vice versa. These changes in water quality may be due to natural factors or human activities.

As rock minerals come in contact with water, some dissolve and become part of the surface- or ground-water system. Other natural materials, such as soil or organic matter, become suspended in the water and move from one place to another. The effects of human activities on water may result from land disturbances, which increase the amount of rock minerals, soils, or organic matter available to be transported by and dissolved in water, or from the addition of human-made pollutants. When water is degraded to a point that affects its use for a particular purpose, it has become polluted.

Water pollution originates from two very different sources: point sources and nonpoint sources. Human activities are associated with point sources (wastewater-treatment plant, storm drain, and factory) and nonpoint sources (suburban lawn, parking lot, construction site, landfill, logging area, septic tank, and agricultural field).

Explorers > Special Topics

Our lives are interlinked with the plants and animals in our surroundings. The ever-expanding human population, with needs for land, water, resources, and recreation, conflict directly with the habitat requirements of many species. By understanding cause-and-effect relationships between natural and human impacts on biological resources, we are able to interpret trends and work with resource managers to evaluate options to correct problems.

Find out more about plants and animals at the sites below:

Ecosystems
Natural Resources

Alaska Biological Science Research
Provide biological information and research findings to resource managers, policymakers, and the public to support sound management of biological resources and ecosystems in Alaska.

The Learning Room
Designed especially for mid-elementary-school-aged kids and up. Learn about all kinds of biologically related subjects.

Diversity and Abundance of Insects

Status and Trends of the Nation's Biological Resources
Summary of the status and trends of our nation's biological resources.

Nonindigenous Species
Discusses the issue of invasion by nonindigenous species.

Potential Effects of Global Change on Bats
Study on why bats are declining in population.

USGS Geology in Parks
Learn geology basics from touring the national parks.

Media for Science
Photo collections of maps, natural disasters, and activities at the USGS.

Monitoring Grizzly Bear Populations using DNA
Reports field methods and results of using DNA to monitor bear populations in the Glazier National Park.

Deserts: Geology and Resources
Describes various types of desert; including extraterrestrial deserts, illustrates various desert features and eolian (wind) processes, and discusses the use of remote sensing in studying deserts and the process of desertification.

Dinosaurs: Facts and Fiction
Do you ever ask "Where did dinosaurs live?" and "Why did dinosaurs grow so big?" Find out here and more!

South Florida Information Access
Provides geological and biological information for the South Florida region.

South Florida Virtual Tour
View beautiful habitat, plants, and animals of South Florida.

Cascades Volcano Observatory
Focuses on hazards, activity, history, and monitoring of volcanoes, with emphasis on volcanoes of the Western United States.

The Whooping Crane Report
Regularly updated reports on breeding whooping cranes.

Sea Birds Photo Gallery

View photos of sea birds.

Midcontinent Ecological Science Center
Contains articles on scientific researches and education pages for kids.

Links to Bat Web Sites

FrogWatch USA
Frogwatch USA is a frog-and-toad monitoring program for amateurs and scientists alike coordinated by the U.S. Geological Survey Biological Resources Division at the Patuxent Wildlife Research Center.

Northern Prairie Wildlife Research Center
Information for wildlife managers, scientists, and the public on natural-resource issues and biota of the North American Great Plains.

North American Reporting Center for Amphibian Malformations
Information on the issue of malformed amphibians, including a current map of the situation in the United States and Canada, and current literature and news articles.

What do the malformations of amphibians look like?
Photos that illustrate different types of abnormalities and malformations on amphibians, such as frogs and lizards.

Agate Fossil Beds
Produced by National Park Service's Division of Publication, this book provides a glimpse of that time, long before the arrival of man, when now-extinct creatures roamed the land which we know today as Nebraska.

House Bat Management
Describes batproofing techniques that will provide effective and acceptable alternatives for dealing with house bat problems and hazards.

An Introduction to Ants
Informative article on the ecology of ants.

Eastern Bluebird
Provides an introduction to the habitat requirements of the eastern bluebird and is designed to assist in the development of a comprehensive bluebird management plan.

North Dakota Prairie
A brief history of native prairie in North Dakota and information on programs and agencies concerned with its preservation.

Northeast Wetland Flora Field Office Guide to Plant Species
See illustrated glossary and more than 200 hundred species with detailed description and photos.

Southern Wetland Flora - Field Office Guide to Plant Species
Contains illustrated glossary and hundreds of detailed species descriptions with photographs.

Attracting Wildlife to Your Back Yard
A guide for homeowners who want to make their surroundings more attractive to wildlife.

Estimated Costs of Maintaining a Recovered Wolf Population
A cost comparison of maintaining a wolf population in Minnesota at levels.

Caterpillars of Eastern Forests
Includes species descriptions, life cycle and morphology information, and tips on photographing, rearing, collecting, and preserving specimens of many caterpillars living in forests of the eastern United States.

Caterpillars of Pacific Northwest Forests and Woodlands
A field guide to caterpillars commonly found in forests and woodlands of the Pacific Northwest, including sections describing the natural history, nomenclature, identification keys, and details for collection and preservation of specimens.

Grasslands
Features several animals and plants dependent on native grassland and provides insight into the relationship between remaining native grassland and biological resources.

Biological Control of Leafy Spurge
nformation on a major biological control program to combat the spread and reduce infestations of the aggressive, exotic perennial weed known as leafy spurge.

Macromoths of Northwest Forests and Woodlands
Informs on the moth's life cycle, species, and habitat. Includes photo of species.

Songbirds of North Dakota
Includes color photos, distributions and descriptive information on selected songbirds in North Dakota.

Butterflies of North America
Contains species photo gallery, information, and maps as to where butterflies appear.

Butterflies of North America
View over 500 photos of butterflies and species descriptions.

Moths of North America
Know more about moths, what they look like, where they live, and how they live.

Glossary of Bird Conservation Terms
Provide standard definitions for many of the terms used in avian conservation biology.

Snow Goose Population Problem
A three part series on the problems associated with overpopulation of snow geese in North America.

Western Wetland Flora
Field guide containing color photographs, line drawings, distinquishing features, range maps, and textual descriptions for 300 species of wetland plants that live in the western U.S.

Northern Prairie Biological Resources
List of information on the biotic resources of the Great Plains for decisionmakers, resource managers, scientists, and the public.

Assessing Breeding Populations of Ducks by Ground Counts
Methodology used to estimate annual abundance of breeding duck pairs on study areas in the prairie parklands and grasslands of southern Canada.

National Wildlife Health Center
Resource site for materials related to wildlife health research and the functions of the National Wildlife Health Center (NWHC).

West Nile Virus
Check out latest reports, preventions, and activity maps of West Nile Virus.

The Patuxent Plant List and Herbarium Collection
Its photo gallery contains a large collection of plants.

Birds of North America: Taxonomic List
List of birds by their family, species, and common names. Some listings link to an informative background page with pictures.

Amphibian Declines and Deformities
Links to researches on amphibian deformities and answers frequently asked questions on the issue.

From Microbes to Mammals - Invasive Species
Links to articles on various invasive species.

Hazards
Links to various hazards reports, including earthquake, volcanoes, flood, landslides, wildfire, wildlife diseases, geomagnetism, and coastal storms and tsunamis.

The Impact of Invasive Species on Reptiles and Amphibians
Links to researches about the issue of native amphibian and reptile populations worldwide under threat by exotic invasive species of plants and animals, including other reptiles and amphibians.

A Field Guide to the Reptiles and Amphibians of Coastal Southern California
Contains species photos, field guides, and illustrated glossary of amphibians and reptiles.

Western Ecological Research Center
Study of ecosystem, wildlife, and global change in Western U.S.

Invasive Species Research
Read reports on invasive plants and animals.

Sea Otter Research
Contains links to studies of sea otters.

Pintail Recovery Initiative
Follow pintail ducks' annual journey up and down the West Coast. Discover how biologists track the ducks, read their weekly journal, and track the ducks yourself using the interactive map.

The Rare Ones
Rare and endangered species

Park Geology Tour of National Parks
Learn geology through online tour of national parks.

Park Geology Teacher's Features
Teaching geology with national park examples.

Glacier National Park
Take an electronic field trip to the crown jewel of the Rockies.

The Fragile Fringe
Lesson plans and activities to teach students about wetlands.

The National Biological Information Infrastructure (NBII)
Use the NBII to answer a wide range of questions related to the management, use, or conservation of this Nation's biological resources.

More Than Skin Deep
A teacher's guide to caves.

GLOBE: Global Learning and Observations to Benefit the Environments Education Program
Teachers and students -- help scientists by sending your scientific data and observations to their data archive.

Bureau of Land Management
The Bureau of Land Management administers 264 million acres of public lands containing natural, historical, cultural, recreational, and economic resources.

FrogWeb: Amphibian Declines & Deformities
FrogWeb is a multiagency initiative that provides information about recent global declines and deformities among amphibian populations; presents efforts made by scientific agencies to study and address the phenomena.

Photo Gallery of Mount St. Helens
View over 190 photos of Mount St. Helens' landscape and wildlife before and after eruption.

Image Gallery from the U.S. Fish and Wildlife Service
Find images of fishes, wildlife, duck stamps, landscapes, and more.

Maps and Images

Topographic . Geologic . Links

- Text adapted from USGS TerraServer and USGS Western Earth Surface Processes Page.

Whether on paper or on a computer screen, a map is the best tool available to catalog and view the arrangement of things on the Earth's surface. Maps of various kinds--road maps, political maps, land use maps, and maps of the world--serve many different purposes.

Topographic Maps

One of the most widely used of all maps is the topographic map. The feature that most distinguishes topographic maps from maps of other types is the use of contour lines to portray the shape and elevation of the land. Topographic maps render the three-dimensional ups and downs of the terrain on a two-dimensional surface.

Topographic maps usually portray both natural and manmade features. They show and name works of nature, including mountains, valleys, plains, lakes, rivers, and vegetation. They also identify the principal works of man, such as roads, boundaries, transmission lines, and major buildings.

The wide range of information provided by topographic maps makes them extremely useful to professional and recreational map users alike. Topographic maps are used for engineering, energy exploration, natural resource conservation, environmental management, public- works design, commercial and residential planning, and outdoor activities like hiking, camping, and fishing.

- Adapted from COLLECTING ROCKS by Rachel M. Barker

Rocks Tell the Story of the Earth

The Earth is made of rock, from the tallest mountains to the floor of the deepest ocean. Thousands of different types of rocks and minerals have been found on Earth. Most rocks at the Earth's surface are formed from only eight elements (oxygen, silicon, aluminum, iron, magnesium, calcium, potassium, and sodium), but these elements are combined in a number of ways to make rocks that are very different.

Rocks are continually changing. Wind and water wear them down and carry bits of rock away; the tiny particles accumulate in a lake or ocean and harden into rock again. The oldest rock that has ever been found is more than 3.9 billion years old. The Earth itself is at least 4.5 billion years old, but rocks from the beginning of Earth's history have changed so much from their original form that they have become new kinds of rock. By studying how rocks form and change, scientists have built a solid understanding of the Earth we live on and its long history.

Rock-forming and rock-destroying processes have been active for billions of years. Today, in the Guadalupe Mountains of western Texas, one can stand on limestone, a sedimentary rock, that was a coral reef in a tropical sea about 250 million years ago. In Vermont's Green Mountains one can see schist, a metamorphic rock, that was once mud in a shallow sea. Half Dome in Yosemite Valley, Calif., which now stands nearly 8,800 feet above sea level, is composed of quartz monzonite, an igneous rock that solidified several thousand feet within the Earth. In a simple rock collection of a few dozen samples, one can capture an enormous sweep of the history of our planet and the processes that formed it.

Types of Rocks

Geologists classify rocks in three groups, according to the major Earth processes that formed them. The three rock groups are igneous, sedimentary, and metamorphic rocks. Anyone who wishes to collect rocks should become familiar with the characteristics of these three rock groups. Knowing how a geologist classifies rocks is important if you want to transform a random group of rock specimens into a true collection.

Explorers > Special Topics

- by Rob Dietz

An ecosystem is an area on the Earth that is a community of living organisms and their surrounding environment. Every person, animal, plant, rock, stream, and piece of land belongs to one or more ecosystems. For example, imagine an ecosystem made up of a freshwater pond that serves as a home for frogs, lily pads, fish, cattails, dragonflies, algae, and protozoa. Each of these organisms, along with its sources of food, sediments, nutrients, and the water itself, is a part of the pond ecosystem, which functions as a unit or a single community. Imagine, also, that this pond lies deep inside a forest. The pond and its inhabitants belong to the larger forest ecosystem, which also contains several rivers, other ponds, many kinds of wildlife, flowering plants, and (of course) trees. Ecosystems on Earth are incredibly diverse, both in size and in form–a large city that contains millions of people, their homes, and a built-up landscape is an urban ecosystem, while a small wildlife preserve within that city serves as a natural ecosystem.

Much like a person, an ecosystem has a given level of health. A healthy ecosystem performs many valuable functions, such as flood control, water purification, seed dispersal, pollination, pollutant removal, nutrient cycling, and habitat provision. These functions are beneficial to both humans and other inhabitants of ecosystems. Consider the value of one wetland ecosystem that helps remove toxic substances from drinking water, provides a nursery for baby fish, and supplies shelter for clams and mussels–and these are only a few of the services provided by this ecosystem. Many ecosystems experience the effects of disturbances. These disturbances can be caused by human actions, such as bulldozing a forest to build a highway, or they can be a result of natural events, such as soil erosion from heavy rains. Disturbances often decrease the ability of an ecosystem to provide valuable function, and thereby decrease the health of the ecosystem. A feature of ecosystems, from the smallest backyard to the entire globe, is that they tend to be resilient. Given time, ecosystems can often recover from disturbances, maintain their health, and continue to provide the functions necessary to sustain life on Earth.

Explorers > Special Topics

- by Frances Pierce

Natural resources, such as coal and oil, are the key sources supporting the lifestyle of today. Coal provides the energy needed to generate more than half of our Nation's electricity. Coal resources are abundant and still relatively inexpensive. The USGS helps the Nation identify the cleanest coal to use in power plants. Oil is the source of gasoline used to power cars, trucks, and boats, as well as being a source of compounds that go into making plastics, synthetic materials, and even medicines. Natural gas is used to heat many homes. The USGS provides the Nation with estimates of how much oil and gas remain and where they might be found.

The development of energy resources provides jobs for many people and contributes to our Nation's economic health. Removing coal, oil, and natural gas from the Earth, however, can affect the environment. Therefore, scientists need to study ways to minimize the negative effects of developing and using energy resources.

Scientists also are investigating new sources of clean, abundant energy. Of all the fossil fuels in use today, natural gas, or methane, is the cleanest burning. Methane may be the fuel that helps our Nation make the transition to using hydrogen gas as an energy source by the second half of this century. Energy produced from hydrogen gas would not generate harmful pollutants or carbon dioxide, a greenhouse gas.

USGS Fact Sheets (listed by Hazards Theme)

USGS activities in the hazards theme area deal with describing, documenting, and understanding natural hazards and their risks. These activities include long-term monitoring and forecasting, short-term prediction, real-time monitoring and communication with civil authorities and others during a crisis. Other significant activities are post-crisis analysis with scenario formulation to develop strategies to mitigate the impact of future events and preparation of coordinated risk assessments for regions vulnerable to natural hazards.

- VOLCANO FAQs

General Interest Publications

Paper copies of the following general interest publications can be ordered from:

USGS Information Services
Box 25286
Denver, CO 80225

- **VOLCANIC AND SEISMIC HAZARDS ON THE ISLAND OF HAWAII**
  Explains the types of hazards posed by volcanoes, earthquakes and tsunamis on Hawaii; gives maps showing the probability of coverage by lava flows.
  Paper copy -- 48 p. Free
- **VOLCANIC HAZARDS AT MOUNT SHASTA, CALIFORNIA**
  Describes the kinds of volcanic activity that have occurred in the past, shows areas that could be affected in the future, and suggests ways of reducing the risks.
  Paper copy -- 21 p. Free
- **VOLCANOES**
  Describes the principal types of volcanoes, different types of eruptions, associated volcanic phenomena, their geologic settings, and how volcanoes are monitored. Explains how volcanic activity endangers and helps mankind.
  Paper copy -- 45 p. Free
- **VOLCANOES OF THE UNITED STATES**
  Describes the principal volcanoes in Hawaii, Alaska, and the Cascades Mountain Range that have erupted during the last few hundred years. Summarizes recent events at active calderas in California and Wyoming.
  Paper copy -- 44 p. Free
- **MONITORING ACTIVE VOLCANOES**
  Explains the need for monitoring volcanic areas in the United States and elsewhere. Describes techniques used to monitor eruptions at Mount St. Helens, Kilauea, and elsewhere.
  Paper copy -- 17 p. Free

Special Publications

Paper copies of the following publications can be ordered from the address above.

- **ERUPTION OF HAWAIIAN VOLCANOES -- PAST, PRESENT AND FUTURE**
  Paper copy -- 54 p.
- **ERUPTIONS OF MOUNT ST. HELENS -- PAST, PRESENT, AND FUTURE**
  Paper copy -- 46 p.

New Fact Sheet: The Alaska Volcano Observatory--Expanded Monitoring of Volcanoes Yields Results

A new fact sheet describes the increased volcano monitoring and eruption warning capabilities of the Alaska Volcano Observatory. Scientists have increased the number of volcanoes monitored with seismic networks from 4 in 1995 to 27 in early 2004. AVO also uses data and images from meteorological satellites to identify hot areas on volcanoes in Alaska and the Russian Far East and eruption clouds resulting from explosive activity.

AVO is a cooperative effort of the U.S. Geological Survey, the University of Alaska Fairbanks Geophysical Institute, and the Alaska Division of Geological and Geophysical Surveys. The observatory was founded in 1988 to monitor and minimize the effects of volcanic eruptions in Alaska.

What's New on USGS Volcano Web Sites?

Panorama images from crater rim of Pu`u `O`o vent, Kilauea Volcano

Near real-time images are now available from a camera (circle in photo) located on the north rim of the Pu`u `O`o crater. The images are refreshed every five minutes. The camera is for research and monitoring purposes and subject to sporadic breakdown, and its remote location makes immediate repair impossible. Be sure to check out the overall status of the Kilauea eruption to provide an overall context for what is happening at the volcano.

Predict an Eruption: Case Study from Kilauea and Mount St. Helens volcanoes

Try your hand at predicting an eruption of Mount St. Helens volcano using data collected by scientists of the USGS Cascades Volcano Observatory. This presentation uses data from several eruptive episodes of Mount St. Helens in the 1980's to show the way in which a series of eruptions were accurately predicted by USGS scientists as far as 3 weeks in advance. Go to Predict an Eruption.

Volcano Watch Current issue of Volcano Watch, a weekly essay written by USGS scientists from the Hawaiian Volcano Observatory.

Anatahan Volcano Update

A volcano update is being hosted by the Hawaiian Volcano Observatory in collaboration with the Emergency Management Office of the Commonwealth of the Northern Mariana Islands.

Live panorama images of Pu`u `O`o's crater

Do you want to see what is going on in the crater of Pu`u `O`o, Kilauea's erupting vent? Then check out the new panorama image from a camera (circled in both photographs) located on the north rim of Pu`u `O`o's crater. The images are refreshed every five minutes. You will always find a link to the panorama on the Kilauea update page. We caution you to view the panorama in the overall context of what is happening at Kilauea Volcano. We urge you to always refer to the Kilauea update when viewing the panorama.

The camera is subject to sporadic breakdown, and its remote location makes immediate repair impossible. Cameras can be where people should not. Pu`u `O`o is off-limits to the general public because of multiple and significant volcanic hazards.

Archive of previous feature stories

Photograph by C. Heliker
12 September 2003

Photograph by C. Heliker
3 October 2003

Top: Within minutes of erupting on the crater floor of Pu`u `O`o, lava drains back into the East Pond Vent and causes vigorous lava spattering as high as 10 m. The flow and drainback lasted only a few minutes. Such activity is probably caused by rising bubbles of gas that lift lava to the surface. The crust breaks, allowing gas to escape vigorously and drive brief spattering or a low fountain. When most of the gas has been lost, lava drains back into the vent. This activity is called gas pistoning. For full sequence of images, see September 2003 archive.

Bottom: Lava spattering from the west vent in West Gap Pit of Pu`u `O`o sails over a hornito on the rim of the pit, now filled with lava. Several flows spilled from the pit down the northwest flank of Pu`u `O`o, adding yet more lava to the west shield. The hornito and West Gap Pit were present before this most recent activity.

USGS Child Privacy Policy

The USGS web site which referred you to this document conforms to the general U.S. Department of Interior policy on privacy as outlined in the DOI Privacy Statement and as detailed below.

This is how we will handle information we learn about you from your visit to our website. The information we receive depends upon what you do when visiting our site.

If you visit our site to read or download information, such as publications or press releases:

We collect and store only the following information about you: the name of the domain from which you access the Internet (for example, aol.com, if you are connecting from an America Online account, or princeton.edu if you are connecting from Princeton University's domain); the date and time you access our site; and the Internet address of the website from which you linked directly to our site.

We use the information we collect to measure the number of visitors to the different sections of our site, and to help us make our site more useful to visitors.

If you identify yourself by sending an E-mail:

If you send us personal identifying information by e-mail (for example, in a message containing a question or comment, or by filling out a form that e-mails us this information), we use it to respond to your requests. We may forward your e-mail to other Government employees or contract personnel who are better able to answer your questions. We do not keep or distribute lists of e-mail addresses to any parties outside of the USGS except as necessary to conduct official U.S. Government business. In no event, do we distribute lists of e-mail addresses to non-Government entities.

We want to be very clear: We will not obtain personally-identifying information about you when you visit our site, unless you choose to provide such information to us.

Privacy

The USGS web site which referred you to this document conforms to the general U.S. Department of Interior policy on privacy as outlined in the DOI Privacy Statement and as detailed below.

How we handle the information we gather when you visit our web site-

Web server activity logs

Like most web servers on the Internet, our servers collect and store all of the information that your web browser sends when it requests a web page, including:

- the name, domain, and numerical internet address of the "host" computer (typically a computer belonging to your Internet Service Provider and not your personal computer) from which you access the Internet;
- the date and time you accessed our site;
- the Internet address of the web page that you came from;
- the page you requested from our site and the number of characters sent to your computer; and
- the information your web browser software sends as its so-called "User Agent," which typically identifies the browser software and may also indicate the operating system and type of CPU used in your personal computer.

It is impossible to determine the actual identity of an individual user from this information.

The logs are periodically summarized and analyzed in order to study site usage over time and to perform other studies to help us improve the site's organization, performance, and usefulness.

Electronic mail

When you send us personal identifying information via e-mail (that is, in a message containing a question or comment, or by filling out a form that e-mails us this information), we use it to respond to your requests. We may forward your e-mail to other Government employees or contract personnel who are better able to answer your questions. We do not retain or distribute lists of e-mail addresses to any parties outside of the USGS except as necessary to conduct official U.S. Government business. In no event, do we distribute lists of e-mail addresses to non-Government entities.

File transfer protocol (FTP)

Many USGS sites using the file transfer protocol may also store your e-mail address if your web browser is configured to provide it. By default most web browser software does not send your e-mail address; this option is configured through your browser preferences. In Netscape Navigator, for example, this option must be set by you through the Advanced preferences category by the item labeled, "Send email address as anonymous FTP password."

Online surveys

When you voluntarily provide us with personal information as part of an online survey, we use it to perform various quantitative and qualitative analyses to improve customer service and satisfaction. We may forward the information collected to other Government employees or contract personnel to perform the actual analysis. You are under no obligation to participate in such surveys. Non-participation will not inhibit your use of our web site in any way. If you provided the information to us in error, you may request its removal at any time.

Ordering products

When you voluntarily provide us with personal information such as name, shipping and billing address, and credit card number when ordering products online, we use the information to fulfill your order. We may forward the information collected to other Government employees or contract personnel or to other computer systems (such as secure electronic commerce servers) to complete the requested transaction.

Marketing information

We may collect information from you, with your permission, that will allow us to provide various customer services, such as promotional materials and product availability notices. We may forward the information collected to other Government employees or contract personnel to provide specific marketing services. We will remove such information at your request.

Collection and release of gathered information

We want to make it clear that we will not obtain personal identifying information about you when you visit our web sites, unless you choose to provide such information to us. Except in the course of officially authorized law enforcement investigations, or in the event of a suspected attempt to deliberately circumvent our system's security with the intent to gain unauthorized access or to do physical damage (for example, an attack by hackers), we do not attempt to identify individual users or share any information we receive with any parties outside of the USGS. In the latter case, collected information associated with a suspected intruder might be shared through the USGS's Bureau Information Resources Security Administrator with an incident response service such as the CERT® Coordination Center.

Retention of collected information

Cookies - Some applications may save a "cookie" on your computer's hard disk to provide a temporary history of actions taken. A common example is the tracking of items placed in an online "shopping basket." We do not retain any record of "cookies" beyond what is necessary for running the application.

Web server activity logs - Monthly extracts of the log files are archived and stored off-line at our discretion for an indefinite period of time. Some statistical summaries derived from these data may be retained online or off-line at our discretion for an indefinite period of time.

E-mail - Information collected via e-mail will be retained at our discretion in a directly readable form for as long as necessary to complete our response. The e-mail itself may be retained in an archival form as required by Federal laws and regulations governing the retention of historical records of government agencies. For more information, please refer to the National Archives and Records Administration's Records Management Program.

Online surveys - Information collected via online surveys may be maintained at our discretion for an indefinite period of time.

Marketing information - Such information may be maintained at our discretion for an indefinite period of time.

Content Accuracy, Completeness, and Usability of USGS Data and Information

We make every effort to provide and maintain accurate, complete, usable, and timely information on our web sites. However, some USGS data and information accessed through these pages may, of necessity, be preliminary in nature and presented prior to final review and approval by the Director of the USGS. These data and information are provided with the understanding that they are not guaranteed to be correct or complete. Users are cautioned to consider carefully the provisional nature of these data and information before using them for decisions that concern personal or public safety or the conduct of business that involves substantial monetary or operational consequences. Conclusions drawn from, or actions undertaken on the basis of, such data and information are the sole responsibility of the user.

Copyrights and Trademarks

USGS-authored or produced data and information are in the public domain. While the content of most USGS web pages is in the public domain, not all the information on our site is in the public domain. Some images/graphics are used by USGS with permission. For other uses, you may need to obtain permission from the copyright holder under the copyright law.

You are welcome to make a link to any of the Web pages USGS has published on the Internet. There is no need to request permission.

The USGS identifier is trademarked and must be used in accordance with the rules outlined at Visual Identity System. Information on who may use the USGS identifier and how to obtain a copy of it is available at Use of the Trademarked USGS Identifier by Outside Organizations.

We will identify material we use from sources outside of USGS, and request others do the same when using information published by USGS. Credit can be provided by including on the page (or via a link to a credits page) a citation such as:

U. S. Geological Survey

Freedom of Information Act

Electronic Reading Room

Background

The Freedom of Information Act (FOIA), 5 U.S.C. 552, as amended, is based on the principle of openness in government and generally provides that any person has a right, enforceable in court, of access to Federal agency records, except to the extent that such records (or portions thereof) are protected from disclosure by one of nine exemptions or by one of three special law enforcement record exclusions. Under the spirit and provisions of the FOIA, Federal agencies are to make their records available to the public to the greatest extent possible.

FOIA request for a copy of U. S. Geological Survey (USGS) records can be made by any individual or public or private organization other than a Federal agency. The request must: (1) be in writing, (2) specifically cite the Freedom of Information Act, (3) reasonably describe the records sought, and (4) indicate a willingness to pay fees, (specify the amount they are willing to pay) or ask for a fee waiver. The request will be sent to the USGS FOIA Officer, Mail Stop 807, National Center, Reston, VA 20192.

Process

Upon receipt, the FOIA Officer will direct the request to the appropriate USGS discipline FOIA Representative. The FOIA representative or an assigned action officer will respond to the request no later than 20 workdays after receipt, as required by the FOIA statute. When it is necessary to forward a request to another installation such as a field office for response, the time limit begins upon receipt by the field office. A time extension, not to exceed an additional 10 workdays, may be taken in certain circumstances. However, the requester must be notified in writing that an extension is being taken, the reason(s) for taking the extension, and the anticipated date of the FOIA response.

A FOIA response must advise the requester of the records that the bureau intends to disclose or to withhold, the exemption(s) authorizing the withholding (including a citation or summary of each exemption), and a strong justification for withholding the record(s). Normally the records to be disclosed will be provided with the response letter. If the records are not provided with the letter, they will be sent as soon as possible thereafter.

Denials

Headquarters USGS FOIA responses involving a denial or partial denial of records must be coordinated with the FOIA Officer. In the central, eastern and western regions, denials are usually signed by the Chief, Office of Regional Services, after consultation with the regional solicitor. A denial or partial denial letter will contain a paragraph advising the requester of the right to file an appeal with the Department of the Interior's FOIA Appeals Officer.

Section 508 and Accessibility at the USGS

Welcome to the U. S. Geological Survey (USGS) web site. The USGS is committed to and is making every possible effort to ensure that all electronic and information technology developed, procured, maintained, or used by the USGS is accessible to people with disabilities, including both employees and the customers we serve.

If you cannot fully access the information on a particular page, please email the contact person, or group, named in the footer information at the bottom of the page and they will help you. This may include providing the information to you in an alternate format.

For further information and to learn more about the regulations governing the accessibility of Federal electronic information products, visit the Section 508 pages listed below:

- Section 508 home page - http://www.section508.gov/
- Access Board - http://www.access-board.gov/508.htm
- Web Accessibility Initiative (WAI) - http://www.w3.org/WAI/

Contact USGS

To Contact Us for Assistance or to Ask a Question

If you have a question or need assistance, you can contact us directly by calling toll-free 1-888-ASK-USGS (1-888-275-8747).

Use [Search](#), [Frequently Asked Questions](#), or the [Alphabetical Index of USGS Science Categories](#) to find the specific USGS information, data, maps, products, or services that you need.

Or you may use the form below to ask a question or send a message to the USGS:

About the Science Center

The Science Center strives to provide teachers and students with resources that help improve the way scientific and environmental issues are discussed in the classroom. The Science Center features great lessons plans and classroom activities, provides educators with a Teacher Lounge where they can share information and discuss the latest issues, and provides users with a Gateway to other great educational resources on the Internet. If you have any questions or comments about this site, visit our feedback form and share them with us!

And now a word from our sponsor...

The Science Center is sponsored by the Chlorine Chemistry Council (CCC)TM and represents the latest effort by the CCC to help bring objective and balanced discussion of environmental and scientific issues to classrooms around the country. Working with premier education organizations like the Science Education for Public Understanding Program (SEPUP) and Project Learning Tree (PLT), the Chlorine Chemistry Council helps equip educators with the knowledge and tools needed to educate the country's students.

To learn more about the Chlorine Chemistry Council, check out the links below:

Comments/Questions*:
(**Please note:** If you wish to receive free education materials, please click on the "free materials" link located at the top of each page within this website.)

SEND FORM | CLEAR FORM

*Order Free Materials**

To receive free materials from the Chlorine Chemistry Council®, simply fill out the form below. **You can request up to 10 copies of each item** that you would like to receive in the corresponding quantity box. When you have finished, simply scroll down to the bottom of the page or click on the "Fill out mailing info" link to fill out your mailing information.

Benefits Brochures

These easy-to-read, full-color brochures illustrate chlorine's beneficial role in our everyday lives with vivid text and photographs.

Quantity:
Fill out mailing info

Chlorine Cornerstone of Modern Medicine®
This brochure describes chlorine's important role in medical applications from acetaminophen to antibiotics, x-ray film to blood bags, and AIDS treatments to anti-cancer drugs.
(view this material online)

Quantity:
Fill out mailing info

Chlorine Vital to Public Safety®
This brochure highlights chlorine's role in manufacturing bullet-resistant "glass," bullet-resistant vests, protective helmets and face shields, seat belts and air bags.
(view this material online)

Quantity:
Fill out mailing info

Chlorine On the 'Front Line' In Hospitals
Not only is chlorine important in manufacturing pharmaceuticals, but it is also key throughout the hospital. This brochure reviews chlorine's importance in the latest diagnostic equipment and surgical techniques used in the nearly 6,500 U.S. hospitals.
(view this material online)

Additional Benefits Brochures

More information about chlorine and its benefits.

Building Blocks of Our World: Chlorine (video)
This six-minute video shows the many uses of chlorine in everyday life.
(view this material online)

Free Online Materials

For your convenience, we offer a number of free, learning materials directly from our site. You can visit any of the materials below by clicking on the link provided.

Here's a Riddle
This 13-page booklet provides an overview of the following six brochures that highlight the different aspects of chlorine chemistry's societal benefits. An all-purpose, general tool to communicate several benefits of chlorine chemistry, the brochure also provides useful quotations from physicians and health officials on the significance of chlorine chemistry.
(view this material online)

Nothing Cleans Like Chlorine
One of the most effective and economical germ-killers, chlorine destroys and deactivates a wide range of dangerous germs in homes, hospitals, hotels, restaurants and water. This brochure illustrates chlorine's disinfectant role as one of the most important public health advances of the 20th century.
(view this material online)

Chlorine Enhancing Everyday Life
Many people are unaware of the many products made with the help of chlorine chemistry. From microprocessors and wires in computers to vinyl siding, windows and plumbing pipes in homes, this brochure depicts chlorine's diverse role in producing hundreds of products we rely on every day.
(view this material online)

Health Insight: A Consumer's Guide to Taking Charge of Health Information
This pamphlet will help you take charge of health information and educate yourself about health risks and opportunities to reduce risks.
(view this material online)

Chlorine's Contribution to National Security
The Chlorine Chemistry Council has designed a number of materials highlighting the many roles that chlorine plays in our lives and day-to-day activities. With the national spotlight focusing on security issues, it is important to understand the role chlorine plays in keeping our country safe. The materials provided here demonstrate that chlorine not only benefits our lives, it helps save them.

CCC Materials

Chlorine Chemistry Quiz

Take our interactive quiz which will test your knowledge of chlorine and chlorine chemistry.

Building Block Chemistry

These lesson activities were designed to introduce students in grades 5 through 9 to basic chemistry and the periodic table. Students learn how chlorine and other elements combine to make products they use every day -- from soccer balls to tennis shoes, from televisions to vinyl siding.

Chlorine Experiments

These experiments are designed for a variety of grade levels and help demonstrate the properties and make-up of chlorine.

Gateway to Education

The Science Center is your gateway to other great educational resources on the web. Here you can see a list of websites that offer useful educational resource to teachers.

CCC and its Partners

About the Science Center

The Science Center strives to provide teachers and students with resources that help improve the way scientific and environmental issues are discussed in the classroom.

Science Education for Public Understanding Resources

With support from the CCC, the Science Education for Public Understanding Program (SEPUP) developed the Understanding Environmental Health Risks Module, which is designed to help students learn to think critically about the environment.

Project Learning Tree Resources

The CCC is proud to be a supporter of Project Learning Tree's latest module entitled Exploring Environmental Issues: Focus on Risk. This new high school curriculum allows students to explore the different aspects of environmental and human health risks that affect their daily lives.

Feedback

The Science Center would like your input on our website. Let us know of any questions and comments which we may be able to provide assistance.

The Science Center is sponsored by the Chlorine Chemistry Council. Created by The Bivings Group.

Classroom

Below is a list of educational resources developed by the Chlorine Chemistry Council (CCC) and its partners. These modules and classroom activities are designed to help teachers discuss chemical elements and the environment in their classroom. If you are interested in getting additional information or have any questions or comments, click here.

- **Chlorine Compound of the Month**
  To help celebrate National Chemistry Week 2003, the Science Center launched a new feature, the Chlorine Compound of the Month. Every month a different chlorine compound is profiled-from its chemical composition to its practical uses. Quick side-bar lessons in basic chemical concepts accompany each write-up. Chemistry becomes fun through these short, colorful articles. The Chlorine Compound Archive will keep all previously published articles accessible. Teachers and home-schooling parents may wish to take advantage of follow-up questions and science activities for students.

- **Take a fun, interactive hospital tour**
  This interactive hospital tour features a mind-boggling array of products created by chlorine chemistry.

- **The Global Bug Conspiracy**
  The Global Bug Conspiracy invites kids to take a look at case files and rap sheets on potentially deadly microbes such as E. coli, giardia and shigella, and the bacteria that cause cholera and typhoid fever. The World Health Organization estimates that diseases associated with dirty water kill at least 6,000 people every single day.

- **The House That Chlorine Built**
  Did you know that many of the household items you rely on every day are products of chlorine chemistry? Do you realize that vinyl (as in "vinyl siding"), an increasingly popular sustainable construction material, is a product of chlorine chemistry? You might be surprised to discover just how many indispensable products found in a typical home have their origins in chlorine chemistry.

- **Building Block Chemistry**
  These lesson activities were designed to introduce students in grades 5 through 9 to basic chemistry and the periodic table. Students learn how chlorine and other elements combine to make products they use every day -- from soccer balls to tennis shoes, from televisions to vinyl siding.

- **Chlorine Experiments**
  These experiments are designed for a variety of grade levels and help demonstrate the properties and make-up of chlorine.

- **Science Education for Public Understanding Resources**
  With support from the CCC, the Science Education for Public Understanding Program (SEPUP) developed the Understanding Environmental Health Risks Module, which is designed to help students learn to think critically about the environment.

- **Project Learning Tree Resources**
  The CCC is currently working with Project Learning Tree on a new risk assessment module that will be available in the Fall of 1998. The module will follow PLT's successful format and help students define risk and learn the skills necessary to make wise decisions.

- **Chlorine Chemistry Quiz**
  Take our quiz which will test your knowledge of chlorine and chlorine chemistry.

Teachers: Join our listserv. Enter your email address and click join.

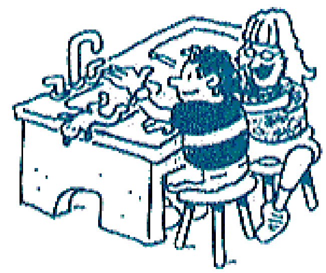
Chlorine Can Bring Chemistry to Life

Introduce students to chemistry without tackling the whole periodic table at once.

Recognizing basic elements as building blocks is essential to the study of science. And looking closer at one element in particular -- chlorine -- can help ignite students' interest in chemistry.



The following materials outline a two-day study of building block chemistry using basic concepts and easy-to-find materials. Additional free materials that can extend your lessons on chemicals in everyday life can be ordered by clicking here or by writing to Schools, Chlorine Chemistry Council, 1300 Wilson Blvd., Arlington, VA 22209.

- Science Scope Article Reprint: Chlorine and Building Block Chemistry
- Teacher Material: Chlorine Can Bring Chemistry to Life
- Student Sheet #1: Chlorine in our Lives
- Student Sheet #2: Exploring Chlorine Compounds
- Additional Activity: Eliminating Microorganisms from Water
- Background: A Common Building Block
- Background: Natural Chlorine? You Bet!
- Additional Teacher Background: Balanced Equations for Chloride Salt Activity

Teachers: Join our listserv. Enter your email address and click join.

PROJECT LEARNING TREE

Since 1973, Project Learning Tree (PLT) has reached more than 20 million students, and each year more than 30,000 teachers attend their workshops. Their goal is to help students learn how to think, not what to think about local and global environmental issues. A recent third-party evaluation of the PLT program has confirmed that it is effective in helping students become environmentally literate -- to understand basic science and, more importantly, to enable them to apply this knowledge in everyday life to make reasonable, well-thought out decisions.

PLT has an established network of workshops in every state that involves -- and is supported by -- classroom teachers, state boards of education, state and federal agencies, professional associations, and industry. PLT works with boards and departments of education in every state, providing you with an opportunity to reach key decision makers.

High School Risk Program

Together with many environmental, industry, and educational organizations, the CCC has supported PLT's development of a classroom curriculum for high school students that examines living with risk. The module provides students with a framework for applying scientific processes and higher order thinking skills to environmental issues. Students will learn to define and assess risk and the costs and benefits associated with various environmental policies and issues.

The module is designed to be infused into existing curriculum and is correlated to the national science standards. For more information, check out PLT's website!

SEPUP

Understanding Environmental Health Risks Module

With support from the CCC and the US Environmental Protection Agency, the Science Education for Public Understanding Program (SEPUP) developed the "Understanding Environmental Health Risks" module to help 9th and 10th grade students learn basic concepts associated with select environmental health risks.

Students are encouraged to look at the risks and benefits to individuals and communities of a variety of environmental topics such as drinking water safety, toxicology, and pesticide use.

Educators interested in ordering materials or learning more from this module are invited to visit the SEPUP website at http://www.sepup.com/

Chemistry | Environment | General Science | Earth Science | Biology
Space and Astronomy | General | Publications | Museums | For Teachers

CHEMISTRY

- **Chemistry.org/kids** -- The American Chemical Society's site for kid-friendly chemistry activities, including National Chemistry Week.

- **Chem4Kids** -- Compiled by a division of the American Library Association, this easy to navigate site includes data on atoms, elements, matter, as well as biographies of famous chemists and will soon include chemistry quizzes.

- **Chemical Educational Foundation** -- The site is dedicated to serving the public interest as a primary national resource for conducting research and educational programs for proper distribution practices and the safe handling, use, storage, transportation, disposal, and recycling of chemical products.

- **TeachingPlastics.org** -- The American Plastics Council introduces the ultimate online scientific investigation resource for teachers and students. TeachingPlastics.org is a site that empowers teachers to introduce basic chemistry principles to students, while helping teachers accomplish some of the goals set by the NSES.

- **Web Elements** -- Maintained by Mark Winter, a professor at the University of Sheffield in England, Web Elements features an interactive periodic table which allows users to learn more about the elements.

ENVIRONMENT

- **Environmental News Network** -- The Environmental News Network is the premier source for science and environmental news on the Internet.

- **North American Association of Environmental Education** -- This site features a list of environmental education and classroom resources, as well as information about grants, obtaining funding, and conducting workshops.

- **Project Learning Tree** -- Like PLT itself, this web site is designed to help students gain awareness and knowledge of the natural and built environment, their place within it, as well as their responsibility for it.

GENERAL SCIENCE

- **National Science Teacher Association** -- This site contains message boards and on-line periodicals, as well as information about joining NSTA and NSTA's extensive resources.
- **Science Education for Public Understanding Program** -- SEPUP designs, develops and disseminates issue-oriented science education materials that promote scientific literacy and the use of evidence and tradeoffs in public decision-making.
- **Science Friday Kids Connection** -- Brought to you by National Public Radio

and Kidsnet, with funding from Toyota, the NEA, and others, this site provides background information and experiments on science issues which are in the news.

EARTH SCIENCE

- **Volcano World** -- This site allows users to learn about volcanoes around the world. Users learn what volcanoes are erupting and can take a virtual tour of volcanic craters.

BIOLOGY

- **Animal Network** -- This site contains listings and information on nearly every type of animal that can be used as a pet. It also contains caring and breed information for individuals in search of new pets.

- **A Guided Tour of the Visible Human** -- This site consists of some 9,000 digitized sections of the body. The site was compiled by the Children and Technology Committee of the Association for Library Service to Children, a division of the American Library Association.

- **Biotechnology Knowledge Center** -- A collection of documents about biotechnology and other life sciences.

SPACE AND ASTRONOMY

- **NASA** -- The NASA site contains the latest information about the U.S. space program. This general NASA site also links to other NASA sites on issues such as the MIR Space Station and the Mars Lunar Probe, as well as to the agency's many educational resources.
- **The Nine Planets** -- This site features photos and scientific information on the nine planets that make up our solar system. It was developed and is maintained by an individual named Bill Arnett.

GENERAL

- **Education World** -- Supported by the National Education Association, Education World strives to be the complete educator's resource guide to the internet. The site covers all academic disciplines and has on-line experiments, teacher forums, articles, etc.

- **Educational Resource Information Center (ERIC)** -- This site, supported by the U.S. department of Education and National Library of Education, is the world's largest database of educational materials. Teachers also can obtain answers to questions about educational research and practices from the AskERIC website.

- **E-mail Projects Homepage** --Allows learners and teachers to participate in E-mail projects in addition to providing educational projects.

- **Federal Resources for Educational Excellence (FREE)** -- This site contains hundreds of federally supported education resources placed on the site by more than 30 Federal agencies.

- **The Gateway** -- The Gateway provides the key to one-stop, any-stop access to high quality Internet lesson plans, curriculum units and other education resources.

- **BJ Pinchbeck's Homework Helper** -- This site gives students access to on-line resources for history, social studies, current events, foreign languages, math, and science.

- **Let's Go!: Around the World** --This site includes more than 500 pages that take students on "Great Learning Adventures" to the Amazon rain forest and Africa, and provides teachers with "Curriculum Connections" pages linking site content to the math, science and social studies curriculums.

- **Librarian's Guide to the Internet** --Helping librarians and other information seekers find resources and services on the Net.

- **The Study Web** --The Study Web features educational resources for teachers and students, including a search engine.

PUBLICATIONS

- ***Education Week*** --*Education Week* considers itself as the place on the World Wide Web for people interested in education reforms, schools, and the policies that guide them.

- ***Online Educator*** -- The *Online Educator* magazine site features extensive resources and links for bringing internet into the classroom. Updated weekly.

- ***New Scientist* Planet Science** -- The site contains articles from *New Scientist* magazine as well as an extensive collection of science news and resources.

- **Scientific American** -- The site contains articles from *Scientific American* magazine as well as an extensive collection of science news and resources.

- **Sci-Journal** -- Sci-Journal is an On-Line publication devoted to giving students the chance to publish works they've done in their school science classes.

- **TCWORLD** --A monthly On-Line publication for technology coordinators and school technology.

MUSEUMS

- **Children's Science Museum** --The site is a public science museum and a center for teacher education, research, and curriculum development at the University of California, Berkeley.

- **The Field Museum of Natural History** -- The Field Museum web site gives users an on-line preview of both permanent and temporary exhibits, and contains a special section which aids students and teachers visiting the actual museum in Chicago.

- **The Natural History Museum** -- This comprehensive site contains extensive scientific information on a variety of disciplines, as well as educational materials tailored specifically for students and teachers.

- **Smithsonian Institute** -- This huge site features general information about events and resources at the Smithsonian, and also contains links to all the museums that make up the Institute. Each museum has its own homepage and all the sites have great education materials.

FOR TEACHERS

- **The Catalyst** -- This site is aimed specifically at chemistry teachers and is a place for educators to share lesson plans and exchange ideas.

- **Community Learning Network** --This site is designed to help K-12 teachers integrate technology into their classrooms.

- **ED's Oasis** --ED's Oasis includes teacher support for classroom Internet use. Uses a set of research-based evaluation guidelines to pick the best web sites for classroom use.

- **Education Free Forum** -- The Education Free Forum is an On-Line collection of free materials available to educators on the web.

- **The Eduzone** -- Eduzone strives to provide educators with an Internet resource where all their classroom preparation and career development needs can be met.

- **Global School House** -- The Global School House is a site for students, teachers and parents to access educational resources and share information.
- **I Love Teaching** -- This On-Line resource is aimed at providing support to young teachers and those currently studying to be teachers.
- **The New Teacher Page** -- The New Teacher page offers resources and materials to people studying to be teachers or people who have just gotten into the classroom.
- **Teacher Talk Forum** -- This site provides learning resources for secondary students, their parents, and educators in addition to a forum for the discussions of issues important to these groups.
- **Teacher's Edition Online** -- This is a teacher resource that helps educators use technology in their classroom. The site also has great ideas about curriculum resources.
- **Teachers.net** -- Teachers.net features a large chat area on a variety of topics and also contains a variety of classroom resources and teacher support services.
- **Teachers Helping Teachers** -- Teachers Helping Teachers aims to provide young teachers with materials for their classroom and to give more experienced teachers a forum to share ideas and methods.
- **The Teacher's Network** -- The Teachers Network is a resource center for teachers and is run by Impact, with funding from large companies such as Exxon.

FOR STUDENTS

- **Homework Help** --Homework Help includes features to help students make the most of their study time and deal with other school related issues.
- **Student Web Pages** --This site includes a tutorial for students who want to publish educational projects on the web, with step by step directions for making personal pages.
- **Surfing the Net with Kids** --This site features Internet sites for kids reviewed, rated and organized by topic.

CHLORINE CHEMISTRY COUNCIL®
TERMS & CONDITIONS OF USE

TABLE OF CONTENTS

GENERAL PROVISIONS

Welcome to the Internet Sites of the Chlorine Chemistry Council® ("CCC"), a business council of the American Chemistry Council, Inc., is a national trade association representing the manufacturers and users of chlorine and chlorine-related products. The Chlorine Chemistry Council, its parent, subsidiaries, and affiliated companies (referred to herein as "Council," "we," "us," or "our") maintain these sites (each a "Council Site" and collectively "Council Sites").

BY USING A COUNCIL SITE, YOU SIGNIFY YOUR AGREEMENT TO ALL TERMS, CONDITIONS, AND NOTICES CONTAINED OR REFERENCED IN THESE TERMS & CONDITIONS (THE "TERMS & CONDITIONS" OR "TERMS") ON OUR SITES. IF YOU DO NOT AGREE TO THESE TERMS & CONDITIONS YOU ARE NOT AUTHORIZED TO USE COUNCIL SITES. WE RESERVE THE RIGHT, AT OUR DISCRETION, TO CHANGE, MODIFY, ADD TO, OR REMOVE PORTIONS OF THESE TERMS AT ANY TIME WITHOUT NOTICE. PLEASE CHECK THE TERMS PERIODICALLY FOR CHANGES. YOUR CONTINUED USE OF COUNCIL SITES FOLLOWING THE POSTING OF ANY CHANGES TO THESE TERMS CONSTITUTES ACCEPTANCE OF THOSE CHANGES.

Some Council Sites or areas of Sites may have different terms and conditions posted. Any such terms will not vary or replace these Terms & Conditions regarding the use of Council Sites, unless they expressly state otherwise. Additionally, a Council Site may contain page(s) or areas with their own Terms & Conditions, in addition to those listed here, which you should review and with which you must agree in order to use those areas.

COPYRIGHT, TRADEMARKS AND RESTRICTIONS

Council Sites and their contents are protected pursuant to U.S. and international copyright laws. All materials published on Council Sites are the copyrighted property of CCC, its parent, subsidiaries, and affiliated companies, third party licensors, or the party credited. The Council claims no copyright in any government or other public domain content that may be on our sites. All trademarks, service marks and trade names, including but not limited to the CCC mark, as well as other marks, owned by the Council are protected by state, federal, and international trademark law. All other trademarks appearing on Council Sites are the property of their respective owners.

Except where otherwise noted, permission to use Materials (such as white papers, press releases, datasheets, and FAQs) from Council Sites is granted, provided that (1) none of the copyright, trademark, or other proprietary notices are removed, (2) the Materials are not edited or modified in any way without prior written consent, (3) use of such Materials from the Council Site is for informational and non-commercial or personal use only and may not be used in a misleading or deceptive manner, and (4) you do not use any Materials, without express written permission, in a manner that suggests an association with any of our business units, services, initiatives or other activities. Further, you agree to abide by all additional copyright notices, information, or restrictions contained in any material or content on the Council Sites.

Materials specified above do not include the design or layout of the Council Sites or any other Council owned, operated, licensed, or controlled site.

LINKING TO COUNCIL SITES

The Council has no objection to links made from other sites to Council Sites, provided that you comply with the following requirements:

(1) You may not frame or alter the appearance of Council Sites.
(2) You may not state or imply that the Council endorses, sponsors or otherwise approves your site or any other sites.
(3) You may not use any Council Trademarks or logos without prior written consent.
(4) In view of the dynamic nature of the Internet, and the possibility of updates and changes, we request that your link enter Council Sites at their home pages.
(5) You must abide by all of the other Council Terms and Conditions of use set forth herein.
(6) Due to the diverse nature of our web activities, websites within the Council Internet family may have linking policies that differ from this policy. In such cases, the linking policy of the particular Council Site will be posted, and will supersede the Terms regarding linking to Council Sites of this document.

SOFTWARE

If you download software or applications from any Council Site, the software or applications, including any files, images incorporated in or generated by the software or applications, and data and instructions accompanying the software or applications (collectively, the "Software") are licensed to you by the Council or our third party licensors for your personal, non-commercial use. We do not transfer title to the Software to you. We (or third-party licensors) retain full and complete title to the Software and all intellectual property rights therein. Except as expressly authorized by us, you agree not to redistribute, sell, de-compile, reverse engineer, disassemble, or create derivative works based on the Software, in whole or in part.

If you have any questions regarding this notice, please send an E-mail to [info@c3.org].

SUBMISSIONS

At times Council Sites may request ideas or materials that include but that are not limited to concepts, know-how, techniques, suggestions, and materials (collectively "Submission(s)"). Except as expressly provided in our Privacy Policy, in a separate written agreement between you and the Council, or otherwise expressly stated, by submitting any Submission, whether solicited by us or not, you are automatically granting the Council a royalty-free, perpetual, non-exclusive, unrestricted, worldwide license to use, reproduce, modify, adapt, publish, translate, publicly perform and display, create derivative works from and distribute such materials and/or ideas or incorporate such materials and/or ideas into any form, medium, or technology now known or later developed throughout the universe, and that all so-called "moral rights" to such Submissions have been waived. This grant of rights means that such Submissions will be owned by the Council, and may be used without any payment to, or further authorization by you. The foregoing grants shall include the right to exploit any proprietary rights in such communication, including but not limited to rights under copyright, trademark, service mark, or patent laws under any relevant jurisdiction.

FORUMS, E-MAIL, AND PUBLIC COMMUNICATION

Council Sites may include forums, chat rooms, e-mail function, or other areas (collectively "Forums"), where users can post or exchange information, ideas, opinions, photographs, images, videos, creative works or any other materials (collectively "Messages") with other users of the Site or the Internet. In no event shall the Council assume or have any responsibility or liability for any Messages posted on Forums or for any claims, damages or losses resulting from their use or appearance on a Council Site. Children under the age of 18 are not authorized to post messages or participate in Forums on Council Sites.

The Council does not control Messages delivered to Forums, and the Council has no obligation to monitor such Forums. If at any time the Council chooses, in its sole discretion, to monitor the Forums, the Council nonetheless assumes no responsibility for the content of the Messages, no obligation to modify or remove any inappropriate Messages, and no responsibility for the conduct of the user submitting any Messages.

The Messages do not necessarily reflect the views of the Council and are not necessarily reviewed prior to posting. The Council makes no warranties, express or implied, as to the content of the Messages in the Forums or the accuracy or reliability of any Messages and other materials in the Forums. The Council reserves the right at all times to disclose any information (including the identity of the persons providing information or materials on its Forums) as necessary to satisfy any law, regulation, or governmental request. Further, the Council reserves the right to restrict, prohibit your use, and remove or edit Messages from any Forum at any time, for any reason.

By posting Messages (including but not limited to acts of uploading files, inputting data, or engaging in any other form of communication) through Forums, you are granting the Council a royalty-free, perpetual, non-exclusive, unrestricted, worldwide license to use, reproduce, modify, adapt, publish, translate, publicly perform and display, create derivative works from and distribute such materials and/or ideas or incorporate such materials and/or ideas into any form, medium, or technology now known or later developed throughout the universe, and that all so-called "moral rights" to such Messages have been waived. This grant of rights means that such Messages will be owned by the Council, and may be used without any payment to, or further authorization by you. The foregoing grants shall include the right to exploit any proprietary rights in such communication, including but not limited to rights under copyright, trademark, service mark, or patent laws under any relevant jurisdiction.

RULES OF CONDUCT

It is a condition of your use of Forums and Council Sites that you do not:

(1) Use any Forums for any illegal purposes (or to solicit any illegal act) including, but not limited to, violating applicable antitrust laws and regulations;

(2) Restrict or inhibit any other user from using and enjoying the Forums;

(3) Post or transmit an unlawful, threatening, abusive, libelous, defamatory, obscene, vulgar, harassing, pornographic, profane, or indecent information of any kind, including images and language or unlawful material or any material that could constitute or encourage conduct that would be considered a criminal offense or give rise to civil liability, or otherwise violate any law;

(4) Post or transmit any message with bigoted, hateful, or racially offensive statements;

(5) Post any message that solicits gambling or engage in any gambling activity;

(6) Transmit or upload any information, software or other material that violates or infringes on the rights of others, including material that is an invasion of privacy or publicity rights or that is protected by copyright, trademark or other proprietary right, or derivative works with respect thereto, without first obtaining permission from the owner or right holder;

(7) Post or distribute any software or other materials that contain a virus or other harmful component;

(8) Advertise or sell or solicit to others;

(9) Use the site or its services for the purposes of sending junk email, chain letters, duplicative or unsolicited messages or "spamming," or in connection with contests, surveys, or pyramid schemes;

(10) Try to gain unauthorized access to an Council Site, other users' accounts, or computers connected to the Council Site though password mining or other means; or

(11) Interfere with another user's use and enjoyment of a Council Site or any other individual's use and enjoyment of related services.

If at any time you are not happy with the Forums or object to any material within Forums, your sole remedy is to cease using them.

CONTESTS AND SWEEPSTAKES, AUCTIONS, AND OTHER ACTIVITIES

Council Sites may contain certain activities including, without limitation, e-mail services, contests, sweepstakes, and auctions (collectively "Contests"). Each Contest has its own rules, which you must read and agree to before you may enter.

THIRD PARTY CONTENT AND LINKS TO OTHER SITES

At certain places on Council Sites, users may be able to link to other Internet addresses. These other sites are not under the control of the Council, and you acknowledge that the Council is not responsible for the accuracy, copyright compliance, legality, decency, or any other aspect of such sites. The inclusion of such a link does not imply endorsement of the site by the Council or any association with its operators. Use of any information on Council Sites or obtained from linked addresses is voluntary and reliance on it should only be undertaken after an independent review. A link or reference herein to any specific commercial product, process or service by trademark name, trademark, service mark, manufacturer or otherwise does not constitute or imply endorsement, recommendation or favoring by the Council.

USER ACCESS

User access and use of Council Sites, or portions thereof may be restricted through the use of a login and password registration mechanism or similar process (collectively "User Account"). You are responsible for maintaining the confidentiality of your User Account, and are fully responsible for all activities that occur under your User Account. You agree to (a) immediately notify us of any unauthorized use of your User Account or any other breach of security, and (b) ensure that you exit from restricted areas at the end of each session. We will not be liable for any loss or damage arising from your failure to comply with this provision.

We may change, suspend or discontinue any aspect of our online services at any time, including the availability of any feature, database, or content available at a Council Site. The Council may also impose limits on certain features and services or restrict your access to parts or all of a Council Site(s) without notice or liability.

PRIVACY AND SECURITY

We respect the privacy of visitors to Council Sites. For more information about how we use and protect the personal information you may provide through our websites, please click here to review the website's privacy policy. Note that the Council reserves the right to change its privacy policy at any time without notice.

Please note Council Sites may contain links to other Internet websites. Whenever you travel to another website you should review its privacy policy. The Council is not responsible for the contents or privacy practices of third-party sites.

NOTICE AND PROCEDURE FOR MAKING CLAIMS OF COPYRIGHT INFRINGEMENT

We may give notice to our users by means of a general notice on any Council Site, electronic mail to a user's e-mail address in our records, or by written communication sent by first-class mail to a user's address in our records.

The Council respects the rights of all copyright holders and we ask our users to do the same. If you believe that your work has been copied in a way that constitutes copyright infringement on a Council Site, or your intellectual property rights have been otherwise violated, please provide the Council's Copyright Agent with the information required by the Online Copyright Infringement Liability Limitation Act of the Digital Millennium Copyright Act, 17 U.S.C. § 512.

Notification must be submitted to the following Designated Agent:

Dell E. Perelman, Esq.
Vice President, General Counsel & Corporate Secretary
American Chemistry Council
1300 Wilson Boulevard
Arlington, VA 22209
Tele: (703) 741-5000
Fax: (703) 741-6000
E-Mail: copyright@americanchemistry.com

This contact information is for notices of copyright infringement only.

To be effective, the notification must be a written communication that includes the following:

(1) A physical or electronic signature of person authorized to act on behalf of the owner of an exclusive right that is allegedly infringed;

(2) Identification of the copyrighted work claimed to have been infringed, or if multiple copyrighted works at a single online site are covered by a single notification, a representative list of such works at that site;

(3) Identification of the material that is claimed to be infringing or to be the subject of infringing activity and that is to be removed or access to which is to be disabled, and information reasonably sufficient to permit the service provider to locate the material;

(4) Information reasonably sufficient to permit the service provider to contact the complaining party, such as an address, telephone number, and, if available, an electronic mail address at which the complaining party may be contacted;

(5) A statement that the complaining party has a good-faith belief that use of the material in the manner complained of is not authorized by the copyright owner, its agent, or the law; and

(6) A statement that the information in the notification is accurate and, under penalty of perjury, that the complaining party is authorized to act on behalf of the owner of an exclusive right that is allegedly infringed.

Through this provision the Council seeks to preserve any and all exemptions from liability that may be available under the copyright law, but does not necessarily stipulate that it is a service provider as defined in 17 U.S.C. § 512 or elsewhere in the law.

NO LEGAL ADVICE

Nothing contained on Council Sites is intended as, nor shall be construed as, legal advice, guidance, or interpretation. No attorney-client relationship is established between the Council and you by your using Council Sites. The information provided on Council Sites is for general informational purposes only, and questions about any law, statute, or regulation should be directed to an attorney with expertise in the relevant area.

DISCLAIMER

COUNCIL SITES AND ALL MATERIALS, INFORMATION, SOFTWARE, PRODUCTS, AND SERVICES INCLUDED IN OR AVAILABLE THROUGH COUNCIL SITES (THE "CONTENT") ARE PROVIDED "AS IS" AND "AS AVAILABLE" FOR YOUR USE. COUNCIL SITES INCLUDING CONTENT ARE PROVIDED WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT. THE CHLORINE CHEMISTRY COUNCIL, ITS PARENT, MEMBERS, SUBSIDIARIES, AFFILIATED COMPANIES, ITS LICENSORS, EMPLOYEES, AND THE LIKE, DO NOT WARRANT THAT COUNCIL SITES AND CONTENT ARE ACCURATE, COMPLETE, RELIABLE, CORRECT, OR FREE FROM ERROR OR OMISSIONS; THAT COUNCIL SITES WILL BE AVAILABLE AT ANY PARTICULAR TIME OR LOCATION; THAT ANY DEFECTS OR ERRORS WILL BE CORRECTED; OR THAT COUNCIL SITES AND CONTENT ARE FREE OF VIRUSES OR OTHER HARMFUL COMPONENTS. FURTHERMORE, THE COUNCIL, AND ON BEHALF ITS MEMBERS, SUBSIDIARIES, AFFILIATED COMPANIES, ITS LICENSORS, EMPLOYEES, AND THE LIKE, HEREBY EXPRESSLY DISCLAIMS ANY AND ALL WARRANTIES OF TITLE AND/OR NON-INFRINGEMENT RELATED TO COUNCIL SITES. YOUR USE OF COUNCIL SITES IS SOLELY AT YOUR OWN RISK.

LIMITATION OF LIABILITY

UNDER NO CIRCUMSTANCES SHALL THE CHLORINE CHEMISTRY COUNCIL, ITS PARENT, MEMBERS, SUBSIDIARIES, AND AFFILIATED COMPANIES, ITS LICENSORS, EMPLOYEES, AND THE LIKE, BE LIABLE FOR ANY DIRECT, INDIRECT, PUNITIVE, INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES RELATED TO YOUR VIOLATION OF THESE TERMS OR THAT RESULT FROM THE USE OF, OR INABILITY TO USE, COUNCIL SITES. THIS LIMITATION APPLIES WHETHER THE ALLEGED LIABILITY IS BASED ON CONTRACT, TORT, NEGLIGENCE, STRICT LIABILITY, OR ANY OTHER BASIS, EVEN IF THE COUNCIL HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, THE COUNCIL'S LIABILITY IN SUCH JURISDICTIONS SHALL BE LIMITED BUT ONLY TO THE EXTENT PERMITTED BY LAW.

INDEMNIFICATION

You agree to indemnify and hold harmless and upon request defend, the Council, its members, subsidiaries, and affiliated companies, its licensors, employees, and the like, from all liabilities, claims, and expenses, including attorney's fees, that arise from your use or misuse of Council Sites and/or breach of these Terms. The Council reserves the right, at it own expense, to assume the exclusive defense and control of any matter otherwise subject to indemnification by you, in which event you will cooperate with the Council in asserting any available defenses.

JURISDICTION

The Council Sites are maintained by or on behalf of the Council, located in the Commonwealth of Virginia, United States of America, or its affiliates. We make no representation that these materials are appropriate or available for use in any particular location. If you use a Council Site, you are responsible for compliance with applicable laws. By downloading or using content or features of a Council Site, you assume the responsibility for doing in compliance with the law that applies in jurisdiction(s) where you are located.

INTERNATIONAL USE

The Council makes no representation that materials on Council Sites are appropriate or available for use in locations outside the United States, and accessing them from territories where their contents are illegal is prohibited. Those who choose to access Council Sites from other locations do so on their own initiative and are responsible for compliance with local laws.

EXPORT CONTROLS

Software available through Council Sites is subject to U.S. export controls. No software available from a Council Site may be downloaded or otherwise exported or re-exported (i) into (or to a national or resident of) any country to which the U.S. now or in the future embargoes goods; or (ii) to anyone on the U.S. Treasury Department's list of Specially Designated Nationals, the U.S. Commerce Department's Table of Denial Orders, or anyone subject to any other U.S. export restrictions. By downloading or using any software available on a Council Site or from a link to a Council Site, you agree to the foregoing and you warrant that you are not located in, under the control of, or a national or resident of any such country on any such list, or otherwise in violation of U.S. export restrictions.

CHOICE OF LAW AND FORUM

This Agreement shall be governed by and construed in accordance with the laws of the Commonwealth of Virginia, United States of America. Actions brought under this Agreement shall be brought in the Commonwealth of Virginia in: (1) the Arlington Circuit Court (17th Circuit); (2) the Alexandria Circuit Court (18th Circuit); or (3) in the United States District Court for the Eastern District of Virginia in Alexandria, provided that federal jurisdictional requirements are satisfied. You agree and submit to the jurisdiction of such courts for the purpose of litigating any claim or action related to this Agreement.

SEVERABILITY AND INTEGRATION

Unless otherwise specified herein or expressly stated at Council Sites, the terms of this agreement constitute the entire agreement between you and the Council with respect to Council Sites and supersedes all prior or contemporaneous communications and proposals (whether oral, written, or electronic) between you and the Council with respect to Council Sites. If any part of these Terms & Conditions or terms specific to a Council Site is held invalid or unenforceable the remaining portions shall remain in full force and effect. The section titles in the Terms are for convenience only and have no legal or contractual effect.

TERMINATION

The Council reserves the right, in its sole discretion, to terminate your access to all Council Sites, a specific Council Site, or an area of a Council Site immediately and without notice. If you have any problems with these Terms & Conditions or with a Council Site your sole and exclusive remedy is to cease using the website(s).

SURVIVAL

In the event that your access terminates as provided herein or you cease using a Council Site(s), these Terms & Conditions shall survive.

CONTACT INFORMATION

If you have any questions regarding these Terms & Conditions, please contact us at info@c3.org. If you have any other questions regarding Council Sites, please contact us at:

**CHLORINE CHEMISTRY COUNCIL®
PRIVACY POLICY**

TABLE OF CONTENTS

GENERAL PROVISIONS

Thank you for visiting a member of the Chlorine Chemistry Council® family of websites. The Chlorine Chemistry Council, its parent, subsidiaries, and affiliated companies (referred to herein as "Council," "we," "us," or "our") maintain these sites (each a "Council Site" and collectively "Council Sites"). This Privacy Policy applies to the Council Sites that incorporate this policy. Please note that this Policy does not apply to other sites affiliated with the Council, our members, other companies' or organizations' websites to which we link, third party sites that link to us, or to our off-line activities.

THIS PRIVACY POLICY DISCLOSES HOW WE COLLECT, USE, SHARE, AND PROTECT INFORMATION GATHERED FROM PARTICIPATING COUNCIL SITES. BY USING THESE WEBSITES, YOU ARE AGREEING TO THE TERMS OF THIS PRIVACY POLICY, AS POSTED IN THIS AREA. IF YOU DO NOT AGREE WITH ANY TERMS OR PRACTICES DESCRIBED IN THIS PRIVACY POLICY, PLEASE DO NOT USE OUR WEBSITES. IN ADDITION, PLEASE REVIEW OUR TERMS & CONDITIONS, WHICH GOVERN YOUR USE OF OUR WEBSITES AND ANY DISPUTE ABOUT PRIVACY.

THE INFORMATION WE COLLECT

We may collect and store any information you enter on our websites or give to us in any other way. The type and amount of information the Council collects about you varies according to how you use Council Sites.

Collection of Personal Information

Many of the features on our websites are offered without collecting any Personal Information from you. "Personal Information" means personally identifiable information, such as your name, position, company, street address, telephone number, fax number, date of birth, e-mail address and other identifiers that permits physical or online identification of a specific individual. You can browse most of our websites and view much of our content on our websites anonymously.

There are certain Council Site(s) and features that require you to provide (voluntarily and at your option) certain Personal Information before you may participate in the website. For example, we collect Personal Information when you send us e-mail or otherwise contact us, enter a sweepstakes, register for off-line and online events, subscribe to a newsletter, or enroll or participate in chats and other online services.

When you make a purchase, or sign up for a paid service, we will also collect your credit card information as additional Personal Information. We will use credit card information only to complete the transactions you have requested.

Providing us with Personal Information is entirely optional and voluntary; however, if you do not provide the Personal Information requested, we may elect to not make the related service available for your use.

Collection of Non-Personal Information

We may also collect and store non-personally identifiable information about your visit whenever you interact with our websites. For example, we may automatically collect your domain name; IP address; means of entry to the site; the type of browser and operating system used to access the site; the date, time and duration of each visit; and the pages you visit.

USE OF COOKIES

Some of our websites may use "cookies" to enhance your experience. A cookie is a small file sent to your browser by a website's computer. Your Web browser places the "cookie" on your hard drive for record-keeping purposes and sometimes to track information about you. We use cookies to track site usage and to improve content and offerings. For example, we may use cookies to enable use of shopping carts or forms on our sites. Depending on the software browser you use, you may opt-out of the cookies delivered by our websites by changing the setting. Be aware that this will disable all cookies delivered to your browser, not just the ones that may be delivered by our websites.

HOW WE USE COLLECTED INFORMATION

We use information you provide about yourself collected through Council Sites to fulfill your request for our products, programs, or services; to respond to your comments and inquires; and to offer you other products, programs, or services that we believe may be of interest to you. For example, Personal Information may be used to communicate with you, such as to notify you when you have won one of our contests, to answer an inquiry, to fulfill a subscription request or product order, or to contact you about a user account with us.

Information from Other Sources

Personal Information you have provided may be used in combination with other information obtained through other means. For example, we may use your name, company, and e-mail address provided to us online in conjunction with our membership records in order to provide you with a user name and password to access a Council Site, forum, or specialized area. In other instances, an online inquiry about a purchase from us may prompt a review of an order placed by you over the telephone.

Information from Online Forums

The information collected in connection with our online forums is used to provide an interactive experience. This information is to facilitate participation in these online forums and communities and, from time to time, to offer you products, programs, or services. Note that online forums may be publicly accessible and other users may view information you post on them.

Use of Non-Personally Identifiable Information

Non-personally identifiable information, including information automatically gathered by our Web servers, is used to determine overall site traffic, popularity of areas of the site, what our users are looking for, and from where our users are linking to us. This information may also be used for aggregate statistical reporting, to improve the design and content of our sites, and to enable us to personalize your Internet experience.

WHO MAY USE COLLECTED INFORMATION

Information collected, whether personal or non-personal, may be shared within the Council, its parent, subsidiaries, and affiliated companies, and externally with third parties, such as members and business partners. However, it is our policy to not disclose externally with third parties personal information collected on our site, except in the following instances:

· The Personal Information provided to us may be transferred, disclosed, or shared with third parties to fulfill a request for our products, programs, or services and to those who may be engaged by us specifically to handle and deliver certain activities (e.g., sweepstakes) and perform other technical and processing functions, such as sending e-mail, fulfilling orders, or otherwise operating our sites. They have access to Personal Information needed to perform their functions, but may not use it for other purposes.

Information provided to us through correspondence may be shared (as appropriate) with other interested parties, including our members.

We may also disclose Personal Information to third parties (and our members) (1) when required by law or when the information is pertinent to judicial or government investigations or proceedings; (2) to protect and defend our rights and property; or (3) when necessary to protect our interests, our website(s), the safety of its users, or the public.

Other than as set forth above, we currently do not intend to share your Personal Information with third parties for other purposes. However, in the future we may disclose Personal Information you have provided to third parties for additional purposes. In the event we do, we will provide notices of such use to our users.

CHILDREN'S ONLINE PRIVACY PROTECTION ACT (COPPA)

We do not solicit or knowingly collect information from minors under the age of 13, in compliance with the Children's Online Privacy Protection Act (COPPA). For more information about COPPA, please visit: http://www.ftc.gov/ogc/coppa1.htm.

COLLECTION OF INFORMATION BY THIRD PARTIES, THIRD-PARTY SITES AND SPONSORS

Some of our sites may contain links to other sites. Other sites have their own information practices that may be different than ours. If you choose to use any of these links, you will be leaving our website and going to a third party (external) website. We encourage you to read the privacy policies at these external sites. We are not responsible for the privacy practices at these external sites or their use of any information they may collect from you.

In addition, you may have linked to one of our websites through another site. For example, in certain cases you may have linked to a sweepstakes or game site through banner or pop-up advertising on another site. In such cases the site you linked from may collect information from users who click on the banner or link. You may want to refer to the privacy policies on those sites to see how they collect and use this information.

Council Sites sometimes may offer content, contests, sweepstakes, or promotions that are sponsored by or co-sponsored with third parties. By virtue of their sponsorship, these third parties may obtain personally identifiable information that visitors voluntarily submit to participate in the contest, sweepstakes, or promotion. The Council has no control over the third-party sponsors' use of this information.

INFORMATION CORRECTION OR CHANGES

You have the ability to correct or change certain information in our records, such as your address and contact information. Generally, you may change this information at any time and as often as necessary. If you need assistance or have questions about correcting information, you can contact us via e-mail at info@c3.org.

E-Mails

If you have provided us with your e-mail address to subscribe to one of our services or to receive notifications or updates about one of the offerings at our sites and you wish to change your address or no longer wish to receive these communications, simply follow the unsubscribe instructions that appear in these e-mail communications.

Please note that any information that we have collected may remain in back-up storage, archival, and/or our log files, for some period of time after a deletion request. This may be the case even though no information about your account remains actively used as described in this Privacy Policy.

SECURITY

For certain Services, it may be necessary to collect payment to conclude the transaction. In such circumstances we use industry-standard secure socket layer (SSL) encryption. We do not sell or rent your personal financial information.

CONSENT TO TRANSFER

The Council reserves the right to sell or transfer your information provided to us to a third party entity in the event that the Council is acquired by or merged with another company or in connection with the potential sale or transfer of some or all of the business assets of our websites or the Council.

INTERNATIONAL USERS

Regardless of where you live or do business, by using Council Sites, you agree that we may collect, use, and transfer your information as described in this Privacy Policy.

NOTIFICATION OF CHANGES

Periodically we may make changes to this Policy. You are responsible for periodically checking our website for changes to this Privacy Policy. Your continued use of the site after these changes are posted constitutes your agreement to the changes with regard to any information collected.

CONTACT INFORMATION

We welcome your feedback regarding this Privacy Policy. If you have any comments, questions or concerns about this Privacy Policy you may contact us at:

WILDFIRE-DAMAGED MARINE CAMPING SITES RE-OPENED

Minister of Water, Land and Air Protection Bill Barisoff, left, and BC Parks area supervisor Blake Dixon examine a section of burned firehose found during a July 29 trip to Okanagan Mountain Provincial Park. Barisoff visited the park to announce that six marine camping sites destroyed when wildfire swept through the park last summer, are now restored and open for use. Due to safety hazards created by the fire, the rest of the park remains closed. [View news release]

Printer Version

Honourable Bill Barisoff

Bill Barisoff was appointed Minister of Water, Land and Air Protection on Jan. 26, 2004. He previously served as Minister of Provincial Revenue.

Mr. Barisoff previously held a variety of critic roles for the Official Opposition, including agriculture, transportation and highways and aboriginal affairs. He served on the province's Motor Carrier Commission and was a member of the Select Standing Committees on Aboriginal Affairs and on Agriculture.

He was first elected in 1996 to represent the riding of Okanagan-Boundary and was re-elected in 2001 for Penticton-Okanagan Valley.

Mr. Barisoff, who was born and raised in Oliver, owned a trucking firm before his election to the Legislative Assembly.

He served as a school trustee for 18 years, including eight as chair of the Southern Okanagan school board; was a volunteer firefighter in Oliver for over 25 years; and sat on the Okanagan Labour Relations Council. He was also chair of the Oliver Recreation Commission for one year.

Bill and Edna Barisoff live in Oliver and have three sons: Glen, Michael and Darren.

Honourable Bill Barisoff
Minister of Water, Land and Air Protection

Water Resource Information

NEW Mackenzie River Basin State of the Aquatic Ecosystem

The Mackenzie River Basin State of the Aquatic Ecosystem Report (SOAER) is a report prepared by the Mackenzie River Basin Board to inform decision-makers about the aquatic health and biodiversity of the major rivers found within the Mackenzie River basin. The report is also intended to identify gaps in current ecological knowledge, both scientific and traditional.

Aquifer Awareness (Funding) Program for BC Communities, 2003-4

The Aquifer Awareness Program will contribute up to $1,000 to eligible British Columbia communities, so they can set up "ground water protection zone" signs at entry points to important aquifers used for drinking water. The deadline for receipt of applications for funding is February 1, 2004.

MTBE (Methyl Tertiary-Butyl Ether) Factsheet

MTBE in gasoline improves air quality by reducing benzene and carbon monoxide emissions, but if spilled or leaked, it can contaminate our valuable ground water supplies.

Tahtsa Narrows Dredging Review

This website is about Alcan Inc.'s proposal to dredge Tahtsa Narrows in the Nechako Reservoir in northwestern BC. Federal and provincial government agencies have developed a coordinated process for review of Alcan's proposal. The process is detailed in 20 steps with an overview document as well. The coordinated Federal/Provincial Process is available here.

Nechako Environmental Enhancement Fund (NEEF)

In 1997, the Province of British Columbia and Alcan signed an agreement to settle the outstanding legal issues related to the rejection of the Kemano Completion Project. The agreement provides for the Nechako Environmental Enhancement Fund.

Our vision is a sustained and healthy water resource.

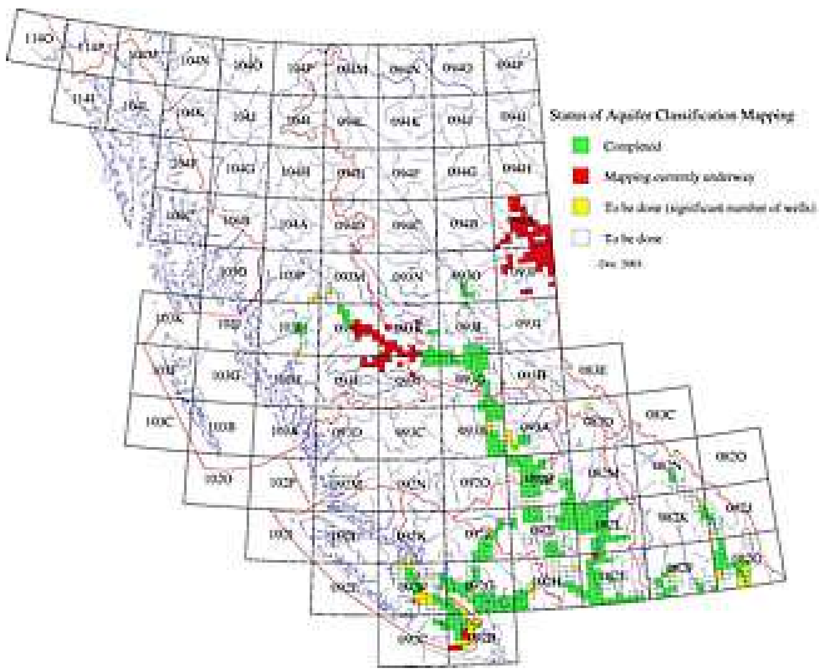
Query the Aquifer Database / View the Aquifer Image Portfolio
Aquifers and Water Wells in BC /
NEW Guide to Using the BC Aquifer Classification Maps / for the Protection and Management of Ground Water

Ground water provides 23 percent of the Province's population with drinking water, comprises 9 percent of total water consumption in the Province and represents 25 percent of the ground water use in the nation (Hess, 1986). It has been recognized for a number of years that a greater understanding of the existence and characteristics of aquifers in British Columbia is essential. The 1993 discussion paper *Stewardship of the Water of British Columbia* proposed that a program for classifying and mapping aquifers in ground water management areas be initiated.

Status of Aquifer Classification Mapping

(Click map for larger view.)

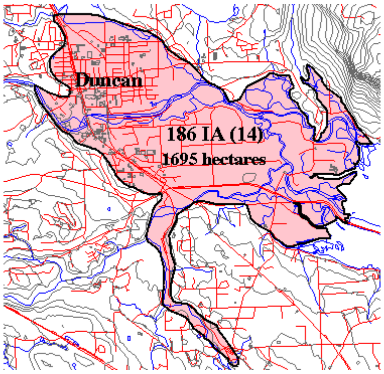


In 1994, a map based Aquifer Classification System was developed for the Ministry of Environment, Lands and Parks "Water Management Program" to identify, map and categorize aquifers using data from the provincial water well database. The objective of this aquifer classification system is to inventory and prioritize aquifers for planning, management and protection of the Province's ground water resource. To date, over 600 aquifers have been delineated. Individual aquifers in the format as shown by the example of the Duncan Aquifer to the lower left are displayed through a query of the aquifer image portfolio.

If you have ArcInfo capability this is the FTP link to digitized aquifer polygons in ArcInfo export format.

Example of an Aquifer at Duncan, BC

(Click map for larger view.)



Classifying aquifers in our Province is of vital importance. In some areas ground water is the only viable and economic source of water supply for individual and community water supply systems as well as augmenting agricultural and industrial uses. Ground water often maintains base flows in rivers and streams during periods of drought and is critical to fisheries habitat and spawning areas. With increasing demand and reliance on ground water from a growing population comes the need to increase efforts to protect and manage the resource.

Aquifer classification mapping provides an appropriate tool for optimizing water resources decisions affecting use and resource protection. There is more information on the BC Aquifer Classification System by Berardinucci and Ronneseth (2002), and Kreye et al, (1994) in the Reports section of this home page.

Aquifers and Water Wells in BC

This interface to ground water aquifers and water well locations is under development and now replaces other methods of delivering ground water data to the public, consultants and water well drillers.

Hard copies of water well location mapping are no longer available as this service has been replaced by Aquifers and Water Wells in BC .

When you have entered your data request, please click on the '**Search**' button adjacent to the entry box.

Help on using this screen.

BCGS grid help: detailed grid.

Search by well tag number. This search returns a **detailed** record for a particular well in a format developed in conjunction with the British Columbia Ground Water Association. For example 000000044593.

Well Tag Number [0000000] [Search] [Erase]

USE CAPITALS FOR ALL THE FOLLOWING SEARCHES!

Summary Search by British Columbia Geographic System Grid. This search returns a summary of water wells in that particular geographic area. (For example entering 092G024414 returns a summary of water wells on a portion of the University of British Columbia campus.)

BCGS Number [ ] [Search] [Erase]

Lithology Summary by British Columbia Geographic System Grid. This search returns lithologies of water wells in that particular geographic area. (For example entering 092G024414 returns lithologies of water wells on a portion of the University of British Columbia campus.)

BCGS Number [ ] [Search] [Erase]

Search by Street Name**USE ALL CAPITALS**

Street Name [ ] and BCGS Mapsheet [%] [Search] [Erase]

Search by **BCGS reference and well number**.

BCGS Reference (like 092G024414) [ ] Well Number (like 2) [ ] [Search] [Erase]

If your search returns saying NO ROWS SELECTED then no record was found matching the description you gave. The searches by legal land description or street name may not always be successful in finding a well due to defeciencies in data as provided. The legal descriptions in the water well database are the legal descriptions of the property at the time the water well was constructed. If your search is unsuccessful in finding a particular well these ways; you may find it with a BCGS (British Columbia Geographic System) search. If you cannot find the well with a BCGS search; then, that record has not been provided to the Groundwater Section by the Owner or Driller or is a recent record which has not yet been processed.

Please note -- This database is updated at the first of every month

Older and Specialized Searches.

Specialized Output for mapping comparisons. Helpful when you are trying to reconcile well numbers from some of the older water well location maps.Search by BCGS.

Search by well tag number. This search returns a **detailed water well record** for a particular well including the lithology of the water well.

Search by well tag number. This search returns lithology information for a particular well.

BRITISH COLUMBIA

REGISTER

of **Qualified Well Drillers** in the Province of British Columbia

****

Pursuant to Section 2 of the ***Ground Water Protection Regulation*,** the Comptroller must establish and maintain a register of qualified well drillers who are authorized to operate in British Columbia. The list of qualified well drillers whose names are in the Register, must be made readily available to the public during normal business hours, or be available in electronic form on the internet. A person wishing to be recognized as a qualified well driller in British Columbia and wanting to be listed in the Register may apply to the Comptroller pursuant to Section 3 of the ***Ground Water Protection Regulation.***

****

Well Driller ID #	Name	Company Name	Company Address	Company Phone #	Company Fax #	Company E-Mail Address	Class of Well Driller*	Date of Registration

* The Register may list qualified well drillers as belonging to a particular class of qualified well driller.

The Comptroller **may remove from the Register** of qualified well drillers any person who:

- fails to meet all of the necessary requirements for registration,
- is no longer actively working in British Columbia as a qualified well driller, or
- is deceased.

A person listed as a qualified well driller in this Register **must advise** the Comptroller in writing **within 60 days of any changes** to the information included in the Register or if they are no longer actively working in British Columbia as a qualified well driller.

By listing persons as qualified well drillers in this Register, the Province of British Columbia in no way guarantees, or may be held liable, for any work performed by the person.

The order in which persons appear in this Register is by date of registration and in no way reflects any order of preference, special favour or any other bias on behalf of the Province of British Columbia.

The person whose name appears in this Register should, in the course of their duties as a qualified well driller in British Columbia, **carry with them the well driller identification card** issued to them by the Comptroller and must **present it upon request** to the Comptroller, the Regional Water Manager, an engineer or an officer under the *Water Act* , or a Drinking Water Officer under the *Drinking Water Protection Act,* as proof of their qualifications as a well driller pursuant to Section 71 of the *Water Act*.

APPLICATION FOR REGISTRATION

As a **Qualified Well Driller**
in the Province of British Columbia

****

Pursuant to Section 3 of the ***Ground Water Protection Regulation*** a person may apply to the Deputy Comptroller of Ground Water for registration as a **qualified well driller** in the Province of British Columbia. The applicant for registration **must provide proof that the applicant is at least 19** years of age and **one of the following** with the application:

- **(i)** documented evidence (e.g. letter(s) and reference) from employer(s) of having a minimum of 5 years full time experience drilling wells in British Columbia or in another jurisdiction;
- **(ii)** the original or a notarized copy of a Certificate of Qualification as a Water Well Driller issued by the Province of British Columbia and documented evidence of having a minimum of 3 years full time experience drilling wells;
- **(iii)** the original or a notarized copy of a certificate as a Ground Water Drilling Technician issued by the Canadian Ground Water Association and documented evidence of having a minimum of 3 years full time experience drilling wells.

****

Applicant's Name: ____

Company Name: ____

Company address: ____
____
____

Company Phone No.: __________________ **Company Fax No.:** ___________________

Company E-Mail Address: ____

Proof of age (to be attached, describe nature of proof, e.g. notarized copy of birth certificate, BC driver's licence, etc.): ____
____

Proof of Qualifications (to be attached to this application - indicate category of proof provided as either (i), (ii) or (iii) as corresponding to the categories in box above): _______
Original copies of documents will be returned to the applicant.

... continued on reverse/

Note #1: As documented evidence of 5 years of full time experience drilling wells in BC or another jurisdiction, an applicant may submit letters of reference from company owners, clients or qualified professionals collectively attesting to the accumulated period of experience.

Note #2: Applications for registration as a qualified well driller using documented evidence of 5 years of full time experience drilling wells in BC or another jurisdiction (i.e. drillers using the grand-parenting provision in (i) above) will **no longer be accepted after midnight on October 31, 2006.**

Note #3: The evidence of experience drilling wells should include information on: the period of experience, employers, summary or the nature of the well drilling (i.e. methods of well construction/types of drilling, types of wells), and province or country if experience was obtained outside of British Columbia. The Deputy Comptroller of Ground Water reserves the right to request additional proof of experience to that submitted by the applicant.

Upon acceptance and approval of this application by the Deputy Comptroller of Ground Water, the applicant will be registered as a qualified well driller in British Columbia and will receive an identification card. There is **no charge** for this application or for inclusion in the register of qualified well drillers.

The Deputy Comptroller of Ground Water **may remove from the register** of qualified well drillers any person who:

- fails to meet all of the necessary requirements for registration,
- is no longer actively working in British Columbia as a qualified well driller, or
- is deceased.

A person listed as a qualified well driller in the register **must advise** the Deputy Comptroller of Ground Water in writing **within 60 days of any changes** to the information on the Register or if they are no longer actively working in British Columbia as a qualified well driller.

The information required by this form and the documents you provide with it will be used to consider your application for registration and for other purposes related to the administration of the *Water Act* and its regulations. This information will be available for examination by any member of the public. If you have any questions about the collection or use of this information, contact the Deputy Comptroller of Ground Water.

The Ground Water Well Database

Search the Well Database.

Well Query Help Notes. It always pays to read the directions.

New Well Notification for the Water Well Owner.

Search the Well Database using a clickable map interface to help you find the BCGS area of the wells you may be interested in. This is still in the early stages of development and is not the recommended search to use. It is useful if you are not familar with the British Columbia Geographic System of Mapping (BCGS).

NTS Map Reference and BCGS Map Reference.

Water Well Statistics. A few details about the history of the **WELL** database and water well drilling in British Columbia.

Register a Water Well in the **WELL** database. An experimental online data entry form.

Water Well Data Elements. A numbered listing of possible fields of interest for ground water databases. A discussion of ground water data management fields and forms.

Service Requests: The Ground Water Section provides search services for confirming information on existing records and making hard copies of available maps, records and reports. Schedule of Charges.

The Well Drilling Data Capture System

(Ground Water Data Management Version 1.0b.)
The Well Drilling Data Capture System has been designed to provide water well drillers with an easy to use customizable database that is compatible with the database systems used. This system was developed with the cooperation and assistance of the British Columbia Ground Water Association. With this system water well drillers will be able to organize and maintain their own water well data, print out water well records for customers and export data selected by the driller to the WELL database. Minimum system requirements are a personal computer capable of running the Windows 95/98/NT operating system.

Ground Water Issues in British Columbia

Statistics compiled in 1981, showed that 22 percent (600,000 persons) of the Province's population depended upon ground water for water supply. Although the volume of ground water extracted amounts to only ten percent of total water consumption in British Columbia, because of the large quantities of water used in the province, this represents twenty-five percent of all the ground water extracted in Canada. The largest use of ground water in the province is by industry (55%), followed by agricultural (20%), municipal (18%) and rural domestic (7%). Certain areas are entirely dependent upon ground water for water supplies.

Numerous ground water resource conflicts currently exist in various parts of the province such as:

*well interference where large capacity wells lower water levels and yields of neighbouring wells, (e.g. Surrey, Mill Bay, Saanich);

*artesian wells which are allowed to flow freely thereby wasting water and lowering water levels and yields in neighbouring wells, (e.g. Surrey, Okanagan, Gulf Islands, Saanich);

*ground water-surface water conflicts, particularly where surface water is fully licensed and ground water extraction depletes surface flows and availability, (e.g. Cherry Creek /Kamloops, Chimney Creek / Williams Lake, Kalamalka Lake);

*excessive ground water withdrawals in coastal areas resulting in salt water intrusion and quality degradation, (e.g. Gulf Islands, Saanich);

*poor well construction practices which result in degradation of ground water quality and contamination, (e.g. Gulf Islands, Saanich);

*health risks, public safety and environmental hazards associated with uncapped and abandoned wells, (e.g. Lower Mainland and Okanagan Valley).

In some areas of the Province, shallow ground water is also susceptible to non-point or diffuse sources of contamination from various activities, such as the unregulated use of chemical fertilizers and pesticides combined with excessive irrigation practices, and the application, disposal and storage of animal wastes on land. Elevated levels of nitratenitrogen in excess of the Canadian Drinking Water Quality Guideline of 10 mg/L, for example, have been found in a significant number of domestic wells in the LangleyAbbotsford, Osoyoos and Grand Forks areas of the Province. Point sources of contamination such as abandoned landfills, chemical spills and former industrial sites are also causing water quality degradation in some areas.

In 1982, the Ministry of Environment (Water Management Branch), in cooperation with the well drilling industry, prepared Guidelines for Minimum Standards in Water Well Construction, Province of British Columbia. Compliance with these standards ensures that water wells are drilled and finished in a manner that protects the health, safety and welfare of the public and the integrity of the resource.

These have been adopted in varying degrees by water well drillers, consultants in the industry and local governments but are not mandatory on a province-wide basis.

In 1986, the Provincial Apprenticeship Board approved the designated trade of Water Well Driller and the regulations for trade qualification and certification by the Ministry of Labour (now the Ministry of Advanced Education and Job Training).

Water well drilling is a recognized trade in the province, and individuals meeting the specified qualifications can hold a Certificate of Qualification as a Water Well Driller. Certification, however, is not mandatory for an individual to work at the trade. An approved training program for Water Well Drillers was finalized in 1986 under the auspices of the Ministry of Advanced Education and Job Training. The Program was developed by a Trade Advisory Committee comprised of representatives of the Ministry of Environment (Water Management Branch), the B.C. Water Well Drilling Association and the Ministry of Labour.

Well construction is addressed in Guidelines for Minimum Standards in Water Well Construction developed by the Water Management Program and the British Columbia Water Well Drilling Association. Well drillers may also apply for certification as a Water Well Driller. Both of these measures are entirely voluntary.

Many old water wells as well as other forms of excavation such as test wells and foundation test holes, may not be properly capped or filled in, thereby posing a potential safety hazard.

In some areas, well interference problems and impacts on surface water resources are serious. Further well drilling and surface water allocation in these areas would threaten the integrity of the entire hydrologic regime, severely impacting individual water users and ecologic systems dependent upon the water resource. Ground water maintains baseflows in rivers and streams during periods of drought and is a critical component to maintaining fisheries habitat and spawning areas.

Many ground water quality problems emanate from inappropriate land-use practices directly over susceptible aquifers: eg., over-application and runoff of agricultural fertilizers and chemicals which may result in high nitrates and pesticides in ground water; land disposal of sewage effluent; chemical spills or leakage from storage tanks and transportation facilities; poorly sited landfills; and incorrect waste disposal practices at former industrial sites. Infiltration of rainfall, snowmelt and streamflow in ground water recharge areas may carry contaminants to ground water especially in sensitive areas where water tables are shallow and surface soils consist of permeable sand and gravel deposits. Areas of ground water discharge and immediate environs surrounding these sites (e.g., natural springs and wetlands), need to be protected from sources of contamination.

Regulation of such land-based activities currently falls under the mandates of the Waste Management Act, the Pesticide Control Act and the Health Act.

Property owners may carry out activities at or near well heads that can threaten the ground water resource. Activities near wells such as storing or mixing chemicals, filling pesticide application containers, applying chemicals through irrigation systems or dumping waste materials can result in ground water contamination. Unused wells in some instances have been used to dispose of various wastes.

Ambient ground water quality is being monitored by the Water Management Program in a number of observation wells in the settled areas of the province, and in specific aquifers where contamination from non-point sources is evident. Point sources of contamination are monitored under the Environmental Protection Program. Water supply systems dependent upon ground water are tested by the purveyors and the Ministry of Health. The Water Quality Check Program administered by the Ministry of Environment, Lands and Parks provides for laboratory analysis of individual water supply sources for homeowners at a subsidized cost.

Some aquifers show evidence of ground water contamination to a point of being impaired or unfit for use, particularly for drinking water purposes. Sources of contamination may be due to natural levels of constituents or from human-induced sources. From an allocation perspective, ground water use without provisions for adequate treatment should not be allowed in areas of known risk to human health. Areas of known or suspected contamination need to be identified and designated as such.

Ground water quantity information in the form of well records are currently submitted by well drillers to the Water Management Program on a voluntary basis. A similar situation exists for ground water assessment reports prepared by consulting firms in the ground water industry. Well record information is compiled, processed and stored in paper files, on microfiche and on computer systems.

A network of 150 observation wells throughout the province provides current and historic information (20 to 30 years in some cases), on water level fluctuations in the major areas of ground water use.

Ground water quality information in the form of laboratory analyses obtained from the Water Quality Check Program and other sampling activities is available for several thousand wells, but because of incomplete documentation of sampling sites in many cases and limited resources for processing this information, much of the data has not been linked to other databases on wells and specific geographical locations.

On June 21, 1995, The Water Protection Act received Royal Assent. Section 3 (2) states: "The property in and the right to the use, percolation and any flow of ground water, wherever ground water is found in British Columbia, are for all purposes vested in the Crown in right of British Columbia and are conclusively deemed to have always been vested in the Crown in right of British Columbia."

The *Drinking Water Protection Act,* 2001.

Our vision is a sustained and healthy ground water resource.

Ground Water

British Columbia *Environmental Assessment Act*:
Reviewable Ground Water Projects

What is the *Environmental Assessment Act*?

The British Columbia *Environmental Assessment Act* requires that certain types of project proposals undergo an environmental assessment and obtain an environmental assessment certificate in order to proceed. The current legislation came into effect in December 2002, replacing the previous *Environmental Assessment Act*, which had been in effect since June 1995. The provincial government is committed to more flexible, efficient, and timely reviews of proposed major projects to help revitalize the provincial economy. This is why a new, streamlined environmental assessment process was introduced in 2002.

The environmental assessment process identifies and assesses the potential effects that may result from a proposed project, and considers measures to minimize or avoid adverse effects. The scope, procedures and methods for each assessment are tailored to the circumstances of the proposed project.

When is a Ground Water Project Reviewable under the *Environmental Assessment Act?*

New Facility

" The development of a new facility is reviewable if it consists of one or more wells, operated either periodically or continuously for one year or more, designed to be operated to extract ground water at the rate of 75 litres or more per second.

Modification to an Existing Facility

" Where an existing facility is designed to extract ground water at a rate of 75 litres or more per second, modifications to the facility are reviewable if the modifications will increase the rate of extraction by 35% or by 75 litres per second or more.

" Where an existing facility is designed to extract ground water at a rate of less than 75 litres per second, modifications to the facility are reviewable if the modifications will increase the rate of extraction by 35 % and result in an extraction rate for the facility of 75 litres per second or more.

Federal Requirements

The Canadian *Environmental Assessment Act* may apply to certain ground water extraction proposals where the rate of ground water extraction is greater than 200,000 m3 /a (about 7 litres per second) or to modifications that increase production capacity by more than 35 %. Should there be a requirement for review under both provincial and federal environmental legislation, the provincial Environmental Assessment Office will arrange for a joint review to avoid duplication and to streamline the review process.

For more information about the environmental assessment review process and projects that are reviewable under the *Environmental Assessment Act*, contact the Environmental Assessment Office:

Water Well Location Maps

Aquifers and Water Wells in BC

This interface to ground water aquifers and water well locations is under development and now replaces other methods of delivering ground water data to the public, consultants and water well drillers.

The Ministry no longer provides hard copies of maps.

A catalog of water well location maps.

For BCGS mapsheets Generally newer better quality mapping.
For Land Districts Generally older mapping of varying quality.

LIST OF FIGURES

LIST OF TABLES

LIST OF APPENDICES

A Preliminary Survey of Methyl Tertiary – Butyl Ether (MTBE) in Ground Water at Selected Well Sites in British Columbia, Canada

by W.S. Hodge, Ground Water Hydrologist, Water Protection Branch

Executive Summary

Methyl Tertiary – Butyl Ether (MTBE) was mandated by the US Environmental Protection Agency as a gasoline additive in 1979 to reduce air pollution and is part of a reformulated gasoline to increase oxygen in the gasoline causing it to burn more cleanly in automobiles. Gasoline containing MTBE is also distributed in Canada, however as of late 2000, MTBE is no longer sold in British Columbia. MTBE is highly soluble and can move rapidly through soils and aquifers. Concern over MTBE contamination of ground water in British Columbia was raised during the November 2000 Legislative Report of Proceedings from the Public Accounts Committee. As part of the Provincial Government's response over this concern the Ground Water Section of the Water Protection Branch conducted a ground water sampling program between June and November 2000. A total of 76 water samples were collected from 58 domestic wells, observation wells and piezometers located in the Lower Mainland, Vancouver Island, and the Interior of BC. Most wells sampled were completed in sixteen shallow, unconfined, highly vulnerable, sand and gravel drinking water aquifers that are regularly monitored by Ground Water Section as part of the Province's Observation Well Network and Ambient Ground Water Quality Monitoring Network. The sampling did not target specific sites contaminated by hydrocarbons. Of the 76 samples analyzed by Analytical Service Laboratories Ltd. all MTBE results were <1.0 part per billion (ppb) except one well, domestic well "U" located in the Abbotsford-Sumas Aquifer. This well had a slight detect of 2.0 ppb MTBE, was re-sampled in December 2000 by Regional Water Management staff and MTBE was confirmed at 3.0 ppb, well below the British Columbia drinking water guideline of 20 ppb based on taste and odour thresholds. Quality assurance / quality control (QA/QC) procedures including taking duplicate samples were followed each time the portable pump was used. The pump and discharge hose were decontaminated by pumping distilled water through the system and submitting this washed sample to ASL for analysis. All QA/QC results were negative. A field survey was conducted in February 2001 to identify potential sources of contamination and to sample wells located approximately 1 km radius of well "U" where MTBE was detected. The majority of surrounding residences were, however, connected to the City of Abbotsford water supply and only 2 residences were using well water for domestic use. These wells, including domestic well "U", were re-sampled in February 2001 and MTBE results were <1.0 ppb MTBE for all three wells suggesting that the very low levels of 2.0 and 3.0 ppb MTBE may have naturally flushed through the aquifer. Possible sources of MTBE included nearby gasoline

storage tanks on private properties. Well owners should protect their water source from MTBE contamination by inspecting the immediate area around their well and pump house and relocating or safeguarding any potential contaminant sources such as gasoline storage tanks a safe distance from their water source.

A Preliminary Survey of Methyl Tertiary-Butyl Ether (MTBE) in Ground Water at Select Well Sites in British Columbia, Canada

1. **Occurrence and Physical Characteristics of MTBE**

   Methyl tertiary-butyl ether (MTBE) is a colourless, volatile organic compound (VOC) produced almost exclusively for use in gasoline. It is made of methanol and a by-product of the oil refining process. Oxygenates (MTBE, Ethanol) were mandated by the USEPA in certain areas as a gasoline additive in 1979 to reduce air pollution and is part of a reformulated gasoline to increase the amount of oxygen in gasoline causing it to burn more cleanly in automobiles. Such reformulated gasolines typically may contain up to 15 percent of MTBE to reduce vehicle carbon monoxide emissions. MTBE has been reported to occur in Western Canada gasoline at an average level of 0.44 percent by volume for all brands, (Tushingham, Hodge, and Roberge, 2000).

   MTBE is lighter than water and has a high solubility in water. The specific gravity of MTBE is 0.740 grams/cm^3 (Aldrich, 1994) whereas water has a specific gravity of 1.00 gram/cm^3. Because MTBE has a high solubility in water, it can readily dissolve in ground water and be transported as a dissolved species by ground water flow. Table 1 summarises some basic physical properties of MTBE and another component of gasoline (benzene) which is included for comparison. MTBE is resistant to microbial decomposition and is difficult to remove in water treatment. It's turpentine taste and smell renders water undrinkable at even 30 parts per billion (ppb).

   MTBE concern was raised in the November 2000 Legislative Report of Proceedings from the Select Standing Committee on Public Accounts. Concern over MTBE contamination to ground water was discussed on several occasions including the potential hazards presented to rivers and aquifers from gasoline pipelines crossing the Province and transport of MTBE in concentrated form by truck and rail. The importance and results of the province wide sampling program being carried out were also discussed during these proceedings.

   Common sources of MTBE are leaking underground fuel storage tanks, spills at gasoline storage sites and storm water runoff from roads and parking lots.

Table 1 – Physical Properties	MTBE	Benzene
Molecular Weight	88.15	78.11

Specific Gravity (g/cm^3)	0.740	0.874
Solubility (mg/L) at 20^0C	4700	1780

2. **Objectives of MTBE Sampling Program**

In order to survey how widespread MTBE might be present in the ground water (and aquifers) in British Columbia, sampling was carried out in conjunction with the 2000 / 2001 Observation Well Network and Ambient Water Quality Network sampling programs.

Briefly, the Observation Well Network is comprised of about 160 wells located in major ground water areas of British Columbia. Each year about 25 of these wells are sampled for inorganic chemical analysis. For further information on the Observation Well Network see the Fact Sheet (Appendix A). The Ambient Water Quality Network was initiated in the late 1980's and comprises about 45 domestic wells and 40 piezometers that are sampled once a year for inorganic chemical analysis to monitor non-point source contamination of nitrate in three regions: Lower Mainland, Osoyoos, and Grand Forks.

Whenever an observation well or domestic well was sampled for regular sampling, MTBE sampling was included. This sampling program was conducted to provide a preliminary survey to check for the presence of MTBE in ground water.

Site-specific sampling of ground water beneath known hydrocarbon contaminated sites was not carried out during this preliminary sampling program. The Ground Water Section sampling program was one component of a number of components to the provincial government response to concerns over MTBE contamination. Preliminary sampling for MTBE was also undertaken by the Ministry of Health Services and local health regions for a number of community water supply systems. Other work has been preparation of a Fact Sheet on MTBE completed in the spring of 2000 (Appendix B) to raise public awareness and the development of Water Quality Guidelines for MTBE. Water quality guidelines for MTBE are available at: http://wlapwww.gov.bc.ca/wat/wq/BCguidelines/mtbe.html The MTBE guideline for drinking water in British Columbia is set at 20 ppb based on taste and odour thresholds.

This report presents the Ground Water Section's MTBE sampling procedures and sampling results and provides recommendations to well owners for protecting and safeguarding their water supplies by identifying and removing potential contaminants (i.e. gasoline storage tanks) a safe distance from the well.

3. **MTBE Sampling Program and Site Selections**

The sampling program included sampling of all established domestic wells within the Ambient Water Quality Network Program in the Lower Mainland, Osoyoos, and Grand Forks, specific observation wells and select irrigation wells in Keremeos. The majority of the wells sampled are shallow, dug and drilled wells and are located in highly vulnerable, unconfined sand and gravel aquifers except observation well No. 65 (located in Saanich, just north of Victoria) which is completed in a bedrock aquifer (Table 2).

During the summer and fall of 2000, the Ground Water Section, Ministry of Environment, Lands and Parks collected a total of 76 samples from 58 wells located in sixteen aquifers in the Lower Mainland, Vancouver Island and the Interior of BC (Figure 1). For privacy reasons, domestic well owners' names have been abbreviated as shown in Table 2 and throughout the text. All wells sampled are shown in Table 2. A photograph of a typical domestic well sampling site is shown in Appendix C.

4. **MTBE Sampling Procedures**

Domestic wells were sampled by turning the inside or outside water tap closest to the well on and filling 2-40 ml purge and trap glass vials. The sample vials contained a small amount of sulphuric acid as a preservative. The sampling locations have been previously established and tagged during the regular sampling program.

Sampling of observation wells and piezometers was carried out by installing a portable submersible pump, pumping the well or piezometer for a specified period (2 to 5 well volumes if possible) through a hose and then collecting and shipping the samples in the same manner as the domestic well sampling. Specific conductance and water temperature were taken at regular intervals during pumping to determine the optimal time for sample collection.

As a quality control measure and to minimize cross contamination by the pumping equipment between wells, decontamination procedures were carried out. Pump decontamination procedures have also been included in Appendix D.

5. **Land Use Survey**

Prior to sampling a well, a visual inspection around the vicinity of the well was carried out to locate and identify any potential MTBE sources. MTBE sources such as gasoline stations, gasoline storage tanks and utility storage sheds were noted. This inspection was preliminary and carried out with the intent of obtaining more detail if a particular well showed the presence of MTBE after initial sampling. If MTBE was detected in a well then a detailed land survey in the vicinity of the wellhead would be carried out when the well was re-sampled to verify the presence of MTBE. The general land use around each well sampled is indicated in Table 2.

6. **Analytical Service Laboratories Ltd.**

All samples were forwarded by courier to Analytical Service Laboratories Ltd. (ASL) in Vancouver for MTBE analysis. The purge and trap 40 ml vial samples were analysed by a Gas Chromatograph Mass Spectrometer with purge and trap sample introduction. ASL was able to analyse and detect MTBE to <1.0 ppb. The turn around time between sample submission and reporting of results was about 10 working days.

7. **MTBE Sampling Results and Discussion**

All MTBE results as shown in Table 2 were <1.0 ppb except for domestic well "U" (2 ppb) located in the Abbotsford area (east of Vancouver).

Well "U" was re-sampled in December 2000 to check the 2.0 ppb result of November 2000. The follow-up sample contained 3.0 ppb MTBE. In February 2001, a field survey was carried out and residences within approximately 1 km radius of well "U" were contacted. Only two other residences were found to be using private well water for domestic use within the surveyed area. The remaining residences are connected to the City of Abbotsford water supply. The three wells were sampled and samples were submitted to ASL for MTBE analysis. The three sample results were <1.0 ppb MTBE including domestic well "U". The fact that MTBE was not detected in "well U" in the February 2001 sample suggests that the low levels of 2.0 and 3.0 ppb MTBE may have naturally flushed through the aquifer. During the field survey of well "U" some potential sources of MTBE were noted. Gasoline and diesel fuel storage tanks on a wooden pedestal were noted located approximately 60m (200 ft) east and slightly down slope of well "U". It was further noted that the pedestal was located on a coarse gravel base and not a concrete or spill containment pad. A gasoline tank on wooden pedestal also on a gravel base was located directly behind the residence. A buried gasoline tank (s) with two hand pumps at surface was noted beside the driveway of a neighbouring property. The hand pumps were padlocked.

This was a preliminary sampling program. It was carried out to determine if MTBE contamination was prevalent in British Columbia and if it was present in shallow unconfined vulnerable aquifers in British Columbia that are regularly monitored. Results should not be interpreted to indicate all similar aquifers are necessarily safe from MTBE contamination nor that MTBE is not present in the aquifer elsewhere. Any future sampling should also target wells located near industrial or commercial areas where the possibility of detecting MTBE is more likely to occur.

Quality assurance and quality control measures (QA/QC) were taken for those observation wells that were pumped using the portable Redi-Flo pump. Following sample collection, step-by step decontamination procedures as shown in Appendix D were taken. QA/QC sample results indicated that use of the portable Redi-Flo pump did not have any effect on the results.

8. **Conclusions and Recommendations**

- The MTBE Preliminary Sampling Program included sampling established domestic wells in the Ambient Water Quality Program Network and specific Observation Wells. The sampling Program did not specifically target any known hydrocarbon contaminated sites. The purpose of the sampling program was to survey a number of aquifers across the province for the presence of MTBE.
- Fifty-eight wells located in the Lower Mainland, Vancouver Island, and the Interior of BC were sampled for MTBE during the summer and fall of 2000. A total of 76 samples were submitted for analysis.
- The sampling program covered a total of sixteen drinking water aquifers. Most wells sampled were shallow, dug and drilled wells and located in unconfined, highly vulnerable aquifers. All wells sampled were from surficial aquifers except observation well 65 (Saanich) which is located in a fractured bedrock aquifer.
- Whenever an observation well was pumped, the pump and hose were washed (decontaminated) using distilled water to identify if cross-contamination of the pumping equipment was an issue. The washed samples were also submitted to ASL Ltd. for analysis as a quality assurance / quality control measure. All QA/QC sample results were <1.0 ppb.
- Of the 76 samples submitted to ASL Ltd. all results were < 1.0 ppb except domestic well

"U" located in Abbotsford which had an initial detection of 2.0 ppb MTBE. This well was re-sampled in December 2000 by Regional Water Management Staff and MTBE was confirmed at 3.0 ppb. In February 2001, a field survey was carried out and residences within approximately 1 km radius of this well were contacted. Only two other residences were found to be using well water for domestic use within the surveyed area. The remaining residences are connected to the Abbotsford City water supply. The three wells were sampled and submitted to ASL for analysis. The three sample results were <1.0 ppb including domestic well "U". Based on these results it would appear that the November and December 2000 MTBE results of 2.0 ppb and 3.0 ppb respectively may have naturally flushed through the aquifer. It should be further noted that MTBE levels of 2.0 or 3.0 ppb are just above the detection limit and below the MTBE guideline for drinking water in British Columbia set at 20 ppb based on taste and odour thresholds.

- During the February 2001 field survey of well "U" some potential sources of MTBE were detected in close proximity to the well including a nearby gasoline and diesel tank located on a wooden pedestal over coarse gravel. This survey was carried out at this time with the intent of identifying <u>potential</u> sources of ground water contamination, and not to assess these sources more fully to determine if they were indeed contaminating the underlying soils and aquifer.
- Based on the results obtained from this survey and preliminary results of independent sampling by local health authorities of a limited number of high risk community wells (Egan, pers comm, 2001), MTBE in ground water does not appear to be a problem at this time.
- The Ministry of Water, Land and Air Protection (MWLAP) should continue to sample a limited number of high risk observation wells completed in unconfined, highly vulnerable aquifers for MTBE in 2001/2002. Results should not be interpreted, however, to indicate that all similar aquifers are safe from MTBE contamination nor that MTBE is not present locally in the sampled aquifer elsewhere. Any future sampling should include wells located near industrial or commercial areas where the possibility of detecting MTBE may be increased.
- Private well owners and purveyors should protect and safeguard their water source by inspecting the immediate area around their well and / or pump house and identify and relocate potential contaminants such as petroleum products and gasoline storage tanks <u>at least</u> 30m (100 ft) distance from their water source and providing safeguards such as spill containment facilities to contain any leaks. In some cases this distance may need to be increased depending on specific site conditions.

[APPENDIX C]

- Photograph of Typical Domestic Well Sampling Site

APPENDIX D

- Step by Step Decontamination Procedures for MTBE Sampling from Observation Wells and Piezometers

APPENDIX D

Step by Step Decontamination Procedures for MTBE Sampling from Observation Wells and Piezometers:

- Fill a clean 21 litre (5 gallon) plastic bucket with distilled water and place the pump inside the bucket washing the outside of the pump and pump sleeve.
- With the pump fully submersed in the 21 litre (5 Imperial gallon) bucket, pump and flush the pump and hose for approximately 5 minutes. Reduce the flow to about 0.02 to 0.04 L/s (1/4 to1/2 Igpm) and top the bucket up with distilled water while pumping to ensure that the bucket is always full.
- After about 5 minutes reduce the flow further and collect another 2-40 ml vials ensuring that the vials do not overflow and there is no head space in the vial. These vials are submitted to ASL and analyzed for MTBE.

Ground Water Protection Regulation - Phase 1

Protecting the Ground Water Resources of British Columbia

Backgrounder

Quick Jumps

Introduction

On July 7, 2004, in Chilliwack, the Honourable Bill Barisoff, Minister of Water, Land and Air Protection publicly announced that the government has enacted the Ground Water Protection Regulation (GWPR). The GWPR is designed to protect British Columbia s valuable ground water resource.

The GWPR deals with aspects of well construction that significantly enhance ground water protection i.e., installing effective surface seals around wells, securely capping and floodproofing wells, and permanently closing unused wells to protect ground water quality. The GWPR also establishes the qualifications for well drillers and well pump installers and provides for a provincial registry of those possessing the qualifications.

Registration provisions in the GWPR for qualified well drillers and qualified well pump installers will come into force on November 1, 2004, as will amendments to the *Water Act* (2001) providing for ground water protection. One year later, on November 1, 2005, the remainder of the GWPR provisions will take effect.

Prior to the GWPR, there was no regulation in British Columbia focussing specifically on ground water or standards for well construction, maintenance, well closure and qualifications for well drillers and well pump installers. Unregulated drilling activities and lack of enforceable well construction standards have contributed to ground water quantity and quality problems in some areas of the province. For example:

- bacteriological contamination of private domestic wells is a problem in local areas of the province;
- old, unused wells are often left unfilled and uncapped and become pathways for contaminants to enter directly into the underlying aquifer; unused wells may even be used for disposal of household and hazardous wastes, causing degradation to local ground water quality; and
- wells and test holes are not always constructed or tested by qualified persons with the knowledge necessary to safeguard drinking water sources and prevent situations where ground water may be adversely affected.

In 2000, the Walkerton tragedy was a wake-up call to all Canadians that a similar tragedy could happen elsewhere. At the same time, a number of reports critical of source water protection had sounded warnings, including:

- Auditor General's 1998/99: Report 5 on Protecting Drinking-Water Sources
- Provincial Health Officer (2001). A report on the health of British Columbians. Provincial Health Officer s annual report 2000. Drinking water quality in British Columbia: The public health perspective.
- Final Report: Panel Review of British Columbia s Drinking Water Protection Act, 2002.

· Top

In 2001, the government made a New Era commitment to pass real comprehensive ground water legislation to improve the quality of British Columbians drinking water, and announced its Action Plan for Safe Drinking Water in British Columbia in June 2002. On the advice of its Drinking Water Review Panel, government reaffirmed the ground water legislation by passing the *Drinking Water Protection Amendment Act* in October 2002. This led directly to the appointment of the Ground Water Advisory Board to provide advice and recommendations and the development of Phase 1 of the Ground Water Protection Regulation.

The new GWPR is the first phase of a comprehensive Ground Water Protection Regulation and includes critically needed standards for well construction and closure, floodproofing of community wells, well identification and qualifications for well drillers and well pump installers. Subsequent phases will reinforce these source protection measures and deal with such matters as well reports, well pumps, flow testing, water analyses and aquifer quality and quantity protection and use.

What is the Ground Water Protection Regulation and What Does it Cover?

The primary purpose of the Ground Water Protection Regulation is protection of the quantity and quality of the province s valuable ground water resource by:

- setting out standards to safeguard and maintain the integrity and efficient use of the ground water resource, and
- ensuring activities related to well water and ground water are undertaken in an environmentally safe manner.

The GWPR is a regulation under the *Water Act*.

The GWPR will be completed in three phases.

Phase 1 (completed and announced July 7, 2004) covers:

- qualifications for well drillers and well pump installers,
- a register for qualified well drillers and well pump installers,
- ground water protection through flood proofing, surface sealing, well caps and covers, protection of the well head, and deactivating or closing of wells (well construction standards), and
- well identification.

Phase 2 will focus on:

- additional standards for well construction, flowing wells, well pumps, flow testing and well operation,
- water analysis for new and altered wells,
- well reports, and
- the establishment of offences for which tickets may be issued.

Phase 3 will focus on:

- implementing water management plans in designated areas,
- drilling authorizations (if necessary) and
- other measures for aquifer quality and quantity protection and use.

· Top

The GWPR Phase 1 is in two parts:

- the main body is results-based and specifies what must be achieved but not how to achieve it, and
- Appendix A (the Code of Practice for Construction, Testing, Maintenance, Alteration and Closure of Wells in British Columbia , or simply the Code) sets out the minimum rules or standards in relation to wells.

The GWPR applies to water supply wells (i.e., domestic wells and non-domestic wells, such as irrigation wells), ground water monitoring wells, recharge and injection wells, dewatering or drainage wells, remediation wells and geotechnical wells that do not involve water transfer (i.e., boreholes, test pits, closed geo-thermal and special types of holes). The GWPR does not apply to geothermal wells, oil and gas wells, or wells used for coalbed methane extraction which are already regulated under other acts, like the *Geothermal Resources Act*, *Mines Act*, and *Petroleum and Natural Gas Act*.

The GWPR does not restrict a well owner s ability to drill new wells. Wells regulated under the GWPR are not licensed and the province does not charge any fees or rentals for extraction of ground water.

Specific provisions of the GWPR Phase 1 include:

- Qualified well drillers and well pump installers must register with the province. Registration begins November 1, 2004. The GWPR recognizes the Industry Training Centre and Canadian Ground Water Association certification. The GWPR includes a grand-parenting provision (available until October 31, 2006) for individuals who can demonstrate that they have the equivalent of 5 years full time experience drilling wells or installing well pumps.
- The GWPR provides for a provincial registry of qualified well drillers and well pump installers.
- Under the GWPR, qualified professionals (Professional Engineers and Professional Geoscientists with competency in hydrogeology or geotechnical engineering) play a role in enhancing regulatory efficiency and flexibility. The GWPR authorizes qualified professionals to approve alternative specifications where it is not feasible to comply with the specifications set out in the Code. This is similar to the role of qualified professionals on the Contaminated Sites roster under the new *Environmental Management Act*, enacted in 2002.
- Well drillers are to attach identification plates (provided by the province) to new water supply wells. All existing community wells are to be tagged with well identification plates before November 1, 2006.
- New wells (with minor exceptions) are to have an effective surface seal.
- New wells (with minor exceptions) are to have a secure cap or cap and cover. Existing wells are to be capped within two years.
- Standards for floodproofing will apply to all community wells to prevent direct entry of floodwaters into the well.
- All wells not in use will need to be deactivated or permanently closed to protect ground water.

• Top

The new GWPR is the initial step toward fulfilling Government s commitment insofar as it represents the first of three phases that, taken together, will make the legislation truly comprehensive (phases two and three are planned for 2005/06 and beyond).

The GWPR may be found here.

Why is the Ground Water Protection Regulation Needed?

In British Columbia, ground water is a valuable natural resource in need of protection. Over 750,000 residents rely on wells as a drinking water supply. British Columbia uses more ground water than any other province in Canada, except Ontario. Seventy-five percent of the ground water extracted in the province is used to support the province s economy (e.g., mineral / paper processing, agriculture, etc.). There are more than 100,000+ water supply wells in the province. Approximately 3,000 new wells are drilled and hundreds are abandoned annually. These wells have never been subject to any enforceable standards for well construction, maintenance and closure. In fact, prior to the GWPR being enacted, British Columbia was the only province in Canada without regulations to protect ground water.

Unregulated drilling activities and lack of enforceable well construction standards have contributed to a number of ground water quantity and quality problems in some areas of the province. These problems could potentially affect human health, public safety and property values. For example:

- bacterial contamination of private domestic wells is a problem in local areas of the province;
- old, unused wells are often left unfilled and uncapped and become pathways for contaminants to enter directly into the underlying aquifer; unused wells may even be used for disposal of household and hazardous wastes, causing degradation to local ground water quality; and
- wells and test holes are not always constructed or tested by qualified persons with the knowledge necessary to safeguard drinking water sources and prevent situations where ground water may be adversely affected.

Impacts of the Ground Water Protection Regulation

How will the Ground Water Protection Regulation benefit all British Columbians?

All British Columbians will benefit from the added aquifer protection of the Ground Water Protection Regulation. Some of the benefits include:

- securing a safe and healthy ground water resource and reducing risk of degradation of water quality and depletion of aquifers,
- increased public confidence in ground water resources,
- improved integrity and safety of wells and community drinking water supplies (consumer protection),
- consistent province-wide performance standards for well drillers and well pump installers (level playing field),
- improved tracking of wells and their condition,
- a system of ground water protection that is efficient and accountable,
- clearer responsibility of well owners to maintain wells in safe and sanitary conditions, and
- enhanced protection of aquatic ecosystems dependent on ground water.

• Top

How will the Ground Water Protection Regulation affect me as a water well owner in British Columbia?

Owners of all new and existing wells should be aware of their new responsibilities under the GWPR. These responsibilities include the need for on-going maintenance of the well and the well head while the well is in use, capping or covering a well and properly closing the well at the end of its useful life.

The GWPR will add slightly to the cost to construct new water supply wells (~4% of the cost for a typical water supply well). The slight increase in cost is mainly for the installation of a surface seal, which is necessary to provide sanitary protection to the well supply. Another cost to the well owner (~6%) is for closing the well after its useful life has been exceeded (generally about 25 years) to prevent the risk of ground water contamination. The minor financial costs are considered acceptable in light of the improved water quality protection benefiting the well owner, other surrounding owners, and the resource.

How will the Ground Water Protection Regulation affect community wells (i.e., wells having more than one connection) and water suppliers?

Water suppliers using community wells, also called water supply system wells, should be aware of their new responsibilities under the GWPR.

Requirements for well identification apply to new and existing community wells. Water suppliers will need to identify their wells by attaching a well identification plate to the well. This needs to be done before November 1, 2006.

Standards for floodproofing will apply to all community wells to prevent direct entry of floodwaters into the well.

The increased cost for drilling, and ultimately closing, a new community well is expected to be approximately 5% - 10% of the current cost of the well. These added costs are primarily for installing a surface seal and for closing a well at the end of their useful life. There are also requirements for on-going maintenance of the well and well head and capping or covering the well.

· Top

How will the Ground Water Protection Regulation affect industry professionals?

The GWPR affects well drillers, well pump installers and qualified professionals (Professional Engineers and Professional Geoscientists) working in the ground water, environmental and geotechnical engineering field. Industry professionals should be aware of their new responsibilities under the GWPR. To help them learn what is expected, training workshops, guidebooks and other information will be provided over the next year through the British Columbia Ground Water Association and the Ministry s Ground Water Home Page.

How will the Ground Water Protection Regulation affect First Nations?

Any increase in costs for well construction, operation and maintenance to comply with the new Ground Water Protection Regulation will be the same on or off reserves / treaty settlement lands. See impacts on Individual Well Owners and Community Wells.

How was the Ground Water Protection Regulation developed?

The GWPR is based on recommendations made by the Ground Water Advisory Board, an expert panel of ground water scientists and engineers and representatives of the well industry. As such, the recommendations help ensure the GWPR is practical and science-based.

Targeted consultation on the GWPR was held with 21 external stakeholder groups in the spring of 2003 including:

- British Columbia Ground Water Association,
- British Columbia Water and Waste Association,
- five British Columbia Health Authorities, and

- Union of British Columbia Municipalities.

The overwhelming response has been that ground water regulations are long over-due. Reaction of targeted stakeholders to the GWPR has been positive. Industry has long been calling for the "level playing field" the GWPR will provide and other stakeholders encourage government to go further and move on to the development of Phases two and three.

Previously, a broad-based consultation with the general public (including well owners) was undertaken in spring 2001 on the then proposed Drinking Water Protection Act, including the new ground water protection provisions.

Frequently Asked Questions about the Ground Water Protection Regulation

Q: What is covered by the GWPR?

A: The GWPR will be completed in three phases.

Phase 1 covers:

- qualifications for well drillers and well pump installers,
- a register for qualified well drillers and well pump installers,
- ground water protection through flood proofing, surface sealing, well caps and covers, protection of the well head, and deactivating or closing of wells (well construction standards), and
- well identification.

Phase 2 will focus on:

- additional standards for well construction, flowing wells, well pumps, flow testing and well operation,
- water analysis for new and altered wells,
- well reports, and
- the establishment of offences for which tickets may be issued.

Phase 3 will focus on:

- implementing water management plans in designated areas,
- drilling authorizations (if necessary), and
- other measures for aquifer quality and quantity protection and use.

The GWPR applies to water supply wells (i.e., domestic wells and non-domestic wells, such as irrigation wells), ground water monitoring wells, recharge and injection wells, dewatering or drainage wells, remediation wells and geotechnical wells that do not involve water transfer (i.e., boreholes, test pits, closed geo-thermal and special types of holes). The GWPR does not apply to geothermal wells, oil and gas wells, or wells used for coalbed methane extraction which are already regulated under other acts, like the *Geothermal Resources Act*, *Mines Act*, and *Petroleum and Natural Gas Act*.

· Top

Q: Why is the GWPR needed?

A: Unregulated drilling activities and lack of enforceable well construction standards have contributed to ground water quantity and quality problems in some areas of BC. These problems could potentially affect human health, public safety and property values.

This is the first time that British Columbia has enacted ground water protection regulations. Prior to enacting the GWPR, British Columbia was the only province in Canada without comprehensive ground water regulations.

Q: What is the purpose of the Ground Water Protection Regulation(GWPR)?

A: The primary purpose of the Ground Water Protection Regulation is protection of the quantity and quality of the province s valuable ground water resource by:

- setting out standards to safeguard and maintain the integrity and efficient use of the ground water resource, and
- ensuring activities related to well water and ground water are undertaken in an environmentally safe manner.

Q: How was the GWPR developed?

A: The GWPR is based on recommendations made by the Ground Water Advisory Board, an expert panel of ground water scientists and engineers and representatives of the well industry. As such, the recommendations help ensure that the GWPR is practical and science-based.

· Top

Q: With whom did the government consult on the GWPR?

A: Targeted consultation on the GWPR was held with 21 external stakeholder groups in the spring of 2003 including:

- British Columbia Ground Water Association,
- British Columbia Water and Waste Association,
- five British Columbia Health Authorities, and
- Union of British Columbia Municipalities.

Previously, a broad-based consultation with the general public (including well owners) was undertaken in Spring 2001 on the then proposed *Drinking Water Protection Act*, including the new ground water protection provisions.

Q: What was the response of consulted stakeholders to the GWPR?

A: The benefits are:

- securing a safe and healthy ground water resource and reducing risk of degradation of water quality and depletion of aquifers,
- increased public confidence in ground water resources,
- improved integrity and safety of wells and community drinking water supplies (consumer protection),
- consistent province-wide performance standards for well drillers and well pump installers (level playing field),
- improved tracking of wells and their condition,
- a system of ground water protection that is efficient and accountable,
- clearer responsibility of well owners to maintain wells in safe and sanitary condition, and
- enhanced protection of aquatic ecosystems dependent on ground water.

· Top

Q: How does the GWPR stack up against similar ground water regulations in other provinces or states?

A: The GWPR addresses critical issues that Alberta, Ontario and Washington State have also addressed: qualifications of the people who do the work, surface sealing of wells, closing of wells and flood-proofing of drinking water supplies.

Q: Doesn't the Drinking Water Protection Regulation (DWPR) already protect ground water?

A: The Drinking Water Protection Regulation does not directly address private domestic wells. The GWPR compliments the DWPR by providing protection to private domestic wells (as well as community wells) by addressing standards for well construction and operation. Standards for well construction and operation in the GWPR also apply to wells used for non-domestic water supply and other purposes.

Q: Why is the Provincial Government adopting the GWPR in phases?

A: We are adopting the GWPR in phases because:

- the scope of the legislation is sufficiently broad
- phasing allows us to gain experience over a short period of time to develop the rest of the GWPR.

Q: When will Phase 1 of the GWPR come into effect?

A: Phase 1 of the Ground Water Protection Regulation will begin to come into force on November 1, 2004 (registration provisions). The remainder of the Phase 1 GWPR (well construction standards) will come into force on November 1, 2005, thereby allowing an additional year of transition for individual well owners, industry and municipalities.

· Top

Q: When will Phase 2 and 3 of the GWPR come into effect:

A: Work on the first elements of Phases 2 and 3 started in the fall of 2003 and are still in development.

Q: Do the drilling standards in the GWPR apply to all wells?

A: No, geothermal wells, oil and gas wells, and wells used for coalbed methane gas extraction are already regulated under other acts, like the *Geothermal Resources Act*, *Mines Act*, and *Petroleum and Natural Gas Act*, and will not be regulated under the GWPR. The GWPR applies to all other wells, however.

Q: Is there flexibility in the drilling standards?

A: Yes, the GWPR does provide flexibility for some standards (e.g., surface seals) by allowing alternative specifications to be approved by the province or by a Professional Engineer or Professional Geoscientist with expertise in ground water.

Q: Why do we need to have qualified well drillers and well pump installers operating in the province?

A: Although this province has some of the best water well drillers in the world, unregulated drilling activities and lack of enforceable construction standards have contributed to ground water quantity and quality problems in some areas of the province. Improperly and poorly constructed wells and test holes can become pathways for contamination of aquifers and drinking water supplies. Having only qualified drillers and well pump installers work in the province will minimize these problems and provide greater protection to well owners.

• Top

Q: Why are abandoned wells a concern?

A: Prior to the GWPR, there were no requirements for wells that are no longer in use to be filled and closed. In addition to the dangers of people and animals falling in excavated wells, these and other wells provide a conduit for contamination to enter directly into the underlying aquifer through the well, degrading the water quality and impacting other well users.

Q: Why is it necessary for wells to have a surface seal?

A: Bacteriological contamination of private domestic wells is a problem in many local areas of the province. This can be minimized or eliminated by installing surface seals in wells to effectively prevent contaminated water from the surface or shallow subsurface zone from entering the well and the aquifer.

Q: Why is it necessary to cap or cover my well?

A: It is necessary to cap or cover your well in order to prevent any contaminants or contaminated flood waters from directly entering the well at the wellhead. For large diameter excavated wells, it is also necessary to cap or cover them as a safety precaution to prevent persons or animals from falling into the well.

Q: Why is it necessary to identify wells with a Well ID plate?

A: It is often difficult to distinguish one well from another in the field. Identifying a well in the field with a well identification plate allows verification of the well to the well record.

Q: Who is affected by the GWPR?

A: Owners of all new and pre-existing wells should be aware of their new responsibilities under the GWPR. Also affected by the GWPR are well drillers, well pump installers and qualified professionals (Professional Engineers and Professional Geoscientists) working in the ground water, environmental and geotechnical engineering field, as well as developers who require geotechnical, monitoring or dewatering wells.

The GWPR will also affect the duties of various government officials under the *Water Act* and *Drinking Water Protection Act*.

• Top

Q: I had a well drilled over 10 years ago, do the new standards apply to my well?

A: Yes and no. For example, the requirement for installing a well cap applies to both new and existing wells, while other requirements such as well identification applies to new and existing community wells but not existing private water supply wells.

Standards for well deactivation or closure also apply to existing wells. Certain standards for well construction may be triggered for an existing well if it is altered. Talk to your local well driller or well pump installer and consult the GWPR.

Q: What cost increases can an individual private well owner expect?

A: For a typical existing water supply well, the cost to the well owner is primarily for closing the well at the end of its useful life (~6% of the cost for a current well). For new water supply wells, the added costs are primarily for the surface seal and for closing the well at the end of its useful life (~10% of the cost for a current well).

The financial costs are considered acceptable for protecting the well supply and ground water resource.

Q: Does the GWPR mean water well licensing and fees?

A: No. Wells regulated under the GWPR are not licensed, nor does the province charge any fees or rentals for extraction of ground water.

Q: How will the GWPR affect the well drilling industry?

A: The GWPR helps ensure a level playing field by providing minimum well construction standards that every driller must meet. The GWPR affects well drillers and well pump installers. Industry professionals should be aware of their new responsibilities under the GWPR. Training workshops, guidebooks and other information will be provided through the British Columbia Ground Water Association and through the Ground Water Home Page.

· Top

Q: How does a well driller or well pump installer become qualified so they can get their name on the register?

A: A well driller or well pump installer will need to apply to the province to become registered. Through the application process, they will have to show their qualifications and experience. Once they adequately demonstrate this, they will be registered and be provided with an identification card.

Q: When can well drillers or well pump installers begin to apply to the province to become registered?

A: Authority to adjudicate applications will come into effect with the GWPR on November 1, 2004. Applications received prior to November 1, 2004 will be held by the Ministry until they may be officially adjudicated under the authority of the GWPR.

Prior to November 1, 2004, the Ministry of Water, Land & Air Protection will be developing and making available registration application forms for use by well drillers and well pump installers.

Q: Do I also need to have qualifications if I drill monitoring wells or geotechnical boreholes?

A: In general, any person who constructs a well regulated under the GWPR is required to be qualified, including persons who construct monitoring wells. A person is not required to have qualifications for constructing a geotechnical well if the well is not likely to disturb or does not disturb an aquifer. A person is not required to have qualifications for excavating a well of 15 m depth or less.

In cases where a qualified well driller is not required, the well construction standards (e.g., standards for surface sealing, capping, protection of the well head) will still apply.

Q: Does the GWPR have grand-parenting provisions for well drillers and well pump installers?

A: Yes, well drillers and well pump installers who are currently not certified by the province s Industry Training Centre or by the Canadian Ground Water Association can be grand-parented, provided they can demonstrate that they have the equivalent of 5 years full time experience drilling wells or installing well pumps. The grand-parenting provision will end on October 31, 2006.

· Top

Q: How will someone know if a well driller or well pump installer is qualified?

A: As a requirement of the GWPR, the Ministry must keep a register of qualified well drillers and a register of qualified well pump installers who are authorized to operate in the province. These registers will be made publicly available likely on the internet.

Registered well drillers and well pump installers will be issued an identification card as proof of their qualifications.

Q: Will costs to well drillers and well pump installers increase because of the GWPR? If so, by how much?

A: The GWPR is not expected to increase costs to well drillers or well pump installers.

Q: With all these new regulations, how will drillers and pump installers know what is expected?

A: Training workshops, guidebooks and other information will be provided through the BC Ground Water Association and through the Ministry Ground Water Home Page.

Q: How will the province enforce the new regulation?

A: Because this is a health and safety issue, we expect high degree of voluntary compliance. We ll be raising awareness through education, guidebooks and brochures, as well as training workshops with industry. There will be general and ticketable offences for non compliance. We will focus our enforcement efforts where we know there is non-compliance or where there is a high-risk to the aquifer or to public health and safety.

Q: What are some of the non-compliance offences and fines?

A: Among the offences are: tampering with a well; failure to deactivate or close an unused well; failure to provide proof of qualifications; introducing waste into a well.

Details of ticketable offences and fines are still in development and will be addressed in Phase 2 of the GWPR.

· Top

Q: Will Ministry staff be going onto people's property to check compliance?

A: The Ministry will rely heavily on voluntary compliance. We will focus our enforcement efforts where we know there is non-compliance or where there is a high-risk to the aquifer or to public health and safety.

Q: What else is the Ministry of Water, Land and Air Protection doing to enhance the management and protection of ground water?

A: In addition to the GWPR, the Ministry of Water, Land and Air Protection has always had a strong tradition of promoting ground water management and protection through non-regulatory means.

The ministry continues to map and classify developed aquifers in the province. To date, the ministry has identified and classified over 600 aquifers in BC and hopes to complete the inventory by 2010. The ministry is also beginning to map in detail, high priority aquifers in the province.

The Ministry is also supporting workshops on ground water protection and monitors ambient ground water levels and ground water quality in developed aquifers throughout the province through its Observation Well Network and Ambient Ground Water Quality Monitoring Network.

Important Links

The registration provisions in the Ground Water Protection Regulation and amendments to the *Water Act* relating to ground water will come into force on November 1, 2004, and the remainder of the Regulation, including Appendix A (the Code of Practice for Construction, Testing, Maintenance, Alteration and Closure of Wells in British Columbia) which sets out the minimum rules or standards in relation to wells will come into force on November 2005.

The legislation is located on the following web pages:

Ground Water Protection Regulation

Amendments to the *Water Act* (2001) (see sections 87-101 of Bill 20)

Existing *Water Act*

The consolidated version of the *Water Act* (i.e., with amendments included) will be in effect on November 1, 2004. A link will be provided from this site to the consolidated *Water Act* shortly thereafter.

Would you like more information on the Ground Water Protection Regulation?

Mathematical Logarithms

The huge ranges of seismic wave amplitudes, seismic moments, atmospheric energies, and other physical quantities is a problem. It would be much easier to communicate the energies or moments of earthquakes to the public on a simple scale that just ranges about from one to ten.

To turn these astronomical ranges into a simple scale, we can use the mathematical device of the **logarithm**. If we raise ten to some power *x* to make a big number *N*, then the **log** of that big number *N* is the power *x*:

$$10^x = N \qquad \log_{10} N = x$$

Now let's review the **log** (base 10) of some example numbers:

N	$x = \log N$
10	?
1	?
100	2
1×10^{25}	25
25	(1-2, ~1.4)
0.01	-2
-1	undefined

Note that while you can take the log of a very small number, which will be negative, you can't take the log of any **negative** number.

RESEARCH

Physics of Earthquakes

During an earthquake, one side of the fault moves suddenly with respect to the other. This process radiates energy as seismic waves, and generates heat due to friction and other non-linear processes. The study of the recent deep Bolivian earthquake suggests that only 4 % of the total strain energy was released as seismic waves, and most of the energy was converted to heat. The total amount of heat energy released is 1 to 10 times more than that released during the major volcanic eruptions such as the 1980 Mt St Helens eruption. This result suggested that melting can be an important mechanism for promoting seismic slip, especially for deep-focus earthquakes.

With the advent of modern broad-band seismic networks we can study seismic wave radiation in detail, from which we can understand how an earthquake nucleates, ruptures, and stops. The goal is to understand the deterministic as well as "complex" aspect of earthquake physics.

Interaction of Atmosphere and Lithosphere

The earth's surface is covered by atmosphere, and energy coupling occurs between atmosphere and lithosphere. For example, during the major eruption of Mount Pinatubo in the Philippines on June 15, 1991, an unusually long (at least two hours) seismic wave train having periods of about 230 sec was recorded at seismic stations throughout the world. This oscillation has a very sharp spectral peak at a period of 228 sec. We found that this wave train is the seismic Rayleigh wave excited by atmospheric oscillations near the volcano that were set off by continuous thermal energy flux from the volcano. This study demonstrated that modern seismological networks can be used to study the physics of volcanic eruptions; it provides new information about how volcanoes affect the Earth's atmosphere and a way to quantify volcanic eruptions. Study of acoustic and gravity waves has interesting applications for understanding unusual waves excited by space shuttles and the impact of the Shoemaker-Levy comet.

Application of Real-Time Seismology to Hazard Mitigation

Advances in seismic sensor and data acquisition systems, digital communications, and computers make it possible to build reliable real-time earthquake information systems. Such systems provide a means for modern urban regions to cope effectively with the aftermath of major earthquakes. While accurate earthquake predictions are difficult, these systems aid in the post-earthquake response and recovery phases, and thus are socially beneficial in modern industrialized urban and suburban regions. In the long term these systems also provide basic data for mitigation strategies such as improved building codes. We are developing a modern seismic network, TriNet, to accomplish this goal. TriNet is a joint project between Caltech, U.S. Geological Survey, and the State of California.

Physics of Long-Term Crustal Processes Associated with Earthquakes

The physical properties of the Earth's crust are likely to change as a function of time. However, physics of such changes is not well understood. For example, after the 1992 Landers, California, earthquake, seismic activity in many places in California increased significantly. One interpretation is that the strength of crust was suddenly reduced when it was shaken by passing seismic waves from the Landers earthquake. We have explored a mechanism for such weakening. Although this field is at an early stage of development, a better understanding of the physics of fluid-filled crust would lead to unraveling many interesting, but mysterious, phenomena associated with earthquakes. These phenomena include changes in seismicity, seismicity patterns, electric-magnetic field disturbances, and changes in ground-water level and chemistry.

CURRICULUM VITAE

Personal
Born -17 October 1936
Japan (Japanese citizen)

Education
B. S. (Physics), Tokyo University, 1959
M. S. (Geophysics), Tokyo University, 1961
Ph.D. (Geophysics), Tokyo University, 1964

Professional Experience
Research Associate, Geophysics Institute, Tokyo University, 1962-65
Research Fellow, California Institute of Technology, 1965-66
Associate Professor, Earthquake Research Institute, Tokyo University, 1966-69
Visiting Associate Professor, Massachusetts Institute of Technology, 1969
Professor, Earthquake Research Institute, Tokyo University, 1970-72
Professor, California Institute of Technology, 1972-89
Director, Seismological Laboratory, California Institute of Technology, 1990-April, 1998
John E. and Hazel S. Smits Professorship of Geophysics, 1989-

Major Research Interest
Kanamori's research centers on the physics of earthquakes. His work includes: (1) quantification of great earthquakes using Mw scale, (2) quantitative study of tsunami earthquakes, (3) seismological study of volcanic eruptions, (4) real-time seismology for hazard mitigation, (5) study of atmospheric waves excited by volcanic eruptions, (6) study of interaction between solid earth and atmosphere, (7) frictional melting due to faulting, (8) synthesis of microscopic and macroscopic physics of earthquakes.

Membership

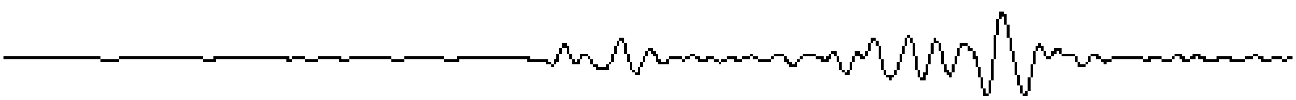
Harvard Seismology: Centroid-Moment Tensor Project

Centroid-Moment Tensor (CMT) solutions are produced on a routine basis for events with moment magnitudes (M_W) greater than about 5.5. CMT solutions are published quarterly in *Physics of the Earth and Planetary Interiors*; you can access the CMT Catalog from here as well. **Quick CMTs** are produced in near-real time, and distributed to interested parties via email; you can also view a map of recent quick CMTs. If you would like to be included in the distribution list for Quick CMTs, send us email.

You can view a gallery of figures related to the CMT project.

Active participants in this project are Adam Dziewonski, Göran Ekström, Natasha Maternovskaya, Michael Antolik and Meredith Nettles.

The Harvard CMT Project is supported by the National Science Foundation grant EAR-9805172.



- **New York earthquake, April 20, 2002: map with CMT focal mechanisms**

Recent Developments

- We have extended the CMT analysis to smaller earthquakes by analyzing teleseismic intermediate period surface waves (Arvidsson and Ekström, 1998).
- We have analyzed the larger earthquakes in the 1997 Umbria-Marche (central Italy) sequence using a new method of surface wave CMT analysis (Ekström et al., 1998).
- CMT solutions have been produced for large (M_w > 6.0) events of 1976, using recalibrated data from the High Gain Long Period seismographic network (Ekström and Nettles, 1997).

Publications

- The CMT method is described in several key references.
- CMT solutions are presented in several papers, and for events in or after 1982, are reported quarterly in *Physics of the Earth and Planetary Interiors*.
- 1976 CMT solutions

The goal of my research is to accurately image and characterize subsurface structures in seismically difficult areas, with high-resolution experiments. I constrain these inversions with independent geophysical and geological data. The seismic imaging, tomography, and monte-carlo optimization techniques I develop improve the productivity of resource exploration and development,

John is a faculty member of the Nevada Seismological Laboratory and the Dept. of Geological Sciences in the Mackay School of Earth Sciences and Engineering, College of Science at the University of Nevada, Reno.

and of hazards assessments. In particular I try to describe the characteristics of earthquake faults and of sites in order to mitigate seismic hazards to life and property.

Key Words: geophysics, seismology, resource exploration and development, seismic reflection, geophysical imaging and inversion, tomography, modeling, scientific visualization, earthquake hazards, tectonics.

- John **teaches**:
  - Geol 492/692, **Applied Geophysics**, next offered Spring 2005 (merges 453/653 with 492/692).
  - Geol 706, **Geophysical Series and Filtering**, #85831, *Mondays and Wednesdays 9:30-10:45 in LMR 355*, now offered Spring 2004 (after combination with easier parts of 757). Interactive exercises in Java.
  - Geol 757, **Seismic Imaging**, may be offered Fall 2006 (after combination with harder parts of 706).
  - Class resources for **geophysical field work**.
  - Geol 702H or 702V, Scientific Visualization Seminar and Workshop, no longer offered but resources still on line.

  John also helps teach:
  - Geol 701V, **Surface Waves, Crustal Structure, and Tomography**, a new offering by Louie, Brune, Zeng for Fall 2004.
  - Geol 100, **Earthquakes, Volcanoes, and other Natural Disasters**, taught by Louie Fall 2003.
  - Geol 101, **General Geology I (Physical Geology)**, taught by Louie Fall 1999.
  - Geol 203, Seismic stratigraphy lectures and lab in **Earth Surface Processes and Deposits** .
  - Geol 333, **Structure, Tectonics and Earth Physics II** offered each Spring by Karlin.
  - Geol 455/655, **Geophysics and Geodynamics**, next offered Fall 2004 by Anderson.
  - Geol 456/656, Plate Tectonic Theory, no longer offered, portions revised into Geol 332/333.
  - Geol 492/692, Environmental Exploration Geophysics (Hydrogeophysics), next offered Spring 2005 as Applied Geophysics.

* John works closely with Optim LLC, a Nevada software company that has partnered with the University through the Nevada Applied Research Initiative (NARI). Optim is the principal supporter of the Center for Migration and Tomography (CEMAT) and the Collaboratory for Computational Geosciences (CCoG) at UNR. Their commercial products include:
  - **SeisOpt®ReMi™**: Refraction Microtremor for Shallow Shear Velocity
  - **SeisOpt®@2D™**: Refraction Velocity Anaysis for Engineering
* **Free Software!** John offers to geophysicists and students:
  - **The Resource Geology Seismic Processing System for Java (JRG)** is a basic reflection processing package with superb graphics, 3-d and crooked-line capabilities, SEG-Y and sound file I/O, and a friendly GUI that runs on any machine (lacks muting, decon, migrations): JRG home - download (240 kb .jar) (run ``java -cp jrg.jar Viewmat") - download source (172 kb .jar) - class exercises using JRG: refraction; reflection; complex numbers; 2-d FFT; wave propagation - sound and image output examples.

- **ModelAssembler** is an open-source, Java-based velocity-model gridding code that can integrate scattered and heterogeneous geophysical data sets. The version 3.0 distribution includes basin data files for the Great Basin (12.6 Mb compressed tar archive). MA3 and the E3D finite-difference code were used on the CCoG facility in lab exercises for a Fall 2002 Geophysics and Geodynamics course to explain: f-d synthetic seismograms; the Courant condition; grid dispersion; Huygens, Fermat, and Snell. More on Shawn Larsen's E3D code from: the OECD's Nuclear Energy Agency; LLNL's Hazards Mitigation Center.
- **AssembleTexans** is a Java code, that will run on an RT-125 bridge computer, and make gathers out of .RSY files by simple concatenation that JRG will view: download source (.java); download compiled .class.
- **The Resource Geology Seismic Processing System (RG)** is a collection of 150 (mostly) simple C codes for seismic processing research, without support for graphics or standard headers: package documenting how to migrate network seismograms; more about RG; program list; download source & Sun binaries (4+ Mb .tar.Z); Clayton's getpar (required); exercise using RG.
- **Getpar for Java** implements some of the features of Clayton's library: source [main() is usage examp.]; tests.
- **Grav2d** is a simple Talwani-prism gravity inversion, in Java so it runs on anything, with no GUI and simple text input and output: download source (.java); class exercise.
- **Surv** is a C code that reduces data collected with an EDM theodolite: download source (.c); usage examples.
- **Fttest** is a C code for a 2-d FFT benchmark: download directory; cross-platform results.

- John's **research projects** include:
  - **The Center for Migration and Tomography** (CEMAT) and **The Collaboratory for Computational Geosciences** (CCoG)
    - Earthquake Hazard Surveys Across Urban Basins (so far: Reno, Los Angeles, Las Vegas)
    - LLNL Cooperative Research: 3-D Evaluation of Ground-Shaking Potential in the Las Vegas Basin
    - Research to Increase Utilization of Geothermal Resources in the Western United States: Assembly of a Crustal Seismic Velocity Database for the Western Great Basin
    - Evolution of the Sierra Nevada - Basin and Range boundary -- tephrochronologic and gravity constraints on the record in Neogene basin deposits
    - Geophysical Test of Low-Angle Dip on the Seismogenic Dixie Valley Fault, Nevada
    - Imaging a Subduction Interface With Local-Earthquake Seismograms, Hikurangi Margin, New Zealand
    - Geophysical Surveys of the Upheaval Dome Impact Structure, Canyonlands National Park, Utah
    - Geophysical Constraints on Extensional Models for the Death Valley Region of California and Nevada
    - The Resource Geology Seismic Processing System for Java
  - The Sound of Seismic
  - Site Response to LARSE-2 Blasts at Precarious Rock Sites Near the SAF
  - Seismic Hazards in the Reno Area

- Reflectivity Structure Below the San Fernando Valley from Northridge Aftershock Recordings

- Read John's **curriculum vita** (with links), or a 2-page resume in PDF or Word RTF format.
- Presentation on Applied Geophysics at the Mackay School of Mines.
- **Photos:** Aerial Geology; geology/geophysics/tectonics thumbnail collection index and archive; higher-res geophysical photos; class fieldwork albums.
- During work hours (9-5 M-F) you can go to John Louie's Web server on his personal Macintosh. This is the home of John Louie's Road Flights page, with time-lapse movies of scenic drives in California and Nevada. *9-5 Mon.-Fri. (and some weeknights) ONLY*
- Additional information may be available through `http://home.netcom.com/~jnlouie`

Nevada Seismological Laboratory Feature

NSL and NBMG scientists observed a probable magmatic event below North Lake Tahoe in late 2003. This slow event was inferred from a cluster of 1600 deep crustal microearthquakes and a small (~1 cm) displacement of Slide Mountain where a permanent geodetic station is installed. The magmatic event is thought to lie approximately 30 km (20 miles) below the surface and stopped abruptly in January of 2004. Details of this study can be found in a *Science Magazine* article just published. Read the press release...

An Explanation of my symbol for Bad Science

It is better to communicate good information than to offer misinformation in the name of good communication.

ABF

*T*his is an image of a raindrop as presented by popular culture. Actually, real raindrops do not look like this (until they have ceased to be rain by splattering on a window, say). Small raindrops are spherical; larger ones assume a shape more like that of a hamburger bun. Of this there is no question. A more detailed discussion of this can be found on the Bad Rain page. (Green might seem like an odd choice as the color of rain, but it follows a long-standing meteorological convention --- see radar maps for an example. However, it does not seem likely that anyone will be misled by this color coding into believing that rain is, in fact, green.)

*Y*et, everything from advertisements to (gulp) The Weather Channel, artistically represents raindrops as teardrops. I once asked a television weatherman why he did this despite the fact that he (presumably) knew better. "Because," he responded, "it is good communication." Sigh... This page is dedicated to the proposition that:

> *it is better to communicate good information than to offer misinformation in the name of good communication.*

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Science

Click on the symbol for its explanation.

Preamble

*T*his page is maintained by Alistair B. Fraser in an attempt to sensitize teachers and students to examples of the *bad science* often taught in schools, universities, and offered in popular articles and even textbooks.

*H*ere, I explain what I mean by bad science and provide pointers to specialized pages on bad science within various disciplines. In particular this page points to Bad Meteorology , a page also maintained by Alistair B. Fraser.

This site accepts no requests for reciprocal links, even if those requests come in the form of a supposed award. Editorial decisions will not be influenced by requests for such *quid pro quo* arrangements.

However, it will gladly link to other sites which explore the same pedagogical isues of bad science.

*W*hen I created this page, in January, 1995, I naïvely expected that other frustrated teachers would rush to build sites devoted to, say, Bad Archeology and Bad Biology. It has not happened. Apparently, most teachers believe everything they teach. Sigh, one is reminded of Lily Tomlin when she said , “No matter how cynical you become, it's never enough to keep up.”

*T*he *Bad Science* and *Bad Meteorology* pages have been cited by over 3000 other web pages, and in books, magazines, and on TV.

What is Bad Science?
(at least within the context of this page)

> *B*ad Science abounds and comes in many guises. This page sets out to attack only one brand: well understood phenomena which are persistently presented incorrectly by teachers and writers, presumably because they either do not know any better or because they don't really care enough to get it correct. By publicizing examples of bad science, I hope to sensitize students, teachers and writers to the horrors of such glib explanations or representations.

What this page is NOT about.

*F*or the purposes of this page, bad science does not mean pseudo-science. I realize that the boundary is permeable, but there is a useful distinction. The practitioners of (what scientists refer to as) pseudo-science generally know and even understand established scientific thought; they just reject it (for reasons which may have little to do with science itself). Treatments of pseudo-science and the paranormal are well treated elsewhere. See, for example, the Skeptical Inquirer , or the Skeptics Society . By way of contrast, purveyors of bad science are generally teachers or writers who just don't know any better.

Study finds errors rife in Science textbooks

This study goes well beyond bad science to include bad editing and the disingenuousness textbook committees who are more interested in using science textbooks as a vehicle for political correctness than scientific correctness.

A copy of the study is available: Review of Middle School Physical Science Texts

*S*imilarly, this page does not address contemporary controversies, about which the experts are still in active debate. Rather, it concerns itself with ideas and facts which are well established and well understood, but which persist in being presented incorrectly.

*A*s such, this page is about teaching rather than research.

The difficulty with science education is that so much of it is actually reeducation.

I find teaching of science fairly easy. I have no difficulties with science education; my difficulties are with science reeducation. If I can teach something about which the students have never heard, I find that they generally both welcome and understand it. It is when I have to teach them about something that they have already learned incorrectly, that I start to identify with Sisyphus.

*W*hy is science reeducation so difficult? I have identified two possible reasons, you may know of others.

- Jonathan Swift is reputed to have observed (I cannot find the original reference), "You cannot reason a person out of a position he did not reason himself into in the first place." So, if science is taught as just a collection of (assumed-to-be) facts, it is nothing but dogma. Dogma stoutly resists subsequent displacement by reason.

- It seems that anything people have learned prior to puberty takes on the status of an immutable truth (this is something well understood by parents, governments, and religions). Rational explanations of why some previous belief might be incompatible with the behavior of nature, and a careful explanation of the actual behavior of nature are of little avail.

*S*o, if science is taught as dogma to the prepubescent, just imagine the problem created for subsequent teachers. For example, most of the university students I encounter have been taught as children that the reason clouds form when air is cooled is that cold air cannot hold as much water vapor as does warm air. When I subsequently carefully explain what is really happening, and show why the previously learned nostrum is nonsense parading as science, I can usually only convince a small fraction of the students. The rest know in their hearts that their grade-eight teacher, say, or their mummy was actually right and that you are just a contrarian who is attempting to destroy the established order. The damage is done, the mind is frozen and the prepubescent dogma lasts a lifetime.

Branches to the Bad Science Pages

Bad Astronomy is brought to you by Phil Plait .

Bad Chemistry is brought to you by Kevin Lehmann and the *Princeton Section of the American Chemical Society.* The main page provides an overview and enables you to branch to:

- The Hydrophobic Effect
- Theory of Ice skating is all wet!
- Ionic solutions don't look like that!

Bad Meteorology is brought to you by Alistair B. Fraser. The main page provides an overview and enables you to branch to:

- Bad Rain
- Bad Greenhouse
- Bad Coriolis
- Bad Meteorology FAQ

The Pathetic Fallacy is brought to you by Alistair B. Fraser.

A Class project: Search for examples of bad science (including the pathetic fallacy) in books and on the Web. Quote the bad claims, explaining what is wrong, and cite the source. This exercise has become ever so much easier these days given the power of Web search engines. In particular, it is now easy to search universities for nonsense. They are fair game, for they should know better. Search the university of your choice courtesy of a special division of google .

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Clouds

Click on the symbol for its explanation.

Bad Meteorology:

The reason clouds form when air cools is because cold air cannot hold as much water vapor as warm air.

*W*hen moist air cools, a cloud can form. This much is true. The process is responsible for the cumulus cloud over Vancouver and the cap cloud over Rainier, shown to the right. Ascending air always cools. The cumulus cloud formed when air over the sun-warmed ground became buoyant and rose; the cap cloud, when the wind (coming from the right) blew against the sloping side of the mountain and was forced up.

Cumulus cloud over Vancouver, Canada

*B*ut did the clouds form because the colder air had a lower holding capacity for water vapor than the warm air? If you believe a legion of teachers (from grade school to university), TV weather broadcasters, and endless textbook writers, this is the reason. They speak of the air being saturated and one even published an illustration of the air being wrung out like a sponge as the temperature dropped (sigh...). Unfortunately, it is not true. Sure, a cloud may form as the temperature drops, but not because some mystical holding capacity of the air has decreased.

*T*o claim that a temperature-dependent holding capacity of the air caused the cloud to form in cold air is to get (approximately) the right answer for the wrong reason. It is like trying to reduce the fraction, 19/95, by imagining that you can cancel the 9s. The right answer ensues, but for the wrong reason. And, if the process was

wrong, it is unlikely to work the next time you try it in a slightly different situation.

Cap cloud over Mt. Rainier, U.S.A

*T*he air (mainly nitrogen and oxygen) no more has a holding capacity for water vapor, than, say, water vapor has for nitrogen. The atmosphere is a mixture of gases. While saturation (which involves bonds between different molecules) is a real phenomenon in liquids it does not describe the interaction of atmospheric constituents.

So, what is going on?

*W*ater molecules are constantly coursing back and forth between phases (another word for the three states: vapor, liquid, and solid). If more molecules are leaving a liquid surface than arriving, there is a net evaporation; if more arrive than leave, a net condensation. It is these relative flows of molecules which determine whether a cloud forms or evaporates, not some imaginary holding capacity that nitrogen or oxygen have for water vapor.

*T*he rate at which vapor molecules arrive at a surface of liquid (cloud drop) or solid (ice crystal) depends upon the vapor pressure.

*T*he rate at which vapor molecules leave the surface depends upon the characteristics of the surface. The number escaping varies with:

1. the phases involved --- molecules can escape from liquid more readily than from the solid (ice);
2. the shape of the boundary --- molecules escape more readily from highly curved (small) drops or ice crystals (convex);
3. the purity of the boundary --- foreign substances dissolved in the liquid or ice diminish the number of water molecules which can escape;
4. the temperature of the boundary --- at higher temperatures the molecules have more energy and can more readily escape.

*A*nd therein lies the origin of the myth. The temperature of a cloud droplet or ice crystal will be (nearly) the same as that of the air, so people imagine that somehow the air was to blame. But, if the (other gases of the) air were removed, leaving everything else the same, condensation and evaporation would proceed as before (the air was irrelevant to the behavior). To assign the behavior of water to an invented holding capacity of the air is like assigning your life's fortunes to an invented influence of the constellations (and as we all know, nobody does that anymore).

So, what do you tell your students?

*W*hat appears to be cloud-free air (virtually) always contains sub microscopic drops, but as evaporation exceeds condensation, the drops do not survive long after an initial chance clumping of molecules. As air is cooled, the evaporation rate decreases more rapidly than does the condensation rate with the result that there comes a temperature (the dew point temperature) where the evaporation is less than the condensation and a droplet can grow into a cloud drop.

*E*vaporation increases with temperature, not because the holding capacity of the air changes, but because the more energetic molecules can evaporate more readily (with, of course, the caveat that evaporation is also influenced by things other than temperature, as described above).

*I*f that explanation is not simple enough for your students, just present the facts: when the temperature drops below the dew-point temperature, there is a net condensation and a cloud forms.

*B*ut **don't** ever teach nonsense by claiming that the air has a temperature-dependent holding capacity for water vapor.

A little history

*T*he idea that it is the air which determines the amount of water vapor which can be present through some sort of holding capacity is an eighteenth century idea which was shown to be false both empirically and theoretically about two hundred years ago! The fact that it is still taught in our schools and defended by teachers and (gulp) professors, is a testimony to the mindless persistence of myth. A discussion of some of the history of this bankrupt idea is offered by Steven M. Babin .

Bad Clouds FAQ

Before writing me with a question about this page, please check the Bad Clouds FAQ to see if the issue has already been addressed satisfactorily.

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Rain

Click on the symbol for its explanation.

Bad Meteorology:
Raindrops are shaped like teardrops.

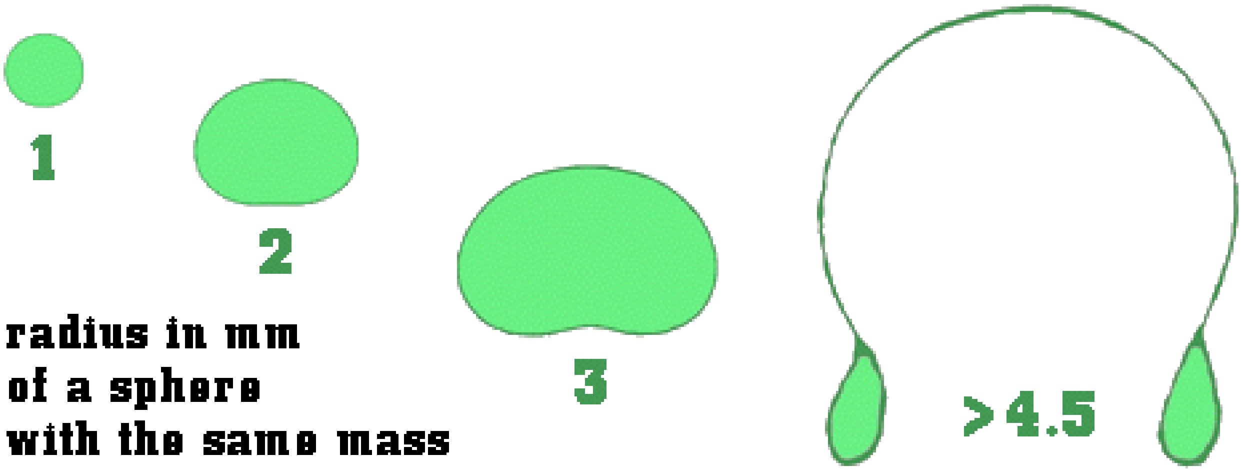
Image derived from the *Weather Channel*

*T*he artistic representation of raindrop as presented by popular culture is that of a teardrop. Actually, real raindrops bear scant resemblance to this popular fantasy (except after they have ceased to be raindrops by splattering on a window, say). It may seem too easy a target to single out the Weather Channel for criticism for their shoddy representation when virtually everyone from advertisers to illustrators of children's books do likewise. Yet, I would like to think they could be held to a higher standard as they attempt to convey the image of purveyors of accurate information.

*S*mall raindrops (radius < 1 mm) are spherical; larger ones assume a shape more like that of a hamburger bun. When they get larger than a radius of about 4.5 mm they rapidly become distorted into a shape rather like a parachute with a tube of water around the base --- and then they break up into smaller drops.

*T*his remarkable evolution results from a tug-of-war between two forces: the surface tension of the water and the pressure of the air pushing up against the bottom of the drop as it falls. When the drop is small, surface tension wins and pulls the drop into a spherical shape. With increasing size, the fall velocity increases and the pressure on the bottom increases causing the raindrop to flatten and even develop a depression. Finally, when the radius exceeds about 4 mm or so, the depression grows almost explosively to form a bag with an annular ring of water and then it breaks up into smaller drops. See, for example Pruppacher and Klett, Microphysics of Clouds and Precipitation, (1978, Reidel, Boston), pp. 316-19, or any other book on cloud physics written by competent authors.

*T*he way raindrops change in shape as they grow is sketched in the cross-sections of drops below. As the drops become distorted, the meaning of a radius becomes vague, so the radius labeled is that of sphere which has the same mass.



These are cross-sections through the drop. Imagine spinning the drop through a vertical axis to see the real shape. So, what looks like some teardrops in the final illustration on the right is actually closer to being a tube of liquid just before it breaks up into small spherical droplets again.

Bad Rain FAQ

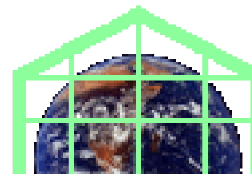
Before writing me with a question about this page, please check the Bad Rain FAQ to see if the issue has already been addressed satisfactorily.

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Greenhouse

Click on the symbol for its explanation.

Bad Meteorology:
The greenhouse effect is caused when
gases in the atmosphere behave as a blanket
and trap radiation which is then reradiated to the Earth.



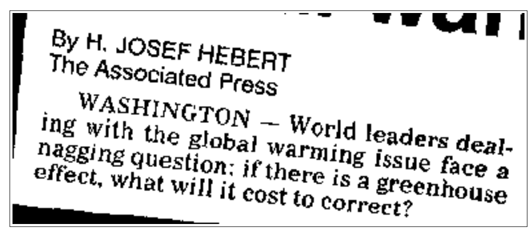
First,

Let's get one thing straight.

The greenhouse effect and global warming ARE NOT the same thing.

There is a *greenhouse effect*, but, if there were not, we would all be dead!

It is becoming increasingly clear that we are also experencing *global warming*, but, that is a different matter.



By H. JOSEF HEBERT
The Associated Press
WASHINGTON — World leaders dealing with the global warming issue face a nagging question: if there is a greenhouse effect, what will it cost to correct?

Silly copy

The *greenhouse effect* is the name applied to the process which causes the surface of the Earth to be warmer than it would have been in the absence of an atmosphere. (Unfortunately, the name, greenhouse effect is a misnomer --- more on that later.)

Global warming is the name given to an expected increase in the magnitude of the greenhouse effect, whereby the surface of the Earth will amost inevitably become hotter than it is now.

This page *only* treats the greenhouse effect --- not global warming.

Second,

Let's establish why there is a greenhouse effect.

> *The surface of the Earth is warmer than it would be in the absence of an atmosphere because it receives energy from two sources: the Sun and the atmosphere.*

*T*he atmosphere emits radiation for the same reason the Sun does: *each has a finite temperature.* So, just as one would be warmer by sitting beside two fireplaces than one would have been if one fireplace were extinguished, so, one is warmer by receiving radiation from both the Sun and the atmosphere than one would be if there were no atmosphere.

*C*uriously, the surface of the Earth receives nearly twice as much energy from the atmosphere as it does from the Sun. Even though the Sun is much hotter, it does not cover nearly as much of the sky as does the atmosphere. A great deal of radiation coming from the direction of the Sun does not add up to as much energy as does the smaller portion of radiation emitted by each portion of the atmosphere but now coming from the whole sky. (It would take about 90,000 Suns to paper over the whole sky).

*S*o, it isn't even as if our atmosphere had only a minor influence on the surface temperature; it has a profound one. In the absence of an atmosphere the Earth would average about 30 Celsius degrees (about 50 Fahrenheit degrees) lower than it does at present. Life (as we now know it) could not exist.

Third,

Let's examine some of the nonsense frequently offered in the name of science.

- Is the greenhouse effect a good thing?

  Well, yes, if you appreciate living.

- Does the atmosphere (or any greenhouse gas) act a blanket?

  At best, the reference to a blanket is a bad metaphor. Blankets act primarily to suppress convection; the atmosphere acts to enable convection. To claim that the atmosphere acts a blanket, is to admit that you don't know how either one of them operates.

- Does the atmosphere trap radiation?

  No, the atmosphere absorbs radiation emitted by the Earth. But, upon being absorbed, the radiation has ceased to exist by having been transformed into the kinetic and potential energy of the molecules. The atmosphere cannot be said to have succeeded in trapping something that has ceased to exist.

- Does the atmosphere reradiate?

  One often hears the claim that the atmosphere absorbs radiation emitted by the Earth (correct) and then reradiates it back to Earth (false). The atmosphere radiates because it has a finite temperature, not because it received radiation. When the atmosphere emits radiation, it is not the same radiation (which ceased to exist upon being absorbed) as it received. The radiation absorbed and that emitted do not even have the same spectrum and certainly are not made up of the same photons. The term reradiate is a nonsense term which should never be used to explain anything.

  Sometimes diagrams are drawn which show the radiation from the Earth's surface rising into the sky and being reflected off of the atmosphere (or clouds, or greenhouse gasses). This too is nonsense. The radiation was not reflected, it was absorbed and different radiation was subsequently emitted.

- Does the atmosphere trap heat (in producing the greenhouse effect)?

  Alas no. As rapidly as the atmosphere absorbs energy it loses it. Nothing is trapped. If energy were being trapped, i.e. retained, then the temperature would of necessity be steadily rising. Rather, on average, the temperature is constant and the energy courses through the system without being trapped within it.

- Does the atmosphere behave like a greenhouse?

  The name, greenhouse effect is unfortunate, for a real greenhouse does not behave as the atmosphere does. The primary mechanism keeping the air warm in a real greenhouse is the suppression of convection (the exchange of air between the inside and outside). Thus, a real greenhouse does act like a blanket to prevent bubbles of warm air from being carried away from the surface. As we have seen, this is not how the atmosphere keeps the Earth's surface warm. Indeed, the atmosphere facilitates rather than suppresses convection.

  One sometimes hears the comparison between the greenhouse effect in the atmosphere (not in real greenhouses) and the interior of a parked car which has been left in the summer Sun with its windows rolled up. This comparison is as phony as is the comparison to real greenhouses. Again, keeping the windows closed merely suppresses convection.

Whether the topic is a real greenhouse or a car, one still hears the old saw that each stays warm because visible radiation (light) can pass through the windows, and infrared radiation cannot. Actually, it has been known for the better part of a century that this has very little bearing on the issue.

Finally,

What does one tell one's students?

The correct explanation (as offered above) is remarkably simple and easy to understand, namely:

The surface of the Earth is warmer than it would be in the absence of an atmosphere because it receives energy from two sources: the Sun and the atmosphere.

But *don't* ever teach nonsense by claiming that the radiation is trapped, or that the atmosphere reradiates, or that the atmosphere behaves as a greenhouse (or parked car), or that greenhouse gasses behave as a blanket.

Bad Greenhouse FAQ

Before writing me with a question about this page, please check the Bad Greenhouse FAQ to see if the issue has already been addressed satisfactorily.

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Coriolis

Click on the symbol for its explanation.

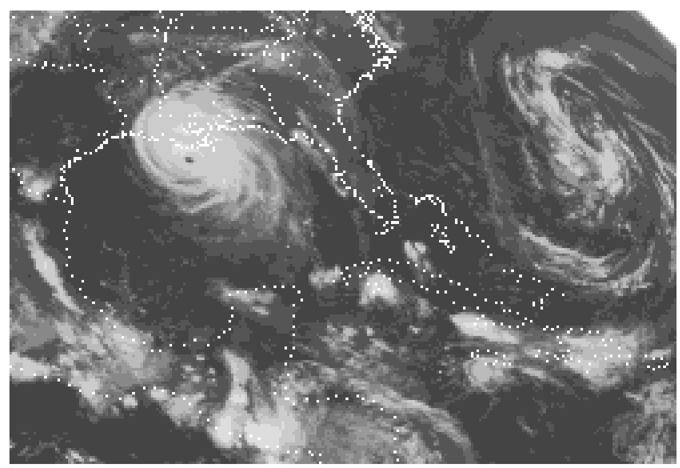
Bad Meteorology:

The water in a sink (or toilet) rotates one way as it drains in the northern hemisphere and the other way in the southern hemisphere. Called the Coriolis Effect, it is caused by the rotation of the Earth.

*F*irst on this page is a discussion of the issue. Towards the bottom of the page you can see examples of incompetence from *PBS*,*NPR*, and *Sports Illustrated*.

The Coriolis force does influence long-lasting vortices.

*O*n the scale of hurricanes and large mid-latitude storms, the Coriolis force causes the air to rotate around a low pressure center in a cyclonic direction. Indeed, the term cyclonic not only means that the fluid (air or water) rotates in the same direction as the underlying Earth, but also that the rotation of the fluid is due to the rotation of the Earth. Thus, the air flowing around a hurricane spins counter-clockwise in the northern hemisphere, and clockwise in the southern hemisphere (as does the Earth, itself). In both hemispheres, this rotation is deemed cyclonic. If the Earth did not rotate, the air would flow directly in towards the low pressure center, but on a spinning Earth, the Coriolis force causes that air to be deviated with the result that it travels around the low pressure center.



Hurricane Andrew

*I*n the accompanying picture of the Caribbean, one can see the cyclonically spiraling clouds of Hurricane Andrew (at the mouth of the Mississippi) and of another vortex in the Atlantic.

But, the Coriolis force is very small, indeed.

water draining in the supposedly wrong way

*C*ompared to the rotations that one usually sees (tires on a travelling automobile, a compact disc playing music, or a draining sink), the rotation of the Earth is very small: only one rotation per day. The water in a sink might make a rotation in a few seconds and so have a rotation rate ten thousand times higher than that of the Earth. It should not be surprising, therefore, to learn that the Coriolis force is orders of magnitude smaller than any of the forces involved in these everyday spinning things. The Coriolis force is so small, that it plays no role in determining the direction of rotation of a draining sink anymore than it does the direction of a spinning CD.

*T*he direction of rotation of a draining sink is determined by the way it was filled, or by vortices introduced while washing. The magnitude of these rotations may be small, but they are nevertheless gargantuan by comparison to the rotation of the Earth. I decided to include a picture of a draining sink, and the first one I tried in my house was found to drain clockwise (the opposite of what the silly assertions would have it do here in the northern hemisphere). This direction was determined entirely by the way the tap filled the sink. The direction of rotation of a draining toilet is determined by the way the water just under the rim is squirted into the bowl when it is flushed.

Is it possible to detect the Earth's rotation in a draining sink?

*Y*es, but it is very difficult. Because the Coriolis force is so small, one must go to extraordinary lengths to detect it. But, it has been done. You cannot use an ordinary sink for it lacks the requisite circular symmetry: its oval shape and off-center drain render any results suspect. Those who have succeeded used a smooth pan of about one meter in diameter with a very small hole in the center. A stopper (which could be removed from below so as to not introduce any spurious motion) blocked the hole while the pan was being filled with water. The water was then allowed to sit undisturbed for perhaps a week to let all of the motion die out which was introduced during filling. Then, the stopper was removed (from below). Because the hole was very small, the pan drained slowly indeed. This was necessary, because it takes hours before the tiny Coriolis force could develop sufficient deviation in the draining water for it to produce a circular flow. With these procedures, it was found that the rotation was always cyclonic.

Why do teachers claim that a draining sink reflects the rotation of the Earth?

A surprisingly large number of my undergraduate students tell me that their high-school teachers told them that sinks drain in opposite directions in the two hemispheres owing to the rotation of the Earth. Why would a teacher offer such garbage to students when it is so easy to check. A trip to the school washroom (let alone the ones at home) will reveal drainage in both directions (which would certainly require the equator to assume a tortuous track through the countryside).

*I*s knowledge just a bunch of abstractions to be memorized with no recourse to the relevance of everyday experience?

*S*igh... I don't know why teachers do this. I can but assume that those who do so just never feel any need to wash their hands --- or their minds.

Incompetence from those we trust

Incompetence from PBS (USA)

Fakery of the first water (so to speak).
*T*here are charlatans operating at a tourist trap in Nanyuki, Kenya. In this little town, located right on the equator, a local mountebank works for tips as he glibly cons busloads of tourists into believing that the rotation of the Earth causes water draining from a container to spin clockwise in the northern hemisphere and counter-clockwise in the southern hemisphere. (Yes, you read that correctly, the charlatan fakes it backwards. You would think that if he were going to sucker people, he would at least get his directions the same as what really happens in large weather systems.)

*T*his man's nonsense was captured (and endorsed) by Michael Palin in one episode of his BBC TV special, *From Pole to Pole,* which is often aired on PBS. The presentation went as follows:

faker:

> This is the northern hemisphere (gesturing to his left), and this is the southern hemisphere (gesturing to his right). If you drain a sink when you're on the northern side of the equator, and you watch the water as it drains, you will see that the water always rotates

clockwise [sic]. (Shot of a pan with water draining clockwise. Floating match sticks are used to make the motion easier to see.) This phenomenon is caused by the rotation of the Earth. The effect becomes stronger according to how far you move to the north or to the south and becomes weaker according to how close you go towards the line [the equator]. So that's why we have to give some distance from the equator so that the rotation can be noticeable.

Palin:

This is known as the Coriolis effect and Peter McLeary has given this same lecture every day for the last six years. It's delivered in the burnt out shell of an old hotel. The equator used to run through the middle of the bar. I bet they were always floating match sticks in the middle of the beer. (The faker has been carrying his pan and water about ten meters to the south of the spot marking the equator, and turns to face the audience.)

faker:

So, this changes to counter-clockwise [sic] indicating that now we are on [sic] the southern hemisphere. (Shot of the water in the pan draining counter-clockwise.)

(Transition to a scene where the faker is placing the water-filled pan directly on the equatorial marker.) So, now we are right on the equator, and as we drain the water, you'll see there will be no rotation. It just drains straight down. And that's how we prove that we are right on the equator. (Water draining with no apparent rotation.)

Palin:

It does work.

*S*ure it does --- in the hands of a mountebank, that is. And now we have Michael Palin acting as a shill for bad science --- and on PBS, no less.

*B*ut, how is the fraud accomplished? The Coriolis force is so tiny that it cannot cause the rotation in the faker's draining pan; indeed at only ten meters to either side of the equator, it is so tiny that it could influence neither the carefully performed experiment (described above) nor the large scale motions of weather systems.

*S*o, the faker must be forcing the rotation by other means, and by a sufficiently unobtrusive way that the busloads of tourists do not spot the means. Indeed, a colleague of mine, who witnessed the performance first hand and knew it was a cheat, was not able to spot how the fraud was perpetrated. (It is an interesting sidelight that when back on the bus, he informed his fellow tourists that they had just witnessed fakery --- the Earth did not cause the rotation they had just seen --- there was widespread disappointment. The tourists preferred the fantasy to the reality.)

Huh?
A correspondent has written me to say that in the version of the program she saw, that "Mr. Palin proceeded to describe how the demonstration was pure bunk and told how the charlatan pulled off his little deception..." Yet, in my version of the program, Palin unambiguously endorses the demonstration.

Could it be that there are two versions out there, the original and an amended one in which Palin attempts to address some of the criticism of the original? Does anyone know?

So far, the only readers who have written me on this point are ones who have seen the Palin-endorsing version. There are no further reports of a version where Palin is claimed to have pointed out that the demonstrator had cheated.

Do-it-yourself fakery.

*T*here are two clues to the successful fakery of the drainage changing direction at the whim of the mountebank. One is revealed in each of the two images (above) which I captured from the TV program:

Non-circular pan

The non-circular pan allows the faker to easily introduce rotation into the pan after he begins. Let us imagine that the pan is filled very carefully so that there is no rotation initially. Indeed, one wants to be able to show the audience that any rotation introduced while filling has died out. Now what? If the pan were circular, it would be harder to start the water spinning by turning the pan itself, but by having the pan nearly square, the water must turn if the pan does.

Turn to face the audience

But how does one turn the pan without the audience becoming suspicious. Obviously, it must be done in such a way that the audience does not attribute the action to part of the fakery, but to a courtesy which enables them to see better.

The procedure is as follows:

- *Find the materials*

  You want two plastic containers: one which is to be the pan to be drained, and the other is a bucket for the storage of water. The pan should be non-circular. I found a quasi-square one (made by Sterilite) for $1.28 in the local Wal-Mart. It is the three-cup size (.7 liter). It works well. Drill a hole (say, 1/4 inch or 3/8 inch) through the center bottom. You don't need a special stopper for the hole: your finger placed underneath works just fine. The other container can be any small plastic bucket with the only restriction that your pan should be able to sit on top of it so that the bucket can catch the water as it drains.

- *Fill the pan*

  Choose the spot that you wish to claim is the equator (the center of your classroom will do). Fill the pan from the bucket there and let the motion from filling die out. (You can insert and then gently remove a vertical object, such as index card, into the water to dampen the motion.) You can then show that there is little or no circulation by floating a match stick (or sprinkling pepper) on the water.

- *Covertly add the chosen rotation*

  If you are going to the north side of the equator, stand in front of the pan facing south. Pick it up, *turn around by turning to your left*, walk to the north end of the room, *turn around by turning to your left*, and face the audience. As you have a non-circular pan, you have now introduced counter-clockwise rotation (which is cyclonic in the northern hemisphere) into the water.

- *The coup-de-grace*

  Add a tracer (such as matches or pepper). Remove the stopper (your finger) and let the water drain. Lie through your teeth by claiming that it is the rotation of the Earth here in the north which is causing the water to circulate the way it does.

- *The other hemisphere*

  Go back to the equator but this time stand on the south side looking north. After filling the pan, *turn around by turning to your right*, walk south, again *turn around by turning to your right* to face your audience (cyclonic rotation in the southern hemisphere is clockwise), and remember to complete the demonstration by lying again.

- *The equator*

  This is the hardest part of the fakery, because it is actually very difficult indeed to eliminate all rotation from a pan of water. It really should sit for a very long time (and your finger might get tired). If the pan is fairly deep, and the hole small, it takes a moment or two before the rotation is apparent. This seems to be the dodge followed by the Kenyan faker.

*W*hat can I say, it all worked the very first time I tried it. If any of you can devise any improvements in the procedure, please send me a note.

Incompetence from Sports Illustrated

One does not normally turn to *Sports Illustrated* for insight into the natural world, unless, possibly that bit of the natural world which sometimes wears swimming suits. However, one does not expect incompetence from the magazine either. Yet, the special Winter 1998 swimsuit issue offers much more than its standard set of salacious images, it offers geographic and scientific swill. In an article by Jamie Malanowski, entitled, Zero Latitude, (starting on page 16) we learn:

> Say you're vacationing at a nice hotel in Costa Rica [sic]. Feeling restless, you go for a walk, heading in a generally southern direction. After a few days and a few beverages of your choice, you stop at an appropriate facility and do what you do whenever nature calls. When you flush, you note that the water whirls down the bowl in a counterclockwise direction. Now resume your walk. Go far enough south, and the next time you hit the head, the water will spin clockwise down the drain. And then it hits you: Somewhere back there you crossed the equator!

Apart from the fact that the equator is one very long (and difficult) walk from Costa Rica, any difference in the behavior of toilets on the journey is the result of happenstance and not the crossing of the line.

Incompetence from NPR (USA)

*O*n October 16, 1996 the NPR program, *Rewind*, blotted its escutcheon with their nonsensical discussion of the Coriolis force. The librarian who prepared it supported her position with references to the book, *Rainbows, Curveballs and other Wonders of the Natural World Explained*, by Ira Flatow, host of NPR's Talk of the Nation - Science Friday and with a previously aired PBS (cum BBC) program called, Pole to Pole (or, Full Circle). You can read about the silliness in Pole to Pole, above. I have yet to see just what it is that Flatow had to say. *Note*: The program has since retracted its mistake.

Incompetence from the author of a standard undergraduate physics textbook.

A physics student from Nottingham University, in the U.K., wrote to tell me that the physics textbook they are assigned in one of his courses states:

> "...on a smaller scale, the coriolis effect causes water draining out a bathtub to rotate counter clockwise in the northern hemisphere..."

Sigh, this mind-numbing example of scientific incompetence is offered by author, Paul A. Tipler, on page 128 of his book, *Physics for Engineers and Scientists*, 4th Edition. One wonders if Tipler gets the relative magnitude of the other forces in nature wrong, or if he reserves this privilege for the Coriolis force. In the U.S.A., the book's publisher is W.H.Freeman, and in the U.K. it is Worth Publishers. *SHAME ON BOTH PUBLISHERS.*

But, competence from teachers

So what do you tell your students.

*T*he direction of rotation in draining sinks and toilets is *NOT* determined by the rotation of the Earth, but by rotation that was introduced earlier when it was being filled or subsequently being disturbed (say by washing). The rotation of the Earth does influence the direction of rotation of large weather systems and large vortices in the oceans, for these are very long-lived phenomena and so allow the very weak Coriolis force to produce a significant effect, with time.

Bad Coriolis FAQ

*B*efore writing me with a question about this page, please check the

Bad Coriolis FAQ to see if the issue has already been addressed satisfactorily.

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Bad Meteorology FAQ

Click on the symbol for its explanation.

Preamble

*T*his FAQ (Frequently Asked Questions) is written by Alistair B. Fraser. It is in response to questions posed over the years by readers of the Bad Meteorology pages. If you have arived on this page without having read those pages or the other Bad Science pages, then what follows, will probably make little sense.

Although the questions presented here are often ones asked by a specific person, each is chosen to characterize a group of similar questions which have been asked about the topic.

Questions grouped by topics

Bad Clouds FAQ (arising out of the Bad Clouds page)

- Air is a sponge
- But, air does have a holding capacity for water vapor
- A correct prediction implies a correct reasoning
- The air-holding water explanation is just a simplification

Bad Rain FAQ (arising out of the Bad Rain page)

- Terminal velocities
- Artistic representation

Bad Greenhouse FAQ (arising out of the Bad Greenhouse page)

- Temperature conversion
- Our atmosphere is not the source of the energy
- But the Sun and atmosphere emit for different reasons
- But our atmosphere would stop emitting without the Sun

- Is it the same radiation emited as received?

Bad Coriolis FAQ (arising out of the Bad Coriolis page)

- You have it backwards
- Why any spin at all?
- Its not the Coriolis force, but the Coriolis effect
- The Coriolis force is fictitious, because it cannot do work
- The teacher was right
- On firing missiles
- Temporal scale versus spatial scale
- Wacky things attributed to Coriolis

General meteorological FAQ

- The full moon and frost
- Heat lightning

Teaching FAQ

- Employment of metaphors
- Persistence of textbook errors
- Teacher intransigence

Be very, very careful what you put into that head,
because you will never, ever get it out.
Thomas Cardinal Wolsey (1471-1530)

Badness Survey

Click on the symbol for its explanation.

Proffering Garbage as Gems

*M*any educators are concerned with making sure that students are presented with a shopping list of knowledge and information. Curricular committees assemble and compile irreducible lists of topics to which a student should be exposed before graduation. (We would not want any of our graduates to have to express ignorance on topic x, so we had better add topic x to our already long list of topics to teach).

*D*uring the process of provisioning students with a vast storehouse of knowledge, it would appear that little attention is directed towards eliminating misinformation. The survey presented below, albeit anecdotal and in only one field, would suggest that the probability of having students being offered garbage as if gems is amazingly high in all levels of our educational system.

*S*urely the elimination of proffered misinformation should be as important a concern for educators (and curricular committees) as the provisioning of proffered information. Yet the results of the survey presented below seem to suggest that the former does not play much of a role in the considerations of educators.

The results of a class survey

*I*n November 1996, I handed the members of my sophomore class of beginning meteorology students a questionnaire about the extent to which they had been taught scientific nonsense and from whom they might have learned it. I received 44 total responses. The percentages can add up to more than 100% because, some people learned the same thing from a number of different sources.

Percentage of Penn State University sophomores in meteorology who had acquired bad information from a particular source (sample size = 44 students)

garbage proffered as gems	*not at all*	*home*	*text-books*	*maga-zines/TV*	*grade school*	*high school*	*univer-sity*

Clouds form because cold air cannot hold as much water vapor as warm air.	39%	7%	27%	30%	32%	30%	5%
There are 7 colors in the rainbow.	5%	32%	32%	36%	86%	34%	7%
The atmosphere behaves like a greenhouse.	9%	5%	41%	50%	41%	64%	14%
Greenhouse gases behave like a blanket.	18%	5%	32%	41%	27%	61%	11%
Direction of rotation in sink is determined by Earth's rotation.	2%	14%	7%	39%	16%	41%	2%
Raindrops are shaped like teardrops.	6%	14%	16%	64%	50%	16%	9%
Average	*13%*	*13%*	*26%*	*43%*	*42%*	*41%*	*8%*

Comments

*F*or any particular piece of misinformation, nearly 90% of the students are likely to have been taught it (100% - 13% = 87%). That is an amazingly high probability of acquiring any particular one of the six pieces of nonsense and represents a virtual certainty that a student will be exposed to at least one of them.

Interpretation of these numbers is fraught with problems. Even taking the average as I have, assumes an unjustified equal weighting of the topics. But the numbers here are only viewed as a hint at the issues.

- *Home*

  At first it might seem that the relatively low probability of getting any particular piece of scientific misinformation in the home implies a greater concern for the truth there. Of course, the more reasonable interpretation is that less scientific *misinformation* is offered in the home because less scientific *information* is offered there. During the next class, I asked my students whether this was, in fact, the proper interpretation and they roundly asserted that yes, it was.

- *Textbooks versus magazines and TV*

Despite the better (but not good) showing of textbooks by comparison to magazines and television, I suspect that this merely suggests that students actually acquire more information (and thus more misinformation) via the latter two than via textbooks. Certainly, my own reading of textbooks suggests that they are a rich mine of nonsense.

- *Educational institutions*

  The probability of acquiring any particular piece of nonsense from an educational institution is about the same as that for magazines or television. This is a shameful indictment of our educational system! At first it might be thought that the universities do a better job than the grade schools or high schools. but each of the latter represents an exposure of about six years while the students surveyed had in generally only been at the university for a year and a few months. If one scaled the data to give the probability of acquiring a particular piece of misinformation per unit time, it is clear that the universities don't do any better than the public schools: all do an abysmal job.

More to be feared than ignorance is the illusion of knowledge.

Québec:	(514) 283-1104
Atlantic Canada:	(902) 426-4926

The Canadian Lightning Detection Network

The Canadian lightning detection network increases public safety by allowing meteorologists to detect and monitor thunderstorms at an early stage in their development.

Thunderstorms are always accompanied by lightning and may produce damaging and dangerous weather such as tornadoes, hail, high winds and heavy rain. Using information from the lightning detection network and other data such as doppler radar, meteorologists will be able to detect thunderstorms earlier, track them more accurately, and if necessary, issue severe weather warnings sooner -- in some cases, one to three hours before a storm hits.

Early warnings give Canadians more time to take appropriate steps to protect themselves, such as:

- cancelling outdoor recreational activities, like baseball and soccer games;
- getting out of the water or sailing to shore before a storm strikes;
- taking shelter if working outdoors on construction sites or farmers' fields.

In Canada, lightning kills about seven people and seriously injures 60 to 70 people a year. Among the 9,763 fires recorded by the Canadian Forestry Service in 1994, 5,324 resulted directly from lightning. The geographic area burned by fire rose to 6,292,021 hectares. The average annual cost of forest fires between 1979 and 1993 is 14 billion dollars.

Severe weather such as thunderstorms, lightning, tornadoes, hail, heavy rains and high winds also exact a high toll. In the 1980s, tornadoes in Barrie and Edmonton killed 35 people. Hail storms in Calgary and Winnipeg in the summer of 1996 resulted in property losses of close to $300 million. In August of the same year, heavy rains hit the Ottawa/Hull area, resulting in total insured property damage of more than $20 million. That figure does not include the cost of repairing the sewers and roads.

Welcome

Lightning flashes occur in Canada about 2.7 million times a year, including about once every three seconds during the summer months. This is based on observations collected during the past five years from the Canadian lightning detection network. Lightning can be deadly. A lightning bolt can carry up to 100 million volts of electricity - a million times more powerful than household current. Each year in Canada, lightning strikes kill about half a dozen people, seriously injure about 70 others, and ignite some 4,000 forest fires. In a recent study, Environment Canada scientists identified several lightning hot spots across the country. See how often lightning strikes in your local area, check out our lightning safety tips and tune into our cross-Canada lightning detection network to see lightning as it happens.

Chatrooms

Advanced Chatrooms

The Advanced Chatrooms offer a wide range of advanced features. You can connect in a variety of ways, using **Java** or **HTML** (for WebTV users) or any **standard IRC client**:

Here is a list of the features of the Advanced Chatrooms:

- Nickname registration (allows you to "reserve" your nickname).
- User profiles (information you can share with other users if you wish)
- Fast and automatic updating of messages.
- The ability to exchange files between users.
- The ability to send "memos" to other users, even if they are not currently online.
- Multimedia (expressive sounds and graphics)
- **Full IRC client compatibility**
- You can use any IRC client (such as mIRC)
    - **First, you must register a username and password** by going through the registration process on this page. Once you are emailed your username and password, THEN you can connect via IRC.
    - The IRC **server address** is **132.183.185.106** and the **port number** is **7000**

If you have technical problems running the Advanced Chatrooms, you can get technical help directly from ChatSpace (the company that makes the software). You can also directly give the company useful feedback on bugs and other problems. Please visit this support page, and **be sure to tell them** that the server is running **"ChatSpace Community Server 2.1 build 76."**

Click here to go directly to the Advanced Chatrooms.

[Return to Top]

Classic Chatrooms

These chatrooms are web-based and **do not require any Java**. They are very basic and easy to use, do not require registration, and should work very well with browsers like Lynx or WebTV. I call them "Classic" because they are very similar to the original chatrooms we began using in 1995...but better! One special feature of the Classic Chatrooms is that they allow people to express themselves using **special graphics** along with text. You can be very creative with them.

Click here to go directly to the Classic Chatrooms Homepage.

[Return to Top]

Palace "Virtual Reality" Chatrooms

The Palace "Virtual Reality" Chatrooms are a special place. They are **completely** graphical, you can create avatars (a customized graphical representation of yourself), and you can explore rooms that actually look like **real rooms**!

Click here to go directly to the Palace "Virtual Reality" Chatrooms Homepage.

[Return to Top]

If you want to organize chat times with friends, need general assistance, or would like to give feedback on any of these chatrooms, please visit the Chatroom Feedback Forum.

If you'd like to participate in a **bulletin-board-type discussion** (where your posts are **permanently** stored on the server),
please visit our BrainTalk Communities at www.BrainTalk.org

[Neurology Department at Massachusetts General Hospital]

Welcome to our Lightning_and_Electric_Shock Chatroom

Occupants: The chatroom is currently empty.

Log on Instructions	• **Nickname**: Type the name that you want to go by in the chat room. • **Text Color**: Choose a color for your messages. The default is black. • **[Join Chat]**: Just click this button to enter the chat room! • **Remember Settings:** Check this to set a cookie which stores your **Nickname** and **Text Color** for future logons.

Inappropriate behavior will NOT be tolerated on this system.

The content of ALL PRIVATE MESSAGES are LOGGED and SAVED on this server, along with the user's IP address and exact date and time of transmission.

These private message logs are ONLY accessible by the System Administrator, and are periodically reviewed for inappropriate content.

Any user sending inappropriate private messages will be immediately banned and reported to their Internet Service Provider.

YOU MUST SCROLL DOWN AND READ THIS ENTIRE DOCUMENT BEFORE LOGGING ON

Massachusetts General Hospital - Official Disclaimer and Privacy Policy

---

The following Disclaimer and Privacy Policy are copied directly from the official Massachusetts General Hospital Web Authoring Policy document, from sections D.7 and D.8 respectively.

By using this website, you acknowledge and agree to the terms of this document.

General Disclaimer and Disclaimer for Interactive Programs

The Massachusetts General Hospital (MGH) web site is intended to provide general educational information and to help users arrange more easily for health care services. Some information on the site is written by health care providers and staff affiliated with MGH or its affiliates through Partners HealthCare System, Inc. ("Partners"), while other information is from outside sources, such as governmental publications.

This site is not an attempt to practice medicine or provide specific medical advice and should not be used to make a diagnosis or to replace or overrule a qualified health care provider's judgement. Nor should users rely upon the MGH web site if they might need emergency medical treatment. **We strongly encourage users to consult with a qualified health care professional for answers to personal questions.**

Use of programs on the MGH site does not establish a doctor-patient relationship. Should you electronically request a referral to MGH or a Partners affiliate, we will use the information you submit to arrange for care where appropriate.

You assume full responsibility for using the information on this site, and you understand and agree that Partners and its affiliates, including MGH, are not responsible or liable for any claim, loss, or damage resulting from its use by you or any user. While we try to keep the information on this site as accurate as possible, we disclaim any warranty concerning its accuracy, timeliness, and completeness, and any other warranty, express or implied, including warranties of merchantability or fitness for a particular purpose. MGH also does not warrant that access to the site will be error- or virus-free.

We provide access to other web sites for your convenience. MGH is not responsible for the availability, accuracy, or content of those external sites, nor does it endorse them.

Material on the MGH web site is protected by copyright law. Unless otherwise stated, users may print or download information from this site for personal, non-commercial use only, provided they identify the source of the material and include a statement that the materials are protected by copyright law. Reprinting or otherwise reproducing any document in whole or in part is prohibited, unless prior written consent is obtained from the copyright owner.

By choosing to use the MGH web site, you acknowledge and agree to the terms of this Disclaimer and our Privacy Policy (see below). We encourage you to read them. We reserve the right to modify these terms and policies and recommend that you periodically review them, because if you use this site you will be expected to comply with them. A current version will always be available here.

Special Points about Interactive Programs

- Certain MGH department sites offer interactive programs, such as bulletin boards and chat rooms. You should understand that any information you provide using these programs (including personal information) is totally voluntary, and will be widely accessible to the general public. It also may be electronically stored indefinitely, and may be used by MGH in the future (such as for educational purposes).
- MGH is offering these interactive programs for educational, patient care, and research purposes. We expect all users to use the programs lawfully and appropriately. MGH has no

oblication to monitor the interactive exchanges on this site or the content or accuracy of such exchanges, and it does not endorse the views of any user. MGH reserves the right, however, to monitor system access and to remove, edit, or refuse to post information that is brought to its attention and that it determines in its sole discretion is objectionable or inappropriate for any reason. MGH shall have a royalty-free, perpetual, irrevocable, nonexclusive license to use comments and postings submitted by users for research, educational, or patient care purposes. No compensation shall be payable for such use.

- If you wish to remove any information you have submittedto this site, we will make reasonable efforts to accomodate your request. Please contact John Lester at lester@helix.mgh.harvard.edu. There is no need to "remove" any posts you make in these chatrooms, since chatroom messages are NOT saved or archived in any way (unless explicitly stated otherwise).

By choosing to use this MGH site, you acknowledge and agree to the terms of this disclaimer and the Privacy Policy (see below), which we encourage you to read.

Privacy Policy

We respect your privacy interests and so operate this site by these principles.

You may use the MGH web site without disclosing personally identifiable information. We want to be clear that we will not obtain such information about you unless you choose to submit it to us. For example, if you email your comments, that identifies your email address. If you request an appointment with a physician, a limited number of hospital administrators and health care providers will see this information and use it to arrange care where appropriate.

We have taken reasonable steps to ensure the integrity and confidentiality of personally identifiable information that you may provide. You should understand, however, that electronic transmissions via the internet are not necessarily secure from interception and so we cannot guarantee the security or confidentiality of such transmissions.

The web server of the MGH web site collects and saves the default information customarily logged by World Wide Web server software. Our logs contain the following information for each request: date and time, originating IP address and domain name (the unique address assigned to your internet service provider's computer that connects to the internet), object requested, and completion status of the request. We use these logs to help improve our service by evaluating the "traffic" to our site in terms of number of unique visitors, level of demand, most popular page requests, and types of errors.

These logs may be kept for an indefinite amount of time, used at any time and in any way necessary to prevent security breaches and to ensure the integrity of the data on our servers.

Please note that we use "cookies," which are small files stored on your computer's hard drive that are used to track personal information. We may use this information to save username and password data when you are accessing interactive parts of our websites, to allow your web browser to "remember" who you are and assist you by "logging on" without you having to type your username and password repeatedly.

Except for authorized law enforcement investigations or other facially valid legal processes, we will not share any information we receive with any parties outside of Partners.

By joining this chat, you acknowledge and agree to the terms of the above document.

HAROLD'S STORY

This is Harold's Story written by his son Cory

The location of the accident was in Alto, New Mexico, which is located in the most southern part of the Rocky Mountains approximately 5 miles north of Ruidoso.

The weather that day was a typical summer day. Cool in the morning and warmer in the afternoon. Ruidoso is known for it's afternoon showers in the mountains. I personally have witnessed the afternoon showers and thunderstorms. However, they were always fast moving and never stayed long. Matter of fact, my family was vacationing in Ruidoso just the week before the accident. My dad and I played golf all week long, and we took my kids fishing. The weather stayed constant all week long. The Thursday before I left, we were on the golf course when a thunderstorm developed. You could hear the thunder and see the lightning, and it was close. My dad starting talking about Lee Trevino being struck by lightning. He leaned over to me and said "I wonder what the odds are of being struck by lightning" and just kinda chuckled as we drove off in the golf cart.

My family and I headed back to Texas on Sunday the 14th, the accident occurred the very next day, a day that I will never forget.

My father and his friends had just completed a round of golf, and were waiting until noon to sign up for a tournament. They decided to practice their putting, while they were waiting.

According to a eye witness, he said at approximately 11:45 am, he saw a tremendous flash of light. When he looked up, he saw white smoke that encompassed the green. The eye witness was approximately 200 yards or less from the putting green. He called 911 from his car, he saw several people that were injured on the green. He told me that when he saw my dad, that there was smoke coming from his body, and that his clothes were on fire.

CPR was administered to my dad, several bystanders were helping others that were not as severe as my dad.

The paramedics arrived at the scene and quickly determined that he had no pulse or heartbeat. They indicated that he was in asystole and v-fib. They immediately shocked his heart with the defibrillator and his heartbeat returned. During the transport to the hospital they had to shock his heart two more times. He was stabilized at the Ruidoso hospital. He was then taken by care flight to the burn/trauma center in Albuquerque. He was breathing by the use of a ventilator, that would soon be placed in his trach. He was on the vent four weeks. He did regain consciousness three days after the incident. But, he was not responding to questions or anything that the doctors tried. He also had skin graph surgery, to repair deeply damaged tissue in his right arm and shoulder. A few days later his heart started beating out of normal sinus rhythm. They had to perform a procedure called cardioversion (electrically shocking the heart).

He currently has a permanently damaged heart, his heartbeat has to be regulated through medication. The worst thing possible, that could have happened, did. My dad went without oxygen to the brain (anoxia) for an extended period of time. He also lacked an ample supply of blood to the brain. He has severe brain damage to the front left lobe. This particular part of the brain controls reasoning, memory (short and long), and communication skills.

After two months in Albuquerque, he was care flighted to Baylor Medical Center in Dallas, Texas. He spent approximately 4 weeks in a skilled nursing center. He still did not know who he was or who the family was. My father spent the next sixty days in rehab, but the doctors determined that he has lost practically all of his short and long-term memory. He cannot walk due to the brain damage and nerve damage in his legs and spine.

He is currently at home, where my mother takes care of him. He requires 24 hours a day care.

MY STORY

This is a photo of me. Did you expect a picture of a person with burn scars or perhaps missing pieces? Most people when they hear that I was struck by lightning are surprised at how NORMAL I look.

One common myth that's makes getting proper medical help for a lightning strike victim difficult is the 'crispy critter' myth. The myth being that when you're struck by lightning you're immediately burnt to a crisp and that if you survive without obvious external injuries then you are very lucky and will be fine. But lightning and the human body have a unique interaction that is different from other types of materials. When lightning hits a tree it blasts the tree apart but when it hits a human body it travels over the surface of the skin, this is called the flashover effect. This makes it possible for a person to be seriously injured but have little if any burning on the skin. Hence the crispy critter myth is thrown out the window.

The Day My Life Changed Forever

On August 6,1997, Vancouver was visited by a viscious torential downpour. Vancouver gets alot of rain but not usually in the form of a tropical storm and with this storm came thunder and lightning. The likes of which I have never encountered in Vancouver in the past 20 years that it has been my home. The city had over 2000 strikes in 3 hrs.

Having spent my first 10 yrs of life in Edmonton, I was not new to these kinds of storms. Since awe inspiring thunder and lightning shows were a common site on the Albertan prairies, I used to watch from the front bay window as sheet lightning filled the sky above the vast fields outside our home. I loved them, they filled me with excitement and wonder.

Somewhere in time, as I grew up living in Vancouver, I developed a fear of thunder and lightning, it wasn't a disabling fear but I always felt very uncomfortable when the rare storm struck. Perhaps it was because Vancouver got the more tranditional lightning bolts rather than the sheets I was used to seeing on the prairies. And Strikes we're always so much closer and louder than I ever recalled from my childhood.

I worked at an automotive repair shop as an apprentice mechanic. (I only had about a year more of practical work I had to complete before I would be ready to get my journeymanship). My husband also works there as a licensed mechanic. It was his day off the day I was struck.

The rain was beating down fiercely and the whole building boomed every 5 minutes or so as lightning was striking all around. The guys found it quite funny because every time there was a really loud thunder clap I'd jump or sometimes scream from being startled. We were all having a good laugh about how thunder scared me. The humor helped me keep my fears at bay and it was turning into a scary but sort of fun kind of day. I knew that people could be struck inside a building and I quoted to the guys lightning facts that I knew, using these as stress relief. We comforted each other knowing that our building wasn't tall and if lightning was going to strike it would strike something higher in the neighbourhood well before it got our building. (We found out that the myth lightning strikes the tallest object in an area is NOT true.)

I was working on a vehicle and John our boss came by to see how I was doing, he laughed as I jumped from another thunder clap and he said "I don't care if it hits something as long as it doesn't strike me" I replied "Well if anyone in the shop will be hit, it'll be me." We all laughed and agreed because everything that happens at work always seems to happen to me. All my life I have always had the strangest luck. But never in a million years did I honestly think I would be struck by lightning, and definitely not inside a building.

I was using the vice on the metal workbench at the far side of the shop. Above this bench are all the three phase circuit breakers for the shops electrical system. I took the aluminum thermostat housing out of the vice and had just stepped back from the bench when BOOM!

All I remember was seeing a blue flash between my outstreched hand and the bench and feeling intense pain engulf my hand. The rubber glove on my hand hand had the fingers blown right through and later looking at my left boot the rubber sole had melted in a few spots.

(Now the next few events happenned in a very short time frame and pretty much at the same time.) I was literally stunned, frozen mentally and physically, my muscles started twitching, my heart spasming, then the pain which was only in my hand at first climbed up my left arm and down the left side of my body. Over a period of about 20 mins the area that first had hurt went totally numb and I started becoming paralyzed but only on my left side. While this was all going on, a customer who was 20 ft from me at the time of the strike came running, asking if I was alright, he said he saw a bolt of lightning jump the 3 foot air gap from the metal bench to my arm. I just kept ranting "I was hit by lightningI was hit by lightning!" over and over in a very distressed freaked out voice.

The guys in the office when they heard the bang looked out and the whole shop was filled with blue light. They thought something like a propane tank had exploded from the sound the strike made. John came down to check me over at this time I could still walk and talk, Ed took care of me while John went to call 911. The phones were dead! Lightning had blown the phone system. (I later learned, when I got to the hospital, that Ed had been struck too. He was on the phone, it blew the receiver up and left a burn on his chest.) They didn't know what to do, they figured since I was still alive I wasn't in immediate danger, it didn't take long and the phones were working again and when they called 911 it was BUSY!

By this time I had taken a really bad turn for the worse I was turning grey, I couldn't walk and my whole left side was partially paralyzed, I was in excruciating pain and my breathing was stopping. It was so strange because I was conscious, sitting down and then suddenly I noticed something was wrong but I couldn't figure out what it was, and then I thought "Oh my god, I'm not breathing." I'd think "inhale" but nothing happened, then suddenly I'd be breathing normally again, and then it would stop. The times it stopped seemed like forever but in reality they probably weren't more than a minute. John finally threw me in a car and took me to the hospital. My breathing finally normalized about an hour after getting to the hospital. Ed was the next to come in, they put him in a bed beside me. We thought the whole thing was too funny.
It was only once the choas of it all subsided and the doctors started checking me out that the revelation came to me how serious the experience was.

Please ComeBack and Read the rest of my Story, I've not quite finished it yet.

This page is under construction.

Please come back soon.

DAVID'S STORY

The date was 8/29/92 at around 4:00pm (give or take). I was on Duty as an Emergency Medical Dispatcher, on a 911 Phone Line, talking to a man in a burning building started by lightning. As I was giving Him instructions on how to safely exit the building (He needed a fire extinguisher to do it), I felt a very, very hot "Spark-Plug" type feeling inside my head, and tasted "Metal" in my mouth. I was tossed about 10-15 feet back to the wall of the Dispatch Room. I don't remember anything for about 30 minutes or so (can't really tell how long). I was taken to the hospital, where the Medics, my Father, and the ER Doctor saw blood coming out of my left ear. I had the worst headache I could imagine, and that "metal" taste made me sick. I spent the rest of the day in the ER to make sure my heart was "running OK", and sent home to rest a couple days (forgot how long). I returned to work a few days(?) later, and thought nothing of it.
I do know that the "Metal" taste stayed with me for a day or so. Tasted like I was sucking on a Copper Pipe or something.

After a period of time (?), I noticed things were not right. I lost some hearing in my left ear, and was dizzy most of the time, forcing me to take more time off from my dearly loved job. Then the Memory part. First it was forgeting what I was saying in the middle of a sentence, then forgetting what people were saying to me.

After more time, I forgot my Mother who died in 1991, and most of my Military and Childhood memories. Thanks to a classmate, I have been told alot of things about what we used to do.

My left ear kept "ringing" and "roaring" like a loud ocean, making me vomit without warning. Grossed out some guests a few times.

I had all the tests, MRI, ENG, CAT, BAER....All showed "abmormal results". The doctors didn't know what to do with me, until I went to one of the top "Docs" in Florida. They said I would have permanent problems with "balance", "Vertigo" and "Headaches".

This set me back. I was so active. I taught CPR since 1981, rising to the area Board of Directors with the American Heart Association, and running 3 "Training Centers" for CPR Instruction, keeping track of over 300 Instructors. I too was in Law Enforcement all during my Military Service, joining various Police and Sheriffs Departments for training, while I got my education. I was a Certified Substance Abuse Counselor in the Navy, and held a Top Secret Clearence +. I worked in Security Consultation and Managment for some large Corporations, and kept track of Million Dollar Budgets for various very up-scale communities.

I am a Life Member of the Police Hall of Fame, and served 12 straight elected years at Florida State Vice President of the American Federation of Police. Now, your wondering, if I have memory problems, how can I remember all of the above. Easy, I am looking at the Certificates on my Den wall.

As of this date of writing the following bother me:
1. Extreme Headaches
2. Vertigo
3. Left Ear Pain (deep) with "ringing" and "roaring"
4. Nausea
5. Vomiting
6. Memory problems
7. Get lost while driving in my town sometimes. (put a compass in my truck!)
8. Walk with a cane for balance control most of the time.
9. Hearing Loss (worse since injury in Left Ear)

As Time goes on, I feel worse, and the WORST SYMPTOM, besides the above is INSOMNIA!!! I go for days with no sleep, pacing the floors, laying in bed wide awake, etc.

I have an ENT and Neurologist (Specialists) and a regular Doctor. I went from making in about two weeks , what I make now in 1 Month in Social Security. Medicare Stinks; Prices go up, but not your Disability Payments.

My friends brought me a Radio Shack Lightning Rod to clip on my belt (as a joke), and call me "Sparky"....Well, I am electrically charged.(grin!) .
I try to laugh about it with others, but no one knows what you are going through EXCEPT another Survivor. Thank God for LESSI and this Web Page. I wish all out there the very best, and please feel free to email me...My friends have long since stopped coming or calling me. May God Bless each and every one of you out there.

David A. Smith ke4uei@gate.net
Stuart, FL

BAILEY'S STORY

Bailey is a list member on The Lightning Strike Survivor List

I was struck by lightning in 1993 while I was living in Atlanta, Georgia.

I was working on the motherboard of a computer and a sudden severe summer storm blew in. I saw a bright hot flash and the next thing I knew I was stuck to the board and felt like a hot piece of charcoal. I knew that I had to pull my hands away and I finally did.

People around me said that a blue arc of light went from the board to my fingers and then my chair was blown back about 10 feet. The heel of my left shoe was burned off and the computer was a smoking heap.

I went to the emergency room where my heart was monitored because it was erratic. At this point, I was not able to see out of my left eye and both arms were totally numb. My heel was burned also. I stayed the night and was released the next day.

Now, six years later, I have no feeling in my left arm from the elbow down and I suffer severe migraines often. I suffer these headaches especially bad when the barometric pressure changes. I gained the ability to predict storms about two days ahead if they are connected to a strong front.

I am left-handed and have had to learn many things over again. I am in law enforcement so the use of my left hand is important.

Luckily I have the support of my wonderful husband and my loving family. I have a great neurologist and support staff His nurse, has been a wonderful help in making me see that I can move on and live.

I know that I am lucky to be alive and I am thankful for that and for finding the Lightning Strike Email Support List.

I am scared of storms but between my husband and my cat, they keep me sane!

Thank you all for listening to me and letting me know that there are others out there going through the same and sometimes worse problems that I am! I would love to hear from anyone who would like to share stories and sometimes complaints with me!

HIT and MISS

A majority of these facts were taken from articles written by Dr.Mary Ann Cooper.They are available in full unedited form at:
The Lightning Injury Home Page

I in no way want to take any credit for the writing and information here. I just gathered the info that I felt was most useful to people wanting to understand lightning injury and strikes and have included it on my page. Dr.Cooper did most of the work and she has my utmost respect and thanks.

The Facts and Myths about Lightning and the people it Injures

Among the myths about negative effects is the "crispy critter" myth. This is the belief that the victim struck by lightning bursts into flames or is reduced to a pile of ashes. In reality, lightning often flashes over the outside of a victim, sometimes blowing off the clothes but leaving few external signs of injury and few, if any, burns.

Myth:
I will probably never know a victim of a lightning injury because they are so rare.

Fact:
The odds of being struck are 1 in 600,000. You are more likely to meet a lightning strike survivor than you are to meet a person who has won the lottery.

Myth:
No one injured by lightning lives to talk about it.

Fact:
The estimate of deaths by lightning is about 3 to 10% of all incidents. There may be as many as 750 to 5000 injuries per year.

Myth:
"When lightning hits the ground nearby, it is 'grounded ' and I am safe. "

Fact:
Despite the fact that we call the earth a "ground," it is very difficult to pump electricity into the ground. Most "earth" is a very good insulator. When lightning hits the ground, it spreads out along the surface and first few inches of the ground in increasing circles of energy called "ground current." If it contacts a fence or a

water pipe or wire entering a house it can be transmitted for quite a distance and cause injury to persons near these paths. The human body is made up of primarily water and salts this makes us basically bags of electrolytes. This makes people better transmitters of electrical current than most ground is, and many are injured by ground current effect each year as the lightning energy surges up one leg that is closer to the strike and down the one further away.

"My mother always told me to stay off the telephone (out of the bath tub, away from windows, unplug the appliances, etc.) during a thunderstorm. "

Good advice, if not always practical. Again, the ground current effect of energy transmitted into the structure along wires or pipes may find the person a better conduit to ground. Many injuries occur every year totelephone users inside the home.

Myth:
Most lightning injuries occur on the golf course.

Fact:
Lightning has injured many people who have been in buldings which were struck. The lightning flows through the building to ground and if a person is in the path to ground they get struck. Many times the strike doesn't do any external damage to the building because it travels through the wiring and the metal pipes, but still the occupants can get struck. Particularly if they're holding or near wiring, pipes, and other metal objects.

A large number are work-related. These include injuries to postal and construction workers and persons using telephones that have not been properly grounded.

Injuries during recreation occur to joggers, hikers, and campers, as well as golfers. In addition, a significant number of people are injured while participating in team sports.

Myth:
Some people can attract lightning.

Fact:
Some have called themselves "human lightning rods," claiming that thunderstorms would change course to find them or that they had been struck multiple times. With lightning victims, some may suffer little injury from a single strike, but the majority have some type of injury complaint. When one claims to have been hit 20 or more times, the odds of being able to talk about it decrease logarithmically. Would any reasonable person not have enough sense to learn to avoid lightning after the first couple of hits?

What Injuries do Lightning Survivors Experience?

Lightning Strike Survivor Max Dearing answers this question with the following excerpt he wrote for LSESSI's web page. I have included my personal experiences as well, inserted among his article. My contributions are colored red.

While not every survivor will experience everything below, most of themare common items. I have experienced most of the effects below at some point or another. Some have become miniscule while others still persist. At any rate here's the list:

Long term memory loss. - You don't even know what's gone until you try to recall it. I know that most of my childhood memories are gone.

I too, am missing significant pieces of my memories before my Lightning Strike. The other day I was looking at photographs of myself and friends at a car meet. I felt sad. Everyone looked like they were enjoying themselves and having fun. But I didn't remember even being there. Even the background was oddly unfamiliar. It was a strange and eerie experience. (May 7/99)

Short term memory impairment. - Usually attributed to old age. i.e.Get up to get or do something and forget what it was. Except this can happen as many as a dozen times a day, or more.(I'm 39 years old and other survivors are far younger than I who complain about this symptom.) It doesn't always happen every day. So the unpredictability is also a factor.

Everything Max wrote describes my experiences with memory as well. Over time the frequency has diminished but I still can't find things I put away 30 mins ago, I can't remember telephone conversations as soon as I get off the phone. This doesn't happen everyday but happens enough that I can't rely on what I remember.

I still put the milk in the cupboard and the clean dishes in the oven. Our house is a fun place for our friends, they're always getting a laugh from my foibles.

Just 2 days ago I did a first: I forgot to take the money from the bank machine after I withdrew it. Fortunately the guy after me was honest and I was able to go back and get it. (May 7/99)

Sleep pattern disturbances. - Sometimes you want to sleep for days. Sometimes you can't sleep for days. Sometimes 15-20 minutes of sleep, and you're good to go for another 36 hours. Another thing that can happen is, when you are just about at the point of sleep and any slight noise will wake you up. When this occurs, you feel as though you've had two days rest, and are ready to go for another 10-12 hours.
Often after getting as much sleep as you can get, you still have severeproblems getting up and getting motivated because of complete exhaustion.
Most of the time I get 2-3 hours of uninterrupted sleep. Occasionally, I can sleep for 6 hours. I have not been able to sleep any longer than 7 hours in almost two years.

Sleep problems have been an on going battle for me as well. I suffer primarily from fatigue. I just want to sleep and sleep and sleep, but sleep doesn't seem to help make it go away.

Fatigue is a common symptom of any brain injury. Lightning survivors typically have frontal lobe brain injury and the problems Max is describing in this page are consistent with these injuries.

I also have trouble falling asleep it can take me 4 or 5 hrs to actually fall asleep even though I am so physically exhausted that I can't do anything except lie there and wait for sleep to come.

I suffer from night sweats. Actually I call them just 'sweats' because I will sweat even during a nap in the day time and while I'm awake. My body temperature regulation is out of whack. My body temperature swings very high to very cold. When it swings high I sweat. When it swings low, it can be 30C/90F inside my home and I'll still have to turn the heat up. (May 12,1999)

Clinical Depression. - Many, if not most, survivors are treated for depressed mindsets. Often the medications work, but for only a limited time.

Irratic Cognitive thinking impartment. - Though still functional in a work or social environment, the ability to rationally communicate in conversation sometimes is difficult. The telephone represents an even bigger challenge. You hear the words, know what they mean, but still can not put the thoughttogether that means anything that is relevent information.

Numbers or numeric processing is sometimes also effected. Additionand subtraction abilities may be gone or severely disrupted (as in my case) but complex division is still intact.

Other effects may be just the opposite. Many physicians may falsly attribute this to early onset of Alzheimers Disease.

Irritability. - Primarily brought on by knowing that you are impaired but cannot communicate it in an intelligent manner, or that you can't relieve or fix the situation.

Muscular and Central Nervous System problems. - Another problem which is attributed to the aging process. Sudden sharp stabbing pains in muscles, joints or tendons. Atrophied muscular groups cause a constant feeling of exhaustion. Some may just call this laziness.

Headaches - Sometimes severe blinding Migrane's. Often, closely experienced "Cluster" headaches.

Headache Relief: Several people have found relief with acupuncture. The National Institutes of Health have recognized acupuncture as indicated for the treatment of several different neurologic things such as headaches and stroke. (Just thought I'd include this info. Who knows it may help someone. July 16/99)

Loss of dexterity and fine motor skills. - Difficulty in typing,buttoning buttons, etc...

Vitamin B6 & B12 Deficiency. - Vitamin deficits can cause all sortsof problems, and the B complex vitamins are necessary for central nervous system health.

Hearing deficits and impairments.

Seizures - Often associated with closed head injuries. It seems that many more electrical shock victims experience sezures than lightning victims. Most survivors indicate that standard medications are reasonably effective, but not totally.

As I find time this page will be updated so...

Please come back soon.

Human Voltage

What happens when people and lightning converge

One of a series of stories covering the quadrennial International Conference on Atmospheric Electricity, June 7-11, 1999, in Guntersville, Ala.

June 18, 1999: Either lightning is attracted to testosterone, or men spend an inordinate amount of time outdoors swinging metal objects about. Men are struck by lightning four times more often than women.

According to a study entitled "Demographics of U.S. Lightning Casualties and Damages from 1959 - 1994," by Ronald L. Holle and Raúl E. López of the National Severe Storms Laboratory and E. Brian Curran of the National Weather Service, males account for 84% of lightning fatalities and 82% of injuries.

Men can take comfort in the fact that the actual number of deaths and injuries from lightning strikes has decreased in the past 35 years. Holle's team attributes 30 percent of the decrease in lightning deaths to improved forecasts and warnings, better lightning awareness, more substantial buildings, and socioeconomic changes. They attribute an additional 40 percent to improved medical care and communications.

The National Weather Service publication *Storm Data* recorded 3,239 deaths and 9,818 injuries from lightning strikes between 1959 and 1994. Only flash floods and river floods cause more weather-related deaths. But according to Dr. Elisabeth Gourbière of the Electricité de France, Service des Etudes Médicales, only 20 percent of lightning victims are immediately struck dead. Still, many doctors do not fully understand how to treat the injuries of the other 80 percent

Recent Headlines

August 16: Planet in a Test Tube

of lightning victims who survive a strike.

Says Gourbière, "The pathology of lightning, or keraunopathy, is known only to a few specialists."

Most doctors are more familiar with electrical shocks, such as those received by industrial workers when they have an accidental run-in with high-voltage equipment. But lightning injuries are not the same as electrical shocks. For one thing, the contact voltage of a typical industrial electrical shock is 20 to 63 kilovolts, while a lightning strike delivers about 300 kilovolts.

Industrial shocks rarely last longer than half a second (500 milliseconds) because a circuit breaker opens or the person is thrown far from the live conductor. Lightning strikes have an even shorter duration, only lasting up to a few milliseconds. Most of the current from a lightning strike passes over the surface of the body in a process called "external flashover."

Both industrial shocks and lightning strikes result in deep burns at point of contact - for industry the points of contact are usually on the upper limbs, hands and wrists, while for lightning they are mostly on the head, neck and shoulders. Industrial shock victims sometimes exhibit deep tissue destruction along the entire current path, while lightning victims' burns seem to center at the entry and exit points. Both industrial shock and lightning victims may be injured from falling down or being thrown, and the leading cause of immediate death for both is cardiac or cardiopulmonary arrest.

If you survive a shock, you still have to deal with the consequences of the electrical burns. Industrial shock burns can lead to kidney failure, infection, muscle and tissue damage, or amputation. Lightning burns are exceptionally life threatening (see box at the end of this story).

Right: High voltage electrical equipment can cause severe shocks and burns slightly similar to those from lightning strikes.

Gourbière says that 70 percent of lightning survivors experience residual effects, most commonly affecting the brain (neuropsychiatric, vision and hearing). These effects can develop slowly, only becoming apparent much later.

Feel the Burn

If you'd like to experience a lightning strike, go golfing one Sunday in July around 4 p.m. If you're really determined, be sure you do it in Florida.

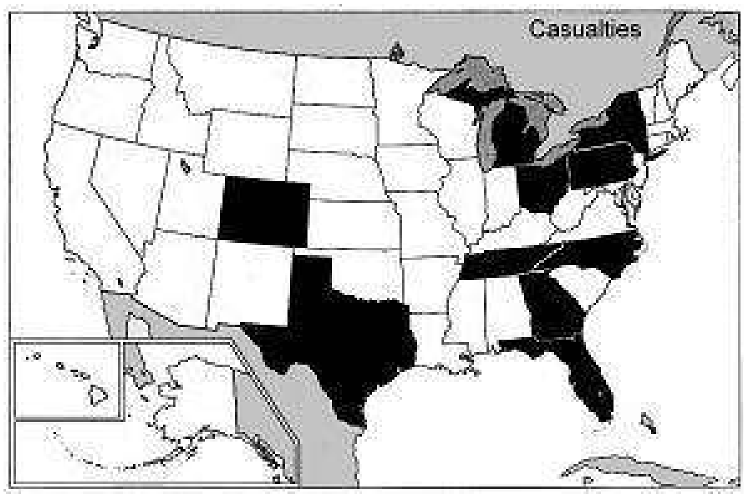
Florida has twice as many lightning casualties (deaths and injuries combined) as any other state. Most lightning casualties occur in the afternoon - two-thirds between noon and 4 p.m. local standard time with a casualties maximum at 4. Sunday has 24% more deaths than other days, followed by Wednesday. Lightning reports reach their peak in July.

Many lightning victims had been walking in an open field or swimming before they were struck. Other lightning victims had been holding metal objects such as golf clubs, fishing rods, hay forks, or umbrellas. But even those not holding metal objects are as likely to be struck by lightning as a bronze statue of the same size.

When you hear thunder, you are already within the range where the next ground flash may occur. N. Kitagawa of Central Lightning Protection, Inc. and A. Sugita and S. Takahashi of Franklin Japan determined the average intervals between lightning strikes in order to estimate how much time someone has to seek shelter. Their news is far from encouraging.

"It is concluded that there exists no safe time interval during which a human is free from direct strikes," they wrote.

In an area with a radius of 500 meters (1,640 ft), most of the intervals between lightning strikes range from 0 to 600 seconds, with a maximum frequency of 40 seconds.



Right: The top ten states in number of lightning casualties (deaths and injuries combined). Florida leads the list, with twice as many casualties as any other state. Other states represented are Georgia, Tennessee, North Carolina, New York, Pennsylvania, Ohio, Michigan, Colorado and Texas.

To avoid being struck by lightning, you should seek shelter when you hear even the faintest thunder. Some of the best places to take refuge are enclosed buildings, or cars and buses (but don't touch the metal!). In case there are no safe spaces nearby, bend into a crouching position until there is a break in the storm.

Isolated trees, telephone booths, and open structures like gazebos or porches make poor lightning shelters. If there is a tall object nearby, move as far away as possible - at least 2 meters (7 ft). Standing next to tall isolated objects like poles or towers makes you vulnerable to secondary discharges coming off those objects.

According to L.G. Byerley III from Lightning Protection Technology and W.A. Brooks, R.C. Noggle, and K.L Cummins from Global Atmospherics, Inc., the growth of towers in the United States has increased the amount of lightning strikes in certain areas. Such towers include cellular telephone and wireless communications, radio, microwave repeater, VHF communications and water towers.

The mechanism for how towers attract lightning is not really understood. But scientists have known for a long time that towers attract more lightning than the undisturbed ground nearby.

The tale of a family in North Carolina clearly illustrates how towers can concentrate lightning strikes. In 1998, a 42 meter (138 ft) tall water tower was erected near Murfreesboro, NC. This tower was about 45 meters away from a farmhouse that was situated on a one acre plot in a large open area of farmland. The family had lived in the farmhouse for the past 10 years, and they had never experienced any lightning damage. After the tower was erected, 5 separate discharges near the house occurred over a period of 5 months, causing the deaths of 2 trees, a fire in electrical equipment, complete destruction of all phone wiring, and damage to electrical fixtures.

Right: Lightning flirts with a 335-ft tall radio tower. Credit: Jeffrey K. Herzer/Missouri State Highway Patrol Communications Division.

Lightning damages have been on the increase in the past 35 years. Holle's team attributes most of this increase to population growth. *Storm Data* recorded 19,814 property-damage reports due to lightning in the United States from 1959-1994. Pennsylvania has the largest number of damage reports, while the highest rates of damage reports weighted by population are on the plains from North Dakota and Oklahoma.

According to Richard Kithil of the National Lightning Safety Institute, most reports of the economic impact of lightning are contradictory and underreported. The National Weather Service *Storm Data* figures place the most recent yearly losses at $35 million, but the process by which this figure is tabulated is open to error. *Storm Data* collects much of its severe weather information from newspaper reports. If an incident is not reported in the paper or is

overlooked by the *Storm Data* reviewer, it may not get into the publication's statistical base.

Kithil conducted his own study based on insurance reports and other sources that keep track of weather damages, and he came up with a much larger figure for the annual cost of lightning strikes.

"It seems reasonable to estimate that there may be $4 to 5 billion in lightning costs and losses each year in the US," said Kithil.

There are currently several different methods used to keep track of lightning strikes, but none of them can be considered perfect. Medical reports, for instance, sometimes report "burns" as the primary cause of death, with lightning listed as a secondary effect. Despite such instances of underreporting, the methods used in the United States to track lightning strikes are considered to be the best available.

"We work with people from other countries who wish they had what we have," said Holle.

Humans versus Lightning

To stand against the deep dread-bolted thunder?
In the most terrible and nimble stroke
Of quick, cross lightning?
(Wm. Shakespeare, "King Lear", Act 4, Scene 7)

Right: Photo Credit: Australian Severe Weather/Michael Bath

In the contest between people and lightning, lightning wins. Although lightning rarely strikes more than one person at a time, over the course of a year the damages, deaths and injuries add up to make lightning a serious threat. By studying the outcome of human-lightning encounters, scientists hope to find more ways to prevent such meetings from occurring in the first place.

Most Typical Disorders Associated with Lightning Strikes

(from "Lightning Injuries to Humans in France" by Dr. Elisabeth Gourbière of the Electricité de France, Service des Etudes Médicales)

Lightning deaths (~20%)
-Asystole/Ventricular fibrillation
-Inhibition of brainstem respiratory centers
-Multi-system failure (delayed death)

Cardio-pulmonary injuries
-Arrhythmias - Arterial pressure changes

-Electrocardiographic changes
-Myocardial damages (infarction)
-Cardiac dysfunction
-Pulmonary edema - Respiratory distress syndrome

Neurologic/psychiatric injuries
-Loss of consciousness/coma
-Amnesia/Anxiety/Confusion/Aphasia/Seizures
-Electroencephalographic abnormalities
-Brain/Cerebellum damages
-Numbness/Weakness in limbs/Partial or complete (but temporary) paralysis
-Neuropathy/Pain syndromes
-Spinal cord injury/Parkinsonism
-Sleep and memory disorders/Concentration disturbances/Irritability/Depression/Various other disturbances such as headaches, tiring easily, lightning storm phobia, etc.
-Post traumatic Stress Disorder

Burns and Cutaneous marking
-Small, deep entry/exit points (typical)
-Contact, metal chain heating (typical)
-Superficial linear
-Flash
-Lichtenberg figures (arborescent, fern-like markings):pathognomonic(on trunk, arms, shoulders)

Clothing, shoes
-Exploded off, torn off, shredded, singed…

Blunt traumas (explosion)
-Contusion, internal hemorrhage (brain, lungs, liver, intestine…)
-(rarely) Fractures (skull, cervical spinal column, extremities…)

Auditory and ocular injuries
-Tympanic membrane ruptured (typical)
-Deafness/Tinnitus/Vertigo
-Transient blindness/Photophobia-Conjunctivitis - Corneal damage
-Retinal abnormalities (macular hole) - optic neuritis
-Cataract

"Lightning injuries are varied and take many different forms. The most dangerous (and possibly fatal) immediate complications are cardiovascular and neurologic. It must be kept in mind that only immediate and effective cardiorespiratory resuscitation (started by rescuers), followed as soon as possible by emergency medical treatment, can save victims who are in cardiopulmonary arrest, or avert the serious consequences of cerebral hypoxia. Some victims remain in a coma despite intensive resuscitation and die of secondary causes including hemorrhages and multiple lesions (encephalic, cardiac, pulmonary, intra-abdominal)."

Photos, Photos, Photos!!!

I went to the 10th Annual Lightning Strike & Electrical Shock Survivor's International Conference in Pigeon Forge this past April 2000.

It was GREAT ! Plan to be there in 2001. If it's the only thing you do next year...
...It will still be the best thing you'll ever do!

My Lightning Page

My Lightning Experience And Helpfull Links

- What Happened To Me
- The Lightning Survivors Group I Belong To
- YOU ARE NOT ALONE!

The above image is courtesy of my Spirit brother, Mike Pendergast, a very talented lightning photographer, and 2x survivor.

I do not recomend that anyone attempt to photograph lightning, under any circumstances, but Mike does take precations.

Thanks for the image, Mike!!!!!

You can see some of his others on his home page, you can find a link below.

This page is devoted to my lightning group and my own close encounter with a lightning strike in July of 1999 and again in October of 2000!

If you are a lightning survivor, and you feel that you want/need help, there is a link for the survivors group that I have joined, I have found these wonderful people to be a blessing, a source of comfort, and a great resource! Check them out!

Contrary to popular belief we are not ALL crispy critters, although that has happened!

A bit of cultural background...

I follow the ways of the Lakota Sioux, so this comes from that perspective.

The Thunderbeings are responsible for storms, and every so often, they single out certain individuals to become Heyoka.

They are (to over simplify things,) the sacred clowns who laugh on the outside while crying on the inside. They are the contraries, who sometimes do certain things backwards.

To create a heyoka, they will hit their human targets with lightning, or an individual will dream of the Wakinyan as they are called, during a vision quest.

I was hit by lightning.

I think that I always knew that I was a Heyoka, I do lots of things backwards. I can remember my father telling me (out of exasperation) that I MUST be a Heyoka after watching me do something REALLY bassackwards, LOL!

My first strike came down through the roof of the trailer I was living in at the time with my husband and 2 kids.

It missed the tree hanging over the trailer, it came down though the wall, into the dryer (I was changing the laundry over at the time, helpful hint, never do your laundry during an electrical storm!),entered my body through my right hand, through me, exiting through my left hand back into the dryer to exit out the dryer vent. It also managed to exit out an outdoor light fixture, and an electrical outlet.

There were scorch marks to prove that it really happened.

When I got hit, at first I was disorientated and had no clue as to what had REALLY happened to me! I went to the doctor the next day and was told that because I was not burnt, there was not much that they could do for me. I am still finding out what my side effects are, even after one year.

I have migraines,where I was not a migraine sufferer before my first strike, my dyslexia is more pronounced, I have spells of (for lack of a better word) "vertigo”, or extreme lighteadedness, and a mild ringing in my ears.

I also have a weakness in both wrists, (probably a side effect from the first strike's path) and chronic pain.

I get very antsy when there is a storm approaching, even when I do not know that one has been forecast, and have found this to be a very common thread with other survivors.

I also have a severe memory impairment. There are days that I am lucky to remember my own name, let alone what I was doing 5 minutes ago, and that is no exaggeration! My kids think it is funny, and while I can laugh about it, it is really very frightening and frustrating. It seems to be mainly my short term recall that is affected, I can remember 15 years ago a lot more clearly, and that is saying something as I am only 32 (10/08/2000)!

Please use the link for the lightning strike survivors page to check on other possible symptoms, if you are interested! It gives much more insight in to what we go through on a daily basis.

Many people who do not understand, assume that we are either faking or trying for sympathy.

Bullsh**.

This is very, very real.

A note of interest, about 15 months I was hit again in October of 2000 at about 2:30 am, local time. It flashed over the bladder of my water bed, and got me in the process.

The strike somehow hit my house, (We bought a 2 story early American/Federal style house in November of 1999,) and went through the electrical systems of the house, leaving all of the appliances and phones intact!

My son was sleeping with me, but seems to have suffered no damage, and my daughter later reported that she could feel a current through her metal bed bunk frame (the kind with the futon on the bottom...) and she too seems to have taken no damage. (We had them checked by a doctor who is familiar with my case.)

We are still trying to find out what was done to me, as I seem to have taken the brunt of the shock.

It is hard to tell what is from my first hit, and what is from the second. The sad part is that I am a bit of a rarity as there are not many people that get hit in Southeast Iowa, so the doctors are not sure how to treat my syptoms and problems.

When I told my husband about the second strike, he did not believe me! My daughter confirmed it later, in a separate conversation, and he STILL did not believe me! Men...

On a lighter note, it is fun to watch others move as far away from me as they can durring an electrical storm! My nickname at work is "the human lightning rod", but storms for me are not much fun anymore, and I have a much healthier respect for the power of a storm!

I now carry a mild charge, and get zapped every time I use a household appliance! It sure makes fixing a meal interesting!! It is also a lot of "fun" at the restaurant where I work as we have a lot of stainless counters, etc.

Update:

I have found a local Neurologist who is willing to treat my symptoms, and am now in a management program. Since I am so far post strike from both encounters, there is nothing that can be done for the original injuries, we can only treat the symptoms.

I am now taking Ametriptyline for the migraines, and paxil for the mood swings, time release B12, a good multi B, a good

Multi vitamin, potassium, and vitamin C.

I do not recomend these as a treatment for everyone, this is what works for me.

I will never be what I was before I was hit, and I can live with that. I have also learned that this has happened to me for a reason, and that I do not need others to belive in order to validate what happened to me. I know that it happened, and that is enough for me.

A note of irony, Mike Pendergast, (my spirit brother), how is also a very talented photographer, was hit for the second time about the same time as I was, and is slowly recovering from multiple burns and other effects. I feel for you, Mike! Be sure to visit Mike's home page using the link provided, you will be glad that you did!

Please come back to see how I and other survivors are faring!

Remember, we are not alone....Mitakuye Oyasin

My email address has changed, it is now spottedeaglehorse2@home.com Thanks!

Lightning Safety for Kids: Introduction

TECHNICAL NOTES: **This web site is intended to be viewed without frames. If you see it in a frame or inside another web site, please click here.**

To enjoy the colors of this web site as they were created, click here for a simple MONITOR ADJUSTMENT.

Hello. My name is Sabrina. I was struck by lightning.

My mom and dad were hit too. We were hiking in a forest at the Grand Canyon and got caught in a storm. We hid in a side canyon until it stopped raining. Then we headed back to the car. My mom saw little birds flying and we stopped to look at them. We were all holding hands and WHAMO. I was so scared that I ran all the way back to the car. We were very lucky because we were not badly hurt. Since we were struck, I have been learning about lightning. I think that if we had known more about lightning, we would have known what to do and what not to do and we might not have been struck.

The reason that I made this web site is because it really hurts when you are struck by lightning and I want to help other kids to learn more about lightning safety. I want to share what I have learned with you. I

think that the more you know, the safer you can be.

This web site is for your whole family to read and you can share it with your friends and teachers. It has links to many other lightning pages that I hope will be interesting and helpful to kids. Some of them are really cool.

Follow this link to my Lightning Information for Kids pages.

Lightning Safety for Kids.

STRUCK BY LIGHTNING

Primal and powerful, lightning is one of nature's gravest hazards. A new national detection system pinpoints almost every **flash**

BY DANE LANKEN

Christine Fram was struck by lightning on August 6, 1997, while inside a building, which is a relatively safe place, in Vancouver, where there is relatively little lightning. In that split second, she joined the 60or so Canadians who are struck by lightning each year. She was not among the six or seven who die but was among those whose lives were, as she says, "rewritten" by the experience.

Then 28 and an apprentice auto mechanic, Fram was standing near a metal workbench in the Grandview Tire and Auto shop on Commercial Drive. Lightning struck the power lines outside, surged through to an electrical box on the wall inside, travelled down to the bench, then jumped across a metre-wide gap to her left hand. She heard a bang and saw a blue flash. A man near her saw the bolt. A blue glow filled the room.

Fram felt pain in her left hand. There were holes in her rubber gloveS, and the rubber sole of her left shoe was melted. Her muscles twitched. Her heart beat irregularly. She was stunned and confused, having weird thought processes, feeling as if she wasn't breathing. Pain spread over her left side, then numbness. She couldn't walk. Her boss drove her to the hospital.

Stupendous bolts of electricity come hurtling from the sky roughly five million times a day worldwide. Considering that each thunderstorm - there are 2,000 in progress at any one time - produces thousands of flashes, it is remarkable that more people aren't injured or killed. Detection systems across Canada and around the world are now helping reduce that risk by sensing almost every bolt, logging its location, direction, timing and frequency, and thus improving our ability to forecast severe storms. We have by no means tamed this force of nature, and we still have much to learn about its impact on humans, but we do know how much damage a bolt can cause and how to protect ourselves.

With its megavolt charges and the explosive effects of its intense heat, lightning can blow apart trees or blast the bricks off buildings. It commonly electrocutes cattle seeking

shelter under trees in rainstorms; the current enters the ground through a tree's roots, then travels up the legs of the hapless creatures.

Most skyscrapers, broadcasting towers, bridges and industrial plants have lightning rods. Devised by Benjamin Franklin in the 1750s, the lightning rod is designed to "catch" a bolt and direct its current safely to the ground. Even the steel reinforcing rods inside the concrete CN Tower - which is struck repeatedly during the summer thunderstorm season - are thoroughly grounded. Steel power pylons, obvious lightning attractors, are grounded as well, and their high-voltage lines are protected by lightning arrestors, devices that sense the surges lightning produces, shut down the system, then automatically restart it seconds later. They keep your power on during an electrical storm - and leave your digital clocks flashing.

But some things can't be protected. Lightning ignites 4,000 forest fires on average each year in Canada, burning more than two million hectares (an area larger than Lake Ontario). Modern forestry recognizes fire as an important player in the forest cycle, but it remains the enemy in certain stands and near communities. Thus the forest ranger, once a sentinel in a tall tower in the woods, then in a patrol aircraft, is now also stationed in an office scanning computer screens for news from electronic lightning-detection systems.

Two years ago, Canada was outfitted with such a system, by which unmanned sensors can pinpoint ground-striking lightning bolts to within a few hundred metres. There are 81 stations - with sensing antennas, GPS receivers and satellite dishes - distributed from coast to coast. A lightning flash almost anywhere in forested Canada is detected by at least 4 and as many as 10 stations, and its strength, polarity and time to the millisecond are recorded.

"They pick up the electromagnetic pulse that lightning produces," says Garry Pearson, who manages the $9.5 million Canadian Lightning Detection Network from an Environment Canada office in Halifax. "It's like your radio crackling when there's lightning nearby."

The sensors transmit the pulses to Global Atmospherics Inc. in Tucson, Ariz., where computers locate the lightning by triangulation and send the information back to Environment Canada offices, all in a few seconds. Similar lightning-detection networks operate in 40 countries - covering much of the forested world.

"We get the information as dots on a screen," says Pearson, "usually overlaid with satellite pictures and other information. It gets kind of exciting sometimes - or at least exciting for meteorologists - when there's a lot going on and we can see how things are developing. Formerly, even with radar and satellites, we couldn't always be sure there was a storm in progress. Now if we see there's lightning, that confirms it."

So the lightning reports are of immediate value in weather forecasting and, as all the information is saved, of lasting value as a source of data.

"We archive everything," says Pearson, "the lats and longs of the strikes, amperage, time to the millisecond. It builds up a climatology of lightning, a history of the more vulnerable places."

That information is vital to airlines plotting routes, power companies planning power lines, golf-course designers, construction firms - and insurance companies, which use the archives to verify claims of lightning damage. In a third of the lightning-damage claims that Global Atmospherics was asked to verify for insurance investigators last year, there had been no lightning.

Forestry departments are the major clients of lightning-detection systems, both the new cross-Canada network and various provincial counterparts. They all do the same thing: watch for lightning strikes in parched or otherwise high-risk regions and, allowing for smouldering time, send up an aircraft in a day or two to look for smoke.

"Give credit to Environment Canada," says Peter Konopelny, a super-visor with Manitoba's forest-fire program. "For accuracy, reliability and maintenance, the new national system is far better than what we had before. And, bottom line, our ability to detect forest fires is greatly improved."

In the months after being struck, Christine Fram found herself changed, not totally impaired but still facing "a whole bunch of little things" she hadn't experienced before - problems with memory, mental quickness and fatigue.

"Sometimes I know I seem dense," she says. "I see an apple in a store, and I can't think of what it's called. And sometimes when somebody says something to me, it takes me longer to figure out what was said. I have trouble with hearing and seeing too, not with the senses themselves but with the brain's interpretation. I can't distinguish conversation from background noise or judge distances so well."

Sorting out the order of things can also be a problem. "I follow a checklist when I get up and get dressed in the morning," she says. "I lost the ability to multi-task. Things are very much one at a time now."

These are all classic TBI (traumatic brain injury) effects, she says, similar to those from a stroke. "I look the same, but my life has been rewritten. My husband has been wonderful. We were planning on having children. Now I don't know."

When lightning strikes a person, the current passes over the skin, which may or may not burn, or along the nervous system throughout the body, which can cause cardiac arrest, blindness, coma, memory loss, depression and other emotional problems. Sometimes the damage is light; sometimes it's severe. Sometimes people recover; sometimes they don't. The main cause of death is cardiac arrest.

Lightning injuries are quite different from other high-voltage electrical traumas. Yet when caring for lightning victims, most physicians make similar assumptions, says Mary Ann Cooper, director of the Lightning Injury Research Program at the University of Illinois.

"Many patients, particularly those without external signs of injury, have been told by medical professionals that they have 'internal burns,'" says Cooper. "This is both a misnomer and an oversimplification of the cellular, vascular or biochemical damage that may have occurred."
The diagnosis and treatment of lightning victims is a complex challenge. Little is known about their injuries from the standpoints of electrical engineering, atmospheric physics and physiology, says Cooper. "Therapy specific to lightning injury has yet to be agreed on and needs development."

Cumulonimbus clouds, the massive and menacing ones that bring us heavy rains, hailstones, high winds and tornadoes, are the main source of lightning. They become electrically charged, apparently through collisions between hailstones and ice crystals, and the charged particles separate, leaving the top of the cloud positively charged and the bottom negative.

When the buildup of positive and negative areas becomes too great, a þash of electric current - and we're talking millions of volts here - jumps across the gap, usually within the cloud and causing that diffused illumination known as heat lightning.

About a third of the time, the current leaps between cloud and ground. Here, the cloud sends out a pulsating, charged channel, called a stepped leader, that travels the 5 or 10 or more kilometres to the ground in a fraction of a second. With each pulse, a portion of the cloud's negative charge is transferred downward and deposited along the channel of ionized air. This channel measures up to 10 metres in diameter at the outset but, once the connection to the ground is made, constricts to the thickness of your little finger.

Meanwhile at ground level, the approaching leader coaxes a positive discharge from any available tall object: a building, church spire, flagpole, tree, even a person (whose hair will stand on end). Roughly 100 metres up, the descending leader connects with the ascending discharge, the circuit is complete, and the charge in the ionized channel drains to the ground in a blinding þash. Often, the process is repeated within a single bolt, giving lightning its flickering appearance.

The surge of current heats the air in the channel astronomically, expanding it at supersonic speed and generating tremendously loud sound waves - thunder. Close up, it's a decided Crack! But as the sound waves are absorbed and buffeted between clouds and ground, it becomes a low rumbling.
In all, it's the wildest son et lumière show on Earth, always dramatic to witness, best to stay out of its path.

Christine Fram used to be a talkative person, fond of conversation, but she now finds that her words travel faster to her hands than through her mouth. "I rely heavily on a computer these days," she says. She has created an Internet site (http://www3.telus.net/lightningsurvivor) devoted to her experience.

"It drives my life right now," she says. "When I was struck, there was very little information. I was providing it to the doctor. If people find the site helpful, that's all I want."

Judging from the stories posted on Fram's and a handful of other websites, including that of a support group called Lightning Strike and Electric Shock Survivors International (www.mindspring.com/~lightningstrike), the web offers a vital outlet for lightning's victims. Some stories are ironic, others are grim accounts of injury, disability and despair.

"It's a life-changing experience," says Fram. "You have to start over again."

A SPECIAL DEDICATION TO MY BEST FRIEND

**As well as Lightning Strike survivors, this page is now dedicated to my best friend Keith Chambless.
He passed away May 23, 2000 from injuries he sustained in a motorcycle accident May 2, 2000.**

**Keith provided so much friendship, comfort, support, encouragement, and laughter throughout everything that life had put on my plate especially my lightning strike.
Keith, I miss you and will remember you always.**

The Lightning Survivors Resources On the Web is dedicated all survivors of a lightning strike. It is also dedicated to those who didn't survive. I hope through this page I can honor them.

SPECIAL THANKS TO:

My husband Rob, Without you, my journey of recovery the past 3 1/2 years would have been painfully lonely. I love you!

My friends and family who support me, love me, and try very hard to understand the depth of my injuries.

Dr. Mary Ann Cooper - University of Illinois at Chicago. She was my first and most significant resource. Her studies of lightning injury and its effects on the human body provided my health care providers with invaluable information.

Dr. Tanya Wulff, Her patience, knowledge of brain injury, her commitment to my emotional health and recovery has helped to guide everyone in an appropriate course of action as I re-established the salvageable parts of my life that I could and came to know and accept the new me, and the new life I've created.

Dr. HT Peters, My wonderful GP

Julie, Mary and all the staff at O/T Consulting, Yvette Hankin and Moira McNicholes at the Worker's Compensation Board.
These compasionate, dedicated people have patiently and gently guided my rehabilitation program forward. Their hard work allowed me to make signifigant improvements in my abilities. They gave me useful skills to compensate for the impairments that couldn't be improved on, thus giving me a better quality of life. I am very grateful.

Last but not least:

Sandy Corbett of Western Occupational Rehabilitation Consultants & Alex Jackson at BC's Worker's Compensation Board. As I am no longer employable due to my brain injury they still provide me with the resources to enhance my life and give it meaning.
My involvement with helping other Lightning Strike Survivors has given me back that special drive that we all need to feel our lives are worthwhile.

Remember, If you can help just one person in your lifetime, your life has not been wasted.

To all those who's career's are devoted to helping and healing, I salute you!

Comments: I was recently struck by lightning while working on an offshore platform for an oil company. Everything turned out alright, I just wanted to know more about what I was experiencing. My main concern was to learn more about the myth of the chances of being struck again. Are my chances just the same as anyone else, or am I more prone to being struck again. Thanks for the page. It was very helpful.

Friday, July 30th 2004 - 05:59:05 PM

Comments: Hello, On July 3, 2004, I was seeing shelter under a wooden gazebo, when it began to rain, in Myrtle Beach, S.C., while visiting a state park. I had only heard a distant rolling thunder, and had seen no lightning. When the rain stopped after only a few minutes, we stood up to leave, when I felt an immediate "grip" of electricity, which seemed to hold me upright, for a second or two, an intense heat in my body, from my chest down, accompanied by a tremendous explosion. I found myself on the floor, in an awkward, sitting position, having been thrown violently, several feet, with no sensation, or movement from the waist down. The lightning entered my body in my upper abdomen, leaving a scorched hole in my shirt, and exited through the side of my right foot, leaving a deep burn on my foot which has still not healed. Within several minutes, my legs began to swell, and turn dark blue as there were no pulses, and even though I could not feel or move them...the pain was excruiating. It was 4 hours before I slowly began to have any sensation, and several days before I even felt like my legs were a part of the rest of me. I could go on and on about the difficulties since leaving the hospital, but the list seems to grow each day, rather than getting smaller. I'm beginning to feel like a circus freak....everyone wants all the gory details, and still have constant pain, the exit wound is slow to heal, I have thes unnerving "jolts" in my legs, and although I know I should be grateful to be alive, I find that I can't sleep, or want so much to sleep in the middle of the day, feel depressed often, and even seem to cry for no reason. Once, I was sitting, talking with a client, and suddenly began to feel this intense heat, and "jolts" in my legs again, and could even smell the unmistakable odor of singed hair and skin....and had to stop my conversation, it was so uncomfortable. It seems I can't regulate my body temperature, and often, break out into a sweat for no reason. I would like very much to hear from anyone who may have had any similar experience. Does it get any better???? How long? Thank You

Tuesday, June 22nd 2004 - 07:16:53 AM

Comments: Yesterday while sitting in the car in the driveway of a friend to wait out a terrible rain and thunderstorm, I think we were hit by lightning. We were parked in the drive under very tall trees, with an open area in the yard to our left.

As I was facing my friend looking to her on my left, we heard this terrible thunder and I saw just out the window the most awful, amazing sight. It was lightning for sure. I do not remember seeing a bolt, but a huge ball of light, rimmed with very white light then moving toward the center brilliant yellow and in the center the reddest hottest red flame like glow. It seemed that the sound and the vision came together or nearly together. We sat still for a long time after that and did not leave the site until we could hear no more thunder. The rain alackened.

When my friend arrived home her husband was furious that a part of the car's left bumper (metal) was deeply dented and the end part of the bumper was missing.

He was sure that she had hit a tree and pulled that part off. Although we did have to back up among some tall trees, neither of us hear or felt any impact. They did return to the site and did find the missing bumper.

Could lightning have hit the bumper?

Comments: Thank you for creating this site. I have seen it linked to from many other areas. I found you from Google. You information and links helped me very much.

I was recently very close to a major strike, and suffered some ill effects. I am getting better, but it was comforting to know that a near-strike could cause my sudden symptoms the day after the strike occurred: extreme, deep fatigue, multiple muscle strains and spasms where I felt the shock wave hit, all-over pain, headaches, ringing in the ears, hypersensitivity in my fingertips, short-term memory loss, and loss of emotional responses, and sunburn-like burning skin all over the side of my body that faced the strike.

Comments: Hi, I stumbled onto your sight after searching on Google for data about ringing in the ears. The information you've presented is frightening, particularly the fact that so many people have been "struck" by lightning while inside the safety of a building. I, too, have adored thunderstorms from a young age, but will no longer be able to view with the same peaceful feeling. The knowledge you survivors share should be communicated loudly to all. Best wishes in all you do,

Comments: I too have a strong fear of lightning. Although I'm told that I'm not going to get struck by lightning, and I shouldn't worry about it, I beg to differ. I have had a few very close encounters of seeing bolts of lightning strike the ground at a close ranges. I've never been struck however. But with today's trying times the odds might seem against everyone. I've heard some true scary stories that even though people were safe indoors, lightning had struck down and took a path through a person's house with the bolt zooming across the room. A Tip I had been taught by my science teacher is that you know your about to get struck by lightning if you feel a strong amount of static electricity and a tingly feeling on and around your body. For a few seconds later BAM! You know where lightning is gonna strike. But my biggest fear is where it's gonna strike next.

Comments:

Thanks for the site. I work for a television news station in San Antonio, and I was struck July 2nd, 2002 while shooting video of an approaching storm. The bolt struck about 10 feet behind me, it hit a fence, I think. It was so loud! I didn't even know I was struck until I got in the news unit and began driving away. My arms and stomach started aching and tingling at the same time, eventually paralyzing me, totally. The doctor later told me that getting struck by lightning the way I did is like wroking out for 100 hours straight! I can tell you that it took well over a month before I could work a full day because I was so tired all the time.

I've been thinking about my 'accident' a lot lately, because I've been noticing that I get sick easily, and I've had this headache that just won't go away. It's in the back of my head, almost as though it's a tension headache.

I'm trying to live my life without always thinking about the strike, but, lately it's been tough. Anyone have similar problems?

Comments: Hi,
My name is jim McGowan. I'm an author and am presently working on a book about individuals who, after suffering a lightning strike, began experiencing psychic awareness (clairvoyance, psychokinesis, precognition, out-of-the-body experience, and others). I would like to interview individuals who've had any of these experiences. Do you know of any, or is there an organizsation of such individuals? Any assistance you can give me will be appreciated.
