Clean Air Markets

Site Map

This map shows where each major item or category fits into the site's sections. Generally speaking, the first four sections focus on EPA providing information, while "Doing Business With Us" provides tools for regulated units.

The site is color coded, and the major section buttons are shown below. Note that some items are linked from more than one place.

- Environmental Issues
- Programs & Regulations
- Progress & Results
- Allowance Trading
- Doing Business With Us

Environmental Issues

- Acid rain
  - What it is, how it's caused, how we measure it
  - Environmental and human health effects
  - What society can do
  - What individuals can do
  - Science experiments
  - Activities related to acid rain
  - Explanation of the pH scale
- Smog / Ozone Transport
- Regional Haze
- Climate Change

Programs and Regulations

- Acid Rain Program

    - Goals
    - Laws & regulations
    - Guidance & fact sheets
    - Information related to sulfur dioxide (SO_2) allowances
    - Program forms
    - Annual Reconciliation of allowances and emissions
    - Applicability determinations

- NOx Trading Programs
    - Summary table - quick description of the different programs
    - Ozone Transport Commission (OTC) NOx Budget Program
    - Section 126 Federal NOx Budget Trading Program / NOx State Implementation Plan (SIP) Call
- Monitoring Guidance (for all programs)

- Reporting Emissions (for all programs)

- Compliance Reports (for all programs)
- US Greenhouse Gas Inventory
- US - Canada Air Quality Agreement

Progress & Results

- Emissions Data
    - Emissions Scorecard
    - Preliminary summaries and raw hourly data
    - E-GRID: a downloadable database

- Compliance Reports

- Deposition Monitoring
    - Clean Air Status & Trends Network (CASTNET) Dry deposition monitoring
    - National Atmospheric Deposition Program (NADP) EXIT disclaimer Wet deposition monitoring; includes maps showing rainfall pH across the US (called isopleth maps)

- Acid Rain Program Progress Report
- National Acid Precipitation Assessment Report (NAPAP) "Biennial Report to Congress: an Integrated Assessment." May 1998 EXIT disclaimer
- Maps and Geographical Information System (GIS) Datasets
- Articles & Papers: academic reports written at an expert level

---

Emissions Trading

- Trading basics - a guide to how cap and trade works
- Buying allowances
  Learn the options for anyone to buy and sell allowances, including the Acid Rain Program allowance auctions
- Sulfur Dioxide (SO2) and Nitrogen Oxides (NOx) allowance & market data
  - Allowance Tracking Systems
    EPA's database of SO2 and NOx allowance accounts and transfers
  - SO2 market analysis
  - NOx market analysis
- Allowance allocations under the Acid Rain Program
  Information about how allowances are initially distributed to emission sources
- Compliance Reports
  Include information about allowance usage and "banked" allowances - amounts saved for future use
- Annual Reconciliation
  How EPA compares emissions and allowances under the Acid Rain Program

---

Doing Business With Us

These features are primarily intended for affected sources, so they tend to be written at a more expert level and do not provide a great deal of background information.

- Items specific to the Acid Rain Program
  - Submit an acid rain permit

  - Review Acid Rain Program Applicability Determinations
    legal decisions on how the regulations apply
  - Submitting Monitoring Plans and other Part 75 Requirements

- Items for all programs
  - Workshop information and materials
  - Register for a program; open an allowance account
  - Transfer allowances
  - Monitoring Guidance
  - Report emissions
  - Annual reconciliation
  - Allowance account query tools
  - Obtain forms

About the Clean Air Markets Division

- What is our Mission Statement?
- What is the Clean Air Markets Division?
- How is the Clean Air Markets Division organized?
- How can you contact us?

Our Mission Statement

Improve human health and the natural environment through the skillful design, operation and evaluation of cap-and-trade and other innovative programs that cost-effectively lower harmful air emissions and their deposition. Focus on lowering outdoor concentrations of fine particles, ozone, mercury and other significant air emissions through programs that offer regional, national, or international solutions to problems from air emissions. Often these programs will cover power plants and other major stationary sources, such as industrial boilers, but they will also consider other important sources of emissions. Goals of these programs include:

- High levels of health and environmental benefits
- Strong technical and analytic underpinning to ensure programs solve the problems that they address
- Accountability through sound monitoring and thorough reporting requirements that are continuously improved over time
- Highly effective market-based mechanisms
- Simplicity and practicality based on technical sophistication
- Clear communication
- Low administration costs
- Creating public access to emissions data from utilities (SO_2, NO_x, CO_2)
- High compliance rates

- Cost-effective emission reductions with reasonable economic impacts
- Customer service orientation, and
- Ongoing audits and evaluation to ensure health and environmental goals are met

---

What We Do

The Clean Air Markets Division manages various market-based regulatory programs designed to improve air quality.

We use experience gathered developing and operating the market-based Acid Rain Program to address other environmental problems. Specific efforts include:

- Designing and operating cap-and-trade programs to reduce emissions of sulfur dioxide (SO_2) and nitrogen oxides (NO_x)
- Assessing emissions control technology options
- Emissions monitoring and reporting
- Conducting atmospheric deposition monitoring and analysis
- Developing information systems for market programs
- Assessing environmental and human health effects
- Assessing benefits and costs of programs
- Educating the public about acid rain, other regional air pollution problems, and market-based mechanisms
- Creating public access to emissions data from utilities (SO_2, NO_x, CO_2)

How We Are Organized

The Division has 4 organizational areas (called "Branches"). Much of our work crosses Branch boundaries.

- **Program Development**
  Chief: Sarah Dunham
  Develops cost-effective air pollution control programs that use market-based approaches and lessen the administrative burden for sources and regulators

- **Emissions Monitoring**
  Chief: Rey Forte
  Provides guidance to States and industry and ensures that emissions are accurately and cost-effectively measured and reported on time

- **Market Operations**

Chief: Janice Wagner
Performs the day-to-day functions required to operate market-based emission reduction programs, such as recording allowance transfers and receiving emissions reports, and works with stakeholders to ensure that the markets operate efficiently

- **Assessment and Communications**
  Chief: Rona Birnbaum
  Assesses the costs and benefits (environmental, human health, and economic) of the Division's programs and communicates this information to decision makers and other customers in a policy context

Environmental Issues

Where to Start

This page provides common questions and links to answers. They are organized by audience. We have not included every possible question, so if you see a question that's similar to yours, try following that link. You can scroll down or follow a link below to see the questions for each audience.

- General public, including students & teachers
- Academic researchers
- Utility employees & people who work with them

General Public, Including Students & Teachers

What is acid rain? What causes it? How is it measured? What does it affect?
Start at the acid rain home page, where you'll find basic information and links to much more.

Where can I find maps of acid rain?
On the Web site for the National Atmospheric Deposition Program (NADP). EXIT disclaimer This network measures wet deposition, better known as acid rain, and produces maps of pH and other chemical characteristics of rain (the lower the pH, the more acidic; read more on the pH page). These maps are called isopleth maps.

What can I do to help solve acid rain?
Look over the items listed on the individual actions page. Also read what society as a whole can do about this problem.

How does allowance trading work?
Read the trading fact sheet.

How can my class buy SO2 allowances so they won't be emitted?
Read information about buying allowances.

Do you have experiments I can do about acid rain?

Yes! Read about them.

Do you have suggestions for activities, both inside the classroom and out?
Yes! Check the activities page.

How much sulfur dioxide (SO2), nitrogen oxides (NOx), and other gases do electric power plants emit (i.e., release) into the atmosphere?
Look at the various emissions reports and maps we offer.

Academic Researchers

What is acid rain and what are its effects?
Start at the acid rain home page.

Where can I find academic papers and more detailed articles?
Review our articles page and also look at the other information under the Progress & Results section.

How does allowance trading work?
Read the trading fact sheet.

How does EPA keep track of who owns what allowances?
Read about the allowance tracking system.

How do I find information about allowance accounts, how many allowances they hold, and allowance trades?
Use the query tools for the allowance tracking system.

What are the emissions from power plants?
Look at the information on the emissions page, including E-GRID, a comprehensive database that you can download.

Are companies complying with the regulatory programs?
Read annual compliance reports.

How do clean air market programs work?
Look at the home pages for each program:
Acid Rain Program | NOx trading programs

Utility Employees & People Who Work with Them

Where can I find the regulations that apply to each program?
Look under each program's home page:
Acid Rain Program | NOx trading programs

How do I query the allowance tracking system?

Use one of the online report forms.

What is necessary to comply with a program?
Visit the "Doing Business with Us" page.

How do I sign up to participate in a program?
Read how to register.

Where can I find forms for each program?
Generally, it's best to read about a particular activity; forms will be linked from there. Start with the "Doing Business with Us" page. If you know the specific form you need, look at the forms page.

How do I keep up with monitoring requirements?
Read the monitoring page, which includes information for each program.

How do I keep up with emissions reporting requirements?
Check the reporting page, which includes information for each program.

Privacy and Security Notice

About Privacy and Security

Thank you for visiting the Environmental Protection Agency Web site, a service of the U.S. Environmental Protection Agency. This statement informs you how we will handle information we learn about you from your visit to our site. Please be assured that the privacy of our visitors is of utmost importance to us. We collect no personally identifiable information about you when you visit our site unless you choose to provide that information to us.

We want to inform you that, for each HTTP request (which is what your Web browser generates when you request a page or part of a page from a Web site) received, we collect and store only the following information, in what is called a log file:

- the date and time
- the originating Internet Provider address (IPA) (this address can refer to a specific computer; more frequently, commercial Internet providers use a temporary IPA which does not link to a specific computer)
- the type of browser and operating system used (if provided by the browser)
- the URL of the referring page (if provided by the browser)
- the object requested
- completion status of the request
- pages visited

We use the information that we automatically collect to measure the number of visitors to the different areas of our sites, and to help us make our pages more useful to visitors. This includes analyzing these logs periodically to determine the traffic through our servers, the number of pages served, and the level of demand for pages and topics of interest.

How Long is the Information Retained: The logs for each day, with no personal information, are maintained indefinitely.

Cookies: EPA does not use "persistent cookies" or any other persistent tracking methods to collect personally identifiable information about visitors to our Web pages. However, some EPA pages have session cookies, to facilitate use of that particular page. These disappear when the Web user terminates a Web session and closes the browser.

Cookies are small files that Web servers place on a user's hard drive. They can serve several functions, depending upon how they are designed:

- they allow the Web site to identify you as a previous visitor each time you access a site;
- they track what information you view at a site (important to commercial sites trying to determine your buying preferences);
- in the more advanced cases they track your movements through many Web sites but not the whole Web;
- businesses use them for customer convenience to allow them to produce a list of items to buy and pay for them all at one time and to garner information about what individuals are buying at their sites;
- advertisers use them to determine the effectiveness of their marketing and offer insights into consumer preferences and tastes by collecting data from many Web sites; and
- they can be used to help a Web site tailor screens for each customer's preference.

To protect your privacy, be sure to close your browser completely after you have finished conducting business with a Web site that does use cookies. If you are concerned about the potential use of the information gathered from your computer by cookies, you can set your browser to prompt you before it accepts a cookie. Most Internet browsers have settings that let you identify and/or reject cookies.

Other Information Collection: In addition to the information automatically collected by the server, EPA offices may collect other information from online visitors. Before collecting personally identifiable information through our Web pages, we will prominently disclose:

- why EPA is collecting the information;
- what information is to be collected;
- the intended use of the information;
- how it will be protected/secured;
- if it will be shared within or outside EPA, including on publicly available Web sites;
- if shared, with whom;
- the opportunity to consent to, or reject, the collection and/or sharing, and

- when it will be destroyed.

How the Information is Used: We may store **non-personally identifiable information** we collect (such as search engine queries and anonymous survey responses) indefinitely to help us better understand and meet the needs of our visitors. We may share **non-personally identifiable information** with others, including the public, in aggregated form (for instance, in a list of our most popular search engine queries), in partial or edited form (such as in a report summarizing responses to a questionnaire), or verbatim (for example, in a complete listing of survey responses).

Your Rights under the Privacy Act: The Privacy Act of 1974 protects the personal information the federal government keeps on you in systems of records (SOR) (information an agency controls that can be retrieved by name or some other personal identifier). The Privacy Act regulates how the government can disclose, share, provide access to, and maintain the personal information that it collects. Not all information collected online is covered by the Privacy Act.

The Act s major provisions require agencies to:

- publish a Privacy Act Notice in the Federal Register explaining the existence, character and uses of a new or revised SOR;
- keep information about you accurate, relevant, timely, and complete to assure fairness in dealing with you; and
- allow you to, upon request, access and review your information held in a SOR and request amendment of the information if you disagree with it.

EPA Web pages do not collect any personal information that is contained in a Privacy Act System of Records as defined by the Privacy Act. Information concerning the Privacy Act can be found at: http://www.epa.gov/privacy/index.htm.

Interaction with Children: Some EPA Web pages provide content to children. It is EPA policy, in compliance with the requirements of the Children's Online Privacy Protection Act (COPPA), to collect no information online about or from children age 13 and under except when it is needed to identify a submission or to answer a question. Any such instances on Web pages for children will be clearly marked, and a separate privacy notice will be posted on that Web page. Under no circumstances will any of the information be used for another purpose or shared with third parties, nor will personally identifying information be published on the EPA Web site.

How e-mail is Handled: By sending us an electronic mail message (for example, an e-mail message containing an official Freedom of Information Act request), you may be sending us personally-identifying information, such as name and address. In these cases, we may retain the information as long as necessary to respond to your request or otherwise resolve the subject matter of your e-mail. Please be aware that email is not necessarily secure from 3rd party interception or misdirection. For your own protection you may wish to communicate sensitive information using a method other than email.

Personal Information via Forms: Some of our pages provide forms allowing visitors to submit search engine queries, questionnaires, feedback, or other information. Some of these forms may request personally identifiable information (e.g., name, address, e-mail address) for specific purposes, such as when the submitter is requesting a personal response, registering for a conference, or subscribing to a mailing list. **All information submitted by visitors is voluntary.**

Site Security: For site security purposes and to ensure that this service remains available to all users, EPA does employ software programs to monitor network traffic to identify unauthorized attempts to upload or change information, or otherwise cause damage to the information on our Web pages. Unauthorized attempts to upload information or change information on this service (hacking) are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and the National Information Infrastructure Protection Act. Except for these authorized law enforcement investigations, no other attempts are made to identify individual users or their usage habits.

Monitoring
US - Canada

NOx Trading Programs

- Overview of All Programs
- Program Home Pages
  - Ozone Transport Commission (OTC) NOx Budget Program
  - NOx State Implementation Plan (SIP) Call

Overview of NOx Trading Programs

All NOx trading programs have the same goal: reduce the transport of ground-level ozone across large distances. However, the programs have different developed through different mechansisms, which has led to differences in the number of states involved, the timing of the compliance period each year, and the expected reductions.

Detailed information is available on the home page for each program, but the following table summarizes the key differences:

	Ozone Transport Commission (OTC) NOx Budget Program	NOx State Implementation Plan (SIP) Call
States Covered	CT, DC, DE, MA, MD, ME, NH, NJ, NY, PA, RI, VT	AL, CT, DC, DE, IL, IN, KY, MA, MD, MI, NC, NJ, NY, OH, PA, RI, SC, TN, VA, WV (Phase 1); GA, MO (Phase 2)
Compliance Period	May 1 - September 30 of each year	May 1 - September 30 of each year (In 2004 the compliance period begins May 31.)
Initial Compliance Year	1999	2003/2004 (Phase 1); 2007 (Phase 2)

Emissions Cap	219,000 tons in 1999; 143,000 tons in 2003	
Baseline Year	1990	1995
Baseline Emissions	490,000 tons	
Program Owner	OTC; Allowances set by OTC, program administered by EPA	States and EPA; States have the option of participating in the trading program and establishing unit allocations, program administered by EPA

What is pH?

Acidic and basic are two extremes that describe chemicals, just like hot and cold are two extremes that describe temperature. Mixing acids and bases can cancel out their extreme effects, much like mixing hot and cold water can even out the water temperature. A substance that is neither acidic nor basic is neutral.

The pH scale measures how acidic or basic a substance is. It ranges from 0 to 14. A pH of 7 is neutral. A pH less than 7 is acidic, and a pH greater than 7 is basic. Each whole pH value below 7 is ten times more acidic than the next higher value. For example, a pH of 4 is ten times more acidic than a pH of 5 and 100 times (10 times 10) more acidic than a pH of 6. The same holds true for pH values above 7, each of which is ten times more alkaline (another way to say basic) than the next lower whole value. For example, a pH of 10 is ten times more alkaline than a pH of 9.

Pure water is neutral, with a pH of 7.0. When chemicals are mixed with water, the mixture can become either acidic or basic. Vinegar and lemon juice are acidic substances, while laundry detergents and ammonia are basic.

Chemicals that are very basic or very acidic are called "reactive." These chemicals can cause severe burns. Automobile battery acid is an acidic chemical that is reactive. Automobile batteries contain a stronger form of some of the same acid that is in acid rain. Household drain cleaners often contain lye, a very alkaline chemical that is reactive.

The following diagram shows the pH scale and the pH of some common items:

Tue, Aug-31

CONFERENCE: EPA LANDFILL GAS TO ENERGY CONFERENCE - Registration required (see link below. Use conference code EPA65006) Agenda

8:00 AM - 5:00 PM Tuesday, August 31, 2004 Galvez Building Conference Center 602 N. Fifth Street, Baton Rouge, LA 70802 Register for Conference EPA65006

PUBLIC HEARING: PUBLIC HEARING:CONOCOPHILLIPS COMPANY/ALLIANCE REFINERY - Public hearing on the draft hazardous waste CAMU/Post-Closure Permit 6:00pm Belle Chasse Auditorium, 8398 Highway 23, Belle Chasse More Information

September 2004

Mon, Sep-06

HOLIDAY

LABOR DAY

Wed, Sep-08

PUBLIC HEARING: PUBLIC HEARING: ENTERGY NEW ORLEANS, INC. - MICHOUD ELECTRIC GENERATING PLANT - Public hearing on the proposed Part 70 Air Operating Permit, Modification & Renewal Of The Acid Rain Permit, Prevention of Significant Deterioration (PSD) Permit and the associated Environmental Assessment Statement (EAS) 6:00pm City Hall, Council of Chambers located at 1300 Perdido Street, New Orleans, LA 70112 More Information

Thu, Sep-09

WORKSHOP:  **ANNUAL ASBESTOS/LEAD WORKSHOP** - Members of the DEQ asbestos and lead staff will address changes in the rules, topics of interest and/or concern, and new asbestos fees which became effective on July 1, 2003. 8:30am-12:00pm in the Galvez building auditorium located at 602 N. Fifth Street, Baton Rouge, LA 70802. More information. For assistance, contact Nick Harmon at (225) 219-3026.

Wed, Sep-15

DEADLINE: **SUBMIT NEW RESPONSE ACTION CONTRACOTR APPLICATIONS FOR QUARTERLY RAC LISTING**

CONFERENCE: **2ND ANNUAL KEEP LOUISIANA BEAUTIFUL STATE CONFERENCE** - Awards Brochure Septemper 15-17, 2004 Riverfront Center 707 Main Street, Alexandria, Louisiana Conference Brochure

PUBLIC HEARING: **PUBLIC HEARING: MONSANTO COMPANY / EMA SETTLING BASIN & NO. ONE WELL POND** - Public hearing on a draft hazardous waste post-closure permits modifications 6:00pm St. Charles Parish Council Chamber, 15045 Louisiana Highway 18 (River Road), Hahnville More Information

Fri, Sep-24

PUBLIC HEARING: **PUBLIC HEARING: FOR PROPOSED RULES HWO86, UT011, AND WQ056** -

Thu, Sep-30

EXAM: **INDUSTRIAL RADIOGRAPHY EXAM** - Deadline to Register is August 26, 2004. A DRC20 form and a check or money order made out to LDEQ for $178.00 are required to register for the exam. More information. For assistance, contact Tabitha Rice (225) 219-3027.

October 2004

Fri, Oct-01

DEADLINE: **DEADLINE: FOR COMMENTS ON PROPOSED RULES HWO86, UT011, AND WQ056** -

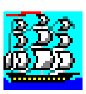
Tue, Oct-05

EXAM: **UST WORKER CERTIFICATION** - Installation/Repair Exam 8:30am. Closure Exam 1:00pm.

Thu, Oct-07

PUBLIC HEARING: **PUBLIC HEARING (10:00 AM IN SHREVEPORT, LA): FOR COMMENTS ON SHREVEPORT-BOSSIER CITY EARLY ACTION COMPACT SIP REVISION** -

Mon, Oct-11



COLUMBUS DAY (OBSERVED) - This is NOT a state holiday.

Tue, Oct-12

TRAINING: **SMOKE SCHOOL (CLASSROOM TRAINING)** - 8:00 - 12:00 DEQ HQ Room C-110 & C-111 For assistance, contact Evita Lagard @ (225) 219-3600

TRAINING: **SMOKE SCHOOL (FIELD TESTING AND CERTIFICATION)** - 7:30 - 8:00 am Registration 8:00 - 11:00 am Testing North Sherwood Forest BREC Park located @ 3140 North Sherwood Forest Blvd, Baton Rouge LA For assistance, contact Evita Lagard @ (225) 219-3600

Thu, Oct-14

DEADLINE: **DEADLINE: FOR COMMENTS ON SHREVEPORT-BOSSIER CITY EARLY ACTION COMPACT SIP REVISION** -

Fri, Oct-15

TRAINING: **SMOKE SCHOOL (FIELD TESTING AND CERTIFICATION MAKE-UP ONLY)** - 7:30 - 8:00 am Registration 8:00 - 11:00 am Testing North Sherwood Forest BREC Park located @ 3140 North Sherwood Forest Blvd, Baton Rouge LA For assistance, contact Evita Lagard @

(225) 219-3600

Wed, Oct-20

TRAINING: SOLID WASTE OPERATOR TRAINING (OCT 20-21, 2004) - At the Holiday Inn I-20, 102 Lake Street, Shreveport, LA. Mor e Information. For assistance, contact Suzanne Bordelon at (225)219-3030.

Thu, Oct-21

EXAM: SOLID WASTE OPERATOR EXAM - At the Holiday Inn I-20, 102 Lake Street, Shreveport, LA. Mor e Information. For assistance, contact Suzanne Bordelon at (225)219-3030.

Fri, Oct-22

CONFERENCE:  **LOUISIANA SOCIETY OF CERTIFIED PUBLIC MANAGERS** - To be held at the Lod Cook Conference Center at LSU.

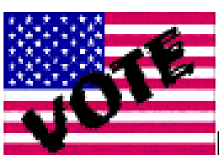
Sun, Oct-31

DAYLIGHT SAVINGS TIME ENDS - Remember to set your clock BACKWARD one hour. You don't want to miss that extra hour of sleep.

November 2004

Tue, Nov-02

HOLIDAY



ELECTION DAY

Thu, Nov-04

DEADLINE: INDUSTRIAL RADIOGRAPHY EXAM TO HELD ON DEC 9 - Deadline to Register is November 4, 2004. A DRC20 form and a check or money order made out to LDEQ for $178.00 are required to register for the exam. More information. For assistance, contact Tabitha Rice (225) 219-3027.

Thu, Nov-11

HOLIDAY

Thu, Nov-25

HOLIDAY

THANKSGIVING DAY

Fri, Nov-26

ACADIANA DAY (MUST BE DECLARED)

December 2004

Thu, Dec-02

EXAM: UST WORKER CERTIFICATION - Installation/Repair Exam 8:30am. Closure Exam 1:00pm.

Thu, Dec-09

EXAM: INDUSTRIAL RADIOGRAPHY EXAM - Deadline to Register is November 4, 2004. A DRC20 form and a check or money order made out to LDEQ for $178.00 are required to register for the exam. More information. For assistance, contact Tabitha Rice (225) 219-3027.

Wed, Dec-15

DEADLINE: SUBMIT NEW RESPONSE ACTION CONTRACOTR APPLICATIONS FOR QUARTERLY RAC LISTING

Fri, Dec-24

HOLIDAY

CHRISTMAS

January 2005

Tue, Jan-11

TRAINING: SMOKE SCHOOL (FIELD TESTING AND CERTIFICATION) - 7:30 - 8:00 am Registration 8:00 - 11:00 am Testing @ Lake Bistineau State Park, Group Camp 2 For assistance, contact Evita Lagard @ (225) 219-3600

Thu, Jan-13

TRAINING: SMOKE SCHOOL (FIELD TESTING AND CERTIFICATION MAKE-UP ONLY) - 7:30 - 8:00 am Registration 8:00 - 11:00 am Testing @ Lake Bistineau State Park, Group Camp 2 For assistance, contact Evita Lagard @ (225) 219-3600

March 2005

Wed, Mar-02

CONFERENCE: DEQ'S ANNUAL ENVIRONMENTAL CONFERENCE - For assistance, contact Leslie Garcia at leslie.garcia@la.gov or (225)219-3272.

April 2005

Sun, Apr-03

DAYLIGHT SAVINGS TIME BEGINS - Remember to set your clock FORWARD one hour. You don't want to be late for everything.

Tue, Apr-12

TRAINING: SMOKE SCHOOL (CLASSROOM TRAINING) - 8:00 - 12:00 DEQ HQ Room C-110 & C-111 For assistance, contact Evita Lagard @ (225) 219-3600

TRAINING: SMOKE SCHOOL (FIELD TESTING AND CERTIFICATION) - 7:30 - 8:00 am Registration 8:00 - 11:00 am Testing North Sherwood Forest BREC Park located @ 3140 North Sherwood Forest Blvd, Baton Rouge LA For assistance, contact Evita Lagard @ (225) 219-3600

Fri, Apr-15

TRAINING: SMOKE SCHOOL (FIELD TESTING AND CERTIFICATION MAKE-UP ONLY) - 7:30 - 8:00 am Registration 8:00 - 11:00 am Testing North Sherwood Forest BREC Park located @ 3140 North Sherwood Forest Blvd, Baton Rouge LA For assistance, contact Evita Lagard @ (225) 219-3600

Send e- mail to webmaster@deq.state.la.us or any member of our WWW Task Force
with questions or comments about this web site. To contact us by phone or mail,
see our Office Address/Phone listing.

About This Site

Our web site is arranged to follow our organizational design for the most part. We hope that you are able to find what you are looking for, but if not, maybe we can help you with this description of some of the options that are available.

Finding what you are looking for:

We have tried to come up with several different ways to find what you are looking for. There is an **alphabetical listing** of all of our articles, which was called the Index of Topics on our old web site. There is also an alternate listing by **media**. In conjunction with this, there are several other listings of **forms, publications**, **data**, and **informational fact sheets**. Another variation on this theme is the **site map** which shows all of the articles in an outline form based on where they are and how they are linked together. There is also a **search form**, which allows you to key in the information you are seeking and it will find the article for you.

Finding out what's going on:

The **What's New** page lists all changes and additions to our page over the last couple of months and when those changes or additions took place. The **Events/Notices** page lists most all events (conferences, meetings, deadlines, training, hearings) and notices (general announcements). The **News Releases** page lists all news releases and public notices.

Getting assistance:

If you have questions or need assistance with any of our pages, please feel free to contact any member of our **WWW Task Force**. If you would rather contact us in person or on the phone, please refer to our **Office Address and Phone Listing**. If you need the e-mail address for a division at DEQ, please refer to our **Email** page.

Comments and suggestions:

We are continuously striving to improve and update our web site and would love to hear your **comments and suggestions**. In the past, we have found those suggestions very helpful and they have led to some of our most popular pages.

Send e- mail to webmaster@deq.state.la.us or any member of our WWW Task Force
with questions or comments about this web site. To contact us by phone or mail,
see our Office Address/Phone listing.

Your Comments

We really do welcome any comments, suggestions, questions, etc. that you may have. The results of our feedback are discussed at the monthly meeting of our WWW Task Force. There are already several items that have been placed on our page as a direct result of requests from the public. We are doing our best to get you the information that you need so please let us know what we are doing well and what we could do better. We need your input!

Feel free to send e-mail to our **webmaster@deq.state.la.us**, any member of our **WWW Task Force**, or any **Division** here at DEQ. There is also a listing of the **address and phone number** of each of our offices if you wish to contact us by letter or telephone.

We welcome all of your comments and suggestions.

Send e- mail to webmaster@deq.state.la.us or any member of our WWW Task Force
with questions or comments about this web site. To contact us by phone or mail,
see our Office Address/Phone listing.

Water Cycle

Water Cycle

Water is the most important substance on the earth. It's the basis of life on our planet. It cycles through Earth's various systems just like blood cycles through our bodies.

BACKGROUND

Do you remember how the water cycle works? The sun's energy causes water to evaporate from the earth's surface. This process forms water vapor in the atmosphere. As water vapor rises, it cools and becomes a liquid again. This is called condensation. The condensed liquid returns to the earth as precipitation. If you've ever watched those huge cumulonimbus clouds gather over Lake Pontchartrain on a summer day, you probably weren't surprised by the afternoon showers that followed!

Rain showers like that are common in a large watershed like the Lake Pontchartrain Basin.

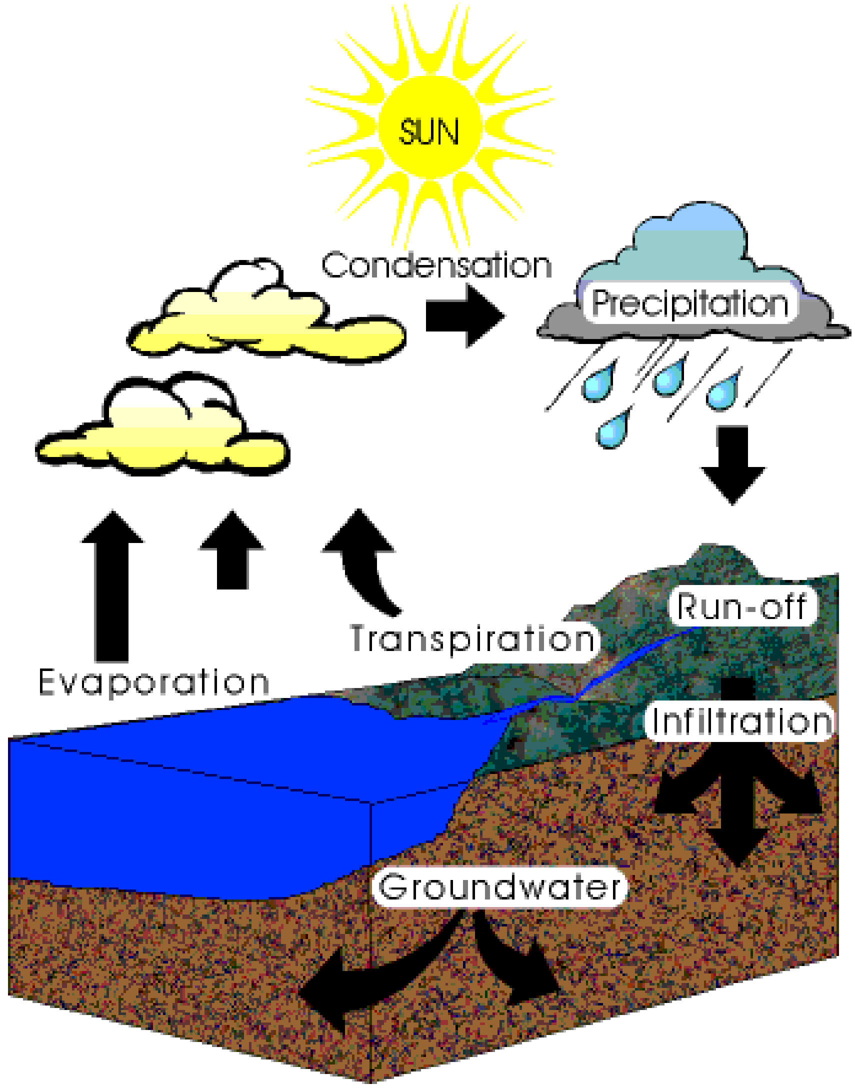
What Happens To All That Precipitation?

- Some of it is used by plants and animals in the Basin. The process of water intake and then breathing out or releasing moisture-laden air is called *transpiration*. . . . .

- Some soaks into the ground and becomes part of the water table or an aquifer in the process known as *infiltration*. . . . . .

- Some enters lakes, streams, and rivers as *runoff*. . . . .

- *Evaporation* from surface water occurs again, and the cycle is complete.



In summary, the *Water Cycle* recycles the earth's water supply over and over!

ACTIVITY

To demonstrate the water cycle, each person in your group or class can play the role of a water molecule passing through the cycle. Try this activity:

Water Cycle Walk

1. On poster paper or butcher paper, make a sign for each stage of the water cycle: sun, cloud, precipitation *(rain, hail, snow, sleet)*, surface water *(lake, river, stream)*, and groundwater. Make signs to represent water use by plants and animals in transpiration also. Place each in an open space in the center of the classroom, ***(see diagram)***.

2. On poster paper or butcher paper, make directional arrows to represent each process of the water cycle: evaporation, condensation, runoff, infiltration, transpiration *(one each for plant and animal use)*. Place each arrow in its appropriate spot on the floor between two

water cycle stages, ***(see diagram)***.

3. Have students represent water molecules *(perhaps wearing ball caps with the brim tilted up, labeled H2O)* and have them do the "Water Cycle Walk" in small groups.

4. Play a tape of music with sounds of a stream, thunderstorm or ocean. After 10-15 seconds, stop the music as a signal for students to stand still. Each student can either explain the stage of the water cycle on which he/she is standing, or can respond to questions about the water cycle.

5. Repeat with remaining groups of students.

Adapted from Lake Pontchartrain Basin Foundation lesson plans

Water Use

Water Use

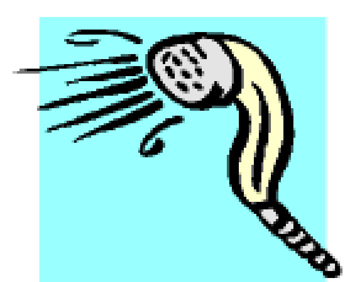
BACKGROUND

Water is all around us. It gushes from our faucets and showers and drinking fountains. We use it so frequently and casually that we take it for granted.

Do you know the source of tap water in Lake Pontchartrain Basin? On the north shore of the lake, it comes from the north shore aquifers. Water for Orleans and Jefferson parishes is drawn from the Mississippi River. What's the source of the tap water in your community? **Here in the United States, each person uses about 100 gallons of water every day.** What impact does that have on water quality?

Take this quick quiz and see!

1. Do you allow water to run when **brushing teeth** or **washing dishes**?
   Or
   Do you run the water only when rinsing?
2. Do you **wash your cars or pets** on a concrete surface?
   Or
   Do you wash them over a grassy area?
3. Do you **let the water hose run** unnecessarily when working outdoors?
   Or
   Do you control the flow with a water nozzle?
4. Do you **waste water by flushing** tissues or hair down



the toilet?
Or
Do you save water and dispose of those things in a trash can?

Now your turn! Using the following chart, try to estimate your family's water use for a day.

ACTIVITY

Daily Water Use Chart

WATER USE	AVERAGE AMOUNT USED	FAMILY WATER USE
drinking water	6-8 ounces per glass	____________________
making beverages	32 ounces per quart	____________________
flushing toilets	3-5 gallons per flush	____________________
taking a shower	5 gallons per minute	____________________
taking a bath	35-40 gallons	____________________
washing dishes	10-15 gallons	____________________
doing laundry	19-45 gallons	____________________
washing hands	32 ounces	____________________
brushing teeth	1 gallon	____________________
washing car	20-30 gallons	____________________
watering lawn	240 gallons/half hour	____________________

HOW DO YOU THINK YOU AND YOUR FAMILY MEASURE UP?

LET'S CHECK !

To calculate the amount of water your family use daily, weekly, monthly, and annually, complete one of the following activities:

1. The simplest way to measure water use is to read your family's water meter at the start and end of a 24-hour period. Subtract the first reading you take from the reading made 24 hours later. That's how much water your family uses in one day. Multiply the number of gallons used in one day times seven to find out how much water your family will use in a week. How would you predict your family's water use for a month? A year?

2. If reading the water meter is not possible, measure your family's water use by the following method. The chart provided above will be useful.

    - Keep track of each glass of water used, whether the person drank it or discarded it. Count 6-8 ounces of water per glass.
    - Record the amount of water used to make coffee, tea, juice, or drink mixes. Each quart uses 32 ounces of water
    - Record the amount of water used for cooking, if any. When possible, measure it before use.
    - Keep track of the number of times household toilets are flushed. Each flush uses 3-5 gallons of water.
    - Keep track of water use during baths and showers. Each shower requires about 5 gallons of water per minute. A tub bath uses about 35 gallons of water.
    - Record the amount of water used for washing dishes. Washing dishes by hand requires about 10 gallons of water, while a dishwasher uses about 15 gallons.
    - Record the amount of water used for laundry. Washing clothes on the low cycle uses about 19 gallons of water; the high cycle, 45 gallons.
    - Keep track of any other water uses, such as washing cars or pets or watering the lawn.

3. Now total all the figures and determine your family's water use for a day, a week, a month, and a year. **Amazing, isn't it?**

How do the choices we make, good and bad, affect our water quality?

How can you improve the choices you make concerning your use of our precious water resources?

Put your heads together as a class and brainstorm:

- List ways that water is wasted.
- List ways to conserve water.

Make posters to share your knowledge with others.

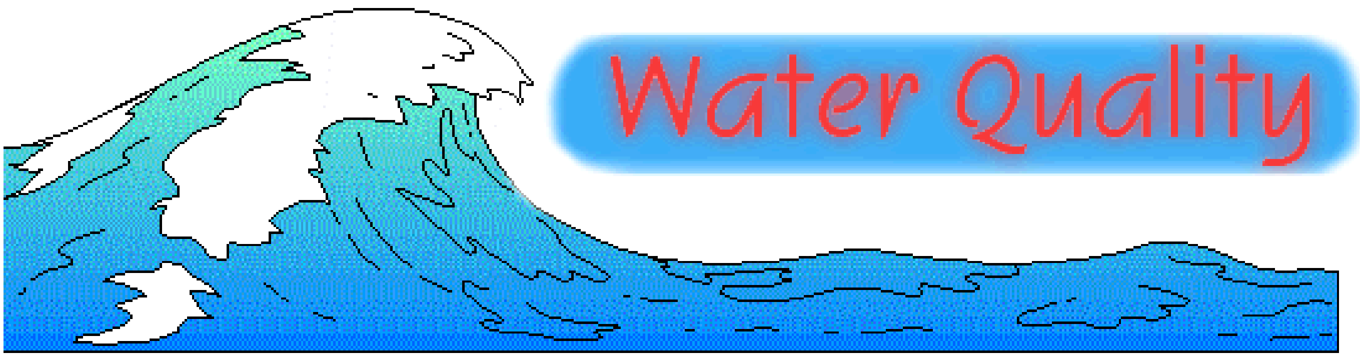
Water Quality

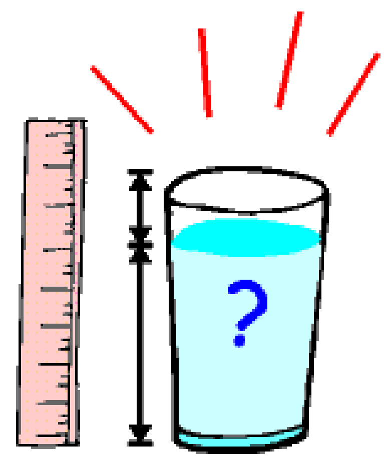
Home | Up | What is New? | Events / Notices | Search | About This Site | Your Comments



What is polluted water? What is clean water?

WATER QUALITY

How do we measure water quality?



BACKGROUND

In order to protect human health and aquatic life, government agencies set water quality standards that are measured in milligrams per liter (mg/L) - or parts per million (ppm). Some pollutants are measured in parts per thousand (ppt), while others are measured in parts per billion (ppb).

These concepts can be difficult to grasp, so consider such minute amounts of pollutants in more familiar terms:

Unit	LENGTH	TIME	MONEY
1 ppt	1 inch/28 yards	1 sec/17 min	1 cent/$10
1 ppm	1 inch/16 miles	1 minute/2 years	1 cent/$ 10,000
1 ppb	1 in/16,000 mi	1 second/32 years	1 cent/$10,000,000

This is how the water quality measurements are expressed mathematically:

	ppt	ppm	ppb
FRACTION	1/1000	1/1,000,000	1/1,000,000,000
DECIMAL	0.001	0.000001	0.00000001

There are many outstanding activities that you can do to explore water quality. You may even choose to take on water quality issues in the Lake Pontchartrain Basin as an action plan proposed later in this lesson.

Factors that affect water quality generally fall into three major categories: **biological, chemical,** and **physical**. These factors must meet water quality standards set by the state of Louisiana. Here is a chart of the major water quality factors found in the Lake Pontchartrain Basin.

Lake Pontchartrain Basin Water Quality Factors

FACTOR	TYPE	SOURCE(S)	PROBLEM
fecal coliform bacteria	biological	human sewage; livestock wastes	possible presence of pathogenic (disease-causing) organisms
dissolved oxygen (DO)	chemical	air aquatic plants	low levels can kill aquatic organisms
nitrogen and phosphorus	chemical	fertilizers and detergents from lawns and urban runoff	excessive algae growth can lead to low DO and eutrophication
zinc, arsenic, lead, mercury, cadmium, nickel	chemical	saltwater intrusion from the Gulf of Mexico	kills freshwater species of plants and animals
mud, sand, other solid particles (turbidity	physical	erosion and runoff from development, agriculture	reduces photosynthesis in aquatic vegetation; interferes with respiration in aquatic animals

? ?

These are only some of the factors that affect the lake basin's water quality.

- **Which others can you investigate?**
- **Which factors are problems in your area?**
- **Do you ever wonder why you can't swim in Lake Pontchartrain and other bodies of water in the Basin?**

The Basin covers a large area, so there are many natural and human activities that depend on our water resources - cities and towns, farms and ranches, business and industry, and recreation.

ACTIVITY

Using the SOURCES column of the Lake Pontchartrain Basin Water Quality Factors chart above, work with a partner and brainstorm a list of places and things in the Pontchartrain Basin that use water and affect its quality. You might want to refer to a map of the area for some ideas. Compare and contrast your list with the rest of the class.

? ?

- **How did your list match up with those of your classmates?**

As you can see, water use in the Basin is extensive, so water quality is always a concern. If a family of four uses about 300 gallons of water in their home each day, just think of how many additional gallons are needed for growing food and for industrial use.

CONCLUSION

We must wrestle with ways to make the most efficient use of our liquid asset - *water*. We must gain an awareness for conservation of water and develop a willingness to do all we can to conserve it.

Water Pollution

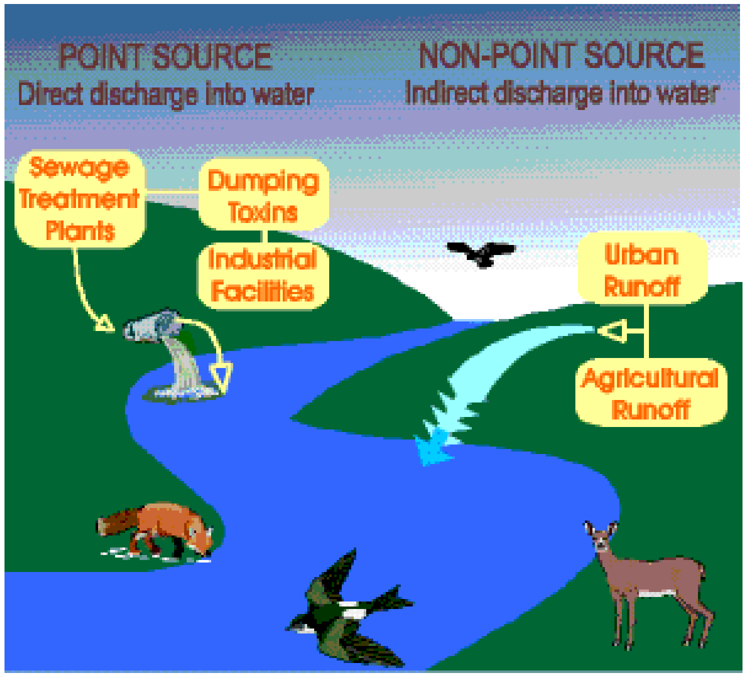
Home | Up | What is New? | Events / Notices | Search | About This Site
Your Comments

Water Pollution

By now you are probably realizing the truth of these two basic environmental tenets, especially when it comes to water pollution. Simply put, water quality in the Lake Pontchartrain Basin is affected by everything and everybody!

BACKGROUND

Water pollution comes from either a **POINT** or a **NON-POINT SOURCE**.
Let's look at some similarities and differences between the two types.



Point source pollution,

...because it enters the water directly, can be easily traced such as from factories and chemical plants. But non-point source pollution, harder to trace and to treat, can cause long-term damage before the problem is handled. It can come from many different sources and travel long distances through a watershed before it is noticed.

Non-point source pollution,

...provides a greater chance for chemicals to mix and react together. This is known as the synergistic effect. A combination of two or more contaminants can be even more harmful than the original pollutants - and harder to treat.

> **In fact, non-point source pollution is the major cause of water pollution in the Lake Pontchartrain Basin.**

Do you realize that most non-point source pollution comes from runoff?

- *Rainwater or wastewater carries various pollutants along as it flows into our lakes, streams, and rivers.*
- Urban runoff from the south shore of Lake Pontchartrain and agricultural/sewage runoff from the north shore are causing serious water pollution problems in the waterways of the Basin.

Here is a chart to help you understand some of the key non-point sources:

NONPOINT SOURCE POLLUTION CHART: *URBAN RUNOFF*

POLLUTANT	SOURCES	PROBLEMS

sediment	construction; tree removal	increases turbidity; affects aquatic organisms; can contain toxins
phosphates/nitrates	fertilizers; detergents; organic debris	algae blooms; eutrophication
toxins; carcinogens	heavy metals; pesticides; herbicides	disrupt food chain; carcinogenic; cause fish kills
organic debris	animal wastes; raw sewage; grass/leaves	deplete oxygen; disrupt food chain; cause fish kills
petroleum products	motor oil; gasoline; axle grease	disrupt food chain; deplete oxygen; harms birds & mammals
pathogens	animal wastes; raw sewage	health hazards
man-made litter	plastic debris; tires; others	unsightly; harms organisms

?

Some of the same pollutants in urban runoff can also be found in agricultural runoff.

- Which ones are they?
- How do they differ?
- Are there any pollutants unique to agricultural runoff?

ACTIVITIES

A. Complete the following chart:

NONPOINT SOURCE POLLUTION CHART: *AGRICULTURAL RUNOFF*

POLLUTANT	SOURCES	PROBLEMS

After a rain, all these pollutants - urban and agricultural - flow or are pumped into a lake, bayou, or river in the Lake Pontchartrain Basin. While we cannot clean up all forms of non-point source pollution as individuals, it is the responsibility of each of us to do what we can to help stem this toxic tide known as **runoff**.

Project F.U.R. (*Fight Urban Runoff*),

...started by a group of students at Holy Cross School in New Orleans in 1990, has been battling this serious problem. They aim to educate the public about the causes of urban runoff in the basin, so that individuals will be able to take appropriate action. Project F.U.R. is featured in the video, "*Pontchartrain Stories*".

Read more about the award-winning Project F.U.R.

While remarkable strides have been made to reduce water pollution in the Lake Pontchartrain Basin, there is still much work to be done - and it will take the efforts of all of us. Solving the basin's pollution problems will not be easy, but you'll find that there is something you can do.

B. Mini Action Plan

In this next activity, you will design a project of your own. Here are some proposed solutions to current problems. Research one and develop a mini action plan to get you started.

Pollution Problems	Proposed Solution
DUMPING USED MOTOR OIL	*stencil storm drains; recycle used motor; oil & filters*
TRASH AND LITTER	*litter clean-up campaigns*
HABITAT	*plant aquatic grass beds*
DEFORESTATION	*plant cypress trees*
SHORELINE EROSION	*plant trees and other vegetation*

Lake Pontchartrain Basin Pollution Solution

Thinking Ahead

1. Which area of the Lake Pontchartrain Basin do you want to target? e.g., north shore, south shore, coastal marshes
2. Which Lake Pontchartrain Basin pollution problem would you like to help solve?
3. What questions do you have about that pollution problem?
4. Where can you get information about that pollution problem?
5. Which people in your school or community can help you understand the nature of the pollution problem? Which resources are available to you?
6. Which obstacles or potential problems might affect your plan?
7. Brainstorm a list of possible solutions to the problem. Ask others for their ideas about your proposed solutions.
8. Can you do the project alone or will you need volunteer help?
9. Make any necessary changes to your plan.

GETTING DOWN TO WORK

The pollution problem I most want to solve is:

This pollution project is needed because:

My proposed solutions include:

Steps I will take to tackle the pollution problem are:

I will recruit volunteer help from:

I will need to get permission for my project from these people and/or agencies:

The Lake Pontchartrain Basin will benefit from my project because:

The following jobs are to be completed on or before the due date by the person(s) assigned:

JOB CHART

JOB	TARGET DATE	PERSON IN CHARGE

MATERIALS AND SUPPLIES

I will need the following items to complete my project:

FINANCES

If I need to finance my project, I will earn or raise funds by:

PUBLICITY

I will publicize my efforts through:

C. JOURNALING

> **"An environmental journal is one of the best ways to learn issues and keep up with current topics."**
> **- Darren Westfall, student**
>
> **" It helps to write down your point of view to form where you stand on an issue."**
> **- Mixalis Petikas, student**
>
> **"I learned about important topics that should be taught to everyone."**
> **- T. J. Willis, student**

Journal writing is an effective way for students

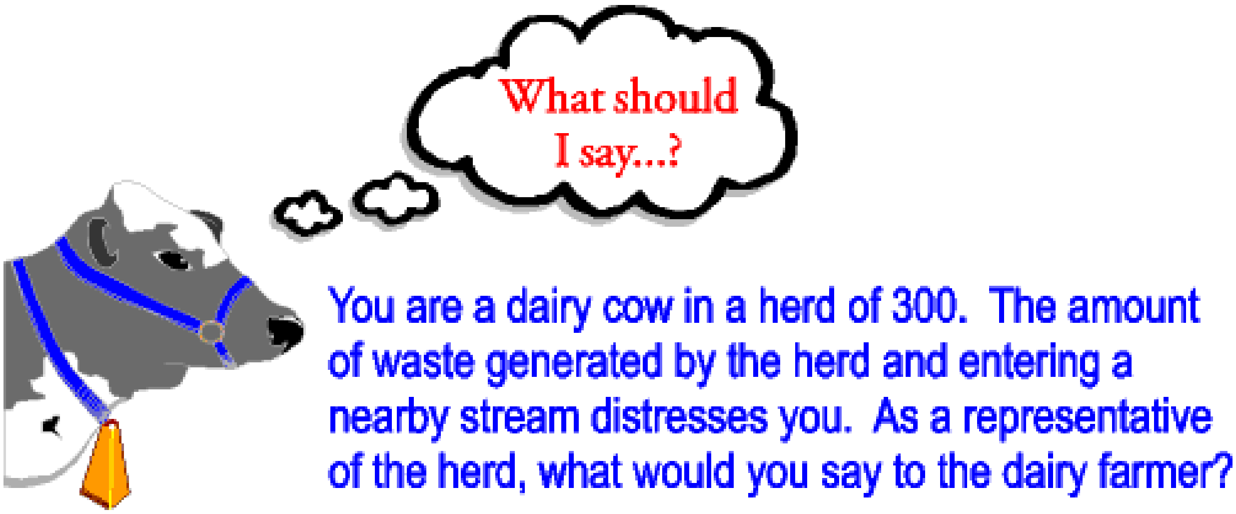
- To reflect on information they are learning.
- To express their thought and feelings on an issue.
- To develop and enhance their writing skills.

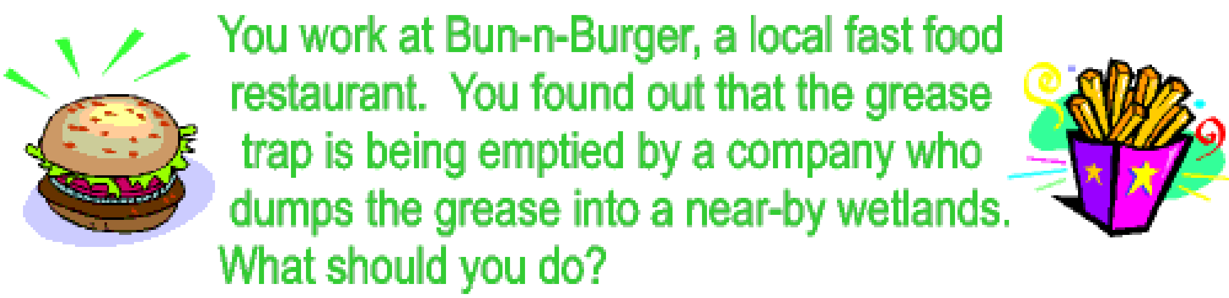
The purpose of this lesson is to offer ways to proceed from personal journal writing to critical journal writing as students examine their present or future place in society.

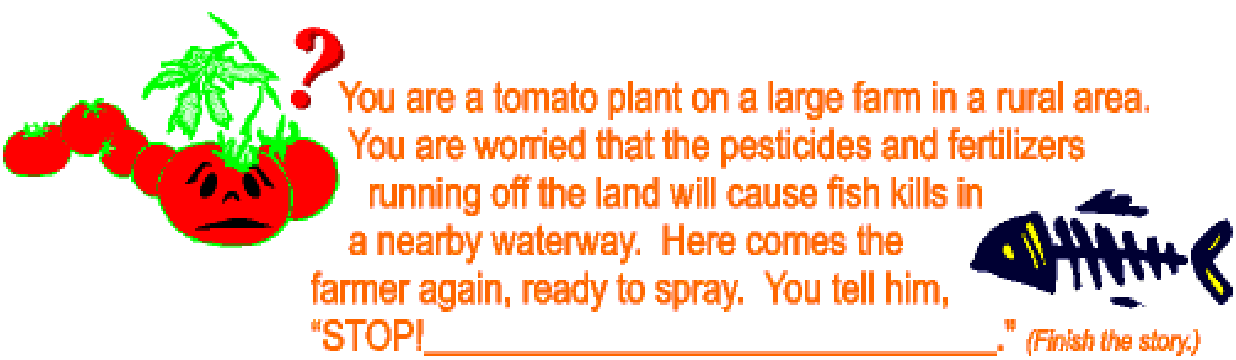
Traditional journal entries encompass questions such as: "What do you know about the topic?" and "What do you think or feel about the topic?" Critical journal writing can require the student to proceed from thoughts or feelings on an issue to formulating a plan of action. An appropriate question to ask would be, "What can you do about the topic?" Students will still be able to write about their feelings and experiences, but their expression will be thoughtful and focused.

Examples of questions for critical journal entries include:

- How do the choices I make, good and bad, affect our water quality?
- How can I improve the choices I make concerning my use of our precious water resources?
- How does my personal use of water affect water quality in the Lake Pontchartrain Basin?
- If I could swim or boat along the shores of waterways in the Lake Pontchartrain Basin, what kinds of pollution would I find?
- How do those pollutants affect living organisms in the Basin?







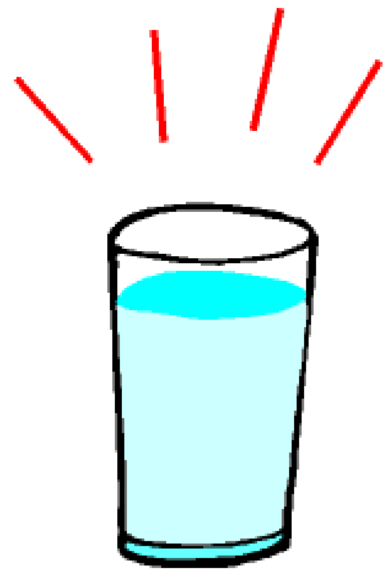
A traditional journal entry, once written, can be a springboard for critical journal writing. Have students take an entry, expand upon it, analyze it, and use it as a basis for a formal essay.

Some strategies for this type of journal entry/essay combination include:

- Developing one's perspective; formulating/exploring beliefs, theories, arguments.
- Assessing consequences of actions.
- Proposing solutions, citing similarities and differences in thoughts or feelings.
- Analyzing actions or examining policies.

This can even by accomplished in small groups, with some students responsible for writing the essay and other students responsible for making a class presentation.

**** Another example of a critical journal entry is to have students listen to or read a* *selected passage, quote, or poem, then react or comment in a journal entry. For example, try this poem on water quality: ****



" The glass of water you're about to drink
Deserves a second thought, I think
For Avogadro, oceans and those you follow
Are all involved in every swallow.
The molecules of water in a single glass
In number, at least five times, outclass
The glasses of water in stream and sea,
Or wherever else that water can be.
The water in you is between and betwixt,
And having traversed is thoroughly mixed.
So someone quenching a future thirst
Could easily drink what you drank first!
The water you are about to taste
No doubt represents a bit of waste
From prehistoric beast or bird
A notion you may find absurd.
The fountain spraying in the park
Could well spout bits of Joan of Arc, or Adam, Eve, and all their kin;
You'd be surprised where your drink has been!
Just think! The water you cannot retain
Will some day hence return as rain,
Or be held as the purest dew.
Though long ago it passed through you!"

- Verne N. Rockcastle

Write a critical journal entry on the poem prompted by such questions as:

1. What do you think or feel about the poetry selection?
2. Why do you feel that way?
3. What is the author trying to tell you about water quality
4. Why do we have a responsibility to not waste or pollute water resources?
5. You are a molecule of water who has spent the last 10,000 years making your way through the water cycle. Trace you family tree. Where does your genealogical search take you?
6. Write the dialogue you have with three other water drops, discussing your travels through space and time.
7. Write an essay based on your responses, or write a poem of your own!

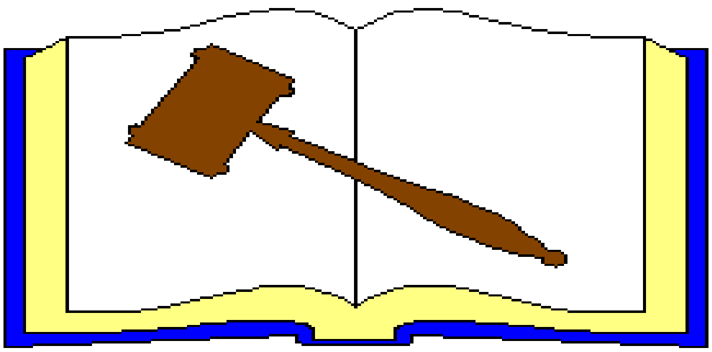
Environmental Rulemaking

Home | Up | What is New? | Events / Notices | Search | About This Site | Your Comments

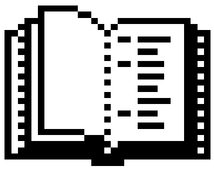


What is Rulemaking?

RULEMAKING - process which allows a proposed regulation to become a rule. This process is outlined by the Administrative Procedure Act (APA).

What State Agency is Responsible for Rulemaking in Louisiana?

LOUISIANA DEPARTMENT OF ENVIRONMENTAL QUALITY (DEQ) - agency concerned with the environmental protection and regulation for Louisiana. DEQ is responsible for the enforcement of rules for the protection of the environment, public health, and safety.



What are the Major Stages in Rulemaking?

1. DEQ submits documents to the Office of State Register for publication in the *Louisiana Register*. The *Louisiana Register* is the official state publication for notifying the public of a proposed regulation. The *Louisiana Register* is published on the 20th of each month.

2. Publication of the following documents in the *Louisiana Register* activates the rulemaking timeclock.

    - Notice of Intent - announces to the public that a change to the DEQ regulations is being considered. It contains a brief description of the rule, the date and time of the public hearing, the deadline to submit comments, and the address for submitting comments.
    - Fiscal and Economic Impact Statement - an estimate of the cost to the State and to those persons affected if the regulation is implemented.
    - Proposed Rule - document which adds new regulations or revises or removes existing text.

3. DEQ conducts a public hearing on the proposed rule 35-40 days after publication of the Notice of Intent. The comment period opens when the Notice of Intent is published and normally closes seven days after the public hearing is held, approximately 42-47 days.

4. After the close of the comment period DEQ prepares the following documents (called the "Summary Report").
    - Summary of the comments received and DEQ's response to them,
    - Concise statement of the comments,
    - List of technical amendments (list of changes made to the regulation since it was proposed, usually as a result of the comments). and
    - Proposed rule with technical amendments incorporated.

    This stage can take as little as a few days or as long as nine months to complete.

5. DEQ submits the Summary Report to the Legislative Oversight Committees. The Legislative Oversight Committees assigned to oversee DEQ regulations are the House Committee on the Environment and the Senate Committee on Environmental Quality.

6. The Legislative Oversight Committees have 30 days to consider the proposed rule. The Committees may, or may not, hold a hearing on the rule. If a hearing is held it must be held between 5-30 days after receipt of the Summary Report from DEQ. If the proposed regulation is identical to an existing federal regulation, this step is shortened to 10 days.

7. If the regulation is not disapproved by the Legislative Oversight Committees, DEQ submits it to the Office of the State Register for publication in the upcoming issue of the *Louisiana Register*.

8. The proposed regulation becomes a final rule upon publication in the *Louisiana Register*.

How Long Does it Take From the Time a Regulation is Proposed Until it Becomes Final?

It varies anywhere from 2 to 12 months. Proposed regulations which are identical to existing federal regulations can become final within 2 months. All other rules take at least 3 months. Rules not finalized within 12 months after publication of the Notice of Intent are void.

Making Smog

This page last updated: 7/16/98

This activity lets students create artificial "smog" in a jar. Teachers can use this module as an introduction to a planned visit from an air-quality scientist, or as the basis for extended discussions on the health problems associated with smog.

CRITICAL OBJECTIVES

- Recognize that invisible air pollutants and weather conditions are involved in creating smog.
- Understand that not all air pollution is visible.
- Appreciate that human activities can cause air pollution.

SKILLS

- Observing
- Drawing conclusions

GUEST PRESENTERS

Guest presenters could include EPA air quality monitoring specialists, state or local air quality managers, chemists, laboratory technicians, or meteorologists.

TARGET GRADE LEVEL

3RD - 5TH

DURATION

20 MINUTES

VOCABULARY

Volatile Organic Compounds	Ozone	Photochemical

Precursor	Smog	Thermal inversion

MATERIALS

- Clean, dry, wide-mouth glass jar (such as a mayonnaise jar)
- Heavy aluminum foil
- Two or three ice cubes
- Ruler
- Scissors
- Stop watch or watch with a second hand
- Matches

BACKGROUND

The expression "smog" was first used in "Turn-of-the-Century" London to describe a combination of "smoke" and "fog". Smog occurred when water vapor in the air condensed on small particles of soot in the air, forming small smog droplets. Thousands of Londoners died of pneumonia-like diseases due to the poisonous air.

Today, smog is usually produced photochemically, when chemical pollutants in the air (notably nitrogen oxides and volatile organic compounds (VOC's) from automobile exhausts) are baked by the sun and react chemically. Ground-level ozone is produced by a combination of pollutants from many sources such as automobile exhausts, smokestacks, and fumes (VOC's) from chemical solvents like paint thinner or pesticides. When these smog-forming pollutants (called "precursors") are released into the air, they undergo chemical transformations and produce smog. Weather conditions, such as the lack of wind or a "thermal inversion", also cause smog to be trapped over a particular area.

Smog causes health problems such as difficulty in breathing, asthma, reduced resistance to lung infections, colds, and eye irritation. The ozone in smog also can damage plants and trees, and the haze reduces visibility. This is particularly noticeable from mountains and other beautiful vistas such as National Parks.

Severe smog and ground-level ozone problems exist in many major cities, including much of California from San Francisco to San Diego, the mid-Atlantic seaboard from Washington, DC to southern Maine, and over most major cities of the South and Midwest.

For more background information, read the "Ozone-Good Up High, Bad Nearby" and "What You Can do to Reduce Ground-Level Ozone fact sheets.

WHAT TO DO

1. Explain that the class will perform and experiment in which they will create artificial "smog" in a jar. Make sure that students understand that the jar is only a model, and models by nature are limited. For example, the purpose of this model is to illustrate the appearance and behavior of smog, not the composition or effects. It is important to understand that smog is not just a "smoky fog", but a specific phenomenon.

2. Select students to perform the experiment. Have them cut a strip of paper about 6 inches by 2 inches. Fold the strip in half and twist it into a rope.

3. Have them make a snug lid for the jar out of a piece of aluminum foil. Shape a small depression in the foil lid to keep the ice cubes from sliding off. Carefully remove the foil and set it aside.

4. Have the students put some water in the jar and swish it around to wet all the inside of the jar. Pour out the extra water.

5. Have them light the paper "rope" with a match and drop it and the match into the damp jar. Put the foil lid back on the jar and seal it tightly. Put ice cubes on the lid to make it cold. (The ice cubes will make the water vapor in the jar condense.) You must do this step very quickly, perhaps with some assistance.

   TAKE NOTE! Be careful to supervise students using matches. DO NOT let anyone breathe the "smog" produced in the experiment, and when the experiment is completed, be sure to release the "smog" outside.

6. Ask students to describe what they see in the jar. How is this like real smog? What conditions in the jar produced "smog"? (Moisture plus soot particles from the burning matches plus carbon dioxide and other solvent vapors.)

7. Ask the students if they have ever seen smog (not fog). Have they ever breathed air outside that smelled funny?

SUGGESTED EXTENSIONS (OPTIONAL)

Have students put a glass thermometer (not plastic) into the jar before they do the experiment. Have them record the temperature before proceeding to step 4. Have them record the temperature during step 5. Ask them to describe what the temperature did and why. Let them try it again without adding water.

SUGGESTED MODIFICATIONS

(a) What conditions are necessary to produce smog in the air? Under what circumstances will these conditions exist in the city? How often are they likely? Can they be predicted in advance?

(b) What are the health effects of smog on people? On plants and trees? Why doesn't everyone in the city get sick or have similar symptoms from smog? What types of people are most sensitive to smog?

For grades 7-12, assign students to small groups to answer the following questions and report back to class in two weeks. One group will consider the physical and chemical sciences and the other group will consider the health and ecological sciences. Each group should consider referring to several sources of information to answer the questions. Students could possibly interview the weather reporter or meteorologist at the local television or radio station or airport, or interviewing a health scientist from the city or county health department or air quality agency.

This page last updated: 12/31/97

Most environmental decisions and regulations are based upon large quantities of numerical data and trends. This exercise introduces students to the fundamentals of reading and analyzing data and extracting comparisons and averages. It can be delivered by the teacher or a guest presenter, or by both together.

CRITICAL OBJECTIVES

Understand how data is collected and analyzed

Recognize air pollutants the government requires to be monitored

SKILLS

Computing & Analyzing Data

GUEST PRESENTERS

Guest presenters could include environmental protection specialists, air quality engineers, environmental scientists, meteorologists, or others familiar with air quality issues or statistical data.

TARGET GRADE LEVEL

6th - 12th

DURATION

40 minutes (or additional session with guest presenter)

VOCABULARY

Air quality monitoring	Ambient air	Smog	Clean Air Act
Criteria air pollutant	Standards	Attainment	Non-attainment
Photochemical reaction	Trends	Data	Volatile organic compounds

MATERIALS

Paper & Pencils

Background Sheet #1-The Clean Air Act

Background Sheet #2-Smog.

Background Sheet #3-The Criteria Air Pollutants.

Student Worksheet #1.

Student Worksheet #2.

BACKGROUND

No matter where you live, but especially in urban areas, each breath you take contains gases or particles that may be unhealthy. We know this from the analysis of air quality data from around the country. We also know that much of the air pollution is invisible and cannot be detected by human senses. Realistically, in our industrial society, it is not practical to expect that air pollutants can be eliminated totally anywhere, so it becomes important to determine what "acceptable" concentrations will be allowed, and equally important to monitor ambient air quality so that these "acceptable" limits are not exceeded. Most air quality monitoring is done automatically by specialized equipment located strategically throughout the country. These monitoring stations collect vast quantities of data and create a record of the concentrations and durations of specific pollutants. For a list of Louisiana monitoring sites and site documentation, visit DEQ's Air Monitoring Operations.

The Clean Air Act establishes certain "standards," or acceptable levels, for various "criteria" pollutants. Most laws and regulations have separate standards for averaged concentrations over certain short- and long- terms (such as maximum 8-hour average concentrations). The Clean Air Act establishes National Ambient Air Quality Standards for six criteria pollutants: carbon monoxide, sulfur dioxide, nitrogen dioxide, ozone, particulate matter (PM-10), and lead. The short-term National Ambient Air Quality Standards (NAAQS) for several of the criteria pollutants are shown in the top line of the two tables in Worksheet 1.

To prepare for the exercises, read the three Background Sheets ***#1-The Clean Air Act***, ***#2-Smog***, and ***#3-The Criteria Air Pollutants***

These exercises look at national air quality trends during the past ten years. They also look at concentrations for the first four "criteria" pollutants in several cities around the country, including New Orleans and Baton Rouge.

Just how clean is your air? You could guess--
but check the accompanying data and find out.

WHAT TO DO

1. Write "1 ppm" on the chalkboard, and next to it write the fraction: 1/1,000,000
   Explain that "ppm" means parts per million" and is similar to "percent" in that "percent" means "parts per hundred." Explain that, like "percent," ppm has no units or dimensions (such as grams or cubic meters). Challenge the class to state which quantity is smaller, 1 ppm or 1 percent. For older students, ask them to compute how much smaller 1 ppm is than 1 percent. Point out that since there are 10,000 "hundreds" in a million, 1 ppm must be 10,000 times smaller than 1 percent.

2. Using ***Student Worksheet 1***, explain to the class what the numbers represent and ask the students to answer the questions. (For more advanced students, request the answers in quantitative terms.) In each table, point out the first line containing the National Air Quality Standards.

3. Using ***Student Worksheet 2***, direct the students to answer the questions and to calculate the percentage change in pollutant concentrations from 1986 to 1995 for the listed pollutants. Call students' attention to the fact that two of the six pollutants have units of µg/m3 which means micrograms per cubic meter, while the other four pollutants have units of ppm, or parts per million. Explain to them that both represent concentrations of pollutants in the air. The four ppm pollutants are all gases, and most fluids (gases and liquids) normally have concentrations expressed as milliliters per liters (part per thousand) or microliters per liter (parts per million). Lead and particulates are solids, and their density cannot be arbitrarily established in relation to air. Therefore, their concentrations are normally expressed as a unit weight (mass) per volume of air. The difference in the units of measure does not affect the calculation of percentage change.

4. Ask the students to identify the most significant changes. Have them speculate as to why the changes might have occurred. Discuss their answers with the guest speaker.

5. Point out to the students that the standards are very different from each other. Ozone's permissible level, for instance, is 75 times lower than that of carbon monoxide. Ask the class to speculate why the standards may be different for different substances. Explain that the human health tolerances are different for each pollutant and each pollutant may cause different health effects. The regulations account for these differences.

SUGGESTED MODIFICATIONS

You can conduct a similar air quality analysis for the area in which your school is located. For more information on Louisiana ambient air quality data, call (225)765-0219 or email your request to deqassistance@LA.GOV. Other states may call the closest EPA Regional Office for information about similar "local" air quality data. To obtain the phone number of the closest EPA Regional Office, visit EPA on the Internet at http://www.epa.gov).

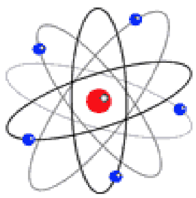
Radon in your home:

Home | Up | What is New? | Events / Notices | Search | About This Site | Your Comments



RADON IN YOUR HOME: WHAT YOU SHOULD KNOW

Last updated: 20-Oct-97

WHAT IS RADON?

Radon is a radioactive gas which comes from the decay of naturally-occurring uranium in soil, rock and water and can get into the air you breathe. You can't see radon. You can't smell it or taste it either. But it could be a problem if it gets into your home. In fact, the Surgeon General has warned that radon is the second leading cause of lung cancer in the United States today. Only smoking causes more lung cancer deaths.

WHERE CAN RADON BE FOUND?

Radon can be found all over the United States. It can get into any type of buildings - homes, offices, and schools - and build up to unsafe levels. But you and your family are most likely to get your greatest exposure at home. That's where you spend most of your time.

WHEN DOES RADON BECOME A HEALTH HAZARD TO MY FAMILY?

Your family's risk of developing lung cancer from radon depends on the average annual level of radon in your home and the amount of time you spend there. The longer your exposure to radon, the greater the risk, and the risk is much greater for smokers. The amount of radon in the air is measured in "picocuries of radon per liter of air," or "pCi/l." EPA recommends that you should fix your home if the results of one *long-term test* or the average of two *short-term tests,* taken in the lowest lived-in level of the home, show radon levels of 4 pCi/lor higher. A short-term test remains in your home for two days to 90 days, whereas a long-term test remains in your home for more than 90 days. With today's technology, radon levels in most homes **can** be reduced to 2 pCi/l or below.

WHAT IS THE RISK OF LIVING WITH RADON IN OUR HOME?

Radon gas decays into radioactive particles that can get trapped in your lungs as you breathe. As they break down further, these particles release small bursts of energy. This can damage lung tissue and lead to lung cancer over the course of your lifetime. Not everyone exposed to elevated levels of radon will develop lung cancer, and the length of time between exposure and the onset of the disease may be many years. Like other environmental pollutants, there is some uncertainty about the magnitude of radon health risks. However, we know more about radon risks than risks from most other cancer-causing substances. This is because estimates of radon risks are based on studies of lung cancer in humans (underground miners). Smoking, combined with radon, is an especially serious health risk. Your chances of getting lung cancer from radon depend mostly on: 1) how much radon is in your home; 2) the amount of time you spend in your home; and 3) whether you are a smoker or have ever smoked.

WHO CAN I CONTACT FOR MORE INFORMATION ON RADON?

You can get additional information on radon from the following sources:

- For information, call the Louisiana DEQ Radon Coordinator TOLL-FREE at 1-800-256-2494. The Coordinator distributes a number of EPA publications on radon free-of-charge.

- For free Radon Ranger comic books (A Children's Guide to Radon), call 1-800-256-2494.

- Also visit EPA's Radon Page on the Web at: http://www.epa.gov/radon/

WASTE - WHERE DOES IT COME FROM? WHERE DOES IT GO?

K-12

OBJECTIVES: The students will identify the various waste materials generated in the school. They will describe the sequence of collection and the destination of the materials identified.

RESOURCES: Classroom wastebasket, maintenance personnel, area road map, chalkboard.

PROCEDURE:

1. Separate the class into three groups.

2. Have group one examine the contents of the classroom wastebasket. Ask the group to identify the various types of waste materials generated in the classroom. Categorize the waste materials as paper products, glass, metals, plastics, organic wastes, etc. Record the findings on the chalkboard.

3. The second group should examine the flow of the waste materials after they are collected from the classroom. This may require an interview with maintenance personnel. Are the wastes consolidated with other classroom's wastes? Why? Are the wastes transferred to a large capacity receptacle? Are any wastes burned in a school incinerator? Are any waste materials recycled? If wastes are collected from the school by the municipality or a commercial disposal firm, where are the wastes disposed?

4. Have the third group determine the types of wastes generated in special subject areas of the school (arts and crafts, gym, home economics, industrial arts, etc.), the school cafeteria, the office, the maintenance area. Are these wastes handled in the same manner as classroom wastes? Determine what other wastes are generated by the school. Where do these wastes go?

5. Regroup the class. Have a member or members of each group report the group findings, beginning with group one. Create a diagram or a flowchart on the chalkboard to outline the reports of groups two and three, indicating the steps between waste generation and waste disposal.

6. Ask whether any members of the class live near or have visited a landfill, an incinerator, a recycling center, or a sewage treatment plant. Ask for descriptions and impressions of the facilities. Determine whether any of these facilities are located near the school. You may need to contact your county planning department for the locations. Plot the facility locations and the school location on the road map. Calculate the distances that waste materials must be

transported to each facility. List the type of wastes generated by the school which are managed by each facility and the distance of each facility from the school.

7. (Optional) Arrange a class field trip to one or more waste management facility. Create a class record for each facility. Include photos, drawings, essays, and audio or video tape recordings.

This lesson plan was prepared by the Recycling Division of the Pennsylvania Department of Environmental Protection.

COMPOSTING PROJECT

6-12

OBJECTIVE:
Creating a compost pile as a classroom project will demonstrate to students that natural materials can be recycled.

RESOURCES:
A location for the project, organic waste materials, a garden pitchfork, soil, water. (Lime, manure, nitrogenous fertilizer, materials to construct an enclosure, a ½-inch mesh screen, and a soil thermometer are optional.) Volunteers must be available to construct and maintain the compost pile.

INTRODUCTION:
Compost is an inexpensive and effective soil conditioner that recycles organic waste materials. Nutrients in plant material are returned to the soil through the breakdown of organic material by the action of microscopic fungi and aerobic bacteria. Organic wastes are decomposed, and the result is a material useful as a natural fertilizer.

In Japan, Europe, and recently in the United States, municipalities have established large-scale solid municipal composting facilities. The volume of organic material composted is diverted from other disposal facilities. Municipalities have found that composting leaves collected in the fall can save disposal fees.

When properly managed, a compost pile will not produce odors or attract pests. The finished product can be ready for use as a garden mulch in as little as six weeks with proper management. Compost has proven valuable for use in land reclamation efforts where erosion or earth moving activities have disturbed the topsoil.

PROCEDURE:

1. Find a suitable outdoor site to locate the compost pile. The pile should be exposed to rainfall, but may work best in a shaded location. Proximity to a water source is suggested.

A good time to start a compost pile is whenever organic materials are available. The fall of the year is quite suitable, since composting can serve as an alternative to the burning or landfilling of leaves. Tree-trimmings, grass clippings, garden refuse, kitchen and lunchroom food wastes, sawdust, manure, wood ashes, hay and straw are among the organic wastes suitable for composting. Meat and dairy products should be avoided.

2. Develop a plan of operation that outlines the procedures for conducting the composting

project. Present the plan to the school principal. Permission and support from administrative and maintenance personnel must be obtained before initiation of the composting project.

3. An easy to manage compost pile can be enclosed on three sides by utilizing wooden pallets, used concrete block, fencing, snow-fencing, or hay bales. The fourth side should be accessible to permit turning the pile. A 4'x4'x4' enclosure can yield a ton of compost.

A compost pile can be constructed without an enclosure. A shallow pit may be excavated and the organic material simply piled. The excavated soil will be added to the pile.

4. Begin the compost pile with a layer of branches or cornstalks to help promote ventilation and drainage. The compost pile is then built with successive eight-inch layers consisting of a six-inch layer of organic material moistened with water and covered with two inches of soil, lime, manure or nitrogenous fertilizer. Shredding the organic materials will accelerate the decomposition process.

The eight-inch layers are repeated until the pile is four feet high. Each layer should be moistened, but not soaked. Materials in the compost pile should always remain as damp as a squeezed sponge. A depression created at the top center of the pile will collect precipitation. (Layering of materials is not essential to the process.)

5. The compost pile is now ready for decomposition. During this phase the temperature within the pile may reach 175º F. The heat is effective in eliminating most disease organisms, insects, and weed seeds. Diseased or infested materials should not be added to the compost pile.

The pile should be turned over and mixed every few weeks to move outer materials to the center. Less frequent turning will delay decomposition. A steady decrease in the temperature at the center of the pile will signal the end of the fermentation process. When the compost is finished, it will have a dark color and a crumbly soil-like texture.

6. Maintain a record of the composting process. Enter the date of compost pile construction, the organic materials added to the pile, the days the compost pile is turned, the date the compost is ready, how the compost is used and other observations.

7. A soil thermometer can be used to monitor the temperature of the pile. Create a compost pile temperature chart plotting thermometer readings over the term of the project.

8. The finished compost may be sifted through a ½" mesh screen with rejected particles returned to the compost pile, or the compost may be added directly to garden soil. Applied as a mulch or top dressing around plants shrubs and trees, the compost will provide soil nutrients, retain moisture, and inhibit weed growth. Look for uses for compost around the school grounds. Consider marketing sifted compost as a fund-raising activity.

9. Prepare a report that will describe the composting project. Refer to the project log (Item 6) for key information. Present the report to the school principal. Consider publicizing the project in the school and community newspaper.

This lesson plan was prepared by the Recycling Division of the Pennsylvania Department of Environmental Protection.

Cleanup of Hazardous Waste Sites

PROBLEM FOCUS:

The cleanup of inactive and abandoned hazardous waste sites and placement of such sites on the Superfund, or National Priorities List (NPL).

OBJECTIVE:

To gain an understanding of how a site is cleaned up and how it is placed on the Superfund list (NPL).

BACKGROUND:

Getting a site placed on the NPL and choosing the appropriate method of site cleanup can be a lengthy process. The basic steps used by the Louisiana Department of Environmental Quality (DEQ) to determine cleanup and to determine whether a site will be placed on the Superfund list are as follows:

- **Site Discovery** - Sites are reported by companies, concerned citizens, disgruntled employees, etc.
- **Preliminary Survey** - Consists of a survey taken by driving through an area. The field investigator will investigate the site to see if the reports are true.
- **Preliminary Assessment** - Consists of a collection and review of all reported historical information pertinent to a given site, includes sources and types of hazardous substances present and identifies the potentially responsible parties.
- **Site Inspection** - An on-site investigation is done at this point in the procedure. A typical on-site investigation involves sampling, surveying, monitoring, reconnaissance, and other field activities.
- **Ranking** - A score of 28.5 or greater on the EPA Hazard Ranking System is required to designate the site on the National Priority List Site for funding by the EPA Superfund. The score of a site is based on three conditions: (1) air; (2) ground water, and (3) surface water. Ranking of a site occurs after each site inspection. If a site does not make the EPA minimum point cut-off for the list, the state must do something in terms of cleanup. If a site is deemed an emergency situation, it is taken out of the point program and remedial action (cleanup) is undertaken. Direct contact by a population and potential for fire and explosions are used as determining factors in the desirability of an emergency removal action.

- **Site Inspection Follow-up** - An on-going investigation of EPA and DEQ personnel of unanswered concerns and questions about the site is completed. Suggestions are made to clean up the site and the cost of further action is assessed.
- **Expanded Site Inspection** - The additional investigation of concerns and questions about the site is completed here. It serves as a reinforcement for step 6.
- **Expanded Site Inspection Follow-up** - Reinforces the investigations with closer supervision by EPA and DEQ personnel.
- **Remedial Investigations** - The following items are completed during this phase of the investigation: (1) visitation to the site; (2) definition of boundaries of contamination and (3) determination of extent and degree of contamination of each of the conditions - air, soil, surface water, etc.

State and federal governments must agree on cleanup procedure and on a schedule for the cleanup.

The following are several ways to finance the cleanup of a Superfund site: (1) responsible party can clean up the site voluntarily; (2) through federal assistance using Superfund money and using a contractor for cleanup; (3) responsible party can be forced to cleanup through legal action and (4) state and local governments can assume the cost of cleanup and use a contractor for cleanup.

Remediation Services, a division the Louisiana Department of Environmental Quality's Office of Environmental Assessment, has the task of administering the state hazardous waste cleanup fund and projects funded through the U.S. EPA's Superfund program. To that end the Remediation Services Division ranks potentially hazardous waste sites to be included on the National Priority List maintained by the EPA for cleanup action. The method used to rank these sites is to score them as to their possible impact on public health and welfare, using criteria such as the contamination of ground water, surface water and air in the vicinity of an inactive or abandoned hazardous waste site. The Remediation Services Division develops supporting information for each site, including monitoring well data, census population figures and surveys of drinking water wells. Louisiana has approximately 400 sites that are being evaluated as potentially hazardous inactive waste sites.

METHODS OF HAZARDOUS WASTE SITE CLEANUP - EXAMPLES & ILLUSTRATIONS

Planning a School Yard Habitat for St. Thomas More School

St. Thomas More Schoolyard
Site of Planned Habitat Project

Personnel with the Louisiana Department of Environmental Quality are currently helping in the design and construction of the St. Thomas More Schoolyard Habitat in Baton Rouge. The habitat's initial feature will be a pond and stream landscaped with native Louisiana aquatic plants. Using the pond, students and teachers will learn about aquatic habitats and food chains, native plants and stream hydrology.

Teachers and personnel from DEQ will develop lessons, in order to ensure they meet the needs of the students. By presenting these topics in an interactive, hands on way, students will gain a greater appreciation of the natural resources they will be charged with protecting as they grow older. They will also learn first hand the types of work done by biologists, hydrologists, and environmental scientists.

Following completion of the pond, the remainder of the habitat will be developed using native herbaceous plants, shrubs and trees. This phase will be largely developed by the students and teachers themselves as they learn about the requirements of animals in our area, and the specific needs of the plants. By placing the right plant species in their correct environment, long term survival of the plants should be improved. This will reduce both maintenance and costs.

Through the interaction of students, teachers and environmental professionals the St. Thomas More Schoolyard Habitat will ensure the development of citizens both knowledgeable about their environment and able to make wise decisions about its conservation.

Pond layout is to begin April 10, 1999 with digging and installation to be completed April 17-18, 1999, weather permitting. More details of the project, and pictures of its construction will be included as the habitat is developed.

Water Fit For A Bug

A Lesson in Evaluating Water Quality

Macroinvertebrate Sampling for Evaluating Water Quality

Overview

Water "bugs" (macroinvertebrates such as insect larvae, snails, crawfish, sowbugs, clams, aquatic worms and leeches) are excellent indicators of water quality, as they live much of their life cycle in the same area of a stream or lake. This lesson demonstrates how to collect stream debris samples, locate, identify and sort "bugs" within the samples, and evaluate water quality based on species diversity and population. Students of all ages can also gain some understanding of the basic causes and significance of water quality problems, as well as potential solutions.

Lesson Description	
Age	can be adapted to any age depending on level of concepts presented and detail of analysis desired
Subjects	biology, zoology, entomology, ecology, and math

Skills	analysis, classification, observation, computation, and dexterity and confidence in the use of equipment (dip nets, magnifying boxes, magnifying glasses, etc.)
Duration	A minimum of 45 minutes should be allowed, if samples are brought to classroom. (Pre-collection time by instructor is dependent on location of suitable water body), 1.5 - 2 hours is best if students are to observe or participate in the sample collection and then sort the samples. Patience and interest is an important factor in the length of time that students actually sort samples.
Group size	A class of 20-30 students may be divided into groups of about 5 students per sample pan. More can be accommodated, if additional instructors are available to help the leader.
Setting	The lesson may be conducted outdoors near a wadeable stream or lake. If collected stream debris is brought to the school or classroom, the lesson should be conducted in an area where spilled water and mud are not a problem.
Key Vocabulary & Concepts	macroinvertebrates, insects, water pollution, pesticides, environment, ecology, life cycles, habitat, experimental method

Accompanying "Bug Sheet"

Objectives

- collect stream debris samples from suitable habitats (or have the sample brought to them)
- locate and identify macroinvertebrates in the samples
- evaluate water quality based on species diversity and population

- understand basic causes and significance of water quality problems along with potential solutions

Method

Ideally, students will be taken to a suitable (safe and wadeable) stream or lake where collection techniques will be demonstrated. If possible, students will be able to collect samples on their own in order to better learn collection techniques. If students cannot go to a water body, instructor can go before the demonstration and collect a large enough sample to divide evenly between groups. After sample collection is complete, students will pick through the debris to locate and then identify macroinvertebrates that can be used to estimate water quality.

Background

Macroinvertebrates are a large group of organisms whose common element is that they lack a backbone. They range from such varied creatures as jellyfish, octopus, worms and leeches, to oysters, clams and snails, to crabs, crawfish and insects. They can be as large as giant squid in the ocean which reach several feet in length or smaller than a flea. Fortunately, what this experiment is looking for falls somewhere in between.

Aquatic macroinvertebrates include primarily larval forms of both common and uncommon insects. Commonly seen insect larvae include dragon flies and damselflies. Less common insects include stoneflies, mayflies, alderflies, midge fly and blackfly larvae. Non-insect indicators include snails, crawfish, sowbugs, clams, aquatic worms and leeches. These and a variety of other macroinvertebrates can be identified using an easy to read "Bug Sheet" which gives generalized body patterns for each of the indicator organisms along with brief characteristics. The sheet also shows which water quality group each indicator organism falls in. Water quality groups include: 1) pollution sensitive ("good water bugs"); 2) somewhat pollution tolerant ("moderate water bugs"); and 3) pollution tolerant ("bad water bugs").

Macroinvertebrates living in any body of water provide excellent indicators of water quality because they are generally forced to live out much if not all of their life cycle in the same area of a stream or lake. Many otherwise terrestrial insects such as stoneflies, dragon flies and midge flies pass through an aquatic larval stage during which they develop into winged adults then fly away to mate and lay eggs, thereby completing their life cycle. In most cases, especially with the mayflies, the largest part of their life span is spent as larvae living in the water. Mayflies take this to such an extreme that the adults generally do not have mouth parts and die within a day or two of emerging and mating, hence their taxonomic name of Ephemoptera.

Other macroinvertebrates live their entire lives in the water. Aquatic snails, crawfish, sowbugs, clams and leeches are all dependent on water for their entire life. However, among these creatures there is still a variety of tolerances to pollution. Gilled snails are dependent on good water quality because they must obtain all of their oxygen from the water. Pouch snails on the other hand can tolerate poor water quality with little oxygen because they are capable of leaving the water and obtaining oxygen from the air. These two types of snails can be separated by the side on which their shells open when the pointed tip is away from the viewer; right for good water snails, left for poor water snails. They can also be separated by the presence of an operculum or "door" on their shell opening. Pouch snails lack an operculum.

Crawfish, sowbugs and clams are all macroinvertebrates generally found in water of at least moderate quality. Crawfish are well known in Louisiana as a delicious meal. Sowbugs are related to common wood lice, otherwise known as "pillbugs" and "roly-polys." Clams are generally small, easy to locate creatures which are obviously dependent on water. Finally, aquatic worms and leeches are both indicators of poor water quality; and no the leeches will not suck your blood, unless you give them a good chance.

Because these organisms depend to varying degrees on clean water, it is possible to evaluate a water body's health based on the type and number found through sampling. However, because each type of macroinvertebrate has a different lifestyle it is important that samples be collected systematically from all suitable habitats so that each habitat type is evenly represented. For example, if collections are only made along steep banks you may find a few mayflies, stoneflies and crawfish, while a much larger population of midge fly and blackfly larvae are living on rocks in the middle of the stream. This could result in an evaluation of good water quality, when in fact the water is of moderate or even poor quality. The important point to remember is that just because you have one good water indicator you do not necessarily have good water. Likewise, having a few poor water indicators does not always mean you have poor water. Ideally, there should be a range of organisms, with a higher percentage of good or moderate water quality species. An evaluation form is utilized to help in this determination.

Water quality can be impaired by a variety of causes and sources. High levels of nutrients from sewage or fertilizers can lead to algae blooms which block sunlight preventing normal aquatic vegetation growth. Reductions in normal vegetation can lead to reduced hiding places for macroinvertebrates and fish, thereby reducing their populations. When this excess algae dies, decay processes caused primarily by bacteria can severely reduce the amount of oxygen in a stream or lake leading to fish kills and reductions in populations of macroinvertebrates sensitive to oxygen levels.

Another source of water quality impairment, one that many people don't think about, is removal of stream bank vegetation. When landowners or flood control managers strip away riparian vegetation from a stream or lake many things happen to the water body. Removal of sheltering limbs and tree roots which provide hiding places for macroinvertebrates, fish, turtles, frogs, snakes, birds and a host of other wildlife frequently leads to loss of these creatures. Removal of streamside vegetation causes water temperatures to rise due to increased sunlight. Rising temperatures reduce the amount of oxygen in the water, cause fish to move away and may promote more algae blooms. Loss of vegetative structure on a stream bank will lead to increased erosion which places more sediment in the stream. Excess sediment can harm fish and other creatures, smother eggs, block sunlight from aquatic vegetation, and actually increase flooding as sediment is redeposited and fills up basins which normally hold back excess water. Finally, removal of riparian vegetation allows pollutants which might otherwise be trapped and degraded by the plants to enter a stream where they can kill fish and other stream life.

Improper use of pesticides around homes, businesses and farms is one form of water quality impairment which may be harder to detect because you cannot readily see the impact. However, macroinvertebrates, fish and other wildlife living in or around a water body will feel it. Pesticides by definition kill pests, whether insect pests or weeds. Unfortunately, many pesticides are extremely toxic to birds, fish and macroinvertebrates, so when used improperly they can enter a water body and kill much of the life found there. This is where macroinvertebrate sampling can really come in handy. A stream or lake may look almost pristine if the water is clear with little or no vegetation and algae, but if pesticides have been periodically introduced it is possible that sensitive indicators like mayflies, stoneflies and caddisflies have been killed off. Proper sampling will detect this and alert investigators to look for sources of the problem.

There are many examples of water quality impairment which macroinvertebrate sampling can help detect. Perhaps the most important aspect, however, is becoming familiar with a water body's habitats, ecology and watershed. By doing so, students can take action toward protecting the overall environment of a water body, thereby protecting much more than just the water.

Materials

1. sturdy D-frame aquatic sampling net - at least one for instructor (available from Carolina Biological Supply, 1-800-334-5551 or Forestry Suppliers, Inc., 1-800 647-5368)

2. for every five students need one of each item listed - plastic dishpan approximately 12" x 14" x 5" for sorting samples, forceps (preferably soft tip entomology forceps but ordinary ones will work (available from Bioquip, 310-324-0620)), medicine dropper and or kitchen baster, two ice cube trays, and in order of preference - a plastic two-way microscope (available at Nature Company Store in New Orleans) or Discovery Scope (available from Delta Education, 1-800 442-5444) or hand lens magnifier

3. 1 bug sheet, 2 sample recording sheets and a pencil for each student

4. large washtub or buckets, if sample must be collected in advance and brought to classroom

5. waders, if desired, for any one planning to wade in the stream

Procedures

1. Overall concept of project based on Background, above, is presented to students in classroom or stream side. Emphasis can be placed on experimental nature of project because leader usually does not know what the results will be. Even if sampling has been previously done on the same stream conditions could have

changed between tests. Basic environmental aspects can be presented now or held until after sampling and analysis is complete.

2. Sampling procedure with net is demonstrated either in the water or on land as appropriate. Different habitat types should be pointed out and described, including:
   - vegetated margins and banks
   - silty substrates with organic debris
   - sandy/gravel bottoms
   - woody debris with associated leaves, algae and fungi

3. If possible, each habitat type should be sampled according to the following procedures. In each case, be sure to look at the inside of the net after dumping a sample into the dishpan. Many of the invertebrates can be found clinging to the netting.

Vegetated margins and banks should be vigorously scooped from the bottom up, starting 2-3 feet down and finishing at the surface. Sand, silt, mud and vegetation should be retained in the net with water allowed to drain away. This should be done for approximately 10 feet of stream bank, working upstream. Retain this sample in one pan or divide among several if needed. Record or remember what type of sample is in each pan. This area will usually have a good diversity of several macroinvertebrate types particularly mayflies, stoneflies, dragon flies, and damselflies. In slow streams, lakes and ponds vegetation may be the best location to find suitable habitat and macroinvertebrates, especially dragon flies and damselflies, but also scuds and sowbugs. If you want to find something quick and easy try here first.

Woody debris should be collected from any area of the water body where it can be found. Debris piles should be approached from downstream with the sampling net held below and downstream while leaves and other loose items are pulled into the net. Small pieces of wood approximately 3 inches in diameter should be collected until you have a total of 4 or 5 feet of wood. Retain samples in one or more pans and remember sample type. Like stream banks, woody debris is usually a good place to sample, especially in slow streams. Look for mayflies, stoneflies and beetle larvae, but large dragonflies can be prowling for other insects and caddisflies can be found filtering the water with tiny nets. Again, like stream banks, this is a good source for quick and easy sampling.

Sandy/gravel bottoms in still water can be sampled by vigorously scooping substrate from the bottom. Move the net approximately three feet across the bottom trying to dig in 1-2 inches. In moving water, scoop as before working upstream so organisms are swept into the net or position the net downstream of a 3-foot sampling area and kick around in the sand and gravel to disturb the substrate and force organisms up into the current. Retain sample as before. This area is not as productive as the previous two locations, but you can find midges, clams, swimming mayflies and very interesting case-building caddisflies.

Silty substrates are found where current is very slow or absent. Samples can be collected as described under sandy/gravel bottoms. This is usually the least productive area, but you may find burrowing mayflies if enough oxygen is present. This is an important area to check for the adequacy of oxygen levels in the stream or pond because this will usually be a low oxygen area. If mayflies are found here the oxygen level in the rest of the water body should be very good.

As was noted in the background section, it is important to try and sample all of the habitat types in order to be most accurate. However, if time is a factor and you want to just find something concentrate on the first two habitats above. These two areas will almost always have something to look at. If comparisons are being made between two different water bodies it is very important to sample the same habitat types, with the same intensity, in each water body.

1. After all samples have been collected and divided into dishpans, groups of no more than 5 or 6 should begin picking through the samples. Students should be told that they are looking for creatures anywhere from about 1/8 inch to 2 inches, with an emphasis on the smaller. Scuds and beetle larvae will usually be on the small side, mayflies and stoneflies are usually about 1/4 - 1/2 inch, while dragonflies and damselflies are usually the largest thing found. However, hellgrammites and craneflies can both be very large but are rarely found. To possibly help alleviate fears of putting their hands in the debris, students can be told that hellgrammites are the only thing that may bite and these are usually large and easy to spot. (Hellgrammites have large pincers on their heads and can give a nasty bite.)

Picking should be done by removing small portions of the debris, one or two leaves at a time, and looking it over closely. Forceps or medicine droppers can be used to pick-up smaller organisms. Woody debris should be scanned carefully on the surface and then loose pieces broken away to find mayflies, stoneflies and caddisflies which hide in crevices. When looking at debris remember the idea of camouflage. Most of the organisms will be brown or black and blend in very well with their surroundings. In green vegetation, damselflies will frequently be green and just as hard to see. Without care, you can almost look right at a mayfly on a stick and not see it. Look for movement to give the creatures away. Water should be kept to a minimum in the pans because it is usually murky, however, if the water is clear enough macroinvertebrates can usually be seen swimming around in the bottom. For this reason, any water present in a pan should be kept as calm as possible to avoid stirring up the mud.

As organisms are located they should be separated into look-alike groups by placing them in individual cells of an ice cube tray. The bug sheets will come in handy here. Microscopes or hand lens can be used to help identification or observe behaviors. Ice cube cells should be filled with tap or clear stream water so that the organisms can be seen and counted. For example, all dragon flies should go in one cell, all mayflies in another, etc. The reason for this is two fold: one, dragon flies, damselflies and hellgrammites will eat anything in a cell with them; two, this facilitates counting the organisms according to taxonomic and water quality groupings. And watch some of the creatures, they are surprisingly mobile and may crawl out of their cell or even the tray. When asked, try not to simply tell students what a particular organism is. Instead, try to guide them to find the answer themselves. For most of the larger macroinvertebrates it is really pretty easy. As the invertebrates are located, identified and separated students should keep a tally of how many of each type they find. This can be done individually or by a group recorder.

2. After at least 20-30 minutes of picking bugs students should be told to complete there tally of each organism type and select one person to call-out their results when asked to. A few more minutes is usually required to complete the tallies. Time spent picking bugs can be highly variable depending on the age and interest of the students. To be completely accurate may take an hour or more of picking for each pan, especially those with a lot of debris, but few groups can sustain their interest that long.

3. While students are completing their tallies the instructor should prepare a black board or flip chart, listing each macroinvertebrate in a fashion similar to that found on the survey form. When ready, each group can call out the number of each macroinvertebrate type they found (ie. 10 stoneflies, 5 gilled snails, 20 dragon flies, etc.). The total for all groups is recorded on the black board and on a master survey form. If more than one water body was sampled, results for each water body should be maintained separately. Students should be asked to complete one survey form based on their own samples. If desired, a second survey sheet can be completed by each student showing overall water body results. By maintaining separate group survey forms it should be possible to show results for different habitat types if each group had a different habitat sample.

4. When all results have been tallied the instructor can explain the use of index letters as shown on the survey forms. See analysis below. If time becomes a critical factor, explanation and use of index letters can be left out and raw numbers and distribution among water quality groups can be used to informally estimate water body quality. If time permits, students can discuss possible impacts to water quality in general and the sampled water body in particular.

5. After completion it is important that all participants wash their hands well with soap and water. This is especially important with small children and when samples were collected from areas of questionable sanitary condition.

Analysis

The survey forms explain the use of letter coding to tally both the presence and population of each indicator group found. The number of letters in each water quality group is determined and then multiplied by the appropriate group factor (ie. # of letters x 3 = index value for sensitive indicators, # of letters x 2 = index value for somewhat tolerant indicators, and # of letters x 1 =

index value for tolerant indicators). These values are added together to get a total index value. Values > 22 indicate excellent water, values of 17-22 are good, 11-16 is fair and < 11 indicates poor water quality.

Remember, the important point is not to have all good water species and no bad water species. Instead, a high quality water body will have a wide diversity of all indicator types from sensitive to tolerant, with, hopefully, a larger number of sensitive or moderately tolerant organisms. Also, this survey was originally designed for clear, flowing northern U.S. streams. Although scores and techniques have been modified slightly, it does not always accurately assess Louisiana, and especially South Louisiana waters. Obviously, if you sample a relatively clear, fast moving central Louisiana stream you will have different results than if you sampled a farm pond or bayou. Both water bodies may have perfectly operating environments with no pollution impacts; however, the stream will have many sensitive indicators such as mayflies and probably rank as having excellent quality, while the pond will probably have more moderately tolerant organisms such as dragon flies and give a rank of good or fair. This is primarily due to oxygen levels, water temperature and habitat availability.

Sampling which finds little variety in the type of macroinvertebrates found, but high populations of each may indicate water enriched with organic matter. Locating only one or two types of macroinvertebrates in very high abundance indicates severe organic enrichment. If a good variety of organisms was found but at low numbers then toxic pollution may be indicated; however, other problems could also cause reduced populations. This program works best when the same or very similar water bodies can be sampled over time so that results can be compared. However, since use of the sampling program for demonstration purposes generally precludes that possibility, it is up to the instructor to gain as much familiarity as possible with what can be expected of different water bodies. This will allow reasonable comparisons and interpretation of what is found in the demonstration water body.

Extensions

This program lends itself to a number of possible extensions and discussions. Aspects of water pollution can be discussed in association with what pollution does to the life of a water body. Discussions on food webs can begin with vegetation and algae growing in water and continue all the way to fish and humans. The macroinvertebrates found during the program form a lower or middle area of the food web, between vegetation and minnows or larger fish. Within the macroinvertebrates there are good examples of smaller food webs because some of the organisms are grazers or detritivores on the fungus and plants (mayflies and stoneflies); some are filter feeders (caddisflies); and some are carnivores (dragon flies and damselflies). If a relatively good microscope is available, placing a drop of water on the slide and allowing students to look at it on their own will show an entire new layer of the food web in the diatoms, flagellates and other microorganisms present.

The concept of watersheds is an important aspect of water pollution control which can be discussed either before or after the sampling program. A watershed is the land area which acts as a collection basin for rainwater which eventually flows to a single stream or river. Watersheds can be as small as a single valley and creek or as large as the Missouri, Mississippi and Ohio River system and its myriad tributaries. This watershed encompasses 30 states in the continental U.S. stretching from Montana in the west to New York in the east, and all the way north into Canada.

Nonpoint source pollution is another aspect of water pollution which can frequently be identified by macroinvertebrate sampling techniques. Stream sampling, along with field scouting of the watershed can frequently locate water quality problems not readily identified by conventional water quality sampling. The Louisiana Department of Environmental Quality, Office of Environmental Assessment maintains a Nonpoint Source (NPS) Program which can provide more information on this important form of water pollution. The NPS program also works with citizen environmental groups to establish Citizens' Monitoring Programs on area streams. Students who wish to pursue this area can be encouraged to contact the department at (225) 765-0355 for more information.

Build Your Own Aquifer

Home | Up | What is New? | Events / Notices | Search | About This Site | Your Comments

Safe Drinking Water Lesson:

Build Your Own Aquifer

BACKGROUND:

Many communities obtain their drinking water from underground sources called **aquifers**. Water suppliers or utility officials drill wells through soil and rock into aquifers for the groundwater contained therein to supply the public with drinking water. Home owners who cannot obtain their drinking water from a public water supply, will have their own private wells drilled on their property to tap this supply. Unfortunately, the groundwater can become contaminated by harmful chemicals, including improper disposal of household chemicals such as lawn care products and cleaners and any number of other pollutants. These chemicals can percolate down through the soil and rock and into the aquifer - and eventually the well. Such contamination can pose a significant threat to human health. The measures that must be taken by well owners and operators to either protect or clean up contaminated aquifers is quite costly.

NOTE: This demonstration should follow a class discussion on potential sources of pollution to drinking water supplies.

OBJECTIVE:

To illustrate how water is stored in an aquifer, how groundwater can become contaminated, and how this contamination ends up in the drinking water well. Ultimately, students should get a clear understanding of what happens above the ground can potentially end up in the drinking water below the ground.

MATERIALS NEEDED:

1 6" x 8" clear plastic container that is a least 6-8" deep (shoe box or small aquarium)
1 lb. of modeling clay or floral clay
2 lbs. of white play sand
2 lbs. of aquarium gravel (natural color if possible) or small pebbles
(As any small rocks may have a powdery residue on them, you may wish to rinse them and dry on a clean towel prior to use. It is best if they do not add cloudiness to water.)

1 drinking water straw
1 plastic spray bottle (be sure the stem that extends into the bottle is clear)
1 small piece (3 x 5) of green felt
1/4 cup of powered cocoa
red food coloring
1 bucket of clean water and small cup to dip water from bucket
scotch tape

PROCEDURE:

1. To one side of the container place the small drinking water straw, allowing approximately 1/8 of an inch clearance with the bottom of the container. Fasten the straw directly against to the long side of the container with a piece of tape. Explain to the students that this will represent two separate well functions later in presentation (if not placed at this time, sand will clog the opening).

2. Pour a layer of white sand completely covering the bottom of the clear plastic container, making it approximately 1 " deep. Pour water into the sand, wetting it completely, but there should be no standing water on top of sand. Let students see how the water is absorbed in the sand, but remains around the sand particles as it is stored in the ground and ultimately in the aquifer.

3. Flatten the modeling clay (like a pancake) and cover of the sand with the clay (try to press the clay into the three sides of the container in the area covered). The clay represents a "**confining layer**" that keeps water from passes through it. Pour a small amount of water onto the clay. Let the students see how the water remains on top of the clay, only flowing into the sand below in areas not covered by the clay.

4. Use the aquarium rocks to form the next layer of earth. Place the rocks over the sand and clay, covering the entire container. To one side of your container, slope the rocks, forming a high hill and a valley. Now pour water into your aquifer until the water in the valley is even with your hill. Let students see the water around the rocks that is stored within the aquifer. They will also notice a "**surface"** supply of water (a small lake) has formed. This will give them a view of both the ground and surface water supplies which can be used for drinking water purposes.

5. Next, place the small piece of green felt on top of the hill. If possible, use a little clay to securely fasten it to the sides of the container it reaches.

6. Using the cocoa, sprinkle some on top of the hill, while explaining to students that the cocoa represents improper use of lawn chemicals or fertilizers, etc.

7. Use the food coloring and put a few drops into the straw, explaining to students that often old wells are used to dispose of farm chemicals, trash and used motor oils. They will see that it will color the sand in the bottom of the container. This is one way pollution can spread through out the aquifer over time.

8. Fill the spray bottle with water. Now make it rain on top of the hill and over the cocoa. Quickly students will see the cocoa (fertilizer/pesticide) seep down through the felt and also wash into the surface water supply.

9. Take another look at the well you contaminated. The pollution has probably

spread further. Now remove the top of the spray bottle and insert the stem into the straw, depress the trigger to pull up the water from the well. (Water will be colored and "polluted.") Explain that this is the same water a drinking water well will draw up for them to drink.

Water Filtration

Safe Drinking Water Lesson: Water Filtration

BACKGROUND:

Water in lakes, rivers, and swamps often contains impurities that make it look and smell bad. The water may also contain bacteria and other microbiological organisms that can cause disease. Consequently, water from surface sources must be "cleaned" before it can be consumed by people. Water treatment plants typically clean water by taking it through the following processes: (1) **aeration;** (2) **coagulation;** (3) **sedimentation;** (4) **filtration;** and (5) **disinfection.** Demonstration projects for the first four processes are included below:

OBJECTIVE:

To demonstrate the procedures that municipal water plants use to purify water for drinking.

MATERIALS NEEDED:

5 Liters of "swamp water" (or add 2 cups of dirt or mud to 5 liters of water)
1 Two liter plastic soft drink bottle with its cap (or cork that fits tightly into the neck
2 Two liter plastic soft drink bottles - one bottle with the top removed and one bottle with the bottom removed.
1 One and one half Liter (or larger) beaker or another soft drink bottle bottom
20 grams of alum (potassium aluminum sulfate - approximately 2 tablespoons; available in pharmacy or spice isle in grocery store)
Fine sand (about 800 ml in volume)
Coarse sand (about 800 ml in volume)
Small pebbles (about 400 ml in volume) (Hint: washed natural color aquarium rocks will work)
1 large (500 ml or larger) beaker or jar
1 coffee filter
1 rubber band
1 tablespoon
A clock with a second hand or a stopwatch

PROCEDURE:

1. Pour about 1.5 L of "Swamp Water" into a 2 L Bottle. Have students describe the appearance and smell of the water.

2. **Aeration** is the addition of air to water. It allows gases trapped in the water to escape and adds oxygen to the water. Place the cap on the bottle and shake the water vigorously for 30 seconds. Continue the aeration process by pouring the water into either one of the cut-off bottles, then pouring the water back and forth between the cut-off bottles 10 times. Ask students to describe any changes they observe. Pour the aerated water into a bottle with its top cut off.

3. **Coagulation** is the process by which dirt and other suspended solid particles are chemically "stuck together" into floc so that they can be removed from water. With the tablespoon, add 20 g of alum crystals to the swamp water. Slowly stir the mixture for 5 minutes.

4. **Sedimentation** is the process that occurs when gravity pulls the particles of floc (clumps of alum and sediment) to the bottom of the cylinder. Allow the water to stand undisturbed in the cylinder. Ask students to observe the water at 5 minute intervals for a total of 20 minutes and write their observations with respect to changes in the water's appearance.

5. Construct a filter from the bottle with its bottom cut off as follows:

a. Attach the coffee filter to the outside neck of the bottle with a rubber band. Turn the bottle upside down and pour a layer of pebbles into the bottle - the filter will prevent the pebbles from falling out of the neck.

b. Pour the coarse sand on top of the pebbles.

c. Pour the fine sand on top of the coarse sand.

d. Clean the filter by slowly and carefully pouring through 5 L (or more) of clean tap water. Try not to disturb the top layer of sand as you pour the water.

6. **Filtration** through a sand and pebble filter removes most of the impurities remaining in water after coagulation and sedimentation have taken place. After a large amount of sediment have settled on the bottom of the bottle of swamp water, carefully - without disturbing the sediment - pour the top two-thirds of the swamp water through the filter. Collect the filtered water in the beaker. Pour the remaining (one-third bottle) of swamp water back into the collection container. Compare the treated and untreated water. Ask students whether treatment has changed the appearance and smell of the water.

NOTE: Advise students that the final step at the water treatment plant is to add disinfectants to the water to purify it and kill any organisms that may be harmful. Because the disinfectants are caustic and must be handled carefully, it is not presented in this experiment. The water that was just filtered is therefore unfit to drink and can cause adverse effects. It is not safe to drink!

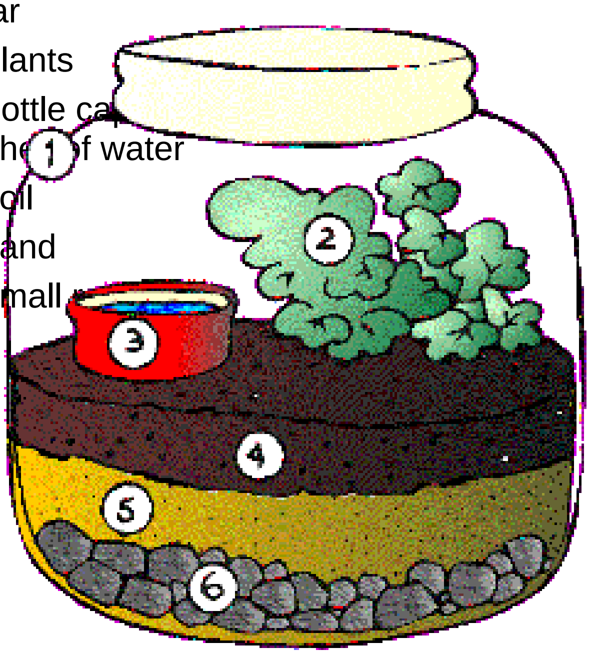
Make a Water-Cycle Model

Make a Water-Cycle Model

You will need:

1. jar
2. plants
3. bottle ca
   she f water
4. so l
5. s nd
6. small



Fill jar as in the picture and put the lid on. Put the jar in a sunny place and see how the water cycle works.

The Water Facts of Life

Last updated: 01/23/97

Source:

United States Environmental Protection Agency
Office of Water
EPA 810-B-95-001
January 1995

Did You Know?

- There is the same amount of water on Earth today as there was 3 billion years ago.
- Three percent of the water on Earth is freshwater and only 1 % is available for human consumption.
- Sixty-six percent of a human being is water.
- Seventy-five percent of the human brain is water.
- Seventy-five percent of a living tree is water.
- You could survive about a month without food, but only 5 to 7 days without water.
- On the average, each American uses about 160 gallons of water a day at a cost of 27 cents.
- Bottled water may cost up to 1000 times more than municipal may not be as safe.

- Two-thirds of the water used in an average home is used in the bathroom.
- Typically 4 to 6 gallons of water are used for every toilet flush.
- On the average, a person uses 2 gallons of water to brush his or her teeth each day.
- A 10-minute shower uses about 55 gallons of water.
- A leaking faucet can waste up to 100 gallons of water a day.
- The average person spends less than 1 % of his or her total personal expenditure dollars for water, waste water, and water disposal services.
- There are about 60,000 community water suppliers in America.
- Pubic water supplies must meet or exceed Environmental Protection Agency standards. Many public water supplies consistently supply water that is much better than the minimum standards.
- The Amendment to the Safe Drinking Water Act in 1986 increased the number of contaminants to be regulated from 26 to 83 and expanded EPA's enforcement authority.
- If a drinking water supplier violates any federal standard, the utility by law must tell the customer.
- Current water treatment methods are designed to make drinking water clear and to kill germs.
- The pipes that carry drinking water from treatment plants to homes are regularly cleaned.
- It takes about 39,000 gallons of water to produce the average domestic auto, including tires.
- It is not safe for hikers and backpackers to drink water directly from remote streams.
- One gallon of gasoline can contaminate approximately 750,000 gallons of water.
- You can help prevent pollution of drinking water sources by carefully disposing of the chemical products you use in your home.
- An acre of corn contributes more to humidity than a lake of the same size.

WATER WASTE & POLLUTION

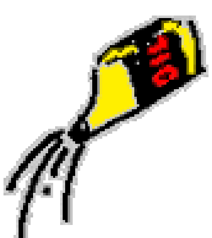
(Embarrassing Moments in the Life of a Water Drinker)

Waiting a week to fix a leak.

Assume little leaks only waste a little water? You can lose up to 200 gallons of water a day from a leaking toilet. And a faucet can drip 604,800 drops while you are waiting.

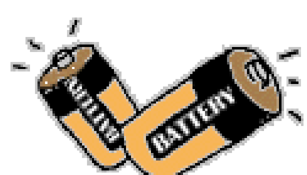
Taking a shortcut and using the hot water tap when cooking.

That's taboo, and it can shortcut your health. Lead can dissolve into hot water from lead pipes and solder. Cold water is better. Heat it on the stove when cooking or making baby formula.



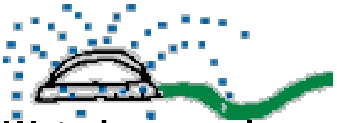
Slipping used motor oil into a storm sewer or burying it in the trash.

Hey slick, oil can leak into lakes, rivers, and wells. Just one pint can expand over an acre of water. Take your used oil to a recycling center.



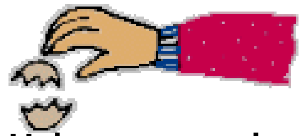
Tossing toxics in the trash.

How tacky! Consider batteries, a common throw-away. They contain lead and mercury. Some ordinary household cleaners have other poisons that contaminate water. Here's a tip, drop them off at a special collection site.



Watering your lawn at high noon.

Caught with your sprinkler on? The hot sun will evaporate the water your lawn needs. Better water early in the day.



Using your garbage disposal all the time.

Want to show good taste after a meal? With your disposal using one gallon of water a minute, you'll be creating a great soil conditioner.

The Five Senses

Ollie L. Jamison
9340 S. King Drive.
Chicago IL 60619
(312) 785-0029

Delano Elementary School
3937 W. Wilcox Street
Chicago IL 60624
(312) 534-6620

Objective:

This lesson was designed for primary grades 1-3. The main objective of this mini-teach is to tell how important the five senses are: to name and identify the five senses; to demonstrate the ability to identify objects through the use of the five senses; to discover the sense of touch as a way to identify the smooth, rough, hard, and soft properties of an object; to discover that sounds and smells are a sources of information; we feel with our skin, we can recognize objects by their touch; and to demonstrate how sound is heard.

SIGHT

Materials Needed:

Use familiar objects from the classroom; horn toy, car, eraser, magnifying glass, marker, crayons, plastic ball and sea shells.

Strategy:

Line up objects on a table and ask the students to identify them. Tell them to close their eyes. While you remove one of the objects let them open their eyes and see if they can tell which object is missing. Let the children take turns playing the game.

The game may be varied in the following ways:

1. Increase the number of objects.
2. Remove more than one object from the group while the child is blindfolded.
3. Place objects in random order instead of in a straight line.
4. Add an object to the group instead of taking one away.
5. Let the child see the object. Blindfold the child and let him try to identify the missing object by feeling the remaining objects.

TOUCH

Materials Needed:

Blindfold, paper towel (Bounty)

Strategy:

Place small brown paper bags, numbered 1-8, on table with objects in each bag. Examples of objects are measuring spoons, candy eggs, sea shells, play turtle. The pupils are to guess what's in the bag by touching and feeling each bag.

TASTE

Materials Needed:

Various foods for a tasting party. Lime, lemon, oranges, plum, kiwi, grapefruit, peaches, salt and sugar mixed, cucumber slices.

Strategy:

A guessing game. Meet in a small group. Let students identify food by taste. Blindfold student, give him or her some food to taste and ask to identify the taste. Is it sour, sweet, salty, or bitter?

SMELL

Materials Needed:

Glass jar with lids, table, cotton balls, cologne (Eternity), black pepper, baby oil, shower gel, garlic powder, bleach.

Strategy:

Place objects in jars. Tell the students that they are going to play a guessing game. **YOUR NOSE KNOWS**: You are to identify each object by its odor.

HEARING

Materials Needed:

Metal spoon, wire hanger. 2 feet of kite string, ruler.

Strategy:

1. Tie the handle of the spoon or hanger in the center of the string.
2. Wrap the ends of the string around both fingers. Be sure that both strings are the same length.
3. Place the tip of your index finger in each ear.
4. Lean over so that the spoon or hanger hangs freely and tap it against the side of the table.

Results:

It will sound like a church bell because the metal in the spoon starts to vibrate when struck. These vibration are transmitted up the string to the ears. Objects must vibrate to produce a sound.

Performance Assessments:

TASTING Activity:

Answer the following questions:
1. Why do hot peppers make my mouth burn?
2. How many different flavors can I taste?
3. How do I taste food?
4. Why does my mouth water when I see or smell certain foods?
5. Why do I like some foods better than others?

SMELL:

Answer the following questions:
1. What are your favorite smells?
2. What smells make you hungry?
3. What smells make you sneeze or make your eyes water?
4. What smells make you think about being clean?
5. Where can you find many different smells?

Make a book about smells. Look through newspapers or magazines. Find pictures of things you like to smell. Cut out pictures and tape or glue them onto pieces of paper. Fasten papers together to make a book "Things I Like To Smell."

HEARING:

Answer the following questions:
1. Why do my ears pop in an airplane?
2. What is sound?
3. How do I hear?
4. Can I hear things when I'm asleep?
5. How do deaf people communicate?
6. How well can animals hear?

Conclusion:

At the conclusion of this mini-teach the students will be able to identify the five senses, and relate these five senses to everyday life.

OUTSIDE ACTIVITY:

Name, identify and describe objects that are related to the five senses.

Smell	Touch	Seeing	Hearing	Taste

-SMILE-

Science and Mathematics Initiative for Learning Enhancement

The SMILE program is designed to enhance the elementary and high school learning of Science and Mathematics through the use of the phenomenological approach. For a brief course description/syllabus click here.

Between 1986 and 1997 each summer session participant was asked to create and publish a single concept lesson plan. These lesson plans include the materials needed, a suggested strategy and expected outcomes. There are currently almost 900 of these lesson plans available (see subject indices below). In addition, starting in 1997 the participants in the academic year program have been asked to present a brief single concept lesson or idea. Summaries of the academic year lessons are at academic year notes. All of these lessons are available in the following formats:

1. A book of each summer's lessons. The cost of a book of all of the lessons developed during a single summer is $10.00. Contact Dr. Porter Johnson (312) 567- 5745, Dr. Ken Schug (312) 567-3438 or the departmental office at IIT (312) 567-3480 for availability.
2. A CD-ROM with all of the lessons (summer and academic year) and links from both this and the SMART web sites for $15.00US to a US address ($20US outside the United States). Contact Roy Coleman at Morgan Park High School (773) 535-2550 for availability.
3. Listings by subject are available by linking to any of the following:

Physics

Awards and Reviews

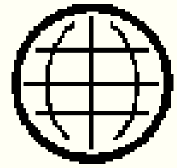
Education Planet	Schoolzone International	NSTA Scilinks

StudyWeb	Big Chalk	Actionbioscience
Wired Patrol	Psigate	Schoolsnet

NOTE: If the following looks really bad or your browser doesn't support tables, try the old home page.

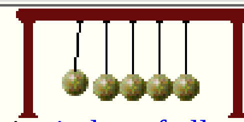
If you have a single concept lesson that you think might fit in with the SMILE concept or would like to see some lessons which have been contributed by persons other than SMILE participants jump to contributed lessons	SMILE has bi-weekly classes during the academic year and we are posting the notes from those classes. If you are interested, jump to academic year notes.
The SMILE PLUS program is a program designed for intensive training of a team of teachers who are from the same school. These teachers then go back to their home schools to provide inservice training for the remainder of the faculty and staff.	This section includes some general information developed by the SMILE program. • Information on Science Fairs: How to start and run a Science Fair, Chicago Public Schools Science Fair information and NEIU's Science Fair Central. • Sources of reference material • Sources of hands on science equipment in the Chicago area

Photos of the 1997, 1998, 1999 and 2000 SMILE participants in action.



Web Addresses of internet sites for general interest in Science.
IIT will occasionally offer Saturday classes for teachers and students on the World Wide Web and searching the Internet. For more information, contact Dr. Porter Johnson

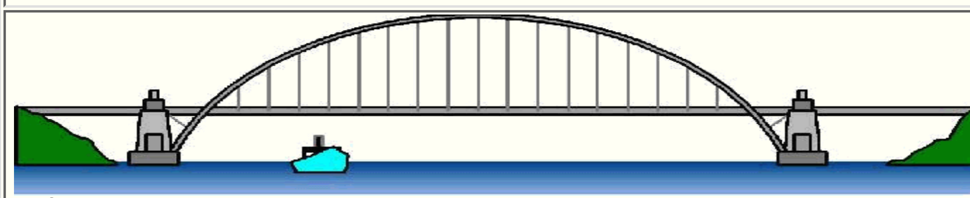
Fall 2004 schedule of classes.
First class and registration will be September 14.
Visitors are welcome to sit in on many of the classes.



The entire index of all sections is also available for you to search with your browser. However, be aware that this index is about 100K and takes a while to transfer.

Additional lessons can be found on the SMART website.

The SMART program is made possible by a generous grant from the Lucent Technologies Foundation.



Information on the High School Bridge Building Contest is available at the 'hsbridge' website.

NOTE: The area code of most of Chicago is now 773. IIT, however, is still in the 312 area code.

Introduction To The Periodic Table

Estellvenia Sanders
P. O. BOX 379291
CHICAGO IL 60637

Chicago Vocational
2100 E. 87 Street
CHICAGO IL 60620
(773) 535-6100

Objective(s):

The purpose of my mini-teach is to introduce various methods of presenting the Periodic Table which identifies the various elements. I will also be introducing some terms and common phrases used in American Sign Language because most of the students I work with are Deaf and Hard of Hearing and I think that it would be most beneficial for the instructors to become familiar with these terms in the event that some Deaf and or Hard of Hearing students are in their classes.

The students will be able to identify the scientist who first wrote the Periodic Table

The students will be able to identify the scientist who amended the Periodic Table

The students will be able to state (or write) specific data relating to the history of the Periodic Table

The students will identify at least five elements which have been represented on the Periodic Table

The students will identify at least two components of the Periodic Table (Metal or Non-Metal)

TITLE: **SCIENCE IN SIGN, PART XVII.**

-

INTRODUCTION TO THE PERIODIC TABLE

-

GRADE LEVEL: 9 – 12 AS WELL AS ELEMENTARY GRADES

Materials:

1 LG. PERIODIC TABLE

1 TV/VCR

1 MOVIE ’THE PERIODIC TABLE’

HANDOUTS ‘THE PERIODIC TABLE’

HANDOUTS ‘THE ZAGHOUSE’

PAPER CUPS

TOOTH PICKS

GUM DROPS

MAGIC MARKER

CHALK BOARD

-

Strategy:

I will begin my presentation by stating my name and finger spelling my name simultaneously.

I will introduce my presentation as Science In Sign part 17 and give the name of my

Presentation “An Introduction to the Periodic Table”.

There will be ten words listed on the chalkboard “VOCABULARY” which I will “sign”

for the students and have the students “sign” after me first and then by themselves.

Once the students have completed the vocabulary, I will explain the brief information to be presented in the movie “The Periodic Table’ (10 min.).

After the movie has been shown, the students will be given their copies of the Periodic

Table and we will discuss the scientists referred to in the film and what promoted each to begin his work. (8 min.)

The students will be given one package of characters, each facing different directions, the hair, fingers, legs, and/or facial expressions will indicate which column it belongs to.

The students will be told that each character must be placed in order by the identifying

Characteristics.

The students will be able to see, once characters are in order, the Periodic Table will be completed. The students will discuss the Zag House for five or six minutes. Remember, science has no definite order.

The culminating activity is that the students will create elements represented on the Periodic Table

Each student will be given several toothpicks of varied lengths, gum drops (at least 20), plastic containers, and element work sheet which will identify specific elements which are to created using the gumdrops. Each student will complete their elements and tell the class what the elements are, identify the number of protons and neutrons in each element (i.e. Hydrogen=1 proton, therefore, the tooth pick would only have one gum drop on it).

The time allotted for this activity will be 15 minutes.

Performance Assessment:

-

The students will complete a quick quiz sheet identifying specific elements and the names of the scientists named in the movie.

There will also be time allotted for questions and answers, critique, and methods to improve and/or change the presentation.

Conclusion:

I will conclude my presentation by asking specific students to sign the vocabulary words which were presented at the beginning of the session, ask the names of the two scientists named in the movie, and remind them that as educators/ teachers in the main streamed class room, we must always use various methods to introduce topics such as the Periodic Table in ways which will hold the students interest and their attention.

I will also emphasize that science is one of the most difficult subjects for students who are Deaf, Hard of Hearing, and Hearing Impaired and that there may be times that the language and the method in which the lesson is present should be modified to meet the students' needs and assure their comprehension of the subject matter. This will also assure the instructor that the student is 100% or at least 99% confident that he or she will pass the class or at least leave with a good working knowledge about the subject.

Rubric:

Because class participation is a prime factor, the students will receive 25 points extra credit for completion of both activities

-

QUIZ (10 QUESTIONS)

10 POINTS PER QUESTION

100—90 A

89 ---80 B

79 ---70 C

69 ---50 D

BELOW 50 MEANS THAT THE STUDENTS NEED MORE TIME ON ASSIGNMENT.

Tempting Temperatures

Marjorie Fields
5935 W. Superior
CHICAGO IL 60644

Ella Flagg Young
1434 N. Parkside
CHICAGO IL 60651
(773) 534-6200

Objective(s):

The students (K-3) will be able to define what a thermometer is and observe changes in temperature using a thermometer.

Materials Needed:

Two thermometers, two empty pop cans labelled A and B, water, measuring cup, and a refrigerator with a working freezer, stop watch or clock with a second hand

Strategy:

Day 1
Fill each can half full of water
Place Can A in the refrigerator and Can B in the freezer
Make a chart
The chart should show the temperature of both thermometers before they are inserted into the cans. Times are charted at five minute intervals (5 minutes, 10 minutes, 15 minutes).

Day 2
Remove both cans from the refrigerator/freezer
Leave both cans out for one hour
Before conducting the test get out your chart
Write on the chart the temperature of the thermometer before it is inserted into the cans
Place the thermometers in the holes at the top of the can
Record the temperatures on your chart after 5 minutes, 10 minutes and 15 minutes on your chart

Performance Assessment:

Using the chart students should be able to fill in the appropriate numbers and symbols that represent temperature and orally explain their observations.

Conclusions:

Using the exam below (Note:This can be administered in written form or orally), students should be able to obtain 80% mastery.

1. How many cans were used?
2. How many thermometers were used?
3. How much water was put in each can?
4. Where was Can A placed?
5. Where was Can B placed?

6. On day 2, how long were the cans left out in the classroom?
7. How do you write 70 degrees? (Teacher directed)
8. Was there a difference in Can A and Can B after 5 minutes, 10 minutes and 15 minutes?
9. What were the differences?
10. Ask students what did they learn from this activity?

Air: Demonstrating Its Presence and Effects

Porter Johnson
406 N Elmwood Avenue
Oak Park IL 60302-2226
(708) 383-2846

Illinois Institute of Technology
Biological Chemical Physical Sciences Dept
Chicago IL 60616-3793
(312) 567-5745

Objective:

To examine the effect of air pressure in a series of experiments that highlight the consequences of the presence of our atmosphere, aimed at grades 6-12.

Materials Needed:

1. A supply of sturdy 6" or 9" balloons [available at "party stores"]
2. Heat Source [hot plate or Bunsen burner], tongs
3. A supply of aluminum soft drink cans, a water bucket
4. Heavy flat smooth rubber mat material [available at American Science Center]
5. String, heavy scissors, metal washers, metersticks, stopwatches
6. A supply of coffee filters, tea bags, matches
7. Stick and propeller blade [available at American Science Center]

Strategy:

We live at the bottom of a 10 km ocean of air. The density of air is about 1/1000 that of water, so that air pressure corresponds to the pressure of a water column of 10 meters [40 feet]. In these experiments we examine the effects of air pressure.

Ethnic Rocket Launch: Remove the cord and staple from a dry tea bag [Lipton or other unflavored] and empty its contents. Form the bag into a hollow cylindrical "silo" and stand it erect. Light the top of the bag. The bag will burn quickly with little residue. As fire reaches the bottom, the bag will rise. A column of warm air aids the launch, which can be quite spectacular.

Dropping Coffee Filters: Modern physics began when, some 500 years ago, Galileo Galilei dropped metal balls of different sizes from the "leaning tower" of Pisa, and observed [or at least claimed to see] that they hit the ground at the same time, in contrast to expectations that the heavier ball would fall more quickly. Galileo had in mind neglecting air resistance.

By contrast, when an empty coffee filter [Mr Coffee or clone] is dropped [nose pointing down], air resistance is not negligible. Drop a coffee filter from heights of one meter and two meters, and measure how long it takes to hit the ground. [We observed that it took circa 1.15 seconds to hit the ground from one meter, and about 2.30 seconds from two meters.] Note that, as the distance is doubled, the time required also doubles. This is an indication that, for most of its travel, the filter is moving with constant speed, the force of gravity [downward] being balanced by air resistance [upward].

Next, put several filters together, so as to increase the mass of the system, while keeping its profile fixed. Measure the time for several coffee filters to fall. We observed the following times from a height of 2 meters:

Number of Filters	Time

1	2.30 sec
2	1.60 sec
3	1.30 sec
4	1.15 sec

We saw that one coffee filter falls through one meter in the same time as the four coffee filters took to fall through two meters. Drop them simultaneously to determine whether they hit at the same time. **[Note: the force of air resistance appears to be a quadratic function of the velocity of the filter.]**

Crushing the Can: Put about 50 cubic centimeters [2 ounces] of water in the bottom of an aluminum can. Heat the can until the water inside begins to boil. Then, take the tongs, turn the can upside down, and push it directly into the water in the bucket. Observe the resulting collapse of the can. The air inside the can has been displaced by water vapor, which condenses when the can enters the cool water. Air pressure on the outside pushes the can inward. This crushing force of air pressure is always present in our environment.

Rubber Mats: Get a supply of heavy flat smooth rubber mat material [about 3-5 mm thickness]. Cut the material into rings of diameter about 30 cm with heavy scissors. Punch a hole through the center of the disc, and push a fairly heavy string through the hole. Tie a metal washer to the string, so that the string will not pull back through the hole. Place the disc on a smooth solid surface, and press the air out from under the disc. Pull up on the cord. If the seal is properly made, you will not be able to pick up the disc with the cord, because you must overcome air pressure [approximately 15 pounds per square inch, or 10000 kilograms per cubic meter].

Measuring Lung Volumes with Balloons: Have every member of the class take a standard 9" balloon, making it limber by blowing it up a few times. After some practice, each class member should fill his/her lungs, expel one full breath into the balloon, and measure the diameter of the balloon. **[Note: Not everybody knows how to blow up a balloon!]** Calculate the volume **V** of the balloon [assume a spherical shape] from its diameter **D** using the formula:

$$V = PI\ D^3 / 6$$

where PI = 3.1416, and D^3 is "**D**-cubed". Then, record the age and height of each participant. Here is a data table for the current SMILE class.

LUNG VOLUME TABLE

Participant Number	Age (years) **A**	Height (in) **H**	Diameter (cm) **D**	Volume (liters) **V**	Fit Volume (liters) **V-fit**
#1	54	71	17	2.57	2.58
#2	37	64	18	3.05	2.85
#3	60	66	17	2.57	1.91
#4	28	70	20	4.19	3.75
#5	28	56	14	1.44	2.66
#6	42	62	15	1.77	2.46
#7	7	40	18	3.05	2.43

The last column in the table is calculated from a "least squares" fit to data with the formula

$$V = -.048 A + .078 H - .353 .$$

The standard deviation of this fit was **+/- 0.66 liters**. A variation of this method of measuring lung volume and comparing with standard formulas is used by medical clinicians to detect lung damage.

Helicopter Blades:

Attach a light plastic propeller to a stick. With the propeller held up, launch the stick by giving it a spin and throwing it up in the air. Depending upon the direction of the spin, the rocket will either accelerate upward, or else plummet to a quick crash. Try launching the rocket with the propeller pointed down, and note the direction of the spin in relation to its motion.

Performance Assessment:

In medieval times in the city of Magdeburg [in Saxony Province; formerly East Germany], two metal hemispheres of diameter circa **30 cm** were connected through an airtight seal, and the air was pumped out of the interior. Teams of horses were then connected to each of the hemispheres. The teams of horses could not pull the hemispheres apart. Using the concept of air pressure, explain this result.

Conclusions:

The effects of air pressure are sometimes subtle and sometimes dramatic. There is a wide variety of classroom demonstrations of the existence of air and its effect in our environment.

Density

Marilyn Martello
920 Frances Pkwy
Park Ridge IL 60068

Clinton
6110 N Fairfield
Chicago IL 60659
(312) 534-2025

Objectives:

Grade 6-8
To discover what properties determine the phenomenon of objects able to float and objects able to sink.
To identify these properties as mass and volume.
To apply density to the three different types of matter: solid, liquid, and gas.

Materials Needed:

For 4 groups of 4 students:
8 objects that will float, 8 objects that will sink (it is important that the objects chosen should differ greatly in density so that when you plot your graph, the objects which float should be way below water density and the objects which sank should be way above the density of water)
4 plastic pails filled 3/4 with water
2 scales with measurements in grams
4 beakers with these measurements: 200ml, 500ml, 1000ml, 2000ml
3 graduated cylinders measuring 25ml, 100ml, 1000ml
4 oz cooking oil, 4 blue colored ice cubes
12 oz clear glass

Strategy:

In the 12 oz glass, put in oil and ice cubes and set aside. Choose an object which will float and one which will sink. Tell the class you have two objects you want them to observe. Drop them into a clear beaker filled 3/4 way with water and ask what happened. Students will suggest that weight is a factor that made one object sink. At this point instruct the class to divide themselves into groups of 4, come and choose an object of their choice, weigh their object, put the object in water, and record their findings on a chart on the board as follow:

Name	Object	weight	sink or float

After everyone had recorded their findings, have the class look at the chart to find any type of pattern (there won't be any). Guide the class to discover that volume of an object is another factor that needs to be explored. Show how to measure the volume of an object by displacement of water using a graduated cylinder. Drop an object into the cylinder filled 3/4 way with water. The water level will rise. Tell the class that they are to mark the water level before and after the object has been dropped. Take the difference between the two markings and record it on the column marked volume on the board (add a volume column to the chart). When everyone has completed their data, explain to the class that they have found the density of their object. Write the formula on the board: Density = Mass/Volume or D = M/V. Using the data from the chart, construct a graph plotting the volume vertically and the mass or weight horizontally. Ask if anyone sees a pattern as to why some objects floated while others sank (again there is none). Point to the fact that we need to plot the density of water on the graph also because the objects were floating in that medium. Help the class measure and weigh water using different amounts 3 times and plot the data on the graph. Draw a line connecting the water "dots" on the graph. Ask the class to look at the graph again. Using the information on the graph, ask if anyone can now explain why some objects floated and why others sank. If no one has the correct explanation, circle the "dots" of the objects which floated (they should all be above the water line). Point to the fact that all the floating objects are above the water line and the ones which sank are below the line. In other words, objects less dense than water will float and objects more dense than water will sink. Apply this concept to gases. Ask the class why does a balloon filled with helium floats in air (helium is less dense than air therefore it rises).

Performance Assessment:

Show the class the 12 oz glass containing the oil and ice cubes (the ice should have melted enough to form a blue fluid accumulation at the bottom of the glass).
Ask: Which fluid is more dense, the oil or the blue water?

Return to Physics Index

Air Movement

Lisa C. Ingram
8848 S. Marshfield
Chicago IL 60620
(312)238-9083

Frederick Douglass Middle Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

To understand the existence and movement of air. Designed for grades 5 through 8.

Materials Needed:

air cannons
apples
tape
plastic bag
kleenex
a book
playing cards
a bowl
colorful smokebombs
a cup
a piece of paper

Strategy:

Teacher will walk around the room with an air cannon. Teacher places items on top of the head of someone and knocks it over with the air cannon. Teacher hits the air cannon, so that air will touch someone. Teacher will ask students, what is inside of this object? Wait for responses. Talk to students about air being everywhere. That it is all around you, even things that look as if they are empty are really full of air.

Experiment 1: Teacher will tape two apples on strings from a door frame or from something else. They should hang about 3cm (1in) apart, and level with your mouth. Wait until the apples are steady then blow hard between them.

Question? Do the apples move apart or together? Why?

Answer: When you blow, you make air between the apples move. This moving air has less pressure than the still air on either side of them. So the still air pushes the apples together.

Experiment 2: Teacher will hold a plastic bag open, pull it through the air to trap some air in it, then close it. Tell the students that you can't see the air in the bag but you can feel how firm and squashy it is.

Question? If you have an empty bag, does it have air in it?

Answer: Yes, air is everywhere, even though you can't see it.

Experiment 3: Teacher will put bits of kleenex on a flat surface and drop a book on them. The bits of paper blow away because the falling book pushes air out of the way and makes a wind.

Question: Does air move things?

Answer: Yes, air moves and vibrates things.

Experiment 4: Teacher explains that air not only moves things, it can also slow things down that move through it. Ask two volunteers to come up and stand on chairs. Below them place a wide bowl. Hand each student some playing cards. Have one student drop their cards end up. Have the other student drop their cards face down.

Question? Which cards fell in the bowl the most? Why?

Answer: The cards dropped faced down usually landed in the bowl because the air pushing up beneath it escapes fairly evenly all around it, so it falls straight down. The card dropped end up, swoops to one side.

Experiment 5: The teacher will take an empty glass (let the students observe the empty glass) and submerge it into water. The teacher will ask students to predict whether or not the paper inside the glass will get wet or not.

Question? Why didn't the paper get wet?

Answer: The air keeps nearly all the water out. (Teacher can tilt the glass to show water going into the cup)

Experiment 6: The teacher will divide the class into groups of a number that will vary. Each group will be given an air cannon. Inside the air cannon will be a colorful smoke bomb. Each group will go in an open area and take turns shooting their air cannons. All students should observe the colorful smoke rings, which are air.

Performance Assessment:

Students will list 3 things that they have learned about air.

Return to Physics Index

Gases Lighter and Heavier than Air

Bonnie Anderson
5414 S. Christiana
Chicago IL 60632-3218
(312) 436-3389

Libby School Annex
5338 S. Loomis
Chicago IL 60609
(312) 535-9350

Objective:

This lesson was designed for students in grades 2-4.
The students will be able to understand and demonstrate that there are gases that are lighter (less dense) and heavier (more dense) than air.

Materials Needed:

Winnie the Pooh storybook, Jensen bars, Helium balloons (already filled), Balloons, Vinegar, Baking soda (about 2 Tbs. for each child, wrapped in a piece of light weight paper), Plastic drink bottles (12-16 oz. size), Small (4") pictures of Winnie the Pooh, 12" lengths of fine monofilament line

Strategy:

Tell children the story "We are Introduced" from **Winnie the Pooh**. Discuss how Pooh got up in the air and ask if the children would like to try to make Pooh Bear fly. Distribute empty balloons, monofilament and pictures of Pooh. Let the children try to make Pooh fly and ask what they observe. Why can't Pooh fly? Ask for suggestions for how to help Pooh.

Distribute monofilament and pictures of Pooh, then bring out helium-filled balloons. Let the children now try to help Pooh fly, but try to control his flight so he doesn't end up on the ceiling! Record the children's observations. They should be able to conclude that a helium-filled balloon is lighter (less dense) than an air-filled balloon, and being lighter than air will help a helium-filled balloon to float up.

Tell the children that they can make another gas to fill a balloon. Do not tell them that the gas will be heavier (more dense) than air. Distribute the plastic bottles filled 2/3 with vinegar, paper packages of 2 Tbs. baking soda, and empty balloons. Demonstrate how to fill their balloons with gas -- place the paper folded with the baking soda in it into the bottle, then put the balloon over the lip of the bottle. As the paper unfolds and exposes the baking soda, the balloon fills with gas. Tie the balloon off when it is full. As the children compare the balloons they have filled, they will find that their newest balloon is heavy compared to both other balloons. Identify the gas they made as carbon dioxide. Let the children work in groups of 3-4 with Jensen bars to compare their balloons. Record their observations. They will discover that carbon dioxide-filled balloons are much heavier than air-filled balloons. Children should be able to conclude that carbon dioxide is heavier (denser) than air.

Performance Assessment:

All children should be able to verbalize that not all gases are the same weight, that some gases are lighter (less dense) and some heavier (more dense). Some children will be able to name the gases helium and carbon dioxide and to indicate which is more and less dense compared to air and to each other.

Children can draw pictures of Winnie the Pooh holding each balloon. The placement of the balloons in relation to Pooh indicates the understanding of the concept of gases lighter and heavier than air.

States of Matter

Kathleen Moore
2304 N. Cleveland
Chicago IL 60614
(312) 327-8671

O. W. Holmes
955 W. Garfield Blvd.
Chicago IL 60621
(312) 535-9025

Objectives:

This lesson is designed for students in grades 1 - 3.

1. To understand the meaning of the words solid, liquid, gas.
2. To provide concrete experiences with solids, liquids and gases.
3. To understand that solids, liquids and gases are all forms of matter, and that matter is anything that takes up space and has weight.
4. To gain an initial exposure to the concept of molecules.

Materials Needed:

(for Activity #1) paper cup, zip-lock baggie filled with water, two empty zip-lock bags, pencil, a solid object such as a rock or a ball; (for Activity #2) 3 balloons for each group: one filled with frozen water, one with water, one with air, one scissors for each group, one empty bowl, chart paper and markers for each group; (for Activity #3) small pieces of paper in three different colors, one for each child in the class; (for Activity #4) vinegar, alka-seltzer or baking soda, one-hole stopper and clear bottle, a second clear bottle, rubber tubing (about 8 inches) or 2 flexible straws taped together.

Strategy:

Activity #1: Hold up a zip-lock bag containing the solid (rock, ball, etc.) Introduce term "solid" Take it out. Ask children to feel it, look at it, etc. Does it take up space? Does it have weight? Does it keep its shape? Ask for other examples of solids, other properties of solids suggested by children; record on chart or board. Hold up baggie with water. Introduce "liquid". Pass around. Does it take up space? Can you see it? Does it have weight? Does it keep its shape? (Pour water into cup so children can see that the liquid takes the shape of its container.) List other liquids, discuss their properties, record on chart or board. Blow air into third, empty baggie. Discuss with children. What's in the baggie? Does it take up space? Does it have weight? (Accept the answer"no".) Does it keep its shape? (Let air out of the bag and ask children where it went.) Discuss other properties, other gases, if any, that children may know the names of. Let them inhale and see how lungs expand like a balloon. Review from board or chart properties of solids, liquids, gases.

Activity #2: Pass out to each group the materials for Activity #2. Tell children they are going to investigate the contents of the three balloons and write their observations on chart paper. They will feel the frozen balloon, cut the rubber off with a scissors. Discuss what they see and feel. Do the same with the water balloon, observing the properties of the water both when it is in the balloon and as they pour it into the dish or bowl. Record observations. Feel balloon with air. Let air out. Write observations. Encourage use of descriptive words such as "hard, invisible, wet, splashy," etc. discuss all observations of all groups. Combine onto large chart with the three headings of solid, liquid, gas. Try to accept all observations as valid.

Activity #3: Begin by telling the children that all matter is composed of tiny particles called molecules. Pass out colored papers. Have all children with "yellow" come up and demonstrate what the molecules in a solid might look like. (Packed very tightly together; this is why a solid keeps its shape and may feel hard). The next group of children ("blues") come up and demonstrate how the molecules of a liquid act (farther apart' moving, which allows us to pour a liquid). Third group demonstrates molecules of a gas (far apart: moving rapidly)

Activity #4: Explain that children will see how another gas, carbon dioxide, takes up space. (Gases are hard for children to deal with since they are invisible; children will need several experiences that demonstrate that air takes up space.) Fill one bottle to the top with water. Put baking soda or alka-seltzer in second bottle; add vinegar, then quickly stop up the bottle with the stopper, which has the hose or straws inserted in it. Place the other end of the hose or straw in the bottle of water and observe the action of the carbon dioxide as it is released in the water. (The reaction lasts for only a short time) Discuss what happened, why, and what we learned about the gas.

Performance Assessment:

1. Use the observation charts from Activity #2
2. Ask small groups of children to play-act what the molecules in a block of ice might look like as the ice begins to melt.
3. Have separate properties written on sentence strips or large pieces of paper. Children must take the property-strips and put them under the headings of "Solid", "liquid", or "gas".

Conclusions:

I had found an experiment in several books that showed how to "weigh air" I found out that these experiments are misleading and wrong. You can't weigh air! At least, not the way these books tell you to. So beware of "weighing air" experiments!

Temperature

Jackie Baker
2430 N. Geneva Terrace
Chicago IL 60614
(312) 665-1066

Crown Community Academy
2128 South St. Louis
Chicago IL 60623
(312) 534-1680

Objectives:

Students in grades kindergarten through second will learn that the skin is not always a reliable sensor of temperature.
Students will learn how to read a thermometer.
Students will practice using a thermometer to determine a specific temperature.
Students will observe that dark colors absorb heat faster than light colors.

Materials Needed:

hot, warm, and cold water in three separate bowls
towels
thermometers (one per child or one for every group of two children)
styrofoam cups (one for each group of two)
water
colored construction paper
crayons

Preparation:

Put a piece of tape over the numbers of each thermometer.
Put a color of construction paper on the inside and outside of each styrofoam cup.
Prepare a graph illustrating the colors used across the bottom and the temperatures in fahrenheit along the side.

Strategy:

1. Set out the three bowls of hot, warm, and cold water and invite one child to tell you which one is hot, warm, or cold. When the child has accomplished this, ask the class what the student used to tell the temperature of the water. When they acknowledge that the child used her hands, ask them if they think our sense of touch is a good way of telling the temperature of something? Tell them that we are going to find out.

2. Have each child put one hand in the hot water and one in the cold water. Have them hold it there for a few seconds. Next, have them put both hands quickly in the luke warm water. Ask them to concentrate on what each hand feels and be prepared to describe what they have felt after everyone has had a turn. After each child has had a turn, discuss what the water felt like to both hands. The children should have noticed that the warm water felt cold to the hand that was in the hot water and felt warm to the hand that was in the ice cold water. Discuss the differences and ask if they still think that skin is a good sensor of temperature.

3. Ask if there are any other ways to reliably measure the temperature? Discuss each idea and then tell the children that you have a thermometer. Give

each child a thermometer with the numbers covered. Allow every child to put their thermometer into the hot water and the cold water; marking a line on the tape where the red indicator stops. Discuss what happened to the thermometer when it was placed in the two different temperatures of water. Have the children take off the tape on the Fahrenheit side and discuss what they see. Have them read the number across from their mark and compare their answers. Their answers should be relatively close. Discuss why a thermometer is a more reliable sensor of temperature than our sense of touch.

4. Tell the children that they are going to get a chance to actually measure the temperature of water when it is placed in the sun. Have the children get into groups of two. They will need one thermometer, a styrofoam cup, and some water in their cup. Make sure that all thermometers start at the same temperature by placing them in a cup of water with ice. Have the children put their styrofoam cups filled with water outside in the sun and place their thermometers in the water. Leave the cups outside for 30 minutes. When the children bring their equipment back inside, have them take a final reading and put their results on the class graph according to their specific color. Discuss the graph. Which color had the highest temperature? Which color had the lowest temperature? Ask the children if they can explain what happened. (Black or dark colors absorb the light energy of the sun and it is changed to heat. Light colors act as reflectors and bounce light off.)

Performance Assessment:

The students will color in a given thermometer to show 80 degrees Fahrenheit. Next, they will write and illustrate what color clothing they would wear to school on a very hot, sunny day.

Exploring the Properties of Matter in the Preschool

Lorraine Watt
8123 South Yale Avenue
Chicago IL 60620
(312)874-2724

Brian Piccolo Elementary School
1040 North Keeler Avenue
Chicago IL 60651
(312)534-4425

Objectives:

Increase awareness of their immediate physical and natural world through manipulation, observation, discussion, art, and hands-on experiences.
Increase the ability to observe and describe events and objects.
Increase the ability to compare events and objects.
Increase the ability to notice and describe changes.
Experience activities that clarify a cause and effect relationship.
Practice making inferences based on observations and experiences.
Practice making predictions about changes and causal relationships that can be verified by further exploration.
Encourage enjoyment, curiosity, exploring, questioning,and using resources.
The emphasis of this curriculum is upon active involvement and questioning about the world. Therefore, it is not limited to specific science activities, but rather is an approach to all experience.
The teacher plays an important role in modeling curiosity and exploration and by posing questions that can lead to further activity and discovery. The teacher must plan appropriate activities that are not too complex or abstract and must help the children organize information in such a way as to highlight patterns and relationships.

Materials Needed:

Sensory/Discovery Table Materials: pulleys, rope, sand, clear plastic 20 ounce soda pop bottles, cup hooks, lumber, twigs, stones, straw, glue, sand and water table objects - i.e. funnels, sieves, water/sand wheels, various objects for sinking and floating experiments, fresh eggs, cream, vinegar, lemon juice, writing scribes and writing materials, kitchen tools - i.e. potato peeler, knife, various types of can openers, guest speakers/demonstrators, science books, ice cubes, sand and water.

Strategy:

At each Learning Center children, are encouraged to interact with each other, with teachers, and with a variety of materials. Through these interactions, children can develop a complex set of language, cognitive and social skills. They can learn how to share feelings, ideas and how to negotiate and solve problems. In the process they naturally compare and contrast the properties of matter. Filling the Sensory Table with different materials offers children varied opportunities for sensory and motor exploration. They can experiment with different textures as the materials used change. Use a bulletin board or pictures on the wall next to the table to reinforce the concepts being experienced by the children.

Demonstrate how tools and machines help make tasks easier to perform - eg. show how the pulley moving the weight of two heavy sand filled bottles makes work easier. The physical environment sends messages to children through the materials selected. The goal is to encourage and support talking, the environment must be filled with things of high interest and involvement -- so that children have lots to talk about. It is in a play environment that children are able to sequence their own learning and move at their own pace. Play environments are more likely than work environments to permit the exploration of materials other than paper and pencils. Children playing have access to the concrete world in all its diversity and to other people with whom they can test both their ideas and social skills. To work well, it has to offer children plenty of interesting choices, clearly organized and accessible.

Performance Assessment:

Ask the question, "What will happen if---? "
Explore the possibilities!!!!!

Return to Physics Index

The Air Out There

Gladys Allen
8011 Lake Street
River Forest IL 60305
(708)771-5769

Louis Wirth Experimental School
4959 S. Blackstone
Chicago IL 606l5
(312)535-1410

Objectives:

The elementary student will be able to;
demonstrate air movement.
indicate the direction of the air.
measure the speed of the air in different areas.

Materials:

1. scissors, square sheet of paper, straight pin, pencil with eraser, piece of crepe paper

2. tagboard, compass, felt tip pen, juice bottle, straw

Strategy:

The students will divide themselves into two groups. Group One will construct a windmill using the following directions: Fold the paper square diagonally. Fold it again. Now, when you open the paper and lay it flat out, it will have an "x" creased through it. Cut along each fold within one inch of the center. Pick up one corner and hold it in the center. Do this with each corner and staple. Stick a pin through the center and attach to an eraser. Mark one of the blades with a small streamer.

Group Two will construct a weather vane following these directions: Cut the shape of an arrow with a long narrow tab from the tagboard. Curve the tip and insert the tab into the end of a straw. Insert the straw into the juice bottle. Mark the directions N, S, E and W.

Have both groups proceed outside and break up into groups of two so that one person will have a windmill and one person will have a weather vane. The windmill will measure the speed of the air by counting the number of times the sticker passes the pencil. The weather vane will point and indicate the direction of movement.

Performance Assessment:

The participation and data collection of each student.

Conclusion:

Air does move, the speed can be measured and the direction can be calculated.

Return to Physics Index

Comparing Densities of Different Liquids

Elaine Messal
148 166th Street
Calumet City IL 60409
(708) 868-6296

Henry Clay Elementary
13231 South Burley
Chicago IL 60633
(312) 535-5600

Objectives:

1) To motivate students to experiment, observe, and calculate densities of several different liquids.
2) To understand that density is the ratio of the mass of a substance to its volume.
3) To be presented with adaptations in grades 4-8.

Materials needed:

1) Equal quantities of the following liquids:
   Liquid A (water)
   Liquid B (water plus red food coloring)
   Liquid C (water plus blue food coloring)
   Liquid D (dark Karo corn syrup)
   Liquid E (light vegetable oil)
2) Transparent plastic cups
3) Graduated cylinders
4) Balances
5) Sets of weights
6) Small paper cups that fit on the pans of the balance
7) Permanent markers
8) Ice cubes (make them green by adding food coloring)
9) Additional quart of vegetable oil
10) Paper toweling

Strategy:

1) Introduce the lesson by telling a story about Mr. Dense and Miss Smile (a teacher). Mr. Dense challenged Miss Smile to have one of her students explain and prove to him why his five unnamed liquids reacted in the manner that he described. The challenge must be met before the end of the week, and the student can't read from a paper. The student must show and explain why mixing equal volumes of A, B, and E, produced different results than mixing equal volumes of A, D, E, and B, D, E, and C, D, E.
2) Place the five bottles of liquids on the table in front of the room as you tell the story.
3) Divide the class into teams based on the number of graduated cylinders available.
4) Each team should use the graduated cylinder to calibrate two transparent plastic cups into 20ml, 40ml, and 60ml by pouring 20ml of water from the graduated cylinder into each cup and marking it with a permanent marker. Repeat for the 40ml and 60ml calibrations.
5) Pour 20ml of liquid A, 20ml of liquid B, and 20ml of liquid C into each calibrated cup.
6) Observe, record, and discuss the results, and pour the contents into another unmarked transparent cup.

7) Wash out and dry the calibrated cups with paper toweling.
8) Teams 1 and 2 pour 20ml of A, D, and E into a calibrated cup.
9) Teams 3 and 4 pour 40ml of B, D, and E into a calibrated cup.
10) Teams 5 and 6 pour 60ml of C, D, and E into a calibrated cup.
11) Discuss and record the results. After the students explain what happened introduce the definition for density and place it on the board.
12) Place the balances, sets of weights, and paper cups on the table. Review how to use a balance to obtain the mass of a substance.
13) Each team should find the masses for the three liquids assigned to them in steps 8-10 and calculate the densities.
14) First they obtain the mass for the paper cup. Then they obtain the mass for the cup plus the liquid, and subtract the mass of the cup to obtain the mass of the liquid. Then they use the mass of the liquid and volume to calculate density.
15) Give each team a chart on which to record their data. Record the data on the same chart drawn on the board.
16) Students analyze the data and conclude that D had the greatest density, A, B, and C (all water), were less dense than D, and E was the least dense.
17) Draw a graph on the board to show the relationships discussed. Place mass in grams on the vertical axis and volume in ml on the horizontal axis. Title the graph, Mass-Volume Relationship For Different Liquids.
18) Pour equal volumes of vegetable oil in transparent cups for each group. Place a green ice cube in each cup. Students observe what happens and explain the results. The ice cube will float on the top and form drops as it melts and falls down through the vegetable oil.

Performance Assessment:

1) Students should be challenged to write how they would prove to Mr. Dense that A, B, and C had the same densities, and the densities of D and E were different. E was the least dense.
2) Students should be given the opportunity to present their explanations to the class.

The Three States Of Matter

Sharon R. West
9053 South Normal
Chicago IL 60620

Edward Hurley
3849 West 69th Place
Chicago IL 60629
(312) 535-2068

Objectives:

Primary Level

1. Define matter
2. Identify and compare solids, liquids, and gases
3. Identify some properties of matter

Materials:

- -two laundry bags
- -butter
- -sugar
- -milk
- -cocoa
- -vanilla
- -quick oats
- -hot plate
- -cup
- -colored chalk
- -measuring cups
- -flask
- -clear vases
- -variety of solids (toy, tools, school supplies)
- -variety of liquids (water, pop, juice, syrup)
- -variety of gases (big balloons, little balloons)
- -balls
- -salt
- -peanut butter
- -wax paper
- -large plastic rectangular container
- -paper towels
- -spoons
- -measuring spoons
- -cylinder container
- -clear containers to pour liquids in

TABLE 1

Take Up Space	Has Weight	Has Shape of Its Own	Takes Shape of Its Container	Has Definite Volume	Has No Definite Volume
solid	solid	solid		solid	
liquid	liquid		liquid (takes the shape of that part of the container which it fills)	liquid	
gas	gas		gas (takes the shape of the container that holds it)		gas (fills any container in which it is put)

Strategy:

1. Introduce the three states of matter
2. Start with a grab bag. Let everyone take an item out of the bag of solid objects.
3. Describe solid objects and talk about color, shape, size, weight, space, and what is it used for.
4. Fill in Table 1 with the children as you are doing the exercise.
5. Ask the class what is left in the bag after everything is taken out.
6. AIR! pass out objects with air in them, such as balloons, and balls.
7. What is air? It is a gas.
8. Talk about what gas does. Use Table 1.
9. Fill a clear container with water and take a cup stuffed with a paper towel in the bottom. Push the cup straight down in the water.
10. Does the towel get wet? No! Why?
11. What is the water in the container? Liquid.
12. Use Table 1 to discuss what a liquid does.
13. Tell the children that solids, liquids, and gases are the three states of matter.
14. Which one of these couldn't I have an example of and why?
15. Just say, there is another form of matter that we do not talk about much, it is a gas called plasma.
16. Make cookies. Ask how many solids, liquids, and gases are in the recipe.
17. Use a bar graph and chart the information.
18. After you have made the cookies evaluate and see if the children can name all the states of matter.
19. Recipe for the cookies are as follows:

No Bake Cookies

one half cup of butter
two cups of sugar
one half cup of milk
two tablespoons of cocoa
one fourth teaspoon of salt

Bring this to a full boil and remove from the heat. add one half cup of peanut butter while it is still hot, also add one fourth teaspoon vanilla flavor, and three cups of Quick Oats. Use a tablespoon and spoon the cookies onto wax paper.

20. Serve the cookies with juice or milk.

Note* Bring in enough solids for every child to have one.

Return to Physics Index

Solids, liquids and gases

Donna Armstrong
2801 S. King Drive
Chicago, Illinois 60616
(312) 326-2270

Frazier Elementary
4027 W. Grenshaw Ave.
Chicago, Illinois 60624
(312) 534-6880

Objective:

Using various examples of solids, liquids and gases, the student will be able to define the three states of matter. They will classify the three kinds of matter, describe its properties and give examples of each one. Lastly, they will describe different ways matter can change and will learn related vocabulary.

Materials needed:

1) Liquids (such as: milk, water, oil, honey)
2) Solids (such as: a block, a ball, a sponge, a feather, a brick and a duck)
3) Gases (such as: balloons filled with air and balloons with helium, a garbage bag with dry ice, a flask with a small amount of vinegar and baking soda and a can of soda pop)
4) Mystery box
5) To show matter changing from one form to another:
   (ice cubes, a hot plate, an egg, a pan, candles, mirrors, etc.)
6) To show that air takes up space and has weight:
   (mystery box, clear shoeboxes filled with colored water, balance scale, 4 beakers (250ml), punchball, paper towels, dry ice inside of a garbage bag, Alka Seltzer tablets, water and a balloon, clear plastic cups, sandwich bags, rubber bands)

@@
Strategy and Activities:

Begin by having the students guess the items in a mystery box. Describe the items in the box. Generalize the specific qualities of each. Do the same for each group of boxed items. Tell what the objects contain. Write the description. Explain that the items with a definite size and shape are solids. Describe the objects with a soft flowing feeling as liquids. Lastly, describe the materials with no definite shape or size as gases. Take examples from each box, tell what specific qualities each has.

To test for air, have each student feel air from a balloon. Second, have students "scoop" air into cups. Place a plastic bag inside and out, feel the air pushing against the bag. Third, place a paper towel inside of a beaker. Put the beaker down into a container of colored water. Decide if the water wet the towel.

Using the model of a molecule chamber, explain that the movement of the molecules represents gases, liquids and solids. Gases move and flow more freely than the others. Its particles constantly strike the walls and bounce off. The molecules of a liquid are packed less closely together than those in a solid. They can move about and we can say a liquid "flows". It takes the shape of a container. A solid's molecules are packed close together and stay in place. A solid has a definite shape.

More discussion will continue as the teacher describes that some liquids become gases when heated. Some solids can become liquids when heated. Gases can become liquids when cooled.

@@

Conclusion:

As the students described the items in each group, they learned more about solids, liquids and gases. They were able to tell why the paper towel did not get wet inside the beaker. They were able to tell what each property was for each item. As a solid, the property was a definite shape. As a liquid, the property is free-flowing. As a gas, the property is more free-flowing and it takes up space.

Density in Relation to Float and Sink

Carolyn C. Roberson-Ellis
150 Surrey Drive
Glen Ellyn, Illinois 60137

Morton Career Academy
401 N. Troy
Chicago, Illinois 60624
312-265-7392

Objectives:

(Grades 6-8)

1. To create a density column from household liquid solutions.
2. To calculate the density of an object.
3. To determine why objects will float or sink in relation to density.
4. To predict the density of unknown solutions.
5. To introduce Archimedes' Principle.

Materials:

The following materials are needed for each group of 3-5 students:

- wood (small rectangular or square shape)
- metal screw or nut
- plastic (small rectangular or square shape)
- corn oil
- corn syrup
- food coloring (for water)
- glycerin
- baby bottle or olive jar
- graduated cylinder
- balance scale
- ruler (metric)
- large plastic container or small aquarium
- paper or plastic cups
- small piece of rubber
- aluminum foil

Strategy:

Instructors Preparations and Student Activities:

1. The individual student stations should be set up before students arrive. Put several drops of food coloring into the aquarium. Use different colors for each group with matching cups. (optional)

2. Each station or group will have the unknown household solutions within the cups. Students are given the information in regards to water (density = one gram/cm^3). Pour the unknown solutions into the baby bottle. Students will observe the various columns formed.

3. One should introduce the concept of density using examples and formula, density = mass/volume. Review methods of computing volume. One should include the water displacement method too.

4. Each group should have an object for which to compute the density. For example, a small piece of wood, plastic, metal screw or nut, and rubber should be used to determine the density.

5. After computing the density, students are to predict whether or not the objects will sink or float in regards to density. Water is used as your medium (1 gram/cm^3). Make a graph and place all predictions of the board.

6. After making predictions, students are to drop the objects into the aquarium

to observe whether or not the objects will sink or float. Remove objects from the aquarium and drop the objects into the baby bottles with the unknown solutions.

7. Knowing the densities of the given objects, students are to predict the density of the unknown solutions. Students will make predictions based upon where within the jar the objects floated. For example, did the object float above or below the water? Would the unknown solution's density be higher or lower than that of the density of a known object (wood, plastic, metal, rubber).

8. After making predictions, give students the names and densities of the unknown solutions. Students can compare their predictions. A graph should be constructed in regards to Mass versus Volume.

Supplemental Activities:

To introduce Archimedes' Principle, students will construct a displacement container using a two liter pop bottle. They should cut the top and construct a spout by cutting the side of the bottle 2cm wide and 6cm to 7cm long. Students will discover, when objects are put into the water, the water will rise or be displaced. (Use heavy objects to make observations, for example a can of pop with a known mass.) Archimedes found that the amount of water displaced is equal to the mass of the object.

In addition, Archimedes' Principle can be demonstrated by having students construct a small barge with aluminum foil with measurements about 10 square centimeters. Have students get as many pennies as possible on their barges. Afterwards, one should explain Archimedes' Principle in relation to why ships float.

Gravity Lesson

Leticia Rodriguez

Ferdinand W. Peck
3826 W. 58th Street
CHICAGO IL 60629
(773) 535-2450

Objective:

This lesson is designed for students in fifth grade, although this lesson can be modified to suit kindergarten through grade 12; even a college level physics course. This lesson can be done within a 60-minute period.

To find out if mass affects the drops of the student-made model parachutes and helicopters.

This lesson incorporates the following Chicago Academic Standards & Frameworks (Science K-6): Conduct experiments and observations and explain what was discovered. Describe conditions that influence change during an investigation. Ask questions and formulate hypotheses. Select and use instruments to collect, organize and present data related to a scientific investigation- timer, stopwatches. Gather data from investigation by applying a variety of scientific skills-measurement and recording methods. Use data based on observations from guided experiments to construct reasonable and accurate explanations. Interpret data and evaluate the accuracy of the outcomes. Compare observations of individual and group results. Use appropriate vocabulary to describe scientific phenomena and instrumentation. Construct simple models that illustrate concepts-a helicopter, a parachute. Compare and contrast an action and reaction in the behavior of objects.

This lesson incorporates the following NCTM- Principles and Standards for School Mathematics: Instructional programs from pre-kindergarten through grade 12 should be able to - Problem Solve; Show Reasoning and Proof; Communicate their thinking coherently and clearly to peers, teachers and others; Create and use representations to organize and record data-graphs, charts, tables, etc.

Materials:

Participation Awards - Super Scientists Awards - Hershey Kisses Treats

Helicopter	**Parachute**
Paper clips	newspaper
Pencils	string
Notebook paper	washers
Scissors+	scissors
Ruler	rulers

Stopwatches
model directions

paper clips
stopwatches
model directions

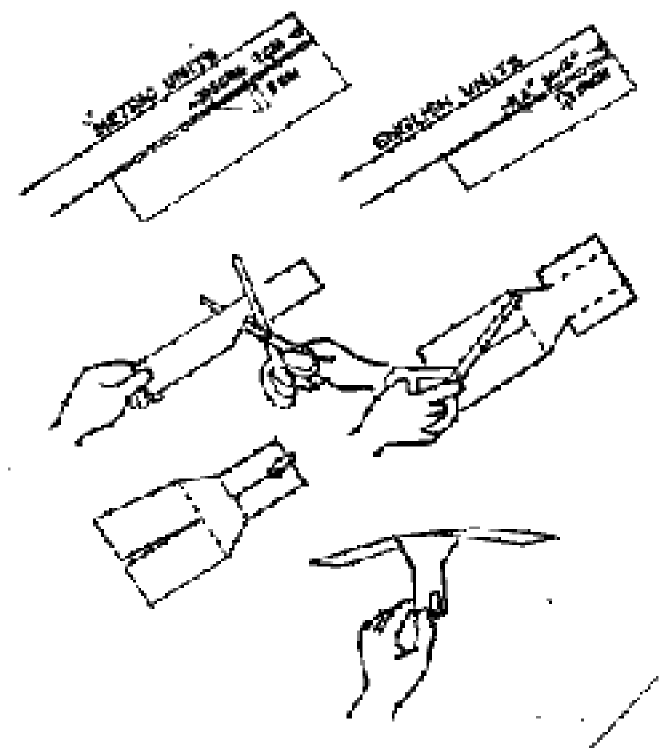
Helicopter Model Directions

· Fold and cut one sheet of paper in half lengthwise.

· Take one of the halves and fold it in half lengthwise.

· Use a ruler to draw a triangle on one edge of the paper.

The base of the triangle will be 1 in. (3 cm) long and one side will be between the 4-in. and 6-in.(9 cm and 14 cm) marks on the ruler. See the diagram:



· Cut out the triangle. Cut through both layers of the paper.

· Open the paper and cut up the center fold to the point indicated on the diagram. This forms the wings.

· Fold the tabs toward the center and attach a paper clip to the bottom.

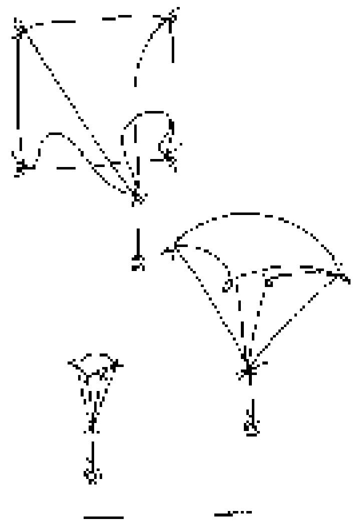
· Fold the wings in opposite directions.

· Hold the helicopter above your head and drop it.

Parachute Model Directions

· Cut a 22 in. (56 cm) by 22 in.(56 cm) square from a newspaper.

- Cut 4 separate strings about 20 in (50 cm) long.
- Tie a string to each corner of the newspaper square.
- Tie the 4 ends of the strings together in a knot. Be sure the strings are all the same length.
- Use a string about 4 in. (10 cm) long to attach the washer to the knot in the parachute strings.



Strategy:

Initiate Motivation: We will begin this lesson by doing the experiments first. The experiments will be done in groups. Four people will be in each group. Within each group there will be: A Retriever; A Recorder; Recorder; A Releaser; A Timer.

Helicopter Activity: 1. Create a helicopter within each group. 2. Pass out helicopter materials to each group. 3. Assign each group to a specific location. 4. Drop helicopters from an agreed height and record time of landing in seconds on notebook paper. 5. Repeat Step 4 with 1 paper clip, 5 paper clips, and 10 paper clips.

Parachute Activity: 1. Create a parachute within each group.   2. Pass out parachute materials to each group. 3. Assign each group to a specific location. 4. Drop parachutes from an agreed height and record time of landing in seconds on notebook paper. 5. Repeat Step 4 with 1 paper clip, 5 paper clips, and 10 paper clips.

Culminating Activity: 1. After students finish their activity and record their data within their groups, all groups should come together as a whole class. 2. Each group should write their data on the board (time in seconds for 1 clip, 5 clips, and 10 clips). Teacher initiates student discussion with the following questions: What happens to the helicopter/parachute as it falls? Why do you think the helicopter/parachute falls to the ground? What was the difference between the helicopter/parachute when it did not have any paper clips and when it had 1 paper clip? What was the difference between 1 paper clip and 5 paper clips? What was the difference between 5 paper clips and 10 paper clips? How do the paper clips affect the landing of the helicopter/parachute? How would you have designed your helicopter/parachute to make it more effective? What do you think your design would accomplish that my helicopter/parachute did not accomplish? Would the new ideas you discovered within your groups change with your new model helicopter/parachute?

Performance Assessment:

The students should be able to perform the criteria set out in the objectives within their groups while creating their model helicopters and parachutes. In addition, students should be able to orally express their findings during the Culminating Activity on an individual basis due to their experience they had within their groups.

Conclusion:

The "Culminating Activity" is the conclusion of this lesson. Pass out Awards accordingly within each group and Hershey Kisses to all students for a job well done.

The Great Tin Race

Bernina L. Norton
3927 W. Fillmore St.
CHICAGO IL 60624-4206
(773) 419-0516

Abbott School
3630 S. Wells St.
CHICAGO IL 60609
(773) 535-1660

Objective(s):

Upon completion of this lesson, 6th-8th grade students will be able to:

Describe and recognize motion

Understand what is a reference point

Describe distance in reference to units of measurement

Calculate speed

Calculate average speed

Measure distance

Understand the relationship between distance and time (speed= distance/ time)

Graph data

Use data to make hypotheses

Materials:

- Various sizes of tin cans with the tops and bottoms removed (open ends)
- Two plastic lids per tin can
- Rubber bands
- Paper clips

- Pencils
- Meter sticks
- Measuring tape (inches)
- Masking tape
- Calculators (optional)
- Timers

<u>Strategy</u>:

The strategies devised to carry out my objectives are as follows:

- Lead inquiry discussion about motion concepts

o Defining motion

o Recognizing motion

o Reference point

o Describing distance

o Calculating speed

o Average speed

- Distribute tin racer blueprint sheets, racer data sheets, and speed graphs. (Enlarge one of the speed graphs to record the groups' average speed at 2 m)

- Allow students time to construct tin racers, raceway and complete racer data sheets.

Note: To complete racer data sheets, the following information is needed:

o Distance, time, and speed for three trials

o Average speed

- Have each group place on the chart the data of their racer (distance vs. time).

- Ask students to make predictions based on the group data, i.e. which racer will be the fastest.

- Conduct the tin race (construct a raceway at 3 meters). Record the fastest racers/speed.

- Compare the predictions with the actual results.

- Discuss ways to improve the speed of the racers.

- If time allows, test those improvements, calculate the speed, and record.

Performance Assessment:

Were the students able to follow the blue prints to construct the racers?

Were the students able to measure the distance and time of the racers?

Were the students able to calculate the speed of the racers for each trial?

Were the students able to calculate the average speed at 1 m? At 2 m?

Were the students able to construct motion graphs of their racer's speed?

Were the students able to make predictions based on the group data?

Were the students able to think of ways to improve their racers?

Conclusions:

Through this exercise, students are able to follow directions to construct both the racers and the raceway. Students use measurement skills to conduct the raceway. Timers allow students to approximate the time. Calculating the speed over several trials provides adequate practice of measuring distance, time and calculating speed. The students record data using a chart and line graph. Predictions were made based on the data presented by the group. It does take time for the students to construct racers that are durable and effective. This lesson can be presented in two sessions: the first to construct the racers and the second to calculate the speed, record data, make predictions and conduct the final race.

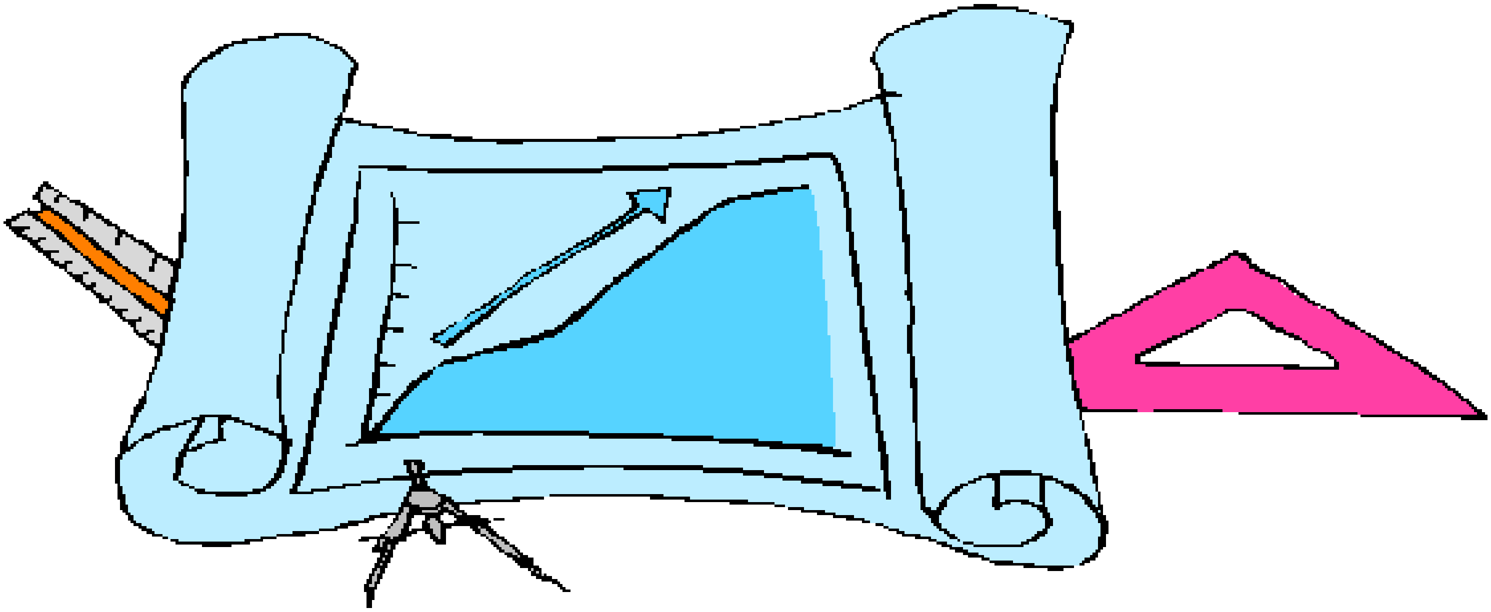
The Tin Can Racer Blueprint



1. Cut off the bottom of an empty coffee can with a can opener.

(This part was done for you! I even filed the metal edges with sandpaper.)

2. Use scissors to punch a hole in the center of both coffee can lids. The holes must be just large enough for a rubber band to pass through.

3. Push one end of a rubber band (a thick one) through one of the holes and hook it around a paper clip on the outside of the lid. Tape the paper clip in place, over the hole, so that the rubber band cannot pull through the hole. Place the lid with the rubber band on the can.

4. Reach into the can and grab the rubber band (be careful of the edges).

5. Push the free end of the rubber band through the hole in the other lid from the inside. Slip the end of the rubber band through a bead so that the bead is on the outside of the lid.

6. Slide a pencil through the part of the rubber band that is on the far end of the bead from the can, so that the pencil stops the rubber band from pulling back through the bead and the lid.

7. Adjust the position of the pencil so that the end of it extends past the edge of the can.

Note: If it is too short, get a longer pencil!

8. Wind up the pencil until it comes back to you freely and put the can on the floor. Let go!

To construct the raceway:

Use masking tape to mark your reference point.

Measure 1 meter from the reference point and use masking tape to mark it. Measure 2 meters from the reference point and use masking tape to mark the end point.

Note: Be sure to record the distance and time traveled on the racer data sheet.

Center of Gravity

Wanda Pitts
3434 S. Calumet
CHICAGO IL 60616

Douglas Community Academy
3200 S. Calumet
CHICAGO IL 60616
(773) 534-9263

Objective(s):

Third grade students will be able to find the center of gravity and to define force and gravity.

Materials:

Assorted shapes made of cardboard, yarn, washers; push pins, and a cork bulletin board.

A knife, new pencil sharpened, potato, empty 2-liter soda bottle with cap, and two metal forks of equal size.

Strategy:

Ask the question what is force? A force is a push or pull. The teacher will put the definition on the board. See if you can find the center of gravity of an irregular shape.

1. Cut out the shape from a piece of cardboard.
2. Pin the shape to a bulletin board with yarn and attach a weight at the end of the yarn.
3. Draw a line behind the yarn, pin the shape at several different points and draw a line each Time.
4. The point at which the lines cross is the center of gravity of your shape.

Can you balance the shape from this point on the eraser of a pencil?

Ask the question what is gravity? The teacher will put the definition on the board. Gravity is the force that pulls objects back toward the earth. Gravity is the pulling force between two objects due to their masses.

1. The teacher will cut a 1-inch thick slice from the center of a potato. Push the pencil through the center of the potato.
2. Place the capped bottle on a desk. Try to balance the pencil (on its eraser) on the top of the cap.
3. Stick the two forks into opposite sides of the potato.
4. Now try balancing the pencil (on its eraser) again on top of the soda bottle. Adjust the forks slightly if needed.

What happened? All things have a balance point, or a center of gravity, at which they are in perfect balance. The pencil with the potato is top heavy and will not balance. By adding forks to the potato, you change the center of gravity.

Performance Assessment:

The students should be able to use specific vocabulary to define force and gravity.

The students should be able to find the center of gravity of an object through the demonstration of these experiments.

Conclusions:

Every weight has a center of gravity.

Mathematics/Physics

The Inertial Balance

Carl E. Martikean
10937 Sheephead Court
DEMOTTE IN 46310-9352
cmartikean@yahoo.com

Lew Wallace High School
415 W. 45th Ave.
GARY IN 46408
(219) 980-6305

Objective(s):

At the end of this lesson, the student will be able to:

1. Explain how either a single pan or double pan balance operates;
2. Explain the physics principle of the balance using Newton's First and Second Laws;
3. Differentiate between mass and weight;
4. Explain how mass and weights are related using Newton's First and Second Laws;
5. Explain the difference between gravitational and inertial mass.

Materials:

Triple beam balance	Centigram balance
Various masses	Two c-clamps
Metal meter stick or 1m of thin metal flat	Wooden blocks formed into an L shape to hold the meter stick in a horizontal position.
35mm film container to be attached to the end of the meter stick	Masking tape, stop watch

Strategy:

Many students confuse the concepts of mass and weight. Our purpose here is to clarify for the student, through self-discovery, the difference between mass and weight. Further, the student will be challenged to discover how to “weigh” objects in outer space with an inertial balance.

Performance Assessment:

Briefly describe the performance assessment that you would use and the expected results that should be obtained. A grading rubric would also be nice.

-

Background

Weighing, really massing on the surface of a planet or planetoid is easily demonstrated with either a two-pan balance or a centigram balance. Ask students what the balance is measuring (mass or weight). Then start a discussion of how the balance operates. What we ultimately are looking for are the physics principles of the balance. Among these are the fact that gravity is used and that no matter what body we were standing on the balance would operate exactly the same. But what would be different? So just what is the balance measuring- mass or weight? How do we know? So, in order to successfully use either a beam balance or a spring balance we need a gravitational force. These balances are a simple (?) demonstration of Newton's second law. So does the balance measure mass or weight? Why?

What if you were in the orbiting Space Shuttle or space station? Would this balance work? What problems would be present? The measurement of mass presents a unique problem. How do we measure mass in a microgravity environment?

In space, because of the free fall conditions neither a beam or spring balance will operate. So there must be a third method of measuring a mass of an object. This brings us back to Newton's first law. This law is the principle of inertia, the property of matter that resists acceleration. The amount of resistance (laziness) is directly proportional to the mass of the object.

To measure mass in space, scientists use an inertial balance. An inertial balance is a spring device that vibrates the sample being measured. The frequency of the vibration will vary with the mass of the object and the stiffness of the spring. In this case we are using a metal meter stick. For a given spring, an object with greater mass will vibrate more slowly than an object of lesser mass. The object to be measured is placed in the balance, and a spring mechanism starts the vibration. The time needed to complete a given number of cycles is measured, and the mass of the object is calculated.

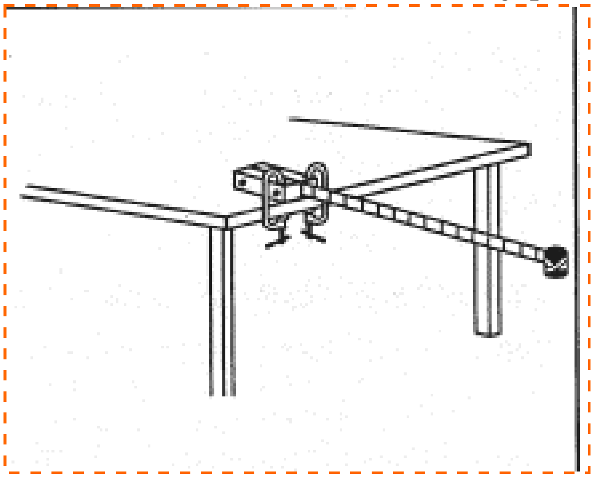
Procedure:

1. Using a drill and bit to make the necessary holes, bolt two blocks of wood to the opposite sides of one end of the metal meter stick.

2. Tape an empty plastic film canister to the free end of the meter stick. Insert a piece of foam into the canister.

3. Anchor the wood block to the table top with C-clamps. The opposite end should swing freely from side to side.

4. Calibrate the inertial balance by placing objects of known mass (pennies) in the sample bucket (canister with foam plug). Begin with just the bucket. Push the end of the meter stick to one side and release it. Using a stopwatch or clock with a second hand, time how long it takes the stick to complete 25 cycles.



5. Make a plot of the data. (See the sample graph.)

6. Place a single penny in the bucket. Use the foam to anchor the penny so that it does not move inside the bucket. Any movement will result in an error (oscillations of the mass can cause a damping effect). Measure the time needed to complete 25 cycles. Plot this data.

7. Repeat this procedure for different number up to 10 pennies.

8. Draw a curve on the graph through the plotted points.

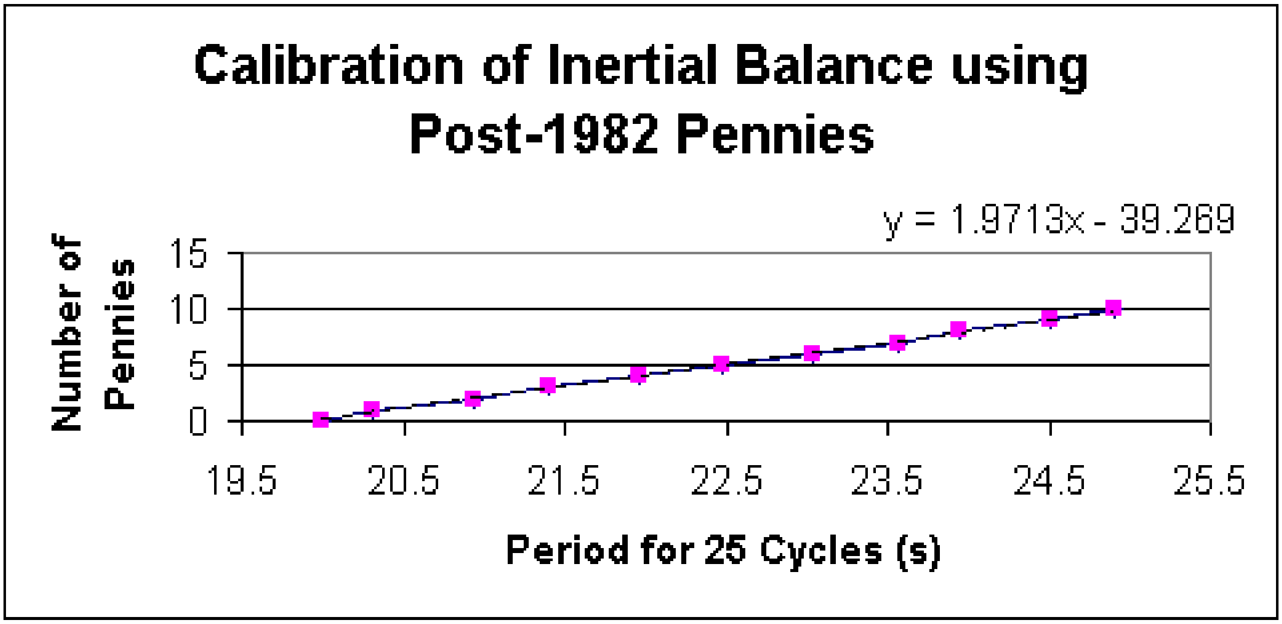
9. Place a nickel in the bucket and measure the time for 25 cycles. Use the pennies plot to determine the mass of the nickel in "penny" units.

-

Conclusions:

25 cycles (s)	Number of Pennies
19.99	0
20.31	1
20.94	2
21.4	3
21.97	4
22.47	5
23.03	6
23.57	7
23.94	8

24.5	9
24.9	10
Quarters	
20.81	1
22.06	2



-

Questions

-

1. Does the length of the meter stick make a difference in the results?
2. What are some of the possible sources of error in measuring the cycles?
3. Why is it important to use foam to anchor the pennies in the bucket?
4. Is there a difference between the nickel's inertial mass and its gravitational mass?

Illinois Institute of Technology
BCPS Department
CHICAGO IL 60616-3793
(312) 567-5745

Objectives:

A ball bouncing on a hard surface is used to study the action of gravity on a simple system. We will let a single ball bounce several times, as well as having several different types of balls to bounce off a hard surface.

Materials:

. A supply of several super balls of various shapes and sizes. [They are conveniently available at a local science supply house, or simply order them from **American Science and Surplus** at http://www.sciplus.com.]
B. Several one-meter rulers, and at least one two-meter stick.
C. Several other types of balls; i.e. tennis balls, ping-pong balls, steel balls, wooden balls, rubber balls, and marbles.
D. A **Happy/Unhappy Ball Set** from a local science supply house, or from **American Science and Surplus** at http://www.sciplus.com.

Strategy:

First, take a super ball and drop it from a height of one meter directly over one of the squares in a floor tile, if there is a tiled floor in your classroom. Count the number of times the ball bounces before leaving the square in question, and record the number. Do this several times. Then, drop a super ball of a different size over the square, and record the numbers. Repeat the experiment while dropping from heights of ½ meter and 2 meters, respectively. You should observe that the ball only bounces a few times within the square, no matter how carefully you may drop it. When you drop it from a greater height, it makes fewer bounces inside the square, and more when you drop it from lower height.

Next, divide the class into teams, and have each team to release a super ball at rest from a height h_0 of one meter, and measure the height h_1 to which the ball rises on first bounce. Each team should record its bounce height in a table on the blackboard. Next, measure the height h_2 for the second bounce. Note that

$$\mathbf{h_2 / h_1 = h_1 / h_0.}$$

Bounce the ball from a height of 2 meters, and show that this relation is still valid.

Try bouncing the super ball off a steel plate [if available], and observe that it bounces much higher.

Show that the super ball bounces much better than most other balls, such as ping-pong balls, tennis balls, or ordinary rubber balls. Also, drop the “happy ball, sad ball” set, to show that two balls may appear to be very similar, and yet bounce quite differently.

Finally, drop a little super ball that lies on top of a big super ball. [You may wish to cut out a little trough in the big super ball with a sharp knife.] After the bounce, the big super ball hardly bounces at all, whereas the little super bounces to far above the height of release. Why? See the website given below.

Performance Assessment:

Give each student a super ball, with the objective of having the ball to bounce back and forth, while remaining close to the initial location. It takes a certain amount of practice for you or the student to learn how to do this, and to accomplish it you must give the ball both a spin and an initial horizontal motion. The initial velocity and angular velocity should be opposite in direction, and comparable, for this to work. Each student is given a passing grade when he/she learns to accomplish this task.

Conclusions:

The bouncing ball is used as a tool to illustrate motion, collisions, and behavior of a body in motion**.**

CHICAGO IL 60617
(773) 375-6285

Jones Academic Magnet
606 S State
CHICAGO IL 60605
(773) 534-8600

Objective(s):

The purpose of this mini-teach is to give the students an understanding of the concepts of Mass vs

Weight and a basic understanding of metric measurements.

Materials:

The following materials are used in this presentation as hands-on learning tools and demonstration;

Inertial Balance

6-C Clamps

3 Beakers – 1000 ml, 500 ml, 100 ml

Very Large Sponge

Ball of String

6 – Ring Stands

Box of small washers

Small of Beads (or small box of sand)

6-Stop watches

Meter stick

Metric scale

Strategy:

This lesson will start with a brain – storming session concerning the relationship and the previous knowledge of the concepts of Weight & Mass. The class will be motivated to formulate

Ideas about the two concepts to be tested in the class .The second step in this process will to demonstrate the concept of Atoms and Density. The small beads will be used to simulate Atoms of matter in Mass .A class member will be asked to measure the mass of an empty 100 ml beaker and then after it has been filled with the beads. Another student will subtract the masses of the full beaker from that of the empty beaker and divide it into the Mass. This procedure will be repeated for the 500 ml and 1000ml beakers. The class will discuss the findings of the demonstration.

The third step in this unit will to divide the class into groupies of four members. A set of string, 4 washers, Ring stand, Stopwatch, and a meter stick. The group will construct and test a pendulum that has 1 wash for the pendulum bob, string for the pendulum arm. The group will count the number of oscillations made by the pendulum in thirty seconds. This procedure should be repeated by adding one washer at a time and counting the number of oscillations up to four washers.

Performance Assessment:

The students will be expected to draw a graph of their finds of the number of oscillations made by the pendulum in thirty seconds . For the first demonstration the class would be expected to find the densities of all three beaker and compare them. Each student will prepare a paper explaining their views on weight vs mass with references from the internet to support their position .

Conclusions:

The individual students will support their final positions in a paper to be turned in to the instructor.

Bouncing Superball Physics

Porter W Johnson
406 N Elmwood Avenue
Oak Park IL 60302-2226
(708) 383-2846

Illinois Institute of Technology
BCPS Department
Chicago IL 60616-3793
(312) 567-5745

Objective(s):

1. To explore several striking and unusual properties of bouncing superballs.
2. To measure and understand the elasticity coefficient for a bouncing superball.
3. To understand the role of energy conservation in relation to bouncing balls.

Approximate Level: eighth grade

Materials Needed:

1. A supply of superballs and meter sticks [one per student or one per two students].
2. A collection of balls for bouncing. You may wish to include a ping-pong ball, a tennis ball, a foam ball, a racket ball or squash ball, a rubber ball, a wooden ball, a steel ball, and "happy balls" and "sad balls", and whatever else is conveniently available.

Strategy:

Drop the superball from a measured height $\mathbf{h_0}$ of, say, one meter. The ball will recoil to a height $\mathbf{h_1}$, where $\mathbf{h_1}$ is less than $\mathbf{h_0}$. Let us call the ratio $\mathbf{r = h_1 / h_0}$ the elasticity coefficient of the ball. Drop the ball from several different heights [for example, 0.5 meters, 1.0 meters, 1.5 meters, and 2.0 meters] and measure the bounce heights. You should obtain data somewhat like the following:

$\mathbf{h_0}$ 0.50 meters 1.00 meters 1.50 meters 2.00 meters

$\mathbf{h_1}$ 0.41 meters 0.83 meters 1.24 meters 1.65 meters

When the superball is dropped from a different initial height $\mathbf{H_0}$, it will bounce to a corresponding height $\mathbf{H_1}$, where $\mathbf{r = H_1 / H_0}$ is the same for each bounce. In other words, the coefficient of restitution $\mathbf{r}$ determines the ratio of the "drop height" to the "bounce height" for the superball from the surface in question. The elasticity coefficient represents the fraction of the mechanical energy of the ball that remains after the bounce, the remaining fraction being converted into heat. In principle, both the ball and the table become warmer in this process of bouncing.

If the superball is left to bounce several times in succession, the heights $\mathbf{h_0, h_1, h_2, h_3, h_4, h_5, \ldots}$ become smaller by the same ratio:

$$\mathbf{r = h_1 / h_0 = h_2 / h_1 = h_3 / h_2 = h_4 / h_3 = h_5 / h_4 = \ldots}$$

After ten to twenty bounces, the ball stops bouncing.

Take the box of balls, and drop each ball from a height of 1.00 meters. Note that there is a wide variety of bounce heights, but that balls that have the same constitution actually bounce to a similar height, independently of their size.

Take a small superball and balance it on top of a large superball that is held in your hand. [You may find it helpful to dig a small hole in the larger ball, so that the smaller ball is easily balanced.] Make predictions as to what will happen to the balls when they are dropped onto the floor from your hand. Do the experiment, and observe that the small ball tends to bounce very high, whereas the larger ball hardly recoils at all. In other words, energy is transferred to the second ball from the first one after they strike the floor.

Performance Assessment:

1. At the racetrack with a paramutual betting system, the track keeps about 8% of the wager and returns 92% to the participants. In other words, when you bet $100, on the average you get to keep $92 after the first bet. How many times must you bet before your holdings are down to $1? Write an essay on why you should never, never bet at the races.
2. Can you make a superball bounce back and forth about a central location. You should release the ball from a given height with both a spin and a horizontal speed. Practice until you learn to do this with agility.
3. Try throwing a superball off a smooth horizontal surface and then under a table. Notice that the superball will typically come right back to you, boomerang style. Try to explain why this occurs.

Multi-cultural Comment:

Students and teachers of physics have wondered long long and often what would happen if a superball were dropped from the top of a high building, such as the **Sears Tower of Chicago.** That building, with a height of **440 meters** above ground level, has recently lost the designation of world's tallest building to a new structure in **Kuala Lumpur, Malaysia** on a ridiculous technicality. Fortunately, the fate of the superball can now be known, as a result of experiments done by resourceful team of Australian researchers at a radio antenna tower of comparable height. When they dropped the superball onto the pavement below, the ball shattered into glasslike slivers, which were propelled at great speeds from the impact point. One of the experimenters narrowly escaped injury from the shattered fragments. Alas, it seems that the superball has limited superpower.

OAK PARK IL 60302-2226
(708) 383-2846

Illinois Institute of Technology
Biol Chem Phys Sci Dept
CHICAGO IL 60616-3793
(312) 567-5745

Objective(s):

This lesson is suitable for an 8th grade student. To study the motion of superballs in the air, colliding with and bouncing off smooth surfaces. Basic features of moving and colliding objects can be demonstrated and studied using this familiar and fascinating toy.

Materials Needed:

A supply of superballs of various sizes and colors for use by students in teams of two. A supply of meter sticks [with some two meter sticks] is needed for each set-up.

For the initial demonstration of bouncing you will need a supply of various types of balls, some of which bounce very well, some poorly, and some not at all. In particular, you should get a **happy ball sad ball** set [available at toy stores everywhere].

Strategy:

Begin by bouncing superballs and showing that their bounce is quite "springy" or "elastic". Show that the smaller superballs bounce just as well as the big ones. Show that superballs bounce better than tennis balls, ping-pong balls, and golf balls.

Show the "happy and sad balls", and ask the group to predict how they will bounce. In particular, have the class discover that the "sad ball" feels a lot like a superball, so that it might bounce rather well. Unfortunately, it does not bounce at all, even though the result is not obvious from handling it.

Practice dropping the ball in front of the class, showing how to release the ball from rest, measuring the height of the **bottom** of the ball above the floor. Also, show how to measure the bounce height, again defined as the maximum height of the bottom of the ball above the floor on first bounce. Divide the class into groups of two, and have them each drop a superball from a height of 100 cm [one meter], and record the bounce heights on the board. Here is a set of typical bounce heights [in cm], arranged in increasing order:

72 76 78 79 80 80 80 81 82 83 85

Note that there are eleven independent measurements on the list, and that the median height is 80 cm, with seven of the eleven measurements lying between

77 and 83 cm. Thus, an "eye-ball" estimate of the measured bounce heights is **(80 ± 03) cm**.

<-------------- RANGE -------------->

72 76 78 79 80 **80** 80 81 82 83 85

MEDIAN

If your students are sufficiently advanced or "calculator literate", you should show them how to compute the mean and standard deviation of these numbers;

The **elasticity coefficient r**, which we define as the ratio of the bounce height to
the initial height, is roughly independent of bounce height, as the class can demonstrate by studying the dropping the ball from initial heights of 50 cm and 200 cm.

Have the class drop the ball from an initial height of 100 cm and measure the maximum heights for second bounce. The data [in cm] may look something like this:

56 58 59 60 63 64 64 66 68 69 72

By "eyeballing" the data, we estimate the measured heights on second bounce to be about **(64 ± 6) cm**. Note that, for two
bounces, the ratio of
second
bounce height to initial height is about $r \times r = r^2$. Correspondingly, for three bounces the ratio would be about $r \times r \times r = r^3$. One can count **10 - 20** independent bounces for the ball, each of lesser amplitude, before the ball seems to stop on the floor.

One can summarize by saying that on each bounce, the ball returns to $r = 0.80$ of its initial height, corresponding to the fact that the fraction $1. - r = 0.20$ of the initial energy is dissipated upon collision with the floor.

Impress upon the class that, because the ball loses some mechanical energy after each bounce, it can **never**, **never** bounce higher than the initial release height, and get them to agree with this basic consequence of energy conservation. Having thoroughly convinced them of this point, take out a smaller super ball and put it into a small indentation in the bigger ball. Hold the bigger ball in your hand, with the smaller one sitting on top of it, and carefully drop it. Repeat the exercise several times, and observe that, under optimal conditions, the smaller ball goes several times higher than its initial drop height. The smaller ball is, in effect, drawing energy from the larger ball, so that is can go much higher than otherwise. [The **Jupiter slingshot** maneuver, in which a satellite can increase its speed by doing a "hairpin" loop around a major planet, which is used to extend the range of inter-planetary rockets, operates because of similar principles.

Performance Assessment:

A superball can be made to bounce several times near its initial location, but it will eventually bounce away because of mis-alignments, imperfections, etc. Can you make a superball bounce back and forth about a given location. This is a skill which each class member can acquire, simply by bouncing the ball on the floor, trying various schemes, and the like. The trick is to release the ball with an initial horizontal velocity and spin. By picking the right initial conditions, the ball can be made to bounce back and forth.

Conclusions:

The vigorous bouncing of the superball is an useful vehicle for illustrating and studying the basic concepts of energy conservation, energy transfer, and dissipation of mechanical energy as heat.

Multi-cultural Component:

In various types of sponsored gambling, whether legal or illegal, the "house" gets to keep a certain percentage **p** of the total amount of the wagers. In other words, the total amount paid to the winners is the fraction $r = 1. - p$, multiplied by the total amount of the wagers. The fraction paid back after two bets [just like two bounces of the ball] is r^2, after three bets it is r^3, etc. Eventually, or course, the "house" ends up with all the money, for the same reason that the balls stop bouncing. Urge your students to keep these points in mind when they think of placing bets. If they persist in gambling, they might wish to learn about the super ball lottery:

A web-based reference on bouncing baseballs is given at the following site:

http://www.exploratorium.edu/baseball/bouncing_balls.html

This site, developed by the Exploratorium [an excellent interactive science museum in San Francisco], outlines experiments with baseballs, tennis balls, and golf balls, and in particular the temperature dependence of the bounce.

Return to Physics Index

Earl Zwicker - Illinois Institute of Technology

The Jensen Bar - What is it and How to Make One (See Sketch and Photo Below)

Earl Zwicker
1809 Heather Court
NORTHBROOK IL 60062
(847) 272-6395

Illinois Institute of Technology
BCPS Department
CHICAGO IL 60616
(312) 567-3384

Objectives:

1. To make a Jensen Bar
2. To learn where to get the materials
3. To learn how to put them together to make a Jensen Bar
4. To learn how to "fine tune" the Jensen bar

Materials Needed:

1. A "one-by-two" inch wood board
   .. at least 4 feet long
   .. pretty much free of knots
   .. pine is easy to work with

   Buy at a local lumber yard (Home Depot, Menards, Builder's Square, etc) Often found in a 10 ft length, so two 4 foot Jensen Bars may be made from it. You may also make "weights" from this board.

2. Cup hooks and eye hooks

   Packages of 1/2 inch brass cup hooks may be found at the local hardware (True Value, Ace, etc). You will need 20. You also will need 10 screw eyes (size 214 1/2 is ok), available at the same stores.

3. Metal rod

   At the local hardware store, buy a smooth metal rod. A 1/4 inch diameter curtain rod will do. Length is not critical, but should be about 12 to 20 inches long.

3. Tools & Supplies

   hand saw

   ruler (British units or metric, your preference. A meter stick usually has both.)
   drill & 3/8 inch bit
   sandpaper
   pencil
   scratch awl or push pin
   carpenter's square

   These items may be found in your school shop, if you have one.

(It pays to be on good terms with your shop teacher!) Seek help if you feel the need, from a colleague, another school, university or industry if you feel the need.)

Strategy:

In General -

The ruler, pencil and square should be used to locate the various points on the bar where you will make holes for installing hooks, etc.

Look at the drawings and picture of the Jensen Bar shown below. This will give you an idea of how your finished bar should look.

The instructions that follow are probably more detailed than you need if you have experience at making things.

1. Making the bar

   With the aid of the ruler, pencil, saw and square, cut the one-by-two to a length of exactly 1.10 meters (or 40 inches if you prefer British). Sand rough ends and corners smooth. You now have a "bar" of wood.

   Either of the 1.10 meter by 2 inch faces of the bar will be called the "2 inch face." One of the 1.10 meter by 1 inch faces will be called the "bottom edge" of the bar. The other will be called the "top edge."

2. Making the center hole

   Push the point of the push pin (or scratch awl) into the bar at the exact center of its 2 inch face, and remove, leaving a small hole. Use the small hole as a guide and drill a hole through the bar (about 3/8 inch diameter) perpendicular to the 2 inch face. A drill press can help ensure perpendicularity. Sand hole edges smooth.

3. Making a "20 cm" hole

   Arbitrarily identify one of the 2 inch faces as the "front" of the bar. Following a procedure similar to #2 above, drill a 3/8 inch hole with its center located exactly 20 cm (or 8.0 inches if using British) to the right of the center hole.

4. The cup hooks

   The idea is to end up with a set of cup hooks along the bottom edge of the bar, spaced exactly 10 cm apart. (Use 4.0 inch spacing for British.) You will also want a cup hook on the top edge of the bar, centered exactly above the 3/8 inch center hole.

   At the exact center of the bottom edge, make a small hole (push pin). It should be directly below and perpendicular to the 3/8 inch center hole. This is where you later will screw in the center cup hook. Do the same at the exact center of the top edge to put (later) a cup hook there.

   On the bottom edge, make 8 more small holes, 4 on each side of the small hole you just made at the center, and space them exactly 10 cm apart (4.0 inch for British).

Carefully screw the cup hooks into the small holes on bottom edge, perpendicular to the edge. If you can, use your fingers to do this, since this will probably give you the best control.

You should now have 9 cup hooks installed on the bottom edge: 1 at the center and 4 on each side. Install a cup hook at the top center also.

You now have a Jensen Bar!

5. Weights

   It is useful to have a set of identical weights that can be hung from the cup hooks, and attached to each other from below, in tandem. A set of such weights can be made from the same "one-by-two" board.

   Cut 10 pieces from the board, each 8.0 cm (3.0 inch British) long. Lightly sand corners and edges. Hold one of the pieces with its 8.0 cm dimension vertical. Use the push pin to make a hole at the center of its top end. Do the same for the bottom end. Then put a screw eye into its top end, and cup hook into its bottom end. Repeat for the other 9 pieces.

   These are the weights.

6. Fine tuning

   Suspend the Jensen Bar from the cup hook at its top center. (This may be done any convenient way: use a 1/8 inch diameter rod clamped to hang over the edge of a table; clamp a board to a table top so that it protrudes out over the edge of the table and mount a screw eye on that end; use a ring stand with a 1/8 inch rod clamped horizontally, etc.)

   The bar should hang so that it balances horizontally. This usually doesn't happen because of uneven density of the wood and/or because of the weight of wood removed by drilling the 20 cm hole.

   In order to make it balance horizontally, weight must be added to the end of the bar that moves up. Find some small nails and lay one at a time at that end, until the bar is balanced horizontally. Then drive the nails into the end of the bar, taking care not to damage the cup hooks.

   It should balance nicely in a horizontal position, and your Jensen Bar is now "fine tuned."

   It is also useful to use a broad-tipped marker pen to place numbers on the front face of the bar. Place a "0" at the center. To the right of center, place a "1" at the 10 cm cup holder position, a "2" at the 20 cm position, etc. Similarly, use a different color marker to number successive 10 cm cup holder positions to the left of "0."

Assessment:

This assessment has two objectives:

a) To test the Jensen Bar to see that it works well enough for classroom use.

b) To provide the beginnings of insight into how it may be used, for teachers who do not usually teach the physical science ideas associated with the Jensen Bar. You will assess your own understanding, and so will learn what questions to ask to get help.

With the Jensen Bar suspended horizontally, hook a weight to the cup holder at position 2. What happens? Is this what you expected?

At what position must you hang a second weight in order to bring the bar back to horizontal?

If two weights are hung (in tandem) at position 2, what happens? Is there a position that a single weight now may be hung to bring the bar back to horizontal? What do you think it is? Does it work?

Can you formulate some simple rules that will correctly predict where and how much weight must be used to bring the bar back to horizontal from an unbalanced position?

What happens if the Jensen Bar is suspended by placing it on a horizontal rod through its center hole? Move the bar to a non-horizontal position and release it. What happens? Try other non-horizontal positions. What happens? Can you explain this?

Conclusions:

We state without proof at this point, that the Jensen Bar may be used from kindergarten through PhD to pose challenging problems in mechanical equilibrium to the learner.

This may be the basis for future "lessons" using the Jensen Bar, to appear on this website.

Return to Physics Index

Richard J. Watson - Orr High School

Linear Motion: Speed, Velocity & Acceleration

Richard J. Watson
1110 South Taylor Avenue
OAK PARK IL 60304

Orr High School
730 North Pulaski Road
CHICAGO IL 60624
(773) 534-6500

Objectives:

This lesson is designed for high school and is adaptable to lower levels.
Students will be able to measure linear distance and time and calculate velocity.
Students will be able to plot graphs to show: speed vs distance; velocity vs distance

Materials Needed:

2 meter sticks per group of 6 students
2 stop watches or watches with second hands per group
1 Pencil and data sheet per group

Strategy 1:

Group students in groups of six:

- 2 students - Using meter sticks in a leap frog manner students will measure distance of 100 meters from teacher designated spot.
- 1 student - Stand at the starting position (designated by teacher) and indicate the vehicle being timed by yelling "GO", or waving arms or flag, as it crosses the designated position.
- 1 student - Stand at the finish position (100m from start) and indicate the end of timing by yelling "STOP", or waving arms or flag as the vehicle crosses the finish position.
- 1 student - Stand, with a stop watch or watch with a second hand, in view of the student indicating the beginning and the student indicating the ending of timing.
  At the "GO" command the student starts timing and at the "STOP" command student ends timing.
- 1 student - Record the time and direction of each vehicle on the data sheet.
  Obtain data from each of the other groups.
- Each group - Collect data for at least 3 vehicles

Strategy 2:

5 students stand at the following positions, one student at each position:

- Start position - indicate the vehicle being timed by yelling "GO", waving arm or flag as it crosses the start position.
- 25 meters position - begin timing at the "Start" command and stop timing as vehicle crosses the 25 meter position.
- 50 meters position - begin timing at the "start" command and stop as the vehicle crosses the 50 meter position.
- 75 meters position - begin timing at the "start" command and stop as the vehicle crosses the 75 meters position.

100 meters position - begin timing at the "start" command and stop as the vehicle crosses the finish line (100 position).

Performance Assessment:

1. Student will calculate the average speed and the average velocity for each group using the following formuli:

   speed = distance/time   velocity = distance & direction/time

2. Student will plot on a graph velocity vs time and speed vs time.

3. Students will measure the time of a vehicle at 5 five distances from "0" to 100 meters and plot the acceleration of the vehicle on a graph.

Conclusions:

1. Students learned the difference between speed and velocity by measuring distances and times and using formuli to calculate speed and velocity.
2. Students learned how to use data from a table to plot a graph showing the information.
3. Students learned that motion is defined in relative terms.
4. Students learned that acceleration is a rate of change in speed or velocity (increase or decrease).

Wanda Pitts - Douglas Academy

Energy

Wanda Pitts
3434 S. Calumet Ave.
CHICAGO IL 60616

Douglas Academy
3200 S. Calumet Ave.
CHICAGO IL 60616
(773) 534-9263

Objective(s):

The students in third grade will be able to describe and compare how energy in different forms affects common objects and is involved in common events. Define kinetic and potential energy.

Materials Needed:

A hammer, nails, wood, ice cube, bat, ball, nerf ball and a basketball net, matches, rubber bands and a slinky.

Strategy:

What is energy? The teacher will put the definitions on the board. Kinetic energy is the energy an object possesses because of its motion. Potential energy is the energy an object possesses because of its position (or state of strain). An example is a bow when ready to shoot an arrow. Model examples for students then let students repeat what was demonstrated to the class.

Performance Assessment:

Examples:
A ball thrown vertically upward leaves the hand with a certain speed and a corresponding amount of kinetic energy. This kinetic energy is completely converted to gravitational potential energy as the ball rises and comes to a stop at its highest point. Then as the ball falls back to earth, its potential energy is gradually changed back again to kinetic energy. Since the ball returns to the level from which it started with the same speed with which it left the hand, it has exactly as much kinetic energy at the end of its flight as it had at the beginning. Although its energy changed from kinetic to potential and back to kinetic again, none of its initial energy was lost. Take a rubber band and stretch it. What kind of energy can a rubber band produce? It takes energy to pull the rubber band in turn this is potential energy.
Take a hammer, a nail and a block of wood, hit the nail into the wood with the hammer. What kind of energy was used?
Hit a ball with a bat. What kind of energy is used?
Kinetic to kinetic, kinetic to potential conversion.
Make a slinky walk down the stairs. What kind of energy is used?
Shoot a ball into a basketball hoop. What kind of energy is used?

Look around the classroom, what sources of energy can you find?
A light switch - potential energy

Which has more energy a ice cube or a lit match?
Hold a lit match in one hand and hold a ice cube in the other hand.
The ice has more mass therefore, it has more potential energy.

If you plug in a fan, what kind of energy is produced?
Kinetic energy (motion)
Can the fan produce energy without being plugged in? Yes, you can turn the blade with your hand.

The students will write their results from the various activities. This writing assignment will give some practice for the IGAP writing test.

Conclusion:

The students should be able to define kinetic and potential energy.
The students should be able to identify when kinetic and potential energy is used in their everyday lives.

Camille Gales - Edward Coles Elementary School

Potential Energy: How is It Related to Kinetic Energy?

Camille Gales
8441 S. Yates Boulevard
CHICAGO IL 60617

Edward Coles Elementary School
8441 S. Yates Boulevard
CHICAGO IL 60617
(773) 535-6550

Objective(s):

This is an integrated primary level math and science experience designed to demonstrate the relationship between potential energy and kinetic energy. The greater the input of potential energy (altitude of the ramp), greater the output of kinetic energy (distance traveled). The steeper the ramp the greater the distance an object will travel (roll).

Materials Needed:

matchbox toy cars, a ramp with an altitude of 3 centimeters and a length of 28 centimeters, a ramp with an altitude of 6 centimeters and a length of 28 centimeters, a ramp with an altitude of 12 centimeters and a length of 28 centimeters, masking tape, a smooth flat surface, centimeter tapes or meter sticks

Strategy:

Place the ramps on the floor or other smooth flat surface. Place the tapes or meter sticks at the end of the ramps. Place each car at the top of the ramp and release it. Measure the distance the car travels. Do three trials for each of the three ramps. Record the results.

Performance Assessment:

Primary level children: develop a chart that shows each trial run for the car (a column for ramp height beside the column for distance traveled), develop a bar graph for each ramp to display the results, explain the relationship between the altitude of the ramp and the distance traveled by the car, accurately state that the unit of measure being used is centimeters.

Intermediate and upper level children: average the results of the three trials, interpret the results in terms of the relationship between the slope of the angle of the ramps and the distance traveled, develop charts and graphs to organize and display the data

Conclusions:

The cars released from the ramp with the altitude of 12 centimeters should travel the greatest distance. When the altitude of the ramp is doubled the distance traveled should also double demonstrating that there is a direct relationship between the altitude of the ramp (potential energy) and distance traveled (kinetic energy).

Mathematics/Physics

Mass/Acceleration

Renee M Allen
P.O. Box 780
Saint Anne IL 60964

Louis Wirth
4959 S Blackstone
Chicago IL 60615
(773) 535-1410

Objective(s):

To see the relationship between mass and acceleration of an object.

Materials Needed:

(8 groups of 3)…………8 pairs of scissors 8 spring carts

1 roll of masking tape 8 metersticks

8 sheets of plain paper 8 pencils

16 masses of 1 kg

Strategy:

Students will work in groups of three. In the group, one will be the starter, one will be the spotter, and one will be the recorder. The recorder will make a data chart as follows:

	Distance Cart Moved	Distance Cart Moved With 1 Mass	Distance Cart Moved With 2 Masses	Conclusions
Trial l Trial 2 Trial 3 Trial 4				

1. The starter should label the number or name of his/her group with masking tape and place it on the spring
2. Locate each group in a marked area against the wall.
3. Starter should release the cart without pushing in spring (force) and observe.
4. Starter should push spring (force) in half way, by forcing against the wall, and release. Then record observation.
5. Starter should push spring in all the way, by forcing against the wall all the way, and release. Then record observations and data on data chart.
6. Repeat #5 using 1 mass (1 kg) on the cart, and record on data chart.
7. Repeat #5 using 2 masses (2 – 1 kg) on the cart, and record on data chart.

Performance Assessment:

Rubric:

5 A. Explanation on paper shows understanding that force produces acceleration.

B. Explanation on paper shows the more mass the less distance the cart will travel.

C. Data chart information all recorded.

4 A. Explanation on paper shows the more mass the less distance the cart will travel.

B. Data chart information all recorded.

3 All information on data chart recorded.

2 About half of the information on data chart recorded.

1 No information recorded at all.

"**It's So Simple**"

Kimberly Baker-Brownfield
4300 W. Ford City Dr. #909
Chicago IL 60652

Jacques Marquette Branch
6201 S. Fairfield
Chicago IL 60629
(773) 535-9500

Objective(s):

- This lesson may be used as an introduction to Simple Machines. It may be applied to various grade levels.
- Students will receive a visual explanation of how machines we see in everyday life work.
- Students will also learn the need for these machines and why we must use them in our everyday life.

Materials Needed:

Include each of the following activities in a separate medium-sized container.

Activity 1. Two sticks of modeling colored clay, plastic ruler, beans (pinto or lima).

Activity 2. One stick of colored clay, two large spools of thread (one without thread), a dowel (cut into two parts - one 4 inches and the other 10 inches), string (10 cm) and Hershey Nugget candy in gold wrappers.

Activity 3. Two medium-sized plastic solo cups, one sheet of laser copy paper (8.5 x 11), six balls of lemon drop hard candies and one stick of colored clay.

Activity 4. A small cardboard box, seven paper fasteners, an 8cm rectangular cardboard strip, 2-5cm cardboard strips, 4-3cm circular pieces of cardboard, glue, one-hole puncher and Hershey Nugget candy in gold wrappers.

Strategies:

Brainstorming, Guided Instruction. Cooperative Grouping and Discovery Learning

Before all activities begin, students should be given an imaginary scenario (on a 4x6 index card about different families. Their task will be to help the family solve their problem using only the supplies in their science boxes.

The following is the story for Activity #1:

> The Wee Davis family is rich. They have lots and lots of gold. One problem they have had lately is trying to fight off the Giants who come out of Monster Lake. The Wee Davis family is nice and would like to share their gold, but the monsters are mean and want to take all of the gold for themselves. Can you help The Wee Davis family fight back against the giants when they attack?

Teacher's Solution:

Students must use the materials for activity 1 to discover how to make a lever that will fire beans back at the giants.

Teacher must allow discovery time and guide students to eventually place the ruler over one stick of clay (like a seesaw). Place a bean on one end of the ruler and create a person (using the clay) to jump on the raised end of the ruler to fire the beans at the giants.

Story for Activity #2

The Wee Jones family is planning to take a vacation. However, they are afraid that if they leave home, the giants will steal their bars of gold. The family would like to pick up their bars of gold and put them in the car to take them on the trip, but they are simply too heavy.

Can you help the Wee Jones family find a way to put the bars of gold in their car without using their bare hands?

Teacher's Solution:

Students must discover how to create a pulley (using the materials given) to lift the gold nuggets.

First, glue the two dowels together to create a 90 degree angle (an upside down L). Place the unthreaded spool on the dowel suspended in the air. Place the longest dowel in the center of the spool of thread to make the pulley stand by itself. Next, place the thread, in one wrap, over the top of the suspended spool making a pulley. Tie one end of string in a knot around a Hershey Nugget and allow one of the clay people to pull the other end of the string.

Story for Activity #3

The Wee Adams family always seems to have a problem with the monsters of Monster Lake when they are trying to take gold from one side to the other. The monsters always steal some of their gold. The Wee Adams family is fed up and needs your help. Can you help the Wee Adams family get from one side of the lake to the other without having to walk in the water and risk losing their gold?

Teacher's Solution:

In this activity, students must discover how to make an inclined plane.

Place the mouths of both Solo cups face down and spread apart. Fanfold the laser paper on the 11inch side (make 4 folds on both 11 inch sides). Place the fan-folded paper on the solo cups and slide your lemon drops from one side of the bridge to the other using the clay family you've constructed.

Story for Activity #4

The Wee Brown family just received word that a sick cousin must have an operation right away. He keeps getting bigger and bigger. The doctors say that he needs 12 bars of gold to cover the cost of the operation. The Wee Brown family will have to send the gold from their safe, but it will take hours or maybe days for them to unload 12 bars from their safe. They may also have to take breaks to regain strength while unloading. Can you help them find an easier and faster way to put their gold into the car and drive to the hospital before their poor cousin explodes.

Teacher Solution:

In this activity, students must discover how to make a bulldozer (lever) with the parts given or make a dolly (wheel and axle). Punch a hole in the center of each wheel and four holes in your box to make a place for the wheels. Use fasteners to lock them in place. Connect two - 4 cm rectangular strips to one end of the box and glue a vertical cardboard strip to each of those pieces. Connect another 4cm strip to just above the rear passenger wheel. Connect the longest strip (8 cm), using fasteners, to this strip (this part will be your lever). Now you can place the gold nuggets on your lift and pick up each piece to help the family get to the hospital. (Please call for further explanation if needed).

The second solution would be to have students create a wheel and axle (dolly).

Performance Assessment:

Teachers may assess student's performance visually. Instructors may also develop a rubric based on how close students come to the teacher solutions given. Students who do not develop a simple machine are obviously not using their background knowledge and should be graded accordingly. Those students whose creations exceed the teacher solutions should obviously be graded higher.

Mathematics /Physics

The Soup Roll

Christine Fair
1842 S Kildare
Chicago IL 60623

Farragut High School
2345 S Christiana
Chicago IL 60623
(773) 534-1300

Objective:

This lesson is designed for Grade 5.

Students will be able to determine if the contents of a can affect how long it takes to roll down an incline.

Materials Needed:

3 6 x 1' ft. slantboards

3 cans each of a creamy soup, a broth and a chunky 10 ¾ ounce soup cans

3 cooperative learning groups which elect a leader, roller and time keeper.

clock with a second hand

1 worksheet per group

3 yardsticks

2 inertia rods

(2 yardsticks with weights attached)

Strategy:

Students will be divided up into groups. Each group will get a can of each type of soup, a stopwatch, a work sheet and a slantboard. Students will roll each can 3 times down the slantboard and record the time from the top of the inclined plane to the very bottom where a yardstick will be placed. Each group will do this three times and average the results. Students will record their times on their worksheets. Do the same thing on a smooth, flat surface, such as the table top or the floor. Is there a difference in your results? Conclude whether a different type of soup rolls faster or slower and explain why.

Students will then try and roll two can down the slantboard at the same time. Students will time the soups to see which moves faster. They will record their findings. Students will be asked to explain why they think one can rolled faster than the other. Students should conclude the heavier can moves slower because of its weight and contents.

A final exercise that could be tried with the entire class is to have class compare to weighted inertia rods. Two students are ask to lift an inertia rod in one hand, with that hand extended. Each student must hold the rod vertically; twisting the inertia rod back and forth with the arm as an axis of rotation. Have two more pupils count how many times the pupils twist the rods. Have the pupils exchange inertia rods, and do the exercise again. The class is the audience. Pose the question to the class **"why do you think one person was able to move they're inertia rod faster?"** The students should be able after exchanging rods to determine that the weights of the two inertia rods are equal, but the weight is distributed differently in each of the rods. The class must explain why one pupil can twist his rod faster than the other pupil. Their explanation must correspond with the explanation of why one type of soup can rolls faster than the others due to the differing weight factors.

Performance Assessment:

Students will be assessed based on their participation. The teacher will observe and pass by each station and ask each student why they feel this phenomena is happening. All students should be able to tell what they saw happening.

Straight Line Motion in Two Parts

Ann M. W. Brandon
1544 Edgewood Ave
Chicago Heights IL 60411
(708) 756-2635

Joliet West High School
401 N. Larkin Ave
Joliet IL 60435
(815) 727-6950

Objectives:

Students will observe both constant and accelerated (changing) motion. They should be able to calculate speed from distance and time measurements. They will graph distance vs time for each motion and observe that the two motions look different when graphed. This was designed for upper middle school to 9th grade students.

Materials Needed:

Per group of 2 or 3 students:

Stomper (battery powered toy car)
Stopwatch, or second hand on a clock
Meter Stick
Toy car, not powered
A long slope (a table with two legs propped up with some books)

Strategy:

Part I: Stomper

Issue a Stomper, stopwatch, and meter stick to each lab group.

Ask the following questions, in writing:

Describe the motion of the car as it rolls along the table.
How can you tell what it is doing?
What do you need to know to find the speed of your Stomper?
Find the average speed of your stomper over a distance of 1 meter.
What can you measure?   How many trials should you try?
Record your measurements and calculations.

Is this a constant speed? How can you tell?
Find the average speed for 2 meters.
Was it the same as the average speed for 1 meter?
What about 3 meters?

Graph the Distance Traveled vs the Time Taken for 1, 2 and 3 meters.
Describe this graph.
Is it straight?
Is this constant motion or changing motion?
What is the relationship between the Distance Traveled and the Time Taken?
Look at the slope (rise over run) of the graph, and calculate this slope.
What does this tell you?

Part II: Car Rolling Down Hill

Trade the toy car for the Stomper.

Help your students create a hill.
Ask your students the following questions, also in writing.

Start your car at the top of the hill.
Describe its motion.
Is it constant motion? Or is it accelerated (changing) motion?

Find the average speed of your car for 1/2 meter.
Record your measurements and calculations.

Repeat for 1 and 1 1/2 meters (or the end of the hill)
What do these speeds tell you? Is it constant motion, or accelerated motion?

Graph the Distance Traveled vs the Time Taken.
Describe this graph. Is this a straight line?
What does this graph tell you about the motion of the car rolling down the hill?

Performance Assessment:

Two possible follow up assessments:

1. Use a "Two Speed" Friction powered car. Wind it up and let it go. Ask for descriptions of its motion. Then ask for a sketch of a distance vs time. It will have a section of constant motion, then shift gears, accelerate, and have a new, faster constant motion.
2. Draw a graph of some motion, and ask for a description of that motion.

Conclusions:

Students should be able to measure distance and time.
They should be able to combine them to find speed.
They should be able to graph distance vs time, and find the slope to find the speed.
They should recognize the difference between constant motion and accelerated motion.
They may even be able to tell the difference in the motions by the sound of the cars as they roll along.

Return to Physics Index

Aviation

Portia Conaway
1952 N. Natoma Ave
Chicago IL 60707
(773) 745-1021

Farren Fine Arts School
5055 S. State St
Chicago IL 60609
(773) 535-1440

Objectives:

This mini-tech is designed for the primary grades but can be modified for middle school grade levels. The main objective for this mini-teach is for students to understand that objects are launched in different ways and fly through the air in different ways. Additionally, students are to understand how to adjust paper airplanes and helicopters to fly better.

Materials Needed:

The following list is every item you will needed to complete this lesson in your classroom.

1. plastic helicopter dart available at American Science and Surplus $5
2. white piece of paper for each student
3. kite
4. stomp rocket available at American Science and Surplus $25
5. 10 paper plates
6. stapler
7. scissors

Strategy:

Intro: 10-15 min.
Demonstrate the helicopter dart and ask students to watch how it takes off and how it flies in the air. Then allow students the opportunity to play with the dart. Next, have a class discussion asking the students how it was launched and how it flew in the air.

Journal Writing: 10-15 min
Have each student write in their journal how they think the plastic helicopter dart was launched and how it flew.

Group Activities: 10-15 min
Divide the students into four groups. Group 1 will put together a kite and practice flying it outside. Each person in Group 2 to will make flying disk. Students take two paper plates and cut a small hole in the center of them. Next, face the tops of the paper plates together and staple together around the edges. Group 3 will make paper helicopter. Students will cut a 2 inch wide strip of paper 12 inches long and tear it in the middle at the top of the strip as far down as they would like without tearing the paper strip in half. Next, students will fold the bottom of the paper strip to add weight. Students then fold the torn part of the helicopter down in opposite directions. Group 4 will make paper airplanes in any design of their choice.

Group Discussion: 15-20 min
Have one or two students from each group demonstrate how their flying object works. Ask presenters of the flying objects to verbally state how they were able to get the object to fly and how it reacted in the air.

Measuring flight: 15-20 min

Have one student fly their object and then measure the distance in no standard unit of measure (foot to foot). Then have 3 to 4 students fly their object from the same place and compare and contrast the distance the objects flew. Ask questions like, "Who's flew the furthest and who's flew the shortest?"

Following the above have each student make the paper helicopters and measure the time it takes to fly a distance of your choice by clap timing. The class will clap the same beat and count the number of claps it take the paper helicopters to hit the ground when launched from a specific spot.

Closing:

Show the students a stomp rocket and ask how they think it will be launched and how it will fly through the air. Next, demonstrate how the rocket works and then allow the students time to play with it.

Homework:

Have the students bring in an object from home that flies or a picture of of something that flies and explain to the class how it is launched and how it flies.

Return to Physics Index

Newton's Third Law

Jerri Chavis
10301 S. Leavitt
Chicago IL 60643
(773) 239-1932

Langston Hughes
226 W. 104th
Chicago IL 60643
(773) 525-5075

Objective:

This mini teach is designed for grades K-2. Children will use inquiry and observation skills to determine **Newton's Third Law of Motion**; for every action there is a reaction; for every force there is an equal and opposite force.

Materials Needed:

(see below group & individual activities)

Individual Activities:

(Stations 1-6 are individual student stations)
Each station should have an instruction sheet with helpful illustrations.

Group Activities:

Balloon Races
Balloons (different shapes & sizes)
Straws, Tape, String

Canister Explosion
Alka-Seltzer(Bicarbonate), 2-35-mm film canisters

Skate Board
2-Skate Boards or 2-Office Chairs

Wrap up surprise
2-Soft drink cans; 2-3 firecrackers (teachers' use only)

==

Individual Stations:

Station #1- Stomper Truck
Stomper Truck, 4x6 piece of cardboard paper, BB's/beads
1. Place cardboard on top of the beads.
2. Next place stomper truck on top of cardboard and turn stomper on.
Ask Question: What do you think will happen?

Station #2- Newton Scales
Newton Scales-2
1. Connect spring scales together
2. Person #1: pulls so that the scale stops on the number 20.
3. Person #2: does not pull.
Question: What do you think each scale will register?

Station #3- Books
Books
1. Person #1: Places books in person #2 hands.
2. Person #2: extends palms up to hold books.
3. Person #1: quickly remove books from person #2's hands.

Station #4-Pyramid
(2-person exercise)
1. 2 persons stand facing each other with palms of hands touching each other.
2. Each person will continue touching and moving feet backwards until they form a triangle.

Question: Who's pushing whom?

Station #5-Weight Scales
Bathroom Scales
1.Each person stands on scale puts hands under lip of table. Pull upward on the edge of the table.
Question: How much do you weigh while doing this?
2. Next, while standing on scales push down on table top.
How much do you weigh while doing this?

Station #6-Step Off
1 Skateboard
1. Step upon the skateboard.
2. Take one step forward, as if walking off the skateboard.

Please have someone hold onto your hands!!!
Question: Describe what you think will happened?

Strategy:

Group Activities
1st Group Activity: Balloon Race will serve as opening activity which allows group to do a cooperative activity together. This activity demonstrates "Newton's Third Law of Motion." By showing the students, when the air in the balloon is pushed out of the balloon, the escaping air pushes forward on the balloon. Allow students to test different hypotheses. What would happen if the balloons were filled with more air? What would happen if the balloons were raced up hill?

How To Construct Balloons For Race:
Determine how long the string needs to be for races (5-6 ft. per racer). Feed string through the straw (useful hint: make a threader out of floral wire, when finished it should look like a bobbie pin; this device needs to be longer than the straw you will be using, it allows for easier feeding of string through the straw). Attach straw and string to balloon with tape. Each contestant's string is attached to the wall/board and held in one hand. The other hand is holding the balloon that will be released at the start of the race.

2nd Group Activity: Station #3-Skate Board
2-Skate Board (you can use in place of skateboards 2-Office Chairs). This activity has two persons standing on skateboards and their palms touching each other. Then they push off from each other. Ask what do you think will happen? Each person should be propelled backwards (opposite directions). If you do not have a skateboard use 2 office chairs and have persons sit facing each other with palms touching. Ask them to push off and see what happens.

Performance Assessment:

(SURPRISE EXERCISE): Introduce students to soft drink device consisting of two cans and one firecracker. Then ask them what do they think will happen when the firecracker is placeed between the cans and lit. Have them write their conclusions in their journals. This will allow you to see if the children truly understand: **For every action force there is an equal and opposite reaction force.**

Alternate Activity: (You can use the two 35mm film canisters and Alka-Seltzer (Bicarbonate in place of the firecracker activity if you like; same conclusions will be drawn). The firecracker is just more dramatic. In order to use film canisters, half fill the two 35mm canisters with H_2O. Close the lid on one of the canisters and lay it down on the table on its side. Add the 1/2 tablet of Alka-Seltzer **quickly** to the 2nd canister. Quickly put the cap on and lay it quickly on its side with the lids facing each other. This is an alternate to the use of a firecracker in class.

Conclusions:

From a philosophical point, for every action in life there is a reaction.
If you touch the world gently....the world will touch you back gently. If you touch the world harshly the world will touch you harshly.

Motion of a Bowling Ball

John J. Miller
1728 E. Forest Ave.
Des Plaines IL 60018
(847) 297-6368

Maine Township High School East
2601 Dempster
Park Ridge IL 60068
(847) 825-4484

Objectives:

The students will be able to make a distance vs. time graph of a bowling ball and have practice reading distance vs. time graphs of various motions.

Materials:

A bowling ball, 5 - 10 stopwatches, a massive object to let the ball collide into and not hurt anyone, white boards (this is a 8 foot by 4 foot sheet of white paneling board that can be bought at most big hardware stores and is cut into 1 foot x 1 foot boards), dry erase markers, and paper towels to clean off the boards.

Strategies:

Phase 1:
This is a Socratic/phenomenological form of questioning to do a lab. One of the "hidden" purposes to this lab is to get away from the standard, cookbook forms of the lab manual, and have the students make the plan of attack with small prompts from the teacher. I will repeat, you want to get away from the "now we'll do this" and move toward the "What do we need to do in order to make a distance vs. time graph of a bowling ball as it rolls?"

In your mind, you know you want to have the students line at equally spaced distances (for example every five feet) in the hall way. You could be courteous with your fellow teachers and warn them a day or two ahead of time. I think it is worth the extra trouble because this is an excellent opportunity to do science outside of the classroom - which is an entire other story. You would like stopwatches in there little hands. You would like the students to all start there stopwatches when you roll the bowling ball slowly. When the ball passes them you would like them to stop their stop watches. You would like someone to collect the data in a column form so that you can make another trial rolling the ball faster. You would like them to go into the classroom and graph the data (distance on the vertical axis and time on the horizontal axis). You can them ask questions such as "What do you notice about the best fit lines of the two trials?" Hopefully you will get the faster trial is steeper and the slower trial is less steep.

Now is a good time to regroup and explain that if the line is horizontal it means the object is stopped and the slope of the line (steepness) tells the speed.

Phase 2
Hand out the white boards and dry erase markers and a paper towel to clean them off. Explain to the students you are going to walk across the front of the class room and you would like them to make a sketch of a distance vs time graph (qualitative graph) of your motion. The following are some suggested motions to walk in order to have the students build from simple to more complicated.

a) walk at a constant speed
b) walk at a constant speed, stop for a time and walk at the original speed
c) walk at a constant speed, stop for a time and walk at a speed faster than the original speed
d) walk slow and then speed up
e) walk fast and then slow down
f) walk forward at a constant speed and then back toward the origin

Phase 3:
Have two students come up to the front of the class room. Have one student make a distance vs. time graph but not show anyone except the other student in front. He will try to walk like the sketch the first student made and the rest of the students will make a sketch of how the walking student walked. Compare the original sketch made by the first student

Performance Assessment:

Walk some method and have the students make a distance vs. time graph of your motion.

Conclusions:

On a distance vs. time graph the slope (steepness) of the line tells you about the speed of the object. The larger the slope (steeper the line) the faster the object travels. The smaller the slope (the less steep the line), the slower the object. A flat line means the object has stopped.

Strings and Springs

Michael McIntosh
8029 S. Washtenaw Av.
Chicago IL 60652
(312) 434-4936

Whitney Young Magnet High School
211 S. Laflin St.
Chicago IL 60607
(312) 534-7539

Objective:

By measuring several periodic phenomena, the student will make graphs and determine what the different shapes indicate.

Materials:

Two springs
Two strings slightly longer than 1 m
120 washers
Four stopwatches

Strategy:

The activities will be in four separate stations. The students will divide into groups of four or five and circulate through the stations.

Station 1 The Bouncy Spring
Hang the spring vertically. Hang 10 washers from the spring. Lift the washers slightly and let them go. Measure the time for 20 bounces. Record the data in a table. Repeat with 20, 30, 40, and 50 washers. Make a graph of the data.

Station 2 The Stretchy Spring
Hang the spring vertically and notice the position of the end. Hang 5 washers from the spring and measure how far it stretched. Record the data in a table. Repeat with 10, 15, 20, and 25 washers. Make a graph of the data.

Station 3 Mass and Time
Hang a string so that it is 1 m long. Attach 5 washers to the end of the string. Pull the washers to to side slightly and let them go. Measure the time for 20 swings. Record the data in a table. Repeat with 10, 15, 20, and 25 washers. Make a graph of the data.

Station 4 Length and Time
Hang a string and make loops at 20 cm, 40 cm, 60 cm, 80 cm, and 100 cm from the top. Hang 15 washers from the first loop. Pull the washers to the side slightly and let them go. Measure the time for 20 swings. Record the data in a table. Repeat for the other loops. Make a graph of the data.

Performance Assessment:

Given pictures of several differently shaped graphs, determine which graph matches which station.

Super-Ball Physics

Porter W. Johnson
406 N. Elmwood Avenue
Oak Park IL 60302-2226
(708) 383-2846

Illinois Institute of Technology
Professor of Physics
Chicago IL 60616-3793
(312) 567-5745

Objectives:

To study the motion of a ball in the air, its collision with a hard surface, and subsequent bouncing. The idea is to take an familiar toy and use it to demonstrate basic features of moving and colliding objects.

Materials Needed:

A large supply of various types of balls to demonstrate some that bounce well, some that don't bounce at all, and some that bounce only a few times. A meter stick [or better, a two meter stick] is needed for each set-up.

Strategy:

1. Begin by showing a variety of balls that bounce to different degrees and with different vigor on a hard surface [table or floor]. Show that Super-Balls of various shapes and sizes bounce more strongly than tennis balls, ping-pong balls, soccer balls, etc. Then give each team of two or three students a Super-Ball and have each team release the ball from a specified height. Have the students measure the "bounce height" of their balls, and enter their measurements on the board, as shown below:

Little Super-Balls

Release Height	Bounce Height
0 cm	0 cm
25 cm	_____ cm
50 cm	_____ cm
75 cm	_____ cm
100 cm	_____ cm
125 cm	_____ cm
150 cm	_____ cm

Draw a graph of bounce height [vertical] versus release height [horizontal] for the various types of objects, and note that the graph is roughly a straight line passing through the origin.

2. The next phase is to study how many times the **Super-Ball** bounces in the vicinity of the spot at which it makes initial contact with the floor. It is convenient to use the tiles on a tile floor, which are squares of standard size [8 x 8 inches, or 12 X 12 inches]. Give each group a Super-Ball and a ruler, have them drop the ball a specified distance above the center of a tile, and record their data in a chart on the board, like the one below:

Little Super-Balls

Drop Height	Number of Bounces
25 cm	____
50 cm	____
75 cm	____
100 cm	____
125 cm	____
150 cm	____

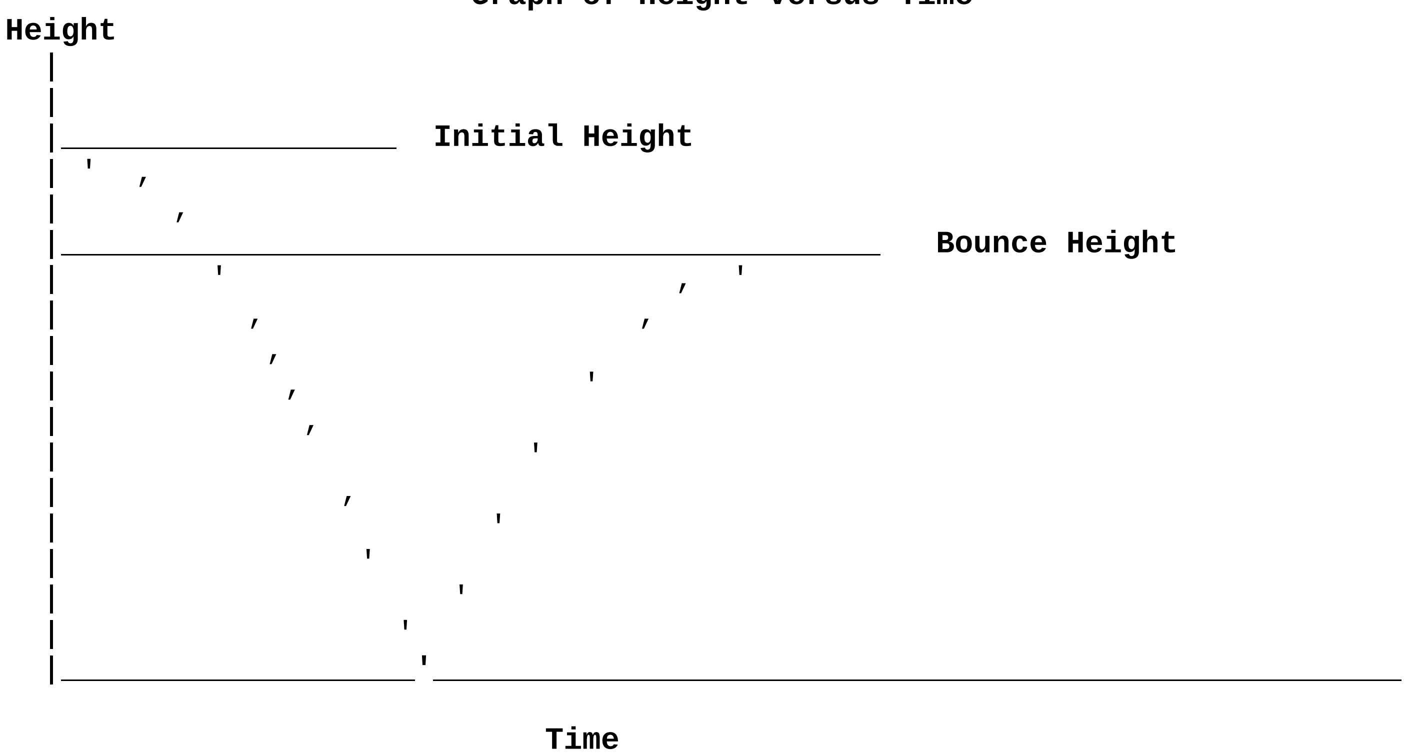
You would expect to see that the balls will bounce only a few times within the alloted square. In general, the balls bounce fewer times inside the region when they are dropped from a greater height. This tendency of balls to wander from the drop point is a reflection of their **chaotic** motion, a feature that they have in common with motion of the invisible molecules in a gas.

Performance Assessment:

Draw a graph of the vertical component of height of the **Super-Ball** above the floor/table [vertical axis] as a function of time [horizontal axis].

Acceptable solution: Note that the ball starts out at an **initial height** at the initial time, starts down slowly, picks up speed, and hits the table/floor after some time. Then it bounces upward, coming up to a **bounce height** that is somewhat less that the height from which it was dropped.

Graph of Height versus Time



Conclusions:

The Super-Ball can be used to illustrate a variety of basic concepts of motion [kinematics]. Its relatively elastic behavior makes it well-suited to illustrating the incessant motion of molecules.

Alternate Performance Assessment:

"A **Wham-O Super-Ball** is a hard spherical ball. The bounces of a Super-Ball on a surface with friction are essentially elastic and non-slip at the point of contact. How should you throw a **Super-Ball** if you want it to bounce back and forth? [**Super-Ball** is a registered trademark of **Wham-O Corporation.** San Gabriel, California.]"

This problem is taken from the book

Newbury, Newman, Ruhl, Staggs, and Thorsen
Princeton Problems in Physics [with solutions]
Princeton University Press 1991
ISBN 0-691-02449-9

The analytic solution to this problem appears in that book. It is shown there that the initial horizontal velocity v, the radius a of the ball, and the initial angular velocity w are related by

$$v = 0.4 w a$$

in order for the ball to bounce elastically back and forth.

The performance-based exercise involves launching a super-ball with just the right horizontal speed and spin so that it will bounce back and forth on the floor.

Inertia

Peter Insley Retired
5652 Giddings
Chicago IL 60630

Objectives:

Inertia

1. Playing card and nickel
   Balance a playing card with a nickel on your index finger. Then with your other hand, try to flick the card out from under the nickel so that the card flies out but the nickel stays on your finger.

2. Tablecloth
   Pull the tablecloth out from under a set of dishes. Fill the cups and glasses with water first.

3. Blocks and glass
   Put a full glass of water on a stack of 6 3"x3"x1" blocks and use a support pole to knock out the bottom blocks.

4. Stack of nickels
   You can knock the nickels out of the bottom of a stack with a credit card.

General Conclusion:

The more weight an object has, the less it moves if you exert the force quickly.

5. Weight and string
   Use thread to suspend a 400g weight and tie another thread below. If you pull fast the lower thread breaks, and if you pull slow the upper thread breaks.

6. Barbie and Ken
   Barbie uses her seat belt and Ken doesn't, so Ken shoots out of the car.

Test:

Put a clothes pin on an embroidery hoop and balance it on a wide mouth bottle. Ask what will happen if you jerk the hoop out. Explain using the idea of inertia.

Momentum

Sandi Sorkin
4214 N. Richmond
Chicago IL 60618
(312) 534-5055

Newton Bateman
4220 N. Richmond
Chicago IL 60618
(312) 534-5055

Objectives:

The main objective of this mini-teach is to demonstrate the concept of momentum. The lesson is designed for grade levels 3, 4, and 5.

Materials Needed:

3 dynamics carts
hammer
block of wood
Jensen Bar
marked off measurements
4 empty pop cans
small fire cracker
skates
tape measure

Strategy:

1. Hold the cart in your hand and demonstrate how the cart works by releasing the spring. Ask the students, "What happens when I release the spring? Why doesn't it go?"

2. Take the cart and place it next to a wooden block. Ask the students "What do you think will happen when I release the spring?" Get their responses. Ask, "What happened?"

3. Take 2 carts back to back and place on a wooden board (platform). Ask the class what will happen? Release the cart and measure the distance. What happened?

4. Compare the results of the equal carts with the cart against the block. Did they do the same thing?

5. Double the weight of one cart by placing a cart on top of another cart. Ask class what will happen. Get response and then release the spring.

6. Place a block at each end of a flat board. Place a single cart back to back with a double cart. Ask the class how the carts should be placed so that they will hit the blocks at the same time. "What can we say?" Write on the board that "lighter" is faster and "heavier" is slower.

7. Place 2 single carts on a balance board or teeter totter. What will happen when the spring is released? Will they stay balanced?

8. Place 2 unequal carts on teeter totter and ask how you should move carts so they reach end of board at the same time and the board remains balanced.

Explain that when the heavier cart is half as far from pivot the board is always balanced. This only happens if the speeds are 2:1.

9. Take out the Jensen Bar and ask if you move the heavier weight on one hook where do you move the lighter weight to balance? Compare this information with where the carts land on the teeter totter. Ask class if the distance is the same ratio. Jensen Bar shows 2 mass x 1 distance = 1 mass x 2 distance. Momentum shows that 2 mass x 1 speed = 1 mass x 2 speeds. When the total momentum is zero the teeter totter is balanced.

10. Place 3 carts back to back and release the springs. What happens?

11. Have 2 children on skates face to face and ask what is going to happen if they push off of each other. Have the children push off and observe.

12. Have the skaters facing the same direction. What will happen when the skater in back pushes from behind? Have skaters do this.

13. Using 4 or 5 skaters lined up - ask what is going to happen when skater at the end pushes skater in front and then each one every 2 seconds pushes the other. Have the skaters enact this. For variety have skaters randomly change their order and see what happens.

14. Take 2 empty pop cans of equal weight and place a fire cracker taped between them. Ask what will happen. Set off the fire cracker. Now repeat this, but this time have some melted wax in only one can, so that it is twice the mass of the other, but do not let the students know.

Performance Assessment:

Do not tell students that the weight in one of the cans is heavier. As an assessment ask what happened when the 2 cans were set off and explain why.

Kinetic Energy and Work

Yolanda Mc Gehee
5451 S Cornell
Chicago IL 60615
(312) 752-7366

Lincoln Park High School
2001 N Orchard St
Chicago IL 60614
(312) 534-8130

Objective:

Kinetic energy can be thought of as the energy associated with the motion of an object and is equivalent to work. An example of kinetic energy is a moving hammer doing work on a nail. The hammer does work on the nail by driving it into the wall.

The main objective of this Mini-teach is for students to observe kinetic energy in balls of the same size but of different mass. Students are to see that balls with a greater mass (weight) and greater height (velocity), have more kinetic energy than balls with a lesser mass (weight) and a lower height (velocity). They will be able to observe this by rolling balls of various masses down a ramp at various heights and measuring the distance the ball moves a block wall. In addition, students will be able to graph the relationship between the distance the block wall moves versus the mass of each ball.

This Mini-teach can be used for grades 5-12.

Materials Needed:

For each group:
(1) ramp with rails
(2) rails
(1) block wall
(3) balls (same size, different mass)
(1) meter stick
(6) blocks
(1) balance

Strategy:

First, obtain three balls of about the same size but, of different mass. Weigh the balls on a balance to determine the mass. Record the mass in grams. Next create three data tables according to the number of blocks used, (2, 4 or 6). In the first column of the data table, list the three balls according to their mass starting from the least to greatest. For the next three columns, label them "trial 1", "trial 2" and "trial 3". Label the final column "average". This is where you will record the average distance of the three trials.

To obtain the first set of data for the first data table, stack the two blocks on top of each other. Place the ramp on top of the blocks on an angle. At the bottom of the ramp, place each of the rails next to each other leaving a space between them. Place the block wall securely between the two rails. Starting at the top of the ramp, roll the first of the three balls down the ramp. Allow the ball to hit the block wall until it has used up all of its energy **(until the ball comes to a complete stop)**. Measure the distance the block has moved with a meter stick. Remember to measure the distance from the end of the ramp to the beginning of the block wall.

Repeat these steps two more times using the same ball at the same height. Perform these same steps using the two other balls at the same height. Do this for each ball at each height (4 and 6 blocks). Record the data in the data charts.

Finally, use the average distances and the mass of the balls to make a graph. Place the average distances on the x-axis and the mass of the balls on the y-axis.

Performance Assessment:

The performance assessment used in this mini-teach is breaking a piece of wood with your hand. This is done by securing a piece of wood on a board holder so that it won't move. Next, make a fist with your hand making sure that your thumb is on the outside of your fist. Lastly, with a very constant motion, force and upward swing of your body, strike the middle of the board. Surprise, the board breaks!

Question:
How do you have to move your hand to do the most work in order to break the board?

Answer:
In order to do the most work and thus break the board, you must hit the board very fast and at a constant speed. The board should also be hit on the grain of the wood because this is where the board is weakest. Finally, your hand should hit the board from a high distance to increase the amount of kinetic energy in your hand.

How to speed up a slow Grandfather - The Pendulum

Arthur Hermann
6166 N. Sheridan Road
Chicago IL 60660
(312) 973 - 2992

Fiske Middle School
6145 S. Ingleside Avenue
Chicago IL 60637
(312) 535-0991

Objectives:

To introduce the concept of periodic motion and relate it to its use in a Grandfather type clock. To discover that the period of a pendulum is dependent on the length of the pendulum and independent of the weight of the bob and the amplitude. Students will discover that a slow running Grandfather clock can be corrected by changing the length of the pendulum.

Materials:

Each group needs a stop watch, pendulum and metal washers.
Materials needed for a pendulum are string and paper clip.
To make a play Grandfather clock you will need a ringstand and a rod and a clockface made from paper.

Strategy:

Begin the class by saying "I'm sure your all wondering why I called you here at this time. In my hand I hold a memo from our CEO that threatens our jobs. We have been given one hour to solve a problem that a has caused a hugh drop in sales." Point to the play clock. "As you can see our clock is five minutes slow. In a moment we will break into our work groups and start working on possible solutions to our problem: What can be done to the pendulum to have the clock run on time?"

At this time you may want a student to come to the front to point out the pivot point, length, and bob. Be sure to demonstrate what a cycle is and how to count cycles. Next pass out a pretend memo from the OLD TYME CLOCK CORP. The memo should state the problem and indicate they may be fired if they do not solve the problem by the end of the period. Each group is given a different length of string to create a pendulum. Lengths may vary from 25cm to 2m. Each group will find the time for their pendulum for 20 cycles. On the board draw a graph with numbers across the top indicating time in seconds. Start with zero using 5 second periods, up to 50 seconds.

When the students have found the number of seconds per 20 cycles ask the students to come forward and tape their pendulum at the appropriate time. Once all the groups have taped their pendulum to the graph, discuss the results. Students will hopefully see the direct relationship between the length and the period of time. Next, each group is given a string of the same length, but this time students may add different numbers of washers. As before the groups will find the period of their pendulum and then come to the front to tape their pendulum on another graph. Hopefully the students will understand the idea that the weight of the bob does not influence the period of the pendulum. Lastly, you should demonstrate the effect of amplitude on a pendulum. You could probably do this in front with help of a student. At this point you should compare the three variables; length, weight and amplitude. Using the collected data ask the students to write their solution to correcting the problem of the slow grandfather clock.

Performance Assessment:

This activity will take more than one period, a good place to break would be after finding the effect of length on a pendulum. For assessment, students should be able to describe what should done to the pendulum and explain how this would solve the problem. The student's understanding of this material can be evaluated by having them predict what the correct length would be for the clock to kept the correct time. Hopefully by experimenting students will discover the length at 20 seconds is the correct length.

Return to Physics Index

Newton's Third Law Of Motion

Lilla E. Green
8044 S. Muskegon Avenue
Chicago IL 60617

Hartigan Elementary School
8 West Root Street
Chicago IL 60609
(312) 535-1460

Objective:

This mini-teach is designed for grades 4 - 6. Pupils will verbalize and demonstrate Newton's 3rd Law of Motion: action and reaction.

Materials Needed:

These materials will be used for teams of five - six pupils.

string
tape
long party balloons
straws (milkshake size)
masking tape
scissors
empty soda pop can with the opener lever intact
nail
bucket/tub of water
11 x 14 piece of cardboard
marbles
ten foot nylon rope
wind-up Tomy truck
giant skateboard (about 20 ft.)
timer (clock)
two demo spring scales
fan cart (Pasco dynamics cart w/ personal face fan attached)
three foot skateboard

Strategy:

Rocket Launch:
Have four - five pupils attempt to get balloons across the room. Some may throw them across, blow them up and release them, or walk them across the room. Lead them to realize that they need a direction for their balloons. Now, have pupils inflate balloons as a team and launch them in races. The balloons slide along the strings on the thrust produced by escaping air. Then pupils discuss what happened and try to give reasons for what they observed. Next, teams travel through four stations which reinforce the idea of action/reaction. The stations are described below:

Stations	Activities
(1)	Soda Pop Can Hero Engine - Pupils observe water streaming through 4-6 holes (made by a nail) in the bottom of a suspended soda pop can. The water causes the can to rotate in the opposite direction from the direction of the streaming water.
(2)	Three foot skateboard - Pupils line up and step up on the skateboard, one at a time. As the pupils step off

the skateboard, they are to observe what happens. Safety Note: Have someone hold their hand as they step off the board.

(3) Truck and Marbles - Pupils space about 20 - 25 marbles evenly under a 11 x 14 square cardboard. Then a Tomy wind-up truck is placed carefully on the cardboard. When the lever is released, the pupils are to observe what happened.

(4) Demo Spring Scales - Pupils pair off and hook one demo spring scale to the hook of their partner's spring. One tries to pull with a force of 4 Newtons while their partner tries to pull at a force of 8 Newtons. Pupils will describe the situation and tell what happens and why.

Groups rotate every four minutes (teacher uses the timer to keep groups on task). At the end of the sixteen - twenty minutes, each group nominates a reporter to share the findings of their team.

As a closing activity, pupils play "Tug Of War" using the giant 20 foot skateboard. First, pupils pair off and join hands with their partners. A piece of masking tape marks the starting off position. Whichever partner comes over the tape, loses the round. Next, have a person with a small physique go against four larger people using the nylon rope, which is looped at both ends. Naturally, the small pupil loses. Then have the four larger pupils stand on the giant skateboard, and have pupils predict the outcome of the tug of war. The class discusses what happened and why. Then a general rule or law is produced through total group participation.

Assessment:

Groups write up their thoughts about each station and post their group's conclusions on the chalkboard. Selected persons report orally before the class.

Conclusion:

Fan Cart: Attach a personal fan to a Pasco dynamics cart with tape. Turn it on. The class concludes that the action of the blades on the fan is the cause of the cart gliding in the opposite direction. This gliding is the reaction force. Pupils form the general law which states that actions take place in pairs with reactions. For every action, there is an opposite (and equal) reaction. For example, with the Hero Engine, water streams in one direction and the can rotates in the opposite direction. With the truck and marbles' activity, the truck goes in one direction while the cardboard goes in the opposite direction. As the person steps off the skateboard, they exert an action force on the board, making it go in the opposite direction. Pupils found that they could not pull on opposite ends of the Demo Spring Scales with different amounts forces. As they pulled, the scales always read the same force. In every activity, pupils conclude that whether a balloon is racing along a string, or whether one is engaged in a tug of war, there will never be an action force exerted without a resulting reaction force.

Objects Race 500

Eloise Dillon
P.O. Box 60426
Chicago IL 60626
(312) 534-5055

Newton Bateman
4214 N. Richmond
Chicago IL 60618
(312) 534-5055

Objective:

ALL GRADES

To determine how shape affects speed.

Materials Needed:

scale
balls
can of beef broth
Three yardsticks
Glass jar with lid
books or blocks
Clear plastic bottle
table
hoops
Various solid disks
can of mushroom soup
Two cans of Comet
construction paper
A smooth flat board
Blue food coloring
Four right angle screw clamps
Set of same mass/same size wooden hoop and metal disk (momentum set)
Set of same mass/same size/different distribution sticks (momentum sticks)

Strategy:

a. Set up incline plane.
b. Prior to lesson empty one container of Comet into the glass jar and seal the empty Comet container with the lid and set it aside out of sight. Collect twenty objects that roll smoothly from the material listed above.
c. Fill plastic bottle half full with water. Add a few drops of blue food coloring to the water. Set this aside out of sight.
d. Place pair of right angle screw clamps on opposite ends of one yardstick. Place pair of right angle screw clamps near the center of one yardstick allowing enough space to hold the yard stick between the clamps. Place the momentum sticks and set on the table off to one side.
e. Place scale on the table.
g. Make three signs: OBJECTS RACE 500, WINNERS, and NONWINNERS. Tape the signs WINNERS and NONWINNERS at bottom of the chalkboard tray at opposite ends.
h. Make an elimination grid by listing the numbers one through sixteen vertically on the board. Have children write down names of object next to number on the board. Start the race by calling children up with their objects. Place the objects at the high end of the incline plane. Align the objects behind a yardstick. Countdown from three to zero. Lift the yardstick straight up. Allow the objects to roll down the incline plane. The first object down the incline plane is the winner of that race. The nonwinning object is to be placed on the bottom ledge by the NONWINNERS sign. The winning object races the winner of the next race. Repeat process until all eight races are completed in the first round. If there is a tie try switching the position of racing the objects. Race objects back to back. If one object clearly pulls away from the other that object

will be faster. Ask the children to make observations about the nonwinning objects and do the same for the winning objects. Repeat the process until all races are completed. Ask the children to make observations about the winning objects and the nonwinning objects.

i. Tell the children that you would like to have some fantasy races with more objects. Proceed with these pairings for the races: the momentum set, the can of beef broth and mushroom soup, can of beef broth and wooden disk and the last race will be the empty can of Comet and the full can of Comet.

j. Ask the children to predict which object do they think will win in each of fantasy races.

k. The results will be that the wooden disk will be faster than the metal hoop. The can of beef broth will be faster than the can of mushroom soup. The empty can of Comet will be faster than the full can of Comet. The full can of Comet will roll a little distance and then come to a full stop. The beef broth will beat the metal hoop because the liquid inside is sliding down the incline. Illustrate this by rolling the bottle of blue water down the ramp.

l. Use the momentum sticks. Swing the sticks out away from your body. It will be easier to swing the momentum stick that has its mass closer towards the center than the one that has the mass distributed towards the end. This can be illustrated by repeating the swings with the yardsticks. The yardstick with the right angle clamps near the end illustrates the metal hoop and the empty can of Comet. The yardstick with the right angle clamps near the middle illustrates solids such as the wooden disks, balls, and the can of mushroom soup.

m. Look again at the race between the momentum set(wooden disk and metal hoop). Show with the scale that both objects have the same mass. Remind them that the disk was faster than the hoop. Ask the children to make observations. Is weight a factor? No it is not. The faster objects have a center of gravity closer towards the middle similar to the yardstick with the right angle clamp near the middle. The hoops have their center of gravity distributed closer to the rim illustrated by the other yardstick with the clamps attached at the end.

n. The full can of Comet was the slowest because the powder inside was also turning trying to reach its own center of gravity while the can was rolling down incline. Illustrate this by rolling the glass bottle of Comet down the incline.

Performance Assessment:

Rank these objects in the order that they would finish in a fantasy race and tell why each object finished in that order. Use a disk, a can of soda, a hoop and a ball.

Newton's Second Law; Mass-Acceleration Relationship with Dynamics Carts

D. James Chichester
1430 N. Hoyne Apt #2
Chicago IL 60622
(312) 292-0246

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815) 485-7600

Objectives:

Students will form their own hypothesis about the relationships between force, mass, and acceleration for their dynamics cart system. First they will qualitatively evaluate a cart system, then collect actual data, then express the data in graphical format to visualize the relationships. This mini-teach is geared for the high school physics student. Minor adaptations can be used for lower grades. CBL units can also be implemented for more advanced high school physics students.

Materials Needed:

Classroom set:
2 different mass automobiles (van & car)
2 bathroom scales (cheap flat ones)
7 dynamics carts
7 table clamp pulleys
7 1.8 meter lengths of string
7 100 gram masses
28 1 kg masses
7 startwatches
7 dynamics cart stoppers
7 calculators

Strategy:

The concepts of force, mass, and acceleration are reviewed with students first. Question: If I push on a car with a constant force, then push on a van with the same constant force, which will accelerate at a higher rate? Let's try it!

Have two students push on a small car with bathroom scales under their hands against the bumpers. Have them push straight ahead, trying to keep the scales at a constant force. Students qualitatively measure the car's acceleration rate. Now two students push on a mini-van with bathroom scales under their hands against the bumper. Students again qualitatively measure the van's acceleration rate. The teacher should be "secretly" calculating the actual acceleration rate of both vehicles using $d = 1/2*a*t^2$.

Ask students to formulate their own conjectures about the relationship between mass and acceleration for objects being pushed or pulled. Students will now complete the following lab.

NEWTON'S 2ND LAW: MASS-ACCELERATION RELATIONSHIP

DIRECTIONS:

1. Assemble your dynamics cart system as follows, be certain cart does not hit pulley. Connect string to cart and hang 100 gram mass over edge of pulley. Place wood stopper block in front of pulley to stop the cart from smashing it. Pull car back on table top until hanging mass is just below pulley, mark the

front of the cart's position on the table with tape. Let cart travel one meter in a straight line towards the pulley, mark one meter traveled position on the table. Be certain the hanging mass still has not touched the ground when cart is at the one meter position.

2. Your cart will be allowed to travel one meter over your table surface. The cart needs to travel the full meter before the attached hanging mass hits the ground.

3. With your startwatch, find the time from the release of the cart to the point that the cart has traveled exactly one meter. Time each trial three times for each amount of mass added to the cart.

4. Average your three time trials for each amount of mass added to the cart, then calculate the average acceleration rate of your cart by using acceleration = $1/(\text{time})^2$.

5. Complete the following data table with your group, then be prepared to graph your results. Do you notice anything about the acceleration rate of the dynamics cart?

Data Table:

Hanging Mass	Cart+Mass	Time 1	Time 2	Time 3	Avg Time	Acc ($1/t^2$)
100 grams	cart					
100 grams	cart + 1kg					
100 grams	cart + 2kg					
100 grams	cart + 3kg					
100 grams	cart + 4kg					

6. After individual groups complete data table, they shall complete a graph of acceleration vs. cart's mass on 2ft x 2ft dry erase boards.

7. Look for similarities and differences between the groups graphs, making changes if necessary.

8. From your table what can you say about mass-acceleration relationship?

9. From your graph what can you say about mass-acceleration relationship?

10. Does the graph and table have a similar relationship for mass-acceleration?

11. Does the graph and table support or change your original conjecture?

Discussion:
Ok, Newton's 2nd Law says that the net force on an object is equal to the objects mass times the objects net acceleration. Or, F=m*a.
Since we kept the net hanging force a constant size, what would happen to the acceleration if we made the mass larger? F=M*a
What would happen to the objects acceleration if we made the mass small? F=m*A

Performance Assessment:

Give students the acceleration rate of either the car or van from the opening activity. Recall what force the scales showed, in pounds, then convert them to the metric units of force (Newtons). Students now need to calculate the car or van's mass from this data. After results are collected we can find the experimental error in the vehicles mass calculation. If the performance assessment tool above is used, you will need to find the force of friction of the vehicle at a constant speed to obtain an accurate NET force of motion and calculate an accurate vehicle mass.

Potential Energy

LaToya Bennett
12155 S. Stewart
Chicago IL 60628
(312) 821-1968

Robert H. Lawrence
9928 S. Crandon
Chicago IL 60617
(312) 535-6320

Objective:

The main objective of this mini teach is to introduce the concept of potential energy. The students will recognize that potential energy is the ability to do work. The students will identify the two factors that effect potential energy. The following activities will demonstrate the effect of height and weight on potential energy. The activities are designed for the intermediate level.

Materials Needed:

weights	wooden blocks	tennis ball	rubber bands
nails	empty spools	meter stick	
hammer	wooden matches	string	
flat empty can	paper clips	ruler with center groove	
large rock	scotch tape	scissors	
pebble	buttons	books of various widths	

Strategy:

Activity - How does the weight of an object effect its gravitational potential energy.

1 Lift the pebble and the stone from the floor to the table.
2 Place the flat can on it's side on floor near the table.
3 Predict what will happen the pebble is pushed off the table and hits the can.
4 Predict what will happen when the large stone is pushed off the table and hits the can.

Activity - The effect height has on the energy of an moving object.

1 Cut an 1 in. square section in the top of a paper cup.
2 Place the cup over the ruler. The end of the ruler should touch the back of the cup.
3 Raise the opposite end of the ruler and rest it on the pencil.
4 Place the marble in the center groove at the ruler's highest end.
5 Release the marble and observe.
6 Repeat the steps above substituting books of various widths for the pencil.

Activity - The effect weight has on potential energy

1 Attach the string to handle of the pail.
2 Secure the opposite end of the string to the edge of the table. The string needs to be long enough to allow the pail to swing about one inch above the floor.
3 Place the paper on the floor under the hanging pail.
4 Position the wooden block on floor in front of the pail.
5 Pull the pail back and allow it to swing into the block. Mark the position

that the block has moved to on the paper.
6 Repeat the steps above adding large pieces of clay to add weight to the bucket.

Activity - The effect weight has on potential energy

1 Cut a 2 inch square section in the top of a paper cup.
2 Place the cup over the ruler. The end of the ruler should touch the back of the cup.
3 Raise the opposite end of the ruler and rest it on the book.
4 Place the small marble in the center groove at the ruler's highest end.
5 Release the marble and observe.
6 Repeat the steps above substituting the large marble.

Activity - Height and potential energy

1 Position the 50 gram weight directly over the first nail.
2 Lift the 50 gram weight to six inches as marked on the wooden bar.
3 Release the weight and observe.
4 Repeat the steps above raising the weight to 8 inches, 10 inches and 12 inches * If the first nail is damaged replace.

Activity - Weight and potential energy

1 Position the 20 gram weight directly over the first nail.
2 Lift the 20 gram weight to the top of the wooden bar.
3 Release the weight and observe.
4 Repeat the steps above substituting various weights.
  * If the first nail is damaged replace.

As a closing activity the student can make a motorized spool. This allows the student a hands, on at home, activity. The students will construct the spool and answer a series of questions. This also serves an evaluative tool.

Activity - The motorized spool

1 Loop the rubber band through two of the holes in the button.
2 Make a small hole in the end of the paper clip and use it to pull the rubber band through the hole in the spool.
3 Hold the rubber band in place in the spool by inserting a short length of a Q-tip or a piece of the wooden match through the ends of the band. Use small pieces of tape to hold the stick in place.
4 Insert a Q-tip or match through the other end of the rubber band, the head of the match or one end of the Q-tip near the hole, and the other end extending out beyond the edge of the spool.
5 Using the long end of the stick, wind the rubber band 5 times. Place it on it's side on a table and let it go. Observe the result.
6 Explain what happened to the spool when it was placed on the table?
7 Why did you have to wind the elastic band?
8 Explain where the energy came from to drive the spool.
9 Wind the spool again 5 times and using the ruler measure how it travels.
10 Predict what will happen if you wind the band 10 times. Test your prediction by winding the band 10 times and letting it go on the table. Describe the result of your prediction.
11 Experiment with your motorized spool by measuring the distance it travels

when wound 10, 15, 20 times. Does the spool go twice as far with 20 turns as it did with 10 turns? Explain why it did or did not.

12 Wind the rubber band 10 times and hold the stick in place with a piece of tape. Put the spool away until the next day.

13 After storing the spool overnight remove the tape and release the spool on the table. How far does it go now?

14 How well did the rubber band store energy overnight?

The students will enjoy reporting their results the next day in class.

Each of the activities are designed to show increased height and or increased weight will increase potential energy.

Momentum

Sandra Tucker
6728 N. Bosworth
Chicago IL 60626
(312)338-5220

Crown Fine Arts Academy
2128 S. St. Louis
Chicago IL 60623
(312)534-1680

Objective:

This lesson is designed for primary level students. They will observe the transfer of momentum.

Materials Needed:

2 or more pairs of rollerblades
2 cars - each car has a spring attached to the front bumper and velcro attached to the rear bumper.
a weight (that will fit on one of the cars)
cue balls
cue stick
marbles
string

Strategy:

Begin with a roller blade demonstration. Tell the students they will need to observe what happens. Students of approximately the same weight will put on rollerblades and will participate in four demonstrations. (Be sure students wearing roller blades are also wearing helmets and other protective gear.)

l. One person stands still. The other person skates into him. At the point when they would collide, they push off from each other.

2. Repeat above, but this time, as they meet they grab on to each other.

3. Both students skate towards each other. When they meet, they push off from each other.

4. Repeat above, but this time, they grab on to each other.

This entire series can be repeated using one heavier student (or two students together) and one lighter student. See if the results are the same. If possible, let all students try these demonstrations with a partner.

Now repeat the demonstration using the 2 cars. The students will observe and discuss what they see. The teacher can draw the diagrams of the car's movement on the board.

1. One car moving - one car still. The springs on the cars are facing each other. Observation: The moving car stops and the still car moves in the same direction the moving car was going.

2. One car moving - one car still. The velcro on the cars is facing each other. Observation: The cars stick together and move slowly in the

direction the moving car was going.

3. Both cars moving towards each other. The springs on the cars are facing each other. Observation: Each car moves in the opposite direction but slower.

4. Both cars moving towards each other. The velcro on the cars is facing each other. Observation: The cars stop.

These demonstrations can be repeated putting a weight on one of the cars. Some of the observations will differ. Students should observe that movement transfers from one car to the other. This is called the transfer of momentum. They should also see that the weight of the car (or other object) affects the speed and direction of the movement.

Now do a demonstration using cue balls. Line up two cue balls. Have a student hit them with a cue stick so they move in an angle. Use a string to show where the ball was hit and the path each ball takes. The students should be able to see a 90 degree angle. Ask them if they see an "L". Repeat several times.

Now give the students a bag of different size marbles and string and let them try to see what kinds of angles are made when you hit two marbles together. Have them observe if the angle changes when the marbles are the same compared to when the marbles are different. Discuss the observations with the class.

Performance Assessment:

Students should be able to describe what "transfer" means, when discussing transfer of momentum.

Return to Physics Index

Projectiles

Rochelle Ingram
8414 S. Carpenter St.
Chicago IL 60620
(312) 224-1079

Delano School
3937 W. Wilcox St.
Chicago IL 60624
(312) 534-6620

Objective:

This miniteach is designed for grades 3-8. The student will be able to measure angle and distance of an arc.

Materials Needed:

balls
water guns
dartboard/darts
rubberbands
aluminum foil
plastic spoons
rocket gun
ping pong guns
bow and arrow
stopper guns
protractors
string
meter sticks

Strategy:

The class will observe a demonstration of a ball rolling off a table, thrown in the air, and rolling off of a ramp. The class will give a very short description of what they have observed.

There will be seven stations set up to observe.

1. Water guns
2. Dartboard/darts
3. Slingshots with a rubberband and aluminum foil
4. Catapults with the plastic spoon and aluminum foil
5. Rocket gun
6. Ping pong gun
7. Bow and arrow

The class will give a very short description of what they have observed.

Performance Assessment:

The class will break up into groups of four. Each group will get some stopper guns to measure the angle and the distance of the stopper. The angle will be measured using a protractor and string. The string will hang straight down in order to figure out the angle of the arc. The distance will be measured using a meter stick. The class will describe their observations and give a conclusion.

Conclusion:

The class will be able to answer this question: What angle was needed to get the greatest distance?

Answer: A forty-five degree angle will give the greatest distance.

Return to Physics Index

Newton's Second Law of Motion

Cynthia D'Souza
7423 N. Sheridan A3
Chicago IL 60626
(312) 508-5978

De La Salle Institute
3455 S. Wabash Ave.
Chicago IL 60616
(312) 842-7355

Objectives:

To verify Newton's Second Law of motion by a) subjecting a body to multiples of a force; b) subjecting two bodies to the same force and qualitatively describing what happens; then quantitatively, the acceleration produced by a gentle ramp. Data is collected, analyzed and graphed.

Materials Needed:

Coffee can, stop watch, meter stick-one each per group of five members. For the demonstration, a lab cart and strong slinky and pulleys, toy carts and weights.

Strategy:

The laboratory cart is kept fixed while a student sits on it holding one length of slinky which will be pulled by teacher till the cart begins to move. This approximates a constant external force. Now two such lengths are held by the student and motion studied. Next the cart is accelerated under three lengths. Conclusions are put up on the board.

The group gathers around the table to compare the accelerations produced by the same force acting on two masses in the ratio 1:2. The arrangement used is a fixed mass in a scale pan falling under its own weight. Conclusions are posted.

Now the groups are handed their equipment and led to the ramp. Marks are made at distances of 0, .50, 1.0, 2.0,meters on the ground and observers with stopwatches stationed there. The coffee can is let go and timings noted.

A graph of d/t is made showing accelerated motion. Each group computes average velocity and acceleration for each mark. To find out if the acceleration is constant, students graph v_{avg}/t. Results are discussed.

Performance Assessment:

Groups answer these questions:
1) What visual evidence have you that the three objects were not moving at constant speed?
2) How does your first graph support this?
3) Find the slope of your second graph. What does this represent?
4) What would happen to the value of acceleration if the ramp were made successively steeper? What setup would you use to show this?
5) What is the value of a when the ramp is vertical?
6) Show by a diagram all the forces acting on the coffee can and which constitutes the unbalanced force.

Conclusions:

1) a a F for constant m
2) a a 1/m for constant F
3) Graph of d/t is not a straight line but v_{avg}\t is, showing that acceleration produced on a fixed mass by a fixed force is constant.

Tops

Sandra Tucker
6728 N. Bosworth
Chicago IL 60626
(312)338-5220

Crown Fine Arts Academy
2128 S. St. Louis
Chicago IL 60623
(312)534-1680

Objective:

This lesson is designed for primary level students. They will observe angular motion - precession.

Materials Needed:

Bicycle wheel - Put handles on the axle through the center. Fill the tire with sand or if no tire, get a vacuum cleaner hose. Fill it with sand and tape it to the rim. On one end of the handle attach a string.
Chair that rotates
Gyroscope
A variety of tops
Cardboard
Plastic lids of various sizes
Push pins
Round toothpicks
Wooden skewers
Scissors
Crayons
Compass
Tape
Glue gun

Strategy:

Hold up the bicycle tire by the handle and ask students to identify the item. Then hold the tire by the string and ask the students what they observe. It falls down. Next, hold the bicycle tire and have someone help to spin the tire. Now hold it by the string and ask students to observe what happens. As the bicycle wheel spins on its axis, it also rotates around the string. Students should note that it is spinning two different ways. You can introduce the vocabulary rotate or revolve.

Next, have a volunteer sit on the chair that rotates. Give them the bicycle wheel to hold and get it spinning. Ask them to angle it to the right or to the left. As the wheel angles to one direction or the other, the chair rotates in the same direction.

Last, ask for a volunteer that is a very good runner. Tell them they need to run straight ahead and then make a sharp turn. Have them practice. Then give them the wheel to hold and spin it for them. As they run and turn, they need to try to hold the wheel upright. They may want to try several times or ask for another volunteer. They will soon see they can't hold it upright. Ask for the student's observations and write them on the board.

Next, show them a gyroscope, and demonstrate some tops. Give the students time to play with the bicycle wheel, gyroscope and tops. After they have finished, ask for any observations they have made about tops and write them on the board.

Performance Assessment:

Students are to use the cardboard, plastic lids, toothpicks, push pins and skewers to make their own tops. They may decorate them. The tops work better if the pins, toothpicks or skewers are glued to the disks with the glue gun. If the top spins, the student was successful. Creativity in the shape of the disk is a plus. For Kindergarten or 1st graders, the teacher should poke the hole in the disk and help to attach the center post with the hot glue.

Extensions:

Disks can be also be used to show how colors mix or to demonstrate optical illusions.

Periodic Motion - The Pendulum

Deborah Lojkutz
6010 Springside
Downers Grove IL 60516
(708) 964-6603

Joliet West High School
401 N. Larkin Ave.
Joliet IL 60435
(815) 727-6950

Objectives:

To introduce the concept of periodic motion and relate it to the movement of a pendulum. To discover that the period of a pendulum is dependent on the length of the pendulum and independent of the bob and the amplitude.

Materials Needed:

Each group needs a stop watch and pendulum with a different bob.

Materials for pendulum -
string
bob - infant stacking rings provide colorful bobs of different sizes and mass
right angle clamp
ringstand
rod

For class graphs - two pieces of end roll paper approximately 21/2 meters long, a meter stick, markers and masking tape

Strategy:

Begin the class period with a discussion of what the students think periodic motion is. After a few minutes, bring out a pendulum from behind the lab table and use it as an example of periodic motion. Point out its various parts - bob, length, pivot point. Demonstrate what is meant by period and amplitude. Spend a few minutes discussing the accuracy of measuring a single period. The students should realize that timing how long it takes for ten cycles and dividing by 10 will lessen the effects of reaction time and result in a more accurate measurement of the period.

Break up the class into groups. Each group is given a pendulum with a different bob but all pendulums are 1 meter in length. (A different option would be to have the students construct their own pendulums 1 meter in length. If doing so, make sure to discuss that the length of the pendulum is measured from the pivot point to the center of gravity of the pendulum bob.) Each group is to find the period of their pendulum by timing it for 10 cycles and using an amplitude of 10 cm. After doing so, they are to experiment with other amplitudes (5 cm, 15 cm, 20 cm, etc.) to determine if the amplitude effects the period. All groups record their data in the class data table on the board under the following headings: Color of bob, Time for 10 cycles, Period, Effect of changing the amplitude.

When all groups have recorded their data, call the class together for a discussion of the results. It should be apparent that the shape and mass of the bob and the amplitude have no effect on the period. Small differences can be explained by experimental error. If the students are not sure that the rings are actually different masses, bring out a scale and prove it. If you are using infant stacking rings, there will be about a 50% difference between the largest and smallest ring's mass.

Each group is given a different length of string to create a new pendulum. Lengths should vary from 25 cm to 2 m. As before the groups will find the period of their pendulum. This time they will graph their results on a length versus period graph.

While the students are finding the period of their pendulums, hang a piece of end roll paper about 21/2 meters long on a wall and label the axes. The vertical axis is marked off to the actual length of the pendulum. The horizontal axis is the period marked in a convenient scale.

When the students have found the period of their pendulum they should remove it from its support bar and hang it on the graph at its corresponding period. Remind the students that the actual length of the pendulum is measured from the pivot to the center of gravity of the bob. When using rings for bobs, the center of gravity is at the center of the ring, therefore it is important that the centers of the rings be lined up on the horizontal axis. By using this self graphing technique, it is not necessary for the students to measure the pendulum's length and the effect of the length of the pendulum on the period is shown quite dramatically.

Once all groups have added their pendulums to the graph discuss the results. The graph should look like a y-parabola. If it is not obvious that it is a parabola remember that the origin is a point on the graph - zero length will have zero period. With a marker sketch the curve on the graph. Discuss with the students the shape of the graph and what it represents mathematically. Hopefully they will come up with the idea that there is a direct relationship between the length and the square of the period. (This depends on their level of math ability.) If this relationship is not obvious, lead the students by a discussion of what needs to be done to straighten out the graph. This approach usually gets to the idea of squaring the period. The students should now verify these predictions by squaring their period and regraphing on the second end roll graph. The students should transfer their pendulums from the first to the second graph. The resulting graph should be a straight line through the origin. At this point the class can discuss the results that the square of the period is directly proportional to the length of the pendulum. This would be a good point to start a discussion of the equation and theory of a pendulum.

Conclusion:

This activity will take more than the usual lab period. A good breaking point would be after finding the effect of the bob and the amplitude. This activity can be used with elementary students up to the first graph.

Evaluation:

The student's understanding of this material can be evaluated by having them use the graph to predict what the period of a pendulum will be for a specific length. They can then experimentally verify their prediction.

Return to Physics Index

Inertia

Peter Insley Retired
5652 W. Giddings Street
Chicago IL 60630
(312) 283-0528

Objective:

The idea is if enough demonstrations of inertia are done, the definition or meaning of inertia will become clear.

Here is a list of the things I did, what I used, and how I did them.

1. Tablecloth and Dishes

Get heavy dishes from garage sales or resale stores. Fill glasses 3/4 with water. Use red dye to make "wine".

Use a cloth that has no hem on the side you are pulling under the dishes. Pull down, not back, on the cloth. Try to have all dishes within 12 inches of the far edge of the table, and no dishes near your end.

2. Eggs and Water Glasses

I used 3 eggs, 3 pieces of mailing tube (or paper towel tubes) cut down, a metal pie plate, 3 glasses of water, and a broom.

The trick is to hit the metal plate with the broom squarely (not up or down), and snap the plate out so that the eggs fall into the glasses of water. The eggs need to be EXACTLY above the water. Wide glasses help.

3. Glasses and Blocks (Samuri Scientists)

Get 5 SMOOTH blocks stacked on top of each other, and put a glass of water on top. Get something heavy to knock the bottom block out.

4. Coin on Pool Balls

Lay a pool ball on a round filter paper, or somehow outline a circle around the ball. Balance a quarter on the pool ball. Hit the pool ball with another cue ball, and try to knock the quarter outside the circle. You can cheat by making the target ball a little heavier that the cue ball.

5. Ken and Barbie

Strap Barbie into a skate or small car, and leave Ken balanced on top. Run them into a wall and watch Ken fly out.

6. $20.00 Bill and Two Wine Bottles

Fill two wine bottles with water. With one bottle standing upright, lay the bill across the neck opening, and then balance the other bottle upside down on top of the first bottle. The idea is to pull the bill out without spilling any water. Holding the bill tautly with one hand, use your other hand to hit the bill in a quick downward motion in order to pull it out.

7. Hoop and Ring

Balance a hoop in the opening of a bottle, and then balance a piece of chalk on top of the hoop. Get the chalk right over the neck of the bottle. Then whip out the hoop and the chalk will drop into the bottle.

These activities have a lot of excitement and a pretty high failure rate. It's a good idea to let a student try to do the activity after you do it, to show them how it is done. A failure is almost as much fun as a success.

The general conclusion from our class was:

All heavy objects seem to have a "lag time" before they get moving (or in the case of Ken, before they stop). The heavier the object is, the greater the lag time. This is inertia.

Then John said:

"An object at rest will stay at rest, and an object in motion will stay in motion in a straight line unless an unbalanced force acts on it."

We decided John was unbalanced and we went back to our original conclusion.

Rockets

Rochelle Ingram
8414 S. Carpenter St.
Chicago IL 60620
(312) 224-1079

Delano School
3937 W. Wilcox St.
Chicago IL 60624
(312) 534-6620

Objective:

This miniteach is designed for grades 3-8. The student will be able to design or build their own rocket.

Materials Needed:

Materials listed are for groups of five.
rocket kits
ditto paper
tape
glue gun
3/4 in. dowel rod
corrugated paper
ruler
scissors
1 in. coffee straw
engine
hanger
recovery wadding

Strategy:

The students will construct the model rocket.

1. Buy the model rocket kits and engines.

2. Read the instructions carefully and construct the model rockets.

3. Attach the engine as directed to the bottom of the rocket.

4. Ignite the engine with the jumper cables that will be connected to the battery of a car or buy the electrical launch controller and launch pad.

5. Your model rocket should be in flight.

The students will now build their own rocket.

1. You roll up a sheet of ditto paper the same diameter of the 3/4 in. dowel rod and tape it.

2. Glue and slide in the 3/4 in. dowel rod about 2 in. inside the rocket tube.

3. Cut out three fins for the rocket in the corrugated paper (3 in. x 1 in.). Make sure the fins are the same size.

4. Attach the fins to the rocket with glue about 3/4 in. apart and symmetrical around the rocket.

5. Attach the coffee straw, which is the launch lug, in between the fins about 2 1/2 in. from the bottom of the rocket.

6. Make a cone with a piece of ditto paper about 2 in. diameter for the nose of your rocket.

7. Crumple and insert the recovery wadding and tape on the nose cone.

8. Prepare the engine and read the instructions very carefully.

9. Prepare to launch your rocket.

Performance Assessment:

To complete the building of the rocket. The rocket should successfully launch and be in flight.

Return to Physics Index

Weightlessness

Cynthia D'Souza
7423 N Sheridan A3
Chicago IL 60626
(312) 508-5978

De La Salle Institute
3455 S Wabash Ave
Chicago IL 60616
(312) 842-7355

Objectives:

Mass remains constant but weight is the force with which the earth pulls the body to itself. Weight is felt by the support given to us by the floor. Weightlessness is a result of free fall. Orbital motion is a form of free fall.

Materials Needed:

analytical balance(1), pliers, string; teddy bear and ball; styrofoam cup, water. For each pair of students: 1 styrofoam cup, rubber bands, 2 weights, such as washers and 1 paper clip.

Strategy:

The concepts of mass and weight are first elicited from students and an acceptable definition written on the board. An analytical balance is displayed and with a nutcracker in the left pan. Discussion is generated as to how mass can be measured on it and what would happen to the balance if the nutcracker were to "lose" weight. Now a thread is used to connect one leg of the nutcracker to the top of the balance and the pans are still balanced. "If the thread were burnt now," says the teacher, "would the pans still balance? Why or why not?" The experiment is promptly performed and results discussed. The teacher holds a large spring balance and has students read the weight of an object. Now he/she jumps to the floor and students discuss why the scale reading decreased to nearly zero.

Students are given their equipment and escorted to the stairwell so that one partner lets drop the cup with the weights suspended outside it by the rubber bands. The other partner at the bottom notes the position of the weights and when the "jump" occurred. Now the teacher shows a styrofoam cup with 2 holes bored in the sides near the bottom. The cup is filled with water. With the holes plugged by the fingers, the cup is dropped. The class observes that as long as the cup falls, no water spills out.

Now the teacher holds teddy and the ball on the same level and lets them fall simultaneously. Students observe that they fall together and hit the ground at the same time.

Performance Assessment:

Back in their seats, the teacher asks the following:
1) What happened to the falling weights? Why did they jump into the cups? By comparison with the falling spring scale what must the weights have been experiencing?
2) Why did the water not spill out of the falling cup? Would the fact of its feeling "weightless" explain why it exerted no pressure on the holes? When did the water spill out?
3) In what way is this experience similar to that of a passenger in an elevator

whose cable has been cut?
Is gravity not acting anymore on the person? How can we tell? Then gravity is not the reason for weightlessness, but the falling away at the same rate of the elevator.

4) How do we normally experience weight?
5) When teddy and ball fall, what fact gives teddy the illusion that he is floating? What gives orbiting astronauts this sensation?

Conclusions:

During free fall; the pliers, the spring scale, the weights and the water were experiencing weightlessness though gravity's force was still acting on them all. If their motion were suddenly stopped, their full weight would seem to return because their supports were pressing upwards into them.

In the freely- falling elevator, a scale placed under the person's feet falls away as fast as the person himself, the scale would read zero and the person feels weightless.

Persons in orbital motion are in free-fall. That's why they experience weightlessness.

Return to Physics Index

Simple Machines

Bonnie Anderson
5414 S. Christiana
Chicago IL 60632-3218
(312) 436-3389

Libby School Annex
5338 S. Loomis
Chicago IL 60609
(312) 535-9350

Objectives:

This lesson was designed for students in grades 2-4.
The students will be able to identify the six simple machines and how they are used in our lives. They will gain a basic understanding of the use of force and effort.

Materials Needed:

For Inclined Plane - Weights (identical for each group), Spring scales, Ramps (cardboard, approximately 5"x30")

For Wedge - Child's ax, "Blocks" of cardboard (use masking tape to tape together 8 4" squares of cardboard to form a block, simulating a wood block), 2" bolts with hex heads, 2" nails with large heads, Pencils, Hand-held pencil sharpeners, Iced oatmeal cookies, Oranges, Plastic knives

For Screw - Pencils, Paper triangle shapes (8" long), 2" screws, "Blocks" of cardboard

For Lever - 3 stuffed teddy bears (2 the same size and 1 much larger), Cement block or wood block , Tongue depressors, Pencils, Sugar cubes or mini-marshmallows, Child's toys (rakes, shovels, hoes, wheelbarrow, broom, Nerf Bat, Nerf Football, canoe and oar)

For Wheel and Axle - Small child's bike (just the front wheel and handlebars will do), Large teddy bear, Large photos of Ferris Wheel, Merry-Go-Round (child's toys work very well), Screwdrivers, 2" screws, "Blocks" of cardboard

For Pulley - Small Kermit the Frog doll, Flagpole about 3' high with fixed pulley and flag, Gallows-type contraption with fixed pulley at top, movable pulley suspending weight at bottom, Spring scale, Snow White doll, Model of well with fixed pulley

Strategy:

Inclined Plane - Draw 2 identical houses on board, except one house has a ramp to get to the door, and the other has stairs. Discuss the houses, and have the children tell you that the house with the ramp probably has a person in a wheelchair living there. Discuss whether it is easier to lift that person straight up to the door or to use the ramp. Use the cardboard ramps to demonstrate the wheelchair ramp in the house. Measure the effort that you need to lift a weight straight up to the height of 12", then measure the effort that you need to pull the same weight up the ramp. Determine which method required less effort. (Be sure to clarify the word plane as a multi-meaning word, since we are not referring to an airplane.) Elicit from the children other examples they may have seen of inclined planes.

Wedge - Display the child's ax and reference it to the tools the settlers and Indians used in "Pocahontas" or the woodcutter's ax in "Little Red Riding Hood". Help the children to describe the ax as being a triangle or a wedge shape.

Distribute a cardboard block, bolt, and nail to each group. Ask the children to compare the bottom of the bolt and the nail, then to compare the effort required to push each into the block.

Distribute a pencil to each child. Ask them to sharpen the pencils without any help. Distribute the sharpeners, have the children observe the edge of the sharpener is a very sharp wedge, then allow them to use the sharpeners to sharpen the pencils. Elicit from the children other examples of wedges they may have seen.

Distribute a plastic knife and either an iced oatmeal cookie or an orange to each student. Ask them to pretend they are very young and have no teeth, so they will have to keep their lips curled around their teeth. Then have them try to eat their cookie or orange without using teeth or fingernails. Have them look at their knife and determine that the knife is a wedge they can use to peel the orange or cut the cookie. Finally, have the students feel their teeth and determine that they are sharp and also function as a wedge they can use to cut the cookie or peel the orange.

Screw - Ask the children to wind the paper triangle around their pencil (so that it looks like a screw). Compare the screw to the nail and the bolt and then ask the children to use their fingers to put the screw into the cardboard block. The children should be able to recognize that a screw is actually an inclined plane wound around. Elicit from the children places that they have seen screws used, such as drills, etc.

Lever - Set up a see-saw with a board and a cement block. Have the two small teddy bears "play" on the see-saw, then have the large bear come to "play". When he jumps on one side of the see-saw, one of the small bears will fly off. Ask the children why this happened and they should indicate that the large bear was too big and/or he ran and jumped with too much force. Define the see-saw as a lever, and point out that a lever has to have 3 components - a fulcrum, a load, and a force.

Distribute a tongue depressor, pencil, and several sugar cubes or mini-marshmallows to each child. Have the children make their own see-saws. They may experiment with moving the fulcrum (pencil) and the amount of force which they apply to the load.

Ask for volunteers to come forward to demonstrate how "Old McDonald" used tools like shovels, hoes, rakes, wheelbarrows. (Sing "Old McDonald".) Ask for a volunteer to demonstrate the use of a broom. Ask for a volunteer to demonstrate use of the bat and ball. (Sing "Take Me Out to the Ball Game.) Ask for a volunteer to demonstrate use of the football. (Sing "Bear Down Chicago Bears".) Display the toy canoe and oar and demonstrate their use. The children should be able to indicate that all of the toys from this demonstration are examples of levers.

Wheel and Axle - Display the front wheel and pedals from a child's tricycle. Help the teddy bear ride the bike. Demonstrate how the pedals (axle) turn the wheel so that the wheel can travel a great distance. Explain how a ferris wheel and a merry-go-round function as wheels and axles.

Distribute the screwdrivers, screws, and cardboard blocks. Have the children use their screwdriver to put the screw into the cardboard block. Explain that a screwdriver is a wheel and axle, with the wheel turning the axle and increasing the force applied. Try to elicit from the children the understanding that a doorknob is another example of a wheel and axle.

Pulley - Display the flagpole and tell the children that Kermit has a job to do - raise the flag! His problem is that he cannot jump to the top of the flagpole to pull the flag up. He finally tries pulling on the rope, which will raise the flag. Have the children observe that Kermit pulled down, but the flag went up, so a "fixed" pulley changes the direction of force. (Be sure to clarify for the children that "fixed" is a multi-meaning word, meaning stationary, not the opposite of broken.)

Use the gallows contraption to illustrate the use of a movable pulley. Determine the force necessary to raise a wooden block, then compare that to the force necessary to raise the block using the movable pulley. The children will be able to see that a movable pulley reduces effort.

Stand Snow White at the well. Tell the children that Snow White has to work very hard for the wicked Queen. One of her jobs is to bring water from the well every day. Demonstrate that Snow White uses a pulley to help her bring up water.

Performance Assessment:

In each example of a simple machine, the children should be able to explain how the machine helped to reduce effort, increase force, or change the direction of force. They should be able to give several examples of simple machines they see and use every day.

Vectors

Eileen Wild Retired
8117 W. Edgewater Road .
N. Riverside IL 60546 .
(708)447-0033 .

Objective:

The student is introduced to the concept that both magnitude and direction are necessary when giving instructions for locating a place. Modifications of this material make it suitable for grades three through twelve.

Materials Needed:

Map transparencies------Chicago Loop, School neighborhood, I.I.T. campus, Cartesian graph paper
Chalk board
Meter stick

Suggested Strategy:

Activity 1. Using the Chicago Loop transparency, the class is invited to take an architectural tour of the Loop. We meet in front of Sears Tower and I inquire as to the route that must be taken to reach the Civic Opera House. The student who answers must give both the number of blocks and the direction. The next step is to go to the chalk board and draw, using arrows whose lengths represents the number of blocks and whose tips point in the correct direction, the route to be taken. This process is repeated for several different locations in the Loop.

Activity 2. Students are shown a map of the I.I.T. campus on the Overhead projector. After dividing the class into groups of two, they are given different locations to find on the campus. The unit of distance chosen for this exercise was the pace. Upon returning to the classroom, each group had to draw on the chalk board their route using vectors. In addition, they had to change their pace unit of distance into meters.

Scalars:

Objective:

To enable students to become familiar with the concept that certain numbers have only magnitude.

Equipment:

Room transparency
Overhead projector pen
Thermometers

Suggested Strategy:

Activity: Students are located near windows, doors and at varying heights throughout the room. Their task is to take and record the temperature at their location. After five minutes, each person goes to the chalk board where the projected image of the room appears and records the results.

The class then analyses the temperature distribution field that they produced. Places of approximately equal temperature are connected. The result is called a temperature field and the lines are called isotherms. A two day sequence of weather maps enable the class to see the movement of hot air across the country.

Performance Assessment:

Both classroom demonstrations and student participation provided varied approaches to understanding.

Return to Physics Index

Inertia

Maeola Walker
963 E. 84th Street, Apt. 201
Chicago IL 60619
(312)723-0945

Chicago Board of Education
1819 W. Pershing Rd.
Chicago IL 60609
(312)535-3730

Objective:

This lesson is for primary students. The main objective of this mini-teach is for students to learn and understand what inertia is. They will learn the difference between inertia for objects at rest and objects moving in a straight line.

Materials Needed:

Two dolls (Barbie & Ken), two carts (skates, skate board)

Strategy:

Place one doll in each cart. Secure one doll with a rubber band, tape or string. Push the carts into a wall. Ask the students what happened and why. (Doll not secured should fly out or fall forward). Talk about seat belts.

Materials Needed:

Two identical coffee cans and a hammer.

Strategy:

Fill one of the cans with a mass (a piece of metal) that will stay in place. Keep top opening of the cans away from the class when placing them on top of table or smooth surface floor. Tap one can lightly with the hammer, and ask students to keep their eyes on the can. Next tap the second can with the hammer, ask the students to watch that can and ask them which can rolled the farthest ... why? (The can with the mass will not go as far as the empty can because the full can has a lot of inertia and tends to stay at rest).

Materials Needed:

A 2 X 4 block of wood, a dowel & a hammer

Strategy:

Drill a hole the diameter of the dowel through the block of wood. Insert the dowel loosely into the block and hold the block precariously suspended. Hit the top of the dowel with the hammer. You will drive the dowel through the block, but the block of wood will not move since its inertia will try to keep it in place, even though that place happens to be in mid air.

Materials Needed:

Large size textbook & friction beads

Strategy:

Place a book on top of a large size desk top. Give the book a thrust with one hand and see how far the book will slide across the desk top. Next sprinkle beads on desk top then place the book on the top of the beads, now see how far the book will slide across the desk top. The book has inertia in each case and tend to keep moving. The reason the book stops in one case is friction.

Materials Needed:

A three foot length of dowel & a 2 X 5 board

Strategy:

Drill a hole the diameter of the dowel in the board. Cone shape one end of the dowel. Place the dowel on the floor with the flat end of the stick (dowel) on the floor. Next place the board on the cone end of the stick until at rest. Raise the stick into the air and pound stick heavily onto the floor. The board should slide to bottom of stick until it hits the floor...why? (because of the inertia in the board.)

Materials Needed:

Three 3 X 5" boards & a hammer

Strategy:

Stack the boards on top of each other. Hit the bottom board horizontally with the hammer. Watch the two boards on top drop into place. Repeat the process with the second board and watch the top board drop into place.

Materials Needed:

Felt or cloth table cloth
8 Meter sticks
4 Clamps
2 Pool Balls
1 Pool cue (wood dowel)
1 One marker & a quarter

Strategy:

Stretch out the table cloth taut and pin it down with the meter sticks and clamps. Put an eight inch circle in the center and another 14 inch circle around the eight inch one.

Place the pool ball in the center with a quarter on top of it. Challenge the students to knock the quarter outside the small circle. Students may not hit the quarter with the pool ball they are shooting at it, and they may not start closer than the large circle.

Materials Needed:

A 5-gallon bottle, crochet hoop & ink pen with a flat top

Strategy:

Place the bottle on a table top. Next balance hoop on bottle top then balance pen on top of hoop. Snatch the hoop from the inside real fast and watch the pen drop into the bottle. The only force acting on the pen is gravity which pulls it straight down.

Performance Assessment:

Students' performance assessment will be measured by their participation and interest in each activity followed by a test on inertia. The students will leave the class with a through understanding of Newton's first Law of Motion.

Return to Physics Index

Torque

Larry L. Smart
5525 W. Quincy St.
Chicago IL 60644
(312)378-9159

Helen Hefferan Elem.School
4409 W. Wilcox St.
Chicago IL 60624
(312)534-6129

Objectives:

This assignment will be for 6th grade students. The main objective of this mini-teach is to show the difference between Work and Torque, in relationship to Force and Distance.

Materials Needed:

1. A Jensen balance bar with ten 50 gram weights.
2. A Torque bar with a 500g weight.
3. A wooden wheel with four nuts and bolts drilled in it.

Strategy:

1. The students are given the weight and distance on the left side of the balance bar and asked where to place another weight in order to balance the bar.
2. Give the student the torque bar and a weight. The teacher moves the weights to different positions on the bar. Record the student's observation.
3. Have some students use a small wrench to loosen 2 bolts and other students use a large wrench to loosen 2 bolts. Record the observations. Discuss the ratio between amount of force and the length of the wrench. (The longer the wrench, the less force required to loosen the bolts.)

Performance Assessment:

Assessment will be based on the following:

1. The teacher will put a weight on the balance bar at a specific location and give the student a weight. The student will be asked to balance the bar by choosing the appropriate location on the bar.
2. Torque worksheet with the formula, (T = D x F).
3. The student will explain why the larger wrench loosens the nut with less force than the smaller wrench.

Conclusions:

1. The torque on both sides of a Jensen Arm, when the bar is balanced, will be equal.
2. The bar will require more force in order to hold it horizontally as the weight is moved away from the handle. (It will feel "heavier", but it is the SAME MASS, only in a different location. It requires MORE FORCE, but is no heavier.)
3. The larger wrench will remove the nuts with less force than the smaller wrench. (D x f = d x F) (The large wrench, a BIG DISTANCE times a small force is equal to a small distance times a BIG FORCE, the small wrench.)
4. The difference between torque and work is the concept of rotation. Torque

```
is work (distance times force) which causes rotation.
```

Return to Physics Index

Give Me Energy

April Luehmann
100 Cedar Ridge Lane, # 308
Richton Park IL 60471
(708)633-0357

Zion Lutheran School
3840 W. 216th Street
Matteson IL 60443
(708)747-7490

Objectives:

The 7th and 8th grade students will be able to define, give examples of, and differentiate between potential and kinetic energy.

Materials Needed:

per group for Lab 1
roller skate
wide, flat board (ramp)
spring scale
2 blocks of wood
some form of weight to be added to the skate
meter stick
log sheets with charts to record data

The Lesson:

Begin by asking the students to find what the following 3 things they see have in common.

Show them:
1. an electric cord
2. a can of Mountain Dew
3. a person climbing up a ladder

Leave the three displayed throughout the lesson. Tell them **at the end of the lesson** and after they have shared their hypotheses that each of the three give something energy.

Strategy:

Hypothetical Situation:

I was camping one day, and I was given the responsibility of starting the fire. As I went out searching for fire wood, I found a terrific small log! It was perfect with the exception that it was too long. I needed to break it. (Bring out a thick and long piece of wood and demonstrate an attempt to brace the wood, step on it, and show the board would not break.) Can anyone give me suggestions as to how I can improve my potential to break my log? (List all answers on board for later reference.)

Do LAB #1:

Directions for the student:

1. Make a ramp with a block of wood and a wide flat board. Measure the height of the ramp. Mass a roller skate with a spring scale and record that data. Place the skate at the top of the ramp and release it. Measure how far the skate rolled, from the bottom of the ramp to the rear wheel of the skate.
2. Raise the ramp by adding another block under the long board. Measure and

record the new height. Repeat the process of rolling the skate and measuring the distance it rolled. Record results.

3. Add weight to the skate. Measure and record the new mass of the skate. Repeat the process again of rolling the skate down the ramp at each of the two heights and measuring the distance it rolled. Record results.
4. Study the results and draw a conclusion.
   *Can you give inanimate objects energy?
   *Did the skate have more energy at any one time?
   *How did YOU give that skate more energy?

****

Return to the hypothetical situation and discuss why adding weight or height will give you potential energy to break your "log." Discuss formula of:
gravitational Potential Energy = Weight x Height

Stand on a rung of a ladder. Ask "How can I increase my potential energy?" Discuss other forms of potential energy: a bow and arrow with the bow pulled back, a skydiver in an airplane, a spring compressed,...
Game: In teams of three, and in 5 minutes, come up with as many examples of potential energy as your team can. Your team will receive one point for each example that no other team thought of, so be creative!

"As I fall off this ladder, I lose potential energy, right? Where does it go? What about that Law of Conservation of Energy?" Discuss and define kinetic energy. As a class, give examples such as a book falling, water tumbling over a water fall, a fist swinging in the air, a baseball player sliding in to home.

Materials Needed:

per group for lab 2
1 full pop can
1 empty pop can
1 ramp
3 blocks of wood
3 cereal boxes or cornstarch boxes
log pages for results

Do LAB #2: BOX BOWLING

The goal of this lab is to knock over the empty cardboard boxes, i.e. **accomplish WORK.** (Remember work is defined as a force applied through distance.) From the discussion of kinetic energy get the students to remind you that kinetic energy is the energy of motion used to do work. Ask the students to try different things to do the MOST possible work (knock over as many boxes as possible).
Rules of the lab:
1. All work must be done by a rolling can.
2. Can must be LET GO, not pushed or pulled.
3. Record every attempt you made and the data you measured.

****

Finish by comparing the results of all the groups. Give them the formula for kinetic energy:
KE = 1/2 x mass x velocity^2

Knowing this formula, discuss which makes a greater impact on the amount of kinetic energy, increasing the mass or increasing the velocity. (Answer: increasing the velocity).

Performance Assessment:

The students will receive points based on demonstrated effort, care in measuring results and recording data, and logical and complete support for the conclusions they claim to be true. The students will also be asked to give a VISUAL example of both potential and kinetic energy and explain the difference between the two.

Newton's Third Law of Motion

John E. McCoy
4343 N. Clarendon
Chicago IL 60613
(312)477-2514

Douglass Math and Science Academy
543 N. Waller
Chicago IL 60644
(312)534-6176

Objectives:

This lesson is for 7th and 8th graders.
Students will be able to do activities to demonstrate Newton's Third Law of Motion.
Students will be able to explain Newton's law.

Materials Needed:

1. dynamic carts
2. 100g weights-6
3. spring balances-3
4. fish line
5. rope
6. clamps-4
7. pulleys-2
8. meters sticks-10
9. scissors,tape,paper
10. blueprint of rocket

Strategies:

Using the PHENOMENOLOGICAL approach, the teacher demonstrates Newton's Third Law of Motion by placing a firecracker between two pop cans and lighting it. Also a student is used to demonstrate force by having the student press against a wall (action) and the wall presses against the student (reaction). Also the teacher pushes down on the student's arm (action) and the student's arm moves upward.

Students move to the various stations to do the activities.
Station 1-Balloon Race
A fish line is extended from two ring stands for the race. The students use tape to attach the balloons to the straw. The fish line is pushed or threaded through the straw. The balloon(s) is/are blown-up and the end is pinched or closed. The students release the balloons. The air comes out the end of the balloon (action) and the balloon moves forward (reaction). The distance traveled is measured in meters.

Station 2-Spring Balances and Weights.
A demonstration of equal force being exerted on a spring balance is set-up for the students. There are two 200g weights attached to each end of the balance. The students are asked to guess the weight on the balance. Later the students will vary the number of weight and check the reading on the balance to see if the amount of force is the same (equal). The weights are pulling downward on the balance scale (action) and the scale is pulling on the weights (reaction).

Station 3-Dynamic Carts
Two carts are placed end to end and a trigger is released where one cart hits

the second cart (action) and the second cart moves backward (reaction). Both carts move backward equal distances because the masses are the same. However, if the masses are varied 2x, 3x or 4x, the students will get some interesting results about the distance that each cart will travel.

Station 4-Roller Skates
Two students, both on roller skates, will pull on a rope and the other students will observe which student moves the greater distance.

Station 5-Rocket Launching
Using blueprints, the students make rockets for launching. The pieces are put together with tape. The rockets are launched by using a straw to blow into the open end.

Conclusions:

1. Students will discover that the activities dealt with forces.
2. Students will discover that the two forces, action and reaction, are equal in magnitude and opposite in direction.
3. The student will discover that the motion of the forces must be in a straight line.
4. Students would have discovered Newton's Third Law of Motion using the PHENOMENOLOGICAL approach.

Return to Physics Index

Pendulums

John J. Miller
1743 E. Forest Ave
Des Plaines IL 60018
(708)297-6368

Maine East High School
6801 W. Dempster
Park Ridge IL 60048
(708)825-4484

Objectives:

The students will be able to determine what factors effect the period (time to swing back and forth) of a Pendulum. I use this for my sophomores in high school but don't let that fool you. This can be used at any level where students can count to twenty and time something.

Materials Needed:

pins
various lengths of string
washers (or any of various weights to hang)
clock with second hand (or anything to time with)
a long piece of cardboard or cork-board with a number-line marking off every five seconds for up to one hundred seconds

Strategy:

Tell the students to grab a length of string, tie a washer to one end and a loop at the other end of the string. Next have the students time the period of twenty swings. Have the students hang their washer at the spot on the number line that corresponds with the time they have found. There should be a pattern that looks something like this:

```
      | |  |  | | | ||
      O O  |  | | | ||
           |  | | | ||
           O  | | | ||
              | | | ||
              O | | ||
                | | ||
                | | ||
                O | ||
                  O ||
                    ||
                    ||
                    O|
                     O
```

Ask the students what factors would affect the period of the swing. With encouragement, I bet they'll come up with length of string, mass, amplitude (how wide an arc), whether the hand moves or not, and possiblely some others. Break the students up into groups and have each group investigate these factors by keeping all factors constant except the one they are investigating. Have each group report back to the class with their findings.

Performance Assessment:

The verbal report to the group may be graded. I believe the ideas of particular interest include whether or not the group controlled the variables, did they actually make accurate measurements and present the data (not just guess or approximate) and then the actual presentation.

Conclusions:

1. Mass of the hanging objects does NOT make a difference.
2. The amplitude does NOT make a difference (for amplitudes less than 40 degrees).
3. Length of the string DOES make a difference. There is a formula if you wish to check it. (Period=2(3.14)Square-root(Length/gravity) or T=2pi*sqrt(l/g))
4. Small hand movements do not make a difference extreme hand movements will.

Return to Physics Index

Bouncing Balls

Porter W. Johnson
406 N. Elmwood Avenue
Oak Park IL 60302-2226
(708)383-2846

Illinois Institute of Technology
Physics Department
Chicago IL 60616-3793
(312)567-3375

Objective:

The student will make careful observations of a ball bouncing off a hard surface one time or sequentially for several trials, to study how the ball travels as it bounces across the room. From these observations, he/she will then be able to describe and explain the motion of the ball.

Materials Needed:

1. A box containing several small super balls, medium-sized super balls, hollow rubber balls, solid rubber balls, tennis balls, golf balls, baseballs, and whatever other types of balls are available.

2. Several meter sticks for measuring the height of the bouncing ball.

3. Several smooth hard flat horizontal surfaces suitable for bouncing balls---floors, lab tables, sidewalks, and the like.

Strategy:

The initial phase of the activity involves making careful, qualitative observations of a single bounce. Next, the students in teams should take a ball and measure quantitatively how high it bounces when dropped from a given height. Then the various types of balls are categorized as to how well they bounce. Finally, one should consider the same ball bouncing several times and study the progressive decrease in the heights to which it goes.

A. Procedures for qualitative study:

Bounce a ball a number of times off the table or desk in front of the class, catching it on first bounce, and ask students to describe carefully what they see. Make a list of the qualitative observations---a list of typical observations is given below:

1. The ball is released from rest and picks up speed until it hits the surface and bounces off.

2. After bouncing off the surface the ball comes back up to a height which is less than the height at which it started, before stopping to climb.

3. The higher the distance from which the ball is dropped, the higher it will bounce.

4. The ball makes very brief contact with the table, seeming to leave it almost instantaneously.

5. The ball makes a sound when it hits the table, which changes with the height from which it is dropped.

6. The ball may bounce differently when it hits different points on the table.

B. Procedures for quantitative study:

1. Each student should be given a ball to drop from a height **h** of one meter and measure the distance **d** to which it bounces upward. The results should be arranged according to the types of balls and the group should discuss which balls bounce well, and why.

2. Each student should release the ball from several heights [**h** = 50 cm, 75 cm, 100 cm, 125 cm, 150 cm, etc] and measure the distance **d** to which it bounces. The ratio **d/h**, which we call the elasticity coefficient, should be roughly the same for each height.

3. If there is time, a given ball should be allowed to bounce several times after being released from an initial height **h**. The sequence of bounce heights, d_1, d_2, d_3, ..., should be measured. Each time the bounce height reduces by roughly the same factor, the coefficient of restitution:

$$d_1/h = d_2/d_1 = d_3/d_2 = \ldots$$

The ball begins at rest from height **h** with potential energy **mgh**, where **m** is its mass and **g** is the acceleration due to gravity. On first bounce it comes up to a height **d**, corresponding to potential energy **mgd**. The coefficient of restitution, **d/h**, is the fraction of mechanical energy remaining after first bounce.

Energy is dissipated in the form of heat and acoustical energy. Physicists believe in the principle of conservation of energy as a consequence of the symmetry of the basic interaction under translations in the time coordinate.

Performance Assessment:

Bounce a ball across the room to an assistant so that it strikes the floor several times. Have each student draw the trajectory of the ball in the notebook, describing its motion as completely as possible.

Conclusions:

A ball bounced off a hard surface loses a specific fraction of its mechanical energy with each bounce.

Multicultural:

The bouncing of a ball on a hard surface is essential for an understanding of baseball, which is played with gusto in Asia, Latin America, the Caribbean Region, and North America. English Cricket [played throughout the British Commonwealth Nations] requires similar knowledge of the physics of bouncing objects.

The deep connection between symmetries and conservation laws was first understood by the Mathematical Physicist **Amelia Emmy Noether** [1882 - 1935].

Robert K. Adair, **The Physics of Baseball**, 2nd edition [Harper 1994].
ISBN 0-060095047-1.

Return to Physics Index

Friction - What a Drag

John J. Miller
1743 E. Forest Ave
Des Plaines IL 60018
(708) 297-6368

Maine East High School
2601 W. Dempster
Park Ridge IL 60068
(708) 825-4484

Objectives:

At the end of this lab students will be able to:

1) recognize that weight and surface type affect friction.
2) recognize that surface area does NOT affect the friction.
3) control variables
4) Recognize that some things are hard to measure like friction because the spring scale needle vibrates.

Materials Needed:

4 wood blocks for each lab group (approximately 2 inches x 3 inches x 6 inches is a good size because then the ratio of areas of the different sides is simple-6 sq. inches by 12 sq. inches by 24 sq. inches).

Small screw hooks that can be screwed into the blocks to hook the blocks together.

1 spring scale for each group (if spring scales are not available you may substitute a rubber band and note the amount the rubber band stretches).

Different surfaces like a table, carpet, glass, etc.

Strategy:

Ask the students what factors they think affect the size of the frictional force. Give the students the equipment and let them try various combinations. At this point DON'T TELL THE STUDENTS WHAT COMBINATIONS TO TRY. Let them explore combinations such as a different sides, different surfaces areas, a train (one hooked after the other), stacking on top, or combinations thereof. Regroup the students together as a whole class after approximately 15 minutes of experimentation to discuss preliminary results. At this point you can remind students to control variables, remind them that they should not pull the spring scale at an angle and that the different sides of the block might have a different grain which can affect results. Let the students go back into their groups so that they can fine tune their results. Have one representative from each group make a brief, final presentation of their results.

Performance Assessment:

Each group can be assessed informally by the lab work they do. I award extra points for each clever idea I see. The presentation can also be used to determine that they have the correct concepts. Also good questions to ask are:

1. What happens if I double the weight by stacking one block on top of the other? Answer: The frictional force doubles.

2. What happens if I keep the weight the same but double the surface area? Answer: The frictional force stays the same.

3. What happens if I double the surface area and double the weight? Answer: The frictional force is doubled (the increase in weight doubles the force and the surface area has no effect).

4. How does the surface type affect the frictional force? Answer: The answers will vary. Typically the smoother the surface is the less friction. However, sometimes glass which is very smooth will produce a large frictional force, specifically if it is very clean. FYI: There is a weak vacuum that is formed that pulls the blocks together when there is little or no air between the surfaces.

Conclusions:

The frictional force is affected by the surface type and weight. It is not affected by the surface area.

Evaluation:

See performance assessment.

Momentum Conserved

Savannah Walker
2510 E. 83rd Street
Chicago IL 60617
(312) 374-5342

Mason School
4712 Keeler Street
Chicago IL 60623
(312) 534-1530

Objectives:

The students will apply two of Newton's Laws of Motion discovering that Momentum is conserved.

Materials:

- Newton's Cradle
- Carts
- Planks with skates screwed to the bottom
- "Crash Dummy Motorcycle"

Strategy:

NEWTON'S CRADLE--Collision
Pull one ball out. Ask "What will happen when I let go?" Let everyone contribute. Then let go. See what actually happens. Do not get into a big discussion at this point! Come back to this at the end.

TWO CART COLLISION--
Define Momentum: Mass x Velocity. Have two carts of equal mass collide with each other from opposite directions. Ask "What happened?" Let everyone contribute. (Newton III, and Momentum is Conserved)
Then have the two carts collide when one of the carts is the same mass as previously and the other has a third cart stacked on top-a larger mass. Ask "What happens?" Let everyone contribute. (still Newton III, also Newton II, Momentum is Conserved)

PLANK WITH ROLLER SKATES ATTACHED--
Have a student walk the plank. Ask "What happened?" (Plank goes the other way.) Let every student contribute. Have students of different weights take turns. Observe any difference this makes. (Newton III, Momentum is Conserved)

CRASH DUMMY MOTORCYCLE--
Construct a "Wall" at the end of an inclined plane. Have the motorcycle with the dummy rider crash into the wall. Ask "What happened?" (Newton III, also Newton I, Momentum is Conserved)

NEWTON'S CRADLE REVISITED--
Go back to the Newton's Cradle. Again pull out one ball. Let go. Ask "What happened?" and "Why?" Students should be able to discuss the results in terms of Newton's Laws for each ball's collision with the next ball. They should also recognize that Momentum is Conserved in each collision. Now try this with two, three, or even four balls. They should be able to extend their conclusions to these unequal mass collisions.

Momentum And Colliding Spheres

Robert Watkins
9001 S. Cottage Grove
Chicago IL 60619
(312) 651-7827

Beethoven Elementary School
25 W. 47 Street
Chicago IL 60609
(312) 535-1480

Objective:

Student will be able to understand that mass x velocity equals momentum.
Student will be able to understand the impacts of collisions and their results.
Student will be able to determine the vector of an incident.

Materials:

Paper, Chalk, Iron Spheres, Marker, Meter Sticks, and String.

Strategy:

The student is asked to think about the content of an object. The student will probably think in terms of the object's weight. The student will learn that weight is the force upon a body due to gravity and that force is usually a push or a pull. Mass is introduced to the student. The student will learn that mass is the quantity of matter in a body. A rolling sphere is shown to class. The student learns that its mass is the matter that makes up this object. After rolling the sphere across a table, the student is asked what happened? At this point velocity is introduced. The student learns that velocity is the specification of the speed of a body and its direction of motion.

The student is told that when we think of mass and velocity together, we call this action momentum. The student learns that momentum is the idea of inertia in motion. Momentum refers to moving things, that is, the mass of an object multiplied by its velocity. Two spheres are shown with the same amount of mass. The student is asked what would happen if both spheres were moving at the same speed toward a wall? At this point, the student is asked what would happen if the two spheres were moving toward each other at the same speed? The teacher advises that when two objects with the same mass are moving toward each other at the same speed and hit each other, we call this activity a collision. We say that both objects had the same momentum and at impact their momentum has been shared equally.

At this point, the teacher demonstrates a collision using spheres of equal mass. The spheres are hung from a ceiling and paper is placed underneath. One sphere is stationary while the second sphere is held at a short distance. The student is asked what will happen when the two spheres collide? The student will give a variety of responses yet the idea of both spheres colliding and being held as they reach their peak in flight will be emphasized. The teacher demonstrates a few trial collisions and tells the student to place an X at the point of release of the moving sphere. An X is also placed at the point of the stationary sphere. The sphere is released and collides with the stationary sphere. Both spheres are caught at their peaks and arrows are placed at each point. The word Vector is written on the board and the student is told that the momentum of each sphere can be expressed involving a technique called vector addition. The student learns that the magnitude of the sphere and its direction are the two elements used to find net momentum. Using a meter stick, the released point is measured to the stationary point. Next, the two points at the sphere's peak are measured. Using meter sticks to draw the lines at a right angle, a parallelogram is drawn. The released point to the stationary point should equal the stationary point to the end of parallelogram after drawing a diagonal line.

The student is asked to start at a given point and walk in one direction counting ten steps. He walks in a second direction and counts ten steps. The student is asked how many steps would it take to return to the starting point. The student will probably feel that if he adds ten plus ten, then the correct answer will be twenty. The student is told that the diagonal line to the starting point is usually greater. After a few trial runs the student learns that although the sides of a figure are equal, the diagonal point to the starting point is usually greater. A second demonstration is given using spheres of unequal mass. The stationary sphere is one half the mass of the moving sphere. After the collision and after the parallelogram is made, the student is told to take one half the length of the sides of the parallelogram due to the unequal mass. Afterwards the student will determine that the distance from the release point to the impact point should equal the distance from the impact point to the length of the diagonal line.

Summary:

The understanding of momentum should help the student in preparing for additional activities in PHYSICS. To introduce the meaning of inertia at the beginning of a momentum lesson is helpful. The student learns the meaning of force and is introduced to mass. The next step is to define velocity and share that momentum is mass multiplied by velocity. Hands on activities are excellent ways to help the student see the reality of what is happening. After vector addition is introduced the student is helped to recognized points of importance. The release point, the impact point and the peak points are placed with an X so the student can recall distance recognition. In conclusion, the student is helped to developed a parallelogram. This method of discovery and development should encourage the student to continue his interest in Science activities.

Straight Line Motion with a Stomper

Ann Brandon
1544 Edgewood Ave
Chicago Heights IL 60411
(708) 756-2635

Joliet West High School
401 North Larkin Ave
Joliet IL 60435
(815) 727-6950

Objectives:

After this experience, the student should

1. be able to define average speed (distance traveled/time)
2. be able to graph distance vs time and velocity vs time
3. be able to find the velocity from the distance time graph (slope)
4. be able to find the acceleration from the velocity time graph (slope)
5. recognize constant velocity, constant acceleration and changing acceleration from the shape of the distance-time and velocity-time graphs

Materials needed:

(for each group)
Stopwatch, meter stick, Stomper (battery powered toy car), large washer or 100 g mass, tape, paper tape (ticker tape) and a recording (ticker tape) timer, Tricycle (optional).

Strategy:

Part I: Begin with the Stomper. Show it going in a straight line along the counter top. Ask: How fast is it going? What do we need to know to find out? (You need a distance traveled and a time.) Give each group a Stomper, stopwatch and meter stick. They should determine the average speed of their Stomper. It should take 10 or 15 minutes for them to do several trials.

Part II: How fast was the Stomper going as it moved along? Was it going the same speed everywhere or did it speed up or slow down? Point out: The stopwatch is only good for substantial times, several seconds. It will not help us answer this question. Demonstrate the recording timer by pulling a meter or so of tape through it. Explain why the time intervals are equal and ask why the spaces are not even. (The spaces are small where the speed was small.)

Each group should do two runs with the Stomper pulling a length of ticker tape behind it. Mark off each tape in groups of six dots. (Each six is one tenth of a second.) The first tape will become a distance-time graph. Rip each six dot section and glue it to a piece of graph paper. The first section goes on next to the origin. The second section goes over one width of tape, but starts up, so that its bottom is next to the first tapes' top. The third goes over one and its bottom lines up with the top of the second section, etc. Thus the vertical axis is the distance traveled in cm. and the horizontal axis is the time in tenths of a second. This graph will have a constant slope equal to the average speed found with the stopwatch. Demonstrate how to find slope.

The second tape will become a velocity-time graph. Each six dot section is the distance traveled per tenth of a second, so it is the average velocity for that tenth of a second. For this graph the vertical axis is the velocity in cm per tenth of a second, while the horizontal axis is again the time in tenths of a second. For this graph, each tape has its bottom on the horizontal axis. The tapes go next to each other in order. This graph will have a slope very close to zero because the speed is very close to being constant. How did this velocity compare to the slope of the first graph? How did it compare to the speed found with the stopwatch?

Be certain that you ask the students to describe each of these two graphs and to compare them to each other.

This is probably as much as you can expect for one day. I would then spend a day or so doing constant velocity problems to reinforce this concept.

Part III: Constant Acceleration

Drop a mass. (Catch it!) Ask if this is constant velocity. Ask how you can find out. Using the recording timers, attach the tape to the mass and drop the mass over the side of the table. (It pays to protect the floor with a book, or a newspaper.) Run two tapes. Mark every sixth dot and create a distance-time and a velocity-time graph. Look at them! The distance graph will **not** be a straight line this time. It should look like a parabola, because the speed is increasing, the slope will increase. The velocity graph **will** be a straight line, but will not be horizontal, because the speed is increasing at a constant rate. The slope of this line is the acceleration. (The change in velocity/the time it took (dV/dt).)

Again, it is very important to ask what these graphs look like and to compare them to each other and to the graphs from Part II.

This is probably a second day's work. It should be followed by problems with distance, velocity and constant acceleration.

Part IV: Constantly Increasing Acceleration

Lay a chain on the counter top. Push it over the edge one link at a time, until it goes by itself. Ask what kind of motion this is. Again, we can analyze this motion if we attach a tape to it. Mark every sixth dot. The distance time graph is optional, be sure to do a velocity time graph. This will not be a straight line because the velocity increases at an increasing rate. (The acceleration (slope) increases at a constant rate, thus we get a parabola.)

It is once more imperative that you ask the students to describe the shape of the graph(s) and compare them to the previous graphs.

Optional: Have Tricycle races. Have someone ride a tricycle pulling ticker tape. The velocity-time graph is the most interesting. Be sure to ask about the accelerations. They will be positive and negative!

Conclusions:

Velocity is the distance traveled/time it took (dD/dt)
Velocity is the slope of a distance-time graph
Acceleration is the change in velocity/time it took (dV/dt)
Acceleration is the slope of a velocity-time graph
Constant velocity gives straight line graphs for both d-t and v-t
Constant acceleration gives parabolas for d-t, but straight lines for v-t
Changing acceleration gives v-t graphs with changing slopes

Performance Assessment:

Using TWO SPEED Racer (a friction car, about $2.75 at "Toys R Us"): Show it to the students. Placing it on a flat surface, where all of them can watch it, pull it back until you hear a click. Let it go. It will go in a straight line, and suddenly increase its speed.

Ask the students to sketch two graphs. A Distance vs Time and a Velocity vs Time graph.

Rubric:

5 pts Graphs are correctly labeled on each axis. Distance-time graph shows as short straight line, sloping up followed by a steeper straight line; also sloping up.
Velocity-time graph shows a short, horizontal line, followed by a higher horizontal line.
4 pts Graphs not correctly labeled, but show the proper shapes.
3 pts Graphs not correctly labeled, and only one of the graphs shows the proper shape.
2 pts Graphs properly labeled, but neither graph is the proper shape.
0 pt No labels, and wrong shapes.

Multicultural Applications:

There are many applications of distance vs time in life including the Summer Olympics track competitions and the speed skating and cross country skiing in the Winter Olympics.

Periodic Motion - The Pendulum

Deborah Lojkutz
6010 Springside
Downers Grove IL 60516
(708) 964-6603

Joliet West High School
401 N. Larkin Ave.
Joliet IL 60435
(815) 727-6950

Objectives:

To introduce the concept of periodic motion and relate it to the movement of a pendulum. To discover that the period of a pendulum is dependent on the length of the pendulum and independent of the bob and the amplitude.

Materials needed:

Each group needs a stop watch and pendulum with a different bob.

Materials for pendulum -
string
bob - infant stacking rings provide colorful bobs of different sizes and mass
right angle clamp
ringstand
rod

For class graphs - two pieces of end roll paper approximately 21/2 meters long, a meter stick, markers and masking tape

Strategy:

Begin the class period with a discussion of what the students think periodic motion is. After a few minutes, bring out a pendulum from behind the lab table and use it as an example of periodic motion. Point out its various parts - bob, length, pivot point. Demonstrate what is meant by period and amplitude. Spend a few minutes discussing the accuracy of measuring a single period. The students should realize that timing how long it takes for ten cycles and dividing by 10 will lessen the effects of reaction time and result in a more accurate measurement of the period.

Break up the class into groups. Each group is given a pendulum with a different bob but all pendulums are 1 meter in length. (A different option would be to have the students construct their own pendulums 1 meter in length. If doing so, make sure to discuss that the length of the pendulum is measured from the pivot point to the center of gravity of the pendulum bob.) Each group is to find the period of their pendulum by timing it for 10 cycles and using an amplitude of 10 cm. After doing so, they are to experiment with other amplitudes (5 cm, 15 cm, 20 cm, etc.) to determine if the amplitude effects the period. All groups record their data in the class data table on the board under the following headings: Color of bob, Time for 10 cycles, Period, Effect of changing the amplitude.

When all groups have recorded their data, call the class together for a discussion of the results. It should be apparent that the shape and mass of the bob and the amplitude have no effect on the period. Small differences can be explained by experimental error. If the students are not sure that the rings are actually different masses, bring out a scale and prove it. If you are using infant stacking rings, there will be about a 50% difference between the largest and smallest ring's mass.

Each group is given a different length of string to create a new pendulum. Lengths should vary from 25 cm to 2 m. As before the groups will find the period of their pendulum. This time they will graph their results on a length versus period graph.

While the students are finding the period of their pendulums, hang a piece of end roll paper about 21/2 meters long on a wall and label the axes. The vertical axis is marked off to the actual length of the pendulum. The horizontal axis is the period marked in a convenient scale.

When the students have found the period of their pendulum they should remove it from its support bar and hang it on the graph at its corresponding period. Remind the students that the actual length of the pendulum is measured from the pivot to the center of gravity of the bob. When using rings for bobs, the center of gravity is at the center of the ring, therefore it is important that the centers of the rings be lined up on the horizontal axis. By using this self graphing technique, it is not necessary for the students to measure the pendulum's length and the effect of the length of the pendulum on the period is shown quite dramatically.

Once all groups have added their pendulums to the graph discuss the results. The graph should look like a y-parabola. If it is not obvious that it is a parabola remember that the origin is a point on the graph - zero length will have zero period. With a marker sketch the curve on the graph. Discuss with the students the shape of the graph and what it represents mathematically. Hopefully they will come up with the idea that there is a direct relationship between the length and the square of the period. (This depends on their level of math ability.) If this relationship is not obvious, lead the students by a discussion of what needs to be done to straighten out the graph. This approach usually gets to the idea of squaring the period. The students should now verify these predictions by squaring their period and regraphing on the second end roll graph. The students should transfer their pendulums from the first to the second graph. The resulting graph should be a straight line through the origin. At this point the class can discuss the results that the square of the period is directly proportional to the length of the pendulum. This would be a good point to start a discussion of the equation and theory of a pendulum.

Conclusion:

This activity will take more than the usual lab period. A good breaking point would be after finding the effect of the bob and the amplitude. This activity can be used with elementary students up to the first graph.

Evaluation:

The student's understanding of this material can be evaluated by having them use the graph to predict what the period of a pendulum will be for a specific length. They can then experimentally verify their prediction.

Why Use Seat Belts?

Larry Brandon
1544 Edgewood Ave.
Chicago Heights IL 60411
(708) 756-2635

Thornwood High School
17000 South Park Avenue
South Holland IL 60473
(708) 339-7800

Objective:

To show some reasons for wearing seat belts.

Materials:

Per Group:

- Board (for ramp - length about .75 m to 1.0 m)
- Dynamics cart
- Books (for propping up one end of board + 1 for barrier)
- Clamp (to fasten barrier down to table top)
- Plasticene (or modeling clay)
- Meter stick or ruler

For Teacher Demonstration:

- Barbie doll or similar type doll
- A seat and dash assembly

Strategies:

Number 1: Teacher Activity

As a demonstration, put a Barbie doll on a block seat on a dynamics cart. Place the cart at the top of a ramp which is set with the top 30 cm above the table top. Clamp a book down as a barricade about 50 cm from the bottom of the ramp. Release the cart and observe where the doll ends up after hitting the barricade.

Number 2: Student Activity

Mark the ramp into 20 cm intervals. Raise one end of the ramp about 30 cm. Position an obstacle such as a book about 30 cm from the bottom of the ramp. Hold the obstacle stationary.

Make a plasticene (modeling clay) cube "passenger" with sides about 2 cm long. Place the passenger on the front of a dynamics cart. Place the front of the dynamics cart at the 20 cm mark on the ramp. (It may make results more graphic if students shape the plasticene into a roughly human shape.)

Release the cart. Observe the motion of the passenger during and after the collision. Measure the distance the passenger moves from the collision point to where it stops. Repeat this step several times and average the distance.

Release the cart from several different distances up the incline to vary the speed. Observe the motion of the passenger and measure the distance as in the previous paragraph. Repeat this procedure several times for each measured 20 cm mark to average the distances.

Possible Extensions:

By spending some money at your local Venture or similar store, you can obtain some "Crash Dummies" and a "Crash Dummy Car." They claim to have a "Crash Dummy Cycle" as well. The car has a facility built in for attaching seat belts. It also gives a very satisfactory crash in that the roof and windshield and front wheels go flying off. If the dummies hit hard enough, they may also fly apart. Students should also get a thrill from this.

Another extension would be to use ticker tape timers and attach ticker tape to each dummy as well as the car. This would provide a difference in time of movement as well as distance differences.

Performance Assessment:

(The following questions should be made available. If students have trouble with the questions, the equipment should still be available. They should obtain their equipment again and do what is needed in order to answer the questions.)

1. Describe the motion of the passenger during and after the front-end collision.

2. How did the speed just before the collision change as the cart was released from further up the ramp?

3. How did the distance the passenger rolled after the collision change as the cart was released from further up the ramp?

4. Describe the motion of an unbelted passenger in a car which collides with a stationary obstacle.

5. Draw a diagram of the forces acting on the cart and on the passenger on the flat before and during collision.

6. Seatbelts prevent a passenger from being thrown from the car. Why is it usually more dangerous to be thrown from the car than to remain in it?

7. Newton's First Law says (in essence), it takes an unbalanced force to change velocity. Explain how this applies to the motion of the passenger during the collision.

Multi-Cultural Implications:

The implications of this laboratory experiment tend to be related to age rather than culture. My observation tends to the idea that mature individuals use seatbelts more than teenagers do. However, European countries do not have speed limits on their highways. Therefore, the Europeans do wear seat belts more than Americans do!

Reaction Time

Roy Coleman
5436 S. Kimbark Ave.
Chicago IL 60615
312-493-2517

Morgan Park High School
1744 W. Pryor Ave.
Chicago IL 60643
312-535-2550

Objective:

Each student will be able to obtain his/her reaction time by making simple measurements. Each student will also be able to find the constituent parts of their overall reaction time.

Materials needed:

Each group of two will need one 30 cm (12 inch) ruler to find their reaction time. For the more advanced activities, each group will need a meter stick, a stopwatch and two funnels connected together by more than two meters of rubber hose.

Suggested Strategy:

The time that it takes you to react to a particular situation is called your reaction time. Your reaction time depends on many factors including the stimulus and the particular part of the body that is to react, i.e., it takes longer to move your foot from the gas to the brake pedal than it does for your fingers to grab something simply because your leg is heavier and it has to move farther.

Today we will be finding the time required for you to grab a dropped object, namely a 12 inch ruler. Brace your hand on the edge of a desk so that the fingers are over the edge ready to grab the ruler as it is dropped. Have your partner hold the ruler such that its zero centimeter mark is even with the center of your fingers and, at some random time, drop it. Record the distance that the ruler fell (where you caught it), during the time that your body was reacting. Do this at least 10 times. It is **important** that the ruler is held **even with** your fingers (not above or below them) and that it is **dropped** (not thrown down). **ALL** readings **MUST** be recorded but any readings that are way out of line can be crossed out and ignored. (In general, your measurements should be between 10cm and 30cm.) Average your readings and then determine your reaction time.

The reaction time can be determined in several ways. You can use the standard equation for freely falling bodies
$S_f=1/2at^2+v_ot+S_o$. Where S_f is the average
distance that the ruler fell, a is the acceleration of gravity (980 cm/sec^2), t is the time that it takes the ruler to fall (the reaction time), v_o is the initial velocity (zero) and S_o is the initial distance (zero). Substituting in zero for v_o and S_o simplifies this to
$S_f=1/2at^2$. Solving this equation for t
yields

$$dt=sqrt(2S_f/a)$$

An alternate method would be to use the following chart to look up the time corresponding to the average distance that the ruler fell.

DISTANCE (cm)	TIME (sec)	DISTANCE (cm)	TIME (sec)	DISTANCE (cm)	TIME (sec)	DISTANCE (cm)	TIME (sec)
0.012 --	0.005	8.281 --	0.130	31.862 --	0.255	70.756 --	0.380

7.656 -- 0.125 30.625 -- 0.250 68.906 -- 0.375 122.500 -- 0.500

Another alternative would be to draw a graph from the above chart and have the students read the time from the graph.

The experiment could be stopped at this point but there are several more things that can be calculated. The time obtained in the first part (call it reaction time-t_r) is really the sum of three other times: 1) the time that it takes for your brain to realize that the object has been dropped (call it processing time-t_p); 2) the time for the nerve signal to travel from your brain to your fingers (call it nerve time-t_n); and 3) the time that it takes for your fingers to close (call this dynamic time-t_d). (i.e., $t_r=t_p+t_n+t_d$)

The easiest of the three to calculate is the nerve time (t_n). Since nerve signals travel at an approximate speed of 30,000 cm/sec, we can measure the distance from your brain to your fingers and use the equation time=distance/rate to find the nerve time.

The next easiest is dynamic time (t_d). Dynamic time can be found by timing 25 **complete** pinches (open and close) and then dividing that time by 50 (since each open and close is two actions).

Processing time (t_p) can be found two ways. One method is to work backwards from the reaction time. Given t_r, t_n and t_d, you can subtract the sum of t_n and t_d from t_r to get the processing time.

Performance Assessment:

Several large sheets of paper should be hung on the wall of the classroom about knee level. Each sheet should have the outline of a gas pedal and brake pedal drawn on the sheet. Each group of students should be able to determine their reaction time and dynamic time for moving their foot off of the gas to the brake.

Multicultural Note:

All of the equations and symbols used in this lesson are the same, regardless of the language of instruction. Ukranian, German, Italian and Japanese physics books all have their physics equations in 'English'.

Projectile Motion

Jan Dudzik
10025 Medill
Melrose Park IL 60164
708-455-0599

Riverside-Brookfield High School
First and Forest Ave.
Riverside IL 60546
708-455-7500

Objective:

As a result of this experience students will:

1. be able to recognize that projectile motion is the resultant of two independent velocities, horizontal and vertical.
2. determine which angle of launch for a projectile will yield the greatest range.
3. realize that the greater the angle of launch, the greater the vertical velocity component.

Materials:

For each group: 2 pieces of foam board 90 cm. x 50 cm., Sheet of paper 70 cm.x 70 cm., Tape, Meter Stick, 4 different colored markers, Angle launcher, Spring.

Strategy:

Roll a ball across the table. Ask the students to define this motion. Throw a ball straight up into the air. Ask the students to define this motion. Using the responses, establish that both objects follow a straight line path, but that one path is in a vertical direction and the other is in the horizontal direction.

Next, have a student throw a ball across the room into a garbage can held by another waist high. Instruct the students to watch carefully and repeat this 2 times. Ask students to write down how they would define this motion, under the heading Day 1 on their record sheet. Collect these Pre-Activity student responses and read some out loud.

Set the stage for the activity by pointing out that they will be investigating how the parabolic path of a projectile is formed. Hand out instructions and let the groups work together for about 20 min.

....DAY 1.... INSTRUCTIONS PART 1

1. Tape a large blank 50 cm. x 50 cm. paper to the table.
2. Draw a 40 cm. line straight up the paper about 4 cm. away from the vertical edge of the paper.
3. Draw another 40 cm. line across the paper about 4 cm. away from the horizontal edge of the paper.
4. Extend the lines so that they meet at one point in the left hand corner.
5. Next, measure about 4 cm. starting from the corner where the lines meet, up along the vertical line and mark it with a dot. This will be the starting point for the vertical foamboard.
6. Repeat step 5 for the horizontal axis.
7. Line up one piece of foamboard so that the bottom edge of the foamboard lies just above the horizontal line on your paper. Guide this board along the horizontal line until it's vertical edge is on the horizontal starting dot. BE SURE the entire bottom is just above the horizontal line and the vertical edge begins on the horizontal starting dot.
8. Line up the other piece of foamboard so that the vertical edge lies right next to the vertical line. Guide this board along the vertical edge until the

edge is on the vertical starting dot.
9. Place the marker down at the corner point where the two foamboards meet.
10. Move both foamboards at about the same SLOW speed simultaneously along their respective lines while the marker moves to stay in contact with the moving corner where the foamboards meet, so as to trace a line on the paper of the movement of the corner.
11. Move until both foamboards have reached the end of their lines.
12. Place boards back to their starting points and this time have the vertical foamboard move a little faster than the horizontal foamboard and again trace the path of the moving corner where the boards meet. (use a different color marker)
13. Repeat again, but this time have the vertical foamboard move more slowly than the horizontal board.
14. Write your names on your sheet and return to class.

After 20 minutes:

Have the students tape their data sheets on the board. Note the similarities. Next, use one of the graphs to establish that the path is the result of two independent velocities by drawing the components. Then, hand out instructions for Activity 2 and instruct the students to notice what happens when you change the vertical velocity but keep horizontal velocity constant.

....DAY 2.... INSTRUCTIONS PART 2

1. Get a new sheet of paper and repeat steps #1-7 from Part 1. Redraw the axis with starting dots.
2. Now, mark a line 30 cm. away from the starting dot on the vertical line.
3. Next, line up foamboards as you did in part one steps 7, 8, and 9. For this trial have the vertical and horizontal boards begin at the SAME SPEED, but as the vertical board reaches the 30 cm. mark it should stop and begin to move back to it's original starting dot. During this trial the however, the horizontal board should move the same speed its entire trip.
4. Move the boards back to their starting position and, for this trial, have the vertical board go FASTER than the horizontal board to begin with but have the vertical board slow down, stop at the 30 cm. mark, and then go back down to it's starting mark. (Horizontal should go slow the entire trip.)
5. Repeat, this time have the vertical board go SLOW, come to a complete stop at the 30. cm. mark, and then go back down to it's starting point. Horizontal should go slow the entire trip.
6.Place the names of the students on the sheets and tape them to the blackboard.

After 20 minutes:

Point out similarities between the group graphs. Call attention to the fact that the greatest angle formed by a resultant path was due to a large vertical velocity combined with a small horizontal velocity. Ask the students to guess what angle to shoot a projectile so that it would go the farthest. Record their predictions. Review at this time the sine and cosine trig functions. Remind the students that this case is geometrically similar and review free fall equations. Hand out a worksheet and have the students draw the components of given vectors. Set the stage for the last activity by pointing out to students that to investigate which angle yields the greatest range they must keep the initial velocity of the projectile the same in each case.

.....DAY 3.... INSTRUCTIONS PART 3

1. Hold a meter stick against the wall. Mark a 1 meter mark with tape and then measure up 2 more m. and mark with tape.
2. Stretch a spring on a meter stick, hold it parallel to the wall and then shoot the spring straight up. Do this several times until you can repeat a shot to go exactly 2 m. several times. Write down how far you stretched the spring. Get an assigned angle for your launch from your teacher. (TEACHER: assign 15º, 30º, 45º)
3. Calculate the speed at which the spring is fired, use the equation

$v^2 = 2\ ad$.

4. Determine the vertical and horizontal components of the original velocity by using v_v= v sin(angle) and v_h = v cos(angle)

5. Use the vertical velocity to find the flight time, $t = 2v_v/a$.

6. Use the flight time and the horizontal velocity to calculate the range $d=v_h t_f$

7. Measure off this distance and shoot the spring using the same stretch.

Performance Assessment:

BEFORE the instruction begins have the students answer:
1. If a baseball player throws the ball as hard as he can, and wants it to go as far as possible, should he throw at an angle to the ground >45,<45 or = 45 ?
AFTER Instruction:
2. The human cannonball is shot at a 30 degree angle with a velocity of 10 m./sec. Determine where they should place the net to catch him.
3. The following is a strobe picture of the human cannonball's ride. At the spots marked, draw the vertical and horizontal components of velocity.
4. Assuming that the initial velocities of the missiles are the same, draw the paths of missiles shot at the following angles: 15^o, 30^o, 45^o, 60^o.

Return to Physics Index

Sports in Physics: Measuring Velocity in a Mini-Olympics

Marion T. Hill
401 E. 32nd St.
Chicago IL 60616
312-326-0287

Disney Magnet School
1440 N. Marine Dr.
Chicago IL 60613
312-252-7455

Objectives:

1. To demonstrate an understanding of the difference between speed, velocity, and acceleration.
2. To compute velocity.
3. To compute acceleration.
4. To read and construct a line graph and a bar graph that show information about velocities of sports activities.

Materials Needed:

(for each group)
Two stop watches, one meter stick or tape, roll of masking tape or chalk, notebook paper, pen, calculator (optional)
(for teacher)
Five-minute video of Olympic competition, bulletin board with pictures of multi-cultural sports activities, chalkboard for graphs or three pre-printed graph poster boards, sports vocabulary in Spanish and English (sports-deportes) (velocity-velocidad) (speedometer-cuentakilometros) (at full speed-a toda velocidad) (Olympic-Olimpico)

Suggested Strategy:

1. Introduce topic with a five-minute video of Olympic events or with pictures of a variety of sports.
2. Involve pupils in a discussion about motion. Ask what we usually notice about motion: how fast something is moving and in what direction something is moving.
3. Guide pupils in a question/answer session which leads them to define speed (rate at which something moves), velocity (speed plus direction), and acceleration (rate of change of velocity).
4. Explain formula for computing velocity (velocity=distance divided by time).
5. Explain formula for computing acceleration (acceleration=(V_2 - V_1) divided by T_2).
6. Divide the class into groups of four or five, distribute materials, assign an area on a playground or in a gymnasium for competition.
7. Establish rules for performing at least 3 competitive events in which velocity can be measured (running, walking, pushing a ping-pong ball with your nose, riding a bicycle, crawling, etc.).
8. Give each group a chart for recording data (names of participants, activities, distance covered, time). Decide on the unit of measure.
9. Have the pupils place all results on a master chart:
   NAME ACTIVITY DISTANCE TIME VELOCITY (ft/s or m/s)
10. Transfer results from the master chart to a large chalkboard graph:
    a. Let x = one activity
    b. Let . = the second activity
    c. Let o = the third activity, etc.

11. Have the pupils connect the lines of the line graph. Ask questions about the results.
12. Have the pupils of each group compute the group average for each activity.
13. Transfer the group average for each activity to a bar graph.

```
      |
      |
      |
   V  |
 (m/s)|
      |
      +----------------------------------------------------
  (Examples)  Walk  Run  Ride      Walk  Run  Ride
                   JETS                 ROCKETS
```

14. Re-explain the formula for computation of acceleration.
15. Have the groups return to the game area, perform one activity and compute acceleration.
16. Transfer the group averages to another bar graph.
17. Lead the pupils in a discussion to summarize the results of the Mini-Olympics.

Performance Assessment:

You and your friends are visiting a park for the day. On a small sign, you read that park officials are offering a $100 prize to the person who can design a one-hour mini-sports competition, complete with a description of the prizes to be awarded to individuals or teams who reach the highest VELOCITIES.

You immediately decide to win the $100. In at least two paragraphs, describe the activities, materials needed, method and unit of measure, distance to be covered; and tell how you will plot the results.

Rubric:

1. Five points = A complete description, including each item listed in the performance assessment
2. Four points = Partial description, with at least one activity, unit of measure, time and/or distance, and one formula
3. Three points = Partial description, with at least one activity, unit of measure, and one formula
4. Two points = Little or no description, with at least one activity
5. One point = Description unclear
6. Zero = No attempt

Return to Physics Index

So You Want to Hit a Home Run?

Karlene Joseph
4452 N. Narragansett
Harwood Heights IL 60630
708-867-1568

Walther Lutheran High School
900 Chicago Avenue
Melrose Park IL 60160
708-344-0404

Objectives:

1. Students will demonstrate a relationship between the position of the baseball bat and the baseball at the point of contact to direct the ball in the appropriate hitting field.
2. Students will determine the center of percussion and the center of mass for a baseball bat.
3. Students will analyze the projectile motion of the path taken by a baseball as it is thrown in the air as well as the projectile motion of the path taken by a tossed bat that is made to flip over itself while in flight.
4. Students will find the center of mass for several irregularly shaped objects and relate this concept to the playing of sports in general.

Materials needed:

Per Lab Group:
Baseball bat, meterstick, string, push pin, two transparencies, weighted object, tape (masking or colored), Baseball (or substitute tennis ball for safety purposes), flat board slightly larger than the width of a baseball bat, flat irregularly shaped object (cut from styrofoam, manila folders, or any material that is relatively stiff)

Per Class:
Video camera, blank video tape
Video tape of portions of a baseball game
VCR with slow motion or frame by frame motion

Strategy:

Begin lesson with a video of portions of a baseball game that involve pitching, strike outs, fly balls to each field, bunts, home runs, line drives, and foul tipped balls. Ask students to watch for physical factors that are involved in the playing of the game of baseball. Make a list of these observations on the chalkboard. Encourage a discussion of how physics is related to baseball. The focus of the lesson will be on batting.

Investigation #1 Ball and Bat Contact
Use a flat board instead of a bat for this portion. (A flat board is used to concentrate on the angle of the bat and to eliminate human errors and skills that influence what is observed.) Students toss the ball at the board while the board is held at different angles. Students record their observation of how the ball rebounds off the board in a data table that includes these types of hits: infield fly, fly ball to each field, ground ball, line drive, foul ball- left or right, foul tipped ball almost straight up. Drawing diagrams of the angles and paths may be helpful in the data chart.

Investigation #2 Get to Know Your Bat
Hold the bat gently from the handle so that the bat hangs downward. Tap the ball all along the edge of the bat from top to bottom. (There is one spot on

the bat that sounds and feels more solid.) Mark this spot with tape.

Investigation #3 The Sweet Spot

Hold the bat horizontally and firmly from the handle. Drop the ball from a height of about 10 cm above the bat so that the ball hits the bat and bounces off. Do this for about 5 to 10 different places on the bat, making sure to include the spot that was taped in investigation number 2. Graph the height the ball bounces vs. the position on the bat. (The ball bounces highest at the marked spot. The marked spot is called the sweet spot by baseball players and the center of percussion by scientists.) To illustrate the center of percussion and its importance to the baseball player suspend a meterstick by a string from a small hole drilled in one end. For a uniform meterstick, the center of mass should be at the 50 cm mark and the center of percussion should be roughly 20 cm below the center. Hit the meterstick at various locations to try to cause the meterstick to swing. (At the center of percussion, the meterstick swings in a wide arc with very little rotation about the vertical axis. At other points on the meterstick, the meterstick wobbles, twists, and vibrates quite a bit more. If the ball contacts the bat at the sweet spot most of the energy from the bat is transferred to the ball in the forward direction since energy is not lost due to rotational motion. The batter's hands sting less since the bat was not caused to vibrate.)

Investigation #4 Balance Your Bat

Balance the bat horizontally on one finger. Mark this spot with a piece of contrasting tape. (This place is the center of gravity for the object. For most objects this place is also the center of mass.)

Investigation #5 Toss Your Bat and Ball

In front of a video camera, toss the ball in the air so that it travels in an arc for a horizontal distance of about 5 meters. Still in front of the video camera, toss the bat so that it flips over itself as it travels, in an arc again about 5 meters horizontally. Students should describe in as much detail as possible the two motions observed. (A good taping of the motion is important here. Choose a uniform background that will provide contrast. Do not move the camera with the motion, instead focus on a central point of the background. It may take some practice to make sure the entire path is recorded in the space allowed.)

Investigation #6 Analysis of the Paths of the Tossed Bat and Ball

Tape a transparency to the TV screen. Play the tape the students made in slow motion or frame by frame. Students plot on the transparency the piece of tape that marks the center of mass for the bat as they see its position on the TV screen. Do the same for the position of the ball as it crosses the screen. (Both paths plotted should be the typical parabolic shape of a projectile. This could be done as a class with a few students helping with the plotting, however it is better to allow each group to plot their own segment. Investigations #7 and #8 may be done during this time by other groups who are not working with the VCR. The centers of mass for any object will follow a parabolic shape regardless of the motion of other parts of the object.)

Investigation #7 The Center of Mass for Irregularly Shaped Objects

Using string and push pins, suspend the irregularly shaped object from a point near the edge. A weighted string hangs from the point of suspension. Students draw the line formed by the string on the object. Several points of suspension are chosen. (The vertical line passing through the point of support must also pass through the center of gravity. Since the center of gravity and the center of mass are at the same location, the intersection of several of the points will determine the center of mass.)

Investigation #8 People Have Centers of Mass, Too

Stand against a wall so that the heels, legs, and back are all touching the wall. Try to touch your toes so that the heels and legs are still touching the wall. (As the student leans forward the majority of his/her center of gravity is no longer over his/her feet, therefore the student will fall before touching the toes.)

Performance Assessment:

1. Give students a few shapes, both regularly shaped and irregularly shaped. Have a dot somewhere within the shape, some shapes may have the dot at the center of mass while others should not. Tell students that the dot represents the center of mass for the shapes. Ask the students the following questions: Do you agree or disagree with the placement of the dot to represent the center of mass? Why or why not? What might you do to prove yourself correct in each case? Why would your method work?
2. Make or buy a ball that has an off-centered weight in it. (The "GUAC" ball) Toss a ball, and the weighted ball in the air. Ask students to observe the two motions. Are the paths what you would expect? Explain and justify your answer.
3. Sometimes when hitting a baseball, a batter's hands will sting. What is causing the sting? Why is the sting not present every time the batter contacts the ball?

Scoring Rubric:
5 points: Answers correctly with clear, sound, multi-faceted, logical arguments (diagrams, examples, sketches, etc.)
4 points: Answers correctly with clear explanation
3 points: Answers correctly but reasons unclearly
2 points: Partially correct with effort toward explanations
1 point: Answers with no supporting evidence
0 points: Answers of "I don't know"

Conclusions:

Center of gravity is an important concept used in sports, not just baseball. A player cannot balance if the center of gravity is not over or under the support base. In sports in which flips and turns of the body are important, such as diving and gymnastics, the athlete's center of mass will still follow a parabolic path while the other portions of the athlete's body will be rotating around this center. An extension of this lesson could be the assignment of individual reports on the origin of several sports that involve projectiles or centers of mass, such as the javelin throw, shot put, discuss, basketball, baseball, darts, diving, gymnastics, golf, archery, the trapeze, juggling, and so forth.

Evaluations:

Discussion of results and discoveries after each investigation seems to be a better method than group discussion at the end of all activities.

Return to Physics Index

Center of Gravity

Minnie E. Bounds
400 Park Avenue
Calumet City, IL 60409
708-891-4552

Dyett Middle School
551 E. 51st Street
Chicago, IL 60615
312-535-1825

Objective:

Predict and find the center of gravity of an object.

Materials Needed:

2 boxes, string, lead sinker, dissecting needle, metric ruler

Strategy:

A) Use a pair of boxes of the same size for each team of students. If different weights are secured in different places in the boxes, all the teams will find different centers of gravity.

B) Weight half the boxes in advance. Secure the weights with glue. Blocks of wood or metal make excellent weights.

C) Examine an unweighted box.

D) Predict where the center of gravity is.

E) Attach a lead sinker to a 30-cm long piece of string. Tie the string to a dissecting needle. Stick the needle into the broad surface of the box at any point near the edge of the box and mark this point.

F) Let the box and the weighted line hang freely from the needle. With a pencil, mark the position of the weighted line at the edge of the box.

G) Remove the dissecting needle. Use a ruler to draw a line between the two points that you marked.

H) Repeat this procedure for three more points on the surface of the box. Remember to mark each point near the edge of the box. The point at which the four lines cross shows the center of gravity of the box.

I) Examine a weighted box.

J) Predict where the center of gravity is.

K) Repeat steps E through H with the weighted box.

L) Extend your index finger and try to balance each box on your finger.

M) Place each box, with the marked side up, on a flat surface. Spin each box.

Results and Conclusions:

1. How do your predictions compare with the actual location of the center of gravity of each box?

2. How is the center of gravity related to the way each box balances?

3. How is the center of gravity related to the way each box spins?

Summary:

1. Answers will vary.

2. The box balances at the center of gravity.

3. The box spins with the center of gravity as its axis.

Culminating Activity:

1. Clean out an empty soup can or an oat meal box and fully remove both the top and the bottom. Now you have a cylinder.

2. Tape a quarter or some other small weight inside it.

3. Prop up one end of a bread board or some other flat board.

4. Place your cylinder at the low end of the board with the quarter in the two o'clock position. When you release the cylinder, it will roll up the hill.

Summary:

Because its center of gravity is very near the position of the quarter. The center of gravity will go down, causing the cylinder to roll up the hill.

Return to Physics Index

Friction

Kathleen Cummings Dominguez
1226 N. Marion Ct.
Chicago, IL 60622
312 276-3776

Sabin Magnet
2216 W. Hirsch
Chicago, IL 60622
312 534-4491

Objectives:

Students will demonstrate a greater understanding of "friction" by cooperatively experiencing and describing a range of phenomena involving friction. Students will understand the term "static friction" and the ratio of friction and weight as it relates to moving an object at rest.

Materials needed:

For each student: wooden sticks, (i.e, popsicle, candied apple and chop sticks)
- one empty thread spool
- metal, plastic, cork and rubber washers
- rubberbands, assorted sizes

For each group: set of slotted weights
- miniature parachutist
- small pan (plastic, from microwave dinners) with a hole for tying the string
- blocks
- spring scale

For teacher's demonstrations:
- Two identical, cylindrical, glass bottles (with tops), filled with various quantities of water
- One wooden slope, at least as wide as the bottles, with sandpaper glued to the reverse side* and two 2" X 4" X 8" blocks
- The teacher wears a pair of jeans with worn knees and a shirt or sweater with worn elbows
- Various surfaces for lunar vehicle runway: smooth, *sandpaper, large frozen tray of ice, carpeting, etc.
- One "slimey" ball
- One crystal wine glass half full of water
- Detergent for washing hands and vinegar
- One spool of thin string
- One pre-made "air car" made from a thread spool, cardboard square and a balloon
- Balloons
- Foam rubber mats of different textures, 24" X 24"
- Column of coins
- Sound tubes

Strategy:

1. Teacher throws a "slimey" ball on the chalkboard and asks students how the ball moves. She rubs an edge of a wine glass to get the glass to sing. She asks the class how it happens. If they don't know, they are told friction did it. Students are asked to rub their hands, then **really** hard, and tell what happens. The teacher rotates the sound tubes so the students can hear and asks the class what makes the sound.

2. Teacher asks students, grouped into cooperative teams, to list examples of friction and then to write a good definition. Answers are written on the board. Class synthesizes answers into one good definition. Students are led to understand that friction can be associated with solids, liquids and gasses and that there are subtle examples as well as flagrant examples. Teacher asks individual students to move a column of coins with one finger on the top of the column. (Teacher demonstrates how to do it: by pressing **hard** on the top coin on the edge closest to her).

3. Students are shown how to make a "lunar vehicle" with the thread spool, various rubberbands, washers and sticks. Students are to predict and/or test-out the best type of components to use which will most effectively use friction to make the vehicle run. Students test their lunar vehicle on various surfaces, i.e., wood, sandpaper, rug, ice and table top. Each group selects its best lunar vehicle to compete with other teams in a race on the indoor/outdoor carpeting.

4. Teacher asks groups to predict what will happen with the two bottles which she is about to let roll down an incline. Students will understand that water creates friction on the glass and slows down and stops that bottle's movement sooner than the empty bottle stops.

5. Teacher asks teams to predict what will happen to the contraption called an "Air Car" when she lets it go. Students will learn that air can reduce friction and overcome gravity.

6. Each group is given a little parachutist, asked to throw him/her into the air, observe and write an explanation as it relates to friction. Each group reads their answer to the class. Students will learn how air can be used to oppose the force of gravity.

7. Groups experiment with various weights and friction using the pan, string, weights, spring scales and various surface textures. The groups are asked to collect data as weight is added to the pan. Students will understand the ratio between weight and the force required to move the weight to overcome static friction, i.e., to move a mass from rest.

Coefficient of Friction: mu = F_{FR}/N

Circular Motion

Jan Dudzik
10125 Medill
Melrose Park, Ill. 60164
(708) 455-0499

Whitney Young H.S.
211 S. Laflin
Chicago, Ill. 60607
(312) 534-7539

Objective:

Students will be able to recognize centripetal force and discern that radius, mass and period influence this force.

Apparatus:

Group Pack: Centripetal Force Apparatus (Ball point pen tube, string, three 2-holed rubber stopper, butterfly paper clip), 30 metal washers, timer, tape, meter stick.

To Assemble the Centripetal Force Apparatus: Pull the 2 m. string through the empty pen tube until a little over a meter passes through the tube. Next, attach the rubber stopper to one end of the string by pulling it about 15 cm. through one hole, back through the second and fastening the string to the part that enters the first hole. Measure off 1 meter of the string that enters the first hole. Take the other end of the string and attach a paper clip. Measure off 1 meter of string on the apparatus starting from the rubber stopper and ending at the top of the tube that you slid up to the meter mark. Place a piece of tape securely on the string just underneath the other end of the tube. Place the apparatus in a ziplock bag carefully to avoid tangles.

Strategy:

Divide the class into small groups. Give each group a pack. Show students how to get the centripetal force apparatus working by grabbing the pen tube with the rubber stopper at the top with one hand and with the other hand, hold the paper clip tightly. Hold the tube vertically above your head and get the stopper moving in a circle parallel to the floor. Move your hand in smaller and smaller circles until you can keep the ball going in circles by only moving your hand in tiny circles. Establish, through questions and class discussion, that the ball wants to travel in a straight line but it is being pulled back by the string. Illustrate this by letting go of the paper clip and have them observe. Identify this pull of the string on the stopper as a force towards the center or centripetal force. Write the word and its definition on the board.

Instruct students to explore this force by having one student in the group get the apparatus going and then pull the string and the paper clip with 10 washers on it down slowly to see what happens. Ask each group to tell what they discovered. Next, have students measure 30 cm. from the stopper to the top of the tube and then place a piece of tape just under the tube. Have the twirler get the apparatus going and look straight ahead and count the number of times it passes in front of him starting with zero up to 30, making sure to keep the tape just under the tube at all times. Have one student time the 30 revolutions. Have a recorder place the time on the board. As a class, determine the average of all the times. Instruct the students to repeat the above for 60 cm. and 90 cm. Calculate the period for each radius, using the average time in seconds and dividing it by the number of revolutions. Make a class graph of Radius vs. T (period). Summarize with the class that, from the data, the period has a direct relationship to the square of R, or as the radius increases, so does the period; and conversely, as the radius decreases, so does the period.

Next, have students explore what happens to the period when mass increases. Have each group time 30 revolutions of 1 stopper with a 1 meter radius and a constant force of 10 washers. Have each group place time on the board and take the average to calculate the period. Repeat with 2 stoppers and with 3 stoppers. (Attach the stoppers to the first one with more string--be sure to remind students to keep the tape just below the tube.) Plot as a class, mass versus T and summarize the relationship as the mass to the square of the period.

Last, have the students explore what happens to the period when force increases by adding washers to the clip in 5 washer intervals up to 30. Have each group take a timing for each interval of 5 washers while keeping the radius at 1 meter and the mass at 1 stopper and the tape just below the tube. Find the average time. Calculate the period for each 5 washer interval and use the data to plot class graph of Force vs. T (period). Note that the graph reveals that F is inversely related to the square of the period or, as the force increases, the period decreases.

Math: Go over the mathematical derivation of $F = 4pi^2Rm/T^2$

This will take at least 3 class periods.

Rolling Spheres on Inclined Planes

Kenneth Guzik
7439 N. Ottawa Ave.
Chicago, Illinois 60648
(312) 775-3742

O.A. Thorp Scholastic Academy
6024 W. Warwick Ave.
Chicago, Illinois 60634
(312) 534-3640

Objectives:

The students will be able to determine the distance of a sphere rolling down an inclined plane and discover that inclined planes make work easier.

Materials needed:

4 meter sticks, 1 2.5 cm. steel sphere, 1 metal incline (120 cm. long), 1 short wooden incline (30 cm. long), 4 wooden blocks (4 cm. high) and masking tape

Strategy:

Review what is a simple machine and the types of simple machines. Demonstrate the procedure as follows:

Place the short incline end-to-end with the metal incline, with the short incline on your left.

Place two blocks under the outer end of each incline so that the two inclines look like slides that meet at the bottom.

Tape a meter stick along both sides of the short incline extending from the vertex. Do the same with the metal incline.

Release (do not push) the steel sphere with your fingertip at the 6 cm. mark on the short incline (D1).

Have your partner locate the top point where the sphere rolled and record the number of centimeters the sphere traveled up the metal incline under **Trial 1** for D2 on Table 1 of the Data Sheet.

Repeat the procedure to record **Trial 2** and **Trial 3** from 6 cm.

Calculate and record the average of the three trials under **Average.**

(See the data table on the next page.)

Repeat the same procedure from 12 cm. and 18 cm. to complete the table.

Data Table

D1	**D2 (cm.)**			
(cm.)	**Trial 1**	**Trial 2**	**Trial 3**	**Average**
6				

12					
18					

Conclusion:

The students should notice that as D1 increases D2 will also increase.

Orbital Motion

Eleanor Kopsian
59l4 North Magnolia Ave.
Chicago, Illinois 60660

Franklin E. Frazier
4027 West Grenshaw Street
Chicago, Illinois 60624
(312) 534-6880

Objectives:

In this activity the students will:

1. compare a circle with an ellipse,
2. communicate an operational definition of an ellipse,
3. understand that as the foci of an ellipse are moved further apart the minor axis becomes shorter,
4. understand that as the foci of an ellipse are moved further apart the major axis becomes longer,
5. communicate a definition of the eccentricity of an ellipse,
6. be able to use a formula to measure the eccentricity of an ellipse,
7. be able to state Kepler's **Law of Elliptical Orbits**,
8. predict the solar energy received at different positions in a planet's orbit.

Vocabulary:

revolve	circle	major axis	ellipse	perihelion
orbit	focus	minor axis	eccentricity	aphelion

Materials Needed:

For each team of two students the following materials are needed:
one foot square foam board, string, thumbtacks, pencils or pens, metric ruler, paper, masking tape or scotch tape, marking pen, data table, graph paper.

Strategy:

Divide the class into pairs.

Activity I Have the students press a thumbtack into point C at the center of the paper where two perpendicular lines intersect. These lines are identified as the major axis (horizontal line) and the minor axis (vertical line). Place a string loop under the tack head and place a pen, point down, inside the loop. Then move the pen outward to stretch the string. The string should stay under the tack head at all times. Hold the pen firmly against the string and move it in a rounded orbit. Paste the completed drawing on the wall.

Activity II Repeat activity I except have the students press a thumbtack 6 cm from the center on each side of C along the major axis. Again, using the pen and the string loop draw a shape. The string should stay under the two tack heads at all times. Paste the completed drawing on the wall.

Activity III Repeat activity II substituting 8 cm on each side of C.

Activity IV Repeat activity II using 10 cm on each side of C.

Activity V Repeat activity II using 13 cm on each side of C.

Complete the data table by measuring and recording the distance between the foci and the length of the minor axis for each shape one through five. Make a bar graph showing the relationship of the distance between the foci and the length of the minor axis for each shape. Discuss Johannes Kepler and his **Law of Elliptical Orbits** which states:

The planets move in orbits which are ellipses and have the sun at one focus. (The other focus is empty).

Discuss the perihelion, the point on the elliptical orbit where the planet is closest to the sun. Discuss the aphelion, the point on the elliptical orbit where the planet is farthest from the sun. Discuss the amount of energy the planets receive from the sun at the perihelion and aphelion.

Hand-Outs:

Worksheets review the concepts of where the aphelion and perihelion are located on the elliptical orbit. They review vocabulary words and use sentence completion to review the concepts learned.

Conclusions:

1. The greater the distance between the foci, the greater the flatness or eccentricity of the ellipse. The eccentricity can be measured by using the formula:

   $$e = \frac{\textbf{distance between foci}}{\text{length of major axis}}$$

   When e=0, the shape is a circle and when e=1.0, the shape is a straight line.
2. The planets move in elliptical shaped orbits with the sun as one focus and the other focus is empty or just a point in space as stated in Kepler's **Law of Elliptical Orbits**.
3. A planet would receive the most amount of heat from the sun at the perihelion which is the point closest to the sun. A planet would receive the least amount of heat from the sun at the aphelion which is the point farthest from the sun.

Evaluation Questions:

l. How many centers were used to draw a circle?
2. How many centers are needed to draw an ellipse?
3. How is an ellipse similar to a circle?
4. How is an ellipse different from a circle?
5. What happens when both foci are placed directly on top of each other?
6. What is the shape of the orbits of the planets?

Positioning the fulcrum in class one levers

Janis Gary Sullivan
2851 S. M. L. King Drive
Chicago, Ill. 60616
312 225-3010

A. O. Sexton School
6020 S. Langley Ave.
Chicago, Ill. 60637
312 535-0640

Objectives:

1. To identify the parts of a class one lever
2. To discover and demonstrate the relationship between force and the distance of the load from the fulcrum
3. To discover that work input = work output with the lever
4. To compute the mechanical advantage of a lever (ratio of the distances through which the forces are exerted)

Materials Needed:

ruler, pencil, 30 pennies, wood block, wood plank (at least 4 feet), bathroom scale, meter stick, various text books

Strategy:

Each group receives the above materials. The group then makes a lever by placing the ruler across the pencil. The pencil (fulcrum) is first placed under the 4 inch mark on the ruler. Ten pennies (load) are placed between the end of the ruler and the one inch mark. Have each group add and record the number of pennies needed on the opposite end of the ruler to lift the ten pennies (load). The experiment is repeated with the ten pennies at one end and the pencil (fulcrum) at the 6 inch and 8 inch marks under the ruler. The groups record the number of pennies needed to lift the ten pennies (load) at the different points of the ruler on the chalkboard chart. The mechanical advantage is worked out using the ratio of the distance of the effort arm to the resistance (load) arm.

Using the discovery of the relationship between the distance of the load to the fulcrum, the groups will lift the teacher (if willing) or a classmate. A wood block and a wooden plank are provided and the class one levers are set up. The student and the textbooks are weighed on the scales and the data recorded. The pupil stands on the load arm and one by one the books are placed on the effort arm until the load arm is raised and the effort arm is touching the floor. Positioning the fulcrum at different points under the plank, find the ratio of the effort arm length to the load arm length to get the highest mechanical advantage. This information is charted on the chalkboard to again note that when the load is placed nearer the fulcrum the effort needed to raise the load is less. Therefore, the longer the distance of the effort arm, the smaller the force needed. The groups then compute work input and work output by using the equation:

$$Fd_{resistence} = fD_{effort}.$$

(where F="load", d=vertical distance "load" is lifted, f="effort", D=vertical distance the "effort" is pulled down) with the data from the chart on the chalkboard. The answer is given in foot-pounds and will indicate that work input is equal to work output.

Action and Reaction

Mitzie Wilkins
9756 S. Indiana Ave.
Chicago, Il 60628
(312) 660-0608

Enrico Fermi Elementary School
1415 East 70th Street
Chicago, Il 60637
(312) 535-0540

Experiment 1

Needed:

One volunteer student

Objective:

To demonstrate that forces occur only in pairs

Strategy:

Have Newton's third law of motion written on the board. Make a brief introduction on Sir Isaac A. Newton and have the whole class read the law.

> Whenever one body (object) exerts a force on a second body (object), the second body (object) exerts an equal and opposite force on the first body (object).

A Handy Hands-on Game

First, extend one hand out and press against the wall. Next, extend hand out in mid air and press. Your body will lean over with nothing to support it. Ask students to explain what happened. Request one volunteer to come to the front of the class. Tell the volunteer that he or she will be your partner in a demonstration to experiment with Newton's third law of motion. Stand facing each other about one arm's length from your partner. The trick is to make your partner move his feet by pushing only on the hands. Each participant should stand with his feet together and one hand behind his back.

Step 1:
You hold up your hand in front of you at shoulder height, palm facing your partner. Tell your partner to push against your hand (you do NOT push back).

Step 2:
Your partner pushes again and you pull your hand back. (Repeat until one partner moves his feet.)

Question: Why do we say that forces occur in pairs?

Answer: Every action has a reaction counterpart (or partner).

continued

Experiment 2

Materials Needed:

1 skate car with propeller fan
6 size C batteries
3 cardboards - sizes: large, medium and small

Objective:

To experiment with the law of action force and reaction force

To sail the skate car or
not to sail the skate car
that is NOT the question!

Question: What do you think would happen if you put various size sailboards on a propelling skate car?

Strategy:

Have class break up into small groups of 3 or 4 members and select a spokesperson. Explain the mechanisms (parts) of the skate car. Demonstrate how the skate car works. Next, hold the large sailboard in front of the skate car approximately 2" away from the fan. Ask students what they think will happen if you turn the fan on. Allow them time to think and discuss the question within each group (approx. 1 or 2 mins.). Regain the students' attention. Ask each spokeperson what her group decided would happen. After all predictions are in, say: "Well, let's put it to the test!" Turn the fan car on while every one observes the results. Ask what happened and why do they think it occurred. Next, put the medium size sail in front of the fan, this time attaching it to the skate car. Ask the groups what they think will happen this time and follow the same procedure. Finally, do the same with the small sail.

Discussion: Newton's third law of motion on action and reaction.

Suggestion:

Put a scoreboard on the chalkboard and select a student to keep score on group predictions.

Example:

The skate car will move	**Right**	**Left**	**Will Not Move**
Group 1			
Group 2			
Group 3			
Group 4

Rotational Inertia

Corla Jean Wilson-Hawkins
8122 South Avalon
Chicago, Illinois 60619
312-933-0527

Bethune Elementary School
3030 West Arthington
Chicago, Illinois 60612
312-534-6890

Objective:

To demonstrate how the resistance of an object to rotation is rotational inertia.

Materials Needed:

This list is for a class size of 32 students divided into groups.

4 ramps
4 cans of broth soup covered with paper
4 cans of tomato soup covered with paper
pendulum
hollow wheel
turn table for turning (if possible - optional)
4 meter sticks
8 100 gm weights
masking tape
balance beam and long pole
solid wheel

Strategy:

To begin the lesson, have the students give you several brainstorming definitions of what they think inertia is. Next discuss what they think rotational inertia is and write that on the board. After discussing the vocabulary, have one student from each group sit on the turn table. Spin them slowly. Using equal weights or books in their hands have them pull their hands close to their bodies and then extend them away from their body. As they pull their hands closer to their bodies they will find that they spin faster than they do when their hands are extended outwards. Use this opportunity to discuss how the distribution of mass makes a difference in the rotational inertia.

Next, using your groups, take the 4 meter sticks and tape the 100 gram weights to the bottom of the stick. Put one on each side and tape around it. Have students collect data on who could balance it vertically the longest with the weights on the bottom and again with the weights on the top. Have the students explain why they thought it was easier to balance the weight on the top of the stick versus the bottom. Some will be good both ways but the norm tends to be with the weights on the top.

Using the ramps, have your groups take the soup cans of different contents that are covered with paper and time them as they roll down the ramp. Have them make a graph charting the time it took and the can that won. Have them to try to figure out why one can won over the other. After a thorough discussion, uncover the cans and talk about the contents in the cans and the distribution of the mass.

Now take the balance beam and have it properly mounted with the wooden stands on each end. Have a student walk on the beam with their hands in their pockets, and again with their hands extended holding a long pole or long stick. Talk about which way was easier to walk. Again reinforce that it is easier to balance when the rotational inertia is farther away from the axis.

For some additional fun, make a pendulum and push it back and forth on a long string. Ask the children to tell you how it is moving. Then shorten the string and let them tell you how it is going. Of course the shorter one moves faster because it is closer to the axis. At this point the children can make a pendulum for a hands on activity.

For a final activity take a ring and a solid disk and roll them down a ramp. They do not have to be the same weight or size because the theory will still prove itself. Have the children guess which one will come down first. Explain to them that since the wooden disk is solid, it's mass is closer to the axis than the hollow ring which has all it's mass on the outer rim.

Conclusion:

The conclusion of this lesson would be to have students explain what we did today in all our demonstrations. Ask them to tell you what they liked best and what they liked the least. See if any of your students can think of other examples of rotational inertia that were not used today that can be added to the lesson.

Evaluation:

Often times when we do a lot of hands on activities, we fail to reinforce the comprehension version in writing. My evaluation of this process will be a short quiz that would include all the examples that we had today and to have the children explain them to me. I would also have them draw some of the demos for me on paper so that I know who really was aware of what was happening in the demonstration. I would be looking for 90% accuracy on the quiz.

Summary:

Event	**Results**	
bottles	empty-easy to move	full-hard to move
turntable	mass at center-easy to rotate	mass at edge-harder to do
meter stick	wts on bottom hard to balance	wts on top easy to balance
balance beam	mass at center-easy to fall	mass out-easier to stay
pendulums	short-swings faster	long-swings slower
soup cans	tomato solid-rolls fast	chicken-liquid rolls slower
disk and ring	disk is faster-mass spread uniformly throughout	ring is slower-mass all at the edge (further out)

Projectile Motion (or You Bet Your Grade)

Roy Coleman
5436-B S. Kimbark Ave.
Chicago, Illinois 60615
312-493-2517

Morgan Park High School
1744 W. Pryor Ave.
Chicago, Illinois 60643
312-881-5050

Objectives:

To calculate the initial velocity of a spring stretched a varying amount and fired vertically from a shooter and to predict, by calculations, where that spring will land when it is shot horizontally off of a horizontal platform. As a additional objective, to learn that ALL data must be recorded but that data which is way out of the ordinary can be ignored when calculating averages and results.

Materials Needed:

The following materials are needed for each group of 2-4 students:

1) a spring with sufficient elasticity so that stretching it about 1 cm will shoot it to a height of about 50 cm. One end should have a paper clip attached and the other should be bent into a loop which will hook over the nail in the end of the shooter described below (Primary level students might use rubberbands instead but they are not as consistent.)
2) a 'shooter' made from a 1" by 1" by 18" piece of wood with a headless nail driven into the end near the edge so that the spring may be hooked to it
3) several metersticks
4) graph paper
5) a section of a room with sufficient height where a spring's shot may be marked and/or measured directly
6) optional - an apparatus which simultaneously drops one object while projecting a similar object horizontally

One of each of the following is needed for the entire class:

1) a securely mounted horizontal surface at a height of 1.5-2 meters above the floor where the students will hold their 'shooters' for the **You Bet Your Grade** part of the experiment
2) a low waste paper basket

Strategy:

INSTRUCTORS PREPARATION:

1) Mark the 'relaxed' position of the spring on the side of the shooter.
2) Stretch and shoot the spring vertically such that it goes to a height of about 50 cm. Make enough shots so that you are confident of the measurements. Mark this stretch on the side of the shooter and number it #1.
3) Stretch and shoot the spring so that it goes to the greatest height that you are going to use. Again, make enough shots so that you are confident of the measurements. Mark this stretch on the side of the shooter and number it #6.
4) Measure the distance between the two marks (#1 and #6) and divide it by 5. Measure down from #1 a distance equal to the result and mark that point #2. Repeat the measurement for points #3 and #5, intentionally skipping where #4 should be. (A suggestion was made to drill holes at each of these points to allow a small nail to be inserted and the paper clip hooked on the nail. Pulling the nail fires the spring.)

CLASS ACTIVITIES:

1) Have the students fire the spring vertically from each of the indicated stretches. They should record ALL of their data and decide which of the points are consistent and which are in error. (Does the height get more consistent as the student gets more experience?) (Does it make a difference if a different person does the shooting?)

2) Plot a graph of height vs. stretch. (Is this graph a straight line?) (Does it go through zero?)

3) Calculate the initial velocity of the spring (v_o=sqrt(2gh)) for each of the stretches and plot a graph of the initial velocity vs. stretch. (Is this graph a straight line?)

4) Demonstrate that a projectile fired horizontally will take the same amount of time to reach the ground regardless of its initial horizontal velocity. This should demonstrate that the vertical acceleration of an object is independent of the horizontal acceleration with the resulting motion being the sum of the two.

5) Show the students the board you have mounted horizontally and how their shooter should be placed. Also show them the waste paper basket that they will be shooting into.

6) Have the students predict, from their graphs, the initial velocity of their spring for a stretch equal to what would be #4.

7) Have the students calculate the time that it will take for **the sp**ring to fall from the board to the top of the waste paper basket. (t=sqrt((2H)/g)) For a high school class, you might just tell them to calculate the time to fall and let them figure out that the spring doesn't fall to the floor but only to the top of the basket.

8) The students should then calculate where to place the basket. (R=v_ot)

9) Place the center of the basket at the calculated place and have them try shooting. (Did they hit it and how many tries did it take?)

Expected Results:

The results for the first few shots should be somewhat inconsistent but, after 5-10 shots, they should improve greatly. Generally the shots should group within about 10% of the average value for each stretch.

Changing the person doing the shooting usually makes a noticeable difference because each person has their own unique way of releasing the spring. Using a shooter with holes and a nail release along the side should eliminate this difference.

The graph of height vs. stretch should, with the possible exception of the first point, be a straight line. It will probably not go through zero since a spring is linear only from the point where all of the coils are separated and it usually takes some small initial stretch to completely separate all of the coils.

The graph of velocity vs. stretch should **NOT** be a straight line because of the square root used to calculate it but, for the small sample of points tested, it will probably be very close to a straight line.

Evaluation:

A student's grade is based on how many shots it takes for the spring to land in the basket. (First shot = A, Second shot = B, etc.)

Physics Lab Rockets

Joseph Dogadalski
755 Sunrise Road
Greenoaks, IL 60048
708-362-4532

Austin Community Academy H. S.
231 N. Pine
Chicago, IL 60644
312-287-5000

Objectives:

To promote interest in laboratory work at the beginning of the high school year.
To discover some qualitative variables involved in making a balloon rocket on a string.
To promote team activity and cooperation by preparing for and having a balloon rocket contest.
To shoot a model rocket outdoors and calculate its altitude.
Three levels of interest:
1. To calculate rocket's altitude by using angles, triangles, and proportions.
2. To compute its altitude by assuming its path is perpendicular to the eye level plane above grass and use the tangent function.
3. To assume rocket's trajectory is a straight line at a non-right angle to the eye level plane and to have each team measure the angle of elevation at two distances in line from the launch point and move over to another line and do the same (see wire model).

Materials:

FOR EACH GROUP: A picture of a line hanging from ceiling to lab desk with a straw and a balloon on it; roll of Scotch tape; straw; packet of a dozen assorted balloons; a monofilament line hanging from ceiling to be attached by each group to their lab station in the classroom; two sighting instrument kits made up of a ruler with a picture of an upside down protractor on it and a plumb line (string and a weight) taped to the point of vertices on the protractor.

FOR THE CLASS: A not too windy day; a grass field 30 by 100 meters; one or two identical model rockets ready to launch; half-dozen rocket engines that will propel the model to a height of 20 to 30 meters; three ropes with knots at 5 meter intervals 30 to 40 meters long, ready to be stretched out at various convenient angles from the launch point; a coat-hanger wire model of a tetrahedron in which the vertices (corners) are held together by rolled up rubberbands and able therefore to be adjusted to various angles.

Strategy:

INTRODUCTORY ACTIVITY: Blow up balloons and let them fly out of hand; watch their random motions; students will thread the prepared line from the ceiling through a straw and tie it to the lab top; tape blown up balloon(s) to the straw and let them fly;

While the groups are experimenting, the teacher can walk around and give clues to "What's happening?". Discuss: action-reaction, conservation of momentum, pressure in an uninflated and inflated balloon, catastrophic punctured balloon, and the conditions needed to make a balloon rocket. Also the teacher will walk around with the wire tetrahedron and show the possible flight paths of the model rocket to be fired, the geometric line of sight, and the angle of elevation to be measured.

Students are to be preparing their design for the contest "shoot off" at the "teacher's shooting range". Maximum height from floor wins. After experience with a half-dozen shots, students should be ready for the contest.

BALLOON CONTEST DATA (best of two shots)

Trial	1	2	(height from floor)
Team A,B,C,...(circle one)			

ACTIVITY: After the contest the whole class will go out to the grass field to shoot the model rocket. Before the rocket launch, student groups will learn the use of their sighting instruments. Before each firing, teams will pick one station on the stretched out ropes radiating from the point of launch. If a student group wants to launch the model rocket, they must learn the 14 safety points of the model rocket society which come with the engines. Otherwise the teacher should always launch the rocket.

MEASUREMENTS

TEAM A,B,C,... (Circle one)	Distance of station from launch point on line 1,2,3.	Angle of elevation
First launching		
Second "		
Third "		
...		

Conclusions:

Rockets should reach a consistent altitude by using the same model, same engines, and the same launch angle. Students will learn the safety points of launching a model rocket.

On the first level of interest, students, by drawing similar triangles with the measured angle of elevation, should be able to calculate the altitude by making a proportion.

On the second level, students should determine the altitude by making the tangent of the elevation angle equal to unknown altitude divided by the distance from launch point and solve the equation.

On the third level, a group will divide into two and stand in two locations on one of the rays (knotted ropes). They will measure two elevation angles and draw an oblique triangle the base side being the distance between their positions on the ray. Having two angles and the included side of an oblique triangle, the group can determine a second short side by the "Law of sines". Using this side, the closer elevation angle and the sine function, students will be able to figure out the altitude of a rocket with any non-right angle trajectory to the level plane. In all these cases, a good figure is worth more than all these words; but especially the wire tetrahedron model will be useful in showing the various possible trajectories in three dimensions.

A measurement of time (seconds) opens up the whole world of motion.

Evaluation:

Student grades will be based on scale drawings of triangles, angles of elevation and the appropriate calculations. Also, the answers to the questions below will be considered.

Questions:

1. When does a balloon act like a rocket?
2. Name some variables that influence the balloon's flight?
3. 20 is to 40 as 60 is .

4. Similar triangles have the same shape but a different   .
5. Would a real rocket work better in outer space?
6. A real rocket's mass is mostly   .

Stress and Strain

Therese Donatello
7929 Elm Grove Dr.
Elmwood Park, Il. 60635
708-453-3524

Weber High School
5252 W. Palmer St.
Chicago, Il. 60639
312-637-7500

Objectives:

Grade level- Junior High

1. To show the stress and strain involved in the movements of the earth's crust with the use of working models.

2. To show how the forces of compression, tension, and shearing effect the movement of the earth's crust.

3. To show how materials effect the movement of the earth's crust.

Materials needed:

The following materials are needed to construct each model:

1. compression model - one piece of wood (30 cm x 15 cm), two pieces of wood (1 in. x 2 in. x 30 cm), two pieces of wood (1 in. x 2 in. x 15 cm), two bolts 30 cm long, and two wing nuts;

2. tension model - one piece of wood (30 cm x 15 cm), two pieces of wood (1 in. x 2 in. x 30 cm), two pieces of wood (1 in. x 2 in. x 15 cm) 2 pieces of screen (15 cm x 10 cm), two screw hooks, and string;

3. shearing model - one piece of wood (30 cm x 15 cm), two pieces of wood (1 in. x 2 in. x 30 cm), two pieces of wood (1 in. x 2 in. x 15 cm), 2 grooved pieces of wood (7 cm x 20 cm x 1 in.), two screw hooks, and string;

4. each model also requires nails, screws, clay, styrofoam, rubber foam, toothpicks, and masses.

Strategy:

INSTRUCTOR'S PREPARATION:

1. The models were made by attaching the two 30 cm pieces and one of the 15 cm pieces to the baseboard.

2. On the compression model drill two holes the size of the bolts in each of the 15 cm pieces. Pass the bolts through the holes and attach with the wing nuts.

3. On the tension model attach the screen to the 15 cm pieces of wood. Attach the screw hooks into the movable 15 cm piece of wood and place the string through the hooks.

4. On the shearing model place the grooved pieces of wood on the baseboard and attach screw hooks to the opposite ends of each grooved piece. (It may be necessary to place a thin strip of wood or plastic along the 30 cm sides to keep

the grooved pieces on the baseboard as they move.) Place the string through the holes of the screw hooks.

5. The styrofoam, rubber foam, and clay are placed in or attached to each model. The toothpicks are placed in each of the materials.

CLASS ACTIVITIES:

1. On the tension and shearing models the students are to place masses on the strings in equal increments and note the movement of materials being tested.

2. On the compression models the students are to turn the wing nuts on each side at an equal rate and note the movement of the materials being tested.

3. The force can be calculated mathematically with advanced classes or spring scales that read in newtons can be used in place of the masses.

Expected results:

1. On all the models the students should note that the clay requires more force to move or break than the styrofoam or the rubber foam.

2. On all the models the toothpicks in the clay not only move apart or together but also move at angles to one another showing the forces at work below the surface. (It was suggested that other models could be made with plastic sides to show the movement of the layers below the surface. Also by using different colors of clay or foam the sub-surface movement might be more visible.)

Conclusions:

The movement of the earth's crust is caused by convection currents below the surface. This movement causes some plates to come together as in the case of India and Asia forming the Himalayas, while other plates move apart as in the case of the Mid-Atlantic Ridge, while still others move along each other as in the case of the San Andreas Fault.

Simple Machines

Susan Frazier
700 East 89th Street
Chicago, Ill. 60619
312-873-6849

Fort Dearborn
9025 Throop Street
Chicago, Ill.
312-881-5180

Objectives:

Adaptable to grades 1 to 12

The student will be able to:

1) define and give examples of "work" and "machine"
2) identify simple machines (inclined plane, screw, lever, wheel and axle, wedge, and pulley)
3) classify simple and compound machines
4) name body parts that can be used as simple machines

Materials:

paint can, book, spring scale, meter stick, string, milk carton, several pulleys, toy car--weighted, three boards-same length, three boards-different length, long pole

Strategy:

Work and Simple Machines

Have several students attempt to open an empty paint can with their hands or attempt to move a heavy desk. Have the students determine that although force was used, the objects did not move a distance and there was no motion; thus, no work was done since work is equal to force times distance.

Then have a student open the paint can by using something to pry off the top of the can. Explain that the object was used as a lever, one kind of simple machine, and that a machine is something that makes work easier to do. Also help the students discover that two or more simple machines can be used together to make compound machines.

Activity-Lever

Tie a book to one end of a meter stick. Use a milk carton weighted with dirt or sand as the fulcrum, the point on which the stick rests or turns. Set the fulcrum at the 15 cm mark. On a chart, record where the fulcrum was set, the load arm length, and the force arm length. Use the end of the spring scale to pull down the end of the meter stick and record the force shown on the scale. Repeat the steps above for 20 cm, 25 cm, 30 cm, and 35 cm. Discuss the placement of the fulcrum in relation to the placement of the load and the amount of force needed to lift the load. Have the children discover the direction the load moves and the direction of the force.

Activity-Pulley

Use a horizontal bar to attach a fixed pulley, a combination of a fixed pulley and movable pulley, and a combination of several fixed and movable pulleys. Lift a load attached to a spring scale straight up in the air. Next, lift a load attached to a fixed pulley, then a fixed and movable pulley, and finally, a multiple pulley combination. Record the force needed for each. Discuss which one required the most force to lift the load. Which one required the least force. Determine the direction of the load and the force for each kind of pulley. Determine the relationship of the number of pulleys used and the amount of force needed to lift the load.

Activity-Inclined Plane, Screw, Wedge

Discuss the relationship of the inclined plane, the wedge, and the screw. Next, attach a car to a spring scale and lift up in the air. Then, pull a car attached to the spring scale up three different inclines--the same length, but different heights. Pull a car up three different inclines with different lengths but raised to the same height. Record the force for each. Notice the relationship of the length and height of the inclined plane and the amount of force used.

Activity-Wheel and Axle

One person holds a stick with one hand while a partner places her/his hands on either side of the person holding the stick. The partner tries to turn the stick "wheel" while the person holding the middle tries to keep the stick from turning. Next, the partner moves her/his hands farther apart and tries to turn the wheel. The partner continues to move the hands apart until the wheel turns easily. The person's arm acts as the axle, and the pole is the wheel. The children determine the relationship between the size of the wheel and the amount of force needed to turn the wheel.

Activity-Culminating

Name body parts used as machines. Rapidly classify machines placed in a brown bag. Use as a team game.

Demonstrating The Kinds of Energy

Willie L. Gray	Adam C. Powell
9943 S. Princeton	7530 S. Shore Drive
Chicago, IL 60628	Chicago, IL 60649
312-568-0287	312-933-6650

Objectives:

1. To investigate the general gas laws and learn how to apply them.
2. To develop a theory of molecular motion that explains the behavior of gases both qualitatively and quantitatively.

Materials needed:

Flask; one-hole stopper with thermometer and ruler attached; clear tape, rubber tubing; beakers; pistons; weights of different masses and graph paper; Safety Glasses.

Introductory Activities:

1. Use small inner tube with weights to introduce the concept of pressure as a force per given area.
2. Have a volunteer sit on an inner tube while someone uses the hand pump to lift them. Permit students to orally discuss what is taking place on the handle of the tire pump, the pump cylinder and the inner tube.

Procedure:

SAFETY GLASSES MUST BE USED FOR THIS ACTIVITY.

Station One:

1. Place the rubber stopper with the attached ruler and thermometer into the flask; (option) add food coloring to the water in beaker.
2. Place the dried flask into the water filled beaker.
3. Notice the temperature inside the flask and position of the liquid in the tubing.
4. Take a reading from the thermometer and the ruler.
5. Convert the degrees Centigrade to degrees Kelvin.
6. Graph your result from your charts. (Temperature vs. Volume)

Station Two:

1. Suspend the piston on a stand. Use different weights to show increased pressure and decreased volume. Permit students to make charts and graphs.

Conclusions & Evaluation:

The conclusion of this lesson is that students will be able to discover two of the general gas laws from their observations, their chart and their straight line and curved graphs. (Boyle's and Charles'). Orally related questions may also be used to further challenge the students' understanding of the behavior of gases.

Come Fly With Me

Karlene Kurth
1900 S. Ninth Ave.
Maywood, IL 60153
708-344-4721

Walther Lutheran High School
900 Chicago Ave.
Melrose Park, IL 60160
708-344-0404

Objective:

For intermediate grades through high school

1. Students will state Bernoulli's principle which is "the pressure in a moving stream of fluid is less than the surrounding fluid."

2. Students will observe examples of Bernoulli's principle.

3. Students will apply what they have learned about guiding airplanes by designing and constructing a model glider whose direction of flight can be controlled.

Materials needed:

For Demonstration: notebook paper, shoebox, text book, medium sized ball, straws, water, beaker, vacuum cleaner with exhaust valve, ping-pong ball

For Activity: shoebox, styrofoam, thread, rubber bands, unsharpened pencils, straws, fan

Strategy:

Through opening demonstrations students should be able to formulate a relationship between moving air streams and the effect they have on objects in the path of the stream. The following demonstrations will be utilized:

1. Place two textbooks with a sheet of notebook paper on top on the table top. Ask a student volunteer to attempt to blow the sheet of paper off the books by blowing under the paper. (The paper should be forced down.)
2. All students hold their textbooks vertically and place a sheet of notebook paper in the book so that the paper hangs over the edge away from them. Students attempt to force the paper down by blowing across the top of the paper. (The paper should be pushed up.)
3. A student volunteer blows through a funnel which has a ping-pong ball in it. He/she attempts to blow the ping-pong ball out of the funnel. Attempt to blow when the funnel is right side up and also when it is inverted. (The ball should stay in the funnel regardless of the direction the funnel is held.)
4. Place medium sized ball on the nozzle of the vacuum cleaner exhaust. Turn the vacuum cleaner on. (The ball should levitate at some height above the vacuum cleaner in the air stream.)
5. Blow through a half straw across the top of another half straw that is placed in a beaker of water. (A spray of water should come out of the straw.)

After these demonstrations the instructor will lead a discussion of the events observed. Stress where the high pressure regions and where the low pressure regions are. Diagram this on the board, label the highs and lows. It should be apparent that the low pressure areas are where there is a moving stream of air. State Bernoulli's principle. Relate the principle to air flight.

Introduce the activity of controlling direction of flight. Define terms ailerons, elevators, rudders. (Ailerons are flaps that can be raised or lowered on the wings, elevators are flaps on the tail, and rudders are on the tail.)

1. Wings and tails are made of styrofoam meat packages. Wings have dimensions of 20 cm x 5 cm. Ailerons should be rectangles on the back edge of the wing and evenly spaced from the center of the wing. Sides of the ailerons should be cut and the front edge should be folded. Tails are 15 cm x 4 cm with elevators made the same way as ailerons but they will tend to be a bit smaller. About 3 cm from each end of the tail fold the tail up and place a 2 cm slit though the folded part to form rudders. These should be folded to the left and right.

2. Attach the wing and tail to the pencil with rubber bands.

3. Adjust the wing and tail so that the plane balances when holding by a thread attached to the front and rear of pencil.

4. Hold plane in front of wind tunnel. The wind tunnel is made of a shoebox that has sections inside made of poster board and the back cut out. Inside the sections are rows of half straws. This provides a steady even stream of air flow when placed in front of a low speed fan.

5. Test each control by bending the ailerons, elevators, and rudders in all combinations.

Conclude activity with a group discussion of concepts. Results of the tests should show that ailerons cause one wing to dip to the right or left, elevators cause the plane to nosedive or rise up, and rudders control left or right turns. Relate these movements to air flow and high and low pressure.

Forces and Acceleration

Marvin Orr
RR 1 Box 318 C
Mokena, IL 60448
815-485-7408

Lincoln-Way High School
Rt. 30
New Lenox, IL 60451
815-485-7677

Objectives:

1. To measure the time it takes a person to travel a known distance when a constant force is applied.

2. To construct a distance vs. time graph for the data collected for objective #1.

3. To interpret the distance vs. time graph and make predictions based upon the graph.

4. To learn that when a constant force is applied to a mass a constant acceleration will result.

Materials Needed:

The following materials are needed for each group of 2-4 students:

1 spring balance
1 tow rope
1 coaster cart (an enlarged skateboard)
1 stopwatch
4 data sheets
4 sheets of graph paper

For the entire class the following items are needed:

1 measuring tape 15 m long
masking tape
overhead graph
If time permits, 2 rideable air hockey pucks. (see Physics Teacher, Nov. 1989)

Strategy:

INSTRUCTOR'S PREPARATION:

1. The data table used by the students should contain the following information:
   A. the distance traveled
   B. the amount of force being applied
   C. the time it takes to travel each distance
   D. if each distance is traveled more than once, an average column

2. The graph that each student is to make is a distance vs. time graph. Distance should be plotted on the vertical axis and time plotted on the horizontal axis.

3. The coaster carts can be constructed out of 3/4 inch plywood or a similar material and roller skate wheels. Alternatives to constructing these carts are roller skates, skateboards, or even wheeled office chairs.

CLASS ACTIVITIES:

1. Have the students pull each other down the hall, on the coaster carts. Distances of 5, 10 and 15m will have been measured out on the floor. While doing this another member of the group will record the time that it takes to travel each designated distance. The student pulling the cart **must** maintain the same force reading on the balance throughout the entire distance.

2. Other group members record on the data table, the distance traveled and the amount of time it took to travel that distance. At least 3 different students should ride the cart.

3. Each student is to plot his/her own distance vs. time graph. (Is the graph a straight line? If not, what is it? Is your graph like your partner's? How are they the same? Different?

4. Based upon their comparisons the students are then to predict what the graph would look like for a person who is twice as massive as themselves. Half as massive.

Expected Results:

The first thing the students should notice is that their velocity continued to increase. This will be obvious to them from their experience of riding on the cart. The student will also have a graphical representation of what they had experienced while riding on the cart.

Since each student will have ridden the coaster carts more than once with a different amount of force being applied each time, they will also come to the understanding that the more force applied the greater the amount of acceleration.

When the students compare their graph with that of their partner's they will see that everyone experienced a constantly changing velocity (acceleration). Therefore, a constant force produces a constant acceleration.

Finally, the students will see that the acceleration experienced by each one of them was not the same. The difference in acceleration that each one of them experienced is related to the amount of force being applied and the amount of mass to which the force was being applied ($a = F/m$ or $F = ma$).

Evaluation:

The student's grade is based upon their data table, graph and their interpretation of the results.

Return to Physics Index

Determining A Spring Constant

Fred Pannell
9038 S. Yates Blvd.
Chicago, IL 60617
312-731-8816

Luther Burbank School
2035 N. Mobile Ave.
Chicago, IL 60639
312-804-3000

Objectives:

(For grade 8 or above)
To determine the spring constant of a hanging spring.
To interpolate and extrapolate information from a graph.

Materials Needed:

The following materials are needed for each group of 2-4 students:
1) a spring support made from a 6" piece of 1" by 4" and a 18"by 3/8" dowel rod
2) a spring support is made by drilling a 3/8" hole in the 4" by 6" piece of wood 4" from the length and 2" from the width. Insert the dowel rod and secure with a little white glue or any wood glue
3) a clamp from which to hang the spring
4) spring (10 to 15 cm in length)
5) meter stick or metric tape
6) set of masses (10-250g)
7) several objects of unknown mass (a bolt or nut between 50 and 150 g)
8) graph paper
9) Grease pencil (optional)

Strategy:

Part I

1) Prepare table as shown:
   f = force in newtons.

f	**stretch in cm**

2) Hang the spring from the support.
3) Select a mass from a set of mass weights (be sure that the mass will stretch the spring at least cm).
4) Convert the mass to force in newtons. Should you use a 250g mass (.25kg), multiply its mass by 9.8 m/sec^2 to get 2.4kgm/sec^2 (2.4 newtons).
5) Support the mass with your hand so that the spring is not stretched and record this position. Slowly release the mass and, when the spring reaches its lowest position, record this position.
6) In your data table record under f, the force in newtons and in stretch in cm record the number of centimeters of stretch.
7) Continue numbers 2 through 6 using four or five other masses.
8) Construct a graph from the data in your data table.
9) Compare your graph with other groups. Are they similar or are they different?

Part II

1) Place an object of unknown mass on your spring and record the stretch.
2) Using the graph determine:
   a) The force in newtons of the object.
   b) The mass of the object.

Conclusions:

1) What can you determine from your graph and others?
2) What would the graph look like if you used springs of different materials, lengths or/and strengths?

Evaluation:

A student's evaluation is based on the accuracy of their unknown masses.

Return to Physics Index

HELICOPTER

Banks, Albert L.
14732 Chicago Rd.
Dolton, IL 60419
1-708-849-1949

Martin L. King High School
1-312-536-8685

Objectives

1. Students will be able to demonstrate the effects of aerodynamics on a wide board.
2. Students will be able to name parts of the helicopter.
3. Students will know the the meaning of the terms: lift, thrust, drag. and weight.
4. Students will learn how to construct a paper device, that can fly and be controlled by manipulating its parts.
5. Students will gain an appreciation of the aerodynamics involved in flying a helicopter.

Apparatus and Materials

1. Model helicopter
2. Card board (1"X 3')
3. Paper (11"X 14")
4. Paper strip (1"X 7")
5. Scissors
6. Cellophane tape
7. Ruler

Recommended Strategy

Perform the following activities:

Background

A. Discuss the development of the helicopter through the ages:
   1. State Leonardo da Vinci's artistic contribution. (1500)
   2. Discuss the first manned helicopter, developed by Paul Cornu and later Louis Bre'guet (1907)
   3. Discuss the first practical helicopter designed by Henry Focke and later Igor Sikorsky (1939)

Activities

A. Rotor design

The helicopter's main rotor and tail rotor do the same jobs as the wings, propeller, and rudder of an airplane. To understand how a rotor works, experiment with a model rotor blade made of a piece of stiff cardboard about 3 inches wide and 3 feet long. Hold one end of the blade with both hands, and turn around in a circle. As you are turning, adjust the angle at which the blade meets the air. This angle is called the pitch of the blade. Vary the angle of the blade as you turn and you will notice that it tilts. The greater the pitch you give the blade, the higher the blade tilts because of its increased lifting power.

B. Paper Airplane

(See paper airplane instructions: any science book)

C. Helirotor

Cut a 3 inch slit in a (1 inch X 7 inch) piece of paper; now make a 1/3 inch slit on each side of the paper just below the three inch slit. You now have two prongs on the top half of your strip of paper. Curl each prong in a direction opposite to each other with your finger nail. Fold the bottom half of each side of the sheet inward until they overlap. Try launching your helicopter from as high as possible. Reverse the prongs. Discuss the aerodynamics involved.

Return to Physics Index

PROJECTILE MOTION

Cunningham, Mary M.
5412 W. School St.
Chicago, IL 60641
1-312-545-0071

Resurrection High School
1-312-775-6616

OBJECTIVES

To measure muzzle velocity of a projectile device.
To predict maximum range of a projectile device at various angles.
To measure range of device at various angles.

APPARATUS NEEDED

Calculator, Tape measure, stopwatch, projectile device, projectiles. (This demonstration used a "Lobster," a device used in training tennis players.)

RECOMMENDED STRATEGY

1. Throw a ball or frisbee out to groups of students. Ask students to toss the ball back and forth. Have students jot down their observations and and a description of the motion of the ball.

2. Introductory discussion: What name could we give to this category of objects? (PROJECTILES) Can you think of some other projectiles? What are some of the characteristics of projectiles in motion? (List all suggestions on board or overhead. If necessary elicit the following terms: velocity, acceleration, time, horizontal motion, and vertical motion.

3. Explanation: In order to analyze projectile motion with all the listed characteristics, we would need a NASA computer. We are going to ignore all factors except velocity, acceleration and time. If necessary review horizontal velocity and vertical velocity.

4. Presentation of activity:
   a. Work in lab groups.

   b. Explain use of the projectile device. The muzzle velocity can be determined by aiming the muzzle straight up. Record the time required for the projectile to leave the muzzle and return to the ground. Do 5-10 trials, find the average round trip time.

   c. Choose 2-3 angles. Predict the range using vector analysis and trig calculations. (See Math Notes) Use the projectile device, measure the range of the projectiles. Compare projected range with actual range. What are the sources of error? (Consider using complementary angles)

5. Post activity discussion: Explain why there were differences between predicted and experimental value of range. What were the variables? How could variables be controlled? What conditions would optimize experimental values? How could

experiment be improved? What other ways could projectile motion be tested?

NOTES

1. Non-Math oriented classes: This activity can be modified for use with students who are not in high school physics. Students could be asked to predict which angle will make the ball go further. They can begin with actually testing the device and could graph the angle vs. distance shot.

2. Math Notes

Muzzle Velocity **V(muz) = A * T**
Where **A** is the acceleration of gravity and
T is half the round trip time for a ball shot directly upward.

Range Calculations The muzzle velocity does not change as the angle is changed. It can be resolved into a vertical and horizontal component.
Consider the angle with the horizontal to be Theta then
V(ver) = V (muz) * sin Theta and
V(hor) = V (muz) * cos Theta
The time of flight can be calculated using the formula, **V(ver) = A * T_{up}** and solving for **T_{up}**.
Time of flight is 2 * T_{up}.
Since the V(hor) is not accelerated,
Range = V(hor) * time of flight

Return to Physics Index

Newton's Laws of Motion

Harris, Wanda Raster Main Elementary School
8222 So. Evans
Chicago, IL 60619
1-312-224-1537

Objectives

To be able to state Newton's 1st,2nd, & 3rd laws of motion.
To initiate an understanding in describing the principles and dynamics involved in the Laws.
To apply the laws to describe everyday occurances.

Apparatus Needed

1 place setting for a table & table cloth toy dump trucks, marbles or standard weights, 1 cup, string, sand, and slingshots (apparatus), stop watch, meter stick & tape 1 embroidery hoop, 1 cup or flask, and a coin 3 or 4 blocks of wood, 1 glass 2 washers & parachute 1 mini trampoline Video recorder & television Video tape footage of baseball player sliding into base and of a rocket launching. Water rocket

Recommended Strategies

Review how motion is relative and how it can be described and measured.

Discuss forces and how they're described and measured.

Place table setting on table cloth, ask students to guess what will happen. Pull table cloth from under place setting, set embroidery hoop on cup - then place the coin on top of the embroidery hoop. Pull the hoop from under the coin. Stack the blocks of wood on top of each other, then set the glass on top of the blocks. Knock the bottom block from under the other blocks,demonstrating that an object will remain at rest until acted upon by an unbalanced force.

Show video tape footage of a baseball player sliding into base. Play game Red Light Green Light. Pick three players, teacher stands in front and says green light (the students run as fast as they can to try to touch the teacher first); however, the teacher will say red light (the students must stop like a statue immediately) while turning around. If caught moving the student will have to return to the starting point. The object of the game is to catch the child moving, therefore demonstrating that an object or mass in motion will stay in motion at a constant velocity until an external force acts on it.

Measure one meter on a flat surface, then mark the beginning and the end of the meter with tape on the flat surface. Remove the meter stick. One piece of tape will be your starting point; the other piece of tape will be your stopping point.

Place one rubber band around the `slingshot'.

Put the`slingshot' behind the beginning or starting point. Place the truck behind the starting point, but in front of the slingshot. Stretch the rubber band back 2 in. Release the rubber band so that it hits the truck. Clock the time it takes the truck to travel 1 meter.

Now, place two rubber bands around the `slingshot':

Repeat the previous directions.

Now, place three rubber bands around the `slingshot':

Repeat the previous directions.

Chart the data, demonstrating the relationship between mass, acceleration, and force.

Take two washers of the same size. Attach a parachute to one of the washers. Standing on desk, drop both washers at the same time. Demonstrating the relationship the direction of a force has on the acceleration of an object.

Have students jump up and try to stay up. Then, jump up and down on the ground. Next, have the students jump up and down on a trampoline.

View a video tape of the space shuttle launching. Blast off a toy water rocket. Demonstrating that forces come in pairs, and for every action there is an opposite and equal reaction.

Return to Physics Index

Simple Machines

Jensen, Tom
3 Stuart Court
Chicago Heights, IL 60411
1-708-757-5857

Bloom High School
1-708-755-1122

Objectives

1) Student will see a large number of everyday items in terms of simple machines i.e. levers,inclined planes, wheels and axles.
2) Student will experience the use of and see demonstrations of simple machines.
3) Student should discover that simple machines reduce the effort required in a task,not the total work.
4) Student will see physics as a part of everyday life.

Equipment and Materials

Variety of simple machines in the classroom or laboratory. (Door handles and hinges etc...)

Simple machines brought from home or work by each student.

Recommended Strategies

Several days before the simple machines activity, assign **each** student in class to bring a simple machine on the assigned day. On each successive day remind the students of their assignment and tantalize them with some "prize" for the best and/or most unique simple machine. Create an atmosphere of suspense concerning the "prize" as well as curiosity and interest concerning simple machines. Get them ready.

On the day of the simple machine activity start by demonstrating some simple tools such as a hammer and nails, pliers etc... (Hammer a nail into a piece of wood with a ball-peen hammer, then try to remove the nail, make a point of the difficulty encountered, and seek suggestions from the class.) After a few sample machines (from tool box and/or kitchen) ask each student individually to show the machine brought to class. The student should categorize the machine (lever, inclined plane) and tell, and demonstrate if possible, its uses. The more unusual items will usually stimulate comments and discussion which must be controlled as time permits.

Often students will forget or not bother to bring any machine. That is their problem. This may be turned into a very positive and creative learning situation. Allow such students to find a machine in the room or among their personal belongings. This is often the best part of the entire activity and under "pressure" machines such as keys, pencils, mechanical pencils, lipstick tubes, compacts, window shade rollers, and an endless supply of machines is created.

As the students present the machines, it might be a good idea to comment on such things as effort vs. work, what the machine is used for, and possible alternatives that might work better.

As the activity is concluded the "winner" is chosen by vote of the class or chosen by the instructor. The "prize" might be a simple machine such as a pop top (lever) with a can of coke attached to it.

Such an activity must be adjusted to grade level, class size (large classes may bring one machine per C.L. group) and time constraints. The activity may by followed with other activities such as lab exercises to quantify the relationship between effort and work, and incorporate concepts such as efficiency and mechanical advantage.

Always emphasize objective #4 to foster an appreciation for, and allay fears of SCIENCE and science classes.

Return to Physics Index

Retrograde Motion

Katich, Rodney
2710 E 98th St.
Chicago, IL 606l7
1-312-978-6377

Bowen High School
1-312-933-7200

Objectives

1) Students will learn the terms for objects in the heavens.
2) Demonstrate the basic motions of heavenly bodies.
3) Using models, show a variety of conceptual schemes explaining these motions.

Equipment and Materials

Model of Herodotus' Earth
Several spheres
Flashlight
Sighting tubes
Three 50 ft. lengths of rope
Epicycle machine

Recommended Strategies

Identify objects in the skies such as the sun, moon, stars, planets, birds, planes, meteors, clouds, comets and so on. A model of each should be available.

Ask students to order these in terms of distance from the earth: birds then clouds are pretty obvious. A discussion of the remaining objects requires some thought; eclipses suggest the correct sun-moon relationship (the sun is further). That the students have not observed the planets and thus have no observed basis for ordering these is a good point of departure for a short survey of historical views.

Orientation on earth: the earth appears to be flat. The sun rises in the east and sets in the west providing a basic set of reference points. From these, north and south are derived.

The sun is the first (as most prominent) celestial object considered. Its apparent motion can be demonstrated by following an imaginary sun at the end of one's finger from the east in an arc across the sky. Other aspects of the sun's activity are its southerly motion in the winter and returning more nearly overhead in the summer, and the length of day at these extremes.

The moon is the next object to be considered; like the sun, it rises in the east, sets west, and can be observed to pass regularly through phases. These phases can be demonstrated using an eclipse model (using discs passing one before the other), and the correct model showing an angular relationship with three spheres and a flashlight.

The stars, considered as a group, are also seen to rise east, set west, given the observer is facing south from a position in the northern hemisphere. Constellations (Ursa Major, Ursa Minor,etc.) rather than individual stars are tracked owing to the number of stars..

Once these observations have been established, various "explanatory" schemes are introduced. Plato's geocentrism can be contrasted with Aristarcus' heliocentric view. At this point one further observation is introduced: planets (or "wanderers") can be seen to move in a band of eight degrees on either side of the ecliptic; moreover, these planets seem to reverse directions from their observed motions to a retrograde motion for a period of time (during which they also appear brighter), before resuming their original path. The Platonic view has difficulty with these new data. Accordingly, Ptolemy modified Plato's view, retaining the geocentricity and circular motion while moving the geometric center of these circles from the Earth to points in space. This innovation can be demonstrated with an epicycle machine. Ptolemy's was the dominant view of planetary motion for nearly 1500 years, until Copernicus' observations led once again to a heliocentric (or sun centered) formulation. That this view can account for "retrograde motion" can be demonstrated by making a series of observations from one moving planet to another when both are in opposition to the sun. Thus both the apparent change in direction and the increased brightness "fit" a sun centered model.

Heliocentrism, then, was revived and built upon with increasing precision with new observations made by Galileo (using a telescope) and culminating with Newton's Laws of Motion.

INERTIA

Monegain, Louise J.
9943 S. Oglesby
Chicago, IL 60617
1-312-721-8466

Park Manor
1-312-962-2670

Objectives

1) Students will learn basic understanding of inertia.
2) Students will demonstrate some activities illustrating inertia.
3) Students will develop a basic understanding of Newton's laws of motion.

Apparatus Needed

Balls various sizes, pie pans with one fourth slice removed, pennies, heavy paper circle, checkers, skate board, stuffed animal, glass, two eggs (one boiled, one raw), cloth napkin, glass of water and straws.

Recommended Strategy

Students should have prior knowledge of speed, force, acceleration, gravity and friction. Demonstrate inertia by snatching a cloth napkin from under a glass of water, and a paper circle from under a checker so that the checker falls into the glass and spinning the two eggs. Group students into cooperative groupings to carry out the following activities:

Activity 1 - Place a ball in the pie pan and spin the ball. Repeat this activity using two balls of different mass.

Activity 2 - Put a ball in motion and try to blow it off of its path with a straw. Repeat this activity using balls of various masses.

Activity 3 - Stack five checkers one on top of the other. Using your fore-finger flick another checker sharply against the bottom checker of the stack to move it from pile keeping pile undisturbed.

Summary

Discuss Newton's first law of motion with students. Have students answer these three questions: 1) How does the pie pan and ball activity help prove the first law of motion? 2) Which ball was the hardest to move off of the straight path? 3) Does inertia increase with mass?

Return to Physics Index

Coefficient of Restitution

Winston, Rosalyn
7447 South Shore Drive
Chicago, IL 60649
1-312-978-5730

Walt Disney Magnet
1-312-525-7879

Objectives

1. To investigate the variables (factors) influencing the bouncing of balls.
2. To find the coefficient of restitution for four balls.
3. To observe how the manipulated and control variable are correlated by graphing the data.

Apparatus Needed

An overhead projector, overhead projector pens, graph transparency, graph paper, metric ruler, 4 meter sticks, 4 basketballs, 4 golf balls, 4 tennis balls ,4 superballs, 20 #2 pencils, masking tape, 1 beach ball, 1 Nerf ball, 1 clay ball, 1 Earth ball.

Recommended Strategies

1. Make a collection of balls of different sizes, weights,and materials.
2. Use such a collection for demonstrations. Get the students to question the collection. Is the biggest ball the heaviest? Is the smallest the lightest? Which ball will bounce the highest? Why does the superball bounce so high?
3. Have the students work in cooperative learning teams. One student will be a demonstrator. One student will be an observer. One student will be a recorder.
4. Using masking tape mark heights of 40 cm, 80 cm, 120 cm, on the wall where the floor surface is hard. Call these heights H1. Instruct students to drop each kind of ball from the three heights and measure the height of the rebound. Record this data on the Data sheet. Call the rebound height H2.
5. Instruct the students to calculate the coefficient of restitution,(Rebound Height) / (Initial Height).
6. Graph H1 on the horizontal axis and H2 on the vertical axis.
7. Graph the results from the data sheet using a different colored pencil to represent each ball.

Inertia

Bowen, Sheila J.
223 Illinois St.
Park Forest, Ill. 60466
481-1628

Gwendolyn Brooks Junior High
333-6390

Objective(s):

Students will be able to explain inertia.
Students will be able to identify the factors that determine inertia.
Students will be able to compare the acceleration of an object with a net force to an object without a net force.
Students will be able to state Newton's first law of motion.

Apparatus Needed:

Card table, tablecloth, two china plates, heavy plastic plate, light plastic plate, styrofoam or paper plate, plastic drinking glass, index card, two pennies, five nickels, paper disc, small plastic disc, three-wheeled cart or rollerskate, dot/tape time, two identical shaped objects of different weights, 500 gram weight, distance/time posterboard graph, average/speed posterboard graph, paste or tape.

Recommended Strategy:

Students should have prior knowledge of speed and acceleration measurements and graphing.
Demonstrate inertia by snatching a tablecloth from under two china plates.
Student teams are to complete and write up the following activities. Each write up should include a prediction and an explanation of what happened and why.

Activity 1 - Place a heavy plastic plate in the center of the table on a tablecloth. Then snatch the tablecloth from under the plate. Repeat this activity using a light plastic plate and then a styrofoam plate.

Activity 2 - Place an index card flat on top of a plastic drinking glass. Place a penny on the center of the card. Hold the base of the glass with one hand. Then using the forefinger of the other hand, flick the card forward so it moves out from under the penny. Repeat this activity using a plastic disc and then a paper disc.

Activity 3 - Stack 4 nickels one on top of the other. Using your forefinger, flick another nickel sharply against the bottom coin of the stack. Repeat this activity using the penny and then the plastic disc.

After the activities, conduct a classroom discussion of factors of inertia observed in each activity. Next have each student handle two objects, identical in shape and appearance but different in weight, to distinguish which has the greatest inertia.

Set up demonstration using a three-wheel cart or rollerskate with an accelerometer on top. Attach the end of two tapes from the dot/tape timer to the cart. Start the timer and give the cart an initial push. Impress on students to observe the accelerometer. Have two students, one for each tape, mark and cut the tape into a series of four dot strips. Take the first strip of one of the students and paste or tape it in the lower left corner vertically on the distance/time posterboard graph. Then take the second strip and paste it with its lower left corner next to the upper right corner of the first strip. Continue pasting each successive strip until you get to the top of the graph. Draw a line connecting the top of the strips. With the second set of tape strips, lay them one at a time next to each other on the horizontal axis of the average speed/time posterboard graph. Start with the first strip to the end of the graph. Draw a line across the top of the strips. Next tie a cord to the cart and place the other end through a pulley at table level and then up to a pulley on a ringstand. Attach the 500 gram weight to the end of the cord. Once again attach two tapes from the dot/tape timer to the cart. Repeat the demonstration releasing the weight. Then tape the strips in the same way to each of the posterboard graphs.
The class should then compare and explain both graphs. Then discuss inertia, its factors and Newton's first law.

Pendulum Problems

Carlson, Robert
14656 Birch St.
Orland Park, Il 60462
349-3958

Providence Catholic H.S.
485-2136

Objectives

1. To review the terms pendulum, period, cycle, frequency, independent variable, dependent variable, damping, and displacement.

2. To review the graphs of the functions: $f(x)=x^0$, $f(x)=x^1$, $f(x)=x^2$

3. To determine experimentally the relationship between the length (L) and the period (T) of a simple pendulum.

4. To derive the mathematical equation which represents the relationship.

5. To observe the graphical relationship between the period (T) and the displacement (d) of a simple pendulum.

Apparatus

weights (uniform mass)- one per student
strings (increments of 10cm)- one per student
overhead projector
graph paper
Apple computer/gameport/100k linear potentiometer (see Radio Shack)
\`Pendulum Plotter' disc
meter stick
stand/clamp

Recommended Strategy

1. Construct a simple pendulum in front of class. Begin a dialogue concerning the motion of the pendulum. Use the words, period, frequency, cycle, independent and dependent variable, and control and try to elicit questions. After discussing the effects of modifying a pendulum, conclude that it is the length (under small displacement) that determines the period.

2. Provide each student with a pendulum. Have them determine the period of their pendulum. Discuss the significance of the number of cycles used to determine the period. Record data on the board. Also graph the period (dependent variable-T) versus the length (independent variable-L) using the vertical axis for (T) and the horizontal axis for

(L). But instead of plotting points, tape each student's pendulum to the board. A curve is generated by the pendulum bobs but in this manner we see, maybe more convincingly, that it is the length of the pendulum that determines the period of the pendulum.

3. Distribute graph paper and, using the overhead projector, help the class to graph $f(x)=x^0$, $f(x)=x^1$, and $f(x)=x^2$. Compare these graphs with the graph generated in strategy 2 above. Lead class to discover that the new function 'fits' between $f(x)=x^0$ and $f(x)=x^1$. At this point, speculate that the new function could have a factor of $x^{1/2}$. Now try to get the kids to look back at the table to guess what must be done to the 'L' values to get the 'T' values. With 'good' data you'll arrive at $T= L^{1/2}/5$.

4. Fit the potentiometer to one end of a meter stick and affix this apparatus to a ringstand. Using the gameport, wire the apparatus to the computer. Boot the Pendulum Plotter program. Displace the meter stick and observe the monitor for a graph which shows simple harmonic motion. Allow time for experiments regarding the displacement of the meterstick. What is being graphed now? Ask students to form conjectures from their experiments.

Sitting on Nails-Boyle's Law

Cieslik, Daniel
2406 Virginia
Park Ridge,Il.60068
698-3582

Mather High School
989-3550

Objectives:

1. To understand the difference between force and pressure.
2. To illustrate that pressure is a force per unit area.
3. To show pressure is a scalar while weight (i.e. force) is a vector quantity.
4. To show the relation between pressures above and below atmospheric pressure upon the volume of an enclosed gas when the temperature remains constant. (Boyle's Law)
5. To illustrate the graph of an inverse relation.
6. To show the effect of atmospheric pressure on a partial vacuum.

Apparatus Needed:

(Obj. 1-3)
Three 1/2" plywood boards whose dimensions are 40 cm. x 20 cm. The first board has one nail in the center. The second has four nails in the center at the corners of a square about 6 cm. on a side. The third has 420 nails that are spaced 1 cm. apart, covering an area of 30 cm. x 15 cm.
(Obj. 4 & 5)
A modified hypodermic syringe used Boyle's Law Experiment similar to Science Kit and Boreal Lab. Cat. No. 64710. Take off the base and top of the syringe and suspend the syringe from a test tube clamp with the plunger up for positive pressure and with the plunger down for negative pressure. A series of standard laboratory weights are needed to provide the forces.
(Obj. 6)
The final part requires an empty ditto fluid can.

Recommended Strategy:

(Obj. 1-3)
Ask students if they would sit on boards with one and four nails. Show the students the board with the 420 nails and ask them if they would sit on these nails. If you are not successful, you sit on the nails. At this point(s) you should also get one of the students to sit on the nails.
(Obj. 4-6)
Have the students collect data on the volume of air as a function of the pressure on the enclosed air. Have them graph their results. To

illustrate the final objective take an empty ditto can with about a cubic centimeter of water in it; with the cover off the can heat it vigorously. Cover the can tightly and allow it to cool. After it is cooled, you take off the cap and blow up the can with your lung power.

Newton's Third Law of Motion

McCoy, Carrol R. H.
P.O. Box 09106
Chicago,Il. 60605
241-6723

Chicago Board of Ed.
890-3730

Objectives:

1. To introduce the student to basic concepts of Newton's Third Law of Motion.
2. To introduce the concept of thrust as one of the forces acting on aircraft to make flight possible.

Apparatus Needed:

Rope, 2 spring balances, bucket with holes on opposite sides of bottom, string, balloons, paper clips, straws, pencils, tape, scissors, paper, wire, Xeroxed copy of Space Shuttle, rocket, calculator, carbon dioxide pellet, firing pin.

Recommended Strategy:

Hook two spring balances together held by supports. Adjust the support so that the balance at the right reads 5 lbs. The balance at the left will also read 5 lbs. Increase the pull to the right to 10 lbs. The pull to the left will also be 10 lbs. The pulls of the balances will be found to be equal in magnitude and opposite in direction for all settings of the support.

Fit a small toy airplane with a screw eye above its center of gravity and fasten a pellet of compressed carbon dioxide underneath. Suspend the plane from a wire passing through the screw eye and stretched across the room. Puncture the pellet with a spring driven needle. (Note: Firing pins for cartridges are available at hobby shops.) The plane is propelled forward while the gas is discharged backward.

Attach the nozzle of a balloon to a straw with a 5 to 10 gram mass. When blown up, the balloon will lift off a table with good stability. The balloon without mass is erratic in its behavior. This experiment shows that some control is needed to cause a rocket to behave as you want it to do.

Powder-Propellant rocket. An inexpensive solid-fuel rocket motor (such as Jetexengine) can be purchased at a hobby shop. A chemical pellet is used as the propellant. (Caution: The fuel is inflammable and should be operated outdoors.) Attach this rocket motor to a model airplane or rocket that is suspended from a long horizontal wire. Fasten the engine just below the center of gravity of the airplane or model. Then ignite the rocket by lighting a fuse.

You may want to introduce the principle of action and reaction by having a student demonstrate a model racing car driven by a carbon dioxide cartridge. A good model will attain speeds close to 60 miles an hour.

Some Practical Applications of Newton's Third Law

1. An athlete executes a high jump by pushing against the earth which, in turn, pushes him/her up in the air.
2. We swim by pushing against the water, which reacts, propelling us ahead.
3. A helicopter rises vertically because of the reaction to the downward push against the air produced by its propellers.
4. The jet propelled plane and the rocket are thrust ahead by the force of reaction on their own products of combustion enabling them to fly at altitudes at which there is not enough air pressure for a conventional propeller-driven vehicle to operate.
5. Water of high pressure hoses leaves the nozzle with great speed resulting in a thrust which pushes the hose with such force that one person cannot control it. Most people have experienced this to a much lesser degree with the garden hose.

Balance and Gravity

Stevenson, Mark
8200 S. Jeffery Blvd
Chicago, Ill. 60617
238-6165

James H. Bowen High School
933-7200

Objectives:

Students will learn the basic concepts of balance and how to determine the location of the center of gravity using a model of the leaning tower of pisa and various other items.

Apparatus Needed:

plexiglass (5cm x 20cm)
string (35cm)
overhead pens
lead weight (100g)
triple-beam balance
beaker (250ml)
salt (2g)
pencil

Recommended Strategy

Have students examine the triple-beam balance and weigh several items. Ask them to notice what are the results of their measurements when the balance is in equilibrium. Raise the question; Where is the center of gravity found using this apparatus?

Make a model of the leaning tower of Pisa from the plexiglass. The model should be slightly larger at the base. Explain that the center of gravity is an imaginary point at which we can consider the entire weight of an object to be concentrated. Place one hole in each of the top corners of the model. Suspend the model from one hole at a time while allowing the string and weight to come to rest below the base. Draw a line from the point of suspension to the base. Repeat this procedure for the opposite side. The X where the lines intersect marks the center of gravity. Place another hole at the point determined as the center of gravity. If you now suspend your weight-on-a-string so that it hangs freely from the center-of-gravity point and lean the tower against a wall while its base stands on the edge of a book, you can find out just how far over it can go without falling. As long as the line remains within the base line of the tower, it will not fall. The instant the line passes outside the base, it falls. Explain to the students that the reason the leaning tower of Pisa has not yet fallen is because its center of gravity still lies within the base.

The lower the center of gravity, the farther over an object can lean. Thus, by concentrating the weight of buildings, cars and boats as low as possible, designers make them more stable.

Ask the students to bring to class at least one item which demonstrates balance or the center of gravity for class discussion.

Return to Physics Index

Friction

Tobecksen, Alan
15310 Harper
Dolton, Il
849-1708

Fenger H.S.
821-2830

Objectives:

1. Students will observe that friction is a force opposing movement.
2. Students will observe that different surfaces have different coefficients of friction.
3. Students will observe that friction is more dependent on mass rather than surface area.
4. Students will observe that there is a difference between static (starting) and sliding friction.
5. Students will perform experiments and record measurements and make data tables.
6. Students will observe that there are differences in the measurements and will postulate as to why.

Apparatus Needed:

heavy books, aluminum foil, wax paper, plastic bags, sandpaper, ditto paper, string, tape, spring balances.

Recommended Strategy:

Present the problem to the students - which wrapped book will be the hardest to pull, which will be the easiest to pull. Have the students, as a group, order the wraps from hardest to easiest (a typical answer - sandpaper, aluminum foil, ditto paper, plastic, wax paper.) Let the students touch the wrappings to get the "feel" of them. Students will then experiment with the equipment to find the right order of wrappings, the difference between static (starting) friction and sliding friction, and whether there is a difference when the book is turned on edge versus flat on the table.

Return to Physics Index

What Is Work?

Economou, Alex Chicago Vocational H. S.
450 East County Road 900 North
Valparaiso, Indiana 46383
(219) 926-3215

Objective:

To show work (w) equals force (f) times distance (d) and the connection between work and potential energy, kinetic energy, and heat.

Equipment:

Single and double pulleys to produce mechanical advantages of 2 to 5, stands and supports for such, string masses from 0.1 to 2 kg, N force scales to 5N, wooden inclined plane about 2 m long, a wood disk or block that can support masses up to 10 kg, a liquid crystal strip about 20 cm long 5 cm wide (the strip should have a temperature change at 25^{o}C to 30^{o}C), two beakers, ice, boiling water, a thermoelectric converter (PASCO SCIENTIFIC, 1876 SABRE STREET, HAYWARD CALIFORNIA, 94545. 1-800-772-8700)

Procedure:

Set up a number of pulley assemblies depending on the number of class experimental groups each with a different mechanical advantage and mass. Determine the force needed to lift at **constant speed** the provided weight, the distance the weight is lifted, and the distance the force at the other end of the string moves as the weight is lifted. A data table can be constructed thus:

mass of object lifted kg	weight of object lifted N	distance object is is lifted m	force used to lift object N	distance the force travels m	column 2*3	column 4*5

Column 6 should be equal to column 7. But column 6 is mgh and column 7 is f*d. Point out that lifting the weight is tiring, because you have done work. How does that work appear on the data table? What is constantly the same in each row? (f*d = mgh) We therefore define work done as f*d. (If f is in Newtons and d is in meters, work has units of Joules.) Mgh is also the work done, but that raised weight has the work somehow in it. Demonstrate this by dropping a weight on piece of chalk. Point out that the weight did work on the chalk, and therefore has the ability to do work when raised. We call that ability because of its position potential energy. Point out that the weight, just before it strikes the chalk has no potential energy. Since we have shown that the work we did was converted to potential energy, then it follows the potential energy was converted to something. Since the weight was moving, the new energy is energy of motion, called kinetic energy.

We know that $V^2{}_f - V_o{}^2 = 2*A*S = 2*g*h$. If $V_o = 0$, then $V^2{}_f = 2*g*h$. Multiply both sides by m. $mV^2 = 2*m*g*h$ or $mV^2/2 = m*g*h$. This states that $mV^2/2$ at end is the same as the $m*g*h$ at the start. This mathematical quantity, $m*V^2/2$ is called kinetic energy, KE.

Next set up an inclined plane so that weights piled on the wooden disc or block will not accelerate as they slide. Tape a liquid crystal strip to the plane's lower third. Demonstrate that the strip changes color with temperature by touching it. Slide the weights and support down the plane. The strip changes color showing heat was produced.

Point out that the KE of the weights as it slid down the plane did not change (no change in speed) but the potential energy did. Why? If we believe that the energy at first equals the energy finally then we must add heat to make a balanced statement;

$$m*g*h \text{ (at first)} = m\,V^2/2 \text{ (at end)} + \text{heat}.$$

Heat must be a form of energy.

To show that heat can be used to make KE and work use the thermoelectric converter, one plate in hot water the other in ice water, in different beakers.

Oscillations

Foreman, Dorothy
8848 S. East End
Chicago, Ill. 60617
721-2471

Joplin School
874-6161

Objectives:

(1) To construct various types of pendulums.
(2) To prove that the mass of the bob and the range of the oscillation (5^o-15^o) do not affect the period of a simple pendulum.
(3) To prove that the length of the swing arm does affect the period of a simple pendulum.
(4) To diagram each activity dealing with oscillations.
(5) To graph length versus frequency.
(6) To observe energy transfers in coupled pendulums of the same length.
(7) To demonstrate knowledge of the formula: T=2pi times the square root of L/G.
(8) To use a simple pendulum to measure the gravitational constant G.
(9) To observe the Pulfrich Pendulum and to make predictions regarding the illusions it causes the eyes to see.
(10) To use a pendulum bob to make Lissajous figures.

Apparatus needed:

protractors, graph paper, meter sticks, metric rulers, stop watches, various sizes of dowel rods, string, washers, metal balls, scissors, empty 2 liter plastic bottle, overhead projector, sand, balance, ring stands, metal supporting rods, c-clamps, scientific calculators, tape, polarizing film, eye hooks, wood glue, drill, saw, sand paper, screws, nails, wooden blocks, safety glasses.

Recommended Strategy:

Procedure for Pulfrich Pendulum:
Set a simple pendulum swinging in a plane. Have students observe its back and forth movement. Have students cover one eye with polarizing film and observe the movement of the pendulum with both eyes open. The pendulum appears to swing in a circle either clockwise or counter clockwise, depending upon which eye is covered. Make predictions regarding the illusions.

Procedures for testing variables:
length, mass, and amplitude: Students will work in groups. Set up work stations around the room. Give each group washers of equal sizes, stop watches, protractors, c-clamps, rods, tape, string, and graph paper.

Testing variable length:
(1) attach one washer to each swing arm, (2) release each bob at 10 degrees amplitude, (3) vary lengths of swing arms: 25cm, 50cm, 75cm, 100cm, 125cm, 150cm, (4) one student will count the number of cycles in one minute. (One student will either time one minute, or will time ten cycles) Do three trials. Average data. Calculate the period for each pendulum. Record all data in data table. Graph length versus time. Using formula, find G for each pendulum tested.

Testing variable mass:
(1) keep all swing arms the same length, (2) keep all amplitudes 10 degrees, (3) vary number of washers added to swing arms, (4) record results, (5) reach conclusion about the affect of mass on the period of the simple pendulum. Testing variable amplitude: (1) keep all swing arms the same length, (2) add one washer to each swing arm, (3) Vary the amplitude from 5 degrees to 15 degrees, (4) record results, (5) Reach conclusion about the affect of amplitude on the period of a simple pendulum.

Procedure for coupled pendulums:
Suspend two pendulums of same length from the same thin dowel rod (string could be used in place of the dowel rod); suspend this rod from a supporting rod. Start with the pendulums at rest. Start one pendulum swinging. The first pendulum begins to lose amplitude while the second pendulum starts to swing faster and faster. At one point both pendulums swing together, with the same period. Finally, the first pendulum comes to rest, and all the energy is in the second pendulum. (1) Predict what will happen next, (2) Observe this phenomenon by means of an overhead projector, (3) What caused both pendulums to finally come to rest?

Procedure for making Lissajous figures:
(1) fill 1/4 of plastic bob with white sand, (2) punch small hole into the center of bottom of the bob and cover the hole with tape, (3) attach large eye hook to top of bob, (4) carefully tape the bob together, (5) attach a short string to the eye hook, (6) attach to the slip knot at the top of string, another string, which when slid through the knot forms a triangle 7/10's the length of the entire system; attach each end of the string triangle to a supporting rod, (7) adjust rod so that the bob hangs 3cm from the black paper covered table, (8) uncover hole, (9) set bob in motion, (10) observe the Lissajous figures made out of sand. (Experiment with colored inks, sugar, etc.)

Acceleration

Oldenburg, Albert
18W354 Holly Ave
Westmont, IL 60559
963-0838

Lindblom Tech High School
471-8700

Objectives:

To develop an understanding of velocity and to distinguish it from speed. To learn to determine the difference between a scalar and a vector quantity. To learn how acceleration is derived from velocity and time.

Materials:

Pencil, paper, adding machine tape, 1-ft x 4-ft brown cardboard, 3-ft x 3-ft brown cardboard, marking pens, paste, stick-paste, 8-ft aluminum u-angle rail, 1/2-lb ball bearing, assorted small wood blocks, assorted pieces of cardboard as shims, mechanical or electric metronome.

Strategy:

Since this lesson follows a number of other already in sequence it is assumed that the student has a certain background knowledge necessary for this lesson on acceleration. The student is reminded of certain concepts and introduced to a few new ones. The equipment is set up before class starts. The 8-ft rails are set up with one end propped up about 2 to 3 cm higher than the other so when the steel bearing is allowed to roll down the track it would take about 10 sec to roll from one end to the other. Now we start the metronome and we make a few trial runs. Then we tape a long piece of adding machine tape parallel to the rail. We mark a line on the tape next to where the center of the ball is and also put a 0 on this line. This will be our starting point for our marks. Now we start the metronome and set it for 96 clicks per minute. Then we take a marker and make a countdown starting from 3 to 0 and when at 0 we start marking until we get up to 11 or when the ball reaches the end of the rail. Then we take the tapes and cut them at each mark. After three students ran their tapes and cut them at each mark, we are now ready for the graphing.

For graph one we will plot distance vs time. Each person in the group will use his tape for a different graph. He will then decide who will use his tape and for which one (graph). Take the cut tapes and label them d_1, d_2, d_3, etc. Take the first tape and paste it on the lower left corner vertically of the cardboard graphs we prepared yesterday. Then take the second (d_2) tape and paste it with its lower left corner next to the upper right corner of the first piece. And continue pasting each successive strip until you get to the top of the graph or you get all ten strips pasted.

To do graph two the second person of each group will label their tape pieces V_1, V_2, V_3, etc. This graph plots V vs t. Paste each strip vertically starting on the bottom line of the graph and next to each other. All ten strips should fit on your graph.

Graph three plots change in velocity vs time. Cut and label the tapes V_1, V_2, V_3, etc. Then lay tape V_9 on top of V_{10} and cut off the difference. Call this delta V_{10}. Likewise place V_9 on V_8 and cut off the difference of V_9. Then do the rest of the tapes in decending order until all delta pieces have been cut. Then paste each delta piece from left to right on the bottom line of the graph.

Recordings:

After the three graphs from your group are done, you may help other groups to finish. Then measure each tape (in cm.), write these values on each tape and record them in a data table for each student. After all this the class will analyze the graphs and develop a consensus for our conclusion.

Determining Momentum and Energy Loss of Balls Colliding Against Different Surfaces

Rich, Loretta
l69 Forest Blvd
Park Forest, Il
South Shore High School
933-8180

Objectives:

1) to relate types of material used in the construction of balls to the purpose for which balls are used in certain sports

2) to show the difference between one-dimensional elastic and inelastic collisions

3) to calculate momentum of various balls colliding against three different surfaces and to compare results with theoretical principles of conservation and energy

4) to record/graph test data to compare momenta of balls

5) to determine if water on a surface affects the conservation of energy in balls colliding against a surface

6) to apply principles of momentum and conservation of energy to the development of protective mechanisms existing in motor vehicles

Vocabulary:

collision
one-dimensional collision
elastic/inelastic collision
momentum
conservation of momentum
graphing/variables
energy
potential energy
kinetic energy
velocity
acceleration
conservation of energy

Materials:

1) various balls (see suggested list below)
2) laboratory balance
3) surfaces (wood, concrete/slate, carpet)
4) water
5) blackboard
6) meter sticks

Strategy:

Identify various balls used in playing different sports. Demonstrate the two types of collisions: elastic and inelastic.

Conduct teacher demonstration of using apparatus to determine momentum of a bouncing ball. Make use of transparency displayed on overhead projector showing basic set-up for measuring distance(d) ball bounced to a point on the meter stick. Mass the ball used in the demonstration and use the distance recorded to calculate the time and the velocity of the bouncing ball. Record results on a data chart. Determine the momentum of the bouncing ball and the potential energy lost during the collision.

Arrange students in groups of 3-4 and give each group three different balls to use for the activity. Obtain the mass for each ball and record data. Using one ball at a time on each surface, drop a ball from a given height (l m) onto a surface and measure the point where the ball bounced up to the meter stick. Use the distance (l m) and the acceleration due to gravity (10 m/s) to calculate the time (t) that it took for the ball to reach the surface. Use the time calculated to determine the velocity of the ball as it dropped to the surface. Determine the momentum of the dropped ball by multiplying it's mass by the velocity. Repeat entire process using the remaining balls, recording data carefully. Spread water on each surface and again bounce each ball, noting any change in the height (d**) recorded. Record final results for all balls on chart on blackboard.

Compare data recorded by all groups on the blackboard, noting the most elastic and/or inelastic balls. Discuss reasons why a particular ball is used in a sport. Using a transparency containing representative class data, show comparisons of data collected on the overhead projector. Discuss conservation of momentum and conservation of energy as it relates to one-dimensional inelastic collisions.

Discuss how water affects inelastic collisions against different surfaces.

Discuss the use of air bags/seatbelts in motor vehicles as safety mechanisms to reduce impact force by increasing impact time during collisions.

Suggested balls: clay, putty, rubber, ping pong, super ball, steel, golf, tennis, squash, baseball, Nerf ball (sponge)

Transparencies: general apparatus, chart with test data from three surfaces to be compared

Hand-outs: Calculation sheet with equations used to find time, velocity, momentum, and potential energy.

Demostrations of Law of Conservation of Linear Momentum

Tisdale, Robert W.
10719 S. Green St.
Chicago, Illinois 60643
785-3682

Percy L. Julian High School
821-2571

Objectives:

My objectives are to - (1) give a graphic demonstration of what the momemtum of an object really is; (2) review some of the more commonly available laboratroy equipment used to study momentum; (3) and produce as well as use some momentum equipment that is very simple, cheap, and easy to use.

Apparatus needed:

The apparatus consisted of an air track, air table, momentum machine, billiard balls, small rubber ball, rope, steel pipe, seltzer water, rubber stopper, two wheel chairs, and small springs.

Recommended strategy:

The first step is to establish what momentum is. This is done with a little twist of humor by telling a story of how three little boys attempt to kill a big ferocious bear by using projectiles of different size mass and different velocities. Of course only the projectile with sufficient mass and velocity is able to do the job.

From their we move on to establish what it means to conserve momentum. We first observe a stationary pipe sealed on one end and with a rubber stopper on the opposite end. The students are asked to tell what the momentum of this system is and with no exception all of them say the momentum is zero. After seltzer water is placed in the pipe the rubber stopper flies out one way and the pipe another way. The students are once again asked to give the momentum of this new system and most will say that the momentum has changed, changed to some nonzero or positive value.

We then proceed with the concept of positive and negative velocity and how the sum of the two momentums resulting from this reaction add up to zero. Hence, momentum is conserved and the law of conservation of momentum is supported.

From this point we examine some of the equipment that is traditionally used to study comservation of linear momentum: air tables, air tracks, and the momentum device. A small demonstration is performed with this equipment. I also bring out that the equipment is expensive and easily damaged. I introduce the idea of using simpler materials to illustrate conservation of momentum.

One piece of equipment consists of two balls with a spring glued to at least one of the balls. You use both balls to compress the spring about one meter directly above a point on the floor. Very quickly you release the balls. Both balls should have equal momentum. If they are of equal mass then they should have equal velocities which will lead to to them landing equal horizontal distances from from the point on the floor. If they are of unequal mass they will still have the same momentum but the more massive ball will have a smaller velocity the less massive ball. This results in the more massive ball traveling a smaller horizontal distance than the less massive ball. The results for this experiment don't give good quantitative data but the results do produce qualitative data that is good enough to support the point.

Another demonstration involved three momentum carts of equal size. One of the carts is securely taped on top of another cart. The result is two carts, one which is roughly twice the mass of the other cart. A spring is placed between these two carts to propel them in opposite directions. Because of the law of conservation of momentum, we can assume that both carts will be given equal momentum. We can also assume that the velocity of the lighter cart will be exactly twice the velocity of the heavier cart. This is the only way two masses, one which is half the mass of the other, can have equal linear momentum. If the velocity of small cart is twice that of the larger cart then the small cart should be able to cover 2 times more distance in any given period of time. We place a block of wood some arbitrary distance, say 2 meters, from the smaller cart and another block of wood one half of former distance, 1 meter in this case, from the larger cart. Both carts should arrive at their finish lines at the same time. It will be clearly observable to the students when the carts crash at the same time. This experiment works very well to be so simple in design.

A third experiment involves the use of wheel chairs. Two students, one much larger than the other, face each other seated in the wheel chairs about about 15 to 20 feet apart while while holding the opposite ends of rope. Before they start pulling they have a total momentum of zero. To maintain a state of zero momentum after they start pulling the larger student will move at a smaller velocity and, therefore, not travel as far. The smaller student will move at a much higher velocity and, consequently, roll for a greater distance. It is important that the wheels of the wheel chair be aligned correctly before the pulling starts and that some one be there to catch the students before they crash in to each other. There are a lot of variations that one can do with this. Two students of similar size can pull. Students can push off of each others hands instead of pull. The results will probaly not be good enough to make good quantitative measurements but they will be quite sufficient for making a qualitative estimate of what should take place.

Centripetal Force

Earnest S.Garrison
536 Landau
University Pk.Il. 60466
534-5146

Schurz H.S.
794-8120

Objectives:

To illustrate the components that govern the size of centripetal force in an object that moves in a circular path around a central point.

Apparatus needed:

Small glass tube (polished ends),2m of fishing line, rubber stopper (#5),paper clips,10-1/4 of an inch washers,and a timing device with a second hand.

Recommended strategy:

Attach one end of the fishing line to the rubber stopper and pass the other end of the line through the glass tube. Then tie the other end of the line to one of the paper clips.This device we will call our centripetal force apparatus.It should look like the following;

```
  STOPPER      ------->     ////////I
                          //        I
  _______________________I          I
I I I                    I          I
I I I                      \\       I
I I I                        \\\\\\\I
I I I
I I I
I I I  <--------GLASS TUBE
I I I
I I I
I I I
I I I
I I I
  I
  I
  I
  I
  I
  I <--------FISHING LINE
```

```
                 I
                 I
                 I
            _____I_____
           I          I
           I          I  <-----WASHERS
           I          I
           I__________I
```

The procedur to be used is to swing the stopper around your head at a constant rate of speed and parallel to the floor.While this happending others in the group count the number of revolution that the stopper makes in a 30 second period of time.This should be done using groups of washers as counter weights of 6,8,&10 each done for three trials.At the conclusion the group should be to plot a graph of velocity square vs radius (of the circle that the stopper moved in).There should be some discussion concerning the effects of how as the number of washers & radius of rotation changed the effects on the number of revolutions per second.

Flight Physics

Group Mini Teach
Antoinette Rabalcaba
Loretta Rich
Renee Russell
Eric Skalinder

Objectives:

Familiarize students with forces influencing a body in flight
Introduce **Bernoulli's Principle**
Construct simple types of aerodynamic designs

Apparatus needed:

two 8" X 11" sheets of paper
one half sheet of paper
cut outs - simple gliders
scissors
paper clips
scotch tape

Recommended Strategy:

A. History - Man's interest in flying examples and living visual aids
B Forces affecting an object in flight (transparency)
C. Balanced Forces
D. Bernoulli's Principle Blow on top of 1/2 sheet of paper to observe lift.
E. Construction of simple falling bodies
   1. The Control Drop a sheet of paper to the floor. Observe its flight pattern. What forces influence the paper?
   2. Construct a cone and drop it to the floor. Observe its flight pattern. What forces have been overcome by the cone shaped nose?
   3. Take one sheet of paper and fold one horizontal end over end five times, press flat, and secure the three paper clips (one clip at the center and the other two clips at 3-4cm from each edge). PAPER WING.
   4. Drop PAPER WING to the floor and observe its flight pattern Use fingernail and thumb too curl edge opposite clips on the paper wing. Drop paper wing to the floor and again observe the flight patterns. Fold and crease to the center open and drop the paper wing again make observations. Next fold up edges to make rudders and drop again.
   5. Parts of an airplane functions (transparency)
   6. Construction of simple aerodynamic structures Wing and Dart

```
pass out cut outs, scissors
test gliders and determine the best designs based upon
the forces which control successful flight
```

CONSERVATION OF MOMENTUM

Ann M.W. Brandon

Thornwood High School
17100 South Park Avenue
South Holland, IL 60473
1-708-339-7800

Objectives:

1) To use a memorable example of an explosion to impress the fact of Conservation of Momentum.
2) Using the Conservation of Momentum, determine the velocity of the tennis ball as it comes out of the tennis ball cannon.

Materials:

1) One tennis ball, new ones work better than old ones.
2) One tennis ball cannon. Directions for construction appear at the end. It must be made out of steel cans, aluminum ones may blow up in your face!
3) Lighter fluid
4) Some matches, and some wooden splints.
5) A photocell timer to time the recoil of the cannon. (optional, but probably the most accurate means of determining the times and velocities.)

Strategy:

1) What?
   Get their attention! With some fluid in the cannon, shake the cannon,place the ball in the front and fire. (Be sure you aim at a solid object,not the windows etc.)
2) Propose the problem:
   What is the velocity of the tennis ball as it leaves the cannon? How are we going to find out? What kinds of measurements can we make to give us the information we need to determine this velocity?

   At this point in the year your students should have several methods to propose:

   Velocity = Distance/Time

   So, if you can time the tennis ball over some measurable distance, you have it made.
3) How:
   Demonstrate the timer: Show that it times in thousandths of a second, while the beam is obstructed.

   Fortunately for the point here, for a memorable shot the tennis ball moves too quickly for an accurate timing. (Somewhere between one and two thousandths of a second for its passage past the photocell.) In order to use the timer we must time the recoil of the cannon and then use Conservation of Momentum to determine the velocity of the tennis ball.

   On the board write the equation for the Momentum in this explosion:

   0 =(Cannon Mass)(cannon velocity) + (Ball Mass)(velocity of ball)

   Ask your students
   "What information will we need to find the velocity of the ball?"

They should mention the masses,and the length of the cannon, and the time that the cannon takes to go past the photocell.

2

Assign each of these tasks to a different student. Record this data in its location in the formula.

Set up the timer in a convenient location. I go out in the hall, this allows you a long range for firing, and lets all the other science students to notice your existence!.

Warn your fellow teachers, if you wish, and send a student down the hall to retrieve the ball.

The cannon should be loaded with fuel, shaken up, then loaded with the ball and placed so that it will roll backwards through the photogate as it fires. Be sure to zero the timer before firing!

Light a splint, and hold it to the hole at the back. With any luck, it will fire!

Record the time. Return to class, place it in the equation and calculate the velocity of the tennis ball.

If you have recorded the length of the cannon in meters, this will give you a velocity in meters per second. Have someone convert this to miles per hour -- the students have a much better feel for this, and should be impressed. 60 mph is fairly typical of a good shot, the Thornwood HS record is 109 mph.

Advice:
Be sure that you discuss the safety involved here.
The cannon must be steel!!!!
Impress your students that aluminum will not work, and will probably send bits of aluminum shrapnel into their face.

If the ball does not fire, remove the ball, add some more fluid, and shake. Concentrate on forcing air into the cannon as you shake. This is especially important if you have had a previous shot.

Your students will probably want to fire the cannon again. I usually do, if you choose to do so, assign the task of remembering the time for the first firing to a nearby student. Remember to zero the timer before firing again.

Making a cannon of your own:

You need three or four cans made of steel. The cans should have an inside diameter of 2 and 9/16 ths of an inch. It is possible that this could be 1/32 in larger, but a reasonably tight fit is important.

With the tops out of two cans, use a bottle opener to punch holes in the bottom of one of these cans. With a nail, punch a hole in the side wall near the bottom of the other. Tape the open ends of these two cans together. These compose the fuel chamber.

Cut the tops and bottoms out of the other two cans. Tape these cans together, and tape them to the bottle openered end of the fuel chamber. These make up the ball chamber. Tape all four to a set of wheels. Be sure the nail hole faces up. It may be useful to tape a stiffening bar to the top of all four cans to keep them from sagging.

WORK,POWER AND ENTROPY

NORBERT L. ZARUMBA

MARENGO COMMUNITY HIGH SCHOOL
618 E. GRANT HIGHWAY
MARENGO, IL 60152
1-815-568-6511

OBJECTIVES:

1:To demonstrate, explain and allow the student to experience work and power. 2:To allow the student to observe that entropy is a real process that must occur whenever work occurs.

MATERIALS:

For part B. Meter stick, chain (about 2 meters), double pan balance, stop watch.

For part A.Jar that can be sealed (gallon condiment jar), 50 ml beaker, support to hold beaker close to top of jar, distilled water, dehydrating agent, analytical balance.

STRATEGIES:

```
                   ----------------------

              ____________|_______________
             | Introduce   entropy.       |
             | Disorder has increased.    |
             |____________________________|
```

DEFINITIONS: WORK=(FORCE)(DISTANCE). Joule=Newton meter.

POWER=WORK/TIME.   Watt=Joule/second.

ENTROPY = the disorder in a system. Entropy always increases when work is done.

ADDENDUM: These topics were chosen as a group for two reasons.

A. In common language we confuse work and power; (many times what is considered "hard Work" or "working harder" is really equal or less work but greater power). Therefore we attempt to clarify these concepts.

B. To introduce the concept of entropy (work cannot occur without an increase in entropy).

BACKGROUND: Before introducing this experiment the students usually will have mastered simple machines (levers, pulleys, inclined planes, etc.). The minimum knowledge required by the by the student to be at ease with the experiment is:

A. multiplication and division,

B. graphing.

This experiment can then be mastered by students in intermediate grades. The calculus presentation would be appropriate for better prepared high school students or college students taking physics for the first time.

TIME REQUIRED: Part B can be completed in a class period (about fifty minutes).

Part A needs long periods of time to complete; but only a few minutes each day after the initial set up. In part A the work is caused by diffusion of water from a lower level to the dehydrating agent which is at a higher level. The beaker of dehydrating agent plus water need be massed (weighed) occasionally (about every two days) for at least a month. This massing will take only a few minutes each time. This part of the experiment is critical to explain entropy. EXPLANATION: In

Part A the student will learn the difference between work and power.

As a phenomenological experiment they will see that something is the same in each case (work); but that something else (power) varies.

At the intermediate level very good students should be able to deduce the difference.

At the intermediate level the student should learn:

3

WORK = (FORCE)(DISTANCE); the unit is, JOULE = (NEWTON)(METER). The newton (which is a unit of force) can be determined using a newton scale; or by massing an object on a balance (grams) and then multiplying by the acceleration of gravity (9.8 meter/second^2).

POWER = (WORK/TIME); the unit is WATT = (JOULE/SECOND).

At the high school level a presentation with problems similar to that in, "Physics,Principles and Problems", Murphy and Smoot; Charles E. Merrill Publishing, 1977. Teachers Edition, 1977; pg 139-142; will be convenient.

At a more advanced level "PSSC Physics, Fourth Edition," Haber-Schaim et al, D.C. Heath and Co. 1976. Pgs 326-328; will be appropriate.

At the calculus level a text like Resnick and Halliday would be used.

CONCLUSION: As Part B progresses it should become apparent, by analogy with Part A, that work is being done and power is being expended (albeit in very small amounts). The phenomenon to be observed in B is:

"What causes the work to occur?"

In A it was the muscles of the student, food, etc.

In B the cause is the decrease in concentration of the dehydrating agent. This decrease in concentration is entropy. The dehydrating agent which was "pure" is now diluted by water; it is now "impure". The disorder has increased. This increase in "disorder" (entropy) has caused the work to occur. The work will continue until the dehydrating agent reaches the same concentration as pure water (forever). By similar logic "increased disorder" (entropy increase) caused the work to occur in Part A.

Therefore:

A.whenever work is done entropy is increased,

B.the greater the power the faster entropy is increased.

THE CENTER OF MASS

Joan C. Preer
Beasley Academic Center
5255 South State Street
Chicago, IL 60609
1-312-536-8745

GRADE LEVELS: Grade 7 and 8

Objectives:

1. To determine the center of mass of two irregularly shaped objects.
2. To determine when the center of mass is inside the boundaries of the object and when the center of mass is outside the boundaries of the object.
3. To determine when an object is stable or balanced or why an object is unstable or unbalanced.

Materials: 8-multi-speed cars
10-forks
10-spoons
10-plastic cups
10-irregularly shaped object cards
10-strings
10-rubber washers
10-nails
1-Leaning Tower of Pisa
1-double cone, cylinder and incline
1-styrofoam center of mass fish
1-3.81 cm metal sphere
10-boxes of colored chalk
10-Q-tips

Strategy:

Opening: Toss a metal sphere across the room; it travels a smooth path or parabola. Then toss the styrofoam fish across the room; it does not follow a smooth path. It wobbles all over the place except for a very special place we are going to discuss today. We are going to talk about the center of mass.

1. Where is most of the mass of the fish concentrated?
2. Look at the two lights as the fish is being tossed through the air. Does the path of either light form a parabolic curve?

Discussion: The center of mass is the average position of all the particles of mass that make up a particular body or object. The metal sphere is a symmetrical object and its mass is concentrated at its center. In contrast, more of the mass of the fish is concentrated toward the head of the fish. Therefore, the center of mass of the fish is toward the heavier end or the head of the fish. When we toss the fish it does wobble all over the place. However, one of the lights does follow a parabolic path. We used this light to mark the center of mass of the fish.

Activity: Slide a nail through one of the two holes in the object. Slip the string over the opposite end of the nail and let it swing freely using the washer to weight the string. Chalk the string letting it mark the straight path, from the point of suspension to the opposite end of the card. Then repeat these same steps with the second hole in the object. The center of mass will be located where the two chalked lines intersect. The center of mass can be checked by placing the eraser of a pencil at the point of intersection and see if the object balances on the pencil.

1. Why does the object swing back and forth when placed on the nail?
2. Where is most of the mass of the object concentrated?
3. Is the center of mass of the object within the boundaries of the object?

Discussion: (Sketch two L-shaped figures on the board.)

Figure a Figure b

If we drop a line straight down from the center of mass of a body of any shape and it falls inside the base of support, as in Figure a, it is in stable equilibrium and the object will be balanced. However, if the center of mass falls outside of the base of support it is unstable and will not be balanced, as in Figure b. In our irregularly shaped object, the center of mass is within the boundaries of the object.

Activity: Stand against the wall and try and touch your toes.
1. Where is your center of mass when you lean forward to touch your toes?
2. What is the base of support for your body?
3. Is your center of mass inside or outside your base of support?
4. Why does your body rotate* forward?

*The rotation of your body as you move forward is called torque.

Then stand away from the wall and try to touch your toes.

1. After you move away from the wall, where is your center of mass?
2. Is the center of mass inside or outside your base of support?
3. This time the body does not rotate forward. Why?

Discussion: You can lean over and touch your toes without rotating forward only if your center of mass is above the area of your base of support. In this case, your base of support would be your feet.

Activity: Determine the center of mass of the multi-speed car. Once you have found the center of mass, select your car's speed. Then joining forces with another team, leave one car stationary and run the other car into one side of the front end of the stationary car. Then run your car into the rear of the same side of the stationary car. Finally, run your car into the center of mass of the stationary car. Determine what happens in each case.

1. Where is the center of mass of the car?
2. When the stationary car is hit in the front, of one side, in what direction does the car move?
3. When the stationary car is hit in the rear, of one side, in what direction does the car move?

Discussion: The center of mass of the car is a few millimeters in front of the rear wheels. When the stationary car is hit in the front, the car moves counterclockwise denoting a counterclockwise torque. When the stationary car is hit in the rear, the car moves clockwise denoting clockwise torque. When the stationary car is hit at the center of mass, the counterclockwise and the clockwise torques are equal. The net torque is equal to zero and there is no rotation. The stationary car is just pushed forward. In relation to the moving car, they are perpendicular to one another.

Activity: Fasten a fork, spoon, and one Q-tip together as shown below:

3

The combination will balance nicely on the edge of a plastic cup (it may be necessary to weight the cup).

1. Where is the center of mass for the whole setup?
2. Would this work if the Q-tip were shorter?

Discussion: It is possible to balance this combination on the cup because the center of mass is somewhere below the point of support. The heavy handles of the fork and the spoon curve toward the cup. This shifts the center of mass of the entire structure to a point directly beneath the spot where the Q-tip rests on the cup, putting the fork, spoon and Q-tip in a state of stable equilibrium; it is balanced. This will work with a shorter Q-tip. However, the Q-tip will have to be long enough to rest on the rim of the cup and have some of the Q-tip overlap.

Demonstration: I have two objects I would like to demonstrate. I want you to consider everything we have covered up to this point. After the demonstration I would like you to explain how you think each object works.

1. **Leaning Tower of Pisa:** When the top is removed, the center of mass of the Leaning Tower of Pisa lies above a point of support, and therefore the tower is in stable equilibrium. When the top is added, the center of mass is outside the base of support. The Tower is unstable so it topples over.

2. **The Double Cone and Incline:** When the cylinder is placed at the top of the incline unrestricted, gravity causes it to roll to the bottom, down hill. However, when the cone is placed on the incline it appears to roll up hill defying the law of gravity. The center of mass of the cone is concentrated at the center of the cone and the cone tapers as you reach the ends. When the cone is placed at the bottom of the incline it is placed there at its center of mass. The center of mass always seeks the lowest position it can reach. The track of the incline widens permitting the center of mass of the cone to be lowered. This allows the cone to reach a more stable position. To reach this stable position the cone rolls up hill.

MEASURING THE GRAVITATIONAL CONSTANT, G

Joel Hofslund

Kenwood Academy
5015 S. Blackstone Ave.
Chicago, IL 60615
1-312-536-8907

BEHAVIORAL OBJECTIVE:

Students will see that the gravitational force is indeed universal; The gravitational force acts not only on, but also between objects of normal size and mass. Advanced students will measure the proportionality constant G which appears in Newton's expression for the gravitational force acting between two spherical objects.

MATERIALS:

A large Cavendish or torsion balance was constructed; Bags of sand (nominal mass 27 kg) acting on 0.3 kg end masses provide the torque. The torsion fiber is a stainless steel wire with a diameter of 0.003 inch (0.0012 cm) and a length of approximately 1.75 m. The lever arm of the balance is approximately 0.9 m. A large frame was constructed of wood and enclosed with plastic windows. Aluminum window screen was used to control electrostatic forces acting on the end masses. The torsion bar was a piece of aluminum edging (of the sort used to encircle kitchen sinks) obtained from a local hardware store.

STRATEGY:

When students study the gravitational force in the usual manner (Kepler's Laws of Planetary Motion are presented as empirical deductions from data; The nature of the required force is deduced from the centripetal force law and Newton's Third Law), the instructor is normally forced to make two concessions which are directly contrary to the phenomenological approach to teaching. First, he must make the unsupported assertion that the law derived from planetary data is "universal," and can be applied to any two objects, including those of ordinary size and mass. Secondly, the instructor must provide the value of the constant G which appears in the Newtonian expression. Since the treatment of gravitation usually occurs in the middle of the first semester, shortly after the students have finally begun to appreciate the phenomenological approach to physics instruction, the traditional treatment runs contrary to the phenomenological teaching philosophy.

An alternative strategy which is consistent with the phenomenological approach would be to provide at least a demonstration of the universality of Newtonian gravitation by showing that objects of ordinary mass do in fact attract one another with a force which cannot be attributed to other causes. It should be possible to extend the demonstration to include actual measurement of the gravitational constant, though this could (and perhaps should) be reserved for advanced students or special projects. Apparatus to accomplish this objective is commercially available. Unfortunately, the cost is prohibitive in the light of most public school budgets. Thus, an attempt was made to build a large-scale version of the traditional torsion balance apparatus which would be economically feasible and provide a clearly visible demonstration of the gravitational attraction between objects of ordinary mass. Drawings and a complete list of materials used are available from the author.

In practice, the torsion balance is allowed to come into equilibrium with the two bags of sand "kitty-corner" from each other, as shown in the diagram. Once equilibrium has been achieved with the sand bags in this position, the bags are

carried to the other end of the apparatus and a new equilibrium position is determined. The change in equilibrium position shows the existence of the force.
2
The dimensions of the apparatus were chosen to make the actual displacement of the end masses as large as possible. Permanent records of the original and final positions can be made by placing a sheet of graph paper over the top window and recording the point directly over the lever arm at each of the two equilibrium positions. This approach will not result in data precise enough to allow a measurement of G.

To make the demonstration quantitative, a more precise method of measuring the angular displacement between the two equilibrium positions must be used. At present, the author has not attempted to improve the apparatus to include such measurements. Usually, an optical lever is used, though Cavendish himself used ordinary ruled markings.

VECTORS

Albert Oldenburg

Lindblom Tech High School
6130 So. Wolcott
Chicago, IL

OBJECTIVES:

To define a vector and its rules. To use as a tool to help clarify its use with motion and forces. To have students discover these relation-ships with the use of various simple equipment and a computer.

MATERIALS:

Three pieces of heavy yarn of different colors, preferably blue, orange, and green. Three pieces of chalk of different colors, blue, orange, and green. A large blackboard protractor. Several meter sticks and 2-meter meter sticks. Three bricks wrapped in plastic. A side clamp for the front desk. A computer with a large monitor. Four large pieces of paper with E,W,N,S printed on them.

STRATEGY:

Post the four large signs representing the directions on the four opposite walls in the classroom before class begins. Ask a student to move a brick from the front desk to his seat. Make it known to the class the direction that the brick was moved and that it might represent the change in position of any object from one position to another. Ask the class to enter into the description of this change in position of the brick (to elicit an answer of "displacement"). Have students take out a sheet of paper and pencil to record a simple data table you place on the board, having length in meters and angle in degrees for each of the three sides of the triangle. Label the sides A,B,C respectively. Also the angles are labelled as alpha, beta, and gamma. Ask those students with calculators to raise their hands, then divide the class into groups of three or four people so each group would have access to a calculator. Challenge each group to find one of the sides and angles, then record them on the board. Then graphically have the students record them on their graph paper. Show students how to graphically add vectors "head to tail", by putting the head of the second vector to the head of the first vector and so forth until all vectors for that problem have been added. While writing vector equations remind the students to indicate above each algebraic symbol a small arrow representing a vector.

After graphing, a chalk and talk review of vectors takes place. At this point the students would be advised to record these notes for future reference. The main concepts revealed here were the addition of parallel vectors (positive or negative) depending on their direction, then adding two vectors at 90 degrees was shown. A third but more realistic way to add vectors at any direction (not 90 or 180 degrees) was also shown. Here we introduced the use of the Law of Sines.

For another class period an interesting computer review was prepared for the students with a dialogue on the computer and displayed on the large monitor. There were several parts to the dialogue. The student takes out a paper and pencil and writes down the answers to the definitions asked for on the first part of the dialogue. A student is asked to operate the computer at the teachers' command. The best answer on the monitor screen is not revealed until the definition is rather thoroughly discussed. The computerized review of the problems are revealed step by step on the monitor with the students recording it. The problem is broken down step by step and reconstructed with complete agreement on each step along the way. First a problem involving parallel vectors was used and repeated a number of times. Then the vector problems using right angles was reviewed. The vectors at

various angles were shown to be quite simplified by using this method. A ditto sheet is then passed out and a few "homework" problems are printed on it to review
2
them. With the use of the computer monitor we substituted some of the homework problem variables in it and proceeded to demonstrate to the students how to solve the problems by breaking them down into steps and reconstructing them.

FRICTION

Jim Szeszol

Mendel Catholic High School
250 East 111 Street
Chicago, IL 60628
1-312-995-3700

OBJECTIVES:

To study the effects of friction in a simple mechanical system.

APPARATUS:

1) Self propelled dynamics cart (coil spring driven)
2) Meter stick
3) stopwatch

Procedure:

1) Perform "Hookes Law" experiment for coil spring constant
2) Determine distance and time for PE transfer
3) Calculate KE transfer for
    a) Translational KE
    b) Rotational KE - wheels, pulleys, axles
4) Determine the efficiency of the system

Calculations : Determine the difference in energy levels using KE formulas for energy of translation and rotation. The ratio of kinetic energy of the cart to the potential energy of the spring will yield an efficiency value for the system.

Conclusion : In most first year physics courses energy lost to friction is traditionally ignored. Through this activity the observation can be made that a significant (80% - 90%) of the system energy is lost to frictional forces while doing useful work.

Extensions / Modifications :

For translational KE only keep the ratio of rotational mass to translational mass small.
example - small wheels - light wheels - single pulley - added mass to cart.

For non-uniform motion - the cart will accelerate at rates dependent on the coil spring constant and the selected step pulley. To study these rates a timer tape can be attached to the cart to determine varying rates of motion.

The Bernoulli Effect - Conceptually

Earl Zwicker
1809 Heather Ct.
NORTHBROOK IL 60062-5869

Illinois Institute of Technology
BCPS Department
CHICAGO IL 60616
312-567-3384

Objectives:

Simply doing and/or observing the experiments (below) should excite the intellectual curiosity for people of all ages. Here is a rough guideline for what might be expected.

Grades K-5: Students should be able to describe at least two of the experiments orally and –- subject to your judgment –- in writing.

Grades 6 –9: Expect students to describe two or more experiments both orally and in writing, and to explain their observations in terms of simply stated Bernoulli Effect:

Where the velocity is high, the pressure is low, and where the velocity is low, the pressure is high.

Grades 10-12: Students should explain observations conceptually and mathematically beginning with an algebraic statement of the Bernoulli Effect.

Materials:

Students:

Experiment 1

These items are usually available at grocery stores.

- Soda straws (one straw cut in half for each student plus a few extra)
- Small paper or plastic cups (a few more than one for each student)
- A regular (2.5 gallon) pail 2/3 filled with water
- A sponge and roll of paper towels
- Vegetable dye

Experiment 2

- Paper – 8.5 × 11 sq. in. – enough for each student to have a sheet. Should not have folds or wrinkles, but may be “used” otherwise.

Teachers:

Experiment 3

- A dime
- A transparent jar or beaker (at least 500 ml)

- A smooth, flat tabletop

Experiment 4

- A wood or plastic spool for sewing thread (it is okay if it still has thread)
- A paper clip
- A piece of paper or light cardboard about 2×2 inches
- A piece of brightly colored heavy yarn 12 to 18 inches long.

Experiment 5

- An electric leaf blower. One with a variable speed is a plus. Its blower tube should have a diameter of 2 to 3 inches, and a length of about 2 feet.
- A hollow rubber ball with a diameter of 2 to 3 inches
- A piece of brightly colored heavy yarn (see experiment 4).

Strategy:

The main idea is to do several different experiments, each time connecting specific observations with the simply stated Bernoulli Effect. This enables students to make the connection in their minds from a variety of concrete, specific observations to the abstract generalization known as our simply stated Bernoulli Effect.

Begin with Experiment 1 materials at hand placed on or near a table at the front of the room. .Hold up one of the small cups and tell your students that you want to show them something, and you would like them try it. Fill the cup nearly full of water by dipping it into the pail. Add several drops of vegetable dye (red, blue, green work well) and stir with a half straw. Hold the cup level with one hand, and - with the fingers of the same hand - hold a half straw vertically so that its bottom end is immersed in the water and its top end is about 1.5 inches above the water's surface. Using your other hand, hold another half straw to your lips so that you can blow through it. Hold the cup so that you can blow a stream of air perpendicular to and across the top of the immersed half-straw. Stand sideways to your student audience and then blow strongly through the straw.

Water will rise up to the top of the immersed straw where it will be broken up into a spray of droplets by the air stream. You have made an "atomizer", somewhat like the rubber bulb operated perfume bottles of years ago. You probably will have to practice a bit to make it work and you should practice in private before you show your students. (You need to have confidence in what you are doing.)

Now invite the students up to each get a cup, etc. so they can make their own atomizers. You probably will want to have the sponge and paper towels handy. Small cups limit the amount of water to sponge up when accidents occur.

After most students have made their atomizers work, get their attention, and ask, "What happens to the water in the immersed straw when you blow across the top?

Almost certainly a student will respond that the water rises up in the straw. For those who are not sure, repeat the experiment with your atomizer, and point out to them how the water in your straw rises up as you blow across its top. (If you have dyed the water in your cup dark enough, it is easy for students to see.)

Now you should ask them why this happens. After getting their input and discussion (which should be given your rapt attention), print on the board the simply stated Bernoulli Effect. Point out that it applies to fluids such as air and water, and then connect any of their statements that may be pertinent to the simply stated Bernoulli Effect. When you do this, illustrate the places of lower and higher (atmospheric) pressure with a simple sketch on the board that includes the air stream. Use a large arrow or two pushing down on the surface of the water in the cup, and a smaller arrow pushing down at the top of the straw. The speed of the air over the water in the cup is low (zero), so the pressure is high (atmospheric), while the speed of the air over the top of the straw is high, so the pressure there is low (less than atmospheric).

It's a good idea to ask your students to come forward to dump the water from their cups into the pail. You probably will want them to keep their cups and straws to take home to show to parents and siblings.

You might ask if they can think of any practical applications of the atomizer besides perfume sprayers. After their input it may be good for you to point out that the carburetors in gasoline engines work exactly the same way to atomize liquid gasoline and mix it with air to form the vapor that is taken into the cylinders and ignited. The expanding gases then act on the pistons to make the car go. Can you think of others?

Experiment 3 probably is a good one to do next, so clear any clutter from the table at the front of the room and have the materials for this experiment on the table.

- It is very important to practice this ahead of time, so that you know you can do it with the particular table and coin (dime) you will use.

With your student audience facing the front of a table, stand at one side so they will be able to see clearly what you are doing.

Place a dime in the clear glass container. Hold it up and shake it around so everyone can hear the clinking of the dime against the glass. Then dump the dime out into your hand, hold it up for all to see, and place it on the table in front of you. Usually 6 to 10 cm from the edge of the table works well.

Now challenge your students. Ask if anyone can move the dime into the beaker without touching the dime with any object or moving the table. After getting their input, you are ready to show them how to do it.

With the beaker on the table behind the dime (from your perspective), tip the beaker so that the bottom edge of its opening is 1 to 2 cm above the table surface and about 6 to 10 cm behind the dime.

Place your lips just above the edge of the table, in front of the dime (you probably will have to kneel on the floor to do this) and then blow a strong puff of air across the top of the dime. It will jump up into the air stream and travel with it into the beaker with a clinking sound. (Practice until you can do it! If it is difficult to kneel, consider using any kind of elevated surface on the table top, like a cardboard box that will be a convenient height for you. When you do this in front of your students, if it doesn't work the first try to two, point out to them that it is tricky to do, and continue until it works. If your students get restless, invite a volunteer up to try.)

Hold the beaker up for everyone to see and shake it so that they can hear the dime clinking on the glass.

Repeat the experiment once or twice more. This is always important; observers need to confirm their first observation and make certain of what they observed. If time permits you may wish to let them try with their own cups and dimes or you might suggest they try this at home with the cups you have given them.

As you did with the atomizer experiment, it is important to help students connect their concrete observations with the abstract, simply stated Bernoulli Effect. Always use a simple sketch at the board. Show the dime on the table (leave a narrow space between dime and table), the puff of air over its top and the tipped beaker behind it. Ask "Where is the pressure low?" Perhaps the students will identify the region over the top of the dime. But the answer to "Where is the pressure high?" (under the dime) probably will require some explanation from you. You may explain that layers of air, even though only hundreds of molecules thick, exist on all surfaces that we can see and they form a thin layer on the bottom of the dime and the table. They are part of the atmosphere and are at atmospheric pressure. Since the speed of the air under the dime is low (zero), the pressure there is high (atmospheric). But the speed of air at the top of the dime is high, so the pressure is low (less than atmospheric). Drawing a large arrow acting up on the dime and a small arrow acting down will help to show that the dime will be raised up by the pressure difference. This sketch forms a picture in the student's mind to help make connections between the concrete and the abstract.

Next, clear the table and place the materials for Experiment 4 near the rear edge of the table.

Hold up the various materials and name them so the students know what they are. Place the paper clip flat on the table and straighten one segment so that it points straight up. Then use it to poke a hole through the center of the 2 in. × 2 in. card. With the straightened segment sticking up through the card, apply a short piece of sticky tape to attach the paper clip to the card from below.

With the card lying flat on the table, place the thread spool on top of the card with the hole along its vertical axis enclosing the vertical part of the paper clip. Now blow strongly and steadily through the hole at the top of the spool, and raise the spool up off the table while doing so. The card will stick to its bottom end until you stop blowing, and then it will fall off! Do this several times. Ask the students why this happens. (You may want to explain that the purpose of the paper clip is to keep the card from slipping sideways out of the air stream at the bottom of the spool.) In order to convince them that you are not sucking air up through the hole instead of blowing air down through it, you can puff your cheeks out as you blow. Then point out that you could not do this if you were sucking air up. Ask them to try sucking air into their lungs with their cheeks puffed out, and they will understand.

In order to dispel any remaining skepticism, holding a piece of yarn in the air stream may be convincing.

Ask them to explain why the card sticks when you blow into the spool. After listening carefully, make a sketch on the board, showing the spool with the card below and a narrow space between. Draw arrows showing the path of the air from the top of the spool to the card below. When the air strikes the card below, it changes its direction and moves radially outward (horizontally) in the space between the spool and the card. The pressure is lower (below atmospheric - a small arrow pushing down) where the speed of the air over the top of the card is high, and pressure is higher (atmospheric - a large arrow pushing up) where the speed of the air is low (zero). The pressure difference supports the card against its weight, which pulls down, so the card "sticks" to the spool.

If you are able to provide enough spools, etc., and if time allows, would it be a good idea to ask your students to do this experiment? Would it be a good idea to let them discover for themselves that the card sticks when they blow air through their spool?

is next, with the leaf blower. You will want the yarn within easy reach, perhaps in a pocket, and the ball nearby on the floor. What follows may well be done on a tabletop if you are tall enough. I have always done it on the floor in front of the table. And of course, you should practice this so you know exactly what you are going to do and that it works.

With the leaf blower plugged in and resting on the floor, hold it by its tube and point it so it will blow air vertically straight up. Then turn it on (at its lowest speed). Place the ball in the air stream and release it so that the ball "floats." Steadily increase the speed of the air to its maximum, floating the ball to a higher altitude above the opening of the air tube. Then decrease the speed to a minimum, so the ball descends to its lowest altitude again. Turn off the blower and ask, "What held the ball up?"

Most students will give the obvious answer that the force of the air stream held it up against its weight pulling down. To which you may respond, "Let's see."

Again, place the ball in the vertical air stream at its lowest speed. Gradually increase the speed to its maximum. Now gradually tilt the blower from the vertical toward the horizontal. Be sure you are aiming the blower parallel to the front of the table, perpendicular view of the students. (Don't blow air at the students.) When you have reached an angle of perhaps 60 degrees from the vertical (prior experimentation will help you determine how great you may make the angle before the ball falls to the floor), stop and allow the students a few seconds to observe that the ball is still suspended in the air stream, then move the tube with air stream and floating ball back to the vertical, lower the air speed to minimum and shut off the blower.

You may now ask, "What held the ball up? If the air stream were just pushing on the ball when it is at an angle, why wouldn't the ball be pushed away and out of the air stream so it would fall to the floor?"

After getting student responses, make a sketch on the board showing the blower and air stream at an angle and the ball suspended in the stream. Draw an arrow to show the ball's weight pulling down and label it with the letter W.

Next, repeat the experiment with the ball suspended at an angle in the air stream. Now hold the piece yarn (about 8 to 12 inches long) in your other hand and move your hand so that the yarn is at the top of the ball. The air will blow the yarn so that it stretches out to show the direction of the stream. Now move your hand to follow behind the ball and directly below it. The yarn will hang limp because the air stream below the ball is not strong enough to support it. Do this several times, top of ball to just under the ball. It will become evident that the speed of the air over the top of the ball is great, while its speed across the bottom of the ball is small.

Restore the system to rest, as in two paragraphs above. Make another sketch of the ball suspended in the air stream but this time locate the ball lower in the air stream, so its bottom actually lies below the line depicting the lower boundary of the stream. Ask, “Where is the air speed high?” And when the students tell you at the top of the ball, draw an arrow in the direction of airflow at the top (which is at about 60 degrees from the vertical) and label it “high speed.” Ask, “Where is the air speed low?” -- and draw a very small arrow at the bottom of the ball. Then draw a very small arrow (preferably in a different color, and pointing downward and perpendicular to the air stream) to show the force from small pressure at the top. Label it P-top. Then draw a larger arrow (same color, pointing upward and perpendicular to the air stream, labeled P-bottom) to show the larger pressure at the bottom. Point out the agreement with the simply stated Bernoulli Effect.

The directions of the force arrows, W (straight down), P-bottom and P-top should serve to satisfy students that the net force due to pressure difference serves to suspend the ball and to hold it in the air stream.

In order to further show this, suspend the ball in a vertical, maximum speed air stream again. Using three fingers, push sideways (horizontally) on the ball, displacing it from the center of the stream, but not so far that it falls. Move the ball back and forth several times this way, pointing out that the part of the ball at the edge of the air stream is subjected to higher pressure, so it is forced back toward the center of the air stream. This is the reason the ball remains suspended in the vertical air stream, despite the fact that it experiences some horizontal “jiggling” forces (due to air turbulence) that tend to force it out so it would fall.

Performance Assessment:

Give each student a sheet of 8.5 inch × 11 inch paper. Ask them to hold the sheet by the corners of its shorter edge and to hold the edge tautly and horizontal. Now challenge them to make the paper rise up without moving it or touching it with any object.

You probably will see a student blow across the top of his/her sheet, causing it to rise up. When most students have caught on, ask them to write an explanation on the paper, using the simply stated Bernoulli Effect.

Pamela S. Moy - Morgan Park High School

Surface Tension

Pamela S. Moy
6101 West 63rd Street
CHICAGO IL 60638

Morgan Park High School
1744 West Pryor
CHICAGO IL 60643
(773) 535-2550

Objective(s):

This activity is written for third to eighth grades or as an introduction to the topic. Depending on how you choose to supplement the information this miniteach may be used for higher or lower levels.
Students will become familiar with surface tension.
Students will determine if soap and heat will affect surface tension.

Materials Needed:

For all to use: One hot plate and a large beaker

For each group you intend to have:
Four small clear plastic cups
Water
Two boxes of gem clips (paper clips)
Dishwashing liquid (just a few drops)
Paper towels
Black pen for labeling

Strategy:

1. Label four cups with A, B, C, and D.
2. Place a beaker of water on the hot plate and heat it until it reaches a boil (be very careful it will be hot).
3. While waiting for the water to boil, fill Cup A to the brim with tap water. Do the same for Cup B. Be sure the water in each cup is exactly to the rim of the cup without spilling over the side.
4. Drop one gem clip at a time carefully into Cup A until you see the water begin to seep over the side of the cup. Count the number of gem clips it takes to cause this to occur. Record this number in a chart and describe the dome of water building on top of the cup.
5. Now add five drops of dishwashing detergent to Cup B and allow about a minute for it to disperse in the water. Repeat the process you used with Cup A. Count the number of gem clips required to cause the water to seep over the side of the cup. Record this in a chart and describe the dome of water building on top of the cup.
6. Fill Cups C and D to the top with the water you have been heating on the hot plate. Be VERY careful not to burn yourself with the hot water or the hot container. Make sure you get the water level to the rim as you did with Cups A and B.
7. Add five drops of dishwashing detergent to Cup D and allow about a minute

for it to disperse in the water.

8. Add gem clips to Cup C until water overflows. Describe the dome. Record this information. Repeat this process for Cup D and record your results in the chart.

Performance Assessment:

Students will demonstrate the ability to work scientifically and accurately in the lab.
Students will answer questions as to why the water looked dome-like and took so long to overflow.
Students will make a hypothesis as to why and how the different conditions in the water affected the surface tension.
Students should analyze error in technique that may have affected the results.

Conclusions:

Students explore the possibilities of surface tension. They will see how detergent and heat lower surface tension. Higher level students may explore bonds and polarity affecting surface tension.

Mathematics/Physics

Compared to What? – Comparing the Density of Different Liquids

Camille Gales
2901 S Michigan
Chicago IL 60616

Coles Elementary School
8441 S. Yates Blvd
Chicago IL 60617
(773) 535-6550

Objective(s):

Demonstrate that different liquids have different densities. Initial activity can be conducted with primary level children. Calculations for finding the densities are appropriate for sixth grade or above.

Materials Needed:

water, liquid dish washing detergent (Palmolive), cooking oil (Wesson), corn syrup, food coloring, small spatulas or scrapers, four tablespoons, digital scale, four graduated beakers, (each group will need 5 clear plastic cups)

Strategy:

Divide the class into four groups.

Teacher preparation: Place each of the four liquids in containers. Label the containers; A (cooking oil), B (water), C (dish washing liquid), D (corn syrup). Pour a few drops of red food coloring into the container holding the water. Place one tablespoon with each of the four liquids. Give each student group five clear plastic cups.

Student Activity: A representative from each group will put 3 tablespoons of cooking oil in a cup, 3 tablespoons of liquid detergent in another cup, 6 tablespoons of water in a third cup. Pour the contents of cup A (oil) into a clear empty cup. Pour ½ of the contents of cup B (water) into the cup with the oil. Observe and record the result. Pour the remaining contents of cup B (water) into an empty cup. Pour the contents of cup C (dish washing liquid) into the cup with the water. Observe and record the results. Make a prediction. If the contents of the first cup are poured into the second cup, how will the liquids layer themselves. Record that prediction. Now pour the contents of the first cup into the second cup. Check the accuracy of your prediction and record the results. **Do not use the contents of cup D yet.**

Teacher preparation: Distribute one liquid to each of the four groups. (The fourth group will get liquid D now.) Instruct the groups to follow the directions listed immediately below.

Student activity: 1^{st} student weighs the empty graduated beaker and records its weight. 2^{nd} student puts 50 ml. of the liquid into the beaker. 3^{rd} student weighs and records the beaker and its contents. 4^{th} student subtracts the weight of the empty container from the weight of the container holding the liquid to determine the weight (mass) of the liquid. 5^{th} student calculates the density by dividing the weight (mass) by the volume (50ml.)

Performance Assessment:

Primary Level:

Ask

- Which liquid is at the bottom? Why is that so?
- Which liquid is in the middle? Why is that so?
- Which liquid is at the top? Why is that so?

Intermediate/Upper:

After each group calculates the density of its liquid, those calculations should be arranged from lightest to heaviest on the chalkboard. If the students have performed the measurements and the calculations correctly the numerical arrangement of the densities should mirror the density layers they created in their cups. Ask the students to predict where liquid D should layer itself based on their calculations. Groups who have the corn oil, the water, and the dishwashing liquid should place three tablespoons of corn syrup into their density cups. Liquid D, the corn syrup, should sink to the bottom since its density is the heaviest of the four.

Buoyancy: What will float and what will sink

Suzzanne' O'Quinn
8117 S. Vernon st.
Chicago IL 60619
(773) 651-1169

Phillips Alternative High School
700 E. Oakwood Blvd.
Chicago IL 60653
(773) 624-4493

Objectives:

This lesson is aimed at the intermediate grade levels (4-6). The students will be able to write and verbally explain why a particular object/item will sink or float. They will also be able to illustrate and/or demonstrate this process. This assignment will either introduce graphing or enhance a students graphing skills, as well as their critical thinking skills.

Materials Needed:

1 Large Clear Container - filled with water
2 Balloons of the same color (one filled with water and one filled with air but close to the same size)
1 Regular Coke
1 Diet Coke
2 Empty 16oz clear water bottles. (one filled with a much heavier substance than the other. Ex: Flour and Salt; air and water; Salt and sugar)
Fruit: two of each of the following: pear, apple, orange, nectarine, banana, lime, potato, plum, tomato, lemon, etc.
Enough copies of a graphing chart of which fruit will float and which will sink
1 Roll of aluminum foil
100 pennies
1 empty but clear dish washing detergent bottle with cap
2 glass droplets

Strategy:

I have a container of water and two balloons of the same color. (One is filled with water and the other with air. DO NOT INFORM THE STUDENTS OF THE BALLOONS CONTENT). At this time, I will show the students the two balloons and ask them as I place each one in the water what do they think will happen? (Placing the two balloons in the container, I now wait and listen to the students observation). POSSIBLE ANSWERS: One sunk because of its weight, one balloon was bigger than the other, one is filled with water and one with air.

Then, I will continue with the two pop cans. I will show the class, two 12oz pops, one being diet and the other regular. I will ask them, what do they think will happen as I place both cans into the container of water? (At this time I'm listening to the students responses.) Then I place the two cans of pop into the container of water, and one floats and the other doesn't. I ask why? (Listen to their responses.) Then, explain why what happened, happened. Diet coke contains nutra-sweet and regular coke contains corn syrup. Corn syrup is more dense than the nutra-sweet that is in the diet coke; therefore, the diet coke was able to float more than the regular coke. Cheap pop may float, not enough corn syrup.

Next, I will hold up two 16oz clear water bottles filled with a white content (one with baking soda and the other salt.) Once again, I will ask the students what they think will happen when I place them in the container of water? POSSIBLE ANSWERS: one will sink, the other will float. They both will sink or float. Well, after placing both bottles in the water, the students received a surprise. They both sunk! Why? I listen to the observations and let them discuss what they think happened. (That is why under the materials I listed several contents. Water and air would have been a good example because one would have floated and the other would not have. However, I wanted the kids to see something different.)

Moving right a long, I introduce the class to the different kinds of fruit I have available. I ask that they all come up with their chart and pencil to make a prediction on what fruit will sink and what fruit will float. Then, have them try each fruit in the water and see what happens. This way the children will have a visual graph of what floats and what sinks. (The teacher must do the experiment himself/herself to find out these results. Smile! Have fun.) Afterwards, the students are free to enjoy a piece of fruit. Now, the floor is open for discussion as to what floated and what didn't and why.

All the students will come back up and make a boat or a floating object, one out of foil and one out of Play-Doh. Then, they will place their floating device in the container of water to make sure it floats. If it floats, they will see how many pennies it can hold before sinking. They will write down their results and sit down and as a group they can talk about their finding.

Finally, I will demonstrate buoyancy using the clear dish detergent bottle and the two glass droplets. Filling the bottle with water and filling one droplet with water and the other half filled with water. Then dropping both droplets in the bottle, closing it tight. One droplet will sink to the bottom, while the other will float to the top. Place your hands just below the neck and squeeze with you thumb and observe what happens. Then repeat the process using your three fingers.

Performance Assessment:

I would expect each student to participate in all exercises. They should all have an idea about why something happened. I would expect that all the students should have a clear understanding of buoyancy, considering the various experiences. Assessing the students should not be stressful. They should be able to identify this concept when they come across it again.

Air Pressure

Brian Cagle
10005 S. Aberdeen
Chicago IL 60643
(312) 445-9347

John W. Cook
8150 S. Bishop
Chicago IL 60620
(312) 535-3315

Objective:

The main objective of the mini-teach is to demonstrate an understanding of how air pressure works. Students will be able to identify, construct, and define the concept of air pressure by working in groups after experimenting with various activities on air pressure. Students will also have a working knowledge of the different terminology used when describing the process of air pressure.

Activity #1: Water Fountain

Materials:

2 jars (one with the lid), 4 straws, small bucket, water, tape

Strategy:

Make two holes in the jar lid, one hole in the middle of the lid and the other near the edge. Place one straw in the middle hole and secure both ends of the hole with clay. Now tape the three straws together and place one end inside the second hole of the jar lid about an inch. Secure both ends of this hole with clay. Fill jar #1 without the lid about three-fourths of the way with water. Now fill jar #2 with the lid about 2 inches high with water and then close the lid. Take jar #2 with the lid and turn it over so that the one straw in the middle hole is half-way in jar #1 and half-way in jar #2. While the other straws which are connected are hanging over the edge into a small bucket. Now observe what happens in jar #1 and jar #2.

Results:

As the water from the closed lid jar #2 pours down into the small bucket through the connected straws, the air pressure inside the jar become less as the air spreads out to take up space left by the water. The air outside in jar #1 is at a greater pressure than the air inside, thus forcing the water up the straw and making a fountain.

Activity #2: The Magic Glass

Materials:

Jar, 4"x6" index card, water

Strategy:

Fill the jar to the top with water and wet the rim slightly. Lay the card on the top of the jar. Hold the card firmly in place and turn the jar over.

Now take away your hand and see what happens.

Results:

The water should stay in the glass, showing that air pressure is exerted on the card from the top, the side, and the bottom as Pascal's law states.

Activity #3: Candle In Glass

Materials:

Shallow dish or pan, candle, matches, tall glass or flask, food coloring

Strategy:

Light a candle and stand it upright in the middle of a pan and secure it with melted candle drippings. Fill the pan half full with water. Then add a drop of food coloring to the water to make it more noticeable from the back of the room. While the candle is still burning, place a narrow glass or flask over the candle. Carefully observe the base of the container, the water level in the container, and the flame. Record your observations.

Results:

The candle will burn for a time but will eventually go out and you will see that the water rises up into the jar. You will find out that the water will rise about one-fifth of the way up the jar. Water rises in the container due to an imbalance in pressure. As the gas inside the container heats and expands causing bubbling around the base. The oxygen inside diminishes, the flame gets cooler, and so does the air resulting in a pressure drop. Water starts to move into the container. When the candle is extinguished, the temperature in the flask drops, causing a further reduction in pressure and a further rise in the water level.

Activity #4: The Power of Air

Materials:

Ruler, 2 sheets of notebook paper, 2 sheets of newspaper

Strategy:

Lay the ruler on the table so about one-third of it lies over the edge. Place two sheets of notebook paper on the ruler and press against the table until the paper is flat as possible. Now hit the overhanging portion of the ruler with your hand and try to make the paper fly into the air. Repeat this procedure using two sheets of unfolded newspaper and record your results.

Results:

The ruler should snap when placed under the newspaper, but not when placed under the notebook paper. The notebook paper is small enough that the ruler can lift it without breaking. While the newspaper has a much greater surface area than the notebook paper. The air presses down on the sheet of newspaper, there is a lot of air pushing down on it and this is enough to stop the paper and ruler from moving.

Performance Assessments:

Through an oral evaluation and teacher observations each student will have to describe the procedure of each activity and the results of each experiment. Explaining what happens when their is an indifference in air pressure and what caused it.

Conclusion:

After experimenting with each activity, each student should have an excellent idea of how air pressure works. While having a working knowledge of some of the key terms associated with air pressure such as: high air pressure, difference in pressure, and low air pressure.

Buoyant Force

Thomas J. Billups
2007 Herbert St.
Berkeley IL 60163
(708) 449-5868

Delano Elementary
3937 W.Wilcox
Chicago IL 60624
(312) 534-6620

Objectives:

This activity was designed for grades 4th thru 8th. Students will be able to construct a graph that illustrates Archimedes' principle of buoyant force. Students will also be able to understand that the buoyant force on an object is equal to the weight of the fluid it displaces.

Materials Needed:

Students will be in groups of 3-4 individuals. Each group should have the following items:

2 liter bottles (tops cut away)	4ea.
Various objects that sink (pad-lock, stone, metal,etc)	3ea.
Various objects that float (candle, styrofoam, toys, etc.)	3ea.
Objects that sink but, float (fruits, lime, apples, etc.)	3ea.
water balloons	3ea.
1/4" plastic tubing	1ea.
spring scale	1ea.

An overflow container must be constructed from one of the 2 liter bottles. First take a Phillips screw driver and heat the tip over an open flame. Next, melt a hole into the plastic container 2-4 cm from the top of the container. Now, force the 1/4" tubing into the hole and secure a tight fit so as not to allow any water to leak out. A styrofoam cup can be used to catch the water flowing from the overflow container and thru the tubing. Finally, fill the container with water until water starts to flow through the plastic tubing. When the water stops flowing through the tube then you have reached a proper water level to perform the experiments. This water level must be reached before beginning each experiment.

Strategy:

Students will be introduced to the concept of buoyancy by observing the first exercise. Two 2 liter containers filled 3/4 of the way with water. In one container place an object that sinks. In another container place an object that floats. Ask the students to observe the two containers and discuss what they see. One key observation should be the change in the water levels and or the displacement of water. After the observation, inform the students that the buoyant force is equal to the weight of the water displaced, and the following experiment will either prove or disproves the theory. Students should weigh an object on a scale, be sure to put all readings on a data table. Next, place the object into an overflow container. The object will displace water into a container or graduated cylinder. Now, weigh the water in the container. Repeat this step for each object and record all the readings on the data table. The students are now ready to construct a graph that illustrates weight of an object vs weight of water displaced. The graph can be done as a group, individual, or class project. The first graph can be done as a class project, by drawing a graph on the board or using an over head projector. Have each group give their findings, from the data table, plot the findings on the graph. The objects that float should cluster together at one end of the graph and the objects that sink should cluster together at the other end of the graph. The water balloons should give you a forty-five degree angle on your graph to divide your graph in two.

Performance Assessment:

Students will receive a maximum of 40 points for completing the data table. Students will also receive a maximum of 40 points for the graph. A short answer quiz worth 20 points will also be administered. A maximum of 100 points is possible.

```
100 - 90 = A
 89 - 80 = B
 79 - 70 = C
 69 - 50 = D
 49 - 20 = F
 19 -  0 = 0
```

Do You Sink or Float?

Jackie Baker
2430 N. Geneva Terrace
Chicago IL 60614
(312) 665-1066

Crown Community Academy
2128 South St. Louis
Chicago IL 60623
(312) 534-1680

Objectives:

Students in first grade will discover objects that sink or float through observation, classification, gathering data, and interpreting data.

Materials Needed:

A variety of different objects
clay
aluminum
pennies
A variety of different fruit
A variety of different types of balls
5 large clear containers for water
towels
water

Strategy:

Opening Activity:
Place a variety of objects into a clear tank filled with water. Ask the children what they observe after each object is placed in the water. Discuss the words sink and float. Have each child take one object, predict if it will sink or float and place it into the water. Ask the children why did some of these objects sink and some float? After the discussion, the students will break up into five groups to explore the concept of sink or float at learning stations.

Stations:

1. Students will play the game "Sinker or Floater" to acquire a better sense of which materials sink or float. Each child takes a turn by reaching into a bag of objects and stating if that object will sink or float. Next, the student places the object in the water and if their prediction was correct they get a point. The students continue the game until all the objects have been selected.

2. Students will discover which fruits float by placing a variety of fruit into a deep container of water. Next, they will draw pictures, on a given piece of paper, illustrating their findings on which fruit floats or sinks.

3. Students will make a boat using clay. Next, they will predict, on a class graph, how many pennies their boat will hold without sinking. Third, they will put their boat in the water container and place pennies inside the boat. Fourth, they will put their actual number of pennies the boat held without sinking. Last, the students will put their name on their boat and place it aside for a group comparison.

4. Students will repeat the exact steps for station 3 using aluminum foil rather than clay.

5. Students will experiment with a variety of balls (golf ball, tennis ball,

football, soccer ball, etc.) to see if they sink or float. First, they will predict by making a real graph, using the actual balls, showing which balls will sink and which will float. Second, they will test each ball in the water container. Last, they will make their own graph, using crayons and paper, to illustrate what they have discovered.

Performance Assessment:

After the students have completed all stations, discuss observations made at each. The students will be assessed on their participation in the group discussion and their work created at each learning station.

Bernoulli Effect

Michael McIntosh
8029 S. Washtenaw Av.
Chicago IL 60652
(312) 434-4936

Whitney M. Young Magnet High School
211 S. Laflin St.
Chicago IL 60607
(312) 534-7539

Objective:

This lesson will show the relationship between velocity and pressure of a fluid. The demonstrations should be appropriate for all levels. The explanations may be more suitable for upper level and high school.

Materials Needed:

1. Coat hanger and two strips of paper (about 4 cm X 12 cm)
2. Hair blower and ping-pong ball
3. Ruler and strip of paper (about 2.5 cm x 5 cm)
4. Two aluminum cans connected by a string (about 1 m long)
5. Bits of paper and whee-o (thin flexible tube, similar to vacuum cleaner hose, about 3 cm diameter and 50-75 cm long)
6. Thread spool, straight pin, and index card
7. Funnel and ping-pong
8. Long narrow plastic bag (two newspaper covers taped together work well.)

Procedures:

Explain each of the items and ask for predictions about what will happen in each case. Demonstrate each of the items or have the students go through each procedure and make observations.

1. Cut off the long side of the coathanger and bend the other sides so that they are parallel to each other. Tape the strips of paper to opposite sides so that they hang down parallel to each other. Blow down between the two strips.

2. A hair blower with a straight nozzle works well.
   A paper cup with the bottom cut out stuck on the end of the blower also works. Turn on the blower and place the ping-pong ball in the air stream. Tilt the blower.

3. Tape the paper to the ruler so that it forms an air foil. Place a pencil on a table and place the mid point of the ruler across the pencil. Blow across the top of the paper.

4. Hang the cans so that they are at the same level and about 2 cm apart. Hold a ruler behind the cans and blow between the cans. (This also works with two apples or two balloons.)

5. Hold the bits of paper in one hand. Place one end of the whee-o over the paper and twirl the whee-o.

6. Stick the pin through the index card and then into the hole on one side of the spool. Blow into the other hole of the spool.

7. Place the ping-pong ball in the funnel. (The top part of a plastic bottle makes a good funnel.) Blow up through the small end of the funnel.

8. Challenge someone to blow up the bag with as few breaths as possible. It will take about five breaths. Flatten the bag. Then claim to be able to blow it up with one breath. Hold the bag open and quickly blow into the bag from about 30 cm away.

Observations:

1. The bottom ends of the strips will move closer together.
2. The ball will rise and float in the air stream.
3. The end of the ruler with the air foil will rise.
4. The cans will move closer together.
5. The bits of paper will be sucked up into the whee-o.
6. The card will remain in place.
7. The ball will stay in the funnel.
8. The bag will fill with air.

Explanations:

The higher the velocity of a fluid, the lower the pressure. This is called the Bernoulli Effect. Each of these activities demonstrate the Bernoulli Effect.

1. The velocity of the air is greater between the two strips. Therefore the pressure is lower between the strips. The higher pressure on the sides pushes the strips together.

2. The air in the stream is faster than the air outside the stream. The higher pressure outside the stream keeps the ball in the stream.

3. The air above the air foil is faster than the air below. The higher pressure below pushes the air foil up.

4. The air between the cans is faster than the air on the sides. The higher pressure on the sides pushes the cans together.

5. The air inside the whee-o is faster than the air outside. The higher pressure outside pushes the paper into the whee-o.

6. The air between the spool and card is faster than the air on the opposite side of the card. The higher pressure on the opposite side pushes the card against the spool.

7. The air is faster below the ball and on the sides. The higher pressure above the ball pushes the ball down into the funnel.

8. The air inside the bag is faster than the air outside the bag. The higher pressure outside pushes the air inside.

Bubbleology Mickey Mouse Style

Paula Z. Jones
9139 S. Oakley Avenue
Chicago IL 60620
(312) 445-3370

Black Magnet
9101 S Euclid
Chicago IL 60637
(312) 535-6390

Objective:

This two day lesson is designed for an intermediate grade level. After blowing bubbles, students will be able to test the effect of four different shape wands and three geometric figures in a bubble mixture. Students will construct water and soap molecules.

Hypothesis:

Does a bubble always form a sphere?

Materials Needed:

Dawn dishwashing liquid, cups, water, yarn, scissors, construction paper, glue, pipecleaners, string, straws, trays, and a large container.

BUBBLE MAKERS

INDIVIDUAL WANDS

Bend pipecleaner to form a circle, square, heart, and triangle.

RECTANGULAR FRAME

Materials: two standard drinking straws; a piece of cotton string 11/2m long. Procedure: Feed the string through both straws and tie a knot.

TETRAHEDRON

Materials: Three standard drinking straws; three half-size straws; and nine pipecleaners. Procedure: Twist two pipecleaners together to make a pipecleaner that is somewhat longer than a standard drinking straw; repeat twice. Put three long pipe cleaners together and twist them together at the top. Slip three standard drinking straws onto the pipecleaners; bend the pipecleaners at the bottom to form feet. Insert three standard pipecleaners through three half-size straws. Make a triangle with them by twisting their corners together. Twist base and top together at corners.

CUBE

Materials: Six standard drinking straws, each cut in half; and twelve pipe cleaners. Procedure: Put three of the pipecleaners together and twist them tightly at one end. Make four complete sets. Slip half-straws onto the pipe cleaner; bend the pipe cleaner to form feet. Make each set look like the capital letter T. Use two sets to form a square with two extended sides. Repeat the procedure with the other two sets. Make one square bottom of the cube by twisting up the extended straws; make the other square the top by twisting the down the extended straws. Fit the top to the bottom, twisting all corners.

Strategy:

Cooperative Learning

1. Each student receives 4 pipe cleaners, a straw, and a cup.
2. Make a circle, square, heart, and triangle with a pipecleaner.
3. Cover the bottom of the cup with Dawn dishwashing liquid.

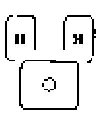
4. Fill the cup with a 1/2 cup of water.
5. Blow bubbles indoors and outdoors.
6. Record results on Bubbleology worksheet.
7. Form three groups.
8. Build a rectangular frame, tetrahedron, and a cube.
9. Record results on Bubbleology worksheet.

Bubbleology Worksheet

WAND **SHAPE**	PREDICT **SHAPE**	INSIDE **SHAPE**	OUTSIDE **SHAPE**	DRAW SHAPE	COMMENTS
CIRCLE					
SQUARE					
HEART					
TRIANGLE					
STRAW					
PIPE CLEANER					
RECTANGULAR FORM					
TETRAHEDRON					
CUBE					

Day two

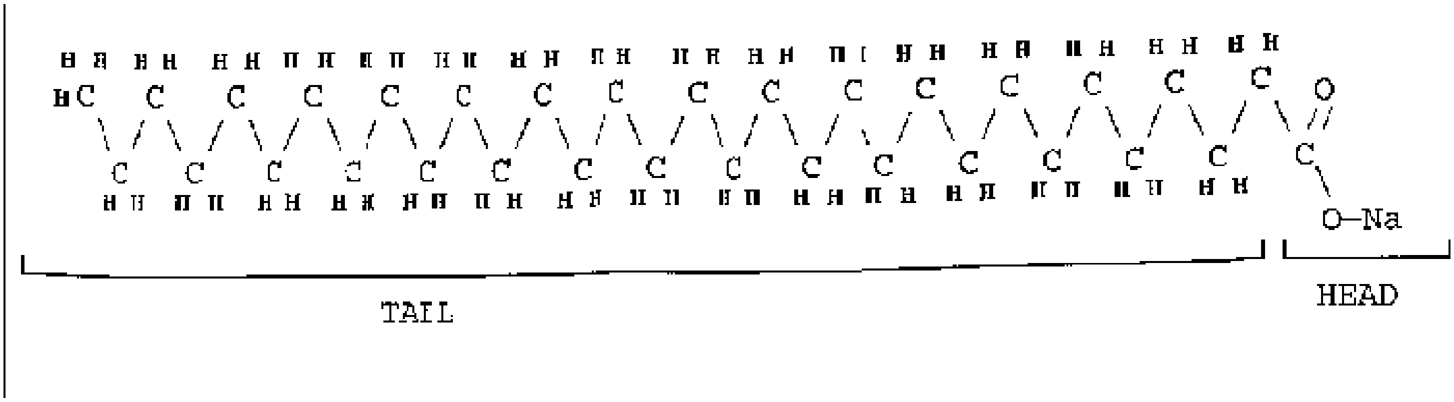
1.Draw and cut out a water molecule that looks like Mickey Mouse.



2. Paste the water molecule on construction paper.

(continued on next page)

3. Draw and cut out a simple soap molecule. (Don't forget to draw circles around the molecules.)



4. Paste the soap molecule on construction paper.
5. Discuss the simularities and differences between water and soap molecules.

Performance Assessment:

Students are evaluated by completing the bubbleology worksheet and constructing water and soap molecules . This assignment is graded as a pass or fail lab in class assignment.

Conclusion:

Regardless of the shape of the wand, bubbles always form spheres.

Pressure in Fluids

Porter W Johnson
406 N Elmwood Ave
Oak Park IL 60302-2226
(708) 383-2846

Illinois Institute of Technology
Department of Physics
Chicago IL 60616-3793
(312) 567-3375

Objectives:

We shall study the properties of fluids under a variety of circumstances to understand the role or pressure in their behavior, and to relate to everyday circumstances.

Materials Needed:

Several two liter "pop bottles" and assorted plastic bottles, several "push pins" for making holes, a medicine dropper for the cartesian diver, a large clear funnel with a stand for holding it in place, several plastic straws and a supply of strong plastic tape or **Duck Tape**, and at least one "middle range" water pistol, a "battery operated" model being preferable.

Strategy:

The first phase is a demonstration of the flow of water out of holes punched with push pins **and some enlarged with nails** in plastic bottles of various shapes and sizes. Let the students report their observations, and write them on the board. Be sure to record every correct observation, whether it is directly relevant for the points you intend to make. Here is a **non-inclusive** list of observations that might be made.

1. If the hole is punched straight into the bottle, the water initially moves horizontally, and gradually drops as it gets further away from the vessel.
2. As the water drains from one of the bottles and the level drops, the water comes out with lesser speed, and falls on an arc that does not extend as far.
3. The stream of water initially gets **smaller** as it leaves the hole, and it will break into droplets if it falls far enough. **Try this with a hole punched in the bottom of the bottle**.
4. If the cap is put back on the bottle the flow slows and eventually stops. If you blow hard into the bottle the rate of flow is increased.
5. With two holes of the same size, the one that is deeper in relation to the "water level" in the bottle will have a greater exit speed.
6. The size of the hole has relatively little effect on the speed of water that exits, although, a bigger stream of water flows out of the larger hole.

Next go outside with the water pistol and shoot it from shoulder level. Have the students divide into groups of three or four, with each group estimating its maximum distance of travel **in meters** by stepping or pacing the distance. Be sure to take along an extra supply of water for reloading the pistol. Go back inside, and record the various answers. You should measure the distance in advance, so that the various answers obtained can be compared with the standard. For the **Drencher Advantage™** power pistol, a range of about 9 meters was obtained.

Fill a two liter pop bottle with water. Take a medicine dropper and fill it partially, so that the dropper just sinks in the water inside the bottle. It will take some experimentation to find the right amount of water in the dropper. Then put the lid tightly onto the bottle. Squeeze the sides of the bottle. Notice that, as the water pressure inside the bottle is increased thereby, the air in the dropper is compressed, and the dropper falls. You might enjoy repeating the experiment with an oval-shaped bottle. The device is called a **Cartesian Diver**.

Fill a bottle completely with water, and insert a plastic straw. Use tape to hold the straw a few millimeters above the top of the bottle and to seal the bottle. Blow gently over the straw, either directly or by means of another straw. If possible, use an air pump to force air over the top of the straw. You will notice that water comes out of the bottle. The water is forced up and out of the straw because of the **Bernoulli Principle**. This mechanism is used **aerosol cans**, in that a liquid is ejected from the reservoir by passing a gas over a tube at high speed.

Many many people believe that the water in a flushing toilet or a draining bathtub will circulate in one sense in the Northern Hemisphere, and in another sense in the Southern Hemisphere, because of the **Coriolis Force, which is responsible for clockwise circulation around high pressure regions and counter-clockwise circulation around low pressure regions in the atmosphere.** Actually, it is difficult to build a toilet or tub that does not have some directional bias and it is simpler to study the effect in a large clear funnel. Fill the funnel with water and **add dye to enhance visibility** while holding your finger on the bottom of the funnel. You will have to pour the water into the funnel symmetrically and wait for several minutes to avoid any residual circulation of the water. Do you see the effect of the Coriolis Force?

Performance Assessment:

Laboratory Exercise:

Punch a hole on the side of a 2 liter pop bottle near the bottom, and fill it with water. Place the bottle on the edge of a table. When the level of water is at a depth **d** above the hole, determine the horizontal distance **s** that the fluid stream lies when it has fallen to a fixed distance of, say, **20 cm** below the hole. Make measurements of **h** for various values of **d**, and make a graph of **d versus h**. Does the graph correspond to a straight line?

Written question:

How does a water pistol work?

Satisfactory Answer:

A pump [mechanical or electrical] builds up pressure inside the vessel partially filled with water, and water is forced out of the hole in the barrel. The operation is exactly the same as that of blowing into the partially filled bottle with a hole in it below the water level.

Conclusions:

The consequences of **Pascal's Principle** [the pressure in a liquid increases with depth and its extension the **Bernoulli Principle** [lower pressure corresponds to higher speed along the path of flow of a fluid] have been explored, and their implications in everyday experiences are examined.

Multi-cultural Components:

A story by **Hans Christian Anderson** describes the little Dutch boy who put his finger into the dike to block whole North Sea. The boy is often depicted wearing wooden shoes.

> **Q**: Why are wooden shoes popular in Holland and other lowland countries?
> **A**: They are very effective in walking through mud, and it is quite easy to remove the mud afterward without damaging the shoes.

You may know that there is a difference in ocean levels of the locks at the two ends of the **Panama Canal**. Part of this difference occurs because the **Pacific Ocean** is more salty and therefore more dense, so that its level should be lower. Incidentally, the locks on the Atlantic side of the canal are further **West** than those on its Pacific side!

Surface Tension

Lisa C. Ingram
8848 S. Marshfield
Chicago IL 60620
(312)238-9083

Frederick Douglass Middle Academy
543 N. Waller
Chicago IL 60644
(312)534-6176

Objective:

To understand the concept "Surface Tension", through several experiments. Designed for students grades 5 through 8.

Materials Needed:

Overhead projector (teacher demonstration)
2 glasses of equal size and depth
a bucket
water
pennies 60 per group or person
bowls 2 per group or person
a box of toothpicks
liquid soap or detergent
a box of cube sugar
clear cups 1 per group or person
bubble solution
bubble wands or other bubble instruments

Strategy:

Students will be asked to brainstorm what surface and tension mean. Also, discuss where they have heard the words before. All comments will be written on the black board. After all demonstrations students will comeback to these comments and form a definition(s).

Experiment 1: Teacher will fill two glasses underwater. Then take them out of the water, holding them rim-to-rim so no water escapes. Stand the glasses on a flat surface so that one rests upside down on top of the other. Teacher will slide one penny between the two rims. When the coin is in place, water molecules will pull together between the rims and stop the water overflowing.

Question: Why did the water stop dripping, even though there is still an opening?

Answer: The molecules are pulling and stretching to form a skin to the water. Thus no water can get out, unless the surface tension is broken.

Experiment 2: Teacher will use the overhead projector to demonstrate. Arrange toothpicks in a circle in a bowl of water. Place a cube of sugar in the center of the circle (place bowl on top of overhead projector). Take another bowl, arrange the toothpicks in a circle again. This time place aa piece of soap or liquid detergent in the center (place the bowl on top of projector). Students should observe and verbally respond, the toothpicks went toward the sugar and they went away from the detergent.

Question: Why did the sugar draw the toothpicks and why did the detergent repel the toothpicks?

Answer: The sugar sucks up water, creating a current that carries the toothpicks with it toward the center. The soap, on the other hand, gives off an oily film that spreads outward. It weakens the surface tension, and the film carries the toothpicks away with it.

Experiment 3: A clear cup with a drop of food coloring, should be placed on top a white piece of paper. Near by should be a bag of at least 60 pennies. (Teacher should set these items up, as stations, in the designated area before children begin) Explanation: Tell the students that they are going to fill their cups up to the brim with water. They will then have someone slide pennies into the color cup of water, until the color water drips on the paper. Tell students not to throw the pennies, they want a drip not a splash. One student in the group should be designated to count the pennies going into the water. They are to this until there is a drip on the paper.

Question: Why does it take so long for the water to drip?

Answer: Surface tension builds around the cup, until it is broken with a penny.

Performance Assessment:

Students will be asked to explain surface tension verbally. They will also be instructed to write one or two sentences defining surface tension.

Displacement of Fluids

Thomas J. Billups
2007 Herbert St.
Berkeley IL 60163
(708) 449-5868

Delano Elementary
3937 W. Wilcox
Chicago IL 60624
(312) 534-6620

Objectives:

This activity was designed for grades 4th thru 8th. Students will acquire a working definition of the word "displacement". Students will also understand that the volume (size) of an object placed in water affects the amount of water that is displaced.

Materials Needed:

Students will be in groups of 3-4 individuals. Each group should have the following items:

2 liter bottles (tops cut away)	3ea.
300 gram weight	1ea.
800 gram weight	1ea.
1200 gram weight	1ea.
1 liter graduated cylinder	1ea.
balancing scale	1ea.
styrofoam cup	1ea.
1/4" plastic tubing (ink pen shell)	1ea.

2 objects same weight (500-1200grams) but different volumes
2 objects same volume but different weights (1 plastic block & 1 styrofoam block)

The 2 liter bottles are converted into overflow containers by taking a Phillips screw driver and heating the tip and using the tip to melt a hole into the container. The hole should be 3cm - 4cm from the top of the container. Next, place the 1/4" tubing into the hole, making sure to get a tight fit. The tubing allows for all the water from the container to flow into the graduated cylinder. * Note the water level should be at the point that water flows thru the tubing then stops. This level should be reached before performing exercises 2 thru 4.

Strategy:

Students will be introduced to the concept of displacement by observing the following exercise. Take two 2 liter containers filled 3/4 of the way with water. A 200 gram weight is placed in one of the containers of water and a 1,000 gram weight placed into the other container. Students should notice that the water levels have increased. Students should also notice that the container with the 1,000 gram weight has the higher water level. Students are then informed that, in each case, the change in water levels is a measure of **displacement**. Displacement is the amount of change in fluid volume from the initial point (beginning water level) to an ending point. Students are then asked to construct a definition of the word displacement based on their observations. Students are then asked to theorize as to what led to the different levels of displacement. Most students tend to theorize that the heavier objects' weight leads to a higher water level. Students are now ready to perform the following experiments to test their theories. Have students form groups of 3 or 4 individuals, so that each group will conduct the following experiments.

Experiment 1:

Place the various weights (300, 800, and 1200 grams) into different identical containers and notice the change in water levels of the three containers. Once again, students should notice that the greater the weight in the container the higher the level of displacement. This observation may lead to the conclusion that the weight of an object affects the amount of water that a object displaces.

Experiment 2:

On a balance scale have students weigh the two objects of the same weight but different sizes. Next, place each object into an overflow container and measure the amount of water displaced. Any object that floats should be held below the water level, until the (displaced) water empties into the graduated cylinder. Students should notice that the object with more volume (greater size) displaces more water. Students conclude that it is an objects' size that determines the amount of water displaced. To prove the findings of experiment 2, perform experiment 3.

Experiment 3:

Place the two objects of similar volumes and different weights into the overflow containers. Students should notice that both objects displace similar amounts of water, which would substantiate the findings of experiment 2.

Experiment 4:

Now place the 300 gram weight into the over flow cylinder and record the amount of water displaced. Next, hold an inverted styrofoam cup submerged under water and record the amount of water displaced. Once again, students should notice that the cup displaces more water than its weight, further illustrating that it is the volume of an object that determines the amount of water that the object displaces.

Performance Assessment:

Students will receive a maximum of 20 points for each experiment completed. A two question essay (20 points) will also be administered. A maximum of 100 points is possible.

100-90	= A
89-80	= B
79-70	= C
69-50	= D
49-20	= F
19-0	= 0

Sinking And Floating

Tunya Alexander
10530 S. Aberdeen St
Chicago IL 60643
(312)233-0619

Frank L. Gillespie School
9305 S. State St
Chicago IL 60643
(312)535-5065

Objectives:

The mini-teach is adapted to grade levels 3-6 and special education.
The main objective of the mini-teach is to explain the Archimedes' Principle, which states that any body completely or partially submerged in a fluid at rest is acted upon by an upward force. The size of the force is equal to the weight of the water displaced. Using this principle, students would be able to tell why some things sink and float.

Materials Needed:

Materials per students

A. Deep-water diver
1. plastic pen top
2. 16oz. of water
3. modeling clay
4. 16oz. clear plastic bottle

B. A Cartesian Diver
1. 16oz. plastic bottle
2. 1 drinking straw
3. 1 bottle top full of modeling clay
4. 16oz. of water

C. Pushing Water with Different Coins
1. 1 small glass
2. tap water
3. several types of coins
4. 1 marker

D. Floating Boat
1. 20 paper clips
2. aluminum foil
3. ruler
4. bucket of water

Strategy:

A. Deep-water diver
1. Stick a small piece of clay onto the pen top. This is the diver.
2. Put the diver into a glass of water. Remove or add modeling clay until the diver floats upright.
3. Completely fill the bottle with water. Put the diver in and screw the top on tightly.
4. Squeeze the bottle and the diver will float up and down.

B. A Cartesian Diver
1. Fill a plastic bottle with water right to the top.
2. Make a diver from a straw, paperclip and clay. Cut the straw 2 inches long, open up a paperclip, take the straw and put it on each end of the paperclip, apply clay round the end of the paperclip.
3. Test that it floats in a glass of water. Add clay until it only just floats.
4. Once the diver is just floating, put it in the bottle of water.
5. Screw the top on the bottle.
6. Squeeze the bottle gently. The diver should sink. Stop squeezing the bottle and it should rise. A diver like this is called a Cartesian diver.

C. Pushing Water with Different Coins
1. Fill the glass with water so that water is about 1cm from the top.
2. Draw a line on the glass at the top of the water.
3. Slowly drop one penny at a time into the glass. Keep adding pennies until the water spills over the edge.
4. Pour out the water and count how many pennies you used.
5. Fill the glass again to the same line.
6. Slowly drop nickels or dimes or quarters into the glass until the water spills over.
7. Pour out the water and count the coins.

D. Floating Boat
1. Cut 2 - 30cm squares from the aluminum foil.
2. Wrap one of the metal squares around 10 paper clips and squeeze the foil into a tight ball.
3. Fold the four edges of the second aluminum square up to make a small square pan.
4. Place 10 paperclips in the metal pan.
5. Set the metal pan on the water's surface in the bucket.
6. Place the metal ball on the water's surface.

Performance Assessment:

The students will be able to answer the following question using Archimedes' Principle:
1. Why do some objects sink?
2. Why do some objects float?
3. What happens when light objects are placed in water?
4. What happens when heavy objects are placed in water?

Return to Physics Index

The Unmixables: Investigating Immiscible Liquids

Joyce Cohen
7947 South Merrill
Chicago IL 60617
312-374-0616

Shakespeare-Elementary School
1119 E. 46th Street
Chicago IL 60653
312-535-1560

Objectives:

Upon completion of this lab activity, the student will
(1) Develop an understanding of some properties of liquids.
(2) Develop skills in hypothesizing.
(3) Discover the immiscible properties of different milks.
(4) Discover that some liquids form an emulsion.

Materials:

For each group of four students:
Eyedroppers, food coloring, pie pans, and 1/2 pint cartons of half and half, 2% milk, and whipping cream, and Dawn(r) dish soap (the green concoction) and a 1/2 pint container of water. Nine empty bottles. Instruction sheet and an observation sheet.

Teaching Strategies:

This activity can be done in any format, before beginning the project I would give some background information, such as: some liquids are immiscible: that is, they will not mix completely and permanently with another liquid. Oil and water are two such liquids.

In preparation, students are told to determine the roles of each person in the group. If there are more roles and responsibilities than people in the groups, some may have more than one assignment.

Equipment/material Gatherer:

(gets one pan of milk and one pan of water, one towel, one box of food coloring, and one bottle of green concoction.)

Experimenter

(drops food coloring and the green concoction into the water and milk as consistently as possible; follows suggestions given on this instruction page and those of the observers and notetakers.)

Observer

(verbally notes what occurs accurately.)

Recorder

(jots down all observations and questions as accurately a possible.)

The experiment:

Preliminary procedures: 1. Put the bowls with water and milk next to each other; let the liquids settle to stillness. 2. Help the recorder, the one who takes notes, before beginning the experiment.

The Experiment, part 1: Adding the food coloring

3. Conduct the first part of the experiment by dropping food coloring in

each bowl, trying to be as consistent as possible. Enjoy and try a variety of "drops"!

4. Complete "The Experiment, part 1: Adding the food coloring" by recording what happens.

5. Complete the observation sheet by generating and recording questions that come to your mind during this part of the experiment.

The Experiment, part 2: Adding the Green Concoction

1. Conduct the second part of the experiment by adding one drop of Green Concoction to the largest food coloring and water "blobs".
2. Complete observation sheet.
3. Add more drops of Green Concoction and watch what happens!
4. Recorder generates and records questions that come to mind during this part of the experiment.

The Experiment, Conclusion

Complete all information by recording what you've learned about the experiment.

Performance Assessment:

We already know that milk contains drops of fat which do not mix with water soluble food coloring. We also know that whenever the dishwashing liquid touches the milk a change occurs. Given this information, what would you do if a oil rig breaks down and spills all of it crude oil into Lake Michigan?

Rubric:

End of Unit Assessment
2 points = Answer with Example and Explanation.
1 point = Answer with Example.
0 points = No Answer.

Return to Physics Index

Surface Tension

Amina Grant
l448 East 52nd. St. #252
Chicago IL 60615
312-324-2229

Shakespeare
1119 East 46th St.
Chicago IL 60653
312-535-1560

Objective:

Students will observe forces between the water molecules which form Surface Tension.

Materials:

The following materials are for a class:

1. overhead
2. beaker
3. straight pins
4. water
5. wire (24 cm. long to make a cradle for straight pin)
6. medicine-cups (to hold 1 part Joy)
7. water soluable pens
8. liquid detergent (Joy) & Glycerin
9. square wire frame (use the same wire from cradle)

Strategies:

Surface Tension

a. Fill the beaker with water, (each student has his own beaker and straight pin).

b. Take the straight pin and show that it is not possible to float a straight pin on the water when it is dropped vertically into the water.

c. Fish straight pin out of the water and dry it off or use another needle.

d. Now hold the needle horizontally as close as possible to the surface of the water (without touching the water) and drop it.

Questions

1. Why is it not possible to float the needle on the water when it is dropped vertically?
2. Why is it not possible to float the needle on the water when it is dropped horizontally?
3. What happened?
4. Why did it happen?

e. The teacher will say, "I predict the straight pin will sit on top of the water if placed right."

f. Give students a piece of wire, demonstrate how to make a "wire cradle" for the straight pin.

g. Put the straight pin on the cradle lift it to the surface of the water, remove the cradle without pulling straight pin beneath the surface.

Question

1. What property of the water keeps the straight pin afloat?

EXPLANATION:

When the needle is dropped vertically into the water, it pierces the water surface. The surface tension at that very small area of the straight pin is not large enough to hold the needle afloat. But when the needle is dropped horizontally, a much larger area of the water surface is involved. When the cradle serves to balance the straight pin on the water surface the forces between the water molecules under and around the straight pin are large enough to hold the needle afloat.

II. At this point include a brief talk about molecules. Use a transparency and overhead to illustrate the forces at work between the molecules.

III. The Circle Inside The Frame

a. Make a soap solution by mixing the following liquids: 1 part Joy, 21/2 parts glycerin, and 3 parts water.
b. Place this soap solution in the shallow container, make a soap film by dipping the wire frame in the solution and taking it slowly out.
c. Make a small loop of thread (diam. 3-4cm), wet it in the soap solution and lay it carefully in the soap film.
d. Once the thread loop lies in the soap film, pierce the center of the loop with a dry object (pencil or dry finger).
e. Slant the wire frame, wiggle it, and observe the perfect thread circle move and travel throughout the whole frame.

Question(s)

1. What made the wrinkley thread turn into a perfect circle?
2. What does this tell us about the forces working on it in the soap film?

EXPLANATION:

This demonstration shows that there is indeed a tension working in the soap film. However, the surface tension of water is much greater than that of soapy water.

Performance Assessment:

The performance assessment that I would use represents COLLABORATIVE LEARNING, teacher and students evaluate an investigation.
i.e. 1. What did we do that helped you most to find an answer?
2. What could we have done better?
3. What new ideas did we discover?
4. What materials and equipment helped us most?
5. How did we use measurements to help find answers?

Scoring Rubric:

1. 5 points: an explanation that is complete
2. 4 points: if student includes a diagram (a)
3. 3 points: the response is generally correct, but the explanation lacks clarity.
4. 2 points: an object identification, more than one.
5. 1 points: the response is incorrect, wrong use of term(s)

Conclusions:

Each project will be judged according to its relationship to the NGUZA SABA principles of Blackness.
e.g. PRINCIPLES

1. Umoja (unity) Does project encompass at least one science area?
2. Kujichagulia (self-determination) Does the project demonstrate an understanding of a need for Afrikan people to develop solutions for their particular needs?
3. Ujima (collective work and responsibility) Is there evidence of shared responsibility for the development and care of the exhibit?
4. Ujamaa (cooperative economics) Were the materials for the project obtained using self-reliant means?
5. Nia (purpose) Is the project based on a hypothesis?
6. Kuumba (creativity) Are students able to discuss project without reciting the written material of the exhibit?
7. Imani (faith) Is there evidence of dedication among the scientists?

Viscosity

Gale Hunter
10750 S. Eberhart
Chicago, IL 60628
(312) 785-1941

Dyett Middle School
555 E. 51st. Street
Chicago, IL 60615
(312) 535-1825

Objective:

Discover what viscosity is and how it relates to our lives.

Materials:

A device that will allow two or more liquids of different viscosity the opportunity to flow at the same time: marbles, wind-up-toy, timer, funnel, eye dropper, toy car, one uncarpeted board, one carpeted board, soap, chop sticks, empty container, small closed containers of different viscosity liquids, large containers of different viscosity liquids, six same size dictionaries, Kyro syrup 100%, Kyro syrup mixed with water 75%, 50%, 25% and water (100%).

Strategy:

1. Briefly discuss the difference between quantitative and qualitative data. Relate the discussion to the following experiments.

2. Discover friction: create two ramps with the books and the boards. Release the toy car on the uncarpeted board first, then the carpeted board. Ask the students why one is slower. Discuss what happens.

3. Discover the results of friction: Have students rub their hands together. Discuss what happens. Rub the chop sticks together and touch them to the area below the nose. Discuss what happens. Rub the chop sticks with soap and then together and touch them to the area below the nose. Discuss the results.

4. Turn the small containers over allowing the liquids to flow. Point out the movement of the air bubble in each liquid. Discuss what happens.

5. Five groups of students: 0% (Water 100%), 25%, 50%, 75%, 100% Kyro Syrup.

6. Students will time how many drops of liquid comes out of a dropper in ten seconds. Discuss the results.

7. Students will drop marbles into the large containers of liquids and time how long it takes the marbles to travel to the bottom. Five marbles should be timed and an average time computed.

8. Data is collected in a table on the board by students. Each group should discuss their results. The total findings should be discussed.

9. Discover how engines work with different viscosities: Pour the liquids into the empty containers. Wind up the toys and put it into the liquids. Discuss the results.

Conclusion:

Through the step by step discussions, students should begin to realize that viscosity is one of the most important properties of lubricating oil. Viscosity is a measurement of resistance to flow or how thick or thin an oil is. Lubricant flow characteristics are relative to temperature. When temperature is increased, viscosity is decreased and vice-versa. Students should understand the motion of molecules in matter before and after heat is applied.

Does AIR Really Exist?

Elyse Futterman
9759 Huber Oval
Niles, IL 60648
708-967-7613

Bernard Zell Anshe Emet Day School
3760 North Pine Grove
Chicago, IL 60613
312-281-1858

Objective:

[Grades 3-5]

Given a teacher demonstration and various learning stations, the students will learn that air is a real substance which occupies space, exerts pressure, and has weight.

Materials:

The following materials are needed for the teacher demonstration:
2 large soft drink bottles, pencil, balloon, and container with warm water.

The following materials are needed for each station:
1) Piece of paper, balloon, straw, 2 suction-cup plungers, water, 2 8-ounce plastic tumblers marked A and B, and deep bowl filled with water.
2) Balloon, beaker, test tube, water, ink, plastic bag, twist tie, book, clay, funnel, jar, straw, and water.
3) Large clear glass jar, plastic bag, string, meter stick, string, pencil eraser, ring stand, and balloon.
4) Thin board, newspaper, straws, pin, cups, water or juice, ring stand, plastic tubes, picture of sink and house, air vent, and carpenter's tool.

Procedure:

Teacher demonstration: Set up two large soft drink bottles. Place a pencil into one, but leave the other bottle empty. Have the students verify that one bottle is empty. Next attach a small balloon over the top of the empty bottle. Then set the bottle in a warm container of water (the students should not be told this). As the students observe, the balloon slowly fills up. The students will discover that the bottle was not empty!

Stations:

1. Can I really feel air? Can I see air move?

   A. Fan your face with a piece of paper.
   B. Blow up a balloon and open the end slowly.
   C. Blow through a straw and place your hand near the end of the straw.
   D. Moisten the edges of the two plungers. Push the ends of both plungers together and pull them apart.
   E. Look at the glasses marked A and B. Push glass A, mouth first, into the bowl of water. Turn it on its side. Observe. Push glass B to the bottom of the bowl, mouth first. Put the mouth of glass A right above glass B and slowly tip glass B on its side.

2. Does air occupy space?

   A. Blow up a balloon.
   B. Fill a large beaker half full of water. Add two or three drops of ink to the water. Insert a test tube open end down. The water does not enter the test tube because air occupies the space. Tilt the tube so that some air escapes. Water now enters to occupy the space vacated by the air.
   C. Wave about and collect air in a plastic bag. Quickly close the bag and tie the end with a twist tie. Place the bag on a table top and balance a book on top of the bag.
   D. Mold some clay around the neck of a funnel. Press the funnel into the mouth of a jug so that an airtight seal is created. Quickly pour water into the funnel. Observe. Put a straw into your funnel. With your finger over the upper end of the straw, insert the straw into the neck of the funnel. Push the straw down through the funnel filled with water. Remove your finger from the straw. Continue pouring water into the funnel. Observe.

3. Does air have weight?

   A. A wide glass jar is displayed. Push a plastic bag inside the jar hanging over the rim. Wrap the string around twice around the rim, just below the threads, and tie it tightly. Reach inside the jar and pull the plastic upward. Observe.
   B. Use string to suspend a meter stick in the middle. In one end of a 15-cm (6-in) length of string, make a loop to fit over the end of the meter stick. Tie a pencil eraser to the other end of the string. Tie another loop in a 15-cm. (6-in.) string and tie an empty balloon on the other end of the meter stick and balance it by moving the eraser on the other end of the meter stick. Mark where the eraser loop is on the meter stick. Remove the balloon and inflate it. Retie the balloon in the same place.

4. Does air have pressure?

   A. Ask two students to compete in a drink race. See who can drink a small glass of beverage fastest. See to it that one pupil has a normal straw, but give the other student a straw filled with pinholes. Have the students examine the difference.
   B. This event should be performed by the teacher. Obtain a thin board. Lay the board on a table so that one end extends over the edge by 15 to 30 cm. Place sheets of newspaper over the remainder of the stick on the table. Be sure to place extra sheets directly over the stick so that the stick does not cut through the paper when you perform this event. Ask the pupils to predict what will happen when you push slowly on the stick. Are the newspapers heavy enough to break the stick? Hit the stick sharply.
   C. Plumber's Magic: Set up a model of the p-trap with plastic tubing so that you design a model of a sink. Have the students pour water into the "sink" and observe what happens to the water.

Return to Physics Index

Air Pressure

Gloria Heard	Willams Carter
9421 South Green	5740 South Michigan
Chicago, Illinois 60620	Chicago, Illinois 60649
312 445-4434	312 947-7160

Objective:

To get a better understanding of air pressure and how it effects our daily lives.

Material Needed:

The following materials are needed to complete these activities at various stations:

A. Balloons	F. Balloon pump	K. Plastic cups
B. Water	G. Cottonballs	L. Spheres
C. Plastic bottles	H. Medicine dropper	M. Food coloring (optional)
D. Boiled eggs	I. Suction cups	N. Glass bottles
E. Balance (scales)	J. Paper	O. Model of human breathing system

Recommended strategies:

1. Get the class' attention by having them do breathing exercises, inhaling and exhaling two or three times.

2. Next, asked class how this process is related to air pressure? Use model of breathing system for demonstration.

3. Give a review of the basic concept of air pressure, that is, how it can be weighed, takes up space, and where and how it is found.

4. Take out two plastic bottles and ask class, if the bottles contain air? Demonstrate to class that the bottles contain air by sucking or taking most of the air out of one bottle. Ask student to compare the changes in the two bottles.

5. Next, ask students whether they think that the bottle can be brought back to its original shape? Do this by blowing air back into the bottle.

6. Repeat the same activity by using a balloon.

7. Have student to divide into groups of four, go to assigned stations, and try to understand the principles that we have discussed.

8. Student helpers will be assigned to the stations for assistance.

Station 1:

Students will do this activity to test whether air is in something.

Material needed: 8-ounce plastic tumblers; Tissue; Deep bowl filled with water

Procedure:
1. Look at the glass. What is in it?
2. Crumple the tissue and put it in the bottom of the glass.
3. Turn the glass over (be sure the tissue does not fall out) and push it mouth first into a deep bowl of water.
4. Now remove the glass without tipping it.
5. What happens to the tissue?
6. What can you say about this?

Station 2:

Students will demonstrate and learn what air can do to an egg.

Material needed: Hard boiled egg, peeled; Glass milk bottle; Kitchen matches

Procedure:
1. Stick two matches in the pointed end of the egg.
2. Holding the bottle upside down, light the matches and put the egg into the mouth of the bottle, pointed end in first. Hold the egg lightly against the mouth of the bottle-don't push! Keep the bottle upside down.
3. What happened? What can you say about this?

Station 3:

Students will learn how air can be compressed.

Material needed: Clear plastic 16-ounce shampoo bottle filled with water;
Medicine dropper filled with a small amount of water

Procedure:
1. Observe the medicine dropper floating in the bottle.
2. Gently squeeze the bottle.
3. What happened? What can you say about this?

Station 4:

How can air pressure make things stronger?

Material needed: Paper straws; Raw potato

Procedure:
1. Hold a straw near one end and try to stick the other end in a potato. What happened?
2. Place your finger over the top of the straw and stick the other end into the potato (do it fast and hard). What happened?
3. What can you say about this?

Conclusion & Evaluation:

The conclusion of this lesson is that students will be able to understand air pressure, how and when it works, and some of the concepts that can be achieved by using air pressure.

AIR PRESSURE

Allen, George Austin Community Academy
5816 N. Sheridan Rd.(8A)
Chicago, Illinois, 60660
1-312-334 3651

Objective

The purpose of these demonstrations is to aid the student in learning basic principles of air pressure.

Apparatus Needed

Balloon Glass Jar
Water Soap
Pencil

Balloon In Jar

Inflate the balloon so that it is slightly larger than the mouth of the jar. Try to force the balloon into the jar; it is difficult, if not impossible. Then slide the pencil down beside the balloon and the balloon may be pushed into the jar. The balloon seals the opening of the jar so that air cannot escape around it, and as it is pushed, it tends to compress the air in the jar slightly. It cannot be easily pushed against the air pressure.

Apparatus Needed

Plastic Glass
Hot Water
Smooth Surface

Gliding Glass

Rinse the glass with hot water. Leave a little water in it, and invert the glass onto the smooth surface. The glass will "skitter" around as if on ice, with almost no friction. As the water is poured out of the glass it is replaced by room air. Heat stored in the glass and water, heats the air somewhat; it expands and the pressure lifts the glass a tiny distance from the surface of the table. The glass floats on a film of water and a cushion of air. This is the same principle used by the surface-effect vehicles or "hovercraft."

Apparatus Needed

Erratic Ball

Table Tennis Ball
Thread
Scotch Tape
Soda Straw With Flex

Attach the ball to the end of the string with a tiny piece of tape. Suspend the ball by the string. Blow upward against the ball through the straw. Blow harder, then slowly, and reverse. Blow gently up against the ball, just off center, and the ball will try to "outflank" the air jet by going around it to where it can hang vertically. The ball's motion will be quite erratic. Blow harder and the ball will go into the center of the air stream and tend to remain there. Moving air exerts less pressure than still air, so the ball tends to remain so that the pull of the moving air around it is nearly equal on all sides.

Apparatus Needed

Crushed Jug

Gallon Size Plastic Jug
with screw on lid
Boiling Water

Put boiling water into the jug and shake it with the lid closed, but loose. When steam and water stops coming out, screw the lid on tight. The jug will begin to collapse. The action can be speeded up by using cold water on the jug. As the steam in the air condenses, the pressure in the jug diminishes. Atmospheric pressure crushes it.

Apparatus Needed

The Hovercraft

An Old Long Playing Record
A Wooden Spool
A Candle   A Large Balloon
Smooth Surface

Fix one end of the wooden spool so that the balloon can be slipped over it. Attach the other end of the spool to the center of the record with candle wax or glue. The holes in the spool and record should match. Inflate the balloon, slip its mouth over the spool and place the record on a smooth surface. Release the balloon and the record will glide over the smooth surface with little friction. When the record rests on the surface it tends to remain there because of the friction created when the surfaces move against each other. The air stream from the balloon puts a thin layer of air between the surfaces, eliminating most of the friction.

The Pressure Of A Liquid

Bradley, Patricia John Hope Community Academy
8005 S. Eberhart
Chicago, IL 60619
1-312-538-8066

Objectives

1. Students will see what happens when the pressure of a liquid is not the same on all sides of a submerged object.
2. Students will find out how the pressures of a liquid (water) works.

Equipment and Materials

Part 1	Part 2
empty milk carton	hollow tubes open on both sides (small orange juice can)
a pen or pencil	bowl or basin
a piece of tape the length of carton	metal jar lid
two liter plastic bottle (put hole in bottom of bottle)	water
2 cans (one large, one small)	drinking glass
put hole in each can 2 cm from bottom, fill each can 5cm high	fish tank
drinking glass	

Recommended Strategies

Begin lesson by using phenomenological approach in demonstrating how water pressure works. Using an empty milk carton, a pen or pencil, and a piece of adhesive tape. The length of the carton will help show how water pressure works. Use the pencil to punch three holes, one above the other, on one side of the carton. Make the top hole at least 3cm (1 1/4 inches) from the top of the carton. Cover the holes with the adhesive tape. Fill the carton with water. Put the carton in the sink or bathtub. Strip off the tape quickly. Which stream of water travels farthest? How does it work? WATER PRESSURE is the key to the answer. The water near the bottom of the carton has the force of all the water above it pushing it out. The water near the top has very little water-and therefore pressure-above it. This demonstrates water pressure from the sides. Next, punch a hole in the bottom of each can (small and large) 2cm from the bottom of the cans. Cover the holes with a strip of tape. Fill each can with water to the same depth (e.g. 5cm, 2 inches, deep in each can). The larger can will hold more water than the small can. Put both cans in the sink or bathtub. Pull off the tape at the same time. Which stream goes farther? (The streams should be the same length.) The depth of the water makes the pressure greater, but the amount of water doesn't. This demonstrates water pressure in downward a direction.

Next, using a fish bowl filled with water, demonstrate water pressure in upward direction by using a two liter bottle with hole in the bottom. Stick bottle in fish tank and watch the water flow upward.

Now you are ready to begin your lesson on water pressure because you have demonstrated that a fluid exerts a pressure in all directions. If an object is placed in a bowl of water, pressure is exerted on all sides of the object. If, however, one side of the object is not in contact with the water, pressure is not equal on all sides. In this activity you will see what happens when the pressure of a liquid is not the same on all sides of a submerged object. To do this activity follow the steps below to learn more about the pressure of a liquid. 1. Fill a drinking glass with water. 2. Fill a bowl or basin with water. 3. Place the metal jar lid under the hollow tube. Now, keeping both objects together, place them in the bowl or basin of water. (Be sure to hold them together, otherwise, the can will turn on its side. 4. Does the plate sink to the bottom? Explain your answer. 5. Slowly pour water from the drinking glass into the hollow tube. At what point does the jar lid sink to the bottom?

ANSWERS 4. NO. Pressure exerted by the fluid (water) pushing upward on the jar lid is greater than pressure pushing down on it. Because there is no water in hollow tube, there is no water pressure. Water pressure on all sides of the object isn't equal because one side isn't in contact with the water. 5. The jar lid sinks to the bottom when the level of the water in the hollow tube is equal to the level of water in the bowl or basin.

LIQUID CONDUCTORS

Perry, Jean M.
2200 Bennett Avenue
Evanston, IL 60201
1-708-491-0411

Oakton Elementary School
Evanston, IL
1-708-492-7981

Objectives

1. Students will construct a circuit tester.
2. Students will predict what liquids are electrical conductors.
3. Students will test and identify liquid electrical conductors and non-conductors.

Apparatus Needed (for each group of four students)

*4 D batteries
*4 battery holders
*1 bulb holder
*8 brass electrical clips
*2 Fahnestock clips
*l l 1/2V miniature bulb
#20 bare copper wire as needed
large covered containers
markers
labels
plastic tumblers
vinegar
salt
ethyl alcohol
sugar
baking soda
distilled water
tap water
lemon juice
safety goggles
paper towels
activity sheet

Recommended Strategy

This activity should follow the study of "series" and "parallel" circuits; the teaching of how to construct a circuit tester; and the testing of solids for their ability to conduct electricity.

Advance Preparation:

-Organize materials in a shoe box or tray for each group of three to four students.
-Test the batteries and bulbs to make sure they work. Have replacements available.
-Make a circuit tester for liquids and have it on display for students to use as a model for making their circuit tester. (Circuit tester should be a series circuit made of four D batteries with the Fahnestock clips as electrodes.)
-Prepare solutions of salt, vinegar, baking soda, sugar, lemon juice, and ethyl alcohol in distilled water. Use your own judgment as to the proportions; the liquids need only be strong enough to light the bulb in the tester. Store the solutions in clearly labeled, covered containers.
-Prepare an activity sheet for recording observations. Activity sheet should include columns for recording the names of liquids tested, student predictions, and observations.

Doing the Activity:

l. Students write the names of liquids to test in chart (activity sheet).
2. Students predict if the liquids will or will not conduct electricity. Prediction is recorded.

3. Circuit tester is made using teacher's tester as model.
4. Each tumbler is labeled with the name of one liquid.
5. Students are reminded to WEAR SAFETY GOGGLES. At least 3 cm of one liquid is poured into the correct tumbler. The clips of the tester are put into each tumbler at equal depth and equal distance apart. Observations are recorded.
6. Testing liquids will need some guidance from the teacher. For best results, the flat sides of the clips should face each other. The liquids should not be mixed, and the clips should be cleaned between tests.
7. Discuss:
   a. What liquids will allow the bulb to light?
   b. What liquids will not allow the bulb to light?
   c. Does the bulb glow with the same brightness with each liquid?
   d. Are there any changes in the clips when you are testing?
   e. Did you notice anything happening in the liquid when you were testing?
8. Record conclusions on overhead or chalkboard.

Optional Activities:

l. Have the students repeat the activity using liquids brought from home such as coffee, liquid soap, orange juice. DO NOT USE CAUSTIC, CORROSIVE, OR POISONOUS LIQUIDS.
2. Interested students may advance into the study of acids, bases, and salts.
3. Challenge students to design another type of conductivity tester.

*These materials can be ordered from:

Liquid Pressure

Johnson, Leon
2605 S. Indiana Ave.
Chicago, Illinois 60616
326-1185

D. H. Williams Elementary School
567-7026

Objectives:

To understand Pascal's Law.
To understand Boyle's Law.
To show that water is a virtually incompressible liquid.
To understand Archimedes' Principle.

Apparatus Needed:

Rectangular bottle, 1 cork stopper, 2 rubber stoppers with opening in the middle, open ended glass tube, Listerine bottle, gallon jug, hammer, clear plastic dishwashing liquid bottles (Ajax or Palmolive) with tops, medicine droppers, water, food coloring, hot water bottle, 4 meters of plastic tubing, C-clamps, metal extension rods, meter stick, rope, 30 cm. square board, swing structure approximately 2 meters tall made of 2"x4" wood with 60 cm. square 3/4" plywood board at top with holes for rope drilled at corners, 4 weights (14.3 lb. exercise weights were used in this mini-teach), 20 cm.x50 cm. plywood board.

Recommended Strategy:

Put glass tube through stopper. Fill rectangular bottle with water. Place a few drops of food coloring in water. Put stopper in top of bottle. Pass bottle around class. Have students note what happens when the sides are squeezed. Repeat this procedure with the Listerine bottle. Have the class note the results of squeezing this bottle. Ask questions as to why this happened.

Fill gallon jug with water. Put cork stopper in top of the jug. Compress the water by pounding stopper into the jug with a hammer. The increased water pressure should cause the jug to break. Explain that this illustrates Pascal's Law.

Show the class a Cartesian Diver model made from plastic soap bottle and medicine dropper. Explain how to make one by filling the bottle with water and medicine dropper with just enough water so that head of dropper floats. Dropper should dive when bottle is squeezed. It should return to the top when pressure on bottle is released. Let each class member make a Cartesian Diver. Explain that Pascal's Law, Boyle's Law and Archimedes' Principle are illustrated in the Cartesian Diver.

Fit plastic tubing through rubber stopper. Fit funnel on other end of plastic tubing. Fill hot water bottle with water. Color water with food coloring. Secure rubber stopper in opening of hot water bottle so that water does not leak and stopper does not pop out. Place bottle on top of 60 cm. square board at top of swing structure. Run rope through 30 cm. square board. Place it on top of water bottle. Run the rope through holes in corners of the 60 cm. square board. Place 20 cm.x50 cm. board at end of ropes for the swing. The C-clamps should be attached to the lab table with extension rods holding the funnel and plastic tubing about 3 meters above the height of the hot water bottle. Height of water in tube with board on top of water bottle should be calibrated as point zero. Place one weight in swing. Measure height of liquid in tube. Mark off point on tube. Continue placing weights in swing. Record weight and height of water with each addition. Make a graph of the weight as it changes the water height. Have a student sit in the swing. Measure height of liquid in tubing. Put this point on the graph. Draw a line connecting points to see if the line is linear or curved.

Bathtub Physics - Density, Buoyancy and Flotation

Russell, Renee
8431 S. State
Chicago, Illinois, 60619
(312) 783-3569 (312) 799-1004
South Shore High School
(312) 933-8180

Objectives:

Understand Archimedes' Principle, flotation and the reaction of bouyant forces. Explain the relationship between density and flotation.

Apparatus needed:

triple-beam balance
hooked mass 50g
spring scale
string
500-ml graduated cylinder
800ml beaker
water
bathtub (large container or pool small)
gallon jug
salt solutions: Use Epson Salt
1. sea water 3.5g of salt per 100cm^3
2. Great Salt Lake 20g of salt per 100cm^3
3. Dead Sea 25g of salt per 100cm^3

Recommended Strategy:

1. Record the weight of an hooked mass with a spring scale. Fill a graduated cylinder half-full of water and record the level of water. Hang the mass from the spring scale and lower the object until it is submerged in the water in the graduated cylinder. Record the weight of the object in the water and the amount of water displaced.

2. Use a bathtub to find a student's volume. Fill the tub half-full and mark the level. Submerge a student and mark the level of the water. Once the student is out of the tub, use a measuring device- large graduated cylinder, gallon jug - to fill the tub to the higher mark. The amount of water needed to do this will be equal to the students volume.

3. Place an uncooked egg in a 800cm^3 beaker half filled with water. Next place the uncooked egg in each of the containers of salt solutions one at a time. Make careful observations of what happens in each solution and record your data.

How To Make Water Run Uphill

Team Teach

MEMBERS:

Edgar Boyd
Dorothy Foreman
Earnest Garrison

Objective:

When asked, each student will be able to explain orally, or in writing how water can run up a hill.

Apparatus needed:

1. large bucket
2. 36" glass (hollow) rod
3. 1,000 milliliter glass florence flask
4. ring stand
5. food coloring (blue or green)
6. One hole rubber stopper
7. propane torch
8. matches
9. 2 gallons of water
10. Safety eye glasses

Recommended Strategy:

Assemble apparatus for this demonstration as shown in the drawing below.

```
                   lllll
                   l   l
                   l   l      FLASK
                   l   l
                   lllll
_____________________|_______________________
_____________________|_______________________      TABLE TOP
                     |
                     |
                     |
                     |
                     |
                     |
                     |
                ...........
                 |       |
                  |     |
```

```
                  |     |          BUCKET
                   |   |
 FLOOR             .....
=================================================================
=================================================================
```

Add the food coloring (blue or green) to the water in the bucket. Heat the flask with the propane torch until air bubbles stop coming out of the glass tubing in the bucket. Turn off the propane torch and allow the flask to cool for a few seconds. You should observe water from the bucket moving up the glass tubing and filling the florence flask. You have now made water run up a hill.

Conclusion:

The principle that explains your demonstrations is atmospheric pressure. The atmosphere exerts a pressure of 14.7 lbs. per square inch (15 lbs.) at sea level. When the flask was heated, the expanding gas (air) in the flask was forced out and down the glass tube. As the flask cooled, the atmospheric pressure forced the water in the bucket to go up the glass tubing and replace the air that was forced out of the flask.

Mathematics/Physics

Fish and Clip

Winnie Koo
3752 S Wallace Street
CHICAGO IL 60609
773-247-3727

Ravenswood
4332 N Paulina Street
CHICAGO IL 60609
773-534-5525

Objective:

Have first grade students understand some of the characteristic of magnets.

Materials:

For each group:

2 trays

30 big paper clips- big fish

50 little paper clips-small fish

15" string, tied to any type of magnet, attached to dowel or non-sharp pencil fishing pole.

	Number of large fish	**Number of small fish**
Trial #1		
Trial #2		
Trial #3		
Trial #4		
Trial #5		
Total		
Average		

-

-

Strategy:

Step 1: Through story telling technique some volunteers will come out to do an activity that will show the class the main characteristic of magnets. The characteristic is that metal contains iron will be attracted by magnets.

Step 2: For the following activity students should work in groups of 2-4 and take turns fishing within their groups. When calculating averages, express answers in whole fish with remainders dropped. Use the table provided for the activity.

Procedure:

(1) Put 30 big paper clips on one tray and put 50 small paper clips on the other tray.

(2) With the fishing pole, students fish for big paper clips and record the catch.

(3) Fish for small clips and record the catch.

(4) Perform 5 trials for (2) and (3).

(5) Find the average number per catch for both small and large clips. Briefly review the concept of average if necessary.

Performance Assessment:

Students will be assessed for their understanding about magnet through the following discussion.

(1) Did the magnet attract more small clips or more large clips? Why?

(2) Did any group catch the same number of small or large clips in each of their trials? Why or why not?

(3) Since each group is using a magnet of the same size, did any two or more groups catch the same number of either small or large clips in any trials? Why or why not?

(4) If the activity is being done differently, such as by wrapping two magnets of the same size together, what kind of result will be expected?

Conclusions:

Even if magnet of the same size and shape, they may vary in magnetic strength.

References:

None.

Janet M. Sheard - West School

Series and Parallel Circuits

Janet M. Sheard
4850 South Lake Park
CHICAGO IL 60615

West School
1010 Forestway Drive
GLENCOE IL 60022
(847) 835-6600

Objective(s):

These lessons are designed for fourth-sixth grade students to do for five-seven days. Each student will be able to:

1. identify man's needs and uses for light in a time line.
2. understand that many people choose science as a career and devote their entire lives studying it.
3. identify what contributions Ben Franklin made to electricity.
4. draw and explain how to build a closed and an open circuit.
5. construct a simple series and parallel circuit.
6. understand the meaning of and use of the following vocabulary words: D-cell battery, current, closed and open circuits, protons, electrons, and neutrons.

Extension:

The students will be able to:

1. construct and attach a switch to a series and/or parallel circuit.

Materials Needed:

For two students to create a series and parallel circuit

1 D-cell battery
4 six inch pieces of wire
1 battery holder with Fahnestock clip
2 bulb holders
2 bulbs
list of electrical symbols used to represent a battery, wire, and switch
student science journal

The following materials are needed to create a switch for one or two students

2 6-inch pieces of wire
1 paper clip
1 3"x 5" index card
2 No. 3 brass paper fasteners
2 brass paper fastener washers
2 Fahnestock clips

Material Needed for Extended Activity:
1 roll 3/4" masking tape

Strategy:

Initial Motivation:

1. Brainstorm with the students to find out what previous knowledge they have about electrical currents and circuits.
2. Prepare a time line entitled "Time Line of Man's Needs and Uses of Light" for each student. Put the dates in sequential order by placing the correct number between the parentheses.
   ( ) FLUORESCENT LIGHTS: 1940 A.D.
   ( ) FIRE: 400,000 B.C.
   ( ) FLASHLIGHT: 1898 A.D.
   ( ) SUN
   ( ) GAS LAMP: 1700 A.D.
   ( ) ELECTRIC LIGHT BULB: 1880 A.D.
   ( ) KEROSENE LAMP: 1800 A.D.
   ( ) TORCH: 6000: B.C.
   ( ) CANDLE: 1300 A.D.
   ( ) OIL LAMP: 100 A.D.
3. Read highlights from a biography of Benjamin Franklin.

First Activity: Create a basic simple circuit.

1. Give each pair of students a box with a D-cell battery, 1 6-inch wire, and a bulb. Explore. "How can you make the bulb light?" Draw at least three ways the bulb lit in a science journal. Choose several illustrations to draw on the board.
2. Discuss the connection between the meaning of a current and a circuit.

Second Activity: Create a simple circuit.

1. Pass out another 6-inch wire, a battery holder, and 1 bulb socket Ask, "Can you make the bulb light?" Explore. Draw several illustrations on the board and in individual science journals. Share and discuss with the class.
2. Reinforce the meaning to make clear the distinction between circuit and current.

Third Activity: Create a series circuit.

1. Pass out another 6-inch wire and another bulb and bulb holder. Ask, "Can you make the bulbs light?" Explore. Draw on the board and in science journals several ways the group discovered to make the bulbs light. Share and discuss with the class.
2. Introduce the secret language of electricity. Draw an illustration on the board using electrical symbols.

Fourth Activity: Create a parallel circuit.

1. Give each student another 6-inch wires. Ask, " Can you make the bulb light?" Explore. Share illustrations and discuss the techniques used to make the bulb light.
2. Identify the name parallel circuit.
3. Pass out the page with the secret language of electricity. Use these symbols to illustrate a simple way to draw a parallel circuit without using pictures.

Extension for the lesson:

1. Attach a switch to the series and parallel circuit by using previous acquired knowledge.
2. Research and prepare a presentation about Michael Faraday, Joseph Henry, Thomas Edison, and Samuel Morse. The teacher should design an information page to collect data for report.

Performance Assessment:

Basic: The student will be able to:

construct and draw an electrical circuit.
recognize electrical symbols.

Proficient: The student will be able to:
illustrate one example of a series and parallel circuit using electrical symbols.
write a definition of a series and parallel circuit.

Advanced: The student will be able to:
draw two illustrations of a series and parallel circuits using electrical symbols with the illustrations.
teach a new student how to create an electrical circuit.
apply the function of an electrical current to another kind of circuit.
write a detailed explanation of an electrical circuit using electrical symbols.

Conclusions:

The students will be able to:
1. explain the difference between a closed circuit and an open circuit.
2. explain the difference between a series and parallel circuit.
3. explain the advantages and disadvantages of series and parallel circuits.

Stephen W. Ha - James Ward School

Simple Circuitry and series circuit

Stephen W. Ha
3752 S. Wallace St.
CHICAGO IL 60609

James Ward School
2701 S. Shields Ave.
CHICAGO IL 60616
(773) 534-9050

Objective(s):

Note: This mini-teach is designed for a 3rd-grade or 4th-grade class.

(1) Explain the elements that are required to build a basic electrical circuit.

(2) Demonstrate and describe a series circuit.

Materials Needed:

A piece of 10-foot wire, a bag of candy, chalks, blackboard, work papers, and five labels (battery, switch, and 3 light bulbs).

Strategy:

Brainstorming (approximate 5 minutes)
- Ask students what they know about an electrical circuit and what they need in order to construct a basic electrical circuit. Then Write down all responses on the board.

- Discuss all responses that are related to the topic of circuitry and lead to the conclusion that a basic electrical circuit must contain a power source, electrical wire, a switch, and a lighting device (a light bulb in this specific lesson).

- Draw a simple circuitry on the board (use D.C. battery as power source) and make sure students learn all symbols being used in a circuitry.

Activity

(1) Let students know they are going to do an activity to help them understand what is a series circuit. Ask for five volunteers for the activity.

(2) Tell the class the series circuit they are going to see will contain 5 components and each student will represent a component after I have put a label on each of them. The components are a battery, a switch, and 3 light bulbs.

(3) Have the five volunteers facing the class and standing in a straight line across the room. The two being labeled battery and switch should stand on each end of the line in a way that, as students look at them, the person

represents the battery should be on the left end and the person represents the switch should be on the right end.

(4) Bring out a 10-foot wire and have each volunteer using his/her right hand hold the wire up. Then they will form a circle, i.e., the battery and the switch should be right by each other now.

(5) Bring out a bag of cookies and tell the class that each cookie will represent the electrons in the current that are getting ready to move along with the current.

(6) Give a piece of cookie to the battery. After he/she have eaten the cookie, he/she will grab the wire with his/her free hand. This means that the battery is full of charge now and the current is getting ready to move through the wire to the next component, as long as a closed path is present.

(7) Then going clockwise I will ask the next component the question "Would you eat a piece of cookie so that the current can pass through to the other side of the wire?" If the answer is "No", any volunteers with his/her left hand holding on the wire must make sure his/her left is off the wire now, and the activity should start all over again from step 6 because there is an open path in the circuitry.

(8) If the answer is Yes" and the current component is not the switch, he/she should eat the cookie, put his/her left hand on the wire so that the current can pass through the component, move to the other side of the wire and go back to step 7. Otherwise, the switch should consume the cookie and grab the end of the wire from the battery. The result is we just complete a series circuit.

Performance Assessment:

A work paper will be passed to each student to work on the material they just learned. They should now be able to identify the standard symbols being used in electrical circuitry. They should also be able to construct a series circuit of their own.

Conclusions:

A series circuit is simple to construct but it is hard to troubleshoot in case a fault is present.

Barbara J. Baker - Doolittle West School

About Magnets

Barbara J. Baker
5431 S. Dorchester Ave,#2
CHICAGO IL 60615

Doolittle West School
521 East 35th Street
CHICAGO IL 60615
(773) 535-1050

Objective(s):

This lesson is designed for second grade level students. Conduct simple experiments and observations and explain what was discovered. Designing a magnet from a sewing needle. Making a compass. Understanding the vocabulary terms.

Materials Needed:

Magnets, sewing needles, cheerios cereal, nails or screws paperclips, hair pins, sand, water, paper cups, large container, cork, contrasting paper towel to place the sand on for example, if you use white sand, use a brown paper towel

Strategy:

Students will be placed in cooperative groups to work the procedures and to study the following vocabulary words:

magnetic fields	magnetic force
magnetic strength	magnetized particles
north & south poles	compass
procedure	compare
repel	contrast
attract	iron

Each group will have a recorder and presenter who will work together to illustrate the phrases by drawings or explanations which will be shared with the whole class.

By dragging the magnet across the sand, students will observe that sand often contains particles of iron.

After the cereal has been crushed, magnets will be dragged across it to see if any iron from the cereal adheres to the magnet.

Magnets will be placed in water and later attract pins to test if water interferes with the magnetic field, the same magnet will be dragged over the sand to compare and contrast the findings.

Moving the magnet across the needle will magnetized the needle, the needle will be inserted into a cork and placed in the large container of water to observe how this handmade compass is working

Performance Assessment:

Students should demonstrate comprehension through visual observation of how the students completed the procedures. The comprehension of the terms and the use of these terms with 95% or higher accuracy. If a magnet or a compass is brought in for show and tell, the student is showing retention and continued interest in magnets.

Conclusions:

The earth and many things in the earth are magnetic.

Mathematics/Physics

Magnet Muscles

Deborah Barnes	Robert H. Lawrence School
1642 E. 56th Street	9928 S. Crandon Ave.
Chicago IL 60637	Chicago IL 60617
(773) 918-9262	(773) 535-6320

Objective(s):

Students will be able to recognize the strength of a magnet, what part of the magnet is the strongest, and what is a magnetic attraction.

Materials Needed: (For an entire class)

Several bar magnets and/or magnets of different sizes and shapes, several magnetic objects (paper clips, nails, iron filings, etc.), several nonmagnetic objects (plastic, paper, coins, etc.), pens and/or pencils, data-capture sheet - one per student (pages 13, 15, 23, 72, 82 92), 20 small nails, large nails, 20 metal paper clips, several compasses, a table or flat surface, wooden rulers and construction paper.

Strategy:

1. The teacher will introduce the topic by explaining some basic facts about magnets. Students will be allowed to observe a magnet.
2. The teacher will also explain the concept of a magnetic field. The students will observe the teacher place a bar magnet under a piece of thermal fax paper. A student can be chosen to come up and sprinkle pieces of iron fillings on the paper. Observe to see what will happen. Then teacher can then discuss the magnetic field of a magnet.
3. The teacher will explain the scientific method, which will be used in the lesson.
4. Cooperative Learning Strategies will be explained prior to placing students in cooperative learning groups.
5. Once each group has been placed, the groups will be given the rules for each learning station. Students will have 20 minutes to formulate a hypothesis, test the hypothesis and come up with a conclusion for each station. Predictions and outcomes are to be in written format by the stenographer in each cooperative learning group.
6. Each group begins to research.

STATION A ATTRACTION ACTION

1. Using a bar magnet, select one object at time to see if it is magnetic.
2. Record your findings on the data-capture sheet provided.
3. Once you have tested all of the objects provided, be creative and find five more objects to test for magnet properties.
4. Repeat step 2.

STATION B MAGNETIC MUSCLE

1. With the 20 nails make a pile on a desk or other hard surface.
2. Choose one magnet and place it in the pile of nails.
3. Slowly lift it out of the pile and record the number of nails it picks up on the data-capture sheet provided.
4. Repeat steps 2-3 with the remaining magnets.
5. Replace the nails with the 20 paper clips and repeat steps 2-4. Compare your results from the first experience.

STATION C MAGNETIC MAP

1. Place the bar magnet in the middle of the piece of paper and trace around it to mark its position.
2. Put the compass on the paper near the magnet. Draw and arrow between the compass and the magnet showing the farthest point where the compass needle is affected by the magnetic field.
3. Repeat step two several times all around the magnet.
4. Once you have completed step three, you will be able to see where the magnetic field exists, where it is the strongest, and where it is the weakest.

STATION D NEIGHBORLY NAIL

1. With the large nail try to pick up some of the smaller nails or paper clips. Observe what happens and record on data capture sheet.
2. With one end of the bar magnet, stroke the nail 25 times in the same direction.
3. Try again to pick up the small nails or paper clips with the newly magnetized nail. Observe what happens and record on data-capture sheet.
4. Carefully throw the magnetized nail against a hard surface.
5. Try one more time to pick up the small nails or paper clips with the nails. Observe what happens and record on data-capture sheet.
6. Repeat this experience using iron fillings instead of nails or paper clip. Observe what happens and record on data-capture sheet.

Performance Assessment:

1. teacher-made test
2. oral- group discussions
3. magnetic journals

Electrostatics

Alyce Glauner
P. O. Box 41603
Chicago IL 60641-0603

Grant Community Academy
145 S. Campbell Ave.
Chicago IL 60612
(773) 534-7275

Objectives:

The main objective of the Mini-teach is to show Primary students that there is electricity in all matter.

Materials Needed:

- Van DeGraff Generator
- Rabbit's Fur
- Plastic Rod 12-18 inches long
- Tape
- Small Paper Scraps
- Puffed Rice
- 5 Balloons
- Glass Rod 12-18 inches long
- Piece of String 15cm long
- 3 Pieces of String 35cm long
- Salt and Pepper
- Mashed Potato Flakes
- Electroscope
- Small stream of running water (if available)
- Enough for the class or group-pop cans, 1 in x 1/2 in, aluminum foil strips combs, foam plates, foam cups, pie plates.

Strategy:

Using the Van DeGraff generator place the pie pans face down on top. Put the generator on have students stand back and watch the plates sail off. If you have older students, they can form a chain to see how far out the charge will travel. Always discharge the generator with a stick when you turn it off. The students can also try one at a time to place their hand on the generator, while they stand on a milk-crate to insulate them from the ground. See what happens to their hair.

After the demonstration, the students go to stations. Your options to set this up:

1) Balloons-Tape one end of 15cm string to a table top. Charge a balloon by rubbing it with the fur. Hold the balloon over the thread, don't touch, the thread should move towards the balloon. Tie a 35cm string to one balloon, hang it on something freely, tie the other string around another balloon, and hang it about 5 cm. away from the first. What happens? Charge one of the balloons, what happens? Charge the other balloon, what happens? The first time they should attract, the second time they should repel. Charge a balloon and see if you can get it to attract to the wall. Tie the last 35cm string around a balloon and hang it up or tape it to a table. Charge the balloon and place your hand close to the balloon, don't touch, it should follow your hand.

2) Combs-Comb your hair very hard. Place the comb near one of the above items. The static electricity will make the item attracted to the comb. Try with a number of different items. Come up with your own ideas. Comb your hair again and place the comb near the running water. The stream of water will either repel or attract (the water really moves).

3) Electroscopes-Rub fur on the bottom of the foam plate, place a pie pan on to the foam plate. Lightly touch the pan to charge it. Bring the charged pan over to the Electroscope. The leaves of foil will repel because of like charges.

4) Make Electroscopes and Electrophorous-Glue a foam cup on top of a pie pan, as a handle. Use two foam plates, turned upside-down, to rub the pan on to charge it. Tape a pop can to the top of a foam cup. Take the foil strip and loop it loosely over the tab of the can.

Performance Assessment:

The assessment would probably be teacher observation. Did the student follow directions? Did the student participate in stations? To what extent was his participation? You could also have them record their observations and results in their journals. A rubric would be easy to make for this exercise using:

4=followed directions, used all stations provided, recorded all information requested.
3=followed directions, used most of the stations provided, recorded most of the information requested.
2=followed most of the directions, used some stations, recorded some information.
1=followed some directions, used few stations, recorded little information.
0=nothing done.

Electrostatics

Jan Dudzik
1117 Greensfield
Naperville IL 60546
(708) 778-8579

Riverside Brookfield High School
1st and Ridgewood
Riverside IL 60546
(708) 442-7500

Objective:

High school students will identify two types of charges and will observe the charging of with various objects by friction, conduction, and induction.

Materials:

For each group: Magic tape, golf tube, cat fur, wool, electrophorus, salt, pepper, cereal, slates and markers.

For teacher use: Van de Graff generator, spectral tube, mini electrostatic precipitator (made from plastic 2 liter bottle with two bands of aluminum foil and pins with paper clip leads to connect to Van de Graff).

Strategy:

Part 1: Give each group tape. Tell them to tear off two pieces about the same length. Have students stick the tape to the table side by side, rub them and then pull them off quickly. Tell students to record what happens when they bring the two pieces of tape close together and encourage them to experiment with the tape trying various pulling speeds, lengths and thicknesses and record their findings on the white boards with markers. Bring one member of each group to the front of the class and share results. The class should arrive at a consensus that there are two distinct charges and that rubbing the tape apart produces a charge that repels and rubbing tapes on top of each other produces a charge that attracts. Next, hand out to students the golf tubes and wool cloth and tell them to charge the tubes using friction. Get them up, out of their seats and tell them to find a favorite attractive object in the room to share with the class. (Have various materials in the room: cereal, salt, pepper, balloons, etc.) When students find their object tell them to sit down. Call them down and have them share their findings with the rest of the class. Reemphasize to the class the fact that and object can be charged by friction and can attract objects.

Part 2: Ask students if they think that they can get heavy things to move with a charged tube. Have them check their neighbor and vote on their white boards. Post the tally. Then, charge a golf tube and bring near a 2 x 4 board balancing on a spoon. When it moves and students are mystified, inform them how strong electrical forces are compared to gravitational forces. Ask students to find out if electrical forces are strong enough to snap charges from neutral objects. Give each group an electrophorus and tell them to charge the bottom plastic plate and then place the neutral pan on top of it. Have them pick up the neutral pan by the handle and bring it near an object to see if it is charged. Note student observations and then instruct students to repeat only this time have them touch the pan with their finger before lifting. A charge should snap off and be heard and felt. Ask if the pan was charged in the first case and then ask if it was in the second case. Students should realize that touching the pan helped the pan to become charged. Illustrate the process of induction on the board. Then, call upon two student volunteers to illustrate this one more time in front of the class. Shut the lights off and hand one of the volunteers a spectral tube. When the charged plate touches it, it should glow. Mention that this glow is seen because the tube has molecules of gas that are easier to excite than air molecules. Then, bring the volunteers over to the Van de Graff generator and ask one to stand with one hand on the top of the generator and hold the other student's hand. Turn on generator and charge students. Have another one come up and join the chain. Illustrate the difference between charging by conduction, induction, and charging by friction.

Assessment:

Show students the 2 liter bottle electrostatic precipitator. Point out the features of design. Burn the incense and turn on the precipitator. Ask students to explain how the smoke is trapped by the precipitator.

Batteries and Bulbs

Beverly Gregor
P.O. Box 388218
Chicago IL 60638

Oglesby School
7646 S Green St
Chicago IL 60620
(312) 535-3060

Objective:

Pupils will be exposed to the uses of batteries and bulbs. Pupils will be able to explain the difference between series and parallel circuits.

Materials Needed:

batteries
bulbs
wire
2 switches
6 sockets
plywood 16"x24"

Strategy:

Pupils will have hands on experience with the batteries and bulbs. They will have to make series circuits with one wire and then two wires. The same will apply to a parallel circuit. The teacher will make two models on the plywood; one will consist of three sockets wired together to represent a series circuit. The other will also consist of three sockets wired together to represent a parallel circuit. Each will be controlled by their own switches.

Performance Assessment:

Pupils will be able to light bulbs with the batteries using the different combinations. Also while the teacher holds up the example she/he has made on plywood. Pupils on a sheet of paper will tell the teacher which example is the series circuit and which one is the parallel circuit.

Conclusions:

Students will have a better understanding of the power of electricity and batteries.

Electromagnets

Shirley Porter-Cesair
2004 So. 13th Ave.
Broadview Il 60153
(708) 344-8917

Charles R. Henderson
5650 So. Wolcott
Chicago Il 60636
(312) 535-9080

Objective:

The students will make an electromagnet and determine the strength of the electromagnet.

Materials Needed:

Small Compasses
Three feet of insulated copper wire per person
Six-volt battery
Size D batteries
Battery Holders
Pieces of Cardboard
Nails (3 inches or longer)
Paper clips, tacks, pins, or other small magnetic objects
Iron filings
Salad oil
Glass or plastic cylinder (100 ml)
Wrought iron stand

Strategy:

Activity 1

Students will work in pairs. Each pair of students will receive a baggie containing materials needed. Allow the students ten or fifteen minutes to explore and manipulate the materials. Have one student from each group connect their compass with wire through the holes in the cardboard. Insert the wire through the Fahnestock clips on both ends. Place the wire over the compass. What happens and why?

Concept:

The electrical current flowing through a wire will create a magnetic field. This magnetic field causes the needle to turn at a right angle to the wire. Reverse the connections to the battery, thus reversing the direction of the current flow, and the needle will point in the opposite direction.

Activity 2

Using the same bag of materials, the pairs of students will begin wrapping the wire around the nail in the same direction until a foot of wire is left at both ends. Insert the end wires into the Fahnestock clips. Hold the electromagnet over a small pile of paper clips, tacks or other small metal objects. How many objects does your electromagnet attract? Take the wire off the battery terminal, and the tacks will immediately fall off.

Concept:

The current passing through the wire produces an invisible magnetic field. When the current is cut off, the magnetic field disappears, then the molecules of the iron return to their helter-skelter position and the nail loses most, but not all, of its magnetism.

Performance Assessment:

As a result of the electromagnet mini-teach, the sixth grade students will be able to describe the characteristics of a magnet and an electromagnet. Both attract metal and have magnetic fields; the electromagnet needs an electrical current.

The students will be able to make an electromagnet with a wire, a battery, and a nail.

The students will be able to test the strength of the electromagnet by using more coiled wire and additional batteries and nails.

Conclusions:

In activity 1 we found that electricity can produce magnetism and magnetism can produce electricity. The opposite ends or poles of magnets are attracted to each other and like ends repel.

In activity 2 we found that current through a wire produces an invisible magnetic field. When the current is cut off, the magnetic field disappears, then the molecules of the iron return to their helter-skelter position and the piece loses most, but not all, of its magnetism.

Electromagnets

Tanya English
8435 Constance
Chicago IL 60617
(312) 734-1301

O'Keeffe Elementary School
6940 South Merrill Avenue
Chicago IL 60649
(312) 535-0600

Objectives:

Grade Level: 3-4

The students will make an electromagnet that will attract a metal object.

The students will increase the strength of an electromagnet so that it will attract an increased number of metal objects.

The students will compare the properties of magnets and electromagnets.

Materials Needed:

For 20 students.

10--20 inch strips of insulated copper wire, 1/2 exposed on each end
10--40 inch strips of insulated copper wire, 1/2 exposed on each end
15--size "D" batteries
1--battery holder for 2 "D" batteries
10--compasses
25--iron nails, 4" long
1--box of paper clips, approx. 300
masking or transparent tape
iron filings
5" x 7" index card or clear transparency

Strategies/Activities:

Activity #1:
Give each pair of students one battery, iron nail, 40" copper wire, and about 30 paper clips. Have them, using only the nail, try to pick up as many paper clips as possible. Discuss methods and results. Then instruct them to wrap the copper wire around the nail ten times leaving 5-6 inches of wire free on each end of the nail. Attach one end of the wire to the negative pole of the battery. Tape securely and then touch the other end of the wire to the positive pole of the battery while their partner uses the nail to pick up paper clips. Then release the wire from the positive pole of the battery. Discuss methods and results. Record the number of paper clips picked up by the magnetized nail by each group.

Concept: Electric current flowing through a wire creates a magnetic field which caused the iron nail to become a temporary magnet. When the electric current is cut off, the nails loses its magnetic property and the paper clips fall off.

Activity #2:
Elicit ideas and suggestions from students on how they can make the nail pick up more paper clips. Possible ideas are to: 1) use more wire; 2) use more

batteries; 3) use more nails. Break students into groups of four and let one group test the idea of using more batteries; another group using 2-3 nails; a third group using more wire, wrapping the nail 15-20 times; and another group wrapping the nail 30-40 times. Reconnect the circuit and pick up as many nails as possible. Record the results of each group and discuss results.

Concepts: The strength of an electromagnet can be increased by using more batteries and/or more wires. Using more nails will increase the electromagnet's capacity to hold more paper clips, without necessarily increasing the magnetic force.

Activity #3:
Have students work in pairs. Give each student a 20" length of wire and a compass in addition to their battery. Have them secure one end of the copper wire to the negative pole of the battery. Have their partner hold the looped center of the wire over the compass and they are to observe what happens to the compass needle when the other end of the wire makes contact with the positive pole of the battery. Repeat this process, but with a slight variation: attach the wire to the positive pole of the battery first, then, holding the looped end of the wire over the compass, complete the circuit touching the other end of the wire to the negative pole of the battery. Observe how the compass needle reacts. Discuss observations. Repeat if necessary.

Concept: Electromagnets have poles which can be reversed when the path of electricity is reversed. This is not a characteristic of regular magnets.

Activity #4:
This is a teacher demonstration in which the students will observe what happens when iron filings are sprinkled over an electromagnet. Place two batteries in a battery holder and connect the end wires to the end wires of an electromagnet (nail wrapped with copper wire). Place them on the overhead projector and place the clear transparency over the electromagnet. Slowly sprinkle iron filings over the transparency and observe what happens to the iron filings. Discuss observations.

Concept: Electromagnets have lines of force.

Assessments:

At the conclusion of the mini-teach, the students will be able to answer thee following questions:

Name 3 ways in which magnets and electromagnets are alike.
(Have poles, attract metals, have lines of force)

Name 3 ways electromagnets differ from magnets.
(Electromagnets need electricity to work, the poles of electromagnets can be reversed, the strength of electromagnets can be increased)

List 2 ways to increase the strength of electromagnets.
(more batteries, more wire)

Electrostatics

John J. Miller
1743 E Forest Ave
Des Plaines IL 60018
(708)297-6368

Maine East High School
2601 Dempster
Park Ridge IL 60068
(708)825-4484

Objectives:

Although this lab is based on the lab I perform with my high school sophomores, it has been adapted for the use for grade school. It works best in dry weather such as winter. This is a set of mini-labs designed to be inexpensive (a set can be made for less than $2.00) so that the equipment can be put in the student's hands and explored. If you are interested in a complete write-up with pictures or have a question, please call me.

Materials Needed:

Plastic Tube (like PVC pipe or golf club tubes)
tiny scraps of paper
Scotch Magic tape
a piece of cloth like wool or fur
Styrofoam square 1' x 1'
A pie-tin with a styrofoam cup glued to the center (hot glued works best)

Strategy:

1. Have the students bring the end of the rod near the bits of paper. (the small bits of paper should not attract to the rod).

2. Have the students rub the plastics rod with the cloth and bring it near the scraps of paper and observe what happens. (The bits of paper should attract to the tube where it was rubbed.) Introduce the term "**neutral**" and "**charged**". We will say that something is neutral if it does not attract tiny bits of paper. We will call something charged if it attracts tiny bits of paper.

3. Now have the students bring the end of the rod that they did not rub near the pieces of plastic. (The small bits of paper should not attract to the rod where it was not rubbed.) Note: This is because the plastic is an **insulator** which does not let the rubbed on charge freely flow.

4. Have the students try rubbing other objects around the room (a comb, a pen, or whatever) to see which ones can hold a charge. (answers vary)

5. Have the students take about 15 cm (6 inches) of the scotch tape and fold the first few cm of each end sticky side together. Have them stick the sticky end down on a tabletop. Now peel the tape up quickly. Bring the tape near the small bits of paper. Is the tape charged? (it should be)

6. Have the students make another tape just like the first and bring it near the other tape where both tapes are free to swing. What happens? (they should repel)

7. Have the students make two new pieces of tape like before but this time have the students place the first one sticky side down. Have the students now place the second tape on top of the first and press down. Peel the two tapes up together THEN separate them. Bring the two tapes near each other and free to hang. What happens? (the tapes should attract)

8. Have the students hang the two tapes freely from the side of the desk. Re-rub the plastic tube and bring it near each tape. What happens? (The tube should repel the tape that was on the bottom and attract the tape that was on top.)

Now is a good time to re-group and provide the students with some content. There are two types of charges, some attract and some repel. Benjamin Franklin set the standard that when glass is rubbed with silk the glass becomes "positive" and when amber (a semi-precious stone) is rubbed with fur it becomes "negative." This is where I ask students to take it on faith that the rod became "negative." The rule for charges is opposites attract and likes repel so positive and positive repel, negative and negative repel and positive and negative attract. The idea of the atom and positive protons and negative electrons may be also introduced along with the idea of electrically polarized. (That explains why neutral objects attract to charged objects.)

9. Ask the students if the rod is negative and this tape repels, what must the charge of the tape be? (negative)

10. Ask the students if the rod is negative and this other tape attracts, what must the charge of the tape be? (positive)

11. Take the styrofoam and rub it with the cloth. Place the pie-tin on the styrofoam while holding it by the insulated handle. Touch the metal (you should get a small shock). Lift the pie-tin by the insulated handle. Now touch the metal. You should again get a shock. This method of charging is called "**induction**." (When the pie-tin was near the negatively charged styrofoam and you touched the metal with your hand, the negative charges were repelled leaving the pie-tin positive. When you picked up the pie-tin by the handle it was positively charged. When you touched it negatives from your hand were attracted and entered the pie-tin making it neutral again.

Performance Assessment:

Make a negatively charged tape by following the procedures in number 5. Rub the styrofoam with the cloth. Bring the styrofoam near the tape that is free to hang. The tape should repel. Ask the students, "What can we say about the two charges?" (They are the same. Really sharp students may say they are both negative. That's good if they can back the statement with facts, not opinions.)

Conclusion:

The conclusions have been placed after each question in parentheses.

Introduction To Magnets

Sheila McKinnon
11556 S. Hale St.
Chicago IL 60643
(312) 316-8967

Sherman School
1000 W. 52nd. St.
Chicago IL 60609
(312) 535-1757

Objective:

The students will familiarize themselves with several different kinds of magnets. They will observe the forces of attraction and repulsion between the different poles. I will introduce and we will experiment with the forces of magnetism, electromagnetism and static electricity. This lesson can be adapted to instruct kindergarten through high school. This is a three to four week unit.

Materials Needed:

The materials needed for this introductory lesson is as follows:

A. magnets of different sizes and shapes (bar, horseshoe, etc.)
B. iron filings
C. stand for holding two magnets with a string
D. miscellaneous items; Such as, bottle caps, buttons, paper clips, coins, pencils, pens, needles, and plastic disks
E. chart paper, tissue paper and drawing paper
F. markers and crayons
G. scissors and string
H. picture charts (for visual display)
I. masking tape
J. clear plastic board, approximately 6x8 or plastic wrap
K. overhead projector machine and transparency sheet
L. batteries
M. wire
N. fur
O. plexiglass case with filings
P. compass

Strategy:

In this unit we will explore the forces of attraction and repulsion. Such as magnetism, electromagnetism, and static electricity.

Sometimes the students will work in small groups on experiments and at other times they will work individually (according to the activity and class size).

The teacher will set up the materials necessary for each experiment and the students will gather the materials that they will need for each experiment.

The strategy of the first lesson is to let the students explore and observe the magnets. They will observe the lines of force, the attraction and the repelling forces that all magnets exhibit. They will also become familiar with the poles of each magnet and observe for themselves the differences between the north and south sides of the magnet.

Each group of students will have to select from the list of materials a chart marker, magnets of different shapes, paper clips, plastic paper cut in squares, iron filings and other miscellaneous materials.

The teacher will use the overhead projector, two bar magnets, iron filings and a transparency sheet to demonstrate and compare the forces of the magnet's poles.

Each group of students will use their experience charts and markers to jot down information that they have gathered about their magnets. They will then present their data to the class.

Later, after the students have completed their observations of magnets, they can begin to experiment with them. They should label each experiment.

The next experiment is to understand how a compass works. They will find out that the earth acts like a giant magnet and attracts other magnets toward its north pole. For this experiment the children will need a bowl, sewing needle and a small square piece of tissue paper. The students will float a small piece of paper in a bowl of water, and rest a needle (that has been rubbed with a magnet) on it. When the needle is still they will mark which way it points. The students can compare their experiments with others that made needle magnets. They should find that all needles should point the same direction, which is along a north-south line.

The third experiment is to let each child make an electromagnet. For this experiment they will need a piece of wire about sixteen inches long, a nail, a C-size battery and three pieces of masking tape. The strongest electromagnet will win a prize. We can test it by observing which student's electromagnet can pick up the most paper clips.

The final experiment will be to demonstrate static electricity. The students will need a picture of snake from the MacMillian Science Activities, a large piece of tissue paper, a small wool cloth, and scissors. They must trace the snake on the paper, cut it out. Then they should rub their pen with the wool until it will begin to make the snake wiggle.

The teacher should set up experimental stations and let the children display and label their work.

Performance Assessment:

The student will be assessed as a group and individually according to whether they have completed every task asked of them. Each student will demonstrate knowledge of what each experiment is about and explain on paper and orally what each experiment demonstrates.

Electricity

Tanya English
8435 Constance
Chicago IL 60617
(312) 734-1301

O'Keeffe Elementary School
6940 South Merrill Avenue
Chicago IL 60649
(312) 535-0600

Grade Level: Primary Grades 1 and 2.

Objectives:

Students will correctly make a simple circuit using a battery, bulb, and a wire so that the bulb will light. (A)

Students will identify contact points in a simple electric circuit. (B)

Students will properly use a test circuit to identify conductors and non-conductors. (C)

Students will correctly construct and use a test circuit to test for conductors and non-conductors. (D)

Students will correctly connect a chemical battery that will light an LCD. (E)

Students will correctly use mechanical energy to make a bulb light up. (F)

Students will correctly use a solar cell to make a bulb light up. (G)

Materials Needed:

For a class of 20.

20--1.5v bulbs
20--D-size batteries
10 yds.--insulated copper wire, cut into 10 inch lengths and stripped 1/2 inch on each end
10--wood blocks, 1/2 x 3 x 5 inches
1 dozen--paper clips
1--hand generator
1--solar cell
06--light bulb sockets
06--battery holders
Box of small ordinary items made of metal, plastics, or fabric, money crayons, string, bottle caps, etc.
3 or 4-- phillips screwdrivers
1 dozen--thumbtacks
1--LCD chemical
2--lemons
20--Christmas tree lights, separated into individual lights leaving 3 inches of wire on both ends. Strip off 1/2 inch on each end of wire.
A light source from an overhead projector or a small lamp.

Activities:

Activity #1:
This is an exploration and an individual activity. Meets objectives A and B.

Give each student one battery and one Christmas light. Without explanation, tell them to make the Christmas light come on. Allow 5-10 minutes for this activity, then have students demonstrate and discuss ways they were successful or unsuccessful in getting the lights to come on.

Concepts: Electricity travels in a path called a circuit. Wires must be correctly attached to the battery's contact points to complete a circuit.

Activity #2:
The first part of this activity is a teacher demonstration; the second part is a student activity. Meets objectives C.

Using the test circuit (see instructions for making) review contact points on a battery. Demonstrate contact points using two batteries and show how two batteries, together, can make the 1.5 v light come on. Explain the use of a battery holder and its contact points. Demonstrate making the light come on using the battery holder.

Show students the circuit set-up and ask them why the light doesn't come on.

Student response: The circuit is not complete, or it is not a complete circuit. Accept all answers that refer to an incomplete circuit. The teacher selects an item from the mystery box and demonstrates how to complete the circuit. Have students select an item from the mystery box and attempt to complete the circuit by making the item touch both paper clips. Have them sort the items by keeping those that make the light come (complete the circuit) from those items that don't. Have students identify common properties of those items that make the lights come on.

Concept: Some materials conduct electricity (conductors) and some materials do not (insulators). Metals are conductors of electricity. When the circuit is incomplete, the path of electricity is interrupted.

Activity #3:
This is a cooperative student activity. Meets objective D. Students will work in groups of four.

Each group will need the following materials: 2-'D' batteries, 1 battery holder, 1-1.5v light bulb, 1-light bulb socket, 2 paper clips, 2 thumbtacks, 2 insulated copper wires, 6 inches ea., 1 wood block, a screwdriver.

Students are to construct a test circuit that will make the light bulb light when completed with a metal conductor from activity #2.

Activity #4:
This activity demonstrates electric power from mechanical, solar, and chemical energy sources. Meets objectives E, F, and G.

Connect a Christmas light to the hand generator; set aside.

Place the solar cell apparatus under the light source; do not turn on the light.

Take two lemons and the LCD chemical clock and place each a copper and zinc end of the LCD chemical clock into one lemon and do the same with the other lemon so that the time display comes on on the clock.

Ask for student volunteers to make the Christmas light come on using the hand generator; to make the solar apparatus work using the light source; and then the teacher disconnects the LCD chemical clock and has students re-connect it so that the clock comes on again.

Discuss with students chemical, solar, and mechanical energy and their uses.

Concept: Electricity can come from many sources, including chemical, solar, and mechanical.

Assessments:

Performance or authentic assessment is used for this topic. The students demonstrate or perform their understanding of the concepts when they make the light bulb come on, the LCD clock come on, correctly sort conductors and insulators, correctly construct a test circuit that will make the light come on when the circuit is completed with a conductor.

Extensions and teacher information:

A battery is a chemical source of electricity. This can be demonstrated by cutting a battery in half, lengthwise to show that it is made of carbon, nickel, and acid. Using a strip of copper and nickel in a beaker of acid such as vinegar, sulfuric acid, lemon juice or lemon, you can show the presence of electricity with a galvanometer. (Tolman and Martin, pp. 247-253)

Directions for making a test circuit:

Place 2 "D" batteries in battery holder. Using 2 strips of copper wire, connect one end of each wire strip to one end of the battery holder wires. Connect the exposed end of one of the copper wires to the light socket contact point. (A small screw on the light socket.) Connect one end of a third strip of copper wire to the other contact point on the light socket. You now should have 2 remaining unconnected copper wire ends. Wrap the exposed wire tightly around the end of a paper clip. Do the same with another paper clip. Secure the paper clips into the block of wood using two thumbtacks, positioning them into the wood so they do not touch and leaving a half-inch space between them. You can secure the light socket to the wood block using clay or screws. Screw the light bulb into the socket, check contact points, and test your circuit by laying a piece of metal across the paper clips to complete the circuit. The light should come on if correctly constructed.

Electricity

Julian Levey
8705 Kedvale
Skokie IL 60076
(708)674-6618

Teachers Acad. for Math and Science
10 W. 35th St
Chicago IL 60616
(312)808-0100

Objectives:

This lesson is appropriate for all grades from 5th through high school. The main objective is to teach elementary electricity principles with the use of materials which are easily available.

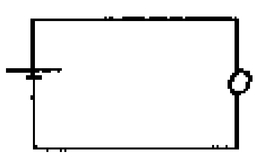
Materials Needed:

1.5 volt batteries (D cells)
3 volt bulbs and sockets
hook-up wire (thin)
single pole knife switches
3 volt buzzers
3 volt motors
battery holders for 2 batteries
These items are obtainable at American Science Center or Radio Shack.

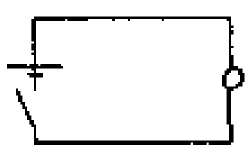
A typical kit for three students working as a group would consist of 2 batteries, 4 bulbs, 4 sockets, 12 pieces of wire (about 8 inches long and stripped at each end), 2 knife switches, 1 buzzer and 1 motor.

Strategy:

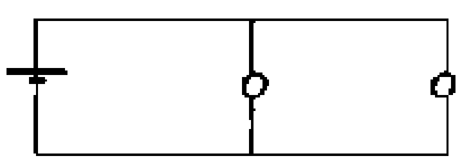
Describe and illustrate the flow of electrical current from the battery, through the wires and through a bulb. Have the students construct a simple circuit using a single bulb:



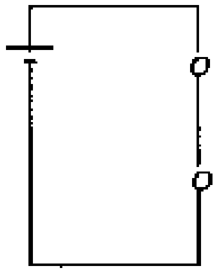
This can be followed by the introduction of a switch into the circuit to show how the light can be turned on and off.



The next step would be an explanation of parallel circuits where the electrical surrent from the battery flows with equal voltage into two or more bulbs.



After the students have hooked up this circuit, they can then hook up a series circuit where the electrical current from the battery flows first through one bulb and then through the other.



Students can then be directed to loosen various bulbs in their sockets to show that a bulb will remain lit in a parallel circuit even though another bulb may be out. This can be compared to the series circuit where the loosening of one bulb in the circuit will cause any other bulb in the circuit to go out also.

A further step would be the hook up of a parallel circuit using different components such as bulbs, buzzers and motors.

Performance Assessment:

Grading the student on his or her performance should be based on two factors:
1. The ability to construct the circuits accurately and have them work properly.
2. The ability to explain the circuits by tracing the flow of current from the battery through the various elements of the circuit.
Each of these factors should be weighted at approximately 50% of the grade.

Resistances In Series And Parallel Circuits

Austin E. Barnett
8414 South Kimbark
Chicago IL 60619
(312) 734-1123

Bogan High School
3939 West 79th Street
Chicago IL 60652
(312) 536-2180

Objectives:

1. To observe the difference in illumination for a given set of bulbs when placed in series and in parallel circuits.
2. To calculate the IR drop across a network of resistances in series and parallel.

Materials:

Six flashlight bulbs and sockets, one switch for each of the two circuits, four "D" cells, masking tape, twenty 10-cm pieces of bell wire, two DC ammeters of range zero amp. to one amp., two DC voltmeters of range zero volts to five volts.

Strategies:

Activity 1. Series Circuit

1. Connect three bulbs in sockets in series with a switch, an ammeter, and two "D" cells that are firmly taped together top to bottom. Place the ammeter between the switch and the two-cell battery. Connect the negative terminal of the ammeter to the negative terminal of the battery.

2. Close the switch. Read and record the amount of current. Open the switch.

3. Reconnect the ammeter between two of the bulbs. Close the switch. Read and record the amount of current. Open the switch.

4. Reconnect the ammeter as in step one.

5. Connect a voltmeter across one of the bulbs. Be sure that the negative terminal of the voltmeter is connected toward the negative terminal of the battery.

6. Close the switch. Read and record the voltage drop. Open the switch.

7. Repeat steps 5 and 6 with the voltmeter connected across two bulbs.

8. Predict what will happen to the voltage drop if the voltmeter is connected across all three bulbs. Repeat steps 5 and 6 with the voltmeter connected across all three bulbs.

9. Remove one of the bulbs from its socket without disconnecting the socket. Remove the voltmeter. Close the switch. Record the ammeter reading. Open the switch.

10. Reconnect the circuit, so that, there are only two bulbs, and sockets in

series with the ammeter, switch, and battery. Record the current value and voltage (IR) drop across the circuit. Open the switch.

Students, this concludes our first activity. Now, let's discuss what took place.

Activity 2. Parallel Circuits

Students, the purpose of this activity is to study the properties of a parallel circuit.

1. Connect three flashlight bulbs in parallel sockets.

2. Connect 2 "D" cell batteries, a switch, and an ammeter in series. Place this in parallel with the 3 sockets. Be sure, that the negative terminal of the ammeter is toward the negative terminal of the battery.

3. Close the switch. Read and record the current value. Notice how bright the bulbs are. Open the switch.

4. Without disconnecting the socket, remove one bulb. Close the switch. Record the current value. Compare the brightness of the remaining bulbs to their brightness before. Open the switch. Replace the bulb.

5. Reconnect the ammeter in series with one of the bulbs. Predict how the current will compare to the previous reading.

6. Test your prediction by closing the switch. Record the current and open the switch.

7. Remove a bulb in a different branch from the ammeter. Close the switch. Read and record the current value. Open the switch.

8. Connect a voltmeter across one socket. Close the switch. Read the meter, and record the voltage. Open the switch. Repeat for each of the other sockets.

Magnets, Electromagnets & Fields of Force

John J. Czerwiec
4140 North Paulina, 2R
Chicago IL 60613
(312) 525-2859

Kenwood Academy
5150 South Blackstone
Chicago IL 60615
(312) 535-1407

Objectives:

Students will perform activities that enhance their understanding of the following:

*Magnets exist only as dipoles.
*A field of force exists around any magnet.
*Only items containing nickel or iron are attracted to magnets.
*Temporary magnetism can be induced by placing iron or nickel into a magnetic field.
*The movement of current through a wire is accompanied by a magnetic field.

Materials needed:

Enough good, strong pairs of magnets so that each person in class has a pair.

A paper/plastic plate and a ZipLok bag large enough to enclose the plate for each member of the class.

A quantity of powdered iron/iron filling.

Enough wire (16 to 22 gauge enameled) so that each member of the class has about 3 meters.

Enough (steel) nails (16 penny sinkers or larger) so that each member of the class has one and a similar sized non-ferrous nail or rod: use aluminum, brass, plastic,copper, wood (even a pencil).

Enough dry cells (11/2 volt C, D, or "ignition") so that each member of the class has one.

Sandpaper, for removing insulating coating from wire.

A large quantity of very small nails (brads).

Optional Power supply with output 12volt@>4amps, approximately 10m wire coiled into loop of about 10cm, neodynium magnets (approx. 2cm^2 by 1/4cm thick), compasses (of the type used in orienteering)

Strategy:

Dipoles & Fields

1. Encourage students to test the repulsion/attraction of magnets. How does the magnet's orientation effect this phenomenon? How can we label the ends of our magnet?

2. Line up magnets in such a way, or on such a device that they will pivot easily. What does moving one do to others? Do magnets have to touch each other to interact?

3. Will magnets stand on thin edge more easily if they are aligned to Earth's poles? Why?

4. Give students plate/bag with iron powder inside. Touch magnet to outside of bag. What happens? Does the way that magnet contacts bag/plate effect the iron fillings?

5. Hold plate parallel to ground, with iron powder in a compact heap. Hold

magnet against plate. Slowly tilt plate so powder runs toward spot above magnet in a sheet-like flow. What happens? What sort of pattern results? Draw it!

6. Repeat the above step holding the magnet against the plate in a different way-- if it was perpendicular before try parallel or vice verse. Try to make a map of the three dimensional field by adding these two-dimensional sets of information.

Electromagnets & Magnetic Metals

1. Begin by having students wind (coil) about half of their allotted wire around their steel nail. Expose the bare copper by sanding off coating. Contact the two free ends to the two terminals of the dry cell. How many nails can you pick up with this electromagnet?

2. Coil the rest of the wire onto the nail. Does the winding direction matter? Test the number of nails picked up.

3. How does the wire feel when it is hooked-up to the dry cell? Does using the electromagnet deplete the battery rapidly or slowly? Why? How might this be improved on?

4. Hold the electromagnet near the "ZipLok Field Mapper". Map the field!

5. Slip the coil off the nail. Try to do this while the electromagnet is connected. What happens to the strength of the magnetic field? Verify your results by using the "Field Mapper".

6. Slide a different material into the coil. What happens? Repeat with metals and non-metals. Does it matter if the metal is a poor conductor or good conductor? How can you explain this? Does it matter if the metal is hollow or solid?

Optional

Really cool demonstration from the Oersted Experiment.
Place a really strong magnet in or near the 10cm loop of 10m of wire. Turn on the power supply for a **very** short period of time (doing otherwise might short your power supply or burn up the wire). You've built a very crude solenoid. Try reversing the polarity. Try changing the position of the magnet. Try mapping the field. See what happens with a compass, or a whole bunch of compasses arranged around the coil (or inside it). What does this tell you about the operation of an electromagnet? What does this suggest about the role of the nail in an electromagnet?

Performance Assessment:

The best proof of learning is in the production of something useful. The goal is to build the strongest electromagnet you can. First plan out what materials you need and how you will connect/build your electromagnet. Creative solutions are appreciated, but consider how each element of your design contributes to the goal. This is called design efficiency, use it! In order to minimize the variables leading to success, a regulated 11/2 volt power supply should be substituted for dry cells. Similarly a pan of nails that is not susceptible to tampering is preferred over paperclips, which students may link into chains. Other means to ensure fairness should be discussed before the competition, as students are badly discouraged when they perceive someone cheated to win. If the rules are "anything goes" be prepared to require students to supply their own materials and set some spending limit (verified by receipts and/or catalog prices) that cannot be exceeded. Efforts to instill fairness in competition pay off with students working harder on the thinking and designing and caring less about the legality or the "the winner".

Conclusions:

The idea that the flow of an electric current is accompanied by a magnetic field revolutionized scientific understanding and has made possible most of modern life. The generation of electricity would not be possible without knowledge of this. Similarly all electric motors operate by taking advantage of this. The fame Ampere holds is directly traceable to Oersted's disclosure of his work at the September 1820 meeting of the Acadmie Royale des Sciences in Paris. The cooperative nature of science is clearly illustrated, as is the relative recency of the discovery.

Evaluation:

Students should answer the questions presented in the strategies. If their understanding is correct they should receive credit for this. If their understanding is lacking they should engage in more activities and this additional work should be acknowledged. Students who do not work and/or do not understand will harm themselves and the advancement of humanity.

How Smart Are You About Electricity, Batteries And Conductors?

Lorraine Epps
1437 N. Long Ave
Chicago IL 60651
(312) 745-6802

Douglass Math and Science Academy
543 N. Waller Street
Chicago IL 60644
(312) 543-6176

Objectives:

Students will:

- identify a battery and how it works.
- identify how a flashlight works.
- understand the relationship between a battery and electrons.
- conduct a test to determine what materials are the best conductors.

(This unit will take two to three weeks) Grades 3-8

Materials:

Overhead projector and transparencies of all activities.
Activity 1. pennies and dimes or aluminum foil, paper towels, water, salt, vinegar, lemon juice and an ammeter
Activity 2. signs and small pieces of colored paper
Activity 3. D-batteries, 1.5 V bulb, masking tape, wire, aluminum foil and materials for decorating
Activity 4. batteries (1.5 or 6 V), bulb (1.5 or 6 V), wood(2 by 6 ins.), 4 feet of insulated copper wire (2 feet for each side), two pencils with eraser tips, two clean head thumbtacks, and a number of objects to be tested

Strategy:

Activity 1: MAKE A BATTERY

Students will identify a battery and how it works.
Teacher will demonstrate how to make a "VOLTAIC PILE" (named after the inventor of the battery).
Students will fold some paper towels about 1 inch square, soak them in one of the solutions with a 1.5 glass of water, by placing a dime, foil and penny on each side of the moistened towel, making a single cell, then connect your cell with wire on both ends of coins to ammeter. Students will notice needle moving thus indicating that there is a flow of current.
Next, students will make more cells piles, connecting them together to see how great the voltage will become. Students will record data as they add cells and take piles apart when finished so coins will not corrode.

Activity 2: **GAME**: PATH OF ELECTRONS

Students will stand in a circle to show how electrons work in a battery called a circuit, (a drawing of a battery showing the path electrons flow). At the top of the circle, one student will be marked negative (-), another will be the positive (+) end of the battery. A third student will be the switch, another one the bulb, and the rest of the students will be the conductors. They will have pieces of paper marked electrons. Students will start passing the pieces of paper around as shown on drawing. When the switch goes out of the circle, the light will go out. (This will show the current of electrons flow around and around the circuit as long as the switch is on. When the switch goes off, the current stop and the flow of electrons will stop and the light bulb will stop glowing.)

Activity 3: MAKING A FLASHLIGHT

Students will make a flashlight to see the relationship between a battery and conductors. Each students will be given materials needed to make a flashlight. First, cut tubes length-wise to fit batteries, then cut a piece of wire (strip bare the insulation), the wire should also be cut longer than the tubes. Make sure wire is connected to the battery and the bulb. Then use the aluminum foil as a conductor. If all connections are correct, current is complete and the bulb will light up. Students can decorate flashlight any way they choose.

Activity 4: CONDUCTIVITY TESTING

Students will construct a conductivity tester. They will learn how to connect one of the terminals of the battery to the bulb assembly (a flashlight bulb in a socket mounted on a piece of wood). One wire from the battery terminal and the other wire to the bulb assembly are to be connected to become the test probes. Wrap the wire around two clean-head thumbtacks (six times). Push them firmly into the erasers of the two pencils. When you apply testing probes to each object, the bulb will light up to show you that all metal objects are conductors of electricity. The bulb will not light up if objects are not good conductors. Students will make a chart to list and show good, poor and non conducting objects. Then list each object on different color pie-shaped papers. Mount them on a wheel to visualize the percentage for each category.

Introduction to Elementary Circuits

Michael D. Jackson
1617 E. 50th Place Apt. 6D
Chicago IL 60615
312-363-4902

W.H. Carter
5740 S. Michigan Ave.
Chicago IL 60637
312-535-9205

Objectives:

1. Children should be able to predict ways to light a bulb.

2. Children should be able to define parts of an electrical circuit.

3. Construct and test models of electrical circuits.

Vocabulary:

1. electrons 2. positive and negative charge 3. conductor 4. energy
5. generator 6. convert 7. circuit 8. mechanical energy 9. battery
10. chemical energy

Vocabulary in Spanish:

1. electron 2. positive et negative charge 3. conductor 4. energia
5. generador 6. convert 7. circuito 8. energia mecanical 9. batera
10. energia quimica

Materials:

1. batteries, D cell 2. bulbs, #48 3. bare copper wire (activity 1)
2. batteries, IS6 cell 2. bulb, #48 3. copper wire 4. switch (activity 2)

Instructional Prompting:

Stimulate discussion by holding up the materials to be used and asking the students to name and describe the function of each. (If students do not supply the information, make sure that these ideas are covered: a battery is the source of electrical energy; the wire provides an unbroken pathway for the activated electrons from the battery to energize the copper electrons in the copper wire. The bulb is placed in the path of the electron flow thus converting this energy into light energy.

Ask the students to predict how they could arrange the materials to light the bulb. Write several of their predictions on the board and discuss the principles of circuits and whether or not their predictions meet the criteria.

Students will now be given the materials for activity 1. After each attempt a drawing of their attempted circuit should be made. This procedure will continue for 15-20 minutes or until the students have perfected their technique of lighting the bulb.

At this point, explain to the students that they have made a circuit with the materials. Review the parts of the circuits, review the criteria of a circuit then have volunteers draw on the chalkboard arrangements that made the bulb light. Stimulate discussion by asking, "What are the three parts of the circuit?" (a source of electricity, a bulb, and a wire); "In what path did the electricity go to make the bulb light?" (It made a complete path or circle from the energy source, to the bulb, and back to the energy source.); "What happened when the path or the circle was broken?" Have the students trace the path of electricity in their circuits when the bulb was on.

After thorough discussion of the simple circuit, the concept of a switch is introduced as a controlled break in a circuit. This switch is constructed with a small (2in x 3in) poster board sheet, a paper clip, and two brass paper fasteners. The switch must be connected between the (-) term. of the battery and the (+) term., with two copper wires connected to the (in) and (out) of the switch. The (in) wire of the bulb was connected to the (out) of the switch, the (out) wire of the bulb was then connected to the positive term. of the source.

Performance Assessment:

1. Request that all children name the three components of a simple circuit.

2. Request that all children, while looking at their materials, name and draw each function in a circuit of the materials they have in front of them.

3. While examining their drawings or reattempting activity 1, have children diagnose the problems with the circuit prior to the successful lighting of the bulb.

Rubric:

3 pts-If students can I.D. all necessary components of a circuit, successfully light the bulb in the circuit and successfully connect a switch to the circuit.
2 pts-If students can I.D. all necessary components of a circuit, successfully light a #48 bulb in the circuit.
1 pt--If students can I.D. all necessary components of a circuit.

Return to Physics Index

Electricity

Marie MCCadd
20332 S. Kedzie Ave.
Olympia Fields IL 60461

Coles Elementary School
8441 S. Yates
Chicago IL 60617
312-535-6550

Objectives:

To explain how objects can receive a static electrical charge.
To describe the effects of bringing objects with like and unlike charges near one another.
To compare conductors and insulators.
To identify and diagram a series circuit and a parallel circuit.
To explain the function of a fuse.

Materials:

T.V. set, string, chalk, balloons, wool cloth, thread, chalkboard, water sprayer, size D batteries, battery clips and holders, small bulbs (#41 & #48), sockets for small bulbs, copper wire, objects to test as conductors, paper clips, plasticine, and strands of steel wool.

Strategy:

1. The students will perform the following activities to understand how objects receive a static electrical charge: Let the string hang about one inch from the front of the T.V. set. When the television is turned on, the string will be repelled or attracted to the television screen. Students will inflate several balloons. They will rub the balloons with a wool cloth to create an electrically charged surface. These balloons will cling to the classroom ceiling and to a chalk drawing of a shelf on the chalkboard.
2. The students will perform the following activities to understand the effects of bringing objects with like and unlike charges near one another: Students will inflate two balloons to the same size and tie a string to each balloon. Both balloons will be given negative charges by rubbing them with a wool cloth. They will repel one another. Next, one of the balloons will be given a positive charge. This balloon will be attracted to the negatively charged balloon. The balloons will be sprayed with water to neutralize them.
3. The students will perform the following activities to compare conductors and insulators: Using a simple series circuit with one small bulb, each student will test objects to observe which materials permit a flow of electrons (conductors) and which materials do not permit a flow of electrons (insulators). Each student will list items tested and test results on a chart.
4. The students will perform the following activities to understand series and parallel circuits: After learning how to read a circuit diagram, each student will construct a series circuit and a parallel circuit. The students will make observations about what happens when one bulb is removed from each of the different types of circuits. They will also observe which circuits have brighter bulbs.
5. The students will perform the following activities to understand the function of a fuse: Using uncomplicated written directions, each student will make a fuse. The students will observe what happens to a fuse when too

much electricity flows through the wires.

Performance Assessment:

1. Using a diagram and sentences, explain how lightning is a form of static electricity.
2. What type of circuits are used in buildings? Explain.
3. Describe a safety device that is used as part of a circuit. Explain how it works.

Return to Physics Index

Magnets, Electromagnets, and Motors

Lynne Nolan
127 S. Western Ave.
Aurora IL 60506

Naperville Central High School
440 W. Aurora Ave.
Naperville IL 60540
708-420-6417

Objectives:

1. Students will understand the general properties of magnets.
2. Students will understand and make an electromagnet.
3. Students will use electromagnets to do work, and they will make an electric motor.

Materials Needed:

Materials needed are listed with the strategy to which they apply.

Strategy:

A. **Exploratory (Give as homework the day before the lesson.)**

Each student is given two magnets and is told to take them home and explore the properties of magnets, making as many observations as he/she can. The guide sheet below might be helpful to direct them.

MAGNETIC PROPERTIES: An Attractive Assignment

1. Do the magnets attract all objects?
2. List 10 objects that are affected by the magnets. Do they have anything in common?
3. List 10 objects upon which the magnet has no effect? Do these objects have anything in common?
4. What might affect the ability of a magnet to attract another object? List as many factors as you can.
5. Is there a limit to the number of things that can be attracted to the magnet at one time? Test this.
6. Try and locate magnets in your house. Do these magnet show the same qualities as the ones above?

DON'T FORGET TO BRING YOUR MAGNETS BACK TO CLASS!!!

B. **Concept development - "A Magnetic Discussion"**

1. List the following on the overhead for students to answer while you check their homework. MAGNETIC OR NOT (Don't list answers, just items)

REFRIGERATOR DOOR	**YES**Students are familiar with this.
SOFA	**NO** Students may argue a sleeper sofa has metal, but most textiles, wood, and foam insulation are not magnetic.
COKE CAN (OR 7UP)	**YES**These are made of steel.
PEPSI CAN	**NO** These are made of aluminum.
DOLLAR BILL	**YES**The ink has a little bit of iron in it, so that pop and candy machines can tell if its the real thing and not a photocopy.
CEREAL	**NO** HOWEVER, cereals claim to be iron fortified, and in some cereals, if a magnet is dropped into the box, it can be recovered from the bottom of the box with iron filings stuck to it. Iron fortified??

2. Go over the above list and include in your discussion student

observations of things that were magnetic in their home. Give as many students as possible a chance to answer. Lead into the properties of magnets..."Let's organize all this information."

3. PROPERTIES OF MAGNETS (list these on the board)
   1. Attract many, but not all metals. (Iron, nickel = magnetic) (Note demos below)
   2. Exert a force at a distance. (Magnets don't have to touch an object to move it. Use the overhead projector to show a magnet pushing another one along, etc.)
   3. Attract or repel another object. Magnets have direction!! Show this by placing two magnets on the overhead; if they attract initially, flip one over--now they should repel. (N vs. S) A COMPASS is an instrument used to detect magnetic fields; the needle is magnetic and therefore is sensitive to other magnets. **LAB 1:** Map the forces or field lines around and/or between two magnets. Trace the magnet(s), and use the compass to determine the direction of the magnetic field.
   4. Can make another object magnetic. (Magnetic Induction) Show this using a magnet and two iron nails. First, show that the two nails aren't magnetic. Then magnetize one nail by touching it to a magnet. Touch the second nail to the first. Observe that they hang together. (Paper clips work well for this too.) Follow-up questions could be the following: Is there a limit to how much you could pick up? Why? What observations support your thinking?
   5. PERMANENT vs. TEMPORARY magnet
      Ask: What would happen if we took the magnet with two nails hanging from it and carefully removed the magnet? (Get Hypotheses) Carefully remove the magnet. The nails retain their magnetism for a short time. These are TEMPORARY magnets. Permanent magnets will stay magnetic forever unless something disrupts their chemistry.

THE DOMAIN THEORY

The atomic structure ultimately determines whether an object is magnetic or not. The Domain theory says that areas of atoms within an object exhibit magnetism. However if these areas are scattered, then they cancel each other out and the object is non-magnetic. If they are lined up in a parallel fashion, all facing the same direction, then the object is magnetic. (This is easily seen by drawing a picture....unfortunately no graphics allowed here.) To check for student understanding, ask the following question: Why did the nail from above become magnetic? Why did it lose its magnetism?

C. **Electromagnets: Turning a magnet "on" and "off"**
1. Permanent magnet--no "on" and "off", always "on"
2. Induced/Temporary magnet--not always reliable, when will it go off?
3. Electromagnet--Turn current on, and magnetic field is on. Current off and magnetic field is off.

What is an electromagnet? A moving electron (current) generates a magnetic field around the wire. Demo: Hook a wire up to a battery; a compass placed nearby will be deflected. Disconnect battery and compass deflects back to rest.

Why/How is this useful? Many items use this principle: power locks in cars, electric staplers, furnace relays, for example. The most familiar example is the junkyard magnet that picks up cars and drops them on top of a stack.

LAB 2: Making a Junkyard Electromagnet

Each group is given some wire, different core materials (nails), a power supply (batteries), and ten-fifteen minutes to experiment and build an electromagnet. The group that picks up the most "paperclip cars" wins. Award magnets as prizes.

D. **Motors...**

If we combine all of our knowledge so far (review the main ideas again), and go one step further, we can begin to understand and even build an electric motor.

1. Electric motors use current to set up two magnetic fields.
2. These fields are set at right angles to each other.
3. By turning a field on and off (alternating current), we cause little pushes against the other magnetic field. This allows us to do work; the flywheel of the motor spins, etc. Demo: a free spinning magnet at rest can be set in motion by bringing a magnet close to it.

LAB 3: Building a Motor

Using the kit provided, follow the instructions, and build the motor. (I usually give students two days or a weekend) Kits are from a catalog.

Performance Assessment:

Question: You are stranded on a desert island and have been captured by some potentially hostile natives. All you have in you pocket are four fairly strong magnets and some string. You must "wow" the natives in two different ways to save your life, what will you do?

Rubric:

5 points: The person designed a compass, taught the natives how to use it, left the island, and navigated back to civilization. Then sold the magnets and began a new life.
4 points: The person clearly stated two different ideas and convinced you as a native that they understand magnetism.
3 points: The person has two ideas, but not clearly stated. You aren't completely convinced or "wow"-ed.
2 points: The person has only stated one idea, or has two ideas that lack explanation. This answer is poorly stated and incomplete.
0 points: The person threw the magnets at the natives and ran the other way.

Multicultural Emphasis:

Dans la langue de votre choix, vous pouvez enseigner cette lesson. Suivez le planning precedent. Donnez-moi un coup de telphone si vous avez besoin de la vocabulaire.

Magnets

Hoi Huynh
2642 North Drake Street
Chicago, Illinois 60647
(312) 489-7284

Clemente Community Academy
1147 North Western Avenue
Chicago, Illinois 60647
(312) 534-4000

Objectives:

To experience another kind of force (beside gravity or electric charge ...) which is always present and affecting us: magnetism.
To explain how magnets, magnetic poles and magnetic fields are related.
To formulate the force law for magnets: ($F = \frac{k\,mm'}{r^2}$)

Materials:

Bar and cow magnets, magnetic compasses, rulers, cereals and papers

Strategy:

Activity 1. Grind the cereal into very fine pieces. Use the cow magnet to attract iron from the cereal.

Activity 2. On the projector, show the two poles of two magnets and how they attract or repel each other.

Activity 3. Break a bar magnet into two halves. Turn a half magnet around on the projector to show they repel each other; magnetic poles always occur in pairs on each magnet. (Otherwise the north half and the south half poles should always be attracted.)

Activity 4. Place a bar magnet on a large piece of paper. Place a compass near the north of the magnet. When the needle comes to rest, make a dot or an arrow on the paper to mark the direction in which the north pole of the compass needle is pointing. Move the compass until the south pole of the needle points to the mark. When the needle is again at rest, make another dot to mark again the direction. Repeat this procedure and connect the points by a smooth curve. Repeat the procedure to draw a few field lines on each side of the magnet. Notice that each line begins at the north pole of the magnet and ends at the south pole. Do any of the field lines cross? The rate at which the needle quivers as it comes to a stop is proportional to the field strength. FOR THE TEACHER: On the projector, cover a bar magnet with a transparency. Sprinkle some iron filings on the transparency while gently tapping it. Compare the pattern made by the filings and the field lines.

Activity 5. Place a magnetic compass on the middle of a metric ruler so that the north and south of the needle is perpendicular to the ruler. Place a bar magnet on each side of the compass on the ruler with the south-seeking poles of the magnets pointing toward the compass. When the compass needle stops at the old position again (pointing north), compare the distances from the compass to the two magnets. If the distances are the same, then the magnets have the same strengths (m=m'). If not, the north-seeking compass needle points toward the stronger magnet (m not = m'). Move the stronger magnet along the ruler until the forces of the magnets balance. The ratio of the square of the distances is proportional to the strength of the poles.

Activity 6. Place two magnets on the overhead. Use Newton's Third Law to "show" that the magnets pull (or push) equally on each other. Therefore, the force must be proportional to each magnet's strength (m, m'). Show that the pull or push (F) is larger when the distance (r) between the magnets is less, thus the force (F) is inversely proportional to the distance (r). It is not obvious that the force is inversely proportional to the **square** of the distance , but the similarity to the Gravitational Force (F_g) and the Electric Force (F_e) should lead to acceptance of the square of the distance between the magnets in the formula:

$$F = \frac{k\,mm'}{r^2}$$

Exploring Series and Parallel Circuits

Pamela Schneider
15223 Clark St.
South Holland, Il. 60473
(708) 339-6461

Luther East High School
2750 Glenwood-Lansing Rd.
Lansing, Il. 60438
(708) 895-8441

Objectives:

1. To arrange batteries, bulbs and wires into functioning series and parallel circuits.
2. To represent simple circuits using schematic diagrams.
3. To explain and compare the effects of series and parallel circuits on bulb brightness, relating the phenomena to the potential differences, current, and resistances throughout the respective circuits.

Materials needed:

for each group of 2-4 students:
- 2 size-D dry cells (batteries)
- 6 pieces of bare copper wire
- 3 flashlight bulbs
- 3 bulb holders
- 1 multi-meter

for demonstration purposes:
- one large scale series circuit
- one large scale parallel circuit
- light bulbs of various wattages
- (optional: logic circuit)

Strategy:

1. Try to arrange one bulb (without holder), one battery and wire in as many ways as possible to make the bulb emit light. Sketch each arrangement, including failures as well as successes. Similarities among the successful trials should be discussed.

   >In order for the light bulbs to light, there must be direct connections from one battery terminal to the metal side of the bulb and from the metal bottom of the bulb to the other terminal. Review the concepts of potential difference, current and resistance. Introduce a "circuit" as a complete path along which a charge can flow from the negative terminal of a power source to the positive terminal of the source. Electrons flow continuously in a closed circuit.

2. Repeat step 1 with the bulb placed inside a holder. Have the students note which two parts of the bulb the holder makes contact with.

   >Contact is made with the metal side and the metal bottom of the bulb.

3. Using one battery, light as many bulbs in as many holders as possible. Sketch each arrangement, noting the ones that work. Compare results among the different student groups.

   >Ask the students which arrangements made the most bulbs glow. When more than one bulb is introduced into a circuit, the possible arrangements include both series and parallel circuits as well as various combinations of the two. The parallel arrangements should make the most bulbs glow. Introduce schematic diagramming (using symbols to represent electric

circuits) for wires, batteries and resistances.

4. [Series] Wire two circuits in series. One should have one bulb, while the other should have two bulbs in series. Do the bulbs light in each of these series circuits? Compare brightness.

   >The circuit with two bulbs should be less bright.

5. In the circuit with two bulbs, unscrew one of the bulbs. Note what happens to the other bulb.

   >The other bulb goes out.

6. [Parallel] Set up a parallel circuit with two bulbs. Do both bulbs light in this parallel circuit?

   >Both bulbs should light.

7. Unscrew one of the bulbs in the parallel circuit. Note what happens to the other bulb.

   >The other bulb should remain lit. Have the students describe in their own words the differences between series and parallel circuits. Guide them in making a descriptive list of the two types of circuits on the chalkboard. Use larger scaled series and parallel circuits with larger light bulbs as part of a demonstration to help develop the concepts. Have multi-meters available to test the current, potential difference and resistance at various points along each circuit.

Series Circuits

>A single path is allowed for electron flow.
>A break anywhere along the path stops the electron flow in the entire circuit. (Devices in series act dependently.)
>The total resistance in a circuit is equal to the sum of the individual resistances along the current path. $R_T = R_1 + R_2 + R_3$ ...
>The current anywhere along the circuit is equal to the voltage supplied by the source divided by the total resistance of the circuit. (Ohm's Law)
>The potential difference, or voltage, is decreased over each resistance. The sum of the "voltage drops" should be equal to the amount of voltage supplied. $V_T = V_1 + V_2 + V_3 + \ldots$
>The voltage drop across each device is proportional to its resistance.

Parallel Circuits

>Branches are formed providing separate paths for the flow of electrons.
>Since current branches into separate pathways, a break in one or more of those pathways does not interrupt the flow in the other paths. (Devices act independently.)
>The total equivalent resistance is less than the value of any individual resistor. $1/R_T = 1/R_1 + 1/R_2 + 1/R_3 + \ldots$
>Each device connects the same two points of the circuit; therefore, the voltage is the same across each device.
>The amount of current in each branch is inversely proportional to the resistance of the branch.
>The total current is equal to the sum of the currents in each branch.

$$I_T = I_1 + I_2 + I_3 + ...$$

Magnets

Mina Valenzuela
6114 W. Cornelia
Chicago, Il. 60634
312-685-9614

O. A. Thorp Scholastic Academy
6024 W. Warwick Av.
Chicago, Il. 60634
312-534-3640

Objectives:

1. Discover how magnets work.
2. Demonstrate magnetic lines of force.
3. Find materials that can be attracted to magnets.

Materials:

Magnets (disk, bar, horseshoe), nails, corks, erasers, paper clips, coins, cloth, wires, foil, paper, sticks, iron filings, compass, thread, tape, pins, plastic, salt, wax paper, pan, pendulum, metal sheet, bottles and container.

Strategy:

1. Demonstrate to the class some magnet tricks.

Trick #1. Floating Disk. Put two rings on the pencil so that the rings repel each other. Hold the bottom ring and move it up and down along the pencil. What did you find out? Try the trick with a stick, too. The upper ring will jump up and down as if it were attached to a spring. The force of magnetic repulsion will keep the top magnet in the air. Students may try this trick by pairs in their seats.

Trick #2. Rolling Rings. Hold one ring between your thumb and forefinger in a vertical position. Hang the second ring on the first ring edge to edge. With a slight movement of your hand you can make the second ring travel round and round the first ring.

Trick #3. Stand up nine nails on their heads in three rows of three nails about one half inch apart. Use horseshoe magnets to remove each nail one at a time without disturbing any other nails. If another nail falls or moves, it is your friend's turn.

Trick #4. Hanging Pendulum. Tie a length of thread to two small disk magnets. Tie the other end of the thread to the pendulum so that the magnets hang about three fourths of an inch from the metal sheet. Arrange several pieces of magnets on the metal sheet. Swing the pendulum and feel the magnetic lines of force. What happens?

Trick #5. Bearded Man. Put about three pinches of iron filings on a picture. Slide a horseshoe or bar magnet underneath the picture. Arrange the filing units into hair, eyebrows, moustache or beard. The iron filings will stand or move. Return the iron filings carefully to the bottle container.

Trick #6. Mix a half teaspoonful of sugar with the same quantity of iron filings in a bottle. Ask the audience how to separate them. As you move the magnet around the bottle, the iron filings will follow but the sugar will be left behind. Repeat the experiment with a salt mixture, water and glue.

Trick #7. Put two bar magnets side by side so that north and north pole are facing each other. What happens? Repeat the procedure by putting north and south pole facing each other. Now what happens to the magnets?

Trick #8. Put iron filings in a small glass pop bottle. Using a testtube, glue it on the inside of the top. Put a cow magnet inside the tube. Shake the bottle and the filings will stand up and form a pattern showing the magnetic lines of force.

2. Predict which objects will be attracted to a magnet. Touch your bar or horseshoe magnets to each of the items. Which are attracted by and stick to the magnet? Which are not attracted? Record the results on the chart by checking yes or no next to each item listed. Decide with your group what kind of material each item is made of.

Electron Current Flow

Greg Zipprich
201 Indiana
Park Forest, IL 60466
(708) 747-4136

Bloom Trail High School
Cottage Grove & Sauk Trail
Chicago Heights, IL 60411
(708) 758-7000

Objectives:

The student will understand how and why electric current passes through a conductor due to a potential difference.

The student will discover the proportional relationship between voltage and resistance and their effect on the measurement of current flow.

The student will discover that, with a constant voltage, the smaller the diameter of a conductor, the smaller the current flow.

Materials needed:

Five-gallon bucket with globe valve attached to the bottom outside rim, 3/4 x 18 CPVC pipe w/screw adapter, 1/2 x 18 CPVC pipe w/3/4 screw adapter, 1/4 x 18 potable water line epoxied to a 3/4 screw adapter, U-tube constructed from 2 12-oz plastic pop bottles glued into 2 3/4 CPVC 90º ells connected with an 18" length of 3/4 CPVC pipe, a 10-foot ladder, enough 3/4 CPVC pipe and couplings to attach the bucket suspended on the ladder to pipe lengths on the tabletop, a stop watch and a 3-liter pop bottle (graduated).

Strategy:

Working on the principle that water and electricity flow with similar characteristics, a discussion of electric current flow is conducted making analogies to the flow of water. In the U-tube, using water dyed blue with food coloring, the fact is explained that water does not move unless additional water is poured into one side causing a difference in potential. This causes movement in the water until potential equilibrium is reached.

Explaining that an excess of electrons at one end of a conductor causes an electrical potential difference, electrons will similarly flow until electrical equilibrium is reached. How much flows (introduce the term, current) depends on the potential difference or pressure (introduce the term, voltage) and the opposition to flow (introduce the term, resistance).

Using the bucket of water at tabletop height with the three different sizes of pipe connected to 3/4 screw adapters, measure the volume of water which flows through each pipe in ten seconds using the graduated 3-liter pop bottle. One student uses the stop watch, another measures the volume and a third keeps a chart of the results on the chalk board.

It can be seen now that if voltage is constant, a smaller pipe (conductor), carries a smaller current. Now the formula, $E = I \times R$, is placed on the chalk board. The students discuss the relationships of the values and are asked to derive the equation, $I = E / R$. We have seen that if resistance is high (the smaller conductor), current is low and that, conversely, small resistance (the larger conductor), transports a larger current. At this time the quantities are introduced for measuring volts, ohms and amperes.

The students are asked, "Looking at the formula how else can we increase the current besides decreasing the resistance?" A student will answer, "By increasing the voltage." At this time the bucket can be placed on the shelf of the 10-foot ladder. The extra 3/4 CPVC pipe and connectors are used to extend the water supply to the tabletop where the pipes were before. Again, three students, a timer, a measurer and a recorder, chart the volume of water from each pipe in ten seconds. More water will come out across the chart because the pressure of the water is increased. Its potential difference is increased. The students, therefore, find that increasing the voltage also increases the current.

If time permits, actual values for voltage and resistance can be supplied and the value for current can be calculated mathematically or this can be begun on the following class meeting.

Conductors and Insulators

Leona Williams
8723 S. Calumet Ave.
Chicago, Illinois 60619
312-874-9743

Cregier Vocational High School
2040 W. Adams St.
Chicago, Illinois 60612
312-997-3690

Objectives:

1. To provide an understanding of basic electrical terms.

2. To compare the electric current flow in conductors and insulators.

3. To teach the operations of a series circuit by designing a quiz board.

Materials:

(For each group of four)

wood
rubber
glass
paper clips
1.5 volt dry cell
cardboard
aluminum foil
plastic
12 volt automotive bulbs
sockets
electrical wire
piezo buzzers
battery holders
nails
coins
paper

Recommended Strategy:

(Teacher Preparation)
Prepare four series circuit units for testing materials. Each unit will consist of a light or buzzer connected to a battery and placed on a wooden board for support.

All materials will be separated into five stations on laboratory desks. Students will be divided into groups.

Activity 1

Students will test 10 different objects to determine if they are conductors or insulators. All data should be recorded.

Activity 2

Construction of quiz board.

Remove the insulation from 4 pieces of electrical wire for about 1 inch on both ends. Wrap several turns of one end around a paper clip. Wrap the other end around a second paper clip. Repeat process until you have four wires with paper clips at each end. Place a 1.5 volt battery into holder. Connect piezo buzzer to the battery. Prepare questions and answers for quiz board. The correct pairs have to correspond to your wiring. Arrange the wiring on the quiz board to conform to it. Whenever a question is answered correctly, by placing the wire from the buzzer to paper clip next to the question and a second wire from buzzer to the paper clip next to the answer, the circuit will be completed and the buzzer will sound. Students will return to seats. A question and answer period will follow.

Results:

After we connect a wire between the terminals of an electric cell, we find that there is an electric current in the wire. A wire that will carry or conduct an electric current is called a conductor. In order to have a current, there must be a complete circuit of conductors, a path that the electrons can follow back to their starting point. Insulators are materials that cannot easily conduct an electric current.

Return to Physics Index

OHM'S LAW

Anderson, Herbert D.
P.O. Box 19391
Chicago, IL 60619
1-312-651-4587

Hermann Raster Elementary School
Chicago, IL 60636

Objectives

(a) to become aware of Ohm's Law, the relationship between current, voltage, and resistance in a series circuit

(b) to solve selected problems using Ohm's Law

Equipment and Materials

Garden hose with nozzle; circuit board or plywood; 3 - 1.5 Volt DC batteries; 6 battery clips & 3 battery holders (not needed if hobby batteries are used); 2- 4.5 V bulbs; l variable resistor (the one used was 25 Ohms 2 Watts); bell wire; screw driver; 2 lamp sockets; multimeter (optional).

Recommended Strategies

1. Review basic laws of electrostatics and conductivity. Also, review schematic diagrams of simple circuits.

2. Use the garden hose to demonstrate the analogy of water pressure with voltage, drops of water with electrons, flow of water with electrical current, resistance of hose and nozzle with resistance in a circuit etc.. During discussion, introduce key vocabulary terms: AMPERE; VOLTS; OHMS; RESISTANCE; CURRENT

3. Connect one, then two, and finally three 1.5 volt dry cells in a series circuit to a socket with a 4.5 volt bulb. The pupils will observe and explain the varying degree of brightness of the bulb with respect to the increased voltage and the increased current.

4. Connect 3 - 1.5 volt dry cells in series to both sockets, using 4.5 volt bulbs. The pupils will notice the bulbs' brightness as compared to using one or two dry cells. The pupils will explain.

5. Insert the variable resistor into the circuit [You will have to connect the negative terminal to the center terminal with a clip], using 3 dry cells to one socket with a 4.5 volt bulb. The pupils will vary the resistance from the least resistance to where the bulb will not light. The pupils will observe and explain.

6. Through discussion, the class will realize the relationship between current, voltage, and resistance (Noting that this is for D.C. current only).

7. Introduce the pupils to **OHM'S LAW : CURRENT =** VOLTAGE

RESISTANCE

VOLTAGE = CURRENT X RESISTANCE **RESISTANCE =** $\frac{\text{VOLTAGE}}{\textbf{CURRENT}}$

Current is measured in Amperes; Voltage is measured in Volts; Resistance is measured in Ohms.

8. If available, use a multimeter to measure the current and voltage in the circuit, then calculate the resistance. Now, measure the resistance and compare to the calculated value.

9. Pupils will use math skills to solve selected problems using **Ohm's Law**

Return to Physics Index

Electric Currents and Circuits

Williams, Claudette
929 Fair Oaks
Oak Park, IL 60302
1-708-383-6661

Dever Elementary School
1-312-889-9188

Objectives

1) To create an awareness of the importance of electricity in everyday life.
2) To introduce basic electrical terms and to illustrate how electricity moves, both in series and parallel circuits.
3) To show the need for a complete electric circuit, how to control electron flow with a switch and to teach series and parallel circuits.
4) Students should be able to wire dry cells either in series or in parallel when given several dry cells, pieces of wire and bulbs.

Equipment and Materials

ammeter	hand crank generator
voltmeter	Christmas tree lights
insulated copper wire	Manila folders
1.5 - volt dry cells	1.5 - volt light bulbs and sockets
foil	brass fasteners or paper clips

Recommended Strategy

Have materials displayed on table or desks. (make sure there is an obvious display of examples of series or parallel circuits, such as Christmas tree lights)

Review the part/importance of electricity in everyday life

Discuss and review the vocabulary you will be using

circuit	volt	voltmeter
current	dry cell	ammeter
series	resistance	terminal
parallel	conductor	ampere
ohm	watt	fuse

Have students divide into groups in order that they may work cooperatively with each set of materials.

a. The first activity should be a simple bulb, battery, and foil assembly. The object of this activity is to reinforce the understanding of what is necessary for a circuit to be completed. A worksheet should accompany the set-up.

b. The second activity will be a human circuit - students holding hands and then touching the generator

c. The third activity will enable each group to devise its own circuits through the use of provided panels and materials. By the process of trial and error along with previous knowledge the students should be able to trace both types of circuits.

A culminating activity will be for the students to begin a take home project which is a question/answer game circuit board.

Return to Physics Index

Magnetism

Gilmore, Marie
360 E. Randolph St Apt 305
Chicago, Illinois 60601
938-3518

Raster School
737-1011

Objectives:

After completing this project, students should be able to:

1. Name two properties shared by all magnets.
2. State what will happen to a magnet that is suspended so that it is free to turn in any direction.
3. Describe how one magnet will affect another magnet when the poles of the magnets are arranged in a certain way.
4. Tell how a piece of iron can be made slightly magnetic.
5. Use your Magnetic Crane to explore magnetism.

Apparatus needed:

1 battery (9 volt)
1 battery snap with leads
1 nail
plastic coated wire (26 in.)
1 rectangular block of wood (4 in. x 1 3/4 in.)
1 angled block of wood (4 in. x 1 3/4 in.)
1 spring clothespin
2 each small screws and nuts
electrical tape
glue
scissors
a ruler
pliers
magnets
iron

Recommended Strategy:

Magnetic Crane Procedure:

1) Glue the angled block to the rectangular block so that it angles out over the edge. Set aside to dry.
2) Put the small screws through the holes in the clothespin so that the heads are on the inside. The heads should touch each other when the clothespin is squeezed.
3) Leaving about three inches of wire at the end, wind the plastic coated wire neatly around the nail starting at the head and winding down. Do not overlap the wire as you wind.

4) Wind the metal end of one of the leads from the battery snap (either one) around the bare metal end of the shorter (3in.) length of wire from the nail. Secure this with about 2 inches of electrical tape so that it does not slip off.
5) Connect the other lead from the battery snap to one screw on the clothespin and secure it there with a nut. Connect the bare metal end of the long piece of wire from the nail to the other screw and secure it with a nut. You may need pliers to bend the wire.
6) Attach the battery cap to the battery.
7) Tape the wires along the blocks so that the nail hangs over the angled block. Tape the battery to the crane so that the snaps face the center.
8) Place the clothespin switch on the back of the crane so that the screws hang over the end of the block. Tape the bottom half of the clothespin to the block.
9) To make your magnetic crane work, press the clothespin switch so that the screw heads touch. As long as you hold the switch closed the nail will attract small metal objects.

What Is Electricity

Oldenburg, Albert
18W354 Holly Ave
Westmont, IL. 60559
963-0838

Lindblom Tech High School
471-8700

Objectives:

To develop an understanding of the fundamentals of static electricity, namely that of materials, conditions, and charge. To learn how to detect a charge by the use of electroscopes. To learn how to determine the force between charges.

Materials

Demonstration Van de Graaf generator, Jacobs ladder, thread, aluminum foil, long plastic tubes (golf club protectors), cat or rabbits fur, ebonite rods, glass rods, ring stands, silk pieces, scissors.

Strategy:

This lesson is usually scheduled as the first in a series at the beginning of the second semester. In fact, the concepts given today are usually spread over three to five class periods. The equipment is set up before class time. Then some time is spent checking to see if it is working properly. One must work very carefully with the Jacob's ladder coil because its output can be deadly, therefore extreme caution must be practiced. It has also been suggested that a clear plastic shield should enclose the apparatus for safety purposes. The lesson starts with the question, "What is electricity?". The student's response gives one six or seven ideas which are written on the blackboard and then are emphasized with the demonstrations. After these are completed the students are divided into groups due to lack of equipment and are pre-instructed how to rotate from station to station doing all three parts of the lesson which consisted of detection of charge, making an electroscope, and determining the amount of force produced by the charge on an object. At least three trials are to be used on the force part and or using different materials to familiarize the student with the workings of Coulomb's Law. After the groups have been finished, the class as a whole will discuss the concepts and develop a consensus for their lab reports to be turned in a few days later.

The Millikan L'Eggs Experiment

Coleman, Roy
10549 S. Homan Ave.
Chicago, Illinois 60655
238-2305

Morgan Park High School
881-5050

Objective:

To use discrete masses to simulate the Millikan experiment (the discrete charge on the electron).

Apparatus:

one balance per group and EITHER
a large number of L'Eggs eggs (from panty-hose) individually numbered and filled with ball bearings or clay such that the filler is divided into 'unit masses' i.e. for a ball bearing filler, use multiples of 7 bearings (or some multiple larger than the weight of the 'shell'). It is nice to have several regular intervals and then skip one (put in two additional unit masses)
OR
10 numbered plastic Easter eggs filled with clay or bearings (as with the L'Eggs eggs) for each group

Strategy:

Present the problem of how to find the mass of a unit 'yoke' where there is a shell and **at least** one 'yoke' in each egg. If the students cannot come up with the idea to mass them on a balance, suggest it. After they have massed their eggs, some may see a pattern but suggest that they draw a histogram of their data (mass vs. number of eggs with that mass (NOT egg number)). It should be obvious from the graph that the masses fall into several groups. From the average mass of each group, students should be able to see that the groups fall at regular intervals and that these intervals correspond to each additional unit mass (one more 'yoke').

Discussion:

A discussion should be held to talk about the number of digits of accuracy needed in the measurements since the shells and unit masses will each vary by some small amount. It is possible for the students to become so involved with making accurate measurements that they miss the pattern or waste too much time on the weighing.

After the experiment is done, a comparison should be made between this experiment and Millikan's oil drop experiment where he found the unit charge of the electron by looking for regular intervals (or discrete units of charge).

Electrochemistry

Allen, Donna L.
804 S. Lyman Avenue
Oak Park, IL 60304
524-8760

Bowen High School
933-7200

Objectives:

One form of energy may be transformed into another. How can electricity be changed into chemical energy? How can chemical energy be transformed into electricity?

Apparatus needed:

Strips of copper, zinc, lead, magnesium
0.5 M solutions of soluble salts of copper, zinc, lead and magnesium (acetates or chlorides)
0.05 M copper (II) sulfate
plastic cups (preferably clear)
index cards (support strips)
voltmeters (milliammeters, galvanometers as available)
insulated wires
one lemon

Recommended strategy:

I. Changing electricity into chemical energy
   A. electrolysis of water
   B. electrolysis of saturated sodium chloride solution
   C. electroplating

II. Changing Chemical energy into electricity
   A. A zinc strip is put into a 0.5 M solution of copper(II) sulfate and allowed to stand for at least two hours. Another cup of the same solution without the zinc strip should be prepared at the same time for comparison. Record observations. Write equation. A reaction has occurred spontaneously with the liberation of a small amount of heat energy. Could that energy be harnessed in the form of electricity?
   B. Stick strips of copper and zinc into a lemon and connect to a meter. Is electricity being generated?
   C. Moisten a small piece of paper towel in your mouth and put it between a penny and a dime. Touch the penny to one lead to the meter and the other lead to the dime. Is electricity being generated? This is a Voltaic cell.
   D. In order to cause electrons to pass through an external circuit instead of reacting directly with the liberation of heat energy, the two electrodes must be separated. However the electrons must have a pathway or the circuit will not be

complete. This can be accomplished with a semipermeable membrane or a salt bridge. The salt bridge can be a U shaped glass tube filled with a conducting solution, but we will use a strip of porous paper which has been dampened with a saturated solution of sodium or potassium chloride.

Fill one cup with the solution of zinc acetate and mount a strip of zinc metal through a slit in an index card in this solution. Fill another cup with a solution of copper acetate and mount a strip of copper metal in this cup. Stand the two cups side by side and hang a damp strip of paper over the sides so that one end is in the zinc acetate solution and the other end is in the copper(II) acetate solution. Now connect the two electrodes by copper wires to the meter. Does the meter give evidence that an electric current is generated? Record whatever quantity and units the meter shows.

Repeat, using all the possible combinations of the four metals. Note which metal is at the positive electrode. Does current flow if the metals are reversed. Twelve observations.

-	+Cu	Pb	Mg	Zn
Cu	XX			
Pb		XX		
Mg			XX	
Zn				XX

Write equations:

Can we rank the metals in order activity? Arrange on a line.

III. Standard Reduction Potentials - The potential difference across a Voltaic cell is easily measured, but it is impossible to measure an individual electrode potential. Therefore the hydrogen electrode which consists of a platinum electrode immersed in a 1.0 M solution of hydrogen ions is assigned a value of zero and all other half cells are measured with respect to this. Here are some standard reduction potentials:

$Cu \longrightarrow Cu^{+2} + 2e$ -0.337 v

$Pb \longrightarrow Pb^{+2} + 2e$ 0.126 v

$Mg \longrightarrow Mg^{+2} + 2e$ 2.370 v

$Zn \longrightarrow Zn^{+2} + 2e$ 0.763 v

Oxidation potential equals reduction potential with the sign changed. The predicted potential difference is the algebraic sum of the oxidation and reduction potentials.

Example: Zn + Cu = 0.763 -(-0.337) = +1.10 v

The observed voltage is always less than the predicted voltage. Calculate the predicted voltage for each of these cells, having first written the equation and identified the element which is oxidized. How do these values compare with differences taken from the number line above?

IV. Discuss drawings of:

A. Flash light dry cell
B. Alkaline dry cell
C. Automobile battery

Electric and Magnetic Fields

Garrison, Earnest S.
536 Landau
University Pk, IL 60466
534-5146

Schurz H.S.
794-8120

Objectives:

To introduce the concepts of MAGNETIC AND ELECTRIC FIELDS to the students via the use of phenomenas as magnetism and electric current flows.

Apparatus needed:

Large magnets(2), Nails, Metal rings, Several Coils of wire, Van De Graff generator, Ping-Pong Ball, Fishing line, Several metal objects.

Recommended strategy:

Set up a stand that has several nails that are attached to the table (tape them if possible).Above the nails place one of the large magnet at distance that will cause the nails to appear to float in air.At this point a discussion is held concerning the set up. Several pieces of materials can be placed in the space between the magnets and the nails to illustrate the their effects on the magnetic field, this should enhance the discussion of the properties of the magnetic field as most objects other than thick metal plates have little or no affect on the floating nails.

The Van De Graff generator can be used to demonstrate the electric field. Suspend a ping-pong ball above the table (use a ring stand if necessary) that has been coated with a metallic paint. The space around the ball is normal before introducing the Van De Graff into space near the ping-pong ball(make sure that the ball can't touch the Van De Graff if swong in that direction). When the generator is turned on the ping-pong ball should swing close to the generator. A discussion should start concerning the space around the ball and generator. Afterwards a small fluorescent tube can be placed in the space near the generator in way that both ends of the tube are the same distance from the generator's surface (creating an equipotential along the tube). Now the tube should be turned slowly in a manner to place one end of the tube close to the generator and the other away from it. The effect of the light glowing should be food for considerable discussion about Electric fields and fields potentials.

Using some clear plastic and wire (heavy gauge) an overhead projection device can be constructed to illustrate the connection between electric and magnetic fields. The plastic should be cut in the shape of a rectangle and a small hole should be drilled in the center of the plastic about the size the of a 12 gauge wire. Then place a strip of wire through the hole in the plastic so that it is perpendicular to the flat surface of the plastics sheet.

```
                                        I-----0
                         WIRE ---->     I
                                        I
                           _____________I __________________
                          /             I                  /
       PLASTIC -------> /                                /
                       /________________________________/
                                        I
                                        I
                                0-------I
```

The two ends of the wire should be attached to a circuit that contains a six volt motorcycle battery and a knife switch hooked - up in series. Now iron fillings should be liberally spread around the plastic sheet. When the switch is closed circles should form around the wire. It may help to tap the plastic sheet gently to help see the lines of force form. These lines are due to the magnetic field made by the current in the wire. This should provide food for much discussion about electric currents and their associated magnetic fields.

Return to Physics Index

Current-Carrying Coils In Magnetic Fields

Landato, Janet
201 S. Harvard
Addison, IL 60101
312 833-3974

St. Viator High School
312 392-4050

Objectives:

At the end of this exercise the student should be able to:

1. predict the direction of movement for the pointer of a home-made galvanometer for a given current direction.

2. describe how the current-carrying coil exerts a force on the magnet.

3. predict how the number of turns of wire in the rotating coil influences the rotation speed of the motor.

4. describe why the DC motor works without an armature.

Apparatus needed:

1.5 m of enameled copper wire, one 1.5 V battery, one film cannister, two paper clips, 4 large rubber bands, one flat magnet with a hole, one hair pin, two nails, one small piece of wood or pegboard, two alligator clips, one large plastic bag

Recommended strategy:

Each student takes a plastic bag with apparatus inside. Teacher asks "How can this 'junk' be used to find out how a current-carrying coil is influenced by a magnetic field?" After a short discussion, the teacher shows models of film-cannister galvanometers and DC motors. Students are encouraged to construct their own models and try to discover:

How does the number of turns of wire on the loop or galvanometer change the behavior of the apparatus?

Does the distance of the rotating coil to the magnet influence the speed of the coil?

Does the number of batteries change the speed?

How does the direction of current through the coil influence the direction that the galvanometer swings?

The direction that the motor coil rotates?

Explain how the coil exerts a force on the moving magnet in the galvanometer.

What makes and breaks the circuit in the DC motor if there is no armature?

Coulomb's Law

Austin A.Winther
Paul Robeson High School
6835 S. Normal
Chicago, IL 60621
1-312-723-1700, ext. 411

Objectives:

Observe qualitatively the relationship between electrical charge and force.

Determine experimentally the quantitative relationship between force and the center to center distance between charged objects.

Experience reinforcement of the above concepts through preferred perceptual modes (tactile, kinesthetic, auditory, or visual) through appropriate activities.

Materials:

Van der Graff generator, ring stand, coffee can, styrofoam cups, string, rubber tipped dart, paper and plastic sheets (optional), overhead projector, file folders, graphite coated pith or styrofoam balls, nylon stranded string, masking tape, centimeter or other grid on overhead transparency, plastic sticks, wood blocks, oak tag board, markers, coat hangers, ruler, index cards, transparent tape, large (approximately 8m*.5m) sheet craft or butcher paper, rubber and glass rods, silk cloth, piece of fur, electrophorus.

Procedure:

1. Set up the Van der Graff, in line with a veriac if the generator does not have a variable control, with the coffee can inverted over the top of the ring stand in such a way that, when the generator is turned on, a clearly visible spark jumps from the generator to the coffee can. Have the students observe the spark and the noise produced and describe what they see. Draw the connection with lightning and be sure the students understand that the light and noise which they saw and heard were due to electrical charge. **Run the generator at a MUCH SLOWER SPEED** and have the students note the sensation the generator produces when they hold their arms close to it.

2. Attach the broad end of a rubber tipped dart to the top of the generator with a piece of string tied around the opposite end of the dart. The other end of the string should be taped to the outside bottom of a styrofoam cup. The cup should then be inverted over the upper end of the dart attached to the generator. When the generator is turned on at high speed the cup will be repelled from the end of the dart and will be held in mid-air by the charges on it and on the generator. Remind the students of Newton's first law. Since the cup was moved from a state of rest by the charge produced by the generator clearly a force was produced by the charge. More examples can be given of the same phenomenon using pieces of paper, plastic, fur or other material. The students should now be able to make a qualitative statement that charged objects produce a force on one another.

3. The quantitative aspects of this activity are available in several published sources. Two which are useful are "Coulomb's Law,"**Laboratory Physics**, James T.Murphy and Judith L.Doyle,Charles E. Merrill,1986.,and "Coulomb's Law on the Overhead Projector," J.B. Johnston,**The Physics Teacher**(January,1979).

4.Several activities can be devised to reinforce the main concepts of this lesson and others related to them. Such activities are by no means limited to the following suggestions.

Kinesthetic activity: Winther's Linear Accelerator: Using a 7.5m *.5m sheet of craft paper, butcher paper or plastic divide the sheet into fifteen equal squares. Label the center square "start" and number out in both directions to seven. Pick five students who are kinesthetic learners. One student is the

operator. The other four are divided into two teams of two. Each team has either 2
positive or negative charges. The operator gives each player in turn a card which tells that player how to move. The team which is the first to have a player to exit the accelerator is the winner. The instruction cards read, "move one space left," "move one space right," "move one space closer to an opposite charge," and "move one space further away from a like charge." This will reinforce for these kinesthetic learners the concept that like charges repel and unlike charges attract . The number and content of the cards may be varied depending on the group using them.

Tactile/Visual Activity: Learning Circle: A learning circle can be constructed out of oak tag board. Cut two circles from the board of the same size approximately 18" in diameter. Divide each circle into eight equal wedge shaped sections. Attach the two circles to each other with a coat hanger sandwiched between them in such a way that they can be hung up. The faces of the circles which have been divided into sections should be aligned with each other, facing outward. In each section of one circle put a a statement from the chapter summary with a key word or phrase omitted. Attach each of the omitted words or phrases to a cloths pin so that the students can attach the word or phrase to the appropriate section of the circle to make a completed statement. The back of the cloths pins and the sections on the back of the learning circle may be coded to facilitate checking the answers of the students after they have matched the words and phrases with the appropriate statements. As either in-class or homework activities students can construct their own learning circles using one the teacher or other students made as a model. This activity serves as reinforcement for tactile/visual students. Puzzles or electro-boards serve the same purpose.

Mathematics/Physics

Sound: The Vibration of Materials

Camille Gales
3001 S. Michigan
CHICAGO IL 60616

Coles Elementary
8441 S. Yates Blvd.
CHICAGO IL 60617
(773) 535 – 6550

Objective(s):

1. Students will recognize that sound is produced by the vibration of materials. 2. Students will recognize that the sound produced is dependent on the type of material that is used. 3. Given four types of material; air, string, wood, and metal, students will identify air as being the poorest conductor of vibrations, and metal as being the best. 4. Students will recognize that if there is no material to vibrate there will be no sound. These activities are suitable for students in the primary grades.

Materials:

rulers	Tubes	Ticking objects	3 ft. cotton string	3 yds. Thin wire	Vacuum jar
	Rubber bands	1 ft wooden rod	3 ft. thin wire	3 yds. Cotton string	Ticking object
	Thin rubber sheets	1 ft. metal rod	Metal spoon	Cups-paper or styrofoam	
	Paper clips				

Strategy:

1. Hold the ruler 4 inches over the edge of the desk. Strike it. Observe its movement and listen for its sound. What kind of movement did the free end of the ruler make? What did you hear?

2. Stretch a thin sheet of rubber over each end of the tube. Secure each end with a rubber band. Thump one end of the tube while gently holding your hand over the other end. Feel and observe. What do you feel? What do you hear? Now place a paper clip on the rubber sheeting at one end of the tube. Thump the rubber sheeting at the other end. What do you see? What do you hear?
3. Get 3 ft. of cotton string. Tie the spoon at the center of the string. Wind about 3 inches of string around the forefinger of each hand. Stick those fingers into your ears and strike the desk with the spoon. Observe. What do you hear? Follow the same procedure using 3 ft. of wire. Observe. What did you hear? Compare the two sounds.
4. Get a wind up clock or a timer. Press one end of the wooden rod against your ear; place the other end against the ticking object. Observe. What did you hear? Follow the same procedure using the metal rod. Compare the two sounds.
5. Get 3 yds. of string and two paper cups. Place a small hole in the bottom of each cup. Place each end of the string through the hole in the cup and secure the string by knotting it. With a friend, stretch the string. One person whispers into the end of the cup. The other person places the other cup to the ear and listens. Observe . Follow the same procedure using 3 ft. of thin wire. Observe. Compare the two sounds.
6. Place a ringing alarm clock inside of a vacuum jar. Ask the class what they think will happen when the air is removed from the jar. (The sound of the ringing should fade into silence or close to silence as the air in the jar is removed.)

Performance Assessment:

After students complete activity #1, they should be able to state that they observed the rapid up and down movement of the ruler and that while the up and down movement was taking place sound could be heard.

After students complete activity #2, they should be able to state that they heard a sound when the sheet of rubber was thumped, that they felt movement at the opposite end of the tube, and that the paper clip bounced when they thumped the opposite end of the tube.

After students complete activities #3,4,5, they should hear sounds through the wood, wire, and the string. They should observe the difference in sounds when they are transmitted through the various materials.

After the students observe activity #6, they should be able to state that the reason the sound in the jar is getting softer is because the air in the jar that is being reduced. When all of the air is removed from the jar the students should not be able to hear the ringing. There is no air in the jar for the alarm clock to vibrate and so there is no sound being heard.

Grading Rubric:

A - Student will be able to state that sound is produced because some material is vibrating. Student will be able to demonstrate vibration by doing activities one and two which involve either seeing or feeling the vibrations. Student will conduct activities 3,4, and 5 to demonstrate and explain that the sound which is produced depends on the material through which the vibration occurs. Student will be able to predict that as the air in the vacuum jar is removed the ringing will get softer.

B - Student will be able to state that sound is produced because some material is vibrating. Student will be able to demonstrate vibration by doing activities one and two. Student will be able to demonstrate that the sound produced depends on the material being vibrated by doing two of the following three activities (activities 3,4, or 5). Student will be able to predict that as the air in the vacuum jar is removed the ringing will get softer.

C - Student will be able to state that sound is produced because some material is vibrating. Student should be able to demonstrate vibration by doing activity one or two. Student will be able demonstrate that the sound produced depends on the material being vibrated by doing at least one of the following activities (activities 3,4,5). Student will predict that the sound in the vacuum jar will get softer.

D - Student will be able to state that sound is produced because some material is vibrating. Student will be able to demonstrate vibration by doing activity one. Student will be able to demonstrate that the sound produced depends on the material being vibrated by doing one of the following activities (activities 3,4,5). Student will observe that the sound in the vacuum

jar is getting softer.

Conclusions:

-

Sound is produced when materials vibrate.

The type of sound produced depends on the material through which the vibration occurs.

There can be no sound if there is no material to vibrate.

Now Hear This!

Juliette M. Walker
751 E. 84st. Apt#2e
CHICAGO IL 60619
(773) 488-3157

Crown Community Academy
2128 S. St.Louis
CHICAGO IL 60623
(773) 534-1680

Objective(s):

In this project, students will be able to describe how sounds are heard by the human ear by creating a model of the human inner ear. This activity may be utilized by grades 3 - 8.

Materials Needed:

Students may be placed into cooperative learning groups of 3.
1long paper roll (used gift wrap rolls are perfect)
plastic wrap   medium sized disc of foil   rubber bands
2cardboard paper discs   doublestick tape   pink tissue paper
flashlights   1 large box   scissors   cardboard fork shape
(1 set of each item is needed for each group)

Strategy:

1. Students will create an eardrum by stretching a piece of plastic wrap across the end of the paper roll fixing it in place with a rubber band.
2. Students will create a set of ossicles with two cardboard discs and a fork shape of thin cardboard. This will be held together with doublesided tape.
3. Students will then attach a disk of shiny foil to one end of the roll, and will attach the other to the plastic wrap "ear drum" on the tube. This will complete the middle ear.
4. Students will then make an outer ear from a cone of cardboard with a hole at its end and will place it on the inside of the tube. Students may design their cone with pink tissue paper, for a more realistic look.
5. Students will then place the middle of the model of the ear on a box, leaving the ends of the rolls hanging off of the front and back.
6. Students will then shine a light onto the mirror and will ask a partner to to talk into the ear and watch for vibrations.
7. Have the students to watch the window of the ear. Have them describe how it responds to shouting, whispering, whistling etc.

Performance Assessment:

Students will be evaluated based upon their models, and oral explanations as to how their ear works.

Conclusions:

This project works because the sound waves from the students voice makes the plastic wrap vibrate. These vibrations are transmitted into the cardboard "ossicles" and can be seen by watching the foil disc for movements. This is a simple model of how the ear works.

Cheryl Pitts - Crown Academy

Let There be Light

Cheryl Pitts
1036 N. Hermitage Ave
CHICAGO IL 60622
(773) 235-8908

Crown Academy
2128 St. Louis Avenue
CHICAGO IL 60623
(773) 534-1680

Objective(s):

The students will learn the process of photosynthesis.
This is for all grades. The level can be scaled according to the level of the students.

Materials Needed:

1. shallow trays or containers (the number needed for your class size)
2. potting soil
3. watercress seeds
4. water
5. cardboard (larger than the tray)
6. stencils (letters and fun designs)
7. SUNLIGHT!!!

Strategy:

1. Fill shallow tray/container half full with potting soil. Scatter watercress seeds freely covering the entire tray/container. Moisten the tray with water.

2. Cut initials and/or design from cardboard, place it over the seedlings. Make sure the sunlight cannot reach the plants beneath. * The cardboard should be a little bit larger than the tray/container except for the cutout areas itself.

3. Leave the tray in a sunny position. Keep the soil moist while the watercress is growing. Wait for approximately two weeks for the plant to germinate and grow.

4. During this growing process do not remove the cardboard. You should occasionally turn the tray/container to allow equal amounts of sunlight parts of the tray.

5. When you observe that the watercress is fully grown, remove the cardboard. You will be able to see your initials or design in the pattern of growth. At this time the watercress leaves will be much darker green than the rest of the plant.

Performance Assessment:

The evaluation will be primarily based on students' observations and data recording of the growth of the plants.

Conclusions:

Because the process of phototropism, the plants will grow toward the light. Hence, the plants will grow through the openings in the stencil and create a pattern.

Pamela Lopez - Betsy Ross Elementary School

Mixing Primary Colors

Pamela Lopez
5122 South Blackstone Ave.
CHICAGO IL 60615

Betsy Ross Elementary School
6059 South Wabash Avenue
CHICAGO IL 60637
(773) 535-0650

Objectives:

The kindergarten students will be able use different ways to mix primary colors. There will be two activities for mixing primary colors.

1. Rainbow Squeeze
2. Color Blends

Materials Needed:

Activity 1 "Gelatin Squeeze"

1. unflavored gelatin
2. water
3. food coloring
4. zip lock bags
5. tablespoons

Strategy:

Preparation
"Rainbow Squeeze"

Pour 2 cups of cold water in to a quart measuring cup. Sprinkle 3 envelopes of unflavored gelatin over the water. Let stand for 1 minute. Then add 2 cups of boiling water. Mix well with a tablespoon. Divide the mixture equally into 3 bowls. Add several drops of blue food coloring to one bowl, yellow food coloring to the second bowl, red food color to the third bowl. Mix well with a spoon. Chill overnight. Remove to room temperature.

Procedure

1. We put the rainbow squeeze into bags.
2. We push out the air, seal the bags.
3. Then we squeeze the bags.
   What colors did we make?

To the tune of "Mary Had A Little Lamb"

1. Mixing paints is lots of fun, lots of fun, lots of fun. Blue and yellow, paints make green. Try and you will see.
2. Purple comes from red and blue, mix them well, mix them well. Red and yellow will make orange. Try and you will see.

Performance Assessment:

The children will have fun feeling the cool gelatin as the colors are being blended together.

Preparation
"Color Blends"

Materials:

1. red, yellow and blue Tempra Paints
2. paint brush
3. 3 cups for each color of paint
4. 1 cup of cold water
5. white construction paper
6. geometric shapes

Procedure

1. Draw shapes to overlap each other to fill the entire piece of paper.
2. Paint one end of a shape. Add the second color to the first, little by little. Fill more of the shape. Each time you will begin to see the color blend.
3. Paint another shape with a different color. Add the second color, continue this procedure from step (2).
   Fill in the entire picture.

Colors To Mix

1. red+blue = purple
2. red+yellow = orange
3. blue+yellow = green

Now you have mixed primary colors to make secondary colors.

Conclusions:

Activity 1- Children will be able to see how the gelatin colors mixed.
Children will be able to demonstrate this activity at home.

Activity 2- Children will review shapes and colors before doing this activity.
Children will have fun tracing shapes and blending colors.

Light and Vision

Nathaniel M. Brown Jr.
8915 South Yates Blvd.
Chicago IL 60617

Robert Fulton Elementary School
5300 South Hermitage Ave.
Chicago IL 60609
(773) 535-9000

Objectives:

Explain Normal Eye

Define Refractive Error terms

Explain Refractive Errors

Demonstrate Refractive Corrections

Materials Needed:

The following materials are sufficient for a class of twenty.

1. 10 shoe boxes
2. 10 flashlights
3. 10 glass or plastic jars
4. 10 glass or plastic jars
5. 10 scalpels
6. 1 gallon various liquids (for example, water or vegetable oil)
7. 10 pencils
8. 20 eye diagrams

Strategy:

Introduction:

The teacher will demonstrate the construction of a shoe box experiment. To construct the shoe box experiment you would use the scalpel to cut two slits into the end of the box; the slits must be close enough for the light source to cover. Once this is done you would than place a jar of water or liquid in front of the light source.

Steps 1 through 5 (Construction of Shoebox Model)

- Draw two lines, two centimeters apart on one end of the shoebox
- Cut a narrow slit along each line
- Put the sheet of white paper in the bottom of the box
- Carefully put the jar full of water in the box. Make sure you line the jar up with two slits
- In a darkened room, shine the flashlight through the two slits. See how the jar of water or oil bends the light. You may need to move the jar to make the rays meet.

Performance Assessment:

Students will be assessed in the following:

- Identify the refractive error based on the location of liquid in the jar and its distance from the light source in the shoebox
- Write and/or verbally explain the following terms: myopia (nearsightedness), hypermetropia (farsightedness), and astigmatism (imperfect vision or image)
- Explain individually and cooperative groups how light affects vision
- Demonstration how refractive light can cause an astigmatism

Polarization of Light

D. James Chichester
1430 North Hoyne Apt#2
Chicago IL 60622
(773) 292-0246

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815) 485-7655

Objectives:

This lesson is most appropriate for high school, but could be revised with a little thought and effort for lower grades.

Students will discover that polarization filters will be able to block incoming light from passing through when filters are positioned perpendicularly to each other.

Students will be able to explain why the filters block some of the incoming light and also redirects incoming light.

Students will be able to explain some of the uses of polarization filters within our society.

Materials Needed:

3 polarization filters, about 1.5 inches by 1.5 inches, per student
3 wood gates that will simulate polarization filters
Several small layered pieces of cheap transparent tape, per student
One transparent protractor
One pair of polarized sunglasses
Small sandwich baggie for students filters and tape swatch
Length of surgical tubing
note: polarization filter sheets, 1 square foot, can be purchased at the American Science and Surplus for $7.50 and then cut with sturdy scissors

Strategy:

Pass out one baggie with the three filters and swatch of transparent tape layerings to each student. Tell the students to take out two filters and play with them for a while. After some time several students should discover that when you hold them on top of each other and rotated just right that you can't see through the overlapped area. Have those students explain how to do this with the filters and allow everyone to do the same. Why does this happen?

Most light travels in waves that comes towards us vertically, horizontally, and at all other angles of tilt. With this illustration on the board, hold one wooden fence vertically in front of your picture and ask what direction will pass through the screen. Hold the same fence horizontal and ask what direction of light would pass through this fence. Hold the fence at an angle that matches one of your illustrated angled light rays. Which direction light would pass through this filter? We're driving home the idea that the fence only allows the same direction light through it that the fences slats are held. This is a concrete example of the polarization filter and light rays.

Send a vertical wave with the tubing through one fence that is held vertically, the wave can get through the fence. Send the vertical wave through two vertical fences, the wave can get through. Send a vertical wave through the first fence which is vertical, and the try to turn the second fence horizontal. Did the wave get through any of the fences, both of the fences, why? We're trying to explain why the filters blocked the light when they were turned just right, perpendicular to each other.

Students should now experiment with the three filters and see if they can discover that if the middle is at a 45 degree angle to the bottom, and the top is perpendicular to the bottom filter that will either give you a hole in the middle of your sheet, or an "unhole" in your blacked out background. The angeled filter redirects the vertical or horizontal light a small amount, thus allowing some of the light from the second filter to pass through the third filter. This can be illustrated by holding the three fences up in front of themselves and taking it step by step with the students.

Place the transparent tape swatch between the two filters. Students should notice different colors of light in the tape depending upon the thickness of the tape. The tape can also be layered on a small piece of cut glass. They could even make their own art projects from this. Placing the clear protractor in place of the tape gives a similar appearance. The dark bands of light represent where the plastic met when the protractor was poured in the mold. These are the relief spots, or points of weakest strength. Engineers can do the same by surrounding parts with transparent plastic and viewing the test pieces under stress through polarization filters. Note: the tape is birefringent, meaning certain colors of light pass through it at different speeds separating out the colors of light.

Have the students find surfaces in the room that reflect light with a glare. Now view the glare through one of their filters while rotating it at different angles of rotation. They should discover that reflected glares are eliminated with a polarization filter. The reflected "glare" light is polarized the same direction as the reflecting surface. Ex: horizontal desktop...horizontally polarized light, vertical watch face...vertically polarized light. Ask students when they normally encounter light that reflects in a glared fashion, and if they normally like looking at this glared light.

Place one filter in front of sunglasses lens, test to see if sunglasses are polarized. Now test a pair of polarizing sunglasses. Hey, just like when they had two polarization filters.

Optional: Take one filter outside on a sunny day and view the sky, not the sun, through the filter. Is the sunlight slightly polarized? It should be somewhat polarized depending upon the weather for the day.

Big Hint: Illustrate your ideas with the filters on an overhead projector so everyone can see what you are doing. Be careful not to melt the filters on the screen and to not tell them what to do with the filters, let them do the discovering and experience the phenomena for themselves.

Performance Assessment:

What direction would the polarizers be in a pair of polarizing sunglasses if you used them while driving your car or fishing on a lake?

Light

Winnie Koo
3752 S Wallace st,
Chicago IL 60609
(773) 247-3727

Ravenswood School
4332 N Paulina
Chicago IL 60613
(773) 534-5525

Objectives:

Lesson for K-4th grade (depends on how you modify them)
(1) Learning about light.

(2) What kind of property does light have?

(3) How light travels in a straight line?

(4) How light can be reflected.

(5) How light can be absorbed.

(6) How light can be refracted.

(7) Light is energy.

Materials Needed:

two mirrors, two volunteers, light source

Strategy:

(1) Each of the volunteers will pick up a mirror.
(2) One of them will go out and stand by the outside door so that he/she can use the natural light as light source. The other person will stay inside the auditorium in a way that both of you can see each other.
(3) Turn off the light in the auditorium.
(4) The person outside will hold the mirror up to make a light beam so that the light beam will hit right on the person who is holding a mirror inside the auditorium.
(5) The person inside will hold the mirror up so that his/her mirror can use the light beam which comes from outside to make another light beam and hit the screen inside the auditorium.

BONUS ACTIVITIES - How to make a Kaleidoscope?

Materials:

a paper towel roll, a 6-foot by 10-foot wrapping paper,
3 pieces of glasses of same size, scotch tape, a cap for the roll
clear plastic paper, two rubber band, drill

Strategy:

(1) Use the three piece of glasses to form an equilateral triangular prism.
(2) Use the hot glue gun to stick them in place.
(3) Pick up the prism and put it inside the paper towel roll.
(4) Use the wrapping paper to wrap around the paper towel roll with the prism inside and tape it.
(5) Put a piece of the plastic paper on each end of the paper towel roll and have each of them stay in place with a rubber bend.
(6) Drill a hole on the cap.
(7) Put the cap on one end of the roll.

Mixing Colors With Light Beams

Angela President
6805 S. Calumet
Chicago IL 60619

Chicago Public School
1819 Pershing Road
Chicago IL 60609
(773) 535-8000

Objectives:

The objective of this lesson is for pre-schoolers and primary graders to learn about mixing colors by light beams. The enjoyment of seeing the colors change and learning the difference from mixing paints.

Materials Needed:

These materials are for the teacher to give the lesson.

Three Projectors or some source of light to project the different colors of mylar paper
A color template
Three pieces of mylar paper, green, blue and red
Three small or medium size mirrors
An overhead projector

Strategy:

To begin this lesson the teacher is to give a homework assignment the night before. The homework assignment is for the children to go home and look at their color television screen. While looking at the T.V. move very close to it and see what colors they see.

When they return the next morning, you ask who did their homework. Those children are to tell you what colors they saw. The teacher then explains that they are going to mix colors of light today.

You begin by placing your three color template on the overhead projector. Turn the overhead projector on, then turn it around so the light beams are toward the back of the class. Now you will ask three students to help find the light beams with the mirrors. When they find them, ask that they put them on the front wall or screen if you have one. Now you ask them "If you mix red and blue together what will you get?", they will say purple. Then you ask the children who have red and blue to put their light beams together. Then ask "What if green and red were mixed together, what color would you get?" As you ask the questions you are mixing the lightbeams. Give the children a chance to try to mix them on their own and take turns. You are also to mix all colors together in different ways.

RED and GREEN MAKE YELLOW
BLUE and RED MAKE PURPLE
BLUE and GREEN MAKE BLUE-GREEN OR AQUA
RED, BLUE and GREEN MAKE WHITE **YES WHITE**

Discuss colors, color mixing by addition is the mixing of light of different frequencies.

Performance Assessment:

I have made this simple for primary children. They will enjoy seeing the lights and colors. This lesson can be used for upper grades if you add a more difficult task. You can also have the children work with paints and learn the difference by working with different colors.

Conclusions:

1. The amazement of this lesson is due to the way the human eye works.
2. Note, the primary colors of light are different than the primary colors of paint.

Sound

Winnie Koo
3752 S Wallace st,
Chicago IL 60609
(773) 247-3727

Ravenswood School
4332 N Paulina
Chicago IL 60613
(773) 534-5525

Objectives:

To demonstrate different ways to produce sound.

Strategy:

Ask students to think of any way they can to make sound. Write it down on the board and then try to categorize it. Students may be confused in the beginning, but they should have a better understanding after they have gone through the activities.

Activity #1

Materials:

a clothes hanger, a 15-foot thin rope

Strategy:

(1) Have a volunteer tie the rope to the hook of the hanger.
(2) Pull the rope hard to ensure the knot is secured.
(3) The volunteer will hold the end of the rope, wraped around his/her hand two times, and walk to an open area.
(4) He/she will then start swinging the hanger in the air. People around should be able to hear the sound being produced by the hanger.

Discussion:
Ask who can tell what made up the sound. The answer may vary, but basically the sound is being produced by the vibration of the hanger through the air. (This is a simulation of string instrument.)

Activity #2

Materials:

two wooden blocks with handles

Strategy:

(1) Have a volunteer hold the blocks by the handle.
(2) Hit the blocks together to produce certain kind rhythm.

Discussion:
Explain to students the method just demonstrated to produce sound is called percussion. Ask them if they can think of a similar way to produce sound.

Polarized Light

Scott R. Welty
1062 Walter
Des Plaines IL 60016

Maine East High School
2601 Dempster
Park Ridge IL 60068
(847) 825-4484

Objective:

This mini-teach was created with high school students in mind but can work with grades as low as maybe 4th or 5th grade. The idea is to show what polarized light is and show some examples and applications from the "real world".

Materials Needed:

*Each student receives 2 square pieces of polarizing sheet, 2-3 inches on a side. They will also receive 1 smaller piece perhaps only 1 inch on a side. You'll also want enough material left over to make two larger filters (maybe 6 inches on a side) for your demo use on the overhead. This material is available from American Science Center, $7.50 for about a square foot. Two or three of these sheets is probably enough for a class set.
*A standard PSSC coil spring.
*You need to build 3 mini picket fences. 1x1 inch stock is fine. I built mine with 4 slats each about 3 feet high. The spacing of the slats should allow the passage of the coil spring with enough clearance to allow the spring to vibrate freely.
*Several rolls of cheap celophane tape. Try some different brands but usually if it has a yellowish tint to it it's the stuff you want.
*Plexiglass squares or glass squares approximately the same size as the student polarizers.

Strategy:

Pass out two polarizers to each student. Ask them to take a few minutes to observe light passing through the filters individually and in series. Suggest various orientations and let them "play for a few minutes". Ask them what they have observed and duplicate what they tell you on the overhead with your filters. Eventually you should get to the point where rotating one polarizer 90 degrees with respect to the other alternately turns the light on and off.

Now to the spring. Suspend one end of the spring in a clamp while you hold the other end suspended about 4 feet off the ground in front of the class. Send signals down the spring and review or discuss basic ideas of wave motion. Now pass the spring through one of your picket fences. Have a student hold the fence with the slats vertical. Now ask which kind of vibrations sent by you will be passed on by the fence, up and down or side to side. Do it! Now add a second student and a second fence. Arrange them so they are both vertical (the fences that is!). Note that the vertical vibrations that pass through the first fence also pass through the second fence. Now have the second student slowly turn his polarizer 90 degrees and note that the vertical vibrations from the first fence are now blocked by the second fence.

At this point, the students will hopefully see the connections between the demo with their polarizers and the spring and you can say, if you like, that a polarized wave is one that is only vibrating in one direction.

Question: What will happen if we put a third polarizer between two already crossed polarizers? Pass out another polarizer to each student but perhaps smaller than the original ones. Most will think that nothing will happen but if the middle one is at 45 degrees to the plane of polarization of the other two light will again get through. The students will eventually discover this and you can duplicate it on the overhead. This is curious. Now try to simulate this with your spring and fences. Have the two outer fences at right angles to each other and the middle one vertical. As you have a student rotate the middle fence 45 degrees you should once again get some waves through the third polarizer. The middle one re-steers the polarized wave to have vibrations somewhat in the direction that the last one will pass.

Give each student a piece of glass or plastic with one piece of celophane tape on it. Again ask the students to place the tape between crossed and uncrossed polarizers and try various orientations of the tape and polarizers. Give them a few minutes to play with this. You might ask along the way if the tape is just another polarizer and how can you tell if it is or not? You will find that the tape will redirect the polarized light similar to what the third polarizer did and yet the tape is NOT itself a polarizer. You can tell because you cannot turn the light on and off by using one known polarizer and one piece of tape.

(Note for the interested: the tape is birefringent. It has two indices of refraction depending on the direction of the vibrations and when you present polarized light at 45 degrees to these directions some of the wave goes down the "fast" axis while some goes down the "slow" axis. This can cause a twist in the direction of the polarization thus allowing the passage of light through the last polarizer.)

Now, either on the overhead or individually with the students or both, try making layers of tape and viewing light through various layers layed down parallel to each other. You should begin to see a color effect depending on how many layers. This tends to be "brand dependent" as to what color you get with how many layers. Try viewing the colors with the polarizers crossed and uncrossed. They change! Is there a rule for what colors change to what other colors?

Optional - Kyro syrup will also have this twisting effect and not unlike the tape the color you see when the syrup is between crossed polarizers depends on the depth of the syrup. You can compare containers of different depths of syrup. You'll need some sort of container with a flat clear bottom.

Many cheap plastic items such as protractors will show colors which indicate locations of stress when viewed between crossed polarizers. You can also try a piece of plastic such as from a zip lock bag. Hold it between crossed polarizers and slowly stretch it. You should see colors appear indicating locations of stress.

Note: Many of the things above require you to manipulate things between crossed polarizers. If you are one of those with only two hands you may want to put one polarizer on the overhead stage while you hang the other in front of the overhead lens. Watch out for heat on this one on some overheads.

Performance Assessment:

Ask the students to find a source of polarized light in the room and to explain how they know that this light is polarized. They may not say the light from one of the polarizers.

Many reflections off of non-conductors are partially polarized such as from a table top. You can prove that this light is polarized by looking at it through ONE polarizer and rotating it. If this light source gets dim and bright then you are in fact looking at polarized light.

Sound

Christine Scott
3221 W. 184 St. #2B
Homewood IL 60430
(708) 957-5423

Beethoven School
25 W. 47 St.
Chicago IL 60609
(312) 535-1480

Objectives:

This lesson was designed for grade K-3. The lesson will be taught over a period of three weeks.

The student will be able to identify and understand these vocabulary words: vibration, volume, pitch, particles, tuning forks, waves and matter.

The student will be able to understand that sound travels through gas, liquid and solid.

The student will be able to understand the idea of pitch, both high and low.

Materials Needed:

Tuning forks, balloons, styrofoam cups, string, 5 gal. can covered with rubber to make a drum, paper clips, stopwatches, glass bottles, spoon, straws, sentence strip paper, scotch tape, water, small teddy bear and pvc pipes.

Strategies:

1. I will model and introduce the lesson by showing the students the Teddy Bear, styrofoam cup and the five gallon can. (The can top is covered with rubber and a hole is in the bottom of it). I will ask students what will happen if I placed the cup on top of the Teddy Bear and turned the hole toward the cup and strike the drum can. We will discuss the effect. Allow students to experiment with striking the can.

2. **What is vibration**?
Display the vocabulary words. Each student will receive a balloon and the second person will receive a stopwatch. Explain. The students will blow up the balloon and knot it. Tell them to place the balloon close to their throats and hum. How does their throat feel? Tell them to experiment with all sorts of sounds on their throats.

Next they will with form partners. Explain how to use the tuning fork and the stop watch. They will observe how long their balloon vibrates and listen to the sound of the balloon vibrating. They will strike the tuning fork and touch the balloon. Discuss the results.

3. **Communication**
Review vocabulary words that we have identified so far. Introduce the other words through this activity. Ask students how they think sound travel through the telephone when they are talking. Discussion. Explain how they will make a telephone using two styrofoam cups, two paper clips, and string about two to three feet long. Each student will make a telephone following direction given by the teacher. They will work as partners. After they complete their phone allow time for communication and play. Discussion.

4. **Pitch**

Explain how a straw flute is used to determine the pitch of sound. Explain how to make a flute. Allow students to experiment after they have made their straw flute. Explain that the pitch of sound gets higher as the length of the flute decreases.

The "Singing Bottles". Explain how pitch is identified by using bottles. Experiment by adding different amounts of water to the bottles to make different sounds. Place the bottles in a row and gently tap the bottle with a spoon. Discuss how does adding water affect the sound made.

Performance Assessment:

All students will be able to identify high pitch or low pitch by performing on pvc pipes as instructed by the teacher.

All students will be able to identify how sound travels by experimenting with the styrofoam cup telephone.

Color

Cecelia Brown
3011 W. Warren
Chicago IL 60612

Anton Dvorak Specialty Academy
3615 W. 16th.
Chicago IL 60624
(312) 534-1690

Objectives:

This Mini-Teach is designed for K-6. This lesson is designed to introduce primary and secondary colors of light.

Materials Needed:

Activity 1

Paper Plates
Scissors
Crayons
Pegs or Pencils
Rulers or Protractors
Tape

Activity 2

Red, blue, and green filters
Overhead Projector
Three Mirrors

Activity 3

Bubble Solution
Bubble Wands or drinking straws for each student

Activity 4

A Flag that has green and black strips, black stars, and a yellow background where the white is suppose to be.

Strategies:

Activity 1 (Circle Wheel)

With the scissors, cut the outer circle off of paper plate, divide the plate into eight equal sessions and color it red, blue, yellow, purple, white, green, indigo, and orange. Put a hole in the center of the circle, push the pencil or peg through the hole and attach the tape to back of plate. The purpose of the peg or pencil is to spin the plate.

Activity 2 (Color Demonstration)

The object to this activity is to show how the primary colors (red, blue, and green) are separate colors but if you mix these colors you make secondary colors. Then if you mix secondary colors you make white.

Activity 3 (Bubbles)

The students use the bubble to first blow and observe. The students are then asked to make a list of all colors that they observe in the bubbles. The students are then asked what kind of light they see hitting the bubbles. They should say they see white light passing through the bubbles causing the bubbles to appear different colors.

Activity 4 (Is Seeing Believing)

The students are given a flag that is black, green, and yellow. The students are then asked to stare at the star in the bottom right hand corner for 30 seconds and then turn the card over to the white side and observe what happens. The students should see the pinkish-red, white, and blue american flag. The colors appear because the eye cones get tied and see complementary colors of the original colors. Example: White light minus green gives pinkish-red, and White light minus yellow gives blue.

Performance Assessment:

The students are then asked to answer in written form "What happens when you add blue, yellow, green, and pink together?" They should answer White.

Sound

Kathleen Moore
2304 N. Cleveland
Chicago IL 60614
(312) 327-8671

O. W. Holmes
955 W. Garfield Blvd.
Chicago IL 60621
(312) 535-9025

Objectives:

This lesson is designed for grade levels 1 - 3.
1. To understand that sound is caused by vibration.
2. To understand that sound travels through solids, liquids and gases.
3. To understand that high pitched sounds are caused by more vibrations and low pitched sounds are caused by fewer vibrations.

Materials Needed:

plastic ruler(s), tuning forks of 2 or 3 different pitches, ping-pong ball attached to a string with tape, boom-box-type radio, balloon filled with air, paper plate, tiny pieces of torn paper, baggie filled with water, scissors, several glass bottles of the same size, large container for water, styrofoam cups, wire coat hangers, string (different types), wire cutters, pencils (with wooden ball attached to the eraser end if possible), stopwatch, flower pots of varying sizes attached to rope, long tubes of PVC pipe cut to different lengths for different tones, xylophone, plastic straws, tape.

Strategy:

1. Ask children if anyone knows what a vibration is. Ask children to vibrate their bodies. Write vibrate on board. Put a plastic ruler overhanging the edge of a table; hit the ruler and watch it vibrate. Ask: "Can we see the vibration? Can we hear the vibration? Can we feel it?" Show tuning fork; hit; listen; touch vibrating tuning fork to ping pong ball attached to a string. Observe the effect; ask same questions. Pass tuning forks around so children can experience the sound and feel the vibration; note differences in pitch. Hold inflated balloon in front of boom-box speaker with volume turned up loud. "Can you feel the vibration? Where is it coming from?" Place small paper plate with tiny pieces of paper on it on top of speaker. (Boombox must be turned so that speakers are facing up.) Observe what happens to the papers. Explain that all sounds are caused by something vibrating; sound is vibration, etc.

2. How do vibrations from tuning fork and ruler reach us as sound? The vibrations cause waves to carry sound through the air. (You will perhaps need to discuss waves, depending on age and experience of children.) "We know sound travels through air. Does it travel through a solid? Put your ear on the desk. Tap the desk. What do you hear?" Try several such examples. "Does sound travel through a liquid?" Get children to talk about experiences they have had such as talking underwater in the bathtub or swimming pool. Can they hear sound under water? "Try putting a plastic baggie filled with water next to your ear. Have another child speak loudly directly into the other side of the baggie. Can we hear the sound through the water? Does sound travel through a solid, a liquid, and a gas (air)? When was it the loudest?" (through the solid) "Why do you think this may be true?" (The molecules in a solid are more tightly packed, so the vibration can travel without being dispersed as it does in air.)

3. Show a child's xylophone or an autoharp. Strike a short bar, then a long bar and ask children what they heard. Do the same for the lengths of PVC pipe. (Hit the end of the pipes with the palm of your hand.) Make a kazoo out of a plastic straw by flattening one end and cutting it into a triangular shape; blow. As one person blows through the kazoo, another takes a scissors and snips an inch or so off the end. Keep doing this and ask the students to notice what's happening to the sound as the straw gets shorter. Help them relate the shortness of length to high pitch through a variety of such experiences.

4. Now allow the children to experiment and "play" with all the materials so that they develop strong physical understanding of vibrations in all the ways that have been presented. Have a set of 8 identical bottles and a container of water and have them fill the bottles with varying amounts of water. See if they can match the scale of the bottles to that of the xylophone. Give children the opportunity to make a string phone or wire-hanger chime. (Tie a length of string to each end of a wire coat hanger. Put the other end of each string in your ears, tap the hanger against something like a desk. Listen for the ringing through the string.)

Performance Assessment:

1. Children must: Arrange bottles with varying amounts of water in row according to pitch. Explain the relationship between the amount of water and the pitch. Tell what is vibrating. Blow across or just into the top of each bottle and explain how the relationship between pitch and the amount of water in the bottle changes. Hypothesize as to why this might be.

2. Make a stereo coat hanger as explained above. Tell how you might make one with a higher pitch (shorter wire). Cut hanger with wire cutter to get different lengths and different pitches.

3. Make a straw kazoo. Listen to its pitch. Have your partner cut off an inch or two with a scissors while you are blowing. What happens to the sound? Cut off another inch. What do you notice now?

4. Listen to the sound of each tuning fork. (Strike tuning fork on your shoe then put it to your ear.) Arrange the tuning forks from highest pitch to lowest. What do you notice about the forks when they look this way?

Conclusions:

The shorter the tube (or straw, or xylophone key or amount of water in the bottle) the higher the pitch. The longer the tube, the lower the pitch. Pitch, (high and low) is caused by the frequency, or number, of vibrations per time. More vibrations per time ("bigger" frequency) = higher pitch; fewer vibrations per time ("smaller" frequency) = lower pitch.

Lenses

Carol Bible
1905 W. Wabansia
Chicago IL 60622
(312) 384-5656

Carter Elementary
5740 S. Michigan
Chicago IL 60637
(312) 535-0860

Objectives:

Students in grades 5-8 will discover, through exploration and observation, what lenses are and what lenses can do.

Materials Needed:

concave lenses
convex lenses
Florence glass
plain glass
Fresnel lens
baggie filled with water
spray bottle with water
meter sticks
baggies
solid glass or plastic cylinder
paper
black marker
overhead projector with arm lowered
light box with an arrow on a screen
lens holders
index card with "AMMONIUM DIOXIDE" written
large lens with long focal length

Strategy:

Opening activities

1. Hand out baggies filled with a convex lens, a concave lens and a plain piece of glass. Students explore and discuss what they observe about these objects.

2. Set up the overhead projector removing or lowering the arm. Explain that the overhead projector has a lens with a light below it. Turn off the lights and spray a steady stream of water over and above the lens. Students will observe that a sort of funnel can be seen with a narrowing in the middle. The point at which the spray of water narrows represents the focal point (the point at which the light rays converge).

3. Hold a piece of blank paper over the lens and find the focal point. Children will be able to observe that the light will be smallest and most intense at that point. Then take a black marker and darken the center of the paper. Hold the paper over the lens again at the focal point. Students will observe the paper begin to smoke.

4. Show students the light box with the arrow on it. Observe the direction of the arrow. Turn off the lights and project the image of the arrow on the wall. Students will observe that the image is upside down.

Stations-Students will be divided into cooperative groups of four. Each group will receive an activity sheet with activities to be performed and questions to be answered at each station.

Station #1 - Display convex lenses with various focal lengths. Students will focus the overhead light onto a paper and notice the distance between the lens and the brightest image (this is called the focal length). They will do this for all of the lenses, make observations about the focal length of these lenses and record any other observations.

Station #2 - Students will find an object in the room and describe the image that they see when they look at it through a Florence glass and then a baggie filled with water. Students will determine whether the Florence glass and the baggie are examples of lenses.

Station #3 - Attach two convex lenses, one with a relatively short focal length and the other a long focal length, to a meter stick using lens holders. Students will look through one lens and then both lenses. Then they will focus on an object far away by moving the lenses back and forth on the meter stick. Students will determine what happens to the image and what this device could be used for. (Telescope)

Station #4 - Attach two convex lenses, both with short focal lengths of about 5 cm., to a meter stick using the lens holders. Students will move the lenses back and forth and focus on a written page from a newspaper or the like. Students will determine what happens to the image and what this device could be used for. (Microscope)

Station #5 - Display the Fresnel lens. Students will determine if it is a lens and if so, how it is the same or different from the other lenses.

Station #6 - Mystery Lab! Students will explain what is happening when they look at the words AMMONIUM DIOXIDE through a solid glass cylinder.

Performance Assessment:

Activity sheets from each group will be collected and assessed.

Mirror Symmetry/Mirror Images

Alan Tobecksen
19702 Calumet Ave.
Lowell IN 46356
(219)696-2959

Henry Clay Elementary School
13231 S. Burley
Chicago IL 60633
(312)535-5600

Objectives:

The intended grade level is sixth grade, but much of this is easily adapted to any grade. This would be at least a two day lesson.

Day 1

1. The learners will understand that different geometric figures will have different lines of symmetry, in different locations and in varying numbers.
2. The learners will develop a definition for symmetry.
3. The learners will use their developed definition of symmetry to predict where lines of symmetry will be located in some other geometric figures.
4. The learners will understand that some figures do not have a line of symmetry.

Day 2

5. The learners will use two mirrors to produce multiple images, eventually developing a mathematical concept to predict what angle will produce what number of images.

Materials Needed:

One mirror per student
One block of wood per student
One rubber band per student
One rubber stopper and pencil per 2 students
One protractor per 2 students
One geometric figure sheet per student
One mirror writing sheet per student
Several round mirrors plus pictures per class
One mirror mirage demo
One long closet mirror
One "WHAT A COOKIE" mirror puzzle

Strategy:

Day 1

Invite a few students to pick up a few coins from the mirror mirage. When they can not do it, ask them why they can not. Next, point out that regular mirrors, such as those found throughout the house, seem to reverse the images that are seen in them. Pass out mirrors. Ask the students if they can read the phrases that are printed on the mirror writing sheet; ask a few students to read a phrase out loud. Try and get the class to agree that a mirror always reverses the images.

Once your students agree that a mirror reverses images, you are ready to fool them yet one more time with the "WHAT A COOKIE" mirror puzzle (words done in red MAGIC marker do not reverse - of course, it is a trick). Do not give them time to think about it or they will figure it out.

Ask the students to hold the mirror in front of them at arms length and look at their nose. Then have them turn the mirror (not their head) so they can see the person next to them, then turn the mirror so they can see the ceiling, then their shoes, then a poster on the wall, etc.

Ask the students to look at the geometric figure sheet. Direct their attention to the rectangle; ask them where they could cut the rectangle into two parts where the one part was a mirror image of the other part. After they tell you, ask them to check their answers with the mirror. Some student will always suggest that you can cut a rectangle on a diagonal; ask the students to check the diagonal. At this point, ask the students to find all of the lines of symmetry (the cut where one part of the figure is the mirror image of the other part) of all of the figures on the sheet.

Day 2

Have the students attach the block to the mirror with the rubberband. Students pair up an make an angle with two mirrors and place a rubber stopper with a pencil stuck in it in front of the mirrors inside the angle. Students arrange the mirrors so they see exactly three images. Point out to the students that this should be a 90 degree angle. Pass out protractors; have the students check the angle. Have the students arrange the mirrors so they can see exactly four images, and check the angle, then five images, and check the angle, then six images, and check the angle, then eight images, and check the angle, then ten images, and check the angle. If you keep doing this and doing it in reverse - that is have the students set the mirrors at a sixty degree angle and count the number of images, then set a fifty degree angle and count images - eventually the students will see a very simple mathematical relationship.

Performance Assessments:

Day 1

Have the students list all the figures on the geometric figure sheet that have no lines of symmetry, all the figures that have exactly one line of symmetry, exactly two lines of symmetry, exactly three lines of symmetry, etc. A suggested grading rubric is 10-11 correct answers is a 4 (meets or exceeds learning expectations), 8-9 is a 3 (satisfactorily meets learning expectations), 5-7 is a 2 (needs improvement), 4 or less is a 1 (does not meet learning expectations.)

Day 2

All students should copy the chart that lists the angles of the mirrors and the number of images that are produced. Ask the students to memorize the chart and be able to reproduce it from memory the next day. The next day the students reproduce the chart from memory. The grade is either 100% or 0%; on the grading rubric the 100% receives a 4 and a 0% receives a 0.

Color

Sandra E. Broomes
P. O. Box 20198
Chicago IL 60620
(312) 238-7871

Sherman
1000 W. 52nd Street
Chicago IL 60609
(312) 535-1757

Objectives:

Designed for Grades 2 & 3. To develop a relationship between colors in paint & colors in light. What colors make white light. What is Roy G. Biv..

Materials Needed:

Materials listed are for groups of four.
tempera paints - red, blue, yellow, and green
paint brushs - various sizes
color filters - red, green, and blue
colored marking pens
white paper
pencil or pen
a prism
overhead projector - transparency
rainbow viewer
color wheel
crayons
flashlights - 3

Strategy:

The lesson would start with a discussion of color in the world around us. Scientists have learned that white light, such as sunlight can be broken up into colors of the rainbow. The students will mix the colors of paint, in paint the artist can make any color by mixing the three primary colors of paint - red, yellow, and blue. They will use the color wheel to create secondary colors and see how colors in paint mix.

The prism will be used with an overhead projector to create a spectrum on the screen. The lights are turned off, two sheets of paper are placed on the overhead with a vertical opening, the prism is placed at the top of the overhead. A band of color called a spectrum is formed when white light passes through the prism. The prism "bends" each color as it goes through. Each students also looks through the prism directed toward sunlight or lights and should be able to see the spectrum. They write down the colors seen.

Students will blend the colors of light by using color filters and flashlights. A wide range of colors can be produced by blending the three primary colors of light - red, green, blue. The three most important complementary colors in light can be created by combining two primary colors. Red light and blue light create bluish red called magenta. Blue and Green Light form Cyan. With green light and red light we create yellow.

When we look through filters, the world takes on a very different look. Filters only let certain colors thought to your eyes. Colored glass, cellophane and plastic are examples of filters. Use a red marking pen to draw an apple, then draw a blue bird, a green tree, an orange flower, purple grapes and a yellow sun. Look at each drawing through the red filter. Does the apple disappear or seem to turn color? What color does the apple appear to be? How about the blue bird? Look at each drawing through the green filter and then the blue filter. Graph out the results.

Performance Assessment:

The students will write down the colors of Roy G. Biv - which are the colors of the rainbow. Red, Orange, Yellow, Green, Blue, Indigo and Violet.

Graph out the results from each group.

	FILTERS		
Drawings	**Red**	**Blue**	**Green**
Red Apple			
Blue Bird			
Green Tree			
Orange Flower			
Purple Grapes			
Yellow Sun

Light

Ozell Bonds
8819 S. Paxton
Chicago IL 60617
(312) 721-8701

Ignace Paderewski School
2221 S. Lawndale
Chicago IL 60623
(312) 534-1821

Objectives:

The main objectives of this mini-teach is for primary students to understand the Nature of Light. This will be accomplished by examples and demonstrations.

Materials Needed:

This is for a group of eighteen students.

1. A large pan of water approximately 2'x 2'.
2. A slinky toy.
3. Three flashlights and transparent red, green, and blue paper to cover the flashlights.
4. About 10 pieces of poster board for boxes to make the periscope.
5. You will need poster board for the color wheels also.
6. One piece of waxed paper and transparent paper.
7. Three equal strips of transparent plastic 1" x 4".
8. White, green, red, yellow, and blue paper.
9. 1 brick.
10. Modeling clay.
11. Two cardboard tubes.
12. Twenty-five mirrors approximately 2" x 5".
13. Model or chart of the human eye.
14. Scissors.
15. Crayons.
16. Quart jar and ruler.

Strategy:

Model Construction:

1. Take the large pan of water approximately 2'x 2' and fill with water.
2. Take the three flashlights and transparent red, green, and blue paper. Cover the end of each flashlight with each paper. Use tape or rubber bands.
3. In making the periscope; form a rectangular box approximately 10"x 4" by cutting and folding with the poster board. Quart milk or juice cartons can also be used. Cut two slits on opposite ends of the carton at a 45 degree angle. The mirrors should be placed in the slit.
4. In making the kaleidoscope; take the three transparent plastic strips. Make into a triangular shape. Tape the whole triangular tube with dark contact tape. Put the sequins and glitter in a transparent I D packet or on a cardboard card about 2"x 2".
5. In performing the after image demonstration you need a piece each of white, green, red, yellow, and blue paper.
   a. In a brightly lit room place a sheet of red paper next to a sheet

of white paper. Stare at the center of the red paper as you count to 30.

b. Now look at the center of the white paper. Count to 20. What color seems to slowly form on the white paper? Is the color really there. Record the results you witness on the chart.

The color **you stare at**	**Red**	**Blue**	**Green**	**Yellow**
The color you see on white				

6. In making the see through brick you will need a brick, flashlight, a piece of cardboard 4 small mirrors, modeling clay and scissors.
   a. Cut a narrow slit about 2 inches deep in the middle of a piece of cardboard about 4" x 4".
   b. Use some modeling clay to prop the cardboard upright in front of the flashlight.
   c. Place the brick a little way in front of the card.
   d. Use the modeling clay to fix the mirrors to match each other in an 45 degree angular fashion.
   e. Shine the flashlight through the slit.
7. In showing the bouncing back of light you will need a large mirror, two cardboard tubes, a flashlight and some books.
   a. Use the books to prop the mirror upright.
   b. Hold one tube at a 45 degree angle with the end touching the mirror.
   c. Ask a student to hold the second tube at a matching angle.
   d. Shine the flashlight through the tube you are holding.
8. In making a rotating color wheel you will need enough poster board. You can get 6 wheels per poster board.
   a. Use 4 feet long piece of string.
   b. Cut out 4 inch circles with a compass.
   c. Divide the circle into 6 pie shaped triangles with the following colors; red, violet, orange, blue, green and yellow.
   d. Poke 2 holes three quarters of an inch from the center of the circle.
   e. Thread the string through the holes and tie the ends together.
   f. Put a twist in the string like with a jump rope, spinning it around in that motion.
   g. Then pull outward on both ends of the string quickly and tightly.
9. In making a pinhole camera you will need to do the following:
   a. Cut off a strip of poster board approximately 12" x 4", Mark off into equal sections, pie shaped triangular sections. Tape together.
   b. Paint the inside of the box black. Make sure you completely cover the color of the poster board.
   c. Tape a piece of tracing paper over one end of the box.
   d. Tape a piece of sturdy brown paper to the other end of the pinhole camera.
   e. Use a pin to make a small round hole in the middle of the brown paper.
   f. Cover your head and the tracing paper end of the box with a cloth or towel.
   g. Point the camera at the window and look through the tracing paper end of the box about six inches away. You should see an upside down window. Be patient the image is not crystal clear.

10. Fill a quart jar about half full put a ruler in the jar.

Performance Assessment:

At the conclusion of the mini-teach students will be able to answer the following questions:

1. What is the main source of light energy?
2. What is the speed of light?
3. What happens when light hits something it cannot pass through?
4. What happens when light passes through water?
5. What are the primary colors?
6. Is white light composed of colors?
7. What happens when the lights are off and you shine a light on an object?
8. Where does light enter the eye?
9. What instrument operates like the eye?

Conclusion:

Students will understand and be able to explain the Nature of Light.

Make Waves

Carol Bible
1905 W. Wabansia
Chicago IL 60622
(312) 384-5656

Carter Elementary
5740 S. Michigan
Chicago IL 60637
(312) 535-0860

Objective:

Students in grade six will discover, through exploration, the basic characteristics of waves.

Materials Needed:

wave machine	Tuning fork
Ripple tank	Oil
Funnel	Plastic bottle (one per student)
Bucket	Paper
Cookie Sheet	Sand
Water	Food coloring
Slinkies	Spring

Strategy:

Opening Activity: Students will come to the front of the room and lock arms. The teacher will pull and push on the first person in a side to side motion thus creating a longitudinal wave. Then the teacher will pull and push on the first person in a forward and backward motion creating a transverse wave. Students will be asked for their observations. Students will then be asked to tell of any personal knowledge of the different types of waves.
Students will divide into cooperative groups and explore six stations. A recorder will write down any discoveries or observations made by the group.

Students will be divided into groups of four.

Stations
1. Wave machines- Students will explore bell wave machines. These are available at most high schools.
2. Ripple tank- Students will observe the patterns that water waves make.
3. Students will fill a funnel with sand and observe patterns made when the funnel is set in a swinging motion and the paper is dragged under it.
4. Students will observe water wave characteristics in a large bucket of water and in a shallow cookie sheet. Students will observe waves in a shallow medium and in a deep medium.
5. Students will observe a tuning fork placed in a cup of water. The water will splash showing vibration.
6. Students will make a wave in a bottle by filling a plastic bottle with a mixture of oil, water and food coloring.

Group Activity: Teacher and students will explore waves through observing the motions of various slinkies and springs.

Performance Assessment:

Reporters from each group will report the discoveries each group made at the six stations. The teacher will record these observations on the blackboard. The group will summarize their results and come to a consensus with regard to their observations of waves. Students will be asked to describe the characteristics of waves and give a definition of a wave on paper.

Return to Physics Index

Homemade Instruments

Clara Williams
5902 W. Ohio
Chicago IL 60644
(312)626-5961

Douglass Math and Science Academy
543 North Waller
Chicago IL 60644
(312)534-6176

Objectives:

These activities can be used by all grade levels.
Students will identify what sound is and make musical instruments out of household items.

Materials Needed:

8 glass bottles
spoon
straws
shoebox
scissors

Strategy:

Activity 1:

1. Take a soda straw and pinch one end flat.
2. Cut off the corners to form two little reeds. The fact that it's cuttable means you can make it into an oboe.
3. Hold the reeds in your mouth without squeezing them.
4. Now blow hard.
5. Carefully cut small holes along the length of the straw about one inch or so apart.
6. Blow in the straw while you cover and uncover the holes to play simple tunes.

Conclusion:

The two reeds opening and closing at high speed first allow air to flow into the straw and then stop the flow. The vibrating air is what produces the sound.

Activity 2:

l. Take 8 glass bottles and fill each bottle with a little more water than the one before.
2. Take a spoon and tap each bottle to hear a different sound.

Conclusions:

When you tap each bottle, it makes the bottle vibrate. The pitch of the note depends on the amount of water in the bottle. The pitch of note is lower with more water.

Activity 3:

l. Take a shoebox and cut a hole in the top.
2. Place several large rubber bands of various widths around the box to make a guitar.

Conclusion:

The plucking of the rubber bands causes them to vibrate producing various sounds. The thicker the band, the lower the note. The thinner the band, the higher the note.

Evaluation:

80% accuracy is successful.

Return to Physics Index

Understanding Waves

Renee Allen
P. O. Box 780
St. Anne IL 60964

Louis Wirth Experimental
4959 South Blackstone
Chicago IL 60615
(312)535-1410

Objectives:

1. Eighth grade students will gain an understanding of waves.
2. Eighth grade students will gain an understanding of the properties that all waves have in common.
3. Eighth grade students will gain an understanding of the types of Waves.

Materials Needed:

1. Ripple Tank
2. Tuning Forks (3)
3. Rope (Make two pieces 2 meters each)
4. Paper (Notebook)
5. Pencils(1 for each group)
6. Springs (Slinky) & (Door Screen)

Strategy:

Arrange five stations:
Station 1 Ripple Tank
Station 2 Tuning Forks and bottle of water
Station 3 Rope tied to door knob or other solid object
Station 4 1 Spring (Slinky)
Station 5 1 Spring (Screen Door)

Divide the class up in groups and have each group take a station. Have the students work with waves at the different stations and write down two observations at each station. Student groups should spend at least five minutes at each station. When all groups have spent time at each station, then class should take their seats and share on board the observations made at each station. Each group should have a scribe and a scribe can be appointed to record all observations on the board. When all has been recorded, the teacher can go over the terms with diagrams and use observation. The terms that need to be covered are: waves (mechanical and electromagnetic), transverse, longitudinal, amplitude, wavelength, frequency, and speed. Next let the students go back and explore the different stations.

Performance Assessment:

Each student in the group would have the same grade

5 points ----------5 observations
4 points ----------4 observations
3 points ----------3 observations
2 points ----------2 observations
1 point ----------1 observation

Return to Physics Index

Making Sounds

Bettye J. Banks
8011 S. Drexel Ave.
Chicago IL 60619
(312) 874-2623

Horace Mann Elementary School
8050 S. Chappel Ave.
Chicago IL 60617
(312) 535-6640

Objectives:

The students will be able to:
- observe that vibrating objects can produce sounds.
- observe that the faster an object vibrates,the higher the sound or pitch.
- observe the slower an objective vibrates, the lower the sound or pitch.

Materials needed:

Activity 1: 24 small mouthed glass bottles of comparable size, 4 metal spoons, 1 large water pitcher and 4 funnels.
Activity 2: 30 wooden rulers with each student at his or her desk.
Activity 3: 4 shoe boxes, 8 small pieces of plywood, 2 large bags of rubber bands and 4 pairs of scissors.

Strategy:

Activity 1: PLAYING THE RULER
Students will hold a ruler on a table with half its length over the edge. Pluck the end of the ruler and listen to the sound. Now move the ruler so there is only a short length over the edge of the table and pluck it again. Then try the same thing with a long length of ruler over the edge of the table. As you move the ruler, what happens to the sound? If more of the ruler is over the edge of the table, does the sound become higher or lower? Then the students will record data from what they observed.

Activity 2: BOTTLE ORGAN
The students will identify how the height of an air column affects the pitch of sound. Students will work in groups, they will pour different amounts of water in each bottle, bottles will be labeled A, B, C, D, E, and F. Next, they will gently tap each bottle with the metal spoon to determine the difference in the pitch produced. Then students will record data on a chart to show which bottle has the highest pitch.

Activity 3: RUBBER BAND GUITAR
Each student will be issued materials needed to make a rubber band guitar. Students will take scissors and cut a hole in the middle of a shoe box. Next, stretching several rubber bands of various lengths and thickness across the top of the box leaving a gap of about half an inch (1cm) between each one. Students will pluck rubber bands to discover what sounds are vibrating. Next they will add two pieces of wood about half an inch square as wide as the box. They are called the bridge. Teacher will ask the questions: What happens when you pluck the bands without the bridge? Is the pitch of the notes made by the looser bands higher or lower? Students will record data.

Light - Reflection - Illusion

George Brydie
14501 Sangamon
Harvey IL 60426

Edward White School
1136 W. 122nd St.
Chicago IL 60643
(312) 535-5671

Objectives:

1. The student will understand **The Law of Reflection** in practical application as it applies to a plane mirror.
2. The student will understand that a distance of an object in front of a mirror is equal to the distance of that object behind the mirror.

Class Strategy:

- Introduce lesson with Phenomenological Floatation Illusion and Magic Box trick
- Students investigate five stations which illustrates the **Law of Reflection**
- Group analysis of data with explanation and use of overhead
- Group Activity - Making of magic box

Floatation Illusion

Material--Mirror 36" x 52" --chair--curtain

Discuss with the students about floating like Michael Jordon -- Inform them you have mastered the art of floatation. Stand on chair, jump down over mirror (straddle it). Remember that you are perpendicular to the audience. Have the assistants pull back the curtain. Lift your leg closest the students. To them it will seems as if you are floating but what you are doing is standing on the leg behind the mirror. Float for a few seconds-let yourself down- have assistants close curtain.

Magic Box Illusion

Material--Box 18" x 24" x 10" with top--contact paper to cover the box--cardboard flap which will fit diagonally in the box--Mirror or Metallic polyester (enough to cover flap)--Cut window in front of box approximately 15" x 18".

Procedure - Attach mirror to flap and place flap diagonally in box - This gives the image of an empty box. Place an object (rabbit) behind flap - Explain to your students that the box is empty - put hand inside - remove top - pull out rabbit.

STATIONS OF INVESTIGATION

Station 1 How High To Place the Mirror

Procedure - Pose the students with the question "How high do I have to hang the mirror in order to see all of myself including my shoes?" Two students hold the mirror against the wall - a third student looks at himself in the mirror, and a fourth measures the maximum height of the mirror off the floor. Attach the mirror at that height and let all the students see themselves in the mirror.

Questions to be answered

1. Does the distance from where you stand to the mirror affect the image of yourself in the mirror?

2. Would a shorter person have to move the mirror in order to see his feet?
3. Can you draw the path of light rays that you see coming from your feet?

Conclusion
Because the image of a person is exactly the same distance behind the mirror, the height of the mirror to the floor is always 1/2 of the person's height (the angle of incident is equal to the angle of reflection.)

Station 2 Funny Reflections
Materials--Unframed square or rectangle mirror
Procedure - Write the following words in large even capital letters **CHEEK, BIKE, DECIDE, BOX, CHICK, CHOKE, BOOK)** cut each in half. Place mirror vertically against the paper.

Questions - Will this work with all printed words? Which letter, when cut in half will appear whole?

Strategy - The image in the mirror shows that all images are actually found behind the mirror.

Station 3 Look at Yourself as Other See You
Material--Two square or rectangular mirrors without frames
Procedure - Have one student stand the two mirror perpendicular to each other. Student observation. Place mirrors in one plane. Make Observations.
Questions - 1. Why did the left hand appear on the right in the perpendicular mirror? 2. How do light rays travel from the object to mirror and back to the observe's eye? 3. What happened to your image when the mirrors were straightened?
Conclusion - The light ray of the object (which is yourself) are reflected in 90 degree angles from one mirror to the other and then back to the eye. In a regular straight mirror, the rays bounce right back to the eye.

Station 4 The Cool Candle Flame
Materials--Rectangular piece of window glass and two identical candles
Procedure - 1. Mount the glass vertically between bricks or books. 2. Fix one candle in front of the glass sheet. 3. Fix the second candle an equal distance in back of the glass sheet. Light only the first candle. Align the second so that the flame of the first seems to be atop the second (if looking from the front).
Questions - 1. Why can you hold your hand above the second candle? 2. What is the distance of the first candle to the glass? What is the distance of the second candle to the glass? Compare the distances.
Conclusion - This shows that the image of an object in a mirror is located behind the mirror, exactly the same distance from the mirror as the object is in front of it.

Station 5 Pong Video Game
Material--pong Video Game and television
Procedure - Play the game - record the winner
Questions - Who won? Why?
Strategy - Just as the tennis ball is reflected off a wall-a narrow beam of light is reflected from a mirror (**the angle of incident is equal to the angle of reflection.**)

Note: Patterns for Magic Box may be obtain at The Museum of Science and Industry or call me at school and I will send you a copy.

Return to Physics Index

Sound

Anne Chamberlain
13919 W 167th Street
Lockport IL 60441
(708) 301-6553

Bethune Elementary
3030 W Arthington Avenue
Chicago IL 60612
(312) 532-6890

Objective 1:

Children shall "discover" that sound waves can be directed with a megaphone and collected with an ear trumpet.

Materials Needed:

Each group of four or five students will need a megaphone/ear trumpet (roll and staple poster paper into a conical shape) and a ticking device (clock or timer).

Strategy:

1. Participants speak to one another--first normally, then with hands cupped around their mouths, and finally through a megaphone. They talk about any differences they notice.

2. Participants listen to one another--first normally, then with hands cupped behind their ears, and finally through an ear trumpet. They talk about differences they notice.

3. Each member of the group counts how many paces away he can hear a ticking device--first with the unaided ear, then with an ear trumpet. The group will compare the distances, and draw a conclusion.

Conclusion:

Sound waves can be collected and directed into our ear and increase our ability to hear.

Objective 2:

Children shall "discover" that sound travels differently through a solid, a liquid, and a gas.

Materials needed:

Each child or group will need a 40 cm piece of 5 cm flexible tubing: an aluminum foil pan: 60 cm of string: tape: a stethoscope: a can of soda: a drinking glass: and a 3 liter tub of water.

Strategy:

After each of the following activities the students name the material the sound traveled through (a solid, a liquid or a gas). They record through which state of matter they heard better.

1. Hold one end of a piece of tubing to your mouth and the other end in your ear as you talk.

2. Tape a foil pan to the middle of a piece of sting. Bang the pan against your desk and listen. Twist the ends of the string around the tips of your index fingers. Place those finger in your ears. Bang the pan and listen again.

3. Listen as you knock on your desk. Place a stethoscope (or your ear) against the desk as you knock again.

4. Open a can of soda. Listen to the bubbles. Place the can next to your ear and listen again.

5. Listen to the classroom next door. Place the open end of a drinking glass against the wall and your ear against the bottom of the glass and listen again.

6. Volunteer students listen to tapping sounds made against a tub of water. Then place one ear into the water while holding the other ear shut and listen again.

Conclusion:

Sound is transmitted best through solids, next though liquids, then through gases.

An Awareness Of Light Made Simply Fun

Marian Hunter
3363 South Giles Avenue
Chicago IL 60616
(312) 808-1530

Morrill Elementary School
6011 South Rockwell Avenue
Chicago IL 60629
(312) 535-9288

Objectives:

1. To remediate sensory-motor deficits in Learning Disabilities students through scientific activities that study light.

2. As a result of these scientific observations the students will:
   - -observe basic properties of light reflection and refraction.
   - -relate reflection and refraction to daily life.
   - -know that the angle which light hits a smooth surface is the same as the angle reflected.
   - -make a visual graph (outline, graph, diagram, or flow-chart), and write a simple sentence interpreting the data.
   - -explain in own words by whole language methods what concepts are in operation.

Materials:

Group:

Darkened room, for sensory exploration of found objects (have sufficient materials a handful for each student), flashlights, two 12" x 12" mirrors, one 12" x 12" plexiglass, one 12" x 12" mirror "book" (that can be opened and closed) one 3-cornered 12" x 12" mirror, four 2" x 2" x 4" grooved blocks (for ends to hold mirror and plexiglass squares), one 12" x 12" squared hard-board (with opening at bottom for hand and arm), sheet of 8" x 11" white paper, 2 simple-lined drawings (a star and a small cat face), pencils, a wide-mouthed glass jar or cup of water, a penny, a walk-in 4' x 4' triangular tripod kaleidoscope covered inside with mylar or mirror and raised 3' above the floor, a few 4" squares of aluminum foil, an overhead projector.

Individual:

For kaleidoscope-3 3" microscope slides, 3 3" squares of mylar, duct tape in different colors.

Strategies:

In a darkened room:

1. We need light to see.

Given a handful of small objects in a bag, student will identify what he has, using cognitive processes - sensation, perception, thinking, reasoning, or memory.

2. Hand-shadows.

Using light from an overhead projector, make hand-shadows.

3. Dust helps us see light beams.

A flashlight beam is directed at a mirror square on the floor. Make chalk dust and sprinkle near the beam. Dust bounces from the beam to the ceiling where the mirror reflects. Various angles can be used and observed.

4. A Light Trick.
A 4" square of mylar is attached to a wall. A bright light is projected on the mylar from above. The mylar now appears as a dark spot. Student stoops and rises from the floor until s/he sees the angle at which the light is reflected. Changing the height of the mylar gives more fun.

5. Tinkerbell.
A penlight laser beam can be used with #4 and #5. Try it in the dark.

Lights On:

1. Seeing Me.
Walk under the kaleidoscope, see oneself, make gestures, count images, differentiate between your left and right images.

2. A Little Kaleidoscope.
Make a 3" kaleidoscope from the lengths of 3 microscopic slides forming a triangle with the long sides, wrapping 3" sheet of mylar around it, and covering with a choice of colored duct tape.

3. We Can't Be Smooth Again.
A smooth piece of aluminum foil is observed before and after it is crumpled.

4. Is The Pencil Broken?
A pencil appears to bend in a glass of water.

5. Is The Penny Gone?
A penny disappears in a glass of water.

6. A Pretty Sight.
Given a mirror book [two hinged plane mirrors], students will decrease the angle from 180 degrees to 2 degrees and count the number of reflected images that small found objects make, as the angles change.

7. Cornered Images.
Observe images in a 3 cornered mirror.

8. Make Copying Easy.
Use the plexiglass square between a line drawing of a star and a sheet of paper. Copy the drawing by reflected light.

9. Can You Write Right?
Using a simple line drawing of a cat face between a hard-board shield and a mirror, finger trace the cat. Looking only at the mirror for guidance, try to write something on a sheet of paper.

10. Twinkle Twinkle Little Red Star.
Use a penlight laser in activities using mirrors.

Conclusions:

Light travels in a straight line.

We see objects by light reflected to our eyes. We cannot see in the dark and identify by cognitive awareness of sensation, perception, reasoning, memory, thinking processes to interpret our environment.

The image of an object is seen exactly the same distance behind a plane

mirror, as the object is in front of the mirror.
Transparent materials bend light.

Return to Physics Index

Pitch

Rosalyn Winston
7447 South Shore Drive
Chicago IL 60649
(312) 978-5730

Walt Disney Magnet
4140 N. Marine Drive
Chicago IL 60613
(312) 534-5840

Objectives:

1. To use the phenomenological approach to problem-solving.
2. To demonstrate the Scientific Process of Inquiry.
3. To observe that the pitch of a sound varies by the length of the vibrating medium.
4. To make a musical instrument by varying the length of the vibrating soda straws.

Materials:

Apparatus needed for a class: overhead projector, overhead projector pens, transparencies, metric rulers, pens, pencils, scissors, tape, 8 21" soda straws per student, open pipe or donated carpet end tubes cut to specified lengths, African Musical Instruments from the Field Museum, tape recorder, instrumental musical tape, computer banner, poster of President Clinton playing the saxophone.

Strategy:

1. Saw open pipes or carpet end tubes to the exact specification in **The Physics Teacher**, May 1986, p.313. (1.32, 1.20, 1.04, .99, .88, .78, .70, .66 meters)
2. Use the open pipes for the phenomenological introduction to pitch.
   Place the carpet end tubes on a table from tallest to smallest.
   The teacher picks up each tube and listens in silence. (Background noise is very useful here.)
   Ask for student volunteers to come up and listen to each pipe.
   Ask the students what did they hear.
   Ask the students what did they observe about the tubes.
   Ask the students what changed as a result of the difference in the length of the carpet end tubes.
3. Make a web of their answers on the board or paper.
4. Make up a hypothesis from the web of observations.
   For example, does the length of the carpet end tube determine the pitch of the sound it produces?
5. Test the hypothesis by making Straw Pan Pipes to these exact specifications: #1. 21.4 cm, #2. 19.0 cm, #3. 17.1 cm, #4. 16.1 cm, #5. 14.3 cm, #6. 12.8cm, #7. 11.4 cm, #8. 10.7 cm
6. Let students work in cooperative learning teams making the Straw Pan Pipes.
7. Allow the students time to practice playing a specific song together.
8. Have all cooperative learning teams play the selected song together.
9. Ask students to write a paragraph telling what they learned from this experience. While they are writing play an instrumental tape.
10. Have another teacher bring in the poster of President Clinton.
11. Indicate Mr. Clinton came to see what they have learned about pitch.
12. Ask for student volunteers to read their compositions.

Performance Assessment:

Use a xylophone the next day and ask what do you observe about the pitch.

Ask them to take their Straw Pan Pipes home and practice playing a specific song for class the next day.

Return to Physics Index

Plane Mirror Images

Ann Brandon
1544 Edgewood Ave
Chicago Heights IL 60411
(708) 756-2635

Joliet West High School
401 N Larkin Ave
Joliet IL 60435
(815) 727-6950

Objectives:

The student will know:

1. Where a plane mirror image is (**behind the mirror, not on the mirror**)
2. How the light reflects (making equal angles)
3. How the "extra" images are formed with multiple mirrors

Materials needed:

Two large (foot square?) mirrors, two sheets of clear plexiglass-also about 1 foot square, four candles, some matches, large paper (about 2 feet x 2 feet), Something to hold up the mirrors, scotch tape, some markers or crayons

Strategy:

I do this as a class demo, after the students have experimented with plane mirrors.

Part I:

Place a large sheet of paper on demo table or desk top. Put one mirror facing the students. Place a candle in front of the mirror, light it, stand behind the desk (so the students can see!) and ask where the image is.

Replace the mirror with a piece of plexiglass. Turn out the lights for the best results. Again, ask where the image is.

Put a second candle randomly behind the plastic. Have the students tell you where you should move it so that this extra candle is exactly where the image is (centered under the image's flame). When everyone agrees on the location it is in the right spot. You should call their attention to this. It is only right when everyone agrees. There is only one perfect spot!

Mark the location of the mirror and both candles. Use magic markers or crayons.

Now have a student use a meter stick to aim at the image. Draw this line of sight on the paper. With a different student and a new color, get a line of sight from some other direction.

Move everything off the paper. Turn on the lights. Hang the paper up on the board.

Pick one of the lines of sight. Point out that the light comes off the mirror and goes along this line to their eye. Also point out that we have picked out only two of the thousands of possible light rays. Ask how the light got to that point on the mirror. Point out that it did not come from the candle behind the mirror--it was not lit! They should tell you that it came from the front, lit, candle.

Draw the path from this candle to the point on the mirror where it reflected out the line of sight. Ask about the angles the light makes when it hits the mirror. They should look equal. You can measure them with a protractor.

Repeat this for the other line of sight. Its angles will also be equal, but not necessarily equal to the first set of angles.

Ask about the distance of the object and image to the mirror. They will be equal.

Part II:

With a new piece of paper: Set up two mirrors at right angles to each other, facing the students. Mark the location of the mirrors. Place a candle in front of the mirrors and light it.

Ask how many images they see. (There should be three, if there are four, the angle is not quite 90º. Play with it.)

Replace the mirrors with plexiglass. Check the angle.

Work on the image locations, one image at a time. Do the two "outside" images first. The third, central image is the tough one. After you have all three, mark the locations of all of the candles.

Lift one mirror and ask how many images there are now. Remind them that images look lit. Point out that this is a simple image, from one mirror.

Replace that mirror and remove the other. Repeat discussion. Replace that mirror.

Have a student use a meter stick to draw a line of sight to the center image. A second student can draw a line of sight to the center image from some other direction.

Turn on the lights and hang the paper on the board.

Follow one of the lines of sight back to the mirror. Ask how this light ray got to that point on the mirror. If it came from the candle, the angles will not be equal. Draw the light ray so that the angles are equal. (You can do this without measuring. It will seem to come from the far side image.) It will be seen that this light ray came from the other mirror. It got to that mirror from the object candle, making equal angles at that first mirror, reflecting to the second mirror and then out.

What can you say about the distances of all the images? (The mirror is halfway between the candle and each of its images. Thus, the object distance equals the image distance for each image.)

Conclusions:

For Plane Mirrors:
Image distance = Object distance

Light reflects making equal angles.
(i.e. Angle of Incidence=Angle of Reflection or ji=jr)

Performance Assessment:

Ask the question: How large a mirror do you need to see yourself from top to toe?

Rubric:

This can be solved using either *Multicultural Applications:*

The bubonic plague was spread throughout England. The colleges were closed to reduce the chance of spreading the disease through the student population. Isaac Newton spent the next 18 months experimenting with light and researching his observations in Latin. Before he was 25 he published them in a book called "Optics."

Hear The Light?

Jane F Long
4931 N Washtenaw
Chicago IL 60625
(312) 271-5482

McAuliffe Elementary
1841 N. Springfield
Chicago IL 60647
(312) 534-4400

Objectives:

The students will illustrate and describe a circuit which uses a tape player, inductor, and flashlight to modulate a light beam.

The students will construct a flashlight transmitter using the materials below.

Materials:

Modulated Laser from "Snack Book", 22 gauge wire, iron nails, flashlight per group, two ear plugs per group, two alligator clips per group, batteries and battery holders for two batteries and four batteries.

Strategy:

Step 1

A. Introduce topic to class by recording your voice into tape recorder, then playing it back to students by way of the modulated laser. (Teacher will have to construct this prior to this lesson.)

B. Have tapes on hand with a variety of music from different cultural groups and play this music to class by way of modulated laser.

C. Pass the tape recorder around and allow each student to say a few words into the recorder. Play back to students by way of laser.

D. Elicit questions and responses from students about what they are seeing, hearing, etc.

Step 2

A. Explain the parts of the transmitter portion of the modulated laser by starting with the tape recorder. Every student should be familiar with a tape recorder.

B. Next explain that a simple ear plug is used. Be sure to explain that the ear piece has been cut off, the wires separated and the alligator clips attached. Pause to make sure class is with you on each step.

C. Next explain that the tape recorder is connected to a wire coil (induction coil). Most students will not know why so you will come back to this part.

D. Point out the flashlight which all students should also be familiar with. Explain that we have interrupted the path between the batteries and bulb and rerouted the path through the induction coil.

Step 3

A. Why do we need the tape recorder and flashlight connected to the induction coil?

B. What have we recently studied that looks similar to this coil? (electromagnets)

C. What did we learn about electromagnets and how did we make them?

D. Suggest that if we make an electromagnet and change the voltage or current going into that electromagnet, we will also change the magnetic field. Pass out nails, wire, battery holders and batteries to each group. Each group will test how many paper clips can be picked up with two batteries attached. Then test how many can be picked up with four batteries. Did the magnetic field change? (Yes, it got stronger)

Step 4

A. Now that we see the magnetic field changes as the voltage changes, what is changing the voltage in the modulated laser? (the variation in the music or sound) Since music is made up of different notes and each note is made up of a different number of vibrations, the varying vibrations create a varying push in current or voltage. This varying voltage changes the magnetic field in the induction coil. What exactly does this mean and why is this important for the working of this laser? (In an induction coil, each loop in the coil interacts with the magnetic fields produced by the other loops in the coil. A self induced voltage is produced as this magnetic field changes. Demonstrate that voltage changes when the magnetic field changes by attaching a coil to a galvonometer and passing a magnet through the coil).

B. The induction coil pushes the current towards the light bulb. Since the music is changing the voltage going to the induction coil, what must be happening to the light? (It is also fluctuating or modulating)

C. Go over the meaning of the two terms: induction coil and modulate. Now say that what we have just described is the transmitter. This transmitter transmits or sends a signal to somewhere else.

Step 5

A. Hold up the solar cell and speaker/amplifier. This is our receiver. In other words it receives the signal that we are sending. Does anyone have any ideas about how this receives the signal? (Solar cell changes the light energy to electrical energy. Since the light beam is modulating, the electrical impulses from the solar cell are also modulating. As we described earlier, this changing electrical impulse or changing voltage is going into our speaker and causing a vibration in this speaker which is equal to the vibrations from the music at the source. So what happens? We hear the music that originated in the tape recorder from the receiver across the room).

Step 6

A. Each group will make the transmitter part of the modulated laser and test it on teachers equipment. Have a contest on who can hear the signal from the furthest away.

Performance Assessment:

Students will use the modulated laser they built as a guide and illustrate the circuit involved in making this work. They will then describe in detail how the modulated laser works.

Rubric:

5 points: Circuit is illustrated completely and accurately. The explanation is clear enough for anyone to follow the instructions and build a modulated laser.

4 points: Circuit is illustrated as above but explanation lacks clarity.
3 points: Circuit is illustrated but not labeled, and explanation lacks clarity and details.
2 points: Circuit is not illustrated completely and explanation unclear.
1 point: Illustration and explanation lack details necessary to understand the lesson completely.

Multicultural Applications:

Have various tapes from different cultural backgrounds to play for the students. Also ask the students how this lesson can apply to our lives and our future. What are the future uses and applications of this type of communication device?

Comparison of Images Formed by Plane, Cylindrical and Spherical Mirrors

Jim Szeszol
29 Mayfair Lane
Aurora IL 60504
(708) 898-6603

Naperville Central High School
440 W. Aurora
Naperville IL 60540
(708) 420-6417

Objectives:

1) To demonstrate that all mirrors reverse the image front to back and that the apparent right to left reversal in a plane mirror is a result of this front to back reversal.
2) To describe plane, cylindrical and concave mirrors in terms of curvature about horizontal and vertical axes.
3) To help students recognize that right to left and top to bottom reversals occur simultaneously and occur only in curved mirrors.
4) To discover that left to right reversals (and top to bottom reversal) occur when the axis of the object is parallel to the curved axis of the mirror and that no left to right reversal occurs when the axis of the object is along a linear mirror axis.

Apparatus Needed:

Plane mirror, cylindrical mirror, concave mirror of short focal length. The cylindrical mirror can be made by gluing a piece of aluminized mylar inside a 120º section of carpet roll.

Recommended Strategy:

1) This exercise can be done anytime during the year as an attention grabber, an introduction to, or review of mirror images.
2) In order to avoid confusion which is associated with left and right in observing mirror images, it seems best to describe orientation along a horizontal axis in terms of some objects in the room such as the window side and door side.
3) Beginning with a plane mirror ask the students to observe the image of their left hand. Ask if the image is reversed left to right. Most will reply that it is. Then ask if the image is reversed to bottom. Point out the inconsistency of their answer and let them sit with that for a while.
4) Using a plane mirror ask the student to cover their eye which is on the wall side; ask them which eye is covered in the mirror (wall side or window side.) Also ask if the image is reversed top to bottom. Direct the students to turn the mirror through 90º, make observations and answer the same questions.
5) Using the concave side of a cylindrical mirror, repeat No. 4 above, asking the same questions.
6) Using the concave side of a spherical mirror, repeat No. 4 above, asking the same questions.
7) Summarize student observations on the board and help the class explain their observations.
8) Observations in a cylindrical mirror can be extended by viewing the image of

two different colored arrows crossed at 90º. Ask the students to turn the object through 90º and observe what happens to the image. Ask them to turn the mirror through 90º and observe what happens to the image this time.

Return to Physics Index

I Can See A Rainbow!

Lorraine I. Crump
11737 S. Hale
Chicago IL 60643

Lawndale Community Academy
3500 W. Douglas
Chicago IL 60623
312-534-1635

Objective:

As a result of this lesson, students will be able to identify the colors of a rainbow using the mnemonic ROY G BIV. They will also recognize primary colors of light. The student will have an understanding of light blending to form new colors. Finally they will answer the question; Why is the sky blue?

Vocabulary:

Retina   Indigo   Magenta   Violet   Primary Cyan

Materials:

1. Three slide projectors or overheads, one of these should be a overhead.
2. Three color filters blue, red, yellow.
3. Various objects of bright colors.
4. Scissors, crayons, pencils each student will need these.
5. White cardboard.
6. Diffraction paper.
7. Construction paper, one sheet each of red, orange, yellow, green, blue indigo, and violet.
8. One glass of water, 1/2 teaspoon of coffee creamer.
9. A flashlight
10. A diagram of the human eye.

Strategy:

The teacher will need to have a cardboard circle measuring 31/2" diameter for each student. Divide the circle into eight. The construction paper should be cut into arches to form a rainbow. Place the beginning letter of the color at the top of the arch i.e., R on the red, O on orange, etc. The three projectors should be set up in such a way that all three light beams will meet on a white screen. One color filter is placed near each projector. The diffraction paper should be cut into a small enough square to be tape over the light of the overhead. Spoon coffee creamer into water, do not stir let powder sink to bottom. Set aside for latter demonstration. Using the diagram of an eye explain the following: Light entering your eye hits the retina stimulating cones, then a message is sent to the brain telling you this is the color.

Activity 1:

The teacher will begin this activity by showing the students a rainbow. This is done with the previously describe overhead-diffration paper set up. Cut on projector, ask students to describe what colors they see. Next have students take the corresponding color and tape it to the board forming a rainbow. When this is complete ROY G BIV is viewed, the teacher should tell students this is the way to remember the colors of the rainbow.

Activity 2:

Place a red filter over one projector showing a red beam of light on a screen. Then do the same with the green filter. This should result in the two colors of light forming yellow on the screen. This should be done with red and blue to make magenta and blue plus green to make cyan. Explain that these colors are called primary colors of light because when combined they make up all the colors of the rainbow. The mnemonic for this is RGB. Finally combine all three to form white light. Next have students step in the path of white light, look at their shadow. What colors do you see?

Activity 3:

Place two filters on the overhead not over lapping. Then have students place an object in front of the light. Look at the color the object takes on. Discuss.

Activity 4:

Project a red light on the screen. Have students stare at it for 30 seconds. Turn off light. Do you still see a red screen? No the red cones in your retina are tired. The color you see is from the cones that are not tired.

Activity 5:

Why is the sky blue? The teacher will shine the flashlight onto a glass from above and move slowly down the back. Note the water color. Explain to the class that the particles of powder cream scatter the light from the flashlight. Putting the flashlight behind the glass causes the blue light to scatter aside allowing only orange-red light to be seen. Placing the light above the glass causes less light to scatter and more blue light is seen. Thus the water looks blue. When applied to the atmosphere, the flashlight is the sun, the water, the sky and the creamer are air particles.

Activity 6:

Give each student a wheel (circle), a red, blue, green crayon, pencil. Have the students color the wheel using two colors on each. Next push the pencil through the center. Spin the wheel to see a new colors.

Performance Assessment:

Give the students the following story. Their reply should use a rainbow diagram, name each color on it, tell why the sky is blue also give an explanation of primary colors used to form all colors.

Once upon a time it was a rainy day. Karlene and her friend April waited for the showers to end before going out to play. Once outside April said "WOW look in the sky, a rainbow!" Describe what the third graders had seen and why?

Rubric:

5 points Answers correctly with clear sound multi-faceted logical arguments (diagrams, examples, sketches, etc.)

4 points Answers correctly with clear explanation and a diagram.

3 points Answers correctly but reason is unclear.

2 points Partially correct with effort toward explanations.

1 points Answers with no supporting evidence.

0 points Answers of "I don't know."

Multi-cultural Project:

The classroom bulletin board can be set up with a rainbow. Highlighting the mnemonic ROY G BIV. Children of multi-cultures can be looking up at it. The caption reads LOVE COMES IN ALL COLORS.

Return to Physics Index

"You may now enter the Holodeck."

April Luehmann
4062 Charleston, Apt. 1 West
Matteson IL 60443

Zion Lutheran School
3840 West 216th Street
Matteson IL 60443
708-747-7490

Objectives:
The main objective is that students will be able to demonstrate a working knowledge of the science of holography:

1. The students will be able to tell the story of the history of holography.
2. The students will be able to differentiate between six different kinds of holography, and use that knowledge in problem solving.
3. The students will be able to compare and contrast photography and holography, and therefore be able to explain the basic characteristics of a hologram along with the reasons for such attributes.
4. The students will be able to list approximately 15-25 present applications of holography in our world around us, from technology to advertising, from biology to architecture, and many more, and will know one particular application in more depth.
5. The students will be able to draw a diagram of the set-up for making a hologram along with labels and definitions of the parts of the set-up.
6. The students will be able to explain "what's going on" in the process of making a hologram, and they will be able to make a hologram.

Materials needed:
A variety of holograms for the students to observe
A set of cut-out pictures to teach the history
A picture of the teacher when you were younger: one for each group
A hologram (at least one per group)
Optional: Stereoscopic glasses and pre-printed images (Can be purchased at American Science Center)
Simple costumes for three different personalities
A class set of "Area of Specialization" packets (Envelope containing a journal article of an application of holography; a different article for each student
Supplies for making a hologram: laser, film, developing chemicals, mirrors, watch with a light, rubber gloves, glass plates with clips, 3 tubs.

Strategy:
Day One: Have students observe a prepared display of a variety of holograms, whatever you can get your hands on. Have one person from each group be "recorder" and write down the comments the group made as they enjoyed the holograms, along with each student's favorite and why. Discuss their observations. Let them tell you all they saw and all their questions, but don't feel like you have to address all these questions now. They will be answered throughout the unit.
Have the students meet with their groups and, based only on what they saw today, give the best definition for a hologram they together can compose.

Day Two: Have the students gather 'round you on the floor for "story time". As you tell the story of the history of holography, put up symbols cut out of construction paper which represent each of the most important points. (I used 11 pictures, including dates, in many colors). Hand out a picture page to each

student containing an abstract collage of the symbols you had put up in sequence. Have them, in their heads or in pairs, practice telling the story using their symbols. Randomly choose a child to follow your symbols and retell the story. Ask that student to "get stuck" at least once so the class can assist. (This takes pressure off the chosen one and keeps the class on their toes.) Write the word "hologram" on the board. Discuss it's Greek origin. Have them guess what each part of the word means. (whole picture)
Have the students meet with their groups and, based on what they've seen, heard, and done yesterday and today, REVISE yesterday's definition of a hologram into a little more precise educated guess.

Day Three: Begin by quizzing students on the history by using your symbols. Then continue by beginning to introduce the differences between different types of holograms when you have someone call you to leave the room. Dress as a business man, storm in and ask the "experts in training" to solve your problem: You, as Mr. Chang, are required to create an appealing way to counteract counterfeiting of credit cards. Your boss has suggested holograms as a possible solution, but you know that there are MANY kinds of holograms, and you have no idea which kind your need for your purpose. Tell them you'll return later for their response and leave. Change your attire two more times creating two new personalities with two completely different needs and functions for holography. Come back as yourself and play dumb: make them explain what happened while you were gone. As they do, list the needs as characteristics of holograms under each character's name. For example: Mr. Chang - mass production, inexpensive, attractive, small, etc. Then teach them about six different types of holograms. Assign each group one character as a customer. Have them develop an argument for which type of hologram to use and why they would want THAT type of hologram as opposed to others. Stress the fact that there is no wrong answer; the argument is what's important. Find another excuse to leave, come back as the characters, and make them defend their recommendation.
Have each group meet to update and revise their definition of a hologram.

Day Four: Hand each group a picture of you and at least one hologram. Discuss with them the "rules of brainstorming," (emphasizing no dumb answers, write down everything, analyze answers LATER.) Have them write these at the top of the handout. On the rest of the handout, have them list the ways photographs and holograms are the same and how they are different. After approximately 15 minutes, meet together as a class and discuss. Use this time to show them the basics of how a photograph is made using a lens to focus the image on the film, and how a hologram is made with two beams which cover the film. Compare for them the negative of a photograph and the "negative" of a hologram. Now show them the stereoscopic viewer. If the main difference between a photograph and a hologram is 2-D verses 3-D, what's the difference between a stereoscopic (3-D) photograph and a hologram. Let the groups work together on comparing them. (Stereoscopic photo: only one 3-D view, Hologram: many different 3-D views). Discuss their results.
Have the groups revise their definition of a hologram.

Day Five: Discuss the importance of having an area of specialization (optometrist, podiatrist,...) Pass out a manila folder to each student labeled "TOP SECRET, Area of Specialization." In each student's folder include an UNIQUE journal article concerning an application of holography. (There are TONS of very interesting articles in the library: holography in chocolate, holography in airplanes, drying cement, telegrams,...) Send each of them to find a secluded location to read and become informed on their area. When they

return, they are to be prepared to give a 10 second summary (1-2 sentences) on what their area is about and a 10 second summary using creative words to grab someone's attention explaining the most amazing aspects of their area. They also must be knowledgeable about their topic because they could be questioned further if someone shows interest in that topic. When they return, make each child stand, state their name, and state their summaries. Have them end each response in "ma'am," so you understand they're done. For example, You: "State your name." John: "Special Agent John Miller, ma'am." At the end of everyone's report, allow the class to ask specific questions of any of the special agents concerning his/her area of specialization.
Have the groups meet to revise their definition of a hologram based on the past 5 days.

Day Six: You will be gradually sketching a typical set-up of a holography lab on the board as you go through this period. Begin by getting them to compare holography to photography and separate the process into three steps: taking the photo, developing, and viewing. Compare this to holography: making the hologram, develop it, and reconstruct or view it. As you sketch each section (the lasers and object for making the hologram, the holographic plate for developing, and an additional light source to view it), review the basic physics principles concerning holography: smooth and diffuse reflection, interference patterns, and diffraction. (These have all been covered by the time we study holography.) Moire patterns can be used to demonstrate interference. If time, or perhaps the following day, blindfold four students, create a "fake" darkroom, and have them demonstrate the motions of "how to make and develop a hologram" as you explain what they are doing.
CULMINATION ACTIVITY: Have them make a hologram. (As experts, tell them, "You may now enter the holodeck.")

Performance Assessment:
Give me your best definition of a hologram: (Be careful not to say too much or be too wordy or use more words to say what you could've said in less words.)
Answer, as an expert with supporting reasons, the question a stranger inquires of you:

1. List some present applications to holography. As an expert, where do you see holography being used in the future?
2. Why are TWO beams of light necessary to create a hologram?
3. Why is a hologram said to be a "window with a memory?"

Expected Results: Students should show an understanding of the practical applications of holography both as an art and as a science, demonstrate an understanding of the basic principles of physics that apply to holography, and show an understanding of the characteristics of a hologram that make it unique and valuable.

5 Points: Answers are creative, clear and accurate. Student shows an in depth understanding of the physics in holography: reflection, interference, and diffraction.
4 Points: Answers are accurate and creative. Going into explanations the specifics of interference is not necessary. Questions answered completely.
3 Points: Answers accurate, but lacking creativity. Fails to demonstrate understanding of interference.
2 Points: Answers all questions with considerable ammount of effort. May be lacking a little in accuracy and creativity.

```
1 Point:   Answers demonstrate little effort.
0 Points:  No effort.
```

Return to Physics Index

Sound

Cynthia R. Newman
2045 E. 93rd St.
Chicago IL 60617

Washington Elementary
3611 E. 114th St.
Chicago IL 60617
312-535-5010

Objectives:

After this lesson, the student should be able to

1. relate the pitch of sound to the length of a vibrating object.

2. define words (pitch, source, medium, detector, air conduction, and bone conduction).

3. examine hearing acuity using the tuning fork by means of air conduction and bone conduction.

4. discuss how Europe contributed to earlier conventions.

Strategies and Activities:

Activity 1: the session will begin by having the instructor define vocabulary words.

Materials Needed:

rulers, straws, and glass bottles

Activity 2:
(a) increase the length of ruler/straw (vibrating object) to get a lower pitch.
(b) decrease the length of ruler/straw (vibrating object) to get a higher pitch.
(c) record the observation made.

Activity 3:
(a) fill one bottle with water almost to the top and fill another bottle half full.
(b) blow across each bottle and listen to he highness/lowness of pitch of each bottle.
(c) tap each bottle and listen to the highness/lowness of pitch of each bottle.
(d) record the observations made.

Activity 4:
(a) each group will take eight pop bottles.
(b) each group will fill the bottles with the appropriate amount of water needed to produce an octave.
(c) each group will produce the piano scale by blowing across the bottles.
(d) record the observations made.

Performance Assessment:

Why was the pitch lower for the bottle with less water when you blew across the top of the bottle? Why was the pitch higher when you tapped the bottle with less water?

Rubric:

3 Answer provided clear explanation
Applied principles learned in class
Used previous example in class to support answer
2 Explanation was somewhat unclear
1 Little or no explanation
0 No attempt made to answer questions

Conclusions:

If the vibrating column is shorter, the pitch will be higher and vice versa.

Materials Needed:

tuning forks, stop watches, and rubber sticks

Activity 5:
(1) students will compare time in seconds for air conduction and bone conduction to examine hearing acuity using the tuning fork.
(2) they will work in groups of four (examiner, timer, recorder and subject).
(3) the examiner will tap a tuning fork with a rubber stick.
(4) then, the examiner will place the tuning fork on the bone protruding behind the right ear (mastoid process) for 3 trials on the subject.
(5) simultaneously, the timer will time how long any sound was heard (even the faintest sound that was heard using the tuning fork) during each trial.
(the timer will start the stopwatch as soon as the tuning fork is tapped).
(6) the recorder will record the time in seconds.
(7) the subject will hold his/her hand up as long as he/she hears the sound.
(8) afterwards, the examiner will follow the same procedure for the left ear.
(9) next, the examiner will place the tuning fork at the midline of the forehead above the level of the eyebrow for 3 trials on the subject.

Conclusions:

The time that the sound was heard occurred longer for air conduction than bone conduction. Greater energy was required for sound to travel for bone conduction than air conduction.

Return to Physics Index

Sound/Pitch

Joan Cwiklik
6228 West Berteau
Chicago, Il. 60634
312-282-6896

O.A. Thorp Scholastic Academy
6024 West Warwick Avenue
Chicago, Il. 60634
312-534-3640

Objective:

To discover how pitch can be changed in instruments that are plucked (strings), blown (woodwinds and brasses) or hit (percussion).

Bottle Music

Materials Needed:

Each group needs 5 bottles of the same size (empty pop bottles work well), water. Optional: Funnel (for filling bottles).

Strategy:

1. Fill one bottle with water almost to the top. Fill the second bottle about three-fourths full, the third half full and leave the last bottle empty.
2. Blow across the top of each bottle. Listen to the highness/lowness of each bottle's note.
3. Record your data.

Conclusions:

When you blow across the top of each bottle, it makes the air inside the bottle vibrate. Small air spaces vibrate more rapidly than large air spaces. When there is little air in the bottle, you produce a high note. When there is more air, the note is lower.

Underwater Recorder

Materials Needed:

Each child needs his recorder, duct tape and a tall container of water.

Strategy:

1. Cover all the finger holes in the recorder with duct tape. Blow gently into the recorder and you should hear a single, low-pitched note.
2. Take a deep breath and blow into the recorder while you push it into the water. What happens to the pitch of the note?
3. Take another breath and blow into the recorder again while you pull it up out of the water. How does the sound change?

Conclusions:

When you blow into the recorder, the air inside it vibrates and you hear a note. The pitch of the note depends on the length of the column of air inside the recorder. When you push the recorder under the water, the water fills up the tube so the column is shorter. You hear a high-pitched note. As you pull the recorder out of the water, the column of air becomes longer and the note sounds lower.

Pipes of Pan

Materials Needed:

Five pieces of bamboo or hollow plastic (PVC) piping, cut into the following sizes: 2, 31/2, 5, 61/2 and 8 inches; non-drying modeling clay and sticky tape.

Strategy:

1. The pieces of pipe are cut to different lengths ranging from 2 to 8 inches.
2. Push a piece of modeling clay into one end of each tube.
3. Arrange the pipes in order of length, with the shortest pipe at one end and the longest pipe at the other end. Tape the pipes together so the open ends are exactly level with each other.
4. To play your Pipes of Pan, place the edge of the open end of the pipe against your lower lip and blow gently across the top of the pipes.
5. What do you notice about the pitch of the notes from the different pipes?

Conclusions:

You should discover that the longer pipes give lower notes and shorter pipes make higher-pitched notes.

Glass Xylophone

Materials Needed:

For each group: 5 glass containers that are the same size (such as empty pop bottles), water, wooden spoon or mallet, funnel for filling bottles.

Strategy:

1. Fill one bottle with water almost to the top. Fill the second bottle about three-fourths full, the third half full, the fourth a quarter full and leave the last bottle empty.
2. Tap the side of each glass gently with a wooden spoon. Each glass will ring with a note of a different pitch. Which glass makes the highest sound and which glass makes the lowest sound?

Conclusions:

When you tap each glass, it makes the glass vibrate. The pitch of the note depends on the amount of water in the glass. With more water, the pitch of the note is lower.

Other activities which were demonstrated include Elastic Band Guitar for exploring stringed instruments and Tapping and Hitting for discovering pitch in percussion instruments.

Return to Physics Index

Reflection Relay

Lillian Degand
4944 N. Washtenaw
Chicago, IL 60625
(312) 878-6740

Peterson Elementary
5510 N. Christiana
Chicago, IL 60625
(312) 534-5070

Objective:

To use the laws of reflection to bounce a beam of light around a classroom to hit targets and to attain the lowest elapsed time to hit the targets.

Materials Needed:

3 pocket sized mirrors for each group
one filmstrip projector
several bullseye targets

Suggested Strategy:

Rules:

1) The light beam must strike each of the three mirrors before hitting the target and there may be obstacles that the beam of light will have to be directed around.

2) The team members must cooperate to direct the beam of light to the target while using all three mirrors to change the light's path.

3) Each team must hit a different target.

4) Each team will be given up to five minutes of preparation time before the clock is started to time the 'official' time.

Scoring:

1) Each team will be timed with the lowest time being the winner.

2) No team will be allowed to use more than two minutes to accomplish the task.

Return to Physics Index

Wave Motion

Susan Frazier
700 East 89th Street
Chicago, Il. 60619
312-873-6849

Fort Dearborn Elementary
9025 S. Throop
Chicago, Il. 60628
312-535-2680

Objectives:

Adaptable to grades 1 to 12

The student will be able to:

1) Identify the frequency, amplitude and phase of a wave.
2) Identify and explain the difference between a transverse and longitudinal wave.
3) Relate the concept of vibration to frequency and pitch.

Materials needed:

ring stand, cone-shaped cup, string, slinky, springs and ropes (two meters long), shoe box, rubber band, paper clips, coffee can, match, ripple tank, overhead projector, paper straws, rice crispies, can with top covered with a balloon, salt, piece of cloth, baster

Strategy:

Hang a cup filled with salt, with a hole in the bottom, from a ring stand.

Pull the cup and allow it to swing back and forth over construction paper.

Notice the straight line made by the salt streaming from the end of the cone.

Then, pull the construction paper along the table and let the pendulum continue to swing. Notice the formation of a wave made by the flowing salt. Have students form groups to experience activities on wave motion.

Activities:

1) Shout (do not blow) at the top of a can covered with a balloon with rice crispies on top. (vibration)

2) Pluck a rubber band which is lined with paper clips and stretched across a shoe box. (transverse wave)

3) Hit a coffee can filled with smoke. (longitudinal wave)

4) Use a slinky, rope or springs to form longitudinal or transverse waves.

5) Make waves in a ripple tank placed on the overhead projector to produce circular waves. (transverse) Place objects in the water to show that the wave moves, but the objects do not. Also, place a wooden block in the water to show incident and reflected waves.

6) Form a human wave by having ten people stand in a line, largest to smallest, with arms locked together, and pull the last person sideways. (longitudinal wave) Then pull the last person forward. (transverse wave) In both cases, the waves will be reflected back along the line.

7) Form standing waves by tying a rope to a fixed object and moving the rope up and down. (incident and reflected wave)

8) Form a standing wave by connecting one end of a string to a timer and placing the other end over a pulley. Connect weights to the end of the string hanging over the pulley. (170 gm) Show a wave in phase and out of phase by using a rope. Have students put their fingers on the vibrating string to locate the nodes and see that the wave is out of phase.

9) Relate vibration to frequency and pitch of instruments.
   a. Slower vibration causes a lower pitch as shown by scratching a cloth slowly, then faster to get a higher pitch.
   b. Blow into a baster and notice the change in pitch caused by squeezing the end of the baster to change the level of water in the baster.
   c. Make a straw instrument by cutting the tip of the straw on each side and blowing into the straw while cutting the bottom of the straw at the same time. Notice the change in pitch.

Culminating Activity:

Make chicken pluckers by putting a hole in the bottom of a paper cup, pulling a string through and tying it on the inside of the cup. (Attach a paper clip to the string inside.) Pull along the outside string with a wet paper towel to produce a loud squawking sound.

Return to Physics Index

How Sound Travels

Joyce Janovec
4515 S. King Drive
Chicago, IL 60653
(312) 924-3498

St. Gelasius
6358 S. Blackstone
Chicago, IL 60637
(312) 324-8430

Objectives:

1. To demonstrate that sound moves through different states of matter.

2. To observe that sound moves better through a solid than it does through a liquid or a gas.

Materials needed:

Demo: bell, tuning fork, cork, balloon, two spoons, musical triangle, slide whistle, two wood blocks, windup clock, 12" ruler, large jar filled with water, paper bag, metal can and lid, plastic container with lid, metal bar, music box motor.

Each group needs: meter stick, windup clock, self-sealing plastic bag filled with water, a block of wood (the same thickness as the plastic bag of water), two plastic cups with one end of a string through the hole in the bottom of one cup and the other end of the string through the hole in the bottom of the other cup. Knot the ends of the string to stop it from pulling out of the holes (home-made telephone), a third plastic cup with a string attached to the bottom of the cup, a metal rod.

Strategy:

Have the children identify different sounds made behind a screen (or desk) by using various materials: ringing a bell, hitting a tuning fork on a cork, blowing up a balloon and releasing air by stretching the neck of the balloon as the air escapes, tapping two spoons together, striking the musical triangle, blowing a slide whistle, hitting two wooden blocks together and ringing an alarm clock. Record the children's answers on the board. Show the materials used and check against the predictions made.

Hold a ruler over the edge of a desk and vibrate it asking such questions as: What is happening? What is your evidence? What is always happening to an object when it is making a sound?

Strike a tuning fork on a cork and quickly lower it into a glass of water. Ask the questions stated above. Does sound travel through other things?

Activities:

Demo: Does sound travel through paper? through plastic? through metal?

1. Put a ringing alarm clock in a paper bag.
2. Close the bag. Can you hear the clock ringing now?
3. Repeat steps 1 and 2 using a plastic container and a metal can.

Does sound travel through water?

1. Fill a glass jar nearly full of water.
2. Have one student cover one ear with her/his hand. Put the other ear against the glass jar.
3. Ask another student to hit two spoons together under water. Do you hear a sound?

Sound travels through different kinds of matter. Sound travels through gases, liquids and solids.

Group: What kind of matter does sound travel best in--air, water, wood or metal?

A.
1. Hold a plastic bag of water against one of your ears. Cover your other ear with your hand. Have someone hold a ticking clock against the bag of water. Listen.
2. Keep the clock in the same place. Remove the bag of water. Listen.
3. Place a block of wood between your ear and the clock. Listen. Do you hear the clock best through the air, the water or the wood?

B.
1. Place the clock 20 cm away from your ear and listen to the ticking.
2. Have your partner hold the clock at the 20-cm mark on the meter stick. Place your ear at the end of the meter stick and listen.
3. Have your partner hold a metal rod to your ear and place the clock against the rod 20 cm away from your ear. Listen. Does sound move differently through some solids than it does through others?

C.
1. Take the plastic cups (telephone) and hold your cup to your ear while your friend talks slowly and clearly into the other cup. Keep the string tight. How does it work? What is vibrating? How do the vibrations of your friend's voice reach your ear?
2. Can a third person talk and listen if another cup with a string is attached? Take the separate cup with the string and attach it to the first line. Keep all strings tight while one friend talks into one cup and the other two friends listen. Can you hear the message of the third party? How many lines could you attach? Does each addition weaken the vibrations?

Draw three squares on the board and in each square draw molecules spaced accordingly to illustrate the three states of matter: gas (molecules far apart), liquid (molecules closer together) and solid (molecules closest together). Have students identify the different states of matter for each square.

Finally, take the small music box motor, hold it in your hand and allow the music to play. Ask the students if they hear the music. Now place the music box motor on top of your desk or on a large surface area and listen to the melody. Is there any difference? Can the students hear the music now? Why?

Return to Physics Index

Mystery of the Mirrors

Lyvonia Hearns
8919 S. Harper Ave
Chicago, Il. 60619
312-743-0458

A. Philip Randolph
7316 S. Hoyne
Chicago, Il. 60637
312-741-4615

Objectives:

[Grades 1-2-3]
Students will be able to:

1. Tell what mirrors are used for.
2. Compare objects in two mirrors at right angles to each other and describe what happened.
3. Demonstrate how a periscope is used to see around corners.

Materials Needed:

The following materials are needed for each group of 1-10 students:

3 milk cartons	1 small candle	1 quarter
2 small mirrors 2" by 3"	1 pencil duct tape	2 wood blocks
8 large mirrors 3" by 6"	drawing paper	primary paper crayons
1 long mirror 4 feet	scissors	newspaper
nametags	1 clock	

Strategy:

Instructor:
Hold up a mirror. Ask "What is this?" (mirror) Ask "Where do we find mirrors?" accept all answers. Since mirrors are found in many places, let's find out what they are used for. We will be Mirror Detectives and solve the mystery of the mirrors by observation and discovery.

Divide students into 4 groups. Each student will get paper and pencil and select a partner to work with. Each group will go to one of the designated stations and write in complete sentences what they observe or discover. Students will move from stations when teacher rings bell. After observing all stations students will come together to share information. All facts are written on chalk board and each student copies for science notebook.

Procedure:

Station 1:

Stand up two 3x5 mirrors and tape them together so that they form a right angle to each other. Face a clock toward the two mirrors. Read the clock. Try to read a page of a book in the mirror. Look at yourself. Try to comb and brush your hair.

You can read the clock and book. You look strange and can't seem to comb and brush the side of the hair you mean to.

Place a quarter on the table between the mirrors. Then as you slowly bring the free ends of the mirrors closer together, additional quarters come into view. Your money seems to grow until both mirrors touch the quarter.

Station 2:

Take two 3x5 mirrors and two blocks of wood (same size) and attach the mirrors to the wood with duct tape. Set the two mirrors facing each other about two inches apart. Place a pencil between them. A parade of pencil images appear in the mirror behind the pencil.

Turn the front mirror a bit. Now you see a curved parade of pencils. Change the angle a bit more. The parade curves more sharply.

Station 3:

Make a periscope. Use a milk carton (1 quart size). Cut a hole on one side of the carton near the top and a similar hole on the opposite side, the same distance from the bottom. Tape two pocket mirrors (2x3) in place parallel to one another, at a 45 degree slant.

Hold the periscope up to your eye and look through the lower hole. Now go to a corner and hold the periscope so that one hole is sticking out. Look through the other hole. You can see what is above you and on the opposite side of the periscope. You can see around corners.

Station 4:

Place a long mirror (4 feet long) low enough so that three students can sit in front of it. Students should have on name tags. Students will sketch the upper part of body looking through mirror. Other students in this group will look through newspaper for a word that describes how they feel about themselves (great, happy, strong, etc.). Cut it out and paste it on the picture they sketched. Students will see themselves as others see them and name tags will be on opposite sides and backwards.

Expected Results:

Mirrors are used to see ourselves and to see how to do things.
To see small images of large objects.
To see behind you, around corners, and over things.
To make things look larger and to multiply images.

Return to Physics Index

Light

Pennie Machnick
255 Leahy Circle
Des Plaines, IL. 60016
708-298-8410

Dirksen School
8601 W. Foster Ave.
Chicago, IL. 60656
312-792-8590

Objectives:

(Grades 4-6)
1. Students will be able to calculate the angle of reflection and the angle of incidence and discover that these angles are equal.
2. They will discover that light disperses through a medium and a variety of colors can be seen. This will resemble a blue sky and sunset.
3. They will discover that light refracts when entering different media.
4. They will discover that light is pure energy.

Materials:

1. Aquarium, high intensity flashlight, Coffee Mate, mirror, protractor
2. prism, screen (use typing paper mounted on a desk size paper clip)
3. beaker, pencil
4. box with any object inside

Procedure:

1. Fill an aquarium three fourths full of water. Add about one half teaspoon of Coffee Mate to the water and mix this solution. Place a flat mirror in the bottom of the aquarium. Shine a high intensity light beam from a flashlight into the side of the aquarium toward the mirror. Turn off the room light and view the angle of reflection and the angle made by the light to the mirror (angle of incidence). Place a protractor along the base of the aquarium. Measure the angle of reflection and the angle of incidence. The angle of reflection and the angle of incidence will be equal in each case.

2. Using the same aquarium and solution, shine the high intensity light through the solution parallel to the base. The water will appear blue like a blue sky because blue light disperses. When the students view the light from the far end of the aquarium, the light appears orange like an orange sunset.

3. Fill a beaker half full of water. Place a pencil into the beaker. The pencil will appear to be broken at the point where the pencil meets the water. Explain that light rays are refracted at angles when they travel through different media.

4. Place any object inside a box. Tell the students that you will hold up the object and they will get five seconds to view it after which you will hide the object and they will describe it. On the count of three turn off the lights in the room and hold up the object. Ask the students to describe the object. They will say they can't. Ask them why. They will say there was no light. Explain to them that light is pure energy. Tell them that pure energy can only by used at that moment. We will never have that particular light beam again. Draw the light rays on the chalkboard to emphasize.

Return to Physics Index

Light And Color

Lillie Mae Rayborn
3109 Shagbark Lane
Hazelcrest, IL 60429
708-957-3899

John D. Shoop School
1460 W. 112 St.
Chicago, IL 60643
312-881-5215

Objective:

For primary students grade K-3 in elementary school.

1. Students will understand how light travels in straight lines by exposing them to various activities.
2. Students will be exposed to the basic behavior of different colors in light.
3. Students will learn where light come from by using a laser.

Equipment and Materials:

For the entire class

1. red, green, and blue filters
2. 3 flashlights
3. transparent tape or rubber bands
4. a white wall
5. a darkened room
6. pencil
7. tracing paper

Recommended Strategy:

1. Use transparent tape or rubber bands to attach a colored filter to each of the three flashlight.
2. Darken the room before mixing green and blue light, guess what color will result. Then turn on the green and blue flashlights and combine the lights on the white wall.
3. The color you see on the wall, making of greenish blue is called cyan.
4. Now guess what will happen when you mix green light with red light, test your guess.
5. Guess the result of red light mixed with blue light. Then test your guess.
6. Place the three flashlight on a table, one at each end and one in the middle. The light of all three flashlights should come together on the white wall. Stand between the flashlights and the wall. How many shadows do you have?
7. What colors are they? Experiment by covering or turning off one light at a time. How do the colors of your shadows change.
8. Create circle patterns. With the pencil, trace the circle found on this paper. Make sure the lines are heavy and dark.
9. Turn the patterns over. Keeping the pencil patterns face down, place the patterns on the stiff cardboard. Go over the lines of the patterns with a ballpoint pen. Lift the patterns. You will see faint circle on the cardboard.

Return to Physics Index

Spherical Mirrors

Bryan, Bill
12828 Blossom Drive
Alsip, IL 60658
1-312-388-1361

Joliet Catholic H.S.
1-815-727-5311

Objectives

After this exercise the students should be able to:

1. Construct ray diagrams of images in spherical mirrors;
2. Find images of objects in spherical mirrors;
3. Distinguish between convex and concave mirrors;
4. Distinguish between converging light and diverging light.

Materials Needed

A. By student: calculator, protractor, shiny serving spoon, paper, pencil.
B. By teacher:
   1. Spherical mirror (dinner plate size).
   2. Box, painted black on the inside.
   3. 2 light sockets, one painted black.
   4. Light bulb.
C. Optional equipment: Laser, mirage device.

Classroom Strategy

A. Pre-class preparation:

1. Place one light socket on one of the inside sides of the box. Place the other light socket on the outside of the box, directly above the socket on the inside. Make sure the sockets are not on the bottom of the box. Now place the mirror at a distance which is twice the focal length of the mirror and insert the light bulb in the socket on the inside of the box. Adjust the mirror and the box so that you get a real image of the bulb above the socket on the outside of the box (the light needs to be on to get a clear image!). The apparatus is now ready for the demonstration.

B. Classroom Procedures:

1. Set up the above apparatus prior to the class. Begin the class with the demonstration. Point out the object and its **real** image. Note that the image is inverted when compared to the object. This will be explained during the activity in class. If a laser is available, shine it over the top of the image and parallel to the principal axis. This beam will pass through the focus and over the top of the object. Another ray, directed over the image and through the focus will reflect off the mirror parallel to the principal axis and over the object. These rays are the same ones used in constructing a ray diagram, but now the students can see **why** we use these rays.
2. On the overhead projector, construct a ray diagram of what was just observed. If the laser was used, refer to the rays demonstrated. Have the students construct the diagram on paper as you do it on the overhead.
3. Have the students take out the serving spoon. Pass out paperclips and have them bend it so they have an object that will have a definite top and bottom. While viewing the concave side of the spoon, move the paperclip from far away from the spoon to close-up. Have the students note if the image is inverted or upright. Do the

same for the convex side of the spoon. For the concave side, the image is inverted until you move inside the focus, where it will then be upright. The convex side never inverts the image.

4. On the diagram on the overhead, show how the parallel light in a concave mirror meets at the focus. Then show what happens to parallel light that reflects off the convex mirror. Distinguish between converging and diverging light.

5. Briefly show a convex diagram and where the image appears to be coming from. This will be explained in a future lesson.

6. Either put a problem on the overhead or have a handout with the problem on it, and have the students work it, using a ray diagram. A homework assignment will then follow.

7. The formula for finding image, object, and focus distances can also be presented, as well as height of the image and object. Or, these can be presented in a future lesson.

8. An image device, consisting of two concave mirrors face-to-face, can be purchased to project a real image of an object. This will produce the same type of image as the light bulb. The device can be displayed on the desk for students to ponder.

Polarized Light

Springer, Ellen
1209 W. Ogden Ave.
La Grange Park, IL 60525
1-708-352-1886

Nazareth Academy
1-708-354-0061

Objectives

1) To expose students to the basic behavior of polarized light.
2) To help students discover that light can be polarized by reflection from a non-metallic surface as well as by passing through certain crystalline materials.
3) To develop a model which can account for differences in light behavior using a second set of polaroid filters.

Equipment and Materials

2 polarizing filters with axes parallel to the edge. 2 polarizing filters with axes 45º to the edge. Distinguish from the above filters by placing them in colored holders. microscope slide, cheap scotch tape (Le Pages or Tuck are good.) plastic champagne glass, shiny metallic surface (aluminum foil), shiny non-metallic dark surface (student folder may be useful here.)

Recommended Strategy

1. Place one polaroid filter between eye and a light source (window is good); slowly rotate the filter. Note any changes in light intensity.

2. Place a polaroid filter in front of a light source. Slowly rotate a second polaroid filter between your eye and the other filter. Note any change in light intensity.

3. Put a single strip of scotch tape on one end of the microscope slide, and several pieces crossed on top of one another on the other end. Place the slide between the filters and slowly rotate one of the filters. Slowly rotate the slide. Note any change in light intensity or other phenomenon.

4. If available, show the segment on polarized light from **Newton's Apple**.

5. View light **reflected** from both a shiny metallic surface and from a non-metallic surface using one filter and rotating it slowly. Note any change in light intensity of the reflected light.

6. View a plastic champagne glass placed between two polaroid filters. Now place the glass on the glare area of a shiny non-metallic surface, and view it through one polaroid filter. Ask students to explain the origin of the colors even though only one filter is used.

7. Obtain a second set of polaroid filters (in colored holders). Compare the behavior of light through both sets of filters when one filter is: a) rotated, b) placed in front or behind the other, c) flipped over.

8. Challenge students to develop a model which will explain the difference in the behavior of light in 7 c above.

9. View a liquid crystal display through one polaroid filter rotating the filter slowly. Note any change in light intensity. A good explanation of the way that a liquid crystal display operates and other information about polarized light can be found in the student publication, **Chem Matters**, April 1984, pp. 8-13.

Colors

Schaumburg, Carl
905 Alfini Dr.
Des Plaines, IL 60016
1-708-827-3466

Von Stueben MSC
1-312-509-5000

Objective

1. Students will understand what colors are in white and other colors of light.
2. Students will understand complementary colors and that colors we see are the result of some colors being removed from white light.

Apparatus Needed

An overhead projector
Various colored pieces of plastic (the whole spectrum if possible)
Various pieces of colored paper

Recommended Strategy

Starting with a clear piece of plastic on the overhead screen, ask, "Has anyone heard that white light contains other colors. How can white be separated into its colors?" Answers of prism, etc. may be suggested. None of these should be present. Place a piece of red plastic **accidentally** over the clear piece. "Is there red light in white?" Yes, because you can see the red light coming through. "What about other colors in white? Are there other colors in yellow and other colors?" Have class find out by overlapping colored pieces of plastic and holding them up to the light. Data table can be developed and discussed.

Ask, "Why is the asphalt street so much warmer than the sidewalk if you are walking in bare feet? What colors come through black?" None, the colors are changed to heat. "What happens to the colors that don't come through various colors?" Changed to heat too. "How could we check this out?" Thermometer.

We can get our eyes to automatically show what colors are removed from light when we look at any color. Place a white piece of paper on the desk with a small x in the center. Place a colored piece of paper next to the white page and stare at the center of the colored piece, counting to 30. Quickly shift your gaze and concentration to the x on the white sheet. The color removed from white light (the complementary color) when you looked at the first color should now appear. Make a table of the complementary colors. To test your results, select a color and place a small piece of its complement in the center. Count and shift your vision. If your colors are complementary, they will switch places. Discuss how this is useful; looking at objects under mercury or sodium vapor lights at first appear the wrong color, but eventually the colors seem more normal. The concept that colors are removed from white light could be discussed by asking what colors are removed (complementary colors) by looking at colors of clothing around you and what colors are removed from light by leaves.

Finish up by projecting on the overhead a flag with green stripes in place of red with opaque stripes of masking tape for the white, yellow field in place of blue, and paste-on opaque stars. Play the Star Spangled Banner. About half-way through the song remove the overhead slide, but have everyone continue to stare at a spot on the screen. The normal colors will appear for the rest of the song.

Reflections Of

Fowler, Elva House
12220 South Stewart Avenue
Chicago,Illinois 60628
264-0855

Cook Elementary School
962-2915

Objective(s):

The student will be able to:
1) define reflection.
2) observe and compare the angle of incidence with the angle of reflection.
3) find the number of images reflected by two mirrors when the mirrors are placed at different angles.
4) demonstrate reflection of light using a kaleidoscope.
5) illustrate how multiple images can be produced with a particular kaleidoscope arrangement.

Apparatus Needed:

Paper, rulers, small mirrors, protractors, small object (e.g. beads, coins), plastic strips, clear contact paper, sequins, beads, duct tape, scissors.

Recommended Strategy:

1) Students draw a broken line on a piece of paper, next a straight line is drawn extending from the broken line at any angle. A small mirror is set upright at the point where the two lines meet. Students then turn the mirror until the reflection of the dotted line is in line with the real dotted line. Next students line up a ruler with the reflection of the straight line in the mirror. The reflection of the straight line in the mirror is extended and drawn on the paper. Next the angle of each side of the broken line is measured with a protractor.

2) Students use two mirrors, a protractor and an object to find out how many images are formed when the two mirrors are placed at different angles.

3) Students construct a kaleidoscope using three plastic strips taped into a triangle with duct tape. In between two clear contact circles are put a few sequins and beads. This circle is looked at through the plastic triangle strips.

Return to Physics Index

Polarization

Hasegawa, Harry
18W780 14th St.
Lombard, IL 60148
620-7945

Lawndale Community Academy
762-7745

Objectives

1) Students will learn basic facts of polarization
2) Demonstrate some phenomenological activities illustrating interference patterns.
3) Make "take-home" project of the interference pattern.

Equipment and Materials

Microprojector
Crystals of:
- sugar
- epsom salt
- salol
- mica
- salt

Clear plastic box
Polarizing films
Cellophane tape
Microscope slides

Recommended Strategies

Review light waves and experiment with polarizing film.
Demonstrate the nature of polarized light showing that polarized light travels in a single plane instead of the 360 degree of unpolarized light.

Demonstrate the interference pattern of various crystals which are placed between two polarized films on the microprojector.

> When light passes through a polarized film, the many color rays (or wave lengths) which make up the white light travel at various velocities and break up or interfere with another ray .
>
> A wave length or white light is then subtracted and shows the complementary color-- the color that is left when white light is subtracted. This is the interference pattern.

Demonstrate light reflecting from a smooth surface such as plastic is polarized. The reflecting light comes to the eye in a single plane.

Show that many digital read-outs are also polarized.

Have students make a take-home project demonstrating interference patterns by placing a number of small pieces of cellophane tapes randomly on a microscope slide. Then view the slide placed between two polarizing films.

Return to Physics Index

Waves

Johnson, Levi
360 E . Randolph
Chicago, Il. 60601
938-3518

James Otis
666-4072

Objectives:

Students will be able to define, label and demonstrate the following vocabulary words: wave, wave motion, longitudinal wave, transverse wave, pulse, crest, energy trough, amplitude, frequency, reflection, rarefaction, refraction and compression.
Students will be able to state the properties that a medium must possess in order that waves may be transmitted through it.
Students will be able to tell the essential difference between a longitudinal and a transverse wave.
Students will be able to know how to make a longitudinal or compressional pulse and a transverse pulse.
Students will be able to determine the time it takes a pulse to travel down the rope or a slinky.
Students will be able to understand that a wave is a means of transmitting energy.

Apparatus Needed:

Marbles, grooved ruler or stick, hose or rope, large pan of water, cork, small stone, ripple tank, medicine dropper, overhead projector, coil spring, meterstick, watch, slinky, string or fishing line, smooth pole or stiff wire, curtain rings, movies [Bd. of Ed. 2797-82 and 4209-22].

Recommended:

1. Place five or six marbles in a groove so that they touch each other. Roll another marble against the end of the line of marbles. The vibration of waves will be transmitted through the line and the marbles on the end will roll away. Roll two, then three and so on. Observe what happens.

2. Move the hose or rope up and down to make transverse waves. Drop the stone into the water. Observe what happens.

3. Fill the flat pan about half full of water. Place the pan on an overhead projector or tabletop. Fill a medicine dropper with water. Allow one drop of water to fall into the center of the pan. Allow another drop to fall near the edge. Notice what happens in each. Sketch the pattern of waves that are seen.

4. Move a rope up and down. Describe and explain what kind of waves are observed.

Cut equal-lengths of string at least one meter long. Tie a curtain ring to one end of each string. Attach the free end of a piece of string to every fifth coil of the slinky. Slip the curtain rings onto the pole [or wire], and then suspend it from the ceiling. Observe: send a longitudinal pulse down the spring by pinching together several coils of the spring and then releasing them. What kind of pulse is this? [longitudinal or compressional]

What happens to the shape of the pulse as it travels down the wire? Quickly pull the free end of the slinky to one side and then return it to its original position. What kind of pulse is this? What happens to the shape of the pulse as it travels down the string? Determine the time it takes a pulse to travel down the string. Change the amplitude of the pulse and again determine the travel time. How does changing the amplitude affect the speed of the wave? Change the medium by stretching the spring to a different length. Determine the speed of a pulse in this new medium. How does changing the medium affect the speed of a wave?

Guitar Waves

Kulak, Tim
6532 W. 173rd Place
Tinley Park, Il 60477
532-1584

Thornwood High School
339-7800

Objectives

1. Analyze wave patterns of guitar notes, chords, and groups.
2. a. Relate wave characteristics to sound and wave shapes.
   b. Relate wave definitions to sounds heard and seen.
3. Illustrate how fixed end strings can vibrate in a number of modes.
4. Prove that the wave pattern of a vibrating string is the superposition of harmonics.
5. Discover factors that control the pitch of a vibrating string.
6. Measure and compare ratios of string lengths for harmonious notes.
7. Convert acoustical signals into electrical impulses electromagnetically. (Optional: Piezoelectrically.)
8. Optional: Observe and analyze wave patterns for processed signals.

Apparatus Needed

Cassette player, connecting cords (Coaxial one end with bare wires), Oscilloscope, long spring, "Duotone Guitars" (call for plan), cylindrical alnico magnets, copper coils or wire, Wave generator (Thornton), computer program on wave superposition, Video: "Donald in Mathemagicland".
Optional: These may be "solicited" from students: Acoustic guitar, electric guitar, small amplifier, various signal processors.

Recommended Strategy

1. Play a cassette of a dynamic rock guitar song into an oscilloscope (Heart: "Crazy On You", Led Zeppelin: "Ramble On", etc.)
2. Chart the relationships between wave characteristics (amplitude, wavelength, frequency, etc.) and what is heard and seen.
3. Run wave generator into speaker and oscilloscope to complete and reinforce this chart.
4. Illustrate standing wave harmonics with long spring.
5. Run computer program on superimposing standing waves to show resulting wave forms.
6. "Duotone" guitar experiment:
   a. Two-string "guitars" have one-meter long strings with metric tape from bridge to nut.
   b. Tune both strings to the same note on each guitar.
   c. "Fret" one string at various lengths to produce harmonious notes; record each length as a decimal.

   d. Create a "group" chord by using each guitar to play a separate note of the chord. Record these string lengths.
   e. Transform decimal ratios into simple fractions using a student-generated chart.
7. Show intro section of video "Donald in Mathemagicland" dealing with Pythagorean string length ratios to validate experiment.
8. Relate ratios to musical intervals.
9. a. Place magnets into copper coils to form a "pickup".
   b. Input ends of wire into oscilloscope and/or amplifier.
   c. Place pickup near a vibrating string and observe.
10. Optional activities:
   a. Illustrate musical moods with various guitar chord intervals.
   b. Observe sounds from different electric guitar pickups and relate to standing wave harmonics.
   c. Observe processed guitar signals to see and hear what is being done with the waves.
   *d. Run computer Fourier analysis on any of the above! (See Bill Blunk and/or Art Schmidt.)

Return to Physics Index

From Vibration To Sound

Persons, Pamela
6730 S. South Shore Drive
Chicago, IL 60649
493-5543

Walt Disney Magnet School
525-7455

Objectives:

1. To identify the parts of a sound wave.
2. To distinguish between a transverse wave and a compressional wave.
3. To describe how musical instruments produce sounds.

Apparatus Needed:

An overhead projector, plastic dish, glass, corks or stoppers of different sizes, tuning forks, rope, slinky, tin cans, string, paper clips, test tubes, test tube rack, student-made instruments, rubber tubing, 6 V cell and connecting wire, a jar of vacuum grease, electric vacuum pump and stand, bell jar and electric bell.

Recommended Strategy:

1. Discuss that sounds we hear are vibrations of molecules in air and other materials. They carry energy in waves that can be reflected, absorbed and transmitted like light waves, but cannot travel like light in a vacuum.

2. Place a large square, clear glass or plastic dish on an overhead projector. Fill the dish one third full of water. Drop corks or stoppers of different sizes into the center of the water and project the resulting wave motion onto a screen. Discuss what caused the waves and their characteristics. Now strike a tuning fork and touch the stem to the surface of the water. Observe the wave pattern produced. Discuss the cause of waves.

3. Tie one end of a rope to a doorknob. Produce transverse waves along the rope by shaking one end.

4. Use a long slinky-type spring to illustrate longitudinal and transverse waves.

5. Point out that wavelength can be measured from crest to crest, trough to trough, or any other two corresponding points.

6. Diagram a wave and label its wavelength and amplitude.

7. Relate sound to mechanical vibrations of all sorts. For example, a drum beat, the snap of a breaking stick, a truck rumbling by on a street. Discuss the vibration one can feel in the speaker of a stereo.

8. Explain the scientific meaning of "tuning in" a certain radio station (the adjusting of the circuit in a radio so that the circuit resonates electrically at the broadcasting frequency of the radio station).

9. Use student-made instruments to illustrate volume and pitch (one-string guitar, earharp, sandpaper blocks, paper tube kazoo, wind chimes, wood block tambourine, tongue depressor finger piano, garden hose recorder, etc.)

10. (IF AVAILABLE) Set up the demonstration of a bell in a vacuum. With the bell ringing, pump the air out of the bell jar, and then allow the air to fill the system again. Discuss why the sound of the bell gets fainter until no sound can be heard.

11. Prepare "learning stations" with independent activities related to the production of sound. For example:
A> Waves in a Coil Spring (To demonstrate a compressional wave)

B> Talking Through A String Telephone (To hear the transmission of sound)

C> Tuning Fork Sounds (To discover how pitch is related to the frequency of sound waves)

D> Test Tube Organ (To determine how the length of an air column affects the frequency of the sound)

12. As enrichment activities students could research the following:
1). Seismic waves transmit the energy of an earthquake. Research earthquakes to determine the types of waves made.
2). Traditionally, soldiers break step when crossing a bridge. In the 1800s a group of soldiers crossing a bridge in step set up a vibrational pattern that caused the collapse of the bridge. Research this incidental bit of history under the topic of bridges or vibrations.

Return to Physics Index

Comparison of Images Formed by Plane, Cylindrical (concave side), and Spherical (concave side) Mirrors

Springer, Ellen
1209 W. Ogden Ave.
La Grange Park, IL 60525
352-1886

Nazareth Academy
354-0061

Objectives:

1) To demonstrate that all mirrors reverse the image front to back, and that the apparent right to left reversal in a plane mirror is a result of this front to back reversal.

2) To describe plane, cylindrical, and concave mirrors in terms of curvature about horizontal and vertical axes.

3) To recognize that one's eyes lie along a horizontal axis, and one's forehead and chin lie along a vertical axis.

4) To help students recognize that right to left and top to bottom reversals occur simultaneously, and occur only in curved mirrors.

5) To discover that left to right reversals (and top to bottom reversal) occur when the axis of the object is parallel to the curved axis of the mirror, and that no left to right reversal occurs when the axis of the object is along a linear mirror axis.

Apparatus Needed:

Plane mirror, cylindrical mirror, concave mirror of short focal length. The cylindrical mirror can be made by gluing a piece of aluminized mylar inside a 120º section of carpet roll.

Recommended Strategy:

1) This exercise can be done anytime during the year as an attention grabber, or as an introduction to, or review of mirror images.

2) In order to avoid confusion which is associated with left and right in observing mirror images, it seems best to describe orientation along a horizontal axis in terms of some objects in the room such as the window side and door side.

3) Beginning with a plane mirror ask the students to observe the image of their left hand. Ask if the image is reversed left to right. Most will reply that it is. Then ask if the image is reversed to bottom. Point out the inconsistency of their answer and let them sit with that for a while.

4) Using a plane mirror ask the student to cover their eye which is on the wall side; ask them which eye is covered in the mirror (wall side

or window side.) Also ask if the image is reversed top to bottom. Direct the students to turn the mirror through 90º, make observations and answer the same questions.

5) Using the concave side of a cylindrical mirror, repeat No. 4 above, asking the same questions.

6) Using the concave side of a spherical mirror, repeat No. 4 above, asking the same questions.

7) Summarize student observations on the board, and help the class explain their observations.

8) Observations in a cylindrical mirror can be extended by viewing the image of two different colored arrows crossed at 90º. Ask the students to turn the object through 90º and observe what happens to the image. Ask them to turn the mirror through 90º and observe what happens to the image this time.

Alternate Theory of Color Perception

Szeszol, Jim
29 Mayfair Lane
Aurora, IL 60504
898-6603

Naperville Central H.S.
420-6417

Objective:

To observe an alternative theory of color perception.

Apparatus needed:

A) Color wheel(s), wooden safety matches (for spindles), masking tape.

B) Black and white slide positives.

Procedure:

A) Activity - assemble color wheel(s) and spin; observe colors in daylight and under fluorescent light. Have students form a possible theory.

B) Land projections - two black and white slides (positives) are prepared and projected as outlined in "The Physics Teacher," March 1968, p. 129. Full color images, not possible with Newtonian theory, are produced.

Discussion:

Edwin Land's (of the Polaroid Land Corp.) "Retinex Theory" states that the eye processes black and white gray scales using three photoreceptors. Each photoreceptor processes the signals differently and then combines the processed information to produce colored images in the brain.

References:

Land, Edwin H. "Experiments in Color Vision," **Scientific American**, May 1959.
Land, Edwin H. "The Retinex," **American Scientist**, 52, 1964.

Return to Physics Index

Microscopes and Telescopes

Vanderjack, Karisa
8100 W. 87th St. #4A
Hickory Hills, IL 60457
430-7244

Dwight D. Eisenhower H. S.
597-6300

Objectives:

1. To use a knowledge of lenses to develop how microscopes and telescopes were first invented.
2. To apply ray diagrams to explain why these instruments work the way they do.

Apparatus Needed:

1. cheap magnifying glasses -- the kind given away at carnivals
2. various converging and diverging lenses
3. poster board, protractor, markers, and ruler for posters
4. cheap telescopes -- see #1
5. compound microscope and astronomical telescope (optional)

Recommended Strategy:

1. As a preliminary stage to my mini-teach, I drew posters containing the ray diagrams for converging lenses, converging mirrors, diverging lenses and mirrors, microscopes (simple and compound) and telescopes (astronomical, Galilean, and Newtonian). I explained that this lesson comes after the teaching of ray diagrams. I displayed my posters of the lens and mirror diagrams. Also, I showed the group an 'air' lens which consists of two watch glasses epoxied together to appear to be a converging lens. When the lens is immersed in water (phosphorine added for effect) and a light shown through the lens, the light actually diverges. This is due to a smaller index of refraction for air than water. Another neat idea is to use very large concave and convex mirrors to show student the pronounced difference in the two. Harry Hasegawa demonstrated using the large concave mirror to project a real image on a far wall.

2. To begin, give every student a cheap magnifying glass. Ask students to explain what it is and what it does. Students will be able to make real images of the classroom lights on their desks. Also, they will be able to magnify print, their finger, etc. Then most students will be able to say this is a converging lens. Refer to lens diagram for distant objects and objects closer than focal length. Ask students if there are other instruments which make objects appear larger. Most will say microscopes and telescopes. Then ask if the telescope actually makes the moon larger than it really is. To illustrate the optical principle that far away

objects look smaller than near objects, let students look out the window, place their hand palm up in front of them, and see if they can put a car in their palm. Then conclude that the telescope makes objects appear closer not larger.

3. Now let students 'play' with various combinations of lenses to form microscopes and telescopes. Pick a distant object to view (example: the wall clock). Also have books or typed papers to view. Let students 'play' for about 5 to 10 minutes with lenses and record their observations. Encourage them to find combinations that have erect and inverted images.

4. Use posters of ray diagrams to explain why certain lens combinations have different effects. Use posters of the microscopes and telescopes in your explanation. Also include tidbits of information on Anton Van Leeuwenhoek and Galileo Galilei and their ideas.

5. As an optional activity, have a compound microscope and a nice telescope for the students to look through and make some qualitative observations.

Return to Physics Index

Optical Illusions

Boyd, Edgar
510 Barrington Ct.
University Park, Il 60466
534-6486

F.L.Gillespie
468-7263

Objectives:

Given the introduction to optical illusions ,each student will be able to identify and construct four optical illusions illustrated in class.

Apparatus needed:

1. White cord string (medium)
2. Transparent sheets (4) 8"x10"
3. Overhead projector
4. Ultra violet light
5. Electric drill
6. 3 cardboard circles 12"in diameter
7. Assorted fluorescent paint
8. Felt pens designed to write on transparent sheets
9. Scissors
10. Straight edge (ruler)
11. Two 8"x 12" cards
12. Six (6) 3" screws; threaded with washers and bolts

Recommended strategy:

Optical illusions are deceptions of the mind. Sometimes these illusions are concerned with color, and sometimes with objects that are moving.

Constructing Optical Illusions Using Light.

Divide each of the three cardboard circles into four equal parts. Shade each of the sections on each cardboard with different colors using a different color fluorescent paint. Place small hole in center of each cardboard. Place 3" threaded screw through washer, place screw with washer through painted side of cardboard. Place washer on back of the cardboard and lock with bolt. Attach completed assembly to drill and lock in place. Stand in front of ultra violet light, turn off lights in room. Turn on drill and observe color patterns. Repeat above procedures for each of the remaining circle cardboards.

CAUTION: DO NOT LOOK DIRECTLY INTO THE ULTRA VIOLET LIGHT

Optical Illusions With Color

Take four(4) 12" sections of string and place each in a different color of fluorescent paint. Allow string to dry. Construct on the 12" x 24" cardboard using straight pins. Using the examples in the packet or examples given in chapter 6, construct several optical illusions of your choice .

Optical Illusions With Changeable Figures

Place several figures on the board taken from the packet of information or chapter 6 of reference book. Each student will duplicate each figure on the 8"x12" card. One can not duplicate with any degree of accuracy the optical illusions that will illustrate changeable figures on a computer. To obtain the optical illusions that will illustrate changeable figures, please contact Edgar Boyd at the school listed on this Mini-Teach Summary.

Reflections With Mirrors

Rubalcaba, Antoinette
3050 N. Natchez
Chicago, Illinois 60634
637-1409

Inter-American Magnet School
880-8190

Objectives:

Students will be able to define reflection.
Students will explain the laws of reflection.

Apparatus needed:

Four to five different texture surfaces, flashlight, paper, carbon paper, candles, pins, protractors, kaleidoscopes, coins, half gallon milk cartons, single edge blades, wood, rubber bands, 8x10 cardboard and two mirrors per student.

Recommended strategy:

Opening: flash a light beam on different surfaces to show reflection. Students read a handout with reverse writing using mirrors.

I. Students locate the image of a candle by means of parallax by placing a second candle behind the mirror and lining up the images.

II. Using pins in front of a mirror, students construct the incident ray, the reflected ray and the normal.

III. Locating image position by using angles of reflection. Students construct rays of reflection by sighting the image of a pin from the left and right sides of the pin. They then draw lines along the rays of reflection extending them beyond the mirror line until they cross.

IV. Students find the number of images reflected by two mirrors when placed at different angles.

V. A periscope is constructed using a half gallon milk carton, two mirrors, and a single edge blade.

Return to Physics Index

Color Mixing

Springer, Ellen
1209 W. Ogden Ave.
La Grange Park, IL 60525
(312)352-1886

Nazareth Academy
(312)354-0061

Objectives:

1. To distinguish mixing of colored pigments (inks, dyes) and mixing of colored beams of light.

2. List the three primary colored light beams, and recognize that these are the colors used in colored TV.

3. List the three primary pigments and recognize that these are used in color printing.

4. By use of the color wheel predict the color produced when either colored beams or pigments are mixed.

5. Demonstrate that shadows are produced by blocking (subtracting) light, and that the bright side of a shadow can be observed by using a plane mirror to block the beam.

6. Explain the formation of the colored shadows formed in overlapping colored light beams.

Apparatus:

Colored filters (red, blue, green; magenta, yellow, cyan), 3 filmstrip projectors, overhead projector, white paper screen, plane mirror, food packages, simple magnifiers, darkened or semi-darkened room.

Recommended Strategy:

1. Have students recall previous experience with color mixing. Ask what will happen when red and green crayons are mixed; what will happen when red and green filters are overlapped on an overhead projector. Do these; note similarity in results.

2. Ask what will happen when beams of red and green light are overlapped on a screen. The intensity of the light beams can be adjusted by blocking part of the lens. Students should realize that mixing colored pigments and mixing colored beams gives different results.

3. Have students predict the results of mixing red and blue beams, and mixing blue and green beams as above. Do it. Ask what will happen

when all three colors are mixed. Do it. From the results draw the color wheel on the board.

4. Students are familiar with mixing crayons. Ask how to make green when no green crayon is available. Point out that the red (magenta), blue (cyan), and yellow on the color wheel are the three pigments they are used to mixing. Show mixing of combinations of magenta, cyan and yellow filters on the overhead. From end flap of a food carton find the color of the inks used. Use a magnifying glass to observe that the picture is formed from the overlapping of colored dots.

5. This next part has to do with the formation of shadows formed by blocking the light from overlapping colored light beams. Overlap red and green beams; have a student hold a hand or some other opaque object in front of the screen. Try varying the distance from the screen. Ask students to explain how the various colored shadows are formed. If a mirror is used to block the light, the color of the light beams(s) that are being blocked can be shown. Try forming shadows when all three beams are overlapped.

6. Interesting shadows can be formed in overlapping red and white beams. The resulting green shadow is most evident if the beams overlap entirely and the intensity of the white beam is reduced. Try combinations of green and white, and blue and white beams.

Reference:

Phys. Teach. 22, **419 (1986) has a discussion of yellow light** produced from overlapping red and green beams.

Return to Physics Index

Comparison of Images Formed By Plane, Cylindrical (Concave Side), and Spherical (Concave Side) Mirrors

Ellen Springer Nazareth Academy
Robert Tisdale Julian H. S.
Levi Johnson Otis Elementary
Alex Economou C. V. S.

Objectives:

1) To distinguish between horizontal and vertical axes and to recognize that ones eyes lie along a horizontal axis and ones forehead and chin lie along a vertical axis.
2) To describe plane, cylindrical, and concave mirrors in terms of curvature about horizontal and vertical axes.
3) To help students discover that image reversal occurs when the axis of the object is parallel to the axis of curvature of the mirror, and that no reversal occurs when the axis of the object is parallel to a linear mirror axis.

This exercise can be done:
1) Anytime during the year as an attention grabber and an exercise in observation and interpretation.
2) As an introduction to mirror images.
3) As a review of mirror images.

Apparatus needed:

Plane mirror, cylindrical mirror, short focal length concave mirror.

Notes: The cylindrical mirrors can be made by gluing a 10 cm by 10 cm piece of aluminized mylar inside of a 120º section of carpet roll tubing. In order to avoid confusion which is associated with left and right when observing mirror images, it seems best to describe orientation along the horizontal axis in terms of some objects in the room, such as window side and door side.

Recommended strategy:

1) Beginning with the plane mirror ask the student to cover one eye with their hand and observe the image of their face. Describe the image as reversed or not reversed top to bottom, or window side to door side. Turn the mirror through 90º and observe the image again.
2) Using the concave side of a cylindrical mirror repeat procedure no.1 asking the same questions.
3) Using the concave side of a spherical mirror repeat procedure no.1 asking the same questions.

4) Summarize student observations on the board and help the class explain their observations.
5) Observations in a cylindrical mirror can be extended by viewing the image of two different colored arrows crossed at 90º. Ask the students to turn the **object** through 90º and observe what happens to the image. Then ask the students to turn the **mirror** through 90º and observe what happens.

LASER HOLOGRAPHY

CAROL ZIMMERMAN

HYDE PARK CAREER ACADEMY
6220 SOUTH STONY ISLAND AVENUE
CHICAGO, ILLINOIS 60637
1-312-947-7237

OBJECTIVES:

To make a Laser holograph and to understand why it works.

MATERIALS:

1 3-milliwatt Neon Helium Laser
3 rubber inner tubes (18 inch diameter) from a trailer
1 slab of marble (20 inches by 23 inches) possibly a tombstone
1 wooden sandbox (20 inches by 23 inches) filled with sand
1 -4mm focal length lens in a lens holder
1 -8mm focal length lens in a lens holder
1 white die to use as an object
1 object support
1 film holder consisting of 2 glass plates and 2 clips
1 white screen
1 black screen
non AH holographic film
green light
developer for holographic film
bucket and continuously running water
6 plastic clothespins with hooks
rubber gloves
2 wooden blocks, slightly smaller than the film holder
1 rubber squeegee, of the type window washers use

STRATEGIES:

The laser must first be turned on since at least fifteen minutes must be allowed to permit the laser sufficient time to warm up. During this time the frequency of the light is changing. Arrange the inner tubes on the table so that the marble slab may be securely balanced upon them. Place the sandbox securely upon the marble slab. Because of size constraints the lab will be set up on a diagonal inside the sandbox. Set the laser in the sandbox with the back in one corner and the light aimed at the diagonally opposite corner. Place the two lenses in front of the laser so that the light shines through the center of both. They must be as close as possible to each other without actually touching. Allow enough space between the laser and the nearer lens holder so that the black screen may be inserted or removed without jarring either. Place the object support in the corner diagonally opposite the laser with the object on it so that it is completely bathed in the light from the laser. At any time while the materials are being aligned in the sandbox the sand may be rearranged to facilitate their proper placement. Place the white screen in the film position directly in front of the object, between the object and the light. Focus the light so that the sharpest possible circle of light is displayed on the screen. Remove the white screen. Place the black screen between the laser and the near lens holder. **DO NOT TURN OFF THE LASER.** Open the film package and place the package, the pieces of the film holder, a plastic clothespin, and the opened container of developer where they may be conveniently found in the dark. Start the water running into the bucket. Turn on the green light and focus it on the sandbox. Make sure that all windows are completely covered. Turn off all of the lights except the green

light. Allow several minutes for your eyes to become accustomed to the dark. Take out one film and place it in the film holder. Press the film holder between 2
the wooden blocks to remove all air, which could cause movement of the film and ruin the holograph. Carefully place the film holder in front of the object in exactly the same spot where the white screen had been. There will be a mark in the sand. Carefully lift the black screen out of the sand, being sure that it still covers the light from the laser. Wait approximately one minute, so that all vibration in the sandbox ceases. Completely raise the black screen for two seconds, exposing the film, then lower the screen into the sand. Put on the rubber gloves. Take the film out of the holder, clip one corner with the clothespin, and place the film in the developer for one to two minutes. You may take the film out of the development solution to check on its progress. The film will darken as it develops. When the developing is completed, place the film in the bucket of water with the hook over the side. It should stay there approximately five minutes. Squeegee the film dry and a preliminary viewing may be taken by shining the laser through the film and viewing the holograph from the same side of the film as the laser. The object will appear to be behind the film, in its original location.

The image is formed when the light rays directly from the laser and the light rays bouncing off the object strike the film simultaneously, forming a pattern of constructive and destructive interference. The light coming through this interference pattern is viewed by the eye exactly as the eye would view the light bouncing off the original object. In addition, if one views the holograph from a different angle one will appear to be viewing the original object from that different angle. A green light is used because the holographic film, designed to be sensitive to the red laser light, appears not to recognize the wavelength of the green light.

Computer Interfacing: Frequency Measurement - The Doppler Effect

John Bozovsky

Objective

To use computer interfacing to measure velocity using the Doppler Shift with sound.

Apparatus

The Apple IIe computer
The Frequency Meter program from Vernier Software
A microphone amplifier circuit using a schmidt trigger which I constructed from instructions supplied with the software.

Strategy

The microphone circuit will be set up to monitor frequency- clamped to a pole and facing outward. The computer program will be chosen to measure frequency and display it on the monitor in large print. Several devices can now be sounded within the proximity of the microphone--tuning forks, various musical instruments, etc.

A discussion will now be generated by asking the class for a method of measuring the speed of an object [or person] moving across the front of the room. It is expected that someone will soon suggest the direct measurement of displacement and time to be divided to give: v=d/t. A volunteer will now be asked to actually perform this movement while distance and time are measured using a meter stick and stopwatch. The formula will now be used to determine the speed v.

Now, a more exotic method will be suggested. A ball with a sounding Sonic Alert inside will be thrown back and forth among the class members. It will be noticed that a change in the frequency of sound is caused by the relative motion of the ball with respect to the listener: It will be noted that the frequency increases during the approach and decreases during the receding of the ball away from the listener. This change in frequency caused by relative motion is called the Doppler Effect which is demonstrated by the formula:

$$f = \frac{v}{v - v_s} f_s$$

f: the frequency detected by the listener

fs: the actual frequency produced by the source

v: the velocity of sound: [345 m/sec]

vs: the velocity of the source

Now for the action. Once again the volunteer will run across the front of the room but this time with a bell attached to him. While distance and time are directly measured to yield v=d/t as before, the computer will be instructed to measure the frequency it hears and to plot this data on a graph as the running person approaches the microphone. This frequency during approach is 'f' in the above formula. The bell is now held motionless directly in front of the microphone and the computer while it measures this frequency as 'fs'. All of this data [including the known speed of sound] can now be used to calculate 'vs', the speed of the runner and compare it with the direct result obtained from v=d/t.

THE MEASUREMENT OF IMPULSE
DURING A COLLISION

Objective

To use computer interfacing to determine the impulse during a collision.

2

Apparatus

Air Track and glider
The Apple IIe computer and a Pasco photogate
The Voltage Plotter program from Vernier Software
A voltage input unit
Bridge and amplifier circuits
Two strain gauges attached to a bar of spring steel
The instructions for the above circuitry are supplied along with the Voltage Plotter software

Strategy

An air track is set up with a single glider. The photogate is now set up at one end of the track. A beam of light is produced on one side of the photogate and is detected by a sensor on the other side of the device. The computer is set to measure the time duration of the eclipsing of the beam caused by the passage of the glider through the photogate. Knowledge of the length of the glider 'd' and this time of passage 't' can be used to determine the speed of the glider: v=d/t. If this value is multiplied by the mass of the glider, the result is the glider's momentum: p=mv.

By this time in the class, it will have been established that momentum is conserved. That is, the total momentum before a collision equals the total momentum after collision. But what happens to the momentum during the collision? [I could merely tell the students the answer to this question, but I wouldn't want to be too impulsive.]

Here is where the second interfacing device enters the demonstration. The strain gauge bar is mounted above the far end of the air track slightly beyond the position of the photogate. The glider is set in motion as before from the opposite end of the track, and is allowed to impact the strain gauge bar causing it to flex. This bending causes the two strain gauges mounted on the top and bottom of the bar to change resistance which is detected by the computer as a change in voltage. The computer program is calibrated to measure this flexing in terms of the force causing the bar to bend. The computer is now instructed to plot this changing force on a graph as a function of time. Force multiplied by time can now be determined as the area under the plotted curve. This relationship is known as the impulse=ft, and can be compared with the total change in momentum of the glider. Hopefully the results will show that the total momentum before collision equals the total impulse during collision which in turn equals the total momentum after the collision.

The Pythagorean Puzzle

Earl Zwicker
1809 Heather Court
Northbrook IL 60062 5869
(847) 272-6395
zwicker@charlie.iit.edu

Illinois Institute of Technology
Biological Chemical and Physical Sci Dept
IIT Center
Chicago IL 60616-3793
(312) 567-3384

Dedication: Thanks to Professor Harald Jensen (1898-1994), Physics Department, Lake Forest College, who originally worked this idea with the high school physics teachers at several summer institutes during the 1970s. This fine example of a phenomenological presentation would not exist if it were not for him.

Objectives:

For teachers (K - Phd): To model the phenomenological approach.

For students (grades 6 and above): To enable each student to prove the Pythagorean Theorem on his own.

For students (grades K - 5): To enable students to identify, name and/or define rectangle, square, triangle, and the concept of area (a measure of the amount of surface).

Materials Needed:

Pieces for Pythagorean puzzle sawed from colored, transparent plastic sheet (all the same thickness - about 1/8 inch - pieces of 4 different colors). Optionally - several $100 Grand candy bars.

Sandwich bags, one for each person, each bag containing a set of the puzzle pieces cut from brightly colored paper. (Use a machine to copy the puzzle onto sheets of yellow paper and cut out.)

Performance assessment rubric.

Strategy:

For teachers: Ask: "Who has seen this before; anyone? Raise your hands." If any hands are raised, then announce - "I need your help! If you have seen or done this before, please do not give it away to those who have not. Please don't spoil their fun."

Next, ask people to form pairs or partners by holding their hands up together. Tell them to remember who their partner is.

1. Have the overhead projector prepared ahead of time by placing a blank transparency centered on its projection area. Then begin by placing the pieces of the puzzle on the overhead and viewing the image on a screen so all can see and participate.

   Challenge teachers to tell you how to assemble the pieces into a solid rectangle using all the pieces - they must **tell** what to do; cannot show.

NOTE: Invariably, teachers - or almost anyone for that matter - will find it difficult to tell you what to do. e.g. They might say, "Move the piece on top next to the gray one." And you will move the piece, but not place them in contact; or you will move the wrong piece, etc. You will not automatically do what they **want** you to do, but rather only and literally what they **tell** you to do. They will laugh to see how "stupid" you seem to be, but they will see that you are doing only what they told you to do.

After 5 minutes or so, somebody might use the word "triangle" or "square" or "rectangle" to describe the piece they wish you to move. As soon as one of these words is used, repeat the word several times, (e.g. "triangle") and ask a volunteer to define the word. Ask them to name the other pieces and get their definition for each piece until everyone agrees and understands correctly the names of the pieces. For triangles, make sure everyone agrees to the meanings of "hypotenuse", "altitude", and "base".

This brings out the need for a common vocabulary, and the need to be able to express one's thoughts with precision. If, then, someone asks you to move a green triangle adjacent to the large, orange square, you will do so, but again, the result is not what the person intended for you to do. You then might ask, "Do you mean that you want me to move a green triangle so that its hypotenuse is in continuous contact with an entire side of the large orange square?" If they express agreement, then do it. Then see if others can express their thoughts with precision by telling you what to do next. But once the point is made, do not belabor it; go on to the next step.

2. Solve the puzzle.

See if they can direct you to the point where you have placed each of the four identical triangles so that each has its hypotenuse congruent with one of the four sides of the largest square, thus forming a **single, solid square.** Once this is done, solving the puzzle will proceed rapidly. But if more than 10 - 13 minutes have passed (aside from the digressions into the need for vocabulary, etc.) and they still haven't solved the puzzle (which is usually what happens), then pass out a sandwich bag of puzzle pieces to each pair.

Then challenge each pair to complete the puzzle to form a solid rectangle using their pieces. NOTE: If no pair succeeds within 5 minutes, then give a hint: Using the pieces on the overhead, show them how to form the **single, solid square** mentioned in the previous paragraph. Then let them take it from there with their paper puzzles. (See Sketch 1.)

The first pair to complete their puzzle should come up and show the rest of us how, using the plastic pieces already on the overhead projector. (After appropriate applause, etc. award them each a $100 Grand candy bar, which you have kept out of sight.)

Then say: Thanks! Now all pairs complete your puzzles!

Everyone complete? OK!

Now let's see how good you really are.

3. Can you arrange your puzzle to form two squares of equal area, using all

the pieces? (There is an alternate solution to the first part where there is an extra rectangle, in which case you omit the phrase 'using all of the pieces' - but, until they ask, do not tell them that they do not need to use one of the rectangles. See Sketch 2.)

Please do so now! (This will happen quickly for the pieces from sketch 1.) Then - ask a pair to show their solution using the puzzle pieces already on the overhead projector.

4. Say: You are now going to prove the Pythagorean theorem. Can anyone state what it is?

   After brief discussion, project a transparency of the Pythagorean theorem in words:

   For any right triangle, the square of the hypotenuse is equal to the sum of the squares of the two sides. In other words:

   If C is the length of the hypotenuse, and A is the length of its altitude and B is the length of its base, then $C^2 = A^2 + B^2$

5. The proof: With the two equal squares projected on the overhead for all to see, show that they have equal areas by laying them on top of each other. Make sure that the squares lie on the blank transparency. Now place them along side each other, and using a felt marker pen, draw an equal sign between them.

   Next, remove two of the four triangles from one square, and one the rectangles from the other. Show that the two triangles and the one rectangle have equal areas (superposition is one easy way). Since we have subtracted an equal amount of area from each of the originally equal squares, the remaining areas must be equal on the left and right sides of the equal sign.

   Again, remove two more triangles from one side of the equal sign, and a rectangle from the other side. Again, the remaining area on the left side must equal the area remaining on the right side.

   But on one side there will be a small square with the length of its side equal to the base of a triangle, and a mid-size square with the length of its side equal to the altitude of the same triangle. On the other side will be a single largest square with the length of its side equal to the hypotenuse of the same triangle. This is easily seen by placing the three squares on the three appropriate sides of any one of the triangles.

Performance Assessment:

1. Hand out 2 blank pages and a copy of the rubric to each pair of teachers.

   Say: I am going to ask each pair to use your puzzle to prove the Pythagorean theorem. Do you want me to take a few minutes to review it? (They will say yes.)

   OK - there are four steps: (Show them again.)
   1. left square area = right square area
   2. subtract equal areas from left and right
   3. repeat

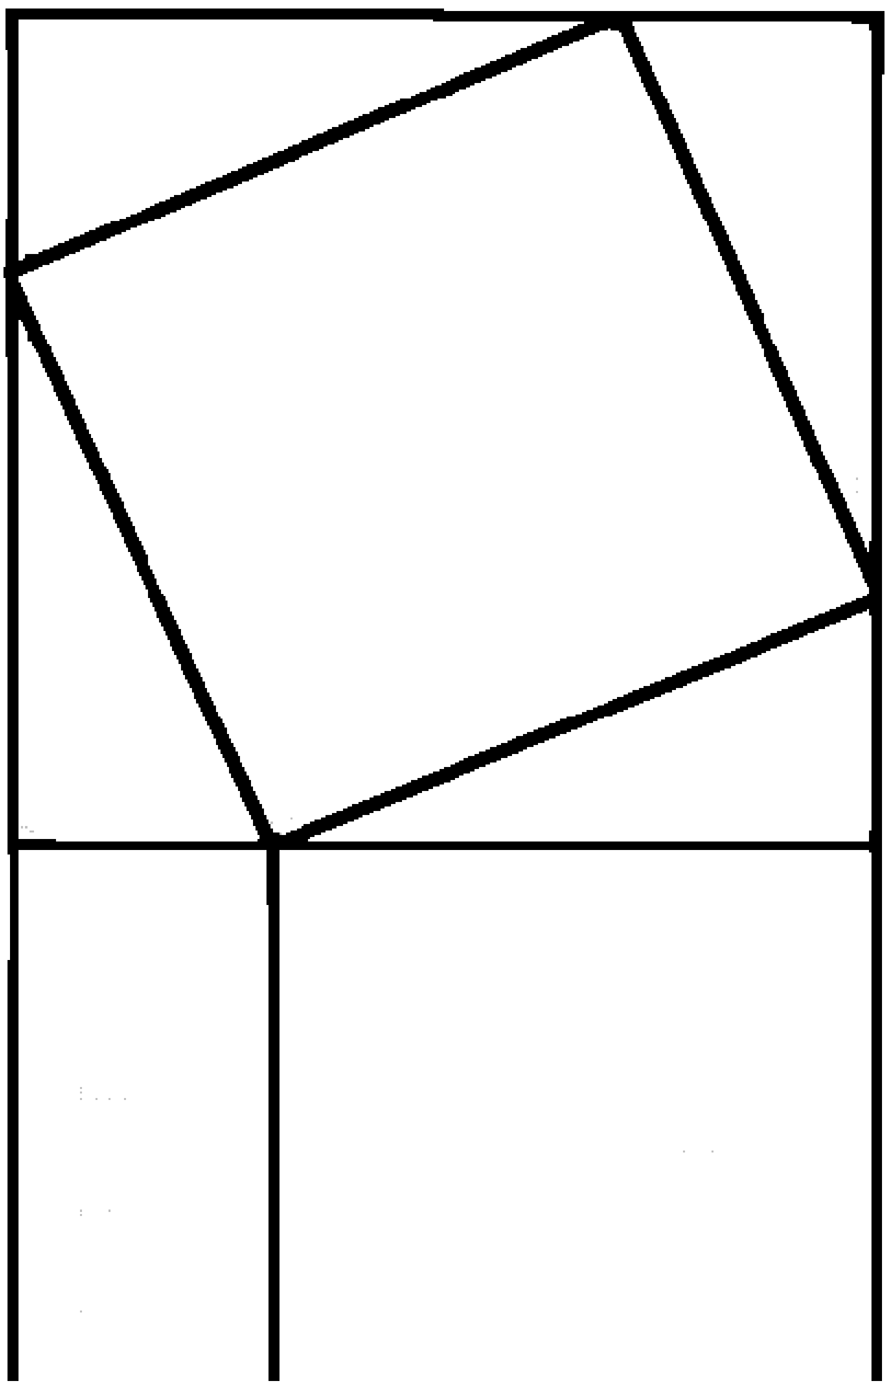
4. remainder areas are equal

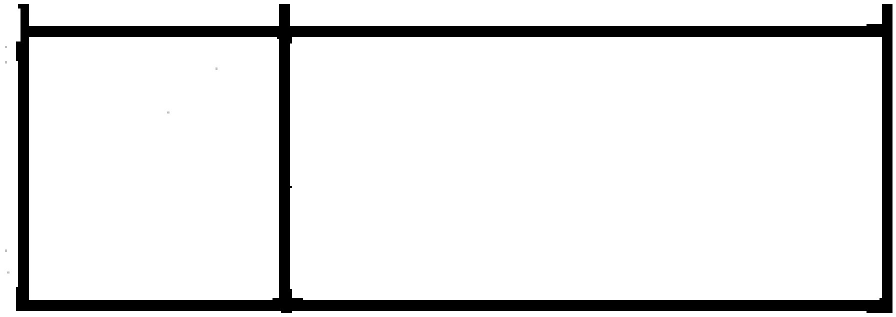
2. Now - each pair write up the proof on your page. Use rough sketches to show the four steps. You have about 7 minutes.

3. When finished, exchange your work with a neighboring pair and use the rubric to score each others work.

References:

If the following graphic does not display or print, contact the author by letter, telephone or email. NOTE: the puzzle should be scaled so that the diagonal square is 3 inches on a side.





Sketch 1

In order to draw the puzzle on your own, use 2 sheets of 8.5 x 11 paper, a pencil, a ruler, a straight edge and a scissors.

Draw a square three inches on a side. (This is easily done by starting at one corner of one of the papers and measuring 3 inches down each edge.) Cut out the square.

Place the square so that its edges lie along the bottom right corner edges of the second sheet of paper. Now raise and tilt the square so that its right bottom corner has moved up the right edge of the page by about 1.5 inches; its left bottom corner should lie at the bottom edge of the page, about 2.5 inches from the right bottom corner of the page. The now tilted bottom of the square will be the hypotenuse of a right triangle, and the right bottom edges of the page will be the altitude and base of the triangle. Use some tape to hold the square in place on the sheet.

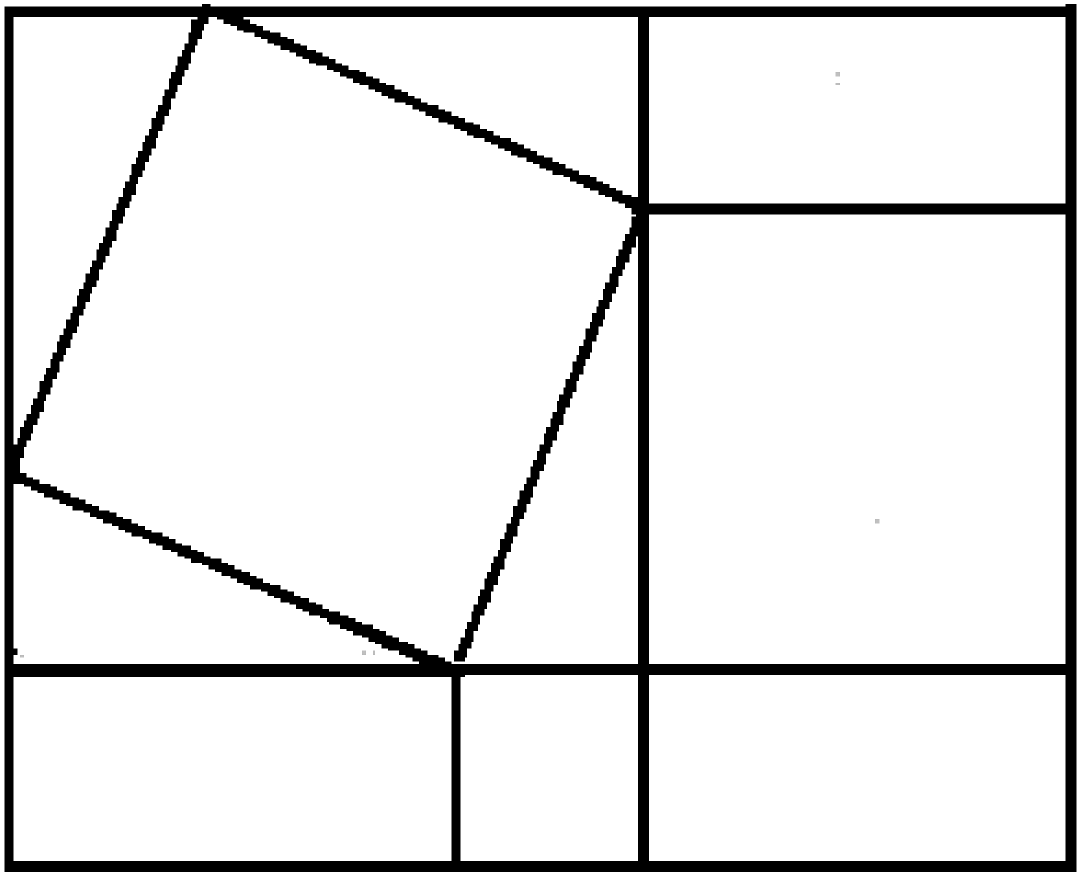
Next, draw a horizontal line across the page so that it passes through the top-most corner of the tilted square. Then draw a vertical line so that it passes through the left-most corner of the tilted square. The square will now be circumscribed within a larger square formed by the horizontal and vertical lines drawn on the sheet. This also leaves the original tilted square surrounded by four identical triangles; the hypotenuses of the triangles are the four sides of the tilted square.

For the upper-left triangle, draw a square using one of the triangles sides as one side of the square. Draw another square using the other side of the triangle.

Now draw vertical lines through the vertical sides of the smallest square (on the left of the triangle).
Then draw horizontal lines through the horizontal sides of the mid-size square (on the top of the triangle).

You should now have formed three identical rectangles with long sides vertical (and equal in length to the altitude of the triangles), and short sides horizontal (and equal in length to the base of the triangles).

Your puzzle is now complete. Cut it out and play with it. Enjoy!



Sketch 2
(an 'extra' piece for the second part)

Identify And Construct A Constellation

Barbara J. Hill
8759 S. Wabash
CHICAGO IL 60619
773-783-6136

Fernwood
10041 S. Union
CHICAGO IL 60628
773-535-2700

-

Objective(s):

The student will identify and construct a constellation.

This lesson is designed for students in the 3rd grade.

Materials:

1. Shoebox, scissors, box cutter, flashlight and batteries, glue, tape, stapler, black construction paper, sharpened pencil or nail, newspaper.

- Select a constellation.
- Label the sides of the shoe box a, b, c, d, (a should be opposite b).
- On the side labeled ‘a’ cut an opening for the flashlight (it should fit snuggly).
- On the side labeled ‘b’ cut out a rectangular shape (size to be determined by the size of the shoe box)
- Secure the top of the shoebox (after openings have been cut).
- Cut a piece of construction paper to cover the opening on side ‘b’
- Place the constellation pattern on top of the construction paper.
- With the pencil (or other sharp object) punch out the star pattern.
- Remove the constellation pattern.
- Place and secure the construction paper
- Slip the flashlight through the opening in side ‘a’ turn it on.
- Point side ‘a’ to a wall in a darkened room.
- Try to identify the constellation of a classmate.

2. Paper cup, scissors, box cutter, flashlight and batteries, glue, tape, stapler, black construction paper, sharpened pencil or nail, newspaper.

- Select a constellation.
- Cut off bottom of paper cup.
- Place the constellation pattern on top of the construction paper.
- With the pencil point (or other sharp object) punch out the star pattern.
- Remove the constellation pattern.
- Place and secure the construction paper to the top of the cup.
- Slip the flashlight through the bottom opening of the cup.
- Turn on the flashlight.
- Point the top of the cup to a wall in a darkened room.

3. Transparent paper, glow in the dark glue or paint.

- Select a constellation.
- Place the constellation pattern under a sheet of transparent paper.
- Put a dot of paint or glue at each star point of the constellation.
- Remove the constellation pattern.
- Hold up the transparent paper.
- Turn off the lights.
- Constellation will glow in the dark.

Strategy:

-

Tell the student to choose which method he will use to make a constellation, shoebox, paper cup or transparent paper.

By completing this activity, the student will be able to name, one or more of the constellations.

Conclusion:

After the students have completed the lesson on the constellations and the related activity. The teach will give a quiz on related vocabulary and pictures of the constellations for the students to identify.

Mikail A. Siddiq - Raymond School

Simple Machines make work easier.

Mikail A. Siddiq
360 E. 87th Place
CHICAGO IL 60619

Raymond School
3663 S. Wabash
CHICAGO IL 60653
(773) 535-1745

Objective(s):

My objective are to show that through the use of simple machines work can be made easier.

Materials Needed:

A board about one (1) meter long and a triangular block of wood.
A pencil sharpener, a long piece of string and a few books.
A single fixed pulley with a string or cord.
A few meter sticks about six.
A compass rose.

Strategy:

First to show that lifting things or books manually requires more force than lifting through the use of simply machines.
Finally to measure the displacement, velocity and attempt to measure the amount of force used.

Performance Assessment:

Describe the operation of a lever. State that a lever can be used to change the direction of a force.
Describe how a wheel and axle machine makes works easier. Explain that force is gained when effort is applied to the wheel of a wheel and axle machine.
Identify two wheel and axle machines.

Conclusions:

Classify simple machines as a lever, pulley, wheel or axle.

References:

Physics: Its Methods And Meanings by Alexander Taffel, Ph.D.

Motion and Force: Practically all of the changes we see in the world about us are the result of motion. (Force: A force means simply a push, pull, or a lift.) A force is being used to change the state from rest to motion.
Motion is controlled or changed by means of force.
Motion: is movement. Uniform Motion: is both the speed and direction of the moving body remaining the same. It is therefore motion at a constant velocity. Accelerated Motion: is motion with changing velocity (speeding up), the rate at which its speed is changing.

Displacement is a Vector: Motion generally involves a change of position of the object being moved. A change of position is called a displacement. To state exactly how the position of the body changed, we must also state in what direction it was moved.

Quantities such as displacement are called Vectors. A vector is characterized by the fact that it has both a magnitude or size and a direction. Quantities having only magnitude, such as the mass or length of an object are called Scalars.

Velocity and Force are Vectors: Two other important vectors related to the study of motion are Velocity, and Force. To tell exactly how an object is moving at a given moment, we give it velocity. By velocity we mean not only speed of a body but also the direction in which it is moving. Thus, velocity is a vector whose magnitude is the speed of the body and whose direction is the direction of motion of the body.

It is evident that a force is a vector, since the effect a force has on a body depends not only on the size of the force but also on the direction in which it acts. Therefore,in describing any force, we must tell not only its magnitude but also its direction.

Representing a Vector:A vector is represented by an arrow drawn to some selected scale. The length of the arrow shows the magnitude of the vector. The direction of the arrowhead shows the direction of the vector. To represent a displacement to the north of four meters, we first select a scale which, in this case, we take as one centimeter =one meter. Now we draw a north - south line four centimeters long to represent four meters. Finally, we put an arrowhead on top of this line to show the direction of the displacement.

Energy: is the ability to do work.

Kinetic Energy: We mean the energy that A body has because of its motion. Any moving body has kinetic energy because it is able to do work by moving other bodies.

M=Mass, d=Distance, F=Constant Force: The work done by the force is (Fxd). If (a)=is the acceleration produced by F, then F=Ma. It follows that the work done is: Fd=Mad: For a body that starts from rest and is accelerated at a constant rate a, the speed acquired by the body after traveling a distance (d) is given by (V^2=2ad) whence,

$$ad=(V^2)/2$$

Substituting this value of (ad)in (Fd)=Mad, we have:

Fd=(MV^2)/2: This quantity is defined as the kinetic energy KE of the body

$KE=1/2MV^2$

Potential Energy: A body possesses energy in a stored form that is not readily noticeable and is called potential. We may define potential energy as the ability of a body to do work because of the relative position of its parts or because of its position with respect to other bodies.

To compute the gravitational potential energy that a body has over a selected base level, we simply compute the work needed to raise it from the base level to its actual position. For bodies near the surface, this work is equal to the surface, this work is equal to the weight of the body (w) times the height it was lifted (h).

Therefore:

Potential Energy =w x h
and since w=Mg
PE =Mgh

Questions for the class:
(1). Describe the operation of a lever.
(2). Describe how a wheel and axle machine makes work easier.
(3). Classify simple machines as a lever, pulley, or wheel and axle machine.
(4). Also in each example of a lever, pulley, or wheel and axle machine, tell whether we are using displacement, velocity, or force or a combination of each.

Return to Physics Index

Kimberly Baker - Marquette East

Moon Phases

Kimberly Baker
737 E. 81st Street
CHICAGO IL 60619

Marquette East
6201 S. Fairfield
CHICAGO IL 60629
(773) 535-9500

Objective(s):

A moon phase chart is an easy way to illustrate the waxing and waning of the moon. Students can discover why the moon isn't visible. They also come to understand why varying locations warrant different phases.

This lesson is designed for second grade, but may be used for upper grades as well.

Materials Needed:

One large poster board
One medium - large size ball
An overhead projector
30 paper circles about 8cm in diameter, made from black construction paper
A calendar with dates of the new moon, 1st quarter, full moon and the 4th quarter
White chalk

Strategy:

1. Make a chart to show the phases of the moon.
2. Use black circles (8cm in diameter) to show the thirty phases of the moon.
3. Use white chalk to show the white portions of the moon phases. For example:
4. Paste or tape the various moon phases in order on the large poster board.
5. Number and label each card, under each moon phase, in the following order: 1 - New moon; 2 - New Crescent; 3 - Crescent; 4 - Crescent; 5 - Crescent; 6 - Crescent; 7 - Crescent; 8 - First Quarter; 9 - Gibbous; 10 - Gibbous; 11 - Gibbous; 12 - Gibbous; 13 - Gibbous; 14 - Gibbous; 15 - Full Moon; 16 - Gibbous; 17 - Gibbous; 18 - Gibbous; 19 - Gibbous; 20 - Gibbous; 21 - Gibbous; 22 - Gibbous; 23 - Last Quarter; 24 - Crescent; 25 - Crescent; 26 - Crescent; 27 - Crescent; 28 - Crescent; 29 - Crescent; 30 - Old Crescent.

Performance Assessment:

1. Have students circle the projector and ball. As the students circle, the ball's crescent grows from First Quarter to First Gibbous, it becomes obvious to them that the Moon's change is gradual rather than a jump from one phase to the next as pictured on some calendars.

(Of course, since each child is in a slightly different location with respect to the ball (Moon) at any given moment, each is seeing a different phase.)

2. Students may also be assessed while having fun with musical moon positions. Chairs are optional. Music should be used. While students slowly circle the moon (ball in front of overhead projector), call stop, then ask students to identify the phase they see.

   (This demonstration actually shows the phase changes of an inferior planet rather than the Moon; it is not intended to be accurate, only to show phases.)

3. To be sure that students have grasped the pattern of moon phases, refer to a calendar for the current moon phase and have each student, on a blank calendar, draw moon phases accordingly. Students can check their accuracy each night by watching the moon.

   (Again, warn students that, because each child is in a slightly different location with respect to the Moon, each is seeing a slightly different phase.)

4. Have students chart the phases from their calendars on the board. Start with the more significant phases first, ie New Moon, 1st qtr., Full Moon, etc... Next, fill in all of the other phases. Be sure to inform students on whether white shading will represent the lightness or darkness of the moon in its phase!

Conclusions:

A moon phase chart is an easy way to illustrate the waxing and waning of the moon. Children who follow a phase on the moon chart each morning will not grow up thinking that the moon has only four phases and will be in a better position to understand other gradational processes in nature.

(773) 535-1460

Objective(s):

This lesson is designed for grades Kindergarten - 8th, for a thirty-five minute, once-a-week science lab period. The main objective of this Mini-teach is to:

(K - 2) understand principles of energy - kinetic energy vs. potential energy
(3 - 5) construct a model roller coaster and demonstrate kinetic energy and potential energy
(6 - 8) design and explain how a model roller coaster uses acceleration, momentum, gravity and principles of potential and kinetic energy

All pupils will be able to relate these principles to everyday life. They will also be able to understand the effects of weight and speed in regards to momentum.

Materials Needed:

These materials are designed for groups of four - five pupils, in the intermediate - upper grades. The Kindergarten - 2nd grade teacher should demonstrate the construction of the model roller coaster, eliciting suggestions from their pupils, in regards to the design of the class roller coaster model.

Each group needs:

12 - 15 ft. of pipe foam insulation
3 - 4 marbles
duct tape / masking tape
model roller coaster

overhead projector
videoclip of "Roller Coasters"
VCR

*optional

* 4-5 12" x 12" tagboard squares
* a chair, or table

Vocabulary list: gravity, friction, energy, kinetic energy, potential energy, momentum, acceleration, laws of motion, Isaac Newton

Strategy:

1) View a three - minute video clip of Nova's "Roller Coasters" or Bill Kurtis' New Explorer's "Physics At the Amusement Park."
2) State the problem the pupils need to explore and have a model of the roller coaster on the blackboard or overhead projector.

Problem: How can I design a thrilling roller coaster ride that stays on track? (For K - 2, have a model roller coaster on the demonstration table. Have pupils volunteer to demonstrate changes they'd like to make in the teacher-made model).

3) Pupils will share their hypotheses (guesses) of the problem.
4) Give each group the materials and assign them the problem of proving that their design is the best, most thrilling ride. Their ride must include at least one loop in the design, and it must stay on the track.
5) Have the pupils show where the marble has potential energy, kinetic energy, where it accelerates and where gravity keeps the roller coaster on track. Their explanation needs to be clear - both to the class and on their group report.
6) They must describe their winning design to the class.

Performance Assessment:

In Kindergarten - 2, pupils will draw the roller coaster, and use arrows to show the marble's trail from start to finish. They will write a sentence that shows they understand that the higher you start off........ the farther your marble will roll before stopping.

With grades 3 - 8, observe how pupils work together. Note whether they put side motion to their track design. This shows they understand how to develop momentum and acceleration. Have pupils share orally and visually with the entire class. They must summarize their results, using their definitions of the principles of gravity, acceleration, potential and kinetic energy and the laws of motion.

Conclusions:

Pupils conclude that the higher the inclined plane is (the place where the marble begins its descent), the more energy can be stored. Their winning diagrams pinpoint potential energy, kinetic energy, gravity and acceleration. All pupils should understand that potential energy is at the start of the first hill, and acceleration and momentum begin at the bottom of the hill. Kinetic energy carries the marble through its course of loops, but as it runs out of energy, it slows to a stop. This is an informal assessment which measures group collaboration and social behavior as well as their comprehension of vocabulary terms.

Lyvonia Hearns - Asa Philip Randolph

Building A Straw Power Tower

Lyvonia Hearns
8919 S. Harper
CHICAGO IL 60619
(773) 734-0458

Asa Philip Randolph
7316 S. Hoyne
CHICAGO IL 60619
(773) 535-9015

Objective(s):

To explore the effects of shape, materials, and balance in building a Straw Power Tower that can support the most pennies. Towers must be at least 58cm (23in.) tall. This activity is for students in grades 2-8. Divide the class into teams of 5 or less.

Materials Needed:

Per Team

Lab Report	Contest Rules	50 Glad straight straws
hole punch	many pennies	120 small metal paper clips
2 large paper clips	scissors	5 clean, empty 1-pint milk or juice cartons
measuring stick	table, desk, or floor	

Strategy:

Set aside 15 straws from the 50 you were given. With your team begin to build a Tower from your straws and paper clips. It can be any shape you want, but you can't use any other materials. Stop building when your 15 straw tower stands up by itself. Make a Weight Basket out of the 1-pint milk carton. Use the large paper clips to attach the weight basket to the tower. The Basket must not touch the ground or floor. Slowly add 20 pennies to your Weight Basket. Where does your tower sag or bend? If you need to, add more pennies or jiggle the basket. Could these weak spots collapse under more weight? Remove your Weight Basket.

List Your Variables

Pick one weak spot on your Tower. What change could make the weak spot sturdier? Anything you could change on your Tower is a variable. Now with your team make a list of changes that might improve your Tower in general. Some variables to think about are:

Shape- Could you make a square or polygon (many sided shape) into triangles to make it stronger?

Strength- of beams- Could you combine 2 or more straws to make a beam stronger?

Length of straws- Could some beams be longer? Should some be shorter (cut straws)

Joints- Are there other ways to connect the straws?

Locations of strong beams- Should the strongest beams be near the top of the tower or the bottom?

Size of foundation (base)- What effect does changing the size of the foundation have on your Tower?

Location of Weight Basket- Does it matter where you attach the Weight Basket? (The bottom must be at least 20cm (8in) off the ground.)

MAKE A CHANGE

Choose one variable from your list. Make the change to a weak spot on your Tower. Make one change at a time. (For ex., if you change to longer beams, don't also change the size of the foundation.) Why is it important to change only one variable at a time? Record the variable you changed on your lab report next to "15-Straw Tower" Now test your change. Attach the Weight Basket to the exact same spot as before. Add 20 pennies and observe your Tower. Did the change make the weak spot sturdier? Record the results.

Keep Building

Set aside 15 more straws from your 50. Continue to build and strengthen your Tower. After these 15 straws have been added, test your Tower with a Strength Test as before. Then change one variable that could make the weak spot stronger. Add the last 20 straws to your Tower. Repeat the Strength Test. Make the final changes until your team is satisfied with your Tower's strength, shape, weight Basket attachment, and height.

Performance Assessment:

Name your Tower. Measure, record, and sign off its official height on your lab report. Gently add pennies to the Weight Basket, counting one by one. How many can the Tower support before the Weight Basket hits the table? Enter your penny count on your lab report. Now write a paragraph on the back of your lab report. List the features that made your Power Tower strong, explaining how each helped the Tower's weak points. Describe your Tower's weak points. What made it finally collapse?

Conclusions:

Display your Straw Power Towers around your classroom. ENJOY!

Mathematics/Physics

10 Cheap or Free Science Tips

Roy Coleman
5436-B S. Kimbark Ave.
Chicago IL 60615

Morgan Park High School
1744 W. Pryor Ave.
Chicago IL 60643
(773) 535-2550

Objective(s):

To give the science and math teacher some classroom tips and/or hints that can be useful while being either free or inexpensive.

Materials and Strategy:

1. To erase permanent marker from smooth, non-porous surfaces go over the permanent marker with erasable marker and then erase all of the marks.
2. To photocopy blue ditto sheets put a transparent sheet of yellow plastic between the ditto and the copier. The clear yellow makes the blue print 'look' black to the copier.
3. To keep your NiCd cell phone battery working for a long time, run it down on a regular basis. Call some number that you know will not answer and let it ring until the phone shuts itself off and then recharge it. Do this about once a month and it will last many years. (I call the school late at night and, if someone answers, hang up and call the police.)
4. To get a **REALLY BIG** funnel and clear beaker, get a 5 gallon bottled water bottle and use a saw to cut the top off. Most bottles water companies will not sell or give away their bottles but many companies that have bottled water will give you the empty bottle if you tell them what you want it for and promise to not tell where you got it.
5. To get free bowling balls go to the nearest bowling alley and ask for chipped or damaged balls. Generally they will give some to you free.
6. To get a bowling ball that will float in water, get a ball with a weight of 11 pounds or less. Bowling balls with a weight greater than 12 pounds will sink.
7. To make a cheap Cartesian diver, use soy sauce or ketchup packets from a fast food place. You do need to sort through them to find the ones that just barely float but about half of them work.
8. For a cheap tornado bottle connector use PVC pipe cut into about 1" lengths. Using two – 2 Liter bottle caps, epoxy them into the pipe to form the connector. To make it easier to epoxy together, drill a small hole in one of the tops, rough up the inside of the pipe and the outside of each of the caps. The hole allows excess epoxy to seep out and the roughness gives the epoxy a good grip. After the epoxy is thoroughly set, drill a 3/8" hole through their centers to form the passage. Ten feet (enough for about 120 connectors) of PVC pipe costs about $1 in the Chicago area, meaning that you can make connectors for most of your students.
9. To annoy the reminder of the faculty, have your students make a 'turkey clucker'. Using a plastic cup, poke a small hole in the bottom, run a COTTON string through that hole and tie the inside end of the string to a toothpick. Wet the string and stroke it with another piece of cotton.

10. Another way to annoy the rest of the school is to get an aluminum rod about ½" to ¾" in diameter and 3’ to 5’ long. Drop the rod on a tile or wood floor.
11. Make a cheap accelerometer from a plastic peanut butter jar. Poke a small hole in the inner liner of the top and tie a knot in a string and pass it through the hole. On the other end of the string tie a cork or styrofoam ball so it does not quite touch the bottom. Submerge the jar in water and then put the lid on tightly. When the jar is held inverted, the cork or styrofoam ball will stretch the string and float toward the ‘top’ (bottom?) of the jar. Moving rapidly will cause the cork or ball to move in the direction of the acceleration.

Physics at the Zoo

Peter Insley Retired
5652 W Giddings
Chicago IL 60630
(773) 283-0528

Objective:

The idea is to try to answer some physics questions at the zoo. The teacher can adjust the level of these questions to almost any grade, or just skip questions that are inappropriate. No materials or apparatus is necessary. We used Lincoln Park Zoo in Chicago.

1. Sizes

Animals are physically designed by evolution to function well. Compare the width of the legs of large heavy animals with the width of a similar small animal. Which animals did you compare and what did you find out?

Now compare faster and slower animals, and see how the legs compare to the body. Which animals did you choose, and what did you find out?

Now compare the weight of an animal with the weight of food consumed each day. Food is necessary for energy, and that energy is mostly used to produce heat and keep the body warm. Heat is lost from the surface, and small animals lose heat more rapidly because they have more surface compared to their weight. (Divide the surface area by the weight to calculate the factor). Compare the animals you have chosen here.

2. Center of Gravity

Look at various animals and estimate where their center of gravity (or balancing point) is. If the center of gravity is not supported by the animal's legs, the animal will fall over. Look at a giraffe, a peacock, an elephant, and a large deer. How do these animals support their center of gravity when they walk and lift a leg or two off the ground? Tell what animals you watched and what you observed.

Look at a pregnant animal and then look at a pregnant woman. How does being pregnant change how they walk? Think about the center of gravity.

3. Estimation

Estimate the weight of various animals, and then look at the plaques and see if they tell you the answer. Which animals did you choose, and how close was your guess? Many people estimate far too high for the American Eagle. Ask the zoo personnel how much an eagle weighs.

4. How Animals Travel

Every animal has to "push off" or exert a force in order to move. Think of snakes and birds. What do they push against? How many hooves are on the ground when a deer pushes off? What did you observe?

Sketch a distance time graph for a monkey or a snake.

5. Archimedes Principle (or Sinking and Floating)

How do turtles, snakes, or Polar bears sink and then rise again?

6. Paddle Boat

There are paddle boats for rent in the lagoon by the restaurant. How much do they sink when a person walks into them? What do they push against?

Estimate how fast you can go in the boat, and compare that with how fast you can walk. Why does the boat float if it is made of metal?

7. Light in the Water

Find one of the tanks where you can see a bear or seal swimming under water. Look up at the surface. Can you see out, or do you see a reflection? Is your vision distorted when you look directly into the tank? How far can you see?

8. How Do Animals Fall?

Look at the monkey and the flying squirrel. How do they use the air to affect their fall? How does a bird do it?

9. Sound

Which animals have the highest and lowest pitched sounds? What about bats? How do they produce such a high pitched sound? Why are sounds under water dangerous to the animals? (So you shouldn't tap on the glass!)

10. Do One Yourself

I hope my questions gave you paws. Now it's your turn. Think about your presentation this summer. Where did you see an application of your lesson at the zoo today?

Shop projects Summer Smile Program

F. Lee Slick
12623 Richard Ave.
Palos Heights IL 60463
(708) 448-4379

Morgan Park High School/IIT Staff
1744 W. Pryor Ave.
Chicago IL 60643
(773) 525-2550

Objective:

This is a listing of the projects that the teachers made in the shop proportion of the Smile Program. This is intended to be a guide as to the type and the different projects teachers can built in a shop class. This is not intended to be a complete list but rather a guide for future classes. The projects are intended to be used in the classroom and teachers are not restricted to this list.

large bird	22	Towers of Hanoi	71	Triangle Puzzle	94
hall pass	19	Small bird	39	wine bottle holder	46
Jensen bar	52	wave bottle	39	conductivity testers	28
plant dolly	8	tile for bases	6	tiles for centripetal	12
hex-a-flex	8	green house	6	bed of nails	5
mystery box	4	'T' square puzzle	6	white board 4x8 sheets	20
teddy bear	1	frame a picture	1	trading card stand	1
nail puzzle	2	air tunnel	1	test tube holder	2
planter	1	anerometer	1	barometer	1
rain gauge	1	bed of nails	5	static charge collector	14
circuit board	1	pulley holder	1	dicot model	1
clock	1	hovercraft	2	belt holder	3
rocket launch	2	nail sculptor	2	quiz board	1
track & rails	1	mitochondrion	1	cell and nucleus model	1
hair follicle	1	arteries model	1	skin + layers model	1
cell & membrane	1				

total projects = 508 in 1996

The above is a list of the projects that were done in the summer of 1996. You are not restricted to this list, these are only suggestions. One project must be something that you will use in the classroom. The second project may be of your choice. You must do 2 shop projects. Three are recommended. If you choose to do a classroom set you must furnish your own materials. The first one is free in most cases. You will be asked for an accounting at the end of the 5 weeks.

The following materials are needed from home if you wish to do some of our projects. 1 three litre bottle, 2 two litre bottles, 1 one litre bottle, 6 20oz bottles, all bottles must be clear.

Materials available for use in shop:

The following tools are located in the student shop in the basement of Seigel Hall. Drill Press, Sander, Band Saw, hammers, saws of various types, pliers, screw drivers, gauges, wrenches, files, clamps, etc. Materials which are in the shop for the teacher's use include assorted wood, plywood, 1 x 2, 1 x 4, 1 x 6, plastics, screws, nails, glue, glue guns, tape, string, and other assorted materials for building classroom projects.

Shop rules: **Safety, Safety, Safety, Safety, Safety, Safety, Safety, Safety**
Please use common sense when in the shop. The University's policy requires all participants to wear glasses when working in the lab or shop. This policy will be enforced. Please avoid loose clothing, be careful of rings, or jewelry. (See detail list at end of report.)

New projects 1997:

string art	accelerometers	centripetal apparatus
cars	electrostatic board	catenary curve apparatus
bird in cage	whale clip	Pythagorean Theorem Puzzle
tornado bottle	student book holder	set of conduit pipes
motor + battery	scissors holder	kaleidoscope
rocket launcher	skate board	large book holder
book shelves	book ends	mole of plastic
bed of nails	music pipes (PVC)	music triangle (Al)
dry marker holder	flower color board	belt holder
small book holder	interference speakers	molar volume 22.4 L
clock telling time	wooden flowers	apple displays

Policies and Procedures for use of Student Machine Shop:

1. No unauthorized person shall use the Student Shop.
2. Authorized persons are those who have taken the shop training course and/or who have been approved by the Student Machine Shop Supervisors.
3. You are not to use the machines in the shop until you have been given appropriate safety instructions by the supervisor.
4. All safety guards must be kept in position while machines are being operated. Safety goggles or glasses are required at all times.
5. Machines are not to be operated while the instructor is out of the room.

6. All adjustments are to be checked and secured before the power is turned on.
7. Remove all wrenches and other tools from the machine before turning the power on.
8. Machines must come to a dead stop before any required adjustments are made. It is a good idea to unplug the machine before working on it.
9. Have the instructor check any special or unfamiliar set-ups before turning the machine on.
10. Make sure loose clothing, jewelry, hair, etc is fastened securely or removed before operating a machine.
11. Students who are not operating a machine should stay clear. If not specified stay at least 3.3 ft or 1 metre away.
12. Do not distract the attention of the machine operator. If operating a machine, concentrate on your work.
13. Pick up the scrap pieces. Throw away the small pieces and put the larger pieces under the storage bench or in a designed place.
14. Shut the power off when you are finished or if you are leaving the machine, never leave the machine running unattended.
15. Use extreme care that all lumber is free from nails, bolts, metal or loose knots before machining.
16. Materials should never be fed into a machine faster than it will cut or sand.
17. "HORSEPLAY" is absolutely forbidden in the shop or lab.
18. Some jobs require a helper. This requires great care on the part of both people.
19. Never perform any operation unless you are entirely sure as to how to perform it properly and safely. Make use of a dry run or practice run.
20. If you notice anything wrong with a machine or something goes wrong with a machine, shut it down and notify the instructor.
21. Report any injury to your instructor immediately, if after hours report to the campus police.
22. Any breakage of tools, bits, blades shall be reported immediately to your shop supervisor.
23. Special tools may be used outside of the Student Shop and must be signed out on the sheet provided by the door. Ordinary tools such as screwdrivers and wrenches may not be taken out of the Student Shop. No tools are to be signed out on an indefinite loan.
24. All tools are to be returned to their proper place when you are finished using them. Do not leave bits in the drill press or lathe.
25. Clean up your area after using the shop, do not leave a mess for someone else to clean up, it is your responsibility to clean up after yourself. Place all waste in the proper containers.
26. The Student Shop Supervisors shall have the authority to alter these policies and procedures.
27. Raw materials in the shop generally belong to groups such as SMILE. The materials are not for everyone's use. However raw materials in small quantities may be signed out from the Shop by an individual student user, provided that the sign out was cleared with the SMILE group or the group which purchased the materials. Large quantities of raw materials must be cleared with the student's advisor or purchased by the advisor.
28. Keys to the shop may be issued to authorized students through their faculty advisor, who will clear this with the Physics Department Chairman or designed person appointed by the Chair or by the Shop Supervisor.
29. No children, nonstudents, nonstaff, or nonfaculty shall be allowed access to the shop. (See rule 1)
30. All shop users are responsible for reading over these rules and procedures and use is conditional upon agreeing to follow all rules and procedures.

31. Violation of these policies and procedures will result in the revocation of all shop privileges.

Return to Physics Index

Heat

Lynnette Millner
10617 S. Forest Ave.
Chicago IL 60628
(312) 568-5813

Robert H. Lawrence School for Math & Science
9928 S. Crandon Ave.
Chicago IL 60617
(312) 535-6320

Objectives:

The objectives of the **HEAT** Mini-teach is for the students to gain knowledge of heat, participate in hands on activities, and to learn the various vocabulary words associated with heat. This Mini-teach is geared for children in the intermediate grades (3-6) and should be done in a science laboratory in groups of 3 or 4.

This Mini-teach is over a span of two weeks. The vocabulary words should be introduced the first week and one activity should be done each day thereafter.

Vocabulary words:

heat	procedure	measure	kinetic
transfer	materials	bunsen burner	conduction
temperature	results	energy	convection
substance	stretch	observe	radiation
molecules	aluminum	particles	infared rays

Key people to research: Benjamin Thompson, bka Count Rumford
James Prescott Joule

Title: Hot Band

Materials: rubber bands

Procedure: Place the rubber band on your forehead and note the band's temperature; hold the rubber band between your thumbs and index fingers with your thumbs touching, stretch the rubber band, quickly touch the stretched band to your forehead.

Results: The stretched rubber band feels warm.
Why? The rubber band is made of molecules similar to a spring. You pulled the molecules apart and then they sprung back together quickly hitting one another. This is a form of mechanical energy.

Title: Cold Hand

Materials: aluminum foil and a throw rug or thick towel

Procedure: Place a piece of foil on the table and a thick towel next to it. Put one hand on the aluminum and the other on the towel. Observe the different temperatures.

Results: The metal feels colder than the towel.
Why? The aluminum foil allowed the heat to move through it whereas the towel

did not. The things feel cold to the touch when heat energy is drawn away from your skin; things feel warm when heat energy is transferred to your skin.

Title: How Heat Blows Up A Balloon

Materials: balloons, glass bottles, bunsen burner or candle, tongs

Procedure: Stretch the balloon over the neck of an empty bottle. Put the bottle on the net on top of the bunsen burner or set it over a candle using the tongs. Remove the bottle after 3-5 minutes and notice the before and after results.

Results: The balloon blows up while over the heat and deflate when taken away from the heat.
Why? When heat is added, the molecules of air in the bottle move faster and farther apart. The gas (air) occupies more space. As more and more air flows into the balloon from the bottle, the walls of the elastic balloon are pushed out by the air. Heat has caused the air to expand.

Title: Heating Water in a Paper Pan

Materials: paper, paper clips, ruler, pencil, measuring cup for water, bunsen burner or candle, paper towels for cleaning or spillages

Procedure: Measure one inch on all four sides of your paper. Mark them with the pencil. It should form a square. Fold the edges of the paper to form sides of an inch high. Fasten the corners with paper clips. Pour about an half of a inch of water in the paper pan. Place your paper pan of water on the net on top of the bunsen burner or candle.

Results: The water got warm but the paper pan did not burn.
Why? The water is a good conductor and was able to carry away the heat before the paper could ignite.

Title: Explosive (POPCORN)

Materials: unpopped popcorn, hot air popcorn popper, bowl, a cup and paper towels for taking the popped corn back to their desks to eat

Procedure: Observe the shape and size of a few unpopped corn kernels. Place some popcorn into the tray and release it slowly into the popper. (Make sure the hot air popcorn popper is ON.)

Results: The corn kernels change from small, hard, yellow kernels to large, soft, white, ball-shaped structures.
Why? The inside of a corn kernel is filled with starch and water. As the kernel is heated, the liquid water evaporates-changes to gas. The gas expands and pushes so hard that it breaks and the starch is blown outward. That is why you hear the popping noise when popcorn is popping.

Performance Assessment:

Cooperative grouping and evaluation based on their ability to come up with good explanations and filling out an observation sheet. The sheet can be set up similar to the way it is written up leaving the spaces blank. For example:
Title:

Materials:
Procedure:
Results and Why?:

Conclusion:

Heat is energy that is transferred between two things because of a temperature difference. Heat flows on its own from a hotter to a cooler substance, regardless of the amount of each substance. Heat is commonly measured in calories, although the joule is preferred.

Specific heat is a measure of how much heat is required to raise the temperature of a unit of mass of a substance by one degree. Water has a much higher specific heat than almost anything else. The high specific heat of water is responsible for the differences in climates between the East and West Coasts.

Heat isn't a thing. It doesn't occupy space nor does it have weight. Heat is energy that raises the temperature of a thing by causing the molecules in that thing to move faster.

THIS IS HEAT!!!!!!!!

Measurement

Tina Hudson
10017 S. Rhodes
Chicago IL 60628-2225
(312) 264-5913

Garrett A. Morgan
8407 S. Kerfoot
Chicago IL 60620
(312) 535-3366

Objectives:

The main objective of my Mini-teach is to introduce and review the use of the Standard Metric System. After which, students will be introduced to alternative ways to measure distance, time, and temperature. My lesson will be targeted to fourth and fifth graders. My main focus is to allow students to use parts of their bodies to calculate measurements of different objects and areas of space. The activities will be designed to lead the students to an understanding of the measuring system presented. The students will then be able to graph and use their informational data to compare with the other students.

The students will begin with the definition of a Basic Measurement. A Basic Measurement is the distance between two points that can be measured and may be named length, width, height, radius or diameter. In order to use body parts for measuring, the Standard Metric system should be primarily taught. This will help the student and improve his understanding for measuring with alternatives. I am going to work with the simple idea that the distance between two points can be measured.

Strategy:

INTRODUCTION

Two students are asked to open the activity with volunteering to participate in the unannounced subject. They are each given a Superball. In class there are two stairways, where the students are going to engage in a race to the top of the stairs using the Superball. They are to bounce the Superball once on each step as they race to the top. The other students are asked to clap their hands as a measuring tool for time. The recorder announces a winner, which is the student who has made it to the top of the stairs using the least amount of claps. The instructor should not dictate to the students the rhythm or how to clap their hands. The observation point is to watch and listen to the way the students will or will not cooperate with one another concerning the rhythm. Now the students should be asked what they think they just accomplished. The rounded response may be: calculated time by using their body parts, which were their hands.

Students may now be told that their body parts can be used as measuring devices. The remaining activities will allow the students to participate in fun activities that involve measuring length, distance, and temperature, using their own body parts.

Activity: MEASURING THE WHITE BOARDS

Using the span of their hands, the students will create their own hand ruler. Each student will use a undefined length of register tape paper and measure the span of their hand. They will mark the paper after each hand measurement. The length may be any that they desire. This will promote interest on how the students will measure the white boards. If one student measures 10 (ten) hand spans and another measures 5 (five) hand spans, then they should realize that the one with the shorter hand ruler will have to add twice as many times as the other.

When students have completed this activity, they should see the resulting data and notice that all hand measurements are not the same. This will promote questions as to why the hand measurements were different. The instructor can now discuss the advantages and disadvantages of using your body parts as an alternative to the Standard Metric System. Some answers that evolved were:everyone has different hand sizes, some small, some big, you always have your body parts with you as an advantage.

Activity: BODY LENGTH OF THE ROOM

Each student will now use their actual body length to measure as a measuring tool to calculate the length of their classroom. Students will choose a partner and one student will lay on the floor closest to a wall to start measurement. The other student will place his foot at the end of the student's foot who is lying down. The end of the student's foot will be a measurement of one complete body for that student. The group will repeat this until the group has measured the entire length of the room, one way. Students are then advised to try this at home and measure different parts of their home with their body length, with the help of another.

Activity: MEASURE GRASS LENGTH USING YOUR FOOT

Promote discussion on shoe sizes. Explain that they vary, and that women shoe sizes are different from men shoe sizes. Students will go outside. Each child will use their own foot measurement to measure the length of the grass. They will start at the edge of the grass, putting one foot in front of the other and count until the distance is completed. Complete and compare the data with other students.

Activity: MEASURING TEMPERATURE

Students are asked to use body parts to calculate a general estimate of temperature. Materials used includes a cup of hot water, a can of cold pop, and a warm towel. Students will touch each object, telling the other students which objects are warmer and colder without using a thermometer. Students will discuss results and realize that they just used their body parts to measure temperature. Some students may experiment and us different body parts to measure temperature. Some students used their fingers, tongue, and jaw cheeks.

Assessment:

Students should now understand that they can use alternative measuring devices. The fun part of their data is that they can use their very own body parts. They are free and always with you. Disadvantages may include the fact that measuring with body parts can also result in inaccurate measurements because everyone can have different size body parts.

Students will be given a metric ruler. They will be asked to find a part of their body that measures exactly one inch. They can test their findings by measuring a sheet of notebook paper. Now the students will understand that they have a permanent measuring tool right on their body and can be used at all times.

VOCABULARY

body parts
span

MATERIALS

body and body parts
register tape
pencil
Superball
metric ruler

Probability

Mary J. Holder
4553 Provincetown Dr.
Country Club Hills IL 60478

Sherwood Elementary School
245 West 57th Street
Chicago IL 60621
(312) 535-0829

Objective:

Probability: A number that tells how likely it is that something will happen. An educated guess. The purpose of this lesson is to introduce children to the skill of probability. This lesson is designed for grades four and five, however may be used at any grade level depending on the level and the ability of the children.

Materials Needed:

A bag of ten pennies for every two children, color pencils or markers, graph paper, six-sided dice, M & M candy (any variety of M & M candies).

Strategy:

Teacher's Opening:
I have some candy. I am going to place 5 pieces in the bag. Four will be yellow and one will be green. Which will be most likely to pick out of the bag? Which will be least likely to pick? Why do you think? Add more candy to the bag and several different colors until you reach the number 10.

Activity #1: Coin Toss
Each group will receive a bag with ten pennies, a sheet of graph paper and markers. On the graph paper will be the following combinations: HHH,HHT,HTH,HTT,THH,THT,TTH,TTT. The students then will number the left side of the graph paper from 1 to 10 starting at the bottom. Take out three pennies from the bag. Throw the pennies 10 times and see which of the combinations will fall. Shade in the graph according to one of the combinations. Establish with the students the rules. The penny that falls closest to them is 1st, one in the middle is 2nd, one farthest away is 3rd. After the ten tries, have one child from each group come to the front of the class and discuss the outcomes of each throw. Students will then take the entire bag of ten pennies and make one throw. Group together all heads and tape together in a line end to end. Repeat for tails and compare the results.

Activity # 2 M & M
Divide the students into groups of twos. Give each group one bag of M & M. One sheet of graph paper and markers for the colors of the M & M. Have the students to write the colors of the M & M at the bottom of the sheet and number the paper on the left starting at the bottom from 1 to 10. Remove one M & M at a time and color in that color. Let the students do this for the 10 tries. Discuss the outcomes with each group of students. Students may use the remaining M & Ms to complete the graph showing the total number of M & M's in the bag.

Activity #3 Spinner
Give each group a spinner with the numbers 1 through 6. The students are to take three tries at spinning to see if the spinner will stop on the number 1. Students then may illustrate or show the results of the spins on the chalkboard.

Performance Assessment:

Give each group a bag of M & M peanuts, or peanut butter. Graph the number of each color and compare the results with the previous activity results.

The Effects of Solar Energy

Jacqueline A. Davis
2228 W. Jackson
Chicago IL 60612
(312) 680-1124

Anton Dvorak Specialty Academy
3615 W. 16th Street
Chicago IL 60624
(312) 534-1690

Objectives:

This mini teach is designed for the primary level. Students will learn that solar energy is absorbed and used in all aspects of life. Students will learn that plants will not grow without solar energy, and that planet earth would be so cold and dark that nothing could survive.

Materials Needed:

Activities 1	Activities 2	Activities 3
Solar Print Paper	**Coloring Activities**	**Terrarium**
sunprint paper	work sheet 1	2 liter bottle
solid object	work sheet 2	soil
transparencies	crayons	seeds
card board		water

Strategies:

Activity #1

1 In class place card board box on grass.
2 Place sunprint paper on top of box.
3 Place object on sunprint paper.
4 Place transparencies on top of sunprint paper.
5 Take class outside on a sunny or an overcast day. Do not expose the paper to sunlight until you have assembled the kit.
Finally, when paper is exposed to sunlight an image will emerge.

Activity #2

1. Color picture one (picture of a person exposed to sunlight)
2. Color picture two (picture of flower and trees exposed to sunlight)

Activity #3

1. Cut the 2 liter bottle in half.
2. Place soil in bottom of 2 liter bottle.
3. Place bean or seeds in the middle of two liter bottle then place more soil on top of planted seeds.
4. Pour water into the soil.
5. Finally cover your terrarium with other half of bottle.
6. No more water is needed.
7. Place in sunlight.

Performance Assessment:

Activity #1

Question: By using Sunprint paper students will observe and verbally explain why colors change when exposed to light.

Answer: Solar energy is absorbed by paper, and causes it to change color. Teacher/Student should try this experiment and watch an image emerge.

Activity #2

Using crayons, students will color the pictures that depict the different reaction that relate to solar energy. (Prior Knowledge)

Question: Ask students to bring pictures up and explain why humans change colors?

Answer: Solar energy is absorbed by humans.

Activity #3

This activity allow the students to measure growth and graph the growth of their own plants.

Question: Ask students what made their plants grow?

Answer: Water and solar energy absorbed by plants made them grow.

Conclusion:

These activities cover material included in major textbook series and motivates children to learn, while having FUN. Solar energy is absorbed and used by all things.

Return to Physics Index

Airplanes

Sandra E. Broomes
P. O. Box 20198
Chicago IL 60620
(312) 238-7871

Sherman
1000 W. 52nd Street
Chicago IL 60609
(312) 535-1757

Objectives:

Designed for Grades 2 & 3. To develop and experiment with flying. To understand basic principals of energy of motion. To make and fly paper airplanes.

Materials Needed:

Materials listed are for groups of four.

paper
pencil
tape
paper clips
pop cans (empty)
string
toy helicopter
balloon

Strategy:

Take two sheets of paper the same size. Crumple one of the papers into a ball. Hold the crumpled paper and the flat paper high above our head. Drop them both at the same time. The force of gravity pulls them both downward. Which paper falls to the ground first? What seems to keep the flat sheet from falling quickly?

Draw a picture of a plane on the board. Write the word lift above the plane. We say the wings give a plane lift and makes a plane go up. Gravity below, drag behind and thrust in front. Ask the students what these words mean. These four forces are always working on paper planes as well as real airplanes.

Take a balloon blow it up and let it go. This will show thrust which makes the balloon zoom across the room. The students will experiment with blowing between the two empty pop cans. We discuss the Bernoulli's Principle.

Each group will make a helicopter and fly it off the 3rd floor. We will go on to make several different styles and designs of paper planes.

Performance Assessment:

Work in groups of four and discuss answers to the questions. Write down results on how planes were made and how long they were able to fly. Did their helicopter fly when launched? Which way did it fly? Students will have the actual paper helicopter and plane as the result of the experiment.

Return to Physics Index

Thermal Energy Transfer - Conduction

Eileen Wild Retired
8117 W. Edgewater Road
North Riverside IL 60546

Objectives:

To examine the thermal energy transfer through a pane glass window and to clarify the physical definitions of heat and thermal transfer.

Background:

Mies van der Rohe, the architect for the IIT campus was known for his extensive use of glass. Many of the campus buildings are oriented in a North-South direction with the major windows facing either East or West. These windows therefore receive either the morning or afternoon sun.

Materials Needed:

Thermometers, transparencies, copper rod, flame source, overhead projector, bubble raft

Demonstrations:

Thermal transfer through a copper rod, bubble raft analogy of a solid

Strategy:

You are going to measure the energy transfer occurring through the windows oriented in each direction. Choose buildings with good air conditioning. The greater the temperature difference, the better the results.

The following date is needed for your computation-
.area of the glass window
.inside temperature
.outside temperature
.glass conductivity K= .84 J/s
.glass thickness-assume l = 10^{-3}

Substitute the above data into the following formula.

$$Q = K \cdot A \cdot \left\{ \frac{\Delta T}{\ell} \right\}$$

Performance Assessment:

Students are required to reproduce this exercise on windows of their own dwelling. The results of their personal investigation solidify their knowledge of energy transfer.

Return to Physics Index

Radioactive Decay Curve

Alan L. Tobecksen
15310 Harper
Dolton IL 60419
(708)849-1708

Henry Clay Elementary School
13231 Burley
Chicago Il 60633
(312)535-5600

Objectives:

Parts of this experiment are suitable for first grade through sixth grade but the intended grade level is seventh through high school.

1. Students will learn to gather and organize data.
2. Students will practice graphing simple data.
3. Students will observe an exponential curve.
4. Students will learn that the points where the quantity becomes one-half as much occurs at regular intervals.

Materials Needed:

Each group of 2 to 4 students will need
30 pairs of dice (60 di)
a container large enough to hold the dice
graph paper

Strategy:

Each group rolls the 60 di all at once. The team removes all di that turn up as either a 5 or a 6. Count the remaining di. Record this information. Gather up the remaining di and roll them again. Continue doing the rolls until there is only 1 di left or 10 rounds have been completed. Students then graph number of roll verses number of dice left.

Performance Assessment:

Subjective: The teacher should observe the students to be sure that the exercise is being done correctly and that data is being gathered and organized.
Objective: The data table and graph can be given a grade.

Conclusions:

Students sometimes have confusion understanding the directions - it is easier to give a short demonstration of what is to be done. Each group usually has an almost perfect result and if all data from all groups is gathered and averaged, a perfect result is guaranteed. The results of remaining di follow this pattern usually very closely - 40 left on the first roll, 27 left on the second roll, 18 left on the third roll, 12 left on the fourth roll, 8 left on the fifth roll, 5 left on the sixth roll, 4 left on the seventh roll, 3 left on the eight roll, 2 left on the ninth roll, 1 left on the tenth roll.
The students love rolling the dice.

Cooperation Blocks

Alan L. Tobecksen
15310 Harper
Dolton IL 60419
(708)849-1708

Henry Clay Elementary School
13231 Burley
Chicago IL 60633
(312)535-5600

Objectives:

This activity is suitable for K - 12.

1. Students will work together cooperatively.
2. Student teams will assemble 5 geometric square puzzles.

Materials Needed:

Each group of 5 students will need 5 packets pre-prepared with the puzzle pieces.

```

x          x         xx   x          x          x   x            x        x
x          x          x   x          x          x   x            x        x
xxxxxxxxxxxxxxxxxxxxxxx   xxxxxxxxxxxxxxxxxxxxxxx   xxxxxxxxxxxxxxxxxxxxxxx

xxxxxxxxxxxxxxxxxxxxxxx   xxxxxxxxxxxxxxxxxxxxxxx
x         x           x   x         x          xx     Cut 5  6" x 6"
x 5A    x             x   x  3A   x           x x     posterboard into
x     x               x   x     x           x   x     these 15 pieces.
x   x                 x   x   x           x     x     Mark each piece as
x x                   x   x x   5A      x       x     indicated.  Place
x         3A          x   x           x         x     the pieces in 5
x                     x   x         x           x     envelopes marked
x                   x x   x        x            x     1A, 2A, 3A, 4A and 5A.
x                 x   x   x       x             x
x               x     x   x      x      1A      x
x             x  5A   x   x    x                x
x           x         x   xx                    x
xxxxxxxxxxxxxxxxxxxxxxx   xxxxxxxxxxxxxxxxxxxxxxx
```

Strategy:

Each student in the group gets an envelope with puzzle pieces. Unfortunately, no single envelope has the right pieces to assemble a square. Students are not allowed to talk or ask for a puzzle piece or in any way indicate that they want or need a piece. However, students may give away any or all of their puzzle pieces to another team member.

Performance Assessment:

Activity is complete when all 5 squares are assembled properly.

Conclusion:

Great fun!

Return to Physics Index

Circles Minilab

Alan L. Tobecksen
15310 Harper
Dolton IL 60419
(708)849-1708

Henry Clay Elementary School
13231 Burley
Chicago IL 60633
(312)535-5600

Objectives:

Parts of this experiment are suitable for third grade through sixth grade, but the intended grade level is seventh through high school.

1. Students will practice measuring in the metric system.
2. Students will learn to gather and organize data.
3. Students will practice graphing simple data.
4. Students will draw the inference that the slope of the line is pi.

Materials Needed:

Each group of 2 to 4 students will need
6 to 10 assorted circular lids (jars, milk containers, coffee cans, etc.)
meter stick
30cm length of string
graph paper
paper to write on to organize the data

Strategy:

Each group measures the diameter and circumference of each lid in their collection. The diameter is measured directly by placing the meter stick across the center; the circumference is measured by wrapping the string around the outside and then measuring the string. The group recorder makes note of the data as each lid is measured. The group then makes a graph of their data ploting diameter on the x-axis and circumference on the y-axis and, hopefully, recognizes that the slope of the line is pi. It is also suggested that a simple calculation of dividing the circumference by the diameter be made by the students for each lid.

Performance Assessment:

Subjective: The teacher should observe the students to be sure that the measurements are being done correctly and that data is being gathered and organized.
Objective: The data table and graph can be given a grade.

Conclusions:

Students from fourth grade through high school should be able to do most, if not all, of the exercise.

References:

Merrill Physics - Teacher Guide

Return to Physics Index

Probability

L'Ouverture Perkins
3648 S. Rhodes Ave.
Chicago IL 60653

William S. Carter Elementary School
5740 S. Michigan
Chicago IL 60627
(312)535-0860

Objectives:

Grade Level: Intermediate elementary (4-6)

a* The student will be able to determine the relationship between equally likely events and their favorable results.

b* The student will be able to graph their results.

c* The student will be able to determine the degree of probability of event.

d* The student will be able to determine if an event is equally likely or not equally likely to happen.

Materials Needed:

Probability board, toothpicks, marbles, toothpick board, cards, dice, cowrie shells, spinners, number cube, coins, peanut butter, jelly, bread, blue and green cubes, unequal and equal spinners.

Strategy:

1. **(c*)** The student will toss 3 coins 60 times to determine the possible combinations of 3 coin families.

2. **(a*)** The student will determine experimental probability of an experiment by removing 2 cubes from a mixed bag of blue and green cubes. The student will then tally the results and compare the experimental probability with the actual probability.

3. **(d*)** The student will determine the likelihood of selecting a peanut butter, jelly or peanut butter and jelly sandwich from a bag.

4. **(d*)** The student will determine the likelihood of selecting any playing card from a hat that is mixed with at least one folded card.

5. **(a*)** The student will determine the number of times a number cube results in 1-2 versus 3-6.

6. **(b*)** The student will toss darts at a dart board, record the results and graph the results.

7. **(b*)** The student will observe a Gauss Curve being formed by marbles being dropped through a probability board.

Performance Assessment:

The student will be able to determine if an outcome is **equally likely** or **not equally likely** from **a**: tossing a coin, **b**: rolling a number cube with faces numbered 1-6, **c**: spinning an unequal spinner, **d**: spinning an equal spinner, **e**: pick a card from cards set up in a pattern: 1,2,1,2, **f**: pick a card from cards set up in a pattern: 1,2,3,3,4,5.

The student will be able to orally explain if the probability of an event happening is 0,1 or between 0 and 1 for the following questions:

1. You toss a nickel and it will land tails up.
2. You will drive a car to school tomorrow.
3. It will snow tomorrow.
4. It will snow sometime during the winter in Chicago.
5. June will follow May.

Students will be able to graph the scores of a test that result in a Gauss or bell curve.

example:														
	scores =	10,	13,	22,	26,	29,	34,	43,	56,	66,	74,	82,	95,	100
	# students	1,	2,	3,	4,	5,	6,	7,	6,	5,	4,	3,	2,	1,

Conclusions:

Exploring the field of probability will help students develop their ability to understand the relationship between equally likely events and the actual results. Understanding this relationship will form the structure for a higher level of logical thinking.

Return to Physics Index

Metric Olympic Games

Angela E. Scott
P.O. Box 858
Dolton IL 60419

Wm. T. Sherman Elementary School
1000 W. 52nd Street
Chicago IL 60610
(312)535-1757

Objective:

The main objective of this mini-teach is for intermediate students to learn estimation and measurement using the metric system, metric lengths, masses, and areas.

Material Needed:

2-3 paper plates or pie pans
3-5 paper or plastic drinking straws
2 bags of marbles
3 meter sticks
cotton puffballs
large sponge
large mixing bowl or bucket
liter measuring set
centimeter graph paper
balance scale with weights
student worksheet

Strategy:

Mini Metric Olympics

1. Work in small groups (5) including a team captain.
2. There are a total of six stations with a different task at each station. Each station should have a task card with complete instructions and materials available. Each group is assigned to one station.
3. Each captain may read the instructions to his team. It is extremely important that, before each activity begins, each student estimates and records his/her estimate on the student score sheet. Captains should check all members on the team before beginning each activity.
4. After each team member performs the activity. He/she measures and records the actual length, mass, volume or area.

EVENT I: COTTON BALL SHOT PUT

1. Have the students predict how far they can throw the shot put and record it.
2. Stand on the starting line and throw the cotton ball. Each student is allowed one throw.
3. Measure and record the shot put.

EVENT II: RIGHT-HANDED MARBLE GRAB

1. Estimate how many grams you can grab with your right hand.
2. Grab a fistful of marbles.
3. Weight them on a scale.
4. Record the weight.

EVENT III: STRAW JAVELIN THROW

1. Predict how many centimeters you can throw the javelin straw.
2. Throw from the starting line.
3. Measure and record.

EVENT IV: PAPER PLATE DISCUS

1. Predict, in centimeters, your throwing distance and record it.
2. Throw from the starting line.
3. Measure and record.

EVENT V: LEFT HANDED SPONGE SQUEEZE

1. Have a sponge soaking in a large bucket of water.
2. Estimate the amount of water, in milliliters, which a student can squeeze out of a sponge.
3. Measure and record.

EVENT VI: BIG FOOT WAS HERE

1. Predict (in square centimeters) the area of your foot.
2. Without a shoe, trace your foot on square centimeter graph paper.
3. Calculate and record the area.
4. Cut out the footprint and put your name and room number on it.

Performance Assessment:

The student score sheets will have 3 columns (the estimated score, the actual score and the difference between these two scores). After the games they should total the third column. The winner is the student with lowest score because the scoring here was designed to measure how close their estimates are to their actual performance.

1. How many liters of water will fill your bathtub? Draw a cartoon and record your data.

2. Select five or more containers of assorted sizes and shapes. Can you arrange them in order from least to greatest and predict their volume accurately? Organize and illustrate your data.

3. Select five or more objects of various sizes and shapes. Can you arrange them from lightest to heaviest and estimate their mass accurately? Organize and illustrate your data.

4. Estimate the distance of a trip to school and back home in metric units. Draw a map to scale that illustrates how far you walk or ride to school. You may choose to do this with a partner and do a combined map so that you are able to make comparisons.

View Tube Triangulation

Pete Insley
5652 W. Giddings
Chicago IL 60630
(312)283-0528

Jones Metropolitan H. S.
606 S. State St.
Chicago IL 60605
(312)534-8600

Objectives:

Measuring Distance; Estimating; Averaging; Standard deviation

Materials Needed:

Meter sticks, rulers, cut down paper towel cardboard tubes

Strategy:

First, get the students to estimate the height of the chalkboard or the doorway. List the estimates and use a calculator to find the average and standard deviation.

Stand far enough away so that you can see the entire object in the tube. Use a proportion to find the height of the object.

$$\frac{\textbf{Height of object}}{\text{Distance to object}} = \frac{\textbf{Distance of tube}}{\text{Length of tube}}$$

List the calculations and again find the average and the standard deviation. Take some time to discuss what they mean again.

Now get a couple of students to measure exactly how big the object is. Have a prize for the best estimate of measurement.

Performance Assessment:

Collect paper with original estimate and calculation of height. Have students write a short paragraph stating how well they think they did on the exercise.

Conclusions:

You can find percentage error in this lab and it has some new meanings to the students. Have them find their % of error. You can also find the probable percentage of error from the standard deviation.

Return to Physics Index

Models of the Earth and the Moon

Anne Chamberlain
l3919 W. 167th St.
Lockport IL 60441
(708)301-6553

Bethune Elementary School
3030 W. Arthington St.
Chicago IL 60612
(312)534-6890

Objectives:

Third grade students will demonstrate the causes of:
A) Day and Night
B) Seasons of the Year
C) Phases of the Moon

Materials Needed:

blue balloons
balloon holder on stick
globe
lamp with transparent lightbulb
markers
styrofoam balls

Strategies:

A) Students form a circle around a lamp with their backs to the light. They make four quarter turns to the left, stopping each time to observe the position of the lightbulb in their field of view (low, high, or absent). Repeat the turns several times with arms extended to the light, saying NIGHT, SUNRISE, DAY, SUNSET. Finally, use a globe, rotate it and note times of day at a fixed location.

B) Children use a marker to draw an "equator" and the letters USA on their blue balloons. They hold them with their sticks slanted on a slight (23 degrees) angle--all pointing to the same corner of the classroom. While standing in a circle around a lamp, they hold a meterstick (or dowel rod) between the lightbulb and the USA to observe the angle of radiation. Since direct rays cause more intense heat and light we can decide which "balloon-Earths" represent USA's summer, autumn, winter, and spring.

C) Children stand in front of a lamp holding a pencil with a styrofoam ball on it at eye level. As they circle their "moonball" they observe and name the lighted parts of it corresponding to the various phases of the moon.

Performance Assessment:

The student will be successful when he can explain to another person--in an oral, written, illustrated or demonstrative manner--what causes day and night, the seasons of the year and the phases of the moon.

Return to Physics Index

Paper Mache Solar System

Fe Andres Juachon
2937 N. Kolmar
Chicago IL 60641
(312) 735-9444

Alexander Hamilton
1650 W. Cornelia
Chicago IL 60657
(312) 534-5485

Objectives:

The students will be involved in hands-on laboratory activities to learn:

1) The relative sizes of the planets in the Solar System.
2) The relative spacing of the Solar System.
3) The cause of the phases of our moon.

Materials needed:

Round balloons of different sizes
Plaster of Paris
Strings
Newsprint
9 styrofoam balls
Transparent light bulb
9 dowel rods
Globe

Strategy:

Begin by reviewing what the solar system consists and naming the nine planets in the order of their distance from the sun.

In order to see the relationship of the size of planets and their relative distance from the sun construct models to scale. (See table on the next page.)

Models made of paper-mache can be used. Shape each planet to the desired size and bake it in an oven for one-half hour. For each of the larger planets blow up a balloon to one inch less than the desired size. Mold a half-inch of paper-mache over the balloon and let it dry for several days.

The planets can be suspended by strings from the ceiling of the room. Arrange them in the order from the sun.

For the relative distances of the planets go out on the sidewalk. Designate each student to represent each planet. Reduce each distance to human footsteps and measure steps down the sidewalk.

To show the phases of the moon, set a lamp without a shade on a table in a dark room. Stand several feet away from the lamp. Hold a ball out in front of you so it is in line with your eyes and the bulb of the lamp. The light is the sun, the bulb is the moon, and you are on the earth. Now move the moon (bulb) slightly to the left of the bulb. How much of the moon is lighted at this point. Turn on your heels so that the ball moves in a circle. At which point is there a full moon? a new moon? a quarter moon?

Conclusions:

The students could make a drawing of what they created. They could write a composition showing step by step how to construct the models.

For the phases of the moon, the students could work with the real moon. Every three nights for one month they can diagram the shape of the moon that is reflecting light. Have them date their pictures. If a night is overcast, leave a space in their series of drawings. They can fill in the empty spaces at the end of the month to show the phases of the moon that did occur on those cloudy nights. Does the moon rotate as well as revolve? (Yes)

Planet	Average distance from sun (km)	Scale distance from sun (cm)
Mercury	58 000 000	5.8 (5 footsteps)
Venus	108 000 000	10.8 (10 footsteps)
Earth	150 000 000	15.0 (15 footsteps)
Mars	229 000 000	22.9 (22 footsteps)
Jupiter	777 000 000	11.1 (11 footsteps)
Saturn	1 426 000 000	142.6 (142 footsteps)
Uranus	2 876 000 000	287.6 (287 footsteps)
Neptune	4 490 000 000	449.0 (449 footsteps)
Pluto	5 914 000 000	591.4 (591 footsteps)

Scale of distances 1 cm = 10 000 000 km

Planet	Scale diameters of planets
Mercury	.76 inches
Venus	1.90 inches
Earth	2.00 inches
Mars	1.06 inches
Jupiter	22.36 inches
Saturn	18.00 inches
Uranus	7.74 inches
Neptune	7.8 inches
Pluto	.54 inches

Return to Physics Index

Earthquake Waves And Their Destructions

Sharione O. Mays
5161 Adams Street
Gary IN 46408
(219) 884-7803

Donald Morrill
6011 S. Rockwell Street
Chicago IL 60629
(312) 535-9288

Objectives:

1. Students will learn characteristics of primary waves and secondary waves.
2. Students will learn how to measure the magnitude of waves.
3. Students will learn how to find the epicenter of earthquakes.
4. Students will learn why waves are more destructive in some areas than others.

Materials:
Activities are recommended for groups of four.
ropes, slinky toys, graphing paper, pencils/markers, ring stands with cross bars carts with wheels, large floor-size erasable world map, 2 liter clear plastic bottles, sand, tin foil pans, plastic and wood model houses, containers of water, stop watch, and spring scales.

Strategy:

Introduction: Today, we are going to investigate the two types of earthquake waves. They are surface waves and body waves.

Vocabulary Building through discovery: Looking at the word "surface". Through the use of questions, the students should be able to infer its meaning by directing the students to the three parts of the earth [crust, mantel, and core]. "Surface" should be similar to the crust of the earth. "Body" should be similar to the earth's mantel and core.
Ex: What part of the earth would be the surface?
What part of you is the body?
What parts of earth would represent the body?

First, we will be discovering the two kinds of body waves.

Activity: Those "Jumping Waves"

1. Give each group a **jump rope** and let them create waves.
2. Allow one student from each group to draw the kinds of waves created.
3. Use the drawings to identify the kind of waves that ropes create as being "transverse waves".
4. Label the various parts of a transverse wave. The "crest" can be the high density. The "trough" can be your low density. "Wavelength" must have one crest, and one trough.

Activity: Those "Slinky Waves"

1. Give each group a **slinky**, and allow them to create more waves.
2. Allow one student from each group to draw the kinds of waves created.
3. Label all the waves that are "transverse waves", and identify the new waves as a "compressional wave".
4. Label the parts of the "compressional wave". The part of the slinky that

is tight or close together is called "compressed". The loose part of the slinky is known as the "rarefaction".

Activity: The "Race"

1. Take the longest **slinky**, and a **spring scale**. At various tension, let the students use a **timer** to see which waves travel the fastest. Take at least three timings. "Compressional Waves" should win this race. Therefore, we are going to call them "Primary Waves" or "P Waves" for short. Now, "transverse waves" came in second place, we will call them "Secondary Waves" or "S Waves".
2. "Surface Waves" always occur at the surface or the "crest" of the earth. This wave rides on top of the " P Waves" and the" S Waves", so it is called the "Love Waves" or "L Waves". " Surface Waves" are the most destructive wave.
   "Compressional Waves" displace soil, sand, and rocks in front and back along its path. "Transverse Waves" displace material perpendicular along its path.

   The first signal of an earthquake is a sharp thump, compressional waves, shear waves and finally the ground rolls caused by surface waves.

Activity: Measuring Waves with a seismograph

1. Take a **ring stand** attach a **string** long enough to reach the surface of the **cart.**
2. Tie the other end of the string to a **marker**, so that, the tip of the marker touches the graphing paper.
3. Make a chart on the graph paper. Let the y-axis represent magnitude, and the x-axis distance.
4. Next, shake the table to create an earthquake using low intensity to high intensity.

   There are two ways that scientist measure earthquake waves. They use magnitude, or intensity. The seismograph measures "magnitude" which deals with the waves along. "Intensity" measures destruction of earthquake waves by the number of deaths, and other visual means.

   When I refer to "low" or "high" intensity, it will relate to force or energy applied.

Activity: Locating, and Plotting Epicenters

1. Place a large erasable **world map** on the floor.
2. Using prepared card containing latitudes, and another set with longitudes coordinates of various earthquake locations. Give each student a card.
3. Call out coordinates in pairs.
4. Next, give each child a **toy car**. They are to place their cars on the appropriate latitude or longitude lines.
5. Roll the cars on their appropriate line and mark the point of intersection.

   Before this activity, you may take the students through directions finding hemispheres, locating continents and oceans.

Epicenters are the origin of earthquakes.

Activity: Is the Earth a Solid Core? Liquefaction

1. Take a **tin pan** and pour **sand** into it. Just enough to cover the bottom.
2. Pour just enough **water** to saturate.
3. Pour another layer of sand.
4. Place a wooden house, or a monopoly game house on top of the sand.
5. Create an earthquake, either shake or strike the desk.

What happened to the house?

Activity: Liquefaction in a Bottle

1. Pour **sand** into a **plastic or jar bottle** using a **funnel**. The sand should measure about 2-3 inches in height.
2. Use a large nail and put a hole into the lids.
3. Put water into another **plastic bottle**.
4. Take the lids and run **plastic tubing**. Make sure the tubing is long enough to reach the sand in the other bottle.
5. Drop your model house into the bottle of sand.
6. Put the lids on both bottles.
7. Squeeze the bottle containing the water, and saturate the bottle containing the sand.
8. Create an earthquake.

What do you observe?

Liquefaction occurs because of unconsolidated sand, clay or rocks. Location is important in deciding on where you should live in this world.

9. Review the activity on epicenters. Bring out the floor map.

Where do we find most of our epicenters located?
Are they located by water?
What type of soil do you find?
Is water important to creating liquefaction?
Where would you choose to live?

Return to Physics Index

Plate Tectonics

Phyllis J. Robinson
1038 West 109th Street
Chicago IL 60643
(312) 238-8093

Mount Vernon Elementary School
10540 South Morgan
Chicago IL 60643
(312) 535 2825

Objectives:

After this experience the students should
1. be able to identify the three main parts of the earth
2. be aware that the earth's crust is made up of pieces called plates
3. be able to state the theory of Plate Tectonics
4. be aware that convection currents could cause the earth's crustal plates to move
5. be able to identify plate divergence as a possible explanation of Continental Drift, seafloor spreading, and volcanic activity near the Mid Atlantic Ridge
6. be able to identify plate convergence as a possible explanation of earthquakes, volcanoes, mountain building, subduction and the rock cycle.

Materials needed:

1. One chart showing the three main parts of the earth
2. A boiled egg and a plastic knife for each group of five students
3. A puzzle showing the large plates of the earth (one per student)
4. A hot plate, aluminum cake pan, water,and balsa wood pieces. (one set)
5. A 750 ml beaker, a pill bottle, two-hole rubber stopper to fit the pill bottle, glass rods, hot water, cold water, two pennies, and food color (one set per group of five students)
6. A sheet of butcher paper 2 m long, 2 demonstration tables, a silhouette of Africa and South America, a marking pen (one set up per class)
7. 2 damp wash cloths per group, 4 popsicle sticks per student, a lump of clay for each student
8. A shoe box, small garbage bag, scissors, newspaper, two boards (30cm X 30cm X 5cm), five pounds of sand, water to dampen the sand

Strategy:

Activity I
Show students the core, mantle, and crust of the earth using a chart. Pass a boiled egg and a plastic knife to each group of two. Have one of the students cut the egg in half. Each person gets half of the egg and will use it as a model to discover the three main parts of the earth. Tell the students that the cracked shells represent the part of the crust called plates.

Activity II
Pass a jigsaw puzzle to each student and instruct them to put it together. Students should discover that the puzzle represents the earth's crustal plates. They should identify the continents and oceans. They should observe that some plates are composed of all continent, all ocean, and a combination of both. Introduce terms by having students move two adjacent plates apart (Divergence); move two plates together (Convergence); and move two plates so that one moves up and the other down with the pieces rubbing past each other (Transformation).

Activity III

Tell the students the theory of Plate Tectonics.
The earth's crust is composed of seven or eight major plates and several smaller ones. These plates move.

Activity IV
Let students relate science equipment to the earth's model. Hot plate - core, water (in an aluminum pan) - mantle, balsa wood chips - crustal plates. Heat the water to boiling. Put chips in the center of the pan. Students should identify the boiling water as a convection current that causes the balsa wood chips (crustal plates) to move.

Activity V
Each group of four students will get a 750 ml beaker filled with cold water. They will fill a pill bottle with hot water, 3 drops of food color and two pennies to keep it from floating. They will cut 2 pieces of glass tubing 8 cm long (straws can be substituted for the glass tubing). Insert a tube into each hole of a two hole rubber stopper and position the tubes so that one sticks out of the stopper more than the other. Insert the rubber stopper into the pill bottle. Wipe any colored water off of the bottle. Hold it by the rim and lower the pill bottle into the center of the beaker of cold water until it sits on the bottom of the beaker. Keep the pill bottle upright. Students should discover that this is a convection current and the colored water looks like lava coming from a volcano.

Activity VI
Students will observe a model of diverging plates. The teacher will push two display tables together leaving a small space between them. She will tell the students that the tables represent two Atlantic Ocean plates and the opening represents the Mid-Atlantic Ridge. The teacher will cut off butcher paper two meters long and slide it through the opening (Mid-Atlantic Ridge) so that 5cm of paper is showing on the surface of each table on each side of the ridge. Have two students each label their paper lava/new crust and mark it with a ruler and pen. Have the student helpers pull out 5cm more of butcher paper and mark it lava/new crust. Have them also tape a silhouette of South America on the left crust and Africa on the right crust. Have helpers pull out 5cm more of butcher paper and mark it as before. Continue the previous steps until the students are able to discover that the seafloor is spreading because new crust is being added. The Atlantic Ocean is getting larger. The continents are moving apart. Volcanoes are forming volcanic mountains and islands along the Mid-Atlantic Ridge. The Atlantic crustal plates are moving apart. (Divergence)

Activity VII
Students should discover that while the Atlantic plates are diverging, the Pacific plates are converging. Ten students will be Pacific crust. They will hold hands to form a circle to define the size of the earth. Drop hands. Ten more students will represent the new Atlantic crust. They will join the earth's circle two at a time at the same place. They will diverge and push the Pacific plates closer together (converge). As more and more new Atlantic crust join the line, some of the Pacific plates will move in front of the other Pacific crustal plates to make room. (This represents subduction). Students should discover that as the new Atlantic crust diverged the Pacific crust converged. They should discover that the Pacific crust made room for the new crust by moving out of the way through subduction.

Activity VIII
Teacher will explain terms subduction, Asthenosphere, and rock cycle.

Activity IX
Students should be told that continental crust does not subduct into the Asthenosphere. Students will use two damp wash cloths to represent continental crust. They will diverge them and discover that volcanoes could develop between the plates. They will converge (push together) the continental crust. They should discover that the rolls and the folds look like mountains. Use popsicle sticks to form anticlines and synclines. Students should discover that pressure which forms mountains and valleys also causes breaks called faults and sudden movements called earthquakes. Use clay to form various mountain forms.

Activity X
Use a Fault Box to observe a model of an earthquake. Cut the bottom of a shoe box with scissors. Cut a small garbage bag so that it will hang down through the bottom of the shoe box by about l0 cm. Attach the bag to the side of the shoe box. Cover the area with newspaper. Place two boards (30cm X 30cm X 5cm) on the newspaper side by side. Place the shoe box on the crack between the board so that half of the box is on each side. Pull up the garbage bag so that it forms the bottom of the shoe box. Fill the box with wet sand. Pack it down and smooth it out. Have a helper hold the box steady. Have students come up in groups of four or five. Let them observe what happens when one of the boards slides out from under the fault box. Return the board and smooth the sand. Slide both boards apart until they are separated 15cm. Do not pull boards all the way out. Return the boards and smooth the sand. Slide both boards apart and push back together. Return the boards and smooth the sand. Slide both boards alternately up and down, back and forth so that the sides rub against each other. Observe results after each trial.

The Science of Airplane Flight

Charles Watson
9739 S Ellis Ave
Chicago IL 60628

William H Brown School
54 N Hermitage Street
Chicago IL 60612
(312) 534-7250

Objective:

After this experience the student should:
1. Be able to define lift, drag, ailerons, rudder.
2. Be able to make a sketch showing the forces which act on an airplane in flight.
3. Be able to explain Bernoulli's principle.
4. Be able to explain how angle of attack is used to increase lift.
5. Be able to identify the control surfaces of an airplane.
6. Be able to explain the movement of air around an airfoil.

Materials Needed:

Patterns, styrofoam meat trays, scissors, razor blades, sand paper, glue, clay, paper clips, tooth picks.

Strategy:

Throw a ball into the air a few times then ask:
l. Why does the ball come down?
2. Why is an airplane able to stay in the air?
3 What are the forces acting on an airplane that allows it to stay in the air?

Have students fan themselves with paper, and identify the forces that acted upon the paper. (thrust, drag).

Have the students hold a piece of notebook paper on the bottom corners. Placing the paper to their mouths and blow upon it. Then ask:
l. What happens to the paper?
2. Explain your answer.

Have students cut out and put together a puzzle of a plane and compare it with the labeled model on overhead projector.

Have students make gliders and test fly them. Then ask:
1. Why did the gliders fly?
2. Why did some of the gliders not fly?

Convection box demonstration, use two small juice cans with the ends cut out, a candle, and a cardboard or wooden box. Use to show up and down drafts.

Pop cans demonstration: have students blow between two pop cans an ask:
1. What happened when you blew between the two pop cans?

Have students build styrofoam airplanes and test fly them and discuss the results.

Return to Physics Index

Aerodynamics

Carole Janda
2750 N. Mulligan
Chicago IL 60639
312-237-3418

O. A. Thorp Scholastic Academy
6024 W. Warwick Ave.
Chicago IL 60634
312-534-3640

Objectives:

Demonstrate skill in hypothesis formulation, identification and control of variables, data collection, organization and interpretation of data.

Discover and understand the basic principles of aerodynamics, including the roles and identity of natural forces involved.

Discover how the force of **GRAVITY** is overcome by the curved shape of an airplane wing and air pressure.

Discover why air pressure is lower moving across a curved surface vs. a straight surface, creating **LIFT**. (Bernoulli's Principle).

Discover why an airplane will stall if there is too much air pressure under the wing.

Discover how **THRUST** force is used to overcome **DRAG** force, caused by friction.

Materials needed:

paper - ditto, 2 sheets per person
- 2cm. x 8cm., 1 per person
- newsprint for graph, 1 per team
- cups, 2 per person
- clips, 5 per team

launcher, wood, with rubber band and thumb tack
floodlight

markers or crayons
small box fan
cool air vaporizer
scissors
cellophane tape

Strategy:

Without any verbal explanation, the teacher will fly a paper airplane four times, measureing and recording the data on chalkboard after each flight. (The **first** flight will have 0 paper clips; the **second**, 1 paper clip; the **third**, 3 paper clips; and the **fourth**, 5 paper clips.) The teacher will make a graph showing the distance of each flight then ask three questions, "What did you see?" "What was happening?" "What does the chart show?" The students will be able to read the graph; identify the source of the data; and then label it to show "Average horizontal distance".

The students will be encouraged to hypothesize the reason some airplanes flew straight, others either went to the right or to the left. (Added weight, and uneven folds of the airplane.)

The students will be grouped into teams of not more than four.

Activity 1: The students will make identical airplanes from one sheet of ditto paper. **Step 1**, fold paper in half, the long side. **Step 2**, turn paper over, like an open book (spine up). **Step 3**, fold upper corners toward center fold. **Step 4**, fold down set of corners toward bottom of paper. **Step 5**, repeat Step 3. **Step 6**, fold back along original fold. Place folded portion on bottom. **Step 7**, bring one wing portion down to fold, starting at the nose carefully fold down to make a wing, repeat for second wing. (It is important that the creases are even and sharp.) The students will be given an opportunity to test their planes for air worthiness. Following this test flight, they will then make another airplane. Each team member will test their planes to determine the MOST air worthy plane to be used in the next activity.

Activity 2: Teams will repeat the teacher's demonstration, using only ONE plane. However, they will fly three trials of each, and record the distance on a data sheet. Using the data, a graph of the "Average distance of each flight," will be made. The students will explain their graphs and compare them to the other graphs. (The added weight affects the distance because of **GRAVITY**, and the placement of the clips on the keel of the plane, = center of gravity)

Activity 3: Each student will hold the end of a 2cm x 8cm piece of paper to their mouth and blow over the top of the paper. (The end of paper rises.) Now blow underneath, what happens? Measure 3cm from the short end of the paper and fold, tape the ends. Drape the untaped end between the forefingers of each hand, now blow over the top. What happens? Blow hard across the flat side. What happens?

Activity 4: Pass out 2 paper cups to each student and a pair of scissors per team. Students should hold the cups about 5cm (2") from their mouth and blow between the rims of the two cups. (The inner cup will pop out.) Cut out the bottom of one of the cups, place it on the bottom of the other cup, and blow again. The cup will no longer pop out. (Air pressure is lost through the bottom of the cup.)

Activity 5: Using a box fan, blow vapor from vaporizer over a wing model to show how air travels over the curved and straight surfaces of an airplane wing. Students will discuss what they saw. Repeat the demonstration. Raise the front edge of the wing and repeat the vapor (air) flow demonstration. Discuss and repeat. For the third demonstration, raise the front edge so that the vapor hits the bottom of the wing. Ask students what would happen if this was an airplane? (Plane would stall and fall). Using an overhead projector transparency with the three wing positions, ask a student to show the path of air using arrows. Is this similar or different from the paper cup?

Activity 6: Introduce Bernoulli's Principle. It takes more energy to move over a curved surface, less pressure causes **LIFT FORCE**. Gas, steam, water, and other liquids are similar to air.

Activity 7: Using a model glider placed on a table or desk, ask students to hypothesize why the plane isn't moving. Push it, why isn't it lifting. What is holding it down? (**GRAVITY**) Ask students to explain how Bernoulli's discovery applied to counteract the **FORCE OF GRAVITY**. Have a student hold a sheet of paper in his outstretched hand, then have him run with it. The paper will **LIFT**. Ask the students to explain how this is applied to the glider.

Activity 8: If the glider is pushed it will move and then stop. Ask students to explain how friction causes the glider to stop. This is called **DRAG FORCE**. How does an airplane overcome **DRAG**? What causes an airplane to move? A propeller or jet engine creates **THRUST FORCE**. When a plane speeds up, **THRUST** is greater than **DRAG**. **THRUST** is the force that pushes an airplane forward through the air.

Aerodynamics is the study of air as it moves around objects. Discuss other areas where Bernoulli Principle is applied. (Automobiles, boats, trains have smooth surfaces, reducing friction, this is called "streamlining"). Engineers designing skyscrapers, suspension bridges, automobile carburetors, pumps, and water driven turbines, all use aerodynamics.

Performance Assessment:

Make a diagram of air currents, using arrows to show the direction of the air above and below an airplane wing. Indicate the **FORCES** involved, and where more air pressure, and less air pressure is present.

Make a diagram of an airplane. Show the direction of the four main **FORCES** that affect flight. Pair the forces. Describe the balance of forces.

Rubric:

5 points - Identification of less air pressure over the curved surface of the wing, and more air pressure under the wing. The direction of the forces of GRAVITY, LIFT, THRUST, AND DRAG, are correctly drawn. GRAVITY vs. LIFT, and THRUST vs. DRAG are paired. A correct description of how LIFT and THRUST balance GRAVITY and DRAG as opposing forces.

4 points - Indicates an understanding, but has not described how the forces are balanced, **or** has not identified the air pressure.

3 points - Has not indicated the correct direction of the forces of GRAVITY, LIFT, THRUST, and DRAG, but has described how the forces are balanced.

2 points - Has not identified the air pressure.

1 points - Has not written anything, has only drawn arrows.

The Puzzle

Tom Jensen
3 Stuart Ct
Chicago Hts IL 60411

Bloom High School
10th & Dixie Hwy
Chicago Hts IL 60411
708-755-1122

Objective(s):

The main objective of the Mini-teach is to make students aware of some of the ways they process information so that they may become more skilled. To develop Thinking Skills in science students.

Materials needed:

A puzzle (preferable manipulative, not crosswords, etc.) of sufficient difficulty to challenge even the best students at the teaching level. This miniteach used a spectral color matching puzzle with many, many incorrect trials but apparently only one correct solution. There should be one puzzle per student.

Strategy:

1. The puzzle is introduced to the class by giving each student a puzzle. The students are told to look at the puzzle carefully and record any and all particulars of the puzzle. Time allotted for the part of the exercise will vary with grade level and complexity of the puzzle.

2. As students begin completing step 1, start a discussion about the puzzle. Typically this will include size, color, shape, number of parts, patterns, similarity (or differences) of parts, etc. Before the discussion ends it is important that each student knows the point of the puzzle. **Note - they have not yet been asked to solve the puzzle**.

3. After the discussion of the puzzle the students are given the following assignment. The student is to formulate a clear method of solving the puzzle. The solution is to be written in such a way as to be used by anyone at this grade level to quickly solve the puzzle. **Note - they have not yet been asked to solve the puzzle**.

4.After allowing sufficient time to formulate a solution bring the students into cooperative groups and allow them to formulate one grand unified solution to the puzzle. The grand unified solution is carefully put in writing and given to the teacher.

Performance Assessment:

The teacher takes each of the grand unified solutions and distributes them to each cooperative group, being careful not to give a group their own solution. Each group is now told to **solve the puzzle** using the grand unified solution they have been given. Time needed to solve the puzzle is to be recorded.

A scoring rubric may be developed based on any number of criteria, such as clarity of instructions, shortest time for a solution, brevity, reduction of incorrect trials etc. The winner gets a big hand. See the Sample.

Scoring Rubric (Sample)

5 Points- The solution was clear, concise and allowed anyone to solve the puzzle in less than 3 minutes. It included the mathematical possibilities of the number of incorrect trials as well as the number of possible correct solutions. It also noted the puzzle color very nearly matched the visible spectrum as learned in physics. Finally it provided a painless solution for eliminating the national debt.

4 Points- The solution was clear and allowed the puzzle to be solved in less than 10 minutes with a minimum of wrong moves.

3 Points- The solution worked, but was long and/or difficult to understand. Time was wasted modifying the solution.

2 Points- Some order and logic existed in the solution. It was unclear and allowed you to make the same errors repeatedly.

1 Point- Solution was Trial & Error.

0 Points- Solution confused, frustrated and discouraged one from trying the puzzle.

Conclusions:

An exercise such as the puzzle, attempted at the high school level should include the following thinking skills:

1. Attributing
2. Analyzing
3. Predicting
4. Comparing/Contrasting
5. Inferring
6. Problem Solving
7. (Cause & Effect depending on the puzzle)

In the discussion follow each step in the strategy the appropriate thinking skill(s) should be mentioned by name and discussed. Example after step 1 Attributing (observations) and comparing and contrasting would probably be appropriate. Eventually the students should begin to be aware of how they think and become more skillful thinkers and learn some physics.

Kinds of Weather And What to Wear

Margaret Ann Thornton
9738 South Greenwood Ave.
Chicago IL 60628
312-375-5078

Cardenas Elementary School
1234 South Millard Avenue.
Chicago IL 60623
312-762-0900

Objectives:

After each demonstration, the student should be able to

1. recognize cloud, and fog formation;
2. recognize the characteristics of rain, snow and wind;
3. determine dress attire for each kind of weather;
4. make a weather book.

Materials needed:

portable burner
pan of water
ice cubes to cover the tray
plastic tray
an electric fan
raincoat
umbrella
galoshes
hat
paper fasteners
crayons
a jar
warm water
matches
a sheet of black paper
cut white paper
snowsuit
snow boots
mittens
manuscript paper
construction paper

Suggested Strategy:

Take the jar and tape black paper on the back of the jar. You can't see through the jar. Fill one third of the jar with warm water. Have the bag of ice and matches nearby. Light the match and hold it over the jar opening. After a few seconds, drop the match in the jar and cover the top of the jar with the bag of ice. Observe the inside of the jar against the black paper background.

While bringing the pan of water to a boil, cover at least half of the plastic tray with ice. Hold the tray of ice above the pan so rising steam hits the tray of ice. What happens to the tray? Continue holding the tray until large droplets form and fall. It's rain.

Turn on an electric fan and proceed to pour cut white paper in front of the fan. This shows some characteristics of snow. Incidentally, a German meteorologist, a scientist who studies the atmosphere and weather, discovered cold clouds. The discovery found that when water and ice coexist, the water is attracted to the ice. At certain temperatures, snow is formed.

With cut paper streamers taped to the front of an electric fan, turn the fan on. Wind is characterized.

With an appropriate wardrobe of clothing, students will model the proper attire for a given kind of weather.

Performance Assessment:

Given a weather phrase, student will brainstorm short stories. After brain-storming, the student will expand phrase into a complex sentence. The student will write an ending sentence to a short story.

In the space provided at the top of the manuscript paper, the student must draw story illustrations. The main idea must be emphasized with a variety of details. All pictures must be colored.

Given construction paper, the student will make a cover page depicting an illustration of a favorite weather story, the title of a weather book, and proper identification.

All stories are organized and fastened onto cover page for completion of a weather book.

The Assessment Scoring Rubric

5 Points

The weather book completed with at least five stories with the appropriate illustrations, colorful cover page and the proper identifying information written at the bottom of the page.
Given phrases should be expanded in complex sentences. All other sentences should be details or related to the main idea. The final ending sentence should tell how the subject feels. All illustrations must be colored.

4 Points

The weather book is completed with a minimum of four stories with the appropriate illustrations, colorful cover page and the proper identifying information.

3 Points

The weather book consists of two completed stories, illustrations, cover page and illustrations.

2 Points

The weather book consists of colorful cover page, incomplete stories and identification.

1 Point

Trial and error.

0 Points

No participation.

Return to Physics Index

Heat Absorption

Marvice Box
1326 N. Lockwood
Chicago, Illinois 60651
312-637-6366

Lawndale Community Academy
3500 West Douglas Blvd.
Chicago, Illinois 60623
312-542-3635

Objectives:

Grades 8-9

1. Describe how the average kinetic energy of matter is measured.
2. Distinguish between heat and temperature, and calculate a change in a substance from one state to another.
3. Understand the value of precise data for use in a comparative study.
4. Demonstrate that a colored surface will absorb more heat from a source of light than a white surface.
5. Explain how instruments detect and measure changes in heat and temperature.
6. Identify the ways in which heat is transferred.
7. To investigate the absorption of heat energy by matter.
8. Analyze data and establish a relationship between factors involved.

Materials Needed:

Thermometers, tin cans, black and white construction paper and cloth, meterstick, styrofoam cups, charcoal, sand, water, candles, lamp, ice cubes, graph paper, radiometer.

Recommended Strategy:

Station 1 Discovery Centers - Directions:

A. Place the clip lamp directly above the cups at height 30cm.
B. Design your own table for recording data. Enter the temperature shown on the thermometer for each material.
C. Turn on the lamp. Record the temperature of the material in each cup after 1, 2, and 5 minutes and report:
   1. Construct a graph of the heating data. Represent each material by a different type of line.
   2. Which dry material showed the greatest increase in temperature.
   3. Which wet solid showed the greatest increase in temperature.
   4. Did the wet charcoal or the dry charcoal show a greater increase in temperature.
   5. Did the wet sand or the dry sand show a greater increase in temperature.
   6. How did the increase in the temperature of the water compare to the increases in the temperature of the solids?
   7. When the light was turned off, which material showed the greatest decrease in temperature.

Station 2 Miniature Greenhouse Discovery Center - Purpose: To investigate the conversion of light to heat energy - Directions:

A. Arrange a clip lamp so bulb is 50cm from plastic wrap.
B. Design your own table for recording data, enter temperature shown on each thermometer then turn on the lamp. Record the temperature inside and outside of the box every 30 seconds for 5 minutes and report:
   1. What is the dependent variable in your data? What is the independent variable?
   2. Construct a line graph of the heating data collected in directions above. Show temperature on the vertical axis and time on the horizontal axis. Use

a solid line for temperature inside, dotted line for temperature outside.
3. Construct a line graph of the cooling data collected in step B. Follow the procedure in number 2 above.
4. How did the temperature change inside the box compare with those outside?

Station 3 Color and Heat - Directions and Experiment:
1. After lighting the candle, allow a drop of wax to drop on to each sheet of black and white paper.
2. Place the lighted electric bulb exactly between the two sheets of paper about 3 inches from each. OBSERVATIONS? CONCLUSIONS?

Station 4 Color and Heat Absorption - Experiment:
1. Hold a tin can in a candle flame until it is completely coated with soot.
2. Pour water into both cans until they are full.
3. Record the temperature of the water in each can.
4. Put the two cans of water directly in the sunlight or near a lamp.
5. Take the temperature of the water in each can every five minutes for about a half-hour. OBSERVATIONS? CONCLUSIONS?

Station 5 A Material's Effect on Radiation - Directions:
1. Place the Black and White pouches flat on a table. Place a thermometer into each pouch. Place the light source 10cm above the pouches.
2. Turn the light on and record the temperature of each pouch each minute for 6 minutes.
3. Repeat using the black paper. OBSERVATIONS? CONCLUSIONS?

Discussion and Follow-up:
- At Specific intervals during the demonstration, students should be given turns for taking temperature readings and recording them on a chart.
- Predict what they think the outcome of the demonstration will be.
- After about 6 readings, or whenever a difference in the temperature of 3 substances has been noted, the data collected should be analyzed and a determination made as to the comparative rate of heating of soil and water.
- Students should be encouraged to report personal experiences at the seashore, swimming area, wearing light colors in summer, dark colors in winter and relate the demonstrations to an actual situation.

Summary Statements:
1. The temperature of matter changes when the amount of heat in it changes.
2. Heat energy travels from a warmer to a cooler location.
3. A thermometer is used to measure the temperature of a substance.
4. Black absorbs all colors of light, so more energy is taken in per unit of time; white reflects all of the colors of light.
5. Much of radiant energy of the sun is changed into heat when it strikes objects. The black or dark colored materials and objects give off and take in heat the fastest. The radiant energy absorbed changes into heat.
6. The lighter, white and shiny objects tend to reflect more of the sun's energy.
7. Water, with its high specific heat, will tend to slow any temperature changes when added to the solids.
8. When exposed to the same source of heat, soil heats at a faster rate than water.

Radioactive Decay/Half-Life

Sallie M. Fladger
P.O. Box 49324
Chicago, Illinois 60649
312-768-4037

John Hope Academy
5515 S. Lowe
Chicago, Illinois 60621
312-962-2760

Objective:

(for grades 3-12)

To demonstrate a model whereby students will perform a hands on application of determining the half-life of a radioactive element.

Materials Needed:

The following materials are needed for each group of 2-4 students.

1) corn candy
2) shoe boxes
3) marker
4) paper
5) pencil
6) graph paper

Instructors Preparation:

1) Have available shoe boxes for each group of 2-4 students.
2) Using the marker place an X at one end of the shoe box.
3) Place 100 pieces of corn candy in each box.
4) Diagram a model data table showing # of corn candy and # of years.

Procedures:

1) Make a data table as shown and make some predictions.
2) Remove the lid and empty corn candy into box.
3) Close the lid and shake the box gently 5 times.
4) Remove the lid and remove all corn candy with the point facing the (X) inside of the box.
5) Count & record in the data table the number of corn candy left after each opening.
6) Repeat steps 3-5 until all of the corn candy is gone.
7) Graph the data from the data table onto graph paper, showing # of candy corn on the vertical & # of years on the horizontal.

Expected Results:

Students should discover that after each shake (which represents years) & the removal of the corn candy (which represents atoms), there is a definite pattern of decay.

Students discover that it was impossible to predict when or how many corn candies would decay.

Evaluation:

The students' data table and graph curve will determine whether the students performed the experiment.

Return to Physics Index

Weather Facts

Dorothy Parker
8122 S. Euclid Av
Chicago, IL. 60617
312-221-0827

Beasley Academic Center
5255 S. State Street
Chicago, IL. 60609
312-536-8745

Objectives:

(grades 3-9)

1) To understand why certain phenomena occur in the atmosphere
2) To learn how weather elements are measured
3) To learn to make and/or use weather instruments
4) To become familiar with weather terminology
5) To distinguish between myths, superstitions, and scientific predictions

Materials needed:

(for groups of six-eight students)
large room thermometer, a weather vane, card-board, narrow jar or test tube, balloons, red narrow balloon, red and blue food coloring, two large jars, aluminum pan, ice cubes, plastic transparent container (shoe box, sweater box, etc.), hot and cold water, candle, plastic wrap, piece of wool, torn scraps of paper, comb, paper bags, tornado in a bottle, sponge, index cards

optional: patterns and materials to make weather vanes and/or pin-wheels

Strategy:

teacher preparation:

1. Make simple weather vane
2. Prepare activity sheets
3. Make tornado in a bottle
4. Make pattern worksheets for weather vane and pinwheel
5. Check books for myths, superstitions, and weather facts
6. Boil a quart of water
7. Have two trays of ice cubes available
8. Set up weather stations

Class activities:

1. Read and discuss myths, superstitions, truisms associated with weather
2. Present vocabulary: air mass, front, high, low, humidity, wind, precipitation, pressure, temperature, tornado
3. Do demonstration with clear container, jar of hot water colored red, jar of cold water colored blue (add salt to the water), divider. With divider separating container in half, pour hot water in one side and cold water in the other side simultaneously. Remove divider and observe
4. Students should report to a weather station

Weather stations

1. Wind-objective: to discover that wind is moving air. Use sponge to wet board. Fan with cardboard. Write north, south, east, west on index cards. Have child hold weather vane with index cards around him. Students will blow and child with weather vane will point it in the direction from which the wind is blowing.
2. Temperature-Thermometer: to learn to read a thermometer. To discover that temperature changes cause fog and clouds. Use room thermometer. Place ice cubes in aluminum pan and hold over jar of hot water. Place long red balloon in test tube. Blow balloon up slightly.
3. Thunderstorms/Static Electricity/Tornadoes: to understand weather phenomena. Blow up paper bags. Break two of them vigorously. (thunder) Rub comb with wool. Hold over bits of paper. Rub plastic, hold in palm of hand, turn hand over. Experiment making tornadoes using the tornado in a bottle. (15-20 ball-bearings, 1 liter plastic bottle, 2-3 drops of detergent)

Conclusions:

After completing activities, students should:
1. Understand why certain phenomena occur in the atmosphere
2. Know that weather elements are measured by instruments
3. Be familiar with weather terminology

Return to Physics Index

Using the Senses as a Means of Observation

Joe Scales	Brennemann
942 E 76st.	4251 N. Clarendon Ave.
Chicago IL. 60619	Chicago IL.
312-224-2884	312-880-8467

Objective:

The purpose of this activity is to have students use their senses in various situations. The situations are such that students find out that their senses are not always accurate.

Material needed:

(For each group of four)
Orange juice, nondiet cola, apples, candy (such as mint or lemon drops), plastic dishpans or washbasins, (large battery jar instead of plastic dishpans or washbasins), large beaker.

Strategy:

On the day before beginning the activity make sure the materials needed are available. If you do not have foodstuffs such as sugar, table salt, flour, baking soda, corn starch, etc., in the laboratory, you may wish to have students bring them from home.

Class activity:

1) The instructor will lecture to the class giving them examples of the various types of senses, smell, taste, hearing, seeing and touch.
2) Encourage student participation.
3) Allow student to practice at various stations attempting to prove their theory of which sense is most important.

Expected results:

The expected outcome of the five activities are such that the students understand that there is not a dominant nor non-dominant sense. In order to identify various sensations correctly you need all five senses.

Return to Physics Index

Reading a Weather Map

Robert A. Urbanek
2719 W. 83rd St.
Chicago, IL 60652
312-476-6985

Bloom Township H.S.
10th & Dixie Highway
Chicago Heights, IL
708-755-1122

Objective:

To enter the data from a weather report as it currently appears in the daily newspaper. The cities needed to make a comprehensive report should be preselected by the person recording in advance. There should be enough cities on the map to make an accurate report for your purposes. After the cities are entered, write the temperature for each city for that day. Draw very lightly, a line between each city with temperature of at least 10º. If you wish more accuracy for your area you may record a temperature of 5º difference for each line. For example, all cities with a temperature between 70º and 74º are between temperature lines of 70º and 75º. When completed the lines should form a contour of irregular or wavy lines. The contour lines should show a pattern of similar temperatures between the lines of temperature gradients, and across the entire country. To get a better picture of how a weather pattern moves and develops, a map should be made for at least 5 consecutive days.

Materials Needed:

The following materials are needed for each group of 5 students:
1) the weather page from a local newspaper for five consecutive days which gives the weather report from several cities across the entire country
2) a sheet of erasable tracing paper
3) a pencil with eraser
4) rubber cement
5) and if possible a small table or lab counter so that the group can all work together
6) a sheet of graph paper

One of the following is needed for the entire class:
1) an overhead projector
2) an transparency of a United States map with or without major cities
3) at least 4 different colored marking pens for transparencies
4) a transparency of graph paper
5) a transparency of previously plotted contour lines on the same map as above

Strategy:

INSTRUCTORS PREPARATION:
1) Plot and mark the desired cities on the transparency map.
2) Start the students off by drawing in at least one contour line, remembering that each student has a different daily weather record.
3) Go around the room working with each group to insure some degree of accuracy and participation.

CLASS ACTIVITIES:
1) Have students plot the location of the desired and/or missing cities.
2) Mark the high temperature for the cities from the weather data chart on their copy, as near as possible to the cities plotted on their maps.

3) Have students plot a line first by separating each city by temperature range in 10º Fahrenheit.
4) Try to connect lines of similar temperature as much as possible.
5) If there is a void over a large area or the lines do not seem to connect seek additional data for missing cities by checking another newspaper or contact the teacher.
6) Students then will choose one city and construct a bar graph of both high and low temperatures for a 5 day period.
7) Compare and/or observe this graph against that of another city and discuss the value of collecting weather data from more than one city.

Conclusions:

This activity is designed to show the value of collecting weather data from all over the country and how this data is used to construct a weather map. Then, using the data for an single location, make a 5 day forecast. The student could be shown how to enhance their map with the use of colored pencils or crayons.

Return to Physics Index

Vectors Via the Calculator (For Non-Math Students)

Junievicz, Alex Gordon Tech
3317 S. Halsted St.
Chicago, IL 60608-6705
1-312-927-6266

Objective

To be able to resolve vector problems without knowledge of algebra or math. Give the student with poor math a chance of passing the course.

Apparatus Needed

Scientific Calculator with Sin, Cos, and Tan.
A Ball of yarn for demonstrating vector-Soft so as not to hurt a student hit with it.
Optional Overhead and overlay of vector-triangle.

Recommended Strategy

First, using the yarn tossed to the class, demonstrate the difference between regular and polar coordinates and that a vector must have a vertex and an angle. A sign on the string may help define the vector.

Next, use a worksheet that explains the steps of using the calculator. (Caution there are some calculators that you enter sin then the angle, where on most you enter the angle and then the function.) Be sure to include the use of the bracket (-). Also before demonstrations, check your calculator to be sure it is in the correct mode by using a known angle i.e., 30 degrees.

DO NOT USE the Pythagorean theorem, but use the Trig functions.

Demonstrate resolving two (or more) vectors using the Horizontal, --saving in memory--calculating the Vertical, dividing, and using the arc-tan to get the angle. Vector A is 2 units at 30 degrees, Vector B is 4 units at 120 Degrees. Find the resultant angle, and length. ----Be sure the memory is cleared----Save Horizontal in memory---
((2(30Cos))+(4(120Cos))m+Divide(2(30Sin)+(4(120Sin))ArcTan
Gives the angle now to find the magnitude
(Write down the angle found)
Using the trig formula R = Adj / Cos Find R
Mr divided angle previously found Cos = Vector Magnitude.

Have the student copy an example as it is worked out for his own notes. A pass out sheet double size 11 x 16 with references and examples functions well.

Return to Physics Index

Calorimetry

Martin, Daniel
9531 S. Damen
Chicago, IL 60643
1-312-238-0043

Chicago H.S. for Agricultural Sciences
1-312-881-5000

Objectives

1. To learn basic principles of calorimetry.
2. To recognize the large amount of energy stored in food.
3. To learn to solve problems associated with calorimetry.

Equipment and Materials

2 Aluminum pop cans
3 small wood or sheet metal screws
1 paper clip
1 peanut half
1 thumb tack

Recommended Strategy

Construct a simple calorimeter by punching three holes in the bottom rim of a pop can equal distances apart and inserting the screws. Now put a hole in the bottom of the same can by sectioning the aluminum and bending it inward. Next drill a hole through the bottom rim large enough to allow a paper clip to be passed through. Finally, cut a rectangular port hole in the can about one inch from the bottom rim. The other pop can should fit snugly on top of the inverted burner pop can at this point. Now measure out a known amount of water and pour it into the whole pop can and record its temperature. Next mass and puncture a peanut half (dry roasted won't work as well) with a thumb tack. With the hole started, impale the peanut on a stretched out paper clip. Remove the peanut, hold it in the center of the top of the burner can and insert the paper clip through the hole in the can and the peanut, resting the end of the clip on the rim of the can. Place the can with the water on top of the burner can and ignite the peanut with a wooden match using the port hole for access. Let the peanut burn out completely and immediately record the temperature of the water. You can now make various calculations and determine the calories released by the peanut, calories per gram of peanut and even a percent error using a known value for peanuts which can be found in a calorie counting table.

Heat given off by peanut = mass of H_2O X change in temp of H_2O X specific heat of H_2O

The short form of the equation is $Q = m*dT*C_p$

Return to Physics Index

10Huh?

Coleman, Roy
10549 S. Homan Ave.
Chicago, Illinois 60655
238-2305

Morgan Park High School
881-5050

Objectives:

To give students some practice at making **reasonable** estimates.

Apparatus Needed:

A good imagination.

Recommended Strategy:

Listed below are a series of questions which probably cannot be easily answered directly but where an answer to the nearest power of ten can, with some 'educated' guesses, be arrived at. (By nearest power of ten, is the answer closer to 10^1(=10), 10^2(=100), 10^3(=1000), 10^4(=10000), etc.) In each of the following questions, parts in square brackets [] represent something that should be replaced with a specific part or object peculiar to your school. It is good practice to have the students explain how they arrived at their answers since there can be some very creative ways of interpreting the questions.

Example: Question - To the nearest power of ten, how many times does a car tire go around while driving to Florida?
Answer (or how to get close) -

	Estimates	actual
distance (miles)	1500	about 1200 to the center of the state
feet per mile	5000	5280
feet for 1 tire rotation	10	about 10 depending on car (3.14 X 2.7)
	750,000	630,000

(rounded to 1,000,000 or 10^6)

To the nearest power of ten, how many:

1) total times does a toilet paper roll go around while the paper is being removed?

2) blades of grass are there in [pick some bounded area they can see from the window]?

3) floor tile are there in the building you are currently in?

4) telephones are there in the city of Chicago?

5) teeth are there in the school building on the average school day? (creative students may include comb, zipper and/or gear teeth)

6) light bulbs are there in the school? (are fluorescent tubes bulbs?)

7) automobile tires are there in Chicago on the average week day?

8) street lights are there in Chicago?

9) leaves on the average tree? (ask in spring or early fall)

10) molecules in the average human body?

11) seconds does the average American live?

12) letters are there in your text book? (creative students may answer 1 - 26 to the nearest power of ten i.e. 10^1- 26 is WRONG since it is either not a power of ten or there are more letters than in the entire library - 10^{26}!)

13) books are there in the school library?

14) steps does the average student take while moving around in the school on the average school day?

15) hairs on the average house cat? (or dog or human head)

16) millimeters high is the school?

17) snow flakes are covering the [pick an area they can see from the window]?

18) black ants does it take to fill a bath tub? (careful about asking this question verbally since creative black students may answer 1 (or 10^0) thinking you mean aunt instead of ant!)

19) stair steps to the moon?

20) sheets of paper are used in the school during the average school year?

21) ping-pong balls does it take to fill the classroom? (basketballs, human heads, etc.)

22) ice cubes could you make if you froze lake Michigan?

23) grooves are there on a 33.3 rpm record that plays for 20 minutes on each side? (10^0=1 - there are really 2, one on each side but to the nearest power of ten, the answer must be 10^0 (or 1))

24) gallons of water fall on Chicago in an average thunderstorm?

25) keys are there in the school on the average school day? (including keys on calculators?)

A real zinger for creative students - To the nearest power of ten, how many students in the school are BOTH male and female? (If they answer 0, 10^0=1 and that means they are answering that one student is both male and female! They really should answer negative infinity since the only way to get zero is to have $10^{-infinity}$.)

Return to Physics Index

To Construct An "ALTITUDE LOCATOR" To Find the Height of the Building, Height of the Tree and Height of Any Given Objects

Desai, Jyotiben
5205 S. Homan
Chicago, IL 60632
737-6113

Schurz High School
794-8120

Objectives:

To learn to define the terms like Altitude, Ratio, Proportion, Similar triangle.
To learn to construct an "Altitude Locator"
To use Altitude Locator to find the angular distance of the Building and the angular distance of the tree.
To construct the similar triangles and determine the height of the building and the height of the tree.

Apparatus needed:

Construction paper, glue, scotch tape, stapler, scissors, strings, paper clips, straws.

Procedure:

Glue the copy of the protractor to the card board and punch a hole in the middle of the Ruler side. Hang a paper clip through the string and pass it through the hole in the protractor. Paste a straw on the ruler side horizontally using the glue or the scotch tape. Look through the hole of the straw to locate the top of the building or the top of the tree and measure the angle of elevation E. Also measure the distance from the base of the object to the person B1. Find the height of the person from the ground to the Eye-level h1. Construct a similar right angle triangle with same angle of elevation.

```
      A
      |\
      | \
   T  |E \                                  D
   R  |   \
   E  |    \                                |\
   E  |     \                               |E\
    H1|      \                              |  \
      |       \                             |   \
      |  O     \                          H |    \
      |90       \                           |  O  \
    K ------------ C                        |90    \
      |     B1   |                          |--------
      |          |                        F     B     G
```

```
      |        h1|
      |          |
      ------------
```

Right angle triangle AKC is similar to DFG(Construction).
Angle KAC=FDG(Construction).
Angle AKC=DFG(Right angle).

```
         Therefore   H1   H
                     -- = --
                     B1   B

                     H1 = H (B1)
                          --
                          B
```

If B1=23.3 meter and B=10 cm. and H=5 cm., h1=1.52 m.

```
                          5cm.(23.3 m)
                          --------------=11.65m
                           10cm.
```

```
H=H1+h1
  11.65+1.52=13.17m.
```

Therefore the height of the tree is 13.17 meter.

We can also find the height of the building using the same method.

Return to Physics Index

Measurement

Johnson, Levi
360 E. Randolph
Chicago, IL
938-3518

James Otis Elementary
666-4072

Objectives:

Given the meter as an initial unit, the student will be able to see the value and relationships of units less than and greater than the meter.

Students will be able to choose the appropriate unit of measure in relation to the linear distance required to measure.

The student will measure within one tenth or less accuracy with each instrument.

Students will be able to show by plotting on histograms linear relationships.

Materials:

Cuisenaire rods, tennis and superballs, string, ten metersticks, tape measure (various size measuring utensils are optional), graph paper about 1 cm square, and stop watch.

Strategies:

Mark off four to five stations labeled A, B, etc.

Station A student will determine his or her time walking a distance of ten meters and record that time.

Station B student will measure arm span versus height. Write in on chalk board and graph when this is complete for the class.

Station C student will test his/her ability to jump horizontally. One student jumps and another makes a mark where lead foot lands and measure in centimeters and record.

Station D student will guess their head size and then measure with tape measure. They will also make comparisons of the sizes of utensils in relation to teaspoon, tablespoon and cup. All of their data are recorded and later compared.

At the end of this activity, students will write a poem or make a rap song about the activity.

Using A Video Camera In the Physics Classroom
(In this case to find the value of "g")

Skalinder, Eric
1330 Main
Evanston, IL 60202
869 - 7308

Francis W. Parker
549 - 0172

Objectives:

To use equipment that is interesting to the students (a video camera and a VCR) as a data gathering tool.
To use the video tape produced in analyzing and understanding motion.

Apparatus Needed:

1. Video camera on a tripod, VCR with "freeze frame" capability and one **new** blank video cassette.
2. Two or three meter sticks.
3. A large, heavy object to drop (needs to be easily visible and not significantly effected by air friction).
4. An effective timing device accurate to hundredths of a second, preferably something that can be clearly seen on the video screen.
5. Five or six plain sheets of paper.

Recommended Strategy:

Tape the meter sticks vertically on the wall end to end and tape the sheets of paper next to the meter sticks every half meter. Beginning at the top sheet draw large heavy lines each half meter and label them appropriately (0, .50, 1.00, 1.50, etc.) These will serve as visual distance reference points on the video screen as the object is dropped.

Look on the video screen and make sure that the whole vertical drop and the stopwatch are visible without camera motion. Start the video tape recorder in the "record" mode. Start the stop watch running. Have someone in the video picture visibly "count" (by raising and lowering their arm) "1, 2, 3" and on "3" another person will drop the object from the "0" meter mark (the bottom of the object should be at the mark.) After it has fallen, stop the video recorder and rewind to the starting point. You should have a video tape recording of the experiment.

Two quantities must then be observed: the distance (d) the object fell and the time (t) that it took to fall that far. Look at the tape which you have made and attempt to freeze frame the object **just** as it is released. This will take many attempts unless your video recorder has a feature which allows you to step through the tape frame by frame. When you believe you have the object frozen as close to the instant of release as possible, note the time (t_0) showing on the stopwatch. (If you have trouble reading the stopwatch it is probably because you are using a portion of the tape which has previous material recorded on that segment. You must use a previously unused portion of tape to see clearly.) Now advance the tape to a "freeze" position where the distance fallen (d) is easily "seeable", probably at a place on the large sheets of paper, and note the time (t_f). Again, it will probably take many tries to stop the tape in a position where you can be sure of the distance the object has fallen and the time it took to fall that far unless you have frame by frame capability.

The only further work left is calculation. Time (t) = $t_f - t_0$. Now substitute the values of "d" and "t" into the equation for uniform acceleration of an object from rest "g" = $2\ d\ /\ t^2$ and you have a value for the acceleration due to gravity. I would ask the students to state how certain they are of their results using this method.

A Potpourri of Science Ideas

Group Mini Teach

Finding Pi

Foreman, Dorothy Joplin School

Objective:

To measure the circumference and the diameter of various cylinders, and to use the ratio C/D to find pi.

Apparatus Needed:

metric rulers, string, graph paper, tape, cylinders of various sizes.

Recommended Strategy:

Roll the cylinders one complete revolution and measure the distance traveled. Use string to measure the diameter. Make a data table. Make a pi graph. Use the pi graph to calculate the constant ratio pi. (Students should discover a direct proportion between the variables).

Return to Physics Index

Computerized Problem Review

Mini Teach Group Summary
Donna Allen
Joytiben Desai
Albert Oldenburg

Objectives:

To summarize the concepts of distance, velocity, vectors, and acceleration. To develop the methods of the problem solving and specific techniques. To give the students a form of computerized problem review.

Materials:

Notebook paper, pencil, chalk, T-V monitor, VHS recorder, several sheets to be handed out (data necessary for ten problem repeats for each problem).

Strategy:

I. Perspective and Update

A. The students became acquainted with and somewhat proficient in l;measuring length, area, volume, time, mass, and various units of each. Also vectors, scalars, error analysis, significant figures, scientific notation, computer notation, orders of magnitude, graphing, direct and inverse proportions.
B. The students have outlined the chapter(s). A form and procedure were given.
C. Lectures and discussions were presented and developed.
D. Quizzes were used to encourage and enhance their concept knowledge (10-20 questions, T,F, or multiple choice scantron, 10-15 min).
E. Experiments are used as a hands on first hand experience of the concepts and their interactions.
F. The examples of the problems are to abbreviate and quantize the concepts, and also to show how they work together are developed during our lecture and discussion periods.
G. A problem assignment is then given the students. In this case problems 1-7 page 47 were assigned.

II. Procedure for Solving Physics Problems

A. From some previous experience in solving any word problem and most physics are word problems, we know that there are key words and tricks to get them solved.
B. O.K. now what are the key words in the first problem, in order? Write them down on your paper.
C. Trick 1. Now since physics problems are similar to math problems we will use the first letter of each word to represent that word like an abbreviation of that word and label each number that we know from the problem.
D. Trick 2. What letter or letters don't we know or have a number

for? Write these down also.

E. Trick 3. How does this unknown letter work together with the known letters?

F. If we are stuck here we could go back to our definitions of our vocabulary to help us out and refresh our memory.

G. In order to keep the problems organized I would like the student to use this simple form from now on in physics.

(page no.),(problem no.)

47-1. Given: (diagram included),(equation form definitions)

Eqn:

Subst:

Ans/units:

H. After this the problems 1-7,pg.47, are assigned for the next day.

I. These problems are handed in the next day. Then I present the students with a ditto sheet of a repeat of from five to ten problems for each problem of the text book assigned problems.

III Computerized Review

A. A computer with a monitor is set up for use in front of the classroom.

B. A program is loaded into the computer and made to appear on the monitor.

C. This program is our review program for doing the problems on page 47 (text) in this case.

D. At this point a student may be asked to operate the computer with the teacher's guidance to enter the appropriate responses.

E. Briefly the program consists of (in basic) a looping statement (to repeat the problem four times), several input statements to input data for the specified problem, an equation to solve the problem, an output print statement to visually see on the screen the answer to the problem, then a next statement to repeat or go back and redo the same problem as many times as the "FOR" statement declared.

F. Then we take the firs four of these problems and develop them according to our physics problem solving procedure on paper concurrently while developing them on the computer monitor screen.

G. We then compare the student papers with the computer monitor screen to see if we are on the right track.

H. After three repeats of each problem, that is each student is writing down the given, equation, substitution, answer/units for each repeat, we move on to the next problem.

I. We then do as many problems with three repeats as time permits.

J. Just before the bell rings I tell the students that they can do as many problems from the ditto sheets as they can and they are to be turned in as more homework problems with certain amount of credit attached.

K. The chapter or unit test is usually predetermined and occurs on the day the problems are handed in.

L. The problems are handed in upon entering class and the students usually seat themselves quietly and quickly to proceed to take their test.

IV. Conclusion:

A. When the students have the opportunity to do this computer review their test scores typically are two to three times those of comparable tests taken without the review.

B. Nearly all the students that participate enjoy and look forward to doing these computer reviews.

Return to Physics Index

AN ALTERNATIVE TEMPERATURE MEASUREMENT

V. K. Brown

Lindbloom T. H. S.
6130 S.Wolcott Ave.
Chicago IL 60636
1-312-624-6264

OBJECTIVES:

Show: (1) alternative method of temperature measurement, (2) thermal expansion of gasses.

EQUIPMENT:

500 ml flask, ring stand, test tube clamp, half-meter-long glass tube, one-hole rubber stopper, thermometer, beaker, graduated cylinder, 2 lb coffee can (or other container large enough to hold sufficient warm water to cover the flask), stamp pad ink or other water coloring substance.

STRATEGY:

This is probably best done as a demonstration, at least for the first time. Fill the beaker mostly full of water, and add enough coloring to make water in the glass tube clearly visible. Insert the glass tube into the stopper. Fill the coffee can with water at about 30ºC, and hold the empty flask almost completely under water with the test tube clamp. Put the stopper in the flask with perhaps 35 cm or so of the glass tube sticking up out of the stopper. Measure the temperature of the room as exactly as possible, and then after perhaps 5 minutes, carefully measure the temperature of the water. Now place a wet finger over the end of the tube and then remove the flask, tube, stopper and all, from the coffee can. Immerse the open end of the tube in the colored water in the beaker, and then remove your finger. Finally, place the neck of the flask in the test tube clamp so that you don't have to stand there holding it and looking foolish. As time passes, the colored water will climb slowly up the glass tube toward the flask.

The exact form for discussing this phenomenon will of course depend on both the instructor and the class. Students might be asked why the water rises, for example. When temperature is suggested, perhaps the class could be asked whether the flask warmed up or cooled off as the water rose. After this, a student might wish to test the temperature of the water in the coffee can with a finger, and then put a hand on the flask to see whether the flask is warmer or cooler than the water. Because of the relatively small difference between the two temperatures, it may be necessary to reveal both the initial (warm) and final (cold) readings of the flask temperature. While the student holds his or her hand on the flask, it may be observed that the water height decreases, and the class may again be asked for the reasons. If more than one is suggested, the students may be asked to propose experiments that might determine what the most important factor actually is.

The class may wish to use the device to measure relative temperatures of the hands of different individuals. If they do, it should be suggested that they determine afterward whether the height of the water at room temperature is still what it was in the beginning. (It won't be, in all probability.)

QUANTITATIVE TREATMENT of the topic turns out to be decidedly non-trivial, and is **not recommended** for most high school classes. If one or more advanced students wish to try, however, the example below uses results obtained during a trial in the summer of 1986. The capacity of the flask with the stopper inserted was 541 ml. The glass tube (one of unusually large diameter) was 48.3 cm long and, when full, held 18.5 ml of water. Room temperature that day was 21.6ºC, and the temperature of the warm water was 28.3ºC.

The colored water rose 17.7 cm in the tube while the flask was inverted. Allowing 2 for the air in the tube, the warm volume was thus about 554.4 ml. Atmospheric pressure is normally about 76.0 cm of mercury. Since we were using water, and mercury is about 13.6 times as heavy as an equal volume of water, normal atmospheric pressure would be about 1034 cm of water. Initial warm volume would thus be about 554.4 ml, and final cold volume would be 547.6 ml. It would seem that the Ideal Gas Law should apply, especially over such a small temperature range. If it did, then we could use the Ideal Gas Law equation

$$P_H V_H / T_H = P_C V_C / T_C,$$

where P=pressure, V=volume and T=temperature **on the Kelvin scale**. Then assuming the original pressure to be atmospheric pressure, we could calculate the final pressure. Using the values supplied above, the result is 1023.56 cm of water. On reflection, however, this just can't be. The atmosphere actually provides not only the pressure on the air inside the flask, but also **enough to support that 17.7 cm of water** as well. The actual pressure on the air inside the inverted flask must therefore be **less** than 1034 cm of water by 17.7 cm, or 1016.3 cm of water. What's wrong?

The main culprit is the fact that water vapor (from the moisture of the stopper, flask, tube, etc.) is by no means an ideal gas, and it therefore does not follow the equation given (although air works quite well). The **Handbook of Chemistry and Physics** gives the vapor pressure of water at 21.6ºC as 19.349 cm of mercury, and that of water at 28.3ºC as 28.848 cm of mercury. Since water vapor pressure at room temperature made up 2.59% of the 1016.3 cm of water (74.70 cm of mercury) that was the total pressure, then the same percentage of the contents of the flask must have been water vapor - which would come to about 14.18 ml, leaving the volume of air as only 533.4 ml at room temperature. Similarly, using the actual warm pressure of 1034 cm of water (or 76.0 cm of mercury) and the actual combined air-and-vapor warm volume of 554.4 ml gives us a volume of warm water vapor of 21.04 ml, almost 50% more. This means the volume of warm dry air was really 533.36 ml, virtually unchanged despite the difference in temperatures!

Using 533.4 ml as the volume of warm dry air and the gas law, along with the reduced pressure after cooling, we find that the final volume of the cold dry air alone **should** have been 530.6 ml. This, added to the 14.2 ml volume of water vapor, would give a final volume of 544.8 ml, instead of the 547.6 ml actually observed. Considering the volume-per-centimeter of the glass tube, that would mean that the water should rise about 7.3 cm **more** than it actually did.

The latter figure is not entirely accurate either, however. If the water in the tube rose further, the pressure would have been lessened and the total volume of the cold sample increased because of that reason, and thus the deficiency in height would be less. Further, as time went on, the height of the water in the tube dropped visibly, indicating some leakage in the system. Additionally, the original and final temperatures were measured only indirectly and may not have been entirely accurate. During the demonstration, a calculation based upon the coefficient of linear expansion of Pyrex glass indicated a negligible effect.

PERSISTENCE OF VISION

Rudy Keil

Schurz High School
3601 N. Milwaukee Ave.
Chicago, IL 60641
1-312-794-8120

OBJECTIVES:

1.To build a persistence of vision model of flying birds.
2.To relate this model to persistence of vision in viewing movies.

MATERIALS:

1. Assorted short strips of movie film.
2. Two slotted circles duplicated on stiff paper.
3. One set of eight birds in various positions of flight.
4. One blunt pencil, four strips of masking tape,one sharp scissors.

STRATEGIES:

Give each student a strip of movie film and have students observe the individual frames.

Distribute materials for the flying birds model. Have students cut two slotted circles and eight slotted bird pictures. Wrap a few turns of masking tape near the blunt end of a pencil. Place one of the circles over the blunt end of the pencil and secure with tape.

Slide the top of bird picture #1 into one of the slots in the circle. Tape the second circle to the pencil so that the lower slot of #1 bird fits into a slot in the second lower circle. Insert birds #2 to #8.

Have your students rotate the flying birds. Ask them to explain why the birds appear to fly.

Refer to the strip of movie film again. Have your students relate the persistence of vision phenomena of the flying birds model to the movement caused by changing frames of film in a movie.

-SMILE-

Science and Mathematics Initiative for Learning Enhancement

The SMILE program is designed to enhance the elementary and high school learning of Science and Mathematics through the use of the phenomenological approach. For a brief course description/syllabus click here.

Between 1986 and 1997 each summer session participant was asked to create and publish a single concept lesson plan. These lesson plans include the materials needed, a suggested strategy and expected outcomes. There are currently almost 900 of these lesson plans available (see subject indices below). In addition, starting in 1997 the participants in the academic year program have been asked to present a brief single concept lesson or idea. Summaries of the academic year lessons are at academic year notes. All of these lessons are available in the following formats:

1. A book of each summer's lessons. The cost of a book of all of the lessons developed during a single summer is $10.00. Contact Dr. Porter Johnson (312) 567- 5745, Dr. Ken Schug (312) 567-3438 or the departmental office at IIT (312) 567-3480 for availability.
2. A CD-ROM with all of the lessons (summer and academic year) and links from both this and the SMART web sites for $15.00US to a US address ($20US outside the United States). Contact Roy Coleman at Morgan Park High School (773) 535-2550 for availability.
3. Listings by subject are available by linking to any of the following:

Biology Chemistry Mathematics Physics

Awards and Reviews

Education Planet	Schoolzone International	NSTA Scilinks

StudyWeb	Big Chalk	Actionbioscience
Wired Patrol	Psigate	Schoolsnet

NOTE: If the following looks really bad or your browser doesn't support tables, try the old home page.

If you have a single concept lesson that you think might fit in with the SMILE concept or would like to see some lessons which have been contributed by persons other than SMILE participants jump to contributed lessons

SMILE has bi-weekly classes during the academic year and we are posting the notes from those classes. If you are interested, jump to academic year notes.

The SMILE PLUS program is a program designed for intensive training of a team of teachers who are from the same school. These teachers then go back to their home schools to provide inservice training for the remainder of the faculty and staff.

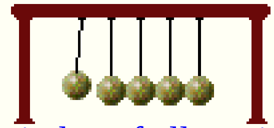
This section includes some general information developed by the SMILE program.

- Information on Science Fairs: How to start and run a Science Fair, Chicago Public Schools Science Fair information and NEIU's Science Fair Central.
- Sources of reference material
- Sources of hands on science equipment in the Chicago area

Photos of the 1997, 1998, 1999 and 2000 SMILE participants in action.

Web Addresses of internet sites for general interest in Science. IIT will occasionally offer Saturday classes for teachers and students on the World Wide Web and searching the Internet. For more information, contact Dr. Porter Johnson

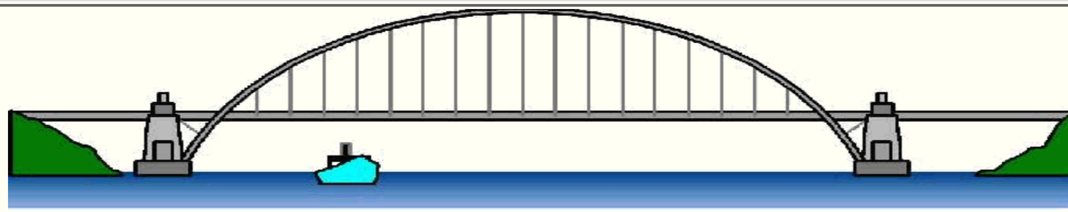
Fall 2004 schedule of classes.
First class and registration will be September 14.
Visitors are welcome to sit in on many of the classes.



The entire index of all sections is also available for you to search with your browser. However, be aware that this index is about 100K and takes a while to transfer.

 Additional lessons can be found on the SMART website. 

The SMART program is made possible by a generous grant from the Lucent Technologies Foundation.



Information on the High School Bridge Building Contest is available at the 'hsbridge' website.

NOTE: The area code of most of Chicago is now 773. IIT, however, is still in the 312 area code.

Charles Buzek - John Spry School

Gathering data about respiration

Charles Buzek
35 S. Kensington
LAGRANGE IL 60525
(708) 482-0024

John Spry School
2400 S. Marshall
CHICAGO IL 60613
(773) 535-1400

Objective(s):

To provide a means for the student to collect data which will further allow the student to analyze that data for the purpose of drawing conclusions.
To initiate in the student the need to design instruments for scientific inquiry and develop an appreciation for the accuracy of such measurements.

Materials Needed:

Balloons, rulers, and a conversion chart for cubic inches

Strategy:

This activity should be prefaced by a brainstorming session in which the students and instructor break down the various divisions of respiration. The students should arrive at three discrete events which can be used to collect data about the breathing process. These events will answer the following questions: 1) How much air do we breathe out normally? 2)Is there any air left in our lungs after we breathe normally? 3) How much is actually in our lungs when we breathe normally? These questions will lead to the following activities:

1) the subject will breathe normally then expel that air in a normal fashion into the balloon. The balloon will then be measured across its broadest part with a ruler.

2) the subject will breathe in and out normally then expel all remaining air into the balloon, exerting as much pressure on the lungs as possible to push out any remaining air. Again the balloon will be measured as above.

3) the subject will breathe in normally, then try to expel all the air that is in their lungs. Again measure as above.

These tests will provide the student with data concerning three aspects of the respiration process. At this point another brainstorming session is in order. What does the data tell us in isolation? Do we need to obtain data from a larger sample? How should that sample be constructed? Do we need to frame special questions relative to the sample group e.g. how do men and women compare in terms of respiration? Is there a size factor? These questions or others will determine how a sample group should be constituted.

Performance Assessment:

The instructor examines the data with the understanding that the measuring device is crude and will deliver data of varying quality. The students will construct a chart which delineates the information for their sample. Then the student will formulate a theory based on the data they have obtained. The student's successful accomplishment of the activity will be determined by how well the data fits the theory.

Conclusions:

This activity ought to be seen by the instructor as only incidentally being concerned with respiration. The emphasis in actuality is on experiment design and interpretation of data. These activities form the backbone of scientific inquiry and should collaterally be the foundation of science instruction.

Biology/Chemistry

Production of Sound

Valvasti Williams Jr.
9607 South Parnell
Chicago IL 60628

Perkins Bass Elementary School
1140 W. 66th.
Chicago IL 60621
(773) 535-3275

Objective(s):

1. Define the word sound
2. Compare/identify high and low pitches
3. Identify the vocal human anatomy
4. Classify the various forms music sound production

Materials Needed:

The teacher will need the following: overhead projector, chalkboard, transparency of *Anatomy involved in Vocal* Production, straws, scissors, speaker amplifier, and soprano recorders (instrument).

Strategy:

Step 1

Students will be given an explanation of the transparency of Vocal Anatomy. Instructor will give an explanation on the following: 1) vocabulary ----pitches, diaphragm, posture, lungs, brain interpretation, ears, etc. 2) demonstration of the vocal chords, 3) location of the anatomy that enables people to make sounds and 4) understanding and demonstrating frequency and vibrations.

Step 2

Instructor will hand out straws and scissors and instruct students to cut the straws into 3 different lengths. The students will then blow their breath over the opening and will discover (hopefully) that the length affects sound.

Step 3

Using a dummy microphone, students will learn to project, articulate and enunciate their voices. (This can be part of the lesson or can be done as enrichment activity). **Please note** that microphones can be researched and microphones can be created through an art project.

Step 4

Each student will be given a recorder (instrument). Instructor will discuss the mechanics of the instrument. The instructor will demonstrate how vocal anatomy is used to play this instrument.

Step 5

Instructor will demonstrate and teach the students how to play a simple tune on a recorder.

Performance Assessment:

The students will be able to:

- discuss the parts of the vocal anatomy that help to produce sound.
- fill in the name three parts of the vocal anatomy and their location on a human body worksheet
- will be to perform using their straw instruments high and low pitches
- will be able to perform on their recorders Three Blind Mice
- write definition of sound

Biology/Chemistry

Feely Balloons

Winnie Koo
3752 S. Wallace Street
Chicago IL 60609
(773) 247-3727

Ravenswood School
4332 N. Paulina Street
Chicago IL 60613
(773) 534-5525

Objective:

Students investigate unknown solids using the sense of touch

Materials Needed:

3-5 small zipper type plastic bags or baby food jars,

3-5 uninflated balloons (each of a different color)

Wide-stemmed funnel

3-5 types of solids with which to fill the balloons such as the following: rice,

beans, salt, powder such as flour and corn starch

Strategy:

1. Instruct students to use their senses (except taste) to investigate the set of balloons and answer Questions 1 – 4 on the "Mystery Solid" Observation Sheet (provided).
2. After ample investigation time, have the groups record what the thing is inside each balloon on the Observation Sheet.
3. Call on each group, asking the spokesperson to tell what the group thinks the contents are and to provide some supporting evidence for these conclusions.
4. Ask students what they might use to make the task of identifying the balloon contents easier, but remind them that they still cannot open or cut the balloons. After discussion, give each group a set of reference containers, telling them that the reference containers hold the same materials as the Feely Balloons
5. Ask students to match balloons with sample containers and record their matches on their Observation Sheets.
6. Reveal the actual contents of the balloons by cutting open one of the sets of balloons and allowing students to examine the contents.

Performance Assessment:

Partner pairs of students. Direct each student to explain to their partner how they made their decision about which solid was in the balloon.

Investigating the Nervous System

Barbara J. Baker
Box 53371
Chicago IL 60653
(312) 720-0648

Doolittle West Primary
521 East 35th Street
Chicago IL 60616
(773) 535-1050

Objective(s):

To investigate which end of an earthworm is more sensitive to odors, light and sound. This lesson could be used for students who are kindergarten through seventh grades.

To investigate why you can't tickle your own foot

Materials Needed:

Paper towels, cotton swabs, flashlights, nail polish remover, vinegar, earthworms and graph paper

Strategy:

SOUND

After placing the earthworms on a paper towel, students will work with a partner to investigate how earthworms respond to stimuli like snap of the finger, clap of the hands, singing the scale in a high pitched voice as well as a low pitched voice. One partner will be responsible for recording what reaction the earthworm made to each of the above sounds. The above steps would be repeated with the other partner recording.

LIGHT

An investigation of how the earthworms respond to the flashlight rays beaming on the front and the rear of the worm. The responses will be again recorded on the graph paper.

SMELL

Dip the cotton swap in nail polish remover. Place the swap near the worm's brain, middle of body and the end of the worm. Record the responses. Place some vinegar on the other end of the cotton swap. Now place the vinegar soaked swap near the worm's brain, middle of body and the end of the worm. Note and record what responses occurred.

Performance Assessments:

The oral discussion will illustrate that the students understand the earthworm has no eyes, that is why there was no response to the flashlight on any part of the earthworm's body.

Reading and interpreting the graph on the responses of the earthworms to various sounds.

The earthworm does not a nose but they have a nervous system that responds to stimuli such as odors.

Students will draw the brain, nerve cord and nervous system of the earthworm by looking at the handout.

They will explain why when the worm is cut in half both sections of the body continues to move.

The answer is each body segment also has a mass of nerve tissue that controls activities within the segment.

What Happens When You Eat?

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60451
(708) 460-5022

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815) 485-7655

Objectives:

These activities will show students what organs aid in digestion and how digestion occurs in the human body. This lesson maybe appropriate for middle grades, but is designed for the upper grade curricula.

Materials Needed:

Activity #1: How Long is the Digestive System?
- yarn (at least 4 different colors)

Activity #2: Digestion
- sugar cubes
- granulated sugar
- 2 clear cups filled with water

Activity #3: Carbohydrate Digestion
- unsalted soda crackers (2 per student)

Activity #4: Hands on Digestion
- a small lump of hamburger (meatball size)
- one plastic baggie
- 1M HCl
- Digestive Juice A (pepsin, trypsin and water)
- Digestive Juice B (bile salts, pancreatin enzyme and water)

Activity #5: How do Villi aid the Small Intestine in Absorption?
- paper towels (10 per group)
- 4 cups of an equal amount of water
- graduated cylinder

Activity #6: A Digestive System Simulation
- large thin plastic bag
- paper sacks (2 sizes)
- M&M's candy
- markers & paper
- trash can
- newspaper
- Zip-lock bags
- masking tape
- sponges
- labeled spray bottles of water

Strategy:

Activity #1: How Long is the Digestive System

Have students cut a piece of yarn according to the following measurements. Allow students to use different color yarn to represent different organs. After the yarn has been cut tie the pieces together.

Esophagus	25 cm
Stomach	20 cm

Small Intestine	700 cm
Large Intestine	**150 cm**
TOTAL	895 cm

Activity #2: Digestion

Place a sugar cube in a cup of water. Place about a spoonful of granulated sugar in the other cup of water. Observe what happens.

Activity #3: Carbohydrate Digestion

Have the students chew two unsalted soda crackers for two minutes without swallowing.

Activity #4: Hands on Digestion

Place the hamburger, 3 eyedroppers full of 1M HCl, one tablespoon of Digestive Juice A and two tablespoons of Digestive Juice B into a plastic bag. Knead the bad with your hands (simulates the stomach) for about 10-15 minutes, it will have been reduced to mainly liquid and have a definite odor.

Activity #5: How do Villi aid the Small Intestine in Absorption?

Compare how 1, 2, 3, and 4 folded paper towels absorb. Dip each paper towel into a cup of water (use the same amount of water in each cup). Record the volume of water left in the cup (using a graduated cylinder).

Activity #6: A Digestive System Simulation

Procedure:

Things to make ahead of time:

1. FOOD TUBE: Lay out two parallel lines of tape on the floor, 3' apart and long enough for half the class to stand shoulder to shoulder on one side of the parallel lines.
2. FOOD PARTICLE: The food particle consists of M&M's placed in small zip-lock bags. These are placed in wadded newspapers in small paper sacks. Place the small sacks in larger sacks with added newspaper. Place all sacks and add newspaper until the large plastic bag is full. This bag is then taped or tied closed to complete the food particle.

Action:

1. Peristaltic Movement: Put the food particle to be eaten at one end of the food tube and a large trash can at the other. Have students line up on both sides, facing each other, squeeze the food particle the length of the food tube.

2. Digestion: Label and/or instruct the players. As the food comes to a student they should narrate what they are doing and why.

   Teeth - tear food apart (break plastic bag)
   Saliva - use spray bottles to moisten food particle
   Stomach - tear small bags apart
   Pancreatic juices - spray food
   Small Intestine - absorbs food, find bags of candy and pass to blood (the teacher can play the role of the blood)
   Large Intestine - reabsorbs water, sponge up water on the floor
   Rectum/Anus - puts the waste papers in the trash can

Performance Assessment:

At the completion of this lesson students should be able to answer the following questions:

1. What system in your body is the same length as the completed piece of yarn? What is it's length (in centimeters, in feet)?
2. From your observations in Activity #2, what can you conclude must be done to food before digestion begins?
3. What physical and chemical changes occurred to the soda cracker?
4. What caused the physical and chemical changes to the soda cracker?
5. Did you notice a taste change in the soda cracker?
6. How was mechanical digestion simulated in Activity #4.
7. What evidence was their that chemical digestion occurred in the hamburger?
8. Which paper towel had the largest surface area?
9. Which cup had the highest volume of water left?
10. How do the villi (of the small intestine) aid in absorption?
11. Follow the path of a food particle through the digestive system; include the organs and their functions.

Conclusion:

These six activities will enhance the student's knowledge of what organs aid in digestion and how digestion occurs in the human body. Students will have a more comprehensive understanding of what happens in their bodies when they eat.

Return to Biology Index

Taste, Smell, Touch

Rocenetta Jacobs
2053 East 93rd Street
Chicago IL 60617
(773) 264-6068

Roswell B. Mason Elementary School
4217 West 18th Street
Chicago IL 60623
(773) 534-1530

Objective:

This lesson is designed for grades third through sixth, although it can be modified for any grade level. The objective is to compare and describe objects by using the senses of touch, smell, and taste, and to demonstrate more clearly how a single sense works by eliminating one of the other senses.

Materials Needed:

1 meter measuring stick
1 spray bottle of perfume (any brand)
dixie cups (number will vary depending upon class size)
hot water (not scalding)
ice cold water
vanilla extract
lemons or lemon juice (your choice)
plain water
vinegar
tonic water
Soda - Coke and Pepsi
Various fruits of different textures and flavors
Assorted items of varying textures i.e.; felt, fabric, carpet samples, piece of marble, sandpaper, leather, wood, etc.
straight pins or tweezers (depending upon age of children)

ACTIVITY #1: TOUCH

Strategy: Students will experience different sensations when the skin is stimulated by touch, pressure, heat, and cold.

To demonstrate the sensation of Pressure: Have the students place their index fingers together and push. The fingers will create a sense of pressure on each other.

To demonstrate the sensation of Heat and Cold: The students will place their fingers into two cups of water simultaneously, one cup of ice water and one cup of hot water. Observe the sensation that your body temperature will adjust to the temperature of the water after a few moments.

To demonstrate the sensation of Touch: Place items of varying textures into a bag or mystery box. Have students close their eyes (or blindfold them), and have them pick an item. They are to describe the item and attempt to identify it based only on the way it feels.

To demonstrate how well the touch sensors are able to distinguish two or more closely spaced objects: Cut three pieces of cardboard and push one straight pin into a piece; two into another; and three into a third. Have students gently touch each pin with a finger and try to determine the number of pins, one, two or three. Each child should be blindfolded or have eyes closed. If children are too young you may substitute with the tweezers.

ACTIVITY #2: SMELL

STRATEGY: Students will investigate both the acuity of the sensation of smell by sniffing various items, and how scents diffuse through air.

The instructor will place four bottles covered and labeled A, B, C, D on a table. Each bottle will contain one of the following liquids: vinegar, vanilla flavoring, lemon juice, plain water. The students will sniff each bottle and write down what they think the contents are. After all students have sniffed the bottles the instructor can tabulate the guesses on the chalkboard or on a wall chart. The accuracy of the student's guesses will depend upon previous experience. Once they have smelled a scent they will never forget it. If they have not smelled these scents they will have difficulty identifying the liquids.

To demonstrate the Rate of Diffusion of a scent: The instructor will hold a spray bottle of cologne and line up 4 students 2 meters from each other and on a straight line with the teacher as one point. The first student will be 2 meters from the teacher. The teacher will spray cologne vertically into the air (not in the direction of the students). Simultaneously, a helper will start timing using a watch with a second hand. When each student on the line first smells the cologne, they will call out; a recorder will record the time at which this happens. The data will be plotted as a graph of distance travelled by the cologne (Y-axis) versus time (X-axis). The rate of diffusion is the distance travelled/time. It can be calculated individually for each person (point) on the line and these values averaged. Also the diffusion rate is the slope of the line on the graph.
The equation: Rate of diffusion = Distance (meters)/ Time (seconds).

ACTIVITY #3: TASTE

STRATEGY: Students will experience the sensation of taste. The students will discover that the sense of taste and smell are integrated.

To demonstrate the sense of taste. The instructor will place fruit of various flavors into cups. Each student will be blindfolded and a partner will place a piece of fruit into his/her mouth. The student should pinch his/her nose closed for the first piece and try to identify the fruit. The partner should follow with the same fruit but the subject's nose should be open. Instruct the student to try to identify the fruit based solely upon taste. In other words don't identify a banana because you know how it feels in your mouth. It should be easier for students to identify fruits with their noses open.

The Coke and Pepsi Taste Test. The question is can you actually tell the difference between Coke and Pepsi? The instructor will place Coke and Pepsi into cups and label them A and B. The students will taste each and try to guess which is which. The results should be tallied and checked for accuracy. This exercise would work well with two liter bottles that have had the labels removed and are marked A and B corresponding with the cups. Math may also be integrated by using percentages. Create a circle graph and indicate the percentage of students that guessed A was Pepsi or B was Coke. This can then be extended to calculate the percentage of correct guesses.

To demonstrate the sensations of bitter, sweet, sour, and salty. The instructor should label cups A, B, C and D. The cups will contain tonic water, representing bitter; fruit juice, representing sweet; lemon juice, representing sour; and salt water, representing salty. The students will taste each solution and try to identify the location on their tongue where the taste of each solution was most prominent. The students should drink plain water in between tastings.

Performance Assessment:

1. Provide a picture of a tongue. The student will accurately identify the location of taste buds and the taste they represent bitter, sweet, sour, and salt.

2. Answer the following questions:

A. If you place a drop of honey or a sugar cube into your mouth, which food will stimulate the sweet taste buds first?

B. When the fruit was tasted with your nose closed it was more difficult to identify. Why?

C. When you have a cold your sense of smell is lost. Explain why?

D. When the human sense of smell is compared to that of animals whose sense of smell is better?

E. Which sensory receptors are stimulated by heat, touch, sight, and smell?

F. Was it more difficult to identify objects by touch only than it would have been using touch and sight together? Why?

Return to Biology Index

Name That Taste

Gracie L. Jones
3062 Stafford
Markham IL 60426
(708) 331-6989

Charles Carroll Elementary
2929 West 83rd Street
Chicago IL 60625
(773) 535-9414

Objective:

This experiment is designed specifically for students in grades three to five. However, it should also be helpful for students in grades six to eight with minimal adjustments. It can accompany lessons which target the five senses, especially the senses of taste and smell or it will work well as a singular experiment which will enhance basic observation skills. Students will learn how the different taste sensations are experienced, particularly that sweet and sour sensors are located on specific parts of the tongue.

Materials Needed:

- Q-tips
- Lemon juice
- Vinegar
- Paper towels
- Granulated sugar
- Shock tarts (candy)
- Cups (4 per group)
- Blindfolds
- Tongue map (This is the shape of the tongue. Show students a design of the of the tongue with the specific taste areas labeled. Have them to create their own map from this design without labeling.)

This experiment should be conducted by students in groups of two or more. This will allow students to act as the subject, experimenter, recorder and observer. Students will need three maps each.

Strategy:

Place the lemon juice, vinegar, sugar and shock tarts in separate cups. Label the bottom of each cup to indicate the contents. On the sides of the cups, write A, B, C or D and place on a table facing the recorder. The subject (or taster) should be blindfolded. Using a clean Q-tip each time, the experimenter will dip the end into one of the cups with the liquid content and place on different areas of the student's tongue. The shock tarts should be placed in the subject's hand and they will place it on different areas of their tongue. Each time the tongue is touched, the student should be asked to identify the taste sensation that they experienced. Each response should be noted by the recorder on the tongue map. Once all students within the group have completed the task, allow students to conduct the experiment again. This time the blindfold should not be included. The experiment should be conducted a third time. This time students will hold their nose and complete each step of the experiment. When the experiment is completed, students should review their individual responses and then compare them with the other students in their group. each group will write their overall results and compare with the rest of the class.

Performance Assessment:

Students will now be able to complete tongue mapping by labeling the areas of the tongue that are more sensitive to a specific taste and areas where taste sensations may overlap with each other. They will also understand how the sense of taste is influenced by both sight and smell.

Return to Biology Index

Breathing Is Essential to Life

Dianne Mehlinger
6700 South Oglesby
Chicago IL 60649
(773) 643-0538

Arthur Libby School
5338 South Loomis Blvd
Chicago IL 60609
(773) 535-9350

Objectives:

Students in the primary and intermediate grades will: 1. Recognize that breathing is a necessary, automatic life process; 2. Observe and record data on respiration rate; 3. Demonstrate how air enters and leaves the lungs; 4. Observe how respiratory rate changes with different activities; 5. Use counting as a means of gathering data

ACTIVITY #1: COLLECT ONE OF THE GASES IN YOUR BREATH

MATERIALS: paper towel
hand mirror

PROCEDURE:

Use the paper towel to clean and dry the mirror. Hold the mirror near, but not touching, your mouth. Exhale onto the mirror two or three times. Examine the surface of the mirror.

QUESTIONS: What happens to the mirror?
Why does the mirror become fogged?

ACTIVITY #2: LISTEN TO PARTNERS BREATHING; COUNT BREATHS PER MINUTE

MATERIALS: stethoscopes
watch or clock with second hand
index cards or sticky note paper with student's names

PROCEDURE:

Use a stethoscope to listen to one another's breathing. Hold breath as long as possible; record how long you held your breath. Pair off students: **Breather**: All students sit quietly (lie down if possible) with hands placed over their stomachs or chests. **WATCHERS**: The watchers must watch their partners and count the breaths taken in one minute (count ONE breath for every time the stomach or chest rises). Teacher cues the watcher when to begin and when to stop after 60 seconds. After the 60 seconds, watchers tell the breathers how many breaths were counted. Then all breathers record their at rest information on the index card or sticky note paper. Students trade places and repeat the activity. Next, students do jumping jacks or run in place for 60 seconds before recording breathing rates as described above.

QUESTIONS: In which case did you breathe more? Why?
Do you think respiration rate would be faster or slower if you ran for 10 minutes before counting breaths?
Would there be a difference in your respiration rate if you checked

it when you were sleeping and then again if you were walking?
Why can't we hold our breath for 5 minutes?

ACTIVITY #3: MEASURING LUNG CAPACITY WITH BALLOONS

MATERIALS: 6" and 9" balloons
cloth tape measure
paper and pen or pencil

PROCEDURE: **CAUTION** Do not do this activity if you have asthma!

Give identical balloons to pairs of students. Instruct each to blow up a balloon as much as possible with only one breath. Measure how big around everyone's balloon is with a tape measure and write down the numbers next to the persons names. Let air out of balloons and repeat two more times. Take an average of three tests.

QUESTIONS: Who was able to blow the most air into their balloon?
What is it about the person that enables him or her to do this?
If you ran in place for 2 - 3 minutes, would you be able to blow as much air into the balloon? Try it.

ACTIVITY #4: **CONSTRUCT A LUNG**

MATERIALS: scissors
1 or 2 liter soda bottle with label removed
7" and 9" balloons
helper

PROCEDURE:

Cut off and discard bottom of soda bottle. Invert the 7" balloon inside the bottle after stretching the balloon over the mouth of the bottle. Cut top off a 9" balloon and stretch this top over the bottom of the bottle. Hold the bottle with one hand and, with your other hand move the surface of the balloon at the bottom of the bottle by pulling and pushing it.

QUESTIONS: What happens to the balloon?
Why does it inflate and deflate?
What large muscle is important in inhaling and exhaling and how does the model demonstrate its action?

ACTIVITY 5: **MEASURING LUNG CAPACITY WITH WATER**
MATERIALS: paper and pen
large pan
empty 1 gallon plastic bottle with a cap
plastic tubing
antiseptic wipes

PROCEDURE:

Make a chart with names of participant. Label name, weight, height and code. For each person tested, fill in the information on the chart, and give a different code letter of the alphabet starting with "A". Pour about 3 inches of water into a large pan and set it in a sink or on a counter. Fill a gallon jug with water and screw on the cap. Place the jug upside down into the pan of water. Remove the top of the jug so that the water remains inside and slip a 3 foot length of clear plastic tubing into the jug. Ask each participant to take a big breath and blow as much air as they can into the length of the tubing. Mark the water level on the jug both before and after blowing and record on the chart. Wipe the tubing clean with the antiseptic wipe before another subject uses it. Compare the data you gathered from your test.

QUESTIONS: Who was able to blow the most air into the water?
What was it about the person that enabled him or her to do this?
If you ran in place for a few minutes, would you be able to blow as much air into the water?

ACTIVITY #3: **OBSERVING AN ANIMAL LUNG**

MATERIALS: an animal lung (sheep or cow)
plastic tubing
scalpel (optional for dissecting lung)

PROCEDURE: Observe trachea, bronchi, bronchioles, and alveoli of animal lung. Observe how lung inflates by blowing air down trachea with plastic tubing.

QUESTIONS: Is the lung of a sheep or a cow the same as a human lung?
What happens when you blow into the trachea with the plastic tube?

Return to Biology Index

Sound and Hearing

Cecile Savage
4841 South Langley
Chicago IL 60615
(773) 548-3662

John Farren School
5055 South State
Chicago IL 60609
(773) 535-1440

Objectives:

To demonstrate that sound travels.
To explore how sound is reflected, amplified and recorded.
To investigate the physical components of the ear and the way it works.
This lesson is designed for a 5th or 6th grade class.

Materials Needed:

one cookie box or cake tin
rubber bands
uncooked rice
scissors
sauce pan or baking tray and wooden spoon
plastic wrap or balloons
cardboard tubes
1 or 2 candles
modeling clay
1 tape recorder and microphone
flashlight
index cards or pieces of smooth posterboard
alarm clock or softly ticking metronome
blindfold
a blank cassette tape
2 funnels
1 yard of flexible plastic tubing

Strategy:

Sound as waves

Activity #1: Stretch the plastic wrap or balloon over the cookie tin; secure with rubber band(s) and sprinkle a few grains of uncooked rice over the plastic. Hold the baking tray over the can. As the tray is being hit with the wooden spoon, the rice can be seen moving and jumping over the plastic membrane. This activity shows that sound travels in waves and reaches our ear drum or tympani much in the same way as it vibrates the plastic over the cookie tin.

Activity #2: Stretch a piece of plastic wrap or balloon over both ends of a cardboard tube; secure with rubber band(s). Make a little hole in the plastic at one end of the tube only. With the clay, build a short stand that has the same height as the candle. Lay the tube over the stand, with the pierced end pointed towards the candle, and just a few inches away from it. Tap the other end with your finger. The vibrations blow out the candle. This activity shows how the vibrations made by tapping the drumhead move down the cardboard tube and push the air out through the little hole at the opposite end, much like they travel down our ears. The pitch or tone of sound waves is measured in Hertz.

Waves: direction and reflection.

Activity #3: this is a game for the whole class room. The class sits down in a circle. One person volunteers to wear a blindfold and sit in the middle. The other players are quiet and a designated student makes a gentle noise, such as popping his/her fingers. The blindfolded student must point in the direction of the noise. Many different players can take a turn at being blindfolded. Whose ears have the best sense of direction?

Activity #4: Use modeling clay to secure 4 equal pieces of cardboard tube in an horizontal manner. They must form a zigzag pattern with an angle of about 90^o between each tube. Without changing that angle, place a square of posterboard facing the adjoining end of the first and second tubes, another square of posterboard facing the ends of the second and third tubes, and a third piece of posterboard facing the ends of the third and fourth tubes. Place a microphone hooked to a tape recorder at one end of this contraption. Set a ticking metronome or alarm clock at the opposite end, but away from the opening of the first tube. The tape recorder will record either nothing or a very faint sound. Now, place the metronome right at the opening of the first tube. The resulting recording should be quite clear. Different experiments can be done: change the directions of the tubes and determine which direction give off the clearest sound; or replace the smooth cardboard with reflector cards of different material or egg cartons. This activity demonstrates that sound waves in air will bounce off a flat, solid surface, like a ball bouncing off a wall. If, however, the sound waves are bounced off a surface that is soft or bumpy, the waves will break up or fade away. Volume is measured in decibels.

Amplifying and recording sound.

Activity #5: making a stethoscope. Take a piece of plastic tubing that fits tightly over the narrow ends of 2 funnels. Attach a funnel to each end. Ask a student to put one funnel over his/her chest and another student to put the other funnel, at the other end over his/her ears. He/she should be able to hear the other student's heartbeat. This activity demonstrates how some devices can amplify sound. The shape of a cone is used to amplify sounds whether receiving them (stethoscope), or sending them (megaphone).

Activity #6: Students face a microphone in a row or two, depending on their numbers. They sing a song together in the microphone, hooked to the tape recorder. The tape will pick up the voice nearest to the microphone drowning the rest. Then, the microphone is tied to the handle of an open umbrella,facing the students standing at the exact same place. Play the tape back. The voices are far clearer than on the first recording. The same experiment can be done recording birds outside. This activity shows students how the umbrella's shape collects the sound waves and reflects them back to the microphone.

Make a model that demonstrates how the ear works.

Activity #7: Stretch plastic wrap over one end of a tube and secure with a rubber band. Roll another sheet of paper to make a cone and insert the smaller end into the other end of the tube. Stand an index card in a vertical way, (secure with modeling clay) very near the end of the tube with the plastic wrap. Shine the flashlight on the plastic wrap so that the light is reflected onto the card. Then shout or sing loudly into the cone. Results: the reflected light should flicker. The cone represents the outer ear (pinnea), the tube is the ear canal and the wrap represents the ear drum (tympanic membrane). When sounds are captured by the outer ear and travel down the ear canal, the eardrum vibrates.

Performance Assessment:

Students should be able to retrace any experiments of their choice step by step. They should know how to explain the following terms: hertz, decibel, stethoscope, pitch, volume, outer ear, ear canal, ear drum, amplify, sound wave, string, wind and percussion instruments.

Return to Biology Index

Bones, Bones, and More Bones

Juliette Walker
9828 S. Dobson
Chicago IL 60628
(773) 731-7145

Crown Community Academy
2128 S. St. Louis
Chicago IL. 60623
(773) 534-1680

Objectives:

This lesson is designed for primary grade levels 2-3, although it can be adapted for intermediate and upper grade levels.

Students will be able to describe the functions of bones in the human body.
Students will be able to describe the make up of a bone.
Students will be able to recognize that hollow bones have more strength.
Students will comprehend that the depletion of calcium in bones causes them to become weak.
Students will be able to describe what the backbone is made up of.

Materials Needed:

ACTIVITY 1
Pictures of Bones
Examples of Bones
Pictures of Joints
Clay

ACTIVITY 2
Paper
Tape
Paper Plates
Measuring cups
Weights (Blocks-small)

ACTIVITY 3
4 Chicken Leg Bones
Vinegar
Containers (4jars)

ACTIVITY 4
Empty Thread Spools (assorted sizes)
String, Scissors
Tape, Balloons
Ruler, Hole Puncher

Background Information:

The skeletal system of the human body is made up of bones. These bones make up the body's shape and protect the internal delicate body parts. An adult person has about 206 bones in his/her body. The number of bones in a person's body varies from person to person. This is due to the discrepancies in the number of little bones in the hands and feet. The bones in the human body are distributed in this way: skull=29, spine=26, ribs and breastbone=25 shoulders, arms, and hands=64, pelvis, legs and feet=62. The central support system for the body is the spine. The spine is made up of 26 linked bones called vertebrae.

Strategies:

ACTIVITY 1 "BONE MAKEUP"

1) Teacher will show students a picture of a bone pointing out the various parts of the bone, and reviewing important vocabulary.
2) Students will create a clay model of the bone, labeling the parts of it.
3) Teacher will introduce the four joints of the human body.

4) The teacher will demonstrate the movements of the joints.
5) Teacher will provide examples of each joint.
6) Students will match up joints with examples.

ACTIVITY 2 "HOLLOW STRENGTH"

1) Students will roll up a sheet of paper (8 1/2 x 11) about 1 in wide into a cylinder. They will make 3 of these (paper bones).
2) Students will stand the bones up on their ends, placing a paper plate on top of the bones.
3) Teacher will ask students to tell what is happening - the hollow rolls will support the plate.
4) Students will begin to add weights (wooden blocks) to the plate.
5) Students will count how many blocks the plate can hold before it collapses the bones.
6) Students will roll 3 more sheets of paper as tightly as they can so that there is no hollow section.
7) Students will stand these "bones" up as before placing the same plate on top of them.
8) Students will place weights on top of the plate until they collapse.
9) Students will deduce what happened. Teacher will explain that hollow bones were able to support more weight. Teacher will also explain that having a hollow center gave the bones a better design and made them stronger. Teacher will continue explaining that the large bones in our body are also hollow, which makes them strong so they can support more weight, but light, so it takes less energy to move them.

ACTIVITY 3 "DEBONING"

1) In cooperative learning groups, students will observe chicken legs soaked in vinegar in jars.
2) Students will observe bones that have not been placed in vinegar.
3) Students will compare and contrast the similarities and differences of the sets of bones.
4) Students will deduce that the bones that were placed in vinegar were weaker and more flexible.
5) The teacher will explain that the vinegar contains an acid which dissolves the calcium phosphate in the bones. Without calcium bones will lose their hardness and will become weaker.

ACTIVITY 4 "GET A BACKBONE"

1) Students will get the following material: 2 large, 2 medium, and 2 small empty thread spools, 1 pencil, scissors, ruler, hole puncher, string, and tape.
2) Students will draw 5 circles on the cardboard by tracing the base of 2 large, 2 medium, and 1 small spools of thread.
3) Students will cut the circles out and will punch holes through the center of them.
4) Students will cut an 18in (45cm) length of string.
5) Students will began threading the spools of thread together beginning with the largest spools, taping the string to the bottom of the largest spool (cardboard circles of corresponding sides will be threaded between each pair of spools).
6) Students will blow up a balloon and will place it on top of the model.
7) Students will stand the column of spools on the table (largest on the bottom) and push top spools about 2 inches to the side.
8) Teacher will explain that the small spools at the top represent the cervical vertebrae, the medium spools represent the thoracic vertebrae and the larger bottom spools represent the lumbar vertebrae. The

teacher will also explain that because the vertebrae, like the spools, are not permanently attached together the human body can bend and lean in different directions. Between each pair of vertebrae is a disk of cartilage that acts as a shock absorber, just as the cardboard circle between the spools keeps them from knocking together. Without this flexible disc the vertebrae would grind together and the body would be able to twist, turn, or bend the torso without pain and damage.

Performance Assessment:

Activity 1
1) Students will color and label the parts of a bone on a ditto sheet.
2) Students will match the joints of the body with examples that represent their movements.

Activity 2
1) Students will observe both models of the bones and will record the differences.

Activity 3
1) Students will observe, and compare/contrast the bones using a Venn diagram.

Activity 4
1) After making model, students will label the three regions of the back.
2) Students will be able to explain how the spine moves.

Return to Biology Index

An Introduction to the Senses

Therese R. Tobecksen
19702 Calumet
Lowell IN 46356
(219) 696-2959

St. Andrew the Apostle
331-155th Place
Calumet City IL 60409
(708) 862-4143

Objectives:

Primary students will identify body parts associated with the five senses. They will name the five senses. They will perform simple experiments involving the senses.

Materials Needed:

Several empty 35 mm film canisters, baby powder, lemon, jar of dill pickles, cinnamon, peppermint oil, chocolate, unpopped popcorn, salt, air popper, fresh dill weed, fresh mint leaves, small fabric samples of various textures, sheets of various grades of sand paper

Strategy:

Begin by making air popped popcorn for the students. Discuss all the ways in which they were able to know that popcorn was popping. Allow students to eat some popcorn and continue discussion. Divide students into groups of four or five. Distribute numbered film canisters containing lemon, dill pickle, cinnamon, peppermint, chocolate, and baby powder. Students will discriminate between the six smells and write the appropriate number next to each on a list. After students have completed the smelling activity, allow them to see what was in the six canisters. Give students the opportunity to see fresh dill weed and mint.

Distribute each film canister containing salt or popcorn kernels. Students will shake the canisters and be able to distinguish between the two sounds. A student will walk around the room shaking the canister. Students cover their eyes and point to where the sound is coming from. Students repeat the activity covering one ear at a time.

Students will be given the opportunity to taste either a piece of chocolate or a dill pickle. They will be asked to try to determine where on the tongue the taste buds are located for the tasting of sweet and sour. After students conclude that sweet is tasted on the tip of the tongue, discuss the reason why we like ice cream cones and lollipops. Students should be led to discover that sour things are tasted on the sides of the tongue toward the front.

With eyes closed or wearing blindfolds, students will be given pairs of circle shapes cut from various types of fabric and various grades of sandpaper. Students will attempt to match two like circles.

Performance Assessment:

Students will point to their body parts that are associated with each of the five senses. Students will draw a head and a hand print and label the sense of touch, taste, sight, smell, and vision on the drawing.

Return to Biology Index

Making and Using a Gel Person to Teach Human Anatomy

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60462
(708) 460-5022

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815) 485-7655

Objectives:

High school students will use a gel person to:

1. describe the overall body plan of a human
2. identify the major organs of the human body
3. aid in the visualization of scanning imaging
4. describe anatomical planes and directions
5. make transverse sections

Materials Needed:

MAKING A GEL PERSON
unflavored gelatine (.25 Oz. Envelopes)
blue food coloring (optional)
gel person mold (gingerbread man)
pasta (assorted shapes & sizes, cooked)
vegetables (beans, cauliflower, cooked)
tray or plate
*materials will make two GEL Persons

VISUALIZATION OF SCANNING IMAGING
gel person
plastic or glass (4" x 6")
ring stand or bracket (optional)
flashlight or small lamp
white card (8.5" x 11")

MAKING TRANSVERSE SECTION
gel person
plastic knife
index cards (4" x 6")
pencil
ruler (15-30 cm, marked in cm)
paper towels and disposal bag

Strategy:

MAKING A GEL PERSON

1. Obtain two gelatine molds in the form of a person.
2. Mix two envelopes of unflavored gelatine into 1.25 cups of boiling water until dissolved. Add one drop of food coloring. This will give some contrast to the "organs" inside the gel person without losing too much transparency.
3. Pour enough of the warm gelatine solution into the bottom of the mold to just cover the bottom (anterior surface of the person). Place in a refrigerator until it gels (about 30 minutes). Set aside the remaining gelatine solution until Step #5.
4. Place pasta and vegetables in the mold on top of the gel.

   Use a small floret of cooked cauliflower in the head (to mimic the brain). In the rest of the body, use any or all of these:
   - several pieces of cooked small elbow macaroni (to mimic hollow organs).
   - one piece of cooked mostaccioli rigati (to mimic a large hollow organ with an irregular surface).

- 2 or 3 canned red beans (to mimic solid organs such as the kidneys).
- one short strand of cooked vermicelli (to mimic solid fiber-like organs such as nerves). You might want to coil a piece of this to show how coiled organs show up in a transverse section.

*Use other soft materials as you desire in addition to, or in place of, those listed.

*Do not use too many pieces. Spread things out a little. You can also put "organs" in the arms and legs as well as the middle part of the body.

5. Fill mold to the top with the remaining gelatine solution. Refrigerate until solid (about 30 minutes).
6. Remove mold from refrigerator and dip in hot water for a few seconds to loosen gelatine. Place a tray or plate over the mold and invert, dropping gelatine form onto tray. Use the gel person as soon as possible. Gel persons can be refrigerated but they do not freeze well.

VISUALIZATION OF SCANNING IMAGING

1. Place one gel person on a 4" x 6" plate of glass or transparent acrylic.
2. Clamp the plate (with the gel person on it) to the ring stand. Instead of using a clamp and ring stand, you can simply have a volunteer hold the plate steady.
3. Use a flashlight or lamp to cast a shadow on the white card. Do this by holding the light source above the gel person and the white card below the transparent plate. This demonstrates the principle of standard X-ray photography.
4. Holding the light source in one hand and the white card in the other, rotate the pair around the gel person without changing the distance or angle of your hands. This mimics the action of an axial scanner used in creating CT scans.
5. Discuss how a scanned image can produce a 3D image of the contents of the body or of an individual organ.

MAKING TRANSVERSE SECTIONS

1. Lay one index card in front of you so the long side is along the left and right and the short side is at the top and bottom. Use a metric ruler and pencil to mark off one index card into 1cm segments. Start at the top by making a line 1cm from the top and proceed down the card. Number each segment by writing a number along the left edge of the card with your pencil.
2. Place a gel person on the index card that you have just marked off into 1cm sections. It should just fit on the card if the lines are along transverse (horizontal) planes of the gel person's "body".
3. Using a new index card, mark off 1cm lines as you did in Step #1. Now sketch the outline of the gel person on this second card exactly matching the way it lies on the first card. Then sketch in the structures or "organs" you see inside the gel person. Keep the sketch simple but accurate.
4. Beginning at the top of the gel person's head, use a plastic knife to cut a transverse section along the first line on the underlying card. That is, cut a transverse section 1cm from the top of the head. Place this section, inferior side up on a clean index card. Mark the number of the section (#1) along the left edge of this clean card.
5. Continue to cut sections in order: at the 2cm mark, at the 3cm mark, and so on, until the gel person's body is completely sectioned. After marking each section lay it on a clean index cards. Three or four sections should fit on each card. Do not forget to mark the number of each section along the left

edge of the clean card as you lay them down.
6. Make a sketch of each section on index cards.
7. Discard your material in the disposal bag. Return usable items (unused cards, pencils, rulers) to the instructor.

Performance Assessment:

At the completion of this lesson students will accomplish the following:

1. Describe anatomical position.
2. Identify the major organs of the human body.
3. Locate and describe anatomical planes and directions.
4. Describe the relationship between your original sketch (made before you cut the gel persons into segments) and the sketches of the transverse sections.
5. Explain how this "transverse sectional anatomy" improved your understanding of how the gel person is structured.
6. Explain how this dissection relates to scanning medical images that might be made of your gel person.

Conclusion:

This activity aids students in understanding and visualizing the mechanics of scanning imaging as a diagnostic technique.

Return to Biology Index

Give Me A Hand, I'm "Thumb-body" Special

Ranada L. Johnson
11514 S. Carpenter
Chicago IL 60643
(312) 995-7029

Horace Mann Elementary
8050 S. Chappel
Chicago IL 60617
(312) 535-6640

Objectives:

This lesson is designed for students grades 4-8. The students will be able to: label the bones in the hand; create a model of the hand; compile a set of fingerprints; and realize the importance of the thumb.

Materials Needed:

Note book paper
Index cards (1 for each student)
Crayons
Flour
Water
Pencil
Scotch tape
Masking tape
Scissors
Blank paper
Wax paper

Strategy:

Activity number 1

The students will begin by discussing the most used part of the body, the hands. The students will make a short list of activities that they can do with their hands. Then they will make a list of activities that can be done without the use of the hands. All answers will be discussed.

Activity number 2

The teacher will have the students toss a ball around the classroom using their hands. The teacher will ask the students what they just did. Then they will write down how they threw the ball. The class will discuss the needed hand movements. Then the students will pass a small ball by using any part of the body other than the hands.

Activity number 3

The students will place their fingers together at the second knuckles with the pinkies up and touching. They will try to move them without sliding them sideways. The students will try this with each finger to determine which fingers are immobile.

Activity number 4

The students will tape down their thumbs and try to complete a number of exercises, such as writing, catching a ball, buttoning clothes, etc.

Activity number 5

The students will use a mixture of flour, salt, and water to create dough. They will flatten it out and press their hand into it to create a handprint. A partner will use a plastic knife to cut the excess dough from between the fingers. The students will then place the bone structure cut out in the appropriate parts of the hand. The dough will be left to dry for several days.

Activity number 6

The students will trace their hand on a blank sheet of paper. They will make fingerprints by using a pencil to make graphite shavings. Then they will rub their finger across the graphite. The partner will place a one inch piece of clear tape across the darkened part of the finger. This piece of tape will be applied to the matching finger on the traced hand. This is continued until all fingers are done.

Performance Assessment:

Students will be assessed on participation and following directions. They will also be assessed on identifying and labeling the bones in the hand.

Conclusion:

At the conclusion of this lesson the students will be able to identify the anatomy of the hand including the fingerprints. They will also know the importance of the hand and its many uses.

Return to Biology Index

Measuring Work

Cynthia Clemons
3001 S. King Drive
Chicago IL 60616

John Palmer
5051 N. Kenneth Ave.
Chicago IL 60630
(312) 534-3704

Objectives:

Students will explain what work is, measure work done in moving an object, and tell how energy is related to work in both machines and the human body.

Materials Needed:

meter stick, bathroom scale, paper, pencil, and a flight of stairs

Strategy:

Part-A: How Much Work Can Your Body Do?

1. Students will walk up a flight of stairs, counting the number of stairs in the flight.
2. Students should measure (in centimeters) the height of one stair and multiply that number by the number of stairs in the flight. This will give them the distance.
3. Students weigh themselves using an ordinary bathroom scale and calculate their weight in N (Newtons). 1 lb equals 4.5 N. This will give them the force.
4. Finally, students will calculate how much work is done when they walk up a flight of stairs. Work is measured in N-meters. The formula for measuring work is, W = F x D.

Performance Assessment:

-Student correctly uses the meter stick to measure the height of one stair.
-Student correctly weighs himself using an ordinary bathroom scale.
-Student correctly calculates his weight in newtons.
-Student correctly calculates the distance in meters.
-Student correctly calculates the amount of work done in walking up a flight of stairs.

Part-B: Can Simple Machines Help Us Do Work?

Materials Needed:

construction paper (13 cm x 13 cm), straight pin, ruler, unsharpened pencil (with an eraser), 45 cm length of string, one-quart size milk carton, scissors, paper clip, a heavy object

Strategy:

1. Students build a model windmill using the 13 cm x 13 cm piece of construction paper, the straight pin, and the unsharpened pencil.
2. Students should cut the top off the milk carton. Then cut 2 deep U-shaped

groves in opposite sides of the milk carton. Put a heavy object into the carton to weigh it down.

3. Tie a paper clip to one end of a piece of string. Tape the other end of the string to the writing end of the pencil.
4. Set the windmill into the groves of the milk carton at the edge of a table so that the paper clip on the string hangs freely.
5. Students predict what will happen when air is blown across the top of the windmill so that the blades catch the moving air.
6. Students should (by mouth), lightly blow across the top of the windmill so that the blades catch the moving air.

Performance Assessment:

-Student is able to make a reasonable prediction concerning the performance of the windmill blades.
-Students can reasonably describe what happened when air was blown on the blades of the windmill.
-Student is able to conclude that moving air on the wheel and axle of the wind-mill allows the windmill to act as a simple machine.

Part-C: Our Body the Machine:

Materials Needed:

Pictures of foods, glue, scissors, construction paper, play food to represent the four food groups, chart of the four food groups, chart showing the recommended daily nutritional requirements, and a chart that shows the nutrients found in some common foods. The chart should also include examples of food sources and the body's need for each nutrient.

Strategy:

1. Students will run in place, and perform a set of jumping jacks.
2. Ask students what allows them to be able to perform these simple exercises?
3. Tell students that the energy needed to perform these simple exercises, comes from the varied foods they eat.
4. Students use a nutrition chart to examine some common foods, their nutritional value, and how the food supplies the body with energy.
5. Students give examples of "junk foods" and "healthy foods."
6. Students identify the four food groups and classify play food into the four groups.
7. Students describe a balanced diet.
8. Students create a balanced lunch using some common lunch items.
9. Students use pictures of food items to create a collage that represents a balanced breakfast, lunch, and dinner.

Performance Assessment:

-Student correctly classifies foods into the four food groups.
-Student creates a collage of food choices that reflect a balanced breakfast, lunch, and dinner.

(See the activity sheet on the next page.)

Activity Sheet: Part-A

How Much Work Can Your Body Do?

Materials: meter stick, bathroom scale, pencil, paper, and a flight of stairs

Procedure:

A. Weigh yourself in lbs. Calculate your weight in Newtons (1 lb equals 4.5 Newtons).
B. Walk up a flight of stairs. How many stairs are in the flight?
C. Measure the height of one stair.
D. Calculate the distance (The bottom of the flight to the top).
E. Calculate how much work you do in walking up the flight of stairs.

Data Sheet

1. My weight is _____ lbs

2. The force I will use is my weight in Newtons. The force is _____
   WORK SPACE _____lbs x 4.5 Newtons = _____

3. The height of one stair is _____ cm

4. The number of stairs in the flight is _____

5. The distance I will walk is _____ meters
   WORK SPACE height of one stair _____ x _____ the number of stairs in the flight

6. Walk up the entire flight of stairs

7. How much work did you do when you walked up the flight of stairs?
   _____ Newtons x _____ meters (distance) = _____ Newton-m of work

8. I can infer that a person with a __________ weight will do less work than a person with a __________ weight when walking up a flight of stairs

Return to Biology Index

Exploring the Left and Right Sides of the Brain

Kathleen Hall
2052 N. Seminary
Chicago IL 60614
(312) 929-7165

Goethe School
2236 N. Rockwell
Chicago IL 60647
(312) 534-4135

Objectives:

This lesson is designed for use with 5th-8th graders. The purpose of the lesson is to have students become familiar with the left and right hemispheres of the human brain and to engage in activities that activate powers that are dominant in each hemisphere. This lesson could be used as a culminating activity after a unit on the brain.

Materials Needed:

* **Drawing on the Right Side of the Brain**, by Betty Edwards, Chapter 1-4 for teacher reference
* model of brain (if available)

For each student:

* Any logic activity (I used AIMS Logic Activity "Who's Who on the Baseball Team?" from AIMS Newsletter July/August 1993)
* Copies of an optical illusion (I used "Old Lady, Young Lady")
* Copies of Cartoon of dog, from **Your Body** kit, (Lucas Manufacturing Company) pg.35, or any line drawing that has recognizable objects (e.g., people, houses, etc.)
* drawing paper and pencils

Background Information:

During the 1960's, doctors discovered through working with patients that had severe epileptic seizures that each hemisphere of the brain processes information differently. Through a series of tests they concluded that both hemispheres use high-level cognitive modes, which although different, involve thinking, reasoning, and complex mental functioning. The left hemisphere is dominant in verbal, analytic, abstract and logical activities. The right hemisphere is dominant in nonverbal, analogic, nontemporal, intuitive, and spatial activities. (Refer to page 40 in **Drawing on the Right Side of the Brain**. Note differences in language domain in the left side and spatial domain on right side.)

Strategy:

1. Work with a partner to do "Who's Who on the Baseball Team?" Teacher should coach students to **follow directions** in a sequential manner. Model by doing the first two items with students.
2. When students are finished, go over the answers and discuss how they reached their conclusions. Lead them to understand that the logical thinking they engaged in was based on putting information in order or in sequence.
3. Teacher explains the theory of the brain's left and right hemispheres. (See Background Information.)
4. Give students directions to make a face-vase drawing:
   a) Draw a profile of a person's head on the upper left side of the paper,

having the profile face towards the center of the paper. (Left-handed students should start on the right side of paper). Try to use your own memorized symbols for a human profile.
   b) Draw horizontal lines on the top and bottom of your profile, forming the top and bottom of the vase.
   c) Go over your drawing of the first profile with your pencil, naming the features to yourself as you go, i.e., forehead, nose, upper lip, lower lip, chin, neck. Repeat this step at least once. This is a left-hemisphere task -- naming symbolic shapes.
   d) Starting at the right side of the horizontal line, (the left side for left handers) draw a second profile facing the center of the paper. The second profile should be a reversal of the first in order to be symmetrical. You may experience a sense of mental conflict at some point in the drawing of the second profile. Observe this and observe how you solve the problem.
5. Elicit discussion from the students about their experience in drawing the profile/vase. Lead them to understand that the first side of the profile was done from memory and from naming the parts. This is left-hemisphere mode. To complete the drawing, students probably had to scan back and forth in the space between the profiles, estimating angles, curves, inward-curving and outward curving shapes, which now had become unnamed parts -- shapes of space between the two profiles. This is right-hemisphere mode -- thinking without words.
6. Distribute copies of a cartoon or simple drawing. Have students first draw the picture right-side up. When they are finished, they should turn the picture upside down and draw it again as they see it (i.e., upside down). The purpose of drawing the picture upside down is to have them attempt to draw without naming objects, but rather to employ the right hemisphere's ability to analyze spatial relationships.

Performance Assessment:

When you're finished, have the students decide which of their drawings is better and which way of drawing (i.e., right side up, in which they use language to identify objects, or upside down, in which they analyze spatial relationships) enabled them to create a better drawing. Lead the discussion in terms of right and left brain hemisphere modes of thinking.

Return to Biology Index

Immunity and Disease

Gregory Carter
9322 S. Rhodes
Chicago IL 60619
(312) 785-0915

William King Elementary
740 S. Campbell
Chicago IL 60612
(312) 534-7897

Objectives:

This Mini-teach lesson is designed for 5th-8th grades. Students will learn how the immune system (an assortment of cells and tissues coordinated through a complex network of molecular messages and interacting genes), fights a war with a pathogenic organism: one of the many bacteria, viruses, and protozoans that can infect our bodies and cause disease.

Materials Needed:

Movie (**The truth about HIV and AIDS**), Construction paper, and Game Board.

Strategy:

Activity 1: The students will be shown the movie on HIV and AIDS which will give them an insight on the immune system, the way the disease is transmitted, and to see and hear other young people who have contracted the disease, and how they are dealing with it, as well as young people who don't have the disease, and what they are doing not to contract it.

Activity 2: Students will cut out letter shapes, and try to fit them into other letter spaces, i.e., trying to fit the letter X into shape O. What this activity shows is how the white blood cells in the immune system fight off any foreign invaders, and how other "X's" will come to destroy the "O" because it does not belong. Yet when the HIV virus enters the blood system, the system is broken down and any foreign invader can enter the body and destroy it.

Activity 3: After Activities 1 and 2, you should have a 30-40 min. lecture and answer and question period on the movie and other hand outs on immunity and disease. The game board is used to play "Jeopardy" answering questions about things that are familiar to students about the disease or immune system (for example, "This NBA star retired after learning be was infected with the HIV virus". Ans: "Who is Irvin "Magic" Johnson"?). This activity will be enjoyable to the students as well as thought provoking.

Performance Assessment:

The students' assessment will basically come from the game and a short quiz on the movie, lecture, and hand-outs as well as prior information learned through the game of life. The expected results would be that students learned how dangerous unprotected sex and doing drugs can be, and that no one is immune to catching AIDS. **SO PLAY SAFE OR NOT AT ALL.**

Return to Biology Index

Healthy Colon with Good Digestion and Fiber

Lenora Jean Black
9736 South Harvard Avenue
Chicago IL 60628
(312) 568-8120

Parkmanor School
7037 South Rhodes Avenue
Chicago IL 60637
(312) 535-3070

Objective:

This mini-teach lesson is designed for the 6th grade. Students will be introduced to the colon and the relationship it has with the body. Students will learn the process of digestion, the process of the colon, and why fiber is necessary for a healthy diet and a healthy colon.

Materials:

Activity one, Movement of Fiber:

2 long tubes, 1 cup of water, 1 empty cup, a small bag of high fiber raisin bran cereal or honey nut toasted oats. Students will work in pairs.

Activity two, Building a Colon:

1 wood stand, 6 or more flexible straws, 1 roll of masking tape. Students will work individually.

Activity three, Coloring the Colon:

Coloring sheet of the digestive system (As in **The Anatomy Coloring Book**), crayons and markers, sheet with the directions. Students will work individually.

Activity four, Making a Menu:

Menu sheet will present food listed for 5 days and to be served 3 times a day. The menu should state the calories for each food presented. Fat intake is optional. Students will work individually.

Strategies:

Activity one, Movement of Fiber:

Each pair of students will take one tube and place the cereal down the tube. Students will then use a liquid to push the cereal down the tube. The tube is the colon and the cereal is the fiber. The students will observe how fiber moves through the colon.

Activity two, Building the Colon:

Students will take the straws and join them at the ends. Students will then tape the straws and curve them into a circle, leaving the ends free. Finally, students will label their colon and intestines.

Activity three, Coloring the Colon:

Students will be presented with a coloring sheet followed by directions. Students are to read the directions and complete the assignment.

Activity four, Making a Menu:

Students will construct a menu for 15 meals (3 meals a day, for 5 days). Students will be presented with a list of foods, their calories and fiber content. They must consider in the menu a healthful daily intake of fiber. The daily calorie intake for an average-sized man is 2500 calories per day; for the average-sized woman is 2000 calories per day.

Here is a list of high fiber foods:

fiber:	calories:	fiber:	Calories:
asparagus	23	turnip greens	17
bean sprouts	13	broccoli	39 (1 spear)
green/giant	16	green/beet	20
kidney	105	collard	14
beets	27	kale	21
carrots	17	mustard	7
mixed vegetables	39	okra	25
potato	55	onions	27
soy beans	77	sweet potatoes	162
squash, zucchini	33	white potatoes	155
tomato	110	spinach	6

Background Information:

The colon is a natural breeding ground for bacteria. The purpose and function of this bacteria is to neutralize, dissipate, avoid and prevent a toxic condition from developing in the colon. However, there are two types of bacteria: the healthy, scavenging type know as **bacilli coli**; and the pathogenic or disease-producing kind. In a proper, clean, healthy environment the healthy scavenging bacteria will control the pathogenic kind. When too much fermentation and putrefaction is generated in the colon (due to neglecting to keep it as free from feces and waste as possible), the pathogenic bacteria proliferate and ailments result. Such waste, through a high fiber diet, must be expelled from the body, and for this purpose your colon is equipped with a very efficient system for elimination, but only if your body is in good working order.

Fiber:

Fiber is an effective vehicle to cleanse your colon. Fiber carries bile and fat out of the body. Without fiber, much of this fat is reabsorbed and recirculated through the body. By helping cleanse fat and debris from the digestive tract, gasses are also reduced, allowing for more optimal absorption of important nutrients. A healthy colon also helps the body better absorb oxygen which is important for memory and energy levels.

Finally, presented below is a list of some of the parts of the body that can be affected by a blocked colon:

lungs and bronchia
heart stomach
spleen
pancreas
kidneys
bladder
prostate
gall bladder
thyroid
nasal catarrh
sinus
eyes
ears
liver

Some other diseases:

Obesity, hypercholesterolemia, cardiovascular disease, hay fever, mineral deficiency, asthma, Parkinson's disease and certain cancers.

Performance Assessment:

Students will be able to satisfactorily answer the following questions:

1. What is the process of digestion?

2. What is the process of a colon?

3. What does "movement" mean in reference to digestion?

4. Name 5 ailments that can be linked to a blocked colon?

5. How many hours does it take for food to pass through the digestive system?

6. Where does digestion begin?

7. What is fiber and why is it important to the digestive system?

8. What is the body's "sewer system."

Conclusion:

Always consider healthy choices in your lifestyle.

Return to Biology Index

Ears and Hearing

Angelica Wright
6131 S. Campbell
Chicago IL 60629
(312) 436-2149

Robert Fulton
5300 S. Hermitage
Chicago IL 60609
(312) 535-9000

Activity A
Objective:

To show sound waves

Materials Needed:

rubber band
plastic bowl
sauce pan
piece of medium plastic
(like a throw-away plastic tablecloth)
uncooked rice
scissors
large spoon
tape

Strategy:

1. Cut the piece of plastic slightly larger than the bowl, allowing for the rubber band to hold it.
2. Stretch the plastic over the bowl, using the rubber band to hold it in place.
3. Tape the edges of the plastic firmly to the bowl.
4. Sprinkle a FEW grains of the rice on the stretched plastic.
5. Hold the saucepan near the plastic. Hit the bottom of the pan with the spoon.

Results:

As you hit the saucepan,the rice jumps up and down. The vibrations of the pan give out the sound waves. The sound waves travel through the air and make the plastic vibrate. The vibrations can be clearly seen as the rice jumps up and down.

Activity B
Objective:

To follow written directions
To make a model that demonstrates how an ear works
To name by common and scientific names, the first three areas of the hearing system

Materials Needed:

index cards
cardboard tube (from toilet tissue)
flashlight
rubber band
plastic wrap
tape
sheet of paper
modeling clay

Procedure:

1. Stretch the plastic wrap over one end of the tube. Secure with a rubber band.
2. Roll the sheet of paper to make a cone. Tape it together so that it does not unroll.
3. Push the small end of the cone into the open end of the cardboard tube.
4. Put some modeling clay on the index card so that it stands vertically. Lay the tube in front of it. Shine the flashlight on the plastic wrap so that a spot of light is reflected onto the card.
5. Shout or sing loudly into the cone intermittently.

Results:

The spot of light will shake very fast only when sound waves are captured.

The cone represents the outer ear (pinna); the tube represents the ear canal, and the plastic wrap, the eardrum (tympanic membrane). As sounds waves are captured by the outer ear, and channeled down the ear canal, the tympanic membrane vibrates.

Performance Assessment:

Both of these activities can be PASS/FAIL per Teacher observation.

Students will name 2 or 3 of the following terms, and the corresponding structures on a diagram:
- outer ear (pinna)
- ear canal
- ear drum (tympanic membrane)

Return to Biology Index

Staying Young with Vitamin E

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60462
(708)460-5022

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815)485-7655

Objective:

This lesson is designed for a high school student. The main objective of this Mini-teach is to explain how Vitamin E inhibits the oxidation of phospholipid and glycolipid molecules in cell membranes possibly preventing the aging of cells.

Materials Needed:

1 Apple/Banana
4 petri dishes
Vitamin E capsules
water
2 ml mineral oil

Strategy:

1. Label the petri dishes -- 1 each of air, oil, Vitamin E, and water
2. Cut three slices of apple or banana for each petri dish.
3. Coat the surface of the fruit with oil, Vitamin E, and water and place in the appropriate dish. The control dish is air. Cover the petri dishes with their lids.
4. Make observations.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. Why do we age? Is oxidation involved?
2. Describe the structure of the cell membrane (The Fluid Mosaic Model).
3. What on the cell membrane enables the organism to recognize the cell as self in addition to acting as receptors for specific hormones and other chemical messengers for the cell?
4. How is aging an oxidation-reduction reaction?
5. Explain why the organism's immune system recognizes the cell as non-self and destroys the cell.
6. How is this destruction prevented?
7. How does Vitamin E prevent aging? air? water? oil?
8. Discuss several life threatening problems that Vitamin E may be involved in preventing.

Conclusion:

Students will understand that a cell ages due to the oxidation of phospholipid and glycolipid molecules in the membrane. Vitamin E may inhibit this process.

Return to Biology Index

Rubber Egg

Angel Lee Gilbert
6000 N. Sheridan Road
Chicago IL 60660

Douglass Middle Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

To demonstrate the semi-permeability of a cell membrane
To lay ground-work for discussion of osteoporosis

Materials Needed:

1 raw egg in its shell
1 jar with a lid
(egg must fit inside the jar)
clear vinegar
flexible tape

Procedure:

1. Measure and record the circumference around the center of the egg.
2. Record the appearance of the egg.
3. Place the egg inside the jar. **DO NOT** crack the shell.
4. Cover the egg with vinegar.
5. Close the lid.
6. Observe immediately, and then periodically for the next 72 hours.
7. Remove the egg after 72 hours and measure its circumference.
8. Compare the appearance of the egg before and after being in the vinegar.

Strategy:

The egg has a hard shell on the outside and the circumference will vary. Bubbles start forming on the surface of the egg's shell immediately and increase in number with time. After 72 hours, the shell will be gone and portions of it may be seen floating on the surface of the vinegar. The egg remains intact because of the thin see-through membrane. The size of the egg has increased.

The shell of the egg is made of calcium carbonate, commonly called limestone. When vinegar chemically reacts with the limestone, one of the products is carbon dioxide gas, those bubbles seen on the egg. The membrane around the egg does not dissolve in vinegar, but becomes more rubbery. The increased size is due to osmosis, the movement of water through a cell membrane. The water in the vinegar moves through the thin membrane into the egg because the water inside the egg has more materials dissolved in it than does the vinegar. Water will always move through a membrane in the direction where there are more dissolved materials. The contents of the egg stayed inside the membrane because the molecules were too large to pass through the tiny homes. This selectiveness of materials moving through the membrane is called semi-permeability.

Performance Assessment:

This is a pass/fail activity.

Return to Biology Index

Learning the Bones and Muscles of the Head and Face

Charles T. Buzek
35 S. Kensington
La Grange IL 60525
(708) 482-0024

John Spry School
2400 S. Marshall
Chicago IL 60603
(312) 345-1700

Objectives:

To create an awareness of the complexity of the human body.
To cultivate a life-long interest in the student's personal anatomy.
To learn the most important bones and muscles of the head and face.

Materials Needed:

No materials necessary. The student will be using their own cranium for the activity. An anatomy wall chart or dummy will be useful but not essential.

Procedure:

Start with the only movable bone of the skull-the mandible. Ask students to trace the outline. The mandible possesses a complement of teeth. These are of four types. Students will be able to feel or see the dentition of a partner.

The four types of teeth are incisors, canines, premolars, and molars.
The maxillary bone lies just above the mandible. It carries the upper dentition which mirrors the lower jaw.

The nasal bone is next for examination. It protects only half of the nose.
The frontal bone corresponds to the forehead. This bone and the others we will discuss for the top portion of the brain serve to cushion and protect that important organ.

Students should touch the top part of their skulls. This is the parietal bone. It is separated from the frontal by a suture which fuses together with other skull bones after we are born.

The next area of study is the occipital lobe. It is in the back of the head. The student can feel a bump there. Students should know that the area of the brain protected by this bone deals with our ability to see.

Along the sides of the skull the students can find the temporal bone. This leads them to a bump just above their jaw which is formed by a bridge of bone called the zygomatic arch. This outcropping of bone serves an important purpose as an attachment for strong chewing muscles which we will discuss next.

The above completes the examination of the bones of the skull. We turn now to the muscles and in particular those attached to the zygomatic bone discussed above. These are the temporalis and masseter muscles. Students should chew on something (a grape is good for this) and feel the muscles contract as they chew. The muscles which allow us to use our faces expressively are discussed now.

The muscle that surrounds the eye is called the orbicularis oculi. Each student should wink and feel the muscle contract.

Another ring of muscles that we use constantly is the orbicularis ori. This circles the mouth and allows us to shape words, eat, express emotions etc. One emotion that we can express with our mouths is laughter. We can pull back our orbicularis ori using a muscle attached to that muscle and the zygomatic arch. This is called the zygomaticus. Students can feel that muscle by indulging in a little risibility.
Do you know a good joke?

Follow Up:

As mentioned in my previous activity students learn what they use. After this activity the teacher should use every opportunity to reinforce the lesson. Quizzes may be given in which actions are listed. The students are then asked to name the muscle or bone that allows that action to happen.

Return to Biology Index

Straight from the Heart

Cheryl L. Trammell
6700 South Shore Drive
Chicago IL 60649
(312) 493-0663

Delano Elementary School
3937 W. Wilcox Street
Chicago IL 60624
(312) 534-6620

Objectives:

(These objectives are adaptable for all grade levels.)

The main objectives of this mini-teach are to define and demonstrate the functions of the heart; observe the vibration of a match due to the pulsation of blood in the wrist; to construct a simple stethoscope and use it to listen to your heartbeat; to measure your heart rate (pulse); to compare your heart rate with your partner's heart rate; and to calculate the number of times your heart beats in one hour.

Materials Needed:

Heart Model	**Vibration Observation**	**Stethoscope Models**
one-half pear	modeling clay	surgical tubing
per student	paper match	2 funnels per model
surgical tubing		modeling clay
plastic spoons		
scalpels		
"heart" vocabulary		

Strategy:

Heart Model

1. Have students turn pear upside down and remove seeds.
2. Cut out two hollow openings at the top and two larger ones directly under them to represent the four chambers in the heart.
3. Introduce the largest artery and the largest vein by inserting surgical tubing in proper positions.
4. Discuss function(s).

Vibration Observation

1. Insert the match into a very small piece of clay (the smaller the better).
2. Flatten the bottom of the clay.
3. Place your wrist, palm side up, on a table.
4. Place the clay on your wrist, and move the clay around on the thumb side of the wrist until the match starts to slowly vibrate back and forth.
5. Count the number of vibrations that the match makes in one minute.

Stethoscope Models

1. Have students work in pairs.
2. Cut the hoses for the stethoscopes into approximately 3 feet lengths.
3. Set out all the material on supply table.
4. Prepare a sample stethoscope. Slide the hose over the end of each funnel. Use clay to hold funnel in place.
5. Instruct students to be quiet because it will be very hard to hear the sound of a heartbeat if there is a lot of background noise and talking.

6. Have one student place one end of the funnel on his ear while the second student places the other funnel near the left side of the chest.
7. Have students listen to the heartbeats of themselves and partners using stethoscopes and compare rates.
8. Calculate the number of times your heart beats in one hour.

Performance Assessment:

At the conclusion of the mini-teach, students will be able to answer the following questions:

Heart Model:

1. How many chambers are in the heart?
2. What are the names of the chambers?
3. What are the functions of the chambers?
4. What is the name of the protective covering of the heart?
5. What is the name of the largest artery?
6. What is the name of the largest vein?

Vibration Observation:

How many times does the match vibrates back and forth with a regular heartbeat?
(For adults it will vibrate 60 to 80 times in one minute.
The vibration for children is from 80 to 140 beats per minute.)

Stethoscope:

1. Did you hear the "lubdub" sounds of the valves snapping shut with each heartbeat?
2. How do you think the stethoscope works?

Conclusions:

Students will understand the functions of the heart and that as the heart contracts, blood is forced through the blood vessels. The blood moves at a rhythmic rate causing the blood vessels in the wrist to pulsate. All blood vessels have this throbbing motion, but the vessels in the wrist are close to the surface of the skin and can be felt more easily. The movement of the blood under the clay causes it and the match to vibrate.

The students will also understand through the use of the stethoscope that sound waves pass along the tube to the ear and that the funnel collects the sound made by the beating heart.

Return to Biology Index

Respiratory System

Mona Turner
1039 Dodge Ave
Evanston IL 60202
(708) 390-9714

Delano Elementary School
3937 W. Wilcox
Chicago IL 60624
(312) 534-6620

Objectives:

This lesson was designed for grades 4-6 to show that the general functions of the respiratory system are to deliver oxygen to the tissues, the importance of cellular respiration, the processes of inhalation/exhalation, determine the volume of air exhaled and to eliminate carbon dioxide formed in the body.

Students will:
- -Demonstrate that there is oxygen in the air we breathe.
- -Build a model of the respiratory system.
- -Measure the amount of air that can be forced out of the lungs.
- -Demonstrate that carbon dioxide is exhaled from the body.

Materials Needed:

Part A
1. Candle
2. Matches
3. Pan
4. Clear cup or glass
5. Water

Part B
1. 2-pieces of straw
2. 2-small balloons
3. rubber cement
4. 1-large balloon
5. rubber bands - 2 small, 1 large
6. tape

Part C
1. Lime powder
2. Water
3. Clear cup or glass
4. Straw

Part D
1. Plastic dish pan
2. 2 feet (61 cm) of aquarium tubing
3. 1 gallon (4 liters) plastic milk jug w/cap
4. masking tape
5. pen
6. an 8 oz cup

Strategy:

Part A
This experiment will show that there is oxygen in the air we breathe.
1. Place a small amount of water in the bottom of the pan, enough to cover the bottom of the pan.
2. Light the candle and place in the water on the bottom of the pan.
3. Cover the lit candle with the glass and observe what happens to the water.

Part B
This model will show the action of the diaphragm in human respiration.
1. Take a piece of straw about 2 inches in length and cut a small triangle in the center, but don't go through to the opposite side. Fit one small balloon over each end of the straw and secure it with a small

rubber band. (Make sure that air will go into each balloon when blown from the top.)

2. Bend the straw in the middle of the hole.
3. Take a second piece of straw and cut a V-shape on the end. Fit the slanted points of the straw into each semi-circle of the hole of the bent straw.
4. Cement the two pieces of the straw together. Allow to dry or use tape to hold until dry.
5. Cut a hole in the bottom of the clear plastic cup using the diameter of the straw as a guide to the size. Push the open end of the straw into the hole of the plastic cup from the inside. Cement the straw into the hole.
6. Take the large balloon and cut the neck off. Carefully stretch the cut balloon over the opening of the cup. Do not crack the cup. Secure the edges with the large rubber band. Do not cement the sides of the cup. The model will only work if there are no leaks.
7. Then pull the bottom balloon gently and observe what happens to the small balloons.

Part C

This experiment will show that carbon dioxide is one of the major cellular metabolic waste products.

1. Place about a teaspoon of lime powder in a cup or glass of warm water and mix thoroughly. Cover the glass and let remain over night.
2. Next day drain the clear fluid off the top of the solution. This is the lime water for the experiment.
3. Place the straw in the lime water and blow into the straw. Observe what happens to the clear fluid.

Part D

This experiment will demonstrate lung capacity by measuring the amount of air that can be forced out of the lungs.

1. Place a strip of masking tape down the side of the milk jug from the top to the bottom.
2. Fill the jug with water using a cup to measure amount of water it takes to fill the jug. Mark each cup on on the tape (these measurements will serve to show the amount of water exhaled) and screw on the cap.
3. Fill the dish pan about 1/2 full with water.
4. Place the jug upside down in the water, and remove the cap.
5. Have a helper hold the jug. DO NOT allow air bubbles to enter the milk jug.
6. Place one end of the aquarium tubing inside the mouth of the jug.
7. Take a normal breath and exhale through the tubing. Mark the water level on the tape.
8. Refill the jug with water and return it to the dish pan.
9. Breath in deeply and make an effort to exhale all of the air in your lungs through the tubing. Mark the water level on the tape.

Performance Assessment:

Students will be able to answer the following questions:

1. What are the chief functions of the respiratory system?
2. Why do we need to breathe?

3. What's in the air we breathe?
4. How do you know there is oxygen in the air we breathe?
5. What would happen if your oxygen ran out?
6. What do the small balloons represent?
7. What do the two ends of the straw to which the balloons are attached represent?
8. What does the longer piece of straw represent?
9. What do the sides of the cup represent?
10. What does the balloon sheet over the cup's opening represent?
11. What happened to the small balloons when you pulled down on the balloon sheet?
12. What happened to the small balloons when you push up on the balloon sheet?
13. What happens to the air once it's in the lungs?
14. What is cellular metabolic activity?
15. What is the primary gaseous waste product of cellular metabolic activity?
16. What's the stuff that comes out when you exhale?
17. What is lung capacity?
18. What happens in the plastic bottle as you exhale into the rubber tubing?
19. What effect does exercise have on the volume of air? Explain.

Conclusion:

At the end of this lesson students will understand the basic anatomy and physiology of the respiratory system.

Mechanism of Vision

Celestine Miller Jeffreys
5342 South Harper
Chicago IL 60615
312-643-2139

Beethoven School
25 West 47th Street
Chicago IL 60609
312-535-1480

Objectives:

This lesson is designed for junior high school students. The objectives are: learning the way light reflected from objects enters the eye; learning the basic anatomy and physiology of the eye; and learning the basic mechanism of perception.

Materials Needed:

For 5 groups of students (4-5 in each group)

The Device

10 cans of equal size (soup, tomato paste, etc.) with the lids on both ends cut out
5 holepunchers
5 toothpicks
15 rubberbands OR tape for each group
large (18"x24") black arrow
aluminum foil
wax paper

Perception Tools

5 sets of the following postcards:
--1 classic European painting, painted between 1500 and 1800
--1 photograph, preferably 20th century
--1 "primitive," American folkart or European painting before 1400
5-8 optical illusions (not the Magic Eye)

Strategy:

1. Have each group cut 2 generously-sized squares of aluminum foil and one generously-sized square of wax paper. The square should fit over the ends of the cans.
2. In one aluminum foil square, use the hole puncher to punch a hole in the center of the square (square A). In the other aluminum foil square, use the toothpick to punch a very small hole in the center of the square (square C). Do nothing to the wax paper.
3. Secure each square to the can with tape or rubber band.
4. Cover one end of a can with square A. Do nothing to the other end of that can. Cover one end of the other can with square B and the opposite end with square C. See diagram below.

```
`ffffffffffffffffffffffp           `ffffffffffffffffffffffp
w                     w            w                     w
w                     w            w                     w
w                     w            w                     w
affffffffffffffffffffffq           affffffffffffffffffffffq
|                    |             |                    |
```

square C square B nothing square A

5. Before you begin the next phase, be sure to have the arrow taped in an upright position to a very bright window. Hold the device in the manner illustrated above, with square B touching the open end of the first can. Look at the arrow. Ask the following questions:

a. What do you see?
b. How did you have to arrange the device in order to get the best image?
c. Why does the image look that way?

Explanation: light is reflected from an object and enters the lens of the eye, where it is refracted and travels to a group of light-sensitive cells in the back of the eye called the retina. Light entering at the top of the lens is refracted to the bottom of the retina; light entering the bottom of the lens is refracted to the top of the retina; light entering the center of the lens is refracted to the center of the retina. Under normal conditions, light reflected from an object is projected onto the back of the retina so that the object projected is upside down and switched from left to right. We don't perceive objects in this manner; the visual cortex "corrects" this so we see the object in its correct orientation. The device strains the light coming to the lens at the top and bottom, so that your perception of the object is fooled into seeing it upside down.

Next...

1. To use the perception tools, have each student study the three pictures. (Note: you must use the pictures described in the materials section. European paintings before 1400, as well as "primitive" art, do not have depth of perception. You also must be careful with Impressionist art because it has a tendency to be very "flat.") Ask the following questions:

a. What is the subject of the painting?
b. List some objects in the foreground and background.
c. In what ways can you differentiate between the objects in the foreground and the background?
d. How did the artist conceptualize foreground and background objects?
e. Do all three pictures have depth?
f. Draw a three-dimensional picture using the techniques you've observed.

2. To use the optical illusions, tape each one on the blackboard or around the room. Have each student look at the illusion for only 30 seconds or so. Ask them to quickly write down what they've seen. It's important that students do not talk or discuss their answers until everyone has looked at the pictures. Discuss the answers with your class. Ask them what lines or contours caused them to see the drawing as they did.

Explanation: light is reflected from objects, projected onto the retina and perceived in the visual cortex. Light is projected onto the retina as a two dimensional representation of three dimensional space. Depth perception takes place because our eyes are not in the same position and we perceive depth by the space between the different objects as they are projected onto the retina. Part of depth perception concerns our experience with the world. We touch objects as infants and can determine if the object is near or far. These experiences are imbedded in our visual cortex and we rely on them when we perceive the depth and distance of new objects. When an artist represents three dimensional space in two dimensions, she uses the same references that our brains use such as the size of an object (the further away, the smaller it is); the clarity of an object (the further away, the less distinct it is); lines of depth (straight lines going from near objects to far objects). Furthermore, contours of objects are perceived in the visual cortex. Cells in the cortex are more stimulated by changes in contours than by flat, continuous space.

Performance Assessment:

Each phase of the demonstration should be accompanied by a written lab report. Students will write their answers on this sheet. For an excellent grade concerning the device, students should: assemble the device in the manner illustrated; view the arrow upside down; explain that light is constricted by the device and causes the image to appear upside down. In assessing the appropriateness of the device, the instructor should observe that the holes are punched in the correct places, all squares are securely fastened to the cans, the device held in the correct manner, the device used to see the arrow in the correct manner. Concerning the three pictures, students should: accurately list foreground and background objects and explain that near objects are larger and more distinct than distant objects. Concerning the optical illusions students should explain why they saw the illusion in a certain way and explain that contours are very important to perception.

Conclusions:

Vision is an interplay between light reflected from the object and the mode of perception in the brain.

Return to Biology Index

Movement Across the Membrane (Diffusion)

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60462
(708)460-5022

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815)485-7655

Objectives:

This lesson is designed for a high school student. The main objectives of this Mini-teach are to explain the concept of diffusion and to show the process how all materials enter and leave the cell.

Materials Needed:

- food coloring
- beakers
- sugar cube
- phenolphthalein
- rubber band
- raisins
- paper towel
- starch
- paper clips
- water
- air freshener/perfume
- test tube
- cellophane
- ammonia
- toothpick
- dialysis tubing/cellophane baggie
- iodine
- paper cups

Strategy:

DIFFUSION

Activity #1

1. Place one drop of food coloring into a beaker of water.
2. Observe what happens for 2-3 minutes.

Activity #2

1. Spray perfume/air freshener at the back of the room.
2. Observe what happens for 2-3 minutes.

Activity #3

1. Fill a cup with water. Gently touch the surface of the cup of water. Taste the water.
2. Drop a sugar cube in the water.
3. Taste the water every 15 seconds.

MOVEMENT ACROSS THE MEMBRANE

Activity #1

1. Fill a test tube 1/2 full with water.
2. Add 2-3 drops of phenolphthalein to the water.
3. Wrap a piece of cellophane over the mouth of the test tube. Secure it with a rubber band.
4. Turn the test tube over an open bottle of ammonia.

Activity #2

1. Obtain a soaked raisin and an unsoaked raisin. Carefully blot the raisins dry. Do not break the skins.

2. Use a toothpick to poke a hole in one end of each raisin.
3. Gently squeeze both raisins.

Activity #3

1. Obtain a piece of tubing (a cellophane baggie could be substituted). Tie a knot at one end then fill it 1/4 with water.
2. Make sure the tube does not leak. Empty the water out of the tubing.
3. Add 3 teaspoons of starch to the tubing.
4. Squeeze the air out of the tubing. Tie a knot at the open end.
5. Wash off the tubing.
6. Fill a beaker 3/4 full with water. Add 10 to 15 drops of iodine and stir.
7. Tie a paper clip around each knot in the tube. Hang the tube in the beaker of water.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. Describe what happened to the drop of food coloring/air freshener molecules?
2. How do molecules move?
3. What is diffusion?
4. What happened to the taste of the water?
5. What caused the taste of the water to change?
6. What happened to the liquid in the test tube?
7. Where was there a high/low concentration of ammonia.
8. Which way did the ammonia move? (Use the word "concentration" in your answer)
9. Explain how gases are exchanged between the respiratory system and the circulatory system.
10. How do gases pass out of the lungs into the capillaries?
11. How do the soaked and unsoaked raisins differ?
12. What do you think is coming out of the raisin, how did this liquid get into the raisin?
13. What does the skin of the raisin represent?
14. What happened to the starch?
15. What happened to the iodine and water?
16. Explain the movement of materials across the tubing.
17. Explain how foods are exchanged between the digestive system and the circulatory system.
18. How is the tubing like a membrane?
19. How does digested food pass out of the intestine into the capillaries?
20. How do materials enter and leave the cells?

Conclusion:

Students will understand the process of diffusion and its role in moving materials across the membrane.

Return to Biology Index

Cervical Vertebrae

Angel Lee Gilbert
6000 N Sheridan Road
Chicago IL 60660

Douglass Middle Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

This lesson has been designed for 8th grade learners, but can be used for other levels. This lesson was developed to show through the use of diagrams and models the function of the cervical vertebrae and how easy it is to damage the cervical vertebrae. Focus: Christoper Reeve

Learners will: determine how and why he was hurt.
why he needed his breathing supplemented.
explain why he could not breath.
demonstrate how he fell.
discuss if he is a paraplegic & recovery techniques.
create their own models.

Materials Needed:

rice cakes	=	bones
marshmallows	=	discs
straws	=	spine
thread (or twine)	=	nerves
needles	=	used to thread the nerves

Procedure:

1. To soften the rice cakes for piercing by the straw, learners must drop several drops of water in the CENTER of the rice cakes.
2. When the rice cakes are soften IN THE CENTER, assemble by putting the straw through rice cake, marshmallow, rice cake, marshmallow, etc. until the desired number are lined up.
3. Thread needle with black or red thread, and "stitch" through marshmallow near the upper rice cake with a single thread. Do this for each marshmallow.

Strategy:

To simulate Christopher Reeve's accident, learners will collapse the "vertebrae" by bringing hands together with force, keeping the "spine" between middle and ring fingers, close to the palms.

Performance Assessment:

The outcome for each learner will determine how well they listened, worked in cooperative learning groups, followed directions and therefore, successfully completed the objectives. Each learner will read informational packet for discussion, participate in discussion (20%), produce one page report (50%), and construct their own cervical vertebrae section or sections (30%).

"Da" I's Have It: A Fun Look At The Eye

Ann Fultz
4343 Mayfair Court
Country Club Hills IL 60478
(708) 957-7977

Charles Holden Elementary
1104 West 31st Street
Chicago IL 60608
(312) 535-7200

Objective:

Kindergarten level: Recognition of parts of the eye.

Materials Needed:

- sponges
- styrofoam balls
- index cards
- pencils
- string
- paper plates
- oranges
- saran wrap
- colored ribbons
- cardboard
- markers
- doll plastic eyes
- construction paper
- balloons
- paper towels
- round candies
- olives
- Pringle potato chip cans
- metallic (shiny) Paper
- "Find Waldo" Book

Strategy:

Students will construct three forms of the eye. Using a styrofoam ball, students will add a plastic eye ball by adhesion. Use a good glue to cause permanent bonding. Students will do likewise with the sponge ball. If the sponge is not shaped in the form of a ball, shape sponge into ball shape before adding plastic eye. Give time for glue to set. This is the time to construct 'fun' eye. Peel orange, keeping the orange whole, don't section it off. Stick your finger into the open groove at the end of the orange. Your finger will allow enough space for you to insert an olive. Voila! The orange is the sclera. The green of the olive is the iris, and the red represents the pupil. Point out that we see the sclera as pure white, while inside, there is a network of movement occurring, hence, the orange with its veins and grooves remind us of how the inside would appear if we could see it.

Blow balloons up and using marker, draw iris and pupil on the front of the balloon. Students can feel the roundness of the balloon and see placement of iris and pupil in relationship to sclera.

Take doughnut-shaped candies and insert a gumdrop into the center. On the center of the gumdrop, place a raisin. You now have the eye parts in an edible puzzle form.

Make tubes out of the yellow and grey construction paper. Roll one tube longer than the other. Tape the ends. Ask children to bring rods and cones up as you hold both tubes in your hands. Place rods and cones on floor in a triangular form. Have students retrieve styrofoam balls and bring them up front. Students will take turns knocking down rods and cones. The winner is the one that "bowls" the most rods and cones down.

Bring balloons and form teams on either side of makeshift net (notebook paper with holes taped to a piece of string held by two students at each end). Students will volley balloons at the same time with the winners being those who keep the balloons on their side off the floor. Instructor periodically calls the name of eye parts, for instance, "here comes the red sclera"; "I see the green sclera with the blue iris"; "Hit that black pupil of the eye dead center."

Using paper plates, black beans and glue, students will construct the first letter of their name. Instruct students to put on their blindfolds (paper towels) before beginning this project. This activity vividly portrays the importance of the eye and allows the student to appreciate the ability to see.

Using the construction paper rod or cone that students made, instruct students to hold rod or cone to side of left hand. Hold at arm's length, with both eyes open, students will be able to see a hole in left hand.

Instruct students to touch the tips of their longest fingers on each hand. Hold hands at arm's length directly in front of your eyes. Hot Dog! We have lunch. Students should be able to see the illusion of a suspended finger (hot dog) in the middle of fingertips.

Extend forefinger about 6 cm from eyes in front of you. Slowly bring finger close to your eyes, with both eyes open. You will see the illusion of two out of the one finger extended. Yea, V for victory, we've come this far.

More Eye Puzzles To Amaze and Entertain Young Ones as well as pique their interest:

Give each student a square piece of cardboard, "3 by 3" perhaps, and have them punch a hole on each side. Holes should be at the edge of cardboard and near the center, or midway through cardboard. Attach a string to each hole. Using a marker, draw a cage on one side and draw a bird on other side. Teacher can draw pictures on chalkboard as students copy. Have students hold both ends of string in hands and twirl. The bird now appears to be inside the cage. To make trick really come alive, use different colored markers, and draw your bird smaller than your cage.

Give students a lined index card. Have them color or trace lines using a marker and/or crayons. Punch hole in center of card with your pencil. Leave pencil in the hole and spin the card. Straight lines now appear to be round lines. If you put a dot between one of your lines you will get the illusion of a race track.

Give each student a Pringle potato chip can. Have them cut off the bottom end of can. They will need a plastic top and a square piece of Saran Wrap. Set aside. Pass out different colored pieces of ribbons and instruct students to cut them into small pieces. Place cut up ribbons in the plastic top. Place Saran Wrap on top of ribbons. Give each student a metallic sheet of paper which they roll to fit into their cans. Glue middle seam of metallic paper, and glue the paper to inside of the cans. Attach plastic top to can. Students turn can. They have just made their own, economical kaleidoscope. And, cheaper yet, is to place a boldly printed picture inside plastic cap. Same effect. Use Sunday funnies or magazines. No expenditure for ribbons needed.

To further reinforce retention of eye parts

"Da" I's Have It

Where: Iowa
Why: No idea
By: Ida give a hoot

Characters: Sclera, Cornea, Iris, Pupil, Retina

Sclera: (boasting) I'm TOUGH, I PROTECT ALL OF YOU, SO DON'T GIVE ME A HARD WAY TO GO.
Fultz: There goes that guy again. I haven't seen him since I don't know when. He promised me he wouldn't complain. I think he's fine, I'm glad he's mine. (You really give singing a bad name).
Cornea: You don't have to toot your horn (convincingly). We know how important you are to us. My membrane is so thin, I'm glad you provide protection yet allow light to pass through my conjunctiva, which is also transparent and produces fluid, and helps keep the front of my eye clean and moist.
Iris: Oh brother, talk, talk, talk (agitated). Tell me, can you change colors as I can, huh, huh?
Retina: (Strutting peacock) All of you step back. I'M THE MOST ASTONISHING PART OF THE BODY. AS SMALL AS I AM (postage stamp size), I CAN DETECT A DETAILED, CONTINUOUS AND MOVING VIEW OF THE WORLD IN COLOR. I'M YOUR SWITCHBOARD. I CONVERT LIGHT RAYS INTO ELECTRICAL MESSAGES AND SEND THEM TO THE WRINKLED GUY (your brain).
Pupil: (whispering) Real truth is, he gossips.
Cornea: (joining the whispering) I think Retina is part of a gang. He hangs out with the rods, the cones, who are related to a network of nerve cells called bipolar cells, and.......
Iris: (interrupting) Yes, I heard they all are connected to another layer of cells called ganglion cells.
Pupil: (Naively) Well, they ARE interconnected, and work together, so I imagine it MUST be a 'good' gang.
Iris: (indignant) What's a good gang? They wouldn't be in 'cells' if they were good. Convicts live in cells.
Sclera: I didn't mean to start a war of words, and/or wonders.
Fultz: I'm grieving, so I'm leaving, because "Eye, Eye, I've" got the blues right now. (Child, you sure give me the blues with that off key singing.) Ouch! My ears hurt.
Pupil: (sarcastically) You might think about going on a diet, you are carrying a lot of muscles, membranes, nerve endings, etc.
Iris: (coyly) I don't diet, however, I do change shape, after a meal of light, bright and/or dim.
Pupil: (mimicking) I always maintain my round shape, thanks to your help, your strong muscles, lengthening and shortening, to change my size, so that I can control light coming in.
Cornea: (bored) Do me a favor. Just keep everything out of my way and I'll remain healthy.
Sclera: (sincerely) I'm glad we had this chat, we learned much about this and that. One thing I know, the eye puts on a mighty show.
ALL; (tune of Old MacDonald) With a blink, blink here, and a tear duct there, here a blink, there a wink, everywhere a blink, blink, blink. Oh my eyes have a job, and they do it well.
Fultz: Opening mouth.....

```
ALL:      (shouting)  DON'T EVEN TRY IT!
Fade to reality.........................
```

Learning the Dissecting Planes

Charles T. Buzek
35 S. Kensington
La Grange IL 60525
(708) 482-0024

John Spry School
2400 S. Marshall
Chicago IL 60603
(312) 345-1700

Objectives:

This paper is designed for junior high students.
Students will learn the basic vocabulary used in dissection.
Students will learn how to orient themselves on a three dimensional figure.
Students will develop the manual dexterity necessary to use scalpels in class.

Materials Needed:

Cucumber
Scalpels
Human anatomy wall chart

Procedure:

It will be necessary to turn the cucumber into an animal. This can be done easily by cutting out holes on the anterior part of the cucumber to symbolize eyes The cucumber is now a "frog". The presence of the eyes now gives the frog an up & down position. These are referred to as the dorsal & ventral side of the animal. The location of the eyes also gives the organism a front & back. These are referred to as anterior & posterior. It should be noted at this point that the cucumber/frog can be made more lifelike by placing short straws where legs would normally be located. At this point students will be ready to begin using their scalpels. With scalpels in hand the students will be directed to make a shallow cut starting from the anterior end along the ventral side of the frog. For those students too young to use a cutting instrument it may be replaced with a Magic Marker. By the end of this part of the exercise the students should have made a shallow incision from the anterior to the posterior end of the frog. This cut is known as the sagittal incision. Now they will be instructed to cut midway on the ventral side of the organism from their left to right side. This is known as the transverse incision. The human anatomy wall chart can be used to quiz the students about their knowledge of the dissecting terminology. For this exercise the terms distal & proximate should be introduced. The teacher can then ask the students to locate a certain organ by giving them clues using the vocabulary they just learned.

Follow Up:

These terms are important to the study of life sciences & should be reviewed. The teacher might consider all situations in a normal classroom context that would require directions. These terms should be used in these situations. For example students should refer these terms to their own persons while they are in the class. Students have ventral and dorsal sides in addition to anterior and posterior directions. Objects in relation to the student's person might be termed as distal or proximate to them. The guiding principle for the retention of a scientific vocabulary is, as in any language, it's constant use.

Some Activities For Teaching the Mechanics of Vision

Charles T. Buzek
35 S. Kensington
LaGrange Il 60525
(708)482-0024

John Spry School
2400 S. Sacramento
Chicago Il 60653
(312)534-1700

Objectives:

Students are to learn the relationship of light to vision, how light moves, how that affects what we see and some structural aspects of the eye.

Materials Needed:

Small bowl, coin, and water
3 by 5 cards
soup cans with ends removed, aluminum foil, wax paper

Strategy:

The following three activities will provide a good introduction to the process of sight:

Take the small bowl and place the coin in its bottom. Place it in front of a student at a distance that first renders the coin invisible to the student. Pour water into the bowl and the student will be able to see the coin that was invisible before.

Each student should have a 3 by 5 card held lengthways and inscribed on one end with an X in the left corner and a dot in the right corner. Students are to hold the card at arm's length, closing the left eye and staring at the X with the right eye. Instructed to draw the card closer to their face the students will notice something interesting about the image on the right. Change eyes and the phenomenon occurs on the left.

Each student should have two soup cans as described. One can to have one end covered with aluminum foil held in place with a rubber band. The other can to have one end covered with wax paper. Using a pencil point make a small hole in the center of the aluminum foil then, holding the aluminum foil can outermost with the wax paper can directly behind it (wax paper facing into the other can), place the cans in front of your eye and you will see an image appear on the wax paper.

Performance Assessment:

In the first activity explain that light travels in a straight line unless interrupted by a material with a different molecular structure. Given this, can the students explain why the coin seems to mysteriously appear?

The students must be able to describe the phenomenon and then come up with a theory to explain it based on their knowledge of ocular anatomy. A little discussion beforehand wouldn't hurt.

For the third activity the students must be able to describe the phenomenon accurately and draw a diagram to explain it.

Conclusions:

It should be stressed to the students that none of these experiments in any way changed the physical world. The phenomena that we observed occurred only within our brains. The coin did not move, images didn't really disappear or appear nor did an object invert itself. We perceived these things to happen because of the nature of our eyes and the way we interpret the information that comes to us from them.

Inhalation and Exhalation

Kelly Ludwig	Lincoln-Way High School
16621 Grants Trail	1801 East Lincoln Highway
Orland Park IL 60462	New Lenox IL 60451
(708)460-5022	(815)485-7655

Objectives:

The main objectives of this Mini-teach are to make a model of the respiratory system that will demonstrate the processes of inhalation/exhalation and to determine the volume of air exhaled.

Materials Needed:

MODEL CONSTRUCTION	VOLUME OF EXHALED AIR
2 pieces of plastic straw	food coloring
2 small balloons	water
rubber cement	paper towel
clear plastic cup	2-L plastic bottle
large balloon	2-hole rubber stopper
rubber band	rubber tubing
tape	glass tubing
	graduated cylinder

Strategy:

Model Construction

1. Take a piece of straw and cut a hole in the middle, do not go through to the opposite side. Fit a small balloon over each end. If the balloons are slightly larger than the straw, cement them to the ends. Put this aside to dry.
2. When the cement has dried, bend the straw in the middle of the hole.
3. Take a second piece of the straw and cut a V-shape at the end. Fit the slanted points of the straw into each semi-circle of the bent straw.
4. Cement the two pieces of straw together. Allow the cement to dry.
5. Cut a hole in the bottom of the clear plastic cup using the diameter of straw as a guide. Push the open end of the straw into the hole of the plastic cup from the inside. Cement the straw in the hole.
6. Take the large balloon and cut the neck off. Carefully stretch the cut balloon sheet over the opening of the cup. Do not crack the cup. Secure the balloon sheet with a rubber band. If necessary, you may tape the edges, but do not cement them to the sides of the cup. The model will work only if there are no leaks.
7. Pull down on the balloon sheet. Observe what happens to the small balloons.
8. Push up on the balloon sheet. Observe what happens to the small balloons.

Measuring the Volume of Exhaled Air

1. Fill a plastic bottle four-fifths full of water. Add several drops of food coloring to the water.
2. Put a short glass tube (does not reach the water) and a long glass tube (almost reaches the bottom of the bottle) through the 2-hole rubber stopper.

3. Connect the rubber tubing. To the short glass tube connect a piece to blow into. To the long glass tube connect a piece that will touch the bottom of a graduated cylinder.
4. Cover the opening of the shorter length of rubber tubing with a paper towel, and after inhaling normally, exhale normally into the rubber tubing.
5. The exhaled air will cause an equal volume of water to move through the outer length of tubing into the graduated cylinder. Record the volume of this water in ml in a data table.
6. Pour the colored water from the cylinder into the 2-L plastic bottle.
7. Repeat steps 4-6 two more times. Record the results in your data table. Calculate the average of the three readings.
8. Run in place for two minutes and exhale into the rubber tubing. Record the volume of the water in the graduated cylinder.
9. Rest for a few minutes until your breathing returns to normal. Then repeat step 8 two times and record the results. Calculate the average of the three readings.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. What do the small balloons represent?
2. What do the two ends of the straw to which the balloons are attached represent?
3. What does the longer piece of straw represent?
4. What do the sides of the cup represent?
5. What does the balloon sheet over the cup's opening represent?
6. What happened to the small balloons when you pulled down on the balloon sheet?
7. What happened to the small balloons when you pushed up on the balloon sheet?
8. What happens in the plastic bottle as you exhale into the rubber tubing?
9. Why is it important to measure the volume of exhaled air three times before and after exercise?
10. How does your average volume of exhaled air before exercise compare to your average volume of exhaled air after exercise?
11. What effect does exercise have on the volume of exhaled air? Explain.

Conclusion:

Students will understand the basic anatomy and physiology of the respiratory system. Also, students will understand that exercise will effect the volume of air exhaled.

Return to Biology Index

Fingerprints--2 mini-teaches and a game

Russ Osantowski
5132 Steger Rd.
Monee IL 60449
(708)748-0752

Carter Elementary
5740 S. Michigan
Chicago IL 60637
(312)535-0860

Objectives:

The main objectives of this mini-teach are to have K-6 students learn:
how to make and preserve fingerprints,
the basic types (arches, loops, and whorls),
and sub-types (tented arches, ulnar and radial loops with the open end of the loops pointing toward the arm's ulna or radius bones) of prints,
to understand the causes and the uniqueness of fingerprints and
to establish rapport with the students at the beginning of the year.

Materials Needed:

for first mini-teach:
pencils, paper and scotch tape.
for the second mini-teach which begins at strategy 7 below:
several feathers or 1 for each child
small jar of talcum powder
small jar of graphite powder
scotch tape
clean, clear, plastic glasses or clean jars (baby food jars are durable and have many other uses),
black and white construction paper, pre-cut into 2" x 1" rectangles,
plastic straw to serve as a teacher's super-small spoon to spoon out above powders in portions smaller than the word "no" at one portion per child.

Strategy:

1. **For the first mini-teach** draw a rectangle on your paper that is about 2" long and 1" wide.
2. Turn your pencil on its side and color the rectangle as black as you can.
3. Rub the tip of your thumb or the tip of 1 finger on the black rectangle until it is gray.
4. Put a small piece of scotch tape on the gray area of the finger in a smooth manner, usually from the tip down or from the first joint up.
5. Holding only the tip of a corner of the tape, peel it off and carefully put it on the paper. Write down what hand and finger it came from.
6. Instructions to students: "Write your name and room number on the paper. Take it home tonight to give to your mother.
7. For those who are finished early-- draw your fingerprint patterns and label the types."

8. **For the second mini-teach**: instructions to students, "Rub your finger on your nose for 2 seconds to get more oil on your finger.
9. Do not touch the cup you are going to get until I tell you how. Put one hand inside the cup to hold it still. Use the other hand to make a fingerprint on the outside of the cup.

10. Can you see it? Now dust or tap less than 1/2 cm of talcum of graphite powder on the print.
11. Use the bottom 1/2 of the feather (the part closest to the quill) to spread the powder evenly over the print.
12. Blow off any excess powder.
13. Take a small piece of scotch tape and put it on print, as in #4 above.
14. Lift off the tape thereby lifting the print.
15. If you used talcum powder, put it on the black construction paper. If you used graphite powder, put it on white construction paper.
16. Examine the print.
17. Classify it as to type and subtype.
18. Draw your print and label its classification.
19. Tape your print to your drawing."
20. GAME: send a detective(s) out of the room and put a print(s) on one or more objects. The detective(s) must find the prints and identify the person(s) to whom they belong.

.

Performance Assessment:

The grade for the print should be put on or near the print and the grades for the drawing and the classification should be put on the drawing.
Students will put their drawing in their science portfolios with their science notes which answer the following questions:

1. Is every print different? Yes.
2. How many prints does the FBI have? 21/2 billion.
3. How many pore holes does a thumb have? 900-1100.
4. Can they be used by measuring their location and number as additional ways of classifying the prints? Yes.
5. How many sweat and oil gland openings are in a finger? Do some reading.
6. Can you be convicted by the edge of a footprint or a handprint? Yes.

Conclusion:

Students will understand that fingerprints are important in solving crimes, identifying lost and/or dead people and in reuniting relatives.

Return to Biology Index

MuscleMania

Celestine Miller Jeffreys
5342 South Harper Avenue
Chicago IL 60615
(312)643-2139

Beethoven Academic Center
25 W. 47th Street
Chicago IL 60609
(312)535-1480

Objectives:

This mini-teach is designed for middle-school students. Through observation, demonstration and brainstorming, students will learn the three different types of muscles and their functions. By building a model of the arm, they will learn its basic anatomy and how muscles, particularly the bicep and tricep, function in relationship to bones. Students will perform an experiment on the relationship between muscle size and muscle fatigue.

Materials Needed:

[for groups of three students]
(10) Pre-prepared wooden upperarm and forearm (humerus, radius & ulna), attached to each other with (5) hinges; each set containing (4) nails or screws in anatomically correct positions
(10) Oblong balloons
(5) Markers
(5) Gallon milk jugs filled with water - weight approx. 8 lbs.
(5) Tape measures
(5) Pre-prepared charts
(1) Chicken/cow cardiac, smooth and skeletal muscles
(15) Copies of arm exercises

Strategy:

Visuals: a large "MuscleMania" banner draped across the front of the class and pictures of weightlifters taped near the students' workstations.

Demonstrate movements that the three types of muscles (cardiac, smooth and skeletal) enable us to perform. The student-demonstrator will jump up and down (skeletal-large muscles), frown (skeletal-small muscles), and eat (smooth). Discuss the continuous beating of the heart (cardiac), and introduce the concept of voluntary (skeletal) and involuntary (cardiac, smooth) control. Pass around the chicken/cow cardiac, smooth and skeletal muscles so students can see and feel the difference between these three types of muscle. Skeletal muscle is striated, cardiac muscle is somewhat striated and smooth muscle has no striations. Also observe the anatomical relationship between skin, fat, muscle and bone. Dispel the myth that muscle can "turn into" fat, or fat into muscle. Discuss contraction and relaxation and have each student perform different types of contraction (tonic, isotonic, isometric).

Students will construct an arm, with bones and muscles, using wooden sticks, balloons and nails. Distribute the "bones" (two 11/2" x 11/2" x 12" sticks attached by a 180 deg. hinge) to groups of three students. Observe how the bones move. Attach the balloons, about 50% full of air, to nails/screws in the bones. Observe where the muscles are attached and how they move with the bones. Be sure to use the terms origin and insertion. Move the whole apparatus and observe how the muscles look when they contract and relax. Using the model, identify terms of movement (abduction, adduction, supination, pronation, flexion and extension). Add striations with a marker and observe how they change in appearance with contraction and relaxation.

Now that students have a basic understanding of muscle anatomy, they will perform an experiment on the relationship of muscle size to muscle fatigue. Remaining in their groups, students will measure each other's bicep muscle by making a muscle, palpating the boundaries, and measuring between the boundaries. Chart the measurement in metric. Then one student will pick up the gallon jug with his/her dominant hand, hold it by the handle, and lift the jug up and down, keeping the elbow as close to the waist as possible. To ensure uniformity, the student will recite, "the rain in Spain stays mainly on the plain"; on "Spain" lift the weight to the shoulder and on "plain" bring the weight down towards the thigh. Be sure to tell the students not to rest between flexion and extension. Muscle fatigue will occur when the person is unable to lift the jug. Another student will count and chart the number of lifts, and measure the muscle after exercise. When all the groups have finished charting and exercising, they will discuss and decide if larger muscles fatigue more or less quickly than smaller muscles. They should also note the change in muscle size before and after exercise. Once each group's hypothesis is finalized, come together as a class and discuss the results. Ask questions concerning factors which make muscles stronger, e.g. diet, general physical condition, etc. Ask students if they moved their hips or shoulders while lifting the jug. Also look at the weightlifters and discuss the concept of size versus strength.

Finally, distribute copies of arm exercises and encourage students to develop their muscles.

Performance Assessment:

Excellent grasp - this student can define and identify the following terms: skeletal, cardiac and smooth muscle; involuntary and voluntary control; tendons, origin and insertion; abduction, adduction, flexion and extension; striation; tonic, isotonic and isometric. Muscle and fat are not interchangeable. Muscles are attached to bones and move in relationship to bones. Some muscles contract and relax synergistically, and cells of the muscles change in appearance. Muscles fatigue and change in size when a person exercises. Muscle size may/may not have anything to do with strength.

Fair grasp - this student can define and identify some of the above terms. Muscles are attached to bones, and they relax and contract. Muscle and fat are not the same thing. Muscles fatigue and change in size when a person exercises. Muscle size may/may not have anything to do with strength.

Poor grasp - this student understands that there are different types of muscles. Muscles move with bones, and relax and contract. Muscles get tired when a person exercises. Muscle size may/may not have anything to do with strength.

Conclusions:

We use muscles when we walk across a room, eat and digest an apple, or simply live.

Breathe In, Breath Out

JoAnn Brooks-Williams
8029 S. California
Chicago IL 60652
(312) 737-4282

Overton Elementary
221 E. 49th Street
Chicago IL 60615
(312) 535-1420

Objectives:

Student will see that plants take in carbon dioxide.
Student will see that plants need sunlight to absorb carbon dioxide.

Materials Needed:

aquatic plants
bromthymol blue 0.01%
water
straws
test tube rack
grow light
dropper
saran wrap
test tubes OR clear plastic cups

Strategy:

1. Label test tubes or cups with A, B, C. Put 5 cm of water in each. Use dropper to add several drops of bromthymol blue. Mix.
2. Place a straw in test tube A and blow as you exhale. When the solution turns yellow, stop.
3. Break off two pieces of the aquatic plant and place one piece each in test tubes A and B only. Plant must be covered by the solution. Seal the three test tubes with saran wrap.
4. Put test tubes A and C in very bright sunlight or under a grow light. Put test tube B in a dark place.
5. Check the test tubes for a color change after 20 minutes. Make a record of the results.

Test tube	**Beginning Color**	**Ending Color**
A	____________	______________
B	____________	______________
C	____________	______________

Performance Assessment:

Students will be able to answer the following questions:
1. What gas was released when we exhaled as we blew into the bromthymol blue solution?
2. Why did the solutions in the test tubes change color?
3. At the end of the experiment, what happened to the solution in test tube A? Why? Test tube B? Why? Test tube C? Why?

Conclusion:

Green plants take in carbon dioxide while in the presence of sunlight.

Objective:

Students will demonstrate that plants release oxygen and water vapor during photosynthesis.

Materials Needed:

soil	spiderwort plants (wandering jew)
test tubes	microscopes
aquatic plants	microscope slides and cover plates
water	2 liter pop bottle
coleus plants	clear plastic cups
dropper	sunlight or grow light

Strategy:

1. Tear off the leaf of a spiderwort plant in a circular direction to expose the lower transparent layer of the leaf. Place it on the microscope slide, put a drop of water on it, then cover it with a slide cover. Examine it under the microscope to find the stomata (holes through which CO_2, oxygen, and water vapor enters and exits the leaf).
2. Place a few aquatic leaves in a test tube of water. Turn it upside down into the clear plastic cup of water. Place it in the sun or under a grow light. Watch for the release of tiny oxygen bubbles.
3. Cut about 2.5 inches off of the top of a 2 liter bottle. Take the black opaque bottom off. Fill the bottom with soil. Put a rooted coleus plant in the soil. Water lightly. Turn the clear top upside down over the plant. Place the terrarium in sunlight or under a grow light. Observe the release of water vapor as it collects on the sides of the bottle.

Performance Assessment:

1. Describe the leaf's stomata or draw a picture of it. Are they opened or closed?
2. Why did we need sunlight for test tubes? terrariums?
3. What would have happened if the test tubes or terrariums had been placed in a dark place?
4. What gases are released during photosynthesis?
5. Describe oxygen. Describe water vapor.
6. Explain how the respiration process in plants and animals benefit each other.

Conclusion:

Green plants release oxygen and water vapor in the presence of sunlight.

Listen To Your Heart Beat

Lula Carey
10422 S. Indiana
Chicago IL 60628

Overton School
221 E 49th St.
Chicago IL 60615
(312) 535-1430

Objectives:

To determine normal pulse rate
To determine factors that cause the pulse rate to change
To construct a graph to show variation in pulse rates
To construct a simple stethoscope

Materials Needed:

pumping heart
tape recorder
exercise tape
stethoscope
scissors
paper towel tubes
chart paper
markers
clay
watch with second hand
10 funnels
4 jump ropes
plastic tubing (different sizes)

Strategies:

- Have students place their right hand over heart. Describe what you feel? Using an exercise tape or record that involves body movements, allow students to exercise for 2-3 minutes. Describe and compare differences in heart beats (orally).

- What is the strongest muscle in your body? Why do you think this is so? The teacher will use a pumping heart to explain and demonstrate the function of the heart.

- You can listen to a heartbeat, but you have to feel a pulse. Your pulse can be converted into a visual display. Give each student some clay and a matchstick. Roll a ball of clay about the size of a dime. Stick a match vertically into the ball. Place it on your wrist. Shift it around until you find the spot with the strongest beat. Describe and explain what you see.

- Show the class a stethoscope. What is this? What is its function? Let each child listen to his/her heartbeat. Describe what you hear. The first stethoscope was invented in 1819. It was nothing more than a hollow tube. Place the following items on a table: paper tubes, rubber or plastic tubing of various sizes and shapes, different size funnels, cut away plastic bottles, paper cups and plastic cups, clay, scissors, tape. Give several students the opportunity to make a stethoscope (Stethoscopes must be functional). Were some items more appropriate than others? Why? Can you think of other items we can use?

- Divide class into groups of five.

  Give each group a working stethoscope; five activity cards with the following words: napper, jumper, walker, twister, jogger, and a watch.

- Each student will select an activity card and take turns exercising for 2 or 3 minutes. Count the heart beats for 15 seconds immediately after exercising. Then multiply by 4 to find the beats per minute. (Be sure to listen for the 2 part sound "lub dub" that is counted as one beat. Record results.

	Gr. 1	2	3	4	5
Napper					
Jumper					
Jogger					
Walker					
Twister					

Performance Assessment:

- What is the hardest working muscle in your body? Why ?
- Explain how the heart functions.
- Outline the circulation of blood through the heart.
- Describe the sound of a heartbeat and explain the functions of each.
- What causes the pulse?
- Did exercise cause the pulse to increase in rate or decrease? Explain.
- What did you learn from the data on the bar graph? How did the data differ among the groups? Explain?

Conclusion:

The heart is about the size of your fist. It is made of muscle. Your heart works like a pump. You hear two sounds during every heartbeat. Doctors call them lub-dub noises. Your pulse tells you how fast your heart is beating. The throb you feel is the blood rushing through the vessel with each heartbeat. During exercise your heart beats faster. When you stop, your heart rate slows down.

Return to Biology Index

Internal Anatomy: A Fun Look At The Digestive System

Ann Fultz
4343 Mayfair Court
Country Club Hills IL 60478

Charles Holden Elementary
1104 West 31st Street
Chicago IL 60608
(312) 535-7200

Objectives:

To introduce, identify, and explain the functioning of some body parts.
To construct a "living doll" composed of the body parts discussed.

Materials:

Plastic tubing
Baggies
Yarn
Sponges
Fabric
Place Mats
Paper plates

Strategy:

Using student bodies, students will stand, breathe in and out. Point out the movement of their chest area moving in and out and let them know that their lungs are performing this action. Repeat for primary students.

Students will jog in place. When given oral command, students will run in place. After this activity, students are directed to feel their hearts.

Instructor, using food items and/or "fun" materials, will construct a doll and introduce, identify, and, explain function of body parts.

For example: yellow squash is shaped like the stomach; bananas will represent lungs; pasta shells will be small intestines, and so on with food items that approximate shape of inside body organs.

Students will construct their own doll using fabrics, sponges, and place mats to make up the body parts. This will be a permanent reminder of how some of their inside body parts are placed inside of them to perform the activity they are responsible for doing.

Performance Assessment:

Students have made their own toy. They have a workable machine. They can see and feel the different textures of materials used for the body parts. Those different feelings will aid them in the placement of the body organs.

Evaluation:

1. Students were able to place body parts on doll.
2. Students were able to identify body parts.
3. Students were able to discern that it takes the working together of all parts to make our bodies run.

Return to Biology Index

Aspects of Individual Human Blood Pressure

Ora Newman
2045 E. 93rd Street
Chicago IL 60617
(312) 374-2706

Fulton Elementary School
5300 S. Fulton
Chicago IL 60609
(312) 535-9000

Objective:

Student will:

1. Demonstrate the relationship between hypertension and the risk factors.
2. Demonstrate how pressure builds up in clogged arteries.
3. Measure both systolic and diastolic pressure by a sphygmomanometer.

Materials needed:

blood pressure cuff kit (sphygmomanometer/SFIG-moe-muh-NOM-e-ter)
plastic tubes with differing diameters
gameboard, bingo style, with risk factors in grids. Boards do NOT need to match each other. (fatty diet, lifestyles and environment, stress, inherited tendency, alcohol intake, overactive adrenal gland, street drugs, caffeine, obesity, kidney disease, diabetes, lack of exercise, smoking, excessive salt intake, cholesterol, other medications, sex, age, race)

Strategies:

Activity 1: Make gameboards with identifying words associated with hypertension (high blood pressure). Teacher calls out words from cards, first blackout "wins" a small prize. Repeat 2 or 3 times for reinforcement.

Activity 2: Using different diameter tubes, have the students compare and contrast the change of flow with a smaller tube vs. a larger one. Await them to make the association to the blood vessels. Would more pressure make the flow as fast as the larger tube? Why?

Activity 3: Using the blood pressure kit, demonstrate how to take systolic (upper) pressure-the first number at which you hear a beat after "pumping" above 200. Allow for individual sensitivities. 180 may be high enough for most. Listen to the beats, but notice the number at which you hear the LAST beat (diastolic). Systolic number is the upper number, diastolic, the "down" number. Average, or normal pressure is 120/80. Chart the class by teams, allowing for individual preference of volunteering information.

Extension activities: Is there a difference in blood pressure if seated? Lying down? After activity? Why? Students can research influencing factors as reports. Comparing diets before and after the blood pressure studies may be of interest.

Performance assessment:

Students will demonstrate ability to take blood pressure by measuring the two levels of pressure, systolic and diastolic.
Students will become more aware of the external and internal influencing factors on blood pressure.

Return to Biology Index

Reliability Of Your Visual Sense

William M. Gordon
9700 S. Oakley Avenue
Chicago IL 60643
(312) 233-5809

Parkman Elementary School
241 W. 51st Street
Chicago IL 60609
(312) 535-2220

Objectives:

Students will:

(a) perform a series of tests on the reliability of their visual sense.
(b) record their observations for each test.
(c) conclude from their data how reliable their visual sense is.

Materials needed:

colored pencils or crayons:
 (yellow, green, red, black)
white unlined paper
pencil with eraser
protractor
paper clip opened
lightweight cardboard
glue
straight pin
3 x 5 file card
ruler

Strategy:

Activity A. Afterimages

(1) With colored pencils or crayons, color the four squares. Use only the color indicated for each square.

(2) Stare at the cross in the center of the colored squares for 30 seconds.

(3) Then, stare at a white unlined sheet of paper.

(4) Observe the colors that appear on the white paper and the position of each colored square.

(5) Closing your eyes for one or two seconds while staring at the white paper will help intensify the colors or cause them to remain visible for a longer period of time.

(6) Repeat the previous three steps as many times as necessary in order to identify each color and its location.

(7) Record the color appearing for each colored square.

Activity B. Color Wheel

(1) Cut out disk and glue it to thin cardboard. Trim the cardboard around the disk, and with a pen, attach the disk to a pencil eraser.

(2) Spin the disk in one direction by striking the disk's edge with your finger as rapidly as possible.

(3) Note the appearance of colored bands. Record the specific color bands and location of each band.

(4) Spin the disk in the opposite direction and again note and record the colors and location of each band.

Activity C. Ambiguous Figures

(1) Look at the ambiguous figure. Determine whether you see a series of cubes piled on top of each other toward the left side or toward the right side.

(2) Look again at the diagram; look continuously for at least 30 seconds.

(3) Record your observations.

Activity D. Seeing Backwards

(1) With a pin, punch a hole in the center of a file card.

(2) Look through the pinhole with one eye while holding the card about 5 cm from your eye. Look toward a light source (windows or ceiling lights).

(3) Slowly pass an opened paper clip from left to right in front of the pinhole between your eye and the card. Hold the paper clip as close to your eye as possible.

(4) Look for the shadow of the clip to appear through the pinhole.

(5) Note the direction the clip shadow moves as you move the clip from left to right.

(6) Repeat the previous three steps but now move the clip from right to left. Note the direction of the clip shadow as you move the clip up and down.

(7) Record your observations.

Analysis:

Write a brief report which explains whether or not your visual sense is 100% reliable. Draw conclusions about the reliability of your vision from the investigations performed and from other investigations with which you are familiar.

Return to Biology Index

How Air Moves In and Out of the Lung

Dorothy Anthony
1202 Piacenti Lane
Chicago Heights IL 60411

Luella Elementary
9928 South Crandon Street
Chicago IL 60617
312-535-6320

Objectives:

To assist pupils in the intermediate grades develop an understanding of the respiratory system.

To demonstrate how air enters and leaves the lungs.

Demonstrate the relationship between the breathing rate and exercise.

Materials needed:

1. A 1-Liter plastic bottle
2. Two 15" balloons
3. Scissors
4. Two rubber bands
5. Watch with a second hand

Strategy:

A. Background

1. Discuss and label the parts of the respiratory system always using our multicultural scientific names which are the same throughout the world. (throat, larynx, trachea, bronchial tube, air sac, lung and diaphragm)
2. Trace the path of the air through the respiratory system.
3. Discuss the process of inhaling and exhaling.

B. Activities

1. Cut the bottle in half (horizontally).
2. Place one of the balloons through the opening of the bottle.
3. Stretch the balloon opening over the bottle opening.
4. Place a rubber band over the balloon to keep it in place.
5. Cut the neck off the other balloon and stretch this balloon across the bottom of the bottle.
6. Use a rubber band to hold the balloon in place.
7. Using a watch with a second hand record the breathing rate of a person sitting (1 min.), walking (2 min.), and jogging in place (2 min.).

Performance Assessment:

Thinking of the balloon in the opening of the bottle as the lungs and the balloon across the bottom of the bottle as the diaphragm, pull down on the stretched balloon - record your finding. Pull very slowly on the stretched balloon - record your finding. Next, pull down faster on the stretched balloon- record your finding. Using the results from your findings to answer the following questions:

1. What happens to the balloon in the bottle?
2. How does air move in and out of the lungs?
3. What large muscle is important in inhaling and exhaling?
4. Does breathing rate increase with exercise?

Conclusions:

The balloon in the bottle opening fills with air when you pull down on the stretched balloon across the bottom of the bottle. When you let go of the balloon across the bottom, the air in the balloon in the opening is pushed out. Air moves in or enters the lungs when the diaphragm moves up (inhaling). Like the heart rate, the breathing rate increases with exercise.

Return to Biology Index

The Senses: Hearing and Sight

Vincent McEnerney
9724 So. Karlov
Oak Lawn IL 60453
708-423-0617

Peck Elementary
3826 W. 58th Street
Chicago IL 60629
312-535-2450

Objectives:

The student will understand the definition of a disability and how it affects Americans who are hearing impaired or deaf and those Americans who are visually impaired or totally or legally blind. Point out that 20% of Black Americans and 20% of U.S. Hispanics are disabled.

Materials Needed:

1. One "Hearing Experience and one" Blind Experience" sheet will be given to the class.

2. 3x5 cards will be issued to the class to record their findings.

3. One fact sheet about "Disability in America Today will enlighten the class.

4. A fact sheet on auditory and visual factors and their relationship to school success will be distributed.

5. A fact sheet on common symptoms of visual handicaps will be shared by all.

Activities:

1. Give eighth grade students a preview example of a Hearing Experience in which one experiences a lack of complete hearing by wearing ear plugs while sitting in the back seat of a car or while walking through their local Jewel Food Store. Use partners as an example in the classroom who are to wear ear plugs for a short period of time. Ask both students to write down their observations. Ask the remainder of the students to write down their findings of what they observed or thought the two sample students were experiencing.

2. Give students a preview example of a Blind Experience in which you (the teacher) walked through your classroom blindfolded with the help of an aide to prevent any problems or injuries. Have two or more students walk through your room and to the hallway with a blindfold over their eyes. While the partners are performing the experiment, ask the remainder of the class to write down their observations and impressions. When the task is completed, the students will write down on the board and on their 3x5 cards detailed observations and insights. Discuss with each student their findings and real life experiences that might relate to the exercise. Pass out sheets to everyone describing the teacher's examples of what he experienced when he performed the exercise. Compare the student and teacher responses!

Evaluation:

The teacher will assess and evaluate whether the students: 1. located relevant details of the experience by their comments and observation on their 3x5 cards;

2. recognized how the disabled (sightless or hearing impaired) adapt themselves the daily challenges of life; 3. do the exercises give you a true feeling and understanding for sightless or hearing impaired individuals who may have other handicaps which could enhance his or her disability?

Since the students are placed within the realm of a real life experience (either by participating and or observing) the assessment and evaluation gained from feedback and the excitement level of the participants will give us an immediate feeling of what we have accomplished.

Ask the question: Have your feelings, insights, and opinions changed since you went through these experiences? Recommend that students try this exercise with the aid of a parent at home. For the blind experience, use the stairs in the home to emphasize the very difficult feeling and fear the process can create! Have all the students write a three paragraph paper on their experiences for homework.

Return to Biology Index

The Investigation Of The Taste Buds

Ola Jean McGehee
1130 So. Michigan Ave. #4208
Chicago IL 60605
312-663-0547

Yale Elementary
7025 So.Princeton
Chicago IL 60621
312-535-3190

Objectives:

(Adaptable to grade levels 1-2)
Students should identify salty, sour, bitter, and sweet tastes.
Students will investigate the sense of taste.
Students will investigate that taste buds are not uniformly distributed over the tongue.

Materials:

Cotton swabs (sterile), drinking cups (disposable), 4 beakers (400ml), water, sugar, baking soda, vinegar, salt, tooth picks, mirror and marking pencils.

Strategy:

Start by giving the students a background of the concept to be developed. Taste and smell are connected. Odors that pass from the mouth to the nose are detected and become a part of a food's flavor. Taste is affected by the texture and temperature of food. Taste buds help you taste the things you eat. A taste bud is a small structure that is sensitive to taste. There are four types of taste buds - sour (acid), sweet, salty, and bitter.

PART-I. Go over the procedure to be used in preparing and tasting the solutions. Caution students to follow sterile procedures. A cotton swab or toothpick should be used for tasting a solution and then immediately thrown into a trash container. Each student should use a new swab for each taste. Be certain the beakers or glasses used to hold the solutions are washed and have been cleaned.

PART-II. Prepare the solutions using the clean beakers. Label the beakers with the solutions A, B, C, and D.

PART-III. Dip a sterile cotton swab into solution A. Run the swab over your tongue. Record the taste of the solution in your chart. Rinse your mouth with water. Discard the swab. Using a new swab each time, repeat the procedure for solutions B, C, and D. Record your results.

OPTIONAL ACTIVITY:

Dip your cotton swab in the solutions. Touch various areas of the tongue. Use a mirror to help locate the most taste - sensitive areas of the tongue.

Performance Assessment:

After the taste demonstration, unknown food products (two types of cheeses) are passed out. Students will keep their eyes closed and use a nose plug in order to distinguish taste. Then release the nose plug and determine the difference in taste, when they are able to smell. These differences should be recorded by each student.

Conclusion:

The conclusion will be based on the results and students' interpretation. The sense organ for taste is the tongue. In the tongue are groups of nerve endings called tasted buds. When you chew food, tiny bits of it enter the taste buds through openings in the tongue. Taste buds for each of the four tastes are located in different areas of the tongue. Taste buds that respond to sweetness are on the tip of the tongue. Some of the taste buds for saltiness are also there. At the sides of the tongue are located the taste buds for sourness. Taste buds for bitterness are at the back of the tongue.

This would be a useful multicultural activity, because it relies on participation rather than discussion.

Return to Biology Index

How the Body's Immune System Responds to a Virus

Margaret Mikel
5445 N. Sheridan Rd. #2708
Chicago IL 60640

Robert Fulton Elementary School
5300 South Hermitage
Chicago IL 60609
312-535-9000

Objectives:

1. Students will be able to make and explain illustrations that show how viruses can appear as foreign invaders in the blood.
2. Students will be able to show how certain cells can recognize and attack the foreign invaders in the blood.
3. Students will be able to show and explain how certain cells can track down and devour the virus.
4. Students will role play how the immune system responds to a virus.

Materials needed:

1. Large red cloth
2. Construction paper
3. Chalkboard
4. Double sided magnets
5. Markers
6. Scissors

Strategy:

A. Background:
   1. Discuss the meaning of the human immune system.
   2. Discuss what the human immune system consist of and where it is located.
   3. Discuss how the healthy body's immune system works. Use the chalkboard and other bulletin board drawings.
   4. Discuss approximately when and where the AIDS-like virus was discovered.
   5. Name some viruses that can break down the body's immune system.
   6. Draw and cut out the following large letters in multicolors.
   7. The letter V will represent the VIRUSES.
   8. The letter T will represent the T-CELLS.
   9. The letter B will represent the B-CELLS.
   10. The letter K will represent the KILLER CELLS.
   11. The letter A inside a circle will represent the ANTIBODIES.
   12. The letters "SOS" will represent the emergency call sign.
   13. One child should be the narrator for the role playing.

Performance Assessment:

1. Three children will place their VIRUS signs on the red cloth which represents the BLOOD.
2. One child will place his/her T-CELL sign on the blood and scream out "VIRUS-VIRUS."
3. Three more children will appear with their T-CELL signs and place them around the VIRUS sign.

4. Two of the children who had the T-cell signs will place the "SOS" signs around the virus and scream out "Emergency-Emergency, B-CELLS, KILLER CELLS."
5. The child with the T-CELL sign begins the attack on the virus.
6. A child with a B-CELL sign comes first and, with an arrow, shoots the A-ANTIBODY at the virus which binds to the virus.
7. Three children with the K signs (KILLER CELLS) move around the blood, track down the viruses, then DEVOUR THEM.
8. The children should remove the VIRUS SIGNS and thus ends the virus in the blood.
9. Everything goes back to normal with one exception, the ANTIBODIES stay in the blood. The antibodies remember the VIRUS and are ready to attack immediately, should the virus ever appear again. Therefore, once you get a disease, you are immune from getting it again.

Multicultural Aspects:

AIDS - Acquired Immune Deficiency Syndrome is a disease that breaks down the body's immune system, which is the body's defense against disease. Therefore, making a person vulnerable to opportunistic infections.

AIDS infects all ethnic cultures. The latest research indicates that all ethnic groups around the globe are evenly divided in their involvement with this disease.

The Female Reproductive Organs

Glenda Faye Rowe
404 Blackstone
Glenwood IL 60425
708-758-1879

John P. Altgeld
1340 West 71st Street
Chicago IL 60636
312-535-3250

objectives:

This presentation is designed for boys and girls between the ages of eleven and fourteen. The lesson is geared to identifying the female pelvic organs and to understanding the changes that occur during puberty and what specific organs are involved in these changes. The lesson will show the path of the human egg cell during fertilization and non-fertilization and explain the process of menstruation.

Materials:

Overhead projector
Plexiglass model
Balloons
Transparencies
Information charts
Activity sheets
Question box
Chalkboard
Markers
Video tape and VCR

Strategy:

1. Have the class blow up balloons to show state of change.
2. Begin board activity with words that denote change (SEASONS, BALD, DAY, HUMANS).
3. Use transparencies to show and explain different parts of the female reproductive organs. The students will trace the journey of the egg from the ovaries on the plexiglass model.
4. The students will view a video on puberty and discuss its contents.
5. The class will review, on the chalkboard, those changes that occur in the female.

Performance Assessment:

The students will be able to define terms associated with changes that occur in the female. The class will be able to trace the passage of the egg cell during fertilization and non-fertilization. Student will be aware and understand those physical changes that occur during puberty.

Multicultural:

Students from all ethnic groups will encounter or experience physical change. The changes will vary but the concept is the same for all ethnic groups throughout the universe.

Return to Biology Index

The Sense Of Touch

Louise R. Wooten
1021 East 193rd Place
Glenwood IL 60425
708-757-4376

Henry Clay Elementary
13231 South Burley Avenue
Chicago IL 60633
312-535-5600

Objective:

Given a group of objects the learner will identify each using the sense of touch.

Materials Needed:

Hands-On Box	Spiny Spurs
Rocks	Sand
Ball	Water
Wood	Clay Dough
Balloons	Metal
Plastic Cup	Styrofoam

Recommended Strategies:

1. Discuss the sense of touch and name ways in which the sense can be used. Tell how the sense of touch is special.
2. Explain how the sense of touch works together with the sense of sight.
3. Place items in the Hands-On Box and have a few blindfolded students identify an object using only his/her sense of touch.
4. Place like objects on a table and have a few blindfolded students identify the same object as in the box.
5. Allow students to examine objects as to texture, shape, and size from the above list. Also as to condition of touch sensation; pain, cold, hot, or sharp.

Performance Assessment:

Give each student a worksheet and have them identify each object using the sense of touch. The students' hypotheses may vary but the idea is that the use of touch is vital in recognizing most things.

Conclusions:

As a result of the demonstration, the students will be able to realize the importance of the touch and sight senses. They will be able to use these senses in many ways.

Multicultural:

Touching objects to achieve familiarity is an aspect for many children's game in many cultures. It is an important sense for everyone because the touch sense works together with the sight sense. Everyone needs the sense of touch in many aspect of life. Touch can be used in games, skin sensation, identification, and other usage.

Return to Biology Index

The Tongue...A Sense of Taste

Dores H. Cook
8148 S. Paxton
Chicago, Il. 60617
(312) 768-5540

Myra Bradwell School
7736 S. Burnham
Chicago, Il. 60649
(312) 535-6600

Objectives:

Students will be able to identify the four taste sensations: salty, sweet, sour and bitter.
Students will be able to recognize the papillae or receptors on the tongue.
Students will be able to locate and label the different taste sense organs on the tongue.

Materials needed:

This list is for a class of thirty first grade students.

1 cup of sugar
1 cup of coffee
1 cup of salt
2 lemons
15 stalks of celery
30 tongue diagrams
30 data tables

4 sticks or cotton swabs per student
4 small cups per student
30 small hand mirrors
30 paper plates
1 quart of lemon water
1 quart of sweet water
1 quart of salty water
1 quart of water-diluted coffee

Strategy:

1. Give each student a paper plate divided into five sections. On the plate place the following items: a pinch of salt, a lemon wedge, a dash of sugar and a dash of coffee. Have the students taste each item and identify each item as being either salty, sour, sweet or bitter.
   Distribute bite size pieces of celery, ask the students to chew the celery thoroughly. (This will cleanse the mouth.)

2. Distribute a mirror to each student. Have them look at their tongue. Help them identify the papillae (receptors) on the tongue.

3. Give each student a data table, four small cups, a piece of celery and four sticks or cotton swabs. Pour 20 milliliters of the salty water in a cup, 20 milliliters of sweet water in a different cup etc., until each student has a sample of each solution.
   The cups should be labeled: A B C D or 1 2 3 4.
   The student will dip one stick in solution A, touch the four locations on the tongue as shown on the diagram on the chalkboard. The student will then record his/her sensation at each location as either salty, sour, sweet or bitter on a Data Table. The student will then cleanse his mouth using the celery. This activity should be repeated for each solution.

4. Distribute a diagram of a tongue to each student and have him/her label the areas of the tongue where the taste sensation is the greatest.

Editorial note from Dr. Porter Johnson added on July 24, 2000: Current research has indicated that all areas of the tongue seem to be equally sensitive to different tastes. See articles in Discover Magazine for more details.

Return to Biology Index

What Is Blood and How It Circulates In and Out of the Heart

Merry Jelks
7820 South Shore Drive
Chicago IL 60649
312-978-5349

A.C. Powell Elementary School
7530 South Shore Drive
Chicago IL 60649
312-933-6650

Objective:

At the end of this mini teach students should be able to explain what blood is and explain the circular movement of blood going in and out of the heart.

Materials Needed:

Crayons,a paper model of the heart, glue, stethoscope, a pump with a one way valve, attached tubing of the correct size to snugly fit a large hand bulb, a diagram of the heart showing continuous circulation.

Strategies:

Students will be given the opportunity to listen to their heart beat and to take their pulse rate.

Teacher will explain and describe what blood is and how it moves in a circular path in and out of the heart.

Students will be given a simple riddle on the functions of the blood in which they will be asked to guess what it is.

After students have answered the riddle, an explanation for taking their pulse and listening to their hearts will be given in reference to the blood circulating in and out of the heart.

Evaluation:

Students will be asked to paste the heart onto the baby diagram and use their red crayon to trace the circular path of the blood in and out of the heart looking at the teachers model.

Conclusion:

At the end of the mini teach I would like for my students to be able to explain what blood is and to trace the circular path of the blood going in and out of the heart.

Return to Biology Index

Skeletal System And External Body Development Of A Full Term Fetus

Joi Lewis
10047 S. Peoria
Chgo., Ill. 60643
312-779-3449

Objective:

Grade level: 9th
Students will learn that growth of a full-term fetus' skeletal system and external body parts become more detailed and distinct throughout the three trimesters of pregnancy.

Materials needed:

(for a class of 25 students):

balloons
a picture frame
toy model car
handout (Fetal Development)
handout (outline of fetal body)
illustration poster (Fetal Development)
miniature size skeleton
paper cut-outs (Skeletal System and external Body Parts-eyes, eyebrows, nose, and mouth)
index cards (5x8)
scissors
glue

Strategy:

Optional: A toy model car and a picture frame used with key words **support** and **build** can be used to introduce the lesson. A toy model car can represent the Skeletal System and External Body Parts. A picture frame can represent the Skeletal System.

Full-Term Fetal Development: Skeletal System and External Body Parts will be presented to the class in the three trimesters (consist of approximately three months each and feature descriptions will be given of each individual month) of pregnancy.

Various Fetal Development handouts (process of conception and detailed fetal development pregnancy months 1-9) and a Fetal Development illustration poster will enhance the lesson.

Lab Activities:

Individual:

1) The class will construct a model of the skeleton of a full-term fetus. Provided are parts of the skeletal system of a fetus. You are to construct this model on a picture of a full-term fetus.
2) The class will apply the following external body parts (eyes, eyebrows, nose, and mouth) to a picture of a full-term fetus.

Group:

1) Each student will be given a balloon to place under their garment. This activity will give each student an idea of how it feels and looks to be

pregnant.

2) **Gestation (pregnancy) Trivia Game**:

a) Three groups needed: 1st, 2nd, and 3rd Trimesters.

b) Each group will be given an envelope containing three strips of paper for three random months of a full-term pregnancy. Feature facts pertaining to the Fetal Skeletal System and External Body Parts Development will be underlined for each month.

c) Each group will write a total of five feature facts (pertaining to the fetal skeletal system and external body parts) from each random month on the index cards, and write the group name on the back of the index card.

d) Each group will select an index card from a trimester other than their own. Each group will have one minute to correctly identify the correct the month to which the feature fact belongs. If the group incorrectly answers the question, the next trimester group has the opportunity to immediately answer. Each group can gain one point for each correct answer. The group with the most points after all the index cards have been selected wins the game.

The Adverse Effects of Birth Control on the Female Anatomy

Deneen Signator
706-2 Marina Court
University Park, IL.
708-534-8875

D.S. Wentworth
6950 S. Sangamon
Chicago, Illinois
312-962-2994

Objective:

For Grade levels 9 -12

At the end of this mini teach students will be able to explain the adverse effects of birth control on the female anatomy. Students will also know the correct terminology of the female anatomy and the various functions of each organ.

Materials Needed:

A model of the female anatomy, a detailed chart of the female anatomy, current birth control methods available on the market today, pamphlets Choice or Chance, HCG Pregnancy Tests, balloons.

Strategies:

Students will define the various parts of the female anatomy.

Students will label the parts of the female anatomy on the model and play birth control trivia.

Students will write down the most effective and ineffective birth control methods available today.

Students will be given four random samples of urine in which to perform the HCG Pregnancy Test. There will be one positive sample, one artificial sample, one control sample, and a negative sample.

Students who receive a positive result will be pregnant for the day.

Conclusion:

The purpose of this mini teach is for the students to learn the correct terminology of the female anatomy and its functions. Students will also learn the pros and cons of birth control.

Return to Biology Index

The Brain Reflex System And How It Works

Bobbitt, Ruby
11110 S. Homewood Ave.
Chicago, Illinois 60643
1-312-779-7614

Chalmers Elementary School
1-312-542-3720

Objective

The students will learn the basic facts about the reflex systems of the brain.

Materials needed

Rope
Penlight or flash light
Rubber hammer or special hit with hand.
Bottles (for balance)
Large paper bags

Recommended Procedure

Teacher will explain and demonstrate the procedure of all materials.

The brain is the major commander of body movements. The motor area of the brain controls the hundreds of different muscles, so that we can run, walk, talk, write, jump etc.

The brain has many different parts, but today we will concentrate on a part of the motor area.

Motor Area Parts

Motor pathways relay messages from the cortex, midbrain, and cerebellum which commands activity in muscles and glands. The midbrain is the most highly developed part of the brain.

Motor Apparatus in cells that acts directly on muscles and glands, putting them to work. These cells carry the brain's commands to the rest of the body.

Brain divisions-Cerebrum -Largest part of the brain. Cerebral Cortex-The twisted, wrinkled, and knotted surface of the cerebrum Cerebellum-Functions in the control of all kinds of movement. It "programs" the coordination of the many individual movements that go to make up actions.

Teacher can explain to the students that there are many ways to enhance their learning abilities, i.e., playing games. Here are some games that the instructor might use.

Games

Eyetoss
Knee Reflex
Mirror-Bag Game

Balance

The procedure of the games

Eyetoss-Hold a thin sheet of plastic with both hands in front of the eyes, have someone toss a ball at the persons' eyes. Ask the student to tell the reaction of his/her eyes.

Knee Reflex- The student will sit, and another student will hit the sitting students knee with the side of the hand, or a piece of rubber hose, ask the student to explain what happened.

Mirror Game-First darken the room, then ask the student to close his/her eyes for a few seconds, then open the eyes with a flashlight shining directly in the eyes. Ask the student to explain the reflex action of the pupil.

Balance- Use a rope to draw an outline of a human body on the classroom floor, then give each student a sheet of paper which has the names of the body movement of muscles i.e., brains, spinal cord, nerve spinal cord. Have each student throw and hit a student on the leg, or arm, and the students to move according to the message sent back from the brain.

This will truly be a very good learning process.

Return to Biology Index

Using Your Senses

Daniels, Elizabeth A.
1748 E. 83rd Street
Chicago, IL 60617

Collins High School
1-312-542-3500

Objectives

To use your senses in identifying unknown substances.

Apparatus and Materials

1. Nutmeg
2. Cloves
3. Cardimis
5. Grits
6. Baking Soda
7. Carrot Juice
8. Spinach
9. Corn Meal
10. Lime Gelatin
11. Banana Nectar
12. Parsley Flakes
13. Light Corn Syrup
14. Vinegar
15. Fennel

Supplies

Santa Hat
Blackboard and Chalk
Lab. Sheet
Petri Dishes
Cotton Swabs

Substances other than the ones listed may be substituted.

Recommended Strategy

(Phenomenological Approach)

1. Review the following terms: Observation, Identifying characteristics, Categorized.

2. Discuss the meaning of the word Observation using a "gimmick" which will help lead into discussion on methods used in "Observing things". Students responded positively to the use of a Santa Claus Hat worn by the teacher. The teacher may use any object that will help initiate the "Observation Process."

3. Senses identified and used by students during class discussion and Lab Experiment are the following:

   (a) Seeing
   (b) Hearing
   (c) Tasting
   (d) Smelling
   (e) Feeling

4. Students worked in groups of 3's in observing substances listed under **Apparatus**

Materials using the senses listed above.

5. Each group of students will receive eight substances to observe. Students will record results on a prepared Lab-Sheet.

Lab-Sheet:

Things you should Observe and Record:

Number of substance used
Color
Odor
Taste
Texture
Name of substance?

Class Evaluation:

Students will discuss "Observations" and "Substance Identification" after the experiment has been completed.

Return to Biology Index

The Human Ear

Kall, Maureen
8415 Budingen
Tinley Park, IL 60477
1-708-821-2048

Objectives

1) The student will develop a better understanding of the human ear.
2) The various parts of the ear will be demonstrated using phenomenological apparatus.

Equipment and Materials

Model of the human ear	Clear rubber tubing
Funnels	Food coloring
Balloons	Salt
Rubber bands	Rope
Hanger	Tape recording of various sounds
Nylon	Straws (Optional)
Shell	Slinky (optional)

Recommended Strategies

Begin the lesson by a quick review of the human senses. Display the model of the human ear and begin to break it down into its various components.

Using a rope (or a slinky) demonstrate the motion of sound waves as they enter into the ear. This may be done by having two students volunteer to hold an end of the rope. Have them begin a wave-like motion with the rope and use this demonstration to start a brief discussion on the physical properties of a wave (ie. crest, trough, frequency & wavelength).

The next step is to explain the function of the eardrum. This is accomplished by using a funnel apparatus. A balloon should be placed over the large end of the funnel (held taut by using a rubber band). On the small end of the funnel a piece of clear rubber tubing should be attached (straws may be attached to the tubing for hygiene purposes). Grains of salt are then placed on the top of the balloon. Into the rubber tubing, high and low pitched sounds should be made. This demonstrates the vibration of the eardrum by a range of frequencies.

The semicircular canals may be shown by molding clear rubber tubing into a circle and filling it approximately half way with colored water. By moving the tubing around the students can be shown the way the semicircular canals are able to balance.

A shell may be displayed to show the shape of the cochlea and a hanger molded into a circle and covered with a nylon may be used to demonstrate the oval window. The rubber tubing may then be used again to represent the auditory nerve which leads to the brain.

At the end of the demonstration/explanation of the parts of the ear a tape of common sounds may be played. The students will then have to use their listening ability to determine the cause of the sounds that are on the recording.

Return to Biology Index

How Do Toxins Affect the Human Body?

Hale, Patricia
1009 W. 129th Place
Chicago, Illinois 60643

Nansen Elementary School
821-2785

Objective:

The learner will be able to identify toxins contained within household products.
The learner will be able to determine specific affects that toxins may have on the human body.

Apparatus Needed:

Household items such as bleach, spray disinfectants, various aerosol sprays, ammonia, and other liquid cleaners.
An empty plastic bottle, cotton, and chicken livers.
Overhead projector, chart of the human body, transparency showing the human body systems, and worksheets on human body systems.

Recommended Strategy:

Put enough cotton to half fill an empty plastic bottle. Then insert a lit cigarette into the opening of the plastic bottle. Squeeze the bottle so that the cotton becomes stained with the nicotine. Then explain that these are toxins that affect the lungs of the body. Ask the question: What are toxins?: Write definition on the board. Toxins are poisons that could damage the human body. Then ask the students to think of things around the house that might contain some toxins that could affect our body on the inside or outside. Write the responses on the board. Then ask the class how they could identify these items as toxic. Explain and show that the labels give warnings that the chemicals therein could be harmful to certain parts of our body. Therefore, it is always important to read labels before using these products. Also explain that the odor of some chemicals can indicate possible harm that it could cause to the body. Show the students various household products and explain that each one could have harmful effects on our human body systems. Also, the effects of gasoline fumes for several days on a checken liver can be shown. Then compare it to a healthy chicken liver. Now show the students a transparency of the human body. Explain that each system is performing a specific job. Go over the terms of the various systems that are working within the body system. Let the students underline the following terms and take turns reading aloud the definition for each system from their worksheet:

skeletal	muscular
circulatory	respiratory
nervous	digestive
urinary	reproductive

endocrine lymphatic
skin

Let the students color each system a different color to distinguish each system and its specific job.
Then ask the students to write one or more key words that relates that system to his or her own body function.
Example: skeletal - bones, muscular - muscles, circulatory - blood.
Then ask students which body system does smoking affect? (respiratory)
Does smoking have a short or long term effect on the body? (long term)
What effect does an insect bite have on the body? (short term)

Evaluation:

Let students get into pairs, and make a list of short term and long term effects that toxins might have on the human body systems.
After about fifteen minutes, make a list on chart paper of the minor or major illnesses that result from short and long term effects of toxins on the human body.

Extension:

Each student will select one or more systems, and tell in his own words briefly how that system performs within the human body.

Return to Biology Index

Cardiorespiratory Fitness

O'Malley, Paul
7437 N. Kostner
Skokie, IL 60076
677-1476

Senn Metro Academy
989-3565

Objectives:
To understand and determine the pulse rate;
To compare the pulse rate before and after exercise;
To use pulse rate recovery time as a measure of fitness;
To approximate a measurement of lung capacity;
To compare lung capacities of males and females, active and inactive;
To learn how to take and compare blood pressure readings.

Apparatus Needed:
Clock or watch with second hand, wet spirometer, if available, round balloons, string, meter sticks, sphygmomanometers and stethoscopes.

Recommended Strategy:
Pulse
1. Discuss the meaning of pulse and pulse rate. Show students how to take the pulse rate in wrist, neck or temple. Time the students as they count their pulse for 30 seconds. Have the students multiply the 30 second pulse rate by two, record the number of beats in 60 seconds. Repeat two more times, and record the average in a data table.

2. Have the students work in pairs, with one taking and recording the pulse, and the other acting as subject. Have the subject stand up and sit down twice every 5 seconds for 3 minutes. Immediately take the pulse for 15 seconds, multiply by 4, and record the post-test rate. After 15 seconds, take another 15 second pulse rate, compute and record the one minute pulse rate in a data table as the 30 second recovery rate. After another 15 seconds rest, take another 15 second pulse, and record the 1 minute recovery rate. Wait 45 seconds, take a final 15 second pulse, and record the 2 minute recovery rate.

Scoring Your Pulse Rates

Rates	Good	Satisfactory	Fair to poor
Resting rate	44-62	64-80	82-100
Immediate Post test rate	80-100	104-134	136-156
30 second Recovery rate	64-84	88-116	118-140
1 minute Recovery rate	56-76	78-108	110-132
2 minute Recovery rate	56-76	78-108	110-132

3.Discuss student scores, using analysis questions.

Lung capacity

4. Define vital capacity, the maximum volume of air that can be exhaled forcibly following the deepest possible inhalation. Also, define the lung volumes that add up to the vital capacity: tidal volume, inspiratory reserve volume, and expiratory reserve volume. As you define each term, demonstrate it with a spirometer. If a spirometer is not available, demonstrate how it would be measured by exhaling in the manner appropriate for each volume. Discuss the range of average values, and the factors which influence these values. (The average adult male vital capacity ranges between 2.8 and 5.5 L.)

5. Have students compare their vital capacities, males vs. females, athletic students vs. non-athletic. Have students inflate a round balloon with the maximum amount of air that can be exhaled after a forcible inhalation. Measure the circumference of the balloon at the widest point by wrapping a string around it and measuring the length of the string. Have each student record his measurement in a data table on the board, with separate columns for males, athletic and not, and for females, athletic and not.

6. Discuss the results and the analysis questions that apply.

Blood pressure

7. Define blood pressure, systolic and diastolic. Develop the concepts by questioning the students about the cause and function of blood pressure.

8. Show the sphgmomanometer, describe the parts, and demonstrate how to use it. Have students answer handout sheet on the steps in using the apparatus.

9. Have students practice taking their lab partner's blood pressure and record the results on the board.

10. Discuss hypertension, variables affecting blood pressure, average and normal values.

11. Have students plan and execute experiments affecting blood pressure or pulse rate, such as: running in place, isometric exercise, breathing into a bag, holding the breath. or submerging one hand in cold water.

Analysis questions

1. Account for the pulse change with exercise.
2. Why is a slower pulse rate considered better than a fast one?
3. Why would a rapid recovery rate be a sign of fitness?
4. What are some variables that determine lung capacities?
5. How could you account for the different lung vital capacities in your classmates?
6. What is normal blood pressure for your age? How does your blood pressure compare to your classmates' blood pressure? Explain.

Return to Biology Index

What's Covering You? and why?

Weathersby, Dorothy
8010 S. Lafayette Ave.
Chicago, Illinois 60620
874-7702

Sherwood School
667-2042

Objective:

The student will be able to describe the four functions of the skin.

Apparatus/Materials Needed:

1. Microprojector (optional)
2. Microscopes (if available)
3. Overhead projector
4. Skin slide
5. Model of the skin
6. Transparency of the skin
7. Crayons
8. Construction paper
9. Toothpicks
10. Plastic gloves
11. Paper cups
12. Water
13. Pepper

Introduction:

The skin is an organ consisting of tissues structurally joined together to perform specific activities (functions). The four main functions are: (1) Protection: The skin covers the body and provides a physical barrier that protects underlying tissues from physical abrasion, bacterial invasion, dehydration and ultraviolet radiation. (2) Maintenance of body temperature: The production of perspiration by sweat glands help to lower body temperature back to normal. (3) Excretion: Not only does perspiration assume a role in helping to maintain normal body temperature, it also assists in excreting small amounts of water, salts and several organic compounds. (4) Perception of stimuli: (sensitivity) The skin contains numerous nerve endings and receptors that detect stimuli related to temperature, touch, pressure and pain.

Procedure:

Before you introduce lesson to your students, make sure the students have one of each of the following: paper cup, toothpick, and a plastic glove. Pour one half cup of water in each cup and sprinkle pepper in the water. Write the title "What's Covering You? and Why?" on the blackboard. Ask the students if they can figure out what is going to be discussed. Hopefully, "the skin" will be their response.

Use the following phenomenological approaches to teach the four functions of the skin.

1. **Protection:** Have the students put on one glove and stick their fingers into the water with pepper. Have the students pretend the glove is representing their skin. Now have the students take their fingers out of the water after a few seconds. Ask what happened? Have the students leave on their glove while you discuss what happened.
2. **Maintenance of body temperature:** By the time you finish discussing function one, the students hand with the glove should be warm and somewhat sweaty. Have the students take off the glove and wave that hand in the air. Now ask what do they feel? Discuss. 3. **Excretion:** Function two and three are somewhat alike. Include in your discussion that excretion is more than letting out a waste. Have the students express their opinion of excretion and the taste of perspiration.
4. **Perception of stimuli (sensitivity):** Have the students take the toothpick and gently rub it on their arm. Ask what they feel? Now, have the students pinch themselves (gently) and turn to the person next to them and touch them. Ask what do they feel? Discuss response.

After you discuss the four functions, show pictures of the skin using the overhead projector, microprojector and model. Pointing out the sweat gland. Inform the students that they have two sections within the skin; the outer (epidermis) and inner (dermis) section. Within the sections are other layers. As independent practice have the students take a sheet of paper and fold it to make four squares. Then have students use crayons to draw a picture representing each function. After completing the activity, pass out colored sheets of the skin showing the outer and inner sections of the skin.

Vocabulary

protection	perspiration
excretion	bacteria
gland	temperature

Return to Biology Index

To Have Or Not To Have Oxygen (Part I - Fermentation)

West, Anna
1143 E. 82nd St.
Chicago, Il. 60619
731-9034

DuSable High School
536-8600

Objectives:

1. The students will be able to describe the process of glycolysis.
2. The students will be able to infer the reactants and products of fermentation.

Materials:

1 liter bottle	grape juice	sauerkraut
7 large styrofoam balls	large balloon	ethyl alcohol
28 small " "	sour milk	bacteria slide
acetic acid	litmus paper	colored circles
3 microscopes	yeast	shredded cabbage
chicken leg	2.5% salt solution	lactic acid
pipe cleaners	waterbase paint	yeast slide
muscle slide	yogurt(optional)	grapes(optional)

Recommended Strategy:

1. Color: 6 large styrofoam balls light blue on one side and dark blue on the other to represent glucose.
   1 large styrofoam ball dark green to represent oxygen.
   4 small styrofoam balls red on one side and pink on the other side to represent adenosine.
   12 small styrofoam balls yellow on one side and brown on the other side to represent phosphate.
   4 small styrofoam balls dark green on one side and light green on the other side to represent NAD.
   8 small styrofoam balls brown to represent hydrogen.
2. Connect: the 6 glucose balls with pipe cleaners
   an adenosine ball with 3 phosphate balls to make ATP (2)
   an adenosine ball with 2 phosphate balls to make ADP (2)
3. Make up student model packages using colored circles that match the styrofoam balls. This can be done for 6 teams.
4. Set-up: Students will bring answer sheets to each set-up and work as a team.

Set-up I. Add a package of yeast to the grape juice in the liter bottle and place the large balloon over the neck of the bottle 3 days ahead. Place in a dark area. On the day of the lesson place the fermented grape juice with the inflated balloon, the microscope with a yeast slide, and a labelled 50 ml beaker sample of ethyl alcohol. As an added treat you can have two or three grapes in foil for each of the students to sample.

Direction sheet: Read all directions first!

1. Test the ethyl alcohol with litmus paper. Is it an acid or base? (Blue to red = acid; red to blue = base).
2. Use your senses to observe the set-up. Which senses should you

not use?

3. Examine the yeast slide under the microscope. Do not move the slide. Use only the fine adjustment knob.
4. List your observations of the entire setup.
5. Decide which reaction is represented.
6. Prepare to move to Set-up II. Remove your waste. You may sample the grapes.

Set-up II. Ten days before the lesson add shredded cabbage to a clear quart container and fill the jar with a 2.5% salt solution. Label the container Homemade sauerkraut. Place a jar of commercial sauerkraut some samples of which have been placed on foil for the students to taste, the microscope set up with the bacteria slide, a sample of shredded cabbage, a 50 ml beaker of 2.5% salt solution, a 50 ml beaker of acetic acid. Optional: plain yogurt, cheese, and tofu can be displayed.

Direction Sheet: Read all directions first!

1. Test the acetic acid with the litmus paper. Is it an acid? (Blue to red = acid. Red to blue= base).
2. Examine the Homemade sauerkraut. You may taste your commercial kraut samples. Use toothpicks to lift your sample from the foil.
3. Examine the bacteria slide. Do not move the slide. Use only the fine adjustment knob.
4. Note the other examples present. List your observations about the entire setup.
5. Decide which reaction is represented.
6. Prepare to move to Set-up III. Remove your waste.

Set-up III. 5 days before the lesson, begin souring a pint of milk. On the day of the lesson, pour the liquid off of the clots into a 50 ml beaker and label. Place the skinned chicken leg (displays muscle tissue) on foil; set up the muscle slide; pour lactic acid in a 50 ml beaker; and place a heavy book at the setup.

Directions Sheet: Read all directions first!

1. Test the lactic acid and sour milk with the litmus paper. Are they acidic or basic? (Blue to red = acid; red to blue = base).
2. One member of the team should hold the book with the arm extended as long as possible. Explain to your classmates how your arm feels.
3. Examine your chicken sample. What type of tissue is predominant (seems to be the most abundant)?
4. Examine the muscle tissue slide.
5. List your observations of the entire setup.
6. Decide which reaction is represented and where this reaction takes place.
7. Prepare to move to Set-up I. Remove your waste.

Lesson Presentation: Request all handouts from writer.

1. Review the students by using the overhead projector and a review sheet which will prepare the students for the lesson.
2. Pass out the lesson sheets 1-3.
3. Sheet 1 will be used to demonstrate the process of glycolysis by using students and the styrofoam balls. The teacher will represent the enzymes.

4. Sheet 2 will be used to demonstrate the possible reactions during Fermentation according to the organism, and also give instructions for the phenomenological activities the teams will perform.
5. Sheet 3 will contain the activity 3 questions 1-5, and homework questions.

Team Activities: Teams will start at their number and rotate to the next higher number every ten minutes. Team 6 goes to 1.

1. Do the vocabulary matching quiz; 2. Use your models and handout sheets to review the process of glycolysis and fermentation; 3. Answer questions 1-5; 4. Set-up I; 5. Set-up II; 6. Set-up III

Return to Biology Index

The Bone Connection

Artis, Emma   Emmet School
7913 South Normal   854-2650
Chicago Ill.60620

Objectives:

1. The student should be able to list the functions of the human skeletal system
2. The student should be able to name some bones in the human skeletal system and at least one function of each

Apparatus Needed:

1. Model of a house under construction (made out of popsicle sticks)
2. Parts of the skeleton (cut into puzzle pieces and placed in an envelope)
3. A rag doll, A doll with a stand, A model of a skeleton
4. A bone cut in half (uncooked chicken or turkey bone)

Recommended Strategy:

1. Show the class a model of a house under construction and pass out a ditto sheet with a picture of a house under construction.
2. Ask students if they can give the purpose of the framework of a house (expected response: Acts as a support for the house)
3. Ask students if they can explain the system in the human body that has a similar function (expected response: The skeleton)
4. Show the students a rag doll and a doll supported by a stand. Ask them why is it that the rag doll can not sit up, but the doll supported by the stand can and why they can sit up in their seats? (expected response: The skeletal system supports the human body and the stand supports the doll, but the rag doll has no support system.)
5. Ask the students to describe how the skeleton differs, if at all, from the frame of a house (expected response: the skeleton is made of living substance.)
6. Pass out activity 2:3 (the student will fill in the body part and the number of bones in each using the model of the human skeleton to count the bones.)
7. Activity 2:4 (Mastering Concepts: similar bones, different function, example: arm and leg bone (humerus) is similar to the leg and foot bone (femur) but they have different functions)
8. Have the class move their finger over their skull to feel the extent (ask if any one can think of the function the skull serves)
9. Give some background information on the long bone of the leg, include that it provides the greatest possible strength with the least possible weight. (roll a piece of note paper and secure it with a rubber band and place a book on top of it. To show how the legs support the body weight. Cut the bone to show marrow

(explain).

10. Give some background information on the muscle (include that bones are moved at the joints by muscles (show a cardboard model of the arm with a balloon attached for muscle and tape as the tendons). Explain further (biceps, triceps, etc.).
11. Pass out the skeleton and let the student assemble it, label the parts and give the function of each.

Return to Biology Index

Nutrition

Gilmore, Marie
360 E. Randolph #305
Chicago, IL 60601
938-3518

Raster School
737-1011

Objectives:

1. To test samples of food to find out if they contain fat.

2. To test fruit juices for vitamin C and compare the vitamin C content of the juices.

3. To calculate the number of calories per day that you eat.

4. To learn what information is given about food on a label.

Materials:

1. unglazed paper (brown paper bags) food samples; margarine, butter, peanut butter, cheese, bacon, banana, salad dressing.

2. Methylene blue solution-dissolve 0.1g of methylene blue powder in 10ml ethanol 4 test tubes, dropper, fruit juices: orange, lemon, grapefruit, lime.

3. Calorie charts, food list from activity.

4. 10 different food labels, paper pencil.

Strategy:

1. a. Hold a piece of unglazed paper up to a light. Notice whether or not light passes through the paper.

   b. Rub some fat or oil on the paper. Hold the paper up to a light. Notice any change in the paper.

   c. This smear test is the test for fats. Test samples of margarine, butter, peanut butter, cheese, bacon, banana, and salad dressing to see if these foods contain fats or oils. Record your observations.

   d. Try other substances that are suspected not to contain fats.

2. a. Add 10ml of methylene blue solution to a test tube.

   b. Use a dropper and add a drop of fresh orange juice to the test tube. Gently swirl the test tube.

   c. Continue to add orange juice to the test tube one drop at a time. Swirl the test tube after every addition. Count the number of orange juice needed to change the color of the solution from blue to colorless.

d. Record this number.

e. Repeat steps 1-3 using lemon juice, grapefruit juice, and lime juice.

f. Record the number of drops of each juice needed to turn the methylene blue solution colorless.

3. a. Use the calorie charts and the food list from activity. Calculate the number of calories per day that you eat.

   b. Use the calorie charts to write balanced meals for one day.

4. a. Collect the labels from 10 of your favorite processed foods.

   b. Fill in the blanks in your data table with the information to each food.

Return to Biology Index

GENETIC VARIATIONS IN HAND SPAN SIZE

RICHARD CHILTON

CHICAGO VOCATIONAL HIGH SCHOOL
2100 EAST 87TH STREET
CHICAGO, IL
1-312-978-1600

OBJECTIVE:
Students shall measure their handspan size to determine if one pair or many pairs of genes control that trait.

MATERIALS:
Metric rulers, Basketball, Lab. Worksheet, Graph paper, and Graphic overlays.

STRATEGIES:
Obtain a metric ruler, lab. worksheet and graph paper. Measure your handspan size as demonstrated by teacher, spreading out your hand on a sheet of paper. Draw a line from the tip of your thumb to the tip of your little finger. Do not include length of fingernails. Measure the length of the line (your handspan) in millimeters. Record the measurements of all members of your class on the chalkboard. Organize the measurements into a graph showing handspan size in groups of 5 mm. Also record the number of students in each group. Draw a graph of the data in the table. Then carry Basketball out to students to see if students can place handspan across the Basketball and hold in place without touching any object. Next, answer the following questions:

(1) What does the graph reveal about the differences in handspans within your class?

(2) Based upon these data, do you think size of handspan size is controlled by one or more pairs of genes?

(3) What other factors can affect hand size?

Conclusion: If a genetic trait is controlled by a single pair of genes, then class results would usually show only two categories or groups. When a genetic trait is controlled by several pairs of genes, a number of different groups will appear. Therefore, this genetic trait must be controlled by more than one pair of genes.

Return to Biology Index

COMPARISON OF RESPIRED AIR VOLUME

Matthew F. Mendyk
Steinmetz High School
3030 N. Mobile
Chicago, IL 60634
1-312-889 0225

BEHAVIORAL OBJECTIVES:

1. Students will see a comparative difference in volume lung capacity.
2. Students will understand that a relationship exists among many sciences.

MATERIALS;

1. Posterboard (to construct calipers.)
2. Metric rulers.
3. Overhead projector.
4. Balloons.

STRATEGIES;

Introduce lesson by comparing respiration systems from organisms that are simple to organisms that are complex.
As man manifests complexity in all systems, so also is his respiratory system. Compare internal and external respiration.

DEMONSTRATION & LABORATORY:

1. Vital Capacity.
   - (A) Stretch balloon.
   - (B) Inhale a deep breath and exhale into your balloon.
   - (C) Use calipers to determine balloons diameter in centimeters.
   - (D) Record information in column labeled vital capacity.
   - (E) Record four additional trials.
2. Expiratory Reserve.
   - (A) Take a normal breath, exhale normally and expel the remainder into your balloon.
   - (B) Measure and record.
   - (C) Record four additional trials.
3. Tidal Volume.
   - (A) Breath normally and exhale into your balloon without disrupting your pattern.
   - (B) Measure and record.
   - (C) Record four additional trials.
4. Statistics.
   - (A) Transfer balloon diameters in centimeters to cubic centimeters by using the graph on your work sheet. (Volume)
   - (B) Record these volumes.
   - (C) Compare class data.
   - (D) Compare data for all classes.
   - (E) Compare data for men and women.
   - (F) Compare other combinations of interest.

CONCLUSION:

1. Air has volume, is matter, and can be measured.
2. The differences in respiration among humans can be determined.
3. Biological evolution appears to develop from the simple to the complex.
4. There is an obvious association among the sciences.
5. The students understand and can define:
   (A) Vital capacity.
   (B) Expiratory reserve.
   (C) Tidal volume.
   (D) Internal respiration.
   (E) External respiration.

Return to Biology Index

THE EYE AND COLOR IMAGES

LACY GRIGSBY

Paul Robeson High School
6835 S. Normal Avenue
Chicago, IL 60621
1-312-723-1700

Objectives: 1) To have the student to observe and experiment with visual after images.

2) To have the student observe white light and its component color spectrum.

3) Introduce the student to the basic colors and their complements within the visual system by demonstration.

4) Introduce the basic parts of the eye.

5) To demonstrate how the optical path and focal system work.

6) To demonstrate how an image is projected upon the retinal network.

7) Show feature analysis of illusions produced by after images.

8) To show the student how to derive any given color.

Materials: Candle, convex lens, overhead projector, color light box, 3 by 5 index cards, envelopes, small triangles (red, blue, green, and yellow), drawings or pictures, matches, and model of the human eye.

Strategies: Pass out envelopes containing four different colored triangles and an index card. see below

```
                                                                    .
                                                              .    ..
                 _______________________________________     ..   . .
                 =          __                         =    . .  .  .
 PA              =       =      =                      =   .  . .   .
                 =     =          =                    =  .   .......
                 =    =      =      =         =        = ......     .
                 =    =             =                  =      .    ..
                 =     =          =                    =     ..   . .
                 =       =  __  =                      =    . .  .  .
                 =                                     =   .  . .   .
                 _______________________________________  .   .......
                                                         ......
```

Have the students in the class place a red triangle in the center of the circle. (Make sure that the student concentrates on looking at the triangle for at least 45 seconds). When the time is up have them stare at the dot on the other end of the card.

2

You should ask them if they see anything unusual as they are staring at the dot. ans. (A blue after image). Wait six minutes then have them try another color on the card. Each time they should see an after image of the complementary color(s). If you have students that don't seem to see the after image, show them the handouts I gave you or pictures from **Human Information Processing** page 216a thru 216d. This may them to see the phenomena and identify the colors.

Light box=PA & Triangle= chalkboard

The color light box should be used at this point. Show the complementary colors, and the white color produced when the three basic colors of light are added together. The triangle of colors should be put on the overhead also, to show the student to derive the other colors and their complements. **NOTE** The room should be dark.

Image=PA

Take the candle and put it about two feet in front of the object you would like to project your image upon. Light the candle. Take the convex lens and move it back and forth between the candle and the screen until you find the focal point. (The candle image should now be projected on the screen in full living color, upside down). This is the time to pull out the model of the eye and show them how the eye works.

These PA's should lead to all sorts of wonderful discussions about photochemicals and proteins, eye structure and function, images and after images, component colors of white light, and colors and their complements.

Biology/Chemistry

Embryology: From Egg To Chick

Ben Butler Jr.
4212 S. King Drive
CHICAGO IL 60653

(773) 373-8298

Laura Ward
410 N. Monticello Ave.
CHICAGO IL 60624
(773) 534-6440

Objective(s):

1.) This lesson will teach students the value of living animals.

2.) This lesson is for first grade students.

3.) This lesson will build student knowledge of basic biology, especially embryology and anatomy.

4.) This lesson illustrates similarities of biological functions in all animals.

5.) This lesson will increase awareness of the value of laboratory animals to science.

Materials:

We will use one incubator with hydrometer, thermometer, distilled water, Chlorox bleach or rubbing alcohol (for cleaning the incubator), chicken feed, lamp with a fifteen watt bulb, one dozen fertilized eggs (obtain them from a distributor), one dozen of regular store bought eggs, transparent plates or saucers, flat wooden sticks or Popsicle sticks to probe the unfertilized eggs, freezer bags (one gallon size) for disposal of raw egg waste, vinegar and transparent disposable cups (16 oz. size).

-

Strategy:

We want to get the fertilized eggs to hatch by putting them in an incubator for twenty-one days with an average temperature of 99.5 degrees Fahrenheit and maintaining an average humidity of about 51%. Secondly, we want to examine an egg on the inside and outside to help identify the parts of an egg. This can be done on regular store bought eggs. Examine an egg in a saucer or plate. Identify the important visible parts of the egg by breaking it open and physically inspect these parts with a Popsicle stick. Use another egg to investigate the shell components by putting eggs in transparent cups with vinegar. Use just enough vinegar to submerge the whole egg. Students will inspect and draw what happens over the next few days. On the fifth day students may inspect and observe the egg with the shell dissolved away (the acetic acid in the vinegar dissolves the calcium carbonate of which the shell is made). We will inspect the egg embryos by candling the eggs. A candler can easily be made with a flashlight and an empty box. We will use an empty Huggies baby wipes box. You can inspect the eggs with the candler to predict the number of eggs that will hatch. Cut a hole in the bottom of the Huggies box. The hole should be about half the diameter of an egg. Place an egg on the hole and illuminate it from below with the flashlight. Inspect the eggs every day or every few days (up to the eighteenth day) to see the stages of development.

—

As the eggs are incubating it will be necessary for the students to go through some daily lessons. The Cooperative extension Service of The University of Illinois at Urbana-Champaign College of Agriculture along with the 4-H Club has issued a workbook to help inculcate the objectives of this lesson. Since I have a mobile unit that goes from classroom to classroom I concentrate on the more salient lessons and the homeroom teacher works with the daily lessons. These lessons include:

"I is for incubator. We set the eggs in an incubator. The incubator is the mother hen for the eggs. Today we set the incubator. We will have chicks in 21 days. Count with me." Use diagrams of the developmental stages of the chick to help the children see what is happening inside the eggs each day.

"T is for thermometer. If the temperature in the incubator goes higher than 103 degrees F., the eggs will not hatch. If the temperature is below 99 degrees F., the eggs may not hatch on time."

"E is for egg. My shell is usually white or brown. Eggs are rich in protein, minerals and vitamins. Eggs are good at all meals and as snacks. Color my shell. When you open me what do you find? Draw what is inside me. Draw the inside of the egg."

"Where am I?" labels the parts of the egg. "Identify the air cell- I am at the large end of the egg. Thin white—I am near the shell. Thick white—I am nearest the yolk. Yolk—I am yellow and feed the embryo. Chalaza – I look like a rope and hold the yolk. Shell – I am hard. Outer shell membrane – I am closest to the shell. Inner shell membrane – I am next to the white. Germ Spot – I am where the chick begins to develop. Vitellin Membrane – I am between the yolk and white."

"H is for hen. A hen is an adult female chicken. I lay eggs. Before I am one I am called a pullet."

"R is for rooster. A rooster is a male chicken. A male chicken under one is called a cockerel."

"C is for chick. A young female chick is called a pullet. A young male chick is called a cockerel."

"A chicken is a bird. I have a comb on my head. My comb is red. How many legs do I have? Find my bill. My bill is yellow."

Performance Assessment:

Students will be able to answer these questions with 80% accuracy.

1. We put the eggs in an _______________.
2. The chicks hatched in _______________ days.
3. The chicks were placed in the ____________.
4. The female chick is called a _____________.
5. The male chicken is called a _____________.
6. The baby chicken is called a _____________.
7. How many parts of an egg can you name?

---

8. How many parts of a chick can you name?

---

9. We feed our chicks ________ and ________.

Conclusions:

-

This exercise will introduce students to the process of reproduction in animals emphasizing the parts of animal eggs (and the function of each) as well as the stages in development from fertilized egg to baby.

-

Mathematics/Physics

Be A "Peder-Reader" - A Discovery Activity

Lilla E. Green
1736 East 85th Street
Chicago IL 60617

Hartigan Community Arts Specialty School
8 West Root Street
Chicago IL 60609
(773) 535-1460

Objective(s):

To learn about the millipede's physical structure and characteristics by observing its behavior in given activities. Pupils will hypothesize whether they think the millipede will make an interesting pet for them or not.

Materials Needed:

two(at least one per eight pupils) giant millipedes; one worksheet per group; primary balance scale; masking tape; metric ruler or tape measure; mirrors; paper plates; dried fruit bits (e.g., raisins); leaf litter; medicine droppers with water; box of washers; magnifying glasses; Instant Hand Sanitizer; assorted materials for millipedes to crawl upon, such as a styrofoam square, a straw fan, a wicker plate and a piece of nylon screening; Kool-ade packets; one **K-W-L** chart per group; rubber gloves (optional)

Strategy: (Activities are five minutes each)

#1. Choose a "Peder-Leader" for each group of "Peder-Readers," who will gently handle the critter and lead the group in filling out the worksheets. Use gloves if you like. One member of the group will record group responses on their K-W-L chart - what you already know about millipedes and what you want to know about them. As you make your rounds to each station, the recorder will fill out the section of the chart labeled - "What I Learned……"

#2. Discuss with your group how long it takes your critter to uncurl and start to "explore." Using a magnifying glass, "read" its body and name your critter. Can you estimate how many legs and segments it has? Discuss with one another whether it sees, smells, tastes, hears and feels. Do this before going to Station #1.

#3. Go to Station #1.

Name your millipede and "read" the millipede's moves. You're now going to observe its manner of getting around. Does it "glide", "sway", "stretch", or "crawl"? Brainstorm with your "Peder-Peers" and see how many verbs you come up with to describe how it moves. Get the styrofoam square, the nylon screening, the straw fan and the wicker plate. Place your critter on it. Can it defy gravity? Turn the critter upside down and note what happens. Imagine among yourselves what Sir Isaac Newton would say about millipede's laws of motion.

#4. Go to Station #2.

Place four to five raisins, some leaf litter, and some dry Kool-ade at various places on a paper plate and allow your millipede to crawl at will. Can you determine if it has a preference? If so, tell how.

Have a group member take the dropper and drop some water on the millipede. Is there a noticeable reaction? Using another paper plate, make a very shallow "puddle" with water from the medicine dropper and place the critter in the puddle. Is there any noticeable reaction? Have the recorder write your findings in the K-W-L chart.

#5. Go to Station #3

Gently place your critter in the primary balance scale and estimate how many washers it weighs. Now weigh it. Who came the closest to their estimation? Now, estimate its length and its width (around the middle segment). Take the tape measure, and measure its length and width in centimeters. (Talk softly to your millipede as you handle it). Record your findings in the K-W-L chart.

#6. Go to Station #4

Take two mirrors and tape them firmly at right angles so that they stand up on the table. Place your little critter squarely in the center of the mirrors. Does something interesting happen? Have your recorder tell how many images you see and describe the shape of your millipede. Is it symmetrical? Explain. Discuss among yourselves whether you think it can "see" its image in the mirror.

Performance Assessment:

Each "Peder-Recorder" will present their group's K-W-L chart orally to the entire class. At the end of their presentation, the recorder will state how many in their group concluded whether or not the millipede will make an "interesting" pet.

Biology/Chemistry

Cool Coral Reefs

Frana L. Allen
4747 South Kenwood
Chicago IL 60615
(773) 924-3721

Skinner School
111 South Throop
Chicago IL 60607
(773) 534-7790

Objective(s):

Grades: K through 8

The students will be able to: 1) identify, color and label the continents of the world and the equator; 2) identify, color, and label a world map and the location of the coral reefs; 3) read about and discuss the three types of coral reefs and make samples of each; 4) identify and produce water temperature between 74 and 78 degrees; 5) identify and discuss the term polyps; and 6) construct a colony of polyps.

Materials Needed:

Cooperative groups of 6 - 1 tub of white crayola clay, colored markers, a box of Riggitoni pasta, package of 200 small paper plates, 6 thermometers, 6 plastic cups, water, 60 world maps, 25 pipe cleaners, 12 pieces of blue paper, 12 coffee cans, glue, scissors, and Scotch tape.

Strategy:

This activity will be set up into 5 stations:

Station 1

Maps: *Where in the World* and *Reefs Around the World*

Color, label and cut out each map

Cover the cans with the blue paper

Glue each map on each can

Station 2

Temperature: What is the approximate temperature of water in a coral reef? Fill a plastic cup 1/3 of the way with warm water. Using warmer and cooler water, depending on the existing temperature, create a temperature of water between 74 and 78 degrees. Use the thermometer to achieve this desired temperature.

Station 3

The three types of reefs are atoll, barrier, and fringing reefs.

Three plates with clay sculptures showing the following: a. *fringing reef* – grows outward from the shoreline; b. *barrier reef*- is separated from the land by a lagoon; c. the *atoll* - a ring of coral far out in the ocean that has a sunken island or volcano beneath.

Station 4

Polyps are animals found growing in the bottom of coral beds. Place a medium size ball of clay on a paper plate. Get four pieces of riggittoni and color each differently with a marker. Get two pipe cleaners and cut them into thirds. Take some more clay and make four small balls, place these balls on the top of the riggittoni and stick the pipe cleaners in the ball. Then, press down. Take the medium ball of clay and spread it thickly on the paper plate. Take the riggittoni and place it standing up in the clay close together, then build the clay around the colony of pasta.

Station 5

Write a group story on Paula, Paul, Pat, and Peola Polyp. Make sure the story contains important facts about coral reefs, their location, and the kind of inhabitants that inhabit a coral. Reference books on coral reefs will be available for students to research.

Performance Assessment:

Students will be assessed on the following items:

- Journal writing entries
- Examples of the three types of coral reefs
- How well the students were able to use the reference materials to enhance their group report
- Oral and written presentation of their group report
- A written quiz which can be administered individually and/or in a group

Sea Activities

Pedro Rodriguez
4634 S. Homan Ave
Chicago IL 60632
(312) 247-4754

Bateman School
4220 N. Richmond St
Chicago IL 60618
(312) 534-5055

Objectives:

This lesson has been designed for the bilingual kindergarten learner, but can be used for other grade levels 1st to 3rd.

*The students will recognize sea creatures.
*The students will learn that the sea water is salty, how to extract salt, and convert seawater into fresh drinking water.
*The students will learn that there are bodies of sea water where the amount of salt is so great that people float effortlessly in them.
*The students will learn and recognize that sea water has chloride ions.

Materials Needed:

*Group students in 4 or 6
*Mural paper, light blue, cut paper 5 foot long
*Crayons
*Sea creatures stencils
*Pencils

Strategy: Setting the stage

Setting the stage in your classroom to create a sea atmosphere. Have the students draw and create the ocean using the sea creatures stencils. After the students have finished, hang the murals created by students around your classroom. This will prepare a learning atmosphere for the student to learn about sea creatures and seawater.

Materials Needed:

*Masking tape
*Small plastic bowl
*Plastic bags large enough to hold the bowl
*Sea salt
*Tap water
*Plastic spoons

Strategy: Fresh Water from Sea Water

The light from the sun passes though the clear plastic and heats the surface of the salty water in the bowl. Although it is a simple process, extracting fresh water from sea water on a large scale is very costly. Sea water is first heated then the steam is boiled off and condensed into fresh water leaving the salt. Group the students in 4 or 6. Have the students cover the bottom of the bowl with a thin layer of sea salt. Fill the bowl one-half full with tap water and stir until all the salt is dissolved. Set the bowl inside the plastic bag and close the opening with masking tape and place the bag in direct sunlight. After 24 hours open the bag and collect the liquid around the inside of the plastic bag with a plastic spoon.

Results:

Have the students taste the liquid collected. The liquid inside the plastic bag will taste like fresh water.

Materials Needed:

*Group students in 4 or 6
*2 Large glass containers or breakers
*Sea salt, making sea water use 35 grams of salt in 965 grams of fresh water
*2 hard boil eggs
*Fresh water

Strategy: Making a egg float

To demonstrate how salt content is measured by the buoyancy force, as the salt content of the water increases. The water gets more dense and has greater buoyancy force, and the fresh water is less dense, and has less buoyancy force. Float an egg in salt water. After you have made sea water, fill two glasses, one with fresh water, the other one with sea water. Place an egg in each one of the glasses. Describe the results to the students.

Results:

The egg will rise and float in the sea water and the egg in the fresh water will sink to the bottom of the glass. This is the result of the buoyancy force, the density of the water increases.

Materials Needed:

*Fresh water
*Sea salt
*Test tube or plastic clear glass
*Medicine dropper
*Silver nitrate

Strategy: Testing for the Chloride Ion

This is a simple chemical experiment which can be easily done to test sea water for the chloride ion. Pour 25 to 30 milliliters of water into a test tube or a plastic cup. Add a few grams (three or four) of sea water. Shake to dissolve the salt. Cautiously add two to three drop of silver nitrate do not shake or stir.

Results:

The silver nitrate will react with the sea water and will turn milkly white if chloride ions are present in the sea water.

Performance Assessment:

Students should be able to:

*Answer oral questions.
*Observe the changes taking place in the experiments.

Return to Biology Index

Animals: Here and Now

Marvin W. Bragg
14346 Ingleside Ave.
Dolton IL 60419
(708) 201-8093

John Hope Community Academy
5515 S. Lowe St.
Chicago IL 60621
(312) 535-3160

Objectives:

Elementary school students (5th-6th grade) will be able to:

1. identify basic "zoo" animals upon sight by name
2. classify animals by particular type (i.e., habits, location, size, special colorings, grouping, etc.)
3. have a basic understanding of the animal kingdom and the various classifications
4. discuss and identify natural habitats of most zoo animals
5. construct and display a small "zoo like" model
6. write a short story or diary about an animal or pet of their choice

Materials Needed:

(per group of 2-3 students)

1. 2 boxes of animal crackers
2. 1 box of crayons
3. 2-4 sheets of poster board (11" x 7")
4. 2-4 sheets of plastic screening (12" x 8")
5. 1 sheet of small self-adhesive zoo animals
6. 1 bottle of glue
7. stapler or roll of masking tape
8. twigs, grass cuttings, small leaves, etc. (for beautification)
9. scissors

Strategy:

A. Zoo model - Students are going to construct a habitat and select animals appropriate to that habitat.

   1. Cut white poster board into a piece 11" x 7".
   2. Cut plastic screening into a piece 12" x 8".
   3. Cut or peel off animal stickers.
   4. Glue, stick on, and arrange animal crackers or animal stickers randomly to 11" x 7" piece of white poster board (be sure to leave sufficient space between animals in order to add any trees, shrubbery, twigs, grass, etc.).
   5. Add anything else that may be seen in or around contained in zoo environment or setting.
   6. After all gluing, cutting, and arranging activities are completed and intact, place 12" X 8" plastic screening directly on top of 11" x 7" white poster board sheet.
   7. Attach the overlapped edges of plastic screening to back of poster board with staples or masking tape to create a "zoo" replica.
   8. Display "zoo" replica on window ledge or other appropriate locations in the classroom so that other students can view, compare, contrast, discuss and enjoy.

B. Animal game activity

1. Select a blank 3" x 5" index card for each child in the class.
2. Write various animal facts unique to one particular animal on each card.
3. Hand out one card to each child.
4. Have each child read the facts out loud to the rest of the class.
5. Once the card has been read, allow the child reading the card to correctly name the animal in question.
6. If the child reading the card incorrectly names the animal, the other children in the class get the opportunity to correctly name the animal.

Performance Assessment:

The student will be assessed according to his/her ability to:

1. construct a "zoo" replica from recent zoo visit or model that the teacher had on display for the entire classroom.
2. participate with other students in an animal guessing game.
3. perform well on a short test or quiz, focusing on animal names, types, special characteristics, habits, origins, etc.

Conclusion:

At the end of this mini-teach students should have a thorough understanding and appreciation of animal life.

Return to Biology Index

Insect Classification

Mushtaq Ali Khawaja
109 Geneva Street
Bellwood IL 60104
(708) 547-6104

Bateman
4220 N. Richmond
Chicago IL 60618
(312) 543-5055

Objectives:

This lesson has been developed for 6th grade students but can be used for other grade levels.
Students will:
- learn the classification system of living organisms
- identify the general body parts of an insect
- learn insect classification into orders, families, genus and species
- demonstrate the ability to classify any given insects by using a scientific insect classification key

Materials Needed:

Colored tissue paper, cut out insect stencils, drinking straws, clothes pins, cotton balls, Q-tips, glue bottles, markers, crayons, yarn thread, napkins, scissors, paper pins, paper clips, Insect Classification Key, 4-6 packets of insect pictures for classification (each containing 12-16 pictures), paper charts, masking tape, etc.

Strategy:

In preparation for this lesson, the teacher will talk in general about insects, explain insect body parts using picture of a grasshopper and important morphological characters that form the basis for insect classification.

Part A Each student will be given all the necessary materials to make a butterfly using colorful tissue papers and attach to it appendages such as 3 pairs of legs, 1 pair of antenna, 1 pair of compound eyes following proper instructions and using appropriate materials. Every student will then identify and familiarize himself/herself with the distinct body parts of an insect. Teacher will interact as a facilitator. All the butterflies thus made will be collected by the teacher and displayed in the classroom to share the work.

Part B Students in class will be divided into equal groups of 4 students each. Each group will be provided with a standard "Insect Classification Key" with a packet containing 16-20 insect pictures for identification purposes. Students in each group will work together to identify given insects using the key and sort them into their respective insect orders. Each group will then make their own "Insect Classification Chart" by pasting the identified insects under alphabetically arranged respective insect orders with their common names written below them. Teacher will act as a facilitator. The work of each group will be collected and displayed in the classroom to share the information.

Assessment:

At the completion of the lesson, the students:

A. Can identify all the given insects using the key.

B. Can identify 80% of all the given insects using the key.

C. Can identify 70% of all the given insects using the key.

D. Can identify 60% of all the given insects using the key.

F. Cannot figure out well or at all.

Return to Biology Index

Bernoulli's Principle and Winged Flight

Ben Stark
1126 N. Harvey
Oak Park IL 60302
(708) 386-8670

Illinois Institute of Technology
IIT Center
Chicago IL 60616
(312) 567-3488

Objectives:

This science "mystery" was originally presented to third graders, but is probably appropriate for grades 3-12. The objectives are (1) to see how the decrease in air pressure which occurs when air is moving (relative to air which is not moving or is moving more slowly) allows birds to fly.

Materials Needed:

wooden dowel

thread

masking tape

three ping pong balls (or styrofoam balls about the same size as the ping pong balls)

hand held hair drier

Strategy:

This lesson makes a perfect "science mystery." It starts out with the wooden dowel. Cut two pieces of thread of equal length (about one foot). Tape one thread (at one end) to one of the balls and the other thread (at one end) to a second ball. Then tape the other ends of the two threads to the dowel near one end; when this is done, the two balls should hang down from the dowel when it is held horizontally so that they are about 1/2 inch apart (horizontally) but at exactly the same level (height-wise). Ask for a volunteer to hold the dowel horizontally (so the balls hang down) and another to blow (gently but firmly) through the space between the two balls. Ask the children to predict what will happen to the balls (most probably will say that the balls will be pushed apart). Actually, if the volunteer is careful to blow straight through the space between the balls and not on the balls themselves, the balls will be pushed **together**! The increase in velocity of the air being blown through the space between the two balls relative to the speed of the (still) air on either side of the ball makes the air pressure lower between the balls than outside of them, and the balls are thus pushed together.

Then take the hair drier and turn it on (the phenomenon and explanation are simpler if the air can be blown without heat, because then you don't have to worry about changes in temperature complicating things). Holding it vertically, place a ball above the stream of air and let it go. The ball will float above the opening of the hair drier, and will be held quite well (laterally) within the stream of air. The blowing air elevates the ball and places it within a stream of air moving relative to the air outside of the stream. Thus, as above, the ball is trapped in a zone of low pressure, and the higher air pressure surrounding the stream of moving air keeps the ball from leaving the zone of low pressure.

This is also the principle of bird flight. The birds' wings are relatively flat on the bottom and convex on the top. When a bird is moving forward through the air, then, the air flowing **over** the wing has farther to go in a given amount of time than the air **beneath** the wing (the shortest distance between two points is a straight line, i.e., beneath the wing; the distance above the wing is longer because it is not in a straight line). Thus, the velocity of the air passing above the wing is greater than the velocity of the air passing beneath the wing, the air pressure is thus greater below the wing than above it, and the bird is pushed up. The same principle of "lift" allows an airplane to fly.

Performance Assessment:

Grading might be best achieved by assessment of a one page (or so) write-up of the experiment that includes accurate discussions of the results of the experiment as well as the principle behind it (the latter may be appropriate only for the upper grades).

Teeth Identification in Omnivores, Herbivores and Carnivores

Allen Nelson
11445 S. Washtenaw
Chicago IL 60655
(312)233-9456

John P. Altgeld
1340 W. 71st. Street
Chicago IL 60636
(312)535-3250

Objectives:

LEVELS: ALL GRADES

The main objective of this lesson is to demonstrate the differences in teeth structure and how it determines what a specific animal eats. This will be accomplished by constructing a raccoon puppet.

Materials Needed:

pictures of various animals (focusing on their mouth)
paper bags (4" X 8")
red modeling clay
corn kernels
black and brown crayons
glue

Strategy:

1. Display pictures of various animals, discussing their teeth structure.
2. Lay the paper bag flat with the flap facing you.
3. Draw a raccoon face above the flap. Allow the students to get creative with their puppets faces.
4. Turn the bag over to, allow some space at the top, then draw the raccoon's tail.
5. Lift up the flap and glue two strips of clay (one on top and one on bottom) to the bag. These should represent the gums of the raccoon.
6. Place individual corn kernels in the clay to represent the different kinds of teeth. Instruct the students to position the kernels so that the front teeth are sharp and the back teeth are smooth and round.
7. Allow the students to demonstrate the functioning of their puppets to one another.

Performance Assessment:

At the completion of these activities the students will be able to answer the following questions:

1. What do omnivores eat?
2. What do carnivores eat?
3. What do herbivores eat?
4. How do the structure of an animals determine what they eat?
5. Describe the different shapes of animal teeth.
6. Can the learner apply this information to the identification of dinosaurs?

Conclusion:

At the conclusion of this activity the students will understand the differences in teeth shapes and how this dictates the diet of an animal.

Return to Biology Index

Insects: Grasshoppers

Wanda Williamson-Johnson
3838 West 111th Street
Chicago IL 60655
(312) 233-5897

Crown Community Academy
2128 South St. Louis
Chicago IL 60628
(312) 534-1680

Objectives:

This lesson was geared for Kindergarten:

Students will learn how to listen and follow direction; to observe living things; to compare and contrast; to record and read information on a graph; to work in cooperative groups; addition skills; how to identify an insect; the characteristics of a grasshopper and the functions of the grasshopper external body parts.

State Goals for Learning:

Students will learn the concept and basic vocabulary of biological, physical and environmental science and their application to life and work in contemporary technological society.

Materials Needed:

a magnifying glass per child
a number of bugs and insects
chart paper and markers
newspaper and a roll of string
green tissue paper
green pipe cleaners
toilet tissue rolls
straight pins
scissors
glue
combs
4 rolls of tissue
clear plastic cups
green construction paper
index cards
clothes pins
masking tape
small paper fasteners
wiggley eyes
styrofoam balls
black craft pom-pom balls
hole puncher
styrofoam peanuts
styrofoam cups
clay
shaving cream

Song; (Tune to: "The Farmer in the Dell")
-- The insect in the jar
The insect in the jar
Has six legs and three body parts.
-- First you have the head
Then you have the thorax
Then have the abdomen which is connected to the thorax.
-- The head has two eyes
And a simple one too
It has two feelers to touch and smell their food.
-- The mouth has large lips
And sharp jaws in between A second pair of jaws
Which is use for tasting things.
-- The thorax has six legs
And two pair of wings

Rubbing them together is how this insect sings.

Vocabulary:

mandibles = sharp jaws
simple eye = sees light and dark
molting = process of shedding skin
thorax = chest
spiracles = airway for breathing
nymphs = baby grasshopper

Procedures:

1. Sing the song "The Insects in the Jar," allow students the opportunity to observe what they have in the jar. Then let them put their name on the chart after they predict if they have an insect in the jar or not.
2. Draw a large picture of a grasshopper on the board and label its body parts.
3. Make a model grasshopper using toilet tissue roll. (Project #1)
   A. Punch holes in the tissue rolls six on the bottom and one on the top.
   B. Cover roll with a thin layer of glue, roll tissue paper around it (same for styrofoam ball).
   C. Take pipe cleaners, cut them in half, punch cleaners through holes, entering on the right side and exiting on the left side.
   D. Cut tissue and construction paper wings, then put a hole in each of them in the same spot.
   E. Line wing holes with the hole on the top of the tissue roll then put paper fastener through the holes.
   F. Line front end of tissue roll with glue, then push the ball on it.
   G. Take black ball and put in the top center on the covered styrofoam ball, then put a straight pin through it.
   H. Put wiggley eyes on each side of the covered ball.
   I. Take short pipe cleaners and stick between the wiggley eyes.
   J. Take marker and draw on mouth.
   K. Staple back in close.
4. Make human grasshopper using oneself. (Project #2)
   A. Read a short story about grasshoppers for background information.
   B. Make a construction paper head band.
   C. Put two holes approximately 1 inch apart from each other.
   D. Put pipe cleaners through the hole to make antennae.
   E. Tape a small green oval in the center of the band.
   F. Tape to your face construction paper mouth and feelers.
   G. Stuff stockings with newspaper.
   H. Take long string and tie at the open ends of the stocking.
   I. Tie the string around your waist (this is the third pair of legs).
   J. Take chart paper, and tissue paper wings, and put a hole through the top of the wings.
   K. Put paper fastener through the holes and open it up.
   L. Pin wings to the back of the shirt.
5. Make a clay model grasshopper. (Project #3).
   Use learned skills to make clay model grasshopper.
6. Preparation for the birth and the protection of the baby grasshopper. (Project #4).
   A. Take clear plastic cup and fill with dirt.
   B. Place styrofoam peanut in the dirt, making sure to leave a side view of the peanut.
   C. Spray shaving cream on the top of the dirt which represents how the mother protects her eggs through the winter.
7. Make human nymph (baby grasshopper). (Project #5).
   Take toilet tissue and wrap your partner from head to toe to illustrate a baby nymph.

8. The various sounds of a grasshopper (Project #6).
   Rub finger nail against a comb.
   Rub two brushes together.
   Rub finger nails against styrofoam cup.

Performance Assessment:

Students should be able draw a picture of a grasshopper including all the details covered in the above three activities. Students should also be able to label each part by sounding the words out to the best of their abilities. Students will be able to answer the following questions:

Name the body parts of a grasshopper.
Identify the thorax.
What do you see on the thorax?
What do you see on the abdomen?
Where are the wings located?
Where are the feelers?
What happens when the grasshopper jumps?
Compare the baby grasshopper to the mother grasshopper? What are the similarities and differences?
Students will be able to recite poem learned about grasshoppers.

Conclusion:

Students will know the life cycle, external body parts, and the function of the grasshopper.

Return to Biology Index

Insect Inquiries

Allen Nelson
11445 S. Washtenaw
Chicago IL 60655
(312)233-9456

John P. Altgeld
1340 W. 71st. Street
Chicago IL 60636
(312)535-3250

Objectives:

LEVELS:ALL GRADES

The main objective of this lesson is to develop in the learner a curiosity about the insect world. Students will collect and observe insects native to the area.

Materials Needed:

Collection Materials
- potatoes
- knives
- spoons
- trowels
- data sheet
- masking tape
- petri dishes
- glass jars with lids
- hand lenses
- markers/crayons
- drawing paper

Model Construction
- 2' square piece of plywood
- 4 (1' by 12') wood strips
- 8 tack nails
- paint (optional)

Strategy:

Collection Technique
1. Allow the students to design their own insect. Have them draw their insect on paper and label the parts. The students must describe the function of these parts.
2. Brainstorm on the following questions.
   - What body parts do insects have?
   - Where do insects live?
   - How can we catch insects to observe?
3. Cut a potato in half lengthwise. (For younger students you may want to have this already done.)
4. With a spoon, hollow out the center of each potato half to form a cavity.
5. On each end of these cavities make identations or entrances to your potato traps. You will want to make sure that the indentations are about halfway above the center of each end.
6. Place the potato halves back together (you can wrap the halves together with masking tape) to complete the trap.
7. Locate the spot you would like to use to collect and, with your trowel, dig a depression in the soil. The area should be deep enough so that the potato traps' entrance is level with the ground surface.
8. Place the potato trap in position. Soil from the depression can be left to one side to fill in after you are through with your collecting.
9. Check your potato daily to record the kinds and number of critters in

your trap.

10. Transfer your critters to a petri dish or glass jar.
11. Observe your critters with a hand lens.
12. Record your observations.

Model Construction ROLLY POLLY DOWNS

1. Draw a circle (2" diameter) in the center of the plywood.
2. Arrange the wood strips in a spoke-like pattern around the circle.
3. Nail the strips in place.
4. Paint your model to resemble a race track. Label the model "ROLLY POLLY DOWNS."
5. Allow the students to race their critters. First one to the circle wins!
6. Remember to release the animals after you have completed these activities.

Performance Assessment:

At the completion of these activities, students will be able to answer the following questions:

1. Which animals in your trap are attracted to the potato for food?
2. Which animals are there because they are attracted to its moisture, a water source?
3. Which could be there just for shelter?
4. Could any of the animals be there to prey upon the other animals in your trap?
5. If traps were set in forests, fields, marshes, etc. would we find different animals? Are there animals that seem to live in all areas?
6. Predict what might happen if we had buried the potato deeper in the ground.

Wonderful Worms

Judith Lessin
2644 W. Harrison
Glenview IL 60025
(708)724-6824

Rogers Elementary School
7345 N. Washtenaw Avenue
Chicago IL 60645
(312)534-2125

Objectives:

Primary children will be able to:

- identify living and non-living things.
- understand the importance of earthworms to the soil.
- name some basic facts about earthworms.
- recognize basic "worm" vocabulary words.
- demonstrate vermicomposting techniques.
- understand that different living things need different environments for living.

Materials Needed:

Earthworms	Shop Towels	Gummy Worms
Water	Paper Plates	Knifes
Containers	Scissors	Top Soil
Sand	Hardboiled Eggs	Acetone
Tape Recorder	Rap Tape	Worksheets
Microphone	Magnifier	Ruler

Optional Materials Needed:

Balance Scale	Terrarium	Books
Flashlight	Prism	Food Processor
Socks	Markers	Transfers

Strategy:

1. Distribute Gummy Worms. Discuss living vs. non-living things. Access children's prior knowledge of worms through discussion.
2. Distribute worms, one wet and one dry paper towel, and the following worksheets: (a) Worm Watching Guide (b) Worm Words (c) Worm Diagram.
3. Discuss the following: (a) Is your worm a living thing? How do you know? (b) What shape is your earthworm? (c) What color is your earthworm? (d) How long is your earthworm? (e) Does your earth worm have legs, eyes, ears, nose, hair, mouth? (f) Is there a difference between the top side of your earthworm and underneath? Can you describe the difference? (g) How does the worm's skin feel? (h) Do you think the earthworm has a skeleton? (i) How does the worm move? (j) Can a worm move backwards? (k) Does a worm have any special features? Describe them. (l) Does a worm prefer a wet or dry paper towel?
4. Referring to their diagrams, have the students identify where the following features are on or in their worms: (a) clitellum; (b) gizzard; (c) crop; (d) anus; (e) mouth; (f) hearts; (g) segments.
5. As background information, for the adults who may be teaching this unit to their students, discuss reproduction in a worm.

6. Distribute sheet "Wormy Activities In the Classroom". Discuss the activities described below.
    a. Write and illustrate a story from a Worm's perspective.
    b. Weigh lunch leftovers for your class after they have been chopped up by a food processor. Find out how many kilograms of waste your class produces in a day, week, month, and year. Feed chopped up waste to your worms.
    c. Share class knowledge with others by writing a newsletter.
    d. Make a Worm Puppet from an old sock.
    e. Have students make "Worms and Dirt". Crumble chocolate wafer cookies and make instant chocolate pudding. Place gelatin worms in the bottom of dessert cups, pour pudding over the top, and then sprinkle the crumbled cookies over.
    f. Make Tee Shirt Transfers or Buttons which proclaim "Worms Eat Our Garbage".
    g. Incorporate descriptive words about worms into creative writing assignments.
    h. Research the giant Australian Earthworms.
    i. Shine a flashlight through a prism so that it casts a spectrum. The worm will crawl through a red light and avoid blue light.
7. Wet a cotton ball with nail polish remover. Put the cotton ball by a worm's head. Then put the cotton ball by a worm's tail. Note any difference in the response.
8. Distribute containers. Make a vermicomposter with sand, top soil, and food waste. Put worms in containers. Feed worms and water soil on a regular basis. Observe over time.
9. Play the audio tape "Worm Rap". Have students do the "Worm Rap". The "Worm Rap", written by Caroline Haviland, can be found in the publication, **SCIENCE AND CHILDREN, JANUARY 1993**.

WORM RAP

A worm doesn't have any bones inside,
But that doesn't stop it from taking a ride.
Through the soil, Yeah, a worm is strong.
If it had to, it could carry 10 others along.

No bones, no bones, no bones, no bones
A worm has got no bones, no bones

A worm doesn't have any eyes to see,
But that doesn't mean it will bump into a tree.
It feels vibrations, deep in the ground,
And then it starts to move and wriggle around.

No eyes, no eyes, no eyes, no eyes,
A worm has got no eyes, no eyes.

A worm doesn't have any feet you know,
But that doesn't stop it from making a hole.
Deep in the soil when the rain comes down,
The worms will come out or they will drown.

No feet, no feet, no feet, no feet

A worm has got no feet, no feet

A worm doesn't have any teeth to chew,
But that doesn't stop it from eating food.
They take little bits of dirt in their mouth,
And when it's all eaten, rich soil comes out!

No teeth, no teeth, no teeth, no teeth,
A worm has got no teeth, no teeth.

No bones, no eyes, no feet, no teeth!
A worm has got no bones, eyes, feet, or teeth!

Performance Assessment:

At the conclusion of this mini-teach unit on worms, students will be able to identify living and non-living things, understand the importance of earthworms to the soil, name some basic facts about earthworms, recognize basic "worm" vocabulary words, demonstrate vermicomposting techniques, and understand that different living things need different environments for living. Different assessment techniques will be used including teacher observation, oral questioning, written tests and worksheets, crayon drawings, and drama presentations with sock worm puppets.

Return to Biology Index

Know Your Cousins - Monotremas, Marsupials, and Placentals

Wilma Haynes
7348 S. Artesian
Chicago IL 60629

Ruggles School
7831 S. Prairie
Chicago IL 60619
(312)535-3085

Objectives:

This lesson is designed for primary students. It identifies some mammals. Students should be able to recognize characteristics of mammals. Students should be able to categorize mammal groupings. Students should be able to describe how mammals grow inside the mother's body and resemble their parents at birth.

Materials Needed:

- chalkboard
- chalk
- feely box
- hair
- fur
- eggs
- milk
- bones
- writing paper
- pencils
- glue
- crayons
- markers
- scissors
- construction paper
- animal flashcards
- animal pictures
- dice
- game board

Strategy:

The activities I devised to carry out my objectives are as follows:

1. brainstorming
2. use of a feely box
3. place mammal vocabulary words into ABC order
4. unscramble mammal vocabulary words
5. make as many words as possible from one vocabulary word
6. write Teasing Tongue Twisters about specific mammals
7. make a Strange Mammal Booklet by putting together parts of mammal pictures
8. make a shadow box with a favorite mammal
9. play Win Lose or Draw
10. play Password
11. play Concentration
12. play Know Your Mammal! (game) Make a game board using poster board and pictures of mammals. A student will start at START and move around the board by throwing a dice and landing on an animal picture. Next, the student will state if the animal is a mammal or not. If the answer is correct, the student will remain on the mammal picture. If the answer is wrong, the student will go back to start.
13. write poems
14. write stories
15. write songs

Performance Assessment:

The students should be able to identify two mammals from the three categories of mammals which are monotremas, marsupials, and placental mammals. The students should be able to state the main characteristics of mammals which are warm blooded, have back bones, have fur or hair, produce their own milk and have live births. The students should be able to identify ten mammals. The students should be able to state that mammals grow inside the mother's body, in the uterus, and are surrounded by the placenta, and resemble their parents at birth.

Return to Biology Index

A Fish Tale

Frances A. Henry
12419 S. Princeton Ave.
Chicago IL 60628
(312)928-1461

John Whistler School
11533 S. Ada St.
Chicago IL 60643
(312)535-5560

Objectives:

This lesson is designed for the primary level student.
The main objectives of this mini-teach are to:

- demonstrate how fish cells respond to fresh and salty water
- determine the age of a fish
- determine if temperature effects the movement of a fish's operculum (gill cover) and mouth
- identify the characteristics of fish

Materials Needed:

- salt
- teaspoon
- masking tape
- marker
- fish net
- ice
- large-mouthed jar
- hand lens
- fish scales (from a local market)
- dark paper
- a small cucumber
- 2 shallow bowls, 1 large bowl
- aquarium with goldfish
- thermometer

Strategy:

1. Fill both bowls one-half full with water.
2. Stir 1 teaspoon of salt into one of the bowls, label this bowl 'salt' using the tape to make the label.
3. Cut the cucumber into thin circular slices.
4. Place 3 slices of cucumber into each bowl.
5. Wait 30 minutes.
6. Remove the slices and test their flexibility by carefully using your fingers to bend them back and forth.
7. Now switch the slices, placing the ones that were previously in the salt water into the pure water, and the pure water slices go into the salty water.
8. Wait 30 minutes and again test their flexibility.
9. Place a dried scale on the dark paper.
10. Study the ring pattern on the scale.
11. Count the wide, lighter bands.
12. Fill the large-mouthed jar with water from the aquarium.
13. Use the net to transfer a fish to the jar.
14. Allow the fish 30 minutes to adjust to its new environment.
15. Count and record the number of times the fish opens and closes its mouth and operculum.
16. Place the jar in the bowl.
17. Fill the bowl one-half full with ice and then add enough water to fill the bowl. Do not add anything to the jar containing the fish.
18. Wait until the temperature in the jar reads 10 degrees Celsius and again count the number of times the fish opens and closes its mouth and

operculum in one minute.

Performance Assessment:

At the conclusion of the mini-teach, students will be able to answer the following questions:

1. What are the characteristics of fish?
   If it has scales, fins and gills-it's a fish.
2. How does fluid pass from one cell to another?
   Osmosis-water moves across the cell membrane toward where there are more dissolved materials in the water. The water moves because there are more particles of salt in the bowl than in the cell.
3. What is the effect of salt water on fish?
   Fish in salt water tend to dehydrate and they compensate for this by drinking large amounts of sea water. They excrete salt from their gills and their kidneys remove very little water from the body.
4. What is the effect of fresh water on fish?
   Water is absorbed into their cells, the surrounding water is less salty. They excrete large amounts of water through their kidneys.
5. How old is a fish?
   Fish scales form rings with each year of growth. The number of wide bands equals the age of the fish. The wider bands are formed annually, the smaller bands are formed seasonally.
6. How does temperature effect the number of times a fish opens and closes its mouth and operculum (gill cover)?
   There is more movement when the water temperature was warmer. Animals conserve energy when in a cold environment. Their body loses heat thus losing energy and movements slow down.

Conclusions:

Students will understand osmosis of cells and how to determine the age of fish. They will also be able to discuss conservation of energy in colder water and characteristics of fish.

Bird Beaks

Katherine Hill
9950 S. Carpenter
Chicago IL 60643
(312)779-3872

Helen J. McCorkle
4421 S State Street
Chicago IL 60621
(312)535-1793

Objectives:

This lesson is designed for students in grades kindergarten through third. The main objective of this Mini-teach is to show students that many different birds can live in the same geographical area because they are adapted to eat different organisms.

Students will be able to:

1. Compare the feeding habits of birds to their physical traits.
2. Expain that many varieties of birds can use the same habitat for gathering food because of adapting traits (i.e. beaks).

Materials Needed:

Per class (divided into 4 groups according to beak types):

1. Scissors
2. Spoons
3. Tweezers
4. Clothes pins (chop sticks)
5. 500 pennies (washer slugs)
6. 500 round beads (marbles)
7. 2 packages toothpicks
8. Cups (one per student)
9. Chart paper and felt pen
10. Crayon and white construction paper

Strategies:

1. Introductory Information:
   1. Background:
      Previous lesson on birds
      Classification of birds by beaks
   2. Make Bird Beak Chart
2. Discussion on beaks; their shape, uses and food adaptation.
3. Two sheets of paper and crayons will be given to each student in all four beak groups.
4. Each bird beak group will draw and color the beak of their bird group.
5. Introduce game and discipline procedures
   1. Game overview: To be played outdoors in defined lawn area, size determined by teacher.
   2. Group students equally into 4 beak types (scissor group, spoon group, tweezer group, clothes pin group).
   3. Pass out "beaks" and one cup (to represent bird's stomach) to each student. Each student gets one type of beak and must keep it throughout the game.

4. Students hold beaks in hand (not mouth).
5. Feeding Procedures:
    1. Teacher throws out handfuls of penny bugs. All students will pick up "bugs" with their "beaks" and place them in their cup (no hands or scooping with cup).
    2. Students must wait for a signal to begin before collecting food. Teacher calls time to end.
    3. Students assemble in their beak type groups, put their pennies together, total, and record group total on chart.
    4. Repeat feeding procedure (above) using worm toothpicks, then bead seeds.
    5. Finally throw out all three items together as before and have the students pick up whatever they want. (By now they know what they are adapted to pick up.)
    6. Again, total in groups and list on chart.
    7, Return to class to dicuss findings.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. Can you classify birds according to the four beak types?
2. Do birds have teeth in their mouth?
3. Do birds use their beak for purposes other than eating?
4. Does the shape and size of a bird's beak decide what can be eaten by that bird?
5. Are birds adapted to certain geographical areas according to beaks?
6. Can all birds use their beak to eat any organisms?
7. How does the bird's feet help him to eat?
8. Which beaks are best adapted to pick up the different items?
9. Why can a large variety of birds eat in the same geographical area?

Conclusion:

Students will be able to understand and compare the feeding habits of birds to their physical traits. Students will also be able to explain that many varieties of birds can use the same habitat for gathering food because of adapting traits (i.e. beaks).

Return to Biology Index

Sharks

Myrtie Bryan
12648 South Wallace
Chicago IL 60628
(312)568-0327

Martha Ruggles
7831 South Prairie Avenue
Chicago IL 60619
(312)535-3085

Objectives:

This lesson is designed for students in grades two through eight.

1. The objective of this lesson is to teach the interrelationship between marine life forms.
2. Students will use role playing to demonstrate an understanding of the issues and diverse opinions people have about sharks.
3. To teach students that sharks use their senses to detect prey.
4. The students will understand that the sharks body parts help it float and make it more buoyant.
5. To show that sharks can detect blood in concentrations of 1 part per million.

Materials Needed:

28 clear plastic cups
4 measuring teaspoons
1 16oz. can of tomato juice
2 newspapers
large container of water
1 pack of construction paper
1 roll of masking tape
red crayons or pencils
10 cucumbers
10 large paper clips
30 plastic lids (drink cups, yogurt, etc.)
1 tape with announcement of shark sighting
10 pairs of scissors
10 plastic knives
1 large container (6"deep)
1 town meeting notice to post in classroom
several staplers
paint and brushes
1 roll of string
shark information cards
10 pieces of string (3"each)

Strategy:

Activity 1

1. Explain that as a class they will hold a class meeting to discuss what should be done about the shark.
2. Read the town meeting notice to the class.
3. Allow the students to choose the group they would like to represent.
4. Explain how the meeting will run.
5. Distribute role cards to the appropriate students.
6. Tell the students to be prepared to comment on other people's statements.

Activity 2

1. Have each group of students cut 20 pieces of string 12" long. Double loop them to six inches and knot the loose ends.
2. Tell the students to punch a hole in the top of each marine creature circle, and attach a string.
3. Beginning with the three top consumers, attach the strings to the ends and middle of a straw.
4. Balance the straw on your finger so the straw hangs horizontally.
5. Tape the string.
6. Attach the seal, fish, and octopus circles to a second straw.
7. Connect the loose string from the top predator level to the straw with the seal and fish.
8. Find the balance point and attach another string.
9. Continue until all levels have been completed.
10. Attach the sun to the string and hang your mobile.

Activity 3

1. Divide your class into four groups.
2. Give each group of students 7 cups.
3. Label cups with numbers 1 through 7.
4. Have the students carefully measure 18 teaspoons of water in cups 2 through 7.
5. Put 1/4 cup of tomato juice into cup number 1. (This represents blood from a wounded fish that a shark might smell in the ocean.)
6. Direct the students to take two teaspoons, of the tomato juice from cup number 1 and put it in number 2. Stir the mixture. Take two teaspoons from cup number 2 and put in cup number 3. Continue this process until cup number 7 has been mixed.
7. Have the students draw 7 circles on a blank sheet of paper to match the 7 cups. Number the circles and color them with the red crayons to correspond to the color in each cup.

Activity 4

1. Give each group of students the shark information cards.
2. Have students draw a shark, including the fins, on a piece of paper.
3. Cut out picture and use it as a pattern to make another shark.
4. Have students paint shark and add gill slits, eyes, teeth, and a mouth.
5. Staple the body shape along the edges. When partly stapled, gently stuff the body cavity with crumpled newspaper to give it shape.
6. Staple the shark on all sides.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. What senses are involved in detecting and tracking prey?
2. What is the function of the lateral line on a shark?
3. What is the lowest concentration of blood that a shark can detect?
4. What determines whether a shark will accept or reject its prey?
5. Why must all the cups have the same amount of water?
6. What do you observe about the color of water in the cups?

7. Which parts of a shark's body are essential for swimming?

Conclusion:

Students will understand that sharks use their senses to track prey. They will understand that the marine food web includes a myriad of sea creatures from zooplankton to tuna and sharks.

Return to Biology Index

Dinosaurs---Read All About Them!

Roberta Fried
3050 Pheasant Creek
Northbrook IL 60062
(708)291-8024

Douglass Math and Science Academy
543 N. Waller
Chicago IL 60644
(312)534-6176

Objective:

The main objective of the Mini-teach is to introduce students to library research as an integral part of scientific research.

Materials Needed:

reference materials	dinosaur stencils
identification sheets	puzzles
construction paper	scissors
glue, tape, fasteners	hole punch

Strategy:

Station I: Using reference books provided, complete worksheets on identification of dinosaurs, their skeletal parts and footprints.

Station II: Solve rebus, addition and footprint puzzles.

Station III: Select patterns of body parts from various dinosaurs. Assemble the parts to create a new animal designed to survive better than its prehistoric ancestors. Be prepared to defend your "improvements".

Performance Assessment:

1. Self-check folders are provided at Stations I and II.
2. Paper models of dinosaurs will lead students into discussions of dinosaur forms and functions.

Conclusions:

Students will improve skills in locating and using reference materials to initiate and support scientific investigation and to locate the answers to specific questions.

Return to Biology Index

Making Your Dog Your Best Friend

Patricia Guthrie
330 Onarga
Park Forest IL 60466
(708)481-7926

May Community Academy
516 South Lavergne
Chicago IL 60644
(312)854-2740

Objective:

This lesson is aimed for students of all grades to show them that hands, voice and heart is the basis of dog training and through demonstration and hands on experience, students will be able to teach a dog simple commands and to play a game.

Materials Needed:

Dog, leash, collar, handouts for class, one toy for four groups (four toys)

Strategy:

1. Students will be introduced to a German Shepard dog named Buster Brown.
2. Students will be introduced to a training collar and leash their and uses will be explained.
3. a. Students will watch a demonstration of Buster performing the basic commands of heel, sit, come and finish (recall), long sit and long down.
   b. Students will brainstorm as a group and explain how they think that Buster learned his commands.
4. Students will learn how a trainer teaches a dog to learn the commands.
   Modeling-showing the dog what you want, i.e. sit;
   a. Hands-gently pushing dogs hind quarters down for his sit while pulling up with the leash at the same time.
   b. Voice-a firm but gentle "sit" coincides with the hand command.
   c. Heart-rewards of praise and/or food.
5. a. Students will be given simple dog toys such as a ball, a tug rope, a squeak toy, etc.
   b. Students will form into groups to develop a strategy for teaching Buster to play a game.
   c. Students will explain to the class what strategy they will use to teach Buster his game.
   d. Students will teach Buster to play his game.
6. The class will discuss what they've learned about how to teach a dog simple commands and playing games.
7. The class will discuss how they learn to play games and will relate teaching Buster to how they learn.

Performance Assessment:

Students should be able to know that training a dog involves uses of their hands, voice and heart with 95% accuracy.

Students should be able to come up with a strategy to teach a dog a trick using their hands, voice and heart at 90% accuracy.

Conclusion:

That the learning process for dogs involves modeling behaviors through use of his leash and collar. Behaviors are taught through the use of hands - i.e. showing a dog what you want him to do, voice - i.e. explaining through simple commands (sit, stay etc.) and heart, use of praise, food, and tone of your voice - i.e. whether you are pleased or angry.

Return to Biology Index

Testing Fats in Food

Patricia A. Banks
6906 So. Paxton
Chicago IL 60649

Rosa L. Parks Middle School
14700 So. Robey
Dixmoor IL 60426
(708) 371-9575

Objectives:

The main objective of this Mini-teach is to provide students with the opportunity to test the presence of fat in foods. Students will become more aware of their daily diet.

Materials Needed:

brown paper bag
peanut butter
margarine
cooking oil
meat
bread (white/wheat)
cheese
peanuts (shelled/processed)
activity worksheet
pencil and paper

Strategy:

Activity 1-Students were shown a brown paper bag to observe and tell what was in the bag. Students gave many different answers. The answers were written on the board, then the actual contents of the bag was revealed.

Activity 2-How can you test for fat? Cover the work area with newspaper. Rub a small sample of each material on the paper bag. Watch for any changes, record what you have observed on the activity worksheet.

Activity 3-The removal of fat from a chicken: The chicken was weighed before cutting. The chicken was cut, the fat and the skin were removed and weighed to determine the percentage of fat. The chicken was weighed again to determine the weight. Finally, the bones were removed and weighed to get an accurate weight of the whole chicken versus the non-fat chicken.

Performance Assessment:

1. Students observed changes on the paper bag when fat was present in a food.

2. Students became more aware of the important of having less fat in their diet.

3. Students discuss the facts of:
   A. Losing weight-people who want to lose weight take some fatty foods out of their diet.
   B. A balanced daily diet-nutrition and metabolism are closely related. The input into metabolism is our diet. In other words, "You are what you eat."

Conclusion:

To determine the effects of diet on growth and health requires not only doing experiments but getting a good understanding and eating a balanced diet.

Return to Biology Index

Toothpick Worms

Judy Hobson
14770 Mission
Oak Forest IL 60452
(708) 687-6745

TAMS
3500 State St.
Chicago IL 60616
(312) 808-0100

Objectives:

The objective of this lesson is to let students experience the role of color in camouflage.

Materials needed:

100 colored toothpicks, consisting of the same number of 4 different colors. (Colored pipe cleaners can be substituted.) Be sure to have each color counted before "seeding" the feeding ground.
1 Spring-type clothes pin (to simulate bird's beak) per child
A bucket of mud for nest formations
Disposable rubber gloves

An area of approx. 20 square meters where toothpicks of one color will blend in well. For example, a freshly mowed area for green toothpicks.

Ahead of time, prepare the feeding ground by placing EACH different color evenly throughout the area, as well as sticking them in the ground vertically. CAUTION: have all participants wear thick-soled shoes as the toothpicks do pose a safety hazard.

Strategy:

1. Tell the students that they will be playing a game in which they will become birds. These birds have only one source of food-toothpick worms.
2. Remind each group of 4 students that they will have to build a nest to which they will bring their worms. Review previous lesson on nest materials. The Field Museum has Habitat boxes in the Harris Center for loan. Order 2 weeks ahead of time.
3. One bird per group will be led to the feeding ground, eyes closed. Upon opening their eyes, the birds will pick up the FIRST worm spotted with the clothes pin beak. Return to nest with the worm, and deposit it there.

RULES: Only one worm per flight can be picked up. Birds don't care what color worms are, so they must fly down and pick up the first one seen. No hovering, keep moving while searching for worms.

4. After each student has gathered two or three worms, it is time to stop feeding. Return to the classroom to count the worms by color, by making a data chart and graphing the result.

Performance assessment:

Ask students these questions:
What color worm was hardest to find? Why?
If you suddenly became a worm, what color would you want to be? Why?

What would have happened if the background was a different color?

Return to Biology Index

The Earthworm

Carolyn Matthews
8631 S. Honore Avenue
Chicago IL 60620

Curie High School
4959 S. Archer Avenue
Chicago IL 60632
(312) 535-2100

Objectives:

1. To acquaint students with earthworms
2. To help students to begin to overcome their fear of earthworms
3. To show students why they should have an appreciation for earthworms

Materials Needed:

Provide a sufficient amount according to the number of student groups
shoe box lids (for worm observation)
black cardboard for covers
tongs
magnifying glasses
flashlights
data sheets

Strategy:

Activity #1 Earthworm and Soil Fertilization

Each group will receive an earthworm for observation, and a checklist of necessary things to observe.

Color
Differentiation between head and rear end
Ears, eyes, nose, mouth, legs
How long is it?
How does it eat?
Describe the worm's appearance.
Where is the clitelum? What is it?
What does the earthworm smell like?
How does it feel?
Do you think that it has a brain?
Do you think that it has a heart? What color is the blood?
Do you have blood vessels?
Can you see them?

Discussion: How does the earthworm have influence on soil structure?

The ingestion of soil; the partial breakdown of organic matter; the mixture of these factions, and the ejection of this material as surface or sub-surface casts; the formation of water-stable aggregates; the aeration of the soil, and the improvement of its water-holding capacity; the addition of lime to the soil.

Activity #2 Miscellaneous Observations

Touch the worm in any spot. Put the worm in an open shoe box. Cover half of the box with a piece of cardboard. Put the worm in the uncovered portion of the box, and observe what happens. How does the worm respond to elevations? Does it prefer to crawl up or down?

Performance Assessment:

Did the students get used to the worms and handle them with confidence?
Did the students exhibit verbally or through their actions a respect for the earthworm as a complex living thing?
When the observations were completed, did most students show some concern about what would be done with the earthworms?

Return to Biology Index

The Amazing Starfish

Doris Agbefe
6140 S. Woodlawn Ave.
Chicago IL 60637

South Shore Community Academy High School
7630 S. Constance Ave.
Chicago IL 60640
312-535-6190

Objective:

The main objective of this mini-teach is to familiarize the students with the amazingly simple but complex characteristics of an Echinoderm. This lesson is geared towards students at the Jr. High-10th grade with slight modifications made as necessary. The lesson is intended to be taught with the assumption that several lessons have been covered on the Starfish.

Materials needed:

1. Preserved specimen of a Starfish
2. Modeling Clay
3. Straws
4. Rubber tubing

Strategy:

Paper is handed out to each student at the beginning of this mini-teach. They are given an opportunity to answer the question, "Are Starfish Simple or Complex?" This should take about 15 mins. The paper is handed in to the teacher. Students are given a brief review of what they learned in previous lessons. Teacher writes on the board the words: Sea Urchin, Sea Star, Sand Dollar, Sea Cumber. Students are asked the question, "What do these organisms have in common?" Students are to answer that these organisms belong to the Phylum Echinodermata. Students are also lectured on a brief review of the organ systems that are present in the Starfish. Special emphasis is placed on the Water Vascular System which is a vital component of some Echinoderms. This system is used for locomotion and food getting. Special emphasis is also placed on the body organization of Starfish. The definition of symmetry is given. Pentaradial symmetry is discussed because this is a type of symmetry that some Echinoderms exhibit.

Performance Assessment:

Students are to construct a figure with the modeling clay that resembles the components essential to the water vascular system. Step 1: Students take clay and make a round flat patty. (This is analogous to the ring canal that is present in Starfish.) Step 2: Students take 5 cut straw sections and place around clay patty. (This is analogous to the radial canals that are present in each arm of the starfish.) An explanation is given on how water enters the starfish and ultimately causes movement. Students assemble themselves in groups of five in a circle to illustrate the concept of pentaradial symmetry. Each student in the circle represents 1 of the 5 arms present in the Starfish. Paper is passed out. Students are now asked to answer the question once again, "Are Starfish simple or complex?" The paper is handed in to the teacher. The teacher evaluates the two answers noting if there is any change.

Multicultural Aspect:

American schools are a great mix of students from various cultures. Jacques Loeb was a German American physiologist who studied sea urchin eggs. He was particularly interested in the concept of parthenogenesis. Parthenogenesis is the reproduction of organism without the fusion of gametes of opposite sex. Explain what happens with bees.

Encyclopedia of Marine Invertebrates. Jerry Walls, ed. 1982, TFH Publications Inc.

Return to Biology Index

A Guinea Pig Makes An Excellent Classroom Pet

Curtis Brasfield
7540 S. Seeley
Chicago IL 60620

Horace Mann
8050 S. Chappel
Chicago IL 6O617
312-535-6640

Objectives:

By carefully studying the behavior of a live guinea pig in a third-grade classroom for four days, the students will gain direct knowledge of the guinea pig's behavior and determine if it will make a good classroom pet.

Materials Needed:

guinea pig (live)	bread	insect
cage	corn	onion
observation guide questions	pellets	pepper
newspaper	apple	salt
carrot	banana	cloth
lettuce	meat	potato

Procedures and Strategies:

A brief outline of the subject to be studied will be presented by the classroom teacher.

The students will then be asked to observe and study the behavior of a live guinea pig in their classroom for four school days and write answers to the following questions based on their observations:

1. What does the animal look like?
2. How does it behave?
3. Does it like young children or does it become easily upset?
4. What foods does it like? Dislike?
5. Can it be trained? How?
6. What kind of noises does it make?
7. Is it safe to keep around children?
8. How often does it sleep during the day? How often does it play?
9. What are some basic rules we need to follow in taking care of the guinea pig in the classroom?

After the four-day observation period, a classroom discussion of the students' findings will take place on the fifth day.

Multicultural Emphasis:

Students will be asked to research the origin of the guinea pig and report their findings to the class for extra credit.

Performance Assessment:

Based on students' observations, study, classroom discussion and research, the students will write, in their own words, at least five reasons why a guinea pig will make a good classroom pet for third graders, and also identify the origin of the guinea pig (the country, the location of the country, and the language of the people who live there).

Return to Biology Index

Animal Behavior: "Groggy Goldfish"

Pearlie M. Hayes
100 Park Avenue
Calumet City IL 60409
708-891-2149

Henry Clay Elementary
13231 S. Burley
Chicago IL 60633
312-535-5600

Objective:

To observe the behavior of goldfish in water of varying temperatures.

Materials:

Goldfish (4)
Fish Tank
Plastic Containers (4)
Thermometers (4)
Ice (large bag)
Timer or Wall Clock

Strategy:

1. Begin the lesson with a review of the definition of hibernation and cold and warm-blooded animals.
2. In groups of 4's, give each group one goldfish in a plastic container with room temperature water from fish tank, one thermometer, crushed ice and a chart.
3. Give each person in the group a job. (a timer, a counter, a reader, or a recorder)
4. Begin the investigation by taking the temperature reading and water operculum count of the control goldfish (20 seconds). Put findings on blackboard.
5. In group, take reading of the water temperature and a 20 second operculum count. Record on chart. (Remember to multiply by 3 to equal a minute).
6. Add a small amount of ice, wait 3 minutes, and take temperature of water and a 20 second operculum count. Observe and record.
7. Add another small amount of ice (use the same amount as used in step 6 above), wait 3 minutes and record the temperature. Take a 20 second operculum count and record on chart. Observe.
8. Continue adding ice in small amounts, recording temperature every 3 minutes until operculum is 0. Observe.
9. When operculum count hits zero, place goldfish in a warmer place and observe reaction. Remove any remaining ice and add some room temperature water. Observe.

Performance Assessment:

Students should be able to take accurate readings of the temperature of water. After a discussion of hibernation, students will predict what will happen to the operculum counts when the temperature of water is lowered. Throughout the investigation students will communicate, observe, measure, interpret, and record data correctly. Students will also write a brief description of what was observed during the investigation.

Multicultural Aspect:

Many kinds of fish live all over the world. They live in all climates on land and at all levels of the ocean. These fish develop bodies and ways of life that suit their particular region. People of all cultures use, observe, and enjoy many kinds of fish.

Return to Biology Index

What Can You Learn From A Mealworm?

Jessie Rucker
124 Hudson Court
Naperville, Il. 60565
708-961-5635

Curie High School
4959 S. Archer Avenue
Chicago, Il. 60632
312-535-2141

Objective:

To practice collecting metric data using mealworms.

Materials needed:

A Balance, 5x7 index card, mealworms, 2 rulers and graph paper.

Strategy:

Begin the lesson by discussing the metric system. It is a decimal system scaled on the powers of 10. Pick up a metric ruler and look carefully at the scale. You will see many little lines and every so often a much longer line marked with a number. The longer lines are centimeter (cm) marks and the shorter lines are one tenth of a centimeter (0.1) or millimeter marks.

Answer the following questions:
1. Using your metric ruler, draw a line that is 8 centimeters long. Put a small mark on the line for each centimeter length.
2. Draw a line that is 8 millimeters long.
3. What do you notice about the relationship between the lengths of these lines?
4. Measure the length of the following line: ___________.
   length = _______mm and length = ________cm.

After the students understand how to determine metric units, have them measure the length of the mealworm (anterior to posterior) in cm. Using a balance, weigh the worm. Record the data in table form on the blackboard.

Example: Name Length Weight Race I Race II Race III Avg.

Set up a racing card in the following manner:
A. Construct a track 1 cm. wide and 10 cm. long in the center of the 5x7 card.
B. Place two rulers on either side of the track to restrict movement of the mealworm.
C. Record the time it takes the worm to reach the finish line at the end of the track. Race the worms three times and then determine the average time. RECORD THE TIME IN SECONDS!
D. Record your results on the blackboard.
E. Using the data collected, graph the weight of the mealworms and the timings of the mealworms.

Questions:

A. What are mealworms? Where are they found?
B. Which worm was the fastest? Slowest?
C. Was there a relationship between weight or length and speed?
D. What is the difference between a spider and an insect?

[Return to Biology Index]

Animal Life Histories Derived From Morphology

Charles Buzek
3338 Park Ave
Brookfield, Ill. 60513
708-485-0209

Spry Elementary School
2400 S. Marshall
Chicago, Ill. 60623
312-542-3700

Objective:

These objectives apply to intermediate level students, specifically 6th grade.

Students will begin to learn the mechanisms of natural selection by deducing information from the physical appearance of the animal.

The format will help to develop reasoning skills.

Students will learn and use information concerning adaptation and habitats.

The class will gain experience in the formation of theories.

Materials needed:

Hand-out sheet showing the earth's biomes.

Hand-out sheet showing various examples of hares and rabbits.

Three exhibit cases from the Field Museum.

Strategy:

Students were introduced to the variety of the earth's biomes, i.e. tundra, taiga, deciduous forest, grassland, desert, rain forest, fresh water and salt water. These areas form habitats wherein can be found animals and plants which have survived because they possess qualities which enable them to adapt to that specific area. As an example, the students are told about a fictitious former student who always preferred to sit in the back of the room even though he had poor vision. The student would have to adapt to his situation by obtaining glasses or fail (not survive).

Students then receive the hand-out concerning the rabbit and hare. We discuss the variety of the animals and differences they show and their habitats, e.g. rabbits with the longest ears are found in desert regions; heat loss controlled through the ears. We focus on the snow-shoe rabbit in order to discuss the useful adaptation that provides the animal with a white coat during the winter. The class then proceeds to make judgments about the animal's food on the basis of the dentition. This leads to a determination of whether the animal is a predator or prey. As the latter, is decided students next theorize as to the rabbit's natural enemies and its ability to escape or defend itself from them. These hypotheses derive directly from the size and shape of the animal. In the last segment of this part of the lesson, the class will be shown the habitat box for the purpose of providing direct corroboration of their theories.

The second part of the lesson utilizes another habitat box from the Field Museum. Students are allowed to examine the animal which is placed in a natural setting. They are asked to describe this setting and name it in terms of the earth's biomes. Then the class begins to construct a natural history using the techniques shown above. Information is listed on the board as it is submitted by the students. At the end of this segment of the lesson students should have identified a habitat with possible alternatives, food, locomotion, characteristics, i.e. aggressive or passive, birthrate, adaptability. **No ideas are wrong, all are included in the list.**

For the concluding part of the lesson, the class will participate in a game which will also allow the instructor to evaluate student comprehension. The class will be allowed to ask four questions relative to where the animal lives, what it eats, type of dwelling, locomotion and then they will be asked to draw a simple schematic diagram of what they think the animal looks like using circles and ellipses. At this time the instructor may give his own "helpful hint" and then bring out the third of the habitat boxes. Students will be able to immediately reinforce or correct their judgments at this time.

Conclusions:

This lesson ideally provides the student with the opportunity to develop his reasoning skills while learning more about the life histories of animals which may not be very familiar to him. The approach is phenomenological since the actual animals are utilized. The students are not only involved in determining specific information they also get involved in using these techniques to hypothesize the shape of an undetermined animal in a game situation. Thus the approach moves away from the standard textbook situation to one wherein the student is actually using tools utilized by zoologists in the laboratory.

References:

Habitat boxes are available through the Field Museum. Call 922-9410 any week-day and ask for the Harris Extension.

Return to Biology Index

Marine Life: Whales

Myrtle Guice
9317 South Prairie Ave.
Chicago, Il. 60619

Powell Elementary School
7530 South Shore Drive
Chicago, Il. 60649
312-933-6650

Objective:

Grade Level six.

Students will fill in crossword puzzle utilizing vocabulary generated from the comparing and contrasting of common- and less common-place objects.

To prepare students for a visit to Shedd Aquarium.

Materials Needed:

An orange, sieve, chalkboard, picture file and school librarian.

Recommended Strategies:

Place the catagories "structure, function and behavior" on chalkboard.

Have students describe an orange.

Demonstrate the working of a sieve in order to convey the concept of the term "baleen". Record each characteristic under appropriate catagory. Follow with descriptions of the whale.

Compare and contrast characteristics of the whale and shark.

Give crossword puzzle to students.

Have students work in teams of three's. Specify one as the recorder and one the reader of clues--but all must contribute to solving the puzzle.

Solicit the help of the school librarian in providing as much material on whales as possible for student reference.

Provide pictures, charts and posters for visual clues.

Conclusions:

Students will complete a whale crossword puzzle as a group activity.

Return to Biology Index

Marine Life: Anatomy of a Humpback

Carolyn Hawkins
8925 S Hermitage
Chicago, IL 60620

Adam Clayton Powell Elementary School
7530 South Shore Drive
Chicago, IL 60649
312-933-6650

Objective:

Grade 3

To prepare students to visit Shedd Aquarium.
Students will assemble a picture of a Humpback whale on a grid.

Materials Needed:

Humpback whale puzzle
Humpback whale grid
scissors
glue
chalkboard--colored chalk
posters of whales

Recommended Strategies:

1. Outline the Humpback whale on chalkboard.
2. List the anatomical parts(to be read by students).
3. Have volunteers label and outline each part in different colors.
4. Distribute jigsaw puzzle and grid.
5. Children will cut out the puzzle pieces, match the letter/number key of the pieces with the letter/number coordinates of the grid, assemble whale pieces onto the grid and glue the pieces down to complete the picture.
6. Optional: Color the whale.
   Have students label parts on their whale.

Resources:

Shedd Aquarium gift shop has an excellent selection of books and posters on whales.
A drawing of a Humpback whale can be traced onto a transparency. Using the overhead, project this image onto the chalkboard. The image of the whale can be enlarged to desired size by moving the overhead either forward or backward. You can then outline the enlarged image onto the board.

Return to Biology Index

Classification of an Echinoderm

Dill, Henry
10437 S. Bensley Ave.
Chicago, IL 60617
1-312-731-1130

Kennedy High School
1-312-838-5225

Objective

To understand how the starfish relates to its classification.

Materials

Preserved Echinoderms, spiders, and other invertebrates and vertebrates.
Microscope projector. Overhead projector
Slides for production including the arthropods and echinoderms.
Illustrations of the starfish.
Animals with exoskeletons.
Chart with the family tree of living organisms.

Recommended Strategy

1. Students will observe the changes in forms, behavior, and feeding characteristics.
2. Ask the students, "Why can a starfish regenerate a missing arm?"
3. Students will be given an opportunity to observe the various parts of an echinoderm.
4. Discuss the historical background of a starfish.
5. Explain how the animal obtain its food.
6. Students will be ask to use the microscope to identify different structures of the organism.
7. Students will be asked, "Of what survival value is metamorphosis?". What is metamorphosis?
8. Students will be asked to explain how starfish reproduce.
9. After all students have identified the various parts of a starfish, they will compare the classification of the starfish with other invertebrates.
10. Students will show in which ways the echinoderms are similar to the chordates.

Activities

Students will give three characteristics of each animal, so they can identify the organism. All students will discuss the relationship between the arthropods and echinoderms.

Exercise 1:
Have students view how the echinoderms develop.

Exercise 2:
The students will dissect the dorsal side of the starfish to expose the internal structures.

Evaluation

Have students write an essay entitled: **How Invertebrates Live**. The students will observe the shift in body plan established in lower groups to bilateral symmetry in the larva stage to secondary radial symmetry in the adult stage. The students will compare these characteristics to the insects.

References

Laboratory Guide for the Biology Sciences, Modern Biology, and the Sciences of Biology.

If you want to see this experiment performed, you can come to Kennedy High School. Materials can be obtained at the American Science Center and the starfish, spider, and the centipedes can be obtained from Ward's catalog.

Summary

Insects are the most numerous group of animals on earth today. They have survived and flourished by combining a high reproductive rate with thousands of individual adaptations to different environments. The phylum Echinodermata consists of animals in which bilaterally symmetrical larvae undergo metamorphosis into adults with pentaradial symmetry. All echinoderms are marine.

But, Why SEX?

McVeigh, Steve
5468 N. Lawler Ave
Chicago, IL 60630
1-312-736-1941

Dunbar VHS
1-312-567-5437

Objectives

1. To find the importance of sex in the study of continuity of life theme in biology.
2. To show the idea of sex offering genetic variability therefore allowing evolution to proceed at a faster rate when necessary.

Materials

Various sizes/colors of felt cloth - red, blue, yellow
Magnets (if chalk board is steel backed) and if NOT, then use pins, tacks, or strips of Velcro tape
Colored dittos - red and blue will do

Recommended Strategy

Ask students the description of the video Pacman game. Hopefully, they will mention monsters, pacman, power pills, maze, etc. Then develop a "biological" pacman maze by using a 3' by 3' piece of RED colored felt.

This felt becomes the background environment for the felt pacman shapes that can stick to it.

Then describe the two pacman types. Each pactype has two traits: eye and skin color. One pactype has red colored eyes and blue skin, the other has blue eye color and red skin.

Arbitrarily decide that blue eye will have superior vision compared to red eye. Superior referring to how they can see the power pills/monsters better than red eyes. Have the students explain why red skin is superior to blue skin color. The idea is that red skin is camouflaged by the RED (maze) environment.

Review, if necessary, the idea of genetic information being duplicated and the products of this duplication are allocated approximately to the daughter cells so that each receives only one copy of each message.

Activities

1. Have a yellow circle of felt as a nucleus placed within the pacman. Then have two felt chromosomes of different shapes and colors to represent the two traits and the alleles for that trait. Ask the students what would happen to the chromosomes, if to reproduce, the pacman will undergo binary fission. Use smaller felt pacmen for the daughter cells formed. Do this reproduction for both pactypes.

2. Ask what traits would "Super Pacman" have, and what process would allow two monoploid pactypes to produce an offspring with both beneficial characteristics, i.e., superior vision and camouflage in the environment. Point out importance of sexual reproduction in offering genetic variability.

3. Using colored ditto masters make an activity sheet that the student can mark in the traits, chromosomes, and offspring pactypes, for both asexual & sexual reproduction. However, this time have a BLUE maze environment, and let red eye be superior to blue eye.

(Note: in any of the above activities, students can come to the felt maze and move the pactypes and their offspring)

Owl Pellets

Robles, M. Elena
1808 W. Farwell 3A
Chicago, IL 60613
1-312-434-1266

Kenwood Academy
5015 S. Blackstone
Chicago, Il. 60615
1-312-536-8850

Objective

1. Discover and mount the contents of an owl pellet.
2. Relate the owls' eating habits with other animals (snake, cow, human).
3. Relate the contents of the owl pellet to the human skeletal system.
4. Discuss the food web, population control.

Materials (per lab group)

- owl pellets
- 3 dixie cups or beaker
- scissors
- hydrogen peroxide(optional)
- paper (white)
- water
- glue
- precut cardboard template
- bleach (diluted)
- various skeleton models
- metric ruler
- overhead projector
- forceps or toothpicks
- holepuncher
- handouts
  - a. bone sorting chart
  - b. skeletal mounting
  - c. bone identification
  - d. procedure
  - e. homework
  - f. key of skulls
- placemat (tray or paper)
- 1 liter bottle
- plastic owl

Procedure

Soak 1 liter bottle in hot water to remove label and base (this can be done at home). Cut bottle just below neck so that it fits snugly inverted in the base. Test cardboard for proper fit inside the bottle. Place owl pellet on the placemat. Gently separate bones from fur (soak in hydrogen peroxide for one minute if pellet is too dry). Place bones on bone sorting chart (make sure you have double of each bone, and one skull). Get teacher's approval. Soak bones in diluted bleach to clean and whiten the bones (soak only three minutes). Get skeleton layout sheet. Arrange bones on layout sheet. Get teacher's approval. Transfer bone layout onto cardboard. Get teacher's approval. Glue bones to cardboard. Use holepuncher to get circles for labeling of bones. Glue labels to cardboard near bones. Cut white paper to fit backside of cardboard (to be used as key for display). Make key for bone display using the bone identification handout. Glue key to cardboard. Place completed bone display into inverted 1 liter bottle which rests on the original bottle base. Hand in for grading.

Recommended Strategy

Begin the lesson by talking about the owl characteristics and its habits. Pass out the owl pellets and discuss the physical characteristics of the pellet. The students will be asked to measure their pellet and data will then be compared. Have the students gently pull apart the pellet. Students will share discovered contents from the owl pellet with the class, through a visual display on the overhead projector. By comparing the number and types of skulls found in each pellet the class will follow into a discussion on the food web and population control. The students will be able to identify their specimen by measuring and using the "key of skulls" handout. Continue the owl pellet project by following the above procedure.

NOTE: This project may take five to seven classes to complete.

SOURCES:
a. Mark Wagner, Kenwood Academy
b. Creative Dimensions
P.O.Box 1393
Bellingham, Washington 98227

OWL PELLET OBSERVATION

1. MEASURE THE OWL PELLET (IN MILLIMETERS)
   a.LENGTH OF THE PELLET ___________mm
   b.DIAMETER OF THE PELLET _________mm

2. IDENTIFY AT LEAST THREE PHYSICAL CHARACTERISTICS OF THE PELLETS - SMELL, COLOR, TEXTURE, ETC.
   1.
   2.
   3.

3. WHAT DO YOU THINK IS INSIDE OF THE PELLET?

4. IN WHICH PART OF THE OWL DOES THE PELLET FORM?

5. WHY DOES THIS PELLET FORM?

6. AFTER OPENING THE OWL PELLET WHAT INFORMATION WAS ATTAINED?

7. WRITE DOWN ONE QUESTION THAT YOU WOULD LIKE ANSWERED BY THE END OF THE OWL PROJECT.

Return to Biology Index

Animals and Their Coverings

Sorensen, Beverly
3116 W. Belden
Chicago, IL 60647

Darwin School
1-312-292-5111

Objective

To review and recall information about invertebrates and vertebrates, cold-blooded and warm-blooded animals and their coverings.

Equipment and Materials

Pictures of animals with an answer sheet
Invertebrates and vertebrates (live, preserved or models, and coverings of animals such as scales, shells, feathers and fur)
Overhead projector with selected pictures of invertebrates and vertebrates to project

Recommended Strategies

1. Show a display of various animals and animal coverings allowing the students to observe as well as handle the material as they come into class.
2. Review cold-blooded and warm-blooded animals - what does cold-blooded mean? Have a student write the meaning on the board. Do the same for warm-blooded. Hold up a frog, a salamander, and a fish, while at the same time asking the class whether they are cold-blooded or warm-blooded. Discuss humans as warm-blooded animals. Re-read the definitions from the board.
3. Review invertebrates and vertebrates by tracing the backbones of skeletons of man, a frog, a snake, a giraffe, a bird, and a fish, while each of these objects is being projected on the overhead projector.
4. Show preserved animals such as crayfish, grasshopper, starfish; also pictures and/or skeleton of a horse, a polar bear, a snake or a giraffe. Have the students determine which of these animals are invertebtates and vertebrates.
5. Discuss animal coverings - have the students obtain animal coverings from the display. Ask: In what way does the animal use this particular covering? Of what is the animal covering made? (Suggested type of coverings - fur, feather, scale, smooth, spiny, hard or soft.)
6. Play a game using pictures of animals and answer sheets. Each station will have a picture of an animal, with a number on the back of each picture and an answer sheet. Students will have a time limit in which which to answer the questions, follow the directions and move to the next station.

Procedure: The leader explains the movement from station to station. Pupils will note the number, turn the picture over and answer letters A, B, C on the answer sheet. After 30 seconds the leader will call stop, the students place the picture face down and move to the right to the next station. At the signal to start the students begin answering the same questions for the next picture. This will continue until the students have completed all the pictures. Questions on each answer sheet for each number:

A. Is the animal cold-blooded or warm-blooded? Write C or W
B. Is the animal an invertebrate or a vertebrate? Write I or V

C. What is the type of body covering of the animal (fur, feather, scale, smooth, spiny, hard or soft)?

Use a transparency on the overhead projector to discuss the answers. After the students have corrected their answer sheets:

A. Search the answers to find and note the animals with fur and the animals with feathers.
B. Ask: Are any of these animals warm-blooded? What does warm-blooded mean? Anticipated answer: The body temperature stays more or less the same no matter how hot or cold the outside temperature.
C. Search the answer sheets and find all the invertebrates. Discuss: Are all of these animals warm-blooded or cold-blooded? Anticipated answer: all invertebrates are cold-blooded. Review the meaning of cold-blooded. Anticipated answer: cold-blooded animals take on the temperature of their environment.

Optional Activities

Do the following exercise using a 5 x 8 inch envelope made from cheesecloth and filled with feathers, a bucket of ice and your hands:

1. Hold the envelope with the feathers on your hand, and at the same time insert both into the bucket of ice. Note: be sure the feathers are between your hand and the ice!
2. Insert your hand in the ice bucket without the ice. Did the feathers keep your hand from getting cold? Discuss how the feathers of birds are used as insulation against the cold. Do the the same exercise using fur.

How do you think these types of coverings effect the body temperature of warm-blooded animals? Do warm-blooded animals need extra protection for cold weather?

Discuss: Animals grow extra thick fur in the winter and shed their fur in the summer. Birds molt or lose their feathers in the summer and fluff their feathers in the winter to keep their body temperature even. Humans wear layers of clothing in the winter to keep their body temperature even.

Animal Behavior

Turner, Homer D.
7713 S. Clyde Ave.
Chicago, IL 60649
1-312-734-1967

Hubbard High School
6200 S. Hamlin
Chicago, IL 60629
1-312-838-5100

Objectives

1) Students will observe stimulus-response behavior.
2) Demonstrate the use of the scientific method.
3) To distinguish between learned behavior versus innate (inborn) behavior.

Equipment and Materials

Leeches	Flashlight
Crayfish	Beral Pipettes
Earthworms	Thermometer
Ice and Water	Batteries and Wire
Liver	Forceps
Sugar	Trays
Vinegar	Box and cardboard

Recommended Strategies

Demonstrate stimulus-response actions from your class by the firing of a toy cap gun. Discuss student reactions to the stimulus by questioning what has happened. Discuss stimulus-response in terms of human behavior. What types of behavior do humans have? What causes us to behave in a certain way? Are we all born with the same behavior? Distinguish between the types of behavior, learned and innate (inborn). List examples of each type, with the class submitting answers.

Concentration will be on the stimulus-response actions of lower animal forms. Introduce the leech and the crayfish to the class as the specimens for this activity.

Introduce the stimuli to be used for the activity. Liver, weak acid (vinegar), and sugar water will be used for chemical stimuli. Battery and wire will be used for slight electrical stimulus. Cardboard box and flashlight will be used to test light-darkness stimulus. Use a section of cardboard for gravity stimulus. Crushed ice, warm water, and a thermometer will be used for change in temperature stimulus.

Students will make up and perform their own strategies with the materials provided by using the scientific method. Review the scientific method.

A. Define the Problem- What is our task for today?
B. Collect Information- Where can we get info. on specimens?
C. Form Hypothesis- What do you think will happen?
D. Experimental Procedures- Be specific as possible and very careful.
E. Observe and Record Data- Be very specific.
F. Conclusions- What do you think happened?

Separate class into groups. Each group will have three students. From each group there will be a speaker, recorder, and materials taken. A particular stimulus will be assigned to each group. Review stimulus with each group and reiterate, we are concerned with stimulus-response actions.

Discussion of methods used and conclusions drawn by each group. Assignment will be handed in as a group activity. Cooperative groupwork is essential.

Groups will exchange assignments during next class period and perform their own strategies to a different stimulus while comparing with another group's strategies.

For homework, groups will makeup their own follow-up questions and answer them as a group.

Return to Biology Index

Classification of an invertebrate:Sponge

Giles, Carol
1313 S. Sacramento Blvd
Chgo, IL 60623
Collins High School
542-4300

Objectives:

To become familiar with primitive animals.

Materials:

A. Sample sponges-two authentic sponges, one synthetic sponge, a large rock, a rubber band, a fish-like tank container (one gallon).

B. A picture of a knight in armor.

C. Dissecting microscope, dissecting needles, scalpel or single edge razor blade, sponge; Grantia.

D.)Discovery Center-microprojector, spicules slides, a poster displaying the geological time periods, a plant, a horny sponge, loofah illustrating five types of sponges, a picture of a finger sponge & a jellyfish.

Recommended Strategy:

1. Show the students a model of a knight in armor.

2. Ask the students, "What did the knight in armor use to insulate his armor?" (expected response: sponge)

3. Show the students a synthetic sponge and an authentic one. Ask students which of the sponges were used to insulate the knight's armor (expected response: the authentic sponge). Inform the students that the synthetic sponge wasn't manufactured until 1936.

4. State some historical background about the sponge. Include various naturalist, zoologist & biologist points of view. Discuss the uses of sponges.

5. Show the students an authentic sponge. Ask the students, "What do you see?" (expected response: holes, pores). Explain to the students that these pores caused the biologist to assign the animal to the phylum Porifera (pore bearing).

6. Show the students a container filled with water. Insert a sponge attached to a rock by a rubber band. Ask the students, "Can the sponge move?" (expected response: No. It's sessile). Then ask,

"What does the rock represent?" (expected response: a substrate).

7. Ask the student how he/she thinks the sponge obtains its food. (expected response:water).

8. Activity 1:
Pass out a handout depicting how the sponge feeds.
Discuss the handout in detail. (Use an overhead projector to illustrate this activity.)

9. Activity 2:
Laboratory exercise. The lab consists of students viewing the sponge, Grantia, under a dissecting microscope. In addition, the student will answer eleven questions.

l0. Activity 3:
After the students have completed the laboratory exercise, instruct them to view six exhibits & answer the questions in the Discovery Center.

Evaluation:

Have the students compare the observable characteristics of a sponge to the jellyfish.

Students will write a short essay entitled **Why Study The Sponge?**

References:

Send a self- addressed stamped envelope to Carol Giles Box l392 Chgo, Il 60690

Return to Biology Index

The Acetate Animal Hunt

Carter, Linda
812 West Junior Terrace
Chicago, Illinois 60613
[312] 327-0598

DuSable High School
536-8600

Objective:

Students should be able to determine which variations (adaptations) would allow an organism to survive and reproduce in a certain environment.

Apparatus needed:

25 clear acetate discs
25 yellow acetate discs
25 red acetate discs
25 blue acetate discs
Discs should be about 1 cm in diameter.

Recommended strategy:

This activity uses acetate discs of different colors to determine which variations may help an organism to survive in a given environment.
Use the entire floor area of the classroom as a habitat for a population of acetate "animals." These "animals" are all of the same species. The variation in the color of the discs representing the "animals" is due to different genetic inheritance. The following are the genotypes for each "animal."

COLOR	GENOTYPE
clear	ccrr
red	ccRR
blue	CcRr
yellow	CCrr

Each individual in the class will act as a predator searching for food. The prey will be the acetate animals. They will be given 2 minutes to search the area for "food." Collect as many acetate animals as possible. When the time is up, reassemble and count the total number of acetate discs found by all members of the class. Chart your findings for each color disc. List number originally used, number found, number left on floor,and frequency of genes left. Students may prepare a bar graph indicating the frequency of color genes remaining in the acetate population. Determine gene frequency by dividing the total number of each color organism by the number of surviving organisms. Then multiply by 100 to find the percentage.

Evaluation:

1. Which animals were most difficult to find? Explain.
2. Explain which acetate animals were the most fit?
3. Which were the most poorly adapted? Why?
4. What will eventually happen to genes of the most poorly adapted animals?
5. As far as the predators (you) are concerned, which of you will live and which of you will die?
6. List several factors that make the predators better adapted for hunting.

Summary:

1. What does it mean for an organism to be adapted to its environment?
2. Explain the concept of "survival of the fittest."
3. Give the students several scenes in which they must determine which organisms within a population would most likely survive if their environment was to change. Have them explain why. Example: Imagine a population of species of giraffe living on an African plain for hundreds of years. Assume that the variation in this species is such that neck length ranges from short to very long. Most individuals have average-length necks, but some have short necks and some have very long necks. Assuming that this population of giraffes has been at genetic equilibrium for centuries, what would happen if another species, such as leaf-eating deer, entered the area? Would the species of giraffes change?

NOTE: This paper has been modified from the original by the SMILE Staff.

Return to Biology Index

Reconstructing A Fossil Pterosaur

Elder, Nathan R.
9207 South Merrill Avenue
Chicago, Illinois 60617-3943

Farragut Career Academy
762-2421

Objectives:

1. Reconstruct the skeleton of Scaphognathus crassirostis.
2. Make inferences about the mode of locomotion, feeding habits, and adaptations of Scaphognathus crassirostis.

Apparatus needed:

l. Scissors
2. Transparent tape
3. Metric ruler

Instructional strategy:

1. Introduce the Animal Kingdom-Birds, Evolution, Habitats, and characteristics Worksheet.
2. Discuss the Geologic Calendar Worksheet.
3. Discuss Early History, Paleozoic: Life Leaves the Sea. Pass out fossils showing stems.
4. Discuss Early History, Mesozoic: Mammals Emerge, Reptiles Reign:
   - Amphibian Modern Skeleton
   - Reptilian Modern Skeleton
   - Aves Modern Skeleton
   - Mammalian Modern Skeleton

Recommended strategy:

1. Phenomenological approach - pass out envelopes containing bones of Scaphognathus crassirostis.
2. Direct students to assemble the skeleton in twenty minutes.

Review Questions:

1. What is the main function of the bones that make up Scaphognathus crassirostis's little finger?
2. List three features of S. crassirostis's skeleton that the animal was adapted to flying.
3. The fossil of S. crassirostis was found in limestone that formed in a warm sea-water lagoon. What could you infer were the feeding habits and food of this animal?
4. S. crassirostis's wings were made of a delicate flap of skin. If this flap of skin tore, the animal could not fly. Use this information to explain how S. crassirostis might have had trouble competing with bird species living during the Mesozoic Era.
5. Explain how the protruding fingers of the middle of the wing might have been used to clutch the edges of the cliffs from which the Pterosaur glided.

6. Explain how once a scientist has reconstructed a skeleton, the scientists can use this and other information to infer the appearance and habitat of the animal, since such a picture or model is called a RESTORATION.

Return to Biology Index

How and Why Chameleons Change Colors

Ross, Shirley Neil School
14422 S. Green St.
Harvey, IL 60426

Objectives:

Given a chameleon, the students will observe the color changes and explain the possible conditions that cause this reptile to change colors.

Given a chameleon, the students will discuss the biological factors that cause color changes.

Given a chameleon, the students will note the amount of time needed in order for changes in the pigmentary system to become apparent.

Apparatus needed:

4 chameleons
16 pieces of felt (4 pieces of beige, black, green, and yellow)
4 flashlights
4 crickets
4 plastic boxes
4 brown paper bags

Recommended strategy:

Divide the class into four groups. Remove each chameleon from a paper bag. Note the chameleon's color at this time. The students will place the chameleons on varying colors of cloth. Note each color change and time needed for this color change to take place. Next, each group will shine a flashlight on the chameleon. Again, note the color change and time needed for this change. Now, place each chameleon and a cricket in a plastic box. Watch for a color change and the time. The students should notice that all of these factors could cause a color change. However, the most influencing factor is light. Explain to the students that the chameleon's ability to change color is controlled by hormones. These hormones act on various pigments in the skin. Special cells called chromatophores in the skin allow the chameleon to change colors. You might also want to discuss the meaning of the words "pigments" and "chromatophores".

Biology/Chemistry

Let It Grow

Virginia T. O'Brien
2540 W. 109th Place
CHICAGO IL 60655
(773) 779-7109

Higgins Community Academy
11710 S. Morgan Avenue
CHICAGO IL 60643
(773) 535-5625

Objective(s):

These activities are designed for students in grade three. Students will identify the parts of a corn seed and a bean seed and understand their functions. Students will identify the parts of the plants that they have grown and understand their functions. Students will be able to compare characteristics of monocots and dicots. Students will identify the parts of a perfect flower and understand the process of seed formation.

Materials:

Gallon size zip lock baggies (one per child), paper towels, nametags, corn seeds, bean seeds, spray water bottles, staplers, scotch tape, corn and any kind of bean seeds soaked in water for 24 hours, peanuts. newspaper, magnifying glasses, hand held microscopes (optional), gladiolas (one per child), straight pins, samples of tomato and bean plant cuttings showing the flower and the early developing fruit, straight pins.

Strategy:

The first activity will be done two weeks prior to the other activities. Each child will receive one large baggie, one paper towel, one nametag, two bean seeds and two corn seeds. Children will fit the paper towel into the baggie and then place the nametags at the top outside of the baggie. Then they will place four staples through the baggie evenly spaced about 1½ inches from the bottom , horizontal to the top of the baggie. Next they will place each of their four seeds inside the baggie on top of a staple. Then they will spray water into the baggies, wetting the paper towels and seeds. Most of the air will be pushed from the baggies and they will be sealed. They will be taped to the window and observed regarding the germination and growth of roots, stems and leaves for the next few weeks. A journal can be kept with pictures of daily growth and measurements can be recorded and graphed.

The second activity is as follows. The children will be given a piece of newspaper, a magnifying glass, and a soaked bean and kernal of corn. Peeling the seed coat from the bean seed they will observe the seed's two parts and find the embryo inside using the magnifying glasses. Removing the seed coat from the corn is more difficult, but children will observe that the corn seed does not split into two parts. The corn embryo will be located and the terms monocot and dicot will be introduced. Have children take apart a peanut and identify it as a monocot or dicot. Have the children examine the seedlings in their baggies and look for other differences between monocots and dicots, for example parallel and netted veins in leaves. Have them draw pictures of corn and bean seeds and corn and bean seedlings and label parts. Have children use hand held microscopes to examine seedlings to find root hairs and stomates and draw what they find.

The third activity is as follows. Children will observe tomato and bean plant cuttings with flowers and the beginnings of fruit formation present. Pollination and the basic parts of a flower involved in seed formation, and the functions of each will be discussed. E ach child will be given a gladiola or some other perfect flower and a straight pin. The children will first remove the sepal and the petals and look for pollen on the inside of the petals. The male parts (the stamens) will be removed next, noting the pollen on their tips. The female part (the pistil) will be identified and it's tip felt for stickiness or moisture. Using a straight pin, the ovary will be split open at the base of the pistil and the ovules located. All flower parts will be examined using magnifying glasses and hand held microscopes.

Performance Assessment:

Journaling, including student generated drawings and oral and written observations, will be evaluated. Specific parts to be assessed are seed, plant and flower parts and their functions.

Conclusions:

Students will understand reproduction in flowering plants and with this knowledge will be ready to compare and contrast them to non-flowering plants.

Biology/Chemistry

Which Sex is it?

Pamela Moy
547 South Clark #1101
CHICAGO IL 60605

Morgan Park High School
1744 West Pryor
CHICAGO IL 60643
773-535-2550

Objective(s):

This lesson is designed for freshman level biology, but it is easily adaptable for lower grades.

Students will be able to identify the parts of a flower.

Students will be able to distinguish between a perfect and imperfect flower.

Students will improve coordination and dexterity.

Materials:

Flowers (preferably ones with both male and female sex organs)

Tweezers

Paper

Scotch tape

Scalpel if desired

-

Strategy:

This may be used as a culminating activity or as an introductory activity. Have students obtain a flower, tweezers, tape and scalpel if desired. Students will remove the parts of the flower (petal, sepal, stamen, pistil or carpel) and tape the parts to a sheet of paper. Students will then label each part and the parts of the stamen and the pistil or carpel.

Performance Assessment:

Students will turn in the paper they just finished taping and labeling. This assignment can be an easy and fast assessment.

Conclusions:

Students should, when complete, be able to identify the parts of a flower and tell whether or not the flower has both male and female sex organs (perfect) or just one sex organ (imperfect).

References:

Any freshman biology text will aid in identification of parts.

Biology/Chemistry

Fun Activities Using Seeds

Imara Abdullah
P.O. Box 19182
CHICAGO IL 60619

Douglas Academy
3200 South Calumet
CHICAGO IL 60619
(773) 534-9263

Objective(s):

This lesson is designed to teach second grade students that seeds come in different sizes, shapes and forms. The students will be able to identify the parts of a seed and their functions in germination.

Materials:

Activity One	Activity Two	Activity Three	Activity Four
Fresh fruits and	Lima, garbanzo,	dry pinto beans	seeds soaked in
Vegetables, handy	black, pinto,	wet pinto beans	water over night
wipes, paper	kidney beans	that have soaked	hand lens
Towels, Baggies,	black-eyed peas	in water over	magnifying glass
Construction paper	small stuffed animal	night, centimeter	paper
Scotch tape	balance scale	ruler, gram and	
Popsicle sticks	graph paper	ounce scale	

-

Strategy:

Activity One

Give student's pre-cut fruits and vegetables. Ask students to remove the seeds of the fruits and vegetables. Use Popsicle sticks to help remove and gather seeds. Put outer portions of fruits and vegetables in Baggies. (Save for compost). Tape the seeds to construction paper labeling the seeds by name. Discuss different sizes, and forms of seeds from fruits and vegetables.

Activity Two

Mix Lima, garbanzo, black, pinto, kidney beans and black-eyed peas together. Give student a portion of the mixture. Ask students to sort the beans noticing their sizes, shapes and colors. Pass around a small stuffed animal. Ask students to guess how many lima beans would weight the same amount as the stuffed animal. Record their estimate for lima beans. Do the same (ask how many beans would weigh the same as the stuffed animal) for all of the beans and record their estimates. Use balance scale to determine the number of beans of each variety that equal the weight of the stuffed animal.

Record the actual amounts and make a graph with data.

Activity Three

Give students dry pinto beans and pinto beans that have been soaked over night. Ask students to weigh and measure dry and wet beans. Compare size and shape of wet and dry beans.

Activity Four

Give students pinto beans that have been soaked over night. Ask students to remove seed coat and open the seed. Use hand lens or magnifying glass to identify the little plant (embryo) inside of the seed. Discuss the parts of a seed and their function. Draw and label the seed and its parts including seed coat, food storage, little plant (embryo).

Performance Assessment:

Rate performance on a scale of one to four according to level of participation (rubric).

Level one -- inattention. Student was off task. Student cannot answer questions about seeds.

Level two -- attention. Student stayed on task. Students can answer "key" questions:" Do all seeds look alike? What are the parts of a seed? How are the parts used when the seed sprouts (germinates)?

Level three -- good attention. The student stayed on task and asks questions about the activities and topic. The student can answer "key" questions.

Level four -- excellent attention. They student stayed on task and asked questions and suggested other activities and ideas about seeds. The student can answer key questions and give statement describing the sequence of a seed sprouting (germinating).

Conclusions:

In activity one, the students removed seeds from a variety of fresh fruits and vegetables and taped those seeds to construction paper. The students discussed different sizes, forms and colors of seeds.

In activity two the students sorted different kinds of bean seeds and compared their weights to a stuffed animal. In activity three the students compared, weighed and measured wet and dry pinto beans. In activity four the students observed the parts of seed using a hand lens and named the part of a seed discussing the sequence of sprouting (germination) and the function of the parts in sprouting.

Biology/Chemistry

Data-gathering Activities Relating to Trees in Their Environment

Charles Buzek
35 S. Kensington
LaGrange IL 60525

John Spry School
2400 S. Marshall
Chicago IL 60657
(773) 535-1400

Objective(s):

Upper grade elementary students will be able to determine heights of trees and their ages. A canopy map will indicate optimal growing areas for the tree.

Materials Needed:

measuring tape, pencils, quadrant (bolt, string, cardboard)

Strategy:

The quadrant consists of a cardboard rectangle large enough to copy 90 degrees from a standard protractor and provide room for a rolled-up siting tube. When the student can line up the top of the tree through the siting tube while maintaining a 45^{O} angle, his distance from the tree is equal to the height of the tree. A less accurate but simpler method for determining tree height is to move back from a tree holding out a pencil until the tree is congruent with the pencil-making sure that the base of the pencil remains on the base of the tree-allow the top of the pencil to drop until the student can line it up with some object on the ground. A companion can then pace out the distance from the tree to the object sighted and thus determine the approximate tree height.

The age of the tree can be approximated by using the measuring tape to obtain the girth of the trunk at a point five feet above the base of the tree. This number is basically the age of the tree but bear in mind that this method does not work on saplings. Where possible the use of the tree-ring method on a cut tree could provide verification for the accuracy of this activity

Students should realize that the tree canopy does not radiate equally from the trunk of the tree. This can be demonstrated by making a map of the canopy. Students will select a tree, locate the eight cardinal points, and then proceed to pace out from the trunk in the eight directions until they are beneath the edge of the tree. This data will serve to allow the student to graph the entire canopy and show its relation to the trunk. Once the canopy has been diagrammed the student should enter into the data any external factors which may contribute to the characteristics he/she has plotted. These factors may be position of the sun or the location of other trees.

Performance Assessment:

Each team will collect data relative to their particular tree. By itself this information is relatively meaningless. But at the end of the individual information gathering stage the teams will submit their data to the instructor who will have designed a question for which analysis of the data will provide an answer. This answer will be provided by the team in the form of a short paragraph which develops their analysis of the data.

Investigating the Structure of the Flower

Charles Buzek
35 S. Kensington
La Grange IL 60525
(708) 482-0024

John Spry School
2300 S. Marshall
Chicago IL 60623
(773) 534-1400

Objectives:

The student will learn the basic anatomy of a flower by means of creating a model.
The student will understand the proportional relationships of the various parts illustrated.
The student will understand the value of modeling for learning purposes.

Materials Needed:

Two sticks of clay
Toothpicks
Two sheets of construction paper-red and green

Strategy:

Though flowers come in many varieties there are types that have both male and female sex organs on the same flower. These types are called perfect flowers. We can construct a model of a perfect flower with the above-mentioned materials. We start with a stick of clay which we use to fashion the stem. The stem will need to support the flower itself and will therefore need to be strong enough to support the structure. So don't stint on the amount of clay, use the entire stick to make the stem. Once done we need to cut out the sepals from the green paper. The sepals were the bud cover while the flower was developing. When the flower opened the sepals are pushed back and begin to shrink since they no longer function as part of the living flower. The sepals should be no larger than one-fourth the size that the petals will be for your model. Start by drawing a circle the size of the stem, this will be cut-out later. Around this circle draw a four-pointed star. This forms the sepals and when the circle is cut out it will fit over the top of the clay stem. Push the sepals down about one-half inch on the stem.

Now cut out from the red sheet the figure which will represent the petals of your flower. Again, as mentioned above, the petals need to be larger than the sepals. The ratio should be about 4 to 1. The petals serve as a type of container for the sexual organs of the plant, attractant of insects, and landing strip for the insects. The number of petals is specific for each floral genus so you are free to decide how many petals you want. As in the case of the sepals you must start with a circle the size of the stem. Once the petals are cut out, followed by the circle, fit them over the stem so that they rest on top of the sepals leaving a knob of clay.

The knob of clay will serve as a platform for the structures that we will now fashion. These structures are the stamen and the pistil. Beginning with the latter we will knead the clay into a shape that resembles a bowling pin. Since we are emphasizing these features they may be slightly exaggerated in size. Thus the pistil may be the size of your petals. The shape of the pistil is a case of form following function. The top portion of the structure is a landing platform for pollen. The enlarged base contains the ovules that sperm from the pollen will eventually fertilize.

Since nature usually prefers to avoid self-pollination the next structure, the stamen, should be modeled smaller in size than the pistil. It consists of the anther, which is the production site of the pollen, and its support, the filament. The latter is made with a toothpick, though for large-scaled models a drinking straw may be used. The anther should be a third to half the size of the filament. Its shape is much like an elongated kidney bean. The stamen should be grouped around the pistil, a suggested number could be six.

Performance Assessment:

Any type of modeling activity requires a high degree of concentration and a considerable return on the effort is a reasonable expectation. Consequently students can be tested on their acquired knowledge by having them make a drawing of a flower based entirely on memory. The drawing should be correctly labelled. One might give a possible number of five quality points based on their drawing and nine points for the flower parts for a total of fourteen points.

Transportation in Plants

Matthew Gibson
500 Kungs Way
Joliet IL 60435
(815) 744-9054

Joliet West High School
401 N. Larkin
Joliet IL 60435
(815) 727-6950

Objectives:

This lesson is designed for middle school and high school. The objectives for this lesson are as follows: 1) Students will understand how the forces of adhesion and cohesion and the process of transpiration aid in the transportation of water through the plant. 2) Students will recognize the form and function of stomata.

Materials:

Glass tube (hollow; the smaller the diameter, the better)
Celery Stalks (with leaves; about 10 stalks for every 25 students)
Microscopes, slides, and cover-slips
Food coloring
2 glass containers
Scalpel
Scotch tape
Clear nail polish
Leaves from plants

Strategy:

1) preparation: mix several drops of blue food coloring with water in the glass container. Place the celery stalks in the container 4 days prior to the date the class will be using the celery. After mixing food coloring and water in the second container, insert the glass tube (the water should creep up the tube, but will not reach the top.) Collect leaf samples from around the campus.

2) the lesson:
PART 1: Have the students observe the water in the tube. Ask them why the water is creeping up the glass rod, apparently defying gravity. After discussing how the forces of adhesion and cohesion are responsible for the ascending water, have them compare the celery and the glass tube in terms of how high the water ascended. Students should notice that the water in the celery has risen to the tips of the leaves, while the water in the glass tube is much lower. Then pose the following question: "Why did the water rise so high in the leaves but not in the glass tube?" Following their responses, explain the Adhesion/cohesion/transpiration theory (include how the gradient of water potential moves water from cell to cell to cell to stomata.) Have the students view a thin cross section of celery under the microscope to discover the location of the xylem cells which are stained blue.

PART 2: Paint a small section of the underside of a leaf with clear nail polish. Let it dry completely. When dry, peel the polish off the leaf by pressing scotch tape to it. If done carefully, the polish should stay attached to the tape as you peel it away from the leaf. Affix the tape to a slide and search for the imprint of stomata in the polish (practice this method ahead of time). Once the students can recognize stomata, have them compare how many stomata are located on the underside of the leaf versus the top of the leaf. Relate their findings to solar radiation, transpiration, and the cuticle.

Performance Assessment:

To assess the student's comprehension of the lesson the following quiz would be administered:

1. Explain in detail how the forces of adhesion and cohesion and the process of transpiration aid in the transportation of water through the plant.

2. Predict what would happen to a plant if all of it's stomata became plugged by a substance that prevented the passage of matter into and out of the leaves. Provide an explanation for your prediction.

This quiz would be worth 6 points. The following rubric would be used for awarding points: Question #1 is worth 4 points with 1 point awarded for each of the explanations of adhesion, cohesion, and transpiration. The final point would be awarded for an overall coherent answer. Question #2 is worth 2 points, with 1 point awarded for a reasonable prediction and 1 point for an accurate explanation.

Structure Of A Plant

Sheila Mckinnon
11556 S. Hale
Chicago IL 60643
(773) 239-4178

Sherman School
1OOO S. 52nd Street
Chicago IL 60609
(773) 535-1757

Objectives:

To Investigate How Plants Grow With And Without Seeds. Use scientific methods to perform simple experiments, including asking a question, making predictions, describing a procedure, making observations, collecting data, and drawing conclusions. Follow directions to complete a simple experiment. Gather, report, and compare data from simple experiments. Devise an experiment to measure plant growth. Test the factors that affect seed germination. Compare seed germination of several kinds of seeds. Observe the directional nature of plant growth. Compare and contrast questions that can be answered by doing experiments. Describe why similar investigations should produce the same results. Relate the results of observation. Organize observations and measurements into charts and graphs. Describe the type of data that can be collected from a simple experiment. Use a metric ruler to chart the height of growing plants. Add and subtract numbers, including decimals through the thousands, and thousandths place. Report the results of experiments in which the scientific method was followed. Investigate and identify the requirements for seeds to germinate. This lesson can be modified to teach grades kindergarten through eighth grade.

Materials Needed:

Flowers, enough for each student to have three
Beans, use a variety of different kinds
Ruler, one for each child
Plastic container, two for each student
Plastic zipper bag
Paper towel
Stapler and staples
Water
Scissors
Tape
Marker
Pen
Index cards
Dye or food coloring
Scapula
Hand lens
Straight pins

Strategy:

I will introduce a series of seven experiments regarding the structure of a plant. These experiments will be taught and studied at separate sessions. The students will investigate each step in the structure of how a plant grows.

The first experiment will consist of demonstrating how a seed is formed. In order to do this experiment you will need two kinds of flowers. One with the male and female reproductive organs and one with the female reproductive organs only. The teacher and students will observe the pistil (ovary) of the plant, and the stamen (pollen producing part of the plant). Flowering plants can have perfect or imperfect flowers. A flower that has both stamens and pistils is known as a perfect flower. For example, lilies, daisies, peach trees, and elm trees have perfect flowers. But in some species the flowers are imperfect. An imperfect flower is one that has either stamens or pistils, but not both.

The second experiment will demonstrate how nutrients are carried by water to all parts of the plant. To do this experiment you will need food color, water, a flower, a clear cup and scissors. Place food coloring in a cup half full of water, and place the flower in the water. It will show the veins in the flower in the color of the dye that was used, especially if a white carnation is used. We discovered how a stem carries water and minerals back and forth from the roots to the leaves.

The third experiment demonstrated what is inside a seed. We dissected a dry bean and a wet bean to find out what the differences were in the embryos of the seeds. We split the beans in half and compared the sizes of the embryos. In a handout we labeled the bean parts.

The fourth experiment introduced how scientist use the scientific method to collect data of an experiment. We did an experiment to compare the growth rate of beans that were soaked overnight to some that weren't. We planted some beans in a botany bag that had been soaked overnight, and planted some in a different bag that were dry. We recorded data of the growth rate of each botany experiment, by measuring information and graphing our results on an index card. For this experiment you will need two zippered plastic bags, paper towel, beans or other seeds, stapler and staples, water, scissors, ruler, and tape. Students should record the progress of growth of their projects. They can keep their records on index cards and place the cards directly under their botany bags. The botany bags should be taped to the window, or as near to the window as possible for best results.

The fifth experiment consisted of taking our plants out of the bag and dissecting the root of one of them. We observed the root under a microscope to see if we could detect the kind of cell growth that had caused the plant to grow. What we were looking for was meiosis to take place, that's when cells divide to make more cells. They undergo ordinary cell division to produce multicellular, haploid organisms. Certain cells of these haploid organisms later become gametes, and fuse to form a zygote. As you may know, in both plants and animals one of each pair of chromosomes in the diploid zygote is inherited from each parent.

In the sixth experiment we took another plant that we had grown and drew all of its parts on a sheet of construction paper. Have the students choose a plant that has complete growth. Such as, a plant with leaf growth, stem growth and plenty of root growth. Make sure they label their pictures and color them.

The seventh and final experiment consisted of planting their plants. For this experiment you will need two containers of dirt, small cardboard labels, straws and scissors. Have the students plant their plants in the pots. Label each container, one for the dry seeds, and the other for the seeds soaked overnight. Make sure that they put their plants in the right container. Have them use their labels to identify their plants. The straws should be slit at the top with scissors and labels inserted. Then the labels should be inserted in the dirt next to their individual plants.

Introduce some background information according to the grade level of the students. Scientist have found that during photosynthesis houseplants can clean polluted air. Through stomates, plants take in not only carbon dioxide but also carbon monoxide, formaldehyde, and benzene. Tested plants that were best at filtering contaminants are philodendron, golden pothos, and spiderplants. Houseplants may someday serve as air-filtering systems in space stations. Plants require water, nutrients, proper temperature and sunlight to grow. Define some scientific terms before carrying out each experiment according to the grade level and teacher discretion.

Performance Assessment:

The assessment is based on the outcome of the students science project. The assessment is also based on the care and observation technique that the student demonstrates on the behalf of the plant. The student should also have kept a journal of the day to day growth of their plants.

Structure of Seeds and Effects of Fertilizer on Plant Growth

Ben Stark
1126 N. Harvey
Oak Park IL 60302

Illinois Institute of Technology
BCPS, IIT Center
Chicago IL 60616
(312) 567-3488

Objectives:

There are two main objectives of this Mini-teach. The first is to learn about the structural components of seeds of higher plants and the functions of each of these components. The second is to investigate how fertilizer affects the growth of plants, particularly of seedlings, and how this relates to seed structure. An additional objective is to learn to express and interpret data/results using graphs. This lesson is fine for grade levels 3-8, with the level of sophistication (particularly regarding the data analysis) scaled appropriately.

Materials Needed:

Each student will need 10 2 inch (5 cm) pots, enough vermiculite to fill the pots, several peanuts (preferably raw) and 12 or so (dry) lima beans (other beans will also work). For the class, there will also be a need for enough flats to hold the pots, 10 or more one-gallon plastic jugs, a source of distilled water, a box of dry fertilizer (such as Miracle Grow), and razor blades (only for dissection of lima beans, if this is desired, and obviously only for older students). A space near a window in the classroom large enough for the flats is also needed, and magnifying glasses are a help.

Strategy:

First Activity: Investigation of Seed Structure

This activity works particularly well with raw peanut seeds, but can also be done with lima beans or other types of beans. If you use peanut seeds, each student should shell a peanut and remove the feathery coat on each seed. The seed (or peanut) can be seen to have two halves, demarcated by a longitudinal line all around the seed. Each student should hold the peanut using both hands and gently push the two halves apart at this longitudinal line. The peanut can then be observed with the naked eye, or with the aid of a magnifying glass. If the peanut has been separated successfully, there will be two similarly sized pieces; these are the "cotyledons" (there are two cotyledons in the seeds of "dicot" plants like peanuts and beans; other plants ("monocots") have seeds with only one cotyledon).

One cotyledon will have, at one end, a small structure that looks like a tiny plant. In fact, it is a tiny plant (actually a plant embryo). Close examination of the embryo will reveal that it has both leaves and a root. In the seed the embryo is in a quiescent state until the seed germinates, at which time it begins to grow. Until it grows large enough to manufacture its own food via photosynthesis, the plant depends on food stored in the cotyledons; the initial growth of the seedling thus depends on the food stored in the cotyledon(s).

The same activity can been done with dry beans, although the cotyledons will have to be pried apart with a razor blade. Alternatively, the beans (e.g., lima beans) can be soaked overnight in water, at which time the seed coat will slip easily from the seed and the cotyledons will separate easily without need of a razor blade.

Second Activity: Effects of Fertilizer on Seedling Growth

Each student should take ten pots and fill each with vermiculite. It is important to use a non-nutritive support (i.e., vermiculite) rather than potting soil, as potting soil has lots of nutrients, which will serve to complicate interpretation of the results. In other words, we want to control the amount of nutrients each plant will get and know what this amount is. A single dry lima bean should then be planted into each pot.

Each student (or group of students) should then prepare fertilizer solutions for the experiment. Into each of 5 one-gallon jugs, place one gallon of distilled water. Leave one of the jugs with water only (i.e., do **not** add any fertilizer to it). To the second jug, add the amount of dry fertilizer recommended on the fertilizer box for one gallon of water; mix/dissolve (this will be "full-strength" fertilizer). To the third jug add **twice** the recommended amount of dry fertilizer, and mix/dissolve. To the fourth jug add **one-half** the recommended amount of dry fertilizer and mix/dissolve. To the fifth jug add **one-tenth** the recommended amount of dry fertilizer and mix/dissolve.

Each student will have two pots/seeds that will be watered throughout the course of the experiment with the contents of **one, and only one** of the five jugs described in the previous paragraph (e.g., there will be two pots watered with the water only, two pots watered with the one-tenth strength fertilizer only, etc.). **All** pots will be watered on **exactly** the same schedule and with **exactly** the same volume of liquid. This will ensure that every one of the ten pots will always get the same amount of water; only the amount of fertilizer that each gets (from none to double-strength) will vary (because of the varying concentration of fertilizer (from none to double-strength) in each of the five jugs). The first watering should occur just after the seeds are planted; subsequent waterings should be on an as need basis (i.e., when the vermiculite is dry).

Students should record their observations in notebooks. In particular, after the seeds have sprouted, they should measure the height of each plant (using a ruler). It is very important when recording data to note the date that those data were recorded (it is also very important to record the date of the initial planting).

Performance Assessment:

Regarding the second activity, all of the seedlings will grow initially to a certain point, because of the food stored in the cotyledons. Beyond this, growth is dependent on photosynthesis and nutrients absorbed by the plants' roots. The latter is, in turn, dependent on the concentration of fertilizer added to each plant.

Thus, we might expect that the seedlings watered with water only (no fertilizer added) will grow to a certain height and then stop growing, when the food in the cotyledons is exhausted. But if the water contains fertilizer, it should support additional growth.

The data (seedling height versus days since planting) should be plotted. Students should use the resulting graphs to help in interpreting the results of the experiment, particularly in a quantitative way (e.g., How long is growth supported by the cotyledons alone? What percentage of the growth with full-strength fertilizer is due to the food in the cotyledons? Is one-tenth strength fertilizer enough to support as much growth as full-strength fertilizer, and if not, at least some growth above that due to the cotyledons alone? Does double-strength fertilizer afford better growth than full-strength fertilizer? Does half-strength fertilizer result in as good growth as double-strength and full-strength fertilizer?, etc.).

It may also be helpful for the students to review the first activity as the second activity is progressing, i.e., to remember what the cotyledons and embryo look like in the seed before germination, compared to how the seedlings appear as they are growing.

A Close Encounter of the Tree Kind

Charles T. Buzek
35 S. Kensington
LaGrange IL 60525

Spry School
2400 S. Marshall
Chicago IL 60153
(312) 354-1400

Objectives:

These activities are designed for a 6-8th grade setting.
Students will learn how to estimate the heighth of a tree.
Students will learn that bark can be a distinguishing characteristic of trees.
Students will learn how to make a bark print.
Students will learn how to estimate the age of a tree.
Students will learn the respiration rates of trees.
Students will learn about turgor in the tree's internal transportation system and how it is affected by the sun.

Materials Needed:

A sheet of carbon paper
A large piece of art or construction paper
A ruler
Plastic baggies
A meter stick
Sections of string at least six feet in length
Masking tape

Strategy:

This is an outdoor activity that will allow your students to gather information in the same way that scientists do.
Select teams of students (three or four in each group).

First activity-Tree measurement

Each group to select a tree. One member will position themself next to the tree. Another will take the ruler and step forward or backward until the ruler exactly fills the heighth of the tree. With this accomplished the student with the ruler will move the top of the ruler from a vertical to a horizontal position making sure that the base of the ruler still sights at the base of the tree. In this position the student will sight down the other end of the ruler and identify some object in the same line as the tree. Once identified, a member of the team will go to that spot, then pace out the distance from that point to the tree. This is the heighth of the tree reduced to a horizontal linear measurement.

Second activity-Age estimation

Scientists estimate that mature trees grow at a rate of an inch a year. Students can select mature trees, measure them around with a tape measure or string with a meter stick, and then compute the average age. This activity will allow your students to add another piece of information in their description of a tree.

Third activity-Bark rubbing

Each species of tree has a distinctive bark. Students will be able to use this information to identify trees during the winter when there are no leaves. It is useful for students to see that while trees conform to a general image they are in particular quite different. Student teams will tape large sheets to a tree and then, using the carbon paper, will rub over the bark creating an image which reproduces the texture of the tree bark.

Fourth activity-Water loss

Each group to fasten a baggie on an individual leaf and leave it there for an hour. Placement of the leaf should involve experimentation some should be in the shade, others in the sunlight. After an hour the baggies should be collected and the water collected should be poured into a graduated cylinder.

Follow-up activity

Students will collect leaves and twigs from the tree. With all of the information collected the teams can now make a display providing all the information that they have collected.

Performance Assessment:

Students will have successfully mastered the activities in this exercise if they can do the following:

Describe the process used in measuring a tree.
Describe the theory behind age estimation.
Describe a theory for water loss difference in leaves on the shady side as opposed to the sunny side.

Return to Biology Index

Aztec Floating Gardens

Vanessa Villalobos
1740 W. Grace
Chicago IL 60613
(312) 327-0969

Oscar Mayer Elementary
2250 N. Clifton
Chicago IL 60614
(312) 534-5535

Objectives:

This lesson was created for students of all ages at the elementary level grades K-8. Students will be participating in a series of short experiments involving plants in order to discover ways to create a hydroponic garden. Aztec history will be explored to gain student interest and to set up the background for the analysis and creation of the "Floating Gardens".

Background Information:

The basis of this project is phenomena derived from Aztec history. The Aztec civilization thrived for three centuries and successfully grew a multitude of produce including pumpkin, squash, and corn. The amazing aspect is that their crops were underwater due to the fact that where they were located, Tenochtitlan (now known as Mexico City), was primarily wet, marshy land. In order to survive, the Aztecs had to create ingenious ways of producing crops in underwater conditions. The students, like the Aztecs, will be faced with the problem of recreating an underwater garden in the classroom.

Materials Needed:

-celery stalks (8 to 10 depending on class or group size)
-red or blue food coloring
-clear plastic cups
-1 lb bag of sand
-1 lb bag of potting soil
-seeds of various plants i.e. peas, Mexican sunflowers, beans, etc.
-ziploc baggies
-paper towels
-large, clear plastic containers (garden itself)
-10 carrot tops (sliced from carrots)
-10 sponges (artificial or real, although real will work best)
-white carnations (optional)
-steel or plastic mesh
-large square or rectangular tupperware containers

Time Constraints:

This unit, depending on class setup, will require one to six weeks.

Procedure:

Mini-experiment #1:

This first "mini-experiment" will introduce the concept of how plants acquire nutrients from the stem upward.

1. Add 8-10 drops of red or blue food coloring to water in a clear cup.
2. Place a celery stalk or white carnation inside the cup.

Within 20 minutes, students will observe that the dyed water has been transported upward within the stem and has been deposited at the leaf tips. If possible, have the students observe a cross-section of the celery (or flower) under a microscope and label all parts. The next day, the changes will be even more dramatic, the leaves having a vibrant, dyed color.

Mini-experiment #2:

This mini-experiment will dispel a common idea among students; that only the method of growing plants is with black soil and seeds.

1. In a small circular pan (the black bottoms of 2 liter bottles will also suffice) add 2 inches of sand.
2. Cut the tops off of several carrots and place them in the pan with sand.
3. Add a small amount of water to the pan, enough to make the sand damp.

Within a few days, the students will observe the carrots beginning to sprout. The carrot tops contain the necessary elements to grow into another carrot plant and can be transported at another time.

Mini-experiment #3:

This experiment will build upon the previous activities' concepts and continue to establish that plants can grow in various environments.

1. Soak a variety of beans in a pot for one evening (if this step is not completed, the seedlings will sprout, but will take a longer time).
2. Fold a paper towel into fourths and add enough water to dampen the towel throughout. Place the towel inside a ziploc baggie.
3. Place 8-10 beans inside the baggie on top of the folded towel.
4. Tape the baggies to the window.

In a few days, the students will observe many changes and should take detailed notes. Discuss the idea that inside each seedling lies "a baby plant" waiting to grow.

Mini-experiment #4:

The students should now be knowledgeable and ready to create their floating gardens. Working in groups, the students should make a list of materials needed for their gardens and then set out to obtain those materials on their own. However, depending on the age level, this may not be possible. In any case, the students may need a variety of materials with which to begin. Soil, sand, plastic containers, seeds, and plastic or wire mesh are the staples of this experiment. Allow the students to work with their groups to discuss and draw up plans for their gardens using previous experience and research.

1. Take the large, plastic tupperware containers (or similar containers), and have the students fill them almost completely with water.
2. Using different materials, the students should now construct their floating gardens based on the group's plans, ideas, and drawings.

It will be interesting to see the different combinations the students have created. Some will create gardens with sand bottoms, soil bottoms, or a mix of both. Other groups may make multi-level gardens with irrigation systems.

Performance Assessment:

Once the students have completed their gardens, they should present them to the class. Students are to explain how they built their gardens and why they think their gardens will enable plants to grow. Questions can then be presented to the groups to guide discussions and provide constructive criticism. Each student should then keep detailed notes of all activities and changes that occur within the gardens.

How Plants Spice Up Our Lives

Trudy S. Moore
6910 S. Oglesby #1
Chicago IL 60649
(312) 363-7887

Scott Joplin Elementary School
7931 S. Honore
Chicago IL 60620
(312) 535-2547

Objectives:

This lesson is designed for the third grade but can be easily adapted to lower or higher grades. The objectives of this lesson are:

* Students will be able to label and identify parts of plants.
* Students will be able to identify spices obtained from plants.
* Students will be able to determine what part of a plant a spice comes from by using taste, touch, smell and sight.

Materials Needed:

Activity I
- Fresh or artificial flowers
- Construction paper in different colors
- Markers/pens/pencils
- Scissors
- Glue

Activity II
- Pencil/Pen
- Copies of puzzle for each student

Activity III
- Small styrofoam cups
- Potting soil
- Popsicle sticks or tongue depressors
- Seedling plants and/or plant seeds
- Rulers
- Newsprint paper for graphs
- Journal

Activity IV
- Small containers with lids preferably to hold a tablespoonful of various spices
- Assorted spices
- Paper
- Pencils/Pens

Activity V
- Pencils/Pens
- Paper
- Food items seasoned with various spices

Presentation:

Depending on the grade level, teacher will discuss various parts of a plant with class and their functions. For the primary level, I would stick basically with the roots, stem/bark, leaves, bud and flower which may produce fruit/seeds. Explain that the roots of the plant hold it firmly in place, preventing it from being washed away by the rains or blown away by strong winds. The roots are also responsible for drawing nutrients from the soil or water so the plant will be able to grow and thrive. The stem is a conduit that allows all the nourishment gathered by the roots to be distributed to other parts of the plant. The bark of a tree operates in much the same way in addition to serving as a protective covering. Buds are the part of the plant that envelope the undeveloped flower before it blossoms. Leaves are the green offshoots of the plant that are often dried and ground to make spices. The seeds are produced by the plant flower and can be ground or replanted to grow another plant. Bring an assortment of spices in, processed as well as in plant form, for children to examine. Popular plant spices to bring are:

1. garlic	2. cinnamon	3. nutmeg	4. mace	5. thyme
6. coriander	7. black pepper	8. bay leaves	9. mint	10. dill
11. vanilla	12. mustard	13. scallion	14. sage	15. fennel
16. rosemary	17.ginger	18. jalapeno		
19. red & green peppers		20. cocoa/chocolate		

Strategies:

Activity I

After dividing children into groups of 3 or 4, give each group a live or artificial plant. They will examine each part of the plant as teacher points out the various parts of the plant. Then students will use scissors to cut out leaves, stems, roots, etc. from colorful construction paper and glue pieces on news print to make their own plants. They will use markers to label the appropriate parts of each plant.

Activity II

Each student will get a puzzle (crossword, word search, fill-in-the-blanks) generated by teacher to complete during class lesson. Answers to puzzle will include spices and/or plant terminology discussed in class.

Activity III

Groups of 3 or 4 students will be given styrofoam cups to plant seeds and/or seedlings. The name of the plant will be written on a popsicle stick or comparable marker and stuck into the dirt after the plant is potted. Students will keep a record of plant growth by making a graph on newsprint paper and writing entries in a daily journal. Each group of children will calculate the growth/projected growth of their plants during allotted period designated by instructor. At end of period, have each group graph the maximum growth of their plants and compare data.

Activity IV

Students will go around to various stations in classroom which have containers holding spices. Each container is labeled A, B, C... or 1, 2, 3... and students must try to identify each by touch, sight, smell or taste. They will record their answers on a separate sheet. Students will also identify what part of the plant each spice comes from.

Activity V

Students will participate in a taste test in class to identify the spices contained in a variety of food products which could range from chocolate milk, and apple pie to rye bread.

Performance Assessment:

Children will be able to identify the parts of the plant, name spices obtained from plants and identify which part of the plant the spice comes from with an 80 percent accuracy. For a written test, students will be given a copy of a plant on a sheet of paper and will be required to label each part that was discussed during the lesson. Depending on how many spices are presented in class, children should be able to identify at least two spices that come from each plant section. Orally, children should be able to tell their favorite spice(s) and tell what foods they can be found in. Assign children to do a one-page research paper on a spice they are not familiar with. Have them use the library, the grocery story and adults as sources of information. Include in paper where plant grows, what part is made into a spice and what foods contain the spice.

Part A-Photosynthesis
Objectives:

To define the term photosynthesis.
To practice iodine test for the presence of starch in leaves.
To compare the results of iodine test of two leaves one that has been exposed to sunlight and one that has not.

Materials needed:

CAUTION! This activity uses heat and requires safety training and **supervision**!

small dish iodine eye dropper plant sauce pan alcohol
beaker tweezers black plastic tape scissors

Strategy:

1. Tape plastic around some of the leaves of a geranium plant. Place the plant in a light place for two days. Then pick a wrapped leaf, and one is not wrapped.

2. Heat water in a sauce pan, warm alcohol in a beaker. Dip both leaves in hot water and then leave them in the alcohol. When the leaves are almost white, add iodine to them.

Results:

The leaf that was not wrapped turns a dark color, but the leaf that was wrapped remains the same. The fact that the wrapped leaf did not change color shows that it did not have any starch. The change in color in the unwrapped leaf indicates the presence of starch. The difference between the leaves is the exposure to sunlight. It goes to show that sunlight is necessary for the manufacture of plant food. This process in which plants use sunlight and other natural resources to make their food is called photosynthesis. The green color or pigment is called chlorophyll. The light is absorbed by the chlorophyll which also transfers the energy thus derived and in some brings about the photosynthetic reactions.

Part B-Water Transport
Objectives:

To show hands-on how water is transported through the stem to other parts of the plant.

Materials needed:

glasses food coloring fresh carnations or celery with leaves

Strategy:

Pour five to seven drops of food coloring to each glass then add some water to each glass. Trim the flowers or celery stem so that the tubes will be freshly open and not clogged. Split the stem of one of the flowers. Put the split stem goes into each of the two glasses that hold two different colors. Put the unsplit flower into one of the glasses with colored water. Leave flowers at room temperature for an hour so.

Results:

The flowers will slowly and gradually change color. The flowers in each glass change to the color of the food coloring in the glass. The flower with the split stem will change into two different colors, one each side of the flower. This process shows that the stem of a plant not only holds the plant or tree in an upright position, but it also helps in the transportation of foods and liquids from one part of the plant to other.

Performance Assessment:

Findings can be judged by the science journal entries, or by oral or written reports. These activities are PASS/FAIL only.

Return to Biology Index

How Buds on Trees Survive the Cold (and Related Mysteries)

Ben Stark
1126 N. Harvey
Oak Park IL 60302
708-386-8670

Illinois Institute of Technology
IIT Center
Chicago IL 60616
312-567-3488

Objectives:

This science "mystery" was originally presented to second and third graders, but is probably appropriate for grades 2-6. The objectives are (1) to see how the delicate tissues of a tree bud are insulated so that they can survive the winter, (2) to learn how to determine the age of a branch/twig, and (3) to see how growth of branches can vary from year to year.

Materials Needed:

Several small branches/twigs, taken from, preferably, a horse chestnut (buckeye) tree in late Fall or Winter (after the leaves have all fallen).

razor blades (for younger children, to be used by teacher only)

hand lenses

Strategy:

This lesson makes a perfect "science mystery." One way to introduce it is to ask the children how they stay warm in the Winter (they stay inside and their houses are heated, they wear warm clothes, they sleep under blankets, etc.). Then you show a branch and focus on the "terminal buds" on that branch (the terminal buds are those at the **end** of each branch). You point out that the terminal bud contains a baby stem and baby leaves and remind them that these "babies" have to stay warm all Winter also. The mystery is, how can they stay warm without the advantages the children have? You might remind the children also how cold it has gotten outside that winter.

Then show the children the outside of the bud(s). Note that the buds are covered by a series of hard overlapping "bud scales." Then, using a razor blade, slice open one or more buds laterally (left to right) through their centers. Observe with the aid of the hand lenses (or with the naked eye if no lenses are available) and perhaps make a drawing of what is seen.

Things to notice in particular are the many layers of the bud scales on the outside of the bud, the "baby" (embryonic) shoot and leaves in the center of the bud (which might be a bit hard to see), and the "cottony" packing material which tightly surrounds the shoot/leaves underneath the layers of the bud scales. The answer to the mystery, then, is that the embryonic shoot and leaves are protected from the cold by both the layers of bud scales and the cottony material, and so are able to survive the Winter cold.

In the Spring, the embryonic shoot/leaves in each bud begin to grow. As they do, they shed the cottony material and the bud scales, which fall off the branch. Loss of the latter produces a series of bud scale scars at the base of the former bud; these look like a series of (mostly) parallel lines around the circumference of the branch. The position of each group of bud scale scars, then, permanently records the position of a terminal bud that had existed at one time in that position on that branch. The distance between adjacent bud scale scars on a branch represents the growth of that branch in one growing season (this might open a lively discussion by determining if the growth of a branch had been the same in each year and, if not, what variables--heat, rainfall, etc.--might have led to growth variations). The overall age of the branch can be determined by counting the number of groups of bud scale scars on it. Note that if your branch has smaller branches growing out of it, they will have to be younger than the main branch, and this should be confirmed by the bud scale patterns on each.

Performance Assessment:

Students could be graded on their diagrams of the dissected buds, with points given for accuracy, neatness, detail, and correct labelling. You could also ask students for a short written report covering such topics as the age of their branches (and how they determined them), if there was variable growth from year to year in the branch and how this was determined, etc.

References:

Probably any good high school or college general biology or botany text would be a useful resource for this activity.

Structure and Function of Seeds

Ben Stark
1126 N. Harvey
Oak Park IL 60302

Ill. Inst. of Technology - Division of Biology
Dept. of Chemical and Biological Sciences
IIT Center - Chicago IL 60616
(312)567-3488

Objectives:

Seeds of flowering plants have two main parts, the "cotyledon(s)" (one or two, depending on the seed type) and the "embryo" (a tiny "baby" plant in a state of suspended animation). When the seed is planted and begins to germinate, the embryo will "reawaken" and begin to grow and develop. Initially it uses resources stored in the cotyledon(s) for this purpose; when the growing plant gets a bit bigger, it is able to (and must) obtain minerals and water from the soil and carbon from the air on its own. In these exercises the structure of a seed (particularly the embryo) is observed and two experiments are performed to show the function of the cotyledons in providing nourishment to the plant during the early times after germination.

Materials Needed:

The following list is intended for a class of 25 students.
1. one bag of lima beans or raw peanuts (note: roasted peanuts will not suffice).
2. 150 paper cold drink cups (10 ounce or larger size)
3. 10 pounds of potting soil
4. one big bag of vermiculite
5. one box of miracle grow (dry) plant food
6. three one gallon plastic milk containers
7. hand lenses
8. razor blades or suitable substitute (choice adjusted for appropriate grade level)

Strategy:

1. Hand out one or two seeds to each child. For this part of the exercise peanuts work a bit better than lima beans, but both are suitable and work the same way. Separate the two cotyledons from each other by carefully inserting a razor blade or other sharp edge between the cotyledons and gently prying them apart (you will see a line in the seed which denotes the point of separation between the cotyledons). At the bottom of one of the two halves you will find the embryo. Close inspection of the embryo, particularly with the hand lens, will show that the seed does, in fact, carry a tiny version of the plant, including leaves and root. Also note the size and location of the cotyledons in relation to the embryo.

2. Plant one or two seeds (of one or both types as desired, each in a separate cup) into the potting soil. Water (with tap water) the pots as needed to keep the soil moist, but don't overwater them. Also, remember to water all pots exactly the same way (same days, same volume of water, etc.). Don't feed this set of plants with the plant food. After a few days the seeds will germinate. The first two oval shaped, leaf-like parts of the plant you will see are the cotyledons; the real leaves will appear later. Record data as follows:

1. Record date of planting.
2. Record watering schedule (days, volumes, etc.).
3. Record date that germinating plant is first visible.
4. At each date following emergence of the plant record both the diameters of the cotyledons and the overall height of the plants. If more than one plant is being measured, be sure to keep measurements for each plant individually.

3. Choose three seeds of the same type. Plant each in a separate cup filled with vermiculite, not potting soil. Fill the three gallon containers as follows:

1. One with just tap water.
2. One with miracle grow made up according to the directions on the box.
3. One with miracle grow made up to only one fourth of the strength listed on the box (e.g., if full strength miracle grow uses one teaspoon per gallon, use only one fourth of a teaspoon per gallon for this container, etc.).

One plant will be watered with water only, one with full strength miracle grow only, and one with one quarter strength miracle grow only. It is very important that each plant get watered only from one of the containers during the course of the experiment and also that all plants get the same volume of liquid on the same days. Watering should be done to keep the soil moist. Record the watering/feeding schedule for each plant, the date of emergence of each plant, and the height of the plant and diameter of the cotyledons at each date after emergence.

Performance Assessment/Conclusions:

I have done these exercises with fifth and sixth graders and even as a science fair experiment for a bright third grader, but they could probably be adapted for high schoolers as well. The data analysis can be more sophisticated as the kids get older, but all grades should be able to draw the seed and embryo as seen through the hand lens. All grades should be able to make a simple graph of the data, specifically height of the plants and cotyledon size versus time (it is useful to plot the height and cotyledon size versus time on the same set of axes). The older grades might do more sophisticated graphs such as (especially for experiment number 2 above) plotting the ratio of plant height to cotyledon diameter versus time. In addition, data from the entire class can be pooled; this allows for cases in which one of an individual student's plants didn't germinate and also allows for lessons in averages.

Things to discuss are the structure of the embryo and the cotyledons (experiment 1), how the sizes and relative sizes of the cotyledons and plants change with time (experiments 2 and 3), and whether giving the plants miracle grow enhances their growth and whether this enhancement occurs throughout the course of the experiment or only after a certain time (experiment 3). Implicit in these discussions is that the cotyledons supply the nourishment for plant growth for a time, but then the plant must get its nourishment on its own. How do the data from experiments 2 and 3 illustrate this? For example, in experiment 2 does the cotyledon size remain constant or shrink while the plant size keeps increasing? In experiment 3 do the three plants grow at the same rate for a while, but eventually do the fed plants grow faster, and does the plant with higher strength miracle grow do the best?

Seed Germination

Calvin Harris
308 W. 145TH Street
Riverdale IL 60627
(708)841-7822

Bethune Elementary
3030 W. Arthington
Chicago IL 60612
(312)534-6890

Objective:

The main objective of the Mini-teach is to show students that water and air are essential to the germination process of plant life and that this process can be demonstrated by using any different number of growth chambers.

Materials Needed:

plastic bag	magic tape
stapler/staples	masking tape
paper towels	fresh-dry lima beans
plastic knives	water-soaked lima beans
clothes pins	

Strategy:

1. Make some physical observations of the soaked seeds and the dry seeds, but be sure you soak the seeds for observation at least 24 hours.
2. Discuss some of the variations when you cut open the soaked seed and when you try to cut open the dry seed.
3. Take a sheet of paper towel and fold it in half and take that half and fold it in half to make a perfect square.
4. Place dry seed on the paper towel securing it with a piece of magic tape.
5. Place a paper towel in a 7" X 8" zip lock plastic bag. Be sure to secure the paper towel inside the plastic bag using your stapler. Staple only the two top ends of the paper towel onto the plastic bag.
6. Moisten your paper towel thoroughly.
7. Place the bag in a warm spot such as against the window. Using a clothes pin, hang it up on a string of wire roped along the window with the seed facing outward toward the sun.
8. Examine the seed package and note how many days must pass before the seed germinates. On the day that the seed begins to germinate, remove the bag from its warm spot to see if the first small roots have broken through the seed coat. Wait three more days and change the position of the plastic bag by rotating the bag 90 degrees clockwise.
9. Examine the seed package and note if gravity has had any adverse effect on the directional change in the stem and root growth.
10. Don't try to save the seedling from the germination test because it will die after planting since its tiny, delicate root has been seriously damaged.
11. Keep this method in mind if your project calls for applying a chemical solution that may affect the speed of germination or if you have to measure root growth in the seedling.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. Why is air an important element for seed germination?
2. Why is water an important element for seed germination?
3. What happens to a water soaked seed?
4. Is the direction of the stem and/or root affected when the growth chamber is rotated?
5. Why can't a dry seed germinate?
6. How long can a dry seed survive while in its dormant state?
7. How long can a soaked seed survive while it is germinating?
8. Will the soaked seed germinate faster if exposed to sun light or artificial room light?
9. What is a growth chamber?
10. What will happen to a germinating seed if it is removed from its growth chamber?

Conclusion:

The students will understand that water, air, and sunlight are important to successful seed germination.

Return to Biology Index

The Structure of A Flower

Dorothy J. Brandon
4915 W. Iowa St.
Chicago IL 60651

Anton Dvorak Elem. School
3615 W. 16th. St.
Chicago IL 60624
(312) 534-1690

Objectives:

Observe the structure of a flower.
What function does each of these structures serve?
Observe the variety of flower shapes.
To identify the parts of a flower reproduction stage: pollination.

Materials needed:

gladiolus flower, forceps, hand lens, dropper, water, microscope slide, scalpel, coverslip and microscope.

Strategy:

Displayed an illustrative drawing of the structure of a flower on the chalkboard. Referring to the display; students and teacher labeled each part of the flower.

Students and teacher reassembled a disassembled artificial flower; labeled the parts as we reassembled the flower.

The class was given live flowers for dissecting. Some dissected parts were placed on diagrams of flowers.

Class members were informed that in flowering plants, it is the transfer of pollen from an anther to a stigma.
Most flowers are pollinated by insects. Some by animals, wind or birds.

Performance Assessment:

The assessment would give the result of the findings of parts of the flower. The live flower revealed more parts than did the artificial flowers, with the exception of the pistil.

Presently, students have become familiar with the basics of the flower.

Thank you!

Return to Biology Index

Birth of a Plant From a Seed

Janet A. Elkins
4205 N. Wolcott
Chicago IL 60613-1017
(312) 477-1440

Douglass Middle S & M Academy
534 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

Students shall be able to label parts of a dicotyledon seed by function as well as by proper names.

Materials needed:

2 each lima beans, and red kidney beans
1 hand lens
1 single edged razor OR scalpel
colored paper, pencils, crayons, scissors, glue
iodine, to test for starch (opt.)
envelopes containing "job" vocabulary as well as the proper name, as follows:
seed embryo, seed coat, food (cotyledons), root (radicle), stem and leaves (plumule), hylum, microphyle, internal landmarks, internal structures

Strategy:

Students will compare and contrast a dry bean versus a rehydrated bean, both lima and red kidney. 24 hours is needed to "fluff" the dried beans. Students can do this for themselves. CAUTION: DO NOT soak for more than 24 hours as the seed coats come off, and the likelihood of decomposition (rotting) is increased, with the growth of some quite interesting molds.

The external landmarks of the microphyle and hylum are easier to see on the dried bean, although the rehydrated beans will show the interior structures better as they will be larger.

Part 1: Students are to examine both dried beans, and locate the "bellybutton", hylum, of each, then scan carefully for the "dimple", microphyle. Drawing what has been described and observed can take place here, depending on time limitations and supplies.

Part 2: Have the students take all the vocabulary words out of the envelope, and separate them into columns of WORDS KNOWN and WORDS UNKNOWN. Further separate the KNOWNS into the EXTERNAL LANDMARKS and INTERNAL STRUCTURES. Place the known names on the drawing. Have students attempt pronunciation of new words. Offer crutches, such as plumule is for the stem and leaves, like a plume. This is also a good time to look at some of the roots, like micro-, meaning little. New words need to be mounted on the individual student drawings. Having the function name and the proper name paired will give a good study guide, incorporating the new and old knowledge.

Performance Assessment:

Words will be correctly paired on student drawings.

Return to Biology Index

Indoor Gardening

Patricia H. Haynes
1620 East 86th Street
Chicago IL 60617
(312) 221-5879

Wirth Elementary School
4959 S Blackstone Ave.
Chicago IL 60615
(312) 535-1412

Objectives:

To learn how different plants grow under certain conditions. To describe several uses of seed plants. The students will identify different seeds.
To plant the seeds and watch them grow. Watch for the seven requirements for growing plants indoors:

1. Room to grow
2. Temperature
3. Light
4. Water
5. Time
6. Air
7. Food

Materials:

Seeds, bulbs, potting soil, quart Ziploc sandwich bags, water, 2-liter bottles, scissors and decorations (optional). Mature plants, as examples are helpful also.

.

Procedure:

1. Fill plastic bag 3/4 of the way with good moist soil (a pot may also be used).
2. Select seed.
3. Plant seed about 1/16 of an inch deep.
4. Water plant with light spray. Set in sunny window.
5. The students may draw the plants as they grow.
6. Measure the stem and root growth each day and graph.

Performance Assessment:

Students will be able to:

1. Understand that plants will grow only under certain conditions that are compatible to each species;
2. Identify different seeds;
3. Observe their indoor gardens's growth;
4. Name the seven requirements for growing plants indoors.

Return to Biology Index

Photosynthesis

Karen F. Adams
10748 So. Drew St.
Chicago IL 60643
312-238-3723

Burnside Scholastic Academy
650 East 91st Place
Chicago IL 60619
312-535-3300

Objectives:

(Adaptable to grade levels 6-9)

The student will:
1. Observe evidence of photosynthesis in a water plant.
2. Assemble the equipment needed to measure the rate of photosynthesis in elodea (water plant).
3. Count bubbles of oxygen gas given off by elodea to determine the rate of photosynthesis.
4. Change the conditions of photosynthesis by altering light intensity and carbon dioxide amount, and determine the effects on the photosynthesis rate.
5. Prepare a graph of the collected data and analyze it.

Materials Needed:

(For each group of four students)

elodea (water plant)
test tube
dechlorinated water (room temperature)
sodium bicarbonate powder (baking soda)
metal stand with rod or test tube rack
lamp (40 watt)
razor blade (single-edge)
tape
clock or timer
metric ruler

Strategy:

PART A. Setting Up the Experiment
1. Obtain a sprig of elodea. Remove several leaves from around the cut end of the stem. Slice off a portion of the stem at an angle and lightly crush the cut end of the stem.
2. Place the plant into the test tube, stem end up, filled with water.
3. Secure the test tube to a metal stand with tape or place the test tube in a test tube rack.

PART B. Running the Experiment
1. Place a 40 watt lamp 5 cm from the plant. After one minute, count and record the number of oxygen bubbles rising from the cut end of the stem. Count bubbles for five minutes. If bubbles fail to appear, cut off more of the stem and recrush.
2. Run a second five-minute trial. Record and average your results.
3. Move the lamp so it is 20 cm from the plant. After one minute count and record bubbles for two five-minutes trials. Again, average and record your results.
4. Add a pinch of sodium bicarbonate powder to the test tube. Place the lamp 5 cm from the test tube. After one minute, record bubbles for two five-minute trials. Average and record your results.
5. Prepare a graph of your results. Use the average number of bubbles for the

vertical axis. Use the type of environmental condition for the horizontal axis.

Performance Assessment:

The students will answer these questions using specific values from the investigation. Diagrams may be included.

1. How does this investigation demonstrate that plants give off oxygen during photosynthesis? Explain your answer based on your observations.
2. How does the rate of photosynthesis change when the light source is moved from a distance of 5 cm to 20 cm?
3. How does the rate of photosynthesis change when sodium bicarbonate is added to the water?

Conclusions:

Plants use green pigments called chlorophylls to trap light energy. The chlorophylls give a plant its green color. Inside the cells that have chloroplasts, the light energy is used to make a simple sugar called glucose. The process by which plants use light energy to make glucose is called photosynthesis.

During this process of sugar production, carbon dioxide combines with water to form glucose and oxygen is released. Oxygen that is produced in photosynthesis is given off as a gas. If a lot of oxygen is being given off, photosynthesis is occurring rapidly. If little oxygen is being given off, photosynthesis is occurring slowly. The amount of trapped light energy and the amount of carbon dioxide available affects the rate of photosynthesis.

The purpose of adding sodium bicarbonate powder to the water increases the amount of carbon dioxide in the water.

This investigation can be performed with water plants grown in many parts of the world, except regions that have permanent ice.

Return to Biology Index

Tree Identification by the Use of Leaves

Elaine E. Messal
148 166th Street
Calumet City IL 60409
708-868-6296

Henry Clay Elementary
13231 South Burley
Chicago IL 60633
312-535-5600

Objectives:

1) Utilize the phenomenological approach to motivate students at the sixth grade level to understand how leaf arrangement and structure can be used for tree identification.
2) Develop the ability and desire to use concepts presented to identify all the trees included in the mini-teach plus the remaining ones in the neighborhood.

Materials needed:

1) Five motivating clue statements on posters
2) Two large sheets of construction paper for every two students
3) Four sheets of typing paper for each student
4) Six leaf samples from the local area for every two students
5) Prepared leaf drawings for performance assessment
6) Herbarium collection and leaf keys for display

Strategy:

1) The night or morning before the lesson, collect six different leaves from the local area for each pair of students. Press them between two folded sheets of construction paper and seal them with masking tape.
2) Divide the class into groups of two and give each pair a sealed set of leaves plus eight sheets of typing paper.
3) Display the five motivating clue statements which follow and have the students guess what is in each set.
   clue 1 One of us is believed to be the oldest and largest of all living things.
   clue 2 Some extinct species of us have been petrified.
   clue 3 Some of us have received names of famous people such as Abraham Lincoln and General Sherman.
   clue 4 Always use our multicultural scientific names, which are the same throughout the world, if you don't want to make a mistake naming us.
   clue 5 The part of us that manufactures food is squeezed between the papers on your desk. Name that part.
   Note: Clues 1, 2, and 3 refer to the coniferous giant sequoia tree, and the final answer for all five clues is LEAVES OF TREES.
4) Each pair of students who are sure of the answer should raise their hands and secretly give the answer to the teacher. Jelly candy leaves may be given as a reward.
5) When everyone knows that the enclosed objects are leaves the sets are opened and each leaf is sketched by each student.
   step 1 A sheet of typing paper is placed over each leaf one at a time.
   step 2 Students use their pencils and sketch over each leaf with an acute angle between the pencil and the paper so the side of the graphite is used. They must press hard to show entire leaf blades, margins, and petioles.
6) After the leaves are sketched, ask the students to observe and identify the

following:

Deciduous Trees

Margins (entire, serrate, lobed, toothed)

Venation (parallel, palmate, net)

Shapes (oval, linear, heart, fan, different shapes from the same tree)

Types (simple, compound, double compound)

Arrangement (alternate, opposite, whorled)

Evergreen Trees

Needlelike (Bundles of 2-5, clustered)

Scalelike

7) Show a leaf identification key to develop the concept of identification by the use of the above structures. Name the six leaves sketched.
8) Show other examples of leaves in the local area by using an herbarium collection or fresh samples.
9) Take the class on a walk around the school building or local area and identify trees by using the leaf structures and arrangements observed and discussed in class.
10) Introduce the importance of using scientific names. They are the same throughout the world. The same common names have been given to more than one plant and improper identification has occurred. **Asimina triloba** is deciduous and **Carica papaya** is evergreen, and both have been called paw-paw or pawpaw. The common name sycamore has also been given to completely different trees.
11) Assign students to write reports about trees which are native to an area or country representing their cultural heritage.

Performance Assessment:

1) Ask students to identify the trees studied on their walk when the same trees are observed again on the return trip.
2) Leaves sketched in class and observed during the walk should be labeled correctly in a station to station test conducted in the classroom. Place numbers on each sketch, fresh sample, or herbarium sheet, and tell the students to write the correct name for each leaf as they are held up or observed at a specific location.
3) Require students to define or draw two examples of different margins, venation, shapes, types, and arrangements.

Seeds-Seed Sort

Anna Summers
10534 S. Vernon
Chicago IL 60628
312-568-8718

Henry Clay Elementary School
13231 S. Burley
Chicago IL 60633
312-535-5600

Objective:

The second grade students will count and sort seeds and find the likenesses and differences of many seeds.

Materials needed:

Small Dixie cups-one per group of 3-4 students: lima beans, kidney beans, pop corn, sunflower seeds, garbanzo beans, black-eyed peas, etc., magnifying lens, balance scale.

Strategy:

1.Students should be given background information about seeds:

Seeds are all different sizes and shapes and they come surrounded by all different kinds of fruit. But all seeds are alike in two ways. Every seed contains a little plant called an embryo. All seeds contain food that helps the little plant grow.

All seeds are remarkable in the way in which they spread themselves in order to grow new plants. Some seeds simply fall to the ground, others float on water, some are fired like buckshot over a distance, and others attach to an animal's fur.

All seeds serve the same purpose, to germinate and grow a new plant in order to perpetuate the plant species.

2. Provide an assortment of seeds. Mix the seeds together so the students can be given a representative sample.

3. Place the students in groups of 3-4 and give each group a small cupful of seeds.

4. Have the students estimate how many seeds are in the cup.

5. Give each group a copy of the worksheet "Seed Sort".

6. The students will dump the cup of seeds into the circle in the middle of the paper and sort the seeds into smaller sets of like kinds and put them in the smaller circles.

7. A record should be made of the name and number of seeds in each circle.

8. Then have the students add the smaller sets to get the total number of seeds in the cup.

9. Have students use a magnifying lens to look closely at the seeds. What color are they? Are there any that have two colors? The students can record their answers on the worksheet "Observing Seeds".

10. Ask the students: What are the shapes of the seeds? Have them record by drawing the shapes of the seeds in the shapes column.

11. Have the students guess how many seeds it will take to cover the line. Lay the seeds on the line, count them and record.

12. The students will use the worksheet "Comparing Seeds" to weigh the seeds. They should estimate how many seeds it will take to balance one gram and then weigh the seeds and record the results. At the bottom of the page record by coloring the graph.

Performance Assessment:

The performance assessment will be the completion of the worksheets "Seed Sort", "Observing Seeds", and "Comparing Seeds". As a result of completing required tasks the student will obtain practice in measuring, counting, estimating, and graphing. The scientific processes practiced in this activity are sorting, classifying, observing, recording, and comparing. Evaluation will be based on completion of each task.

Multi-Cultural Aspect:

Dr. George Washington Carver was a great scientist who found many ways to use plants. He made more than 100 different things from corn. As an extension to this exercise you may bring in different dishes prepared in the manner of different ethnic groups. An example might be a preparation of a bean burito which is a food prepared by the Hispanic culture.

Return to Biology Index

Algae--Where does it Live?

Mary Ellen Dote
3024 Halifax
Westchester, IL 60154
(708) 562-5432

St. Cletus School
700 W. 55th Street
La Grange, IL 60525
(708) 352-4820

Objectives:

1. To understand what green algae is and where it grows.
2. To test the growth of algae in four different types of water - lake water, well water, distilled water and tap water.
3. To watch and record the growth of algae.

Materials needed:

Types of water:
- Tap
- Well
- Distilled
- Lake Michigan

Four (4) quart jars

microscopes
slides (concave)
cover slips
medicine droppers
pipette
pencils
plastic or glass covers

Strategy:

Display a gallon of lake or pond water to the class. Have students observe the water and describe what they see, especially the "green growth". Discuss what they think this growth is, such as, plant life. Name the plant -- ALGAE.

The teacher will then distribute a worksheet and have the students list the characteristics or traits of the algae plant. They will also hypothesize about which type of water algae can grow in best (distilled, lake, well or tap) and why.

Set up two microscopes with a sample of chlorella--a type of green algae. The class will then be able to identify algae in their projects.

Divide the class in groups. Each group will have a sample of well, tap, distilled and lake water. They will also have a sample of chlorella. They will place a drop of chlorella and a drop of one type of water on the microscope slide. Students should observe and draw a picture of what they see. They will observe four types of water.

The teacher will distribute four quart jars labelled WELL, TAP, DISTILLED and LAKE water. Each jar will be filled approximately 3/4 full of the above types of water. Using a pipette, 10 cc of lake water containing algae will be added to each type of water. A pencil will be placed over the jar and covered with a plastic or glass lid to allow air to enter.

Observe the algae growth in each jar for 2 to 3 weeks. Record results twice a week on a chart by taking a sample of the water and placing it under the microscope. They may also observe the growth (or lack of growth) without a microscope but this may be more difficult to record results.

Extensions:

You may want to check the pH level of the water for different results.
You may want to add fish (same kind) to each container of water to see if this affects the growth of algae.
You may also duplicate a culture of algae in lake water, prepared as described above. Shield algae from sunlight with transparent colored paper to determine which color of light is necessary for algae growth.

Evaluation:

Did the class understand the scientific method used in this experiment? (same jars, same amount of water, same amount of algae in each type of water.)
Were the students able to observe and record results?
Did they questions results?

LAB SHEET

GREEN ALGAE--WHERE IS IT FOUND

1. List 2 or 3 characteristics or traits of green algae.

2. HYPOTHESIS (OR SCIENTIFIC GUESS). In which type of water will green algae grow the most? Will it be well water, distilled, tap or lake water. Why?

3. Using a microscope, draw the algae you see in a drop of each type of water. Do this twice a week for at least two weeks.

Return to Biology Index

What are Some Substances That Will Cause Algae To Grow?

Liz Jones
8141 S. State St.
Chicago, Ill. 60619
(312) 874-5552

Yale School Elementary
7025 S. Princeton Ave.
Chicago, Ill. 60621
(312) 535-3091

Objective:

Students will learn how to set up a controlled experiment. Students will be able to determine the effects of oil, detergent, copper crystals sulfate and lawn fertilizer have on the growth of algae.

Materials Needed:

4 large jars
glass plates (lids)
pond water
markers for glass jars
4 pencils #2
laundry detergent powder
dry lawn fertilizer
copper sulfate crystals
graduated cylinder

Procedure:

1. Collect 4 quart jars. Clean each jar with soap thoroughly. Make sure the jars are rinsed thoroughly, so that there are no leftover traces of chemicals. Fill each jar about three-fourth full with distilled water.

2. To each jar add 10 milliliters of pond water. Before measuring the pond water, stir the water thoroughly.

3. To the first jar, add 15 grams of detergent. Label this jar #1, detergent.

4. To the second jar, add 15 grams of lawn fertilizer. Label this jar #2, lawn fertilizer.

5. To a third jar, add 3 or 4 small crystals of copper sulfate. Label this jar #3, crystals copper sulfate.

6. To a fourth jar, add 15 milliliters of oil. Label this jar #4, oil.

7. Do not add anything to the fifth jar. Label this jar #5, control jar.

8. Use the glass-marking pencil to mark the water level in each jar and then place a glass plate over each jar. Prop up one side of the glass plate by laying a pencil over the edge of the jar so that air can get into the jar but so that dust and dirt will not settle into the jars from the air.

9. Set all the jars in a well-lighted place, but not in direct sunlight. Observe the jars each day for about 2 weeks. If so much water evaporates from the jars that you think the results will be affected, add distilled

water to bring the water back up to its original level.

Recommended Strategy:

Discuss orally what is meant by a controlled experiment and a variable factor. Using two identical plants, have students follow procedures in setting up a controlled experiment. Students will learn how to apply the scientific method by setting up an experiment showing the effects various substances have on the growth of algae. Divide students into four groups picking a number 1 thru 4. Each group will be given four cleaned jars containing a measured amount of distilled water, detergent, oil, lawn fertilizer and copper sulfate. Students will be given a worksheet to answer one of the question stated: What they already know about algae and what they want to learn? Students will answer the follow up questions after the experiment is completed. What did they learn? Students will be given unlabeled pictures of green algae along with a wet mount of algae. They will be asked to compare the algae on the wet mount with the pictures and to identify the type.

Analysis:

1. Define scientific method? What are the steps?

2. Why is it important that the jars be cleaned before beginning the project?

3. Which jar do you think will have the greatest and least amount of growth?

4. What might be some reasons why algae would grow in some jars but not in others?

5. How do you think copper sulfate would affect the growth of algae?

6. What is a controlled experiment?

7. What are the two groups in a controlled experiment? Explain how they differ.

Return to Biology Index

The Parts of A Perfect Flower

Guinevere Miller
1936 E. 173rd Street
South Holland, Ill. 60473
(708) 895-3056

Englewood High School
6201 S. Stewart Ave.
Chicago, Ill. 60621
(312) 723-1710 Ext. 643

Objectives:

Upon completion of this lab activity, the student will be able to
(1) identify each flower part.
(2) explain the role of each flower part.

Materials needed:

(1) Gladiola/lilies
(2) razor blades
(3) glass slides
(4) paper towels
(5) markers
(6) glue or scotch tape
(7) construction paper
(8) toothpicks
(9) two dissecting microscopes
(10) overhead projector
(11) prepared lab sheets
(12) prepared transparency

Strategy:

(1) The students should study the model of the flower and determine whether the flower is complete or incomplete, perfect or imperfect. The students should now focus their attention on the diagram of the flower and label all flower structures.
(2) The students should carefully dissect the flower, answer questions and do the required drawings.
(3) As the students dissect their flower, use the overhead projector to show each flower part.
(4) Have each student or each group of students tape or glue and label each flower part on construction paper.
(5) Have the students observe pollen grains and ovules under the dissecting microscope.

Student Activities:

Part A: The Sepals and Petals. Carefully examine your specimen. Trace the stem to the base of the flower.

(1) Does the stem appear wider as it nears the base of the flower?
(2) What is the thick part of the stem called?
(3) What is its function?
(4) Do you see green leaves surrounding the bottom of the flower?
(5) What are they called?
(6) How many can you count on your specimen?
(7) What is their function?

Observe the colored petals of your flower

(8) How many are present?
(9) What advantage to the flower are colored petals?

Part B: The Pistil and Stamen. Carefully remove enough sepals and petals from your flower so that you can observe the inner parts. Do you see a large stalklike part in the center of the flower? This part is called the pistil. It is divided into three areas. The large, bottom part is called the **ovary**, the middle area is called the **style** and the top part is called the **stigma.**

(10) Draw and label the three areas of the pistil: **stigma, style and ovary.**

Surrounding the pistil are several upright stalks.

(11) What are these called?
If you observe carefully, you can see structures attached to the tops of the stalks.
(12) What are these called?
(13) What do they produce?

Part C: The Ovary. Carefully remove the pistil from your flower. With your razor blade, cut across the ovary.

(14) What do you see inside the ovary?
(15) What is the function of the ovary?
(16) What is the biological function of the flower?
(17) Draw the stamen and label the **anther** and the **filament.**
(18) Name the three ways that pollen may be carried.
(19) What is a perfect flower?
(20) What is a complete flower?

Return to Biology Index

Photosynthesis: A Controlled Experiment

Coley, Juana
23 W. 143rd Street
Dixmoor, IL 60426
1-708-385-4286

Rosa Parks Middle School
1-708-339-9550

Objective

To measure the amount of starch left in a leaf of a geranium plant under the following conditions; carbon dioxide increased, decreased and neither increased or decreased.

To prove increased starch increases the process of photosynthesis in the green plant.

Apparatus Needed

3 Geranium Plants (same size, shape and color)
3 2 gallon plastic bags with twist to close
2 250ml Beakers
1 500ml Beaker
1 Hot Plate
1 Pair of Plastic Tongues
4 Petri Dishes
1 1pt. 91% Isopropyl Alcohol
1 Package of Alka-Seltzer
1 50mL of Soda Lime
1 Bottle of Potassium Iodide
3 Pieces of Cardboard
1 Pitcher of Water

Recommended Strategies

1. Mark plants A, B and C.
2. Put cardboard pieces at the bottom of each bag.
3. Put plant A in one bag with one 250mL beaker half filled with water. Place Alka-Seltzer in water, twist close.
4. Put plant B in one bag. Put 50mL of Soda Lime in a Petri dish and place in bag with plant B, twist close.
5. Put plant C in one bag. Twist close. (This is the "control" plant.)
6. Find a sunny place in your classroom to place all three plants. (The plants must have same amount of sunlight and water.) The plants are to set for one day.
7. After one day, remove plants from bags. Break off one leaf from each plant put in Petri dishes marked A, B, and C.
8. Half fill the 500mL beaker with water.
9. Fill the 250mL beaker with alcohol.
10. Place beaker with alcohol into beaker with water, on to the hot plate.
11. Take leaves one at a time and put in beaker with hot alcohol. Leave in for ten minutes.
12. Remove leaf with plastic tongues.
13. Place leaf on paper towel to dry, then place in Petri dish.
14. Place several drops of potassium iodide on each leaf.

15. Observe color change of the three leaves. (the darker the color (purple) the more starch. The lighter the color, the less starch.

Conclusion

To determine how much starch is left under three conditions.

1. Carbon Dioxide increased.
2. Carbon Dioxide decreased.
3. Carbon Dioxide neither increased or decreased.

Discussion

1. What were the results of plant A, with Alka-Seltzer? Was the carbon dioxide increased, decreased, or remained the same?
2. What were the results of plant B, with the soda lime? Was the carbon dioxide increased, decreased, or remained the same?
3. What were the results of plant C, the "control" plant? Was the carbon dioxide increased, decreased, or remained the same?

Return to Biology Index

Four Parts of a Green Plant and the Functions of each Part

Hawthorne, Sarah F.
2054 E. 69th Street
Chicago,Il. 60649
1-312-493-1960

Coles Elem. School
1-312-933-6550

Objectives

The learner will learn four parts of a green plant and the functions of each part.

Apparatus Needed

An apple; bag of tea; two stalks of celery (a stalk of raw celery and a stalk of celery in colored water); an onion in a cup/glass of water; one sweet potato in a cup/glass of water; four posters (each poster should show pictures or drawings of a part of the green plant.......roots, stems, leaves, and the flower); several packages of different green plant seeds; different kinds of green plants (with and without flowers). **Optional** Four milk cartons (soil should be in each milk carton); four 5x7 cards with the name of a part of a green plant on each card.

Recommended Strategy

Display the following foods on a table: an apple, a bag of tea, an onion (in a cup or glass of water), and a stalk of raw celery. Have the students identify the foods on the table. Discuss what the foods have in common. Try to come to a general conclusion that the foods on the table come from green plants.

Display a live green plant and ask students to identify the parts of the plant. As the students identify the roots, stems, leaves, and flowers, have another student point out the part that was identified. For each student that correctly identifies the roots, stems,leaves, and the flower, give him/her a milk carton and a package of green plant seeds.

After identifying the part of a green plant, have the students give the order in which the plant will grow starting with the seeds. As the students determine the order in which the plant will grow, display posters with pictures of each part of the green plant.

Discuss the functions of each part of the green plant: roots a) take in water from the soil; b) take in minerals; c) store excess food; d) transport water and food to other parts of the plant; and e) hold or anchor the plant in the soil.

stems a) support the plant; b) expose the leave to sunlight; c) transport food and water to other parts of the plant; and d) sometimes, photosynthesis (food) is made in the stem.

leaves a) take in carbon dioxide; b) release oxygen (the exchange of gases.....taking carbon dioxide into the leaves and releasing oxygen out of the leaf...... is referred to as respiration); c) chlorophyll; d) photosynthesis; and e) take in energy from the sun.

flower a) sexual reproduction.

Optional

1. Have the four students that were given milk cartons with soil and seeds plant their green plant seeds. The plants will remain in the classroom for class observation.
2. Play the game "Plant Charades". Divide the class into four groups. Give each group a card with the name of a part of the green plant written on it. Each group will have 5 minutes to suggest ways to demonstrate the part of the plant without talking. The winning group will be the group that guesses the most parts of the plant.
3. Use the celery in colored water to demonstrate how water and minerals travel through plants.

Return to Biology Index

The Effects of Light and Temperature on the Growth and Development of Plants

Robinson, Minnie L.
15616 Woodlawn East Ave.
South Holland, IL 60473
1-708-331-0738

Fenger High School
11220 South Wallace Ave.
Chicago, IL 60628
1-312-821-2830

Objectives

1. To show how visible light constitutes only a small part of the spectrum of radiant energy.
2. To show how light can be separated into a variety of colors if passed through a prism.
3. To show that certain colors correspond to different wavelengths of the light present.
4. To show how certain wavelengths are reflected by plant pigments and others are absorbed.
5. To show that when plants are grown in different wavelengths and temperature variations,the size,color and the length of their growth processes are affected.

Equipment and Materials

overhead projector
Early Scarlet Radish Seeds
two thermometers
12 mini peat plant pots
two trays or containers
labels
Polaroid Camera
12 medium peat plant pots
vermiculite
plant food
water
two quart bottles
graph paper
small metric ruler
green and red transparency paper
clear transparency sheets

Recommended Strategies

Review light waves using a prism. Show how light waves can be separated with a prism. Show the different colored light waves. Show how some of the colors can be reflected and others can be absorbed. Encourage students to list the size, color, height, number of leaves, etc., from plant samples given.

Using five groups of students, distribute two samples of experimental plant samples to each group. Also, distribute data sheets to each group. Students will observe and record observations. Plot the temperature and growth patterns on a graph.

Procedure for growing radish plants: Obtain 12 mini peat pots. Fill each pot to the halfway mark with vermiculite. Plant 10 radish seeds in each pot. Cover them with a thin layer of vermiculite. Water them thoroughly, using a diluted solution of plant food. Use red and green transparencies to cover two pots with red and two pots with green. Use different shades of green and red transparencies to cover one with red and one with green. Place three uncovered plants with the plants covered with the colored transparencies in the sunlight. Observe and record data on a daily basis. Place three uncovered pots in a dark room. Observe and record data daily. Record data on the length, size, color, number of leaves and temperature for each experimental plant sample.

Please note: Each experimental plant sample received a normal day without any manipulation of temperature.

After 10 to 15 days of observation and recording data, place two of the plants covered with red transparency (plants grown in sunlight) in the darkness. Repeat the above procedure using plants covered with green transparency and plants not covered. Place two of the plants grown in a dark room in a sunlit environment. Observe and record data daily. Record data on the length, size, color, temperature and number of leaves for each experimental plant sample.

Use photographs taken with a polaroid camera to show stages of development. Use graphs and charts to plot and make an analysis of the growth processes of plants' responses to visible light wavelengths in relationship to the temperature.

Summary

Plants usually respond to light, touch and temperature. They respond with leaves, flowers and fruit. Visible light can be separated into different colors. Some colors reflect light while others absorb light. A difference in light wavelengths will significantly affect the length, color, germination period, number of leaves, quality and quantity of fruit. Darker shades of green and red transparency sheets produced a significant degree of change in plant development compared to lighter shades of red and green. Temperature differences were slight and not controlled. All plants received a normal temperature during the experiment.

Note: all plants grown in the light received a full day of sunlight. All plants grown in a dark room received a full day of darkness. All plants were watered at the same time using the same amounts of water from the diluted plant food. All data was recorded at the same intervals.

Return to Biology Index

From Flower to Fruit

Ward, Joy A.
8437 S. Rhodes
Chicago, IL 60619
1-312-874-0536

Hope Community Academy
1-312-962-2760

Objectives

1) Students will learn that flowers have essentially four parts.
2) Students will learn both the male and female reproductive parts of the flower.
3) Students will learn about self-pollination and pollination by insects and other animals.

Equipment and Materials

Petri dishes
Dissecting kits
Scotch tape
Magnifying glasses
Saran wrap
Construction paper
Overhead projector
Prepared transparency
Prepared worksheets
Silk scarf
Pictures

Lily plants
Geranium plants
Gladiola plants
Apples
Spices
Fruits
Nuts
Olives
Honey
Indigo

Recommended Strategies

Display flowers, scarf, pictures and edible items at front of the classroom.

(Phenomenological Approach) - Students will answer questions about the flowers, honey, dye, pictures, etc. Example: What do you notice? Possible answers: flowers, fruit, colors, etc. Show picture of bee pollinating flower. Ask: What do you know about bees and flowers? Possible answers: Bees make honey, insects pollinate flowers.

Students will use handouts to identify the parts of a flower and the sub-parts.

Demonstrate the parts that are male and female by use of the overhead projector.

Use a transparency of flower diagram.

Use a sample flower (lily) to show the studied parts.

Pass the lily around the classroom for each student to see.

Students will show knowledge of the parts of a flower by dissecting a lily and/or a gladiola. They will affix each part on a prepared sheet and label the parts.

Show picture of apple flower and cross-section of an apple. Teacher will cut an apple in half and show the remnants of the pistil. Teacher will cut the apple crosswise to show the ovules. (eggs)

Students will eat products of the flower: seeds, nuts, raisins, etc. Students will observe the cut apple and cross-section and then eat the parts. Students will color labeled sheets for take-home or bulletin board display. Students will place dissected plant sheet on construction paper for bulletin board or take-home.

Optional

Dissect pollen tubes and count number of pollen grains. Calculate length of time it takes pollen to travel down the tube using worksheet suggested from United Graphics. (see resources) Rate = distance/time

Resources

The Effects of Over Exposure to Ultraviolet Radiation on the Growth of Plants and Bacteria

Chaffin, Mildred C.
7354 S. King Dr.
Chicago, Il 60619

Hyde Park Career Acad.HS.
947-7180

Objective:

Students should be able to explain the deleterious effects of ultraviolet radiation on the growth and development of plants and bacteria. Also students should be able to describe the effect of ozone on ultraviolet radiation.

Materials:

String bean and mustard green seeds, ultraviolet lamp, glass apparatus, potting soil, water trays, pots for the plants, glass plate, slide projector, autoclave, fluorescent poster board and chalk,
slides, E.Coli bacteria, nutrient media, petri dishes, petri dishes with nutrient agar, incubator, bunsen burner, test tube racks, NaCl, cardboard box, ring stand

Strategy:

Two experiments were performed to demonstrate the effect of ultraviolet radiation on plants and bacteria. Another experiment was performed to further demonstrate how glass filters ultraviolet radiation. The glass was used to mimic the effects of ozone on ultraviolet radiation.

Experiment 1:

1. String bean and mustard green seeds were germinated on cotton in petri dishes for 3 days. During that time, the seeds were given a few drops of water daily.
2. On day 4, the germinated seedlings were transferred to the pots containing potting soil. Each seed type had two test groups and one control group. Eight plants were used in each group.The two test groups differed in that one was shielded by glass when exposed to ultraviolet radiation (u.v.r.) -labeled (SE)- but the other was not shielded when exposed to u.v.r. and it was labeled (U.S.E.).
3. From day 5 to day 10 the test groups were exposed to (u.v.r) for 2 hours daily.

Experiment 2:

1. Expose a fluorescent surface to u.v.r.in a dark room.
2. Expose the fluorescent surface to u.v.r. but this time place a glass plate in front of the u.v.r. lamp.

Experiment 3:

1. Grow E.Coli cells in nutrient media for 24 hours.
2. Take out 1 mL of the E.Coli cells to use as the control group. Do not expose this group to u.v.r..
3. Expose the remainder of the cells to ultraviolet light.

4. At 5, 20, and 60 seconds take out .1 mL of E.Coli cells
   Place each group of cells in separate test tubes and label each one.
5. Dilute each group of cells to 10-6 concentration and plate out
   .1 mL of cells on nutrient agar then incubate for 24 hrs.

Conclusion:

Experiments have shown that ultraviolet radiation damages and kills the cells of living organisms. The experiments performed in this project alone demonstrate this. We see examples of its deleterious effects not only in plants and bacteria but in human beings as well. Skin cancer is an example of this. It is caused by ultraviolet radiation being absorbed by our skin cells.There are, however, protective mechanisms in our bodies and in our environment that function to minimize or prevent the deleterious effects caused by over exposure of living organisms to ultraviolet radiation. Pigment, present in the skin of most human beings, and ozone, present in the stratosphere, both serve to absorb ultraviolet radiation.

Showing Nature's Way-Plant Development and the Plant Parts We Eat

Ewers, Katherine
8126 S. Homan Ave.
Chicago, IL 60652
(312)778-3760

Burke Elementary School
(312)924-5823

Objectives

The student will demonstrate and record the stages of plant growth.
The student will categorize food plants by identifying the edible part.

Apparatus needed

1. Live bean pods, sprouts, and plants showing blossoms and beans.
2. Posters showing the plant stages.
3. Blackboard with 32 squares for listing and picturing the parts of the plant we eat.
4. Duplicated copies of the song and illustrated booklet (or plain paper to fold into 8 squares for writing and drawing a booklet. Long plain paper to be folded into 32 squares for making a chart of the plant parts we eat.
5. Scissors, pencils, crayons and colored chalk.
6. Fresh vegetables to show as examples.

Recommended strategy

Pantomime the stages of plant development. Students signal with thumbs if they understand each stage. Discuss the meanings. Pass song sheets and all act it out while singing the song.

Guided practice-Students point at posters showing diagrams and indicate the vocabulary words labeling the parts.

Independent practice-Students make an 8 page booklet showing the stages of development in a bean plant, labeling the parts with vocabulary words, and coloring it correctly.

Observation-Pass bean pods. Students open them to see the seeds. Pass bean sprouts. Students open the seed food to see the tiny leaves. Pass bean plants in the stages of development; showing the stem, the leaves, the blossom and the seed pod.

Check for understanding-Ask students to identify what they see.

Extension-Other Edible Plant Parts. Students fold a large paper into 32 boxes for a chart. Model on the blackboard; Title-Plants We Eat, one category in each box going down the right side of paper- seeds, sprouts, roots, stems, leaves, blossoms, fruits. Show a sample of fresh vegetables for each category. Students name three examples for each category and color a picture, labeling it, for each box across the paper. Volunteers fill in the blackboard chart, and all fill in individual charts.

Review-Sing "A Hole in the Ground" (a progressive song describing what grows from the hole; roots, stem, branch, leaves, blossom, fruit and seeds.

Next step-Read and explain the booklet and chart to someone at home tonight, and be ready for a test tomorrow on labeling the parts of a plant. Try sprouting corn seeds and bring in the various stages of development for extra credit.

Song

A tiny seed is sleeping in the ground, sleeping in the ground, sleeping in the ground.
A tiny seed is sleeping in the ground, showing nature's way.

The sun comes out and warms the seed, warms the seed, warms the seed.
The sun comes out and warms the seed, showing nature's way.

The rain comes down and wets the seed, wets the seed, wets the seed.
The rain comes down and wets the seed, showing nature's way.

The roots grow down and spread their toes, spread their toes, spread their toes.
The roots grow down and spread their toes, showing nature's way.

The leaves are growing inside of the seed, inside of the seed, inside of the seed.
The leaves are growing inside of the seed, showing nature's way.

The stem humps its back and stands straight and tall, stands straight and tall, stands straight and tall.
The stem humps its back and stands straight and tall, showing nature's way.

The leaves grow out and wave in the breeze, wave in the breeze, wave in the breeze.
The leaves grow out and wave in the breeze, showing nature's way.

The blossoms grow and look beautiful, look beautiful, look beautiful.
The blossoms grow and look beautiful, showing nature's way.

The fruit grows out with its new seeds, with its new seeds, with its new seeds.
The fruit grows out with its new seeds, showing nature's way.

A tiny seed falls back to the ground, back to the ground, back to the ground.
A tiny seed falls back to the ground, and starts the great replay.

GERMINATION: NAME THAT SEED

Blonzella Campbell
Chicago Vocational High School
2100 East 87th
Chicago, IL 60617
1-312-978-1600

Objectives:

1. The student should gain an appreciation of the complexity or the seed.

2. The student should be able to recognize and differentiate between the male and female reproductive organs of a flower.

3. The student should be able to differentiate between a monocot and a dicot seed.

4. The student should be able to associate germination time with the growth of the young plant.

Materials: Corn seeds, corn stalk, gladiolas (flower), soaked corn seeds, soaked bean seeds, single edge razor blade, magnifying lenses, glass jars (showing germinating bean and corn seeds).

Strategies: The student walks into the classroom and finds on their desks a large corn stalk and a tiny corn seed. The students begin to examine the two. The teacher observes them for a few minutes. The teacher begins to question them concerning what they are examining.

Suggested questions:

1. What are you observing?
2. What is the relationship between the seed and the stalk?
3. Which one of the life processes has to have taken place to get the stalk from the seed?
4. What kind of reproduction has taken place?
5. What is the first step in sexual reproduction?

GLADIOLAS (Flowers):

6. What are the names of the male and female reproductive organs?
7. Which organ will put their gametes into the other?
8. Why is the stigma sticky?

GLASS JARS (Containing germinating seed and plants)

The teacher will then give each group of students a set of germinating seeds and plants which has been started at different intervals. The seeds were soaked over night and

2

placed in glass jars between the glass jars and the paper towels. The students moisten the seeds daily and watch for the germination of the plant.

Materials: Corn seeds; Corn stalk; Germinating beans and corn seeds; tobacco flower

Cell Structure and Function

Barbara J. Baker
5431 S. Dorchester Ave.
Chicago IL 60615

Doolittle West Primary School
521 East 35th Street
Chicago IL 60616
(773) 535-1050

Objectives:

Discuss scientific advances brought about by the Mars Surveyor Space Program which impact on daily life, especially any animal and plant cell movements.
Identify laboratory apparatus like microscopes, slides and coverslips; use the microscopes to view cells and organisms.
Learn vocabulary pertaining to cells.
Draw and color what is seen under the microscope.
This lesson could be used for grades 3rd-5th.

Vocabulary:

cell membrane	endoplasmic reticulum
cytoplasm	golgi bodies
nucleus	Paramecium
mitochondria	Euglena
lysosomes	Ameoba

Materials Needed:

Newspaper articles about the Pathfinder landing on Mars. Microscopes, slides and coverslips, flowers and onions, posters of enlarged animal and plant cells, plant and animal cell component labels, cartoon posters of 3 types of cells and various strands of human hair, Elodea specimen and pond water (Elodea is a commercially available alga). This is a list of materials for each student in the class with the exception of microscopes: posters of enlarged animal and plant cells and cartoon posters of Paramecium, Euglena, and Amoeba; lemon gelatin dessert mix; l pint (125-ml) resealable plastic bag; quart bowl; large grape.

Strategies:

1. Classroom discussions about the Mars Space Program.
2. Articles on the Mars space program read aloud in class followed by role playing.
3. Locating articles that discuss possible fossils of cells found on Mars.
4. Using a slide to observe Elodea specimen under the microscope.
5. Observing what type of movement the specimen is making.
6. Flagellar, ciliate, and amoeboid motion will be looked for under the microscope.
7. Predict the condition of hair by observing a strand under the microscope.
8. Determine which end of the hair strand was attached to a live cell.
9. Gather some pollen from a flower, place it on a slide, and observe the pollen under the microscope.
10. Draw the cells you see from items 4, 8, and 9 above on a sheet of paper; color the cells.
11. Observe the same slide 30 minutes later or the next day to see what changes occurred.
12. A cooperative team will use a small picture of the animal cell that is

labeled with the parts of the cell to identify the same parts on the enlarged poster of the animal cell that is not labeled.

13. The other cooperative group will place and paste the parts of the plant cell on the enlarged poster of the plant cell using the small labeled picture of the plant cell as a guide.
14. Each student will make a World-Class Cell Model.
    a. Have an adult helper mix the ingredients for the gelatin dessert according to the instructions on the box.
    b. Allow the gelatin to cool to room temperature.
    c. Pour the gelatin into the resealable bag, seal the bag, and place it in the bowl.
    d. Set the bowl and bag in the refrigerator and chill until the gelatin is firm (about 3 to 4 hours).
    e. Remove the gelatin from the refrigerator and open the bag.
    f. Using your finger, insert the grape into the center of the gelatin
    g. Reseal the bag.
    h. Place the bag of gelatin on a flat surface such as the kitchen counter. Observe its shape.
    i. Hold the bag over the bowl as you gently squeeze it (the bowl is used in the event that you squeeze too hard and the bag opens). Observe the shape of the bag as you squeeze
15. Thin layers of onion cell skin will be prepared, placed on slides, covered with coverslips, and observed under the microscope.
16. Write a rap or poem concerning the structure and/or movement of cells.

Performance Assessment:

1. Students will share the articles on Mars with role playing.
2. Students will take a multiple choice quiz on the hierarchy of the organizational levels of living things. Below is an example of testing students on knowing the difference between cell, tissue, organ, system and body. You may rewrite it leaving cell off each item.

   Directions: On the quiz below one list would be in a correct order if you were to write organ in the blank. Which list is that?

   a. cell, tissue, system, body, ______
   b. cell, tissue, ______, system, body
   c. ______, cell, tissue, system, body
   d. cell, ______, tissue, body, system

3. The nature of movements of cells in the human body will be discussed.
4. The labeled posters of plant and animal cells will be read aloud.
5. A simple model of a cell with 3 parts will be made.
    a. Each student will understand that the plastic bag represents the membrane of the model cell.
    b. Each student will properly name the pale color of the gelatin dessert as the grayish jellylike material cytoplasm, that fills the cell.
    c. Floating in the gelatin is a grape the represents the nucleus.

Mold Investigations

Ben Stark
1126 N. Harvey
Oak Park IL 60302

Illinois Institute of Technology
BCPS, 3101 S. Dearborn
Chicago IL 60616
(312) 567-3488

Objectives:

This activity will allow students to observe how molds grow. It will also allow them to investigate the fact that there are many types of molds and that their spores exist in various locations (even in the classroom). Possible modifications/additions allow students to design experiments and use the microscope. This exercise is appropriate for grades 3-8, and discussions can be scaled as required.

Materials Needed:

Each student will need 3-5 slices of bread (inexpensive white bread works fine) and a zip lock sandwich bag for each slice of bread. A simple water spray bottle is also needed. For additional modifications access to a refrigerator is useful. For microscopic observations about 4 microscopes, about two dozen microscope slides and cover slips, and several sets of tweezers are adequate for a class of 20-25.

Strategy:

Give each student several slices of bread and a zip lock sandwich bag for each slice. Each student should find a place in the classroom, hall, etc. and wipe an area in that place with a slice of bread. The slice should be sprayed **lightly** with water and then sealed inside the bag. This can be repeated for other locations with additional slices of bread. Each bag should be labelled with the student's name, the date, and the location which was wiped with that slice. The bags can be stored in a central location or taped to the students' desks to make daily observations more convenient. The students can examine their specimens each day and record their observations in a notebook. It may take 7-10 days or so for visible growth to appear (longer in the refrigerator (see below)), so don't be alarmed if you don't see something after only one or two days.

Controlled experiments can be easily adapted from the basic procedure described in the previous paragraph. For example, two or more slices can be wiped in the same area, but incubated under different conditions. One possibility is to omit the water spray from one slice to investigate whether the water spray enhances the mold growth (here, the unsprayed slice is the "control" for the effect of the water spray). Other experiments could include wiping the same area with several slices, spraying them all, but incubating them under different conditions (e.g., at room temperature or in a refrigerator (here the room temperature incubation is the control for the incubation in the cold); exposed to the light or in a dark location (here the dark incubation is the control for the effect of light); etc.).

If microscopes are available, they can be used to examine the mold that grows (see **Performance Assessment** section below). For each specimen place a drop of water in the middle of a microscope slide. Use the tweezers to sample a small bit of mold from a piece of bread and shake the sample off in the drop of water. Cover the water/mold with a cover slip. Examine under the microscope beginning at the lowest power and then going to higher power if desired. Make sure, however, that you know how to use the microscope before trying this.

Performance Assessment:

After about 7-10 days mold should begin to grow (it may take longer in the refrigerator or for the samples that were not sprayed with water). Microscopic mold spores (which are single cells) exist almost everywhere. When they land on a food source (such as a slice of bread), they begin to multiply and eventually grow into a large, multicellular organism, which can be seen with the naked eye. Different species of molds have different colors, textures, etc. in these "macroscopic" forms, and so students should be able to make a crude estimate of how many different types of molds they are growing. They can see, for example, if different types of mold were wiped from different areas. The experiments with variation of water, temperature, or light will allow the students to see if these variables affect the rate of growth of all or some types of mold. After the mold has grown up on the bread slices, the microscopic observation can be an exciting end point for the exercise, as the students observe and compare the structural details of their various molds (even at the cellular level) with those details that they see with the naked eye.

Students can be assessed on the thoroughness of their notes, the care with which they set up their controlled experiments, and the sophistication with which they explain their results.

References:

Any high school or college general biology textbook should have ample sections on this material.

Micro-organisms

Janet Elkins
4205 N. Wolcott
Chicago IL 60613-1017
(312) 477-1440

F.A. Douglass Middle Math & Science Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176 VM 534-6299 x4110

Objectives:

This lesson has been developed for 6th grade students, but is easily adaptable to other levels.

Students will: -follow written directions
-discover additives which will deter micro-organism growth

Materials Needed:

-250 ml beaker
-jar of bouillon (either beef or chicken will work)
-water
-3 test tubes
-labels "salt", "vinegar", "control"
-test tube rack

Strategy:

One (1) bouillon cube is to be dissolved in 250 ml of very warm water. As the cube is dissolving, add 1 t of salt to the test tube labeled "salt"; 1 t vinegar in the test tube labeled "vinegar". Pour equal amounts of the bouillon into the test tubes. The salt may NOT dissolve quickly, but **leave it alone**-if you try to stir it in, you may remove some of the salt, or "blurp" it, losing some of the liquid, or contaminate another container by using the stirrer more than once.

With the test tubes arranged in the rack, LEAVE ALONE, uncovered for 2-3 days. This can take place over a weekend. Spores will drop into the tubes from the air. Perhaps a duplication of Pasteur's experiment would be helpful at the same time: put bouillon into 2 containers, one open to the air straight up, and one open to the air, but the opening is off to the side so that things could not "drop" into the container. Compare these two containers to show that things "dropped" in from the air, and did not spontaneously grow in the containers.

Students are to examine and record their findings.

Discussion. Most will find the control tube to be very cloudy and the other two will be less so. Both salt and vinegar inhibit the growth of micro-organisms.

Performance Assessment:

The outcomes of each student should indicate that the directions were followed, therefore PASS. Any other outcome will be a fail for the first objective, that of following written directions. Teacher may use discretion in allowing a repeat of the experiment for half credit; 3/4 credit for a 2-3 paragraph identifying the cause of the different outcomes.

Micro-organisms

Janet Elkins
4205 N. Wolcott
Chicago IL 60613-1017
(312) 477-1440

F. A. Douglass Middle Math & Science Academy
543 N. Waller
Chicago IL 60644
(312) 534-6176

Objectives:

This lesson has been developed for 6th grade students, but is easily adaptable to other levels.

Students will:

-assemble a wet-mount slide
-demonstrate the use of a microscope, focussed on the specimen
-demonstrate the mastery of observation
-utilize vocabulary of mold structural parts in journal and/or presentation/questioning by Teacher

Materials Needed:

Paper towel or paper napkin
Clean, blank slide(s)
Slide cover(s)
Water
Mold from piece of bread
Forceps
Microscope

Strategy:

In preparation for this lesson, students/teacher will **already** have prepared some bread mold. I usually wipe the classroom floor (if uncarpeted), a chalk ledge, or window sill with half a slice of home-made bread. I lightly spray it with water, and then EITHER place in a sealed baggie, OR lay on a saucer in an out-of-the-way place. If you use the saucer method, you may need to re-moisten the bread every day or two.

Once the mold has started to grow (2-3 days), you may want to allow it to dry out, so that student(s) or you who are sensitive to molds will be less so. I **ALWAYS CAUTION** against touching or breathing the molds.

Part A (I usually give the directions for making a wet-mount 3 times; tell, show, tell. My directions differ from our science text.) Place a clean slide on top of a paper towel or piece of paper. Place 1 or 2 drops of water on it. (Use the tip of your finger, or use a dropper.) With the forceps, take a TINY pinch from the bread mold and MASH around into the water. (Tiny because we are using a microscope, and just a bit will look big; the mold structures are sturdy, and will not be harmed. Having them spread out will allow the light of the microscope to shine through it so the structures can be easily seen.) Holding the slide cover by the sides between forefinger and thumb, slide 1 edge TO THE EDGE of the water droplet, and then DROP the cover on to the slide. (If there are any air bubbles, they will show up as silver shapes, but should not be a problem.)

Part B Secure the slide on the platform with the slide clips. (Holds the slide steady for viewing.) Make sure that some of the mold is over the light which is coming in via the mirror or lamp. Then with the lowest-powered lens (usually the shortest) in place, focus by slowly turning with the coarse adjuster until you see something; then adjust the fine knob until the "picture" is clear. DRAW what you see in the journal, or on the observation sheet. LABEL the ball-like top "sporangium", and the stem AND root-looking parts "hyphae". COMPARE it with your team members.

Performance Assessment:

A. Can prepare a wet-mount slide, using material from the experiment

	slide cover atop slide specimen	1
	slide cover indicates air bubbles-some	1
	-few	2

B. Can put a slide on the microscope platform

	light shining on specimen in lens	1
	specimen focussed-somewhat	1
	-sharply	2

C. Can label/name	-microscope parts (max. based on YOUR microscope)	
	1 pt. per part	0-6
	-mold parts	1-2
	-did drawing	1
	-labeled drawing	1
	-1 pt. per part labeled	1-3

PASS = 11 pts. or more; FAIL = 10 pts. or less.

Cell Division and Mitosis

Nicholas DiGiovanni
1340 Wilshire Dr
Naperville IL 60540
708-357-8856

Naperville Central High School
440 W Aurora
Naperville IL 60540
708-420-6417

Objectives:

1. For grades 9-12 (may be modified for younger).
2. Students will make a slide of onion root tips and observe different phases of mitosis.
3. Students will be able to state why cells divide.
4. Students will draw the different stages of mitosis and try to arrange them in order of division.
5. Students will demonstrate each phase of mitosis and the main characteristics of each.

Materials:

1. Prepared onion root tip mitosis slides.
2. In place of these and to promote interest, students may set up their own slides. Materials needed per slide are: fresh grown onion root tip, 5-10ml distilled water, 5ml 6M HCl, 1 ml Feulgen reagent in a vial, 5 ml 45% acetic acid, dropper pipette per solution, beaker, slide, coverslip, and a pencil with eraser or small cork to squash the slide. Materials needed per class are: 5-10 ml Carnoy's solution (1 glacial acetic acid : 3 absolute alcohol) in vial, 2-3 cups and onions, and toothpicks.
3. A microscope per student or pair.
4. Two different colored pipe cleaners cut at varied lengths to represent chromosomes for assessment (4 chromosomes per cell). I use 2 long and 2 short blue pipe cleaners and 2 long and 2 short red pipe cleaners connected with beads which represent the centromeres. This model would use the long pipe cleaners as a homologous pair of chromosomes and the short as another pair. Two pipe cleaners of each size and color are used to model replication. Each chromosome is composed of two chromatids.

Strategy:

This lesson would be used after cells have been observed with microscopes in the lab. After a review of cell parts, the teacher would exhibit the onion (or prepared slides) and explain that root tips have been cut for the students to observe. Explain that the stain to be used in this preparation is different because something will be noticeable that could not be seen in past labs (chromosomes). Try to have the students guess this by questioning them about the cells they are observing - i.e. dividing cells - and how these are different than previous cells observed. Nuclei were observed before but not the chromosomes.

LAB

Students are more eager to learn how to set up their own slides and observe them than to use a prepared slide with which they may be unfamiliar. Steps 1-8 explain slide preparation. Go to #9 if prepared slides are being used.

1. Advance preparation:
a. Take an ordinary yellow onion. Cut off any old root growth. Place the onion in a cup of water so that only the root portion is under water. To do this, push toothpicks into the side of the onion which extend outward and hold it on the rim of the cup. New roots should grow within two days.
b. Cut off .5-1 cm of growth at the root tip - enough for all the students.
c. Transfer immediately to Carnoy's solution. After 24 hours, roots should be stored in 70% ethanol in a refrigerator. This stops cell division.

(Steps 2-9 to be completed by students)
2. Obtain a root tip.
3. After obtaining the root tip, pour off the fixative and replace it with 2-5 ml distilled water. Solutions may be poured into a beaker or down the drain.
4. After 1 minute remove the water with a pipette and add 2-5 ml 6M HCl.
5. After 3 minutes carefully remove the acid and wash tissue off with distilled water. Agitate the vial for 1-2 minutes. Discard the water.
6. Use forceps to transfer the tissue to a vial containing 1-2 ml Feulgen reagent. The reagent may be added to this vial if desired. (CAUTION: this dye will stain hands and clothes permanently.) After 20 minutes use forceps to transfer the tissue to a vial containing 5 ml 45% acetic acid.
7. Place 1-2 drops of acetic acid onto a microscope slide and transfer the tissue to the drop. Using dissecting pins and razor blades tease and macerate the tissue into tiny pieces.
8. Place a coverslip over the macerated tissue trying not to get air bubbles under the coverslip. Press down firmly onto the coverslip with a small cork or pencil eraser to spread the cells in a very thin layer. Push down in a perpendicular direction and the coverslip should not break.
9. Once the slide has been prepared or obtained from the teacher, observe it and draw all the different views of cells present under high power. Be careful to observe the nucleus and chromosomes since this is what was not observed previously.

Discussion

1. During the 20 minute stain time (Step 6) it is important to have the students discuss what the cells are doing. Since these cells are in the root tip, they are rapidly dividing. During normal cell activity the chromosomes are unwound and too thin to be seen. During cell division, chromosomes thicken, take up stain and can be easily observed. The students should also try to come up with reasons why cells divide (possible answers: to grow, to repair or replace damaged cells, to reproduce, or to differentiate in the cell cycle of multicellular organisms). Although it is better to have the students elicit these, it may be necessary to give them some of the reasons since this is an introduction. Also at this time explain what is happening in interphase. Cells need to replicate the chromosomes before dividing to ensure that the newly formed cells contain the same genetic material (chromosomes).

2. What the students are observing is an ordered process by which the cells divide the chromosomes so that one copy of each goes to each new cell. Once they have drawn all the different views of cells they have observed, they should share them with their lab groups, the teacher and perhaps the class. Hopefully all the stages of mitosis have been observed and drawn. These can be put on the board or overhead so that the entire class can see all the phases/views and copy them onto their papers. It is not necessary to name the observed cells with a phase of mitosis, but it may be easier so that students can more easily

differentiate them and relate them to a new vocabulary term. Once all the students have drawings of all the phases of mitosis, ask them to arrange the pictures in a way which would show a logical sequence of cell division.

3. Have one member from each group explain what order they put the drawings and why they did it that way. After all students have explained their process, students may wish to choose the model that they think is best. Students should now look into their textbooks to find out what is happening in each phase and how the text organizes the phases of mitosis.

Assessment:

1. Students are to make a model of a cell which is in the process of mitosis and cell division. They should draw on their paper the border of a cell which is dividing. These need to be big enough so that the pipe cleaners can be put inside. There needs to be a cell border for interphase, prophase (perhaps one for early and late prophase), metaphase, a partially dividing cell for anaphase, a nearly totally divided cell for telophase, and two new cells for the daughter cells.

2. Students will take the pipe cleaners and place them in the "cells". They should arrange four "chromosomes" properly in the various phases of mitosis. The pipe cleaners may be taped or glued on the paper and a description written which describes the events occurring within the cell. The pipe cleaners may be manipulated and each phase described to the teacher. Students may work in groups of four and only one student from each group would be tested to save time evaluating the mitosis demonstration.

3. The teacher should determine the grading method, points or letter grade, but a recommended method would be: 5 for all the phases demonstrated exemplary in proper order with a detailed description of each. 4 for correct demonstration of phases and clear description. 3 for a generally correct model but lacking some clarity and detail. 2 for a partial demonstration, perhaps the phases are out of order or improperly shown and the description is incoherent. 1 for an incorrect demonstration of model and explanation.

Other notes:

1. For a multicultural emphasis on teaching, students can observe that different organisms have cells which look very similar. Different races and nationalities of people must have cells which are not distinguishable from each other.

2. It may not be necessary to use a visible pipe cleaner model to better understand mitosis, but when teaching meiosis the model is very good to demonstrate crossing over and variable gamete formation as well as differences from mitosis.

Return to Biology Index

Cell Size and Division or How Big Would You Want To Be If You Were A Cell

Nicholas DiGiovanni
1340 Wilshire Dr
Naperville IL 60540
708-357-8856

Naperville Central High School
440 W. Aurora Rd
Naperville IL 60540
708-420-6417

Objectives:

1. For all grades: to illustrate the usefulness of models to represent things which are too small (cells or molecules) or too large in science.

2. For primary grades: to learn to measure with a ruler, to cut a cube, and determine smaller particles react faster than larger particles.

3. For middle grades: to determine surface area and volume of a cube in addition to the above.

4. For upper grades: to determine the surface area to volume ratio and relate this to cell size, to determine why cells divide and 1-3 above.

Materials:

2500 ml 2% agar solution (sufficient for 15-20 set-ups or pairs)
a cake pan
phenolphthalein powder
1 250 ml beaker or cup
50 ml .4% NaOH solution
a metric ruler, stirrer or spoon, plastic knife, and paper towels

Strategy:

1.Advance Preparation:
Mix enough agar powder in boiling water to make a 2% agar solution. Use enough water to fill a cake pan to a depth of 3 cm (approximately 2500 ml). Stir until all the powder is dissolved. As the agar cools, add 1 g of phenolphthalein (if solid is unavailable, add several ml of liquid phenolphthalein indicator) per liter of solution and stir thoroughly. If the color is pink, add dilute acid drop by drop until the solution turns colorless. Pour the mixture into the cake pan to solidify. This will provide the agar for the model of the cells. If agar is unavailable, substitute potatoes, but then razor blades must be used and a dye found which will penetrate the potato in a short time.

2. Discuss models and their importance with the class. In this activity we will use agar blocks to represent cells.

3. Give the students a 6x3x3 cm block of agar cut from the cake pan, a plastic knife, and metric ruler. Ask them to cut three separate cubes 1x1x1, 2x2x2, and 3x3x3 cm from the block.

4. Ask the students, "If you were a cell which cell would you rather be (small, medium, or large) and why?" Write this down.

5. Ask the students to place the cubes into the beaker. Then the teacher pours

the NaOH into the beaker to just cover the cubes. (CAUTION: Sodium hydroxide is caustic and can burn the skin and eyes.)

6. The cubes should remain in the solution for 10 minutes. They should be stirred occasionally with the spoon. When the NaOH comes into contact with the agar blocks, the blocks and perhaps the solution will turn a pink color. The students enjoy this.

7. Depending on the grade level, students should be given a task to do while the cubes are "soaking". Primary grades may be asked if this were a cell, what type of things might move into it. Older students may be asked the same as well as to explain diffusion since this is what is happening. They should also be asked to set up a data table in which they determine the surface area, volume, and surface area to volume ratio for each cube.

8. After 10 minutes the cubes are taken out of the beaker with a spoon and dried off with a paper towel. The students should cut the cubes in half and measure the distance from the outer edge inward that has turned pink and record this.

9. Students will discover that the distance that the solution travelled in each cube is the same (5 mm). There is a pink border around the 2x2x2 cm and 3x3x3 cm cube, but the 1x1x1 cm cube is pink throughout. Ask if the pink represented food, water or something else needed by the cell to survive, which "cell" got the needed substance distributed to all its parts. They should see that the smallest cell is most efficient since it is pink throughout.

10. Mathematically, students should observe that the smallest cube has the largest surface area to volume ratio (SA:VOL). Therefore this illustrates that a large SA:VOL promotes better efficiency in moving things into and out of cells and thus survival. This can also be related to smaller particles reacting faster than larger particles in chemical reactions (i.e. Granular sugar dissolves easier than sugar cubes.)

Assessment:

Students can be asked which type cell they think would have a better chance for survival, one which is 1x1x1 cm or one which is .1x.1x.1 cm. They need to justify their response. 5 points for a proper mathematical as well as written explanation. 4 points for an explanation which is a little unclear. 3 points for a proper explanation but improper or no math. 2 points for an unclear explanation but shows thought. 1 point for an honest attempt.

The Effects Of Osmotic Balance And Imbalance In Living Cells

Wayne Brown
16561 So. Kenwood Avenue
South Holland, Illinois 60473
708-339-5197

Collins High School
1313 So. Sacramento Blvd.
Chicago, Illinois 60626
312-534-1500

Objectives:

1. Students will review the processes of diffusion and osmosis.
2. Students will prepare a wet mount of an elodea leaf in tap water and a wet mount of an elodea leaf in salt water for microscopic observation.
3. Students will observe and diagram cells of both wet mounts.
4. Students will distinguish between osmotic balance and osmotic imbalance in elodea leaf cells.

Materials needed:

microscope	cover slips	medicine droppers
microscope slides	elodea (water plant)	water
6% salt solution		

Strategy:

Begin the lesson by either reviewing the definition of diffusion and osmosis and/or by discussing the previous lab on the same topic.

Diffusion - the gradual movement (spreading out) of molecules from an area of greater (higher) concentration to an area of lesser (lower) concentration.
Osmosis - the movement of water and dissolved materials from an area of greater (higher) concentration to an area of lesser (lower) concentration through a semi-permeable membrane.
Divide the activity into Part A, osmotic balance, and Part B, osmotic imbalance. Students may work individually or in pairs.

Part A: Osmotic Balance

1. Prepare a wet mount of an elodea leaf in tap water for microscopic observation.
2. Observe the cells of an elodea leaf under low and then high power of your microscope. Locate a single cell along the leaf edge. Observe the location of the chloroplasts in relation to the cell wall.
3. Save this slide for Part B.

Part B: Osmotic Imbalance

1. Prepare a second wet mount using another elodea leaf. Use 6% salt solution instead of tap water.
2. Let the wet mount stand for two to three minutes and then observe cells of this leaf under high (dry) power.
3. Place the tap water slide on the microscope stage next to the saltwater slide.
4. Compare the saltwater leaf to the tap water leaf by simply switching back and forth from one slide to the other while viewing under high power.
5. Check the saltwater slide carefully. Observe the location of the

chloroplasts in relation to the cell wall when viewed under high power.

6. Diagram, on a sheet of unlined paper, a single cell from each slide. Label the cell wall, plasma membrane and chloroplast in both cells.

Conclusion:

When living cells are placed into any environment where there is a higher water concentration inside the cell compared to outside the cell, water loss called plasmolysis, can result. This may be harmful to the cell. However, most cells live in an environment where the movement of water in and out of the cell is equal. Therefore the cell is in "osmotic balance" and there are no harmful effects to the cell.

Evaluation:

Use the following information to help you answer these questions:
(a) Elodea cells normally contain about 1% salt and 99% water.
(b) Tap water normally contains about 1% salt and 99% water.
(c) Salt solution contains 6% salt and 94% water.

1. What observable change is seen in the cells showing an osmotic imbalance?
   Explain your answer.
2. What observable change is seen in the cells showing an osmotic balance?
   Explain your answer.
3. In the wet mount using salt solution, where was the higher concentration of water located at the start of this experiment? Where was the lower concentration?
4. According to osmosis, water moves from areas of high concentration to areas of low concentration. In which direction should water move in the cell of Part B? What evidence do you observe to support this?
5. What term describes the condition of a cell when it loses water?

Return to Biology Index

Cells, The Structural and Functional Units of Life

Carollyn V. Warlick
7515 So. Normal Street
Chicago, Illinois 60620
312 731 6756

South Shore High School
7500 South Constance Street
Chicago, Illinois 60619

Objective:

In this exercise you will

A. Have a working knowledge of the vocabulary applicable to plant and animal cells and the organelles within each cell.
B. Observe the general structure and organelles of cork cells, plant cells and animal cells using iodine and methylene blue.
C. Apply your knowledge of lab equipment, chemicals and operations of the microscope.
D. Discuss the similarities and structurally diverse differences between eukaryotic and prokaryotic cells.
E. Observe the structure of:

1. ELODEA 2. ONION 3. CHEEK 4. CORK

(Draw, label and identify whether plant or animal; prokaryotic or eukaryotic.)

F. Identify major differences between plant and animal cells.
G. Student will be able to list principle functions of each cellular organelle.
H. Students will be able to identify and state the characteristic that is unique to eukaryotic cells, that is, the compartmentation; a sequestering of functional metabolic machinery.
I. Students will have an understanding of the structure and functions of the cells.
J. Be able to identify cells by size and shape whether unicellular, multicellular, plant or animal.

Materials:

Compound Microscope	Cork Stopper
Scalpel or Single-edged razor blade	Onions
Cover Slip and Slides	Elodea
Flat Toothpicks	Cheek cells (taken in class)
Forceps	Lugol's Iodine
Paper towels; Kleenex	Methylene Blue and Water

Recommended Strategies:

Have the students prepare work stations with

1) paper towels
2) microscope
3) gather materials from stations set up in class room necessary for lab.
4) use alcohol for cleaning lab areas after experiment. Each table will have an onion wedge, a stem of elodea and a cork stopper.

CAUTION STUDENTS ON:

1. Use of iodine and methylene blue because of damage to clothing and discoloring of skin.
2. Iodine inhaled can be hazardous to your health.
3. Use of sharp objects: take necessary precautions.

Return to Biology Index

A Hands-On Approach to Teaching the DNA Structure and FUNCTION

Carter, Linda
812 W. Junior Terrace
Chicago, Illinois 60613
327-0598

DuSable High School
536-8600

Objective:

To understand the structure of DNA and the way in which DNA duplicates by building simple models of DNA and its components.

Apparatus Needed:

Large and small paper clips, 5 cm lengths of colored pipe cleaners, styrofoam blocks.

Recommended Strategy:

1. Suggested use of materials:
   Large paper clip to represent deoxyribose sugar
   Small paper clip to represent phosphate group
   Yellow pipe cleaner - adenine base
   White pipe cleaner - thymine base
   Red pipe cleaner - guanine base
   Orange pipe cleaner - cytosine base

2. To form a nucleotide, hook a large paper clip to a small paper clip. Then take a short piece of pipe cleaner and fasten it to the center of the large paper clip. Remember what each of these represents.

3. Put half of your nucleotides to one side (two of each color). These will be used later as your free nucleotides. Line up the remaining nucleotides in one row and write down their order, then determine what the other side of the ladder would have to be to match. Do this about three times to familarize yourself with the order in which the bases pair.

4. Make a flat model of DNA, using the nucleotides you have before you, hook half the clips together (using one of each color), making sure the large and small clips alternate to form one side of the ladder. Using the four remaining nucleotides, match the bases in proper order, hook the pipe cleaners together and then hook the clips together to form the sides.

5. To show replication, unhook the pipe cleaner bases from each other to form two chains. Now using your free nucleotides that you put to

the side, match them in their proper order and fasten the bases and paper clips together to form two DNA molecules.

6. To make a three-D model, use two pieces of styrofoam and one of the flat DNA models. Straighten out the two paper clips at each end and press them into the styrofoam strips. Hold a styrofoam strip in each hand, stretch out the model, and twist slightly to give a spiral staircase effect.

Part II: mRNA STRUCTURE and TRANSCRIPTION

Objective

To use the DNA model to build a model of mRNA which will demonstrate its structure and the way it is formed by transcription.

Apparatus Needed:

Models from Part 1, the same materials, plus large colored paper clips to represent ribose, and green pipe cleaners to represent the uracil base.

Recommended Strategy:

1. Use the materials to form nucleotides of mRNA, at least two of each of the four bases.

2. Use the flat model of DNA from Part 1 and your mRNA nucleotides to demonstrate transcription. Unhook your flat molecule at its bases. Match the mRNA nucleotides in their proper order (keep in mind that thymine is replaced by uracil).

Evaluation

For a follow up assignment write a report describing the structures of DNA and mRNA and the processes of replication and transcription.

Return to Biology Index

PLANT AND ANIMAL CELLS

Will White
Copernicus School
60l0 Throop Street
Chicago, IL
1-312-925-2549

OBJECTIVES:

1. Being able to identify parts of plant and animal cells and to describe function(s) of each part.

2. Being able to distinguish between plant and animal cells.

MATERIALS:

Solution of sodium borate (see attached)
Solution of polyvinyl alcohol (see attached)
Zip-lock transparent sandwich bag for each pupil
Modeling clay
Saran Wrap
Lima bean seeds - dyed
Dry rice - dyed
Peppercorn
Packing material bubbles
Overhead projector
Transparencies
Containers - McDonald`s hamburger boxes and petri dishes

STRATEGIES:

1. Abstract to Concrete
   a. Develop vocabulary and describe functions associated with each organelle by:
      (1) Listing the following on chalkboard and discussing functions:
      plasma membrane cytoplasm nucleus cell wall
      vacuole mitochondria ribosomes chloroplasts
      nuclear membrane
      (2) Use overhead projector and transparencies to show plant and animal cells to reinforce structure name and function of each part.
   b. Construct models of plant cell and animal cell by adding mixture of polyvinyl and sodium borate into sandwich bags. To this mixture add organelles (nucleus-clay nuclear membrane-saran wrap vacuoles-bubbles mitochondria-dyed dry rice ribosomes-peppercorns embedded in thin rolls of clay) (cell wall and chloroplasts-hamburger container and dyed lima beans added to plant cell.
   c. Review with worksheet that requires students to distinguish between plant and animal cell and describe functions of each organelle.
2. Concrete to Abstract
   a. Worksheet used as guide in constructing models of plant and animal cell.

b. Names and functions of each organelle discussed as each item is added.

c. Review structures and corresponding functions through use of chalkboard and overhead projector.

2

REQUIRED MIXTURES

1 liter-polyvinyl alcohol mixture

l. Using magnetic automatic stirring hot plate and large beaker, heat l liter of distilled water to boiling.

2. 40 grams of polyvinyl alcohol powder added gradually (approximately 2 or 3 grams at a time) until dissolved. Continue adding polyvinyl powder until 40 grams have been dissolved in l liter of distilled water.

100 milliliters-sodium borate - Mix 4 grams of sodium borate powder to 100 ml of tap water in container.

Return to Biology Index

Eartha Sherrill - Daniel Hale Williams School

People Are Like Peas in a Pod

Eartha Sherrill
11337 South Normal Avenue
CHICAGO IL 60628

Daniel Hale Williams School
2710 South Dearborn Street
CHICAGO IL 60616
(773) 534-9226

Objective(s):

The objectives of these activities are:

1. To observe and appreciate the diversity of individuals within a population.

2. To promote student understanding of how dominant traits, recessive traits, genotypes, and phenotypes help produce variation in a population.

3. To demonstrate how to construct a Punnett Square.

These activities are designed for grades 5 - 8.

Materials Needed:

Activity One
- 1 dozen intact fresh pea pods
- a roll of paper towels

Activity Two
Enough materials for groups of two.
- styrofoam cups
- one-half cup of black-eyed peas
- plastic or metal tray
- metric ruler
- graph paper
- Science notebook

Activity Three
- 2 pieces of 8-1/2" by 11" black or dark colored construction paper cut into 4 parts, each about 2 1/2" by 8 1/2"
- 2 pieces of clear transparency film cut into four parts

Strategies:

Activity One
1. Write the words population, species, and variation on the blackboard.
2. One member from each group will obtain a pea pod.
3. Have each group examine a pod to observe the variations in pea size. When students open the pods, they will notice that the peas near the center are larger. Why? Are the peas constricted? This can lead to

a discussion of heredity and environment.

4. Relate the terms species, population, and variation to the pea pods.

Activity Two

1. Have students form groups of two and have one member from each group get the supplies.
2. Point out that the cup of peas is the group's sample population and that they are looking for variations within that sample.
3. Ask students to pour the peas onto the tray so they can see all the peas at once. Each group should look for ways the peas are similar or different.
4. Tell each group to choose three differences (variables) including one that can be measured with the ruler.
5. Monitor the class as they decide which characteristics of peas they will select. Those who can't find any characteristics other than color, texture, or size might need a little prodding. Ask those students a question such as, "What other differences do you see?"
6. Taking one variable at a time, students should sort their peas on the tray, then write the variable and record the number of peas showing that characteristic in their notebook.
7. Students will take the results for each variable and plot the number of peas on the graph paper. (A bar graph works well.) Place a model on the chalkboard as an example.
8. Have those students who finish the sorting, classifying, and plotting before others, compute the data percentages and record them in their notebook.
9. When the class has finished the assignment, have each group share their results. Write the results on the chalkboard and discuss the similarities and differences between the findings of each group. Some questions to consider for discussion: Why are some peas wrinkled or small? Why are there differences between samples?

Activity Three

1. Discuss and write the terms dominant trait, recessive trait, genotype, and phenotype on the blackboard. Have students write the definition for each in their notebook.
2. Place students in groups of two and have one member from each group get the materials.
3. Explain to students that they have two pieces of dark construction paper and two pieces of clear plastic. Say "The dark paper represents a dominant gene and the clear plastic represents a recessive gene." In the activity, use the words "dark" or "clear" to describe the phenotype and the letters "D" for dominant and "d" for recessive to describe the genotype.
4. Write the following instructions on the chalkboard.

   Describe the genotype and phenotype.

   1. Place one dark strip on top of the other dark strip. Result?
   2. Place one dark strip on top of one clear strip. Result?
   3. Place one clear strip on top of one dark strip. Result?
   4. Place one clear strip over the other clear strip. Result?

5. Discuss and demonstrate the results on a Punnett Square. Then show students how to show inheritance through three generations.
6. Provide students with a list of dominant genes in humans. Working in pairs, students will select one human trait and demonstrate three

generations on a Punnett Square.

7. Individual groups will write their results on the chalkboard. Then each group will discuss the accuracy of their results.

Performance Assessment:

Students will write a paragraph explaining how inheritance of dominant and recessive genes helps produce variation in a population.

Conclusions:

Dominant and recessive genes can contribute to variation in a species. Variation is necessary for the survival of a species.

Mathematics/Physics

DNA Extraction with Kitchen Chemistry

Donna M. Bronson
2921 S. Michigan Ave.
Chicago IL 60616

John B. Drake
2700 S. King Drive
Chicago IL 60616
(773) 534-9130

Objective(s):

Students will learn that you can extract DNA from various foods that are found in your refrigerator. This lesson is designed for middle school grades.

Materials Needed:

Dry split peas, Blender (optional), Dish detergent, Toothpicks, Meat tenderizer, Small Glass Containers, Alcohol, Onions, Yeast, Brocolli, Raw chicken liver, Strainer

Strategy:

Students will follow these procedures for DNA Extraction:

Step 1.

1. Measure out 1 cup of water, ¼ cup of peas, and ¼ tsp. of salt. Stir until salt is dissolved. Leave the peas in water until softened. (I would soak the peas overnight to soften them.)
2. Put the peas and the salt water in the blender and chop for just a couple seconds. You may use a fork to squash the peas. The mixture should be lumpy, containing small pieces of peas. Too much blending will break up the DNA and make it too hard to see.
3. Gently mix the peas and water from the blender with a few drops of soap in a new container.

Step 2.

1. Put the pea mixture in the strainer.
2. Filter about 1/3 cup of the liquid into a small glass container.
3. Wet the end of a toothpick and dip it into the meat tenderizer.
4. Put the end with the enzymes in the cell mixture and gently stir.

Step 3.

1. Slowly pour in an equal amount of alcohol (about 1/3 cup)
2. The alcohol will form a layer on top of the cell debris.
3. Watch carefully as the DNA precipitates through the alcohol. The DNA is clear. Small bubbles will attach to the strands as they migrate up through the alcohol. Use the toothpick to gently stir the alcohol layer. Notice how those strands move like snot. The snotty substance is the DNA.

Performance Assessment:

Now that you have extracted DNA from peas, think about each step of the procedure and why it works.

How did each of the ingredients in the demonstration help extract DNA from the other parts of the cell?

What part of cells would be most affected by soap?

What is it in meat tenderizer that breaks down meat?

Alcohol and salt: Why does only the DNA, and not the other parts of the cell, rise to the top after addition of alcohol?

Biology/Chemistry

Monstrous Mutations

Pamela S. Moy
6101 West 63rd Street
Chicago IL 60638

Morgan Park High School
1744 West Pryor
Chicago IL 60643
(773) 535-2550

Objective(s):

Middle School to High School

- To understand and observe mutations.
- To recognize and adapt to mutations
- To observe how mutations effect survival skills

Materials Needed:

Nine dry peanuts in shell (per group of three students)
Blanket for the peanuts
Table or desk
One cup (per group of three students)
15 plastic knives
Six pairs of goggles
Cotton
Stop watch
Large roll of duct tape or masking tape
String
Paper bag containing the letters A through H on slips of paper

Strategy:

1. Students should form groups of threes. Each student will simulate an animal that can only digest peanuts as its food source.
2. Unfortunately, random mutations have produced some unusual characteristics in recent offspring. Each group will find out what mutation they represent by selecting a letter from the paper bag the teacher has provided.
3. The letter drawn will correspond to the characteristics listed in Chart 1. This letter will also represent the letter of each group's home location and storage cup.

Chart 1

Letter drawn by groups	Characteristic produced by mutation
A	Long fingernails (produced by plastic knives taped to fingers with tape)

B	No fingers (produced by taping each hand closed)
C	Lack of peripheral vision (produced by putting on goggles and stuffing cotton in the sides to prevent viewing from the side)
D	Hands fused together in front of body (produced by placing hands together in front of body and taping them together)
E	Feet and ankles fused together (produced by taping the ankles tightly together with tape)
F	No arms (produced y taping the arms down to the side of the body with tape)
G	Arms fused together behind the back at the wrists (produced by placing arms behind the back and taping tightly at the wrists)
H	Blind (produced by using goggles taped over securely with tape)

Each group should attain the proper materials and prepare itself to represent the characteristic produced by the letter of the mutation selected from the paper bag.

5. Each group should begin the activity at the specified location in Figure A. The goals of each group are to:

A. Gather the food (nine peanuts per group)

B. Store the food for later use (place the nine peanuts in your letter-designated container).

C. Retrieve the food at a later time (remove the nine peanuts from the container and return with the peanuts to the home location).

D. Process and consume the food (remove the peanuts from the nine shells and consume these peanuts).

6. To begin the activity, each group should position itself at its specified home location. The teacher will start the stop watch and each group will begin with food gathering. Group members should proceed to the blanket containing the peanuts and gather nine peanuts per group. These nine peanuts should then be transported to a container. The three group members should return to their home location. At this point, the group will proceed back to the plastic container to retrieve its food. Once the group has removed all nine peanuts, it will return to the home location. The

group will open the peanut shells and remove the contents. Each group member will consume the contents of three of the peanut shells at the completion of this process, the amount of time required to achieve this will be recorded.

7. Each group will continue until the peanuts have been consumed and time has been recorded.

8. The teacher will write the times required for each group to complete the process on the chalkboard (a bar graph can be made).

Performance Assessment:

Successful completion of activity

DNA/Genetics

Sandra E. Broomes
P.O. Box 20198
8720 S. Ashland
Chicago IL 60620

William T. Sherman School
1000 W. 52nd St.
Chicago IL 60609
(773) 535-1757

Objective(s):

grades K-9

understanding DNA, which is the genetic material for every person and every other living thing

Materials Needed:

Materials are listed for groups of 2-4.

Project 1. - 1. Large grape 2. Sandwich size ziplock bag 3. Lemon Jello

Project 2. - 1. Masking tape 2. 2 pennies 3. Marking pen 4. Pencil 5. Ruler 6. Sheet of typing paper 7. Small hand towel

Project 3. - 1. ZOOB

Project 4. - 1. Scissors 2. Model of double helix

Project 5. - 1. Sculpt hubs

Strategy:

Project 1

1. Mix Jello ingredients.
2. Let Jello cool at room temperature.
3. Pour the Jello into the ziplock bag.
4. Seal the ziplock bag.
5. Place the ziplock bag into the refrigerator.
6. Let it chill for about 3 to 4 hours in the refrigerator.
7. Remove the Jello from the refrigerator and open the bag.
8. Use a finger to insert the large grape into the center.
9. Reseal the bag and then put the bag on a flat surface.
10. Observe its shape as it is now.
11. Gently squeeze the bag.
12. Observe as you squeeze the bag.

Project 2

1. Place one small piece of tape on the front and back of each penny.
2. Use the pen to write a capital E on one side of each penny and a lowercase e on the other side.
3. Use the pencil, ruler, and paper to prepare a chart.
4. Stretch the towel out on a table.
5. Hold both coins in your hands and shake them back and forth several times, then toss the coins together over the towel.
6. Put an X on your chart under "Trail 1" and next to the letter combination showing coins.
7. Toss the coins three more times, recording each letter combination under Trail 1.
8. Repeat steps 5 through 6 two more times, recording the results of each trial.

Project 3

1. Sort out the different pieces.
2. Connect the different pieces to form a double helix.

Project 4

1. Cut out the four pages from the book.
2. Looking at the inside of the model score along all score lines.
3. Cut out precisely and fold into hill and valley.
4. Fold as it is indicated and crease firmly.
5. Glue all 8 pieces together using the letters A through G in alphabetical order to make a single large net.
6. Crease paper and check how the paper folds to form the double helix.
7. Start gluing with flap number 1.
8. Work in numerical order from 1 to 13 until the double helix is completed.

Performance Assessment:

Students will be assessed on the following items:

- journal writing entries
- examples of cells
- model of double helix and nucleotide models
- oral and written presentation of their group report

Groovy DNA Beads

Celestine M. Jeffreys
5342 South Harper
Chicago IL 60615
(312) 643-2139

Hales Franciscan High School
4930 South Cottage Grove
Chicago IL 60615
(312) 285-8400 x69

Objective:
This lesson is designed for 7th - 10th graders. The main objective of this mini-teach is provide students with a hands-on experience matching DNA nitrogenous base pairs, arranging nucleotides into codons, and visualizing the size of a single gene.

Materials Needed:
(For Pairs of Students)
--Plastic beads (the type which you can string), approximately 1,000. You should have 6 **distinctly different** colors.
--String (3 strings per group), approximately 2.5 feet long.
--Plastic baggies (1 for each group).

Strategy:
Note: place at least 42 beads in each bag, making sure that you've given each pair of students a wide variety of all 6 colors. You must give out all 1,000 of the beads in the baggies. Place the three strings in the baggie. Although I've used green, pink, blue, yellow, orange and purple in this write-up, you aren't limited to these colors. But you need to choose the colors which will represent each nitrogenous base.

A **nucleotide** of DNA is made of three parts: a nitrogenous base (the part we're going to work on); a 5-carbon sugar called **deoxyribose**; and a phosphate group. There are four nitrogenous bases of DNA **A, G, C, T** (Adenine, Guanine, Cytosine and Thymine).

1) The beads in your plastic bag represent one of the four nitrogenous bases. For now, set aside the orange and purple beads.
2) Green represents A; pink represents G; blue represents C; yellow represents T. So each color represents a **nitrogenous base** of DNA. Write the colors in the space below:

A = _____________ G = _____________ C = _____________ T = ______________

3) Take both of the strings out of your bag and tie a knot in one end of the string. The knot should be secure, but not tight.
4) In a reasonably random order (in other words, don't string AGCTAGCT), string 21 beads on one of your strings. In the space below, write the nitrogenous bases you have strung together.

-- --
(string #1)

DNA stands for **deoxyribonucleic acid** and is unique in a few ways: A, G, C, T (adenine, guanine, cytosine and thymine) are the nitrogenous bases; it is inside the nucleus; it is always double stranded. Now that you have made one strand of DNA, you are going to make its **complementary** strand. In order to make a complementary strand of DNA, you need to know that green and yellow (adenine and thymine) are **base pairs**; blue and pink are **base pairs** (cytosine and guanine).

5) In the space below, write the color of the other part of the nitrogenous base pair. The first one is written for you.

A = green ----> T = yellow
T = yellow ----> A = _______
G = pink ----> C = _________
C = blue ----> G = _________

6) On the first line, again write the nitrogenous bases you strung together. On the second line, write the other part of the nitrogenous base pair. In other words, if you strung together ACCGTTA on the first line, then on the second line you'd write TGGCAAT. This is called **base pairing** because the nitrogenous bases A and T (adenine and thymine) are paired, as are C and G (cytosine and guanine).

-- --
(string #1)

-- --
(string #2)

7) Now that you've written the complementary strand of DNA, use the other string in your bag to string together the beads that represent each nitrogenous base. Put a loose knot at the other ends of both strings.
8) Hold both strings at both ends. Make sure that the **base pairs** are touching. Gently twist the two strands to the right. You've created a **double helix.**

MAKING A COMPLEMENTARY STRAND OF RNA

RNA stands for **ribonucleic acid.** RNA is similar to DNA with two differences: the 5-carbon sugar is a ribose instead of deoxyribose; and RNA does not have thymine, instead RNA has **uracil**. So, green is paired with purple (adenine with uracil); yellow is paired with green (thymine in DNA is paired with adenine in RNA); and pink is still paired with blue (guanine with cytosine).

1) You'll now use the purple beads which will represent U (uracil).
2) In the space below, write the color of the other part of the nitrogenous base pair. The first one is written for you.

DNA	RNA
A = green -------->	U = purple
G = pink ------>	C = _________
C = blue ------>	G = _________
T = yellow ------>	A = _________

3) On the first line below, again write the nitrogenous bases (string #1) of DNA. On the second line, write the corresponding RNA strand. So that if you string together ACCGTTA, you'd write UGGCAAU.

-- --
(DNA string #1)

-- --
(RNA string #1)

4) String the beads which represent the **nitrogenous bases** of RNA.

CODONS

DNA **transcribed** into RNA will (eventually) make proteins. Proteins are important because they control biochemical pathways within the cell, direct the making of essential compounds like lipids, carbohydrates and nucleotides, and are responsible for the structure and movement of the cell. A protein "begins" as a sequence of **codons**. Codons are 3 nucleotides of RNA. So that if you had UGGCAAUCG --> UGG is a codon; CAA is another codon; UCG is the third codon in this string of RNA.

1) Again write down the RNA strand (RNA string #1) you've made and put a slash between each codon.

-- --
(RNA string #1)

2) Separate the codons on your string by making a 1/4" - 1/2" space in between the beads.
3) How many codons did you get? ________________

THE GREAT LEAP FORWARD

Now that we've been working with nitrogenous bases, let's take a leap into chromosomes.

1) Using all three strings, string all of the beads in the baggie (in random order).
2) Put a loose knot on both ends of the strings.
3) Have the students hold each string horizontally. They should stand next to one another with the ends of the strings touching. They are representing one strand of the double-stranded DNA.
4) We have approximately 75,000 to 100,000 genes in human cells. A single human gene has about 10,000 nitrogenous base pairs. If the class holds only 1,000 base pairs, how many more classes and how many more beads would we need in order to represent a single human gene? __________ and __________
5) EXTRAPOLATION: how is it possible to get all that genetic information inside one chromosome? (answer: genes portions of DNA which is **coiled** inside a chromosome)

Performance Assessment:
Students will be able to:
- identify the four nitrogenous bases of DNA;
- identify the two base pairs of DNA;
- describe the shape of a DNA strand;
- identify the four nitrogenous bases of RNA;
- identify the two base pairs of RNA/DNA;
- explain the size of a codon;
- explain and visualize the size and number of human gene(s).

Conclusion:
The concept of DNA/RNA base pairing and formation of codons is difficult for students to understand and visualize. This activity is inexpensive and easy.

Wearing My Genes: Basic Principles of Heredity

Anita Jacobs
7939 S. Jeffery
Chicago IL 60617

Horace Mann
8050 S. Chappel
Chicago IL 60617
(312) 535-6640

Objectives:

This lesson is for special education 5-8th grades. Students will be able to:

1. Explain what heredity is.
2. Distinguish the difference between the dominant and recessive genes.
3. Explain the difference between phenotype and genotype.
4. Predict the results of a monohybrid genetic cross using the Punnett Square.

Materials Needed:

1. Punnett square (drawn on 8 1/2" X 11 sheet of paper)
2. mirrors
3. marshmallows (marshmallow stars have different shapes and colors)
4. construction paper

Strategy:

An explanation of what heredity is, with student questions and responses. The students, grouped in two's, will be given a drawing of a pair of jeans, on the pants pocket the students will find their sex chromosomes, either an XX=female or XY=male. Students will be given an explanation of what the sex chromosomes are. Students are then given a mirror, taking a look at themselves, the students explain what they see. The students will see that everyone has different or similar traits that are passed from their parents.

Activities

1. Using a peek-a-boo writing paper, students will write a description of what they see.

2. Given a worksheet titled "Designer Genes", students will do the following activities: An explanation of what a dominant and recessive gene is given in the directions. (Ref. **The Human Body.**) For example, some of the traits discussed on the worksheet are:

   a. Examine the eye color (dark is dominant; blue is recessive)
   b. Look for dimples (presence of dimple is dominant; absence is recessive).
   c. Look for attached or unattached earlobes (unattached is dominant; attached is recessive).
   d. Ability to roll tongue into a u-shape (ability is dominant; inability is recessive).

3. The students will pick one of the above traits and write a possible genotype for the characteristics they can observe (called phenotype). For instance, if a person can roll her tongue, she could have either a

RR genotype (the presence of two dominant genes) or **Rr** (the presence of one dominant and one recessive gene called **hybrid**).

4. Students will then use a Punnett square to write their findings. Draw a square making 4 boxes. Working in pairs, one student will put his genotype at the top of the box. The other student will put her genotype on the side of the box. The letters at the top and left of the square represent the genotypes.

	D	D
D		
d		

   a. After the crossing of each genotype from the female on the side of the square and the male on the top, the students will then have their possible genotypes and phenotypes of the offspring.

	D	D
D	DD	DD
d	Dd	Dd

5. As a manipulative, use marshmallows of varied sizes and colors to represent the genotypes of the parents and the possible genotypes of the offspring.

   a. Students will use the same characteristic as in step #3. Have students choose marshmallows which will represent the dominant and recessive genes.

   b. Using the 4 boxes, the students will place their marshmallows in the appropriate boxes according to the genotypes.

6. Next, give students a copy of a **karyotype**. A karyotype is a picture of the 23 pairs of human chromosomes. In order to prepare, you should first label each chromosome pair, one with a letter (a for example) and the other half of the pair with a number (1 for example). Students will cut the x's and will match appropriate pairs of chromosomes, starting with 1a, 2b, etc, and then paste or tape the pairs on construction paper.

Performance Assessment:

Given a puzzle vocabulary the students will try to put together the meaning of the vocabulary words:

1. heredity
2. gene
3. genotype
4. phenotype
5. dominant gene
6. recessive gene
7. offspring
8. Punnett Square
9. hybrid

Students will construct a Punnett square, and will explain how we inherit traits.

Conclusion:

From these activities the students will learn:
- what dominant and recessive genes are;
- how to write a genotype and a phenotype;
- distinguish between the genotype and the phenotype.

The students will have a better understanding of what heredity is.

Return to Biology Index

Inheritance in Maize (Indian Corn)

Renee Allen
l466 W. 113th Place
Chicago, Illinois (60643)

Louis Wirth Experimental
4959 South Blackstone
Chicago, Illinois (606l5)
(312) 535-1410

Objectives:

To calculate the phenotypic ratios for some monohybrid and dihybrid crosses.

To determine the genotypes of parents from the phenotypic ratios of their offspring.

Materials needed:

mutant corn ears
pencil and paper
straight pins
calculators

Background:

Commercially available corn represent crosses between various parental genotypes. Results of a cross between pure-breeding purple kernel corn and pure-breeding yellow kernel corn produces offspring which are all purple (demonstrating dominance). A cross between two of these offspring produce 3/4 purple and 1/4 yellow kernel corn. These are the commercially available ears.

Strategy:

Obtain ears of corn representing offspring of crosses from various mutant and wild type plants from a biological supply company. Divide the class into groups of two or three. Give each group an ear of corn. Place a pin at one end of a row of kernels to mark your starting row. Using a pencil to point to the kernels, one partner should indicate the phenotype of each kernel while the other partner keeps a tally.

Each ear of corn is labeled with a code.

Conclusions:

1. For each ear of corn, calculate and record the ratio of the phenotypes. Divide the number of purple by the number of yellow. Also, divide the number of starchy by the number of sweet.

2. From the data, determine the genotypes of the parents in each cross.

3. How do the actual offspring phenotype ratios compare with the expected ratios?

Traits

Jennifer Wesley
4853 S. Kimbark
Chicago, Il 60615
312-924-4426

Scammon Elementary School
4201 W. Henderson
Chicago, Il 60601
312-794-8175

Objective:

Grade level 6

Students will understand that certain physical traits are inherited from their parents through the genes.

Materials needed:

posters, chalkboard, collage, and activity handout

Strategy:

Review with the students Mendel's experiments with the pea plant.

Bring in posters of animals and their offspring. Students will recognize their likenesses and differences.

Students will turn toward their partners and observe their physical traits such as eyes, hair, cheekbones etc.

Demonstrate to the students the Punnet Square with the use of the chalkboard.

Discuss the game the "Happy Gologg".

Students will complete the activity sheet using the mirrors in which they will check their own physical traits for their own recessive and dominant traits.

Conclusion:

This lesson will conclude the unit on determining traits in an organism.

References:

Science: Teacher's Edition - 6, published by Addison-Wesley, 1989, source for the game "Happy Gologg"

Return to Biology Index

Principles of Heredity

Williamson, Morris
1202 E. 161st Place
So. Holland, Il. 60473
(312)596-4560
Esmond School
238-6243

Objectives:

To learn the role of genes in inheritance
To understand the idea of dominant and recessive genes
To understand the role of chance in the inheritance of traits

Apparatus needed:

craft sticks or tongue depressors, construction paper
colored markers, self-adhesive labels, 5/16" x 1/2"
2 transparencies, overhead projector

Recommended strategy:

The labels are applied to the craft sticks, which will represent chromosomes, in different positions for each trait. The labels represent genes. Seven traits are being considered: stem length, flower position, seed shape, seed color, seed coat color, pod shape and pod color. Different colored labels are used to represent the various traits. There should be a pair of sticks for each dominant and each recessive trait. A capital letter is used for the dominant trait, and a lower case letter for the recessive trait.

Make a key for the traits for a garden pea plant, and give one to each student. Make a transparency diagramming meiosis using letters in lieu of sex cells. Make another transparency of a Punnet Square, diagramming the cross of the F1 gametes from the first transparency. Have a vocabulary sheet with the following information and definitions: Gregor Mendel, dominant character, recessive character, alleles, homozyous, heterozyous, hybrid, genotype, phenotype, Law of Dominance, Punnet Square, F1, F2, trait, gene and heredity.

Begin the lesson by showing pictures of animals from the same litter and ask about their similarities and differences. Ask if they have noticed any similarities and differences among family members. Lead into the concepts of inheritance and heredity.

Lead into the fact that the study of heredity is called genetics. Pass out chromosome sticks and the nucleus cut from construction paper. Review meiosis and ask what the sticks and labels are representative of based on our study of meiosis. Use the chromosome models to lead into the concepts of: chromosome pairs, genes, dominant trait, recessive trait, heterozyous, genotype and phenotype. Discuss the meanings of the various word roots and go over the definitions on the vocabulary sheet. When discussing each concept, use the board to illustrate each. The students should also be moving and grouping their chromosome/gene models in the "nucleus" to correspond with each concept. Ask the class to give the genotype and phenotype of their various combinations.

Introduce to the Punnett Square by randomly shuffling two homologous sets of chromosome sticks and asking them what combinations they think might occur when you separate into pairs. Discuss chance and ask what games of chance with which they are familiar. Tell them that the Punnett Square is a method of determining the probability of certain combinations.

Use the transparency with letters for gametes and discuss what would be the result of a cross between F1 offspring. Then introduce the transparency with the Punnett Square and diagram results.

Now, on their own have create various gene combinations with their chromosome models. Have them describe the genotype and phenotype. Give examples of various F1 crosses to use with a Punnett Square. Also, have them list traits that they have in common with their parents, grandparents or other relatives.

Return to Biology Index

BEANS AND GENES/GENETIC PROBABILITY

JOYCE CRAFT

HYDE PARK ACADEMY
6220 S. STONY ISLAND AVE.
CHICAGO, IL 60637
1-312-947-7180

OBJECTIVES:

1. DISTINGUISH **EXPECTED** AND **OBSERVED** GENETIC RATIOS.
2. DEMONSTRATE THAT IN GENETIC CROSSES, AS THE NUMBER OF OFFSPRING INCREASES, THE DIFFERENCE BETWEEN OBSERVED AND EXPECTED RESULTS DECREASES.
3. DEMONSTRATE THE PRACTICAL APPLICATIONS OF GENETIC PROBABILITIES.

MATERIALS:

EACH TEAM NEEDS 2 BOXES*; 100 RED BEANS; 100 WHITE BEANS;
CALCULATOR (OPTIONAL).
NOTE- RED AND WHITE BEANS SHOULD BE THE SAME SIZE & AND SHAPE.

STRATEGIES:

EACH BOX REPRESENTS A PARENT ORGANISM. EACH BEAN REPRESENTS A GENE. EACH BOX WILL CONTAIN 100 BEANS. IN EACH CROSS, A RED BEAN REPRESENTS A DOMINANT GENE (R=RED) AND A WHITE BEAN REPRE- SENTS A RECESSIVE GENE (r=WHITE). THE CONTENT OF EACH BOX IS DETERMINED BY THE GENETIC MAKEUP OF EACH PARENT. THE CLASS IS SEPARATED INTO LAB TEAMS OF 2 OR 3 STUDENTS EACH. 2 MEMBERS OF THE TEAM WILL **EACH** HAVE A BOX OF 100 BEANS. THE THIRD PERSON RECORDS THE DATA.

THE TEACHER BEGINS THE ACTIVITY BY PLACING THE GENOTYPES OF THE PARENTS (P_1) ON THE BOARD. EACH TEAM NOW COUNTS OUT THE APPROPRIATE NUMBERS AND COLORS OF BEANS PER BOX: RR=100 RED BEANS; Rr=50 RED AND 50 WHITE BEANS; rr=100 WHITE BEANS.

THE TEACHER NOW TIMES THE CLASS FOR ONE MINUTE DURING WHICH EACH STUDENT PAIR PULLS 2 BEANS AT A TIME (ONE FROM EACH BOX) AND ARRANGES THE PAIRS IN ROWS: RR;Rr;rr. AT THE END OF THE MINUTE, COUNT THE NUMBER OF RR,Rr AND rr. USING THIS DATA, CALCULATE THE OBSERVED RATIO** FOR EACH GROUP.

NEXT THE TEACHER RECORDS THE RAW DATA FROM EACH TEAM INTO A CHART ON THE BOARD AND ADDS RESULTS TO GET CLASS TOTALS OF RR, Rr AND rr. CALCULATE CLASS RATIOS.

WORK THE CROSS ON PAPER AND CALCULATE THE EXPECTED RATIOS. COMPARE EXPECTED RATIOS WITH OBSERVED TEAM RATIOS AND OBSERVED CLASS RATIOS. WHICH ARE CLOSER TO THE EXPECTED AND WHY?

VARIATIONS:

EACH TEAM CREATES A CROSS, DETERMINES EXPECTED RATIOS ON PAPER, CREATES PARENT GENOTYPES WITH BEAN BOXES, DOES 4 TRIALS OF ONE MINUTE EACH, CALCULATES OBSERVED RATIOS AND DISCUSSES DIFFERENCES BETWEEN SINGLE AND MULTIPLE TRIAL RESULTS.

JELLY BEANS,OR OTHER OBJECTS MAY BE SUBSTITUTED FOR BEANS. SOLICIT STUDENTS FOR IDEAS!

*OATMEAL BOXES; QUART SHERBERT CONTAINERS; ETC. **CALCULATION OF RATIOS: TOTAL RR=A, Rr=B, rr=C. A+B+C=D D/4=E. A/E=1ST RATIO; B/E=2ND RATIO; C/E=3RD RATIO. EXPRESS RATIOS IN WHOLE NUMBERS.

Biology/ Chemistry

Saving Humpty Dumpty

Christine Etapa
4409 South Christiana Avenue
CHICAGO IL 60632
773-247-1996

Gunsaulus Scholastic Academy
4420 South Sacramento Avenue
CHICAGO IL 60632
773-535-7215

Objective(s):

Students will describe how shoe design, manufacturing, retailing, consumer use, and disposal impact environments and societies. Students will discuss ways to reduce, reuse, or recycle resources in the life-cycle for a shoe product. Students will investigate why consumers purchase certain shoe products. Students will examine the influence of packaging on consumer choice, and determine if consumers consider waste disposal, and recyclability, when making purchasing decisions. Students will investigate the shock absorption and energy return of given surfaces.

Materials:

Each of the materials listed below are understood to be per group.

One gallon container	stop watch	measuring cup
Eight hard boiled eggs	graph paper	Nike rubber granules
Three poster boards	stirring stick/ latex gloves.	Worksheets
Rubber Cement	scissors	Nike upper materials
meter stick	New vocabulary list	Nike foam material
marker	tape	Elmer’s glue

Strategy:

1. Review the concept of cycles. Have students give examples of cycles.

2. Tell students they'll be starting a unit of study that uses an athletic shoe as an example of a product cycle.

3. Discuss why they chose the shoes they are wearing, and ask if they considered waste disposal problems that could be caused by the shoes, or the packaging..

4. Have students remove one of their athletic shoes, and examine its make-up.

5. Make a pile of all the athletic shoes in the middle of the floor, and ask a volunteer to measure the length, width, and height of the shoe pile. Discuss the problem of waste disposal for these shoes, then expand to Chicago's, then North America's etc.

6. Have student's measure one shoe. How far would they all reach, if you place them toe to heel? Expand on this idea.

7. Have students weigh one of their shoes, double it, and calculate a class average. Discuss the municipal waste created if everyone buys 4 pr. of shoes per year? Expand.

8. Introduce the concept of cycles, as it might apply to the pile of shoes.

9. Introduce new vocabulary, noting the difference between recycling, downcycling, reducing, and reusing.

10. Tell the students they are going to make some playground material, from used athletic shoes, and when it is dry, they will investigate its shock absorption, and energy return capability.

11. Discuss Nike's efforts in being environmentally conscious about its product waste. They provide playground-surfacing material from product waste. Ask if this is recycling, downcycling, reusing, or reducing?.

12. Students will follow directions given to them on handouts, to test various playground surfaces, using the scientific method. Data will be graphed later.

-

Performance Assessment:

1. Students should be able to measure the materials being used with 100% accuracy.

2. Students should be able to work in cooperative groups with little supervision.

3. Students should be able to write up the experience using the scientific method, with 90% accuracy.

4. Students should understand the concept of a cycle, with 100% accuracy.

5. Students should understand the difference between recycling, downcycling, reusing, and reducing, with 90% accuracy.

6. Students should have collected necessary data with 90% accuracy.

7. Students should be able to graph the data they collected with 100% accuracy.

8. Students should be able to graph the data they collected with 100% accuracy.

9. Students should be able to choose products that are environmentally friendly, given the information discussed and experienced, with 100% accuracy.

Conclusions:

Conserving resources and sharing responsibility for sustainable communities is a job for both consumers and businesses. This can be accomplished by conserving resources at the tech stage of a products life cycle, or by consumers making wise, and environmentally friendly choices, when they buy manufactured products.

Products undergo scientific testing to determine how to reuse and recycle them, or reduce waste made by them. Materials may retain or change their properties in the recycling process. Using controlled variables in experiments to test products helps establish clearer relationships between cause and effect.

Materials have different properties and vary in their abilities to absorb forces or return energy.

Life in a Drop of Water

Marva L. Anyanwu
1672 West 92nd Place
CHICAGO IL 60620
(773) 233-3846

Wendell E. Green
1150 West 96th Street
CHICAGO IL 60643
(773) 535-2575

Objective(s):

Grade Level: Middle/ Upper Level -Elementary School

Periods: 4-40 minutes

To observe the wealth of living organisms in a drop of water from our freshwater ecosystems

To classify the types of organisms observed as single-celled or multi-cellular

Use a key or chart to identify and name the organisms found

Background:

Ecologists divide freshwater ecosystems into bodies of running water and bodies of standing water. In the latter the current slows and most suspended particles settle to the bottom. Lakes and ponds are bodies of standing water that will serve as the sources for water samples to investigate freshwater ecosystems.

Protists, which comprise many of the organisms found in the water samples, are mostly single-celled microscopic organisms. They have a nucleus and other cell parts. There are three groups of protists: protozoans (animal-like protists), algae (plant-like protists), and fungi.

Materials:

Pond water, lake water, microscopes, slides, cover slips, droppers, paper towels, small dishes, key of freshwater microorganisms (obtained from a book such as one of the references listed below)

Strategy:

1. Teacher will collect enough pond/lake water in order for each student to have his/her own sample.
2. Review usage and handling of a microscope during period 1.
3. Explain the steps for preparing a slide (period 1). Each student will be required to prepare a slide using the water sample(s). Place a drop of water on the slide and cover with coverslip, make sure no air bubbles are present.
4. Observe the slide under the low power objective lens and search for protists. Watch also for movement.
5. When you find some protists that are not moving or moving slowly switch to the high power objective lens.
6. Draw your protists within circles (about 8 cm in diameter) drawn on sheets of paper.
7. Note the eyepiece and objective lens magnifications and calculate total magnification. This is the eyepiece magnification times the magnification of the objective lens (both should be marked right on the lenses).

NOTE: Pond water can be simulated by preparing a culture of hay infusion. Method: Fill a large jar about two-thirds full of tap water. Let it stand uncovered for three or four days so that air can dissolve in it. Cut some hay or dried grass into short pieces and drop two handfuls into the water. Cover the jar and allow the culture to incubate about two weeks. When the culture is ready, examine several drops taken from different parts of the jar.

Performance Assessment:

Draw and label living organism observed under the microscope.

Use the key to identify and group organism(s) found in the water samples.

Conclusions:

With all life, irrespective of scale, there is a continual struggle and competition for survival. A pond is a miniature cosmos. A diverse range of living forms, both animal and plant, compete for energy supplies, food, space, and other resources.

Willie Hoskins - Williams School

Topics in Environmental Science

Willie Hoskins
9432 S Langley
CHICAGO IL 60616

Williams School
2710 S. Dearborn
CHICAGO IL 60616
(773) 534-9226

Objective(s):

To model the atmosphere of the earth. To build a model to simulate the greenhouse effect. To use diagrams and models to generate data. To analyze and interpret data, especially the results of introducing pollutants into nature. To form scientific hypotheses of how long-term exposure to pollutants will affect the future of the earth.

Materials Needed:

candles, matches, saucers, dirt, rocks, gravel, small plants, water, lamp, thermometer

Strategy:

The instructor strikes the match and lights the candle. Each student is asked what he or she observed. The instructor will hold the bottom of a saucer over the flame. Then blow out the match and examine the underside of the saucer. The same procedure will be repeated with burning paper. Discuss what was observed and conclude that when the yellow part of the flame came in contact with the cool dish, a black substance as well as moisture was deposited moisture also was present. Explain to the students that anything can be called a fuel, and that most fuel contains carbon, hydrogen, or both. When a carbon containing fuel burns incompletely, it usually glows with a yellow color and deposits black carbon as was seen on the saucer. When the flame cools more slowly, the carbon in the fuel joins with oxygen from the air and forms carbon dioxide (CO_2), a colorless gas. The moisture formed on the saucers, because every flame gives off water vapor. This is because the fuel contains hydrogen which reacts with oxygen in the air to form water vapor.

Draw and illustrate all levels of the Earth's atmosphere. Take two clear plastic containers and fill with two centimeters of gravel and one layer of rocks. Add one and a half inches of soil. Plant plants in the dirt, put a little water on each new planting, add one more inch of soil, and water until soil is soaked. Place a thermometer in the soil and be sure the bulb is submerged in the soil and the end is resting on the wall of the container with the number clearly visible through wall or top of container. Cover one of the containers with plastic or plastic wrap. Check the thermometer in both containers after 40 minutes. Discuss and record data and conclude that the temperature increased in the covered container.

Performance Assessment:

Students should observe the changes in the atmosphere and the soil temperature inside the container at different times compared with the atmosphere and temperature of the room.
They should also compare the model greenhouse and the illustration of Nature's Greenhouse. What happens at different temperatures? What happens during photosynthesis?

Conclusions:

Incomplete combustion of fuels can lead to the production of soot. Heat trapped by the cover of an artificial environment increases the temperature of that environment just as thought it happens in the greenhouse effect on Earth.

Biology/Chemistry

How Pollution Disrupts Our Natural Environment

Sheila Mckinnon
11556 South Hale St.
Chicago IL 60643
(773) 239-4178

Sherman Elementary School
1000 W. 52nd Street
Chicago IL 60609
(773) 535-1757

Objective(s):

1. The pupils will be able to design and conduct simple scientific investigations and /or experiments in which observations are made, data are gathered and organized, and reasonable conclusions are drawn.
2. Conduct simple experiments and observations and explain what was discovered.
3. Demonstrate how repeated observations improve confidence in results.
4. Describe conditions that influence change during an investigation.
5. Describe ways that technology is helping to solve the problems of pollution.
6. List 3 causes of air pollution and how it affects plant and animal life.
7. Describe how Global Warming has effected our atmosphere.

Materials Needed:

Experiment No. 1: Each student will participate in the following experiment. (*Note: this can also be a group activity)*. The materials needed in this experiment are: 1 pair of plastic gloves, a thermometer, and 3 plastic grocery bags

Experiment No. 2: The following materials are for a group of 3 to 4 students.

2 clear plastic cups, 1 clear glass bowl, 2 thermometers, water, paper and pencil.

Strategy:

Introduction: Three major problems involved in atmospheric depletion are: 1) ozone-destroying gases, 2) acid rain, and 3) deforestation. All of these problems together cause global warming. The problem with global warming will be discussed and analyzed.

General Information:

Our atmosphere is under increasing pressure from greenhouse gases which threaten to change the climate and put holes in the ozone layer. When the atmosphere is healthy it is an efficient system able to adapt to changes. Without this ability life on Earth would be non-existent. The greenhouse gases have massively traumatized the earth's atmosphere. Chloro-fluorocarbons (**CFC)** from our refrigerators and fire extinguishers destroy and damage the ozone layer. The earth is acidified by sulfur and nitrogen oxides from our cars and factories. The life expectancy of our earth as we know it, today, can no longer sustain good quality air as we know it today for our future generations.

Experiment No. 1:

Note: Gloved hand represents the EARTH

The gloved hand wrapped in plastic bags represents the toxins emitted in the atmosphere.

- Students will take the temperature of the room and record its temperature **(this represents the gloved hand).**
- Distribute 3 plastic bags, 1 pair of rubber gloves and 1 thermometer to each student.
- Students are then to put on the rubber gloves
- Students will wrap one hand with the 3 plastic bags, leaving the other hand in the rubber glove.
- Students will slide the thermometer between the glove and the plastic bags and record the temperature in their journals
- Please note : the temperature of the gloved hand will not be recorded

The students will compare their data with one another and discuss their findings.

Experiment No. 2

The students in this experiment will show how the greenhouse effect gives off toxic gasses that are enclosed in our environment heating up the earth's atmosphere. **Note: This activity should be cone on a sunny day, if this is not possible use a lamp.**

- Fill each cup ¾ full of water
- Before you place the bowl over the glass of water record the temperature in the journals
- Put a glass bowl upside down over one of the cups
- (Note: both cups need to be in the sun)
- Leave the cups in the sun for about an hour before temperature is taken
- Observe the glass bowl and note the changes if any. Record data in journal
- Remove the bowl, take the temperature of the container of water, and record
- Take the temperature of the container of water that was not covered, and record
- Compare temperatures to find the difference
- Through discovery student should be able to note the differences in temperatures.

Performance Assessment:

The students will be assessed by the instructor in the following ways:

- Through their journal writing
- By their ability to execute the experiments
- Through discussions, and
- Through their written explanations on the causes and affects of Global Warming.

John Whistler Elementary
11533 S. Ada
Chicago IL 60643
(312) 535-5560

Objectives:

This lesson was designed for fourth grade students. The main objectives of this mini-teach are to identify and be aware of how much garbage we can produce, identify landfills and their purposes, and explain how recycling saves energy and resources while reducing pollution.

Materials Needed:

Rubberbands, brown paper bag, tape, crayons, scissors, 1 gallon glass jar, measuring cup (250ml), red food coloring, 1 gallon jug water, paper plate, china plate, paper towel, terry cloth dish towel, plastic bag, plastic foam cup, glass, plastic wrap, reusable refrigerator container, carrots in a plastic bag, carrots out of plastic bag. This lesson is designed for whole class participation.

Strategy:

Do an activity called Test Your Recycling Sense. Tell students that you are going to hold up two objects and that they must tell you which object is better for our environment. Paper plate-china plate, paper towel-terry cloth dish towel, plastic bag-paper bag, plastic foam cup-glass, carrots in plastic bag-carrots out of plastic bags. (Note: The second items in each pair, above are better for our environment.)

A second activity is an experiment showing how pollution effects wildlife. Pour one-half cup of water into the gallon jar. Add and stir in two drops of food coloring. Add one cup of water at a time to the jar until the red color disappears. It takes about 7 or more measuring cups of clear water to make the red color disappear. The children should know that when pollutants are put into streams, they go through the entire stream. They do not disappear. They merely spread out just like the food coloring did in the experiment. However, they are still present in the stream and are very dangerous to wildlife and humans.

A third activity is an experiment with rubberbands to determine one effect of plastic garbage pollution on sea animals. Hook one end of the rubberband around your little finger. Stretch the rubberband across the back of your hand and hook the free end on your thumb. Try to remove the rubberband without touching anything. Seals and fish do not have hands. How can they remove the plastic rings from six-packs of beverages if they get these around their bodies.

A fourth activity is to have students sing a recycle song. The name of the song is Recycle Now, sung to the tune of "Three Blind Mice", Verse One, Recycle Now, Recycle Now, For earth's own sake, For earth's own sake, We cannot bury our trash today, Our landfill can't handle it anyway, To recycle is smart for everyone, To save our earth, So recycle now. Verse Two, Recycle Now Recycle Now, For earth's own sake, For earth's own sake, We know how to save a tree every day, To keep our papers in every way, I'll tell my parents to save them too, So we'll save a tree. Verse Three, Recycle Now, Recycle Now, For earth's own sake, For earth's own sake, We know that aluminum and glass are good, To throw away plastic-we never should, I'll tell my parents to save them too, So we'll save our earth.

A fifth activity is to have students to construct a folder using recycled brown bags. Reuse grocery bags to make student folders. Not only is this a great activity for recycling but also this activity can be used as a great listening to directions experience. The cover can be developed as an art project.

1. Unglue and unfold the bottom of a large brown bag, preferably one that is a single thickness of paper

2. Flatten bag by placing the advertising toward you. Pull the front edge with your left hand, and the back folded edge with your right hand.

3. Cut off the bottom at the last fold.

4. Tape the top edges of the bag together. Tape the bottom edges of bag together.

5. Measure 30 cm. down from the top edge, then fold the bottom edge up.

6. Tape edges only. You may want to use staples or glue instead.

7. Fold in half and decorate.

Performance Assessment:

Students will construct a useful folder to hold their school papers. They will construct this folder from recycled brown bags. Upon completion of their folders they will have a clear understanding of how important it is to recycle.

Conclusion:

At the conclusion of this mini-teach the students will be able to identify the ways we can dispose of garbage and the many ways they can recycle.

Return to Biology Index

Building A Biome

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60462
(708)460-5022

Lincoln-Way High School
1801 East Lincoln Highway
New Lenox IL 60451
(815)485-7655

Objective:

The main objective in this Mini-teach is to show students how different plants grow in each biome.

Materials Needed:

2-L cardboard carton
sandy soil or potting soil
seeds: 5 lima beans, 30 rye grass, 10 impatiens
clear plastic wrap
scissors
lamp (light source)
index cards
tape

Strategy:

1. The teacher will assign each group one of the following biomes: desert, grassland, rain forest, or deciduous forest.
2. Cut the entire front wall from a carton. Poke a few small holes in the uncut side for drainage. Staple the spout closed.
3. Fill the carton with soil to within 3 cm of the top. NOTE: If you have been assigned the desert biome, use sandy soil.
4. At one end of the carton, plant 10 impatiens seeds. In the middle of the carton, plant 5 lima beans. Scatter 30 rye seeds on the soil surface at the other end of the carton.
5. On your index card, write the names of your group, the seeds, and the type of biome. Tape the card to the carton.
6. Water the seeds well. Cover the open part of the carton with plastic wrap.
7. Put the carton in a warm place where it will remain undisturbed. Observe the carton every day.
8. After the seeds have sprouted, and depending upon which biome your group has, give it the following amounts of light and water.

Desert:	little water, 5-6 hours of light
Grassland:	medium water, 5-6 hours of light
Deciduous forest:	medium water, 1-2 hours of light
Rain forest:	much water, no direct light

"much water":	keep soil surface wet
"medium water":	let surface dry, then add water
"little water":	let soil dry to a depth of 2.5 cm, then water
9. Observe the development of the plants in your biome and in the biomes of the other groups. Record your observations.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. In which biome did most of the seeds grow best?
2. Where did grass seeds grow best? The beans? The impatiens?
3. Which plants grew well in more than one biome?
4. How do beans react to little light?
5. Explain why plants grew differently in each biome?
6. Why did the seeds need water when they were planted?
7. What was the variable in the experiment?
8. Predict how the impatiens, lima beans, and rye seeds would grow in the tundra and coniferous forest biomes.

Conclusion:

Students will understand how different plants grow in each biome.

Return to Biology Index

Zebra Mussels and Water Pollution

Allen Nelson
11445 S. Washtenaw
Chicago IL 60655
(312)233-9456

John P. Altgeld School
1340 W. 71st. Street
Chicago IL 60636
(312)535-3250

Objectives:

The main objectives of this Mini-teach are to show the proliferation of zebra mussels and their effects on local bodies of water.

Materials needed:

zebra mussels (obtain at any boat dock)
paper plates
5 foot piece of plastic rain gutter
tape
black pepper or poppy seeds
hand lens
rulers
a plastic toy boat
water

Strategy:

1. Begin by going to a boat dock or marina to obtain the mussels. You might also walk along the lakeshore and look for rocks that have some zebra mussels attached to them.
2. If possible allow the students to pull a mussel off a rock.
3. Place the zebra mussels on a paper plate. Allow the students to examine them with a hand lens. Have the students measure their mussels.
4. Have the students identify the basic structures of a zebra mussel.
5. Discuss how the zebra mussel is a biological invader.
6. Have the students brainstorm on possible ways zebra mussels were introduced into Lake Michigan.
7. Obtain a plastic toy boat. Drill two holes in the bottom of the boat. From the top place tape over the holes.
8. Pour water into the boat to simulate how a boat takes on ballast water.
9. Remove the tape to show how a boat releases its ballast water.
10. Retape the holes. Place poppy seeds in the boat to represent a zebra mussel population.
11. Repeat step #8.
12. Place the boat over the rain gutter and repeat step #9.
13. Have the students discuss the proliferation of the zebra mussel.

Performance Assessment:

At the conclusion of the Mini-teach students will be able to answer the following questions:

1. What is the environment of the zebra mussel?
2. How did the zebra mussel reach Lake Michigan waters?
3. Where were zebra mussels first discovered?
4. How are filtration plants dealing with zebra mussel populations?
5. How are boaters and marinas dealing with zebra mussel populations
6. How does the introduction of a new population affect the present ecosystem?
7. How does the zebra mussel population affect water conditions?

Conclusion:

Students will understand how a biological invader was introduced into Lake Michigan and how it affected man and the ecosystem.

Return to Biology Index

Soil Examination

Allen Nelson
11445 S. Washtenaw
Chicago IL 60655
(312) 233-9456

John P. Altgeld Elementary School
1340 W. 71st Street
Chicago IL 60636
(312) 535-3250

Objectives:

The main objectives of this Mini-teach are:

1. Students will recognize different populations in a soil sample.
2. Students will demonstrate and observe water and wind erosion.
3. Students will construct a levee flood control technique.

Materials Needed:

1. Soil Sample - 4 to 6 cubic centimeters of turf per group, hand lenses, paper plates, microscope (optional).
2. Water and Wind Erosion - one piece of 10x13 inch shelving board per group, 2 pieces of 1x2 furring strips, nails or screws, catch container, loose soil, straws, plastic cups, water.
3. Levee Construction - use apparatus constructed in #2, sand, plastic sandwich bags, twist ties, plastic spoons, 2 quart pitcher.

Strategy:

Soil Sample

1. Place the turf sample on a paper plate. Analyze the soil using your hand lens. Look for as many different populations as you can find.
2. Draw any organisms you can identify.

Water and Wind Erosion

1. Attach the furring strips to the shelving board (the 2 inch side should be vertical). Place one strip along the top left side of the board and the other strip 5 inches away (parallel).
2. Make sure the board is placed on a 45 degree incline.
3. Place a mound of loose soil midway up the board, on the opposite side place a piece of turf.
4. Distribute a straw to each group, allow students to blow on both soil samples. Observe what happens.
5. Distribute 2 eight ounce cups of water to each group, allow students to pour the water over each soil sample. Remember to use your catch containers! Observe what happens.

Construction of Levee

1. Use the apparatus constructed in strategy #2, but remove the soil samples.
2. Give each group 6 plastic sandwich bags and 6 twist ties, plastic spoons, and a container of sand.
3. Allow students to fill their sand bags and give them time to develop their own methods for constructing a levee.

4. When students feel their levee will hold back the water, they should raise their hand and the teacher will pour water from a pitcher to test levee strength.
5. If students levee does not hold back the water, allow them to rearrange their sand bags.

Performance Assessment:

At the completion of this Mini-teach students will be able to answer the following questions:

1. What is a population? List the types of populations found in your soil.
2. What is a community? Give an example of a community.
3. From your observations, what held the soil together?
4. What is water erosion?
5. What is wind erosion?
6. From your observations which soil sample had a greater amount of wind erosion? Explain your answer.
7. From your observations which soil sample had a greater amount of water erosion? Explain your answer.
8. When would levee construction be needed within a given area?
9. If your levee successfully held water, explain why? If not, why?
10. What properties of sand make it useful in levee construction?

Conclusion:

At the conclusion of this Mini-teach students will understand the following:

1. Soil contains many different populations.
2. Less erosion occurs in areas where turf exists.
3. When levee construction is needed and how levees are built.

Return to Biology Index

Food Webs

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60462
(708) 429-1005

Lincoln-Way High School
Route #30
New Lenox IL 60451
(815) 485-7655

Objective:

The main objective of this Mini-teach is to show students that a food web consists of many food chains put together. Also, a food web shows the food relationship in a community.

Materials Needed:

index cards
tape
markers/colored pencils
chalkboard/large sheet of paper

Strategy:

1. Obtain an index card from the teacher. Write the name of one living thing (plant or animal) on the card. Draw a picture of the organism.
2. The teacher will begin by sticking the "SUN" to the board.
3. If you (the students) have something on your card that needs the sun directly to grow, raise your hand then attach your card to the board.
4. Draw the arrows in the proper places, following the energy flow.
5. See if your organism will eat any of the new organisms just posted. If it does, raise your hand. Attach your card to the board. Draw the arrows.
6. Continue to see if your organism will eat any of the new organisms posted. If so, raise your hand and then attach your card to the board. Draw the arrows.
7. Continue to add all the cards, if possible. Try not to get caught without a place in the food web for your organism.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. Where do all living things get energy from?
2. What is a producer?
3. What do the arrows mean?
4. What is a first order consumer? Give an example of a first order consumer.
5. What is a second order consumer? Give an example of a second order consumer.
6. What is a top order consumer? Give an example of a top order consumer.
7. If an organism does not get posted what will happen to it?
9. What is a food web?
10. What does a food web tell us about life?

Conclusion:

Students will understand what a community is and the food relationship that exists within.

Return to Biology Index

The Effect of Automobile Exhaust on Hydra in an Environmental Chamber

Donald H. Anderson
3008 N. 78th Avenue
Elmwood Park, Ill. 60635
708-456-2268

Foreman High School
3235 N. Leclaire Avenue
Chicago, Illinois 60641
312 534-3400

Objectives:

1) To study the structure and habitat of the hydra.
2) To determine if morphological and/or behavioral changes occur within the animal upon exposure to automobile exhaust.
3) To determine if the hydra may be used as an indicator to detect pollution from automobile exhaust.

Materials:

100 brown hydra (a fresh water Hydrozoan), fresh pond water, 2 environmental chambers, mixed crustaceans including daphnia and artemia (for feeding), auto exhaust, large tire inner tube with delivery tube to the environmental chamber, 10 petri dishes, 6 eye droppers or clean micropipettes, hand lens, one binocular stereo microscope with zoom lens, clock, one microprojector and prepared slides (plain hydra, hydra with spermaries, with ovary, budding and feeding).

Strategy:

1) Fill four petri dishes to one centimeter in depth with pond water. Label the petri dishes A_1, A_2, B_1 and B_2. Place five hydra in each dish.
2) Examine the hydra in each group, describing their morphology and behavior.
3) Place two petri dishes in each of the two environmental chambers.
4) **CHAMBER A** is the experimental chamber connected to the source of pollution. (The automobile exhaust contained within the inner tube).
   CHAMBER B is the control containing room atmosphere.
5) Source of auto exhaust: use a small gasoline engine or automobile to produce gases. Route gases to the inner tube using appropriate attachments and tubing with a two way valve near the inner tube fill valve. Back pressure from the filled inner tube will propel gases regulated by the two way valve routed to the experimental chamber.
6) Fill chamber A with automobile exhaust by using appropriate valves and tubing from pollution source (the large inner tube). Feed gases into the intake valve (located on the bottom of chamber A). Close the exhaust and intake valves on chamber A after gases have filled it to its entire volume.
7) Allow the exhaust and intake valve on chamber B (the control chamber) to remain open to allow the room atmosphere to mix freely within the chamber.

Observations:

1) After each of four 24 hour periods, examine both groups of hydra using the binocular microscope.
2) Compare any morphological changes that may have occurred in the hydra in group A, (chamber A) with the hydra from group B (the control chamber B).
3) Indicate changes by diagrams or descriptions using a data chart.

DAY	# OF LIVING HYDRA	MORPHOLOGICAL CHANGES	BEHAVIORAL CHANGES	OTHER CHANGES

1				
2				
3				
4				

Care of the Hydra

1) Feed the hydra artemia (washed to remove salt) during the observation periods.
   Observe any changes in feeding habits and record them on the data chart.
   Fresh water crustaceans need not be washed, but the food must be free of dead organisms.
2) Replace the water in the petri dishes with fresh pond water daily.
3) Place the petri dishes containing hydra back into their correct environmental chamber.
4) Refill chamber A with automobile exhaust.

Repeat the above experimental strategy

Reduce the trial periods to 12 hours over a four day period. This will result in eight readings, one for each 12 hour period. Modify the existing chart to accommodate the additional readings.

Record and Summarize Your Observations

The Effects of Trash and Garbage On the Environment

Bernadette M. Gilbert
8336 S. LaSalle Street
Chicago, Illinois 60620
(312) 846-8840

Charles Kozminski Community Academy
936 E. 54th Street
Chicago, Illinois 60615
(312) 535-0980

Objectives:

To recognize the importance of solid waste management.
To be able to identify the four "R's"; reuse, reduce, recycle and recover.
To understand what a landfill is.
To analyze individual solid waste management habits.
To understand what is biodegradable and what is non-biodegradable.
To understand why composting is a landfill alternative.
To understand some of the associated pollution problems.
To understand how incineration reduces waste and produces emission.
To view the video tape "The Rotten Truth" provided by the Illinois Department of Energy and Natural Resource in order to enhance individual knowledge of solid waste disposal and the recycling process.
To view the video tape "The Resource Revolution" to learn more about the recycling of plastics.
To learn songs: "You're Really Making Me Sick" and "Reduce, Reuse, Recycle"

Materials needed:

Two 2 liter plastic pop bottles, netting or mesh fabric, rubber band, classroom storage containers (will be decorated by students), plastic bags, soil (dirt), vegetable or fruit scraps, grass, newspaper, plastic and other garbage which will decompose in a landfill, video tape, "The Rotten Truth", provided by the Illinois Department of Energy and Natural Resource, video tape worksheets, video tape, "The Resource Revolution", guessing game activity sheets, aluminum cans, glass bottles, paper napkins, fruit peel and other "Clean" trash items as needed (avoid materials of organic origin), cassette player or tape recorder, television and VCR.

Procedure:

Learn the vocabulary and the categories of waste that occur daily.
Questions--What is garbage? Where does it go?
Discuss landfills and problems that relate to the landfills.
Introduce the concepts of Reduce, Reuse, Recycle and Recover.
Set up a bulletin board divided into sections with the four "R's" categories as headings. Have students begin tacking up items appropriate to each heading and have them explain why the items belong in that category. Some items may be appropriate to more than one category
Review video tape, "The Rotten Truth" and give a short quiz on information from the video.
Make your own Compost Column. Observe and chart what happens over two to four weeks. Discuss the conditions of the various kinds of waste. Discuss biodegradability. Compare the compost to real landfills. From your observations, discuss the potential environmental problems associated with waste in landfills (leachate, contamination of water, smell, methane gas, garbage truck traffic, litter, scavenging birds, loss of natural resources and energy.)

Students will play a game of twenty questions. Without letting the class see what you are doing, put one of the trash objects in a brown paper bag. Show the contents to one student then set the bag aside. The class will then begin asking questions to determine what is in the bag. Some suggested questions are: Do I come from the earth? Am I made from a renewable resource? A nonrenewable resource? Am I made by a person? Am I biodegradable? Am I packaging? Am I a container? Do I contain food? Am I recyclable? Am I compostable?

Separate, prepare and label different types of recyclable trash.

Learn songs: "You're Really Making Me Sick" and "Reduce, Reuse, Recycle".

Evaluation:

Students should be able to tell the difference between natural and human made materials, packaging and non-packaging items, animals, plants and minerals, renewable and nonrenewable resources and be able to identify compostable and recyclable materials.

Conclusion:

As educators and consumers, we are entrusted with the job of teaching children how to make intelligent decisions about solid waste. These decisions can begin in the schools and continue in the homes and stores. The solid waste dilemma will not go away. Changing our way of disposing of trash and garbage will help reduce the amount of garbage that ends up in landfills. Solving the solid waste disposal problem will take a major overhaul in our lifestyle. As consumers and educators, we can accept this challenge and help educate our citizens for change.

Return to Biology Index

Population Study and Applications Using PTC Paper

Susan H. Smigla
5909 W. Altgeld Ave.
Chicago, Illinois 60639
(312) 622-6344

Leslie Lewis Elementary
1431 N. Leamington Ave.
Chicago, Illinois 60651
(312) 534-3060

Objectives:

1) To understand the terms dominant, recessive, haploid (monoploid), diploid, genotype, phenotype, scientific sampling and scientific modeling.
2) To know and understand how human population traits such as PTC tasting, widow's peak, bent little finger, tongue rolling and many other traits are distributed.
3) To understand how the various genotypic ratios are distributed throughout a population.
4) To understand the laws of chance and how they are applied to population genetics.

Materials:

PTC Testing Paper (if testing for that trait), graph paper, 2 coins of the same denomination for each team. (Students can provide their own coins.)

Strategy:

To demonstrate scientific sampling, have the class test themselves to see which students in the class are PTC tasters and which are not. Have the students test their families and/or use the data from several classes to provide a sufficiently large representation of the population to work with.
Graph the data. Title the graph PTC Tasters (or PTC Nontasters). Label the horizontal axis "Number of Tasters" (Nontasters) and the vertical axis "Total Number of People Sampled". Plot a "best fit curve". To obtain a ratio, divide the total number of tasters (nontasters) by the total number of people sampled.
To demonstrate scientific modeling, divide the class into partners. Use a "coin toss" with 2 coins of the same type for each pair of partners. Put the coins in the hand, cup the hands and shake them. Open up the hands and allow the coins to roll out onto the table. Put down tally marks in the appropriate columns to

ref**lect the combinations shown.**

Counts	**Possible Combinations**		
	2 Heads	**2 Tails**	**1Head/1Tail**
Total			
Ratio			
Total Number of Flips			

Total the columns. Obtain the ratio by dividing the total of a combination (ex. 2 Heads) by the total number of flips.
In this genetic experiment, "T" is the symbol for tasters and "t" is the symbol for nontasters. "Tt" therefore would be the symbol for a heterozygous taster. Pretend that 2 heads is the "genotype" TT, 2 tails is the "genotype" tt and 1

head/1 tail is the "genotype" Tt. Make a graph of the "tasters" as shown in the data table for your coin flips. Title this graph "Penny Tasters". Mark the horizontal axis "Number of Tasters" and the vertical axis "Number of Flips". Plot a "best fit curve". Compare the curves of the graph that you made of the actual PTC paper tasters with the curve of the graph that you made of the "tasters" that you obtained from your "coin toss".
On a punnett square, show the possible results that would occur for the following matches and record the ratio of tasters to nontasters. A) TTxTT, B) TTxTt, C) TtxTt, D) ttxtt, E) TTxtt and F) Ttxtt.

Study Questions:
1) Based on the data table from your "coin toss", how many people in your "population" would be "tasters"? How many would be "nontasters"?
2) Based on the data table from your "coin toss", determine the ratios of the coin "tasters" to "nontasters". How does this correlate with the data that you have obtained from actual population samples?
3) How does the "coin toss" demonstrate random pairings of genes? (Explain)
4) Gamblers place bets on things that have the greatest odds of occurring. If you were to place a bet on the coin toss, which combination would you bet upon? Why?
5) In looking at the data of the tasters vs nontasters, which genotype comes up most frequently? Which phenotype comes up most frequently?
6) Do you think that scientists are able to come up with reasonable statistics based on scientific sampling and modeling? Defend your answer.
7) Based on your data, can you tell which trait is the dominant trait and which trait is recessive? How?
8) Looking at the data obtained on your graphs, do the curves go up in a predictable pattern?
9) Based on your graphs, if you were to sample 200 people, what do you think the total number of tasters would be? Nontasters? How about if you sampled 500 people? What would be your results if you sampled 1000? How are you able to predict your answers?
10) Based on the data obtained from your punnett square matches, if you were to pretend that the ability to taste was a desirable trait to mate for, which mates would insure the most tasters in the offspring? Which matches would produce the least number of offspring that are tasters?
11) Can two parents that are tasters have children that are nontasters? Explain.
12) The appearance of various genetic deformities and diseases in a population can be studied by the same techniques that we have been using. Do you believe that couples about to get married should have genetic counseling?
13) What if you have found out that you were a carrier for a genetic defect, what action do you think that you should take? What about if it was your spouse?

Extension:
1) Using a pedigree chart test your family for one or several of these traits:

1) PTC Tasting	2) Tongue Rolling
3) Widow's Peak	4) Hair on the 2nd finger joint
5) Attached ear lobe	6) Bent little finger

The more people in your family that you can test, (Grandparents, Aunts, Uncles, Cousins, etc.) the better your data will be. Be sure that you differentiate between blood relatives and relatives through marriage.
2) Set up a data table and include ratios for your results.
3) Set up a graph and interpret your results. Be sure to include a "best fit

curve".
4) Based on your pedigree, try to figure out the genotype for the traits that you have sampled.
5) Based on your graph and ratios, calculate the percentage of the population that carries these features and whether the trait is dominant or recessive. Determine whether you have a large enough population sampled to do these calculations and how the size of the sampled population would affect your ability to have a valid conclusion for your data.

Biological Communities

Jimmie Whitney
18907 Jonathan Lane
Homewood, Illinois 60430
(708) 957-4019

Lucy Flower Vocational High School
3545 West Fulton Blvd
Chicago, Illinois 60624
(312) 534-6767

Objectives:

1. List familiar organisms found in several different communities.
2. Distinguish between producer and consumer organisms in your list.
3. Examine and identify as many organisms as possible from a soil community.

Materials Needed:

l. soil sample
2. newspaper
3. vials
4. hand lens
5. four small jars (baby food) with cover
6. isopropyl alcohol or methyl alcohol

Procedure:

You are probably used to thinking of your city, town or neighborhood as a community. But did you know that all animals and plants live in communities too?

Part A.

Based on your knowledge and previous observations, list in table form, at least four organisms found in these communities: Home, Farm, Forest, Ocean and Pond. Identify the organisms as producers or consumers. Circle the organisms that you consider to be consumers.

> Producers are usually green in color and are capable of producing their own food. Consumers are usually brown or other color and cannot manufacture their own food. They obtain food by eating or consuming.

Part B. Soil Community

Collect a variety of soil samples. Place each sample in a plastic bag to prevent drying and then label the bag. Vegetation found on the soil must be included with the sample. Divide students into four groups. Give each group a sample of soil and a sheet of newspaper. Empty the bag of soil on the sheet of newspaper. Probe through the soil and look for hidden organisms. Record in table form the common names of all observed consumer and producer organisms. Record the approximate numbers of each type of organism that is listed. Place small consumer organisms into containers (jars) of isopropyl alcohol for future microscopic study.

Return to Biology Index

The Effects of Pesticides on the Food Chain

Betty Conley
363 W. Hill St.
Chicago, Ill. 60610

Byrd Academy
363 W. Hill St.
Chicago, Ill.60610
312-280-4000

Objective:

Grade Level 4

Students will be able to generalize that all animals, including people, depend on plants as a food source.
Students will describe and construct a food chain.
Students will tell how pesticides enter the food chain.
Students will discuss possible consequences of pesticides entering the food chain.

Materials needed:

Ecology box showing examples of pollutants harmful to wildlife.
Pictures of plants and animals.
Overhead and transparency "Let's Look at a Food Chain".
5 strips of paper.
Identity cards for game (1-2 hawks, 3-4 shrews, and 9-18 grasshoppers).
50-100 pictures of corn (2/3 yellow, 1/3 another color).
A stapler.
Colored chalk.

Strategy:

Activity 1.

Students will walk around and study the pictures hanging on the walls. Teacher will give some facts about an animal or plant using important vocabulary words, ending each statement with, "Who am I?" The students will find the picture of the organism and identify it.

Example: My rep has me stalking deer, cattle, and man. I have been trapped, shot, and poisoned by both farmers and bounty hunters. Everyone has forgotten that I am grandparent to man's best friend. They even accused me of eating a grandmother. Who am I?

Example: I am a carnivore but I'm not an animal. Who am I?

Activity 2.

Students will write the correct vocabulary word on the board next to it's definition.

Activity 3.

Students will look at and discuss the transparency "Let's Look at a Food Chain." They will identify the seen and unseen organisms and discuss their relationships. They will tell what eats what. They will describe the food chain as the teacher makes a chain with strips of paper.

Activity 4.

Students will put the following organisms in order, making a food chain: shrew, hawk, corn plant, and grasshopper. They will then discuss the relationship of these organisms.

Activity 5.

Students will play a game that will help them understand how pesticides affect a food chain. After the pictures of corn have been scattered around the room or field, the grasshoppers will have 15 seconds to hunt for food. Whatever corn they find, they will put in their "stomach" (a brown paper bag). After 15 seconds the shrew will start to hunt the grasshoppers. After another 15 seconds it is time for the hawks to hunt the shrews. Whoever is tagged by the animal hunting it, must give that animal their "stomach" and sit down. They have been eaten.

Anyone remaining alive will come to the front of the room and empty the contents of their stomachs. The contents will be divided into two groups, yellow and other colors, and counted. Students will record the results on a chart on the board.

Teacher will then inform the students that the colored corn was sprayed with a pesticide. Class will discuss what pesticides are, what they do to plants and animals, and why they are used.

If a grasshopper's "stomach" contained any other colored corn, that grasshopper is considered dead from pesticide poisoning. Any shrews for which half or more of their food supply was other colors would also be considered dead. The hawk may not die at this time, however a large accumulation of pesticide in the hawk's body may result in damage to the reproductive system. The eggs produced may have shells too thin to survive the nesting process.

Conclusions:

This unit should cause students to think about man's responsibilities to wildlife and the possible consequences of their actions. It should cause students to investigate and create ways of living that will enhance the environment for all living creatures.

Evaluation:

Students will construct a food chain of what they ate for dinner.
Students will give two examples of ways in which pesticides could enter the food chain.

The Properties of Air

Dores H. Cook
8148 S. Paxton
Chicago, Il. 60617
312-768-5540

Gallistel Language Academy
10347 S. Ewing Avenue
Chicago, Il. 60617
312-933-6540

Objective:

First Grade

Students will be able to describe the properties of air. They will be able to conclude that air is a gas, that air has weight, that air exerts pressure and that moving air is called wind.

Materials needed:

The following list is for a class of thirty students. Each student should have one:

small plastic zip-lock bag
balloon
bubble gum
straw
9x12 sheet of construction paper

The teacher will need:

two 2 liter bottles
two pans
eight balloons (same size)
tape
styrofoam cooler
hot plate (heat water)
string
hot water
ice
meter stick
clamp
metal pot

Strategy:

These activities and experiments are teacher directed. Each lesson should take approximately fifteen minutes to complete. The exception is the second lesson, which could not be timed.

1. Initially the students should inhale deeply and slowly exhale to ascertain whether or not they see anything. They should inhale again, hold their breath and roll the air around in their mouth to determine whether or not they can taste the air. Finally, the students take three short "sniffs" of air to determine if they smell anything. After each of these activities, the students should conclude that air is a colorless, tasteless and odorless gas.

2. Take two empty plastic bottles and place a balloon over the mouth of each bottle. Put one bottle in a pan of hot water and put the other bottle in a pan with ice. Observe the results. The consensus should be that air exerts

pressure.

3. Suspend a meter stick from a curtain rod. Tie three balloons on each end. Make sure the meter stick is balanced. Remove three balloons (from the same end) inflate them and tie the end of each. Then rehang the inflated balloons. The students should conclude that air has weight.

4. Inflate a balloon. Inflate a plastic bag using a straw. The students should note that air takes up space and that air has no definite shape.

5. Fold a sheet of paper several times to make a fan. Move the fan rapidly back and forth in front of your face. The students should feel the air. They should conclude that moving air is called wind.

Return to Biology Index

How Organisms Respond To Changes In Their Environment

Carmella Gordon
9700 S. Oakley
Chicago, Il. 60643
312-233-5809

Farragut High School
2345 S. Christiana
Chicago, Il. 60620
312-542-3000

Objective:

To observe the reaction of living cells to mechanical and chemical stimuli.

To observe the streaming of protoplasma in living cells.

To identify the relationship between cell response and survival.

Materials:

Living culture
Droppers
Vinegar
Decaffeinated coffee
Sugar
Specimen pipettes
Compound Microscope
Salt crystals
Microscope slides and coverslips
Caffeinated coffee
Cotton fibers

Strategy:

1. Using a specimen pipette, remove a drop from the collected specimen.

2. Place culture on the microscope slide and cover. Focus microscope to locate organism.

3. Having observed the normal activity, some artificial stimuli will be introduced so that the cell response can be observed. Record observed behavior on chart provided.

4. Prepare a new culture specimen if necessary; repeat strategies 1-2.

5. Cautiously place a small salt crystal near some of swimming organisms. Observe and record their response.

6. Continue to add each stimuli along side of covered organism. Observe and record the behavior of the organism.

7. Observe movement. Are new structures visible on the organism? Has movement stopped?

Conclusion:

Bridging the learning experience, is man being affected by environmental pollutants?

Return to Biology Index

Recycling

Brad Wohlgemuth
6939 W. Wolfram
Chgo, Ill. 60634
312-237-1171

Thornton Twp. H.S.
151st and Broadway
Harvey, Ill. 60426
708-596-1000

Objectives:

Grade level 9-12

Students will match the vocabulary words with the definitions.

Students will explain the benefit of recycling to the environment.

Students will list three things they can recycle at home.

Students will list several ways that home recycling can be profitable.

Students will discuss how recycling may help solve the landfill problems in urban areas.

Students will name and locate on a map three different landfill areas in the south suburban area.

Materials needed:

The following materials will make one game packet for a class of fifteen.

250-Index cards any size (number depends on class size, each game set requires 50 cards 25 red and 25 blue)

3	18"X 24" Posterboard	1	Overhead projector
1	X-acto knife or razor blade	3	Transparencies
1	Ruler	15	Pencils (regular school pencil)
1	Overhead projector	15	Sheets of graph paper
1	Map of local area (road map)	300	Poker chips red, blue, and white

Strategy:

A. Discussion on landfills and problems that relate to the landfills.

B. Talk about the amount of waste an individual family creates and what it contains e.g. plastic bottles 8.7%, newspaper 41%, aluminum 8.7% and glass 8.2% and misc. 35.6%

C. Show grids on overhead.

1. Grid one shows one square, the square represents the garbage one family creates in one day.

2. Grid two shows five squares, the squares represent the garbage of five families in one day.

3. Grid three shows twenty-five squares representing the garbage twenty-five families create in one day.

4. Talk about the number of families in the area and the amount of garbage created by those families.

D. Intro to home recycling, what materials can be recycled and the benefits to the individual and the environment.

E. Simulation game (for instructions and rules send a self addressed 8 1/2 X 11 envelope to the address above)

F. Graph the results of the simulation.

G. Discussion on the problem of volume in recycling and demonstration of reducing volume and setting up home recycling centers.

H. Homework assignment.

Conclusion:

The purpose of this exercise is to demonstrate to students the effect of recycling on the environment by reducing the amount of garbage going to the landfill. In addition, the economic advantages to the recycler and the community will become evident after playing the game. The lesson will give the student the opportunity to experience some of the problems related to recycling in the home and in the community.

Urban Effects On Inshore Plankton

Arnam, Steve
3849 W. Foster Ave.
Chicago,IL 60625
1-312-463-5178

Roosevelt H.S
3436 W. Wilson Ave.
Chicago,Il. 60625
1-312-509-4900

Behavioral Objectives

This lab activity in counting plankton, reinforces the use of the microscope. Differences encountered in count may lead to an exercise in graphing the observed results and stimulate discussion concerning plankton count variation from selected collection sites. The Phenomenological Goal of the lab is the realization of urban water pollution problems. A recognition of cause and effect relationships in an urban area is a concern I feel students should have early in high school biology. Students should arrive at certain conclusions through inquiry rather than being told answers. This microscope lab will have students critically thinking about the discrepancies of plankton counts along our shore and through problem solving techniques they will arrive at a few hypotheses.

Equipment and Materials

Projecting microscope
Slides (gridded,see **Preparation**)
Beral pipet (eye dropper)
Plankton samples (preserved)
Microscope
Coverslips
Plankton collector (see **Preparation**)
Lab notebook or data sheets w/graph

Preparation and Strategies

You could either purchase a plankton net (approx. $45.00) or make one. In order to make one you should use a 3 lb. coffee can with both ends removed. Cover one of the ends with fine mesh netting (50 mesh or smaller) and surround the outside with an embroidery hoop that fits (approx. $0.75). Tighten the hoop while periodically pulling the mesh so there is no sagging. Ideally the mesh must must be taut over the bottom. Tape the embroidery hoop and net along the sides with duct tape to ensure its tight fit. You may have to remove the duct tape and retighten the mesh if it begins to sag. Take the tape with you on the collection trip. The collecting can nets are easy to make and are really inexpensive. Using the plankton net you can now sample any aquatic community. For this lab I used Chicago beaches from 31st Street north to Evanston and then took samples in both Highland Park and Zion, IL. Students can repeat this experiment by resampling beaches along Chicago or areas along Lake Michigan or even their own projects. The possibilities are endless! As a beginning microscope activity the "Urban effects" lab can be used during the first weeks of school focusing on manipulation and viewing skills. This lab could also be used in plankton studies further into the semester. Gridded slides for counting plankton can be made by copying graph paper onto acetate, using Xerox or thermofax process. Cut the desired size and tape the acetate to one side of a slide.

Student Procedure

1. Take specified labeled (site designation) Beral pipet and shake thoroughly.
2. Immediately place 2 drops on your slide.
3. Make a wet mount (glass slide up if using acetate grid on slide).
4. Place slide under the microscope and count the number of plankton.
5. Record the number on your data sheet.
6. Have your partner count the same slide or repeat your count.
7. Record the number on your data sheet.
8. Average the 2 plankton counts and record.
9. Repeat the following procedures with a different sample.

Station	**A**	**B**	**C**	**D**	**E**	**F**	**G**	**H**	**I**	**J** .

Acid Rain And How It Affects Our Environment

Iftner, George   Schools, various
262 W. 148th Pl.
Harvey, Il 60426
339-6381

Objective

Demonstrate phenomenologically the effects of acid rain on our environment and perform long-term "real-time" experiments.

Materials

6 Petri dishes, pipette, large bell jar or similar item, sulfuric acid, two 2-liter soft drink containers, 4 small pieces of marble or limestone, continuous strip of chart paper approximately 3 ft by 6 ft, pastel crayons or markers, small growing plant, 4 small pieces of raw fish, 2 green leaves, small amount of soil.

Strategies

1. 2 or 3 days in advance, prepare Petri dishes with soil & stone, leaf, and raw fish. One set is to be watered with distilled water, the other wetted thoroughly with 50% sulfuric acid. Keep hidden from view.

2. Prior to the lesson, a) cover an area of chalkboard or wall with the drawing paper; print OUR ENVIRONMENT at the upper right. b) set out the Petri dishes prepared in #1 above, but keep covered from view for the moment. c) make 14 slips of paper, each with one of the following printed on it:

LAKE	FISH	CARS	FACTORY	WIND	SUN	FISHERMAN
PEOPLE	SMOKE	TREES	RAINCLOUD	RIVER	HILLS	HOUSES

3.Pass out the name slips to 14 students at random. Ask the class if they like to draw. (The response should be most positive - I've yet to see a class at any grade level that didn't like "artwork!") Say something like "Let's make a mural about our environment. This should be fun!" Have the slip recipients come up and draw that which is on their slip. Be complimentary and encourage creativity! Guide each artist as to the approximate location of his/her item...(the factory, cars, sun and smoke should be toward the left end of the production and the other items oriented toward the right.)

4. Admire the production! THEN, complete the title by adding "ACID RAIN AND HOW IT AFFECTS", so that the complete title now reads.

"ACID RAIN AND HOW IT AFFECTS OUR ENVIRONMENT"

5. Display the Petrie dishes and show the class how the acid has

affected soil/stone, plant, and animal materials compared to the items in plain water. Discuss briefly, then augment the mural with more smoke, rain, and wind, and describe how acid rain is formed. (Tailor the scientific descriptive language to the grade level involved, i.e., don't get involved with chemical formulas unless the class has had some exposure to them.)

6. Create 3 or 4 groups and have the groups spend about 5 minutes listing what effects they think acid rain would have on the various aspects of their mural. Poll the groups for their ideas and develop a list on a chalkboard. Augment the list with any facets the class may not have considered. Be sure to list all ideas even though not specific to acid rain...indicate that these items "fit better" in different topics and will be covered in future lessons.

7. Set up the following long-term experiment:
   - a - Place the potted plant under the bell jar; Add a Petri dish or other small vessel of 10% sulfuric acid; (Maintain plant normally including acid solution).
   - b - Put about one inch of 10-15% sulfuric acid solution into one of the soft drink containers. Suspend a marble or limestone chip above the solution. Cap tightly.
   - c - Duplicate (a) and (b) with water only as controls.
   - d - Put a piece of raw fish in each of two Petri dishes; immerse one in water and cover, immerse the other in weak acid solution and cover. (Note: these pieces of fish will deteriorate but the effect of the acid solution will become evident over a period of time.)

8. Secure articles dealing with acid rain as available and distribute to the class for their further interest and edification.

NOTE: **SAVE THE MURAL!**

Return to Biology Index

Filtering Water To Prevent Pollution

Ander, Perry
6800 N. California Avenue
Chicago, Illinois 60645
764-6677

Robeson High
723-1700 ext.113

Objectives:
Students will see the techniques that are used to filter our water. Students will gain an idea as to various pollutants which can contaminate our water and an appreciation of the need to keep our water supplies clean. If supplies are available students can filter water at their desks.

Apparatus needed:

1. A large "filtering tube" (This is a large test tube which is open at the top and narrows down into an opening at the bottom. If not obtainable a long necked glass funnel is sufficient.)

2. A large glass fish tank or jar

3. A bag of charcoal pebbles, sand, and gravel obtainable at a retail tropical fish store.

4. Micropore filter paper

5. Petri dishes

6. Chlorine (Obtainable at a retail outlet store that sells swimming pool supplies)

7. A strainer (found in the kitchen) or screening

Recommended Strategies:
For this lesson students should be issued a "lesson outline". This outline, numbered Roman numeral I-VI would enable the students to answer questions as they are presented during the lesson. For example numeral I would require students to define pollution; numeral II would ask students to list three ways in which water is polluted; III would require the students to list four ways in which water is purified; IV would ask students to write what part of the water purification was represented by pouring water through a household strainer; V would ask students to write what occurred when the filtered water from the strainer was allowed to settle in a test tube and what part of the filtration process was represented here; VI might ask students to write what occurred when water was filtered further from the test tube through a filtration funnel lined with layers of charcoal, sand and gravel. Of course the answers to these questions would become clear as the lesson was presented. **Also the outline can be varied to the teacher's tastes.**

The teacher should begin the lesson by asking the student to define pollution. As suitable answers are generated Roman numeral I can be filled in by class. Next teacher could generate from the class what they believe pollutes our water. As answers are generated Roman numeral II can be filled in. This point should be emphasized by "polluting" a fish tank or vessel which has been filled with clean water. Pollutants can be represented by such household products as car motor oil, food dyes, scraps of paper, soil, leaves, clay balls, or coffee grounds. These should be added as students express their ideas as to what pollutes their water. A dramatic effect should be achieved as students see their water "polluted" before their eyes.

Now the teacher should try to elicit an answer to the question: "List four ways by which polluted water is made pure." At this point students could be asked to assemble a "puzzle" which the teacher has passed out to each student. Similar to the Tic-Tac-Toe quiz show on morning T.V. this puzzle, when assembled, spells out the techniques of water filtration; namely screening of polluted water, sedimentation of polluted water, filtration of the water, and chemical treatment of the water. This can be done by drawing a jigsaw puzzle of perhaps 5 pieces on a single piece of unlined paper and simply writing the steps of the puzzle on the drawn pieces. The puzzle can easily be reproduced, cut out, and handed to pupils. The teacher can now elicit a response when the question "What is the first step of water purification" is asked. By reading from their assembled puzzle students can readily answer: "Screening." At this point the teacher can readily filter some of the polluted tank water through a household strainer. Perhaps students can do this at their desks with strainers brought from home. Their outline should be filled out too, i.e., what did straining the polluted water remove from the water? (large particles). Next the teacher can ask for the second step of the purification process. Once again by referring to their puzzle students can readily reply that it is "sedimentation." Now, the water that has been screened can be spilled into a beaker of perhaps 250ml. or a test tube, and allowed to settle. More impurities should settle out. Simultaneously students should further fill out their outline describing what they see.

Again, by reading the puzzle, students can reply that "filtration" is the third step of water purification. At this point the teacher should refer to the filtering funnel which has been layered from top to bottom in the order: one layer of pebbles, one layer of sand, one layer of charcoal. A long stemmed funnel lined with filter paper should be placed below the layered filtering funnel to further filter the water. Of course students are writing what they see on the outline.

Original polluted tank water should be quite a bit cleaner by now. But the demonstration can be further continued handing students a petri dish and three small slices of boiled potato to use as a growth media within the petri dish. Onto one slice a drop of the polluted water from the tank should be placed; onto a second slice a drop of the filtered water from the filtering funnel should be placed; onto the third potato slice a drop of the filtered water and a drop of chlorine mixed with this filtered water should be placed. Cover the dish and allow for bacterial growth for a few days. Students can now complete their class outline sheet by noting on which portion of the potato did bacteria grow. That is, did the filtered water show any difference in bacterial growth than the polluted water? Did the filtered water plus the chlorine show differences in bacterial growth than the other two drops? The completed outline could now be handed to the teacher as the pupil's progress.

It can be noted that a long stem clear glass funnel can be layered with the materials mentioned and used as a "filtering funnel."

Return to Biology Index

Living Organisms As Indicators of Pollutants In Fresh Water Ecosystems

Hubers, Hendriekje
11725 S. Karlov, Apt. 1B
Alsip, IL 60658
(312) 371-2437

Chicago High School for
Agricultural Sciences
(312) 881-5000

Objectives:

1. Use Hydra as a biological indicator of water pollution.
2. Learn about Hydra's natural environment, feeding behavior, reproduction, and reactions to stimuli.

Materials:

2-4 water samples from local ponds, streams, lakes, or rivers
1 glass culture dish (or depression slides)
Hydra population
Hydra medium
Brine shrimp or Daphnea
4-6 droppers or pipettes
microprojector or microscopes
heat filter

Strategies:

A Hydra population can be maintained and reproduced in the classroom. If Brine Shrimp are fed to the Hydra, make sure the salt water is rinsed off, otherwise you will kill your Hydra. Daphnea can also be used as food for your Hydra.

1. With a dropper remove one Hydra (with some water) and place on a culture dish or depression slide. If you use a culture dish, you can prepare more than one Hydra for later observation. Place the culture dish on the stage of the microprojector. Before turning on the light source, place a heat filter above the culture dish (a petri dish with water makes a good heat filter).
2. Observe and record the Hydra's structure and movements. You may also want to discuss Hydra's reproductive behavior and how it changes depending on the environmental conditions.
3. With a dropper place one Daphnea or Brine Shrimp (make sure you have rinsed the salt water off) in the dish with the Hydra. Observe and record your observations on the Hydra's feeding behavior.
4. Look at the pond and lake water samples. Discuss with students which sample they think is the most contaminated and why, and what

effects they think each water sample will have on the Hydra when added to the Hydra's environment. You can use as many water samples as you want, just make sure that only one type of water is added to each Hydra.

5. Add one drop of water from source A to one Hydra sample. Observe and record your observations. Set this sample aside, you will come back to observe it in about 10 minutes.
6. Repeat step 5 using water from source B. Repeat for as many water samples as you want to study.
7. After 10 minutes for each sample, observe again and record if there are any changes.
8. Write your conclusion on your observations.

Evaluation:

1. Research other types of biological indicators and write a strategy for how you could use this organism to determine the presence of contaminants in any kind of ecosystem.

Note: Another demonstration which can be done in class is using Elodea as an indicator. Use the same type of set-up you would use for demonstrating photosynthesis.

Return to Biology Index

Air Pollution

Levine, Stephen
7743 W. Chestnut Drive
Orland Park, Illinois 60462
(312) 429-0269

Gordon Upper Grade Center
388-7200

Objectives:

1. To develop a greater awareness of the variety and amount of particulate matter in the air.
2. To determine relationships between amount of pollution and time of day or week.
3. To locate general sources of pollution for the area and to develop some suggestions for improving air quality.

Apparatus Needed:

1. Microscope slides
2. Petroleum jelly
3. Masking tape
4. Magnifying glass or microscopes

Recommended Strategy:

Coat one side of each slide with petroleum jelly. Select several different places within your city or residential area to place the slide; e.g., inside school classroom, outside of school classroom, inside your home, outside your home, window ledges, and field. Label the location on masking tape that you attach to each slide. Each student should have three slides to look at, and these slides should have been placed in the places that I mentioned above.

Expose all slides the same length of time (6 hours, 1 day, 1 week, etc.)

After collecting the slides, place them on a sheet of white paper with coated side up. Examine under strong light with magnifying glass or microscope. Each student should have a microscope for this purpose.

Compare exposed slides with control slides that were left indoors in a closed box or drawer.

I asked the students questions about what they observed on the slides. Some of the questions are as follows:

Which of your slides had the most particles?
Where was this slide placed?
Which of your slides had the fewest particles?
Compare results with your classmates find out who had the slide with the highest particle count. Where was it placed?
What is the likely source of this pollution?
How might this pollution be reduced?
What might be done by individuals, community groups, industry, or

government to help to reduced air pollution?

The above questions can also be given on paper and handed out to the students to work on in class.

Return to Biology Index

Water Purification

Wilson, Wardell
7923 S. King Dr
Chicago, Il 60619
468-4083

Raster School
737-1010

Objectives:

Participants will develop an understanding and appreciation of water purification techniques and their implications for health maintenance. Upon completion of the activities students will:

- explain how polluted water can be a source of disease
- illustrate how a lack of oxygen in water can kill fish
- interpret and explain the water cycle
- express ways of purifying water for drinking purposes
- differentiate ways in which the body uses water

Apparatus and Materials:

Various water samples - tap water, distilled water, well water, mineral water, carbonated water, reverse osmosis water, five day old pond water; glass slide, microscope, candle. (Activity 1.0)
Charcoal placed in large funnel followed with gravel and then sand, flask, paper napkins for filter. (Activity 2.0)
Two jars filled with tap water colored with methylene blue, dried grass placed in one jar. Close jars tightly with screw tops and set for five days, litmus paper. (Activity 3.0)
Decomposition reaction jars with electrode tops, Reverse Osmosis Myron Meter. (Activity 4.0)
Reverse Osmosis Water Purifier and a Carbon Block Filtering Water Purifier. (Activity 5.0)

Recommended Strategy:

This P/A (Phenomenological Approach) lesson is based on the IDEAL Problem Solving Method utilizing the following steps:

I - Identify the problem (What are you asked to do here?)
D - Define the problem (What are the parts? How related?)
E - Explore the possibilities (Interpret and analyze problem)
A - Act upon the possibilities (Plan and follow a strategy)
L - Look for results (Explain results from the strategy)

Vocabulary:

Sediments, desalination, aeration chlorination, toxicity, acid rain, ionized, water borne disease, typhoid, cholera, carcinogens, chloroform, carbon tetrachloride, trihalemethanes, acid rain, suspended solids, dissolved minerals, precipitate, dialysis, respiration, cell oxidation, excretory organs, conductivity apparatus, oncology.

P / A

Nationwide newspaper reports, magazine articles, and network T.V. specials frequently focus on drinking water pollution and its impact on health. EPA scientists point out that over 700 chemicals have been found in America's drinking water and over 34 states have serious drinking water pollution problems. One way of coping with this problematic situation is to identify how water becomes polluted and understand how it can be purified by various methods.

Activity 1.0 Observe drops of water from pond water jar on slide under microscope. Write and illustrate on paper what you have identified and observed.

Activity 2.0 Pour remainder of pond water into filtration set up. Funnel and catch in flask. Record observation, then observe drops of flask water under microscope. **(Activity 2.1)** Add aluminum sulfate to the flask and watch for a sticky jelly like substance - aluminum hydroxide - Observe substance and then observe drop under microscope. Shake and then filter through napkin into another beaker. Examine this water and residue and record what you found.

Activity 3.0 Observe the two jars prepared earlier - Jar A and Jar B - with the same amount of tap water with blue coloration, and dry grass in Jar A. Discuss observation. Use litmus paper to test for pH in both jars. Note results.

Activity 4.0 Illustrate the water cycle and compare it to the process of distillation of water. Define hard and soft water. Explain how boiling of water removes carbonate ions and the deposit collects in tea kettles and steam irons. Have students picture in their minds that frozen distilled water, frozen rain water, winter icicles are generally very clear and un-cloudy whereas frozen tap water is unclear. Have students observe and try to explain. ...NOTE... Pure water is neutral, it has equal numbers of hydronium and hydroxide ions. As water becomes ionized with acids or bases, it moves from the pH #7 position of neutral yellow and the water becomes less pure, this degree of impurity is reflected in the cloudy ice cubes. (Acid rain water, when frozen would look more like frozen tap ice cubes. Can you explain?

Activity 5.0 Place tap water and distilled water in decomposition reaction jars. Insert electrode top and screw tight, plug into electrical outlet. Notice which jar of water is being decomposed and describe your observation. NOTE: These are drinking waters. Which would you prefer to drink. (Observe student faces)

Activity 6.0 Discuss with class the purpose of the oil filtration system in an automobile. Especially the purpose of the filter and oil relative to overall performance of car. Compare and contrast the human excretory system relative to urine and water. Illustrate. Also, explain the role of our skin and nose in the elimination of water. Have students blow breath on cold mirror and note results. Have students do research on the desert animals that never drink any water but make their water from their food. Insert jar over burning candle and note the formation of water. Explain. Students are now ready to focus on the true role of water in the human body. Have them explain two or more ways by which water enters the human body and the purpose of bodily water. Using anatomy/physiology charts, illustrate that over 70% of our daily food is water, over half of our body weight is water, that we lose about two liters of water daily through our sweat, urine, and breathed out moisture - as observed on the cold mirror. Help students to understand that lots of water is good for the body in that it leads to a high volume of urine, causing the kidneys to do less work. Concentrated urine is harder for the kidneys to remove. Explain that this could be one of the reasons why some people have to go on the kidney machines or to take " dialysis treatments." Another reason for lots of the "right kind of water" is that it may prevent urinary calculi (kidney stones). Alert citizens are concerned about their environment and especially keeping our water clean.

Photosynthesis, Respiration, and the ATP-ADP Cycle

Clovis O. Price Jr.
P.O. Box 379202
Chicago IL 60637
(312) 907-8267

Lucy Flower High School
3545 W. Fulton
Chicago IL 60624
(312) 535-6755

Objective:

The objective of this activity will be to demonstrate the three processes of photosynthesis, respiration, and the molecular interaction between ADP and ATP and the process by which they lose and gain phosphates in the process of energy conversion. Students will learn about chloroplasts by the construction and labeling of a chloroplast; aerobic respiration in the mitochondria by the construction and labeling of a mitochondrion; and the chemical interaction of ADP and ATP by atomic modeling of ADP and ATP molecules as well as a game.

Materials Needed:

(5) bags each of red beans, black beans, and lima beans.
(30) Ritter Dishes (clay planters/potting dishes)
(30) pieces of construction paper (strips preferably)
(5) bags of potting soil
(5) containers of glue
(5) packages of thin tipped markers
(5) packages of thick tipped markers
(10) packages of sponges (green, brown, and light green)
(10) tennis balls

Strategy:

Photosynthesis consists of the absorption of light by chlorophyll pigments and conversion of this light to chemical energy. This occurs in organelles called chloroplasts on membrane systems known as thylakoids. Respiration reverses the process of photosynthesis, releasing the stored chemical energy. Respiration occurs in organelles called mitochondria. ATP consists of three parts, adenine, ribose, and (3) phosphate groups. Adenine when bonded to ribose gives us adenosine. Adenosine plus three phosphate groups gives us ATP. Adenosine bonded to two phosphate groups is ADP. In the energy production cycle in the chloroplasts and mitochondria, energy is stored when ATP is produced from ADP and a phosphate group "P".

The ATP/ADP cycle provides energy for cellular activity. When energy is necessary the third phosphate group breaks off from ATP. This forms ADP and releases energy. When a phosphate group is freed up, it may move on to another molecule in a process called phosphorylation. The molecule gains both the phosphate group and the energy. ATP synthesis is catalyzed by ATP synthetase. Photosynthesis, respiration and ATP/ADP are related. Photosynthesis stores energy, respiration releases it, and ATP is the central molecule in this process.

The students will use the thin markers to mark the chemical symbols for each of the ADP/ATP chemical components on the surface(s) of the beans. There will be (1) chemical symbol marked on each bean. Red beans may be used to represent the carbons, lima beans to represent the hydrogens, black beans to represent oxygens, and white beans to represent the nitrogens; long grain rice will be used to represent the single and double bonds. After the beans are marked, they will be chemically arranged to represent the structures of the ATP/ADP molecules. The beans will be glued to a sheet of construction paper. After the glue has dried, the construction paper with the beans will be placed in a Ritter dish. The Ritter dishes will be at least half filled with soil and watered. The germination of the beans will occur within a few days. This germination is followed closely by the beginning of the photosynthetic process which we have been studying.

The students will each be issued 1-2 sponges. The students will carve the sponges into chloroplasts. The residual sponge will be used create the thylakoids. Half beans will be used to represent ATP synthetase molecules. A similar activity can be used to create models of mitochondria.

Using tennis balls the students will play a game of catch to demonstrate the loss of 1 phosphate to form ADP from ATP and the gain of one phosphate to form ATP from ADP. The first toss will represent ATP to ADP; the return toss will represent ADP to ATP and so on. The process (the game of catch) will be repeated until the students have clearly demonstrated their knowledge of the phosphate loss, phosphate gain process.

Performance Assessment:

Students should be able to explain the ADP/ATP cycle with 90-95% accuracy after they have completed both components of the exercise. Students should be able to relate the process directly and indirectly to chloroplast and mitochodrial function with 80-90% accuracy. Students should be able to explain the gain of a phosphate and the loss of a phosphate with the same degree of accuracy. This will be supplemented by a Timer-Board Activity. What does the Timer-Board Activity consist of? The students will be asked individual terms and vocabulary related to the activity which we have just completed.

Each participant will be given at least 60 seconds to define a particular term or answer a particular question. Each student will be given (5) points for every correct response up to a maximum of (50 points) for an "A" on the Timer-Board Activity. Total points will be written on a pre-printed scoring sheet beside the names of each of the students (our scoring sheet is our scoring board). The scoring sheet is blocked off so that a number (5) in red ink can be written in every block depending on how the student scores. There is a residual 2 1/2 points for answers that are not wrong but simply inaccurate.

What's the Matter?

Earline Muhammad
10140 South Luellla
Chicago IL 60617
(312) 721-7197

Louis Wirth Academy of International Studies
4959 South Blackstone
Chicago IL 60615
(312) 535-1410

Objective:

To Understand the Chemical Properties of Matter

Materials Needed:

Vinegar
Steel Wool
Household Ammonia
Tablespoon
Two Small Baby Food Jars
Wooden Matches

Strategy:

Strike Match. Observe what happens to the match as it burns.
Fill one-half of one jar with steel wool.
Add enough vinegar to cover the steel wool.
Write IRON ACETATE on the side of the jar.
Allow the jar to stand undisturbed for five days. (A chemical reaction between the vinegar (acetic acid) and steel wool (iron) that produces iron acetate.
Pour one tablespoon of liquid containing iron acetate into the second jar. Pour one tablespoon of household ammonia (ammonium acetate) and stir. Note and record observations.

Observations:

Chemical reactions do not create or destroy matter, but only rearrange the combinations of atoms in matter. For example, wood in the match stick (which contains carbon, oxygen, and hydrogen), plus oxygen in the air combine in a chemical reaction to form water (which contains oxygen and hydrogen), carbon, and carbon dioxide (which contains carbon and oxygen). Chemical reactions often give off energy (for example, the chemical reaction of the match burning gives off heat and light).

In the case of the green blob, iron plus vinegar produces iron acetate. Iron produces iron acetate. Iron acetate plus "ammonia" (ammonium hydroxide) produces ammonium acetate and iron hydroxide (the green blob)

In biological systems the same principles apply. Living things contain the same atoms as the non-living part of the earth, but the "chemical reactions of life" rearrange the atoms in the non-living organisms into new combinations (the chemicals of life).

Performance Assessments:

As a result of focusing on the chemical properties of matter, and the above activities, students will be able to answer the following questions:

What changes occurred when the match was burned?
What happened when the iron in the steel wool combined with the vinegar?
What happened when ammonium hydroxide and iron acetate combined?
In our experiment, The Green Blob, was a new material produced? Why or Why not?

Conclusion:

Students will understand the chemical properties of matter and its relationship to living and non-living things.

Return to Biology Index

What's the Matter?

Earline Muhammad
10140 South Luella
Chicago IL 60617
(312) 721-7197

Louis Wirth Academy of International Studies
4959 South Blackstone
Chicago IL 60615
(312) 535-1410

Objectives:

To Understand The Physical Properties of Matter
Designed for 6th and 7th Grade

Materials:

Apples(2)	Oranges(2)	Feather	Book of Matches
Ice Cubes	Graduated Cylinder	Beaker	Plants
Water	Wood	Flask	Book
sugar	Steel	Paper Cups	Spoons
Salt	Paper	Rocks	Single Beam Balance

Part A: To Recognize that Matter is Anything That Takes Up Space and Has Mass.

Procedure:

Groups of 4 or 5 students.
Pass out sugar, salt, wood, steel, paper, paper cups, rocks, plants, and spoons.
Place 3 or 4 objects on students desk.
Have the students touch, smell, taste, and look at the objects.

Questions:

How can one tell the difference between each object?
What do the objects have in common?
What do we call all material?
Look at the objects again. Are there differences in length, width, and thickness?

Part B: To Show That Gravity Controls the Weight of an Object.

Procedure:

Drop a book on the floor.
Drop a book and a feather on the floor.
Drop a book and a book of matches on the floor.
What is gravity?
What does this activity tell you about what gravity does to objects?
Discuss why an apple and orange of similar size may be different in weight.
Discuss reason why masses of different objects are not the same.
Discuss density.
Place the apple on the scale and weigh it.
Cut the apple in half and one half and two quarters;
Weigh the apple again.

Weigh the orange.
Cut the orange into four equal pieces.
Weigh the orange again.
Observe what happens when you weigh the apple and the orange.
Observe what happens when you weigh the cut apple and orange.
Record your observations.

Questions:

What is mass?
Can the mass of the object change?
Can the weight of an object change?
Did the mass of the apple change? Did the weight change?
Did the mass of the orange change? Did the weight change?

Part C: To Show That all Matter Has Volume.

Procedure:

Cut a wood block and a sponge so that they have the same length, height, and width as each other.
Place the wood and the sponge on top of each other.
Weight both the wood and the sponge.
Observe that they are the same dimensions.
Record your observation.
Fill a flask with water and freeze it.
Measure the volume of the ice in the beaker.
Cover the beaker with plastic wrap and let it thaw at room temperature.
After the water has melted, record the volume of water in the flask.
Place flask containing cold water over beaker.
Record the amount of water in the flask.
Fill graduated cylinder with 300 ml of cold water.
Place paper towel over boiling water.
Record your observations.
Remove paper towel from top of beaker.
Place graduated cylinder containing cold water over beaker.
Record your observations.

Questions:

What is Volume?
What is Density?
What Causes Matter to Change State?
What are Molecules?
What Causes Molecules to Speed Up?
How May Mass and Volume Be Measured?
What Causes Molecules to Slow Down?

Performance Assessments:

As a result of focusing on the Physical Properties of Matter, students will be able to:

Tell What Atoms Are

Tell What Two Things Control the State of Matter
Tell What a Molecule Is
List Three States of Matter
Describe Solids, Liquids, and Gases in Terms of Shape and Volume
Develop the Skills of Observation and Inference
Explain Density

Conclusion:

Students will understand the physical properties of matter and answer the questions.

Return to Biology Index

The Chemistry of Water

Virginia Harris
7031 S. Bennett Avenue
Chicago, Illinois 60649
312-493-7869

DuSable High School
4934 S. Wabash Ave.
Chicago, Illinois 60615
312-536-8600

Objective:

Grade level: Ninth

1. To discuss the phenomenological properties of water.
2. Discuss and demonstrate solubility of liquids.
3. Students will define and give examples of expansion.
4. Demonstrate surface tension individually and as a group.
5. Students will make a water molecule combining the class molecules together forming water.

Materials needed:

(For each student.)

Activity 1

One large beaker, black pepper, one small needle, water, and a dish washing detergent.

Activity 2

One large styrofoam ball, two small styrofoam balls, two toothpicks.

Strategy:

Review properties of water showing the natural existence of water in three states. Discuss and demonstrate the solubility of water using sand, sugar, oil, vinegar and salad dressing. The students will readily recognize that all substances do not dissolve in water and that there are other liquids that are good solvents.

Students will observe a can of coke that has been left in the freezer overnight. What happened? Why? Car radiators sometimes freeze in winter. Why?

In Activity 1, students will fill a large plastic container with water. Sprinkle the surface of the water slightly with black pepper. Discuss observations. Drop a dish washing detergent in the center of the dish. Observe what happens. Class will discuss observations.

Place some water in a large plastic cup. The water can be at any level in the cup. Let the water stand for two or three minutes. Place a small needle on the surface of the water. Observe what happens? Why? Place a small needle on the surface of the water using forceps. Discuss observations. Was it easier to place the needle on the surface of the water with your fingers or with the forceps? Class will discuss their observations and give reasons as to what they think happened.

In Activity 2, students will construct a water molecule showing how the hydrogen atoms are bonded to the oxygen atom using toothpicks. The class will bond their molecule with another molecule (in a straight chain) to show how water is formed. The water molecule looks very much like a Mickey Mouse hat. It has a covalent bonding and is polar because of the 105 degree angle between the hydrogen atoms.

Conclusion:

The natural existence of water in three different forms is indeed a phenomenon. Plants and animals cannot survive without it. We use it in every aspect of our daily lives. Solubility, expansion and surface tension are some of the properties that makes water unique.

We should not waste or pollute water because there are some countries who do not have any water. We should always remember those without and create ways to help.

Chromosome Karyotyping

Gray, JoAnne S.
11730 S. Oakley
Chicago, Illinois 60643
881-7072

George Henry Corliss High School
821-2515

Objectives:

1. Students will be able to demonstrate a microtechnique for reliable chromosomal analysis of leucocytes obtained from peripheral blood.
2. Students will be able to prepare a karyotype from the chromosomes of a normal human male or female.
3. Students will be able to use the karyotyping techniques for diagnosing a chromosomal disorder.

Apparatus and Materials:

1. Centrifuge and Tubes
2. Construction Paper
3. Coplin Jar
4. Deionized and Distilled Water
5. Fixative Solution
6. Flat- ended forceps
7. Human Chromosome Kit (order)
8. Human Chromosome Photographs
9. Human Karyotype Forms
10. Incubator or Hotwater Bath
11. Methanol
12. Microscope Slides and Cover Slips
13. Oil Immersion Microscope and Oil
14. Overhead Projector
15. Ruler
16. Scissors
17. String or Yarn
18. Tape or Glue
19. Tape Player and Music
20. Transparencies
    a. Cell Mitotic Stages
    b. Birth Certificate
    c. Chromosomes: Normal and abnormal
    d. Human Karyotype
21. Xylene

Recommended Strategy:

Order chromosome kit at least three weeks prior to use
Set up microtechnique one week prior to use

I. **Background:**

A. Discuss myths, superstitions and misconceptions associated with biological inheritance and human development.
   1. State an example of a heredity superstition.
   2. Enlist additional examples from the students.

B. State a brief history of Genetics, include Genetic Principles and how teaching has helped in eliminating misconceptions.

II. **Motivation:**

Before class place two large circles on the floor one inside the other using the string or yarn (represents membranes of cell). Use 2 different colors of construction paper to make hats, label one side chromatin and the other side chromosome. Make 2 centromeres cut in half and label.

A. Discuss the normal chromosome complement of human males and females.
B. Explain the history of the establishment of the correct chromosome number in humans.
C. Review cell division - explaining how sex cells receive too much or not enough genetic material.
D. Choose a short and a tall student to dance the "Chromosome Jig."
E. Note the two circles on the floor and discuss purpose, sizes,

arrangement, where "chromatin" should stand, and cell stage represented.

F. Place construction paper hats on dancers heads (chromatin sides showing, each hat is a different color).

G. Dancers will now perform within the nucleus, the remaining students will assist in providing clues:

Note Steps may be shown on overhead during performance or for review after the dance. Soft music may be played.

1. New cell stage - Interphase
    - (a) Chromosomes indistinct (chromatin)...dancers kneeling
    - (b) Chromosomes unravel (chromosome sides of hats showing)
    - (c) Chromosomes duplicate and gradually coil
        - (1) 2 more dancers, same size as originals, come in wearing chromosome hats.
        - (2) Place centromere on locking hands of each two dancers.
2. Prophase
    - (a) Chromosomes contracted enough to become distinct
    - (b) Chromosomes twist around while constantly contracting
3. Metaphase
    - (a) Chromosomes are fully contracted
    - (b) Chromosomes separate
    - (c) Teacher quickly, without students being aware of purpose, sprinkles confetti (chemical) on dancers to stop metaphase, before the spindle fibers appear. Puzzled dancers will stop dancing and separate.
    - (d) Teacher states, "now nuclear membrane disappears," and asks a sitting student to remove it

III. **Development:**

When possible list responses on chalkboard

A. Discuss the purpose and name of the chemical (confetti).

B. Describe the position of the dancers, thank dancers as they sit.

C. What process is seen when chromosomes stop in this case? (Ans. Arrested metaphase)

D. Ask why arrest metaphase for chromosome studies?

E. Ask how does one obtain his/her own chromosomes?

F. Ask why would one need to see his/her chromosome?

G. Show on overhead:

- (1) Birth certificate showing an error in stating sex
    - (a) Ask class to study certificate and note any errors
    - (b) Use this to lead into karyotyping
- (2) Examples of the following karyotypes:
    - (a) Normal male and female - try your own
    - (b) Chromosome set used to make karyotypes

IV. **Activities:**

A. Laboratory Exercise - Human Chromosome Study/Karyotyping

Allow time for students to complete the following:

- (a) Prepare a normal human karyotype
- (b) Prepare an abnormal human karyotype
- (c) Teacher designed analysis and discussion section

B. Chromosome Syndromes

List disorders and determine name and sex affected by the disorder.

V. **Evaluation Prepare an evaluation exercise**

VI. **Extension** (Homework Exercise)

A. List a hypothetical anomaly, its causes, symptoms and probabilities of occurrence, rank the likelihood of aborting the fetus on a scale of 1-5. 1 representing never, and 5 always.

B. Write a paragraph supporting your decision. If you are opposed to abortion in all cases, then write a paragraph that supports your values.

Return to Biology Index

The Role of Enzymes

Rucker, Jessie B.
24 W 615 Parkview Ct.
Naperville, Il 60540
961-5635

Curie Metro High School
838-5041

Objectives:

To explore the role of enzymes in chemical reactions.
To determine what kinds of cells contain more catalase than others.

Apparatus and Materials:

Chalk
Potato
Raw hamburger
Raw liver
Boiled liver
Spinach leaf
Carrot
3 percent hydrogen peroxide
Manganese dioxide
Boiling water
Graduated cylinder
scalpel
10-mL test tube
Test tube rack
Spot plates

Recommended Strategy:

Phenomenological approach
Comparisons, analogies, and summarization

1. Review the following terms: organic compounds, dehydration synthesis, hydrolysis, potential energy, kinetic energy, and activation energy.

2. Place two keys on an overhead projector and have the students compare them to the structure of enzymes.

3. Using paper models on the overhead projector, demonstrate to the students the role of enzymes in hydrolysis and dehydration synthesis.

STUDENTS ARE NOW READY TO BEGIN THE EXPERIMENT.

PART I

Measure 2 mL of hydrogen peroxide, H_2O_2, in a graduated cylinder and pour it into a test tube. Add to the test tube enough manganese dioxide, MnO_2, to cover the end of a scalpel.

1. Describe the reaction.
2. When the reaction ends, add 2 mL more hydrogen peroxide to the

test tube. Does the reaction occur again?

3. When the reaction ends, add a little more manganese dioxide. Does the reaction occur again?
4. Based on your observations, which of the following statements is the most probable assumption? Circle the letter of the statement you choose.
   a. The hydrogen peroxide is used up and the manganese dioxide remains unchanged.
   b. The manganese dioxide is used up and the hydrogen peroxide remains unchanged.
   c. Both the hydrogen peroxide and the manganese dioxide are used up.
   d. Neither the hydrogen peroxide nor the manganese dioxide is used up.

PART II

Place three small pieces of each: chalk, hamburger, liver, spinach, potato, and carrot on a spot plate. Pour enough hydrogen peroxide on each food stuff to fill the depression. Be sure to prepare the same amount of each food stuff and to keep them separate.

Note the speeds of the reactions. The faster the reaction, the more vigorously the liquid bubbles and the warmer the container becomes. Make a data chart, list the items in order from the fastest reacting to the slowest reacting.

5. Which substances contain more of the enzyme, those at the top of the list or those at the bottom?
6. Are the meats near the top or bottom of the list? the plants?
7. Which, if any, of the items did not produce a reaction? If a substance produced no reaction, explain why.

PART III

Place three small pieces of raw liver and three small pieces of boiled liver on your spot plate. Fill each depression with hydrogen peroxide.

8. Describe what happens.
9. Based on this test, what assumption can you make about the effect of boiling enzymes?

ANALYSIS

10. What two products does hydrogen peroxide change into when it breaks down?
11. What effect does a catalyst have on this chemical reaction?
12. What do you think causes the bubbling in this reaction?
13. What is the function of an enzyme?
14. What enzyme acts on hydrogen peroxide in living organisms?
15. Would this enzyme act on chemicals other than hydrogen

peroxide? Why or why not?

SUMMARY QUESTIONS

1. Summarize what you have learned about the role of enzymes.
2. What analogy can be best used to describe the role of enzymes?
3. Write a list of terms that were used to help you to understand how enzymes operate. Use each term in an appropriate sentence.

Return to Biology Index

The Coding of Protein Molecules By D.N.A.

Glenn, Georgia S.
2231 W. 80th Street
Chicago, Illinois, 60620
776-0341

Bogan High School
838-5080

Objectives:

Use paper models to demonstrate how DNA controls protein synthesis.

Use paper models to show the role of mRNA in protein synthesis.

Use paper models to show the role of tRNA in protein synthesis.

Apparatus needed:

Paper models to represent the following molecules: 5 deoxyribose thymine, 5 deoxyribose adenine, 1 deoxyribose cytosine, 1 deoxyribose guanine, 3 ribose uracil, 2 ribose adenine, 1 ribose cytosine, 2 tRNA molecules, 2 amino acid molecules. Cut out models beforehand and place in an envelope. Print the DNA Neucleotide sequence A,A,T,A,G,T on the envelope. Prepare a large "place mat" on which to assemble your protein molecule. Construct by taping two large sheets of construction paper together. Represent the nucleus by drawing a half circle on the left edge of your "place mat". Make it wide enough to accommodate a double strand of nucleotides. Make several circles to the left of the half circle to represent a few ribosomes in the cytoplasm.

Strategies:

Remove the puzzle pieces from the envelope. On the "place mat", start at the left edge inside the red half circle, arrange your DNA nucleotides in the linear sequence written on the envelope. Attach the corresponding nucleotides to make the right side of the DNA ladder. (Place the results on the board)

Unzip the six nucleotides from the right half of your molecule.

Attach the appropriate ribose nucleotides to the left half of your DNA nucleotides. (Record results on the board)

Slide the ribose nucleotides to the right side of the half circle representing the nucleus and turn RNA nucleotides right side up.

Attach the appropriate amino acid molecule to the appropriate tRNA molecule.

Move the attached amino acid along with the tRNA to the appropriate bases on the RNA template. Try to arrange these molecules so that they will be built on top of a circle used to represent a ribosome.

Students will identify what amino acids they have put together by looking at a chart showing the codons used to represent various amino acids.

CONCLUSIONS: Each student has built a dipeptide made up of the amino acids leucine and serine. Large protein molecules are built the same way, but with many more amino acids being brought to the mRNA template by tRNA.

EVALUATION: Answer the following questions to show understanding of protein synthesis:

1. To join tRNA molecules to the mRNA pattern, which sequence of tRNA molecules will match base pairs of the U,U,A sequence in mRNA?
2. Which tRNA sequence of bases can join U,C,A sequence in mRNA?
3. How does the sequence of bases on mRNA control the type of tRNA joining it?
4. A base sequence of A,A,A mRNA could only join with what sequence of bases in tRNA?
5. What specific amino acid is brought to the mRNA by a tRNA with a terminal sequence of A,G,U? (Use an amino acid - codon table)
6. What amino acid is brought to the mRNA by a tRNA terminal sequence of A,G,U?
7. How many half rungs of mRNA are responsible for the coding of one amino acid?
8. A protein molecule consists of the following amino acid sequence: leucine, glutamine, tyrosine, leucine, serine, serine. What would be the sequence of tRNA molecules responsible for forming this protein?
9. A ribosome receives the following mRNA message: AAA, CGA, GAA, GUU. What will be the sequence of tRNA bases joining the mRNA molecule? B. What will be the sequence of amino acids formed from this code?
l0. Explain how a sequence of bases in DNA can instruct a cell to produce a certain protein.

Return to Biology Index

Natural and Synthetic Fiber

Grant, Erskine
5050 S Lake Shore Drive
Chicago, Illinois 60615
947-0225

Washington High School
646-4860

Objectives:

To identify wool, cotton, linen, and silk with the aid of a microscope. To identity several natural and synthetic materials placed on a table.

Apparatus needed:

microscope, table, cotton fiber, linen fiber, silk fiber, wool fiber, leather belt, styrofoam cup, polyester bottle, rayon blouse, vinyl clothes bag, wood plank, nylon stockings, polyester and cotton shirt.

Recommended strategy:

The students were given a list of vocabulary terms to define prior to this assignment. Arrange the terms written on the board in two categories. "Natural and Synthetic Fibers." Student will be given a description of the four natural fibers placed under the microscopes as well as the natural and synthetic fibers placed on a table. Identify the types of fibers placed on the slides under the four microscopes as well as the items placed on the table.

Return to Biology Index

MOLECULAR SHUFFLE

Johnson, Betty
9653 So. Merrion
Chicago, Illinois 60617
(312) 994-6912

Haugan Elementary School
(312) 478-0680

Objective:

To observe how a selectively permeable membrane works.

Materials:

cellophane dialysis tubing
glass rod
string
starch suspension
80% glucose solution
distilled water
3 beakers
medicine droppers
2 test tubes
Benedict's solution
Bunsen burner
tripod
iodine

Strategy:

Soak a 20-cm section of cellophane dialysis tubing in water for a few minutes. Rub the ends between your thumb and index finger until the ends separate. Insert a glass rod to hold it open. Twist one end and tie it tightly with string. Remove the glass rod and then fill the dialysis bag 3/4 full with starch suspension and 1/4-full with 80% glucose solution. Tie the top of the bag with string. Leave a loose piece of string 10-15 cm long. Rinse the outside of the bag with distilled water. Leave the string outside the beaker so that you may remove the bag from the water. After 20 minutes withdraw a dropper full of water from the beaker. Place this liquid in a test tube and add 10 drops of Benedict's solution. Heat in a boiling water bath for 10-15 minutes.

While the water bath is boiling, place 30 drops of the liquid from the beaker in a test tube. Add three drops of iodine. Observe the color of the water after the iodine has been added. (If it turns blue or black, then starch is indicated.) Now add 20 drops of iodine to the water in the same beaker and observe any color changes. Report your results by answering questions 1-8.

Evaluation:

The students should answer the following questions:

1. What happens when you heat Benedict's solution and some water from the beaker?
2. Explain your results?
3. Do you note any changes in the amount of liquid in the beaker?
4. What conclusion can you draw from this observation?
5. What is the purpose of adding iodine to the liquid from the beaker?
6. What happens when you add iodine to the liquid from the beaker?
7. Describe any changes observed when iodine was added to the beaker?
8. If a change has occurred, what does this indicate?

Return to Biology Index

CONSTRUCTING A DICHOTOMOUS KEY

MARGARET BANKHEAD

ROBERT A. BLACK MAGNET SCHOOL
9101 SOUTH EUCLID AVE.
CHICAGO, IL 60649
1-312-375-2040

Objectives:

To construct and use dichotomous keys.

Materials:

Shoes (Use one shoe from each of 10 students).

Worksheets: "Using A Dichotomous Key"
"Imaginary Animals"

Strategies:

Procedure:

1.Arrange chairs in a circle.

2.Instructor takes off one shoe and place it on the floor in the middle of the circle.

Dialogue

3."There's one of my shoes, so let's have a shoe from about ten of you".

4.Tell the students that they are to divide the shoes into two piles. Tell them the piles don't have to have equal numbers of shoes but, that they all have to agree on some obvious characteristic that will distinguish the shoes in one pile from the shoes in the other pile.After agreement is reached,tell the students a record of the agreement will be kept on the board.

5.Draw two horizontal lines some distance apart on the chalkboard. Label the lines with the agreed upon characteristics. (Fig.1).

```
__________

__________
```

FIG.1

6.Return to the pile of shoes. Tell the students one pile will be pushed aside for the moment but, now they must again divide the pile of shoes into two distinct piles. After agreement is reached add this information to the chalkboard sketch. (Fig.2).

```
                  _____________
_______________/
               \_____________
```

FIG.2

7. Continue the procedure of dividing the shoes into two distinct piles and adding the information to the sketch until there is only one shoe with the identifying characteristic, at which point the shoe is identified and the

owners name is added to the sketch (Fig.3).

```
                                                         ______________
                                           _____________/
                             _____________/             \______________
                                          \_____________
```

FIG. 3

8. Divide the second pile of shoes in the same manner as the first pile until all the shoes have been identified.
9. Push all the shoes back together in one pile[Adding perhaps a shoe from the distance past or one with characteristics unlike those used in the original construction].
Discuss the meaning of the term dichotomous explaining that the word means "two forks".
10. Tell the students that dichotomous keys usually appear in a more compact form and that the diagram can be easily converted by adding numbers to each characteristic used. Label the diagram in numerical sequence following the same order the characteristics were agreed upon.
11. Have the students redeem their shoe by taking it from the pile and placing it on the correct branches of the key which will lead to its' correct identification. After all the shoes have been redeemed the shoe added earlier should remain. Ask a student to follow the key until the shoe is identified. Students should discover that a key works only for identification of those items used in its' original construction.
12. Pass out the two worksheets. Complete the " Using A Dichotomous Key" sheet in class. Assign the " Imaginary Animals" sheet for homework.

ACTIVE TRANSPORT ACROSS THE PLASMA MEMBRANE

Dorothy Sarmiento
Lindbloom Technical High School
6130 S. Wolcott Ave.
Chicago, IL 60636
1-312-471-8721

Objective:
The student will be able to comprehend that energy is required to move substances across the cell membrane against the concentration gradient.

Materials:
Dry Yeast
0.75% Na_2CO_3
0.02% neutral red dye
0.75% acetic acid
filter paper discs to fit funnels

Strategies:
Demonstrate the dye (neutral red) by adding weak acetic acid. Color change occurs.
Place 25 ml of 0.75% Na_2CO_3 in a large test tube. Add 1 gm dry yeast. Boil solution gently for 2 minutes. Label the tube A.
Place 25 ml of 0.75% Na_2CO_3 in a large test tube, warm, and then add 1 gm dry yeast. Allow the solution to sit for 10 minutes(to activate the yeast) Label the test tube B.
Add 25 ml of 0.02% neutral red to test tube A. Observe and record color change.
Add 25 ml of 0.02% of neutral red to test tube B. Observe and record color change.
Filter a portion of the contents of each test tube. Observe and record color of cells left on the filter paper and color of solution of each test tube.
Think about your observations and answer the following questions:
a) Did the dye enter the cells of either test tube?
b) Did Na_2CO_3 enter the cells of either test tube?
c) Is the cell membrane of the cells of A or B permeable?
Conclusion? Either the cells of test tube B put out something to change the solution or the dye entered the cells and was changed in the cytoplasm. (It is known that the cytoplasm is slightly acidic)

Add an equal amount of acetic acid to the remaining contents of test tube A.
Observe and record any color change.
Filter a portion of the suspension. Record color of cells.
Remove the filter paper of the original filtration of test tube A contents.
Place a drop of acetic acid on the cells.
Observe and record any color change.

Biology/Chemistry

Food Chain

Lyvonia G. Hearns Retired and feeling Wonderful!
8919 S. Harper Ave.
CHICAGO IL 60619
773-734-0458

Objective(s):

Create different types of food chains.

Compare a balanced food chain to an unbalanced food chain.

Primary Grades (Kgn, 1st, 2nd, 3rd.)

Materials:

Peanuts in the shell or candy in a wrapper (hard candy) (approx. 150) of each.

Set-up:

Large open area – circle to start; may wish to break the class in half & work with one half at a time.

Strategy:

When you need energy in the morning before you come to school what do you do? Eat breakfast. Review that living things need food to give them energy. Plants get energy from sunlight. Grasshoppers get their energy from plants. Birds get their energy from grasshoppers. Draw the food chain on the board as you go along. Explain that this is a food chain. The plants and animals in a food chain depend on each other to live. What would happen if all the plants died? (Erase plants from board) Can grasshoppers get their food or energy from the sun? No. The grasshoppers would die. (Erase the grasshoppers) All the animals that eat/ depend on the grasshoppers would die too. So every part of the chain is important.

Today we are going to experiment with creating our own food chain. We are going to have the sun's rays (teacher and 3 students), some plants (16), some mice (11), some snakes (7), and some hawks (3). Break students into groups (suggestions: group by clothing – i.e. pick 16 people in green to be plants, etc). Have all the plants sit on the floor next to each other in a straight line. Behind them have the mice sit next to each other (facing the plants' back), behind them the snakes and behind them the hawks, (to form a pyramid) [Option: if space is limited have the plants create an outer circle, the mice inside, the snakes inside them and the hawks at the core.]

Explain that you and your 3 helpers are the sun's rays and that you have energy (peanuts in the shell) to pass out to the plants. Give each plant a handful of peanuts (at least 16). The plants should keep 2 peanuts (do not eat yet) and pass the rest to the mice behind them. Make sure you notice how many peanuts are handed to you before you pass them on. The mice should keep 2 peanuts and pass the rest to the snakes. The snakes should keep 2 peanuts and pass the rest to the hawks. The hawks should end up with a lot of peanuts. (Do not eat the peanuts yet).

Discuss how the chain worked (everyone got food – well distributed, the sun was the original source of energy, all the participants depend on each other). Who got the most peanuts? Why do the hawks need the most energy? (They are bigger, they need more energy to move and fly). Make comparisons between a big athlete like Shaq and a kindergarten student. Who would need more food for energy?

Collect all the peanuts and explain that now we are going to see what happens if the food chain is not balanced. This time there are no hawks because humans that were hunting killed them all. What that means is that since there were no hawks to eat the snakes we have even more snakes than before. Have all the hawks now become snakes and join that group. Start the chain as before, (Every student keeps 2 peanuts). What happened when we got to the snakes? Did each snake receive more food or less food than before from the mice? (Less) When there are too many snakes there is not enough food for them all and some will die of starvation. We need the hawks to balance the chain.

Collect the peanuts and put the hawks back in their spot. This time we had a bad drought and only half of the plants survived. Only give out peanuts to half of the plants (or half as many peanuts to all the plants) Keep the same numbers of students in the other groups. Continue the chain as before keeping 2 peanuts as before. What was different this time? Did everyone receive as many peanuts as they did the first time we did this? No. Some of the animals will die off because there isn't enough food for everyone, (hawks may not receive any peanuts).

Performance Assessment:

Students will fill in an observation chart or (make a chart) by choosing a food chain for each animal or plant listed in the lesson. (i.e. sun – corn-cow-humans).

-

Conclusions:

-

We can see from our experiment today that food chains need to be balanced. Now you can eat your peanuts.

Memory and Learning

Mary A. Mason
3018 200th Place
Lynnwood IL 60411
(708) 418-1535

Clay Elementary School
13233 South Burley
Chicago IL 60409
(312) 535-5600

Objective:

The teacher will introduce primary students to the various parts of the brain and provide specific activities and a plastic model designed to help improve memory.

Materials Needed:

One gallon plastic water container (for each student)
A child's silhouette (for each student)
A drawing of a brain, that can be divided, into three puzzle pieces of the three science words below, (for each student)
Science Words, Medulla, Cerebellum, Cerebrum (for each student)

Strategies:

Activity One

Medulla

Teacher will ask three (3) volunteers to come up, close their eyes and put their hands behind their backs. Teacher will prick one with a pencil. The student should make an involuntary movement. Teacher will touch another student on the neck. Teacher will touch the other student lightly on the hand. The medulla is responsible for respiration, circulation, muscle tone, nerves, reflexes, and it controls all internal functions.

Cerebellum

Teacher will draw a line on the floor and ask a student to walk in a straight line while the class observes. The cerebellum is responsible for balance, muscular coordination and motor skills.

Cerebrum

Teacher will discuss students' various emotions. When students feel sad or happy, the cerebrum is stimulated. The cerebrum is also responsible for higher level skills and critical thinking.

Activity Two

Teacher will whisper a nonsense sentence to a student. The student whispers the nonsense sentence to the next student. This continues until every student has heard the sentence. "Cherry Berry is my favorite fairytale for toddlers" is a good choice. Rhyming and alliteration with the "F" and "T" sound help the memorization process even though the sentence is a nonsensical one.

Activity Three

Song to teach the Continents

When teaching a song, the medulla and cerebrum are at work. The medulla allows a person's muscles to perform in such a way that she/he can pucker so air can pass, thus forming the lips to sing. The cerebrum is responsible for the part that allows students to "know" the words and the tune to the song.

"Continents, continents, what are you?
Continents, continents, what are you?
Continents, continents, what are you?
You are a great big world.

A is Africa
A is Australia
A is Asia
A is Antarctica
E is Europe
N is North America
S is South America

You are a great big world."

This song is sung to the tune of any familiar nursery rhyme.

Activity Four

This song is sung to the tune of any familiar nursery rhyme.

"I know the five great lakes.
I know the five great lakes.
I know the five great lakes.
All I need to know is HOMES.

H is Lake Huron
O is Lake Ontario
M is Lake Michigan
E is Lake Erie
S is Lake Superior

All I need to know is HOMES."

Activity Six

Each student is given an empty one gallon water container and a silhouette of a child's head. They will color the picture, cut it out and paste the silhouette on the container. Each student will be given a "brain puzzle". He/She will match each puzzle piece with the original copy that they received earlier. Teacher and students will discuss and label the 3 (three) parts of the brain. When a child can say the vocabulary words and demonstrate an understanding of the functions of the brain, then he/she can place the words and brain parts into the brain (container). THEY CANNOT PUT ANYTHING INTO THEIR BRAINS UNLESS THEY CAN SHOW COMPLETE UNDERSTANDING. THEY MUST REALLY KNOW IT.

The container will be used for the entire year to collect data that the students have learned. The students can put the five Great Lakes and the Seven Continents into the brain (container). Students can also put math facts and times tables into the container. This is an excellent source of recall for students to use to review skills already learned. I emphasize reviewing the information in the brain (container) frequently to put knowledge into long term memory.

Assessment:

Student will demonstrate mastery of material in the brain through a periodic checking system set up by teacher. If student forgets material that he/she has already learned, he/she must take it out of the brain. This is an ongoing process. Checking can also be done by another peer. Peer tutoring is strongly encouraged.

Conclusion:

The knowledge that we have acquired as teachers and techniques for teaching it, if combined with what I believe to be a "true calling", is the greatest formula for becoming an effective, highly motivated educator.

Memory and learning go hand in hand. All students do not learn at the same rate, but all children can learn. Using different strategies and creating a safe and positive learning environment will enable students to learn and be successful.

Return to Biology Index

Cells Are Us

Cheryl L. Trammell
6700 South Shore Drive
Chicago IL 60649
(312) 493-0663

Delano Elementary School
3937 W. Wilcox Street
Chicago IL 60624
(312) 534-6620

Objectives:

(These objectives are suitable for K-3 grade levels.)

The main objectives of this mini-teach are to show that the cell is the basic unit of life; that cells divide slowly to become mass of cells (mitosis); and that there is a gradual loss of cells throughout life.

Materials Needed:

Cell Observation(s)
"Cells Are Us" song
paper
pencils
microscope
slides
slide covers
iodine
eye dropper
cotton swabs
water
long balloons
string
marbles

Cell Loss Observation(s)
(memory)
pencils
paper
shopping bag
various items to be used
for observation
index cards
envelopes
markers
"Hocus Focus" picture

Strategy:

Cell Observation
1. Distribute "Cells Are Us" song to class.
   Have class sing song which explains about mitosis.
2. Ask students to draw a dot on paper. Tell class: "This was you -- billions of cells ago."
3. Distribute microscopes. Have students:
   a. Gently scrape inside of cheek with cotton swab;
   b. Stir end of cotton swab in drop of water on a slide;
   c. Add a drop of iodine solution to color cells;
   d. Look at slide under microscope to observe skin cells.
4. Give each student two long balloons and string. Have students blow up one balloon and twist the ends in opposite directions to give an idea of what the first egg cell division looks like. They can also tie a string in the opposite direction (if the balloon doesn't burst) to show a model of the second division. Explain that the cells go on dividing.
5. Demonstrate how cells keep getting smaller and smaller, and become crowded for room. Show how they begin to arrange themselves into a ball, or sphere, with an open space in the middle because of their rounded shape.
   a. Take some marbles and push them together.
   b. Demonstrate how the marbles pack tightly if you use just a few.
   c. Add more marbles and you will find that they tend to arrange themselves around an opening left in the center.
   d. Explain how this process goes on and on and on.

Cell Loss Observation (memory)

1. Distribute "Hocus-Focus" picture to the class. Have students write down at least six differences that they see between panels.
2. Put 18-20 various items into shopping bag. Have the students observe as you name the items as you remove it from the bag. Have volunteers orally recall as many of the items as they can. The volunteer with the most correct responses may select one of the items as a prize.
3. Draw/write duplicates of various pictures and symbols on index cards. Place in two separate envelopes. Have students observe cards for one minute then write down the names of the items in the envelope.
4. Have students with color-coded cards work in pairs. Mix up and turn over the cards in both envelopes. Have students try to find and match like pairs.

Performance Assessment:

At the conclusion of the mini-teach, students will be able to answer the following questions:

1. What are cells?
2. Can you explain mitosis?
3. Why is cell division important?
4. What effect does aging have on mitosis?

Conclusions:

Students will understand that a cell is a tiny unit of life; the smallest "building blocks", from which all living things are made and that cell production slows as we age.

Return to Biology Index

Enquirer-type Newspapers Have Many Uses

Russ Osantowski
5132 Steger Road
Monee IL 60449-7002
(708) 748-0752

Carter Elementary
5740 S. Michigan Ave.
Chicago IL 60637
(312) 535-0860

Objectives:

This lesson is for 2-12th grades. Using this high interest reading students will learn about animals, including humans and their care and feeding, photography and how to make false photos, critical thinking skills, weighing of evidence skills, research skills, the journalism techniques, citation exactness, increased judgment and scientific method skills, especially making conclusions.

Materials Needed:

Several Enquirer-type newspapers, especially the Star, Sun, and Weekly World. Try to read until you find at least one interesting article for the lesson you wish to teach. Some of these papers have 99% of their articles about movie stars only. Try for those that have a wide variety of articles.

Strategy:

Photocopy 6 copies of each article that you like. Assign groups of 2, 3 or 4 students to each article. They must read it and report on it for several integrated (interdisciplinary) purposes. For example, an article and picture about the (or a) Loch Ness monster being hoisted aboard a Navy ship may convince some students that this prehistoric animal does exist and that our government doesn't want us to know about it. A journalism assignment might be for one student to write out and report on the answers to the journalistic questions of "Who, What, Why, When, Where and How" as stated in the article. A research assignment might be to have a student make comparisons as to the features of dinosaurs as compared to the features shown in the photographs. Another research assignment might be to compare and graph the number of sightings over the last 500 years and to create graphs as to the population density so as to properly weigh the sightings. This could lead to a comparison of time spent in or near the lake (loch is the Scottish word for lake). Another research project could be on the invention of the submarine (by a teacher) for use by the United States Navy, who rejected the invention several times before finally accepting it.

Another assignment could be to look at the article and to write down the reasons other investigators gave to show how the witnesses were misreading what they saw due to light and cloud shadows on the lake, or mistaking a wave going over a log, etc.

As to the human animal their are many interesting articles, that bear more scientific inquiry to negate them or to expand them or to verify that their basic content accomplished what its author claimed in the title. For example in a recent article about possibly being a shopaholic, which was claimed to being addicted to alcohol or drugs or nicotine, if a person answers 4 out of 8 questions in the quiz given, the person should seek professional help before they make things worse by causing their own bankruptcy. An assignment could be to talk to and interview with written notes the school counselor as to whether this article seemed sociologically and psychologically sound and why or why not. If the counselor is a potential shopaholic, then have the school nurse or the school social worker interviewed.

The possibilities are endless. These short articles have such high reader interest, even your reluctant readers will finish them and give a report with high enthusiasm.

Now, feel guilt-free to indulge your urge to buy these magazines. They are to help your students read and more importantly to think clearer, and in a more scientific manner - to weigh probabilities and possibilities and to discuss future courses of action and additional study. Also, they are good for some humor too.

Return to Biology Index

Living and Non-Living

Ollie L. Jamison
9340 S. King Drive.
Chicago IL 60619
(312) 785-0029

Delano Elementary School
3937 W. Wilcox Street
Chicago IL 60624
(312) 534-6620

Objective:

This lesson was designed for primary grades 1-3. The main objective of this mini-teach is to generalize that all living things need air, water, food and shelter.

Materials Needed:

Plant, wood, plastic, bird, hamster, turtle, crab.

Strategy:

1. Take the students for a walk around the school. Have each student make a list of all the living things they see.
2. Develop a game for the identification of living and non-living things.
3. Tell the pupils to bring a healthy plant to school. Do not water the plant for a week or two. Have the students observe what happens to the un-watered plant. Keep a class journal of what happened.
4. Tell the students to hold their breath for as long as they can. Record the amount of time each student holds his or her breath. How did you feel after this activity?
5. Have students explain different kinds of shelter used by humans. Ask them if all people need shelter.
6. Have students think of things that might destroy the good air at home or out-of-doors. (Answers might include smoking, pollution, strong odors etc.)

Performance Assessment:

1. How does something in the world qualify as a living thing?
2. What two groups can everything in the world be divided into?
3. What is an organism?
4. What are two differences between living and non-living things?

Conclusion:

At the conclusion of this mini-teach pupils will be able to tell that all living things need food, air, water and shelter in order to survive.

OUTSIDE ACTIVITY:

Write the name of all living things under the appropriate category.

Living Things	**Non-living Things**

1.	1.
2.	2.
3.	3.
4.	4.
5.	5.

All living things have three general characteristics. What are they?

1.
2.
3.

Return to Biology Index

Freshwater Sharks Bite Children at 35th Beach. A Play

Russ Osantowski
5132 Steger Road
Monee IL 60449-7002
(708) 748-0752

Carter Elementary
5740 S. Michigan Ave.
Chicago IL 60637
(312) 535-0860

Objectives:

This lesson is for 2-12th grades. Students will learn about the many different scientific occupations as well as some possible specializations therein, and perhaps a little bit of other life considerations, ecological, financial, educational, sociological, and emotional as to greed, avarice, truth justice and the American Way. It integrates biology, physics, drama, chemistry, genetics engineering areas, etc.

Materials Needed:

3x5 cards. That's all really. But, you are probably reading this on a computer so you will have to transfer the parts to 3x5 cards. Therefore you will need access to printer, scissors, and glue or a printer and laminator to print, cut and glue the parts of this play onto 3x5 cards or to just print or photocopy, cut and laminate this play.

Strategy:

Other than on career day it is hard to transmit the enthusiasm and thinking involved of a professional educated person pursuing their knowledge and their detective-like dedication in this full-run headlong pursuit. By putting these cards and more in the hands of students, each one will have a new and interesting part to play, will see a glimmer of how complex our ever increasing store of knowledge and our society is and will be motivated to want to make a more relevant concentration in their education.

The setting of the play is a sort of "town meeting" or in this case, a public meeting attended by the Chicago ward committeeman who is also a Chicago city building inspector, and other people in the neighborhood of the 35th street beach, 60% of whom are shouting that something has to be done to save "Our Children, Our Future" (which is the present motto of the Chicago Board of Education).

Be or appoint a moderator for this discussion. Tell the students that they must observe, take notes and write 1-5000 paragraphs on what is happening in this meeting what the thoughts are of the people there, what they said, where they are coming from, going to and what type of person they are, by writing a 1 paragraph character sketch of each person. They must write about 1-30 characters in the play.

Here are the parts to be glued on the front and sometimes back of 3x5 cards, or just laminated from the printed or photocopied page.

Pro shark. SHARKS NEVER HAVE CANCER AND THEY EAT EVERYTHING THAT CAUSES CANCER. In fact I have been FEEDING THEM CANCEROUS LIPS AND LUNGS removed from smokers and many human cancerous body parts removed by local surgeons as well as fish with cancer. I have injected live cancer cells into them and they never get it. As a microbiologist I think I HAVE FOUND ALL of the ANTIBODIES in a shark THAT PREVENT CANCER from growing. As a marine biologist I have been researching for these antibodies that their bodies make and I'm trying to synthesize them.

Pro shark. I am an Ecologist. The previous invasions of the lamprey eel and the zebra shell mussels haven't done any appreciable damage. Let's wait and see, the cures might pollute the water. In fact, the last invasion is clearing up not only the Great Lakes, but also the Mississippi River. And, it is providing a possible new food source, for certain fish, so the zebra mussels have proved to be very beneficial in the long run for water reservoirs, as free hardworking purifiers.

Pro shark. I am a cytologist. I have discovered how the shark's cells repel cancer. I feel I can clone these cells and inject them into humans to replicate and cure cancer. Like all scientists, I will need several freshly caught sharks everyday for the next five to ten years to finish my research.

Pro shark. I am a chemist and have found that sharks have a chemical in their body made near or in their (liver?) that keeps them hungry most of the time. My niece is very thin because of anorexia nervosa. If I can isolate and synthesize that chemical, I can sell it worldwide to doctors to treat that disease. I always wanted a mail order business that was a guaranteed moneymaker. More importantly, so does my wife. The mentally ill (neurotic) anorexic people will always be with us so our new business will be recession proof. The fisherman delivers daily.

Pro shark. I'm a physicist. I'm freezing different sharks, making molds of them and filling the molds with different liquid combinations to equal exact scaled down models made of real airplane materials of equal mass. I then suspend them in wind tunnels to test for a new jet design.

Pro shark. When night falls, I am the

fisherman. I know people are afraid of the sharks, and I catch them at night by using bloodball bait and nets and hooks that I have shot out with a crossbow at night. I come back just before dawn, haul in my catch, throw it into a large body bag in my trunk and await my calls on my cellular phone while I have breakfast at the IIT cafeteria. I am parked at the IIT lot across the street. I'm wondering about getting my lazy brother-in-law to do the same for Loyola, DePaul, Northwestern, U. of Illinois, and Roosevelt professors.

Pro Shark. I am a virologist and I have designed a virus to carry the all purpose virus I found in the freshwater sharks that keep them from ever getting ill. They never die from illness. They only die when bitten by accident in a feeding frenzy and then they are eaten by other sharks. I designed a human virus to carry this virus into human cells to take over the mitochondria and to make these protective viruses so humans will live longer or maybe forever.

I am a virologist and I have designed a virus to carry over the genetic cell design for reproduction of teeth to the human body so that we will keep growing new teeth and we will never ever have to see a dentist in our lifetime.

I am a chef and I have 67 proven recipes for shark fin soup, etc. I'm working on creating new ones and I'm writing them down so I can write and sell my cookbook worldwide.

I'm a marina owner and I have rented out 25 more spaces to charter boat captains. This is $50,000.00 extra income in boat rental dock and drydock fees, per year. I now spend the winter in Florida and let my son run it during winter arthritis time.

As a geneticist I've found a variant gene on chromosome 17 that is psoriasis susceptible causing cells to divide at a faster rate and never mature. I can see the normal development easier in a shark's cells and gain clues as to what is needed for normal growth.

As a Chicago licensing official whose brother-in-law is a building inspector. Boat owners, new restauranteurs, and commercial fishermen are pounding on my door with money in their hands. New hotels are going up on 35th street and they need liquor, food and other licenses. I own 4 vacant lots on 35th street.

Antishark. I am Sister Teresa and I run the Catholic orphanage on 35th street with 3000 children of wading and swimming age.

I'm a mother of 15 children, ages 1-15 and we live next to the 35th street beach. My children love to swim and sailboard there.

Pro or anti shark. I am Mrs. Know-It-All. I interrupt people, and say things like, "I know where you're coming from," and that "You scientists are nothing but educated fools," or "It's about time we had some meaningful research done once and for all and children should not stop progress, they should be in school all summer anyhow." WRITE YOUR OWN SPEECH AS QUICK AS YOU CAN. WRITE MORE IF YOU WANT TO.

Neutral. As an engineer in the Army Corps of Engineers, I'm in charge of the shoreline and all inland waterways including all rivers. If an underwater fence is put up by the beach to stop sharks from biting and eating parts of swimmers, it would cause many people to lose their lakeshore homes at the southern tip of Lake Michigan in Ill. and Ind. unless you spend $1,000,000,000.00 to build a jetty due east to prevent beach erosion. Your taxes will go up to pay for this.

Return to Biology Index

Food For Energy - Four Food Groups

Anna M. Rembert
1050 N. Trumbull
Chicago IL 60651
(312)235-4605

Faraday Elementary School
3250 W. Monroe Street
Chicago IL 60624
(312)534-6670

Objectives:

This lesson is designed for students in grades two through four.
1. Teach the students the importance of eating properly with a balanced diet.
2. Identify foods that belong in the Milk Group and the Meat Group.
   a. State and/or understand that most food in the Milk Group and the Meat Group come from animals.
   b. State and/or understand that foods from the Milk Group and the Meat Group give them energy.
3. Students will be able to state and understand that foods in the Fruit-Vegetable Group and Grain Group come from plants.
   a. Identify foods that belong in the Fruit-Vegetable Group and Grain Group.
   b. State and understand that grain is made into flour and flour is used to make bread and other grain products.
   c. State and understand that foods from the Fruit-Vegetable Group and Grain Group give them energy.
4. Know where various foods come from and that animals eat plants.

Materials Needed:

Food Chart
Cut Pictures of Food
Index Cards
Glue
Food Triangle
Flannel board and velcro
Zip Lock Bags
Popcorn and Popper
Butter
Variety of foods from each food group:
- Loaves of long Italian or French bread
- Pound of 3 different types of sliced meat (roast beef, turkey, ham, salami, bologna, etc.)
- Pound of 3 different cheeses (American, Swiss, Cheddar, etc.)
- Tomatoes 2
- Lettuce 1
- Oil

Crayons
Scissors
Ice
Rock Salt
Milk
Sugar
Vanilla flavoring
Salt
Plastic Gloves

Strategy:

1. Have the students jump, blink their eyes, clap their hands.
2. Ask each student how the body is able to do these things.
3. Introduce the concept that food produces energy, and that is how we are able to do activities such as running, etc.
4. Introduce the Milk and Meat groups.
5. Show food cards from each group and ask where these items come from?

6. The students will say that most of the Milk and Meat groups come from animals.
7. Have the students wash their hands.
8. Explain why it's important to wash our hands when we are handling food.
9. Make ice cream which is a food for energy.
10. Give each student a small Zip Lock Bag, and plastic gloves for their hands.
11. Add 4 ozs. of milk, three teaspoons of sugar, and 1/4 teaspoon of vanilla flavoring, then zip the bag.
12. Take a gallon size Zip Lock Bag add 2 cups of ice and 1/4 cup of rock salt, place the small zip lock bag into the larger Zip Lock Bag with the ice.
13. Shake the bags; make sure the inside bag stays closed and sitting upward.
14. Shake the bags until you have ice cream. Then remove the small bag and eat the ice cream.
15. While eating the ice cream, review and discuss how we get proteins, and other nutrients from milk and meat, also why they are energy foods. Talk about the exception to this group (legumes).
16. Next, we'll introduce the Fruit/Vegetable group and the Grain group of food.
17. Show food cards from each group and ask where these items come from.
18. The students will say that most of the Fruit/Vegetable group and the Grain group come from plants.
19. Discuss each group and the nutrients received from each group.
20. Have the students wash their hands.
21. Now we are going to make popcorn.
22. Measure 1/4 cup of popcorn and place in the corn popper.
23. Place butter in the top while popping the corn.
24. Add salt and pass the popcorn around to each student.
25. Discuss the value of the Fruit/Vegetable group and the Grain group.
26. Show how these groups are used for energy.
27. Next, we'll introduce the combination groups.
28. Discuss the foods that belong in the combination groups such as pizza, and sandwiches, etc.
29. Have the students wash their hands.
30. Each student will make a sandwich using a variety of meat, cheese and vegetables.
31. While eating, review and discuss the four food groups and the combination group and how they are used for energy.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following question regarding these topics.

1. Why we need energy in our body: for breathing and various exercises?
2. Energy is measured in units called calories.
3. Food contains various nutrients such as protein, carbohydrate, and fats.
4. Students can identify foods that belong in the Milk and Meat groups.
5. Understand that food from these groups comes from animals.
6. State that energy comes from these two groups. (Milk and Meat)
7. Students can identify foods that belong in the Fruit/Vegetable and Grain Groups.
8. Understand that food from these groups comes from plants.
9. Students will be able to classify foods into the Four Food Groups.
10. State that energy comes from these two groups. (Fruit/Vegetable and Grain)
11. State and understand food preparation safety rules.
12. Help prepare a Combination Food.
13. Know the importance of a balanced diet.

Conclusion:

Students will know the Four Food Groups and understand the importance of a balanced diet. They will also know the importance of food preparation safety, and will understand how quickly bacteria multiply.

Classification

Bobbie Dixon Heard
2617 South Michigan
Chicago IL 60616

McCorkle Elementary School
4421 South State Street
Chicago IL 60609
(312) 535-1793

Objective:

The students will observe various apples, contrasting them, and classifying the apples based on structure and color.

Materials needed:

Different kinds of apples:

Red Delicious, McIntosh, Granny Smith, Golden Delicious, Rome Beauty

hand lens
ruler
plastic knife
paper towels (for clean-up)

SAFETY TIP: Advise students to use EXTREME CAUTION with the plastic knives.

Strategy:

1. For co-operative groups of 3-4 students.
2. Give each group a basket of apples, different colors, various sizes, stems, without stems, etc.
3. The groups' project will be to show how the apples are alike and how they are different. The groups will categorize the apples into as many categories as possible. (By sizes, color, stems vs. non-stems, etc.)
4. Give each child a hand lens to look through. Invite each child to closely observe the apples' skin color. Discuss. Compare and contrast.
5. Have the students cut each apple through the center. Measure the diameter, record. Observe the texture of each apple inside and outside the apple. Record.
6. Have the students look for the seeds. Are the number of seeds in each kind of apple the same? Are more seeds found in any one kind of apple? Record.
7. The groups will be able to compare seeds, if the number of seeds are different. Data can be graphed.

Performance assessment:

Students will be able to tell how apples are alike and different.

Curriculum Connection:

LANGUAGE ARTS/ARTS Have students draw pictures of their favorite apple, then have them write a descriptive paragraph telling how the apple looks and smells.

MATH Have students draw an apple to scale. Students can measure diameter and circumference of the apples and graph the results.

POSTER Students can use the poster "parts of an apple" and be able to

identify parts of an apple.
LITERATURE Students will read selected books relating to "The Apple".

A Biology Game To Promote Classification And Observation

Charles T. Buzek
35 S. Kensington
LaGrange IL 60525

Spry School
2400 S. Marshall
Chicago IL 60653
(312) 534-1700

Objectives:

Students should learn to observe with an eye to noticing differences and salient characteristics. Also students should be able to communicate these observations in a brief manner.

Materials needed:

A wide selection of specimens from the lab's collection were used but in ordinary classroom situations any found objects would be useful.
Enough 3 by 5 cards for the class.

Strategy:

Each student is to have a specimen jar in front of them at start of class with a 3 by 5 card. They examine the specimen very closely. They are next asked to write down a careful description of the specimen on the card. When this has been completed students will hand in their cards. The instructor will mix up the cards and then pass them out to the class again. The students will read the cards and then try to match them to the specimen.

Performance assessment:

For each individual student, performance can be measured by the success they have in matching their card to the appropriate specimen. Overall class performance should not be less than 90%.

Conclusions:

Students will need to observe their specimen and very carefully note those characteristics which are significant and may not be confused with the other specimens. Students that have difficulty matching their cards will learn what they would need to do in order to make their description clearer. It will also be seen that a system for describing organisms needs to be succinct and less cumbersome. Again, this is an exercise that points out the need to classify and how to go about it in a way that will enlighten rather than confuse.

Introduction to the Scientific Method

Maureen P. Kall
8415 Budingen
Tinley Park IL 60477
708-532-7029

Hillcrest H.S.
175th & Pulaski
Country Club Hills IL 60478
708-799-7000 (ext. 51)

Objectives:

The main objective of this lesson is to get the students involved in a class activity while introducing the process of the scientific method.

This lesson may be used on any grade level. It may be used as just a problem solving situation or as a beginning class activity.

Materials Needed:

String - One piece per person (about 3 feet long)

Strategy:

1. Divide students into groups of two.
2. Each student should tie the ends of their string into loops (big enough to put their hands into loops but small enough that the string will not be continuously falling off).
3. One person from the pair should place the string onto his/her wrists such that it resembles handcuffs with about two feet of string in between each of their hands.
4. The other member of the pair is to place one loop around one hand only. They are to then take the string and place it between their partners' body and their connected hands. The student should then attach the other end of their string around their other wrist (see diagram 1).
5. The students should now be connected such that they must devise a plan to separate themselves from each other without removing the string from around their wrists.
6. You should then have the students write out their ideas on what they believe would be the best way to solve this problem using the first two steps of the scientific method. (State the Problem and Form a Hypothesis)
7. Now using the third step (Testing the Hypothesis) the students are to try to untangle themselves by the methods they devised when forming their hypothesis.
8. After giving the students ample time to try to test their hypothesis they are to finish their scientific method by either accepting or rejecting their hypothesis and forming a conclusion.

Performance Assessment:

As stated above the students are to write out for themselves how they are going to solve the problem using the scientific method. Another problem may also be given to the student such that they are to try to solve the new problem using the method they just learned.

Conclusions:

It may be nice if you are able to show the students how to get separated from one another since most of them will be unable to do so. The main trick is that you do not need to move yourself around at all which most of the students will find themselves doing (suggestion: tell the girls in the class that are wearing skirts or dresses that they will be unable to do the lab - this leads the students to believe that they have to manipulate their bodies in many different directions). All that needs to be done is for one of the students to rotate their hands such that the string is perpendicular to their partners. They are to take the half of the string which is in the upper half and note which hand it is closer to on their own body. They are to take that half and loop it through their partners wrist loop on the opposite hand of their partner (if the string was closest to their own left they are to go through their partners' right). The loop should be pulled through the wrist loop in the direction of the person's fingertips. Once the loop is pulled through the wrist loop it is to be pulled over their partner's hand. The student should then be able to extract themselves from their partner by moving the string off to the side (see diagram 2 on the next page). If you try to do this and have any problems in solving it, feel free to call me.

In the following diagrams assume that you are person 1 and that you are standing with your hands up, palms facing you.

Diagram 1
The following diagram shows the initial positions of the two students and their ropes:

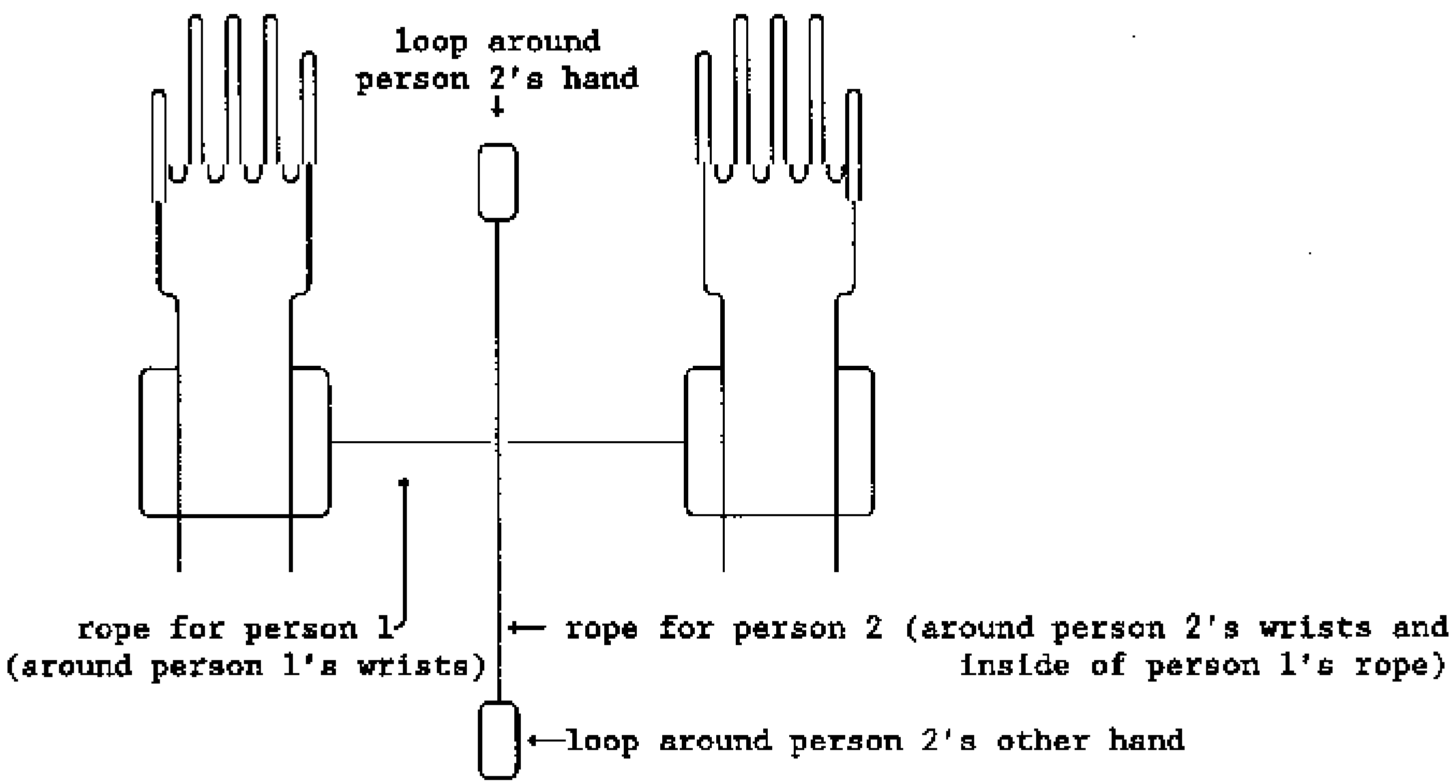

Diagram 2
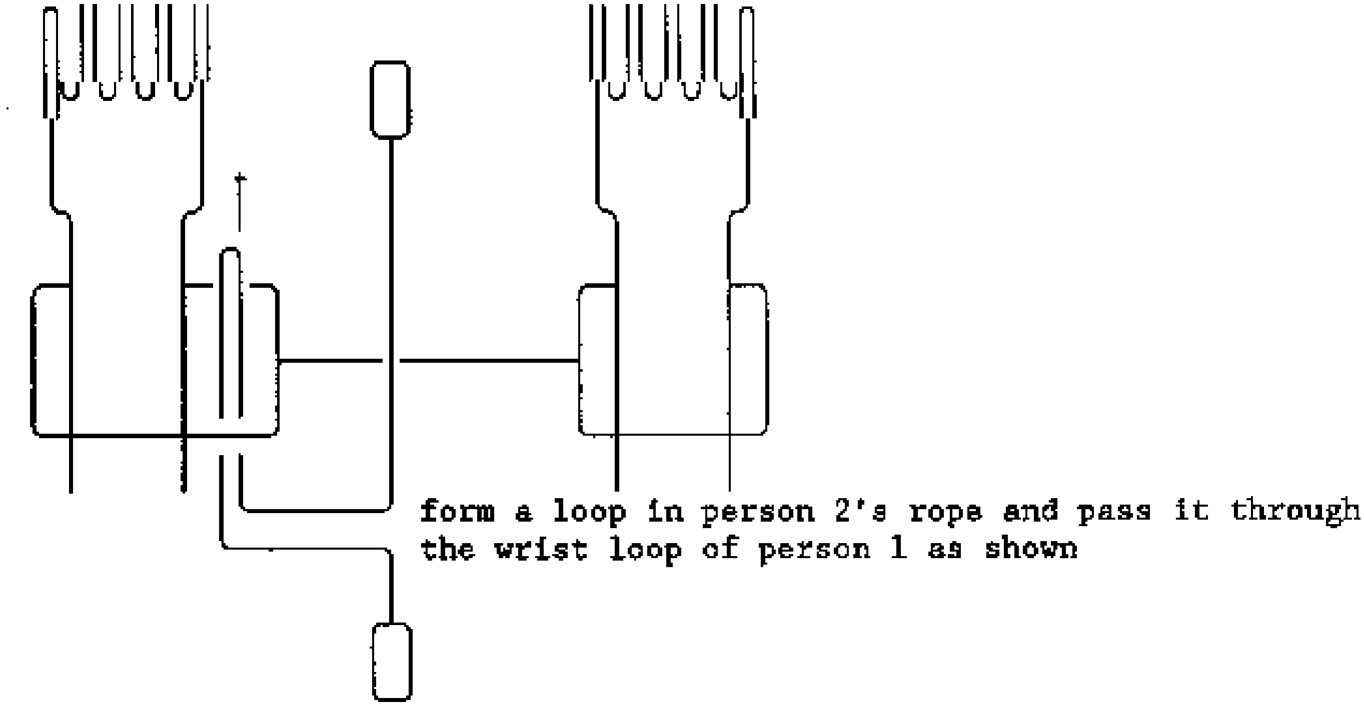
To 'untangle' themselves, form a loop in the rope from person 2 and pass it through person 1's wrist loop as shown below:



Finally, pass the loop from person 2's string over the hand of person 1.

A Demonstration of Photo- and Geotaxes in nauplii of Artemia salina

Daniel C. Koblick
5436 S. East View Park, #1
Chicago IL 60615

312-288-8032

Illinois Institute of Technology
Life Sciences Building
3101 S. Dearborn
Chicago IL 60616
312-567-3480 (Biology office)
567-3490 (DCK office)
567-3600 (IIT switchboard)

Objectives:

This presentation was designed for High School students, but can be modified for use in Middle School. Students are presented with an easily observed orientation behavior of small crustaceans with respect to light and gravity, given some description of the habitat and feeding behavior of the organisms and encouraged to relate the phenomena observed to the needs of the organisms in terms of adaptation.

Materials Needed:

- 1 plastic shoebox with lid.
- 1 or 2 liters of 4% NaCl.
- A vial of brine shrimp (Artemia salina) eggs.
- 1 siphon, consisting of a two foot length of india rubber tubing with six inch segments of glass tubing inserted in each end.
- 2 wire pinch clamps
- 1 one liter flask (a clean milk carton will do).
- 1 100 ml. graduate cylinder.
- 1 approx. one cm internal diameter glass tube, about eight inches long.
- 2 black rubber stoppers to fit above tube (Size 00).

Procedure:

Hatching of brine shrimp eggs.

Brine shrimp eggs are available from tropical fish dealers. Purchased in quantity (1/2 to 1 lb.) from a biological supply house such as Carolina Biological Supply or Ward's Natural Science Establishment greatly reduces the unit price. Each egg is as small as a grain of fine sand. A teaspoonful contains many thousands of eggs. The eggs will remain viable for several years if kept cool and dry. If placed in a 2% to 4% salt solution the eggs will hatch into tiny larvae (known as nauplii---singular = nauplius). Do not use iodized salt, nor reagent grade salt; best results are obtained using sea salt, which is usually available in the gourmet section of your supermarket. A 4% salt solution is easily made up by making a saturated solution (add about 8 ounces of salt to two cups of water in a quart jar, agitate vigorously, and allow excess salt to settle), and diluting 100 ml of the saturated supernatant solution to one quart with water. (If you use tap water, allow it to stand overnight before use to get rid of the chlorine it has been treated with.) The best way of obtaining nauplii free of unhatched eggs and dead larvae (large numbers of eggs do not hatch, and many more die within minutes of emergence from the egg), is to fill a transparent plastic shoe box with 4% salt solution to a height of 1 to 11/2 inches, raise one end of the box about 1/2 inch by placing a wedge under it, so that the depth varies as it does in a swimming pool, and sprinkle about 1/2 teaspoonful of dry eggs over the surface. If this is done gently, the eggs will float on the surface. Penetration of the salt solution into the eggs initiates development. Oxygen is required, and this is obtained directly from the air by the floating eggs. At room temperature, nauplii will emerge about 36 hours after wetting; at 30 degrees centigrade, emergence time is about 24 hours. If the boxes are not disturbed during this period, unhatched eggs remain on the surface and the rapidly swimming nauplii are found in the solution. These can be separated by siphoning the bulk of the solution into a beaker or other container. After a short time, the nauplii will sink to the bottom of the vessel (this behavior is called a positive geotaxis) and a concentrated suspension of them can be made by transferring them to a test-tube by means of a dropper pipette.

Demonstration of Phototaxis:

Stopper one end of the glass tube and, holding the tube vertically, transfer the concentrated suspension of nauplii to the tube. Fill to the top with salt solution and stopper the upper end in such a way as to exclude all air bubbles. This can be done by holding a fine pin in the open end of the glass tube while introducing the stopper. The pin distorts the stopper and provides a pathway for excess solution and air to escape when the stopper is pushed into the tube; if the pin is then carefully pulled out (holding the stopper in place), no air bubbles will be trapped in the tube. Invert the tube a few times to spread the nauplii evenly and place it on a horizontal surface. Direct the light from a penlite flashlight on one end of the glass tube and cover the remainder of the tube with a paper towel. After a few minutes, almost all of the nauplii will be found at the lit end of the tube. If the opposite end of the tube is then illuminated, the nauplii will again move to the illuminated end. (Because of reflections of light in the glass tube, not all the nauplii move to the point of greatest illumination; some will remain in the body of the tube. If a round bottomed test-tube had been used for this demonstration, a large number of nauplii would be found at the center of curvature of the semi-spheroidal part of the tube. This is because the bottom acts as a crude lens, concentrating the light at its focal point.)

Questions For General Discussion:

Beside the light gradient, what other gradients might be present in the tube? (Gravitational gradient, chemical gradients of oxygen, carbon dioxide, excretory products of the nauplii themselves.) In what ways did the experiment try to minimize the effects of these other gradients? (Equal distribution of artemia at the beginning of the experiment, horizontal light gradient compared to vertical gravitational gradient, exclusion of air bubble.) Of what use is this built-in response to the nauplii? Why does the unpurified seasalt produce better yields of nauplii than purified table salt or iodized salt?

Background:

The brine shrimp lives in salt swamps such as those often found inland of the dunes at the seashore, in man-made evaporation ponds used to obtain salt from the ocean, and in salt lakes such as those found in the intermountain desert region of the western United States. (Multicultural note: large salt water lakes are found in many parts of the world; One of the larger of these is the Caspian Sea, into which the famous Volga River flows.) Few other organisms can tolerate such a high concentration of salt as is found in these locales. Sea water varies from about 2.9% to about 3.5% salt, depending on the latitude and the time of year. The Great Salt Lake, in northern Utah, undergoes long term variations in salt content, but since records have been kept it has varied erratically between 25 and 35%. Adult brine shrimp can tolerate a salt content of as much as 50%. Since few organisms can grow at such high concentrations as that found in the Great Salt Lake, brine shrimp from this locale do not have much selection in the way food. They live almost entirely on the photosynthetic green alga (singular of algae) Dunaliella. Like many other primitive aquatic plants this organism is attracted to light, rising to the surface in the daytime, and sinking at night. The positive phototaxis of Artemia keeps it at the same depth as its prey.

Nutrition

Donna Lynn Attinello
18959 Boulder Ct.
Homewood, Illinois 60430
(708) 799-3323

Gallistel Language Academy
10347 S. Ewing Ave.
Chicago, Illinois 60617
(312) 535-6540

Objective:

To identify and describe the main nutrients in our diets that are needed by the body as a source of energy.

Materials Needed:

Grocery Store Ads, Overhead Projector, Chalkboard, Scissors, Markers, Graph paper, Pictorial Examples of Food, Food from actual stores.

Strategy:

1. Review vocabulary terms: cell, nutrient, food, diet.

2. Name (through the brainstorming process) some foods eaten the previous day. Predict how they can be grouped: Meats, Grains, Fruits and Vegetables, Milk Products.

3. Observe chart of food groups from overhead transparency.

4. Classify foods into groups from grocery store ads. Students work in groups of four. Place foods on individual charts.

5. Play "Nutrition Bingo". One student holds up a picture or object of food. The other students place markers on cards until a few bingos have been won.

6. Construct a chart of what they ate for their last two meals. Work in groups of two.

7. Graph a class chart of one meal eaten as a composite of each group of two according to food groups.

8. Examine food labels from four or more different foods. Chart information regarding the content. Categories are: Protein, Fat, Carbohydrates (sugar and starch), Vitamins and Minerals.

9. Compare and contrast results collectively during a "share time" discussion.

Conclusion:

Students will be aware of the necessity to eat a well balanced diet.

Biology Trivia Questions

Carol Giles
Box l925
Chgo, Il 60690

Collins High School
1313 S. sacramento Blvd.
Chgo, IL 60623
1-312-534-1500

Please note that students are to use their Internet resources to find the answers to these questions.

1. Are all invertebrates cold blooded?
2. What is the difference between a toad and frog?
3. How many heart chambers does a crocodile have?
4. Is the toad becoming more reptilian?
5. How many eyelids does a camel have?
6. Is the sun getting larger or smaller?
7. The fire ant has many enemies (true or false).
8. All insects live inside a hard skeleton (true or false)?
9. The name "Amphibians" comes from the Greek word which means what?
10. What organ needs the most energy, the heart or the brain?
ll. A Cuban Land Crab can outrun a horse (true or false)?
12. Is a rabbit a rodent?
l3. How many kinds of insects die after stinging only once?
14. Is a Giant Panda a bear?
l5. Why would you want to change an organism's DNA?
l6. Why are we in the primordial ooze?
17. Name the nut that is used in the manufacturing of dynamite.
18. Name the most popular green vegetable in the world.
19. Name the only food that lasts and does not spoil.
20. Primitive man used butter as what?
21. Name the largest tree on earth.
22. What is the difference between a physical change and a chemical change?
23. Which cells have DNA, white blood cells or red blood cells?
24. Define genetic engineering.
25. What is the significance of Morton's salt slogan "When it rains it pours?"
26. Is a Mandrill a baboon?
27. What is the purpose of a Punnett square?
28. Do all animals with two chambered hearts live in the water?
29. How many chambers does a fish's heart have?
30. Why does one become thirsty after eating salty foods?
31. Explain the story of Typhoid Mary.
32. Which is older, a bacterium or a virus?
33. This age is the age of electricity. What will the next age be named?
34. List three traits of a bird.
35. List three organisms that belong to the Arthropod Phylum.
36. Name the phylum of organisms that have spiny skin.
37. All fungi are producers (true or false)?
38. Digestion starts in the ___________?
39. Why do the left and right sides of the heart seem backwards in drawings of the heart?
40. Seaweed is used to make many products - name five.
41. White cells increase in number during an infection (true or false).

42. Nasal sprays contain a drug that _______ the capillaries in the Nose?
43. If your nervous system is slowed you become ____________?
44. In what ways are plants sexy?
45. Is a tomato a fruit or a vegetable?
46. Name a plant leaf which, when placed in soil or water, grows into a new plant.
47. Name three plants that can reproduce asexually by their stem.
48. Elephants develop for almost two years before they are born (true or false).
49. Name two sex cells.
50. Name the disease where blood cells do not carry enough oxygen.
51. Which type of behavior can be changed, innate or learned?
52. Armadillos are reptiles. (True or false)
53. Name the phylum of animals that have baggy bodies.
54. List some medicinal uses of cocaine.
55. Who is "Typhoid Mary"?
56. Jean Harlow, an actress, died as a result of what?
57. How many stomachs does a cow have?
58. Why do women menstruate?
59. Do porcupines shoot their quills?
60. Julius Caesar and Napolean Bonaparte were born with ________?
61. Name the largest creature on earth.
62. What type of bird is one likely to find in one's backyard?
63. Which bird has two toes in the front and two in the back?
64. Distinguish between a jungle and a forest.
65. How does one distinguish a baby Parakeet from an adult?
66. Are mealworms "true" worms?
67. Name the largest muscle.
68. How are ticks related to crayfish?
69. What is the order of succession in a forest?
70. If you were walking through a canyon, which plants would you expect to evolve first?
71. What are the functions of the following laboratory equipment: a beaker, a funnel, a watch glass, a wire gauze, a ring stand and an evaporating dish.

Return to Biology Index

Biology Trivia

Carol Giles
Box l925
Chgo, Il 60690

Collins High School
1313 S. Sacramento Blvd.
Chgo, Il 60623
312-542-3500

Objective:

(Grades 2-10) To determine if you can answer the following questions.

l. Name the smallest bones in the body.
2. How many muscles are in the body?
3. The word hormone is derived from a greek verb meaning?
4. Is there a difference between a hare and a rabbit?
5. What is the purpose of a formula?
6. Distinguish between an autotroph and a heterotroph?
7. Name six types of sponges.
8 Who is Dr. R.E. Grant?
9. Write the plural for of the following words: Genus, taxon, paramecium, fungus, bacterium, thallus, phylum, octopus, apparatus.
l0. Name the uses of carbon dioxide.
ll. If you blow into a test tube of bromothymol, what happens?
12 How many types of sharks are there?
13. Most sharks are dangerous to people? True or false?
l4. How many rows of teeth does the shark have?
15. Does the shark always have a supply of teeth?
16. Do sharks have bones?
l7. If sharks stop swimming, what will happen?
l8. If a shark is in still water, what will happen?
19. What are the pores on the shark's snout for?
20. A baby shark is called?
21. What is a feeding frenzy?
22. What is so unusual about the Thrasher Shark?
23. Name the Shark's only enemy.
24. Name the predator that has no natural enemy.
25. Why do fish give off a glow, especially in the very deep waters.
26. Name the animal with the largest teeth in the world.
27. How does the elephant help man?
28. Which are older, the sharks or the dinosaurs?
29. How can one protect themselves from a shark?
30. Name the shark that regularly eats dolphins, sea lions, whales and people.
31. Are planktons solely tiny plants?
32. If one boils a maple leaf for an hour, what colors will one see?
33. Does an acid solution have an excess of hydrogen ions?
34. As one grows older, what happens to one's bones?
35. Most people have at least 25 moles. True or false?
36. White Sharks never get sick. True or false?
37. Do all types of dogs belong to the same species?
38. Whose skin is thicker a man's or a woman's?
39. How come you gain weight when the temperature drops?
40. Which snakes are larger, male or female?
41. Do toads have teeth?
42. How does one determine the weight of one's skin?
43. What is a "Dactylogram"?

44. The word "autopsy" comes from the Greek word meaning to?
45. What is the word toad an acronym for?
46. What weighs more your skin or your brain?
47. What "killed off" the DoDo Bird?
48. Do deaf people get seasick?
49. Male canaries sing. True or false?
50 Name the oldest living thing.
51. How comes nobody gets a headache and a toothache at the same time?
52. Do kangaroos live in trees?
53. Ron is undergoing a "rhytidectomy". Explain.
54. What's the longest street in Chicago?
55. Can whales roll their eyes?
56. What is a group of turtles called?
57. What is a gnathologist?
58. Female Aphids aren't born pregnant. True or false?
59 What fish has no brains?
60. What is the purpose of a baleen?
6l. Is a whale eyesight good or bad?
62. Name some plants and animal plankton.
63. What is a manatee?
64. Why is a food chain important?
65. What is a scaffold?
66. How many days does a human pregnancy consist of?
67. What fish has no brains?
68. What is the purpose of a microscope?
69. List the characteristics of a mammal.
70. Is DDT harmful to all living things?
71. Name the oldest living thing.
72 List several biodegradeable products.
73. How many stomaches does a cow have?
74. Why do some farmers make their cows swallow magnets?
75. What is a trait?
76. Why study science?
77. Draw a water flea?
78. Who is Gregor Mendel?
79. List fifty organisms.
80. What is the purpose of punnett square?
81. Name the tallest animal in the world.
82. Where does rubber come from?
83. List twenty examples of matter.
84. List the ten body systems.
85. What do water, ice, and snow have in common?
86. List several materials that are often recycled.
87. What is an immune system?
88. List twenty-five insects.
89. How do fungi reproduce?
90. Name the five kingdoms.
91. What is the purpose of ozone?
92. What is a petri dish?
93. What is a semiconductor?
94. Who was the first person to write about ecological phenomena and to introduce concepts to scientific literature?
95. What is the difference between a globe and a map?
96. A dried grape is called what?
97. List the uses of flowers.

98. Is a bee warm-blooded?
99. Name two types of reproduction.
100. If both parents have brown eyes, can an offspring have blue eyes? Explain.

The Characteristics of Living Things

Mary Hopkins
2213 South Millard
Chicago, Ill. 60623
312-277-7725

Edward Coles School
8440 South Phillip
Chicago, Ill. 60617
312-933-6550

Objective:

Grade Level 8

1. The students will identify the characteristics of living things using the method of observations.
2. The students will use recall to place visual data in proper order.
3. The students will transfer common names used to explain characteristics of living organisms to their scientific name.
4. The students will retain the structure of organisms through role playing.
5. The students will observe an exhibit using the overhead projector and explain on paper what they observed using the scientific process.

Material needed:

an overhead projector
a culture dish
a bottle of Duco cement
a bottle of red nail polish remover
a small rock or stone
pictures of a cell, a tissue, an organ, a system and an organism.

Strategy:

The students studied living things in seventh grade. They have seen a film this week. Today we will review the characteristics of living things. Place on the chalkboard/wall the following: a poster with the names of the systems and their functions with a cover for the name of the system. The processes and functions of all living things. Place all other posters on your desk.

Review the cell theory. Ask students questions about living things and record the answers on the board, **accept** all answers. If they need stimulation ask questions. Examples-How are living things classified? What do living things do? How can you determine when something is living? What is an organism? Can you prove you are one? Leave on the chalkboard, tie in later. Review cells, tissue, organ, systems and organism. Now have students take out pencil and paper observe on the overhead projector the following: 3 dishes about one-half full of water. The following will be placed in each dish: a stone, 3 drops of nail polish and two or three drops of Duco cement. The students will observe and write their observations. Now discuss. Return students to the chalkboard and place the things we noted on the chalkboard in the proper category according to the scientific processes all living things do.

Game:

Divide the students into two groups. One student from each group will pull a card to see who will be first, 3 points will be given for correct answer. If a student needs assistance from the teacher the group will receive 2 points. The opposing team may steal if they cannot answer for one point. One person from the group will draw and the group may give only one answer. The group must answer in one minute. Continue the same procedure as above. This is good way to help students retain data and enjoy doing it.

Watercycle

Clara Phillips
8041 So. Merrill
Chicago, Ill. 60617
312-734-5175

Dawes Elementary
3810 W. 81st Pl.
Chicago, Ill. 60610
312-838-5250

Objectives:

Grade level 3

To become aware of the natural circulation of water from oceans, lakes and rivers by evaporation into the air.

To know that condensation occurs to produce rain falling to the soil, running off to rivers, lakes and then to the ocean once again.

Materials Needed:

A teakettle, about 18 inches of tubing, a clear glass bottle with a narrow neck, ice, a pan large enough to contain both the bottle and ice water, and a heat source. **NOTE**: These materials should be used by the teacher.

Strategy:

1. The lesson will begin with a review of cloud formation. The science textbook has stated that clouds are made up of tiny drops of water. Our experiment will help to prove this fact. On the chalkboard there is a chart naming and defining some of the clouds: cirrus clouds, cumulus clouds, stratus clouds, and nimbus clouds.

2. There will be a discussion of the three steps in the water cycle:
evaporation, condensation and precipitation.
The sun causes water to **evaporate**. The moisture meets colder air and **condenses** forming clouds. When droplets in a cloud are too heavy the water falls to the earth as **precipitation**.

3. Do the following experiment:
Pour a pint of water into the kettle and attach the tubing to the spout of the kettle as airtight as possible.
Place the other end of the tube in an empty bottle.
Place the bottle with the tube in a pan, pack ice around the base of the bottle.
Boil the water in the kettle until you see a few drops of water collecting inside the bottle.

Conclusions:

The energy from heat speeds up water molecules and some move so rapidly that they evaporate or escape into the air as gas or water vapor. As more molecules rise they push into the tubing and pass through it to enter the bottle, which has been cooled by the ice. At that stage the cold air slows down the gaseous water molecules and they come together or condense, once again returning to the liquid state.

On earth there is a natural circulation of water from oceans, lakes and rivers by evaporation into the air. Then condensation occurs to produce rain falling to the soil, running off to the rivers, lakes and then to the oceans once again.

Return to Biology Index

Diffusion

Charles, Harold
846 E. 100th Place
Chicago, Il 60628
1-312-568-1243

Farragut Career Academy
1-312-542-3000

Objectives

After the completion of this lesson, the student will be able to:
1. Understand the movement of liquid molecules in a solid
2. Explain how molecular weight affects diffusion rates.

Equipment and Materials

Agar
Petri dishes
Number 5 Cork Borer
Dropper
Marker pens
Overhead projector

Chemical solutions of:
- $AgNO_3$
- NaCl
- KBr
- $K_3Fe(CN)_6$

Recommended Strategy

Demonstrate movement of molecules by (1) opening a bottle of perfume in one corner of the room and later observe the odor, (2) adding several drops of food coloring in a large beaker of warm water and later observe, (3) adding several sugar cubes in a large beaker of water and later observe. Elicit from the students the conclusion that: (1) molecules move because of some force and (2) molecules move from areas of greater to lesser concentrations.

Before class, pour boiled agar into several Petri dishes to a depth of 4 mm, cover and allow to cool and solidify overnight. Punch four holes, l5 mm apart, in agar surface by using a #5 cork borer. Remove each agar plug from borer before making another hole.

Obtain 1N solutions of these chemicals: $AgNO_3$, NaCl, KBr and $K_3Fe(CN)_6$. Number the holes then add several drops of each solution to separate holes. Do not allow them to overflow.

After several hours, observe the movement patterns of each chemical. Calculate the diffusion rate by measuring the distance/time. Then compare the diffusion rate of each chemical based on molecular weight.

In some instances, bands will appear at the interface of different chemicals representing a precipitate. Other color changes may result over longer periods of time, due to dilution and equilibrium.

Variations in this demonstration can include:

l. Comparing agar dishes that were refrigerated versus room temperature. Also, changes that occur as the colder dishes become warmer.

2. Comparing various chemical mixtures (e.g. dyes, inks) to determine the different diffusion patterns.

3. Comparing Agarose (a clearer compound) with nutrient agar using similar chemical compounds.

4. Placing the agar plugs in stacks in an agar base and apply different chemical solutions to determine the rate of diffusion and vertical diffusion chromatography, then the lateral diffusion across the plate.

Biology Trivia

Giles, Carol

Collins High School
1313 S. Sacramento Blvd.
Chicago, IL 60623

l. Are all invertebrates cold-blooded?
2. Name the organism that has teeth as strong as steel, has no natural enemies & will never catch cancer?
3. Do fish have eyelids?
4. What is the difference between a crocodile & an alligator?
5. Name the largest animal on earth?
6. Do snails breathe?
7. Does a fungus have a stomach?
8. What animals besides birds lay shell covered eggs?
9. Name the largest organ in the human body.
10. Name the largest muscle in the human body.
11. Can a person whose stomach has been removed digest food?
12. How does carbon monoxide affect the body?
l3. How does the body rid itself of hormones?
l5. Are all humans born with 206 bones? Verify your answer.
16. Which is larger a centimeter or a millimeter?
17. What is a cloud called at ground level?
l8. Where does rubber come from?
l9. A dried grape is called?
20. What is Cannabis sativa?
21. Do birds have teeth?
22. What is rigor mortis?
23. The numerous amount of joints are located(on the human body)?
24. Is a spider an insect? Verify your answer.
25. Are armadillos reptiles?
26. The tallest animal is?
27. Why do some farmers make cows swallow magnets?
28. The study of plants is called______________?
29. Which is smaller an atom or a quark?
30. How could you quickly tell whether a cell was a prokaryote or a euckaryote?
31. State the difference between osmosis & diffusion.
32. Why is ATP important?
33. What is a hermaphrodite?
34. Name the dog that has a black tongue.
35. What is the symmetry of an ameba.
36. State the difference between a habitat and a niche.
37. Name the slowest bear.
38. What is a goiter?
39. Digestion begins in the ______________?
40. True or false: corn is a flower?
41. True or false: all flowers have 4 parts?
42. Name an animal knights used to pad their armor.
43. Why do dogs dig up bones?
44. Is the frog becoming more reptilian?
45. Why do toads bury themselves in mud?

46. If you saw a single organism in the water, how could you tell if it was a frog or a toad?
47. True or false: the human digestive system is about 90 feet long.
48. True or false: there are more bones in the neck of any bird than in the neck of a giraffe.
49. The study of birds is called?
50. What is the purpose of a crop (in birds & worms)?
51. What is a life span of a fly?
52. True or false: there are 500 different kinds of fleas alone.
53. Describe carbon dioxide as a solid.
54. Name the smallest bird.
55. Can an entomologist, with his expertise, determine how long an individual has been dead?
56. List three ways frogs breathe.
57. If frogs have lungs, how can they remain under water for long periods of time?
58. Why was the bison very valuable to the Indian?
59. What advantages do multicellular organisms have over single celled organisms?
60. What are lichens?
61. Why is the mitochondria referred to as the"power house"of the cell?
62. A person's arm is lacerated. How does one know whether an artery or a vein has been severed?
63. Can all animals with eyes see colors?
64. Is hair alive?
65. How many legs does an arachnid have?
66. Before injecting xylocaine into a patient's jaw, the doctor hides the needle. Is this an example of positive or negative reinforcement?
67. What is tetany?
68. What is meant by "survival of the fittest"?
69. Why should a mountain climber be concerned about a "build up" of lactic acid?
70. True or false: all organic substance contain carbon.
71. Differentiate clearly between breathing and respiration.
72. Why is the sea blue?
73. Why aren't there sharks in Lake Michigan?
74. True or false: the weasel and the ermine are the same animal?
75. True or false: there are 10 different kinds of rice.
76. Distinguish between a dwarf and a midget.
77. True or false: many species of butterflies, like birds, fly South for the winter.
78. How many hearts does the average earthworm have?
79. Mary drew a picture of a fly with one pair of glasses on. Her brother said,"Mary one pair of glasses won't be enough." Why did her brother say this?
80. True or false: only female mosquitoes bite.
81. Name the animal with the largest brain in proportion to its body.
82. True or false: bees can see ultraviolet light.
83. Where are the cicadas' hearing organs located?
84. What is ichthyosis?
85. Why are the human lips reddish in color?
86. The cheapest pet is probably a______________.
87. Pintos, Mavericks and Mustangs are names of _______________.
88. Why doesn't the water in the ocean freeze?
89. The fastest land animal is the ______________
90. List three animals that weigh over a ton.
91. Who is Mr. Bunsen?
92. What is scoliosis?
93. You're eating a ham sandwich with mayonnaise. Point out the protein, the fat & the CHO.
94. Are brown eyes dominant over blues?
95. Name the bacteria that forms colonies shaped like a bunch of grapes and will

manifest themselves when food is left too long.

96. Name the function of the outer ear.
97. The embryonic human hand begins as a solid stump. What enzyme selectively destroys tissue to form fingers?
98 List ten phenotypes.
99. Name the animal that was sacred in Egypt and also killed Queen Cleopatra.
100. Why is the Dead Sea so named?
101. What is one year in a cat's life equivalent to in human years?

Return to Biology Index

Nutrition Awareness

Cora, Luis
2943 N. Keating
Chicago, Il 60641

Lake View High School
880-8140

Objective(s):

After the completion of this lesson, the student should be able to:

a) Determine his or her ideal body weight.
b) Determine the kilocalories in fat, protein, and carbohydrate in food.
c) Demonstrate familiarity with the food groups relating to kilocaloric content.
d) Estimate the basic metabolic rate (BMR), energy for voluntary activities and the energy to process food.
e) Identify the food sources of vitamin and minerals and their role in the body's metabolism.

Materials

Charts containing information about:

1. kilocaloric values.
2. vitamines and minerals; their food sources and function in the body.
3. articles on nutrition from newspapers, magazines and publications.

Recommended Strategy

a) To calculate the desirable body weight for an average body frame in females, start with 100 lbs. and add 5 lbs. for each additional inch of height over 5 feet. Males follow the same procedure except start with 110 pounds. Therefore, a female who is 5ft., 4in. tall should weigh within 10 percent of 120 lbs. A male 5 ft., 9 in. tall should weigh within 10 percent of 155 lbs. Individuals with small frames should be close to the lower limit of the +10 percent range, while those with large frames can be near the upper +10 percent range of the calculated desirable body weight.

b) For this part of the exercise the teacher can have kilocalorie charts or have the students figure them out by the following procedure: Determine the grams of the particular food. Multiply the carbohydrate grams times four, the fat grams times nine, and the protein grams times four, and add the products. (Alcohol, not a nutrient, is grams times seven).

c) The kilocaloric chart will also be useful in this part of the exercise.

d) The BMR is influenced by a number of factors: age, height

and sex. The BMR of females is less than that of males and decreases with age; however, it is higher in thin, tall people. To calculate the basic metabolic rate for males, add a zero to the body weight and then add twice the body weight to that number. To calculate the BMR for females attach a zero to their body weight and then add their weight to that number.
To calculate their energy for voluntary activities, the person must classify his/her life style as one of the following:

Sedentary (e.g., office work):add 20 percent to the BMR

Light Activity (e.g., student, laboratory work):add 30 percent to he BMR.

Moderate Activity (e.g., shop worker):add 40 percent to the BMR.

Heavy Activity (e.g., outdoor-type occupation):add 50 percent to the BMR.

e) In order to calculate the energy to process food we need to know the number of kilocalories eaten daily to calculate the number of kilocalories necessary to process the ingested food. The energy required to digest and absorb the nutrients in food is about 6 percent of the daily kilocalories. Students should total the kilocalories from their basic metabolic rate, voluntary activity and food processing requirement and record the information as follows.

Basic metabolic rate.................. kilocalories

Voluntary activity.................... kilocalories
Energy required for

food processing....................... kilocalories

Total energy required daily........... kilocalories

Total energy intake from diet......... kilocalories

Difference between total energy
required and total energy intake
from diet............................. kilocalories

Return to Biology Index

Observations (collecting data)

English, James
8019 S Yates
Chicago, Ill 60617
221-9666

Simeon H.S.
962-2800

Objectives:

To observe and gather data concerning the earthworm.
To determine the effects of light and incline on the behavior of the earthworm.

Apparatus needed:

Earthworms, live (3 or more)
Dissecting pan
Black paper
Paper towels
Scissors
Light source
Watch, with second hand
Book

Recommend strategy:

1. Place moistened paper towel in dissecting pan.
2. Cover one half of the top of dissecting pan with black paper.
3. Place three earthworms in the pan so that the anterior half of the worms are in the light and the posterior half of the worms are in the dark, under the paper.
4. Shine light on the boundary between the black paper and the uncovered area above the pan for three minutes.
5. Record reaction in table you have made. (Table A)
6. Repeat procedure with earthworms reversed from original positions. (Record in table A)
7. Remove the black paper from the dissecting pan.
8. Place one end of dissecting pan on a book to create an incline.
9. Place three earthworms in the dissecting pan so that the center of the worm is in the middle of the pan with the anterior end toward the raised end of the pan.
10. Wait three minutes and record the number of worms that move toward the raised end of the pan or toward the lower end of the pan. (Record in table B)
11. Repeat procedure with worms in reversed position. (Record in table B)

Analyses:

1. Do the anterior and posterior ends respond equally to light? Explain.
2. Which stimulus seems to be stronger in forcing a response in the earthworms, light or gravity?
3. How is the earthworms response to light and gravity beneficial to the preservation of its species?
4. After a few weeks of drought, the ground may be dug up and no earthworms will be found. After a few days of rain the earthworms are seen on the road and sidewalk surface, even during daylight. Suggest a reason to explain this behavior.

Note: The four previous questions should be discussed and answered after lab. Students should make two tables (A and B) to record the earthworms behavior. Table A should show the earthworms reaction to light. Table B should show the earthworms response to gravity.

Table A Reaction to light after three minutes

Anterior half in light	Movement toward light Movement toward dark	
Anterior half in dark	Movement toward light Movement toward dark	

Table B Response to gravity after three minutes

Anterior end facing upward	Movement downward Movement upward	
Anterior end facing downward	Movement downward Movement upward

Diffusion

Gupta, Raj
7517 Franklin Street
Forest Park, ILL. 60130
771-2794

Schurz High School
794-8120

Objectives:

1. To develop the concept of diffusion.

2. Demonstrate diffusion of molecules of matter in various states.

Apparatus and materials needed:

Peppermint oil, potassium permanganate, evaporating dish, 250 ml. beaker, glasses, water, powdered drink mix, straws, raisins, pipette, spatula, sandwich bag, marble and teaspoon.

Recommended Strategy:

1. Orally review the structure of the cell by using the sandwich bag filled with water and a marble to represent an analogy of the cell. The students know about the presence of openings in cell membranes and about the possibility of molecules moving through these openings.

2. To demonstrate diffusion, pour sufficient peppermint oil to cover the bottom of an evaporating dish. As each student detects the odor, he or she will raise his hand. Continue until all members of the class have detected the odor of diffusing molecules. At the conclusion of the demonstration, the air and oil molecules have spread out and mixed evenly, they continue to bump and move. This spreading out is called diffusion.

3. To observe diffusion of a solid, fill a 250 mL beaker with distilled water and add several crystals of potassium permanganate. Watch the results as the crystals settle to the bottom. Discuss this phenomenon with the students.

4. To observe diffusion of a liquid, place a glass of water at each student's desk. Do not touch the water; keep the water still for this test. Carefully drop a teaspoonful of powdered drink mix into the glass of water. Watch it for a few minutes without touching the glass. It will go to the bottom and start diffusing.

5. To observe diffusion in raisins, place several raisins in a glass of water. Let them sit overnight. Keep some raisins dry for a control. Distribute to each student some soaked raisins and dry raisins. Let them compare the two kinds of raisins and answer the questions on the worksheet.

Evaluation:

Answer the following questions to show the understanding of diffusion.

1. What is diffusion?
2. Refer to the raisin experiment and explain the difference between the soaked raisins and the dry raisins.
3. What is the evidence that something passed out of the raisins but not everything?
4. What is the difference between the bag's cell membrane and the raisin's cell membrane?.

Return to Biology Index

Problem Solving: Dots, Symbols, Words, and Proteins

Sims, MaryLouise
9749 S. Michigan Avenue
Chicago, Illinois 60628
568-6122

Farragut Career Academy
762-2421

Objectives:

1. The student will be able to state the steps of the I D E A L PROBLEM SOLVING Method.
2. The student will be able to solve problems using dots, symbols, and word analogies using the I D E A L PROBLEM SOLVING Method.
3. The student will be able to determine the amino acid sequence of a protein given a set of symbolic amino acids.
4. The student will be able to state the amino acid sequence difference between sickle cell hemoglobin and normal hemoglobin.
5. Students will learn that the number and sequence of amino acids identify the protein.

Apparatus Needed:

1. An overhead projector.
2. An overhead transparency of a set of dot puzzles. (Critical Thinking)
3. An overhead transparency of symbolic analogies. (Critical Thinking)
4. An overhead transparency of word analogies. (Critical Thinking)
5. Two sets of transparency forms representing a hypothetical protein.
6. Transparency showing sickled red blood cells along with cartoon sketch of a sick youngster; the same transparency shows normal red blood cells with a cartoon sketch of a healthy youngster.
7. Opaque copy for each student of the sheet for the determination of the amino acid sequence of a hypothetical protein.
8. Opaque copy for each student of the steps of the I D E A L PROBLEM SOLVING Method.
9. Opaque copy for each student of a beta chain segment of normal hemoglobin compared to a beta chain segment of sickle cell hemoglobin.
10. Opaque copy for each student: Questions for Review

Recommended Strategy:

1. Show transparency of item 6 in Apparatus Needed. Solicit responses from students concerning physical effects of sickle cell anemia.
2. Discuss opaque copy shown in item 8 in Apparatus Needed.

3. Show transparency of item 2 in Apparatus Needed. Solicit responses from students concerning steps of the I D E A L PROBLEM SOLVING Method which are:
   I - Identify the problem.
   D - Define the problem.
   E - Explore the possibilities.
   A - Act upon the possibilities.
   L - Look for the desired result.
4. Solve dot problem. Discuss students' strategies used in doing so.
5. Show transparency of Symbol Analogies. Solicit responses from students. Be sure to have each student giving an answer to explain their exploration of possibilities and their action upon them.
6. Show transparency of Science Word Analogies. Allow students to respond to the I D E A L (Identify, Define, Explore, Act, Look) steps.
7. At this point summarize: You have learned that the dot puzzle has parts; if your exploration of possibilities and action on them are sound you will receive the desired geometric figures with the desired dimensions. Symbols have parts with definite spatial arrangement, color, similarities, and differences. If your I D E A L is sound your results are correct. Words have parts (individual alphabets, prefixes, roots, suffixes - all of which give meaning to the word). A change of alphabet within a word may change its meaning or misspell it.
8. This is true of proteins. Proteins are composed of amino acids. Each amino acid has a definite chemical make up; the R-groups identify the amino acid. The number and sequence of amino acids identify the protein.
9. Now we shall follow the method described on your sheets to determine the amino acid sequence in a hypothetical protein. (Item 7 in Apparatus Needed).
10. Show transparency of protein pieces. (Item 5 in Apparatus Needed) Allow students to solve the sequence. Discuss.
11. Change the symbolic amino acid in the sixth position in each of the completed hypothetical proteins. Solicit answers about the result of the change. Is it the same protein? Why is it different? What are some possible results of the change?
12. Refer students to their diagram on opaque sheets of the difference between sickle cell hemoglobin and normal hemoglobin.
13. Show transparency of item 6 in Apparatus Needed again. Discuss.
14. Allow students to answer Questions for Review:
    A. List the steps of the I D E A L PROBLEM SOLVING Method.
    B. How do amino acids differ from each other? State at least two differences.
    C. Compare the Dots, Symbols, and Word Analogy problems with the Protein Composition problem.
    D. State at least two reasons why it is important for the medical

research scientist to know the amino acid sequence in certain proteins.

E. How does Hemoglobin S (sickle cell hemoglobin) differ chemically from Hemoglobin A (normal hemoglobin)?

Biology/Chemistry

Clouds Movement and Type

Tanisha Guterz-Kwaaning
9043 S. Ada
CHICAGO IL 60620

John Farren
5055 S. State
CHICAGO IL 60609
(773) 535-1440

Objective(s):

This lesson is designed for 5th – 7th grade. However, this lesson can be modified for any grade level. Students will learn how to determine cloud movement and direction. Students will be able to differentiate between the different types of clouds. Students will also be able to predict the weather based on the types of clouds they observe.

Materials:

Teacher: mirror, cloud chart, cotton candy, and white paper

Students: construction paper, nephoscope, glue, cotton, scissors, markers and labels

-

Strategy:

You may start with a lead-in motivator such as a cloud in a bottle, a book about clouds or a poem about clouds. You may also tell the children that it is a cloudy day and to just look out of the window for a few moments.

1) Teacher will begin by clouds and what they are.

Questions:

What are clouds?

Where do they come from?

What are they made of?

How do they move?

Are clouds all the same or are they different?

What do clouds remind you of?

2) Describe the different characteristics of clouds.

Teacher will ask students to draw some clouds on the board.

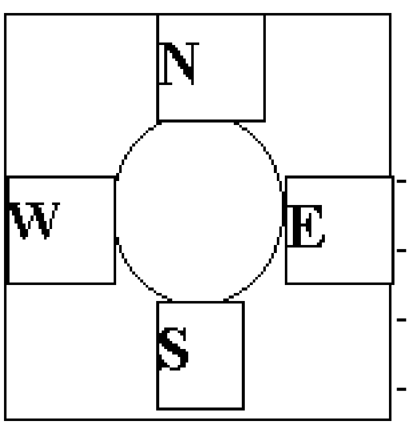
3) Teacher will then ask: Have you ever noticed the cloud movement?

4) Teacher will explain that the direction of cloud movement will tell you the wind direction. It also tells the meteorologists which way the wind is blowing.

5) Students will become meteorologist. Meteorologists use all types of computers and special devices to predict the weather. Well we don't have those gadgets but we can make one. We will make a device call a ***nephoscope.*** This is a device used to help us track cloud movement. We will then know from which direction the wind is blowing.

6) Student will be put in groups of two or three (It depends on how many mirrors you have). Each student will be given a mirror and a handout (the handout should have a square the same size and shape of the mirror with a medium sized hole in the middle. The students should be able to see the clouds moving in the mirror when they lay the mirror on the ground). Students must use scissors to cut out the square and then the circle. The square paper with the hole in it should then be taped on the top of the mirror. The hole should reveal the mirror.

7) Students should now write the cardinal points on the paper (N, S, E, and W). See example below



-

-

-

8) Teacher and students will now move outside. We are all meteorologists now. We will refer to each other as Meteorologist. (Meteorologist Bobby, etc.)

9) Once outside students first look at the clouds and just observe for a few moments.

10) Next students must place their nephoscopes flat on the ground. They look into the mirrors and notice the movement of the clouds. Students must note what direction the clouds are moving in. (If clouds are moving toward the east then winds are coming from the west). You can use an instant camera to take pictures of the clouds. They will come out perfect.

11) Students will then be told to focus on one cloud. Observe the shape, the movement, and the position of the cloud. Students will then be asked to close their eyes while the teacher counts to five. Students will open their eyes and observe any change in the cloud they focused on.

12) Students will be asked if the cloud is a solid, liquid, or gas.

13) Class will move back into the classroom and take a look at the pictures of clouds. (Chart or photos.)

14) Meteorologists will talk about the different types of clouds and the names for them. We will also talk about the weather conditions that the clouds may bring. We will also discuss the altitudes of the clouds and how it affects cloud movement that brings about the change in weather.

15) Student will be asked if they see certain cloud in the sky what type of weather can they expect.

16) All groups will be given construction paper, glue stick, cotton, a handout, and labels with the names of the different types of clouds. Each group will be asked to create a certain type of cloud and label it, then predict the weather they will expect.

Performance Assessment:

Students will create and label certain types of clouds with cotton, construction paper, and glue. Students will predict the weather based on the clouds they create. Students will name different types of clouds when given a description of the weather. Students should be able to perform successfully at least at 85%.

Conclusions:

The culminating activity will focus on how clouds taste. Students will be asked what do they think clouds taste like. Students will be given cotton candy to eat. They will learn that these types of clouds taste sweet. Students may use the Internet for further observations of weather predictions and clouds.

Biology/Chemistry

Natural Cleaners

Jeannine Frazier
511 East Browning Apt 301
CHICAGO IL 60653
(773) 255-4156

Farren Fine Arts
5055 South State Street
CHICAGO IL 60609
(773) 535-1440

Objective(s):

This lesson is designed for 4th and 5th grade students. The purpose of this lesson is for students to gain an understanding of the effects that commercial cleaners have on the environment and teach them to make their own cleaners out of less hazardous materials. The lesson will also meet Illinois State Goal 13:

Having a working knowledge of the relationships among science, technology, and society in historical and contemporary contexts

CAS B

Demonstrate an understanding of the need for protecting, conserving, and efficiently utilizing renewable and nonrenewable natural resources

CFS

Design solutions to selected pollution and environmental problems

Materials:

32 oz bottle of cooking oil, 32 oz bottle of lemon juice, 2 16 oz boxes of baking soda, 2 gallons of vinegar, 1 gallon of distilled water, 7 measuring cups, 7 spray bottles, 25 rags, 1 roll of paper towels, various commercially available cleaners

Strategy:

The students will engage in hands on cooperative learning.

1. The teacher will have a 2-liter bottle of dirty water (waste water from an ordinary kitchen also containing dirt). She will then ask the students if they would drink the water.
2. The teacher will inform the students that there are many chemicals in our water. Many come from industries or from commercially available chemical cleaners.
3. The teacher will tell the students there is a way for us to prevent these chemicals from polluting our water.
4. The teacher will ask the students if they know ways by which we can prevent these chemicals from polluting our water.
5. The teacher will ask the students what chemicals are used to clean their homes.
6. The teacher will ask the students to look at the ingredients of the commercial cleaners that are passed around the class.
7. The teacher will then inform the students that they can clean their homes with natural cleaners.
8. The students will set up an experiment in which they will compare the performance of the natural cleaners to that of the various commercial chemical cleaners.

The following are the recipes for the natural cleaners:

All Purpose Cleaner: Mix 50 ml of baking soda, 125 ml of vinegar, and 4 liters of warm water. Store in spray bottle.

Glass Cleaner: Mix one part vinegar with five parts water. Store in a spray bottle.

Scouring Powder: Sprinkle baking soda on the stained surface and rub with a damp cloth.

Wood Polish: Mix one part lemon juice with two parts cooking oil. Use a soft cloth. Store in spray bottle.

Performance Assessment:

The students will be assessed on their ability to follow directions, document data, and an oral presentation. The total number of points will be 15. The highest score will be five points for each section, e.g. (following directions 5, documentation 5, oral presentation 5).

Conclusions:

As a result of this lesson, one will learn that commercial cleaners contain chemicals which may have effects on the environment and will gain appreciation for natural cleaners as substitutes.

Biology/Chemistry

Rock Formation.

Therese Donatello
7929 W. Elmgrove Dr.
ELMWOOD PARK IL 60707
708-453-3524

St. Edward School
4343 W. Sunnyside
CHICAGO IL 60630
(773) 736-9133

Objective(s):

The Junior High student will be able to show how rocks are formed by cementation, compaction, and evaporation.

Materials:

EVAPORATION; Each group will need 2 test tubes, 40mL of water, 3-4 teaspoons of salt, 3-4 teaspoons sugar, 2 toothpicks, 2 pieces of string, and 2 plastic caps.

CEMENTATION; Each group will need 2 plastic cups, 1 jar large enough to hold the plastic cup, enough sand to fill the cup ¾ full, enough white glue to fill a cup ½ full, enough water to fill the cup with the glue, and a stick.

COMPACTION: Each group will need a pencil sharpener, 4-5 crayons of different colors, and a 12 inch piece of aluminum foil.

Strategy:

EVAPORATION:

A. Place 20 mL of water into each test tube. In one container add salt until no more will dissolve. In the other test tube add sugar until no more will dissolve.

B. Pour a thin layer of each solution into separate plastic caps.

C. Tie a string to one end of a toothpick and place the other end of the thread into the test tube so it doesn't touch the sides or the bottom of the test tube.

D. Place the test tubes and the plastic caps where they will not be disturbed.

E. Check the solutions daily and record any changes.

CEMENTATION:

A. Poke small holes into the bottom of a plastic cup that will let a solution flow through but not the sand.

B. Fill a cup ¾ full of sand.

C. In a second cup mix ½ cup white glue with ½ cup water.

D. Suspend the cup with the sand over the jar.

E. Slowly pour the glue solution over the sand and allow it to drain through for several days.

F. Cut away the cup when the sand feels dry to the touch and record the results.

COMPACTION:

A. Use a pencil sharpener to make a pile of crayon shavings (use different colors to represent the different minerals) on a sheet of aluminum foil.

B. Fold the edges of the foil to make a rectangular packet.

C. Gently flatten the packet by squeezing it between your palms.

D. Unfold the packet and examine the “rock” that was formed.

E. Return the “rock” to the foil packet and stand on it. Then open and examine it again.

-

Performance Assessment:

The student should be able to answer the following questions.

A. In the evaporation experiment compare what happened to the thin layer solution and the solution in the test tube.

B. In the compaction experiment explain what kind of rock was formed giving at least three reasons.

C. In the compaction experiment explain what happened as more pressure was applied to the packet of crayon shavings.

D. Based on what you know about heat and rock formation what do you think would happen to a packet of crayon pieces that was heated on a hot plate for three or four minutes. Tell what the crayon pieces represent and what kind of rock was formed.

Conclusions:

The student will be able to explain the formation of rocks by the various methods described and infer the formation of other rocks when given information for another type of experiment.

Biology/Chemistry

Land Formations

Barbara J. Baker
5431 S. Dorchester Ave., #2
CHICAGO IL 60615
(773) 643-8225

Doolittle West
521 East 35th Street
CHICAGO IL 60616
(773) 535-1050

-

Objective(s):

This mini-teach is designed for 2nd grade.

The objectives of this mini-teach are:

1. To develop an understanding of how land is naturally developed

2. To learn about several land formations as well as earth science and chemical terminology

3. To provide opportunities for the students to make models of various types of land and to investigate a case of erosion in the formation of a cave

Materials:

Commercial clay of green, blue, and gray colors, play dough, pebbles, sand, teas (for shrubbery), food trays, nine 3x5 cards and newspaper (for keeping the desks clean). A quantity of clay and play dough sufficient for making models of a mountain, lake, bay, gulf, cave, island is needed.

Strategy:

Teacher should introduce the following vocabulary by writing them on the board:

erosion	rain	wind	glaciers	volcano
mudslides	snow	island	gulf	cave

bay lake meadow peninsula mountain

Students will write the terms down and research pictures that illustrate each term.

Pictures of a cave, an island, gulfs, lakes, and mountains will be circulated, discussed and posted.

Students will work in groups of twos to create a model of a land formation. The teacher's model of a cave will be viewed and analyzed. The handout of water going through soil will be distributed to each student. Students will take turns pouring water over the playdough model of the cave to simulate erosion.

Students will listen to the definitions of 3 types of caves: limestone, ice and sea caves. They will also listen to the definitions of a hill and mountain and build models of these as well as caves.

Performance Assessment:

The students are expected to have 95 % accuracy in looking up the words and writing the meanings. Cutting and pasting pictures of the land forms is also acceptable.

The students should show enthusiasm in making the model and successfully completing it.

High interest is evident if students bring in pictures of land formations they have discovered in magazines or newspapers.

Cooperative team effort in making the models is expected from each group. .

Each student will have 3x5 cards to write their names on one side and the types of land formations they see posted on the other side. Learners will place their cards with the name sides showing with the type of each formation underneath not shown. Teacher will collect the cards and mark them.

The above assessment could be repeated until everyone receives 95 % accuracy. Students who achieved 95 % the first time will tutor those who missed naming the land formations correctly.

Conclusions:

Students will understand the differences between pairs of similar landforms such as a hill from a mountain, a meadow from a plain, and a gulf from a bay. They will understand that the actions of water, air, ice, lava and waves pounding on the rocky shores help in creating caves. They will know of the chemical substances in a cave like calcium carbonate, carbon dioxide, and the components of stalactites and stalagmites. The students will learn that chalk is made of (calcium carbonate). We will practice a few chemical formulas such as H_20 (water), $C0_2$ (carbon dioxide), and $CaC0_3$ (calcium carbonate).

OCEANS…..AWAY

Frana L. Allen
4747 South Kenwood
CHICAGO IL 60615
773-924-3721

M. T. Elementary School
111 South Throop
CHICAGO IL 60607
773-534-7790

Objective(s):

This lesson is designed for third and fourth graders. The students will: a) locate on their world map the oceans, seas and continents of the world, b) identify ocean related occupations (marine ichthyologists, oceanographers, underwater archaeologists, and marine ecologists), c) fill in paper models of an ocean floor using the following terms: continental shelf, continental slope, trench, floor and island, d) discuss the Titanic and how an iceberg could be destructive to a ship as well as the Exxon Valdez and the effects it had on the ocean inhabitants then and now, e) unscramble a preplanned food chain, and f) explain, and answer specific questions pertaining to experiments on pollution, salt water versus fresh water, icebergs, and digging underwater.

Materials:

These materials are for groups of four. They are broken down into six stations.

Station 1 -----enlarged map of the world that shows oceans, seas and continents; crayons

Station 2 -----worksheets with ocean related occupations and definitions and pencils

Station 3 -----enlarged paper model of an ocean floor and a list of words and terms that can be cut out and pasted to the ocean floor model; glue, scissors, and crayons.

Station 4------specific pictures of a food chain found in the ocean, crayons, scissors and green string (to represent plant life in the ocean)

Station 5------four different worksheets pertaining to four different experiments and the experiments themselves (see below), pencils

Station 6------research books, articles and/or video clips of the documentaries/movies of the Titanic and the Exxon Valdez disasters, paper, pencils

Strategy:

This activity will take four, forty minute periods.

Day 1

Station 1

Each group of four students will be given an enlarged map of the world in which they will have to label in the continents, oceans and seas. Students will have to do this activity without any aid from the instructor. After fifteen to twenty minutes the instructor will go over the maps using the overhead projector.

Station 2

Discussion of ocean related occupations and their definitions. Instructor will then assign/or have students choose what occupation they would like to hold in their group. The occupations are as follows: marine, oceanographers, ichthyologists, underwater archaeologists, and marine ecologists.

Day 2

Station 3

Instructor will discuss with students about the geology of the oceans and will introduce the following terms: trench, continental shelf, continental slope, floor, and island. The students then will be given an enlarged picture of an ocean floor and using the words and definitions students will fill in the words in the appropriate blanks and color the picture.

Station 4

Instructor and students will engage in a dialogue pertaining to the diets and habitats of fish of the deep. Students will then be given a picture of a food chain drawn out which contain sun, phytoplankton, zooplankton, herring, bluefish and decomposers. Pieces of green string will be attached to the ocean floor (for example, through holes punched into it) to represent the phytoplankton at the bottom of the food chain. Other food chain components will be cut out and also attached to the ocean floor.

If time permits: A sheet will be given to each student group containing various ocean plants and animals and those groups will make their own food chains.

Day 3

Station 5

The instructor will set up at least four experimental stations. The stations should relate in some way to the ocean occupations that the students are exploring. (Suggestions: Surface Tension, Salt water vs. Fresh water and/or Water Pollution). There are many water/ocean experiments available for instructor use on the WEB and in books (examples are listed below).

Station 6

Instructor will either take the students to the local or school library or have available in the classroom reference books for the students use about the Titanic and the Exxon Valdez disasters. Have the students write a short paper on the how these disasters came about and the long range implications each has on today's environment. Students will report their findings to class.

Performance Assessment:

Students groups will be assessed on how well they do the tasks in the lesson.

Conclusions:

Students will gain knowledge and understanding of the oceans and ocean-related occupations.

Crown Academy
2128 South St. Louis
CHICAGO IL 60623
(773) 534-1680

Objectives:

Grades 3-8 (CAUTION: THIS PROJECT REQUIRES MUCH ADULT SUPERVISION)

Students will be able to:

A: Synthesize a delectable delicacy from common chemicals: create candy.
B: Observe how molecules interact with each other in PHYSICAL CHANGES.
C: Observe how the addition of heat can cause molecules to interact and form new molecules in CHEMICAL CHANGES.

Materials Needed:

Per Group:

sugar	water	1 quart pot	whipping cream
measuring cups	stirring spoon	electric burner	candy thermometer
4 jars	large ceramic surface to cool the candy		butter/margarine
	string	4 pencils	

Strategy:

Student background knowledge is needed. These lessons are to be used as part of a unit on matter and molecules. Discuss and do other activities that helps students to understand that matter is made up of molecules.

Molecules are the smallest particles of a substance of matter that will still have the same properties as the original substance. Although a molecule is too small to be seen, chemists can still study how molecules interact with each other. The making of candy will be a fun way to observe the changes in the states of matter: from solids to liquids, liquids to gas, gas back to liquids, liquids back to a solid that is a different substance from that which was started with.

Demonstration: ACTIVITY 1 CARAMEL CHEMISTRY

Place about 1/2 cup sugar into a deep nonstick pot. Place the pan on the burner over low heat. Continuously stir the sugar as you gradually increase the heat. Have the students observe the sugar as it is being heated and describe what is occurring. Eventually, the sugar will melt and break down to form carbon. Keep stirring as you discuss because the sugar melts quickly and could start to stick and burn. Caramel is a combination of sugar and carbon. Remove the pan from the heat when the sugar is straw colored. If you want to make delicious candy caramel, add whipping cream and butter slowly as you stir. Taste the caramel.

The sugar has been converted to caramel through a chemical reaction. If heated too long, the sugar turns the dark brown color of carbon and loses all of its sweetness - an interesting change, but not tasty. The heat causes the sugar molecules to chemically change into a different substance, therefore it looks and tastes differently from the original white sugar.

Student Group: ACTIVITY 2 ROCK CANDY AND MOVIE GLASS

Put 1 cup of water into a pot on the burner. Slowly add in 2 cups of sugar. Constantly stir over the heat until the sugar dissolves into the water. Slowly add up to another 2 cups of sugar (or as much sugar that will be dissolved into the water over the heat). Remove the sugar from the heat before the solution reaches the boiling point. Use the candy thermometer to make sure you have reached the temperature of 270 degrees.

MOVIE GLASS:

Pour the hot mixture onto the flat ceramic surface to cool. In about an hour, the mixture will start to cool and harden. This is the solution that hollywood movie-makers use to create the "glass" bottles and windows that the actors are hit with or thrown through. The solid sugar molecules (crystals) dissolved into the water to become a liquid. As the liquid cools down, the crystal molecules return to a solid that appears translucent.

ROCK CANDY:

Follow the directions above to heat the sugar. Take the string and tie a paperclip to one end. Tie the other end around a pencil. Put the string into the jar and have it hanging towards the center from the pencil that is placed over the jar's opening. Pour in the hot sugar solution. Sit the jar in a cool and dark place for at least 2 days. The students should begin to see the sugar begin to return back to the solid crystal form. This time the sugar crystals will be larger than before but will be in the same form. This is a Physical Change.

Performance Assessment:

Each child will be able to write a description of what is occurring to the sugar. In this description, they must be able to state that the activity that involves dissolving the sugar into the water is a physical change that occurred when the sugar molecules became a liquid. The liquid then turned into a gas as it boiled. When the solution was poured into an item to cool, it returned to a solid.

Each child must also describe the difference between the chemical change with the sugar over the heat, and the physical changes when dissolved into the water.

Conclusions:

The molecules of a substance of matter can be changed in two distinct ways. One is a physical change where the molecules can be returned back to the original form. The second is a chemical change where the molecules react to form an entirely different substance.

Joyce E. Combest - Daniel Dale Williams School

Can Young Children Distinguish Between Living and Non-living Things?

Joyce E. Combest
3365 S. Indiana Avenue
CHICAGO IL 60616

Daniel Dale Williams School
2710 S. Dearborn Street
CHICAGO IL 60616
(773) 534-9711

Objective(s):

This science project has been designed for Head Start children (ages 3 and 4 years old) so that they will be able to identify living and non-living things as a result of their learning through discovery from their observation of and interaction with a set of natural phenomena in their community. Each teaching/learning session lasts from 10-15 minutes which consists of large groups (of 15-17 pupils) or small groups (of 3-6 pupils) who work in teacher directed activities or child selected centers.

This science module is to be implemented through the integrated unit approach while simultaneously relying heavily on a set of guide-lines referred to (in the field of Early Childhood Education) as "Developmentally Appropriate" practice. The concept provides a frame-work for program planning that embraces age and individual appropriateness in all four (physical, emotional, social, and cognitive) domains. The forthcoming strategy is to be implemented with attention to different needs, interests, and developmental levels, via behavior modification-techniques so that each child may realize a measure of success.

In terms of subject matter, what will be the focus of study? For organic or living things, it will be various materials from plants. For inorganic or non-living things, it will involve observing and collecting objects such as rocks, gravel, pebbles, sand, concrete, and bricks; other non-living subject matter will include items made of steel, brass, silver, copper, aluminum, plastic, glass, and clay, such as nails, screws, coins, cups, glasses, etc.

Materials Needed:

- -Two tables for displaying materials
- -Two sheets of poster board for labeling centers
- -Two 8"x11" comb binders
- -Two Polaroid cameras
- -Assorted construction paper, plastic plates, and tempera paints for art
- -Brown paper lunch bags (approx. 7"x4")
- -Glad cling wrap and miniature rubber bands
- -An assortment of 10 fruits, vegetables, nuts and legumes, (organic or living items)
- -An assortment of 10 small safe household inorganic or non-living items as described above
- -One-half dozen oranges
- -Childrens' safety scissors
- -Stick glue

-Black yarn
-Multi-color felt tip markers
-Magazines (for cutting and tearing)
-A rock and soil collection
-A rock, mineral and crystal study set
-A rock and soil sample set
-Science picture concept cards
-1 globe

Strategy:

It is proposed that the following activities will enhance children's understanding of the difference between living and non-living things.

(1) Nature walk: Divide class into groups "A" and "B" and go on a nature walk. Group "A" will take pictures of Living Things; group "B" will take pictures of non-living things. Later, arrange and place photos in a booklet for additional observation and study. Alternate groups may recite related songs and poems outside such as "We Need Trees", "I am Looking for a Rock", and "Boulders and Stones".

(2) "Feel and Find" Game: Place four items in each brown bag. In so doing, select two different items from each category of "organic" and "inorganic" objects; then choose ten pupils to play the game. Each student is asked to take something out of the bag and name the item orally. Children are given turns to answer in sequential order. All children have items that have been carefully prepared and placed in plastic wrap for health purposes.

(3) Half Orange Art: Place a small amount of tempera paint in each of eight plastic plates; use red, yellow, blue, brown, white, orange, purple, black, green, pink. Take an orange cut in half across the sections. Give each child a half. Pupils will dip the orange in paints and create artistic designs. Children learn that an orange is considered a living object, but the paints are not.

(4) "My Own Book": (A) Children will browse through magazines, select pictures of living things, cut them out and use stick glue to arrange them on white 8"x10" construction paper. Punch three holes (in notebook fashion) in each picture page and tie with black yarn. Each child draws a picture of himself on the front cover of his booklet. (B) This activity can be repeated using non-living items.

Teacher provides support and encouragement for the act of taking responsibility for the completion of assigned tasks; for showing empathy and concern; and, for responding to the needs of others. Teacher approval is administered via immediate positive reinforcement for each successful approximation of the desired behavior until it is shaped.

Performance Assessment:

Students should show that they have achieved the desired outcome behavior (and the instructional objective) by distinguishing between the two concepts above (living and non-living things) with 80% accuracy, by naming, selecting, classifying, arranging, and matching in oral and written form.

The teacher will utilize a "six item" criterion referenced test or rubric (based strictly on the conditions of the behavioral objective) to ascertain if the student can differentiate between living and non-living things. The set of "six competencies" will be accompanied by six boxes to check that will indicate mastery of the concept.

Elaine Pauline Agusto-Laster - Daniel Hale Williams Elementary School

Stacking the Deck on Nutrition

Elaine Pauline Agusto-Laster
8042 South Evans
CHICAGO IL 60619
(773) 488-1485

Daniel Hale Williams Elementary School
2710 South Dearborn
CHICAGO IL 60616
(773) 534-9226

Objective(s):

To introduce and demonstrate the word classify. This will be done by having students arrange a variety of foods into their proper food groups. This and other related activities will aid in the development of the students' critical thinking skills.

An introduction to the food pyramid and the grouping of food will provide for students an awareness of how foods are categorized, as well as their levels of importance to the human body.

Materials Needed:

Construction paper; Food Playing Cards; 3-inch by 5-inch index cards; paste or glue sticks; scissors; crayons or markers; *The Pressure's On!* scorecards; and pencils.

Strategy:

Discuss with the class that classifying is a way of assigning (a thing) to a class or category. Demonstrate on the chalkboard how classifying is done. Have a food ready list for students to select from. From this list, have students place each of the foods into their correct sections.

Through a variety of class activities students will learn how foods are classified, and are arranged into groups on the food pyramid. In the first activity the class will play the game *Go Fish!* (1) Divide the class into groups of three and give each group a set of cards. (2) Deal seven cards face down to each player and put the remaining cards face down to form a draw pile. (3) If players have two foods from the same food group, they place them down as a match. (4) In turn, each player asks the player to the left for all the foods from a certain food group. For example, Horace might say to Hilary, "Give me all your Grains." If Hilary has cards from the Grain Group she must give all of them to Horace. If not, Hilary says, " Go Fish." Horace then has to draw from a pile. (5) Play continues until a player has matched all of the cards and has none left in his/her hand. That person is then declared the winner.

The second activity is called *The Pressure's On!* The concept, of this activity, is that foods vary in amount of sodium, cholesterol, and fat that they contain. Limiting the amount of these substances in the diet can help reduce the risk of heart disease. The objective is for the player to have the least amount of sodium, cholesterol, or fat when the foods cards are totaled. The directions for this activity are: (1) Prior to class, photocopy one set of Food Cards for each group of six. Then photocopy one *The Pressure's On!* Scorecard for each person. (2) Divide the class into groups of six and give each group a set of Food Cards, which have been cut apart and shuffled. Turn the cards face down on the desk or playing surface. (3) One at a time, in turn, each player draws a card, turns it face up, and announces the food, and the amount of sodium. That person then records the amount of sodium on their score card under the sodium column. Continue choosing, and recording until all forty-eight cards have been selected. (4) Each player adds up the total amount of sodium on their cards, and the player with the fewest milligrams is the winner. (5) Shuffle the cards, and play again, but for this round, count total milligrams of cholesterol. Once again, the lowest amount wins. (6) Shuffle and play round three counting grams of fat. Again, the lowest amount of fat is the winner. (7) Discuss the effects large amounts of sodium, cholesterol, and fat have on health.

Performance Assessment:

To assess the students' understanding of classifying, give each student a pre-drawn food pyramid on construction paper and reproduce sheets of the six food groups. Tell the students that they are to place each of the foods in their correct food groups.

Conclusions:

The students have gained a greater understanding of classifying. They also have an awareness of the food groups, and what foods have a significant or insignificant value to the human body. Most of the activities were hands-on and allowed for greater student participation.

Imara Abdullah - Douglas Community Academy

Calorie Connection

Imara Abdullah
P.O. Box 19182
CHICAGO IL 60619

Douglas Community Academy
3200 So. Calumet
CHICAGO IL 60616
(773) 534-9263

Objective(s):

Measurements require using standardized units. After studying measurements in customary and metric units the students will be exposed to using heat as a measurement unit in determining the calories of a brazil nut. Next the burning of sugar occurs so fast it can be compared to the quick energy rush that occurs when sugar is burned in body. Finally, the charts with caloric measure of different food will show the work scientist have done in computing calories. The computation of the number of calories needed while at rest and with daily activity level will connect the caloric measure to the body metabolism.

Middle grade students will understand the term calorie.
Middle grade students will understand that sugar burns quickly in the body.
Middle grade students will compute the calories needed for his or her body according to their usual activities.

Materials Needed:

Ring stand, foil pie pan, thermometer, long matches, paper clips, shelled Brazil nut and clay.

Ring stand, foil pie pan, matches, calorie charts with a variety of foods on it.

Formula for computing basal metabolic rate
Formula for computing calories for body weight and activity level
Chart of average body weights and average caloric intake needed for boys and girls
Scale to weight students

Strategy:

The strategy is phenomenological, using strategies in which students can observe, interact, collect data, and discuss concepts through answering questions from observed activities.
Brainstorming is used and students are asked to draw conclusions about observations. Students are encouraged to form an hypothesis and follow the scientific method in testing and re-testing their hypothesis.

PROCEDURE:

Calorie Experiment:
Set up ring stand and foil pie pan with 100 milliliters of water in the pie

pan. Record the water temperature. Put a Brazil nut on an opened paper clip Place the bottom of the paper clip in the clay. Place the Brazil nut and the paper clip directly under the pie pan. Stabilize the position of the nut on the paper clip by putting the end of the paper clip in clay and pressing the clay down. Light the Brazil nut with the matches. Let the nut completely burn up under the foil pie pan. Now measure the water temperature in the pie pan with the thermometer. Note the differences in the water temperature. Each degree of rise in temperature was caused by the release of one tenth kilocalorie from the nut. Multiply difference by 1/10th because 100 milliliters was used (1/10th of a liter). Take beginning temperature of water subtract that temperature from the ending temperature of water. Multiply difference by 1/10th for calories of a Brazil nut.

Sugar Experiment:
Set up ring stand and foil pie pan. Place small amount of white sugar in pie pan. Light matches and place under pie pan. Heat pie pan until sugar melts.

Caloric Intake activity:
Use scale to weight students. Use calorie charts of average caloric intake for boys and girls and charts of calories needed for average activities. Examine charts with students. Calculate calories needed for daily intake. The basal metabolic rate, for women, is determined by taking your weight and multiplying it by 10. Then divide that number by the number of minutes in day. For men the basal metabolic rate is determined by taking your weight and multiplying it by 11. Next divide the number by the number of minutes in a day. Note the average person burns approximately one calorie per minute. Next use charts to compute number of calories needed per day for specific ages and activity levels.

Performance Assessment:

Create rubric of performance task and participation requirements.

Conclusions:

A calorie is the unit standardized to measure food energy. A kilocalorie is the amount of heat energy that is needed to raise the temperature of one liter of water by one degree celsius. Sugar is used as quick energy by the body. But the body needs energy to perform task and food to provide balanced nutrition. Scientist have computed the caloric value of many foods. Charts are available of calorie amounts.

Biological Flight

Russell C. Osantowski
5132 Steger Rd.
Monee IL 60449-7002
(708) 748-0752

Bateman Elementary
4220 N. Richmond
Chicago IL 60618
(312) 534-5055

Objectives:

This lesson is for K-6th grades. Students will learn about the many different ways that seeds fly in birds, in air, and why. They will collect seeds, learn Bernoulli's principle including lift, ailerons, elevators, drag and how to make a paper helicopter that simulates some seed flights. It integrates botany, biology, zoology (how birds are built to fly), chemistry, physics, and art with student drawings, tracings and a picture of Brancusi's sculpture entitled "Bird in Flight."

Materials Needed:

Paper, pencil, scissors or paper cutter, scotch or plastic tape, (all of the following are optional items you may wish to use and/or give to your students) including carbon paper, stapler and staples, a photocopy of the encyclopedia article regarding Bernoulli's principle, and a photocopy of the Brancusi's sculpture cited above from any good encyclopedia.

Strategy:

1. Take the children outside to collect seeds and sometimes things that look like leaves. Or have them bring to class different types of seeds they find. Throw the seeds up into the air or drop them from as high as you can reach, to illustrate how they fly. Explain that on a windy day many will fly farther. Note: if you stand on a chair, your students will quickly imitate you,
2. Cut a strip of paper, 2" by 8" and hold it to the tip of your chin with your index finger. With your lips slightly pursed, blow air above the paper in a thin fast stream. The paper should rise, because, according to Bernoulli's principle, air or liquid moving faster than the things around it creates low pressure in the flowing area. Therefore, the air underneath it has a higher pressure and pushes up creating "lift". However, if you put the edge of the paper beneath your nose, and blow a thin stream of air beneath the paper it will also rise, but, this is due to the force and speed of the air flow. It is not caused by Bernoulli"s principle.
3. Explain that the outer coatings of some seeds must be dissolved by the digestive juices of certain birds before they can germinate. Therefore their flight only ends when they are excreted, either by the bird in flight or resting on a branch or after a baby bird in the nest excretes the seed. Can you think of other animals that might carry seeds this way?
4. Dandelion seeds fly through the air by wind but burr type seeds fly by sticking to the coat of animals or onto clothing of anyone, like velcro.
5. Maple tree seeds and other seeds fly like a helicopter and although they are normally encased in a single wing, it twirls like a helicopter rotor which is the large main blade that keeps it in the air. **To make a paper helicopter**, take an average sheet of paper (8 1/2" by 11"), and fold it lengthwise in half. If your class does not have scissors easily available

to them, just have them fold and re-fold the paper back and forth several times. Explain that this folding weakens the fibers in the paper so that it will tear much more easily and accurately.

Tear it in half. If the paper is lined, fold it in half again and tear it from the top down 13 lines, including the one inch large space at the top of the line. If the paper is unlined (plain), fold it lengthwise from the top only one-half way down to the middle of the paper. Re-fold it several times and along this vertical line tear it down only to the middle of the paper. See the diagram below. Bend the wings about 30 degrees in opposite directions.

```
 ________________    _________________    ________________
| one half of    |  |        .        |  |                |
|    your        |  |        .        |  |                |
|    original    |  |        .        |  |                |
|    sheet       |  |        .        |  |                |
|     of         |  |        .        |  |                |
|    paper       |  |        .        |  |                |
|                |  |    fold         |  |                |
|                |  |    and          |  |.....      .....|
|                |  |    tear to      |  |   last         |
|                |  | make the rotor  |  |   fold         |
|                |  |   wings         |  |   and tear     |
|________________|  |_________________|  |________________|

              ________________
             |       |        |
             |       |        |
             |       |        |
             |       |        |
             |       |        |
             |.......|........|    Your finished product
             |                |
             |_____      _____|
                  .     .
                  .     .  Dotted lines are where folds must be.
                  ._____.
```

Then skip about 1 and 1/2" and make sure you do nothing to this sort of middle section of this paper. Gently fold the bottom of the paper up along this imaginary horizontal line that is 1 and 1/2" below the bottom end of your vertical tear.

This is the hard part. You must be very careful not to tear it too far in on either side. We will now explain. On this horizontal line, tear in from each edge only 1/3 of the way toward the center and stop. Now, fold in these two sides so that each one exactly covers the middle side. You now have something that sort of looks like a "Y". Hold it up as high as you can reach, and in one motion, pull it down and let go at the same time, to make it fly.

Performance Assessment:

Oral questioning and discussion for the examples. Observation and/or grades for the completion of the hands-on paper helicopter project.

Conclusions:

This is a successful introductory lesson to a unit on seeds and parts of a plant. Children will be bringing in examples of flying seeds long after this lesson is over.

Return to Biology Index

A Taste of Our Classroom

Carisa R. Bryant
1154 West 104th St.
Chicago IL 60643

W. K. Sullivan Specialty Elementary School
8255 South Houston
Chicago IL 60617
(312) 535-6585

Objectives:

This lesson is geared toward 3rd thru 6th grades. Students will learn:

1) To list the four tastes that the tongue can detect.
2) To map the individual areas of taste on the tongue.
3) To demonstrate the ability to identify objects through the use of taste.

Materials Needed:

blank paper
drawing paper
crayons
construction paper
tape
glue
scissors
pencils
students in groups five or six
food items for each of the regions of the tongue:

1) sweet (example: cookies or candy)
2) sour (example: pickles or lemons)
3) bitter (example: tonic water)
4) salty (example: pretzels or salted peanuts)

Strategy:

Activity A (Who am I Game?)

Twenty five slips of paper will be in a paper bag. Each student will select one slip of paper. Each individual slip of paper will have a description of a different food item on it. Every student will take a turn reading the description of their food item orally to the class. After the student has read their description orally, the rest of the class will try to identify the food item.

Activity B (Brain Storming)

All students will be divided equally into four groups. There will be a group for each one of the four taste areas (sweet, sour, bitter and salty). Each group will be required to list as many foods as they can for their category. After each group completes their food list, they will draw a picture of a tongue, and label each region. Afterward the students will color and identify the region of the tongue that their list represents.

Activity C (A Taste of Classroom)

Every student will select a food item from the "Taste" buffet. The "Taste buffet will contain items that are sweet, sour, bitter and salty. Afterward, the students will identify on their tongue map what category the food item came from. Also, have the students list the food ingredient which made the food taste sweet, sour, bitter or salty.

Activity D (Making the Tongue Map)

Students will make a model of the tongue and identify each region.

Performance Assessment:

Students that complete activities B thru D will receive a letter grade of A.

Conclusion:

At the conclusion of this mini-teach, the students will be able to identify the four major taste buds: bitter, salty, sour and sweet.

Return to Biology Index

Usefulness of Irrigation

Gloria T. Bond
8608 S. Avalon Ave.
Chicago IL 60619

Coles School
8441 S. Yates Ave.
Chicago IL 60617
(312) 535-5669

Objective:

To show that water is necessary for plant growth.
To show how a dam can turn a nearly useless water way into a valuable form of irrigation.

Materials:

Lima beans
Dry soil
Paper cups

Lima beans
Soil
Paper cups
Water

Dam
2 plastic straws
pail
2 catch pans
2 flexible tubes

Plywood 36 x 30

Procedure:

Attempt to grow the lima beans in very dry soil. After 7 days, plant some more lima beans in very rich soil and water regularly. Compare the beans in size and growth development. Keep a growth chart.

To construct the dam, cut pieces of 1/4 inch plywood according to following dimensions; front piece 36 inches long, 6 inches high, 6 inches wide, cut 2 angles 9 inches from each end and 2 inches above the base. To construct the back piece, cut 36 inches long, 12 inches high, 12 inches wide, 2 angles 8 inches from each end and 8 inches above base. Cut 2 side pieces, 30 inches long, 12 inches high slanting from 12 inches to 6 inches. Cut 4 top pieces, 33 inches long and 10 inches wide. Nail the front, back and sides together. Caulk joints. Cut triangle piece for dam. Drill 2 holes in the triangular piece same size as straws. With a straight pin, punch holes along one side of each of the two straws. Plug one end of each straw. Push the other end through the dam. Set a pail of water on a platform behind the model. Put the 2 flexible tubes in the pail and let water run slowly into the troughs. Water will flow right out of the trough without a dam. A lake will form behind the dam and the irrigation pipes will take water to dry areas for watering of the soil.

Conclusion:

Plants must have water in order to grow. Through irrigation pipes, water can be directed to dry areas where it is needed as long as there is a source of water such as a dam.

Water Conditions

Kelly Ludwig
16621 Grants Trail
Orland Park IL 60464
(708) 429-1005

Lincoln-Way High School
Route #30
New Lenox IL 60451
(815) 485-7655

Objective:

The main objective of this Mini-teach is to show students that water is an important physical factor (abiotic) in the environment of all living things.

Materials Needed:

- petri dish
- stapler/staples
- paper towel/filter paper
- vinegar-soaked radish seeds
- alcohol-soaked radish seeds
- forceps
- tooth picks
- water-soaked radish seeds
- soap-soaked radish seeds

Strategy:

1. Divide your petri dish into four parts. Use the filter paper/paper towel, tooth picks and stapler.
2. Label the four parts as follows; Water, Vinegar, Soap, Alcohol (in pencil).
3. Wet the paper towel/filter paper in the petri dish.
4. Place five water-soaked radish seeds on the part of the dish marked "Water".
5. Use your forceps, rinse off five vinegar-soaked seeds. Place them in the part of the dish marked "Vinegar".
6. Use your forceps, rinse off five soap-soaked seeds. Place them in the part of the dish marked "Soap".
7. Use your forceps, rinse off five alcohol-soaked seeds. Place them in the part of the dish marked "Alcohol".
8. Cover the seeds with a wet paper towel circle or filter paper.
9. Label your petri dish (name & date). Store your experiment for a few days.
10. After a few days, examine your seeds.

Performance Assessment:

At the conclusion of the Mini-teach, students will be able to answer the following questions:

1. What were the four environments of your seeds?
2. Which seeds do you predict will not grow?
3. Which seeds do you predict will grow? Explain your answer.
4. What happened to the vinegar-soaked seeds?
5. What happened to the soap-soaked seeds?
6. What happened to the alcohol-soaked seeds?
7. What happened to the water-soaked seeds?
8. Suppose you had placed five dry seeds in a dry petri dish, what would have happened and why?
9. What must the environment provide seeds before they can grow?
10. What must all living things obtain from their environment?

Conclusion:

Students will understand that water is an important physical factor in the environment of all living things.

Return to Biology Index

Measuring Matter

Jessie D. Barnes
942 E. 148 St.
Dolton IL 60419

Henry Clay Elementary School
13231 S. Burley
Chicago IL 60633
312-535-5600

Objective:

The fourth grade students will measure the mass of objects using a balance scale and measure the volume of an irregularly shaped object, using displacement.

Materials needed:

balancing scale
coins
paper clips
pencils
blocks
rocks
soda can
water
crayons
heavy thread
50-ml graduated cylinder
bolt
books
nails

Recommended Strategy:

Phenomenological approach and Performance assessment

1. Review the following terms:
   matter, solid, liquid, gas, mass, grams, centimeter, and milliliter
2. Place an apple in a sack and staple the sack shut. Leave another sack flat and staple the top of the sack shut. Pass both sacks around for the students to observe and determine which sack contains a solid, liquid or gas object. Have the students name the object in the sack and describe to the class the shape, color, size, and weight of the object.

Performance Assessment:

Part I

A. Place a coin in one of the balance pans.
   1. What happens to the balance?
B. Add paper clips to the other balance pan, one at a time, until the pans balance.
   1. How many paper clips are needed to balance the pans?
   2. What is the mass of the coin?
C. Find the mass of other objects.
   1. What do you predict the mass of each object will be?
   2. What is the mass of each object?
   3. How can the balance measure mass?

Part II

D. Set a graduated cylinder on a table, away from the edge. Fill it with water up to the 20-ml mark.

   1. What is the volume of the water in the graduated cylinder?
E. Tie a piece of heavy thread around the bolt. Make sure the thread is long enough for you to hold onto when the bolt is lowered into the graduated cylinder.
   1. What do you think will happen to the water when you lower the bolt into the graduated cylinder?
F. Carefully lower the bolt into the water. Watch the level of the water.
   1. Describe what happened to the level of the water.
   2. What is the volume of the water in the graduated cylinder now?
   3. How much did the bolt increase the volume of the water?
   4. What is the volume of the bolt?
   5. How is a graduated cylinder used to measure the volume of an object? The volume of the displaced water is equal to the volume of the object.
   6. Use your graduated cylinder to find the volume of a crayon.

Multicultural Statement:

The metric system is used universally. Children of all cultures can benefit from the understanding and use of the metric system.

Return to Biology Index

Dinosaur Tracks and Critical Thinking

Charles T. Buzek
35 S. Kensington
LaGrange IL 60525
708-482-0024

Spry School
2400 S. Marshall
Chicago IL 60623
312-387-1517

Objectives:

This activity is designed for classes from 5th grade up.
Students will learn the major geologic eras.
They will learn the rudiments of how tracks are made and how to read them.
They will use powers of observation and critical thinking to produce a scenario.

Materials Needed:

This activity can be designed as an individual project or class project.

As an individual project, small boxes like shoe boxes can be used. These will have the bottom part of the box covered in clay.

As a class project, you will need a 1/2 inch thick piece of plywood about 3 feet square, 4 2x4s about 3 feet in length, and a 25 lb. bag of plaster. The four 2x4s will be used as a border for the plywood. Pour in plaster and water, mix well and begin to form a landscape.

Strategy:

You will want to create a landscape. I suggest a plain with a river running through it. This can be formed by hand or a stick. You will have to work quickly as the plaster sets within an hour. Once the landscape is formed you will begin to place the tracks in the wet plaster. I recommend using a pencil as a stylus. The form of the tracks will be chicken-like for the carnivore and circular for the herbivore. Have a story-line in mind before you begin placing the tracks. Once finished, allow the plaster to dry and then use spray paint to create the impression of grass and water. The story-line should be as involved as possible, providing a lot of evidence for a wide variety of interpretations.

Performance Assessment:

The students will be asked to observe the model carefully all the while taking notes and bearing in mind that the sides of the model represent the cardinal points. Then they will return to their seats and will be asked to write a scenario for what they have seen based on the evidence they have found. Though the instructor will have had a story-line in mind when the model was made, it is important to remember that there are **no right answers**. Any scenario described is correct if accompanied by sufficient evidence to support the view. Students should be counseled to give complete descriptions. Try to include evidence that will allow the students to completely describe the scene, e.g. weather, direction of wind, time of day, etc. and include these factors in their discussion of the scenario.

Students will be assessed on the basis of accounting for each set of tracks with a full discussion of the type of animal that made them and what information can be inferred from the tracks. They will need to delineate the sequence of events from the start of the scenario to the end.

Evaluation:

This activity is directed to exercising and sharpening students' critical thinking skills. It also incorporates a writing component making this a multi-disciplinary activity. For students from multi-cultural backgrounds whose dominant language is other than English the activity itself represents no obstacle since very little discussion is needed to get the students started However the assessment portion of the activity could be modified to allow the student to write in his native language or draw a diagram using a basic vocabulary and numbering system to demonstrate comprehension.

Return to Biology Index

Discover Science

Claire Davis
7804 S. Cornell
Chicago, Il. 60649

Myra T. Bradwell Elem.
7736 S. Burnham
Chicago, Il. 60649
(312) 535-6600

Objective:

To determine if students have mastered the following skills:

1. Comparison
2. Observation
3. Identification
4. Data Gathering

Materials:

1. Various mounted photos from magazines of plants, animals, insects and fish that relate to the questions provided by teacher.
2. Lab equipment such as:
   a) beaker
   b) graduated cylinder
   c) slide
   d) cover slip
   e) microscope
   f) thermometer
   g) hand lens
3. Graph paper
4. M & M's
5. Timer

Strategy:

Collect an assortment of photos from wildlife and science magazines. Mount the photographs on construction paper. Display the photographs around the classroom. Place a question pertaining to the photos beneath each of the pictures. Questions related to science experiences and students prior knowledge will also be displayed on walls and bulletin boards in the classroom. Provide an answer sheet that is numbered to correspond with visual displays and questions. Students will be allowed to observe photographs and questions for 2 minutes (teacher will use a timer) at each station. Students will be encouraged to move on after 2 minutes in order to allow everyone an opportunity to view and read each question and visual display. (Please note that no talking should be allowed.) Provide questions that may touch on the vocabulary as follows:

1. Knowledge - recalling previously learned information

2. Comprehension - understanding/translating

3. Application - applying knowledge

4. Analysis - relating elements of what's observed

```
5.  Evaluation - making judgements on definite criteria
```

Return to Biology Index

Data Sampling

Debra Dortch
942 East 80th Street
Chicago, IL 60619
(312)723-4358

Henry Suder Elementary
2022 West Washington
Chicago, IL 60602
(312)534-7864

Objectives:

Students will be introduced to data sampling.
Students will turn the data collected into useful information, make graphs and use the graphs to solve problems.

Materials needed:

600 mL of soil for each group
uncooked twist macaroni (worms)
dried lima beans (seeds)
small rocks
large sealable plastic bags
measuring cups
newspaper
rulers
balance scales

Strategy:

Divide the class into four groups. Give each group, except one, a soil mixture of 600 mL of soil, 15 lima beans, 150 mL of rocks and 75 mL twist macaroni. The other group will get the same soil mixture, except use 150 mL twist macaroni instead of 75 mL macaroni. Label each bag with a different letter corresponding to a different spot on a backyard map you have drawn on the board or overhead projector. Do not tell which group has the bag with the most worms.

Tell the class this story;

You love to fish and decide that you would like to take a few friends on a fishing trip on Saturday. You will need a lot of worms (at least 50). You will need to dig many holes in the backyard to find that many worms. Your mother would rather you not dig so many holes in her yard. You remember in science class that you learned about sampling. You ask if you can dig just four holes and from these four holes you will examine the dirt and replace the soil. By taking these four samples you can pick the best spot for worms. Then you will need one large hole in that spot and you promise to fill it in again. Your mother loves the idea and, thanks to science, your fishing trip is saved.

Pass out newspaper, bags of soil, measuring cups and maps of the backyard. Have balance scales and rulers on a nearby table so the students can use these as part of the observations. Share these predictions with the class by writing the results of the findings on the chalkboard. Predict at this time which soil mixture will have the most worms.

The students will complete a table and organize their data. Pass out a data table with columns marked "number of worms", "number of rocks" and "number of seeds." Label the rows of the table with the soil amount (75, 150, 300, 450 and 600 mL). Count only the contents of the 75, 300 and 600 mL sample and predict the contents of the remaining two. Each child must replace each soil sample completely into the bag before taking the next measurement. At no time should the entire contents of the bag be dumped onto the newspaper. Only the measured amount needs to be poured out for counting.

Conclusion:

Using the measured data, have students complete the table and predict the missing data. Discuss these predictions and record them on the chalkboard or the overhead projector. Draw three graphs using the soil measurements (x-axis), and the observed number of seeds, worms and rocks (y-axis). One student from each group will graph his groups counting for each graph. Compare the graphs with the tables. The class can decide which soil mixture is worm rich by using the graphs and the tables.

Evaluation:

Post activity discussion can focus on some of these questions:

1) Which method of prediction was easier, using the tables or graphs?
2) Can you name four ways in which we observed the soil?
3) Can you name other ways in which data collection can be used in real life?

Physical And Chemical Change Of Six White Substances

Jacqueline Sanders
7337 South Shore Drive
Chicago, Illinois 60649
(312) 221-5922

Myra Bradwell School
7736 South Burnham
Chicago, IL 60649
(312) 535-6600

Objectives:

(1). To determine whether the reaction between selected white substances and vinegar, water and iodine are chemical or physical.
(2). Make a hypothesis using observation, touch and smell.
(3). Through chemical analysis the students will be able to determine what happens to each of the substances - i.e. will they (a) clump or clot; (b) bubble or fizz; (c) separate; (d) give off a sweet or foul odor; (e) change colors.

Apparatus Needed:

(1). Petri dishes or Egg cart.
(2). Six white substances: powdered sugar, salt, baby powder, cornstarch, baking soda and plaster.
(3). Water
(4). Vinegar
(5). Iodine

CAUTIONS TO STUDENTS:

Use of iodine can cause damage to clothing, irritation to skin and breathing iodine can be hazardous to your health.

Strategy:

Test each substance individually with the following materials: water, vinegar and iodine. Make a hypothesis using observation, touch and smell.

Conclusion:

The substances have been identified as follows: powder sugar, salt, baby powder, cornstarch, baking soda and plaster.

Vocabulary:

Physical Change- is one in which the appearance of matter changes but its properties and makeup remain the same.

Chemical Change- is a change that produces one or more kinds of matter that are different from those present before the change.

Chemical Property- the ability of substances to undergo or resist chemical change.

Observation- is an examination of something in nature. Observing is more than seeing, it requires attention to details. It is a skill that requires patience and practice.

How Big Is Big?

Lucille Smith
7929 South Greenwood
Chicago, Il. 60619
312-846-2319

Horace Mann Elementary School
8050 South Chappel
Chicago,Il. 60649
312-933-6648

Objectives:

This activity, as described, can be used effectively, in grades 2 thru 6.
This project should be used as a culminating activity, after the completion of the unit on whales.
To reinforce the enormous size of the whale.
In this activity, students will assemble a life-size whale, outside of the school, using a picture of a Humpback whale on a grid.

Equipment and Materials:

Humpback whale puzzle
Humpback whale grid
Whale-size comparison chart
Crayons and markers
Yardstick
Transparent Tape
8-9ft. X 12ft. (108 sq. ft.) heavy weight plastic drop-cloths

Preparation:

You will need a copy of the Humpback whale puzzle and Humpback whale grid for each student. You will need a space at least 48 ft. X 18 ft. for the full-size drawing. An outdoor area is best.

Procedure:

Introduce the project to your students by reviewing the body parts of the whale, the Humpback whale puzzle and the Humpback whale grid, previously completed in prior lessons. Refer to Marine Life: Whales and Anatomy of a Humpback in this book.

Recommended Strategies:

Tape together eight drop-cloths to form a rectangle measuring 18 ft. wide by 48 ft. long.
Mark off and draw squares totaling l0 squares in length and 5 squares in width.
Assign one square of the Humpback whale puzzle picture to each student.
Have the students find the box on the large grid that matches the letter/number coordinate key of their piece.
Instruct the students to reproduce their small part of the whale into the appropriate box.
It will be important for you to monitor the boxes that form the outline of the whale. Lines that start in one box and extend to the next must meet.
For maximum effect, place your entire class **inside** the whale!

Extra Sensory Perception

Heflin, Marie
9225 S. Justine
Chicago, IL 60620
1-312-239-3319

Walter Dyett M.S.
1-312-624-4517

Objectives

1) Class will cooperatively define E.S.P.
2) Class will cooperatively identify the relationship of E.S.P. to man's five senses.
3) Class will classify experiences of examples into respective categories.

Equipment and Materials

Oak tag strips with ESP terminology.
Chalkboard and chalk.
Overhead projector and diagram of mind.
Excerpts from listed bibliography mounted on construction paper.
Pro and Con packet for further discussion.

Bibliography

Science Good, Bad And Bogus Martin Gardner
Mysteries of the Unknown Time Life
ESP Christopher Milbourne

Recommended Strategies

Review five senses and their respective functions. Develop concept of extrasensory perception. Elicit from students some characteristics which determine some ESP phenomena. Exhibit illustrations and distribute to students some excerpts from **Mysteries of the Unknown**. Have student place each excerpt under respective category.

Assign debating team Pro and Con side, each with supporting material in the take home packet.

For Safety's Sake: Introduction to Laboratory Safety in Science

Gaddis, Linda
7206 S. Indiana
Chicago, Illinois 60619
874-9599

Walter H. Dyett
624-4517

Objectives:

1. To supply students with a list of safety precautions and guidelines as they apply to the science laboratory.
2. To associate the correct laboratory safety rule for the work being done by the students.
3. To identify the type of safety precautions being observed through the use of safety symbols.
4. To practice safety in and out of the science laboratory.

Apparatus Needed:

pictures of safety hazards
safety symbol charts
extension chord
seat belt
fire extinguisher
safety test
first aid kit
safety guideline ditto
student safety contract
safety goggles
apron
step stool
plastic gloves
safety blanket

Strategy:

1. Pictures of safety hazards placed around the room with the following questions attached to each:
   a) What is happening in this picture?
   b) How could this accident have been avoided?
2. Students will move about the room and formulate answers to the questions posed. Answers will be discussed after students have been seated.
3. A display containing the following items:
   fire extinguisher, step stool, extension chord, seat belt.
4. Several students will be asked to pick up an item and stand in front of the picture of the accident that this piece of equipment could have been used to prevent, and then give their reason for making this decision.
5. The students will be given a ditto explaining the guidelines for laboratory safety which they will review with their teacher.
6. A student will be chosen to assist in the proper use of safety clothing and safety equipment.
7. Safety symbol charts will be viewed at this time. Students will be asked to form groups of three (or four depending on class size)

in order to match up the correct symbol(s) with the safety guidelines that were discussed on the ditto sheet earlier.

8. Approximately fifteen minutes before the class is dismissed, the teacher will administer a quiz on laboratory safety.

Assignment:

Students will be required to:

1. design their own first aid kit.
2. prepare a list of ten safety hazards not mentioned in class.
3. have their parents' co-sign their student safety contract and return it to class.

Return to Biology Index

The Frigid Gourmet

Drolson, Rochelle
4830 N. Central Park
Chicago, Ill. 60625
312-267-2059

Clemente High School
292-5062

Objectives:

Students will be able to explain why the freezing temperature of water has to be lowered in order to make ice cream; they will know what chemicals are used to lower the temperature and how each of these chemicals are soluble in water.

Apparatus needed (for a class of 30):

15 graduate cylinders filled with 45 ml of milk, 5 ml of sugar for each cylinder, 3 drops of vanilla for each cylinder, 3 drops of any color food coloring for each cylinder, 15 250 ml beakers, 30 wooden sticks, 30 test tubes, 30 large styrofoam cups, 30 thermometers, 30 small plastic containers, 2 large bags of ice, 500 ml rock salt, 500 ml isopropyl alcohol, 500 ml mineral oil

Strategy:

CHART:

CHEMICALS	EFFECTS ON MELTING POINT OF ICE RAISE, LOWER, OR STAY THE SAME	TEMPERATURE (C)	SOLUBLE OR INSOLUBLE IN WATER	SCIENCE SURPRISE YES OR NO
A. NO CHEMICAL (ICE ONLY)				
B. ROCK SALT				
C. ALCOHOL				
D. MINERAL OIL				

DIRECTIONS FOR MAKING SCIENCE SURPRISE:

Step 1: Pair off with another class member

Step 2: Picking up equipment

- a. You and your partner are to pick up the necessary equipment
- b. Partner 1 - one graduate cylinder, one 5 ml container of sugar, 3 drops of vanilla in cylinder, 3 drops of food coloring in cylinder
- c. Partner 2 - one 250 ml beaker, 2 wooden sticks, 2 test tubes, 2 large styrofoam cups, two thermometers, two small plastic cups

Step 3: At your table, mix the ingredients from the graduate cylinder with the sugar in the beaker and stir with the wooden stick.

Step 4: Pour l/2 of the mixture from the beaker into each test tube

Step 5: Add the wooden stick to the test tube and place the test tube in a styrofoam cup with a thermometer

Step 6: Go back to lab station and have your styrofoam cup filled with ice and one of the chemicals according to your group title (A,B,C, or D)
MAKE SURE THE MIXTURE IN THE TEST TUBE IS COMPLETELY SURROUNDED BY ICE AND MAKE SURE NONE OF THE ICE AND CHEMICALS GET IN THE TEST TUBE

Step 7: Making the science surprise

a. Record temperature of the thermometer (as soon as it stops moving) on the chart
b. Grasp the top of the test tube with 2 or 3 fingers and twist it back and forth in beaker-do not lift it up
c. To see if the mixture is changing, every once in awhile lift up on stick. When the stick starts to stay stuck in the mixture, you know a change is taking place.

Step 8: Remove the test tube from the beaker. Rub between your hands for about 20 seconds.

Step 9: Grasp the stick and carefully remove the mixture from the test tube

Step l0: You have made a science surprise! You may eat it!

Step ll: Looking at your chart, fill in the second column for your chemical only.

Step l2: Pour a little of the ice water (no ice) from the styrofoam cup into the small plastic container. Is it soluble or insoluble? How can you tell?

Step l3: Finish filling in the chart for your chemical only.

EVALUATION QUESTIONS:

l. What was the science surprise?
2. How had the materials in the test tube changed during the experiment?
3. What had to happen to the materials to make a change?
4. Did all the materials change? If so, why not?
5. Results of the chart
   a. Fill in as a class the rest of the chart
   b. Is there a pattern among the materials that changed? What do they have in common?
   c. Which materials lowered the melting point of ice?
   d. Which materials raised the melting point of ice?
   e. With which chemicals did the melting point stay the same?
   f. With which chemicals did one have a science surprise?
   g. What do the chemicals that helped to produce a science surprise have in common?
   h. Name the chemicals (if any) that didn't produce a science surprise. What do they have in common?
   i. What about those mixtures that used ice only. Did they get a science surprise? Why or why not?
   j. Do you think to make a science surprise, the temperature of ice has to change? If so, how will it change?

6. Why can't one make a science surprise with ice alone?
7. Form a conclusion about what is needed to make a science surprise.

BONUS QUESTIONS

l. Why is salt added to the roads in winter to remove ice?
2. Methanol (freezing point is -97.8C; boiling point is 64.7C) was used as an antifreeze in cars. It has been replaced by ethylene glycol (freezing point is -l5.6C; boiling point is l97.6C) WHY?

Return to Biology Index

GenEng

English, Jami
7932 S. Yale Ave.
Chicago, Il. 60620
483-9043

Dyett Middle School
624-45l5

Objectives:

Genetic Engineering will explore the basic structure of the DNA molecule, the pairing of base molecules, gene splicing, and re-combining of DNA by chemically removing a segment of DNA from the nucleus of a cell, and inserting it into a plasmid for reproduction.

Students will be able to identify the phosphate and sugar molecules of the DNA strand, pair off the base molecules correctly using a paper model, simulate the removal of DNA segments from a cell nucleus, simulate the chemical cutting or separation along the bases of a plasmid from a bacterium, inserting the donor strand of DNA and inserting the DNA into the plasmid so that it can reproduce with the new, donated characteristics provided by the inserted DNA.

Apparatus Needed:

Duplicated pages (both sides) from "Splice of Life" (Teachers' Guide):

Genetic Blueprint	DNA Replication	Splicing Life
Find The Gene	Lab to Market Maze	Lab to Market
	Glossary	

Recommended Strategy:

1. Orally review the vocabulary listed on the Glossary page.
2. Oral reading of the Genetic Blueprint sheet and completion of activity 2.1 to identify the phosphate and sugar molecules and learn the base pairing rule, A to T and G to C.
3. Oral reading of activity 2.2 (Amino Acid Decoder) to learn which DNA code for bases determines which amino acid.
4. Using a pre-cut DNA Replication sheet (activity 2.3) each group of two students will pair off the "free" nucleotides with the unzipped strands of DNA.
5. Oral reading of the Splicing Life sheet and completion of activity 3.1, matching the DNA strands to sites A, B, or C on the plasmid where the restriction enzymes have chemically cut the bases to permit the simulation of inserting the donated strands of DNA.
6. Oral reading of activity 3.2 (Find the Gene) using the base pairing rule to construct three (3) DNA probes that will bond to the three (3) DNA fragments given.
7. Additional activities (3.3 -Splicing Life Crossword and 4.2 - Lab To Market Maze) can be done by simply following the given

directions.

Return to Biology Index

PAPER CHROMATOGRAPHY - CHEMICAL AND MECHANICAL

VALERIE YOUNG
KENWOOD ACADEMY
5015 S. BLACKSTONE AVE
CHICAGO, IL 60615
1-312-536-8907

OBJECTIVES:

To determine all of the pigments present in the chloroplast of a green plant. the student will prepare and read a chromatogram by removing, seperating, and identify the pigments by using a technique called chromatography.

MATERIALS:

test tubes, test tube holder, filter paper (strip type) or chromatography paper, cork, thumbtack, green leaf (such as spinach, geranium,grass or the leaf off a tree), carrot leaves are most suitable. They provide a good source of carotene. Glass pipette, tweezers, scissors, hotplate, small beaker (Pyrex), ethyl alcohol (use denatured.) Acetone may be used to extract chlorophyl from the leaf. A glass rod, water and a solvent which consists of 45 ml petroleum ether, 5 ml acetone, and l ml benzene (this is enough solvent for 20 students)

STRATEGIES:

CHEMICAL PREPARING of LEAF PIGMENTS (May be prepared by one member of your class or the teacher. From this preparation , enough pigment will be made available for the entire class.) Each class member will then prepare his/her own chromatogram.

1. Fill a 600 ml beaker 1/4 full of water. Set this beaker on a hot plate.
2. Bring the water to a boil.
3. Place entire package of spinach (if using frozen spinach) into the boiling water. Bring to a boil again..
4. After one minute, remove the spinach with tweezers and squeeze out all excess water. Then transfer the boiled spinace to a 400 ml beaker containing 80 ml of ethyl alcohol.
5. Heat the beaker by placing it onto the hot plate. Leave it on the hot plate for only about 30 seconds or until the alcohol begins to bubble. Allow the alcohol to cool. Then reboil it several more times.
6. Remove the beaker from the hot plate. Squash the spinach with a glass rod. Reheat and squash until the alcohol solution becomes a dark green color. Enough pigment is now available for the entire class.

PREPARING THE CHROMATOGRAM

Prepare a strip of filter paper chemically as follows:

1. Cut two small notches (one on each side of the strip) about 2 cm from the bottom.
2. Use scissors to taper at the bottom of the paper to a point.
3. Attach the filter paer strip to a cork using a thumbtack and position the strip so that when inserted into a test tube, the filter paper tip just touches the bottom. Adjust the height by moving the strip either up or down on the cork.(The filter paper strip should not touch the sides of the test tube. Trim if necessary.)
4. Dip the fine end of a tiny glass pipette into the pigment solution prepared in the first section.

5. Touch the pipette to the filter paper between the notches. Allow the pigment solution to flow onto the paper.
6. Allow the spot to dry (about thirty seconds). Then add more pigment solution to the same spot. Make 20 applications of the solution. Allow time for drying between applications.

Prepare a strip of filter paper mechanically as follows:

1. DO NOT CUT NOTCHES ON THIS FILTER PAPER STRIP but taper the bottom as in the chemically prepared paper.
2. About 3 cm from the bottom take a leaf you have previously collected and a coin (preferrably a dime)
3. Place leaf on the filter paper and rub the dime across the leaf about six or seven times removing the pigment onto the paper.

SEPERATING THE PIGMENTS:

CAUTION: SOLVENT IS HIGHLY FLAMMABLE. Before proceeding, all flames in the laboratory must be extinguished. Make sure the room is well-ventilated. Do not inhale fumes.

l. Add solvent to a height of l cm in the test tube.
2. Place the filter paper strip into the tube. It is important that the pointed tip just touch the solvent.
3. DO NOT move or shake the tube for at least 15 minutes. Remove the paper chromatogram from the test tube when the level of solvent almost reaches the the top of the paper strip.
4. Examine the chromatogram for the presence of different bands of color. Each color band is a different pigment. You will find the following pigments: CAROTENE - at the top of the paper - ORANGE
   XANTHOPHYLL I - in the middle of the paper - YELLOW
   XANTHOPHYLL II - in the middle of the paper - YELLOW (may be only one yellow band)
   CHLOROPHYLL a - toward bottom - BRIGHT GREEN
   CHLOROPHYLL B - lowest on paper - KHAKI GREEN

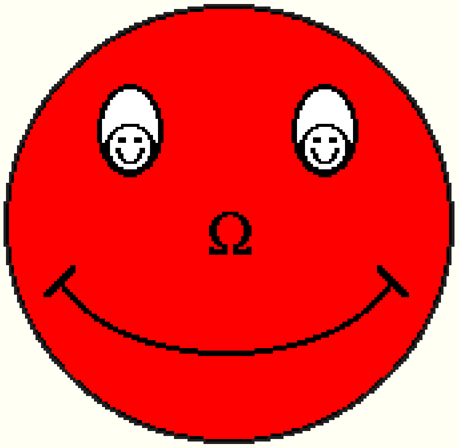
SMILE PROGRAM MATHEMATICS INDEX

The SMILE website is hosted by the Illinois Institute of Technology



The following is a collection of almost 200 single concept lessons. These lessons may be freely copied and used in a classroom but they remain the copyright property of the author(s) and the directors of the SMILE program.

The Mathematics lessons are divided into the following categories: Geometry and Measurement, Patterns and Logic, Probability and Statistics, Recreational and Creative Math, Practical and Applied Math, Arithmetic, Graphs and Visuals, Algebra and Trigonometry, and Miscellaneous.

Geometry and Measurement

- The Pythagorean Puzzle by Earl Zwicker - Illinois Institute of Technology - Dedicated to Prof. Harald Jensen, Lake Forest College
- Areas of States - Estimation by Janice C. Harvey - Carver Middle School
- Liquid Volume by Robert Foote - Disney Magnet
- Spherical Geometry: A Global Perspective by William R. Colson - Morgan Park High School
- Geometry Distance of Triangles using a Protractor by Eileen Lally - A. Philip Randolph Magnet School
- Circles - Diameter, Circumference, Radius and the Discovery of Pi by Kathleen Ryan - Randolph Magnet School
- How To Measure Area by Levi Johnson - James Otis
- An Introduction to Pi and the Area of a Circle by Edwina R. Justice - Gunsaulus Scholastic Academy
- Area and Perimeter by Monica Starks - John Fiske Elementary
- Shapes (Geometric) (Lesson 2) by Violet M. Nash - Spencer Math and Science Academy
- Shapes (Geometric) (Lesson 1) by Violet M. Nash - Spencer Math and Science Academy
- Measurements: Inches by Joyce McCoy - Spencer Math & Science Academy
- Getting To Know You by Kathy Koval - Randolph School
- Inch by Inch and Centimeter by Centimeter Extravaganza by Pamela J. Bates-Hines - Ninos Heroes Academy

- Interior Design by Sally Hill - Horatio May Community Academy
- Maximizing & Minimizing the Area of Rectangles Given a Fixed Perimeter by Tim Amrein - Franklin Fine Arts Center
- Phenomenological Pizza by Robert Foote - Disney Magnet School
- An Introduction To Volume by Linda James Woods - Harold Washington Elementary School
- Measurement of Volume by Richard Murray - Gage Park High School
- Volume and Surface Area by Charlotte Goldwater - Kenwood Academy
- An Introduction to Area and Perimeter by Edwina R. Justice - Gunsaulus Scholastic Academy
- An Introduction to Estimation and Measurements by Christeen Brown - Robert Fulton Elementary
- Circumferences, Diameters, and Radii by Dwayne Belle - Fuller School
- Measuring in Inches and Centimeters by Debra Thomas - Douglass Math and Science Academy
- Estimation by Iona Greenfield - Carnegie Elementary School
- Measurement of Objects Using Similar Triangles in The Plane by John Gabrielson - Chicago H.S. for Agri. Science
- Travel Triangles by Sarah Barrett - Mars Hill School
- Measurement-What is it? by Claudy E. Chapman - Hartigan School
- Finding the Sum of the Exterior and Interior Angles of a Polygon by David Drymiller - Morgan Park High School
- Forming, Measuring and Labeling Angles by Essie Lee May - May Community Academy
- What's My Area? by Karen L. Mickel - William Carter Elementary School
- Geometry and the Geoboard by Jacqueline Darling - Simmye Anderson Community Academy
- An Introduction to Angles by Samuel A. Anoma - Hyde Park Career Academy
- Use A Chair To Teach Math by Laura B. Reed - Rosa L. Parks
- Measurement (cup, pt, qt, gal) by JoAnn Campbell - Leslie Lewis School
- Measurements In The Metric System by Christine Fair - Farragut Career Academy
- The Area of a Circle (Version 2.0) by Edwina R. Justice - Gunsaulus Academy
- The Surface Area of a Cylinder (Version 2.0) by Justice, Edwina - Gunsaulus Academy
- Similarity by Kee, Natalia - Harlan Community Academy H.S.
- Polygons Made To Order by Malone, Loretta - Washington High School
- Properties Of Quadrilaterals by Olson, Margaret A. - Morgan Park High School
- Parallel lines and Angles by Singleton, Earl M. III - Daniel Hale Williams
- The Surface Area of a Cylinder by Justice, Edwina - Gunsaulus Academy
- Soap Film Models by Pintozzi, Joan - Curie Metro. H.S.

- Primary Geometry by Pitra, Barbara - Marconi Community Academy
- Proving Pi by Williams, Gwendolyn D. - Paul Robeson High School
- The Solar System by Fred J. Schaal - Lane Tech High School
- How Many Regular Polyhedrons Are There In This or Any Universe? by Lawrence E Freeman - Kenwood Academy
- The Area Of A Circle by Edwina R. Justice - Gunsaulus Academy

---

Patterns and Logic

- M&M MATH by Barbara P. Lorde - Crispus Attucks Academy
- Using Symmetry to Create A Community Quilt by Beverly Brown - Hedges West
- Sorting and Analyzing by Vickie Townsend - Crown Fine Arts Community Academy
- Sorting Through Life! by Barbette Flennoy - Joseph Stockton
- Number Patterns in Pascal's Triangle by Ulysses Harrison - Dunbar Vocational High School
- Visuals Patterns in Pascal's Triangle by Ulysses Harrison - Dunbar Vocational High School
- To Classify Beans And Peas by Gwendolyn Williams - Adam Clayton Powell
- Chess Math by Louis C. Jackson - Lincoln Elementary School
- TESSELLATIONS: An Application Of Simple Regular Polygons by Mary Racky - Kenwood
- Logic and Reasoning by Pearline Scott - Greeley School
- Tower of Hanoi by Paul Eubanks - Washington High School
- Logic by M. Elaine Granger - Irvin C. Mollison
- Counting Triangles by Mamie P. Scott - Coles School
- Using Diagrams in Problem Solutions by Angel L. Torres - Peabody School
- Formula Determination by Odom, Clark - Collins H.S.
- Classification by Wilburn, Delores B. - Shakespeare School
- ="Learning by Logic - Total Surface Area by Boyd, Carolyne - Bennett Elementary

---

Probability and Statistics

- Laws of Probability: Mutually Exclusive-vs-Mutually Inclusive Draws by Mikail A. Siddiq - Raymond School
- Probability by Ana Timbers - Stockton
- Probability of Childhood Games by Robert Foote - Disney Magnet School
- Probability by Sandy Reed - Robert Fulton School
- Phenomenological Probability by Robert Foote - Disney Magnet School

- Mean, Median, Mode, etc. by Charlotte Goldwater - Kenwood Academy
- Paper Toss Shootout by Edwina R. Justice - Gunsaulus Scholastic Academy
- Statistics of Mars* by Wilhelm L. Lilly - Kenwood Academy
- Averaging by Sharon Thomas - Emmanuel Christian School
- Probability by Turner, Emily - Joplin Elementary School
- Probability by Moss, Laura Willis - South Shore Community Academy
- Modeling Permutation Group by Mary Margaret Nee - Von Stueben Science Center

---

Recreational and Creative Math

- Boomerang by Wilhelm L. Lilly - Kenwood Academy High School
- How Much is a Million? by Sharon Simmons - Joseph Stockton Elementary
- Rocket High by Elizabeth Kelly - Pilsen Community Academy
- Making Ice Cream by Vickie Townsend - Crown Fine Arts Community Academy
- Games Using Multiplication by Amaechi Onyeali - Carter Elementary
- Napier's Rods by Irene Santos - Alexander Graham School
- The Golden Rectangle by Edwina R. Justice - Gunsaulus Academy
- Paper Folding to Make Cubes by Koshy Kanicherilnalil - Chicago Public Schools
- Integer: Tic-Tac-Toe Four In A Row! by Conchita A. Little - Terrell School
- Fractions and Paper Folding by Bill Wagner - Hyde Park Career Academy
- Number Up by Ernestine Bickham - Maria Saucedo Magnet School
- Math Game Using A Tic-Tac-Toe Board by Gertrude Franklin - William Penn
- The Moebius Strip by Arnita Newton - Kenwood Academy
- Fraperdec* by Connie Taylor - Holy Angels School
- How To Use An Abacus by William Gordon - John Hope Academy
- A Fibonacci Primer by Freeman, Larry - Kenwood Academy
- Geometric designs in the game of "Life". by Byrne, Willaim - Martin Luther King H.S.
- Paper Pool by Williams, Barbara - Cook Elementary School
- Graphing Game by Lalagos, Thomas - Hyde Park Career Academy
- Geometric Bingo by Lawrence, Anne - Wells Community Academy

---

Practical and Applied Math

- What Does Greatest Common Factor Mean to Me? by Stephen Ha - Lloyd Elementary School

Park Manor

- Ratios and Proportions by Mamie P. Scott - Edward Coles Elementary School
- Draining the Swimming Pool by William Byrne - Martin Luther King
- Sales Tax and Discounts by Denise Folk - Richard E. Byrd Academy
- Mixture Problems by Alphonso Kennedy - Lindblom Tech. H. S.
- An Introduction to Percent by Kenneth Surdell - Lewis School
- Solving Word Problems by Barbara Trotter - O.A. Thorp Scholastic Academy
- Problem Solving: Steps and Strategies by Barrett, Sarah G. - Mars Hill School
- Time by Davenport, Gracie - Spalding School
- Problem Solving by McCree, Marilyn - District 12
- Ratios by Murray, Richard - Gage Park High School
- Learning ratios and proportions through scale drawings. by Laskey, Erwin - Eugene Field School
- Problem Solving by Rogers, Patricia - Edward Hartigan
- Ratio and Proportions by Trotter, Barbara - Ole A. Thorp
- From Hypothesis To Conclusion...Reading Maps To Understand Proofs by Blaszak, Maryann - South Shore Community Academy
- Triangulation by Brandon, Ann M. W. - Oak Forest High School
- Cuisenaire Rods And Math by Linda Easter - Dewitt Clinton Elementary School

---

Arithmetic

- Introduction To The Number Line by Sheila Alexander - Manley School
- Extending Our Knowledge of Place Value by Angie Morris - Burnham School
- Filling the Glass (Water, Air, and Fractions) by William R. Colson - Morgan Park High School
- Having Fun working With Fractions by Brian Cagle - John W. Cook
- Number Addition Race by Janice Schaults - Randolph Magnet School
- Lesson for Multiplying and Dividing Fractions with Post It Notes by Robert Foote - Disney Magnet School
- Adding Mixed Numbers with Unlike Denominators by Camille Gales - Edward Coles Elementary School
- Multiplication by Virginia Muhammad - John Hope Community Academy
- Putting the Pieces Together (Making a Fractional Quilt) by Demetria E. McKnight - Bateman Elementary School
- Factors by Edwina R. Justice - Gunsaulus Scholastic Academy

- Place Value by Dwayne Belle - Fuller School
- Percentages by Emma Taylor - Douglass Math and Science Academy
- Counting and Place Value by Carole Gills - Edward Coles School
- Ratio and Proportion by Valesta Cobbs - John Fiske Elementary School
- Introduction to Fractions Using Cuisenaire Rods by Gwendolyn M. Manson - Benjamin Banneker
- Measuring Mixed Numbers by Karen Trout - Sumner Math and Science Academy
- A "New Set of Numbers" (An Introduction of Integers) by Barbara Barlow - Caldwell School
- Primary Understanding and Use of Place Value by Eleanor Brzozowski - Hanson Park School
- Introduction To Equivalent Fractions by Rose Cartwright - Lyman Trumbull School
- Fickled Fractions by Elizabeth Chambers - Keller Gifted Magnet Center
- Addition and Subtraction of Signed Numbers by David Drymiller - Morgan Park High School
- Working with Cuisenaire Rods In Mathematics by Willis Grace - O. A. Thorp Academy
- The Generation Of Fractions by June Muhammad - Park Manor School
- A Method of Front-End Arithmetic by Eddie Newton - Carver Area High School
- Money: Demonstrating Coin Values up to $1.00 by Camille Gales - Coles Elementary School
- How Divine Is My Proportion? by Edwina R. Justice - Gunsaulus Scholastic Academy
- Equivalent Fractions by Gertrude Lockett - Emmanuel Christian School
- Division For Third Graders by Savannah Walker - Mason School
- Prime and Composite Numbers by Charlotte Goldwater - Kenwood Academy
- A Fictional History of Place Value by Bette B. Jarrow - Goudy Elementary
- Fundamentals of Multiplication by Carl D. Mason - Suder School
- Place Value by Ceopal Porter - Dr. Ralph J. Bunche
- Fractions, Simplifying Parts of Shapes -- One-Half, One-Third, One-Fourth by Austin, Sarah - Mary Bethune
- Fraction Message by Harper, Charles - Goldblatt Elementary School
- Identification of Equivalent Fractions by Jarrow, Bette B. - Gaudy School
- Introducing Powers and Models-I by Barrett, Sarah - Mars Hill School
- Math Technique in Multiplication and Division of Fractions by Garth, Frieda - Farragut Career Academy
- Introduction to Fractions on the Numberline by Jones, Claudia R. - Crane High School
- Equivalent Fractions by Williams, Flora - O. A. Thorp
- Introducing Powers And Models-II by Barrett, Sarah - Mars Hill School
- Understanding Fractions by Bradley, Florida - Hartigan

- Odometers and the Place Value Chart by Bronson-Cochran, Donna - George B. Swift
- Basic Mathematical Operations Using Mathtiles by Jones, Claudia R. - Farragut Career Academy
- Adding Integers by Thomas, John Charles - N. F. Simeon Voc. H. S.
- Locating Rational Numbers On the Number Line by Winebrenner, William - Dunbar Vocational
- Continued Fractions With A Calculator by Fred J. Schaal - Lane Tech High School

---

Graphs and Visuals

Mathematics/Physics

Areas of States - Estimation

Janice C. Harvey
P. O. Box 671
ROBBINS IL 60472-0671

Carver Middle School
801 E. 133rd Place
CHICAGO IL 60627
(773) 535-5655

Objectives:

Students will learn how to use the formulas for measuring the area of simple geometric shapes to estimate the area of an irregular shape**.** Students will learn how to estimate the area of the states using the formulas for the areas of rectangles, squares and triangles. This lesson is designed for seventh and eighth grade students.

Materials:

Each team will need these materials. (Students will work in pairs.)

- Outline maps of individual states with distance scales.
- Rulers
- Calculators
- Pencils
- Paper
- List of areas of all 50 states

Strategy:

Review the formulas for finding the areas of rectangles, squares, and triangles. Remind students that in real life measurement situations, it is often easier to use estimation. Choose an irregularly shaped, flat object or draw an irregular shape on the board. Demonstrate to the students how the shape can be divided into sections. Approximate each section with a rectangle, square or triangle.

These formulas may be used:

- Area of a rectangle =length ´ width
- Area of a triangle = 1/2 ´ (base) ´ (height)
- Area of a square = $(side)^2$

Have students, working in pairs, choose a state and estimate the area of that state by using different shapes. They may estimate the area of the state by using the formulas for finding the area of the various shapes, and by referring to the scales on the maps.

-

Performance Assessment:

As a performance assessment for this lesson, give each student an outline map of a state to estimate the area of that state. Student's final estimation should be within an 80% accuracy range.

Conclusion:

-

By using the formulas measuring the areas of simple geometric shapes and the map scales, the students will be able to estimate the land area of certain states.

Objective(s):

Students will learn and use formulas for the volume of a rectangular prism and volume of a cylinder.

Students will see the relationship between cubic centimeters and milliliters.

Students will compute formulas with and without calculators.

This lesson is designed for a junior high classroom.

Materials:

Depending on how many students you will use for this project, the amount of materials vary. If you break students up into small groups, you should use one of each of these materials in each group.

1. Plastic graduated cylinder measuring milliliters

2. Different size cylindrical containers such as coffee cans, Pringles potato chip cans, cookie tins, and the like. (Make sure these are made of a durable material that can hold water without falling apart. Cardboard is not good.)

3. Different size rectangular prism containers such as plastic storage containers, tins, and the like. Make sure the base is either square or rectangular.

4. Water

5. Food dye (Optional)

6. Rulers or tape measures

7. Calculators (optional)

Strategy:

At the beginning of the class, go over the formulas for finding the volume of a rectangular prism; that is base times height or length times width times height. Explain that the basic formula (base times height) also applies to the volume of a cylinder, except that the base is now a circle so the formula for the base is Pi multiplied by radius squared. Then multiply the base times the height. Once students are comfortable using these formulas, take one of the smaller rectangular containers and have students measure the length, width and height in centimeters of the container using tape measures. (DO NOT TELL THEM HOW TO MEASURE. This will lead to interesting discussion.) Once they have measured the sides, compute the volume. Your answer will be in cubic centimeters. This is the same as milliliters since there are 1000 cubic centimeters in a liter and 1000 milliliters in a liter. Once the volume is computed, measure the water in milliliters to see how it compares to the computed volume. If all is done correctly, you should have a close match. If the water overflows or the container is not completely full, a mistake was made. Elicit a discussion with your students to see why this happened. After showing how to do one to the class as a whole, then break up the class into groups and have them do two containers per group (One cylinder and one rectangular prism). After they have measured and calculated as a group the volume of their containers, let them check the volume with water. Observe as they measure and pour to determine accuracy of calculations and measurement. First calculate using the formula, then check using water. At the end of the class, discuss each of your findings and any problems you may have had. To more clearly see and measure the water used in this lesson, you may elect to use drops of food dye in the water.

Performance Assessment:

As a performance assessment for this lesson, give a child a container of each type to calculate the volume. Then have the child measure and pour the water into the containers to check his or her work. This lesson in itself is a performance assessment.

Conclusions:

Students should conclude in the end of this lesson that the formula for volume in cubic centimeters comes very close to the actual volume of the container in milliliters. They should also be able to detect what went wrong if a mistake occurs.

(773) 535-2550

Objective(s):

Suggested Grade Level: 3-12

1) Relate prior knowledge about the globe to definitions and properties in spherical geometry.
2) Given a common definition or property in Euclidean geometry, make a conjecture about the corresponding statement in spherical geometry.

Materials Needed:

Clear, inflatable globe (optional: 1 small globe per group)
Index cards (1 per group)
Chalkboard/whiteboard with compass and meter stick
Optional:
Apples or white styrofoam balls (1 per group)
Paring knives or black markers (1 per group)
Lenart sphere (kit available from Key Curriculum Press)

Strategy:

Begin with a review of terms and definitions from Euclidean (conventional) geometry. This should be done through questioning, not lecture, in order to assess prior knowledge. Students should at least have a basic understanding of points, lines, and planes for this lesson to be appropriate. Particular content, including properties to be investigated, will be chosen according to the knowledge and grade level of the students.

Split the class into groups of 3-5 students. Produce a clear inflatable globe containing latitude and longitude markings. Have a general discussion about latitude and longitude. If available, give each group a small globe of some type to use for individual reference. Compare to a flat map. What is different about the latitude/longitude markings?

Eventually, someone should note that on the globe, latitude/longitude markings are not lines, but circles; then, that latitude circles are of different sizes, while longitude circles are all the same. Using the list of terms developed in the opening discussion, identify corresponding parts on the surface of a sphere and give their accepted names in spherical geometry (see List #1 below).

When the class seems comfortable with the new terms, give each group an index card containing a statement of a postulate or property in Euclidean geometry and instructions to translate it into a corresponding statement in spherical geometry (see List #2 below).

Depending on class level and time available, follow-up activities could include such things as:

1) What would a spherical ruler/compass/protractor look like?
2) If parallelism does not exist in spherical geometry, can we still construct figures that correspond to parallelograms? What would be their properties?
3) What about spherical "triangles"? What would correspond to acute, right, or obtuse? What could we say about angle sums? Is there anything corresponding to the Pythagorean theorem?

In my class, I gave each group an apple, a paring knife, and the following instructions: "Cut your apple to represent a spherical 'triangle'. Do this by scoring an 'equator' and one or two great circles through the poles. Question: What is the possible range of the sum of the measures of the angles of the triangle? (Answer: Greater than 180º and less than or equal to 360º.) If they gave and explained a satisfactory conjecture, I gave them a small cup of caramel dip and permission to slice and eat their apple. If knives and food are inappropriate for your classroom, this activity (as well as many others) may also be done using a white styrofoam ball and black marker.

List #1
Corresponding terms (examples):

Euclidean	**Spherical**
point	same ("polar" points are endpoints of a diagonal of the sphere)
line	great circle
plane	sphere
ray	none
line segment	arc of a great circle
angle	angle (intersection of two arcs)

List #2
Corresponding statements (examples):

1) E: There is a unique straight line passing through any two points.
   S: There is a unique great circle passing through any pair of nonpolar points.
2) E: If three points are collinear, exactly one lies between the other two.
