

# Bisexuality

From Wikipedia, the free encyclopedia

**Bisexuality** is romantic attraction, sexual attraction, or sexual behavior toward both males and females,<sup>[1][2][3]</sup> or romantic or sexual attraction to people of any sex or gender identity; this latter aspect is sometimes alternatively termed *pansexuality*.<sup>[4][5][6]</sup>

The term *bisexuality* is mainly used in the context of human attraction to denote romantic or sexual feelings toward both men and women,<sup>[1][2][3]</sup> and the concept is one of the three main classifications of sexual orientation along with heterosexuality and homosexuality, which are each parts of the heterosexual–homosexual continuum. A bisexual identity does not necessarily equate to equal sexual attraction to both sexes; commonly, people who have a distinct but not exclusive sexual preference for one sex over the other also identify themselves as bisexual.<sup>[7]</sup>

Bisexuality has been observed in various human societies<sup>[8]</sup> and elsewhere in the animal kingdom<sup>[9][10][11]</sup> throughout recorded history. The term *bisexuality*, however, like the terms *hetero-* and *homosexuality*, was coined in the 19th century.<sup>[12]</sup>

### Sexual orientation, identity, and behavior

Bisexuality is romantic or sexual attraction to males and females. The American Psychological Association states that "sexual orientation falls along a continuum. In other words, someone does not have to be exclusively homosexual or heterosexual, but can feel varying degrees of both. Sexual orientation develops across a person's lifetime—different people realize at different points in their lives that they are heterosexual, bisexual or homosexual."<sup>[7][13]</sup>

Sexual attraction, behavior and identity may also be incongruent, as sexual attraction or behavior may not necessarily be consistent with identity. Some individuals identify themselves as heterosexual, homosexual or bisexual without having had any sexual experience. Others have had homosexual experiences but do not consider themselves to be gay, lesbian, or bisexual.<sup>[13]</sup> Likewise, self-identified gay or lesbian individuals may occasionally sexually interact with members of the opposite sex but do not identify as bisexual.<sup>[13]</sup> The terms *queer*,<sup>[5]</sup> *polysexual*,<sup>[5]</sup> *heteroflexible*, *homoflexible*, *men who have sex with men* and *women who have sex with women* may also be used to describe sexual identity or identify sexual behavior.

Some sources state that bisexuality encompasses romantic or sexual attraction to all gender identities or that it is romantic or sexual attraction to a person irrespective of that person's biological sex or gender, equating it to or rendering it interchangeable with pansexuality.<sup>[4][6]</sup> The concept of pansexuality deliberately rejects the gender binary, the "notion of two genders and indeed of specific sexual orientations",<sup>[6]</sup> as pansexual people are open to relationships with people who do not identify as strictly men or women.<sup>[4][6]</sup>

Bisexual activist Robyn Ochs defines bisexuality as "the potential to be attracted—romantically and/or sexually—to people of more than one sex and/or gender, not necessarily at the same time, not necessarily in the same way, and not necessarily to the same degree."<sup>[14]</sup>

According to Rosario, Schrimshaw, Hunter, Braun (2006):

...the development of a lesbian, gay, or bisexual (LGB) sexual identity is a complex and often difficult process. Unlike members of other minority groups (e.g., ethnic and racial minorities), most LGB individuals are not raised in a community of similar others from whom they learn about their identity and who reinforce and support that identity. Rather, LGB individuals are often raised in communities that are either ignorant of or openly hostile toward homosexuality.<sup>[7]</sup>

Bisexuality as a transitional identity has also been examined. In a longitudinal study about sexual identity development among lesbian, gay, and bisexual (LGB) youths, Rosario et al. "found evidence of both considerable consistency and change in LGB sexual identity over time". Youths who had identified as both gay/lesbian and bisexual prior to baseline were approximately three times more likely to identify as gay/lesbian than as bisexual at subsequent assessments. Of youths who had identified only as bisexual at earlier assessments, 60 to 70 percent continued to thus identify, while approximately 30 to 40 percent assumed a gay/lesbian identity over time. Rosario et al. suggested that "although there were youths who consistently self-identified as bisexual throughout the study, for other youths, a bisexual identity served as a transitional identity to a subsequent gay/lesbian identity."<sup>[7]</sup> By contrast, a longitudinal study by Lisa M. Diamond, which followed women identifying as lesbian, bisexual, or unlabeled, found that "more women adopted bisexual/unlabeled identities than relinquished these identities," over a ten-year period. The study also found that "bisexual/unlabeled women had stable overall distributions of same-sex/other-sex attractions."<sup>[15]</sup> Diamond has also studied male bisexuality, noting that survey research found "almost as many men transitioned at some point from a gay identity to a bisexual, queer or unlabeled one, as did from a bisexual identity to a gay identity."<sup>[16][17]</sup>

## Kinsey scale

In the 1940s, zoologist Alfred Kinsey created a scale to measure the continuum of sexual orientation from heterosexuality to homosexuality. Kinsey studied human sexuality and argued that people have the capability of being hetero- or homosexual even if this trait does not present itself in the current circumstances.<sup>[18]</sup> The Kinsey scale is used to describe a person's sexual experience or response at a given time. It ranges from 0, meaning exclusively heterosexual, to 6, meaning exclusively homosexual.<sup>[19]</sup> People who rank anywhere from 2 to 4 are often considered bisexual; they are often not fully one extreme or the other.<sup>[20]</sup> Sociologists Martin S. Weinberg and Colin J. Williams write that, in principle, people who rank anywhere from 1 to 5 could be considered bisexual.<sup>[21]</sup>

Psychologist Jim McKnight writes that while the idea that bisexuality is a form of sexual orientation intermediate between homosexuality and heterosexuality is implicit in the Kinsey scale, that conception has been "severely challenged" since the publication of *Homosexualities* (1978), by Weinberg and Alan P. Bell.<sup>[22]</sup>

## Demographics and prevalence

Kinsey's 1948 work *Sexual Behavior in the Human Male* found that "46% of the male population had engaged in both heterosexual and homosexual activities, or 'reacted to' persons of both sexes, in the course of their adult lives".<sup>[23]</sup> Kinsey himself disliked the use of the term *bisexual* to describe individuals who engage in sexual activity with both males and females, preferring to use *bisexual* in its original, biological sense as hermaphroditic, stating, "Until it is demonstrated [that] taste in a sexual relation is dependent upon the individual containing within his anatomy both male and female structures, or male and female physiological capacities, it is unfortunate to call such individuals bisexual."<sup>[24][25]</sup> *The Janus Report on Sexual Behavior*, published in 1993, showed that 5 percent of men and 3 percent of women considered themselves bisexual and 4 percent of men and 2 percent of women considered themselves homosexual.<sup>[26]</sup>

More modern studies estimating the demographics for bisexuality have varied. A 2002 survey in the United States by National Center for Health Statistics found that 1.8 percent of men ages 18–44 considered themselves bisexual, 2.3 percent homosexual, and 3.9 percent as "something else". The same study found that 2.8 percent of women ages 18–44 considered themselves bisexual, 1.3 percent homosexual, and 3.8 percent as "something else".<sup>[26]</sup> In 2007, an article in the 'Health' section of *The New York Times* stated that "1.5 percent of American women and 1.7 percent of American men identify themselves [as] bisexual."<sup>[27]</sup> Also in 2007, it was reported that 14.4 percent of young US women identified themselves as "not strictly heterosexual", with 5.6 percent of the men identifying as gay or bisexual.<sup>[28]</sup> A study in the journal *Biological Psychology* in 2011 reported that there were men who identify themselves as *bisexuals* and who were aroused by both men and women.<sup>[29]</sup> In the first large-scale government survey measuring Americans' sexual orientation, the NHIS reported in July 2014 that only 0.7 percent of Americans identify as bisexual.<sup>[30]</sup>

From an anthropological perspective, there is large variation in the prevalence of bisexuality between different cultures. Among some tribes, it appears to be non-existent while in others a universal, including the Sambia of New Guinea and similar Melanesian cultures.<sup>[31]</sup>

## Studies, theories and social responses

There is no consensus among scientists about the exact reasons that an individual develops a heterosexual, bisexual or homosexual orientation.<sup>[32]</sup> Proposed reasons include a combination of genetic factors<sup>[33][34]</sup> and environmental factors (including fraternal birth order, where the number of older brothers a boy has increases the chances of homosexuality; specific prenatal hormone exposure, where hormones play a role in determining sexual orientation as they do with sex differentiation;<sup>[35][36]</sup> and prenatal stress on the mother).<sup>[37][38][39]</sup>

The American Academy of Pediatrics has stated that "sexual orientation probably is not determined by any one factor but by a combination of genetic, hormonal, and environmental influences."<sup>[40]</sup> The American Psychological Association has stated that "there are probably many reasons for a person's sexual orientation and the reasons may be different for different people". It further stated that, for most people, sexual orientation is determined at an early age.<sup>[41]</sup> The American Psychiatric Association stated: "To date there are no replicated scientific studies supporting any specific biological etiology for

homosexuality. Similarly, no specific psychosocial or family dynamic cause for homosexuality has been identified, including histories of childhood sexual abuse."<sup>[42]</sup> Research into how sexual orientation may be determined by genetic or other prenatal factors plays a role in political and social debates about homosexuality, and also raises fears about genetic profiling and prenatal testing.<sup>[43]</sup>

Magnus Hirschfeld argued that adult sexual orientation can be explained in terms of the bisexual nature of the developing fetus: he believed that in every embryo there is one rudimentary neutral center for attraction to males and another for attraction to females. In most fetuses, the center for attraction to the opposite sex developed while the center for attraction to the same sex regressed, but in fetuses that became homosexual, the reverse occurred. Simon LeVay has criticized Hirschfeld's theory of an early bisexual stage of development, calling it confusing; LeVay maintains that Hirschfeld failed to distinguish between saying that the brain is sexually undifferentiated at an early stage of development and saying that an individual actually experiences sexual attraction to both men and women. According to LeVay, Hirschfeld believed that in most bisexual people the strength of attraction to the same sex was relatively low, and that it was therefore possible to restrain its development in young people, something Hirschfeld supported.<sup>[44]</sup>

Hirschfeld created a ten-point scale to measure the strength of sexual desire, with the direction of desire being represented by the letters A (for heterosexuality), B (for homosexuality), and A + B (for bisexuality). On this scale, someone who was A3, B9 would be weakly attracted to the opposite sex and very strongly attracted to the same sex, an A0, B0 would be asexual, and an A10, B10 would be very attracted to both sexes. LeVay compares Hirschfeld's scale to that developed by Kinsey decades later.<sup>[45]</sup>

Sigmund Freud believed that every human being is bisexual in the sense of incorporating general attributes of both sexes. In his view, this was true anatomically and therefore also psychologically, with sexual attraction to both sexes being an aspect of this psychological bisexuality. Freud believed that in the course of sexual development the masculine side of this bisexual disposition would normally become dominant in men and the feminine side in women, but that all adults still have desires derived from both the masculine and the feminine sides of their natures. Freud did not claim that everyone is bisexual in the sense of feeling the same level of sexual attraction to both genders. Freud's belief in innate bisexuality was rejected by Sándor Radó in 1940 and, following Radó, by many later psychoanalysts. Radó argued that there is no biological bisexuality in humans.<sup>[46]</sup>

Human bisexuality has mainly been studied alongside homosexuality. Van Wyk and Geist argue that this is a problem for sexuality research because the few studies that have observed bisexuals separately have found that bisexuals are often different from both heterosexuals and homosexuals. Furthermore, bisexuality does not always represent a halfway point between the dichotomy. Research indicates that bisexuality is influenced by biological, cognitive and cultural variables in interaction, and this leads to different types of bisexuality.<sup>[31]</sup>

In the current debate around influences on sexual orientation, biological explanations have been questioned by social scientists, particularly by feminists who encourage women to make conscious decisions about their life and sexuality. A difference in attitude between homosexual men and women has also been reported, with men more likely to regard their sexuality as biological, "reflecting the universal male experience in this culture, not the complexities of the lesbian world." There is also evidence that women's sexuality may be more strongly affected by cultural and contextual factors.<sup>[47]</sup>

Camille Paglia has promoted bisexuality as an ideal.<sup>[48]</sup> Harvard Shakespeare professor Marjorie Garber made an academic case for bisexuality with her 1995 book *Vice Versa: Bisexuality and the Eroticism of Everyday Life*, which argued that most people would be bisexual if not for repression and other factors such as lack of sexual opportunity.<sup>[49]</sup>

## Brain structure and chromosomes

LeVay's (1991) examination at autopsy of 18 homosexual men, 1 bisexual man, 16 presumably heterosexual men and 6 presumably heterosexual women found that the INAH 3 nucleus of the anterior hypothalamus of homosexual men was smaller than that of heterosexual men and closer in size of heterosexual women. Although grouped with homosexuals, the INAH 3 size of the one bisexual subject was similar to that of the heterosexual men.<sup>[31]</sup>

Some evidence supports the concept of biological precursors of bisexual orientation in genetic males. According to Money (1988), genetic males with an extra Y chromosome are more likely to be bisexual, paraphilic and impulsive.<sup>[31]</sup>

## Evolutionary theory

Some evolutionary psychologists have argued that same-sex attraction does not have adaptive value because it has no association with potential reproductive success. Instead, bisexuality can be due to normal variation in brain plasticity. More recently, it has been suggested that same-sex alliances may have helped males climb the social hierarchy giving access to females and reproductive opportunities. Same-sex allies could have helped females to move to the safer and resource richer center of the group, which increased their chances of raising their offspring successfully.<sup>[50]</sup>

Brendan Zietsch of the Queensland Institute of Medical Research proposes the alternative theory that men exhibiting female traits become more attractive to females and are thus more likely to mate, provided the genes involved do not drive them to complete rejection of heterosexuality.<sup>[51]</sup>

Also, in a 2008 study, its authors stated that "There is considerable evidence that human sexual orientation is genetically influenced, so it is not known how homosexuality, which tends to lower reproductive success, is maintained in the population at a relatively high frequency." They hypothesized that "while genes predisposing to homosexuality reduce homosexuals' reproductive success, they may confer some advantage in heterosexuals who carry them" and their results suggested that "genes predisposing to homosexuality may confer a mating advantage in heterosexuals, which could help explain the evolution and maintenance of homosexuality in the population."<sup>[52]</sup>

In *Scientific American Mind*, scientist Emily V. Driscoll stated that homosexual and bisexual behavior is quite common in several species and that it fosters bonding: "The more homosexuality, the more peaceful the species". The article also stated: "Unlike most humans, however, individual animals generally cannot be classified as gay or straight: an animal that engages in a same-sex flirtation or partnership does not necessarily shun heterosexual encounters. Rather, many species seem to have ingrained homosexual tendencies that are a regular part of their society. That is, there are probably no strictly gay critters, just bisexual ones. Animals don't do sexual identity. They just do sex."<sup>[53]</sup>

## Masculinization

Masculinization of women and hypermasculinization of men has been a central theme in sexual orientation research. There are several studies suggesting that bisexuals have a high degree of masculinization. LaTorre and Wendenberg (1983) found differing personality characteristics for bisexual, heterosexual and homosexual women. Bisexuals were found to have fewer personal insecurities than heterosexuals and homosexuals. This finding defined bisexuals as self-assured and less likely to suffer from mental instabilities. The confidence of a secure identity consistently translated to more masculinity than other subjects. This study did not explore societal norms, prejudices, or the feminization of homosexual males.<sup>[31]</sup>

In a research comparison, published in the *Journal of the Association for Research in Otolaryngology*, women usually have a better hearing sensitivity than males, assumed by researchers as a genetic disposition connected to child bearing. Homosexual and bisexual women have been found to have a hypersensitivity to sound in comparison to heterosexual women, suggesting a genetic disposition to not tolerate high pitched tones. While heterosexual, homosexual and bisexual men have been found to exhibit similar patterns of hearing, there was a notable differential within a sub-group of males identified as hyperfeminized homosexual males who exhibited test results similar to heterosexual women.<sup>[54]</sup>

## Prenatal hormones

The prenatal hormonal theory of sexual orientation suggests that people who are exposed to excess levels of sex hormones have masculinized brains and show increased homosexuality or bisexuality. Studies providing evidence for the masculinization of the brain have, however, not been conducted to date. Research on special conditions such as congenital adrenal hyperplasia (CAH) and exposure to diethylstilbestrol (DES) indicate that prenatal exposure to, respectively, excess testosterone and estrogens are associated with female–female sex fantasies in adults. Both effects are associated with bisexuality rather than homosexuality.<sup>[47]</sup>

There is research evidence that the digit ratio of the length of the 2nd and 4th digits (index finger and ring finger) is somewhat negatively related to prenatal testosterone and positively to estrogen. Studies measuring the fingers found a statistically significant skew in the 2D:4D ratio (long ring finger) towards homosexuality with an even lower ratio in bisexuals. It is suggested that exposure to high prenatal testosterone and low prenatal estrogen concentrations is one cause of homosexuality whereas exposure to very high testosterone levels may be associated with bisexuality. Because testosterone in general is important for sexual differentiation, this view offers an alternative to the suggestion that male homosexuality is genetic.<sup>[55]</sup>

The prenatal hormonal theory suggests that a homosexual orientation results from exposure to excessive testosterone causing an over-masculinized brain. This is contradictory to another hypothesis that homosexual preferences may be due to a feminized brain in males. However, it has also been suggested that homosexuality may be due to high prenatal levels of unbound testosterone that results from a lack of receptors at particular brain sites. Therefore, the brain could be feminized while other features, such as the 2D:4D ratio could be over-masculinized.<sup>[50]</sup>

## Sex drive

Several studies comparing bisexuals with hetero- or homosexuals have indicated that bisexuals have higher rates of sexual activity, fantasy or erotic interest. Van Wyk and Geist (1984) found that male and female bisexuals had more sexual fantasy than heterosexuals. Dixon (1985) found that bisexual men had more sexual activities with women than did heterosexual men. Bisexual men masturbated more but had fewer happy marriages than heterosexuals. Bressler and Lavender (1986) found that bisexual women had more orgasms per week and they described them as stronger than those of hetero- or homosexual women. They also found that marriages with a bisexual female were happier than heterosexual unions, observed less instance of hidden infidelity, and ended in divorce less frequently. Goode and Haber (1977) found bisexual women to be sexually mature earlier, masturbate and enjoy masturbation more and to be more experienced in different types of heterosexual contact.<sup>[31]</sup>

Research suggests that, for most women, high sex drive is associated with increased sexual attraction to both women and men. For men, however, high sex drive is associated with increased attraction to one sex or the other, but not to both, depending on sexual orientation.<sup>[56]</sup> Similarly for most bisexual women, high sex drive is associated with increased sexual attraction to both women and men; while for bisexual men, high sex drive is associated with increased attraction to one sex, and weakened attraction to the other.<sup>[50]</sup>

## Community

### General social impacts

The bisexual community (also known as the bisexual/pansexual, bi/pan/fluid, or non-monosexual community) includes members of the LGBT community who identify as bisexual, pansexual or fluid.<sup>[57]</sup> Because some bisexual people do not feel that they fit into either the gay or the heterosexual world, and because they have a tendency to be "invisible" in public, some bisexual persons are committed to forming their own communities, culture, and political movements. Some who identify as bisexual may merge themselves into either homosexual or heterosexual society. Other bisexual people see this merging as enforced rather than voluntary; bisexual people can face exclusion from both homosexual and heterosexual society on coming out. Psychologist Beth Firestein states that bisexuals tend to internalize social tensions related to their choice of partners<sup>[58]</sup> and feel pressured to label themselves as homosexuals instead of occupying the difficult middle ground where attraction to people of both sexes would defy society's value on monogamy.<sup>[58]</sup> These social tensions and pressure may affect bisexuals' mental health, and specific therapy methods have been developed for bisexuals to address this concern.<sup>[58]</sup>

Bisexual behaviors are also associated in popular culture with men who engage in same-sex activity while otherwise presenting as heterosexual. The majority of such men — said to be *living on the down-low* — do not self-identify as bisexual.<sup>[59]</sup> However, this may be a cultural misperception closely related to that of other LGBT individuals who hide their actual orientation due to societal pressures, a phenomenon colloquially called "*being closeted*".

In the U.S., a 2013 Pew survey showed that 28% of bisexuals said that "all or most of the important people in their life are aware that they are LGBT" vs. 77% of gay men and 71% of lesbians. Furthermore, when broken down by gender, only 12% of bisexual men said that they were "out" vs. 33% of bisexual women.<sup>[60]</sup>

## Perceptions and discrimination

Like people of other LGBT sexualities, bisexuals often face discrimination. In addition to the discrimination associated with homophobia, bisexuals frequently contend with discrimination from gay men, lesbians, and straight society around the word *bisexual* and bisexual identity itself.<sup>[24][61][62]</sup> The belief that everyone is bisexual (especially women as opposed to men),<sup>[63][64]</sup> or that bisexuality does not exist as a unique identity, is common.<sup>[24][65]</sup> This stems from two views: In the heterosexist view, people are presumed to be sexually attracted to the opposite sex, and it is sometimes reasoned that a bisexual person is simply a heterosexual person who is sexually experimenting.<sup>[62]</sup> In the monosexist view, it is believed that people cannot be bisexual unless they are equally sexually attracted to both sexes, regulating sexual orientation to being about the sex or gender one prefers.<sup>[24][61]</sup> In this view, people are either exclusively homosexual (gay/lesbian) or exclusively heterosexual (straight),<sup>[24]</sup> closeted homosexual people who wish to appear heterosexual,<sup>[66]</sup> or heterosexuals who are experimenting with their sexuality.<sup>[62][67]</sup> Assertions that one cannot be bisexual unless equally sexually attracted to both sexes, however, are disputed by various researchers, who have reported bisexuality to fall on a continuum, like sexuality in general.<sup>[7][27]</sup>

Male bisexuality is particularly presumed to be non-existent,<sup>[64]</sup> with sexual fluidity studies adding to the debate. In 2005, researchers Gerulf Rieger, Meredith L. Chivers, and J. Michael Bailey used penile plethysmography to measure the arousal of self-identified bisexual men to pornography involving only men and pornography involving only women. Participants were recruited via advertisements in gay-oriented magazines and an alternative paper. They found that the self-identified bisexual men in their sample had genital arousal patterns similar to either homosexual or heterosexual men. The authors concluded that "in terms of behavior and identity, bisexual men clearly exist", but that male bisexuality had not been shown to exist with respect to arousal or attraction.<sup>[68]</sup> The assertion of Bailey that "for men arousal is orientation" was criticized by Fairness and Accuracy in Reporting (FAIR) as a simplification which neglects to account for behavior and self-identification.<sup>[69]</sup> Further, some researchers hold that the technique used in the study to measure genital arousal is too crude to capture the richness (erotic sensations, affection, admiration) that constitutes sexual attraction.<sup>[27]</sup> The National Gay and Lesbian Task Force called the study and *The New York Times* coverage of it flawed and biphobic.<sup>[70]</sup>

The American Institute of Bisexuality stated that Bailey's study was misinterpreted and misreported by both *The New York Times* and its critics.<sup>[71]</sup> In 2011, Bailey and other researchers reported that among men with a history of several romantic and sexual relationships with members of both sexes, high levels of sexual arousal were found in response to both male and female sexual imagery.<sup>[72][73]</sup> The subjects were recruited from a Craigslist group for men seeking intimacy with both members of a heterosexual couple. The authors said that this change in recruitment strategy was an important difference, but it may

not have been a representative sample of bisexual-identified men. They concluded that "bisexual-identified men with bisexual arousal patterns do indeed exist", but could not establish whether such a pattern is typical of bisexual-identified men in general.<sup>[73][74]</sup>

Bisexual erasure (or bisexual invisibility) is the tendency to ignore, remove, falsify, or reexplain evidence of bisexuality in culture, history, academia, news media and other primary sources.<sup>[24][61][75]</sup> In its most extreme form, bisexual erasure includes denying that bisexuality exists.<sup>[24][75]</sup> It is often a manifestation of biphobia,<sup>[24][61][75]</sup> although it does not necessarily involve overt antagonism.

There is increasing inclusion and visibility of bisexuals, particularly in the LGBT community.<sup>[76][77]</sup> American psychologist Beth Firestone writes that since she wrote her first book on bisexuality, in 1996, "bisexuality has gained visibility, although progress is uneven and awareness of bisexuality is still minimal or absent in many of the more remote regions of our country and internationally."<sup>[78]</sup>

## Symbols

A common symbol of the bisexual community is the bisexual pride flag, which has a deep pink stripe at the top for homosexuality, a blue one on the bottom for heterosexuality, and a purple one, blended from the pink and blue, in the middle to represent bisexuality.<sup>[79]</sup>

Another symbol with the same color scheme is a pair of overlapping pink and blue triangles, the pink triangle being a well-known symbol for the homosexual community, forming purple where they intersect.<sup>[80]</sup>

Many homosexual and bisexual individuals have a problem with the use of the pink triangle symbol, as it was the symbol that Hitler's regime use to tag and persecute homosexuals (similar to the yellow Star of David constituted of two opposed, overlapping triangles). Therefore, a double moon symbol was devised specifically to avoid the use of triangles.<sup>[81]</sup> The double moon symbol is common in Germany and surrounding countries.<sup>[81]</sup> Another symbol used for bisexuality is a purple diamond, conceptually derived from the intersection of two triangles, pink and blue (respectively), placed overlapping.

## Within BDSM

In Steve Lenius' original 2001 paper, he explored the acceptance of bisexuality in a supposedly pansexual BDSM community. The reasoning behind this is that 'coming-out' had become primarily the territory of the gay and lesbian, with bisexuals feeling the push to be one or the other (and being right only half the time either way). What he found in 2001, was that people in BDSM were open to discussion about the topic of bisexuality and pansexuality and all controversies they bring to the table, but personal biases and issues stood in the way of actively using such labels. A decade

The bisexual pride flag.

The overlapping triangles

The double moon

later, Lenius (2011) looked back on his study and considered if anything has changed. He concluded that the standing of bisexuals in the BDSM and kink community was unchanged, and believed that positive shifts in attitude were moderated by society's changing views towards different sexualities and orientations. But Lenius (2011) does emphasize that the pansexual promoting BDSM community helped advance greater acceptance of alternative sexualities.<sup>[82][83]</sup>

Brandy Lin Simula (2012), on the other hand, argues that BDSM actively resists gender conforming and identified three different types of BDSM bisexuality: gender-switching, gender-based styles (taking on a different gendered style depending on gender of partner when playing), and rejection of gender (resisting the idea that gender matters in their play partners). Simula (2012) explains that practitioners of BDSM routinely challenge our concepts of sexuality by pushing the limits on pre-existing ideas of sexual orientation and gender norms. For some, BDSM and kink provides a platform in creating identities that are fluid, ever-changing.<sup>[84]</sup>

## Within feminism

Feminist positions on bisexuality range greatly, from acceptance of bisexuality as a feminist issue to rejection of bisexuality as reactionary and anti-feminist backlash to lesbian feminism.<sup>[85]</sup> A number of women who were at one time involved in lesbian-feminist activism have since come out as bisexual after realizing their attractions to men. A widely studied example of lesbian-bisexual conflict within feminism was the Northampton Pride March during the years between 1989 and 1993, where many feminists involved debated over whether bisexuals should be included and whether or not bisexuality was compatible with feminism.

Common lesbian-feminist critiques leveled at bisexuality were that bisexuality was anti-feminist, that bisexuality was a form of false consciousness, and that bisexual women who pursue relationships with men were "deluded and desperate." Tensions between bisexual feminists and lesbian feminists have eased since the 1990s, as bisexual women have become more accepted within the feminist community,<sup>[86]</sup> but some lesbian feminists such as Julie Bindel are still critical of bisexuality. Bindel has described female bisexuality as a "fashionable trend" being promoted due to "sexual hedonism" and broached the question of whether bisexuality even exists.<sup>[87]</sup> She has also made tongue-in-cheek comparisons of bisexuals to cat fanciers and devil worshippers.<sup>[88]</sup> Sheila Jeffreys writes in *The Lesbian Heresy* that while many feminists are comfortable working alongside gay men, they are uncomfortable interacting with bisexual men. Jeffreys states that while gay men are unlikely to sexually harass women, bisexual men are just as likely to be bothersome to women as heterosexual men.<sup>[89]</sup>

Donna Haraway was the inspiration and genesis for cyberfeminism with her 1985 essay "A Cyborg Manifesto: Science, Technology, and Socialist-Feminism in the Late Twentieth Century" which was reprinted in *Simians, Cyborgs and Women: The Reinvention of Nature* (1991). Haraway's essay states that the cyborg "has no truck with bisexuality, pre-oedipal symbiosis, unalienated labor, or other seductions to organic wholeness through a final appropriation of all powers of the parts into a higher unity."<sup>[90]</sup> However, *Cyberfeminism and Bisexuality* by Jane Cyborg, a short essay published as a book in 2015, states, "Cyborgs can be bisexual, and cyberfeminism can and should be accepting of bisexuality."<sup>[91]</sup>

A bisexual woman filed a lawsuit against the magazine *Common Lives/Lesbian Lives*, alleging discrimination against bisexuals when her submission was not published.<sup>[92]</sup>

## History

*Shudo* (Japanese pederasty): a young male entertains an older male lover, covering his eyes while surreptitiously kissing a female servant.

Ancient Greeks and Romans did not associate sexual relations with binary labels, as modern Western society does. Men who had male lovers were not identified as homosexual, and may have had wives or other female lovers.

Ancient Greek religious texts,

reflecting cultural practices, incorporated bisexual themes. The

subtexts varied, from the mystical to the didactic.<sup>[93]</sup> Spartans thought that love and erotic relationships between experienced and novice soldiers would solidify combat loyalty and unit cohesion, and encourage heroic tactics as men vied to impress their lovers. Once the younger soldiers reached maturity, the relationship was supposed to become non-sexual, but it is not clear how strictly this was followed. There was some stigma attached to young men who continued their relationships with their mentors into adulthood.<sup>[93]</sup> For example, Aristophanes calls them *euryprōktoi*, meaning "wide arses", and depicts them like women.<sup>[93]</sup>

Similarly, in ancient Rome, gender did not determine whether a sexual partner was acceptable, as long as a man's enjoyment did not encroach on another's man integrity. It was expected and socially acceptable for a freeborn Roman man to want sex with both female and male partners, as long as he took the penetrative role.<sup>[94]</sup> The morality of the behavior depended on the social standing of the partner, not gender *per se*. Both women and young men were considered normal objects of desire, but outside marriage a man was supposed to act on his desires only with slaves, prostitutes (who were often slaves), and the *infames*. It was immoral to have sex with another freeborn man's wife, his marriageable daughter, his underage son, or with the man himself; sexual use of another man's slave was subject to the owner's permission. Lack of self-control, including in managing one's sex life, indicated that a man was incapable of governing others; too much indulgence in "low sensual pleasure" threatened to erode the elite male's identity as a cultured person.<sup>[95]</sup>

## Media

Young man and teenager engaging in intercrural sex, fragment of a black-figure Attic cup, 550 BC–525 BC, Louvre.

Bisexuality tends to be associated with negative media portrayals; references are sometimes made to stereotypes or mental disorders. In an article regarding the 2005 film *Brokeback Mountain*, sex educator Amy Andre argued that in films, bisexuals are often depicted negatively:<sup>[96]</sup>

I like movies where bisexuals come out to each other together and fall in love, because these tend to be so few and far between; the most recent example would be 2002's lovely romantic comedy, *Kissing Jessica Stein*. Most movies with bi characters paint a stereotypical picture.... The bi love interest is usually deceptive (*Mulholland Drive*), over-sexed (*Sex Monster*), unfaithful (*High Art*), and fickle (*Three of Hearts*), and might even be a serial killer, like Sharon Stone in *Basic Instinct*. In other words, the bisexual is always the cause of the conflict in the film.

— Amy Andre, *American Sexuality Magazine*

Using a content analysis of more than 170 articles written between 2001 and 2006, sociologist Richard N. Pitt, Jr. concluded that the media pathologized black bisexual men's behavior while either ignoring or sympathizing with white bisexual men's similar actions. He argued that the black bisexual is often described as a *duplicitous heterosexual* man spreading the HIV/AIDS virus. Alternatively, the "Brokeback" white bisexual is often described in pitying language as a *victimized homosexual* man forced into the closet by the heterosexist society around him.<sup>[97]</sup>

## Film

In 1914 the first documented appearance of bisexual characters (female and male) in an American motion picture occurred in *A Florida Enchantment*, by Sidney Drew.<sup>[99]</sup> However, due to the censorship legally required by the Hays Code, the word bisexual could not be mentioned and almost no bisexual characters appeared in American film from 1934 until 1968.<sup>[99]</sup>

Notable portrayals of bisexuality can be found throughout mainstream media in movies such as *Black Swan*, *Frida*, *Showgirls*, *The Pillow Book*, *Alexander*, *The Rocky Horror Picture Show*, *Henry and June*, *Chasing Amy*, *Velvet Goldmine*, *Kissing Jessica Stein*, *The Fourth Man*, *Basic Instinct*, *Mulholland Drive*, *Sunday Bloody Sunday*, *Something for Everyone*, *The Rules of Attraction*, and *Brokeback Mountain*.

## Literature

Virginia Woolf's *Orlando: A Biography* (1928) is an early example of bisexuality in literature. The story, of a man who changes into a woman without a second thought, was based on the life of Woolf's lover Vita Sackville-West. Woolf used the gender switch to avoid the book being banned for homosexual content. The pronouns switch from male to female as Orlando's gender changes. Woolf's lack of definite pronouns

Angelina Jolie is an openly bisexual American actress.<sup>[98]</sup>

allows for ambiguity and lack of emphasis on gender labels.<sup>[100]</sup> Her 1925 book *Mrs Dalloway* focused on a bisexual man and a bisexual woman in sexually unfulfilled heterosexual marriages in later life. Following Sackille-West's death, her son Nigel Nicolson published *Portrait of a Marriage*, one of her diaries recounting her affair with a woman during her marriage to Harold Nicolson. Other early examples include works of D.H. Lawrence, such as *Women in Love* (1920), and Colette's *Claudine* (1900–1903) series.

The main character in Patrick White's novel, *The Twyborn Affair* (1979), is bisexual. Contemporary novelist Bret Easton Ellis' novels, such as *Less Than Zero* (1985) and *The Rules of Attraction* (1987) frequently feature bisexual male characters; this "casual approach" to bisexual characters recurs throughout Ellis' work.<sup>[101]</sup>

## Music

Rock musician David Bowie famously declared himself bisexual in an interview with *Melody Maker* in January 1972, a move coinciding with the first shots in his campaign for stardom as Ziggy Stardust.<sup>[102]</sup> In a September 1976 interview with *Playboy*, Bowie said, "It's true—I am a bisexual. But I can't deny that I've used that fact very well. I suppose it's the best thing that ever happened to me."<sup>[103]</sup> In a 1983 interview, he said it was "the biggest mistake I ever made",<sup>[104][105]</sup> elaborating in 2002 he explained "I don't think it was a mistake in Europe, but it was a lot tougher in America. I had no problem with people knowing I was bisexual. But I had no inclination to hold any banners or be a representative of any group of people. I knew what I wanted to be, which was a songwriter and a performer [...] America is a very puritanical place, and I think it stood in the way of so much I wanted to do."<sup>[106]</sup>

In 1995, Jill Sobule sang about bi-curiosity in her song "I Kissed a Girl", with a video that alternated images of Sobule and a boyfriend along with images of her with a girlfriend. Another song with the same name by Katy Perry also hints at the same theme. Some activists suggest the song merely reinforces the stereotype of bisexuals experimenting and of bisexuality not being a real sexual preference. Lady Gaga has also stated that she is bisexual,<sup>[107]</sup> and has acknowledged that her song "Poker Face" is about fantasizing about a woman while being with a man.<sup>[108]</sup>

Ric Ocasek of The Cars said that he was bisexual in an interview in 1986, stating, "I like beautiful women. Tall, thin, beautiful women. Fat little ugly women. I like all kinds of women. I'm always attracted to the opposite sex. I'm attracted to both sexes, actually. But not only beautiful men -- I think I like weird men."<sup>[109]</sup> Brian Molko, lead singer of Placebo is openly bisexual.<sup>[110]</sup> Green Day frontman Billie Joe Armstrong has also identified himself as bisexual, saying in a 1995 interview with *The Advocate*, "I think I've always been bisexual. I mean, it's something that I've always been interested in. I think people are born bisexual, and it's just that our parents and society kind of veer us off into this feeling of 'Oh, I can't.' They say it's taboo. It's ingrained in our heads that it's bad, when it's not bad at all. It's a very beautiful thing."<sup>[111]</sup> In 2014 Armstrong discussed songs such as "Coming Clean" stating, "It was a song about questioning myself. There are these other feelings you may have about the same sex, the opposite sex, especially being in Berkeley and San Francisco then. People are acting out what they're

feeling: gay, bisexual, transgender, whatever. And that opens up something in society that becomes more acceptable. Now we have gay marriage becoming recognized... I think it's a process of discovery. I was willing to try anything."<sup>[112]</sup>

## Television

In the Netflix original series *Orange Is the New Black* the main character, Piper Chapman, played by actress Taylor Schilling, is a bisexual female inmate who is shown having relationships with both men and women. In season one, before entering the prison, Piper is engaged to male fiance, Larry Bloom, played by actor Jason Biggs. Then, upon entering the prison, she reconnects with former lover (and fellow inmate), Alex Vause, played by Laura Prepon.<sup>[113][114]</sup> Another character who is portrayed as bisexual in the show is an inmate named Lorna Morello, played by actress Yael Stone. She has an intimate relationship with fellow inmate Nicky Nichols, played by Natasha Lyonne, while still yearning for her male "fiance", Christopher MacLaren, played by Stephen O'Reilly.<sup>[115]</sup>

The FOX television series *House* features a bisexual female doctor, Remy "Thirteen" Hadley, played by Olivia Wilde, from season four onwards. The same network had earlier aired the television series *The O.C.*, which for a time featured bisexual Alex Kelly (also played by Olivia Wilde), the local rebellious hangout spot's manager, as a love interest of Marissa Cooper.<sup>[116]</sup> In the HBO drama *Oz*, Chris Keller was a bisexual serial killer who tortured and raped various men and women. Other films in which bisexual characters conceal murderous neuroses include *Black Widow*, *Blue Velvet*, *Cruising*, *Single White Female*, and *Girl, Interrupted*.

Beginning with the 2009 season, MTV's *The Real World* series featured two bisexual characters,<sup>[117]</sup> Emily Schromm,<sup>[118]</sup> and Mike Manning.<sup>[119]</sup>

The Showcase supernatural crime drama, *Lost Girl*, about creatures called Fae who live secretly among humans, features a bisexual protagonist, Bo,<sup>[120]</sup> played by Anna Silk. In the story arc she is involved in a love triangle between Dyson, a wolf-shapeshifter (played by Kris Holden-Ried), and Lauren Lewis,<sup>[121]</sup> a human doctor (played by Zoie Palmer) in servitude to the leader of the Light Fae clan.

In the BBC TV science fiction show *Torchwood*, several of the main characters appear to have fluid sexuality. Most prominent among these is Captain Jack Harkness, a pansexual who is the lead character and an otherwise conventional science fiction action hero. Within the logic of the show, where characters can also interact with alien species, producers sometimes use the term "omnisexual" to describe him.<sup>[122]</sup> Jack's ex, Captain John Hart is also bisexual.<sup>[123]</sup> Of his female exes, significantly at least one ex-wife and at least one woman with whom he has had a child have been indicated. Some critics draw the conclusion that the series more often shows Jack with men than women.<sup>[124]</sup> Creator Russell T Davies says one of pitfalls of writing a bisexual character is you "fall into the trap" of "only having them sleep with men" He describes of the show's fourth series, "You'll see the full range of his appetites, in a really properly done way."<sup>[125]</sup> The preoccupation with bisexuality has been seen by critics as complementary to other aspects of the show's themes. For heterosexual character Gwen Cooper, for whom Jack harbors romantic feelings, the new experiences she confronts at Torchwood, in the form of "affairs and homosexuality and the threat of death", connote not only the Other but a "missing side" to

the Self.<sup>[126]</sup> Under the influence of an alien pheromone, Gwen kisses a woman in Episode 2 of the series. In Episode 1, heterosexual Owen Harper kisses a man to escape a fight when he is about to take the man's girlfriend. Quiet Toshiko Sato is in love with Owen, but has also has brief romantic relationships with a female alien and a male human. British newspaper *The Sun* ran the headline "Dr Ooh gets four gay pals" prior to the first series, describing all of *Torchwood*'s cast as being bisexual.<sup>[127]</sup>

## Webseries

In October 2009, "A Rose By Any Other Name"<sup>[128]</sup> was released as a "webisode" series on YouTube. Directed by bisexual rights advocate Kyle Schickner,<sup>[129]</sup> the plot centers around a lesbian-identified woman who falls in love with a straight man and discovers she is actually bisexual.<sup>[130]</sup>

## Among other animals

Many non-human animal species exhibit bisexual behavior.<sup>[9][10][11]</sup> Examples of mammals that display such behavior include the bonobo (formerly known as the pygmy chimpanzee), orca, and the bottlenose dolphin.<sup>[9][10][11][131]</sup> Examples of birds include some species of gulls and Humboldt penguins. Other examples of bisexual behavior occur among fish and flatworms.<sup>[131]</sup>

Many species of animals are involved in the acts of forming sexual and non-sexual relationship bonds between the same sex; even when offered the opportunity to breed with members of the opposite sex, they pick the same sex. Some of these species are gazelles, antelope, bison, and sage grouse.<sup>[132]</sup>

In some cases, animals will choose to engage in sexual activity with different sexes at different times in their lives, and will sometimes engage in sexual activity with different sexes at random. Same-sex sexual activity can also be seasonal in some animals, like male walruses who often engage in same-sex sexual activity with each other outside of the breeding season and will revert to heterosexual sexual activity during breeding season.<sup>[132]</sup>
