1. Introduction

Udo Bade & Keith Lewin

As a follow-up to the World Conference on Education for All in 1990 several countries in southern and eastern Africa started analysing and revising their examination systems with the ultimate aim of improving the quality of teaching/learning. Examinations in countries of the region are a well established feature of the educational systems reaching back to colonial days. The achievements of pupils during the primary school cycle are in most cases tested in end-of-cycle examinations, whereby the performance of a pupil is tested in comparison with other pupils sitting the examination (norm-referenced tests). Such assessment procedures do not provide the full picture and fail to deliver sufficient information about the success of an education system in imparting those skills and competencies as laid down in the curricula.[1] In order to find out how proficient a pupil is in a particular subject, concept or skill without referring to other norm groups of pupils a different approach is required. This may have several elements which include greater use of school based assessment, evaluation of project work and techniques of continuous assessment. It may also seek to define competencies in terms of criterion statements against which performance can be judged. Criterion-referenced assessment is attractive since it sets standards that do not depend on the performance of other pupils and should provide reliable data on what has been achieved during the primary school years. Some countries in the region e.g. Botswana and Swaziland are already experimenting with this kind of approach to assessment.

[1] See Kellaghan, Th. & Greaney, V. (1992) Using Examinations to Improve Education. A Study in Fourteen African Countries. World Bank Technical Paper No. 165. The World Bank, Washington D.C.

Applying more comprehensive concepts of assessment is a significant step towards the improvement of the quality of teaching and learning. National examination systems are mostly designed to judge the individual pupil's achievements for selection purposes and to deliver comparative information about the performance of individual schools and regions. They are often an unreliable guide to actual levels of achievement.

Three aspects have to be taken into consideration when constructing most forms of assessment instruments:

(1) the validity of assessment instruments (do they measure what they claim to be measuring? do they predict future performance adequately if they are to be used for selection?);

(2) their reliability (do they work a consistent measure of performance which could be repeated with similar results? are measurement errors reduced to acceptable levels?);

(3) their technical efficiency (is the system secure, cost-effective, or as appropriate time scale, free of bias towards or against different groups of candidates?).

For most pupils in the region primary education ends after seven to eight years with a national examination. The more selective such examinations are the greater is the attention and importance given by society, because the results of such annual exercises determine significantly the future of many children and the hopes and ambitions of many parents for their offspring.[2] The outcome of the examinations also have severe repercussions on the schools on learning and teaching methods, and on the teachers' role in local communities and within the education system (see box:»Vihiga plan«is the way out/Fortunes change for Kikuyu).

COMMENT

'Vihiga plan' is the way out

PARENTS in Sabatia Division of Vihiga District have embarked on an ambitious programme to improve education standards in the area.

Part of the master-plan lies in setting up an in-service training centre for secondary and primary school teachers and their deputies. Those who attended the leaders' meeting on how to improve education in the area made proposals of providing lunch to all examination classes in future.

However, whereas there is no so much novelty in advocating for managerial skills for headteachers, or even starting schools' feeding programme, it is important that parents are ready to initiate the scheme on a harambee basis.

Going by the results of the last year's Kenya Certificate of Primary Education (KCPE), one can just understand the urgency of having efforts to improve education in Vihiga. Out of 56 districts and municipalities, Vihiga was number 41.

By all standards, those results were not rosy, but perhaps the most important aspect is that parents are prepared to reverse the situation.

But even then, they are throwing a big challenge to the Ministry of Education and the Teachers Service Commission (TSC) whose responsibility is train and appoint of headteachers.

In the past, appointment of headteachers in both primary and secondary schools has been done in total disregard of experience and competence of headteachers and their deputies. Poor supervision of schools added to the problem.

As the leaders' meeting at Vokoli Girls Secondary School noted, there is paucity in supervision of headteachers, who more often become their own masters and oppressors of parents and other people who refuse to toe the line, or who question their decisions.

It is also important for the Ministry of Education to acknowledge community based programmes, and support them.

Fortunes change for Kikuyu

By STEPHEN [illegible]

The performance of the Kenya Certificate of Education has greatly improved in Kikuyu Division, according to the local education officer, Alan [illegible].

He said the division which used to attain last position in the district was number [illegible].

Kikuyu came third after Lari and Githunguri in last years KCPE results.

Addressing a prize-giving ceremony at Kikuyu Township Primary School recently, the officer [illegible] teachers, pupils and parents to work harder to get better results.

The remarking of [illegible] Gitau Primary School KCPE papers elevated it up from 110th to fourth position with a mean score of 420 marks in the district's 100 schools.

The Zonal Inspector of Schools, Mr James [illegible] and the Teachers Advisory Centre (TAC) tutor, Mrs Magdalene Kiambuthi, praised teachers for their work which had enabled [illegible] to produce six of the top 10 schools and also six of the top 10 pupils in the district.

Kabete produced the best candidate in [illegible] from Mabia-ini Primary School.

Daily Nation 07/3/95

Tuesday, February 28, 1995

Despite the great attention paid to matters of testing and examining at the end of primary education, the examination results rarely provide sufficient information on the effectiveness of the educational system to make confident judgements on educational quality and learning problems. If we are interested in influencing the teaching-learning process in the classroom positively we may have to start with improvements in the ways pupils are assessed. This can indicate what is not being understood and assimilated, and can point the way to strategies to improve levels of achievement.

Any assessment system provides opportunities for teachers, pupils, and educators (e.g. curriculum developers, examination-/testing specialists) to monitor progress and learn from failures as well as successes. However, if large parts of examinations consist mainly of straightforward recall questions where pupils are simply asked to reproduce from memory, opportunities for a more comprehensive assessment of learning outcomes are lost and much teaching will follow objectives narrowly defined by a restricted range of questions. The mere recollection of facts or names does not give any hint of the pupil's problem-solving skills, often so strongly emphasized in the primary school curricula as essential outcomes of learning.

Repetition of whole sections from textbooks fails to indicate whether learners are able to apply their knowledge and skills to different situations. Poorly constructed multiple-choice tests leave much space for guess work and may encourage rote learning. They need to be replaced by a broader concept of assessment testing more complex cognitive processes. Consequently, the first step in a reform of conventional examinations is to analyse existing tests in terms of whether and to what extent they contain items requiring higher-order thinking and application. The next step is to develop or improve test items which examine pupils' abilities to apply what they have learned to less familiar situations and problems or which require them to link events or facts to each other in a consistent way.

The development and design of test items is mainly the domain of examination specialists and/or curriculum developers. The work of all those involved in examinations should, but often does not, include a strong research component in order to find out what kind of assessment procedures deliver the most valid and reliable results efficiently and have the greatest positive influences on classroom teaching. Educationists responsible for the design and analysis of national examinations in eastern and southern Africa are trying hard to improve their assessment systems and to answer the challenges of new ideas and requirements.[3] During recent years new subjects were added to previous core subjects, i.e. like Languages and Mathematics. In many primary school systems History, Geography and Civics or Social Studies have been included, along with science based subjects like Science, Agriculture, Environmental Science, Home Economics. Most or all now feature in the national examinations. Writing meaningful tests for the more practical subjects which go beyond recalling facts requires familiarity and experience with the respective school curriculum as well as with the possibilities and limitations of different types of assessment. Often the demanding curriculum objectives of subjects like Science or Agriculture are not easily tested in an appropriate way. Developing test items assessing pupils' understanding and application of knowledge and skills to new situations require sophistication in constructing assessment instruments even where testing is restricted to multiple-choice questions for reasons of cost and administrative feasibility.

[3] See Njabili, Agnes F. (1993) Public Examination: A Tool for Curriculum Evaluation. Mture Publishers, Dar-es-Salaam.

Education experts responsible for revising national examinations to improve the quality of education can learn from the approaches adopted to reform in different countries in the region, particularly in the following areas:

→ widening the range of skills tested and the instruments used;

→ redesigning examination items to include more which test skills of higher-order thinking;

→ gradually shifting the basis of testing from a norm-referenced to a more criterion-referenced system (measuring pupils' success or failure in relation to criteria which represent competencies independent of the performance of other pupils);

→ considering the possibilities for introducing continuous assessment alongside or instead of terminal examinations, and

→ using pupils' records and profiles which can reflect the acquisition of demonstrated competencies of a wider range of different types than can conventional examinations.

One country in the eastern and southern African region has over many years spearheaded new developments in using national examinations for monitoring and meaningful assessment purposes. Kenya started reforming primary education examination in 1974 with the declared aims of making the examination more relevant, improving the quality of education and ensuring greater equity in the access to secondary schools. Two major strategies for reform were employed; changing the content of the examination papers, and introducing an information-feedback system.»It was hoped that changes in the questions set would make the CPE more relevant as a leaving examination, more equitable to pupils in less-privileged socioeconomic groups, and more reliable as a selection instrument. The introduction of an information-feedback system would, it was hoped, do something to improve the overall quality of the primary school system and to reduce quality differences between high performing and low performing schools.«[4]

[4] Somerset, Anthony (1988) Examinations as an Instrument to Improve Pedagogy. In: Heyneman, Stephen P. & Fägerlind, Ingemar (eds.) University Examinations and Standardized Testing - Principles, Experiences and Policy Options. World Bank Technical Paper No. 78, Washington DC, pp. 171-194, p. 174.

The experience and expertise developed in Kenya over nearly twenty years is therefore very relevant to the present discussion on revising national examination systems in other countries of the region. The Kenya Certificate of Primary Education can serve as an example of possibilities and as entry point to become acquainted with assessment techniques at the end of primary school in the subjects SCIENCE and AGRICULTURE, and for monitoring primary schools in general.

The success of the reform of the primary school examination system has not been achieved without problems. Over the years Kenya has become more and more»exam-ridden«. The results of primary or secondary school examinations receive more and more public attention. Even to the extent that candidates' results are announced over public radio! Regions and school districts compete vigorously to top the lists in the national examinations, very often to the disadvantage of pupils who are unlikely to score highly and those who succeed but do so as a result of long hours of repetitive 'cramming'. The incentives to cheat and find illegal means to pass the test have also created many problems. Heavy emphasis on examinations leads to a neglect of the broader pedagogical tasks of the schools. The school curriculum may be only taught according to the importance of examination subjects and other aspects of the national examination ignored. The»examination tail is wagging the curriculum dog«! John Keeves reminds us of the real purpose of national examinations,»There is little doubt that a national examination has a substantial influence on the teaching that occurs in schools not only during the year at the end of which the examination is held, but in all years that have gone before... it is important that the examinations should have beneficial effects on the teaching and learning that takes place at all earlier stages of schooling«.[5]

[5] Keeves, John P. (1994) National examinations: design, procedures and reporting. UNESCO: IIEP, Paris, p. 98.

The design and conduct of national examinations is therefore not an affair of one group of specialists alone. Examination specialists, curriculum developers, psychometrists and teachers have to cooperate to maximize the beneficial influence of the examinations on practical teaching and avoid excessive testing and examination preparations in the schools. Despite all good intentions on behalf of those setting the national examinations it seems to be extremely difficult to prevent examination»fever«once such examinations have gained too much importance in society as the means through which credentials are obtained, promotion through the school system rationed, and jobs in the labour market allocated.

The manual on IMPROVING TEST DESIGN tries to assist those educationists who are responsible for the design, conduct and control of national examinations in developing higher quality assessment instruments which can provide better information on pupil achievement, a fairer basis for selection, and influence learning and teaching to improve educational quality. It can also be used as a kind of source for training those assisting in the development or processing of examinations. The manual consists of two parts:

Volume 1: Constructing Test Instruments, Analysing Results and Improving Assessment Quality in Primary Schools in Africa,
Volume 2: Assessment of Science and Agriculture in Primary Schools in Africa; 12 Country Cases Reviewed.

Both volumes are the result of two pilot training workshops in Kenya dealing with the development of test items for Science, Agriculture, and Environmental Science and the use of national examinations for improving the quality of primary education. These workshops were jointly organised and conducted by the German Foundation for International Development (DSE), Education, Science and Documentation Centre, and the Kenya Institute of Education (KIE) in cooperation with the Kenya National Examinations Council. Participants came from different countries in eastern and southern Africa. Each country invited was asked to nominate one curriculum developer and one examination specialist, thus guaranteeing that the curriculum aspects for Science, Agriculture, Environmental Science were equally considered with the examination requirements.

Volume one deals with the practical aspects of test construction, analysis and the improvement of assessment procedures. In addition Prof. Keith Lewin (University of Sussex) takes up some of the theoretical aspects, especially the possibilities and limitations of criterion-referenced assessment and test development in general. The practical exercise on developing and administering tests draws to a large extent on the experiences with assignments carried out during the second training workshop in Kenya, where participants designed test items, conducted tests in primary schools and analysed the test results in groups. The experiences of twenty years of examination reform are presented in two analyses authored by education specialists from the Kenya National Examinations Council and the Kenya Institute of Education. Finally, abstracts and papers are documented indicating the discussion and direction of examinations and test constructions in eastern and southern Africa.

Volume two starts with an account and analysis of the present situation regarding primary school leaving examinations of countries in the region. Detailed information for each country is provided in a tabulated overview illustrated by original examination papers in Science, Agriculture and Environmental Science mainly from 1993 and 1994. In few countries Science and Agriculture feature only as part of a larger»General Paper«. In these cases the items covering Science or Agriculture have been included in the documentation. South Africa and Namibia are also included, although presently they have not yet started end-of-primary examinations, but discussions on the composition and design of examinations are in progress. Furthermore, examples of follow-up communications after the examinations from different countries are presented.

2. Theoretical and Practical Aspects of Item Construction for Primary Science Subjects

2.1. Criterion-Referenced Assessment - Panacea or Palliative?

Keith Lewin

Assessment stands at the heart of effective school systems. Without an adequate system of assessment selection will be difficult to legitimate, certification will carry a wide range of meanings, monitoring of school performance will be difficult, and diagnosis and remediation of learning problems will be haphazard. Approaches to assessment vary. This chapter addresses some issues concerned with the long running debate about the relative virtues of norm- and criterion-referenced approaches to assessment and examination.

Many developing countries inherited public examination systems that were essentially norm-referenced. Since the primary purpose of the majority of these examinations was and is the selection of pupils to higher levels of education this is not surprising. Much recent thinking has tended to stress the value of criterion-referencing approaches to both public- and school-based assessment. In these achievement is measured against levels of performance defined by statements of attainment, rather than graded in ways which depend on the performance of other candidates.

One example of these trends is provided by the aftermath of the World Conference on Education for All at Jomtien. This was different from the Universal Primary Education (UPE) initiatives that preceded it in the 1960s (e.g. the Addis Ababa conference). For the first time the declaration included a concern for levels of achievement alongside renewed ambitions to universalise enrolments over the basic education cycle. The implication was that most national systems needed to develop their own country-based definitions of acceptable levels of achievement in different curriculum areas. An important inference was that more stress on criterion-referenced approaches to assessment would assist this process.

This chapter is in three parts. The first part discusses recent thinking on criterion-referenced assessment and raises a number of issues concerned with the advantages and disadvantages of the approach. The second part illustrates some of the dilemmas that may arise by presenting brief case studies of recent developments in the UK and in Mauritius both of which have attempted to link public assessment with criteria for attainment. The last part addresses some issues concerned with the effects of examination practices on internal efficiency with a special concern with repetition rates.

Issues in Criterion-Referencing

Context and Definitions

Discussion of norm-referenced and criterion-referenced testing has a long history. The first mention of approaches to assessment which appear to be criterion-referenced can be traced back into the nineteenth century though it was not until the 1960s that the term was first widely used and an extensive professional literature began to develop. The modern origin of criterion-referenced testing probably lies in the experiences of the U.S. military in 1939-45 in training personnel as operatives of new equipment.»Criterion performance requirements«(Miller 1962)[1] came to specify outcomes and define training experiences. Significantly, most of the tasks to which the approach was applied were closed-ended and often single-event orientated (see below).

[1] For further references see 2.4. Bibliography.

The first wave of emphasis on criterion-referencing techniques in the curriculum development literature was concerned with the use and abuse of behavioural objectives in providing a basis for systematic curriculum development and in defining a framework for teaching and the assessment of learning outcomes. Most recently the growth of various types of vocational provision in many countries has led to increased emphasis on competency-based approaches to training which have been seen as especially suited to criterion-referenced assessment. In a way this echoes the earliest developments of criterion-referencing in relation to military training. Increased stress on criterion-referencing may also reflect the pressures on many education systems to be seen to be publicly accountable in performance terms, and to respond explicitly to demands for increased quality and relevance. Criterion-referencing seems to offer a method to satisfy these developments.

The simplest definitions of norm- and criterion-referenced tests distinguish between tests which are designed to compare the performance of individual students with that of other students, and those which assess performance against a criterion independent of the performance of others. This sounds a simple and powerful distinction. A moments thought indicates that things are not so simple.

In fact, this common kind of definition does not identify two different types of test very effectively; criterion-referenced test items may look very similar to norm-referenced items. If there is a useful distinction it is more concerned with differences in the interpretation of performance on test items than in the nature of the items themselves.

We should note that tests constructed to produce norm-referenced outcomes can be regarded as criterion-referenced - the selection of particular items creates the criteria.

Similarly, criterion-referenced instruments can be used to rank candidates and compare their performance and may therefore be treated as norm-referenced instruments. In either case it can be argued that the validity, reliability, and suitability to purpose of a test may suffer if it is designed for one purpose and used for another. However the point stands that it is the use made of results, rather than the nature of items that most clearly distinguishes between test types.

The reality is that it is often difficult to find examples of either type of examining which do not contain some elements of the other. For example, public school examinations are often considered to be norm-referenced tests with a certain proportion of candidates placed in each grade, year after year, identified from scores standardised onto a normal distribution. Analysis of results over time often produces patterns inconsistent with true norm-referencing. In principle the proportions of candidates achieving each grade should remain constant from year to year. In practice it is not uncommon to observe that greater proportions of higher grades are awarded if time series data is analysed for some public examinations. Where this is the case the strict assumptions of norm-referencing are broken. It is often thought reasonable to suggest that if actual levels of achievement are judged to be increasing greater proportions should get higher grades. But this argument admits the influence of an underlying attachment to a standard of achievement independent of the population taking the test, which is a kind of criterion. Pass rates between subjects may differ significantly. In a norm-referenced system it is not obvious why this should be. The most obvious explanation is that there is a sense in which different standards are being applied to different subjects.

As noted above the items that are selected for a norm-referenced test can be regarded as defining criteria against which performance is being assessed. Each will be drawn from a notional set of similar items designed to assess similar outcomes. It is difficult to argue against the view that many tests that claim to be designed within norm-referenced assumptions adhere implicitly to judgement of standards which link performance to that in previous years (a historical criterion-reference point) and to the judgements of experts concerning acceptable expectations of levels of performance defined by competence in the subject area. They thus manifest some characteristics of criterion-referencing.

Performance on criterion-referenced tests is supposed to be defined independently of the performance of others. It is also often linked to the concept of mastery, which is a quality defined dichotomously - either it is possessed or it is not. Successful performance against a criterion is judged to indicate acquisition of knowledge and skills and readiness for subsequent learning. But few real school tests appear to be tests of mastery which simply assess performance against a criterion in terms of success and failure. This is because it is often not possible to define a criterion with sufficient precision to decide unambiguously whether or not it has been achieved. Judgement intervenes and is often influenced by what are thought to be reasonable expectations of performance at a given level with a given group of candidates - a norm-referenced consideration. Moreover, it is unusual to have criterion-referenced assessments that have no gradation in performance beyond an indication of whether or not a particular criterion has been achieved. More often information is provided and sought on the extent to which performance against a criterion may have failed or succeeded. Grades of performance begin to appear on scales. Though there may be fixed points defined by criterion, interpolation may be norm-referenced. Even the fixed points may be defined more by the proportions of candidates they identify than by absolute levels of achievement which is again a process with a norm-referenced flavour.

The distinction between norm- and criterion-referenced testing is therefore blurred and dogmatic approaches to differentiating between the two have not proved particularly helpful. A less rigid approach, which recognises that the approaches are not in opposition, but inextricably linked in practice, can offer useful insights and suggest new procedures.

The rest of this chapter explores some of the key issues related to developing and using assessments that have a criterion-referenced flavour though they may have hints of a norm-referenced pedigree.

The Origins of Criteria

Much is written about the specification of criteria and surprisingly little about from where criteria originate. This is surprising since it is hardly a trivial issue. A first analysis suggests that there are a number of possibilities which include:

- expectations of society concerning competent behaviour,
- the logic of a subject area,
- the judgements of practitioners within a field,
- historically determined expectations of achievement,
- politically determined priorities applied to education.

Criteria may be suggested by collective expectations of competent behaviour. Thus there is likely to be an expectation that an electrician can wire a house or a plumber can mend a leaking tap. These kinds of expectations may not be sufficiently precise to define a criterion operationally, but they may have a strong formative influence.

What is commonly believed about the characteristics of competence is easy to adopt when developing criteria which may be applied to certification since it may require little further legitimation. It will be widely understood and accepted.

Another possible source of inspiration is the logic thought to be associated with a subject area of the curriculum. A commitment to an empirical approach to the teaching of Science suggests that the knowledge and skill necessary to design experiments, collect data and interpret results should be the basis for the definition of some appropriate performance criteria. Necessary sequencing of ideas may also indicate both the form and ordering of learning criteria (concepts of mass and volume are necessary to comprehend density).

Those who practise a profession may be identified as the group most likely to be able to define the nature of competent behaviour. Criteria for educating scientists could be derived from the opinions of the community of professional scientists. It may need careful consideration to decide whether such experts really are in a position to determine criteria appropriate for the science education of the majority, who will not become professional scientists.

Criteria identified often stand in a clear relationship to previous practice. It is rare that attempts to develop criterion-referenced assessment completely replace existing expectations of levels and types of achievement. More often they refine and extend them.

Thus attempts to introduce criterion-referenced standards to GCSE (General Certificate of Secondary Education) have been compromised by explicitly linking a reference point to previous GCE standards.

Finally, we should not forget that criterion definition may attract the interest of political process. This may seek to include or exclude particular outcomes and incorporate more or less workable criterion statements. It may happen in Science, though not perhaps as much as in other subjects. Nevertheless, ample examples can be found where this has been a consideration.

Curriculum developers and examiners are missing from this list. This is not because they are marginal to the process. It is to act as a reminder that their most valuable role may be to act as an honest broker between criteria emerging from different sources rather than as another vested interest. Durable criteria will not come only from those charged with the technical task of generating working definitions.

Types of Criterion-Referencing Statements

Criterion-referenced statements can usually be located within domains which define the boundaries within which judgements are to be made about achievement. Black and Dockrell classify domains into a threefold typology - single act, closed and open.

A single act domain»comprises a discrete single phenomenon such as the ability to jump 1.25 metres using the straddle jump, or to recall the valency of oxygen«(Black & Dockrell 1984, p. 52). Outcomes are unambiguous. Their statement is often coincident with the appropriate assessable outcome. They may often be judged educationally trivial since they are so narrowly defined and cannot easily be inter-related. They generally stand as discrete achievements.

Closed domains are those cases where it is possible to specify all possible items that could be used to test the domain. For example, if recall of the names of the planets were to be tested all possible cases would be known, though all might not be used in a test that sampled from the full set. The domain is closed because all instances that define acceptable performance are known and can be defined.

Open domains are the most difficult to specify. They are also the ones most commonly applied to educational rather than training tasks. In these cases it is not possible to identify all possible cases that would indicate that performance within the domain was acquired. For example, if it was desired to test whether a concept like gravitational attraction had been understood, there is no way of defining all the potentially infinite set of cases that could be presented that would illustrate mastery of the idea. Open domain specification is more receptive to outcomes that have an integrative character and/or may be defined at a higher level of generality. The price is increasing ambiguity.

The definition of these three types of domain is complemented by another distinction which is of great significance (Black and Dockrell 1984). **Explicit** domain definition occurs when it is possible to specify a domain in advance of constructing items to test its acquisition. This is most likely to be possible in the case of single act domains where the domain virtually specifies the test item. Most discussion of criterion-referenced test construction assumes explicit domain definition as the first step. Satterly (1989) is one of many who adopt this approach. Though this is conceptually attractive it often proves difficult to define domains operationally without developing both domain statement and exemplars.

Implicit domain definition abandons the notion of pre-determined domain statements in terms of a more emergent process. In this case experienced teachers and examiners develop items which in their judgement distinguish between the performance of candidates. The domain is then defined with reference to these items which are judged to discriminate between candidates that are competent and those who are not. This kind of **instrument defined** domain usually stops short of formal statements that can be scrutinised and compared. It seems to reflect what practitioners often do in developing criterion-referenced instruments. In reality it is the exemplars rather than the domain specification that become definitive.

The Precision of Specification

It is important to consider how precisely criteria can be defined. Throughout the 1960s and 1970s arguments raged about the value of different types of statements of educational objectives. The programmed learning movement in particular attempted to pre-specify every learning outcome on the way to more general educational goals. These attempts to define the outcomes of learning more and more precisely became entwined with the development of criterion-referencing. Familiar Tyler-style objectives (specified in terms of behaviour and content) were elaborated into Mager-style objectives (behaviour, conditions, and standards) and Gagne’s five stage objectives (action, object, situation, tools and other constraints, capability to be learned). Most recently in the United Kingdom National Vocational Qualifications (NVQ) specifications typically involve statements of performance criteria, range statements, knowledge and skill requirements, and indications of specific assessment tasks.

Some resisted these developments despite their promise of a precision of definition that would lead inexorable to desired outcomes. They argued that much that was valued could not be captured by behavioural educational objectives and that other types of outcomes (e.g. those located by expressive objectives as discussed by Eisner (1968)) were at least as important. Others began to realise that the search for greater and greater precision in specification was producing diminishing returns and undermining viability. It became clear that, except for the simplest single outcome learning tasks, comprehensive specification of learning outcomes quickly led to the generation of very long and unwieldy lists of behavioural objectives.

Popham wrote one of the first collections of papers on criterion-referencing in the early 1970s (Popham/Baker 1970) and initially identified himself as a committed proponent of the approach. Like others he became concerned that the original idea - that outcomes could be precisely specified - was not achievable. By 1984, he recanted on some of the more extravagant claims for criterion-referencing. Thus he discarded the idea that items that were equivalent but different could be created (functional homogeneity) if only the specification was precise enough, by saying that»About the only way we can ever expect to attain functional homogeneity is to keep pruning the nature of the measured behaviour so that we’re assessing ever more trifling sorts of behaviour. That would be inane«(Popham 1984, p. 39, cited in Wolf 1993).

A softer view gained ground that meso-level specification was essential and that interpretation of these through»common understandings«(which involved judgement based on experience and example) was in practice the only workable approach. Wolf (1993) illustrates this by showing how difficult it is to understand the nature of performance specified by detailed statements of behavioural objectives of manageable length, and how much easier this becomes if examples of typical assessment tasks are given. It is usually the examples, rather than the statement of the objective, that are definitive in shaping the items that are produced by those who do not write the criterion statements.

Levels of Acceptable Performance

Acceptable levels of performance can be defined in a number of ways. It may be sufficient to simply assess performance against a stated criterion which is sufficiently precise to define an acceptable outcome, e.g. can 100 metres be run in less than 14 seconds on a single occasion? More often outcomes cannot be so precisely defined. It may also be necessary to sustain performance across several cases to have confidence that special conditions did not apply or that serendipity has intervened in a particular instance.

One interpretation of a criterion-referenced approach is that performance can be judged in terms of a dichotomous judgement - either the criterion is achieved or it is not. This implies it is really only judgements at the borderline that are important and that it does not matter by how much a performance criterion is exceeded or failed. Whilst this may seem reasonable and workable for individual items, it is usually the case that performance on several criteria is grouped together and these may also measure performance across more than one domain. It begins to appear unreasonable to insist that all items have to be answered successfully in order to demonstrate acceptable performance, though this is sometimes advanced as a condition. Lower thresholds - e.g. 80% of items answered correctly begin to be applied in practice. Whenever this is permitted decisions have to be made on acceptable methods of aggregation.

In many situations value is attached to gradations of performance, partly because it is recognised that the quality of a performance against a criterion usually cannot be reduced solely to statements of measurable outcomes. Assessors and teachers often distinguish between satisfactory and good performance (e.g. on project work) - though two projects may both be considered a pass one may be thought to have reached a different standard than another. Some qualities (for example»elegance«) may be valued in the design of an experiment or the solution of a mathematical problem. These qualities may be felt to warrant recognition and require some grading of the quality of a pass. A level of acceptable performance may then acquire a»flavour«(»starred«,»distinction«) over and above its satisfaction of a criterion.

Judgements about acceptable levels of performance for mastery against criteria may be influenced by norm-referenced considerations. A decision has to be taken as to what it is reasonable to expect as an outcome for a particular group of candidates. It would seem pointless to set criteria of performance at levels unlikely to be achieved by most candidates of a particular age and ability. Similarly, setting criteria at a level regarded as trivial and easily met by most candidates would also be of little value.

Modes of Assessment

The range of options in choosing modes of assessment is very wide. They include individual and group testing; written, oral and practical tasks; open and closed book conditions; self, school-based, or external assessment; continuous formative or infrequent summative assessment; time constrained or unconstrained testing. It is well established that different modes and different formats affect candidates' performance. In the United Kingdom girls appear to perform less well on objective test items and appear to take more time to complete them. Some research suggests that there are cultural differences in trade-offs between speed and accuracy which result in different performance levels in timed tests.

An emphasis on criterion-referencing can be applied to virtually any mode. The format chosen may constrain the range of criterion against which performance can be evaluated. This may be of particular concern where curricula goals are essentially open-ended and assessment instruments are pre-disposed towards closed ended outcomes. A case in point is the widespread reliance on multiple-choice items for testing Primary Science achievement. Though these may be capable of assessing a much wider range of outcomes than they are commonly directed towards, valued outcomes (e.g. manipulative skills, powers of expression, affective outcomes) may be inaccessible through this particular method.

Continuous assessment is as susceptible to criterion-referenced approaches as other forms of examining. It offers the opportunity to reach corners of cognitive and affective achievement that other methods cannot easily reach if a wide range of approaches to gathering assessment data is used. Some recent research has explored possible relationships between external examination results and internal test performance in a sample of schools in Papua New Guinea. Though not conclusive, this study is suggestive that the schools with the highest scoring students have the lowest correlations between external examination score and internal test scores. Conversely the lowest scoring schools appear to have the highest correlations. One possible explanation is that higher performing schools do indeed assess a different and wider range of traits in internal tests than do low performing schools. Clearly the mode of examining can create a different pattern of results (Ross 1994).

Assumed Antecedents

The definition of appropriate criterion-referenced statements generally contains assumptions about antecedent conditions. The specification of a particular learning outcome usually presupposes that other conditions have been met. At the lowest level it will usually be taken for granted that pupils possess adequate levels of literacy and numeracy for them to achieve the criterion specified. By extrapolation it will be assumed that necessary prior learning has taken place and that essential knowledge and skills have been retained.

There is a sense in which the logic of criterion-referencing suggests that all assumed antecedent conditions should be made explicit. They can then be transformed into criteria which would define readiness to approach a new criterion performance level. Though logical, this is of course impractical. The best that may be possible will be to note any essential pre-conditions that might exist that could prevent the possibility of a criterion level of attainment being achieved.

The creation of criterion statements of performance is a forward looking act. The probability of their achievement cannot be separated from previous attainment. This is why the often neglected, but centrally important question of antecedent conditions should be an integral part of attempts to specify criteria.

Reporting Outcomes and the Aggregation Problem

Reporting the results of criterion-referenced tests presents a number of dilemmas. Some of the most important are noted below. First, simply reporting performance in terms of mastery or non-mastery has several disadvantages. It does not distinguish exceptional candidates from those whose passes are marginal; it may allow little insight into the causes of failure or success; single pass/fail boundaries may be so high as to discourage most candidates or so low as to fall into disrepute; pass/fail boundaries may come to be regarded as maximum rather than minimum levels of achievement; pass levels may be achieved through different aggregations which undermine any single construct of mastery.

The last issue merits expansion. Problems of aggregation permeate criterion-referenced and competency-based assessment systems. What at first sight may appear as a simple problem may be very complex to unravel. Once a judgement on performance is compiled from several sources of data the rules associating these have to be determined. What these rules are will determine which candidates meet the criterion and which do not. The kind of dilemmas that arise concern questions of how raw scores on the same criteria should be aggregated; what conditions apply across assessments of different criteria when these are associated together into an overall judgement (are they standardised, are they weighted, do all have to be passed above the criterion level?).

An illustration of the kind of problems that persist concerns the extent to which compensatory performance is permitted. This refers to the degree to which higher performance against one criterion might compensate for low performance against another.

The simple criterion-referenced view of competency - that all its elements can be specified and all essential parts have to be mastered - proves difficult to work in practice. If it is applied it may result in lowering criterion levels sufficiently to allow acceptable proportions of students to be judged competent. In practice some form of compensation is usually allowed. Aggregation rules allow low performance in some areas if the overall performance is judged adequate. But, paradoxically, this accommodation which is necessary to have a workable criterion-referenced system, introduces ambiguity into the meaning of competence or mastery. Those succeeding will have different performance profiles. Mastery will have plurality of meanings.

Criterion-Referencing in Practice - Two Case Studies

England

There are many sources which discuss assessment in the United Kingdom and which relate to the national curriculum and the development of criterion-referencing. This brief review draws attention to some features that may have wider relevance.

The underlying model of attainment is based on the identification of 10 levels of achievement which are specified in relation to attainment targets (ATs) specified for each subject. There are seventeen ATs for Science which are grouped as shown below.

• Exploration of science, communication and the application of knowledge and understanding.

AT1 Exploration of Science

• Knowledge and understanding of science, communication, and the applications of science.

AT2 The Variety of Life
AT3 Processes of Life
AT4 Genetics and Evolution
AT5 Human Influences on the Earth
AT6 Types and Uses of Materials
AT7 Making New Materials
AT8 Explaining How Materials Behave
AT9 Earth and Atmosphere
AT10 Forces
AT11 Electricity
AT12 The Scientific Aspects of Information Technology
AT13 Energy
AT14 Sound and Music
AT15 Using Light and Electromagnetic Radiation
AT16 The Earth in Space
AT17 The Nature of Science

Examples of Attainment Targets are included in the appendix. **AT1 Exploration of Science** is concerned with the development of intellectual and practical skills that allow the exploration of the world of science, the development of understanding of scientific phenomena, and familiarity with the procedures of scientific exploration and investigation. Broadly speaking they cover the general skills associated with:

- Planning, hypothesising and predicting.
- Designing and carrying out investigations.
- Interpreting results and findings.
- Drawing inferences.
- Communicating exploratory tasks and experiments.

The remaining ATs are all classified under knowledge, understanding, applications and implications of science. AT2 is concerned with the variety of life and focuses on knowledge and understanding of the diversity and classification of life and of the relationships, energy flows, cycles of matter and human influences within ecosystems.

There are four **Key Stages (KS)** in the national curriculum. KS1 covers ages 5-7 approximately, KS2 8-11, KS3 12-14, KS4 15-16.

For Science KS1 and 2 include ATs 1-6 and 9-16 only. The ten levels of performance are related to Key Stages as follows:

→ KS1 1-3
→ KS2 2-5
→ KS3 3-7
→ KS4 4-10

Each level of performance for each attainment target has a statement defining the level. The diagram shows how the Key Stages relate to the range of attainment targets at different ages.

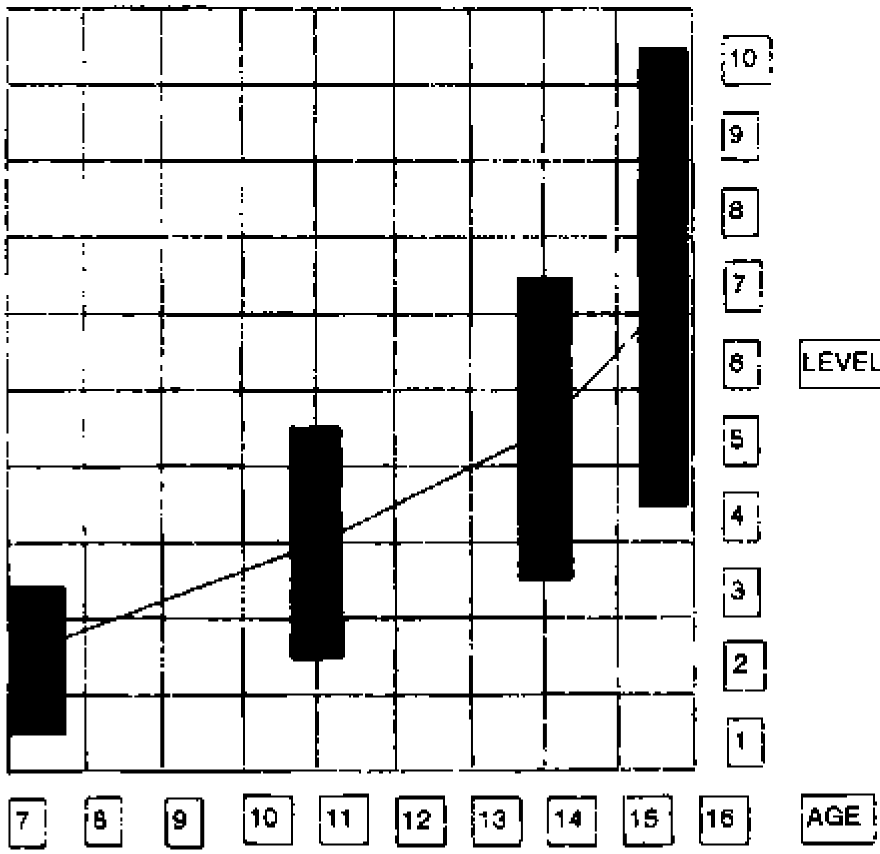

Diagram 1: PUPIL ACHIEVEMENT LEVELS - TGAT MODEL

The expectation is that average pupils will reach level 2 by the end of Key Stage 1 (KS1), level 3/4 at the end of KS2, level 5 at the end of KS3, and levels 6/7 at the end of KS4. Achievement will be spread over a range of levels since pupils will differ in their ability and attainment at any particular age. Progression through the levels is anticipated for all children. Pupils will have the psychological reward of reaching higher levels as they get older, unlike in norm-referenced systems.

Important issues which have arisen in implementing this system are summarised below.

(1) The national curriculum has introduced statements of attainment that define levels of performance on the Science curriculum for each domain of attainment. This is the first time there have been a single set of outcomes defined for Science teaching throughout the primary and secondary school. The specification is essentially criterion-referenced in the sense that the attainment targets (ATs) represent the criteria. However, it is not clear that the ATs are defined sufficiently precisely to ensure what is expected is the same in every school.

(2) From the outset a range of levels of achievement has been anticipated from children of a given age/grade. Performance is reported in terms of level and no one level is the only one appropriate to children in a particular grade. Thus normal children are not all expected to reach say level 5 at one particular age - some will work at level 4, some at level 5 and some at level 6. The range of performance considered normal increases for the higher Key Stages. This recognises that differences in achievement may have a cumulative character that heightens differences over time. KS4 in Science actually has two variants in the specification of ATs, one for more able pupils and one for those who are less capable. It is not clear whether the step size between levels remains constant or increases. The definition of normal expectations seems to suggest that step size increases with level. No clear expectations exist about the distribution of pupils at the end of Key Stages across levels.

(3) There has been considerable debate about the linking of grades from the previous assessment system (i.e. GCSE) to performance levels. There is a problem of reconciling the expectation of an equivalence in standard to the principle of regarding the levels of attainment as being criterion-referenced. To admit linking to a norm-referenced examination appears to contradict the intention of establishing a criterion-referenced system.

(4) Since it is expected that»typical«pupils should perform at Levels 2, 3/4, 5, and 6/7 at ages 7, 11, 14 and 16 there is a sense in which operationally AT criteria are likely to be interpreted in ways which result in this pattern of achievement. To put it another way, if there was a wide divergence from this pattern the framework of Key Stages, ATs and levels of attainment would be undermined. The issue is clearly addressed in the Dearing Report which discusses linking the mid-point of achievement at the end of each Key Stage to»the actual performance of a random sample of pupils on the knowledge, understanding and skills required by a programme of study within a particular Key Stage«(Dearing, R., 1993, p. 43). This is a clear indication of an intention to norm-reference.

(5) As currently specified, it is not clear what procedures are appropriate for the aggregation of performance on attainment targets (ATs) in different domains, or what conditions relate to satisfactory performance at a particular level within a domain. The former is problematic if compensation is permitted and good performance in one domain can make up for poor performance in another. Can exceptional achievement on AT1 compensate for poor performance on AT2 and 3? Within a domain, performance at a particular level may be demonstrated by a pupil in one assessment context but not in another designed to assess the same attainment target at the same level. What conclusion is to be drawn?

(6) Comparability in levels of achievement at the same level in different Key Stages is problematic. Is it really likely to be the case that a level 5 performance by an 11 year old carries the same meaning as a level 5 performance of a 16 year old. It seems unlikely that this is literally the case though in principle it should be so.

(7) The burden of assessment may be excessive. The average pupil reaching level 7 after 11 school years would have been assessed on some 700 statements of attainment. A classroom teacher at Key Stage 1 (7 year olds) with 35 pupils who assessed all pupils against every appropriate statement of attainment would make and record about 8000 judgements each year. This has struck some as an excessive load that has begun to erode teaching time in favour of assessment. Recent changes have responded to this by reducing the burden by as much as 50% at some levels.

(8) The use of attainment targets to define attainment fragments the curriculum. Those outcomes which involve the integration of a variety of skills and understanding are likely to be undervalued and ignored in the assessment process. Skills employed in design and development of experiments may not readily fall into separately assessable components. The whole activity may be more than the sum of its parts. This problem is a strong argument against overspecification of ATs to more and more precise levels.

Mauritius

The Mauritius Examination Syndicate (MES) is experimenting with the introduction of Essential Learning Competencies (ELCs) and Desirable Learning Competencies (DLCs), building on work originally undertaken at the National Council for Educational Research and Training (NCERT) in India. The philosophy behind this is essentially one of criterion-referencing performance in grades 4 and 5 on school-based tests, and in grade 6 which leads to the Certificate of Primary Education.

Essential Learning Competencies are intended to represent the levels of learning achievement in all subjects (knowledge, understanding, skills, abilities, interests, attitudes and values) which are considered minimum but essential for all students to acquire. It is argued that they can be regarded as attainment targets below which learning achievement is not sustainable. Since there is a range of ability and children will progress at different rates, higher order competencies have been specified involving more complex mental processes and/or learning content. These are denoted Desirable Learning Competencies (DLCs) and are treated as optional levels of achievement for certification. Performance on DLCs are considered, in combination with that on ELCs, for selection into secondary schools. This is thus a kind of two level system, though currently the relationships between the levels are not specified in any particular way.

The Mauritius Examination Syndicate has recognised the impossibility of measuring competencies directly in favour of defining detailed learning objectives. Performance on these can be assessed through observable behavioural outcomes. Each subject in the Certificate of Primary Education Examination (CPE) was analysed using a simple taxonomic model (Knowledge, Understanding, Application for»content subjects«and Comprehension and Expression for languages) to identify groups of objectives that could be specified behaviourally. These groups were discussed with a large number of teachers to validate their classification. The lists of»Learning Competencies«that emerged were judged against six criteria. These were:

1. **Sustainability** - achievement that would be retained and used at subsequent levels.

2. **Communicability** - to ensure that each statement had a clear meaning using a standard presentation including two dimensions (content, ability).

3. **Learning Continuity** - to relate ELCs/DLCs to those that come before and after as part of a continuum.

4. **Functionality** - to ensure that statements are at an appropriate level of generality.

5. **Measurability** - to ensure that a learning competency was measurable with a well defined range of acceptable outcomes.

6. **Achievability** - to adjust ELCs/DLCs to appropriate contextual factors including the developmental level of pupils.

As the system is implemented ELCs/DLCs will be used to structure the CPE and should provide diagnostic insights into performance in grades 4 and 6.

Some examples of ELCs and DLCs are included in the appendix (see: chapter 4.5.). Important issues with the implementation of this system appear to be:

(1) ELCs/DLCs are not graded by level. As statements of learning competencies they imply that either candidates possess these competencies or they do not. This may be acceptable on a competency by competency basis but there are obvious risks when they are applied to the population of pupils in a particular grade. ELCs may be set at a low level to ensure that most pupils do in fact demonstrate these competencies. In this case the tasks they present to average and above average pupils are likely to be seen as trivial. Alternatively the ELCs may be set at a higher level to challenge average and above

average pupils. If so large proportions will fail to meet the criteria and they will cease to have practical significance as minimum levels of achievement. The problem lies in specifying a single level rather than a band of acceptable achievement levels for a grade.

(2) There is a risk that minimum levels, wherever they are set, become maxima if there is no recognition of performance above the minimum. If performance is assessed dichotomously then there is no particular incentive for pupils to perform above the minimum level necessary to achieve the ELC or DLC. In so far as this might encourage teachers to give more attention to those pupils having difficulty in acquiring the competency this might be welcomed. If it suppressed the performance of the best pupils it might be a matter of concern.

(3) The problems of aggregation and compensation remain under discussion. Is performance on ELCs simply the total number of ELC items correctly completed? Should minimum scores apply to domains or topics before a competency is deemed to be acquired? Can performance in one area compensate for performance in another either within subjects or across subjects at CPE? How can performance on ELCs be aggregated with performance on DLCs?

(4) Can adequate progression be demonstrated for ELCs and DLCs at different levels? Or are they simply more educational objectives which extend the range but not the level of achievement assessed?

Assessment and Repetition

Table 1 displays a number of indicators of levels of educational development in African countries based on the most recent UNESCO data. From this we can see that unweighted Gross Enrolment Rates (GERs) averaged about 76% in 1990 as they did in 1980. Gender disparities appear prominently for both GERs and Net Enrolment Rates (NERs). At secondary level both GERs appear to have increased over the last decade as, in most countries, secondary school systems have expanded at a faster rate than primary. Average secondary GERs have increased from about 17% to 23%. In most countries transition rates from primary to secondary have almost certainly increased over this period. The average ratio of GER secondary to GER primary increased from 0.23 to 0.28 suggesting that this was a common pattern. Repetition often appears as one of the main sources of internal inefficiency in school systems which results in a suppression of GERs below levels they would otherwise reach (Colclough with Lewin 1993).

Enrolment rates, the rate of flow of pupils through the school system, and the transition rate into secondary are all influenced by assessment practices and levels of achievement. Table 1 shows that repetition can be high in all grades through the primary school system. Characteristically it is greatest in the grade preceding primary school leaving examination levels, as failing students repeat to improve their chances of gaining access to secondary school. This is most commonly at grade 6 and repetition averages 28% at this level. Average repetition rates in each grade are around 20% implying that enrolment rates could be about 20% greater at no extra cost if repetition was reduced to insignificant levels. Repetition is a very significant source of internal inefficiency in many systems.

Internal school assessments generally determine rates of repetition and promotion through the primary school. The information which is used to determine whether or not students repeat will vary considerably from system to system. Most commonly teachers make judgemental decisions on unstandardised data drawing on experience with other students. Although this may appear in some sense to be criterion-referenced (teachers applying the criterion of successful completion of a year’s work), in practice it may well have a strong element of norm-referencing, with those pupils well below average in performance being retained in the grade for that reason.

It is also likely that individual teachers will not wish to have repetition rates amongst their classes much greater than other teachers, so a»normal«expectation may exist. In addition there may be national norms (as in China under the nine year basic education law) concerning the rate of repetition that is acceptable. Almost certainly the level of performance that results in decisions to repeat will vary from school to school and from teacher to teacher. A further complication will arise when there are incentives to keep repetition rates high (either because this will result in increased enrolment or because it will maximise pass rates of pupils entered for public examinations).

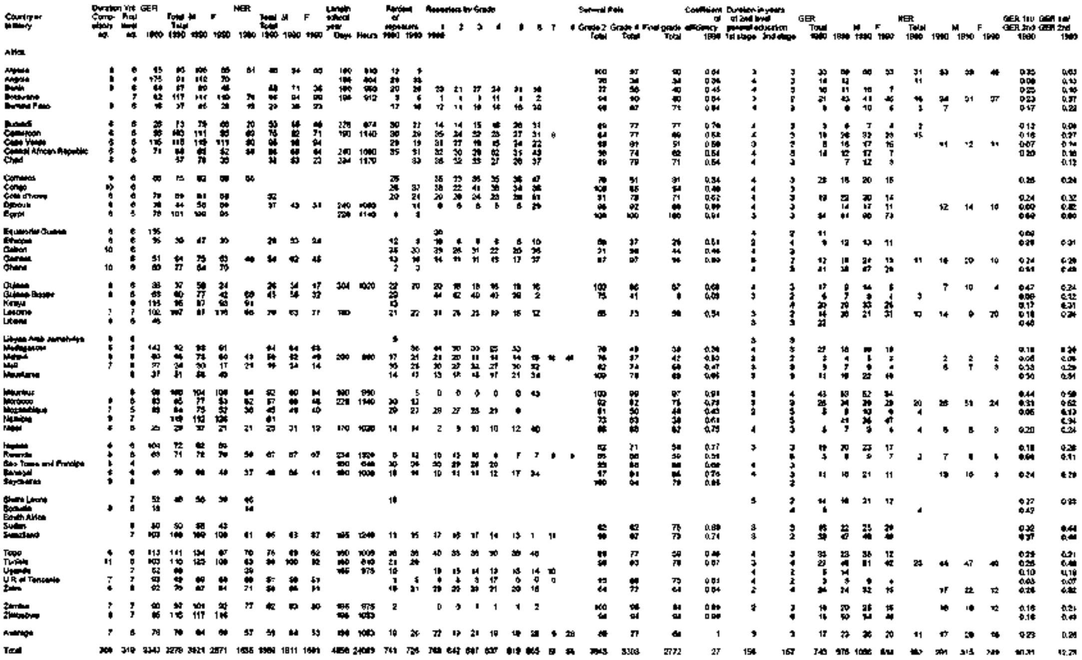

Table 1. First level education: enrolment ratios

SOURCE: UNESCO (1993) World Education Report 1993. Unesco Publishing

Internal, school-based assessment in most primary school systems is based on instruments that mirror primary school leaving examinations. This is evident from research studies (e.g. Chimwenje in Malawi 1993) and from the kind of books published to assist revision. The decisions that teachers make will therefore be based on experience mediated by information provided by tests that mimic public examination formats. Thus, for example, if the latter use multiple-choice items then most assessment will follow this pattern regardless of the emphasis of curricular objectives. If they are designed according to norm-referenced criteria (so that for example facility values are about 50% and discrimination is high), school tests will also adopt similar assumptions.

There is an opportunity to use increased emphasis on criterion-referenced approaches to assessment to encourage teachers to think more carefully about the learning outcomes that define acceptable performance and use performance against these criteria to identify areas of special weakness in need of remediation. In principle decisions to invite students to repeat should be based on a common yardstick of achievement rather than a sliding judgemental scale that differs from school to school. This should also draw attention to where schools rather than pupils are failing. There are schools in some systems where more than 30% of children within a grade become repeaters. This invites questions about the quality of the school and its teachers, and the appropriateness of the standard that is being applied (rather than the easy assertion that low performance is attributable to out-of-school factors). More emphasis on criterion-referencing should place achievement levels closer to those which are attainable by the majority of pupils in effectively managed schools since little purpose is served by defining criteria out of reach of a large proportion of pupils.

There remains a risk that more emphasis on criterion-referenced approaches to internal school assessment will be seen as unduly time-consuming and complex and that instruments will be used as if they were intended to be norm-referenced. Ideas of measuring performance against averages, ranking pupils in order of achievement within the class, and rating relatively good and poor schools by comparison of examination results are deeply embedded in the culture of teachers. Attempts at criterion-referencing do encourage clear consideration of educational purpose which ought to be part of every teacher's lesson planning. There is no particular reason why criterion-referenced instruments should be more time-consuming to construct and use than well constructed norm-referenced assessments. Often individual items within a criterion-referenced set may be similar to well constructed items used for norm-referenced assessment as noted earlier. The real problem is to find ways of improving the reliability and validity of internal school assessments and adopting simple criterion-referencing can help with this.

In countries where there are not enough places in secondary schools to accommodate all those completing primary school the transition from primary to secondary is generally controlled through a primary school leaving examination. These examinations are often retained when transition rates reach high levels and almost all children proceed to secondary since selection (for different secondary schools) remains an issue. An external examination also provides information which is otherwise unavailable which can be used to monitor school performance.

Primary school leaving examinations have a considerable importance in determining life chances. The content and format of them often washes back onto curriculum decisions and assessment practices at the school level. They exercise extensive influence over teaching and learning (Dore 1976, Oxenham 1984). They also determine the amount of repetition that takes place in the transition grades.

Two types of repetition occur in the final grades of the primary cycle. The first is amongst those who have failed a primary school leaving examination and repeat in order to pass. The second type of repetition is by those who have passed but who wish to improve their ranking to be selected by better secondary schools. In some systems (e.g. Mauritius) the latter may reach 40% of all repeaters in the last year of primary.

Where external assessment instruments are norm-referenced and pass and fail grades are determined on a norm-referenced basis, it will be the case that a pre-determined proportion of candidates will»fail«. This will remain true whether or not their actual level of achievement improves. Assessment in this case is a zero sum game where improvement by one child (or school) must be balanced by relative deterioration by another. There will be as many pupils and schools above average as below and not all pupils/schools/districts can be above average (as in the debate concerning whether 50 States in the USA could all be above average on elementary school tests; Cannell cited in Shephard 1991).

In norm-referenced systems it is not clear what implications should be drawn where failure rates (and consequent repetition) is great. The problem is that if the assessment really is norm-referenced then high rates of failure are the result of conscious design and cannot be changed by improved performance amongst candidates. Thus in some systems pass rates in key subjects like English and Mathematics may be as low as 20 -30%. If the assessment is norm-referenced this implies a particular judgement of where to draw the pass/fail boundary. It carries the message that the achievement of the majority of candidates in these subjects is not worth recognition. Pedagogically this seems undesirable. If pass rates vary between subjects in norm-referenced systems it is because of choices made to make some subjects relatively difficult rather than because some subjects are intrinsically more difficult.

Introducing some elements of criterion-referenced assessment to primary school leaving examinations is claimed to be attractive for a number of reasons. In principle it would seem to:

- allow performance to be measured against a fixed and public standard,

- reward improvements in performance since all pupils, schools and districts could see performance improve at the same time,

- permit certification based on criteria,

• encourage educational objectives to be more clearly specified.

The main disadvantage is that criterion-referencing would not necessarily»pass«the numbers of pupils for which places exist at secondary level. It might also make it more difficult to finely grade performance. Leaving qualifications certifying specific levels of achievement related to criteria would not guarantee entrance to secondary schools. They might therefore be seen to have limited value. Significant numbers of candidates might be»qualified«according to entrance criteria but would not necessarily be admitted to a secondary school. A greater emphasis on criterion-referenced approaches could increase the probability of curriculum sensitive item writing, improve the quality of diagnostic information available and improve standards of attainment (Lewin 1992) if introduced flexibly without over specification of attainment levels.

Concluding Remarks

This chapter has discussed the issues that surround the development of criterion-referenced assessment instruments and identified major problem areas. It has summarised recent experience with the national curriculum in England and with Learning Criteria in Mauritius. Finally, it explored some of the relationships that exist between decisions on testing and repetition and transition rates from primary to secondary school.

The title of the chapter contains a question that has not been answered. Is criterion-referencing a panacea that will overcome objections to norm-referenced styles of assessment, or is the new emphasis a false dawn? This analysis suggests that it is neither. Criterion-referencing cannot of itself resolve many of the enduring dilemmas in assessment. Intrinsically it is no more reliable or valid than other approaches. Neither is it more cost-effective or technically less demanding. Nor can it resolve the difficulties of undertaking and legitimating the selection of some students from many. The approach does have the special value that it forces systematic consideration or purpose in a more focused way than most others. For this reason alone its development is worth encouraging. It is more than a palliative that allows prevarication. It can actually help draw attention to critical issues that require policy decisions and may make it more difficult to avoid these. The problem of repetition and its reasons is one area in which this is evident.

In conclusion the challenge for the future is to explore the complementarities between criterion-referenced and norm-referenced approaches to assessment. Neither on their own are sufficient to service the needs for information to aid decision making on individuals, schools, and education systems.

2.2. Test Development - Designing Tests and Presenting Results

Keith Lewin

Introduction

This chapter provides a simple introduction to the construction of some forms of assessment. To design an assessment instrument decisions must be made in three main areas These, are:

(1) Deciding on the purpose(s) of the test.
(2) Developing (or utilizing existing) statements of specific measurable learning objectives.
(3) Selecting the most appropriate test instruments.

The first three parts of this chapter discuss these issues briefly. The fourth part lists some key concepts. The fifth part briefly discusses the construction of simple tests. Part six and seven provide some examples of types of multiple-choice questions and a checklist of good practice in their construction. Finally, the last two sections comment on reporting results and introduce simple standardization procedures.

Purposes

It is always important to have clearly in mind the purpose(s) for which a test is being constructed. Its nature will depend upon, amongst other things, the uses to which results will be put (rank ordering for selection, diagnostic feedback on individuals or on the effectiveness of teaching, evaluation of curriculum materials, comparison of previous and present achievement of individuals etc.). A recent list of purposes covers the range likely to be encountered (Pennycuick 1990):

Recording and reporting attainment	Diagnosis and remediation
Certification and qualification	Curriculum evaluation
Selection and social regulation	Feedback on teaching and organizational effectiveness
Prediction	Teacher motivation and appraisal
Measurement of individual differences	Curriculum control
Motivating students	Evidence for accountability/resource provision
Monitoring progress and feeding back information	Maintaining or enhancing standards
Guidance	

Assessment plays a central role in teaching strategies; it can provide opportunities for revision (both before and after administration), it may be used to motivate students, its nature almost certainly influences patterns of learning. Assessment is not therefore a necessary chore, but an integral part of teaching and learning. It is thus important that those who use assessments, as well as those who design them, have a clear idea of their purposes and what it is hoped will be achieved through the use of particular assessment instruments.

Objectives

To be able to construct any assessment that measures achievement for whatever purpose it is essential that such achievement is specified in terms of measurable and observable outcomes. A well designed curriculum will indicate the nature of its intended outcomes. If it does not then users must develop such specifications in order to be able to construct an assessment instrument that is valid.

For any curriculum there is likely to be a range of objectives of different types, e.g. at general and more specific levels, short-term and long-term, within different domains (cognitive, affective etc.). Not all of these will be susceptible to direct measurement during the teaching of a course and some perhaps not at all. Though it may be that some desirable objectives are of a kind which cannot be assessed easily many valued outcomes are likely to be directly assessable, albeit with varying degrees of precision. Without systematic attempts to define intentions and measure progress towards their achievement it will be difficult if not impossible to make judgements concerning the effectiveness of teaching.

Several taxonomies of education objectives exist in which attempts have been made to break down learning behaviour into well defined categories. An example of such a categorization in the cognitive domain with descriptions of meaning and illustrative objectives derived from them is included below (see Table 2, derived from Bloom et al. 1971). References to other taxonomies may be found in books cited in the reading list.

Table 2: Major Categories of Cognitive Objectives with Examples		
Descriptions of the Major Categories in the Cognitive Domain	**Illustrative General Instructional Objectives**	**Illustrative Behavioural Terms for Stating Specific Learning Outcomes**
1. Knowledge Knowledge is defined as the remembering of previously learned material. This may involve the recall of a wide range of material, from specific facts to complete theories, but all that is required is the bringing to mind of the appropriate information. Knowledge represents the lowest level of learning outcomes in the cognitive domain.	Knows common terms. Knows specific facts. Knows methods and procedures. Knows basic concepts. Knows principles.	Defines, describes, identifies, labels, lists, matches, names, outlines, reproduces, selects, states.
2. Comprehension Comprehension is defined as the ability to grasp the meaning of material. This may be shown by translating material from one form to another (words to numbers), by interpreting material (explaining or summarizing), and by estimating future trends (predicting consequences or effects). These learning outcomes go one step beyond the simple remembering of material, and represent the lowest level of understanding.	Understands facts and principles. Interprets verbal material. Interprets charts and graphs. Translates verbal material to mathematical formulas. Estimates future consequences implied in data. Justifies methods and procedures.	Converts, defends, distinguishes, estimates, explains, extends, generalizes, gives examples, infers, paraphrases, predicts, rewrites, summarizes.
3. Application Application refers to the ability to use learned material in new and concrete situations. This may include the application of such things as rules, methods, concepts, principles, laws and theories. Learning outcomes in this area require a higher level of understanding than those under comprehension.	Applies concepts and principles to new situations. Applies laws and theories to practical situations. Solves mathematical problems. Constructs charts and graphs. Demonstrates correct usage of a method or procedure.	Changes, computes, demonstrates, discovers, manipulates, modifies, operates, predicts, prepares, produces, relates, shows, solves, uses.
4. Analysis Analysis refers to the ability to break down material into its component parts so that its organizational structure may be understood. This may include the identification of the parts, analysis of the relationships between parts, and recognition of the organizational principles involved. Learning outcomes here represent a higher intellectual level than comprehension and application because they require an understanding of both the content and the structural form of the material.	Recognizes unstated assumptions. Recognizes logical fallacies in reasoning. Distinguishes between facts and inferences. Evaluates the relevancy of data. Analyses the organizational structure of a work (art, music, writing).	Breaks down diagrams, differentiates, discriminates, distinguishes, identifies, illustrates, infers, outlines, points out, relates, selects, separates, subdivides.

5. Synthesis Synthesis refers to the ability to put parts together to form a new whole. This may involve the production of a unique communication (theme or speech), a plan of operations (research proposal), or a set of abstract relations (scheme for classifying information). Learning outcomes in this area stress creative behaviours, with major emphasis on the formulation of *new* patterns or structures.	Writes a well-organized theme. Gives a well-organized speech. Writes a creative short story (or poem, or music). Proposes a plan for an experiment. Integrates learning from different areas into a plan for solving a problem. Formulates a new scheme for classifying objects (or events, or ideas).	Categories, combines, compiles, composes, creates, devises, designs, explains, generates, modifies, organizes, plans, rearranges, revises, rewrites, summarizes, tells, writes.
6. Evaluation Evaluation is concerned with the ability to judge the value of material (statement, novel, poem, research report) for a given purpose. The judgements are to be based on definite criteria. These may be internal criteria (organization) or external criteria (relevance to the purpose) and the student may determine the criteria or be given them. Learning outcomes in this area are highest in the cognitive hierarchy, because they contain elements of all of the other categories, plus conscious value judgements based on clearly defined criteria.	Judges consistency of written material. Judges the adequacy with which conclusions are supported by data. Judges the value of a work (art, music, writing) by use of internal criteria. Judges the value of a work (art, music, writing) by use of external standards of excellence.	Appraises, compares, concludes, contrasts, criticizes, describes, discriminates, explains, justifies, interprets, relates, summarizes, supports.

When devising objectives that utilise verbs related to statements of behaviour it is important to remember that it is the candidates that have to discriminate between meanings. The difference between comparing and contrasting may be clear to test constructors; experience would suggest that often it is unclear to many school pupils. Whatever system of classifying objectives is used some useful guidelines apply if tests are to be developed based on statements of learning objectives.

- Objectives should be stated in terms of <u>student behaviour</u>, not in terms of learning activities or the intentions of the teacher.

- Objectives should begin with an <u>action verb</u> that indicates the behaviour a student is expected to demonstrate.

- Objectives should be stated in terms of <u>observable changes in behaviour</u>.

- Objectives should be <u>stated as precisely as possible</u> in terms that have agreed meanings.

- Objectives should <u>relate to only one process</u> at a time.

- Objectives should be stated at an a<u>ppropriate level of generality</u>.

- Objectives should represent <u>intended outcomes</u> of learning experiences.

- Objectives should be <u>realistic</u> given the context.

In constructing objectives it is as well to remember that some verbs describe behaviour far less ambiguously than others (see the list below from Mager 1962).

Verbs open to many interpretations	Verbs open to fewer interpretations
to know	to write
to understand	to recite
to really understand	to identify
to appreciate	to differentiate
to appreciate fully	to solve
to grasp the significance of	to construct
to enjoy	to list
to believe	to compare
to have faith in	to contrast

Selection of Instruments

Having decided on the purpose of a test and arrived at appropriate statements of observable outcomes, a strategic choice can be made between available testing techniques. Four relevant background questions should help to narrow the choice. These are:

(1) Is the technique viable? (e.g. Does it demand skills and staff-time in setting and marking that are unavailable?).

(2) Can it measure effectively the behaviours we are interested in? (e.g. Multiple-choice questions cannot test powers of expression).

(3) Is it appropriate? (e.g. Does it reinforce or undermine overall objectives? -A testing strategy concentrating on recall of information will not encourage the application of concepts and principles by students).

(4) What assumptions do we make in opting for a particular strategy? (e.g. Are students sufficiently literate to understand and reply to test questions or is the test primarily testing literacy?).

The range of available techniques is very wide. Some of the common possibilities are indicated below. Most combinations from the columns are possible.

Table 3: Testing Techniques					
Modes	Methods	Conditions	Marking	Occurrence	Timing
Individual	Written	Open Book	Self	Continuous	Fixed Time Limit
Group	Oral Practical	Functional Information Closed Book	Internal External	Frequent Infrequent	Flexible Time Limit

Questions in written examinations commonly take two main forms, i.e. **Open Response** where a candidate has freedom to structure an answer in whatever way he/she feels is appropriate (typically»essay«questions); **Closed Response** where questions are structured to admit only one unambiguously defined response (typically objective multiple-choice questions). Between these two extremes lie many different types which use different levels of structure and varying degrees of pre-specification of acceptable responses.

Table 4: Advantages and Disadvantages Associated with Different Type of Items		
	Open Response	Closed Response
Abilities measured	Powers of expression can be tested. High levels of reasoning may be required, e.g. inference, organization of ideas, comparison and contrast, synthesis, evaluation. Inefficient at indicating knowledge of factual information.	Powers of selection of correct response from given options - may work by elimination. Recognition may be more important than recall. Individual words or phrases may be required for recall. Can operate at high reasoning levels, though synthesis and evaluation difficult to test. Measures factual knowledge efficiently.
Scope	Covers a limited area, questions can usually only sample small parts of curriculum. Fluent students can avoid displaying the extent of their ignorance.	Curriculum content can be efficiently covered at knowledge levels. Reliability benefits from this.
Motivational Implications	Encourage development of powers of expression and the ability to organize material in a communicable form. Selective in-depth consideration of curriculum worthwhile.	Encourages the development of broad background knowledge and abilities.
Examiner	Small numbers of questions therefore less preparation.	Large numbers of questions, many pitfalls in their construction. Time-consuming and demanding.
Scoring	Time-consuming and unreliable, allows comment on candidates' reasoning.	Rapidly scored and reliable.

Some Key Concepts

There are a number of terms associated with tests that it is necessary to be familiar with. Amongst the most important are:

• Validity
This has two primary meanings; **Content Validity** is the degree to which a test comprehensively samples achievement of the objectives of a course in relation to its content; **Predictive Validity** is the extent to which test results can be relied upon as an indication of future performance. Content validity can be applied at individual question level.

• Reliability
This has many definitions related to different ways in which it can be calculated. It refers to the confidence that can be placed in achievement on a test (or individual items) as being a replicable indication of performance (e.g. would the results be the same if marked by different examiners or if taken under similar conditions by the same candidates at a different time).

• Facility
An indication of how easy a test (or item) is for average candidates (or conversely called Difficulty, defined by how difficult a test (or item) is for average candidates).

• Discrimination
An indication of how effectively a test (or individual item) discriminates between the performance of high and low achieving candidates.

• Norm-Referenced Tests
Tests where the performance of a candidate is compared to the performance of other candidates, e.g. a public examination where a fixed proportion of candidates achieve particular grades.

• Criterion-Referenced Tests
Tests where the performance of a candidate is expressed in terms of its relationship to a fixed criterion that is dependent on the nature of the achievement being measured, not the performance of others.

• Domain-Referenced Tests
A test consisting of items which sample representatively performance in a clearly defined area of knowledge or skill.

• Table of Specifications
This refers to a test plan, usually in the form of a grid, that tabulates different characteristics of a test, e.g. content areas and behavioural outcomes for each item in a test (see below).

Table 5: Test Specification

Topics	**Abilities/Behaviours:**				
	Knowledge	**Comprehension**	**Application**	**Analysis/ Synthesis Evaluation**	**Total %**
1. Solid Friction	1,2,3	4	5		25
2. Surface Tension	6,7,8,9	10		11	30
3. Elasticity	12,13	14	15		20
4. Momentum	16,17	18	19	20	25
Total %	55	20	15	10	100

Specifications of this kind may be useful in indicating the distribution of items and planning the desired coverage. Information on item characteristics may also be included (e.g. facility value). A modified grid of this kind can be used to keep track of individual pupil progress and achievement throughout a year.

Simple Test Construction

In constructing simple tests a number of stages are desirable. These clearly vary depending on the purpose(s) identified and the strategic decisions made about the instruments to be used. By way of example let us consider the design of a multiple-choice question paper. Though different decisions may be made on the inclusion of items depending on whether the test is to be treated as norm- or criterion-referenced, much of the procedure likely to be used has common elements.

Sequence of Events

(1) Make decisions on purpose and identify statements of testable objectives. If the test is criterion-referenced identify domains which will be assessed.

(2) Map a **Table of Specifications** for the test. Greater specificity of the table may make it easier to decide whether a question is appropriate for inclusion. The map should indicate how domains are covered by items.

(3) Write test questions (see checklist of Use in Constructing Multiple-Choice Questions). Domain definition may suggest criterion-referenced items.

(4) Logically review test question items - preferably getting another experienced member of staff to participate. This may include:

• consideration of the question as a whole; e.g. for validity, relevance, likely facility;

• checking classification against a Table of Specifications;

• answering questions without referring to answers anticipated;

• examining questions in terms of»checklist«criteria;

• ensuring that presentation and format allow for ease of understanding, response and marking.

(5) Empirically review test items:

• item facility
• item discrimination
• reliability assessments
• instructional sensitivity procedures.

Illustrative examples of types of items, a list of some common pitfalls in their construction, and a Checklist of points related to writing items are provided on the next pages.

Some Examples of Item Types

1. **Free Response**

How far is it from Cairo to Nairobi? When will the next election take place?

2. **Fixed Response** (Multiple-Choice)

• What is the capital of Zimbabwe?			(STEM)
(knowledge of specific facts)	A	Colombo	
	B	Lagos	
	C	Lilongwe	
	D	Accra	
	E	Harare	

What is the product of 5 and 3?		
(problem solving)	A	1 2/3
	B	8
	C	15
	D	35
	E	112

• If an electric refrigerator is operated with its door open in a perfectly insulated sealed room, what will happen to the temperature of the room?		
(prediction)	A	It will rise slowly.
	B	It will remain constant.
	C	It will drop slowly.
	D	It will drop rapidly.

• Should merchants and middlemen be considered as producers or non-producers. Why?		
(decision, explanation)	A.	As non-producers, because they make their living of producers and consumers.
	B	As producers, because they are regulators and determiners of price.
	C	As producers, because they aid in the distribution of goods and bring producer and consumer together.
	D	As producers, because they assist in the circulation of money.

• A rubber balloon inflated with hydrogen is released from the earth's surface. As it rises it increases in size and finally bursts. This is because:

(application)
- A The temperature inside the balloon increases.
- B The pressure of the air outside the balloon decreases.
- C The air outside gradually enters the balloon.
- D The increase in the temperature of the air outside the balloon causes the balloon to expand.
- E The changes in temperature outside the balloon weaken the rubber.

3. Clarification/Matching Pairs

Choose the letter heading which most appropriately answers the question. Each heading may be used once, more than once, or not at all.

A	Aluminium	1. Which one is a non metal...
B	Copper	2. Which one is normally stored underwater...
C	Phosphorus	3. Which one is the most electropositive...
D	Sodium	4. Which one forms a black oxide...
E	Zinc	

4. **Multiple Completion/Selection**

Which of the following are insects?

1. ants 2. spiders 3. flies 4. mice

- A 1 2 3 4
- B 1 2 3
- C 1 2 4
- D 1 3 4
- E 3

5. **Proper Sequence**

Which one of the following lists the animals in order of the size of normal adults?

- A elephant, cow, rabbit, goat
- B cow, elephant, rabbit, goat
- C elephant, cow, goat, rabbit
- D cow, elephant, goat, rabbit

6. **True/False**

Kenya borders on:

		True	False
A	Malawi	❑	❑
B	Zaïre	❑	❑
C	Tanzania	❑	❑
D	Uganda	❑	❑

7. **Assertion/Reason**

A ship floats with a smaller volume submerged in sea water than in fresh water when carrying the same load *because*

the density of sea water is greater than that of fresh water.

SELECT
- A If both statements are true and the second is a legitimate explanation of the first.
- B If both statements are true and the second is NOT a legitimate explanation of the first.
- C If the first statement is true and the second false.
- D If the first statement is false and the second true.
- E If both statements are false.

8. **Attitude Measuring Questions**

Most commonly Likert-type scales (with statements and four of five responses of the agree-disagree type) are used though there are alternative techniques, e.g.
(1) Most of the things I learn in Science lessons I find interesting.
- Strongly agree
- Agree
- Undecided
- Disagree
- Strongly disagree

(2) I like Science practicals more than Science theory periods.

It is good practice to include both positive and negative statements relating to the same idea to provide a balance in the format of items. It is also preferable to have several items on the same theme so that it is possible to form a scale for a particular attitude by aggregating responses. This is likely to provide a more reliable measure than single items.

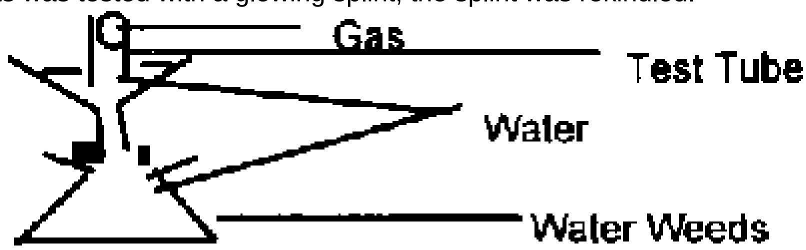
9. The following items are presented for criticism

1. How many colours are there in the rainbow?

A	1
B	3
C	5
D	7
E	15

2. Archimedes' principle states that
A For every action there is an equal opposite reaction.
B Objects less dense than water float.
C Plug vortices are anticlockwise in the Northern Hemisphere.
D Gold is heavier than silver.
E When a body is immersed in a liquid the upthrust is equal to the weight of liquid displaced.

3. The apparatus shown below was set up and after a few hours in sunlight, it was observed that some gas was collected in the test tube.
When the gas was tested with a glowing splint, the splint was rekindled.



This experiment shows that in sunlight the water weed
A Produces carbon dioxide
B Produces oxygen
C Produces hydrogen
D Respires
E Transpires

4. Physiology teaches us that
A The development of vital organs is dependent on muscular activity.
B Strength is independent of muscle size.
C The mind and body are not influenced by each other.
D Work is not exercise.

5. In the definition of a mineral which of the following is incorrect? A It is produced by a geological process. B It has distinctive physical properties. C It does not contain more than one element. D Its chemical composition is variable.

6. Meat can be preserved in brine because A Salt is a bacterial poison. B Bacteria cannot withstand the osmotic action of brine. C Salt alters the chemical composition of the food. D Brine protects the meat from contact with the air.

7. What does the term growth mean? A Maturation B Learning C Development D Gauche E None of these

8. What is the best definition for a vein? A A blood vessel carrying blood going to the heart. B A blood vessel carrying blue blood. C A blood vessel carrying impure blood. D A blood vessel carrying blood away from the heart.

Checklist of Use in Constructing Multiple-Choice Objective Questions

(see Ebel/Frisbie (1991) Essentials of Educational Measurement)

1.	Multiple-choice test items should be based on sound, significant ideas that can be expressed as independently meaningful propositions.
2.	The wording of a multiple-choice item should not follow familiar textbook phraseology so closely that verbal memory without comprehension will provide an adequate basis for response.
3.	Giving the final examination as a pretest will help to identify items that can provide valid measures of specific achievements in the course.
4.	Drafting each multiple-choice item in pencil and double spaced on a separate sheet of paper will facilitate revision of the item and its assembly into the test.
5.	The stem of a multiple-choice item should state or clearly imply a specific direct question.
6.	Item stems including the word»not«and asking in effect for an incorrect answer tend to be superficial in content and confusing to the examinee.
7.	The responses»none of the above«and»all of the above«are appropriate only when the answers given to a question are absolutely correct or incorrect (as in spelling or arithmetic problems).
8.	The intended answer should be clear, concise, correct, and free of clues.
9.	All of the responses to a multiple-choice test item should be parallel in point of view, grammatical in structure and general appearance.
10.	The distracters in a multiple-choice item should be definitely incorrect but plausibly attractive to the uninformed.
11.	The use of compound responses, including an answer plus an explanation, or some combination of two elements, sometimes solves the problem of providing four good alternative answers to a multiple-choice test question.
12.	While most multiple-choice items provide at least four alternative answers, good ones can be written with only two or three alternatives.
13.	A student who selects the correct response to a multiple-choice item by eliminating the incorrect responses demonstrates useful achievement.
14.	To function properly a multiple-choice item must be expressed in carefully chosen

	words and critically edited phrases.
15.	In general the best multiple-choice test items are those that about half the examinees answer correctly.
16.	One can make some multiple-choice items easier by making the question more general and the responses more diverse, or harder by making the question more specific and the responses more similar.
17.	Subsequent, and preferably independent, review of the drafts of multiple-choice test items is likely to improve their quality.
18.	Some of the most effective multiple-choice test questions call for a best answer rather than an absolutely perfect correct answer.
19.	Items testing recall of incidental details of instruction or special organizations of subject matter are ordinarily undesirable.
20.	The stem of a multiple-choice item should be expressed as concisely as possible without sacrificing clarity or omitting essential qualifications.
21.	The responses to a multiple-choice item should be expressed simply enough to make clear the essential differences among them.
22.	True statements that do not provide good answers to the stem question often make good distractors.
23.	The responses to a multiple-choice item should be listed rather than written one after another in a compact paragraph.

Reporting Test Results

Testing may have many purposes. The most appropriate form in which to report results depends partly on the purpose for which they have been collected. In brief reporting raw score marks with no additional information has little value particularly where such marks appear individually. Useful characteristics of performance to consider communicating may include:

- Arithmetic Mean of Marks

This at least provides a reference point against which to judge performance indicated by raw scores. It is unreliable in many ways but better than nothing. It may be considered as providing a test facility index.

- Range of Marks

Though a test may be marked out of 100 only 30% of the mark range may be used, e.g. minimum mark 40, maximum mark 70. This is important if any comparisons or aggregations are subsequently performed.

- Dispersion of Marks

Standard deviation is one indicator of this and is most simply defined as:

$$\text{The square root of} \quad \frac{(\text{the sum of each deviation})^2}{(\text{the number of cases})}$$

$$\text{i.e. Standard deviation} = \sqrt{\frac{\sum(X_1 - Xav)^2}{n}}$$

The magnitude of this is an indication of the spread of values. Its meaning becomes difficult to interpret where mark distributions diverge considerably from a normal distribution.

- Frequency Distribution of Marks and Percentile Ranks

By calculating the frequency with which marks are obtained and producing a table of cumulative frequency, percentile ranks can be obtained. A candidate’s score can then be reported in a form that relates performance to that of other candidates (see the example given in Table 6).

Table 6: Test Results (75 Candidates, Mark Range 1 to 10)			
Score	**Frequency**	**Cumulative Frequency**	**Cumulative Percentage**
10	5	75	100
9	2	70	93
8	12	68	90
7	17	56	75
6	14	39	52
5	10	25	33
4	10	15	20
3	3	**5**	7
2	0	2	3
1	2	2	3
0	0	0	0
	75		

Thus, a student with a raw score of 5 has a percentile rank of 33, i.e. approximately 2/3 of the students score approximately 1/3 less. Large percentile differences near the 50th percentile or median score may represent small raw score differences and small percentile differences at the top or bottom of the range may represent large raw score differences. Percentile ranks cannot be added; they do provide comparison in terms of a reference group.

• A histogram constructed from the frequency tabulation of raw scores provides a useful diagrammatic representation of several test characteristics and is a valuable piece of information to provide. Its shape is a useful guide to the meaning of such statistics as the standard deviation etc.

• Profile Reporting

Where a test has several components which are intended to measure different types of performance, profile reporting may be appropriate. This involves reporting separately on different areas of skill or knowledge rather than reporting an aggregate mark derived from several Science tests which are directed towards measuring different characteristics. Aggregation may well degrade the quality of the information that can be provided if results in different areas do not inter-correlate. For example suppose we have the results of three Science tests:

Table 7: Marks on Three Papers of Science Tests				
Candidate	Paper I Recall of Information	Paper II Comprehension/Application	Paper III Practical Skills	Aggregate Mark
Kwasi	52	61	38	151
Kofi	37	41	72	150
Hamid	61	49	31	141
Nasreen	70	71	48	189
David	30	28	62	120

At a glance we can see that Paper III results do not appear to correlate positively with Paper I and II results. If we produce a single aggregate mark by addition we disguise useful information. Note that although Kwasi and Kofi have similar aggregates Kwasi has achieved his mainly through good performance on Papers I and II; Kofi, on the other hand, achieved his largely through a high score on Paper III. This clearly has implications for any individual attention that may be given to them to improve their performance as well as whether it is intended to allow performance in one area to compensate for that in others.

One way of reporting results like those above is to draw up a matrix of categories to provide indications of performance on different test types, e.g.

Name Kofi				Subject Science	
		Performance			
Recall of Information			X		
Comprehension/Application			X		
Practical Skills				X	
	Well below average	Below average	Average	Above average	Well above average

This procedure is not perhaps valuable when marks between tests are highly correlated. However, high correlation between test marks on different tests designed to measure different capabilities does raise questions concerning whether they do in fact measure different things. A scattergram of marks obtained on two tests (or different parts of the same test) provides a simple diagrammatic indication of the extent of correlation between measures of performance on different traits. Several statistical methods for calculating such correlations are available. See for example:

Standardizing Test Scores

Simple addition of raw scores to produce aggregates for overall ranking can be very misleading. Table 8 and 9 show this.

Table 8: Raw Scores on Eight Tests

	Subject								Total
	A	B	C	D	E	F	G	H	
1. Kwasi	80	50	80	50	25	60	32	42	419
2. Kofi	95	70	15	80	40	40	30	48	418
3. Hamid	30	80	65	20	70	55	34	40	414
4. Nasreen	81	60	30	60	60	36	44	42	413
5. David	94	20	75	50	50	30	47	46	412
6. Kim	60	90	20	75	30	45	45	46	411
7. Naisun	100	40	40	70	20	40	52	48	410
8. Cream	10	75	50	55	30	60	56	45	381
9. Sam	31	30	60	70	48	35	55	50	379
10. Nona	80	10	50	25	30	70	50	55	370
11. Sharifah	20	80	50	30	40	55	60	52	367
12. Vina	70	25	10	50	40	50	55	60	360

Table 9: Scaled Scores on Eight Tests

1. Vina	67	19	0	50	40	50	83	100	409
2. Sharifah	11	88	29	17	40	63	100	60	408
3. Nana	78	0	57	8	20	100	67	75	405
4. Sam	23	25	71	83	56	13	83	50	404
5. Cream	0	81	57	58	20	75	87	25	403
6. Naisun	100	38	43	83	0	25	73	40	402
7. Kim	56	100	14	92	20	38	50	30	400
8. David	93	13	93	50	60	0	57	30	396
9. Nasreen	79	63	29	67	80	15	47	10	390
10. Hamid	44	88	79	0	100	63	13	0	387
11. Kofi	94	75	7	100	40	25	0	40	381
12. Kwasi	78	50	100	50	10	75	7	10	380

Table 9 indicates the results of applying a simple scaling correction for the range of marks used. Rank order is completely reversed.

$$\text{Scaled Score} = (\text{Raw Score} - \text{Minimum Raw Score}) \times \frac{100}{\text{Range of Raw Scores}}$$

This correction does not standardize the marks and give equal weightage to each component though it is a better reflection of relative performance than raw scores alone.

Standardization of marks on different tests to give equal weightage to all components is most simply accomplished by computing a corrected score that relates performance on each paper to the mean and standard deviation of marks obtained. A standard score or Z-Score can be simply derived

$$\underline{\text{Z} - \text{Score}} = \frac{\text{Raw Score} - \text{Mean Score}}{\text{Standard Deviation}}$$

$$= \frac{\text{Deviation of Raw Score}}{\text{Standard Deviation}}$$

This can be converted to a mark that does not go negative by employing an arbitrary scale with, for example, a mean of 50 marks and a standard deviation of 15.

The standardized mark then becomes

$$(\text{Z-Score} \times 15) + 50$$

Summing standardized marks of this kind does give equal weightage to each component score in terms of relative performance under certain conditions.

Suppose we have 5 candidates taking 3 papers and we want an indication of overall performance, weighting each paper equally. The aggregate and standardized aggregate scores are as shown below.

Table 10: Aggregate and Standardized Aggregate Scores of Candidates

Candidate	Paper 1	Paper 2	Paper 3	Aggregate	Rank	Standardized Aggregate	Rank
Kwasi	68	48	63	179	1	164	1
Kofi	60	74	43	177	2	151	3
Hamid	46	59	71	176	3	157	2
Nasreen	40	87	37	164	4	131	5
Kim	76	32	51	159	5	148	4
Mean Raw Score	58	60	53				
Standard Deviation	13.39	19.26	12.52				

Under certain conditions standardization can change the rank order of candidates when aggregate scores are compiled. It will almost certainly modify the magnitude of differences in relative performance. Standardization techniques of this kind are only really appropriate to large populations where distributions approximate a normal curve. They can themselves be misleading when applied to very skewed distributions.

2.3. Developing and Administering Tests in Primary Science and Agriculture - A Practical Exercise

Udo Bude & Keith Lewin

This chapter discusses the need to improve skills in the creation of assessment items used in primary school leaving examinations in Africa. The first section provides a rationale for the importance of this kind of activity. The second gives an overview of a workshop process that we have found useful in encouraging reflection and developing skills. It includes examples of workshop tasks which provide a condensed experience of the test construction, review, administration, analysis and revision process based on material used in the workshop held in Nyeri in Kenya in 1994. The test instrument created was piloted in Kenyan schools. Results were analysed using simple techniques to provide a basis for appraisal of performance characteristics and quality of the items that had been generated.

The need to improve the quality of test and examination questions is well established. Studies in Africa from the early 1980s and before attest to great variations in the technical attributes of test items between countries, the importance of examination content in influencing teaching and learning, and the possibility that existing procedures and instruments may lack adequate reliability, validity and curricula relevance. (ILO/JASPA 1981; Somerset 1982; Oxenham (ed.) 1984; Somerset 1988; Kellaghan and Greaney 1992). In this section we focus especially on the construction, analysis, and review process for multiple-choice styles of test construction. This is not because they are the only or perhaps the best way of assessing achievement at the end of the primary cycle. It is because they are indeed the most widely used style of test construction at this level. They offer advantages of cost, convenient administration, wide sampling of the curriculum, reliable marking, and convenient statistical methods of checking for some types of fraudulent behaviour. The well-known limitations include the inability to assess some types of valued outcomes, uncertainties over how correct responses are generated, influences on the curriculum in action that may discourage some types of classroom activity, and the risk that school achievement is narrowly defined by performance on them. The advantages can only be realised where technical quality is high, administration is efficient and honest, and item writers can set questions which span an appropriate range of cognitive outcomes. The disadvantages are also limited where these conditions are satisfied. This is why adequate training and support for those who become item writers is needed.

Many of those who become test constructors have backgrounds and experience that only prepare them partially for the demanding roles that they are required to play. They may have taught for many years in the school system at a particular level and find themselves required to examine at other levels (especially the case with primary school leaving examinations which are often constructed by those whose teaching experience is at secondary level). They may have worked in different parts of the Ministry of Education unrelated directly to examining and test construction as administrators, or inspectors. Even those with a background in curriculum development are unlikely to have a significant amount of specialised training in examination construction. A wide range of skills are needed for effective test construction. These include a sophisticated awareness of children's thinking in Science at different ages and the ability to translate this into questions which have appropriate levels of cognitive demand and are expressed using language structures that are accessible to children (especially the case where the medium of instruction is not the mother tongue). It is also important to have detailed knowledge and understanding of the curriculum and its intended learning outcomes, preferably based on the experience of teaching the relevant curriculum at an appropriate level. Statistical competence is essential if quantitative data on performance is to be interpreted meaningfully and pilot studies used to improve item performance against explicit criteria. Skill in deciding what balances should be struck between the demands on examinations to provide valid and reliable data for selection, to certify competencies against known standards, and to use the power of examinations to influence learning and teaching and support the achievement of curricula goals.

African examination authorities have become more and more aware of the need for systematic staff development to develop necessary skills and in many cases donors have assisted in supporting training programmes for staff. Though the picture is changing it is still all too frequently the case that the construction falls short of the standard that pupils and parents have a right to expect and governments need to have confidence in results that determine life chances and underpin quality improvement in education and increased levels of achievement. Any strategy that attempts to improve matters must depend on a mixture of in-house training and support, mutual assistance between examining authorities across Africa which can share expertise and training opportunities and access to external knowledge and expertise which reflects the most recent developments in the field.

The material presented in the rest of this chapter provides a basis for training and development exercises that can be mounted at within countries and at regional level and can readily be adapted to reflect specific demands of particular national systems. Thus, though we have chosen to base this exercise on the Kenya Std. 7 syllabus for Science and Agriculture, this was only chosen for reasons of expediency given that the practical application of the trial test materials was in Kenyan schools.

The Overview which follows explains step by step common procedures followed in the writing of items which can be used to develop a trial test paper of any number of items. It explains the process through which the pilot instrument was tried out in six schools, the results statistically and judgementally analysed, and the process of critical review that followed. In reality a revised test instrument would then have been designed and re-piloted to improve the quality of the test.

The item writing task is made up of a number of sections denoted **Information** and **Assignments.** Short summary contextual information is provided in the Information briefs which prepares the ground for the Assignments, each of which defines a task to be undertaken in groups. The trial test paper that was produced is then reprinted in full. Each group administered the test according to an agreed procedure that arose from discussion of good practice. This included standardised administration conditions, subsequent interviews with relevant teachers which were written up commenting on opinion concerning the quality and relevance of the items in the test instrument, and reflections on the administration of the test in relation to ideal conditions. Test data was then analysed manually by the groups. This was deliberate to ensure deeper understanding of the process than would be the case if results were simply entered into a computer to generate item statistics that might not be understood at all. The groups were then invited to reach judgements on the performance of the items based on the data generated. This was particularly fruitful when outcomes were compared with anticipated characteristics of performance challenging groups to explain why patterns emerged that they had not expected (thus some items were easier than anticipated and some more difficult, some differentiated more strongly between boys and girls than others in ways which were not predicted).

The tasks we have devised are designed to make use of the previous experience of participants. We deliberately tried to include in the groups individuals from an examination department background and those who had experience of curriculum development. It was also useful to spread subject expertise in the groups across the life and physical sciences.

In summary the process outlined below consists of:

- Basic Information Sheets containing information relevant to each task (Overview, Info 1)

- Assignment sheets specifying group activities used in construction, administering and analysing tests (Assignment 1, Infos 2-4)

- Test item development procedures (Assignments 2-4, Info 5)

- Item prediction (Assignment 5)

- Trialling in schools (Assignment 6, Test Administration)

- Marking procedures (see Marking Scheme for the Test Paper)

- Analysis of Items (Assignment 7, Infos 6 and 7)

At the end of this chapter some conclusions are reached on the further development of tests and enhancements to the workshop process.

2.3.1. The Item Writing Task

OVERVIEW

The task is to create a 30 item test which will be set in six local schools. The work will be organized in three working groups. Each group will produce ten to fifteen items. The specification for the items is as follows:

1. Items should relate to the following Topic Areas in Grade 7:

Science	**Agricultural Science**
Living Things Properties of Matter Weather Making Work Easier	Soil Conservation Diseases and Pests Simple Farm Accounts

Note: Read Info 1: Primary Education Syllabus, Kenya, May 1992

2. All items should be above the level of knowledge recall and recognition, i.e. at least comprehension or application level.

3. Each group should produce a total of 10-15 items, at least two of each category which assess learning outcomes related to:

→ Observation - skills of looking and seeing
→ Classification - skills of categorising cases according to rules
→ Measurement - skills of deciding how or what to measure
→ Recording Data - skills of deciding how to record data
→ Interpretation of Data - skills of interpreting data e.g. graphically

4. The procedure will be as follows:

→ all individuals draft at least two items after agreeing with group leader which areas they will cover to avoid unnecessary duplication;

→ each individual discusses each item written with other members of the group and revises the items;

→ group and group leader review all items produced to arrive at a list of about 10 items covering the curriculum areas identified above in Science and Agricultural Science;

→ each group constructively reviews work of other groups to improve items;

→ final list of items constructed;

→ 30 item instrument applied to pupils in six schools;

→ test papers marked by each group for the pupils tested (i.e. each group marks two schools only);

→ facility values and discrimination index calculated for each item;

→ each group reviews results on technical and other criteria;

→ summary report written commenting on items.

5. Test administration will take place in six schools - two high achieving, two average, two low achieving. Each group will be responsible for administering the test in two schools.

6. Each group will split into two sub-groups - one for each school visited. One member will make sure the items are administered effectively and answer any questions about the test. Other group members should prepare a semi-structured interview schedule to ask about assessment issues e.g. items on last years Primary School Examination e.g. which type of item pupils found most difficult/easy? Why? Which were»unfair«? Which did girls do best/worst? How do teachers prepare pupils for the examination? The visit should include reviewing pupils' work books and establishing which text books are available and how they are used. If possible, examples of test questions used by teachers should be collected.

7. Group leaders will organize the marking and simple statistical analysis and take responsibility for coordinating the production of a short written report.

8. Proposed Timetable

→ DAY 1	
am	Task introduction/
am	Writing individually
pm	Peer critiques/
pm	Item revision
→ DAY 2	
am	Group critiques of items/Revision
pm	Draft selection and compilation
→ DAY 3	
am	Inter group item critiques/Final selection
am	Interview preparation
pm	Production and copying/
pm	Predictions of item performance
→ DAY 4	
am	Administration and interviewing in schools
pm	Discuss and write up interview notes
→ DAY 5	
am/	Marking and statistical analysis
pm	
→ DAY 6	
am/	Analyses and report writing
pm	
→ DAY 7	
am	Reporting/Discussion of findings

SCIENCE (abstracts)

STANDARDS IV-VIII

I. INTRODUCTION

The work contained in this syllabus is presented in form of units. The units for each class need not be dealt with in the order in which they are written. The teacher should feel free to tackle any unit as might be dictated by environmental conditions and/or children's interests.

The teacher should, at all times, realise that SCIENCE IS DOING not just being told and therefore pupils should be actively involved in learning.

The teacher should use a variety of teaching methods, for example, nature walk, group activity, project work, demonstration, and so on, in handling the content.

Pupils and teachers should collect most of the resource materials required. Other materials should be constructed by pupils under the guidance of the teacher.

II. AIMS OF SCIENCE TEACHING

The main aims teaching Science in primary schools are:

1. To enable children to acquire and preserve certain useful ATTITUDES about themselves and their relationship with the environment.

2. To enable children to acquire a basic scientific KNOWLEDGE.

3. To enable children to acquire certain manual and thinking SKILLS which are useful in solving practical problems.

III. GENERAL AND SPECIFIC OBJECTIVES

At the end of the course the learners should be able to:-

1. Apply a problem solving approach to all investigations.

Specifically the learners should be able to:

(a) Identify problems, design investigations, examine evidence and take responsibility for their own learning.

(b) Demonstrate the skills of observation classification, measurement, recording, communication, making predictions, formulating hypotheses from evidence.

(c) Analyse cause and effect relationships, control variables and draw rational conclusions.

(d) Recognise the relevant information required to solve a particular problem.

(e) Use a variety of sources for acquiring any necessary information.

(f) Put in order the information gained during their study of science.

(g) Seek new ways of finding further information.

(h) Demonstrate feelings of self-confidence and a sense of working together.

2. Identify the major factors of, and develop and use appropriate skills and technologies for solving the problems relating to:-

(a) Conservation and utilisation of energy and other resources.

Specifically the learners should be better able to:-

(I) Observe and record how plant, animal, and human resources are used in their community.

(II) Devise other methods of utilising the above resources.

(III) Observe and record various sources and uses of energy.

(IV) Observe and analyse methods of conserving energy in the community.

(V) Make simple machines that make work easier.

(b) Use of communication.

Specifically the learners should be able to:-

Communicate using a variety of techniques e.g. writing, drawing, modelling, graphing, sketching and making charts, oral (debates, interview, discussions, drama), listening and interpretation of information.

(c) Public health and hygiene in the community.

Specifically the learners should be able to:-

(I) Practise care when handling medicines.

(II) Discuss dangers of drug abuse.

(III) Prevent drug abuse by educating self and others.

3. The learner should be able to collect, record, interpret and communicate for rational decision making.

This objective has no specific objectives. Rather it will be achieved through work in all other objectives.

4. The learners should be able to develop flexibility and adaptability in solving problems.

Specifically the learners should be able to:-

(a) Develop a willingness to listen.

(b) Develop a feeling of concern, care and consideration for others.

(c) Accept new ideas.

(d) Experiment with new ideas.

(e) Co-operate in group activities (family, class and community).

(f) Accept and participate in desirable cultural activities and practices.

(g) Share new ideas in the family, class and community.

(h) Educate family and community on these values and importance of new ideas.

(i) Adjust to new changes in the environment,

(j) Demonstrate honesty, patience and accuracy in solving problems,

(k) Recognise the need for flexible planning.

5. The learners should be able to adopt solutions to problems of management and conservation of available resources.

Specifically the learners should be able to:-

(a) Identify various human resources available in the community.

(b) Relate use of resources for meeting family needs to values, goals, standards and available resources.

(c) Consult with local experts when solving problems.

(d) Plan and use labour saving devices to save time and energy.

(e) Analyse and encourage recreational activities conducive to good physical and mental health.

(f) Make economic contribution to the individual and the community.

6. The learners will be better able to promote, preserve and evolve their national heritage for their cultural, spiritual and economic development.

Specifically the learners should be able to:-

(a) Make excursions to places of national cultural and scientific interest.

(b) Use their required scientific skills and knowledge to re-design and improve traditional tools and implements.

(c) Investigate the scientific validity of traditional beliefs and practices.

(d) Acquire a balanced perspective on such beliefs and practices.

(e) Take independent decisions when confronted with conflicting viewpoints arising from such beliefs and practices.

(f) Discourage those beliefs and practices which are detrimental to community health, spiritual well being and economic development.

7. The learners will be better able to identify and utilise opportunities for productive work in the home and the community.

IV. SUMMARY OF CONTENT

Standard Four:	Weather and Astronomy, Living Things, Heat, Making Work Easier, Properties of Matter, Health Education, Soil.
Standard Five:	Living Things, Soil Balancing and Weighing, Heat, Sound, Properties of Matter, Health Education.
Standard Six:	Weather, Living Things, Environment, Properties of Matter, Electricity, Making Work Easier, Health Education.
Standard Seven:	Weather and Astronomy, Living Things, Environment, Soil, Properties of Matter, Electricity, Making Work Easier, Health Education.
Standard Fight:	Living Things, Environment, Properties of Matter, Energy, Light, Making Work Easier, Health Education.

STANDARD SEVEN

Unit 1: Weather

(I) Constructing weather measuring instruments

- rain gauge
- wind vane
- wind sock

- liquid and air thermometer

Unit 2: Living Things

(I) Inter-dependence between:

- plants
- animals
- plants and animals

(II) Blood circulatory system

- heart
- blood vessels
- blood

(III) Importance of blood circulation

(IV) Composition of blood

- plasma
- blood cells
- platelets

Unit 3: Environment

(I) State the meaning of environment

(II) Describe components of the environment

(III) Pollution in:

- soil
- water
- air

(IV) Conservation of:

- soil
- water
- air
- plants
- animals

Unit 4: Properties of Matter

(I) States of matter (atoms and molecules should NOT be mentioned)

(II) Changes of state e.g. water to vapour

(III) Comparing weights of equal volumes in different substances

(IV) Density: Activities to demonstrate

- Units of density (No calculation of density required)

(V) Composition of air

Unit 5: Electricity

(I) Electric circuits in series and parallel using

- batteries and bulb (Ohm's Law not required)

Unit 6: Making Work Easier

(I) Motion

- making things move
- stopping moving objects

(II) Describe what force is

- mention units of force (No calculations required)

(III) Describe what friction is

- state advantages and disadvantages of friction
- reducing friction

(IV) Making work easier using levers e.g. wheel barrow

(V) Identifying positions of:

- fulcrum
- load
- effort

Unit 7: Health Education

Drug Abuse

(I) The health, social and economic implications of abusing the following drugs:

- tobacco
- alcohol
- miraa (khat)

(II) Demonstrate the effect of cigarette smoke on a piece of wet white material.

AGRICULTURE (abstracts)

I. INTRODUCTION

This course is designed for upper primary classes starting at Std. IV. The pupils are expected to have gone through the integrated Lower Primary Science Course as a foundation upon which this course shall be built.

By Standard IV, it is expected that the pupils will have developed to a stage where they can be introduced to practical Agriculture.

The course is designed to help both the pupils who will end their formal education at K.C.P.E. level and also for those who will go for further education. For this purpose, the course is meant to give pupils a foundation for real life agriculture if they take farming after school and also for further agricultural education in post-primary institutions.

The following are proposed guidelines which will help the teacher to organize and teach Agriculture.

1. Scheming

The teacher who will handle this subject should be familiar with local environmental changes and when they occur. This is important so that projects may be well timed to concur with these changes. Teachers also should as much as possible see that they relate the school activities with those being carried out in the community e.g. weeding - when the local community is weeding their crops....

2. School Shamba

In many instances, pupils' interest towards Agriculture is killed through use of school garden as a place of punishment. The garden should be looked upon as a place of learning, a laboratory to carry out experiments and a resource for ideas.

II. OBJECTIVES OF PRIMARY SCHOOL AGRICULTURE

1. To demonstrate through practical experience that agriculture is a profitable and honourable occupation.

2. To create awareness of the importance of agriculture in the daily life of various communities and Kenya as a whole.

3. To assist the pupils practically acquire agricultural knowledge and skills which are relevant and useful to their lives.

4. To stimulate genuine interest and develop positive attitudes leading towards active participation in agriculture.

5. To ensure that the schools take an active part in rural development by integrating agricultural activities in the school curriculum.

6. To develop self reliance, resourcefulness, problem solving ability and occupational outlook in agriculture.

STANDARD SEVEN

Unit 1: Diseases and Pests

(a) Crop Pest and Diseases

(I) Observing and identifying the differences between healthy and unhealthy crops.

(II) Identifying common symptoms of various diseases and pests on crops.

(III) Identifying nutrient deficiency in crops.

(IV) Finding information on and practising methods of control and treatment of the common diseases in crops.

(V) Methods of maintaining soil fertility.

(b) Livestock Diseases and Parasites

(I) Observing and identifying the differences between healthy and unhealthy animals.

(II) Identifying symptoms of various diseases and parasites on animals.

(III) Finding information and practising methods of control and treatment of the various diseases and parasites in livestock.

Unit 2: Animal Feeding

(I) Discussing the constituents of balanced diet e.g. carbohydrates, proteins, vitamins, mineral salts, water.

(II) Identifying common feeds on the farm for feeding livestock.

(III) Identifying the nutritional deficiency symptoms in livestock.

(IV) Practising feeding the animals on school/home farm with balanced diet.

Unit 3: Soil Conservation

(I) Discussion on soil conservation methods.

(II) Visiting farms and identifying soil conservation methods used in the community.

(III) Practising some of the methods of soil conservation on school/home farm or garden e.g. mulching, cover cropping, terracing, contour farming, tree planting.

Unit 4: Fish Farming

(I) Finding information on the following:

- (a) siting a fish pond
- (b) construction of fish pond
- (c) type of fish kept
- (d) fish rearing, fish harvesting, fish preservation, fish marketing.

(II) Constructing a fish pond where possible.

(III) Rearing some fish in the pond.

(IV) Visiting some fish farms where possible.

Unit 5: Storage

(I) Studying the various methods of storage in the community both traditional and modern by visiting:

- (a) large/small scale farms
- (b) dairies
- (c) marketing boards' stores
- (d) co-operatives stores

(II) Discussing storage of farm produce, agro-chemicals.

(III) Observing and practising the methods used in keeping the stores clean, safe, dry and free from pests.

Unit 6: Youth Organizations

(I) Discussing the roles of youth agricultural organizations e.g. Young farmers Clubs, 4-K clubs (Kuungana, Kufanya, Kusaidia Kenya).

(II) The relationship of Y.F.C. to the Agricultural Society of Kenya.

(III) Identifying the roles of youths in these organizations at school, home and national level.

(IV) Participating in community projects which are agriculturally oriented e.g. construction of dips, water projects, freedom from hunger walks, national youth weeks etc.

(V) 4-K Club activities.

(VI) Participating in activities of agricultural organizations e.g. agricultural shows, farmers field days, etc.

Unit 7: Methods of Grazing

Discuss the following methods of grazing including their advantages and disadvantages.

(I) Rotational grazing

(a) paddocking
(b) strip grazing
(c) tethering

(II) Zero grazing (stall feeding)

(III) Herding

NB: Visiting local farms to see how these methods are carried out.

Unit 8: Simple Farm Accounts

(I) Discussing and identifying documents used in farm accounts.

(II) Importance of farm accounts.

(III) Discussing and identifying types of farm accounts.

Assignment 1: Basic Instructions

• 3 working groups - each group produces 10-15 items.

• All items should be above the level of recall and recognition.

• Items to cover topics and skills identified in table of specification.

• Each person drafts two multiple-choice items for different learning outcomes.

→ Items should have a key and three distractors.
→ Items should fit into half a page or less.
→ Art work should be sketched.

• Items should be reviewed by half groups and revised.

• Group leaders should coordinate production of items.

• Each item should indicate the name of the developer and the topic/skill areas intended.

REMEMBER THE ART WORK

IF STUCK LOOK AT RESOURCE MATERIALS AND DISCUSS WITH ANOTHER GROUP MEMBER/FACILITATOR!

EXAMPLES:

Table of Specification - Topics by Skills					
Content	**Observation**	**Classification**	**Measurement**	**Recording**	**Interpretation**
Living Things					
Properties of Matter					
Weather					
Making Work Easier					
Soil Conservation					
Diseases and Pests					
Simple Farm Accounts					

GROUP 1		
Name	**Topic**	**Skill**
1. Mwanza	Living Things	Observation
	Weather	Classification
2. Mariam	Soil Conservation	Measurement
	Properties of Matter	Interpretation
3. Grace		
4. Moshoeshoe		

Info 2: Advantages and Disadvantages of Multiple-Choice Questions

Multiple-choice questions require pupils to select the correct answer from among several options - typically options»A«through»D«or»True«and»False«. In other types of questions pupils construct their responses, in writing, speaking, or perhaps by creating a piece of art or music.

Multiple-choice question types can have a dramatic effect on what happens in the classroom. If the examination primarily contains items which have pupils selecting from among options, then pupils are likely to spend much of their time preparing for the test with worksheets in which they select the correct answer. This type of behaviour is less likely to help pupils make the extensive web of mental connections which help them to understand and use what they learn in school. However, multiple-choice questions are a very efficient way to measure a large body of knowledge and are likely to be an integral part of any test developed and used for large-scale testing.

Advantages	Disadvantages
• Because multiple-choice questions take little time to answer, a test can measure a broader range of content than is possible with a test which relies solely on essay items or performance tasks. • They are less costly to score. If specially prepared forms are used, they can be machine scored, allowing thousands of answer sheets to be scored in a very short period of time.	• It is more difficult to design multiple-choice questions which measure higher levels of thinking and problem solving. • It is more difficult to design questions which measure more complex, real-life types of skills and thinking. • They take more time to develop because of the need to construct four or five response choices. • Multiple-choice tests promote multiple-choice teaching -that is, teaching where students are always looking for the one right answer.

Advantages	Disadvantages
• They are an efficient way to measure recall of factual knowledge and some skills.	• There is a high chance of being able to get the correct answer by guessing, which is not the case with performance tasks or essays. If a multiple-choice question has four options, the student has a 25 percent chance of guessing the item correctly.

Note: This information is based on Capper, Joanne (March 1994) Testing to Learn... Learning to Test. A Policymaker's Guide to Better Educational Testing. Executive Summary. Academy for Educational Development, Washington D.C., p. 23.

Info 3: Format of Multiple-Choice Items

STEM	Pupils of Makumbe Primary School have observed for a number of years that their maize crops get damaged by strong winds.		
	What should they do to stop the damage in future?		
	A. Apply more fertilizers to their maize crop.	**X**	
DISTRACTOR	**B.** Grow a short maize variety.	**X**	OPTIONS (A-D)
	C. Intercrop maize with beans.	**X**	
KEY	**D.** Plant trees around their maize plot.	**X**	

NOTE:

• The stem should not test trivia.

• The stem should set an unambiguous task.

• The stem should not contain any kind of»cues«(hints, signals etc.).

• The stem and all options should be checked for reading level (especially if language of instruction differs from regional/local languages).

• The options should all be plausible, comparable and similar in essential particulars.

• Avoid grammatical clues in the options.

• The key must be absolutely correct.

• The distractors must be indisputably wrong.

Info 4: Suggestions to Consider in Writing Higher-Order Items

• Avoid questions that start with words such as who? what? when? where? These always solicit factual information.

• Use words like why?, because... These require students to reason.

• Give a set of conditions and ask the students to predict a future result.

• State a problem and ask the students to suggest a solution, e.g. separating salt from sand.

• Use as much stimulus material as possible, e.g. diagrams, pictures, graphs, tables. These are easier to set questions on than long winded statements.

• While thinking of the item to write, think in terms of problems to be solved rather than facts to be remembered.

• Always strive to use real life problems instead of abstract concepts.

PRACTICE MAKES PERFECT. KEEP ON TRYING. DO NOT GIVE UP

Assignment 2: Item Writing and Gender Aspects

Recent Curriculum Revisions/Reforms have introduced changes designed to make subjects like Science and/or Agriculture more relevant. An important aspect of this is to ensure that new courses are equally relevant to boys and girls. Items developed for examination need to be checked thoroughly for gender bias.

As the next step review the items developed so far in your working group and consider the following questions:

- Does the language used for the items show gender bias? (Is»he«used more than»she«, boys' names more than girls' names, first person or third person accounts of situations etc.).

- Do the items cover situations and topics likely to be of interest to both girls and boys and circumstances they have experience of? (Work environments, home life, school experiences).

- How many women/girls - men/boys feature in the items?

- Do illustrations show women/girls in a positive or negative way?

- Are there any differences between female/male illustrations? (Who is shown in a modern or in a traditional context. Who features in what kind of situations?).

- On which questions are boys likely to perform better; on which are girls?

- Do any items relate specifically to concerns likely to be of special interest and relevance to girls or boys? (infant care, child birth, inheritance, farming activities etc.).

Info 5: Gender Stereotypes in Science Teaching/Learning

Girls appear to underachieve in most scientific areas in comparison to boys in many countries in Africa, especially when their participation rates are taken into account.

This cannot be explained by biological or intellectual factors, but rather by peer pressure and cultural expectations which influence the design of school curricula, the nature of examinations, which may include items which favour boys rather than girls, and the way Science is taught in schools (some topics may be less interesting for girls; teachers reinforce stereotypes prevailing in society; boys receive more attention; textbooks contain gender bias etc.).

Working against Stereotypes:

- Given appropriate conditions girls achieve in Primary and Secondary Science as well as, if not better, than boys.

- Research has produced no reliable evidence that girls have less Science ability than boys have.

- When girls see that Science addresses their concerns and values they show just as much interest as boys do.

- When girls recognise that a problem relates to areas that are important to them, and they are free to include contextual aspects, they are able to produce valuable and realistic solutions to problems.

• Though differences may exist between boys and girls (e.g. in spatial awareness, verbal reasoning, numerical facility) they are small and may differ between populations, and are unlikely to have significant effects on school achievement in Science. Given time, girls can weigh up aspects of the complex problems they perceive and come to conclusions which they can justify.

• Girls have the same rights as boys to acquire relevant skills and understanding to serve as a base for citizenship and employment.

Adapted from: Harding, Jan (July 1992) Breaking the barrier. Girls in science education.

FOR FURTHER READING:

Eshiwani, G. (1988) Participation of Girls in Science and Technology Education in Kenya. Ann Arbor. Michigan State University (Working Paper 168).

Obura, Anna P. (1991) Changing Images. Portrayal of Girls and Women in Kenyan Textbooks. Nairobi/Kenya.

Tsayang, G.T. & Ngwako, A.D. et al. (eds.) (Sept. 1989) Gender and Education. Proceedings of a Workshop. Occasional Paper No. 2, University of Botswana. Gaborone.

Assignment 3: Individual Review of Test Items and Prediction of Outcomes

• In terms of difficulty (D)

• Discrimination (do the best students get the item correct?)

• Most powerful distractor

• Differences between boys and girls

Make a table of the following kind:

Item Number	Difficulty	Discrimination	Distractor	Gender Difference
1	H	L	A	B
2	M	M	C	G
3	L	H	B	B
4	M	L	A	G

H = High, M = Medium, L = Low
B = Boys>Girls G = Girls>Boys

Assignment 4: Further Review of the Draft Test

• Split into three groups.

• Analyse test items in sub-groups of two or three. Participants identifying key and the length of time to complete. Do not stop to argue. Note items where there is a problem.

• Meet in groups 1, 2 and 3. Return to problem items and suggest essential editing. Indicate items to be discarded. Write down suggested edits and pass on for correction. Each group concentrates on parts of the test:

For example:

Group 1 to concentrate on items 1-14.
Group 2 to concentrate on items 15-26.
Group 3 to concentrate on items 27-38.

Make suggestions on other items if more were produced and if there is time.

→ Check clarity of stem - can you understand what you are asked to do?

→ Is key clearly correct?

→ Are distractors suitably balanced?

→ Is diagram ok?

→ Is language ok? (Consider primary students' level of English).

→ Select the final 30 items for the **Test Paper.**

TRIAL TEST PAPER: Science and Agriculture (incl. Making Scheme)

Time: 1 hour

1. This booklet consists of 30 questions.

2. Write your name and the name of your school below

your name ____________________
name of your school ____________________

3. Indicate below by a tick (√) whether you are a boy or a girl

boy ( )
girt ( )

4. For each of the questions in this booklet four answers are given. The answers are lettered A, B, C, D. In each case only one of the answers is *correct.* Choose the correct answer and circle it using a pencil as shown in the following example:

<u>Example</u>

The process by which water is lost to the atmosphere from the soil is called

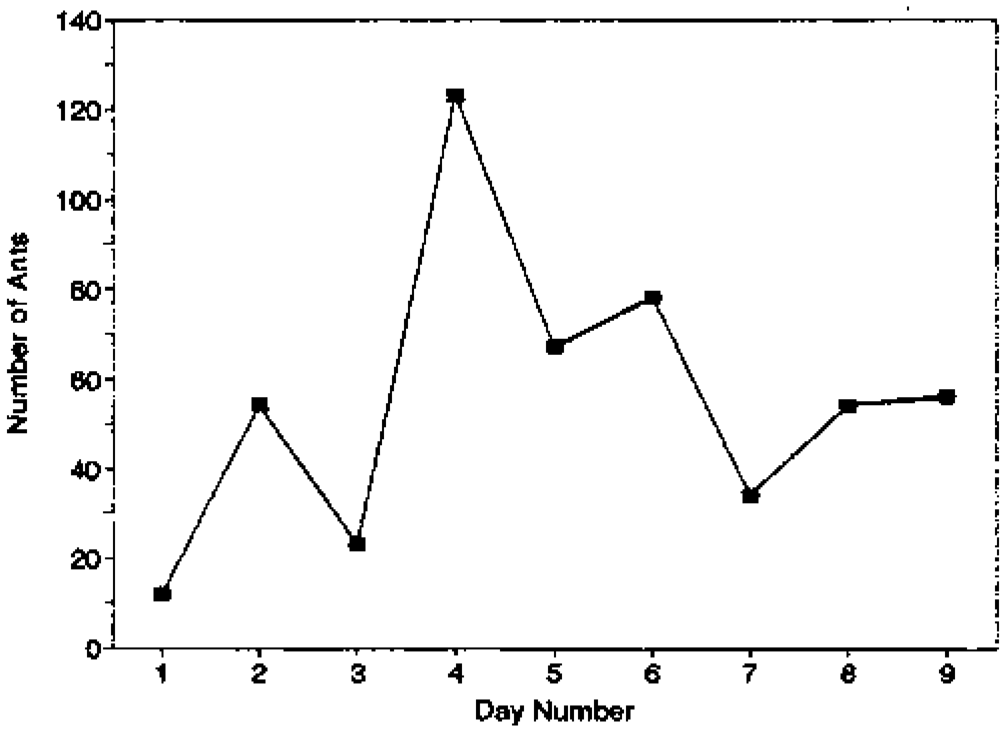
A. Condensation
B. Evaporation
C. Distillation
D. Transpiration

The correct answer B is circled, if you want to change the answer that you have circled rub it out and circle a new answer.

5. Answer ALL the questions

Note: This TRIAL TEST PAPER was developed by participants from Eastern and Southern Africa during a workshop on»Writing of Test Items for Primary School Leaving Examinations«, Nyeri/Kenya 1994, jointly organized by the German Foundation for International Development (DSE) and the Kenya Institute of Education (KIE).

1. Standard 7 pupils at Mathaithi Primary School studied and counted ants on a 4 square metre piece of land. They kept the following record for 9 days.



Number of Ants on Different Days

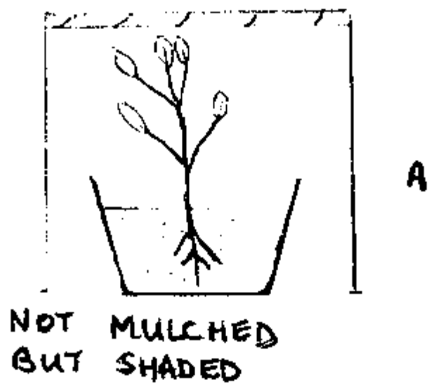
On which days did they find less than 50 ants?

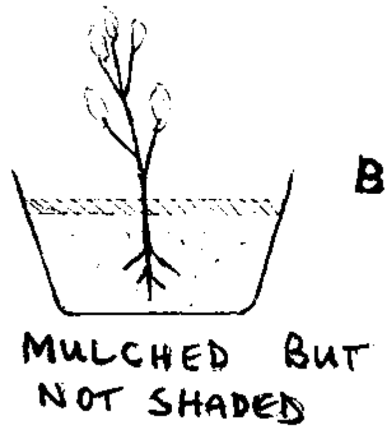
A. Days l, 3 & 6
B. Days 3, 5 & 6
C. Days l, 3 & 7
D. Days 2, 4 & 5

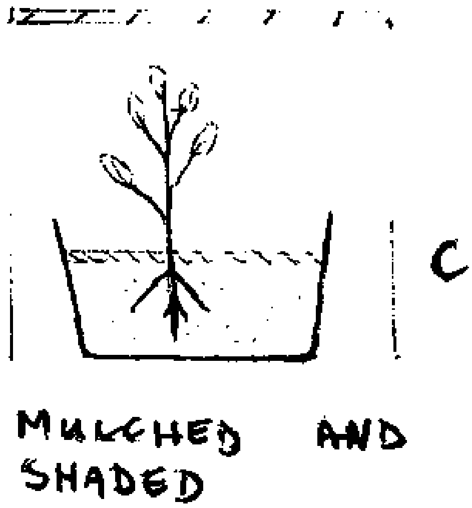
2. Which one of the following weather instruments is INCORRECTLY matched with what it is used to measure?

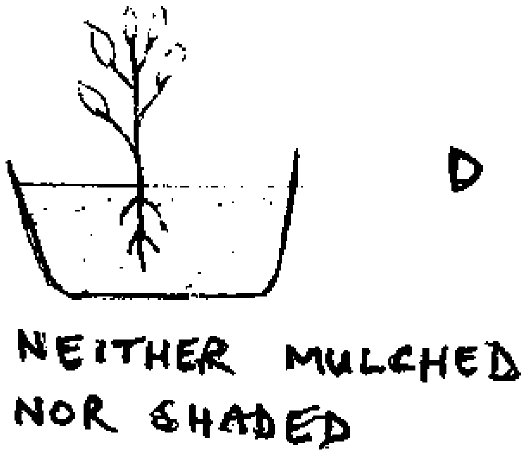
	Instrument	Use
A.	Anemometer	Windspeed
B.	Thermometer	Temperature
C.	Hygrometer	Rainfall
D.	Barometer	Pressure

3. John planted some seedlings in pots as shown below.









Which of the pots will conserve more water

A. Not mulched but shaded
B. Mulched but not shaded
C. Mulched and shaded
D. Neither mulched nor shaded

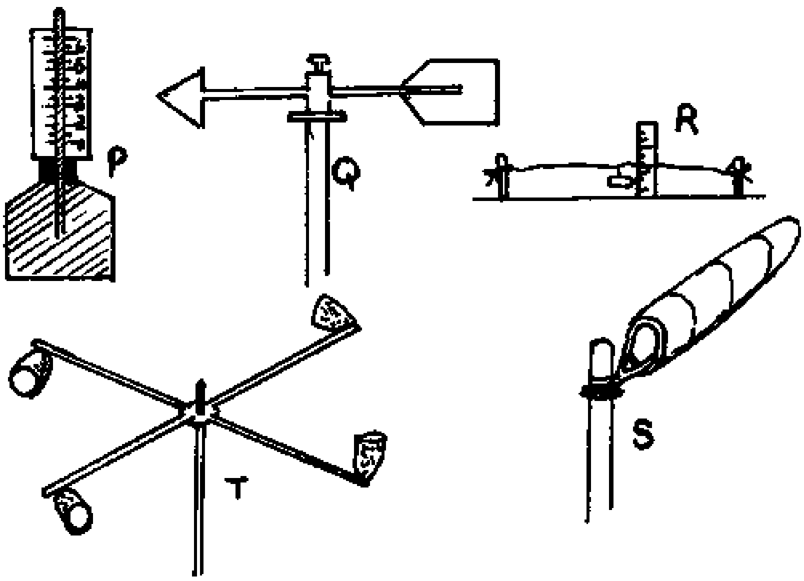
4. Look at the chart which gives the weather recorded by a Standard 8 class for a period of 5 days:

Day	Temperature	Humidity	Cloud/Sun	Rainfall
1	29°C	2 units	Half sun/half cloud	0 mm
2	19°C	8 units	no sun/full cloud	30 mm
3	20°C	6 units	half sun/half cloud	12 mm
4	28°C	2 units	sun	0 mm
5	30°C	1 unit	sun	0 mm

Which of the following conclusions are they most likely to have made?

A. Low temperatures, low humidity and some sun bring rain.
B. Low temperatures, high humidity and thick clouds bring rain.
C. Low temperatures and low humidity *bring* clouds.
D. High temperatures and high humidity bring some rain.

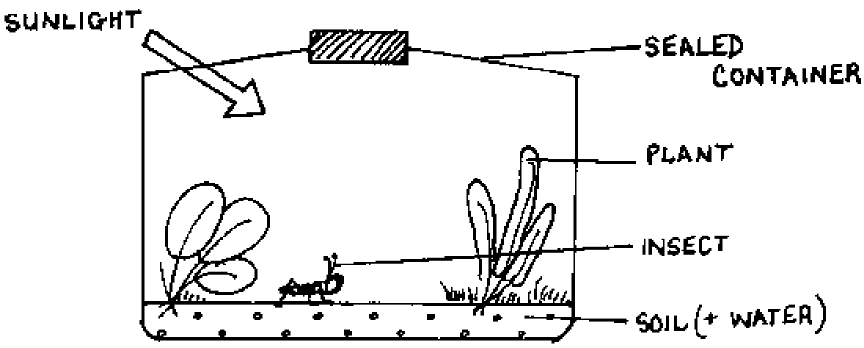
5. Look at these drawings of apparatus used to measure the weather:



Which two items of the above apparatus measure the SAME weather characteristic?

A. P and R
B. Q and R
C. T and P
D. Q and S

6. Study this arrangement of a sealed, large transparent container:



Select the <u>MAIN REASON</u> why these plants and the insect can live together (for some time) in the sealed container:

A. The insect may eat the plants.
B. The plants use the carbon-dioxide.
C. The plants recycle oxygen and water.
D. The plants use water.

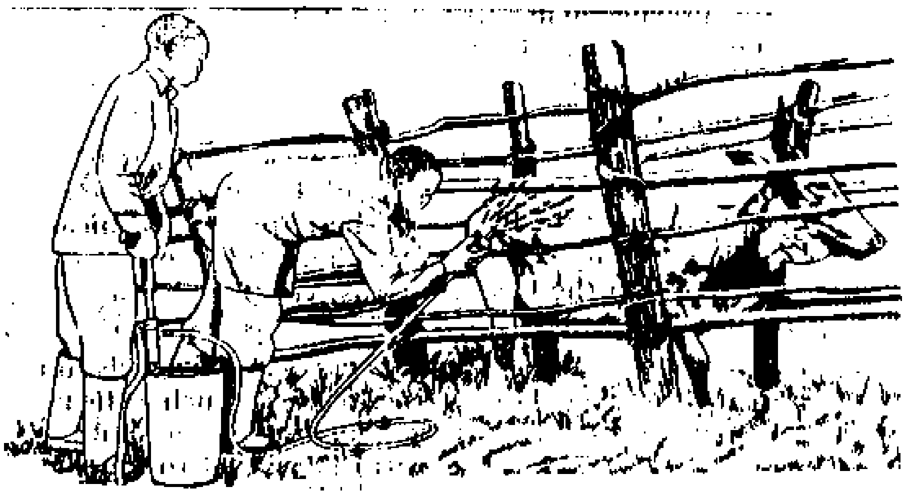
7. The list below gives the methods commonly used to control soil erosion

i) mulching
ii) planting vegetation
iii) constructing gabions
iv) terracing

Which of these methods would BEST be used in an area with a gentle slope?

A. (i) and (iv)
B. (i) and (ii)
C. (ii) and (iii)
D. (ii) and (iv)

8. The diagram below shows Peter and Mary carrying out an activity to control animal parasites.



The parasite being controlled is most likely:

A. Flea
B. Tick
C. Tsetse fly
D. Wireworm

9. The leaves of most tea plants on a farm look pale yellow between the veins while the veins themselves are green. What is wrong with the tea plants?

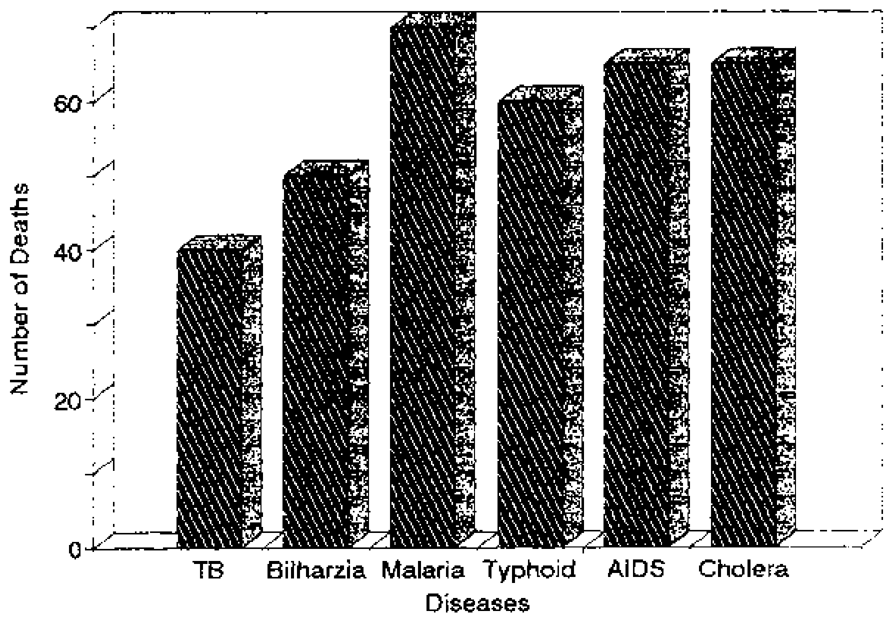
They are:

A. deficient in nitrogen.
B. deficient in magnesium.
C. attacked by tea thrips.
D. deficient in calcium.

10. Which of the following sets of diseases is caused by the same type of organism?

A. cassava mosaic, tobacco mosaic and blight
B. blight, coffee berry disease and rusts
C. black rot, maize streak and bacterial wilt
D. blight, black rot and rusts

11. Study the bar graph below which shows the number of people who died from various diseases in country X and answer the question that follows:

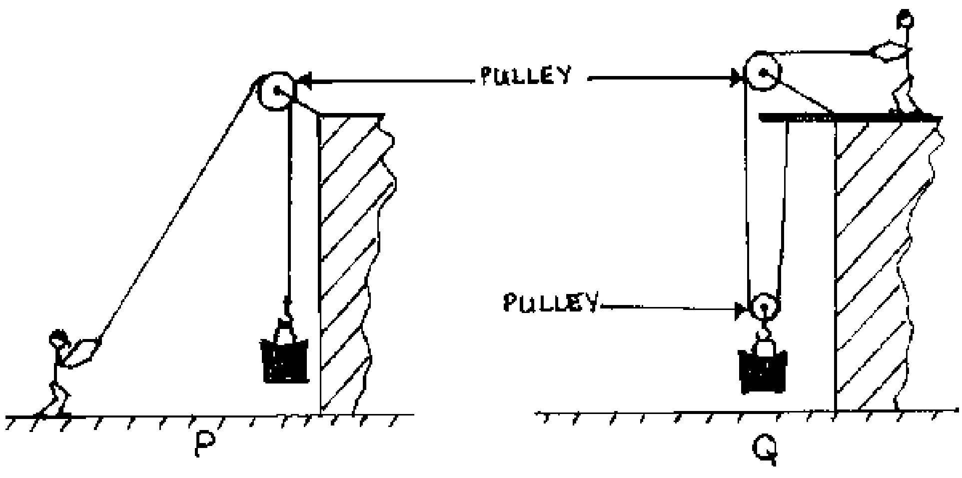


Deaths by Type of Disease

Which of the following is true according to the graph?

A. Tuberculosis (TB) and Cholera killed 120 people.
B. Bilharzia and Typhoid killed 120 people
C. Malaria and AIDS killed 135 people.
D. Cholera and malaria killed 140 people.

12. Diagrams P and Q show two men lifting two pails of equal weight up to the ceiling.



In which picture does the man have to pull less hard?:

A. P because he is on the ground.
B. Q because he is on the ceiling.
C. Q because he applies less effort.
D. P because he is pulling downward.

13. The table below shows an egg production record on Mr Kamau's farm in a certain week.

Day of the Week	Mon	Tue	Wed	Thur	Fri	Sat	Sun
Number of Eggs	60	56	65	63	67	55	60
Number of Damaged Eggs	7	2	11	9	12	0	6

If all the eggs were sold, on which days of the week did Mr Kamau get the highest returns?

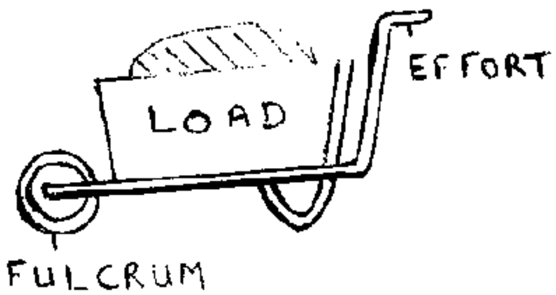
A. Monday and Friday
B. Monday and Tuesday
C. Thursday and Saturday
D. Friday and Saturday

14. What would be the main aim of a farmer who plants maize in the first season, beans in the second season, and potatoes in the third season in his shamba?

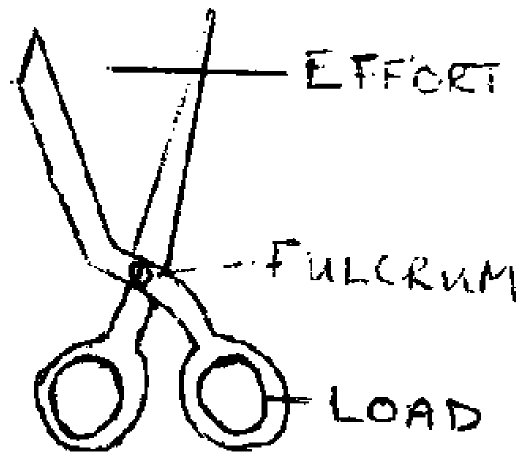
A. To improve crop yield from an unproductive shamba.
B. To provide the farmer with a variety of crops.
C. To maintain a good crop yield without loss of soil fertility.
D. To select a crop most suited to the season.

15. In which of the following lever systems are the load, effort and fulcrum labelled correctly?

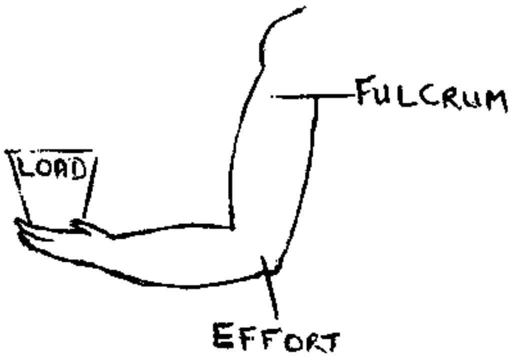
A



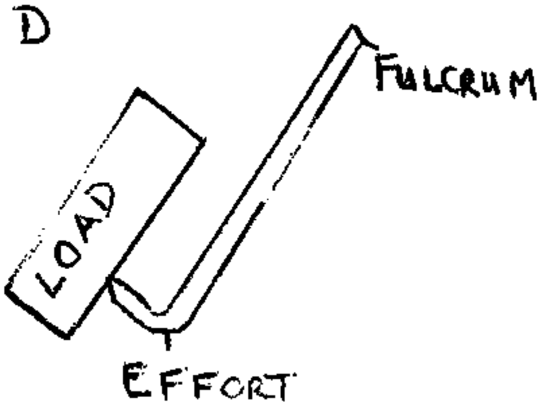
B



C



D

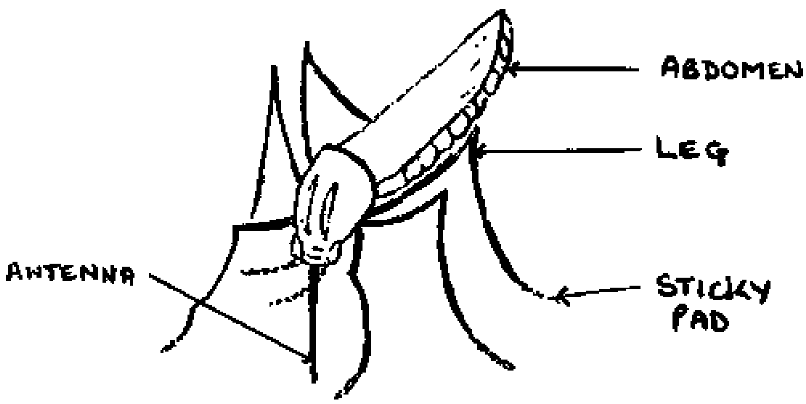


A.
B.
C.
D.

16. Maryam visits a farm where livestock are reared. She finds some of the cattle have watery eyes, hair loss on the tail end, and the abdomen and chest are swollen. Which disease are these animals likely to be suffering from?

A. Anthrax
B. East coast fever
C. Nagana
D. Foot and mouth

17. Below is a diagram of a certain insect. Which part is wrongly labelled?



A. antenna
B. leg
C. abdomen
D. sticky pads

18. Below is a record of sales and expenses for Tofila's farm in November 1993

SALES

Date	Details	Amount
Nov 1	Sale of rabbits	600.00
Nov 12	Sale of carrots	350.00
Nov 25	Sale of Tomatoes	355.00

EXPENSES

Date	Details	Amount
Nov 5	Wages	400.00
Nov 12	Pesticides	140.00
Nov 25	Fertilisers	800.00

Which one of the following conclusions can correctly be made from the record?

A Tofila made a loss in November
B. Tofila made a profit in November
C. The sale of tomatoes could pay for fertilisers
D. Tofila neither made a loss nor a profit

19. Which of the following farm information is correctly matched?

	Farm Information	Farm Record
A	Types of diseases and parasites contracted by farm animals	Marketing
B	Prices of farm products	Health
C	Sales and expenses	Inventory
D	Farm yields	Production

A.
B.
C.
D.

20. Below are a farmer's income and expenditure records for the month of January, 1993:

Date	Details	Shs
18-1-93	Paid for clearing field	830.00
20-1-93	Paid for ploughing	1050.00
25-1-93	Bought 50 Kg maize seed	2000.00
26-1-93	Sold chickens	2300.00
28-1-93	Sold eggs	1000.00
29-1-93	Sold tomatoes	580.00

What conclusion can be made from these records?

A. The farmer made least profit from the sale of chickens during the month of January 1993

B. The farmer made more profit from the sale of eggs than from the sale of tomatoes during January 1993

C. The farmer neither made profit nor loss during the month of January I993.

D. The farmer incurred loss during the month of January 1993

21. Which of the following things are interdependent?

A	B	C	D
Cattle	Pitcher Plant	Locust	Oxen
Tickbirds	Weaver Bird	Ants	Farmers

A.
B.
C.
D.

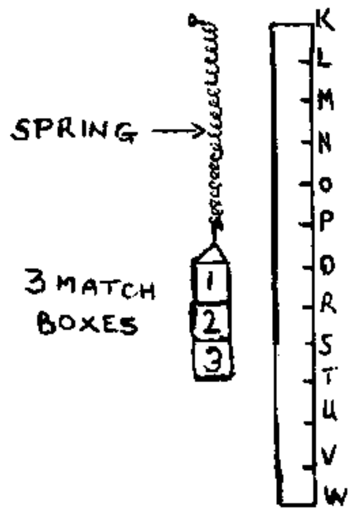
22. Which of the following shows the correct order of changes in state when water at 20° C was first cooled to -10° C and then heated to 100° C?

A. Liquid → gas → solid → liquid
B. Liquid → solid → gas → solid
C. Liquid → liquid → liquid → liquid
D. Liquid → solid → liquid → gas

23. A measuring cylinder was filled with water to the 30 cm^3 mark. A glass cube of sides of length 2 cm was then lowered into the measuring cylinder. What was the final reading on the measuring cylinder:

A. 8 cm^3
B. 28 cm^3
C. 32 cm^3
D. 38 cm^3

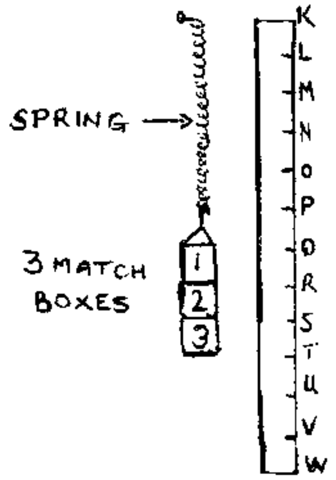
24. A stone was slowly lowered into water in a measuring cylinder marked in cm^3. The water level was originally at the 15 cm^3 level. The diagram shows the stone in its final position.



The volume of the stone was

A. 10.0 cm^3
B 7.5 cm^3
C 22.5 cm^3
D 15.0 cm^3

25. A spring of length KM will stretch to the position P when three identical matchboxes are hung at one of its ends as shown in the diagram



Which of the following statements points out what is likely to happen when a total of five identical matchboxes are hung at the end of the spring? It will stretch to position:

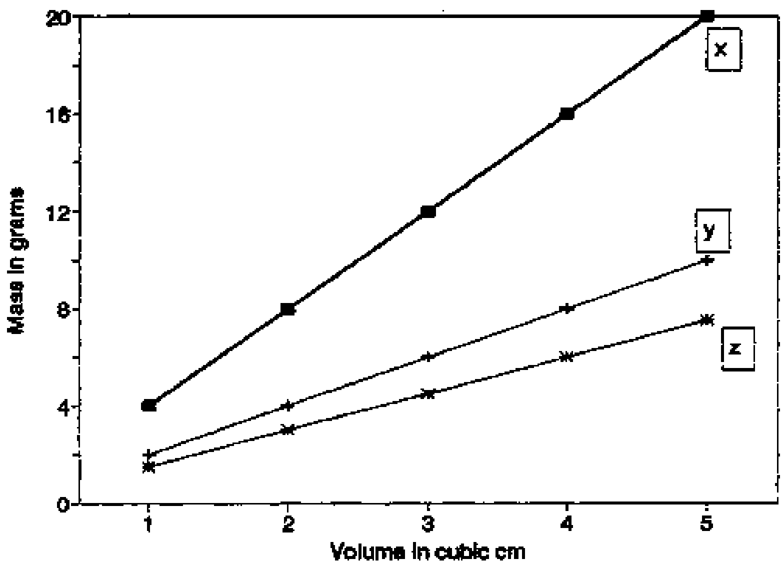
A. P
B T
C. U
D. V

26. Peter noticed that in his maize <u>shamba</u> some plants had large holes on the leaves and stem. The maize plants had most likely been attacked by:

A. Maize weevil
B. Grasshopper
C. Aphid
D. Stalkborer

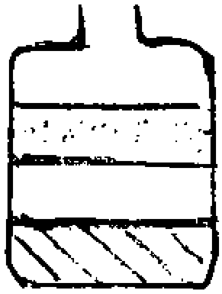
27. Below are graphs showing the relationship between mass and volume of three different liquids X, Y Z. The formula for density is

$$\text{DENSITY} = \frac{\text{MASS}}{\text{VOLUME}}$$



Mass of Liquid by Volume

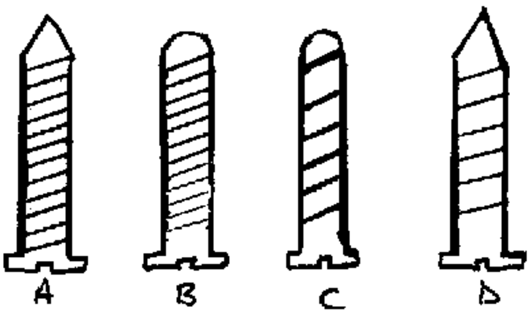
These three liquids were poured into one bottle shaken and allowed to settle as shown below.



Choose the correct statement below

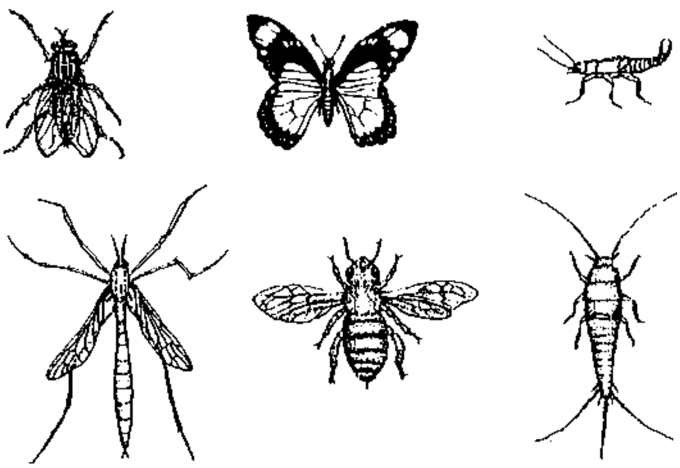
A. Liquid Z was found in the middle
B. Liquid X was found at the top
C. Liquid Y was found at the bottom
D Liquid X was found at the bottom

28. With the help of a screw driver you are required to drive four wood screws given below into a piece of wood. Indicate below which screw would require least effort to go into the wood.



A.
B.
C.
D.

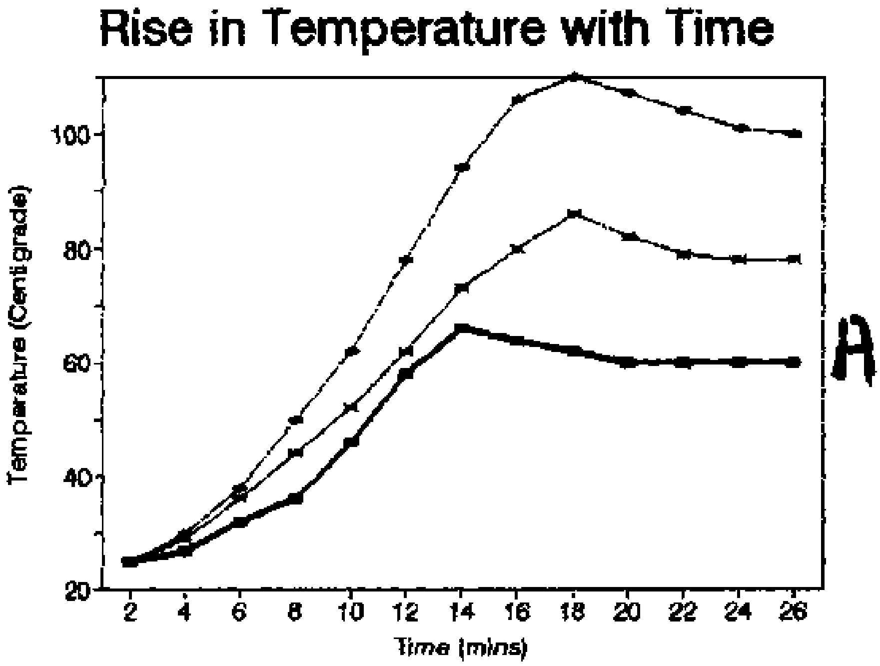
29. Observe the animals represented by the diagrams below and choose the statement that applies to all of them.

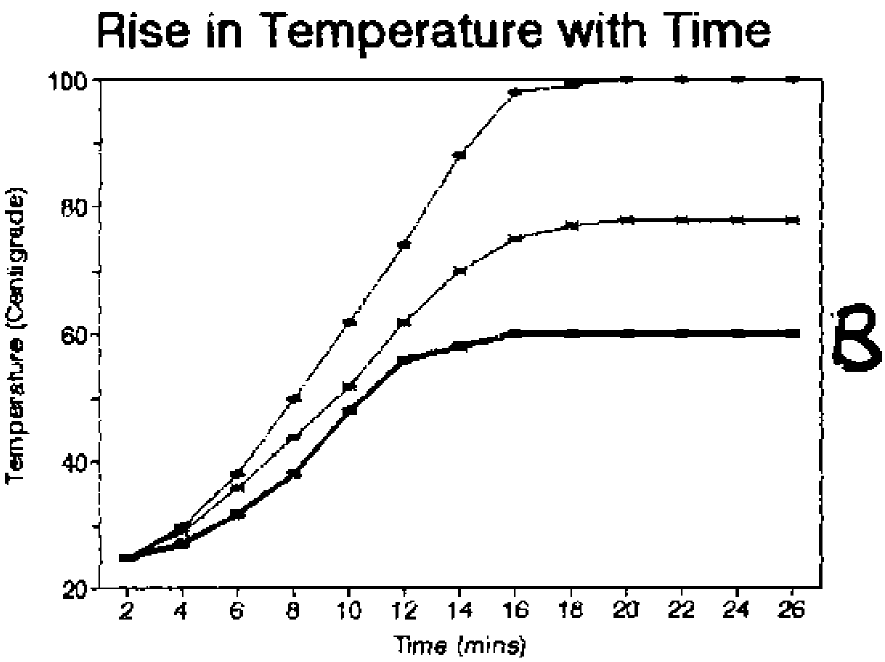


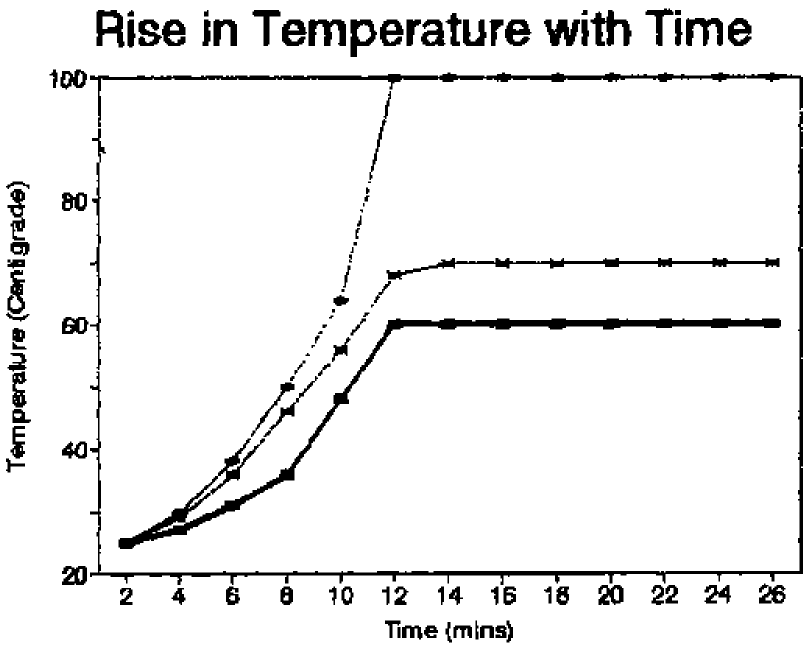
A. The wings can be easily seen.
B. The legs are longer than the body.
C. There is a pair of antennae on the head.
D. The abdomen has hair-like structures at the end.

30. Pupils from Bemba Primary School heated three liquids separately and took the temperature of each every two minutes. After boiling they continue to take the temperature for about 10 minutes. The first liquid boiled at 78°C, the second at 100°C, and the third at 60°C

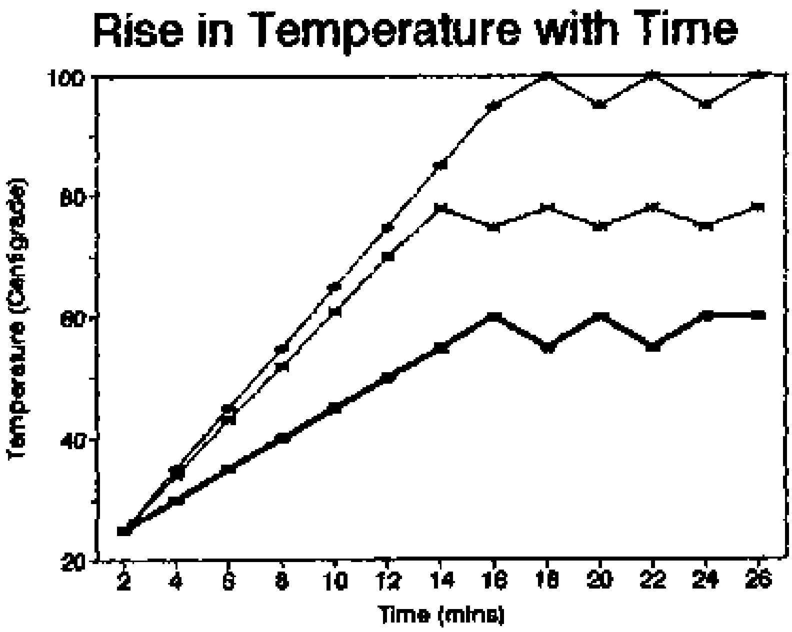
Which of the following graphs best show how the temperature of the liquids changed.







C



D

A.
B.
C.
D.

MARKING SCHEME FOR TRIAL TEST PAPER»SCIENCE & AGRICULTURE«

(1)	C	(16)	C
(2)	C	(17)	A
(3)	c	(18)	A
(4)	B	(19)	D
(5)	D	(20)	C
(6)	C	(21)	A
(7)	B	(22)	D
(8)	B	(23)	D
(9)	B	(24)	B

(10)	B	(25)	D
(11)	C	(26)	D
(12)	C	(27)	D
(13)	D	(28)	A
(14)	C	(29)	C
(15)	A	(30)	B

SUMMARY	
Key	Frequency of Items
A	5
B	7
C	10
D	8
Total	**30**

Assignment 5: Item Prediction

Look at the reviewed and edited 30 items of the final test paper. Before you start the trials in school try to assess the items in advance, and compare your predictions later on with the test results after the analysis of the data.

- Which items do you expect to be easy for the pupils?
- Which items do you expect to be difficult for the pupils?
- Which items would favour girls?
- Which items would favour boys?

- List those items which would discriminate well.
- List those items with the strongest distractors.

Assignment 6: Administration of Test

- Groups 1, 2, 3 split into two sub-groups.

- Each sub-group nominates test administrator.

- Test administrators meet to develop **brief note:**

  → How should the test be introduced?
  → What instructions should be given?
  → Time limit?
  → Queries?
  → Collection of papers.

- Other group members meet in group 1, 2 or 3. Design **interview agenda** for school visit.

  → Interview questions for Science teachers based on last year's examination paper, school based testing practices and assessment. Include some discussion of performance differences and difficult types of item.

  → Notes to review students' books.

  → Notes to observe facilities, especially textbooks, and school based tests.

  → Assume you have about 45 minutes to interview and 45 minutes to observe.

Info 6: Summary of Item Analysis Procedures

1. The analysis of multiple-choice items is usually undertaken for one of several reasons:

- A pre-test analysis is undertaken on a representative sample of candidates to determine which items have appropriate difficulty and discrimination.

- A post-test analysis is used to establish whether items have performed acceptably in terms of difficulty and discrimination.

- Analyses are needed of particular groups of candidates (e.g. girls, rural and urban) to decide what differences there are in performance and which kind of items produce most of the variation in performance.

2. Item difficulty (D) is established by calculating the proportion of candidates obtaining a correct response to each item or to the test as a whole. The simplest formula for this is

$$\mathbf{D = N_c / N_t}$$

where N_c = Number getting the correct response, and
N_t = Number of candidates responding to the item.

3. For norm-referenced tests, where the performance of each candidate is compared to that of others (and the expected distribution usually approximates a normal curve), it is desirable that average difficulty is about 0.5. This allows the maximum variation between candidates to occur. If most items are very easy D>0.70 or very difficult D<0.30 it will be difficult to separate out the performance of candidates and the level of discrimination will be low.

4. It may be desirable to include more items with D>0.50 than with less so that even poor candidates have the satisfaction of a numerical score that appears to approach 40 to 50%. The decision on the average D for a test is ultimately arbitrary, but it should not be so high that it seriously reduces discrimination levels in a norm-referenced test.

5. Items should be selected for their content validity. The value of D should be a secondary consideration. The value of D is not directly related to the cognitive level of items - e.g. recall items can have high or low D as can application items.

6. Criterion-referenced tests (where performance is compared to a criterion performance represented by the test item) are not concerned with discrimination across the range of scores. It is therefore inappropriate to select items for these tests on the basis of the “D”-value. The logic is that it is the criterion that is defined first and candidates are invited to achieve successful performance. If most do not, the criterion may be revised and vice versa. Mastery learning criterion-referenced tests assume that most will be able to master the performance and the value of D will be high.

7. Discriminating power refers to the ability of an item to separate candidates in a distribution that correlates well with performance on a complete test (or sub-test). High scoring candidates overall should score well on each individual item. If they do not, good candidates are performing poorly on an item and the reasons need investigation (e.g. they may be confused by ambiguous wording that less able candidates fail to perceive; the item may measure a different trait than the overall test).

8. The discrimination power (DI) of an item can be calculated simply by dividing candidates into quartiles (top 25%, upper middle 25%, lower middle 25%, lowest 25%) and applying the formula below:

$$\mathbf{DI = (N_u - N_l)/N_t}$$

where N_u = Number getting the correct response in the top 25%,
N_l = Number getting the correct response in the lower 25%,
N_t = Total number of correct responses in upper and lower groups.

Alternative methods divide candidates into two or three groups rather than four.

9. When DI is positive and > 0 the item is discriminating in the same way the test does. When it is negative and D< 0 the item is penalising those who score highly overall. When D is close to zero no useful discrimination is occurring.

10. A DI >0.3 is usually considered acceptable for a well behaved item. If DI is lower the item should probably be revised. Where DI is negative it may be measuring a skill or cognitive process unrelated to other items within the test.

11. Items can have an acceptable DI but have little or no content validity. The latter has to be assured.

12. Criterion-referenced tests need to discriminate in a different way to norm-referenced tests. With norm-referencing good discrimination is desirable across the whole range of marks. With criterion-referencing it is only significant at the level of the criterion performance - much better or much worse performance is not of concern for grading.

13. Distractors are those alternatives which are incorrect for each item. Analysis of the D and DI values of distractors can indicate whether

- many candidates chose one distractor (in which case it may be misleadingly worded);

- particular types of candidate are attracted to a distractor (in which case one group of candidates may be disadvantaged);

- no candidates chose a distractor (in which case it should be discarded);

14. Good distractors attract comparable numbers of lower scoring candidates for each alternative. Higher scoring candidates should be the minority of those who chose distractors.

15. A simple measure of the internal consistency of a test is to calculate performance on different groups of items (split halves) and compare these. The most convenient approximation of this is to use the Kuder-Richardson formula known as KR21.

$$\text{Reliability (KR21)} = \frac{k\,(1-(m\,(k-m)/ks^2))}{k-1}$$

k = number of test items
m = mean score (arithmetic mean)
s = standard deviation of test scores

16. KR 21 tests if all items measure the same thing (homogeneity). It is roughly equivalent to split-half tests of reliability where performance on half the items is compared to performance in the other half. It is not appropriate for tests where not all candidates complete all items (speed tests). The higher KR21 is the more consistent the test items.

17. Item analysis has to be undertaken for a purpose (item selection, post-test assessment, performance analysis). This should be decided at the outset.

18. The content validity of items is critical and consideration of this should precede consideration of D and DI.

19. Item analysis should be approached systematically and records kept of the results of each analysis so that it may be referred to subsequently. Item content should be recorded with item statistics.

Assignment 7: Preliminary Analysis of Data

• Give each candidate a number (e.g. School 1/1-50, School 2/1-63, School 3/1-48 etc.).

• For each school split papers into boys and girls.

• Mark whole set recording total score for each candidate.

• Note average score of boys and girls.

• Arrange papers in order of total score and separate into two halves (to get high and low scoring groups).

• Mark each item by counting number of A/B/C/D-responses in each group.

• Work out overall facility value

$$\mathbf{F} = \frac{\mathbf{N}\,\text{Correct} \;\text{x}\; 100}{\mathbf{N}}$$

• Work out discrimination index for key and for distractors

$$\mathbf{D} = \frac{\mathbf{N}_u - \mathbf{N}_l}{\mathbf{N}/2}$$

(number of correct answers of top candidates (N_U) minus number of correct answers of bottom candidates divided by half of the total number of candidates (N/2))

• Work out **F** and **D** for boys and girls separately.

SCHOOL NAME

Item		Options				Facility Value	Discrimination Index	Facility Value (Female)	Facility Value (Male)
		A	B	C	D	F	D	FF	MF
01	N_U								
	N_l								
02	N_U								
	N_l								
03	N_U								
	N_l								
04	N_U								
	N_l								
05	N_U								
	N_l								
06	N_U								
	N_l								
07	N_U								
	N_l								
08	N_U								
	N_l								
09	N_U								
	N_l								
10	N_U								
	N_l								
11	N_U								
	N_l								
12	N_U								
	N_l								
etc.									

N_u = number of upper group achievers
N_l = number of lower group achievers

Info 7: A Simple Measure of Reliability

$$\text{Reability (KR21)} = \frac{K\,(1 - (M\,(K - M)/KS^2))}{K - 1}$$

K = number of test items (30)
M = mean score (arithmetic mean)
S = standard deviation of test scores

• KR 21 tests if all items measure the same thing (homogeneity).

• Roughly equivalent to split-half tests of reliability.

• Not appropriate for speeded tests (if a larger number of students do not complete the test).

• Not an indication of constancy of score over time.

Note: See also Info 6, Nos. 15 & 16.

WORKING GROUP RESULTS

Outline for Interview with Science/Agriculture Teachers

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP II

Name of School:

1. General Feelings about the 1993 Examination Paper

1. Level of difficulty
2. Language used
3. Accuracy of diagrams
4. Syllabus coverage
5. Time allocated to exams
6. Clarity of instructions
7. Gender or area bias
8. Chances of questions used in teaching being used in the National Examination
9. Who sets this exam, do you get a chance to be involved?

2. School-Based Assessment

1. How often do you test?

2. Who sets these tests?

3. Are there any exchanges between teachers and schools?

4. Are you given any training?

5. At what level of difficulty and on what sections do you test?

6. Do you evaluate your tests?

7. Do you have resources to help you set tests?

8. What is the purpose of this testing?

9. Do you keep records?

10. Are the results fed back to the pupils or parents (do you have prize givings)?

11. Do you institute remedial work to help those who are not passing?

12. What types of questions do you set, i.e. multiple-choice or longer answers (try to get a sample)?

13. What problems do you encounter with different methods?

3. Books

Ask these questions first about text books and then about the pupils' exercise books.

1. What type of books are used?
2. How many books?
3. Do you have a resource centre?
4. Do the pupils own their books or do they belong to the school?
5. Do the pupils value their books?

Now with regard to pupils' exercise books

1. How are the notes laid out?
2. How do you control the quality of the diagrams?
3. How frequently do you inspect the books?
4. How frequently are you inspected?
5. What problems do you encounter e.g. pupils losing books, copying?
6. Any other comments?

7. **Select pupils' exercise books at random and study them carefully,**

paying special attention to the following:

→ Are the exercise books kept regularly?
→ Do pupils describe things in their own words?
→ Are informations kept uniformly in all books?
→ Do the books mainly contain copy work from chalkboard?
→ Check topics covered with syllabus for Std. 7.

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP III

Outline for Interview with Science/Agriculture Teachers

Name of School:

Sex of interviewee:
Teaching experience:
Grade taught:
Teacher's qualification:

Number of Science & Agriculture teachers:
Number of Science & Agriculture periods per week:

• INTERVIEW QUESTIONS BASED ON THE 1993 KCP SCIENCE AND AGRICULTURE EXAMINATION

1. Was the syllabus adequately covered by the examination?

Yes ❑ No ❑

2. Did the examination meet the curriculum objectives?

Yes ❑ No ❑

3. To what extent was the Science syllabus covered?
(Last year before they sat for the final exam?)

Less than half ❑ Three quarters ❑
Half ❑ More than three quarters ❑

4. Would you say last year's paper was easy or difficult?
Give reasons.

5. Which questions do you think were difficult?
Give reasons.

6. Which questions do you think were easy? Give reasons.

7. Are you happy with the multiple-choice type of questions in the exam?

Yes ❑ No ❑

Give reasons.

• QUESTIONS ON SCHOOL-BASED TESTING PRACTICES

1. How often do you test your pupils?

2. How do you generate your test items?

KCPE past papers ❑ Set own questions ❑
Other methods (specify) ❑

3. Do you meet any problems when administering school-based tests?

Yes ❑ No ❑

4. What do you think is the root cause of these problems?

5. How have you tackled these problems?

6. To what use do you put the results of the tests?

• QUESTIONS RELATED TO PERFORMANCE DIFFERENCES

1. How was the performance of your pupils in the 1993 KCPE Science paper?

Overall ❑ Good ❑ Average ❑ Bad ❑

2. How do you compare the performance of

- boys and girls?
- rural and urban pupils?

3. What suggestion would you make so as to attain better performance of your pupils in the KCPE Science and Agriculture papers?

• BOOKS AND EQUIPMENT

1. Does the school provide textbooks to pupils?

Yes ❑ No ❑

If yes, are they adequate?

2. Are the books suitable to the syllabus?

Yes ❑ No ❑

3. What equipment does the school have for Science and Agriculture teaching?

• NOTES TO REVIEW PUPILS' NOTE BOOKS

The team should review 5 pupils' Note Books selected randomly from Std. 8 and note

1. Topics covered
2. Adequacy of notes
3. Relevance
4. Accuracy of notes, diagrams etc.
5. Evidence of teacher review of notes

Reports on Interviews in Primary School

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP IA

1. Introduction

This is a report of an interview held at **Kangocho Primary School** on 22nd March, 1994. The Science/Agriculture teacher was not available since he had gone to hospital. Some teachers, a Std. 6 Science teacher and the headmaster of the school were interviewed instead. The school has six subject panels for Languages, Mathematics, Geography/History/Civics/Religion, Home Economics/Business Education, Art & Craft, Science/Agriculture, each comprising six teachers on average.

2. KCPE 1993 Science/Agriculture

The paper was considered to have fair and adequately covered the syllabus. Boys performed better than girls. Teachers are fairly happy with the KCPE format but some feel that multiple-choice items deny pupils chances to reason and express themselves. KCPE results of a given year are analysed to ensure that weak areas are given adequate attention in the teaching of candidates for the following year.

With regard to pupils' preparation for the exam, the pupils are adequately prepared through zonal, divisional and district level examinations. In Standards 4 to 8 pupils are given nine examinations per year and during the final year (Std. 8) the third term is devoted to KCPE past papers. Pupils write the exams and difficult topic areas are identified and discussed by the teacher(s) and pupils.

3. Teaching/Learning of Science/Agriculture

Teaching is rather theoretical due to lack of equipment. The school does not have a shamba for practical agriculture and there is no science room. The science equipment is borrowed from the nearby secondary school, but the school has spring balances, thermometers, torch cells and circuit wires (leads).

The set books are those recommended by the Kenya Institute of Education. Two pupils share a book. Textbooks are given to the pupils in January and collected in December of each year. Some parents buy textbooks for their children as encouraged by the school management. Textbook needs are discussed during staff meetings and the money available, raised through Harambee meetings and donations, is used according to decisions of the staff. Examination of note books showed that pupils are given some notes and a few exercises to do.

4. Test Construction/Generation

Teachers have an idea of test construction as taught during methodology courses at Teachers' Training Colleges; but there is no course in Measurement and Evaluation per se at Teachers' Training Colleges.

The setting of zonal, divisional and district level examinations is done by subject panels which use the KCPE format but panelists are not experts in setting questions.

5. General Comments

The education system in Kenya seems to be exam driven since it is highly competitive. Besides grading and ranking pupils' performance, schools and districts are ranked. This in effect forces teachers to teach to the exam. Syllabuses are rushed through to ensure coverage so that pupils are prepared for the exam. One would only feel sympathy for the pupils as regards the number of examination papers they have to go through. Somehow the pupils tend to cope with the situation.

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP III B

1. Introduction

Three members of the group interviewed the headteacher and three Science and Agriculture teachers of **Nyamachaki Primary School** on 22nd March, 1994 between 11.30 a.m. and 12.45 p.m. The interview was carried out by following guiding questions which had been prepared the previous day.

The purpose of the interview was to collect information about the school concerning its background history, current number of Science and Agriculture teachers, time allocation and the teaching of Science and Agriculture subjects, availability of facilities and teaching/learning materials, 1993 Kenya Certificate of Primary Education (KCPE) Science and Agriculture examination and school-based testing procedures practised.

2. Findings of the Interview

2.1. Background History

Nyamachaki Primary School is located a few kilometres from Nyeri town in Central Province. The school was established in 1933. It started with 560 pupils, but the number has risen up to 1,169 pupils currently. Most of the pupils in the school are residents of Nyeri town and from surrounding areas. However, there are some pupils who come as far as 10 km from the school. These pupils travel by bus to and from the school every day.

2.2. Current Number of Teachers

The school has a total number of 33 teachers out of whom six are men and the rest are women.

Out of the 33 teachers, eight teach Science and Agriculture subjects in Std. 3-8. Three of them teach in Std. 7 and 8. They are trained grade Pl teachers with a teaching experience of more than four years.

Of the three Science teachers teaching in Std. 7 and 8, two are females, one is male.

2.3. Time Allocation and the Teaching of Science and Agriculture

The Science and Agriculture subjects are each allocated three periods per week. Interviewed teachers remarked that time allocated for Science was not enough, but the time for Agriculture was sufficient. They said they used some of the Agriculture periods for teaching Science.

Pupils of Std. 4-8 are allocated 2.15 hours per week in the school timetable for remedial instruction and preparatory work. If this time is well utilized by pupils and teachers it is likely to improve pupils' progress and performance. Teachers mostly use the lecture method of teaching. Very few practicals and demonstrations are done during teaching.

2.4. Availability of Facilities and Teaching/Learning Materials It was learnt from teachers during the interview that:

- the school has a workshop room for Art and Craft and Home Science practical instruction;

- the school has buildings that are enough for 24 streams/classes;

- out of the 24 classes, 9 of them are semi-permanent structures. The walls and roofs of these structures were constructed with corrugated iron sheets;

- pupils' textbooks for Science and Agriculture subjects are not enough. The ratio is about one book for ten pupils;

- the books are suitable for the syllabuses of Science and Agriculture subjects;

- there are insufficient numbers of teachers' guides and syllabuses. There are only three syllabuses for Science and Agriculture for the whole school;

- there are no Science kits for practical instruction;

- the school has a demonstration plot but currently it is not used for offering practical instruction for Agriculture lessons.

2.5. 1993 KCPE Science and Agriculture Examination

The following were findings from the interview with regard to last year's KCPE Science and Agriculture examination:

- The syllabus was adequately covered by the examination.

- The examination adequately met the curriculum objectives of the subjects.

- Before Std. 8 sat for the examination, more than 3/4 of the syllabuses for the subjects had already been covered.

• Interviewed teachers indicated that the following items[1] were:

- very difficult: Items No. 22 and 42;

- difficult: Items No. 3, 4, 10, 16, 18, 21, 29, 30, 32, 35, 37, 48, 57, and 60;

- moderately difficult: Items No. 2, 5, 11, 13, 17, 19, 25, 28, 31, 33, 47, 49, 52, 53, 55, and 56;

- easy: Items No. 1, 6, 7, 8, 9, 12,14,15, 20, 23, 24, 26, 27, 34, 36, 38, 39, 40, 41, 43, 44, 45, 46, 50, 51, 54, 58, and 59.

[1] See: Vol. 2 - Assessment of Science Mid Agriculture in Primary Schools in Africa; 12 Country Cases Reviewed

• Last year's exam was generally of the right standard.

• Interviewed teachers explained that some of the items were:

- difficult because they required memorizing complex subject matter; interpretation of complex material asked in the items and involved calculations; also pupils had not performed many experiments; some of the examined material on diseases had not been taught because the syllabus does not specify which diseases have to be taught;

- easy because they were short and of recall type; were more or less related to pupils' environment and experiences or had diagrams which were easy to analyse.

• Boys performed better than girls and most of those who performed poor were girls.

• Urban pupils performed better than pupils who came from rural areas.

• The following suggestions were put forward so as to attain better performance of pupils in the KCPE Science and Agriculture exams:

- provision of adequate and accurate materials for undertaking practical activities (they are not provided so far);

- provision of enough teaching/learning materials;

- to have 5 periods per week for Science teaching;

- teachers to be given seminars on topics in which they have low competence in teaching them effectively.

• The average score of the school last year was 431.67 out of a total score of 700. Hence the school was among the best schools in the District. The average score for the school has never gone below 404 for the past three years.

2.6. School-Based Testing Practices Undertaken

It was found out from the interview that:

• the teachers give quizzes after covering every topic. The quizzes are prepared by the teachers themselves using the syllabus and other course materials;

• pupils of Std. 6-8 are given 3 external exams per term;

• results of test/exam scores are recorded and used for guiding the teacher in undertaking remedial teaching;

- no problems are encountered in administering school-based tests apart from inadequate availability of stationery;

- pupils are prepared for exams by being drilled in answering past KCPE papers and other examination papers.

Reports on Test Administration

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP IA

School: **Kangocho Primary School**

Class Tested: Std. 8 (14 year olds)

No. of Pupils: 64 (32 boys + 32 girls)

Progress of test:

(1) After 15 minutes, most candidates on No. 11.
After 30 minutes, most candidates on No. 20.
After 55 minutes, most candidates finished.

Candidates checked their answers once they had completed all items.

(2) All candidates brought pencils and erasers; they appeared to have been briefed beforehand and were co-operative and well disciplined.

(3) One should bear in mind we are testing long-term memory - the children were not asked to revise their Std. 7 Science and Agriculture knowledge; certain factual recall (diseases, symptoms, etc.) may be poor as a result.

(4) All of the Std. 8 pupils in Kangocho Primary School wrote the test.

(5) All candidates completed the test in the time allocated (1 hour).

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP III A

School: **Mathaithi Primary School**

Introduction

The test was administered on the 22nd March, 1994. The pupils had just finished writing a KCPE Mock Examination Paper. They were 78 candidates and could not be fitted in one room.

General Instruction

The test administrator explicitly explained why the test was administered. It was administered to find out how good or bad the test was. It was not part of the mock exam they were going through. It was most unfortunate that the whole exercise coincided with the time when they were writing their mock. The test administrator went over the general instructions. They were told they would not be given separate answer sheets. They would circle the letter that corresponded with the correct response. An example was demonstrated on the chalkboard. Rubbers were put on each desk just in case the candidates wanted to make a correction in their responses. Caution was made on number 25. They were asked to alter the distractors on that item and write those written on the chalkboard. Half the pupils were asked to go to another room. Mostly those who remained were boys. The starting time of the test was 10.10 a.m. and the finishing time was 11.10 a.m. The information was displayed on the chalkboard.

General Observations

Some candidates, mostly boys, took a shorter time. Others even went over the paper trying to make readjustments to those items they did not get the answers straight away. No candidate needed any help and explanation of any item. Pupils' discipline was fantastic.

Physical Condition of the Classroom

The classroom set up was conducive to class activities. It was very spacious. Most space was taken by the big tables the children were writing on.

Reports on Test Results in Schools

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

<u>GROUP IA</u>

School: **Kangocho Primary School**

Number of candidates:	64 (32 male & 32 female)	
Number of test items:	30, each scoring one point	
Performance Statistics:	• Overall average:	16.56
	• Average for males:	17.03
	• Average for females:	16.09
	• Range of scores:	11 to 26
	• Standard deviation:	3.07 (corrected)
	• Test reliability:	0.22 (KR21)

Item Analysis

1. Facility

(1) Items within acceptable range of difficulty of 30-70%: 4-6, 12, 13, 17, 20, 22, 24, and 27 (10 items)
(2) Items above acceptable range of difficulty: 1-3, 8, 11, 14, 15, 18, 19, 26, and 29 (11 items)
(3) Items below acceptable range of difficulty: 7, 9, 10, 16, 21, 23, 25, 28, and 30 (9 items)

Note: See items in the TRIAL TEST PAPER, pp. 82-98.

Possible explanations of items above acceptable range of difficulty:

Item 1: The candidates appeared to be well prepared for reading a graph.
Item 2: This was a simple knowledge (recall) question.
Item 3: This was within the candidate's daily experiences in agriculture.
Item 8: No comment as F = 100 (and D = 0).
Item 11: Same as for Item 1 above.
Item 14: F = 70.31 ≈ 70, acceptable.
Item 15: Simple observation in everyday situations.
Item 18: »Sales«and»Expenses«were clues.

Item 19: Very simple classification.
Item 26: Same as for Item 3 above.
Item 29: Simple observation.

Possible explanations of items below acceptable range of difficulty:

Item 7: Candidates may not know the meaning of»gentle«and»steep«slopes.
Item 9: Candidates may not be familiar with this type of deficiency disease in tea; inadequate coverage in textbooks.
Item 10: Advanced classification required.
Item 16: Not within the pupils' everyday experience.
Item 21: The term»interdependent«misunderstood. (As predicted!)
Item 23: Poor concept of volume and, possibly lack of equipment.
Item 25: Information lacking in stem and of comprehension level calling for prediction.
Item 28: The pointedness of the screws became the criterion rather than the threads.
Item 30: Lack of equipment and possibly not knowing that boiling takes place at constant temperature.

2. Discrimination

Items displaying poor discrimination are:

Item 1: Very easy for both upper and lower groups, therefore, no discrimination.
Item 6: The majority of the upper group opted for the distractor. The diagram emphasized use of CO_2. The word»recycle«was unfamiliar.
Item 8: Familiar to both groups.
Item 11: As in Item 1 above.
Item 13: Both groups found the calculation simple.
Item 14: Option A because of its closeness to the key C attracted the upper candidates.
Item 16: Both upper and lower groups were unfamiliar with the disease, hence choice of B which is familiar to them.
Item 19: Borderline.
Item 22: The topic was moderately understood by both groups.

3. Distractors

Item 1: Distractors did not work - the question should have been pitched at a higher level.
Item 2: Distractors for A and B are negative; possibly»incorrectly«was misunderstood. Option D did not work.
Item 3: Distractors for B and D are negative; possibly lower candidates are not familiar with»shading«.
Item 4: Item had too many variables for the lower group to establish the overall relationship.
Item 5: Distractors B and C hardly worked; the instruments were obviously different in function. The key D and option A worked equally.
Item 6: Distractor B with highest D (0.22) strongly attracted candidates in both groups not identifying the key.
Item 7: The option for»constructing gabions«only appears once and in distractor C; this might have been an attraction for the lower group. The meaning of»gentle«was misunderstood hence D = 0 for distractor D.
Item 8: Distractors did not work.
Item 9: Distractor A attracted the majority of the candidates as they are familiar with the element Nitrogen. The negative Ds for options A and C are insignificant (difference of 1).
Item 10: The variations are mainly due to guess-work.
Item 11: Distractors A and B hardly worked. Distractor D functioned despite negative D.
Item 12: The distractors worked for both groups more to the disadvantage of the lower group.
Item 13: Distractors B and C hardly worked.
Item 14: Distractors B and D hardly worked.

Item 15: The lower group was attracted by option C, possibly thought movement involved the whole arm.
Item 16: Both groups were attracted by distractors A and B possibly because they are familiar.
Item 17: Distractor B did not work because it was obviously correct. Diagram misleading.
Item 18: Distractor C did not work; distractors B and C attracted more of the lower group because of poor addition skills.
Item 19: Distractors A and B did not work effectively.
Item 20: Distractors A and D did not work. Distractor B was the most effective.
Item 21: Distractor D was the strongest because of the misunderstanding of»interdependent«.
Item 22: Distractors A and B worked well; C was weak (only attracted lower group).
Item 23: Distractor A hardly worked. Weaker candidates opted for B (poor volume concept).
Item 24: Distractor A hardly worked; C and D attracted the lower group.
Item 25: Distractor A hardly worked; distractor C attracted most candidates.

WORKSHOP on»WRITING OF TEST ITEMS FOR PRIMARY SCHOOL LEAVING EXAMINATIONS«- Nyeri/Kenya, 1994

GROUP II B

School: **Kwanderi Primary School**

X_{all} = 15.073

X_B = 15.833

X_G = 14.0

Standard Deviation = 3.054 Reliability = 0.777

Facility index	30 - 70%	=	4, 5, 13, 14, 15, 17, 20, 22, 24, 26, 27, 28
	> 70	=	1, 2, 3, 8, 10, 18, 19, 29
	<30	=	6,7,9,10,12,16,21,23,25,30

Boys scored well on 15 items.
Girls scored well on 13 items.
Boys = Girls 2 items.

Item Analysis

• Questions 1, 2 and 3 were very easy with facility indices above 80%. Maybe this was due to the fact that the purpose was to ease the candidates into the examination.

• Question 3
Distractor A did not work well because the discrimination index was 0.

• Question 4
Discriminated very well. All the distractors were quite reasonable.

• Question 5
Most candidates chose A; maybe diagram R did not appear familiar to them. The key has a negative discrimination index which means that $N_l > N_u$; the»wrong«students, those that performed badly on the whole test, got the item correct.

• Question 6
Distractor D did not discriminate at all. Most candidates chose option B. Maybe the word»recycle«was not familiar to the candidates.

• Question 7

To a majority of candidates D was the most popular, because they did not seem to know the difference between a gentle slope and just a slope. The word»gentle«did not guide them in any way.

• Question 8
Distractors A and B did not discriminate at all. This might have been due to the inability to classify the parasites into internal and external parasites and then to decide on the method used to control the parasite. It might be that the pupils did not thoroughly analyse the diagram. Discrimination index for B was negative, so the distractor did not work well.

• Question 9
The most popular distractor was D; the key was negative which means that it did not work well $N_l > N_u$.

• Question 10
There was clear evidence of guessing since all distractors were chosen. This could be due to the inability to classify diseases according to the causative agent. This was a very difficult question with facility index of 0.293, which is low.

• Questions 11, 18, 19, and 29 were quite easy with a facility index above 0.8.

• Question 12
C and D have positive discrimination indices. So they were behaving the same way as the total test. C was the key but D appeared correct to the candidates. This clearly shows that there are hardly any practical experiments carried out in the classroom.

• Question 13
Some candidates chose A. This could be due to the fact that they concentrated on the number of eggs produced, but did not take into account the number of broken eggs.

• Question 14
Most candidates either chose option B or D because the idea of conservation of soil fertility did not click, all they considered was crop type and season. However, the facility index was 0.61 showing that the question was not very difficult. In fact it proved to be difficult for candidates to evaluate each distractor and decide the main reason.

• Question 15
The question was not accurately read so that for distractors B and C the discrimination index was 0.

• Question 16
The discrimination index for B was positive, so $N_l > N_u$. Therefore, the distractor did not work.

• Question 17
Maybe the»antenna«was not clearly labelled, so candidates may have been affected in a way. All the distractors worked, in fact it was a relatively easy question.

• Question 20
Distractors C and D have discrimination indices which are positive meaning that $N_l > N_u$; therefore, the distractors did not work.

• Question 21
The key A has a negative discrimination index, so the distractor was poor. To the candidates D appeared to be the correct answer. It seems that the stem needed to be improved, because it was not quite clear what type of interdependence was required.

• Question 22
It was not a very easy question. The discrimination index for B was 0, so it did not discriminate at all.

• Question 23
Distractors A and D have positive discrimination indices; $N_l > N_u$.

• Question 24
It was clearly evident that the candidates had problems with reading the scale such that options A, B and D did not discriminate well. A and B both had positive discrimination indices and D did not discriminate at all.

• Question 25
Absence of practicals actually being conducted in class hampered the students' ability to score. Most candidates chose C; $N_l > N_u$. So the distractor did not work well.

• Question 26
This was a very difficult question for the candidates and there was a lot of guessing. For all the distractors Dl was positive.

• Question 27
The graph proved difficult to the candidates such that discrimination index for C was 0.

Question 28
Most candidates chose option D because they concentrated on the tips of the screws not the number of threads. In fact the only variable should have been the number of threads and the tips should have been the same.

• Question 30
It was the most difficult question. Candidates failed to interpret the graphs.

2.3.2. Reviewing the Item Writing and Testing Process

The objective of the exercise on item writing, testing and analysis was to train participants in the construction and analysis of test items for Primary Science and Agriculture. This was approached through a practical task which entailed writing assessment items, constructing a trial examination paper, applying it to groups of pupils and analysing the results. This involved several steps which included:

Deciding a Specification for the Range of Items to be Constructed

Multiple-choice items are widely used in assessment at the end of primary school in many African countries. The Certificate of Primary Education (CPE) in Kenya consists entirely of multiple-choice items and pupils are used to the format. Many of the underlying principles of item construction and analysis can be demonstrated through the development of multiple-choice questions. For these reasons, and the limitations of time it was decided to focus on the construction of an instrument with about 30 multiple-choice items. This was a sufficient number for all participants to contribute to the process.

Since the instrument had to be piloted on Kenyan pupils the content for items had to be drawn from the Kenyan Science and Agriculture curricula. It was decided to try out the instrument with pupils entering Grade 8 and thus material from Grade 7 was identified as that which was most appropriate to use.

To focus the exercise specific areas of the curriculum were identified and several items were written relating to each. As the intention was to concentrate on developing items above the level of recall five skill areas were identified in which items could be produced. The areas and the content topics chosen are indicated in **Assignment 1,** Table of Specification - Topics by Skills.

The skills identified were some of those judged most important to develop at primary level.

They were chosen after discussion of the meaning of each which can be summarised briefly as:

Observation	=	skills of looking and seeing
Classification	=	skills of categorising cases according to rules
Measurement	=	skills of deciding how or what to measure
Recording Data	=	skills of deciding how to record data
Interpreting Data	=	skills of interpreting data e.g. graphically

Development of Test Items

Test items were developed by participants working individually after discussion of the approaches that could be used and the pitfalls to avoid. Kenyan curriculum materials in Science and Agriculture were made available. Each individual produced at least two items for comment and improvement by other participants.

The development process alternated between writing periods and collaborative discussion of items produced in small groups. This was the first level peer auditing process. Participants were then grouped into three working groups and each was asked to produce between 10 to 15 items after internal review. This resulted in the production of more than 40 items which were then produced in the form of a trial test paper. This paper was then reviewed and edited to select the 30 items required for the final version.

As an additional exercise participants were asked to predict which items would be easy or difficult, which would discriminate well, which would be the strongest distractor, and which would favour boys or girls.

Trial of Test Items in Schools

Six local schools were identified where the test could be applied. These included some schools ranked very highly in national lists and other schools that were typical of the Nyeri District. Six teams of participants were organized, one for each school. In each team one member took responsibility for administering the test and the others arranged to interview school staff about assessment issues. Test administration was standardised as much as possible. The test was administered to a whole class group in all the schools except for one where the whole year group was tested. The test was timed for one hour.

Test administrators and the participants who interviewed teachers were asked to write up their observations briefly to feed into the discussion of how the test performed.

Marking of Responses

Altogether 338 papers were analysed from the six school samples. Marking was organized in school groups and participants developed an agreed procedure. First scripts were sorted in to boys and girls and then marked. This enabled overall averages to be calculated and differences in average score between girls and boys to be noted. Facility indices for items could also be calculated. The papers were then ordered from the best to the worst and performance of the top and bottom halves was calculated to arrive at a simple discrimination index. The power of different distractors was also assessed. A grid for results was developed to help make the task simple and systematic as shown below.

SCHOOL NAME:

Item		Options				Facility	Discrimination	Facility for Females	Facility for Moles
		A	B	C	D				
1	N_u N_l								
2	N_u N_l								
3	N_u N_l								
4	N_u N_l								

Facility values are given by:

$$F = \frac{\text{N CORRECT}}{N} \times 100$$

where N CORRECT is the number of candidates getting the item correct and N is the total number of candidates.

Discrimination values are given by:

$$D = \frac{N_u - N_l}{N/2}$$

where N_u = Score of upper 50%
N_L = Score of lower 50%

A simple measure of reliability was also calculated - the Kuder Richardson KR21.

$$R\,(KR21) = \frac{K\,(1-(M\,(K-M)/KS^2))}{K-1}$$

K = number of test items (30)
M = Mean Score (Arithmetic Mean)
S = standard deviation of test scores

KR21 tests if all items measure the same thing (homogeneity) and is roughly equivalent to split-half tests of reliability. It is not appropriate for speeded tests and is not an indication of constancy of score over time.

Analysis of Item Characteristics

A summary of the performance of the test is given below:

	School 1	School 2	School 3	School 4	School 5	School 6
N	64	78	48	41	38	70
Xav	16.56	16.24	14.80	15.07	18.55	20.43
Xbav	17.03	16.05	16.40	15.83	18.36	21.10
Xgav	16.09	16.83	13.20	14.00	18.92	19.72
O^-	3.07	3.51	3.88	3.05	2.77	3.35
R	0.22	0.41	0.52	0.20	0.08	0.43

Where

N = number of candidates analysed
Xav = average score
Xbav = average for boys
Xgav = average for girls
O^- = standard deviation
R KR21 reliability

The analysis for the first five schools was aggregated since these schools were all normal public schools. The analysis of the sixth school, which was residential and an institution with a selected intake, was undertaken separately. Summary results are shown next page.

Item	Schools 1 - 5		School 6	
	Facility	Discrimination	Facility	Discrimination
1	97.1	0.04	98.5	0.03
2	84.6	0.13	100	0.00
3	77.9	0.04	90.0	0.14
4	56.0	0.31	78.5	0.26
5	63.0	0.12	68.6	0.40
6	33.8	0.06	50.0	0.20
7	17.9	0.16	34.3	0.29
8	99.2	0.02	94.3	0.11
9	17.5	-0.03	24.3	0.09
10	15.8	-0.03	21.4	0.20
11	81.7	0.12	87.1	0.09
12	35.0	0.23	54.3	0.51
13	65.0	0.15	80.0	0.29
14	66.7	0.07	75.7	0.20
15	71.7	0.27	74.3	0.34
16	21.0	0.13	34.3	0.06
17	55.6	0.34	78.6	0.37
18	73.8	0.31	85.7	0.29
19	79.7	0.10	88.6	0.23
20	62.9	0.35	60.0	0.51
21	20.9	0.10	41.4	0.43
22	24.0	0.32	77.1	0.34
23	24.5	0.24	50.0	0.60
24	54.0	0.36	81.4	0.31
25	26.9	0.27	48.6	0.51
26	68.5	0.17	60.0	0.34
27	56.8	0.28	67.1	0.49
28	36.1	0.42	61.1	0.26
29	59.4	0.06	97.1	0.06
30	20.7	0.04	41.4	0.43
Average	52.3	0.17	66.8	0.28

From this it can be seen that the average facility in the five schools is at a level we would expect if we wished to maximize discrimination i.e. about 50%. In fact the test discriminates much more effectively in School 6 (0.28 compared to 0.17 on average). If this were a real test then we should be concerned that the items that were designed worked best in separating the performance of more able pupils but not so well with more average performers.

Other data indicate that some items (e.g. 3, 8, 9, 10, 15, 17, 18, 20, 22, 25, 28, 29, 30) were more difficult for girls than boys. It was also true that the data on item performance showed that the power of distractors varied widely from item to item and the reasons for this were examined.

Concluding Remarks

The item writing exercise simulated the creation of a test instrument for Primary Science and Agriculture as part of a training exercise. Participants were unfamiliar with the Kenyan curriculum on which material was based and some had not been directly involved in test construction and analysis previously. The construction of valid and reliable test papers of this kind would be a task that would normally occupy several technically competent staff for some months. It was therefore impressive that within less than a week we were able to specify, develop, try out, and analyse the performance of a test instrument that we designed.

The primary purpose of this exercise was to develop skills in creating test items. The pre-test that we used had to be modest in scale and the sampling employed could not be representative of the population of pupils in Kenyan schools. Its purpose was to assess our success in creating items rather than reach conclusions about the performance of pupils that might have more general applicability. In this the exercise succeeded.

The analysis drew attention to a number of problems in item construction that included

- items which discriminated poorly or in some cases negatively;

- items where the performance difference between boys and girls was exceptionally large;

- items which were too difficult or too easy to be useful in discriminating performance;

- items where distractors had very uneven power and where some options were so implausible no candidates chose them; items that required a lot of time to understand and complete;

- items that required high quality diagrams to function as intended;

- items which may test language facility more than an intellectual skill.

The results of the trial also provided food for thought in a number of areas:

(1) It was interesting that the instrument designed appeared to function more as expected in School 6 than in the other five schools. In School 6 discrimination was relatively high despite the test being quite easy for most candidates. This implies that most items were understood as intended and the best pupils performed well on each item. In the other schools the picture was more mixed, suggesting that the participants might be better at writing items for the best pupils.

(2) The fact that a number of items appeared easier for boys suggested the possibility that it was the form of the item rather than the intellectual skill that might be responsible for the differentiation. It was not possible to resolve this question without more systematic research. If those items which favoured boys were removed from the test the overall differences in performance would of course reduce. This might or might not be considered desirable depending on what the reasons were for the differential performance on some items rather than others.

(3) The predictions that participants made of the performance of items were fairly inaccurate and on average not much better than guessing. This can be partly explained by their unfamiliarity with Kenyan pupils. It did illustrate the importance of pre-testing items wherever possible to reduce the possibility of poor quality items surviving into national test instruments.

(4) The item construction process resulted in a number of over-complex items being produced that were judged inappropriate for the final instrument. There may be a temptation to design items that are cleverly conceived and impress other item writers but that are too difficult for many candidates.

(5) The importance of analysis of item performance was evident. It helped explain why many items did not function as intended. It suggested that much might be learned by combining examination performance data with teaching and learning studies to establish why differences in performance emerged and how they might be reduced. This was seen as a challenge for the future.

3. Primary School Examinations in Kenya with Special Reference to Item Construction for Science and Agriculture

3.1. The Use of Examination Results for Monitoring Performance of Schools, Districts and Provinces

Francis K. Kyalo, Kenya National Examinations Council

Kenyans wait for the results of national examinations with awe and trepidation. This is so because many people erroneously believe that failing in examinations spells doom. This is attributable to the fact that a person failing in examinations may find it exceedingly difficult either to find employment or to continue with further education or training. Thus, an examination has a tremendous influence on schools, districts and the education system in general. Any information pertaining to examination results is taken with a lot of seriousness by the students, teachers, parents, education administrators and the public at large.

The curriculum which was followed in Kenya between 1963 and 1984 was seen by the»Report of the Presidential Working Party on a Second University in Kenya (1981)«as unadaptable to the changing needs of society.

The Certificate of Primary Education (CPE) examination then consisted of three papers, namely: English, Mathematics and a General Paper consisting of Geography, History & Civics and General Science. To most candidates/school-leavers who did not proceed to the next cycle of education, this general certificate was terminal and they were expected to join the work force. Unfortunately, they had no employable skills.

In the new 8.4.4. system of education, that was examined for the first time in 1985, the primary education curriculum was revamped in structure, duration and content. Previously, candidates had been examined and certified at the completion of seven years of primary education. With the new system of education, the duration was increased to eight years and more emphasis was placed on the acquisition of practical skills. The teaching of pre-vocational subjects such as Art & Craft, Agriculture, Business Education, Music and Home Science was taken more seriously than in the previous primary school curriculum which emphasised the purely academic subjects. Learners are thus being equipped at every level with adequate skills and knowledge for self-employment. It is now much more the responsibility of the candidate to make good use of the knowledge and skills gained through the school system. The certificate is therefore not an automatic ticket to employment.

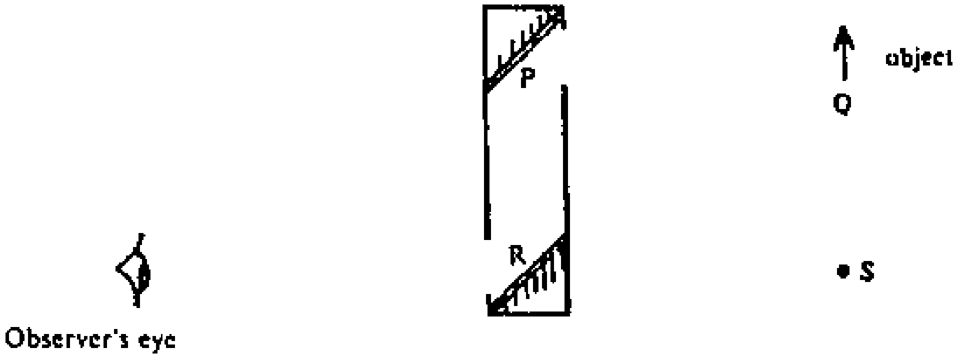
As a matter of policy, it was decided that the students would be tested by means of a national written examination - Kenya Certificate of Primary Education (KCPE) - and assessment of practical work at the school level. This assessment of the practical skills was to be conducted by the Ministry of Education, which was also to issue the results in a revamped school-leaving certificate at the end of the course. The KCPE was to be conducted by the Kenya National Examinations Council.

This called for a change in the examination system. The former Certificate of Primary Education (CPE) was replaced by the Kenya Certificate in Primary Education examination (KCPE) which is tested in seven papers that include, English Language and Composition; Kiswahili Language and Composition; Mathematics; Science & Agriculture; Geography, History & Civics, Religious Education; Art & Craft and Music; Home Science and Business Education.

In the KCPE examination psychomotor skills are tested indirectly. It is intended that questions that are set based on experimental situations test, albeit indirectly, the acquisition, or lack, of the practical skills required for a candidate to respond correctly to such questions.

Question 27, in the 1991 KCPE Science Section, could be cited as an example of questions that are set to test acquisition of practical skills by the candidates.

27. The diagram below represents a periscope, an object and an observer's eye.



The image of the object as seen by the observer will appear at

A. **P**
B. **Q**
C. **R**
D. **S**

A periscope uses plain mirrors and therefore the candidates were expected to use their knowledge of the properties of a plain mirror to answer this question. The small percentage of candidates who scored this item correctly shows that most candidates did not have this knowledge. More than half of the candidates in the sample chose option C which shows that the image is formed on the mirror. Anyone who has ever used a plain mirror to view himself/herself knows that this is not true.

One's image always appears to be formed behind the mirror. Simple experiments done by the pupils using plain mirrors would help them to know that the image of an object placed in front of a plain mirror is formed behind the mirror. Thus teachers should seize every possible opportunity to have their pupils perform simple experiments to make their acquisition of scientific concepts easier and faster.

In due course, the Kenya National Examination Council (KNEC) in conjunction with the Ministry of Education will assemble data on the performance of candidates in the national examinations and in the assessment of practical skills at the school level to establish the degree of correlation between the two modes of assessment. This will be done to enhance the quality of instruction at the school level for the acquisition of practical skills.

Before the inception of the KCPE examination, the possibility of the KNEC sending out, to primary schools assessors for the practical component of such subjects as Agriculture, Art & Craft, Music and Home Science was explored. However, this was found to be practically impossible due to the following constraints:

- The present KCPE candidature is quite large (421,617 in 1992 in 12,900 schools) and the logistics of practical tests for such a large number of pupils are overwhelming.
- The short duration in which to administer, mark, process and release results in time for those who qualify to go to secondary schools.
- Lack of materials, apparatus and facilities to conduct practical examinations.
- The large expense that a practical examination would entail.
- The varied conditions in individual primary schools which would make the results of such

an examination inequitable and therefore invalid and unreliable. The results of such an examination, therefore, cannot be used as a basis of certification and ranking of candidates at a national level.

In view of these constraints, practical skills are, in addition to KCPE examinations, assessed at the school level by the teachers and external assesssors through projects that are recommended, organized and monitored by the Inspectorate Section of the Ministry of Education. The grades obtained from this school-based assessment are used to award each pupil a School Leaving Certificate, while the scores they obtain in the national examination are used to award each pupil a KCPE Certificate and also to rank them according to their achievement.

The results of national examinations are used to monitor performance of schools and districts. Every year, after the release of KCPE results, the KNEC prepares schools' and districts' order of merit lists. Such order of merit lists are based on the schools' or districts' mean scores. There are two kinds of order of merit lists. One is based on the mean scores on overall performance while the other is based on the performance in individual subjects. Thus, the standing of a school or district in the overall performance, or in each subject, can be determined.

Initially, the order of merit was done for all schools, irrespective of their size. This generated a lot of public outcry because the comparison was regarded as unfair, especially between the large and small schools. The current practice is to compare similar schools in terms of the number of candidates. The order of merit lists enable each school and district to compare its performance against that of other schools and districts. Each school, or district, could also compare its current performance with its previous performance. Thus any improvement, or otherwise, in performance can be noted from the order of merit. Such information has been found to have the following positive influences on the education system:

- The schools and districts that perform very well are motivated to work even harder in order to maintain or even improve further.

- The schools that perform poorly are stimulated to work harder so that they too can be at the top of the order of merit list. In fact, each year a number of schools and districts improve their performance significantly.

  This has been made possible by the schools and districts tightening educational guidance, school supervision or even by removing inefficient headteachers, teachers and field staff. In addition, the parents exert pressure and therefore the school authorities are forced to seek for ways and means of improving the performance.

- Ranking of schools and districts stimulates fruitful competition between schools and districts.

- The quality and frequency of school inspection and supervision has improved. In an attempt to improve performance in their regions, the District Inspectors and Assistant Primary School Inspectors are visiting schools more frequently than ever before.

- Teachers in some districts organize mock examinations at the district or divisional levels. In groups, they set and moderate test items to almost the same standard as the Council examinations. The experience so acquired has made the teachers more effective in their instructional duties, in addition to improving their performance.

- Teachers, nowadays, are paying more attention than ever before to the curriculum requirements, its interpretation and implementation. They are more committed to their instructional duties. They teach before and after the official working hours.

- It has encouraged the school committees and the parents'/teachers' associations in schools to be more interested, not only in the acquisition of physical facilities, but also in the quality of instructional programmes of the schools. In some schools, for instance, the teachers are paid a honorarium for working outside their normal working time.

Some negative influences of the ranking of schools and districts have been cited by educators and members of the public. One such influence is where teachers force pupils to repeat some classes. This has already been rectified by the Ministry of Education by issuing a warning that such a practice should stop. This has borne results because the increase of candidates in 1992 (421,167) over last year's (362,093) is quite significant. This also shows that the rate of repetition is going down. Another negative influence has been the overworking of the primary school pupils by teachers who give instruction outside the official working time. This practice has been a result of overloaded syllabi. The problem has, however, been addressed during the recent review of the curricula for the 8.4.4 education system. The syllabi have either been pruned or re-organized in 1992 to facilitate effective coverage within the time allocated for the teaching of each of the subjects.

Similarly, after the release of the KCPE examination results, the Council prepares a KCPE Newsletter. In this Newsletter, comments on the candidates' performance in individual questions, and papers as a whole, are provided. The candidates' weaknesses, what was expected of them and suggestions for improvement in the teaching and learning procedures are highlighted. Corrective measures are also recommended where the teachers and pupils seem to misinterpret the official curriculum. Thus examination results are used to monitor how the schools are implementing the curriculum in the process of curriculum appraisal. Furthermore, the teachers are given an opportunity to suggest more effective instructional methods to the KNEC for dissemination to other schools. This is done by means of a questionnaire at the end of each issue of the KCPE Newsletter.

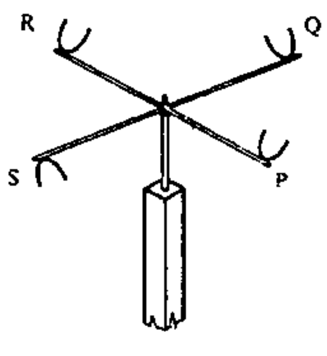
National examinations in Kenya generate a lot of data on candidates' performance. Some of this data reflects the manner in which the requirements of the curriculum are interpreted by the teachers. For instance, the KCPE Science syllabus may require students to be involved in the learning/teaching situation by being allowed to carry out many simple experiments, make and record their observations, and draw conclusions from these observations. Well-designed Science examination items can be developed to test whether or not this requirement has been met by the teachers.

The KNEC uses the data generated by item analysis to highlight incorrect interpretation of the official curriculum by the teachers and pupils alike. The data so generated is then used to suggest corrective measures to be taken by those charged with the responsibility of developing and implementing the curriculum.

A KCPE item, such as the one cited below, clearly shows how it is possible to set an item which tests how well the candidates have acquired the practical skills as per the syllabus requirements.

Question 9 (1991 KCPE Science Section)

A pupil constructed a simple anemometer as shown in the diagram below.



Which one of the cups should be correctly placed so that the instrument can function properly?

A. **P**
B. **Q**
C. **R**
D. **S**

The question was testing the candidates' understanding of the construction and use of a simple anemometer. Candidates who answered the question correctly were above average in their performance in the Science section of the paper. The fact that about half of the candidates in the sample chose option D, which is incorrect, suggests that most pupils had never constructed or used an anemometer. In most cases, its use may have been illustrated to them by means of a drawing on the chalkboard and therefore the pupils found it difficult to understand. If pupils were given a chance to construct and use an anemometer, very few would have problems with such a question.

Thus, well-designed test items assist in strengthening the process of curriculum implementation and appraisal.

The foregoing discussion suggests very clearly that examinations have a very positive role to play in educational development. In order to maximize their contribution to educational development, it is necessary that examinations reinforce the objectives for which they are meant. They can do this by testing the knowledge and skills that are appropriate and relevant to the majority of the candidates. Finally, examinations should also assist in the process of curriculum implementation and appraisal.

3.2. Testing and Monitoring Procedures Developed for Primary Schools

Paul M. Wasanga, Kenya National Examinations Council

The Purpose of Testing and Monitoring Pupils

When trying to establish the worth of anything, and hence evaluate it, we need information and yardsticks against which to judge not only the information we require, but the information we receive. In education we are basically concerned with the worth of such things as curricula, teaching methods and course materials. One major significant source of information, although not the only one, is the performance of those being taught -»the pupils«. Since performance can be determined by testing, one needs to concern oneself with the question, why test (assess) and monitor pupils?

Below are some reasons that have been advanced for assessment and monitoring of pupils. It is in order to:

- gather information about a wide range of the pupils' characteristics as a feedback for making decisions;
- accumulate records of progress for the pupils;
- provide information from which teachers can obtain insights into their own effectiveness in teaching;
- allocate pupils to sets or groups;
- compare new teaching materials with old ones;
- give incentive to learning and aid to remembering;

• determine pupils’ strengths and weaknesses;

• predict pupils’ future performance;

• determine the effectiveness of the methods of instruction;

• determine the suitable candidates for further education in institutions of higher learning (e.g. secondary schools);

• assign individual pupils grades that show how different their abilities are from those of other pupils.

To be able to carry out all the above tasks it is important to develop measurement procedures that can fulfil such requirements well. The procedures used to assess and monitor the primary school pupils in Kenya are discussed below.

Methods Developed for Testing and Monitoring Primary School Pupils in Kenya

The primary school pupils in Kenya are assessed using two methods, school-based continuous assessment and Kenya Certificate of Primary Education (KCPE) examination offered by the Kenya National Examinations Council.

School-based Continuous Assessment

Continuous assessment involves updating of judgements about performance of the pupils. It therefore should be:

- systematic;
- objective;
- comprehensive;
- cumulative and
- guidance-oriented.

Many educators hold the view that continuous assessment of the pupils is best carried out by the class teacher. This, of course, is based on the assumption that the teacher is almost always in close contact with the student and his/her assessment should therefore provide a reliable and valid assessment of the pupils’ performance. Since such an assessment is done in schools by the teachers, it is called school-based continuous assessment.

<u>Instruments Used for School-based Assessment</u>

To determine the extent of the pupils’ learning, various instruments are used to measure the pupils’ performance in Kenyan primary schools. Some of the commonly used instruments are:

• Exercises

These are questions, assignments, quizzes etc. set and administered by class teachers to pupils at regular intervals or at the end of a specific topic. Pupils are expected to complete the exercise during class-time/period and hand over the work to the teacher. The main aim of these exercises is to determine whether the pupils have mastered/learned the topic covered. Thus, most of such exercises normally test recall of knowledge.

• Terminal tests

These are tests that are administered by the teacher/school at the end of each term. Such tests cover topics/subject matter taught during the term. These tests are done under controlled time limits and similar conditions. Such tests normally sample all major topics covered in a term. These tests are more valid than the exercises because, although the teachers who set them may not have experience in setting tests that measure all the skills, the tests do not test recall of facts only.

• Home-work

This is another method used to test and monitor pupils' progress in Kenyan primary schools. In this method the pupils are assigned work at the end of a lesson. The pupils then take it home. There is no time restriction and the pupils are even free to consult books, friends or even parents. These home-work exercises reinforce teaching and enable the pupils to identify areas not clearly understood during class period.

• Projects

In addition to the final examination (KCPE) the primary school pupils are also assessed by their teachers through projects recommended by the inspectorate of the Ministry of Education. In the Kenyan context, a project may be defined as any set task from which time constraints have been largely removed.

The projects offered to the primary school pupils are normally chosen from the courses which are supposed to have been covered in Standard 7 and 8; for example in Art and Craft, sculpture, containers, body covers, fabric decoration, graphic design, wood work, metal work, leather work etc. may be chosen as projects, while in Music pupils may be asked to make musical instruments. All the other practically oriented subjects like Science and Home Science are organized along similar lines.

Marks obtained from such course work (projects) are normally incorporated in the pupils' leaving certificates.

• Zonal/district organized tests

These are tests that are set and administered by teachers in zones/divisions or even in districts. These tests might also be referred to as inter-school tests. To set these tests, a number of experienced teachers is selected from different schools in the particular zone. These teachers set the tests, and selected officials organize the administration and marking of such tests. Zonal tests are usually given to primary pupils at the end of class 7. Marks obtained from such tests are used to predict the performance of the pupils in the Kenya Certificate of Primary Education examination.

• Fieldwork

Fieldwork involves a visit to and the study of an area outside the classroom by the pupils. Fieldwork calls for the pupils' skill in observation and mastery of concepts and accurate recordings. Before the fieldwork starts, the teacher normally identifies the area of study and the task the pupils are expected to carry out. The teacher then visits the site, and arranges for transport if any is required. During fieldwork pupils are expected to discuss their observations and record them. The teacher then may ask the pupils to write a report. The teacher gives marks to the pupils based on their recordings and reports.

Use of the Information Obtained from School-based Continuous Assessment

The information obtained from school-based assessment is usually kept by the teachers and also by the school administration. Such information is used for:

- gauging the teachers' effectiveness in teaching;
- guiding teaching;
- providing motivation to the pupils;
- providing feedback information to the parents and other interested people to aid counselling and decision-making;

• comparing the pupils with others from different schools and suggesting areas of improvement;

• continuity of performance of the pupil.

This information should therefore be stored in such a way that it is:

• permanent;
• easily understood;
• easily interpreted;
• easily retrieved.

<u>Problems Associated with School-based Continuous Assessment</u>

These include:

• inflation of scores;

• fake scores;

• missing scores;

• absent pupils;

• testing of recall of facts by the teachers because of lack of knowledge on measurement and time for writing questions that test higher abilities;

• unreliability of scores;

• subjectivity of teachers;

• unavailability of trained teachers;

• lack of uniformity in facilities available in primary schools across the country.

Because no system has been developed to eliminate such problems, in Kenya continuous assessment scores are not included in the Kenya National Examinations Council certificate for primary school leavers.

Kenya Certificate of Primary Education Examination

At the end of the eight years of primary schooling the Kenya National Examinations Council offers a written examination. This examination is called the Kenya Certificate of Primary Education (KCPE). This examination replaced the unpopular Certificate of Primary Education (CPE) which has been accused of being biased towards recall questions only and failing to adequately examine practical skills.

The Kenya Certificate of Primary Education examination offers a broader concept of assessment by testing many subjects and more complex cognitive processes like reasoning. This is demonstrated by the questions that are designed to test practical skills. These questions are set in such a way that they are able to sort out those who have been exposed to practical skills and those who have not. This is especially so for papers like Science and Agriculture, Art, Craft and Music, Home Science and Business Education.

To come up with questions that test practical skills and other higher abilities, using multiple-choice format is not a simple matter. The Kenya National Examinations Council, however, uses experts and experienced examiners to develop papers that meet this challenge. This, of course, involves hard work and dedication on the part of those who set and moderate such questions. A discussion of what goes on during setting and moderation of Science questions is illustrated below.

Setting of Science Questions at KCPE Level

Science questions are set by a group of experts who have a good knowledge of the primary school Science curriculum. These experts are drawn from the whole country. Normally, ten experts are involved in this exercise. The first exercise during the setting involves drawing a table of specification.

To draw such a table, the experts have not only to be conversant with the objectives of the curriculum but also have to carefully re-study them. This is done so as to make sure that all the content in the syllabus is tested and also that all the skills are tested. Below is an example of a table of specification drawn by setters and moderators for Primary Science KCPE examination.

Table of Specification for Science KCPE

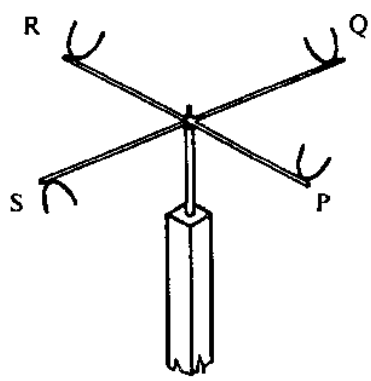
Abilities	Knowledge	Comprehension	Application	Higher Abilities	Total
Content Area					
1. Energy	1	1	1		3
2. Living Things	3	2	1	2	8
3. Properties of Matter	1	1	2	2	6
4. Environment		1		1	2
5. Making Work Easier		1	3	1	5
6. Weather and Astronomy		2			2
7. Soil	1	1			2
8. Health Education	1	1			2
Total	7	10	7	6	30
	23.33%	33.33%	23.33%	20%	

This table of specification shows that the content in primary science can be summarized in eight broad areas. According to the objectives in the syllabus the skills are weighted. Using this table, questions are set in such a way that:

- 23.33% of them (7 questions) test knowledge (recall of knowledge);
- 33.33% comprehension (10 questions);
- 23.33% application (7 questions);
- 20% higher abilities (6 questions).

Thus, a paper set using this table does not test recall of facts only but also all other skills demanded by the curriculum. Below are some questions that have been used before to test skills other than knowledge.

(1) Question 9, KCPE Science 1991:



A pupil constructed a simple anemometer as shown in the diagram.

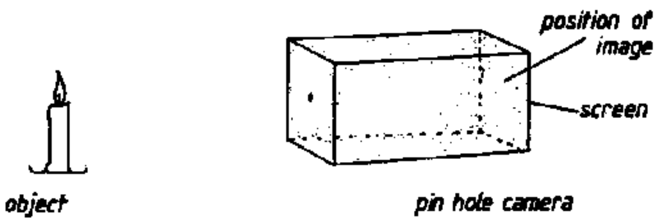
Which one of the cups should be correctly placed so that the instrument can function properly?

A. **P**
B. **Q**
C. **R**
D. **S**

This question requires the candidate first to have knowledge of what an anemometer is (an instrument used for measuring the force/speed of wind), and then look at the diagram and work out which cup is placed wrongly. This question cannot be said to test recall only; it is also testing a practical skill because the candidate has to work out how the cups should be placed for the instrument to function properly.

(2) Question 12, KCPE Science 1988:

Study the arrangement shown in the diagram below and answer the question that follows.



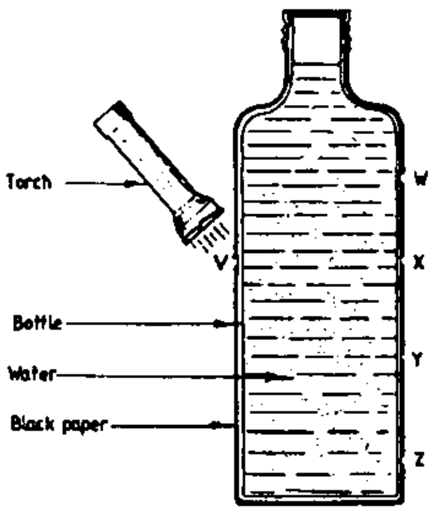
Which one of the following statements is correct? The image formed on the screen is

A. upside down
B. brighter than the object
C. round in shape
D. bigger than the object.

The question requires the candidate to construct lines from the object through the pin-hole to the screen so as to determine how the image would be. Obviously this cannot be recall.

Although the question itself is a multiple-choice question the skill tested here is a practical skill which involves reasoning. The two questions below serve as further examples of such questions.

(3) Question 4, KCPE Science 1990:

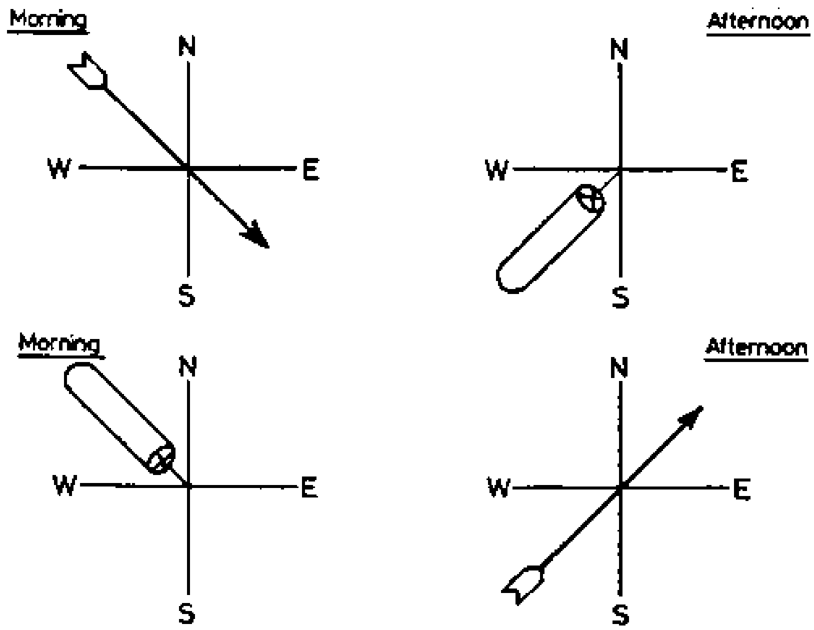


Kamau filled a transparent bottle with water and then covered it completely with black paper and made a small hole, **V**, on one side and four other small holes **W, X, Y, Z** on the opposite side. He shone light from a torch into the water as shown in the diagram.

At which point is the light most likely to shine out?

A. **W** B. **X** C. **Y** D. **Z**

(4) Question 16, KCPE Science 1989:



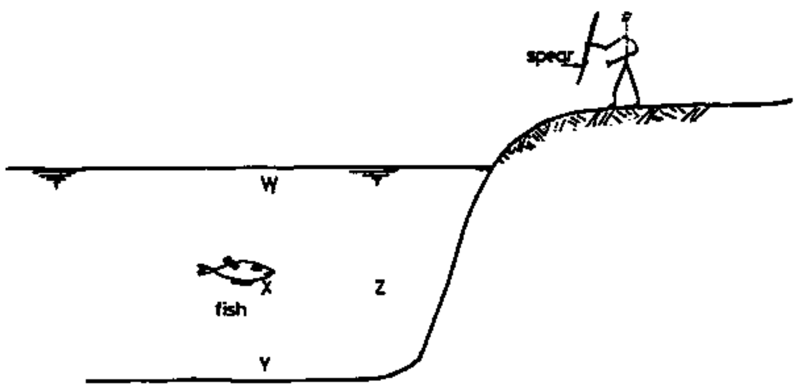
Omar made a wind vane and a wind sock and placed them in an open place. He then observed them in the morning and in the afternoon. The positions of the instruments were as shown in the diagram below.

Which one of the following gives the correct record of the wind direction for the day?

	Morning	Afternoon
A.	**SE**	**SW**
B.	**NW**	**NE**
C.	**NW**	**SW**
D.	**SE**	**NE**

(5) Question 12, KCPE Science 1989:

A fisherman looks down into a lake and sees a stationary fish as shown in the diagram below.

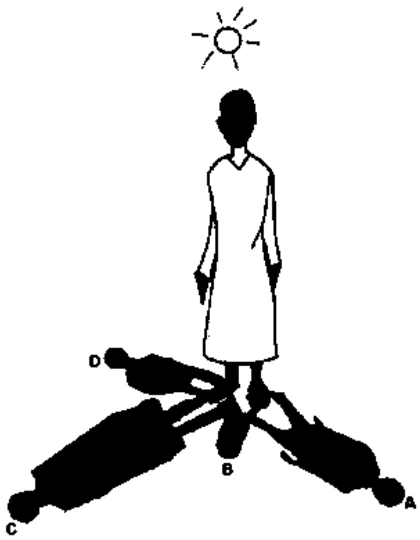


At what point should he aim his spear in order to have the **BEST** chance of hitting the fish?

A. **W**
B. **X**
C. **Y**
D. **Z**

Questions testing higher abilities than recall and practical skills are not confined to Science only. Such questions are also found in all the papers offered in the Kenya Certificate of Primary Education examination. Practical skills are, however, commonly tested in Art, Craft, Music, Agriculture, Home Science and Business Education as illustrated by the following questions.

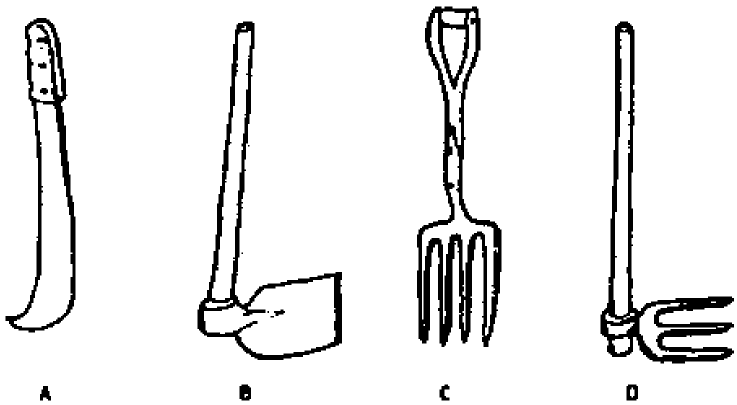
(6) Question 19, KCPE Art and Craft 1988:



Which one of the shadows of the figure is correct if the sun is at the position as shown in the illustration?

(7) Question 52, KCPE Agriculture 1990:

Which one of the tools illustrated in the diagram below is suitable for digging a hard ground?



All the questions given as examples above clearly indicate that the Kenya National Examinations Council has made great strides towards the production of paper and pencil examinations that are capable of testing higher abilities and practical skills instead of recall of straightforward knowledge at primary school level. It should, however, be understood that the Kenya National Examinations Council examines and grades Std. 8 pupils from the results obtained in the Kenya Certificate of Primary Education only. The Kenya National

Examinations Council does not offer continuous assessment tests mainly because the KCPE candidature is very large (about 421,617 at present) and owing to the problems associated with continuous assessment discussed earlier.

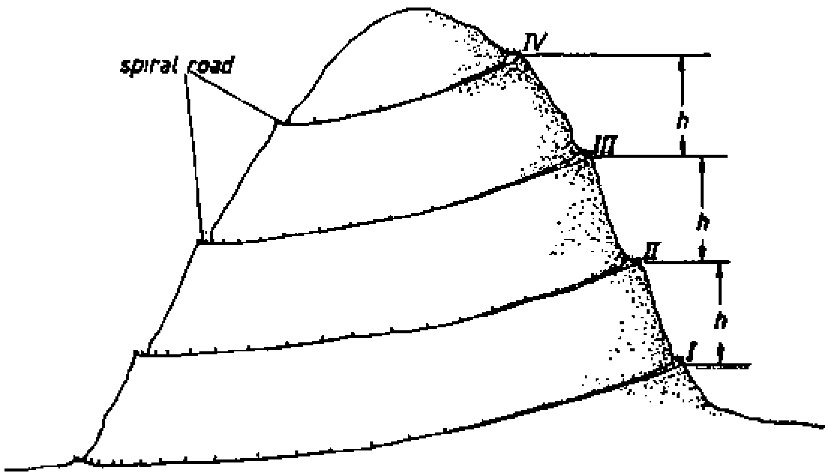
<u>Use of KCPE Results for Monitoring Primary School Pupils</u>

Unlike school-based continuous assessment, which is used continuously to monitor pupils' progress in education, KCPE results are only used to advise the teachers on areas of weaknesses so that they may re-assess their strategies of teaching. This advice is normally given in the form of backwash documents written by the Council. This document is called the **KCPE Newsletter.**

The KCPE Newsletter discusses questions done poorly by the Std. 8 candidates and suggests how misconceptions, that lead to the poor performance in the particular questions, can be corrected. The two examples below serve to illustrate this point.

(1) Question 20, KCPE Science 1989:

Naposho walked to the top of the hill along the spiral road represented by the diagram below.



If the heights, **h** between the points are all the same, the effort used during the climbing was

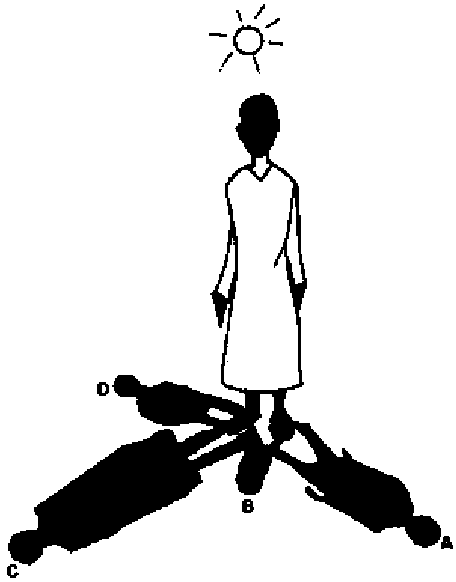
- **A.** least between points II and III
- **B.** least between points III and IV
- **C.** least between points I and II
- **D.** the same between all the points

Response Pattern

Option	A	B	C*	D
% Choosing the Option	6.27%	33.97%	28.73%	30.55%
Mean Mark on other Questions	26.59	31.7.1	31.83	30.45

Question 20 was testing application knowledge in a new situation. It was scored correctly by only 28.73% of the candidates who were slightly of above average ability (had a mean mark of 31.38 compared to the sample mean of 21.01). Options B, C and D were chosen by candidates of almost similar ability because their means were less than a mark about the sample mean. This indicates that most candidates were only guessing the answer and hence the very small Discrimination Index (0.01). It is possible that most candidates failed to see the relationship between what they had learned in class and what was being tested in this question. Teachers are advised, therefore, to relate what pupils learn in class to real-life situations outside the classroom, for this is the ultimate goal in education. Knowledge that cannot be applied to solve problems and help us understand the world around us is dormant and hence worthless.

(2) Question 19, KCPE Art and Craft 1988:



Which one of the shadows of the figure is correct if the sun is at the position as shown in the illustration?

Choice of the wrong options A, C and D in the question clearly indicates that the candidates may not have had practical exposure of body figures in the sun to enable them determine the sizes of shadows at various positions of the sun.

Conclusion

This paper outlined several ways in which the Kenyan primary school pupils are tested and monitored. School-based continuous assessment was looked upon as a systematic, objective and comprehensive way of collecting information about pupils. Exercises, terminal tests, home-work, projects, zonal/district organized tests and field-work were discussed as some of the instruments of doing this. The Kenya Certificate of Primary Education examination was also discussed as a procedure of testing and monitoring primary school pupils. It was demonstrated that questions offered at KCPE level do cover a variety of skills including practical skills.

3.3. Developing Tests for Complex Cognitive Processes

Obadiah Mucheru, Kenya National Examinations Council

Introduction

Most school curricula are designed with the explicit purpose of inculcating cognitive, psychomotor and affective skills in students. The success of any curriculum in fulfilling this objective can be assessed through the administration of tests at any stage of its implementation. Hence one of the major purposes of assessment in education is to investigate the extent to which students have gained from instruction.

The success of such an investigation would be enhanced if:

- the stock of knowledge possessed by students at the beginning of a programme of instruction is known;

- the objective of instruction or the structure of knowledge the students are expected to acquire is clearly stated and understood;

- the investigator can develop relevant testing instruments that can be used to show the gains made by students at any stage of instruction.

In the following we discuss the efforts item writers should make to ensure that they write items that test higher order thinking abilities.

Instructional Objectives

Instructional objectives are statements of what the instruction is expected to accomplish. Instructional objectives should be expressed in terms of quantifiable, measurable outcomes. Ebel (1963) distinguishes between the explicitly and implicitly stated instructional objectives and goes on to state that objectives that have been prepared to guide instructional planning or to communicate intended learning outcomes to students can also be used for evaluation planning and test development.

According to Ebel, an explicitly stated objective contains a verb that indicates, in operational, behavioural, or observable terms what the learner must do to demonstrate attainment of the objective. He gives the following examples of verbs that distinguish explicit and implicit statements of instructional objectives.

Verbs that Distinguish Explicit Statements of Instructional Objectives

Explicit, Behavioural	Implicit, Non Behavioural
Observable	Inferential
identify, explain, describe, summarize, select, develop, predict, differentiate, define, compare, write	know, consider, understand, discuss, realize, remember, judge, perceive, think about, comprehend, imagine

While developing tests the developer should translate the knowledge and abilities students are expected to acquire into tasks (test items) that require a demonstration of the students' achievements.

Taxonomy of Educational Achievements

A number of educators have developed taxonomies of educational outcomes for use by test developers. Three such classifications are shown in the figure below:

	Bloom's Taxonomy	Ebel's Relevance Guide	Gagne's Learning Outcomes
A.	Knowledge	Terminology Factual Information	Verbal Information
B.	Comprehension	Explanation	Intellectual Skills Cognitive Strategies
C.	Application	Calculation Prediction	
D.	Analysis		
E.	Synthesis		
F.	Evaluation	Recommended Action; Evaluation	
G.			Attitudes
H.			Motor Skills

The taxonomies classify all educational objectives into a hierarchy of categories based on presumed complexity (Gray, 1991). Each succeeding category involves behaviour believed to be more complex than the one previous and each is considered to be prerequisite to the next.

Cognitive Abilities

The term cognition refers to an act or process of knowing that involves the processing of sensory information i.e. perception, awareness and judgement. Cognitive learning includes problem solving, observation, concept formation and creative thinking. In more practical terms students who have followed a curriculum whose aim is to cultivate a wide range of cognitive skills should be expected to demonstrate some or all of the following abilities:

(1) Ability to identify terms and definitions.

(2) Ability to identify the reasons and conclusions of a piece of reasoning.

(3) Ability to judge whether an argument is sound.

(4) Ability to predict an outcome.

(5) Ability to explain or illustrate an event, principle etc.

(6) Ability to recommend appropriate action to solve a problem.

(7) Ability to solve specific mathematical problems.

The abilities numbered (2) - (7) are fairly complex in nature and any tests designed to elicit the extent of students' achievement of the abilities are likely to be complex.

However, most test developers are more acquainted with Bloom's taxonomy of the cognitive domain. In using Bloom's taxonomy it can be safely assumed that any item that tests beyond knowledge tests higher (complex) thinking abilities.[1]

[1] See 2.2.3. Table 2: Major Categories of Cognitive Objectives with Examples

In writing items the tasks should be stated in a style that will lead the student to engage in the desired thought processes.

Types of Questions for Different Cognitive Abilities

Knowledge - The pupil is expected to recall learnt information.

- name the - - -
- label the - - -
- state the procedure used to - - -
- define the term - - -
- describe how - - -

Comprehension - The pupil is required to show an understanding of the general nature of any new material or information.

- state the reasons for - - -
- indicate the advantages and disadvantages of - - -
- why is material/tool Q used for - - -?
- what does the phrase/statement/formular etc. tell us about - - -?
- state in words what the graph/picture etc. shows about - - - .

Application - The pupil is expected to apply what has been learnt to a problem which is new to him/her.

- what advice would you give to e.g. a farmer, a painter etc. to solve the problem of - - -?
- what is likely to result from - - - (unfamiliar set of circumstances)?

• use a graph to show that - - -
• solve - - - (a numerical problem).

NB: It is important to note that the problem whose solution is sought should be new to the target group, and not to the writer of the item. When we forget this cardinal rule, we often fail to recognize such questions as testing complex skills.

Analysis - The pupil is expected to be able to break down materials into its component parts and identify its organisation, structure and the relationship between parts etc.

• name the separate parts of - - - (e.g. a plant, a given instrument etc.)

• show in the form of a diagram the component parts of (a given instrument, object, tool etc.)

• identify the inconsistences that are apparent in (a given piece of evidence or between two or more pieces of evidence).

Synthesis - The pupil is expected to put together pieces of evidence, or information to produce the desired results e.g.

• the pupil should be able to use an organizing principle (temporal, behavioral, causal) to hold material together.

Evaluation - The pupil is supposed to judge the value of a given piece of information.

• is the evidence given adequate to enable one to make the conclusion that - - -?
• how reliable is the evidence available - - -?
• to what extent is (a given phenomenon) influenced by - - -?

Summary of General Rules for Setting Higher Order Items

• Avoid questions that start with words such as who? what? when? where?. These tend to solicit factual information.

• Use terms like **why? - - because - - which of the following statements - -** etc.

• Give a set of conditions and ask students to predict a future result.

• State a problem and ask students to suggest a solution.

• Always think of problems to be solved rather than facts to be remembered.

• Always strive to use real life problems - not abstract concepts.

• Avoid using long winded statements.

• Use as much stimulus materials as possible. These include diagrams, graphs, tables, pictures, etc. They are easier to write items on.

The Specifications Grid

The first task of a test developer is to draw a specifications grid to show the topics and skills to be tested and the number of items to be developed in each case. While most item writers use Bloom's taxonomy of the cognitive domain to indicate the skills to be tested other taxonomies may be used. In Science subjects it is not unusual to use science skill processes such as observation, measurement, recording, predicting, etc. instead of Bloom's taxonomy. The most important thing is to have a plan for the test to be developed.

Moderation

The moderation of items should be done by a panel of subject and measurement experts. They should scrutinize each item and improve it or discard it depending on its relevance to the desired goal. The moderating panel must ensure that:

- every item has face validity, i.e. each item appears to test what it purports to test;

- the intended key is the single correct or the best choice among the given responses;

- all the options are plausible and that the distractors are indisputably wrong;

- each item is set at a reasonable level of difficulty for the average candidate;

- the phrasing of each item is unambiguous;

- each item is independent i.e. picking the right answer in one item is not dependent on the student's ability to pick a correct answer in another item in the paper;

- the item does not contain irrelevant difficulty - e.g. long statements which can be shortened without changing the intended meaning;

- the item does not test trivial knowledge;

- the item is free from bias i.e. that the item neither gives an advantage nor a disadvantage to particular candidates on the basis of factors which are extraneous to the purpose of the test;

- each item correlates to the whole test;

- all diagrams are accurately drawn and labelled.

An item which does not meet any of the above criteria should either be improved or substituted.

Evaluation of Test Items for Bias

The evaluation of test items for bias is an important step in test development. The evaluation should be done by a person or persons who are truly conversant with the target population for whom the test is designed. It can be done at the moderation stage or after the moderation. The evaluation for bias can be done by asking a series of questions such as the following:

- Is the language used in the test items, as well as the activities reflected in the items, likely to be offensive to members of any group? i.e. Are the items culture free?

- Are the activities reflected in test items relevant to the life experiences of the persons responding to the items? e.g. Do the items have a rural or an urban bias?

- Are the connotations of key words and phrases in the test items essentially the same for all students?

- Are the test items written in a straightforward, uncomplicated, easily read manner?

- Is the content of test items so interesting to examinees that they will be distracted from the task at hand?

Arrangement of Items in the Test Paper

Most students are filled with anxiety when they are confronted with tests. This anxiety may boil over if the first few items in a test paper require the student to engage in complex thought processes. As a general rule a test paper should start with easier questions, the more difficult questions appearing towards the end.

Observations and Conclusions

• The term complex-cognitive skills can be used to refer to the skills that go beyond the knowledge or recall level.

• It is difficult for any two people or any two groups of experts to all the time agree on the skill a particular item is testing. The mental processes that the student has to engage in is the single most important determinant of the skill the item is testing.

• When items are meant to reveal whether the student can apply knowledge to solve new problems, care must be exercised to ensure that the problems are new to the student, not to the item writer.

• It is important for the item writers at any level to be fully conversant with what goes on in the classroom. They should also have a good mastery of the subject matter and the objectives of both the curriculum and the particular subject for which they are expected to produce items.

• The task in every test item must be clearly stated. The stem should be stated in the form of a question whenever possible.

• It is easier to test the higher abilities using the»best answer«rather than the»absolute correct answer«type of items.

• The moderation of a test paper should be regarded as a most important stage in test development. Moderators must be fully conversant with the requirements for education in the country. They should also be subject and measurement experts. And since elimination of bias is part of the moderation exercise, the moderators should be fully conversant with the target population.

3.4. Skills in the Construction of Science Tests

Grace Kigoto, Kenya Institute of Education

Introduction

Constructing a good test is not easy, yet the curricular changes witnessed in many of our African countries, especially in the last decade, have demanded more rigorous testing. At the same time, sharp criticisms and bitter attacks have been raised against testing. But it is a well known fact that testing is an essential part of teaching and learning. Efforts have, therefore, to be made by one and all to acquire knowledge, skills and attitudes necessary for the construction of good tests.

Requirements for Constructing a Good Test

A good test can serve several purposes. For example:

- it can provide teachers with relevant information for improving instruction;

• it can help pupils improve their learning through motivation;
• it can facilitate educational planning and decision making.

The Kenya Certificate of Primary Education (KCPE) examination offered at the end of the primary cycle (8 years) is intended to guide in:

• ranking candidates according to their achievement in subjects and therefore selection to secondary schools;

• awarding certificates;

• data collection that can be used by teachers, curriculum developers and educational planners.

An item writer should possess an understanding of the following:

• the structure and goals of the curriculum to be tested;
• the behaviours and processes to be learned;
• the psychological and educational characteristics of the learner.

A good test must be carefully planned in order to serve the purpose it is intended for. The following procedures have been suggested:

• State the general objective of the course and define each objective of the unit in behavioural terms. (See Appendix I for action verbs to use in stating objectives behaviourally and Appendix II for Science Process Skills and Attitudes).

• Make an outline of the content to be covered or that already covered during the course.

• Prepare a table of specifications.

• Construct test items to measure the students' behaviour specified in the table of specifications.

Specifying Objectives to Be Tested

This indicates the learning outcomes that the test developer will accept as evidence that the lesson objectives have been achieved. Secondly, this specifies the student behaviour that is to be measured by test items.

Bloom's taxonomy of intellectual abilities and skills provides categories as follows:

Knowledge:	This provides mainly recall of knowledge e.g. terms, facts, rules and principles.
Comprehension:	This involves understanding of what is being communicated, so that the individual can make use of the material or idea.
Application:	This concerns the use of data, in particular to handle general ideas, rules of procedure or generalised methods, as demonstrated within the category.
Analysis:	The breakdown of information into its constituent elements or parts so that its ideas are made clear.
Synthesis:	Involves putting together elements and parts to form a whole. An individual can take a variety of data and arrange it in such a way as to constitute a pattern.
Evaluation:	This involves the ability to exercise judgement.

Outlining the Content

After specifying the objectives to be tested, the tests constructor should make an outline of the content to be covered by the test. This ensures adequate sampling of the subject matter of the course. This content outline should show specific elements of the content.

Preparing the Table of Specifications

This is the most crucial stage in the construction of a test, some times called a test blue-print. A table of specifications ensures balance and comprehensiveness of a test. The table has two dimensions. The first represents the different abilities that the student should display and the second represents the subject matter.

Table of Specifications: Science and Agriculture					
Skill	Knowledge	Comprehension	Application	Higher Abilities (Analysis, Synthesis, Evaluation)	Total
Content					
Health Education: Diseases & how to prevent them; Cleanliness	1	1	1	-	3
Energy: Sources, forms, uses and conservation	1	1	1	1	4
Making Work Easier: Construction	-	1:	1	-	2
Properties & Characteristics of Soil: Sedimentation, water retention, stickiness and use of locally available soil	1	1	1	-	3
Soil Fertility: Fertilizers, manures, mulching and soil erosion	1	1	1	1	4
Pollution: Pollutants and the environment	1	1	1	-	3
Land Utilization: Uses and farming systems	1	1	1	-	3
Farm Economics: Effect of spacing and fertilizer application, farm records and simple accounts	1	-	1	1	3
Total	7	7	8	3	25

Each row indicates the number of items to be used. It is important that the number of items on each area of content and to each objective in the table of specifications reflect the relative emphasis given during instruction.

Construction of Test Items

Depending on the purpose of the test and the mental abilities students should display, the test constructor will use different types of tests.

Free Response Type

In these, the student is expected to create rather than to choose a correct response. There are completion items and essay types. In completion items the student gives one or two words or a phrase to complete a sentence.

Essay type of question items are easy to construct and when done properly, they can measure complex learning outcomes. They allow for creativity and originality. However, there are disadvantages of using these tests. For example, they can be highly unreliable. It is also difficult to cover all topics using essay type of questions.

To be clear and specific, such action verbs like»describe«,»identify«,»list«,»compare«,»distinguish«,»give reasons for...«should be used when constructing essay questions. To increase reliability, the evaluator should prepare a marking scheme showing the main points expected and the distribution of marks.

Choice Items

These can be marked objectively and are easy to score. They are, however, difficult to construct and can be open to guessing. There are 3 types, namely, multiple-choice items, matching items and true-false. We shall only discuss multiple-choice items in this context.

A multiple-choice item has two parts: a stem and options. The stem can be written as a question, or an incomplete statement. Of the options, one is the answer or **key** while the other options are called **distractors.**

The following should be borne in mind when constructing multiple-choice items:

- The stem should be clear and should include a single problem only.
- Avoid placing the correct answer too frequently in any one position.
- Avoid having similar or related words in both stem and correct answer.
- Check that no item has more than one key.
- Avoid making the correct answer longer or shorter than the distractor.
- Avoid using choices that are unrelated to the subject of the item or are obviously wrong.
- All choices should be plausible.
- Each response should be preceded by an identifying number.
- As far as possible, avoid the use of negatives.
- Each item should stand on its own and no item should provide a clue to the answer of another item.
- The distractors must be a result of common errors or a misunderstanding. (See Appendix III - Test Construction Guidelines)

The above are steps/hints towards the construction of a good test. Before a test is finally declared good, the following needs to be done:

Content Analysis

The content validity is assessed. It is carried out to determine the extent to which test items adequately measure the objectives of the course.

Item Analysis

This takes place after the test has been administered to the learners. Item analysis helps one to identify the objectives and content that has been mastered by the learners and those that require further training. Two types are discussed here:

(1) Item Difficulty

This is calculated by getting the number of learners who got the item right out of the total number of learners who did the test e.g. if 16 out of 20 learners got the item correct, then we have 16/20 = 0.8. The higher the value of item difficulty, the easier the item is. This shows that most of the learners answered the item correctly and so had achieved the objective.

Another method of calculating item difficulty is by using the formula

$$P = \frac{C}{T}\ (100)$$

Where P is the percentage of pupils who answered the test item correctly, C is the number of pupils who answered the test item correctly, and T is the total number of pupils who attempted the test item.

E.g. suppose that an item is answered correctly by 40 students out of a total of 60 who attempted it. The level of difficulty P will be

$$P = \frac{40}{60}\ (100) = 66.6\%$$

(2) Item Discrimination

This shows the extent to which a test item distinguishes between bright learners and weak learners. The following method is used:

- arrange all marked answer papers of the learners in ascending order starting with the paper with lowest mark at the bottom;

- calculate the total number of learners at the top one-third and the bottom one-third. The middle one-third is NOT used;

- count the number of learners in the high score group who answered the item correctly. Call this H;

- count the number of learners in the low score group who answered the item correctly. Call this L;

- calculate the item discrimination (D) as follows:

Item discrimination

$$D = \frac{H - L}{\frac{1}{2}N}$$

Where N = total number of learners from high and low score groups.

The highest value of D is 1 if all the learners in the H group got the items right and none in the L group got it right.

Normally, an item discrimination value of 0.3 or higher shows that the item distinguishes between bright and weak learners.

Example: If 7 out of 10 in the upper group answered correctly and 3 out of 10 answered correctly in the lower group, then D is 7 minus 3, divided by 10 = 0.4.

The above is not that easy especially for a beginner. Worse still, even after much struggle to come up with a good test, you will always find that either the item was not that good or some bitter criticisms will come from those affected by test results (e.g. parents). This further calls for patience, an imaginative mind and lots of practice in item writing.

Conclusion

We have seen that a test writer requires to have:

→ Knowledge of the structure and goals of the curriculum which, in the case of Science, would also include science process skills;

→ Knowledge of the subject matter;

→ Knowledge of the characteristics of the learner;

→ Skills in test construction and correct interpretation of test scores;

→ A creative mind;

→ Patience to sit for long hours and also accept criticisms, etc.

Appendix I

Action Verbs to Use when Writing Behavioural Objectives

For knowledge	•	define	write	underline
		state	recall	select
		list	recognize	reproduce
		name	label	measure
For comprehension	•	identify	illustrate	explain
		justify	represent	judge
		select	name	contrast
		indicate	formulate	classify
For application	•	predict	choose	construct
		select	find	compute
		assess	show	use
		explain	demonstrate	perform
For analysis	•	analyze	select	justify
		identify	separate	resolve
		conclude	compare	break down
		differentiate	contrast	criticize
For synthesis	•	combine	argue	select
		restate	discuss	relate
		summarize	organize	generalize
		derive	conclude	
For evaluation	•	judge	support	avoid
		evaluate	defend	select
		determine	attack	choose
		recognize	criticize	identify

The following are open to a variety of interpretations and therefore are **not recommended:**

to know	to appreciate	to enjoy
to understand	to fully appreciate	to believe
to really understand	to grasp the significance of	to have faith in

from: Kenya Institute of Education, Primary Teacher Education, Draft Teaching Guide for Science, 1985.

Appendix II

Science Process Skills and Attitudes

Skills

- observation and recording
- asking questions
- sorting and classifying
- collecting data
- interpreting data
- making predictions
- drawing conclusions
- reporting and exchanging information
- making hypotheses
- experimenting (controlling variables)
- measuring
- manipulating/handling materials

Attitudes

- curiosity
- self-confidence
- cooperation
- responsibility
- interest
- practical approach to solving problems

from: Kenya Institute of Education, Primary Teacher Education, Draft Teaching Guide for Science, 1985.

Appendix III

Test Construction Guidelines

The following are standard guidelines applicable to the preparation of all assessment instruments.

1. All items of similar format should be grouped together.

2. Arrange items in order of difficulty.

3. Items should be well separated by leaving enough blank space between items for ease of reading.

4. Items should be completed on the same page where they begin.

5. Illustrative material should be placed above the items that refer to them.

6. Items should be randomised.

7. Select a format for answers.

8. Student data should be recorded.

9. Instructions should be reviewed.

10. Proof-read the test.

Guidelines for Constructing Essay Questions

1. Relate each question to an instructional objective.

2. Give adequate time for each item.

3. Indicate level of details required.

4. Use essay items only where objective items cannot be used to evaluate.

5. Allow no options so all candidates should do same items.

6. Evaluate the candidate in terms of his presentation rather than the position he takes in answering questions.

7. Define the tasks clearly and unambiguously.

8. Do not begin essay items with such words as»who«,»when«,»reason«,»evaluate«, etc. as these focus on recall. It is better to start with words like»compare«,»contrast«,»give examples«,»reason«,»evaluate«, etc.

9. You should know the processes you want the student to use in answering the question and select the appropriate verbs.

from: M.B. Ogunniyi, Educational Measurement and Evaluation (Hongkong, Wing Lee Printing Co. Ltd.), 1984.

3.5. Technical Efficiency in Constructing Test Items

Joseph M. Khakame, Kenya National Examinations Council

Introduction

Technical efficiency in construction of test items can be defined as a process of ensuring that a test item is reliable, valid and discriminates appropriately among ability levels of the examinees. This definition is based on the assumption that the item will form part of a test intended for Norm Reference Testing (N.R.T.). It is categorical that the test be for N.R.T. because the purpose for which the scores of such a test are used is basically selection and placement. In the Kenyan case, the Kenya Certificate of Primary Education (KCPE) examination is both terminal for the majority of examinees and for selection and placement of most of the examinees of higher ability.

Kenya has for many years since the early 1970s been striving to ensure that the examinations whose results are used for selection and placement adequately meet these requirements. In addition to these requirements, the examinations are used for certification. These examinations are:

• the Kenya Certificate of Primary Education (KCPE) (Certificate of Primary Education before 1985);

• the Kenya Certificate of Secondary Education (KCSE) (Kenya Certificate of Education before 1988);

• the Kenya Advanced Certificate of Education (KACE) which was phased out in 1989.

This paper will focus on the KCPE examination and the Science paper in particular.

Types of Tests

The tests to be discussed will be of achievement more than of aptitude. It is, however, difficult to distinguish between an achievement and an aptitude test. Aptitude tests are predominantly used to predict the future learning of a candidate. Whereas we categorise the KCPE tests as achievement, the purpose for which they are used make them have considerable resemblance to aptitude test items. Most of the items in these tests are ability-based and, for this reason, the tests have departed from the dichotomy of achievement versus aptitude testing. A follow-up study by the Examinations Council to check and confirm the predictive validity of these tests was carried out. The examinees who scored high on the KCPE Mathematics paper of 1985 performed extremely well on the KCSE Mathematics paper of 1989. This has proved that although the KCPE tests are predominantly achievement tests, they have high predictive validity.

There are many forms of tests which can be used to measure the achievement of examinees who have gone through a prescribed course of study. These are:

→ essay-type (free response)
→ objective type of which there are various types

- multiple-choice
- matching
- true or false
- structured (open-ended).

The essay-type items are used in the testing of English Composition and >Insha< (Kiswahili Composition). These two papers are scored by readers. This is a subjective scoring. The readers' knowledge of content and their moods can easily influence the reliability and validity of the scores. It is also argued that essay-type tests are better suited for higher ability testing. This is debatable but it is also clear that the testing is highly influenced by the candidates' verbal facility. The application of this mode of testing in KCPE therefore suits the purpose of the two papers except for the subjectivity of the readers.

The multiple-choice mode of testing is used in all the other papers for the KCPE examination. These include Mathematics, English Language, Lugha Ya Kiswahili, Home Science, Business Education, Geography, History, Civics, Religious Education, Art and Craft, Music, Science and Agriculture. There are three reasons for choosing this mode of testing at KCPE level. First, it is possible to sample a large part of the content to be tested. Second, its objectivity ensures that the scoring is accurate and in addition the responses of the candidates are least affected by verbal ability, other than the ability to read. Finally, scoring is possible by use of a machine which is faster than people and is not subject to bias or fatigue errors.

Although many people have a notion that multiple-choice type tests are used at elementary levels and the performance of the examinees is greatly influenced by guesswork, the truth of the matter is that this is a fallacy. It has been tested at university level, especially in the United States of America, and proved to be more effective than the essay-type examinations. Multiple-choice items can be used to test all ability levels. These are Knowledge (recall), Comprehension, Application, Analysis, Synthesis and Evaluation. This taxonomy of ability levels by Benjamin Bloom gives a basis for designing a test. It would be futile to design and write a test without a table of specifications in which the ability levels are clearly spelt out.

For each of the contents to be tested, specific weighting in terms of number of items per ability level must be determined. The formula used is not mathematical but takes into consideration the importance of the content to the learners, the amount of time the content is allocated in the curriculum, and the relationship of the particular content to the rest of the content. Below an example of a multiple-choice item strategy for high level testing is provided.

- Give a stimulus in the stem. This can be in the form of facts followed by a hypothesis.

- Four options are given where the examinee is to agree, disagree, show some doubt or doesn't know.
- For each option a set of ten to twenty facts are given where some of the facts are false.
- The examinee is asked to choose the option which best suits the hypothesis based on the appropriate accompanying facts.

The interesting thing about such a test item is that three of the options normally have supporting facts which will require a very high level of ability to be able to discount all the fallacies and finally choose the key from the three options. The fourth option is obvious for the examinees who do not know.

Test Item Analysis

Item analysis is a detailed statistical description of how a particular test item functioned when it was used in a test. The analysis provides information about the difficulty of the item, discrimination among abilities of examinees, the relative attractiveness of the options and deduced reasons for abnormal behaviour of the item.

Pre-test item analysis is a desirable evaluation of the suitability of an item. However, in Kenya the competitiveness of the system and the use of the end results of the tests prohibits its use.

The theory and practice of item pre-testing cannot be overemphasised. Kenya initially carried out pre-tests in the early 1970s, the results of which were used to set standards upon which the current KCPE examinations are based. The reasons why pre-testing is not used in this country are:

- the competitiveness of the education system makes pre-testing unreal;
- it is difficult to retrieve all the items after pre-testing;
- the results of a pre-test cannot be valid and reliable under the current set-up;
- the examinee cannot be motivated to take the pre-test to give valid results;
- there are many publications complete with answers and such pre-tested items can easily form part of the publications;
- the cost of pre-testing under the prevailing circumstances cannot be justified;
- the present method of test item analysis serves a very useful purpose. The results of this analysis, when used in the setting of a similar test, give the desired outcome;
- the impression of pre-testing to the general society would greatly injure the reputation of the Examinations Council.

The purpose for which such a pre-test could be used cannot be imagined and therefore lack of motivation on the part of the examinee would make the pre-test results invalid. The converse of this would be the impossible retrieval of the items from the examinees which would negate the original purpose and therefore the whole exercise would be futile.

Preliminary item analysis is usually performed on some candidates' scripts to check for the following before the actual scoring:

- a wrong key entered by the test writer,
- a wrong key entered in the computer system,

- a printing error that renders the key incorrect,
- an originally correct key made incorrect by the passage of some historical event.

Item Difficulty

The purpose for which a test is designed will dictate the nature of items to be used in the test. It is desirable to have a test where all the items are of low difficulty in an attainment test used to determine how well a group of examinees have learned a set of skills. If, on the other hand, the test is to be used for selection, as it is the case in Kenya, the items on the test must be of varying levels of difficulty. However, it is desirable in this case that a majority of the items should be in the middle difficulty range. The item difficulty is determined by the percentage of the examinees scoring the item correct. Take for example 24,136 examinees; when 12,068 of the examinees get an item correct, this will be 50% difficulty. From 50% to 60% is considered to be middle difficulty, 40% down to zero would be considered to be on the difficulty side. Again referring to the 1991 KCPE Science paper, there were 30 items, 16 of which were between middle difficulty and easy, six were slightly more difficult and eight were very difficult. The item difficulty results are used as a quick check to see which of the items behaved well. A more detailed analysis of performance is carried on from there.

Test analysis is carried out at the scoring stage of the KCPE examination. This analysis serves the following purpose: test for item bias.

It is very clear that Kenyan society has many social differences based on religion, culture and the geographical distribution of the examinees. There are many religious groups which are likely to influence the social set-up of various groups of people. At the test development stages, all items are carefully checked for bias. Any item which does not meet this stringent test is thrown out. However, there used to be one or two out of 100 in the 1970s that passed unnoticed by the experts.

This problem is no longer there. However, during this analysis, patterns of poor teaching emerge and this information is used in the writing of the backwash document normally referred to as the KCPE Newsletter.

Assessing Item Discrimination

Item discrimination is critical in a test if that test is to be used for ranking, selection and placement of examinees. This indicates the relationship between the high ability examinees' response to an item and the response of the low ability group in the same sample. Ideally, the sample should be divided into three groups and a comparison made between the top and bottom groups.

KCPE tests are of adequate length and the inclusion or otherwise of the item that is being tested for discrimination is not significant. The mean score for each of the two groups is least altered by the inclusion or exclusion of the score for the item in question. However, the Kenya National Examinations Council does not use this method of determining Item Difficulty Profile.

If we take a sample of 24,136 examinees, and divide it into three groups according to the ability ranges on the test, this will give us 8,045 candidates per group. It is assumed that the question to be analysed is of middle difficulty; therefore the middle group is expected to remain so. Let us take item No. 24 on the 1991 test in Science and Agriculture.

24. Sankuri classified some of the animals he had seen during a visit to a national park into two groups using a certain characteristic:

Group I	**Group II**
Lizard	Mouse
Frog	Ostrich
Crocodile	Leopard

Which one of the following shows the characteristic that Sankuri used?

Group I	**Group II**
A. Carnivore	Herbivore
B. Lay eggs	Bear their young alive
C. Body temperature varies	Body temperature constant
D. Do not care for their young.	Care for their young.

Sample statistics: N = 24,136 × 14,78 **-** SD = 4.48; Max. Score = 30

Table I

ITEM No. 24	RESPONSES				
	A	B	C*	D	D-INDEX
Candidates & % Choice	1,454 (6.01%)	4,064 (16.83%)	12,519 (51.86%)	5,975 (24.74%)	0.55
Mean Score ($\bar{x}$)	10.39	12.17	16.46	14.22	

*Key

The KNEC method of determining the **discrimination index** is based on the dichotomy of correct and wrong responses made by examinees in the sample. Table I above shows the responses where the key represents correct response while the three distractors represent the wrong responses. Candidates who did not respond to the item (omits) have not been included in the table. To determine the index, the following formula is used:

$$\text{D}-\text{Index} = \frac{\text{Mean Score}\,(\bar{x})\begin{pmatrix}\text{for examinees getting}\\ \text{correct response}\end{pmatrix} - \text{Mean Score}\,(\bar{x})\begin{pmatrix}\text{for examinees getting}\\ \text{the wrong response}\end{pmatrix}}{\text{Standard Deviation (SD)}}$$

Using the results from Table I:

$$\text{D}-\text{Index} = \frac{16.46 - (\bar{x}\text{ of groups A, B, D, and omits})}{4.48} = 0.55$$

This is an item of middle difficulty, and the proportion of examinees scoring correct come from the high ability group ($\bar{x}$ =16.46) and those who were wrong are of average ability and below, that is $\bar{x}$ = 14.22, 12.17 and 10.37 respectively.

Importance of Discrimination Index to an Item Writer

For example, if the mean score for the examinees getting the item correct was 12.00 and the mean for the candidates getting the item wrong was 16.40 from the formula:

$$\frac{12.00 - 16.40}{4.48} = 0.98$$

An item of this kind would indicate that there is something drastically wrong with the question in any of the following ways:

- the high ability candidates ignored the facts and chose to reason, but their reasoning did not have a sound scientific basis;

- the item has a bias which is likely to be fallacious and this obscures the facts which are likely to be very trivial;

- the item is so difficult that most candidates guess but in the process the higher ability candidates try to reason and this distracts them from the key.

An analysis of all items for item discrimination gives a guide to the setters to come up with similar items for the future tests that will:

- have the desired discrimination among candidates by ability levels. This is an essential requirement for a test whose results are intended for selection and placement;

- allow the low ability candidates to score on a few items. This is necessary because each examinee who takes the KCPE examination gets a certificate that shows attainment grades. In the Science and Agriculture paper 1991, there were four Science and eleven Agriculture items respectively that were easy. This gives a total of 15 questions which is 25% of the whole paper.

Critical Analysis of Test Item Discrimination Statistics

When item discrimination is done to a test, it is easy to put the print-out on the shelves and wait for the next year to carry out a similar analysis. However, if the findings of the analysis are critically looked at, very good use of the findings can be discovered.

The subject specialist and the item writers should do this analysis to be able to use the findings fully. Item No. 2 of the 1991 Science and Agriculture paper is analysed in detail.

2. As Kizito was adding kerozene to his lit stove, the whole stove caught fire. The MOST effective way to put out the fire would be

A. covering it with soil
B. beating it with a leafy branch
C. covering it with a piece of cloth
D. pouring water over it.

Table II

ITEM No. 2	RESPONSES				
	A*	B	C	D	**D-INDEX**
Candidates & % Choice	8,984 (37.21%)	1,556 (6.44%)	10,638 (44.06%)	2,874 (11.79%)	-0.02
Mean Score (x)	15.33	13.08	15.18	12.71	

* Key

This question was not discussed in the KCPE Newsletter because it was scored correct by more than 30% of the examinees which was the criterion for the choice of question appearing in the backwash document.

Item No. 2, however, is of interest for item writers because of the distribution of candidates choosing the key and those choosing a popular distractor.

First, the distractor C was chosen by 44.06% of examinees of above average ability, whereas the key A was chosen by 37.21% of examinees of above average ability. All other options were chosen by candidates who were of below average ability. It is apparently clear that this item is difficult. The two options A and C were the most plausible choices and since the item asked for the MOST effective way, both options can be effective depending on the circumstances. In some life situations, soil is hard to come by e.g. a candidate from an urban setting may not be able to gather 1 kg of soil in one hour by which time the fire would be completely out of control. If the same examinee under the urban conditions was quick to think, a wet cloth would have been a solution, but the cloth in question was not indicated to be either wet or dry. An examinee could make that decision that the cloth is wet, therefore it can be used to put out the fire quickly covering the fire so that the supply of oxygen is cut off.

The item writers and the subject specialists should imagine they were the examinees and what they could do in a real life situation.

Most of the items on the Science paper were beyond simple recall and in fact even those which may have appeared to be recall items contained information that required high level ability skills.

Relative Attractiveness of Choices

When an item writer drafts an item with four choices, it is hoped that those examinees who know the correct answer will choose the key and the remaining examinees will equally opt for the three distractors. But, unfortunately, this is to a lesser extent the case. The analysis of the 1991 KCPE Science paper revealed that:

• out of the 30 items, 10 had one very plausible distractor which made the other two distractors implausible;

• in cases where many examinees scored correct, for example items No. 11, 19 and 20, the remaining examinees were attracted by one distractor.

Consideration of the ability ranges of candidates opting for the strong distractor shows that the item was based on misconceptions and fallacies, that is if such an ability is below average. Table III shows a summary of the 10 items.

Table III Summary of 1991 Science Test Items (Selection)

ITEM No.	% Scoring Correct	% Choosing Main Distractor	Abilities
2	37.21	44.06	Low
6	10.90	52.80	Above average
8	37.18	34.02	Low
11	45.52	29.08	Mixed abilities
18	18.61	47.13	Mixed abilities
19	66.16	26.06	Low
20	68.71	23.84	Low
27	15.99	51.26	Mixed abilities
28	10.70	65.89	Mixed abilities
30	34.81	55.10	Low

The strong distractors should be carefully analysed so that similar distractors are not inadvertently used in future on similar items. Strong distractors where the majority of the examinees have low ability can be ignored.

All this data is available to the six setters of the paper. It is up to the setters to study these findings so that when they write items, they follow the set standards and only use the responses in the past paper as a guide. It is logical and reasonable to assume that a response distractor which attracted many examinees in the 1991 KCPE examination of above average ability must be either biased or the question was ambiguous. These types of responses are critically analysed and the conclusions are used as a guide in generating responses to the new items for a future examination.

In conclusion, the reason for avoiding to discuss or even mention reliability and validity statistics here is that these two features are derived from the mean, standard deviation and correlation relationships of a sample. They are the factors which are used in test item analysis whose results therefore fulfil the requirements of validity and reliability. The Examinations Council has over the years developed a system where item writers are trained before they can be used in the actual process of examination item writing. The current system of test item analysis is not fully developed.

There is still room for increasing the statistical features in the test item analysis, and the processes involved in test item analysis may be added to the training of the item writers in order to produce better test items in future.

4.1. Examinations Policies to Strengthen Primary Schooling in African Countries

THOMAS OWEN EISEMON

Centre for Cognitive and Ethnographic Studies, McGill University

Abstract - Examinations can be a powerful instrument for influencing the kind of instruction students receive, what they learn at school and how they will use school knowledge and skills in daily life. Attention is given to the examinations administered to African primary school students which are the basis for selection for secondary education. Findings are drawn from recent studies in two East African countries, Burundi and Kenya. These studies suggest: (1) that the scope of the school leaving examinations should be increased and should emphasize assessment of knowledge in the domains of science, modern agriculture, health science and nutrition; (2) greater use should be made of vernacular languages for testing to encourage explanatory instruction especially in scientific subjects; and (3) examination items should be constructed to measure high level cognitive skills of importance for performing practical tasks involving applications of modern scientific knowledge.

INTRODUCTION

This paper examines the use of school leaving examinations for strengthening the internal and external efficiency of primary education in African countries. It will focus on examinations policies in three key domains, those relating to: (1) the scope of examinations; (2) the language of testing; and (3) the construction of test items. It will suggest how manipulation of examinations policies may influence the kind of instruction students receive, and what they learn and may retain from schooling. Examinations can be a powerful and positive instrument of educational policy if their impact on instruction and learning is better understood. That is the purpose of the paper. Interest in using examinations for improving primary schooling in African countries has increased in recent years for many reasons; chief among them the recognition that examinations reform is a relatively low cost, effective strategy for stimulating educational change (Heyneman, 1986, 1987).

In contrast to primary schools in western countries with well developed systems of secondary education where the first years of schooling are considered crucial and are the object of much attention, schools in many parts of Africa tend to allocate scarce instructional resources to the upper stage of primary schooling which prepares students for highly selective secondary school entrance examinations. Better trained, more experienced teachers are often assigned to teach the final years. Students in the upper stage of primary schooling may receive more hours of instruction and are more likely to study from textbooks which are either distributed to them or which their parents purchase. Consequently, manipulation of examinations policies may not change the present allocation or perhaps more accurately, the misallocation of instructional resources. The intention of examination reform is, instead, to change the way these resources are used resulting in subtle changes in teaching and in the cognitive outcomes of primary schooling.

Educational researchers and policy makers in Africa and elsewhere have been ambivalent in their thinking about national examinations. Examinations are often viewed as the cause of poor quality primary schooling as well as the source of urban/rural, regional, gender and other disparities. This is contested by advocates of examination reform who have shown that well managed systems with the research capacity needed to design and assess test instruments can not only produce examinations that avoid the usual biases but also provide feedback to schools to improve student achievement (Somerset, 1983, 1987; Savage, 1985). The Kenya National Examinations Council has been described as an exemplar of such a system (Somerset, 1983; Eshiwani, 1986).

THE USE OF EXAMINATIONS FOR EDUCATIONAL IMPROVEMENT

National examinations have a long history in developing countries with a colonial experience that is important to review. India was the first to experiment with examinations as a strategy for improving the quality of post-secondary education. These were not the national examinations we know today but external examinations set by universities established for the purpose of accreditation and examination which did not offer instruction. The three original Indian universities at Bombay, Calcutta and Madras founded in the late 1850s along the lines of the University of London had this function. Their purpose was to give uniformity to the first degree programs of affiliated colleges, increase standards and restrain the growth of higher education. By the 1880s, it was acknowledged that the affiliating/examining model had failed in all of these respects (Ashby, 1966). Lord Curzon's efforts at the beginning of this century to reform Indian higher education by strengthening the affiliating and examining functions of the universities that by then had become centres of sedition did not have greater success (Basu, 1974). Irregularities in affiliation and examination, the result of pressures from caste, communal and linguistic groups for expanded access to higher education, plague the Indian university system to the present day (Altbach, 1972; Eisemon, 1982). The lesson that Britain drew from this experience, and France from a somewhat similar one in Vietnam, was that educational expansion had to be controlled from the outset; controls could not be successfully imposed at a later time.

The lesson was applied in Africa where formal education for the indigenous population developed in a presumably more logical, more planned way, i.e. from the bottom up under the close scrutiny of colonial authorities. Use of external examinations set and marked in the metropolitan countries and administered to African students desiring higher education either abroad or at the collegiate institutions established in Africa after the Second World War effectively controlled access to further education and ensured success of initial efforts to implant metropolitan standards. Newly created institutions of higher education were also affiliated to metropolitan universities that, for a time, awarded degrees to students who undertook their undergraduate training in Africa. During the period of decolonization and the first years of independence, the external examinations required for university studies were partially localized. This was done by either adapting overseas examination papers for administration in Africa and increasing African participation in marking papers, or in the case of British West Africa, by establishing a regional examinations council to set and administer examinations that followed the metropolitan model of how external examinations should be conducted.

It is remarkable, in retrospect, how well these systems of external examination worked: so well that they were retained many years after independence. Overseas examinations for university entry are still taken by a large number of African students usually attending prestigious private secondary schools who hope to do further studies abroad. In many African countries, the overseas examinations continue to set the standards for measurement of achievement in academic subjects and for good examination practice, generally.

The creation of national systems of primary and secondary education and eventually higher education after independence led to the establishment of national systems of examination in many African countries or to mixtures of national and local examinations systems in the larger countries like Nigeria. There is great diversity in the ways these have been established. Perhaps the most typical model is an examination unit located in a national or state ministry of education, though many like the Kenya National Examinations Council have autonomous status. There is even greater diversity in the scope of the functions of these units. In Kenya, the Council is responsible for almost all examinations including those administered at teacher training colleges and most pre-university professional and technical examinations as well. That is atypical.

What is common is that few examinations units have the capacity to do more than set, administer and mark examinations, and announce results. They function for the purpose of allocating educational opportunities and in this respect, most are unlike their predecessors in the colonial period which had a broader mandate to strengthen the quality of instruction. The responsibilities of African examinations bodies are, however, much more complex. There are more levels and subjects of instruction to be examined, more students taking examinations, greater political pressures on the autonomy essential to the examination process and few resources needed to innovate on existing practices. The implication of this is, simply, that examination reforms at the primary or other levels of the educational system will be difficult and expensive to introduce, and harder to institutionalize than the examinations focused strategies of qualitative improvement characteristic of the colonial period. But the centrality of examinations to instruction and learning merits attention to examinations policies and to strengthening the capacity of examinations units as an element of any package of qualitative improvements which may also include better facilities, more textbooks, support for more frequent school inspection, in-service teacher training, and so on.

CURRICULAR INNOVATIONS AND THEIR IMPLICATIONS FOR TESTING

Major investments have been made by the World Bank and other donors and by African governments in developing capacities to prepare, evaluate, publish, distribute and to train primary school teachers in the use of instructional materials. Interest in textbooks has been accelerated by the findings of international studies of educational achievement which have stressed the contribution of textbooks and other qualitative inputs to student learning in developing countries (Heyneman and Loxley, 1983; Heyneman *et al.,* 1981). A great deal has been accomplished in this regard, more than is generally recognized. Twenty years ago, most of the textbooks used at the primary level were either imported from metropolitan countries or, in the case of vernacular language primers, published locally by religious groups. Today, many African countries have textbook publishing industries of varying scale, and a cadre of trained textbook writers and illustrators. Larger countries like Kenya and Nigeria have significant private sector involvement in textbook development and publishing, though ownership, management and technical support is more often foreign than indigenous (Eisemon *et al.,* 1986).

This capacity has enabled African countries to make substantial efforts to adapt and to expand the content of primary schooling. What that implies differs from country to country. There are, nevertheless, three general trends. The first relates to the increasing importance that has been given to the teaching of vernacular languages. Here, again, there is much variation. In Tanzania and Rwanda, vernacular languages are used for instruction throughout the primary cycle in most rural schools. In Burundi, the local language is used in the lower stage of the primary cycle and a transition is made to the metropolitan language in the final years. In Kenya, local languages and/or Kiswahili or English may be used in the lower stage while English has been retained for the upper stage. In most countries, the teaching of vernacular languages has been assigned a central place in the primary school curricula and in the rhetoric of educational reform. However, metropolitan languages continue to be used for upper primary and secondary schooling in many African countries.

The second concerns the teaching of practical subjects such as health, nutrition, home economics, agriculture and pre-vocational skills. These subjects were also emphasized in primary schools in the colonial period (see, for example, Bude, 1985; Foster, 1965). Their revival as a strategy for fostering rural development has been prompted in part by recognition that the possibilities for expansion of secondary education and formal employment are limited. Most students who attend primary school will return to their families and whatever knowledge and skills they have acquired will be put to use in a rural environment, either in agriculture or in some form of employment they will create for themselves. The primary school curricula has been enlarged in consequence. In Kenya, for instance, twelve subjects are taught in the final year of primary school!

The third tendency has been to encourage what was described in the 1960s as discovery or inquiry oriented instruction, or what is still known in some parts of East Africa as the ‘new approach’ to primary school teaching (Eisemon *et al.,* 1986). In the late 1960s, the United

States Agency for International Development (USAID), UNESCO, the Nuffield Foundation, the British Council and other donors initiated curriculum development programs in Africa which were mainly aimed at the improvement of primary and secondary school teaching of science and mathematics (Yoyole, 1985). These employed, what were then, the lastest theories of instructional innovation in Western countries emphasizing development of high level cognitive skills.

Each of these trends poses a major challenge to established examination policies and practices; which subjects should be examined to ensure coverage of the mandated curricula, how should practical knowledge and skills be measured, in what language should testing be carried out, and how can examinations be developed to assess students' conceptual understanding of subject-matter as opposed to mere recall of disparate facts on which they have been drilled?

Testing to increase coverage of the school curricula

Achievement tests have the dual purpose of measuring what students have learned to ascertain whether certain minimal levels of performance are obtained, and selecting some students for further education. These objectives are not necessarily incompatible. But often if there are few opportunities for further education to be allocated, selection guides the construction of examination papers and test items. If domains of content are left off such tests, they are likely to be neglected in instruction. A test with good predictive validity, but poor curriculum or instructional validity may select good students for secondary school, but undermine the educational objectives which are intended to benefit students who are not continuing their formal education beyond primary school. The concepts of curriculum validity and instructional validity put the burden of proof on the examining authority to show that there is a reasonable relationship between examination content, the intended curriculum, and what is actually taught.

We have studied the impact of examination design on curriculum coverage at the primary level in Burundi and Kenya (Eisemon, 1988; Eisemon *et al.,* 1989a, b). Both countries have highly selective systems of secondary education, entrance to which is dependent on student performance in a rigorous examination administered at the end of the primary cycle. In Kenya, about a third of the students taking the Kenya Certificate of Primary Education Examination go on to some form of secondary education. In Burundi, less than 10% do so. Compared to Burundi, primary school instruction in Kenya is poorly monitored to ensure implementation of the curricula. Many rural schools are seldom inspected. Moreover, there are wide variations in the factors that influence coverage of the school curricula like trained teachers, textbooks, classrooms and instructional space for teaching many subjects, but especially compulsory practical subjects. In Burundi, there is much less variability among primary schools and instruction is closely supervised. For instance, school directors are required to make one hundred and fifty classroom visits during the school year and file reports with school inspectors.

Students taking the *concours national* in Burundi are examined in only four academic subjects and student marks are weighted in favour of tests of French reading comprehension and grammar. The examination is designed mainly from the perspective of selection for secondary education. Not surprisingly, we have found that the instruction given in the upper stage of the primary cycle often deviates from the curricula despite, or perhaps because of, close teacher supervision. Teachers frequently skip lessons in compulsory subjects like agriculture and home science that are not examined (Eisemon *et al.,* 1989a).

Kenya's Certificate of Primary Education examination has been designed to measure student achievement in all subjects in the school curricula, and the various papers are weighted equally in calculating final marks. The introduction of the 8 + 4 + 4 system in 1985 lengthened the primary cycle by an additional year. Its most important feature, though, was the emphasis on Kiswahili and practical subjects. Although the government produced a revised syllabus and new textbooks, very little was new in these curricular reforms except the emphasis on pre-vocational training. The major innovation was that what was supposed to have been taught for many years was to be examined. The Kenya National Examinations Council was given the task of setting new papers for health (previously taught and examined as integrated science which is to say that little importance was given to it), Kiswahili (not examined, and therefore, often not taught in the upper stage of primary schooling), agriculture (hitherto a small part of the science syllabus), and other subjects like art and crafts (on the basis of project work). These subjects were made compulsory papers. The changes were widely criticized in the public press and resisted by many educators (Eisemon, 1988). Implementation created many practical problems; facilities had to be constructed, texts produced, classrooms equipped and teachers trained for the new syllabus. Nevertheless, the effect was dramatic. Syllabus coverage, our studies indicate, was increased in spite of a great many difficulties in both urban and rural schools (Eisemon, *et al.,* 1986; Eisemon, 1988).

A strong and consistent, if not particularly insightful, finding of most research on effective schooling is that differences in the scope and amount of instruction received produce large variations in student performance. Typically, reducing such variation and raising achievement levels is seen as a school management problem to be remedied by closer teacher supervision, more frequent school inspection and by measures that will ensure a more equitable distribution of instructional resources like textbooks. The impact of examinations policies on students' opportunities to learn what primary schools are supposed to teach is less well recognized.

Coverage of the school curricula is a serious problem in primary schools in many African countries. While the scope of examinations can be increased to foster greater coverage, there is often not enough time or instructional resources to cover the subjects that ministries of education have prescribed, or to teach them in the innovative ways that curriculum developers expect (Eisemon *et al.,* 1989a). Ministries have various policy devices to deal with the problem; for example, revision of the scope of the school curriculum to bring intentions closer to the realities of implementation. Unrealistic expectations are in part responsible for low levels of test performance. In Burundi, for example, average scores for recent mathematics and French comprehension and grammar papers in the *concours national* are only slightly above the chance level. A closer relationship between examining authorities and those responsible for curriculum development and teacher supervision is required.

Testing practical knowledge and skills

Some of the most influential instruction that takes place in primary schools in terms of the ways school leavers think about and perform tasks in daily lives, is given in subjects that are often not examined or are poorly covered in secondary school entrance examinations; for instance, health, nutrition, home economics, principles of modern agriculture and science, especially biology. Testing in academic subjects like language arts and mathematics is also seldom designed to assess skills and knowledge of practical importance.

Information processing skills are important to a wide range of practical activities; for example, comprehending instructions on how to do some practical task such as administering medicines or applying fertilizers. The ability to encode, decode, recall and make text based inferences is not sufficient for comprehension. Readers must make inferences from their prior knowledge and experience in understanding these texts. Comprehension of such texts is one of the mechanisms through which schooling facilitates adoption of modern health and agricultural practices based on interventions derived from modern science.

Processing procedural information requires performing complex cognitive tasks which make literacy functional. Procedural texts have many features that do not enhance comprehension. Typically, they are brief texts with a high density of information expressed in many conditional statements (Eisemon *et al.,* 1987; Eisemon, 1989b). Crucial information is seldom marked with text cues aside from those setting apart different kinds of information. The structure of this genre of printed information is highly varied. There are relatively few conventions to which discourse must conform that might facilitate information processing. Although their purpose is instructional, these texts often assume familiarity with the subject and some related expertise. In many African countries, procedural texts require comprehension of information presented in two or more languages for correct inferences (Eisemon and Nyamete, 1990).

The mathematical problem solving tasks imbedded in procedural texts such as calculating the amount of a product that must be purchased or how much of it is to be administered are difficult to perform with the information provided. Units of measure are frequently unfamiliar and necessitate conversion. For this reason, adults rarely perform calculations in everyday life compared to how often they estimate solutions to practical problems. Abilities in estimation, of course, have a relationship to skills in calculating correct answers. But these skills are not necessarily a proxy for each other (Eisemon, 1989b; Eisemon *et al.,* 1989a).

Schooling affords students little exposure to text genres and numeracy tasks they will be exposed to as adults and, in consequence, little opportunity to develop the necessary skills (Eisemon, 1989b). Moreover, conventions of testing poorly simulate naturalistic tasks. Reading comprehension tests usually present students with narrative or descriptive texts and a set of tasks that involve recalling or inferring information from the texts as if comprehension does not involve using prior knowledge. Most comprehension tasks do not require integrating information presented in more than one stimulus text and testing of literacy and numeracy skills is done independently. Mathematics instruction and methods of examining achievement emphasize correct answers, penalize students for good ‘guessing’ through marking practices and powerful distractors, and make extensive use of narrative texts for constructing problem solving tasks (‘story problems’).

Elsewhere (Eisemon, 1988, 1989b; Eisemon *et al.,* 1989a, b) we have described alternative and more naturalistic approaches to assessing literacy and numeracy skills in primary school students. Stimulus texts were designed to incorporate many features of procedural texts and comprehension and numeracy tasks constructed to elicit prior knowledge acquired from instruction in science and other subjects. Similar texts and tasks were used to measure adult literacy and relate it to important outcomes of schooling. Among Burundian and Kenyan farmers, for example, functional literacy scores had a larger effect on farm ouput than years of schooling and most other indicators of cultivators’ skills and production characteristics, including expenditures on fertilizers and other modern production technologies (Eisemon, 1989a). While there is much scope for testing practical skills in academic domains, many complex issues are raised. These have to do with techniques of measurement, assumptions about how functional knowledge and skills should be assessed and, ultimately, about the way language arts and mathematics are taught.

In many African countries, there are strong pressures to vocationalize basic education, resulting in programs to prepare students for self-employment. In contrast to technical training which has as its primary objective the development of productive skills leading to levels of measurable expertise, the aims of pre-vocational instruction are more modest and more ambiguous. Most pre-vocational instruction has two foci; the development of skills that may be useful in a wide range of production situations as well as those which are associated with particular kinds of work whose mastery is in some sense a prerequisite for subsequent technical education, formal or informal. Because such instruction occurs in the context of basic education and employs methods drawn from the teaching of academic subjects, pre-vocational education has the additional purpose of providing experiences to facilitate the transfer of cognitive skills from academic to practical domains.

Measuring outcomes of pre-vocational education is complicated by many factors, not least is the difficulty in deciding what production knowledge and skills should be tested, and how this should be done. In academic subjects, knowledge and skills are hierarchical and cumulative, at least from the standpoint of curriculum and measurement specialists. And there are widely accepted methods for assessing task performance. However, there is little to guide testing of outsomes of pre-vocational education.

Improving testing of outcomes of pre-vocational education requires understanding: (1) the knowledge and skills important to productive activities and their relationship to schooling; (2) key production tasks associated with these activities; (3) what constitutes competent task performance; and (4) how expertise is acquired. In brief, it necessary to look outside school to develop strategies for assessing the effectiveness of practice studies.

In Burundi and Kenya, agriculture and crafts are the principal subjects of pre-vocational education. We have studied how primary school children are taught these subjects as well as how production knowledge and skills are used in everyday life (Eisemon *et al.,* 1989b; Eisemon, 1989b). School instruction in agriculture and crafts share certain characteristics. Typically, production knowledge and skills are imparted by individuals without training, experience or much interest in the domain of instruction. Thus, students have few opportunities to observe expertise. Practical work is emphasized but little importance is given to competent task performance. Progression from one topic of instruction to another is not based on demonstrations of task mastery. While topics may be ordered in the syllabi according to some taxonomy of complexity, there is often a great deal of redundancy indicating that the skills may not be hierarchical.

Outside school, children acquire agricultural and craft skills in very different ways. Children observe adults engaged in productive activities from a very early age and through this, encode important information about production processes. They acquire production skills through experimentation usually imitating adults. Learning of production tasks is spontaneous and often undirected. Children, having become proficient in one task, learn another gradually expanding their repertoire of skills. Learning agricultural and craft skills always involves working with objects of value to produce things of value.

In so far as craft skills are concerned, our studies suggest useful strategies for measuring skills but also indicate that those implicated in expert performance are unlikely to be learned in school. The Kenya Certificate of Primary Education examination presently tests outcomes of craft instruction by requiring students to produce craft objects for assessment. A better method, that is more consistent with the aims of pre-vocational education, would be to test student performance of tasks fundamental to expertise (Eisemon *et al.,* 1988). Efficiency, for example, is fundamental to expertise in many craft occupations like soapstone carving, an important form of self-employment in western Kenya. Assessment tasks can be constructed to measure students' efficiency in selecting stones for carving or in the choice of tools and subject matter. But such expertise is unlikely to be developed through formal instruction. Soapstone carving is probably like many other craft occupations such as carpentry and tailoring in these respects. Assessment of student products may provide few insights into the skills students have acquired that are involved in expertise or can be generalized to other practical domains. Improving present assessment practices engages the issue of whether these skills are best taught in school.

While many primary school students who are being taught crafts are novices, they begin instruction in agriculture with much production knowledge and skills. In fact, agriculture is not a pre-vocational subject for most students in rural areas. It is their present and future vocation.

Literacy and numeracy are one mechanism through which schooling seems to influence agricultural productivity. These skills affect capacities to effectively use modern agricultural inputs. Also involved is a knowledge of the scientific principles which underlie modern agricultural practices. Schooling affects the way farmers think about and practice agriculture (Eisemon, 1989a). Testing outcomes of agricultural instruction should emphasize how well students are able to apply the scientific knowledge they have acquired to practical production problems.

While variability is characteristic of most production situations, there are many production problems that exist across a wide range of situations - low soil fertility, poor drainage, crop infestation, and so on - and practices that are effective in dealing with them derived from modern as well as indigenous scientific knowledge. Farming expertise involves an ability to identify these problems, deduce their causes and select appropriate intervention strategies. Schooling should impart 'theories' and information that guide practical problem solving, especially involving the use of modern agricultural technologies. The effective use of hybrid varieties to increase yields is illustrative. This requires some knowledge of genetics and soil chemistry, however rudimentary.

The scientific principles of modern agriculture may be taught, or students expected to integrate what they have learned in science and agricultural classes (Eisemon, 1989a). In

Kenya, agricultural teaching at the primary level incorporates biology and other sciences and until recently, students were examined on the knowledge of principles of agriculture rather than their practical skills in, say, crop care. In Burundi, agriculture is divorced from instruction in science and it is not a paper in the national examination administered at the end of primary school. In order to investigate the effectiveness of agricultural instruction in Burundi, we have developed tests similar to the ones formerly used by the Kenya National Examinations Council to measure achievement in agriculture which assess problem solving skills using modern scientific knowledge (Eisemon *et al.,* 1989b). However, they are different in two respects. First, we have attempted to measure students' abilities to solve some practical production problems with indigenous knowledge and practices. Agricultural education in Burundi and most African countries condemns indigenous farming knowledge and practices by neglect, though such knowledge and practices like intercropping, particular patterns of crop rotation, crop fumigation and use of indigenous varieties are demonstrably effective in many production situations and some times superior to modern production technologies. Second, because agricultural education in Burundi, Kenya and other countries is offered in a metropolitan language, as is most science education, we have tested students in their mother tongue to better assess what they have learned in both subjects, and whether they have integrated this knowledge into their thinking. In sum, testing outcomes of pre-vocational instruction necessitates careful specification of what kind of impact schooling might have on domains of performance, taking into account the production knowledge and skills which children possess, and designing measurement strategies that capture crucial features of expertise.

Testing in the mother tongue to improve measurement of achievement

Language policies in many African countries where basic education is the responsibility of the national government, prescribe the use of a metropolitan language for instruction in the upper stage of the primary cycle and for examination in most academic subjects. This is seen as having several practical advantages, one of which is that in linguistically heterogeneous situations, learning and being examined in a metropolitan language is perceived to favour no particular linguistic group. In linguistically homogeneous situations like Burundi where French is the medium of most instruction in the final years of primary schooling and is used for most papers in the *concours national,* other justifications are offered that, essentially, favour the preparation of an elite for higher education *vis-à-vis* the competing needs of those who are unlikely to use French in later life. Examination policies, thus, determine language of instruction policies at the primary level just as much as they reflect those adopted for secondary and higher education.

Poor proficiency in the language of instruction is an impediment to acquiring knowledge and skills and, thus, depresses levels of performance, though not necessarily to the same extent. In other words, students with little grasp of the language of assessment may 'know' more than their test results reveal. There is much evidence of that in African studies comparing the performance of students in the mother tongue and in a metropolitan language (Zepp, 1982; Eisemon *et al.,* 1989b). Nevertheless, what performance differences reveal about how testing in a metropolitan language affects the measurement of student ability is not well understood.

In Burundi, we compared the performance of students in French which is used for the final two years of primary schooling and for the *concours national* as well as in Kirundi, the mother tongue of most students in that country (Eisemon *et al.,* 1989b). Tests were developed measuring reading comprehension skills and problem solving skills in the domains of science, agriculture and mathematics. As expected, students who received the tests in Kirundi scored higher on most tests than those who took them in French, although performance levels were low for all tests. The performance differences were largest for the tests of achievement in science and agriculture. In mathematics, however, students scored slightly higher in French.

Responses to question items were examined using monotone regression splines analysis to determine how language of assessment affects the performance of students of different ability (Ramsay and Abrahamowicz, 1989). In this analysis, ability was estimated from the student's response pattern for each test, and the estimate compared to the student's response to individual questions. In the reading comprehension and science and agriculture tests, the performance of the most able students was most affected by being tested in French. Conversely, testing in the mother tongue did not increase the performance of students with less ability. These findings have at least two implications. First, students with poor proficiency in the metropolitan language learn so little that their achievement levels are almost unmeasurable. Greater attention needs to be given to raising the proficiency of these students in the metropolitan language. Second, mother tongue testing better estimates the knowledge and skills for those students who, presumably, are the most proficient in the second language. It may be useful for better identifying the most talented students for further education.

In mathematics, the French and Kirundi tests performed similarly in discriminating students. Since most of the test items were story problems, the similarity can not be explained simply in terms of the fact that the items required little language comprehension for correct solution. Most required complex representations of information for problem solving. The similarity in test results may be attributable to the use of the mother tongue for instruction in mathematics in the lower stage of the primary cycle which facilitates learning, especially for students with poor proficiency in French. In learning science in French or in understanding French scientific texts of the kind that were used to measure reading comprehension, students' difficulties may be compounded by lack of mother tongue scientific vocabulary and concepts. The lack of transfer of knowledge and skills from the metropolitan language to the mother tongue of African students is often noted (e.g. Berry, 1985). The importance of the development of the mother tongue for learning science in the metropolitan language is not given much attention in this connection.

These findings lead us to question the use of metropolitan languages for instruction and assessment in subjects like science, health and agriculture which have great practical importance for the majority of primary school leavers who do not continue their studies. There are several reasons why serious consideration should be given to expanding the scope of vernacular language assessment beyond the usual language arts papers, even if this is not accompanied by radical changes in the use of metropolitan languages for instruction. For one thing, it may provide a more accurate representation of the knowledge and skills primary school students have acquired and a better indication of the quality of education they have received. In addition, use of vernacular language questions to measure achievement in science, agriculture, health and nutrition may encourage more explanatory instruction. That, at least, might motivate many teachers to ensure that what is taught in a metropolitan language is really understood. It might also facilitate development of the student's mother tongue as a language of scientific discourse and, in doing so, increase capacities to use science in daily life. Indigenous languages will not develop as languages of scientific discourse unless they are used for instruction in science and practical subjects.

Testing to foster better teaching

Cramming is usually deplored in discussions of the 'backwash' effects of achievement testing. Still, it is necessary to distinguish between good and bad examination cramming. Bad cramming has three characteristics: (1) it involves drilling and accords little importance to learning activities requiring self-study skills; (2) it is focused on increasing student's exposure to possible examination items and correct answers and not on developing basic knowledge and skills, and (3) it results in distortion of the program of instruction in order to make time for extensive review.

Bad cramming may be an important though unintended outcome of the way examinations are constructed and administered. For instance, test items constructed to measure recall of textual information promote teacher reliance on choral recitation as an instructional strategy. Similarly, a highly randomized process of selecting examination items, though it may encourage teachers to cover the subject syllabi, also encourages unfocused examination preparation. Conversely, highly predictable examination items provide incentives for teachers to skip some lesson topics in order to increase time for review of other more important topics. Avoiding these extremes requires an understanding of teacher examination preparation strategies; i.e. how they decide what is likely to be examined, their beliefs about what guides the construction and selection of examination items and the methods they employ to coach students.

In Kenya, a great deal of information is made available to teachers about the content of the school leaving examinations. The Kenya National Examinations Council publishes sample papers, newsletters to teachers and, of course, many teachers are selected to mark the examination scripts under the Council's strict supervision. There is, in addition, an important indigenous cottage industry in the production of examination guides containing samples of questions used in previous examinations. The guides are purchased by parents and by teachers. Teachers, we have found, make extensive use of such guides in preparing students for the KCPE examination largely because they are suitable for class drills and written exercises (Eisemon *et al.,* 1988). The expanding sales and number of new editions of these guides provides some indication of the confidence that parents, students and teachers place in them.

Teachers select the questions that are most likely to be asked and drill students on the correct answers (Eisemon, 1988). Teachers 'work backward' from their knowledge of examination questions in constructing regular lessons, highlighting topics that are the most often examined and, again, drilling students on the correct answers. Teachers often do not vary either the form or the content of previous examination questions in their drills. They are presented *verbatim.* That may be the result of a poor understanding of how the examination items are constructed, i.e. of the knowledge and skills they are supposed to measure. Students do not, it seems, need to know *how* to answer the questions but rather *what* to answer. This may also reflect the need to cover as many examination items as possible. The students' exercise books into which these items are transcribed have the characteristics of examination guides; they are simply lists of questions and answers.

Examination preparation does not involve explanation of principles and concepts which students can use to organize knowledge that test items may be intended to elicit. It is not that teachers assume that important principles and concepts are understood from previous instruction. There is very little explanation given by teachers under other circumstances. Classroom discourse in academic subjects is characterized by vocabulary building, by introduction of new and unfamiliar terms in a language that is neither the student's nor the teacher's mother tongue. For this reason, teachers favour listing and fill in the missing word exercises in regular classes, and drilling the correct answers when coaching students. Such strategies are far from optimal in terms of student understanding. They persist since they are rooted in a complex of factors such as insufficient teacher understanding of subject matter, insufficient assistance from principals and others (inspectors, Ministry of Education staff development personnel), lack of textbooks and other instructional materials, lack of instructional time, pressures for examination success as well as the content and construction of examinations.

In Burundi we have investigated how teachers prepare primary school students for examinations, and the impact of teacher strategies and skills on student performance (Eisemon *et al.,* 1989b). Examination preparation practices involve; (1) increasing the amount of instruction students receive; (2) review of essential content; (3) frequent testing to identify performance deficits and build test taking skills; and (4) diagnosis of sources of student errors and selection of appropriate instructional methods to remediate them.

Teachers used various strategies to increase instruction prior to the administration of the *concours national* examination; lengthening the school day, substituting lessons and combining morning and afternoon shifts. Only a few teachers however, increased the length of the school day in the period prior to the examination. In most cases, this could not be easily done because many teachers and students resided at considerable distance from the schools. In some schools, the school week was lengthened by adding Saturday afternoon classes. As noted above. many teachers used class periods allocated for teaching pre-vocational subjects to teach academic subjects. These practices did not have much direct or indirect impact on student performance because the amount of additional instruction provided was insignificant compared to the effects of combining shifts. The number of times classes were combined was strongly related to student performance particularly for subjects like mathematics.

The impact of review strategies on student performance was difficult to assess. Creating more time for review of the syllabi may or may not be an effective examination preparation strategy, depending on the coverage of examination items, the predictability of item selection, the way the subject syllabi are constructed, and other factors. Teachers with a history of success in preparing their students for the *concours national* examination varied greatly in the amount of time they spent in lesson review. Some strictly adhered to the instructional timetable which allows only about three weeks for review. Others accelerated coverage of lesson topics in order to begin reviewing before the start of the third trimester when the examination is given.

What teachers review and how they review is, of course, more important than when they begin reviewing for examinations. The point is that successful teachers were not effective merely because they did more cramming. Nor, surprisingly, was student performance correlated with taking frequent mock examinations. In Burundi, these are set and administered at the cantonal rather than at the school directorship, school or classroom level. Moreover, the examining authorities do not produce sample papers or newsletters to guide teachers in preparing students as the authorities do in Kenya. Nevertheless, teachers do design examination-like learning tasks especially for review lessons. In some lessons we observed, these were simply correct answer drills. The teachers assumed that student examination success was dependent on their ability to recall correct answers to questions that might be formulated in many ways. An analysis of recent *concours national* examination papers suggested that this assumption was not entirely unfounded.

The most effective teachers, though, were those with the most insight into examination tasks and student performance. We presented teachers with sample examination questions and student responses. We asked them what students needed to know to correctly answer the questions, why they made certain errors and what could be done to better prepare the students. Teachers' responses were rated. Teacher ratings exhibited a high degree of variability both within the group studied as well as across the subjects of examination items. A few teachers scored highly on all measures, and a few very poorly. Teacher ratings for specific subject domains were correlated with student test scores and *concours national* results for science, mathematics and reading comprehension. The effect of teacher skills was stronger when opportunity to learn and school management factors were taken into account. What these findings suggest is that effective teaching is enhanced by teacher understanding of examinations that might be developed through in-service training. Another implication is that examining authorities should provide more guidance to teachers as to how they should prepare students for examinations.

Improving examination questions

Examinations should be viewed as determinants of the teaching students receive; as inputs, not just terminal outcomes of schooling. They influence how teachers select and organize knowledge for instruction. They also affect the learning tasks teachers construct from which students acquire and practice skills.

The expansion of primary schooling has favoured increasing reliance on the multiple choice format for examinations in many African countries. Multiple choice tests have the advantage of being machine scoreable and, thus, tests constructed in this format are easier and less costly to administer, and less subject to allegations of evaluation bias. Kenya has probably had more experience with such testing than most African countries, though a large proportion of the examination papers administered by the National Examinations Council are set in the more conventional essay mode and marked by trained evaluators.

In the early 1970s, major efforts were made to increase the proportion of Certificate of Primary Education examination items requiring 'reasoning' as opposed to use of descriptive information in answering questions (Somerset, 1983, 1987; Savage, 1985). Comparison of test items in the 1973 and 1976 examinations indicated that while the proportion of descriptive items declined from 74% to 23%, those involving some reasoning increased to 28% the remainder measuring lower level cognitive skills. The 1973 examination apparently did not require any reasoning for successful performance (Heyneman, 1986, p. 43).

Our interest in examination construction was prompted by work which examined how adults used literacy skills and scientific knowledge acquired in primary schools (Eisemon *et al.,* 1987; Eisemon and Nyamete, 1990). We found that adults experienced a great deal of difficulty in integrating knowledge acquired in school and from social experience in performing practical tasks involving administration of modern medicines and use of agricultural chemicals. In studies of Kenyan mothers' comprehension of texts for using commercial oral rehydration salts solutions, for example, well-schooled mothers with complete primary education who used these products often combined the treatment with administration of traditional purgatives. They did not understand how oral rehydration therapy worked and, thus, also relied on traditional treatments they could explain but which might worsen their child's condition.

Oral rehydration therapy is mentioned in the health syllabus and questions about it appear in the Kenya Certificate of Primary Education examination which are expressed in the multiple choice format; for instance: Your baby brother is suffering from diarrhoea and vomiting. Which one of the following would you give him to improve his condition? (A) plenty of fruit juice; (B) breast milk regularly; (C) plenty of water with a little sugar and salt; or (D) plenty of milk and porridge (KNEC, 1984, p. 119). (C) is the Correct answer although the administration of any fluids and nourishment is essential to recovery from diarrhoeal illnesses. When teachers we have observed prepare Standard VIII students for the examination, they usually have them recite the correct answer and transcribe the question into their exercise books for later study. The formula for oral rehydration therapy is to be committed to memory so that it can be recalled.

An experiment was conducted in a Nairobi primary school in which we asked teachers to prepare Standard VIII students for two sets of mock examination questions; one taken from the Health Science and Science sample papers prepared by the Kenya National Examinations Council, and the other covering similar topics that were revised to elicit high level cognitive skills. The revised questions were expressed in the multiple choice format of the sample papers (Eisemon *et al.*, 1988). The difference had to do with how the questions were constructed and what they required of students. For example, a question on knowledge of incubation, vaccination, immunization and modes of transmission of infectious diseases that in the sample paper merely required students to recognize the definition of immunization was changed so that students had to infer the correct answer. The premises were imbedded in a scenario that like the question concerning oral rehydration therapy, represented events in everyday life. But the 'wrong' answers were not plausible if a student actually understood that immunization usually confers immunity even when a child is exposed to contagious diseases.

The revised questions promoted significant changes in the ways teachers prepared students to answer them. Teachers spent more time on lesson preparation and read the relevant sections of the teacher guides and student textbooks. Their lesson plans emphasized explaining the meaning of new concepts and terminology. In the review lessons, teachers explained disease processes and various precautionary or treatment modalities. The teachers commented on how difficult it was to prepare for and teach the lessons in comparison to the review lessons that are normally taught. The students were then tested to ascertain what they had learned. Preparation for the revised questions enhanced performance on both tests. Think aloud protocols were obtained from a sample of students to examine how they answered the questions. The results indicated that the revised questions elicited explanatory knowledge of oral rehydration therapy and other health subjects, and that the students acquired this from the instruction they had received. Examination preparation had not imparted mere facts.

Improving achievement testing should not be limited to better examination administration, marking and reporting of results, though that is certainly important. The construction of examination questions needs to be improved as well. The psychometric properties of examination items do not necessarily reveal a great deal about how good a question is in eliciting meaningful demonstrations of competence or encouraging teaching that facilitates development of high level cognitive skills. These objectives should guide the construction of test items to which teaching efforts are addressed. Major changes in teaching practices are likely to result which, in turn, influence what is learned **and bow** school knowledge and skills are used.

CONCLUSIONS

Primary school leaving examinations in many African countries, those which select students for secondary education, either cover only the academic subjects in the school syllabus or emphasize these subjects in weighting student performance. From the standpoint of the majority of primary school leavers who do not go on to secondary school and who will remain agriculturalists or combine agriculture with informal sector employment, the examinations should be designed in such a way that the subjects which should be the most important to them are taught and achievement measured. This means testing subjects like modern agriculture, health and nutrition and giving the marks obtained importance in examination results as is the case in Kenya. Different approaches to teaching and assessing learning in language arts and mathematics to foster acquisition of functional literacy and numeracy skills are also required.

The language of assessment influences the cognitive skills examination items measure and, in turn, affects teaching and how school leavers use information they have learned in school. Most assessment is carried out in a metropolitan language. However, primary schooling is the terminal stage of schooling for most children who will have little opportunity to develop or even retain proficiency in metropolitan languages after they leave school. Use of a vernacular language for assessment of student performance in scientific and practical subjects is suggested.

Finally, careful attention must be given to the ways achievement is measured. Teachers teach students to answer examination questions. If examination questions do not measure high level cognitive skills, teachers will place importance on students' recall of correct information for examinations. Changing test items to elicit high level cognitive skills associated with reasoning and problem solving and knowledge that is relevant to performing tasks in daily life may improve teaching and strengthen the effects of schooling as well.

A prerequisite for any successful strategy for improving examinations is a capacity to undertake research involving not only conventional psychometric studies of test characteristics but also investigation of how students perform examination tasks and how the examinations relate to the instruction they receive. Few examining authorities in rich countries have such capacity. But the need to acquire it may be greater for many African countries in which external examinations have a more important role in allocating educational opportunities and resources for improving the quality of education are more limited.

PRESENT ASSESSMENT PROCEDURES AND PRACTICES

For the Nine-Year Basic Education Programme, the assessment of students through national examinations occurs at the end of each phase in the structure, that is 7 years of primary, the Primary School Leaving Examination (PSLE) and at the completion of 2 years of junior secondary, the Junior Certificate Examination (JCE). The purpose has been to provide information primarily for selection. The question we have been asking each year was Who obtained scores falling in the top 20%, 30%, 75% etc. of all the examinees?' The system that best suits this requirement is refered to as 'norm-referenced' testing. The norm here is the specific group of students writing a national examination in any one year. The performance of each student is compared to that of the norm group. A student score can be in the top 10% or 30% relative to the scores of other students taking the same examination.

A similar practice prevails in the school where monthly or end of year examination scores are rank ordered in each class or sometimes stream, and a student is reported as in position 1, 2 or 3. The interpretation that some parents put on the rank order is that their child is the best in the class (which is correct), and therefore that their child performs at a level that should get them an "A" in the external examination (an incorrect conclusion). Because the score only gives a position which is relative to the group that is taking the test, in this case their class, this position can never be generalised to a different norm group, say the national population of the PSLE examinees. When a group changes, the performance pattern may change, so would the relative position of any single score.

The PSLE uses instruments developed by the Department of Curriculum Development and Evaluation (CD&E). There are seven achievement test papers presented for the PSLE. one objective paper for each of the examinable subjects, i.e. Setswana. English, Mathematics. Science and Social Studies: and a composition and letter writing paper in Setswana and English. The PSLE is a norm-referenced lest, and this means therefore that the scores of each individual student obtain meaning by being compared to the scores of the other students who sat for the PSLE in the same year. The treatment of scores obtained in the JCE is the same as that of the PSLE.

Limitations of the Norm-Referenced System as Practised

1. The curriculum coverage of the papers may not remain consistent across the years.

Curriculum coverage in the PSLE achievement papers is controlled through conscious effort by examiners to have a fair representation of the different units in the final paper. One obvious problem has been keeping this representation of units in the examination paper constant from year to year. Table 1. and Table 2. show the differences in the scheme of questions appearing in the Setswana papers for 1988 and 1989 and the Mathematics papers for 1990 and 1991 respectively.

Table 1. Distribution of items over language categories in the 1988 and 1989 Setswana PSLE Multiple-choice Exam.

	1988 Items		**1989 Items**	
Language Category	*Num.*	*Percent*	*Num.*	*Percent*
1. Grammar/syntax	8	13	11	18
2. Word knowledge/vocabulary	27	45	11	18
3. Sentence mechanics	6	10	8	13
4. Use of figurative language	4	7	8	13
5. Reading Comprehension	15	25	21	35
6. Unclassified	0	0	1	2
TOTAL	**60**	**100**	**60**	**99**

TOTAL	**60**	**100**	**60**	**99**

In view of these differences in the curriculum coverage of the two examination papers, it can be argued that students writing the two papers may have not necessarily been exposed to the same tasks. These two papers are therefore not parallel. If two papers are not parallel, comparison of student performance across the years is definitely limited: hence changes in the standards of performance within each subject are difficult to monitor. This also presents a problem if one wants to compare particular domains or sub-areas in the subject, say ‘use of figurative language’ as in the case of Setswana. or Geometry in Mathematics. It should however be noted that the problem illustrated here is not only perculiar to the two subjects.

2. Test results appear to be insensitive to improvements in educational input.

Test raw scores in each of the five examinable PSLE subject areas are standardised to a common scale (T-scores with a mean of 50 and a standard deviation of 10). The letter grades for each subject are derived from fixed cut-off values, and these have remained constant across years. T-scores are then averaged across subjects and the average score (aggregate) is used for selection. Table 3. shows the T-score cut-off points for the letter grades while Figure 1. is a representation of those on a normal curve.

Table 3. Standard scores (T-scores) cut-off points for average grade levels A B C D and E.

Letter Grade	**Standard Score Range**	**Standard Deviation Range**	**Percentage of Candidates (approx.)**
A	63+	+ 1.3 SD and over	7%
B	55-62	+0.5 SD to + 1.2 SD	24%
C	46-54	-0.4 SD to +0.4 SD	41%
D	-45	Below -0 5 SD	28%

NOTE: The statistics given for the approximate percentages of candidates that obtain different grades each year are averages calculated over four consecutive years.

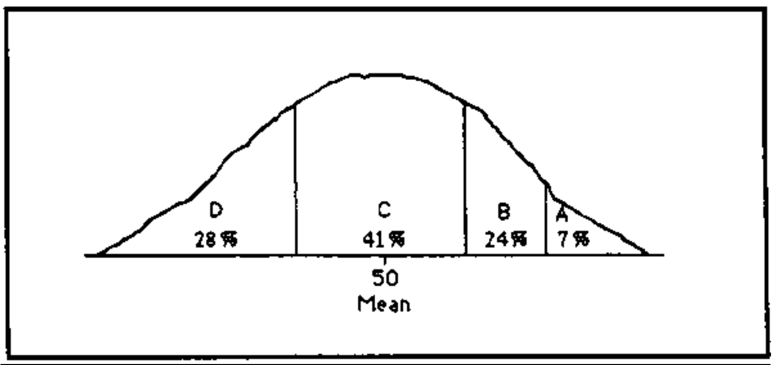

Figure 1

The meaning of each letter grade would remain constant only if the performance of the PSLE candidates remains consistent across the years. In effect what really happens across the years is that irrespective of the changing groups of candidates taking the PSLE nationally, performance on this examination remains consistent because the ‘A’, ‘B’, ‘C’, and ‘D’ proportions remain the same. These grades therefore, do not tell us much about actual student performances from year to year. They present a rank-ordering of students. In his discussion on selection examinations and achievement testing in Botswana, Somerset emphasised the importance of a more informative assessment system that goes beyond sorting students into a performance order. He alludes to the fact that “Education Officers, teacher trainers, in-service teams, curriculum developers and the teachers themselves should be told which subjects and which topics caused candidates most difficulties so that appropriate remedial action can be taken” (Somerset, 1977).

3. Examination reports do not describe the knowledge and skills which students have.

The current reporting system does not focus on the performance of an individual student with regard to the knowledge and skills instruction was aimed at. Rather reporting focuses on the position of the student in relation to other students who sat the same examination.

4. Test results cannot be used easily as a basis for advising students for career development.

In addition to aptitude tests which provide information about a student’s potential ability in different fields of study, career guidance officers need achievement test results to advise students since they (achievement tests) describe student competencies. The present reports on achievement tests do not reflect such competencies, hence they have limitations if they are to be used as a basis for individual career counselling.

5. The correspondence between stated curriculum objectives and the questions which appear on any year’s test is usually contested by many hers.

As it has already been established earlier in the discussion, the achievement domains which the examinations sample across the years are quite inconsistent. This is because of the norm-referenced testing procedures, which select test items on the basis of specified statistical features. The items which meet such specifications may not necessarily be those that test the skills emphasised in the instructional programme being examined. As a result, teachers sometimes query the curriculum validity of the examinations.

6. The reliance on a single ‘high stakes’ examination score (while ignoring many years of student performance in the classroom) is disconcerting.

The PSLE and some subjects areas in the JCE do not use scores from continuous assessments for certification. Teachers have voiced their dissatisfaction with a system of certification that ignores teacher assessments with the argument that they (teachers) have a better opportunity to give more valid assessments of student performances across the curriculum, than a single 1 hour examination paper.

7. *The norm-referenced reporting system does not provide the description of individual student competencies in practical subject areas.*

The Junior Certificate Examination assesses students in the different practical subject fields, and as in the PSLE, reports reflect a comparison of an individual student performance with the performance of other students. The report does not describe to the prospective trainer or employer the kinds of skills that a student can or cannot perform.

From the above-listed limitations we can conclude that it is difficult to use norm-referenced tests to determine if a student has mastered the specific skills prescribed by their instructional programme, as the primary function of the tests is to provide information about the student’s relative standing. This however does not mean that the test data are irrelevant for instructional planning.

AN ASSESSMENT SYSTEM THAT ADDRESSES THE KEY LIMITATIONS OF CURRENT ASSESSMENT PRACTICES.

The preceding discussion presents indications that the present assessment procedures are not compatible with the changes in the curriculum. It is the expressed interest of the current curriculum to focus instructional activities on the learner. An alternative system that may be used to interpret the meaning of students' scores is 'criterion-referenced' approach.

Criterion-Referenced Testing

The early stages of criterion-referenced testing are very closely associated with learner-centred approaches such as individualised instruction or programmed learning, and are therefore designed to measure the mastery of specific learning outcomes or to describe "what Johnny can do" (Popham, 1978). This system is usually used in a situation that requires information on the learning of individual students. The learning of an individual student is in this case compared against the desired learning target. The judgement of individual student performance is against defined criteria, in the form of sets of learning outcomes.

In order to correct the limitations of the present system and retain selection procedures that will continue to be used at national level, a move should be made towards a system whose main function would be to:-

1) describe what students can do throughout their schooling, in order to report their achievements as well as diagnose their problems, and

2) report their competencies at the end of primary or secondary level education such that grade levels for certification examinations are referenced to a criteria of stipulated competencies.

At school level, assessment needs to be more integrated with the instructional activities, such that it informs the instructional decision making process. Assessment should become a systematic process of gathering information about individual student performance used to describe 'what Johnny, Tshepo, Mpho.... can do'. The main focus of assessment in this mode is to help students learn. This distinction is very vital in the conceptualisation of an assessment system that is programmed to provide feedback to teachers, such that they can make professional judgements about appropriate adjustments in the instructional environment. Testing then becomes a systematic process of gathering evidence of what the child can do relative to the instructional outcome, gathered at an opportune time that will allow the teacher to use the feedback to make judgements about appropriate adjustments in the instructional environment.

Whilst the selection role of the national Primary School Leaving Examination may remain, this will become a secondary function. The main focus of national examinations will be to describe student performances as measured by tests that are fully controlled by the curriculum, with certification criteria that reflect student competencies rather than their relative standing when compared to the norm group.

Key Benefits of Criterion-Referenced Testing

1. Improving the match between the notional examinations and classroom instruction.

> "The curriculum that is actually implemented by teachers in schools is, called the **effective curriculum.** The effective curriculum consists of those topics and learning objectives that teachers actually teach to students. The effective curriculum stands in contrast to the **desired curriculum.** The desired curriculum consists of those topics and learning objectives which are found in the national curriculum and which government desires to be taught. The effective and the desired curicula are often overlapping but are also different. Obviously, when a national curriculum exists and when government invests in educational inputs, it is desirable to have these two curicula be congruent." Nitko (1989)

A criterion-referenced test development process provides a common point of reference for instruction, classroom assessment, and external assessments (national examinations). This provision is in the detailed curriculum objectives that precede lesson preparation and test construction. The test blueprint defines desired student learning outcomes; the content or skill as well as the cognitive processes involved. The blueprint presented in Figure 2. attempts to focus both teaching and testing on the same curriculum.

BLOOM'S TAXONOMY	KNOW LEDGE	COMPREHEN SION	APPLICA TION	ANALY SIS	SYNTHE SIS	EVALUA TION
READING		1. read a passage and answer questions that follow it.	1. pronounce each word according to spelling	1. identify in text correct punctuation and capitalisation	1. read passage and dramatize it.	
		2. read a text and carry out instructions		2. read text and state its main points.		

a. This table is based on the STD 7 reading instructional objectives (Setswana).
b. Every one of these statements is preceded by the phrase Pupils will be able to...
c. For an example of a complete test blueprint, refer to Appendix 2.

> "In the presence of a high-stakes' examination, the key to making the effective curriculum correspond more closely to the desired curriculum is to create examinations that are very tightly aligned with the desired curriculum. The examination must clearly emphasize the student performances which are emphasized by the curriculum. Further, all of the important curriculum objectives should be represented in the test specifications (blueprint) and teachers should be convinced that these objectives may appear on an examination. As a result, the force that motivates teachers to teach to the test is harnessed and directed to the desired end: **Teaching to the test is essentially teaching the desired curriculum.**" Nitko (1989)

Because the 'high stakes' examinations may have such a strong influence on what is taught in the classrooms, an attempt to focus the two curicula on the same area should make teaching more effective and testing more valid.

2. Examinations reports describe the knowledge and skills which students have.

> "Since test results can be referenced to pupil performances, one may analyze the results of the national examination to describe what students are capable of doing." Nitko (1989)

A criterion referenced testing system bases instruction and testing on well defined student learning outcomes, which are tasks that students will perform if curriculum objectives have been attained. A test that checks for the attainment of these objectives gives a score that can be interpreted as an indicator of the extent to which a student has achieved the stated curriculum objectives. Controlled sampling of the curriculum allows for the generalisation of a score on a test to performance on the overall domain being sampled.

3. The correspondence between staled curriculum objectives and the questions which appear on any year's test is clear to many teachers.

There are procedures in criterion-referenced testing that enhance the correspondence between a test item (or assessment task) and the objective it is intended to assess. The objective is the starting point. Further definition of the domain described by the objective is given by the cognitive category of the objective in the blueprint. Item writing rules provide further definition of the task through sample items and guide-lines on the construction of the different components of the item.

4. The curriculum coverage of the papers is controlled for consistency across the years.

Table 4. shows an example of a test plan with a representation of the different parts of the curriculum in a test. National examinations based on criterion-referenced test development procedures will have test plans which will serve as sampling procedures. Test plans control the selection of objectives to be tested, and if the same test plans are used in any two years, then curriculum coverage of the two examinations should be comparable.

Table 4 The Test Plan.

STANDARD 5	**NO. OF OBJECTIVES**	**NO. OF ITEMS**
Our Country		
Location	5	2
Our Resources	8	3
Culture	2	1
TOTALS		

a. This table is based on the STD 5 instructional objectives in Social Studies.
b. For an example of a more detailed lest plan refer to Appendix 3.

5. *National educational progress can be evaluated.*

"Since test results can be referenced to pupil performances, one may analyze the results of the national examination to describe what students are capable of doing. Since test specifications (blueprints) remain constant over several years, one may monitor progress on specific curriculum objectives by comparing over the years the percentage of the nation that has learned each objective. Pupils' performance on clusters of objectives (e.g., those dealing with knowledge of concepts versus those dealing with solving unfamiliar problems) can be compared as well." Nitko (1989)

Figure 3. represents a situation where national test results do reflect the changing performance of students across time. The information allows for detection of the effects of educational policies, curriculum materials and teaching strategies.

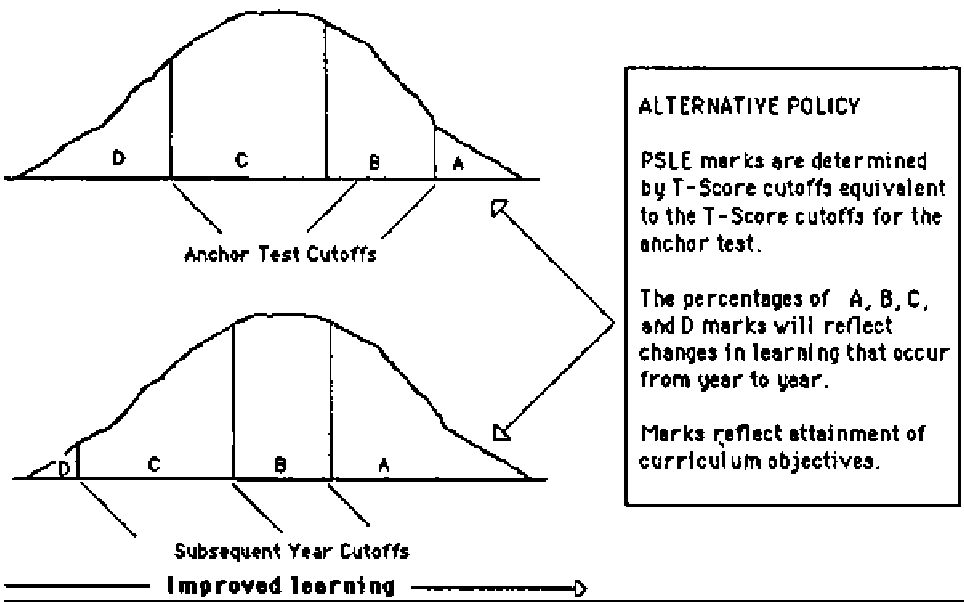

Figure 3

ALTERNATIVE POLICY

PSLE marks are determined by T-Score cutoffs equivalent to the T-Score cutoffs for the anchor test.

The percentages of A, B, C, and D marks will reflect changes in learning that occur from year to year.

Marks reflect attainment of curriculum objectives.

Student specific test results can be used to describe what students in a school or district can do. School progress can be monitored. The information obtained would allow school administrators to make appropriate decisions on improving the performance of the school. In-service programmes would also be targeted on deficiencies revealed by patterns of student achievement in their constituencies.

4.3. Evaluation of Examination Needs of Primary & Secondary Schools in Namibia (Abstracts)

University of Cambridge Local Examinations Syndicate[1]

[1] International Consultancy & Training Services, October 1990, abstracts pp. 23-34.

Analysis of Question Paper Quality

The following analysis of question papers is an attempt to indicate areas which are likely to need attention when assessment schemes are developed to support curriculum development at Primary, Junior Secondary and Senior Secondary levels....

Physical Appearance

Given that we are dealing with an examination system in which students, in general, do very badly, it is important that the physical appearance of the paper and its layout should be as user-friendly as possible. Quite simply, the students have enough difficulty answering the questions without being placed under greater pressure by the way in which they are presented. This is partially the responsibility of the Examiners who set the paper but there should be quality control systems within the Examinations Division to ensure that papers are properly edited. For example, where a question requires the students to use a piece of stimulus material to answer several part-questions, it is important that the stimulus material can be seen as the questions are read. It is not desirable for students to have to turn over the page as happens frequently at present.

The presentation of question papers would be greatly improved if moderators and Examiners were involved in question paper design and if professional staff of the Examinations Division had a greater editorial role.

This has probably not developed in the past since many papers were directly imported from the Cape but it is a matter which will need attention in the future....

It is also noticeable that the question papers are, in general, lacking in graphic material such as photographs, line diagrams, graphs, charts and maps. This is a matter which will need urgent attention if the question papers are to test higher level skills rather than recall and if they are to be made more accessible to a wider ability range. This would be an important issue in any country but in Namibia where command of the language of instruction is, and will continue to be a problem for the foreseeable future, the use of graphic information will help those whose reading comprehension is weak.

In addition, the use of graphic materials also raises the content validity of question papers in subjects where, in the real world, graphic material is the normal way of communicating information. For example, in a recent Std. 8 English paper, students were asked to extract information from some advertisements but these were presented as plain typescript without artwork and as a result did not look like real advertisements. This shows a technical weakness and is unlikely to interest students already struggling with the language.

It is recommended that Examiners are actively encouraged to consider the physical appearance of question papers and to use graphic stimulus material where appropriate.

It was also observed that many question papers required students to write their answers on separate answer booklets. This required the rubrics to be more complicated than would have been the case had students answered on the question paper. It also causes, as evidenced by comments in Examiners' reports, students to make mistakes in copying question numbers, writing their names on the front etc... Such administrative complexities are confusing for the students but equally importantly they are frustrating for markers trying to locate answers and this necessarily results in a reduction in examiner reliability.

It is recommended that where possible and where economically viable students should answer in spaces provided in the question paper. The layout of the paper should assist rather than hinder students.

Wording of Question Papers

Since Namibia is a country where a very large percentage of the student population have difficulties with the language in which the examination is set, whether it be English or Afrikaans, it is extremely important that the reading level of both the rubrics and the questions is set appropriately. If the reading level is inaccessibly high then the validity of the papers is reduced since the knowledge and skills which the paper purports to test are hidden by the language element. For example, the Std. 4 History paper included the following words and phrases:»erected according to«,»vagrancy of the indigenous people«,»which culminated in«,»led a punitive expeditions»signed in the vicinity«of.

It is recommended that Examiners and moderators are directed to pay particular attention to the reading levels in order to make them more accessible to the target population.

Question Types and Skills Tested

To criticise the content of past question papers is somewhat unfair since Examiners have been constrained by syllabuses which place much emphasis on recall of facts, text book proofs, etc., and, in the absence of training, have closely followed the general format of papers set in the Cape.

A Gazette[1] of the Examinations Board sets out the weightings of different skills to be tested as:

> *»... every question paper shall be graded to test the pupils' knowledge and skill at the levels of factual knowledge, understanding and insight, in the proportion of 50%, 33 1/3%, 16 2/3% respectively;«*

[1] Gazette No. 1/89, Volume 6, 1 March 1989, Examinations Board of South West Africa.

No-one believes that the teachers can follow these instructions and it is generally accepted that question papers set in schools test little more than recall. Moreover, a brief survey reveals that external exams suffer from the same problem. This can be illustrated by an analysis of the Std. 4, Ordinary Grade, History paper for 1989 (Appendix I):

Standard 4 History (Ordinary Grade) 1989

Section A

Questions 1 to 6 were short answer questions all requiring recall of a name. For example,»Name the German officer who managed to free Omaruru from the Herero attack in 1904«,»Name the British commander during the Battle of >Congella< «.

Questions 7 to 12 were a badly set out form of multiple-choice with a negative stem:»Write... the answer between brackets that does not suit the introductory sentence.«

The Republic of Orange Free State (was established in 1854/had Josias Hoffman as its first president/was north of the Vaal-rivier/had Bloemfontein as its capital).

Questions 13 to 18 were short answer questions of the gap filling type. Five of these required a name to be inserted.

»In 1874 Lord Carnarvon sent....., a British historian to South Africa to propagate the idea of a federation.«

Questions 19 to 24 required students to match items in two parallel lists. This is effectively a multiple-choice situation with decreasing numbers of options. The questions all concerned the matching of people's names with an associated act.

Questions 25 to 29 used a map as stimulus material but each question merely required recall of a name or a date.

»When (month and year) was the town numbered 5 on the map conquered by the Union troops?«

Questions in section B required students to write paragraphs containing»at least five facts«on a number of topics.

»Describe the events since 1954 which culminated in the founding of the Republic of South Africa.«

Questions in section C asked for essay-type answers each containing»at least ten applicable facts«.

»Write an essay on the efforts of President M W Pretorius to unite the Orange Free State and the Transvaal.«

As can be seen from the above the question paper places a very heavy emphasis on the recall of names and events. This is a direct result of the teaching syllabus and subsequently ensures that teachers will continue to teach by rote....

The nature of the questions also leads one to question the relevance of what is being tested and hence taught. Further evidence of this can be gained by looking at the Std. 8 paper for Mathematics. However this should be considered with the knowledge that there are serious problems in the teaching of Mathematics in Namibia. Students, teachers and examiners expect extremely low levels of achievement in Mathematics and they are not disappointed in this expectation. It was suggested by a Senior Officer within the Ministry that over the years the students had developed a»phobia for Mathematics«. This was denied by a Mathematics teacher who went on to suggest that it was the teachers who had the phobia! Whatever the truth there is clearly a severe problem which has taken on the form of a vicious circle: poor and unconfident teachers create a fear of Mathematics in students who go on to become unconfident teachers... and so on. This matter clearly requires the concerted efforts of curriculum developers, material writers and teacher trainers. **The assessment system must also play its part by placing greater emphasis on applications of Mathematics in real life situations and at more realistic levels....**

Examination Patterns for the Future

At present the examinations which take place in the primary phase are for the purpose of selection for the next Grade. Whether by design or by accident they have become a harsh filter with the majority of students unable to pass particularly in subjects such as Mathematics and Languages....

With the introduction of automatic promotion in the primary phase the need for a selective examination will be greatly diminished. Indeed prior to the end of primary examination proposed below, the main purposes should be for diagnosis of individual learner difficulties, evaluation of the teaching programme, and reporting student progress at the level of a school report.

It is recommended that there are no external or semi-external summative examinations during the primary phase prior to the PSLE and that schools are permitted to devise their own assessment schemes for reporting purposes.

If necessary, schools should be given guidance and support in the development of non-threatening formative testing methods. They would be helped in this if the primary curriculum explicitly identified levels of achievement which could be tested in each Grade. These **attainment targets** would then act as benchmarks when constructing and grading tests. It is hoped that an additional advantage to be gained from creating a less formal assessment system, at this level is that the administrative pressures on teachers and principals will be reduced allowing them to concentrate on teaching.

Whilst end-of-Grade testing would not be standardised it would be important to introduce standardised tests in a few key areas for the purposes of diagnoses and evaluation. In particular batteries of standardised tests should be available in the fields of basic numeracy and reading.

The frequency of such testing would depend on the curriculum and the attainment targets set. As a minimum, students should be tested annually in reading and/or oral communication and a record of progress kept. In Arithmetic, testing could take the form of criterion-referenced end-of-unit tests to determine whether individual pupils have mastered a particular concept. The tests should be constructed to encourage positive achievement. As a general rule, one would hope to see about 70% of pupils mastering a concept at a 70-80% success rate in such criterion-referenced tests. This is in direct contrast to the low success rates currently achieved in the promotional tests.

It is strongly recommended that the test results be used for identifying individual students within a school who require remedial assistance; diagnostic testing should be followed by active remedial work where necessary.

It is beyond the scope of this report to specify the precise nature of the primary assessment since the primary curriculum is not yet in place.

However, it is strongly recommended that a small panel of experts in primary teaching, curriculum development and testing be set up immediately to consider requirements in this area. Two of the members should be identified as potential Examination Officers of the NEAA to eventually assume special responsibility for primary testing.

The following should be considered guiding principles by the panel:

1. Testing should be non-threatening and should reward positive achievement in the primary phase.

2. Much of the testing will be school-based and will be conducted by the class teacher.

3. Batteries of standardised tests in certain skill areas will need to be produced centrally by NEAA for use by schools.

4. The tests should allow for diagnoses of learner difficulties and for the evaluation of courses/materials.

5. Administration of the tests should not place unreasonable demands on the human or physical resources of a school.

Primary School Leaving Examination

Since the end of Grade 6 will be the exit point from the education system for many students it will be necessary to establish a formal Primary School Leaving Examination.

Since the curriculum for Grades 1-6 has not yet been developed it is not possible to predict in detail what the format should be. This should be agreed by the»task force«created to develop the curriculum.

It is recommended that the primary assessment panel referred to above be involved in both the design of the primary curriculum and the design of the PSLE.

Since it is important that the PSLE is perceived to be an appropriately demanding, valid and reliable examination, it should be administered by the NEAA.

It should also be a predominantly external examination with the proportion of marks allocated to school-based assessment limited to, say, 20%. (If desired this percentage could be increased for predominantly practical subjects provided that adequate controls could be imposed in order to keep reliability to an acceptable level.)

The examination should be certificated by subject rather than by groups of subject. As argued elsewhere, this would ensure that students were rewarded for positive achievement.

Grading should not be by predetermined cut-off points but should be by expert judgement coupled with statistical evidence. This will help to reduce the fluctuations in pass rate due to variation in the level of difficulty of papers from year to year.

The question papers should be designed to reflect the best aspects of the new primary curriculum. In each subject the questions should test the range of skills and content required by the syllabus and not place undue emphasis on recall of isolated facts. The situations chosen for problem-solving questions and others should be relevant as far as young Namibians are concerned and should avoid unacceptable degrees of cultural bias. These issues should be controlled by having each PSLE question paper moderated by a panel of experts as advocated for higher level examinations.

Whilst the papers should maintain appropriate standards and should include tasks which the more able would find demanding the emphasis should be on allowing students to show what they know and can do. They should therefore be designed to give a higher mean mark and standard deviation than exams do at present. Associated with this, the marking schemes or memoranda should be detailed enough to ensure inter- and intra-examiner reliability but should not punish all errors, however trivial, as tends to be the case at present.

Since it is highly desirable that the PSLE should reflect a new philosophy of both teaching and testing it is recommended that question paper setters are trained in the theory and practice of item writing before specimen papers are developed for the new curriculum.

Junior Secondary School Certificate

It should be noted that a new broad curriculum for the Junior Secondary phase (Grades 7, 8,9) and proposed syllabuses for the subjects included in that curriculum were presented publicly in Namibia in October 1990. Included in the proposals was an outline for assessment procedures during Grades 7 and 8 only.

The following principles were incorporated:

(a) the assessment would be school-based with no external components;

(b) in all subjects, continuous assessment would be allowed up to a pre-determined maximum weighting (greater for practically based subjects);

(c)»formal tests«would be set and marked by teachers;

(d) promotional criteria would be based on success in specified subjects or groups of subjects rather than on an aggregate mark.

4.4. Primary Science School Leaving Examination (Abstracts)[1]

by Richard Bradbury

[1] Malawi-German Primary Science Project. Occasional Papers No. 1. Domasi. October 1992, pp. 2-8. **Note:** Since 1995 the PSLCE uses multiple-choice test items. Science is now part of a paper called»Science Incorporated«consisting of three parts: Section A»Agriculture«(25 marks), Section B»Science«(30 marks) and Section C»Health Education«(15 marks).

Background to the Primary School Leaving Certificate Examination

Pupils who reach the end of the eight year primary education course in Malawi, in theory at the age of 14 but on average at 15, are expected to take the Primary School Leaving Certificate Examination (PSLCE). This is an external examination set and marked by the Malawi National Examinations Board (MANEB), a parastatal organization which is responsible for all primary and secondary school examinations in the country and for certain other kinds of testing. The PSLCE undoubtedly has a great influence on what is studied in the schools and on how it is taught, particularly in the latter half of primary education (Standards 5 to 8). This is not only because the examination syllabuses (largely perceived through past examination papers) become the de facto curriculum, but also because the PSLCE acts as a selection test for admission to secondary education. Since there is very limited provision of secondary places (under 10 per cent over 100,000 PSLCE candidates each year are accepted for secondary school) there is great competition to do well in the examination. Pupils, parents and teachers insist on studying only those things which are known to be tested in the examination. The consequence is that aspects of examined subjects which are not in the examination are ignored and other parts of the curriculum which are not examined at all, such as physical and religious education and art, are simply dropped in the last few years of primary education.

It is therefore necessary for any curriculum development project in primary education to take this examination into consideration. In view of the shortage of secondary school places, it is unlikely that it will be abolished in the near future (this was anyway tried in the early 1960s with apparently disastrous consequences; Banda, 1982). It should instead be regarded as a necessary evil which can with skill and effort be managed as a positive influence on what is taught and learned. In educational jargon, curriculum development in these circumstances should be assessment-led.

There has recently been some attempt to use this approach to influence the curriculum through the PSCLE. For many years, the examination was administered by the Ministry of Education and Culture (MOEC) with only the final-year secondary examination, the Malawi Secondary Certificate of Education (MSCE) being run by an examining Board, then called the Malawi Certificate of Education and Testing Board (MCETB). The Ministry provided little more than basic administrative support for the examination and the professional inputs to ensure quality were lacking. The question papers in almost all subjects regressed to testing simple recall of often trivial facts, with little or no attempt to test the so-called higher level skills such as comprehension, analysis, reasoning or problem solving. This state of affairs was generally bemoaned but nothing was done about it until 1987 when, with World Bank support, MANEB was formed to replace the MCETB and to take charge of all school examinations in Malawi. A report by Somerset (1987) detailed the deficiencies of the current examinations, particularly PSLCE, and made recommendations for improvements. Between 1989 and 1992 a British test development consultant was attached to MANEB and began to implement some of these recommendations.

A brief summary of what was done may be of use to future curriculum development. The setters and moderators of questions in all subjects were assembled for a one week workshop. Starting from the axiom of»what you test is what you get«(WYTIWYG) they were asked to scrutinise past question papers in order to find out what had been tested in terms of both content and abilities. They were then asked to decide what ought to be tested in the light of the current syllabuses, teachers' guides and pupils' books. Large mismatches were found, particularly in the practically orientated subjects like Agriculture, Home Economics, Needle Craft, and Science and Health Education; the guides and books often promoted an activity or experimental approach to the subjects which was not reflected in the examinations. Participants were then asked to draw up a content/ability specification grid for their subject, showing what balance of each they would wish to test.... Using the grids, they were next asked to set a specimen question paper reflecting this balance. As guidelines, they were given the»principle of the 3Ps«, viz, that questions should as far as possible be based on:

→ Problem: pupils should be asked to find an answer from data given or situations shown, rather than just to supply a fact from memory;

→ Practical: questions should be based on real situations and realistic contexts and as far as possible have some relevance for people in Malawi;

→ Picture: situations should be presented through drawings, photographs, diagrams, maps, graphs or tables as appropriate.

These principles were designed to confront the worst features of the current papers which featured such questions as»name two kinds of latrines«, or, worst of all,»what garment is made in Standard 6«.

Among subsidiary principles used were the idea that a good examination question should be usable as worthwhile teaching material, and that the teacher's guides and pupil's books were a good source for the»3Ps«if their material were adapted somewhat to show slightly unfamiliar situations which could be used to test pupil's understanding of the underlying principles.

The question papers produced by the workshop were later edited and pretested in sample schools to check that the new style of questions was not too difficult for pupils at this level. Following satisfactory results, the papers were printed in quantity and sets sent to each primary school in the country with Standard 8 pupils. Receipt was monitored by means of reply-paid acknowledgement cards. The schools were also informed that papers of this type would be set in the PSLCE from July 1991 onwards, which has indeed been the case.

It may be gathered from the above account that the intention of recent test development has been to exploit the present syllabuses and teaching materials to best advantage, and to encourage teachers by the example of the examinations to widen the range of abilities taught. This has been attempted in all subjects but it is of particular relevance to Science and Health Education where a reasonably good if incomplete set of teachers', guides and pupils' books exists.

It may be worth noting at this point that Somerset (1987) made the following observations:

»In developing new curricula it is important that teaching and learning goals on the one hand, and assessment goals on the other should be closely co-ordinated. If the development of prototype assessment instruments is delayed until after other work on the curriculum has been completed, there is a real danger that the profile of skills tested by the assessment instruments will diverge significantly from the profile specified for teaching and learning. The new curriculum should include sections giving examples of questions which could be used by teachers and examiners to measure the progress of pupils towards mastery of the desired competencies. Learning and assessment should always be seen as complementary parts of the same process.«

These points should be borne in mind for future curriculum development which must be based on the new syllabuses produced by the Malawi Institute of Education (MIE) and shortly to be introduced into the schools. These syllabuses show from their columns for»suggested assessments«that Somerset's points have so far been ignored. There is a danger that examinations based on the new syllabuses may prove once again a restrictive influence unless some further test development is begun well before pupils in Standard 5-8 begun to be taught the new material in 1996 - 99...

Science and Girls

Whilst all boys study Science, girls are given the option of studying either Home Economics or Needle Craft instead. Girls are in any case under one third of pupils entered for the PSLCE. In 1992, of 106,073 candidates, 34,368 or 32.4 per cent were girls. Of these girls 11,408 did Home Economics (3,061) or Needle Craft (8,347) being 33.2 per cent of girls and 10.8 per cent of all pupils. Those taking Home Economics are examined on Health Education as part of it, but those taking Needle Craft are not examined on it at all. There is thus some minimal element of Science in Home Economics but none at all in Needle Craft. Girls are already at an educational disadvantage in Malawi as the low proportion enrolled in Standard 8 shows: social and economic pressures force them to drop out of school early. They also perform less well than boys in all subjects of the PSLCE. Lack of Science education will further handicap that minority which succeeds in going on to secondary school where Science is compulsory. The MOEC has considered abolishing this practice of making Science optional for girls, but it seems unlikely that this will be done until the new curriculum takes effect for Standard 5 in 1996...

Nature of Questions Set in PSLCE Science

The Science questions in the paper set in July 1992 have been analysed... The extent to which school science apparatus is shown in them has been noted, as has the occurrence of experiments or procedures described verbally which could have been pictured. It should be noted that all the apparatus shown is simple and made from cheap and easily obtainable materials (except batteries and bulbs). All could be used by a teacher to demonstrate or done by pupils themselves, even at home. In this respect, the setters have observed the 1989 - 91 phase of test development and based questions on material shown in the teachers' guides and pupils' books which should be within the capacity of any teacher to demonstrate in the classroom...

Seventeen questions were set, nearly all having sub-questions with marks separately apportioned. Of these 17 questions, 6 were on biological topics which do not require apparatus other than the organisms studied. Of the remaining 11,6 showed apparatus and an activity or procedure to be done with it. Of the other 5 questions where a verbal description was used instead of a drawing, it would have been possible to use an illustration instead. Indeed, illustrations have been used for some of these topics in the 1991 paper or in the specimen paper.

Of abilities tested, 10 questions seem to test recall only. Two questions which look as if they test more than this by requiring pupils to reach conclusions from observation of the results of experiments (Q5 on water pressure and Q17 on permeation of soils by water) are in fact exact copies of the experiments in the teachers' guides and could be answerable by recall alone. Of the remaining 7 questions, 5 do appear to test application of principle in that they show or describe procedures or experiments which are slightly different from those in the teaching materials, but which can be understood and interpreted by use of the appropriate principle. Two questions appear to test comprehension or interpretation.

An allocation of marks to abilities tested shows that out of 60 marks for the Science section of the paper, 35 were given to recall sub-questions, 5 to comprehension and 20 to application of knowledge or principle. This division (which is of course subjective) does not achieve the target of 50 per cent of marks for recall questions and 50 for more than recall... although it would if Q17 had been adapted properly.

It seems reasonable to conclude that the 1992 paper tried to test the specified range of abilities. In terms of content, there were more marks for biological questions (20) than is intended by the specification grid (15). It is again a subjective judgement, but there seems a small tendency to regress to the pre-1991 style of questioning with questions of the»name this...«type. This type of question was never actually abolished, which is a pity since its continuance may encourage a regression to more recall questions...

Support for Testing Higher Level Objectives

It is to be hoped that the above account demonstrates that MANEB's test development policy is to make examination questions support higher level objectives as far as possible. The only limitations are the syllabuses and teaching materials, which in the case of Science are not a serious obstacle, and the need to maintain some continuity with the old form of questioning by retaining some items to test recall. The effect of recent changes of the emphasis of questions on the ways in which teachers use this material or adjust their teaching approach is of course not known, although it might be possible to do some research on the topic. In order to exploit the changes in question style more, MANEB and MOEC ought to make more use of examination data to draw the attention of teachers to the real point of some of the questions and to appropriate ways of teaching for them. This technique has been used in Kenya with apparent success (Somerset, 1987). Unless this is done, the support which the examinations are trying to give to the higher level objectives remains passive. The idea of reporting examination data to teachers and organizing local seminars to discuss it has been raised here, mainly by the World Bank (1989) but seems to have provoked no reaction from MANEB and MOEC.

What Pedagogic Approach to School Science is Reflected in Questions?

From the above, it may be evident that recent test development has tried to encourage an approach to Science which is based on the use and observation of real materials and apparatus, on simple experiments to be performed, and on making conclusions from experiments. A contrary approach before 1991 tended to emphasise naming and definition, the acceptance of principles as facts with no need for experimental demonstration, and minimal use of any inductive or deductive reasoning. This latter approach, although still detectable at times, has been discouraged by the recent reforms. It is now in the teachers' best interests in terms of examination success to ensure that pupils have at least seen the demonstrations and experiments in the teachers' guides, and preferably also those in past question papers. Likewise, pupils should be made aware of the need to predict the results of experiments and explain them, using appropriate principles. If the general view that learning is more successful through»interaction with objects«(Piaget) is accepted, pupils ought to do better as a result of being taught via concrete demonstration and preferably via direct participation. But it is necessary to repeat here that the support of the examinations for this approach to teaching is at best passive. The material and attitudinal obstacles to teachers adopting it in practice are well known (Siege and Voss-Lengnik, 1990) and it is obvious that intervention of some kind will be needed to influence teachers more radically.

It may be thought that the concept of Science promoted by the PSLC syllabus, teaching materials and examination alike is a very limited one, even allowing for the scarcity of resources in Malawi. There is little to encourage pupils to devise experiments of their own or to deduce principles from observation. There is no social context for Science, which must seem a baffling activity to pupils in a rural society. There is no acquaintance with the discoveries of great scientists, which might convey human interest as well as some appreciation of scientific method by empathy. Nor is the use of Science made clear, as it easily might be in relating, say, discoveries in medicine to daily life. It is not the fault of the examinations alone, but a very isolated and mechanical concept of Science is being promoted in the Malawian curriculum, both old and new.

4.5. Learning Competencies For All. Essential and Desirable Learning Competencies for Standards 4, 5 and 6 (Abstracts)

Towards a holistic approach to examination reform

Prepared by:

Mauritius Examinations Syndicate
in collaboration with
Ministry of Education and Science,
Mauritius Institute of Education
and ***Mahatma Gandhi Institute.***

LEARNING COMPETENCIES: *AN INTRODUCTION*

'A nation's children are its greatest resource. In only a few decades the prosperity and quality of life of ail nations will be determined By to-day's children...'

Cited in: *Master Plan for Education for the year 2000*

Why the Learning Competency Project?

The Philosophical and Sociological Background

In an age where illiteracy has become a major handicap, every nation owes it to her children to make sure that all of them irrespective of class and creed have access to at least the basic education that will enable them to become literate and functional citizens. This is rightly now the international trend.

Mauritius which has always given due importance and status to education has followed suit: universal free education is available at the primary, secondary and tertiary levels. Yet a closer look at the real situation shows that it is not yet time for us to rest on our laurels.

> *"At present while 99% of our children enter standard I, only a little more than 70% of the cohort pass the CPE examination. One quarter of our children leave school at that point without basic education"*

acknowledges Honourable A Parsuramen, Minister of Education and Science. In other words nearly 30% of our children leave school, after six years, illiterate, innumerate and labelled as failures. This wastage of human potential and of economic and human resources has to be tackled urgently. Again to quote the Minister of Education and Science:

> *"Mauritius needs the talents of all its people. We cannot afford to ignore the potential of large groups of our citizens, nor indeed would it be socially just for us to do so."*

Having achieved the first goal of primary education, we have now a social and moral obligation to improve the quality of education to ensure that *all* our children irrespective of social, regional, economic background are given *quality education* and helped to develop their abilities and the basic life skills and competencies necessary to function in the present society.

The Learning Competency Project was initiated by the MES with precisely these objectives in view:

(1) to identify the basic skills and learning competencies needed by children to become literate functional citizens;

(2) to provide direction for curriculum developers to develop competency-based instructional materials;

(3) to provide broad guidelines to teachers to adapt teaching learning strategies to the learning competencies;

(4) to redesign the examination papers in terms of the learning competencies;

(5) to provide a basis for certifying pupils' achievement.

Pedagogical Basis

While it is necessary and desirable to get the majority of pupils to pass the CPE examination, one major pedagogical concern is to improve the performance of pupils to bring them all up to a reasonable attainment level - to make them really literate and numerate.

By setting clearer and step-by-step attainment targets (expressed in terms of essential and desirable learning competencies), this document proposes an in-built mechanism for more effective teaching. It gives a clearer sense of direction in the day-to-day teaching so that teachers may know step-by-step what they are expected to achieve and they can discover/diagnose at what step a child is facing difficulties.

The document also provides the basis for *target-related assessment* which can take various forms:

(a) diagnostic to identify pupils' difficulties;
(b) formative for improvement;
(c) summative for certification.

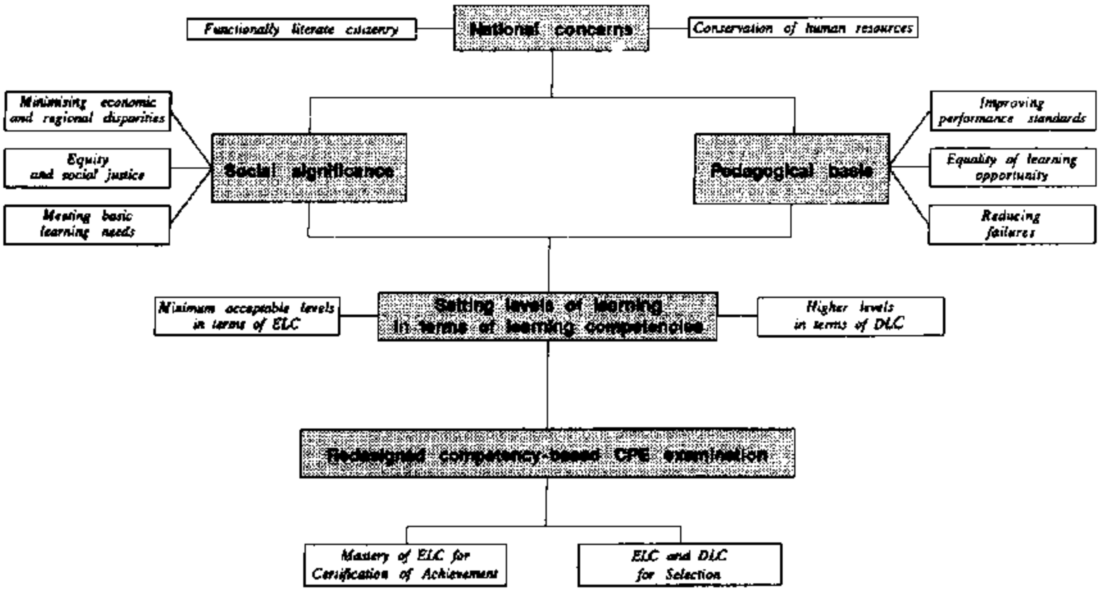
What are Essential and Desirable Competencies?

Essential Learning Competencies (ELC) represent the levels of learning in a particular subject comprising such basic knowledge, understanding, skills, abilities, interests, attitudes and values which are considered minimum but essential for all students to acquire at the end of a particular standard or stage. They can be regarded as attainment targets below which learning is not sustainable. In other words, they are the 'minimum vital'.

However, children do not all have the same potential and while it is necessary to bring all children up to the agreed-upon essential level of learning, children with higher abilities must be catered for and attainment levels must be pitched higher to meet their learning needs. Therefore, higher order competencies involving more complex mental processes and/or learning content have been laid down and termed **Desirable Learning Competencies** (DLC). The ELC are a must for *all* students while DLC are optional though desirable, for every one to exercise his higher order mental faculties and can thus be used to discriminate amongst high flyers.

For examination purposes a judicious combination of the two types of competencies will be used. The ELC are more suitable for certification while DLC are more appropriate for ranking purposes.

The theoretical framework of the Learning Competency Model may be depicted as In the figure on page 3.



Theoretical Framework for teaming Competencies

Methodology used to formulate Learning Competencies

The **first step** in the project was to analyse the present syllabuses and question papers and to study the international literature on competency-based teaching and testing.

Different models have been used in different countries. *Basic Skills Testing Programmes* are used in Australia where the skills tested include two aspects of literacy (Reading and Language) and three aspects of Mathematics (Number, Measurement and Space) and where the scores represent growth along a continuum. In some Australian states, profiles have been developed within subject areas and each component is further divided into levels of competence representing standards of performance.

England and Hong Kong have specified *“Attainment Targets”* with criteria set at a number of different levels rather than pass/fail at only one level. The USA have *Minimum Competency Testing* and India developed the *Minimum Levels of Learning.*

The Models may vary from country to country but they all acknowledge the impossibility of measuring competence, as such. We can only define objectives and measure the *behavioural outcomes* of these objectives. When we teach a lesson to develop a child’s ability to understand - we cannot examine and certify whether the thought processes involved in understanding were developed and used in that particular lesson, we can only assess his level of understanding by the answers he gives to the questions we ask and depending on his answers - which are measurable - we can decide about his level of understanding. Hence the care with which tests (class tests as well as external ones) should be constructed to ensure that they measure what they are supposed to measure.

The MES chose a taxonomic model which states learning objectives in terms of:

Knowledge, Understanding and Application for content subjects and Knowledge, Comprehension, Expression (which includes Application) in the case of languages.

This model is close to the Indian Experience but different and more adapted to the Mauritian context.

The **second step** in the project was to break down each subject into its major skills and the competencies implied in language subjects or content areas and the corresponding competencies. Thus Learning Competencies were laid down for each subject examined at CPE level giving due importance to certain skills presently neglected and overlooked which are yet essential components of the subject, e.g. the oral skills in languages and the psychomotor skills in EVS. We have also considered some of the non-cognitive elements like attitudes, values that are important not only for the development of competencies in individual subjects but also for the healthy growth and integration of the child in society.

The **third step** was the categorisation of the Learning Competencies into the two groups: ***Essential and Desirable.*** *Essential Learning Competencies* constitute the levels of achievement to be developed in *all* children at the end of the primary stage while *Desirable Learning Competencies* set the attainment levels for children with a *higher ability.*

Strategy for formulating Learning Competencies

To develop the lists of Learning Competencies, the MES adopted a *participative* strategy.

Subject working groups comprising curriculum developers, chief examiners, inspectors, head teachers, deputy head teachers, practising teachers and research officers were constituted to work out the Learning Competencies in each subject.

A Steering Committee was also set up to monitor the progress of the panels.

These were the different stages in the development of the project:

(a) *August to November 1991*

After a careful analysis of the prescribed textbooks, of question papers and of relevant documents, the subject working groups, under the guidance of Prof Pritam Singh laid down the competencies for each subject. This material was regularly reviewed by the Research and Development Section of the MES in accordance with the observations of the Steering Committee.

(b) *10th to 16th December 1991*

The first draft of Learning Competencies was prevalidated by about 250 practising teachers who had been sent the list of competencies in advance. Advantage was taken of their experience (i) to identify the competencies to be deleted, modified or added and (ii) to identify those competencies that can be acquired only by bright students and are not essential. Such competencies - named *Desirable Learning Competencies* are listed in **blue** in the document.

(c) *December 1991*

To ensure further judgemental validity the modified draft of Learning Competencies was submitted for critical and thorough review by senior experts from NCERT, New Delhi, who have experience in this field.

(d) *22 April 1992: National Seminar on Reforms at CPE Level*

The seminar on proposed reforms at CPE level provided some reflections and observations which were incorporated.

(e) *July 1992*

Final Draft.

The following criteria were applied to judge whether a Learning Competency formulated is acceptable for inclusion in the list.

Firstly, it must be *sustainable* in the sense that it represents achievement which can sustain learning from one unit to the other and from one standard to the next so as students can derive benefit from instruction for further learning.

Secondly, it must be *communicable* which means that the levels of learning stated in the document in the form of learning competencies form a common basis for the teachers, evaluators, inspectors and administrators. Each Learning Competency has a common pattern of statement representing two dimensions, namely the content element and the ability aspect, to facilitate communication.

Thirdly, an attempt was also made to provide *learning continuity* in each topic and sequenced in such a way that clusters of competencies of a unit are built upon the clusters of competencies of the preceding unit. An attempt was also made to develop a continuum of learning competencies as far as possible across standards 4 to 6 besides the learning continuum established within each standard.

Fourthly, the criterion of *functionality* was used. It means that teachers are capable of developing these competencies in teaching. Learning Competencies are stated at a proper level of generality, neither too global to be measurable nor so atomistic as to be unwieldy.

Fifthly, unless a learning competency was *measurable, i.e evaluable* it was not to be listed. A learning competency must provide a well defined goal, where a statement in terms of specific learning outcome is necessary, to make it testable.

Sixthly, *achievability* was the final criterion which means that under the given conditions all learning competencies are attainable. They are in accordance with the cognitive development and the maturity levels of students.

Why the hierarchical presentation?

A look at the document shows that the competencies are presented in a hierarchical way both across standards and more importantly within each standard. The reason is that learning objectives have an intrinsic hierarchy

knowledge → understanding → application

which is reflected in both content and competencies as a result of which we have a hierarchy of competencies and a hierarchy of content. Logically we cannot expect a child to multiply till he understands the principle of addition; likewise we cannot expect him to write a sentence correctly in a particular language till he has mastered certain syntactical and grammatical structures of the language and has the required vocabulary. This hierarchical nature of the competencies listed has a direct implication for teaching: given their hierarchical nature, a competency cannot be taught unless the preceding one has been acquired. Teachers must therefore make sure - not necessarily through formal tests - that the pupils have acquired the prerequisite competency before they teach the next one.

To Conclude

The present document is not a teaching syllabus nor an examination syllabus. Its main focus is not on the content elements of the different subjects but on the *acquisition of the competencies.* Although there are certain subjects like EVS and Maths which are more content oriented than others and all subjects have a content component, in the present document content is above all a tool for the development of the identified competencies.

This explains the use of **action words** to define all the competencies to be taught. At the. end at a particular standard we expect the child to be able to *recall, decode, analyse, interpret etc...* It is immaterial whether the teacher uses passage 1 or 2, topic 1 or 2 to achieve this, as long as the child develops the required competency and reaches the level of *knowledge, understanding* and *application* appropriate for his age. The success of the Learning

Competency Project rests on *competency-based teaching and testing.*

The Learning Competency Project is part of a continuing search for standards in education. As such it relates to a particular time frame: as the demands of society change, the acceptable levels of learning and areas of essential learning have to be reviewed and updated. As performance standard goes up with improved instruction and better learning, the list of ELC also changes and some of the present DLC become ELC.

Notes

1. Learning Competencies have been formulated for Standards 4,5 and 6 for all subjects examined at CPE level. The prerequisites for Standard 4 have also been listed.

2. **Code used for the Learning Competencies**

The *first* figure represents the skill/topic referred to, the *second* refers to the standard and the *third to* the competency to be developed.

Thus in the code **2.4.6** for English, **2** represents the second skill listed i.e. *speaking;* **4**- *Standard 4* and 6 **-** the *sixth competency* to be developed.

Topics	Prerequisites	Standard 4	Standard 5	Standard 6
				6.6.12 *Acquire and practice good health and safety habits.*
				6.6.13 Give reasons for taking a balanced diet.
7. Air		7.4.1 Show the presence of air in the environment.	7.5.1 State that air is a mixture of many gases such as oxygen, carbon dioxide and nitrogen.	
		7.4.2. Demonstrate that soil contains air.	7.5.2 Demonstrate that air is necessary for burning.	
		7.4.3 Demonstrate that water contains air.	7.5.3 Name items which easily catch fire.	
		7.4.4 Name some light objects which can float in the air.	7.5.4 List some of the ways to extinguish fires.	
		7.4.5 Conclude that air is present all round us even in ‘empty’ space.	7.5.5 List certain precautions to be taken to prevent fires.	
		7.4.6 Demonstrate that air exerts pressure.	7.5.6 Explain three causes of air pollution.	
			7.5.7 State that air is essential for living things.	

Topics	Prerequisites	Standard 4	Standard 5	Standard 6
			7.5.8 Infer that air exists around us.	
			7.5.9 Demonstrate that air expands on heating and contracts on cooling.	
			7.5.10 Give three reasons why air pollution is dangerous.	
			7.5.11 Infer that air exerts pressure in all directions.	
8. Weather	8.1 Describe prevailing weather (from pictures).	8.4.1 Observe and record weather characteristics.	8.5.1 State that wind is air in motion.	
	8.2 Interpret a simple weather calendar.	8.4.2 Name and recognise the instruments used to measure temperature, rainfall and wind direction.	8.5.2 Show that wind has speed and direction.	
	8.3 Record the weather using symbols in a calendar for a week.	8.4.3 Name the winter months and summer months.	8.5.3 Read the temperature from a thermometer.	
	8.4 Record the weather in a weekly calendar, using symbols.	8.4.4 Mention the weather characteristics of summer and of winter months.	8.5.4 Read and recognise a map with isotherm/isobar/isohyet.	
		8.4.5 Name the prevailing winds.	8.5.5 List the three main types of rainfall.	
		8.4.6 Explain the importance of rain.	8.5.6 Measure rainfall using a simple rain gauge.	
		8.4.7 *Develop an interest in weather reports on radio and television.*	8.5.7 Make models of anemometers and windvanes in small groups.	
		8.4.8 *Develop an awareness that out weather is influenced by cyclones in*	8.5.8 Differentiate between land breeze and sea breeze.	

Topics	Prerequisites	Standard 4	Standard 5	Standard 6
		summer.		
			8.5.9 Interpret isotherm/isobar/isohyet maps.	
			8.5.10 Differentiate between weather associated with cyclones and anticyclones.	
			8.5.11 Interpret cyclone bulletin.	
			8.5.12 Explain how rainfall distribution in Mauritius is related to relief, seasons and the South East trade winds.	
			8.5.13 Interpret a rainfall histogram.	

4.6. Science in the National Curriculum - Attainment target 9: Earth and Atmosphere

Knowledge and understanding of science, communication and the applications and implications of science (ATs2-17)

Pupils should develop their knowledge and understanding of the structure and main features of the Earth, the atmosphere and their changes over time.

LEVEL **STATEMENTS OF ATTAINMENT**

Pupils should:

1
- know that there is a variety of weather conditions.
- be able to describe changes in the weather.

2
- know that there are patterns in the weather which are related to seasonal changes.
- know that the weather has a powerful effect on people's lives.
- be able to record the weather over a period of time, in words, drawings and charts or other forms of communication.
- be able to sort natural materials into broad groups according to observable features.

3
- be able to describe from their observations some of the effects of weathering on buildings and on the landscape.
- know that air is all around us.
- understand how weathering of rocks leads to the formation of different types of soil.
- be able to give an account of an investigation of some natural material (rock or soil).
- be able to understand and interpret common meteorological symbols as used in the media.

4
- be able to measure temperature, rainfall, wind speed and direction; be able to explain that wind is air in motion.

• know that climate determines the success of agriculture and understand the impact of occasional catastrophic events.

5 • know that landscapes are formed by a number of agents including Earth movements, weathering, erosion and deposition, and that these act over different time scales.
• be able to explain how earthquakes and volcanoes are associated with the formation of landforms.
• be able to explain the water cycle.

6 • be able to explain the processes by which igneous, sedimentary and metamorphic rocks were formed and are recycled.
• be able to describe how the properties of minerals and rocks are related to their uses as raw materials.
• understand how different airstreams give different weather.

7 • be able to state qualitatively the relationship between pressure and winds.
• be able to recognise patterns in the distribution of the Earth's major surface features (continents, mountain belts, areas of very old rock, oceans, ocean basins, trenches and ridges) and zones of active crust (earthquakes and volcanoes).

8 • understand that geological time scales are very long compared with human and historical time scales, and have a general knowledge of how geological time scales can be measured.
• be able to interpret evidence of modes of formation and deformation of rocks.

9 • be able to use appropriate scientific ideas to explain how changes in the atmosphere cause various weather phenomena.
• be able to describe in simple terms the layered structure of the inner Earth, and explain the evidence that favours such a model.

10 • understand the theory of plate tectonics and use it to explain some major geological features on the Earth's surface.
• understand how plate tectonic theory brought about a revolution in our understanding of the way the outer part of the solid Earth works.

Science in the National Curriculum. HMSO. London.

4.7. Boat Building (The Properties, Classification and Structure of Materials) - Worksheet

Statement of attainment

Pupils should:

3/3a be able to link the use of common materials to their simple properties.

Resources

• Copies of the worksheet for this activity

Acceptable responses

A choice of material for each part of the model should be made. The actual materials chosen are less important than the reasons given for choosing them. In total, at least two different properties of materials should be named or described.

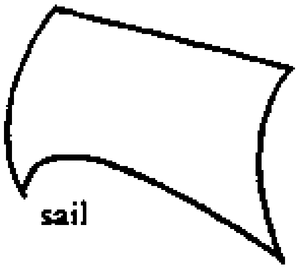
Suitable properties would include:

strength	hardness
weight (density)	flexibility
elasticity	non-absorbency

The correct terms need not be used; it is sufficient to convey the meaning of the property (for example, ‘it won’t tear’ or ‘it would be easy to cut’).

Boat Building

Example answers only – others are possible

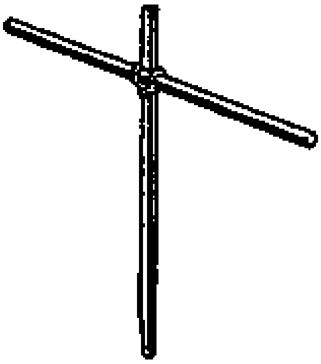


sail

I would use paper / nylon fabric / foil

because it is strong

and catches the wind

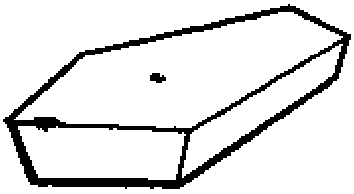


mast

I would use rubber / card / wood

because it is stiff

and light



hull

I would use wood / polystyrene / plasticine

because it is light or floats

and easy to cut

Materials - Levels 2-5

Boat Building

 sail	I would use because it is and	paper/nylon fabric/foil ______________________ ______________________
 mast	I would use because it is and	rubber/card/wood ______________________ ______________________
 hull	I would use because it is and	wood/polystyrene/plasticine ______________________ ______________________

Code 4285 09 4

DSE in Brief

The German Foundation for International Development (DSE) is an institution which provides a forum for development policy dialogue and the initial and advanced training of specialists and executive personnel from developing and transitional countries. In addition, it supports German experts preparing themselves for their assignments in developing countries and maintains the Federal Republic of Germany's largest centre for documentation and information on development cooperation issues.

Conferences, meetings, seminars and training courses support projects which serve economic and social development, thus contributing to an effective, sustainable and wide-ranging development process.

The DSE cooperates with partners at home and abroad. A considerable number of the programmes take place in the developing countries, and the rest in Germany. Since 1960 the DSE has given advanced professional training to more than 120,000 decision-makers, specialists and executive personnel from over 150 countries. Through its dialogue and training events the DSE currently reaches more than 10,000 participants annually.

Founded in 1959, the DSE contributes to development cooperation on the basis of the guidelines of the German Federal Government's development policy. The institutional donor is the Federal Ministry for Economic Cooperation and Development (BMZ). Some of the DSE programmes are, however, financed by other donors (e.g. other Federal ministries, the Federal Länder, the European Union).

Also, the Federal Länder of Baden-Württemberg, Bavaria, Berlin, North Rhine-Westphalia and Saxony have made conference and training centres available. Since its establishment, the DSE has been jointly financed by the Federation and the Länder. This finds expression in the decentralized structure of the German Foundation with its specialized departments (Centres) and conference centres in a number of Federal Länder.

"Effective Teaching"

A 5-day-workshop for teachers and trainers in professional and technical vocational skills training

This is a born teacher!
Did you ever come across this statement? True, some seem to be naturally good at their job: not only are they liked and their courses favoured, they can almost always attract their students' attention. How do they do it? you might have wondered already. To tell you the truth right away – it is neither born talent nor charm alone!

What makes a good lesson, what stimulates thinking, what helps noting and remembering information, what grips the attention of an audience during a lecture – all this will be part of the workshop "Effective Teaching". Catering for professional and technical skills teachers and trainers, the seminar aims to improve teaching and training skills and to equip participants with the needed know-how. Topics covered are:

- Learning theory
- Learning objectives and lesson planning
- Teaching and training methods
- Visual teaching aids
- Methods of control and evaluation

Since one should practise what one preaches, a lot of exercises will be incorporated into the 5-day-schedule: learning-by-doing-sessions will follow lectures and debates. Some parts of the seminar will be recorded on video to allow for an analysis of each participant's teaching performance. Out of this, recommendations for improvement will be worked out together.

By the end of the seminar you will hopefully be able to apply as much of the theoretical knowledge and practical experience in your daily teaching as possible. Thus, not only you will benefit but your students as well: As much as you will enjoy teaching, as much they will enjoy learning from you!

Number of participants: 8 to 10

Seminar schedule

Effective Teaching

Day 1

Unit 1:	Welcome	Introduction of lecturer, participants and topic
Unit 2:	How human beings learn	Introduction of theory and discussion (Part 1)
Task 1:	Mini-Lesson	Preparing a presentation
		Presenting the presentations (presentations will be videotaped) and feedback
Unit 2:	How human beings learn	(Part 2)

Day 2

Repetition:		Last day's lecture
Unit 3:	Learning objectives	Introduction of theory and exercise
Unit 4:	Teaching methods	Introduction of theory and exercise
To Task 1:	Mini-Lessons	Watching the videos of the presentations
Unit 5:	The lesson	Introduction of theory and discussion
Unit 6:	The 4-Step-Method	Introduction of theory and discussion
Evaluation:		Feedback on the first two days of training

Day 3

Repetition:		Last day's lectures
Unit 7:	Questions in lessons	Introduction of theory and exercise
Unit 8:	The lecture	Introduction of theory and exercise
Unit 9:	Visualization	Introduction of theory
Task 2:	Visual aids	Preparing a visual aid and presenting it
Summary/Outlook		Handing out of handouts/Introducing task 3

Day 4

Task 3:	Model-Lesson	Preparing a presentation
		Presenting the presentations (presentations will be videotaped) Individual feedback

Day 5

Task 3:	Model-Lesson	Continuation of presentations (videotaping) Individual feedback
Unit 10:	Evaluation and control	Introduction of theory and discussion
		Assessment of seminar
Closing		Handing over of certificates

Schedule of the days

start	8.00 am
1. break	according to progress of sessions
lunch	12.00 am to 1.00 pm
2. break	according to progress of sessions
end	5.00 pm

Tasks

Task 1:	Prepare a mini-lesson. Choose out of given topics. Duration: 6 +/- 2 minutes
Task 2:	Prepare a visual aid (media will be assigned) to support a lecture.
Task 3:	Prepare a model-lesson. Choose topic from your field of expertise. Apply what you have learned during the seminar. Duration: 20 +/- 5 minutes

Effective Teaching, Day 1 - 1

No.	Title	Content/Activity	Material	Time
1	Introduction	Registration, putting on name tags Welcome of pax Introduction facilitator	Stickers, markers, registration form Prepared meta-cards	8.00 – 8.30
2	**Partner interview:** Introduction	Each participant draws one piece of postcard, finds partner & asks for: - name - what he/she likes about teaching - what he/she dislikes about teaching - expectations re E.T. seminar to be put on four meta-cards and presented to plenary one by one	5 pairs of postcards diagonally cut in halves; meta-cards, markers manila paper, glue/masking tape	8.30 – 9.00
3	Introduction	Facilitator gives brief feedback on expectations; Outlines objectives, methods, content & schedule of training;	Flipchart 10 copies seminar schedule	9.00 – 9.15
4	Lecture/Discussion “How human beings learn” – part 1	Input on: - Learning – a definition - Different types of learning - Different ways of learning of human beings - Different ways of learning of animals - Learning theory - The three steps of human learning	Transparencies Laminated meta-cards	9.15 – 10.00

	Break			10.00 – 10.15

Effective Teaching, Day 1 - 2

5	**Game** **Exercise**	Option 1: Pax form circle, person who throws ball to another pax says word; last letter of word must be first letter of next word – related to factors influencing memory performance Option 2: Pax work in pairs and find example for learning material from their field of teaching suitable for each of the 9 ways of human learning; results shared in plenary	Softball Exercise sheets "Different ways of human learning"	10.15 – 10.30 20 – 30 minutes
6	Lecture/Discussion "How human beings learn" – part 2	Recap first input; further input on: - The 3 components of the memory - The sequence of learning - How to prepare information for storage - How to remember information - How learning is enjoyable	Transparencies	10.30 – 11.15
7	**Individual work** Mini Lesson	Introducing task 1 "Mini lesson" - audience: aliens - time presentation: 5 – 7 minutes - aim: student can use/understand item - time preparing: 1 hour Then pax work on their own; if approached by pax, allow only restricted use of media	Cord, choice of prepared cards representing items (tools, daily equipment), pegs Band paper, pens/pencils, markers	11.15 – 12.00

	Lunch			12.00 – 13.00

Effective Teaching, Day 1 - 3

8	Continuation of **Individual work** Mini Lesson	Same as # 7	Same as # 7	13.00 – 13.15
9	Introduction Mini Lesson	Drawing of lots to establish sequence of pres. Introducing feedback method Kiss – Kick – Kiss Introducing procedure, reason for video taping Reminder of time frame, rules	Laminated meta-cards with feedback steps Prepared lots 1 – 10 Paper, pencil	13.15 – 13.30
10	**Presentations** Mini Lesson	Presentations by pax: - presentation/video taping of presentation - feedback by presentor - feedback by other pax - feedback by facilitator Time per pax: 15 – 30 minutes approximately	Camera, tripod, extension cord, stop watch, 1 – 2 tapes	13.30 – 13.45 13.45 – 14.05 14.05 – 14.25 14.25 – 14.50 14.50 – 15.10

	Break			15.10 – 15.25

Effective Teaching, Day 1 - 4

11	**Presentations** Mini Lesson	Same as # 10	Same as # 10	15.25 – 15.45 15.45 – 16.05 16.05 – 16.20 16.20 – 16.40 16.40 – 16.55
12	Summary Feedback/Mini Lesson	Facilitator summarizes major learning through presentations; outlines three areas to which feedback was given; introduces three major areas of competence of a teacher/trainer	Transparency	16.55 – 17.05
13	**Feedback**	Pax indicate how satisfied they are with day 1 by marking on the sun rays	Evaluation sheet “Shining sun”	17.05 – 17.10

Effective Teaching – Alternatives for Day 1 schedule

No.	Title	Content/Activity	Material	Time

Effective Teaching, Day 2 - 1

No.	Title	Content/Activity	Material	Time
1	**Review**	Pax choose one colored envelope and try to answer/explain question/statement they find inside; other pax may help or facilitator	10 envelopes, 3 different colors; 10 statements concerning input of day 1	8.00 – 8.45
2	Lecture/Discussion “Learning Objectives”	Input on: - The importance of learning objectives - Implications for objectives - Taxonomy of objectives Explaining by example “Learning how to ride a bike”	Transparencies Laminated meta-cards Pin-board, pins or whiteboard, masking tape	8.45 – 9.30
3	**Group work** Formulating objectives	Pax are grouped according to 3 colors of envelopes and asked to work out objectives for “Learning how to drive a car” for one area each: - psychomotor area - cognitive area - affective area	Meta-cards, markers	9.30 – 10.00

	Break			10.00 – 10.15

Effective Teaching, Day 2 - 2

4	**Presentations** Formulating objectives	Presentation of results of each group to plenary; corrections or comments by pax/facilitator; Facilitator summarizes importance of 3 areas & points out specific feature of each area	Pin-board, pins/whiteboard, masking tape	10.15 – 10.45
5	Lecture/Discussion "Teaching Methods"	Input on: - Definition - The right choice - Didactical arrangements Collecting methods known & used by pax on whiteboard (10 – 15 methods)	Transparencies Whiteboard, markers	10.45 – 11.00
6	**Group work** Teaching Methods	Pax are divided into 2 groups by fitting cut-up postcard segments together, then working on - advantages of methods collected - disadvantages of methods collected per group writing results of discussion on meta-cards; cards have to be divided equally among group members for presentation	2 postcards, cut-up into 5 strips each meta-cards, 2 colors, markers	11.00 – 11.40
7	**Pro – Contra Debate** Teaching Methods	Each method is presented to plenary in form of a pro – contra debate with - advantages - disadvantages - further comments/arguments If needed, facilitator intervenes, corrects, summarizes to facilitate flow of debate, gives also inputs on possible use of methods	Manila paper, glue/masking tape, marker	11.40 – 12.00

	Lunch			12.00 – 13.00

Effective Teaching, Day 2 - 3

8	**Energizer** Ping-Pong-Pang	Pax form circle & conduct game		13.00 – 13.15
9	Continuation of **Pro – Contra Debate** Teaching Methods	Same as # 7 Facilitator summarizes debate; repeats importance of criteria for choice of method	Same as # 7	13.15 – 14.00
10	Video watching Mini Lesson	Facilitator explains reasons for feeling awkward when seeing oneself on tv; Each mini lesson is viewed; facilitator may pause tape to point out body language/mistakes committed during presentation; each pax is asked if they may want to share further observations of own presentation with group	Video camera, tv monitor, tapes with recorded mini lessons, extension cord, linking cord camera – tv	14.00 – 15.30

	Break			15.30 – 15.45

Effective Teaching, Day 2 - 4

11	**Energizer**	Facilitator conducts stretching exercises with group		15.45 – 15.50
12	Lecture/Discussion “The Lesson”	Facilitator summarizes learning from watching mini lessons & develops basic structure of a lesson on the observed examples of mini lessons	Laminated meta-cards, pin-board, pins/whiteboard, masking tape	15.50 – 16.20
13	Lecture/Discussion “The 4-step method”	Facilitator gives brief background info on dual training system in Germany & application of 4-step method in context of skills training, then input on: - the 4 steps of the 4-step method Comparison to basic structure of lesson	Transparencies	16.20 – 16.40
14	**Feedback**	All sit in circle and give oral feedback by passing on the ball; Facilitator introduces task 3 “Model Lesson” and asks pax to think of a possible topic they may want to present	Ball	16.40 – 17.00

Effective Teaching – Alternatives for Day 2 schedule

No.	Title	Content/Activity	Material	Time

Effective Teaching, Day 3 - 1

No.	Title	Content/Activity	Material	Time
1	**Review** Matching exercise	10 different statements/questions & 43 answers are displayed on table. Each pax chooses one statement and searches for correct answers; facilitator checks choices and puts wrong answers back; Each pax elaborates on own statement & explains answers	10 statements/questions indicating number of answers, 43 meta-cards providing correct answers	8.00 – 9.00
2	Lecture/Discussion “Questions in Lessons”	Input on: - The exceptional quality of a teacher’s question - Different kinds of questions - Grade of difficulty - Technique of questioning	Transparencies	9.00 – 9.20
3	**Partner work** Formulating questions	Pax choose end of string to find partner, then read exercise sheet “Philippine Profile” & formulate 1 or 2 questions per category: - knowledge - comprehension - initiating thinking Results are shared/corrected in plenary	5 strings 10 copies exercise sheet band paper, pencils	9.20 – 10.00
4	**Brainstorming** Effect of questions	Pax do collective brainstorming on effect of good & bad questions which are collected on whiteboard; comparison with transparency	Whiteboard, markers Transparency	10.00 – 10.15

	Break			10.15 – 10.30

Effective Teaching, Day 3 - 2

5	**Role play** Lecture	Pax are divided into 2 groups by counting 1, 2, 1, 2…; each group has to prepare worst lecture they can think of presented in a role play (duration: 10 – 15 min) while other group observes & vice versa Processing of presentation, identifying elements which make lecture appear so bad	Choice of pax	10.30 – 11.30
6	Lecture/Discussion “The Lecture”	Input on: - The content & preparation of lectures - The structure of lectures - Comprehensibility of lectures By relating input to role plays whereever possible	Transparencies	11.30 – 12.00

	Lunch			12.00 – 13.00

Effective Teaching, Day 3 - 3

7	**Energizer** Pegs	All pax get 3 pegs each which they try to stick on other pax while avoiding getting any themselves; persons with most pegs has lost	30 cloth pegs	13.00 – 13.10
8	Discussion/Lecture “Visualization”	Input on: - Why visualization is so important - Some basic rules - Examples of design elements - Teaching and visualization	Transparencies	13.10 – 13.40
9	**Individual work** Visual aids	Pax choose 1 postcard out of display; on back is stated the media they will work with; each pax has to prepare a visual aid related to text of “Philippine Profile”	10 Postcards, different motives with choice of media written on back as listed below; manila paper, cartolina, meta-cards, whiteboard, overhead transparencies, black board, flipchart; markers, crayons, rulers, lettering stencil, set square, protractor, correction fluid, glue	13. 40 – 15.30

	Break			15.00 – 15.15

Effective Teaching, Day 3 - 4

10	**Evaluation** Visual aids gallery	All visual aids are displayed and visited one after other as if going through an art gallery; All pax briefly tell what was easy – difficult in executing work; Feedback on work by other pax, facilitator, pointing out ways of improving; Summarizing advantages – disadvantages of each media Brief summary of activity/importance of visualization	Boards/walls for display, masking tape, pins, clips	15.30 – 16.45
11	Outlook	Distribution of handouts Introducing next task “Model lesson” & outlook on procedure for next two days; Clarifying questions	10 copies of handout “Effective Teaching”	16.45 – 17.00

Effective Teaching – Alternatives for Day 3 schedule

No.	Title	Content/Activity	Material	Time

Effective Teaching, Day 4 – 1 + 2

No.	Title	Content/Activity	Material	Time
1	**Individual work** Model lesson	All pax work on preparing model lesson; facilitator puts task on whiteboard: - Prepare a model lesson - choose topic from your field of expertise - apply what you learned during seminar - state topic & objectives in writing - duration of presentation: 20 minutes +/- 5 Facilitator checks on work & progress of each pax in between; is available for giving advice throughout whole morning Shortly before lunch break sequence of presentations is established by drawing lots; pax may trade among each other before sequence is finalized	Sufficient stock of various media & working tools Prepared lots 1 – 10	8.00 – 12.00

	Break			10.15 – 10.30

	Lunch			12.00 – 13.00

Effective Teaching, Day 4 – 3 + 4

2	Introduction Model lesson	Facilitator repeats procedure of presentations & explains rules for feedback: - Presentation model lesson - Feedback of presenter - Feedback of 4 pax assigned prior to presentation - Feedback of facilitator - Pax are asked to use page on feedback in handout as displayed on overhead & briefly explained Assigning first 4 pax for giving feedback	Laminated cards feedback rules, camera, tripod, tapes, extension cord, stop watch Transparency Feedback sequence sheet	13.00 – 13.20
3	**Presentations** Model Lesson	Presentation of first pax, then processing presentation as explained in # 2 Checking for objectives to clarify whether achieved or not Assigning next 4 pax for feedback Time frame per pax inclusive set-up: 40 – 50 minutes; 4 – 5 presentations can be processed depending on flow	Choice of pax	13.20 – 14.05 14.05 – 14.50 15.05 – 16.00 16.00 – 16.45
4	Summary	Brief summary of today's activities Outlook on procedure for last day		16.45 – 17.00

	Break			14.50 – 15.05

Effective Teaching – Alternatives for Day 4 schedule

No.	Title	Content/Activity	Material	Time

Effective Teaching, Day 5 – 1 + 2

No.	Title	Content/Activity	Material	Time
1	**Presentations** Model Lesson	Facilitator welcomes pax & repeats procedure of presentations & explains rules for feedback: - Presentation model lesson - Feedback of presenter - Feedback of 4 pax assigned prior to presentation - Feedback of facilitator - Clarifying objectives Assigning 4 pax for giving feedback Presentations continue Time frame per pax inclusive set-up: 40 – 50 minutes; if not all can finish before lunch break, at least 2 pax should be left for afternoon instead of only 1 in order not to expose one individual	Laminated cards with feedback rules, feedback sequence sheet, Camera, tripod, extension cord, tapes, stop watch Choice of pax	8.00 – 8.20 8.20 – 9.00 9.05 – 9.50 10.05 – 11.00 11.00 – 11.45

	Break			9.50 – 10.05

	Lunch			11.45 – 13.00

Effective Teaching, Day 5 – 3 + 4

2	**Presentations** Model Lesson	Continuation of presentations same as # 1 Facilitator summarizes day's presentations; explains procedure with video tapes (transfer of recordings to vhs which is delivered to pax for later viewing)	Same as # 1	13.00 – 13.45 13.45 – 14.30 14.30 – 14.45
3	**Evaluation**	Brief input on: - The double function of control - Demands on control - The most important kinds of control Which are related to forms used during E.T. seminar Handing out of evaluation forms	10 copies evaluation form	15.00 – 15.20
4	Graduation/Closing	Handing over of certificates Closing of seminar	10 Certificates	15.20 – 15.40

	Break			14.45 – 15.00

Effective Teaching – Alternatives for Day 5 schedule

No.	Title	Content/Activity	Material	Time

Participant Reaction Evaluation Form

Use the scale 1 to 5 to express your reactions to the course based on the following statement: (Please circle only one choice for each statement.)

Strongly DISAGREE 1	Disagree 2	Neither 3	Agree 4	Strongly AGREE 5

Overall, I was satisfied with this course.	1	2	3	4	5
My knowledge and skills increased as a result of this course.	1	2	3	4	5
Knowledge and skills gained in this course are applicable to my work.	1	2	3	4	5
It was easy for me to understand the course content.	1	2	3	4	5
The methods used to deliver the course content were effective.	1	2	3	4	5
I enjoyed the parts with active involvement of the participants.	1	2	3	4	5
Group work and individual exercises stimulated my learning a lot.	1	2	3	4	5
Material for the participants was adequate.	1	2	3	4	5
The instructor explained the subject clearly.	1	2	3	4	5
The instructor answered my questions clearly.	1	2	3	4	5
The instructor was supportive and helpful.	1	2	3	4	5
I got good advice from other participants throughout the seminar.	1	2	3	4	5

What new things/changes can you apply to your job – immediately and after some time?

____

____

____

What parts of the seminar did you enjoy most? Why?

____

____

____

What parts of the seminar did you not enjoy? Why?

____

____

____

Further recommendation/comments not covered by this evaluation form:

____

____

(Continue on the back if you need more space!)

Thank you for your answers!

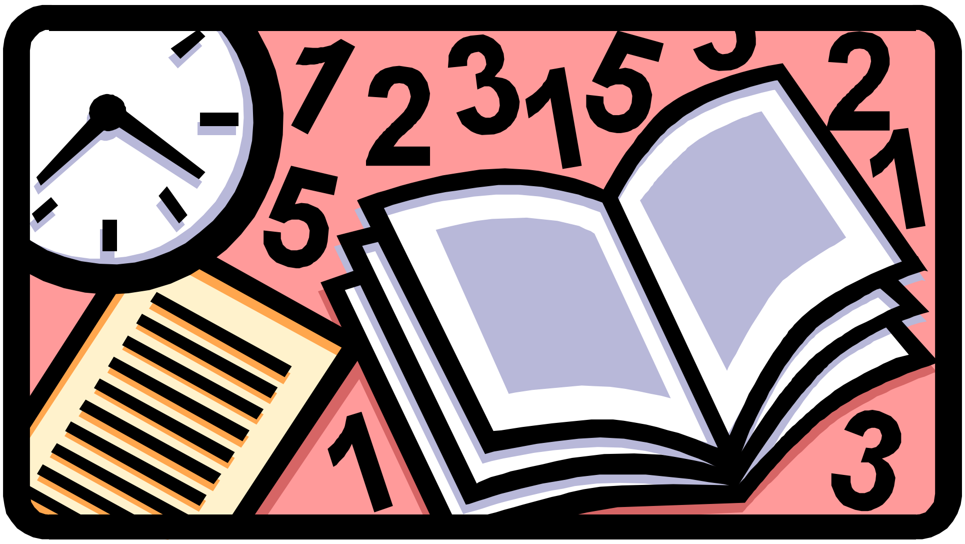
Effective Teaching



A seminar for teachers and trainers in professional and technical vocational skills training

Unit 1 Introduction

1. General remarks

This handout coming along with the workshop "Effective Teaching" is meant to provide general knowledge on the areas covered during the seminar. Since the training is participant-oriented, some of the topics may not be touched during the training, while others will be looked into with more depth. In any case, the handout cannot substitute the workshop since the training is, to a large extent, based on a "hands-on" approach: The main relevance of the training lies within the concrete workshop experience.

Nonetheless, this collection of basic knowledge can help you with your training: not only can you read in private and without stress about the various topics of the seminar, the handout can also be used like a tool-box from which you can pick the tools needed for your training. It hopefully provides you with general rules of teaching and inspires your planning of your instructions. Although technical knowledge and skills are the basic requirements for a trainer, they loose their value without skills in training and teaching. Thus, training skills are the transmission between trainer and student - they are one of the key factors for successful instruction.

As for content and design, this handout and the related workshop are based on the work of Konrad De Bortoli: A consultant of the German Development Service, ded, to TESDA Region VII, he conducted numerous workshops throughout the Philippines between 1999 and early 2001. All participants were provided with a handout which is the basis for this revised edition. It is hoped that the training continues to be as successful and empowering as it used to be then.

Cornelia Frettlöh

ded-consultant to the University of Southern Philippines Foundation, USPF
Salinas Drive, Lahug, Cebu City
April 2001

Unit 2 How Human Beings Learn

1. Learning – a definition

Everybody talks about learning these days: parents, teachers, master craftsmen, bosses, professors, politicians. Very often they refer to the age of information which makes continuous, life-long learning a must. "Human beings learn as long as they live," is a true saying. We experience this every day: we are learning something new again and again, in the factory, at work, on vacation, while we travel. But what really is learning? What do we learn and how do we learn? And what is the best way to learn? In order to answer these questions, let us first look closer into the meaning of learning.

Learning has been defined in various ways. The essence of all these definitions, however, could be put as such: Learning means that we change our behavior due to experiences. This definition excludes changes of behavior due to chemical influence, like taking drugs or, due to momentarily physical changes like being tired or, changes due to genetics while growing up. On the other hand it is broad enough to include the many different ways of what and how we learn.

Definition	=	Learning	=	change of behavior due to experiences

If learning is defined as change of behavior, learning theory can be equated with behavior theory. A good theory in this context then should enable us to explain and to predict behavior. Thus, it should make statements about human learning and under which conditions learning results are best. To understand this relationship between high learning results and the conditions required, let us have a closer look at the different types of learning.

Definition	=	Learning theory	=	behavior theory to explain and to predict behavior

2. Different types of learning

Behavior means doing something or - also - not doing something. The fact that somebody has learned, can be seen in his/her behavior after learning, as stated already in our definition of learning. If, for example, a trainee does not change his/her behavior, then it is impossible for the trainer to know whether s/he has learned anything. This is even more obvious when we look at some examples:

- previously, s/he was not able to explain a concept, but now s/he can!
- previously, s/he was not able to start a stop watch, but now s/he can!
- previously, s/he was not able to be on time, but now s/he can!

Looking at the examples, we can hereby identify different types of learning: Through learning we can acquire knowledge (s/he understands the meaning of the concept and therefore can explain it), skills (s/he can handle the stop watch and therefore start it) and attitudes (s/he values punctuality and therefore is on time)**.** When we have learned something, we are able to change our behavior; we then have acquired new patterns of behavior.

Learning often is quite complex and involves all areas. Let us look at driving: What actually happens when we learn how to drive a car? What knowledge is acquired? What skills are acquired? What attitudes are acquired? What patterns of behavior are acquired? We can easily see that all three areas are involved which then results in the actual behavior of how we drive a car.

So through learning we can acquire new…

…knowledge

We **know** more than before.

…skills

We **do** things better than before.

…attitudes

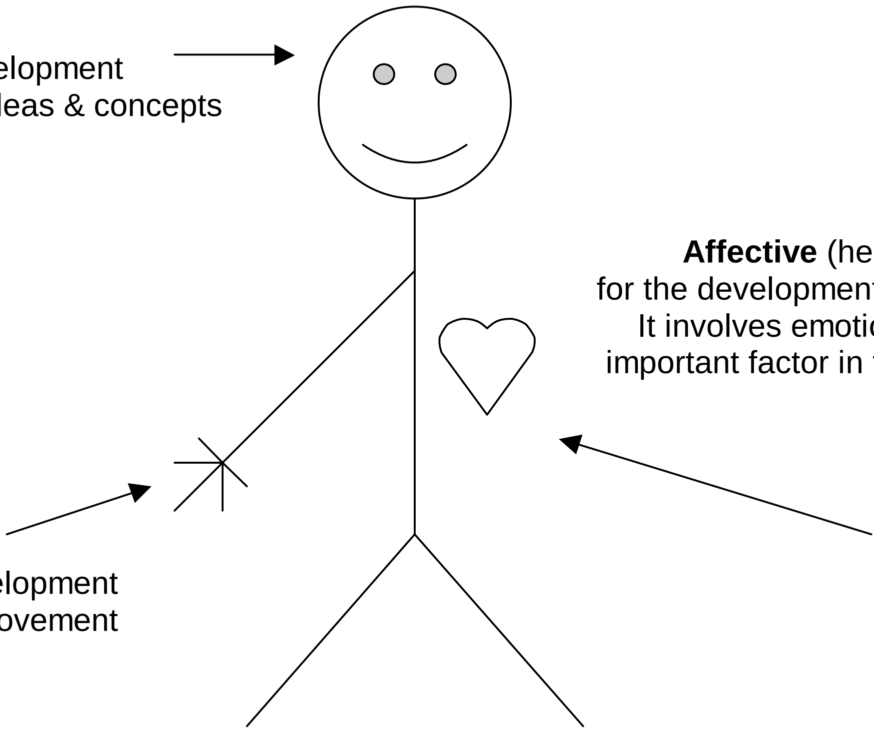
We hold a different **opinion** than before.

…patterns of behavior

We **behave** differently than before.

These different types of learning can also be expressed in other terms: cognitive, psychomotor and affective type. Pestalozzi, a Swiss educator, speaks of "Head, hand and heart". He recommends that successful learning and teaching has to activate all three types equally.

As we saw already, **cognitive** learning (head) is concerned with the development of ideas and concepts. It covers much of what academic learning demands. It involves, among other things, understanding, reasoning and problem solving.



Affective (heart) learning is important for the development of values and attitudes. It involves emotions and affect. The most important factor in teaching appreciation is, of course, the teacher.

Psychomotor (hand) learning involves understanding the external world through the senses and the muscles. It varies from large muscular to fine motor skills based mainly on perception. This type of learning is particularly crucial in vocational training.

Deutscher Entwicklungsdienst

3. Different ways of learning of human beings

By now, we have already defined learning and identified different types of learning. But how do we learn? Let us again look at some examples:

Trial & error

A supervisor holds a stopwatch in his/her hand, and fumbles with the crown and the pushbuttons in order to find out how it can be started, and what function the various knobs have. S/he notes what happens when operating the crown and the pushbuttons on the side. S/he becomes familiar with the functions of the watch, and can operate it to conduct the desired function. S/he has learned by trial and error.

Observation & imitation

It is shown to the supervisor how s/he can start and stop the stopwatch by pressing the various knobs. S/he watches closely and copies until s/he succeeds in operating it. S/he has learned by observation and imitation. (By the way, most of social learning is acquired by observation and imitation.)

Insight

The supervisor reads in the operating instructions that the stopwatch must be wound up carefully so that the spring does not break, and that the crown must be pressed vertically so that the axle is not deformed. S/he appreciates this and follows the advice. S/he has learned by insight.

Repeated perception

Whoever needs to look up the same telephone number frequently in a telephone directory will gradually note this number. S/he has learned by means of repeated perception.

Adaptation

As a heavy smoker a student in a class would like to light a cigarette. S/he looks around, and sees that no one is smoking, even those of his/her colleagues whom s/he knows to be smokers. S/he adapts, and from now on refrains from smoking, mostly also when it does not suit his/her environment. S/he has learned by adaptation.

Instilling in the mind

Somebody reads the definition of learning. S/he repeats it several times until s/he knows it by heart. S/he has learned by repetition, or by instilling it in his/her mind.

Repetition

So we now know that human beings learn and thus change their behavior in various ways. Of course, learning can also be very complex and thus involve different approaches that are combined.

4. Different ways of learning of animals

As in other fields, e.g. drug or food research, research on learning is also carried out on animals because, as research objects, humans are much more complicated than animals. As we all know, not only human beings can learn or change their behavior, other creatures can do so, too. We only need to think of the circus, of dancing elephants, seals playing football, cockfighting, spider-fights or boxing bears. Animals can also acquire new patterns of behavior, they are able to learn. One of the most famous experiments was carried out by the Russian physiologist Pavlov. It is commonly referred to as Pavlov's dog:

Conditioning

A dog is fed on meat. The secretion of salvia in his mouth is measured. Every time the meat is offered, a bell sounds. After about 25 repetitions, the dog secretes saliva as soon as it hears the sound of the bell, without having seen the meat. The dog has learned to respond in a particular way to a certain stimulus that means to behave as required. This is called learning by conditioning: a particular stimulus is followed by a particular response.

Reinforcement

Another famous example is Skinner's rat experiment in the so-called Skinnerbox:
A rat in a cage is given food when it presses a lever while a certain light is on. It is rewarded by food when it behaves as desired. The reward of food reinforces learning. Such learning is called learning by reinforcement. A form of behavior can be promoted and changed by reinforcements.

Trial & error

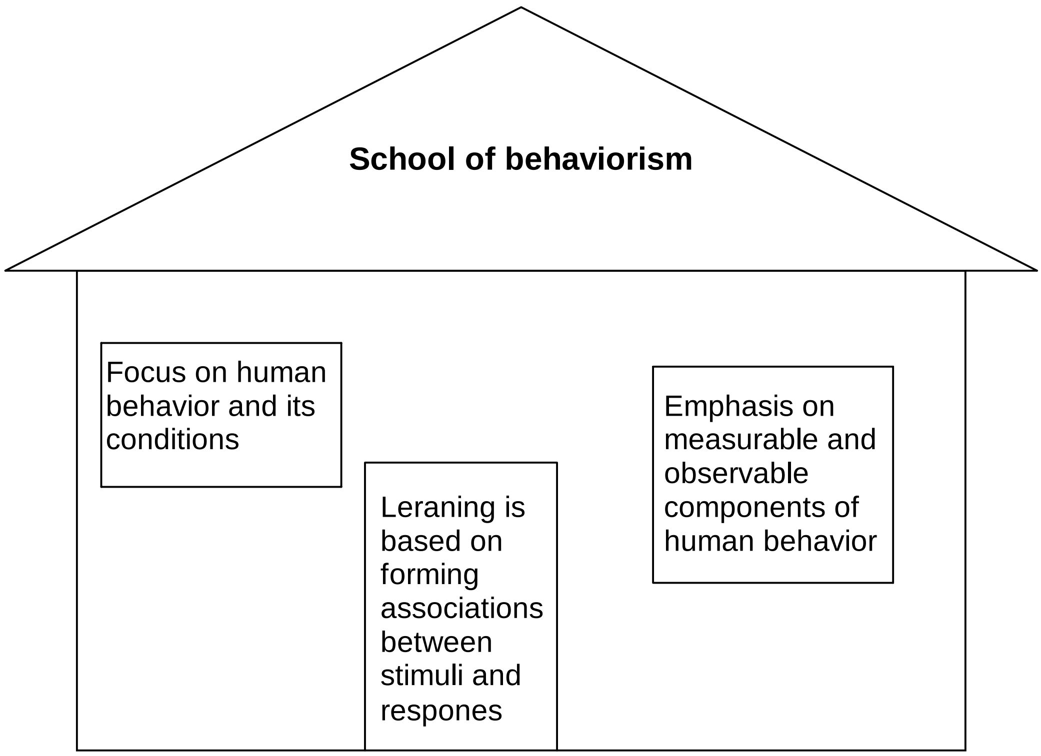
Thorndike conducted an experiment with a cat in a cage: A hungry cat is locked into a cage; the door can be opened by means of a loop. When the cat draws on the loop, it can leave the cage and reach the food lying outside the cage. The first experimental sequences are characterized by random behavior of the cat: it scratches, bites the bars and runs round the cage. It eventually operates the loop by chance. In the following sequences, the time until the problem is solved becomes shorter and shorter, although the entire learning process is conducted very slowly and unsystematically. Only in the course of the final phases of the experiment does the cat operate the loop immediately it is placed in the cage. We call this learning by trial and error.

Animals can only learn in the ways just illustrated. Like animals, human beings are also conditioned: a certain form of behavior can be achieved by praise or punishment, by devoting or withholding attention (reinforcement), and certain skills, e.g. the operation of a stop-watch, can be learned by trial and error. But these simple forms of learning are not sufficient. We only need to think of learning a foreign language. It can easily be appreciated that it would take considerable effort to teach a person a foreign language only by means of reinforcement. Think of learning how to drive a car by trial and error!

The main difference between animals and human beings is their reason, their intellect, which enables them to think and to understand. They can understand what they learn. They can understand why something has to be done the way the trainer or teacher says.

5. *Learning theory*

Let us now have a closer look at some learning theories and what they have to offer with regard to teaching. Within psychology, there are two major schools of thinking: behaviorism and cognitivism. Behaviorism focuses on human behavior and its conditions. Being influenced by the natural sciences, the emphasis is on measurable and observable components of human behavior. Behaviorists look into the specifics. Learning according to them is based on forming associations between stimuli and responses.



Inspired by **Pavlov, Watson** developed a learning theory of classical conditioning: a particular stimulus will lead to a particular response. **Guthrie** took this concept a step further by linking stimulus and response: once this linkage is established – a certain stimulus is followed by a certain response -, it will repeat itself automatically. He also elaborated on three methods to change behavior: the tiring-method, the threshold-method and the incompatible stimuli method.

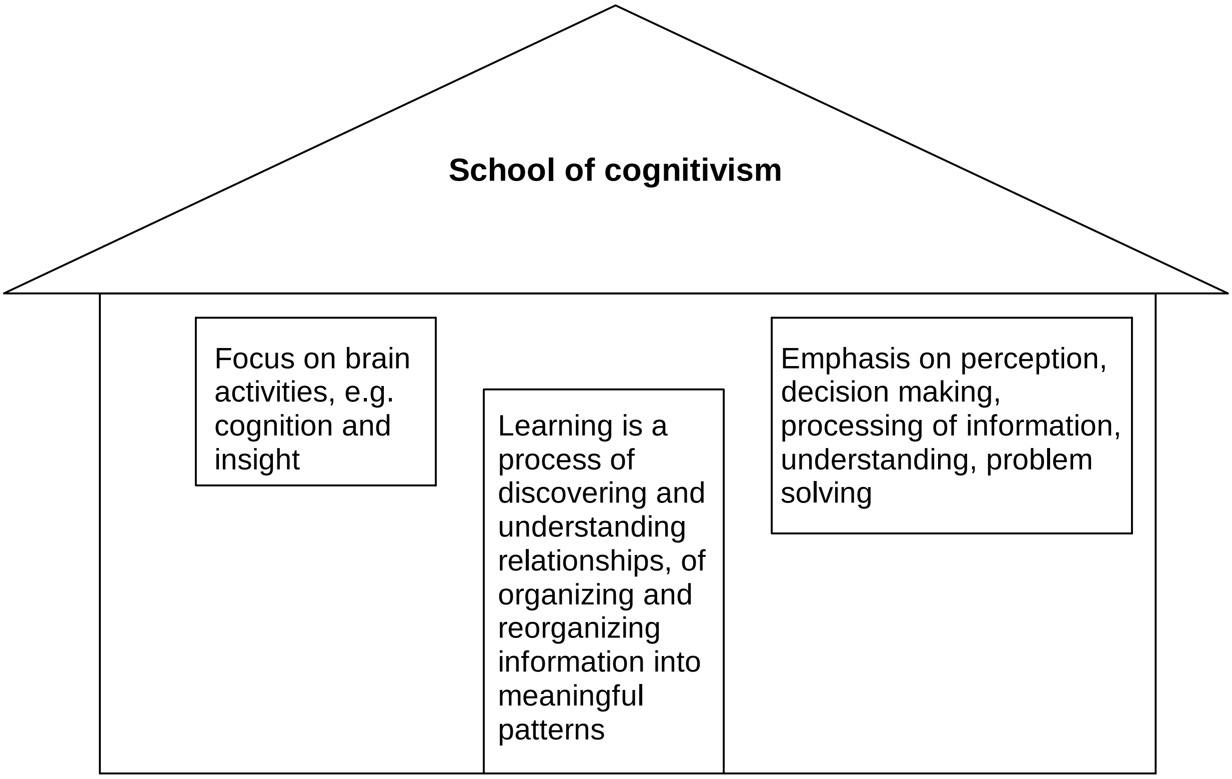
Thorndike introduced the law of effect: a positive condition will be reinforced, a negative condition will fade away. The more often a certain stimulus-response-reaction is practiced, the more it is reinforced. This enhanced the drill-approaches in teaching.

Skinner developed the theory of operant conditioning to explain behavior that occurred without a particular stimulus. To him learning is mainly a consequence of reinforcing responses. His most important discovery was that learning is most successful when it is continually reinforced in the beginning and lasts longest by intermittent repetition.

Hull tried to establish a system which would allow to forecast reactions. Central to his theory is the concept of habit: a hierarchy of habits comprises numerous stimulus-response-connections. These are related to each other by a common goal: behavior is useful by aiming for a goal. Thus habits are reinforced, also by antedating goal responses, e.g. a rat in a maze already licks its mouth when entering the last round before it actually reaches the goal.

Spence took this idea a bit further. To him antedating goal responses can by themselves be sufficient to reinforce behavior. The power of a habit does not rely on reinforcement like Hull said, it is a matter of quantity of stimulus-response-reactions.

Cognitivism focuses on brain activities such as cognition and insight. According to this school learning is a process of discovering and understanding relationships, of organizing and re-organizing information into meaningful patterns. The emphasis is on perception, decision making, processing of information, understanding and problem solving.



Hebb somehow stands between behaviorism and cognitive psychology. He developed a neuro-physiological theory according to which the phenomenon of neural activity in the brain is responsible for learning. This cell activity creates a state of arousal: The optimum functioning of human beings takes place at a medium level of arousal. The organism tries to maintain that level.

Tolman elaborated the theory of goal-oriented behavior. To him all behavior is goal-oriented which means behavior is not so much influenced by stimuli but by cognition. Learning then is not a result of stimulus-response-connections but cognition: to be aware that a certain behavior leads to reward. This knowledge directs behavior.

Gestaltpsychologists, among them Köhler, Koffka and Wertheimer, concentrated on synthesis instead of the classical analysis as established by Freud: they stated that the whole is bigger than the sum of its parts. Their main interest were the laws of perception which they transferred onto the thinking process. According to them human beings don't learn by trial and error but by insight.

Bruner developed a theory of categorizing. The value of what has been learned is measured by the level to which it can go beyond the given information. To him human beings categorize stimulus-events and out of this develop concepts and systems of related categories with broader validity. He recommended discovery oriented learning.

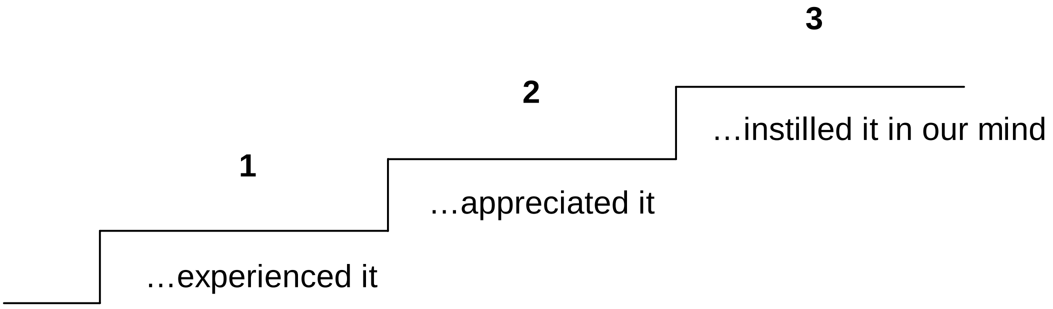
Piaget's focus was on development of the child. He identifies four stages of development and defines intelligence as an interactive process of two human ways of functioning: to rehearse previously learned activities (assimilation) and to modify behavior (accommodation). The optimum equilibrium between the two equals the maximum intelligent behavior.

Though each of these theories emphasizes their differences, they have much more in common than one thinks at first. Historically the search for a learning theory somehow takes for granted that there is just this one theory. But suppose there isn't just one theory to explain human learning; since there are so many ways of learning, there might also be the need for many different theories to explain them. Bandura and others have developed systems which try to integrate various theoretical positions. In day-to-day teaching we should try to take into account that there are many ways of learning. Therefore our teaching methods should reflect this variety by applying different methods, so that as many students as possible can be reached and benefit from our teaching.

6. The three steps of human learning

Learning, as we have defined it, begins with experiencing something: from a friend, on television, in a book, from the teacher, from the trainer. We receive some – new – information. We then reflect on it, because we also want to understand and comprehend it. We try to find out what the information means which we have experienced. This understanding and appreciating of information ultimately distinguishes human learning from learning of animals. However, it is quite obvious that we also have to remember what we learned. Without memory, we would not be able to learn anything, that is, to instill something in our mind.

Therefore, we have not learned something until we have…



In professional education and training a pupil or a trainee experiences something new in class or in instruction – from the teacher and the trainer, from a book, by way of teaching aids etc. Explanations by the teacher, questions by learners, joint discussions, reflection etc. help the pupil gain his/her own insights or understanding. S/he appreciates and understands why something is as it is. In this way two important steps towards the success of learning are mostly made in class: the students experience something and they understand and appreciate it.

But unfortunately, what has been experienced and understood, has not yet been remembered and instilled. This is also true in class and in instruction. Here, too, only remembering makes learning complete and successful. Generally, more time passes than is available in class or in instruction until one has instilled something in the mind.

To achieve the latter, it is important to know what enhances memorizing information. As for understanding, it has above all something to do with logic, with consideration, with reflection, with inquiry, with explanation. We need someone to answer our questions and to explain the material to us. Remembering and instilling has above all something to do with repetition. We mostly remember only what we repeat to ourselves again and again.

To understand this better, let us look at a model of the human memory that can help us to explain its functioning and therefore understand better how human beings learn.

7. The three components of the memory

We should be aware that at present we are still unable to completely understand how our brain and particularly our memory functions. Therefore we are only looking at a model, which does not represent any physical structures: they are only abstracts or a concept that helps us to understand the human memory.

Accordingly, the human memory consists of three parts: the sensory, short-term and long-term memory.

The sensory memory is very limited in terms of quantity of information which it can make accessible to us and also in terms of duration: It is a phenomenon that only lasts for parts of a second. That means a very limited number of stimuli are accessible – can be remembered or noted – within a very short period of time, even though we have not paid them any attention.

For example, during a cocktail-party we can talk with someone without noting what is being said around us but as soon as our name is being mentioned, we suddenly listen. Or, we walk in the street and a good friend of us passes by. We continue to walk and only two seconds later we stop and turn around because we have recognized our friend: the sensory memory then is like an echo – therefore sometimes the sensory memory is also referred to as the echoic memory.

Nevertheless, these perceptions can lead to vital response. We only have to think of driving a car: a car horn, a pedestrian in the center of the road, a red light. Here, perceptions often trigger off essential reactions, although they only stay in the memory for parts of a second, and then are forgotten.

The short-term memory is a phenomenon that only lasts for about 20 seconds if the information is not repeated. It can store about 7 items plus or minus 2. It allows us, for example, to look up a number in the telephone directory and dial up this number without looking at it again. It allows us to forget this number immediately after we have dialed it. However, should the line be busy and we have to dial it again, we usually will have to look it up a second time.

The short-term memory is an active, ongoing process. It stores information only for a very short time – as long as it is repeated. Afterwards it deletes this information. Basically it can be said that it comprises everything that is within our attention or awareness at a given moment. As such, it can also be called the actual consciousness.

Each day we are exposed to thousands and thousands of sensual impressions through the eye, the ear or the skin. All of these impressions first enter the sensory memory where they leave a sensory mark. At the next stage they enter our short-term memory where they are associated with words and names.

If we are not attentive, these perceptions pass by like noises in the street or like the sound of a foreign language. They are regarded by the short-term memory as uninteresting for storage. Thus, the short-term-memory has the function of a filter or "door-keeper": it decides what to let pass and store and what to dismiss and delete. This is an extremely important function, because it protects us against over-loading with information.

The long-term memory comprises everything else. It consists of encoded, consolidated information out of the short-term memory which then is equated with concepts and meaning. Not only does it store information over a much longer period of time than the short-term memory, it also is much more passive as opposed to the active ongoing process of the short-term memory. It is also much less susceptible to interference and its capacity is much higher. While it is easy to call upon information in the short-term memory, it can take much longer to retrieve information from the long-term memory.

Previous models thought of it as a continuous recording of all our experiences, not unlike a video tape. Recent research has developed different models: they are all of an associative nature. Basically this means that all information is linked with each other and forms knots like in a big web. For example, when we search for a certain item in our memory, we don't just simply produce a long chain of answers and see whether they fit the question or not, we try to limit the area in which the information can be found by linking it with other information.

The three components of the memory – a model

Type of memory

Sensory memory → **short –term memory** → **long-term memory**

Iconic or echoic | primary: kept up through repetition | secondary: encoded out of short-term memory

Content of memory

Input: sensual impressions → words or names kept up through repetition → encoded consolidated → concepts meaning

8. *The sequence of learning*

Looking at the model of the memory, learning has to take into account the three different components. And since the learning process presupposes a time sequence, it follows that learners must go through the 4 phases of learning: the preparation phase, the acquisition phase, the storage phase and the memory phase. To understand the four phases better, let us look at an example: we try to learn the English word " façade".

façade

The preparation phase: concentrating & perceiving

Here we concentrate on our task. We see the word and the explanation. This perception is absorbed in the sensory memory. It is stored there only for a very short time – just as long as to leave a sensory impression.

↓ Sensory memory

Acquisition phase: naming & understanding

Here we become aware of the words as such. We learn that the word façade corresponds to the front side of a building – that is, we understand its meaning. All this takes place in the short-term-memory. There it stays as long as we pay attention to it.

↓ Short-term memory

Storage phase: repeating & encoding

It may happen that we have really understood the meaning of the word façade but when we are asked after a few minutes, we can no longer remember it. In order to remember the meaning and to apply it later, we repeat the word and its meaning several times and encode it. This then will migrate into the long-term memory where it is kept for a very long time.

Memory phase: abstracting & linking

What has been learned, is admittedly absorbed into the long-term memory. But although we know the meaning of the word façade, it may be that we cannot remember it a few days later: The stored information cannot be recalled under every condition or at any time. To retrieve and remember stored information, we have to get abstracts of its meaning and link it with other existing information.

↓ Long-term memory

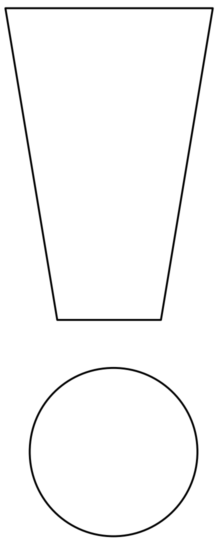
9. *How to prepare information for storing*

As already outlined, we have to prepare information for storage so that we can retrieve and remember it later. Let us again stay with our example: we want to learn the meaning of the word “façade”. After we have heard the explanation of the word we spontaneously think of the word “face”. We associate the word “façade” with “the face of a building”. Such linking of words is called association. When learning the meaning of the word “façade”, the word “face” is the mediator.

That way we have made use of what we learned at an earlier stage: the meaning of the word “face”. If we had not had such a mediator, we perhaps would not have learned the word “façade” that quickly.

The greater the number of connecting links, the easier and quicker the learning process. These connecting links may be words (“face”) or images (a building can have a face). The material to be learned (“façade = front view of a building”) is encoded by the connecting links. This also reflects the model of the long-term memory: all stored information is linked among itself like in a big web. In the same way encoding and abstracting are important performances in learning. The better the learning material is structured, the better we learn.

Preparing information for storage means:



Be conscious of meaning.

Learn sensible material

Structure learning material.

Make abstracts from meaning.

Link unknown to known information.

Make use of mediators, particularly visuals.

10. How to remember information

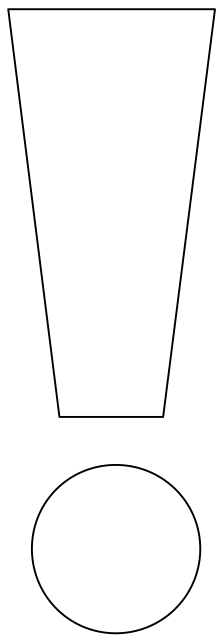
"I worked through everything and understood everything – and now I have forgotten all!" This is the lament of many students before an examination. S/he has assimilated the material, comprehended it, but is unable to remember it.

Remembering depends on:

- the nature of the material to be learned
- the preparation of the material to be learned
- how often the material has been repeated

The nature of the learning material will have an impact on the learning strategy – learning a language is different from learning how to drive. Next we must prepare the material to be learned – we must organize and portion it. But remembering has above all something to do with repetition. For information to migrate from short-term to long-term memory, it needs to be repeated several times. In the same way, the more often information is repeated, the better it is remembered. As for repetition to be effective, it should take place in intervals: short breaks at the beginning, longer breaks later. Mnemonics can also be very helpful. However, the best review is application of what we have learned: Practice should be conducted in different settings, e.g. learning from a textbook, reviewing in a group together with other learners.

Remembering information means:



Organize material.

Portion material.

Repeat material.

Learn in intervals (short breaks at the beginning,

longer breaks later).

Make use of memory techniques.

Review material.

Application is the best review.

The retention span of learning material also is related to the way we acquire information: the more senses are involved in the learning process, the higher the learning results. Teaching therefore should try to make use of teaching methods that incorporate as many senses as possible.

Acquiring and remembering information

10%	by reading
20%	by hearing
30%	by seeing
40%	by seeing and hearing
60%	by talking about it
80%	by exploring and phrasing on your own
90%	by exploring and overcoming difficulties on your own

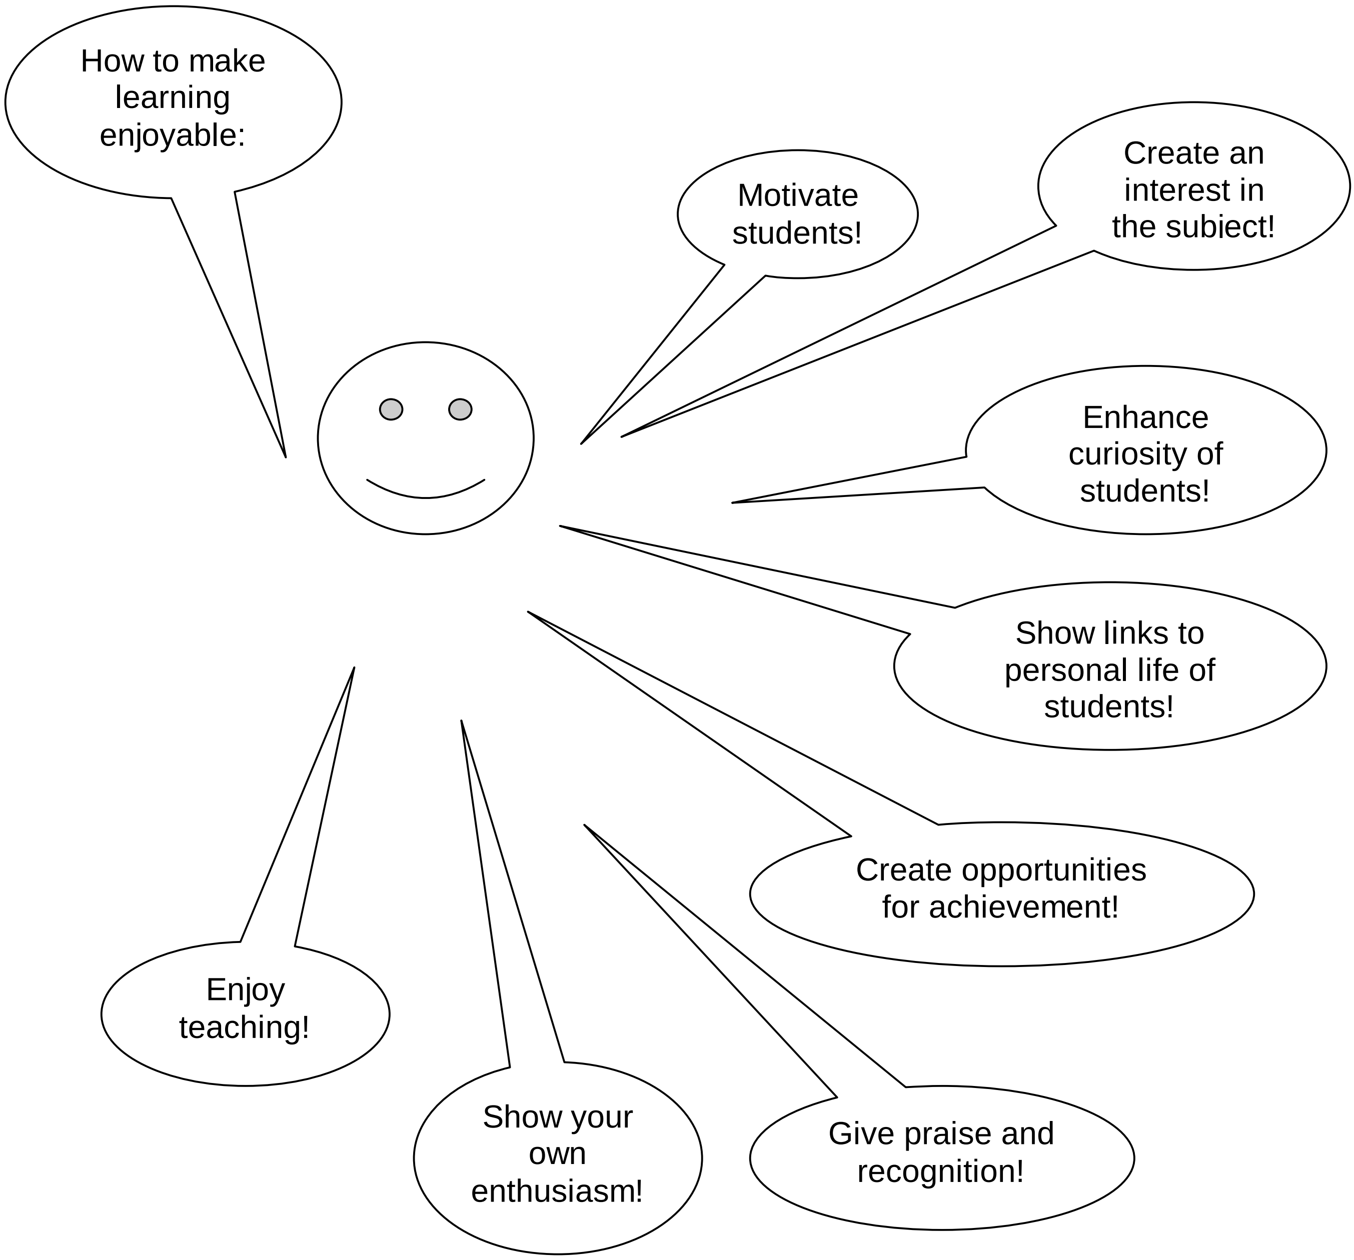
11. How learning is enjoyable

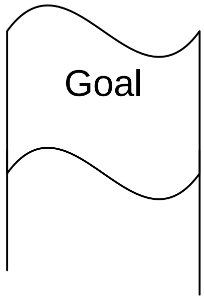
As we have seen, learning is a very complex process: often, it means work, even hard work. However, we know from our own experience that we learn much easier when we are interested in a subject – we even enjoy it! Enjoying to learn is thus associated with readiness to learn, with motivation for learning: it is associated with the why and wherefore of learning.

Wherever interest in a subject is present, occupation with the corresponding material to be learned is felt to be exciting, and pursued again and again. As teachers we should therefore aim to create an interest in the subject and try to motivate our students to explore the material to be learned. Of course, curious people enjoy learning more. Learning is also enjoyable if we can link it to our own problems in life, to our own experiences or to what has been learned earlier.

Learning is also enjoyable if an incentive is created by the new task, since human beings have a need for reward and recognition by other people (extrinsic motivation – coming from without). Admittedly, the level of difficulty may not be so great that the solution is thought to be unachievable. The more frequently the learner has an achievement, that is,

realizing that s/he can solve more and more difficult tasks, the more s/he will like the material and enjoy learning (intrinsic motivation – coming from within).
As teachers we should aim to make learning as enjoyable as possible. The best way to achieve this is to make use of our knowledge about how human beings learn and to apply this knowledge to our lessons. But foremost, we have to enjoy what we are doing ourselves: enjoy the teaching and what we are teaching. Because if we don't enjoy it how can we expect our students to enjoy learning it?





Unit 3 Learning Objectives

1. The importance of learning objectives

In the previous chapter, we had a closer look at general aspects of human learning. We also defined learning as a change of behavior due to experiences. To assess whether someone has learned something or not, therefore requires a clear statement about what is being learned (content) and how it is being demonstrated or performed (behavior) by the end of the learning process.

The precise formulation of learning objectives, with an integrated description of behavior and the contents of learning, is crucial for the learning process. If you name operationalized objectives,

- say what the pupil has to know after the lesson or how s/he has to handle, do or use something
- name the resources at her/his disposal (by using a dictionary, a tool)
- say how s/he has to do it (in which time, with what precision)

This reduces misunderstanding concerning training measures and thus helps both parties involved – the teacher and the student.

Occasionally, goals are expected to be written exclusively in the form of operationalizable objectives. This has admittedly eliminated imprecise formulations of objectives. However, the setting of operationalizable objectives often makes excessive demands on the teachers and is questionable in the case of learning achievements of higher quality resulting from longer term learning process. Complex learning objectives are very difficult to operationalize.

2. Implications for objectives

1. It is sensible – both for pupils and for teachers – to specify as far as possible the objectives of instruction and learning.

2. Objectives for a certain learner group need not be identical for all learners. They can and sometimes must be different for subgroups or individual learners according to their different preconditions of learning. Such objectives may be different with regard to the amount of subject matter covered and/or the level of achievement.

3. It is advisable to ask whether a minimum level (basis) of objectives is to be set for all learners. In that case you have to find out objectives suitable for the poorest pupils.

4. We should inform the pupils about the instructional objectives in advance. We should tell them criteria, which enable the pupil on his/her own to assess or control whether s/he has mastered the instructional objectives.

5. Specifying instructional objectives cannot and must not mean that the teacher tries to reach them in a totally inflexible way, without deviating from his pre-planned lesson structure. Teaching and learning is a process that must leave room for changes during the lesson and for alternative objectives. But we can only know that we deviate from a certain instructional objective or lesson plan, if we first have it defined precisely.

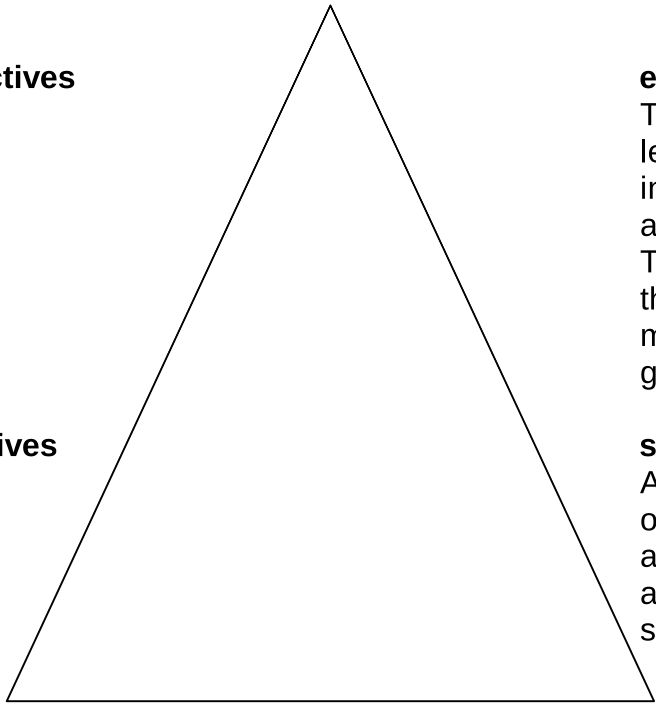
6. Only if you define your objectives precisely in advance is it possible to assess and evaluate the achievements of your students adequately to prior fixed norms. If not, you run the risk of judging out of the moment, which might not be fair to your students' performances, resulting in either over- or underrating them.

Learning objectives should be…

S	specific	stated in action verbs	S
M	measurable	indicating minimum level of concept response	M
A	attainable	according to trainee potential and field of experience	A
R	realistic	resource- and reality-based	R
T	time bound	be in coherence with the training timetable	T

3. *Taxonomy of objectives*

Objectives can be classified in various ways: one way is by their degree of abstraction. So we will normally find three levels: general, rough and individual (detailed) objectives. These then give rise to the pyramid of objectives, which starts from a few abstract objectives at the top, which are then broken down into various concrete and precisely operationalized specific objectives at the bottom.



General objectives

educational policy
They constitute the highest level of abstraction and clarify intentions in educational policy and basic education goals. They are normally set out in the educational platforms of ministries or socially influential groups.

Rough objectives

subject/training course
At the middle rough objectives outline the knowledge and abilities, which are to be achieved by means of the subject or training course.

Specific or detailed objectives

actual teaching
Using them, individual or detailed objectives can be formulated for the concrete level of teaching.

Another way to classify objectives is by their degree of difficulty and by their areas: as already outlined in Unit 2, we can distinguish between cognitive, affective and psychomotor learning domains.

The psychomotor domain (hand):
Here the objectives can be ordered according to the degree to which operations have become automatic.

Level	General Instructional Objectives	Action Verbs
Perception	Recognizing a given set of actions. Watching a series of motions.	attend to, listen, look at, notice, observe, view, watch
Set-up	Positioning self for action. Recognizing given procedures as preliminary to action.	adjust, arrange, order, position, prepare, select
Guided response	Imitating and repeating performance of skilled instructor. Assuming roles or situations. Acting out pre-planned actions. Demonstrating procedures and methods.	act, demonstrate, display, exhibit, illustrate, perform, role-play, show, repeat demonstrated skill (drill, fry, paint, sew, type etc.)
Internalized response	Performing skill/task up to or exceeding established standards.	Perfecting demonstrated skill (drill, fry, paint, sew, type etc.)
Complex response	Applying internalized skill to new situations and under any given circumstances. Combining internalized skills to perform complex operations.	Integrate skill into complex actions and problem solving

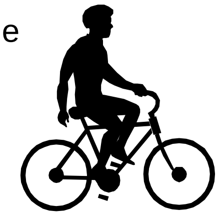
The cognitive domain (head):
In the cognitive domain the hierarchy of objectives follows the principle of increasing complexity. It is assumed that higher objective levels cannot be reached until those beneath them have been dealt with.

Level	General Instructional Objectives	Action Verbs
Knowledge	Knowledge of common terms, specific facts, methods and procedures, basic concepts, principles.	arrange, define, duplicate, label, list, memorize, name, order, recall, recognize, relate, repeat, reproduce
Comprehension	Understanding of facts, principles, verbal material, charts, graphs etc. Interpreting, translating, summarizing given information.	classify, describe, discuss, explain, express, identify, indicate, locate, recognize, restate, review, select, tell, translate
Application	Applying concepts and principles in practical situations and in different context. Demonstrating correct usage of a method or procedure.	apply, choose, demonstrate, dramatize, employ, illustrate, interpret, operate, perform, practice, schedule, sketch, solve, use
Analysis	Recognizing assumptions and logical fallacies in reasoning. Separating whole into parts, until relationship among elements is clear. Evaluating the relevance of data. Analyzing structures.	analyze, appraise, calculate, categorize, compare, contrast, criticize, diagram, examine, experiment, discriminate, distinguish, inventory, question, test
Synthesis	Writing a well-organized theme, giving a well-organized speech by combining elements to form a new entity from original one. Proposing a plan for an experiment. Integrating different areas of learning into a plan for solving a problem.	arrange, assemble, collect, compose, construct, create, design, formulate, manage, organize, plan, prepare, propose, set up, write
Evaluation	Judging the logical consistency of written material, the adequacy with which conclusions are supported by data, the value of a work by use of external standards of excellence.	appraise, argue, assess, attack, choose, compare, defend, estimate, judge, predict, rate, score, select, support, value

The affective domain (heart):
Here one can produce a hierarchy of objectives according to the degree to which values and attitudes have been brought into the student's consciousness and to what degree they have been internalized and become automatic.

Level	General Instructional Objectives	Action Verbs
Receiving	Listening attentively. Showing awareness of the importance of learning. Paying close attention to the classroom activities.	ask, follow, listen, reply, watch
Responding	Performing according to received input (lecture, demonstration etc.)	answer, comply, conform, execute, follow observe, perform, practice, present, show
Valuing	Developing and demonstrating a preference according to outlined values and standards.	complete, describe, differentiate, explain, form, initiate, invite, join, justify, propose, select, share
Transferring	Appreciating values and high standards in other areas.	adhere, alter, arrange, combine, compare, defend, generalize, identify, integrate, modify, relate, synthesize
Creating	Displaying general awareness with regard to values and standards. Creating standards in which proper conditions prevail. Total behavior is consistent with values internalized.	act, discriminate, display, influence, practice, propose, qualify, question, revise, solve, use, verify

Let us take the process of learning of riding a bicycle as an example for the taxonomy of learning objectives in the different domains.



Hierarchy of cognitive learning objectives:

Knowledge	The pupil can name the elements of a bike: frame, fork, handlebars, saddle, wheel, pedal, chain, bell…
Comprehension	The pupil can describe how the movement of the legs causes rotation of the pedals and the front chain wheel. S/he also can describe that the chain as a link between the front chain wheel and the back wheel will advance the bike.
Application	The pupil can describe how a drum brake works by comparing their elements with those of a rim brake.
Analysis	The pupil can calculate the transmission and the speed of a bike, when different chain gears are used.
Synthesis	The pupil can make a plan how to assemble and how to adjust the ball-bearing of the front wheel.
Evaluation	The pupil can decide between two bikes which one is the best: quality of fabrication of the frame, handling, equipment, transmission.

Hierarchy of affective learning objectives:

Receiving	The pupil is listening to the teacher while s/he is telling the advantages of a cleaned bike and an oiled chain.
Responding	The pupil cleans his/her bike and puts oil on the chain, because his/her teacher has recommended it.
Valuing	The pupil prefers to use a bike which is in a proper condition and which has an oiled chain.
Transferring	The pupil likes always to use equipment which is in proper condition.
Creating	The pupil creates standards where proper conditions are integrated.

Hierarchy of psychomotor learning objectives:

Perception	The pupil observes a person who is using a bike.
Set-up	The pupil recognizes the position of pedals and own posture in relationship to the bike.
Guided response	The pupil can ride a bike a certain distance without falling. The pupil on the bike can follow a line drawn on the floor and can pass some obstacles.
Internalized response	The pupil tries other possibilities to ride a bike: Without use of the hands. Taking with him/her another person on the carrier.
Complex response	The pupil can use the bike in any circumstances.

Unit 4 Teaching Methods

1. Definition

According to the dictionary a method means the

Method	=	a way or manner of doing something
	=	the use of an orderly system as opposed to luck

In the context of teaching a method means

Teaching method	=	the way a teacher uses to impart knowledge to students
	=	the way of developing skills and capabilities
	=	the way of facilitating exchange of experiences

We know that we can teach the same knowledge in different ways and that different teachers prefer different methods. However, different objectives demand different structures and methods as do different target groups. Regarding all these facts we can emphasize that we need a variety of different methods to conduct a successful lesson or training.

2. The right choice

To chose the right methods we have to consider a number of aspects: First of all, does this method lead us to our learning goal? This may very much depend on the domain of learning – affective, cognitive or, psychomotor. Next we have to check whether the method is compatible with the subject, e.g. language training is different from math teaching. Another consideration is the target group: how can the participants best be reached? Age is an important fact here to be considered. Of course, participants also have to be comfortable with a method; the same holds for the teacher who has to be able to handle it. Last, not least, we have to assess whether a method can be realized in a given context or not.

?

1. Does this method lead us to our learning goal?
2. Does this method fit to our subject?
3. Does this method address the target group?
4. Are all participants - teacher as well as students - able to handle the method?
5. Is it possible to realize this method?

3. *The most common methods*

The most common methods are now looked at with reagrd to their respective advantages and disadvantages.

The Lecture

Advantages: Easy to plan; teacher pre-determines concept and flow of thought; very effective to impart knowledge.

Disadvantages: Tiring; demands intellectual activity only.

Teacher-Student-Conversation

Advantages: Intellectual activity can be better controlled and managed; freedom to speak is encouraged and is possible; more learner-centered.

Disadvantages: Only intellectual activity; not action intensive.

Discussion/Debate

Advantages: Intense intellectual activity; student can weigh her/his opinion vis-à-vis the group's opinion; creates points of view; develops tolerance.

Disadvantages: Only intellectual activity; result cannot be pre-planned.

Role-play, Planning-Game, Case-Method

Advantages: Exercise to develop complex strategies and persuasive power; exercises presentation skills; satisfies play instinct.

Disadvantages: Only simulating reality; taking much time.

Groupwork

Advantages: Very intensive; including all participants in the process of developing ideas; reduces of inhibitions; generates more solutions at a faster rate.

Disadvantages: Inspite of good preparation time frame difficult to plan and predict.

Fieldtrip/ Interview

Advantages: Close to reality; high independence; recognizes the real capability of students.

Disadvantages: Taking much time; process and result can be planned only partially.

Documentation/ Presentation/ Publication

Advantages: Highly effective for instilling in the students' mind; very good method for self-assessment; exercises presentation skills; good opportunities for generalizing.

Disadvantages: Organizing public participation demands more work; time intensive.

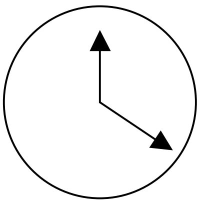
Project/Practicum

Advantages: Very close to the interests of the students; close to reality: creative; high social education components; action intensive.

Disadvantages**:** Much preparation and time required; open ended – unpredictable results.

4. Didactical arrangements

During the preparation we have to take into account the flow of the different methods. The student will get tired and bored if parts of the learning session get too long; s/he will stop listening and start to be restless. When there are parts which are too short, the student will get nervous and loud; s/he will feel that too much is demanded of him/her. These facts also relate to the theory that human beings try to maintain a medium level of arousal. Therefore lectures, presentations and all other activities where the teacher is in the center should not be longer than 20 minutes. As for activities during which the students are in the centre, these should not be shorter than 20 minutes.

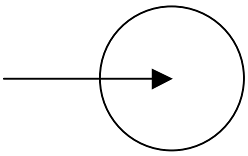


20 – minute – rule

teacher-centered:
each part not longer than 20 min e.g. lecture, presentation

students-centered:
each part not shorter than 20 min e.g. group or partner work

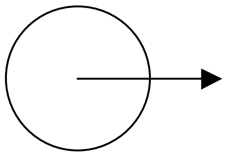
Of course, these activities should alternate – receiving activities (= the students are passive) should alternate with giving activities (= the students are active): breathe in and breathe out! Naturally, that also relates to the retention span of information: the more we are actively involved in acquiring information, the more of it we will remember.



alternation – rule

receiving activities - giving activities

breathe in - breathe out



Unit 5 The Lesson

1. General considerations

The basic concept of the „old-school" is often referred to as the funnel model: the teacher imparts knowledge and facts via a funnel to the students who are considered to be empty containers which can simply be filled with knowledge. This model, however, does not comply with modern research results and human learning theory as we have already seen in unit 2; on the contrary, this approach to teaching is quite counterproductive with regard to learning results.

In modern schools we therefore expect interactive lessons where the students play an active role. As we already know learning is much more effective when the students take part, can be creative, are motivated and enjoy learning. The question for pedagogy is: How can we achieve this?

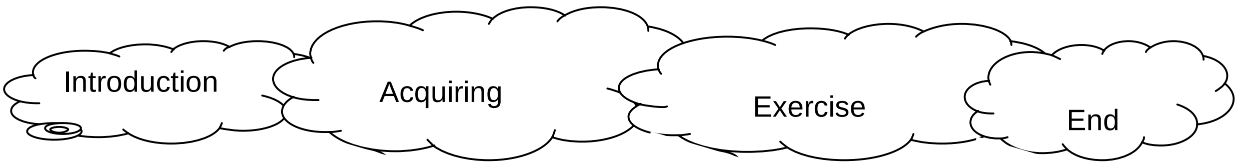
There is not one simple single recipe, but there are some basic rules and experiences. For example, we know that human beings learn almost all their social behavior by imitating other human beings. It is no surprise then that one of the most important rules states: "Learning by doing", as espoused by the American scientist of education John Dewey. As we also know already, human beings learn best, when they have to use most of their senses. There are a lot of methods of interactive/learner-centered lessons. "Copy – Use" exercises are one of the most famous.

Not so frequently used are conversation, discussion, debate, role-play, excursions, interview, documentation, presentation, publication, projects and practicum. Even if we cannot always include methods demanding intense activity, it is important to include activities which improve the lessons concerning creativity, variety and high learning results.

The creative use of these rules - despite the very different conditions of schools and classes - is the real interesting and exciting task of a teacher or trainer.

2. Basic structure of lessons

Taking into account the 20-minute-rule when choosing the right teaching method, the basic structure of lessons consists of four phases, namely: the introduction phase, the acquiring phase (mostly teacher-centered), the exercise phase (mostly students-centered) and the end. Assuming a time span of 60 minutes per lesson, it is divided into a 5 – 25 – 25 – 5 minute rhythm.



5 minutes 25 minutes 25 minutes 5 minutes

Introduction

A good introduction is as important as all other parts of a lesson. The first impression of the “audience” is formed here at the start. During the introduction most of the students or participants decide whether the subject is interesting for them or not. But that does not only depend on the subject, but also on how it is presented. Therefore a good start is the most important precondition for a good “race”. There are a lot of different ways to start a good lesson; here are some basic features:

Orientation and Motivation:

- Calm down the students
- Create an atmosphere
- Inform about objectives and sequence
- Try to get the interest

Connect to well known subjects:

- Control the homework
- Repeat exercises
- Tell stories out of the surrounding of the subject
- Tell something about a famous person

Catch the attention:

- Include actual or historical linkages
- Use riddles, comics, amazement
- Use cognitive dissonance
- Create contradiction
- Use provocation
- De-familiarize

Acquiring

This is the part where the “knowledge-transfer” takes place, the working out of a subject. Here, very often the teacher is the center of the lesson unless s/he chooses a learner-centered teaching method (discovery approach).

- Impart facts, a theory or show an example
- Show an experiment
- Guide the student to a new insight
- Prompt them to detailed examination
- Let the students examine an object
- Or…..
- Or …..
- Look to “Teaching Methods” and “The Lecture” (Unit 4 and 9)

Exercise/ Apply

During this phase the students should be in the center of activities. Thus, they should explore the presented learning material, apply it etc. in order to find out whether they have really understood what has been presented to them.

- Use exercises with simple tasks
- Let the students try their own experiments
- Discuss in small groups about applying to similar tasks,
- Start to solve more complex problems
- Or or or

End

Here it is important "to tie up all loose ends" – to summarize what has been learned and link the activities of this lesson with further topics and tasks.

- Saving of knowledge
- Consolidation
- Teacher or students repeat/summarize/generalize
- Teacher gives prospect for coming lesson
- Homework or test for consolidation and check
- Teacher checks, assesses, evaluates
- Eventual self-assessment of activity and results
- Assessment from other students

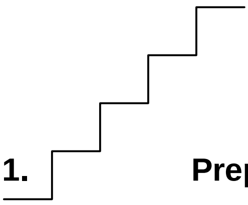
Unit 6 The Four Step Method

1. Introduction

The "Four Step Method" is a simple but very successful method for skills training. The four steps refer to the way human beings learn. The set up is similar to the structure of a lesson: We have to prepare the students, to motivate them, to open their mind (step 1). The acquiring phase here is done by demonstration (step 2). The student’s activity is the applying of the newly learned skill, but still within a learning atmosphere (step 3). The exercising and strengthening take part in the real work situation, but still have to be monitored and evaluated by the trainer (step 4).

For the teacher or trainer this method requires very good explanation skills since each step of what s/he is doing has to be explained. As a skilled person one may take a lot of things for granted. However, the success of the four step method lies, among other things, in the ability of the teacher/trainer to explain exactly what s/he is doing. And remember: quality training is very time consuming!

2. The 4 steps of the Four step method



1. **Preparation of student**

- take away the shyness
- motivate
- show the objectives and tasks
- evaluate the knowledge
- familiarize with the work place
- give advice concerning safety

2. **Demonstration and explanation**

- position the student so that s/he is standing in the same direction to the work piece as you are
- demonstrate the whole procedure in original time
- in case of complicate procedures divide them into modules and teach them step by step
- repeat the demonstration and make the single steps visible
- say what you are doing, how and why you are doing it in that way (what? how? why?)
- give the opportunity to ask questions

3. **Student activity**

- encourage the student to try it on his/her own
- don’t interrupt the student in his/her first attempts unless it concerns matters of safety
- make comments on serious mistakes only
- precision is more important than speed
- let the student say what s/he is doing, how and why

4. **Exercising and strengthening**

- give enough time to exercise
- acknowledge progress
- control so that no mistakes are done during exercising
- change conditions of exercising
- slow adaptation to real working condition

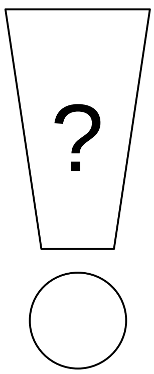
Unit 7 Questions in Lessons

1. The exceptional quality of a teacher's question

We remember most of the acquired information when we explore it on our own, phrase it in our own words and overcome difficulties by doing so. Therefore discussions and debates play a vital role in teaching. The active participation of the learner can also help to prevent misunderstandings. At the same time the participants don‘t get tired because they are involved. A very common method to enhance this kind of involvement of students is the teacher-student-conversation. Within this context questions are crucial for success.

As teachers we don‘t ask because we do not know something, but because we want the students to learn something what they didn‘t know before. We want to provoke the students to think about a special item. By asking her/his questions, the teacher attempts to bring the student into a productive embarrassment and to start a learning process.

Teacher's questions are the most important medium to lead a conversation and the most important instrument for…



- Guiding the attention of students
- Arousing the curiosity of students
- Arousing appreciation of problems
- Initiating thinking
- Saving of results
- Evaluating students
- Disciplining students

2. Different kinds of questions

As already stated, questions can concern various areas. It will depend on the situation and on the purpose which question a teacher is going to ask. Here are a number of different types of questions:

Questions concerning **knowledge**	*Ex.:*	Who was…? What is the name of….?
Questions concerning the **process**	*Ex*.:	Are you ready now? Does everybody have a copy?
Questions concerning the **relationship**	*Ex*.:	What's the matter with you today? Why are you so tired today?
Questions concerning the **content**	*Ex*.:	What is this article all about? What is the summary of the first paragraph?
Questions concerning **comprehension**	*Ex*.:	Can you tell in your own words….? Can you explain….?
Questions which initiate **thinking**	*Ex*:	How can we solve this problem? What are reasons for this problem?

Open questions — Allow for several and different answers; arouse further thinking and questioning

mostly allow for just one fixed answer — **Closed questions**

It depends on the situation which kind of question we will ask. But there are several forms to avoid:

Chain questions: The teacher asks several questions one after the other without leaving enough time to answer

Leading question: The teacher includes the answer in the question. So it is hard to have a different opinion for the student.

Echo questions: Some teachers repeat the answer of the students by changing them to questions.

Trick questions: The teacher tries to show up the student.

Rhetorical questions: Rhethorical questions are a style of speech. They are not meant to be answered and should be avoided in teaching.

3. Grade of difficulty

To be effective and initiate productive answers of the students a question has to be neither too easy nor too difficult (demanding too much/demanding too little). Here are some samples for demanding too much:

In a **factual** way: The teacher takes knowledge for granted which the students don‘t have yet.

In a **linguistic** way: The teacher uses words, which are not known, or a style, which isn't appropriate.

In an **intellectual** way: The teacher takes a way of thinking for granted for which the students are neither mature nor trained enough for.

Students from whom too much is demanded usually give wrong answers or keep idle and/or silent. The teacher immediately has to try to change the question to give the student a chance to respond with a correct answer. On the other hand, demanding too little often results from the fear of the teacher that the students may no longer be interested in the topic if they give a wrong answer. These students feel bored and get restless.

4. Quality of questions

Getting a feeling for good and bad questions is an important task for a teacher to lead discussions and to initiate a learning process. This also helps to teach students how to ask in the right way. Here are some effects and characteristics of:

Bad questions…

☹ are leading questions.

☹ demand yes/no answers.

☹ serve the self-portrayal of the teacher.

☹ try to emphasize the lack of knowledge of others.

Good questions…

☺ make the class curious.

☺ are answered lightly and fast.

☺ show what is happening in the group.

☺ touch common interest.

☺ include the students' personality.

☺ do not close an issue.

☺ show the targets.

☺ make wishes visible.

☺ may lead to a new question.

5. Technique of questioning

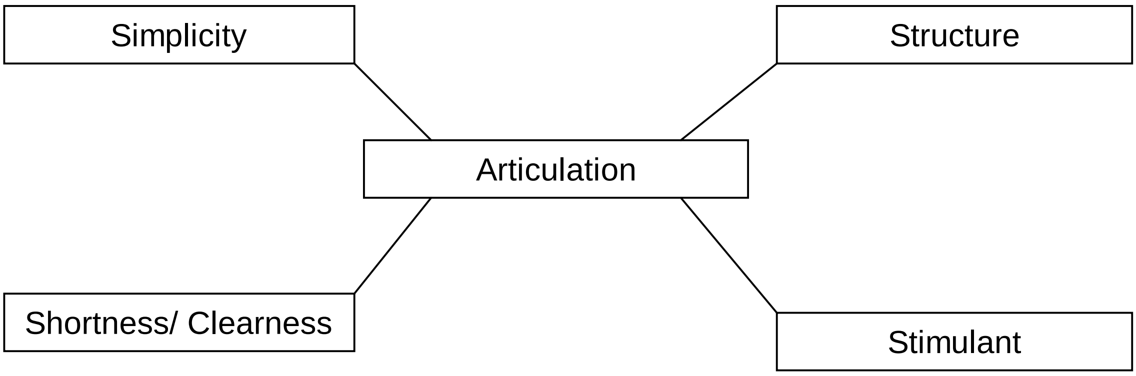
It is very important to ask the right question. Therefore it is necessary to know what question has what effect:

Question formulation	**Effect**
Starting with an interrogative Why What Who When Where HoW	Make a problem evident
Only one question per sentence	Focus on one problem; not demanding too much nor too little
Short, precise questions	Understand the problem easily
Give the question to the whole group	All students are included, start to think
Give enough time	Thinking without time pressure Chance to give reasons for the answer
Formulate open questions	Initiate thinking Opinion forming

Unit 8 The Lecture

1. Comprehensibility of lectures

The most important criterion for effectiveness of lectures is comprehensibility. To make a lecture comprehensible, five major features should be considered which are also related to one another:



Simplicity:

- Speak in simple terms
- Avoid complicated formulation or foreign words
- Give explanations of specific terms
- Use simple constructed sentences

Shortness/Clearness:

- Use short sentences
- Be exact in what you say
- Concentrated on the objective
- Be precise in your statement
- Give only important and necessary explanations
- Maximize your time

Deutscher Entwicklungsdienst

Structure:

The visible structure:

- What is the topic?
- Reasons for the topic
- Following the structure
- Summarizing

The order of ideas must follow a logical flow:

- Sequence information in a logical way
- Create relationship between different items
- Avoid jumping from one idea to another
- Distinguish between important and unimportant items
- The red thread must be visible

Stimulant:

- Support your statements by stories
- Use a pictorial language, give examples
- Visualize your statements
- Present data and facts by comparison
- Give your own opinion
- Be creative in formulation
- Show that you are interested yourself
- Create an atmosphere
- Include the opinion of a student, if possible
- React to the audience

Articulation:

This is the connector between the other four features. You need a clear and precise articulation to bring your message across. The success of a lecture depends – apart from the content - on the positive body signals the lecturer is showing. Those body signals stand for competence and credibility. There are some general rules:

Voice: speak loud and clear; make pauses, especially when you move; speak slowly; apply verbal emphasis; express enthusiasm.

Posture, bearing: stand upright; face the audience, open, not hidden; stay with both feet on the ground; raised head, but not snooty.

Arms and hands: resting position; pictorial gestures according to the speech; slow, quiet movement; avoid movement below waist; avoid putting hands into trouser pockets.

Face: face the audience, don't look from the corner of your eye, maintain direct eye contact with the audience, 3-5 seconds per person; show facial expressions related to what you say.

Movement: move single-minded, not around; calmly handle your tools, control the movement; move from the front/center of to the side of the room from time to time.

2. Pro and contra of lectures

In modern school systems the lecture is often considered outdated. It is a precept that the teacher has not to talk too much. So many teachers avoid this method and use others. But if we want to create a common base of information or if we want the students to know facts, the lecture is still the cheapest, simplest and most effective method of presentation!

Advantages:
- Efficient transfer of information, explanation, interrelation, facts and dates
- Easy to plan
- Provides opportunity for the creativity of the teacher

Disadvantages:
- Very low activity demand from the students
- Small feedback.
- Tiring
- Demands only intellectual activity

3. The content and preparation of lectures

The most important steps in preparing a lecture are the laying down, the revising and the editing of the content. During a lecture the teacher should try to portray his/her knowledge in a vivid way, therefore s/he needs to edit the information s/he has. That means s/he has to create a colorful, interesting, easily remembered and, of course, attractive material, which „reaches“ the audience best and which will be a useful basis for further reflection, discussion and use. For an expert it is not the problem to get the right information, facts and data, mostly the problem is to choose out of this pool of information those items that fit best to the objectives. To avoid „overloading“ a lecture, regard the following rules:

- Lay down the theme
- Choose the material
- Order it

- Structure it
- Limit it to the essential part
- Make a list of main points and facts
- Show the red thread
- Estimate the time frame
- Shorten

Before elaborating on the lecture it is important to ask yourself the following questions: Which kind of group is the audience? What are their expectations? If you are a teacher you can answer these questions quite fast. To work most efficiently and give an attractive lecture, which includes also talking without a script or even notes, it is important to structure your preparation according to the following steps:

Start and fix the objective of the lecture (Every lecture needs a target)
Keep discarded target formulations; these may serve as captions or key words later
Elaborate the material through brainstorming or mindmap
Work with symbols and colors
Complete and save the ideas found in the brainstorming and mindmap through reading in the literature or in your own notes
Order the key words

1. "talk-think" attempt, note the gaps, but talk
Go on ordering, filling the gaps, changing
Order arguments
Maybe a new brainstorming

2. "talk-think" attempt
Write down the good and important formulation
Work out examples

3. "talk-think" attempt
Fix phrasing, samples and quotations
Pause for inspiration (If possible some days)
Rework
Formulate the end (It is good to fix up some important phrases word by word)
Formulate the introduction (both, introduction and end, should not be more than 20-25 % of the whole lecture)

4. "talk-think" attempt with watch
Shorten (A lecture isn't well prepared if you don't have to shorten it!)
Write your notes on index cards, for every idea one card
The cards must be: well ordered, clearly written, numbered
Use different colors, make tables

Last "talk-think" attempt with watch, again memorize the pictures of the note-cards

Deutscher Entwicklungsdienst

4. The structure of lectures

There are different kinds of models for structures. These models are like "intellectual building plans“, which make it easier to collect and edit the material. The following model is very common:

Introduction - Main part - End

Introduction	Greetings, Theme, Objectives Organizational affaires Motivation
Transition to main part	
Main part Central idea 1 Central idea 2 Central idea 3	4 Structural elements: • Signposts – important information • Bridges – make links • Fences – limit topic • Markings – give meaning 4 Relaxation elements: • Questions • Examples • Comparisons • Persons
Transition to the end	
End	Result/Conclusion Summarize Generalization/Prospects

Unit 9 Visualization

1. Why visualization is so important

As we already know, learning is most effective when all senses are involved in the learning process. Within that context visualization plays a vital role: we apparently can store and remember information far better when it is linked to images. Therefore we should aim to make maximum use of visualization in our trainings and lessons.

Of course, visualization should not be a substitute for the spoken word: It serves to supplement and illustrate what is being said. Sometimes, visualization "tells" even more than all spoken words together: Try, for example, to describe the color red in words. Or think of complex technology processes: here visulaization is a vital element in teaching.

Functions of visualization

- Animation
- Information
- Documentation
- Illustration
- Securing results

Enhancing

- Learning process
- Remembering information
- Retrieving information

2. Some basic rules

When using text, e.g. on transparencies, be aware of the amount and how you structure it. Also pay attention to the letters as such, e.g. size, capital/small letters. Be aware of the use of colours: if not used with thought, the result may just be a colourful image without enhancing the learning process as such.

Some basic rules….

… for writing:

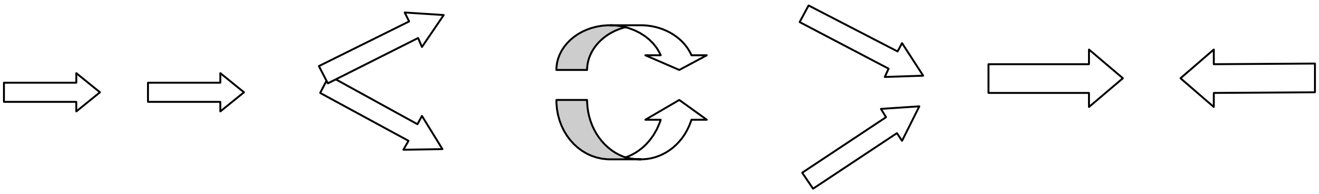
- Form columns
- Avoid whole sentences
- Use key words
- Avoid wide spacing between letters
- Avoid bold letters
- Use capital and small letters
- Same letter size for same importance
- Think of reading habits (top left to down right)
- Use only known abbreviations
- Check writing from the distance
- Show links by same colour and form

…for colour coding:

- Use neutral colour (black) for main parts
- Use red for calling the attention
- Use other colours (green, orange, blue) for emphasis
- Group according to colour (e.g. positive – negative)

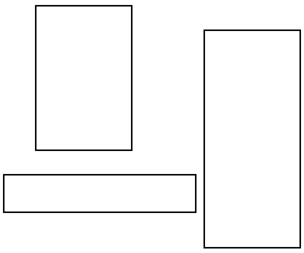
3. Examples of design elements

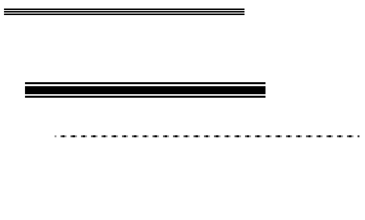
arrows

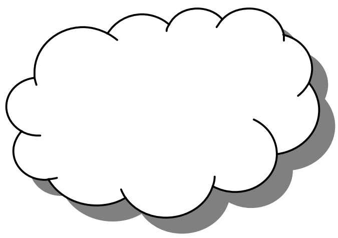


linear diverging cyclic converging contrary

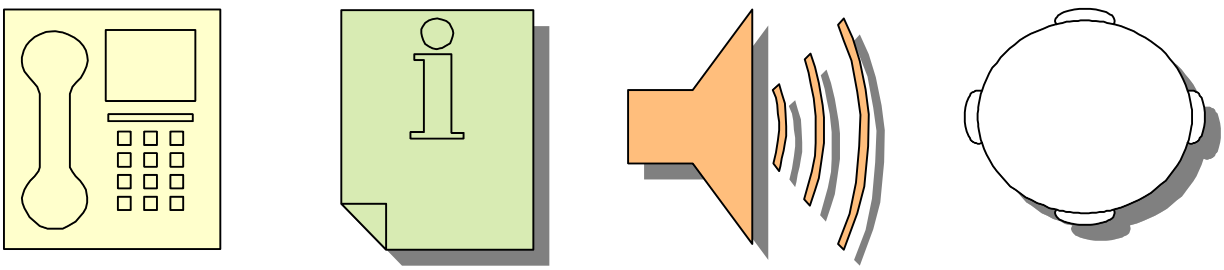
rectangulars, lines, stripes, clouds



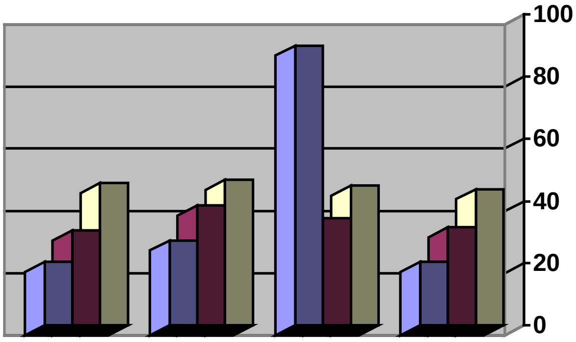




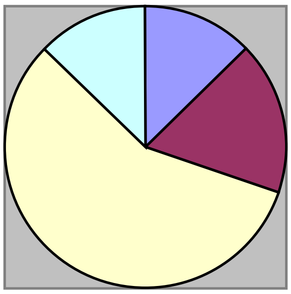
pictograms



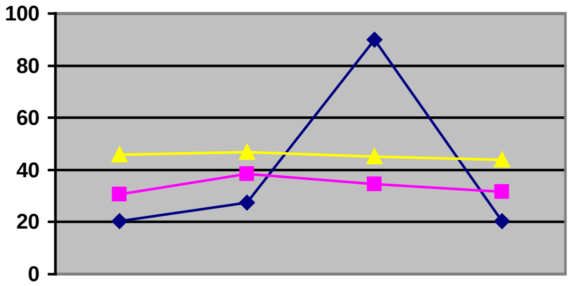
charts



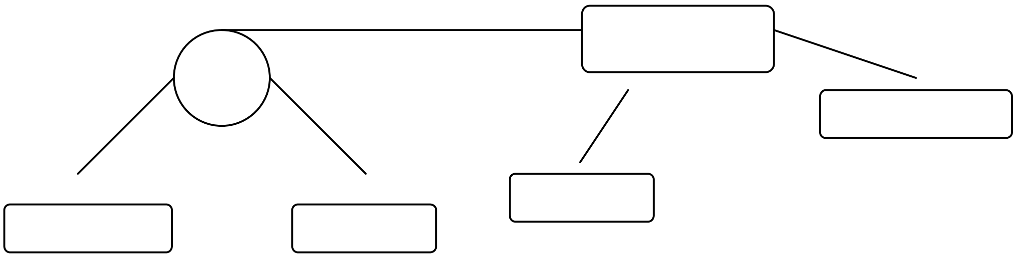
Column chart: comparison of various sizes



Pie chart: the whole and its parts



Curve chart: visualizing developments



Organigram / flow chart: visualizing structures and procedures

4. Advantages and disadvantages of common visualizing media

Blackboard/Whiteboard:
Advantages:
- Found in almost every classroom
- You can show developments
- Cheap
- Large space for writing

Disadvantages:
- Teacher may tend to speak with back facing the audience
- Most drawings and writings are developed during the actual teaching of the lesson
- Often not well structured

Flipchart:
Advantages:
- Focus is on page that is being displayed
- Easy to prepare in advance

Disadvantages:
- Stand and flipcharts are expensive
- Not easy to handle, particularly for small people

News-print/manila paper:
Advantages:
- Good to prepare in advance
- Good for team work
- Cheap
- Flexible

Disadvantages:
- Needs other tools like markers or crayons and scotch tape or pins
- Needs walls or boards
- Attention: beware of „paper-war“ (too many sheets displayed)
- Does not last long (cheap quality)

Overhead Projector:
Advantages:
- Takes little time to present
- Can be prepared in advance, also with the help of the computer
- You can show colored pictures
- You can keep contact to the audience while presenting

Disadvantages:
- Sometimes loud
- Demands experience in handling
- Not functioning during brown-out

Slides:
Advantages:
- Similar to overhead projector

Disadvantages:
- Not as flexible as overhead projector
- If you make your own slights, it is expensive
- You have to darken the room
- Audience gets easily tired.

Pinboard:
Advantages:
- Often mobile – you can move it around the classroom
- Flexible medium; encourages participation especially together with the use of cards and pins

Disadvantages:
- Participants must be able to express their thoughts clearly in writing
- Participants must write legibly

Power point presentations:
Advantages:
- Makes presentations interesting with the use of colors, graphics and animation

Disadvantages:
- Teacher tends to get glued to the table where the computer is based
- Needs special skill in developing slides
- Requires further expensive equipment (lcd)

5. Teaching and visualization

As we know already, learning results are better when many senses are involved. We therefore should try to activate as many of the students' senses as possible in order to create multi-channel information. Teaching which addresses the students' ears, eyes, sense of taste and feeling, reaches the affective (heart) as well as the cognitive (head) perception and thus can reinforce motivation. As for visualizing, it must be an active process. If the object, for example, is merely presented to the student, there is no guarantee that the information will be stored in the latter's memory. In order to learn, there must be a process of interaction with the object in question.

Direct observation of the real object facilitates spatial orientation and allows sequences of operations to be identified more easily and accurately. The ideal scenario therefore is for the actual object to be shown in a real situation. If the original is too large or the reality is too loud or dangerous, simulations or models should be used. A combination of theoretical and practical learning helps students to understand how they can apply new knowledge in real life situations. Also incorporating professional experience helps to link teaching to real life.

Complex and complicated processes can be simplified: it is important to show the essentials so that the principle of how something functions, for example, is understood. As teachers we should proceed from the simple to the complicated, the known to the unknown, the concrete to the abstract.

The more we involve the students, the higher the learning results. We should give opportunities for exploring and learning by discovery and teamwork; ready made solutions should be avoided.

Requirements for teaching

Address all senses:

- Multi-channel information
- Allow for cognitive and affective perception
- Facilitate active visualization

Link teaching to reality:

- Use originals
- Combine originals with media
- Combine theory and practice
- Incorporate professional experience

Observe teaching principles:

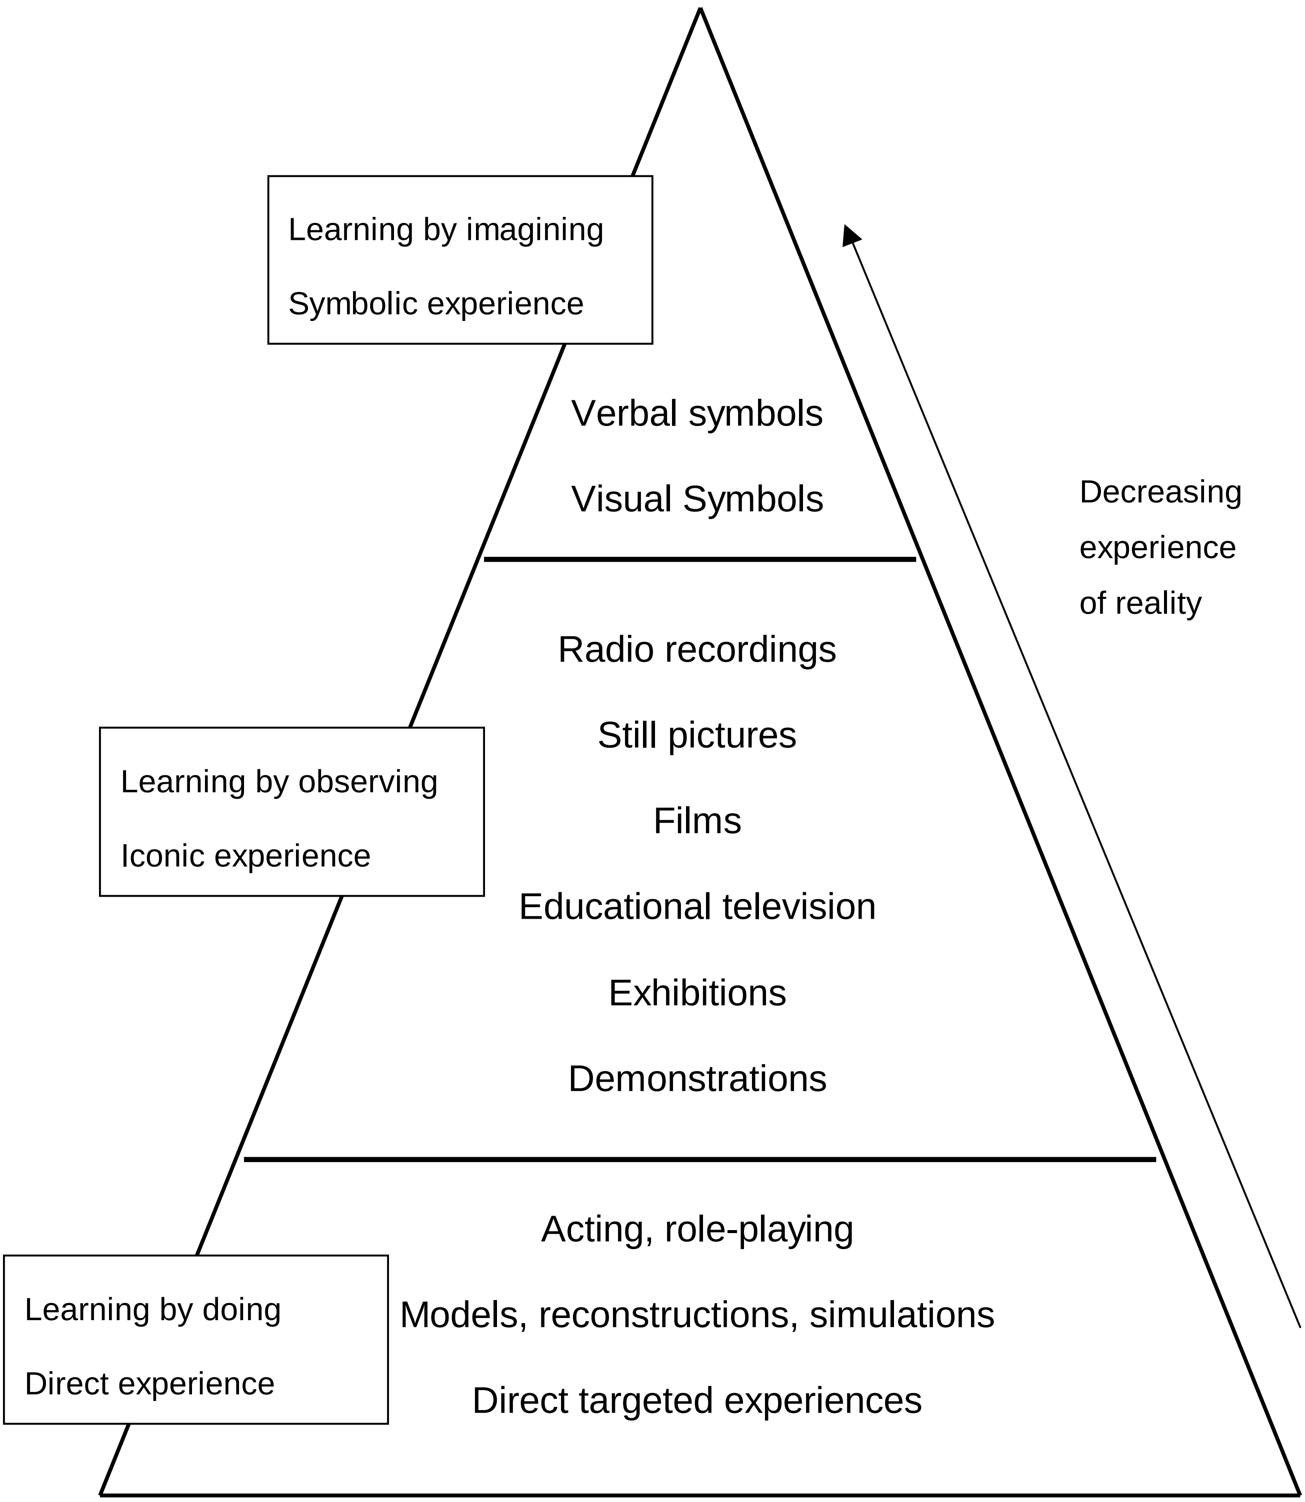
- Show only the essentials
- Simplify complex and complicated processes
- Proceed from the simple to the complicated
- Proceed from the known to the unknown
- Proceed from the concrete to the abstract

Involve students:

- Avoid ready made solutions
- Allow students to work independently with media
- Encourage teamwork

6. The hierarchy of media in teaching

Dale's pyramid of experience



Unit 10 Control and Evaluation

1. The double function of control

Control

….shows the teacher the results of his/her work concerning knowledge, skills and behavior. From the results of control s/he gets clues for the further design of the lessons.	……should enable the students to estimate their performance and their status of development. Assessment should be praise and/or an incentive to change behavior.

The main objective of control is the **stimulation** of high learning results!

2. Demands on control

Control should be:

- objective (measurable)
- comparable (between students, classes)
- possible to evaluate and to compute

Learning objectives and control tests should correspond to a high degree. This relates to the expressions and verbs used (should be the same) and to the incorporation of the three areas of learning in the control tests:

- cognitive (knowledge etc.)
- affective (attitudes, behavior, abilities etc.)
- psychomotor (skills, practical know how etc.)

The students should know the demands made on them: Learning objectives for each part as well as demanded conditions concerning time, quality and quantity. Only what has been taught based on objectives can finally be controlled.

3. The most important kinds of control

3.

Pieces of work,
Examinations

2.

Performance controls,
Tests

1.

Regular control,
Control questions,
Exercises

Regular control, Control questions, Exercises

These are the most important methods for a teacher to get knowledge about the learning results, learning capability and learning success. If possible, regular control exercises should be part of all lessons.

Advantages:

- The teacher always knows the learning results by getting feed back.
- The students have the opportunity of exercising and (hopefully) feeling successful.

Disadvantages:

- Frequent controls can interrupt the ongoing processing of knowledge.
- Positive effects only show, if the control is not in a written form and does not get an important meaning: it is not considered as a test.
- Control is difficult to evaluate and judgment difficult to justify without a written document.

Performance controls, Tests

A bigger learning unit should be ended with an announced, mostly written performance control test.

Advantages:

- The students get the opportunity to see the whole subject and can prepare.
- They get relatively objective information about their level of knowledge.
- The teacher also gets an overview about the results of the last unit.
- Tests offer a relatively objective way of assessment and are easy to evaluate.

Disadvantages

- These kinds of control can easily be perceived as important breaks and opportunities to stand to the test and thus de-motivate the students to study and practice on the other lessons which they believe will not come out in the test.

When formulating tests, a variety of exercises can be used. The most important are:

- Short answer or completing exercises
- Right/wrong answer exercises
- Multiple choice exercises
- Matching and assigning exercises

However, all simple forms of tests cannot control either abilities of understanding connections and correlations or abilities of verbal expression or of applying knowledge.

Pieces of work, Examinations

First of all, pieces of work and examinations should give an objective overview of the level of performance of the whole group. They also should enable the teacher to make a final evaluation of each student. Examinations should be compared with general norms and scales of performance. Their main objective should not be to single out students who are less efficient.

Control of practical skills is fairly easy with regard to quality and quantity since these are measurable. However, to control and judge attitudes and abilities is a far more difficult task.

Controlling and judging skills:

- Ask for quantity only after repeating the particular skill training a couple of times.
- Increase demand for quantity step by step.
- With regard to quality insist on high standards right from the beginning.
- Note down the scale of judgment (e.g. +/- 0,05 mm off target for "well down") and make it known to the students.

Controlling and judging attitudes and abilities:

- Allow for variations to complete an assignment to discover creative potential.
- Ask for proposals to solve a problem to discover creative potential.
- Attitudes of students show when given opportunities to work creatively and on their own.

Appendix Unit 4 Brainstorming

1. General rules for brainstorming

Brainstorming is one of the most common methods to systematically collect new ideas for problem solving. It is most effective in teaching when problems arise that should be solved in a new way.

The ideal number of participants in a brainstorming session ranges between 5 and 10. Since brainstorming needs an atmosphere of trust and mutual respect, it should be only used when participants are quite familiar with each other. Also everybody should be aware of the rules and stick to them:

- Each idea, each proposal is wanted!
- No critique or judgemental comment is allowed!
- Quantity goes before quality – the more ideas the better!
- Ideas of others should be further developed!

The time of the actual brainstorming should be limited to 5 to 15 minutes. The moderator of the brainstorming should secure the ideas mentioned on a black- or whiteboard, flipchart, manila paper, metacards, overhead or other media.

It is the task of the moderator to ensure that all participants stick to the rules. Most important in this context is that no idea should be ridiculed or criticised however funny or strange the suggestion may be. To ensure this, examples should be given, particularly to groups that are not yet familiar with this method. To freely associate and thus come to even seemingly absurd ideas is not easy when never experienced. However, positive effects will show when brainstormings have been conducted several times.

The moderator should encourage participants to come up with ideas, but should refrain from uttering own ideas too often. When the flow of ideas stops, the brainstorming should be ended.

2. Phases of brainstorming

Problem:	Name the problem and explain it to the participants.
Discussion:	Allow for a short discussion (about 5 minutes). First proposals for solution can already be mentioned.
Brainstorming:	Collecting of ideas – watch the rules!
Assessment:	Judging the ideas.
Solution:	Agreeing on solution and/or further steps of action.

3. Assessment of ideas

Usually a lot of new ideas are collected during a brainstorming. It is part of the rules that these ideas are not assessed during the brainstorming as such. Therefore a lot of ideas appear to be unrealistic, not fit for implementation or, even absurd at first mentioning. However, the collection of ideas is a source of inspiration for finding new solutions and/or new approaches to deal with a problem.

To make use of this collection, each idea now needs to be looked at. Sometimes an idea just needs to be modified to be useful. Here are a number of questions that can be applied during the assessment process and thus help to find out whether ideas are useful or not.

Can the idea be…

…used differently?
…modified?
…changed?
…expanded?
…reduced?
…combined with?
…interchanged?
…replaced?

Usually, in problem solving we tend to stick to known solutions. The challenge sometimes, however, is to find new approaches. To allow for creative and unusual ways of thinking, brainstorming is an appropriate method to bring out new ideas – as long as the rules are followed.

Appendix Unit 9 Mind Map

1. Left and right brain

Mind map is a special visualization method. As the words imply, it tries to capture our thoughts in the form of a map, thus taking special features of the human brain into account. The human brain consists of two sides: the left and the right brain. Each side is linked with special abilities:

Left **L**ogic brain	**R**ight c**R**eativ brain
Speech	Creativity (new combinations)
Calculations	Artistic activity
Intellectual Analysis	Musical ability/Rhythm
Reading	Emotions
Writing	Recognition
Naming	Comprehension
Ordering	Perception of abstract patterns
Sequencing	Spatial abilities
Complex motor sequences	Facial expressions
Critique	Holistic ability
Evaluation	Intuition
Logic	Images
	Color

In traditional teaching and training the left brain is usually given a higher preference. Learning results, however, are much higher when both sides of the brain are stimulated and used: analytical exercises should be combined with creative, expressive activities. When the "weaker", that is less used side of the brain is encouraged to co-operate with the "stronger" side, we will get a synergy effect (1 + 1 = 5!).

2. Mind map and thinking process

Mind mapping is a method to visualize the thinking process. It does not process the thoughts; it merely makes them visible.

Thinking doesn't follow any logic. Our thoughts jump from one topic to the next; they switch from general themes to details, or even abandon a subject completely and go on to a totally new one, perhaps coming back to the previous one at a later stage. We choose a trail, then leave it, continue on another trail and yet, we keep an overview of the whole.

This complex, associative process cannot be made visible with common linear, logically ordered and structured writing techniques. If, however, we want to tap our thinking for producing new ideas, concepts for lectures and manuscripts, for planning activities or for preparing exams, mind map is an ideal technique to keep visible track of our thoughts. Thus, it combines the abilities of the creative side of our brain (intuition, new combinations, images etc.) with the abilities of the logical side (naming, writing, ordering).

3. General rules for mind mapping

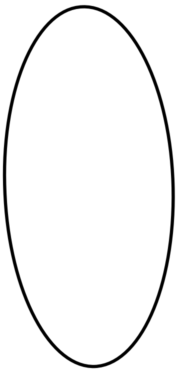
- The topic of the mind map is written in the center of a black/white board or a sheet of paper and circled. Central aspects of the topic are written all around the circle – they are the main branches. From these, side branches can be drawn. Whatever comes to the mind can now be written down – branches can be added or completed.

- Since boards cannot be turned around and are mostly shaped horizontally, one should try to seek appropriate position for drawing branches and lines.

- To facilitate better perception, the numbers of main branches should be limited. Also, side branches should not be subdivided too often. Branches and side branches can be differentiated by color. Also, links and connections can be made visible by color. Arrows can indicate related topics.

- If presenting a pre-fabricated mind map, write and draw clockwise. This supports better and easier perception.

- As often as possible, words should be replaced by symbols and pictures. This makes remembering easier and stimulates further thinking.



Mind map "Model lesson" – an example

Adaptability	Education	Initiative
Age	Experience	Leadership
Ambition	Habits	Patience
Aptitude	Imagination	Temperament
Dependability	Intelligence	Tolerance
Determination	Interest	Versatility

Make use of **young trainees**'...

- interest in other persons
- urge for experience
- urge for activity
- urge for self-determination & responsibility
- wish for acceptance
- wish for acknowledgement and praise
- wish for applying

- Slower speed of learning
- Less perfect short-term memory -
  better long-term memory
- Reduction in performances of perception -
  greater reaction time

Consider **adult trainees**’

- Greater accuracy
- Greater experience
- Greater attention and perseverance

Advantages

Well kept tools and machines

Well maintained equipment

Maximum and proper use of resources

Good quality of products/service

Low number of rejects/complaints

Faster production

Higher output

High safety standards

High environmental standards

Motivated staff

Learning

= change of behavior

due to experiences

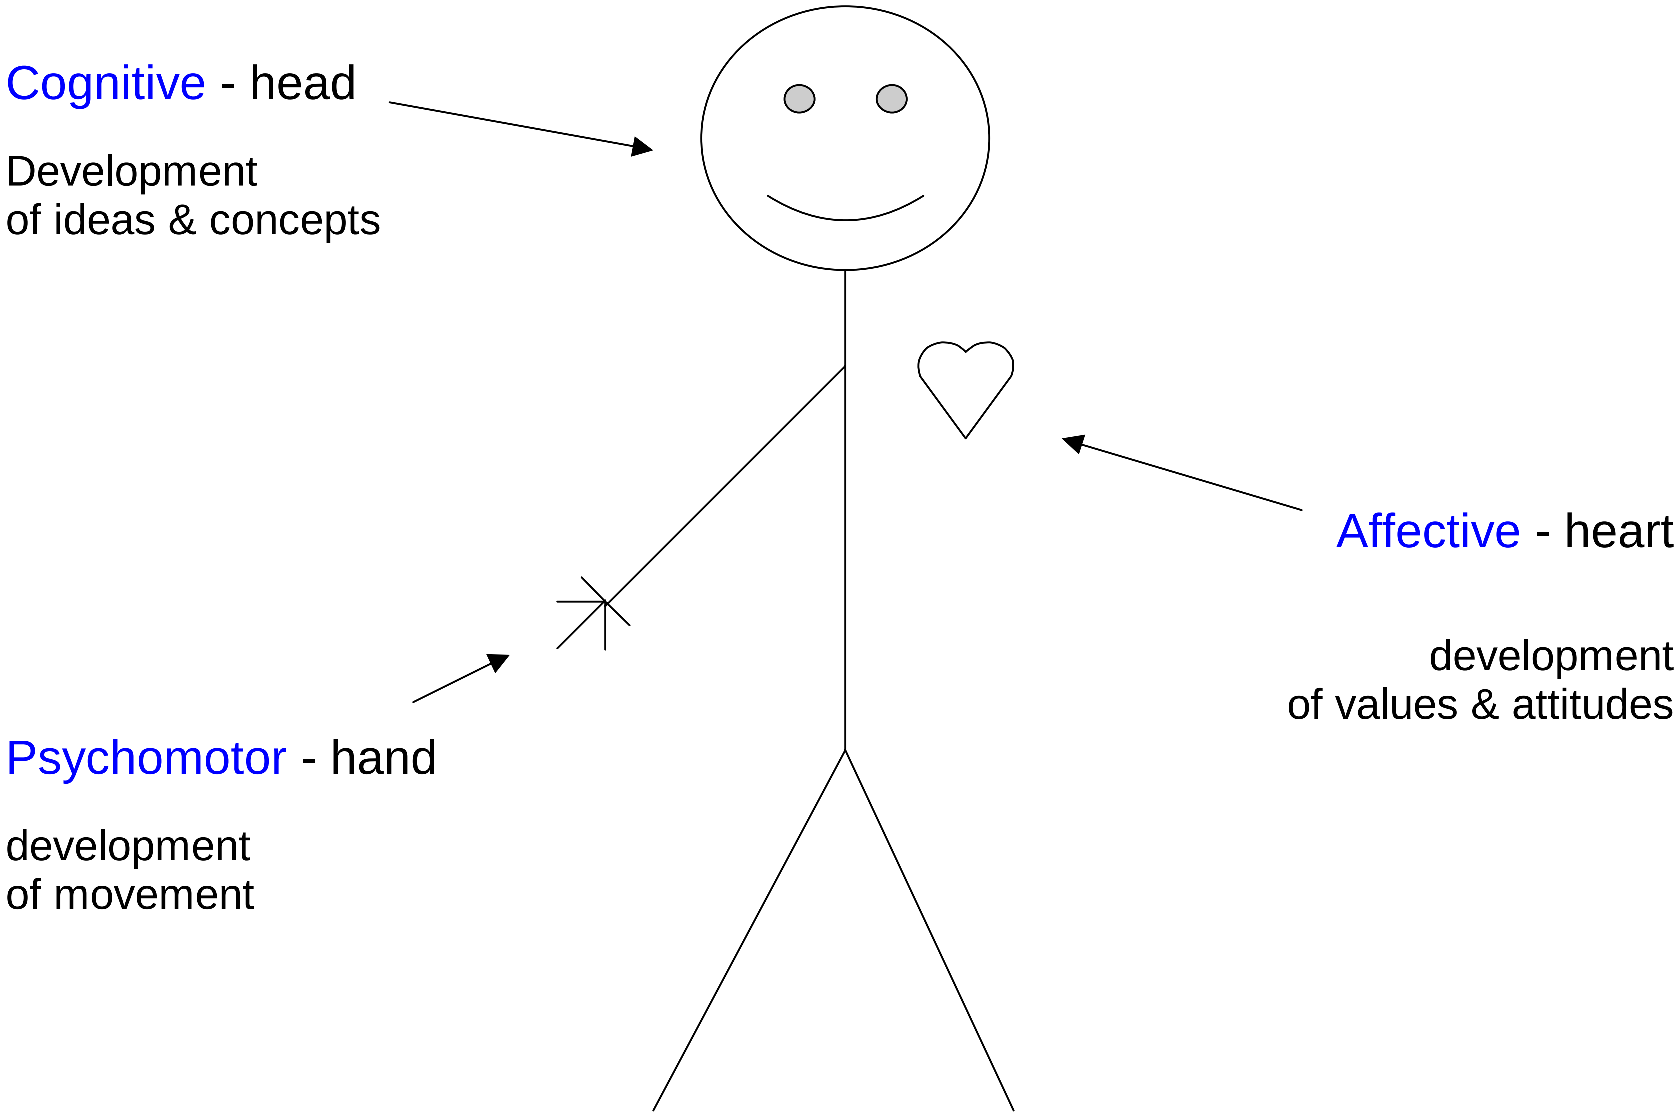
Through learning we acquire new

knowledge

skills

attitudes

patterns of behavior



Cognitive - head
Development
of ideas & concepts
Affective - heart
development
of values & attitudes
Psychomotor - hand
development
of movement

G o a l

Learning objectives

- say what the trainee has to know after the instruction or how he/she has to handle something
- list by which help he/she has to do it (by using a dictionary, a tool)
- say how he/she has to do it (in which time, with what precision)

Learning objectives should be…

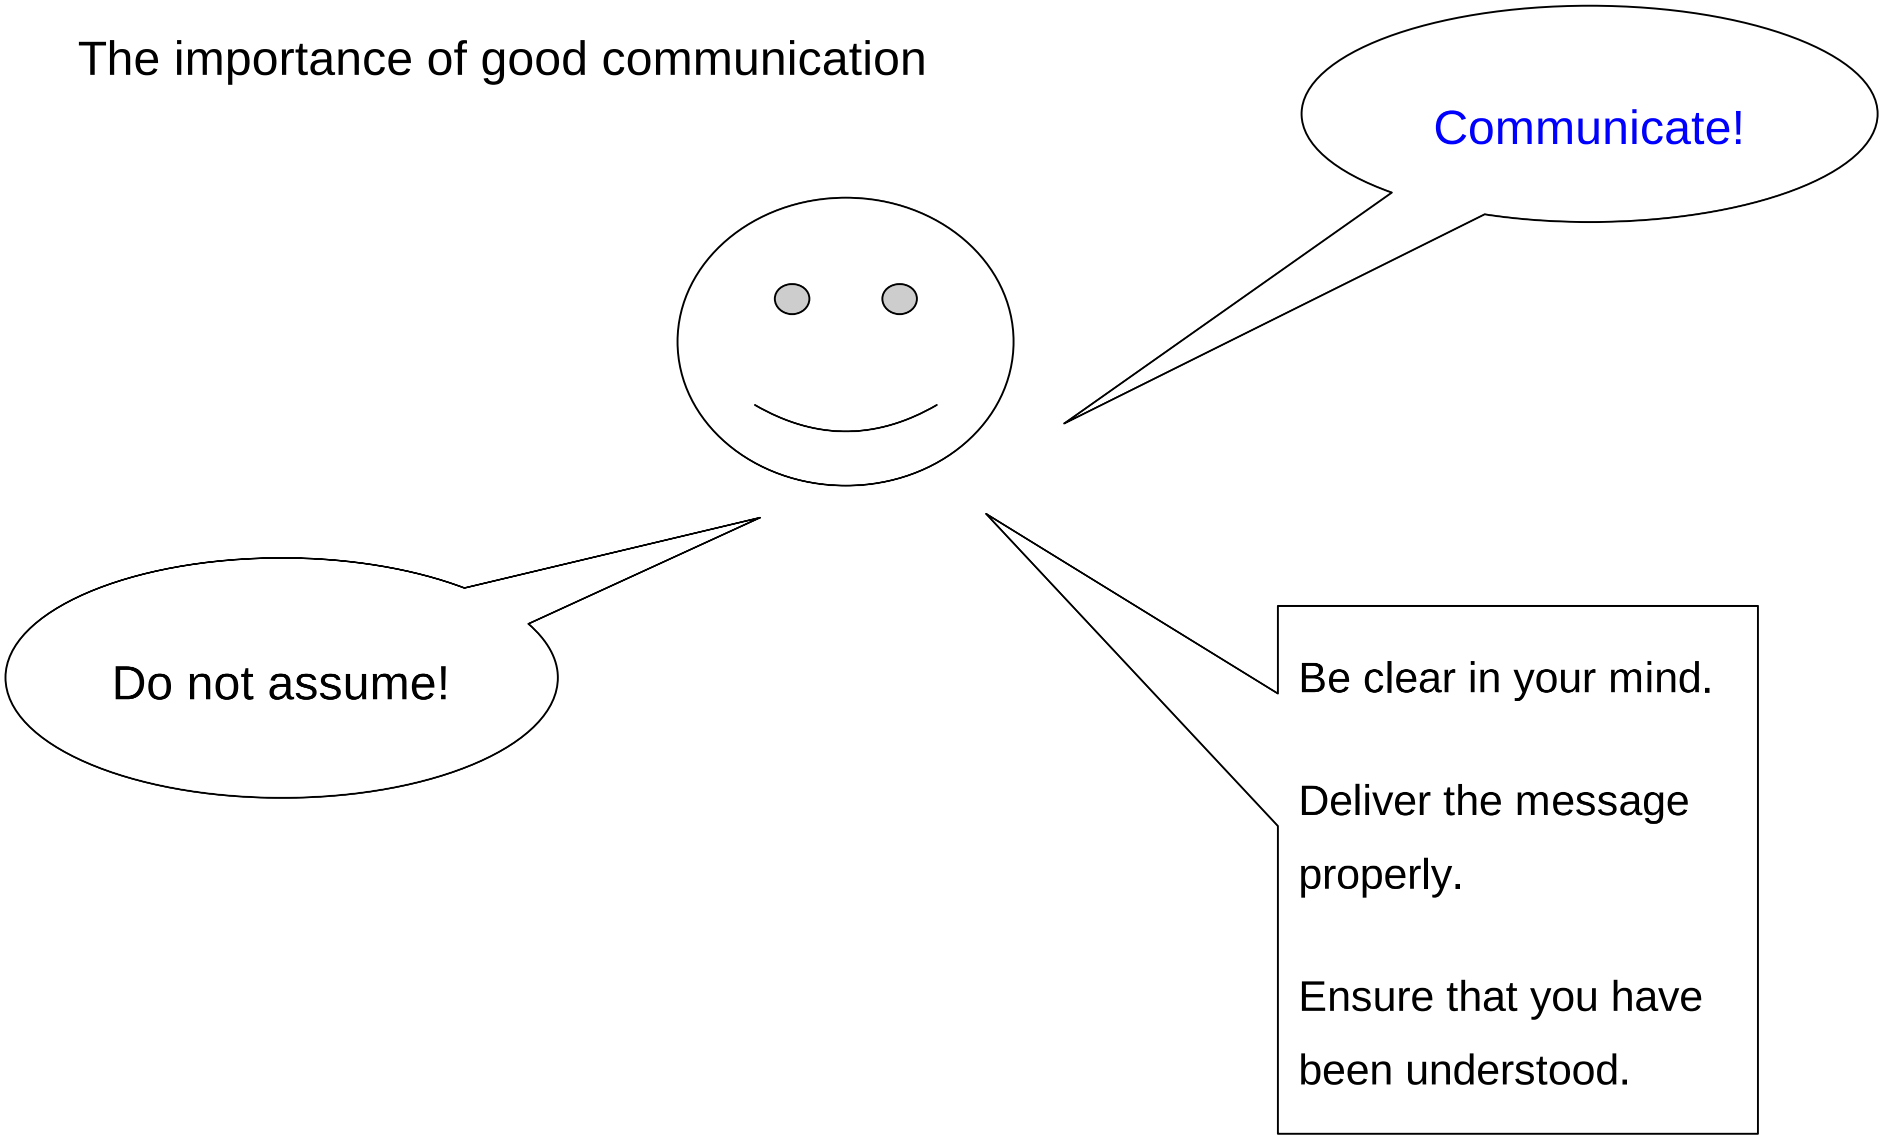
S	specific	stated in action verbs
M	measurable	indicating minimum level of concept response
A	attainable	according to trainee potential and field of experience
R	realistic	resource- and reality-based
T	time bound	be in coherence with the training timetable

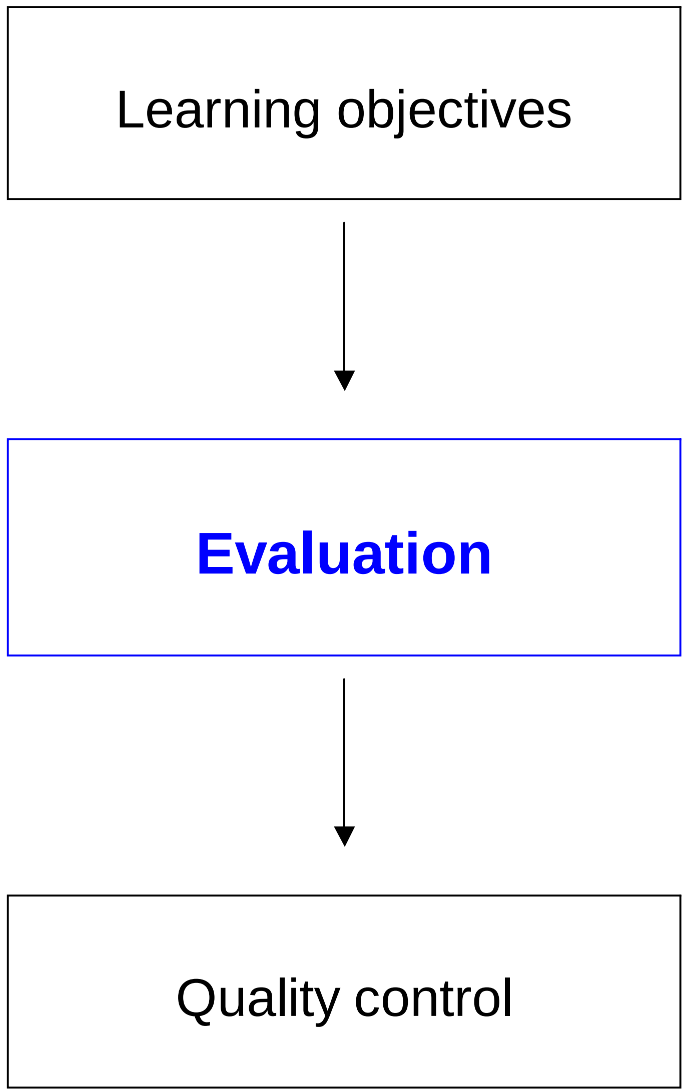
Psychomotor	Cognitive	Affective
perception	knowledge	receiving
set-up	comprehension	responding
guided response	application	valuing
internalized response	analysis	transferring
complex response	synthesis	creating
	evaluation	

To formulate a **training plan** means to identify

- the needs
- the competencies
- the learning modules and learning steps
- the objectives
- the time-frame
- the entry requirements

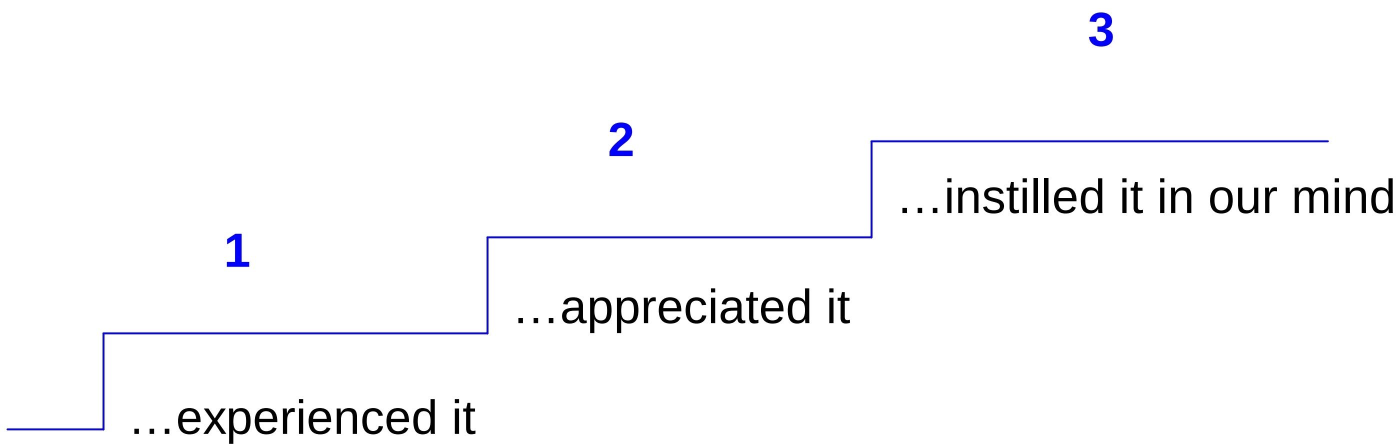
The importance of good communication





Learning objectives
Evaluation
Quality control

We have not learned something until we have…



Ways of learning

trial and error

observation and imitation

repetition

instilling something in the mind

insight

repeated perception

adaptation

Method	=	a way or manner of doing something
	=	the use of an orderly system as opposed to luck
Training method	=	a consciously followed way
	=	to achieve specific training objectives

- social form
- sequence of goal-oriented steps
- pedagogical concept

Training methods based on **presenting**

Trainer:	**Trainee:**
Lectures Demonstrates Presents Performs Guides process of perception and thinking	Listens Watches Re-enacts in the mind Imitates Observes Gains understanding, perception, orientation

Training methods based on **discussing**

Trainer:	**Trainee:**
Establishes objectives Explains topic Introduces Asks Gives inspiration Answers Corrects Confirms Summarizes	Answers Asks Contributes experiences Argues Discusses Debates

Training methods based on **acquiring**

Trainer:	**Trainee:**
Introduces problem or task Arranges working method Assesses work attitude Assesses result Assists if necessary	Clarifies objectives Organizes the work Searches for solutions Procures information Solves problems Works out functional solutions Controls results Presents results

Training methods based on **processing**

Trainer:	**Trainees:**
Organizes processing Motivates Imparts exercising and repetition techniques Offers transfer	Memorize learning matter Develop performance speed Develop performance security Transfer learned matter to other topics and areas

The four step method

1. Step	=	Preparation of student
2. Step	=	Demonstration and explanation
3. Step	=	Student activity
4. Step	=	Exercising and strengthening

1. Preparation of trainee

- take the shyness
- motivate
- show the objectives and tasks
- evaluate the knowledge
- familiarize with the work place
- give advice concerning safety

2. Demonstration and explanation

- place trainee facing same direction to the work piece as you
- demonstrate whole procedure in original time
- divide complicated procedures into modules
- repeat demonstration and make single steps visible
- say what you are doing, how and why you (what? how? why?)
- give opportunity to ask questions
- summarize and demonstrate uninterrupted

3. Trainee activity

- encourage trainee to try it on his/her own
- don’t interrupt trainee in first attempts
- make comments only on serious mistakes
- precision is more important than speed
- let trainee say what he/she is doing, how and why

4. Exercising and strengthening

- give enough time to exercise
- acknowledge progress
- control that no mistakes are done during exercising
- change conditions of exercising
- slow adaptation of real working condition

„Effective Skills Training“

A three half-days, one whole day workshop

- You are a teacher or trainer at a school, college or training center and are already experienced in training people or have just started to work.
- You are a workshop owner and constantly confronted with the fact that you have to train newly hired staff since they lack the skills required.
- You are part of the human resource department of a company and responsible for the dual training system, DTS, and/or other in-house training activities.
- You are a supervisor at a company and responsible for finding the right people for the right job which often means to train them before they can actually start working.

In short,

- you are one of the people concerned with professional and technical vocational skills training and would like to improve your training skills.

During the workshop „Effective Skills Training“ you will take a closer look at the importance of training, its meaning and what is required of a good trainer. You will examine the relevance of training goals and how they are helpful for evaluation and quality control. You will learn to identify different training methods and understand how you can best make use of them. The seminar, therefore, is focussed around three major areas:

Who – The human factor
What – The training goals
How – The training methods

The inputs consist of general information and basic aspects of learning theory relevant for training. They are given in form of lectures, teacher-student discussions and group work.

The main emphasis of the seminar, however, lies on developing the communication skills of each participant with regard to skills training since these are crucial for any successful training. To achieve the latter, a series of exercises is incorporated into the workshop with some parts being videotaped. Combined together, these exercises lead to one of the most effective skills training methods, the Four-step-method.

By the end of the seminar each participant will be able to deliver a presentation out of his/her field of expertise applying this method. It is hoped that this „hands-on“ approach will also enhance the transfer of what has been learned during the workshop to the various actual training sites.

Number of participants: 8 to 10 (maximum)

Day 1

	Welcome	Introduction of facilitator & participants
Unit 1:	Who – The human factor	Lecture and discussion
Task 1:	Explaining	Preparing a mini-presentation
		Presenting the presentations (presentations will be videotaped)
		Feedback

Day 2

	Repetition	Main results of previous day's inputs
Unit 2:	What – The training goals	Lecture, discussion and group work
Task 2:	Evaluating	Preparing for evaluation of work piece
		Role play "Evaluating trainee's work"
		Feedback

Day 3

	Repetition	Main results of previous day's inputs
Unit 3:	How – The training methods	Lecture and discussion
	The 4-step-method	Watching the video-tapings
		Demonstration
	Summary	Handing out of handouts
Task 3:	Training	Preparing a model training session applying the Four-step-method

Day 4 (whole day)

Task 3:		Presentations/role play “Model training session” (presentations will be videotaped)
		Feedback
	Evaluation	Assessment of seminar
	Closing	Handing over of certificates

Schedule of the days

<u>Day 1 to day 3</u>

Start	8.00 am
Break	according to progress of sessions
End	1.00 pm

<u>Day 4</u>

Start 8.00 am

Breaks and lunch according to progress of sessions

End 5.00 pm

Tasks

Task 1: Prepare a mini-presentation. Choose out of given topics. Work in pairs.
Duration of presentation: 5 – 8 minutes

Task 2: Prepare an evaluation of trainee’s work piece. Work pieces will be provided.
Work in pairs (trainer – trainee).

Task 3: Prepare a model training session applying the 4-step-method.
Choose topic from your field of expertise.
Duration of presentation inclusive Step 3 (student activity): 20 minutes

Effective Skills Training, Day 1

No.	Title	Content/Activity	Material	Time
1	Introduction	Registration, putting on name tags Welcome - Introduction facilitator Introduction of pax (drawing of own portrayal inclusive likings/dislikes w/regard to senses, name/position, expectations for seminar; presentation to group) Outline of seminar/leveling of expectations	Stickers, markers, registration form Sample cartolina, self-portrayal Cartolina, markers Flipchart, handouts	8.00 – 8.45
2	Lecture/Discussion “Who – The Human Factor”	Input on: - General considerations - The supervisor Group activity: - Collecting ideas about activities involved in training Input on: - The trainer Group activity: - Collecting experiences about characteristics of different trainees in general and with regard to age Input on: - The trainee - The trainer – trainee relationship Group activity: - Collecting advantages of well trained staff for company/business Input on: - The human factor as the big difference	Transparencies Manila paper, meta-cards, markers Manila paper, meta-cards, markers Manila paper, meta-cards, markers	8.45 – 9.45

	Break	Working break		10.00 – 10.15

3	Exercise 1 –	Grouping participants into pairs (criteria: at least 1 fluent English speaker per pair)	Strings	9.45 – 10.00
	Introduction	Introducing task: choose one tool out of display & prepare presentation covering: - use - handling - safety - maintenance Both pax are actively involved in presentation	Flipchart Display of various tools related to expertise of pax	
	Preparation	Preparation time: 30 minutes Presentation time: 5 – 10 minutes (min/max)		10.00 – 10.40
	Presentations	Introduction of feedback rules kiss-kick-kiss Drawing of lots for sequence of presentations Distribution of feedback sticks	Feedback sticks Lots	
		Presentations Feedback round (2 presenters – 2 observers – facilitator)	Video cam, tripod, tape	10.40 – 12.00 (3 x 25 min)

	Lunch break			12.00 – 13.00

3	Exercise 1 – Presentations	Energizer Continuation of presentations Summary of presentations		13.00 – 13.15 13.15 – 14.05 (2 x 25 min) 14.05 – 14.15
4	Summary	Each pax draws envelope & tries to answer statement Opportunity to clarify questions related to morning's input	Colored envelopes with prepared statements	14.15 – 14.45
	Break			14.45 – 15.00
5	Lecture/Discussion "What – The training goals"	Input on: - The meaning of learning - The areas of learning Group work or plenary: - Collecting ideas what a trainee needs to learn in a particular field of expertise (plenary or small groups w/related expertise) - Presentation of results Input on: - The importance of learning objectives - Formulating learning objectives - Classifying learning objectives Group work or plenary: - group results according to three domains - put them into sequence - additional: formulate objectives - Presentation of results	Transparencies Manila paper, meta-cards, markers Laminated meta-cards "cashier" Meta-cards, markers	15.00 – 16.30
6	Summary/Feedback	Summary on input Oral feedback round on first day	Ball	16.30 – 17.00

Effective Skills Training, Day 2

No.	Title	Content/Activity	Material	Time
1	Review	Each pax draws one strip and explains why s/he agrees or disagrees with statement Opportunity to clarify questions related to previous day's input	Strips with prepared statements	8.00 – 8.30
2	Lecture/Discussion "What – The training goals	Input on: - The training plan - The importance of communication - Evaluation and quality control	Samples of training plans	8.30 – 9.00
3	Exercise 2 – Introduction/Preparation Presentations	Introducing task: role play on giving feedback on work piece of trainee, dealing with respective behavior Assigning roles of trainers – trainees *Trainer*: choose one model work-piece & study description *Trainee:* study your assigned role & own work-piece Preparation time: 15 minutes Presentation time: 5 – 10 minutes (min/max) Suggestions for observation Presentations Feedback round (Trainee – trainer – observers - facilitator) General recommendations for dealing with particular trainee character Explaining assessment criteria for particular work-piece	Flipchart Display of various work-pieces with project descriptions Description of trainee characteristic & faulty equivalent of chosen work-piece	9.00 – 9.20 9.20 – 10.00 (2 x 20 min)

	Break			10.00 – 10.15

3	Exercise 2 – Presentations	Continuation of presentations Summary of criteria/procedure of feedback		10.15 – 11.15 (3 x 20 min) 11.15 – 11.30
4	Lecture/Discussion “How – The training methods”	Input on: - The three steps of learning - Different ways of learning - The meaning of training method	Transparencies	11.30 – 12.00

	Lunch break			12.00 – 13.00

4	Lecture/Discussion “How – The training methods”	Energizer Group activity: - Collecting methods used in training - Grouping methods into 4 categories - Analyzing roles of trainer – trainee for each category Watching video with day 1 presentations Summary of video presentations	Manila paper, meta-cards, markers Transparencies TV, video cam, tape	13.00 – 13.15 13.15 – 14.00 14.00 – 15.00

	Break	Working break		14.45 – 15.00

4	Lecture/Discussion “How – The training methods”	Input on: - The Four-step-method Demonstration workshop area: - Volunteer is asked to shorten wooden profile 2 cm - Analysis of observed demonstration - Analysis of actions involved - Repetition of demonstration according to action-analysis Input on: - Final conclusions	Transparencies Bench vise, wooden profile, saw, dry square, measuring tape, pencil; Posters sequence-of-actions-analysis	15.00 – 16.00
5	Exercise 3 – Introduction Preparation	Introducing task: - Choose skill - Carry out action analysis - Prepare instruction for model presentation using 4-step-method. Presentation time: 15 – 20 minutes (min/max) Handing out of seminar handouts	Work sheets “Action analysis” Seminar handouts	16.00 – 16.50
6	Outlook/Feedback	Outlook on day 3 of seminar Feedback on seminar day 2 by pax setting points	Barometer for content, methods, atmosphere Points	16.50 – 17.00

Effective Skills Training, Day 3

No.	Title	Content/Activity	Material	Time
1	Introduction	Establish sequence of presentations Assign trainee for role-play Present feedback sequence (trainer – trainee – observers – facilitator) & rules (kiss – kick – kiss)	Lots for sequence Feedback sticks	8.00 – 8.15
2	Presentations “Model training session 4-step method”	Training session presentation Feedback round Duration presentation: 15 – 20 minutes Feedback round: 20 minutes max	Choice of pax Video cam, tripod, tapes	8.15 – 10.20 8.15 – 8.55 8.55 – 9.35 9.35 – 10.15
	Break			10.15 – 10.30
2	Presentations “Model training session 4-step method”	Continuation of presentations	Choice of pax Video cam, tripod, tapes	10.30 – 12.00 10.30 – 11.10 11.10 – 11.50
	Lunch break			12.00 – 13.00

2	Presentations “Model training session 4-step method”	Energizer Continuation of presentations	 Choice of pax Video cam, tripod, tapes	13.00 – 13.15 13.15 – 15.15 13.15 – 13.55 13.55 – 14.35 14.35 – 15.15

	Break			15.15 – 15.30

2	Presentations “Model training session 4-step method”	Continuation of presentations	Choice of pax Video cam, tripod, tapes	15.30 – 16.50 15.30 – 16.10 16.10 – 16.50
3	Evaluation Graduation	Summary of training Oral feedback round Written evaluation Handing over of certificates/closing of seminar	 Ball Feedback sheets Certificates	16.50 – 17.15 17.15 – 17.30

Participant Reaction Evaluation Form

Use the scale 1 to 5 to express your reactions to the course based on the following statement: (Please circle only one choice for each statement.)

Strongly DISAGREE 1	Disagree 2	Neither 3	Agree 4	Strongly AGREE 5

Overall, I was satisfied with this seminar.	1	2	3	4	5
My knowledge and skills increased as a result of this seminar.	1	2	3	4	5
I can apply what I learned in this seminar to my work.	1	2	3	4	5
It was easy for me to understand the seminar content.	1	2	3	4	5
The methods used to deliver the seminar content were effective.	1	2	3	4	5
I enjoyed the parts with active involvement of the participants.	1	2	3	4	5
Material for the participants was adequate.	1	2	3	4	5
The instructor explained the subject clearly.	1	2	3	4	5
The instructor answered my questions clearly.	1	2	3	4	5
The instructor was supportive and helpful.	1	2	3	4	5
I got good advice from other participants throughout the seminar.	1	2	3	4	5
I would recommend this seminar to my colleagues.	1	2	3	4	5

What new things/changes can you apply to your job – immediately and after some time?

____

____

____

What parts of the seminar did you enjoy most? Why?

____

____

____

What parts of the seminar did you not enjoy? Why?

____

____

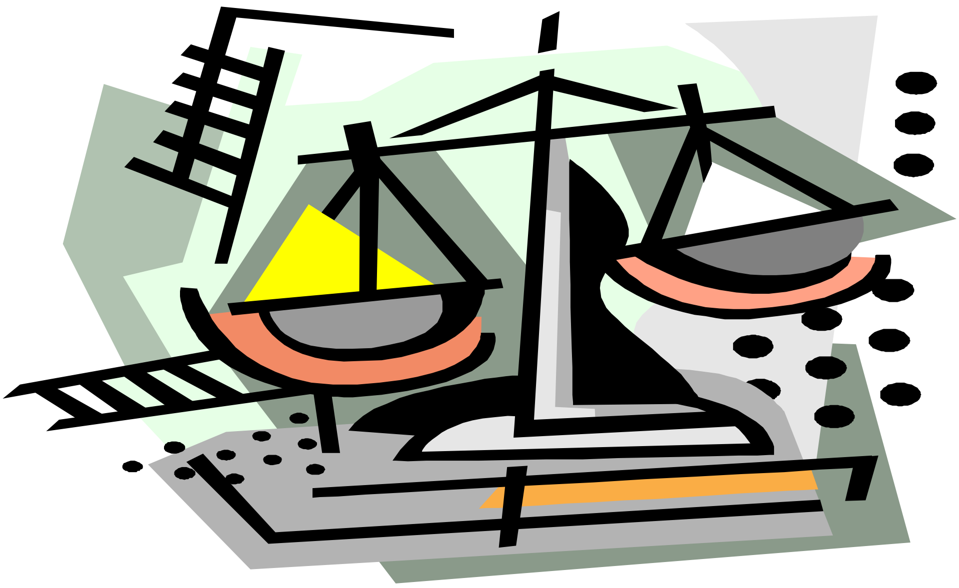
Effective Skills Training



A seminar for teachers and trainers in professional and technical vocational skills training

Content

Introduction

This handout comes along with the workshop „Effective Skills Training". It is meant to cover the main inputs given by the facilitator during the training sessions. It can be read during and after the training to help recall and better understand what has been covered during the sessions. As such, it also provides general information relevant for all who are involved in skills training: trainers, company supervisors, workshop owners, and human resource department staff.

However, it cannot substitute the training as such. While the handout focusses on three main areas – the human factor, the training goals and the training methods -, the emphasis of the seminar itself is on developing the communication skills with regard to training. Though the respective exercises of the workshop are, of course, related to the content of this handout, they are not documented in here: It is rather the actual experience of the workshop than the reading of the written material that facilitates the learning for the participants.

Nonetheless, it is hoped that the material provided can also help to enhance people's awareness of the importance of training and its numerous benefits. Further material promoting training in general and in-plant training in particular is available in form of a cd, vcd or video which can be obtained through the ded. More information on this can be found on the ded homepage www.ded.ph.

Cornelia Frettlöh

Consultant of the German Development Service, ded, to the
University of Southern Philippines Foundation, USPF
Salinas Drive, Lahug, Cebu City
January 2002

Unit 1 The Human Factor

1. General considerations

Skills training today takes place in a variety of set-ups: it can be part of formal and non-formal training, it can be conducted at school, at a vocational training center, at community level, at the factory or in a workshop. Schools, colleges and training centers are usually expected to hire professional part-time or full-time trainers who, apart from the skills training, may also be in charge of classroom instruction.

formal

non-formal

Skills Training

school, college

training center

company

community

Within the private sector, the situation is quite different. If at all, only the bigger companies conduct their own in-house training and, therefore, employ their own in-house trainers. Their job isn't really much different from the jobs of trainers at schools and training centers with the one exception that the respective training measures are tailor-made for the specific needs of a company.

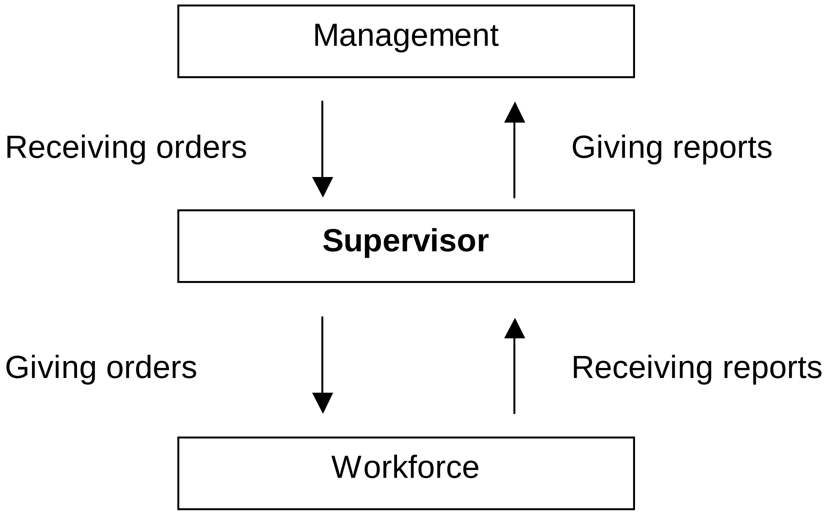
Small- and medium-sized enterprises may also acknowledge the need for in-house training, but to employ a full-time trainer is out of the question for most of them: it may not only be beyond their reach financially, it would perhaps also not meet their real training needs. In that scenario, it is usually the supervisor who will be the one in charge of training. In the same way, also the owner of a business is a trainer with the sole difference to the supervisor that he/she has no management above him/her but simply represents it him-/herself.

Both situations have in common that their training approach is very often not systematically organised, particularly in small enterprises. Skills training there just „happens"; whenever the need arises, the respective person is shown how to perform a certain skill and then again left on his/her own. Depending on the goals, this may be sufficient, but even then it is important to recognize basic principles of skills training in order to achieve high learning results.

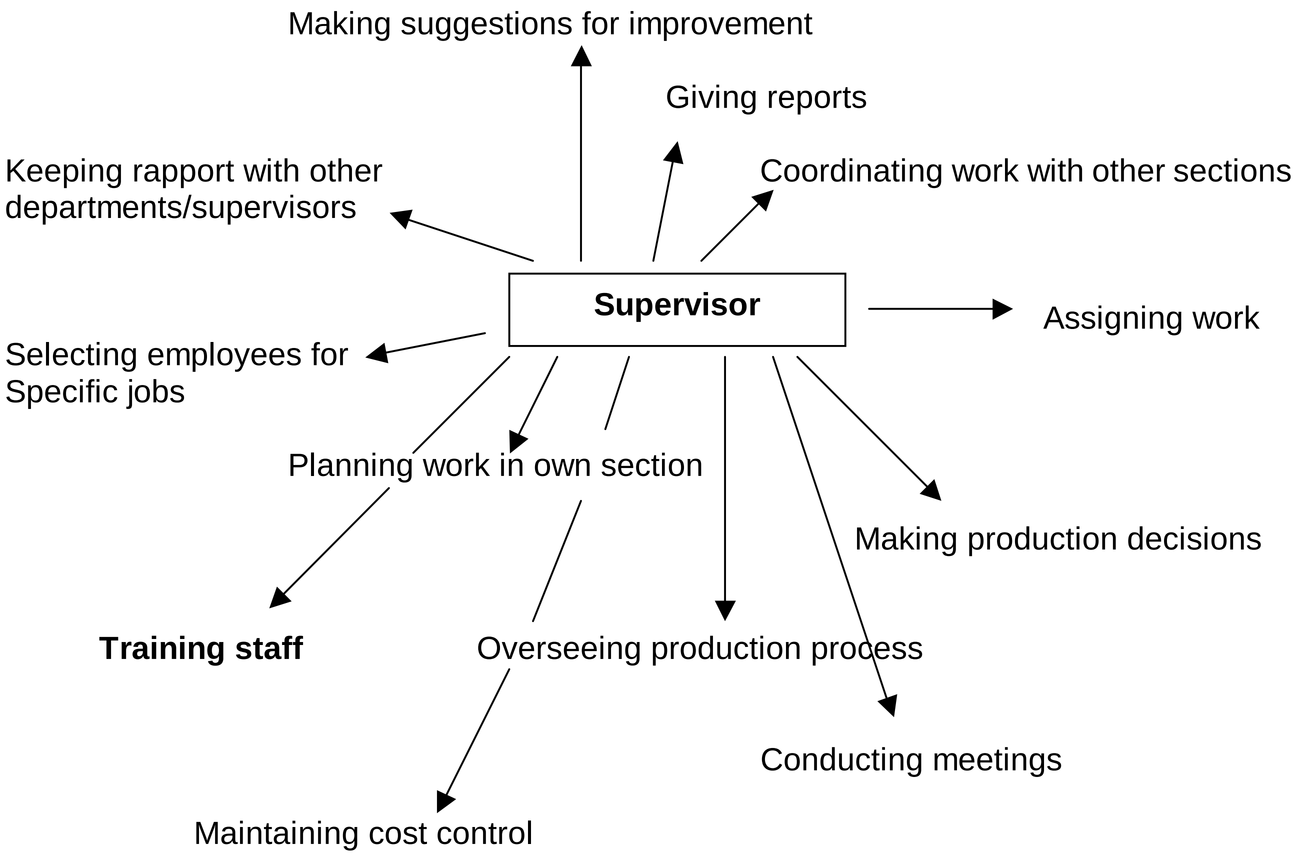
As for DTS-programs (Dual Training System), it is envisioned that the training be divided among a training institute and a company, the latter at least providing the exposure to real working conditions, and thus allowing the trainee to apply what he/she has learned. Once again, it is most likely at the supervisory level where the responsibility for the training will lie. Let us therefore first have a look at the supervisor in the company.

2. The supervisor

The role of a supervisor within a company can be described as that of a mediator: positioned between management and workforce, he/she has to relate management decisions to the workforce and ensure their implementation, but also communicate workers' concerns to management.



The tasks and responsibilities range from making suggestions for improvement, giving reports, conducting meetings, coordinating work with other sections and keeping rapport with other supervisors and departments such as HRD, personnel/staff; they include planning work, overseeing the production process, making production decisions, maintaining cost control, assigning work to workers and selecting employees for specific jobs. Doing the latter, however, may very well lead to another crucial responsibility: training. Finding the right people for the right job sometimes can simply mean training people.



To fulfill the duty of a supervisor, he/she relies to a great extent on the skills of the workers in his/her section since they are the ones who actually do the job. To meet deadlines, to ensure high quality in production, you not only need the proper tools and equipment but people who can handle them skillfully. It is the human factor that makes the difference!

Unfortunately, the labor market does not always provide the staff needed, be it the specialist, be it the operator of a particular machine. As a supervisor, you will be among the first to be confronted with this problem; management will expect you to come up with suggestions for solutions or even expect you to handle it all on your own. For example, they may hire people who meet a minimum level of requirements but still cannot perform the job expected from them unless their skills are being upgraded. Management may also introduce new equipment and send you to a training, and, in return, expect you to train others who will also operate these machines. In any case, chances are that, being a supervisor, you will have to train other people at some point in your working life.

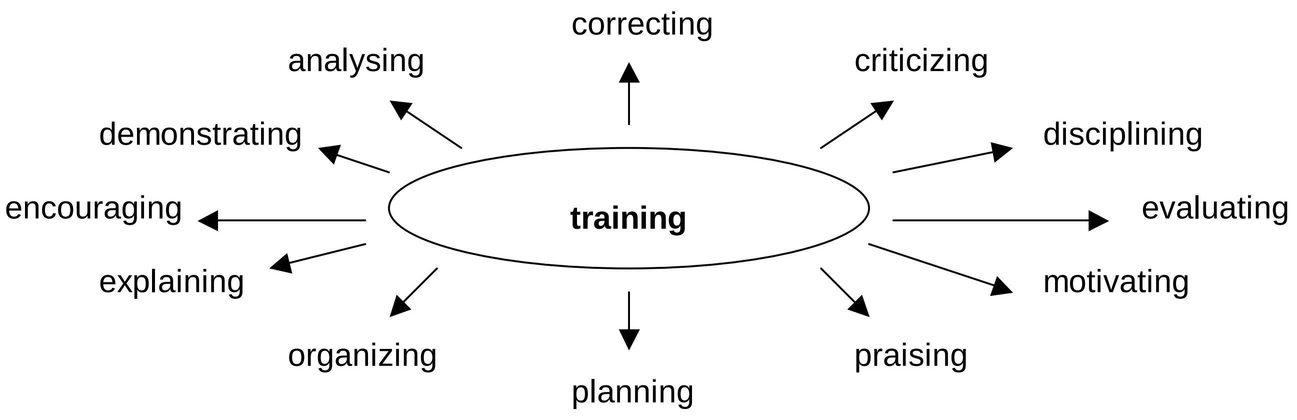
Becoming a trainer, however, should not just be another add-on responsibility of a supervisor. Management has to be aware that quality training is time consuming and therefore proper adjustments have to be made, for the trainers as well as for the trainees. To understand all aspects involved in training, let us now have a look at what it takes to be a good trainer.

3. *The trainer*

The main task of a trainer is to train. When we look into the dictionary, it provides the following definition:

to train	=	to give teaching or practice, esp. in an act, profession, or skill
	=	to make ready for a test of skill

Taking a closer look we will find that training involves quite a range of different activities, such as:



As for demonstrating, it can mean many things, from welding over sawing to cutting, baking, drilling, painting, sewing, typing etc. What is being demonstrated will depend on the skill to be learned. The first requirement for you as a trainer therefore is that you can perform all the occupation specific skills involved in a particular profession and therein meet professional standards. You must also be equipped with the relevant specialized knowledge of your respective craft to be able to explain what you are doing and to give further background information whenever needed.

Analysing, correcting, evaluating, organizing and planning are some of the methodological skills you need as a trainer. You will have to organize training, decide on the sequence, plan and execute it, monitor progress of your trainees, evaluate skills and knowledge and correct mistakes. You may even have to deliver short presentations at times and make use of visual aids for better understanding.

Last, not least, you must be able to display social skills, that is communicating with and relating to others. You have to be able to explain, to encourage, criticize, motivate and praise. Without communication skills and the ability to handle different kinds of people, your professional expertise, e.g. as a welder, is hardly of any use when it comes to training. Unless you can communicate the crucial points to your trainees and explain them how and why something is done in a particular fashion, you will not be successful as a trainer. The professional competence of a trainer therefore comprises three areas:

The similarities to what is required of a good supervisor are quite obvious: He/she also needs technical, methodoligacl and social skills. The focus, of course, is different. While the trainer focusses his/her attention on the training process and the trainees, the supervisor is mainly concerned with all aspects of the production process. Nonetheless, as a trainer you also have to keep the production process in mind, in a way.

Skills training is not a purpose in itself. It is related to the needs of the industry and business sector, thus leading to or even creating (self-)employment. A thorough analysis of the skilled manpower needed in the respective business' sectors should be the foundation upon which the various training schemes of training centers and schools are build. For you as a trainer this means permanently updating your own knowledge on the latest developments in your field of expertise, be it new techniques, be it new procedures or equipment and machines. If you are not company based, staying in close touch with the industry of the area is an indispensable necessity, since the ultimate goal of skills training is to enhance the job opportunities of the trainees. Which leads us to the next set of people involved in training: the trainee.

4. The trainee

Each trainee is different. While some can easily assimilate some subject matters, they encounter difficulties in other areas. As a trainer, you have to consider the individual traits and characteristics which differentiate each trainee and cause each to react in his/her own peculiar way. Some of these individual differences are:

Adaptability	Education	Initiative
Age	Experience	Leadership
Ambition	Habits	Patience
Aptitude	Imagination	Temperament
Dependability	Intelligence	Tolerance
Determination	Interest	Versatility

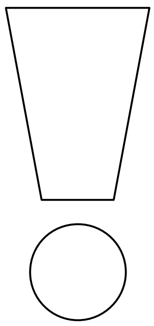
As a trainer, you also have to adapt the training to the background of the respective trainees. This means being considerate of the level of knowledge they have, whether they are slow learners or fast learners and how they learn best. To recognize the different needs of different people in a training context is a crucial requirement for a trainer since it is his/her responsibility to facilitate learning for all trainees.

As was already said, the differences between learners depend on a wide variety of factors, one of them being age: in general, the ability to learn increases rapidly from early childhood to the early twenties, after which it declines very slowly up to about the age of 45. Somewhere around 55, a steeper decline begins. While manipulative skills are usually learned faster by the younger ones, middle-aged people can be more adept at learning due to their better background of knowledge and experience. Despite of age, continuous learning has become a necessity today because of the constant and rapid changes in procedures, processes etc.

4.1. The young trainee

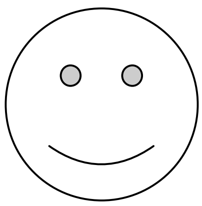
Youth, the time between childhood and adulthood (10/12 to 18/20 years), is the period in which the growing human being attempts to become an independent personality. The central conflicts of young people stem from that intermediate position. This transition period and the physical changes involved often lead to uncertainty and problems of orientation. The young people’s difficulties with their own development frequently then lead to difficulties with their environment, particularly with adults. The group of persons of their own age (peer group), on the other hand, is an important aid to orientation for young people since it is also the training ground for behavior in adult society.

When dealing with young people as trainees, the following aspects should be considered:



- Young people want to be taken seriously. They would like to take on responsibility.
- They have a great urge for action and wish to press forward into the material sectors of adults but without being patronized.
- They are looking for role models in adults, but are still uncertain in dealing with them. Adults, in particular teachers and trainers, must try to break down this barrier.

Young people enjoy learning whenever



- Teaching makes link to their interest in other persons
- Teaching is eventful and diversified (urge for experience)
- They can do something themselves (urge for activity)
- They can help in planning and organizing and do things on their own (urge for self-determination & responsibility)
- They are invariably accepted with all their idiosyncrasies
- Minor achievements are also acknowledged and praised
- They can apply what they have learned to genuine problems within their life

4.2. *The adult trainee*

Adults generally consist of personalities which are relatively complete. They have increasing experience of life and clearer ideas of themselves and their goals than young people. They are accustomed to acting as persons who are independent and free, who are fully capable of running a business and making sound judgements. All in all, they have developed habits which they are not easily willing to abandon or have questioned. This commitment becomes stronger, the older one becomes.

The tendency towards consistency, towards maintaining and retaining opinions and attitudes can pose a serious problem, though, when it comes to learning. For learning always means change of behavior due to experience: new knowledge, new skills or new attitudes lead to new behavior. It may therefore be difficult for them to accept new approaches, techniques etc. and thus „unlearn“ previous behavior.

It is also a fact that earlier learning experience governs the nature of acquiring and processing new learning experience, that is what we have learned and how we learned. Depending on the experience, previous learning can have a positive or a negative effect; an adult will be motivated by hope of success or fear of failure and be a confident or rather apprehensive learner due to his/her individual learning history. To accept new forms of learning is not impossible, but will take time.

As a trainer, you have to take those aspects into consideration when dealing with adult trainees. Adults also show a:

- Slower speed of learning, therefore require more time
- Less perfect short-term memory, but usually a better long-term memory for matters concerning the profession
- Reduction in individual performances of perception, greater reaction time

On the other hand, they show a:

- Greater accuracy and improved care in the process of learning
- Greater general and professional experience and experience of life with more points of contact for learning
- Greater attention and perseverance

Deutscher Entwicklungsdienst

5. The trainer - trainee relationship

In the transition period between childhood and adulthood, young people develop ideas about who they might be and what they want to become, and orient themselves thereby according to models and prototypes. The latter are generally abstract concepts or characteristics – they prescribe how one is to live, for example. Models can be persons in their own personal environment, such as teachers, trainers, parents or older persons, also personalities of public importance.

A model is only effective when young people can observe and copy how adult models master problems which they themselves also have. For you as a trainer that means that you should avoid giving the impression of being able to do „everything“, and do it perfectly. It may even lead to defiance on the part of the trainees as there is too great a distance between you and them: you are too far away to be a model and you also may cause a feeling of inferiority – I can never be like this model.

Though young people want to be taken seriously, that doesn't mean to treat them in exactly the same way as other adults. On the contrary, it may tempt them to have exaggerated opinions of themselves and even result in considerable disciplinary problems. The art of relating to them means finding the right tone for the right situation and person. For your young trainees you will be a model, a supervisor, and even a counselor at times.

As towards the adult learner, wherever possible you behave in a partner-like and friendly manner; you express criticism carefully and fairly and you show that you have confidence in his/her capability. In your training approach you utilize supportive and reinforcing elements to make learning an experience of success from the very beginning. As much as the young trainee needs to be encouraged, this holds also true for the adult learner.

6. The human factor as the big difference

As we already said, it is the human factor that makes the difference: Whether staff is well-trained or not, will show in many ways. Though quality training is defenitely time consuming and, of course, a cost factor, it is also an investment in the future that will surely pay off. Particularly when it comes to in-house training, a proper cost analysis will show that it is always to the advantage of the business to ensure that their employees meet the qualifications required for a particular job.

When comparing the performance of two imagined companies with the same kind of set-up except for staff – the one working with well-trained people, the other working with people who are not equipped for the jobs that they perform – the advantages of training show easily:

Advantages

Well kept tools and machines

Well maintained equipment

Maximum and proper use of resources

Good quality of products/service

Low number of rejects/complaints

Faster production

Higher output

High safety standards

High environmental standards

Motivated staff

Unit 2 The Training Goals

1. The meaning of learning

In the previous chapter we came to the conclusion that the human factor makes the big difference with regard to production or service: we need the right people to do the right jobs. To ensure that this happens, it is important to specify what a person is required to know and must be able to do for a particular work placement. If we cannot find someone who meets these specific requirements, we then will have to start training somebody: we will have to find a person who is willing to learn. We also said that continuous, life-long learning is a must since there are always changes – new procedures, new machines, new technologies. So learning is really an integral, necessary part of our working life. But what really is learning?

Learning has been defined in various ways by different scientists. The essence of all these definitions, however, could be put as such: Learning means that we change our behavior due to experiences. This definition excludes changes of behavior due to chemical influence, like drinking beer or taking drugs, changes due to momentarily physical strain, like being tired or, changes due to genetics while growing up. On the other hand it is broad enough to include the many different ways of what and how we learn.

Definition

Learning = change of behavior due to experiences

2. The areas of learning

When learning is defined as change of behavior, the fact that somebody has learned something should be seen in his/her behavior after learning. If, for example, a trainee does not change his/her behavior, then it is impossible for the trainer to know whether he/she has really learned anything. This is quite obvious when we look at an example:

- Previously, he/she was not able to explain a band saw, but now he/she can!
- Previously, he/she was not able to cut wood with a band saw, but now he/she can!
- Previously, he/she was not able to cut accurately, but now he/she can!

Looking at this example, we can hereby also identify different types of learning: Through learning we can acquire knowledge (he/she understands the functions of a band saw and therefore can explain it), skills (he/she can operate the band saw and therefore cut wood) and attitudes (he/she values precision and therefore cuts accurately)**.**

So through learning we can acquire new…

…knowledge

We **know** more than before.

…skills

We **do** things better than before.

…attitudes

We hold a different **opinion** than before.

which leads to new…

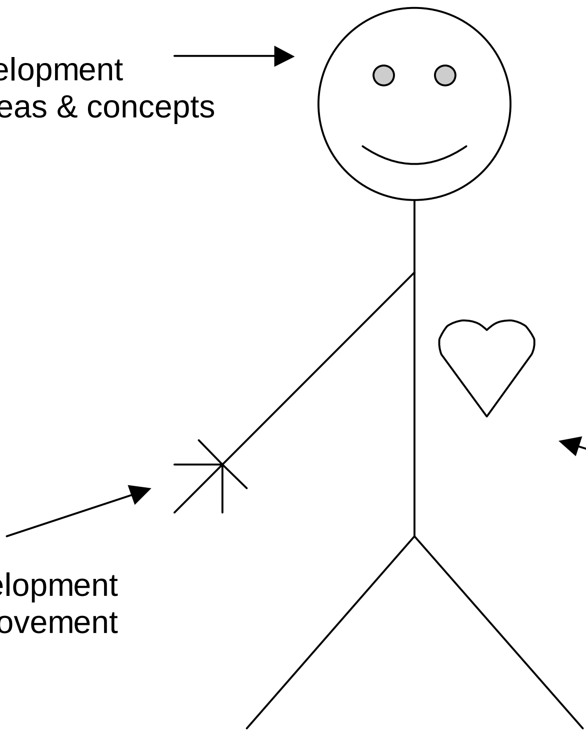
…patterns of behavior

We **behave** differently than before.

Learning often is quite complex and involves all areas. Let us, for example, look at driving: What actually happens when we learn how to drive a car? What knowledge is acquired? What skills are acquired? What attitudes are acquired? We can easily see that all three areas are involved which then lead to the actual behavior of how we drive a car. These different types of learning are also known as the cognitive, psychomotor and affective type. Pestalozzi, a Swiss educator, speaks of "Head, hand and heart". He recommends that successful teaching and learning has to activate all three types equally.

The **cognitive** learning (head) is concerned with the development of ideas and concepts. It covers much of what academic learning demands. It involves, among other things, understanding, reasoning and problem solving.

Development
of ideas & concepts



Affective (heart) learning is important for the development of values and attitudes. It involves emotions and affect. The most important factor in teaching appreciation is, of course, the teacher.

development
of values & attitudes

development
of movement

Psychomotor (hand) learning involves understanding the external world through the senses and the muscles. It varies from large muscular to fine motor skills based mainly on perception. This type of learning is particularly crucial in vocational training.

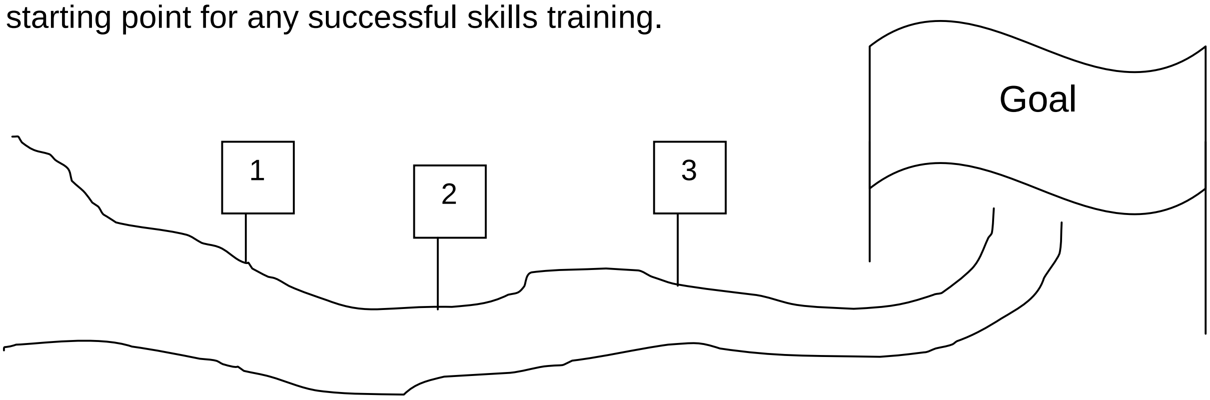
Though skills training mostly is concerned with psychomotor learning – the hand -, also cognitive and affective learning – the head and the heart – are involved in this process, else the training may not meet the desired result or even fail altogether. In the example above, the trainee may be able to operate the band saw, but since he/she lacks the right attitudes, the cuts are not being carried out accurately. Another example: when a trainee learns how to type, he/she not only has to be able to strike the keys on the typewriter in a certain pattern, but also has to display a sound knowledge of spelling and grammar as well as the general willingness to work accurately and with care. If not, the typed document might be full of mistakes and the sheet crumpled or even torn.

3. The importance of learning objectives

As we know already, training means to give teaching or practices, esp. in a profession or skill. It also means to make people ready for a test of skill. In vocational training the skills to be taught range from welding over metal work, woodwork, to tailoring, secretarial work and so on. The goal of the respective training courses therefore, is to produce professional welders, metal workers etc. Even though this is already specific with regard to the craft involved, the goal is still far too general to be of use in daily training.

Each craft in itself is usually composed not just of one, but many different skills. For example, before a plumber can install a water pipe system, he/she has to take the measurement, cut the pipes, cut the threads and so on. To become a plumber then means to learn a whole variety of different skills. To ensure that all aspects of a profession are covered, the overall training goal needs to be broken down into more specific learning goals or objectives. This holds true not only for training courses with a broader goal, it is also a requirement for the learning process of complex procedures that involve more than just one skill.

As a trainer, it will usually be your task to define what are the single learning steps involved in a particular learning process and to put these single steps into a logical sequence. To formulate precise learning objectives also helps you to control whether your training has been successful or not. In a way, the clear formulation of learning objectives is the key starting point for any successful skills training.



4. Formulating learning objectives

When learning means change of behavior due to experiences, successful training can be measured according to the behavior of the trainees after a learning experience. To assess whether someone has learned something or not, therefore requires a clear statement about what is being learned (content) and how it is being demonstrated or performed (behavior) by the end of the learning process. The precise formulation of learning objectives, with an integrated description of behavior and the contents of learning, is crucial for the learning process. It reduces misunderstanding concerning training measures and thus helps both parties involved – the trainer and the trainee.

Learning objectives

- say what the trainee has to know after the instruction or how he/she has to handle something
- list by which help he/she has to do it (by using a dictionary, a tool)
- say how he/she has to do it (in which time, with what precision)

We should inform the trainees about the instructional objectives in advance. We should tell them criteria to enable them to assess or control on their own whether they have mastered the instructional objectives.

Objectives for a certain learner group need not to be identical for all learners. They can and sometimes must be different for subgroups or individual learners according to their different levels. Such objectives may be different with regard to the amount of subject matter covered and/or with regard to the level of achievement.

If you want to formulate objectives for all learners, you have to find objectives suitable for the poorest trainees. That does not mean to abandon established standards – to let pass trainees for the next level of training when they do not meet the required qualifications.

Only if you define your objectives precisely in advance it is possible to assess and evaluate the achievements of your trainees adequately to prior fixed norms. If not, you run the risk of judging out of the moment, which might not be fair to your trainees' performances, resulting in either over- or underrating them.

Learning objectives should be…

S	specific	stated in action verbs	S
M	measurable	indicating minimum level of concept response	M
A	attainable	according to trainee potential and field of experience	A
R	realistic	resource- and reality-based	R
T	time bound	be in coherence with the training timetable	T

5. Classifying learning objectives

Objectives can be classified in various ways. A useful way to classify them when it comes to actual training is by their degree of difficulty and by their areas. According to the three areas of learning, we distinguish between cognitive, affective and psychomotor learning domains and the respective objectives. In skills training, of course, the emphasis is on the psychomotor domain – the hand, but as we saw already, the other two domains are also important – the head and the heart.

All three domains involve in themselves different levels: in the psychomotor area (hand) operations to be performed become more and more automatic; in the affective area (heart) attitudes become more and more internalized; in the cognitive area (head) the material becomes more and more complex.

On the following pages, you find detailed information for each domain with the different levels of learning involved, a general description with what the objectives of each level are concerned, and suggestions for action verbs to be used. This may particularly helpful for those who will have to develop a training plan, e.g. human resource department. To illustrate the meaning, the learning process of becoming a cashier is added for each domain as an example.

The psychomotor domain (hand):
Here the objectives can be ordered according to the degree to which operations have become automatic.

Level	General Instructional Objectives	Action Verbs
Perception	Recognizing a given set of actions. Watching a series of motions.	attend to, listen, look at, notice, observe, view, watch
Set-up	Positioning self for action. Recognizing given procedures as preliminary to action.	adjust, arrange, order, position, prepare, select
Guided response	Imitating and repeating performance of skilled instructor. Assuming roles or situations. Acting out pre-planned actions. Demonstrating procedures and methods.	act, demonstrate, display, exhibit, illustrate, perform, role-play, show, repeat demonstrated skill (drill, fry, paint, sew, type etc.)
Internalized response	Performing skill/task up to or exceeding established standards.	Perfecting demonstrated skill (drill, fry, paint, sew, type etc.)
Complex response	Applying internalized skill to new situations and under any given circumstances. Combining internalized skills to perform complex operations.	Integrate skill into complex actions and problem solving

Hierarchy of psychomotor learning objectives:

1.	The trainee observes the handling of a cash register.
2.	The trainee prepares the cash register for work: checking power, paper roll, change, laser reader.
3.	The trainee processes cash purchases.
4.	The trainee handles credit card purchases.
5.	The trainee can carry out all transactions involved, e.g. redeeming a voucher, correcting prices, issuing written receipts.

The affective domain (heart):
Here one can produce a hierarchy of objectives according to the degree to which values and attitudes have been brought into the student‘s consciousness and to what degree they have been internalized and become automatic.

Level	General Instructional Objectives	Action Verbs
Receiving	Listening attentively. Showing awareness of the importance of learning. Paying close attention to the classroom activities.	ask, follow, listen, reply, watch
Responding	Performing according to received input (lecture, demonstration etc.)	answer, comply, conform, execute, follow observe, perform, practice, present, show
Valuing	Developing and demonstrating a preference according to outlined values and standards.	complete, describe, differentiate, explain, form, initiate, invite, join, justify, propose, select, share
Transferring	Appreciating values and high standards in other areas.	adhere, alter, arrange, combine, compare, defend, generalize, identify, integrate, modify, relate, synthesize
Creating	Displaying general awareness with regard to values and standards. Creating standards in which proper conditions prevail.	act, discriminate, display, influence, practice, propose, qualify, question, revise, solve, use, verify

Hierarchy of affective learning objectives:

1.	The trainee listens to a lecture about payment and safety precautions involved.
2.	The trainee examines bills for authenticity.
3.	The trainee double-checks all transactions, e.g. received payment, change, credit card signatures, daily account.
4.	The trainee handles all financial transactions with care.
5.	The trainee prefers situations where safety standards are met.

The cognitive domain (head):
In the cognitive domain the hierarchy of objectives follows the principle of increasing complexity. It is assumed that higher objective levels cannot be reached until those beneath them have been dealt with.

Level	General Instructional Objectives	Action Verbs
Knowledge	Knowledge of common terms, specific facts, methods and procedures, basic concepts, principles.	arrange, define, duplicate, label, list, memorize, name, order, recall, recognize, relate, repeat, reproduce
Comprehension	Understanding of facts and principles, verbal material, charts and graphs etc. Translate verbal material into mathematical formulas.	classify, describe, discuss, explain, express, identify, indicate, locate, recognize, restate, review, select, tell, translate
Application	Applying concepts and principles in practical situations and in different context. Demonstrating correct usage of a method or procedure.	apply, choose, demonstrate, dramatize, employ, illustrate, interpret, operate, perform, practice, schedule, sketch, solve, use
Analysis	Recognizing assumptions and logical fallacies in reasoning. Distinguishing between facts and inferences. Evaluating the relevance of data. Analyzing structures.	analyze, appraise, calculate, categorize, compare, contrast, criticize, diagram, examine, experiment, discriminate, distinguish, inventory, question, test
Synthesis	Writing a well-organized theme. Giving a well-organized speech. Proposing a plan for an experiment. Integrating learning from different areas into a plan for solving a problem.	arrange, assemble, collect, compose, construct, create, design, formulate, manage, organize, plan, prepare, propose, set up, write
Evaluation	Judging the logical consistency of written material, the adequacy with which conclusions are supported by data, the value of a work by use of external standards of excellence.	appraise, argue, assess, attack, choose, compare, defend, estimate, judge, predict, rate, score, select, support, value

Hierarchy of cognitive learning objectives:

1.	The trainee can name the different forms of payment: cash, credit card, down payment.
2.	The trainee can explain the single steps involved in cash payment.
3.	The trainee can perform the mathematical operations involved in cash payment.
4.	The trainee can compare the advantages and disadvantages of each form of payment.
5.	The trainee can plan how to settle the daily account of the cash registry.
6.	The trainee can assess possible causes for mistakes in daily account.

Likewise, this can be done for all other professions or crafts. Depending on the complexity of the skills and knowledge involved, one set of learning objectives with the three different domains will not be enough, of course. It is the function of the training plan to cover all the important learning areas.

6. The training plan

The training plan is an instrument to help us to train people. It contains information about the topics to be covered and the time frame of a particular training activity. It can vary from a rough outline to a detailed plan.

To ensure that the right people do the right job, it is important to specify what a person is required to know and/or must be able to do for a particular work placement. Training plans break down the major qualifications – e.g. being a welder, tool and die maker, plumber – into learning modules and single learning steps, along with the respective learning objectives and the time it supposedly takes to achieve them. They incorporate different subjects and topics to be tackled, such as technical drawing, trade mathematics etc.

To formulate a training plan means to:

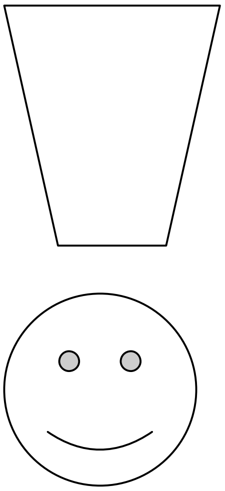
- Identify the needs with regard to skilled workforce
- Translate the needs into competencies
- Break down competencies into learning modules and single learning steps
- Formulate objectives
- Allocate a time-frame
- Specify entry requirements for potential trainees, e.g. educational background, working experience

Within the business sector, a lot of companies are not conducting training courses as such or follow a particular training plan. Nonetheless, there is a growing awareness that a company will benefit in many ways once a systematic approach to training is established. However, a training plan is only as good as the people who implement it. In that context, once again it must be stressed that the ability to communicate with others is one of the crucial requirements for a trainer.

7. The importance of communication

Very often, we just assume that the other person knows what to do and how to do it and why to do it. The reason why problems arise has partly to do with this assumption. When investigating the real cause of a problem at work, many times we will find that people have not been instructed sufficiently, if at all: how to do things in the correct manner and why this is important. Basically, it is a lack of communication.

To avoid that the same mistakes happen again and again, a company can begin to document and systematize what an employee for a particular position should know and what general company rules and policies are to be followed. This way, important information is not being forgotten or left out. Instructions are laid down and can be referred to in case problems arise. Also, each workstation in a production line can be equipped with a chart that lists the sequence of steps and procedures to be observed at this particular placement. This helps to rule out mistakes, thus increasing quality and safety.

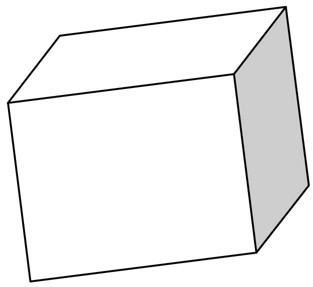


As was said, however, it is not enough to put all these matters just in writing. Once again, it is the human factor that makes the big difference. It is usually up to the supervisor or trainer to communicate what is important to the respective people: to explain the rules, to point out and demonstrate the procedures, to correct, to evaluate etc., thus facilitating learning. To do this successfully, it is useful to plan or reflect in advance on how to proceed with a particular skills training or instruction. This way, you ensure that you don't forget important things, that you are clear about the objectives and sequence of instruction and that you have an idea of how long it may take. And together with your objectives, you already have established the criteria for evaluation.

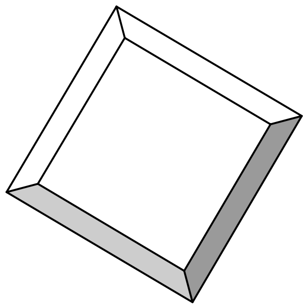
8. Evaluation and quality control

As we said, learning means change of behavior due to experiences. Learning objectives, therefore, state what kind of behavior we expect at the end of a learning process: what a trainee has to do/know, with what help he/she is going to do it (e.g. with a particular tool), and how he/she is going to do it (with what precision, in what time). Thus, we have already established criteria, which allow us to evaluate the performance of a trainee.

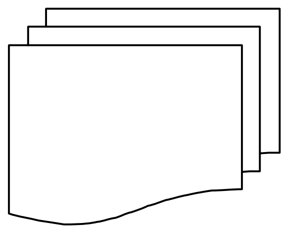
In skills training, evaluation is vital for long-term success. Evaluating means to ensure that things are done in the right way, thus guaranteeing quality work and production and good service in the long run.



Evaluation is a constant, on-going process. It means not only assessing the results at the end of a learning process, it also means to correct mistakes in between. That may incorporate repeating demonstrations, explaining a matter again, perhaps in a different way, or pointing out reasons why a work piece does not meet the required standards and how it can be improved. It also means to give an opportunity to ask questions and enough time to exercise and strengthen a particular skill.



Once more, we can see that communication skills play a vital role: as a trainer, you must be able to criticize the trainees in a way that they are not discouraged, yet understand what you mean. It is of no use “to beat around the bush” - that is to pretend that something is well done when it is, in fact, not. Also, the “This-will-do” attitude is of no help. To approve of a piece of work that does not meet established standards simply because it still somehow functions or satisfies the need, is un-professional! Thus, you will only encourage wrong work attitudes and also damage your own reputation as a good, quality-conscious trainer.



It is quite obvious that a company will benefit from the craftsmanship of their workforce. With globalization and increasing competition, quality will be one of the key factors that determine the success or failure of a business in the long run.

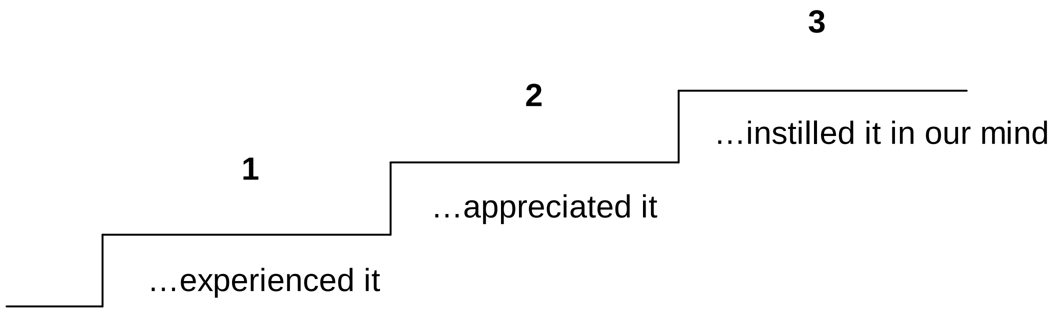
For the individual, the benefit is also obvious: the better skilled and trained a person is, the higher are the chances for employment or successful self-employment. In training people, you as a trainer not only contribute to other people’s life in form of passing on skills and knowledge. You can also nurture and help develop the pride that people have: the pride in their craft and trade and in a job well done.

Unit 3 The Training Methods

1. The three steps of learning

Since learning means change of behavior due to experiences, the first step in learning means that we have to experience something new: new knowledge, new skills, or new attitudes. However, having experienced something does not mean that we have learned it already. Apart from experiencing something new, we also have to understand the meaning of it - we have to appreciate it, the second step in learning. If not, it will be very hard to really learn it – that is, to remember it, the third step in the learning process. Without instilling the new knowledge, skills or attitudes in our minds, the learning process is not complete.

Therefore, we can say that we have not learned something until we have…



But how do we really learn? Let us take a closer look at different ways of learning of human beings that are also relevant for successful training.

2. Different ways of learning

To understand the different types of learning, let us look at some examples:

Trial & error

A supervisor holds a stopwatch in his/her hand, and fumbles with the crown and the pushbuttons in order to find out how it can be started, and what function the various knobs have. He/she notes what happens when operating the crown and the pushbuttons on the side. He/she becomes familiar with the functions of the watch, and can operate it to conduct the desired function. He/she has learned by trial and error.

Observation & imitation

It is shown to the supervisor how he/she can start and stop the stopwatch by pressing the various knobs. He/she watches closely and copies until he/she succeeds in operating it. He/she has learned by observation and imitation.

Insight

The supervisor reads in the operating instructions that the stopwatch must be wound up carefully so that the spring does not break, and that the crown must be pressed vertically so that the axle is not deformed. He/she appreciates this and follows the advice. He/she has learned by insight.

Repeated perception

Whoever needs to look up the same telephone number frequently in a telephone directory will gradually note this number. He/she has learned by means of repeated perception.

Adaptation

As a heavy smoker a student in a class would like to light a cigarette. He/she looks around, and sees that no one is smoking, even those of his/her colleagues who are known smokers. He/she adapts, and from now on refrains from smoking, mostly also when it does not suit his/her environment. He/she has learned by adaptation.

Repetition

Somebody reads the definition of learning. He/she repeats it several times until he/she knows it by heart. He/she has learned by repetition, or by instilling it in his/her mind.

So human beings learn and thus change their behavior in various ways. Of course, learning can also be very complex and thus involve different approaches that are combined. Also, people have a preference for a particular way of learning: some learn easier by insight, others have to find out on their own, thus learning by trial and error.

By the way, people, children in particular, learn most of their social behavior by observation and imitation. In the context of training this means to display exactly the behavior we expect of our trainees, else our training is unlike to be successful. For example, if we want our trainees to cherish punctuality, we as role models have to be on time ourselves: Practice as you preach!

People also adapt to their surroundings. Just think of a very tidy environment, everything clean, no garbage around; it is quite hard to carelessly throw away something there. But once the environment is already littered, it doesn't take much to add another plastic bag full of garbage or throw away an empty bottle. For successful skills training this means to provide an environment where the desired conditions prevail: It is not enough to put up a poster about "Five S", the Five-S-approach has to be put into practice to be taken seriously!

3. *The meaning of training method*

When it comes to training, there are a variety of different methods that each make use of the various ways human beings learn. Before we have a closer look at those methods, let us first define what a method is.

According to the dictionary a method means:

Method	=	a way or manner of doing something
	=	the use of an orderly system as opposed to luck

Correspondingly, a training method means:

Training method	=	a consciously followed way
	=	to achieve specific training objectives

Furthermore, a training method is identified by:

- The social form (individual, pair, or group instruction)
- A sequence of goal-oriented steps
- A pedagogical concept

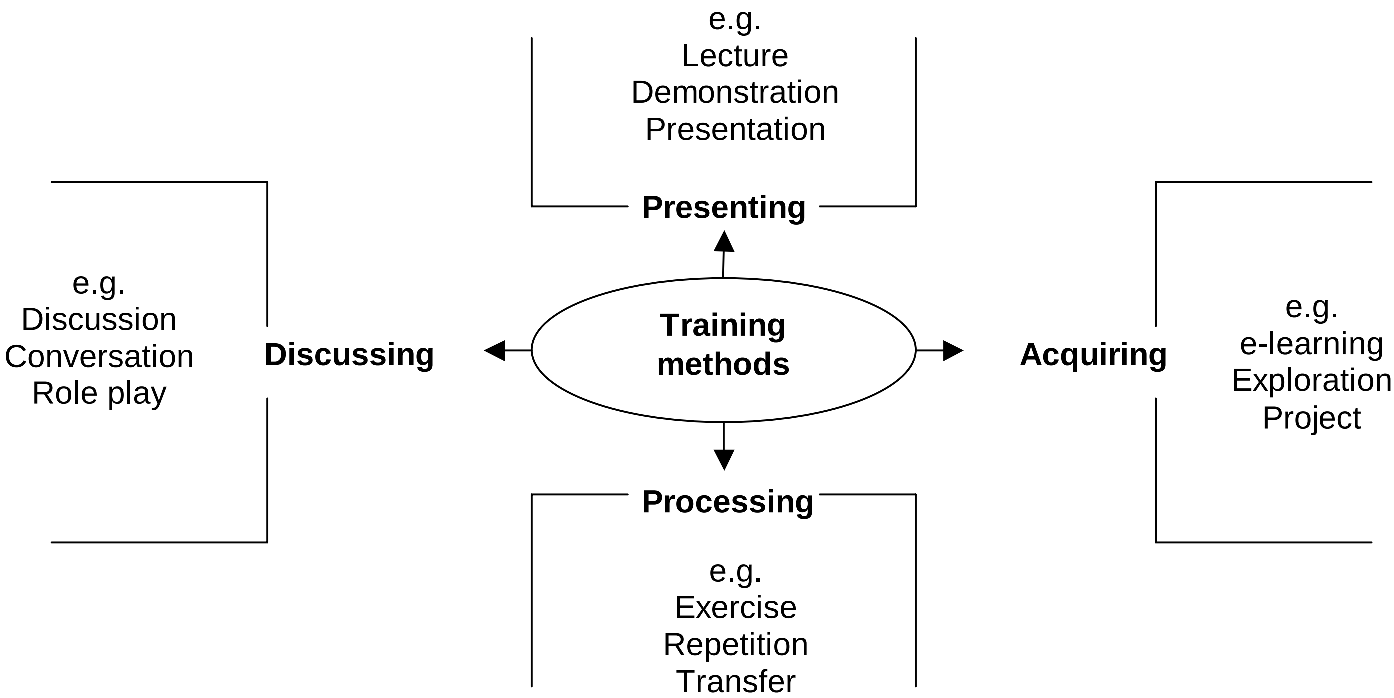
If, for example, the pedagogical concept of independent planning, executing and controlling is favored, these steps will also be highly dominant in the respective training method as is the case with the project method. The training itself then takes a typical course; patterns and individual steps can be identified clearly.

Based on these characteristic features and the definition, it is obvious that the widespread "observe – copy" approach in itself cannot be regarded as a training method. Though the trainee may learn something, the major shortcomings are:

- The training and learning is unplanned and unsystematic.
- It is a so-called "stealing with the eyes" instead of training/learning.
- It is copying without any planned and explicit demonstration.
- Beginners cannot cope because it is usually too much for them.

4. The four categories of training methods

Training methods can be grouped into four main categories. Each category puts the emphasis on a different aspect within the learning process, such as presenting, discussing, acquiring, or processing the material to be learned. Within each category, trainer and trainees are differently involved in the training process with regard to giving or receiving activities. Each category also has its particular features with certain advantages and disadvantages.

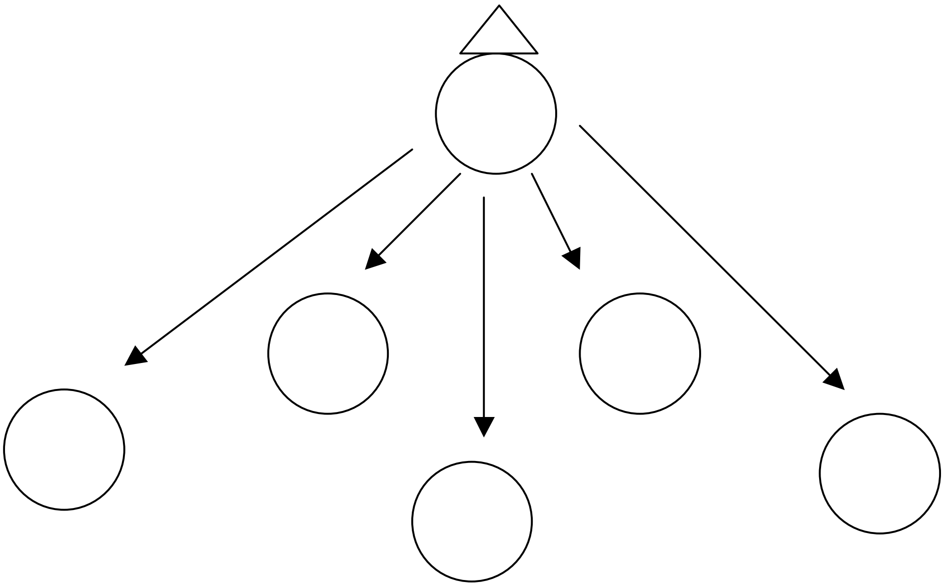


Training methods
based on **presenting**

Trainer:	**Trainee:**
Lectures Demonstrates Presents Performs Guides process of perception and thinking	Listens Watches Re-enacts in the mind Imitates Observes Gains understanding, perception, orientation

Lectures and presentations are used to present abstract topics and training matters, to explain complicated connections, problems, complex structures and non-visible features. To enhance learning, the trainer can make use of visuals such as films, slides, mock-ups, and originals. The trainer is active and giving, the trainees are passive and receiving.

Demonstrations are used to facilitate practical skills learning. Original tools and working materials are preferred. The trainer is active and giving, the trainee is receiving and active only insofar as he/she follows the outlined steps and patterns when imitating the observed behavior. The emphasis is on the trainee re-enacting what has been demonstrated and not on finding own solutions. The broader context of the respective skill is usually neglected.

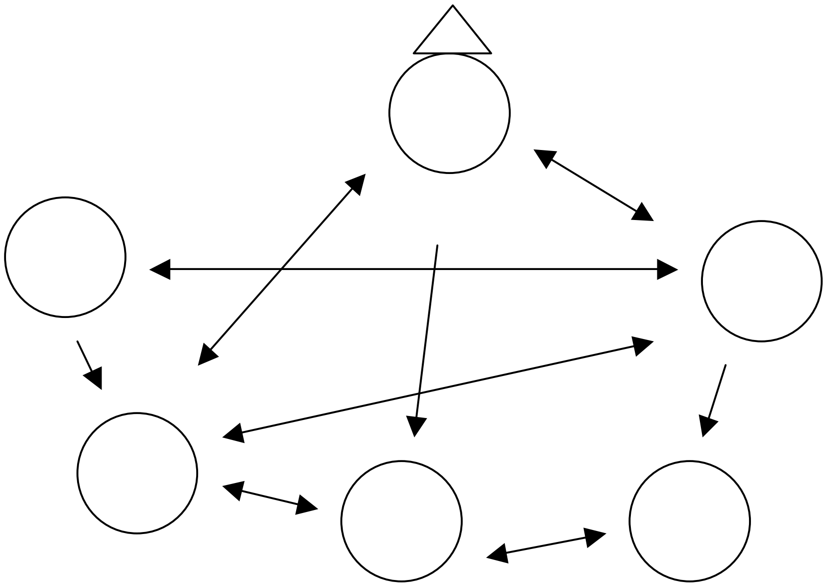


Training methods
based on **discussing**

Trainer:	**Trainee:**
Establishes objectives Explains topic Introduces Asks Gives inspiration Answers Corrects Confirms Summarizes	Answers Asks Contributes experiences Argues Discusses Debates

Methods favoring dialogue, such as discussion, conversation, debate, circle talk, role-play etc. are useful to enhance understanding and analyzing. The trainer guides the trainees by using the questioning technique; he/she gives ideas, makes suggestions etc. The trainees are actively involved in the learning process. They learn how to communicate and express themselves.

Topics can range from factual training matters over problem solving to exchange of experiences and opinions, the latter helping to develop tolerance and understanding. Also, matters concerning the training itself can be tackled. Depending on the choice of method, the trainer is more or less dominant; sometimes, he/she is just the moderator of an exchange.

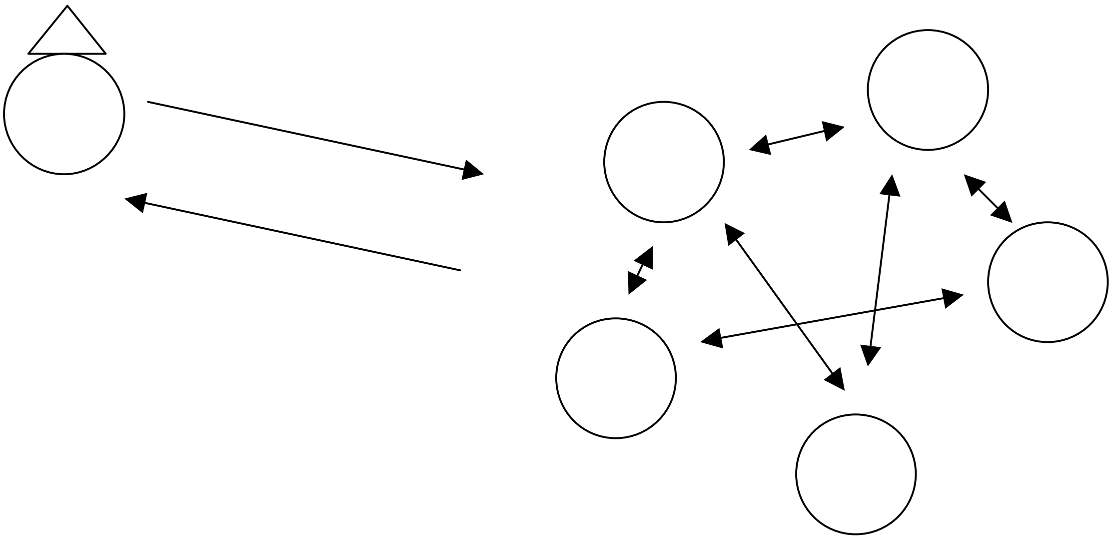


Training methods
based on **acquiring**

Trainer:	**Trainee:**
Introduces problem or task Arranges working method Assesses work attitude Assesses result Assists if necessary	Clarifies objectives Organizes the work Searches for solutions Procures information Solves problems Works out functional solutions Controls results Presents results

Project method, e-learning, exploration, guide text method, planning game, case study etc. are all based on the assumption that you learn most by exploring the subject matter and overcoming difficulties on your own. These methods try to develop independent learning, enhance planning, organizing and executing competence along with social competence since group work is mostly favored.

The trainees are actively involved in the learning process. They approach the trainer for help or advice when needed. The trainer is a counselor and organizer who remains at the background and only interferes when necessary.

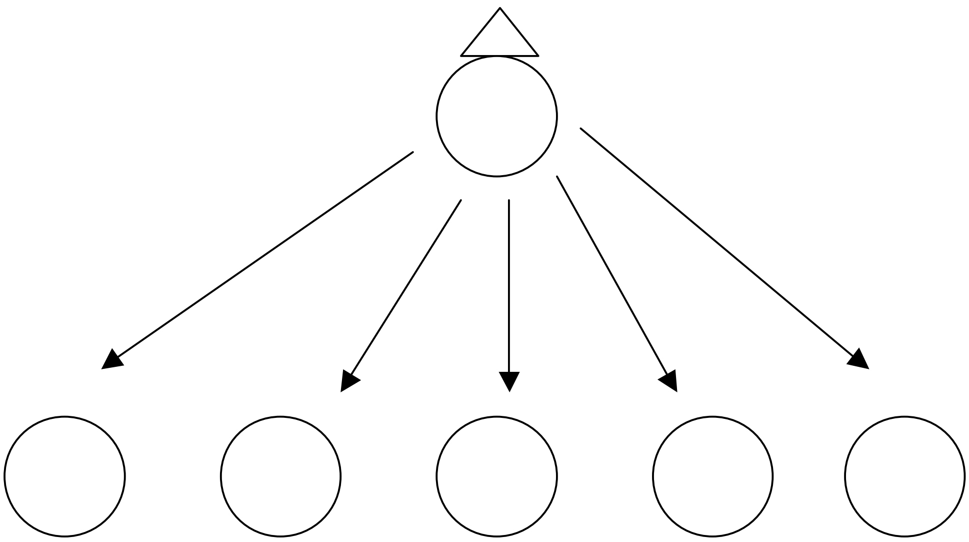


Training methods
based on **processing**

Trainer:	**Trainees:**
Organizes processing Motivates Imparts exercising and repetition techniques Offers transfer	Memorize learning matter Develop performance speed Develop performance security Transfer learned matter to other topics and areas

Methods based on processing are focused on the third step of learning, the instilling in the mind. They aim to strengthen the new skill or knowledge through exercises, repetition and transfer to new areas, that is changing the working conditions and making use of the fact that application is the best revision of learned material.

The trainer organizes this process by motivating and giving exercises and tasks to do. He/she controls the progress of the trainees, corrects when necessary, evaluates and also acknowledges progress.

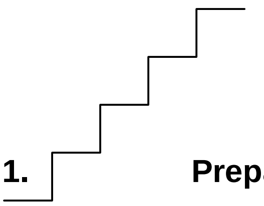


5. The Four-step-method

The Four-step-method is a simple but very successful method for skills training on a one-to-one level. It combines features of two categories: presenting and processing. The four steps refer to the way human beings learn: that they have to experience something new, to appreciate it and, last, not least, instill it in their minds to make the learning process complete.

For you as a trainer this method requires very good communication skills since each step of what you are doing has to be explained in detail. As a skilled person you may take a lot of things for granted. But as we already pointed out, assuming that the other person knows already can lead to serious misunderstandings and cause a lot of trouble. Also, it is not sufficient to simply demonstrate without explicitly telling the trainee what and how and why you are doing something. Without proper explanation, crucial procedures may not be noticed, thus leading to wrong ways of doing something.

The success of the four-step-method lies mainly in the ability of the trainer to explain exactly what he/she is doing. Another crucial feature is the follow-up: the trainee is given enough time and opportunity to strengthen the skill. During these exercises the trainer will observe the trainee and correct him/her when necessary, and acknowledge progress, of course. All in all, this approach can be considered quite effective, even though it is time consuming. But remember: quality training always requires plenty of time!



1. **Preparation of trainee**

- take the shyness
- motivate
- show the objectives and tasks
- evaluate the knowledge
- familiarize with the work place
- give advice concerning safety

Deutscher Entwicklungsdienst

2. Demonstration and explanation

- place the trainee that he/she is standing in the same direction to the work piece as you do
- 1. demonstration: demonstrate the whole procedure in original time
- in case of complicated procedures divide them into modules and teach them step by step
- 2. demonstration: repeat the demonstration and make the single steps visible; demonstrate difficult steps repeatedly
- say what you are doing, how and why you are doing it in that way (what? how? why?); go into detail
- give the opportunity to ask questions
- 3. demonstration: summarize and demonstrate uninterrupted

3. Trainee activity

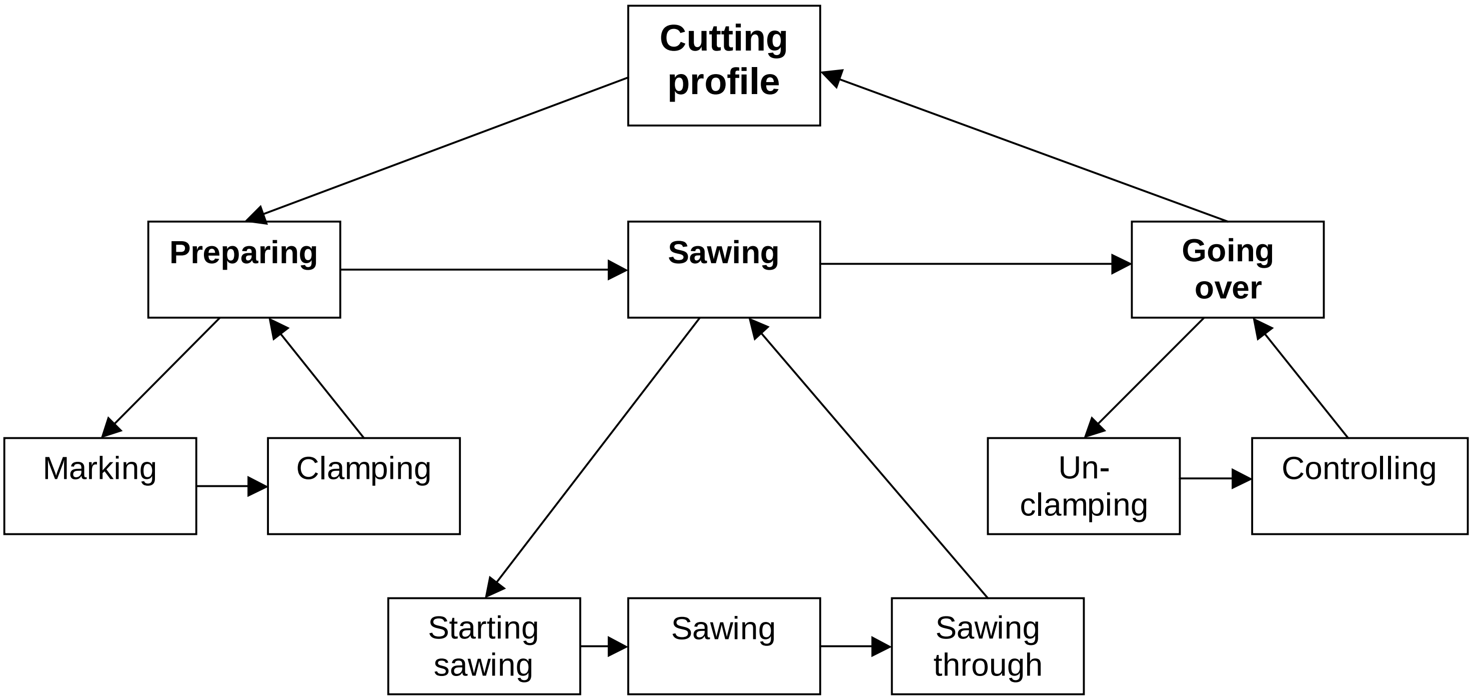
- encourage the trainee to try it on his/her own
- don't interrupt the trainee in his/her first attempts
- make comments only on serious mistakes
- precision is more important than speed
- let the trainee say what he/she is doing, how and why

4. Exercising and strengthening

- give enough time to exercise
- acknowledge progress
- control that no mistakes are done during exercising
- change conditions of exercising
- slow adaptation of real working condition

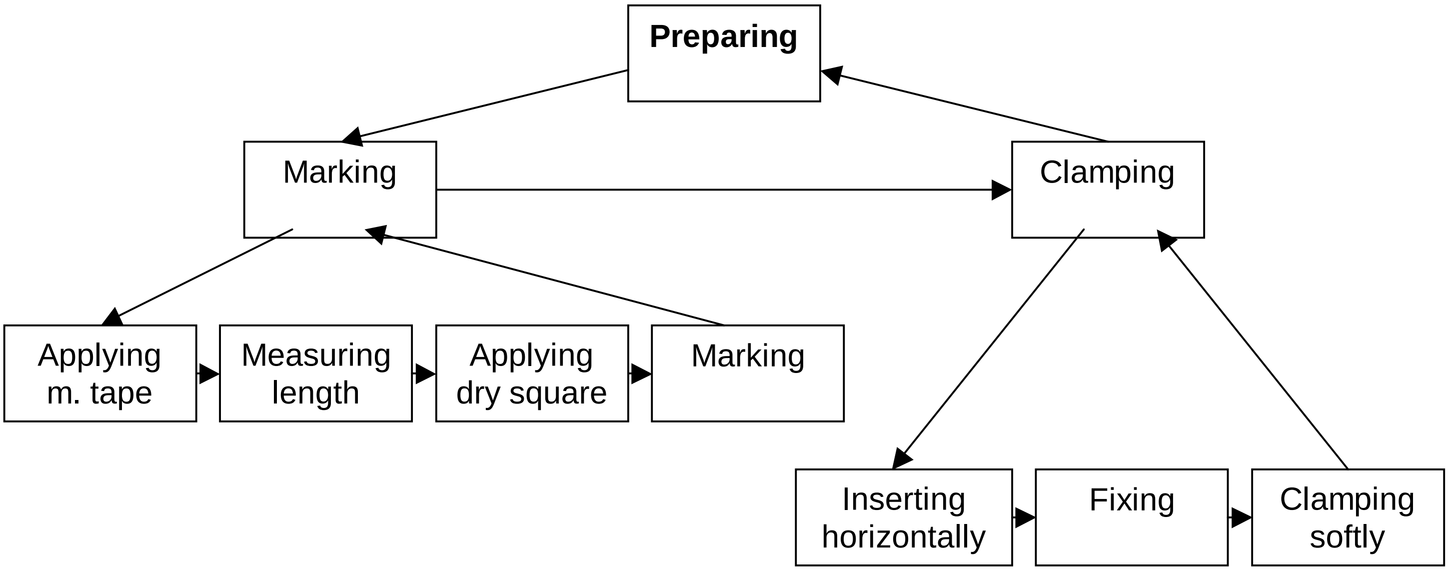
6. Example of sequence-of-actions analysis

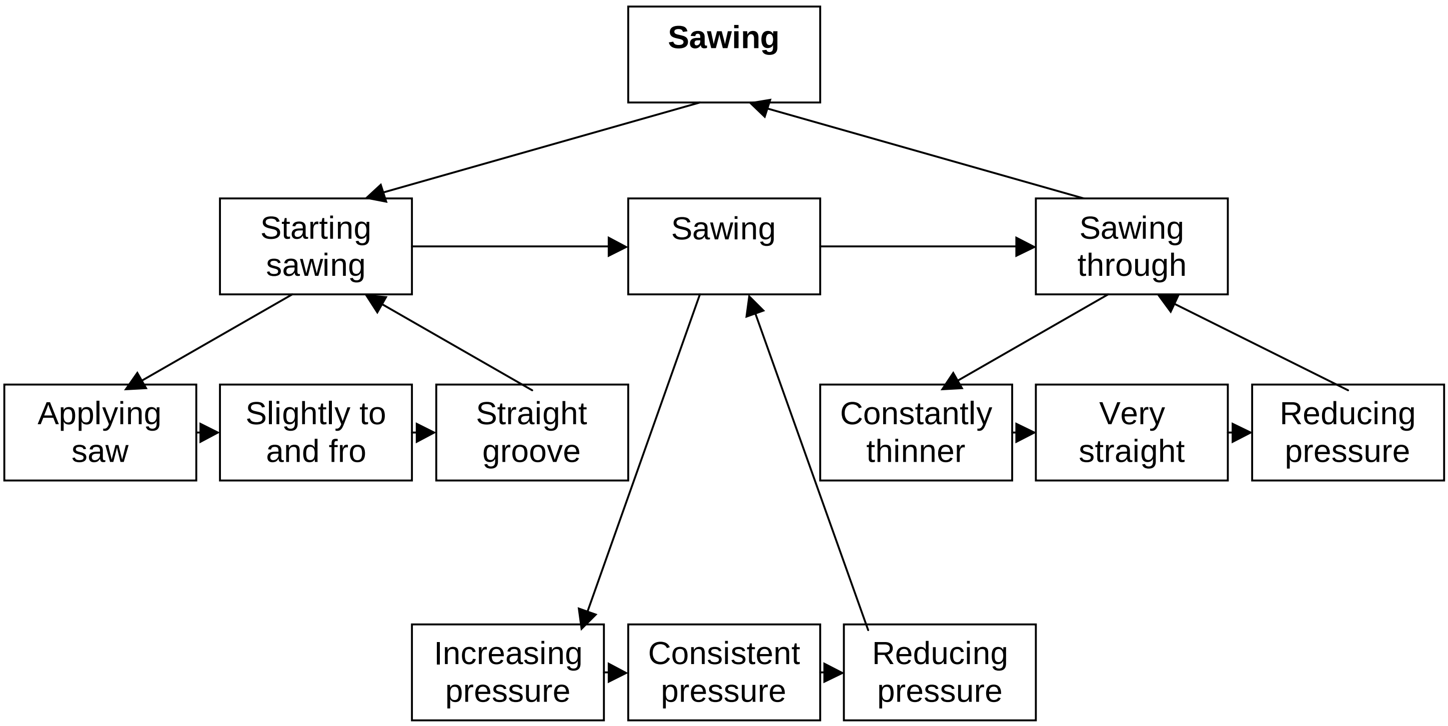
Let us now look at an example of a sequence of actions within the context of a Four-step-method training: the skill to be taught is cutting a profile. First, the task has to be analyzed and broken down into the major steps, such as preparing – sawing – going over. Each of these three major steps once again is analyzed and broken down into the main activities involved: Preparing then really means marking and clamping, sawing means starting, sawing and sawing through, while going over involves unclamping and controllingg. The chart below shows this sequence of activities.

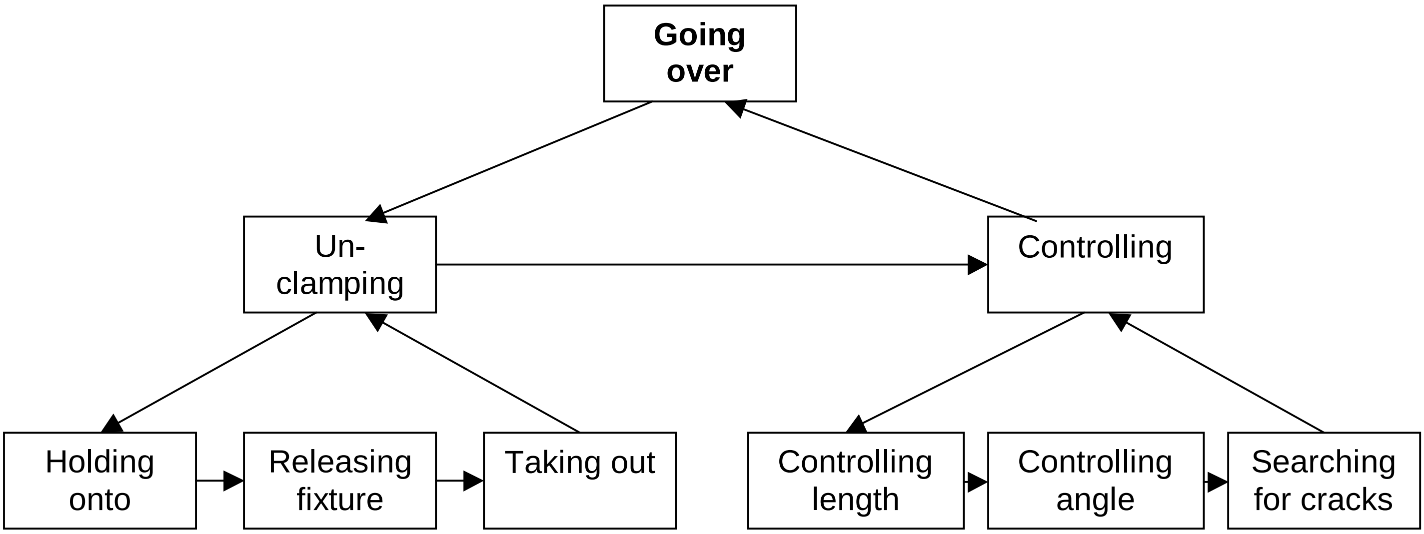


When analyzing each activity, however, we will find that it is not yet enough to describe preparing as marking and clamping. In order to be able to execute these activities, once again they have to be broken down into the various actions involved. Thus it is ensured that all important actions are included and made visible to the trainee. It also helps to prevent assuming the trainee may already know or that he/she may just recognize each action by simply observing the demonstration of the skill.

The following three charts illustrate the sequence of actions for the three major steps involved in cutting a profile: preparing, sawing and going over.







When demonstrating the skill, the trainer explains what he/she is doing (learning segment), how he/she is doing it (learning tip), and why he/she is doing it in that particular way (explanation). The chart below takes up the 22 single actions involved in cutting a profile and lists the learning tip and explanation for each.

No.	What? Learning segment	How? Learning tip	Why? Explanation
1	Applying measuring tape	Putting profile on level surface, hooking tip of measuring tape to pre-cut side and applying tape to upper edge of profile	To ensure correct measurement
2	Measuring length	Marking correct measurement with tip of pencil	To allow for precise marking with dry-square
3	Applying dry-square	Long side is applied alongside marked spot, short side is applied to edge of profile	To guarantuee sawing at right angle
4	Marking	Pulling fine pencil tightly along dry square on top side of profile; apply same procedure for marking both sides of profile using drawn line on top side as point of reference	To minimize deviation from correct measurement

5	Inserting profile horizontally	Edge of profile is level with edge of bench vise; marked line is 1 to 2 cm away from vise	Condition for straight and safe sawing
6	Fixing profile	Tightening vise slightly until profile holds	Final corrections are still possible
7	Clamping vise	With appropriate force, so safe sawing is possible	If clamped too tightly, wood can be damaged
8	Applying saw	Saw blade is lying exactly on drawn line in vertical position to profile using thump as guide with safe position of hands ensured	Starting point determines the whole result
9	Sawing slightly to and fro	Exerting as little pressure as possible on workpiece	Danger of tilting teeth and material breaking off
10	Sawing straight groove	Keeping saw perpendicular	To get proper vertical cut
11	Continuing sawing with increasing pressure	Increasing sawing pressure appropriately	Sawing pressure depends on sawing speed; ensuring quality
12	Sawing consistently through material	Finding optimum for frequence and stroke using whole length of saw blade	To achieve best quality cut
13	Reducing pressure	Reducing sawing pressure appropriately	Sawing pressure depends on sawing speed; ensuring quality
14	Getting constantly thinner	Preparing for sawing through with low pressure while keeping up frequenzy	Too much pressure and too little frequenzy can cause material to break off
15	Sawing very straight	Saw blade has to run parallel to remaining workpiece	Like during start: danger of tilting teeth and material breaking off
16	Reducing pressure	Sawing through with minimal pressure	To reduce parts breaking off, to avoid cracks
17	Holding on to workpiece	Taking clamped part into hand	Falling down of workpiece could cause damage
18	Releasing fixture	Turning vise in correct direction exerting slight pressure	If turned in wrong direction,workpiece will be damaged
19	Taking out profile	Putting workpiece on level surface	Here, final length measurements can best be taken

20	Controlling length	Measuring tape is exactly applied to upper edge of profile	A slanting position would cause inaccuracy of measurement
21	Controlling angle	Putting dry-square on cut end	Divergencies of angle can be made out against light
22	Searching for cracks	Examining area of sawing for cracks	Probability of cracks in that area is highest

7. Final conclusions

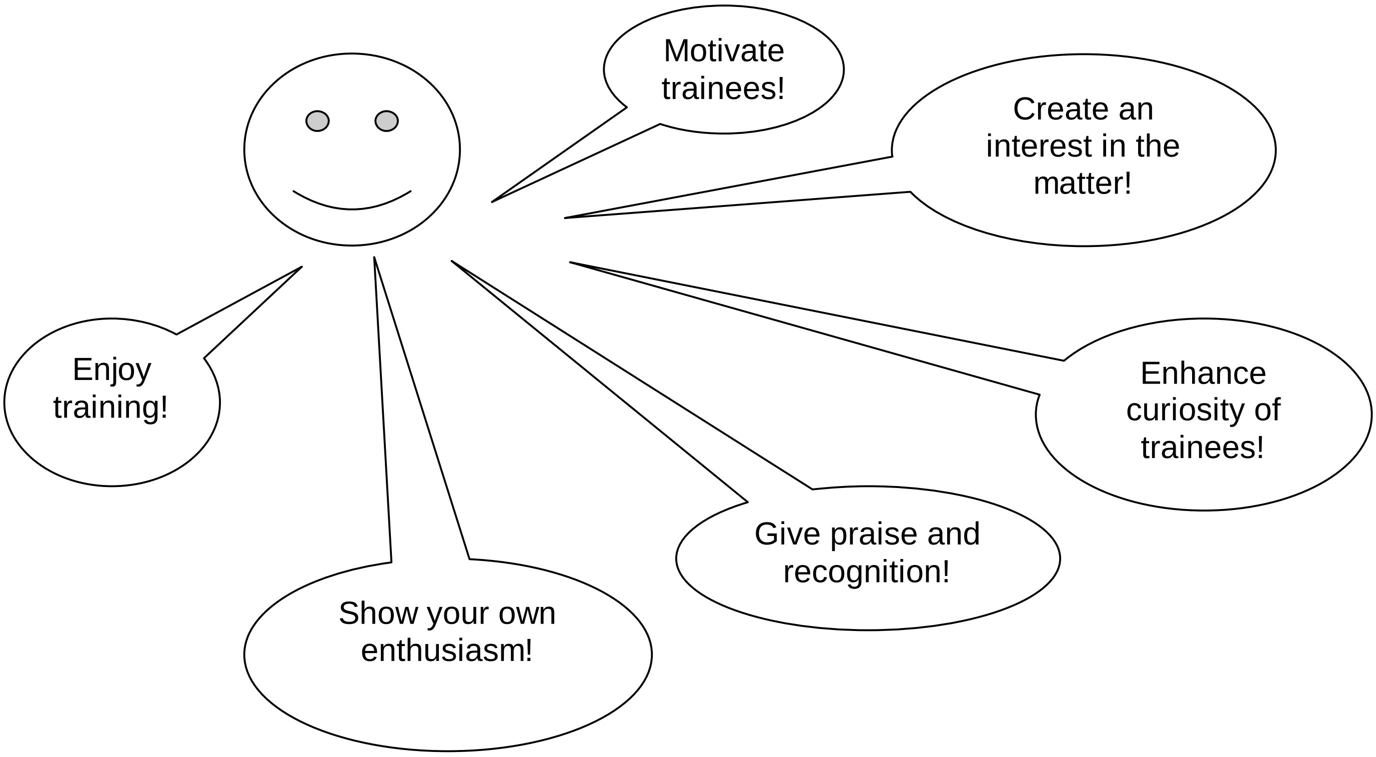
As we said earlier, a training method is a consciously followed way to achieve specific training objectives. Depending on these particular objectives and the nature of the material to be taught, you will decide which of the training methods out of the four categories you will choose. Your choice of method will also depend on your trainees – whether they can handle this particular method or not. Also you as the trainer must be able to handle the method you use. For example, it is not advisable to do role play when you are neither confident with the method nor convinced that your trainees will benefit from this exercise!

We also said that a training method is identified by its social form: training can take place on an individual (1 : 1) level, but there can also be pair or group instruction. Once again, this will depend on the objectives and the nature of the training matter.

Group instruction, of course, is favored out of organizational and financial reasons. But there are also other benefits: trainees can compare each other's performance, they can find help and assistance in other trainees, the likeliness of discussions and thus clarifications of problems is higher, and there is also a greater challenge while learning in a group as compared to learning on one's own. Particularly young trainees will favor group instruction since they rely so much on their peers and are usually more comfortable when being with people of their own age. Also the adult trainee will be happy to exchange views with people in similar positions whose advice on matters concerning the training can be asked.

In skills training, however, it is important to ensure that each trainee has an equal chance of learning. This may mean to present background information/theoretical knowledge to the whole group, while the actual demonstration of the particular skill is done on an individual or pair level. When demonstrating a new skill to a whole group, you have to ensure that the trainees' follow-up activities are supervised on an individual level. You also have to ensure that each trainee gets his/her turn and nobody is being left out. Once again, it has to be said that quality training is time consuming.

Whatever method you choose, however, they all have in common that you must have good communication skills: The success of your training efforts will largely depend on your ability to communicate!



Exercise 1

Explain the use, handling, safety and maintenance of a particular tool.

General remarks	Example: wooden hand saw
Use: State the major purpose. Name the features. Point out variety. Give reason for particular features.	**Use:** A hand-driven tool for cutting wood. Consists of handle and thin flat steel blade with row of V-shaped teeth on the edge. Direction of teeth indicates direction of sawing. Size of saw depends on wood (humidity, hardness, thickness). Wooden saw must have flexible blade. Bigger teeth make a rougher cut, finer teeth make a smoother cut. Set teeth allow blade to cut through wood.
Handling: Explain handling in general. Explain reasons. Give special tips where possible.	**Handling:** Fix piece to be sawn firmly with cut 0,5 to 2 cm off bench vise – if too close, saw gets into bench vise; if too far, material bends or breaks off, no straight cut possible; if not fixed firmly, material bends, no straight cut possible. Position body properly to make use of its force (upright position, body at ease, feet apart, sawing below waist level for proper vision of marking). Start with short strokes. Continue with long strokes using whole blade. Finish with short strokes reducing pressure.

Safety: Point out safety measures. Highlight possible consequences if advice is not followed.	**Safety:** All cutting tools should generally be handled with care. If not, injuries, such as cutting fingers, are likely to happen. Fix piece to be sawn firmly, else piece might fall down or saw might slip. Ensure safe position of fingers. Be aware of piece cut off falling down and hitting your feet. Insure firm grip of saw to avoid saw slipping off work piece. Be aware of sharp teeth.
Maintenance: Explain maintenance measures. Discourage wrong use.	**Maintenance:** Sharpen teeth with triangle file when needed. Apply oil to blade to prevent corrosion. Use wooden saw only for wood, not for metal. Don't cut through nails or screws.
Demonstration: Show how tool is used by demonstrating.	**Demonstration:** (see pages 33 – 37 of handout)
Application: Allow for trainees' exercise.	**Application:** Let trainees practise after they have observed proper demonstration. Vary exercises according to trainee's ongoing performance. Emphasize that accuracy is more important than speed.

Exercise 2

Evaluate and control work piece of trainee and give feedback.

General remarks	**Example: cutting profile**
Task: State trainee's task. Point out particulars.	**Task:** Cut a profile to length of 76 cm. Ensure right angle of cut. Handle material carefully.
Assessment: Assess execution of skills involved. Control particulars.	**Assessment:** Control length. Control angle. Control cut side for cracks. Control profile for other damage.
Diagnosis: Point out achievements. Point out failures. Diagnose cause of failure, e.g.: Has not understood task. Cannot perform skill required. Is afraid to use tool/equipment/machine. Has used wrong tool. Has used wrong material. Displays wrong work attitude. Thinks speed is more important than accuracy.	**Diagnosis:** Possible failures: Too long, too short – not familiar with correct measuring procedure; not able to read metric tape measure; wrong work attitude regarding accuracy. No straight cut/right angle – not familiar with correct marking procedure; wrong sawing technique; lack of sawing exercise; wrong work attitude regarding quality. Cracks – wrong sawing procedure; lack of sawing exercise; wrong work attitude regarding quality. Wood damaged – clamped too tightly in bench vise; tigthening bench vise instead of releasing when taking work piece out; wrong work attitude regarding quality.

Cure: Offer opportunities for overcoming mistakes according to diagnosis, e.g.: Repetition of knowledge required. Repetition of skill involved. Offer of help in general. Special assignments.	**Cure:** Explain metric system. Incorporate practical measuring exercises in daily training. Demonstrate correct measuring procedure again. Let trainee repeat exercise. Demonstrate correct marking procedure again. Let trainee repeat exercise. Demonstrate correct sawing procedure again. Let trainee exercise. Vary exercises. Emphasize importance of accuracy instead of speed. Point out additional costs through careless work (rejects, minor quality, abuse of resources, extra time to correct mistakes). Offer assistance whenever needed.

Dealing with different trainee behavior:

Type of trainee	**Trainer behavior**
The **aggressive** trainee	Remain objective and calm. Do not enter into quarrel. Reject personal attacks. Lead back to subject. Ask other trainees to discuss matter. Keep focus on training issue.
The **bored** trainee	Awaken interest. Emphasize importance of subject. Encourage to participate. Transfer responsibility. Call for attention. Ask selective questions to evaluate knowledge.

The **entertaining** trainee	Call for attention. Interrupt private discussions. Prevent activities that are not related to training. Concentrate on subject. Point out importance of serious attitude. Increase involvement in serious activities.
The **nervous** trainee	Try to calm down trainee. Try to focus trainee's attention on work piece and your feedback. Interrupt trainee politely when talking too long. Ask trainee to be brief and precise in statements. Have main points summarized. Ask selective questions.
The **over-confident** trainee	Call for attention. Emphasize importance of accuracy. Evoke ambition in trainee for good craft. Point out details. Give specific assignment to improve skill. Give responsibility.
The **quiet** trainee	Recognize progress. Ask questions to find out where trainee needs more instruction. Encourage trainee to ask questions himself/herself. Show that you take trainee seriously. Ensure trainee is being recognized despite his/her quiet nature.
The **quick** trainee	Acknowledge interest and result of first attempt. Stress that precision is more important than speed. Give reasons for accuracy. Point out that speed will come with time. Assign exercises. Vary conditions of exercises.

The **shy** trainee	Encourage to cooperate. Encourage to talk. Reinforce self-confidence. Address directly. Praise progress. Entrust with specific task.
The **slow** trainee	Encourage. Support. Talk slowly. Emphasize important points. Let trainee repeat important points to ensure he/she understood.
The **timid** trainee	Encourage. Reassure. Find out cause of fear. Help to overcome fear. Create opportunity for achievement. Acknowledge progress. Assign specific task.

Learning how to learn should be part of the curriculum

Visual

Visual learners find it easier to take in new information through pictures, diagrams, charts, films etc.

Auditory

Verbal learners find it easier to take in new information through the spoken word.

Kinesthetic

Kinesthetic learners find it easier to take in new information through copying demonstrations and getting physically involved.

- [ ] When I touch an object and play with it, I can describe it much better as opposed to just thoroughly looking at it.
- [ ] Only when I have made a paper airplane myself do I know how it works. From observing alone I cannot remember it.
- [ ] Explaining me how to operate a machine or equipment, or being able to observe an experiment during instruction, I remember the process much better as opposed to only having a hands-on experience.
- [ ] I can find a way through town easier when I not only have been explained or shown it on the map, but also traced the route with my finger.
- [ ] I understand the design of a blossom or leaf better when looking at a drawing in a book than by examining it myself.
- [ ] I remember experiences better than conversations or what I read.

The Learning Environment

My learning results are best

- When music is played during learning
- When I am not distracted by any kind of noise
- When I am alone in the room
- When someone I like stays with me in the same room
- When I am together with my classmates
- When I am surrounded with strangers (atmosphere of a café)
- When I have eaten before I start learning
- When I can eat or drink during learning
- When I am in a good mood
- When I am angry or frustrated
- When I am looking forward to something nice after I finish learning

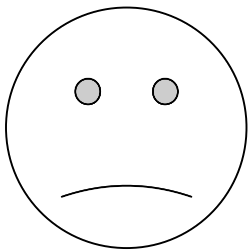
The Learning Atmosphere

Statements describing the learning atmosphere at school:

- I can follow some teachers very well, with others I have difficulties
- There are teachers I am afraid of
- With these teachers my marks are usually low
- With these teachers my marks are usually high
- I feel inhibited by my classmates or colleagues
- In a certain environment, I can concentrate myself very well, in others not
- I often experience thinking blockades and I do not understand despite repeated explanation

Learning Difficulties

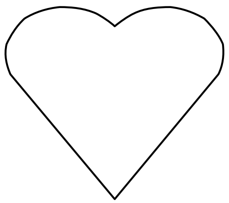
Mental sphere:



- Reduced ability to structure when acquiring information
- Reduced ability to abstract and conceptualize
- Limited ability to transfer known facts to new situations
- Restricted imagination
- Restricted perception
- Reduced memory performance
- Reduced ability to concentrate
- Language deficits

Learning Difficulties

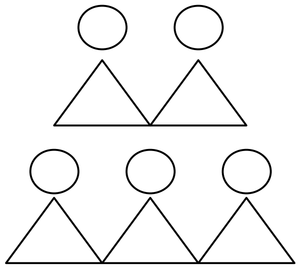
Emotional sphere:



- Lacking emotional stability
- Strong orientation on needs when acting
- Rather passive drift approach than active problem solving and shaping of life
- Tendency for depression or aggression
- Deficiency in acknowledging and expressing own feelings
- Strong fear of failure
- Negative self-image with low self-esteem
- Low staying power, little perseverance
- Aversion against school and school tiredness

Learning Difficulties

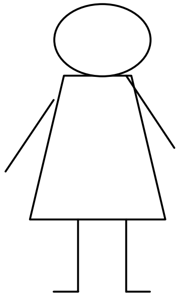
Social sphere:



- Reduced ability and willingness for cooperation
- Difficulties with accepting and coping of social role
- Social behavior ranging between being the clown or being strongly inhibited
- Loner
- Emotional outbursts
- Problems to subject to social rules

Learning Difficulties

Physical sphere:



- Frequent delays in physical development such as muscle development, growth, sexual maturity etc.
- Reduced performance with regard to speed, coordination and strength during work proceedings
- Weakness with fine motor skills and therefore with precision
- Poor coordination between muscle activity and perception

Easy to remember:	Hard to remember:
Meaningful	Senseless
Connected	Isolated
Systematic	Unsystematic
Clearly arranged	Confusing

Structured Information Unstructured

Why skimming through a text?

Survey reading is useful when…

1 topic of text is not totally unknown to us

2 we look for specific information to answer given or self-constructed questions

3 we deal with a longer text of which only a part is important for us

4 we want to get a first impression before reading it in detail

5 we are already knowledgeable about a topic and only like to verify whether a text contains any new information for us

6 we quickly want to know whether a text contains any interesting or important information for us

Questions

Knowledge	Comprehension			Values
	Causes	Results	Countermeasures	
Asking for: Terms Numbers Names Details to be memorized	Lead further into topic and require thinking, combining and arguing			Concern personal opinions and values

Who?

Chain of key words

Rules for Mind Mapping

1. We begin with a word, symbol or picture representing our topic.

   We put it at the center of a blank page.

   We use the paper in landscape format.

2. We write down key words.

   We connect them with lines (branches) radiating from our central image.

   We print key words for easier reading.

   We print one key word per line/branch.

   We create side branches for points related to the key words.

3. We use colors, pictures, dimensions and codes for emphasis/association.

   We highlight important points, e.g. using text marker.

   We illustrate relationships using colors, arrows etc.

Seminar Papers

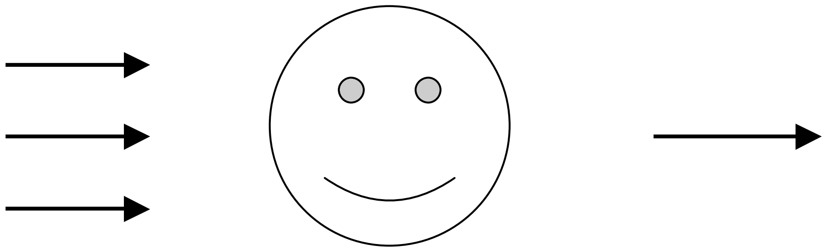
Introduction	Topic, reasons for topic, importance of topic
Main part	Development of central ideas/main bulk of information
End	Summary/Result/Conclusion

Title page	Title/topic, subtitle, author, purpose of presentation, month & year
Table of content	List of numbered chapters and respective page number
Bibliography	List of books used for writing the paper stating name of author, title, place and year of publishing, appearing in alphabetical order
Quotes	Identified by quotation marks, statement of source inclusive page number

Requirements at work

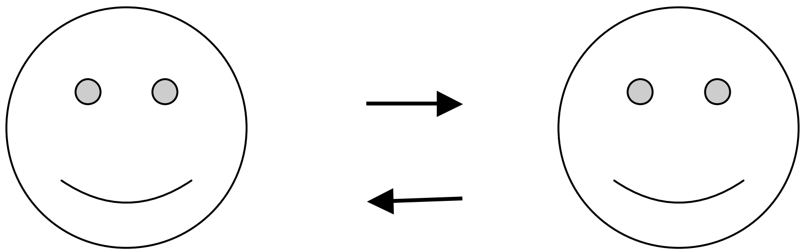
1. Organizing and carrying out assignments

- Determination
- Accuracy
- Systematic course of action
- Organizational ability
- Coordinative ability



Requirements at work

2. Communication and cooperation

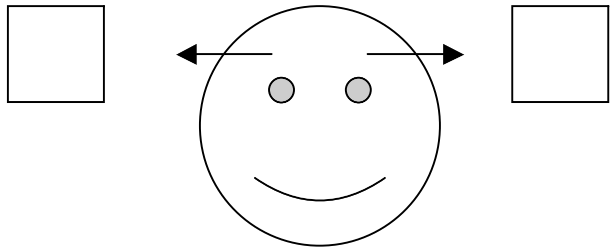


- Open-mindedness
- Ability to cooperate
- Ability to work in teams
- Appropriate behavior towards customers
- Appropriate behavior towards colleagues
- Intuition

Requirements at work

3. Application of learning techniques

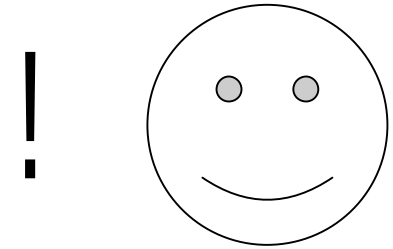
- Using learning techniques
- Deductive thinking
- Ability to transfer methods to other areas
- Thinking in systems



Requirements at work

4. Independence and responsibility

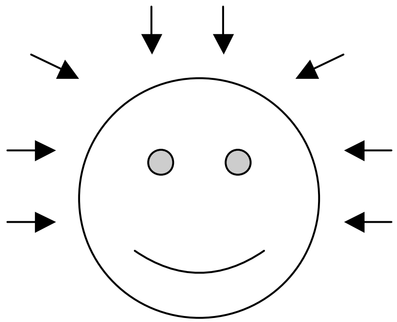
- Involvement
- Reliability
- Acting prudently
- Ability to criticize oneself
- Ability to express own opinion



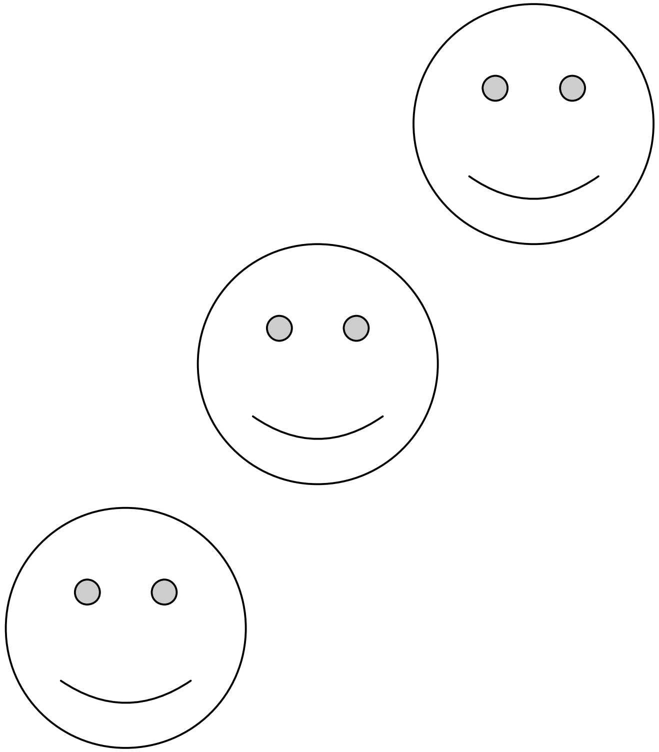
Requirements at work

5. Ability to work under stress

- Ability to concentrate
- Perseverance
- Adaptability



Importance of group work



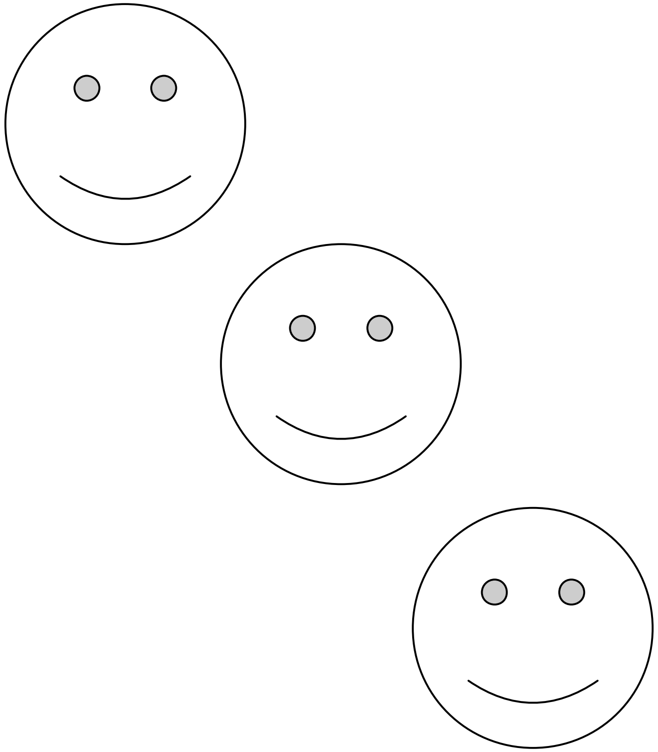
Associations

Explanations

Assistance

Activation

Check of performance



Group work & Social skills

Fair sharing of workload

Finding a compromise among different views

Using convincing technical arguments

Dealing with criticism

Accepting the superiority of other teams’ results in a fair appreciation

Effective Classroom Learning

A 4-day workshop for classroom teachers in high schools, colleges and professional technical skills training institutes

„Tell me - and I forget.
Show me - and I remember.
Let me do it - and I understand."

Confucius, 551 – 479 BC

Already Confucius, a Chinese philosopher of ancient times, knew what modern learning research recommends teachers and instructors of today's training facilities: in order to achieve high learning results, students have to be involved actively throughout the whole learning process. How to apply this simple but most effective rule to classroom teaching and learning, is the main focus of this seminar.

The essence of classroom teaching can be described as imparting new knowledge to students. A major requirement in that context is handling information, both for teachers and students alike. How the process of procuring, understanding and processing information can be enhanced, is one focus of the seminar: Through a variety of exercises, participants will learn how to apply reading, summarizing, researching and visualizaing techniques using the appropriate working tools.

Furthermore, participants will be exposed to the results of modern brain research and the resulting consequences for learning and teaching: While concepts and ideas are explained in brief lectures, a variety of tests, experiments and games will let participants experience the concrete meaning of these findings.

Topics covered during the training are:

- Brain Power
- Learning Strategies
- Handling Information
- Conclusions

All activities used during the training such as tests, games, experiments, exercises etc. can easily be used in the real classroom setting. The question of transfer of the seminar inputs to day-to-day teaching is constantly addressed throughout the training. The overall objectives of this seminar are to enable teachers to prepare lessons that cater for the different learner styles and focus around students' activities, to equip students with learning methodology, to diagnose major learning problems, and to counsel students with learning difficulties.

Number of participants: 12 to 14

Effective Classroom Learning, Day 1 - 1

No.	Title	Content/Activity	Material	Time
1	Introduction Associations	Each participant introduces him/herself by using one of the postcards displayed	Postcards with different motives	8.00 – 8.45
2	**Exercise:** Associations	Each participant is asked to find a way to learn name of facilitator	Whiteboard: Cornelia Frettloh	8.45 – 8.50
3	**Group work:** Associations Expectation setting	Pax are divided in 3 – 4 groups and invited to draw, write, scribble what they associate with learning on a big sheet On a separate sheet they note expectations and possible fears for this seminar	Big flipchart paper Crayons, markers Manila paper	8.50 – 9.10

4	Introduction: Outline workshop	Overview - objectives - content - methods	Flipchart	9.10 – 9.20
5	**Experiment:** Forming categories	Two volunteers (male/female) are asked to put all meta cards with words in respective labeled envelopes	2 sets of meta cards, envelopes	9.20 – 9.30
6	Lecture/Discussion Brain Power 1	Learning – general considerations Modern brain research: Neurons Brain development	Transparencies	9.30 – 10.00

	Break			10.00 – 10.15

Effective Classroom Learning, Day 1 - 2

7	**Game** Sensual Awareness Touching & Feeling 1	Walk around in room & shake hand with all other participants; note the difference in each handshake	Flipchart	10.15 – 10.25
8	Lecture/Demonstration Brain Power 2	Recap first input Developing neuronal network	Transparencies	10.25 – 10.40
9	**Test:** Learner Type	Each participant gets a test sheet and is asked to answer questions to find out which learner type he/she is; Assessment of test, comparison	Copies of test sheet Posters 3 learner types	10.40 – 10.55
10	Lecture/Demonstration Brain Power 3	Recognizing individual differences Demonstration of physic law: “Pressure equals force divided by area” Creating multi-channel information	Transparencies Hammer, different nails, wood Various pencils Clay, water bottle, coins, stand	10.55 – 11.30
11	**Exercise:** Learner types & lesson plan	Individual work: Pax select next topic in their teaching & work out how it can be presented catering for all three learner types	Matrix for lesson planning	11.30 – 12.00

	Lunch			12.00 – 13.00

Effective Classroom Learning, Day 1 - 3

12	**Game** Sensual Awareness Touching & Feeling 2	All pax touch item in sachet and try to identify content	Flipchart 14 sachets with different items	13.00 – 13.15
13	Assessment exercise Learner types	Participants present their work in groups of similar teaching expertise & decide which is the one to be presented to plenary 4 presentations of lesson plan to plenary	Manila paper for presentations	13.15 – 14.15
14	Lecture/Discussion Brain Power 3	The human memory	Transparencies	14.15 – 14.30
15	**Exercise:** Linking	Participants go back to groups and discuss how topic presented can be linked in manifold ways; 4 presentations to plenary	Manila paper for presentations	14.30 – 15.00

	Break			15.00 – 15.15

Effective Classroom Learning, Day 1 - 4

16	**Game** Sensual Awareness Touching & Feeling 3	Choose partner and write with finger on his/her back a word; let person guess the word; repeat if necessary; Change roles and execute exercise again	Flipchart	15.15 – 15.25
17	**Test:** Left & right brain	Participants are divided in 2 groups. One group gets information in form of a drawing, other group in written form. Both groups have to draw what they remember. Assessment of results	Copies of information/drawing Paper Stopwatch (5 min/8 min)	15.25 – 15.45
18	Lecture/Discussion Brain Power 4	The left and the right brain **Exercise:** “Folding hands” exercise “Brain Jogging” exercise Stimulating learning	Transparencies	15.45 – 16.10
19	**Presentations:** Consequences for teaching	Each participant gets a statement outlining a particular consequence for teaching. They present it to group, explain meaning & agree/disagree with statement (reasons!).	Statements	16.10 – 16.30
20	**Test:** Forming categories	2 volunteers are asked to retrieve particular cards from envelopes. Assessment of results/reasons for difficulties	Envelopes	16.30 – 16.45
21	Feedback	Complete sentence exercise: Most surprising insight/experience/sensation… for me today was….throw wool to next pax	Whiteboard with sentence Ball of wool	16.45 – 17.00

Effective Classroom Learning, Day 2 – 1

No.	Title	Content/Activity	Material	Time
1	**Exercise:** Repetition Day 1	Each participant chooses one copy of “Brain Power” transparency. Transparencies are put on OV, respective part. Explains meaning to group	Transparencies, paper copies	8.00 – 8.30
2	**Exercise:** Evaluation name learning	Pax write name of facilitator on card Exchange on strategies how to learn unusual material (association patterns)	Whiteboard: Cornelia Frettloh	8.30 – 8.40
3	**Exercise:** Learning deficits	Brainstorming on reasons for bad performance of students considering learning results; Clustering of cards; Outline of importance of learning methodology	Meta-cards, manila paper Transparency	8.40 – 9.00
4	**Test:** Input channel & memory performance	Participants reflect on 6 statements on OV on individual preference; Test executed & reflection on results; Display of all results to plenary Conclusions & transfer to daily teaching	Transparencies Test papers & utensils Stopwatch Posters 3 learner styles	9.15 – 10.00

	Break			10.00 – 10.15

Effective Classroom Learning, Day 2 - 2

5	**Game** Sensual Awareness Looking & Seeing 1	Gym exercises for the eyes: - circle your eyes - near/far - enlarge vision horizontally/vertically - increase perception closing eyes w palms	Flipchart information	10.15 – 10.20
6	Lecture/Discussion: Learning Strategies 1	Recap test result Enhancing memory & skills performance	Transparencies	10.20 – 10.40
7	**Exercise:** Time-management 1	3 groups prepare schedule for student Comparison of results Reasons for decisions	Exercise sheets Manila paper	10.40 – 11.45
8	Lecture/Discussion: Learning Strategies 2	Planning learning activities Preparing for exams	Transparencies	11.45 – 12.00

	Lunch			12.00 – 13.00

Effective Classroom Learning, Day 2 - 3

9	**Game** Sensual Awareness Looking & Seeing 2	Work in pairs: I am seeing something you cannot see and its color is… Once guessed, repeat other way round		13.00 – 13.10
10	**Assessment/Exercise:** Time-management 2	Self-Assessment: Use of time Sharing of results/transfer to teaching reality Recap input: Reconsideration of learning schedule: Any changes? Work in 3 respective groups	Assessment sheet “Time thieves”	13.10 – 13.35
11	**Field trip:** Learning Environment	Assessment of study place What changes should be made? Why? Input learning set-up, diet, rest etc.	Set-up of learning space (table, chair, utensils)	13.35 – 13.50
12	Lecture/Discussion Learning Strategies 3	Self-assessment: best individual learning environment; best atmosphere at school	Transparencies Voting cards	13.50 – 14.00
13	**Exercise:** Case Study	Work in 2 groups: Discuss case of Bong and find answers to questions 1 – 3	Exercise sheets “Case study” Manila paper	14.00 – 14.45
14	**Lecture/Discussion** Learning Strategies 4	Learning difficulties Comparing input with answers to question 1	Transparencies	14.45 – 15.00

	Break			15.00 – 15.15

Effective Classroom Learning, Day 2 - 4

15	**Game** Sensual Awareness Looking & Seeing 3	Visualizing: Participants make inner journey to favorite place…	Instructions	15.15 – 15.25
16	**Exercise:** Asking questions	Round 1: Give instructions for drawing. No questions allowed Round 2: Repeat. Questions allowed Compare results, time consumption	Band paper Instructions for drawing Stopwatch	15.25 – 15.35
17	**Lecture/Discussion** Learning Strategies 5	Overcoming difficulties: Pax read statements to plenary & give example Comparing input with answers to question 2 – 3	Transparency Cards with statements Learning index box	15.25 – 16.00
18	**Counseling circle:** Learning Difficulties	Choose from provided cards or make up own problem; 2 circles: Students/teachers students in outer circle present their problem to teacher in inner circle & ask advice; repeat 2 x change of inner/outer circle; repetition; Plenary: state your problem and share advice given to you; comment on quality	Pre-prepared meta-cards with problems, plain meta-cards Stopwatch (3 x 3,5 min, repeat)	16.10 – 16.50
19	Feedback	Participants write on cards what was useful for them & what they could do without	Manila paper harvest truck - garbage truck, meta-cards	16.50 – 17.00

Effective Classroom Learning, Day 3 – 1

No.	Title	Content/Activity	Material	Time
1	**Exercise:** Repetition Day 2	Participants are grouped in 4 sets and furnished with one learning dice per group: First round: They throw the dice and answer the question in group; others can help Second round: all questions are answered by respective group members in plenary	4 learning dices	8.00 – 8.45
2	Lecture/Discussion: Handling Information 1	General importance Reading techniques: - survey reading - enlarging the view span - 5 step reading method	Transparencies Poster “5-step reading method”	8.45 – 9.05
3	**Exercise:** Enlarging view span	Work in pairs: Each pair gets one set of reading pyramid + sheet for pulling; repeat exercise with partner	7 sets of 2 reading pyramids, one sheet for pulling	9.05 – 9.15
4	**Exercise:** 5 step reading method	Survey reading: 1:30 min Formulate 2 questions Execute other 3 steps of method	Exercise sheets “The human memory” Stopwatch	9.15 – 10.00

	Break			10.00 – 10.15

Effective Classroom Learning, Day 3 - 2

5	**Game** Sensual Awareness Smelling	Each participant is asked to establish the smell in each container	Flipchart information Containers with different products: brown sugar, soap, cinnamon, alcohol, vinegar, garlic…	10.15 – 10.30
6	Lecture/Discussion: Handling Information 2	Summarizing techniques - rules for marking	Transparency Poster "Marking rules"	10.30 – 10.40
7	**Exercise:** Marking	All participants mark exercise sheet & compare results of marking: - Planning learning activities	Exercise sheets: " Planning learning activities" red fine felt pens, pencils, text markers, rulers, erasers	10.40 – 11.00
8	**Exercise:** Visualizing	All participants prepare visualization of sheet "Human memory" All results get displayed and are compared	Exercise sheets: "The human memory" Band paper	11.00 – 11.30
9	**Competition game:** Re-enforcing rules for marking & reading	Pax work individually: - Rules for marking - Rules for fast survey reading - 5-step reading method	Exercise-sheets Stopwatch Prizes (6)	11.30 – 12.00

	Lunch			12.00 – 13.00

Effective Classroom Learning, Day 3 - 3

10	**Competition game** Reference books	Work in pairs: Check at all the 8 work stations & complete your answers	Work sheets Reference books (atlas, telephone directory, dictionary, handout seminar) Prizes (2)	13.00 – 14.00
11	Lecture/Discussion Handling information 3	Researching techniques: - Use of reference books, libraries, internet - Importance of questions - Different questions	Transparencies Example “Bird” in handout p 46 Example “What makes the light shine?” on whiteboard	14.00 – 14.15
12	**Exercise:** Formulating questions	Work in groups (expertise related): Choose topic & prepare questions Present to plenary Process importance for teachers/students	Manila or band paper	14.15 – 14.45
13	**Competition game:** Working tools	Work in 2 groups: Solve crossword puzzle “Effective Learning”	2 sheets with crossword puzzle; question sheet Prizes (7)	14.45 – 14.55
14	**Game** Sensual Awareness Tasting	Try out 2 types of same basic ingredient and state the difference in taste	Flipchart information Food for tasting (mango, peanuts)	14.55 – 15.00

	Break			15.00 – 15.15

Effective Classroom Learning, Day 3 - 4

15	Lecture/Discussion Handling information 4	Working tools - use of different tools - how to introduce in teaching (exercises) Visualizing techniques - charts - diagrams - tables - cluster - definition networks	Tools on display Handouts pages 47 – 54 Transparencies	15.15 – 15.45
16	**Exercise:** Visualizing information	Participants choose one workstation and visualize the information given in a sketch drawing. When completed, they move on to the next station. Outputs are exhibited and compared in plenary. Importance for teachers/students is processed.	Band paper Exercise sheets for 8 workstations	15.45 – 16.50
17	Feedback	Participants are asked to evaluate by setting their points in relation to content/methods and barometer atmosphere	Charts Points	16.50 – 17.00

Effective Classroom Learning, Day 4 – 1

No.	Title	Content/Activity	Material	Time
1	**Exercise:** Repetition Day 4	Participants choose one type of exercise that they want to use in their teaching; explain exercise to plenary	Meta-cards with samples of learning exercises	8.00 – 8.30
2	**Brainstorming**	Expectations of employers towards trainees/staff	Meta cards	8.30 – 8.45
3	Lecture/Discussion: Conclusions 1	Learning methodology and the world of employment The importance of group work Mind mapping	Transparencies Poster "Concept Learning"	8.45 – 9.15
4	**Exercise:** Group work	Individual preparation for group work: Mind map on topic "Overhead projector" Participants divided in 2 groups: Each group has to present how to work with the overhead projector; presentations will be judged on: - knowledge - communication - creativity - team work	Different transparencies, ov markers, 2 projectors, band paper	9.15 – 11.00

	Break			9.45 – 10.00

Effective Classroom Learning, Day 4 - 2

5	**Game** Sensual Awareness Listening	Participants are asked to close eyes & identify noise one by one	Flipchart information Items to produce noises: water jug, cup, teaspoon, ball, handkerchief, book, paper…	11.00 – 11.15
6	**Exercise:** Group work	Presentations of group work - Feedback - Assessment presentations - Transfer to teaching reality	Voting cards	11.15 – 12.00

	Lunch			12.00 – 13.00

7	**Lecture/Discussion** **Conclusions 2**	Recap/analysis of - Learning difficulties - Expectations employers - Learning – a broadened concept	Results brainstorming on "Learning problems" "Expectations employer" Transparency	13.00 – 13.10
8	**Role play:** Pro & contra debate	All participants are asked to convince their director why it is important to introduce learning methodology in curriculum	2 Pro & 1 Contra chair	13.10 – 13.45
9	**Game** Sensual Awareness Listening	Participants are asked to close eyes & listen to music and input going mentally through 4 seminar days	Flipchart information Cd, player	11.00 – 11.15
10	**Evaluation/Graduation**	Distributing evaluation forms Feedback circle Handing over of certificates	Evaluation forms Ball Certificates	13.45 – 14.30

Participant Reaction Evaluation Form

Use the scale 1 to 5 to express your reactions to the course based on the following statement: (Please circle only one choice for each statement.)

Strongly DISAGREE 1	Disagree 2	Neither 3	Agree 4	Strongly AGREE 5

Overall, I was satisfied with this seminar.	1	2	3	4	5
My knowledge about learning increased as a result of this seminar.	1	2	3	4	5
I can apply what I learned in this seminar to my work.	1	2	3	4	5
It was easy for me to understand the seminar content.	1	2	3	4	5
The methods used to deliver the seminar content were effective.	1	2	3	4	5
Games, exercises and tests stimulated my learning a lot.	1	2	3	4	5
Material for the participants was adequate.	1	2	3	4	5
The instructor explained the subject clearly.	1	2	3	4	5
The instructor answered my questions clearly.	1	2	3	4	5
The instructor was supportive and helpful.	1	2	3	4	5
I also learned from other participants throughout the seminar.	1	2	3	4	5
I would recommend this seminar to my colleagues.	1	2	3	4	5

What new things/changes can you apply to your job – immediately and after some time?

____

____

____

What parts of the seminar did you enjoy most? Why?

____

____

____

What parts of the seminar did you not enjoy? Why?

____

____

____

Further recommendation/comments not covered by this evaluation form:

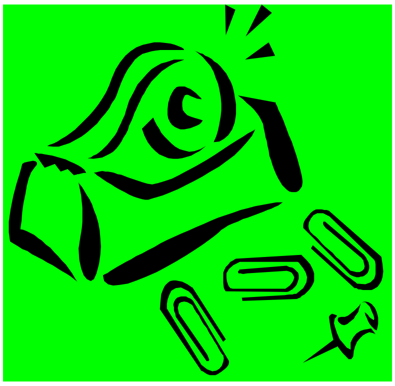
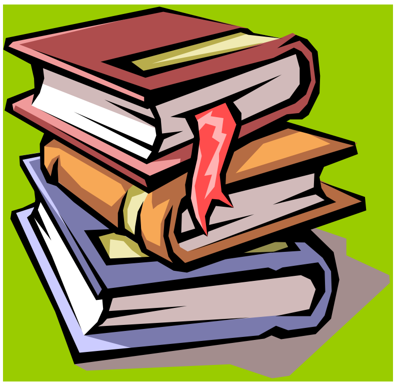
(Continue on the back if you need more space!)

Thank you for your answers!

Effective Classroom Learning





A seminar for teachers and trainers in professional and technical vocational skills training

Content

Introduction

“Tell me – and I forget. Show me – and I remember. Let me do it – and I understand.”

This saying of the Chinese philosopher Confuzius is, in a way, the essence of the seminar coming along with this handout: “Effective Classroom Learning” aims to make teachers and trainers aware that achieving high learning results means to get students actively involved throughout the whole learning process.

In order to understand this simple but most effective rule the first part of the training is centered round the function of the brain in the context of learning. The second part of the training translates these findings to day-to-day teaching: How teachers and trainers can assist their students in becoming self-reliant learners, how they can diagnose major learning problems and how they can counsel students with learning difficulties, all of which leads to a new concept of learning.

This handout coming along with the training covers the main inputs given during the seminar. It also provides the background information for the various exercises executed. While the seminar itself is built around different learning experiences for its participants, the handout provides further elaboration on the respective topics for those who want to go deeper into the subject. By itself, this material is intended to create understanding of the numerous factors influencing learning and to raise the awareness for the importance of learning in modern societies.

Cornelia Frettlöh

Ded-consultant to the University of Southern Philippines Foundation, USPF

Unit 1 Brain Power

1. Learning – general considerations

Learning has gained more and more attention over the past years. Be it policy makers, be it business people, be it teachers or parents, all stress the importance of learning: not only is there far more information available than it used to be, it is also outdated much faster than in previous days, which again leads to changes in the working environment. Hence, continuous lifelong learning has become an indispensable part of our working lives.

But what really is learning? Which factors influence learning? And how can the process of learning be improved? Before we try to answer these questions, let us first agree on what we mean by learning. One of the broadest definitions states that learning means change of behavior due to experiences: Being exposed to new knowledge, experiencing new skills, exploring new attitudes leads to new patterns of behavior. We know more than before, we can do things better than before, we hold a different opinion than before - all of which allows us to behave differently than before.

Through learning we acquire new…

Knowledge

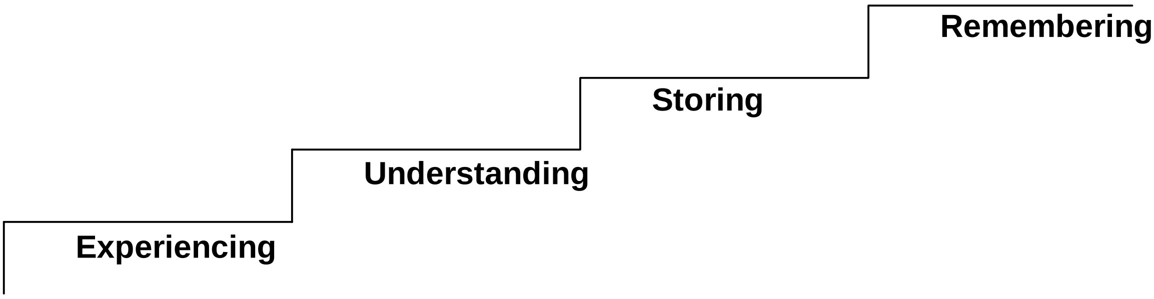
Learning = **Change of behavior due to experiences**

Skills

Attitudes

New patterns of behavior

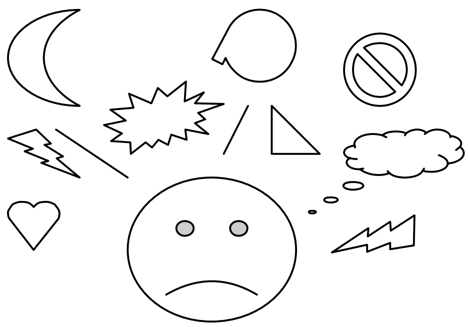
However, behaving differently than before requires that we can recall what we have learned previously. Prior to that, it also requires that we really understand what we learn. The learning process therefore involves four major steps: experiencing something new, appreciating and understanding this new experience, storing it in our memory and recalling it later.



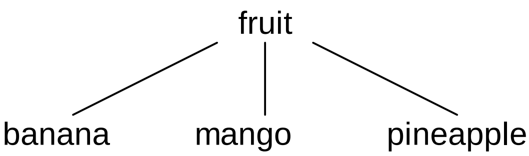
The question now is: How can this process be enhanced? Modern brain research has come up with interesting insights, which help us to find answers to this question.

2. Learning and modern brain research

In order to remember what we have learned new information needs to be stored in our memory in a way that it can be retrieved any time. One of the biggest difficulties within that context is to protect ourselves from learning too much: Since innumerable impressions and perceptions compete with one another for our attention, our memory has to decide what to store. If not, within no time we would just drown in senseless data trash. Therefore, our memory has to perform two major tasks:



At first, it has to distill what it considers worth-while remembering from all the thoughts, ideas, impressions, experiences and perceptions we are exposed to. So our brain has to differentiate between important and unimportant information.

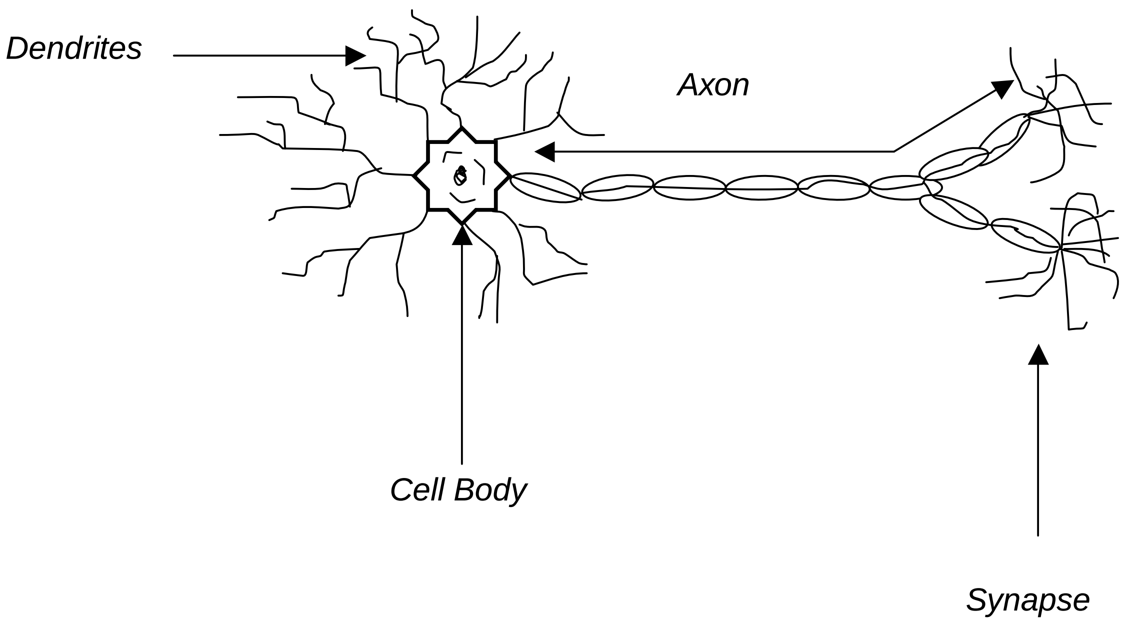


Next, this extract has to be put in a certain order. For this reason we need categories. For example, to remember mango, banana and pineapple, we need the category *fruit*. Categories allow us to link different bits of information among each other and to put them in a systematic order. In return, this also allows us to retrieve stored information more easily.

Modern brain research has identified neurons as the crucial elements in performing these two major tasks: A network of 10 – 15 billion neurons filters and sorts all information that is stored in our memory.

Neurons are the units that make up the human nerve system. They are mainly found in the brain (approximately 10 – 12 billion), the spinal cord, the brain stem (connection between brain and spinal cord) and the whole body in form of threadlike branches. A bundle of neurons are called a nerve.

A neuron consists of the *cell body*, *dendrites* (hair-like extensions of the cell body), the *axon* (an extension of the cell which can have lots of branches), and *synapses* (the point where the axon of one neuron connects with the dendrite of another). The function of neurons is to transmit impulses in form of electrical and chemical changes. The receiving structure of electrical impulses are the dendrites, the transmitting structure are the axons.



Schematic drawing of a neuron: 20,000 neurons would fit on a pin head.

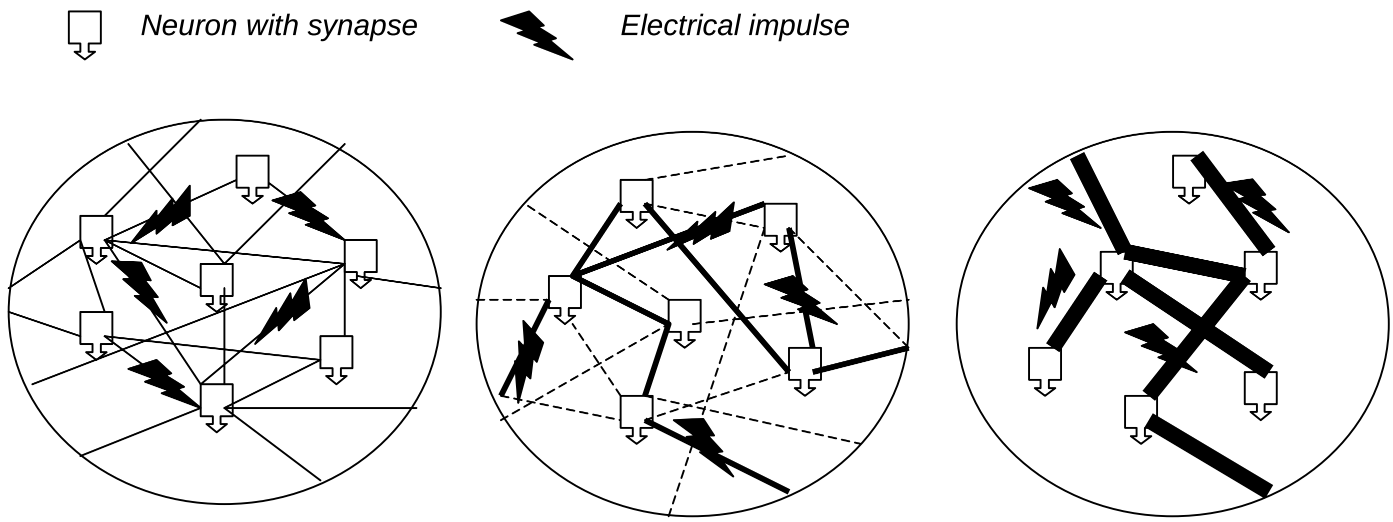
Repeated transmission of impulses between two cells enhances these activities; pathways are being established. Each stimulus a human being is exposed to changes this neuronal network by strengthening a particular connection and, eventually, weakening another. All learning experiences can be translated into this basic reaction pattern. A closer look at the development of the human brain will reveal further insights.

Deutscher Entwicklungsdienst

3. Brain development

When we are born, the major part of our brain is already developed. Its actual growth is finally completed during the following months. With regard to the neuronal net itself, its maturation takes place in two phases: from birth until the age of 2 and from childhood until the end of adolescence.

The neurons of a newly born baby are connected among each other like in an even, densely woven net. This neuronal net passes on impulses in all directions. Until the age of two the number of these connections (synapses) increases.



Age 0 – 2 *Age 2 – end of adolescence* *Adult*

With the process of learning setting in, connections between particular neurons (synapses) are strengthened since the number of impulses increases. On the other hand, connections rarely used will slowly wither.

After adolescence, learning mainly consists of using the existing connections. During adulthood, hardly any new neuronal connections will be added.

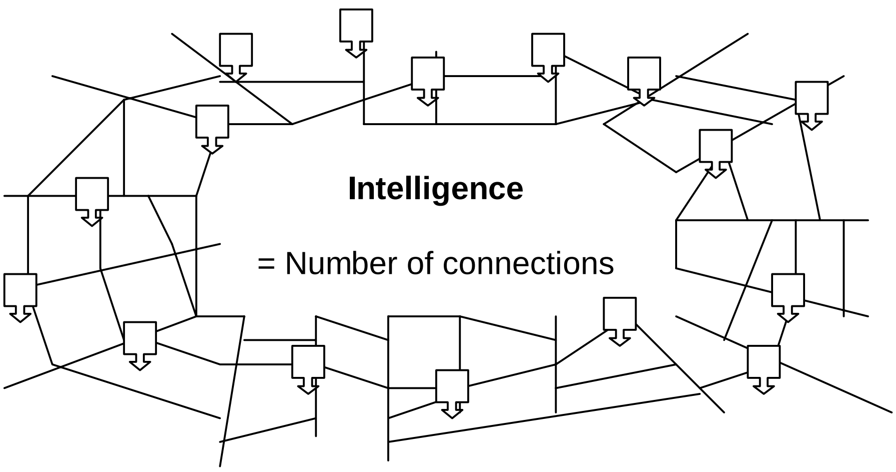
This shaping of the brain is strongly influenced by the environment each individual is exposed to. Particularly during the first two years, sensual impressions like noise, smell, taste have as much influence on the brain's development as the type of food a baby gets, the air it breathes, the people it is relating with. As adults we cannot recall these first experiences, yet they have a strong impact on our whole life. They determine the way we think by establishing perception patterns. These patterns differ from individual to individual, family to family, region to region, country to country, culture to culture.

The way the brain is structured is irreversible. It corresponds and is highly compatible with the immediate environment we have been exposed to during our first months of life. Likings and dislikes are being developed, preferences for visual, audio or touch established. For example, an African baby that is being carried around on its mother's back during its first months is likely to develop a high preference for touch. Likewise, the brain of a baby growing up in a very deprived environment or suffering malnourishment will never develop its full potential.

This process can also be expressed in computer language: during the first months the hardware is installed. Correspondingly, at the age of two until the end of adolescence the installation of the software takes place. In a way, the circuit diagram of the neurons is being established. The decision is made which neurons are connected among each other. Thus the structure of thinking of the future adult is basically being determined.

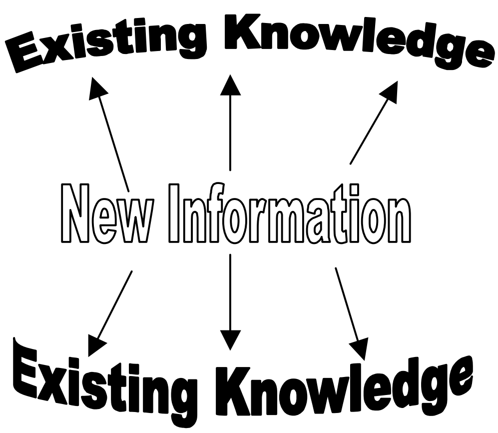
As adults, we almost exclusively rely on this existing neuronal network since hardly any new connections are being established. This also helps to explain why adult learners usually have problems accepting ways of learning they are not familiar with: in a way, they lack the software. This difficulty is also expressed in the saying, "You can't teach an old dog new tricks". On the other hand, the more varied the stimulation during childhood and adolescence, the more complex structures are being formed which, in return, offer more points of reference for future learning.

Looking at these findings, we can already draw two major conclusions: First, it is quite obvious that human beings need a stimulating environment right from the start for the optimal development of their brain since intelligence is not so much depending on the number of neurons but on the number of connections. Second, it is also obvious that the numerous individual differences among learners need to be recognized in the learning and teaching process.



4. Developing the neuronal network

Learning is a self-stimulating process: the more we know, the easier we learn. The more English a student knows, the easier and faster he/she learns even more English. The secret behind this formula is very simple: whenever we can link new information to already existing information – unknown to known information -, we stand a good chance that our learning efforts will be successful. We stand an even better chance, when we can link new information not only in one but manifold ways – when new information appears in different connections, when we can incorporate it into our existing net of information by linking it to various other points of reference.



The more we know, the more we can perceive. Our knowledge influences everything we perceive, since perception relies on the ability to recognize. What we don't know, we can only perceive very vaguely, if at all. For example, words and letters in a foreign language are only noise and lines without meaning for us. Increasing our knowledge means to enhance our ability to perceive. The best basis for learning – perceiving, understanding, storing and remembering – is a broad network of knowledge.

This also explains the advantage adult learners have over young learners: grown-up people have a much greater professional and life experience which offers far more points of reference for connecting new information.

To support the development of the neuronal network of children and young students, they should be exposed to challenging tasks from early age on. Teaching approaches that lead to sudden insights should be fostered. Instead of providing students with ready-made solutions (spoon feeding), they should be encouraged to come up with their own ideas on how to solve a particular problem (discovery method). The feeling of pleasure that goes along with the successful, independent solving of a task is far more sustainable than any reward from outside. Thus, a positive attitude towards learning is reinforced.

The more students can try on their own and experiment with familiar day-to-day items during the process of learning, the faster they acquire new knowledge. Whenever possible, the learning content should also relate to daily life experience. Not only does it stir the interest of students and motivate them, it once again means applying the very simple but most effective teaching principle: establishing links between known and unknown information.

5. Recognizing individual differences

Though there are a lot of common features with regard to the learning process, there are many differences when it comes to the individual learner. Considering the development of the brain, we know that every human being is different. These differences also influence the style of learning of each individual. They depend on a wide variety of factors:

Connecting links & prior knowledge

As we said already, understanding means linking and incorporating new information to and into knowledge already stored. Thus, how quickly we understand something is also dependent on the number of verbal and pictorial connecting links and prior knowledge.

Reference to life

The assimilation of an item of information, attention, interest, motivation for a subject are associated with the question whether we can draw a relationship to our own life, whether we see a sense or use in the subject matter.

Style of learning

Whether we can learn facts better through lecture or group work or through other methods, whether we can learn better by heart or by discovering the solution to a problem ourselves, also depends on the style of learning we have experienced.

Basic patterns of perception

During the first months of our lives, the basic patterns of perception are developed, likings and dislikes for audio, visual, touch etc. are established. They influence our preference for learning by reading, hearing, seeing, feeling or experiencing what is new.

Learning success and good school results do not only depend on the absolute intelligence of a person (the ability to perceive, combine, memorize), but also on the compatibility of learning patterns. As students, we always have a partner – the teacher, a book, other students – and we are learning well when we recognize ourselves in the other, when our pattern is in accordance with the pattern of the partner. Therefore, the same content, regardless of its degree of difficulty, can be learned easily or with great effort. An example taken from a physics class will illustrate this.

The students are asked to learn the law “Pressure equals force divided by area”.

Listening

The first student attempts to assimilate the information by listening. Fundamental principles are explained in the course of discussion and misunderstandings are clarified.

Observing

The second student apprehends the law by observation and experiment. He/she observes how a sharp nail is driven into the wall more quickly than a blunt nail, because there is a minimum contact area of the point of the nail thus increasing the pressure.

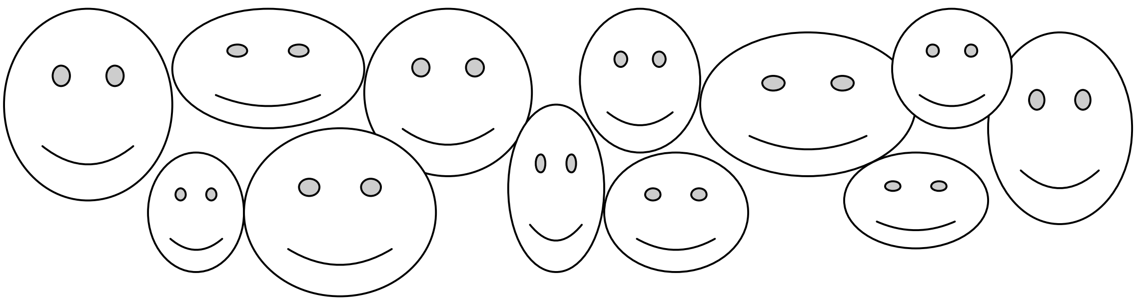
Handling

A third student apprehends the law by means of handling and feeling. He/she takes hold of two pencils. First he/she presses one finger against the flat surface of the pencil, then a finger against the sharp tip of the other pencil. Here, he/she experiences pain, because the point noticeably increases the pressure as a result of its low surface area.

Reading

The fourth student apprehends the law by insight and reasoning; he/she reads about the abstract formula.

Had the subject matter only been explained in writing, the first three trainees would have had considerably more difficulties in learning the law. Today’s teaching still favors mostly one single learner type with a preference for verbal expression and abstract thinking. However, the number of students equals the number of different learner types. While it is obvious that a teacher cannot take account of each individual learner in a class over a long period of time, he/she should still try to give all of them an equal chance for learning. This means recognizing different needs of different students by making the link to the conditions pupils bring with them and by adapting the teaching to the various forms of learning.



Even though we cannot cater for all the different learner types in our daily teaching, at least we should allow the development of these different types, such as the reading loner, the teacher-fixated contributor, the discussion loving talkative type, the curious listener, the competition-driven and the competition-frustrated – just to name a few out of many others.

It means to relate individually to the different students and to make use of different teaching methods in order to provide for as many students as possible.

For good learning results, it is also crucial to make students aware that they each favor a certain learning style. Students become more relaxed and can listen better to a lecture even if it is not their learning channel. Knowing how we learn best helps us to compensate for instructions that are not favoring our particular way of learning.

6. Creating multi-channel information

As we know, each learner favors a particular way of learning. This usually includes a preference for a certain input channel, like audio, visual or kinesthetic. The physic class was a good example when the same content – pressure equals force divided by area – was presented in different ways, thus facilitating learning for as many students as possible.

We also know that we remember new information better when it appears in more than just one particular context. To make learning successful, it is important to present new information in different ways using different input channels. The retention span of newly learned information is also related to the way we acquire it: the more senses are involved, the higher the learning result.

Acquiring information	Remembering information
By exploring & overcoming difficulties on your own	90 %
By exploring & phrasing on your own	80 %
By talking about it	60 %
By seeing and hearing	40 %
By seeing	30 %
By hearing	20 %
By reading	10 %

A lot of people complain they cannot remember new information or have a hard time learning something new. Usually, they hold their memory responsible for this. Though it is true that the memory is the most crucial factor for successful learning, it is most often not the one to be blamed for low learning results.

What we remember depends to a large extent on the way we prepare new information for storage – how we encode it will influence our ability to decode it later. The quality of our encoding determines the quality of our decoding. The difficulties we have with recalling something is not so much a problem of recalling itself but very often of the previous step: the encoding. To understand this better, let us have a closer look at our memory.

7. The human memory

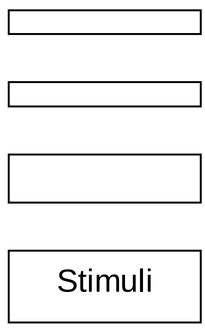
As we said, learning means change of behavior due to experiences. Memory then equals the impact left by experiences. In other words: there is no proof of learning without any change in the memory. And, vice versa, a change in the memory indicates a learning process.

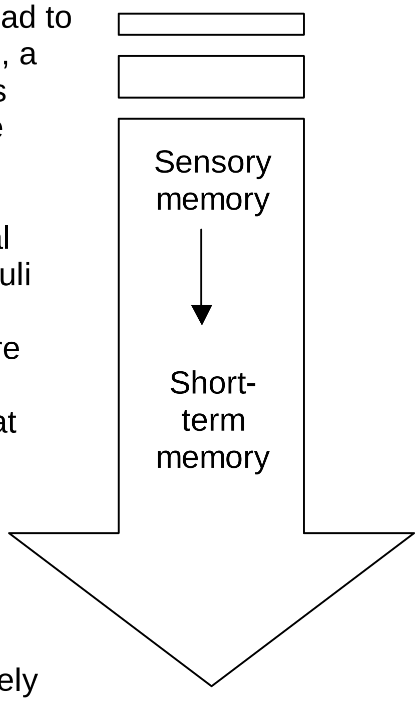
The role of attention is by no means less important. What we learn depends on our attention. Despite being exposed to numerous impressions and stimuli each day, we only remember a fraction of them: what we learn and remember is to a large extent a function of our attention.

At present we are still unable to completely understand how our memory functions. Therefore we are only looking at a model: It does not represent any physical structures. It is just a concept that helps us to understand the human memory and how it works better. According to this model, the human memory consists of three parts: the sensory memory, the short-term memory and the long-term memory.

The sensory memory is very limited in terms of quantity of information which it can make accessible to us and also in terms of duration: It is a phenomenon that only lasts for seconds. That means a very limited number of stimuli can be remembered or noted within a very short period of time, regardless of whether we pay them any attention or not.

For example, during a cocktail-party we can talk with someone without noting what is being said around us but as soon as our name is being mentioned, we suddenly listen. Or, we walk in the street being deeply in thought when a good friend of us passes by. We continue to walk and only two seconds later we stop and turn around because we have recognized our friend: the sensory memory then is like an echo – bringing back the information to us that we just saw someone we know. The sensory memory represents the fact that we can avail of a stimulus for some time after it occurred.

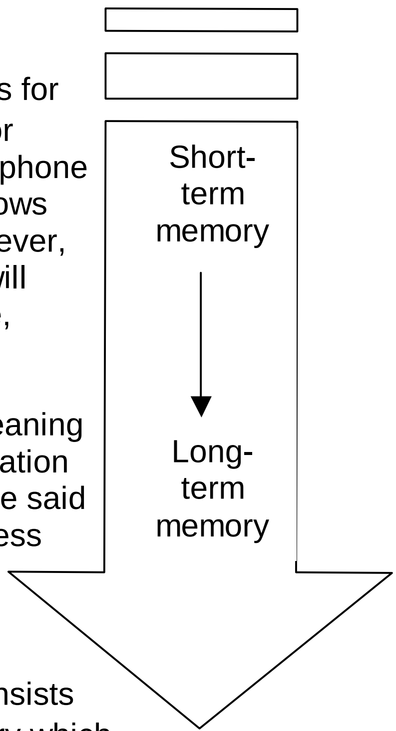




As short-lived as these stimuli or perceptions may be, they can lead to vital responses. We only have to think of driving a car: a car horn, a pedestrian in the center of the road, a red light. Here, perceptions often trigger off essential reactions, although they only stay in the memory for parts of a second, and then are forgotten.

Each day we are exposed to thousands and thousands of sensual impressions through the eye, the ear or the skin. All of these stimuli first enter the sensory memory where they leave a sensory mark. At the next stage they enter our short-term memory where they are associated with words and names. From the fact that we only remember a fraction of all these impressions we can conclude that there must be a filter:

If we are not attentive, these perceptions pass by like noise in the street or like the sound of a foreign language. They are regarded as uninteresting for storage. Thus, the sensory memory has the function of a filter or "door-keeper": it decides what to let pass and store and what to dismiss and delete. This is an extremely important function, because it protects us against over-loading with information.

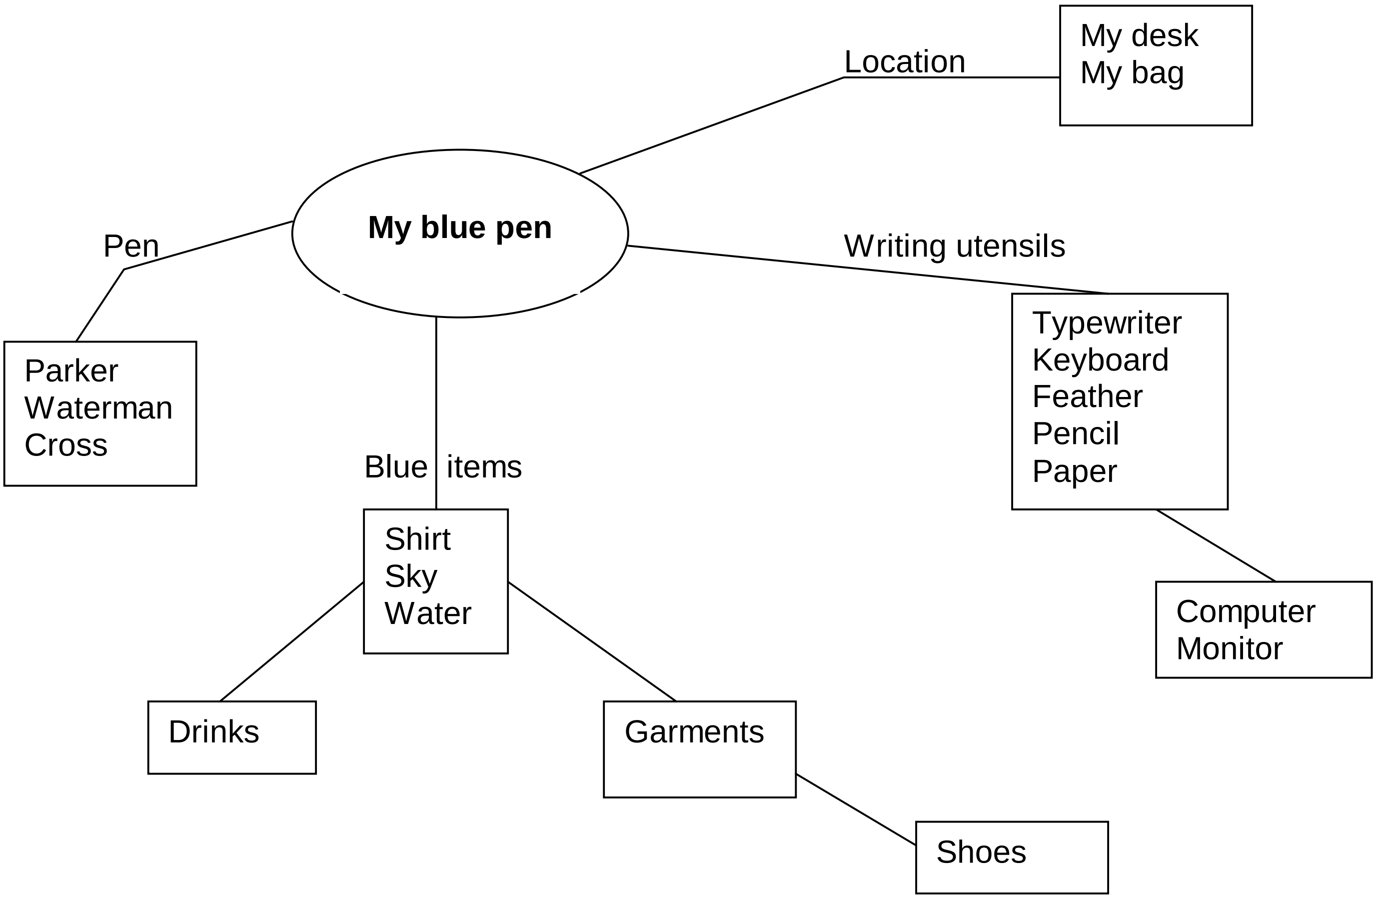


The short-term memory is a phenomenon that only lasts for about 20 seconds up to minutes. It can store about 7 items plus or minus 2. It allows us, for example, to look up a number in the telephone directory and dial up this number without looking at it again. It allows us to forget this number immediately after we have dialed it. However, should the line be busy and we have to dial it again, we usually will have to look it up a second time. To remember it for a longer time, we have to repeat it constantly.

The short-term memory is an active, ongoing process. It gives meaning to the information that is perceived. However, it stores this information only for a short time unless it is being repeated. Basically it can be said that it comprises everything that is within our attention or awareness at a given moment. As such, it can also be called the actual consciousness.

The long-term memory comprises everything else. It consists of encoded, consolidated information out of the short-term memory which then is equated with concepts and meaning. Not only does it store information over a much longer period of time than the short-term memory, it also is much more passive as opposed to the active ongoing process of the short-term memory. It is also much less susceptible to interferences and its capacity is much higher. While it is easy to call upon information in the short-term memory, it can take much longer to retrieve information from the long-term memory.

Previous models thought of the long-term memory as a continuous recording of all our experiences, not unlike a videotape. Recent research has developed different models: they are all of an associative nature. Basically this means that all information is linked with each other and forms knots like in a big web. For example, when we search for a certain item in our memory, we don't just simply produce a long chain of answers and see whether they fit the question or not, we try to limit the area in which the information can be found by linking it with other information. In the example below, “My blue pen” is linked to various other bits of information or knots which themselves are linked to many more knots, which are not displayed in this illustration.



As we already said, we remember new material better when we incorporate it into already existing information: It reflects the way our memory is structured. With regard to learning strategies, memorizing alone is not very helpful. Synapses are only strengthened mechanically, so to speak, without giving this new information any particular meaning. New synapses are mainly being established when new information is being applied. Affections reinforce this process. For example, newly learned English words used when talking to a girl- or boyfriend will migrate much easier to the long-term-memory since there is a link between these words and a strong emotion such as love. Also, remarkable material is remembered much easier and longer than insignificant material as well as outstanding, important or very emotional events: we can recall them more clearly and longer than other events.

8. The left & the right brain

Traditional teaching and training favors a certain learner type with a preference for verbal expression and abstract thinking. This involves usually activities such as thinking in words, talking, writing, reading, calculating, analyzing, which corresponds with abilities of our human brain such as speech, ordering, sequencing, intellectual analysis etc. However, that only makes up half of our abilities.

From modern brain research we know that our brain is divided into two parts, the left and the right brain or the left and right hemisphere. They each are identified with different abilities:

Left — **L**ogic brain	**R**ight — c**R**eativ brain
Speech	Creativity (new combinations)
Calculations	Artistic activity
Intellectual Analysis	Musical ability/Rhythm
Reading	Emotions
Writing	Recognition
Naming	Comprehension
Ordering	Perception of abstract patterns
Sequencing	Spatial abilities
Complex motor sequences	Facial expressions
Critique	Holistic ability
Evaluation	Intuition
Logic	Images
	Color

As we can see, traditional teaching and training highly favors the left side of the brain. Learning results are much higher, though, when both sides of the brain are stimulated and involved in the learning process: analytical exercises should be combined with creative, expressive activities. When the less used side is encouraged to cooperate with the stronger side, we usually get a synergy effect meaning 1 + 1 = 5 (instead of 1 + 1 = 2). The ability to see relationships and patterns, and make unfamiliar combinations and connections, is the core of creativity. To ignore these abilities and not involve the right side of our brain in the learning process means to limit ourselves unnecessarily and to neglect our full potential. As we already know we learn best whenever we can link the learning material with corresponding images, drawings, associations, and emotionally touching impressions. It should be a prerequisite for all teachers and trainers to equally involve both sides of the brain of their students during instruction in order to achieve better learning results.

9. Stimulating learning

Thinking requires a lot of energy. To keep our brain active, we use up 18% of our daily input of calories, infants even use up almost 50%. Therefore, before each learning operation the brain asks unconsciously: Is it really worth the effort? The neuronal network of a student needs to be convinced again and again that learning is worthwhile. This cost-benefit-analysis is influenced by prior experiences: If new information can be linked to an existing point of interest, attention increases and the desire for more information develops. Generally speaking, the brain wants to be enticed.

Of course, students have certain preferences, some of which are genetically influenced. Those with an inclination for mathematics will have no trouble learning how to execute mathematical operations. On the other hand, those with a strong aversion against languages will find it very hard learning them. For teachers the latter group of students poses the big problem: How can they be motivated to learn? How can they achieve at least a minimum result?

To equip students with the right learning strategies is one answer to this question. When we are aware of how we learn best we will have far less problems in achieving at least minimum results. How we find out about the individual learner types, how we can plan and organize our learning efforts, and further important details with regard to learning strategies will be the focus of the next unit.

The more associations are touched by a new information, the greater the chance that attention is aroused. If there are no associations that signal points of interest, new information just passes by without getting any attention. Worse, new information can even frighten our students: it is a normal reaction embedded in our genes to be careful when confronted with the unknown or unfamiliar. Our hormones signal “danger” and they prepare our body for running away. In the learning context this means there is a blockade; we are unable to grasp anything. Instead, we build up a strong aversion or resistance, thus preventing any learning at all.

To overcome this blockade, we can make use of the so-called secondary associations, which are related to the environment in which the learning takes place. Secondary associations can be music we listen to while learning something, a particular method like group work or any other feature to which the learning material is tied. If these secondary associations are positive, it is much easier to recall the information linked to them.

The advantage for learning means that we can package new information in familiar ways, which recall positive feelings. This helps to reduce the fear and stress when confronted with unknown material. We recognize something familiar which in itself is already an achievement and therefore a stimulant for learning. In that context, curiosity is a crucial factor for overcoming this fear; it is a strong motivator for learning new material. Whatever is associated with fun, pleasure and delight, is learned and remembered much easier.

As teachers and trainers, it is our task to motivate students. Motivating means creating an atmosphere conducive for learning: it means to stimulate curiosity, to identify points of interest, to mobilize positive affections and, of course, to present the learning material in a way that recognizes the findings of modern brain research relevant for learning.

10. Consequences for teaching

In teaching and training, the following rules should be considered:

Knowing the learning objectives

The student always needs to be aware of the value and meaning of the learning material. Only then attention and the urge to learn are aroused, and the content is stored sensibly.

Sensible curriculum

When the practical use of learning material cannot be concluded from prior learning units or its relation to reality, it is stored badly in the memory. Hence, it is also useless for later use since it is stored in an isolated way without any linkages. Sequence and structure of a topic have to take the process of understanding into account rather than any specific subject concerns.

Mobilizing affections

When curiosity, fascination, enthusiasm etc. are lacking, the readiness to learn is not aroused. On the other hand, whatever is linked to affections is remembered more clearly and longer, since affections reinforce the input and allow for cognitive and affective perception. Curiosity in particular is a great stimulant for learning and can also help to overcome the fear of the unknown. Presenting new material in a familiar way also helps to reduce this fear and bypass related learning blockades.

Creating associations

Examples and pictorial additional explanations furnish new information with further points of reference for storage in the brain. Graphic description guarantees better transition from the short- to the long-term memory and offers varied possibilities for recalling the information later. The more associations we have when exposed to new information, the higher the possibility of remembering. Associations help to store details and they also arouse attention and interest.

Creating multi-channel messages

The more senses are involved in learning, the higher the retention span. Different input channels offer different possibilities for associations for deeper understanding. This enhances attention and the motivation to learn. It is also easier to remember the new information later. Multi-channel messages also recognize the fact of different learner types with various preferences.

Applying didactical principles:

From the whole to the detail

The whole usually offers linkages to the day-to-day experiences, something familiar. This allows for incorporating new information on different levels. With many points of reference available, also details can be remembered better.

From the known to the unknown

Explaining facts or connections helps to recall known association patterns. To link a new term to known information is much easier than first learning a new term without any point of reference.

From the concrete to the abstract

Whenever a principle, law, proceedings or any other abstract material has to be learned, it is much easier when described as real action. It can be visualized and conclusions can be drawn accordingly to help understand the abstract résumé.

From the simple to the complicated

Complex and complicated processes can be simplified: it is important to show the essentials so that the most important - the basic principle, for example - is understood. This also creates an interest for the details and the more complex matters of a topic.

Deutscher Entwicklungsdienst

Linking teaching to reality

Establishing links to real life enhances curiosity and interest and offers more points of reference for storing new information. In the same way, exposure to reality and direct observation of the real object facilitates spatial orientation and allows easier and more accurate understanding. Putting students actively to the test outside of school in a real life situation where they can make use of what they learned usually has a great motivating effect on their performance.

Repeating new information

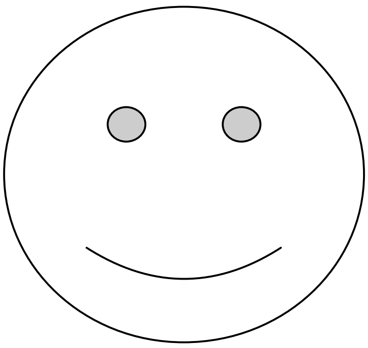
Each learning material needs to be repeated at intervals. It enhances remembering since the learning material appears in a different context and different connections, which once again allows for more associations and linking points. Application – using what has been learned – is the best way of repeating and reviewing.

Involving students actively

Avoid ready-made solutions. Allow students to come up with own solutions for problems and to work independently with media as well as to conduct experiments during natural science classes. Give challenging, suitable tasks already at an early age to foster a positive attitude towards learning.

Making learning enjoyable

Fun and a sense of achievement create an atmosphere conducive for learning. Information linked with positive events and feelings are learned and remembered much easier. Create opportunities for achievement and give praise and recognition as often as possible. Correct mistakes casually; if they are emphasized too much, the contrary may happen and students will just store and recall the wrong information.



Unit 4 Conclusions

1. Learning methodology and the world of employment

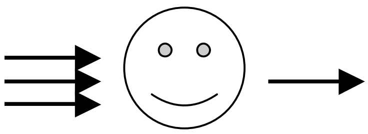
As we have seen in the previous units, learning is quite a complex process. While some factors simply have to be recognized, such as the brain's structure in form of the neuronal network, others can be influenced and changed, like learning strategies.

The more we know about learning in general and about our individual learning profile in particular, the better we can organize our learning efforts in order to achieve good learning results. Hence, it is quite obvious that students and trainees will benefit tremendously when they are equipped with learning methodology and knowledge about learning as such.

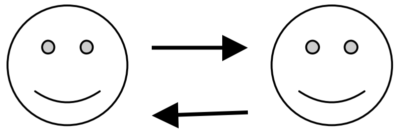
These benefits, however, are not limited to the time of study and training. The rapid spread of new technologies and the changes in work organization and process sequences in production are dramatically influencing the profile of work. Today's and future graduates from schools and training centers are not only required to have expertise in a particular professional area, they are also expected to have so-called key qualifications or core skills. While workers are still asked to carry out orders, they also have to be able to handle unforeseeable situations: They must identify problems and find the optimum solution. This requires both social and methodological skills. Some of these core skills with examples of essential individual qualifications are:

1. Organizing and carrying out the assignment

- Determination
- Accuracy
- Systematic course of action
- Organizational ability
- Coordinative ability

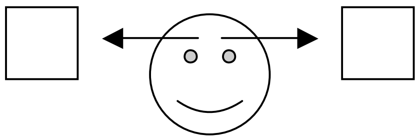


2. Communication and cooperation



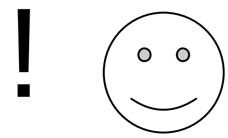
- Open-mindedness
- Ability to cooperate
- Ability to work in teams
- Appropriate behavior towards customers
- Appropriate behavior towards colleagues
- Intuition

3. Application of learning techniques



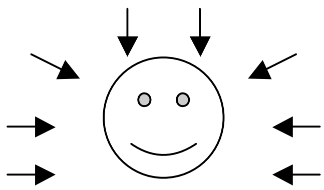
- Using learning techniques
- Deductive thinking
- Ability to transfer methods to other areas
- Thinking in systems

4. Independence and responsibility



- Involvement
- Reliability
- Acting prudently
- Ability to criticize oneself
- Ability to express own opinion

5. Ability to work under stress



- Ability to concentrate
- Perseverance
- Adaptability

For teaching and training this means to equip students and trainees not only with the professional expertise, but also with methodological and social skills. Introducing learning methodology in the curriculum is one major step to prepare graduates for the demands and challenges of the work of employment: It helps them to deal with the constant changes due to new technologies and to upgrade knowledge faster and easier.

2. *The importance of group work*

As mentioned already, the world of employment has undergone tremendous changes with regard to organizing work and production processes. To a large extent, modern manufacturing technology is based on teamwork: Single working steps are united into working procedures and executed by teams. The whole team is responsible for the way they organize work and for the result in terms of quality and quantity.

The ability to work in a team is also required in other work areas. When it comes to research and problem solving, solutions are no longer found by individuals but by whole teams: people with different expertise have to work hand in hand to come up with the optimum solution for a particular problem. Instead of working isolated (one brain), different ideas are put together (many brains), discussed etc. to find the best possible option.

Working together as a team, however, also has to be learned. In daily teaching and training, assignments should therefore be given not only to individuals but also to groups. While teamwork is beneficial for the demands of future work and employment, it also has a favorable effect on learning as such:

Associations

When trying to understand the learning material, it provides more associations, which help to link the new information and remember it better; mixed learning styles also ensure better learning and make it more enjoyable.

Explanations

Difficulties of understanding can be revealed and clarified in discussion; in addition, different opinions and viewpoints can be gained.

Assistance

In cases of uncertainty, it is possible to find assistance and support in another person in the same position; it also saves time since tasks are divided among group members.

Activation

There is a greater challenge to the activity of the individual in a group than in learning on one’s own; participating and contributing increase the learning commitment.

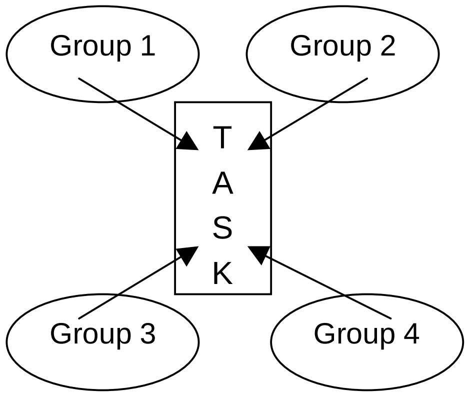
Check of performance

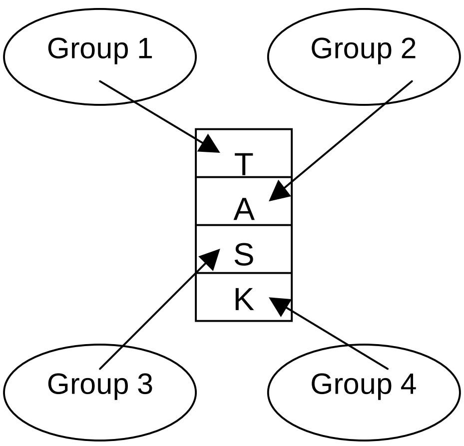
By comparison with others, one's own performance can be assessed more realistically; this can lead to new or additional incentives to learn, thus raising the quality of the work.

Depending on the task the groups are given, there are two major types of group work: the common job group work and the job sharing group work.

Common job group work

means that all groups are intensively working on the solution of the same problem: all groups are given the same task, materials and questions. At the end, each group is asked to present its results. This embodies a repetition, which means reinforcement. The other positive side effect is that the output is higher – more groups mean more ideas, solutions, and contributions. There is also the element of competition and self-critique – which group has the best solution, what are other solutions lacking. At the end of the common job group work, every student and trainee should be familiar with the new knowledge without additional homework.





Job sharing group work

means that every group is working on a particular part of a solution. At the end every group presents the results; these partial contributions are assembled and put together into a final complete result like pieces of a puzzle to a picture. Though this form of group work saves time, learning is not as intensive, since there is no repetition and the results of other groups are usually presented in lecture form without any active involvement of the other students and trainees. In addition, the output tends to be lower because fewer people work on a particular task.

The ability to efficiently work in a team requires a number of social skills such as:

- Fair sharing of work load
- Finding a compromise among different views
- Using convincing technical arguments
- Dealing with criticism
- Accepting the superiority of other teams' results in a fair appreciation

These abilities cannot be trained in conventional ways. They have to be experienced and practiced. Measuring progress in that field is based on observation over longer periods.

As for assessing results of group work, these criteria can be helpful:

- Correctness of matter presented (knowledge)
- How well explained (communication)
- Format of presentation (creativity)
- Team work (social)

As already mentioned earlier, group work is also a good learning strategy: Instead of learning alone, we can form a learning group. The ideal group consists of 2 to 6 people. Among these a kind of working contract is established to define the common objective and goal. The learning then is divided into parts and assigned to group members; the group works together until the plan is completed. While individual strengths can be used, especially with regard to different learning styles, group members can support each other also in other ways by sharing opinions, experiences, knowledge and fears. The learning group is also a good audience to present results to; the feedback helps to tell how well a subject is understood. At the end, learning groups should review how they worked together, so they can improve when tackling future learning projects.

3. Learning – a broadened concept

For many years the focus of teaching and training has been the content level of a particular subject. In its approach this style of instruction is concentrated on imparting knowledge (facts, rules, terms, definitions etc.), facilitating comprehension (phenomena, arguments, explanation etc.), creating understanding (connections, systems, processes etc.) and enabling evaluation (judgment of theories, statements, measures etc.).

While this is still of major importance, other areas of learning, such as learning methodology, social skills and affective learning become the focus of attention: As mentioned earlier, information is outdated much faster than it used to be. Consequently, employers ask for employees who are able to handle information and constantly upgrade their knowledge – in short, employees who have learned how to learn. At the same time, the organization of work processes asks for staff used to work in teams and capable to take on responsibility.

These new requirements should, of course, be reflected in the curricula of schools and training centers. If taken seriously, they will lead to a new approach in instruction based on a broadened concept of learning.

Broadened concept of learning			
Content-subject related learning	**Methodological-strategic learning**	**Social-communicative learning**	**Affective learning**
• Knowledge (facts, rules, terms, definitions…) • Comprehension (phenomena, arguments, explanations…) • Understanding (connections, systems…) • Evaluation (judging theories, statements, measures) etc.	• Excerpting • Looking up • Structuring • Organizing • Planning • Deciding • Designing • Keeping order • Visualizing etc.	• Listening • Explaining • Arguing • Asking • Discussing • Cooperating • Integrating • Facilitating discussions • Presenting etc.	• Developing self-confidence • Enjoying a topic/ a method • Developing identification and commitment • Building up values etc.

Unit 3 Handling Information

1. General considerations

One of the core requirements for successful learning is the ability to handle information. As recipients of information in the context of teaching and training, students and trainees are daily confronted not only with inputs in form of lectures, presentations, experiments etc., but also with printed material such as textbooks, articles from newspapers and magazines, internet printouts and the like. All these inputs have to be understood, analyzed, sorted and processed in a way that they can easily be stored and recalled later.

At the same time, students and trainees also have to present information: They can be asked to give a lecture, to inform about the results of group work, to submit a report etc. Oral and written exams also require them to give inputs; the results of these tests indicate how successful they were in handling information.

While of major importance for the time of study and training, the ability to handle information is also vital for the working world: not only is information outdated faster and faster these days, the amount of new information is also constantly increasing.

This unit focuses on the main methodological skills required for handling information in the context of teaching and training. While basic information is given on the areas covered, exercising these respective skills is a necessity for long-term success.

2. Reading techniques

Efficient reading is a crucial step for successful learning. Apart from mere reading skills it involves the ability to stay concentrated to the task and topic, to grasp the content, to filter out the important information and to process it in a way it can be used and/or recalled later. Depending on the amount of information involved, it is also quite time-consuming.

To make maximum use of time, it can be useful to just skim through a text instead of reading it thoroughly. For example, when we want to get a first impression or obtain certain key information of a text, survey reading is a helpful method. The common word-by-word reading approach is not only tiresome and ineffective in that context; it is also very often a waste of time since only very selective text utilization is required. The following criteria help us to decide when survey reading should be practiced:

Why skimming through a text?

Skimming through a text (survey reading) is useful and makes sense when…

1 the topic of a text is not totally unknown to us

2 we are looking for specific information in a text answering given or self-constructed questions

3 we deal with a longer text of which only a certain part is important for us

4 we want to get a first impression of a text before reading it in detail

5 we are already knowledgeable about a topic and we only like to verify whether a text contains any new information for us

6 we quickly want to know whether a text contains any interesting or important information for us

Rules for survey reading

In survey reading it is important…

➡ That we remain concentrated so we don't have to read a previous paragraph again since these deviations prevent reading success and reduce reading pleasure

➡ That we search for something particular during reading: for terms, numbers, explanations and other information we consider important

➡ That we do not focus our eye on single words but on whole word clusters. This extension of the view span can be practiced and learned.

➡ That we concentrate on items with special emphasis such as headlines, words in bold print and summaries at the end

- That we don't take every single word serious and try to remember it since our memory could not keep up with this demand. We have to be selective. Focusing on the essential is a must!
- That we identify the crucial words representing the meaning and the mental structure of the author, working from top to bottom
- That we, if required, jump from paragraph to paragraph to get an overview and to judge whether there is anything important for us

When conducting exercises in survey reading, a time limit should be given according to the level of the reading ability of a respective class/group. Important is that the work is done under real time pressure. With the help of the word pyramid below we can exercise to enlarge the view span, thus increasing reading speed: we take a sheet of paper or cardboard and cut out a window at the top as high and broad as the last line of the pyramid. Then we cover the pyramid with the paper and start pulling it slowly downwards, thus revealing one line after the other. We make a note of the word/sentence we see or any questions we may have.

Enlarging the view span

Test

Success

Text marker

Concentration

Reading pleasure

Overhead projector

Marking and underlining

Preparing for exams and tests

Fast reading has to be practiced

Instruction can be fun and enjoyable

The reading speed is constantly increasing

Headlines and subtitles usually stick out in text

With ongoing practice, the view span is increasing

This reading exercise and training has been a success

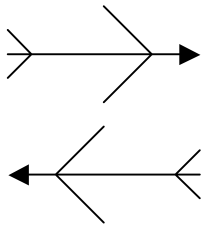
Focusing on the important and essential is surely a must

The best way to practice is with a partner who pulls the sheet for us and controls our answers of what we have seen. Other pyramids can be made for further practice. This helps to improve reading speed by enlarging the view span.

Reading speed and survey reading are both used in the 5-step reading method: This method is a systematic approach for reading. While it may not be needed all the time, it should be explained and practiced often enough since it improves reading results considerably. Else, students and trainees may just spend a lot of time reading without arriving at useful results.

The 5-step reading method

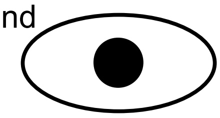
1 Skimming through information
At that stage, we look out for headlines, bold printed matter and other emphasized items, the beginnings of paragraphs or, in case of books, at the table of content. During the first step we want to obtain a rough idea of the content and the composition of the text.



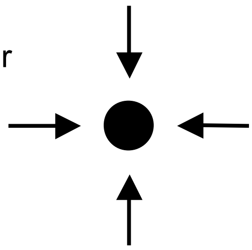
2 Forming questions
Now we try to find out which questions are tackled in this text. For which questions does the text provide us with answers? In the beginning, we write down these questions; later on, these questions can be clarified mentally.

?

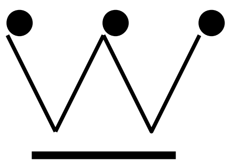
3 Reading thoroughly
Next we read the text thoroughly while keeping our questions in mind and the reason for reading – what do we want to know? During reading we make brief “just-a-second pauses” so what we have read can settle.



4 Summarizing
After each basic idea we stop and reflect on what we read and whether we understood everything. We summarize the reading content in own words – in written form or mentally. For this step, loud talking to one self can be very useful.



5 Repeating
At the end we repeat the major statements and information of the text. We consider our questions we formulated during step 2 and our markings of the text we may have done during reading. The repetition can be executed in writing, mentally or as a monologue.



3. Summarizing techniques

Evaluating a text and summarizing the information in short statements, charts, sketches or other graphic drawings is a major skill in handling information. A first step can be marking and underlining. If executed in the right manner, it helps us to recall the important information of a text.

In that context, a text marker is a very useful tool since it makes important parts of a text catching one's eye. When reading the same text for repetition purposes later, it is usually enough to concentrate on the marked parts: they bring back all the other important information of the text. In a way, the marked parts have the function of a key: they open up areas of our memory in which we have stored the connected information. For example, when marking the word "high pressure", this word helps us to retrieve other information that we have associated with it when reading the text for the first time. (What happens when we have high pressure as a weather condition? How does it occur? In what way does it affect people's health? Etc.) We hardly have to read this sideline information again since it reappears with the respective key word.

However, this requires that we use the text marker only for the key words. If we mark whole sentences or even paragraphs, the eye does not know on which part to focus. When marking too much, our memory fades and for repetition purposes we have to read the whole text again. This is time consuming and also boring. Therefore, we should only mark key words and make sparing use of text markers, so our eye immediately catches the key words which trigger off our memory. We should also stick to one marker color; various colors may lead to confusion. Important sideline information can be marked with a fine red felt pen: Red as a signal color can easily be recognized and the fine line distinguished from the bold marked parts.

Rules for marking

1 We keep a pencil, ruler, marker and fine red felt pen ready for use on our desk

2 We skim through the text to get a first impression

3 We underline important parts with pencil to recognize the text structure. Pencil can be easily erased, so it is no problem if too much is underlined at this stage

4 We skim through the underlined parts to identify the key words, which, after careful consideration, we finally mark. Yellow has proven to be a good color.

5 We underline sideline information with a fine red felt pen. We are careful not to underline too much.

6 We write down the key words on a separate sheet to check whether we have understood everything.

7 When we remember the important sideline information at this point, we know we have chosen the right key words.

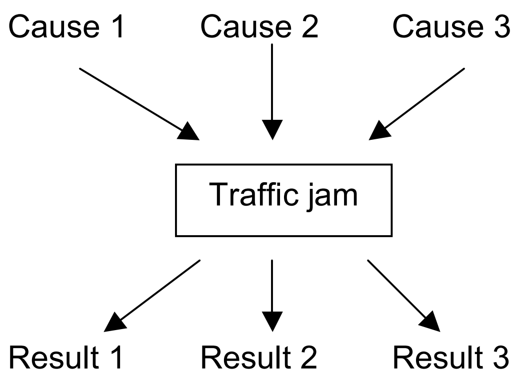
8 We will finally see that we can remember easily the key words, which will help us to recall most of the other information. The details are linked to the key words! And, after all, we cannot remember everything.

As said already, information can also be summarized in charts, sketches or other graphic drawings. Most of us remember information much better once it is associated with images. The crucial factor in that context is that we develop our own individual summaries and structures, which we then translate into graphics. While students and trainees may have difficulties structuring a text, their learning results will improve when they get sufficient assistance and practice in these techniques.

Here are two examples how information can be translated into graphic structures:

Example 1:

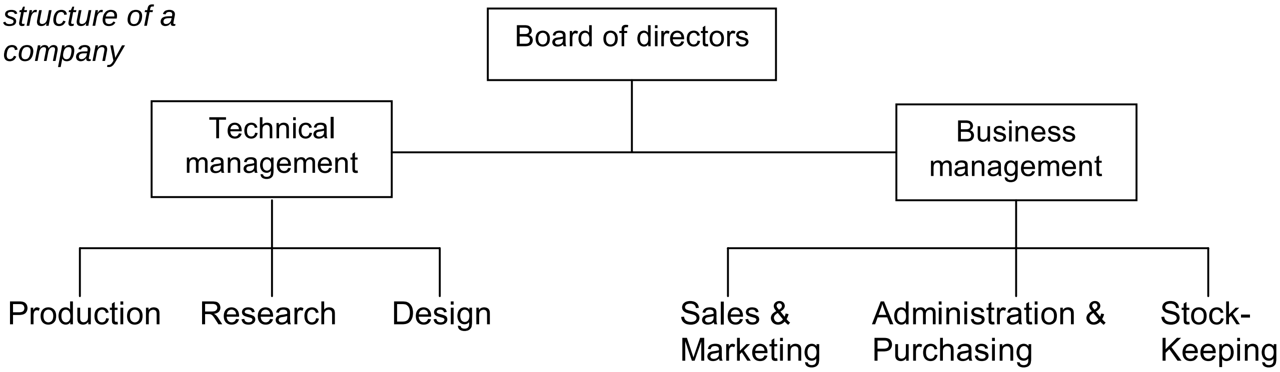
A text about the problems heavy traffic causes in a city like Manila



This visual aid is not only useful for processing information, it can also be useful when delivering a short speech on the topic: While it ensures that all important inputs are mentioned, it allows for free phrasing which makes any speech always far more attractive than just reading a pre-written text.

Example 2:

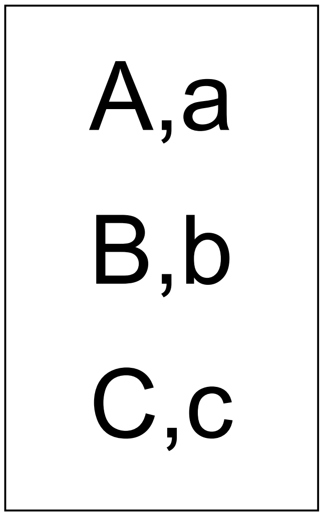
A text about the structure of a company



This visual aid not only helps to structure and understand information given purely in words, it also enhances remembering this data.

4. Researching techniques

So far, we looked at handling information on condition that it is already available. However, handling information can require to research for it: a particular problem has to be solved, an answer to be found for a question, material for a presentation to be put together. To obtain or verify information, we can make use of libraries, the Internet or special resource persons who are experts in their field. The requirement here is that we know how and where to look for what particular information.



With regard to reference books such as dictionaries, subject catalogues or encyclopedias, it entails dealing with content tables and catchwords, managing the alphabet, quick leafing through books to get a first impression, fast skimming through a text and recognizing the wanted terms of information.

Once again, exercising how to work with reference books is crucial for success. Competing games with material such as an atlas, various specialized dictionaries, telephone directories etc. combined with crossword puzzles, sorting and spell check exercises can be very helpful. Like in survey reading, a tight time limit should be set to stimulate quick and speedy looking up.

Whenever a library is at hand, a visit should be made to ensure students and trainees know how to avail of the respective books. As for the Internet, they should be familiarized with the basic research strategies when using search engines. What holds true in general, holds particularly true for the Internet: the more specific the question (meaning the term for the search request), the more specific the answer. In the age of information we usually do not suffer of lack of information, we are rather confronted with too much information!

When we are conducting research, we usually try to find an answer to a given topic and/or problem. Here, the art of questioning can be very helpful. In general, those who ask questions usually benefit more from learning. Questions are like focal points in our memory to which the answers are glued. This tie between question and answer, however, requires that we ask goal-oriented and well thought-out questions. Although all of us started life with an insatiable curiosity, most of us learned that answers are more important than questions. Hence, the art of questioning is usually underdeveloped. A varied questioning training helps us to develop topic-centered questions, to relate questions to particular areas and to establish question-answer connections. Thus we not only further our ability to ask, but also to understand and answer questions.

The ability to ask questions not only helps us in research, it can also enhance our problem-solving skills. For most of us this will require shifting the initial emphasis away from focusing on “the right answer” and toward asking, “Is this the right question?” and “What are different ways of looking at this problem?” Successful problem solving often requires replacing or reframing the initial question. Questions can be framed in a wide variety of ways, and the framing will dramatically influence our ability to find solutions.

Questions can be grouped according to three major areas:

Knowledge	**Comprehension**			**Values**
	Causes	Results	Countermeasures	
Asking for: Terms Numbers Names Details to be memorized	Lead further into topic and require thinking, combining and arguing			Concern personal opinions and values

Who?
What?
Where?
When?
Why?
How?

How can we sharpen our question-asking skills so that solutions will start to come to us? We can begin by asking simple, “naïve” questions children might ask, such as, “Why the hammer blow causes the nail to jump?”, “Why is the sky blue?”. Aiming to ask questions we have not raised before is a way to stimulate our curiosity, which again stimulates learning. Creating questions is also a good start to research on a particular topic. Here is one example focusing on the image of a bird in flight:

How does a bird fly?

- Why does it have two wings?
- Why does it have feathers?
- How does it take off?
- How does it slow down?
- How does it accelerate?
- How high can it fly?
- When does it sleep?
- How good is its eyesight?
- What does it eat?

Other topics for creating questions could focus on images such as flowing water, the human body, a landscape, reflected light, a knot or braid.

When we want to obtain and/or verify information by conducting an interview with a resource person, we also need well thought-out, goal-oriented questions. Only when we are aware of what we want to know can we ask the kind of questions that prompt the answers we are looking for. What stimulates our own mind, can also stimulate the mind of our resource person: Asking surprising, unexpected questions can lead to interesting, unique insights and may also help to reveal the personality of our interview partner!

5. *Working tools*

Once we have compiled the information we need, the next step in handling information usually includes processing and/or storing it. For that matter, we have a number of useful tools, which help us to keep order in terms of filing and presenting information. Exercises on how to use these learning aids help us to be aware of their purpose and correct use. Once familiarized with these items, competitions among students can be held who comes up with the most creative learning poster.

Correcting mistakes:
- Eraser
- Correction fluid
- Correction tape
- Plain stickers

Writing utensils:
- Pencil
- Fountain pen
- Felt pen
- Ballpoint pen
- Marker
- Text marker
- Crayon

Storing notes
- Card-index box
- Index card
- Alphabetical index card

Cutting & Sticking
- Scissors
- Cutting knife
- Puncher
- Sharpener
- Glue stick
- Fluid glue
- Scotch tape
- Masking tape

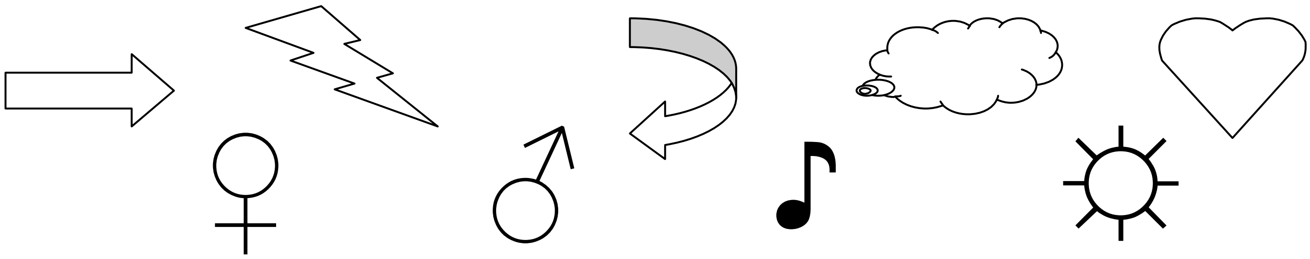
Fastening papers
- Paperclip
- Stapler
- Fastener
- Binder

Designing
- Ruler
- Dividers
- Set square
- Protractor
- Lettering guide
- Curve stencil
- Drawing board

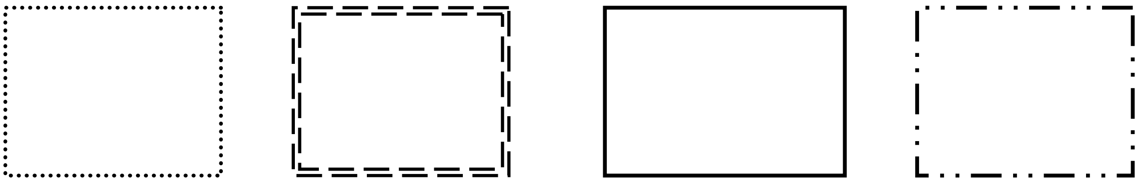
Design elements
- Symbols
- Stickers
- Frames
- Backdrops
- Ready-made letters

Filing papers
- Filing tray
- Clear sheet protector
- Folder
- File
- Index sheet
- Divider

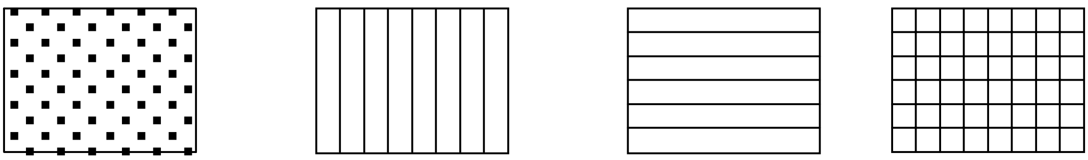
While basic skills such as precise cutting out of shapes and figures, tidy gluing, accurate drawing of lines etc. are usually learned at an early stage, proper execution should be monitored and, if necessary, reinforced through exercises. Often the state of students' exercise and notebooks leaves a lot to be desired, an indicator that they are not aware of the importance of good visual presentation of learning material in achieving high learning results: It is much easier to learn material that is well structured and presented than confusing, unsystematic material hardly legible. The following page displays a variety of samples that can be used in design and layout.



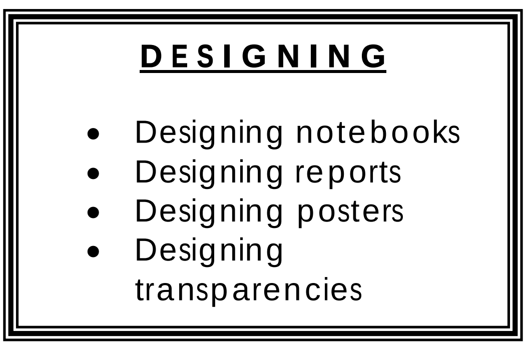
Examples of symbols and design elements

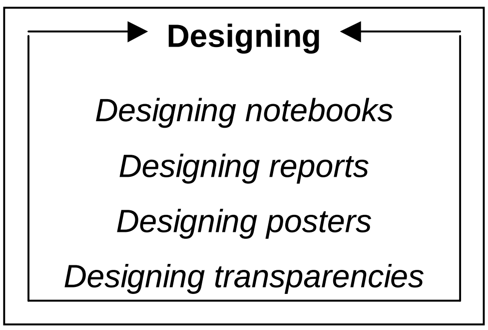


Examples of border designs



Examples of marking areas





Examples for layout & design

The next set of examples shows how the same information can be presented in different ways: While example 1 and 2 only differ with regard to the lay out, example 3 is also shortened and reduced to the essential information.

Example 1

THE USE OF SCAFFOLDS
Definition: A scaffold is a framework of metal or wooden/bamboo poles and planks used as a temporary platform from which building repair or construction is carried out. Dependent scaffolds are usually fixed on a house or a wall and cannot stand freely while there are poles only on one side of the scaffold while the other side is connected with the building, which gives it a proper stability. Independent scaffolds do not require the support of any wall or building because of having poles on both sides, which allow erecting them in-dependently. Scaffolds can carry workers and material but one must be careful not to put too much load like blocks and mortar so that the planks cannot carry the load and will break down.

Example 2

The Use of Scaffolds

<u>Definition:</u>
A scaffold is a framework of metal or bamboo/wooden poles and planks used as a temporary platform from which building repair or construction is carried out.

<u>Dependent scaffolds</u> are usually fixed on a house or a wall and cannot stand freely while there are poles only on one side of the scaffold while the other side is connected with the building, which gives it a proper stability.

<u>Independent scaffolds</u> do not require the support of any wall or building because of having poles on both sides, which allow erecting them independently.

Scaffolds can carry workers and material but one must be careful not to put too much load like blocks and mortar so that the planks cannot carry the load and will break down.

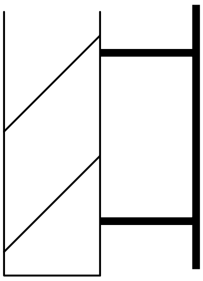
Example 3

The Use of Scaffolds

Scaffolds are put up when work has to be done above men's height.
They carry persons and construction material.

Types of scaffolds

<u>Dependent Scaffold</u> | <u>Independent Scaffold</u>

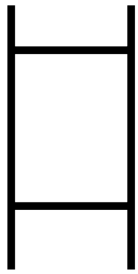


Are fixed onto the building and cannot stand alone.

Are more stable but cannot be erected freely.

Can be erected without connecting it to a building.

Can be erected everywhere but are not as stable.



<u>Do not overload scaffolds! Be careful when working on them!</u>

6. *Visualizing techniques*

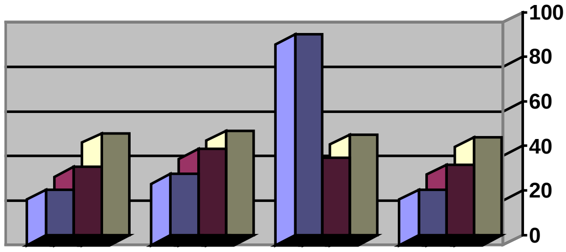
Good visualization not only enhances understanding, it also helps to remember new information. The various degrees of improvement can easily be seen in the examples above: While number 1 just gives a 1:1 information, number 2 already structures it by simply introducing paragraphs and underlining the key words. Number 3 goes a step further by incorporating illustrations and reducing the information to the most important parts.

While it is important that teachers and trainers make use of visual aids during instruction, it can be of great benefit for students and trainees to be actively involved in the visualization process themselves: Instead of presenting them with the finished product, they can be asked to "translate" text, figures and statistics into meaningful charts and tables on their own. The more they practice this skill, the more they can apply it when learning by themselves, e.g. when summarizing information. At the same time, this kind of constructive thinking also improves their understanding capability when asked to interpret charts and tables.

Charts can be used for different purposes. The main are:

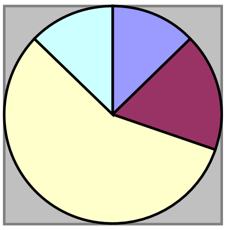
Column chart

Comparison of various sizes



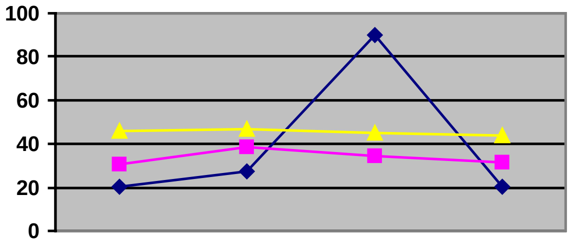
Pie chart

The whole and its parts



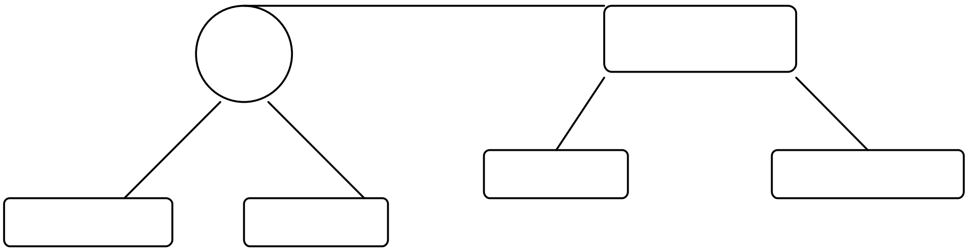
Curve chart

Visualizing developments



Flow chart

Visualizing structures & procedures

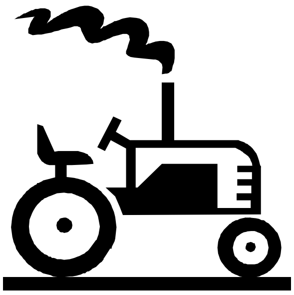


Apart from charts, many other forms can be used to visualize information, such as diagrams, tables, word clusters, definition networks, structural trees and so on. As we said already, visualizing techniques are also very useful for summarizing information.

When doing group work, students and trainees can also be asked to prepare a visual aid that supports the report on results they give to the whole class. While the visualizing process itself will already enhance understanding and learning of those actively involved, it will also be of benefit to the whole class: If only presented verbally, we remember about 20% of information. If an oral presentation is combined with visual aids, the retention span already increases up to 40%.

Whatever form we choose for visualizing information, the most important requirement is that it is clearly arranged and easy to remember.

Example **"Diagram"**
A schematic drawing can be used to illustrate and simplify complicated technical and other learning material, e.g. engines, machinery, the human body etc. Diagrams help us to understand and remember information better, particularly when having been drawn by ourselves. In textbooks, they usually are labeled already; for reviewing purposes we can cover the proper terms and try to label the diagram ourselves. Terms we find hard to learn can be covered with another color so they immediately stick out when we do another review.



Exhaust pipe

Steering wheel

Driver's seat

Engine

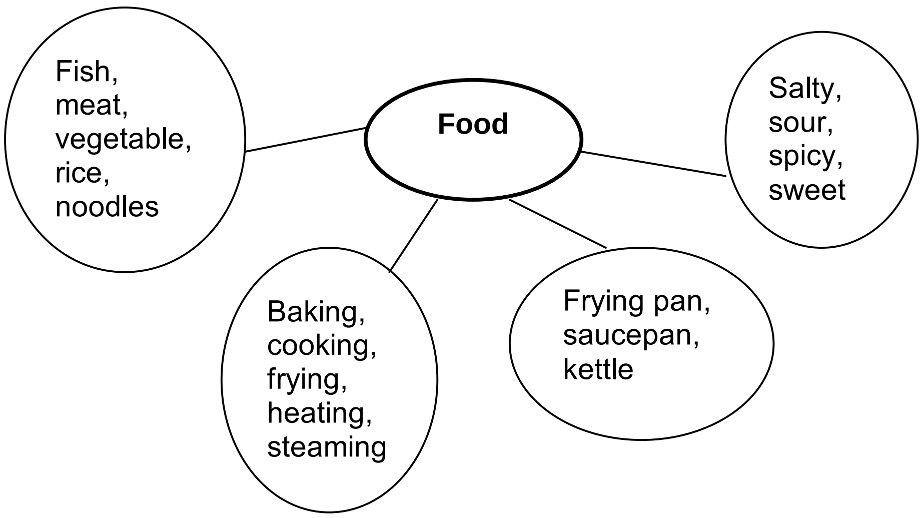
Wheels

Example **"Table"**
Tables are useful to list information that can be grouped according to categories. They help to structure and clearly arrange information, which else may be confusing if only presented as plain text.

Continent	**Country**	**Capital**
Asia	Philippines	Manila

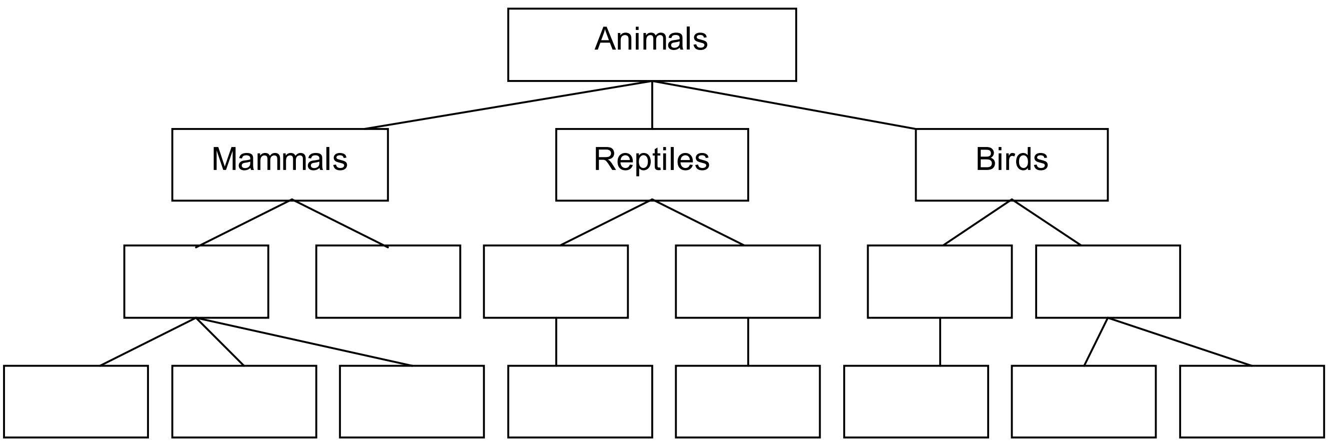
Example **“Cluster”**

Clusters are another way to group information. While the heading or generic term is in the center, terms related to it are arranged around the center by groups. Clusters can also be used to visualize key words with regard to a particular topic. They are also very useful in processing the results of brainstorming that have been noted on meta-cards.



Example **“Definition network”**

Definition networks can take on many different forms. The one below is hierarchically structured; others can display a causal structure visualizing causes and consequences of a particular problem.



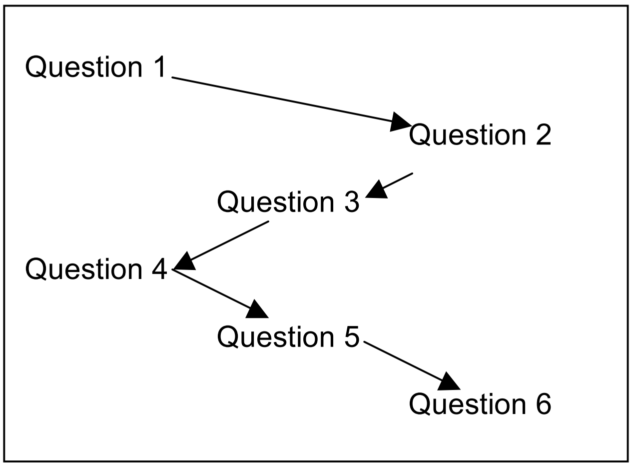
Visualizing techniques are not only useful when summarizing or presenting available information to others, they can also be used in preparation for a presentation. Though students and trainees are mostly required to copy, make notes or use other forms of reproductive writing, training and study also involve writing reports, presenting papers and giving a lecture.

Usually, it is not enough just to start writing about a topic. If not given any thought beforehand, we may forget important aspects or not keep to the point. The first step therefore is to collect information and ideas, after which the material has to be sorted and sequenced in a way, that one point leads to the next. This outlining guarantees a logical flow of information and arguments. A very helpful exercise in that context is preparing a visual framework for writing. If executed thoroughly, the writing process itself will hardly pose any serious problems.

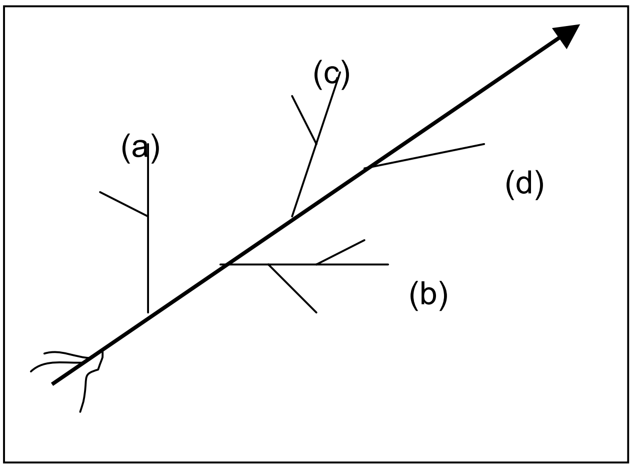
Frameworks for organized writing

1. ....
    - 1.1. ....
    - 1.2. ....
2. ....
    - 2.1. ....
    - 2.2. ....
    - 2.3. ....

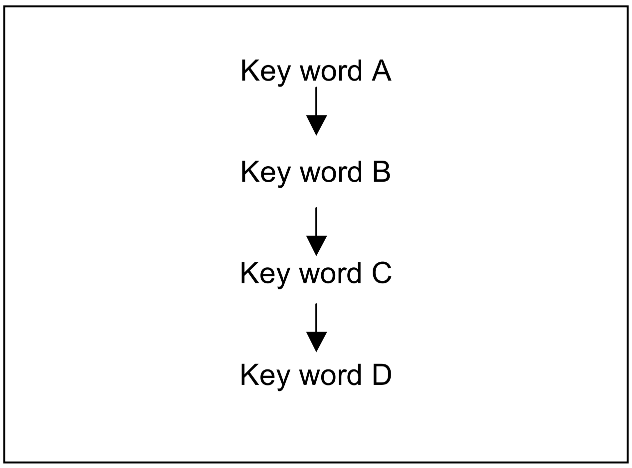
Plan for outline



Chain of questions



Tree frame



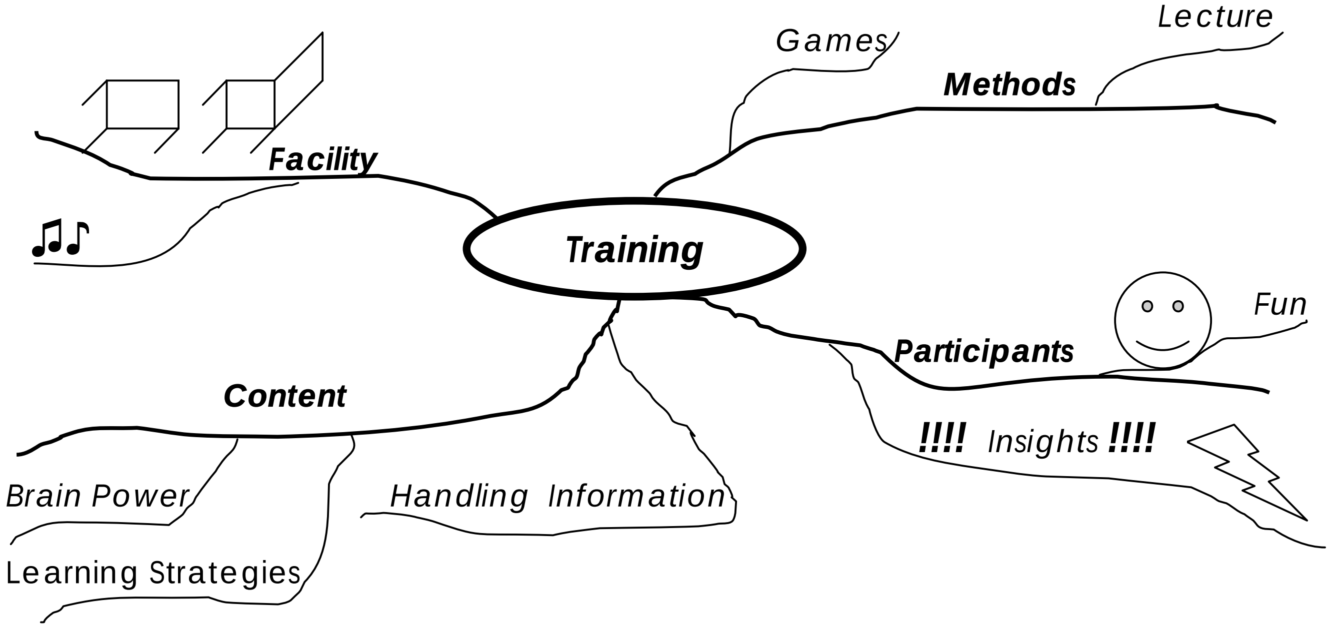
Chain of key words

7. Mind mapping

Although valuable as a tool for structuring ideas in a formal, orderly fashion, outlining is useful only after the real thinking has been done. Trying to generate ideas by outlining, we will find that it slows us down and stifles our freedom of thought. We could also say it is illogical to try to organize our ideas before we have generated them!

Outlining is a linear note-making system, which excludes our brain's capacity for color, dimension, synthesis, rhythm and image. Instead of variety, it guarantees monotony; it only involves the left hemisphere of our brain, the logical brain, while suppressing the creative half. However, when we start to think about a particular topic, chances are that ideas, key words, and images float into mind, one associating with the next. Instead of constructing whole paragraphs or ordered outlines, our mind jumps from one idea to the other; we daydream and doodle all of which is part of the creative thinking process. Mind mapping is a method for visualizing and continuing this natural thinking process on paper.

The example below shows a sketch of a mind map about "Training". While the topic of the mind map is printed in bold letters at the center, major key words related to it are arranged around it and linked to the center by branches. Whenever possible, symbols and drawings are used instead of words.



Mind mapping allows us quickly to start and generate more ideas in less time. While all outlines tend to look the same, each mind map looks different. Thus, the result can be remembered much easier due to its particular characteristics.

Mind mapping nurtures our unique, individual self-expression; regular practice will help us to discover our own originality. All we need to begin mind mapping is a topic, a few colored pens, and a large sheet of paper.

Rules for Mind Mapping

1. We begin with a word, symbol or picture representing our topic.

   We put it at the center of a blank page.

   We use the paper in landscape format.

2. We write down key words.

   We connect them with lines (branches) radiating from our central image.

   We print key words for easier reading.

   We print one key word per line/branch.

   We create side branches for points related to the key words.

3. We use colors, pictures, dimensions and codes for emphasis/association.

   We highlight important points, e.g. using text marker.

   We illustrate relationships using colors, arrows etc.

Mind maps are mirrors; they show us how the brain looks and works. At the same time, they also stimulate the right and the left hemisphere of the brain. While they make use of linking, their visual excitement helps the memory: ideas are easier to recall. Therefore, they are also easy to review, that is to be recreated from memory and checked against the original. They save time since they only record key words.

We can use mind maps for:

- Teaching/training
- Making a speech/presentation
- Project planning
- Writing reports/essays/books
- Brainstorming sessions
- Problem solving
- Creativity
- Taking minutes

8. Seminar papers

When asked to present a paper, we can make use of all the various techniques in handling information: from researching information over reading and evaluating it to structuring, sequencing and designing it. As for students and trainees, they must be familiarized with these techniques and made aware of the features to be considered when preparing a paper.

Papers usually consist of three major parts:

Introduction	Topic, reasons for topic, importance of topic
Main part	Development of central ideas/main bulk of information
End	Summary/Result/Conclusion

The following features should be considered:

Title page	Title/topic, subtitle, author, purpose of presentation, month & year
Table of content	List of numbered chapters and respective page number
Bibliography	List of books used for writing the paper stating name of author, title, place and year of publishing, appearing in alphabetical order
Quotes	identified by quotation marks, statement of source inclusive page number

Unit 2 Learning Strategies

1. The importance of learning methodology

When learning, many students feel insecure since they lack the needed methodological competence and routine. In the classroom, methods are usually teacher-oriented: it is the teacher who prepares the learning units for the students. In turn, students often feel helpless when not given instructions by a teacher. Simply calling on students from time to time to use different learning methods on their own is not enough: methods have to be taught as well. Since they can only be learned through applying them, repeated and varied exercises must be part of the classroom activities.

The emphasis on the subject matter as such in most curricula leads to the neglect of learning methods. The importance, however, of methodological skills is increasing in many job related areas. Also, life-long learning has become a regular feature of the working life. Therefore, education should be more than just teaching the subject matter. Education should also aim to equip students with sound methodological skills so that they will become competent, self-reliant learners.

This will also help to improve learning results: Students, who have learned how to learn on their own, are usually higher motivated and thus perform better.

Learning how to learn should be part of the curriculum.

A first step in that context is to assist students to become knowledgeable about their own preferences for learning. Being aware of our own learning style allows us to make use of tips and suggestions that comply with our individual pattern. Thus we can also compensate for inputs delivered in a way we do not favor.

2. Input channels and learning styles

As we saw in Unit 1, we all develop individual learning patterns. These can be grouped according to three major learning styles related to the sensory input channels of looking & seeing, listening & hearing and touching & feeling:

Visual

Visual learners find it easier to take in new information through pictures, diagrams, charts, films etc.

Auditory

Verbal learners find it easier to take in new information through the spoken word.

Kinesthetic

Kinesthetic learners find it easier to take in new information through copying demonstrations and getting physically involved.

We may dominate in one style and have a preference for another. Previous learning may have been hindered if it did not cater for our learning style. Schools for that matter usually are not geared to kinesthetic learners. To find out which channel we have an inclination for, the following statements will give us a first idea.

- ☐ When I touch an object and play with it, I can describe it much better as opposed to just thoroughly looking at it.
- ☐ Only when I have made a paper airplane myself do I know how it works. From observing alone I cannot remember it.
- ☐ Explaining me how to operate a machine or equipment, or being able to observe an experiment during instruction, I remember the process much better as opposed to only having a hands-on experience.
- ☐ I can find a way through town easier when I not only have been explained or shown it on the map, but also traced the route with my finger.
- ☐ I understand the design of a blossom or leaf better when looking at a drawing in a book than by examining it myself.
- ☐ I remember experiences better than conversations or what I read.

The following statements help us to double-check whether we are aware of our preferred learning style followed by some tips.

Visual learners

◊ Use phrases such as ‘I *see* what you mean’, ‘I get the *picture*’, ‘That *looks* right’

◊ When relaxing, prefer to watch a film or video, go to the theatre or read a book

◊ Prefer to talk to people face to face

◊ Fast talkers, dislike listening to others

◊ Forget names, remember faces

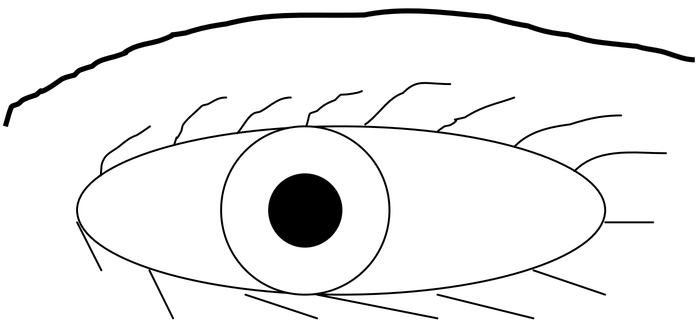
◊ When lost or need directions, prefer a map

◊ When inactive, tend to doodle or watch someone/something

◊ When angry, are silent and seethe

◊ Reward people with a note or card

◊ Well dressed, tidy and organized



Visual learners learn best by:

- Writing down key facts or, better still, mind map
- Visualizing what they are learning
- Creating pictures/diagrams from what they are learning
- Using time lines, for remembering dates
- Creating their own strong visual links
- Using pictures, diagrams, charts, film, video, graphics etc.

Auditory learners

◊ Use phrases such as 'I *hear* what you are saying', 'That *sounds* right', 'That *rings* a bell'

◊ When relaxing, prefer to listen to music or radio

◊ Prefer to talk to people on the phone

◊ Enjoy listening to others, but impatient to talk; talk in a rhythmic voice

◊ Forget faces, remember names

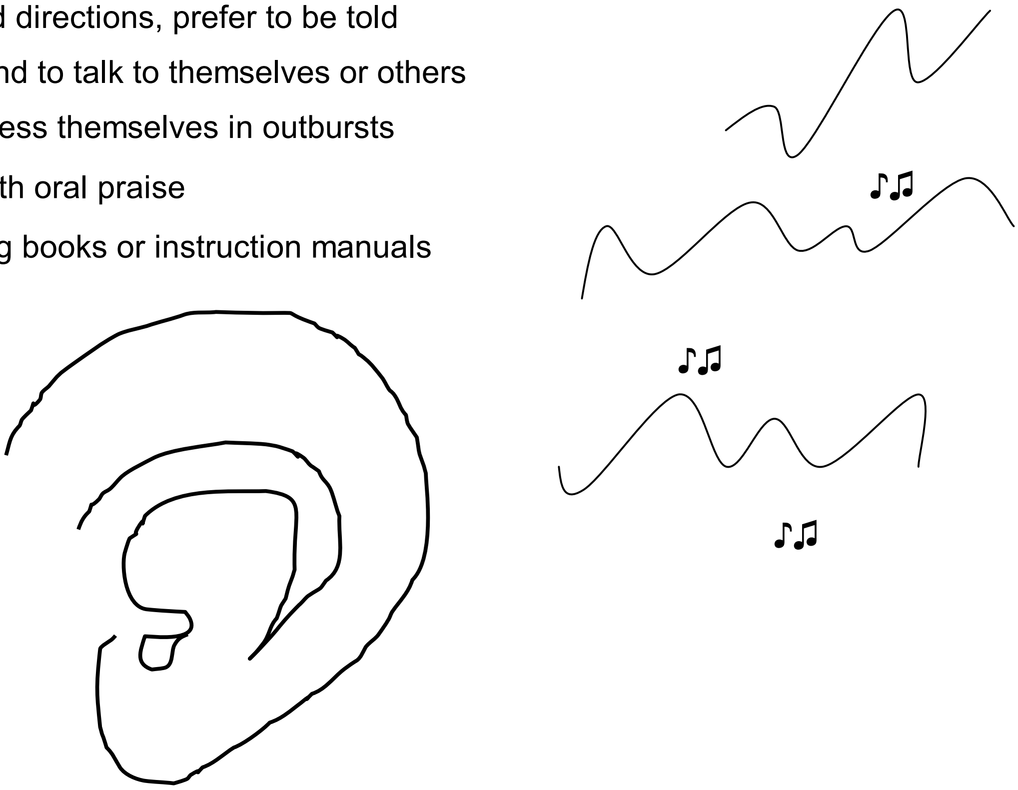
◊ When lost or need directions, prefer to be told

◊ When inactive, tend to talk to themselves or others

◊ When angry, express themselves in outbursts

◊ Reward people with oral praise

◊ Do not like reading books or instruction manuals



Auditory learners learn best by:

- Hearing a seminar, presentation or explanation
- Reading aloud to themselves
- Reading with emotion or accent
- Making a tape of key points to listen to in the car, whilst ironing etc.
- Verbally summarize in their own words
- Explain the subject to someone else
- Use their own internal voice to verbalize what they are learning

Kinesthetic learners

◊ Use phrases such as ‘That *feels* right’, ‘I found it easy to *handle*’, ‘That *touched* a nerve’

◊ When relaxing, prefer to play games and sport

◊ Prefer to talk to people whilst doing something else

◊ Slow talkers, use gestures and expressions

◊ Shake hands with people they meet

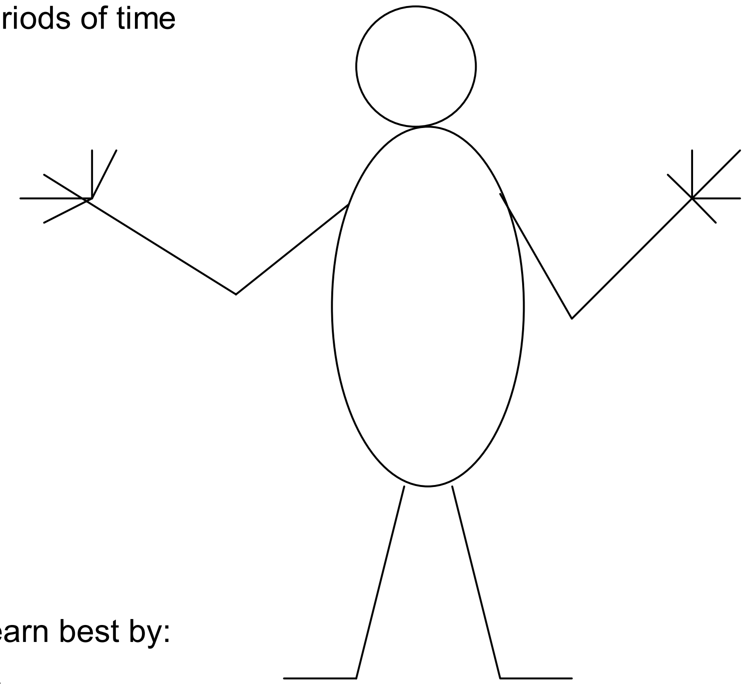
◊ When lost or need directions, prefer to be shown the way

◊ When inactive, fidget

◊ When angry, clench their fists, grit their teeth and storm off

◊ Reward people with a pat on the back

◊ Cannot sit still for long periods of time



Kinesthetic learners learn best by:

- Copying demonstrations
- Making models
- Recording information as they hear it, preferably in a mind map
- Walking around whilst they read
- Underlining/highlighting new information/key points
- Putting key points on to index cards and sorting them into order
- Getting physically and actively involved in their learning

Learner Type Test

Described below are different ways of learning. To each statement put in a number in the box at the right according to how much you remember using this particular way of learning:
Put 3 when you remember a lot by using this way of learning.
Put 2 when you remember a number of things by using this way of learning.
Put 1 when you remember only a few things by using this way of learning.

Ways of Learning

a) I prepare a chart when working with a factual text. … … … … … … ☐

b) The teacher gives a lecture on the lesson topic. … … … … … … ☐

c) In biology, I collect various plants, dry them, stick them in a folder and write short explanations. … … … … ... … … … … … … … … … … ☐

d) Our teacher shows us a cartoon (no comments) about smoking. … … ☐

e) A student reads a text from the textbook to the class. … … … … … … ☐

f) I look at the pictures and drawings in the textbook. … … … … … … … ☐

g) I prepare a drawing covering a learning unit. … … … … … … … … ☐

h) I listen to an English language audiocassette. … … … … … … … … ☐

i) The teacher shows us slides concerning a learning topic. .. … … … … ☐

j) The teacher explains to me how the President is elected. … … … … … ☐

k) I write the words I have to learn on a notepad. … … … … … … … … ☐

l) I look at an exhibition in the museum. … … … … … … … … … … ☐

m) I read a text in the textbook. … … … … … … … … … … … … … … ☐

n) A student reports on the results of his/her working group. … … … … … ☐

o) I conduct a simple experiment during the chemistry lesson. … … … … ☐

p) I listen to a debate in the radio on an actual topic. … … … … … … … ☐

q) I look at a picture book about daily life in India. … … … … … … … … ☐

r) I note down the most important information of a text. … … … … … … ☐

Add the numbers you entered in the boxes!

Auditory learner type (hearing):	b + e + h + j + n + p	=	☐
Visual learner type (seeing):	d + f + i + l + m + q	=	☐
Kinesthetic learner type (doing):	a + c + g + k + o + r	=	☐

All previous tests and exercises may indicate that we favor a certain input channel but that we also remember well when involving another input channel. As we know already, multi-channel messages in general are most successful to achieve high learning results. For reading, for example, this could mean to

- Visualize the key message
- Read aloud or hear the words internally
- Get physically involved – underline, highlight, mind map etc.

Thus, various input channels are catered for and involved in the learning process. This is a good way to improve learning results.

3. *Input channels and memory performance*

How well we remember newly learned information, depends to a large extent on the input channel involved in acquiring this new information. The following test is related to the performance of our sensory and short-term memory while it also helps us to find out what preference we have with regard to the input channel.

The test involves the three major learning styles: kinesthetic, audio and visual, the latter being divided between reading and observing. After each presentation of words to be remembered, mental arithmetical exercises are being conducted for 30 seconds (see box below). Then, 30 seconds are given to recall the words/terms presented. The result of correctly remembered words has to be transferred to the assessment sheet.

First, the person conducting the test shows different words one by one for about two seconds each followed by 30 seconds mental arithmetic and 30 seconds for recall.

Reading:

Plastic bag	rice	candle	newspaper	basket
Bicycle	cat	soap	forest	money
Horse	television	shop	guitar	bucket

Next, he/she reads a list of 15 words loud and clearly with an intermission of two seconds between each word followed by the same procedure as described above.

Hearing:

Street	mountain	pig	bread	slippers
Plate	wardrobe	bus	lamp	river
Umbrella	stamp	hut	radio	flower

Then, 15 drawings are shown representing one item for two seconds, again followed by mental arithmetic and 30 seconds for recall.

Seeing:

Tree	house	car	cup	key
Airplane	faucet	clock	telephone	bottle
Hat	suitcase	boat	table	book

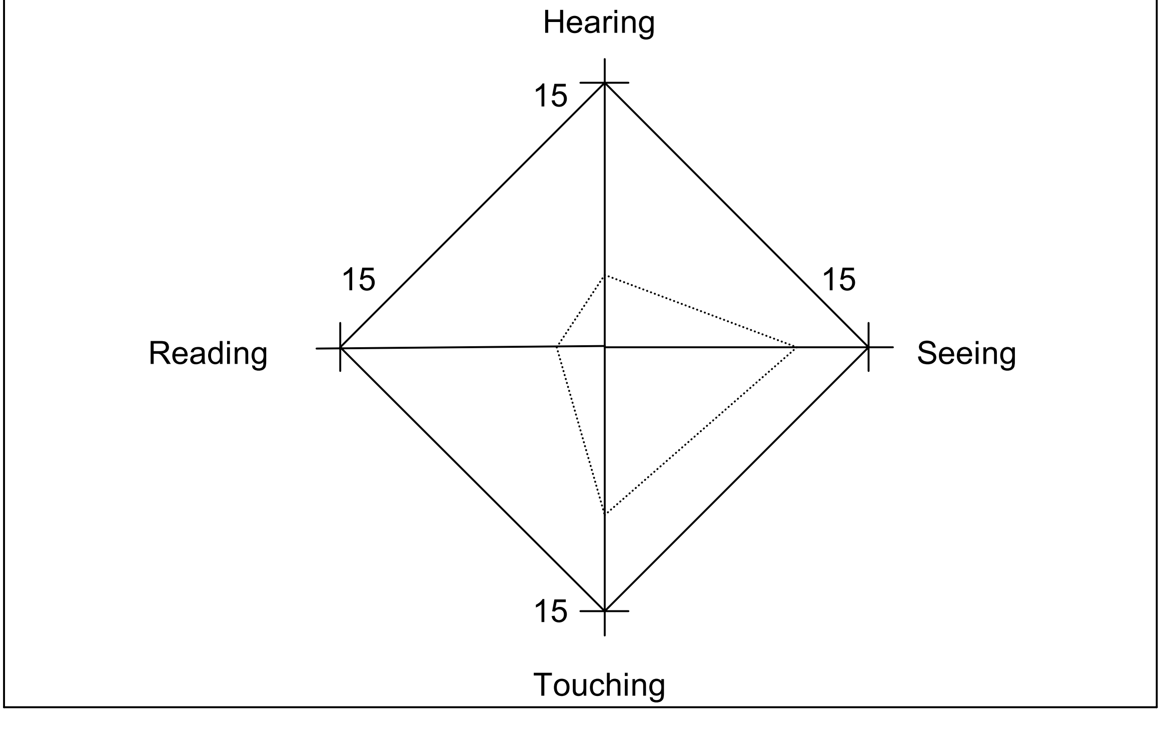
Finally, day-to-day items are given to participants; they can be held for 2 seconds each and are then passed on to the next participant. After mental arithmetic and time for recall the final assessment is made.

Touching:

Scissors	ruler	paper clip	envelope	eraser
Pencil	ball	coin	sharpener	pocketknife
Rope	stone	spoon	diskette	ring

The results of each exercise are noted in an assessment chart. The diamond with continuous line in the example below shows the result of a person who has remembered all 15 words in each category, which is the maximum result. The diamond with the dotted line shows the result of a person with a preference for seeing and touching while having problems with reading and listening. This person should try to visualize the learning material and put emphasis on graphic presentation. He/she will probably have problems when just listening to lectures or reading textbooks without getting physically involved. The bigger the diamond, the better the memory performance. The more even the diamond stretches to all four sides the more the different input channels are equally good.

Assessment chart



Mental arithmetic exercise box

3 x 7	3 : 3	6 x 5	2 x 10	5 x 5
2 + 17	8 x 5	11 – 4	1 + 6	35 – 6
9 – 3	10 – 7	8 : 4	7 x 2	2 : 2
4 x 4	5 : 1	17 – 4	8 x 7	6 x 7
9 + 3	7 x 7	7 + 3	8 x 4	4 – 3
15 – 9	18 + 2	9 : 3	3 x 3	4 x 2

4. Enhancing memory and skills performance

A great part of learning is devoted to memorizing terms, definitions, names, words, dates and other facts. As already explained in unit 1, learning is most successful when both sides of the brain are involved, that is as many senses as possible. Another significant approach includes the systematic and active repetition of the learning material. Instead of just reading a text, a list of words or some historical dates it is much more effective to actively and consciously instill this information in the memory. This can be achieved through written summaries, structuring, marking and reading aloud of new information, talking about it, question and answer games, mind maps etc.

The importance of repetition can be seen in the following charts: Chart 1 shows how much we remember of new information without repeating it. After one day, we already have forgotten half of the new information, and after 14 days we only can recall 10 %, quite a dramatic decline!

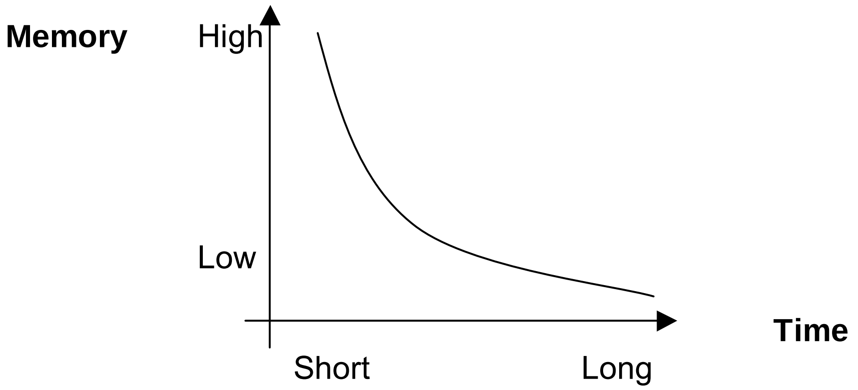


Chart 1

Chart 2 shows how much of the new information we remember after repeating it after one day: a considerable portion of the new information already is deleted after this short period of time. Chart 3 features a repetition of the learning material already during the same day we were exposed to it. Even if we don’t repeat it during the following days, we still recall quite a big portion.

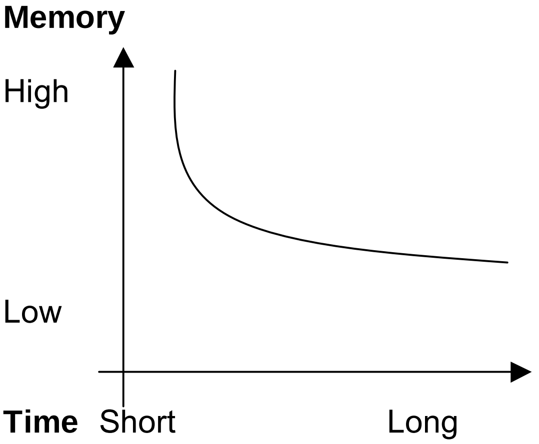

Chart 2

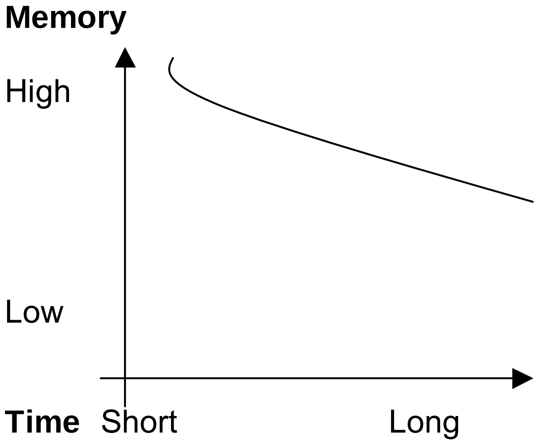

Chart 3

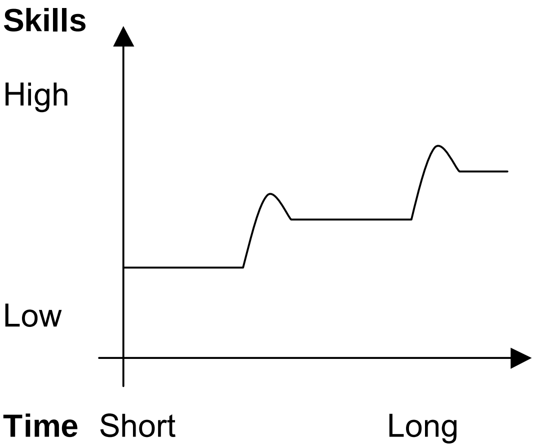
Of course, the result will also depend on the way we repeat – whether we get actively involved in the process or not, whether we repeat systematically or not. There are also other factors influencing the outcome of our efforts. For example, newly learned English words compete with a lot of other information. About ten units of more or less complex news can be remembered per day as an average. If we spend a lot of time in front of television or the computer each day, the newly acquired information will have a hard time to find its way to the long-term-memory. What is being stored there is also decided during night: Sleep stabilizes the content of the memory – but only when the new information has been used during the day. If the day-to-day relation is lacking, the whole learning effort is useless in the long run.

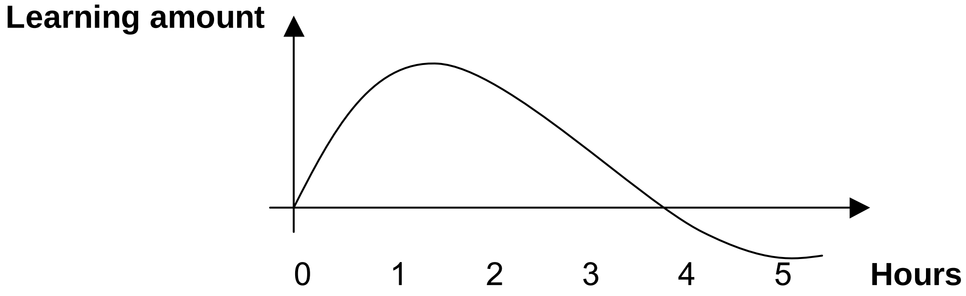


With regard to skills, repetition in the sense of exercising is also crucial for the long-term success. However, this learning curve looks quite different: As shown in the left, it starts at a certain level with a steady base line called a plateau. After continuous exercising, it rises sharply and immediately after drops a little bit: it has reached another plateau on which it continues steadily until there is another sharp rise or ‘learning high’.

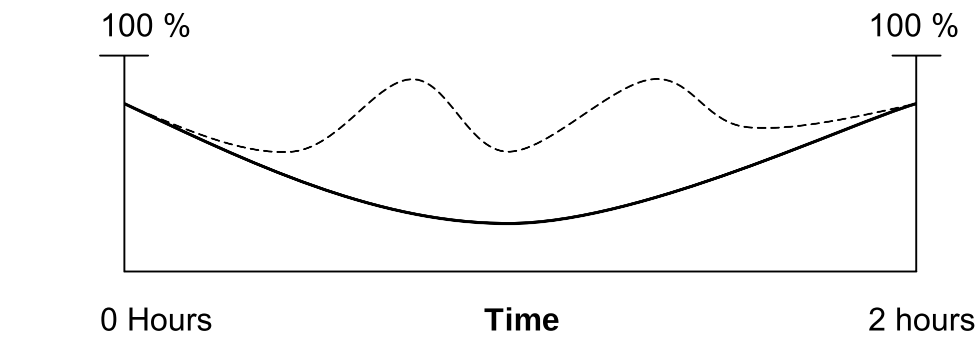
This curve tells us that training is a continuous, ongoing process. We first have to pass through a plateau before we can move on to the next level. The decline after the experienced ‘high’ is part of this process to stabilize our achievements and is the confirmation that learning takes place. In other words: We have to learn to love the plateau!

Though repetition is crucial for the success of our learning efforts, a lot of learners commit a serious mistake when preparing for an exam: Instead of planning and scheduling their work properly, they wait for the last day and then start repeating all the learning material. They believe they will not forget so much when they repeat it just briefly before the exam. This, however, is quite a wrong assumption.

Since our memory needs some time before it reliably stores new information in a way that it can be recalled later, it is useless to start learning completely new material just one day before an exam. On the contrary, this may cause simply confusion and chaos, which, in return, lead to insecurity, nervousness and lack of concentration. Finally, starting late also means that too much information has to be reviewed. This attempt will lead to learning for hours on end, which will have just the contrary effect: instead of remembering what we learned, we begin to forget it. This is illustrated in the chart below: the longer we learn without a break, the lesser we remember. The result of this unfruitful learning effort is very often confusion paired with self-doubts and exhaustion.



Instead we should start reviewing manageable portions early and regularly. Learning with regular breaks (dotted curve line) keeps the recall high, due to increased effects of primacy and recency: the start and the end of a learning session are more memorable than the middle. Also, during breaks the subconscious processes the new information as well as it relieves physical and mental tension. The amount we recall while learning without breaks is much lesser (continuous line).



5. Planning learning activities

Portioning

The first step in planning our learning activities is the portioning: Before we start with our homework or preparation for an exam, we divide the material to be learned in manageable units and tasks. These can be written on small pieces of paper and put on a pin-board. Thus, we not only have a clear idea of the work to be undertaken, we can also plan and schedule minor or major breaks between the different units. We can also see how the amount to be learned slowly decreases – it provides us with a sense of achievement!

Easy start

The next important step is the sequencing of our learning: with what to start? In order to get into the proper learning mood, it is recommended to start with an easier assignment. Also, the first 15 minutes are usually spent to get going and concentrated on the task before we reach our full efficiency. So if we have an interesting and promising first job to be done, the more stimulating it is to continue with learning since our self-confidence grows with success, thus increasing the chance that we can also handle difficult assignments.

Sequencing

Once successfully started, the performance chart usually stays high for quite some time. Therefore, more difficult tasks are completed during this time, after which we again switch to tackle easier tasks. We may finish with a final complicated assignment, which is easier to be executed with leisure time just waiting around the corner.

Variety

For sequencing, variety is an important factor: it prevents monotony thus increasing the percentage of recall. It also makes learning more interesting. For example, similar subjects should not be learned one after the other, like learning languages. Also written and oral exercises should alternate, difficult with easy ones and son on.

Break-time

With regard to breaks, shorter and longer intermissions help to keep mentally fit. After 30 minutes, a 5 minutes break is useful for getting up, stretching the body, fetch a drink etc. If we learn for a longer period of time, we should include a longer break of 20 minutes after one to one and a half hour working time. The break should really be used for relaxing, e.g. listening to music, going for a short walk outside or just doing some physical exercises and not for other strenuous activities like watching television or working on the computer. Activities like these would interfere with the learning process and reduce attention, jeopardize the learning success and unnecessarily prolong the working time.

Scheduling

To prevent having to learn too much, learning activities need to be properly scheduled. This means to be aware of how we use our available time. If, for example, we always complain about shortage of time, a proper monitoring of all our activities for one week can be very helpful: We can find out whether our time management is effective or whether we are wasting time. Based on these findings, activities can be properly scheduled – learning as well as leisure. The following statements may give you an idea how you make use of your time.

Tracking down the time thieves

- I talk too frequently and long to my friends on the phone.
- I spend too much time in front of the tv or computer.
- I am dawdling too often and avoid unpleasant tasks.
- Often, I work too grimly; this deprives me of mental fitness and costs me time in the end.
- I have so many hobbies that I have hardly any time left for schoolwork.
- I search far too long for certain items because I do not keep things in order.
- I am distracted too much through visitors and other disruptions.
- I like to listen to music when learning; that way, I cannot keep to the point and need more time.
- Very often, I just start working without any plan, which prevents proper progress.
- I can hardly say No when others try to keep me from working.
- I tend to keep putting off my work, which strains me somehow and paralyzes my work.
- Often, I make things difficult for myself, I brood and can’t move on.
- I do too many irrelevant things and am not concentrated on the important tasks.
- Usually, I only work under pressure; as a consequence, I tense up.

The evaluation of this exercise and the detailed monitoring of our activities for one week help us to assess how we spend our time and which are the problem areas. The next step is to introduce proper planning. For this, we use our diary and schedule important activities such as when to start preparing for exams etc. When scheduling, we consider the time of the day for our activities – whether we perform best during morning or afternoon. We also plan days off as a reward or a special treat for good results: We commit to learning, but we also reward ourselves and enjoy the days off!

6. Preparing for exams

Planning

As we already said, it is important to start preparing for an exam early enough: last-minute learning can have the contrary effect. Therefore, we have to schedule our exercising and reviewing activities well in advance. Like for learning in general, all rules are also applicable to exam preparation: portioning, sequencing, keeping the learning varied, getting actively involved through talking about it, preparing charts, drawings etc. The more graphic we prepare the learning material and the more we get actively involved, the more we remember. Preparing a codigo is also a good form of preparation: we don't have to take it with us for the exam; the preparation itself helps us to memorize the most important!

Working under time pressure

Another important preparation step involves working under time pressure. Exams only allow limited working time; we can test to work under time pressure by working through previous exams under a given time limit. We can also pick out particular exercises and set a clock so we know whether we can cope or not. Thus, we not only exercise how to work under time pressure, we also develop a feeling for time.

Staying calm

The morning before the exam we should avoid repeating the learning material since it will increase our tension and nervousness. We also try to stay away from heated discussions among classmates about the exam's topic: all what causes insecurity or stress is of disadvantage!

Clarifying the demands

As soon as we obtain our exam papers, we check all the exercises in order to assess whether we understand what we are asked to do. If we are still unclear what is expected of us despite intensive thinking, we ask the teacher, even though this might not be welcomed. Afterwards, we arrange on the sequence of the tasks and allocate the available time. For the start, we tackle something easy – not necessarily the first exercise – so we have already achieved something, which, in return provides self-confidence and optimism. If we get stuck with a difficult exercise later on, we switch and work on exercises we can solve. Thus, we ensure to collect as many points as possible.

Sticking to the topic

During work we make sure we stick to the topic. Writing too much, not concentrating on the essential or avoiding getting to the point only does more harm than good. It also leads to waste of time, which, as we all know, is scare during an exam.

Rewarding ourselves

When we finally receive our results, we make sure to recognize and reward our successes: It encourages positive emotions about learning, ensures that learning is fun, enjoyable and worth doing again. Although incentives should be given along the way, the end deserves most of the attention. All too often, rewards are overlooked and any success passes unrecognized, never to be repeated.

7. The learning environment

The following statements will help us to find out what kind of learning environment is most conducive for us. First, we look into the personal learning atmosphere.

My learning results are best

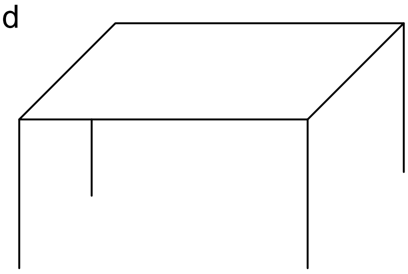
- When music is played during learning
- When I am not distracted by any kind of noise
- When I am alone in the room
- When someone I like stays with me in the same room
- When I am together with my classmates
- When I am surrounded with strangers (atmosphere of a café)
- When I have eaten before I start learning
- When I can eat or drink during learning
- When I am in a good mood
- When I am angry or frustrated
- When I am looking forward to something nice after I finish learning

The next set of statements describes the learning atmosphere at school.

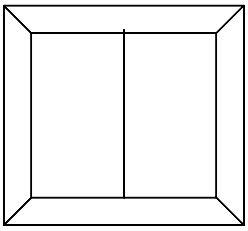
- I can follow some teachers very well, with others I have difficulties
- There are teachers I am afraid of
- With these teachers my marks are usually low
- With these teachers my marks are usually high
- I feel inhibited by my classmates or colleagues
- In a certain environment, I can concentrate myself very well, in others not
- I often experience thinking blockades and I do not understand despite repeated explanation

Our answers to these statements make clear what learning conditions are favorable for us and what conditions cause stress or even mental blocks. Though there are individual preferences and dislikes, some general aspects should be considered:

The Workspace should be inviting and encouraging to study. Distractions should be removed while everything needed should be at hand: books, pens, rulers etc. Posters and mind maps on display can help to stimulate the mind and get into the right learning mood.

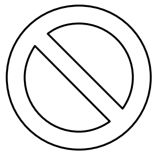


The desk or table should have navel height and as much space as necessary: Beware of cramping! The chair should be comfortable, straight backed and high enough so our feet are flat on the floor and the thighs parallel to the ground. A good posture increases the supply of blood to the brain.

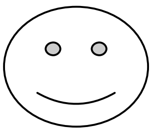


The Working Conditions should allow for proper light – natural light is best, such as sitting next to a window. For artificial light, a standard bulb is better than fluorescent. Since oxygen is essential for the brain to function, the cleaner and fresher the air the better. At breaks, spending time outside in fresh and clean air is most recommendable.

Mind & Body should be in the right condition: While sufficient sleep and regular rest is a must for our brain to function properly, unlimited television viewing and hour-long playing of computer games is a clear no.



Regular exercises help to clear the arteries and provide oxygen for the blood: Our brain uses 25 % of our body's oxygen and blood supply. A healthy, balanced diet also contributes to learning success; too much sugar, starch, caffeine, alcohol and other unnecessary drugs lead to mental dullness.



Energy for learning is released through relaxation. Before starting to learn, we should try to get into a calm and positive mood. Simple relaxing exercises at the start and during break times can help us.

With our eyes closed we

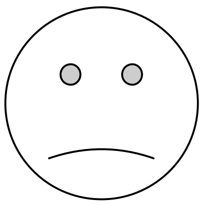
- Sit or stretch out and listen to relaxing music
- Tense and relax each muscle in turn, starting with our feet and working up our body
- Imagine walking down a flight of stairs; after each step, we exhale and say 'I am even more relaxed now'

8. Learning difficulties

A common complaint of students is that they spend a lot of time for learning, yet the test result is not satisfactory. Possible reasons for the low success rate can be found in the previous paragraphs on learning strategies; when the suggestions mentioned there are followed over a longer period of time, it surely will show in the results. However, students may need guidance and advice when encountering problems. They may not be aware of the mistakes they are committing when learning. Also, they need to be familiarized with learning methodology during school time so they can make use of it for their own individual learning efforts eventually.

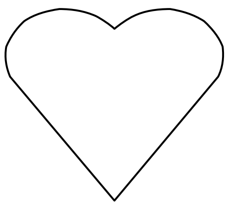
Causes for learning difficulties are of varied nature. Particularly young people may display certain characteristics or behavior that affect their learning success:

Mental sphere:



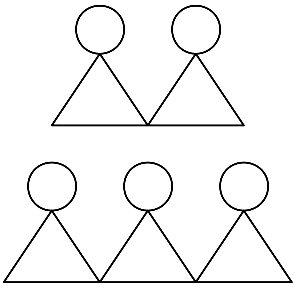
- Reduced ability to structure when acquiring information
- Reduced ability to abstract and conceptualize
- Limited ability to transfer known facts to new situations
- Restricted imagination
- Restricted perception
- Reduced memory performance
- Reduced ability to concentrate
- Language deficits

Emotional sphere:



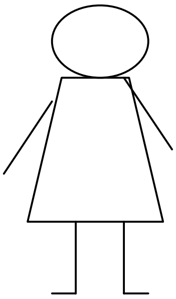
- Lacking emotional stability
- Strong orientation on needs when acting
- Rather passive drift approach than active problem solving and shaping of life
- Tendency for depression or aggression
- Deficiency in acknowledging and expressing own feelings
- Strong fear of failure
- Negative self-image with low self-esteem
- Low staying power, little perseverance
- Aversion against school and school tiredness

Social sphere:



- Reduced ability and willingness for cooperation
- Difficulties with accepting and coping of social role
- Social behavior ranging between being the clown or being strongly inhibited
- Loner
- Emotional outbursts
- Problems to subject to social rules

Physical sphere:



- Frequent delays in physical development such as muscle development, growth, sexual maturity etc.
- Reduced performance with regard to speed, coordination and strength during work proceedings
- Weakness with fine motor skills and therefore with precision
- Poor coordination between muscle activity and perception

9. Overcoming difficulties

When comparing research studies on normal young people and young people with learning difficulties, the latter group shows a reduced performance when receiving and processing information. This means these young people have more difficulties than others to receive and process new information in their short-term memory in a way that it can be stored in the long-term memory.

This seems to suggest that they don't have problems in general to store and recall information later on provided that they were able to store it in their long-term memory. Therefore these learners need more time, more repetition and more assistance on how to memorize the learning content, so it will migrate from the short-term to the long-term memory.

Students and trainees can remember sharply outlined and well-structured learning material much better since it also offers a structure to process it in the short-term memory and then store it in the long-term memory.

Easy to remember:		Hard to remember:
Meaningful		Senseless
Connected		Isolated
Systematic		Unsystematic
Clearly arranged		Confusing
Structured	Information	**Unstructured**

As teachers and trainers we can enhance the learning process, particularly in skills training, by:

- Counting the working steps with the fingers, thus recalling the sequence of actions
- Formulating What-How-Why questions and answers and asking the trainee to repeat them while he/she tries on his/her own
- Speaking out loud while conducting work: loud thinking along, loud imagining, so the trainee can follow the thinking process
- Creating mnemonics
- Linking learning material to reality of student/trainee
- Developing association patterns
- Drawing a flow chart to visualize a procedure/process

Repetition is crucial for storing new information in the long-term memory. As teachers and trainers, we can encourage students/trainees to enhance the results of review by:

Learning with a partner or in a group

Being in a group among peers, it is much easier to ask questions, which may be considered “stupid questions” in class. Thus the student can ask all the things he/she may be expected to have understood or to know already without loosing face. At the same time, the student can help to answer questions of others: We are learning most when we have to explain something to somebody else.

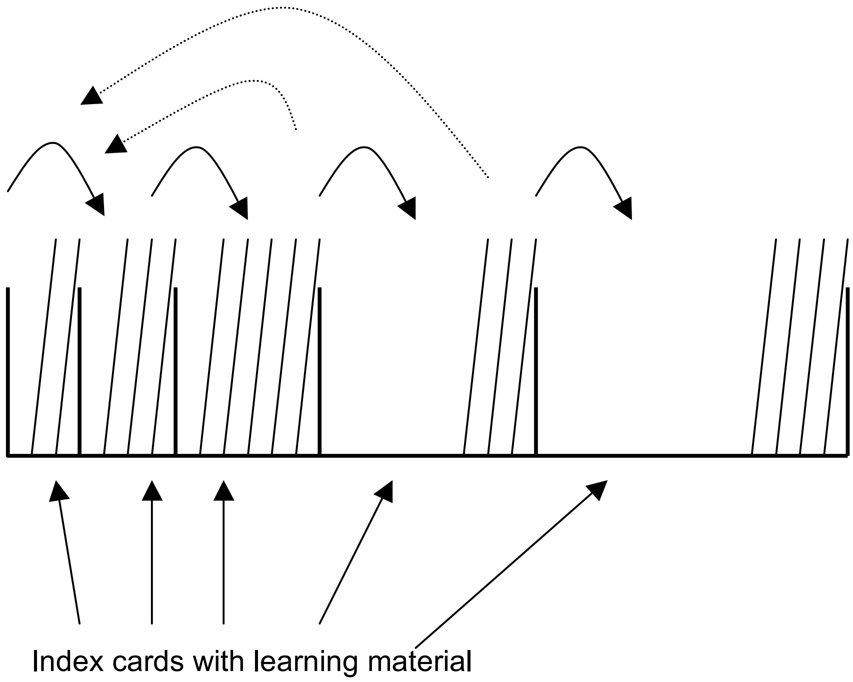
A learning group can be formed part-time to prepare for an exam or as a regular way of learning together – subject related or doing homework in general.

Preparing visual aids

Students should be advised to prepare visual aids like mind maps, charts etc. on their own while learning. It will enhance the understanding of the learning material since it needs to be processed for visualization. At the same time it supports the remembering of information since the learning material is linked with a visual.

Using a learning index-box

A learning index-box is very useful for learning vocabulary or any other material, which has to be repeated for memorizing it well.



All index cards start in the first compartment. When learning and reviewing, index cards we have processed correctly move on to the next compartment until, after five rounds of reviewing, they reach the final compartment. Index cards we have not memorized stay or are transferred back into the first compartment. Each learning session involves all first four compartments until all index cards have reached the fifth compartment. This process can be repeated after some time meaning all index cards go back to the first compartment until we decide to sort out those we really have learned well. Of course, new index cards with new learning material can be added all the time.

SUPERVISORY SKILLS

These Handouts are part of the training manuals for a Two Year Training Course on Furniture and Cabinet Making

Author:	Organisation:	Contact Address:	Edition:
Jürgen Hierold	German Development Service Philippines (DED)	7 Juan Luna St., San Lorenzo Village, Makati 1223, Manila, Philippines e-mail: dedphil@pacific.net.ph	09 / 1998

BASIC SUPERVISORY SKILLS

This course was used for trainees from the furniture industry but can be adapted to any other industry.

The reason to give a small insight into the Supervisory Skills for vocational trainees was the fact that quite a few of the graduates were promoted into supervisory level soon after starting their contracts in the company and that they did not have any knowledge about it.

SUPERVISORY SKILLS Edition 9/98 Prepared by: Jun Lim / Emil Torrejas / Juergen Hierold	Handout Nr: **SP01**	Subject: **ORGANIZATIONAL STRUCTURE /RESPONSIBILITY**

1. 0. 0. INTRODUCTION

Just imagine: Until a few weeks ago you were a normal worker in the production line and you received your orders from your boss or a supervisor. They gave you instructions of what to do and how do to it and you were doing it. Two weeks ago the production manager of your company talked to you and offered you a job to be a supervisor yourself. You happily agreed because it means 30 Peso more every day and you do not have to do all the dirty work yourself anymore.
Last Monday you started your new assignment and you suddenly realize that this new job is not so easy after all. Before you had to deal only with the work itself but now you have to tell other people what they have to do!

Just think about some of the problems you suddenly have to deal with:

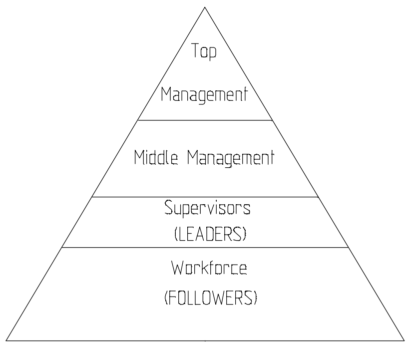
- Machines are not adjusted properly — Dimensions of the product are not accurate
- Wrong tools are used for the job — Wrong materials have been used
- Accidents are happening — Products are not finished in time
- The quality of the product is not good — Jobs take too long to be finished
- Your former buddies in the production line don't want to have a beer with you after work!!!!!!!

You wonder what is going wrong because you actually thought that you were a skilled wood worker.
Actually there is a big difference between the two jobs and you have to learn some new skills before you are really able to do your new job properly.

Exercise 1:
Make a list of a supervisor's duties and responsibilities individually, discuss them in the class, make a poster on the wall, keep it as a reminder as long as the course runs.

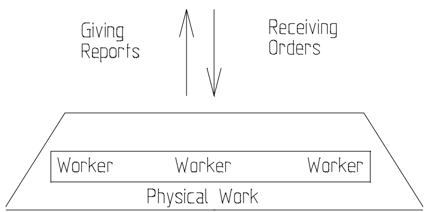
2. 0. 0. ORGANIZATIONAL STRUCTURE / SUPERVISORS RESPONSIBILITIES

Let us have a look at the organizational structure of your company to get an idea of what changed in your work life. In the picture on the right side you can see a rough layout of a company's structure. Now, you moved up from the workforce into your new position as a supervisor and that means that you moved up from being a **"Follower"** to being a **"Leader".**



Here in this course we want to give you a first idea of what it means to be a leader instead of a follower.

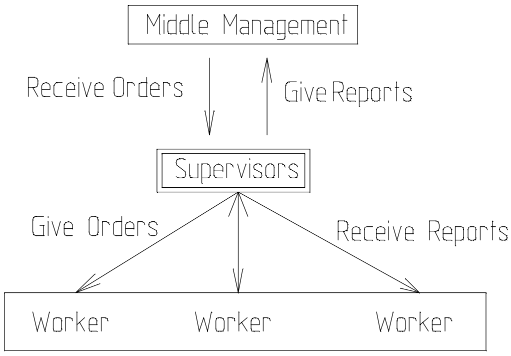
As a follower you received your orders from the supervisor or the middle management and you were following these orders. Sometimes they would ask you for a statement about some problems and you had to report to them.
Your main task was to function as a worker and to do what you were told. The skills you had to provide were mainly technical, on how to run a machine and to use tools. Most of your labor was physical, like planing a piece of wood, the dimensions of the final product were given to you and you had to do it according to the order.



In your new position as a supervisor you will find a completely different situation to handle:

- You have to receive orders from the management and give reports to them **And**
- You have to give orders to the workers and receive reports from them.

Now it should be easy to understand that most of your work as a supervisor will be more mental and not so much physical. You need a better theoretical understanding of woodworking, that's what we provide you with in the other lectures like Technical Drawing, Mathematics…



<u>Exercise 2:</u>
Split into groups of 3 – 4 people, go to the workshop and pick a machine like the circular saw, each one of the group should explain a certain function of the machine or a setup for a certain job to the others in about 5 minutes, discuss the results in 10 minutes.

If we have a closer look at the organizational structure we can see that you have even more responsibilities in your new work life:

2. 1. 0. Responsibility to the Middle and Top Management

The management is expecting from you to do a lot of things in your department or section. They want to be able to rely on you when it comes to the planning of the work in your section and the coordination of work with other sections (Example: You are the supervisor in the assembly, so you have to report problems to the management regarding the supply of parts from the machining section). You have to be able to train and select employees for specific jobs. It is very important that you are able to communicate with the workers so that they do understand their work assignments. To maintain work discipline and morale in your section you need to have a natural authority which has to be based on knowledge and skills. To make your section an efficient one you have to make production decisions (Which job has priority? When do we start with the next order? Which worker will be assigned at which machine? Will the spindle molder work more efficient if you assign two workers?). At the same time the management expects from you that you will maintain a proper cost control (Material waste, proper production flow, unproductive workers). In order to improve the productivity of your section the management expects written comments and suggestions about the situation.

2. 2. 0. Responsibility to the Workers of your Department

The workers in your section are the ones who will do the actual jobs like machining, assembly and so on. To achieve a high quality and In Time production you have to rely on your workers. A good working morale is a very important factor, get to know the special skills of your workers in order to assign them to the right jobs and explain all the matters connected to this assignments (special jigs, deadline, tools to use). If necessary you have to instruct and train workers for special jobs.
Try to create a trusting working climate were the workers will be able to talk openly about problems in meetings. Treat all workers equally, do not favor your old buddies from the production line because this will make others jealous. Handle workers problems correctly, have a good relationship with the personnel / staff department because they can help you in all sorts of explanations and problems like workers payment and benefits. Sometimes you might have to take over the role of a counselor but be careful that you do not get involved personally into the problems, it is very important that you stay objective in all department matters. Your workers will be efficient if you provide them with a predictible and stable work load.

2. 3. 0. Responsibility to Other Supervisors

It is very important that you get to know all the other supervisors very well in order to establish good working relationships with them. (Improve the work flow between the departments, exchange of information like deadlines for parts and products, quality and tolerance problems, create a supervisor team that can communicate and coordinate properly with the management)

2. 4. 0. Responsibilities to the Staff / Personnel Department

The staff department will approach you first regarding information about workers. You have to be able to judge requests for information from staff managers, try to be a middle man in these situations. Coordinate standardized reporting forms and instruments with the staff managers in order to judge the employees performance. Consult with appropriate staff managers to utilize their special expertise on staff problems (work attitude, late, drinking, fighting…)

2. 5. 0. Responsibility in Labor Matters (if company is unionized)

You have to know the basics of the CBA (Collective Bargaining Agreement) to keep a professional relationship with the union. You have to respect the terms of the agreement as a representative of the employer, even though you may personally disagree with it. Treat all workers equally, union members or not.

Exercise 3:
Split into groups of 3 – 4, in each group act as supervisors from: Machine Section, Assembly Section, Finishing Section. Discuss common problems between the three different departments like quality control, production flow between departments.

3. 0. 0. SUPERVISORY SKILLS

Now that you have an idea of all the responsibilities (quite a lot, don't you think???) we should try to think about skills you might need to fulfill all these responsibilities and do a good supervisor job. You realized already that your technical skills and knowledge are only a part of the skills needed to be a good supervisor.

3. 1. 0. Communication with Others

3. 1. 1. Giving Instructions and Orders

As a result of Exercise 2 we found that it is easy to follow the instructions of one student, but very hard to follow another one. Obviously one has the gift of being able to communicate very well, the other one not.
Which factors are important to instruct another person in the workshop?

- Knowledge of the technical facts and details
- Theoretical knowledge to support the demonstrations
- Authority
- Ability to demonstrate
- Self confidence
- Planning

It is very important that you know the technical details of the process you want to explain to somebody else, so, if you come from the production line yourself, you should be capable of doing so. All the processes of woodworking should be easy for you to explain, or are you using "This thing there" for words like "saw blade" and "fence" ?? If you do so, you have to familiarize more with the machine and the process before you start explaining things to somebody else.

You have to be able to demonstrate the work process, this will support your explanations very much. Think about safety aspects before you make a demonstration because you have to consider that the worker will copy your action later on.
Theoretical background knowledge is quite an important factor as well because it enables you to answer questions of the worker, especially when you are asked “Why is this like that” ??
You can only be self confident and have some authority if you learn and practice the above mentioned factors. The workers will only accept you as a supervisor if you have authority based on knowledge.
If you only scream and shout at them in order to be an authority, they will laugh about you at your back and not follow your explanations.
In order to give good instructions you have to plan them, especially when you are new in the job of supervisor. Before you give instructions, take a piece of paper and write down keywords for the processes you want to explain.

Exercise 4:
Write down the keywords on how to change a saw blade in a circular saw. Discuss the results in the class, come up with a final solution for this machine setup.

3. 1. 2. Receiving Instructions and Orders

When you were a worker you received your orders from a supervisor and now you receive them from somebody from the middle management. What is the difference between the two?

- As a worker you normally received an instruction for one job and when that was finished you got the next one. The communication was pretty easy because you and the supervisor spoke the same “technical language” and he could even help you with some complicated setups or jigs.
- Now you have to communicate with somebody from the middle management and you might have problems understanding him. What is wrong? The fact is that you and him are not speaking the same “language” anymore because you are a ”technician” and he is a “manager”. You have to learn to follow his instructions even so his technical knowledge might be limited. Apart from that you will not only receive one single instruction, but most probably orders for the whole day. You have to translate these instructions into technical language and distribute the different jobs to your workers. It is very important to write down the instructions you receive because there might be many of them and you might forget some details. With the help of these written notes you can make a plan for the day and you will be able to give proper instructions to your workers.

Exercise 5:
Your manager will give you instructions for today's workload of your department. Make written notes of these instructions. Ask questions about details you might not understand. Put the instructions you received from the manager into orders for your workers.

3. 1. 3. Importance of Staff Meetings

Hopefully there are regular staff meetings in your company because they are very important in order to improve the communication problems. It is necessary to create an open working atmosphere on these meetings, telling the truth and not using permanent excuses is very important. Only if facts are stated on these meetings you can start planing and changing problems in the production. Meetings have to be prepared, the main purpose of a meeting is discussing problems and not having a snack! Make an agenda of the topics you want to discuss and make notes while the meeting goes on! If you want to discuss production problems, do not say: “Our production is not working!” The result will be frustration because the problem you state is too big and as such unsolvable.

Try to break down one big problem into many small ones, delegate them to different workers and collect results. You will find that suddenly it is much easier to solve a big problem.

Exercise 6:
One of your workers comes to you and tells you: "The Circular Saw is not working accurately!" Try to break this big problem into small ones! Make a list of things that might be wrong on the saw.

Different meeting situations are possible in your situation:
1. The manager will ask you to **give a report** in front of the top management about the situation in your department.
2. You conduct a meeting with your workers in order to **give orders** on how to improve the situation in your department.

In both situations you have to be the **active person**, so again, better be prepared for the meetings:
- In the first case you might be asked why your department is not working properly. You should be able to explain the situation clearly, state facts and numbers, so it would be good to make some written notes before the meeting because you might forget things especially when you are excited about the situation. Try to take written notes of the management's recommendations in order to implement them later on.

- With the help of your written notes you will be able to come up with the right orders for your workers. Make a list of jobs for each worker before you conduct a meeting with them. If possible give them the instructions in writing with a deadline to finish the job. Try to split big jobs which will take weeks to do into many smaller ones, it will be easier for the worker to do these jobs. In general, be always open for discussions with your workers about how do to a job. Now, these guys are the ones who really have to do the job, so maybe they have some suggestions on how to do a job faster and better. Maybe talk with the management about rewards for good ideas in this respect.

Exercise 7:
Split into groups of 3 – 4, conduct staff meetings with your fellow students, discuss the situation in the lumberyard with them, give orders to them and check whether they understood them by letting them report.

3. 2. 0. Planning Process

3. 2. 1. Determination of Goals

Before we can start with the planning of the production we have to determine the goals we want to achieve. Normally you will do that first with the management, most of the time they will give you the production numbers (goals) to achieve in one day, week, month. Study the given information like Drawings, Bill of Materials carefully!
You have to consider some aspects for the determination of your goals:

- Output of the production = number of items to produce in which time (50 chairs in 1 week)
- Quality and workmanship = determine the quality of the product in relation to the time available
- Cost and Budget control = consider the costing when you produce the chair, production time and quality are relevant

Clarify these aspects before you start your production planning in order to achieve the right number of chairs before the deadline, in the right quality and within the cost frame.

3. 2. 2. Plan the Accomplishment of Goals

Now that we have predetermined the goals to achieve we have to ask: “How can we achieve these goals?”
You have to think about some given facts before you can continue:

- How many skilled workers do I have to do the job?
- Which machines / tools are suitable for the job and are they available at that time?
- Which jigs are necessary and are they available or do you have to prepare them?
- Are the right materials available / prepared for the job? (Contact Lumberyard, Machining)
- In a small company you even might have to do the costing, so you need the necessary data like material prices, available dimensions and machine hour rates.

With this information and the drawing etc. you are able to start the planning of the production for the next period. Discuss it again with the manager if the production goal is too high, be specific, have facts and numbers when you go to him.

3. 2. 3. Development of Plans and Actions

After you gathered all the data, you should be able to proceed with your planning to the implementing stage. You have to prepare for example **routing sheets** where all the processes for a certain work piece are described. You state as well the equipment used for each process, plus the estimated time for the process. Depending on your system you can determine the workers on the routing sheet as well. This way it is easy to utilize the manpower properly and you can inform the workers easily about their daily duties.

In a normal workshop you do not have only one order at a time but maybe three to four, so you have to make a **production plan** in order to coordinate the different orders with each other because they have different deadlines, materials, need different equipment and manpower. You are the one who has to know, at which stage each order is. This production plan can help you when you have to consider changes in your production line and the timing of deadlines. A proper production plan makes the discussion with the management much easier.
When you start making a production plan, try to incorporate your best workers into this process because they have the most practical experience and good judgement.
Try to update the production plan daily to make the most use of it. Check for “bottle necks” in your production line, machines like circular saw and spindle molders are often overloaded with work and the whole production line has to slow down because of one machine. Try to think of alternatives like: second shift for special equipment, different production processes where different equipment is used, more manpower in certain sections.

3. 2. 4. Controlling and Review Procedures as Part of Planning

Controlling is the work a supervisor performs to assess and regulate work in progress and to assess the results secured. In order to do so, we have to be able to establish some activities to analyze this progress:

- **Setting Performance Standards**

Before we can actually evaluate performance we have to set some standards and criterias to be able to do so. (Example: 2500 Table legs, Model # 23432 in 100 hours production time in the quality of the sample given to the customer)

- **Measuring Performance**

After setting the standards we can now record the results of the worker or production line. (After 50 hours production time, only 500 legs are finished, quality is lower than the sample)

- **Evaluating Performance**

Now that we have our actual production results, we can compare them with the standards from before and we will find out whether we reached our production goals or not. (Evaluation compares standards with results: 500 legs finished after 50 hours = lower than the standard, quality is not as good as sample = lower than standard)

- **Taking Corrective Action**

You have to take corrective action especially if you do not reach your production goals, meaning your production is too slow, the quality too low… (How can you make your production faster? Training of workers, better machines and equipment, use of jigs, bottleneck in the production, more workers necessary, another order is still blocking some machines, no materials allocated for this order)
Controlling and review procedures are essential for the implementation of plans. Without them you will never be able to tell whether you could accomplish the goals or not.
The above mentioned production plan is already one very important tool for controlling because you can follow the production process on it and you can identify bottle necks and other problems.
Try to set a **quality standard** for each specific product. This is especially true if you were sending a sample to the customer. Once the customer accepted the sample, you have to keep this quality standard and you can not send him products with a lower standard! If you have a **Quality Control Department** in your company, try to work together with them, so that you know all the quality factors before you start the production of the item.

If you are involved in costing, establish a proper **post calculation process** in order to check on the accuracy of your costing.
Check on the **physical accomplishments** (number of work pieces, in specific time, in a certain quality) of the workers, it is an important thing to know about the efficiency of each single person in the production line. The easiest way is to evaluate a worker's data from his punsh card and the routing sheets.

3. 3. 0. Technical Competence

Your technical skills are very important to be a good supervisor because like mentioned before you have to be the mediator between the management and the workforce. Talking to the management, they will be expecting from you some proper explanations of work processes, especially if you want them to invest in new equipment or tools. The workers will only accept you as a supervisor if you have at least the same technical knowledge compared to them Talk to the management about sending you not only to Supervisory courses, but as well to some technical courses in order to improve your theoretical and hands on knowledge. Before you were ordered to do things in a certain way, now you are the one who has to tell others how they should do things. Before you give instructions, think about what you say !!!!!!!

3. 4. 0. Teamwork and Sharing of Knowledge

Once you are accepted by the workforce as a supervisor, it will be easy to incorporate the best workers into your production planning and implementing processes. Treat them as part of a team, give them some responsibilities that they can handle and which will make them feel as part of the production team. Do not give them too much responsibility because they might get frustrated. Introduce the principle of sharing of knowledge; make them aware that they learn when they share knowledge. It is very important that you are the first one to share your technical knowledge with the others to make them aware of the advantages.

Exercise 8:
Discuss the importance of proper machine setup in relation to joint accuracy in small groups.

3. 5. 0. Training and Development of Workers

You get some new workers into your department and you want to assign them to some jobs. What should you do?

- Interview them one by one about their background and work experience (take notes which you can use as your personnel file of a specific worker)
- Find out where they worked before and why they stopped working there
- Brief them about your companies / departments working policies
- Assign them to some jobs in their field of experience and observe them one by one
- Take notes about their performance
- Sit down again one on one and discuss the working results (safety, productivity, quality, housekeeping, proper use of equipment and tools)
- Assign them to tasks which they are able to accomplish

To further enhance the quality and productivity of the workers you have to conduct some training:

You can develop these workers either in **informal training**, meaning to say you train them within the production while you assign a job to them. This training has the advantage that you can take care of each worker by himself. On the other hand communication is not so easy because of the noise in the workshop. Mostly you will only have time to show him HOW something works but not WHY. When it comes to the next assignment you might have to start from zero again.

On the long run your staff development will be more efficient if you try to introduce some **formal training** to your department / company:

- Before you can actually start with a formal training, you should evaluate the workers strength's and weakness' in order to know WHAT you should teach them
- Try to classify them into maybe three different skills levels (Beginner, Advanced, Experienced) and make training plans according to these results
- Talk to the HRD department and the management about time and a room to conduct some of this formal training for the three different levels on a Saturday or as evening classes
- Do not put all workers into one class because the experienced ones will be bored and the beginners will be overcharged and can not follow your explanations
- Give them some basic theoretical background knowledge about woodworking so that they can follow your instructions later on much easier because they will understand WHY you need this saw blade or another (Make photocopies of some of the WTSC Training handouts)
- Accompany the theoretical lectures with some hands on practices in a quiet workshop
- Try to convince the HRD department to introduce a company internal grading and certification system. At the end of a "Circular Saw Training Module" the worker should undergo a hands on exam and if he passes should receive a certificate as a "Circular Saw Operator". This system should be accompanied as well by some financial incentives, workers who undergo these training and take them seriously should be paid a little bit higher than workers without the certificate. Try to convince somebody from the management to hand out the certificates to stress the importance of the program
- Make a Manpower Development Plan with HRD to send some workers to Skills Training Centers like WTSC, especially if you do not have time and facilities to conduct training in your own workshops
- Be serious about the training and explain it to your workers according to that. While courses are conducted, discipline, attendance and active participation should be valued very high

3. 6. 0. Maintain Workers Discipline and Productivity

After you trained your workers in the technical skills you will still encounter problems. Here the workers attitude towards his work is an important factor. Even if he is a very skilled craftsman, a worker can show a very bad overall performance because of his attitude towards work, being punctual, finishing work at the given deadline and so on.

3. 6. 1. Provisions by the Company to Strengthen Discipline and Productivity

But before we think about how to improve the workers attitude and discipline we should not forget about what the company should provide to create a proper working environment:

- A safe working space is important, in the machining section use fences and guides, build proper jigs, in the finishing section provide masks to keep the workers from inhaling fumes and dust.
- Proper lighting has to be provided, how can you expect a worker to work accurate if he can not see what he is doing?
- Is the workshop floor out of concrete and are you able to use trolleys for the workshop internal transport? (If you have to carry all the work pieces by hand, how much time will be wasted by doing so and how many pieces will be dropped and the machined edges spoiled?)
- How much is the company paying the workers and do they take care of SSS? Is the payment realistic and according to the workers capabilities? Do **not** tell your workers about commitment by the heart, they can **not** feed their children on it!!
- Is the workshop cleaned daily, as dust free as possible and are the machines maintained regularly by a mechanic?
- Are the tools organized in a tool room and are they kept sharp all the time?
- Does the company provide good quality raw materials or is it the cheapest Gemilina with lots of knots, pith, cracks…? Maybe more expensive material will turn out cheaper because you have less waste and less work in planing it?
- Does the company have rules and regulations for disciplinary action? Get to know them! Talk with the staff department about the problems of disciplinary action. If you have to apply them, treat all the workers the same, do not privilege old buddies!!!!
- Observe the workers on the machines and equipment while they are working on it. Think about jigs and fixtures to improve the quality and speed of their work! Sometimes small things can help speeding up the work very much! Involve the workers in the process of improving the for example the setup of the machine!
- Is there an existing production administration system implemented? Do you use Routing Sheets, Cutting Lists, Drawings, and Samples to speed up the production?

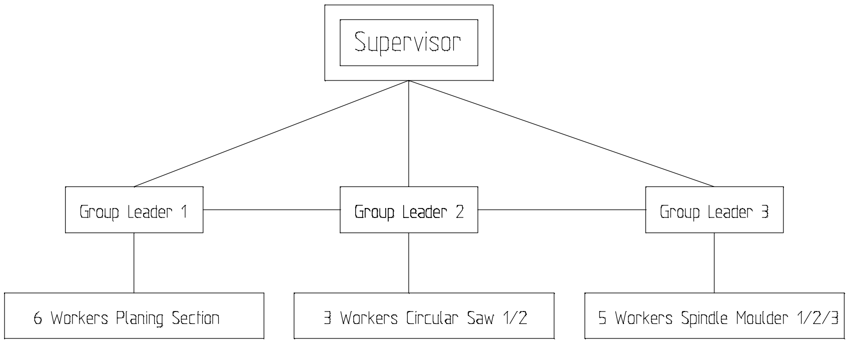
Check this list, partly you will find that it is your own responsibility to change and improve the situation, other aspects have to be discussed with the management before you can act on them. You are like a mediator between workers and management; you have to have good relationships with both parties!

Exercise 9:
Write down a list of improvements for your company.

3. 6. 2. Department Organization and Motivation of Workers

If you can implement all the things mentioned in the list above you will find that you have created a good basic environment of job motivation: the worker receives a good salary and his work situation allows him to work productive. Looking back to the beginning of the course we said that there are “Leaders” and “Followers” in every production line. Your manager identified you as a leader, now you have to do the same thing in your department! Try to figure out in individual talks WHY people work in your company. A lot of them are just working because they need some money to survive, but they do not have any ambitions in their “career”. It will be very hard for you to motivate them to take over more responsibility. If you are new in your position, identify the possible leaders who have some ambitions and start working with them firstly.

Create a production team and involve them actively in the planning and decision making. Give them some responsibilities in the production and you can concentrate more on the management of the production. It is a little bit like having your “own company”, now you are in the higher management and you have your own “group leaders” as supervisors supporting you in the day to day activities. Try to convince the management to accept your new department structure and some salary increases for the motivated group leaders. You have to be careful not to overburden your group leaders, in the end it is still you who has the final responsibility for the department. If you overburden them, they will get frustrated easily, so set realistic and attainable goals for the group leaders and the workers.



By creating such an internal department structure you can solve some of the problems related to motivation: By delegating work and responsibilities to your group leaders they feel treated as individuals and they can implement some of their ideas, in the end they feel that their work is meaningful.

- Try to work down with this system to the workers who do not have a lot of self motivation
- Try to get them involved in the system in small steps
- Make notes of their performance, set regular individual meetings to discuss their improvement or the lack of it
- You might have to give some of the guys a deadline, if they do not improve, talk to the staff department about laying-off some workers in order to replace them with more motivated ones
- If you see potential in a worker but he lacks certain skills, give him some individual attendance or send him to some training courses outside

3. 6. 3. Rules and Regulations and their Implementation

The "Rules and Regulations" of your company is a very important tool to keep up work discipline. Most probably the rules and regulations are existing but like with so many other things, are they really implemented?
When you start your job as a supervisor, get a copy of the rules and regulations and read them carefully! Go to the staff department and discuss the contents and the routines with the responsible managers. Sit down and “translate” them into terms the workers can easily understand. Conduct a meeting with the workers and explain the rules and the consequences of possible misbehavior.
Give them examples: How much money does it cost the company if 50 workers come 30 minutes late 20 days a month at an average salary of 150 Peso/day?
8 hours x 60 minutes = 480 minutes a day 150 Peso / 480 minutes = 0.3 Peso / minute
0.3 Peso / minute x 30 minutes late x 20 days / month x 50 workers = **9000 Pesos / month**
Apart from that the productivity is lower because they are only 450 minutes on their work place instead of 480, only 94 % instead of 100 %.
Clarify with the workers that once they sign the working contract with the company, both parties agree to certain terms, which should be binding for both parties.

Clearly state in front of the workers that you will make no exceptions when it comes to disciplinary action, you have to treat all the workers equal, whether you like one personally or not.

3. 6. 4. Implementing Disciplinary Action

Check with the staff department on implementation guidelines and forms for disciplinary action. Keep written proof of misbehavior! Ask the worker for a one on one discussion and:

- Describe the performance problems and review past discussions and reminders
- Ask for reasons for the situation and listen openly to the employee's response (do not get involved too deeply into personal problems because you will loose your objective position and your judgement will be spoiled!)
- Indicate what kind of disciplinary action you must take, and explain why
- Discuss and agree on ways to improve the workers performance and set a follow - up date
- Ask the employee to summarize the discussion in order to find out whether he takes the situation seriously and whether he understood the problems
- Indicate your confidence in the employee's ability to improve and give hints on how to do so!

Like mentioned before your role as a supervisor is to be a mediator between the workforce and the management! You have to try to stay objective. Leave personal emotions out of a meeting like that! You have to learn to live with the problem that suddenly some of the workers are **not** your friends anymore!

Exercise 10:
Discuss the following situation: You caught some workers drinking Tanduay in the lunch break and the rules and regulations of your company state clearly: No alcohol on the job!!
What do you do?
What do you think happens if one of the workers will cut his hand off on the circular saw because he was drunk and you did not report him?

3. 7. 0. Department Administration

If you read these handouts carefully you will realize that you are not only a leader now, but a "pencil pusher" as well. Before all your work was physical but now you have to take written notes all the time; conduct meetings were you have to give written reports and suggestions!
All this writing helps you to administer your department, you can not memorize all the information any more which is given to you and which you want to give to others! We mentioned already the paperwork, which you have to do to administer your department well. Do you have a desk and a shelve where you can store all the information? If not, go to the management and ask them for a quiet spot or even a small office space close to your production area where you can put these administration tools! As a worker you can **not** work without a saw, so as a supervisor you can **not** work without a desk!

4. 0. SUMMARY

To sum up all the responsibilities and abilities a supervisor has in his day to day work we can say that he has to "manage resources". These resources can be of very different nature:

- Machines and equipment
- Energy and utilities
- Materials and supplies
- Human Resources
- Information
- Money

The most important resource the supervisor has to deal with is the human resource. Every human being is different in character, attitude, experience in private and work life, so you have to treat them all as individuals.

On the other hand you are a representative of the management as well, so you have to be very careful in taking sides in any discussions with the workers. You can see that it is not an easy job to be on one hand considerate with all the individual characters and on the other hand you are supposed to treat them all the same!

You have to learn to think before you talk and act because you are a:

MEDIATOR / ORGANIZER / INTERPRETER

BETWEEN

WORKFORCE **AND** **MANAGEMENT**

5. 0. 0. Daily Sequence of Work Activities for a Production Supervisor

5. 1. 0. Before Start of Shift (15 – 30 minutes)

- Check production schedule and/or work orders for the day
- Check equipment to be used
- Check supply of materials for the day
- Check tools needed for the day
- Line up equipment, materials, and tools for the day
- Line up firm work schedule for the day

5. 2. 0. Beginning of the Shift (15 – 30 minutes)

- Check attendance and assign employees to work stations, get support from your "group leaders"
- If necessary (because of absences), balance the work force by changing assignments or by securing additional help from other departments (discuss with management)
- Assign production and/or work orders
- Stress critical qualities to watch
- Specify when the work should be completed

5. 3. 0. During the Shift (6 – 7 hours)

- Check workmanship with each employees, approve, correct, instruct or train as needed
- Check work progress with each employee. Add help, allow more time, or assign additional work
- Check housekeeping, this is a continuos process! Good work cannot be done in an untidy place!
- Check back when production or quality appears unsatisfactory, especially with new employees
- Stay on the shop floor supervising and/or available for questions, assistance, and instructions most of the time
- Be on the floor immediately before and after breaks and for 15 minutes before quitting time
- Inspect critical quality areas as work progresses. Correct problems as soon as they are detected
- Perform final inspection of parts, subassemblies, and so on, before they move to next department (if possible, get group leaders involved)
- Check/Report/Conduct a study on recurring quality problems
- Check periodically to see that materials and supplies are on hand
- Check periodically to see that tools and equipment are in proper operating condition
- Report material shortages or recurring defects
- Report and/or request maintenance, repair, or replacement of defective tools or equipment

5. 4. 0. Once a Day

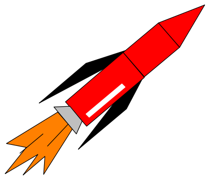
- Observe one employee or work station continuously for 15 minutes
- Look for time wasted, dull or improper tools, need for work positioning jigs and fixtures, interference, delays and bottlenecks, and expenditure of excessive time to get parts and materials. Do find ways to cut costs or make improvements in any of these

5. 5. 0. End of Shift (15 minutes)

- Make a list of unsolved problems that came up during the day. Consider ways to handle them
- Think about jobs that have to be done the following day / shift like checking production and/or work orders, materials and tools
- Complete all paperwork. Avoid holding any paperwork for the following day.
- Make a list of jobs that must be done the next day. Take it home with you and complete it before coming to work. Use this form to make your own daily plan!

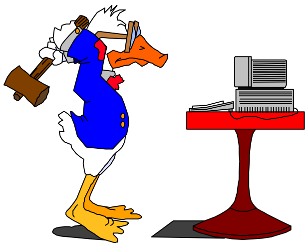
The Four Step Method

1. ***Step:*** **Preparation of student**



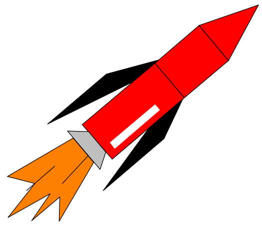
2. ***Step:*** **Demonstration and explanation**

3. ***Step:*** **Student activity**



4. ***Step:*** **Exercising and strengthening**

1.Step: Preparation of Student



➔ **take the shyness**

➔ **motivate**

➔ **show the objectives and tasks**

➔ **evaluate the knowledge**

➔ **familiarize with the workingplace**

➔ **give advices concerning safety**

<u>2.Step: Demonstration and Explanation</u>

- **place the student so that he is standing in the same direction to the workpiece than you.**

- **demonstrate the <u>whole</u> procedure in original time.**

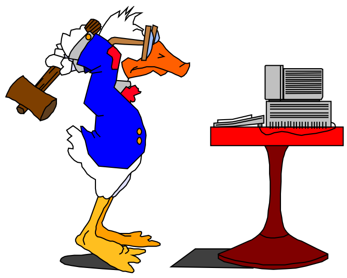
- **in case of complicate procedures devide them into modules and teach them step by step.**

- **repeat the demonstration and make the single steps visible.**

- **say <u>what</u> you are doing, <u>how</u> and <u>why</u> you are doing it in that way.**

- **give the opportunity to ask questions.**

<u>3. Step: Student Activity</u>



➔ enhance the student to try it on his/her own.

➔ don’t interrupt the student in his/her first attempts.

➔ make comments on serious mistakes.

➔ precision is more important than speed.

➔ let the student say <u>what</u> he/she is doing, <u>how</u> and <u>why.</u>

4. Step: Exercising and Strengthening

- ➔ give enough time to exercise.

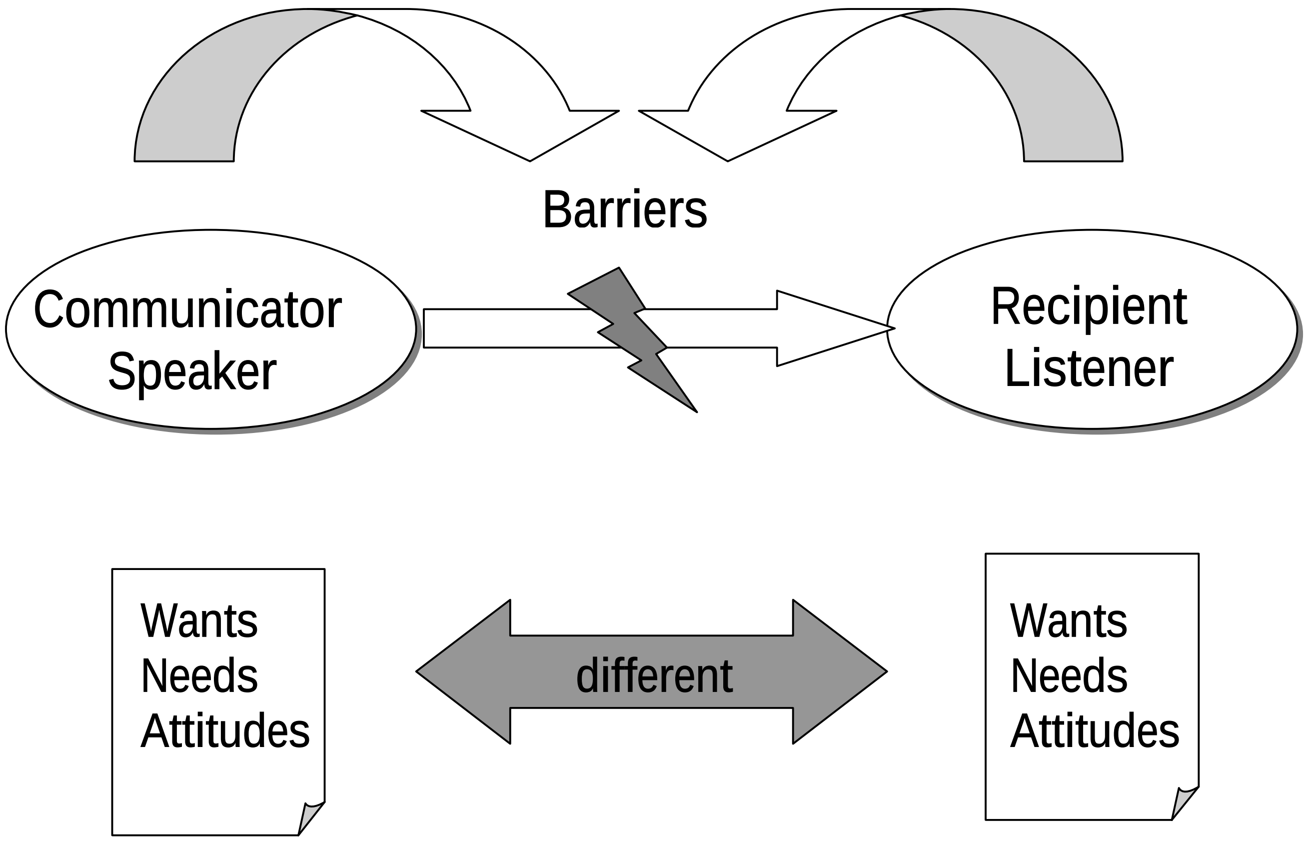
- ➔ acknowledge progress.

- ➔ control that no mistakes are done during exercising.

- ➔ change conditions of exercising.

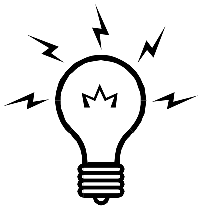
- ➔ slowy adapt to real working conditions.

TWO-WAY COMMUNCATION



- Maintaining eye contact
- Listening to what the other person is saying
- Mirroring body language

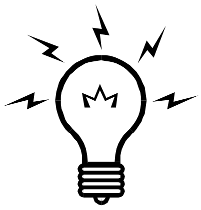
The **three rules** that govern good communication are all **associated with clarity**:



- Be clear in your own mind about what you want to say
- Deliver the message properly
- Ensure that the message has been correctly understood

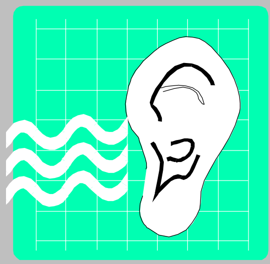
Good communication means
saying what you mean –
and fully comprehending any feedback.

The **three rules** that govern good communication are all **associated with clarity**:



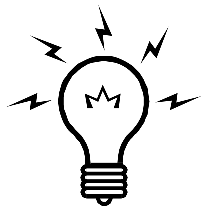
- Be clear in your own mind about what you want to say
- Deliver the message properly
- Ensure that the message has been correctly understood

Good communication means saying what you mean – and fully comprehending any feedback.

Type of Listening


<u>EMPATHIZING</u> Drawing out the speaker and getting information in a supportive, helpful way.
<u>ANALYZING</u> Seeking concrete information and trying to disentangle fact from emotion.
<u>SYNTHESIZING</u> Proactively guiding the exchange towards an objective.

GIVING FEEDBACK



- Show an understanding of exactly what went wrong and why.
- Draw out ways in which poor performance or behaviour can improve.
- Use questioning to let the staff member know what you think and why.
- Aim to express your negative opinions honestly, but in a positive manner.
- Above all, take negative feedback away from the emotional zone by being objective, not personal.

Questions to ask yourself

?

- ☐ Am I devoting enough time and resources to strategic planning and overall monitoring?
- ☐ Is my desk overflowing with uncompleted tasks?
- ☐ Am I delegating routine but necessary tasks to staff?
- ☐ Is staff training given priority to ensure effective skills for future delegation plans?

Questions to ask yourself

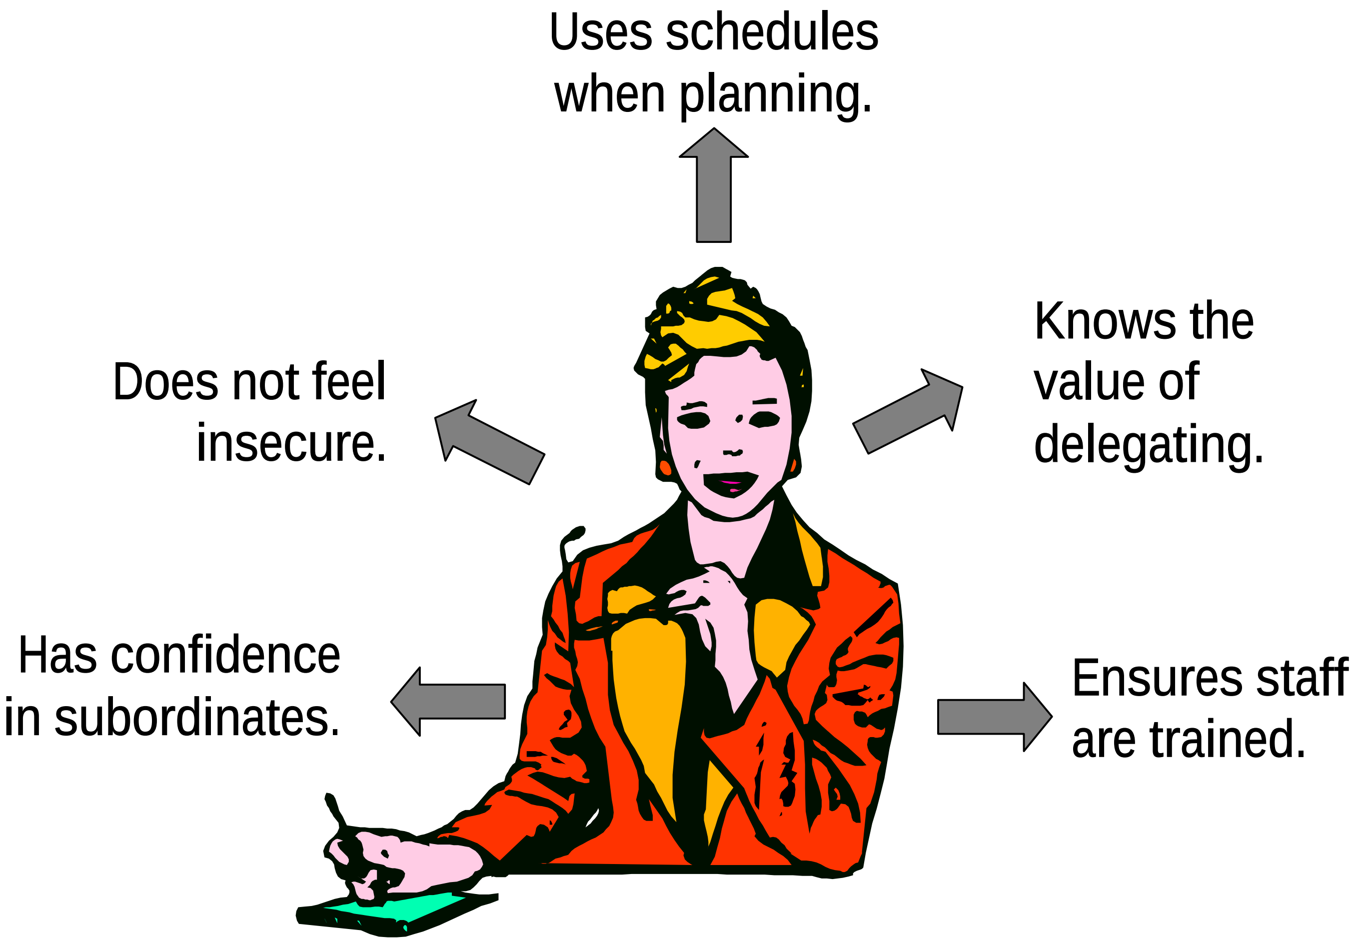
?

- ☐ Can I learn from the way my own boss delegates to me?
- ☐ Why should it upset me if a subordinate performs part of my job brilliantly?
- ☐ How much spare work capacity is there in my unit?

Questions to ask yourself

?

- ☐ Is the task suitable for delegation?
- ☐ Is the delegate competent to perform the task?
- ☐ Will I brief them fully and correctly?
- ☐ Will I give them all the right backup, authority, and resources?
- ☐ How much spare work capacity is there in my unit?



THE EFFECTIVE DELEGATOR

Keep always in mind

!

Repetition of the same error is inexcusable, since it shows failure to learn from mistakes

Selecting tasks

1. Keep a detailed time log (2 weeks)
2. Note all activities (tasks)
3. Note the time they take
4. Divide the tasks in 3 groups

What task am I doing that need not to be done?	Do not complete them yourself or delegate them.
What am I doing that could be done by somebody else?	Delegate these tasks to subordinates.
What task am I doing that can only be done by me?	You cannot delegate these, so prioritize them

Moulder 1/2/3

Things to do for a good briefing

- ☐ Keep objectives as clear and concise as possible.
- ☐ Build a certain amount of flexibility into the brief.
- ☐ Base the objectives on requires outcomes.
- ☐ Make a checklist to avoid overlaps and omissions.
- ☐ Ensure that the delegate is fully aware of the aims.
- ☐ Allow the delegate to comment on the brief.

Structuring a brief

OBJECTIVES Defines the task, listing the major objectives and sub-objectives in clear and concise language.
RESOURCES Specifies what personnel, finance, and facilities are available or need to be obtained.
TIMESCALE Sets out the schedule with review points, stage completion dates, and final deadlines.
METHOD Describes procedures, as agreed with the delegate, and summarizes the key points.
LEVELS OF AUTHORITY Specifies the range of the delegate's authority and to whom they will report.

DO'S and DONT'S in Delegating

DO'S
▪ Do encourage all delegates to make their own decisions. ▪ Do move from hands-on to hands-off as soon as possible. ▪ Do intervene when absolutely necessary, but only at that time. ▪ Do ask delegates if they feel thoroughly prepared for their task.

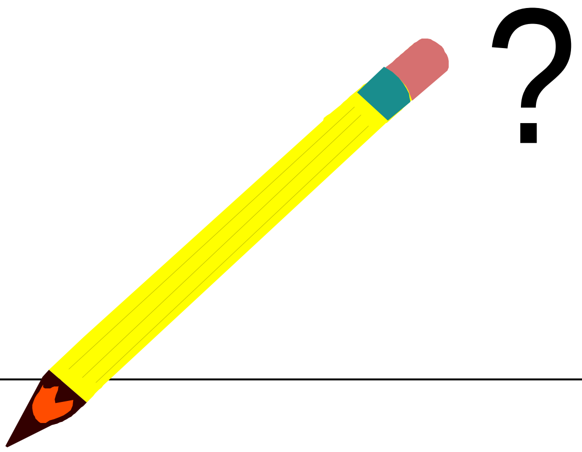
DONT'S
▪ Don't say or hint that you doubt the delegate's ability. ▪ Don't miss any stage in the briefing process. ▪ Don't place seniority above ability. ▪ Don't deny a delegate the chance to learn by interfering to much. ▪ Don't take back a task without a good reason.

Questions to ask yourself

?

- ☐ Was I too hasty in making the appointment?
- ☐ Is there somebody available who would do better?
- ☐ How can I prevent this problem from recurring?
- ☐ What would I do differently if I could start again?
- ☐ What are the delegate's strength and weaknesses?

Questions to ask yourself



- ☐ What is the meeting for?
- ☐ Why is it being called?
- ☐ How will I know if it has been successful?
- ☐ Who should attend?

Workplace Motivators

MOTIVATORS
ACHIEVEMENT The urge to achieve is a basic human drive. Is a great source of satisfaction.
RECOGNITION Enhance self-esteem. May be reviewed as a reward itself.
JOB INTEREST Responsibilities should be matched to individuals' interest.
RESPONSIBILITY Opportunity to exercise authority and self-direction.
ADVANCEMENT Promotion, progress and rising rewards. Feeling that advancement is possible.

<u>Management Styles</u>

THEORY X

- ☐ If I did not drive my people constantly, they would not get on with their work.
- ☐ I sometimes have to fire somebody or tongue-lash them to encourage others.
- ☐ Leaders have to lead by taking all key decisions themselves.
- ☐ I find that most people are unambitious and must be forced to raise their sights.
- ☐ I keep my distance from the team since it is necessary for effective command.

Management Styles

THEORY Y

- ☐ If somebody falls down on the job, I first ask myself what I did wrong.
- ☐ I should sometimes take a back seat at meetings and let others take the lead.
- ☐ If I ask someone for their opinion on an issue, I try to do as they suggest.
- ☐ People should appraise their bosses as well as be appraised by them.
- ☐ Anyone can have creative, innovative ideas if they are encouraged.

Keep always in mind

!

Establish a system that is constructive

– not obstructive –

in which people can hope to perform at their best.

Keep always in mind

!

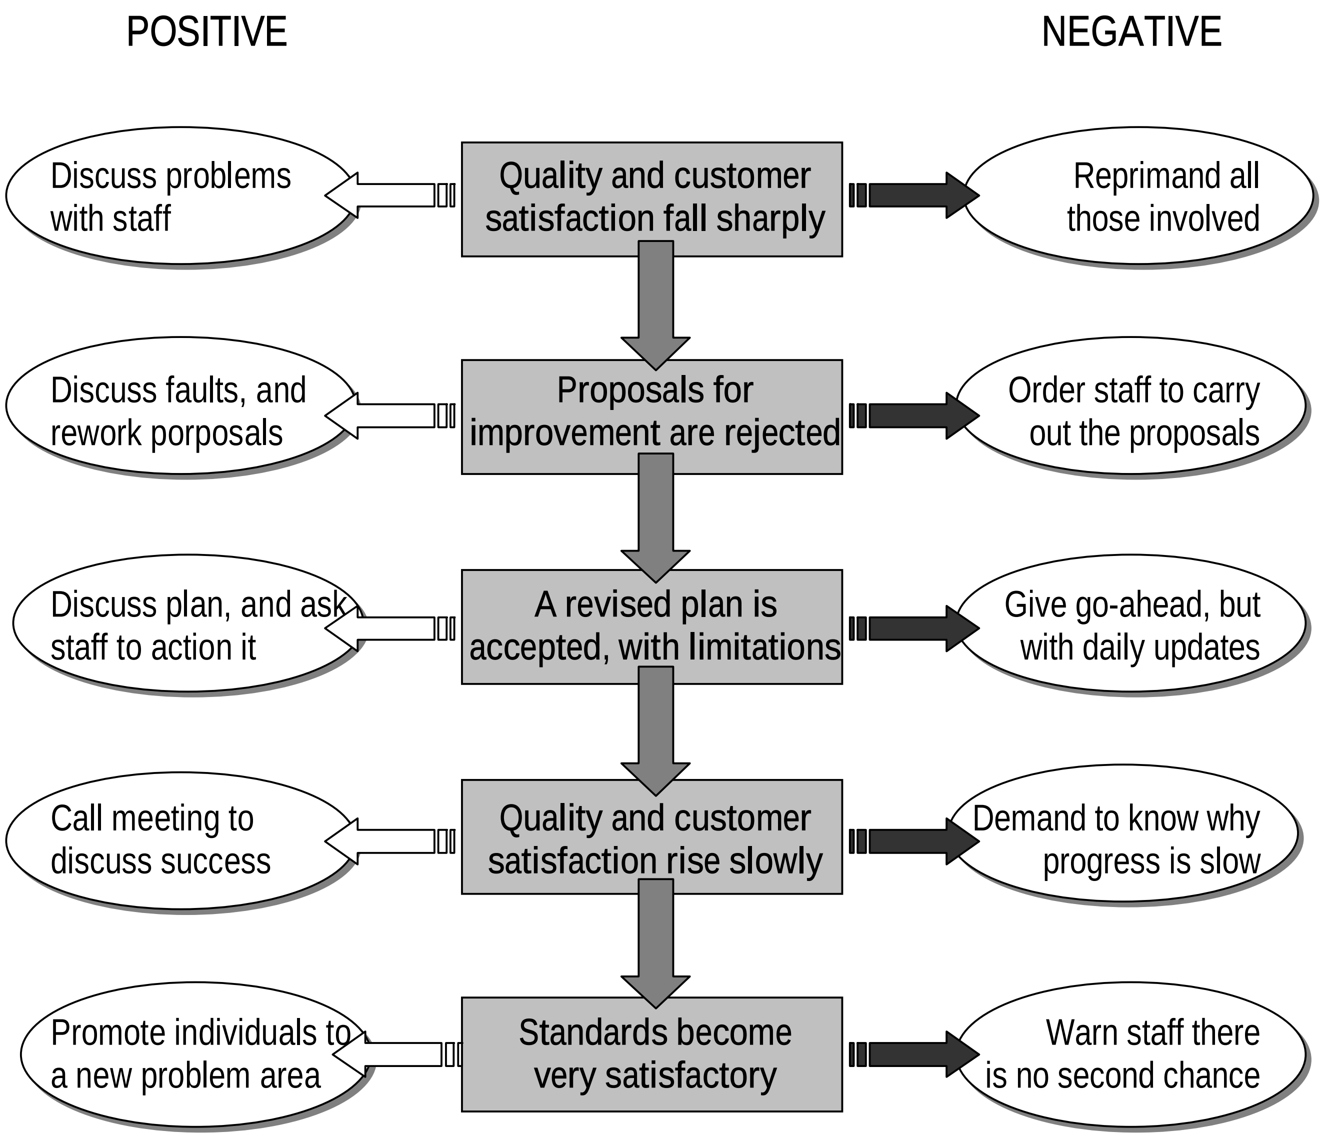
Repetition of the same error is inexcusable, since it shows failure to learn from mistakes

Questions to ask yourself

?

- ☐ What precisely went wrong, when and where?
- ☐ What were the root causes of the failures?
- ☐ When were the deviations first signaled?
- ☐ Why were the warning signals not acted upon?
- ☐ What could have prevented the failures from occuring?

SOLVING PROBLEMS WITHOUT ATTRIBUTING BLAME



Disciplinary Action

- Set one-to-one Meeting
- Describe performance problems.
- Review past discussions.
- Ask for reasons for the situation.
- Listen openly to the employee's response.
- Indicate what kind of disciplinary action you must take.
- Explain why.
- Discuss and agree on ways to improve the workers performance.
- Set a follow-up appointment.
- Ask the employee to summarize the discussion.
- Indicate your confidence in the employee's ability to improve.

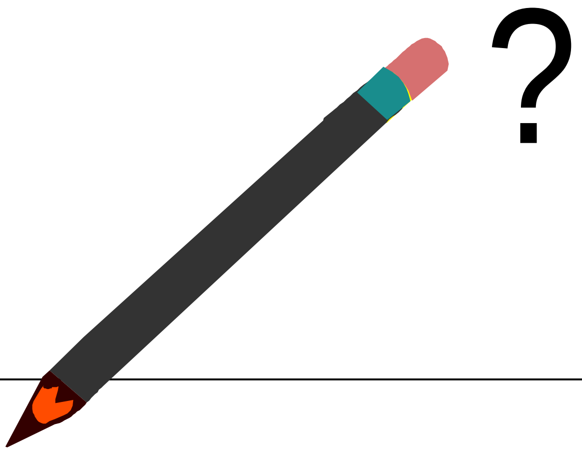
Questions to ask your staff



- ☐ Can I do anything to help you to perform better?
- ☐ Am I doing anything that hinders your performance?
- ☐ What do you see as your strengths and weaknesses?
- ☐ Have you any ideas about how you can improve yourself?
- ☐ How could your job or the system be improved?

Non-financial rewards

REWARD	FACTS TO CONSIDER
RECOGNITION Handwritten note, engraved trophy	Reward that is personal as well as being effective in both the short and the long term.
GIFTS AND PRIVILEGES Holidays, sports facilities, merchandise	Immediate, and stimulating in the short term. May not meet long-term motivational needs.
SPECIAL EVENTS Weekends away, parties, gatherings	Involve staff from all levels. Can stimulate, relax, bond, and motivate staff.
PROFESSIONAL TRAINING On- or off-site courses	Effective, focused training brings high returns. Company gains a qualified employee, who feels valued.
SELF-DEVELOPMENT Personal, non-vocational training	Very high motivational value. Enhancing self-image raises performance level at work.
EQUIPMENT Company car, lap-top	Expensive equipment is highly motivational. Need to ensure that equipment is fully utilized.

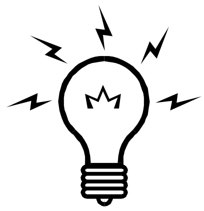
Financial rewards

REWARD	FACTS TO CONSIDER
SALARY INCREASES Increases in basic rate of pay	
COMMISSIONS AND BONUSES One-off payments linked to targets	
PERFORMANCE RELATED PAY Regular wage increases based on target-linked performance	
SHARES/STOCK OPTIONS Gifts of shares, or the chance to buy shares at a fraction of actual value	
SPECIAL RATES Help with mortgage/rent, insurance, and other items.	
FAMILY HEALTH BENEFITS Paid or subsidized schemes offering privat family health care	

How to make your production faster:

- Training of workers
- Better machines and equipment
- Use of jigs
- Identify bottleneck in the production
- Allocate materials for each order right in time
- Reduce set-up times

The idea of KAIZEN



- ➔ "In its broadest sense, quality is anything that can be improved."

- ➔ "There is always a better way."

- ➔ "There is no acceptable best way."

The management should provide you with:

- ☐ Technical drawing of the item
  (or a sample)
- ☐ Specification of material, hardware and the quality standard (or a sample)
- ☐ Quantity of items that should be produced
- ☐ Machine rates for each machine in the workshop
- ☐ Operator rates (if they are not included in the machine rates)
- ☐ Material prices

Determination of time

➔ Define the different steps of work to be done in the correct order.

➔ Fix the appropriate machines you want to use.

➔ Determine the amount of work (number of pieces, m^2, etc.).

➔ Consider the time for the machine set-up.

➔ Compute the time for each working process based on your experience.

➔ Add a percentage for transportation inside the workshop.

Table of Contents

Supervisory Development Program

A seminar for improving supervisors skills

Before we start talking about supervisors and supervision we should have a proper definition for this word. One way is having a look in the dictionary:

The dictionary defines supervision
in the following words:
"the act of supervising, the authority to direct or supervise".
It comes from the Latin ***supervidere***.
Super signifying "**over**" and *videre* meaning "**see**".

Supervision as a management function refers to the act of keeping a close eye on the work of workers and employees in the performance of the jobs assigned to them. Thus, the individual who is in charge with this function and responsibility is generally called a supervisor. Supervision is the process of **"looking over their shoulder"** to see that things are operating correctly.

This seminar is desined to help you to better understand the tasks and responsibilities of a supervisor and give you ideas how to improve your supervisory skills.

Hopefully the outcome of the seminar will enable you to transfer your new knowledge into your company and thus enhance the productivity and quality.

Sabine Schacknat

1.0 Particulars about Supervision

Just imagine:

Until a few weeks ago you were a normal worker in the production line and you received your orders from your boss or a supervisor. They gave you instructions of what to do and how do to it and you were doing it. Two weeks ago the production manager of your company talked to you and offered you a job to be a supervisor yourself. You happily agreed because it means some Pesos more every day and you do not have to do all the dirty work yourself anymore.

Last Monday you started your new assignment and you suddenly realize that this new job is not so easy after all. Before you had to deal only with the work itself but now you have to tell other people what they have to do!

Think about the problems you suddenly have to deal with:

- ➔ Machines are not adjusted properly
- ➔ Dimensions of the product are not accurate
- ➔ Wrong tools are used for the job
- ➔ Wrong materials have been used
- ➔ Accidents are happening
- ➔ Products are not finished in time
- ➔ The quality of the product is not good
- ➔ Jobs take too long to be finished
- ➔ Your former buddies in the production line don't want to have a beer with you after work!

You wonder what is going wrong because you actually thought that you were a skilled wood worker!

Actually there is a **big difference** between the two jobs and you have to recognize what these differences are.

And you have to **learn some new skills** before you are really able to do your new job properly.

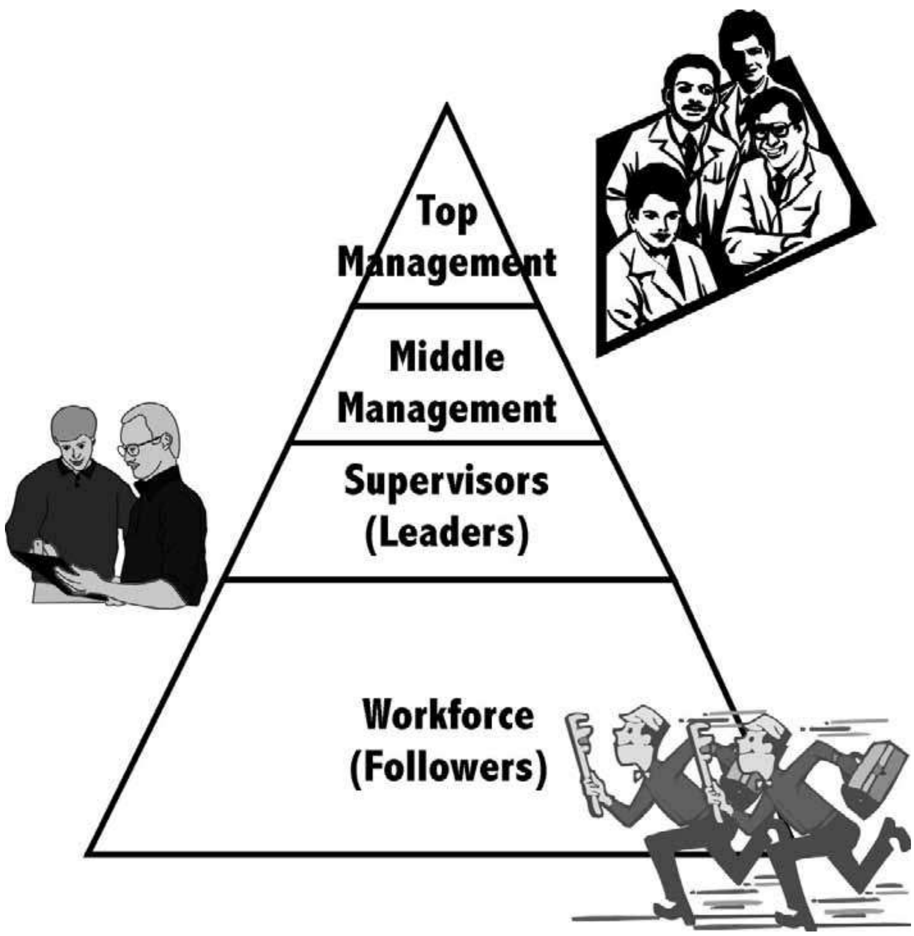
2.0 Organizational Structure and Responsibilities

2.1 Organizational Structure in a company

Let us have a look at the organizational structure of a company to get an idea of what changed in the work life if you change from a worker to a supervisor. In the picture you can see a rough layout of a company's structure. Now, you moved up from the workforce into your new position as a supervisor and that means that you moved up from being a **"Follower"** to being a **"Leader".**

As a follower you received your orders from the supervisor or the middle management and you were following these orders. Sometimes they would ask you for a statement about some problems and you had to report to them.

Your main task was to function as a worker and to do what you were told. The skills you had to provide were mainly technical, on how to run a machine and to use tools. Most of the labor was physical, like planing a piece of wood, the dimensions of the final product were given to you and you had to do it according to the order.

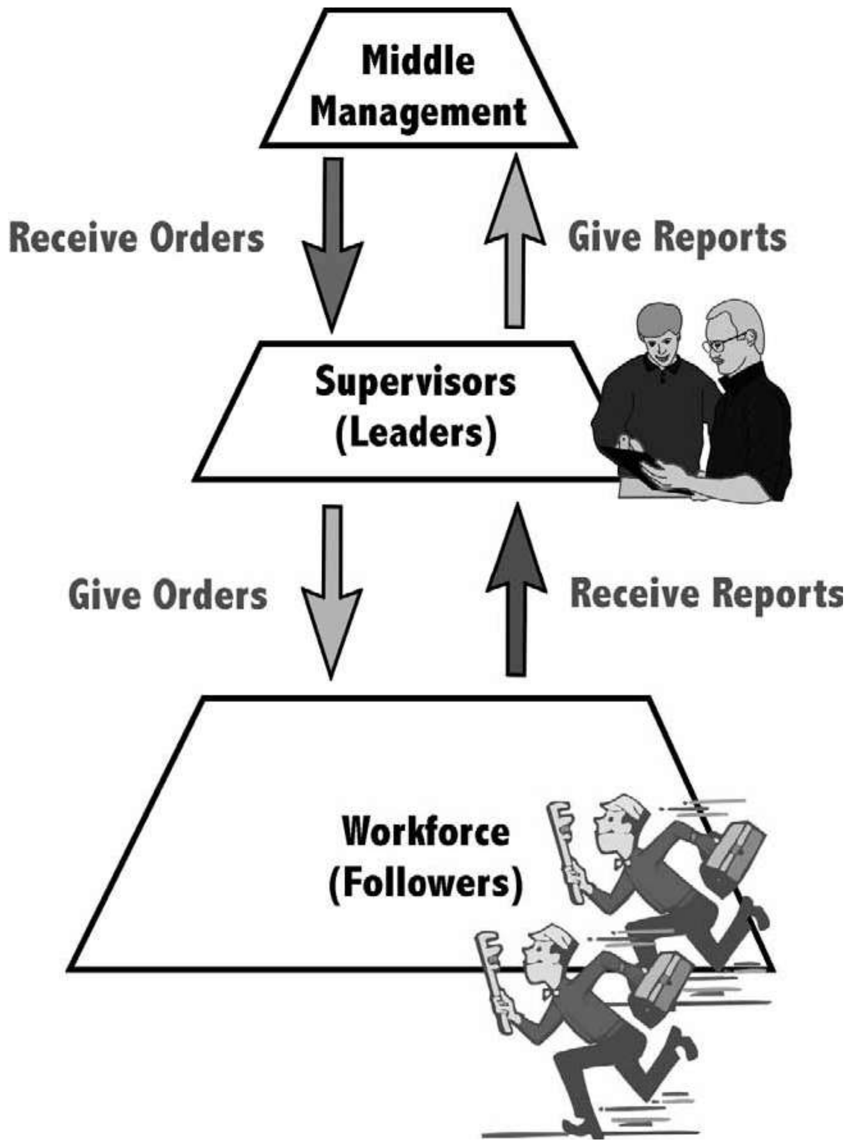


In the new position as a supervisor you will find a completely different situation to handle:

You have to receive orders from the management and give reports to them.

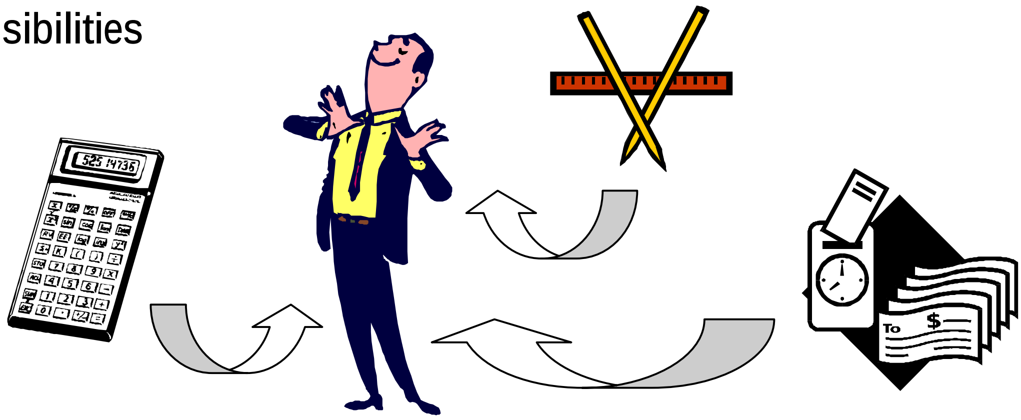
and

You have to give orders to the workers and receive reports from them.



Now it should be easy to understand that most of your work as a supervisor will be more mental and not so much physical.

1.2 Responsibilities



If we have a closer look at the organizational structure we can see that a supervisor has a lot of different responsibilities in his work life:

1.2.1. Responsibility to the Middle and Top Management

The management is expecting from a supervisor to do a lot of things in the department or section. They want to be able to rely on him when it comes to the planning of the work in the section and the coordination of work with other sections *(Example: You are the supervisor in the assembly, so you have to report problems to the management regarding the supply of parts from the machining section).* The supervisor has to be able to train and select employees for specific jobs. It is very important that he is able to communicate with the workers so that they do understand their work assignments.

To maintain work discipline and morale in the section he needs to have a natural authority which has to be based on knowledge and skills. To make the section an efficient one he has to make production decisions such as:

➔ *Which job has priority?*
➔ *When do we start with the next order?*
➔ *Which worker will be assigned at which machine?*
➔ *Will the machine work more efficient if you assign two workers?*

At the same time the management expects from the supervisor that he will maintain a proper cost control *(Material waste, proper production flow, unproductive workers).* In order to improve the productivity of the section the management expects written comments and suggestions about the situation.

1.2.2 Responsibility to the Workers of the Department

The workers in the section are the ones who will do the actual jobs like machining, assembly and so on. To achieve a high quality and In Time production the supervisor has to rely on his workers. A good working morale is a very important factor, the supervisor has to get to know the special skills of his workers in order to assign them to the right jobs and explain all the matters connected to this assignments *(special jigs, deadline, tools to use)*. If necessary he has to instruct and train workers for special jobs.

The target is to create a trusting working climate were the workers will be able to talk openly about problems in meetings. The treatment of all workers has to be equally. The workers problems have to be handled correctly, a good relationship with the personnel / staff department has to be established because they can help in all sorts of explanations and problems like workers payment and benefits. Sometimes the supervisor might have to take over the role of a counselor but he has to be careful that he does not get involved personally into the problems, it is very important that he will stay objective in all department matters. The workers will be efficient if the supervisor provide them with a predictible and stable work load.

1.2.3 Responsibility to Other Supervisors

It is very important that each supervisor gets to know all the other supervisors very well in order to establish good working relationships with them. This will improve the work flow between the departments, the exchange of information like deadlines for parts and products, it will help to solve problems with quality and tolerance problems. It is the target to create a supervisor team that can communicate and coordinate properly with the management.

1.2.4 Responsibilities to the Staff / Personnel Department

The staff department will approach the supervisor first regarding information about workers. He has to be able to judge requests for information from staff managers, try to be a middle man in these situations. A supervisor should coordinate standardized reporting forms and instruments with the staff managers in order to judge the employees performance. He should consult with appropriate staff managers to utilize their special expertise on staff problems (work attitude, late, drinking, fighting…)

1.2.5 Responsibility in Labor Matters (if company is unionized)

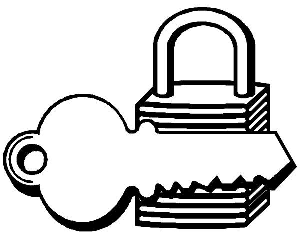
The supervisor has to know the basics of the CBA (Collective Bargaining Agreement) to keep a professional relationship with the union. He has to respect the terms of the agreement as a representative of the employer, even though he may personally disagree with it. The treatment of all workers has to be equally, union members or not.

1.2.6 Responsibility in general

The main purpose of supervision is to determine whether the individual who is responsible for the action **understands the information** and the directions that were given to him previously, and whether he is **following them satisfactorily**. The executive seeks to learn where further advice and instruction are needed by the subordinate. Another chief importance of supervision is that it can **catch deviations** of actual from planned results at a time when **corrective action** may be taken immediately. The executive, however, should remember several things about supervision. Many subordinates do not ordinarily like close supervision. As a matter of record, **successful managers do not over-supervise.** Subordinates who have been properly selected and indoctrinated need less supervision than a group seeking a complex of objectives, the significance of which they do not understand.

> Subordinates who have been properly selected and indoctrinated need less supervision

- ➔ Directing
- ➔ Guiding
- ➔ Leading



> Create an atmosphere where workers perform their assignments because they want to perform.

Directing, guiding, and leading are three **key words** that sum up the whole spectrum of supervision. Directing is a verbal or written function. It is telling subordinates **what they have to do and how they are to do it.** As a function of order-giving, it may range from a simple request to an authoritative command. The secret of effective leadership is not ordering people, but creating an atmosphere where they perform their assignments because they want to perform them. Exhibiting their leadership qualities, supervisors are able to guide and lead their subordinates grow and develop into capable and reliable workers and employees of which every organization would have reason to be proud of. To be able to direct, guide, and lead, in line with the function of a supervisor of "watching over", he must know what is going on, who is doing what, and what the working conditions are.

> The supervisor must know what is going on, who is doing what, and what the working conditions are.

2.0 Skills required by Supervisors

Based on all the responsibilities a supervisor has in a company we can summarize all the skills a supervisor should have to do a proper job. For the purpose of effective supervision, three sets of skills are required, namely:

3.1 Interaction Skills	3.2 Analysis Skills	Technical Skills
		3.1.1 Communicate clearly 3.1.2 How to delegate 3.1.3 Successful meetings 3.1.4 Motivating people 3.1.5 Discipline 3.1.6 Rewarding performance 3.1.7 Training and developing the staff	3.2.1 Planning a process 3.2.2 Improving a process 3.2.3 Reducing costs 3.2.4 Daily Routine Activities	
Interaction skills include all the techniques managers and supervisors use to relate to their employees for purposes of providing direction and feedback. Basis for all interaction is the ability to communicate clearly!	**Analysis skills** enable managers as well as supervisors to study problem situations and other aspects of management, break into the minutest details and as such have a clear grasp and understanding of them. With everything set in clear perspective, they are able to formulate and implement the steps that may be found warranted by the circumstances in relation to the whole work system.	**Technicals skills** are very important for a supervisor. If a supervisor is not able to understand the working process and has not the knowledge which is required in his specific area of the production, he will not be able to make the right decisions and to plan properly. The workforce will not respect him because of his lack of experience and knowledge. If a former, excellent worker is promoted to a supervisor or foreman, he usually has enough technical skills.

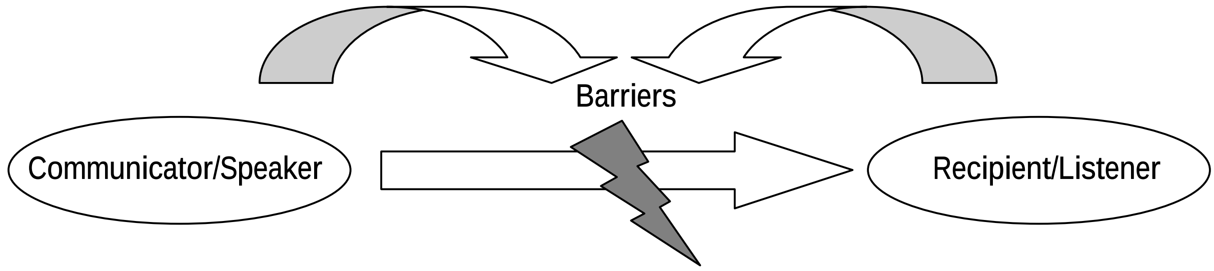
3.1 Interaction Skills

3.1.1. Good Communication

3.1.1.1 Communicate clearly

Good communication is the lifeblood of organizations. It takes many forms, such as speaking, writing, and listening, though its purpose is always to convey a message to recipients. Use it to handle information and improve relationships.

Effective communication hinges on people understanding your meaning, and replying in terms that move the exchange forward – preferably in the direction you would like it to go. Communicating is always a two-way process. There are always at least two parties involved in any communication, each of whom may have different wants, needs, and attitudes.



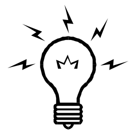
These wants and needs can present barriers if they conflict with those of the other party, and such barriers may stop you conveying or receiving the right message. Breaking down barriers is one of the first steps towards good communication.

- Maintaining eye contact
- Listening to what the other person is saying
- Mirroring body language

all help you to communicate successfully.

The three rules that govern good communication are all associated with clarity:

- Be clear in your own mind about what you want to say
- Deliver the message properly
- Ensure that the message has been correctly understood



Good communication means saying what you mean – and fully comprehending any feedback.

2.1.1.1 Understanding Body Language and Gestures

Your body language – a huge range of unconscious physical movements such as posture, facial expression, and gestures – can either strengthen communication or damage it. Even if you are sitting completely still, you may be unknowingly communicating a powerful message about your real feelings. Because of its subtlety and range, body language is difficult to read and to control. However, a broad understanding of body language is one route to understanding the real opinions of others.

Make sure you are not unintentionally showing a hostile expression or posture.

Conquering Nerves

The nervousness people feel before making a presentation or attending a meeting is very natural. Use body language to appear more confident than you feel by making a conscious effort to smile and to relax your arms. Look people in the eye while you are talking or listening to them, keep your posture comfortably straight, and do not fiddle with your hands.

Keeping your Distance

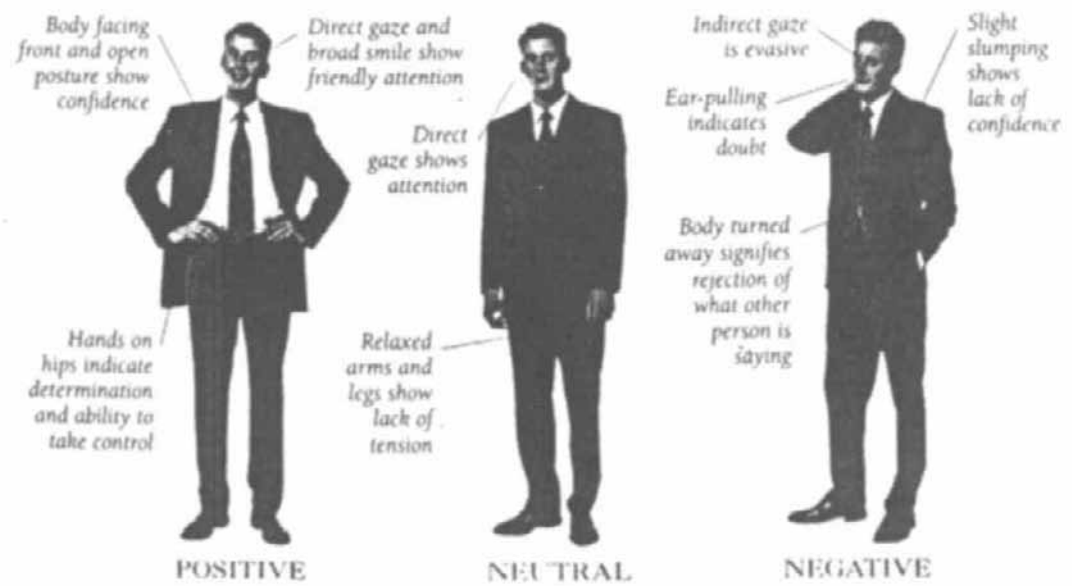
Leaving an acceptable distance between people is part of body language, and this distance changes depending on situation. For instance, guests at a social gathering stand closer to each other than strangers in a non-social situation. Always take care not to intrude into another's personal territory in case you arouse defensive or hostile reactions.

Supportive gestures

Supportive gestures such as making eye contact and nodding while somebody is talking, create empathy – unless the person to whom you are speaking can tell that you are concealing your true feelings. Everyone can control their body language to an extent, but not totally. To avoid that the body language is contradicting you, try to be as honest as possible and show always respect to the one you are talking to.

Communicating by Body Language

Posture is all-important in body language. On a first meeting, these three postures would create very different impressions. The positive posture might have the best effect on the outcome by encouraging open communication, while the negative one would make communication difficult.

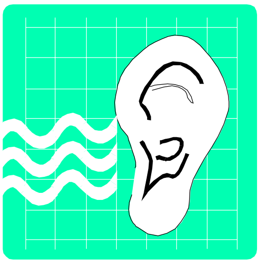


Recognizing Gestures

All skilled public speakers use gestures for emphasis. Devices like smacking your fist into an open palm, pointing, or spreading your palms can all reinforce points you make verbally. Remember that over-assertive gestures, such as banging a table, or other signs of anger, can alienate people.

> Practise a range of gestures in front of a mirror to find those that look natural for you.

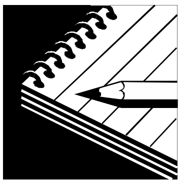
2.1.1.2 Learning to Listen



The two-way nature of communication – so that both sides understand each other – is widely ignored. Listening techniques are vital, since how you listen conveys meaning to the other person and helps to make the exchange successful.

Showing Attentiveness

When you are in search of information, consensus, or a working relationship, the more obviously you listen attentively the better. You may need to speak to get a respons, but show you do not wish to dominate the conversation. Ask open questions, which lead to discussion, and keep your responses brief. Repeat key words silently as you hear them to help you to remember what is said.



If you are taking notes while people are speaking, do not try to write their words in longhand and in sequences or you will fail to keep up. Instead, listen to what is being said and note down the key points in your own words. Try writing a succinct explanation of each point, and use headings and numbers to structure your notes.

Interpreting Dialogue

Keep an open mind about what people say.

Take statements at face value without reading hidden meanings into what is being said. Test your understanding by rephrasing statements and repeating them to the speaker. It should then be clear that you have understood each other – or they may correct you and clarify their statement. However, watch for physical signs, such as evasive eye contact, and verbal signs, such as hesitation or contradiction, that provide clues to the thruthfulness of the message. Be careful not to hear only what you want to hear and nothing else.

Recognizing Prejudice

Think about the words you hear, not the person saying them.

When what you see or hear only fulfils your own expectations you probably have an inflexible mind-set. Most people have this problem and are unconsciously influenced by stereotypical views. We are also influenced by others, and often adopt their opinions without thinking. Prejudices block good communication. If you can recognize your prejudiced ideas, you will be a better listener. A frequent mistake is to assume that you know what somenoe is going to say, and not to listen to the actual message. However, people do not always behave according to stereotype or expectation. Listen very carefully to what people are saying to you and do not let your prejudices get in the way.

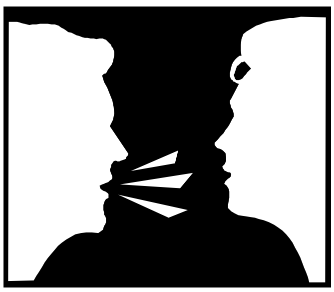
Type of Listening	Putting Methods into Practice
EMPATHIZING Drawing out the speaker and getting information in a supportive, helpful way.	Empathize by imagining yourself in the other person's position, trying to understand what they are thinking, and letting them feel comfortable – possibly by relating to their emotional experiences. Pay close attention to what the person is saying, talk very little, and use encouraging nods and words.
ANALYZING Seeking concrete information and trying to disentangle fact from emotion.	Use analytical questions to discover the reasons behind the speaker's statements, especially if you need to understand a sequence of facts or thoughts. Ask questions carefully, so you can pick up clues from the answers and use the person's responses to help you form your next set of questions.
SYNTHESIZING Proactively guiding the exchange towards an objective.	If you need to achive a desired result, make statements to which others can respond with ideas. Listen and give your answers to others' remarks in a way that suggests which ideas can be enacted and how they might be implemented. Alternatively, include a different solution in your next question.

Acting on what you hear

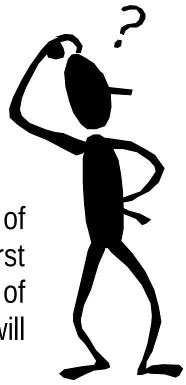
In some cases, communication is an end in itself – an update on progress, for example. In others, action is vital – clearing a bottleneck in the production, say. What you must never do is promise an action and fail to deliver. A classic example is the employee attitude survey, which always raises expectations of action to remedy management errors. Failure to act on the survey findings means you have not listened and instead delivers a harmful message. Keep your promises – and take action as soon as possible.

> Keep promises in writing as soon as you can to avoid misunderstandings.

Listen → Respond → Act



3.1.1.3 Asking Questions



Knowing what to ask

The right questions open the door to knowledge and understnding. The art of questioning lies in knowing which questions to ask when. Address your first question to yourself: if you could press a magic button and get every piece of information you want, what would you want to know? The answer will immediately help you compose the right questions.

Choosing questions

Ask a specific question if you want to hear a specific answer

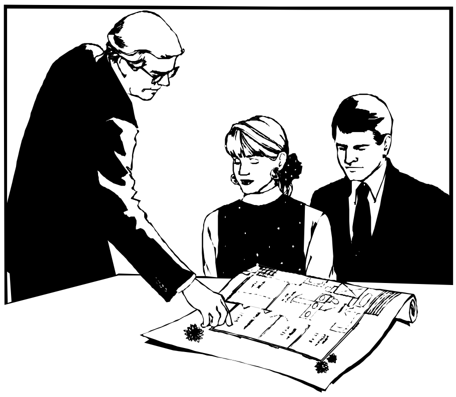
When preparing questions in advance, always look at the type of question that best meets your aims. You may want to initiate a discussion, obtain specific information, attain aparticular end, or send a command cloaked as a query. However, be aware that prepared questions will rarely be enough – answers to them may be incomplete or may prompt a whole new line of questioning. Keep asking questions until you are satisfied that you have received the answers you require. When asking prepared questions, watch out for clues in the answers that you can follow up later with a new set of questions.

Striking the right tone

Your tone of voice is a part of communication in itself – for example, you may convey anger by speaking harshly or sympathy by speaking softly. The wrong tone may generate a counter-productive response, so work on improving your ability to manage your voice. Practise until you are happy with how you sound. You can often steer pople towards agreement by using an optimistic and confident tone of voice.

Type of Question	Examples
OPEN Question does not invite any particular answer, but opens up discussion.	What do you think about the company setting up a canteen for all members of the staff? I think it is a good idea.
CLOSED Question is specific and must be answered with a yes or a no.	Do you ever read the company magazine or newsletter? No.
FACT-FINDING Question is aimed at getting information on a particular subject.	What percentage of staff has replied to the employee survey? Out of 2,000 questionnaires we got 70 per cent.
FOLLOW-UP Question is intended to get more information or to elicit an opinion.	Is this a good response compared with last time? Two-third is average, so this indicates reasonably good morale.
FEEDBACK Question is aimed at getting a particular type of information.	Do you think that the content of the newsletter has improved? Yes, I like especially the new reports about the sections.

3.1.1.4 Working with Feedback



Managers and supervisors spend much of their time delivering and receiving messages in person. This can be the most critical – and satisfying – arena of communication. Honesty and feedback are both essential if you are to achieve clarity and progress.

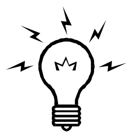
Being Understood

Delivering a message that may be misunderstood is all too easy. It may happen because you are not clear about what you want to say; or because your language is vague even though your objectives are clear; or your body language contradicts your verbal message. A useful way to avoid misinterpretation is to **get the recipients to repeat your message –** you can then use their feedback to try to correct any misapprehensions. Use positive body language to emphasize your verbal message.

Giving Feedback

Feedback is essential to communication – to check that you have understood the other person's message, and to react to what they have said and done. It is vital that you react honestly to the statements or actions of your employees or staff members. Give reasons for positive feedback, and use questions when giving negative feedback. It can be difficult to give negative feedback, but remember that it is bad management to avoid doing this. When giving negative feedback, follow these simple rules to avoid any antagonism:

- Show an understanding of exactly what went wrong and why.
- Draw out ways in which poor performance or behaviour can improve.
- Use questioning to let the staff member know what you think and why.
- Aim to express your negative opinions honestly, but in a positive manner.
- Above all, take negative feedback away from the emotional zone by being objective, not personal.



Below are some examples that you can use:

"I especially like how you found a solution for using an existing cutter block in producing the item."

"You are the right person for this job, because..."

"Would you agree that this sample is very unsatisfactory?"

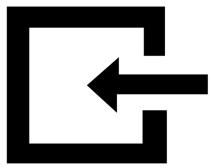
3.1.1.5 Giving and Receiving Orders

When you were a worker you received your orders from a supervisor and now you receive them from somebody from the middle management. What is the difference between the two?

- As a worker you normally received an instruction for one job and when that was finished you got the next one. The communication was pretty easy because you and the supervisor spoke the same “technical language” and he could even help you with some complicated setups or jigs.

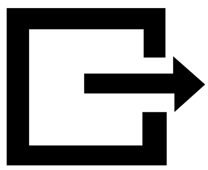
- Now you have to communicate with somebody from the middle management and you might have problems understanding him. What is wrong? The fact is that you and him are not speaking the same “language” anymore because you are a ”technician” and he is a “manager”. You have to learn to follow his instructions even so his technical knowledge might be limited. Apart from that you will not only receive one single instruction, but most probably orders for the whole day.

Receiving Orders



You have to translate the instructions you received from the middle management into technical language and distribute the different jobs to your workers. It is very important to write down the instructions you receive because there might be many of them and you might forget some details. With the help of these written notes you can break down the work into small steps, decide what machinery you want to use and which worker would be the right one to choose. You have to prepare a time schedule for the work and compare it with the ongoing processes in the workshop so that you will know which machine and which worker is available when. Than you can make a plan for the day(s) and you will be able to formulate proper instructions to your workers.

Giving Orders

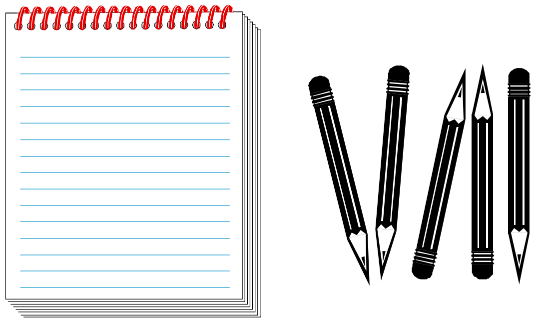


It is very important that you know the technical details of the process you want to explain to somebody else. All the processes of the work should be easy for you to explain. If you are not certain in a specific area you have to familiarize more with the machine and the process before you start explaining things to somebody else. In order to give good instructions you have to plan them. Before you give instructions, take a piece of paper and write down keywords for the processes you want to explain.

You have to be able to demonstrate the work process, this will support your explanations very much. Think about safety aspects before you make a demonstration because you have to consider that the worker will copy your action later on.

You can only be self confident and have some authority if you learn and practice the above mentioned factors. The workers will only accept you as a supervisor if you have authority based on knowledge.

3.1.1.6 Compiling Reports



Reports are formal documents that will be read by others. They must always be accurate and well laid out, finishing with a definete conclusion.

Researching a report

If you are reporting on an activity of your own, check every fact to ensure acccuracy. If you have been asked to report on a subject – say, a new market for a product – write down what you need to know as a series of points. Then note the sources you can tap and match them to the points, making sure everything is covered. Before finalizing, get information supplied by one source confirmed by at least one other reliable authority.

Structuring a report

Write the purpose of a report and summarize its main conclusions in your opening paragraphs. In the body of the report, support your findings with evidence, set down in logical sequences, in numbered paragraphs. Use headings, subheadings, and bullet points, all of which are effective structural aids, drawing attention to key facts. Use underlining and bold type for emphasis. End the report with recommendations for action in summary form.

Ensuring clarity

Reports are not works of literature, but good ones follow the rules of good writing. Avoid ambiguities. If you are unsure about your conclusions, state the alternatives and invite the readers to make up their own minds. Express yourself in short sentences. Above all, put yourself in the readers' shoes. Will they understand what you mean? If you can, get a friend or colleague to read the report before you distribute it.

Be ruthless:
Cut out all unnecessary words in your report.

DO'S	DONT'S
▪ Do make each report interesting. ▪ Do emphasize your most important findings and facts. ▪ Do use numbered paragraphs to make cross-referencing easier and to keep points separate. ▪ Do use headings for changes of subject and sub-headings for related themes.	▪ Don't write long, unbroken paragraphs. ▪ Don't overuse the first person singular (I) or allow your personal prejudices to show. ▪ Don't draw conclusions from insufficient evidence. ▪ Don't print your report without thoroughly checking your sources.

3.1.2. How to delegate

3.1.2.1 What is delegation and why to do it

Explaining Delegation

Delegation involves intrusting another person with a task for which the delegator remains ultimately responsible. Delegation can range from a major appointment, such as the leadership of a team developing a new product, to one of any number of smaller tasks in the everyday life of any organization – from arranging an annual outing to interviewing a job candidate.

> Delegate to boost staff morale, build confidence, and reduce stress.

Increasing your time

Managers and supervisors commonly claim that the short-term demands of operational and minor duties make it impossible to devote sufficient time to more important, long-term matters. Strategic planning, control, and training are among the higher level activities which will suffer under the burden of undelegated, routine tasks which you wrongly attempt to do yourself. To create more time for yourself, more routine work must be handed down by delegation. Also, the more frequently you delegate the more experienced staff become, and the less time you need to spend on briefing.

> Set aside enough time each day for concentrating on your long-term projects.

The costs of avoiding delegation

Delegation takes time to organize and prioritize but the costs of avoiding it are high. The manager who does not delegate will not only seem disorganized, but will spend many hours each week completing low-priority tasks. This can result in:

- Excessive hours worked by senior managers or supervisors
- Low morale among under-employed staff
- Basic processes slowed down by bottlenecks
- Poor quality of work
- Missed deadlines

Questions to ask yourself

- ☐ Am I devoting enough time and resources to strategic planning and overall monitoring?
- ☐ Is my desk overflowing with uncompleted tasks?
- ☐ Am I delegating routine but necessary tasks to staff?
- ☐ Is staff training given priority to ensure effective skills for future delegation plans?

3.1.2.2 Recognizing and dealing with barriers

Barrieres preventing delegation are often based on negative feelings of insecurity and mistrust.

Doing it yourself

As a supervisor, you will probably be more efficient at many tasks than your staff. But if you attempt to do everything because you are quicker, surer, and more proficient you will inevitably find yourself overburdened. As a result you will not have sufficient time to spend on the higher-level tasks that only you can do.

Avoid keeping work because you do it better

Overburdening staff

The fear of overburdening staff is a strong barrier to delegation – it is natural for good supervisors to want to ensure that staff workloads are not excessive. If staff members appear to be working to full capacity, how can you delegate tasks without overburdening them? One solution is to keep back tasks and find time to do them yourself. A more sensible approach is to make employees analyze their own use of time and free capacity for more work. If staff shortage is truly the problem, the answer is to take on more staff.

Loosing control of tasks

The desire to be in total control is a common human trait. Delegation involves the loss of direct control, and this loss is a potential barrier to the delegation process. When delegating, the supervisor passes on responsibility for completion of a task to a chosen delegate. The delegator retains overall control by appointing the right person, having a clear idea of how the task should progress, and exchanging regular feedback.

Questions to ask yourself

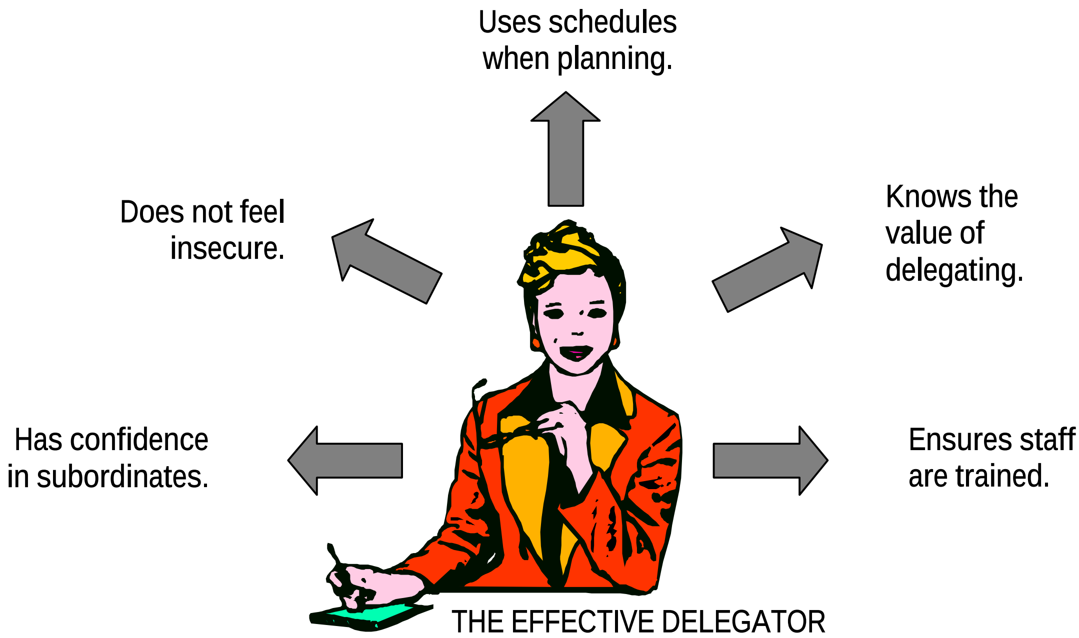
- ☐ Can I learn from the way my own boss delegates to me?
- ☐ Why should it upset me if a subordinate performs part of my job brilliantly?
- ☐ How much spare work capacity is there in my unit?

Dealing with fear

Fear is a major barrier to delegation. Sometimes supervisors fear that delegates will perform so well that they challenge the delegator's own position. A parallel fear is that loosing part of the job diminishes personal importance. These fears may underlie a third – that the delegate will do badly. Tackle the fears by asking yourself four questions:

- ☐ Is the task suitable for delegation?
- ☐ Is the delegate competent to perform the task?
- ☐ Will I brief them fully and correctly?
- ☐ Will I give them all the right backup, authority, and resources?

If the answers are positive, then there is nothing to fear, and the delegation should succeed. Once you have overcome your initial fears, your efficiency as a delegator and supervisor will be greatly increased.



Being to busy

Some supervisors do not delegate enough because they lack the time to explain or monitor the tasks which should be delegated. Therefore, they are always busy doing the tasks that should have been delegated and they don't have time to delegate tasks – a vicious circle. Organize your schedule to ensure that you have enough time available to plan and manage a delegation properly, including writing an effective brief and the actual monitoring of your delegates.

> If you often say "I don't have time", you are badly organized.

Lacking trust

If both sides in the delegation process do not trust each other, the process will be hindered. A manager must have complete confidence in a delegate's ability to perform the task, and delegates should feel that their supervisors are consistent and fair in their approach. Subordinates must feel assured about their supervisors integrity, competence and loyalty. On both sides, trust is conditional. Maintain trust by showing respect to your delegate and by giving honest and constructive feedback during the delegation.

3.1.2.3 Selecting tasks

Before you can start delegating you must decide which tasks you could, or should, be delegating.

Analyzing your time

The way you, as a supervisor, distribute your work and how much time you allocate is probably under your control. A useful exercise is to determine how your actual expenditure of time matches the areas or tasks for which you are responsible. Start the analysis by keeping a detailed time log for at least two weeks: note all activities you undertake and the time they take. You will probably find that only a small amount of your time has been spent on the high-level activities that only you can do. Far more time will have been taken up by routine activities that could have been delegated.

Breaking down your tasks

After analyzing your use of time, analyze the tasks you are undertaking. Do this by dividing the tasks listed in your time log into the three groups outlined below:

Use this breakdown as a basis for reducing any unnecessary activities, delegating more tasks, and concentrating on tasks that only you can complete.

Where delegation seems to be necessary it has to be cleared with your own supervisor.

What tasks am I doing that need not be done at all? → Do not complete them yourself or delegate them.

What am I doing that could be done by somebody else? → Delegate these tasks to subordinates.

What tasks am I doing that can only be done by me? → You cannot delegate these, so prioritize them.

Prioritizing tasks

Having decided which tasks to delegate, your first concern is to allocate these tasks. Then prioritize the tasks you have decided to handle yourself according to their importance and urgency. Start each day by listing these tasks and tackle them one by one in order to priority. If circumstances allow, always complete a task before starting a new one. The closer you keep to this system, to more effective you will be.

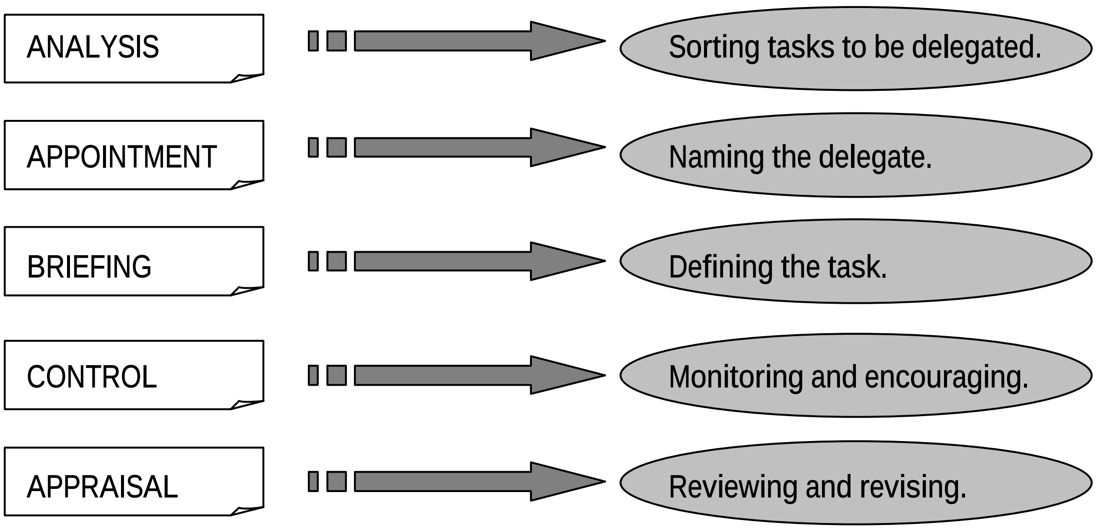
Do not attempt to undertake more than seven tasks in one day.

3.1.2.4 Planning a structure

Exploring the fundamentals

The basis issues involved in delegation are **autonomy** and **control**. How much authority is the delegate able to exercise without referring back to the delegator? How far should the delegator exercise direct influence over the work of the delegate? When choosing a delegate, you are assessing whether a particular person is fully capable of performing the task within available resources. Having appointed a delegate, you must ensure that they are allowed sufficient autonomy to undertake the task in their own way, subject to an initial briefing and regular reports on progress.

Understanding the stages:



Setting up a structure

When setting up a structure, your priority will be to ensure that the organizational framework is balanced and responsive to any of the inevitable changes that can occur. Do this by ensuring that each delegate has sufficient support and back-up when unforseen problems arise and that, as far as possible, adequate cover will always be made available in any absence. Inform each delegate of the support structure you have devised so that each knows where they can go to seek assistance immediately in a crisis.

> Ensure to provide enough support and back-up to each delegate.

Avoiding duplication

When planning a structure, delegating, and distributing tasks, avoid giving the same task to more than one person. To prevent confusion, create a chart with all key activities listed on the left-hand side, and the names of those with delegated resposibility along the bottom line. Tick off each box in the chart with both a task and a delegate to reveal any gaps or overlaps in the distribution and structure of the tasks.

Defining the tasks

To delegate effectively, you need to define the tasks and also have a good understanding of a proposed delegate's abilities. So for each task in your planned delegation, work out a clear definition, including the skills required and the range of responsibilities to be delegated.

Setting guidelines

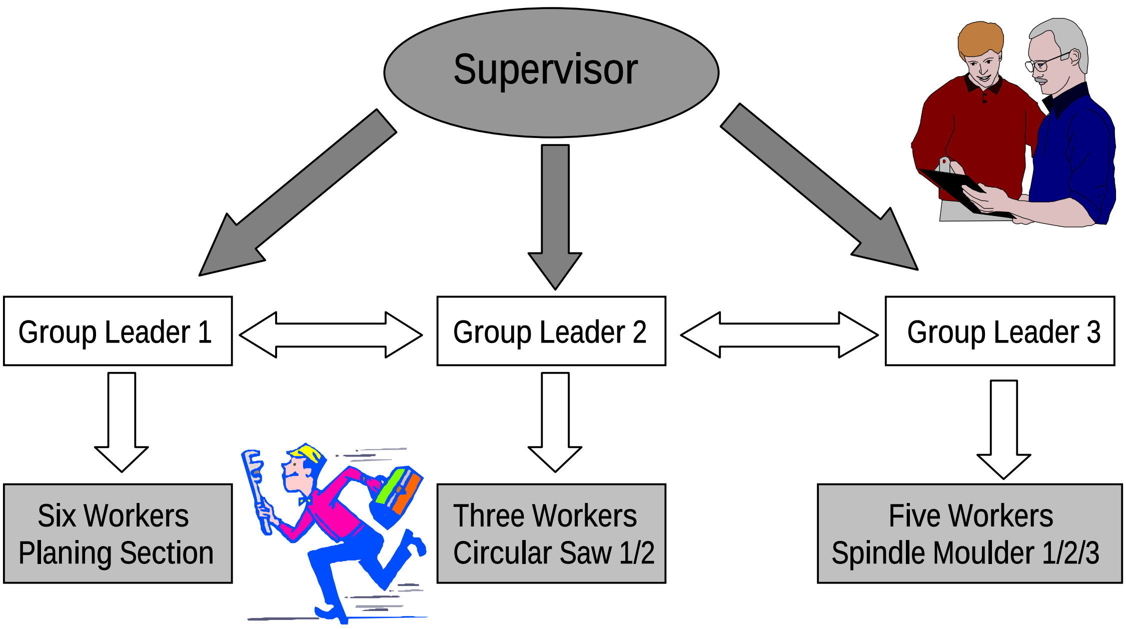
> Make clear to delegates the areas for which they are accountable.

Delegation operates within guidelines, and the most important of these is an understanding that each delegate will be accountable for a specific task. It follows that you must define the tasks very clearly, and the delegate must confirm that they fully understand what the task involves. However clear the delegation, and however much you wish to avoid interference, there are likely be occasions when the delegate does not know what to do. The guideline here is: when really in doubt, ask.

Appointing Sub-Leaders

Create a production team and involve them actively in the planning and decision making. Give them some responsibilities in the production and you can concentrate more on the management of the production. It is a little bit like having your "own company", now you are in the higher management and you have your own "sub-leaders" as supervisors supporting you in the day to day activities. By creating such an internal department structure you can solve some of the problems related to motivation: By delegating work and responsibilities to your group leaders they feel treated as individuals and they can implement some of their ideas, in the end they feel that their work is meaningful.

- Try to work down with this system to the workers who do not have a lot of self motivation
- Try to get them involved in the system in small steps
- Make notes of their performance, set regular individual meetings to discuss their improvement or the lack of it
- If you see potential in a worker but he lacks certain skills, give him some individual attendance or send him to some training courses outside.
- Sharing authority does not mean giving it away. You as a supervisor always remain ultimately responsible.



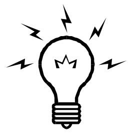
3.1.2.5 Briefing effectively

Using a checklist

When planning a brief, first define your objective and compile a full checklist to ensure that all the individual aspects of a task are included. The more complete the final brief, the more confident you can be that the task will be successfully executed. Your delegation should be based on breaking down a task into all aspects, naming the person who is responsible for each item, and eliminating overlaps of responsibility. Use the checklist to ensure that nothing significant has been omitted from the brief, and that component tasks have an explicit timetable.

Things to do:

- Keep objectives as clear and concise as possible.
- Build a certain amount of flexibility into the brief.
- Base the objectives on requires outcomes.
- Make a checklist to avoid overlaps and omissions.
- Ensure that the delegate is fully aware of the aims.
- Allow the delegate to comment on the brief.



Structuring a brief

Parts of a brief	Factors to Consider
OBJECTIVES Defines the task, listing the major objectives and sub-objectives in clear and concise language.	List all the objectives and discuss them with the delegate before finalizing any agreement. Ensure that this list is referred to continually.
RESOURCES Specifies what personnel, finance, and facilities are available or need to be obtained.	Finalize resource needs after the objectives have been set. Ensure you include the limits to spending authority in the delegate's budget.
TIMESCALE Sets out the schedule with review points, stage completion dates, and final deadlines.	Use the schedule to motivate the delegate and to provide the basis for a critical path analysis showing all the completion stages.
METHOD Describes procedures, as agreed with the delegate, and summarizes the key points.	Devise and agree a thorough outline plan that will provide the delegate with a concrete but flexible methodology within which to work.
LEVELS OF AUTHORITY Specifies the range of the delegate's authority and to whom they will report.	Apply autority limits that tell the delegate when it may be appropriate to refer to you, and when they should use their own initiative.

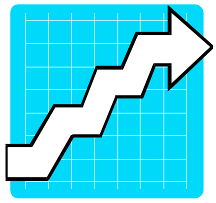
Briefing sessions

The supervisor's task primary at the briefing is to communicate effectively and ensure the delegate's full understanding of the assignment: Explain the task objective clearly and state your expectations in terms of deadlines and levels of measured achievement. Be clear about which areas of the brief are flexible and which must be followed to the letter

Ending a briefing

Draw the briefing session to a conclusion by summarizing the key points of the delegation. End the meeting by thanking your delegate for taking on the task and communicate your confidence that the assignment will be carried out successfully – it is important to emphasize that you have appointed this delegate because you trust his or her abilities. Finally, establish a date for a follow-up meeting to review progress

3.1.2.6 Monitoring progress



Reviewing progress

Once a task is underway, you will need to review its progress and the performance of the delegate. There are a number of ways in which you can keep tabs on proceedings, including face-to face discussions with the delegate, written reports, and personal observations. Choose a system that suits you, is appropriate to the task, and gives you all the informantion you need to review what has been achieved so far. It must also enable you to check that you are on course to achieve the objective and pinpoint any corrective action that may be required.

Avoiding interference

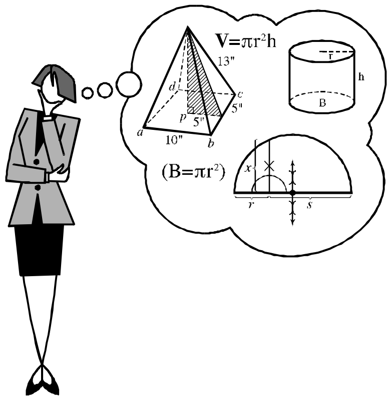
Supervisors who can maintain a distance between themselves and their delegates are more likely to see positive results. Nobody will work in exactly the same way as you, so resist the temptation to intervene the moment you suspect the task is not being performed your way. Instead, set up a system of regular checks, meetings, and reports, wether formal or informal, to ensure that the task objectives are being met. Heavy intervention, in which the delegator makes all the decisions, will frustrate the delegate and deny him or her the chance to gain experience.

Operate on the assumption that every process can be improved.

DO'S	DONT'S
▪ Do encourage all delegates to make their own decisions. ▪ Do move from hands-on to hands-off as soon as possible. ▪ Do intervene when absolutely necessary, but only at that time. ▪ Do ask delegates if they feel thoroughly prepared for their task.	▪ Don't say or hint that you doubt the delegate's ability. ▪ Don't miss any stage in the briefing process. ▪ Don't place seniority above ability. ▪ Don't deny a delegate the chance to learn by interfering to much. ▪ Don't take back a task without a good reason.

3.1.2.7 Analyzing Difficulties

Both the delegator and delegate need to analyze, and learn from, any difficulties encountered during a delegation. The first step towards finding a solution to a problem is to ascertain whether it stems from you, your delegate, the task brief, or procedure.



Questioning yourself

If a delegated task has not been performed to your satisfaction, look first at your own actions. Perhaps you should have kept this particular task to yourself, or been more selective when choosing a delegate. Go over the brief to find out if you could have made it clearer, and examine your monitoring procedures to be sure that they were adequate for the task. Maybe you made yourself too remote, or did not provide sufficient guidance when problems arose. Be as objective as possible in this self-examination so that you can identify and deal with your own weakness.

> Deal with any known difficulties at once.

Questions to ask yourself

- ☐ Was I too hasty in making the appointment?
- ☐ Is there somebody available who would do better?
- ☐ How can I prevent this problem from recurring?
- ☐ What would I do differently if I could start again?
- ☐ What are the delegate's strength and weaknesses?

Looking at Performance

Results alone will not necessarily tell you all you need to know about the performance of a task. More accurate indicators can be gathered from your **feedback sessions** with your delegate, and other **personal observations**. However, remember that you cannot maintain a delegate's trust if you make inquiries behind his or her back. Be open about seeking relevant information from trusted colleagues and inviting comments from those who are affected by the delegation. If any defects come to light, it is your responsibility to take steps to improve the delegate's performance.

Learning from Failure

Knowing how to deal with failure may be as valuable as the successful outcome of the task. Take the opportunity when things go wrong to extract as many useful lessons as possible. Naturally, managers and delegates alike will be tempted to come up with excuses rather than explanations when a failure occurs, but excuses elucidate very little and are usually smokescreens that obscure the reals causes of error. When you have identified a failure, carefully analyze the causes and discuss these with the delegate. Always stress that the sin is not to fail but to make the same mistake again.

> The sin is not to fail but to make the same mistake again.

3.1.3 Successful meetings

3.1.3.1 Participating a meeting
3.1.3.2 Running a meeting
3.1.3.3 One to one meetings

Most managers and supervisors feel they spend too much time in meetings. However, a well-run meeting can be a productive way to communicate.

3.1.3.1 Participating a meeting

If you as a supervisor are a participant in a meeting you are not active in the way you are when you are running your own department staff meeting. But you have to be active as a participant.

Being properly prepared
Usually the manager will ask you to give a report about the situation in your department or want to consult you concerning some problems with customers or the production. You have to be properly prepared for the meeting, otherwise you will hinder a productive and positive outcome of the meeting. You should be able to explain the situation in your department clearly by stating facts and numbers. So it would be good to make written notes before the meeting because you might forget things especially when you are excited about the situation. Take also written notes of the management's recommendations in order to implement them later on. If you are not sure that you got all the important points of the meeting do not hesitate to ask.

3.1.3.2 Running a meeting

When you are chairing a meeting, stay in control of the proceedings, and never let arguments get out of hand.

Preparing for a meeting
When preparing for a meeting, ask yourself four key questions:

- ☐ What is the meeting for?
- ☐ Why is it being called?
- ☐ How will I know if it has been successful?
- ☐ Who should attend?

Theses questions will determine wether the meeting is necessary. All meetings should have a purpose that will be achieved by their end. If final decisions are not made, there should at least be a plan of action. The most effective meetings are usually small with only vital people attending.

Circulate all relevant papers before th e start of a meeting.

Opening a Meeting

After making any necessary introductions, remind all those present of the meeting's purpose, what outcome it is expected to deliver, and when it will end. If there are ground rules, state them straight away. Check that everybody has any relevant papers and that the agenda is approved. If there has been a previous meeting, minutes may need approval and discussion, but do not discuss anything that already features on the agenda. Instead, go straight into the first item, preferably calling upon another participant to initiate the discussion.

Conducting a Meeting

Strike a balance between keeping the discussion process moving briskly forward and ensuring that everyone who wants to speak has a chance to state their opinion. The custom of debating an issue until a decision is made can be time-consuming and lead to tension. To prevent this, act as a timekeeper (make sure you have a watch to hand). Set time limits to discussions so you can end the meeting at the appointed time.

> Make sure you stick to the time limit for each item on an agenda.

Closing a meeting

Allow yourself enough time for winding up a meeting. Summarize the discussion and check that others agree with your account. Make decisions about unfinished business, which may include nominating someone to deal with it, and, finally, run through the implementation of any decisions taken. These decisions determine the actions, which will be the result of the meeting. Assign each action to a person, and attach a time target for completion.

3.1.3.3 One to one Meetings

A meeting with a staff member can be formal or informal. Use one-to-one meetings to check performance and find out if coaching or counselling is needed.

Meeting formally

For formal one-to-one meetings the rules are the same as for any other meeting. Get to the point quickly, stick to the agenda, sum up at the end, and make sure that the other side agrees with the summary. In any one-to-one meeting the relationship between the supervisor and subordinate has a tendency to move into one of dominance and submission. To make meetings productive, listen to the other person, aim for rational discussion, and be courteous. Remember that a certain degree of confrontation may be perfectly healthy – and also unavoidable.

- ☐ Try to meet staff for formal one-to-one meetings at least monthly.
- ☐ Stick to an agenda, and make sure you agree on any decision.
- ☐ Remember to listen to what is being said, and do not dominate the meeting.

Being prepared

For regular meetings, preparation can make all the difference between a satisfactory or unsatisfactory outcome. Some companies stage one-to-ones between supervisors and subordinates every month to discuss any problems, define objectives, and deliver written performance reviews. For these one-to-ones, the supervisors distribute the reviews a few days beforehand. This preparation time gives the staff a chance to consider their response.

Coaching Staff

Good managers must be good coaches who know how to encourage staff to raise their performance at work, improve their knowledge, and realize their full potential. Coaching is inherent in the whole management process and should not be confined simply to performance reviews and annual appraisals. As a supervisor, take the initiative by setting staff goals, by regularly encouraging staff to achieve higher standards, and by discussing any strength or weaknesses. As the people being coached gain in confidence and performance, they will take on more responsibility for setting personal targets for improving at work.

> Listen to your staff. Coaching and counselling may provide solutions to discontent.

Counselling Staff

Problems that arise either from work or from personal life can be helped by counselling. But unless you are a trained counsellor or have considerable experience, leave this to a professional, who will help people to confront and resolve their problems. If an employee has become unhappy over a situation, offer to arrange a counselling interview, and be sympathetic. The counsellor will try to help the individual get to the root of any problem. Give practical support when you can.

3.1.4 Motivating people

3.1.4.1 What is Motivation

Defining Motivation

Motivation is the will to act. It was once assumed that motivation had to be injected from outside, but it is now understood that everyone is motivated by several differing forces. In the workplace, seek to influence your staff to align their own motivations with the needs of the organization. To release the full potential of employees, organizations are rapidly moving away from **"command and control"** and towards **"advise and consent"** as ways of motivating. This change of attitude began when employers recognized that rewarding good work is more effective than threatening punitive measures for bad work.

Motivating long term

Self-motivation is long-lasting. Inspire self-motivated staff furtherby trusting them to work on their own initiatives and encouraging them to take responsibility for entire tasks. Highly motivated individuals are vital to supply organizations with the new initiatives that are necessary in the competitive business world.

3.1.4.2 Recognizing Needs

Satisfying Basic Needs

A well-known psychologist developed a "two-factor" theory for motivation based on **"motivator"** and **"hygiene factors"**. Hygiene factors – basic human needs at work – do not motivate but failure to meet them causes dissatisfaction. These factors can be as seemingly trivial as parking space or as vital as sufficient holiday time, but the most important hygienic factor is finance. A manager should try to fulfil staff members' financial needs. People require certain pay levels to meet their needs, and slow income progression and ineffective incentives quickly demotivate. Fear about lack of security in a job also greatly demotivates staff.

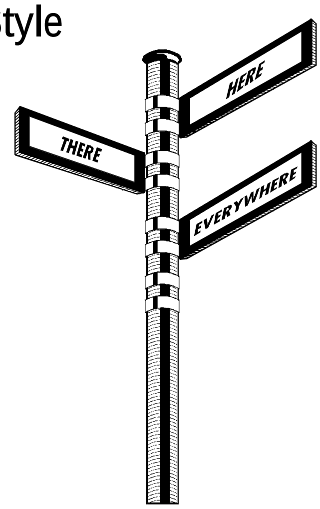
Ensuring Motivation

The second factor is a set of "motivators" that actually drive people to achieve. These are what a manager should aim to provide in order to maintain a satisfied workforce. How much a person enjoys achievements depends purely on its recognition. The ability to achieve, in turn, rests on having an enjoyable job and responsibility. The greater that responsibility, the more the individual can feel the satisfaction of advancement. Motivators are built around obtaining growth and "self-actualization" from tasks. You can raise motivation in your staff by increasing their resposibility, thereby "enriching" their jobs.

Heightening Workplace Motivation

MOTIVATORS	WHY THEY WORK
ACHIEVEMENT	Reaching or exceeding task objectives is particularly important because the "onwards-and-upwards" urge to achieve is a basic human drive. It is one of the most powerful motivators and a great source of satisfaction.
RECOGNITION	The acknowledgement of achievements by senior staff members is motivational because it helps to enhance self-esteem. For many staff members, recognition may be viewed as a reward itself.
JOB INTEREST	A job that provides positive, satisfying pleasure to individuals and groups will be a greater motivational force than a job that does not sustain interest. As far as possible, responsibilities should be matched to individuals' interest.
RESPONSIBILITY	The opportunity to exercise authority and power may demand leadership skills, risk-taking, decision-making, and self-direction, all of which raise self-esteem and are strong motivators.
ADVANCEMENT	Promotion, progress, and rising rewards for achievment are important here. Possibly the main motivator is the feeling that advancement is possible. Be honest about promotion prospects and the likely tirmescale involved.

3.1.4.3 Assessing your own Management Style



It is important that you understand your attitide towards your subordinates. Your thinking will be influenced by your experience, and will shape the way in which you behave towards all the people you meet.

Knowing your style

The forces that drive managers will strongly influence motivational behaviour. It is important, therefore, to understand your own assumptions and priorities, paying paritcular attention to your personal and corporate ambitions, so you can motivate others effectively. If you put your job first, you are probably highly motivated and know your career will benefit from success. Success is not just about meeting task objectives, but also about building an efficient, creative team that will succeed even in your absence. For this, a "share-and-collaborate" style may be more effective than an authoritarian "command-and-control" method.

Evaluating your Tendencies

Theorist Douglas McGregor defined two sets of management styles, which he labelled Theory X and Theory Y. Theory-X managers believe their staff respont mainly to the rewarding carrot and the disciplinary stick. Theory-Y managers believe their staff find work a source of satisfaction and will strive to do their very best at all times. Most people are not entirely X or Y, but fall somewhere in between. The X and Y theories apply not only to individuals but to organizations as well. Theory-X managers and habits will often be found in Theory-X organizations, and vice versa. Study the statements below to judge which of the theories best describes you and your organization.

THEORY X

- ☐ If I did not drive my people constantly, they would not get on with their work.
- ☐ I sometimes have to fire somebody or tongue-lash them to encourage others.
- ☐ Leaders have to lead by taking all key decisions themselves.
- ☐ I find that most people are unambitious and must be forced to raise their sights.
- ☐ I keep my distance from the team since it is necessary for effective command.

Managing by Theory X

A typical Theory-X manager is likely to keep away from his or her workforce much of the time. In fact, the only time the two meet is when orders or reprimands are to be given.

THEORY Y

- ☐ If somebody falls down on the job, I first ask myself what I did wrong.
- ☐ I should sometimes take a back seat at meetings and let others take the lead.
- ☐ If I ask someone for their opinion on an issue, I try to do as they suggest.
- ☐ People should appraise their bosses as well as be appraised by them.
- ☐ Anyone can have creative, innovative ideas if they are encouraged.

Managing by Theory Y

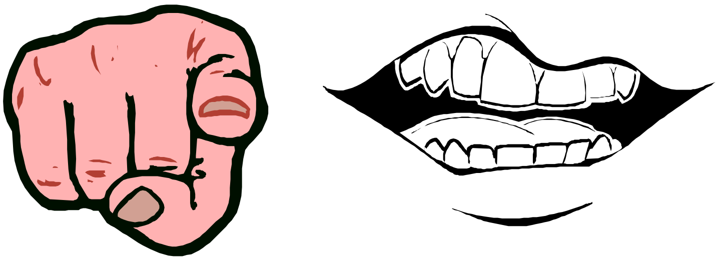
Collaborating with staff over decisions to be made, and getting feedback before implementing decisions, are traits that tend to be typical of a Theory-Y manager. This approach is often more motivating than that of Theory X.

Managing to Motivate

An essential foundation for motivation is a positive workplace environment created by you , the supervisor. Employees have the right to expect fair treatment and understanding. They also expect professional competence, part of which includes delegating tasks in order to increase staff members' self-management and participation.

Establish a system that is constructive – not obstructive – in which people can hope to perform at their best.

3.1.4.4 Creating a no-blame culture



Anyone with responsibility – including yourself – must accept their failures. However, to motivate effectivly you need a culture in which no blame is laid for failure. Errors should be recognized, then used to improve changes of future success.

Learning from mistakes

The lessons of failure are valuable, not only to the individuals involved, but also to the organization. Discuss the reasons for failure, so that you can eliminate them and strengthen the platform for success. Taking a constructive and sympathetic attitude to failure will motivate and encourage staff. If you choose to punish failure or motivate by fear, you will not create lasting success. Make it clear that tolerance of error has its limits. Repetition of the same error is inexcusable, since it shows failure to learn from mistakes.

Repetition of the same error is inexcusable, since it shows failure to learn from mistakes.

Using action review

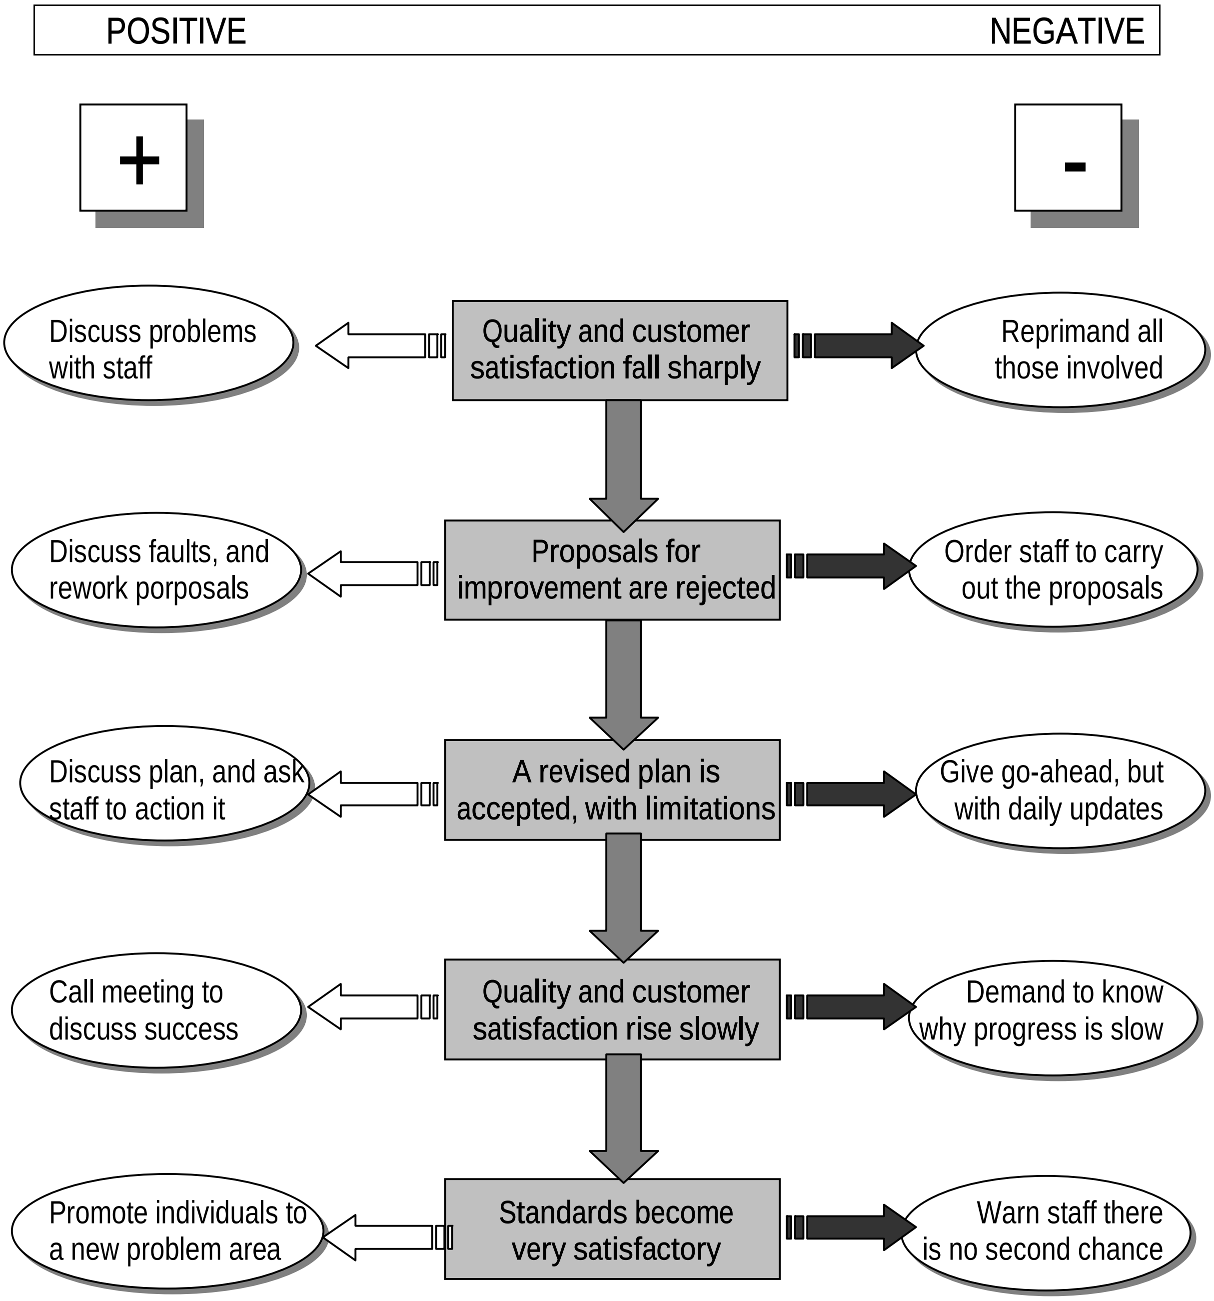
Action review is the process of systematically reviewing the success or failure on any project in order to learn from mistakes. The selected participants in the review agree on the lessons to be learned. These are put on record and circulated to everyone involved in the project, helping to establish what went right and what went wrong, and the reasons why. Use action review to inform staff what they should and should not do in futrue, and to spotlight the parts of the system that are in need to reform.

Be firm but fair when you are drawing attention to error, and do not pull any punches.

Questions to ask yourself

- ☐ What precisely went wrong, when and where?
- ☐ What were the root causes of the failures?
- ☐ When were the deviations first signaled?
- ☐ Why were the warning signals not acted upon?
- ☐ What could have prevented the failures from occuring?

Solving problems without attributing blame



3.1.4.5 Winning Co-operation

The basic component of a motivational environment is co-operation, which you must give to your staff, as well as expect from them.

Helping Staff

Two key motivational questions to ask your staff are:

- "What do I do that stops you from doing a better job?"
- "What should I do to help you perform better?"

If you co-operate by acting on the answers, for example by investing in new tools or training if requested, you can bring about major improvements in motivation. Not acting on such feedback will demotivate. The prime objective is to **help staff to help themselves.**

Moving Control Levels

Levels of control vary from an insistence on checking and approving every action, to laissez-faire, in which people are free to perform as they wish and be judged only by the results. Increase motivation by moving towards less rather than more control. To do this, discuss and agree tasks, objectives, and methods beforehand, then allow the implementation to proceed independently, subject only to reports on progress and major deviations. In case of problems, do not blame, but consider potential remedies.

> Do remember that the best discipline is self-discipline.

Taking an overview

When analyzing staff motivation, stand back and look at the overall situation. Do not concentrate solely on one set of needs – wether they be team, individual, or task needs. Think about atmosphere, team complaints, and results achieved. Above all, ask a lot of questions – you will then form a picture of how the system operates and how well it works.

Using free incentives

Free or easy-to-supply incentives are a simple and essential way to win and maintain co-operation. Start by thanking people for a job well done, and follow this up with a written acknowledgement. It comes hard to many managers, but is an essential counterweight to criticism. Other ways to increase co-operation include acknowledging staff achievments publicly and holding specific meetings for the purpose of boosting morals. Be friendly and polite at all times – bad manners demotivate – and deal sympathetically with personal requests, such as time off for a special purpose. Play the helpful friend, not demanding employer, in these circumstances.

Working conditions

When we are talking about winning the co-operation of the workforce we should not forget about what the company should provide to create a proper working environment. A proper workplace shows the staff that you value them and will increase their co-operation. Ask yourself the following question about the workshop situation and try to improve until you reach the proposed conditions. Formulate similar questions for other workspaces such as packaging area, administration office, etc.

- ☐ A safe working space is compelling. Do they use in the machining section fences and guides, proper jigs and other safety equipment?
- ☐ Does the finishing section provides masks to keep the workers from inhaling fumes and dust?
- ☐ Is proper lighting be provided?
- ☐ Is the workshop floor out of concrete and are you able to use trolleys for the workshop internal transport?
- ☐ Is the workshop cleaned daily and as dust free as possible?
- ☐ Are the machines maintained regularly by a mechanic?
- ☐ Has the workshop a dust exhaust for the machines?
- ☐ Are the tools organized in a tool room and are they kept sharp all the time?
- ☐ Does the company provide good quality raw materials or is it the cheapest available?
- ☐ Is there an existing production administration system implemented? Do you use Routing Sheets, Cutting Lists, Drawings, and Samples to speed up the production?

Asking for suggestions

The result from one survey showed that in the typical company only 4 per cent of the ideas for improvement ever reach the top. Do not let that happen. Invite suggestions via a suggestive box, or hold brainstorming meetings. Respond positively to all volunteered ideas. Use marketing devices such as "Idea of the month" to recongnize and encourage good contributions. If at all possible, accept each suggestion, even if it must be modified. If you must reject any ideas, explain to the staff why – and do it with sincere regret.

Using Individual Efficiency Projects

When you find a suggestion that you are keen to implement, allow the person from whom it came to see it through to fruition. The idea behind this action is that the staff member whose suggestion it was is likely to have the most enthusiasm for it and be very motivated to ensure that it is a success. He or she should be free to delegate the whole task or any of its parts, but it remains their responsibility. Use this as one of your chief motivating factors when requesting suggestions from your staff and you are likely to be much encouraged by the increased enthusiasm that will result.

3.1.4.6 Dealing with Demotivation

The course of people management seldom runs smooth, and emotions often run high on both sides of the process. The most valuable technique you can use for preventing demotivation is a sympathetic and understanding human response.

Identifying causes

Demotivation must first be analyzed before you can do anything about it. It may be caused by stress, emotional problems, or physical illness. Alternatively, there may be something wrong with the job itself, or with the person's approach to it. Talk to the demotivated person in order to identify where the problem lies, and tailor the remedy to the cause, for example by arranging secretarial help for someone who is overworked.

Tackling Problems

Personal difficulties and workplace problems are both potential causes of demotivation at work. Never ignore your staff's emotional strains, even if performance is going well, because there is a high probability that the personal troubles will eventually affect work. Your first responsibility must be to the job. At the same time, you must also look after the individual. Approach emotional upsets in the same way as workplace difficulties. First, get the problem clearly defined, then seek the root cause. See if there is a solution that the individual will accept. If so, act upon it. It is important not to let the situation worsen. If you are unable to provide enough help, make sure that you find someone who can.

Encouraging Teamwork

When team members of your staff seem to be constantly at loggerheads, masterly tact is usually required to replace the element of confrontation with collaboration. One course of action is to move the couple into a larger team, insisting that they co-operate with and not ignore each other. Another approach is to have the two people swap roles for a while, so that they can gain an understanding of each other's workload. If all else fails, separate the two warring parties permanently to avoid disrupting the work of the entire team.

3.1.5 Discipline

3.1.5.1 Rules and regulations

The "Rules and Regulations" of your company is a very important tool to keep up work discipline. When you start your job as a supervisor, get a copy of the rules and regulations and read them carefully! Go to the staff department and discuss the contents and the routines with the responsible managers. Sit down and “translate” them into terms the workers can easily understand. Conduct a meeting with the workers and explain the rules and the consequences of possible misbehavior. Clarify with the workers that once they sign the working contract with the company, both parties agree to certain terms, which should be binding for both parties.

Give them examples!

How much money does it cost the company if
50 workers come 30 minutes late 20 days a month at an average salary of 150 Peso/day?

8 hours x 60 minutes = 480 minutes a day
150 Peso / 480 minutes = 0.3 Peso / minute

0.3 Peso / minute x 30 minutes late x 20 days / month x 50 workers = <u>9000 Pesos / month</u>

Productivity is lower because the attendance per day is only 94 % instead of 100 %.

3.1.5.2 Disciplinary Action

Check with the staff department on implementation guidelines and forms for disciplinary action. Keep written proof of misbehavior. Ask the worker for a one on one discussion and:

- Describe the performance problems and review past discussions and reminders
- Ask for reasons for the situation and listen openly to the employee's response (do not get involved too deeply into personal problems because you will loose your objective position).
- Indicate what kind of disciplinary action you must take, and explain why
- Discuss and agree on ways to improve the workers performance and set a follow - up date
- Ask the employee to summarize the discussion in order to find out whether he takes the situation seriously and whether he understood the problems
- Indicate your confidence in the employee's ability to improve and give hints on how to do so.

Your role as a supervisor is to be a **mediator** between the workforce and the management. You have to stay objective. Leave personal emotions out of a meeting like that.

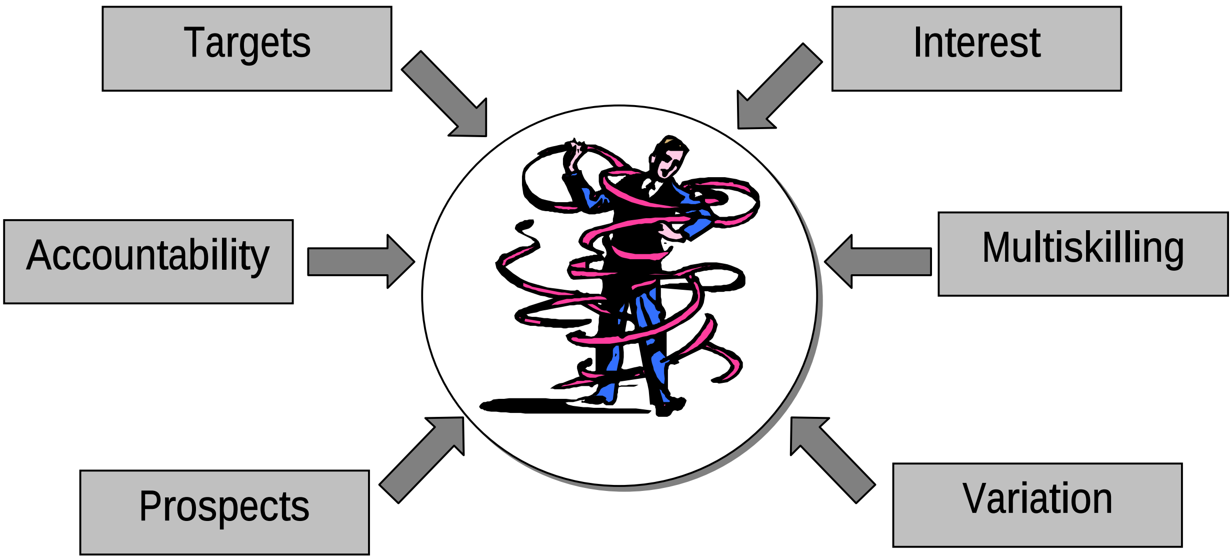
3.1.6 Rewarding performance

3.1.6.1 Evaluating each job
3.1.6.2 Appraising effectively
3.1.6.3 Rewarding exceptional preformance

3.1.6.1 Evaluating each job

Before you can start to evaluate the performance of somebody in a job, you have to find out about the features of the job and if these features are still appropriate. Conduct a thorough evaluation of all aspects of each job and the way you measure performance before you start appraisals.

Defining performance
Every job has its own skills, necessary knowledge, and attributes, so be sure to know and to specify them. Whatever level of job you are looking at, it should be of interest and give satisfaction to the worker. Including the factors below will help to make any post more appealing in the long term and motivate the job holder to perform more effectively. Check each job if the different areas are covered or if you have to make adjustments.



Another part of the process of evaluating an exsisting job involves looking at past performance levels and deciding what new qualities or tasks are needed to improve them. Arriving at a single measure of performance is difficult. Financial results are the best all-inclusive measure, but do not rely solely on them, since they will convey the wrong message – that only profit counts. To measure quality, rather than just quantity, include staff morale, customer satisfaction, inter-team collaboration, and other specific areas.

Using grading systems

Your organization may run its job and reward system in a rigid, graded way. And you may be in a situation where almost all of the factors are outside of your control. If that is the case, make the most of the rewards that you are able to distribute. If you are in a position to make such decisions, remember that grading jobs and their occupants, and assigning to each grade a salary band may be useful. Aim to keep the number of grades as small as possible, the pay bands as wide as possible, and the importance to staff of the grading system as low as possible.

Regard grading systems with caution – not as sacred.

Putting the job first

The key point to remember when evaluating jobs is that the job is more important than the grade, which is merely an administrative convenience. The lure of rising one or two grades may well be motivational, but rules for how many grades staff can advance at any one time, or stating that "a lower grade cannot be the manager of a higher grade" are nonsensical and unnecessary. Get the right person for the right job, and make it clear that the grade goes with the job, not vice versa.

3.1.6.2 Appraising effectively

The true objective of appraisal systems is not to blame, reward, or praise, but to develop. In some progressive organizations, the appraisal is not labelled as such, but is called a "personal development plan" or something similar. Conduct your appraisals properly, and you will help people to form an objective view of their past performance. More importantly, you will also be equipped to encourage better staff performance as well as to enable and assist the interviewee to take on greater responsibility in the future.

Discussing weaknesses

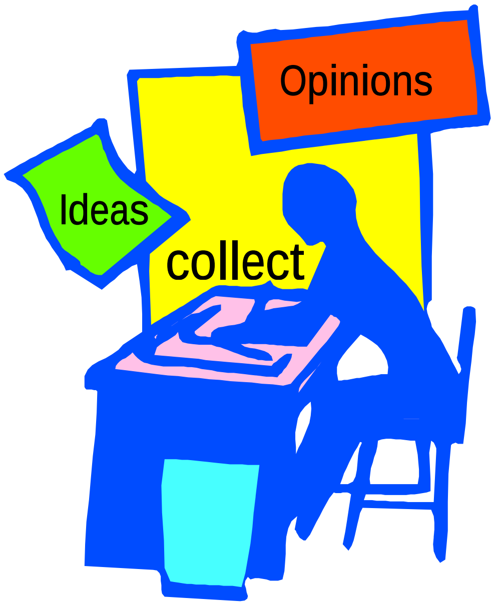
In appraisals, emphasize what the people being appraised have done well – their strength. You must, of course, also remark on and discuss their weaknesses, but only for improvement´s sake. Eliminating weaknesses strengthens performance. It is not just staff performance that should be discussed. How does the person being appraised perceive the contribution of the appraiser? Has the supervisor been helpful and motivating throughout the year? If not, the appraiser has just as great a responsibility to improve performance as the others.

Questions to ask your staff

- ☐ Can I do anything to help you to perform better?
- ☐ Am I doing anything that hinders your performance?
- ☐ What do you see as your key strengths and weaknesses?
- ☐ Have you any ideas about how you can improve or develop yourself as a team member?
- ☐ How could your job or the system be improved?

Listening to opinions

Appraisal interviews provide a chance to talk widely over external and internal matters, so do not confine them to issues of personal performance. Remember that all employees are sources of ideas and opinions. Discuss these throughout the year, not just at appraisals. Note the ideas and opinions that you think the company could benefit from, and consider implementation. The appraisal is ideal for constructive question-and-answer sessions, and you, as the suppervisor and appraiser, should do more listening than talking.



Following-up after appraisals

The fact that formal appraisals tend to take place annually does not mean that appraisal is a once-a-year-only process. In particular, the formal appraisal contains elements that need to be followed up more regularly – perhaps monthly or quarterly. For instance, if a weakness was diagnosed, and training followed, has this been effective? Is the person now confident with that element of his or her job, and able to use the new-found knowledge effectively at work? Follow up any interpersonal problems on a quarterly basis. Such follow-up is essential for maintaining the high level of motivation that the appraisal should have triggered. If an appraisal did not motivate, use the follow-up to find out why, and how to get better results.

Developing ability

Write a list of the key qualities that are needed for a particular task, and assess how they match the qualities of the jobholder. If you feel there is a mismatch – especially one that is likely to cause demotivation – do not reallocate the task, but take immediate action to develop the missing attributes. Abilities are learned, and rarely inborn. In almost every case it is possible to be taught a necessary skill, and where abilities are weak they can nearly always be developed. If you feel certain qualities need to be acquired, be sure to provide the training.

Evaluate strengths and weaknesses → Ensure job makes full use of strengths → Provide training to improve weaknesses

3.1.6.3 Rewarding exceptional performance

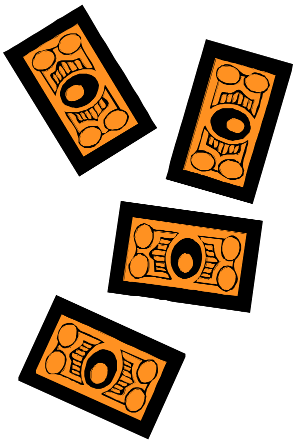
Defining exceptional performance
The term "exceptional performance" is not a fixed, scientific measure. It varies from task to task, and job to job. As a supervisor, it is important that you recognize and reward what you consider to be genuinely exceptional. To do this, carefully work out, and fix solidly, the levels at which both financial and non-financial rewards are triggered off. Seek to ensure not only that good work gets good rewards, but also that top standards are not so high as to be impossible to achieve.

Offering non-financial rewards
Achievement is its own reward – but it is never enough. Achievers also want recognition. Even a simple "thank you" is an important, underused reward that costs nothing. Staff also value inclusion in events like away-days to discuss company strategy. Such events fit into development programes that are central to sustaining job satisfaction, increasing responsibility, and enhancing career progress and personal growth. Other non-financial rewards such as gifts and holidays may prove cheaper than cash rewards – and everyone loves to receive presents. However, these provide less motivation than individual recognition, and are not substitutes for good, year-round management.

Considering non-financial rewards

REWARD	FACTS TO CONSIDER
RECOGNITION Handwritten note, engraved trophy	An often overlooked form of reward that is personal as well as being effective in both the short and the long term.
GIFTS AND PRIVILEGES Holidays, sports facilities, merchandise	Immediate, and stimulating in the short term. May not meet long-term motivational needs.
SPECIAL EVENTS Weekends away, parties, gatherings	Involve staff from all levels. Can stimulate, relax, bond, and motivate staff.
PROFESSIONAL TRAINING On- or off-site courses	Effective, focused training brings high returns. Company gains a qualified employee, who feels valued.
SELF-DEVELOPMENT Personal, non-vocational training	Very high motivational value. Enhancing self-image raises performance level at work.
EQUIPMENT Company car, lap-top computer	Expensive equipment is highly motivational. Need to ensure that equipment is fully utilized.

Offering cash rewards



Use rewards in the form of pay increases or financial benefits to recognize achievement, prevent a high-flying staff member from leaving the company, or encourage an individual to take a greater level of responsibility in his or her job. Remember, however, that this type of reward often has only short-term motivational value. It can also lead to resentment among other staff members, and discourage interaction within a team.

Considering financial rewards

REWARD	FACTS TO CONSIDER
SALARY INCREASES Increases in basic rate of pay	Money is a powerful short-term motivator: the bigger the rise the higher the motivation. The impact wears off relatively quickly.
COMMISSIONS AND BONUSES One-off payments linked to targets	Increases motivation and job satisfaction. There can be difficulties in fixing rates and relating these rewards to base pay.
PERFORMANCE RELATED PAY Regular wage increases based on target-linked performance	Is motivational and can be a tax-effective incentive. There may be a delay between earning and receiving PRP, therefore weakening its impact.
SHARES/STOCK OPTIONS Gifts of shares, or the chance to buy shares at a fraction of actual value	Encourages long-term loyalty and sense of involvement. Reward is not immediate, and initial benefit may be small.
SPECIAL RATES Help with mortgage/rent, insurance, and other items.	Has considerable staff-retention value and can act as "golden handcuffs". Has low motivational value.
FAMILY HEALTH BENEFITS Paid or subsidized schemes offering privat family health care	It is in an organization's interest to have healthy staff. Has low motivational value as healthcare provision is increasingly expected from companies.

Celebrating success

Personal thanks for exceptional performance are powerfully reinforced by being repeated or given at a public celebration. Celebrate success, and you can motivate everybody in the unit, not just the achiever. External awards and dinners have proliferated, and few industries are now without them. Pay for entries and tables at these events, and make a fuss of any winners. The same format applied internally is also effective. If a whole team, rather than an individual, is involved, celebration is highly appropriate. Parties give you the chance to motivate by words and by singling out special contributions. Ensure that any event of this type is carefully planned and well staged. Skimping on any element, especiallly on catering, is a false economy in terms of motivation.

3.1.7 Training and developing the staff

3.1.7.1 The importance of training

Training helps to improve the technical skills of team members and develop the managerial and interpersonal relations within a unit. Review and upgrade the skills of a unit constantly to meet current and future challenges successfully.

Assessing costs

Despite the expense involved in training, it is cheaper than the cost of persisting without it, which will damaging the performance. Calculate the costs of training, including training staff, materials, room hire, course fees, subsistence, travel, and loss of work hours. Weigh up these costs against the expected financial gains and improvements evident in team performance following training.

Training unit members

When trying to optimize the various skills in a unit, involve the whole unit/team in planning its own development. The aim is to reinforce the strengths and eliminate the weaknesses of all the unit members, and develop those skills necessary to seize future opportunities and see off any threats. Discuss these aims with the whole team, draw up a training plan, and work out with each individual what his or her own needs are now and what will benefit projects and the unit as a whole in the future. It is ineffective and demoralizing to delegate a task to someone who lacks the necessary skills. Never place people in new or changed roles without first providing the training they need, and always keep the option of further training available. Always build delegation on a foundation of on-going training at all levels so that suitably qualified people will be available whenever you need them.

> Listen to the feedback given by trainees about training courses.

Training leaders

As a supervisor, you should be exemplifying the qualities necessary to manage a unit/team successfully. Ensure that you receive the requisite training to develop prioritizing, process-chasing, delgation, and motivating skills. Make these an integral part of your personal development plan, and ensure that unit members – especially your sub-leaders – also develop their own leadership skills. Listening carefully, criticizing constructtively, being tolerant of error while correcting mistakes, and retaining objectivity are leadership qualities that members should use within a team and in future projects.

> Set an example to your staff by being trained yourself.

3.1.7.2 Developing a training plan

Since you want to get the best out of your staff you should think about training and developing them in a structured and planned way. You as a supervisor can not do it alone, you need the co-operation of the HRD department and the top management. Formulate well planned proposals and emphasize on the advantages of a successful training program.

Informal training

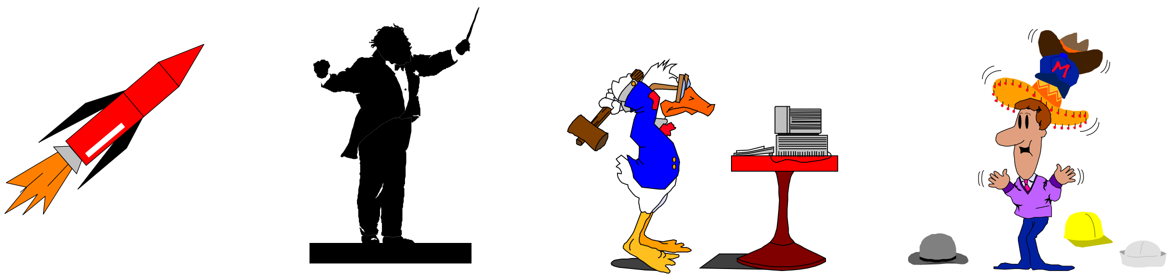
You can develop your staff in informal training, meaning to say you train them within the production while you assign a job to them. This training has the advantage that you can take care of each worker by himself. On the other hand communication is not so easy because of the noise in the workshop. Mostly you will only have time to show him HOW something works but not WHY. When it comes to the next assignment you might have to start from zero again. To avoid this, you have to use a specific training method that assures a good and long-term training effect. We call the method the Four-Step Method, which will be explained in the following chapter.

Formal training

On the long run your staff development will be more efficient if you try to introduce some formal training to your department / company. A formal training will be done either through you or part of your more experienced staff in a planned and organized schedule or mostly through other training institutions.

- ☐ Before you can actually start with a formal training, you should evaluate the staffs strengths and weaknesses in order to know WHAT you should teach them.
- ☐ Try to classify the staff in each training relevant area into three different skills levels (Beginner, Advanced, Experienced) and make training plans according to these results.
- ☐ Talk to the HRD department and the management about time and a room to conduct some of this formal training for the three different levels on a Saturday or as evening classes.
- ☐ Do not put all staff members into one class because the experienced ones will be bored and the beginners will be overcharged and can not follow your explanations.
- ☐ Accompany the theoretical lectures with some hands-on practices in a quiet workshop.
- ☐ Try to convince the HRD department to introduce a company internal grading and certification system. At the end of a “Circular Saw Training Module” the worker should undergo a hands on exam and if he passes should receive a certificate as a “Circular Saw Operator”. This system should be accompanied as well by some incentives, workers who undergo these training and take them seriously should be acknowledged. Try to convince somebody from the management to hand out the certificates to stress the importance of the program.
- ☐ Make a Manpower Development Plan with HRD to send some staff members to Training Centers, especially if you do not have time and facilities to conduct training in your own company.
- ☐ Be serious about the training and explain it to your staff according to that. While courses are conducted, discipline, attendance and active participation should be valued very high

3.1.7.3 Effective teaching with the 4-step method



1. 2. 3. 4.

The informal training in a company to teach technical or handicraft skills of any kind should be done in an appropriate way to ensure a successful impact. There is a special method for this kind of teaching that was developed by taking into consideration the principle of learning of the human being. This method is taught in Germany and many other countries to mastercraftsmen to equip them with a proper knowledge to teach effectively and successfully. You have to break down each working process in very small steps and make a kind of work analysis that will help you to apply the four-step method. You find a form for the work analysis on page 47.

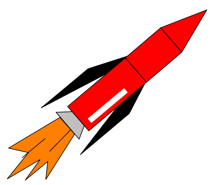
The four-step method

Learning is not only done by explanation but also by imitation, repetition and exercise. To manifest the learned topic in the long term memory you have to concentrate on all of these parts to assure a positive result. The four steps are the following:

1. Step: Preparation of the trainee
2. Step: Demonstration and explanation
3. Step: Trainee activity
4. Step: Exercising and strengthening

<u>1. Step: Preparation of the trainee</u>

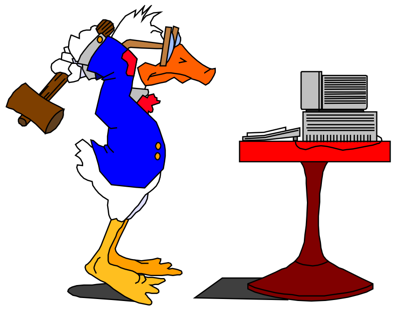
- ➔ Take the shyness
- ➔ Motivate
- ➔ Show the ojvectives and tasks
- ➔ Evaluate the knowledge
- ➔ Familiarize with the working place
- ➔ Give advices concerning safety



2. Step: Demonstration and explanation

- ➔ Place the trainee so that he is standing in the same direction to the workpiece than you.
- ➔ Demonstrate the whole procedure in the original time.
- ➔ In case of complicated procedures devide them into modules and teach them step by step.
- ➔ Repeat the demonstration and make the single steps visible
- ➔ Say **what** you are doing, **how** and **why** you are doing it in that way.
- ➔ Give the opportunity to ask questions.

3. Step: Trainee activity



- ➔ Enhance the trainee to try it on his/her own.
- ➔ Don't interrupt the trainee in his/her first attempts.
- ➔ Make comments on serious mistakes.
- ➔ Precision is more important than speed.
- ➔ Let the trainee say **what** he/she is doing, **how** and **why**.

4. Step: Exercising and strengthening

- ➔ Give enough time to exercise.
- ➔ Acknowledge progress.
- ➔ Control that no mistakes are done during the process.
- ➔ Change the conditions of exercising.
- ➔ Slowly adapt to real working conditions.

How to break down a working process

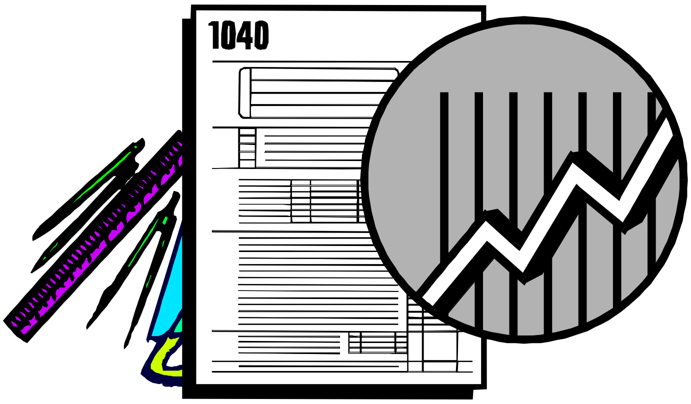
3.2 Analysis Skills

3.2.1 Planning a process



3.2.1.1 Determination of goals

Before we can start with the planning of the production we have to determine the goals we want to achieve. Normally you will do that first with the management, most of the time they will give you the production numbers (goals) to achieve in one day, week, month. Study the given information like technical drawings, bill of materials, etc. carefully.

You have to consider some aspects for the determination of your goals:

Output of the production	=	number of items to produce in specific time
Quality and workmanship	=	determine the quality of the product in relation to the time available and the requirements of the customer
Cost and Budget control	=	consider the costing when you produce an item, production time and quality are relevant

Clarify these aspects before you start your production planning in order to achieve the right output before the deadline, in the right quality and within the cost frame.

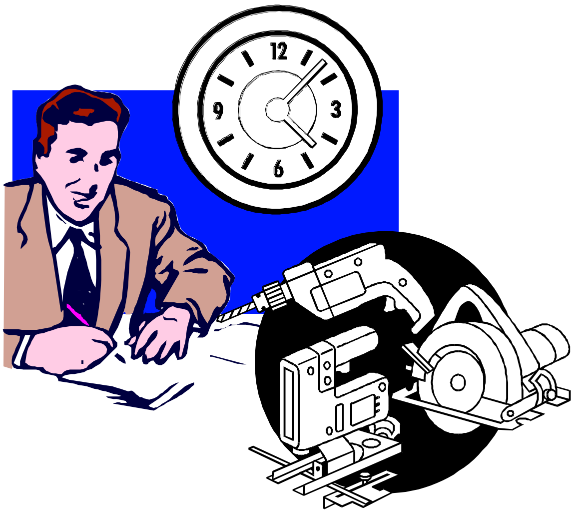
3.2.1.2 Plan the accomplishment

Now that we have predetermined the goals to achieve we have to ask: “How can we achieve these goals?”
You have to think about some given facts before you can continue:

- How many skilled workers do I have to do the job?
- Which machines / tools are suitable for the job and are they available at that time?
- Which jigs are necessary and are they available or do you have to prepare them?
- Are the right materials available / prepared for the job? (Contact Lumberyard, Machining)
- In a small company you even might have to do the costing, so you need the necessary data like material prices, available dimensions and machine hour rates.

With this information and the drawing etc. you are able to start the planning of the production for the next period. Discuss it again with the manager if the production goal is too high, be specific, have facts and numbers when you talk to him.

3.2.1.3 Development of Plans and Actions



The implementing stage

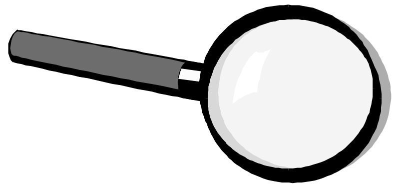
After you gathered all the data, you should be able to proceed with your planning to the implementing stage. You have to prepare for example routing sheets where all the **processes** for a certain work piece are described. You state as well the **equipment** used for each process, plus the **estimated time** for the process. Depending on your system you can determine the workers on the routing sheet as well. This way it is easy to utilize the manpower properly and you can inform the workers easily about their daily duties.

The use of a production plan

In a normal workshop you do not have only one order at a time but maybe three to four, so you have to make a production plan in order to coordinate the different orders with each other because they have different deadlines, materials, need different equipment and manpower. You are the one who has to know at which stage each order is. This production plan can help you when you have to consider changes in your production line and the timing of deadlines. A proper production plan makes the discussion with the management much easier. When you start making a production plan, try to incorporate your best workers into this process because they have the most practical experience and good judgement. Try to update the production plan daily to make the most use of it. Check for “bottle necks” in your production line, machines like circular saw and spindle molders are often overloaded with work and the whole production line has to slow down because of one machine. Try to think of alternatives like: second shift for special equipment, different production processes where different equipment is used, more manpower in certain sections.

3.2.1.4 Controlling and Review Procedures

Controlling is the work a supervisor performs to assess and regulate work in progress and to assess the results secured. In order to do so, we have to be able to establish some activities to analyze this progress:



Setting Performance Standards

Before we can actually evaluate performance we have to set some standards and criterias to be able to do so. (Example: 2500 Table legs, Model # 23432 in 100 hours production time in the quality of the sample given to the customer). Try to set a quality standard for each specific product. This is especially true if you were sending a sample to the customer. Once the customer accepted the sample, you have to keep this quality standard and you can not send him products with a lower standard. If you have a Quality Control Department in your company, try to work together with them, so that you know all the quality factors before you start the production of the item.

Measuring Performance

After setting the standards we can now record the results of the worker or production line. (After 50 hours production time, only 500 legs are finished, quality is lower than the sample).

Evaluating Performance

Now that we have our actual production results, we can compare them with the standards from before and we will find out whether we reached our production goals or not. (Evaluation compares standards with results: 500 legs finished after 50 hours = lower than the standard, quality is not as good as sample = lower than standard).

Taking Corrective Action

You have to take corrective action especially if you do not reach your production goals, meaning your production is too slow, the quality too low, etc.. Controlling and review procedures are essential for the implementation of plans. Without them you will never be able to tell whether you could accomplish the goals or not. The above mentioned production plan is already one very important tool for controlling because you can follow the production process on it and you can identify bottle necks and other problems.

How can you make your production faster?

- ➔ Training of workers
- ➔ Better machines and equipment
- ➔ Use of jigs
- ➔ Identify bottleneck in the production
- ➔ Allocate materials for each order right in time

If you are involved in costing, establish a proper post calculation process in order to check on the accuracy of your costing. Check on the physical accomplishments (number of work pieces, in specific time, in a certain quality) of the workers, it is an important thing to know about the efficiency of each single person in the production line. The easiest way is to evaluate a worker's data from his punsh card and the routing sheets.

3.2.2 Improving a process

3.2.2.1 The principle of continuous improvement
3.2.2.2 The process of contiuous improvement
3.2.2.3 Case study: Shortening customers' telephone waiting time
3.2.2.4 The idea of Total Quality Management

3.2.2.1 The principle of continuous improvement

Usually you look for a problematic area in your production to improve the working process. When the cause of a problem has been identified, and a "cure" found, it must be implemented and evaluated once again, to confirm that the solution is working. If not, the analysis starts once again. But if the cure was the right one and the problem was solved you stop thinking about it and consider it as a solved problem. That was the traditional way of handling situations like that. If you want to implement the idea of "continuous improvement" in the company your way of thinking has to change.

Reasons to implement
You might ask, if a problem has been fixed, why can't it be checked off the list of things to correct, and fogotten about? Because nothing is static: suppliers may change some aspect of their materials; equipment may develop problems that, however slight, affect output; technology may be upgraded, requiring new and different training, and so on. A modern company which considers Total Quality Management (TQM) should allow for this **ongoing cycle of continuous quality improvement**, a concept that Japan has been using for a long time but which is still quite a revolutionary idea to most western organisations.

Learning from the Japanese
The principle behind the continuous improvement is **Kaizen**, a Japanes term which can be translated:
#

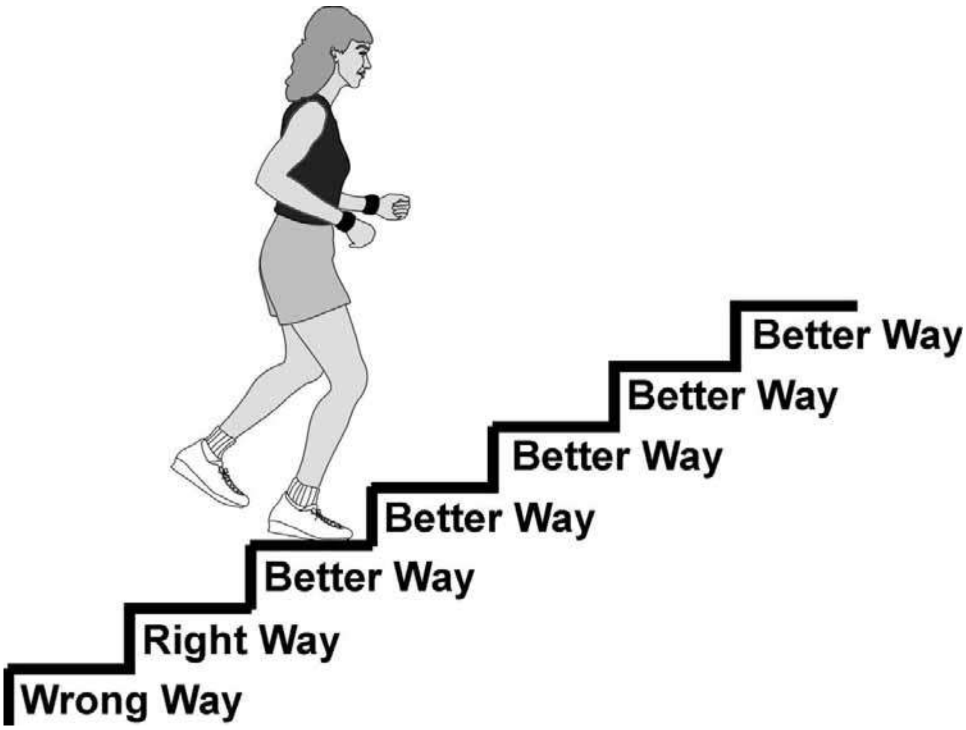
Kai = change
Zen = good

Kaizen means improvement. Moreover it means continuing improvement in personal life, home life, social life, and working life. When applied to the workplace Kaizen means continuing improvement involving everyone - managers and workers alike.

Kaizen can be stated the following:

- "In its broadest sense, quality is anything that can be improved."
- "There is always a better way."
- "There is no acceptable best way."

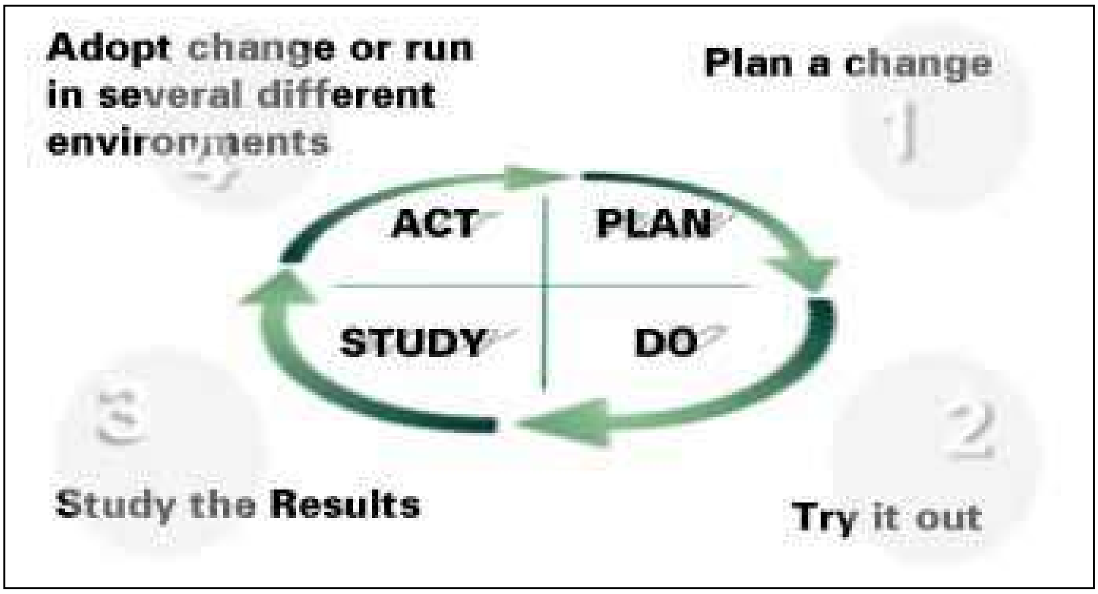
It is through Kaizen that the processes which bring forth or sustain the product are made more competitive. If customer satisfaction (the larger the better) and cost (the smaller the better) are choosen as the primary quality characteristics, then the focus of workplace Kaizen is to improve value, and hence competitive advantage. Total Quality Control is the system to implement Kaizen.



3.2.2.2 The process of continuous improvement

The Deming Wheel

The process of continuous improvement, called PDSA or, alternatively, PDCA (Plan/Do/Study or Check/Act), is often referred to as the *Deming Wheel*. The impact of Dr. Deming's teachings on American manufacturing and service organizations has been profound. He led a sweeping quality revolution that is improving the competitive position of the United States. Dr. Deming himself called the cyle the *Shewhart Cycle* (after its inventor, Dr. Walter Shewhart, a statistician and author of Statistical Methods from the Viewpoint of Quality Control), illustrated below:



Continuous improvement focuses on examining the processes in an operation, to learn where mistakes are being made, why they are happening and if it is possible, practical and economically desirable to prevent them from recurring. Inspection has its place in this practice, but it is inspection of the process, not the product -- a principle in line with Dr. Deming's teachings.

So how do you improve a process?

1. **First, you need to recognize the problem**
   The recognition of a problem may come from internal (worker) or external (supplier/customer) sources. Both sources are invaluable, but unfortunately not all organisations provide feedback opportunities. Identify a problem area or the opportunity for improvement, the reason for working on it, and an indicator- with an emphasis on the customer-for measuring improvement.

2. Define and identify the problem

Then the process giving rise to the problem has, likewise, to be identified and documented. *Flow charts* often prove to be the most useful form of documentation, as they are geared to breaking any operational process down to its nuts and bolts. Break down the problem area to determine its subparts, identify the components with the most impact on the customer, clarify the problem statement, and set a target for improvement.

3. Measure and analyse the performance

Once a process has been documented, its performance can be measured and analysed. There are a number of methods available to do this, but the method used will be determined by both the type of measurements being taken and what is being analysed. Evaluate the information gathered, and identify and verify the root causes of the problem. Utilize cause and effect analysis and the questions, "What causes this?" and "Why does this condition exist?" to eliminate the problem's symptoms and identify the underlying or root cause.

4. Find a solution for the problem

Identify and select the proposed solutions or countermeasures to correct the root cause of the problem identified and verified in step 3. Evaluate potential countermeasures for effectiveness and feasibility, and support the one chosen for implementation with appropriate data such as cost-benefit analysis, barrier/aid identification, and an action plan to assure any barriers are overcome.

5. Implement and evaluate

Confirm that the problem and its root causes have been identified, countermeasures implemented, and the problem decreased and the target for improvement met. Assure that once a problem and its root causes have been identified and countermeasures implemented, the problem doesn't reoccur. Once the data obtained confirm that the countermeasures have been successful, the improvement can be standardized, using control charts and/or standards or procedures. Replication should be utilized where the results are successful and can be shared with other areas doing similar work.

6. Evaluate

Decide what will be done with any future problems, evaluate the team's effectiveness and lessons learned, and develop an action plan for remaining problems. This step identifies the Deming Wheel as a tool, which should continue to be used to evaluate the problem and any changes in circumstances. By continually turning the wheel, adjustments can be made as circumstances change.

3.2.2.3 Case study: Shortening customers'telephone waiting time

This is the story of a Quality Control program that was implemented in the main office of a large bank. An average of 500 customers call this office every day. Surveys indicated that the callers tended to become irritated if the phone rang more than five times before it was answered, and often would not call the company again. In contrast, a prompt answer after just two rings reassured the customers and made them feel more comfortable doing business by phone.

1. **Selection of a Theme.**

   Telephone reception was chosen as a QC theme for the following reasons: (1) Telephone reception is the first impression a customer receives from the company, (2) this theme coincided with the company's telephone reception slogan, "Don't make customers wait, and avoid needless switching from extension to extension", and (3) it also coincided with a company-wide campaign being promoted at that time which advocated being friendly to everyone one met.

   First, the staff discussed why the present method of answering calls made callers wait. Figure 3.1 illustrates a frequent situation, where a call from customer B comes in while the operator is talking with customer A. Let's see why the customer has to wait.

   At (1), the operator receives a call from the customer but, due to lack of experience, does not know where to connect the call. At (2), the receiving party cannot answer the phone quickly, perhaps because he is unavailable, and nobody can take the call for him. The result is that the operator must transfer the call to another extension while apologizing for the delay.

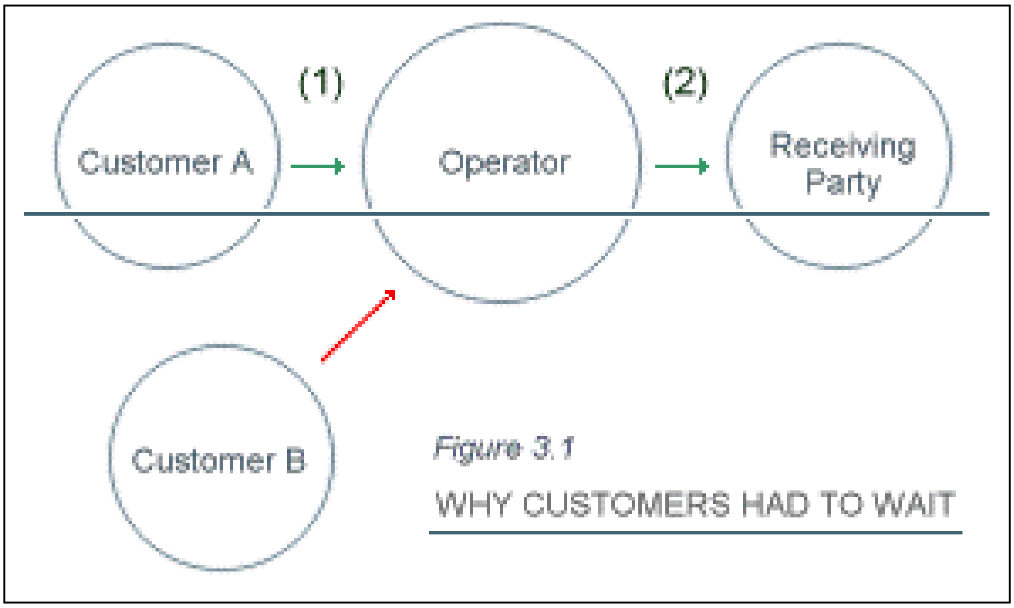


Figure 3.1

WHY CUSTOMERS HAD TO WAIT

2. Cause and Effect Diagram and Situation Analysis

In order to fully understand the situation, the circle members decided to conduct a survey regarding the callers who waited for more than five rings. Circle members itemised factors at a brainstorming discussion and arranged them in a cause-and-effect diagram (Figure 3.2). Operators then kept check sheets on several points to tally the results spanning 12 days from June 4 to 16. (See Figure 3.3.)

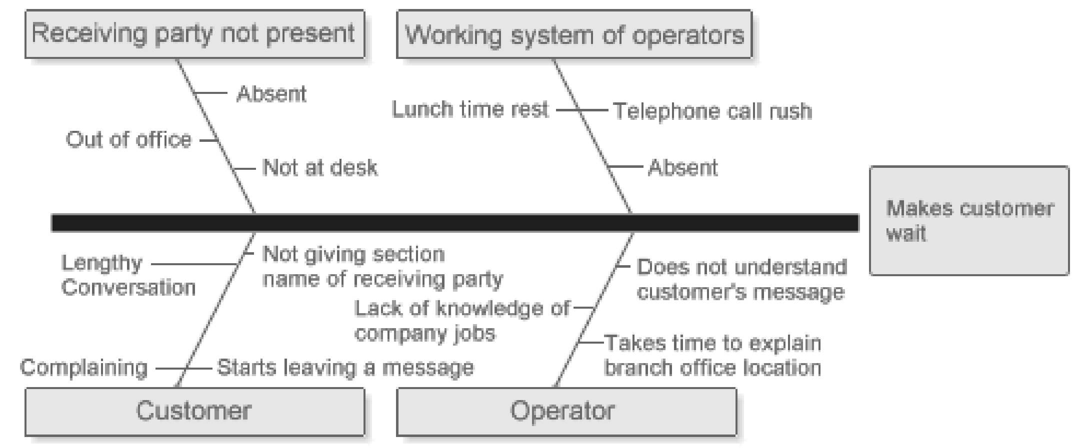

Fig. 3.2 Cause and Effect Diagram

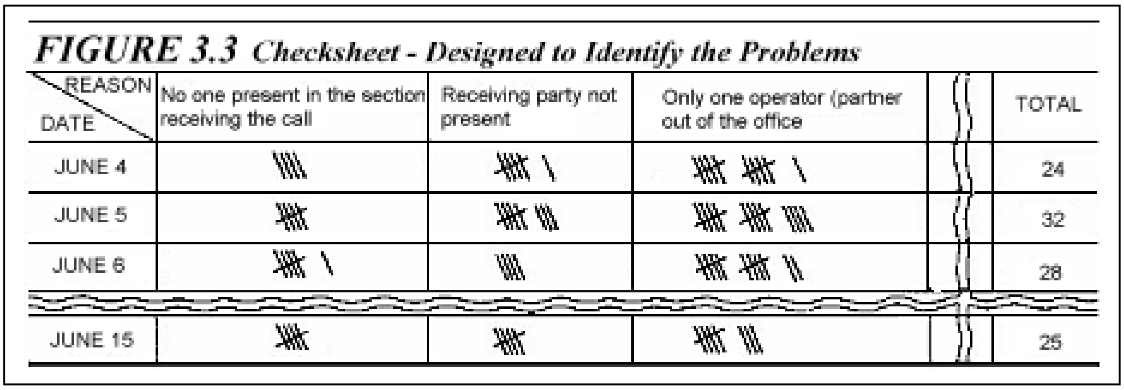

FIGURE 3.3 Checksheet - Designed to Identify the Problems

REASON / DATE	No one present in the section receiving the call	Receiving party not present	Only one operator (partner out of the office		TOTAL
JUNE 4					24
JUNE 5					32
JUNE 6					28
JUNE 15					25

3. Results of the Checksheet Situation Analysis

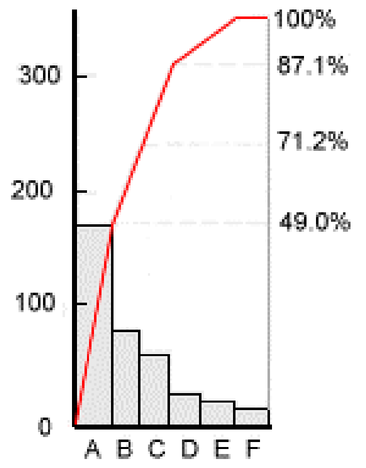
The data recorded on the checksheets unexpectedly revealed that ‘one operator (partner out of the office)’ topped the list by a big margin, occurring a total of 172 times. In this case, the operator on duty had to deal with large numbers of calls when the phones were busy. Customers who had to wait a long time averaged 29.2 daily, which accounted for 6% of the calls received every day. (see figures 3.4 and 3.5)

FIGURE 3.4 ***Reasons Why Callers Had to Wait***

		Daily average	Total Number
A	One operator (partner out of the office)	14.3	172
B	Receiving party not present	6.1	73
C	No one present in the section receiving the call	5.1	61
D	Section and name of receiving party not given	1.6	19
E	Inquiry about branch office locations	1.3	16
F	Other reasons	0.8	10
	Total	29.2	351

Figure 3.5

Reasons why callers had to wait. (Pareto Diagram)



4. Setting the Target
After an intense but productive discussion, the staff decided to set a QC program goal of reducing these waiting callers to zero. That is to say that all incoming calls would be handled promptly, without inconveniencing the customer.

5. Measures and Execution.
(1) Taking lunches on three different shifts leaving at least two operators on the job at all times. Up until this resolution was made a two-shift lunch system had been employed, leaving only one operator on the job while the other was taking a lunch break. However since the survey revealed that this was a major cause of customers waiting on the line, the company bought in a helper operator from the clerical section.
(2) Asking all employees to leave messages when leaving their desks. The objective of this rule was to simplify the operator's chores when the receiving party was not at his desk. The new program was explained at the employees' regular morning meetings, and company-wide support was requested. To help implement this practice, posters were placed around the office to publicize the new measures.
(3) Compiling a directory listing of the personnel and their respective jobs. The notebook was specially designed to aid the operators, who could not be expected to know the details of every employee's job or where to connect his incoming calls.

6. Confirming the Results.

Although the waiting calls could not be reduced to zero, all items presented showed a marked improvement as shown below. The major cause of delays, ‘one operator (partner out of the office)," plummeted from 172 incidents during the control period to 15 in the follow-up survey.

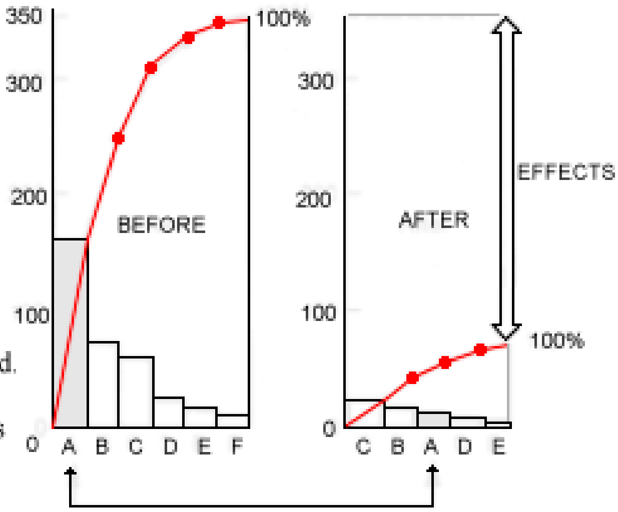
FIGURE 3.6 Effects of QC (Comparison of Before and After QC)

	Reasons why callers had to wait	TOTAL NUMBER BEFORE	TOTAL NUMBER AFTER	DAILY AV. BEFORE	DAILY AV. AFTER
A	One operator (partner out of the office)	172	15	14.5	1.2
B	Receiving party not present	73	17	6.1	1.4
C	No one present in the section receiving the call	61	20	5.1	1.7
D	Section and name of receiving party not given	19	4	1.6	0.3
E	Inquiry about branch office locations	16	3	1.3	0.2
F	Other reasons	10	0	0.8	0
	Total	351	59	29.2	4.8

Period: 12 days from Aug. 17 to 30.

FIGURE 3.7

Effects of QC (Pareto Diagram)



Problems are classified according to cause and presented in order of the amounts of time consumed. They are illustrated in a bar graph. 100% indicates the total number of time consuming calls.

from 'The Quest for Higher Quality - the Deming Prize and Quality control," Ricoh Company Ltd.

3.2.2.4 The idea of Total Quality Management

Total quality management is a holistic, dynamic approach to management. It involves all of the aspects of quality, but takes them further and integrates them completely into an organisation. TQM focuses on:

- Customer satisfaction.
- Involvement
- Continuous improvement.

Customer satisfaction.

Whether the customer is external or internal to the company, this is what keeps a company in business. Marketing departments often take on the task of determining what the customer wants, via methods such as customer surveys. But surveys may have design pitfalls: if you don't ask the right questions, you won't get the right answers. TQM must consider both current and future customer needs, while keeping in mind such possibilities as the development of new products that customers might not think of on their own but which they would respond positively to.

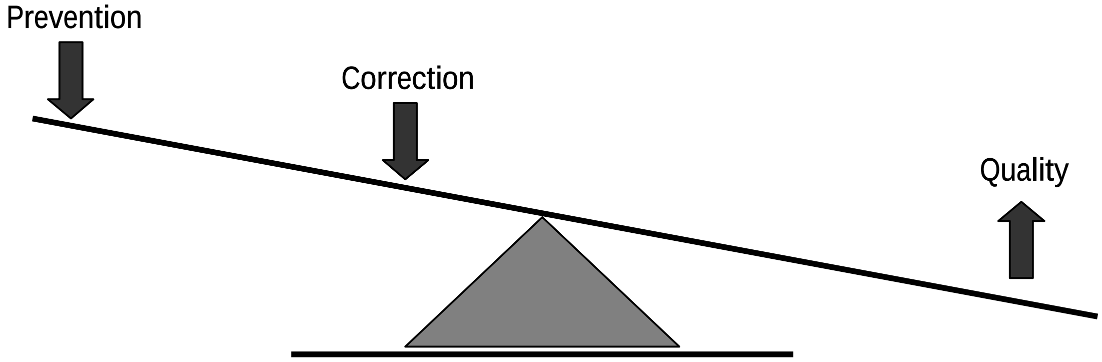
Involvement.

To achieve TQ, everyone in an organisation must be committed. Achieving this commitment is not easy and takes a long time. This is why most authors suggest that organisations need strong leadership and commitment from the top. Companies use mechanisms such as Quality Circles (which nowadays are cross-functional teams that meet regularly) and suggestion schemes to include people in the TQ objective. However, if these are not complete with training and information sharing, they won't work. The best results come when people work on issues which are relevant to them, using techniques they are familiar with, and they have the responsibility and often the resources to effect changes. Prior to practical and effective implementation of the TQ the following breakthrough concepts are necessary:

- Change the way of thinking of the individual
- Change the way of doing things in the company

Continuous improvement

In the ideal TQM environment, all processes are constantly under examination, and everyone in the company is committed to the concept of continuous improvement. If an organisation recognises that analysis and improvement of processes must be never-ending in order to achieve and retain customer satisfaction, provides avenues for both customer and employee feedback, and uses all the quality tools available, Total Quality Management can be realised.



3.2.3 Reducing costs

3.2.3.1 Different kind of costs

Costing is a very complex and sensible topic in managing a business. In this supervisory module we cannot cover the whole area of costing because this subject would cover a complete seminar by itself. But as a supervisor you should have in general a good understanding of the different kind of costs you will find in any company or workshop. Without this knowledge you will not be able to calculate properly or to recognize areas where you could reduce costs. You should identify the difference between direct costs and overhead costs.

Direct costs: Can be related directly to a job order. Direct work, materials, etc.
Overhead costs: Can not be related directly to a job order. Insurances, repairs, rents, etc.

To look more specific at different kinds of costs which play an important role in the workshop we have to divide them further. Mainly you have to deal with three types of cost:

- Material costs
- Production costs
- Overhead costs

Material costs
The material costs contain actually of two different kind of costs. One is easy to understand: the material costs are the costs for producing a specific item (direct costs). So the costs are directly related to a job order. But materials also causes overhead costs like storage, administration, work that you have during ordering materials, etc.. If we talk about real material costs we have to consider that they should consist of the two different types mentioned above, the direct and the overhead costs of material. Therefore your selling price for a specific material cannot be the same than the one you payed your supplier. Usually the management provides you with the material costs you have to use if you are the one the make a calculation.

Production costs
The production costs are all the costs created through work in the production for one job order. They can be related directly to the job order and include the work on machines, work done manual with hand tools, the set-up for the machines etc.. To determine the production costs you have to know the different machine rates you have to relate to each machine, the rates for the workers and the exact time for each operation. Production costs are also direct costs. A lot of companies include in the production costs the overhead costs for the machines and hand tools. Then the production cost is also a combination of direct and overhead costs for production. If your company don't do it this way, you have to include these overhead costs in the general overhead rate.

Overhead costs

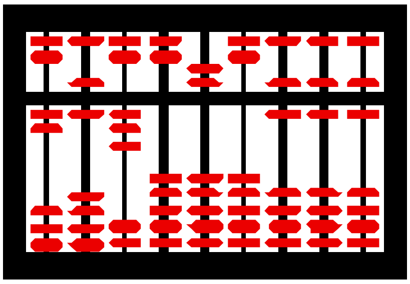
As mentioned before overhead costs are no direct costs, which means you cannot relate them to a job order. To run a company you have to pay a lot of additional costs such as SSS, taxes, insurances, rents, electricity, administration costs, repairs, maintenance, payment of interest, depriciation costs, vacation allowance, etc.. But nevertheless somehow the money for the overhead costs has to be earned. So you have to include these expenses partly in the costs for producing a job order/product. This is usually done by an overhead rate (in per cent) which you add to the production and material costs of a product.

Reducing costs

Since you are now familiar with the different types of costs you can determine in which area you can mostly influence the saving of costs:

	Material costs	Production costs	Overhead costs
Measures how to reduce the costs	➲ Proper storage of material should be implemented. ➲ Implement measures that reduce the waste material. ➲ Prepare effective cutting lists/schemes that consider the measurement of the raw material. ➲ Train the staff in not wasting materials.	➲ Follow the 5 S program, which enhance the cleanliness and order in the workshop. ➲ Train your staff regularly in all necessary areas. ➲ Provide regular maintenance to secure effectivly running machines. ➲ Shorten the set-up times by improving the way of doing it (training, specialize staff). ➲ Use always sharp tools. ➲ Prepare good jigs and other devices which will speed up the production ➲ Take care of right-in-time delivery of the materials. ➲ Always try to avoid bottle-necks. ➲ Make a proper production plan which you revise every day. ➲ Follow safety instructions, accidents do not speed up the production!	➲ Provide regular maintenance that will lower the costs for expensive repairs. ➲ Save energy whenever you can (electricity, fuel,...). ➲ Insist on following all necessary saftey instructions so that there will be no accidents.

3.2.3.2 Basis for proper calculations



If you as a supervisor are also responsible for preparing calculations for new items you need a specific knowledge for doing it. But you also need specific information from your management or your superior. Without these information you will not be able to come up with a proper costing.

The management should provide you with the following:

- ☐ Technical drawing of the item (or a sample)
- ☐ Specification of material, hardware and the quality standard (or a sample)
- ☐ Quantity of items that should be produced
- ☐ Machine rates for each machine in the workshop
- ☐ Operator rates (if they are not included in the machine rates)
- ☐ Material costs

With these information you can come up with the cost of sales for an item. If they expect you to give the net amount, you need the margin and the overhead rates they ususally add to the cost of sales.

Machine rates

The correct computation of the machine rates does not belong to your responsibilies, since it is a very complicated business management skill and usually done by specialized personnel like plan managers. They have to consider for example the depreciation, the interest and the expenses for the machine in relation to the space it requires and also the extimated operating life for a year.

Technical knowledge in woodworking

In general you need a lot of technical knowledge for preparing a calculation. You have to be able to perform the following:

- ➔ Interpret technical drawings properly.
- ➔ Recall the different materials and the hardware.
- ➔ Memorize the operations of all woodworking machines.
- ➔ Recognize the fastest production processes.
- ➔ Describe the working process step by step.
- ➔ Predict possible bottle-necks.
- ➔ Estimate the time for each working operation.
- ➔ Consider and estimate set-up times for each machine.

Measuring of materials

The first step for making a calculation is to determine the need of the different materials. We usually prepare a **cutting list** and an additional **list for accessories** such as hardware. For the accessories list you have to check not only for the supplier but also if the items are available in time. A cutting list is not only used for calculation but also afterwards in the production process. Below you can see an example for a very detailed cutting list, which provides all the necessary information for calculation and production process. The use of the metric system in your workshop should be trained and carried out since it is already an international standard.

Item:		Order number:
Customer:		Date:

Cutting List (including computation)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
No.	Part	Material	No. of pieces	Length mm	Width mm	Thickn. mm	Area m^2		Volume m^2	Waste	Vol. + Waste	Price m^2	Price
1	Leg	Gimelina	4	477	50	50	0,10	60		40	0,14	162,-	22,68
2	Rail	Gimelina	2	1130	10	50	0,02						
2	Rail	Gimelina	2	630	10	50	0,01	60	0,03	150	0,08	162,-	12,96

Title of column		Comment
1.	No.	Number of the item
2.	Part	Name and use of the different parts of the item (Leg, rail, profile,...)
3.	Material	Type of the solid timber, of the wooden material, quality standard
4.	No. of pieces	Number of the same pieces
5.	Length	Exact measurement (length) of the finished item in mm
6.	Width	Exact measurement (width) of the finished item in mm
7.	Thickness	Exact measurement (thickness) of the finished item in mm
8.	Area	Surface area: length x width x number of pieces
9.	Raw thickness	Thickness of material when it comes from lumber yard
10.	Volume	Volume in m^2
11.	Waste Material	Waste in per cent, specified from the company for each material
12.	Vol. + Waste	Volume plus waste amount to the volume needed (in m^2)
13.	Price m^2	Price per m^2 for solid timber, wooden materials, or veneers
14.	Price	Price for the computed items

With a complete cutting list you can compute the material costs for your job order.

Determination of time

The second step for making a calculation is to determine the time that is needed for each working operation. You need this for the computation of the costs of production. The more experience you have in the production process the easier it will be for you to estimate the time for a working procedure. The scheme for the determination of working time is the following:

- ➔ Define the different steps of work to be done in the correct order
- ➔ Fix the appropriate machines you want to use
- ➔ Determine the amount of work (number of pieces, m^2, etc.)
- ➔ Consider the time for the machine set-up
- ➔ Compute the time for each working process based on your experience
- ➔ Add a percentage for transportation inside the workshop

When you have gathered these information you can prepare with the help of machine rates and operator rates the **costs of production**. But you can also use the information for the preparation of **routing sheets** and your further production planning process since they are vital for the production process.

Machine set-ups

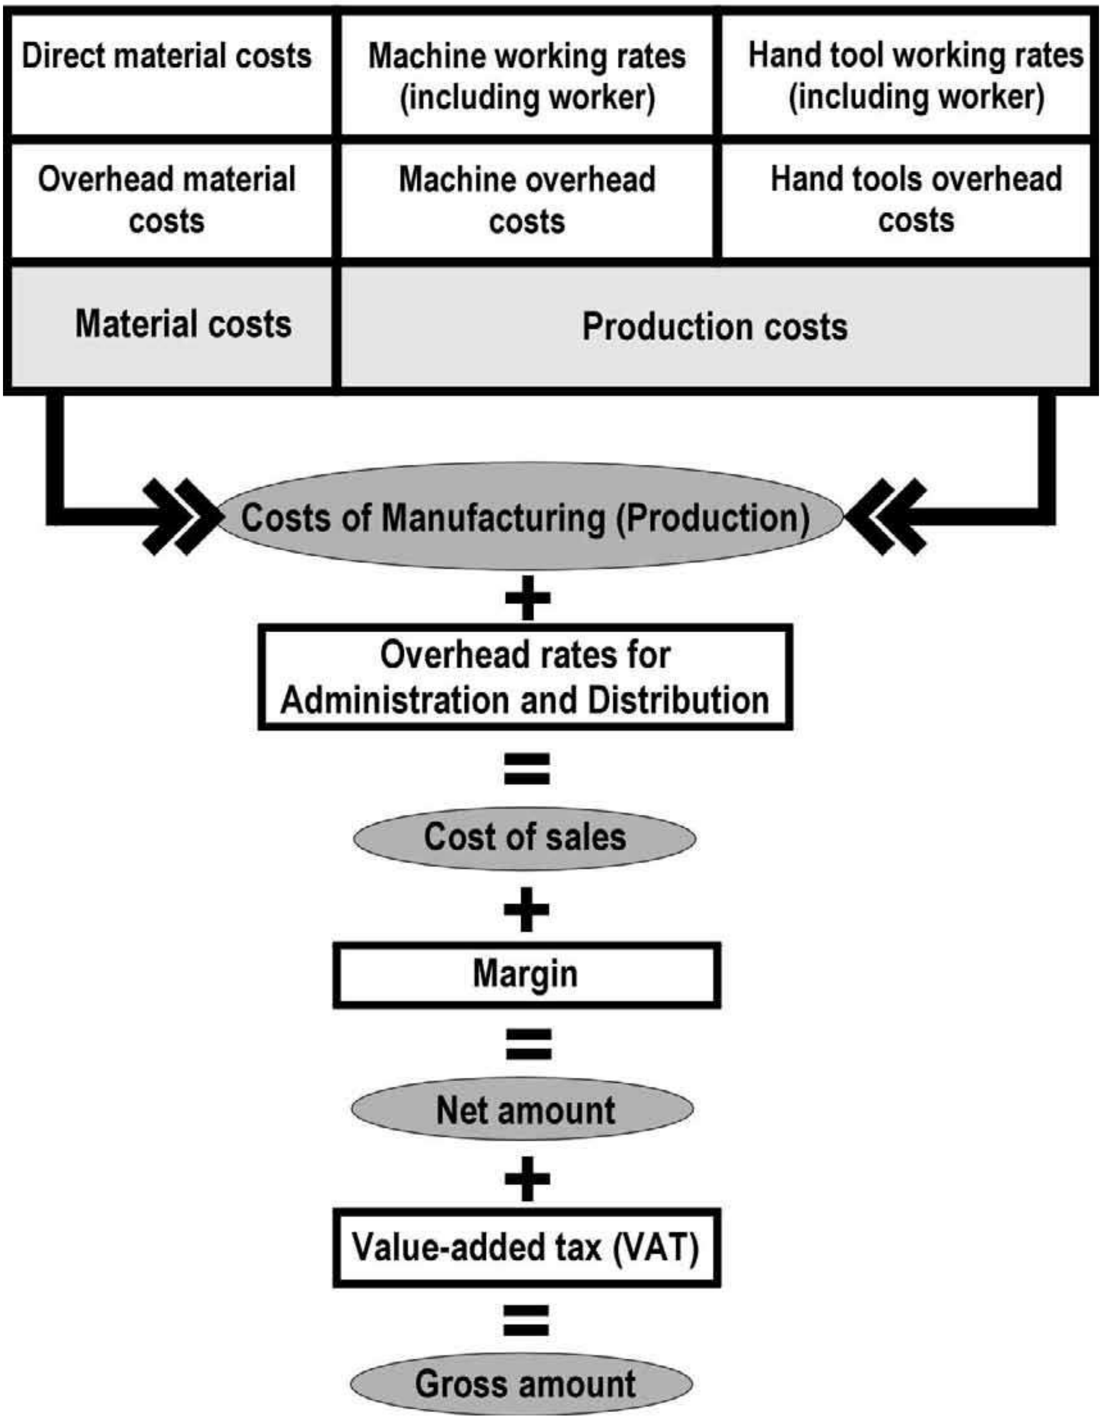
A special cost factor is the time for the set-up of machines. The lower the number of items you have to produce the more important are the costs for the set-ups. It is advisable in general to lower the time for machine set-ups as much as possible to minimize the costs in production. Below you find some measures for lowering the time for machine set-ups:

- ☐ Look for set-up "friendly" machines when you buy a new one
- ☐ Train your staff in setting up all the machines
- ☐ Store tools and devices for set-ups clearly arranged and close to the machine
- ☐ Use fences, jigs and measuring devices
- ☐ Use only carbide tipped tool since they last much longer
- ☐ Specialize some workers for complicated and costly set-ups
- ☐ Very frequent set-ups can be avoided by buying a second machine of the same type
- ☐ Pay attention to the need of only a few set-ups during the design process of a product (choose suitable measurments)

The time you need for the most frequent set-ups can be determined by time and motion studies so that you have a proper estimation for the duration of them.

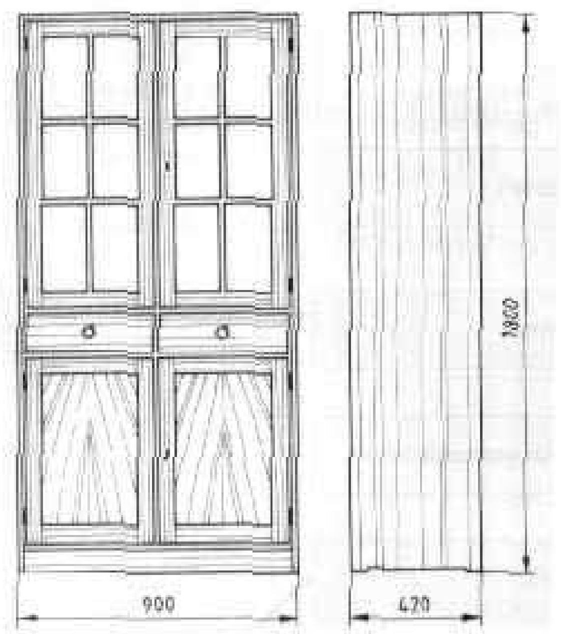
To have an overview of the basis for proper calculations look at the picture below. You as a supervisor can be responsible for determining the material and the production costs as long as you get the required information form your superior. For coming up with the cost of sales or even the net amount of an item you need to know what the overhead rates and the margin are.

Basic Scheme for Calculations



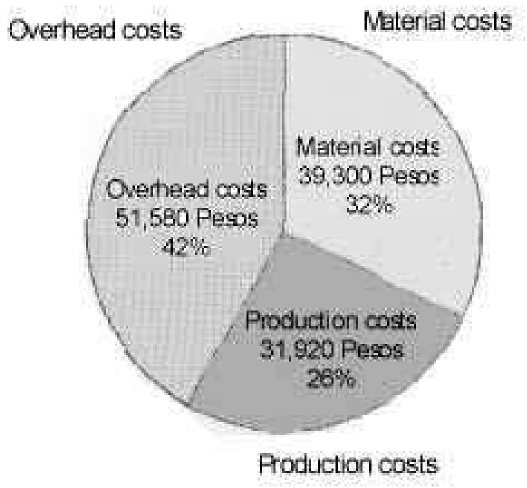
Let us have a look at a example. Here you can see the composition of the **cost of sales** for a product and how to come up with a **gross amount** the customer has to pay.

Composition of a Price



Solid timber: Mahagoni
Finish: Matt Finish
Gross amount: 156,080.00 Pesos

Cost of Sales: 100% (122,800 Pesos)



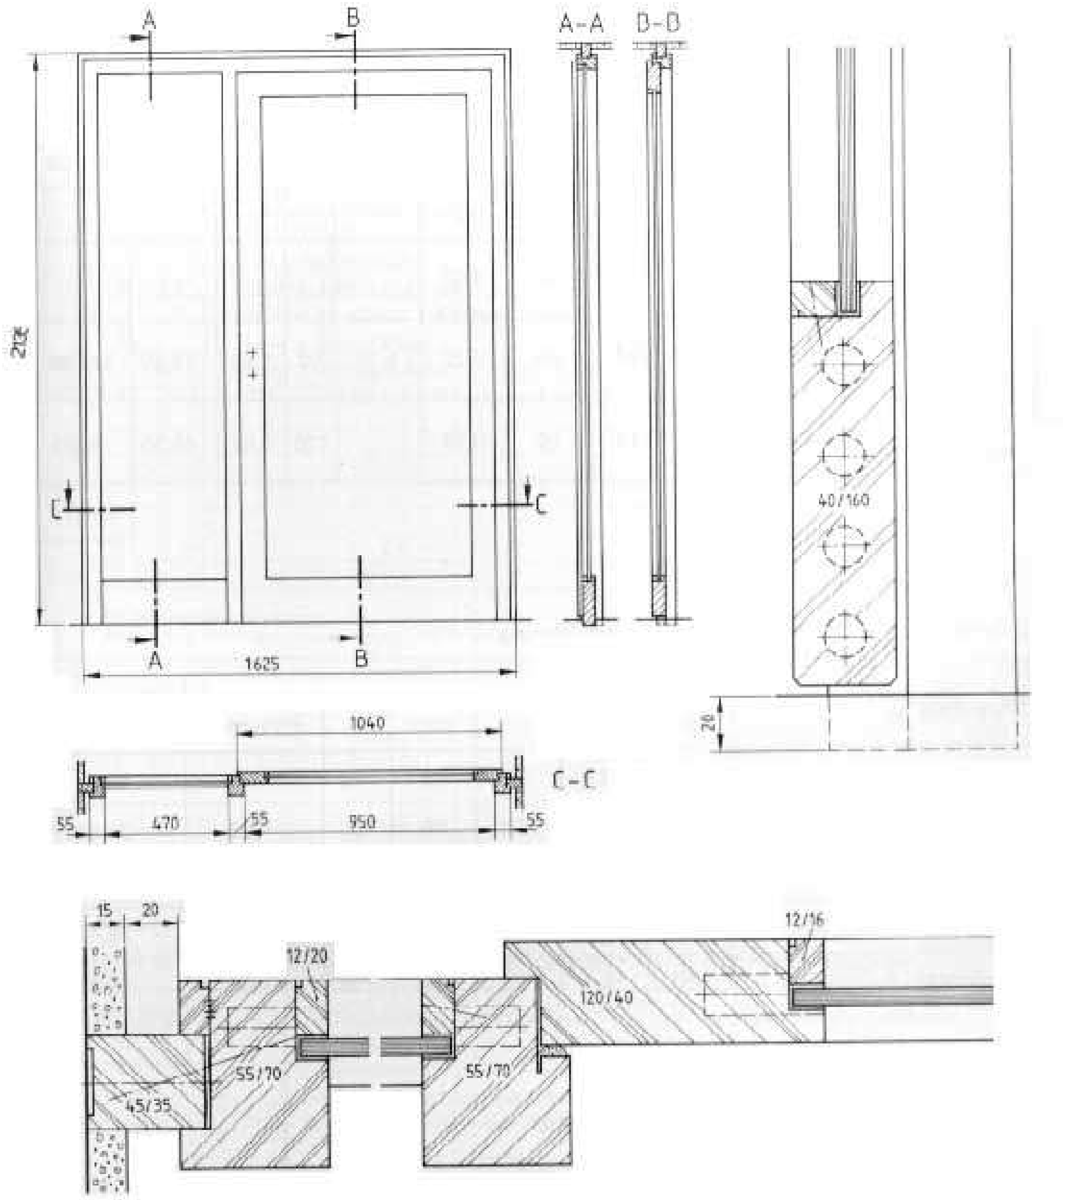
Material costs 39,300 Pesos 32%	Chipboard Solid timber Veneer Plywood Glue, screws Hinges Laquer, etc.
Production costs 31,920 Pesos 26%	Machine rates Operator rates
Overhead costs 51,580 Pesos 42%	Taxes Insurances Administration cost Rents Electricity Maintenance Repairs Depreciation Interest, etc.
Margin 13,540 Pesos 11%	Rate to cover risks and for further investments
VAT 20,460 Pesos 15%	Value added tax

<u>SELLING PRICE</u>
(Gross amount)

Example for a Technical Drawing

Technical drawing for an entrance door

All measurements in mm



Overall measurment: 1625 x 2135 mm
Solid timber: Philippine Mahagoni
Finish: Polyurethan laquer, glossy
Joints: Dowel
Glass: Security glass, 12 mm

3.2.4 Daily Routine Activities

5. 1. 0. Before Start of Shift (15 – 30 minutes)

- Check production schedule and/or work orders for the day
- Check equipment to be used
- Check supply of materials for the day
- Check tools needed for the day
- Line up equipment, materials, and tools for the day
- Line up firm work schedule for the day

5. 2. 0. Beginning of the Shift (15 – 30 minutes)

- Check attendance and assign employees to work stations, get support from your "group leaders"
- If necessary (because of absences), balance the work force by changing assignments or by securing additional help from other departments (discuss with management)
- Assign production and/or work orders
- Stress critical qualities to watch
- Specify when the work should be completed

5. 3. 0. During the Shift (6 – 7 hours)

- Check workmanship with each employees, approve, correct, instruct or train as needed
- Check work progress with each employee. Add help, allow more time, or assign additional work
- Check housekeeping, this is a continuos process! Good work cannot be done in an untidy place!
- Check back when production or quality appears unsatisfactory, especially with new employees
- Stay on the shop floor supervising and/or available for questions, assistance, and instructions most of the time
- Be on the floor immediately before and after breaks and for 15 minutes before quitting time
- Inspect critical quality areas as work progresses. Correct problems as soon as they are detected
- Perform final inspection of parts, subassemblies, and so on, before they move to next department (if possible, get group leaders involved)
- Check/Report/Conduct a study on recurring quality problems
- Check periodically to see that materials and supplies are on hand
- Check periodically to see that tools and equipment are in proper operating condition
- Report material shortages or recurring defects
- Report and/or request maintenance, repair, or replacement of defective tools or equipment

5. 4. 0. Once a Day

- Observe one employee or work station continuously for 15 minutes
- Look for time wasted, dull or improper tools, need for work positioning jigs and fixtures, interference, delays and bottlenecks, and expenditure of excessive time to get parts and materials. Do find ways to cut costs or make improvements in any of these

5. 5. 0. End of Shift (15 minutes)

- Make a list of unsolved problems that came up during the day. Consider ways to handle them
- Think about jobs that have to be done the following day / shift like checking production and/or work orders, materials and tools
- Complete all paperwork. Avoid holding any paperwork for the following day.
- Make a list of jobs that must be done the next day. Take it home with you and complete it before coming to work. Use this form to make your own daily plan!

TRADITIONAL QUALITY CONTROL

Under traditional quality control, inspection of goods and services (checking to make sure that what's being produced is meeting all expectations) takes place at the end of the operations process. The problem with this sort of inspection is that it doesn't work. It won't ensure quality, however you define it. Think about a simple test, like the F-Test, that shows how difficult it is to realise a specific sign or characteristic in a limited time range. Imagine how much more difficult inspection is at the end of a process for a product with several hundred or thousand parts, such as a car -- or a forklift.

There are three main problems with inspection under traditional quality control:

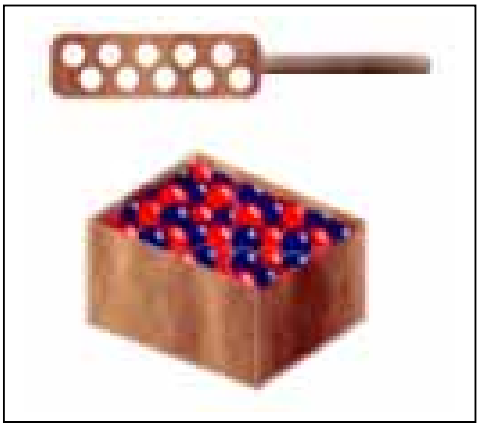
- it's **costly**, in terms of both tangibles and intangibles (e.g. materials, labour, time, employee morale, customer goodwill, lost sales)
- it's **done too late in the process**, often resulting in defective or non-acceptable goods actually being received by the customer
- it's **done by the wrong people**--by separate "quality inspectors" rather than by the workers themselves

Another problem with inspections is often the lack of operational definitions between upper management and "quality inspectors", inspectors and workers, and even between inspectors, as to what constitutes a "quality product". For example, to meet quotas, inspectors may approve goods that don't meet 100% conformance, giving the message to workers that it doesn't matter if their work is a bit slipshod here and there. Or one inspector may be following different procedures from another, or using different measurements.

According to one of the quality "gurus", W. Edwards Deming,

> **"Inspection with the aim of finding the bad ones and throwing them out is too late, ineffective, costly. Quality comes not from inspection but from improvement of the process."**

To prove his point, Dr. Deming would demonstrate the "red bead test" in his lectures:



Audience members would be selected to perform one of several roles in a business (worker, inspector, or foreman). The "workers" would be supplied with raw materials (red and white beads, mixed together in a large container) and equipment, in the form of a paddle with 50 holes in it. The beads would be poured into a smaller vessel, then back into the larger vessel to simulate a production process; and then each worker would dip the paddle into the vessel, filling each hole with a bead. This would represent one day's production for each worker. Inspectors counted each red bead in the paddle as a defect, and records were kept for each "worker". Low number of total defects, over several days, might result in promotions or pay raises, while a high number might result in dismissal.

It doesn't take the workers long to realize that it is random luck, not their innate skill or ability to learn, that determines the number of "defective" red beads that end up in the paddle. Under the conditions given, every worker will experience good (fewer red beads) and bad (more red beads) days, without any means to tip the scales to their advantage. Nor would any amount of inspection have an affect. The only thing that could lead to improvement would be to improve the process -- i.e., reduce the number of red beads in the incoming material -- and that would be management's job, not the workers. In Deming's view, **management is responsible for 94% of quality problems**.

Other quality experts, like J.M. Juran, think that there is a place for inspection in a quality process -- just not the traditional method. Inspection occurs at varying places "upstream" in the process, right from the point of incoming materials, in order to detect and correct errors long before the final product emerges. This is usually much less costly than having to scrap or rework final products that don't conform or are judged unfit for use. Juran also supported the concept of workers being allowed to self-inspect their work, given the appropriate information and tools to do so.

TOTAL QUALITY CONTROL

Total quality control focuses on examining the processes in an operation, to learn where mistakes are being made, why they are happening and if it is possible, practical and economically desirable to prevent them from recurring. Inspection has its place in TQC, but it is inspection of the process, not the product -- a principle in line with Dr. Deming's teachings.

So how do you improve a process?

1. First, you need to recognize the problem
   The recognition of a problem may come from internal (worker) or external (supplier/customer) sources. Both sources are invaluable, but unfortunately not all organisations provide feedback opportunities.

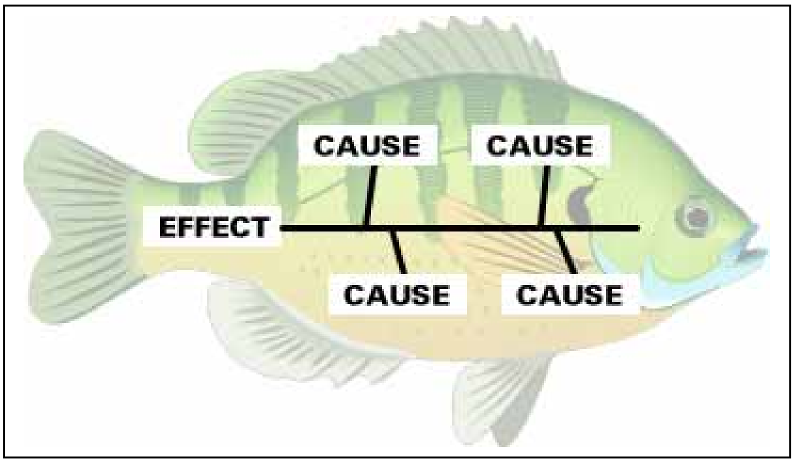
2. Define and identify the problem
   Then the process giving rise to the problem has, likewise, to be identified and documented. *Flow charts* often prove to be the most useful form of documentation, as they are geared to breaking any operational process down to its nuts and bolts.

3. Measure and analyse the performance
   Once a process has been documented, its performance can be measured and analysed. There are a number of methods available to do this, but the method used will be determined by both the type of measurements being taken and what is being analysed. For example, *control charts* using can provide a highly effective visual indication of the points where a process is not in control, as well as when corrective action should or should not be taken. Deming and other quality "gurus" teach that some variation in a process is inevitable and is not cause for concern, but it should be held to a minimum in most cases. *Pareto analyses* arrange data in order of priority or importance, and often reflect a high percentage of problems arising from a few causes (the "vital few"). *Fishbone diagrams* concentrate on one problem effect (result), and attempt to show all the causes contributing to it which may be negatively affecting it.

THE SEVEN QUALITY CONTROL TOOLS

1. Cause and Effect Diagram

The cause and effect diagram is also called the fishbone chart because of its appearance and the Ishakowa chart after the man who popularized its use in Japan. Its most frequent use is to list the cause of particular problems. The lines coming off the core horizontal line are the main causes and the lines coming off those are sub causes.

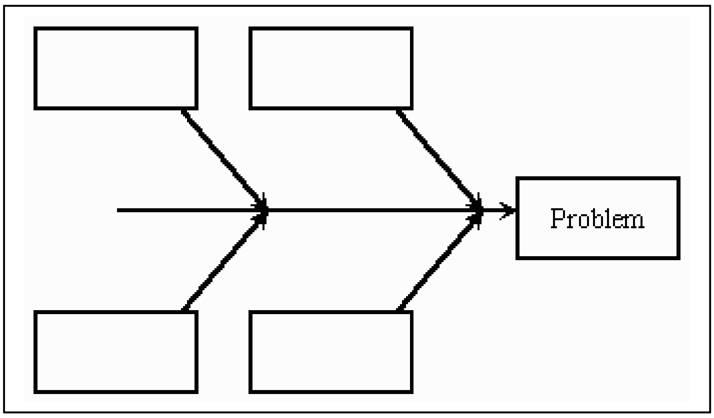


A CAUSE AND EFFECT DIAGRAM IS USED FOR:

1. Identifying potential causes of a problem or issue in an orderly way (example: Why has membership in the band decreased?; why isn't the phone being answered on time?; why is the production process suddenly producing so many defects?)
2. Summarizing major causes under four categories (e.g., People, Machines, Methods, and Materials or Policies, Procedures, People, and Plant)

STEPS IN CONSTRUCTING A CAUSE AND EFFECT DIAGRAM:

1. Prepare a flip chart or an overhead transparency of the following template:



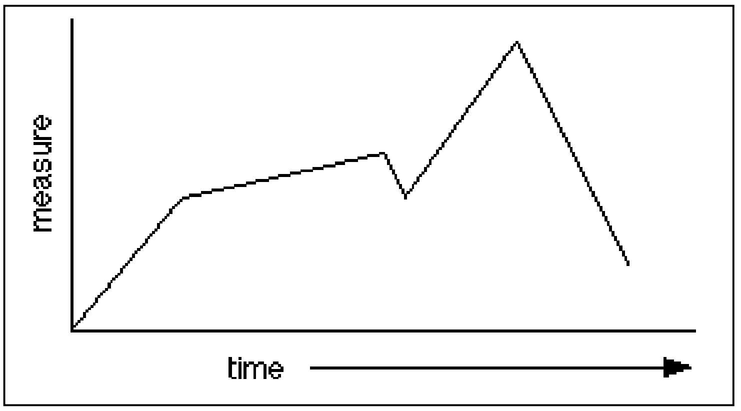
2. Write the issue (problem or process condition) on the right side of the Cause and Effect Diagram.
3. Identify the major cause categories and write them in the four boxes on the Cause and Effect Diagram. You may summarize causes under categories such as:

- Methods, Machines, Materials, People
- Places, Procedures, People, Policies,
- Surroundings, Suppliers, System, Skills

4. Brainstorm potential causes of the problem. As possible causes are provided, decide as a group where to place them on the Cause and Effect Diagram. It is acceptable to list a possible cause under more than one major cause category.
5. Review each major cause category. Circle the most likely causes on the diagram.
6. Review the causes that are circled and ask "Why is this a cause?" Asking "why" will help get to the root cause of the problem.
7. Reach an agreement on the most probable cause(s).

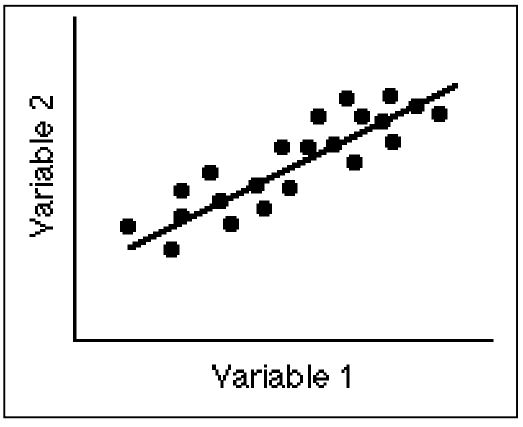
2. Run Chart

The run chart shows the history and pattern of variation. It is helpful to indicate on the chart whether up is good or down is good. This tool is used at the beginning of the change process to see what the problems are. It is used at the end (check) part of the change process to see whether the change has resulted in a permanent improvement.

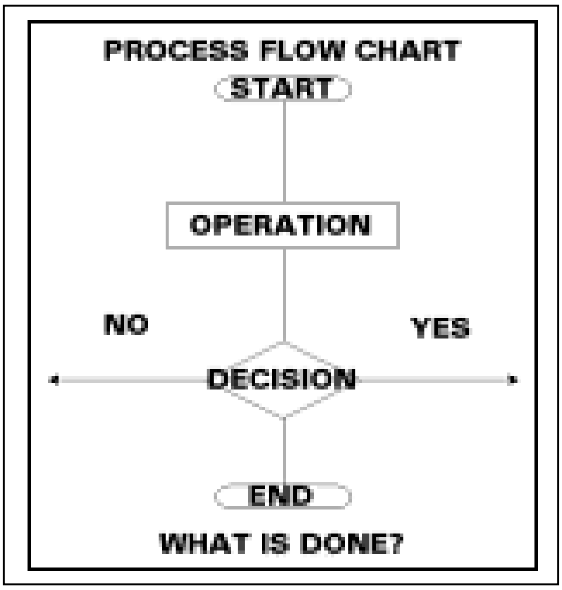


3. Scatter Diagram

The scatter diagram show the pattern of relationship between to variables that are thought to be related. For example is their a relationship between out side temperature and cases of the common cold? As temperatures drop, do colds increase. The closer the points hug a diagonal line the more closely there is a one to one relationship.



4. Flowchart



The flowchart lists the order of activities. The circle symbol indicates the beginning or end of the process. The box indicates action items and the diamond indicates decision points. A beneficial technique is to map the ideal process and the actual process and identify the differences as targets for improvements.

A flow chart is a pictorial representation showing all of the steps of a process.

A Flowchart is used for:

1. Defining and analyzing processes (example: What is the registration process for entering students?)
2. Building a step-by-step picture of the process for analysis, discussion, or communication purposes (example: Is it possible to shorten the length of time it takes for a student to complete the program?) Defining, standardizing, or finding areas for improvement in a process

STEPS FOR CREATING A FLOWCHART ARE:

1. Familiarize the participants with the flowchart symbols
2. Brainstorm major process tasks. Ask questions such as "What really happens next in the process?", "Does a decision need to be made before the next step?", or What approvals are required before moving on to the next task?"
3. Draw the process flowchart using the symbols on a flip chart or overhead transparency. Every process will have a start and an end (shown by elongated circles). All processes will have tasks and most will have decision points (shown by a diamond).
4. Analyze the flowchart for such items as:

- Time-per-event (reducing cycle time)
- Process repeats (preventing rework)
- Duplication of effort (identifying and eliminating duplicated tasks)
- Unnecessary tasks (eliminating tasks that are in the process for no apparent reason)
- Value-added versus non-value-added tasks

5. Pareto Chart

The Pareto shows the distribution of items and arranges them from the most frequent to the least frequent with the final bar being misc. The tool is named after Wilfredo Pareto, the Italian economist who determined that wealth is not evenly distributed. Some of the people have most of the money. This tool is a graphical picture of the most frequent causes of a particular problem. It shows where to put your initial effort to get the most gain.

A PARETO CHART IS USED FOR:

1. Focusing on critical issues by ranking them in terms of importance and frequency (example: Which course causes the most difficulty for students?; which problem with Product X is most significant to our customers?)
2. Prioritizing problems or causes to efficiently initiate problem solving (example: Which discipline problems should be tackled first? or, What is the most frequent complaint by parents regarding the school?; solution of what production problem will improve quality most?)
3. Analyzing problems or causes by different groupings of data (e.g., by program, by teacher, by school building; by machine, by team)
4. Analyzing the before and after impact of changes made in a process (example: What is the most common complaint of parents before and after the new principal was hired?; has the initiation of a quality improvement program reduced the number of defectives?)

STEPS IN CONSTRUCTING A PARETO CHART WITH STEP-BY-STEP EXAMPLE:

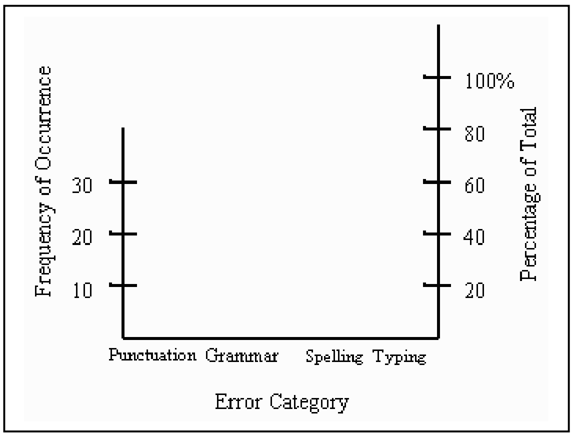
1. Determine the categories of problems or causes to be compared. Begin by organizing the problems or causes into a narrowed down list of categories (usually 8 or less).

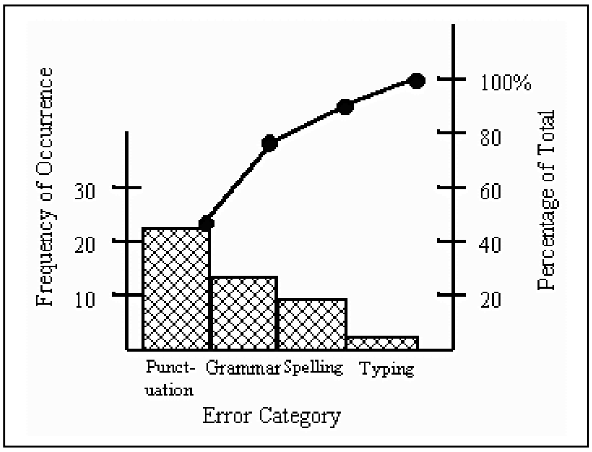
2. Select a Standard Unit of Measurement and the Time Period to be studied. It could be a measure of how often something occurs (defects, errors, tardies, cost overruns, etc.); frequencies of reasons cited in surveys as the cause of a certain problem; or a specific measurement of volume or size. The time period to be studied should be a reasonable length of time to collect the data.

3. Collect and Summarize the Data. Create a three-column table with the headings of "error or problem category", "frequency", and "percent of total". In the "error or problem category" column list the categories of problems or causes previously identified. In the "frequency" column write in the totals for each of the categories over the designated period of time. In the "percent of total" column, divide each number in the "frequency" column by the total number of measurements. This will provide the percentage of the total.

Error Category	Frequency	Percent of Total
Punctuation	22	44 %
Grammar	15	30 %
Spelling	10	20 %
Typing	3	6 %
TOTAL	50	100 %

4. Create the framework for the horizontal and vertical axes of the Pareto Chart. The horizontal axis will be the categories of problems or causes in descending order with the most frequently occurring category on the far left (or at the beginning of the horizontal line). There will be two vertical axes-one on the far left and one on the far right. The vertical axis on the far left point will indicate the frequency for each of the categories. Scale it so the value at the top of the axis is slightly higher than the highest frequency number. The vertical axis on the far right will represent the percentage scale and should be scaled so that the point for the number of occurrences on the left matches with the corresponding percentage on the right.

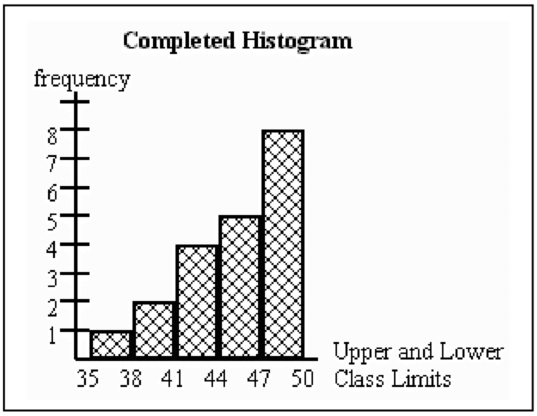




5. Plot the bars on the Pareto Chart. Using a bar graph format, draw the corresponding bars in decreasing height from left to right using the frequency scale on the left vertical axis. To plot the cumulative percentage line, place a dot above each bar at a height corresponding to the scale on the right vertical axis. Then connect these dots from left to right, ending with the 100% point at the top of the right vertical axis.

6. Interpret the Pareto Chart. Use common sense-just because a certain problem occurs most often doesn't necessarily mean it demands your greatest attention. Investigate all angles to help solve the problems-What makes the biggest difference? What will it cost to correct the problems? What will it cost if we don't correct this problem?

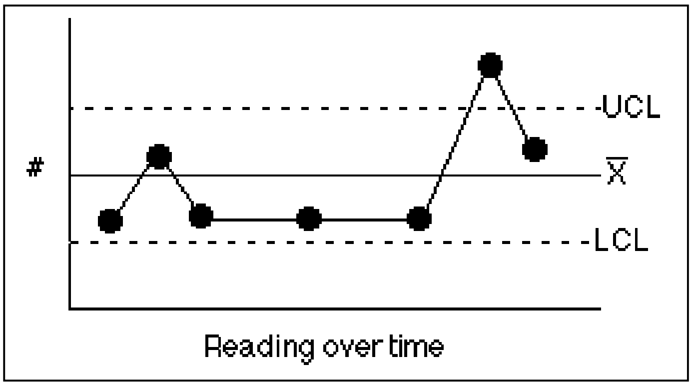
6. Histogram



The histogram is a bar chart showing a distribution of variables. An example would be to line up by height a group of people in a course. Normally one would be the tallest and one would be the shortest and there would be a cluster of people around an average height. Hence the phrase "normal distribution". This tool helps identify the cause of problems in a process by the shape of the distribution as well as the width of the distribution.

7. Control Chart

The control chart is a line chart with control limits. It is based on the work of Shewhart and Deming. By mathematically constructing control limits at 3 standard deviations above and below the average, one can determine what variation is due to normal ongoing causes (common causes) and what variation is produced by unique events (special causes). By eliminating the special causes first and then reducing common causes, quality can be improved.



TOTAL QUALITY CONTROL

CASE STUDY:SHORTENING CUSTOMERS' TELEPHONE WAITING TIME

This is the story of a QC program that was implemented in the main office of a large bank. An average of 500 customers call this office every day. Surveys indicated that the callers tended to become irritated if the phone rang more than five times before it was answered, and often would not call the company again. In contrast, a prompt answer after just two rings reassured the customers and made them feel more comfortable doing business by phone.

1. Selection of a Theme.

Telephone reception was chosen as a QC theme for the following reasons: (1) Telephone reception is the first impression a customer receives from the company, (2) this theme coincided with the company's telephone reception slogan, "Don't make customers wait, and avoid needless switching from extension to extension", and (3) it also coincided with a company-wide campaign being promoted at that time which advocated being friendly to everyone one met.

First, the staff discussed why the present method of answering calls made callers wait. Figure 3.1 illustrates a frequent situation, where a call from customer B comes in while the operator is talking with customer A. Let's see why the customer has to wait.

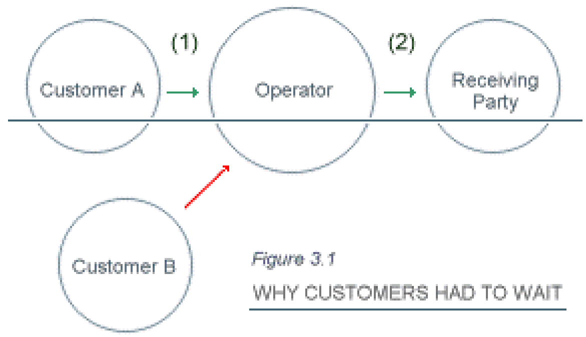


Figure 3.1

WHY CUSTOMERS HAD TO WAIT

At (1), the operator receives a call from the customer but, due to lack of experience, does not know where to connect the call. At (2), the receiving party cannot answer the phone quickly, perhaps because he is unavailable, and nobody can take the call for him. The result is that the operator must transfer the call to another extension while apologizing for the delay.

2. Cause and Effect Diagram and Situation Analysis

In order to fully understand the situation, the circle members decided to conduct a survey regarding the callers who waited for more than five rings. Circle members itemised factors at a brainstorming discussion and arranged them in a cause-and-effect diagram (Figure 3.2). Operators then kept check sheets on several points to tally the results spanning 12 days from June 4 to 16. (See Figure 3.3.)

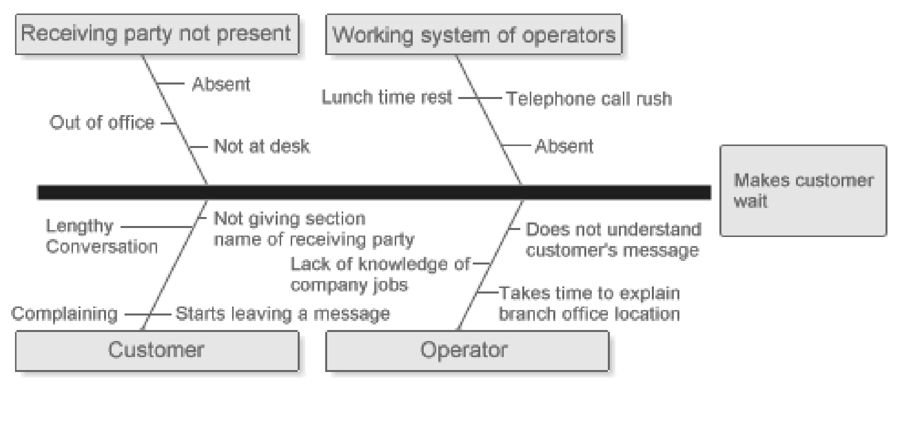

Fig. 3.2 Cause and Effect Diagram

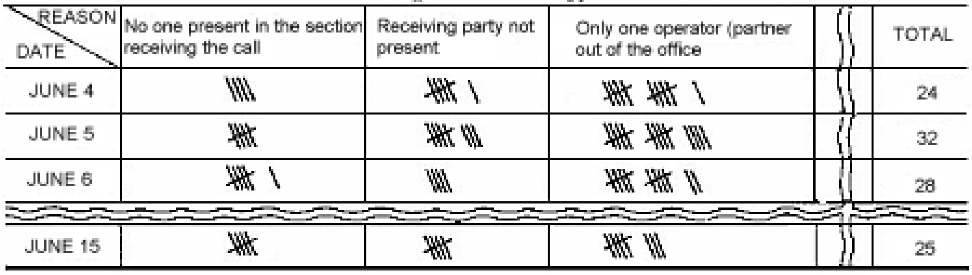
***FIGURE 3.3** Checksheet - Designed to Identify the Problems*



3. Results of the Checksheet Situation Analysis

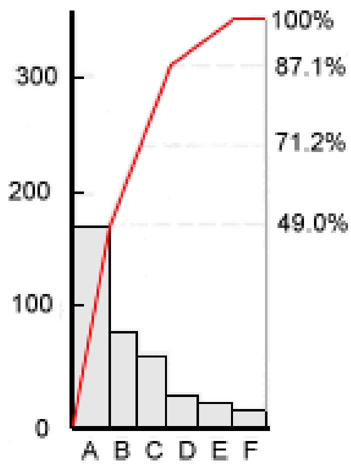
The data recorded on the checksheets unexpectedly revealed that ‘one operator (partner out of the office)’ topped the list by a big margin, occurring a total of 172 times. In this case, the operator on duty had to deal with large numbers of calls when the phones were busy. Customers who had to wait a long time averaged 29.2 daily, which accounted for 6% of the calls received every day. (see figures 3.4 and 3.5)

***FIGURE 3.4** Reasons Why Callers Had to Wait*

		Daily average	Total Number
A	One operator (partner out of the office)	14.3	172
B	Receiving party not present	6.1	73
C	No one present in the section receiving the call	5.1	61
D	Section and name of receiving party not given	1.6	19
E	Inquiry about branch office locations	1.3	16
F	Other reasons	0.8	10
	Total	29.2	351

Figure 3.5

Reasons why callers had to wait. (Pareto Diagram)



4. Setting the Target

After an intense but productive discussion, the staff decided to set a QC program goal of reducing these waiting callers to zero. That is to say that all incoming calls would be handled promptly, without inconveniencing the customer.

5. Measures and Execution.

(1) Taking lunches on three different shifts leaving at least two operators on the job at all times. Up until this resolution was made a two-shift lunch system had been employed, leaving only one operator on the job while the other was taking a lunch break. However since the survey revealed that this was a major cause of customers waiting on the line, the company bought in a helper operator from the clerical section.

(2) Asking all employees to leave messages when leaving their desks. The objective of this rule was to simplify the operator’s chores when the receiving party was not at his desk. The new program was explained at the employees’ regular morning meetings, and company-wide support was requested. To help implement this practice, posters were placed around the office to publicize the new measures.

(3) Compiling a directory listing of the personnel and their respective jobs. The notebook was specially designed to aid the operators, who could not be expected to know the details of every employee’s job or where to connect his incoming calls.

6. Confirming the Results.

Although the waiting calls could not be reduced to zero, all items presented showed a marked improvement as shown below. The major cause of delays, ‘one operator (partner out of the office)," plummeted from 172 incidents during the control period to 15 in the follow-up survey.

FIGURE 3.6 Effects of QC (Comparison of Before and After QC)

	Reasons why callers had to wait	TOTAL NUMBER BEFORE	TOTAL NUMBER AFTER	DAILY AV. BEFORE	DAILY AV. AFTER
A	One operator (partner out of the office)	172	15	14.5	1.2
B	Receiving party not present	73	17	6.1	1.4
C	No one present in the section receiving the call	61	20	5.1	1.7

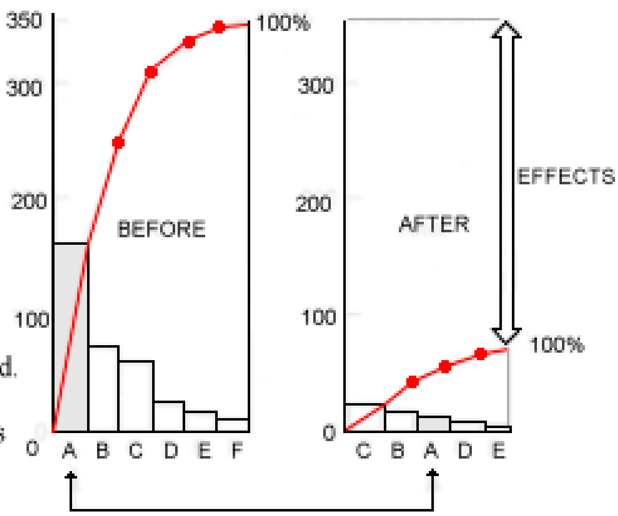
Period: 12 days from Aug. 17 to 30.

FIGURE 3.7

Effects of QC (Pareto Diagram)



Problems are classified according to cause and presented in order of the amounts of time consumed. They are illustrated in a bar graph. 100% indicates the total number of time consuming calls.

from 'The Quest for Higher Quality - the Deming Prize and Quality control," Ricoh Company Ltd.

4. Find a solution for the problem

5. Implement and evaluate

   When the cause of a problem has been identified, and a "cure" found, it must be implemented and evaluated once again, to confirm that the solution is working. If not, the analysis starts once again. See also the case study "Shortening customers' telephone waiting time". This cycle needs to be applied to every process in every operation, and it should never stop.

   You might ask, if a problem has been fixed, why can't it be checked off the list of things to correct, and fogotten about?

   Because nothing is static: suppliers may change some aspect of their materials; equipment may develop problems that, however slight, affect output; technology may be upgraded, requiring new and different training, and so on.

   Total quality control should allow for this ongoing cycle of continuous quality improvement, a concept that Japan has been using for a long time but which is still quite a revolutionary idea to most western organisations.

The principle behind the continuous improvement is Kaizen, a Japanes term which can be translated:

Kai = change Zen = good

Kaizen means improvement. Moreover it means continuing improvement in personal life, home life, social life, and working life. When applied to the workplace Kaizen means continuing improvement involving everyone - managers and workers alike. Kaizen can be stated the following:

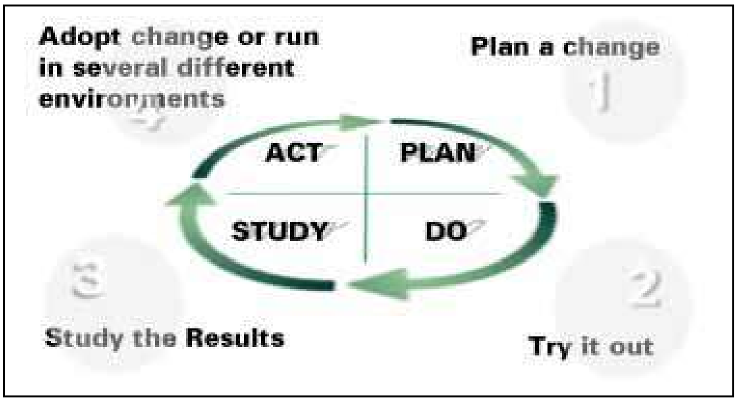
- "In its broadest sense, quality is anything that can be improved."
- "There is <u>always</u> a better way."
- "There is <u>no</u> acceptable best way."

It is through Kaizen that the processes which bring forth or sustain the product are made more competitive. If customer satisfaction (the larger the better) and cost (the smaller the better) are chosen as the primary quality characteristics, then the focus of workplace Kaizen is to improve value, and hence competitive advantage. Total Quality Control is the system to implement Kaizen.

Tools for continuous improvement

1. The Deming Wheel

The process of continuous improvement, called PDSA or, alternatively, PDCA (Plan/Do/Study or Check/Act), is often referred to as the *Deming Wheel*, although Deming called it the *Shewhart Cycle* (after its inventor, Dr. Walter Shewhart, a statistician and author of Statistical Methods from the Viewpoint of Quality Control), illustrated below:



Step 1: Identify a problem area or the opportunity for improvement, the reason for working on it, and an indicator- with an emphasis on the customer-for measuring improvement.

Step 2: Break down the problem area to determine its subparts, identify the components with the most impact on the customer, clarify the problem statement, and set a target for improvement.

Step 3: Evaluate the information gathered, and identify and verify the root causes of the problem. Utilize cause and effect analysis and the questions, "What causes this?" and "Why does this condition exist?" to eliminate the problem's symptoms and identify the underlying or root cause.

Step 4: Identify and select the proposed solutions or countermeasures to correct the root cause of the problem identified and verified in step 3. Evaluate potential countermeasures for effectiveness and feasibility, and support the one chosen for implementation with appropriate data such as cost-benefit analysis, barrier/aid identification, and an action plan to assure any barriers are overcome.

Step 5: Confirm that the problem and its root causes have been identified, countermeasures implemented, and the problem decreased and the target for improvement met.

Step 6: Assure that once a problem and its root causes have been identified and countermeasures implemented, the problem doesn't recur. Once the data obtained in step 5 confirm that the countermeasures have been successful, the improvement can be standardized, using control charts and/or standards or procedures. Replication should be utilized where the results are successful and can be shared with other areas doing similar work.

Step 7: Decide what will be done with any future problems, evaluate the team's effectiveness and lessons learned, and develop an action plan for remaining problems. This step identifies the Deming Wheel as a tool, which should continue to be used to evaluate the problem and any changes in circumstances. By continually turning the wheel, adjustments can be made as circumstances change.

2. Benchmarking

Another method employed in continuous quality improvement is known as benchmarking. Benchmarking involves the comparison and measurement of similar processes, and might take place on any of three levels:

- Within a company (e.g., between departments)
- Between a company and its competitor(s) or
- Against other industries.

It may not be known beforehand whether the process selected for comparison is better, equivalent or worse than the one being measured, but often those doing the benchmarking will look for the "best in class" -- a top-notch yardstick against which to measure and which, it is hoped, will aid in their own process improvement.

Benchmarking is not new. We all perform it to some extent every day, and never give it a second thought. For example, we may realize that our colleague has found a quicker route to work. The majority of us will be keen to learn how this improvement has been achieved, so we ask. We get the maps out and clarify exactly the route taken, and implement the action to achieve the improvement...until an even better route is identified. Improvement is a never ending journey.

What can be so difficult about examining how other organizations have achieved improved performance?
The answer is nothing, but "examining others" is a world away from really learning "how" they achieved the improvement.

1. How do you identify a suitable activity to benchmark?

As with all improvement activities, it is better to start with a known problem area that is able to be defined, or an activity where improvement will provide maximum benefit.
Once the subject activity is identified, spend as much time as possible defining it. The more clearly you know your problem, the easier it will be to identify differences that will lead to major improvement.

2. How do we gather the information?

- Develop a questionnaire with all the information you want to obtain. Remember to phrase questions to gain maximum comparative information. Ask open-ended questions-How? Where? When? Who? What?-and allow for scaled answers (very important, important, not important). Review the questionnaire with a team of others to identify ways to improve it.
- Complete the questionnaire for your own organization. This is a good test of the questions and also ensures that you can respond to similar requests for information from your benchmarking partners.
- Write down your reasons for asking each question. Again, this will test if all the questions are really necessary, and will provide you with a ready-made answer when the partner asks, "Why do you want to know that?"
- Talk to the benchmarking partner. Describe and clarify your areas of interest, objectives and primary questions. Ask if these areas have been covered before (the information you seek might already be available).
- Arrange a visit (eyes are as useful as ears-and they double your chances of learning).

3. How should a visit be performed?

- Prepare thoroughly. Find out as much as possible about the benchmarking partner from other sources (publications, consultants, trade associations, etc.) so that you can maximize knowledge gained from direct contact with the partner.
- Use a small team (two people is ideal) and nominate one as the leader. Thank the partner (again and again). Debrief as soon as possible after the visit.

4. What to do with the information gained?

- Use it to compare the similarities and differences in your two organizations and activities, in order to clearly identify improvement opportunities. Share the knowledge with all interested parties in your own organization, and then take the improvement action!

But several of the quality "gurus" warn of the limitations in benchmarking, some of which include copying a more successful competitor's performance without understanding the underlying reasons for the performance, and seeing it as an end in itself. Even if your company found it was the "best in class", that doesn't mean it's time to stop looking for ways to improve quality. The search for total quality control should be never- ending.

QUALITY ASSURANCE

Quality assurance is the method by which organisations try to ensure that their product conforms to specifications and meets customer expectations. "Assurance" consists of a system of rules or procedures setting standards for activities in an organisation. It is possible to develop this for one company, but having one which several conform to has its benefits. For example, the need for Quality System Standards was recognised in the 1960's by UK armed forces, which had suffered from high levels of equipment failure. Successful implementation there led to similar standards being applied to other high-risk industries (e.g., nuclear plants).

Once the benefits of applying such standards had become apparent, the concept spread to industries in general, leading to the development by the British Standards Institute in 1979 of a standardised, formal quality assurance system known as BS5750. Although companies could follow their own, internally developed quality standards, it also become apparent that implementing a formal, nationally approved system could give a distinct edge in an increasingly competitive marketplace, and more and more companies chose to go with BS5750. This, in turn, led to the development of an internationally recognised Quality System Standard known as ISO9000. Instituted by the Geneva-based International Organisation for Standardisation, and directly based on BS5750, ISO9000 (and no, it is not an incorrect acronym, but simply usage of the prefix "iso", meaning "equal") was formally adopted by a number of countries in 1987.

Like BS5750, ISO9000 has three levels, the first, ISO9001, is the most demanding. The second level concerns only production and installation, while level 3 is limited to final inspection and tests. ISO9001 covers the following areas:

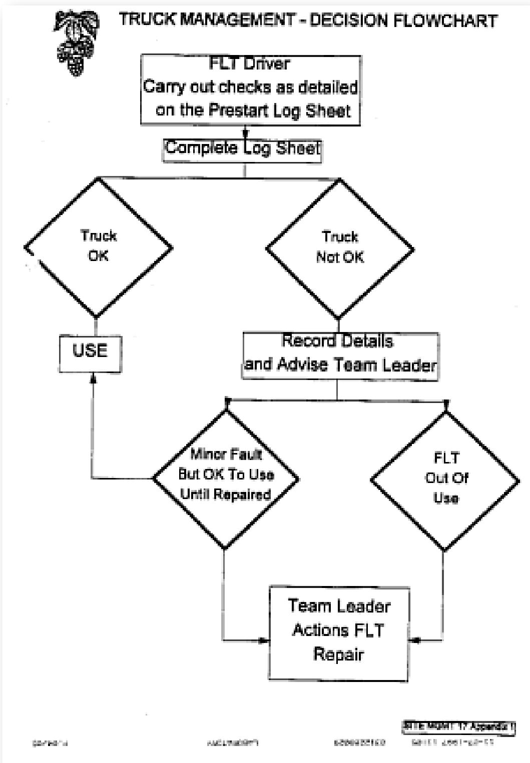
Although the standards were originally developed for use in manufacturing, they have been expanded to apply to service industries as well. Sometimes ISO9000-type procedures are in place even if the system has not been formally adopted.

ISO9000 has a lot to recommend it: it's well laid out and easy to follow, provides opportunities to discover and implement quality improvements in operational processes, and reassures customers that a company is both in compliance with industry - wide system specifications and has a commitment to providing the best possible product. It would seem that ISO9000 is the perfect way to ensure quality. But is it? Rules are not always what they seem or appropriate:

Businesses often think that, once they "have ISO9000", they automatically have a quality product, but that may not be the case. Take another look at the list of areas above for ISO9001: each process is being monitored, but there's no guarantee that the process itself -- no matter how long or recently it's been in place -- is any good. It's been pointed out that, under ISO9000 rules, you could produce a lifejacket made out of concrete.

ISO9000 is a good starting point, and should be customised for individual organisations. But in its current form, it doesn't cover enough ground; opportunities for quality improvements to a process are not necessarily spotted or acted upon; it doesn't allow for customer feedback, and it can be too inflexible.

CASE STUDY - FOUNTAIN BREWERY - FORKLIFTS



Forklifts are important pieces of equipment at the Brewery, as they are used to transport the completed packages of beer from their pallets to loading areas and then onto delivery trucks.

Scottish Courage follows ISO9002 procedures, adapted for the company's use, for the management and maintenance of their forklifts. A Truck Management Decision Flowchart is appended to this basic outline of procedures, which, when used in conjunction with the "FLT Prestart Log Sheet", helps the employees decide whether a forklift is operational, faulty but operational, or not fit for use. Scottish Courage implemented BS5750 in 1991 solely for its Small Packaging area. Quality System Manager *Terry McLaughlin* says there were two reasons for the implementation: it was seen as a good commercial advantage, and they were under external pressure from customers. "When Scottish Courage and Scottish & Newcastle merged in 1995," he recalls, "management looked at its business strategy and decided to make Quality System the foundation of operations. ISO then became the objective for everybody." Systems were phased in over several years, and the entire site received full ISO registration in July 1996.

"We've decided as a company that we want to base management on ISO and Total Quality; it enhances our business opportunities", says Terry. ISO procedures add consistency to the Brewery's operations, but "it's not seen as set in stone. It's an organic system, is being developed and will continue to be developed. Procedures are subject to regular change if we feel things are not as good as they could be."

TOTAL QUALITY MANAGEMENT

Total quality management is a holistic, dynamic approach to management. It involves all of the preceding aspects of quality, but takes them further and integrates them completely into an organisation. TQM focuses on:

- Customer satisfaction.
- Involvement
- Continuous improvement.

Customer satisfaction.

Whether the customer is external or internal to the company, this is what keeps a company in business. Marketing departments often take on the task of determining what the customer wants, via methods such as customer surveys. But surveys may have design pitfalls: if you don't ask the right questions, you won't get the right answers. For example, it's an asset if your salespeople are perceived by all concerned as polite and cheerful, but that won't improve your sales figures if they can't supply your customers with necessary product on a timely basis. TQM must consider both current and future customer needs, while keeping in mind such possibilities as the development of new products that customers might not think of on their own but which they would respond positively to.

Involvement.

To achieve TQ, everyone in an organisation must be committed. Achieving this commitment is not easy and takes a long time (for example, Juran would say five years). This is why most authors suggest that organisations need strong leadership and commitment from the top. Companies use mechanisms such as Quality Circles (which nowadays are cross-functional teams that meet regularly) and suggestion schemes to include people in the TQ objective. However, if these are not complete with training and information sharing, they won’t work. The best results come when people work on issues which are relevant to them, using techniques they are familiar with, and they have the responsibility and often the resources to effect changes. Prior to practical and effective implementation of the TQ the following breakthrough concepts are necessary:

- Change the way of thinking of the individual
- Change the way of doing things in the company

Continuous improvement

In the ideal TQM environment, all processes are constantly under examination, and everyone in the company is committed to the concept of continuous improvement. If an organisation recognises that analysis and improvement of processes must be never-ending in order to achieve and retain customer satisfaction, provides avenues for both customer and employee feedback, and uses all the quality tools available, Total Quality Management can be realised.

Maintenance & Repair
Module 2

(32 hours Course)

With technical assistance from:

GERMAN DEVELOPMENT SERVICE

General Survey –"Maintenance & Repair"- Module 2 Course

TARGET PARTICIPANTS
min 18 years old, at least High School graduates, experienced workers, supervisors or leadsman

LENGTH OF COURSE
32 hours / 4 days

OBJECTIVES

At the end of the course, the participants should be able to:

- know the importance of maintenance for an industrial plant in general.
- know the common types of bolts, nuts, stud bolts, parallel- and taper pins, keys, snap ring and make use of them.
- know different types of bearings, the tolerances for shaft and housing, the arrangement of bearings, different methods on how to locate them, different mounting and dismounting methods and the tools needed during these operations.
- know the most important types of seals, e.g. face seal, O-ring, Radial shaft ring, V-ring, Labyrinth ring, Packings …….
- know typical operation materials e.g. lubrications, gaskets, sealing materials, cleaner, cleaning cloth and how to use them efficiently.
- know the importance of safety check and environment conscious before starting a repair job. Use the proper safety procedures and the safety equipment
- Study a typical method on how to repair a machine: Verify, dismount, clean, repair and mount one type of enclosed gear drive. Lubricate the unit and make a test run.

COURSE OUTLINE

THEORY (50 %)	HANDS-ON TRAINING (50 %)	METHOD
• Joint Connections • Rolling Bearings • Seals • Repair job procedure • Safety during repair activities	• Dismount a speed reducing gear completely, incl. ball bearings and gaskets • Mount the gear and choose the right lubrications • Assemble the gear together with an electric motor on a mounting plate and align their coupling and make a test run	• Lectures / Discussions • Worksheets • Practical Sessions • Case studies/Group discussions • Videos

Table of Contents

August 2000

Dear Reader,

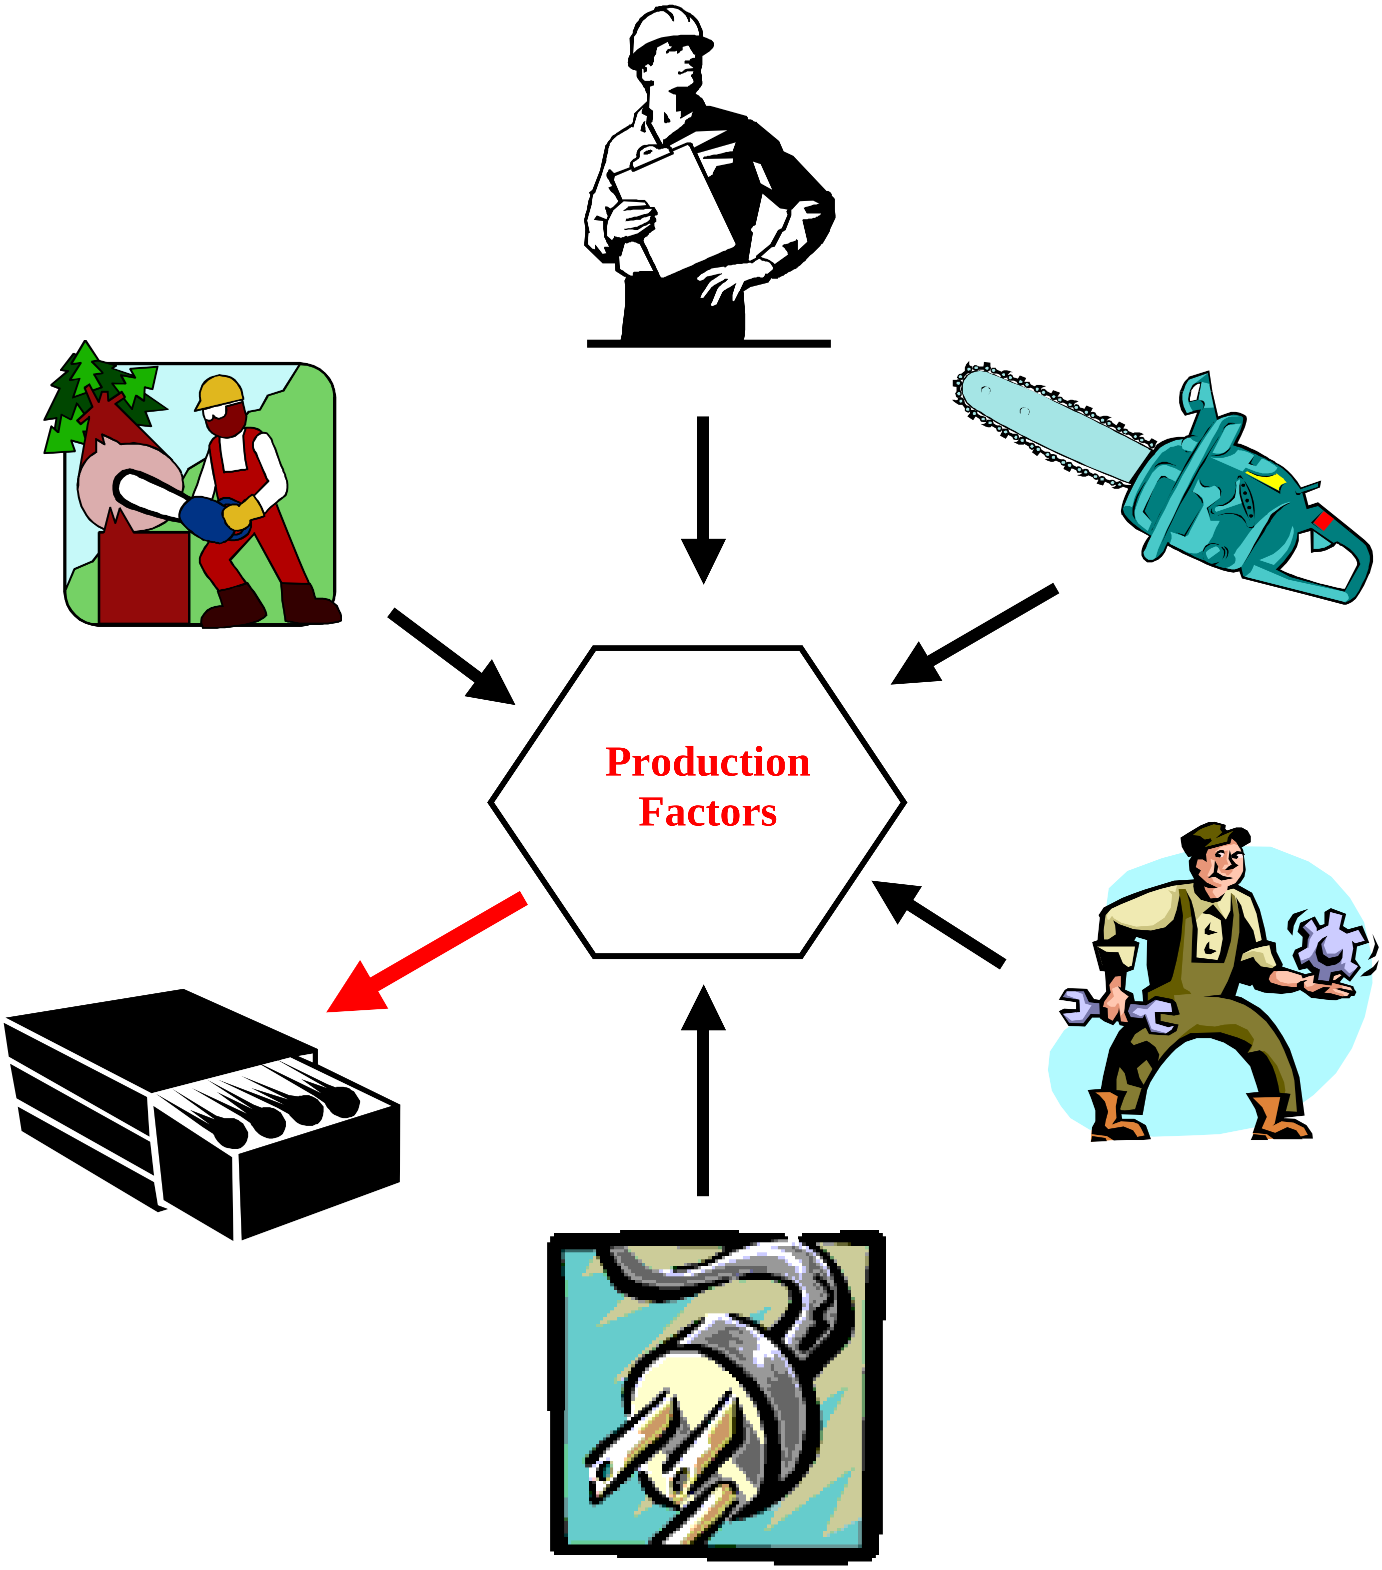
I would like to comment this handout, because otherwise you might get a little confused while studying it.
The most important thing to know is, that this handout is developed for a **non-formal** Training Center. The participating government officials and the involved companies were not interested in long-term courses. So, I had to respect the wish of my project partners for a course with this length and was limited on the most important subjects.

One or two of the modules are still under construction. Sorry for this.

DED – Development Worker

1. INTRODUCTION IN MAINTENANCE & REPAIR MODULE II

1.1 Importance of Maintenance in General



1.2 Examples of typicall Machinery and the common Repair Tasks

Machine	A	B	F	S	M	L	EM	DB	H	P	RW
Elelectric Motor	X	X	X	X	X	X	X	X			
Gear Drive	X	X	X	X	X	X	X				
Pump	X	X	X	X	X	X	X	X			X
Exhaust Fan	X	X	X	X	X	X	X	X			X
Drier	X	X	X	X	X	X	X		X		X
Disintegrator		X	X	X	X	X	X				X
Centrifuge	X	X	X	X	X	X	X	X	X	X	X
Compressor	X	X	X	X	X	X	X			X	
Injection Moulding	X	X	X	X	X	X			X	X	X
Rollers	X	X	X	X	X	X	X				
Conveyor Belt System	X	X	X	X	X	X					
Stirring Aparatus	X	X	X	X	X	X	X				X

A = Alignment
B = Ball Bearing
DB = Dynamic Balancing
EM = Exact Measuremment
H = Hydraulic
M = Machine Shop

S = Sealing
L = Lubrication
F = Fastening
P = Pneumatic
RW = Repair Welding

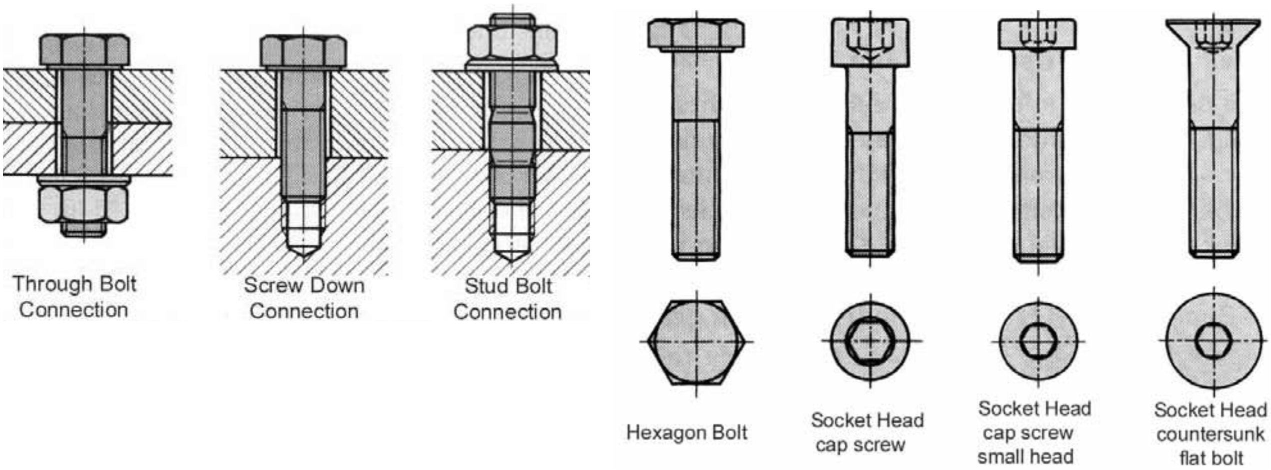
2. JOINING

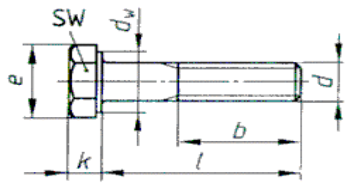
The joints we will explain in this chapter can be applied universally as ready-to-mount machine elements. This is especially due to the fact that the dimensions of the popular joints are standardized according ISO (International Standardization Organization).

2.1 Screw Joints

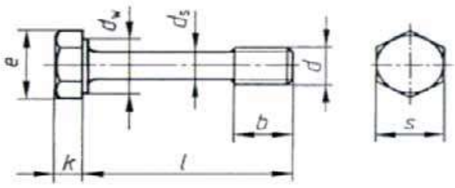
2.1.2 Types of Screws and Bolts

Practically we distinguish screws through the form and size of head, through dimensioning of shaft and thread and through the material from which they are produced.

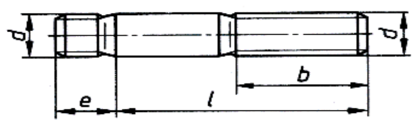




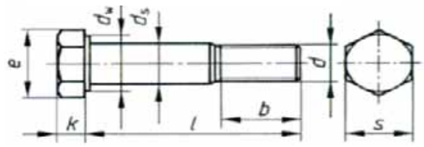
Hexagon Bolt



Anti-Fatique Bolt

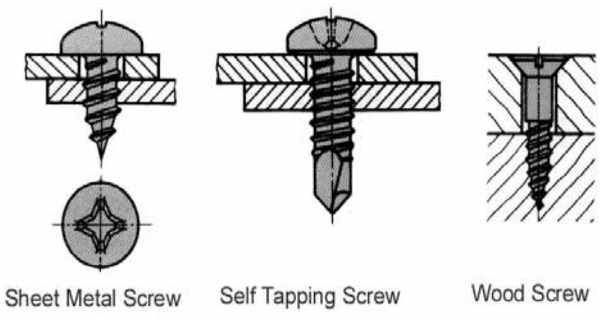


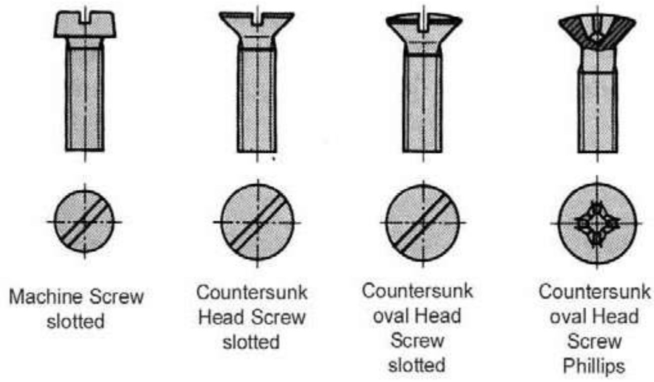
Stud Bolt

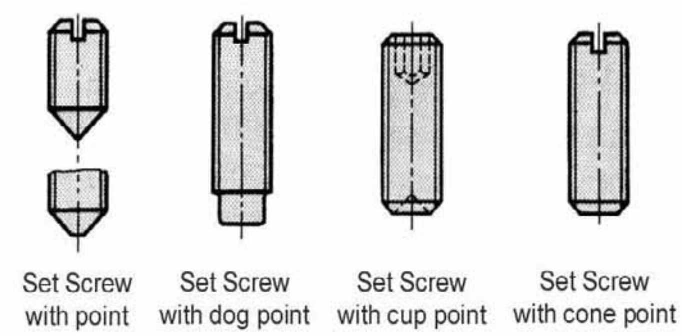


Body Fit or Dowel Bolt

Hexagonal Head Screws and bolts are used with nuts in through holes and without nuts in threaded holes, in which an internal thread is cut in the actual work piece.
Stud Bolts are used if the joint is to be separated frequently. The shorter threaded end of the stud is screwed into the workpiece.
Hexagon Socket Head Screws save space because of their cylindrical heads, which can also be countersunk.
Body-Fit Bolts are used if movement between the workpieces must be prevented, and shear forces are high. Their shank diameter is slightly higher than the thread diameter.
Anti-Fatigue Bolts are used in screwed joints subject to continous alternating loads. The anti-fatique bolts are tightened with wrench to a specific value specified by the manufacturer. Anti-fatique bolts have a longer life under the condition of alternating loads than normal bolts.







Slotted Head Screws and cross-recessed (Phillips head) screws can have various head patterns: half round (domed head), cheesehead, countersunk, raised cheesehead or raised countersunk

Set Screws are screws without a head, threaded for their entire length. Depending on the application they can have various ends: coned point, full dog point, cupped point. Grub screws (setscrews) are used for the clamping or locking of hubs, bushes or bearings.

Wood Screws are available with slotted, square or hexagonal heads. They are used for joints between wooden parts.

Sheet Metal Screws (self-tapping screws) are used to make joints with sheet metal. Their threads are similar to wood screws. As they are tightened, they cut their own thread in the sheet metal. The hole in the sheet should have the same diameter as the core of the screw. Clamp nuts (sheet-metal nuts) are also frequently used. The joints are vibration-resistant and can be separated any number of times. Sheet metal screws are available with slotted, cross-recessed or hexagonal heads.

Thread Bushes are used if the thread is to be cut in a soft material and/or if the screwed joint has to be detached often.

Thread Inserts (Heli-Coil) are used if the thread already cut in the workpiece has been damaged. Thread inserts consist of a rhomboid-form chrome nickel steel wire formed into a coil to produce an inner and an outer thread. Procedure to repair a damaged thread:

- Drill out the damaged threads using the drill size specified in the manufacturers catalog
- Tap the hole using the special Coil Tap specified in the manufacturers catalog
- Install the replacement Coil. Wind the Coil into the hole. To brake the tang using the recommended special tool.

2.1.2 Designation of Screws, Bolts and Nuts

The designation of all screws, bolts and nuts are world wide standardized in the **ISO Norm:** For further information ask your supervisor or your supplier.

Example for Hexagon Bolt:
Hexagon Bolt ISO 4017 M12 x 80 - 8.8

ISO 4017	=	Specific ISO Norm
M12	=	Metric thread 12 mm outside diameter
80	=	Length of Shaft is 80 mm
8.8	=	Tensile Grade 800 N/mm^2, Offset Yield Stress 640 N/mm^2

Property Classes for Bolts:

Steel screws are marked with the manufacturer's symbol and the strength rating. This consists of two numerals separated by a point, for example 8.8. The first number is one-hundredth of the minimum tensile strength in N/mm^2, in our example the strength of 800 N/mm^2. The second number is ten times the apparent yield point ratio. Just multiply the first number with the second number (8 x 8 = 64) and multiply it by ten (10 x 64 = 640 N/mm^2).

Property Class	3.6	4.6	4.8	5.6	5.8	6.8	8.8	10.9	12.9
Tensile Grade in N/mm^2	300	400	400	500	500	600	800	1000	1200
Offset Yield Stress in N/mm^2	180	240	320	300	400	480	640	900	1080

2.1.3 Materials for Bolts and Nuts

- Black (standard bolt)
- Chrome-plated
- Nickel-plated
- Black finishing (Gunmetal look)
- Zinc coated (galvanized)

2.1.4 Minimum Screw-In length for bolts

To give a bolt connection its full strength, the minimum screw-in length should be at least 1 times the outside diameter of the thread.

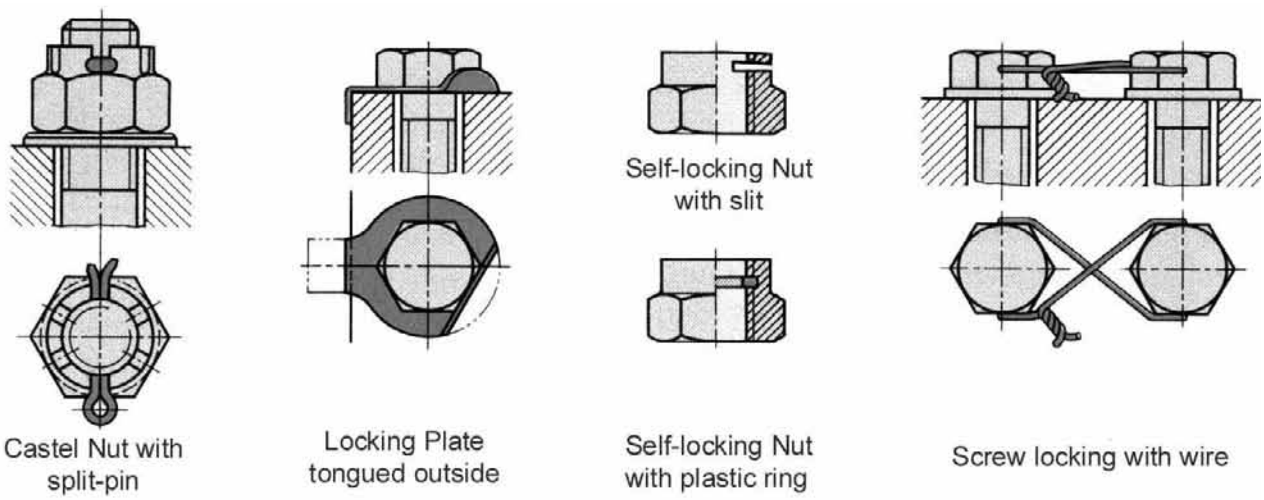
Minimum screw-in length = 1 x D of thread

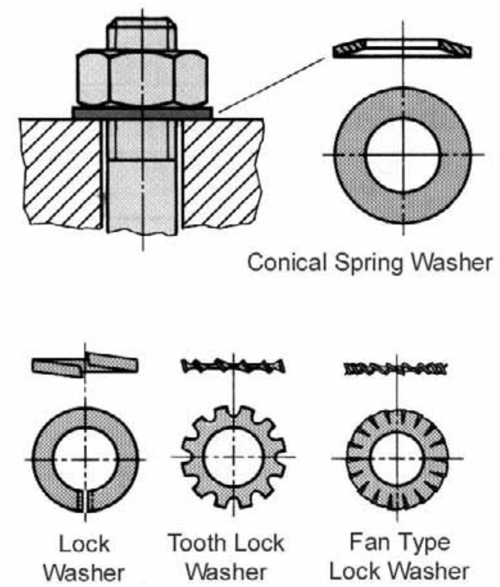
2.1.5 Nuts

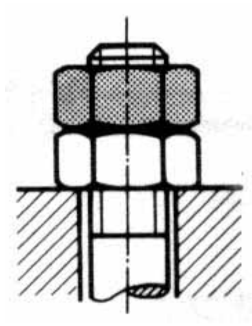
Type	Use	Type	Use
	Hexagon Nut For general use in combination with all kind of bolts. Thickness of about 0.8 x d		Castle Nut To secure the bolt connection with split-pin
	Cap Nut • Protection for the end of the thread • Protection against injury		Self-locking Nut with plastic Ring This type will protect the bolt connection against loosening
	Ring Nut or Lifting Eye Ring for transportation of equipment		Wing Nut For often to loose/ fasten bolt connections. Can be tightened by hand.
	Capstan Nut (Cross Hole Nut) For adjustment of axial play and for fixing bearings on shafts		Groove Nut For adjustment of axial play and for fixing bearings on shafts

2.1.6 Bolt Connection Locking

Screw joints are subject to vibration. They can loosen by themselves. Screw lockings are necessary and specified when human lives or expensive/sensitive equipment depend upon stability of such joints, e.g. in motor vehicles, elevators.







Counter-Nuts

Spring **washers** and toothed or **serrated lock washers** apply a load to the nut and also bite into its surface and that of the workpiece. Convex or corrugated spring washers are also used. In the case of double nuts (locknuts, counter-nuts or check nuts), the top nut elongates the end of the screw or bolt within the elastic range as it is tightened down against the lower nut. This presses the two nuts together and prevents them from coming loose.

Lock **washers** are made from thin steel sheet. If a **wire keeper is** specified, a soft steel wire is inserted through holes in the screw head and twisted to tighten it. The wire must be attached in such a way that it is stressed in tension if a screw tends to work loose.

Castle nuts can be locked very reliably by means of split pins. However, the range of adjustment is limited by the number of slots on the nut.

Elastic stop nuts (self-locking nuts) have a firmly located polyamide ring at the end of the thread, which is pressed into the bolt threads when the nut is screwed on, and prevents the screwed joint from working loose. The friction exerted by the polyamide ring means that greater tightening torque is required. These nuts must be used only once.

One common method of locking bolt connections is the use of glue (**LOCTITE**). The bolt thread and the female part of the thread must be free of oil, grease or any other contamination.

2.1.7 Screw Tightening Tools

Screwdrivers with a plain blade are used for slotted-head screws. To prevent damage to the screw head, the screwdriver blade must be of the correct width and thickness. It must be flat and not ground to a wedge shape**.** For the various types of cross-recesses screws there are special patterns of screwdriver.

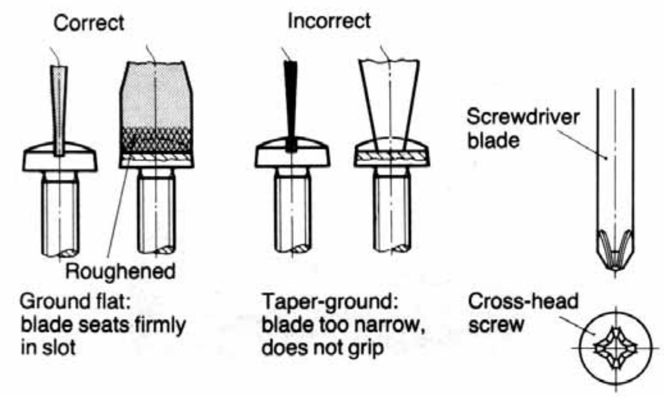
The force exerted by a spanner or wrench should be sufficient to obtain an adequately firm screwed joint after tightening, with no risk of overstressing or stripping the thread. This can occur if the spanner is extended by attaching a length of tube to its handle, in which case the thread may well be damaged beyond repair. Spanners should always be an exact fit on the bolt head or nut.

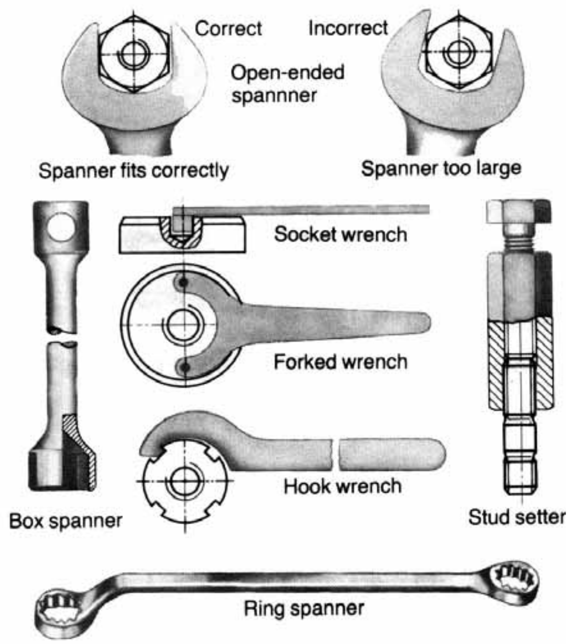
If the spanner is too large, the bolt head or nut will be damaged and will tend to become round, so that even the correct size of spanner no longer fits; furthermore, a slipping spanner could cause an accident.

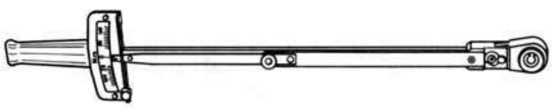
Torque wrenches indicate the amount of torque being exerted on a suitably calibrated scale. If the values specified by the automobile manufacturer, for instance, are adhered to, all threaded connections on the vehicle will be tightened correctly.

Screws and nuts should not be tightened with too much force or they may be damaged; if they are too loose, on the other hand, they could fail to grip and work loose.

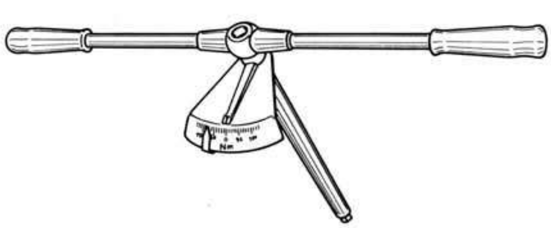
Most torque wrenches can be set to a definite value. If this is exceeded, the wrench slips and therefore cannot overtighten the joint. There are many plug-in heads and inserts for torque wrenches, particularly for tightening various sizes of hex bolts and nuts.







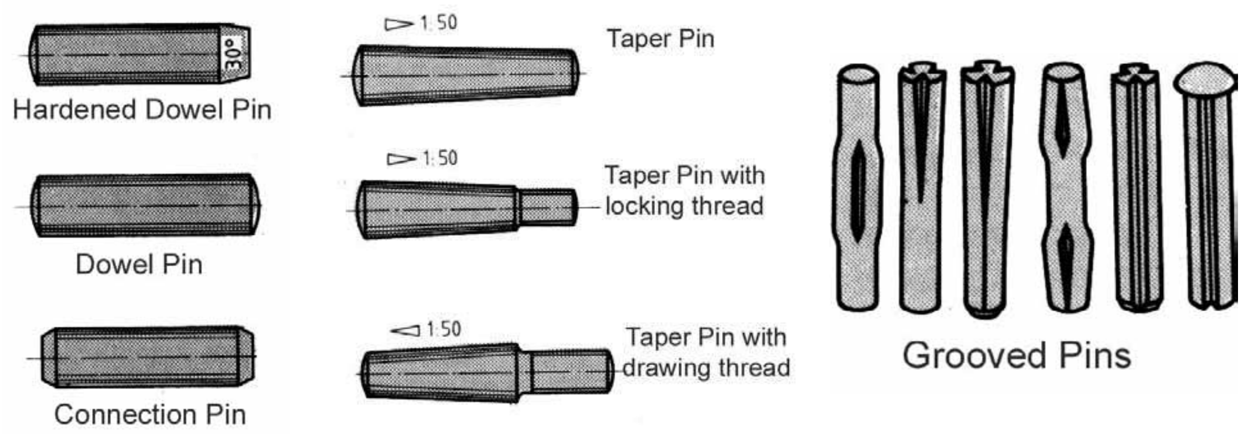
Torque Wrench



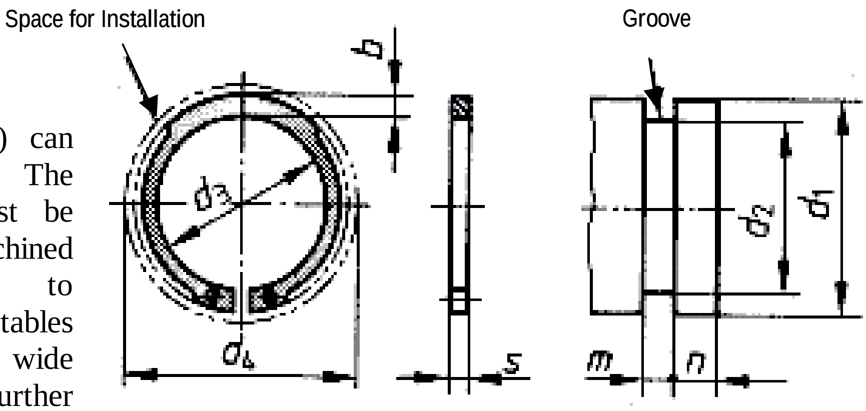
2.2 Pin Connections

Pin connections fulfill two functions:

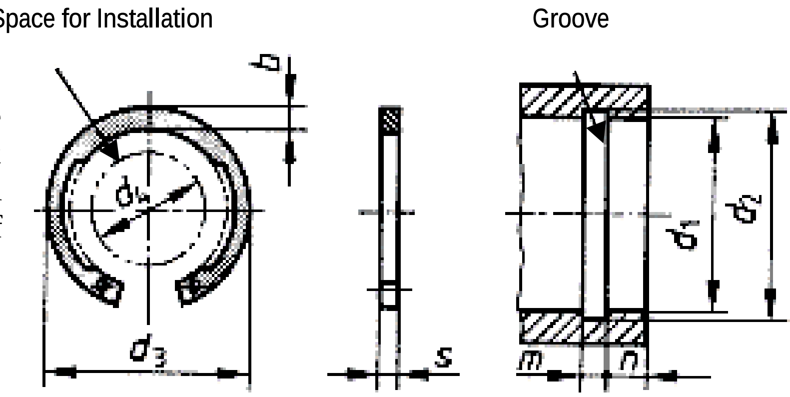
a) Connection of components such as hand wheels, small gears, cranks, etc., to shafts
b) Fixing components such as housing covers, stops, parts of cutting tools, etc., against shifting and to ensure that they occupy their original position, even after detaching and reassembling. Pins are subject to shearing stress.



2.3 Snap Rings



Snap Rings (Seeger Rings) can absorb great axial forces. The grooves for the ring must be sharp-edged and machined precisely according to measurement tables. Those tables are following the world wide accepted ISO standard. For further information ask your supervisor or check with the supplier manual.

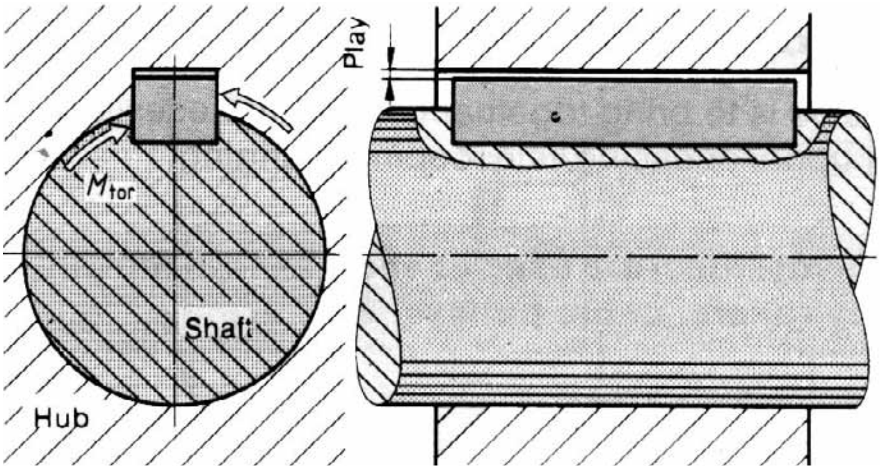


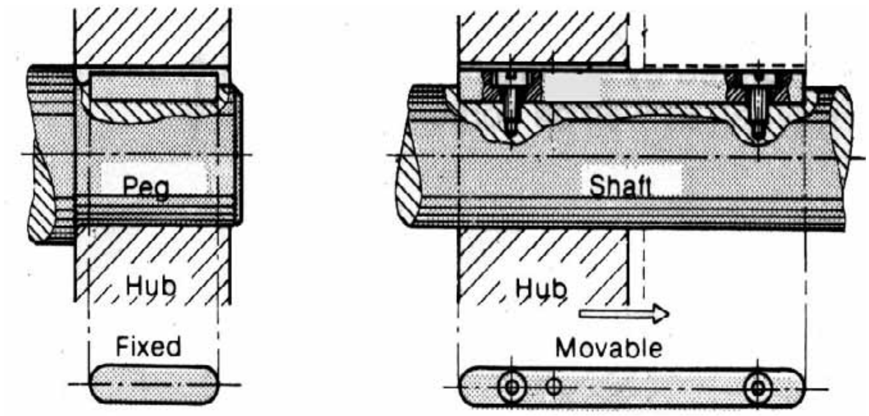
To measure and order a snap ring just measure for shafts, the shaft diameter. For holes, just measure the hole diameter. In addition measure the thickness of the ring.

Example for Shaft:
Shaft 40 x 1.75 is a ring for a 40 mm shaft with a thickness of 1.75 mm.

2.4 Feather Keys

The feather key connection is transmitting torque by positive locking. Depending on the type of connection the fit between the feather key and the keyway needs a different layout.
For example: For sliding gears there should be a loose clearance fit between the hub keyway and the feather key. Between the shaft keyway and the feather key there should be a transition fit.





The size of feather key depends on the diameter of the shaft. The table below shows the standardized sizes according ISO.

Diameter	**6 to 8 mm**	**8 to 10 mm**	**10 to 12 mm**	**12 to 17 mm**	**17 to 22 mm**	**22 to 30 mm**	**30 to 38 mm**	**38 to 44 mm**	**44 to 50 mm**
Width	2 mm	3 mm	4 mm	5 mm	6 mm	8 mm	10 mm	12 mm	14 mm
Height	2 mm	3 mm	4 mm	5 mm	6 mm	7 mm	8 mm	8 mm	9 mm

3. ROLLING BEARINGS

Bearings, especially large heavy-duty bearings are a major capital expense for many industries, with each one costing several hundred to thousands of dollars. Even more significant is the replacement cost for such bearings, since lost production and labor cost must be included in total cost involved when a bearing fails. Premature failure can happen through:

- Poor Fitting (fits to tight or to loose, wrong mounting tools) = 16 % of all bearings
- Poor Lubrication = 36 % of all bearings
- Contamination = 14 % of all bearings
- Fatigue (overloaded, or incorrectly serviced) = 34 % of all bearings

3.1 Introduction

All bearings that transfer loads via rolling elements are named rolling bearings. They use balls or other rolling elements, located between bearing rings, to minimize friction. The rolling elements are separated and held in position by "cages".

The fundamental purpose of a bearing is to transmit a load between a stationary part of a machine **(most likely a housing)** and a rotating part of a machine **(most likely a shaft)** with a minimum of resistance.

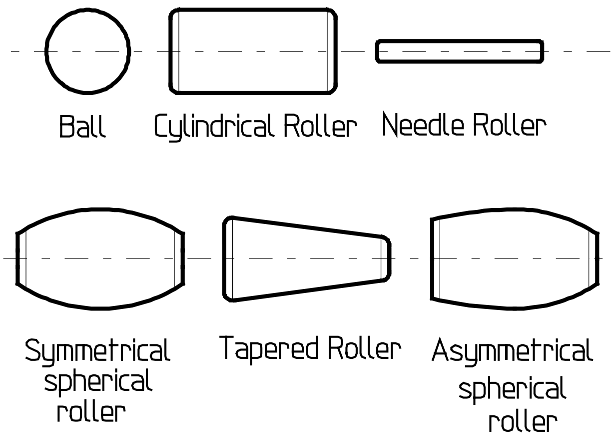
A rolling bearing has to transmit loads between the inner and outer rings of the bearing via the rolling elements. Depending on the type of rolling element that are used, the rolling bearing are classified into two groups:
- Ball Bearing – Load is carried over a very small surface – **Point Contact**
- Roller Bearing – Load is carried over a bigger surface **– Line Contact**

In general we can say, that ball bearings will generate under the same load more friction than roller bearings.

Bearings are further classified by the specific shape of their rolling elements:
- Ball, Cylindrical, Spherical, or Tapered.

Bearings are also classified by function depending on the direction of the applied load.
- Radial, Thrust or Combined

Rolling Elements



3.2 Components of Bearings

Outer Ring The outer ring is mounted in the housing of the machine and in most cases it does not rotate. The raceway against which the rolling elements run have different forms – sphered, cylindrical, tapered – depending on the type of rolling elements.

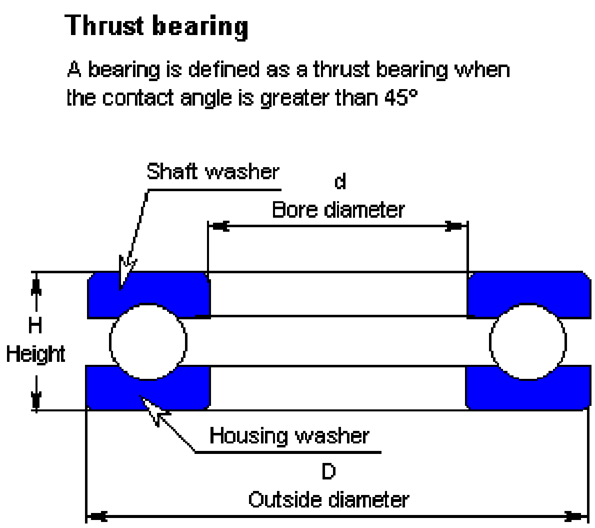
Cage The cage separates the rolling elements preventing contact between them during operation, which would cause poor lubrication conditions. With many bearings types the cage holds the bearing together during handling.

Inner Ring The inner ring is mounted on the shaft of the machine and is in most cases the rotating part. The bore can be cylindrical or tapered. The raceways against which the rolling elements run have different forms - sphered, cylindrical, tapered – depending on the type of rolling elements.

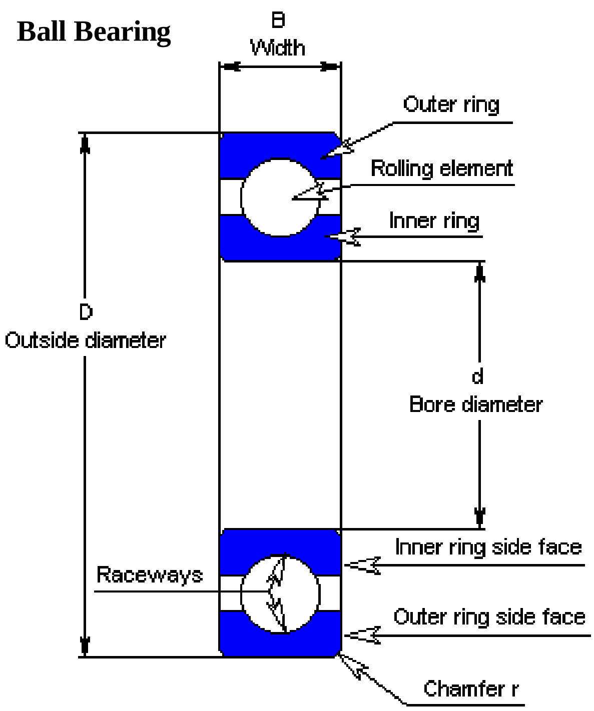
Rolling Elements The rolling elements can be balls, cylindrical rollers, spherical rollers, tapered rollers or needle rollers. They rotate against the inner and outer ring raceways and transmit the load acting on the bearing via small surface contacts separated by a thin lubrication film.

Seal Seals are essential for a long and reliable life of the bearing. They protect the bearing from contamination and bearings with integral seals are becoming increasingly popular.

Guide Ring Guide rings are used in spherical roller bearings. The function of the guide rings is to guide the rollers in the bearings so that they rotate parallel to the shaft and to distribute the load evenly. The quality demands for guide rings are extremely high and even the slightest ovality is totally unacceptable.



Ball Bearing

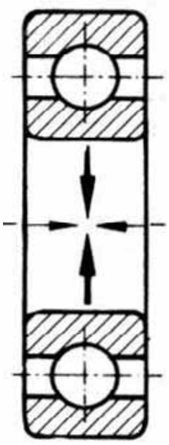


Materials used in bearings production:

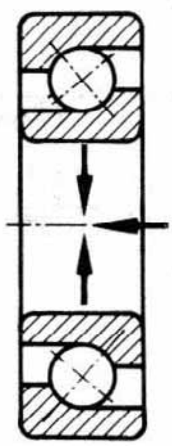
- Through hardening steel, very clean for outer and inner ring
- Hardening steel, very clean for rolling elements
- Cages are made out of steel, brass or light alloy and plastic
- Side shields are made out of rubber, metal sheet or polyurethane or synthetic

3.3 Types of Bearing

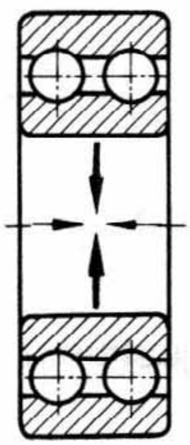
There are more than 20,000 different bearings available on the market. The weight for example can be only a few grams up to more than 70 tons. Below you can find the most common types:



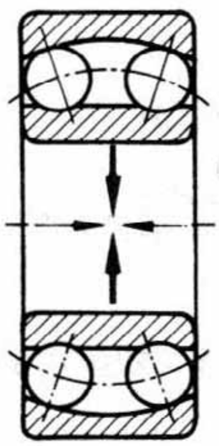
Deep Groove Ball Bearing



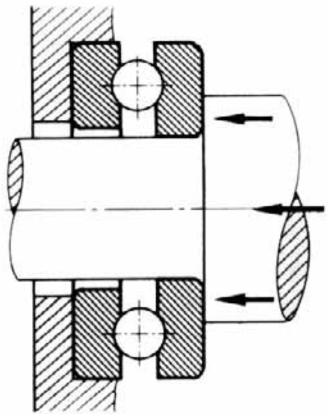
Angular Contact Ball Bearing



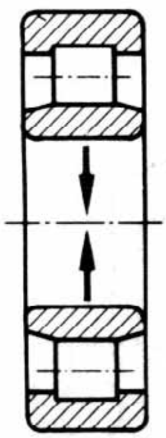
Double Row Deep Groove Ball Bearing



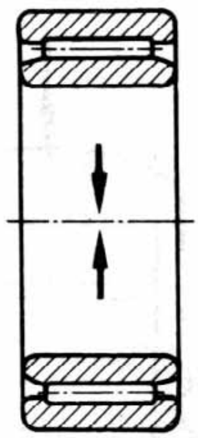
Self-Aligning Ball Bearing



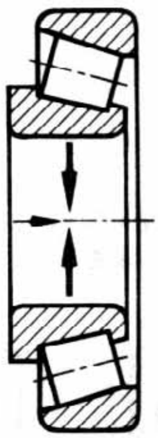
Thrust Ball Bearing



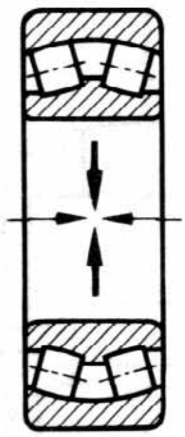
Cylindrical Roller Bearing



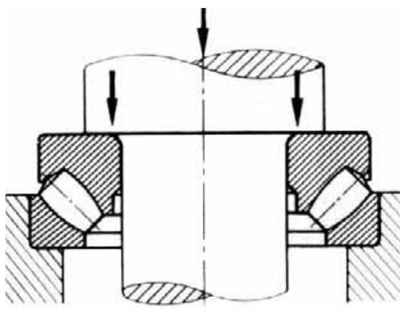
Needle Roller Bearing



Taper Roller Bearing



Spherical Roller Bearing



Spherical Roller Thrust Bearing

Note: The arrows show the possible load (radial, axial or combined)

3.4 Bearing Properties

Bearing Type	Loads	Comments
Deep Groove Ball Bearing	• High radial loads at very high speed • Combined loads	Most popular and cheap bearing. Used in a wide variety of applications. Simple in design, non-separable. High to very high speeds. Low friction and quit running. Double row available.
Angular Contact Ball Bearing	• Combined loads	Raceways in the inner and outer ring. Used in general engineering. Double row available as well as four point contact ball bearings. Suitable for combined loads
Self Aligning Ball Bearing	• Combined loads	Two rows of balls with a common spherical raceway in the outer ring. Particular suitable to correct misalignment.
Thrust Ball & Cylindrical Thrust Bearing	• Purely axial loads only	Are composed of washer-like bearing rings with raceway grooves for the balls. The ring attached to the shaft is called the inner ring or tight washer and the ring attached to the housing is called the outer ring or loose washer. Suitable for axial loads in one direction. But there are also double direction bearings available.
Cylindrical Roller Bearing	• Purely radial loads at high speed if there are no flanges • Moderate combined loads if flanges	Rollers are guided between integral flanges on one of the bearing rings. Suitable for high speeds and high radial load. Double row available. Inner and outer ring separable. Available in N (separable outer), NU (separable inner), NJ (separable inner, one direction), and NUP (non-separable).
Needle Roller Bearing	• Purely radial load	Roller bearing with cylindrical rollers, which are thin and long to their diameter. Best suitable for high radial loads with limited radial space.
Taper Roller Bearing	• Combines loads	Taper roller bearings have tapered inner and outer ring and tapered rollers. Separable designed. Double row bearings available.
Spherical Roller Bearing	• Combines loads	Two rows of rollers. Common raceway in the outer ring. Particular suitable to correct misalignment. Bearings available with cylindrical bore and tapered bore.
Spherical Roller Thrust Bearing	• Combined loads	Have a spherical raceway in the outer ring with the rollers diagonally arranged in a single row. These bearings have a very high axial load capacity and are capable of taking moderate radial loads. Capable of handling misalignment and are suited for moderate speed operation.

When selecting a rolling bearing the following points should be always considered:

Property	Comments
Loads	What kinds of loads are to expect with this type of machine? Is this bearing suitable for this application?
Misalignment	It is always important to align auxiliary drives exactly. But if misalignment is a permanent problem, then self-aligning bearings should be chosen.
Temperature	Is the chosen bearing suitable for the temperature condition? Especially plastic cages and plastic bearing seals are sensitive against higher temperatures.
Speed	Deep groove bearings are most suitable for very high speeds. But more speed means also more friction this could generate a temperature problem. There are special high speed/high precision bearings available.
Mounting & Dismounting	Mounting & Dismounting is a cost factor. Consider this if you design or redesign a machine. Bearings with cylindrical bore and separable parts are most suitable if dismounting is often required.
Available space	If there is a space problem deep groove bearings are useful when shaft is small. Needle roller bearings for radial loads only should also be considered.
Quit running	Especially deep groove ball bearings are designed for quit running. If noise is a factor, than consider choosing a bearing type with special design for quit run.
Stiffness	Roller bearings have a higher stiffness than ball bearings.
Axial displacement	If axial displacement (shaft is moving) is a problem, then bearings with the ability to stand combined loads should be selected. Or cylindrical/needle bearings with one flange.
Precision	Some machines, especially with high rotation need high precision bearings.

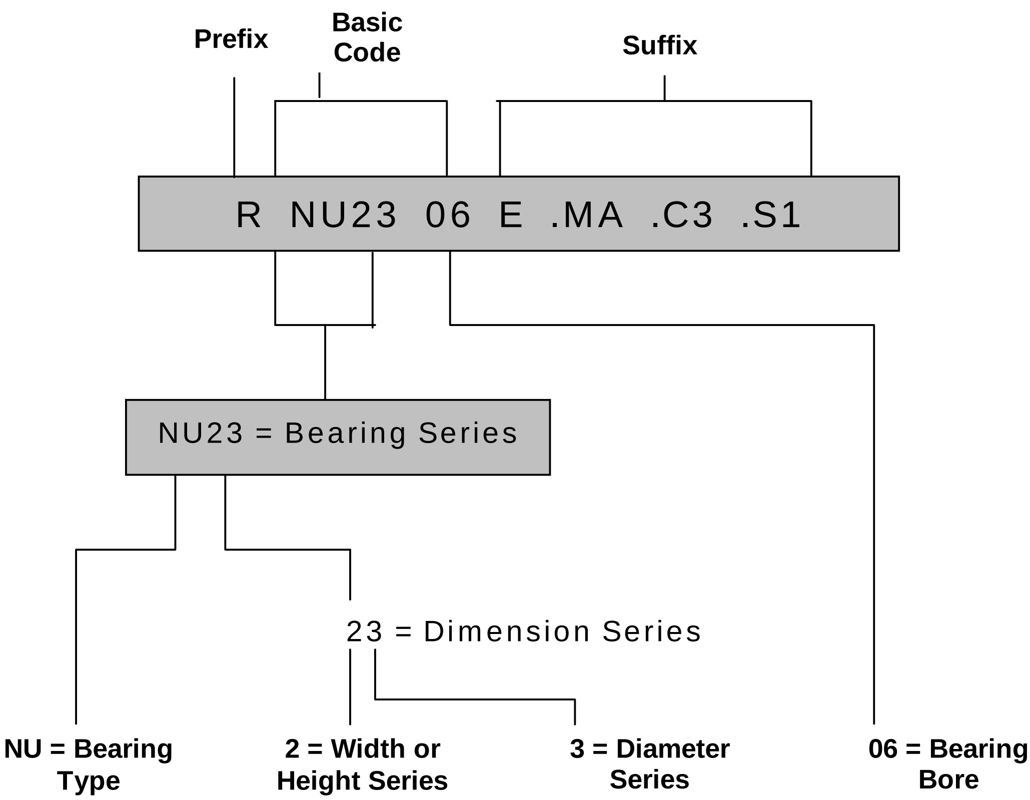
3.5 Bearing Designation System

3.5.1 Basics

Rolling bearings can be applied universally as ready-to-mount machine elements. This is especially due to the fact that the main dimensions of the popular bearings are standardized according ISO (International Standardization Organization).
In this chapter we like to enable you to understand the bearing designation system. For further information study the manufacturer catalogue.
The basic designation system consists of three, four or five figures of a combination of letters and figures.

The first letter (not the Prefix) represents the bearing type

0 Angular contact ball bearings, double row
1 Self-aligning ball bearings
2 Spherical roller bearings and spherical roller thrust bearings
3 Taper roller bearings
4 Deep groove ball bearings, double row
5 Thrust ball bearings
6 Deep groove ball bearings, single row
7 Angular contact bearings, single row
8 Cylindrical roller thrust bearings
N Cylindrical roller bearings (N = outer ring no groove; NU = inner ring no groove; NJ = only one shoulder on inner groove; NUP = only one shoulder on inner groove plus one loose inner flange)



- The first figure of the two-digit number for the dimension series indicates the width series (the height series for thrust bearings) and the second figure the diameter series.
  Popular diameter series are 8, 9, 0, 1, 2, 3, 4 (increasing outside diameters in this order). There are several width series in each diameter series e.g. 0, 1, 2, 3, 4 (the higher the figure the greater the width).
- The last (or the last two numbers) indicate the bore diameter. Just multiply the number by 5 and you will get the bore diameter in mm.
  For bearings which have a bore diameter smaller than 10 mm and equal to or greater than 500 mm, the bore diameter is generally given in millimeters direct, the size identification being separated from the rest of the bearing designation by an oblique stroke, e.g. 618/8 (d = 8 mm) or 511/530 (d = 530 mm). This is also true of standard bearings to ISO 15, which have bore diameters of 22, 28 and 32 mm, e.g. 322/28 (d = 28 mm). Bearings with bore diameters of 10, 12, 15 and 17 mm have the following size identifications:
  00 = 10 mm
  01 = 12 mm
  02 = 15 mm
  03 = 17 mm
  For some deep groove, self-aligning and angular contact ball bearings having a bore diameter smaller than 10 mm, the bore diameter is also given in millimeters (un-coded) but is not separated from the basic designation by an oblique stroke, e.g. 629 or 129 (d = 9 mm).

3.6.2 Additional Designation Codes

Code for Bearing Bore Normally: Number x 5 = bore ∅	
Bore Reference number	**Bore ∅**
3 to 9	3 to 9 mm
00	10
01	12
02	15
03	17
04	20
96	480
/500	500
/530	530

Codes for special design characteristic	
A	New modified model
B	Internal design
DA	Spli inner ring
E	Reinforced design
K	Tapered Bore 1:12
K30	Tapered Bore 1:30
N	Groove for snap ring –outer ring
RSR	With one seal
2RSR	With two seals
S	Lubrication groove and holes – outer ring
ZR	With one dust shield
2ZR	With two dust shield

Suffix for cage design The cage suffixes P, H, A, B are often added to the material code	
F	Machines steel cage
L	Machined light metal cage
M	Machined brass cage
T	Machined cage of laminated textile
TV	Cage of polyamide
J	Pressed steel cage
Y	Pressed brass cage
P	Window type cage
H	Snap type cage
A	Outer lip riding
B	Inner lip riding

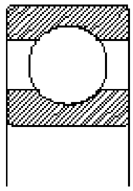
Code for accuracy and bearing clearance Precision and Clearance are often combined e.g. P52 = Precision P5 & Clearance C2	
Without suffix	Normal tolerance PN (PO) Normal bearing clearance
P6	Tolerance < PN (PO)
P5	Tolerance < P6
P4	Tolerance < P5
P4S	Reduced P4 tolerance
P2	Special precision
SP	Ultra Precision
C1	Bearing clearance < C2
C2	Bearing clearance < CN (CO)
C3	Bearing clearance > CN (CO)
C4	Bearing clearance > C3
C5	Bearing clearance > C4

Special codes e.g. for heat treatment	
S1 to S4	Special heat treatment, dimensionally stable above 150 degrees C.

3.6.3 Examples to Bearing designation

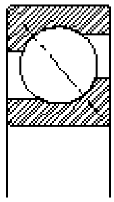
1st number	Deep groove ball bearing, single row
2nd number	Width series - 2
3rd number	Diameter series - 0
4th number	Bore hole: 6 x 5 = 30 mm

6206



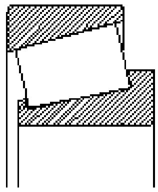
1st number	Angular contact bearing, single row
2nd number	Width series – 3
3rd number	Diameter series - 0
4th number	Bore hole: 5 x 5 = 25 mm

7305



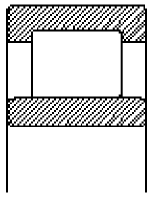
1st number	Taper roller bearing
2nd number	Width series – 0
3rd number	Diameter series - 2
4th number	Bore hole: 9 x 5 = 45 mm

30209



1st number	Cylindrical roller bearing
2nd number	/
3rd number	/
4th number	Bore hole: 17 x 5 = 85 mm
NU	No flange on inner ring. Flange on outer ring.

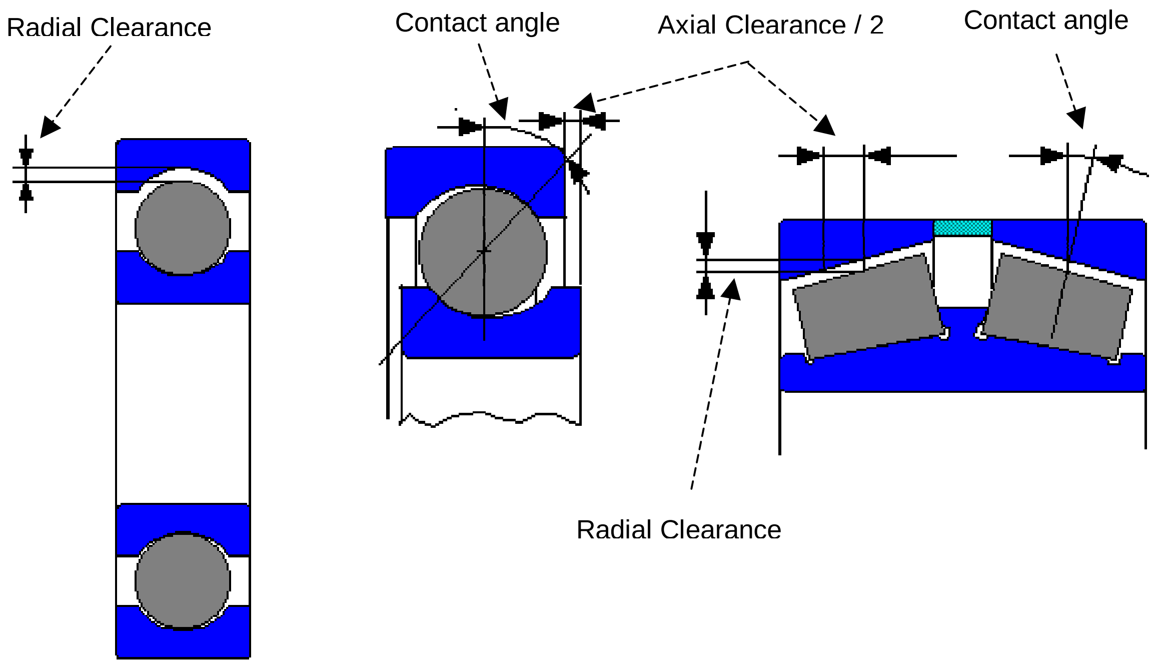
NU 417



3.6 Internal Bearing Clearance

Bearings are designed with a specific internal clearance that measures the total clearance between the rings and the rolling elements. Internal clearance provides:

- Free rotation of rolling elements
- Compensation for thermal expansion
- Optimum load distribution



Choosing the correct internal clearance is important because bearings hold shafts, armatures, gears and other rotating devices in proper alignment. The amount of internal clearance influences noise, vibration, heat build-up and fatigue life. Impact loads, severe vibration, and ring fit also affect internal clearance. To obtain the optimal internal clearance for specific application, those parameters must be balanced.

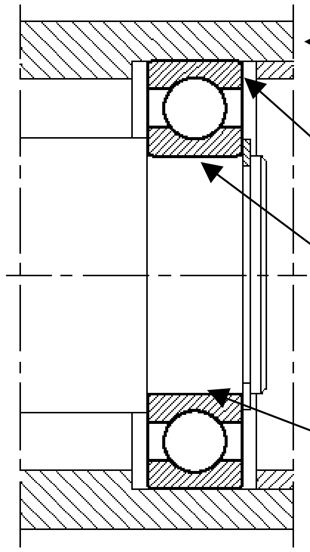
Internal clearance can be separated into two categories: **radial and axial**. The total internal clearance is the amount that one ring can be displaced relative to the other ring, either radial or axial.

Radial clearance of Deep Groove Ball Bearing

Dimensions in mm

Nominal bore diameter									
	over	**2.5**	**6**	**10**	**18**	**24**	**30**	**40**	**50**
	to	**6**	**10**	**18**	**24**	**30**	**40**	**50**	**65**
Bearing clearance in microns (0.001 mm)									
Clearance group C2	min	0	0	0	0	1	1	1	1
	max	7	7	9	10	11	11	11	15
Clearance group CN (normal)	min	2	2	3	5	5	6	6	8
	max	13	13	18	20	20	20	23	28
Clearance group C3	min	8	8	11	13	13	15	18	23
	max	23	23	25	28	28	33	36	43
Clearance group C4	min		14	18	20	23	28	30	38
	max		29	33	36	41	46	51	61

3.7 Tolerance of Housing and Shaft



Even a properly selected bearing will fail prematurely if the shaft and housing fits are incorrect. Too much or too little interference between the mating parts can cause early failure. This becomes even more critical when bearings are replaced. A failed bearing can damage the shaft and housing, causing them to be out of tolerance.
A loose fit between the shaft and bearing inner ring (or the housing and the outer ring) can lead to relative movement, or "creep" between these parts. Creep wears out the mating surfaces, increasing the clearance between them. Eventually, the process can generate abnormal heat and vibration and possible contamination from wear particles.

At the other end of the spectrum, excessive interference causes other problems that can decrease service life. Two key concerns are fracturing the inner ring and reducing the bearing's internal clearance. Too much interference builds high stress, which can sometimes fracture inner rings.
Also, an interference fit can decrease the internal clearance of a bearing due to growth of the inner ring or shrinkage in the outer ring. When the interference is too great, internal clearance becomes negative, resulting in excessive heat buildup and premature bearing failure.

Proper fit selection has a narrow margin for error. As a rule of thumb, the rotating part should have the interference fit. To specify the correct fit, the main factors that influence fit recommendations should be understood:

Which ring rotates, the inner or outer one? Is the load stationary? These factors determine which ring should have the interference fit. There are three possible combinations:

- Tight (or interference) fit on the inner ring - a common approach
- Tight fit on the outer ring - also common
- Tight fit on both rings - rarely seen

Normal fits for engineering are:

	Shaft	Housing
Ball bearings	j5...k5	H6...J7
Roller bearings	k5...m5	H7...M7

Examples to show how narrow the tolerances are:

Ball Bearing	Bearing Dimension	Shaft Tolerance j5	Housing Tolerance H6
61804	d = 20 mm D = 32 mm	+ 0.005 mm - 0.004 mm	+ 0.016 - 0 mm
6320	d = 100 mm D = 215 mm	+ 0.006 mm - 0.009 mm	+ 0.029 - 0 mm

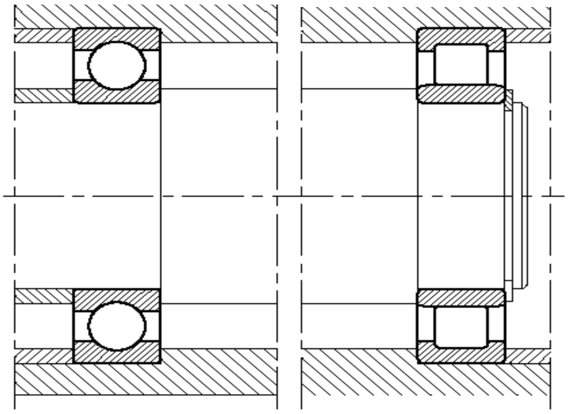
3.8 Bearing Arrangement

Locating and Floating Arrangement

In order to guide and support a rotating shaft, at least two bearings are required, which are arranged at a certain distance from each other. A bearing arrangement with locating and floating bearings can be selected, depending on the case. The floating bearing has the function to compensate the moving of the shaft because of the thermal expansion during operation.

Cylindrical roller bearings of N and NU designs are ideal floating bearings. These bearings allow the roller and cage assembly to shift on the raceway of the lipless bearing ring.
All other bearing types, e.g. deep groove ball bearings and spherical roller bearings only function as floating bearings when one bearing ring is provided with a loose fit. The ring under point load is therefore given a loose fit; this is generally the outer ring.

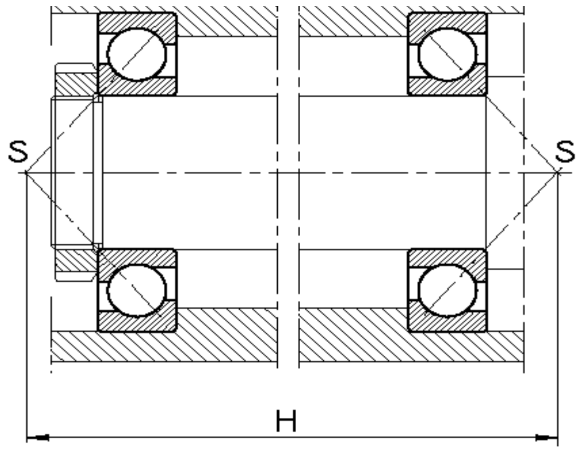
Locating Bearing Deep Groove Ball Bearing | **Floating Bearing Cylindrical Roller Bearing NU**



Adjusting Bearing Arrangement

As a rule, an adjusted bearing arrangement consists of two symmetrically arranged angular contact ball bearings or tapered roller bearings. This arrangement is particularly suitable for those cases in which a close guidance is required.
Adjusted bearing arrangements are also possible by preloading with springs. This elastic type of adjustment compensates for heat expansion. They are also used when bearings are in danger of vibrations when stationary.

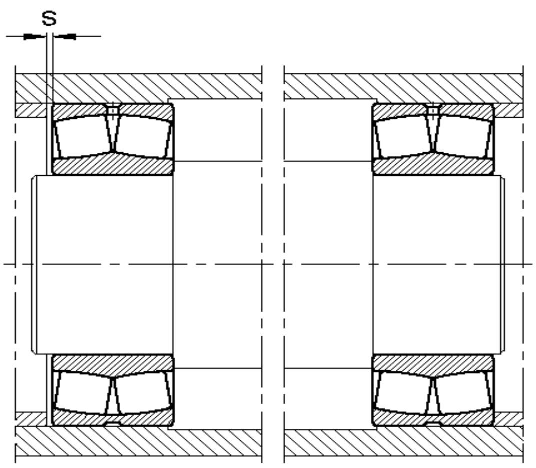
Adjusted Angular Ball Bearings in "O" Arrangement



Floating Bearing Arrangement

The floating bearing arrangement is an economical solution where a close axial guidance of the shaft is not required. Its design is similar to that of the adjusted bearing arrangement. In a floating bearing arrangement, the shaft, however, can shift by the axial clearances relative to the housing. Deep groove ball bearings, self-aligning ball bearings and spherical roller bearings, for example, are bearing types, which are suitable for the floating bearing arrangement. One ring of both bearings - generally the outer ring - is fitted to allow displacement.

Floating Bearing Spherical Roller bearing



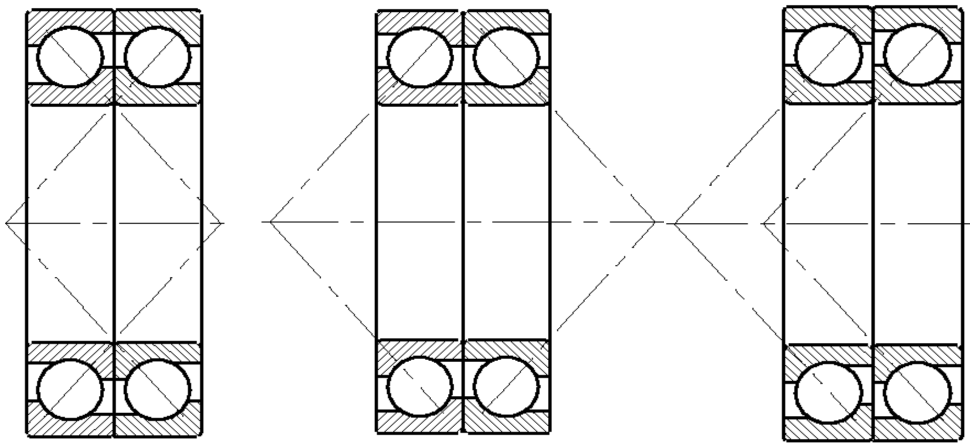
Arrangement of Angular Contact Bearings

Single row angular contact ball bearings of universal design are intended for mounting in pairs, either in X arrangement (face to face), O arrangement (back to back) or T arrangement (tandem) or for group mounting.

O-Arrangement: Two angular contact bearings are mounted with the pressure center of the left-hand bearing pointing to the left and the pressure center of the right-hand bearing pointing to the right. With the O-arrangement the bearing clearance is obtained by adjusting the inner ring.

X-Arrangement: Two angular contact bearings are mounted with the pressure center of the left-hand bearing pointing to the right and the pressure center of the right-hand bearing pointing to the left. With the X-arrangement the bearing clearance is obtained by adjusting the outer ring.

Tandem-Arrangement: Two angular contact bearings are mounted with the contact lines parallel. The thrust load is evenly distributed between the bearings.



X-Arrangement **O-Arrangement** **Tandem-Arrangement**

3.9 Axial Location of Bearings

Locating bearings and floating bearings

Locating bearings have to accommodate axial forces, which the holding element has to stand. Examples of holding elements are: shoulders on shafts and housings, snap rings, housing covers, shaft end caps, nuts, spacers, etc.

Floating bearings

They have to transmit only small axial forces resulting from thermal expansions so that the axial location has to prevent lateral displacement of the ring. A tight fit frequently does the job. With non-separable bearings, only one ring has to be firmly fitted; the other ring is held by the rolling elements.

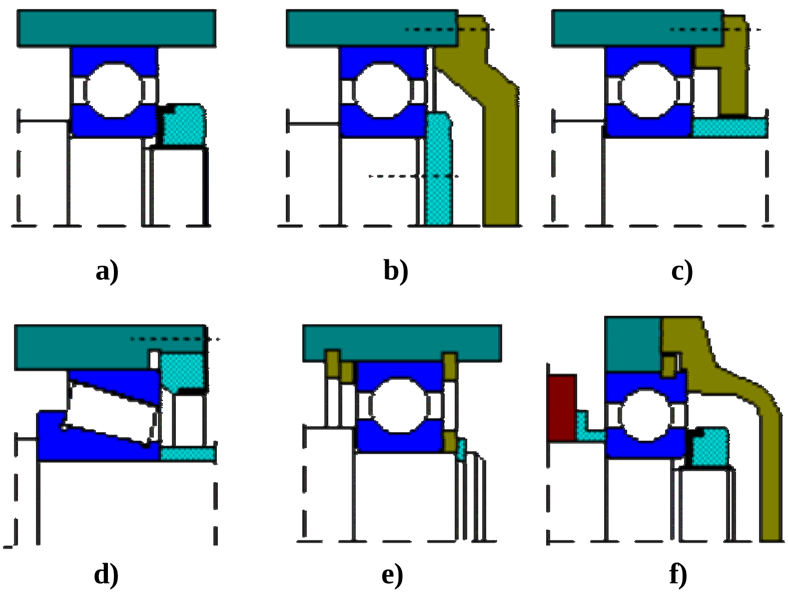
Adjusted and floating bearing arrangements

Since adjusted and floating bearing arrangements transmit axial forces only in one direction, the bearing rings need to be supported only on one side. Another bearing, which is symmetrically arranged, accommodates the opposite force. Locknuts, ring nuts, covers or spacers are used as adjusting elements. In floating bearing arrangements, the movement of the rings to the side is restricted by shaft or housing shoulders, covers, snap rings etc.

3.9.1 Bearing with cylindrical bore

Axial adjustment:

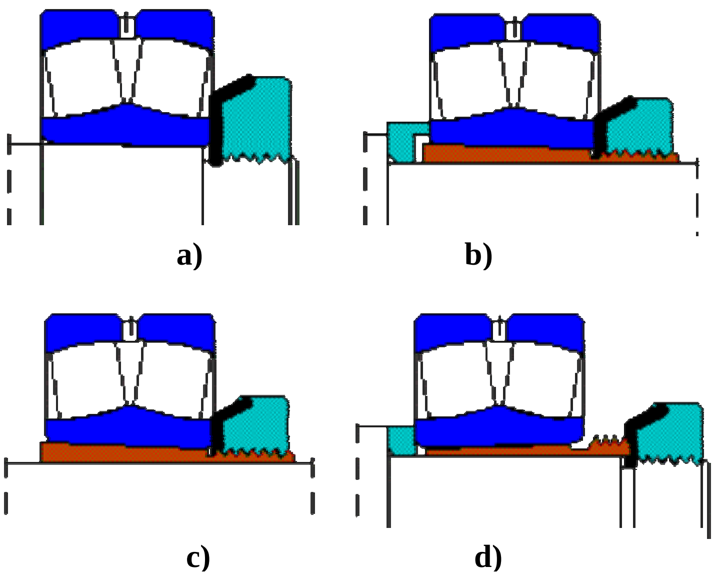
- using a shoulder of a shaft: a, b, c, d, e, f
- using a shaft nut or an end plate or an thread ring: a, b, d, f,
- using a house end cover: c
- using spacer sleeves or collars: c, f
- using a snap ring: e, f



3.9.2 Bearing with tapered bore

Axial adjustment:

- using a shoulder of a shaft and a shaft nut: **a)**
- using a spacer ring and a mounting sleeve with shaft nut: **b)**
- using a mounting sleeve and a shaft nut: **c)**
- using an end plate and a withdrawal sleeve and a shaft nut: **d)**



3.10 Mounting Rolling Bearings

Just to make you aware on how accurate bearings are manufactured and therefore to be treated with care, study the table below.

Tolerance of Bearing Fabrication - Example with Ball Bearing 6202 (d=15 mm, D=35 mm)

Tolerance Classes	Inner Ring	Outer Ring
PN	0 -0.008 mm	0 -0.011 mm
P6	0 -0.007 mm	0 -0.009 mm
P5	0 -0.005 mm	0 -0.007 mm
P4	0 -0.004 mm	0 -0.006 mm

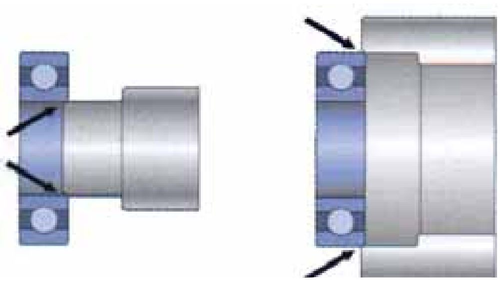
3.10.1 Before Mounting

- All the necessary parts, tools and equipment should be at hand
- Drawings or instructions should be studied to determine the correct order in which to assemble the various components.
- Housings, shafts and other components of the bearing arrangement should be checked to see that they are clean, particularly any threaded holes, leads or grooves where chips of previous machining operations might have collected. Burrs should be removed.
- The dimensions of all components, which will be in contact with the bearing, should be checked. The diameter of cylindrical shaft and housing seats is usually checked using a micrometer gauge either outside or inside type. Tapered bearing seats are checked using ring gauges or special taper gauges, which, can be supplied by the manufacturer.
- In many cases it is advisable to keep a record of the measurements. When measuring it is important that the components being measured and the measuring instruments have approximately the same temperature. This means that it is necessary to leave the components and measuring equipment together in the same place to reach the same temperature.
- The bearings should be left in their original packages until immediately before mounting so that they do not become dirty. Normally, the preservative with which new bearings are coated before leaving the factory need not be removed; it is only necessary to wipe it off the outside cylindrical surface and from the bore. If, however, the bearing is to be grease lubricated and used at very high or very low temperatures, or if the grease is not compatible with the preservative, it is necessary to wash and carefully dry the bearing.
- If there is a risk that the bearings have become contaminated because of improper handling (damaged packaging etc.), they should be washed before mounting. Any bearing which, when taken from its original packaging, is covered by a relatively thick, greasy layer of preservative (this may be the case for some large-size bearings with D >= 420 mm) should also be washed and dried.
- Bearings, which are supplied ready greased and which have integral seals or shields at both sides should never be washed before mounting.

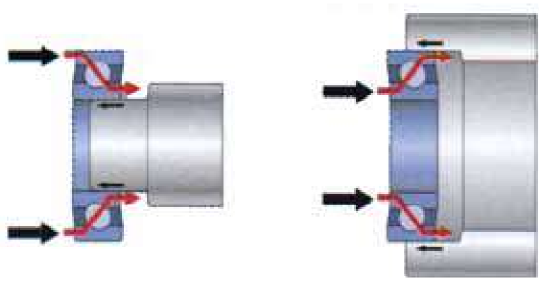
3.10.2 Mounting

Skill and cleanliness when mounting ball and roller bearings are necessary to ensure correct bearing performance and prevent premature failure.

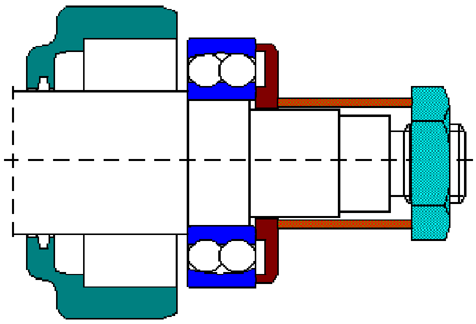
- Anything that may come into contact with bearings should be kept clean, including workers' hands, benches, tools, solvents, and cloths. Perspiration, condensation - any type of moisture should also be kept away from bearings. Handle bearings with clean cloths.
- When bearings have to be mounted in unprotected places, which is often the case with large bearings, steps should be taken to protect the bearing and mounting position from contamination by dust, dirt and moisture until installation has been completed. This can be done by covering bearings, machine components etc. with waxed paper or foil.
- Avoid nicks - and damage from compressed air. Use extreme caution when using compressed air around bearings. Compressed air is a source of moisture, which can cause corrosion in bearings.
- Depending on bearing type and size, **mechanical, hydraulic or thermal methods** are used for mounting. Make every effort to avoid nicking bearings, which can be caused by striking them with hardened steel tools or sharp objects. Even though bearings are heat-treated, surfaces are brittle and fractures can easily occur. Nicks on the exposed surfaces can cause bearings to be improperly mounted, which will reduce bearing life.
- Never apply major loads through the ball complement when mounting bearings.
- Prevent loose particles from falling into bearings while being mounted. This danger might occur on a hydraulic press or while using the drift tube technique.
- In heating bearings for easier mounting heating temperatures should, in general, **not exceed 100 degrees Celsius**. There are several heaters available (e.g. Induction heaters, Heating oven or aluminum heating rings). Because of economical reasons, use the best fitting heating-device to heat the bearings.



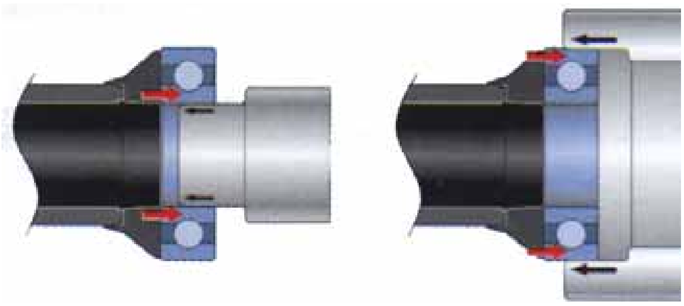
Shaft and Housing Interference Fit



Wrong! Uneven distributing of forces can result in raceway damage



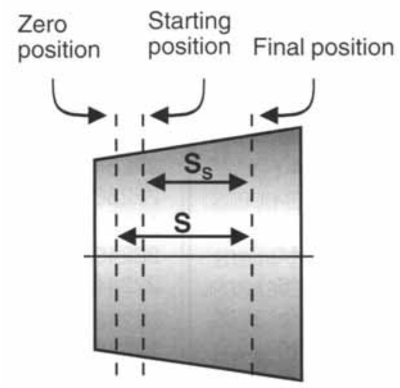
Screw down method



Use the correct tools to prevent raceway damage

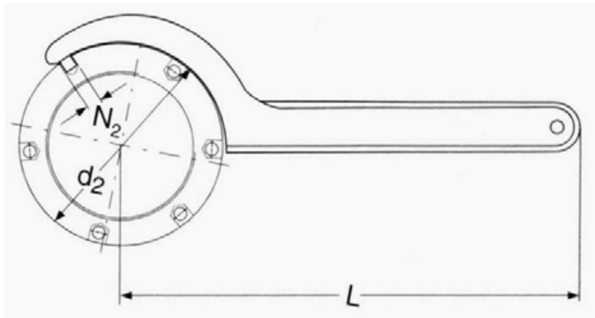
Mounting Tapered Bearings

The bearing or the sleeve has to move from the zero-position to the final position

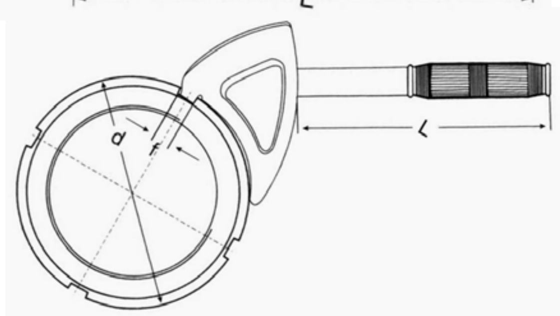


Manual Mounting with a) Hookspanner or b) Impact spanner

a)

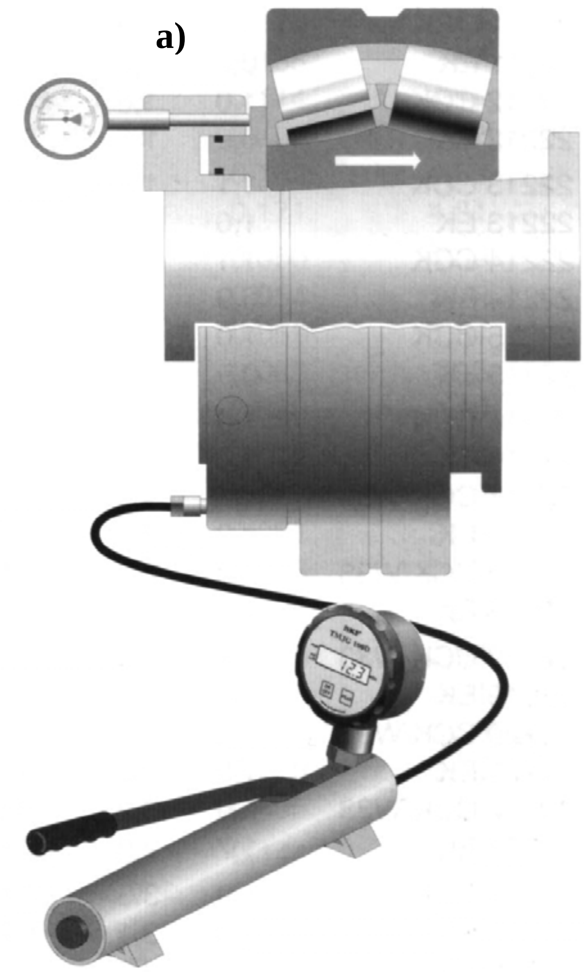


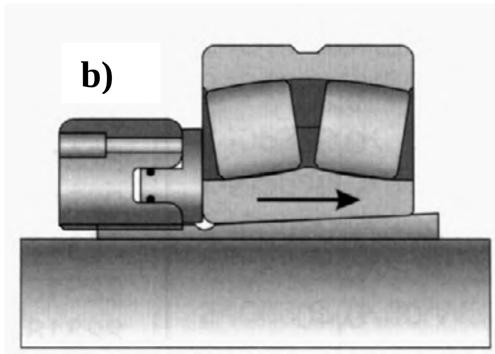
b)

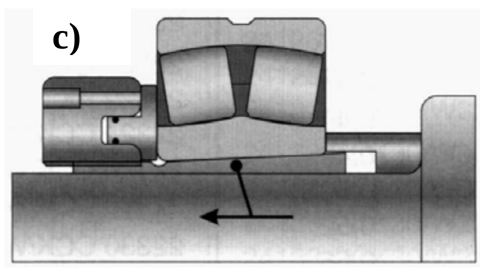


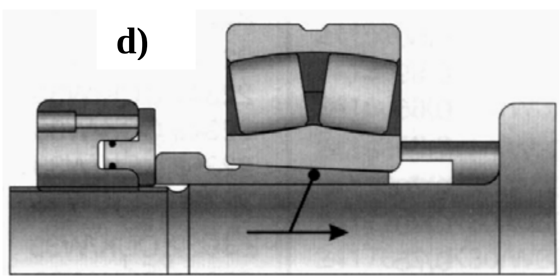
Mounting with Hydraulic Equipment

a) **Set up - ready to mount**
b) **Mount on a sleeve**
c) **Two sliding surfaces**
d) **Two sliding surfaces**



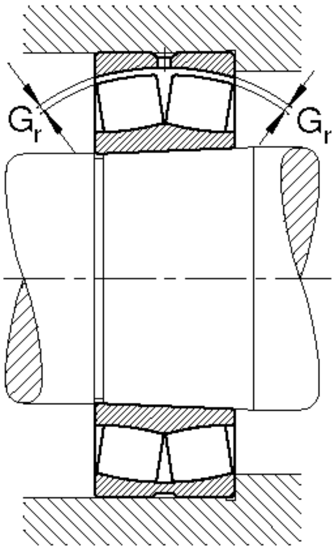






By driving up the inner ring on the shaft or sleeve, the tight fit required is obtained and is measured by checking the radial clearance reduction due to the expansion of the inner ring or by measuring the axial drive-up distance. Feeler gauges are suitable accessories for measuring the radial clearance.

With spherical roller bearings the radial clearance must be measured across both roller rows



Radial clearance reduction in sherical roller taper 1:30

3.11 Dismounting

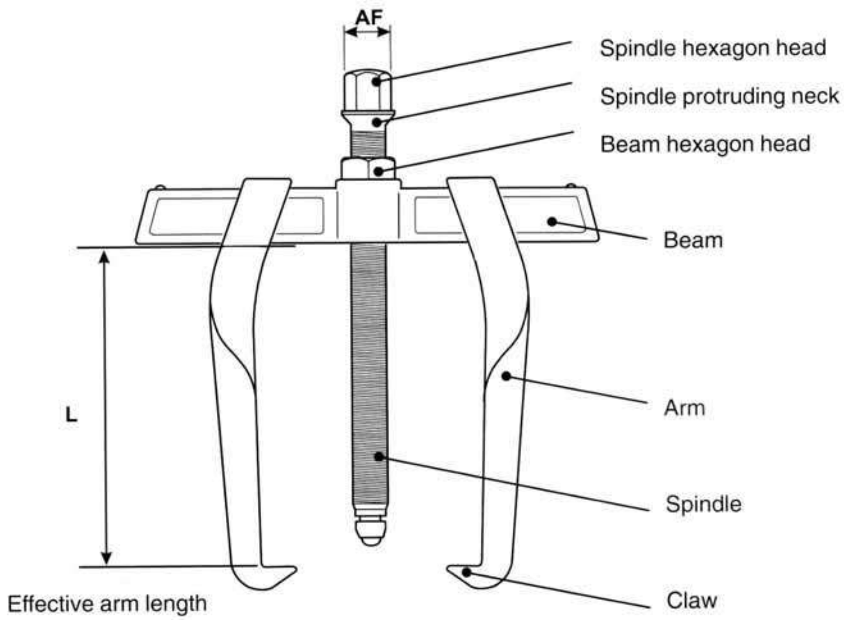
In general we can say, that if bearings are to be used again after removal, the force used to dismount them must on no account be applied through the rolling elements.

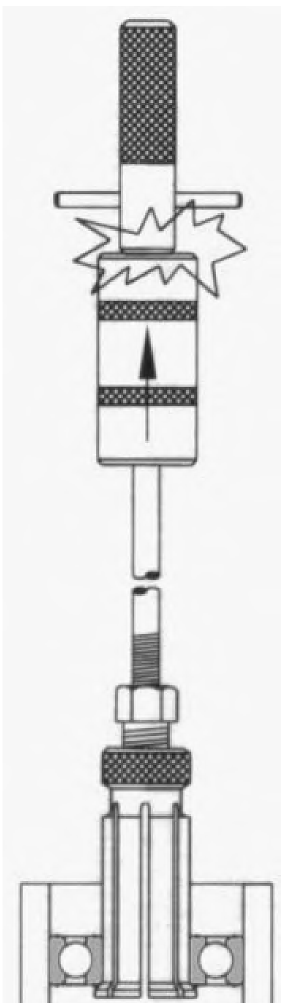
3.11.1 Dismount bearings with cylindrical bore

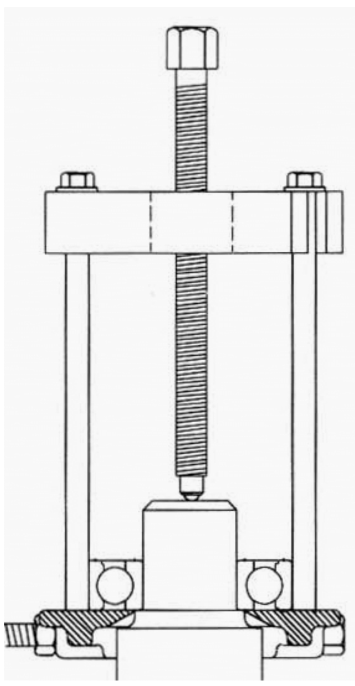
If the bearings are to be used again, the extraction tool should be applied to the tightly fitted bearing ring. With non-separable bearings, the following procedure is recommended:

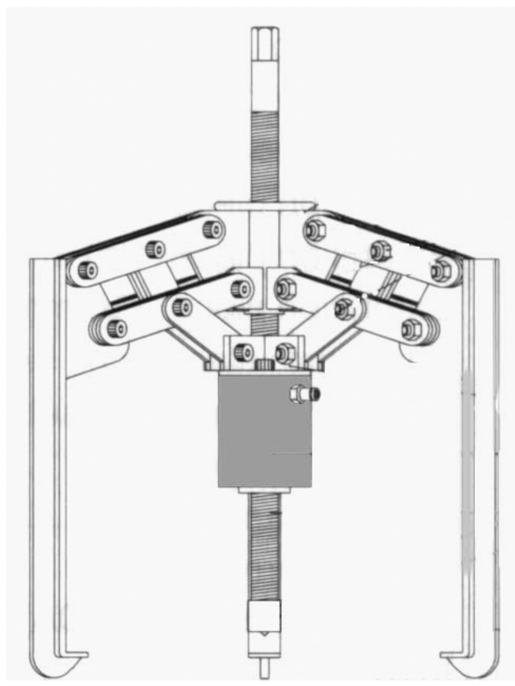
- If the outer ring is tightly fitted, the bearing and the housing are removed from the shaft and then the bearing is extracted from the housing by pressing off the outer ring.
- If the inner ring is tightly fitted, the shaft with the bearing is removed from the housing and then the inner ring pressed off.

Common dismounting tools:





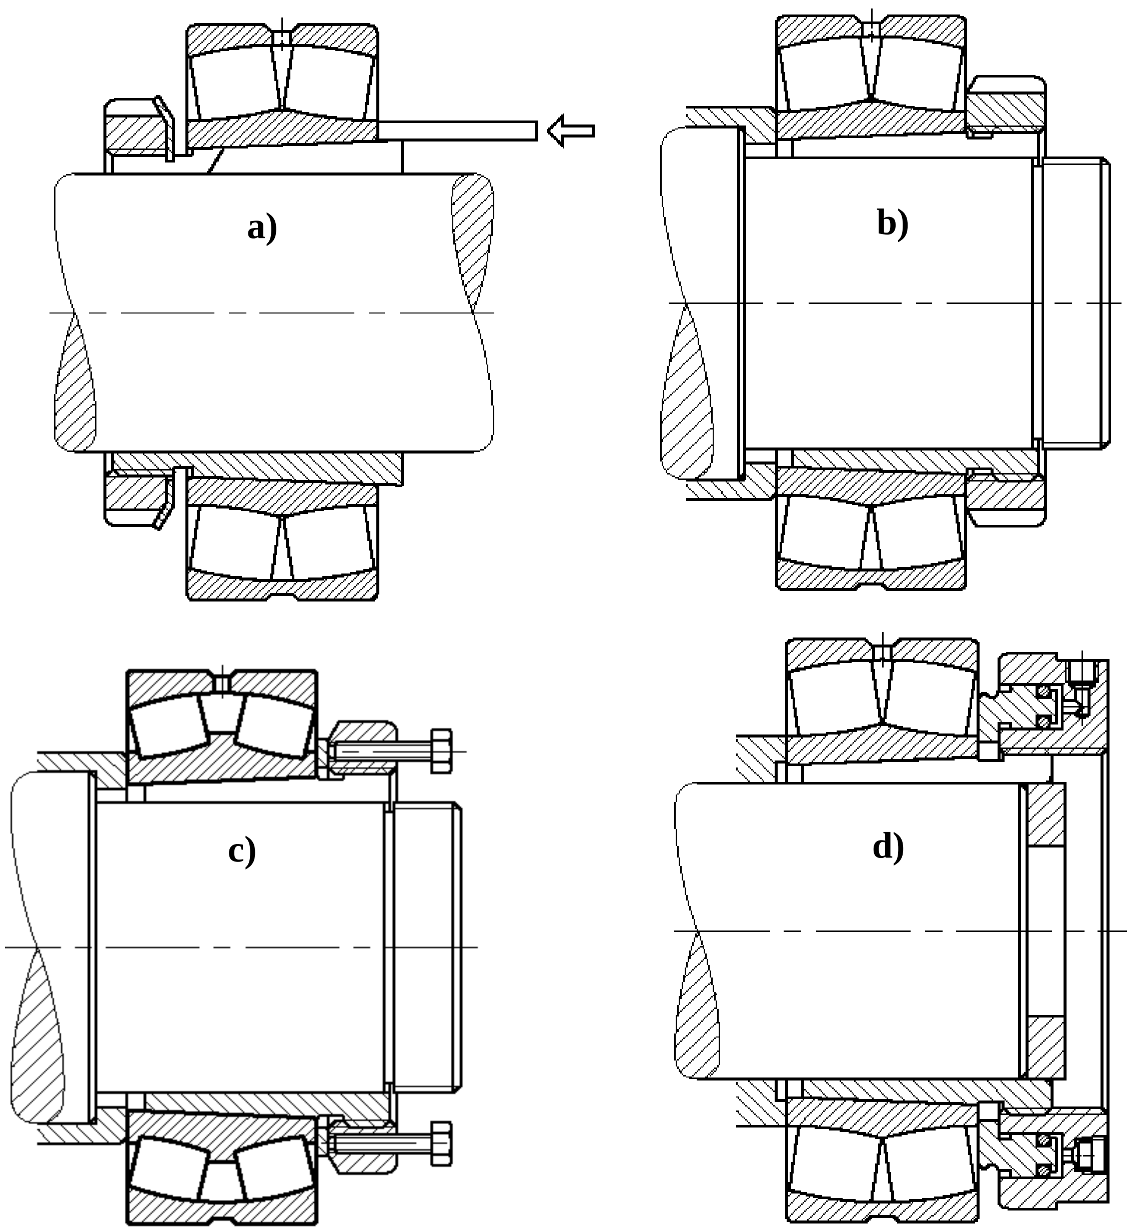




With separable bearings, the ring with the rolling element and cage assembly can be removed independently of the other ring. The inner ring can be removed using a “Heating Ring”. If the method with the heating ring will not work, than it is possible to grind carefully the inner ring on the shaft. Through the tension, given from the interference fit, the inner ring will split. But take care of the shaft!

3.11.2 Dismounting Bearings with tapered adapter sleeves – 5 Methods

a) The inner ring is driven off the sleeve using a metal drift or a piece of tubing.
b) Dismounting a withdrawal sleeve with an extraction nut.
c) Dismounting with nut and thrust bolts applied to the inner ring via a washer.
d) Dismounting a withdrawal sleeve with a hydraulic nut.
e) Dismounting a spherical roller bearing from the withdrawal sleeve with the hydraulic method. Oil is pressed between the surfaces of the bearing and sleeve. The withdrawal sleeve is released abruptly. (Not shown in the picture)



3.12 Storage

Before the manufacturer will pack the bearings, they are normally treated with a rust preventive compound. To preserve your bearing properly, do not unwrap it until you are ready to mount it. A tag on the outside of the packaging carries the exact part number and normally a serial number as well. Record this information when you receive the bearing, along with its arrival date. In this way they can be stored in a cool and dry place for several years. But there are some critical points to consider:

- The humidity should not exceed 60 %. Moisture can cause problems.
- The storage rack should be free of permanent vibration. Otherwise the balls or rollers will rock against the outer ring with each vibration. This can lead to so called ”flat spots” and damage the bearing.
- Bearings with side shields and lifetime lubrication are also problematic to store for a long time. The grease properties can change during the years.

Bearings, which are not stored in their original packages, should be well protected against corrosion and contamination. Large rolling bearings should only be stored lying down, and preferably with support for the whole extent of the side faces of the rings. If kept in a standing position, the weight of the rings and rolling elements can give rise to permanent deformation because the rings are relatively thin-walled.

4. SEALS

The purposes of seals are:

- To prevent dirt, dust and moisture from penetrating inside the protected housing.
- To ensure that gases, liquids and other materials capable of flow cannot escape.
- To keep different materials stored in different sections of the housing separated (for example water and oil in water pumps)

Classification of Seals:

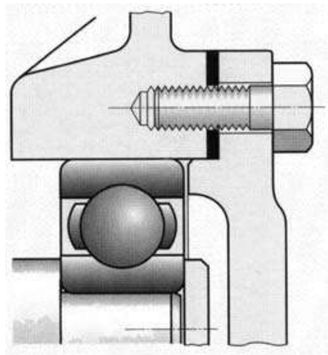
Classification	Sub-Group	Type of Seal
Static Seals		• Face seals (Gasket, Sealing Compound) • O-Ring
Dynamic Seals	**Non Rubbing Seals**	• Gap type seals • Labyrinth seals • Baffle plates • Lamellar rings • Bearing with shields ZR • Gaiters
	Rubbing Seals	• Mechanical seals • Felt rings or felt strips • Radial shaft seals • V-rings • Spring seals • Bearing with seals RS • Packings

Seals are used in billions of machines, appliances and vehicles. They get in contact with thousands of different products and fluids. The environmental factors are as well to consider when choosing a material of a seal. The following questions should be frequently asked before choosing seals material. Remember, choosing all the times the "best" material will raise your maintenance cost.

Duty:
- Medium?
- Concentration of medium?
- Max. Pressure?
- Min. Pressure (Vacuum)?
- Max. Temperature?
- Min. Temperature?
- Liquid or Gas?
- Vibration?
- Abrasion?

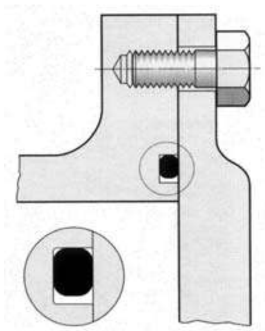
4.1 Static Seals

Face seals (Gaskets)



They are able to compensate slight surface irregularities and able of making a tight seal if the surface is slightly distorted. In some cases they are required to transmit and uniformly distribute pressing forces produced by the clamping devices (for example screws).
Where loads are light the seals can be a **gasket** made of paper, oiled paper or pressed board. Gasket compounds can mostly replace paper seals. On surfaces containing severe machining grooves or score-marks, the paper gasket makes a better seal if it is coated with a suitable **sealing compound** as well. Permanently elastic sealing compounds and those, which harden after application are available.
Asbestos-metal woven fabric is suitable as a sealing material for high temperatures and pressures. The surface can be covered additionally with metal foil, for example copper as used on cylinder head gaskets. Cork-chloroprene rubber (Neoprene”) and cork-silicone rubber seals remain highly flexible under heavy pressure loads, and are resilient when the load is removed. The rubber encloses the individual cells of the cork completely, and forms a bond between them. These materials are used as seals for hydraulic equipment and transmissions

O-Ring



Round-section seals (0-rings) are ring-shaped seals of circular cross-section. They are manufactured from soft, permanently elastic plastics, for example nitrile butadiene rubber, and used for sealing both stationary and moving parts. They should be treated with care and not be accidentally twisted on assembly. The sealing action is produced by deformation of the round sealing ring.

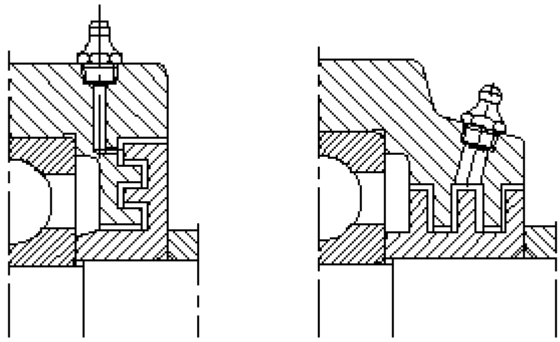
4.2 Dynamic Seals

4.2.1 Non-Rubbing Seals:

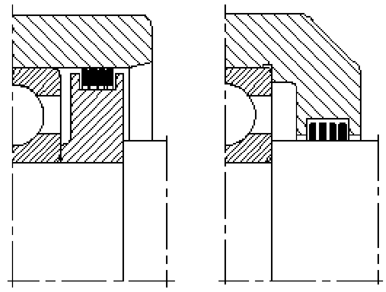
The only friction arising with non-rubbing seals is the lubricant friction in the lubricating gap. The seals do not show any wear and can function for a long time. Since non-rubbing seals do not generate any heat, they are suitable for very high speeds.

Labyrinth Ring

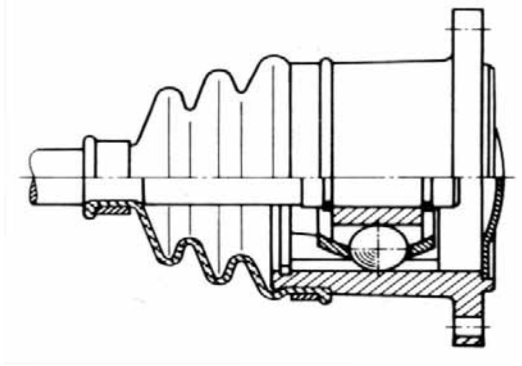
Labyrinths (b), whose gaps are filled with grease, have a far greater sealing effect. If the environment is dirty, grease is pressed from the inside into the sealing gaps in short time intervals.



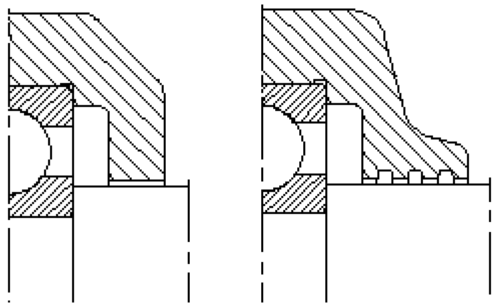
Lamellar Rings
Lamellar rings of steel (f) with spring disks to the outside or to the inside need a small mounting space. They seal against grease loss and dust penetration and are also used as a seal against splashing water.



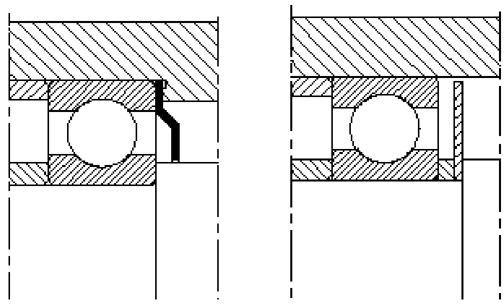
Flexible Gaiters
Flexible gaiters or bellows of synthetic material protect bearing points against penetration by dust and dirt. They often contain the grease for lubrication of a pivot. They are used at the steered wheels of vehicles and on rear axle shafts (Figure



Sealing Gap
A simple method of protection which is frequently adequate, is a narrow sealing gap between shaft and housing



Baffle Plates
Prevent grease from escaping from the bearing. The grease collar, which forms at the sealing gap, protects the bearing from contaminants.

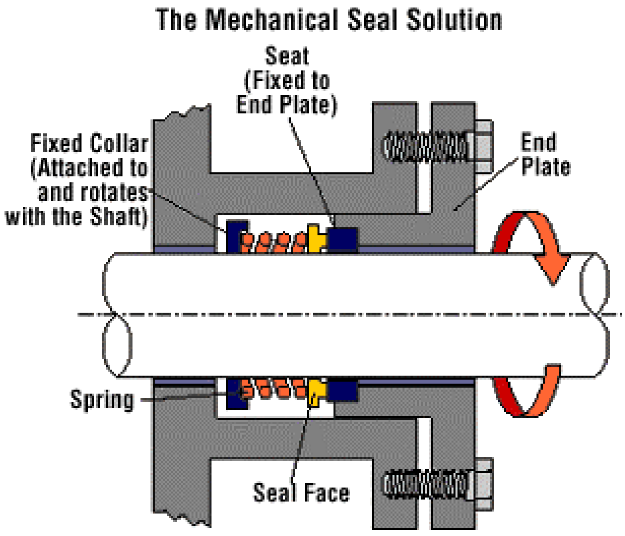


4.2.2 Rubbing Seals:

Rubbing seals contact their metallic running surfaces under a certain force (usually radial). This force should be kept to a minimum to prevent excessive increases in the frictional moment and the temperature. The lubrication condition at the contact surface, the roughness of the contact surface, and the sliding velocity also influence the frictional moment and the temperature as well as the seal wear.

Mechanical Seals

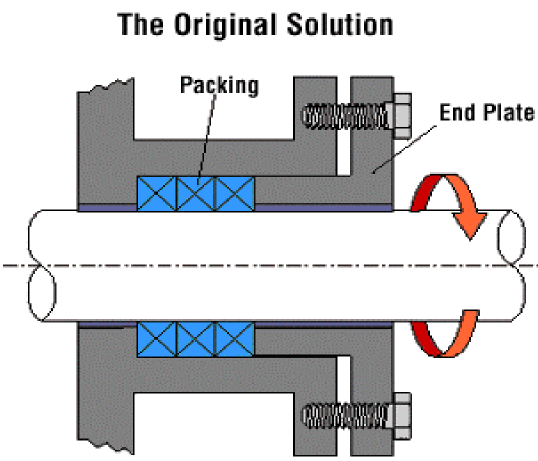
A mechanical seal is a containment device. It prevents leakage. It keeps contents from leaking out and contaminants from leaking in. It operates under dynamic, not static conditions. Instead of directly sealing the rotating shaft as packing does, a mechanical seal's sealing surfaces are between a pair of faces, one rotating, the other stationary. The mechanical seal remains the most cost effective method for sealing a rotating shaft. They can be found on equipment with rotating shafts, such as pumps, agitators, mixers, automotive engines, and compressors. Common examples of where mechanical seals are used include:



Water pump in appliances or automobiles; Air conditioning compressors; Oil pipeline pumps; Pharmaceutical mixers; Wastewater treatment pumping stations …….

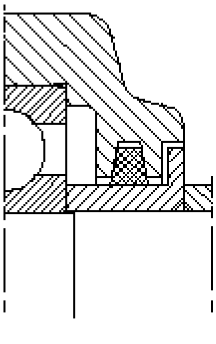
Packings

Packings (gland or stuffing-box seals) are used on shafts and spindles to keep chambers or cylinders at different pressures or containing different materials separate from one another. Packings can be made from fibrous materials, metal fibers, soft metals or elastic sealants. The original solution for sealing a rotating shaft was to use packing. This was the standard method of sealing pumps before the 1950's. As operating conditions became more demanding and pumps were used on a greater variety of fluids, mechanical seals were designed to handle these conditions.



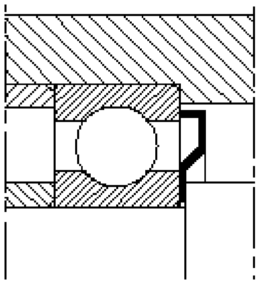
Felt Rings

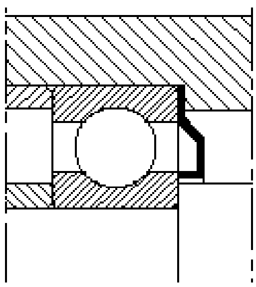
Felt rings (a) are simple sealing elements which prove particularly successful with grease lubrication. They are soaked in oil before mounting, and are an especially good means of sealing against dust. If environmental conditions are adverse, two felt rings can be arranged side by side.



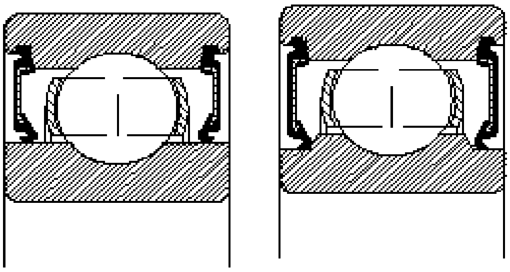
Spring Seals

Spring seals are highly efficient for grease lubrication. They consist of thin sheet metal and are clamped to the face of the inner or the outer ring while the sealing edge contacts the other ring under slight tension.





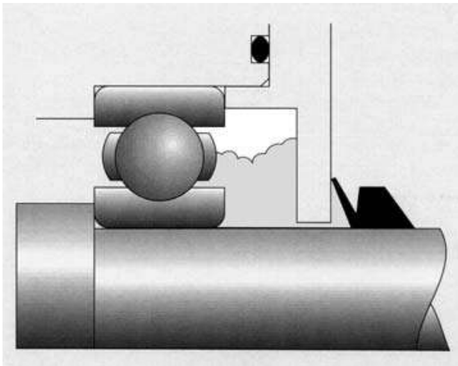
Sealing Washer



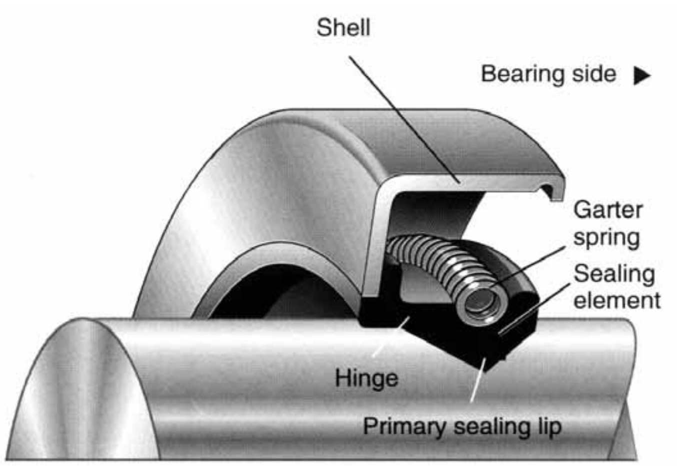
Simple designs are possible with bearings with one or two sealing washers. The washers are suitable to seal against dust, dirt, a moist atmosphere, and slight pressure differences. They are maintenance-free bearings with two sealing washers and a grease filling. The most commonly used sealing washer design is 2RSR made of acrylo-nitrile-butadiene rubber (NBR) for deep groove ball bearings is lightly pressed on the ground inner ring. Design 2RS for very small deep groove ball bearings contacts a chamfer at the inner ring faces.

V-Ring

The V-ring is a lip seal with axial effect. During mounting, this one-piece rubber ring is pushed onto the shaft under tension until its lip contacts the housing wall. Axial lip seals are insensitive to radial misalignment and slight shaft inclinations. With grease lubrication, rotating V-rings are suitable for circumferential velocities of up to 12 m/s, stationary ones up to 20 m/s. V-rings are frequently used as preseals in order to keep dirt away from a radial shaft seal.



Radial Shaft Seal

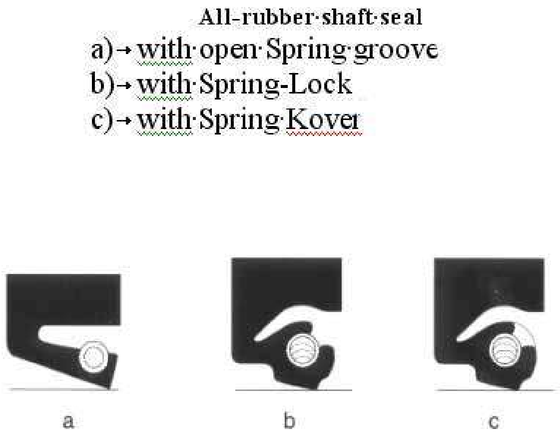


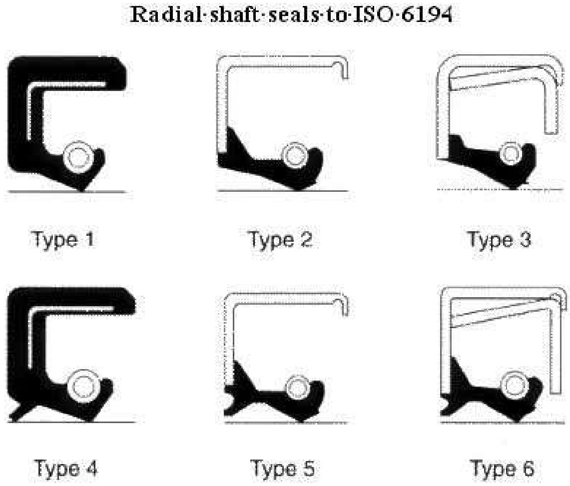
Other names are “radial lip shaft seal” or “lip ring” an “oil seal”. Radial shaft seals are, above all, used at oil lubrication. The sealing ring, equipped with a lip, is forced against the sliding surface of the shaft by a spring. If the chief aim is to prevent the escape of lubricant, the lip is on the inside. A sealing ring with an additional protection lip also prevents the dirt penetration. They are designed to withstand high sliding-contact speeds and in special cases high oil pressures as well. They have a powerful sealing action and a long operating life. In addition, they are standardized, cheap and easy to assemble. The cup section is made from a resilient plastic which is resistant to oil and ageing, for example “Perbunan” or silicone rubber. The sealing lips of the cup section are pressed lightly and uniformly against the shaft by a tubular spring. Dustproof seals have a dust lip in addition to the sealing lip.

Because of the importance of radial shaft seals for the efficient sealing of bearing arrangements, we will focus in this handout more on radial shaft seals and their application as well as on their designs and executions.

4.3 Radial Shaft Seal (“radial lip shaft seal”, “lip ring”, “oil seal”)

4.3.1 Types of Radial Shaft Seal





4.3.2 Materials of Radial Shaft Seal

The performance and reliability of a radial shaft seal are largely dependent on the material from which the seating lip is made. If seals fail regularly after a short period of operation, it may be advisable to replace them with seals of another material, e.g. one which is more wear-resistant or medium resistant. But consider that for example using all the time the “best” ring available will raise also your maintenance cost. For example the “best” radial shaft seal on the market has a temperature range from –75 degree Celsius up to 260 degree Celsius and is very resistant against abrasion.

The following questions should be considered:
Is the Radial Shaft Seal resistant against?

- The mediums they are contacted with? (Water, oil, grease, salts, alcohols, acids, alkalis, fuels etc.)
- The operating temperature they are contacted with? (Some can stand temperature from –70 to 260 degree C)
- The wear they are affected with? (Abrasive material such as sand, grit etc.)
- The pressure they are affected with?
- The speed they are affected with?
- The eccentricity they are affected with?

For normal applications with contact with mineral oils and greases a **Nitrile** seal will do a good job. The recommended continuous operation temperature is from –54 to 107 degree C.

Polyacrylate elastomer seals are recommended continuous operation temperature is from –40 to 150 degree Celsius. They are well suited for extreme pressure lubricants. They should not be used together wit water.

Fluorelastomer seals operate over the widest range of temperature and chemicals. They handle temperatures from –40 to 204 degree Celsius. They resist most of the lubricants, which will destroy nitrile, polyacrylates or silicones.

PTFE are suitable for high temperatures from –73 to 340 degree C.

4.3.3 Shaft and Housing Tolerances

Shaft Tolerances:

Shaft ∅ in mm	Max ∅ in mm	Min ∅ in mm	Shaft ∅ in mm	Max ∅ in mm	Min ∅ in mm
over 6 to 10	+0.000	-0.090	over 120 to 180	+0.000	-0.250
over 10 to 18	+0.000	-0.110	over 180 to 250	+0.000	-0.290
over 18 to 30	+0.000	-0.130	over 250 to 315	+0.000	-0.320
over 30 to 50	+0.000	-0.160	over 315 to 400	+0.000	-0.360
over 50 to 80	+0.000	-0.190	over 400 to 500	+0.000	-0.400
over 80 to 120	+0.000	-0.220			

The surface finish should be smooth enough to maintain contact with the seal lip, and yet rough enough to have lubricant –holding pockets. The surface should have no machine lead.

House Tolerances:

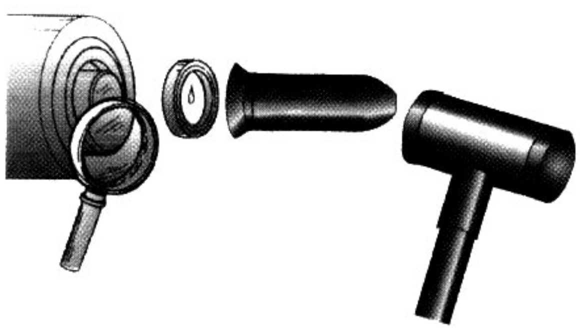
The seal is usually press-fitted into the bore. Therefore the outside diameter must be larger than the bore diameter. It is normally machined with **ISO H8 Tolerance.**

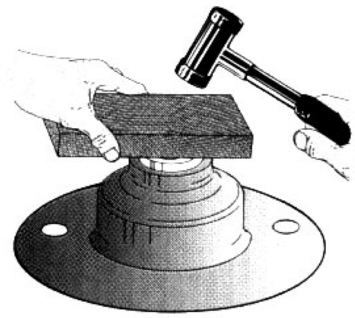
House ∅ in mm	Max ∅ in mm	Min ∅ in mm	House ∅ in mm	Max ∅ in mm	Min ∅ in mm
over 6 to 10	+0.022	-0.000	over 120 to 180	+0.063	-0.000
over 10 to 18	+0.027	-0.000	over 180 to 250	+0.072	-0.000
over 18 to 30	+0.033	-0.000	over 250 to 315	+0.081	-0.000
over 30 to 50	+0.039	-0.000	over 315 to 400	+0.089	-0.000
over 50 to 80	+0.046	-0.000	over 400 to 500	+0.097	-0.000
over 80 to 120	+0.054	-0.000			

4.3.4 Installation of Radial Shaft Seal

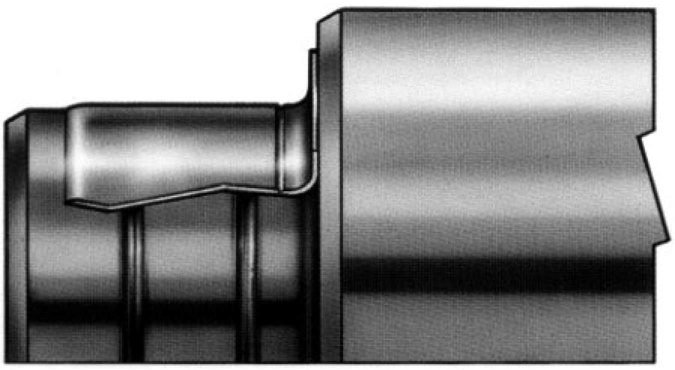
Guidelines for proper installation:

- Check the dimensions of the selected seal. They should match those of shaft and bore.
- Check the new seal for any damage (dents, scores or cuts). **Never** use damaged seals. Carefully clean the seal if it has become dirty.
- Chamfer the housing bore corner to prevent damage to the outside surface of the seal.
- Check to see that the counterface on the shaft is undamaged (no bruises, scratches, cracks, rust or raised areas).
- All shaft edges over which the seal has to be passed must be chamfered or rounded.
- Lightly grease or oil the seal before installation.
- After installation, check to see that other machine components or shaft shoulders do not rub against the seal.
- Use proper mounting tools. If no suitable tools are available, a wooden block and hammer can be used. To avoid shearing of the seal, the blows should be applied centrally.





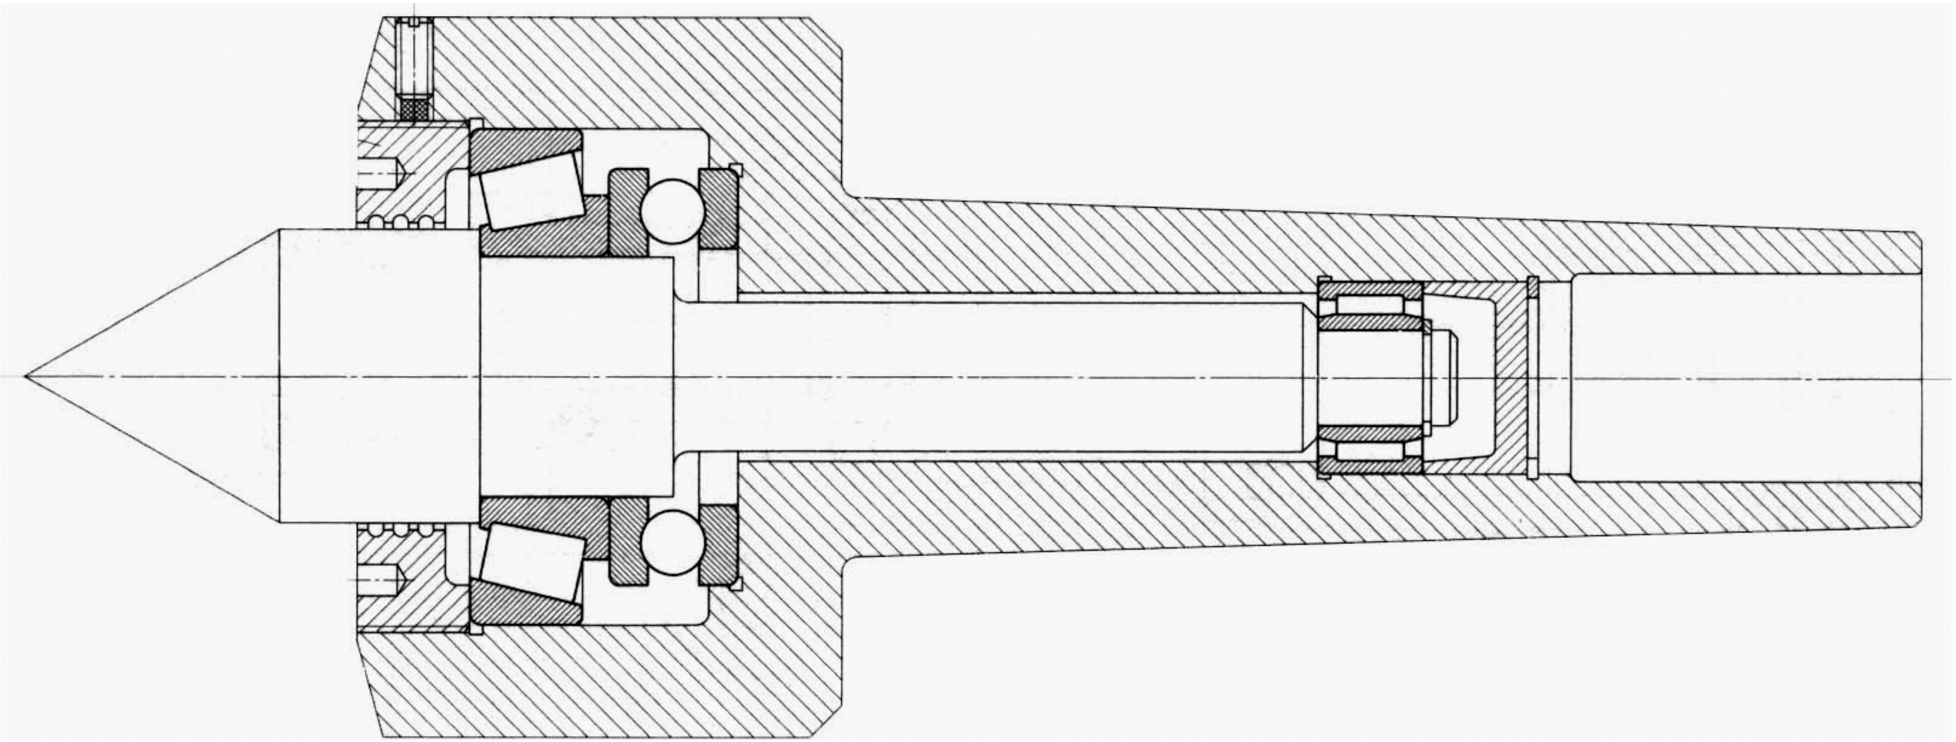
Repair of worn out seat of radial shaft seal using an adapter sleeve. For further information ask your supervisor or the bearing distributor. (Speedy-Sleeve)



5. REPAIR JOB

5.1 Exercises in:

- Interpreting technical drawings
- Determining different rolling bearings
- Locating sealings
- Analysing the positioning of rolling bearings (floating, locating and adjusted arrangements)
- Determining the type of lubrication of assembly
- Describing the sequence of assembling

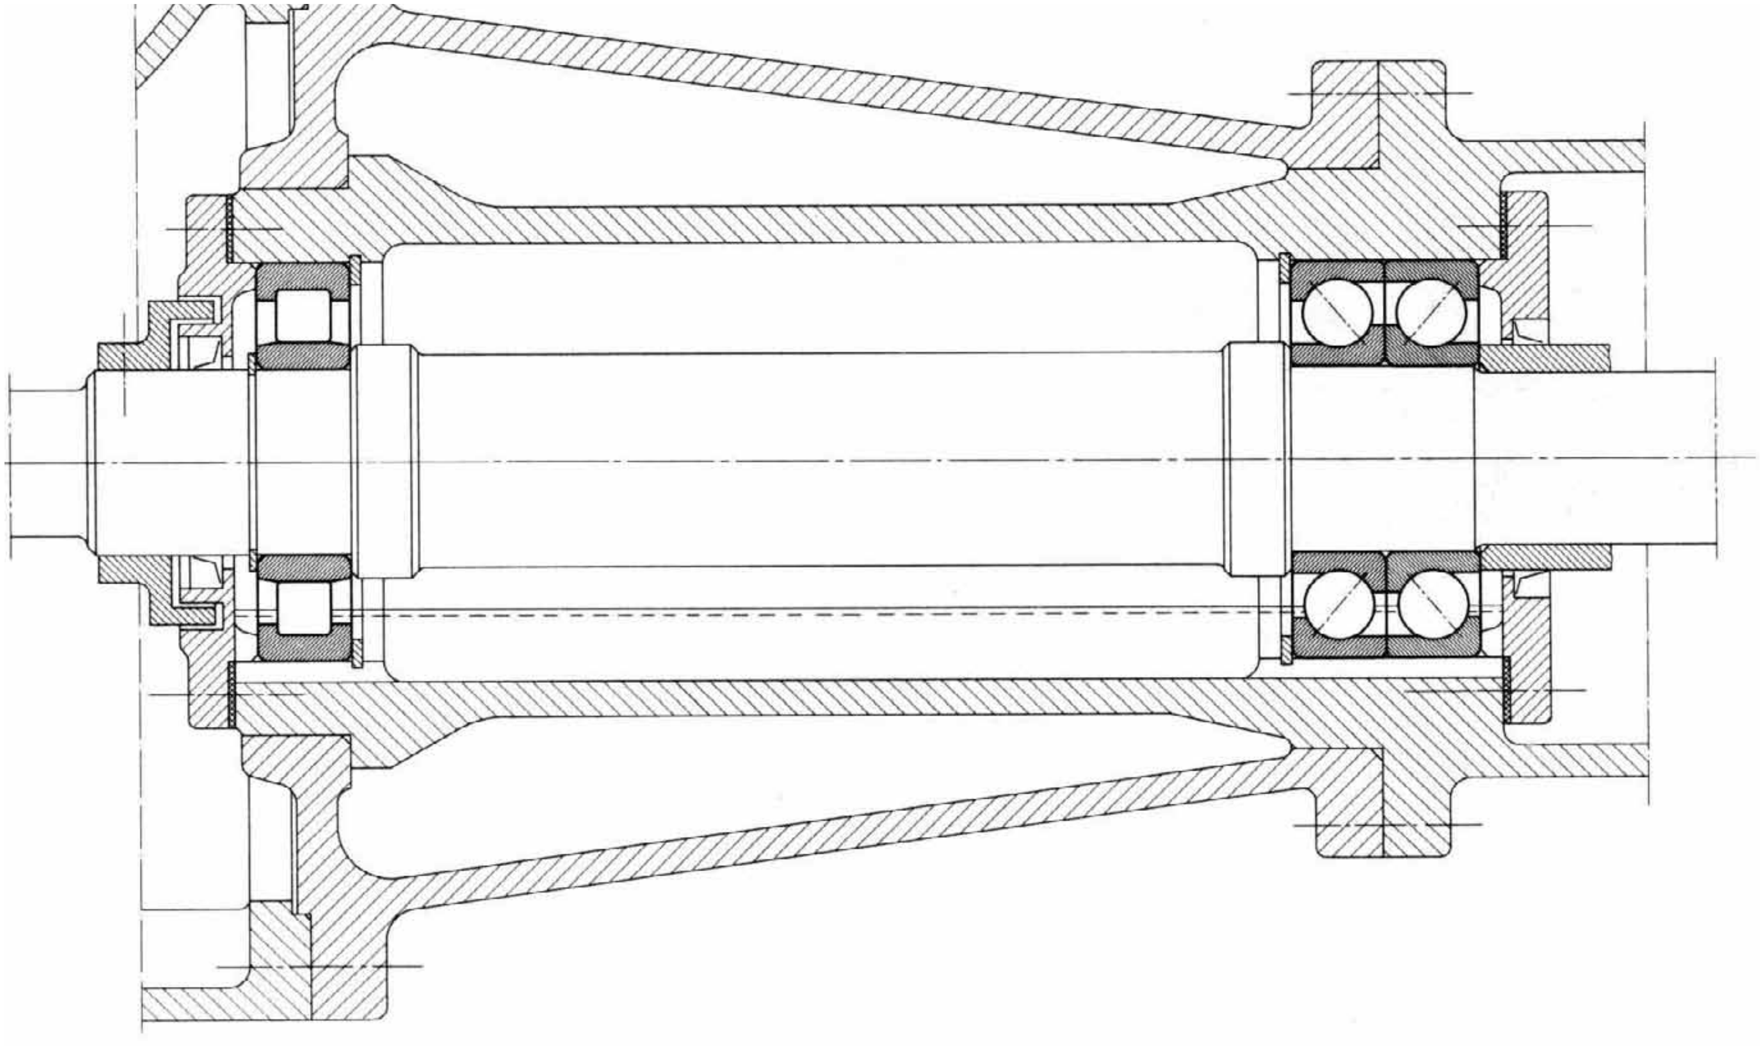


Working Sheet No. 1 – Live Center

1. Write down the different types of bearings.	
2. What seals are used to keep the dirt out of the bearing housing?	
3. Which is the floating side and which is the adjusted side?	
4. Discuss with the other trainees how the bearings are fixed.	Left side: Right side:

5. Discuss with the other trainees how to assemble the live center.

Exercise No. 2 – Water Pump



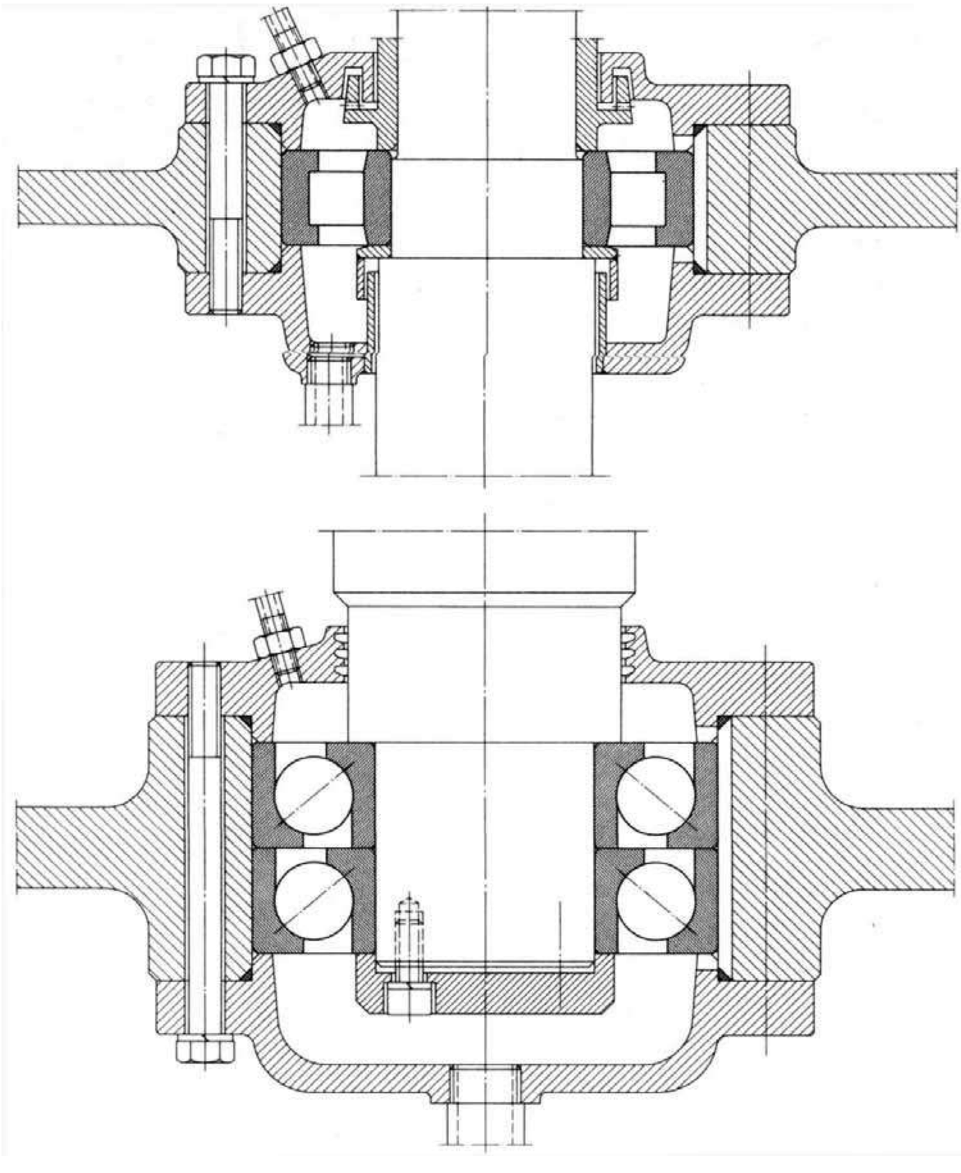
Working Sheet No. 2 – Water Pump

1. Write down the different types of bearings and the type of arrangement of the left side assembly.	
2. What seals are used to keep the dirt out of the bearing housing?	
3. How are the bearings lubricated?	
4. Which is the floating side and which is the adjusted side?	
5. Discuss with the other trainees how the bearings are fixed.	Left side: Right side:

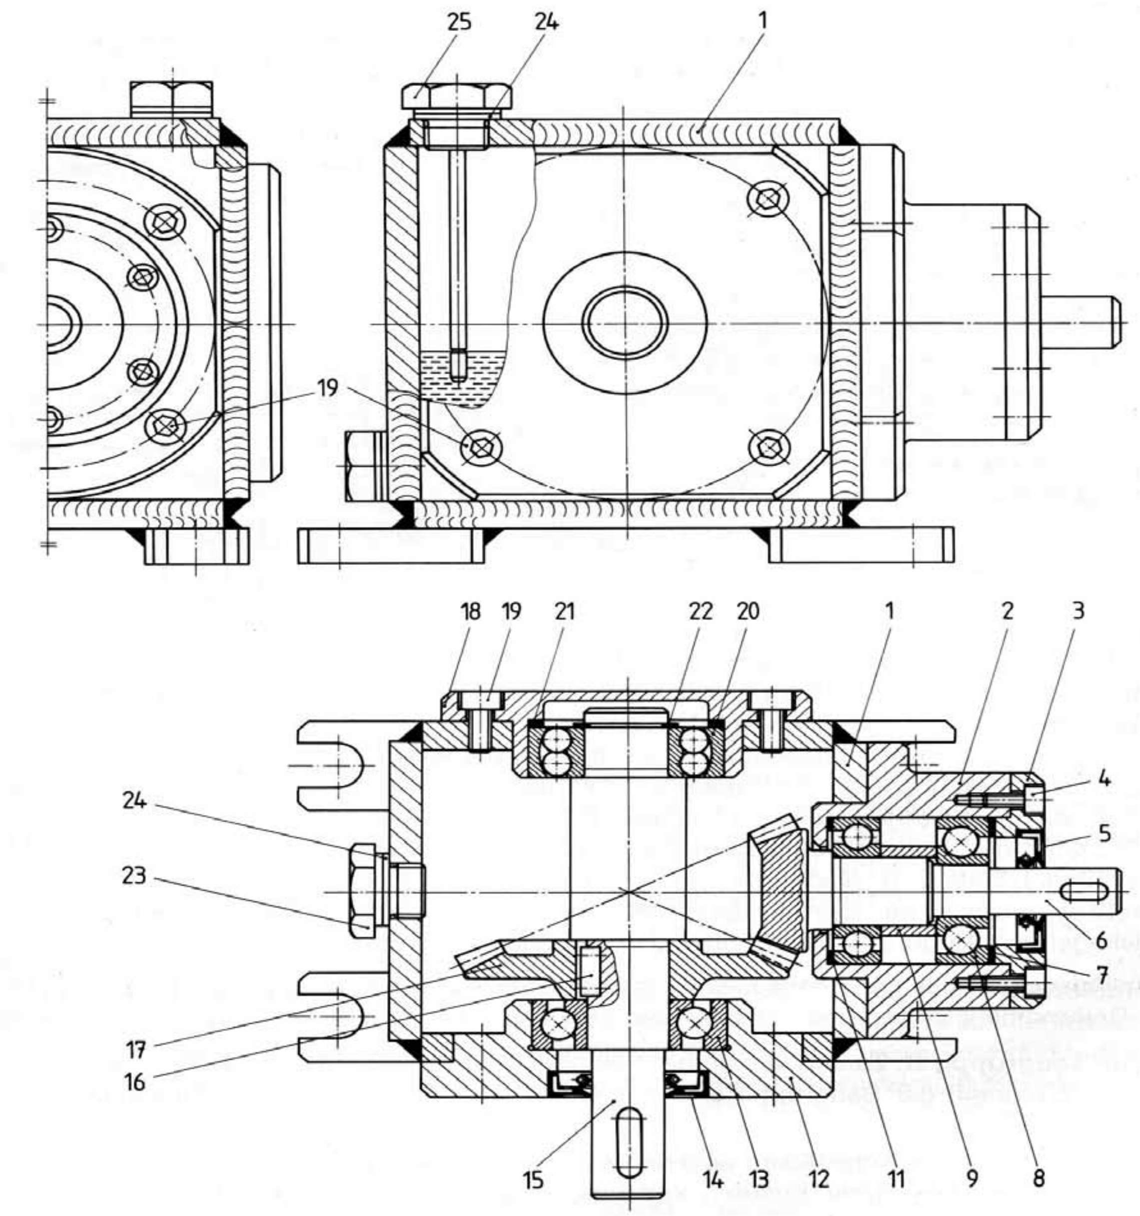
6. Discuss with the other trainees how to assemble the water pump.

Exercise No. 3 – Converter

1. Write down the different types of bearings and the type of arrangement of the lower side assembly.	
2. What seals are used to keep the dirt out of the bearing housing?	
3. How are the bearings lubricated?	
4. Which is the floating side and which is the adjusted side?	
5. Discuss with the other trainees how the bearings are fixed.	



Interpreting Technical Drawing – Self Study



List of parts: Bevel Gear Drive

5.2 General Instructions for a Repair Job within the Workshop

Working Steps	Comments
1. Prepare Workplace for disassembling	• Remove parts, tools and jigs from previous jobs from the working area • Clean up the working area • Provide container for used oil • Provide new cleaning rags to clean up spilled oil and grease
2. Safety Check	Ask yourself the following questions: • Do I have the permission to do the job? • Am I skilled/trained to do the job? • Are there any hazards for me, for my colleagues or for the environment? E.g. Machine under pressure, machine under vacuum, machine filled with a hazardous medium, hazard because of electric shock …..
3. Sketch the outside Machine Contours	• To make sure that the machine can be re-assembled properly even after a longer period (e.g. Break because of lack of spare parts) • Consider that a colleague of you might re-assemble the machine. • Store the draft together with the machine parts
4. Remove Oil	• Before opening any part of the machine, remove oil • Catch the oil in an adequate container and store it for disposal • Do not spill oil
5. Mark all Parts before starting to disassemble	• To make sure that the machine can be re-assembled properly even after a longer period (e.g. Break because of lack of spare parts). Consider that a colleague of you might re-assemble the machine. • Use letter or number punch to mark parts • It is also possible to mark parts using a center punch, a small chisel or water and kerosene resistant paint
6. Draft a plan in your mind on how to dissemble the machine	• Use all available resources like manuals, drawings ….. • Think first before starting to screw!
7. Dissemble the Machine	• Use the proper tools • Don't use any force and take care not to damage any part • Remove first couplings, pulleys, sprockets from the shafts • Open the housing • Remove shafts, bearings, sealing • Store all parts properly in a box with a soft surface. For sensitive parts put some cleaning rag around
8. Sketch the inner Assembly	• If necessary sketch the inner assembly. Consider that a colleague of you might re-assemble the machine. • Especially take note of spacer rings. Sketch the position of them.
9. Clean all Parts	• Clean all parts using kerosene; Use scraper to remove old seal • During cleaning look already for damages
10. Determine the Damages	• Try to find the causes for the overhauling • Transfer all your findings to the maintenance history log

Working Steps	Comments
11. Distribute Work and Actual Repair	• Measure seats from all bearings and seals • Order spare parts and give parts to the machine shop • Weld broken parts, remove all dents from sealing surfaces, gears and other important parts • Dynamic balancing of parts
12. Break	• Break because of lack of spare parts and machine shop work • Store all parts properly (for longer storage, put some grease on critical parts and cover the whole machine with plastic foil)
13. Prepare Workplace for re-assembling	• Remove parts, tools and jigs from previous jobs from the working area • Clean up the working area
14. Re-assembling	• Before re-assembling make a plan in your mind on how to mount all parts. • Polish all seats of bearings and sealing • Do not use any unnecessary force! • Use the proper tools and methods for the installation of bearings and sealing • Do not over-grease bearings; Apply also grease to lip-rings and O-rings • To adjust bearing clearance, backlash and axial play of shafts use the proper measuring method and exactly fitting spacer rings • Use new flat seals or sealant • Use new bolts and nuts for re-assembling
15. Oil Filling	• Check the Machine-File or in the Owner-Manual to determine the proper type of oil • Do not overfill the reservoir; Do not spill oil; Check the sealing surfaces against oil leaking
16. Test Run	• Before installation the machine a test run should show the proper repair of the machine. In case of a problem it is easier to solve it with in the workshop.

5.3 Shortcuts on sketching Machine Parts during dissembling

Part	Shortcut	Detailed	Part	Shortcut	Detailed
Radial Shaft Seal with on lip (lip on the left side)			V-Ring (lip on left side)		Radial Shaft Seal with one lip and one dust lip (lip on the left side, dust lip on the right side)			Labyrinth-ring		Radial Shaft Seal with two lips			Packing

Disassembling - Sketch of Gear shaft including seals, bearing and spacer ring

6. SAFETY

Safety equipment during repair activities

- Safety glasses
- Steel toed shoes
- Hard hat when using a overhead crane or other lifting devices
- Leather gloves when doing rough work
- Rubber gloves when cleaning machine parts or handling parts which are contaminated with product
- Plastic apron and gumboots when using steam cleaner
- Face shield when doing grinding work or cleaning machine parts with steam cleaner
- Heat protecting gloves when carrying hot parts

Safety rules during repair activities

- When you enter a production area log in. When you leave the place log out.
- Inform other colleagues when you start with activities they should know.
- Make sure that a machine you start to work on is electrically disabled.
- Be careful when opening any machine, which works under pressure or vacuum, like pumps, fans, compressor, hydraulic equipment or others. They can be still under working pressure and harm you.
- Be careful when opening any machine/parts, which can possibly contain products, like pipes, tanks, boilers, pumps and others. These products can harm your eyes, your body or even your breathing.
- When handling heavy parts/tools use always a lifting device or ask your colleagues for help. You can seriously damage your back.
- When handling oil or grease, try to avoid spill or if spilled then remove it immediately.
- When working with oxy-acetylene burner, take care of fumes from old oil, grease or parts of products. Keep your head out of the fume or wear a suitable mask.
- Do not light a fire near petroleum or other inflammables.
- When opening bolts use the correct size of tools. Besides damaging the bolts you might slip off and damage your hands.
- When storing shafts or other round shaped parts prevent them from rolling of the working table using for example wood.

MAINTENANCE & REPAIR MODULE 2 – FINAL KNOWLEDGE TEST

1. Name 3 different types of bolts (3 points)

______________________________ ______________________________

____

2. What is the advantage of a stud bolt? (1 point)

- ☐ a. They are cheaper because they do not have a head.
- ☐ b. They are stronger than hexagon bolts.
- ☐ c. They will protect the housing thread if the joint is opened frequently.
- ☐ d. They will not rust so easy.

3. When do we use Body-Fit bolts? (1 point)

- ☐ a. When space is limited.
- ☐ b. If there is no hexagon bolt, we can use them instead.
- ☐ c. To prevent movement between the workpieces.
- ☐ d. No need for Body-Fit bolts at all.

4. Describe the procedure on how to repair a thread using “Heli-Coil”. (1 point)

____

____

5. What is the minimum screw-in length for bolts? (1 point)

- ☐ a. 1 times the diameter of bolt
- ☐ b. 0.8 times the diameter of bolt
- ☐ c. 1.2 times the diameter of bolt
- ☐ d. 1.5 times the diameter of bolt

6. Name 4 different types of nuts. (4 point)

______________________________ ______________________________

______________________________ ______________________________

7. Name 4 different methods to prevent bolt and nut connections from loosening. (4 points)

______________________________ ______________________________

______________________________ ______________________________

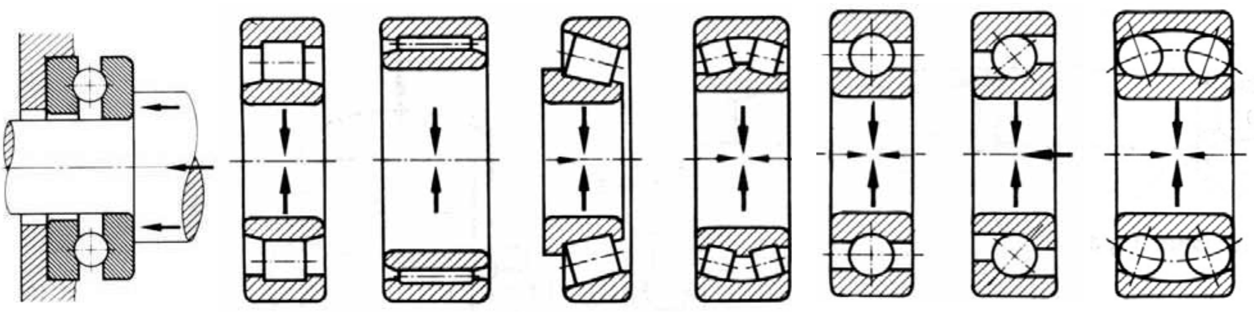
8. Name the four main parts of rolling bearings. (4 points)

______________________________ ______________________________

______________________________ ______________________________

9. Name the 8 bearings below. (8 points)

1. ______________________ 5. ______________________
2. ______________________ 6. ______________________
3. ______________________ 7. ______________________
4. ______________________ 8. ______________________



1 2 3 4 5 6 7 8

10. What are the 3 common types of loads for rolling bearings? (3 points)

______________________ ______________________

____

11. Which of the following statements about storing bearings is true? (1 point)

☐ a. No need to store bearings. The supplier will deliver them in time.
☐ b. Bearings should be stored in a warm place in vertical position.
☐ c. Bearings should be stored beside the machine.
☐ d. Bearings should be stored in a dry place in horizontal position.

12. Name the 3 possible bearing arrangements. (3 point)

______________________ ______________________

____

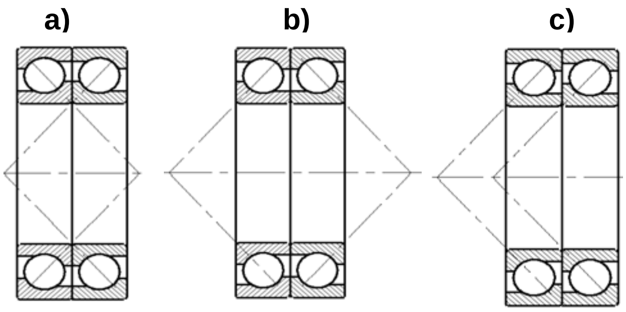
13. Which of the following statements about mounting tapered bearings is true? (1 point)

☐ a. The radial clearance can be measured with a feeler gauge.
☐ b. The radial clearance can be measured with a steel rule.
☐ c. The radial clearance can be measured with a micrometer gauge.
☐ d. The radial clearance can be measured with a micrometer height gauge.

14. Name 2 bearings suitable for radial loads and 2 bearings good for axial loads. (4 points)

Radial Loads	**Axial Loads**

15. Name the 3 bearings arrangements below. (3 point)



a) …………………..…………..

b) …………………..………..

c) …………………..………..

16. Name the 3 bearing mounting methods. (3 point)

______________________________ ______________________________

____

17. Which statement is true? (1 point)

- ☐ a. Radial shaft seals are static seals.
- ☐ b. Felt rings are non-rubbing seals.
- ☐ c. O-rings are non-rubbing seals.
- ☐ d. Face seals and sealing compounds are static seals.

18. What is <u>not</u> important for the radial shaft seal selection? (1 point)

- ☐ a. The size of the bearing.
- ☐ b. The medium that will come in contact with the seal.
- ☐ c. The max. temperature that will occur during operation.
- ☐ d. The max. working pressure

19. Which of the following statements about V-rings is true? (1 point)

- ☐ a. V-rings will hold the grease inside the housing
- ☐ b. V-rings will keep oil inside the housing
- ☐ c. V-rings work with a spring ring
- ☐ d. V-rings will keep dirt outside the housing

THREAD INSERTS FOR THREAD REPAIR

Thread Inserts (also called Heli-Coil) are used if the originally thread has been damaged. Coil inserts are made from high quality stainless steel wire, with a diamond shaped cross section, wound to the shape of a spring thread. The insert, which is larger in diameter than the tapped holes is compressed during installation then allowed go spring back, permanently anchoring the insert in the tapped hole.

Steps in repair:

- Drill out the damaged threads using the drill size specified in the manufacturers catalog
- Tap the hole using the special Coil Tap specified in the manufacturers catalog
- Install the replacement Coil. Wind the Coil into the hole. To brake the tang using the recommended special tool.

Advantages of Heli-Coil:

- They create stronger and more efficient threads.
- Simply and easy to use.
- Designed for use in material such as alloys, steel, magnesium, plastic etc.
- Simplifies changeover from inch to metric, and vice versa
- Meets Aviation Specifications
- Coils are interchangeable with other brands of helically wound inserts.
- Wide temperature range of up to 430°C
- Specials available in Inconel or Phosphor Bronze

The Coil Range:

The multiple size repair kit range from Unified, Metric, NPT, Spark Plug and British Standard thread forms.

- Inserts are available in five lengths,1 x dia. to 3 x dia.
- Inserts are available as replacement packs, bulk or stripfeed.
- Inserts are available in free running or screw lock style for applications where the thread assembly is subject to vibration.
- Inserts can be supplied in Inconel X-750 for high temperature applications.
- Coatings such as cadmium, silver and dry film lubricant are available.
- High speed taps with either intermediate, taper or bottoming leads and spiral point or spiral flute for machine applications.
- Wide range of tools and accessories:

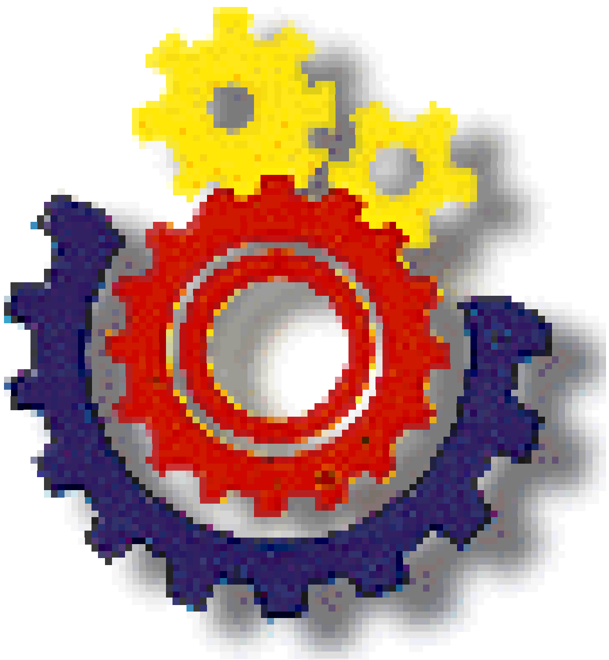
1. Do you know what a floating and a locating bearings is? ☐ Yes ☐ No

Maintenance & Repair - Module 1

(32 hours Course – Maintenance Management & Maintenance of Mechanical Drives)



With technical assistance from:

GERMAN DEVELOPMENT SERVICE

ded

General Survey –"Maintenance & Repair"- Module 1 Course

TARGET PARTICIPANTS
min 18 years old, at least High School graduates, experienced workers, supervisors or leadsman

LENGTH OF COURSE
32 hours / 4 days

OBJECTIVES

At the end of the course, the participants should be able to:
"

- know different "Maintenance Strategies" and "Condition Monitoring" Tools
- know the importance of "Preventive Maintenance Schedule", "Maintenance Log" and "Repair History Log".
- know the principles and how to install and maintain different mechanical drives: Belt Drives, Chain Drives, and Enclosed Gear Drives.
- know the classification and the most common shaft couplings
- align shafts for the installation of couplings using different methods.
- know the hazards during maintaining mechanical drives and know how to work safe.
- calculate speeds for belt drives, chain drives and gear drives.

COURSE OUTLINE

THEORY (50 %)	HANDS-ON TRAINING (50 %)	METHOD
• Maintenance Strategies • Condition Monitoring Tools • Preventive Maintenance Schedule • Maintenance Log and History files • Typical mechanical drives and their accessories • Maintaining different kinds of drives • Types of check: lubrication, temperature, and vibration. • Alignment methods of mechanical drives • Applied Mathematics	• Work out the advantages/disadvantages of Maintenance Strategies • Align a typical disk coupling using the coupling alignment trainer • Install at least two complete mechanical drives on a base plate (electric motor, reducer, chain drive and electric motor, reducer, belt drive) • Make use of different couplings • Align all shafts and make a test run • Exercises in Mathematics	• Lectures/Discussion • Practical Sessions • Teaching Video

Table of Contents

August 2000

Dear Reader,

I would like to comment this handout, because otherwise you might get a little confused while studying it.
The most important thing to know is, that this handout is developed for a **non-formal** Training Center. The participating government officials and the involved companies were not interested in long-term courses. So, I had to respect the wish of my project partners for a course with this length and was limited on the most important subjects.

One or two of the modules are still under construction. Sorry for this.

DED – Development Worker

1. MAINTENANCE MANAGEMENT

A goal of maintenance **is to eliminate or to avoid** unnecessary or unplanned downtime due to failure. The objective of Maintenance Management (MM) is to ensure the reliability and safety of plant equipment. Knowing that all equipment components will wear, appropriate management must be applied to avoid unplanned failure.

Maintenance can influences the entire plant operation, from product quality to on-time delivery, to safety records and to the impact of environmental pollutions. Poor maintenance procedures can cost a company millions of Pesos in repairs and poor quality and lost production, whereas good maintenance practices can cut production costs immensely.

Still the advantages of MM are underestimated. Why is this so? Here are some samples on how we handle other common situations in life:

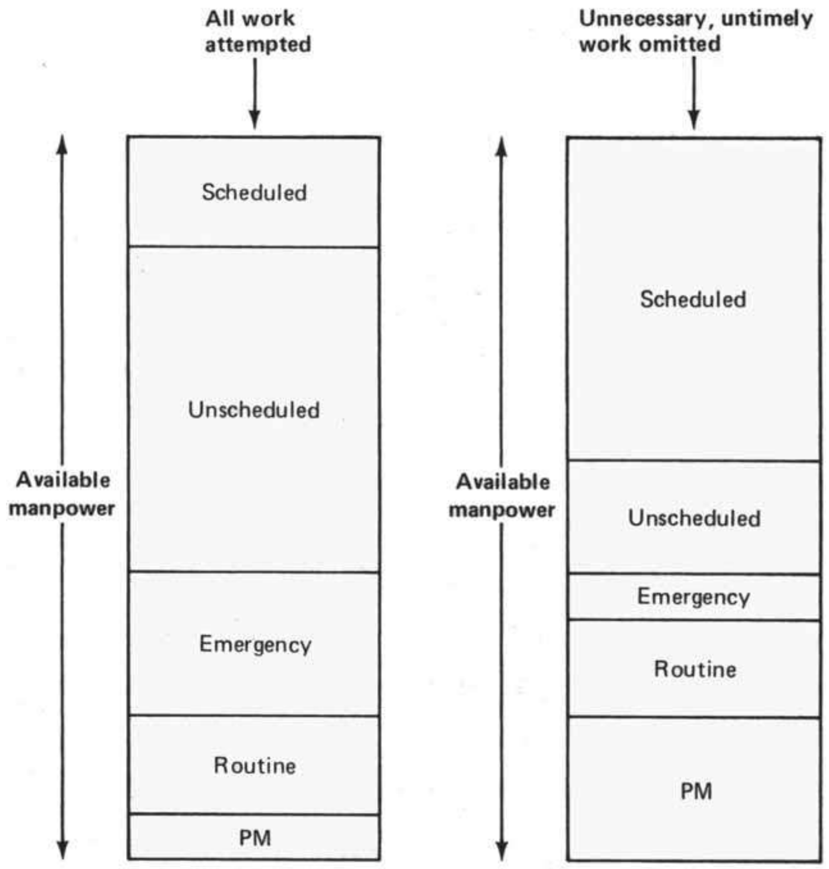
- *We go to the doctor only when we are sick*
- *Our car goes into the shop only for repairs*
- *In our home, we call electricians, plumbers, etc. only when there is a problem*
- *The focus of technical education is on dismantling/reassembling equipment*
- *In the workplace, the best "fixer" gets the promotion*

This **"bad habits"** has integrated itself into the maintenance workplace also. It is unlikely that these "habits" can be changed overnight. Moving from the approach of **"Fixing"** as the principal activity of maintenance to the approach of **"Wear Management"** - which is proactive - takes time, and a good engineering.

1.1 Types of Maintenance Strategies

Maintenance Strategy	Explanation
Run to failure Corrective Maintenance or Breakdown Maintenance	No routine maintenance tasks are performed on the equipment and then only after the equipment has suffered a failure. Repair or replace upon failure. (Reactive Maintenance)
Preventive Maintenance	Any maintenance activity for which a pre-determined job procedure has been documented, for which all labor, materials, tools, and equipment required to carry out the task have been estimated, and their availability assured before start of the task. Repair or replace on time or cycles.
Predictive Maintenance	An equipment maintenance strategy based on measuring the condition of equipment in order to assess whether it will fail during some future period, and then taking appropriate action to avoid the consequences of that failure. Employ condition monitoring to detect early stage failures. Replacement or repair is scheduled on-condition.
Planned Overhauling	The scheduled, comprehensive examination and restoration of e.g. machines, devices to an acceptable condition
Condition Monitoring Redesign and condition-control (proactive)	The use of specialist equipment to measure the condition of equipment. Vibration Analysis, Lubrication Analysis and Thermography are all examples of Condition Monitoring techniques. Changes in hardware, loading or procedures. Condition monitoring detects the presence of root causes of failure.
Redundancy	Deploy active shared-load or stand-by redundant systems

1.2 Shift from an overbalanced "Unscheduled Work" more to "Scheduled Work"



1.3 Example of a simple Preventive Maintenance Schedule

Time (weeks)

	1	2	3	4	5	6	7	8	9
Pump-1	AF	AF	AF	AF	AF	AF	AF	AF	AF
Pump-2	AG	AB	AG	AB	AG	AB	AG	AB	AG
Pump-3	ABCD	ABCD	ABCD	ABCD	ABCD	ABCD	ABCD	ABCD	ABCD

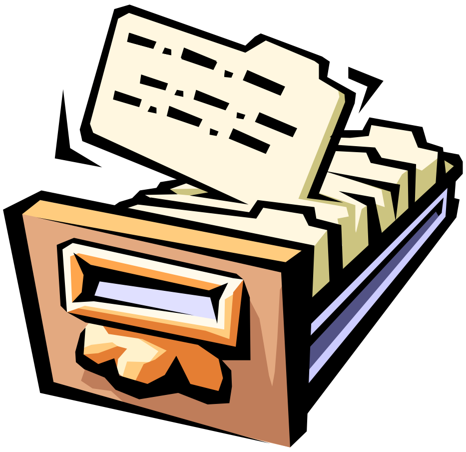
GEAR DRIVE REPAIR REPORT					
Location: Building 511, 1st floor			Machine: Paper mill # 5		
Gear drive type: Reducer 1:20			Serial no.: 10245156		
Date of putting in operation: 5/20/1997			Manufacturer: Flender Germany		
Date of Repair: 5/26/2000 Special maintenance requirements: Oil Grade 05			Auxiliary drives: ☐ Belts ☐ Chain ☒ Coupling Flexible Coupling ☐ Others		
Part	Failure	Mark	Part	Failure	Mark
Auxiliary Drive	Chain or belt broken		Gears	Seat worn out	
	Sprocket/Pulley worn out			Broken teeth	
	Keyway problem			Worn out teeth	X
	Drive shaft bent			Others	
	Coupling damaged		Lubrication	No oil	
	Coupling rubber broken	X		Little oil	X
	Others			Dirty oil	
Sealing	Lip seal defective	X		Water in oil	X
	Housing seal defective			Breather defective	
	Others			Others	
Shaft	Seat of bearing worn out		Housing	Cracked	
	Seat of Lip seal worn out	X		Problem with bolt connection	
	Bent or broken			Problem with pin connection	
	Others			Others	
Bearings	Worn out	X	Base Plate	Loose, weak	
	Excessive damaged			Problem with bolt connection	
	Others			Problem with foundation	

EQUIPMENT FILE



To ensure a quick and smooth planning of maintenance activities as well as the actual repair job, it is advisable to maintain an equipment file for all equipment, used in the plant.
The following data should be included:

1. Specification	• Type of equipment • Brand • Model • Date of installation • Serial number • Capacity • Speed • Load
2. Location	• Building • Floor
3. Technical Drawings	• Including detailed drawings
4. Spare Part No., and where to get them	• Bearing • Sealing • Lubricant • Drive • Coupling
5. History of Preventive Maintenance Activities	To monitor and improve Preventive Maintenance measures
6. History of Repair Activities	To find out the cause of break down and prevent the same failure again for the future

1.6 Condition Monitoring – 7 Tools

Lubrication Analysis	Analyzing lubricant samples at regular intervals. Lubricant analysis is in general strong in detecting failures in gearboxes, and hydraulic systems.
Vibration Analysis	Measuring vibrations of rotating machines. Vibration analysis is in general strong in detecting failures in high-speed rotating systems. Vibration analysis is especially strong in localizing the point of failure depending on the application.
Thermography	Measuring the temperature e.g. of bearings at relevant measuring points at regular intervals.
Visual Inspection	Maintenance personnel travel scheduled routes checking such things as the presence of coupling guards and the integrity of belts.
Operational-dynamics Analysis	Using various devices, employees check equipment to make sure it's meeting design specifications. A damper might be checked to make sure it's receiving a 50-percent airflow, as designed.
Electrical Monitoring.	Technicians regularly check all electrical components with voltmeters, infrared equipment, and other devices to guarantee their operational integrity.
Failure Analysis	This determines why a piece of equipment failed and how that can be prevented in the future.

Effectiveness of Lubrication-Analysis, Vibration-Analysis and Thermal-Analysis in compare:

	Predictive What is going to happen?			**Failure Analysis Why did it happen?**		
	Lube Analysis	**Vibe Analysis**	**Therm Analysis**	**Lube Analysis**	**Vibe Analysis**	**Therm Analysis**

1.6.1 Lubrication Analysis

Fluid condition management, when properly implemented, delivers the following productivity and profitability improvements:

- Minimized downtime
- Extended machine life
- Reduced labor costs
- Reduced fluid consumption and disposition costs.

What should be analyzed after taking a sample from a machine?

• **Chemical Properties**	Because of the oxidation of the lubricant, the durable molecules break into smaller pieces, which changes the properties of the lubricant. The test includes e.g. the viscosity, the decrease of additives, the flashpoint.
• **Fluid Contaminants**	If the lubricant carries other fluids, most likely water. These fluids are not so good at minimizing friction, so they are considered contaminants.
• **Solid Contaminants**	Mechanical action within machines creates mechanical stress that sometimes exceeds the elastic limits of the metal. Microscopic pieces of metal break off the component surface. The oil carries those pieces away so more stress can break off more pieces.

1.6.2 Vibration Analysis

The vibration analysis is a condition-monitoring tool, which is capable of measuring vibration caused by rotational and structural problems like imbalance, misalignment, looseness etc. It is also capable of measuring vibration in higher frequencies caused by rolling bearing problems. The results are usually compared with previous data to ensure that there is for each measuring point a history.
Companies, which use Vibration monitoring, have many advantage:

- Less Downtime
- Less Spare Parts Inventory
- Less Overhaul-Overkill
- Longer Production Runs
- Better Quality

Using vibration analysis, companies will have a list of "invisible" anomalies. This list will show problems long before failure, which will allow repairs to be scheduled during off hours. Problems with bearings are detected long before they fail so that other associated mechanical components are unaffected. No shafts are broken so the repairs are done in a fraction of the time. During repairs, other machines that have impending problems detected with vibration monitoring can be corrected. The parts have been ordered in advance as needed.

Especially for important equipment like Turbines, Engines, Fans, Conveyors, Pumps, Gear Boxes, etc. is advisable to monitor continuously using transducers, which are connected with a data-storage system.

1.6.3 Thermography

Regular measuring of temperature at machines is like an early warning system. The results are usually compared with previous data to ensure that there is for each measuring point a history. There are contact and non-contact thermo tools available.

- An accurate contact tool comes often with a temperature range from –200 °C up to 1300°C. The accuracy is +/- 0.5°C.

- Non-contact measuring tools are normally laser tools. This method is safe and fast in use, even in critical application like hot surfaces or moving parts.

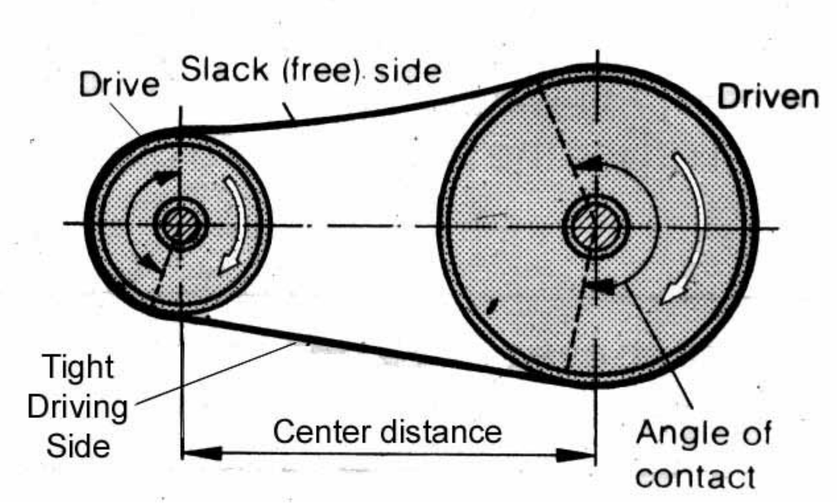
Similar to the vibration analysis, especially for important equipment like Turbines, Engines, Fans, Conveyors, Pumps, Gear Boxes, etc. is advisable to monitor continuously using transducers, which are connected with a data-storage system.

2. MECHANICAL DRIVES - BELT DRIVES

In general, we can say that belt drives transfer the turning moment between two shafts. This is possible because of the contact force between the belt and the belt wheels. The required contact force is generated, by the belt **pre-tension,** which is applied during the installation of a belt drive.

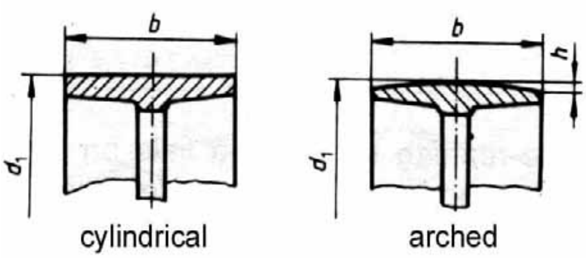
Advantages of belt drives:
- Can operate at much higher speeds than chain drives
- Elastically load transmission (quiet operation)
- Cheaper than chain drives
- Easier and cheaper to maintain than chain drives
- Lower own weight compared to chain drives (less centrifugal forces)
- Wide horsepower range (for heavy loads multiple belt drives possible - up to 12 belts)

Disadvantages of belt drives:
- Limited shaft distances
- High loads for the bearings
- Due the slip effect lower speed at the driven wheel



2.1 Flat Belt Drives

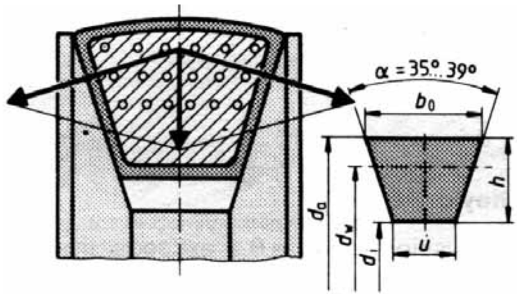
This type of belt requires great care during installation. Sometimes the belts are even cut to length and spliced direct on the jobsite. Only experienced workers should do this job. The common materials are leather, nylon or a combination of both. To bring the two ends of the belt together there are different techniques from gluing, sewing and fixing with fasteners.



Types of pulleys for flat belt drives

2.2 V-Belt Drives

V-Belts are endlessly produced belts with a trapezoidal cross-section. The most common material combination in use is a rubber body with nylon fibers or tire cord inside to increase the tensile strength. V-belt drives can work with transmission ratios up to 10:1.



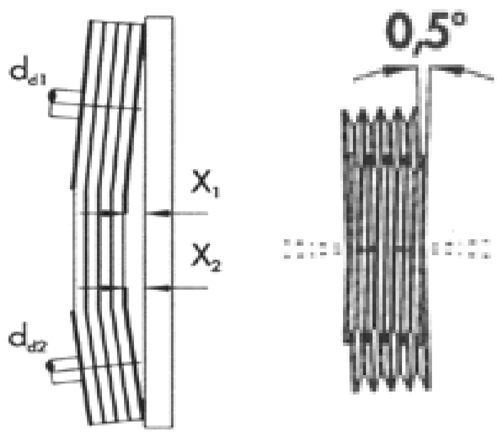
V-belt direction of force and trapezoid dimensioning

V-belt pulleys are constructed single or multi-grooved. Be carefull and use the right belt-form for the given pulley groove.

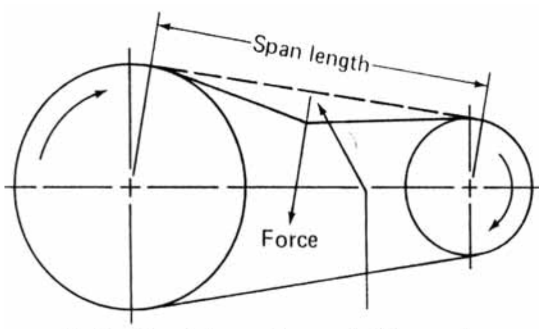
2.2.1 Installation of V-belt drive

- Check if the V-belt will fit to the pulley. Only a fitting belt can transform the full transmission load.

- Align the two pulleys carefully using a straightedge. Misaligned drives can damage the bearing and the belt itself. Especially when installing multiple belt drives it is extremely important to align properly, because otherwise not all of the belts will carry the same load. The vertical misalignment should not exeed 0.5 degree.



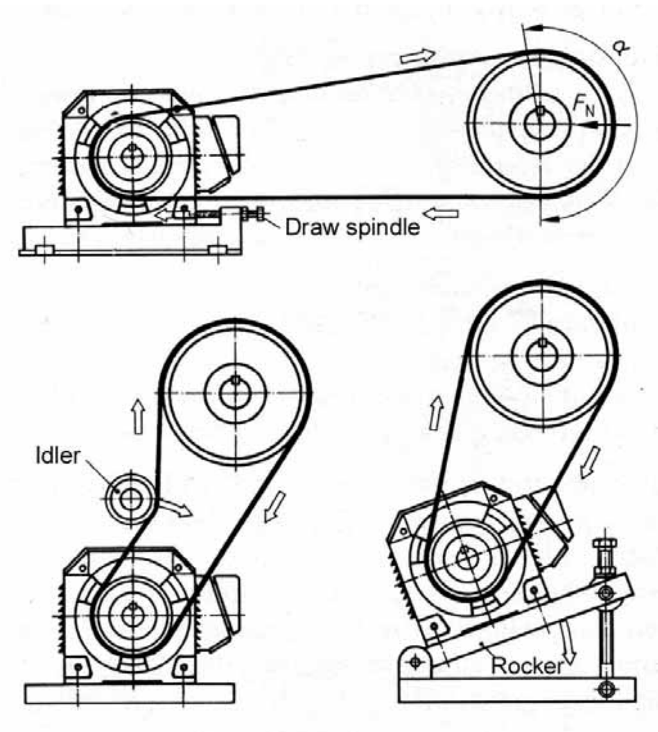
- Adjusting the V-belt tension is also very important for the working life of the whole drive including the bearings. Consult the belt manufacturer to find the recommended tension for the belt. Some manufacturers offer some tension test devices



Deflection 1.5 mm for each 10 cm of span

- The most common techniques to tension belts are the use of elongated holes with adjustment spindles and the use of rockers.

- For machines with nonadjustable centers, the best way to take up the slack is to install a tensioner.



2.2.2 Maintenance Principles for V-Belt Drives

There are two generally accepted maintenance principles for installing new belts or any multiple-belt drive.

Principle No. 1: Always replace all the belts.
Older belts naturally become stretched or worn from use. If old and new belts are mixed, the new belts will be tighter, will carry more than their share of the load, will probably fail before their time and may also contribute to uneven pulley wear.

Principle No. 2: Always use a matched set of belts from one manufacturer.
If unmatched belts and brands are mixed, the belts may have different dimensional and performance characteristics, and they could work against each other, resulting in unusual strain and short service life.

Principle No. 3: Always adjust belts after a short run-in period
The newer generations of belts are made of thermally active polyester tensile cords with a higher elongation resistance. Even for this new type of belts, it is recommended to re-adjust the tension of the belts after a short run-in period.

V-Belt Drive Troubleshoot:

Problem	Cause	Cure
Belt slips	• Drive under-tensioned • Drive overloaded • Worn pulleys • Shock loads	• Re-tension properly • Redesign with larger pulleys or more belts • Replace Pulleys • Drive under-tensioned or under-loaded. Check drive design
Belts wears rapidly	• Pulleys worn • Overloaded drive • Belt hitting guard/frame • Dirt and grit entering drive	• Replace or re-machine • Redesign with larger pulleys or more belts • Provide more clearance • Provide closed guards
Belt mis-matched	• Mixed old and new belts • Belts not of same make • Worn or improperly machined pulleys	• Replace with new set • Replace with new set • Belt will ride at different positions in the grooves. Replace Pulleys.
Belt brakes	• Improper belt installation • Insufficient tension • Shock loads	• Belt squeezed over pulley. Install new belts properly • Belts whipped on start-up or under shock • Drive under-tensioned or under-loaded. Check drive design
Belt jumps grooves	• Drive misaligned • Tensioner not located properly • Excessive whip and vibration	• Check and realign • Redesign tensioner position • Shorten center distance or add tensioner
Belts crack	• Belt slipping • Excessive heat • Pulley or tensioner to small • Chemical attack	• Increase tension • Provide adequate ventilation. Check slippage • Increase diameter • Provide adequate protection
Belt vibration	• Pulleys not balanced • Weak base construction • Resonant condition	• Provide dynamically balanced pulleys • Redesign with additional supports or bearings • Until there is an improvement try to change center distance; increase or decrease number of belts or add tensioner

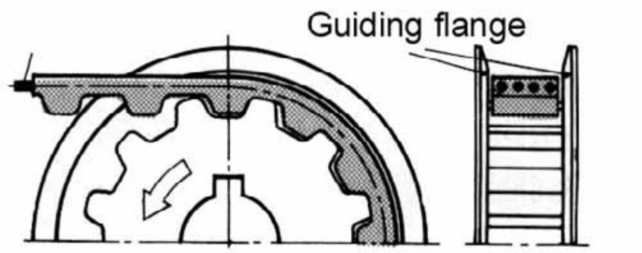
2.3 Positive-Drive Belts (also Synchronous Belt or Toothed Belt)

Positive-belt drives are widely in use in all parts of industry. One advantage of this belt type is the constant speed for driven wheel and drive wheel, because of the teeth, which do not allow any slip.

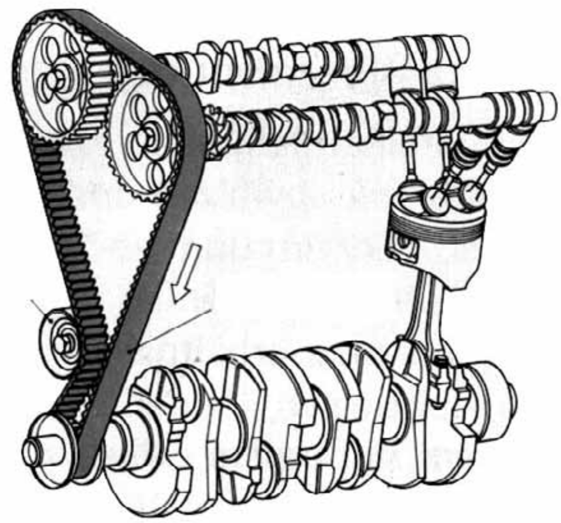
To install positive-drive belts, follow the same general procedure as for V-belts. It is normal for this type of belts to ride towards one side of the pulley when operating. Most of the pulleys will come with two flanges. If there is only one flange, then install the flanged side to the side where the belt moves.

Positive-belts do no rely heavily on tension to operate. Unlike V-belts and flat belts, all they need is to fit properly on the pulley, tooth to tooth. If available, follow the instructions of the belt manufacturer to tension the belt. This will extend the life expectancy. Tensioners should be used whenever it is absolute necessary to prevent a jump over of some teeth of the belt.

The material of "Synchronous Belts" is normally a polyurethane body for abrasion and chemical resistance, and for stretching resistance aramid fiber tensile cords. The tensile cords also provide excellent flex fatigue life and high resistance to shock and alternating loads. Nylon facing gives strength and durability to the belt teeth.



Toothed belt drive (synchronous belt drive)



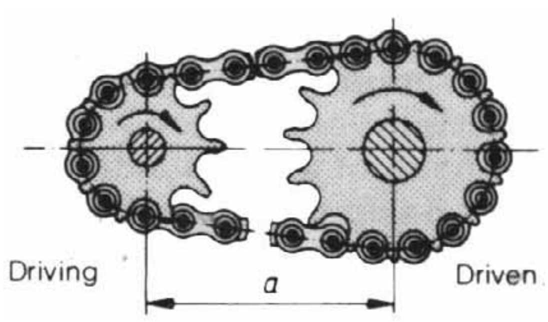
Toothed belt with idler for driving camshafts

3. CHAIN DRIVES

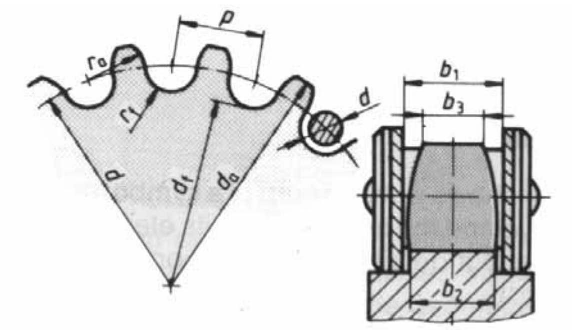
In general, chain drives transfer slip-free power between two shafts over a distance which cannot be bridged with gears. The transmission forces are carried by the chain-links gripping in the teeth of the sprocket wheels.

Advantages of chain drives:
- Usable in a wide range of drive applications
- Moderate to heavy loads
- Can be used in critical areas where moisture, heat and oil is present

Disadvantages of chain drives:
- Only for lower speeds (except high performance precision roller chain drives)
- Relatively high maintenance costs
- With moderate or high speeds permanent lubrication necessary



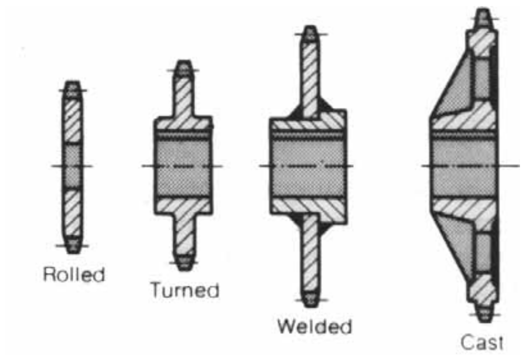
Simple chain drive



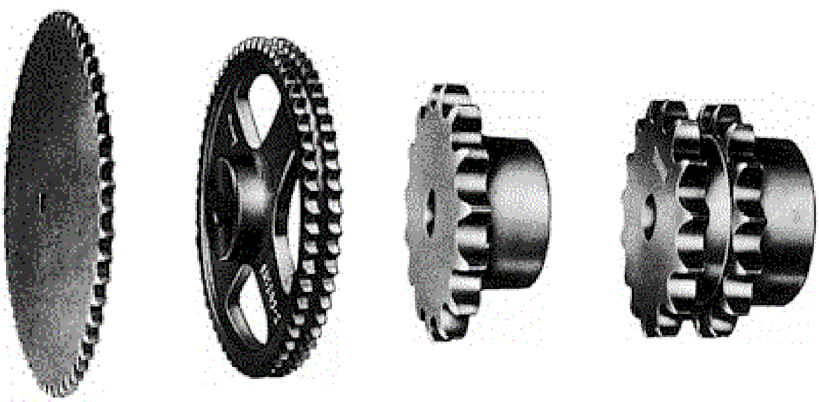
Main dimensions of sprocket wheel

3.1 The Sprocket

Sprockets are available on the market in a big variety. They are normally made out of the following materials: Low Carbon Steel, High Carbon and Cast Iron.
The borehole comes often with standard sizes. It must be machined to the required size.



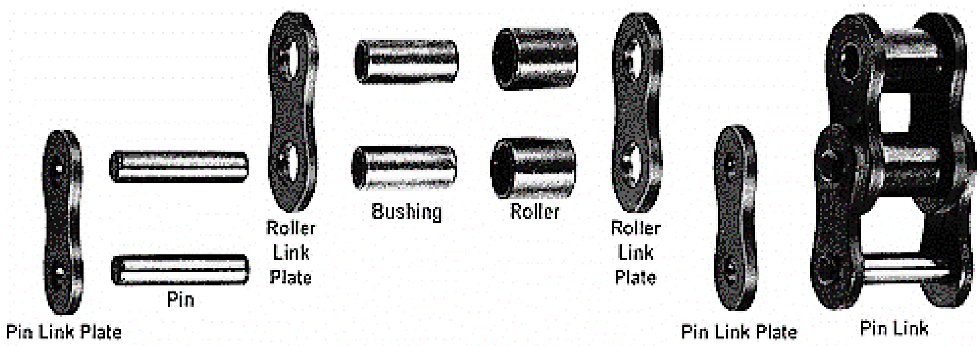
Manufacturing method



Sprocket Teeth:
Chain drives are also used for high-speed power transmission. To meet this requirement, the **sprocket tooth tips** are strengthened by means of high frequency hardening.
Hardening of tooth tips is required in the following cases:

- The number of teeth is 24 or less and the sprocket is used at higher speeds
- Small sprockets and speed ratios over 1:4
- Use with heavy loads at low speed
- Use under abrasive conditions

3.2 The Chain



3.2.1 Roller chain layout

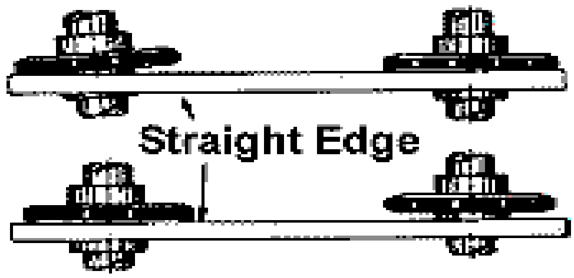
Speed Ratio and Chain Lap
The speed ratio of Chain drives can range up to 7:1 under normal conditions. However, a speed ratio of 10:1 is possible if the required speed is very slow. Chain lap on the small sprocket must be at least 120°.

Distance between Shafts
Optimum distance between sprockets is 30 to 50 times the pitch of the chain except when there is a pulsating load. In such cases, the distance can be up to 20 times the pitch of the chain.

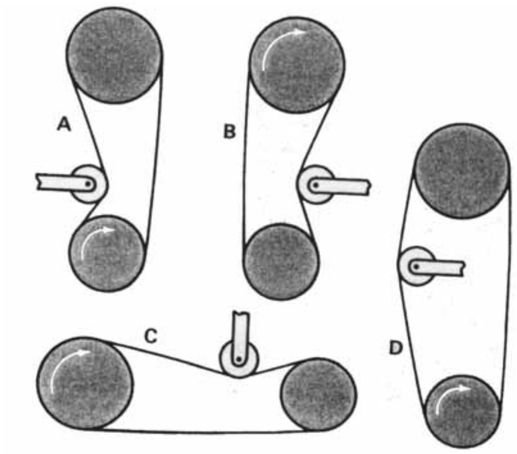
Layout
When arranging the roller chain drive, the centerline of both sprockets should be as close to horizontal as possible, though the angle of installation can be up to 60°. If installation is close to vertical, the chain tends to slip off the sprockets easily with slight chain elongation, In this case, an idler or guide stopper is recommended.

3.2.2 Roller chain Installation

Aligning Shafts:
For efficient operation, both the driving and driven shafts must be level and they must be parallel which each other. To align the sprockets use a straightedge. Misaligned drives can damage the bearing after a short time.



Chain Tension:
Generally, roller chain is used with adequate slack. If the chain is tightened excessively, chain damage or rapid use of lubricant may result. If the chain is too loose, damage due to vibration or chain winding, may result. Adequate slack is to be adjusted to 2 % up to 4% of the chain span. For example, if the span is 800mm, slack should be 800mm x 0.04 = 32mm. The chain will elongate slightly from the beginning of initial driving from 0.05% to 0.1% of the full length. As this causes extra slack, adjustment of slack is required. An idler can be used to take up the slack or the shaft can be adjusted. After this adjustment, chain elongation should be minimal. If you place the idler outside the chain loop (picture A, B, C) install it nearer to the small drive sprocket. If you place it inside the chain loop, (picture D) mount it nearer to the large sprocket.



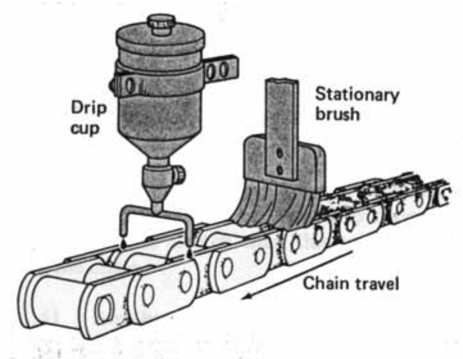
3.2.3 Roller chain Lubrication

Proper lubrication of roller chain is essential for good performance and full chain life. Care should be taken to strictly follow the lubrication schedule and recommendations. If this is not done, the service life of the chain will be shortened and maximum power transmission will not be delivered, no matter how high performing the chain or sprocket is.
Since wear between pins and bushings cause chain elongation, lubrication must be maintained on all contact surfaces. Proper lubrication forms an oil film which:

- Reduces abrasion and chain wear
- Reduces chain friction and noise
- Functions as a coolant when the chain is run at high speeds
- Functions as a cushion against impact

Only high-grade oil of suitable viscosity should be used. The proper type of oil to be used depends on the chain specifications, working conditions and lubrication system.

Oils to avoid:
Heavy oil, Low-grade oil, Impure oil or grease, Used oil



Types of lubrication application:

- Manual Application - Oil is applied with an oil filler or brush on the slack side of the chain.
- Oil Bath Lubrication - The chain is installed in a leak free casing.
- Lubrication By Rotating Disc - Oil can be splashed on the chain using a rotating disc installed in a leak-free casing. For this method, speed along the circumference of the disc should be over 200 m/min. If the width of the chain is over 125 mm, use a rotating disc on both sides
- Lubrication Using a Pump - The chain is contained in a leak free case and a pump is used to circulate and cool the oil

3.2.4 Chain Maintenance

Chain is usually replaced when the chain does not engage properly with the sprocket due to damage of its parts or elongation. To help prevent premature wear or damage, the following points should be checked. Observe the chain and sprockets for these items:

- Abnormal Noise
- Chain rising on the sprocket
- Stiff bending of chain
- Whether the chain contacts the case
- Damage on the sprocket teeth surfaces and side surfaces of teeth and engaging area
- Bending of chain and rotation of roller
- Vibration of the chain
- Chain winding around the sprocket
- Amount and condition of lubrication
- Abrasive stretch of the chain
- Appearance of chain, check for dirt, corrosion, damage on the outside surface of the roller, contact marks, etc

Lubrication
While the chain is driving, check if the lubricating oil moves toward the link plates, and if the chain or rotating disc is immersed in the lubricating oil of the oil bath. When the chain is stopped, check for dirt or abrasive particles produced by improper lubrication. When the chain is removed, the connecting link pin and the edge of the inside of the bushing should be checked. If there is any damage, or a red or reddish brown color can be noticed, lubrication is improper or insufficient. Regardless of the lubricating system used, roller chain should be washed periodically with petroleum or gasoline.

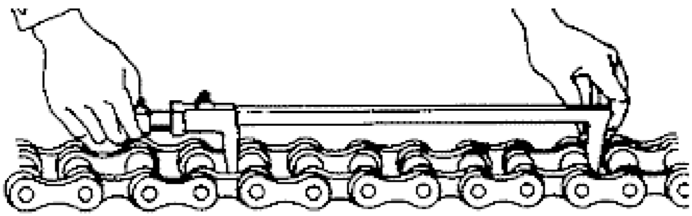
Sprocket
Chain and sprocket engagement can be checked by observing the roller and tooth surfaces. The installation should also be checked. The normal area where wear will occur is slightly above the bottom of the lowest point between the sprocket teeth.

Chain Elongation
Chain stretch is calculated as the total amount of elongation caused by wear. Chain life can be estimated by measuring chain elongation.
Measuring Chain Elongation:

- The chain should be measured by stretching it slightly
- Measure the distance, using a vernier caliper. Note: When measuring, use at least 6 to 10 links to help keep any measuring error to a minimum. When measurement cannot be done with a vernier caliper, it is possible, though less accurate, to use a tape measure. If a tape measure is used, the measured length should be as long as possible.

Maximum Allowable Chain Elongation

Number of teeth on driving sprocket	Chain Elongation
60 and under	1.5 %
61 to 80	1.2 %
81 to 100	1.0 %
100 and over	0.8 %



Replacement of Chain

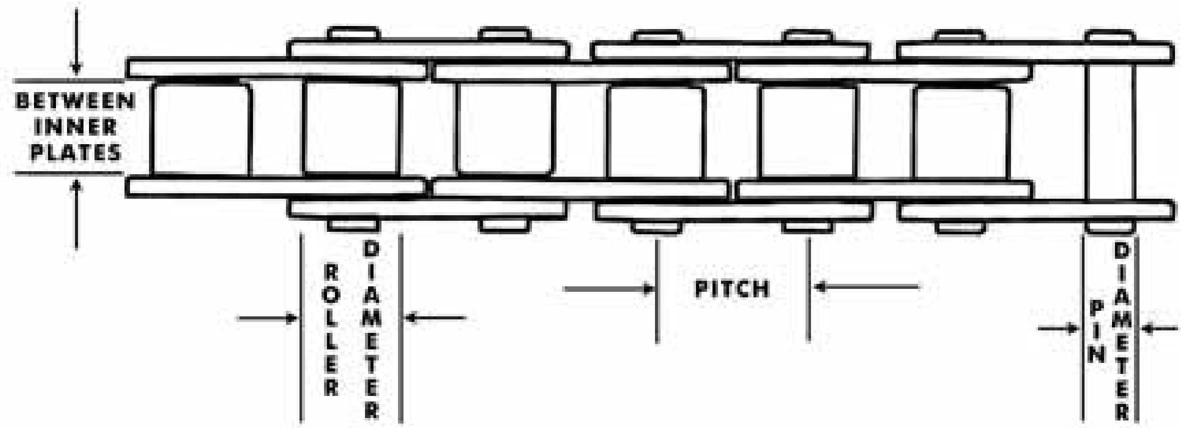
There are two relatively simple methods for cutting Roller Chain. One way is to use bench vise and punch, and the other is to use a chain breaker:

Using a bench vise and punch:

- For riveted type Roller Chain, first grind down one end of the pin to be removed. For split pin type, be sure to take out the pin.
- Put the chain into the vise and tighten the vise to secure the chain.
- Hit the head of the pin with a punch or hammer. Be sure to hit the pins alternately so that they can be removed at the same time.

Note: For riveted types, be sure to grind off the riveted part of the pin. If the pin is taken out without grinding, it will take more time and may damage the chain

3.2.5 Chain Dimension



Chain No.	Pitch	Roller Diamter	Distance between Inner Plates	Pin Diameter
#25	¼	0.130”	1/8	0.091”
#35	3/8	0.200”	3/16	0.141”
#40	½	0.312”	5/16	0.156”
#41	½	0.306”	¼	0.141”
#50	5/8	0.400”	3/8	0.200”
#60	3/4	0.468”	½	0.234”
#80	1	0.625”	5/8	0.312”
#100	1 1/4	0.750”	¾	0.375”
#120	1 ½	0.875”	1	0.437”
#140	1 ¾	1.000”	1	0.500”
#160	2	1.112”	1 ¼	0.562”

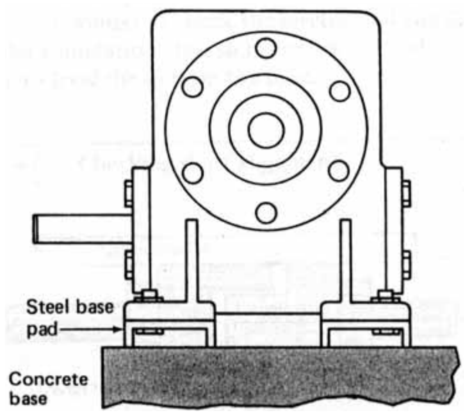
4. MECHANICAL DRIVES – ENCLOSED GEAR DRIVES MAINTENANCE

This chapter will only handle the gear drive related maintenance topics. The “Maintenance & Repair Module 2” will give more detailed information about gear drives in general.

4.1 Gear-Drive Installation

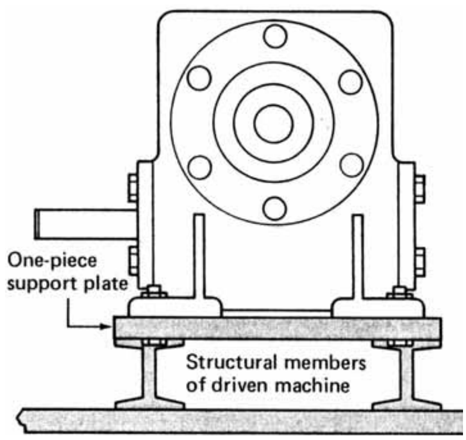
4.1.1 Floor Mounting

The foundation should be always completely solid. It is not advisable to mount a drive direct on the floor. Steel base pads or the newer generation of hard rubber-nylon pads must be used to contact the drive to the floor.



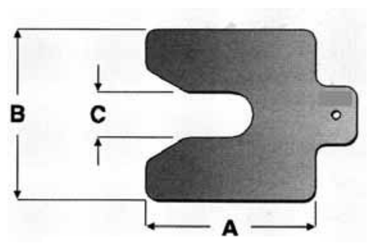
4.1.2 Structural Mounting

Enclosed gear drives are often mounted on the framework of the machine on which they drive. A support plate is used to hold the unit. The plate should be thick enough to support the weight of the drive and to stabilize the whole structure.



4.1.3 Leveling and Fixing the Gear Drive

Lift the gear drive over the mounting bolts or stud bolts and set it carefully down. Install, but do not tighten the fasteners. Use a spirit level to check the levelness of the drive and foundation. Use shims under the feet of the drive to level the unit on the base. Then tighten down all the bolts that hold it in place. Tighten the fasteners crosswise like when you mount a wheel on a car.



Shim

4.1.4 Installing the Accessories

Clean the input and output shafts of the gear drive and inspect the key seats in the shaft. Remove burr from the key seat corners. When installing auxiliary drives like belt drive, chain drive or straight coupling, think about the additional loads for the bearings if one of them will be misaligned. Cover all the moving parts with an appropriate casing. Make sure that the oil fill plug and the oil drain plug is accessible and not blocked by a part of the accessories.

4.1.5 Lubricate before Test-Run

Improper or inadequate lubrication is a leading cause of early gear drive failure. In addition, to the gearing, the bearings must be properly lubricated before the test-run.
Most gear drive housings have a small vent called "breather". This prevents the buildup of pressure or the formation of a vacuum inside the housing and assists the flow of lubricants within the drive. Be sure the breather is in good working condition.
Some gear drives are delivered already with the proper lubrication. Do not rely on that. Check the supply of lubrication and if necessary add some oil or grease. If you install the drive in a very hot or very cold operation environment, check with the manufacturer for special lubrication instructions.

4.1.6 Test Running (no-load test)

Make one final check to see that all the components in the drive package are securely tightened down on the base or foundation. Be sure that you have supplied the gear drive and other parts with the correct amount of the proper lubricant, as recommended by the manufacturers.
Do not connect the system to load. The purpose of no-load test is to see that all drive package components operate properly. It allows you to identify any faulty parts and repair or replace them before they can damage the equipment that is to be driven by the system. Make sure you alert all personnel concerned that you are about to test the drive. Start the motor and listen to unusual sounds.
If there are some strange sounds, stop the drive and disconnect the electric energy line (or lock the switch). After opening the top of the housing, check the gears and the movement of the bearings. Check the lubrication. Check the alignment of the shaft. After location and correction of the difficulty, replace the housing cover and start the drive again.

4.1.7 Run-In

After an acceptable no-load test, slowly apply about 50 % of the operation load. Listen carefully for unusual noises or signs of trouble, as you did when test-running the drive. If possible, allow the drive to operate under this half load for 8 to 10 hours. Check the hold-down bolts. Inspect also the other system components, particular belts, chains and couplings. If everything is o.k, increase the load to full operating level. Check the bearing temperature for excessive heat and watch for signs of abnormal oil leakage.

4.1.8 Condition Monitoring

Include the gear-drive in your condition-monitoring program. Develop a log chart for the drive system. Following the maintenance log, check regular oil level, temperature of bearings, vibration and take oil samples for lubrication analysis. Auxiliary drives should be also included in the maintenance program for the drive.

4.1.9 Storage

If an enclosed gear drive is to be stored in the plant for a longer period before being installed, special treatment is needed:

- Fill the drive completely with oil. Place a tag on the housing stating that the oil must be lowered to operating level before use.
- Keep the external shafts coated with a light film of oil or grease.
- Protect the shafts with clean oil soaked rags.
- Put also some oil on the visible seals to prevent drying out

4.2 Troubleshooting for Enclosed Gear Drives

	Possible Causes									Potential Solutions									
Symptom	Overloads	Lubricant problem	Bearing misaligned	Excessive overhung loads	Shaft misalignment	Insufficient thermal HP capacity	Faulty bearing	Faulty seals	Faulty breather	Check load vs. nameplate HP	Check type and quantity of lubricant	Inspect and replace bearings as needed	Reduce overhung load	Provide more cooling	Replace drive with larger unit	Check breather for functioning	Check and replace seals as needed	Clean up seal contact area on shaft	Check and align shafts
Excessive gear wear	•	•								•	•				•				
Bent or broken shaft	•			•	•					•			•		•				•
High temperature	•	•				•				•	•			•	•				
Bearing noise and failure	•	•	•	•			•					•	•						•
Oil leakage								•	•							•	•	•	
Broken gear teeth	•		•		•					•		•							

5. SHAFT COUPLINGS

Almost every mechanical drive used in industrial plants has a coupling. The main purposes of couplings are:

- To transmit power from a motor or engine to a machine (pump, gear box, fan, etc.)
- To compensate misalignments
- To compensate axial elongation of shafts

Shaft couplings range in size from extremely small ones (servo mechanism) to huge ones (electrical power plant generator).

5.1 Classification of Couplings

Practically we distinguish the following two types of couplings:

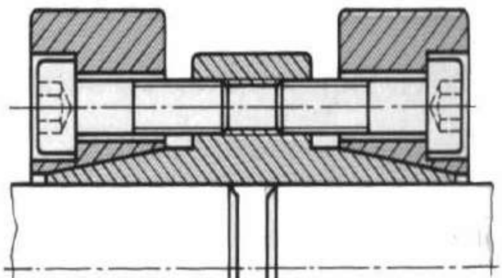
- Rigid Couplings
- Flexible Couplings
- Elastic Couplings

5.1.1 Rigid Couplings

Rigid couplings have the function to connect two shafts so that they are joined as made out of one piece. Exactly aligned shafts are required for this coupling type.

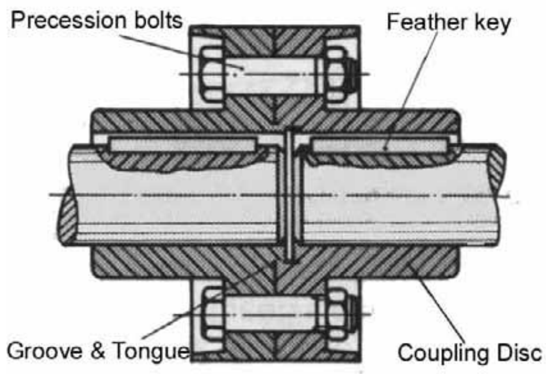
Split Coupling:
Transfer turning moment by frictional connection. The coupling is slotted and therefore after screwing up pressed against the shafts. The feather keys fix the location.
Uses: For small turning moments and low speeds

Shaft Coupling with tapered sleeves
Two exactly aligned shafts are connected by screwing up two conical rings on a tapered sleeve. Trough the conical rings and sleeves there are so much friction between the sleeve and the shafts, that it is not necessary to use feather keys.



Rigid Coupling with Taper Sleeve

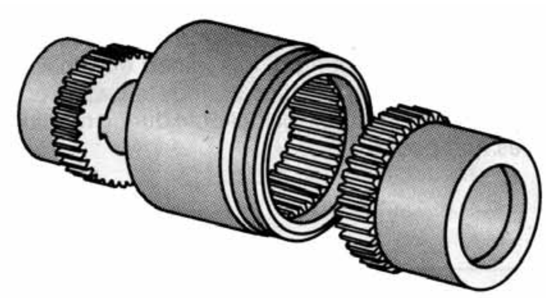
Disc Coupling:
The two half's are joined by precision bolts and transfer the turning moment by frictional connection and interlocking. Exact running of the shafts are guaranteed through groove and tongue connections.



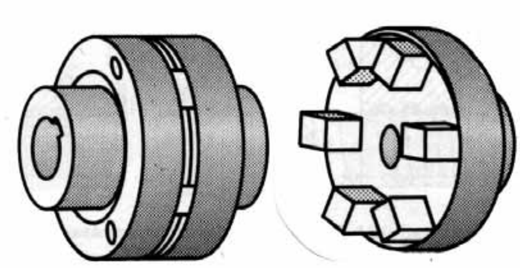
5.1.2 Flexible Couplings

These type of couplings transfer the turning moment through positive locking. They offer sufficient play for small changes in length and displacement of shafts.

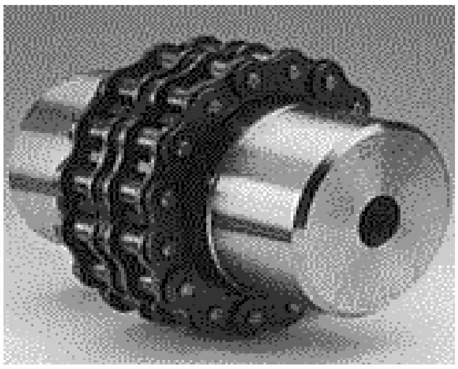
Curved Teeth Coupling
To lock or unlock the coupling the toothed coupling muff is moveable designed. This can also compensate the elongation of the shafts. Used for high torques.



Claw Coupling
They transfer the turning moment with interlocking claws. Easy to install. Flexible enough to compensate some misalignment and some elongation of the shafts.



Roller Chain Coupling
The Roller Chain Coupling is a safe, compact and powerful flexible coupling, able to handle loads from 0.1 - 11,000 kW. The sprocket teeth are specially shaped and hardened, and torque is evenly apportioned



5.1.3 Elastic Couplings

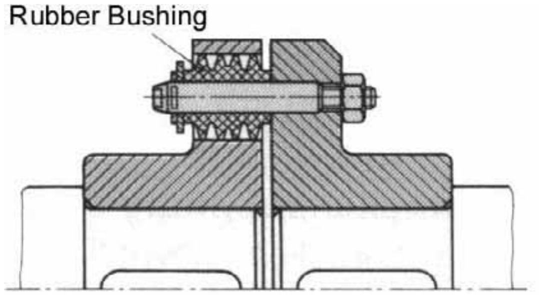
These type of couplings transfer the turning moment through elastic elements. Bumps and vibrations are softened. The start of the driven machine is a little bit delayed because of the deformation of the rubber element, which is an advantage for the bearings. Elastic couplings offer sufficient play for small changes in length and displacement of shafts.

Claw Coupling with rubber elements

They transfer the turning moment with interlocking claws. Easy to install. Between the claws there is a rubber element inserted.

Disc Coupling with rubber bush

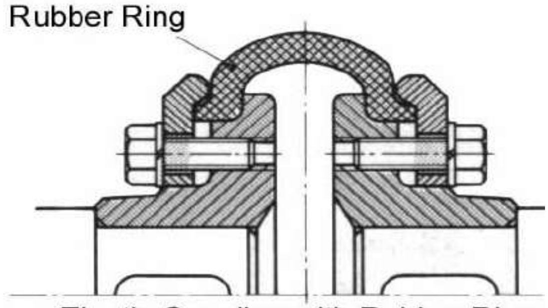
Both coupling discs are joined with precise machined alignment pins. One half of the coupling comes with holes in which are the rubber elements inserted.



Elastic Coupling with Rubber-Bush

Rubber Ring Coupling

Both coupling discs are joined by a firmly clamped rubber ring. This rubber ring is strengthened by fiber layers similar to an automotive tire.



Elastic Coupling with Rubber Ring

5.2 Proper Coupling Selection

To make a good selection of coupling for the given application it is necessary to know some basics.

- **Horsepower** -- Almost every coupling is sized based on the horsepower to be transmitted. The exceptions would be chain and rigid designs, which are selected based on the shaft diameters to be coupled.

- **Type of Drive --** If the power source is a reciprocating engine, there can be problems with torsional vibration in a continuous steady form, which can be transmitted directly into the driven machine. The elastomeric design coupling can help to dampen this vibration.

- **Type of Driven Equipment --** Driven machines are classified according to their load characteristics, and a service factor is assigned based on those characteristics. Multiplication of the service factor by the input horsepower gives you the design horsepower upon which most couplings are sized.

- **Coupling Operating Speed --** Most selections are based on the HP at a certain RPM. As always, as the speed goes down the torque goes up. The other thing to check is that the maximum speed of the selected coupling is not exceeded.

- **Shaft Sizes –** The selected coupling must fit to the bore required. In many instances, it is necessary to go to a larger coupling than design would indicate in order to get the bore size you need.

- **Space Limitations –** The coupling's length and diameter must fit within the necessary confines.

- **Environment** -- If the environmental temperature it is over 77 degrees C or below -34 degrees C it can change the operating characteristics of an elastomeric coupling or effect the lubrication of a mechanically flexible coupling. If the environment is wet or oily, it limits the types of couplings you can consider. There are many environmental related things, which can affect the service life of a coupling.

6. SHAFT ALIGNMENT (COUPLING ALIGNMENT)

What is the Objective of accurate alignment?

The objective of shaft alignment is to increase the operating lifespan of rotating machinery. To achieve this goal, machinery components that are most likely to fail must operate within their design limits. Since the components that are most likely to fail are the bearings, seals, coupling, and shafts, accurately aligned machinery will achieve the following results:

- Reduce excessive axial and radial forces on the bearings to insure longer bearing life and rotor stability under dynamic operating conditions
- Minimize the amount of shaft bending from the point of power transmission in the coupling to the coupling-end-bearing
- Minimize the amount of wear in the coupling components
- Reduce mechanical seal failure
- Maintain proper internal rotor clearances
- Lower vibration levels in machine casings, bearing housings, and rotors

What are the Symptoms of misalignment?

Misalignment is not easy to detect on machinery that is running. Misalignment will be only obvious trough secondary effects of the following symptoms:

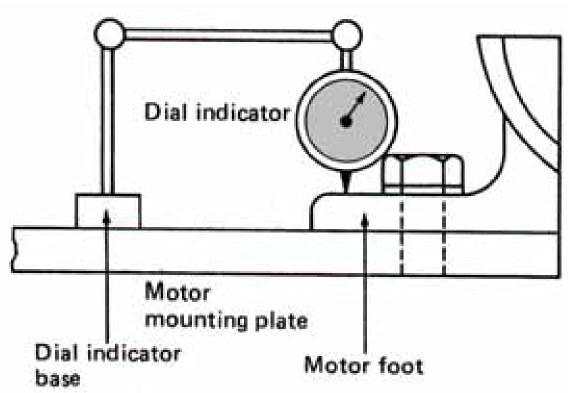
- Premature bearing, seal, shaft, or coupling failures
- Excessive vibration
- High casing temperatures at or near the bearings or high oil temperatures
- Excessive amount of oil leakage at the bearing seals
- Loose foundation bolts
- Loose or broken coupling bolts
- Some flexible coupling designs run hot under misalignment conditions. If it is an elastomeric type, look for rubber powder inside the coupling
- Unusually high number of coupling failures or they wear quickly
- The shafts are breaking (or cracking) at or close to the inboard bearings or coupling hubs

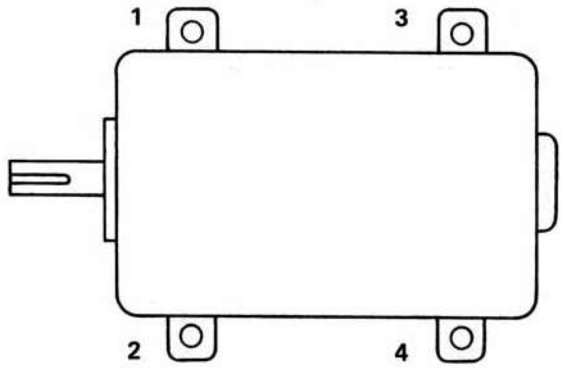
6.1 What to Align?

- Mounting Foot Leveling
- Alignment of Coupling Faces – Angular (coupling faces parallel)
- Alignment of Coupling Contour – Horizontal (bring them to same height)
- Alignment of Coupling Contours – Parallel (align them sideways)
- Adjusting the Gap between Coupling Half's (not all couplings!)

6.1.1 Mounting Foot Leveling

In the figure below you can see a plan view of a typical electric motor. This method is designed for rather bigger motors. Take the following steps to level the electro motor feet:



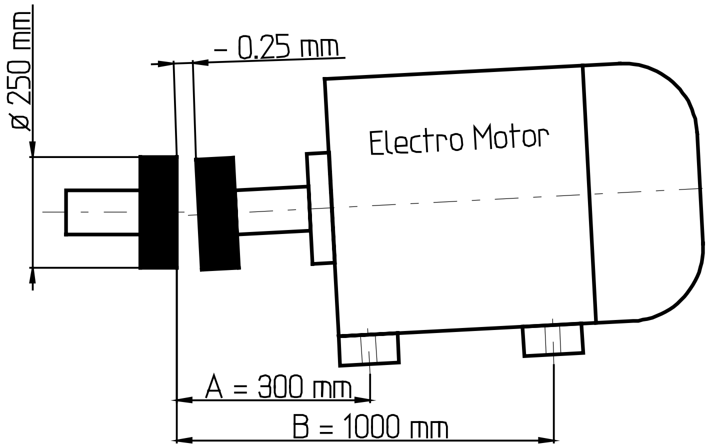


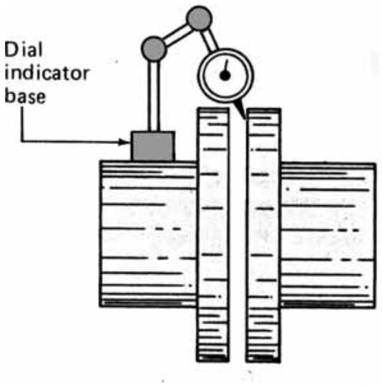
1. Tighten all four motor bolts.
2. Place the dial indicator on a clean surface of the motor mounting plate
3. Clean the indicator contact area on the motor foot (make use of a file)
4. Start with No.1, and place the point of the dial indicator on the cleaned surface
5. Set the dial indicator at zero.
6. Loosen the bolt holding down foot No. 1 and also the bolt of the next closed foot (No. 2)
7. Read the dial indicator to determine the amount of spring that has occurred.
8. Insert shims under foot No. 1 to take up the amount of spring.
9. Next, tighten all four motor bolts again. Move the dial indicator to foot No. 2. Repeat the procedure of loosening the bolts, reading the amount of spring, shimming, and re-tightening the bolts.
10. Move on to feet No. 3 and No. 4, following the same methods. If the dial indicator shows that no spring has occurred, then you need not add any shims under that particular foot. After you have removed all of the spring from the motor feet, the bolts will be relieved of excessive tension, and coupling alignment will be easier to accomplish.

6.1.2 Alignment of Coupling Faces – Angular (coupling faces parallel)

There are two common methods on how to determine the misalignment of the coupling faces.

- **The dial gauge method**
- **The feeler gauge method**





The Dial Gauge Method

Some computation is necessary to determine the shim thickness required to align couplings in an angular plane. Mount the dial indicator on one of the coupling half's and place the point of the indicator on the inside face of the other half. Turn the coupling half with the dial indicator 360 degree around and measure the misalignment.
In the example the angular misalignment on the top is **–0.25 mm**.
The diameter **"D"** of the coupling is **250 mm**.
The distance "**A"**, from the inside of the driven half to the centerline of the motors closer motor feet is **300 mm**.
The distance **"B"**, from the inside of the driven half to the centerline of the motors farther motor feet is = **1000 mm**.
To compute the required shim thickness under the motors **closer** and motor **farther** feet to correct the –0.25 mm angular misalignment, use the following formulas:

Shim (S) needed under closer feet:

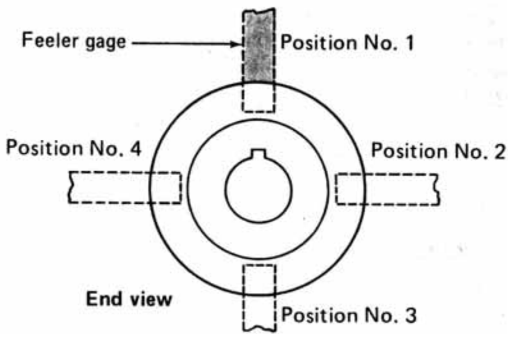
S = Indicator reading x A/D
S = - 0.25 mm x 300 mm/250 mm
S = - 0.3 mm

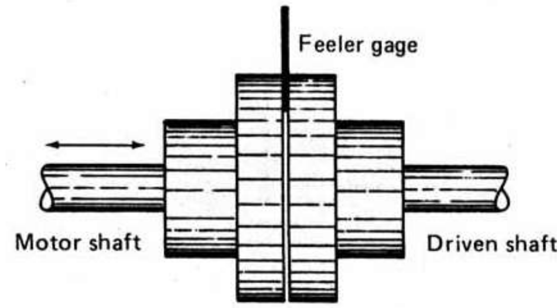
Shim (S) needed under farther feet:

S = Indicator reading x B/D
S = - 0.25 mm x 1000 mm/250 mm
S = - 1 mm

The Feeler Gauge Method

Move the (not fully fastened) motor near the already fixed driven unit, until the gap is just a little larger than the specified gap. Simply insert the feeler gauge between the coupling half's at several positions as shown on the picture below. If the gauge cannot enter at some positions, the shafts are out of angular alignment. To correct this condition, place shims under the motor feet. Always try to align the shaft as accurately as you can.

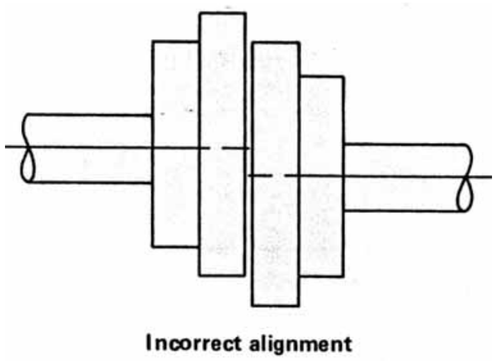




6.1.3 Alignment of Coupling Contour – Horizontal (bring them to same height)

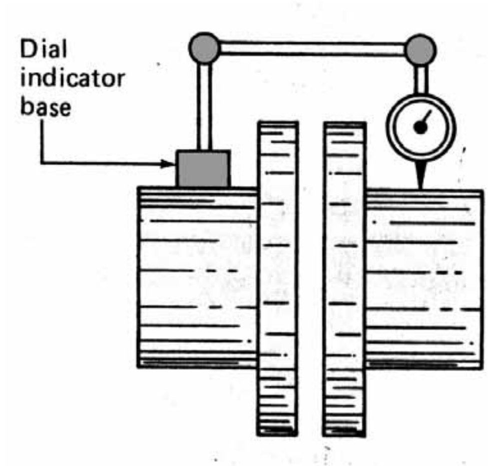
There are two common methods on how to determine the misalignment in height:

- **The dial gauge method**
- **The straight edge method**



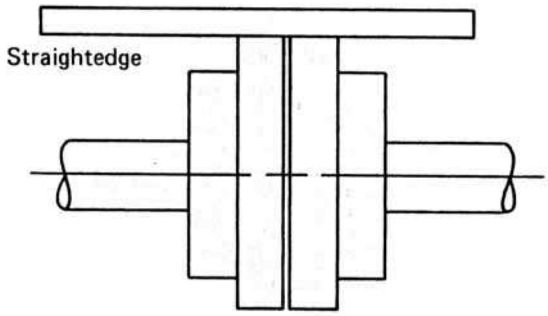
Dial Gauge Method –Horizontal Alignment

If the coupling installation requires more precise alignment of the shafts, then use precision instruments for the job. Mount the dial indicator on one of the coupling half's and place the point of the indicator in contact with the top of the other half. Manually turn the half on which the dial indicator is mounted to take four readings at points around the other coupling half. Use shims to raise the lower unit.



Straight Edge Method

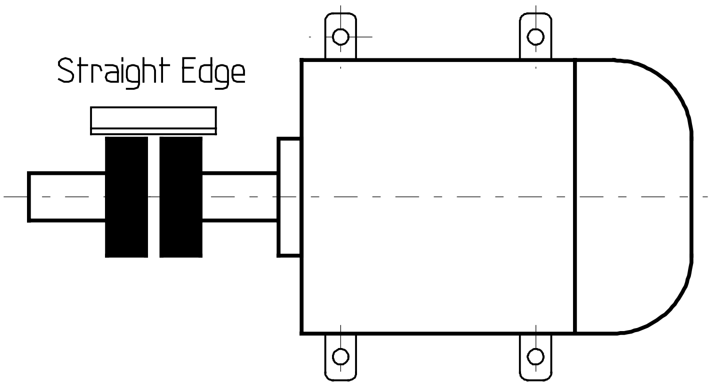
In addition to checking the angular alignment of the shafts, it is necessary to make sure that they are horizontal aligned. To check this, place a straightedge across the tops of the coupling half. Adjust the height of the motor shaft as needed to bring the shafts into alignment.



Proper parallel alignment

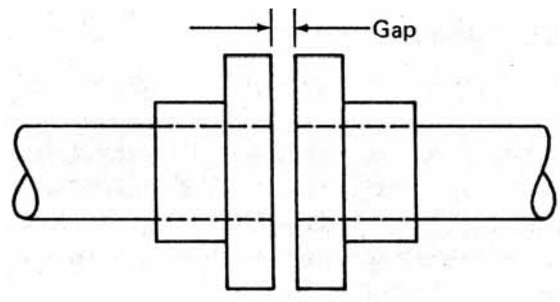
6.1.4 Alignment of Coupling Contours – Parallel (align them sideways)

In addition to checking the horizontal alignment of the shafts, it is necessary to make sure that they are sideways aligned. To check this, place a straightedge sideways of the coupling half. Adjust the motor.

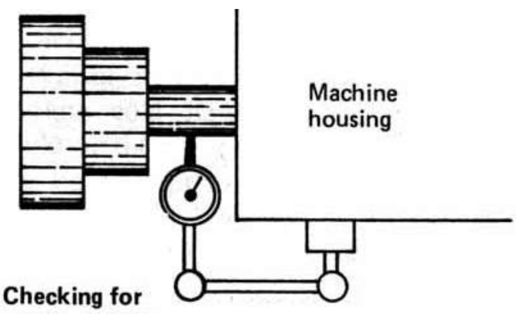


6.1.5 Adjusting the gap between the Coupling Half's

The gap between the faces of the two coupling half's is essential for the proper operation of the whole drive unit. The amount of gap required for the specific type of coupling is usually provided by the manufacturer.

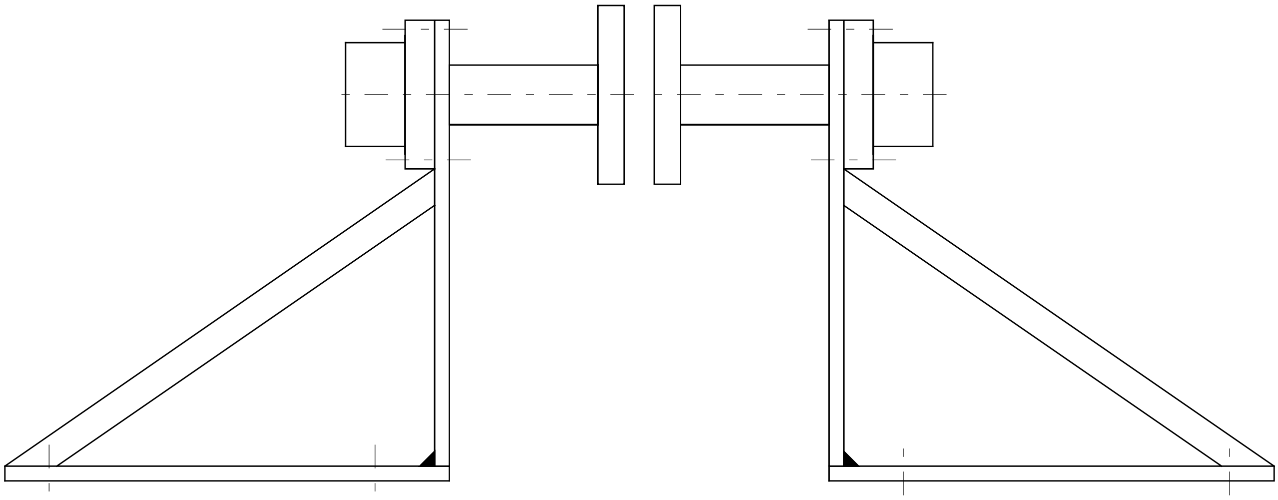


Sometimes it is necessary to check also the shaft against crook. The picture besides shows how to handle this method.



Checking for crooked shaft

Exercise - Steps of Coupling Alignment



Case: Pump was removed for repair

1. Put motor and pump in place
2. Fix both of them (not too tight)
3. Check parallelism of coupling using either feeler gauge method or dial gauge method
4. Calculate the necessary shim sizes, using the calculation method
5. Remove or add shims at motor or pump
6. Check one by one all motor feet for leveling (clearance)
7. If necessary correct leveling of motor feet
8. Proceed with horizontal alignment of coupling
9. Remove or add shims at motor or pump
10. Adjust the gap of coupling
11. Radial (sideward) alignment of coupling, using the straight edge method
12. Tight all bolts
13. Final check of all alignments, using the dial gauge

7. Safety Precautions for the Maintenance of Mechanical Drives

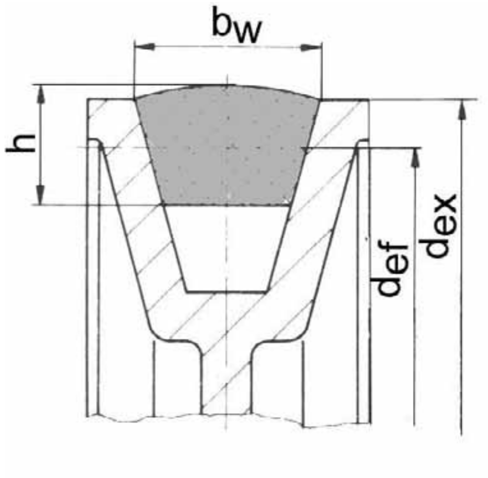
Maintaining drives, like discussed in the chapters before (chain drive, belt drive, gear drive etc.), is under disregard of safety rules a dangerous procedure.

Comply with the following to avoid serious personal injury:

- Use always care to prevent injury
- Wear the personal protective equipment like protective clothing, safety goggles, safety shoes and when necessary safety gloves.
- Guards must be provided to cover the moving parts of mechanical drives
- Before starting to work on a mechanical drive, **STOP** the machine and **LOCK-OUT** the power. Let your fellow workers know that you are – or will be – working on it.
- Never strain yourself by lifting or shifting mechanical parts that are too heavy. Use proper lifting devices for handling heavy parts.
- Before starting a test-run clean up the workplace and remove all tools, containers, etc.
- Clean up all grease, solvent and lubricant spills. Wipe the area incl. the mechanical drive with couplings and the protection cover dry and clean.
- Before you start up the drive, make sure that all fasteners are tight and all guards are in place. Inform all the workers near the mechanical drive that you start the test-run.
- Stay at the beginning of the test-run near the power switch. In case of any unusual sound or vibration, switch off the drive immediately.

8. CALCULATION OF SPEED FOR V-BELT DRIVE AND GEAR DRIVE

8.1 Single V-Belt Drive



h = **belt height**
b_w = **upper belt width**
d_{ex} = **external diameter**
d_{ef} = **effective diameter**
n = **revolution per minute (rpm)**

Calculation of V-belt drives is done on the basis of the effective diameter of the pulley.

effective diameter = external diameter - 2 x belt height / 2

$$d_{ef} = d_{ex} - 2 \times h / 2$$

Since we have a driving pulley and a driven pulley we have to give them different formulary abbreviations. Driving pulley = d_{ef1} and driven pulley = d_{ef2}

driving d x n = driven d x n

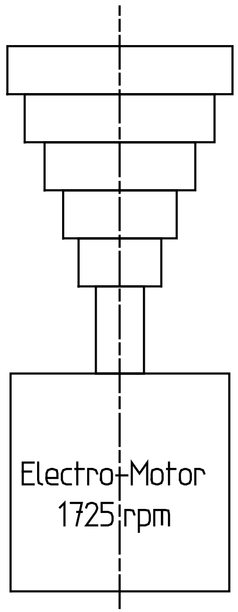
$$d_{ef1} \times n_1 = d_{ef2} \times n_2$$

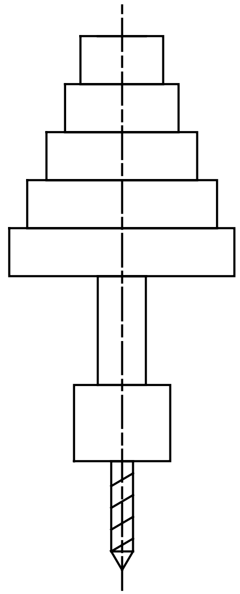
$$n_1 = \frac{d_{ef2} \times n_2}{d_{ef1}}$$

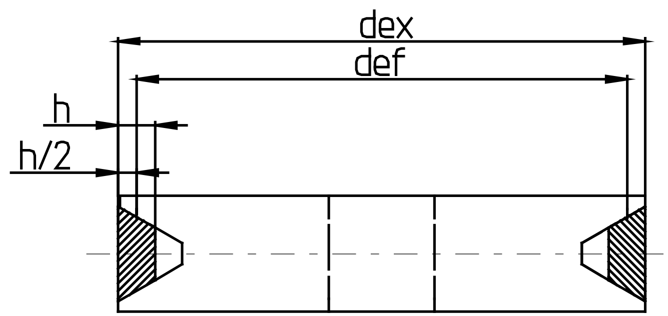
The transmission ration **(i)** is the ratio between the the input and output speeds.

$$i = \frac{n_1}{n_2} = \frac{def1}{def2}$$

Exercise in in Spindle Speed Calculation – Workshop Drill Press CDC



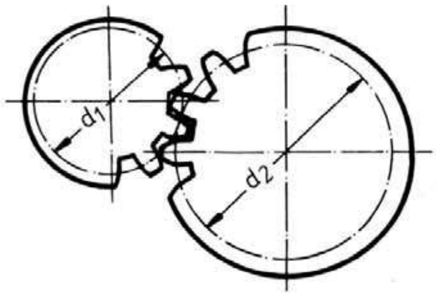




$$\text{Spindle Speed} = \frac{\text{Motor Speed x Pulley Diameter}_{ef1}}{\text{Pulley Diameter}_{ef2}}$$

	Drive Side		Driven Side		
Transmission Step	**Outside ∅ of pulley (d_{ex})**	**Effective ∅ of pulley (d_{ef}) $d_{ef} = d_{ex} - 2 \times h/2$**	**Outside ∅ of pulley (d_{ex})**	**Effective ∅ of pulley (d_{ef}) $d_{ef} = d_{ex} - 2 \times h/2$**	**Spindle Speed**
1					
2					
3					
4					
5					

8.2 Simple Gear Drive



d	**=**	**pitch diameter**
n	**=**	**revolution per minute (rpm)**
z	**=**	**number of teeth**
i	**=**	**transmission ratio**

Since we have a driving gear and a driven gear we have to give them different formulary abbreviations.
Driving gear = $\mathbf{d_1}$ and driven gear = $\mathbf{d_2}$
Driving gear = $\mathbf{n_1}$ and driven gear = $\mathbf{n_2}$
Driving gear = $\mathbf{z_1}$ and driven gear = $\mathbf{z_2}$

Claculation of speed using the pitch diameters

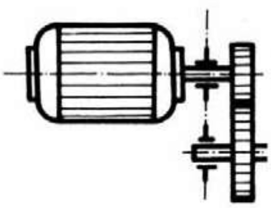
$$\mathbf{d_1} \times \mathbf{n_1} = \mathbf{d_2} \times \mathbf{n_2}$$

$$\mathbf{n_2} = \frac{d_1 \times n_1}{d_2}$$

Claculation of speed using the number of teeth

$$\mathbf{z_1} \times \mathbf{n_1} = \mathbf{z_2} \times \mathbf{n_2}$$

$$\mathbf{n_2} = \frac{z_1 \ x \ n_1}{z_2}$$



Ratio (i) calculation:

$$\mathbf{i} = \frac{\textbf{driving r.p.m.}}{\textbf{driven r.p.m.}} = \frac{\mathbf{n_1}}{\mathbf{n_2}} = \frac{\mathbf{d_2}}{\mathbf{d_1}} = \frac{\mathbf{z_2}}{\mathbf{z_1}}$$

Exercises in calculating simple Gear Drives

Calculation of electric hand drill

In a hand drill, the motor rpm of 3600 1/min is transmitted to the drill spindle via two gears with 8 teeth and 32 teeth. Calculate the rpm of the drill spindel.

Find:

Given:

Solution:

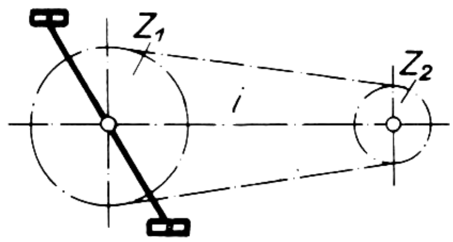
Calculation of ratio of bicycle drive

Calculate the transmission ratio between the pedal wheel with 48 teeth and a pinion with 15 teeth.

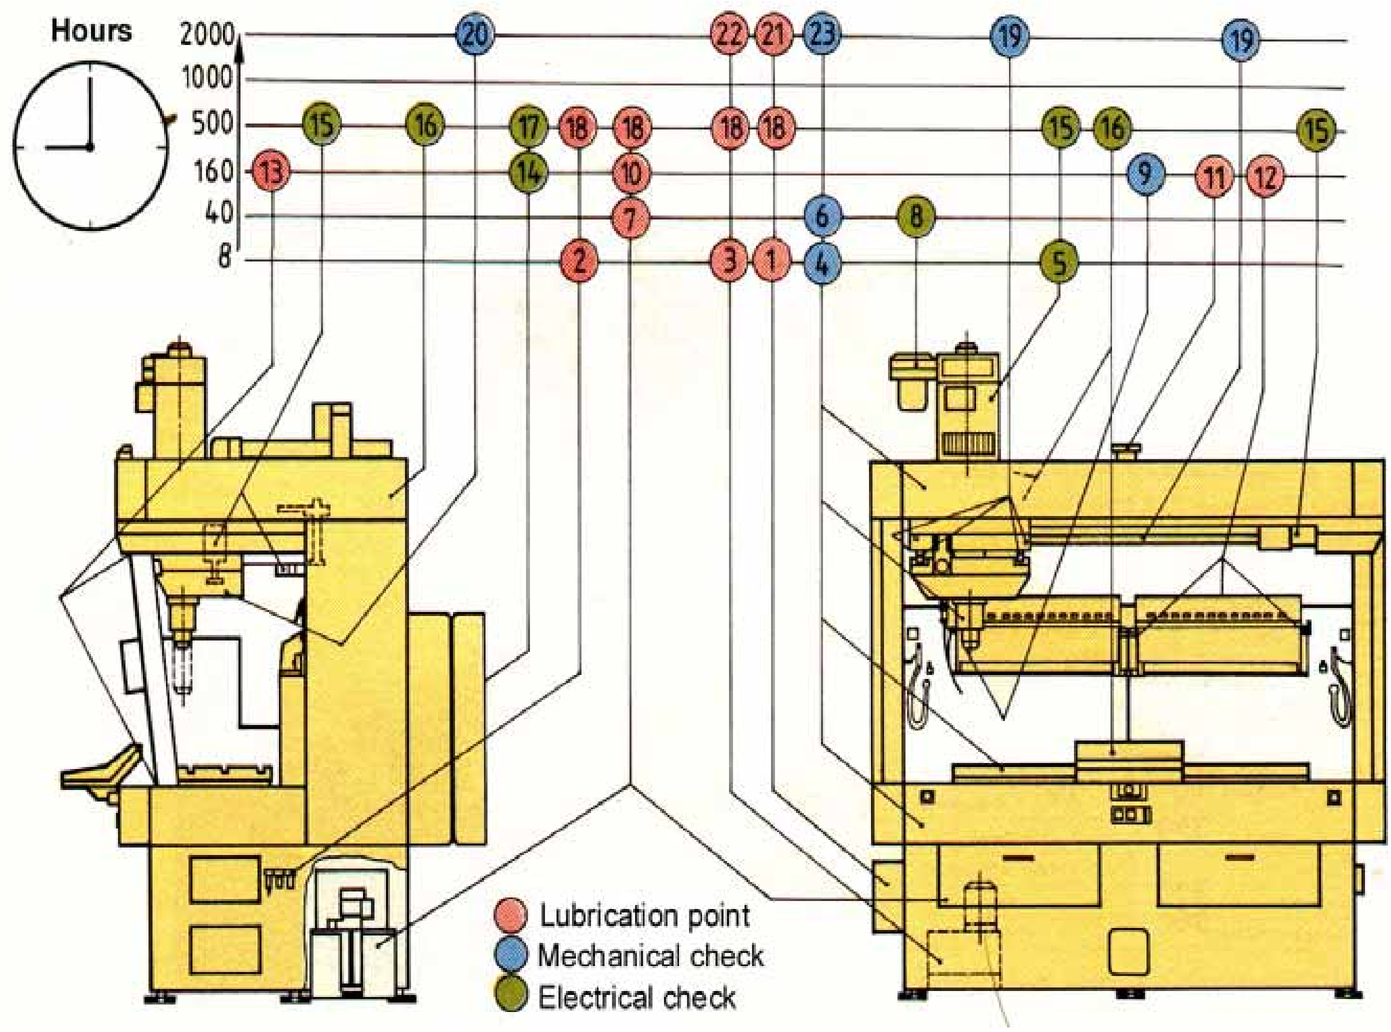
Find: Ratio **i**

Given:

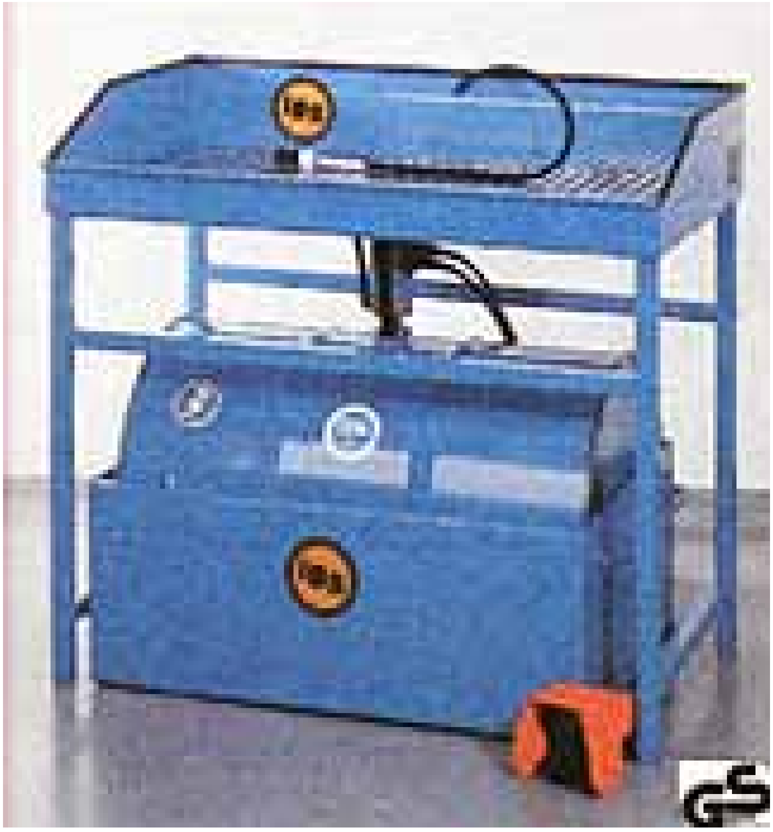
Solution:



EXAMPLE OF A DETAILED MAINTENANCE CHART FOR A MILLING MACHINE



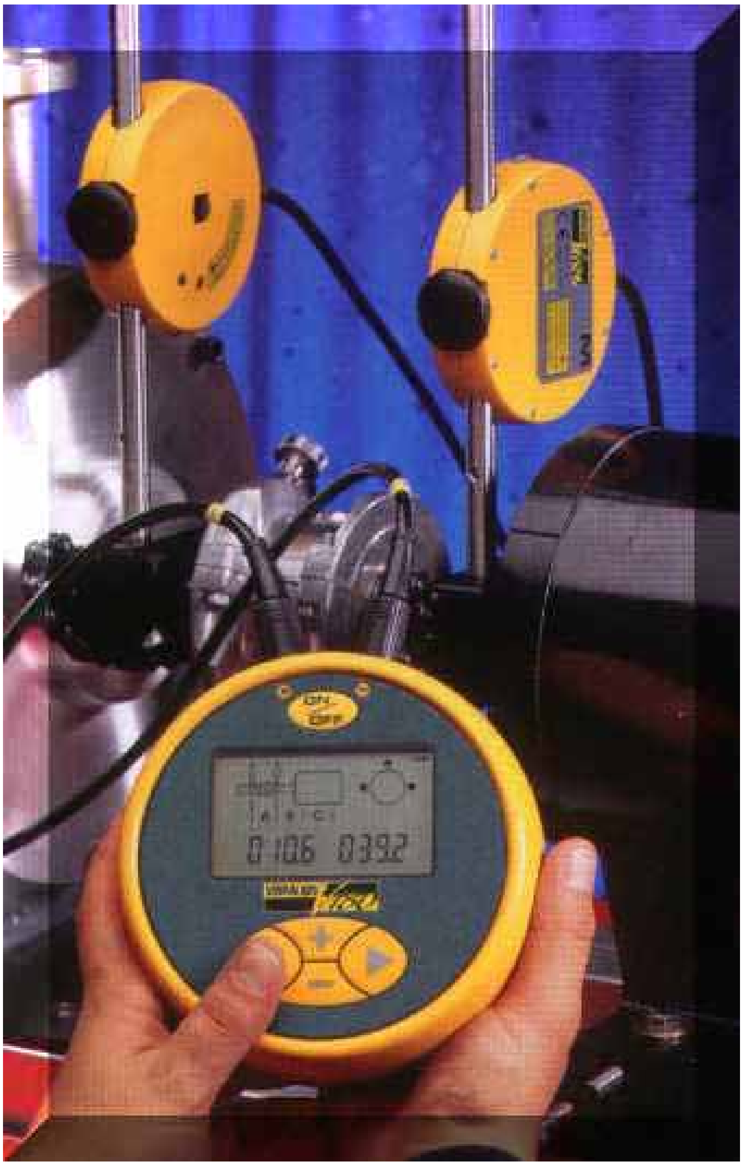
CLEANING MACHINE FOR MAINTENANCE DEPARTMENT



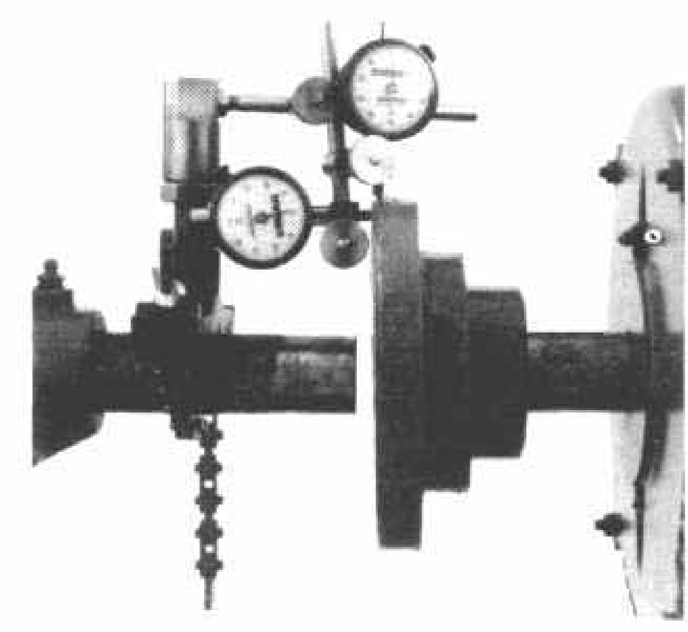
MAINTENANCE SYSTEM - IMPLEMENTATION KEY STEPS:

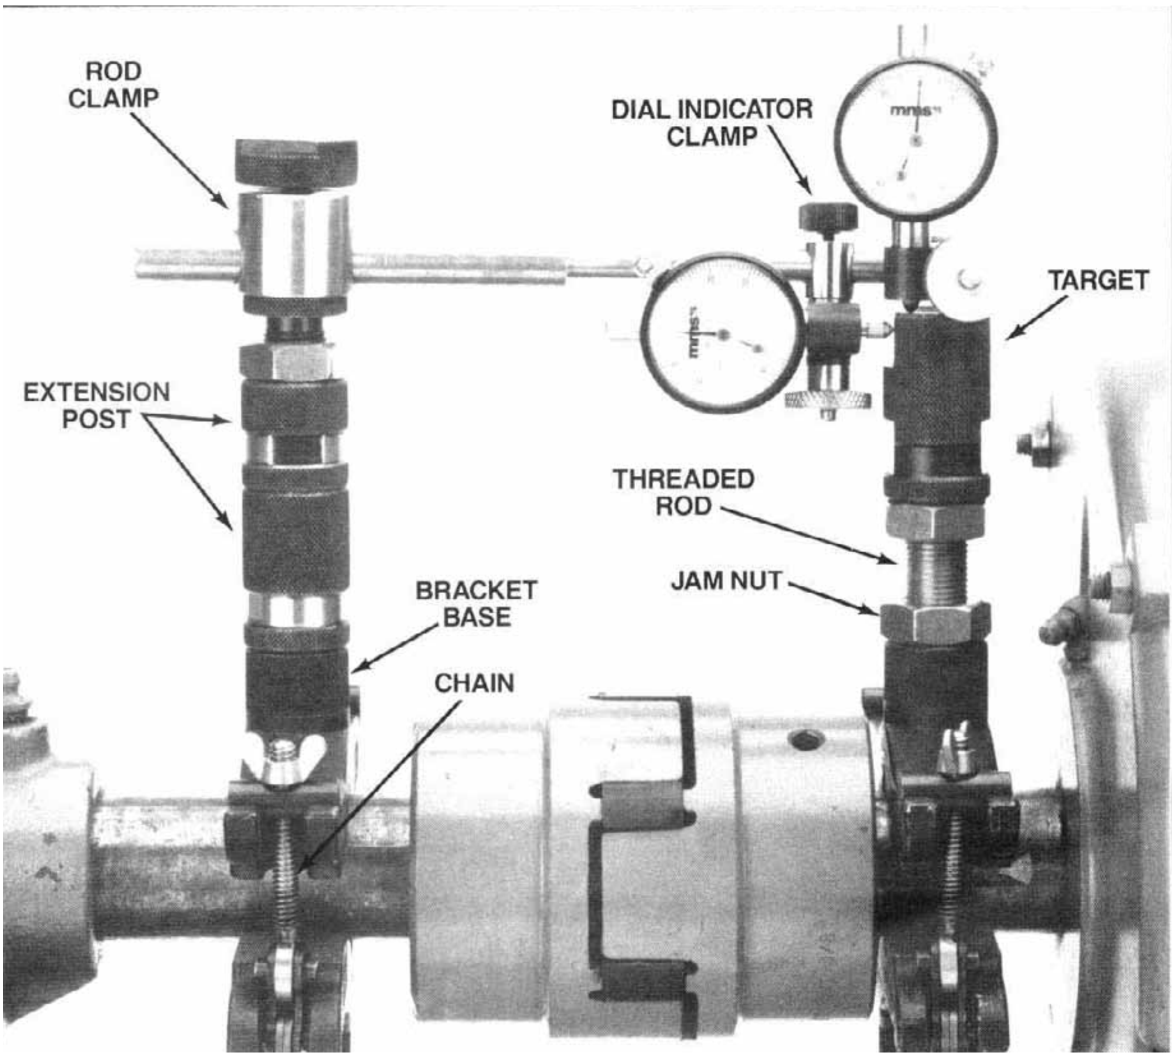
1. Number the equipment.
2. Create a file for each equipment
3. Gather data on the equipment (manuals).
4. Develop Preventive Maintenance task and daily routines.
5. Review existing maintenance service.
6. Implement a work order system.
7. Implement an inventory system for spare parts and consumables.
8. Develop a purchasing system that meets the needs of the maintenace department.
9. Train the management team on the process and its specific elements.
10. Communicate to the entire maintenance team the pending changes and their involvement in the process.
11. Train specific individuals such as the planner and inventory clerk.
12. Use the complete system on a small scale to test the process.
13. Modify the process as required.
14. Document the process.
15. Perform a skill's assessment of the work force.
16. Establish a training program to correct skills deficiencies.
17. Report final results to the Planrt Manager.
18. Establish a follow up audit in 6-12 months.

LASER BASED SHAFT ALIGNMENT TOOL



MANUAL SHAFT ALIGNMENT TOOLS



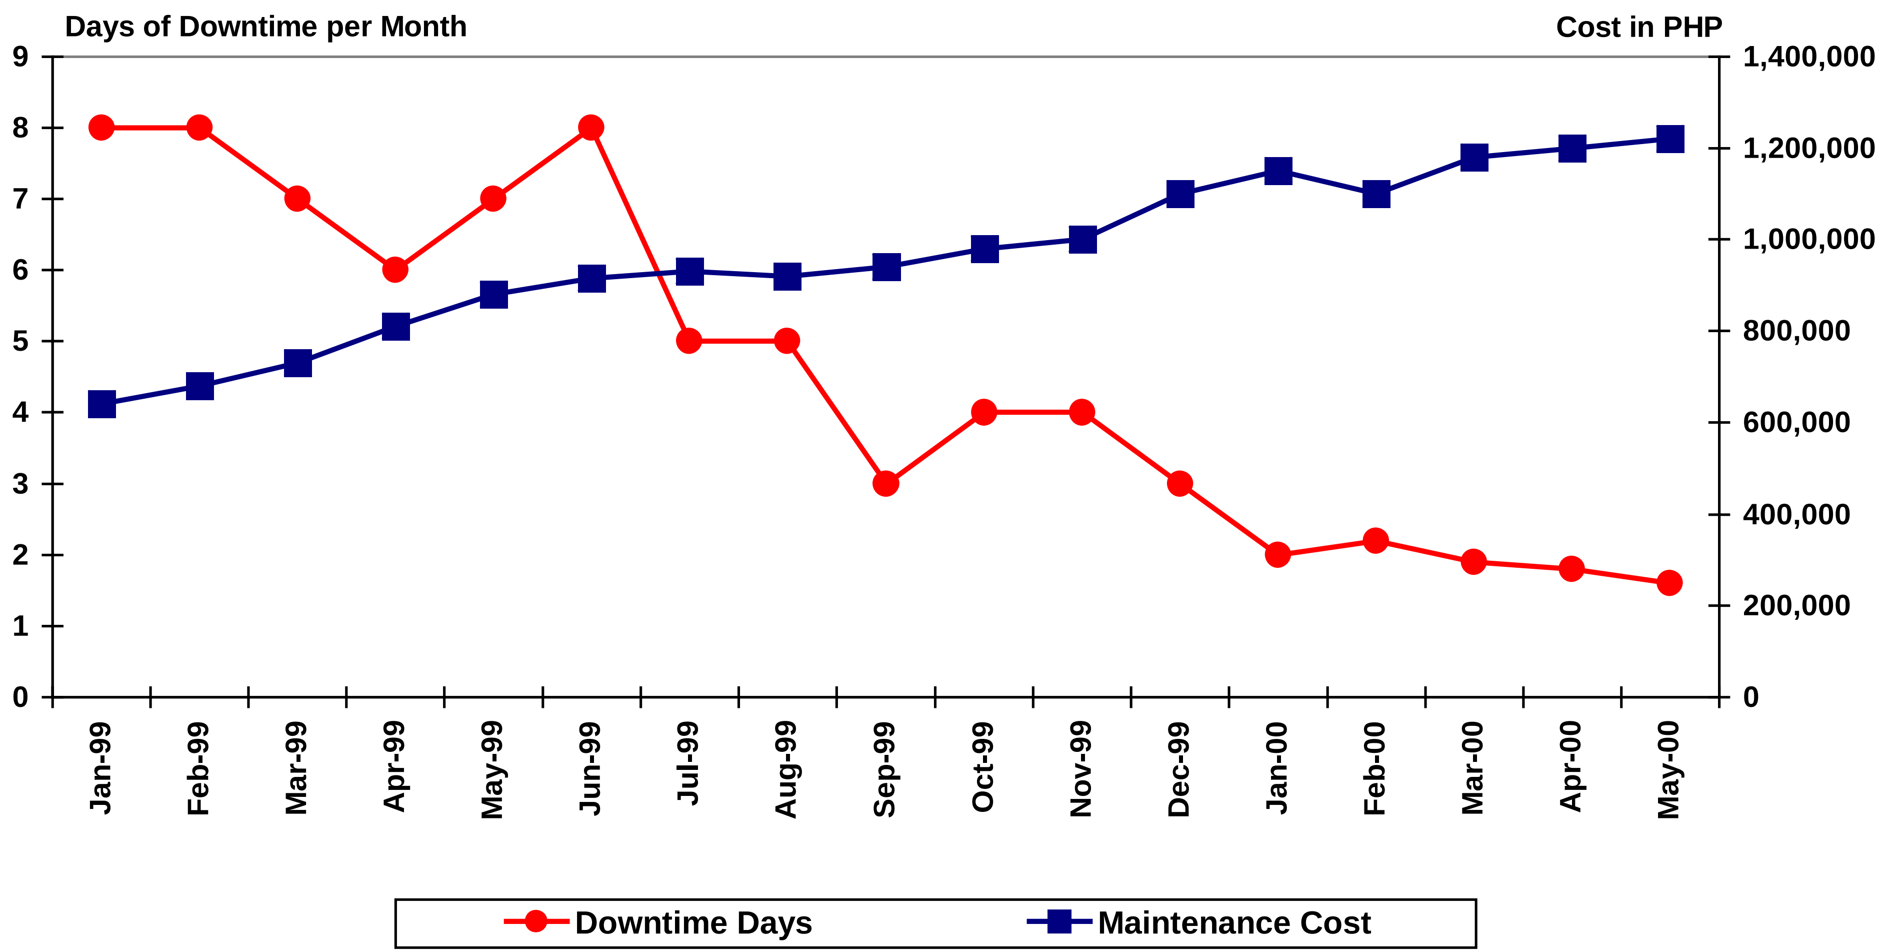


Maintenance Strategies – Output of Discussion Batch #41

Strategies	Advantages	Disadvantages	Use
Run to failure	• Cheap because small overhead cost	• Unplanned Downtime • Higher repair cost	• Simple & cheap machinery • Low value products
Preventive Maintenance	• Scheduled work • Less Downtime • Less repair cost	• Higher overhead cost • Long preparation time	• Complicated & expensive machinery • Bigger industrial plants • High value products
Predictive Maintenance	• Less downtime • Make use of lifetime span for equipment • Less repair cost	• High overhead cost • High equipment cost • Training cost for manpower • High salary for trained people	• Critical equipment • Expensive equipment • High value products • Bigger industrial plant
Planned Overhauling	• Less downtime during running period • Reconditioning of complete machine • Planning and scheduling in advance • Good preparation	• Loose of production time • More manpower through sub-contractual works • More workload to the planners	• Seasonal machinery • When low production or storage is full • Expensive critical equipment
Redundancy	• Less Downtime • Time to repair broken equipment • Less manpower	• Higher cost because of double equipment • Higher cost for installation • Spare machinery damage during storage for long period	• Very critical products or processes • Bigger industrial plants • Expensive and critical equipment

Minimizing Downtime at any Price?

Days of Downtime per Month vs Total Maintenance Cost



GLOSSARY

Unplanned Maintenance - any maintenance activity for which a pre-determined job procedure has not been documented, or for which all labor, materials, tools, and equipment required to carry out the task have been not been estimated, and their availability assured before commencement of the task.

Unscheduled Maintenance - any maintenance work that has not been included on an approved Maintenance Schedule prior to its commencement.

Predictive Maintenance - an equipment maintenance strategy based on measuring the condition of equipment in order to assess whether it will fail during some future period, and then taking appropriate action to avoid the consequences of that failure. The condition of equipment could be monitored using Condition Monitoring, Statistical Process Control techniques, by monitoring equipment performance, or through the use of the Human Senses. The terms Condition Based Maintenance, On-Condition Maintenance and Predictive Maintenance can be used interchangeably.

Vibration Analysis - the process of monitoring the condition of equipment, and the diagnosis of faults in equipment through the measurement and analysis of vibration within that equipment. Typically conducted through hand-held or permanently positioned accelerometers placed on key measurement points on the equipment. Commonly used on most large items of rotating equipment, such as turbines, centrifugal pumps, motors, gearboxes etc.

Work Order - The prime document used by the maintenance function to manage maintenance tasks. It may include such information as a description of the work required, the task priority, the job procedure to be followed, the parts, materials, tools and equipment required to complete the job, the labor hours, costs and materials consumed in completing the task, as well as key information on failure causes, what work was performed etc.

Work Request - The prime document raised by user departments requesting the initiation of a maintenance task. This is usually converted to a work order after the work request has been authorised for completion.

Tribology - the process of monitoring the condition of equipment through the analysis of properties of its lubricating and other oils. Typically conducted through the measurement of particulates in the oil, or the measurement of the chemical composition of the oil (Spectographic Oil Analysis). Commonly used for monitoring the condition of large gearboxes, engines and transformers, amongst other applications

Thermography - the process of monitoring the condition of equipment through the measurement and analysis of heat. Typically conducted through the use of infra-red cameras and associated software. Commonly used for monitoring the condition of high voltage insulators and electrical connections, as well as for monitoring the condition of refractory in furnaces and boilers, amongst other applications. Shutdown - that period of time when equipment is out of service. Shutdown Maintenance - Maintenance that can only be performed while equipment is shutdown

Run-to-Failure - No Scheduled Maintenance - an Equipment Maintenance Strategy, where no routine maintenance tasks are performed on the equipment. The only maintenance performed on the equipment is Corrective Maintenance, and then only after the equipment has suffered a failure. Also described as a No Scheduled Maintenance strategy.

Repair - any activity which returns the capability of an asset that has failed to a level of performance equal to, or greater than, that specified by its Functions, but not greater than its original maximum capability. An activity which increases the maximum capability of an asset is a modification.

Purchase Requisition - The prime document raised by user departments authorising the purchase of specific materials, parts, supplies, equipment or services from external suppliers.

Purchase Order - The prime document raised by an organisation, and issued to an external supplier, ordering specific materials, parts, supplies, equipment or services.

Maintenance Policy - a statement of principle used to guide Maintenance Management decision making.

Maintenance Schedule - a list of planned maintenance tasks to be performed during a given time period, together with the expected start times and durations of each of these tasks. Schedules can apply to different time periods (eg. Daily Schedule, Weekly Schedule etc.)

Maintenance Strategy - a long-term plan, covering all aspects of maintenance management which sets the direction for maintenance management, and contains firm action plans for achieving a desired future state for the maintenance function.

Failure - an item of equipment has suffered a failure when it is no longer capable of fulfilling one or more of its intended functions. Note that an item does not need to be completely unable to function to have suffered a failure. For example, a pump that is still operating, but is not capable of pumping the required flow rate, has failed. In Reliability Centered Maintenance terminology, a failure is often called a Functional Failure. Would you classify a planned equipment shutdown as a failure? Would you classify a routine equipment shutdown at shift change as a failure? Under this definition, the answer in the first case would be yes, but in the second case would be no. The justification for the inclusion of planned shutdowns as failures is that a failure, as defined, causes a disruption to the desired steady-state nature of the production process, and therefore should, ideally, be avoided.

Maintenance & Repair Module 1 – Course

Introductory Questions to the Trainees

The Trainer should ask this questions to get an overview about the knowledge and the work of the participants. He will be able to understand the structure of the company in terms of maintenance.

1. Profession and experience of trainees?
2. Did you attend trainings like this before?
3. Why does a company need maintenance personal?
   Because each machine can fail and break down. If all machines would be perfect, there would be no need for maintenance personal
4. What kind of machinery needs maintenance?
   All rotating machines like: Pumps, Gear-boxes, Exhaust fan, Compressor, Dryer, and Mixer. But also Pipelines, Pressure valves, boilers ……
5. What kind of maintenance jobs do you perform?
   Repair, Overhauling, Preventive Maintenance ……..
6. How is your daily work balanced (scheduled or unscheduled)
   Scheduled work should predominate the unskilled work.
7. How is your maintenance department organized?
   Manager, Planner, Supervisor
8. How is a maintenance order processed?
   Verbally or through, job order form. Is there a given time to finish the job?
9. What kind of maintenance strategy do you follow in your company?
   Important to give later some proposals how to improve.
10. Do you follow a maintenance schedule for the routine jobs?
    Important to give later some proposals how to improve.
11. Do you fill up a maintenance log for each machine?
    Important to give later some proposals how to improve.
12. Do you fill up a maintenance history log for each repair?
    Important to give later some proposals how to improve.
13. What kind of condition monitoring tools do you use?
    The 7 tools

MAINTENANCE & REPAIR MODULE 1 – FINAL KNOWLEDGE TEST

1. Which of the following statements about Maintenance is the most important one?

- ☐ a. Maintenance of industrial equipment is cheap.
- ☐ b. Maintenance should eliminate or reduce downtime.
- ☐ c. There is no need for skilled personnel in maintenance.
- ☐ d. Maintenance is not so important.

2. Name at least 3 different Maintenance Strategies.

____________________________________ _______________________________________

____________________________________ _______________________________________

3. What information does the Maintenance Log show?

- ☐ a. The cost of equipment.
- ☐ b. The order numbers of spare parts.
- ☐ c. The history of Condition Monitoring
- ☐ d. The preventive Maintenance Schedule.

4. What information does the Maintenance History show?

- ☐ a. The date of last oil check.
- ☐ b. The order numbers of spare parts.
- ☐ c. The length of belt drive.
- ☐ d. The history of all repair activities.

5. Which of the following statements about tensioning V-belts is true?

- ☐ a. Too little tension can damage bearing.
- ☐ b. Apply enough tension to prevent slipping.
- ☐ c. Only the trained experts from the manufacturer should tension belts.
- ☐ d. To little tension will change the center of pulley distance.

6. When do V-belts transmit power most efficiently?

- ☐ a. When the V-Belt sides contact the groove sides.
- ☐ b. When the top of the belt is higher than the pulley.
- ☐ c. When the bottom of the belt rests on the groove bottom.
- ☐ d. When the belt sides contact the bottom and the groove sides.

7. After a run-in period the belt should be ………………………..

8. The most common cause of chain-drive failure is improper or inadequate ………………..

9. A chain begins to ride higher and higher on the sprocket teeth when it becomes worn and

………………………

10. Which is the right lubrication method for very slow chain drives?

- ☐ a. Splash
- ☐ b. Manual
- ☐ c. Permanent
- ☐ d. Drip oiler

11. After how many hours of operation should you inspect a new chain drive?

- ☐ a. 24 hr
- ☐ b. 72 hr
- ☐ c. 120 hr
- ☐ d. 168 hr

12. Name at least one advantage and one disadvantage of chain drives

______________________________ ______________________________

______________________________ ______________________________

13. Name the 3 classifications of couplings

______________________________ ______________________________

____

14. What is not important for the coupling selection?

- ☐ a. The horsepower to be transmitted
- ☐ b. The operation speed
- ☐ c. The environmental temperature, which will affect the coupling
- ☐ d. The type and size of ball bearing used in the electric motor

15. If a gear drive is noisy during no-load testing, what should you do?

- ☐ a. Inspect the gear teeth
- ☐ b. Check the oil reservoir
- ☐ c. Inspect the shaft and the bearings
- ☐ d. No. a., b., and c.

16. Name 3 methods to align couplings

______________________________ ______________________________

____

17. Name 2 couplings, which allow longitude expansion of the shaft

Part 1. Based on Knowledge Requirements of the Training Regulation for Plant Maintenance Mechanic

Training Plan for Schools / Centers and for Industry Immersion for Plant Maintenance Mechanic

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
1.1 **Safety Precautions**	To interpret safety precautions and analyze the safety conditions of the working place	1.1.1 Safe handling of tools, equipment and materials 1.1.2 Protective clothing and equipment 1.1.3 Cleanliness and tidiness 1.1.4 First-aid Treatment 1.1.5 Fire extinguisher 1.1.6 Safety and health regulation	To be imparted during the entire subject			Regular meeting and exercises. Information material. Seminars and learning sessions

C = Classroom SS = School shop IN = Industry

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
1.2 **Blueprint Reading and Drawing**	To explain the information given in technical drawings and apply this information for different manufacturing processes. To translate the abstract in formation into practice..		**30**			
		2.2.1 **The working Drawing** : requirements of an explicit working drawing, manufacturing speci-fication to ensure correct processing.	6			Lecture
		1.2.2 **ISO Limits and Fits**: general and shafts; commonly used holes and shafts; tolerances grades; commonly used fits; use of table	4			Tutorial
		1.2.3 **The reference surface**: datum featuring used measuring and setting-up	4			Practical Exercises
		1.2.4 **Machining accuracy**: dimension chain and classification; rules in dimensional relationship	4			
		1.2.5 **Geometrical Tolerances**: Conventional representation of geometric tolerances especially to straightness, flatness, parallelism and locational tolerances	4			

C = Classroom SS = School shop IN = Industry

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
		1.2.6 **Surface Finish**: Definition of terms; conventional representation specification	**4**			
		1.2.7 **Graphs**: Use and interpretation; making graphs of different types, Cartesian, polar and logarithmic	4			

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
1.3 **Shop Mathematics**	To demonstrate basic mathematical operations and solve related workshop problems.		**60**			Self-learning programs Problem-solving teamwork
		1.3.1 Average, percentage, ratio proportion	4			Evaluation and assessment instruments
		1.3.2 Manipulation of formulas, areas and plan figure, volumes and weight of common regular solids	12			Lecture
		1.3.3 Geometrical properties of a circle	4			
		1.3.4 Simple trigonometric functions and application	16			
		1.3.5 Pythagorean theorem	12			
		1.3.6 Workshop problem in layout, measuring, setting-up and machining	12			

C = Classroom SS = School shop IN = Industry

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
1.4 **Measure-ments and Inspection**	To list measuring tools and distinguish the application in different operational areas.		**12**	**18**		Lecture Practical exercises
		1.4.1 **Tools of measuring**: The reference gauge, the measuring tools and comparators	4	6		Instructional materials
		1.4.1.1Measuring Tools: Use, care and calibration of vernier calipers, micrometers, dials, indicators, special measuring tools, special applications in measuring angles, tapers, center distances, bore, etc.	8	12		Evaluation assessment instruments

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
1.5 **Materials and Heat Treatment**	To classify the physical properties of metals and distinguish heat treatment operations and procedures needed to fabricate simple parts.		**12**			Lecture
		1.5.1 Tool Components	4			Instructional materials
		1.5.1.1 Physical properties of tool components for cutting and shearing, drawing, hot pressing tool, extrusion tools dies sinking tools: - Low melting alloys - Cast iron, high grade - Carbon steel	2			Evaluation and assessment instruments Company visit
		1.5.2 Heat treatment operations	2			
		1.5.2.1 The procedure followed in: - Hardening - Tempering - Flame hardening	2			
		1.5.2.2 Heat treatment equipment and control	2			

C = Classroom SS = School shop IN = Industry

Knowledge Requirements	Objectives	Contents	Learning Hours/ Venue			Didactical Remarks (Recommendations)
			C	**SS**	**IN**	
1.6 **Toolroom Machining**	To identify and explain parts and functions and operating procedures of various machine tool.		**30**	**150**		Lecture
		1.6.1 **Materials Preparations**: machines used for preparation of materials: power hacksaw, band saw, abrasive cutters, gas cutting	2	2		Practical exercises Instructional materials
		1.6.2 **Marking and Layout**: The manual method of location of holes and outlines	2	4		Evaluation and assessment instruments
		1.6.3 **Turning**: The machine tools needed, work holding devices, tools and attachment - Safety precaution - Spindle speeds and feed rate for different materials and tools - Turning faults and correction	8	42		Company visit Trainer and simulators
		1.6.4 **Milling**: Machine tool used, work holding devices, tools and attachment used: - Safety precaution - Spindle speeds and feed rate for different materials and tools - Work holding devices - Milling computations	8	42

PLANT MAINTENANCE MECHANICS

OCCUPATIONAL SKILLS STANDARDS
(Part of the Training Regulation)

- **Introduction**
- **General Principles**
- **Job Description**
- **Index of Knowledge Requirements**
- **Index of Skills Requirements**
- **DACUM Research Chart for Plant Maintenance Mechanics**

OCCUPATIONAL SKILLS STANDARD

PLAN MAINTENANCE MECHANICS

INTRODUCTION

This Occupational Skills Standard defines the MINIMUM required stock of knowledge and skills a tradesman is supposed to possess to qualify as a PLANT MAINTENANCE MECHANIC. A tradesman is granted a certificate of proficiency (national skills certificate) under this occupational title once he passes the Competency Assessment.

This Occupational Skills Standard is herein formulated and developed for any, and/or all of the following purposes:

1. To upgrade the level of skill of workers in the METALS and ENGINEERING INDUSTRY, with the end in view of coming up with quality products/service, optimal use of equipment/tools/materials and increased productivity.

2. To provide employers with a structural basis in the preparation of job specification necessary for salary and /or wage administration.

3. To enhance the development of human resources through a precise assessment of skilled manpower in the Metals and Engineering Industry at large.

4. To serve as a basis in the establishment of Testing and Certification System, which machinery can be used for setting up of a classified pool of Plant Maintenance Mechanics ready to service both domestic and overseas requirements.

5. To facilitate the setting up of a machinery for determination of appropriate and adequate remuneration and the implementation of “equal work ,equal pay” .

6. Finally, to enhance the government’s desire to professionalize the skilled worker for which role the Technical Education and Skills Development Authority was established.

GENERAL PRINCIPLES

1. Classification

1.1 This Trade Skills Standard classifies PLANT MAINTENANCE MECHANIC into two two (2) classes: Class B and Class A (the higher).

1.2 Candidates who wish to be certified for their competency as PLANT MAINTENANCE MECHANIC will be required to show by written examination and by practical demonstration that they are in possession of the knowledge and skills required by the standard.

1.3 Candidates who passed the trade test will be issued a certificate bearing their names and photograph and shall be listed in the National Registry of Certified Skilled Workers in the Philippines.

2. Entry Requirements

2.1 Candidates for certification as PLANT MAINTENANCE MECHANIC class B must:

2.1.1 Have had one year work experience as Plant Maintenance Mechanic; or

2.1.2 Have completed a short intensive training in Plant Maintenance Mechanic conducted by Technical Education and Skills Development Authority (TESDA) , or any certified industrial/training institution; or equivalent course requiring a minimum of 720 hours of practical training recognized by TESDA followed by one (1) year working experience as a Plant Maintenance Mechanic, or

2.1.3 Have completed a primary apprenticeship training approved by the Department of Labor and Employment, or a appropriate training which equates to a short intensive course as Plant Maintenance Mechanic.

2.2 Candidate for certification for Plant Maintenance Mechanic Class A must:

2.2.1 Have had one year relevant working experience as Plant Maintenance Mechanic Class B or,

2.2.2 Have completed an intensive advanced training course in Plant Maintenance Mechanic conducted by TESDA or any certified industrial/training institution, or

2.2.3 Have had at least four (4) years working experience as Plant Maintenance Mechanic.

3. Definition of Terms

For the purpose of this standard, the word

3.1 Class - refer to the category according to the level of difficulty and complexity of skills and knowledge required of the job.

4. Delimitation of this Standard

In the context of this prepared standard, Plant Maintenance Mechanic's body of knowledge and skills covers only machine maintenance and does NOT include:

4.1 machine tool rebuilding
4.2 production tooling

JOB DESCRIPTION

PLANT MAINTENANCE MECHANIC

A Plant Maintenance Mechanic performs preventive and corrective maintenance, repairs and maintains fluid systems, install and removes machinery, and fabricates and fits machinery parts.

CLASSIFICATION

In this Occupational Skills Standard, Plant Maintenance Mechanics are classified according to level of difficulty and complexity of skills and knowledge required of the job and consideration on safety.

A PLANT MAINTENANCE MECHANIC CLASS B is equivalent to a skilled worker who has the ability to do a practical job or work at high level of efficiency and manipulative skills.

A PLANT MAINTENANCE MECHANIC CLASS A is equivalent to a highly - skilled worker who has the ability to perform a wide range of tasks at high level competence.

PLANT MAINTENANCE MECHANIC

CLASS B

A Plant Maintenance Mechanic Class B performs preventive maintenance, repairs and maintains fluid system, and fabricates and fits parts into assembly.

In particular, under limited supervision of a Class A mechanic, he:

1. Lubricate and adjusts machines, belts and drives, chain and sprockets drives, gobs, couplings and seals and participates in training and orients trainees and performs housekeeping;

2. Replaces gaskets and seals, hydraulic lines and fittings and steel piping system and installs plastic tubes to machines;

3. Performs cutting with hacksaw, cutting with cold chisel, filling and marking of workpieces;

4. Drills, counterbores, countersinks and spot - faces holes and performs threading using taps and dies;

5. Welds, hardens and tempers metals and operates lathe to turn and face workpieces;

6. Bolts, pins and dowels parts and fits wheels, keys and bearings and bends pipes.

PLANT MAINTENANCE MECHANIC

CLASS A

A Plant maintenance Mechanic Class A performs preventive maintenance, repairs and maintains fluid systems, installs and removes machineries, and fabricates and fits parts into assembly.

In addition to performing work of the Plant maintenance Mechanic Class B, he:

1. Maintains linkages and mechanism, bearing, gear drives, centrifugal and pneumatic clutch and gear box drives;

2. Diagnose machine breakdown and remove and installs plain bearing bushes and sleeves and roller bearings;

3. Removes and installs belts, chain drives, flexible couplings and universal joints;

4. Maintains hydraulic strainers/filters, cylinders, motors or pumps, and repairs/replaces;

5. Repairs/replaces internal parts of vane-and piston -type hydraulic pump or motor;

6. Repairs/replaces hydraulic gaskets and seals, flexible hoses. Lines, fittings and valves;

7. Install and maintains air-compressor and water pump;

8. Transport, moves, installs, positions and aligns machineries;

9. Reams holes and laps flat surfaces and aligns machineries;

10. Cuts, shapes, welds and solders metal using gas cutting equipment; and

11. Aligns parts, scrapes workpieces, fits flanges and balances static rotating parts.

INDEX OF KNOWLEDGE REQUIREMENTS

Code	Knowledge Requirements	Class B	Class A
1.1	**SAFETY PRECAUTIONS**		
1.1.1	Safe handling of tools, equipment and materials	X	
1.1.2	Protective clothing and equipment	X	
1.1.3	Cleanliness and tidiness	X	
1.1.4	First-aid treatment	X	
1.1.5	Fire extinguishers	X	
1.1.6	Safety ad health regulation	X	
1.2	**BLUEPRINT READING AND DRAWING**		
1.2.1	**The Working Drawing:** requirement of an explicit working working drawing, manufacturing, specifications to ensure correct processing	X	
1.2.2	**ISO Limits and Fits:** general and shafts, commonly used holes and shafts; tolerances grades; commonly used fits, use of tables	X	
1.2.3	**The reference surface:** datum featuring used measuring and sitting up	X	
1.2.4	**Machining accuracy:** dimension chain and classification; rules in dimensional relationship	X	
1.2.5	**Geometrical Tolerances:** Conventional representation of geometric tolerances especially to straightness, fitness, parallelism and locational tolerances	X	
1.2.6	**Surface Finish:** Definition of terms; conventional representation specification	X	
1.2.7	**Graphs:** Use and interpretation ; making graphs of different types, cartesian, polar, and logarithmic	X	
1.3	**SHOP MATHEMATICS**		
1.3.1	Average, percentage, ratio and proportion	X	
1.3.2	Manipulation of formulas Areas and plan figure	X	
	Volume and weight of common regular solids	X	
1.3.3	Geometrical properties of a circle	X	
1.3.4	Simple trigonometric functions and application	X	
1.3.5	Pythagorean theorem	X	
1.3.6	Workshop problem in layout, measuring, setting up and machining	X	

Code	Knowledge Requirements	Class B	Class A
1.4	**MEASUREMENTS AND INSPECTION**		
1.4.1	Standard of length; international metric standard; the flow chart showing interrelation form primary workshop measuring instrument; dimensional stability in the workshop, the “ ten percent rule “ calibration of measuring tools.		X
1.4.2	**Tools of Measuring :** The reference gauge, the measuring tools, and comparators:	X	
	1.4.2.1 Gauges Blocks: the use and care of gauges block as measuring and marking tools		X
	1.4.2.2 Measuring Tools: Use, care, and calibration of vernier calipers, micrometers, dial, indicators, special measuring tools, special applications in measuring angles, tapers, center distances, bores, etc.	X	
	1.4.2.3 Comparative Measurements: types of comparators; profile projection and tool makers microscope		X
1. 5	**MATERIALS & HEAT TREATMENT**		
1.5.1	Tool Components		
	1.5.1.1 Physical properties of tool components for cutting and searing, drawing, hot pressing tool, extrusion tools, dies sinking tools:		
	- Low melting alloys	X	
	- Cast iron , high grade	X	
	- Carbon steel	X	
	- Tool steel and alloyed steel		X
	- Rubber, polyurethane		X
	- Carbides		X
	- Composites		X

Code	Knowledge Requirements	Class B	Class A
1.5.2	Heat treatment operations		
	1.5.2.1 The procedure followed in:		
	- Annealing		X
	- Normalizing		X
	- Hardening	X	
	- Tempering	X	
	- Flame hardening	X	
	1.5.2.2 Heat treatment equipment and control	X	
	1.5.2.3 Inspection of heat treated parts		
	- Crack detection		X
	- Warpage test		X
	- Hardness test		X
1.6	**TOOLROOM MACHINING**		
1.6.1	**Materials Preparations:** machine used for preparation of materials: power hacksaw, bandsaw, Abrasive cutters, gas cutting .	X	
1.6.2	**Marking and Layout:**		
	1.6.2.1 The manual method of location of holes and outlines	X	
	1.6.2.2 The use of jigs borers		X
1.6.3	**Turning:** The machine tools needed, work holding devices, tools and attachment		
	1.6.3.1 Safety precaution	X	
	1.6.3.2 Spindle speed and feed rate for different materials and tools	X	
1.6.4	**Milling:** Machine tool used, work holding devices, tools and attachment used		
	1.6.4.1 Safety precaution	X	
	1.6.4.2 Spindle speed and feed rate for different materials and tools	X	
	1.6.4.3 Work holding devices	X	
	1.6.4.4 Milling faults and ratifications		X
	1.6.4.5 Milling computations	X	
	1.6.4.6 Advance milling problems		X

Code	Knowledge Requirements	Class B	Class A
1.6.5	**Grinding:**		
	1.6.5.1 Safety precaution	X	
	1.6.5.2 Selection of grinding wheel	X	
	1.6.5.3 Grinding wheel specifications	X	
	1.6.5.4 Balancing & mounting of grinding wheel		X
	1.6.5.5 Dressing a grinding wheel		X
	1.6.5.6 Wheel speed, work speed and feed rate		X
	1.6.5.7 Work holding devices	X	
	1.6.5.8 Grinding operations involving		
	- Surface grinding		X
	- Cylindrical and taper		X
	- Internal grinding		X
	- Linear form grinding		X
1.6.6	Machining surfaces of Irregular shapes		X
1.6.7	**Bench work operations safety, tools, work holding devices for:**		
	- Filing	X	
	- Scraping	X	
	- Drilling / counter boring	X	
	- Reaming		X
	- Tapping	X	
	- Polishing		X
1.7	**HAND AND POWER OPERATED TOOLS**		
1.7.1	Types and uses of handballs (wrenches, files, pliers, pullers, screw drivers, punchers, hacksaws and hammers)	X	
1.7.2	Types and uses of power tools (grinders, sanders, polishers, electric drills and hydraukic pullers)		X
1.8	**HYDRAULICS AND PNEUMATICS**		
1.8.1	Knowledge of the symbols used in hydraulic and pneumatic diagram	X	
1.8.2	Types of control valves and application	X	
1.8.3	Basic flued principles	X	
1.8.4	Hydraulic and pneumatic pipings		X
1.8.5	Uses of filters and strainers	X	
1.8.6	Types of pumps and uses		X

Code	Knowledge Requirements	Class B	Class A
1.8.7	Liquid use in hydraulic system		X
1.8.8	Hydrostatic testing		X
1.9	**MECHNISM AND MACHINE ELEMENTS**		
1.9.1	Identification of common machine parts	X	
1.9.2	Kinds of bearing and their uses	X	
1.9.3	Storage, cleaning and lubrication of bearings	X	
1.9.4	Identification of different kinds of seals, packing and gaskets	X	
1.9.5	Procedure in installing of belts, couplings and bearings	X	
1.9.6	Clearance / timing of gears		X
1.9.7	Relation of machine parts and others	X	
1.9.8	Cams and their uses		X
1.10	**MACHINE REPAIR AND OVERHAUL**		
1.10.1	Function of machine elements	X	
1.10.2	Function of machine parts	X	
1.10.3	Steps and procedures in dismantling and assembling of:		
	- standard parts	X	
	- major parts / components of machine		X
1.10.4	Common machine faults	X	
1.10.5	Special tools / fixtures for dismantling / assembling		X
1.10.6	Fits and tolerances		X
1.10.7	Electric arc and gas welding	X	
1.11	**PREVENTIVE AND CORRECTIVE MAINTENANCE**		
1.11.1	Lubricating procedures for machines like shaper, drilling, lathe, milling , boring and grinding machine	X	
1.11.2	Frequency for changing of oils of shop equipment/machine tools	X	
1.11.3	Identification of machine parts requiring lubrication	X	
1.11.4	Knowledge of checking out machine for major repair		X
1.12	**MACHINE RECONDITIONING**		
1.12.1	Knowledge of machine tool standard		X
1.12.2	Machine metrology	X	
1,12,3	Knowledge of transporting equipment	X	
1.12.4	Sequence of reconditioning operation		X
1.12.5	Steps and procedures in setting-up parts	X	
1.12.6	Type and uses of rust preventive and paints		X

INDEX OF SKILLS REQUIREMENTS

Code	Skills Requirements	Class B	Class A
2.1	**PERFORMING PREVENTIVE MAINTENANCE**		
2.1.1	Performing PM inspection		X
2.1.2	Lubricating machines	X	
2.1.3	Maintaining belts and V-belt drives	X	
2.1.4	Maintaining chain and sprocket drives	X	
2.1.5	Inspecting and maintaining linkages and mechanism		X
2.1.6	Maintaining bearings		X
2.1.7	Maintaining gear drives		X
2.1.8	Adjusting gibs for free operations	X	
2.1.9	Maintaining couplings	X	
2.1.10	Inspecting/maintaining centrifugal clutch		X
2.1.11	Inspecting/maintaining pneumatic clutch		X
2.1.12	Inspecting/maintaining gear box drives	X	
2.1.13	Lubricating seal faces	X	
2.1.14	Participating in safety training program	X	
2.1.15	Orienting OJT trainees/operators on safety and maintenance	X	
2.1.16	Performing housekeeping	X	
2.2	**PERFORMING CORRECTIVE MAINTENANCE**		
2.2.1	Diagnosing machine breakdown		X
2.2.2	Removing and installing plain bearing (bushes and sleeves)		X
2.2.3	Removing and installing plain bearing on shafts		X
2.2.4	Removing and installing roller bearings		X
2.2.5	Straightening shaft using a press		X
2.2.6	Replacing a shaft		X
2.2.7	Removing and installing V-belt assembly		X
2.2.8	Constructing belt joints with mechanical fastener		X
2.2.9	Constructing belt joints with adhesive		X
2.2.10	Removing and installing chain drives		X
2.2.11	Installing and aligning flexible coupling		X
2.2.12	Replacing universal joints		X
2.2.13	Installing and aligning closed gear drive		X
2.2.14	Removing and installing lip seal		X
2.2.15	Removing and installing mechanical seals		X
2.2.16	Ordering materials for the job		X
2.2.17	Updating machine maintenance record		X

Code	Skills Requirements	Class B	Class A
2.3	**REPAIRING AND MAINTAINING FLUID SYSTEM**		
2.3.1	Inspecting a hydraulic system		X
2.3.2	Replacing and clean hydraulic strainer/filter		X
2.3.3	Refilling hydraulic system		X
2.3.4	Inspecting hydraulic cylinder		X
2.3.5	Replacing hydraulic motor or pump		X
2.3.6	Replacing internal parts of hydraulic pump (vane type)		X
2.3.7	Replacing internal parts of hydraulic pump (piston type)		X
2.3.8	Replacing internal parts of hydraulic motor (vane type)		X
2.3.9	Replacing hydraulic gasket and seals	X	
2.3.10	Repairing flexible hose (high pressure)		X
2.3.11	Repairing /replace hydraulic lines		X
2.3.12	Replacing damaged /faulty lines/fitting		X
2.3.13	Replacing valves in a hydraulic system		X
2.3.14	Inspecting pressure control relief valve (relief, reducing, sequencing)		X
2.3.15	Inspecting directional valve		X
2.3.16	Installing and replace a steel piping system	X	
2.3.17	Installing air compressor		X
2.3.18	Lubricating air compressor		X
2.3.19	Inspecting/maintain air compressor		X
2.3.20	Installing plastic tube		X
2.3.21	Inspecting/maintaining water pump	X	
2.4	**INSTALLING AND MOVING MACHINERY**		
2.4.1	Preparing area for machine installation		X
2.4.2	Raising machinery using jacks, bars and blocks		X
2.4.3	Transporting machinery using forklift		X
2.4.4	Transporting machinery using overhead crane or chain block		X
2.4.5	Moving machine/equipment using roller		X
2.4.6	Moving machine/equipment with skids or dollies		X
2.4.7	Positioning and secure machinery on foundation		X
2.4.8	Leveling machinery on foundation		X
2.4.9	Aligning shaft (reverse indicator method)		X
2.4.10	Performing alignment test		X
2.4.11	Connecting machine to air or hydraulic source		X
2.4.12	Blocking and bracing equipment for moving or shipping		X
2.4.13	Cribbing a piece of equipment to distribute the load over a large area		X

Code	Skills Requirements	Class B	Class A
2.5	**FABRICATINGt SIMPLE PARTS**		
2.5.1	Cutting metal stock with hacksaw	X	
2.5.2	Cutting metal stock with chisel		X
2.5.3	Filing workpiece	X	
2.5.4	Marking workpiece	X	
2.5.5	Drilling holes with portable tools	X	
2.5.6	Drilling holes to size with drill press	X	
2.5.7	Counter boring holes to depth	X	
2.5.8	Counter sinking holes	X	
2.5.9	Spot-facing hole		X
2.5.10	Reaming holes with hand reamer		X
2.5.11	Reaming hole using machine reamer		X
2.5.12	Cutting thread with hand taps	X	
2.5.13	Cutting thread with dies	X	
2.5.14	Removing damaged thread screws etc.		X
2.5.15	Lapping flat surfaces		X
2.5.16	Lapping holes	X	
2.5.17	Installing gas regulator		X
2.5.18	Flame cutting metal with gas equipment	X	
2.5.19	De-burring with hand grinder	X	
2.5.20	Shaping (form) metals using heat	X	
2.5.21	Gas welding ferrous metals		X
2.5.22	Lead soldering metal		X
2.5.23	Off-hand grinding workpiece		X
2.5.24	Cutting off materials with disc cutter		X
2.5.25	Arc-welding ferrous metal	X	
2.5.26	Annealing metals		X
2.5.27	Hardening metals	X	
2.5.28	Tempering metals	X	
2.5.29	Turning workpiece	X	
2.5.30	Facing workpiece	X	
2.5.31	Grinding flat surfaces on surface grinder		X
2.5.32	Milling workpiece square	X	

Code	Skills Requirements	Class B	Class A
2.6	**FITTING PARTS INTO ASSEMBLY**		
2.6.1	Fitting parts into assembly		X
2.6.2	Bolting parts	X	
2.6.3	Doweling parts	X	
2.6.4	Pinning parts to a shaft	X	
2.6.5	Locating parts by pegging		X
2.6.6	Fitting /extract wheel	X	
2.6.7	Fitting parallel and tapered keys	X	
2.6.8	Fitting/extract bearing	X	
2.6.9	Aligning parts		X
2.6.10	Scraping a small flat surface		X
2.6.11	Hand scraping bearing (round) surface		X
2.6.12	Balancing static rotating parts		X
2.6.13	Bending pipes	X	
2.6.14	Fitting pipe flange		X

TASK ANALYSIS SHEET _____

OCCUPATION TITLE: : PLANT MAINTENANCE MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**3**		**Inspect/Maintain V-belt drive**
LEVEL		PERFORMANCE OBJECTIVES : Given malfunctioning belt drive, spare parts, supplies, tools and equipment, the student(s) / trainee(s) must be able to maintain a V-belt drive. The drive must deliver rated power smoothly and at rated speed.	

STEPS	**PERFORMANCE CRITERIA**	**RELATED KNOWLEDGE, ATTITUDE AND SAFETY**	**TOOLS, EQUIPMENT, AND MATERIALS**
1. Run mechanism at normal rate and load. 2. Check for flying dirt, oil, grease, water and other debris. 3. Check for flapping, oscillating, and slipping of belts. 4. Check for squealing, binding and rubbing of parts. 5. Turn off mechanism power. Remove belt guard. 6. Check belts and pulley for uneven wear and damage, and replace if necessary. 7. Check for loose mounting bolts and loose guards. 8. Check for hot belt, bearing and pulley. 9. Check pulley alignment. 10. Check belt tension. 11. Clean, inspect drive for wear and damage. 12. Install belt guard. 13. Start mechanism and test. 14. Note findings in preventive maintenance inspection report. 15. Make necessary recommendation.	• The drive must deliver rated power smoothly and at rated speed and free of uneven wear, squealing, high temperatures, flapping, flying dirt, rubbing of guard, and unscheduled shut down.	• Explain the principle of operation of V-belts • Enumerate the maintenance practices in the use of V-belts • Enumerate the conditions of V-belt malfunction, symptoms, and causes of failure • Follow the standard procedure in removing and installing V-belts • Exercise extreme care in the inspection of V-belts at running condition.	• Feeler bar • Level set • Mechanic's tool box • (hand tool) • Personal safety equipment • Set of V-belts sheave groove templates • Straightedge or wire • Switch lock out • Tension meter • Thermometer (Fahrenheit) • Tachometer

TASK ANALYSIS SHEET _____

OCCUPATION TITLE : PLANT MAINTENANCE MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**4**	TASK	**Inspect/maintain chain and sprocket drives**
LEVEL		PERFORMANCE OBJECTIVES : Given the necessary tools , materials and equipment, the student(s) / trainee(s) must be able to maintain chain and sprocket drive. Chains and sprockets must operate within manufacturer's specifications.	

STEPS	PERFORMANCE CRITERIA	RELATED KNOWLEDGE, ATTITUDE AND SAFETY	TOOLS, EQUIPMENT, AND MATERIALS
1. Run mechanism at normal rate and load; Check for: • hot bearing, sprockets, and chain. • flying dirt, oil, grease, water and other debris. • loose, flapping, chain. • rubbing, squealing, binding parts and loose bolts. 2. Stop and turn off machine power. 3. Remove safety guards(s) inspection plates; check for: • chain and sprockets for uneven wear and damage. • loose set screws, mounting bolts. Tighten as necessary. • correct for chain elongation in accordance with manufacturer's specifications. 4. Start mechanism and test. 5. Note findings in PM Inspection Report with findings and action to be done. 6. Submit report to supervisor for final decision.	• Chain and sprocket drive must deliver rated power at rated speed smoothly , be free of uneven wear, squealing, high temperature, loose bolts, flapping chain, flying dirt, steam, oil, water and other chemicals, rubbing , binding, and unscheduled shut down.	• Explain the principle of operation of chain drives, and its specifications • Enumerate the operating symptoms of malfunctions of chain drives and causes of failure • Enumerate the standard practices in the maintenance of chain drives • Follow the standard procedure in handling, aseembly and disassembly of chain drive. • Observe safety precautions in the inspection of chain drives while the machine is running.	1. Chain detacher (s) 2. Coupling tools 3. Drive pins 4. Fahrenheit thermometer 5. feeler bars 6. Level set 7. manufacturers specifications 8. Mechanic's tool box 9. Personal safety equipment 10. Piano wire and tightener 11. straightedge

OCCUPATION TITLE: PLANT MAINTENANCE MECHANIC				
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**	
TASK NO.	**8**	TASK	**Adjust gibs of slide ways**	
LEVEL		PERFORMANCE OBJECTIVES : Given a machine mechanism adjustable gibs, lubricants, tools and equipment, the student(s) / trainee(s) must be able to adjust gibs for free operation. The moving part must operate freely without binding or side movement with specified clearance.		

STEPS	**PERFORMANCE CRITERIA**	**RELATED KNOWLEDGE, ATTITUDE AND SAFETY**	**TOOLS, EQUIPMENT, AND MATERIALS**
1. Remove gibs and wipe /clean area(s). 2. Determine gib clearance on both sides and ends with feeler gages. 3. Check sliding surfaces of mechanism for excessive wear with dial indicator and micrometers. 4. Check gib surfaces for excessive wear and galled with dial indicator. Replace, straighten , or scrape if necessary. 5. Adjust gib by loosening screw at small end and tightening screw at large end of gib. Draw up to point of feeling pressure and back off to specified clearance. 6. Lubricate. 7. Operate the mechanism for freedom of operation without side movement.	• Moving parts must operate freely, without binding or side movement with specified clearance.	• Explain the reasons for using gibs in slide ways. • Enumerate the different types or shapes of gibs.	1. Dial indicator 2. Feeler gages 3. Gib wrenches or slotted screw driver head 4. Mechanic's tool box (hand tools) 5. Oil can 6. Personal safety equipment 7. Scrapers 8. Shim stock (assortment of metal shims) 9. Wiping rags

TASK ANALYSIS SHEET _____

OCCUPATION TITLE: PLANT MAINTENANCE MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**9**	TASK	**Inspect/maintain drive couplings**
LEVEL		PERFORMANCE OBJECTIVES : Given a machine, tools and equipment; the student(s) / trainee(s) must be able to inspect and maintain drive couplings. The coupling shall perform smoothly, clean and without vibration and noise.	

STEPS	**PERFORMANCE CRITERIA**	**RELATED KNOWLEDGE, ATTITUDE AND SAFETY**	**TOOLS, EQUIPMENT, AND MATERIALS**
1. Coordinate with operator regarding the inspection . 2. Observe the drive coupling while it is running: • coupling for flying dirt, oil, or grease. • for any unusual noise generated. • for any vibration of the part. 1. Clean and adjust as necessary : • Tighten mounting bolts • Alignment of coupling halves. 1. Record work done on preventive maintenace inspection form. 2. Submit preventive maintenance Inspection form to Supervisor 3. Record in Equipment Maintenance Record the maintenance action done.	• Coupling shall be clean and adjusted to perform smoothly without vibration and noise • Recommend further action . • Inspection report submitted	• Explain the operating principle of drive couplings. • Enumerate the different types of couplings. • Explain the main considerations in the installation of drive couplings. • Describe the method of installing drive couplings. • Enumerate the different malfunctions of couplings, causes and corresponding remedy.	• Coupling • Mechanic's tool box • Dial indicator • Rags • Solvents • Preventive maintenance Inspection form • Rags

TASK ANALYSIS SHEET _____

OCCUPATION TITLE: PLANT MAINTENANCE MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**13**	TASK	**Lubricate seal faces**
LEVEL		PERFORMANCE OBJECTIVES : Given the necessary tools, equipment and materials, the student(s) / trainee(s) must be able to lubricate seal faces to manufacturers specifications.	

STEPS	**PERFORMANCE CRITERIA**	**RELATED KNOWLEDGE, ATTITUDE AND SAFETY**	**TOOLS, EQUIPMENT, AND MATERIALS**
1. Turn off mechanism power. 2. Consult manufacturer's manual. 3. Select lubricant. 4. wipe off fittings. 5. Lubricate. Wipe off excess lubricant. 6. Start mechanism, observe. 7. Inspect for lubricant leakage.	• Lubricated seal must conform to manufacturers specifications.	• Knowledge of lubricating oils • Knowledge of different seals	• Mechanics tool box • Lubricant • Manufacturers manual • Rags

TASK ANALYSIS SHEET _____

OCCUPATION TITLE: PLANT MAINTENANCE MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**14**	TASK	**Participate in safety training program**
LEVEL		PERFORMANCE OBJECTIVES : Given an opportunity to participate in a safety training program, the student(s) / trainee(s) must be able to work in the company following the safety precautions and practices in the plant.	

STEPS	**PERFORMANCE CRITERIA**	**RELATED KNOWLEDGE, ATTITUDE AND SAFETY**	**TOOLS, EQUIPMENT, AND MATERIALS**
1. Handle safely cylinder tanks in moving from one place to another. 2. Lift loads safely. 3. Put out fires using appropriate fire extinguishers. 4. Apply first aid for cuts, and burns. 5. Apply artificial respiration. 6. Apply cardio-pulmonary resuscitation.	• Observable behavior or safety practices noticeable.	• Enumerate the causes of accidents • Explain the hidden costs of accidents. • Describe the safe handling of materials and tools. • Enumerate the different types of fires and corresponding fire extinguisher to put it out.	1. First aid kit 2. Fire extiguisher 3. Fire fighting equipment 4. Safety posters

TASK ANALYSIS SHEET _____

OCCUPATION TITLE: PLANT MAINTENANCE MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**15**	TASK	**Orient OJT trainees on safety and maintenance practices**
LEVEL		PERFORMANCE OBJECTIVES : Given the necessary material tools and equipment, the OJT student(s) / trainee(s) must be oriented on safety and maintenance practices. Upon completion the OJT student(s) / trainee(s) can perform machine operating procedures within company's safety standards.	

STEPS	PERFORMANCE CRITERIA	RELATED KNOWLEDGE, ATTITUDE AND SAFETY	TOOLS, EQUIPMENT, AND MATERIALS
1. Orient the OJT trainee on the physical layout of the plant. 2. Present /discuss plant /department structure and policies. 3. Present/discuss general safety precautions and specific safety on machine operations. 4. Demonstrate job tasks as necessary. 5. Ask for and discuss questions from new employees.	• Oriented personnel must be familiar with organization's safety policies and machine operating procedures.	• List down the organizational structure of the plant. • List down the organizational structure in the maintenance department. • Enumerate company regulations regarding: absences and tardiness; Timekeeping; wage computation • State the general safety precautions in the plant. • Enumerate the different personal safety equipment while doing the job.	1. Floor plan of facilities 2. Tools 3. Spare parts 4. Company policies 5. Organization's safety and health policies 6. New employee personnel files 7. Personal safety equipment

TASK ANALYSIS SHEET _____

OCCUPATION TITLE: PLANT MECHANIC			
DUTY NO.	**A**	**DUTY**	**PERFORM PREVENTIVE MAINTENANCE**
TASK NO.	**16**	TASK	**Perform housekeeping**
LEVEL		PERFORMANCE OBJECTIVES : Given the necessary tools, equipment and specific work area, the student(s) / trainee(s) must be able to perform housekeeping. When completed, the area and equipment must be clean with all tools and devices properly stored.	

STEPS	**PERFORMANCE CRITERIA**	**RELATED KNOWLEDGE, ATTITUDE AND SAFETY**	**TOOLS, EQUIPMENT, AND MATERIALS**
1. Inspect maintenance area of responsibility 2. Clean enclosing area. 3. Clean area under machines and work tables 4. Clean Workbench and vise. 5. Clean machine of chips, dust and grime. 6. Dispose off all trashes in an approved area or container. 7. Arrange for acquiring cabinets for storage of lubricants. Arrange lubricants in storage. Clean around lubricant storage. 8. Maintain trash box around the area.	• The area and equipment must be clean with all tools and devices properly stored.	• Explain the importance of cleanliness in the performance of workers especially maintenance men. • Enumerate and explain the Japanese **5 S**s of workplace management. • Explain the phrase " a place for everything and everything in its place."	• Brooms scrapers • Scrapers • Mops • Rags • Dustpans • Trash cans

DACUM Research Chart for PLANT MAINTENANCE MECHANIC

Duties — **Tasks**

A — Perform Preventive Maintenance

Perform PM inspection	Lubricate machines	Maintain belt V-belt drive	Maintain chain and sprocket drives	Inspect, maintain linkage and mechanism	Maintain bearings	Maintain gear drives	Adjust gib for free operations
A-1 A	A-2 B	A-3 B	A-4 B	A-5 A	A-6 A	A-7 A	A-8. B
Maintain couplings	Inspect/ maintain centrifugal clutch	Inspect/ maintain pneumatic clutch	Inspect/ maintain gear box drive	Lubricate seal faces	Participate in safety training program	Orient OJT trainees/ operator on safety and maintenance	Perform housekeeping
A-9 B	A-10 A	A-11 A	A-12 A	A-13 B	A-14. B B	A-15 B	A-16 B

B — Perform Corrective Maintenance

Diagnose machine breakdown	Remove and install plain bearing (bushes and sleeves) B	Remove and install plain bearing on shafts	Remove and install roller bearing B	Straighten a shaft using a press	Replace a shaft	Remove and install a V-belt assembly	Construct belt joints with mechanical fasteners
B-1 A	B-2 A	B-3 A	B-4 A	B-5 A	B-6 A	B-7 A	B-8 A
Construct belt joints with adhesives	Remove and install chain drive	Install and align flexible couplings	Replace universal joint	Install and align closed gear drive	Remove and replace lip seal	Remove and install mechanical seals	Order materials needed for the job
B-9 A	B-10 A	B-11 A	B-12 A	B-13 A	B-14 A	B-15 A	B-16 A
Update machine maintenance record							
B-17 A

Standard Time Model for a One Year Program (First Level) Recommended for Dual Training System and Dualized Programs

Part 1: **1st Semester (18 weeks)**	
16 weeks Fulltime In-School/Center Training to cover the Knowledge Requirements 1 week = 5 days = 30 hours (h) (6 hours per day) **16 weeks = 80 days = 480 h** Note: This number of hours is exclusive to be spent for the Knowledge Requirements. It is possible to add hours for General Educational Subjects, Academs or other activities which are not part of the Dualized Program.	**2 weeks Industry Immersion** 1 week = 6 days = 48 hours **2 weeks = 12 days = 96 h** Industry Immersion is a suggested scheme where trainees join in selected firms for familiarization and job induction of possible company assignment.

Part 2: **2nd Semester (18 weeks) plus Semestral Break (10 weeks)**		
18 weeks		**10 weeks**
1 day (8 hours) per week In-School/Center Training to cover the Related Knowledge **18 weeks** **"=" 18 days** **= 144 h**	**5 days (40 hours) per week In-Firm Training to cover the Skills Requirements** **18 weeks** **"=" 90 days** **= 720 h**	**6 days (48 hours) per week In-Firm Training to cover the Skills Requirements** **10 weeks** **= 60 days** **= 480 h**
In-School/Center Training = 144 h	**In-Firm Training = 720 + 480** (= 150 days) **= 1200 h**	

Summary	**In-School/Center**	**Industry**
Part 1 **Knowledge Requirements**	**480 h** (80 days)	**96h** (12 days)
Part 2 **Skills Requirements**	**144 h** (18 days)	**1200 h** (150 days)
	624h **= 32,5 %**	**1296 h** **= 67,5 %**
Total	**1920 h** **=100 %**

Dualization of Curriculum: Creating a time frame

Name of participant:________________________________ Institution: _________________________________ Region:________

Occupational title (of existing curriculum or Training Regulation):____

Creating a time frame. 60 – 70% of the total duration of the program must be imparted by the training company while 30 – 40% should be imparted by the school/training center.

Please decide/answer the following questions and justify your decision:

What level(s)/(class(es) your draft Dualized Core Curriculum shall cover?

Does the existing Training Regulation/Curriculum contain time allotment for Knowledge or Skills Requirements?

How long (Semesters, weeks, days) shall be the total duration of the program? Shall Saturday be included?

For the pilot implementation it is recommended that the first part of the program shall be organized as full time in-school/center, to impart the Knowledge Requirements. It is also recommended that part 1 should include an Industry Immersion as a suggested scheme where trainees join in selected firms for familiarization and job induction of possible company assignment. How long shall be the full time in-school/center part and how long shall be the integrated Industry Immersion (weeks) ?

How shall be the time divided between Knowledge Requirements and Industry Immersion (Part 1 of Dualized Core Curriculum) and Skills Requirements (Part 2 Dualized Core Curriculum) ? Please indicate the total time for Knowledge Requirements and Skills Requirements (only in weeks):

Knowledge Requirements and Industry Immersion (Part 1):

Skills Requirements (Part 2):

Please create a time model:

Knowledge Requirements and Industry Immersion (Part 1) = ……….. weeks = ……….. days

Knowledge Requirements will not only be imparted in Classroom but also in School-Shop.
How will be the time divided (days) between Classroom and School-Shop for Part 1 ?
(This should be only a first assessment, which can be changed in the future development)

No:	Topics	Knowledge	Skills	
		Classroom	School-Shop	Industry
	Knowledge Requirements and Industry Immersion **(Part 1 of the Dualized Core Curriculum)**	……………	…………..	…………
	Summary	…………..		………..
		…………		

Skills Requirements (Part 2)
Skills Requirements will not only be imparted in the Industry but also in School/Training Center.
What will be your time model for this part of the Dual Training Program? How many days per week in School/Training Center? Any other model?

According to your decision about the model, please write down:

Skills Requirements (Part 2): **Total time = ……….. weeks = ……….. days**

Time to be spent in Industry = ……….. days

Time to be spent in School/Training Center = ………... days

The time portion for imparting the Skills Requirements in School/Training Center has to be divided between Classroom and School-Shop. (This should be only a first assessment, which can be changed in the future development)

Time portion for Skills Requirements to be imparted in Classroom = ………. days

Time portion for Skills Requirements to be imparted in School-Shop = ……… days

No:	Topics	Knowledge	Skills	
		Classroom	School-Shop	Industry
	Skills Requirements **(Part 2 of the Dualized Core Curriculum)**	……………	…………..	**………….**
	Summary	…………..		**………**
		………….		

Please list the whole time frame of your Dual Training Program.
Check in the total summary whether your time portions for
In-School/Training Center and In-Industry are within the demanded
30 – 40 % or 60 – 70 %

No:	Topics	Knowledge	Skills	
		Classroom	School-Shop	Industry
	Knowledge Requirements and Industry Immersion (Part 1 Dualized Core Curriculum) **Skills Requirements (Part 2 Dualized Core Curriculum)**	**………** **………**		**……..** **……..**
	Total Summary	**…….** **= ….. %**		**…….** **= …… %**
		……. **=100%**		

Dualized Core Curriculum for Knowledge Requirements and Industry Immersion. Fixing the time portions for classroom, school-shop and industry (Industry Immersion)

Name of participant:___________________________________ Institution: ____________________________________ Region:_________

Occupational title (of existing curriculum or Training Regulation):____

Please list all topics of the Knowledge Requirements of the existing curriculum or Training Regulation you are going to dualize.

Please allocate the time portions for the particular topics of Knowledge Requirements. Do this according to their importance.

Please decide how much of the time portion for every particular topic should be imparted in classroom and how much should be imparted in school-shop.

Please check with your time frame. Since the time frame was only a first assessment, you can change the time alloted to classroom and school-shop.

Core Curriculum for Knowledge Requirements and Industry Immersion (Part 1 of the Dualized Core Curriculum):

1. Notes on the series "Basic skills in metal working"

When training people for occupations in the metal-working industry, the acquisition of work experience, abilities and skills in manual and simple mechanical metal-working is of fundamental importance.
The work techniques

- scribing
- measuring and testing
- sawing
- shearing
- drilling and countersinking
- threading
- filing
- bending and straightening

are taught in complex assignments.

The series "Basic skills in metal-working" is suitable both for imparting knowledge and for developing the ability of trainees within the framework of polytechnical training and for consolidation and revision purposes further vocational training.

When designing the transparencies, great importance was attached to the use of coloured and perspective representations of the technical and technological relations and facts.

Despite the necessary simplification, scientifically based information is given.

For reasons of economy, the transparencies have been designed in A 4 format and are kept in a folder together with technical and methodical notes.

The transparency cases are ideal for keeping personal notes and additional self-made covering sheets which are used with the transparencies.

For proper placing of the transparencies on the overhead projectors in upright size or broadside format, a simple frame has been enclosed with the series. The three-point arrangement of the frame (narrow side to the left) allows proper fixing of the covering sheets in the supporting system.

The covering sheets can easily be adjusted to size and allow the teachers to provide additional information or to vary their presentation of information. The original transparencies are not damaged by this. To help make the plastic covering sheets true to size, markings have been provided on the edge of the sheets (short vertical or horizontal strokes).

In the technical notes, no information about health protection, industrial safety or fire prevention has been given. For information of this type, see the relevant regulations and specialized literature.

3. Notes on the transparencies

Film no. 1

Tidiness at the workplace

An essential task of polytechnical training is educating the trainee to achieve order and discipline. The first transparencie of this series allows the teacher to inform the trainees from the first lesson on how to arrange their workplace most suitably thus contributing to tidiness at the workplace.
The arrangement and selection of tools and testing instruments depends to a large extent on the work to be done.
For this reason, the arrangement of the tools and testing instruments on the work table should be considered only as an example. The arrangement of tools in drawers depends on the number and type of the tools.
It is essential that the attention of the trainees be drawn to the importance of properly placing and preparing tools and testing instruments for high-quality work.

Film no. 2

Sawing by hand

The transparency shows the initial sawing of a flat steel with a hand hacksaw and, in a magnified section two saw teeth cutting into the steel.
In this way basic knowledge from the manual training, such as the design of the hand hacksaw, can be revised and consolidated.
Using this transparency, the following crucial points can be dealt with:

- Clamping of a workpiece (maximum dimension is in the direction of cutting, rigid clamping)
- Clamping of the saw blade (the teeth point in the direction of cutting - red arrow -)
- Initial sawing under a small lead angle
- Geometry of the cutting edge.

It is advisable to mark the individual angles at the saw tooth with different colours and to explain these using a self-made covering sheet.

Film no. 3

Selection of saw blades

The selection of saw blades is mainly governed by the tasks to be fulfilled.
The transparency is intended to help the trainee to recognize the saw blades by their pitch (spacing between crests) and to select them according to the material to be worked and in accordance with its properties.
In three magnified sections, a coarse, a medium and a fine pitch can be distinguished. The teacher should take this opportunity of explaining how the selection of saw blades should be made according to the material to be worked:

Section 1: fine saw pitch for
- thin-walled workpieces such as pipes, sections, etc.
- hard materials such as alloyed steels and cold formed materials such as wires, sheets and plates etc.

Section 2: coarse saw pitch for
- soft materials where a large number of cuts can be expected, such as aluminium
- plastic materials such as thermoplastic material, etc.

Section 3: medium saw pitch for general workshop use.

Film no. 4

Power hacksaw

In this transparency, the power hacksaw is shown as a diagrammatic sketch. In a magnified section the operating princip: of the sawing process is illustrated. The following can be acquired by the trainee:

- Design and operating principle of a power hacksaw (crank drive)
- Clamping of the workpiece
- Drawing mode of operation
- Load of the saw frame and
- Altering the cutting pressure by shifting the weight on the saw frame.

Film no. 5

Sawing work

Two examples of special sawing work are given. In example 1 the trainees are informed about the sawing of deep cuts with the saw blade turned by 90°. Example 2 shows the sawing of pipes in prismatic clamping jaws. The hand hacksaw is not shown. It should be pointed out that when sawing pipes the pipe must be turned several times in order to avoid tooth breakage and uneven cutting. In both examples, the function of the clamping jaws which are used must be dealt with.

Film no. 6

Shearing

Sheets and plates as well as flat and sectional bars can be cut by shearing, while scribing can be adhered to precisely. This requires knowledge of the shearing process. The relevant transparency shows the operating principle of shearing in a simplified way.
The two shear blades with the conical cutting edges and the holding down clamp with the workpiece can be seen.
The acting forces are marked by red arrows. A distinction must be made between the absorption of force by the holding down clamp and the continuously acting cutting forces of the shear blades.
The workpiece is shown in the phase of bending and initial separation (slide planes form in the material).
In a magnified section of the area of cut, the trainees can see:

plate is pushed forward and is difficult to guide.
Note that the plate thickness in Figure 1 is magnified. In general, hand plate shears are only used for cutting thin sheets (e.g. steel sheet up to about 1 mm thick, aluminium sheet up to about 2 mm thick).
Figure 2 shows the punch (dark blue), the die plate (green) and the sheet strip (workpiece/lighter blue). In the die plate only the path of the punched material is indicated. The outline of the opening in the die plate has been omitted.
The opening in the die plate (lower die) can be illustrated in a self-made covering sheet.
The following form of representation is recommended (cf. transparency no. 7)

s = blade clearance
α = clearance angle

Film no. 9

<u>Holding and guidance of the scriber</u>

Transferring the shape and size of the workpiece according to workshop drawings to the starting material requires great care. The scribed lines must be clearly visible and must also remain visible during working. For this reason, scribing is often carried out with a scriber. Using transparency no. 9, holding and guidance of the scriber can be explained to the trainees. The accuracy of the size of the workpiece is determined mainly by the quality of scribing.
Instruction in careful, scrupulous work and care of the scribing tools is the essence of this transparency.

Film no. 10

Scribing

Before scribing bores, one or two reference edges are required. The reference edges of the workpiece (underlined in red) can be derived from the simplified technical drawing (dimensioning from 2 reference edges).
The fitting of the try square to the prepared reference edges is shown. The teacher should demonstrate how the dimensions must be plotted from the right-hand reference edge using the steel measuring tape.
Scribing is done using the scribing point. This scratches the surface of the workpiece. A considerable notch effect is caused by the sharp base of the scribed line, causing concentrations of stress which have several times the value of normal stresses. Therefore this danger must be indicated during lessons. With soft materials or materials where the surface must not be damaged (because of the corrosion hazard), scribing points of brass or lead pencils should be used.
The transparency does not show whether or not the surface of the workpiece has been prepared for scribing. Whitening with whiting, coppering with copper sulphate or varnishing with scribing varnishes make the scribed lines easier to distinguish.
Using a concrete example from the works production, it should be shown that the shape to be scribed and the quantity play an essential part in the selection of the scribing process.

Film no. 11

Punching

Punching is the technique immediately subsequent to scribing. The punch provides a scribed line with controlling punch marks in order to control the scribed lines, which become less visible as work proceeds. Half of the control punch marks must be left on the work edge. Furthermore, centres of bores are fixed by punching. In practice, a distinction is made between marking-out punches (point angle 30 - 40^{o}) and centre punches (point angle 60^{o}) (see transparency).

Punching requires a lot of skill.
The punch must be inclined so that the position of the centre can be observed.
When the centre corresponds with the scribed centre, the punch must be held vertically; the side of the hand must rest on the workpiece. The punch must then be driven into the workpiece by a short vertical blow with a locksmith's hammer up to a weight of 250 g.

Film no. 12

Twist drills

The punched bore (see transparency no. 11) is drilled by means of a drilling tool and a drilling machine.
As a rule, standardized twist drills are used in practice. Twist drills above 10 mm in diameter are generally made with a taper shank (machine taper) and below 10 mm diameter with a cylindrical shank.
The transparency can be used both for showing the parts of the drill, the tool geometry and the parts of the drill point, and for revision, exercise purpose and checking progress.
The following can be seen on the two drills (top to bottom):

Left drill: diameter $>$ 10 mm
tang, taper shank of tool, mark recess (neck), body with principal cutting edge, flute and secondary cutting edges (margins)

Right drill: diameter $<$ 10 mm
cylindrical shank, body with principal and secondary cutting edges and flute.

Figure 1 shows the angles at the cutting edge of the drill.
The angle of lip clearance α, lip angle β and cutting rake γ must be explained. The relation of the cutting rake to the flute helix angle in connection with the material to be worked must be mentioned.
In Figure 2 the designations at the drill point, such as the principal cutting edge, helical flute, chisel edge angle of point, flank, web thickness (secondary cutting edge, margin not drawn) and the flank of the secondary cutting edge can be discussed.

In Figure 3 the point angle , which is formed by the two principal cutting edges, is marked. This largely depends on the material to be worked. For aluminium it is 130 - 140^{o}, and for steel approx. 118^{o}.
The point angle affects the service life of the drill's cutting edges. The two principal cutting edges must be of equal length in order to avoid drilling faults.
Explain to the trainees that labour productivity is increased by continuously improved drill points using commercial spiral drills. (e.g. centring grind drill).

Film no. 13

Drillings

Using this transparency, the purpose, use and special features of drilling can be dealt with and effective operating processes such as drilling with drill jigs ean be explained.
Figure 1 shows that it is advisable to pre-drill large holes. The pre-drilled hole serves as a guide and also relieves pressure from the chisel edge of the larger drill. Moreover, it helps prevent the drill from going off-centre.
The illustrated hole is a through hole.
Figure 2 shows a through hole.
Figure 3 shows a blind hole. The trainees should be instructed that, when determining the depth of the hole, one should not start at the drill hole point but at the cylindrical part of the hole.
Figures 4 and 5 show that a base is required for making a through hole so that the drill table is not damaged.

Film no. 14

Bench-type drilling machine

The transparency shows the design and operating principle of a commercial bench-type drilling machine in section.
The trainees should by familiarized with the design and operating principle of the machine step by step. The coloured representation of the most important assemblies is of great assistance and allows trainees to draw conclusions regarding

the modular unit principle of machine tools.
It is advisable to trace the direction of force lines from the driving motor via the belt drive to the drill spindle and the tool.

The trainees should make use of their prior knowledge.
The most important assemblies shown are:

- electric motor as drive
- cone pulley drive
  (other types are equipped with gear drives)
- drilling spindle with feeding mechanism and chuck
- drill table for holding workpieces
- column to support the assemblies.

Film no. 15

Countersinking

With this transparency the trainees are given a survey of the most important countersinks and can classify countersinking into the systematics of manufacturing processes. Countersinking is a technnique in which pre-drilled or cored holes are bored and their faces worked.
This is illustrated by four examples.

Figure 1 Counterbore and counterboring tool with pilot
The counterbore is used for countersinking cylindrical recesses (bolt head reception). The fixed or exchangeable pilot pin guides the counterboring tool with pilot.

Figure 2 Tapered countersink (countersinking cutter)
Tapered countersinks are used for taper countersinking and for deburring. The angles of taper correspond to the standardized countersunk angles of bolts and rivets and are of 60^{o} or 120^{o}. The spacing of the cutting edges is non-uniform in order to avoid the cutting edges from digging in.

Figure 3 Counterbore with spiral flutes
Counterbores with spiral flutes are used for boring cored holes. It is clear from the picture that counter-bores with spiral flutes are provided with several

principal cutting edges, in most cases 3, more seldom; this allows smooth running.

Figure 4 Centre drill

The centre drill is a combination of a single-edged drill and a centre reamer or form countersink and is used for centring workpieces as a preparation for turning. The cutting edge angles of the countersinks have been indicated and should be supplemented by the standardized numerical values.

The trainees should be made aware that in countersinking too there is a rotating primary motion and a straight-line feeding motion.

Film no. 16

Internal threading

This transparency shows the preparation of a bore with internal thread in four steps.

Step 1 Preparation of a core hole

The core hole is prepared with the spiral drill using a table drilling machine. The diameters of the core hole bores are standardized. If the core hole is excessively large, the thread is not sufficiently cut (Refer to the use of chart books or standards, the selection of the correct diameter of spiral drill and checking by means of a vernier caliper).

Step 2 Spot-facing of the bore

The core hole bore should be spot-faced up to the nominal thread diameter by a 60^{o} conical countersink.

Step 3 Entering tapping of the internal thread

The entering tap must be applied at right angles to the workpiece surface on all sides and turned into the core hole bore with low feeding power.

The marked start of cut should be observed when determining the depth of the core hole in a blind hole bore.

Step 4 Plug tapping of the internal threading

The plug tap is initially turned in by one hand. Once insertion into the entering tappings of the thread is secured, the tap wrench can be put on and the thread can be plug tapped.

In magnified sections the quantity of chips is shown which is obtained in internal threading.

The trainees should be instructed that the chips are to be loosened and broken by alternately turning forward and backward.

The trainees must recognize by means of practical examples how important standardization is for the national economy.

Film no. 17

External threading

A simple cutting die is shown on the transparency. This cuts an external thread on a bolt.

The design of the cutting die should be explained:

- Cutting die holder (shown in green) with outlined threaded pins (holding screw, 2 thrust bolts and 2 spreading screws).
- Cutting die with 4 cutting edges: spot-faced at 60° on both sides. The start of the cut has alength of 1.25 to 1.5 times the pitch. Cutting dies are made of tool steel (shown in bluish-grey).

As compared with internal threading, external threading has the following special features:

- Before using the cutting tool, the bolt head must be chamfered and, if necessary, filed so that it is crowned (top left).
- The thread is cut by the cutting die in one operation without interruption (cooling, lubrication, chip breaking and chip removal are necessary)
- After starting the cut, no more pressure should be exerted.

Film no. 18

Calculation of length subject to bending

Bending is the plastic change in the shape of a solid body and is used in a number of ways in the metal-working industry.

When forming a material, its volume remains constant. During bending, the material layers are stretched and upset. Since only the so-called neutral fibre retains its original length, it is used

for calculating the length subject to bending.
A bent workpiece is shown on the transparency in a very simplified way. The neutral fibre has been drawn in black. As a rule, it passes through the centre of gravity of the material cross-section (with symmetrical cross-sections it passes through the centre).

In order to illustrate stretching and upsetting to the trainees, a covering sheet can be placed within the range of length, l_3 to illustrate this in a grid structure.
In the case of a very small bending radius ($r < 5$ s) the bending radius is shifted towards the pressure side.
The formula for calculating the length subject to bending shown on the transparency only applies if the bending radius is r 5.
Using this transparency, a simple length subject to bending can be calculated.
This transparency is suitable for checking progress, etc.
For this purpose, the formula should be covered over.
Note that an example with a bending radius < 5 s has had to be chosen because of the design of the transparency.

Film no. 19
<u>Bending in vice I</u>

Sheets, strip and flat steels of small dimensions are angled or bent in a vice.
The transparency shows the angling of workpieces in the vice with two examples:

Figure 1 Sheets of low strength and parts with a free bending leg are bent with a wooden hammer. The blows should be applied near the bending edge. Shims with formed edges (not shown) give the desired form to the bending point. Shims of wood or other soft material prevent damage to the workpiece surface. Plastic yielding results in internal stresses which favour the formation of cracks.

Figure 2 When bending short free legs a block of hard wood or another softer material should be used together with a locksmith's hammer.
Direct blows with a locksmith's hammer would result in buckling of the workpiece edges and workhardening of the material.

Film no. 20

Bending in vice II

This transparency shows the rounding off of a workpiece in the vice in two figures.

Figure 1 Preliminary bending of a flat steel or sheet
The figure shows the phase pf preliminary bending over a mandrel (round steel or pipe).
Ensure that the workpiece is firmly clamped.

Figure 2 Finish bending
The finish bending of the pre-bent workpiece also proceeds in a vice.
Observe its resilience.
When bending soft materials use shims to prevent surface damage caused by the vice-jaws (shown in brown).

Film no. 21

Straightening of workpieces

Workpieces must be straightened in the case of

- distortion of the components after heat treatment in the production process
- distortion caused by transport or storage.

Its purpose is to restore the original shape, and it is essentially based on a displacement of material. Straightening requires great technical skill and theoretical knowledge about the structural constitution and stress distribution.
Using Figures 1- 3 essential basic knowledge can be gained using three examples.

Figure 1 Deformations in the centre of the sheet are eliminated by stretching by applying light, uniform circular, hammer blows, striking more densely towards the edge. For small sheet thicknesses and sensitive materials a wooden or rubber hammer should be used.

Figure 2 Edge stresses are eliminated in a simular way.

Figure 3 The buckled angle steel is aligned by stretching of the upset side.

Note: This method (one-sided stretching) can also be used to round off an angle steel.

Finally, bending and straightening should be compared with other production methods from the point of view of material economy.

Film no. 22

Measuring with a vernier caliper

The design and handling of the vernier caliper can be demonstrated efficiently with functionable models and the vernier caliper itself. This transparency is suitable for revision purposes and for learning the three basic possibilities of measuring with vernier calipers.

1 Measuring of external dimensions between the fixed and the movable leg

2 Measuring of internal dimensions by cross jaws - the measuring blades for internal measurement are aligned with the measuring faces for external measurement.

3 The depths of blind holes and grooves are measured by the depth micrometer (not shown in green).

In the magnified section, a part of the sliding member with the vernier and the beam millimeter divisions can be seen. The last scale division has not been drawn accurately; it must coincide with the scale division for 34 mm on the beam.

Film no. 23

Testing of components

The verbal statements in German must be translated for the trainees:

Testing	Measuring
Dimensional testing:	Gauging:
Non-dimensional testing:	Comparing with specimens:

The transparency shows the testing of components using selected examples.

In the lessons, the teacher should supplement the symbolic representation using actual examples from practice.

In the Section "Measuring" reference should be made to comparing the physical quantity to be measured such as length, temperature, work, etc. (measuring quantity) of the workpiece, components or machine with a known quantity of the same type such as unit lengths, scale divisions, etc.
The purpose of measuring is the numerical determination of a measuring value (measuring value = numerical value x unit of measurement).
The Section "Gauging" should illustrate that a component must be checked for observance of the actual dimension within a tolerance range (limit gauges) or that the form of a component approaches a specified form (form gauges).
Non-dimensional testing deals mainly with the comparison of specimens, such as comparing the sound of grinding wheels after slight bouncing (clear sound indicates proper condition), etc.

Film no. 24

Testing with form gauges

This transparency shows how to check the planeness of one or several faces and the angularity of a component.

Figure 1 Checking the angularity of a component with a thin steel try square.
The thin steel try square is shown here checking an angle of 90° on a component.
If there is angularity no gap is present when the thin steel try square is set on the surfaces to be checked (red).
(Mention the bevelled edge steel square).

Figure 2 Checking the planeness of the two bearing surfaces (red) of the component.
The hairline gauge has wedge-shaped ground measuring faces. The measuring edge is slightly rounded off. It is a high-quality testing tool and must be handled and used with care.
Typical testing patterns are found in testing. The handling of the hairline gauge when checking planeness must be explained (light gap method).

Film no. 25

Design and use of files

The transparency shows a double-cut flat file on a workpiece which is clamped in a vice.
The basic design of a file and its usage can be explained by means of this transparency:

- The shank of the file with the two cuts and the tang with the handle can be seen; conclusions can be drawn about the cross-section
- The magnified section shows the contour of the file teeth and the chip space during one stroke of the file. Owing to the angular ratios given the file can be assumed to be one used for steel working. Using a self--made covering sheet the geometry of the cutting edge can be shown, if required. But it is in any case clear that scraping is required.(negative rake angle).

The contact of the file on the workpiece shown and the distinguishable grooves in the workpiece should prompt discussion on the correct filing direction with reference to the workpiece edge and the quality required (see transparency no. 27)
Explain to the trainees that manual filing for repairs and assembly work is at present often more economical than the use of the corresponding machines.

Film no. 26

Types of files

The correct selection of files is important for high-quality filing.
Three characteristic types of file are shown:

1 Single-cut files	for soft metallic materials milled teeth
2 Double-cut files	for hard metallic materials cut teeth
3 Rasps (rasp cut)	for soft materials such as wood, etc.

The file teeth are clearly recognizable in magnified sections.

Film no. 27

Filing I

The teacher can explain the mode of operation when filing using four figures:

Figure 1 Rough filing is done if more than 0.5 mm material is to be removed

Figure 2 Cross stroke filing is required when a high degree of planeness is required.

Figure 3 Smoothing is done with longitudinal strokes

Figure 4 Filing of 2 work faces in one plane

Film no. 28

Filing II

Rough filing is compared with smoothing.

Figure 1 As a rule, only the motion of th arm should be used for filing.
When rough filing, the right hand has a guiding and feeding function while the left hand exerts pressure.

Figure 2 When smoothing and when using moderate sizes of file the left hand must assume the guiding function while the right hand is responsible for feeding.

METAL

on Fundamentals
of General Metallography

ibe

PROFacto

Author:
Ing. Gerhard Umlauff,
Hennigsdorf Institute of Technology

The micrographs included in this series of projection films on fundamentals of general metallography were made available by Laboratory of Metallography, Materials Engineering Department, Hennigsdorf Institute of Technology.

Designed by
Günter Brabant

Prepared for publication by
Dipl.-Ing. paed. Marianne Quendt,
Dipl.-Ing. paed. Günter Zweynert

1. General

This series of projection films on fundamentals of general metallography can be used for the theoretical education and practical training in metal fabrication. It can also be used for further and refresher training in the metal-fabricating field. It covers the following subjects:

		Film no.
(1)	Crystalline structure of metals	1, 2, 3
(2)	Structure and real lattice	3, 4, 5, 6
(3)	Methods of examination	7 thru 13
(4)	Eutectic diagram	14
(5)	Solid solution diagram	8, 9, 15
(6)	Precipitations from solid solutions	16
(7)	Deformation of metals	17, 18, 19
(8)	Recrystallization	19, 20
(9)	Iron-carbon diagram	21 thru 26

To aid instructors in making preparations for lessons and avoid misinterpretations of the contents of projection films, all of the films have detailed explanations attached to them. Ease of comprehensibility called for the liberal use of colors in the design of projection films on methodological principles.

All crystallographic relationships (e.g., lattices and unit cells) were marked in blue, whereas transitions to higher temperatures accompanied by state changes were marked in red.

Cooling curves of thermal analysis and heating curves of thermal treatment were plotted against a blue background, whereas constitutional diagrams and those relating to strength properties were plotted against yellow and green backgrounds, respectively.

Micrographs of metals were unilaterally fixed to base films, thus providing for various forms of representation during classes. To enable instructors to plot their own diagrams, blank films nos. 27 and 28 were provided with centimeter grids. A4 size films are used together with frames to take up base films.

The films in this series are contained in suitable bags which together with the booklet and frame are accommodated in a plastic folder, thus providing for ease of storage together with other types of information carriers.

2. List of projection films

Film no.	Film title
1	Crystal lattice
2	Grain and grain boundary
3	Unit cells
4	Crystal growth
5	Real lattice structure
6	Dislocation
7	Etching possibilities
8	Macro- and micro-etching
9	Coarse and fine grains
10	Segregations in rimmed steel
11	Metallurgical microscope
12	Thermal analysis
13	Curve of solidification
14	Eutectic
15	Solid solutions
16	Precipitations from solid solutions
17	Stress-strain diagram
18	Process of deformation
19	Work hardening of copper
20	Recrystallization of copper
21	Iron-carbon diagram no. 1
22	Iron-carbon diagram no. 2
23	Steel corner of the iron-carbon diagram
24	Ferrite-Austenite
25	Primary and secondary cementite
26	Pearlite-Ledeburite
27	Blank film with centimeter grid
28	Blank film with centimeter grid

3. Explanations of films

Film no. 1

Crystal lattice

It is essential to point out that the crystalline structure of metals can be explained only with the use of a model theory. To convey such model concepts, film no. 1 should be presented together with films nos. 2 and 3 which are concerned with grains and grain boundaries and with unit cells, respectively. By representing rows, lattice planes, space lattices, and unit cells and indicating the order of magnitude of the lattice constant, it is possible to explain the abstraction from the solid sphere model to the point lattice. Geometric laws can thus be understood more easily.

If required, portions of the film presented can be covered during instruction (e.g., representation of the lattice plane and unit cell). This allows the students' attention to be concentrated on what is being discussed.

Film no. 2

Grain and grain boundary

This film compares a model concept that is used to explain the polycrystalline structure of metals with real structural conditions. When viewing this film it is necessary to take into account the different scales. This film can be used to explain the term anisotropy which indicates variation in properties in different directions, e.g., in a steel sheet. When discussing the contents of the film, halves thereof can be covered and compared with micrographs, and more particularly film no. 7 (etching possibilities), film no. 8 (macro- and micro-etching), and film no. 9 (coarse and fine grains).

Film no. 3

Unit cells

This film shows a body-centered cubic unit cell and a face-centered cubic unit cell as the most important representatives of the crystal systems. It should be noted that multifarious cubic unit cells occur in nature and that not only the form and size but also the configuration or arrangement of the atoms are of importance (properties of metals).
It is appropriate for a table of lattice constants and other values to be set up during discussion of the subject matter.
The imaginative faculty of students can be substantially supported through using a combination of sphere model and film representation.

Film no. 4

Crystal growth

This film shows, in a series of single images, the process of crystallization during transition from the liquid to the solid phase (anisotropy of crystal growth). It should be pointed out that crystals will not assume a stable position in the melt but will move within the melt up to a certain degree of solidification. Since impurities often tend to accumulate in the residual melt during solidification, segregations in the structure will occur. It is in this particular context that film no. 10 (segregations in rimmed steel) can be referred to. The objective should be to reduce model concepts to reality. Such terms as real structure and structural faults can be introduced to explain the actual behavior of materials. This confirms the possibility of affecting the properties of materials.
Also, film no. 4 can be used to discuss the dependence of the grain boundary upon the number of nuclei present. The individual images of this film can be presented one after the other, with those that are not be shown being covered.

Film no. 5

Real lattice structure

This film, which is a continuation of film no. 4 (crystal growth), is concerned with the structural faults of crystal lattices. The extent to which these forms of real lattice are discussed in classes is left to the discretion of the instructor. However, it is essential that he should discuss at least vacant lattice sites, exchange atoms, and interstitial impurities. It should be pointed out that the exchangeability of atoms (the atomic volume must be no greater than fifteen percent of the atoms of the basic lattice) and incorporability of atoms at vacant sites (comparison with the sphere model in film no. 1) are limited. It was only in recent years that concepts of the real lattice structure could be developed as a result of researches conducted by solid state physicists. They form the basis for the theory of dislocations and, hence, for the workability of metals.

Individual types of fault should be presented and discussed separately by covering the film. Film no. 5 provides the basis for discussing the contents of film no. 18 (process of deformation).

Film no. 6

Dislocation

To be able to explain the process of translation (deformation by shear - film no. 18) it is necessary to introduce the term dislocation. Only edge dislocations will be discussed here notwithstanding the fact that, in reality, there are numerous forms of dislocations such as screw dislocations, mixed-type dislocations, and so on. This representation of dislocation requires that we confine ourselves, for epistomological reasons, to few atoms and lattice planes although, in actuality, thousands of atoms are involved in it. A dislocation is a higher energy (lower equilibrium) site surrounded by stress concentrations.

Be sure to point out the possibility of such stresses joining so as to increase the overall stress level (cf. film no. 19 that is concerned with the work hardening of copper).

Film no. 7

Etching possibilities

Microscopic and metallographic examinations of metals and alloys are not usually performed in all areas of vocational education and training. However, it is necessary to discuss problems associated with structural examinations. This film can be used to compare theoretical knowledge with practical results of structural examinations. Students should realize that results of structural examinations obtained with the use of micrographs form the basis for obtaining new knowledge (e.g., in constitutional diagrams). Shown in this film are, at a scale of 100 : 1, two micrographs of pure copper etched using hydrochloric acid and iron chloride, respectively.

It can be seen that etching results in the grain boundaries and, later, the grain surfaces being attacked, with the structural pattern thus being essentially dependent upon the time of etching.

Contrast etching is also possible by using other and more aggressive etchants. The action of etching agents can be discussed by reference to film no. 2 (grain and grain boundary).

Film no. 8

Macro- and micro-etching

This film can be used to demonstrate different methods of examination. In metallography, a distinction is made between macroexamination and microexamination depending upon whether a particular structure can be observed or identified with the naked eye or by means of a microscope. Shown in film no. 8 are the images of an etched pure aluminum ingot (at a scale of 1 : 1) and of a structural steel microsection (at a scale of 100 : 1).

In the case of the pure aluminum ingot, there can be seen grain growth taking place as a result of cooling of the small cast ingot from the outside in. Indentation results from the decrease of volume. Whereas the structural pattern of pure aluminum allows only the kind of crystal formation to be seen, that of structural steel provides qualitative information about individual structural components. Because of the larger number of nuclei of crystallization, the structural constitution of mild steel is nearly uniform in all regions.
Film no. 8 can be discussed in connection with films nos. 2 and 4 that are respectively concerned with grains and grain boundaries and with crystal or grain growth.

Film no. 9

Coarse and fine grains

This film, which can be discussed in connection with film no. 4 (crystal growth) and film no. 13 (curve of solidification), enables instructors to explain the development of different grain sizes. It includes two micrographs of different grain size low-carbon steel etched using 3 % alcoholic nitric acid, the scale being 100 : 1.
It is essential to discuss the effect of grain size upon material properties (structure, behavior) with particular reference to the causes of formation of coarse grains.

Film no. 10

Segregations in rimmed steel

The macrostructure of steel is greatly influenced by processes of segregation taking place during solidification thereof. Such elements as phosphorus and sulfur show a marked tendency toward segregating. Segregations present in the original steel ingot are correspondingly modified during metal working operations.
This film shows the images of two macroetches and of one Baumann sulfur print of rimmed steel. The segregations shown here are generally referred to as macro- and microsegregations, respectively. Be sure to give instructions for use and fabrication (welding, drilling, corrosion, etc.) of rimmed steels.

Film no. 11

Metallurgical microscope

A metallurgical microscope can be used to examine the kind, proportion, size, form, and distribution of structural constituents.

Unlike transmitted-light microscopy of biological objects, the metallurgical microscope is a reflected light microscope.

Film no. 11 shows the "Epityp" 2 metallurgical microscope made by VEB Carl Zeiss of Jena, G.D.R., and it is supplemented by a schematic representation of the optical path in the microscope.

It is recommended that the applications of a metallurgical microscope be explained during a visit to a metals testing laboratory. The specimens examined using the microscope should be ground, polished, and etched metal surfaces.

The contents of film no. 11 can be discussed in connection with those of film no. 7 (etching possibilities), film no. 8 (macro- and micro-etching), and film no. 9 (coarse and fine grains).

In so far as examinations performed using metallurgical microscopes are concerned, it should be pointed out that what counts is the results obtained rather than details of methods of examination.

Film no. 12

Thermal analysis

This film can be used to explain metallographic analyses of metals and alloys made with a view to determining melting points and intervals. It should be pointed out that for a determination of solid state transformation points use should preferably be made of a dilatometer which allows changes in length to be measured, since the heat of transformation is too low for a thermal analysis to be done.

Film no. 12 shows the arrangement of an electrically heated furnace with the sample connected to the reference junction which, in turn, is connected with the measuring instrument. Also shown is a schematic diagram of a thermocouple with measuring and reference junctions. Be sure to again explain the operating principle of the thermocouple, if necessary. It is in connection with the discussion of thermal analysis that film no. 4 (crystal growth) and film no. 13 (curve of solidification) can be touched upon and discussed, respectively.

Film no. 13

Curve of solidification

This film can be used to again explain the process of crystallization and, at the same time, learn and practice the reading of diagrams. Also, this film can be used together with film no. 4 (crystal growth) to explain the thermodynamic theory of fusion and solidification. The film also shows individual phases of the process of crystallization in a didactically simplified and graphic form as well as the curve of solidification of lead of which the solidification temperature is 327°C. It should be pointed out that such an 'ideal curve' can be obtained under laboratory conditions only.

Film no. 14

Eutectic

This film shows, in a concentrated form, the solidification curves of five alloys, the constitutional diagram, and the schematic representations of structural patterns. Using this film, it is possible to explain the plotting of a constitutional diagram from cooling curves as well as the constitutional or state changes taking place during the cooling of individual alloys. Be sure to point out that structures constitute what is known as a crystal aggregate.

It is essential that students should realize that constitutional diagrams are stores of information on the states of alloys in dependence upon both temperature and concentration and that they are required for making and heat-treating alloys (concentration and temperature, respectively).

It is recommended to present the individual images in their proper order by covering portions of the film.

Film no. 15

Solid solutions

This film can be used to explain the constitutional diagram of complete miscibility of alloy components in the liquid and solid states, which is derived from the curves of solidification of four alloys. From the diagram there can be read changes taking place during the cooling and heating of alloys in dependence upon both temperature and concentration.

The micrographs show equal-appearance solid solutions of which the composition can be determined by chemical analysis only. By using the schematic representations for substitutional and interstitial solid solutions, it is possible for this subject matter to be discussed and repeated graphically.

Depending upon the procedure used by the instructor, portions of the film can be covered one after the other.

Film no. 16

Precipitations from solid solutions

This constitutional diagram with solid state miscibility gaps and the cooling curve of an alloy with the corresponding micrographs (in dependence upon temperature) can be used to explain the process of hardening by precipitation and the changes in the properties of alloys which are due to dispersion. The schematic micrographs enable students to arrive at a better understanding of the process of precipitation and the change in solubility of an alloy with decreasing temperature.

Students should realize that properties of materials are temperature-dependent.

The contents of this film should be discussed in steps corresponding to individual stages of instruction.

Film no. 17

Stress-strain diagram

The objective of conveying knowledge of the workability of materials is to enable students to interpret processes proceeding within materials during working, for example. To prepare students for a discussion of processes of deformation, this stress-strain diagram of a soft type of steel which includes the most important parameters as well as the elastic and plastic strain, respectively, can be used to explain such characteristics as strength and strain. This film can also be used for a discussion of materials testing. It is essential that special importance be attached to the distinction between elastic and plastic strain and elastic and plastic deformation.
The contents of film no. 17 should be discussed in connection with those of film no. 18 (process of deformation) and film no. 19 (work hardening of copper).

Film no. 18

Process of deformation

Film no. 18 shows the stages of deformation of a lattice portion in six individual images. Preferably, part of a lattice model should be used to explain the terms elastic and plastic deformation. Sliding in plastic deformation occurs along a slip plane and is made possible by dislocation. It is appropriate for the contents of film no. 6 (dislocation) to be discussed again in this context.
It is essential that knowledge of the polycrystalline material involved in the elementary process of sliding, which was here acquired on a portion of the lattice only, should be extended to cover the entire material.
The contents of this film should be discussed in steps.

Film no. 19

Work hardening of copper

Work hardening of metals can be regarded as being due to an increase in dislocation density, the accumulation of dislocations at obstacles, and the addition of concentrations of stresses around individual dislocations. This film can be used to discuss cold working results. It shows the changes in tensile strength, elongation, and reduction in area of pure copper during wire drawing and enables several curves to be compared. Intentional and unintentional changes in properties due to cold working should be discussed in detail.

This film enables students to read and interpret the diagram and compare the structures of soft and work-hardened copper wire.

Film no. 20

Recrystallization of copper

After having clarified the term work hardening, it is essential to explain the terms recrystallization, cold working, hot working, and critical amount of deformation. Students should realize that properties of materials have to be influenced by increasing the temperature and causing the structure to re-form in the solid state far below the melting temperature.

This film shows the variation in tensile strength and elongation as a function of the temperature of annealing. The recrystallization range is supplemented by schematic micrographs. The film allows to explain processes proceeding during recrystallization, desirable heating (e.g., annealing as an intermediate stage of wire drawing in order to make possible additional drafts), and undesirable heating (e.g., in the soldering of contact springs which may involve a loss of elasticity). Be sure to distinguish between cold and hot working in dependence upon the recrystallization temperature of a metal ($T_R \approx 0.4\ T_S$ in $^{\circ}K$). Also, point out the relationship between time of annealing and structure.

Film no. 21

Iron-carbon diagram no. 1

The contents of films 21 through 26 have to be discussed on the basis of the iron-carbon diagram described in the literature. The forms of constitutional diagrams can be assumed to be known. Since structures of alloys are to be considered crystal aggregates, the modification of iron can also be dealt with here.

This film shows, in the left and right halves thereof, the cooling curve of pure iron and the iron-carbon diagram up to 2 % of C (steel corner), respectively, as well as schematic micrographs of steels having 0, 0.4, 0.8, and 1.2 % of C at temperatures below 723°C. Explain that the different solubility of iron modifications for carbon and the consequent change in the temperature of transformation lead to the iron-carbon diagram.

It is essential that film no. 21 be discussed, step by step, in connection with the contents of film no. 24 (ferrite-austenite), film no. 25 (primary and secondary cementite), and film no. 26 (pearlite-ledeburite).

Film no. 22

Iron-carbon diagram no. 2

This film can be used in vocational education and training. It shows the complete iron-carbon diagram and a graphic representation of the structural rectangle, which provides information about the proportional percentages of structures present under equilibrium conditions. It is essential to point out that this diagram corresponds to a state of equilibrium (extremely slow heating and cooling), whereas this equilibrium is often disturbed in engineering and technical processes.

After having discussed the contents of films 24 through 26, it is appropriate to replace the phase designations in state fields with the names of the respective structures. For this, film no. 22 has to be covered with a blank film on which the diagram is supplemented by dashed vertical lines at 0.8, 2.06, and 4.3 % of C as well as by the names of structures.

Film no. 23

Steel corner of the iron-carbon diagram

This representation forms the basis for all heat treat methods. It is for this reason that knowledge of the iron-carbon diagram with steel corner is of particular importance. To be able to correctly interpret all temperature-dependent processes proceeding within a particular material, it is recommended to discuss variations in the structure of steels with 0.4, 0.8, and 1.6 % of C.
By partly covering the film, it is possible to draw the student's attention to the steel whose structure is being discussed.

Film no. 24

Ferrite-Austenite

The original micrographs (200 : 1) in this film show the ferritic and austenitic structures of iron. Since austenite cannot generally be observed at room temperature, a high-alloy austenitic chromium-nickel steel had to be used for examinations.

Film no. 25

Primary and secondary cementite

This film shows the structure of primary cementite in ledeburite (at a scale of 100 : 1) and the structure of secondary cementite in pearlite (at a scale of 500 : 1).
Primary cementite is the bar- or needle-shaped structural constituent of hypereutectic iron-carbon alloys. It is precipitated from the melt in the form of platelike crystals along the C - D line (iron-carbon diagram).
Secondary cementite is a structural constituent of hypereutectic iron-carbon alloys appearing as grain-boundary

cementite or, in the case of higher carbon contents, as needles in pearlite. It is precipitated, along line E - S, from gamma-iron solid solutions because of diminishing solubility.

Film no. 26

Pearlite-Ledeburite

This film shows the structures of both pearlite and ledeburite (the scales being 500 : 1 and 100 : 1 for pearlite and ledeburite, respectively). When showing the structures of pearlite and ledeburite it is necessary to consider that ledeburite (liquid-solid transition) is, in general, much coarser in grain than pearlite (solid-solid transition). The metallographic specimens were etched using 3 % alcoholic nitric acid.
Ledeburite is a eutectic that is composed of austenite and cementite. Pearlite is a lamellar conglomerate of ferrite and cementite.

1. General

Educational material for courses on metallography divides naturally into the following subjects: Fundamentals of general metallography; ferrous materials; nonferrous materials and their alloys; materials testing; corrosion and corrosion prevention.

This series of projection films can be used for the theoretical and practical education and training in metal fabrication. It can also be used for further and refresher training in the metal-fabricating field.

To aid instructors in preparations for lessons and avoid misinterpretation of the contents of projection films, all of the films are accompanied by detailed explanations. Ease of comprehensibility called for the liberal use of colors in the design of projection films on methodological principles.

All crystallographic relationships (lattices, unit cells, structural faults, etc.) were marked in blue, whereas transitions to higher temperatures accompanied by state changes were marked in red.

Cooling curves of thermal analysis and heating curves of thermal treatment were plotted against a blue background, whereas constitutional diagrams and those relating to strength properties were plotted against yellow and green backgrounds, respectively.

Projection films nos. 5 and 9 are photomicrographs taped in their respective fields with the use of Prena adhesive tape.

To enable instructors to plot their own diagrams, films nos. 18, 19, and 20 were provided with cm grids.

The films and booklet are contained in plastic folders.

This series of projection films is supplied complete with a frame to take up films.

3. Explanations of projection films

Film no. 1

Classification of steels

This film serves to explain the properties of heat-treated, case-hardening, and tool steels. Instructors should describe the relationship between the properties of steels and the iron-carbon diagram and discuss the dependence of grades of steel upon carbon contents and structural constitutions. Also, it is recommended to make additional use of films nos. 21 (iron-carbon diagram no. 1), 22 (iron-carbon diagram no. 2), and 23 (steel corner) of the series of projection films on fundamentals of general metallography, in order to take the element of formality from the classification of steels.

Film no. 2

Properties of unalloyed steels

The tensile strength, yield strength, elongation, and reduction of area are given in a diagram as a function of the carbon content. Also shown are schematic micrographs of steels having different carbon contents. Since steels whose carbon content is less than 0.8 percent show mixtures of ferrite and pearlite (with different proportions of these structural constituents), there can be noted a relation between structural composition and steel working and fabricating behavior.

For example, the ultimate tensile stress increases as the proportion of pearlite increases.

It is essential to discuss changes in steel properties due to heat treatment. In the diagram, this dependence is expressed by indicating the as-hardened tensile strength.

Be sure to include the said films nos. 21 and 23 in the discussion of film no. 2 showing the properties of unalloyed steels.

Film no. 3

Austenite - Pearlite

This film shows the schema of austenite-pearlite transformation and micrographic representations of pearlite, sorbite,

and troostite drawn from electron micrographs. The effect of the rate of cooling upon the austenite-pearlite transformation can be explained in connection with the said film no. 23 (steel corner).
Characteristic features include the diffusion of carbon from austenite to secondary cementite and the self-diffusion of iron atoms during transformation of face-centered cubic unit cells into body-centered cubic unit cells.
After having explained the mechanism of transformation (with the lower part of the film being covered), the individual structures corresponding to the different rates of cooling can be dealt with one by one. For this, it is necessary to consider the scale of 20,000 : 1 (electron microscope).
The term sorbite (finely lamellar pearlite whose structure is still within the limits of resolution of the optical microscope) should be used only to describe that structure which is formed on cooling from the austenite region. The same comments hold true with regard to the term troostite (extremely finely lamellar pearlite).
Such terms as tempering sorbite, osmondite, quenching sorbite, tempering troostite, and quenching troostite should no longer be used as they are now obsolete.

Film no. 4

Martensite

Rapid supercooling results in gamma-iron solid solutions being transformed into alpha-iron solid solutions by what is known as lattice flip-over. Rapid cooling provides against processes of diffusion taking place. Carbon will remain imbedded in the alpha-iron solid solution. There is formed a tetragonally distorted unit cell of extreme hardness.
This film shows Bain's principle of transformation. The possible location of carbon atoms is drawn in red and hatched. The film can be partially covered as shown in the sketch.

Film no. 5

Structure in hardened steel

To show structures in hardened steels, use is made of micrographs (x 500) of martensite and martensite containing residual austenite (etched using 3 % alcoholic nitric acid). Residual austenite is formed when steel having more than 0.6 % of carbon is cooled from excessive temperatures or at too rapid a rate. If residual austenite is present, then the desired hardness will not be obtained.

Film no. 6

Stress-relief heat treatment

This film shows the steel corner of the iron-carbon diagram with annealing field, the time-temperature curve, and a definition of the annealing process. It is used in connection with a discussion of stress-relief annealing. It is essential to again refer to the location and significance of line A_{c1}. Be sure to discuss the subject step by step; for this, it is necessary to partially cover the film.

Film no. 7

Normalizing heat treatment

Normalizing is used to refine the coarse and irregular structures of castings, forgings, and rolled pieces. Using this film, it is possible to determine the annealing temperatures required for different grades of steel. In the diagram, the annealing field is drawn in red and hatched. When plotting a temperature-time curve it is necessary to consider that higher normalizing temperatures are required for lower-carbon steels. It is for this reason that the process of annealing is marked, in this diagram, by a series of dashes.

A definition of the annealing process is given in the lower half of this film.

The subject of normalizing heat treatment should be discussed in steps and in connection with film no. 9 showing structural changes.
It is essential to again refer to the location and significance of lines A_{c1} and A_{c3}, respectively.

Film no. 8

Soft annealing heat treatment

Soft annealing provides for a major improvement of both machinability and cold-formability inasmuch as cementite tends to take on the smallest surface for a given volume (granular cementite). Using film no. 8 in connection with film no. 9 showing structural changes, it is possible to discuss the steel corner of the iron-carbon diagram with annealing field, plot a temperature-time curve of soft annealing as a function of the carbon contents of steels, and work out a definition of soft annealing heat treatment.

Film no. 9

Change in structure

This film is used in connection with films nos. 7 and 8 showing normalizing and soft annealing heat treatment, respectively.

This film shows the

- as-cast structure of cast steel prior to normalizing heat treatment (x 50), with ferrite and pearlite being shown in a Widmannstätten arrangement;
- as-normalized structure of cast steel (x 50);
- structure of C 100 W1 prior to soft annealing heat treatment (x 500); pearlite can be seen here, with cementite being arranged in lamellar form; and
- as-soft-annealed structure of C 100 W1 (x 500); globular cementite can be seen to be finely divided in ferrite.

All structures were etched using 3 % alcoholic nitric acid.

By partially covering the film being projected, it is possible to show individual micrographs and compare them with each other. It is essential to show students that the structural constitution of a material can be changed both intentionally and unintentionally. This allows instructors to discuss changes in material properties as a function of the structure of a material. Conversely, the structure of a cast material can be concluded from certain properties thereof.

Film no. 10

Hardening

This film can be used to discuss steel hardening problems. When explaining the steel corner of the iron-carbon diagram, with the line of hardening temperatures being dotted red, it should be pointed out that sub-pearlitic steels have to be heated as far as the austenite region. In the case of super-pearlitic steels, however, quenching from the

region extending up to A_{c1} will be sufficient.
Higher hardening temperatures would not only result in the formation of residual austenite but involve a major risk of cracking as well.
Film no. 10 also shows the temperature-time diagram in addition to giving a definition of hardening.

Film no. 11

Procedure of hardening

This film, together with film no. 10, is used to explain the individual procedural steps of hardening. Heating the work to high temperatures is followed by rapid quenching to harden the structure. Re-tempering allows higher quality properties to be obtained. This is illustrated by the temperature-time diagram of hardening.
In the steel corner of the iron-carbon diagram, the red dotted line shows the hardening temperatures and the fields for tempering treatments.
The dark-yellow field (ž) relates to low-temperature tempering, whereas the red fields (A and V) relate to medium-temperature and high-temperature tempering, respectively.
Combined hardening and high-temperature tempering is generally referred to as refining by heat treatment (V).
When discussing the contents of the film it is appropriate to take the proper treatment temperatures from the relevant standards and work out a technology for a particular work. The iron-carbon diagram is here serving as a clue only, in order to explain the effect of heat treatment and the transformations effected.

Film no. 12

Surface hardening

This film is used to illustrate the purpose of superficial hardening and provides useful information about parameters of individual hardening methods.

The upper representation shows a hardened shaft. The hardness traverse across the diameter is shown on the left of the cross section.
Surface and case hardening are based on martensite formation. When discussing the contents of this film it is essential to point out that in surface hardening the carbon content required for martensite formation is already contained in the steels and the surface hardness is obtained by local heating. With case hardening, on the other hand, the minimum carbon content is achieved through diffusion into the surface.
In the case of nitriding, strength-improving elements are nitrogen compounds such as iron, chromium, aluminum, and vanadium nitrides. The hardness of nitrides exceeds that of the martensite. The extremely hard and wear-resisting surface is, however, very thin.

Film no. 13

Hardness survey

This film includes a diagram showing the thickness of the hardened surface layer obtained using the individual methods of hardening. When discussing the contents of this film it is necessary to point out differences in hardness level as a function of the hardening procedure and distance from the surface. In the upper part of the film, black fields indicate the depths of hardened layers (which can be obtained in general hardening), while the vertical lines indicate the maximum values.
Films nos. 12 and 13 should be dealt with together, since different steels and methods are used for hardening. The green region in the diagram applies to both case and flame surface hardening.

Film no. 14

Hardening and tempering diagram

Quenching and subsequent tempering is a method of improving a steel's strength and impact or toughness properties. The quenching and tempering diagram in this film shows the tensile strength, the yield strength, the proof strength, and the impact strength of an alloy steel containing 0.28

percent of carbon, 2.5 percent of nickel, and 2.5 percent of chromium.

The tempering temperatures required to achieve certain quality properties can be taken from the quenching and tempering diagram. For example, if the material containing 0.28 percent of carbon, 2.5 percent of nickel, and 2.5 percent of chromium is required to have a strength in the range of from 100 to 120 kgf/mm^2, then it is necessary that a tempering temperature of about 500°C be chosen.

Be sure to discuss film no. 14 in connection with film no. 1 that is concerned with the classification of steels.

Film no. 15

Weld

For a graphic depiction of theoretical relationships, the buildup of a weld was included in this series of films as a practical example. Certain regions of the schematic cross section are used and related to parts of the iron-carbon diagram. The structure and hardness of a material can be inferred from micrographs.

The diagram showing the hardness traverse across the weld region need be discussed qualitatively only. The heat treating processes dealt with previously should be touched upon, too.

Film no. 16

Selection of high-alloy steels

This film presents a selection of high-alloy steels, allowing the alloying elements and the most important properties to be easily explained to students. In the case of high-alloy steels, the proportion of alloying elements usually exceeds the 5 percent limit. The alloy element content is included in the designations. Only the principal alloy elements and contents were marked in color, with green, lilac, and blue being used for chromium, manganese, and tungsten, respectively.

Film no. 17

Readily castable ferrous materials

The term castable ferrous materials is used to describe those ferrous materials of which the carbon content exceeds the limit of solubility in the gamma-iron solid solution. High-carbon ferrous materials have excellent casting characteristics. In this film, a distinction is made between cast steel, malleable pig iron, white cast iron, spheroidal graphite cast iron, and flake graphite cast iron. The structures and properties can be derived from micrographs.

Classification of cast ferrous materials

Structual scheme

It is important that students should be able to identify the names of particular cast materials with the special characteristics thereof. Aiding students in acquiring this ability are schematized micrographs of cast ferrous materials.

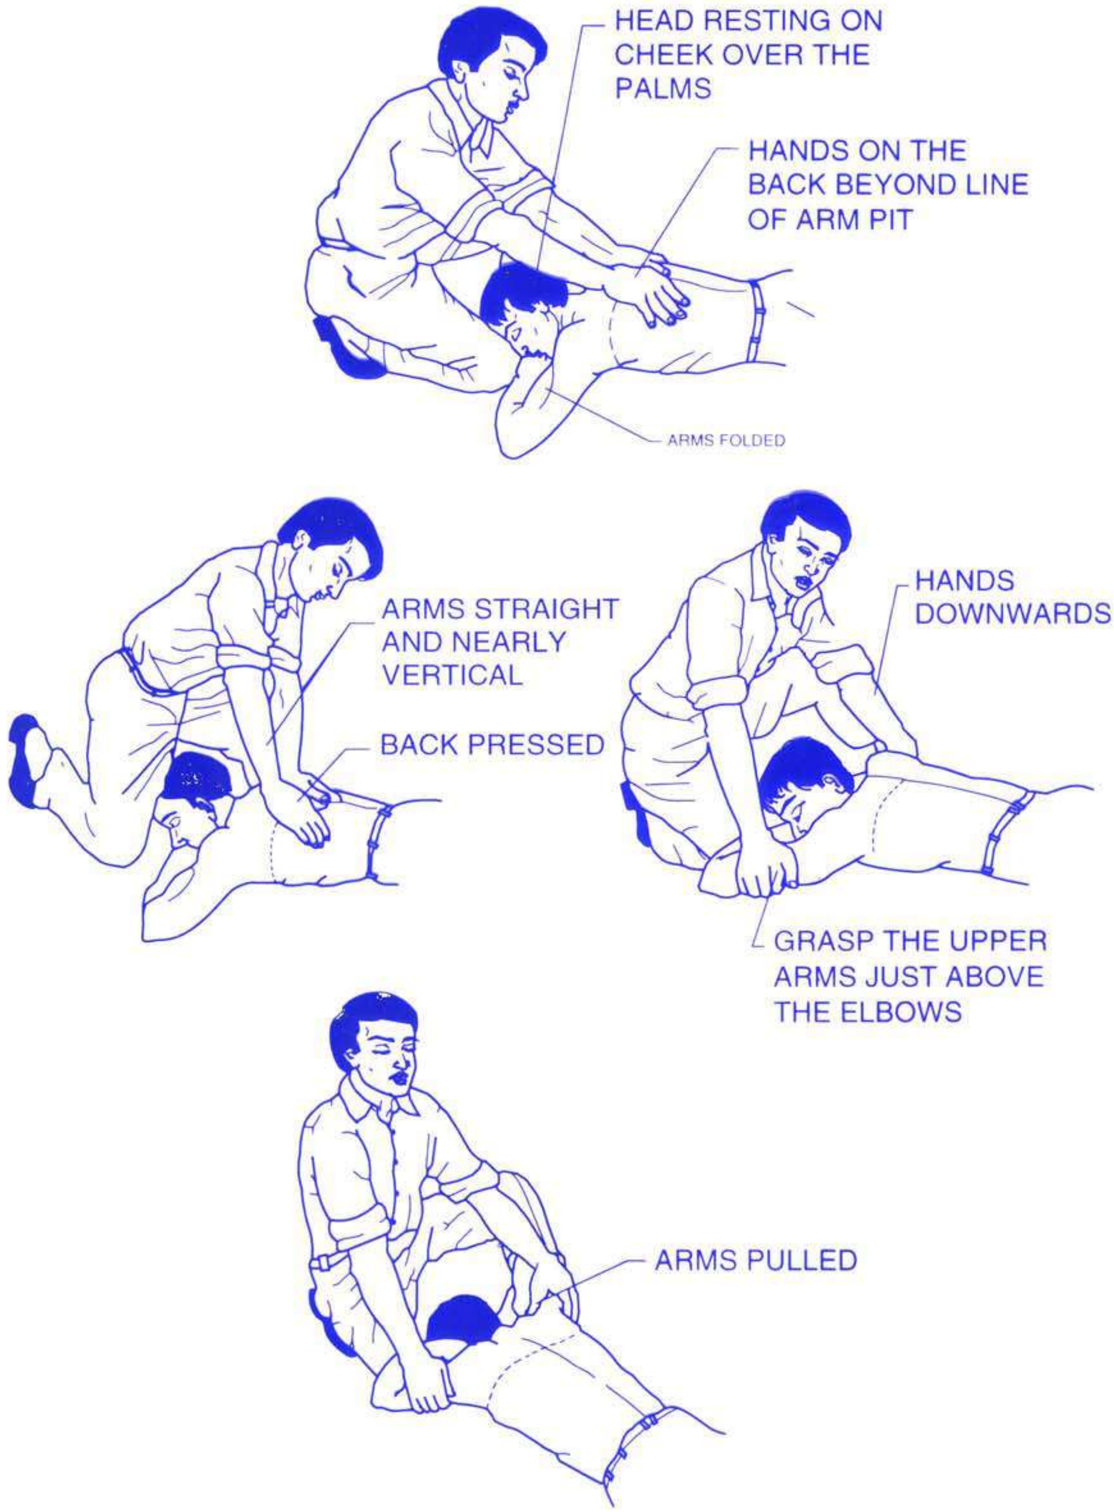
ARTIFICIAL RESPIRATION - NELSON'S ARM-LIFT BACK-PRESSURE METHOD

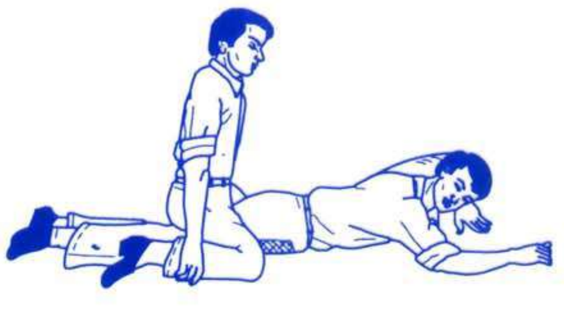


ARTIFICIAL RESPIRATION - SCAFFER'S METHOD

Lay the victim on his belly, one arm extended directly forward, the other arm bent at the elbow and with the face turned sideward and resting on the hand or forearm as shown.

Kneel astride the victim, so that his thighs are between your knees and with your fingers and thumbs positioned as shown

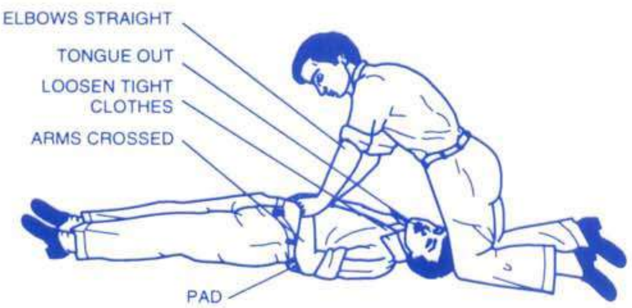
With the arms held straight, swing forward slowly so that the weight of your body is gradually brought to bear upon the lower ribs of the victim to force the air. out of the victim's lungs as shown

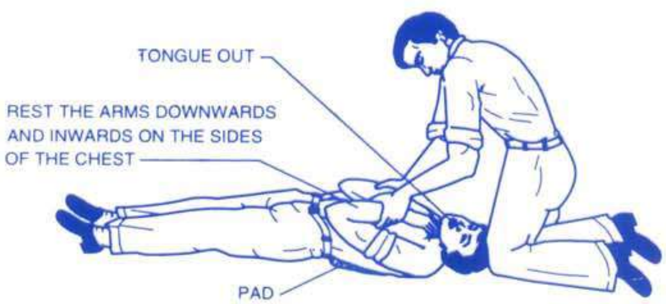


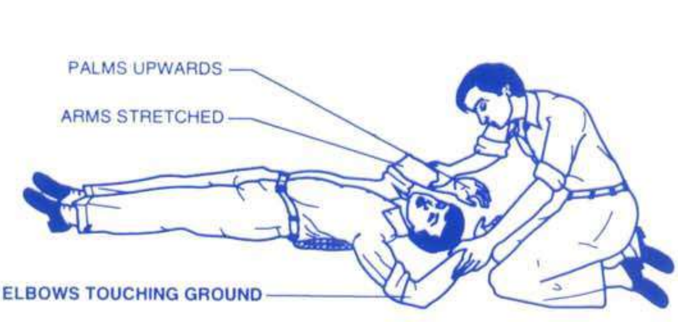
Now immediately swing backward removing all the pressure from the victim's body as shown and thereby allowing the lungs to fill with air

After two seconds, swing forward again and repeat the cycle twelve to fifteen times a minute

ARTIFICIAL RESPIRATION - SILVESTER'S METHOD







To be used if the victim cannot lie on his belly or chest due to injury.

- Lay he victim flat on his back and place a roll of clothing under his shoulders to ensure that his head is thrown well back.
- Wipe saliva out of his mouth: Pull the tongue forward and towards the chin and hold it in this position if there is an assistant if not, tie it with a strip of cloth, cross the strip under the chin, and tie below the neck to prevent the tongue from blocking the wind pipe.
- Kneel over the Victim's head and grasp his arms above the wrist as shown.
- Swing forward and press his arms steadily and firmly downwards and inwards against the sides of the chest to force the air out of the lungs as shown.
- Bring the victim's arms steadily first upward and then backwards until they are in line with the body and the elbows are almost touching the floor as shown, this allowing the lungs to fill the air.
- After three seconds, swing forward again and repeat the cycle. The complete cycle should take about six seconds.

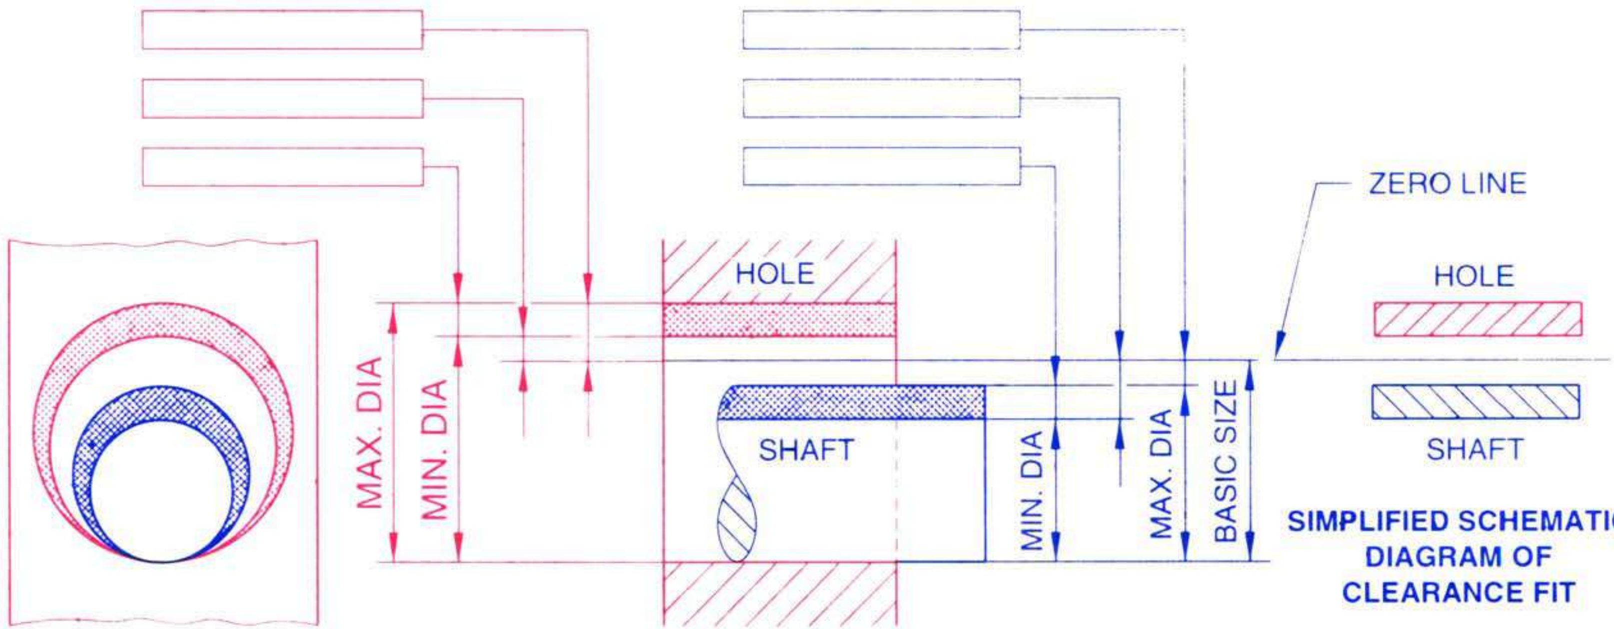
LIMITS AND FITS - TERMINOLOGY

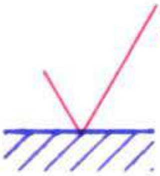


SIMPLIFIED SCHEMATIC DIAGRAM OF CLEARANCE FIT

- The zero line is the line of zero deviation and represents the ________ size.
- The deviation which gives maximum limit of size is called __________ deviation.
- The deviation which gives minimum limit of size is called __________ deviation.
- By convention, when the zero line is drawn horizontally ____________ deviations are shown above and __________ deviations are below it.

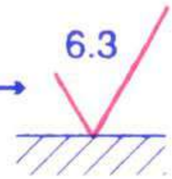
TR 01 06 01 01 98

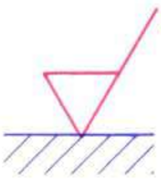
METHOD OF INDICATING SURFACE ROUGHNESS



← This is the basic symbcl and has no meaning as it is.

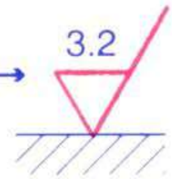
Should be followed by roughness value. →

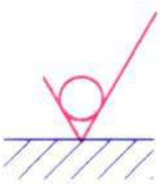




← Removal of material is by machining only.

Should be followed by roughness value. →





← Removal of material is prohibited.

Roughness value must be obtained without removal of material. →

Vocational Education Teacher Training for the Implementation of "Reflection Learning"

– A Case Study of a Successful GTZ Implementation in Serbia, including a Road Map for Starting Reflection Learning in Other Countries -

Report to
German Technical Cooperation (GTZ-CRYSTAL)

Michael Axmann
Chapel Hill, NC 27514, USA
Michaelaxmann@yahoo.com

March 04, 2004

Content

Explanations and Definitions (*German expressions in italics*) used in Teacher Training in Serbia	
Annual Didactical Planning (*Didaktische Jahresplanung*)	Interdisciplinary planning done by all the teachers in one vocational class at the beginning of the school year
Case Studies (*Fallstudien*)	Complex situations in business administration to be tackled by teams of students
Cooperative Reflection Counseling (*Kollegiale Praxisberatung*)	Counseling approach used for giving feed back to teachers
Economics, Business Administration, Accounting and Office Work (*Wirtschaftswissenschaften*)	Focus of the training offered in this course using five different modules
Modules	Key areas of teacher training covered in this course
Future Lab (*Zukunftswerkstatt*)	Teaching method developed by R. Jung to bring out creative potential in people
Key Qualifications (*Schlüsselqualifikationen*)	New requirements to be met in the labor market such as the ability to think in functional matters, to plan precisely, to anticipate difficulties and to implement solutions that truly respond to problems
Life Skills (*Handlungskompetenzen*)	Competencies acquired in this course dealing with subject matters, people and one self
Method Manual (*Methodenhandreichungen*)	An array of practical tips for using reflection-learning methods during this course
MT (Moderator or moderator team)	One or more teachers who organize teacher training
Question-related Methods *(fragend-entwickelnder Unterricht*)	Teaching method which will focus on methods using questions and answers in cooperation with students
Reflection Learning (*Handlungsorientierung*)	New approach in vocational education based on whole cycles of learning. "Reflection Learning", as it is used in this report here, refers to learning processes that are relevant for learners, that stress comprehensive and joint planning in groups, and that produce planning strategies that take concrete actions and finally evaluate the results.
Scenario Technique (*Szenariomethode*)	Teaching method that can deliver pictures of future situations
Self-organization	One of the three pillars of the program apart from teamwork and combining theoretical and practical aspects of teaching
Simulated Enterprise Offices (*Lernbüros*)	Simulation of work in a wholesaling company
Supervised Trial-run Teaching Situations (*Gruppenhospitationsunterrichts*sbesuche)	Teaching experiments of teachers in their schools in the presence of teacher trainers and peers
Teacher Functions (*Lehrerfunktionen*)	These are besides teaching counseling, educating, organizing, inventing and grading
Teaching Observation Sheets (*Unterrichts beobachtungsbogen*)	Worksheet for taking notes during teaching experiments

Abstract

This case study was written after having worked in Serbia in vocational education teacher training for three assignments spread over almost 12 months. The material for this case study is based on my own training material, training strategy and feed back from the participants as well as on my own observations of the teachers in my workshops.

It outlines my strategy of carrying out teacher training in Serbia, provides the material used in the teacher training and describes the three steps taken in a five week program – a two-week teacher training seminar, followed by two-week trial-run teaching situations in various vocational schools in Serbia and finished off with a one week teacher training seminar for future teacher trainers.

This approach illustrates a comprehensive package of training interventions with the focus being on the implementation of Reflection Learning Practices (RLPs) in schools. Reflection Learning stands for learning processes that identify problem situations that are relevant for learners, stress comprehensive and joint planning in groups and come up with strategies that take physical action and finally evaluate the results.

The case study first focuses on the Serbian experience and then drafts a roadmap for running these kinds of programs in other countries. The case study provides the complete set of training materials used in the five-week training program in the annex.

Acknowledgements

First of all I would like to thank Dr. Gustav Reier from the GTZ project Reform of Vocational Education in Serbia for letting me work in Serbia and his support in carrying out three assignments within in the last 12 months there and special thanks goes to all the workshop participants that I had the pleasure in working with for five whole weeks.

This case study would not have been written without the keen interest of Friedrich Hammerschmidt, GTZ-CRYSTAL, in teacher training. I am grateful for his financial support of this case study.

I would also like to thank two of my workshop participants, Danica Koncar from the Vocational School in Kula and Dragana Curcic, from the Vocational School in Becje for writing down their view of the training from a participant's perspective.

"Reflection Learning" – An Experiment with a New Training Approach in Serbia ***(Executive Summary)***

The approach described here in vocational education teacher training for the implementation of reflection learning in Serbia stretched our over a period of one year. It was delivered in three steps in a five week program – a two-week teacher training seminar in April 2003, followed by two-week trial-run teaching situations in various vocational schools in Serbia in May 2003 and finished off with a one week teacher training seminar for future teacher trainers in March 2004.

The first workshop was a 10-day training course in a modular approach. The principle of reflection learning was used in a hands-on approach based on many examples from best practices of teachers in vocational schools and delivered through action-oriented methods. The workshop focused in four modules on didactics, methods, communication techniques in class and on grading and making assessments in reflection learning situations.

The teachers came from the 18 pilot schools of the Ministry of Education (MoES)- GTZ project "Reform of the VET-System in Serbia" and had been selected by MoE and the respective school directors based on their own expression of interest.

The second workshop in May 2003 focused on trial-run teaching situations in 9 of the 18 pilot schools of the MoES/GTZ project in Serbia "Reform of the Vocational System in Serbia", which took the same group of 18 participants into the day-to-day work of "reflection learning" (or in Serbian: "activna nastava") lesson planning in commercial schools in Serbia.

The whole workshop took place over a period of 2 weeks. In the morning of each day of the workshop a different pilot school was visited and one lesson (ranging from economics, business administration, commercial correspondence, accounting to Serbian language) was carried out by two participants. The rest of the group watched the lesson and after that the lesson was discussed with the whole group by reviewing the main principles of planning and carrying out the lesson as well as by looking at lesson alternatives. After each lesson the method of "Cooperative Reflection Counseling" was used for giving feed back to the teachers.

The principle of "reflection learning" was the guiding principle and the teachers in those 9 vocational pilot schools delivered this new way of teaching through action-oriented methods. This 10-day workshop in May apart from the trial-run teaching situations now also dealt with using different kinds of media (such as the Internet, stock market games, business games, films etc.) in different class situations in commercial education.

The third workshop in March 2004 - after the Ministry of Education and Sports (MOES) in Serbia had selected a number of teachers for future teacher trainers – emphasized looking at additional skills for teacher trainers. The focus in this one week workshop was threefold:

- To deepen the understanding of didactics for commercial lesson planning and get to know more didactic planning tools;
- To jointly prepare trial-run teaching situations and carry them out in schools and in micro-teaching (=in the presence of other teacher trainers and not in school) situations;
- To systematically get tools to evaluate, assess and also grade trial-run teaching situations.

The whole five-week approach was developed with a specific focus on active participation of all the participants, and the principle of learning by teaching in so-called "Trial-run Teaching Situations (TRLS)" was a key element in the workshop design.

Detailed training materials in a modular approach were developed and used in the workshop settings. The key in spreading out the approach was to use some of the 18 participants of the workshop group to go back into their schools and "ignite" the interest in Reflection Learning Practices in their specific schools. After each step of the workshop sequence, the participants suggested follow-up steps to be taken to spread out the approach to the participating pilot and other interested schools.

Evaluations and workshop appraisals showed very strong appreciation and satisfaction with the approach on the side of the participants. This can also be said by the moderator of this three-pronged workshop strategy when it comes to workshop participation and reflection learning practices in trial-run teaching situations.

However, it should be made clear at this point that teacher training is always an ongoing process and even a stretch of five weeks in teacher training can only looked upon as an appetizer and making a good start. This is why for the further implementation of this approach in Serbia as well as for trying it out in other countries a roadmap should be followed that takes up some of the learning experiences in Serbia and also emphasizes;

- Preparing teachers and trainers systematically for their jobs in schemes in vocational education and training in schools (in-service) and universities (pre-service),
- Designing new learning environments in vocational education and training that allow for more independence on the side of the learners, flexibility on the side of the program planners and relevance when it comes to curricula and learning materials,
- Make school-based vocational education more practical,
- Setting up national institutes of vocational education and training, and
- Integrating "life-long vocational training" in the institutional framework for vocational education teacher training, and learning in general.

1. Problem Analysis - the Challenge of Reflection Learning in Schools of Vocational Education and Training vis-à-vis a Changing World of Work

Teachers and trainers in vocational education and training do not operate in the vacuum and splendid isolation of our vocational schools. Employers, especially in the last 10-15 years have called time and again for teamwork and improved communication skills in the work place. These are proven factors in labor productivity improvement in companies, so it is only natural that firms have called for them in vocational education and training. It is not the "hard skills" of e.g. memorizing the four components of a good marketing-mix are, but the "soft skills" of developing marketing concepts in a team and defending them against a number of competent fellow students/colleagues. This kind of learning stresses comprehensive learning: planning, carrying-out, monitoring and evaluating. This new style of learning now practiced in industry has impacts on learning in vocational education and certainly also in teacher training for vocational education.

But it is not only the employers that have changed their way of looking at vocational education; it is also our students in vocational colleges who have different expectations when they come to our schools. It used to be that one program in vocational education and training would be enough for a whole lifetime. A little training and retraining could always be done on the job. This has changed dramatically.

Today, new technical as well as commercial and IT-contents come up almost every year, and the need for recurrent training -if not for second or third job careers - is omnipresent. The solution for many vocational students is to learn how to organize themselves and to organize their own vocational learning and look for teams and patterns of self-organization.

To my own surprise as a teacher and trainer with more than 20 years of experience, today's students sometimes come with up with far better solutions than we anticipate. That is not because previous generations of vocational students were not as smart as this one, but because current students in vocational education have discovered the enormous potential of teamwork and individual self-organization, and we as trainers are beginning to think more along those lines, too.

These new insights by employers, students, trainers and also curriculum developers have led to a vast restructuring process in vocational education in general and the issues – relating to teacher training - are:.

- Focusing on the relevance of in-service teacher training programs in vocational education for students, employers and teachers themselves;
- Forgetting the spoon-feeding of our own teachers and instead helping teachers to take their own process of learning-and-becoming-teachers into their own hands;
- Combining theoretical and practical aspects of teaching in learning situations that have real-life importance and are fun;
- Making use of team work in teacher training and turning it into a powerful tool for teachers in their vocational schools;

- Developing new “ways of learning” and setting up new "cultures" in grading and testing, since new testing systems should be consistent with new training systems and compatible with training.

The above-mentioned key problems in teacher training will be addressed in this paper by suggesting a new way of “Reflection Learning Practices (RLP)” , and it will be shown in this paper how they have been tackled in the vocational education teacher training programme in Serbia - in what I believe - a very creative and innovative way.

2. What are “Reflection Learning Practices (RLPs)” and why should we Train our Teachers in that way!

“Reflection Learning” is a new approach in vocational education and training which is based on whole cycles of learning. “Reflection Learning” as it is used in this report here refers to learning processes that are relevant for learners, that stress comprehensive and joint planning in groups, and that produce planning strategies that take concrete actions and finally evaluate the results. This "Reflection Learning " cycle has a number of new challenges especially for us as trainers.

Three reasons for using “Reflection Learning” are given here, looking at it from the aspect of the clients of vocational education, the students, from the aspect of who is going to implement it, ourselves, the teachers and taking a demand-driven view, looking at why the employers like it.

Why is Reflection Learning recommended for students?

The only safe prediction that can be made with regards to future job profiles is that they will change. Present professional job know-how gets obsolete in ever shorter periods. The pass-outs of the vocational training programs cannot always immediately come back and join the training system for another half year. So the key aspect is to qualify them to organize their own learning-on-the-job and prepare them for life-long learning. They need to learn technical and vocational contents without too much dependence on a trainer. Since students have to learn how to organize themselves, trainers and teachers must learn how to teach with a minimum of guidance.

Simultaneously with the introduction of new technologies, the labor markets are calling for new “key qualifications”. Subsequently in the past, this has led to a misunderstanding that by taking up the new technical contents (such as e.g. pneumatics, electronics, CAD/CAM or CNC) as training topics in vocational schools, the challenges of the employment system would have been answered by the training system adequately. But soon it had become clear that by focusing on technical issues only without major innovations in the training innovations this would result in “the sale of old wine in new bottles”.

In a way, in lecturing, the student was expected to learn the training essentials under conditions which can be compared to students expected to learn driving a car by continuously remaining in the passenger seat during training!

Reflection learning methods on the other hand do put the student in the driver's seat and the use of innovative methods in training young people is therefore a very crucial point that must be combined with new technical contents.

Why Reflection Learning is recommended for teachers and trainers?

For teachers and trainers working in advanced training with a high pace of innovation it will become more difficult to stay abreast with their students in terms of technical know-how. Recurrent further training for trainers will not solve this dilemma completely, because the learning ability tends to fade with growing age.

Thus, it is more important to keep pace with new developments in didactics and methodology of vocational education and training. Changing his/her role from a lecturer dispensing information to a moderator of team work (holding some of his/her information back) offers the chance that students make technical progress even beyond the technical know-how of the teacher. To the surprise of the trainers who start using this methodology the results of some teams are sometimes much more sophisticated than expected by the trainer. This is due to the mental potential of teams. As in quality circles, the success of the team does not depend mainly on the technical expertise of the trainer.

As long as it was regarded as normal that an engineer or an economist lectured on his technical know-how and that his/her audience just memorized what he/she said and demonstrated, the mastery of methodology meant that the trainer was able to lecture. His/her ability to make students understand was less valued than the high level of technical or economic know-how. In order to generate the broader learning effects of modern vocational education and training, however, the trainer's capabilities in coaching often matters more than his/her technical expertise.

Furthermore, in Reflection Learning, teaching and training are no longer limited to teaching and lecturing only, but other teacher and trainer functions, such as counseling, educating, organizing, grading and innovating become an integral part in each training program for teachers and trainers.

With conventional vocational education and training, for too long, we made our students develop a brain that acts like a computer with a small processor and a huge memory, but what they actually need to succeed in today's world of work (as much as we need in our computers) is a brain with a much bigger processor unit while the memory capabilities could be much smaller!

Why Reflection Learning is wanted by employers?

Employers have realized that the nature of technical know-how for solving enterprise problems has changed:

- The ability to think in functional contexts now matters more than knowing vast amounts of isolated details,
- Systematic and analytic approaches towards new problems are more appreciated than experience with old patterns, and
- Precise planning and anticipated trouble-shooting has become more important than quick trial and error actions when the problem occurs.

The lecturing of information ("spoon feeding") in connection with testing the memorizing ability ("pseudo applications") produces an employee who is poorly prepared to meet the present job requirements in modern sectors of industry and the whole service sector offering maintenance and repair.

The new kind of training in both schools and enterprises originates from the way quality circles operate in industry. The transfer to the field of training was boosted and promoted by employers who were no longer satisfied with the human training product which the conventional training system offered to them. In other words: the changing labor market requirements forced the training system to follow. And, this is not only true for Germany, where these new approaches have been developed, but also makes a lot of sense in development projects, where reforms in vocational education and training are tackled, for example in Serbia.

3. A Case Study of a Successful Implementation of Reflection Learning

3.1. The Setting of Vocational Education in Serbia

In Serbia, after the political transformation in October 2000, the main problem in vocational education and training seemed to be the transition from vocational education and training into the labor market, indicating enormous demand-supply mismatches. On the one hand there was irrelevant vocational education and training providing school leavers only with insufficient skills and competencies, and on the other hand there was the labor market, with its precise demands, skill requirements and competencies. Both systems seemed to exist parallel to each other and were not trying to match these different expectations.

Directly related to the problem there was evidence that vocational education and training in Serbia was not demand-oriented enough and that it was also too theoretical, which can be seen in the more than 500 professional profiles in the country and also in vocational curricula of all kinds.

The qualification of teachers and trainers in vocational education and training in Serbia with respect to methods, content and technology is outdated and developments of the last 10 years, for example in Europe, have not yet been incorporated in Serbia. Pre-service teacher training as a means to prepare future teachers for the variety of tasks in vocational education does not exist in Serbia.

On the other hand, there is a high demand for qualified people in the private sector as well as in public administration, who will be able to actively participate in the transformation process and who will possibly be helpful in starting new businesses in Serbia's transitional economy as well as supportive in improving the competency level of the country's labor force in the field of administration.

The German Technical Cooperation (GTZ) is currently working very closely with the Serbian Ministry of Education and Sports (MoES) in the reform of vocational education and training by:

- supporting MoES in restructuring VET in Serbia,
- gearing VET programs in selected regions towards growth sectors with employment potential and
- enabling selected institutions to develop demand-oriented programs in commercial education and qualifying teaching staff and trainers.

These initiatives cover the development of closer linkages with enterprises in services, the bank and the wholesaling sector. National and regional bodies that equally focus on the relevance of the supporting ambience for vocational education and training have been started.

So far, in particular, commercial apprenticeship programs, curriculum development following the DACUM (Developing a Curriculum) approach, and teacher training programs oriented to the introduction of reflection learning methods have been started and 18 pilot schools all over the country have been selected to implement the first wave of these reforms.

The teacher training component provided the basis for this case study of a successful implementation of Reflection Learning practices. For this specific teacher training programme 18 teachers from the 18 pilot schools had been selected for this workshop. They came with a variety of special subjects such as economics, business administration, accounting, mathematics, business law, commercial correspondence and Serbian language, which they taught in their own schools.

3.2. Description of the Approach Taken in Serbia

The vocational education teacher program in Serbia as described here lasted four weeks in two blocks of two weeks each (one in April and one in May 2003).

The first two-week block covered work in a seminar on the first four modules. The second two-week block dealt with the fifth module and with trial-run teaching situations carried out by 2-3 teachers and group observation by the rest of the teachers and took us all over Serbia to 9 different cities in 10 days.

The five modules were:

Module 1: How Do I Define My Own Didactic Concept in Business Administration and Economics?
Module 2: Selecting Methods that Fit Me!
Module 3: Professional Communication – How Do I Implement This in Class?
Module 4: Making Assessments and Judgments as a Teacher, Promoting Students and Supporting Colleagues
Module 5: Media – Useful Implementation of Learning Devices in Commercial Education

Each of the five modules covered 10 units of 90 minutes (4 units of 90 minutes a day) and spread over a period of 2 ½ days, so that the first 4 modules could be offered in the first two weeks of the seminar. For a more detailed list of the modules see Annex 1: Module Work. There was a big "group homework assignment" after the completion of the first two weeks, which was the preparation of the trial-run teaching situations within the setting of the second two-week training programme.

The fifth module was offered in the afternoons of the second block with the school visits, the trial-run teaching situations and the subsequent discussions taking place in the mornings in different schools all over the country.

Table 1: Organization of Teacher Training

Days/Weeks	**Week I**	**Week II**	**Week III**	**Week IV**
Monday morning	Module I, Unit 1 and 2	Module 3, Unit 1 and 2	School A: School visit, trial-run teaching situations and discussion	School F: School visit, trial-run teaching situations and discussion
Monday afternoon	Module 1, Unit 3 and 4	Module 3, Unit 3 and 4	Module 5, Unit 1	Module 5, Unit 6
Tuesday morning	Module 1, Unit 5 and 6	Module 3, Unit 5 and 6	School B: School visit, trial-run teaching situations and discussion	School G: School visit, trial-run teaching situations and discussion
Tuesday afternoon	Module 1, Unit 7 and 8	Module 3, Unit 7 and 8	Module 5, Unit 2	Module 5, Unit 7
Wednesday morning	Module 1, Unit 9 and 10	Module 3, Unit 9 and 10	School C: School visit, trial-run teaching situations and discussion	School H: School visit, trial-run teaching situations and discussion
Wednesday afternoon	Module 2, Unit 1 and 2	Module 4, Unit 1 and 2	Module 5, Unit 3	Module 5, Unit 8
Thursday morning	Module 2, Unit 3 and 4	Module 4, Unit 3 and 4	School D: School visit,	School I: School visit,

			trial-run tea-ching situations and discussion	trial-run tea-ching situations and discussion
Thursday afternoon	Module 2, Unit 5 and 6	Module 4, Unit 5 and 6	Module 5, Unit 4	Module 5, Unit 9
Friday morning	Module 2, Unit 7 and 8	Module 4, Unit 7 and 8	School E: School visit, trial-run tea-ching situations and discussion	School J: School visit, trial-run tea-ching situations and discussion
Friday afternoon	Module 2, Unit 9 and 10	Module 4, Unit 9 and 10	Module 5, Unit 5	Module 5, Unit 10

The five modules were structured according the following line of thinking:

Module 1: How Do I Define My Own Didactic Concept in Business Administration and Economics?

Training work in didactics in Serbia put the teachers into the situation of students and encouraged them to develop lessons that are age and school career appropriate. For example, the "Economic Principle" as a subject was presented differently in an apprenticeship class for future wholesalers clerks in Serbia than in a class for full-time commercial college students.

In the training programme, curricular content in Serbia was always translated into lesson topics that strongly interested and stimulated the particular students: For example, which lesson topic is more likely to motivate learning: “The Equilibrium Price in Quantitative Theory”? Or “The Price Does it – We are Setting a Sale Price for our own Students’ Newspaper” - after the students have been through planning, designing, advertising for and preparing the lay-out of their own newspaper in previous lessons in economics and business administration!

Questions that teachers in this session had to address were:

- How do students learn and what needs to be done to support this?
- What is the general vocational and educational mandate of my school?
- Where may the students have been exposed to specific contents before this lesson (e.g. teaching marketing implies thinking about - before the lesson - where the students have been exposed to it already and then finding good examples accordingly)
- What is the relevance of this specific topic for my students in their future? For example, when I teach the contract of sale, how does this relate to my students in apprenticeship classes or full-time students who have never had work experience?
- How can I make content very concrete and tangible? What should the examples look like and how do I structure the lesson so that my students are motivated?

- What maybe a teacher's (also hidden) agenda in defining content, for example in economic policies such as the comparison of economic systems in Serbia ?

The development of the didactical concept of each trainer was an essential part in the training workshop and received a very high importance. In a way, all the other later essentials have a supporting function for this one.

Module 2: Selecting Methods That Fit Me!

The objective of this essential was to build up methodological competencies in teachers by presenting different kinds of methods that can be used in teaching in commercial schools.

In doing this teachers are viewed as moderators in learning processes for self-organized team work and the teacher's job as a coach is to make sure that permanent communication takes place among the participants.

The Serbian teachers perceived the content of this field of learning "methods" as an experienced work form, in other words saw methods in their training program as carried out by their teacher trainer. This is considered particularly important, because methods are believed to be used better after having seen them in operation first before attempting to use them in one's own setting.

In particular, the teachers worked on what is considered the basic repertoire in teaching in vocational education:

- Phasing a lesson;
- Using group and partner work in a class comfortably;
- Motivating different groups of learners;
- Preparing different kinds of learning arrangements;
- Steering class activity;
- Offering patterns of learning; and
- Reflecting and debating together with vocational students.

They were also exposed to increasingly sophisticated methods such as case studies, projects, and moderation cycles.

Module 3: Professional Communication – How Do I Implement This in Class?

Studies in Europe show that it is still the case in vocational schools that 60-80% of all the words said come from the teachers rather than from the students. It is no wonder then that some students graduate with communication deficiencies. [1]

[1] Of course, communication skills are also dependent on many other things, such as class and educational level of parents.

Therefore, also in this course in Serbia it was regarded as very important that teachers reassess their own communication competencies and come to a professionalization of their communication skills in the light of the above. Reflection and diagnosis competencies of teachers were also supported in this essential.

The objectives in this essential were to

- Learn to be able to take a role in discussions;
- Structure the tasks;
- Listen actively and carefully;
- Divide into groups and design meaningful tasks for each group;
- Provide and receive feedback; and
- Summarize results in groups.

When referring to professional communication, it is always better done than talked about. This is why communication exercises were also offered here in a variety of situations. In this essential, teachers were also increasingly exposed to more process oriented communication methods such as, for example, working comfortably with the tool of a future lab.

Module 4: Making Assessments and Judgments as a Teacher

Every one of us has had the experience in school of how painful it could be when we felt that our teacher did not grade us correctly! This is why particular emphasis is placed on dealing with making judgments and assessments as a teacher in Reflection Learning.

In this essential the Serbian teachers learned how to put together written tests and check achievements in

- Learning;
- Methodical; and
- Social competencies.

In this essential structured help was also given to them as to how to

- Set up tests covering the same topics for different age groups;
- Cover all the competencies laid out in the previous lessons;
- Deal with the aspect of turning competency achievements into “gradable” tasks;
- Return tests with a maximum of “learning” to all the students in the class.

However, it is not only the grading for Reflection Learning that they learn: at least as important seems to be learning how to support and promote those students who have not done so well. Special emphasis is given to ways to deal with under performers in vocational classes and how to get them back into the “main stream” of learning.

In other words, teachers in Serbia learn how to put together written tests, grade them and return them to their class following certain guidelines. They also learned how to develop alternative grading procedures, for example when it comes to making assessments about group or project work. And they developed criteria on how to assess and judge reflection learning of their students, using qualitative criteria in measuring different competencies.

They learned about typical misjudgments of vocational teachers, and they learned how to prepare written reports about students and how to defend them in grading conferences in their schools.

Module 5: Media – More Than Just Learning Devices

In the training course the use of media in commercial schools is derived from their usefulness and necessity for learning with vocational students. Media are considered useful and necessary, when the following criteria are met:

- Media are tools in a process of getting students to learn better;
- Media are no means in itself;
- Media can be used to shape the problem analysis in a lesson;
- Media can be used to better visualize solutions and show transfer of competencies gained in the lessons; but also
- Good media usage alone never makes good teachers!

In principle, media should be selected or prepared by the trainees themselves (if possible). The content of this essential is *how* and *when?* to use media such as blackboards, overhead projectors, information sheets, school books, flip charts, even the Internet and others. Using media is considered to be part of our job and every teacher should be comfortable using his repertoire of them.

In the second part of the teacher training program video was used in school to tape case study teaching situations and discuss them afterwards vis-à-vis the following video usage criteria for trial-run teaching situations, such as:

- Organizing recognizable phases in teaching;
- Setting up learning arrangements for the students;
- Communicating with students;
- Using different strategies to make students participate;
- Promoting competencies in teaching situation;
- Dealing with disruptions in class;
- Relating with the students (such as appreciation and understanding).

3.3. Lessons Learnt

Looking back as a moderator of this training workshop, I would like to point out the following few things.

First, it was striking to see how important the first module –didactical analysis - was for all the participants and how we always kept coming back to it in the whole training program like a red thread.

Secondly, most of the used teaching methods were new to the participants and therefore created a lot of interest, especially after seeing them being used in the seminar itself. The question of how the methods could be used in the Serbian vocational schools was always answered with a lot of examples given by the participants. A kind of an “eye-opener” in this respect (for the participants as well as for me) was the use of the future lab method in structuring future teacher training program for teachers in commercial education in Serbia. This phase showed how much (hidden) creativity there was and how well those teachers active and present in this seminar knew what kind of activities needed to be taken .

Thirdly, assessment of reflection learning techniques was covered in the fourth module and many practical examples were given. However, it became clear in the coursework of that module and it was also mentioned late in the participants’ evaluation that much more of assessment techniques were needed in future teacher training for the implementation of Reflection Learning.

In the trial-run teaching situations of the third and the fourth week, the quality of the lessons presented was generally good. Many lessons seen had already all the dimensions of reflection learning processes in them. It was particularly interesting to see the students enjoy their own teachers’ new approaches in practice and as a result their (maybe higher) motivation to learn, because simply they (the students) were so much more involved in their own and learning process. This has been pointed out to me by a number of interviews, which I conducted with students after the trial-run teaching situations.

The public interest (newspapers, radio, TV and local politicians) was there wherever we showed up with our “teacher training on the road”. However the downside of that is that the public expectations in Serbia might have expected too much too quickly. Teacher training is not something that gives instant results in 2x2 weeks. It may change attitudes and might send teachers on their own learning curve, but this of course was only a first “appetizer” and sustainable structures of teacher training will still have to be set up later.

3.4. Results from the Participants’ Evaluation

Participants’ evaluations were made after each two-week course. In general, both courses were very much appreciated by the participants. According to the participants’ evaluation, the following things were said about the first course:

- very comprehensive modular approach;
- commercial contents chosen were very appropriate for VET teachers in Serbia;
- chosen methods were interesting and their application became always immediately visible;
- 100 % active teaching;

- learning to learn and teach in a different way;
- useful and applicable for teaching in VET schools in Serbia;
- completely new;
- realization of reflection learning is absolutely possible in Serbia;
- perfect also in teaching Serbian language, literature and foreign languages;
- constant feedback to our school work: Can you use it in your teaching process?
- worth trying!

The second leg of the four-week programme was as appreciated as the first one. By being put in trial-run teaching situations, participants remarked that they

- Gained significant experience on how reflection learning can be implemented in vocational schools;
- Approved of tailor-made seminar structure to the current state of vocational education in Serbia;
- Were able to experiment with reflection learning techniques in schools;
- Reached an interesting public by drawing lots of attention to reflection learning experiments in schools;
- Needed curriculum changes for better integration of reflection learning;
- Gained confidence to work as a change agent in their own schools;
- Wanted much more of the same.

3.5. Spreading out the Approach – Working with the Trainers

The key in spreading out the approach was to use some of the 18 participants of the workshop group to go back into their schools and ignite the interest in Reflection Learning. After the first training program in Serbia, the workshop group - in a participatory planning exercise - suggested the following next steps to be taken to spread out the approach to the participating pilot schools, which were then carried out immediately:

- Information of other teachers about reflection learning methods in 18 pilot schools through teachers' conferences;
- Plan group school visits, practical teaching sessions and seminars in May 2003 for the same participants in 9 selected pilot schools;
- Translate relevant German literature on reflection learning;
- Carry out similar seminars – with the workshop participants being the moderators at their own schools - for other teachers from pilot schools;
- Select multiplicators for training of teacher seminars (ToT);
- Organise ToT seminars;
- Provide insight on German teacher training through a study visit to Germany;
- Organise e-mail chat rounds for multiplicators for exchange of ideas.

The second workshop in May 2003 was followed by these steps that the participants agreed upon:

- Plan a sequence of one-day workshops to be held in September and October at the pilot schools to be held by those teachers that will be selected by MoE;
- Draft articles for the monthly journal of MoE on selected issues of reflection learning and reflection learning principles, to be done by selected participants from this workshop and supported by GTZ;
- Select multiplicators for training of trainer seminars (ToT) ;
- Organise ToT seminars with those moderators selected by MoE, carried out by Michael Axmann;
- Think about a handbook for "reflection learning" lesson planning, (to be done jointly among Michael Axmann and moderators by the end of the year).

3.6. Making the Approach Sustainable – Organizing Training of Trainers (ToT) Workshops

In the following months most of the initiatives mentioned in 3.5. were pursued and the idea of introducing reflection learning practices in vocational schools got more and more popular also at the level of the implementing schools and the Serbian translation of reflection learning "Activna nastava" became a household word and much discussed issue in Serbian vocational schools.

In a third step (after the first two initial workshops in 2003) the Ministry of Education and Sports (MOES) in Serbia selected a number of teachers who had undergone training in the previous workshops to now turn them into teacher trainers. In March 2004, these future teacher trainers got a further training workshop, in which they were prepared for their new tasks.

The focus in this one week workshop was threefold:

- To deepen the understanding of didactics for commercial lesson planning and get to know more didactic planning tools;
- To jointly prepare trial-run teaching situations and carry them out in schools and in micro-teaching (=in the presence of other teacher trainers and not in school) situations;
- To systematically get tools to evaluate, assess and also grade trial-run teaching situations.

More training for the future teacher trainers will have to come and the MOES is currently thinking about ways and means to turn this into a long-lasting new initiative. It will be interesting to see, how the Serbian government will maintain reflection learning practices in its vocational schools in the future and which mechanisms it will set up to meet this goal. One positive side effect will certainly be coming from the currently planned National Institute for Vocational Education and Training, which in intended to have one department entirely focusing on in-service teacher training.

4. Defining a Road Map for Starting Reflection Learning elsewhere – it will work!

At this point some readers might say, this works in Serbia and it also did in Germany, but there is no guarantee that it might work elsewhere. There is a number of reasons that it might work anywhere, but there are also a few prerequisites that need to be observed before running teacher training programs in reflection learning.

4.1.Organizing Reflection Learning with Teachers – a Joint Effort

On the following pages a set of recommendations will be given that might serve as guidelines for setting up similar programs in vocational education and training elsewhere. However, they would have to be further analyzed and specified for each individual country pursuing them.

I. Prepare teachers and trainers better for their jobs, by:

- ✓ Setting up pre- and in-service teacher facilities for future teachers in vocational education and training,
- ✓ Helping teachers and trainers to take their own process of learning-and becoming-teachers into their own hands,
- ✓ Combining theoretical and practical aspects of teaching in learning situations that have real-life and real-work importance,
- ✓ Emphasizing a legal and didactical framework in teacher training and the joint role of vocational schools, vocational education teacher training institutes and enterprises in teacher and training of trainers, and
- ✓ Making frequent internships and/or initial apprenticeships in enterprises mandatory for vocational school teachers.

This could be done by using new and innovative approaches in teacher and instructor training in vocational education and training and should also be supported by strengthening the school management of vocational schools and colleges in countries interested in making those changes. It should always be supported both on the university level (pre-service teacher training) and the school level (in-service training) and it should be kept in mind that this usually does not show immediate results.

II. Design new learning environments in vocational education and training that allow for more independence on the side of the learners, flexibility on the side of the program planners and relevance when it comes to curricula and learning materials, by:

- ✓ Qualifying students in vocational education and training to organize their own learning-on-the-job,
- ✓ Designing flexible and short cycles of training schemes that directly respond to training needs,
- ✓ Seriously shifting the role of the teachers and trainers away from lecturing towards coaching, and

- ✓ Trying to make curriculum development and the design of learning materials a joint process between ministries, training institutes, vocational schools and associations of enterprises.

This could be done by putting out vocational students more in the “driver’s seat” of their own learning e.g. when it comes to dealing with complex tasks such as designing marketing concepts or planning routines for CNC machines. Vocational education and training has been for too long of a time been like teaching our students how to drive without ever putting them in the car. This is clearly a whole rethinking process of what vocational education and training should be all about and it does not happen over night.

III. Make school-based vocational education more like general education in many ways, by:

- ✓ Making the content in vocational schools more general,
- ✓ Ensuring that young people learn how to solve problems, work in teams, be enterprising and creative through the way they are taught,
- ✓ Introducing more soft skills such as languages and communication skills,
- ✓ Providing sufficiently wide skills,
- ✓ Ensuring that young people get direct opportunities to learn about the nature of the economy and the world of work, and altogether
- ✓ Making vocational education and training (VET) tracks less of a dead end.

This could be done for example - such as in Serbia – by working with Simulating Enterprise Offices, SEOs in vocational education and training. These SEOs are simulation processes where students are guided through a process of actually setting up small businesses and developing products and services.

IV. Set up national institutes of vocational education and training for better:

- ✓ Adapting the vocational education and training system to the needs of the knowledge society,
- ✓ Supporting efforts to the transparency and employability of VET,
- ✓ Updating initial and continuing vocational training e.g. by developing new vocational qualifications,
- ✓ Developing scenarios for future development of vocational education and training, and
- ✓ Conducting vocational training research with a view to identifying correlations between technological and labor market developments.

This could be done for example by looking at organizational structures and task descriptions of similar national institutes. One could also make cross comparisons of recently established institutes of vocational education and training for example in certain transition countries such as Hungary and Slovenia and look at their institutional set up and draw lessons for other countries in the region interested in setting up similar cases.

V. Integrate "lifelong vocational learning" in the institutional framework for vocational education and training, by:

- ✓ Emphasizing "learning to learn" skills in vocational education and training,
- ✓ Focusing on team work capabilities,
- ✓ Mobilizing resources for making lifelong learning opportunities more widely available,
- ✓ Ensuring collaboration among a wide range of partners and stakeholders,
- ✓ Developing policies for the recognition of all forms of lifelong learning, including informal and distance learning, and
- ✓ Designing guidance and counseling for lifelong learning.

This could be done by looking at some national systems in vocational education and training that take these reform initiative into consideration. Some countries currently working on this include Germany, Austria, Switzerland, Denmark, the Netherlands, and Australia.

If and how this can be integrated in schemes of vocational education and training and skills development also in developing and transition countries to become "bridges to further and life-long learning" will have to be seen in individual planning processes in countries willing to experiment with this.

4.2. Trial-run Teaching Situations and Counseling

One of the keys to successful in-service teacher training on the teaching level are Trial-run Teaching Situations (TRTS). Without them no teacher training is true and my hypothesis is that no changes will happen at all, unless TRTS are applied. This is why they are mentioned separately here as a "key ingredient" for successful implementation of reflection learning.

TRTS can be done in a number of different setting. In Serbia they were carried out by groups of 2-3 teachers and were held at their own schools in the presence of the directors of the schools, interested teachers from that school and other schools, and in the presence of the teacher training group.

The important thing is that they are always "teaching experiments", where the teachers had the right to show where they are at in their development of reflection learning processes and yes, they had the right to make mistakes.

TRTS in Serbia followed certain rules. Setting up and following up on these rules is also highly recommended for other country settings. The teachers, prior to the teaching situation, hand out a written preparation to all the participants. Different ways of written preparations for TRTS exist. The preparations are in writing and must always include some remarks about the specific class, the objectives of the lessons, didactical and methodological explanations for that specific lessons and literature used.

Observing participants should watch carefully and take notes for the following discussions of the trial-run teaching situations. Taking notes can either be done individually or using a format for recording trial-run teaching observations, which is attached as Annex 2.

When correctly practiced, trial-run teaching situations give invaluable quality feedback to teachers that will enhance their learning and give orientation to their improvements as vocational teachers.

My experience in Serbia showed that TRTS lost some of their "exam character" due to this frequency and varied settings, and hence teachers in the course of the two-week programme became more relaxed about them and looked at them more as learning opportunities.

This is positive, because the real learning takes place in the counseling situations after the case-study teaching situations! Up to this point the teachers have planned and carried out a lesson and now they are open to feedback. Feedback can be given in many different forms and it can also be done in different settings. It is of utmost importance that – in the course of this counseling process - the teacher gets into the position that she/he comes to realize alone what to do differently next time. Once again, if only giving advice here is practiced (instead of counseling!), then teachers will only accept this advice for the duration of the TRTS and will not change habits.

If, on the other hand, the teachers feel comfortable in these peer situations, then they may themselves come up with their own observations, like: "The students were so passive in participating. Do you think that could relate to my planning things too much, instead of involving them in the planning process more?" These kinds of questions occurred more and more in the course of the teacher training programme in Serbia and more so in the last week after the group found out that this kind of counseling was good for all of them.

If this is the conclusion of a talk at the end of TRTS, the teachers have learned indeed much more than by having received tons of advice by more experienced teachers of what to do better in this or that situation!

4.3. Evaluation Mechanisms by Teacher Trainers - Continuous Improvements

In this chapter, some monitoring and evaluation mechanisms will be described that can be done to improve and assess the quality of teacher training, some of which have been done in Serbia. In a way they can also be seen as a way of quality control, rounding off a whole package of teacher training..

“Jour fixe”

The “jour fixe” is a regular meeting of all the teacher trainers and a way of giving feedback among the teacher trainers and providing a forum for ongoing work.

For example, half-day meetings could have the function of critically monitoring the ongoing training cycle and providing a forum for discussion. For each jour fixe, 4-6 teacher trainers can sign on as responsible moderators; they are in charge of clarifying the agenda with their colleagues, moderating and documenting outcomes. Meetings could focus on, e.g.:

- Implementing new legal framework for teacher training into daily work;
- Identifying training needs for teacher trainers; and
- Developing identical criteria for good lesson planning and implementation.

Further Training Programs for the Teacher Trainers

Training programs could focus on e.g.:

- Learning how to do improve “Cooperative Reflection Counseling”;
- Working with new media (Internet, Multi-media);
- Developing special learning promotion programs for weaker students;
- Using scenario techniques and future labs comfortably;
- Identifying “creative ways” to release organizational duties in schools

These training programs could take place outside the schools, and outside experts help. They take place a minimum of once or twice a year and last a weekend or a couple of workdays.

Preparing New Teacher Trainers

Assuming that there would be something like a career path in becoming a teacher trainer, these people would usually need training in order to be equipped to carry out all the tasks of a teacher trainer competently.

A typical preparatory training for new teacher trainers, for example, could consist of 4-6 hour sessions each, for example in:

- Developing criteria for a “good” teacher trainer;
- Discussing and implementing counseling situations after trial-run teaching situations;
- Dealing with feedback;
- Accompanying written theses by junior teachers;
- Writing final reports for our teachers; and
- Assessing in an exam situations

Evaluations by Teacher Trainers and Students

This evaluation can always be done on a voluntary basis by teachers who have been through the program. Teachers should describe their points of view, their experiences and their suggestions for future changes of the program. I personally consider particpants feedback as a way of continuously improving teacher training courses. This is way I asked two of my teachers to give one. A flashback by two former trainers in my work in Serbia is given in Annex 4. The same could be done with students who ‘experience” their teachers, when they come back form teacher training and are sometimes surprised to see what the training has done to them and how it will affect their new learning situation!

Annex 1: The Five Modules of the Teacher Training Course

Module 1: How Do I Define My Own Didactic Concept in Business Administration and Economics?

1. Introduction of Participants and Expectation Check
2. Presentation of Course Work and Literature and Development of Criteria for Good Lessons
3. Developing Topics in Our Lessons
4. Lesson Preparations under a Perspective
5. What is a "Didactical Analysis" in Economics?
6. Didactical Work in Concrete Learning Situations
7. Competencies and Qualifications – Where are the Differences?
8. Structural Analysis for Lessons and Developing Guidelines for Observing Lessons
9. Micro-Teaching: MT Carries Out a Model Lesson in Marketing
10. Group Analysis and Discussion about the Micro-Teaching Experience

Module 2: Selecting Methods that Fit Me?

1. Gathering Methods for Lessons and Presentation of a Specific Case Study
2. Case Study "Industrial Enterprises in Competition"
3. Contd.
4. Contd.
5. Discussion about the Case Study and its Usage in Schools
6. Didactical Annual Planning and the Implications on Methods
7. Introduction into Simulated Enterprise Offices
8. Planning of an Enterprise Visit with a School Class
9. Working in a Simulation (Part 1): Working with Fictional and Real Enterprises
10. Working in a Simulation (Part 2): Division of Tasks in Simulated Enterprise Offices

Module 3: Professional Communication – How Do I Implement This in Class?

1. Professional Communication – What is that?
2. A 5-phase model of communication ability and its first Phase: "Developing rules for our daily work in commercial classes!"
3. Second Phase with an Info-Market-Place introducing the four main departments of a whole sale company
4. Third Phase with Station Briefing for the Management of a Model Enterprise
5. Argument Stations in Enlarging the Product Range of a Model Enterprise
6. Short presentation of more complex communication models and introduction into a Future Lab with the Topic: Teacher Training in Serbia
7. First Phase of the Future Lab: The Critique Phase
8. Second Phase of the Future Lab: The Phantasy and Utopian Phase
9. Third Phase of the Future Lab: The Realisation Phase

10. Discussion of Transfer Potential of these Experiences into our Schools

Module 4: Making Assessments and Judgments as a Teacher, Promoting Students and Supporting Colleagues

1. Analysis of formal curricula for the Assessment of Achievements in Commercial Education
2. Development of Assessment Criteria for Crediting Reflection Learning
3. We develop Class Testes in Reflection Learning!
4. ….. and Return them to our Class!
5. Assessment of Oral Contributions in Reflection Learning
6. Assessing Group Work
7. Self-assessment by Students – is that possible at all?
8. Cooperative Reflection Counseling Part 1: Problem in Teacher Training Using Group Synergies

Activities in disruptions

Educational competency

Relation with the students
- Appreciation
- Understanding
- Emotions

Conclusion for Teacher's Activities: **Pedagogical and social competencies**

Annex 3: "Cooperative Reflection Counseling" (*Kollegiale Praxisberatung*) – Discussing Trial-run teaching Situations Using Group Synergies

In the Serbian teacher training experience Cooperative Reflection Counseling was structured in six phases plus an agreement both at the beginning and at the end. The agreement at the beginning set the tone for the counseling and identified seating arrangements, promised total discretion and agreed on the moderators.

In phase 1, the trial-run teaching group always has the first shot at looking back at the lesson and explain the thoughts the group had prior to starting the lesson, what went as planned, what went well and what not so well.

In phase 2, the audience responded. In this phase only positive feed-back was allowed.

In phase 3 the trial-run teaching group seeking counseling got other feedback from the rest of the group. The participants could give all kinds of feedback and they could also refer to more formal remarks about didactical and methodological issues that they might have written down during the lesson, e.g. also on their observation sheet (Annex 2). It was very important in Serbia that the trial-run teaching groups got plenty of chance to respond especially to the more critical remarks.

Phase 4 raised other perspectives and multiple meanings that resulted from the problem layout. The participants came in with sentences like: In your position I would …; I make the hypothesis that …; I have a wild thought …etc.
It was important in this phase that everything went and nothing was forbidden!

In phase 5 the whole team developed alternatives. Helpful were sentences like "I as the teacher, … student, … teacher trainer, … director, … mother, … chamber of commerce representative would do …". The group was supposed to come up with a lot of alternatives and new patterns. The trial-run teaching group should then pick out what suited them best and also gave a feedback to the group.

In phase 6 the group decided what was good for them in that situation and which alternative were to be taken over in their future repertoire for reflection learning teaching. In Serbia, we found out that a role-play trying out these new habits at the end of this phase was good for exercising new patterns before going out into school routine again.

The final agreement was always helpful for the teaching team, because a certain degree of commitment was made. A sentence like "I am going to try it out and I will let you know next time!" was good when it was wrapped into questions like:

- Who does this with whom?
- What exactly do I want to do?
- How do I want to do it?
- When and where will I do it?

Annex 4: Flash Backs

Looking Back and Looking Ahead, Danica Koncar, Kula Commercial School, Serbia

I was one of 18 participants in the 4-week seminar „Reflection Learning – Didactics and Methods“ which took place in two legs, one in Kikinda, Serbia from March 1-13, 2003 and the second one in 9 different cities in Serbia from May 12 –23, 2003. Michael Axmann was our teacher trainer.

My previous work experience as a teacher can also be summarized in two phases: after visiting the Faculty of Economics in Belgrade and working in departments of accounting and controlling in my country, I started my job as a teacher in a commercial school, where I have been teaching different subjects such as accounting, business administration and economics.

Being a teacher for me has always meant to be more than just being a lecturer. During the seminar in Kikinda I got some practical advice on how to implement this more directly. The main question that we addressed in Kikinda was how to carry out reflection learning processes and make it meaningful to the students and to us.

The main thing we learnt in the four weeks was how to actively "ignite" the learning in our students and how to support it in teams with other teachers and with other subject matters*.*

We were exposed to quite a number of new teaching methods which were shown in different settings for a variety of topics and group working forms. In Kikinda, for the first time I heard out about essentials in being a teacher in commercial education and also about involving different subjects and covering not only our own narrow view of being a subject teacher. We had lots of interesting discussions about Reflection Learning and it turned out that the majority of the group was willing to experiment with Reflection Learning. In the first part of the seminar we also looked at ways of grading our students in Reflection Learning processes.

The second part of the training was particularly interesting, but also quite stressful. In a way, the last 2 weeks were a continuation of the first part, where we all had to actually teach specific lessons in our own schools with the rest of the group sitting in the class. The trial-run teaching situations *took place in 9 different cities all over Serbia and were, in a way, an exam situation for all of us.*

The lessons had been prepared by previously formed groups of 2 or three teachers who had chosen their favorite class situation in their own schools and their own topic. The teaching situations were followed by the rest of us. After each trial-run teaching situation we came together for a group counseling situation in which the teacher trainer and a moderator chosen from among ourselves together with the rest of us pointed out the positive things as well as those things that could still be improved.

This after-lesson-analysis gave each of the participants the opportunity to learn more about the different aspects of planning, carrying out and evaluating lessons in schools. Competent planning was proven by taking into consideration the very conditions of each class, setting appropriate objectives, reflecting on didactical issues, using appropriate methods, bringing in media that would correspond to the lesson plan and finally choosing work and social forms of interacting in class that were suitable to the students with a focus on bringing out their (the students') creative potential.

Each new day added a new aspect. At the end of the four-week training program every participant had got started thinking about changing their view of teaching commercial subjects towards ***encouraging our own students in problem solving and helping them in their own way of finding solutions for real-life and real-work problems.***

It was a pleasure working in this seminar with our teacher trainer and with my colleagues. Part of the wonderful working atmosphere was taken home into our own schools when in my own school I invited a number of my colleagues to three trial-run teaching situations, after which we had very interesting discussions on how to make Reflection Learning the standard way of teaching and working in our schools.

SIX MONTHS LATER . . . Ćurćić Dragana, Secodary school of Economics and Trade, Bečej, participant of the seminar Reflection-learning, Didactics and Methods

The school year 2003/2004 is in the progress and I have been analysing every single minute of my class as I have never done before.
Have I motivated my students for their assignments?
Are the examples I have been using suitable for their age?
Have I attained the aim of the class?
I often wander if I learned enough during the seminars. I think I did, at least for the beginning.
Do I need more ´theoretical knowledge´ besides my experience? Perhaps I do, since these things cannot be separated!

My school is among 18 schools which participated in the pilot programme ´business administrator´. This programme was supported by the Ministry of Education and Sport, as well as GTZ, the German Technical Cooperation, an organization for technical collaboration. A series of seminars were organized for the teachers of these schools. I attended the seminar managed by Mr. Michael Axmann.

The seminar consisted of 2 parts.
1st. part: April 1st – April 13th, 2003. ´Theoretical part´ which definitly was not long-winded presentation.
2nd. part: May 12th – 23th, 2003. A visit to 9 schools in which we gave lectures we prepared in advance.
The participants of the seminar were mostly professors of vocational, economic subjects.

Being a professor in mathematics and not being accustomed to the exact content of the seminar, I was worried whether I would be able to fit in since it was not ´my field´.

The aim of the theoretical part of the seminar was achieving the desired results through work. Each workday was divided into 4 parts, each lasted 90 minutes. In the first 15 minutes of each part we listened to the introductory part of the lecturer. He would set a particular problem, then at least one method referring to the work with students, and the remaining part was for us. We experienced things which we did not expect. Noone told us how to activate students – we were activated ourselves.

We were divided into groups trying to work out the solution of a particular problem. We realized that it was easier to work in groups or at least, in pairs although in our schools we were taught to work individually. All the time I expected evaluation of our work and further instructions (such as ´try something else´, ´it is better if you´, ´perhaps you should´). In the first couple of days I thought that our work was not graded because we were not accustomed to a new situation, but later I realized that we were not supposed to be graded at all. The point is that we have to find a solution ourselves, to estimete what is good and what is bad in our work, to find a way to active teaching.

That is why I found the second part of the seminar well-organized and interesting.It was a sort of checking of what we had learned. Once again, we were divided into pairs, according to our interests. We were given several weeks to prepare a class and to perform it in front of the students. As we had expected, it turned out to be the most difficult!

Where should we start from? Although I have had a lot of experience in teaching, I had problems in choosing the appropriate topic and adopting it to knowledge and abilities of the students. After the class everything seemed to be much easier. We had 9 classes in 9 towns. Each class was analysed.
I think I learned most in the second part of the seminar. First of all, I learned to listen to the others, to hear about their impressions of the classes.

Although the participants of the seminar were not familiar with the content of my class (because of the subject I teach), they were able to follow my teaching. The same thing happened to me during their classes. There were a lot of suggestions how to improve a class, to approach a new working method or a topic.There were some objections too, but they were well-intended. Noone expected to give a perfect class. We are aware that in Germany one has to study two more years after they graduate in order to become a professor.

I would also like to mention the problem of grading and modular teaching .I sometimes still have difficulties with the first one, but we did not discuss this problem in details since we ran out of time.
Modular teaching is not regulated by law in our country. However, I think it is a very important prerequisite for successful implementation and application of active teaching.

Blended Learning in International Human Resource Development

On the characteristic features and the comparative didactic advantages of face-to-face learning, distance learning and e-learning

Prof. Dr. Rolf Arnold[1]

Contents

[1] *Holder of Chair for Education, esp. Vocational and Adult Education, and Head of the Centre for Distance Studies and Continuing Education (ZFUW) at the University of Kaiserslautern and of the Rhineland-Palatinate Virtual Campus (VCRP)*

1 Basic hypotheses and objectives

Integration hypothesis

The initial euphoria prompted by the expectations attached to the opportunities afforded by self-learning courses and virtual methods of content distribution has waned somewhat in the recent professional debate on adult learning (Nuissl et al. 2003, p.5): E-learning in continuing education practice does not often appear to work properly without face-to-face learning. According to an overall assessment of current experiences by the *Deutsche Institut für Erwachsenenbildung* (German Institute for Adult Education) in Bonn, preference is presently given to approaches that combine e-learning with the face-to-face method(Kraft 2003, p.43).

In international discussion, too, the view is gaining currency that the various distribution and didactic methods need to be *integrated*. In recent years, for example, technology-based distributed learning (TBDL) has gained ground internationally. TBDL integrates different ways of teaching and learning in a specific didactic setting:

"A distributed learning environment is a learner-centred approach to education, which integrates a number of technologies to enable the opportunities for activities and interaction in both asynchronous and real-time modes. The model is based on blending a choice of appropriate technologies with aspects of campus-based delivery, open learning systems and distance education" (Institute of Academic Technology/University of North Carolina; cited after Bates 2000, p.27).

These integral approaches are 'hybrid learning environments' (cf. Kerres 2000), where traditional face-to-face methods, self-directed learning processes and technology-based modes of learning are combined to a validated purpose. Bloh and Lehmann have stressed this hybrid concept in the debate in Germany and advocate the following:

Accounting for the respective strengths and weaknesses, a coherent combination of
- basic components (asynchronous teaching-learning networks) with, for example,
- elements of face-to-face study,
- elements of (classic) distance study (guided independent study approach),
- web-based multimedia and/or hypermedia elements along with
- aspects of teleteaching and teleconferences (remote classroom approach) (Bloh/ Lehmann 2002, p.93)

They bring the basic argument emerging in the current international debate into sharp relief. New technologies in teaching and learning are applied not to seek the one best method, but to identify a sound combination of the specific advantages of the various modes. To do so, it is indispensable to conduct a more precise analysis of the comparative didactic – and in this case developmental - advantages of the various teaching-learning modes. This is what the present report aims to do in outline.

Hypothesis 1: Comparing the respective capabilities and advantages of face-to-face learning, distance learning and e-learning will not result in identifying a one best approach. Rather, the vision emerging in the international debate is one of an integrated deployment of new technologies in the teaching-learning setting that advocates a didactically sound combination of these learning methods in so-called hybrid learning environments. This is about integration, not substitution (= integration hypothesis).

Implications for development cooperation:

The responsible use of new technologies in the reorganization and ongoing development of international competency-building should not succumb to a multimedia euphoria that sees e-learning as the answer to all problems. Instead, what we need above all (!) is a didactic strategy for international human resource development as a whole. Only as part of this strategy can sound decisions be taken on how suitable face-to-face teaching, distance learning and e-learning are for achieving what goals and building what competencies in the light of today's findings in teaching-learning research.

Hypothesis about the general transfer proximity of distance learning

As to the use of new teaching-learning technologies in development policy, we can say this much: In international human resource development, distance has always been a basic problem, because cooperation is often with countries and regions that are many thousands of miles away from Europe or the learning measures. For many decades attempts have been made to solve this problem by flying counterparts or scholarship-holders to Germany where, after a German language course, they obtained their qualifications at specialized training establishments. This practice has been frequently criticized, and in the last 20 years projects in particular have increasingly availed themselves of local, foreign-language short-term measures or upgrading courses in a third country. A major target of criticism was the *transfer problem*: Specialists from developing countries acquired qualifications far away from their occupational setting in a different language and/or cultural milieu, which on their return home they were then supposed to apply in work environments from which they had frequently become alienated.

Looking at the recent debate on continuing education, we can see that in all the more modern approaches in continuing occupational training, the *transfer distance* between the learning location and the place where qualifications are put to use has shortened. The role of workplace learning and training in various learning locations has thus greatly increased in recent years, particularly in corporate HR development. (cf. Dehnbostel 1996; 2001a; b; Hanft 1997; Reinmann-Rothmeier/Mandl 2001). At the same time, the debate surrounding distance-learning didactics on the ‘disappearance of distance from distance learning’ (Arnold 2000) has sharpened an awareness that the distance learning approach is not just a form of learning with a short transfer distance – learners frequently remain in their occupational and social settings and these are often deliberately catered for (e.g. in project work and final qualifying assignments) - but also that through the increasing use of chatrooms, e-mail, etc. distance learning is also less susceptible to 'distance'. On the contrary: the facilities for technology-based queries and contact with the 'teacher' enable an *personalized learning process* that go far beyond the level of communication afforded by face-to-face learning/teaching. Incidentally, in some face-to-face situations (e.g. mass lectures) the distance to the participants is greater than in distance teaching or study courses. These also adhere to the rather dubious precept of 'a uniform pace of learning' and a kind of 'staple diet for all'[2] that may at best just happen to appeal to learners' 'personal tastes' (= individual learning requirements).

For the transfer problem in areas of international human resource development, we may hence infer the hypothesis:

Hypothesis 2: In many respects, distance learning approaches have greater transfer proximity. Learners remain in their social and frequently also occupational settings and can thus directly 'match' what they have learnt against their issues and problems and situate it in their fields of activity.[3] Application of the skills and knowledge acquired often also forms part of the general didactic design (hypothesis of the general transfer proximity of distance learning).

Implications for development cooperation:

As concerns the special difficulties of international human resource development, the 'merged'[4] and/or off-campus forms of continuing education

---

[2] The adult educationalist Erhard Meueler from Mainz talks about the 'head waiter syndrome' in adult education (“serving up the cooked meals”), which he attempts to tackle using a 'recipe book of methods and social forms' (Meueler 2001, p.198 et seqq.).

[3] The notion deriving from learning theory of 'situating' what is learnt, which is what was and is meant in adult education by the principle of gearing learning to the learner or to the situation: The idea behind learner-centred learning "(...) is that adult education measures – the courses and discussion groups – should not normally be geared to a preset subject matter but to the prior experience and expectations of those addressed by the measures.” (Tietgens 2001, p.305)

[4] The notion of 'Entgrenzung' (merging boundaries) is increasingly used in the international debate on the effects of globalization and postmodernism. In his book entitled 'What is Globalization', the much-respected

afford some advantages: Distance or e-learners can remain in their professional and personal environments and transfer the acquired skills and knowledge much more directly. At the same time, this kind of 'workplace learning' or 'parallel in-service course of study' ensures acceptance of their transfer efforts from the outset because they remain part of the context in which this know-how is applied, and are not alienated from it. It is not uncommon for scholarship-holders to return after several months or years in Germany or Europe to the 'backward' system and encounter so much resistance that they can hardly apply anything or only little of what they have learnt. Considering the substantial costs usually incurred by this kind of 'travelling education', the issue of cost-efficiency is now almost unavoidable.

In HR development cooperation the scope afforded by off-campus teaching and learning, alternating with face-to-face phases as in sandwich methods, for instance, has not even begun to be genuinely explored.[5] For this reason, we suggest that cooperation projects increasingly employ this kind of in-service or workplace-linked approach (e.g. through reduced working hours and temporary 'secondment' to face-to-face upgrading courses). From a cost standpoint, but also – and in very special measure! – with a view to the transfer and sustainability of international competency-building, this would appear to be of fundamental importance.

Blended learning and the hypothesis of the primacy of didactics

In recent years, *new media* have been increasingly propagated as the great hope for a new kind of adult learning. Multimedia and e-learning measures[6] are often seen as *the* cure-all for continuing education, human resource development or education systems in international competition. In the latest newsletter of the *Forschungsinstitut für betriebliche Bildung* (Research Institute for Corporate Training), for example, under the heading, ‘Conquering international markets with e-learning' we read:

“More than any other product in the education sector, e-learning would seem predestined for international marketing. With properly prepared, network-assisted seminars, education agencies can gain entry into international business. (...) E-learning affords a major business advantage for international marketing: the outlay pattern for network-assisted multi-media learning is quite untypical for the education sector. Comparatively high initial investments are offset by lower overheads – even with ongoing content updates.” (Severing/Fietz 2003, p.3)

---

sociologist Ulrich Beck uses the term 'Vielörtlichkeit' (multi-locality), postulates a transition from 'monogamous to polygamous locality' and asserts that "Our own lives are no longer tied to a place, they are no longer fixed, settled. We live 'en route' (literally and figuratively), we lead a nomadic life, in the car, in the airplane, in the train or on the telephone, in the Internet, a transnational life based on and shaped by mass media. These technologies are media that transcend time and place. They eliminate distance, make distance close and proximity distant – absence in the same place. Living in one place no longer means living together and living together no longer means living in the same place.“ (Beck 1997, p.131 and 138 et seq.).

[5] In this context cf. the experience gained by the CAPADOC project at the University of Kaiserslautern, where Chilean university lecturers are upgraded online and invited to attend a short in-depth face-to-face course in Germany (ecampus.uni-kl.de/public/U_KL_CAPADOC/index.html).

[6] E-learning can be understood "as a generic term for all variants of internet-based teaching and learning measures” (Kerres 2001, p.14), i.e. as *learning in virtual information and communications networks*.

This line of argumentation has been confirmed by extensive experience. Nonetheless, the maintenance costs of distance learning and e-learning are sometimes greatly underestimated. The users of these 'distant' facilities frequently seek far more contact with the institutional provider (via telephone, e-mail, etc.) than do users of face-to-face education measures, who can evidently already satisfy most of their 'contact needs' through simple participation and experience (and face-to-face interaction).

a) The term *multimedia*

There is no single definition for *multimedia* and it is understood to mean all kinds of things. In the present report, the hallmark of multimedia applications and/or *new media* is that they integrate different storage media and communication media and are network-enabled (cf. Fischer/Mandl 2000). These media are network-enabled in the sense that they can be used in internal networks (*intranets*) of organizations or companies or on the global Internet for the distribution of data. On the other hand, network-enabled means that the new electronic media enable the user to collate information and thus connect contents, not just technical systems.

A new dimension opens up through the possibility of integrating communicative functions, too, with the help of *interactive media*, thus adding a social or at least interactive aspect to the content one. Developing and disseminating network technologies enables new forms of cooperation between learners and teachers on the one hand and amongst learners on the other that would be inconceivable in this form and density in traditional training and continuing education.

b) The term *blended learning*

A term gaining increasing currency is 'blended learning'[7] - a metaphor that really only suggests a suitable 'blend' of various learning scenarios, which is why the actual question relates to the criteria for measuring this suitability.[8] These are primarily didactic, they help

---

[7] Number 2/o3 of Inwent journal in.puncto deals with the the concept of blended learning and concludes: “It is probably the same as with a good whiskey: It is the right mixture that makes the blend and hence the high quality” (Die richtige Mischung 2003, p.1). In the Financial Times, Davis (2001) observes that “Blended Learning has become the standard term for the use of a wide range of learning technologies and methods in the workplace. Examples include the traditional classroom, web-based tutorials, web-based simulations, online-collaboration, online-coaching, video-conferencing, phone conferencing, knowledge management systems … the list goes on.” (Davis 2001)

[8] There are hardly any sound concepts or empirical research findings on this question. “It is not clear how the individual components of such arrangements can be combined for didactic effect, which technical, didactic-

gauge how far a learning scenario can really foster sustainable, competency-building learning. Also, cost-benefit considerations and – particularly in international HR development – the issue of worldwide accessibility are of growing importance.

Overall, though, the *hypothesis of the primacy of teaching* still applies.[9] In other words, experience has shown that a higher relevance and pedagogic effectiveness in teaching-learning processes cannot automatically be attributed to the use of 'new media', so that any allusions to the 'educational value of the Internet' (Marotzki et al. 2000) are misleading and unsubstantiated.

All promises of easier, more motivated and more effective learning through the use of multimedia capabilities try to divert attention away from the fact "(...) that learning is impossible without willingness, concentration, the (often arduous) effort and students' own (re)constructing activities (as defined by Piaget); in short, without the learner doing learning work. In an overall pedagogic-didactic approach, technologies/media can be used to assist this process, but they *cannot replace* it." (Bloh/Lehmann 2002, p.15 et seq.) The media selection, therefore, is always embedded in an overall didactic context:

> "A didactic vision aimed at integrating the selected media into the planning process implies a detailed assessment of which medium is particularly efficient for achieving which objectives, for imparting which contents, for implementing which teaching methods and for promoting which target group." (Seel/Dörr 1997, p.111).

As for basic and continuing education, the following applies:

> "Good teaching may overcome a poor choice in the use of technology, but technology will never save bad teaching" (Bates 1995; cited from ibid., p.11).

It is not the medium or the choice of technology that makes the difference, it is the didactics and the adult or occupational education concept! This aspect is often overlooked and we are distracted by the apparent benefits of more rapid and convenient distribution. 'Learning' only takes place when the learner is able to acquire sustainable competencies. Easier accessibility of 'content', as the subject matter is sometimes called today, is no guarantee for success,

---

methodological and, not least, organizational standards are needed, for what learning contents, teaching-learning goals and learner types these environments are (particularly) suitable." (Kraft 2003, p.44).

[9] Klimsa provides a matter-of-fact definition: "Here, 'new media' are understood to denote hybrid media based on microprocessor technology, storage technology and/or communication technology that are also characterized by interactivity, individuality, asynchronicity and multifunctionality. They create a continuum amongst all forms of communication processes – from intrapersonal and interpersonal up to mass-media communication." (Klimsa 1993, p.119)

however. Rather, the learner must also be able to ‘gain access’ to the content. This requires didactic analysis and preparation that offers learners helpful and practicable avenues for approaching the subject and prompts them to acquire knowledge, abilities and skills on their own. No competency has so far been developed just by clicking on and downloading 'content'. This is why the didactic approach takes precedence over all decisions on learning organization and distribution.

Hypothesis 3: Multimedia learning poses no or hardly any 'innate' didactic problems, but it does give rise to genuine adult education problems. This means that the quality and sustainability of face-to-face learning, distance learning and e-learning equally depend on the choice of contents, the didactic-methodological environment and on mobilizing and involving the learner – an aspect that is often overlooked in the general euphoria (hypothesis of the primacy of teaching).

Implications for development cooperation:

For the special problem of international HR development, this means that this sector in particular should step up efforts to develop adult education approaches further, rather than turn its attention too fast towards technology-based ways of learning. The options cannot be assessed and judged properly at all without a didactic strategy, if we want to prevent a virtual replication of unsuitable and frequently outdated models of adult learning (e.g. posting text on the web as a new form of knowledge 'fodder' overloaded with content).

This means that the new ways of reorganizing learning (distance learning and e-learning) clearly highlight the need to scrutinize everything – including the familiar and costly forms of face-to-face learning, which may have always been inadequate.

As we can see from the above, the point is not to switch approaches from face-to-face learning to distance learning to e-learning, but rather to develop a didactic strategy for sustainable adult learning in an intercultural context. So in international human resource development we must look somewhere other than where we thought - just as the following amusing story by Watzlawick shows:
A drunk is looking for something under a street light. A policeman asks him what he is looking for, and after he replies 'My key', they both search together. After a while, the policeman asks, “Are you sure that you lost your key here?” The drunk answers, “No, not here, behind the hedge, but there is more light here!” But we have not reached the punch-line yet. Watzlawick asks the reader, “Do you find this absurd?” – and of course we all find this preposterous – “If so, you, too, are looking in the wrong place!” (Watzlawick 1990) Similarly,

I think that the solution to our problems in international competency-building is not technological, it must be didactic. We will not find a solution just by 'switching' from face-to-face learning to distance learning or e-learning. The two latter forms of learning organization and distribution merely offer more ways to organize sustainable competency development.

For this reason, we can postulate the following additional hypothesis:

Hypothesis 4: We will not be able to fully substitute one monolithic model (face-to-face learning) with another (e.g. telelearning, virtual learning). Rather, our concern must be to combine the various modes and ways of learning in a didactically effective way into a complementary strategy. The current dominance of teacher-centred front-of-class teaching in many areas of our social learning cultures has, however, been long outdated. (hypothesis of the end of monolithic models).

2 Building competencies through lifelong learning calls for clear criteria on significant and sustainable learning

Crossing three learning boundaries

Less than ever can adult learning today be confined to the traditional forms of imparting knowledge in institutionalized continuing education measures. Rather, competencies are developed throughout life, informally and through the self-directed learning of individuals, groups and organizations. What we need to do is to forge an adequate strategy for this variety of teaching-learning settings. What is needed, in my view, is a strategy of lifelong learning or life-accompanying learning that

is based on a broader *notion of content* that integrates both knowledge and experience, both abilities and values ('attitudes'), into the adult learning process,

a) lifts the traditional boundaries of *learning locations* and also professionally facilitates, promotes and supports deinstitutionalized learning (workplace, autodidactic study), and finally

b) not only facilitates learning by individuals, but enables and promotes the learning processes of *groups, organizations or even social units (e.g. regions*[10]*).*

A key problem in education – internationally - is a learning culture based on front-of-class teaching (*knowledge 'fodder'*). Today, we know that central key qualifications and competencies are *not* imparted if learners (pupils, students, scholarship-holders) are not able or 'allowed' to take initiative and creative action when learning and approaching contents. Moreover, the concern is no longer to impart 'stored knowledge', instead, 'reflective' forms of knowledge in competency-building (method competency etc., in short: key qualifications) are becoming increasingly important. A purposive effort must be made to open the way to acquiring these, to make them accessible or 'experiential'.

Material knowledge (Know-how)	Reflective knowledge (Know-how to know)		
Stored knowledge (Knowledge for storing facts, theories, data, etc.)	*Method knowledge* (Knowledge on procedures for obtaining, presenting and communicating information)	*Reflection knowledge* (Knowledge for examining, criticizing and adducing reasons for concepts and assessing their implications)	*Personality knowledge* (Knowledge for recognizing personal involvement, i.e. emotions and interpretations, in interactions)

Fig. 1: From 'know-how' to 'know how to know' (based on Arnold/Schüßler 1998, p.61)

In my view, this also implies that *multimedia* today is a relevant topic in the educational and human resource development debate, but is nonetheless of subordinate relevance (also, and particularly, in the context of globalization). By expecting too much from multimedia arrangements in learning measures, we are in danger of replicating front-of-class teaching knowledge 'fodder' in the virtual domain, so to speak, instead of first superseding it in real educational practice. Only after we have agreed on the objectives we are pursuing in education and competency-building, and on the didactic preparations that are required to develop a comprehensive and science-based operational competency in the respective learning cultures, can we actually put didactically relevant multimedia learning environments to effective use (to foster learning and support the acquisition of skills and knowledge) and

10 The notion of 'learning region' in particular is of key importance for international cooperation, but has so far hardly been addressed at all (cf. for example: www.fes.de/FESLBBerlin/Ressourcen/download/Broschuere_lernende_Region.pdf).

also – on the basis of empirical findings – objectively judge whether multimedia learning, as often claimed, facilitates both a convenient presentation of content and self-exploratory and more sustainable learning.[11]

Hypothesis 5: Effective, sustainable, competency-building learning is only possible if learners can actively explore the material themselves. Method and problem-solving competencies and team ability can only develop if pro-active and cooperative learning is 'permitted' and deliberately encouraged (hypothesis of the end of the passive learning model).

Implications for development cooperation:

Development cooperation institutions need a competency model for their work. This means that they, too, need to define more clearly what competencies for self-directed and cooperative activities they want to promote in their HR development measures. In the international competency debate, German international cooperation will have no option but to set objectives, such as imparting key qualifications or instigating the development of competency in leadership, cooperation and organization, and to strive to achieve these effectively using practicable didactic strategies. Only after these strategies have been defined can any decision be taken at all on the most suitable learning and distribution organization (face-to-face or distance learning). Nonetheless – and this self-criticism is warranted – too many of the models presently used are passive learning models, that is, models that accord hardly any systematic role to self-directed learning by individuals, groups and organizations in partner countries.

[11] In my view, many contributors to the current debate take the second step before the first, 'presupposing' that multimedia also fosters the ability to act independently. They overlook that working at a PC is not necessarily the same as the autonomous effort to solve problems, and ignore that too much user-friendliness is not always conducive to the learner making his/her own efforts – Hegel talks about 'Anstrengung des Begriffs', the labour of understanding. This is exactly what the Frankfurt philosopher Gernot Böhme meant when he said that thoughtless visualization causes the imaginative faculty to atrophy.

Criteria for sustainable adult learning

We cannot circumvent the urgent need to settle didactic issues by turning to the convenient options of multimedia learning that do not overcome front-of-class teaching-learning culture, maybe even unintentionally reinforce it (due to its cinema and entertainment-like nature). In other words multimedia learning, too, must ultimately meet the criteria of sustainable learning suitable for adults that have been clearly defined by adult education research in recent years (cf. Fig. 2).

As far as developing competencies is concerned, a teacher-centred form of face-to-face learning is therefore just as restricted as a simple presentation of contents in a multimedia learning environment. Key to both forms of learning organization is that they must be designed to help the learner explore the subject – at least to a certain extent. In practice, this means prompting and requiring the learner to become active. To acquire knowledge effectively, it is not enough for learners to memorize contents; they must be able to implant it into their minds through cognitive effort. Important in this context is that they articulate it themselves (cf. Müller 1999), i.e. reproduce what they have learnt in their own words and apply it in other settings. The psycho-cognitive precept that applies here is that learning is 'thinking action', or 'organizing action' (*Ordnen des Tuns*), as coined by Swiss cognitive psychologist Hans Aebli (Aebli 1980).

Apart from the learner's own activity and self-directed efforts in the learning process, on the basis of empirical studies Mandl and Reimann-Rothmeier have identified three other factors that play a role in sustainable learning. These are shown in Figure 2.

These considerations lead to another hypothesis:

Hypothesis 6: Sustainable, competency-building learning is generally possible in all forms of learning organization (face-to-face teaching, distance learning and e-learning). The form is not the decisive factor; the crucial question is to what extent didactic scenarios meets the criteria of sustainable adult learning (active, self-directed, constructive, situational, social).

Five criteria for sustainable lifelong learning	
Active	Learning is only possible through the active participation of the learner. This requires learners to be motivated to learn and have or acquire an interest in what they are doing and how to do it.
Self-directed	In the learning process, the learner takes over direction and control. Although the extent of this self-direction and control varies depending on the learning situation, no learning is possible without a degree of self-directed activity.
Constructive	Learning is always constructive. As a matter of principle, without the experience and knowledge background and interpretation of the individual no cognitive process can take place.
Situational	Learning always takes place in specific contexts, so that every learning process is also situational.
Social	In the final analysis, learning is also always a social process. For one, the learners and all their activities are always subject to sociocultural influences. For another, all learning is interactive.

Fig. 2: Adult learning and learning ability from a constructivist framework (based on Reimann-Rothmeier/Mandl 1996; 2001)

Implications for development cooperation:

A didactic strategy for international HR development would have to point out more accurately what special opportunities for active, self-directed, constructive, situational and social learning are available or not available in face-to-face learning, distance learning or e-learning modes. This would be a first step towards a didactically sound application of these three options based on their comparative advantages.

Something that should not be underestimated, though, is that distance learning and e-learning make the delivery level more transparent. Any developer of distance learning courses has to make the contents visible and verifiable. The same applies to e-learning.[12] The following figure shows that the criteria for sustainable lifelong learning are by no means met by just one

[12] Viewed in this light, employing this mode can also trigger an improvement in the quality of the whole curriculum of a provider. This effect is repeatedly described in the literature and also tallies with the Kaiserslautern experience: A fellow lecturer who didactically prepared his lecture as distance-study material could hardly advance an argument to himself or others as to why he should not present this material to his face-to-face students as well. If he decides to take this step, the next question is already preprogrammed: Why should face-to-face students have to attend his lecture if distance learners receive equal course credit for studying the material independently?

mode: All forms of learning and distribution can generally meet the sustainability requirement, and do so in a variety of ways. The advantages of distance learning and e-learning are not in any way automatic, i.e. for the most part they do not depend on didactic considerations, as is demonstrated later.

Criteria for sustainable competency-building	***Face-to-face teaching***	***Distance learning***	***E-learning***
'Active'	The learner can include his/her own objectives and 'learning projects', i.e. concerns, questions, etc., and take an active role, i.e. not merely act as a recipient-reproducer in the learning process.	Distance learners have their own learning and handling strategies for dealing with contents, must carry out assignments for submission on their own and keep in contact with the provider institution.	As in distance learning – the learners must have the basic competencies to actively shape their learner role, using the facilities in the learning environment.
'Self-directed'	The teacher provides scope for self-exploration and withdraws progressively to function as a learning mentor, facilitator or coach.	A large degree of self-organization is necessary and learners must direct the learning process and in part also the intensity and depth at which they engage in the individual modules.	Hypertextual materials in particular allow for a large measure of personalized learning, that can be self-directed
'Constructive'	Learners themselves work out results, that is they construct the learning object – guided by questions or guided texts.	Prepared material (contents) is processed but the learners must develop the learning object on their own (through their own cognition) and also construct applications and solutions themselves.	
'Situational'	Learning in the real-life setting, e.g. at the workplace (in the German 'dual system') with access to direct learning through experience	The learners remain in their own real-life and workplace setting and are therefore often 'closer' to the situations where what they learn can be applied (exception: initial university degree for example – a distance study course in law in preparation for the profession without being able to apply knowledge/skills in practical situations).	
'Social'	Opportunities for face-to-face interaction and real-life cooperation (project or life-like, activity-centred learning)	Face-to-face phases are usually also available with localized support and distance learners organize their own regional study groups that can be instigated by an institution.	Chatrooms, video-conferencing and e-mail facilitate a real-time exchange, which resembles direct social interaction in many respects, but with its own 'quality' as well.

Fig. 3: Sustainable learning in face-to-face teaching, distance learning and e-learning

3 Didactic features of face-to-face learning, distance learning and e-learning

While face-to-face learning, distance learning and e-learning are forms of learning organization and distribution of contents that differ in strict categorical terms and in their specific profiles, in actual practice many mixed modes have evidently already emerged. Rolf Schulmeister, for example, describes a number of hybrid forms that can be scaled by their relative share of virtual components, and distinguishes the following forms: face-to-face seminar plus web script – face-to-face seminar (plus script) plus communication platform – face-to-face seminar alternating with virtual tutorials or virtual seminars – virtual seminar proper and/or complete private study (Schulmeister 2002, p.130).

There is another point here, however: The terms face-to-face learning, distance learning and e-learning in turn denote a host of different arrangements that can differ greatly. Face-to-face learning can mean a front-of-class lecture as well as an interactive and cooperative seminar that is not confined to the input of the teacher but caters for the experience or even the feelings and problems of the participants. The same holds for distance learning and e-learning, as is demonstrated below.

Hypothesis 7: Face-to-face learning, distance learning and e-learning are prototypes that are mostly found in hybrid form. Analyzing the respective specific features and comparative didactic advantages of these prototypes can help identify which mode plays a special role for what definite competency-building requirements.

Face-to-face learning

Face-to-face learning or education[13] designates the predominant pattern in learning cultures worldwide. People come together to learn, grouped around an older, experienced or even specialized professional who passes on his/her knowledge and competencies as a 'knowledge agent’. Today, high esteem is still attached to the function and position of these agents of knowledge in many cultures– in some cases they are elevated to an almost sacred status. This predominant form of learning culture is certainly rooted in dialogue as a specifically human form of exchanging information and knowledge. At least prior to the invention of the

[13] ‘Face-to-face' interaction seems to be a more appropriate term for the specifics of face-to-face learning than 'interactive learning', as e-learning also enables interactive learning.

letterpress and the mass circulation of books, as well as the literacy of broad sections of the population, there was no genuine alternative way of passing on knowledge.

The flip-side of these cultural and historical roots of face-to-face learning is its persistence as a learning model. Although various, often convenient sources of knowledge have been available for many decades already – at least in the developed countries of the world – hardly any *self-directed, autodidactic learning culture* has developed that could provide for a new rationale and didactically intelligent use of face-to-face forms of learning. Large parts of face-to-face teaching are still used for front-of-class knowledge presentation, as if nothing had changed in the last decades or even centuries, and as if there were no more didactically convenient ways of knowledge presentation today. Questions that are still virtually ignored are:

- Do learners really need to congregate to acquire new knowledge, abilities and skills effectively?

- What competencies can be developed without face-to-face interaction or with a scaled-down form of classroom teaching?

- What competencies can only be developed face-to-face? What are the disadvantages of this form?

An often overlooked problem with face-to-face learning is that face-to-face interaction is always only a direct interaction with one or a few learners, while the rest of the group (class, seminar participants) are obliged to listen. This is why classroom teaching tends to be a less cooperative form of learning, apart from approaches in modern vocational and technical activity-centred education. In her comparative study, the Canadian distance study expert Linda Harasim therefore asserts that

> "In typical face-to-face classroom communication, participation rates are unequal. Firstly, the instructor takes up most of the available class time. Class discussion, if and when this occurs, is often characterised by one or two students dominating the discussion with the majority remaining silent. In the on-line-courses at OISE, however, generally most students are participating and within each group the volume of contribution is relatively equally spread." (Harasim 1990, p.57).

An empirical criticism often levelled at face-to-face teaching, which mostly uses front-of-class teaching forms, is the high rate of forgotten content and the unintentional socialization effects of this teaching/learning method. Earlier investigations by the American Audiovisual Society have already pointed out that the sustainability of human learning (retention) rises sharply with the degree of learner activation. They estimate that we retain 20% of what we hear, 30% of what we see and 80% of what we (can) do ourselves (cf. Witzenbacher 1985, p.17; Gudjons 1992, p.50). The Munich psychologist Bernd Weidenmann thus observes:

"Every lecture, including transparencies or slides, could be replaced by a printed text or a diskette. Unlike the spoken word, texts allow the learner to adopt an individual pace of learning, process it in various ways and refer back to it at a later point." (Weidenmann 1995, p.26).

Heinz Klippert levels an even more fundamental criticism at mediatory face-to-face communication, where he highlights the unintentional – 'hidden' – educational effects of teacher-directed learning:

"To put it bluntly, what, then, is the actual educational effect of traditional classroom teaching and instruction? A very dubious ritual indeed is surely the dependence, uncertainty and thoughtlessness induced in the pupils. Many pupils ask themselves why they should give unnecessary thought to the subject matter, if the teacher selects and explains the essentials in the end and sets the test and exams accordingly? It is just this logic based on experience that inevitably leads to intellectual indifference and a creeping disenfranchisement. This criticism is admittedly harsh and pointed but it is nonetheless warranted. The recurrent complaints of many professors about their student's inability to study on their own is an indication as is the unmistakeable criticism by many (large-scale) enterprises of the scant personal initiative and methodological and social skills of apprentices." (Klippert 1994, p.18).

Accordingly, there is little to recommend the hypothesis underlying face-to-face learning that the best way to initiate learning is teaching. The attendant expectation that something that is taught can also be learnt. Only a fraction of what the teacher 'talks about' is actually also acquired by the learner in the long term. The unintentional side-effects of teacher-centred or leader-centred learning culture are also devastating. If we compare this with the activity-centred or 'life-like' learning methods (Arnold 1996) as widely advocated in modern corporate pedagogy, such as projects, business games, guided texts, teamwork with guided questions, etc., there is no reason to automatically assume that these methods are ultimately less important for developing sustainable specialist competency, if we consider the learning time that is 'wasted' by mediatory methods. Rather, activity-centred learning methods are characterized by a qualificatory polyvalence: they impart specialist knowledge and ability in a way that also enables the learner to develop methodical and social competencies at the same time. Activity-centred methods are part of a learning culture that is subject-focused while fostering activity and self-reliance, clearly anticipating the forms of cooperation and leadership that play a central role in modern work organization.

Implications for development cooperation:

Lively and cooperative activity-based learning can constitute a preparation for, and necessary accompaniment to, modern corporate policy which is of growing importance for international cooperation and the continuing education of change agents.

A comparative review and assessment of face-to-face learning or teaching, distance learning and e-learning should not cause us to lose sight of the above findings regarding the limited effectiveness and the unintentional educational effects of the familiar forms of face-to-face learning. As a rule, efforts to develop distance learning and e-learning courses are in danger of 'falling for' the teaching-learning illusion, i.e. the assumption that teaching is an indispensable and appropriate way of initiating learning. When applying these new forms of teaching and learning, account must be taken of experiences gained with self-directed, activity-based learning arrangements.

Hypothesis 8: Face-to-face learning frequently takes the form of front-of-class teaching. In this form, with its low retention rates, it is a very ineffective way of imparting content. Another, greater, problem are the (unintentional) educational effects, i.e. dependence, uncertainty and disenfranchisement of the learners. These tend to impair the development of methodological competencies for autonomous learning, which are essential for learners' personal development and their ability to plan their own lifelong learning. Experience with action-centred, lively and cooperative teaching-learning modes therefore also sets a major didactic benchmark for the use of distance learning and e-learning.

If we look at the specific features and comparative educational advantages of face-to-face learning and/or face-to-face interaction in learning processes, we have to concede - for all the criticism – that there are three competency contexts where the face-to-face relationship is indispensable:

- For one, this is the case in almost all measures where *psychomotor skills* can be imparted, acquired or habitualized via the sequence 'observation' – 'trial activity' - 'direct feedback'. These psychomotor competencies are particularly relevant in a vocational and technical education setting (e.g. skilled worker training, skill training), but also in sport and in parts of academic education (e.g. medical operation techniques). In these areas, favourable experience has been gained with computer simulations and/or virtual laboratories or workshops. Yet the 'real-life' setting, which is always a face-to-face situation, cannot be replaced by this kind virtual simulation, at best only supplemented. A metalworker can feel the resistance of the material only through direct contact and needs someone to watch and imitate to obtain the necessary direct and very specialized instruction in the use of tools, physical motion, etc.

- For another, the face-to-face relationship with a teacher, mentor or facilitator is also indispensable in all measures where the concern is *personal development* and *social competencies*. No-one can learn communication and cooperation abilities by studying documents or being in a chatroom. The same holds for other key qualifications, such as empathy, which are frequently more important, particularly in training and upgrading executives, than the acquisition of specialist knowledge about management techniques. The whole area of 'emotional competency' (cf. Arnold 2003; Golemann 2002) must also be considered. This competency can only be developed by someone who is ready and able to take a critical look at their own behavioural and response patterns and alter these in an often painful process by assimilating the critical feedback of a coach or the other members of the learning group. Developing intercultural operational competency also necessitates these kinds of self-reflective steps, which is why face-to-face contacts are indispensable here, too.

- Finally, we must not overlook that 'personal motivation' is a factor in all learning areas, also where knowledge is self-directed and can be acquired without the need for face-to-face contact. Topics can come alive when they are conveyed, explained and illustrated with personal enthusiasm. Ties between the teacher and the learner can often be established that foster personal development. In education, this is referred to as 'pedagogic relevance'. Nonetheless, this personal motivation does not justify the front-of-class, face-to-face learning method that dominates our education culture; it merely shows that other learning modes must ensure that they do not degenerate into impersonal learning bureaucracies, reduced to 'content and client management'.

Hypothesis 9: As a rule, face-to-face relationships are indispensable in learning settings that seek to develop behaviour. This applies in particular for the development of practical-professional abilities and skills in vocational and technical education, and also in the academic world. Where key qualifications are imparted and management, emotional or intercultural competencies are developed, too, personal contact between learners and teachers or facilitators is indispensable. Moreover, personality and/or the development of a personal relationship in the educational setup can play a *fundamental motivating role, engendering a sense of identification with and enthusiasm for the contents.*

Implications for development cooperation:

International HR development in development cooperation must be clear about whether, and if so how, it aims to develop the personality (e.g. ability to communicate and cooperate, emotional competency) and psychomotor competencies, where forms of face-to-face learning are almost imperative. There must be a candid discussion of whether and how far development cooperation, explicitly and implicitly, aims to establish a relationship with the donor country that can only be mediated along a personal-cum-pedagogic avenue, which would call for a complete reappraisal and new decisions on the shape of the resulting face-to-face contacts.

Distance learning

We are used to seeing distance study and face-to-face study as two opposing ways of organizing learning, where the dividing line is primarily the varying points where the boundaries between teaching and learning disappear. At the same time, education policy attaches great expectations to a convergence of the two alternatives, as indicated by the following statement by the Bund-Länder Commission for Educational Planning and Research:

“The further development of distance study also affords new opportunities for studying in an information society.” (BLK 1997, p.5)

Under ‘distance teaching’ or ‘distance’ or ‘private’ study, a publication from the 90s subsumes

“(...) all forms of teaching and learning (...) that allow for (and require) a didactic-pedagogic personalization of learning largely independently of time, place and personal mediation and at the same time entrust essential didactic functions of the teaching-learning process, such as the organization of subject matter, learning achievement tests, practice transfer, to media (text, audio-visual) and thus provide for guidance for the individual learning process.“ (Eckert 1994, p.32).

Here, the *disjunction of time and place in teaching and learning* in distance study is elevated to a didactic vision with far-reaching expectations attached to the scope for personalizing the learning process. The synchronicity and direct interactivity of teaching and learning, which is theoretically a possible, if not always practical reality of face-to-face study, is *implicitly* accorded a *benchmark status*: *We see distance study from a face-to-face perspective and therefore tend to perceive its implicit otherness as a deficient form of teaching and learning*. In other words, it is perceived as a form of learning that ought to be made to resemble face-to-face study as closely as possible by 'adding' social and tutorial components. In particular, 'distance' or didactic distance, the disappearance of boundaries and the time gap between teaching and learning are seen as a problem and great efforts are made to get rid of the 'distance' in distance study as far as possible.

Distance learning can already look back at a *long tradition,* also internationally. This tradition has always sought to overcome the 'tyranny of distance' (Northcott 1984). Distance was seen as a deficit which had to be overcome. The prime concern was to find out how to transform the distance in distance learning back into proximity. Or more precisely: What tricks can be used to do so (Peters 1997, p.36)? The history of distance learning is the history of these tricks. These efforts can be traced into the present and be divided into five categories according to Otto Peters, long-standing principal of Fernuniversität Hagen, a distance learning university, and former Chairman of the International Council for Distance Education:

- *Correspondence model*: Its precursors are correspondence courses – the term 'study letters' is still used today! – some of which can be traced back to the letters of the apostle Paul. The leitmotif of later correspondence courses, universities or schools was: overcoming physical distance and isolation through addressing the learner personally. This model was very successful particularly in the 19th century, following the establishment of a reliable postal system. Otto Peters takes a critical look at the 'correspondence culture' that lingers even today in long-distance learning courses and asks:

  > “(...) whether the feigned proximity and friendly familiarity are commensurate with the quite different atmosphere in institutions of higher education. How much does it help a professionally experienced student used to studying to have the contents presented in a personal manner and be repeatedly addressed in deliberately informally written study texts? (...) And how detrimental is it when these mechanical and frequently repeated forms of address start to grate?” (ibid., p.37et seq.).

- *Conversation model*: This model sought to assimilate the learner's perspective by drafting the study letters in the form of a didactic dialogue with an imaginary learner. The idea behind this guided didactic conversation (Holmberg 1985, p.26) was to create a kind of conversational atmosphere by using a clear, somewhat colloquial language (ibid.). Holmberg, who made this model known internationally, comes to the following conclusion in his investigations:

  > “Empathy and personal approaches are thus considered guidelines for presentation of learning matter in distance education.” (Holmberg 1989, p.51)

- Another model of distance education according to Peters is the *teacher model* (Peters 1997, p.41 et seqq.). This model typically tries to transfer as many of the usual teacher functions[14] as possible onto the study material or the additional video cassette, CDs or virtual learning platforms provided. Importance is attached to a learner-friendly layout and to gearing contents towards anticipated real-life settings and applications (e.g. case studies, situational relevance, self-testing assignments). These efforts have led to an important breakthrough towards providing a rationale for a separate distance-education didactics. There was a shift away from the simple - sometimes clumsy – attempt to move closer to the participant towards systematic research into *exactly how* to enhance the self-instructive impact of the material for the learner.

- The *tutorial model* attempts to design material that resembles a consultation, a 'tutorial in print' (Rowntree 1992, p.82). This model stems from the British tutorial tradition, where so-called 'fellows' - not the teachers themselves – provided counselling and guidance to new students. Peters points to the etymology of 'tutor' (Latin: 'protector') and argues that this model

  > “(...) basically calls on learners to get through the material on their own . The tutorial in print thus only performs an advisory function in cases where difficulties are expected to arise. (...) In this kind of procedure, of course, monologues and expositions as a teaching method are abandoned. The text is not supposed to present contents but to evoke the idea of a *conversation* with an imaginary tutor. Questions are posed, advice is given, views expressed and connections drawn." (Peters 1997, p.45)

- The *technology-assisted model* denotes all approaches to technically preserve normal teaching lessons in a face-to-face institution of higher education (audiotapes, CDs etc.) and supply these to external – i.e. absent – students. In this connection Otto Peters alludes to the audiotape distance study at Waterloo University in Ontario, which produces and sells about 90,000 audiotapes a year (ibid., p.46). This model deliberately refrains from a

[14] Otto Peters provides a supplementary and illuminating list to our previous considerations on face-to-face teaching and face-to-face communication, where he breaks down the following functional profiles for teachers: “Teachers

- arouse and direct the *attention* of learners,
- arouse and enhance *interest,*
- *motivate* learners,
- specify and provide the rationale for *learning goals,*
- remobilize *prior knowledge* with a bearing on the subject matter,
- present *teaching content* in a sequence of instalments that facilitates reception and understanding,
- repeatedly present difficult subject matter with particular clarity,
- give advice on the best way to learn the contents presented,
- verify teaching and learning performance through *feedback*,
- *practice* with learners,
- help them *apply* what they have learnt.” (Peters 1997, p.42).

special didactic preparation of the material for distance learners who do not come from the 'usual' student milieu, a restriction that may pose a problem in adult didactics, but may perhaps be warranted in financial cost-benefit terms.

Hypothesis 10: Distance learning has a long tradition and has gained diverse experience in handling teaching-learning measures that enable people to learn independently of time and place. In addition to correspondence course experiences originating from way back in the 19th century, models include the conversation model (guided didactic conversation), the teacher model, which has played a pioneering role in many respects (the material as 'teacher'), the tutorial model (tutorial in print) and the technology-assisted model. All these are guided by the inherent didactic concern to minimize or overcome the distance to the learner, which is seen as a handicap.

Implications for development cooperation:

For developing countries in particular, with the frequent large distances between educational institutions and prospective target groups, the distance learning model is an obvious alternative, as experience from many countries of the world shows.[15] Essential for distance education in developing countries, however, is the availability of a functioning postal system that guarantees the punctual delivery of the study letters and the assignments for submission – something that is lacking in many partner countries, or only available in urban regions at best. Nonetheless, for international HR development purposes we recommend stepping up collaboration with distance universities operating almost everywhere in the world and making use of these as distributive channels, developing them further in the process.

If we look at the advantages and disadvantages of distance learning compared with face-to-face forms of teaching, we can say this about the universities: The convergence of teachers and learners in space and time at a 'lecture' has been retained to this day, for reasons related to the resilience of cultural patterns. This is the case even though it has long been possible to present knowledge in ways that make better didactic sense and are better able to facilitate learning, and lectures have long since degenerated into a ritual of university didactic; not, however, the notion of disputation, which is increasingly in decline considering the masses of students that now populate our face-to-face universities. 'Distance' in distance education, which is treated as a deficient form of teaching in comparison with face-to-face teaching and learning, can be completely reinterpreted as a long overdue historical *opportunity to*

[15] Those worth mentioning include the University of South Africa (UNISA), whose roots go back to 1873 and which, with 130,000 registered students, accounts for more than a third of all students in South Africa and is one of the ten largest universities in the world. With 210,000 students, the British Open University also belongs to the world's largest universities, as does the China Central Radio and Distance University, which enrolled more than 600,000 students in 1986, to cite but a few examples.

supersede the synchronicity of teaching and learning in one place at institutions of higher education and universities, but not only there. Seen in this way, it is not the disappearance of 'distance' but the disappearance of (superfluous) proximity or better, 'presence' (in the sense of the unity of time and place in teaching and learning) that marks didactic progress on the way to a modern learning culture. From this paradigm, it is a very small step to the hypothesis that distance education is the future of face-to-face education, a hypothesis that is variously invoked in the relevant literature (Peters 1996, p.19) and that the BLK takes up in its already cited statement: “The further development of distance study also affords new opportunities for studying in the information society.” (BLK 1997, p.5).

Hypothesis 11: The ways of imparting knowledge in face-to-face education reach over into our current learning culture from a time when there was little 'intermediate memory'. The distance education approaches that make purposive use of storage media (print media, CD ROMs, etc.) thus also mark the future contours of face-to-face education (= hypothesis of distance education as the future of face-to-face education).

Proceeding from a definition of the organizational-didactic difference between proximity and distance in study courses as a key criterion for interactive opportunities (between teachers and learners), a detailed appraisal reveals that face-to-face and distance education both largely constrain or channel interaction and that 'distance' is a common feature of both. In both distance and face-to-face education, the planning of a course of study in particular is usually carried out without any interaction and coordination with the learners, quite unlike open adult education approaches or those geared to the participants or their real-life environment. Instead, the design, selection and didactic preparation of contents is carried out by the teacher or author and/or - in the case of distance education - the planner as part of the industrial production of a teaching course. Both 'construct' the layout for their course(s) and the implementation without any systematic inclusion of the user, naturally, however taking into account experience gained with previous measures and the anticipation of user interests. Nonetheless, it is valid to say that both forms of study involve *remote planning*. Neither face-to-face nor distance education is designed and conducted in direct exchange with the target group.

The actual 'distance' in distance study does not come into play until the measure is conducted. Here, the distance student is clearly in a different situation to the face-to-face student, without implying that this situation should be gauged as 'worse' or in some way detrimental as concerns its learning relevance. On the contrary, distance students have to rely more on themselves, since learning in distance education is less dependent on the teaching side than on the individual's ability to acquire the knowledge imparted, as the models outlined above show. To master the subject matter, however, distance learners must be skilled in developing information processing and learning strategies, which - incidentally - are qualities that have recently been accorded increasing weight on the labour market. The face-to-face student has initial difficulty in - and perhaps also lacks adequate opportunity for - developing these general skills and/or 'key qualifications'. Nonetheless, the face-to-face student can engage in dialogue and enjoy direct contact with the teaching staff. This opportunity to have a say in learning goals and co-shape the learning process is generally seen as an essential element in measures that aim at scientific education, not just at knowledge transfer.

But does education and competency-building really only take place in direct interaction at one place and time? Do they not take place *also and perhaps in a far more pronounced way when study is organized such that the learner first acquires, or must acquire, methods (accessing, presentation, documentation and learning methods) and undergoes what educational theory calls 'formal education'?* And are not study courses that foster the mental self-discipline of the learner thus ultimately 'closer', i.e. nearer to the learner and the development of his/her problem-solving competencies, if 'proximity' is understood not just in terms of time and place but also in terms of the directness of the educational effect? From this perspective, on second thoughts we must modify our initial analysis of the proximity-distance relations in distance and face-to-face education, especially as we have already seen that direct interaction in studying is not an end unto itself and that face-to-face study frequently fails to 'keep' its promises of interaction. The constant availability of interaction doubtless served a purpose historically (in the age of scant storage options), but we cannot retain the common forms of teaching and learning in one time and place for nostalgic reasons, only if they prove their functional worth anew. We are still awaiting the evidence.

Hypothesis 12: Face-to-face and distance study both contain didactic features of proximity and distance. If we do not confine our understanding of 'proximity' in teaching-learning processes to a time and place, but also bring it to bear on the directness of the - formal - educational effect (method competency, mental self-discipline, etc.), the impression of greater proximity in distance education cannot be completely dismissed (= hypothesis of the mixture and necessary redefinition of 'proximity' and 'distance' in studying).

In the following, I wish to consider more closely – on two other levels – the proposition that didactic aspects diagnosed at first glance as 'distance elements' turn out, on closer inspection, to enable a greater proximity between teacher and learner than some face-to-face methods:

- One level is the *transparency of the curriculum's content*. The content of distance learning courses is not derived from dialogue or in the teaching-learning discourse; it is structured more clearly in distance-learning material than in the logic and constraints of oral speech that are a feature of lectures and seminars. Distance-learning material also often contains carefully prepared transfer, exercise and reflective assignments that engage learners in a kind of virtual interactivity, calling on them to take a position. Viewed from this standpoint, the transparency and the virtual interactivity of study material often enables the learner to get closer *to* the subject matter and gain a deeper understanding of it; they can respond better to individual questions and learning difficulties that arise in submitted assignments, for instance, while the simultaneous mode of addressing learners in face-to-face study means that any response to an individual problem suspends the educational process for the other learners. The picture emerging, then, is *that distance study may well enable greater 'proximity' than face-to-face study, i.e. that it is closer to the substance of the learning process and the individual comprehension and assimilation problems of the learner.*

- Another level where distance study appears to have greater didactic proximity is that of *learner motivation*, and here I regard the distance-study mode as 'closer' as regards content and time. In many distance-learning courses the students have a broad choice from an overall curriculum; in compliance with general and formal requirements they can ideally compile the content of their individual learning programme to suit their interests and specific motives, which are often linked to their occupation. But even while already engaged in a course of study, they are not obliged to pay simultaneous attention, as they would be in a face-to-face setting, and need not 'take note' of everything if they are only interested in parts of the course or special aspects of a topic.

> This form of asynchronous use of a textually linear (as opposed to a temporally linear) course curriculum ultimately calls for greater structural adjustment in long-distance learning measures to suit the needs and requirements of the user.[16]
>
> On balance, the impression is that the learning type of self-directed learner is very widespread in distance study, but that this didactic environment is 'used' also by other learning types, including more conventional types (such as the teaching-learner). This *multiple use* is made possible because distance study is an externally organized form of self-directed learning.[17] Distance-education didactics must cater for different learner expectations and learning styles at the same time. The development of distance study into an independent study mode, which is a useful and welcome trend in many respects in adult didactics - and hence also into a role model for more self-organized learning in face-to-face study - must therefore also provide for learner types who employ learning strategies that are less typical of distance learning, but whose expectations also need to be met.

As already pointed out, we all tend to measure distance education against face-to-face study and against this backdrop, to conceive of it as a deficient mode of study. This also applies to the supposed sustainability of learning processes. Maybe because we ourselves have 'grown up' in a face-to-face teaching environment, in my view we are too ready to assume that solely or largely *verbal* presentation of knowledge necessarily results in its sustainable acquisition, a hypothesis that Klaus Holzkamp calls the 'teaching-learning short circuit'. In a 1996 interview we were able to conduct with him shortly before his death, Holzkamp pointed out that this kind of forced learning through teaching “(...) over the heads of the learners (prompts) above all opposition, refusal, evasion, where - assuming there is any learning going on at all - this

---

[16] As far as learning and learner motivation in distance study itself is concerned, in a Kaiserslautern study students from all disciplines stressed the motivational character of asynchrony. Particular importance was attached to the ability to schedule study-time as required and to be largely independent of a specific locality (93.1% and 85.3%, resp.). As to the framework conditions of study organization, 'sensibilities' varied by subject with *distinct differences between students with and those without a technical-scientific background*: The latter group, composed of students taking the adult-education and the total quality management distance study courses, rated the special didactic features of distance study (working with didactically prepared material, support during face-to-face phases) clearly higher than the students with a technical-scientific background on the one hand; but on the other hand they were also less ‘sensitive’ to the deadlines, performance requirements and learning goals in distance study; they were less interested in greater student involvement (e.g. in decisions on performance). *Altogether, our impression is that technical-scientific distance learners are more atypical, but more 'adaptable' (cf. Arnold/Lehmann 1997).*

[17] P. Jarvis stresses this aspect: “(...) it is only with distance education that learners are apparently free from the immediate presence of teachers. But, and necessarily, distance education institutions are very centralized in many ways, so there is no genuine learner autonomy in this form of education either.” (Jarvis 1995, p.139).

‘defensive learning’ is not geared to exploring the subject matter, but merely to ‘placating’ the teacher so as to avoid sanctions.” (Holzkamp 1996, p. 24). Holzkamp also alludes to the *scandalously low sustainability* of 'teaching-learning', comparing it against the model of 'expansive learning' (ibid.) that is more closely aligned with the questions and needs of the learners and their 'learning projects', as Holzkamp says.

In many respects, distance study follows the teaching-learning pattern but 'spares' (to use an expression by Bernd Weidenmann) the 'working memory' of the students and - unlike face-to-face study - gives them scope to acquire the subject matter at their own pace, enabling them to take their own time for a more in-depth and longer consideration of certain aspects. In this context, Weidenmann states that:

> “Language that is spoken and heard is ephemeral. The page of a book or a figure is different; I can look at them as long and as often as I wish. As a listener, then, I permanently depend on my short-term memory to connect the new information with the previous and current information. As I cannot remember everything at the same time, I must keep deciding what could be unimportant and what important. Perhaps I pause for some moments to decipher a statement or reflect on it myself. For a while, therefore, I cannot take absorb the contents of the lecture because the capacity of my working memory is no longer sufficient to absorb new information. I may then lose the thread. So I use up more capacity to work out what was said during my 'downtime'. As a result, I am again not really following for a while. Remember, all this is not a pedagogic accident: It is the normal consequence of the limits of the human working memory.” (Weidenmann 1995, p.56 et seq.)

This detailed description of the small steps in synchronous face-to-face teaching-learning clearly illustrates its structural limitations and the specific features that impair sustainability. These are largely due to the fact that people in a learning process are evidently hardly able to maintain continuous attention; rather, they learn *discontinuously*, which is why the study mode that caters for the discontinuous acquisition is also able to ensure more sustainable learning - at least in its basic approach. This assessment would also appear to be warranted because we have already known for a long time that sustainable learning (in the sense of retention) rises substantially with the degree of learner activity.

If we consider the qualitative and didactic advantages of learning supported by study material outlined so far, along with its suitability for adults, this hypothesis of the exemplary role of distance study for face-to-face study becomes apparent immediately. This holds in particular for the assumption that self-directed learning in distance study does indeed appear to facilitate the development of comprehensive competencies. Nonetheless, the expository and monocontextual spirit may be even more deeply inherent in distance than in face-to-face study, since information, facts and ideas are condensed into a script, which is uncharacteristic of the multiple perspectives and ephemerality that is increasingly a feature of our knowledge.

Hypothesis 13: The transparency of content and virtual interactivity of study material often enable the individual to get closer to the subject matter than is possible in the simultaneous mode of addressing learners in face-to-face study. In terms of learning motivation, too, distance study can come 'closer' to the needs and requirements of users. Finally, the possibility of asynchronous use of the course material is better suited to their time schedules and preferences (= hypothesis of the greater proximity of distance study to users).

If we choose the dual-mode strategy[18] of *dovetailing distance and face-to-face education* instead of *columnizing parallel structures*, I believe we can expect such a mixture not only to lead to a higher competency impact (self-organized learning), but also to a greater multiplicity of contexts in scientific learning. *Seen from this vantage point, i.e. in the dual mode, distance study can indeed serve as a model for scientific learning in a knowledge society.*

Hypothesis 14: Teacher-centred learning, the predominant teaching form of face-to-face study, is marked by a scandalously low level of sustainability. Due to its nature, spoken and heard language overtaxes the 'working memory' of students. The dual mode can therefore point the way to another future learning culture that can cater to both the advantages and the structural limitations (e.g. factuality of 'printed' knowledge versus provisionality).

E-learning

There is a Babylonian confusion of terminology in computer-based and net-based learning. We have computer-based training (CBT), computer-assisted learning (CAL), web-based learning (WBL) or online learning and/or virtual learning, to name just a few of the many different terms. In recent years, e-learning has gained increasing currency as an all-embracing category. This concept encompasses everything "currently (but also previously) available on the market for personal or organizational, local or distributed, synchronous or asynchronous, individual or collaborative, receptive or interactive (learning) (...), although these varieties can be more or less combined or integrated." (Bloh/Lehmann 2002, p.18).

The key advantage to e-learning is its independence of time and place, which enables users to avail themselves of the learning options in a fairly flexible and personalized way. E-learning

[18] In the international debate on distance study, the 'dual mode' denotes measures 'available' in both the face-to-face and distance-learning modes and where it is partly up to the students themselves what mode they want to study, or wish to switch between. Penn State University in the USA offers 'dual' programmes.

shares this advantage with distance learning, which is why we can argue that e-learning is an extension of distance study.

Hypothesis 15: Didactically prepared distance-learning material to facilitate learning is the precursor of a learning model that will constitute the future of sustainable learning: self-directed learning in a multimedia network.

Distance students also learn in an asynchronous way in line with their own time windows, and for this learning they need the self-study skills that enable them to explore learning contents independently while self-directing much of their preparation for exams and projects.

In the course of time different scenarios have emerged regarding the application of new media in education courses; they differ by their degree of virtualization. In the following we will look at two models.

According to Bremen (2002), there are three scenarios for media application that differ in the form of organization:

- At the first level, media can be used to support (traditional) face-to-face teaching (**enrichment approach**), where the multimedia applications are presented in a teaching environment or proffered for preparation and follow-on. In this approach, new media are used as distribution or visualization media and as self-learning modules for preparation and follow-on.

- At the second level, multimedia components are offered to complement face-to-face teaching (**integrational approach**). In this case, greater use is made of net-based communication facilities. This takes place in hybrid teaching environments, combining face-to-face and online phases.

- At the third level, multimedia substitutes face-to-face teaching (**virtualization approach**). Here, traditional teaching venues are completely superseded by e-learning measures (by virtual seminars, for example), although these are supposed to be underpinned by face-to-face phases (mostly at the beginning or end).

Lehmann (2002), in contrast, distinguishes four optional prototypes for the application of new educational media as part of the strategy development of a higher education institution or other adult education institutions:

Additive mode	Mixed mode	Semi-virtualized mode	Fully virtualized mode
Start up	Strategically important field of experimentation	Virtual training courses	Virtual education providers
Expanded interaction options Digital distribution **Supplementary virtual forms of contact offered**	Virtualization of individual **teaching events, subcomponents or courses** while retaining face-to-face teaching components	Virtualization of single or several **training courses** without alternative face-to-face facilities	**Fully developed education providers** All the functions of an institution are mediated by the web; the campus is 'defunct'.

Fig. 4: Development options of e-learning (cf. Lehmann 2002, p.231, modified)

- The **additive mode** is equivalent to a *digital declaration of intent*, an 'initial approximation to the information age' (Lehmann 2002, p.232).This primarily simplifies administration (e.g. by way of new, simpler methods of distribution) and expands the interaction opportunities (through e-mail consultations).

- The **mixed mode** is an expanded model of the previous forms of teaching and learning that combines virtual online with traditional face-to-face forms. The aim is to partake of technical changes in learning culture, round off content and improve quality (e.g. through tutorials).

- The **semi-virtualized mode** is meant to reach user groups in particular that cannot or do not wish to attend traditional educational institutions. Individual or several courses of study are provided exclusively online. This reduces space requirements, but the decentralized structures available can also be utilized more effectively in cooperative networks.

- The **fully virtualized mode** can potentially act as an agency for networking the mixed-mode components. This comprises the use of virtual teaching measures, but also the 'transformation of all the administrative functions' (Lehmann 2002, p.231). This can facilitate resource sharing (with other educational institutions, for example).

A comparison of the two models illustrates the ways multimedia teaching/learning measures can be used from a strategic-didactic perspective:

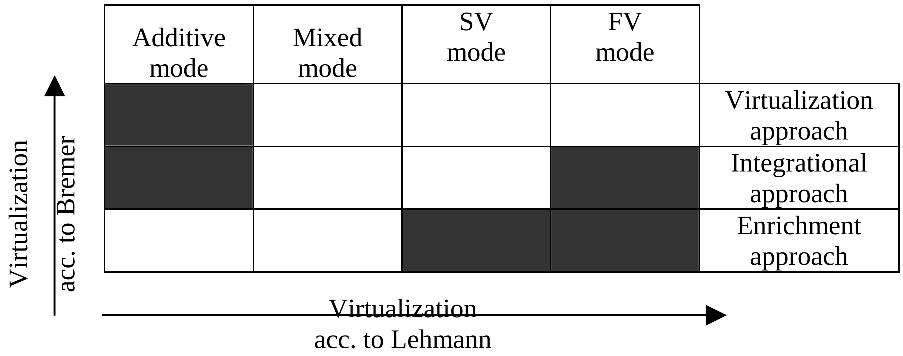

Fig. 5: Strategic-didactic options in multimedia teaching courses

Hypothesis 16: When using and implementing online-assisted forms of teaching and learning (e-learning), there are four different strategic development options, each with its own specific advantages, conditions for use (preconditions) and perspectives: (1) the additive mode (supplementary virtual facilities), (2) the mixed mode (parts of the measures are virtualized), (3) the semi-virtualized mode (virtualization of individual programmes) and (4) the fully virtualized mode (fully developed virtual courses).

Experience gained in recent years with the application of multimedia in teaching has shown that it is useful to combine the various teaching and social forms as well as different media into a media portfolio geared to the relevant target group in order to exploit the advantages of web-based and traditional modes of learning, and to create synergies. The following points are of strategic relevance:

- Need for learning advice
- Need to include forms of social exchange (cf. Döring 1999)
- Phased enlargement of media competency as the fourth cultural technique (cf. Baacke 1999)
- Adjustment of the teacher role and the role of those responsible for designing the teaching-learning arrangement

New media offer many opportunities for applying multimedia and telecommunicative learning. Studies have not, however, been able to prove that these applications are more efficient than traditional courses. In the USA in particular, many comparative studies on online learning and face-to-face learning have been conducted, largely in the university sector. Most found no significant difference in efficiency or only small advantages for online learning (No Significant Difference Phenomenon, Saba 2000).[19] Nor are the findings of research so far on hypermedia systems particularly encouraging, a fact frequently attributed to a lack of skill in handling new media (cf. Dillon/Gabbard 1998; Tergan 2002). In this connection, Kerres (2001) also sheds a critical light on frequently advanced arguments in the discussion on the advantages of new media. There is no clear empirical evidence that using new media directly improves learning motivation, learning achievement or the efficiency of education courses (cf. Kerres/Petschenka 2002).

These findings substantiate our hypothesis that the opportunities afforded by new media do in fact depend more on the didactic design of the learning environment than is often assumed.[20] This is corroborated by the findings of an extensive Australian study that reveals that high-quality teaching with new media is based on the same success criteria as in traditional forms of teaching, that is, on the didactic design and the didactic abilities of teachers (Alexander/McKenzie 1998, cited after Bremer 2002).

In our view, a problem with the use of new media is that many multimedia courses are modelled on traditional forms of teaching or learning. Using multimedia resources, they replicate learning from books or lessons already held by teachers. Learning media for adult learning requirements must, however, be designed quite differently. A major opportunity afforded by new media is the option 'for *another kind* of learning' (Kerres/Petschenka 2002, p.241); it is not enough to simply replicate traditional learning processes using new media.[21]

Implications for development cooperation:

This opens up diverse options for using e-learning for international HR development. Experience shows that in such contexts, it makes sense to start with the additive mode, where little or no experience has been gained so far in handling new educational media. In cooperation with national providers/sponsors, it is a good idea to experiment with mixed-mode projects

---

[19] See also: http://teleeducation.nb.ca/nosignificantdifference/

[20] In the study entitled 'An evaluation of information technology projects in university learning', over 100 projects applying new media in teaching were examined.

[21] Repeated reference is rightly made to the 'didactic deficit' in planning and implementing e-learning. This pertains to multimedia courses as much as those of face-to-face teaching. Learning measures with new media are sometimes measured against benchmarks that are tacitly passed over for traditional forms of teaching (e.g. learning effectiveness, efficiency, …).

(virtualization of subcomponents or single courses). From here, e.g. as part of a separate project component, one can then proceed to build up individual virtual training courses (semi-virtualized mode).

Experience indicates that the fully virtualized mode calls for several years of prior experience with e-learning. In addition, it is not absolutely necessary to develop and distribute full-scale virtualization in the partner countries themselves, since distance is 'disappearing' in development cooperation as well due to worldwide networking. We therefore recommend the centralized development of individual standard upgrading themes and making these available on a GTZ educational server. It is, however, also necessary to build up and maintain a support apparatus. E-learning is not electronic learning; we are still dealing with people who are learning,[22] enquiring and seeking contact – but at an electronic level. We need an apparatus with adequate resources.

4 Comparative advantages of individual forms of distribution

The design and use of all teaching-learning and distribution channels are subject to the so-called *implied didactic context* (Klafki 1985). This means that no form has greater didactic worth per se and can inherently ensure sustainable competency-building learning better than others. Rather, when adopting distance learning or e-learning forms we must proceed on the premise that any decisions regarding goals, contents, methods and media must be taken in line with a general set of aims. Changes to any parameters will affect the others and are not random (Jank/Meyer 1994, p.197). For this reason, Bloh/Lehmann are right to point out that

"(...) there is no reason to assume that (in the online sector) this general didactic argument should not apply and that the design of an online learning environment is less complex than that of a learning unit in the face-to-face mode." (Bloh/Lehmann 2003, p.56)

When looking at the *comparative advantages* of the three learning organization and distribution modes examined, we can say that the above-mentioned five principles of an

- active,
- self-directed,
- constructive,
- situational and
- social

[22] Also with the same cognitive and emotional mechanisms as in in face-to-face learning – a fact that is frequently overlooked and tends to be misrepresented by notions like e-learning, virtual learning, blended learning.

process (cf. Fig. 2) can (or cannot be) be brought to bear both on the traditional setting of face-to-face teaching and on distance study or multimedia settings (e-learning). Learning as a social process – as we know from interactive educational work - is certainly easier to arrange in traditional learning environments than with the new media, but – as already mentioned – e-learning also enables a relatively open social exchange in very specific forms, with their own opportunities and difficulties,[23] which poses the question of whether we should also make a fundamental reappraisal of the actual role of social relations in teaching-learning processes.[24] Making successful didactic use of the specific advantages of the new media is not just measured by the provision and demand for multi-media applications; we must also be assured that the learners actually learn in a sustainable manner that develops competency. Two-dimensional or three-dimensional graphics, colour figures, audio and video sequences, etc. can also be deployed to didactic effect in traditional learning settings with 'old' media. The personalization of learning paths, a purposive increase in social interactivity and 'practising' as well as the promotion of 'self-learning competencies' for self-directed lifelong learning can be achieved in traditional settings, but it is equally possible that they may *not* be (cf. Arnold et al. 2003).

If new media are added to existing methods, there is a danger that most attention is paid to the existing structure (e.g. information infrastructure). What is needed in contrast is a sustainable 'change in learning culture' (cf. Arnold/Schüßler 1998): *Only through a new learning culture can the use of multimedia facilities really bring added benefit.* We should not follow tradition too closely. Because certain teaching tasks are quite closely bound up with certain forms of event (e.g. introduction – lecture), when assessing alternatives it is easy to look less at whether they are best suited for the teaching task and more at whether they can do the same as the traditional teaching form in this context, with new options are first viewed through old spectacles. We overlook that perhaps the old form has already been obsolete for a long time and only persists due to the resilience of learning culture patterns.

Implications for development cooperation:

[23] On the problems with CMC (***C****omputer* ***M****ediated* ***C****ommunication*) see Döring (1999).

[24] Just as people do not learn in a sustainable way just because they more or less steer themselves through a learning environment, learning does not take place just because they come together in seminar room in a silent, sedentary learning setting. This is the assumption, though, when we require of the new modes of learning a stricter rationale than we do of familiar forms of face-to-face learning. The same applies here too: *Everything needs to be audited and matched against criteria, which in turn calls for a concept of sustainable learning that develops competencies in line with adult needs and conditions!*

> ***For international HR development this means adopting the principle of 'audit everything'! Only by auditing and assessing individual teaching and distribution forms on the basis of criteria can we really progress towards developing sustainable competency-building courses. To reiterate the point: Forms of face-to-face learning can be sustainable and can develop competencies, just as forms of e-learning and distance study can be less effective. In all their glory, new methods and resources should not blind us to the actual didactic challenge facing international HR development!***
>
> ***Nonetheless – beyond the didactic issue – there are also strategic reasons why using teaching-learning forms that are independent of time and place are particularly attractive for international HR development. These strategic reasons are related to rolling back 'travelling education and addressing participants directly and more conveniently using distance teaching and/or e-learning courses. This strategic use of new teaching-learning forms also makes sense because they make transfer easier, particularly in development cooperation. It calls, however, for HR development strategies that enable in-service learning. Supervisory and support facilities need to be developed and maintained, since self-directed learning in the distance or e-learning mode is directed by the learner, but he/she needs guidance and advice. The success of these kinds of measures – as international discussion has now established – depends on three factors: 1) support, 2) support and 3) support.***

Aside from didactic aspects, the comparative assessment of face-to-face teaching, distance learning and e-learning must therefore also account for strategic considerations in development cooperation. And it is precisely the latter that point to the high strategic relevance of stepping up the use of forms of distance learning and e-learning that are not subject to traditional boundaries. Based on a general conceptual design for adult education ('criteria for sustainable competency-building'), it is recommended to identify theme clusters where standard upgrading modules can be given a new didactic design and prepared for use in distance study or e-learning (e.g. project management, vocational training for instructors).

Decisions can be taken on the basis of the aspects compiled in the table below:

Mode	Typical features	Genuine advantages	Genuine disadvantages
Face-to-face teaching	People come together to learn, grouping around an older, experienced or even specialized professional who passes on his/her knowledge and competencies as a 'knowledge agent'.	- Comparatively low initial investments for new courses - Face-to-face contact and opportunity for direct social cooperation - Imparting psychomotor abilities in situational learning ('imitation', learning by watching and doing) - Personal development and commitment (personality as motivation factor, pedagogic relevance)	- Simultaneity (learning at one pace) guided by of a teacher-centred plan ('head waiter syndrome') - The much-praised interaction is often only a dialogue with one learner while the majority remains silent ('learning culture of the silent/sedentary listener'), although of course this effect can be avoided by an appropriate didactic-methodological scenario
Distance learning	“(...) includes all forms of teaching and learning (...) that allow for (and require) a didactic-pedagogic personalization of learning largely independently of time, place and personal mediation and at the same time entrust essential didactic functions of the teaching-learning process, such as the organization of subject matter, learning achievement tests, practice transfer, to media (text, audio-visual) and thus provide for (a) guidance for the individual learning process.” (Eckert 1994, p.32)	- General transfer proximity due to the learners 'staying' in their real-life setting and occupation (in in-service learning) - Learning content can be situated - Independent of time and place (asynchronous learning) - Unlimited number of participants possible in principle (industrial model) - Comparatively high level of self-directed learning (autodidactic learning)	- Higher initial investments (study material development, mentor system, etc.) - Ongoing 'renovation' investments (for updating study letters) - Operational postal service vital - Trend towards didactic 'staple diet' (the same for all) through standardized courses
E-learning	... can be understood "as a generic term for all variants internet-based teaching and learning measures" (Kerres 2001, p.14), i.e. *as learning in virtual information and communications networks (also using CD ROMS, videoconferencing, etc.).*	- Highly convenient layout and handling (convenience lead) - Transfer proximity possible thanks to learners 'staying' in their real-life setting and occupation (in in-service learning) - Learning content can be situated and personalized (through hypertextual multibranching) (face-to-face at a distance)	- Net access must be ensured - Permanent 'maintenance' of the learning environment (also for updating) and guaranteed tutorial system - Very high initial investments in comparison - Problems of net access and availability of efficient computers

		- Unlimited number of participants in principle (industrial model) - Independent of time and place (asynchronous learning) - Comparatively high level of self-directed learning (autodidactic learning) - Can be disseminated worldwide - Highly accessible in principle	

There is no doubt that the main advantages of using new media lie in their independence from time and place as contrasted with traditional (face-to-face) events. Moreover, the following specific advantages must be stressed:

- Convenience lead
- Easier to standardize
- Easy to reproduce
- Ability to activate

The major advantage of new media lies in the greater convenience afforded by this integration. This alone does not constitute a didactic advantage, but simply more convenient and faster utilization options. Due to improved standardization, learning contents can be used across institutions, through cooperation amongst the various educational establishments. Ease of reproduction facilitates the updating and 'maintenance' of learning contents, though only in the longer term. And finally, their activate potential offers an opportunity to reach new user groups.

The implementation of new media must, though, be in line with pedagogic *strategies*. That is the only way they can contribute to improving learning culture. One advantage of applying multimedia learning measures is the possibility of separating cognitive acquisition and practical exercises: if the theoretical foundation has been laid via online courses, teachers in face-to-face phases can concentrate more on applied teaching.

Finally, however, we need to mention that all the learning modes examined can have a very different effect on different learning types. The cultural factor also has a disparate effect. Comparatively few findings are available to date on the issue of how online learning is shaped by culturally patterned behaviour (Labour et al. 2000, p.6), but online tutors have observed that the following cultural specifics determine online communication:

- Choice of words
- Formality or informality of writing
- Amount of self-disclosure
- Amount of willingness to take risks by sharing ideas or comments (ibid. p.6-2)

Labour et al. summarise:

“What is not always immediately accessible to the reader are the cultural meanings that the participant wishes to convey in the message via the choice of vocabulary, syntax or metaphor, etc.” (ibid., p.6-3)

Considerations of this sort point to an aspect that is of fundamental importance especially for international cooperation. The way we handle the new learning technologies is subject to universal standards at first sight only; learning itself, i.e. deciphering, interpreting, acquiring and applying contents in the learning process, follows patterns that are subject specific (keyword: learning types) and culture specific (keyword: culturally patterned). The advantages and disadvantages of all learning and distribution modes must therefore be analyzed against the backdrop of the as yet modest research findings on the intercultural differences in learning behaviour and learning cultures.[25]

---

[25] One starting point here could be the earlier work of Renate Nestvogel (cf. Nestvogel 1982).

5 Outlook: Scenarios

The following scenarios are taken from cooperation in vocational and technical education:

End of long-term upgrading

Four technical teachers from a technical secondary school in Guatemala are to receive upgrading in Germany. The staff have serious misgivings because the instructors are dedicated colleagues who play a major role in school development. As if in answer to the problem, an offer arrives for a multimedia sandwich course from Inwent: a two-year programme made up of two distance-learning phases on technical and occupational education topics, and at the same time two six-week compact phases, one in Germany, one in Spain, to enhance technical skills based on the distance study course and try out/experience new didactic teaching methods.

The distance-study phases are under close guidance in an online tutorial system by a German and a Spanish university. Every two weeks, the participants must prepare assignments for submission for which they receive detailed feedback. They are also required to report and reflect on their experiences in applying what they have learnt in their school setting. To this end a chatroom is made available to them at certain times every week, where they can clear up questions and discuss problems with the tutor.

A condition for admission to the sandwich course is the release of the instructors from their duties for 15 hours a week. They undertake to pursue their studies in this time and not to engage in other gainful employment. All these details are agreed in an upgrading agreement between the German coordinating institution and the Guatemalan side.

End of ‘travelling education’

In an Indonesian project, all lecturers in occupational education are to be trained to professionalize local training centres for instructors and technical teachers. A four-month e-learning programme is chosen that provides texts, tasks and applied cases in a virtual learning environment that focuses on relevant issues in occupational, adult and university education. The participants remain in their positions but are released for study one day a week. After enrolment in the programme a training module is 'released' every month, where students work independently on text and assignment material on certain subjects and receive credit under a points system. At the same time they can communicate closely with their tutor at Inwent who inspects and comments on their work and discusses it with them. This tutor is not a regular employee but is specially contracted to function as a guide in addition to his normal occupation. The curriculum includes the preparation and adaptation of subject matter from a Swiss and Scandinavian university cooperating in this programme as part of a syndicate. Course credits acquired may be counted towards a Masters programme run by these universities using distance learning and e-learning. Each participant therefore has access to further education beyond this programme where they can obtain a university degree.

Sudan Council of Churches * Munuki Water and Sanitation Project

Small Projects'

Training Manual

Volume III.

Sanitation

by

Márta and Rudi Guóth-Gumberger

1987

0. Introduction

TABLE OF CONTENTS

0.2. Foreword

Two people are named as authors of this training manual; however, in reality it is the result of the work of very many people. We hope that it will serve a great number of people as well.

The development of the manual has a long history. We had the opportunity to work with the Sudan Council of Churches from 1982 to 1987, first in the Integrated Rural Development Programme in Yirol, and then in the Munuki Water and Sanitation Project in Juba, both in Southern Sudan. We had been assigned as Water Supply Coordinator (Marta) and Community Development Coordinator (Rudi). In the beginning we had background knowledge but little field experience. So we started to learn with and from the people and from the literature. At the same time we started training the people with whom we worked. In the beginning the training was exclusively on site. However, in the second project, the training became more formalised into a full two years programme of both class and field work. We began from the actual level of knowledge of the trainees without the assumption that "one should know this or that", and gathered whatever knowledge was necessary to do the project work together. Soon, compiling and distributing of written material became necessary, and so this manual was begun.

It includes many of our experiences in the water and sanitation work during the last five years. The bulk of the information was ready in first draft in April 1987. Photocopies were distributed to the participants of a three months training course. Contributions and questions from the participants were invaluable, and many sections were revised/improved. Actually, the manual would have never been written without the eagerness of the Munuki project's staff to learn. This interest made learning and teaching very enjoyable. After the training course, the entire manual was revised further and finally completed to the present version.

We thank our colleagues in the Munuki Water and Sanitation Project for all we learned from them, for their good cooperation and for their contributions to the manual. They are: Edward Lako, Arthur A. Columbano Lado, Rhoda Benjamin, Joseph Lado Lubajo, Joan Batul Eliaba, Simon John Lubang, Gloria Habakuk Soro, Paulino Onorato Legge, Prissy M. Wai Wai, Jackson Onan. We also thank the course participants from Swedish Free Mission and Sudanaid for their contributions. They are: Inga Andersson, Margaret Toya, Isaac Kajokole Kenyi, James Jamil, James Wani, Lona Kojo Michael, Julius Sebit, Erasto Tupa, George Mogga Wani, Elijah Biar, Rose Paul, Robert Otik, Rhoda Yangi Wesley, Quintino Pitya, Anna Itto Njimirano, Ben Juma.

We extend our thanks also to Tom Benton, Sr. Margaret Donohue RSM, Paul McGleenan, Paul Hiebert, Char Holcomb, Stephen Power SJ, Dr. Douglas Reitsma, Susan Sunflower, Dr. Ruth Goehle, Betsy Bascom, for the tiresome work of proofreading.

We thank Mike Gogonya, Hakim Benjamin and Stephen Hakim for many of the drawings.

We are also very grateful to Michael Kubrom Habtai who shared his office with us during the weeks of final revision and typing, made the SCC library available for us and encouraged us with practical help and supporting words.

We thank the Sudan Council of Churches, and especially the Deputy General Secretary, Kosti Manibe, for the generous support which made this manual possible, by providing working facilities, financial resources, an electronic typewriter and numerous other resources.

There are many other individuals whom we would like to thank for their helpful contributions, but who are too numerous to be named.

We apologise for mistakes which remain in the manual in spite of revisions and corrections, and kindly ask the readers to send any corrections, comments and suggestions about the manual to one of the following two addresses:

Márta Guóth-Gumberger, Rudolf Gumberger
Neue Heimat 5a
D-83024 Rosenheim
Germany
Tel.: 08031/81103
Fax: 08031/43695

Munuki Water and Sanitation Project
Sudan Council of Churches
P.O. Box 469
Khartoum
Sudan

For further copies of the manual please contact:

Publicity Office
Sudan Council of Churches
P.O. Box 469
Khartoum
Sudan

As this work would never have been possible by our own strength without God's help, so we hope that God will also protect and strengthen any persons who use this manual and any future work done with the help of this manual.

Khartoum, 11.11.1987
Márta and Rudi Guóth-Gumberger

0.3. Purpose Of The Manual

The following introduction should help the reader to orientate her/himself to the manual and make best use of it.

According to the title, this manual is intended for small development projects with 20 to 40 staff members. The administrative and organisational structures described correspond to this project size.

Secondly, this book is a training manual. It does not intend to present all the information available for professionals about a covered topic, but rather to select the most basic and relevant information about a topic. Then it arranges and presents it in such a way as to introduce a beginner, but also that a trained staff can find it helpful. The manual will help senior staff to organise and improve their management.

The aim of this manual is to train senior secondary school leavers to become skilled technicians in water supply and sanitation work, to run a store, to keep records and do qualified field work, or to become community development officers. They should be able to lead a team later on and to do basic work in administration.

However, the manual can serve different purposes as described below:

1. Training:

- It can be used by the trainee for self-study or as complementary material to the teaching in class.

- It can be used by the teacher/instructor as a guideline for preparing lessons in class about the covered topics.

- Some parts can be used as guideline for technical training for illiterate people.

- Some parts can be used as guideline for training sessions in the community.

2. Guideline:

- It can be used by experienced people as a help to develop and build up a new small project.

3. Reference book:

- It can be used as reference in day-to-day project work in the different covered fields.

- It can be used by the trainee for looking up particular information after the course.

- It can be used for revising previously acquired knowledge.

0.4. Possible Readers of the Manual

The manual provides material for a two years training course for several (technical) areas with 25% training in class and 75% training in the field. It is expected that not everything in the manual is for every trainee or reader.

The manual was developed in a water and sanitation project. Therefore, major parts deal with these subjects. However, many parts are of a more general nature so that they might be useful for staff of other projects, for churches, communities and development organisations.

In detail, material from the manual might be useful for the following groups of staff:

No	Staff or Trainees	Relevant Sections	Relevant Chapters
1	senior staff in management functions	1,2,3,7	4.18; 4.21; 5.1; 5.2;8.11 8.29; 9.8
2	administrative staff, typist	1,2	5.1; 5.2; 5.8
3	bookkeeper	1,5	2.9-18; 3.3-4; 7.2-12
4	community development staff	1,4,9	2.7; 2.11-12; 2.18; 3.1; 3.2; 3.11-13; 5.1-2; 5.8 7.1; 7.6; 8.1-11; 8.29; 8.33; 8.36-39
5	water supply staff	1,5,6,7,8,9	2.11-15; 2.18; 3,1-2; 3.11-13; 4,1-2; 4,15-16;
6	other technical staff like building staff	1,3,5,6,7	
7	storekeeper	1,5,6,7	8.32
8	logistics staff	1,3,5,7	2.18; 6,3-5
9	driver	1,3,5	2.18; 6,3-5; 7.6

0.5. Summary of the Contents

The manual consists of nine sections, compiled in three volumes:

Volume I **ADMINISTRATION** **and** **COMMUNITY DEVELOPMENT**	1. General Knowledge 2. Administration 3. Running a Vehicle 4. Community Development
Volume II **WATER SUPPLY**	5. Mathematics 6. Basic Technical Knowledge 7. Building Administration 8. Water Supply
Volume III **SANITATION**	9. Sanitation

Volume I contains the general parts combined with community development, volume II and III contain the technical parts.

The manual was divided into three volumes so that it can be used in parts and become more handy for the reader- Sanitation was taken as a separate volume, because many may be interested in this section alone. Still, the manual is one work and the different sections belong together. There are many references pointing to other chapters in a different volume.

The different sections are briefly introduced in the following:

1. General Knowledge

Relevant information not fitting into the other sections was compiled here. "Using a Dictionary", "Reading Techniques" and "Study Techniques" are useful for the work with the manual. "Private Budgeting", "First Aid" and "Applications" are also generally needed knowledge.

2. Administration

The basic administrative knowledge and procedures for a small project of 20 to 40 staff members are compiled here.

3. Running a Vehicle

Here everything which a responsible user of a vehicle - not a mechanic! - has to know in order to run the vehicle economically and to prevent unnecessary damages is compiled. The section is important for both senior staff or logistics staff and drivers.

4. Community Development

This section compiles basic information necessary for community development work, both of general nature and background information as well as practical procedures.

5. Mathematics

The manual is not intended to be a mathematics book. Therefore, you cannot find detailed explanations of mathematical principles. Rather you will find a collection of mathematical knowledge in recipe-style about whatever was found necessary for the project work - mostly very simple things and few more sophisticated.

6. Basic Technical Knowledge

Basic technical knowledge for the water supply and sanitation work is compiled here, "Basic

Technical Drawing", "Using Measuring Tools", "Tools", and "Cement and Concrete" being the most important ones to be studied first.

7. Building Administration

The specific administration necessary for construction work is described her, consisting of "Planning", "Record Keeping", "Cost Calculation", "Purchasing" and "Storekeeping".

8. Water Supply

The section about water supply starts with general knowledge about water, discusses the different well types, the selection of a well site. Construction of hand dug wells with concrete rings is described in detail. An overview about pump types is given; some of them are described in more detail, especially hand pumps, and basic plumbing is added. "Well Disinfection", "Water Treatment" and "Health Education" are discussed in the end.

Hand dug wells and hand pumps were deliberately selected as main topics to be covered. Other books (see bibliography No. 17, 18,35) cover these topics much more comprehensively; however, here the emphasis was to prepare training material in easily understood overviews and step-by-step procedures.

9. Sanitation

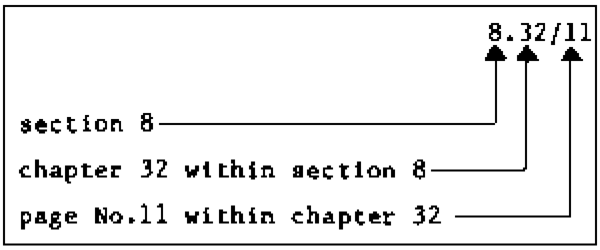
This section starts with general background knowledge about sanitation. The different types of disposal systems are introduced and guidelines for selecting the suitable latrine suggested. Deliberately, only sanitation systems without water were selected to be covered. Several are described in more detail. The main emphasis lies on compost latrines, including different designs, composting process, construction, operation and maintenance, and follow-up. Chapters about children's squatting slab, bath, waste matter and pesticides complete the section. Many parts of this section are suitable for training sessions about sanitation in the community or in schools.

0.6. Format and style of the Manual

As the purpose of the manual is to assist trainees, teachers and field staff, we put emphasis on giving it a consistent and easily understandable format. The colleagues in the project work found that providing structures was helpful, and they had no difficulties at all filling the structures with life and flesh. Therefore, the manual offers a lot of structures, forms, tables, boxes, and step-by-step procedures. This shall help to gain an overview about the field and to easily find the required information.

A) Format of the Manual

The page numbers on top of each page reflect the format of the manual. Each one of the nine main sections contains several chapters. Each chapter has one or more pages.



The introduction with foreword, etc., is added as another section 0. The appendix with bibliography, index, etc., is added as section 10. Section 0 and 10 are attached to all three volumes to help the reader use the manual. Thus, the volumes contain these sections:

Volume I: sections 0, **1, 2, 3, 4,** 10 Volume II: sections 0, **5, 6, 7, 8,** 10 Volume III: sections 0, **9,** 10

Consecutive page numbers at the bottom of each page run in each volume separately.

Each chapter starts on a new page. Both the title of the section and the chapter are named:

8. Water Supply

8.14. **Basic Plumbing**

Directly under this headline you will find one or several bible quotations in some chapters. These were used for the prayer fellowships which were an integrated part of the three months course, and are related to the topic where they are mentioned.

Usually, each chapter starts with a brief introduction as each chapter is an entity by itself and should be readable by itself. The material within one chapter is mostly structured according to the same system, for example, in the lesson "Basic Plumbing":

A) <u>Threads</u>

1. <u>Thread Types</u>

    a) Internal/External Threads
    b) Right Hand/Left Hand Threads
    c)..........
    d).........
    e).........
    f).........

2. <u>Thread Standards for Bolts and Nuts</u>

    a) Metric Coarse Threads M
    b).........
    c).........

3. <u>Thread Standards for Pipes</u>

    a).........
    b).........

4. <u>Pipe Measurements</u>

B) <u>Basic Operations of Plumbing</u>

1. Cutting with a Hacksaw
2. <u>Pipe Cutting</u>
3..........

C) <u>Pipe Joints</u>

1..........
2..........
....

Most lessons have only a structure A, B, C,... and 1., 2., 3.,... All titles are capitalised and underlined, as well as other important words within the text. All important messages are put into boxes. Step-by-step procedures are either numbered or put into a box with a separate column giving the reasons. All tables are in boxes.

As each chapter is a separate entity and can be used as a teaching unit, a continuous flow between the chapters is not maintained. Repetitions occur sometimes, otherwise, a reference refers to the relevant chapter containing more information about a certain point.

B) Language of the Manual

The manual deliberately uses simple English to explain a topic, to give trainees with limited English knowledge a chance. Simple sentence constructions were preferred to elegance of style. Some special vocabulary in the different topics was introduced, but always with explanations. Often another equivalent word is given in brackets, e.g.

"serrated (= toothed)",
"aquifer (= water-bearing layer)"

As the book is a training manual, no foot-noting was applied. We used drawings and information from books together with project experience and compiled them for the teaching purpose. The literature used and useful for further readings is compiled in the bibliography.

C) Drawings

Many drawings are added for illustration and easy reading. In the technical part, mostly proper technical drawings are used (such as cross-section, layout plan, etc.), because they convey the information in a more correct and complete way than other types of drawings. The reader/trainee not acquainted with technical drawings must study chapter 6.1 "Basic Technical Drawing" before reading. Experience showed that the trainees without previous technical training were soon able to read technical drawings. The drawings in the manual shall also give the trainee practice in reading technical drawings. Almost all drawings are placed below or beside the relevant text, although this way consumed more space. This shall ease the reading as well.

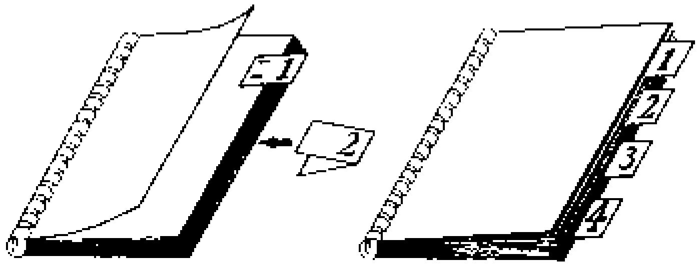
0.7. Instructions on how to Use the Manual

As not everything in the manual is useful for each reader, you need to pick what is interesting for you. Selection should be easy because of the provided structures. The following can help you to make full use of the manual:

1. Do not attempt to read the manual from the first to the last page like a novel.

2. Make yourself acquainted with the format and the paging of the manual (see 0.6).

3. Cut separation taps from carton paper for the different sections and glue and staple them to the title page of each section



4. Use the SQ3R-method explained in 1.3 to read the manual.

5. Read the table of contents and mark which chapters are interesting for you.

6. Decide which chapters to read first. Chapters 1.2, 1.3, 1.4, 5.1, 5.2, provide necessary

basics for further reading of the manual; for technical staff also 5.3, 5.4, 6.1.

7. Apply the SQ3R-method for each chapter as well. Read the headlines of the chapter first to get an overview, collect your questions about the material, etc.

8. Underline important key-words; write your notes, remarks and questions into the manual wherever needed.

9. Use the list of abbreviations, list of forms used, list of leaflets and posters, in the end of each volume.

10. Use the index in the end of each volume to quickly find information about a certain point.

11. Use the bibliography for further studies.

0.8. Instructions on how to Teach with the Manual

There are many books about how to teach, and teaching methods are not the topic of this manual. Thus, only a few suggestions are compiled in the following on how to teach with this manual (see also 4.14; 4.24).

A) General Learning Conditions

Help obtain good learning conditions:

1. Take special care that the class becomes a community, that the trainees get to know and respect each other, that they can mutually help each other. Fruitful learning can only take place in an atmosphere of cooperation.

2. Believe that the trainees are capable of learning. Trust is essential for encouragement and learning.

3. Take special care that the physical situation is supportive for learning: an adequate room, water, feeding, sanitation must be available. Involve the trainees by distributing assignments (fetching water, cleaning, organising food, etc.).

4. Take care that the trainees have sufficient materials like files, paper, pens, etc.

5. Arrange the class in the classroom in a circle whenever possible. This is the case for most of the chapters in this manual, except for the ones involving calculations.

B) Planning Lessons

Good preparation is essential for good teaching:

1. Take time for preparing your lessons. Roughly estimate as much time for preparation as for class time.

2. Plan the syllabus before a training course.

3. Each chapter in this manual is an entity by itself and can be used as guideline for a lesson. Some chapters may take several lessons to cover. Roughly, maximum five pages can be covered in a teaching unit of two hours.

4. Plan extra lessons in the beginning of the course just for explaining the syllabus and the format of the manual.

5. Plan enough time for evaluation.

6. When planning your lessons, mix the teaching methods: mix group-work with class discussions, calculations with explanations on a model, etc.

7. Have your teaching material (models, posters, etc.) ready before the lesson.

C) Teaching Methods in Class

A variety of teaching methods is suitable for teaching with this manual in class:

1. You can structure many lessons according to the SQ3R-method (see 1.3):

S = Survey:	Explain at the beginning what the lesson will cover.
Q = Question:	Ask the trainees if they have questions about the topic and note these down. Check after the lesson if the questions were answered.
R = Read:	Conduct the lesson. Explain the material.
R = Recite:	Let trainees repeat and explain with their own words what they have learnt and understood.
R = Revise:	Give homework, revise the following day or after one week.

2. Use group-work. Let groups of 4 to 5 discuss a certain question, try to read a passage or a drawing of the manual together, collect different aspects of a topic, etc.

3. Use discussion in the whole class to summarize group-work, to introduce something new, to explain an aspect relevant to all.

4. Use from time to time work on a certain assignment for each trainee alone (e.g. calculations).

5. Use role plays whenever possible (e.g first aid, interaction of technicians with the community, etc.). They are fun and very educative.

6. Teach by action whenever possible (e.g. cleaning and rehabilitating a latrine, safety measures, interview, etc.).

7. Include field visits into your training programme.

8. Use posters, models, actual examples, whenever possible. Many of the drawings in the manual can be drawn on big posters for use in class. Well construction work is best understood when demonstrated with small models. Bring pieces of material for everything you discuss in class.

D) Questions

Asking questions is a way to learn, for both the teacher and the trainee.

1. Encourage the trainees to ask questions.

2. Ask at the end of a lesson whether there are any questions.

3. Ask in the beginning of a lesson if questions remain from the day before.

4. If you cannot answer a question, do not pretend and dodge around. Admit it, look it up after the lesson, and answer it the next day.

5. Spend some time before and after the lesson in class to give the trainees a chance to ask.

E) Homework

Study on her/his own is essential for the trainee in order to be able to digest the material learnt.

1. Give homework to almost all of your lessons.

2. Encourage students to keep their homework well filed and organised with chapter numbers and headlines.

3. Ask trainees from time to time to prepare for a lesson on their own by studying the manual in advance.

4. Take time to correct the homework and return it as soon as possible.

F) Teaching Field Work

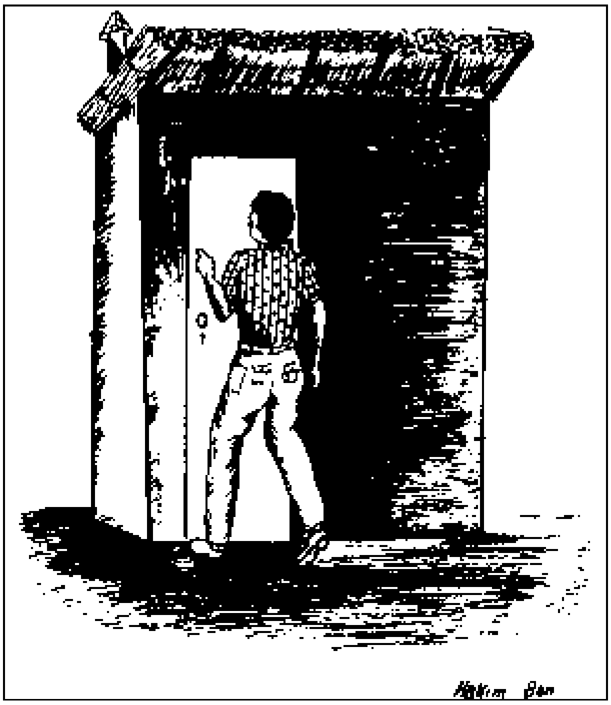
Some extra efforts in teaching field work will improve the results considerably.

1. Before you do a new type of work the first time in the field (like lowering concrete rings into a well), discuss the step-by-step procedures in detail in class. Use a model to illustrate the steps. This will help the trainees to keep an overview of the work. It will also help them see themselves as a part of the whole team and process rather than individuals doing just menial work. Discussion beforehand in class is better than trying to explain on the spot in the hot sun when half of the staff cannot hear you.

2. Sit down in the shade with the staff after having completed a new job or after something has gone wrong. Evaluate what happened by asking: What did you learn? What was new? What went wrong? What could be done better?, etc. (see also 2.7). This can help a lot how to judge the situation and how to improve techniques.

3. The same methods can be applied when teaching field work to illiterate people. Using models is even more important.

9. Sanitation



9.1. Importance of Adequate Sanitation

Everybody has to dispose his/her waste matter every day, not only faeces and urine (together called excreta), but also rubbish and other waste.

In each culture, ways have been developed to deal with this problem and in all cultures there are certain taboos regarding waste, and especially regarding defaecation and urination. Everywhere, also, the problems of health and pollution are present. Adequate sanitation means to deal with these problems in an effective way, that is find a solution which is harmless or even useful.

In order to do this, hygiene (= personal cleanliness) and sanitation (= public cleanliness) are equally important and depend on each other. Clean water supply, needed for health and hygiene, must go with taking care of excreta and garbage. If the connection is not considered, diseases spread easily. Therefore, sanitation is an important preventive health measure.

The importance of sanitation will become clear to people if health education and information are based on the daily life experience and practice. Change will only happen if it is convenient and the solutions offered are easy and accessible.

The following questions can stimulate reflection on the topic in a group:

1. Is food a need of your body?

   What are your efforts for satisfying this need?

2. Is water a need of your body?

   What are your efforts for satisfying this need?

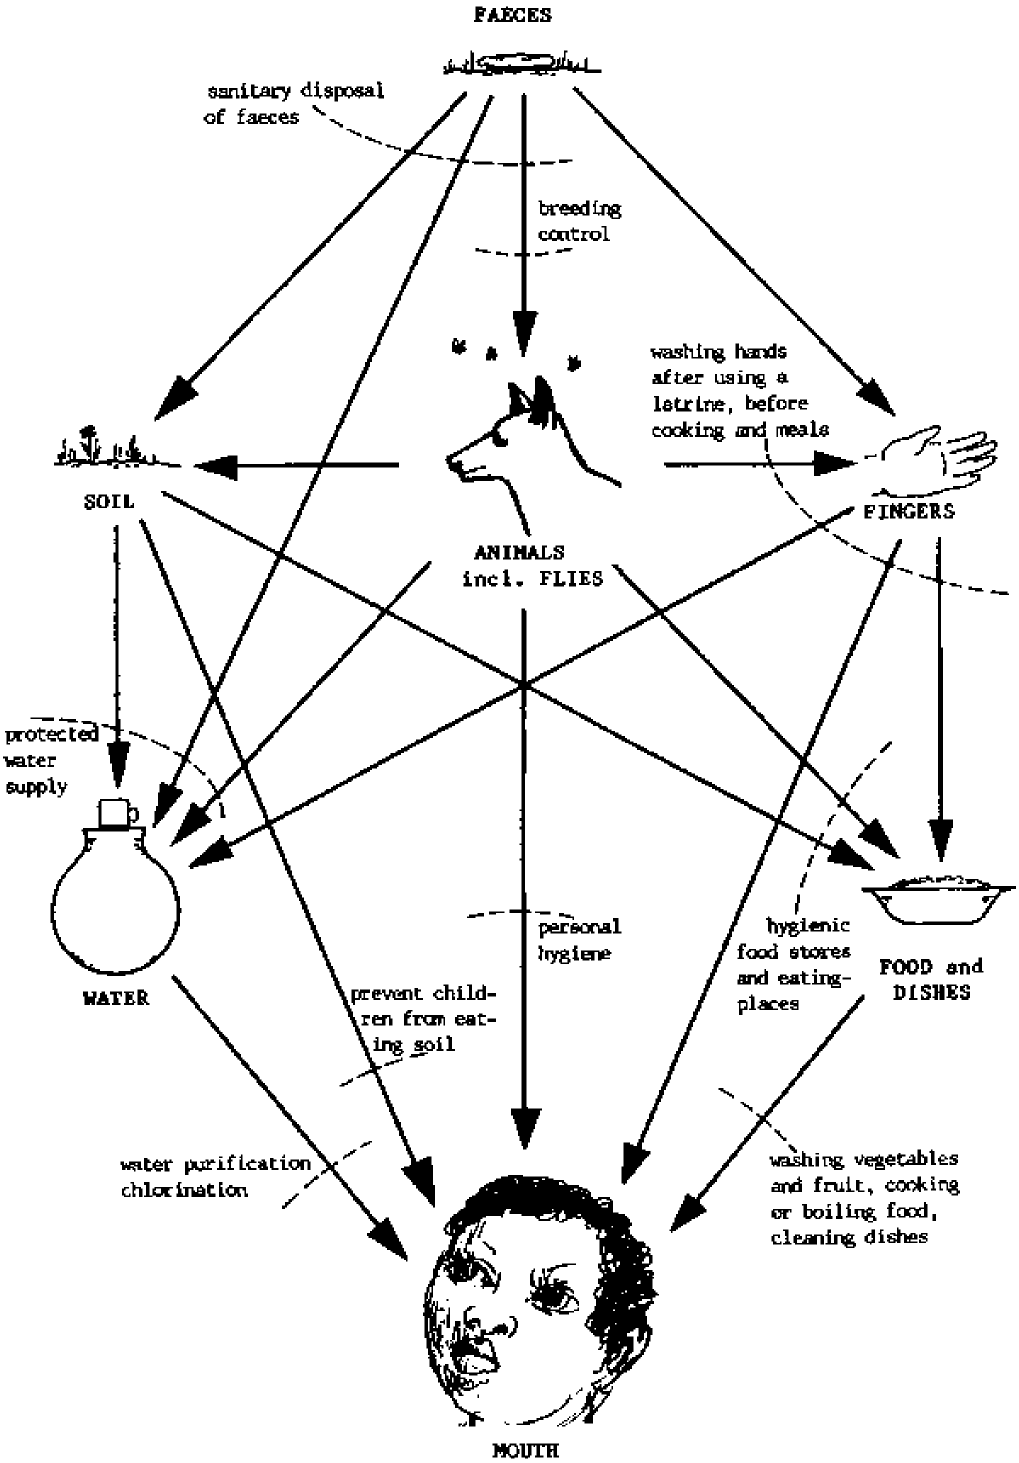
3. Is sleep a need of your body?

What are your efforts for satisfying this need?

4. Is defaecation a need of your body?

What are your efforts for satisfying this need?

The following picture explains the connection between sanitation, water supply and disease, and shows in which ways the transmission cycle can be broken:



9.2. Life Cycles

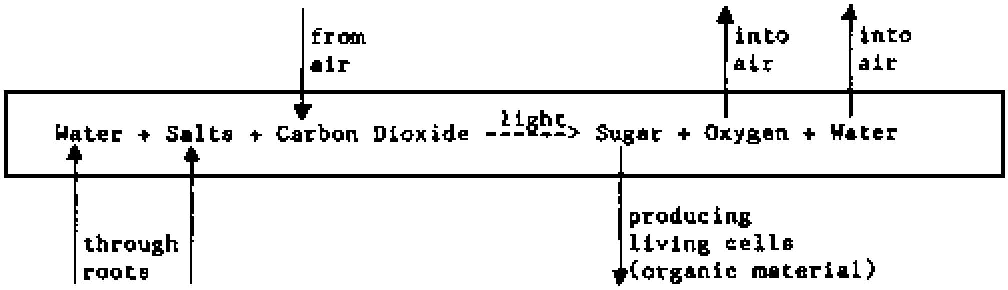
Jn 6,57; 12,24

The world was created in such a way that the different living creatures support and benefit from each other mutually. These processes are repeated again and again, they happen continuously in life cycles. If the life cycles are interrupted or disturbed, there might be no immediate visible reaction, but disastrous effects will show in the long run.

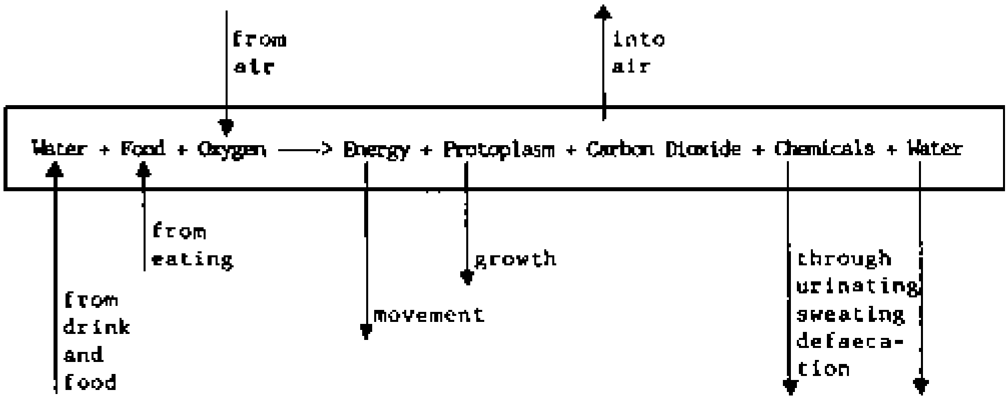
A) <u>Life Processes of Plants and Animals/Humans</u>

The two following basic (and simplified) life processes of plants and animals (including human beings) correspond and supplement each other.

1. <u>Plants: Photosynthesis</u>

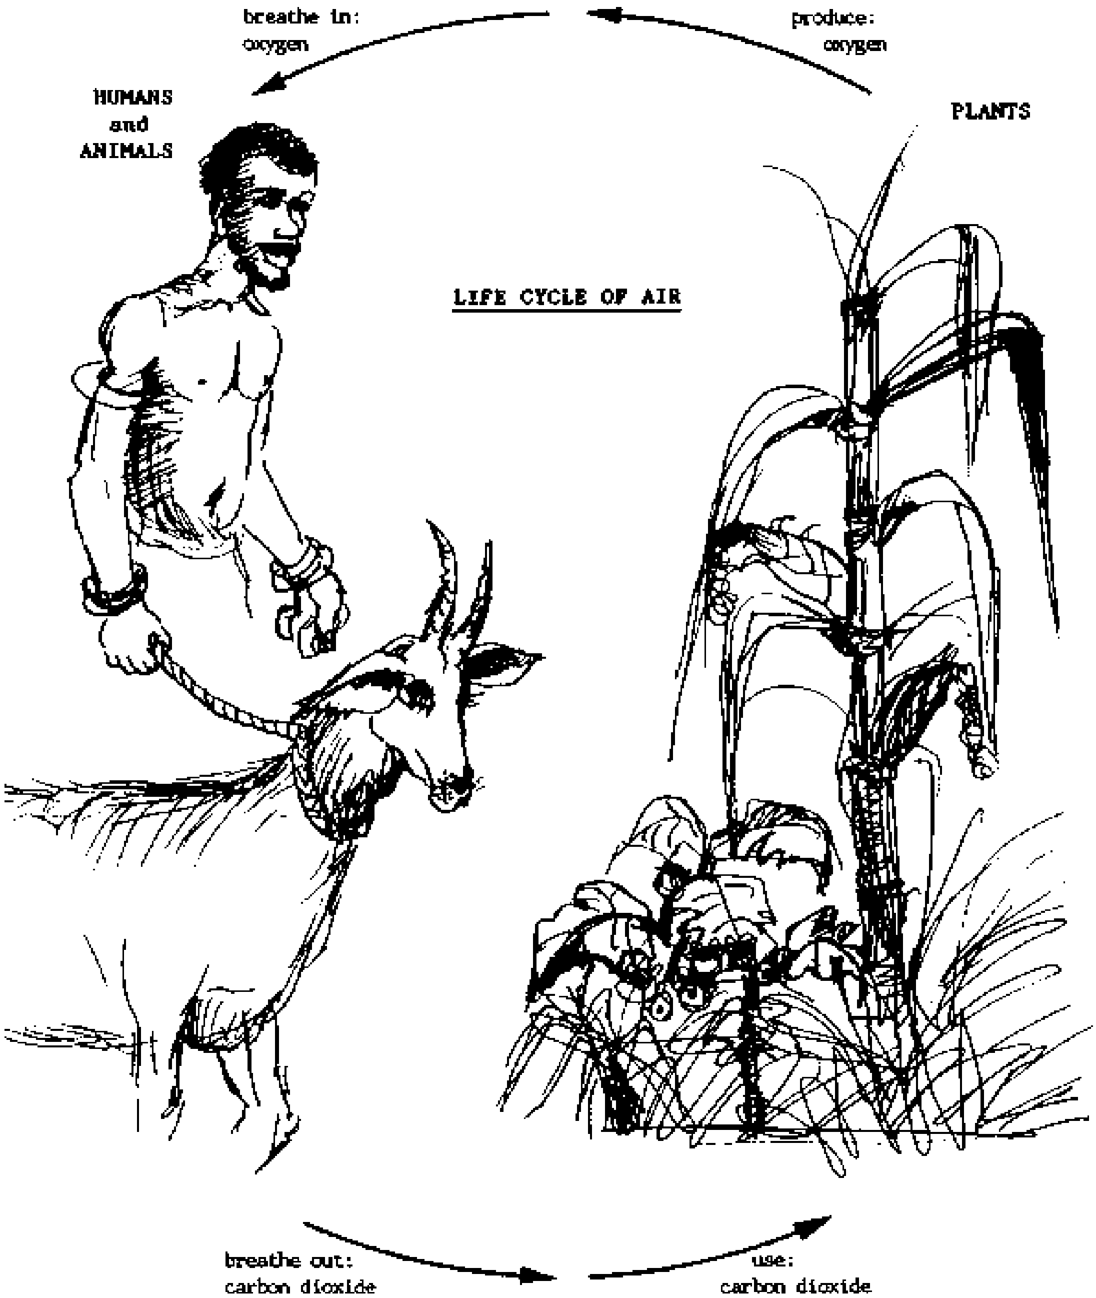


2. <u>Animals and Humans: Respiration</u>



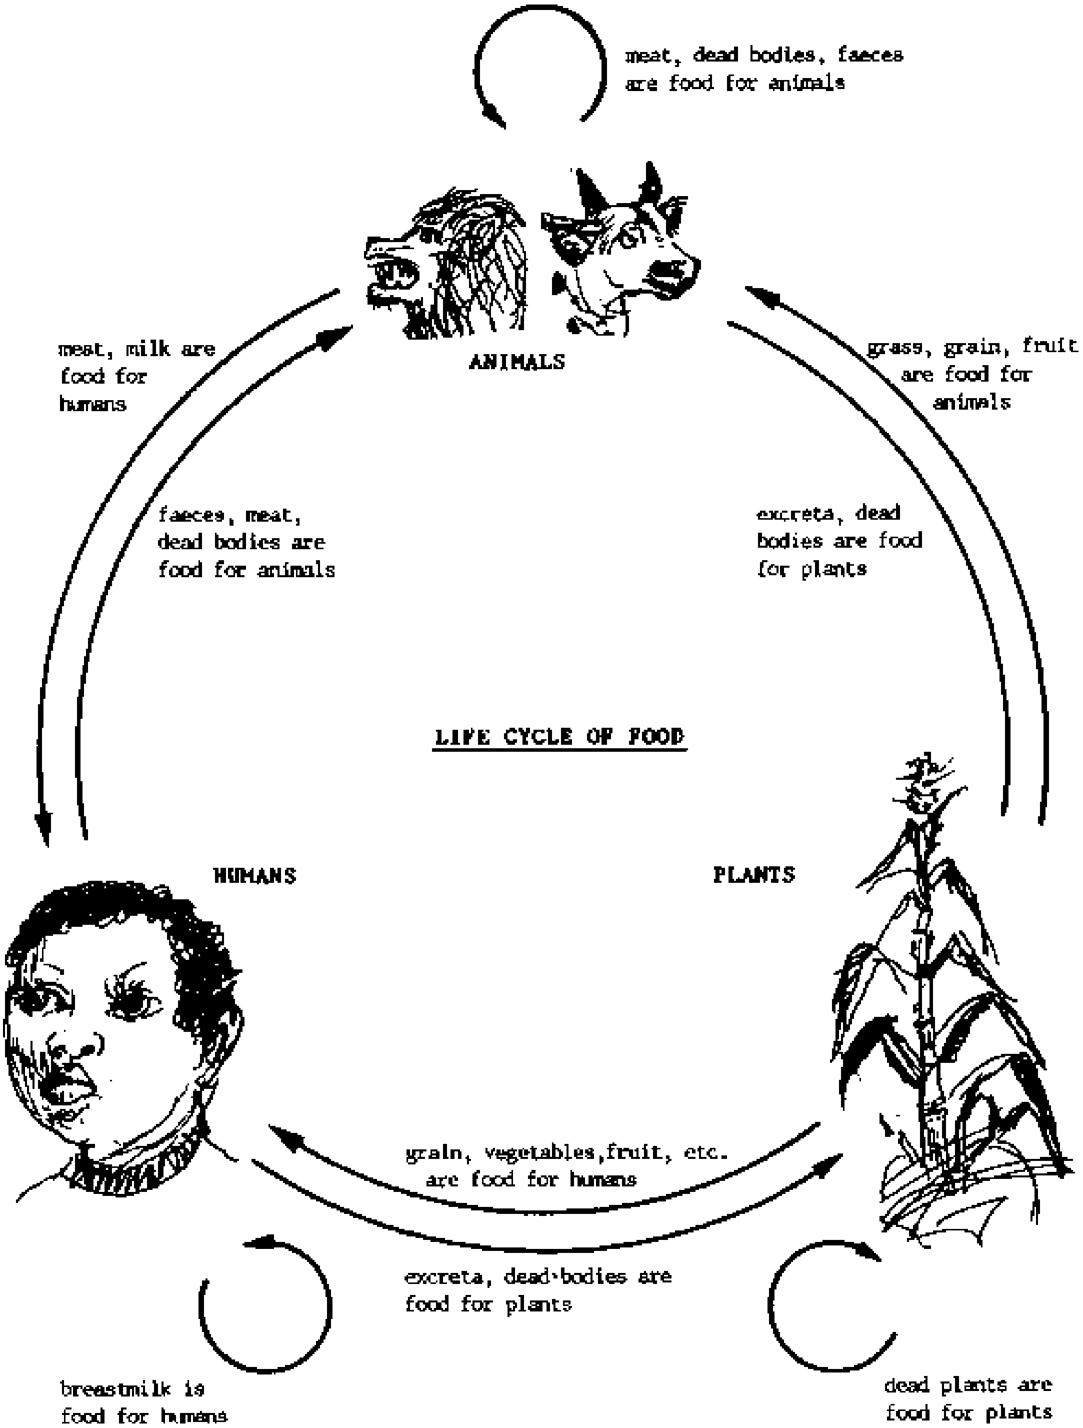
What is a waste product of the plant is a resource for the animal and the human being, and the other way round.

This fact can clearly be shown in the life cycle of air and the life cycle of food:



Therefore:

ONE CANNOT LIVE WITHOUT THE OTHER.



Therefore:

ONE CANNOT LIVE WITHOUT THE OTHER

B) Use of Human Excreta

Problems will arise if the life cycle is interrupted at any place. Using human excreta is one way of fitting into the life cycle.

The following is valid, when using human excreta:

	turns into	
Waste	------------------>	Resource

However, because of the dangers involved, we have to pursue a double aim:

Aim 1:	Avoid Harm	--------------->	Control Diseases
Aim 2:	Support Benefits	--------------->	Utilize Fertilizer

9.3. Flies/Mosquitoes/Cockroaches

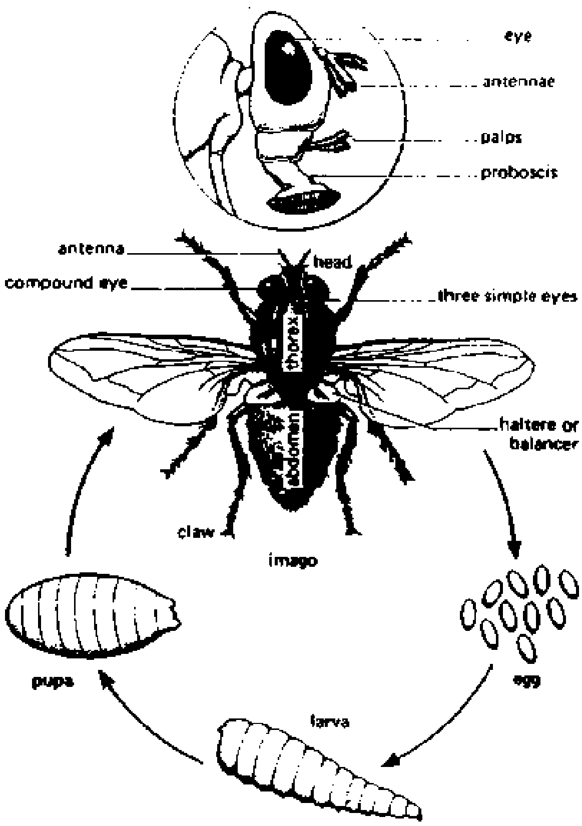
Waste disposal provides two attractive materials for the breeding of insects: rich organic material (that is faeces), and water. The presence of insects and other animal life in latrines is necessary for the break-down of the organic matter and changing it into safe manure. Problems occur if the insects leave the latrine and become carriers of disease (= vectors), either by carrying it mechanically or as hosts.

The three insects most connected with sanitation are:

A) <u>Flies</u>

There are eleven families of flies connected with waste disposal. The most common are the house fly and the blow fly. Their main breeding place is not latrines, but garbage, the house fly preferring more solid material, the blow fly more liquid one.

A female fly lays its eggs into excreta or garbage, about 130 in a batch and 21 batches in her lifetime, that is altogether about 2,730 eggs. After one or two days, maggots come out of the eggs, living on the waste. The maggots become pupae after about ten days and after another 3 to 6 days the adult fly creeps out of the pupa. It lives for about 30 days. The process of developing from egg to maturity varies according to the temperature between 12 and 46 days.

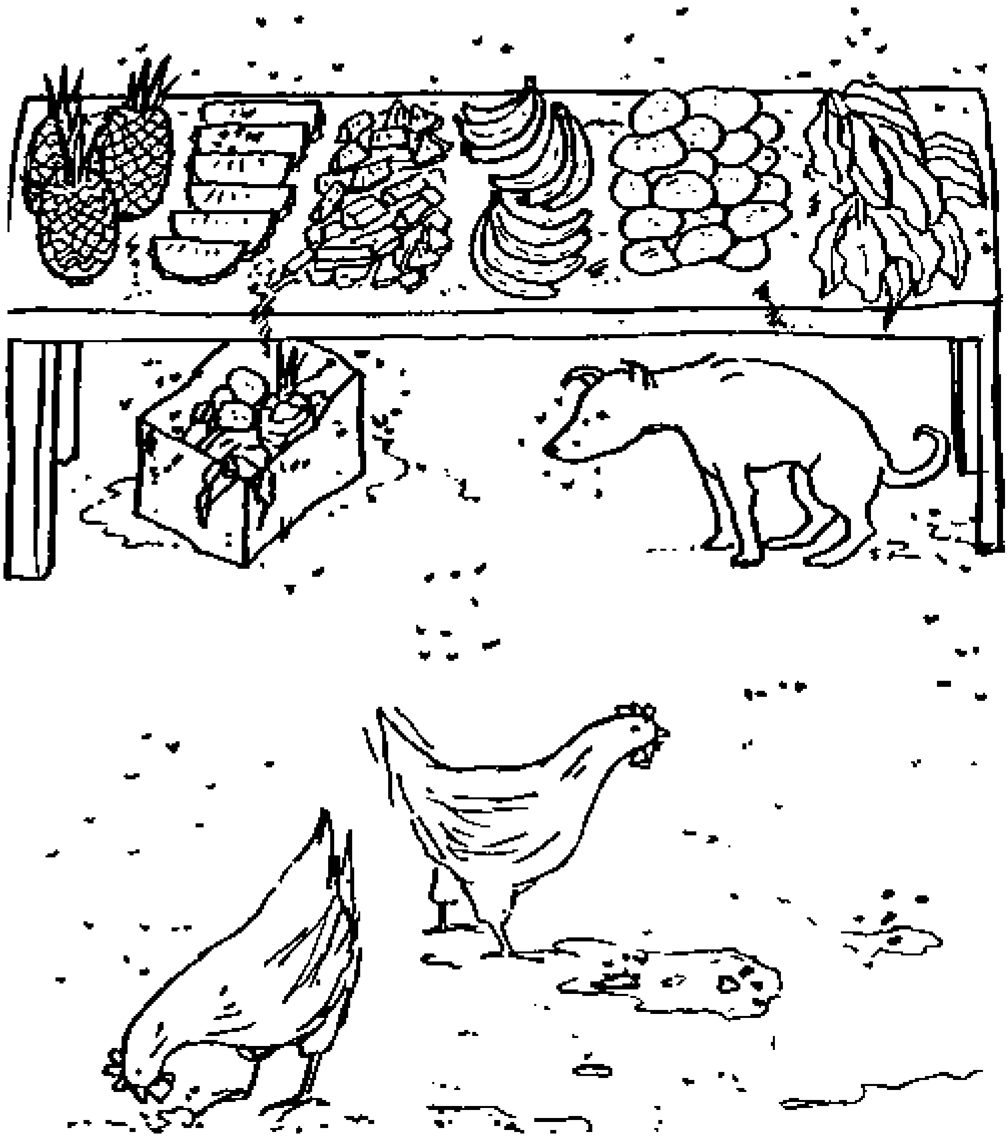


Flies can fly up to five miles in a day and, thereby, transmit diseases over quite a distance.

House and blow flies transmit germs and worm eggs by

- carrying them on the hairs of their feet and body,
- defaecating (every few minutes),
- vomiting.

Other flies transmit diseases by being hosts to parasites or germs and injecting them into the blood of a person when they bite, e.g. sand flies, black flies and tse-tse flies.



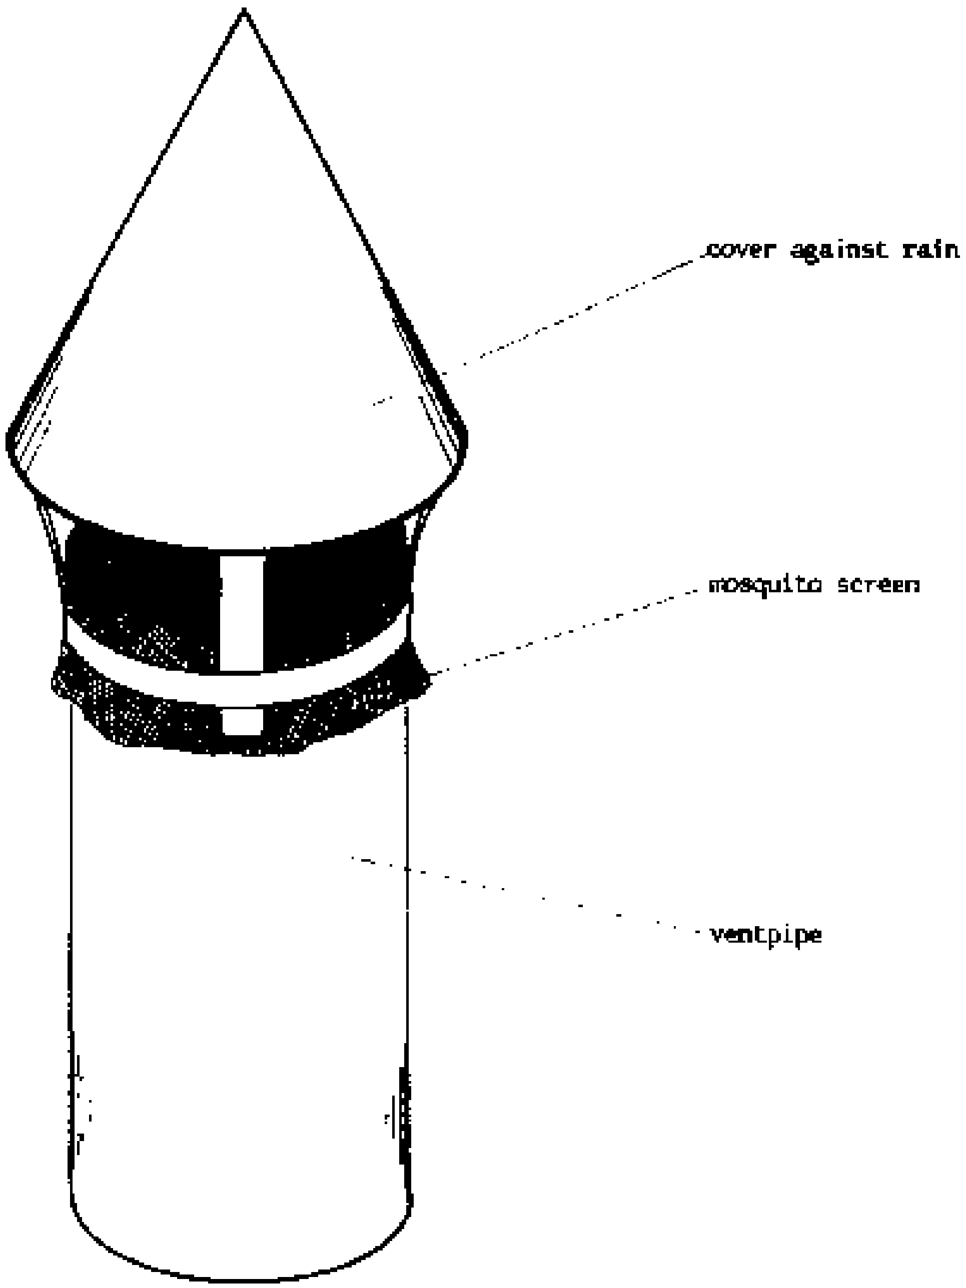
Flies can be controlled in the following ways, most effectively, if method 1 and 2 are combined:

1. Mechanical Control

- Keep general cleanliness.
- Eliminate breeding places, e.g. garbage heaps.
- Build and use latrines properly.
- Use screening, especially for places where food is kept.
- Use a fly-swatter.
- Build and use fly-traps:

Example 1:

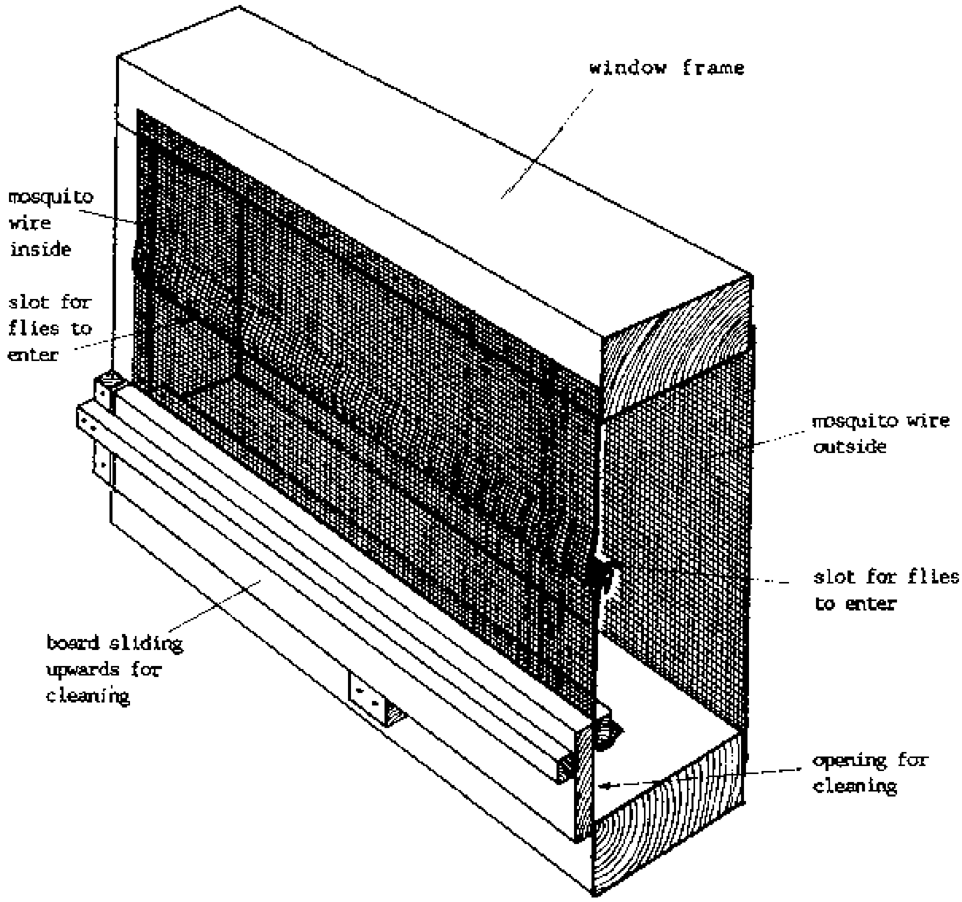
Screened ventpipe for a latrine



Example 2:

Fly-trap window in a latrine

ISOMETRIC VIEW OF CUT FLY-TRAP WINDOW

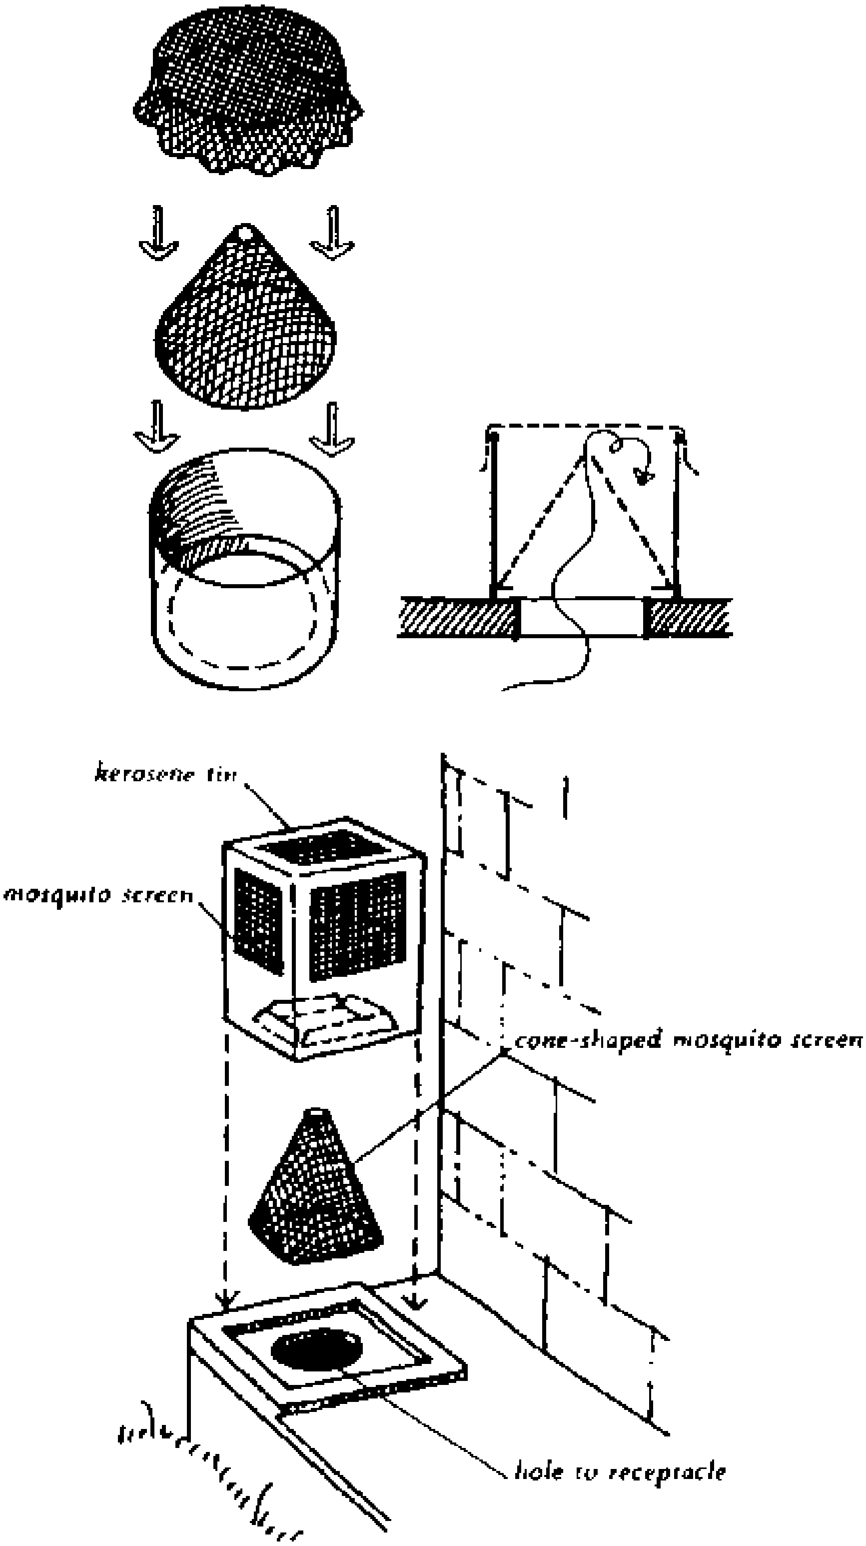


A latrine is usually dark, and the flies are attracted by the light falling in through the window. They enter the fly-trap in the window, cannot escape and die.

The trap is made in a very simple and inexpensive way. Mosquito wire is nailed on the window frame inside and outside. The flies will be trapped in between. The mosquito wire on the inside consists of two parts. They are nailed in such a way, that there is a little overlapping slot in between them, about 5 mm open. The flies will enter through this slot. Another slot of about 3 cm is left open in the bottom for cleaning out the dead flies. This opening is covered with a board, which can slide upwards to allow cleaning. The dead flies can be given to the chicken as food. Such a trap will not catch all flies, but most of them.

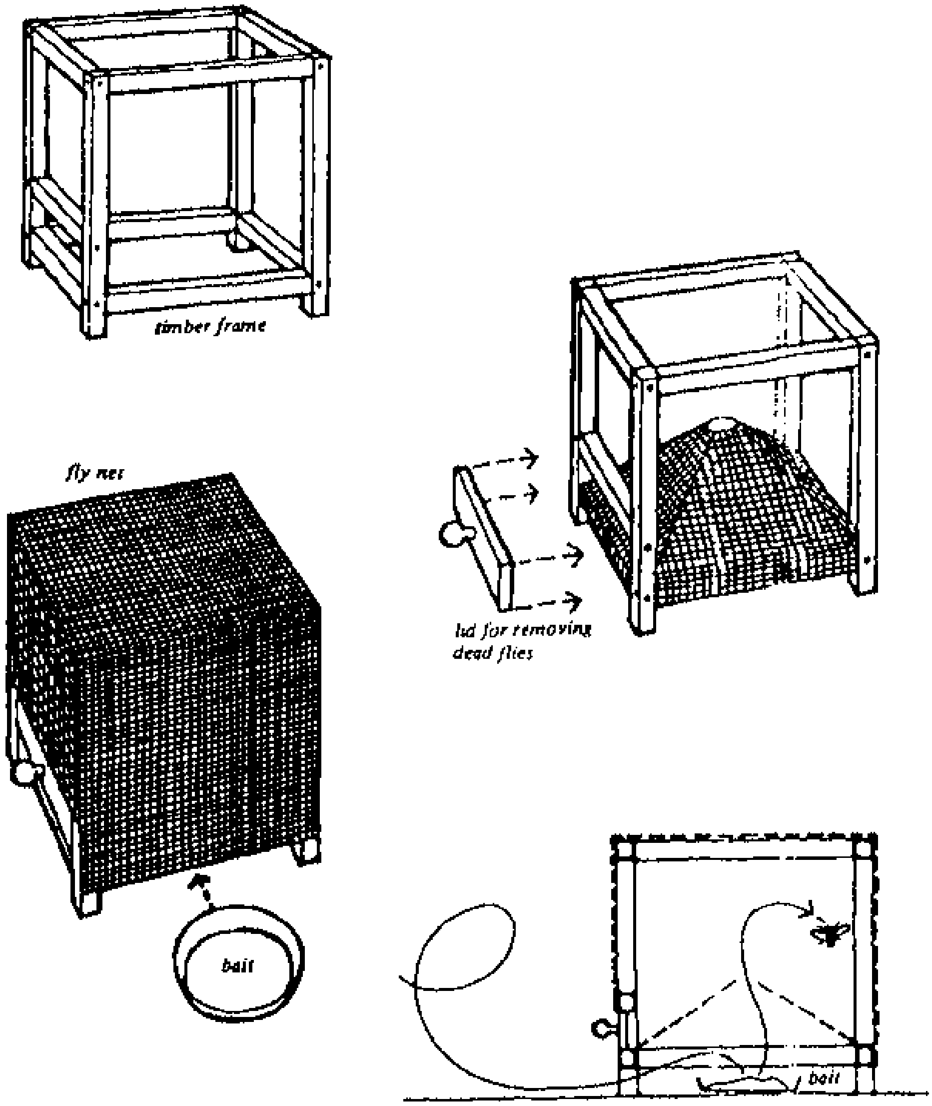
Example 3:

Fly-traps attached to the squatting hole of a latrine



Example 4:

Free standing fly-trap with bait



2. <u>Biological Control</u>

Encourage predators and parasites which live on flies (and mosquitoes) like frogs, lizards, chamaeleons, spiders. Also some birds live mainly on flies and mosquitoes.

3. <u>Chemical Control</u>

Using pesticides can be more harmful to human beings and domestic animals than it is for the pests they shall control. It will also kill the enemies of the flies and mosquitoes. The flies and mosquitoes will develop resistance quickly and will not be affected anymore by the poison.

If chemical control has to be used, take all precautions necessary (see 9.22).

4. <u>Thermal Control</u>

As 40°C is the lethal temperature for mosquitoes and 49°C for flies, burning rubbish or pouring boiling water over it will kill all eggs and larvae. However, this method is dangerous and of limited use, especially for compost latrines.

B) Mosquitoes

Mosquitoes breed in water and some kinds especially in foul water, that is flooded latrines, septic tanks, drains, etc.

There are two types which transmit diseases. That is Anopheles, transmitting malaria, and different Culicinae mosquitoes, transmitting filariasis, yellow fever, Dengue fever, and other virus diseases. The transmission happens when an infected mosquito (only the female) is sucking blood, which it needs to do before laying its eggs, and thereby, injecting the parasites into the blood stream of the person bitten. Other mosquitoes will be infected when sucking blood from this person, and then spread it to other people.

Concerning control see the chapter about flies. The most important is the eradication of breeding places (like filling up pools with standing water),keeping grass short, having screening in the house and keeping doors shut after dusk, and using mosquito nets in order not to be bitten and infected.

C) Cockroaches

Cockroaches need about 7 to 15 months to develop from egg into adult. They also depend on darkness. They are living on organic material and may move from waste matter to food if a place is not kept clean. However, no known disease is spread by cockroaches. They are not dangerous like flies, but rather a nuisance. The best control is to cover food properly to give them no access, and to keep the house clean, airy and light.

9.4. "Germs"

When talking about "germs" in connection with diseases, we have to consider different types of living creatures, most of them too small to be seen by human eyes (= micro-organisms).

They are as follows:

A) Bacteria

Bacteria are everywhere, e.g. 100 millions in 1 gram soil, and also in our bodies. They are adjusted to it and many are helpful and even necessary. We use bacteria, e.g. when making cheese or vinegar. Bacteria do most of the work to transform dead organisms into harmless matter. Most bacteria are not pathogenic (= causing disease).

Bacteria are distinguished as

- aerobic = needing air to live,
- anaerobic = needing no air to live
- facultative = living with or without air.

They reproduce by dividing themselves.

Their names are given according to their shape, e.g., bacilli are rod-shaped bacteria.

Diseases caused by bacteria are for example

- tuberculosis (TB)
- diphteria
- leprosy
- typhoid
- cholera
- tetanus
- pneumonia

- menegitis
- syphilis
- diarrhea (some kinds).

Diseases caused by bacteria can be treated by antibiotics like penicillin etc.

B) <u>Viruses</u>

Viruses are smaller than bacteria. They are consisting of nuclear material (DNA), enclosed in a coat of protein. They are parasites and cannot live outside living cells. They multiply rapidly by division.

Diseases caused by viruses are for example

- measles
- influenza (flu, cold)
- small pox
- hepatitis
- polio
- yellow fever
- aids

Virus-caused diseases cannot be treated with antibiotics, as viruses do not respond to them.

C) <u>Protozoae</u>

Protozoae are single celled small animals which can move. Amoebae are a kind of protozoae.

Amoebae divide themselves into either

- cysts:

  They are covered with a coat and carried outside the body. They are not harmful, unless they reach the intestines of somebody, where the coat breaks and reproduction starts.

- two new amoebae:

  Those divide again and again and live on the mucus covering the intestines. By that they destroy the lining of the intestines and cause bleeding. They move to the liver, but cannot infect other people, as they die shortly after leaving the body.

Diseases caused by protozoae are for example

- amoebiasis
- malaria (transmitted through mosquitoes)
- sleeping sickness (transmitted through tse-tse fly)
- giardiasis

D) <u>Worms</u>

Worms are animals, laying eggs. Some can be several metres long when living inside one's body.

Infection happens, except for the hook worm which comes through the skin, through the mouth by infected fingers, food or water.

The following diseases are caused by worms for example:

- schistosomiasis/bilharziasis (transmitted through water snails)
- filariasis (transmitted through mosquitoes)

- onchoceriasis (transmitted through flies)
- tape worm (transmitted through pig/cattle/fish)
- ascariasis
- whip worm
- pin worm

Clean water and proper sanitation plus personal hygiene and cleanliness are the best method to prevent most of the above diseases. If affected, get proper treatment by a trained person and take the full course of medicine prescribed as it was ordered.

9.5. Diseases Transmitted by Faeces

The following diseases are transmitted by faeces or urine in different ways (see also 8.6):

- polio
- hepatitis
- gastroenteritis
- cholera
- typhoid
- bacillary dysentry
- amoebiasis
- giardiasis
- worms
- schistosomiasis (= bilharziasis)
- filariasis and others.

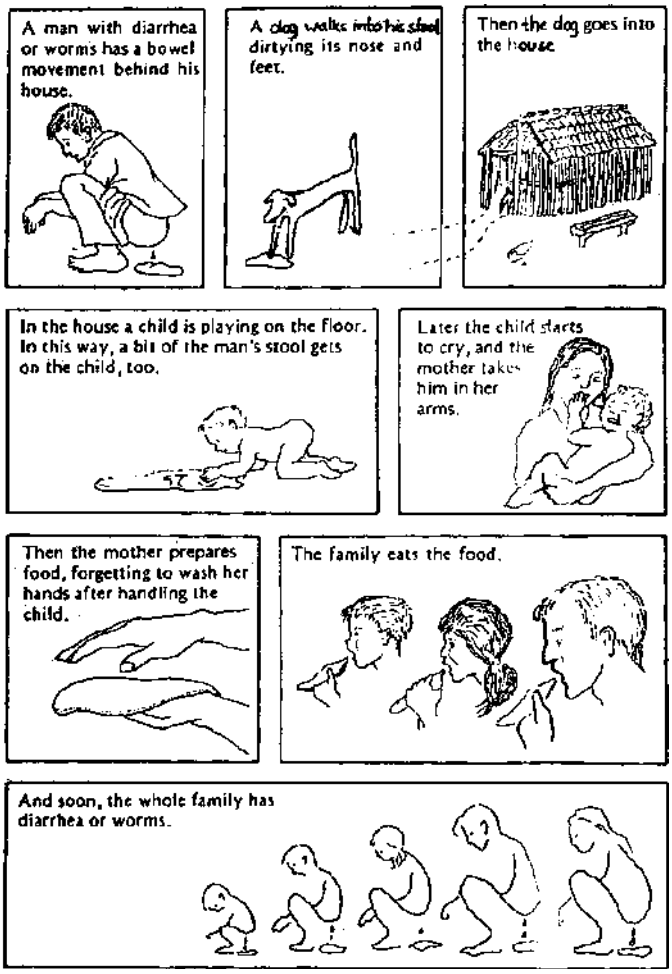
Therefore:

It is indispensable to dispose of human excreta in a sanitary way if we want to reduce and combat the sicknesses transmitted via faeces.

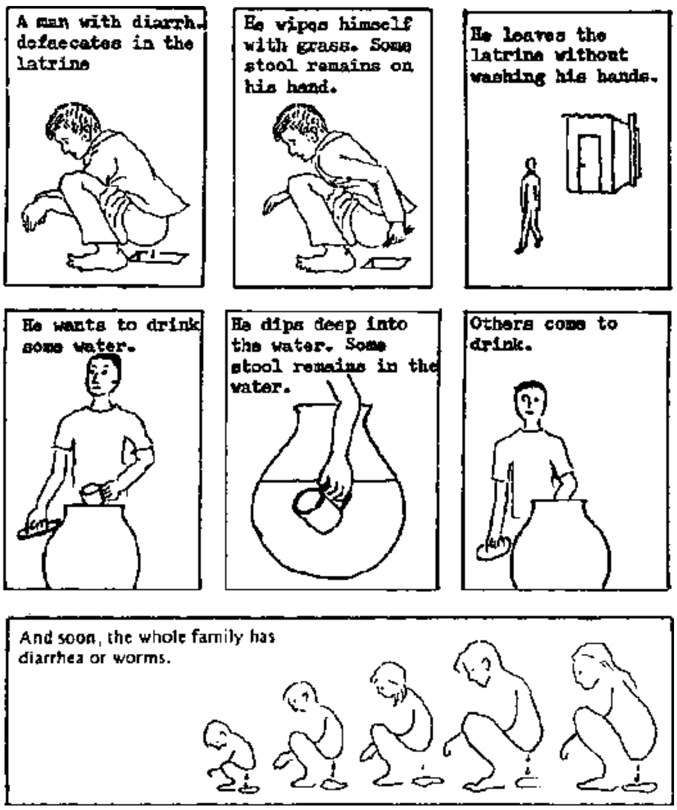
If you want to reduce your suffering from intestinal diseases and the suffering of your family, try to keep to the guidelines and suggestions in the following chapters.

Most time, you cannot <u>see</u> how the contamination is spread and reaches your body. It can happen for example in the following two ways:

<u>Possible Way, How Intestinal Diseases Can Spread</u>



Another Way, How Intestinal Diseases Can Spread (see also 8.38/1f)



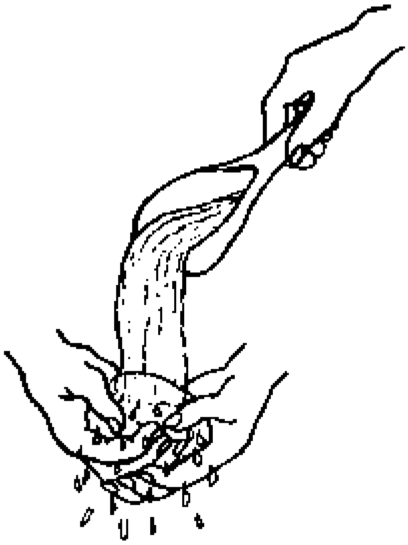
9.6. Basic Guidelines for Cleanliness (Hygiene)

Lev 5,2-3.21.24; 12; 15,7.8.11.12.15.31; Num 19,11.15.16.19; Ez 36,25.29;
Mk 7,14-23; Mt 15,2.10-20; Lk 11,39; Acts 10, 15.28: 11,8-9; 2 Cor 6,6

These are the most important guidelines to be followed:

1. Always wash your hands with soap after a bowel movement. Soap is cheaper than treatment of diarrhea. Have water and soap in or near the latrine, if possible, to remember easily.

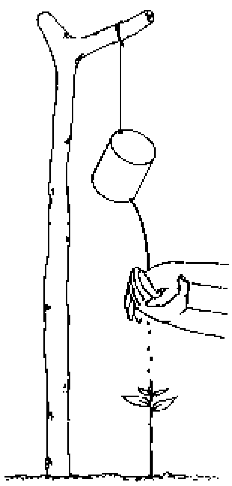
2. Always wash your hands with soap before the meals and not only afterwards. If you have no soap, use ashes. If water is scarce, use the "leaky tin" for hand-washing.



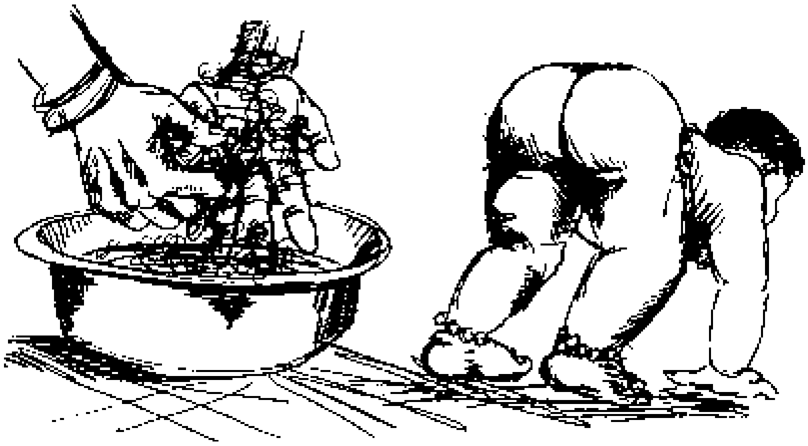
LEAKY TIN:

- Find a small empty tin.
- Punch a small hole near its bottom with a nail.
- Hang the tin from a branch or fix it on a pole.
- Pour only one small cup of water into the tin.
- Mash your hands in the fine stream of water leaking through the hole.
- Plant a tree seedling below the tin.

Design: AMREF, Nairobi



3. After cleaning a baby after a bowel movement, wash your hands with soap.



4. Bathe often. This prevents skin infections.

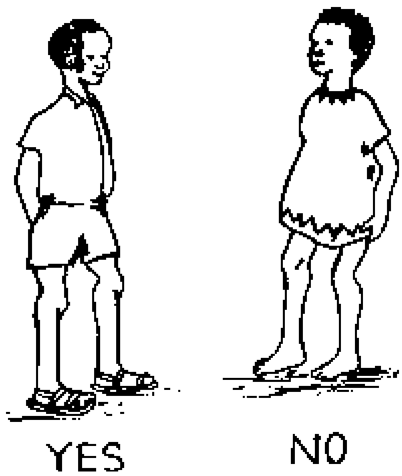
5. Brush your teeth every day in the morning and evening, and after each time you ate sweets as soon as possible.

6. Cut your finger nails short.

7. Do not spit on the floor or wall inside the house. Spit can spread disease. Cover your spit outside with some dust.

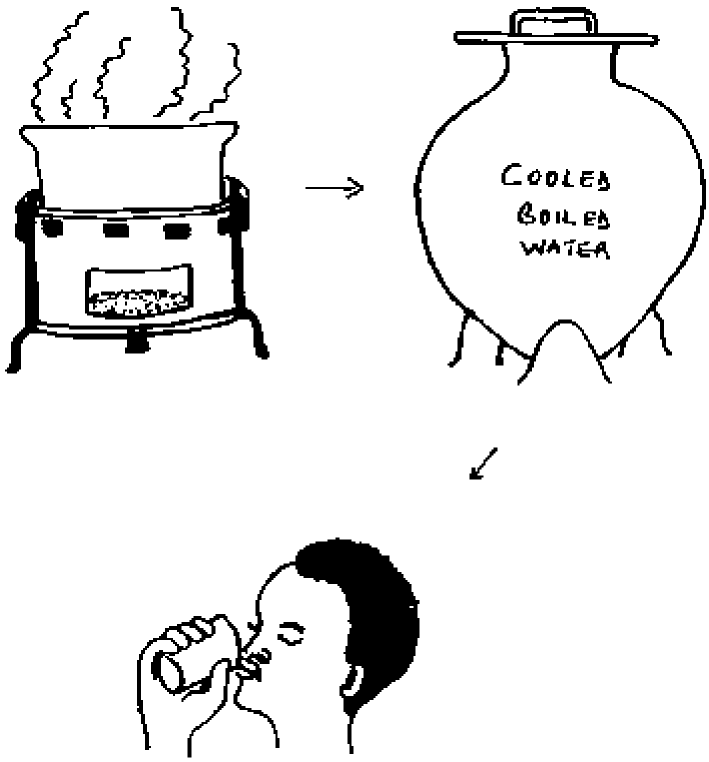
8. De-louse the whole family often. People with lice should cut their hair short, comb it several times per day and wash it with soap. Against clothes-lice boil the clothes and iron it. Lice and fleas carry many diseases.

9. Do not go barefoot or allow children to do so in areas where hook worm or sand fleas are common.

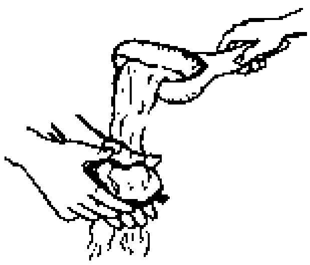


10. Do not let dogs or cats lick children or climb up on beds or tables or come near to the cooking place. Dogs and cats, too, can spread diseases, especially worms.

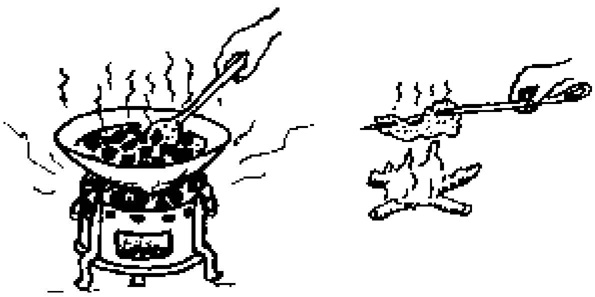
11. Drink safe drinking water (from a safe source or boiled and not contaminated afterwards, from a clean cup).



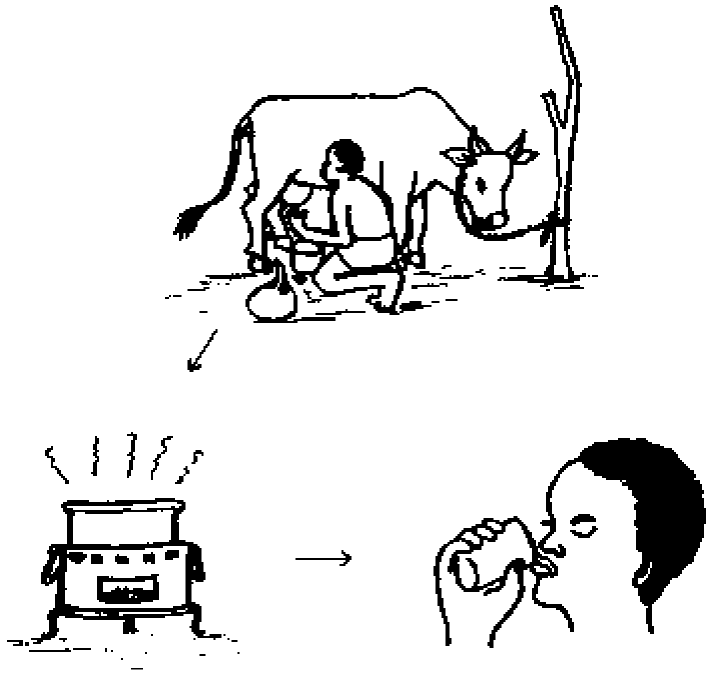
12. Before eating fruits or vegetables, wash them well with water you can drink safely. Insist that children do the same.



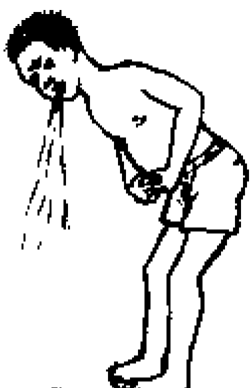
13. Only eat meat that is well cooked or roasted. Be especially careful with liver and intestines.



14. Drink only milk which is boiled.



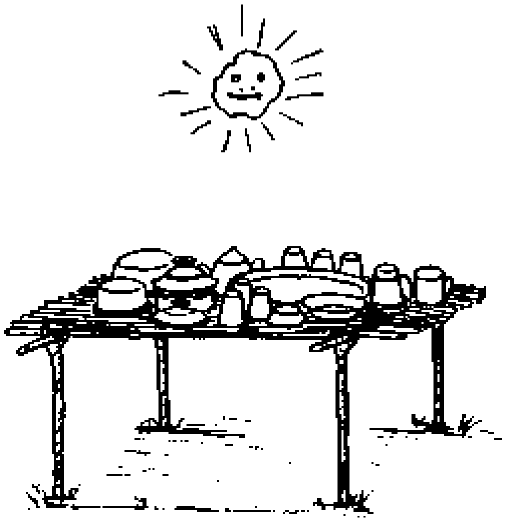
15. Do not eat food that is old or smells bad. It may be poisonous,



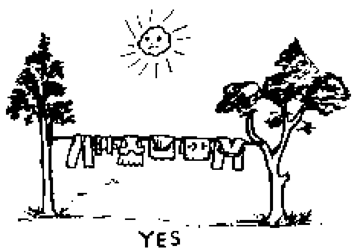
16. Do not let flies and other insects crawl on food; these insects can spread diseases. Do not leave food scraps around; put them into your latrine. Do not leave dirty dishes lying around, as they attract flies and breed germs. Protect food by keeping it covered or in cupboards with screens.

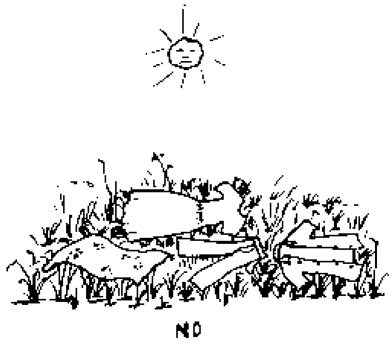
17. People with tuberculosis, flu, cold, hepatitis or other infectious diseases must eat from separate plates and drink from separate cups.

18. Put dishes on a stand after cleaning them and not on the ground.



19. Hang and spread sheets and blankets in the sun often. If possible, do not spread them on the ground, but hang them up. Wash clothes and underwear frequently and hang them up for drying. Iron if possible.





20. Clean the home and compound often. Fill in cracks and holes in the floor and walls, where fleas, bedbugs, cockroaches and scorpions can hide. It is very advisable to smear the floor regularly.

21. If children or animals have a bowel movement in or near the house clean it up at once. Bury it or throw is into the latrine. Better even, get a children's squatting slab and teach the children how to use it.

Reflect on which of these guidelines you have followed already?

Are the guidelines practicable?

Which ones have you not followed yet? Why? Could you change something?

Do all members of your family follow these guidelines?

Discuss all this with them.

9.7. Types of Disposal Systems

There is a wide range of disposal systems for human excreta (= sanitation systems). The following is an overview about the most common sanitation systems. The list is not complete and there are also mixtures of different types in use, but it includes all the systems used in Sudan.

A) <u>Overview of Sanitation Systems</u>

see table page 9.7/2

B) <u>Short Description of the Different Sanitation Systems</u>

1. <u>Defaecation in the Open</u>

see 9.9

2. <u>Pit Latrine from Local Materials</u>

see 9.10

3. Pit Latrine from Permanent Materials

A pit latrine from permanent materials consists of a pit which may be lined, a slab, and a superstructure from permanent materials like bricks, etc.

4. VIP

see 9.11

5. Double Vault Compost Latrine

see 9.12, 9.13, 9.14, 9.16, 9.17, 9.18

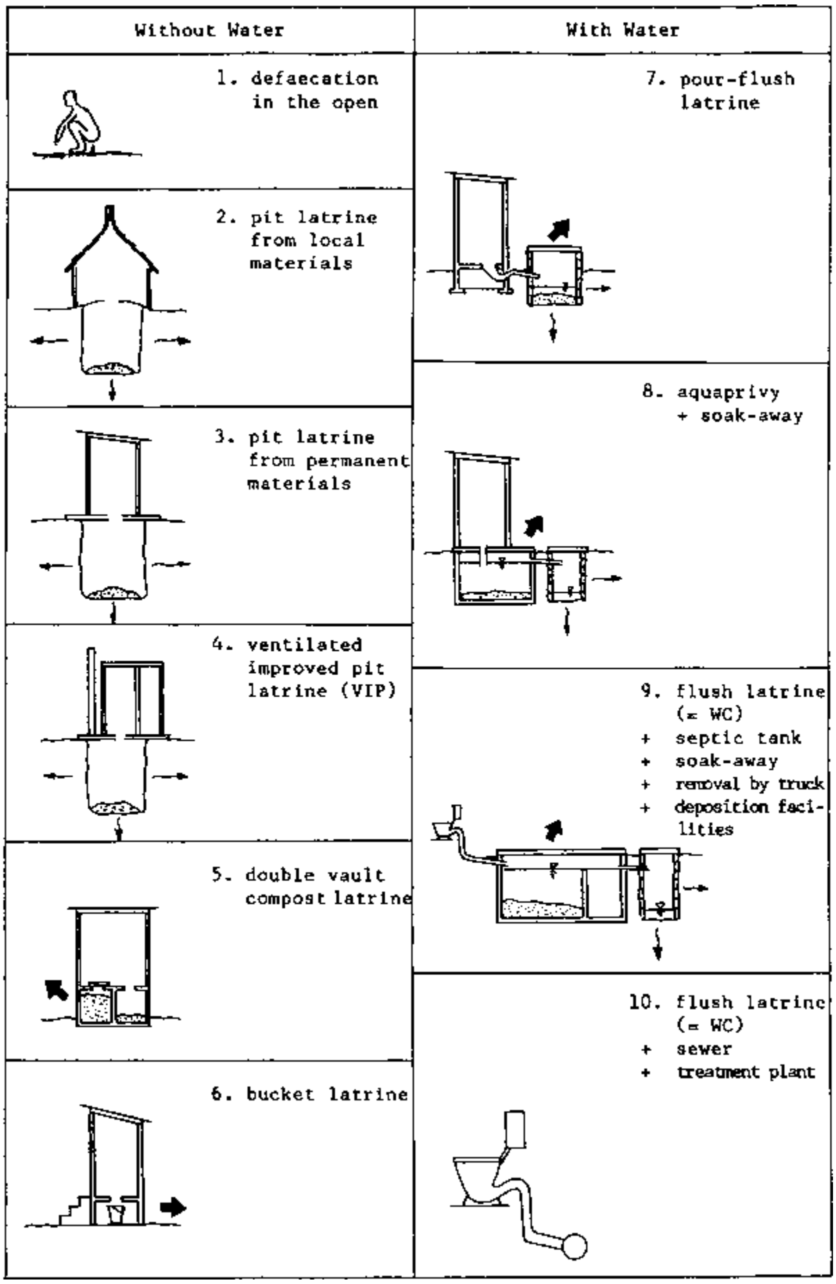
6. Bucket Latrine

A bucket latrine consists of a permanent building with a squatting slab. A bucket is placed from outside underneath the squatting slab. The bucket has to be emptied every time it is full. The contents have to be buried nearby. Handling of fresh excreta is necessary. Flies have easy access to the excrements.

7. Pour-Flush Latrine

A pour-flush latrine consists of a building, a squatting slab with a pan with a waterseal, and a pipe leading to a soak-away pit. After each use, one must flush the latrine with 2-3 lit water. The liquids soak away into the ground, eventually into the groundwater; the sludge has to be emptied from time to time by truck. The septic tank provides a breeding place for mosquitoes.

OVERVIEW OF SANITATION SYSTEMS



8. Aquaprivy

An aquaprivy consists of a superstructure over a septic tank. A chute (= large diameter pipe) reaches into the water in the septic tank from the squatting hole and, thus, provides a seal against smell and insects. The chute has to be washed regularly; water has to be filled into the tank regularly in order to keep the water table constant. Excess liquid flows through an overflow pipe into a soakaway pit and from there into the ground and, eventually, into the groundwater. From time to time the sludge in the septic tank needs to be emptied. For this the superstructure and the slab have to be removed. The gases from the septic tank are dangerous; the septic tank provides a breeding place for mosquitoes.

9. Flush Latrine and Septic Tank

A flush latrine (= WC = Water Closet) is connected with a piped water supply. After each use the toilet bowl is to be flushed with about 20 l water. The contents flow through pipes into the septic tank. Excess liquid flows through an overflow pipe into a soak-away pit and then into the ground and, eventually, the groundwater. The septic tank has to be emptied by a truck regularly. The unsafe contents have to be deposited somewhere. The septic tank provides a breeding place for mosquitoes. Blockage and insufficient water supply make the WC unsafe and inconvenient.

10. Flush Latrine and Sewer

If a flush latrine (WC) is connected with a sewer, the flushed contents flow through a pipe into the main sewer (= a large diameter pipe under the street), and from there into a treatment plant near the next river. There the sewage should be treated (in optimal case mechanically, biologically and chemically). Then the cleaned water is released into the river. Sewage system and treatment are technically sophisticated and very expensive. Therefore sewage water is very often released into rivers without sufficient treatment.

C) Comparison of the Different Sanitation Systems

The features of the different sanitation systems are compared in the following table:

System	No.	Name	Rural Application Possible?	Urban Application Possible?	Construction Costs?	Operating Costs?	Kind of Labour Required?	Selfhelp Possible?	Soil Conditions Required?	Water Required?	Possible Positions for Use	Anal Cleaning possible with....	Investment Off-site necessary?	Re-use of Excreta Possible?	Safe for Health?	Assistance from Institution Required?	Not Suitable if...
without water	1	defaecation in the open	not suitable	not suitable	none	none	none		any	no	squatting	anything: toilet paper ordinary p. grass, corncobs, sticks stones, water	no	partly	dangerous	no	not advisable
	2	pit latrine from local materials	yes	partly	low	low	unskilled labour	yes	stable, permeable soil groundwater below pit	"	squatting or sitting	"	"	no	safe if well kept	II	if ground-water near
	3	pit latrine from permanent materials	"	yes (in medium density areas)	medium	"	some skilled labour	"	"	"	"	"	"	"	"	"	"
	4	VIP (ventilated improved pit latrine)	"	"	"I	"	"	"	"	"	"	"	"	"	"	"	"
	5	Compost Latrine (double vault)	"	"	"I	"	"	"	any(can be built above ground)	"	"	"	"	yes	"	"	if socially not accepted
	6	bucket latrine	no	no	"	high	"	"	"	"	"	"	deposition pit	partly	dangerous	some	not advisable at all
with water	7	pour flush latrine	partly	yes (in medium density areas)	II	medium	"	partly	stable, permeable soil groundwater deep	yes, near latrine	squatting	only toilet or ordinary paper, water	treatment facility for sludge	"	only if well kept and water available danger of mosquito breeding	availability of trucks	if insufficient water and grass etc. used for anal cleaning
	8	aquaprivy + septic tank	"	"	"	"	"	"	"	"	squatting or sitting	anything	"	"	"	"	if insufficient water
	9	flush latrine + septic tank + soak-away + removal by truck + deposition facility	no	"	high	high	skilled labour	no	"	piped water in the house	"	only toilet paper and water	"	"	"	"	if insufficient water and grass etc. used for anal cl.
	10	flush latrine + sewer + treatment plant	"	yes (in high density areas)	very high	very high	engineer + skilled labour	"	any	"	"	"	sewer + treatment plant		only if well kept and water available	administration of sewers and treatment facilities	"

9.8. Selecting the Right Latrine

Ez 34,17-19

There are many different sanitation systems. Which is the best?

There is no "best latrine" for all conditions everywhere.

Instead, the best solution for each given condition needs to be selected each time again.

In the following, we give suggestions how to select the right type of latrine for certain conditions. These suggestions are the subjective opinion of the authors and the project staff. Others have other opinions because they have different priorities and different assumptions.

A) Criteria (= Guidelines) for Selecting the Right Latrine

We suggest that the following criteria shall guide our choice:

1. Protection of groundwater and surface water.

2. Protection of health.

3. Saving water.

4. Acceptability by the community.

5. Economic suitability.

Protection of groundwater is the first priority, because groundwater is one of the most valuable and essential resources of the people. In most areas, where people depend on on-site sanitation, they also depend on on-site water supply. Protection of the groundwater is a "must" if we want to protect health and well-being.

Protection of both, individual and public health is essential as well. Therefore, sanitation systems which allow and encourage mosquito breeding and, thus, malaria as well as other transmission of diseases, are questionable.

Saving water, that means to use as little water as possible, is also a high priority, because the majority of people has no access to clean and sufficient water. It seems to be irresponsible to waste water on sanitation, while other reasonable options are available, and at the same time uncountable people have to carry water over long distances and do not get sufficient and clean water at all.

The chosen sanitation system must be understood and accepted by the users. However, this depends very much on and can be influenced by education.

The system should be affordable for the majority of people. It is a great advantage if the users can maintain the system on their own and with their own resources.

B) Sanitation with Water

All sanitation systems with water have the following disadvantages:

1. They support mosquito breeding and, thus, malaria and other sicknesses. Septic tanks and their lids are only tight in theory. Normally, compounds with septic tanks have mosquitoes during the whole dry season. The same is valid for pour flush latrines and aqua privies.

2. Water is not available in such quantities (in a dry country like Sudan) that everybody

could use a sanitation system with water. Even in the urban areas, there are many people without sufficient water supply even for drinking, if the water supply is insufficient, all sanitation systems with water become unsafe and inconvenient.

3. Sanitation systems with water endanger the groundwater and sometimes the surface water. The overflow is directed into the groundwater by soak-away pits. Also, many septic tanks are leaking or flooded during rainy season.

4. Sanitation systems with water are considerably more expensive than those without water.

5. Sanitation systems with water spoil quickly if ordinary paper, grass, leaves, corncobs, small sticks or stones are used for anal cleaning.

6. Flush latrines are very often discriminating for village people who never learnt to use them.

Because of these reasons, mainly the first two, we suggest:

Discourage all sanitation systems with water.

The exception may be very crowded urban areas with multi-storey buildings (see also 8.29/5).

C) <u>Sanitation Systems without Water</u>

For obvious reasons like cleanliness, public health, contamination of ground and surface water, and handling of fresh excreta, we suggest:

Discourage defaecation in the open. Discourage bucket latrines.

Thus the choice remains between the different types of pit latrines and the compost latrine.

Groundwater protection is a high priority. Therefore:

Avoid flooded latrine pits by any means.

because they

- endanger the groundwater by bacteriological pollution,
- increase the nitrates and nitrites in the groundwater,
- encourage mosquito breeding,
- are a nuisance for the users,
- can collapse easily (see also 8.7/4).

Therefore:

If the groundwater in rainy season is 2 m below the bottom of the pit, and the next well is more than 50 m away, the pit latrine is suitable.

The reasons are:

The pit latrine

- is simple to build,
- is simple to use,
- and misuse can be corrected easily.

The type of pit latrine depends on the local conditions and the availability of materials.

For areas with high groundwater table there are three options:

- bucket latrine,
- flush latrine with sewer,
- compost latrine.

The bucket latrine is excluded because of hygienical reasons, the flush latrine is beyond reach (for the majority). Therefore, the compost latrine remains the only alternative if we insist on the groundwater being protected.

Therefore:

The compost latrine is the suitable solution if either

- the groundwater table is high (less than 4 m at least temporarily), or
- the subsoil is rock (digging deep is not needed), or
- the subsoil is black cotton soil, or
- the owner wants a well and a latrine on the same compound, or
- the owner is interested in a latrine which will never be finally full,
- the owner is very interested in fertilizer.

A great deal of care and attention for the latrine is necessary, as well as repeated health education. The concerned people (users, project staff) must be ready for that. This is a condition for the functioning of the compost latrines. The costs for a pit latrine and a compost latrine are about the same. Therefore, the compost latrine turns out to be cheaper on the long run if we consider its life time.

D) Maintenance of Sanitation Systems

There is no maintenance free sanitation system.

except defaecation in the open.

If people want to live in more densely populated areas and remain healthy, there is no way out: they will have to participate in the up-keep and maintenance of a sanitation system.

The up-keep and maintenance is the most difficult part of establishing a sanitation system.

This is more difficult than any technical problem. This is valid for all types of sanitation systems. We can see that on the examples when the up-keep and maintenance do not function:

- smelly, dirty latrines, flooded with water, with many flies;
- overflowing buckets;
- blocked pour flush latrines;
- blocked WCs;
- smelly septic tanks;
- streets flooded by not-functioning sewers.

Most books about sanitation are based on the assumption that sanitation with water is the best, only it is not (yet) reachable for most people. This is a subjective and biased opinion, based on certain priorities and the assumption that the technology most common in industrialised countries is good at all and the best for everybody. The above suggestions for the selection of a latrine differ from this opinion. They represent an approach towards water supply and sanitation in which the two fields are seen in connection with each other and on the background of the needs of the majority of people.

9.9. Defaecation in the Open

Defaecation in the open, be it behind the fence of the neighbour or in open spaces or dried up riverbeds, is dangerous. It not only harms the one doing it, but also others who can be infected by diseases transmitted from the uncovered excreta. It harms the community.

This problem was already known-in the times of the Old Testament: "You must have a latrine outside the camp, and go out to this; and you must have a mattock among your equipment; and with this mattock, when you go outside to ease yourself, you must dig a hole and cover your excrement. For Yahweh, your God, goes about within your camp to guard you and to deliver your enemies to you. Your camp must, therefore, be a holy place. Yahweh must not see anything improper among you or he would turn away from you." (Deuteronomy 23,12-14; The Jerusalem Translation)

Therefore:

Contribute yourself to reducing defaecation in the open:

- Avoid defaecating in the open.
- Construct latrines.
- Contribute to the cleaning and up-keep of the latrines you use.

However, there are situations when you are forced to defaecate in the open, e.g. on a journey or when visiting people in a village where there is no latrine. In these cases act in a responsible way:

If you are forced to defaecate in the open

- Look for a small hole or dig one with a stick.
- Cover your excreta with earth, grass and leaves.

This will ensure quick decomposition and prevent flies from transmitting germs.

In general, urine is a sterile and harmless substance. Thus it is by far less dangerous for transmitting diseases than faeces. However, certain sicknesses are transmitted by urine, too.

Therefore:

If you have hepatitis, typhoid fever, bilharzia (= schistosomiasis), leptospirosis or other serious sicknesses, always urinate into a closed latrine.

In areas with schistosomiasis (= bilharzia) nobody should urinate in the open, especially not into a river or lake.

A person with schistosomiasis has the disease for life and, unless adequately treated, will continue to pass eggs through the urine.

If you want to use urine as a fertilizer, it must be diluted by water, otherwise it will "burn" the plants (cause them harm because of the great concentration of chemical substances in the urine).

Therefore:

Dilute collected urine with water (1 part urine/5 parts water) and pour it directly in the garden as fertilizer.

9.10. Pit Latrine from Local Materials

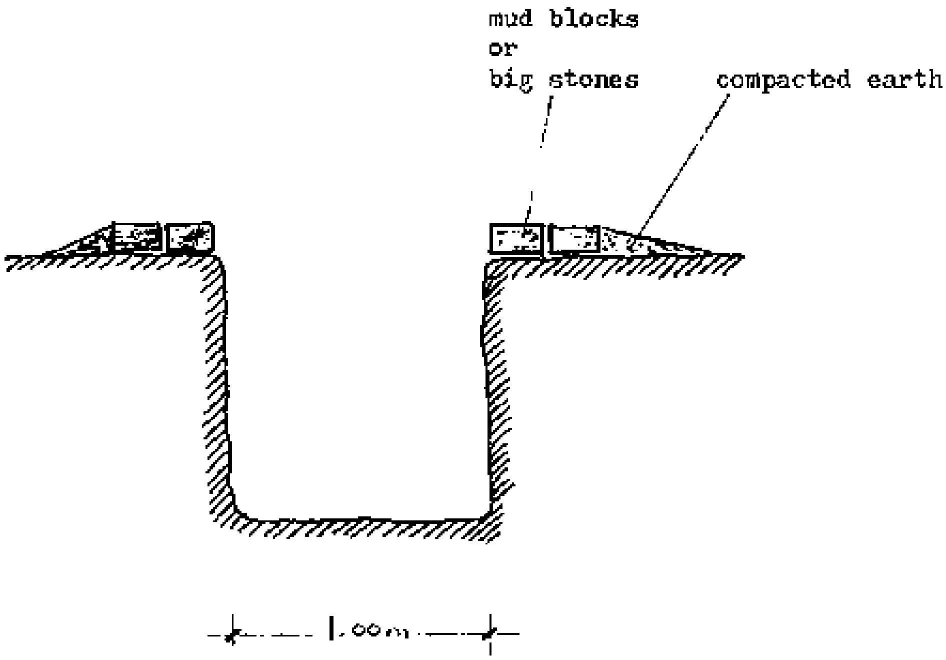
The most simple type of pit latrine, made completely from local materials, is not an ideal solution. But in many places, for example in remote villages or very poor areas, another type of sanitation is not available for people. Therefore, it is important to make the best out of it and use the materials locally available.

Following the guidelines below can improve the latrine considerably. Spread this information among the people who may need it.

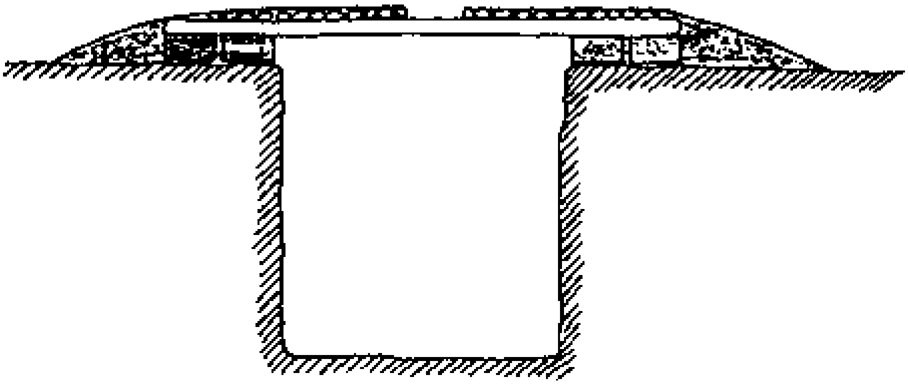
1. Select a location for your latrine which is not flooded during heavy rains, preferably a bit elevated, and far enough from the kitchen and a well, always downstream or downhill from where the water is taken.

2. Dig a pit. It should be small with straight walls, maybe 1.00 m × 1.00 m or round. It should never reach the groundwater. If the water is near or the soil can easily collapse, dig it only 1.00 m or 1.50 m deep.

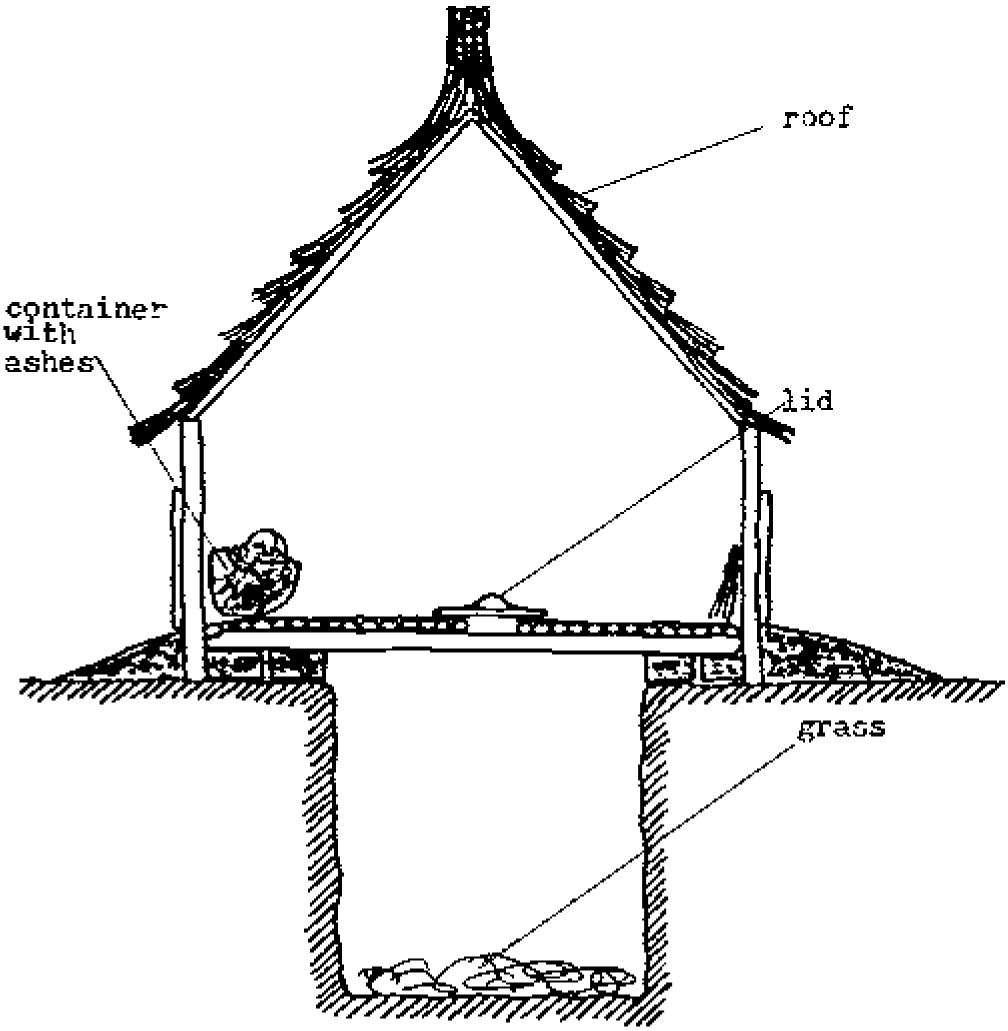
3. Make a few mudblocks or take big stones. Build a collar around the pit or make the collar from mud directly. It is important that the level of the "slab" is above ground. Fill earth around and compact it well.



4. Construct a slab from poles, covered with earth. The squatting hole must be 20 × 40 cm. If it is too small, the latrine will not remain clean.

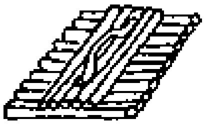


5. Build a roof over the latrine and a wall around if, it is most important to prevent rainwater from entering the pit.



6. Smear the floor. A smeared floor is easier to be kept clean.

7. Build a fitting lid for the squatting hole:



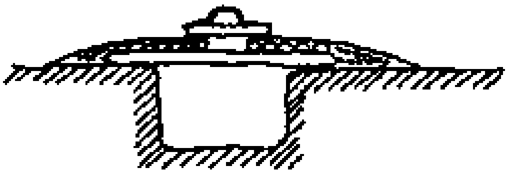
8. Put a container, e.g. a broken clay pot with ashes and sand, a calabash, and a broom into the latrine.

9. Put grass and leaves into the pit before starting to use it.

10. Use the latrine in the way described for compost latrines (see 9.17). Discuss and explain the correct use to the family members repeatedly. Insist on keeping the rules.

11. When the latrine is full, build a new one. Cover the contents of the first with earth. After one year you can dig them out as fertilizer for the garden and you may use the pit again.

12. Build a small children's squatting slab from local material.



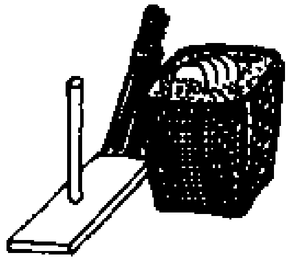
This will help the children to learn how to use a latrine properly. (see 9.19)

Such a latrine will have no bad smell and have few flies and no mosquitoes and will, therefore, be safe if

- the contents of the pit are kept dry;
- the lid is always closed;
- ashes and sand are sprinkled after each use, and grass and leaves regularly added.

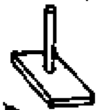
How to improve your pit latrine

1. Put a lid, a container with sand and a tin for sprinkling and a broom (not to be used elsewhere) into the latrine!



2. Put some sand or ashes into the hole after each use!

3. Close the lid after each use!

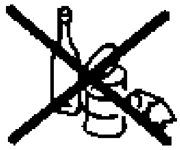


4. If dirty, pour sand over the dirt and sweep it into the hole!

5. Put grass, leaves, sweepings, kitchen left overs into the hole several times a week!

6. Do not pour any water into the hole! Clean the latrine dry or with wet grass, but do not rinse it with water!

7. Do not put glass, tins or plastic into the hole!



8. Do not use desinfectant, old engine oil or DDT!

Further information:

If there are too many flies or a bad smell, a screened ventpipe can help.
If your pit is full of water and mosquitoes, a compost latrine prevents these disadvantages.

9.11. Ventilated Improved Pit Latrine (VIP)

The ventilated improved pit latrine (VIP) was designed to reduce smell and fly nuisance. The main difference, compared with a traditional pit latrine, is the ventpipe.

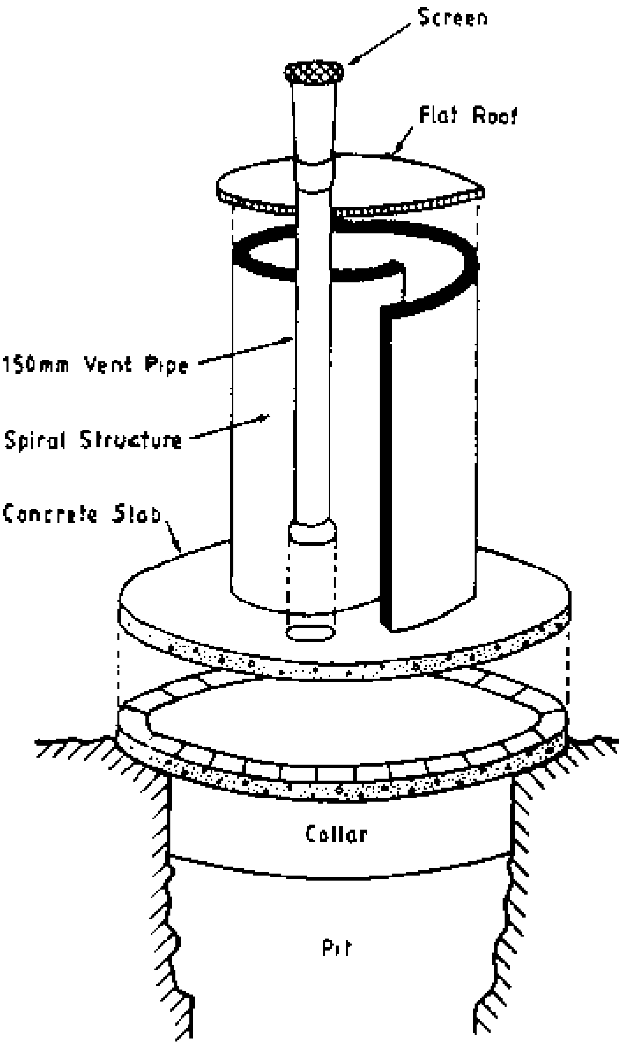
The ventpipe (Ø 8-20 cm) is painted black and placed on the sunny side of the latrine. The air inside the ventpipe will thus heat up and create an updraft to expel bad smells. A corrosion resistant screen on top of the ventpipe prevents the flies from escaping and entering.

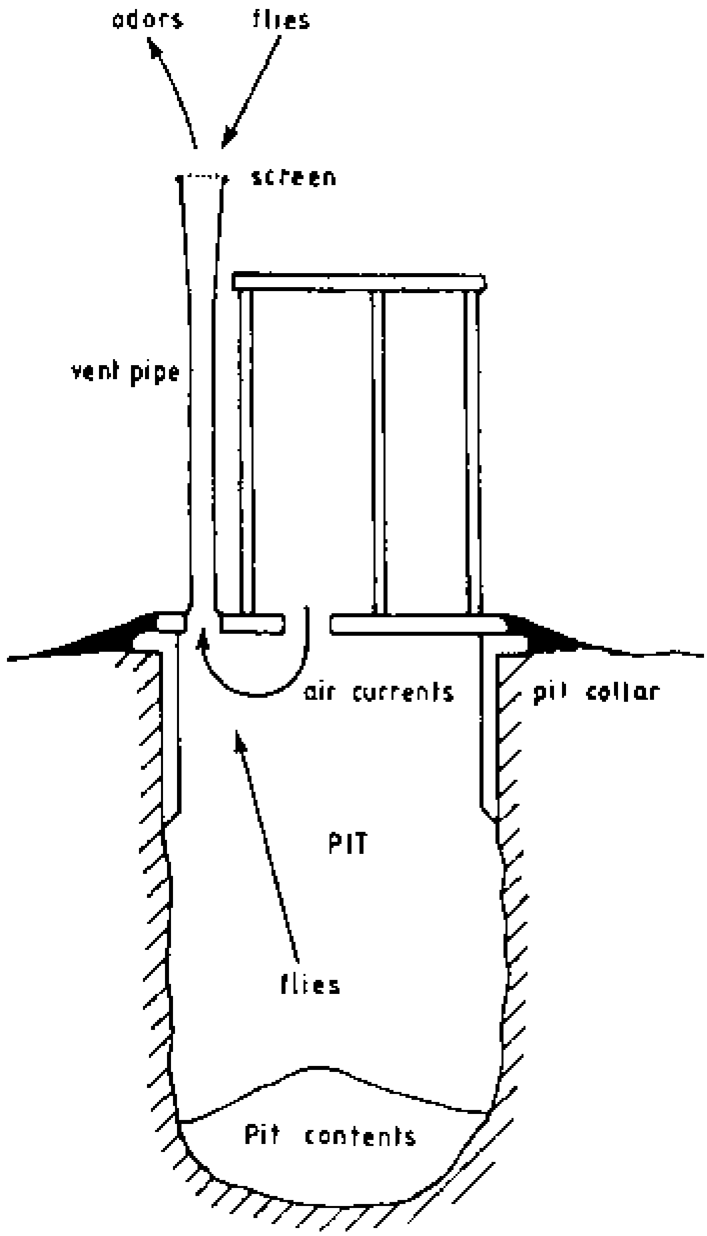
Many VIPs have no removable lid on the squatting hole. The interior of the latrine is dark, as the superstructure is constructed in spiral shape. Thus flies do not escape from the squatting hole, but are attracted by the light falling into the pit through the ventpipe. Dark latrines, however, may cause users to leave the latrine slab dirty. Snakes and scorpions also like to hide in the dark. Therefore, it is more advisable to provide a window and a removable lid.

Whether a VIP is safe healthwise depends on correct use and operation and maintenance; it is best managed in the same way as a compost latrine (see 9.17).

Remember:

A badly kept, dirty pit latrine does not differ from defaecation in the open.





9.12. Compost Latrine

A) Description of a Compost Latrine

A compost latrine consists of a pair of waterproof vaults (= receptacles) that receive excreta, ashes, sawdust, grass, leaves, sand, kitchen residues, etc. Each vault is equipped with a slab with a hole for defaecating, a rear opening for removing the compost, and a hole for the ventpipe.

B) Usage of the Compost Latrine

Only one receptacle is used at a time. The other one is closed by a permanent lid. When almost full, grass and soil are put into it and it is closed. Then the second receptacle is used until almost full.

While the second receptacle is being filled (6 to 12 months), the contents of the first one have time to decompose. Then they are not dangerous anymore for transmitting diseases. When the second is almost full, the first one is emptied and used again. Thus the two receptacles are used alternatively.

C) Special Features of a Compost Latrine

- The compost latrine works as a part of the life cycle, recycling human excreta as a resource, usable as fertilizer.

- If well kept, the compost latrine prevents spreading of diseases.

- There is no groundwater pollution.

- Deep digging is not necessary; the compost latrine can be built above ground.

- The pit cannot collapse.

- Only composted, dry matter needs to be handled.

- The compost latrine is never finally full, but can be re-used again and again.

- The costs are reasonable.

D) Possible Problem Areas of Compost Latrines

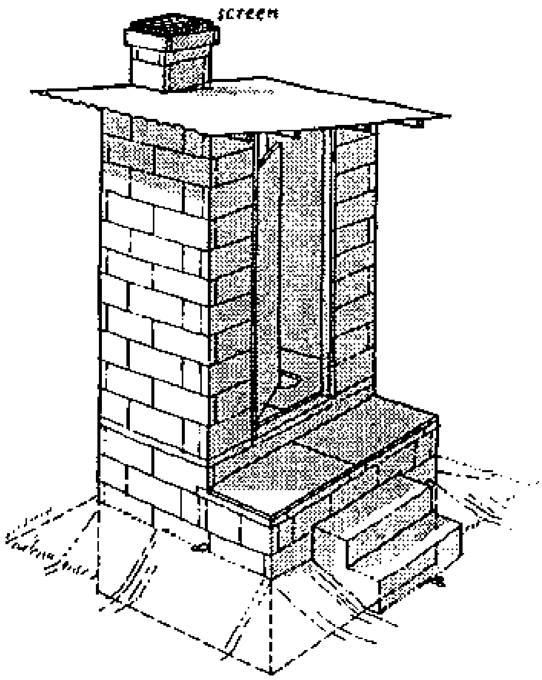
Compost latrines must be used in the correct way (as any other latrines). However, if not used correctly, the contents may not decompose in time, and they will be very unpleasant to empty (like those of a septic tank). Compost latrines need a high degree of care and attention from each user. Intensive and repeated health education is needed for promoting compost latrines.

E) Types of Compost Latrines

There are different types and ways of constructing a compost latrine:

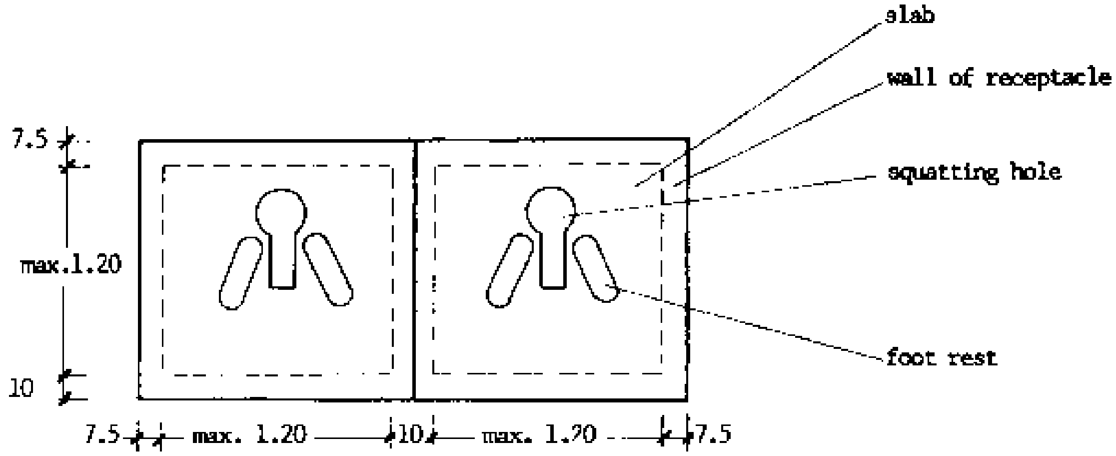
1. Double Vault Compost Latrine below Ground

This compost latrine is built from cement blocks. Basically the same type, but larger and built from bricks, is described in detail in 9.14.

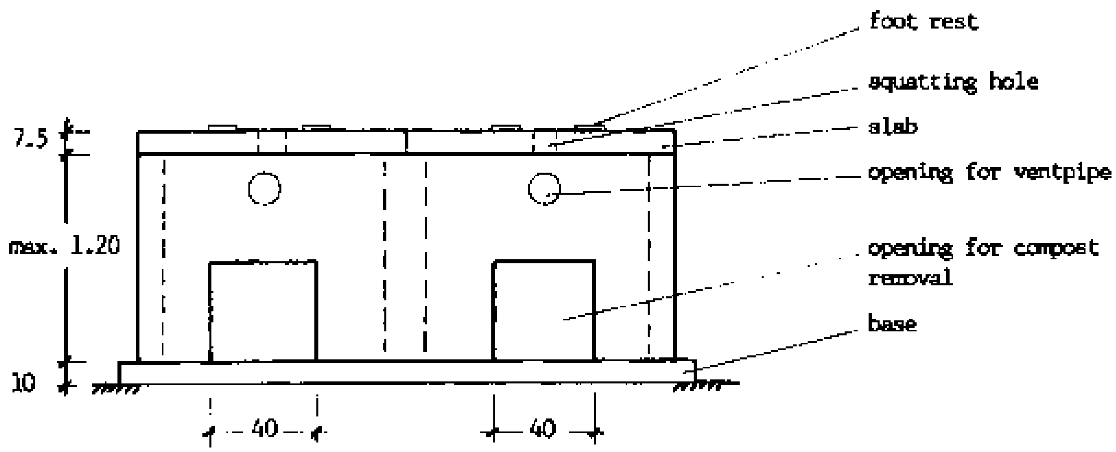


2. Double Vault Compost Latrine above Ground

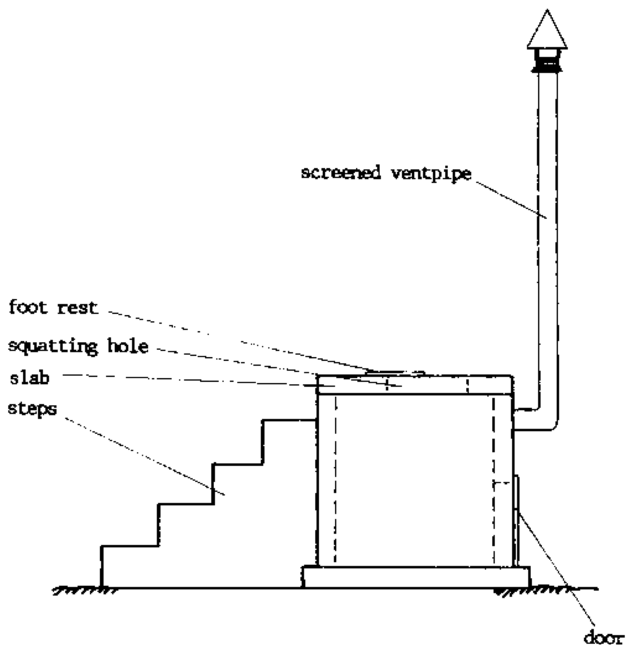
LAYOUT PLAN



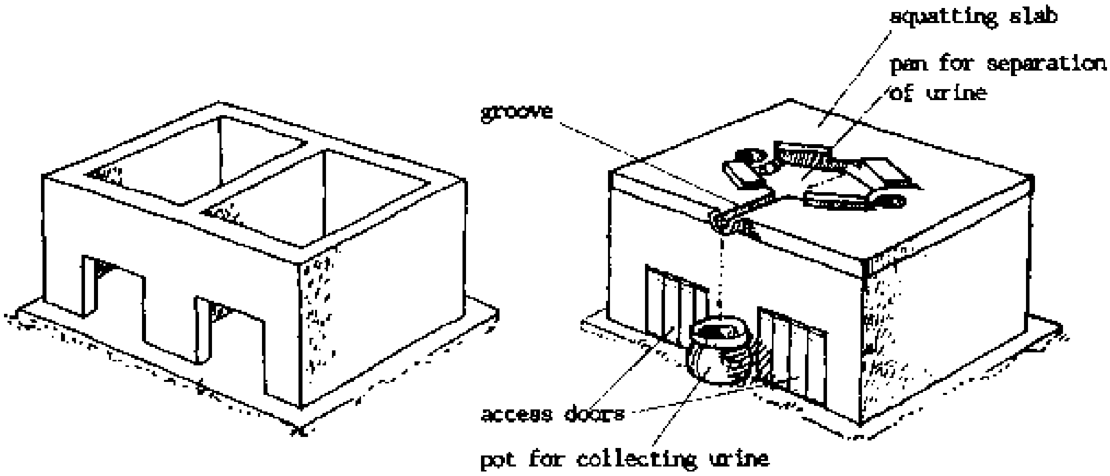
BACK-VIEW



SIDE-VIEW

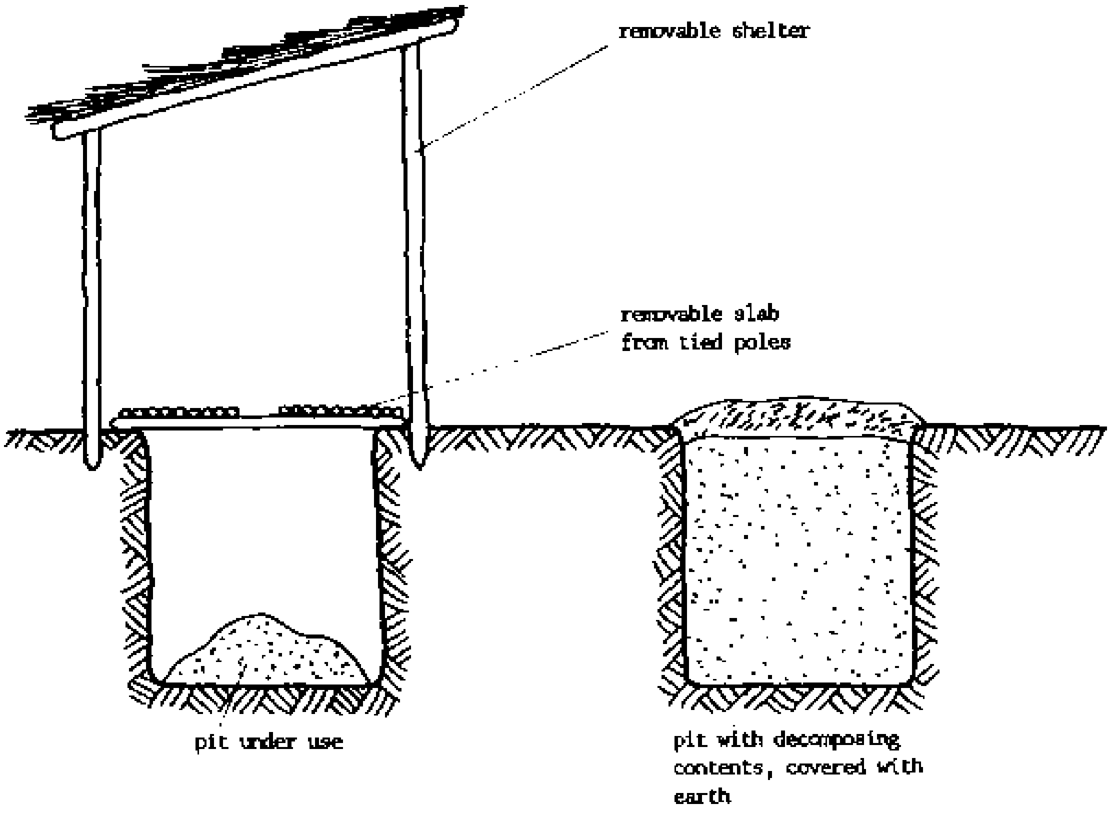


3. Double Vault Compost Latrine above Ground with Separation of Urine (Vietnamese Compost Latrine)



4. Compost Latrine from Local Materials

When the pit is full, a new pit is dug and the slab and superstructure moved on top of it. Six months later the decomposed contents of the first are removed.



F) Example for Advertising Leaflet about Compost Latrines

Sudan Council of Churches * Munuki Water and Sanitation Project

DO YOU WANT TO DO SOMETHING FOR YOUR HEALTH AND THE HEALTH OF YOUR FAMILY???

WHY NOT BUILD A LATRINE?

YOU THINK THERE ARE PROBLEMS?

- The underground is rocky and it will be hard work and expensive to dig.

- Or the water is near and the latrine may be flooded and become a breeding place for flies and mosquitoes.

- Or building materials have become too expensive.

THE COMPOST LATRINE WILL SOLVE YOUR PROBLEMS!!!

- Only one metre deep to dig - the best for rocky ground.

- Completely closed compartments - the best if the water table is near; no flooding anymore.

- Never troubles as with a WC if the water supply is cut - you do not depend on a water supply.

- To be used for generations and it will never fill up finally - once you invest, always you enjoy.

- The waste is turned into manure in a safe way - you can even use it in your garden.

- Cash contribution only £S 250.000 m/ms for the standard version.

Office Hours:
Monday to Friday, 7.30 a.m. to 2.30 p.m.

YOU ARE WELCOME ANY TIME!

9.13. Composting Process

Composting takes place in the compost heap in the garden or in a compost latrine. It is important to understand the process for being able to maintain a compost latrine properly.

Composting is a biological process. Various types of organisms break down organic substances to make humus (= mature compost). This needs to happen under controlled conditions. Otherwise, decomposition will not take place fully, leaving a foul, smelly mass with pathogenic (= sickness carrying) organisms behind.

The following factors influence decomposition:

A) Availability of Air (Aeration)

Some microbes need oxygen to carry on decomposition (= aerobic decomposition). Others do not require oxygen (= anaerobic decomposition). Both types are going on in a compost heap.

Conditions with enough air available (= aerobic conditions) are necessary for rapid and smell-free decomposition and for destruction of pathogenic organisms by heat.

Air is provided on the surface and by earthworms, maggots, beetles, cockroaches, and others digging into the heap. Obviously, in flooded pits with too much moisture, the material becomes soggy, compact and unable to contain sufficient air in between the particles.

B) Temperature

Dry decomposition produces a lot of heat. In the middle of a compost heap it can reach 50°C. High temperatures contribute to the destruction of pathogenic organisms.

C) Moisture

The best moisture content in a compost heap is 50-60%. Too much or not enough moisture are both bad for the composting process. An extremely wet latrine is bad for composting and invites mosquito breeding. It can be caused by

- humid climate,
- water used for anal cleaning,
- urine and faeces deposited,
- too many users,
- no addition of organic refuse,
- no addition of sand, ashes or other dry matter,
- an unventilated receptacle,
- entry of rain water, surface water or groundwater.

Take care that the compost is not too wet and muddy by regularly adding enough dry material.

If it is wet, check the cause and remove it.

D) Ratio of Carbon and Nitrogen

Carbon and nitrogen are two different chemical substances found in nature.

Microbes feed on organic matter containing, amongst other things, carbon and nitrogen; they use carbon for energy and nitrogen for body building. The carbon and nitrogen content must be balanced in a compost heap. It is best if there is 15 times more carbon in the compost than nitrogen (Carbon/Nitrogen ratio = C/N ratio = 15/1).

Faeces have only 8 times more carbon than nitrogen (C/N ratio = 8/1); urine has even less carbon than nitrogen (C/N ration = 0.8/1). Therefore, it is very important to add carbon-rich material in order to reach the correct balance.

Carbon rich materials are all organic materials (such as grown plants) especially:

- ashes	Almost all carbon
- sawdust	C/N ratio = 500/1
- straw	C/N ratio = 150/1
- green leaves, grass, kitchen residues	C/N ratio = 15/1

Therefore:

Regularly pour ashes, leaves, grass, sawdust, etc. into the compost pit in big quantities. Put all kitchen residues into the pit.

Do not worry about the pit being filled too quickly. The volume of all these materials is very much reduced during decomposition.

E) Life in the Compost Heap

A variety of organisms live in a compost pit, like viruses, bacteria, fungi, algae, earthworms, fly maggots, snails, ants, spiders, beetles, cockroaches, mice, etc. They play a major role in mixing, airing, and tearing apart the contents of the latrine. As long as they remain inside the receptacle, their activities are good and should be encouraged. They should not be killed by chemicals or poisons or disinfectants poured in. But we do not like to see such organisms outside the receptacle.

Therefore:

- Always keep the lid closed.

- Check the screens on the ventpipe for eventual holes and repair.

- Keep the covers for emptying well covered with earth.

- Sprinkle ashes and sand after each use to reduce flies.

- Do not throw tins, glass, plastic into the receptacle.

- Do not pour DDT, old engine oil or disinfectant (Dettol, Finik) into the pit (see also 8.7/4).

F) Destruction of Pathogenic Organisms

Pathogenic organisms are destroyed by

- high temperatures,
- time,
- unfavourable pH value (alkalinity or acidity),
- competition for food,
- antibiotic action,
- toxic by-products of decomposing organisms,
- anaerobic conditions.

After six months in a closed receptacle, the contents of a well-functioning compost latrine are safe enough to be taken out.

Take them out and cover them with soil. Most parasitic organisms have been destroyed.

The period of one year in a closed receptacle is on the safe side. All pathogenic organisms are destroyed.

However, if the compost latrine was not well kept, or no organic material was added, or the contents are muddy, it will be unpleasant to remove the contents. Dispose of them in a trench and cover them immediately with earth. Learn from experience and keep the latrine better next time.

G) Compost as Fertilizer

Addition of compost will make the soil more fertile, easier to cultivate, and improve its water holding capacity. The fertilizer from compost is well balanced in all its ingredients. Plants can use it almost 100%. Compost does not endanger the groundwater as chemical fertilizers do. Compost is a treasurable resource.

9.14. Compost Latrine Construction

Three different designs for compost latrines are described here:

1. Compost latrine, standard size (15 - 25 people), from permanent materials;
2. Compost latrine, standard size (15 - 25 people), with local superstructure;

3. Double compost latrine, large size (100 - 120 people), from permanent materials;

The construction steps and the materials needed are given for the first design only. However, they are similar for the other designs.

A) Designs

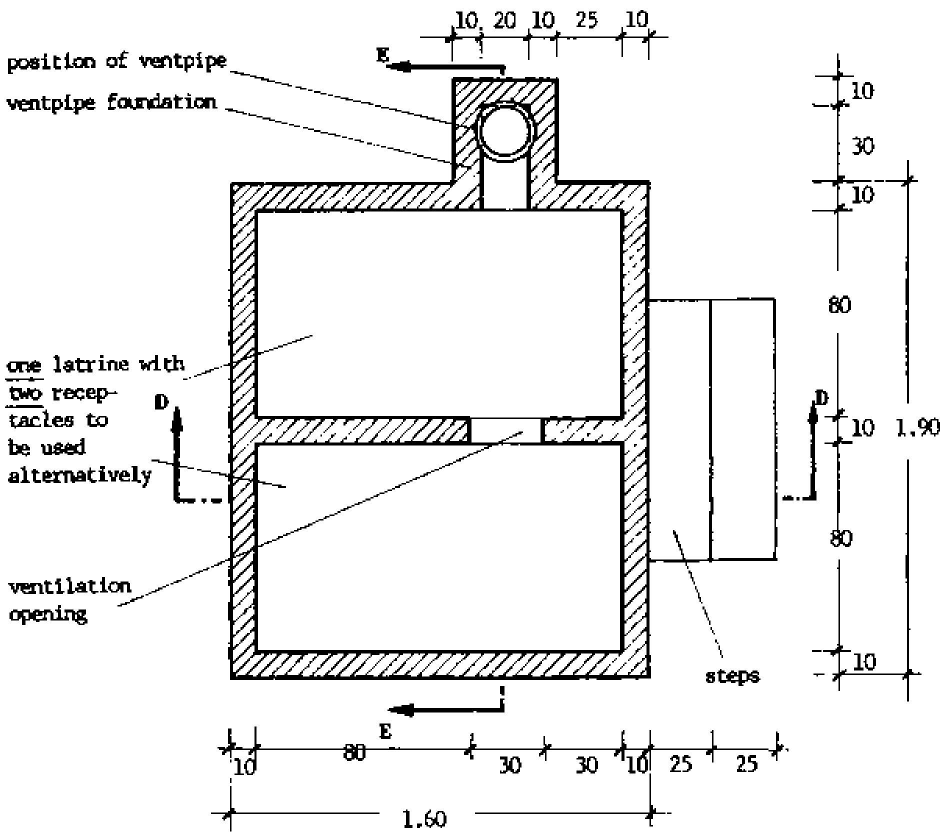
1. Compost Latrine from Permanent Materials

The compost latrine, standard size, is intended for extended families. The volume of the two pits together is about $2.7m^3$; this is equal to the volume of an ordinary round pit Ø 1.00 m, 3.50 m deep. It is built from half-brick wall throughout. Additional reinforcement in the slabs makes it unnecessary to have a beam to bridge the pits.

Prefabricated Parts:

Quant.	Item	Measurements	Remarks
2	concrete slabs with squatting hole and foot marks	95 cm × 110 cm × 5 cm	reinforcement: welded mesh and 1 Ø 10 mm
2	concrete covers	50 cm × 110 cm × 5 cm	reinforcement: welded mesh; two handles
1	lid from cement mortar 1:4	53 cm × 20 cm × 5 cm	see 9.14/19
1	wooden lid with handle	53 cm × 20 cm × 2 cm	see 9.14A9
1	ventpipe from ferrocement	inside Ø 20 cm, outside Ø 25 cm, length 2.70 m	reinforcement: chicken wire with screen and rain-cover

LAYOUT PLAN A-A PITS



SCALE 1:25

How to read technical drawings is explained in 6.1.

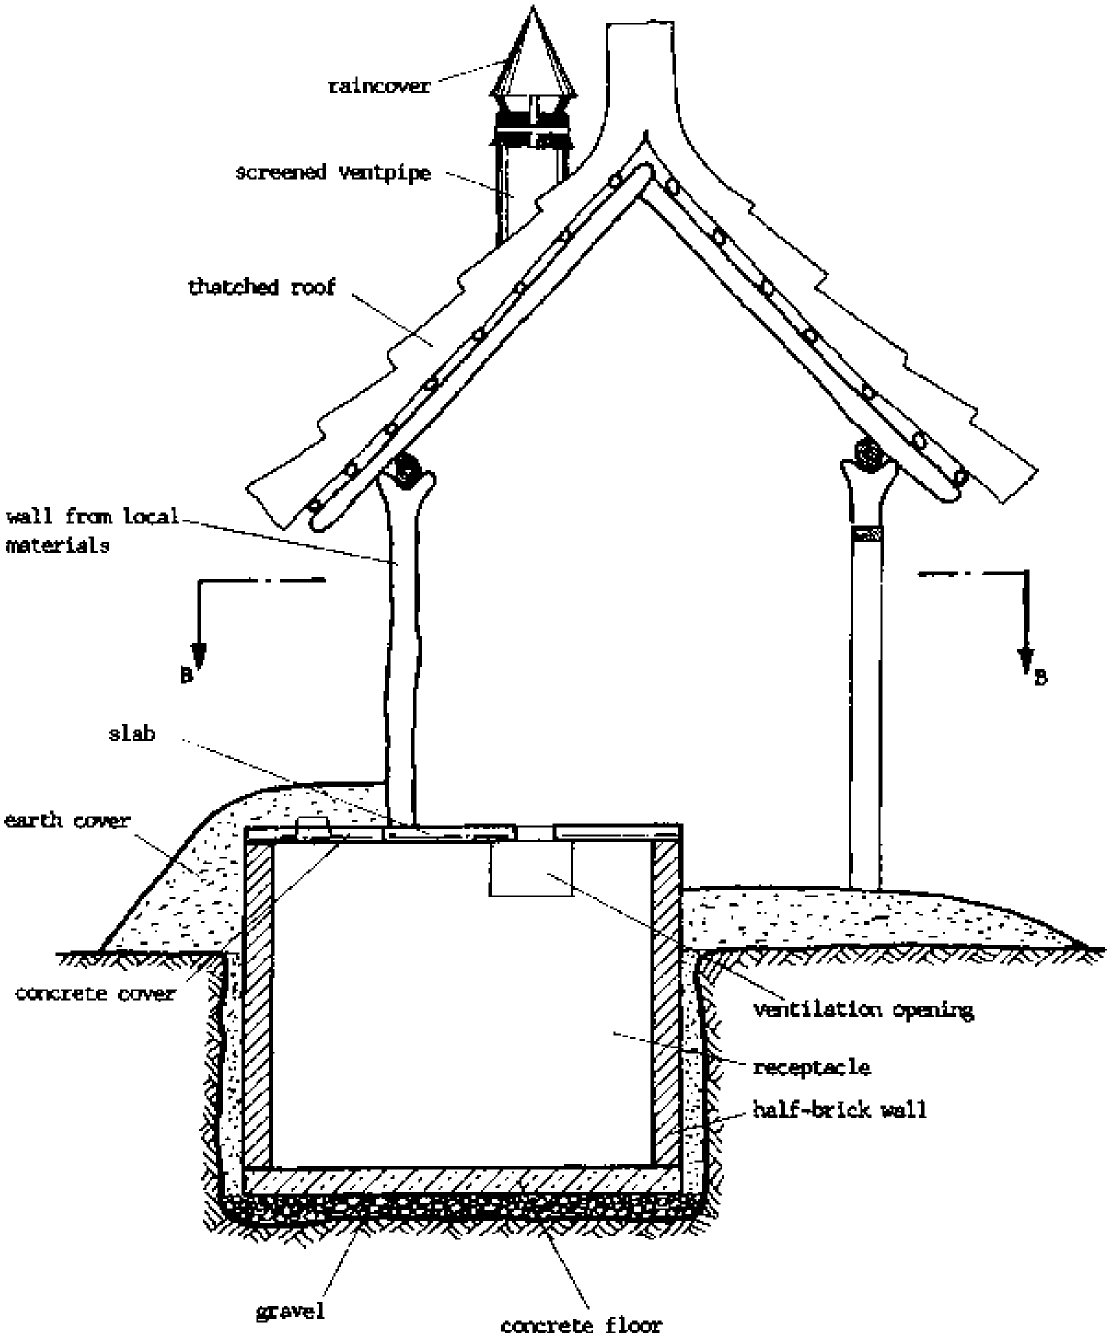
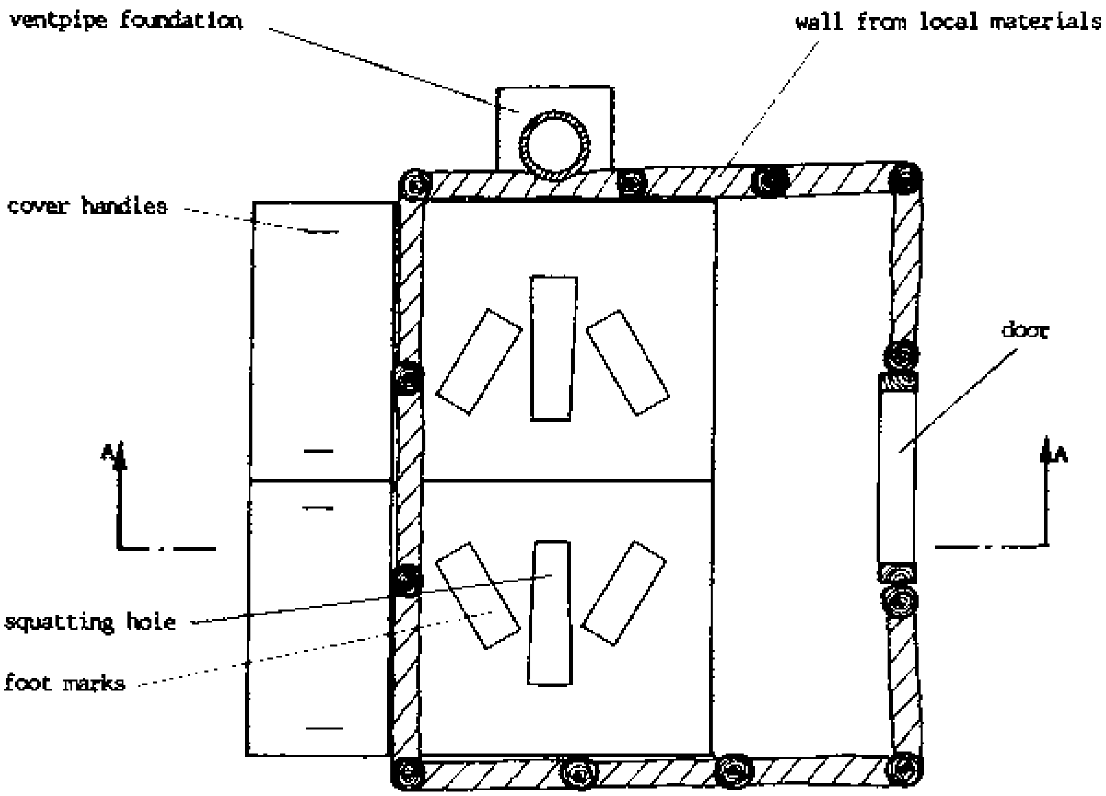
2. Compost Latrine with Local Superstructure

The pit including the slabs is exactly the same as for the compost latrine from permanent materials.

CROSS SECTION A-A



LAYOUT PLAN B-B



SCALE 1:25

3. Double Compost Latrine for Institutions (Schools, Offices, Clinics, etc.)

The volume of the two pits is 5.1 m^3, the volume of all the four together is 10.2 m^3. All walls are one brick walls (alternatively, the superstructure can be built as half-brick wall). A reinforced concrete beam spans the pit. For more users a triple compost latrine can be built.

Prefabricated Parts

Quant.	Item	Measurements	Remarks
2	concrete beams	15 cm × 20 cm × 2.50 m	reinforcement 2 Ø 10 mm
4	concrete slabs with squatting hole and foot marks	170 cm × 125 cm × 5 cm	reinforcement: welded mesh
4	concrete covers	85 cm × 125 cm × 5 cm	reinforcement: welded mesh; with two handles
2	lids from cement mortar 1:4	53 cm × 20 cm × 5 cm	see 9.14/19
2	wooden lids with handle	53 cm × 20 cm × 2 cm	see 9.14/19
2	ventpipes from ferrocement	inside Ø 20 cm, outside Ø 25 cm, length 2.70 m	reinforcement: chicken wire with screen and rain-cover

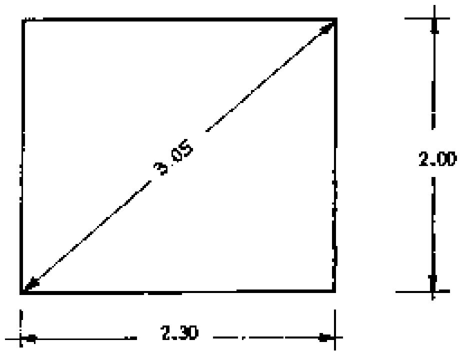
B) <u>Step-by-step Procedures for Construction of a Compost Latrine, Standard Size</u>

1. <u>Pit</u>

Dig a pit 2.00 m broad, 2.30 m wide, and 1.00 m deep, with straight walls (see 6.2, Marking Rectangular Layout Plan)

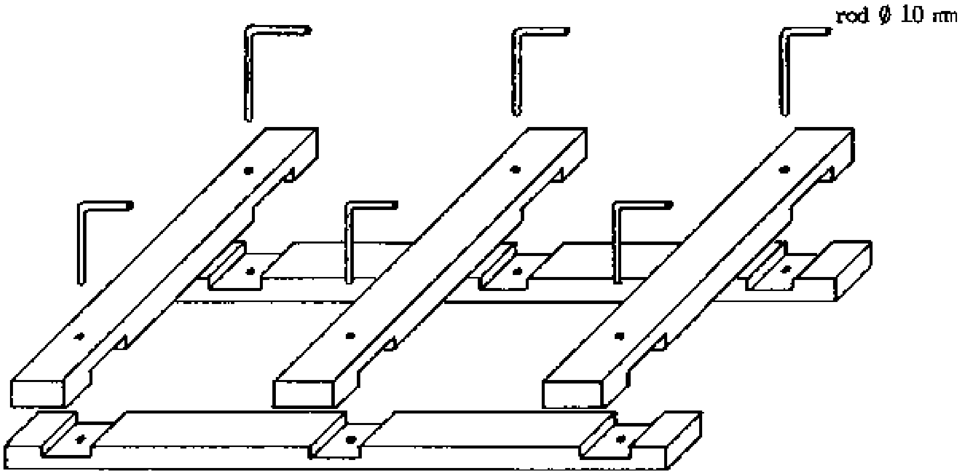
Pit 2.00 × 2.30 × 1.00



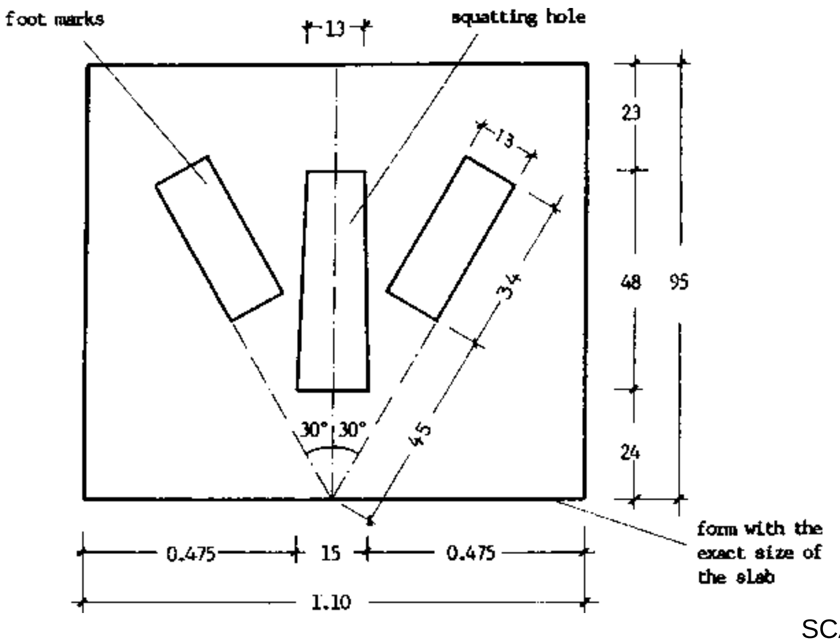
2. Slabs and Covers

- Prepare two sets of wooden frames from timber 2"×4" which can be used for manufacturing many slabs and covers (for measurements see 9.14/15).

EXPLODED DIAGRAM

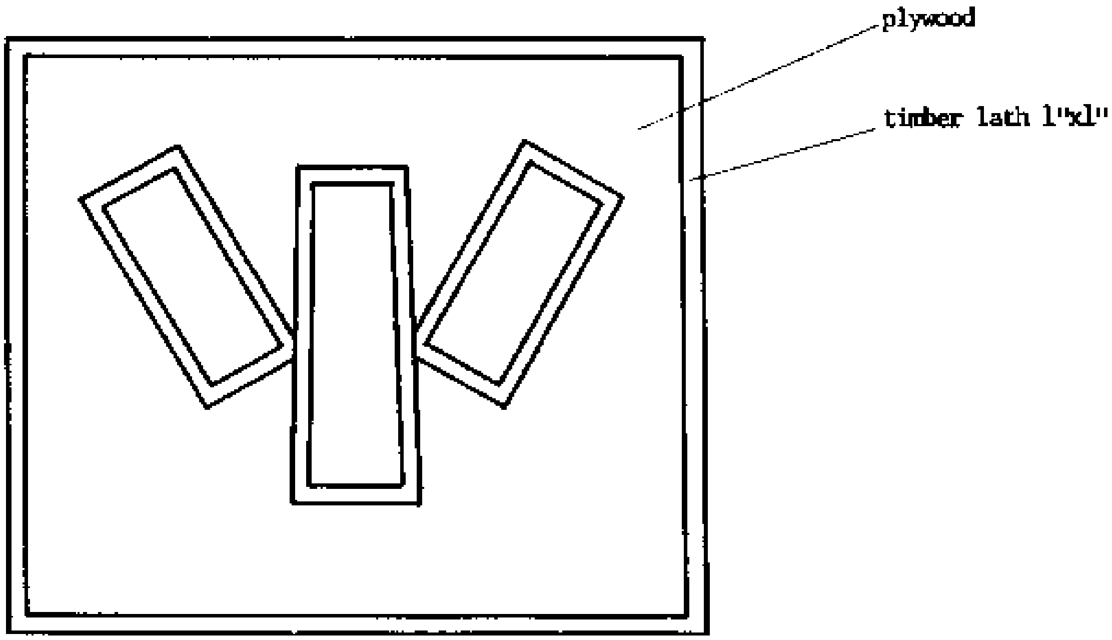


- Prepare a form for the squatting hole and the foot marks. It can be used for manufacturing many slabs. Cut it from plywood, and cut out the places for the squatting hole and the foot marks.



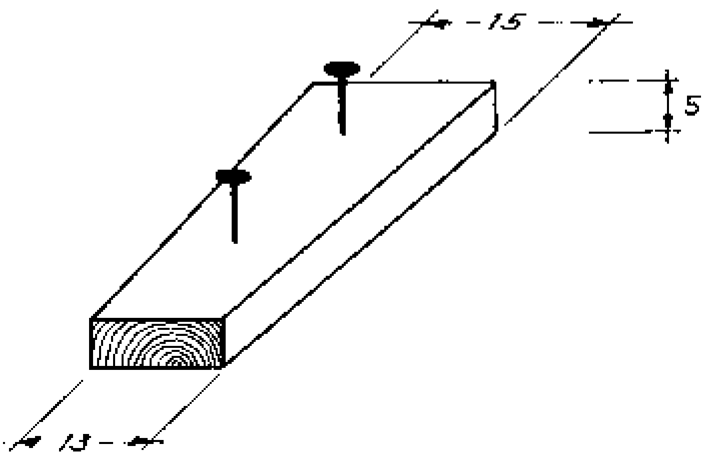
SCALE 1:12.5

- Reinforce all edges with timber 1" × 1" like this:



SCALE 1:12.5

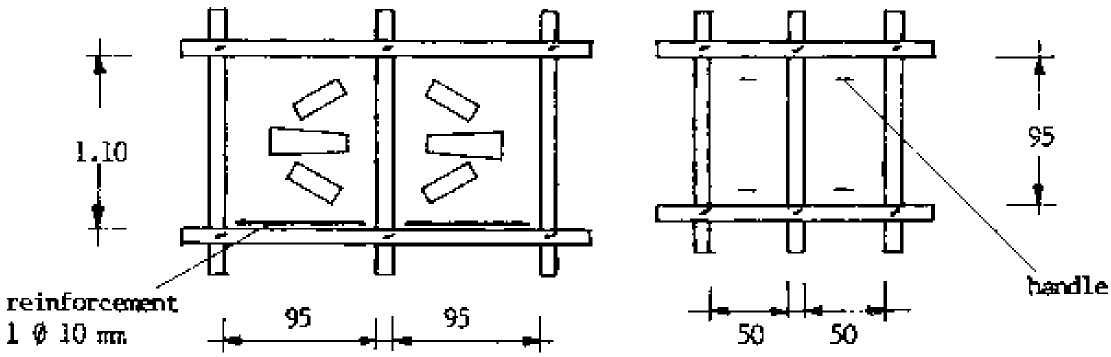
- Prepare a wooden plug for casting the squatting hole which can be used many times. It needs to fit easily into the form for the squatting hole



- Put wet sand on level ground, and level its surface with a straight edge.

- Paint the frame inside with old engine oil.

- Place the frame on the sand. Check the measurements <u>inside</u> and, especially, if both diagonals are equal. Slabs which are not rectangular cause a lot of troubles when placed on the pits later.



SCALE 1:50

- Place the plug for the squatting hole (see drawing above).

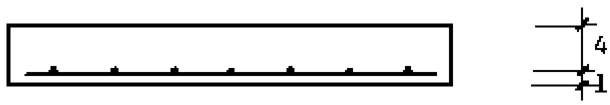
- Cut welded mesh in the size of slabs and covers. Cut out the places for the squatting holes. Cut reinforcement Ø 10 mm for the beam. Cut handles for the covers from reinforcement Ø 6 mm.

- Mix the concrete (mixtures see C).

- Pour concrete 1 cm thick into the frames and compact it well.

- Place the welded mesh, reinforcement Ø 10 mm and handles on top of the concrete (location see above drawing).

- The position of the reinforcement should be like this:



- Pour the rest of the concrete and compact it well.

- Make the top of slabs and covers straight with a straight edge. Make a concrete finish.

- Remove the plug from the squatting hole and apply a finish inside the hole.

- Mark on the slab where you have placed the additional reinforcement Ø 10 mm.

- After an hour, cover the slabs and covers with wet sand and a nylon sheet.

- The frames can be removed after 6 hours.

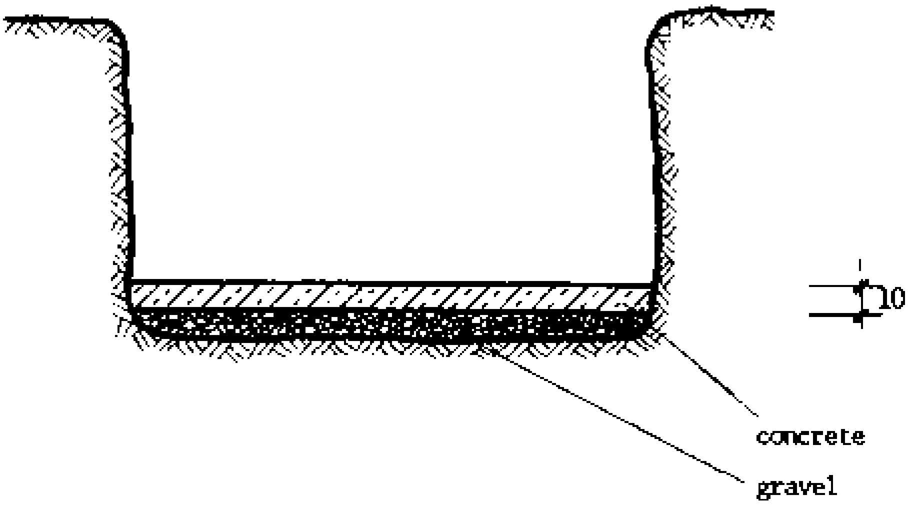
- Keep slabs and covers wet for five days.

- Do not move or lift them before a week.

Slabs and covers can be either manufactured on site or centrally in a workshop. The latter is more economical if many latrines are to be built.

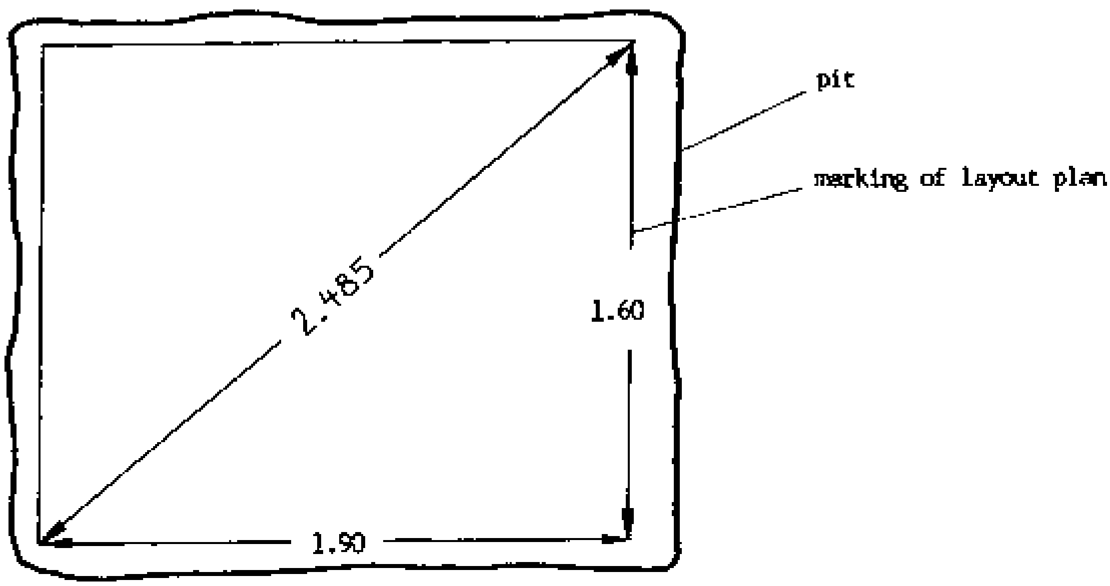
3. Floor

- Put some gravel into the pit and level it.
- Cast a concrete floor 10 cm thick and compact it well.
- Level the top. A concrete finish is not necessary.



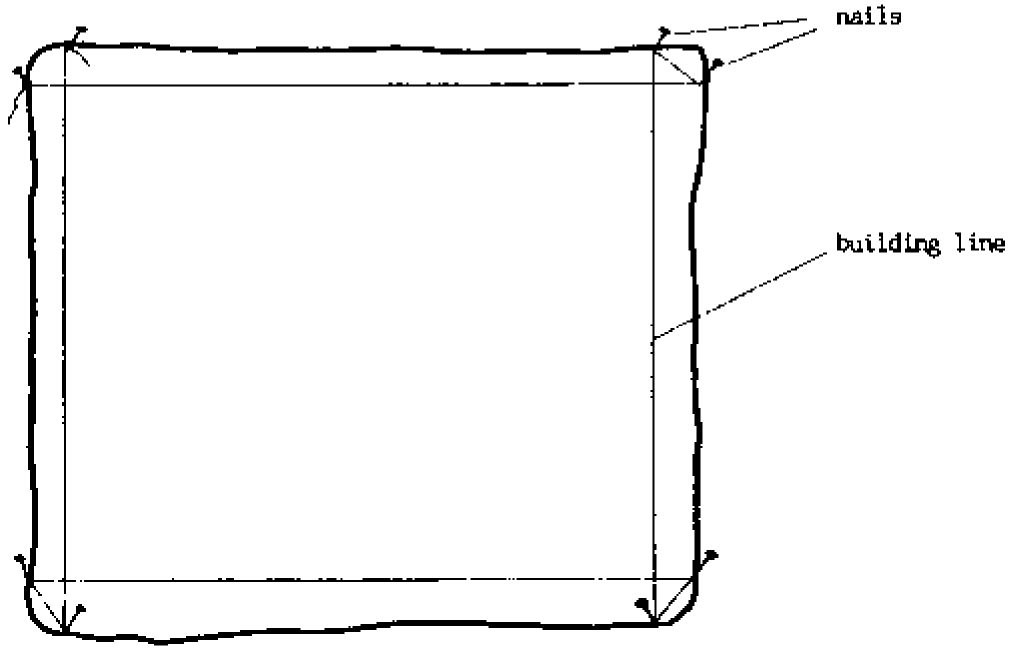
4. Brick Walls

- Mark the layout plan of the pit (outside edge) on the concrete floor (see 6.2, Marking Rectangular Layout Plan).

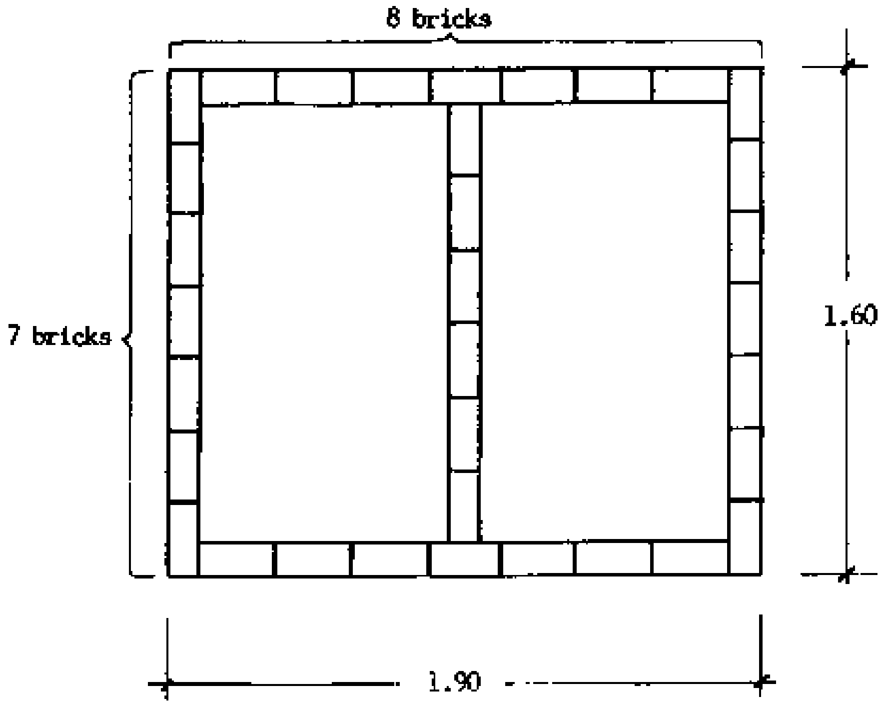


SCALE 1:25

- Span a building line. Check all sides and diagonals.



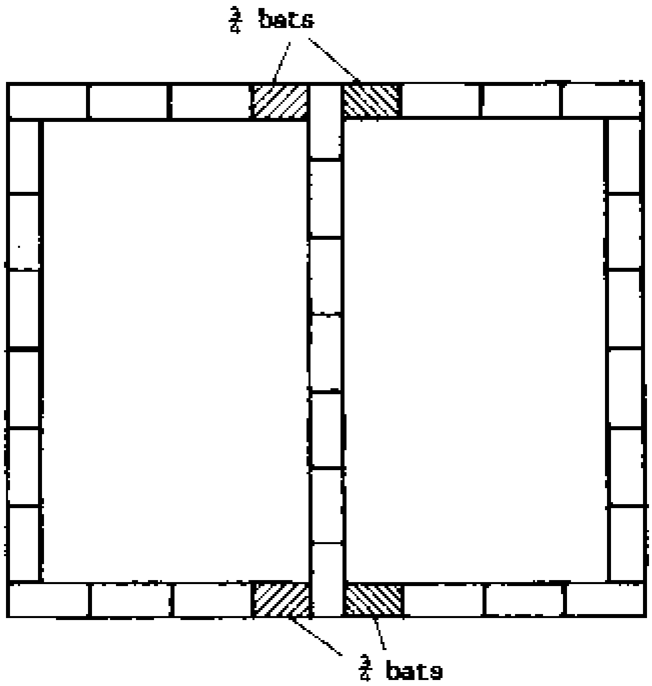
- Build the first course.



8 × 22 cm = 176 cm
8 × 1.75 cm = 14 cm
190 cm

7 × 22 cm = 154 cm
6 × 1 cm = 6 cm
160 cm

- Build the second course.



SCALE 1:25

- Build again the first course and continue building first and second course alternatively.

- Check the measurements and diagonals from time to time; check as well if the walls are vertical.

- Continue to build the walls until about 30-40 cm above ground; however, leave the openings for ventilation and to the ventpipe.

- Build the foundation for the ventpipe.

- For details see also 6.7, Bricklaying.

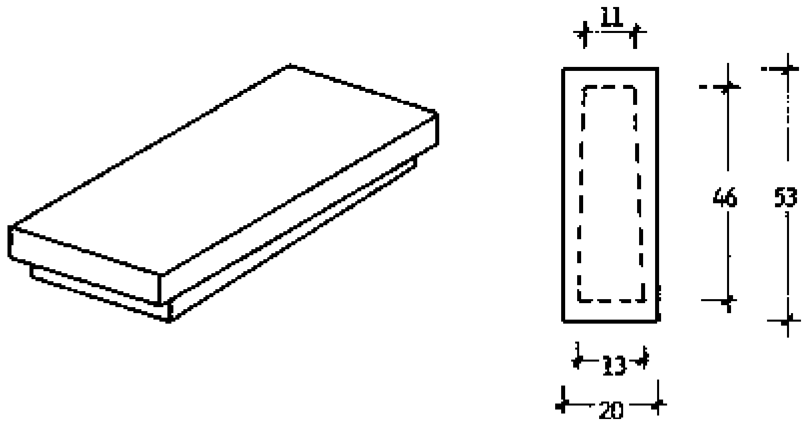
5. Plastering

- Plaster the two pits inside with cement mortar (mixture see C).

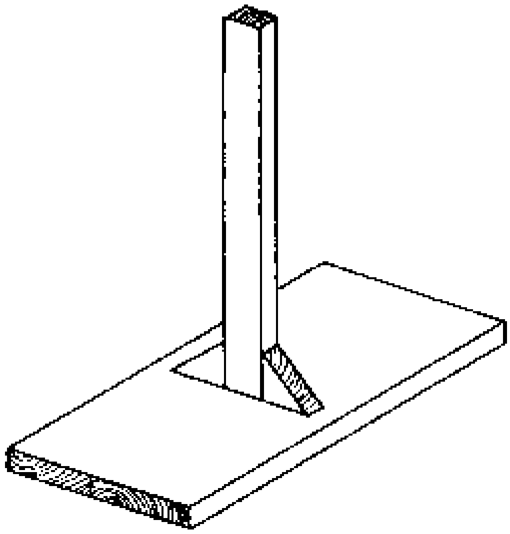
6. Preparing the Lids

- Make a heavy concrete lid for the squatting hole not to be used.
- Make a wooden lid with handle for the other squatting hole.

Concrete Lid:



Wooden Lid with Handle:



SCALE 1:15

7. Placing the Slabs

- The slabs must have been cured at least for two weeks before you can place them on the pit.

- Place cement mortar on the wall where you place the slabs.

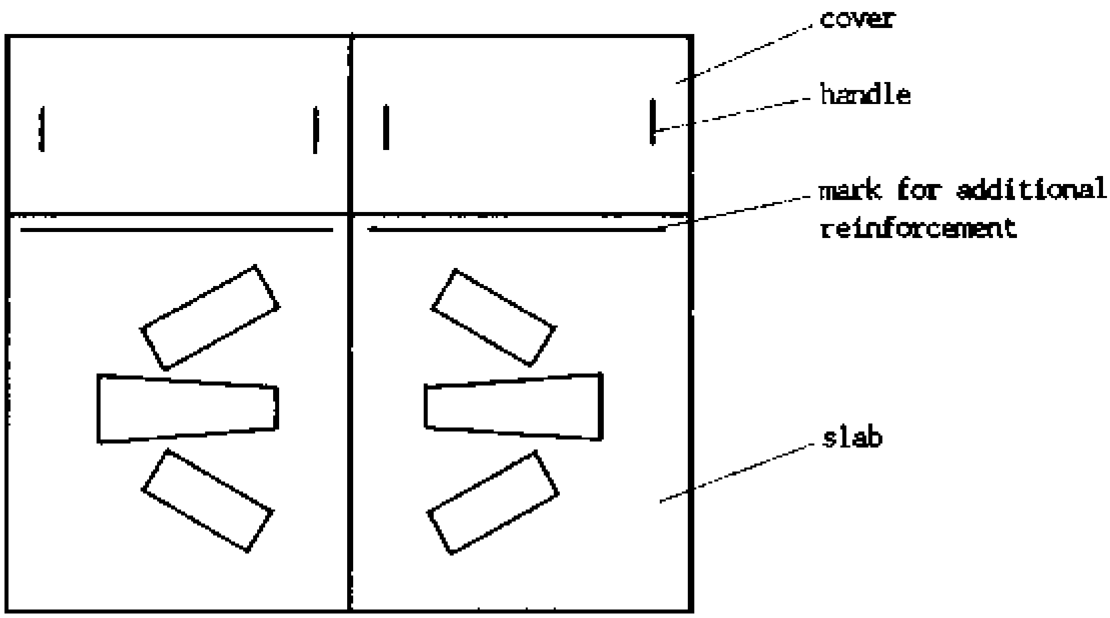
- Place the slabs. The mark for the reinforcement Ø 10 mm must be above the pit, not above the wall. The additional reinforcement Ø 10 mm acts instead of a beam which spans the pit.

- The squatting positions must face each other (see drawing).

- Make sure with the spirit level that the slabs are horizontal. Fill in all cracks with cement mortar.

- Place mud mortar on the wall where you place the covers.

- Place the covers. Fill in all cracks with mud mortar.



8. Superstructure

The superstructure is to be built by the owner. Its construction is conventional building. It can be done with permanent or local materials and shall not be described here.

9. Fixing the Ventpipe

Manufacturing ventpipes is described in 9.15. When the superstructure is completed,

- Fix mosquito wire on top of the ventpipe with wire.
- Fix a small roof on top of the ventpipe against rain.
- Fix the ventpipe in its foundation with cement mortar.
- Connect the ventpipe with the superstructure with an anchor from flat iron or similar.

10. Preparing the Latrine for Handover

-Clean the pits and slabs from mortar and brick rubble. The pit must be dry.

- Prepare the pit for use as described in 9.16.
- Put earth over the covers as an additional seal.
- Put the heavy concrete lid on the squatting hole not to be used first.
- Put the wooden lid on the other squatting hole.
- Place a basket with ashes or sand with a tin, a broom and papers in the latrine.
- Fix the posters for instruction on the wall.

11. Operating Instruction

After the technical work is done, inform the community development staff to conduct an operating instruction for the users of the latrine (see 9.17).

C) Materials Needed for a Compost Latrine, Standard Size, without Superstructure

Work	Cement Buckets	Sand Buckets	Gravel Buckets	Mixture	Bricks	Other Material
slabs	3	8	6	1:2.7:2	---	1 welded mesh plus reinforcement Ø 10
finish of slabs	1/2	---	---	---	---	---
filling under floor	---	---	10	---	---	---
floor	3	8	10	(1:3:4)	---	***
walls	$4\frac{1}{2}$	18	---	1:4	700	---
ventpipe foundation	$\frac{1}{2}$	2	---	1:4	30	---
plastering	2	12	---	1:6	---	---
fixing slabs and ventpipe	$\frac{1}{2}$	2	---	1:4	---	ventpipe mosquito wire
steps	$\frac{1}{2}$	4	---	1:8	20	---
contingency	$1\frac{3}{4}$	26			250	
Total	$16\frac{1}{4}$ = 5 bags		50		1000	

1 bag of cement = $3\frac{1}{4}$ buckets; 1 bucket is about 10 litres;

*** in black cotton soil put 2 layers of welded mesh into the floor (see 6.6/11).

9.15. Ventpipes

Some basic information about ventpipes for latrines and a way to manufacture ventpipes locally are compiled here.

A) <u>General Information</u>

A correctly installed and well maintained ventpipe is an improvement for any pit or compost latrine. It has the following functions:

1. It provides ventilation for the pit. The gases produced during composting can escape.

2. It enables the contents of the pit to dry (in a hot climate).

3. It acts as a fly-trap.

In order to serve these purposes, the following conditions must be fulfilled:

1. The ventpipe must have a sufficient diameter, either a smaller diameter with smooth inside surface or a larger diameter with rough inside surface. 10 cm diameter is the minimum for smooth pipes, 15 - 20 cm diameter is better.

2. The ventpipe must be long enough; it should reach higher than the highest point of the roof (to avoid turbulences above the ventpipe).

3. It is an advantage if the ventpipe is dark or black because it will heat up more and, thus, create an upward draft.

4. It should be exposed to sun. The sun will heat it up and create an upward draft.

5. Rain should be prevented from entering the ventpipe by a small cover. There must be sufficient space between the top of the pipe and the cover to allow air to pass (drawing see 9.3/3).

6. The top of the ventpipe must be sealed with mosquito wire to prevent flies from escaping and, thus, kill them. As the gases produced by the composting process are highly corrosive, ordinary mosquito wire gets holes after some time. It is most essential to replace the mosquito wire every 6 to 12 months.

7. The footing of the ventpipe must have no cracks which would allow flies to escape.

A ventpipe with its screen torn is worse than a latrine without a ventpipe. The warm gases escaping from the ventpipe will attract by their smell more flies than without a ventpipe. You can feel the gases with your hand over a ventpipe if the composting process has already begun.

Therefore, you should only install a ventpipe if you or the users are able and ready to maintain it, i.e. to replace the mosquito wire regularly. Otherwise, it is better to have a latrine without a ventpipe. Such a latrine can also function well and be smell-free if sand and ashes are poured into the pit after each use.

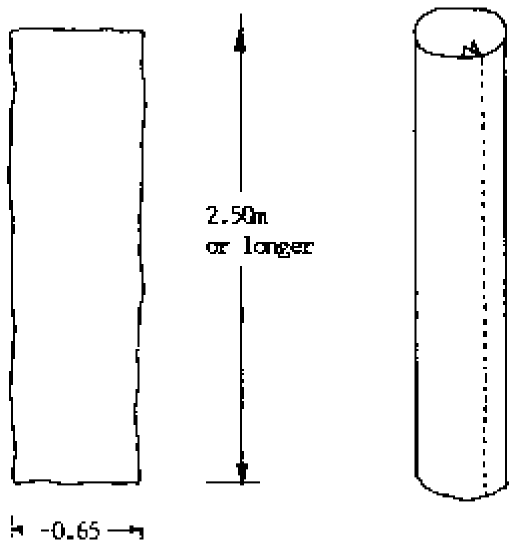
B) Manufacturing Ventpipes Locally

Manufacturing ventpipes locally might be an alternative to industrially produced plastic or metal pipes which can be expensive depending on the logistics facilities of the area. Do not use asbestos cement pipes because mining and production of asbestos cause asbestosis, a deadly lung disease for the workers.

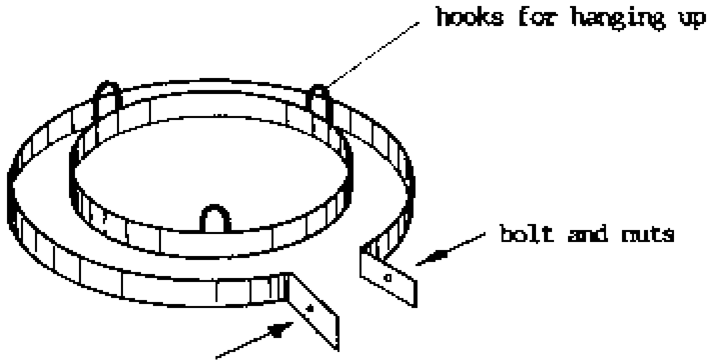
Also, local manufacturing encourages local skills and local trade and provides work and income.

Ventpipes from ferrocement, inside Ø 20 cm, can be produced according to the following steps:

1. Make a mould for the ventpipe by sewing a 0.65 m × 2.50 m sack-cloth to form a sleeve or pipe. Preferably, take good quality sack-cloth or canvas.

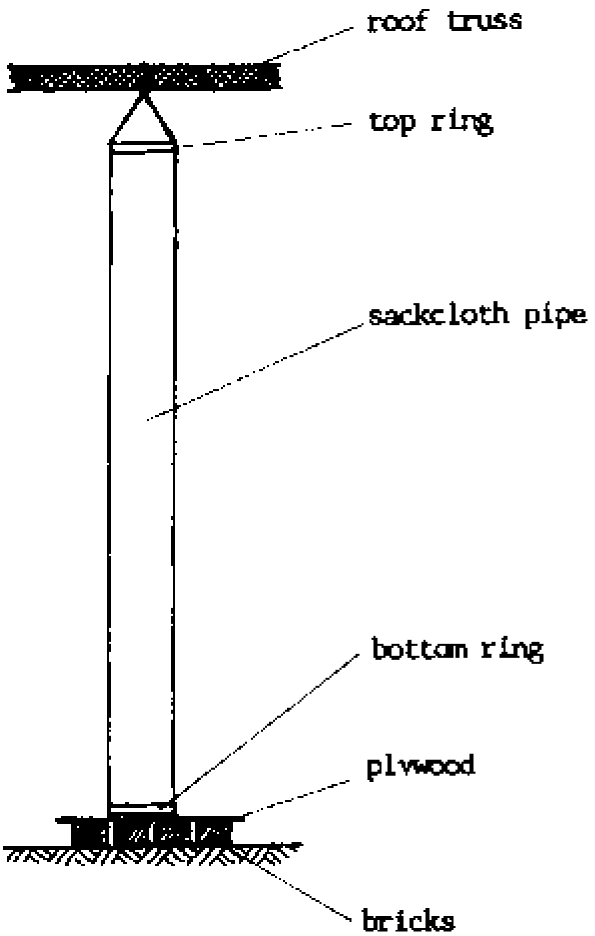


2. Fix a ring of reinforcement Ø 8 mm or a ring of flat iron, 2 cm broad, on top and bottom of the sack-cloth pipe. A double ring from flat iron to be closed by a bolt can be easily fixed and removed again. The sack-cloth is clamped in between the two rings.



3. Dip the sack-cloth pipe into water until it is completely wet.

4. Hang the top of the sack-cloth pipe on the roof truss. Place some bricks and a piece of plywood under its bottom end.



5. Fill the sack-cloth pipe with sand from the top. Take care that it is straight.

6. Mix cement mortar 1:4.

7. Plaster the sack-cloth pipe evenly in a 1 cm thick layer.

8. Cover the pipe with a nylon sheet.

9. Next day wrap one layer of chicken wire around the pipe.

10. Make the pipe wet.

11. Add a second layer of plaster 1 cm thick. Smooth the outside of the pipe.

12. Cover the pipe with a nylon sheet and keep it wet for three days,

13. Wait for seven days.

14. Remove the bricks and the plywood.

15. Remove the sand.

16. Lower the pipe to the ground.

17. Remove one of the rings holding the sackcloth.

18. Pull out the sackcloth pipe.

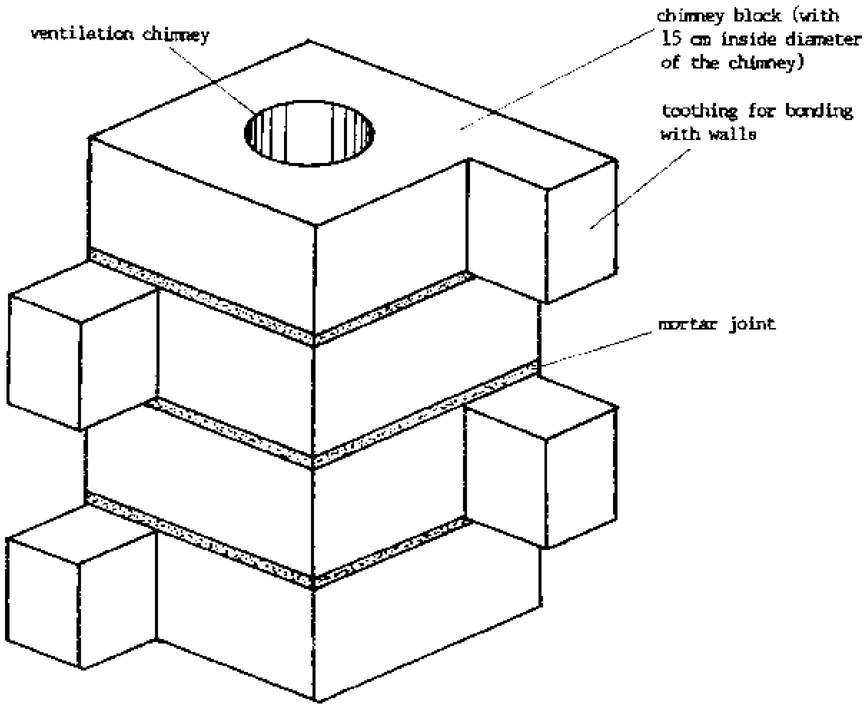
19. Store the pipe carefully and let it cure for another two weeks.

A ventpipe of this kind is quite heavy. The inside is not completely smooth and the pipe might not be completely straight, but the large diameter compensates for that.

The ventpipe is quite strong once installed, but not very resistant to damages during transportation. It should not be transported over long distances by car and should be handled with great care.

The ventpipe can also be manufactured without chicken wire (because of the costs). In that case it must be carefully kept wet for three days and even more care is needed for transportation.

Another alternative to produce ventpipes locally is by making chimney blocks. Square blocks with a round opening are made from a cement/sand mixture or cement/soil mixture and then built as a ventpipe into the corner of the latrine (see bibliography No. 46, April 83).



9.16. Operation and Maintenance of a Compost Latrine

The following operating instructions are primarily intended for a compost latrine. But they are as valid for all sanitation systems without water, like

- pit latrine of local materials,
- VIP (ventilated improved pit latrine),
- children's squatting slab.

Any pit latrine will function better if managed like a compost latrine.

A) Essential Equipment Inside the Latrine

The following items are vital for a well kept latrine. Provide, maintain and replace them when broken:

- basket or any other container with ashes and sand,

- calabash or tin for sprinkling ashes and sand,

- container with waste paper or toilet paper (if people use paper for anal cleaning; when paper is not provided, people might use the leaflets from the wall for their cleaning),

- broom (not to be used elsewhere),

- removable lid for squatting hole,

- permanent, heavy lid for squatting hole of the second receptacle (from concrete or timber with a heavy stone; see 9.14/19),

- instruction leaflets and posters on the wall.

B) Starting-up a Latrine

Before the latrine is used for the first time, put into the receptacle some loosely packed organic residue: grass, weeds, leaves, sawdust, yard sweepings. This absorbs liquids, provides carbon for the composting process, increases the variety of micro-organisms and prevents the pile from becoming too compact. All compost and pit latrines will function better if you start them up like this.

C) Daily Use

The daily use is described in the leaflet following which is to be used for explanation and shall be finally fixed on the wall of the latrine.

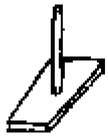
These rules are the core of good latrine keeping. Success of a latrine will depend on keeping them or not. The reasons for these rules are given in chapter 9.13.

It is not easy to introduce these rules in an extended family, an office or school community, etc., using a latrine together.

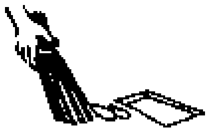
How to use your compost latrine

1. Put some sand or ashes into the hole after each use!

2. Close the lid after each use!

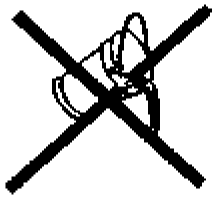


3. If dirty, pour sand over the dirt and sweep it into the hole!



4. Put grass, leaves, sweepings, kitchen left overs into the hole several times a week!

5. **Do not** pour any water into the hole! Clean the latrine dry or with wet grass, but do not rinse it with water!



6. **Do not** put glass, tins or plastic into the hole!

7. **Do not** use desinfectant, old engine oil or DDT!

Sudan Council of Churches - Munuki Water and Sanitation Project - Juba, Box 209

To run a compost latrine successfully requires a kind of "administration", such as home administration or school administration. The up-keep needs to be organised, implemented and followed up.

We suggest compiling the work which needs to be done regularly in a check list:

Tasks of the person caring for the latrine:

Daily

- Sweep the latrine.

Once a Week

- Fill the basket with ashes and sand.
- Fill the basket with paper.
- Sweep the walls.
- Put grass and leaves into the latrine.
- Check posters and leaflets.
- Check the contents of the pit whether they are dry.
- Check if the outside lids are well covered with earth.
- Check the screen on the ventpipe.

The following suggestions shall help to ensure a proper up-keep:

1. A person needs to be assigned for overall responsibility concerning the latrine, preferable an elderly person or somebody else with authority. The up-keep of latrines does not work if no one or everybody is responsible. For the daily and weekly up-keep, the different members of the community can be assigned in weekly shifts. The person in overall charge shall remind and encourage the members in their tasks.

2. Repeated instructions of the community or family are necessary, like an operating instruction in the beginning and follow-ups later on. Sit down from time to time with the family/community to discuss problems and remind the members of the correct use.

3. Make use of the psychological effect: A clean place is much less likely to be messed up than a dirty one. Keep your latrine very clean and people will hesitate to mess it up.

4. Keep an eye on who is using the latrine. Usually it is always the same people who notoriously make the latrine dirty. Check the latrine after such a person has used it and, if it is dirty, call her/him back to clean it. Insist that the one causing the dirt will clean it him/herself without quarrelling.

5. Do not use latrine cleaning as a means of punishment or threat for faults of other kind. Do not assign the lowest status people in the family/community for latrine cleaning. This produces the deep impression that latrine cleaning is something shameful and disagreeable. On the contrary, try to explain that by cleaning the latrine we are contributing to the life cycle and preventing diseases, which is a very important and honourable task. Additionally, as Christians we are called to the service of others.

D) Changing Vaults (see leaflet following page)

When the receptacle of a compost latrine is almost full, cover the pile with grass and soil. Close the vault with a heavy lid and start up the second receptacle.

E) Removing Compost

When the second receptacle is nearly full, it is time to remove the compost from the first one. Take off the cover, and remove the contents with hoe and shovel. Do not remove all of it, but leave some to give the new pile a good start. The compost should by now be fairly dry, soil-like and completely odour-free. It is very much reduced in volume. It is not any more dangerous to handle than soil in the garden. Carry the compost to the garden and put it into a shallow trench. Cover it with about 10 cm of topsoil and grow vegetables on top.

F) Number of Users

A compost latrine should not be overloaded; that is used by too many people. 15 to 20 people can use the standard size of compost latrine (volume 2.7 m^3) and will need about one to one and a half years to fill one receptacle. All kitchen waste of the same number of people should be added to provide sufficient carbon.

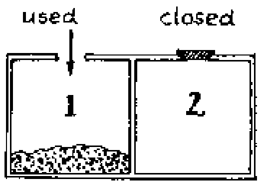
G) Maintenance of the Latrine

Keep the outside covers (those used when emptying the latrine) well covered with earth. Arrange the ground around the latrine so that surface water drains away.

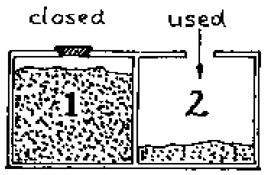
Check the screen on the ventpipe. If it has a hole, replace it. Ordinary mosquito screen might be corroded after 3 months only.

How to empty your compost latrine

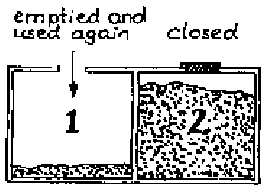
1. Use one receptacle only! The other one is closed with a permanent lid.



2. When almost full, put grass and soil into receptacle and close it with the permanent lid! Use the second receptacle!



3. When the second receptacle is almost full, put grass and soil into it and close it with the permanent lid! Empty the first receptacle with hoe and shovel! Use the compost in the garden! Now use again the first receptacle!



4. Continue to use the 2 receptacles alternatively, one at a go!

5. When emptying, repair any cracks with cement mortar and replace the masquito wire on the ventpipe if corroded!

H) Rehabilitation of a Compost Latrine

A well kept compost latrine is odour-free and without flies. But what to do if the slab looks like a "map", is full of urine and faeces, with hundreds of flies swirling around, and the pit is like a smelly pool??? Such a latrine needs a general rehabilitation.

1. Procedure

- Scratch all faeces from the slab with sticks into the hole.

- Pour lots of sand and ashes over the wet slab and let it soak.

- Brush the sand into the pit and repeat several times.

- Pour earth, sand and ashes into the pit until no water can be seen anymore and the contents are wet, but not soaked. You might need quite a lot of material for that.

- Pour grass, leaves and especially ashes in plenty into the pit. The contents most likely have too much urine and not enough carbon.

- Clean the inside of the latrine including walls.

- Rub the slab with wet grass or wet sponge and throw it into the pit. Do not rinse the slab with water.

- Pour ashes over it and sweep them in.

- Replace or provide baskets with sand and ashes, paper, broom, lid, etc.

- Check the outside of the latrine for eventual necessary maintenance.

- Seriously advise the users for future use.

If such a rehabilitation is done in time, the pile can still decompose reasonably. If you have to empty a compost pit and the contents are not decomposed but a cesspool, it will be very unpleasant to empty it (by hand or desludging truck).

Learn from experience and keep the latrine better.

Do not blame the compost latrine, but the people who failed to teach and implement the proper up-keep.

2. Example for a Rehabilitation of a Compost Latrine in an Institution (School or Office)

The following detailed action plan is advisable if we want durable improvement. For compost latrines in private homes the rehabilitation process is to be simplified but keeping to the same basic steps.

- Form a group to work on this task.

- Contact the persons responsible for the compost latrine(s) and ask for permission and support for the action.

- Prepare an "action plan".

- Develop a questionnaire.

- Test the questionnaire.

- Prepare and duplicate the final questionnaire.

- Conduct interviews with the users.

- Inspect the compost latrine and write a small report.

- Evaluate interviews and inspection.

- Prepare users' meeting about problems.

- Conduct the meeting with the aim of a decision about how to manage the compost latrine(s) in future.

- Do the practical rehabilitation including cleaning, making the pits dry, and providing missing equipment.

- Prepare operating instruction with drama, poster and health education.

- Conduct operating instruction.

- Handover the compost latrine(s) with the keys to the people in charge.

- Follow up the compost latrine regularly for eventual problems.

Guidelines for conducting the interview:

- Introduce yourself.

- Ask if the time is suitable.

- Explain purpose of interview (which is: gathering information about compost latrines in general, gathering information for improving the compost latrines on the SCC compound).

- Ask if the person is ready for the interview.

- Ask the questions and fill the questionnaire. Make sure that the person has understood the question properly. Do not comment on the answers. Note down the answers also if they are wrong.

- Ask if you can note down the name of the person. If not, note down only male or female.

- Hand out the anonymous questionnaire. Ask for it to be filled in and thrown into the closed box.

- Thank for the interview.

INTERVIEW OF COMPOST LATRINE USERS ON THE SCC COMPOUND

QUESTIONNAIRE

1- Did you hear about compost latrines? yes/no

2. Do you know what a compost latrine is? yes/no

3. How many pits does a compost latrine have ....

4. Why does a compost latrine have two pits?
....
....
....

5. What happens with the contents of a compost latrine?
....
....
....

6. Why do we need to put ashes or sand into the compost latrine after defaecation?
....
....
....

7. Why must the squatting hole always be covered by the lid?
....
....
....

8. Do you like compost latrines? yes/no
Why?..
....
....

9. Do you see any difference between the left and the right compost latrine on the SCC compound? yes/no

10. Are there any problems with the compost latrine on the right side yes/no

Which problems?..
....
Is the latrine dirty? yes/no

11. What do you think are the reasons for these problems?
....
....

12. Are there any problems with the compost latrine on the left side? yes/no

Which problems?..
....
Is the latrine dirty? yes/no

13. What do you think are the reasons for these problems?
....
....

14. How do you think these problems could be solved?

....
....
....
....

15. Are you ready to attend a meeting about the latrine problem? yes/no

16. Can your department contribute regularly money for the latrine up-keep? yes/no

17. Are you ready to participate personally in the latrine cleaning in shifts? yes/no
only if...
....

18. Are you ready to attend an information meeting for the users? yes/no

19. Would your department like to take over responsibility for the care of one of the compost latrines? yes/no

20. Which of these suggestions No. 15-19 would you prefer? No.......

21. Do you have any further comments or suggestions?
....
....
....
....
....
....
....

22. Are you ready to give
your name:..
title:...
department:..
male/female

Date of Interview........................ Name of Interviewer:..

GATHERING INFORMATION ABOUT COMPOST LATRINES ON THE SCC COMPOUND

QUESTIONNAIRE

Please kindly answer the following questions. They are necessary for gathering information about the sanitation situation on the SCC compound. Make a cross at the correct answer. You can cross several possible answers. Do not write your name on the questionnaire. Please, throw the filled questionnaire into the closed box in the Munuki office. Thanks.

1. Are you

0 male
0 female

2. Where do you go for a long call?

0 outside the SCC compound into the bush
0 to the flush latrine (WC) near the dispensary
0 to the flush latrine (WC) in one of the guest house rooms
0 to the compost latrine on the left side
0 to the compost latrine on the right side

0 at home

3. Where do you go for a short call?

0 outside the SCC compound into the bush
0 at the fence
0 in the bathroom behind the generator
0 to the flush latrine (WC) near the dispensary
0 to the flush latrine (WC) in one of the guest house rooms
0 to the compost latrine on the left side
0 to the compost latrine on the right side
0 at home

******

9.17. Operating Instruction for Compost Latrines

For all compost latrines built, an operating instruction is conducted for the users. The most important point is not just to have a latrine building, but to use it properly and keep it clean. Otherwise, it will be worse than defaecation in the open and not only become a nuisance, but a danger to health as well.

Therefore, the operating instruction is aimed at giving the future user an idea about what they can do to keep and maintain the latrine properly to avoid problems. It is conducted at the place of the latrine with <u>all</u> members of the household or institution who are going to use the latrine.

The methods used are demonstration, drama, posters, model, leaflets, flip-chart, songs, depending on the audience and the time available (see 4.26 to 4.29).

The topics covered are as follows:

- Why do we need a latrine?

- What is a compost latrine?

- How do we use a compost latrine?

    * every day (see poster series attached)
    * when full (see poster series attached)

- What else do we need to pay attention to?

    * Who is responsible for taking care?
    * What to do if there are problems?

The operating instruction will be followed by regular follow-up visits (see 9.18) and may be repeated if need be.

9.18. Latrine Follow-up

It is essential to follow up whether compost latrines are used correctly and, eventually, to advise and encourage the users.

A) Questions to the Users

The following questions need to be discussed with the owner/users.

No.	Question	Possible Suggestions
1	Do you have any problems with your compost latrine?	
2	How many people use the latrine?	
3	When did you start to use this pit?	
4	How full is it?	
5	Did you empty a pit already?	
6	Do you use sand and ashes?	It is preferable to use sand and ashes.
7	Do you regularly add grass, leaves, kitchen waste?	Adding these materials is necessary for better composting.
8	Is the container for ashes and sand filled regularly?	This is very necessary to encourage the users. Little children can be assigned for this task.
9	Do the users sprinkle sand and ashes?	Remind them if they forget.
10	Do you sweep the latrine daily?	This is very important for cleanliness
11	Do you use the broom somewhere else?	The broom shall not be used elsewhere because of transmission of diseases.
12	Are there many flies in the latrine?	Pour lot of sand and ashes. Keep the lid always closed.
13	Are there many flies in. your kitchen?	Keep your compound clean and dry. Bury or burn rubbish.
14	Are there many mosquitoes in your compound?	Your latrine pit must be dry. Your bathing place must be dry. Dig ditches for run-off of rain water. Fill up all water pools in the surrounding.
15	Is the run-off of the bathing place muddy and dirty	Dig a soak-away pit and fill it with stones or broken bricks.

B) Inspection

The following points need to be inspected.

No.	Check	Possible Help
1	Are the latrine surroundings clean?	Clean the surroundings.
2	Is the latrine clean inside?	Clean the latrine inside.
3	Is the latrine slab clean or is there urine spilled ("maps")?	Scratch off any dried dirt. Sprinkle ashes and sweep it into the pit. Rub the slab with wet grass. Do not rinse.
4	Is there a basket with sand and/or ashes, a tin, paper, a broom inside? Is there a wooden lid and a concrete lid on the two holes?	Replace what is missing.
5	Are all the leaflets and posters, "How to use the latrine", on the wall?	Replace what is missing.
6	Look into the pit with a torch. Is there water in the pit? Is everything well covered with sand or ashes?	Fill earth, sand, ashes, grass, leaves into the pit until all water is sucked up.
7	How full is the pit?	If the pit is almost full, the contents can be pushed back with a stick for even filling. Remind the owner to call the project when he wants to change the receptacle.
8	Is there any bad smell?	Put a lot of ashes into the pit to stop it.
9	Are there many flies?	Advise the owner on the correct use (to place the lid, etc.) which will reduce the flies.
10	Are the concrete covers of the emptying holes well covered with earth and air tight?	Cover the concrete covers with earth.
11	Is any place around the latrine and especially the steps washed out?	Fill any washed out place with earth.
12	Does the mosquito wire on top of the ventpipe have holes?	Replace it by new mosquito wire.

Do not forget to fill in the form, "LATRINE FOLLOW-UP" after each check and put it in the file of the latrine. This is necessary to see any improvement/deterioration and to evaluate by comparing with other latrines and over a certain period of time.

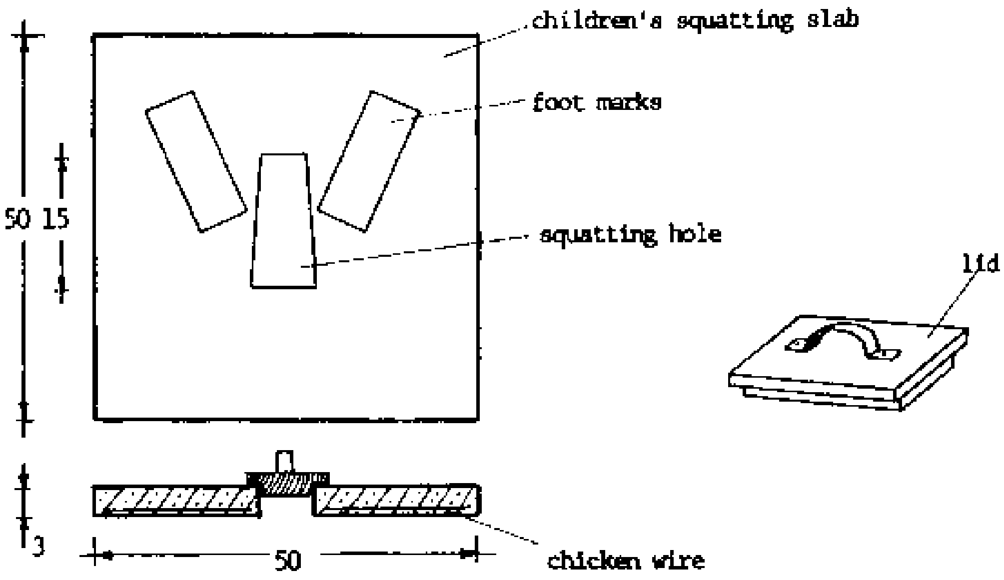
9.19. Children's Squatting Slab

Children will learn after a certain age to imitate the adults when defaecating. However, because the squatting holes of the latrines are too big, they will not go there, but just squat anywhere, in or near the compound. Thereby, they will provide breeding places for flies and contribute to the transmission of diseases. This can be helped by taking the excrements of a child immediately and throwing them into the latrine. However, the children's squatting slab will provide an easier solution and can additionally help to introduce the child into using a latrine properly later on. It will also help to reduce the nuisance of smell and flies from the excreta of the children squatting just anywhere.

The children's squatting slab is a slab of 50 × 50 cm from concrete, reinforced with chicken wire with a small squatting hole in the middle. It has a wooden lid.

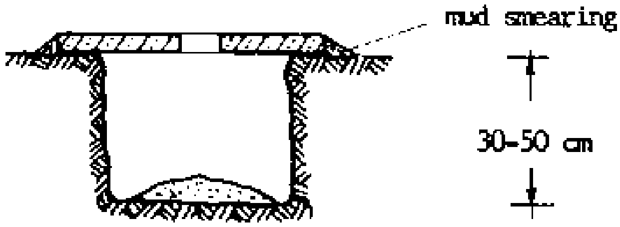


SCALE 1:10

It is to be used as follows:

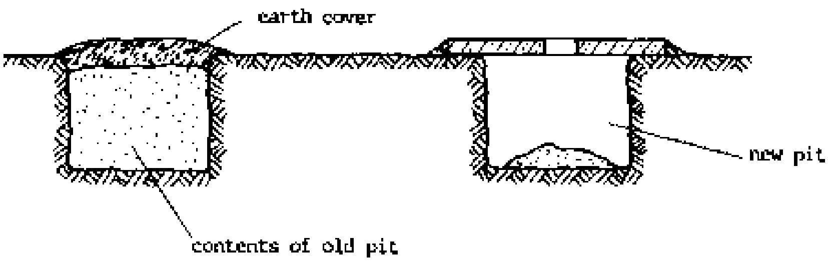
1. Dig a pit a bit smaller than the slab so that the slab can rest on the edges of the hole. It should not be deeper than 50 cm and in a place which is not flooded by rains. Put the soil of the digging aside and partly around the edge of the pit, to raise it a bit above the normal ground

2. Place the slab and smear the edges with mud so that it is sitting firmly on the ground. Put the lid on the squatting hole.



3. Teach the children to use the squatting hole properly, to put some sand or earth into the hole after defaecation and to replace the lid after finishing.

4. When the pit is full, take away the slab and put it on a new pit. Cover the old, full one with earth.



9.20. Bath and Soak-Away Pit

A place for taking a bath is essential for personal cleanliness and hygiene. It can be within the house with running water from a tap or a separate building, where we get water from an elevated tank, or just a place with a fence using water from a bucket. However, in any case it is important to keep it clean in order not to make it a breeding place for germs and let it become a smelly nuisance, especially if it is also used for urinating.

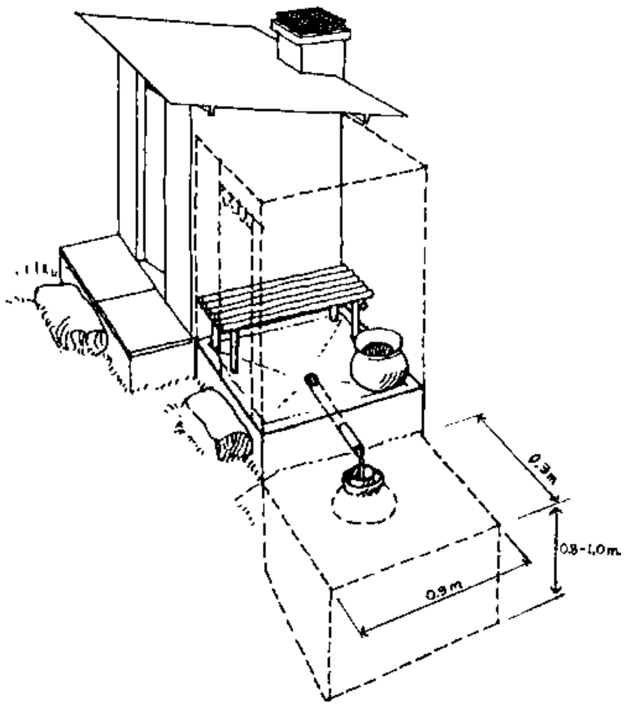
Therefore, take care that

- there is never standing water in the bathing place, but that it can run off easily;

- the water is not just running outside and then forming a cess-pool stinking in front of your fence;

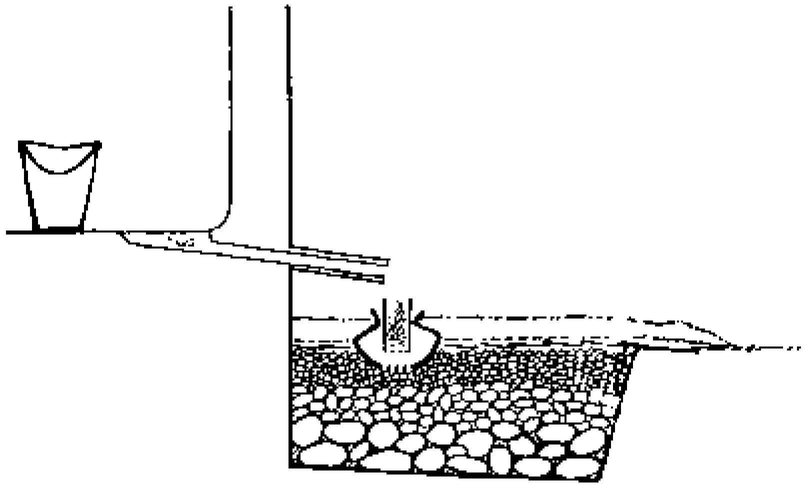
- you clean the bath regularly with enough water and soap. Normally, there is no need for disinfectants like Dettol, Finik, etc., if you keep the place clean and dry. Disinfectants should be used only if there are fungi infecting the feet. Then disinfect the bathing place - using boiling water is as effective as any disinfectant. Do not forget to treat the disease, otherwise it will just spread again.

A latrine with bath and soak-away pit:



To prevent water from standing, care for proper drainage and a soak-away pit. A soak-away pit to last for many years and not be clogged by grease and silt and bacteria, must be built properly.

Cross-section through soak-away pit:



In order to build a proper soak-away pit, do as follows:

1. Choose the Proper Location

It should be at least 6 m distance from the house and 30 m from the nearest source of water supply. It should not be in an area where surface water will stand or flow over it sometimes. The soil should be neither pure sand nor pure clay.

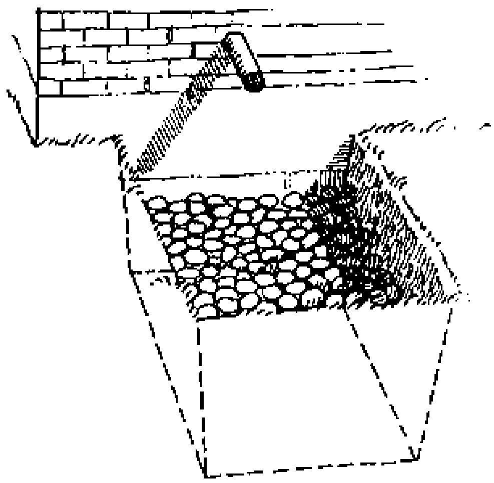
2. Dig a Pit

The bottom of the pit should be at least 1 metre above the groundwater level in rainy season and 1 m above any impervious layers. The size should be about 1 m deep and 1 to 3 m diameter.

3. Fill the Pit

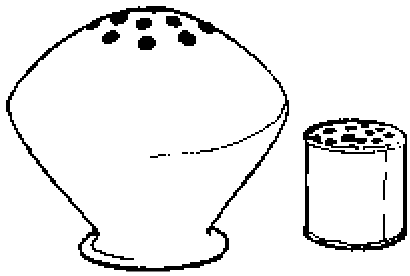
In the bottom third, big stones (about the size of a papaya), on top of that the next third, middle size stones (about as big as mangoes). The rest shall be filled with small stones or gravel; if available, you can put a layer of charcoal in between.

Soak-away pit with second layer of middle size stones:

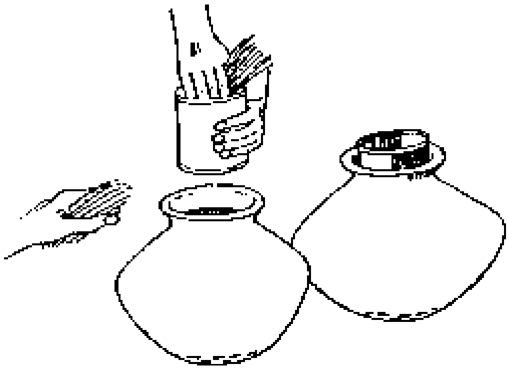


4. Prepare and Put a Silt and Grease Trap

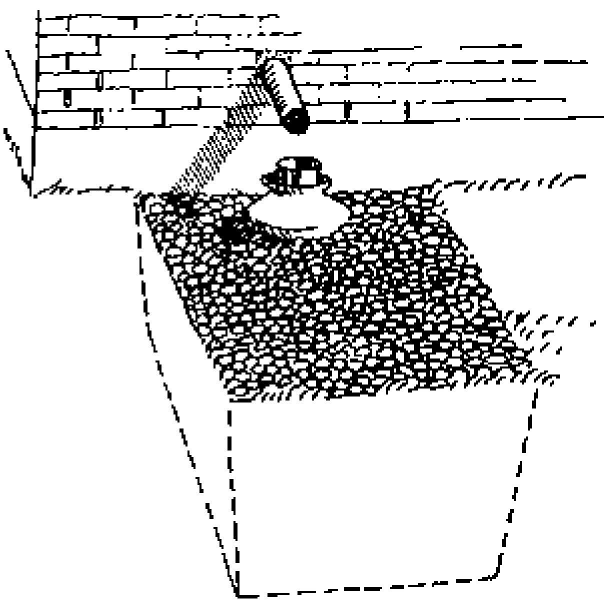
Make holes into the bottom of a clay pot and a tin fitting into the mouth of the pot.



Fill the pot with grass or straw, but do not press it together. Put the tin into the mouth of the pot and fill it also with grass.



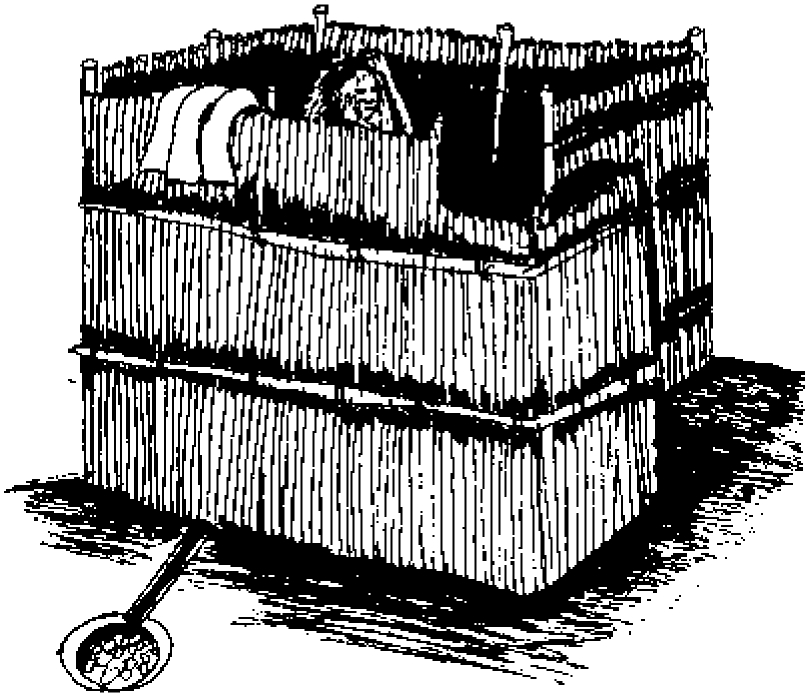
Put the pot with the tin into the layer of small stones under the outlet of the waste water.



5. Cover the Pit with palm leaves and old sackcloths or mats, so that only the silt trap looks out. Cover the mats with 5 to 10 cm of earth.

For maintenance you have to change the grass in the pot every two weeks.

If the pit is not soaking anymore (after some years), take out everything, wash the stones, take away a layer of soil from the walls of the pit and let it dry out. Then start again at step No. 3 to re-do it.



9.21. Handling Waste Matter in The Home

Beside excreta, there is other waste matter in the household which needs to be handled in a proper way to avoid diseases.

A) Principles

1. Minimize rubbish (e.g. by using a basket for shopping instead of buying new nylon bags each time).

2. Check to see if waste can be a resource by reusing/recycling it.

3. Whenever you are collecting, handling or disposing of waste, take care not to get injured (if you do, disinfect and clean immediately), and wash afterwards with soap and enough water.

B) What Can You Do with Waste Matter?

In crowded areas only a collection system could ensure safe disposal. However, if that is not available and we cannot re-use the waste safely, we should try to get rid of it in a safe way, that is:

1. Rubbish

Rubbish means all material which is not organic, like broken utensils, scraps of metal, glass, nylon bags, old batteries, rubber, etc.

If you collect rubbish in a waste-bin, do not mix it with garbage.

Always cover the bin not to allow rats, flies, etc. to live and breed in it.

Re-use it if it is possible in a safe way, e.g. use nylon bags several times after washing them, or re-use tins, but cut them open with a tin-opener to have a smooth edge and you will not cut yourself.

Bury it regularly in a suitable pit. The pit needs to be far enough from wells and streams to prevent water pollution. The bottom of the pit should be at least 1 m above the water table in rainy season.

The pit should also be far enough from houses to prevent nuisance by smell, flies, rats, etc.

Eventually burn the rubbish, but always cover it with soil.

2. Garbage and Other Organic Matter

Garbage means organic matter like food and crop waste, sweepings, kitchen leftovers, etc. Additionally, there is organic matter like small branches and leaves, animal manure, dead animals and ashes. Do not mix it with rubbish, but collect it separately. Re-use if possible and safe, e.g. kitchen leftovers as animal food. Recycle by using it for composting, either by throwing it into your compost latrine, or on a compost heap. A compost heap you can make by digging a pit, 1 m deep, throwing the waste in and covering it with earth immediately to prevent flies, rats, etc. It is very good if you can mix garbage, animal manure and ashes. This will give a very good manure for the garden.

Ashes you can also re-use for cleaning, for your pit latrine or compost latrine, or for making combo.

In case of bigger dead animals you have to bury them deep enough and cover them properly with soil to prevent them from being dug out again by dogs or hyenas.

3. Paper

Paper can be completely re-used if it is collected in a separate basket, either as scrap paper for drafts, for wrapping things, for the latrine or for lighting a fire.

4. Waste Water

Waste water can be re-used for

- cleaning,
- watering trees or the garden (if it is not too soapy).

If it is not re-used, it should be disposed of in a soak-away pit (see 9.20).

9.22. Pesticides

A) General Information

Pesticides are poisonous chemicals for killing "pests", that is insects, weeds, fungi, etc. They are designed for use in agriculture, disease control (mosquito control), timber protection, etc. Pesticides are advertised as offering a promise of a better life, easier and more comfortable, higher production and higher profits.

But

- they do not fulfill these promises, especially in the long run: Even if production increases, there is no guarantee that the poor will share the benefits. They will rather be the ones suffering most from the side effects.

  Costs are increasing and a crisis develops between worsening control of the pests and spiralling prices, and efficiency decreases.

- they have serious side effects, especially, if used uncontrolled.

The background for the uncontrolled use of pesticides in Sudan and other Third World countries shows a new dimension of underdevelopment: beside the economical exploitation there is an ecological exploitation. Chemicals whose production, marketing and use are forbidden in industrialised countries, because of its well-known dangers for the health of people and the environment, are produced, marketed and used in Third World countries. E.g. West Germany exports yearly 140,000 metric tons of chemicals whose use in Germany is either severely restricted or forbidden at all.

Annually there are about 500,000 poisonings' in connection with pesticides according to WHO and a high rate of unreported cases.

Poisonings happen because of misuse or overuse by

- poor training in the proper use and improper handling and use;
- irresponsible marketing practices;
- spraying on calendar schedule.

There is also a very low awareness about the dangers among the public. Pesticides are seen as "medicine" (almost in a magic sense) and not as the poisons they actually are.

The legislation in Third World countries is often not sufficient and, where it exists, problems arise because of inadequate enforcement.

See also 8.7/4.

B) Example DDT

DDT is a very good example for all the things described above:

DDT is one of the "Dirty Dozen", that is extremely hazardous pesticides which are banned or severely restricted in industrialized countries as threats to public health and environment, e.g. in Germany it has been forbidden since 1972. In Sudan its use was officially banned in 1980 according to some literature, but just to be replaced by other chemicals of similar kind or to be used inspite of the ban.

The chemical name of DDT is DichlorDiphenylTrichlorethane ($C_{14}H_9Cl_5$) Its use as an insecticide was detected in 1939.

It is so far prohibited in 15 countries because of its

- toxicity:

  This is increased by DDT being persistent and accumulating in body fat at each level of the food chain, and it is also increased in case of a protein deficient diet.

- residual action on humans, the wildlife and environment:

It concentrates in mothers' milk and in the fat tissue of the body. In Sudan it was used in the Gezira since 1947. The result is that in the fat of a Sudanese a residue content of an average of 30.9 ppm is found compared to a world level of 6 ppm.

Because DDT is essentially non-biodegradable in the environment, it is meanwhile present in virtually all foods and living things. The half-life of DDT in soil is a minimum of 2.5 years, that means that after 2.5 years half the amount originally applied will still be there, after five years a quarter, and so on. Its break-down products, DDD and DDE, are also extremely long lived and extremely toxic for fish and birds.

- alteration of the ecological balance:

DDT is lethal to many predators and parasites of the target pests. It also contributes to the deterioration of the soil quality because of destruction of micro-organisms, earthworms and ground insects. The World Bank, therefore, suggests it not to be used in agriculture.

- development of resistance:

It was originally thought of as a weapon against malaria. Meanwhile, 51 out of the 60 malaria-bearing mosquito types are resistant, and altogether there are more than 300 DDT-resistant pests now.

- health risk:

It is thought to be carcinogenic (= causing cancer). It also causes nerve and brain damage, as well as liver and kidney damage and tremors. There is also a decrease in sperm count reported which may be due to impurities of DDT.

C) Safety Precautions

For the use of DDT and other pesticides, the following safety precautions are necessary:

- Wear protective clothes which cover the whole body including a hat and veil covering the whole head, and long gloves.

- Wear special working clothes which are to be removed at the end of each working day.

- Wash the clothes and the body using soap at the end of work with sufficient water, using separate containers for cleaning which shall not be used for anything else. Dispose of the water in a safe way.

- Wear rubber boots.

- Handle the pesticide with special implements and not with the hands or containers used for other purposes.

- Secure safe transport and storage and proper equipment for application including spare parts and repair facilities.

It is quite clear that all these do not happen in practice for different reasons. However, the question to be asked is whether the use of pesticides is necessary and reasonable at all, and, if necessary, when and where to use them, or whether there are safer alternatives.

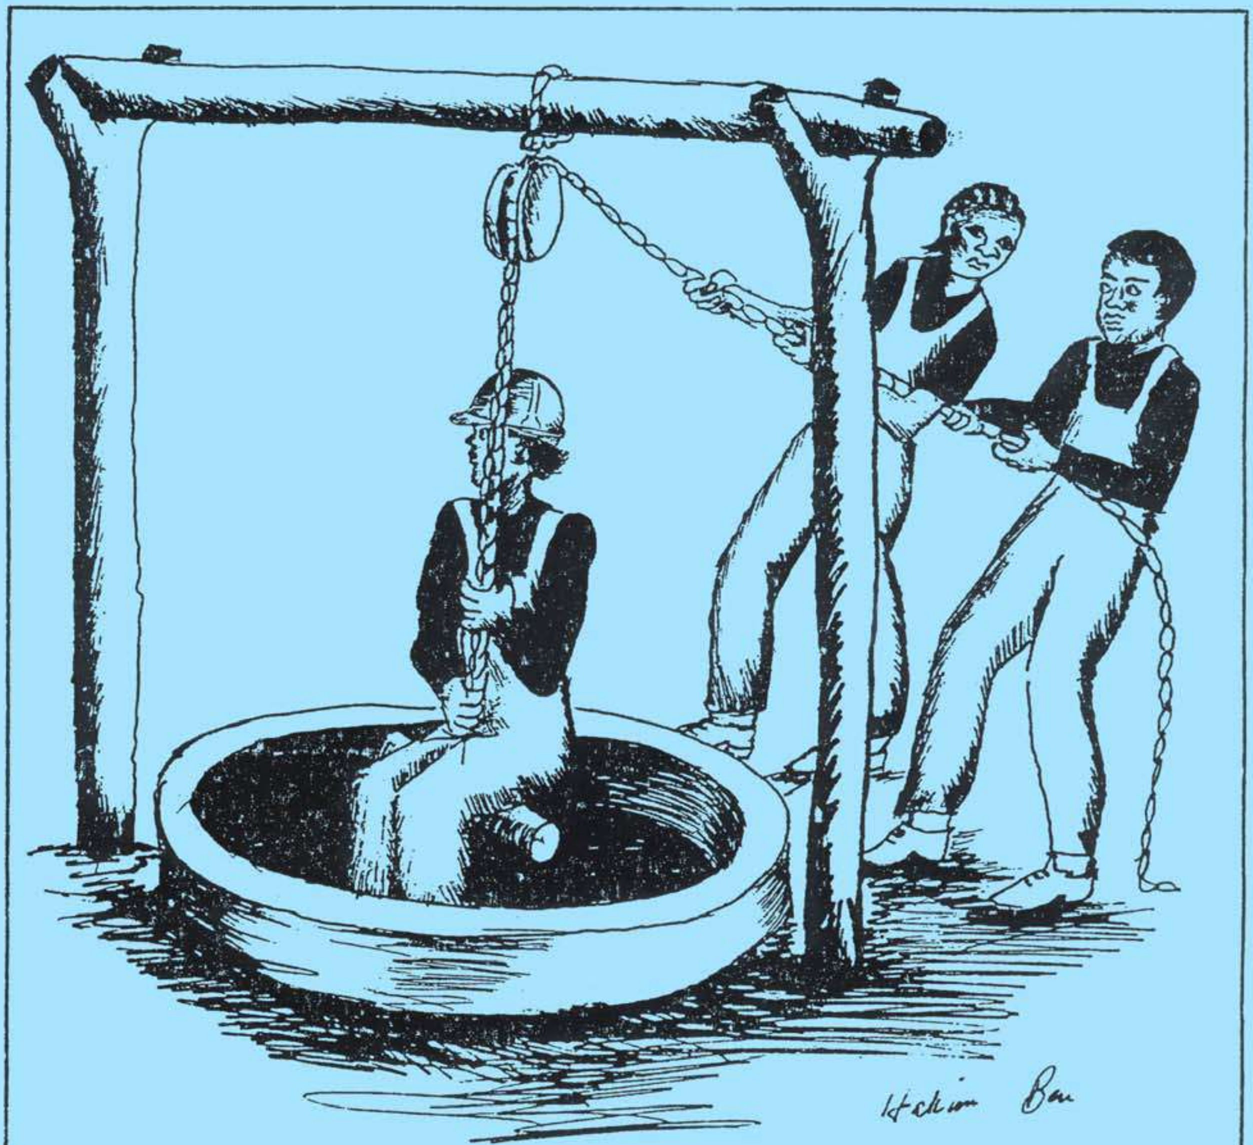
Sudan Council of Churches * Munuki Water and Sanitation Project

Small Projects'

Training Manual

Volume II.

Water Supply



by

Márta and Rudi Guóth-Gumberger

1987

0. Introduction

TABLE OF CONTENTS

0.2 Foreword

Two people are named as authors of this training manual; however, in reality it is the result of the work of very many people. We hope that it will serve a great number of people as well.

The development of the manual has a long history. We had the opportunity to work with the Sudan Council of Churches from 1982 to 1987, first in the Integrated Rural Development Programme in Yirol, and then in the Munuki Water and Sanitation Project in Juba, both in Southern Sudan. We had been assigned as Water Supply Coordinator (Marta) and Community Development Coordinator (Rudi). In the beginning we had background knowledge but little field experience. So we started to learn with and from the people and from the literature. At the same time we started training the people with whom we worked. In the beginning the training was exclusively on site. However, in the second project, the training became more formalised into a full two years programme of both class and field work. We began from the actual level of knowledge of the trainees without the assumption that "one should know this or that", and gathered whatever knowledge was necessary to do the project work together. Soon, compiling and distributing of written material became necessary, and so this manual was begun.

It includes many of our experiences in the water and sanitation work during the last five years. The bulk of the information was ready in first draft in April 1987. Photocopies were distributed to the participants of a three months training course. Contributions and questions from the participants were invaluable, and many sections were revised/improved. Actually, the manual would have never been written without the eagerness of the Munuki project's staff to learn. This interest made learning and teaching very enjoyable. After the training course, the entire manual was revised further and finally completed to the present version.

We thank our colleagues in the Munuki Water and Sanitation Project for all we learned from them, for their good cooperation and for their contributions to the manual. They are:

Edward Lako, Arthur A.Columbano Lado, Rhoda Benjamin, Joseph Lado Lubajo, Joan Batul Eliaba, Simon John Lubang, Gloria Habakuk Soro, Paulino Onorato Legge, Prissy M. Wai Wai, Jackson Onan.

We also thank the course participants from Swedish Free Mission and Sudanaid for their contributions. They are:

Inga Andersson, Margaret Toya, Isaac Kajokole Kenyi, James Jamil, James Wani, Lona Kojo Michael, Julius Sebit, Erasto Tupa, George Mogga Wani, Elijah Biar, Rose Paul, Robert Otik, Rhoda Yangi Wesley, Quintino Pitya, Anna Itto Njimirano, Ben Juma.

We extend our thanks also to Tom Benton, Sr. Margaret Donohue RSM, Paul McGleenan, Paul Hiebert, Char Holcomb, Stephen Power SJ, Dr. Douglas Reitsma, Susan Sunflower, Dr. Ruth Goehle, Betsy Bascom, for the tiresome work of proofreading.

We thank Mike Gogonya, Hakim Benjamin and Stephen Hakim for many of the drawings.

We are also very grateful to Michael Kubrom Habtai who shared his office with us during the weeks of final revision and typing, made the SCC library available for us and encouraged us with practical help and supporting words.

We thank the Sudan Council of Churches, and especially the Deputy General Secretary, KostiManibe, for the generous support which made this manual possible, by providing working facilities, financial resources, an electronic typewriter and numerous other resources.

There are many other individuals whom we would like to thank for their helpful contributions, but who are too numerous to be named.

We apologise for mistakes which remain in the manual inspite of revisions and corrections, and kindly ask the readers to send any corrections, comments and suggestions about the manual to one of the following two addresses:

Márta Guóth-Gumberger, Rudolf Gumberger
Neue Heimat 5a
D-83024 Rosenheim
Germany
Tel.: 08031/81103
Fax: 08031/43695

Munuki Water and Sanitation Project
Sudan Council of Churches

Sudan Council of Churches
P.O.Box 469
Khartoum
Sudan

As this work would never have been possible by our own strength without God's help, so we hope that God will also protect and strengthen any persons who use this manual and any future work done with the help of this manual.

Knartoum, 11.11.1987
Márta and Rudi Guóth-Gumberger

0.3 Purpose of the Manual

The following introduction should help the reader to orientate her/himself to the manual and make best use of it.

According to the title, this manual is intended for small development projects with 20 to 40 staff members. The administrative and organisational structures described correspond to this project size.

Secondly, this book is a training manual. It does not intend to present all the information available for professionals about a covered topic, but rather to select the most basic and relevant information about a topic. Then it arranges and presents it in such a way as to introduce a beginner, but also that a trained staff can find it helpful. The manual will help senior staff to organise and improve their management.

The aim of this manual is to train senior secondary school leavers to become skilled technicians in water supply and sanitation work, to run a store, to keep records and do qualified field work, or to become community development officers. They should be able to lead a team later on and to do basic work in administration.

However, the manual can serve different purposes as described below:

1. Training:

- It can be used by the trainee for self-study or as complementary material to the teaching in class.

- It can be used by the teacher/instructor as a guideline for preparing lessons in class about the covered topics.

- Some parts can be used as guideline for technical training for illiterate people.

- Some parts can be used as guideline for training sessions in the community.

2. Guideline:

- It can be used by experienced people as a help to develop and build up a new small project.

3. Reference book:

- It can be used as reference in day-to-day project work in the different covered fields.

- It can be used by the trainee for looking up particular information after the course.

- It can be used for revising previously acquired knowledge.

0.4 Possible Readers of the Manual

The manual provides material for a two years training course for several (technical) areas with 25% training in class and 75% training in the field. It is expected that not everything in the manual is for every trainee or reader.

The manual was developed in a water and sanitation project. Therefore, major parts deal with these subjects. However, many parts are of a more general nature so that they might be useful for staff of other projects, for churches, communities and development organisations.

In detail, material from the manual might be useful for the following groups of staff:

No	Staff or Trainees	Relevant Sections	Relevant Chapters
1	senior staff in management functions	1,2,3,7	4.18; 4.21; 5.1; 5.2;8.11 8.29; 9.8
2	administrative staff, typist	1,2	5.1; 5.2; 5.8
3	bookkeeper	1,5	2.9-18; 3.3-4; 7.2-12
4	community development staff	1,4,9	2.7; 2.11-12; 2.18; 3.1; 3.2; 3.11-13; 5.1-2; 5.8 7.1; 7.6; 8.1-11; 8.29; 8.33; 8.36-39
5	water supply staff	1,5,6,7,8,9	2.11-15; 2.18; 3,1-2; 3.11-13; 4,1-2; 4,15-16;
6	other technical staff like building staff	1,3,5,6,7	
7	storekeeper	1,5,6,7	8.32
8	logistics staff	1,3,5,7	2.18; 6,3-5
9	driver	1,3,5	2.18; 6,3-5; 7.6

0.5 Summary of the Contents

The manual consists of nine sections, compiled in three volumes:

Volume I	1.	General Knowledge
ADMINISTRATION	2.	Administration
and	3.	Running a Vehicle
COMMUNITY DEVELOPMENT	4.	Community Development
Volume II	5.	Mathematics
WATER SUPPLY	6.	Basic Technical Knowledge
	7.	Building Administration
	8.	Water Supply
Volume III	9.	Sanitation
SANITATION		

Volume I contains the general parts combined with community development, volume II and III contain the technical parts.

The manual was divided into three volumes so that it can be used in parts and become more handy for the reader. Sanitation was taken as a separate volume, because many may be interested in this section alone. Still, the manual is one work and the different sections belong together. There are many references pointing to other chapters in a different volume.

The different sections are briefly introduced in the following:

1. <u>General Knowledge</u>

Relevant information not fitting into the other sections was compiled here. “Using a Dictionary”, “Reading Techniques” and “Study Techniques” are useful for the work with the manual. “Private Budgeting”, “First Aid” and “Applications” are also generally needed knowledge.

2. <u>Administration</u>

The basic administrative knowledge and procedures for a small project of 20 to 40 staff members are compiled here.

3. <u>Running a Vehicle</u>

Here everything which a responsible user of a vehicle - not a mechanic! - has to know in order to run the vehicle economically and to prevent unnecessary damages is compiled. The section is important for both senior staff or logistics staff and drivers.

4. <u>Community Development</u>

This section compiles basic information necessary for community development work, both of general nature and background information as well as practical procedures.

5. <u>Mathematics</u>

The manual is not intended to be a mathematics book. Therefore, you cannot find detailed explanations of mathematical principles. Rather you will find a collection of mathematical knowledge in recipe-style about whatever was found necessary for the project work - mostly very simple things and few more sophisticated.

6. <u>Basic Technical Knowledge</u>

Basic technical knowledge for the water supply and sanitation work is compiled here, “Basic

Technical Drawing", "Using Measuring Tools", "Tools", and "Cement and Concrete" being the most important ones to be studied first.

7. Building Administration

The specific administration necessary for construction work is described her, consisting of "Planning", "Record Keeping", "Cost Calculation", "Purchasing" and "Storekeeping".

8. Water Supply

The section about water supply starts with general knowledge about water, discusses the different well types, the selection of a well site. Construction of hand dug wells with concrete rings is described in detail. An overview about pump types is given; some of them are described in more detail, especially hand pumps, and basic plumbing is added. "Well Disinfection", "Water Treatment" and "Health Education" are discussed in the end.

Hand dug wells and hand pumps were deliberately selected as main topics to be covered. Other books (see bibliography No.17, 18,35) cover these topics much more comprehensively; however, here the emphasis was to prepare training material in easily understood overviews and step-by-step procedures.

9. Sanitation

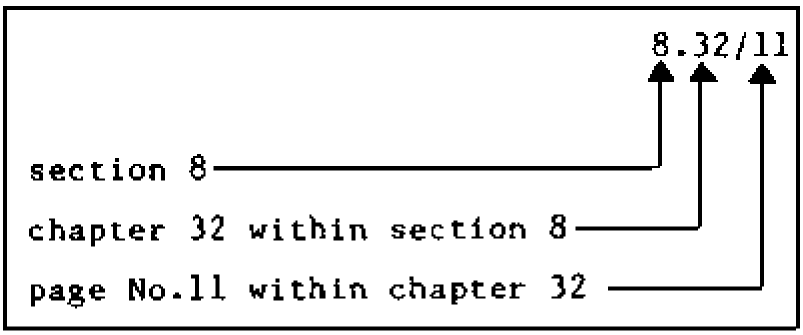
This section starts with general background knowledge about sanitation. The different types of disposal systems are introduced and guidelines for selecting the suitable latrine suggested. Deliberately, only sanitation systems without water were selected to be covered. Several are described in more detail. The main emphasis lies on compost latrines, including different designs, composting process, construction, operation and maintenance, and follow-up. Chapters about children's squatting slab, bath, waste matter and pesticides complete the section. Many parts of this section are suitable for training sessions about sanitation in the community or in schools.

0.6 Format and Style of the Manual

As the purpose of the manual is to assist trainees, teachers and field staff, we put emphasis on giving it a consistent and easily understandable format. The colleagues in the project work found that providing structures was helpful, and they had no difficulties at all filling the structures with life and flesh. Therefore, the manual offers a lot of structures, forms, tables, boxes, and step-by-step procedures. This shall help to gain an overview about the field and to easily find the required information.

A) Format of the Manual

The page numbers on top of each page reflect the format of the manual. Each one of the nine main sections contains several chapters. Each chapter has one or more pages.



The introduction with foreword, etc., is added as another section 0. The appendix with bibliography, index, etc., is added as section 10. Section 0 and 10 are attached to all three volumes to help the reader use the manual. Thus, the volumes contain these sections:

Volume I	: sections 0,**1,2,3,4,**10
Volume II	: sections 0,**5,6,7,8,**10
Volume III	: sections 0,**9,**10

Consecutive page numbers at the bottom of each page run in each volume separately.

Each chapter starts on a new page. Both the title of the section and the chapter are named:

8. Water Supply

8.14 **BASIC PLUMBING**

Directly under this headline you will find one or several bible quotations in some chapters. These were used for the prayer fellowships which were an integrated part of the three months course, and are related to the topic where they are mentioned.

Usually, each chapter starts with a brief introduction as each chapter is an entity by itself and should be readable by itself. The material within one chapter is mostly structured according to the same system, for example, in the lesson “Basic Plumbing”:

A) Threads

1. Thread Types

    a) Internal/External Threads
    b) Right Hand/Left Hand Threads
    c) ....
    d) ....
    e) ....
    f) ....

2. Thread Standards for Bolts and Nuts

    a) Metric Coarse Threads M
    b) ....
    c) ....
    ....

3. Thread Standards for Pipes

    a) ....
    b) ....
    ....

4. Pipe Measurements

B) Basic Operations of Plumbing

1. Cutting with a Hacksaw
2. Pipe Cutting
3. ....

C) Pipe Joints

1. ....
2. ....
....

Most lessons have only a structure A, B, C, ... and 1., 2., 3., ... All titles are capitalised and underlined, as well as other important words within the text. All important messages are put into boxes. Step-by-step procedures are either numbered or put into a box with a separate column giving the reasons. All tables are in boxes.

As each chapter is a separate entity and can be used as a teaching unit, a continuous flow between the chapters is not maintained. Repetitions occur sometimes, otherwise, a reference refers to the relevant chapter containing more information about a certain point.

B) Language of the Manual

The manual deliberately uses simple English to explain a topic, to give trainees with limited English knowledge a chance. Simple sentence constructions were preferred to elegance of style. Some special vocabulary in the different topics was introduced, but always with explanations. Often another equivalent word is given in brackets, e.g.
"serrated (= toothed)",
"aquifer (= water-bearing layer)"

As the book is a training manual, no foot-noting was applied. We used drawings and information from books together with project experience and compiled them for the teaching purpose. The literature used and useful for further readings is compiled in the bibliography.

C) Drawings

Many drawings are added for illustration and easy reading. In the technical part, mostly proper technical drawings are used (such as cross-section, layout plan, etc.), because they convey the information in a more correct and complete way than other types of drawings. The reader/trainee not acquainted with technical drawings must study chapter 6.1 "Basic Technical Drawing" before reading. Experience showed that the trainees without previous technical training were soon able to read technical drawings. The drawings in the manual shall also give the trainee practice in reading technical drawings. Almost all drawings are placed below or beside the relevant text, although this way consumed more space. This shall ease the reading as well.

0.7 Instructions on how to Use the Manual

As not everything in the manual is useful for each reader, you need to pick what is interesting for you. Selection should be easy because of the provided structures. The following can help you to make full use of the manual:

1. Do not attempt to read the manual from the first to the last page like a novel.

2. Make yourself acquainted with the format and the paging of the manual (see 0.6).

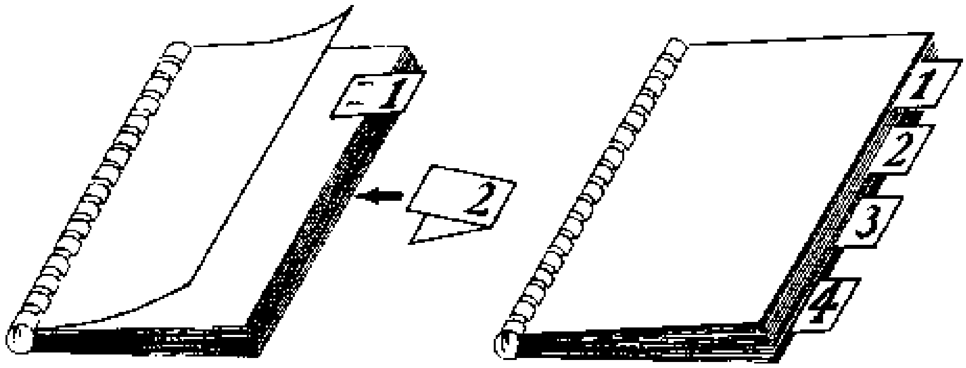
3. Cut separation taps from carton paper for the different sections and glue and staple them to the title page of each section.

4. Use the SQ3R-method explained in 1.3 to read the manual.

5. Read the table of contents and mark which chapters are interesting for you.

6. Decide which chapters to read first. Chapters 1.2, 1.3, 1.4, 5.1, 5.2, provide necessary basics for further reading of the manual; for technical staff also 5.3, 5.4, 6.1.

7. Apply the SQ3R-method for each chapter as well. Read the headlines of the chapter first to get an overview, collect your questions about the material, etc.



8. Underline important key-words; write your notes, remarks and questions into the manual wherever needed.

9. Use the list of abbreviations, list of forms used, list of leaflets and posters, in the end of each volume.

10. Use the index in the end of each volume to quickly find information about a certain point.

11. Use the bibliography for further studies.

0.8 Instructions how to Teach with the Manual

There are many books about how to teach, and teaching methods are not the topic of this manual. Thus, only a few suggestions are compiled in the following on how to teach with this manual (see also 4.14; 4.24).

A) <u>General Learning Conditions</u>

Help obtain good learning conditions:

1. Take special care that the class becomes a community, that the trainees get to know and respect each other, that they can mutually help each other. Fruitful learning can only take place in an atmosphere of cooperation.

2. Believe that the trainees are capable of learning. Trust is essential for encouragement and learning.

3. Take special care that the physical situation is supportive for learning: an adequate room, water, feeding, sanitation must be available. Involve the trainees by distributing assignments (fetching water, cleaning, organising food, etc.).

4. Take care that the trainees have sufficient materials like files, paper, pens, etc.

5. Arrange the class in the classroom in a circle whenever possible. This is the case for most of the chapters in this manual, except for the ones involving calculations.

B) <u>Planning Lessons</u>

Good preparation is essential for good teaching:

1. Take time for preparing your lessons. Roughly estimate as much time for preparation as for class time.

2. Plan the syllabus before a training course.

3. Each chapter in this manual is an entity by itself and can be used as guideline for a lesson. Some chapters may take several lessons to cover. Roughly, maximum five pages can be covered in a teaching unit of two hours.

4. Plan extra lessons in the beginning of the course just for explaining the syllabus and the format of the manual.

5. Plan enough time for evaluation.

6. When planning your lessons, mix the teaching methods: mix group-work with class discussions, calculations with explanations on a model, etc.

7. Have your teaching material (models, posters, etc.) ready before the lesson.

C) <u>Teaching Methods in Class</u>

A variety of teaching methods is suitable for teaching with this manual in class:

1. You can structure many lessons according to the SQ3R-method (see 1.3):

   S = Survey: Explain at the beginning what the lesson will cover.

   Q = Question: Ask the trainees if they have questions about the topic and note these down. Check after the lesson if the questions were answered.

   R = Read: Conduct the lesson. Explain the material.

   R = Recite: Let trainees repeat and explain with their own words what they have learnt and understood.

   R = Revise: Give homework, revise the following day or after one week.

2. Use group-work. Let groups of 4 to 5 discuss a certain question, try to read a passage or a drawing of the manual together, collect different aspects of a topic, etc.

3. Use discussion in the whole class to summarize group-work, to intro duce something new, to explain an aspect relevant to all.

4. Use from time to time work on a certain assignment for each trainee alone (e.g. calculations).

5. Use role plays whenever possible (e.g first aid, interaction of technicians with the community, etc.). They are fun and very educative.

6. Teach by action whenever possible (e.g. cleaning and rehabilitating a latrine, safety measures, interview, etc.).

7. Include field visits into your training programme.

8. Use posters, models, actual examples, whenever possible. Many of the drawings in the manual can be drawn on big posters for use in class. Well construction work is best understood when demonstrated with small models. Bring pieces of material for everything you discuss in class.

D) <u>Questions</u>

Asking questions is a way to learn, for both the teacher and the trainee.

1. Encourage the trainees to ask questions.

2. Ask at the end of a lesson whether there are any questions.

3. Ask in the beginning of a lesson if questions remain from the day before.

4. If you cannot answer a question, do not pretend and dodge around. Admit it, look it up after the lesson, and answer it the next day.

5. Spend some time before and after the lesson in class to give the trainees a chance to ask.

E) Homework

Study on her/his own is essential for the trainee in order to be able to digest the material learnt.

1. Give homework to almost all of your lessons.

2. Encourage students to keep their homework well filed and organised with chapter numbers and headlines.

3. Ask trainees from time to time to prepare for a lesson on their own by studying the manual in advance.

4. Take time to correct the homework and return it as soon as possible.

F) Teaching Field Work

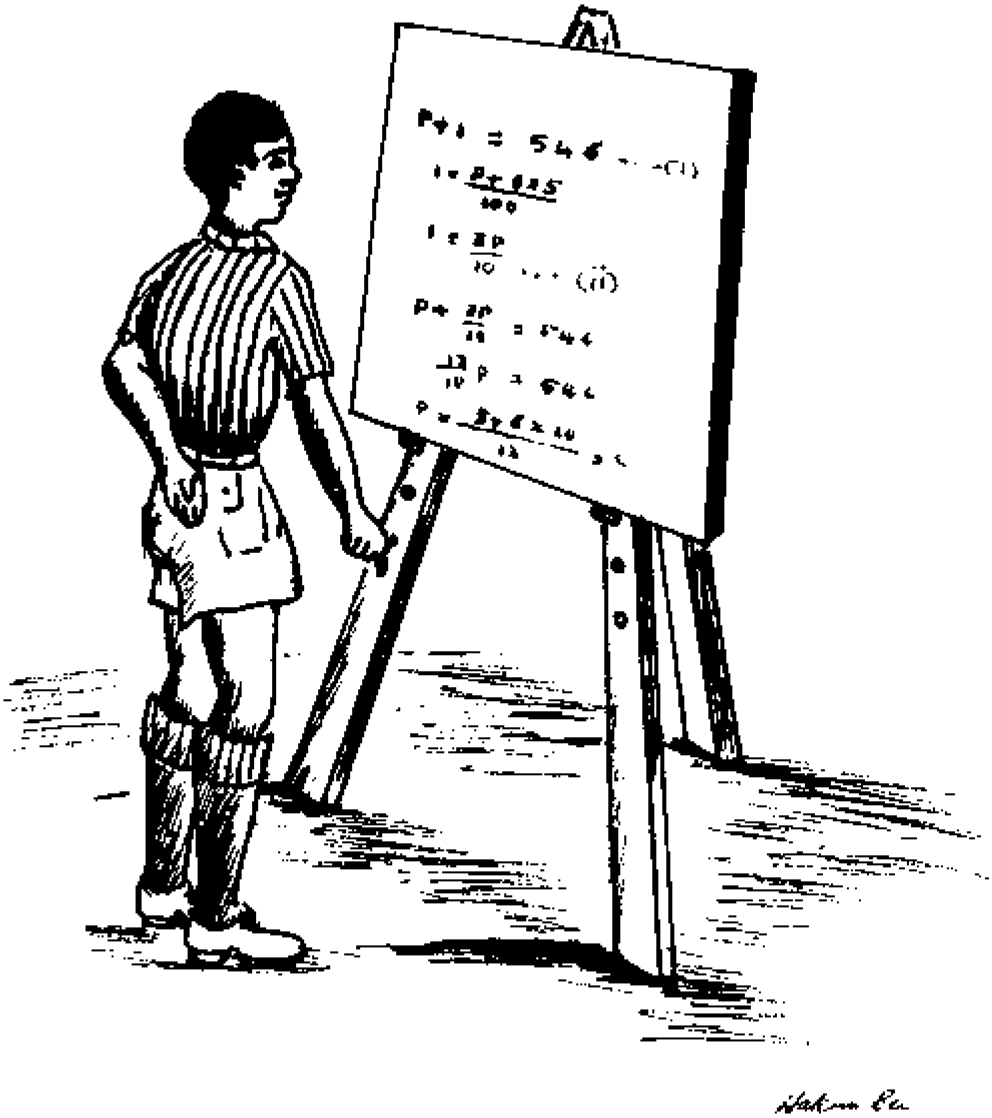
Some extra efforts in teaching field work will improve the results considerably.

1. Before you do a new type of work the first time in the field (like lowering concrete rings into a well), discuss the step-by-step procedures in detail in class. Use a model to illustrate the steps. This will help the trainees to keep an overview of the work. It will also help them see themselves as a part of the whole team and process rather than individuals doing just menial work. Discussion beforehand in class is better than trying to explain on the spot in the hot sun when half of the staff cannot hear you.

2. Sit down in the shade with the staff after having completed a new job or after something has gone wrong. Evaluate what happened by asking: What did you learn? What was new? What went wrong? What could be done better?, etc. (see also 2.7). This can help a lot how to judge the situation and how to improve techniques.

3. The same methods can be applied when teaching field work to illiterate people. Using models is even more important.

5. Mathematics



5.1 Basic Calculations

The most basic rules for calculations are compiled here for the everyday project work.

A) <u>Decimals</u>

Money, measurements (not time!) are expressed in decimals. All the figures to the left of the decimal point are whole numbers - units, tens, hundreds, thousands etc. All those to the right are fractional parts - tenths, hundredths, thousandths etc.

whole numbers: thousands, hundreds, tens, units
decimal fractions: tenths, hundredths, thousandths

$$9432.127 = (9\times1000)+(4\times100)+(3\times10)+(2\times1)+\frac{1}{10}+\frac{2}{100}+\frac{7}{1000}$$

No matter how many figures come after the decimal point, they amount to less than one unit. 0.78925 is <u>less</u> than one.

The figures to the right of the decimal point are called "decimal places". For example, 4.06 has 2 decimal places.

B) <u>Addition and Subtraction of Decimals</u>

Adding and subtracting decimals is just the same as adding and subtracting whole numbers.

- The sums must be set down in an orderly way.

- Keep the units, tens, hundreds, etc., in their correct columns.

- Keep the tenths, hundredths, thousandths, etc., in their correct columns.

- Keep the decimal points in a vertical straight line.

- A whole number like 15 may be written 15.00 to keep it more easily in the correct columns. Putting the decimal point and adding a convenient number of zeros (= noughts = 0) after it does not alter the amount.

- Start the work on the column farthest to the right of the decimal point. Carry tens in the ordinary way, as if the decimal point was not there.

- Put the decimal point in the answer under the decimal points above.

- Using checkered paper can help to avoid mistakes.

<u>Example:</u>

```
Addition          Subtraction
   6.8              613.090
   4.54            - 23.418
  15.00            --------
    .38             589.672
 ------             =======
  26.72
 ======
```

C) <u>Multiplication and Division of Decimals</u>

The most frequent cause of mistakes in multiplication and division of decimals is putting the point in the wrong place. There are simple rules for placing the point correctly.

1. Multiplication of Decimals by 10, 100, 1000, etc.

- To multiply a decimal number by 10, simply move the point one place to the right.
- To multiply by 100, move the point two places to the right.
- To multiply by 1000, move the point three places to the right.
- Add extra zeros (= noughts), if necessary.

Examples:

$4 \times 10 = 4.0 \times 10 = 40$

$6.7 \times 100 = 6.70 \times 100 = 670$

$4.329 \times 10 = 43.29$

$4.329 \times 100 = 432.9$

The decimal point is moved one place right for each zero in the multiplier, e.g. to multiply by $\underbrace{10{,}000}_{\text{4 zeros}}$ you move the decimal point 4 places.

$8.25346 \times 10{,}000 = 82534.6$

2. Division of a Decimal by 10, 100, 1000, etc.

- To divide a decimal number by 10, move the point one place to the left.
- To divide by 100, move the point two places to the left.
- To divide by 1000, move the point three places to the left.
- Add extra zeros (= noughts),if necessary.

Examples:

$200 \div 10 = 200.0 \div 10 = 20$

$27.6 \div 10 = 2.76$

$27.6 \div 100 = 0.276$

$0.48 \div 100 = 000.48 \div 100 = 0.0048$

The decimal point is moved one place left for each zero in the divisor:

$$43{,}597.65 \div \underbrace{10{,}000}_{\text{4 zeros}} = 4.359765$$

3. Multiplication of a Decimal with a Whole Number

- Work like for ordinary multiplication sum.

- Start at the far right of the decimal point.

- Keep the figures and the decimal points in their correct columns.

- Check that you have the same number of decimal places in the answer as you have in the numbers you are multiplying.

Example:

Multiply 468.25 by 3

```
 468.25
      3
1404.75
```

4. Multiplication of a Decimal Number by Another Decimal Number

- Ignore the decimal points while you multiply.
- Count how many decimal places there are altogether in the two numbers you have multiplied.
- Count that number of places from the right in the answer, and put in the point.

Example:

Multiply $2.\underbrace{45}_{\text{2 places}}$ by $3.\underbrace{6}_{\text{1 place}}$

altogether there are 3 decimal places

```
 245
  36
7350
1470
8820
```

$8\underbrace{820}$

3 decimal places in the answer

5. Division of a Decimal Number by a Whole Number

- Work like for an ordinary division.
- Keep the figures and the decimal points in their correct columns.
- Extra zeros may be added after the decimal figures of the dividend.
- You will sometimes be able to get an exact answer, but sometimes you may only work to two or three decimal places.

Example:

Divide 26.1 (= dividend) by 6 (= divisor)

```
    04.35
6 | 26.10
    24
     21
     18
      30
```

6. Division of a Decimal Number by a Decimal Number

- First turn the divisor into a whole number by moving the decimal point the necessary number of places to the right.

- Move the decimal point of the dividend the same number of places in the same direction. (If you multiply the dividend and the divisor by the same amount, the answer will still be the same:

Example: $\frac{30}{10} = \frac{300}{100} = 3$)

- Then work out the division in the ordinary way.

<u>Example:</u>

Divide 2.367 (= dividend) by 0.46 (= divisor)

```
2.367 becomes 236.7 ]both have been        (or 2.367 = 236.7 )
0.46  becomes  46   ]multiplied by 100         0.46    46

          5.145
46   | 236.700
       230
         6.7
         4.6
         2.10
         1.84
          .260
          .230
          .030
          ....
```

D) <u>Rounding Up and Down</u>

When looking for the nearest whole number:

- Ignore anything less than half.
- Count half or more as another whole number.

<u>Examples:</u>

357.1 → 357
357.4 → 357
357.5 → 358
357.9 → 358

When looking for a certain number of decimal places:

- Look at the following decimal place.
- If the last figure is less than 5, ignore it.
- If it is 5 or more, add 1 to the previous figure.

<u>Examples:</u>

4.213 → 4.21
4.214 → 4.21

4.215 → 4.2 2
4.219 → 4.2 2
4.295 → 4.3 0

E) Avoiding Mistakes

Keep to the following discipline to avoid mistakes:

- Always use enough space for calculations. Squeezing them onto a small piece of paper leads to mistakes.

- Always write clearly.

- Calculate each addition and subtraction twice before you proceed to use the answer. This will help avoid wasting time searching for mistakes later on.

- Don't let yourself get a ridiculous answer! Before you work out a problem in detail, you can make a rough estimate of what the answer should be. If your answer is very different, you will know you have made a mistake. A rough estimate is not a guess. You simplify the figures so that you know the answer cannot be more than a certain amount, or less than a certain amount. Therefore, the right answer must lie between them.

Examples:

2.73 x 15 = ?

$$\left.\begin{array}{l} 2 \times 15 = 30 \\ 3 \times 15 = 45 \end{array}\right] \text{The answer must be between 30 and 45.}$$

2.73 x 15 = 40.95

5.2 Percent Calculations

"Per cent" (= %) means "out of each hundred".
" % " can be replaced by " $\times \frac{1}{100}$ " or by " × 0.01 ".

The percentage is a certain part of a whole. % indicates the proportion of the part to the whole. For comparison 100 is used as a convenient standard.

Example:

$$5\% = 5 \times \frac{1}{100} = \frac{5}{100} = \frac{1}{20} = 0.05; \text{ or conversion back:}$$

$$\frac{1}{20} = 0.05 = 0.05 \times 100\% = 5\%$$

A) Equivalents

The size of each part of a whole can be expressed in four different ways. Watch out for these equivalents:

No.	Expression	Conversion
1.	in words	
2.	as a fraction	fraction × 100 → %
3.	as a decimal	decimal × 100 → %

4.	as a percentage of the whole	% ÷ 100 → fraction or decimal

Parts of a whole

in words	fraction	decimal	percentage	drawing
the whole	1	1.00	$\frac{100}{100}$ = 100%	
three quarter	$\frac{3}{4}$	0.75	$\frac{75}{100}$ = 75%	
one half	$\frac{1}{2}$	0.50	$\frac{50}{100}$ = 50%	
a third	$\frac{1}{3}$	0.33	$\frac{33}{100}$ = 33%	
a quarter	$\frac{1}{4}$	0.25	$\frac{25}{100}$ = 25%	
a fifth	$\frac{1}{5}$	0.20	$\frac{20}{100}$ = 20%	
a tenths	$\frac{1}{10}$	0.10	$\frac{10}{100}$ = 10%	
a twentieth	$\frac{1}{20}$	0.05	$\frac{5}{100}$ = 5%	
a hundredth	$\frac{1}{100}$	0.01	$\frac{1}{100}$ = 1%	

B) <u>Basic Operations</u>

There are two basic operations:

<u>1. Operation</u>

Calculate a certain percentage of a given number (= whole).

> To find the percentage of a given number, write the percentage as a fraction (with the denominator 100) and multiply it by the number. Simplify by cancelling, if possible.
>
> $$\text{part} = \frac{\text{percentage}}{100} \times \text{whole}$$

<u>Example 1:</u>

Your salary of £S 120.000 shall be raised by 157% at the beginning of the year. What will be your new salary?

given:	salary £S 120 = 100% (= whole)
asked:	15% of £S 120 =? (= part)
15% of £S 120	$= \frac{15}{100} \times £S\ 120 = £S\ 18$
old salary	£S 120
15% increase	<u>£S 18</u>
new salary	<u>£S 138</u>

Example 2:

The costs estimated for a double compost latrine of a school are £S 9500. 5% shall be added for supervision and depreciation of equipment. How much will be the total costs?

given: building costs £S 9500 = 100% (= whole) asked: 5% of £S 9500 =? (= part)

5% of £S 9500 $= \frac{5}{100} \times £S\,9500 = £S\ 475$

building costs	£S 9500
5% supervision	£S 475
total costs	£S 9975

2. Operation

Calculate what percentage one number (=part) is of another number (=whole).

In order to find what percentage one number (= part) is of another number (= whole), we divide the part by the whole and multiply by 100. Thus you obtain a result in %.

$$\text{percentage of a part of a whole} = \frac{\text{part}}{\text{whole}} \times 100$$

Example 1:

During one month the project car was driven 255 km for CD-department, 510 km for WS-department and 315 km for Administration, total 1080 km. How many % did each department drive?

given:	total 1080 km	= 100% (= whole)
asked:	255 km (=part)	=? % of 1080 km
	510 km (=part)	=? % of 1080 km
	315 km (=part)	=? % of 1080 km
CD:	$\frac{255\,\text{km}}{1080\,\text{km}} \times 100$	= 23.6%
WS:	$\frac{510\,\text{km}}{1080\,\text{km}} \times 100$	= 47.2%
Adm.:	$\frac{315\,\text{km}}{1080\,\text{km}} \times 100$	= 29.2 %
		100.0%

(Check if the sum of all percentages is 100%!!)

Example 2:

The total costs of a well were £S 8700. £S 3900 were contributed by the community, £S 4800 by the project. How many % did the community contribute, and how many % the project?

given:	total costs £S 8700	= 100% (= whole)
asked:	£S 3900 (= part)	=? % of £S 8700
	£S 4800 (= part)	=? % of £S 8700
community:	$\frac{£S\,3900}{£S\,8700} \times 100$	= 44.8%
project:	$\frac{£S\,4800}{£S\,8700} \times 100$	= 55.2%
		100.0%

5.3 Measurements

The most important and common measurements for water supply work are compiled here in transformation tables.

A) <u>Measurements for Distances in Metric System</u>

		to these:				
		mm	**cm**	**dm**	**m**	**km**
If you want to change these units:	mm		÷ 10	÷ 100	÷ 1,000	÷ 1,000,000
	cm	× 10		÷ 10	÷ 100	÷ 100,000
	dm	× 100	× 10		÷ 10	÷ 10,000
	m	× 1,000	× 100	× 10		÷ 1,000
	km	× 1,000,000	× 100,000	× 10,000	× 1,000	

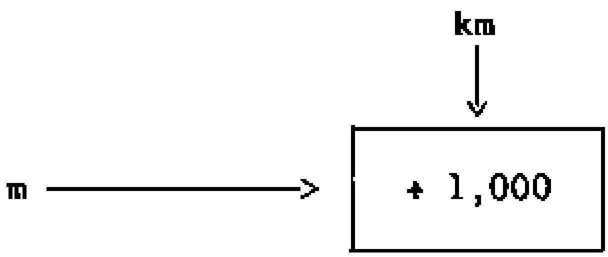
mm = millimetre
cm = centimetre
dm = decimetre
m = metre
km = kilometre

Using transformation tables you can change from one unit to another. Use them as follows:

<u>Example:</u>

435 m =? km

You want to transform the unit “m” to “km”. Look in the left column for “m” and along the top row for “km”. You find the necessary operation for transformation where the column of “km” meets the row of “m”: ÷ 1,000



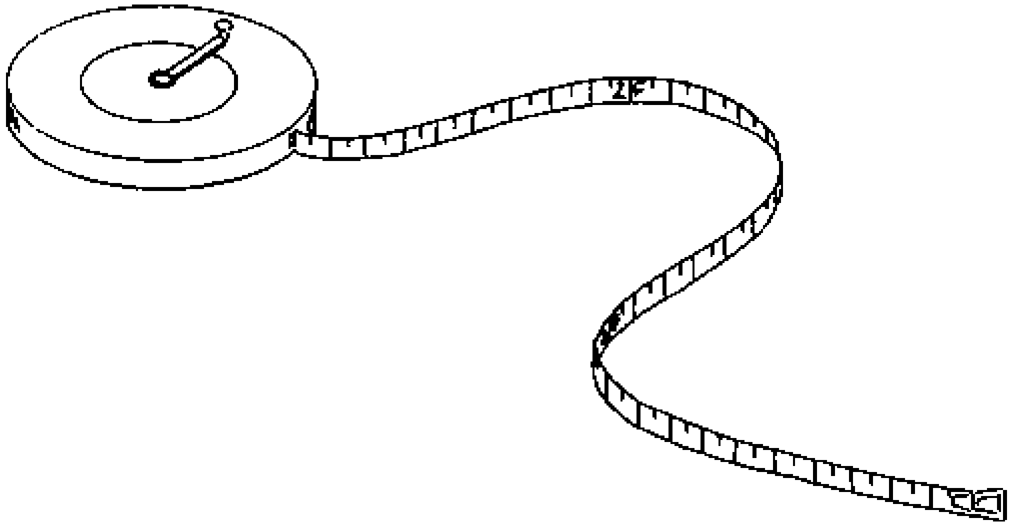
Therefore divide 435 by 1,000.

435 m = (435 ÷ 1,000) km = 0.435 km

B) <u>Measurements for Distances in English System</u>

		to these:				
		1/16 “	**“**	**‘**	**yd**	**mile**
If you want to change these units:	$\frac{1}{16}$ “		÷ 16	÷ 192	÷ 576	÷ 1,013,760
	“	× 16		÷ 12	÷ 36	÷ 63,360
	‘	× 192	× 12		÷ 3	÷ 5,280
	yd	× 576	× 36	× 3		÷ 1,760
	mile	× 1,013,760	× 63,360	× 5,280	× 1,760	

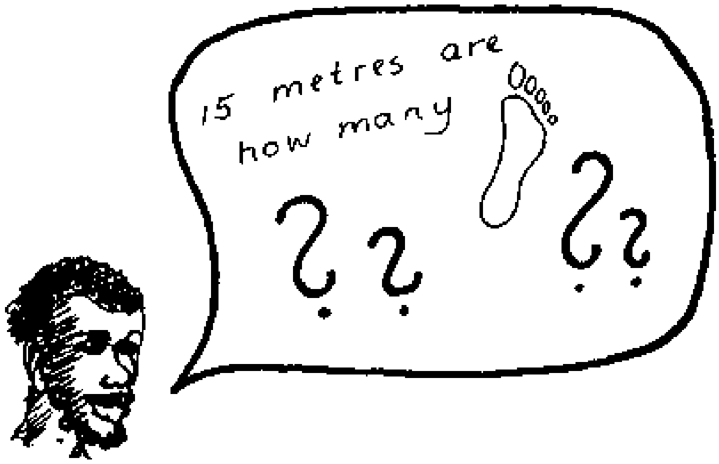
1/16 “ = one sixteenths inch
“ = inch
‘ = foot
yd = yard
mile = mile



C) Measurements for Distances: Transformations between Metric and English System

		to these:						
		cm	**“**	**‘**	**yd**	**m**	**km**	**mile**
If you want to change these units:	cm		÷ 2.54	÷ 30.48	÷ 91.44	÷ 100		
	“	× 2.54		÷ 12	÷ 36	÷ 39.37		
	‘	× 30.48	× 12		÷ 3	÷ 3.28		
	yd	× 91.44	× 36	× 3		÷ 1.09		
	m	× 100	× 39.37	× 3.2808	× 1.0936		÷ 1,000	÷ 1,609
	km					× 1,000		÷ 1.609
	mile					× 1,609	× 1.609	

cm = centimetre
“ = inch
‘ = foot
yd = yard
m = metre
km = kilometre
mile = statute mile



D) Measurements for Areas in Metric System

		to these:		
		cm^2	**dm^2**	**m^2**
If you want to change these units:	cm^2		÷ 100	÷ 10,000
	dm^2	× 100		÷ 100
	m^2	× 10,000	× 100	

cm^2 = square centimetre
dm^2 = square decimetre
m^2 = square metre

E) <u>Measurements of Volumes</u>

		to these:				
		cm^3 = ml	**dm^3 = lit**	**gal**	**drum**	**m^3**
If you want to change these units:	cm^3		÷ 1,000	÷ 4,550	÷ 220,000	÷ 1,000,000
	dm^3	× 1,000		÷ 4.55	÷ 220	÷ 1,000
	gal	× 4,550	× 4.55		÷ 48.4	÷ 220
	drum	× 220,000	× 220	× 48.4		÷ 4.55
	m^3	× 1,000,000	× 1,000	× 220	× 4.55	

cm^3 = cubic centimetre = ml = millilitre
dm^3 = cubic decimetre = ℓ = lit = litre
gal = gallon (imperial)
drum = drum
m^3 = cubic metre

For transformation of measurements of pumping rates (= yields = discharge = volume/time) see 8.34/1.

F) <u>Measurements for Time</u>

		to these:			
		sec	**min**	**h**	**days**
If you want to change these units:	sec		÷ 60	÷ 3,600	÷ 86,400
	min	× 60		÷ 60	÷ 1,440
	h	× 3,600	× 60		÷ 24
	days	× 86,400	× 1,440	× 24	

sec = second
min = minute
h = hour
days = days

G) Measurements for Weights

		to these:			
		mg	**g**	**kg**	**t**
If you want to change these units:	mg		÷ 1,000	÷ 1,000,000	÷ 1,000,000,000
	g	× 1,000		÷ 1,000	÷ 1,000,000
	kg	× 1,000,000	× 1,000		÷ 1,000
	t	× 1,000,000,000	× 1,000,000	× 1,000	

mg = milligram
g = gram
kg = kilogram
t = tonne = metric ton

H) Measurements for Temperatures

Conversion formulas:

$$°F = \frac{9}{5}°C + 32$$

°F = degree Fahrenheit

$$°C = (°F - 32) \times \frac{5}{9}$$

°C = degree Celsius

Conversion table (approximate):

°C	°F
-18	0
-10	14
0	32
10	50
20	68
30	86
40	104
50	122
60	140
70	158
80	176
90	194
100	212

°F	°C
0	- 17.8
10	- 12.2
20	- 6.7
30	- 1.1
32	0
40	4.4
50	10
60	15.6
70	21.1
80	26.7

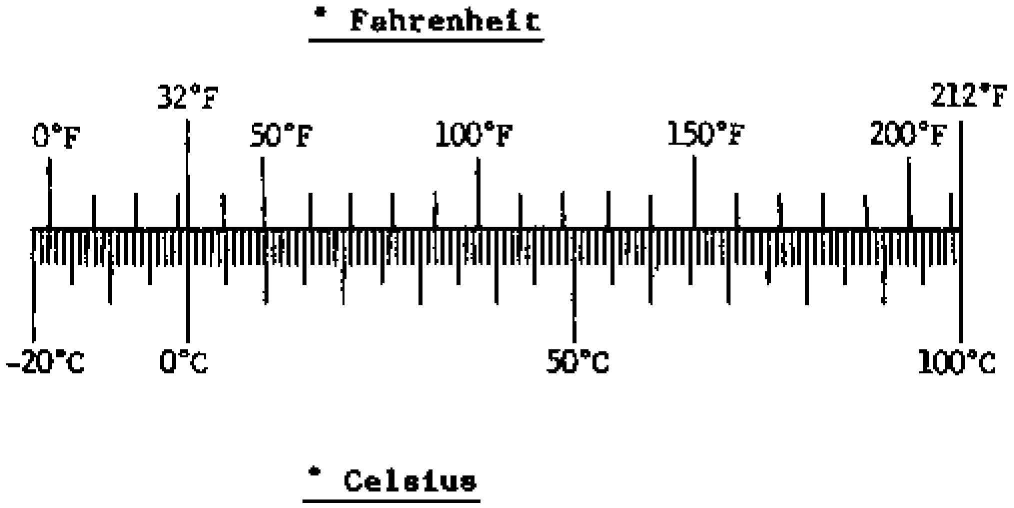
180	82.2
190	87.8
200	93.3
210	98.9
212	100

Conversion scale:



5.4 Basic Geometry

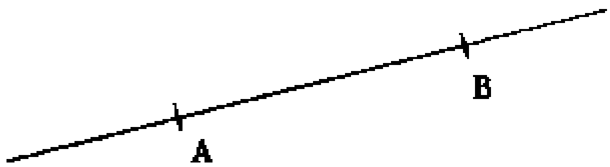
The most basic terms and definitions of geometry necessary for technical work are compiled here:

A) Point

or ×

A point is a very small area. For example the crossing of 2 straight lines is a point.

B) Straight Line



A straight line is indefinitely long and indefinitely thin. Any 3 points on the line mark a 180° angle. Two points define a straight line. A straight line is the shortest distance between 2 points.

Examples for straight lines:

- the edge of a table
- a measuring tape
- the string of a plumb bob

C) Plane

A plane is indefinitely long and broad and indefinitely thin. Straight lines can be fitted into the plane in any direction. Three points define a plane.

Examples for planes:

- a piece of paper
- the straight surface of a table

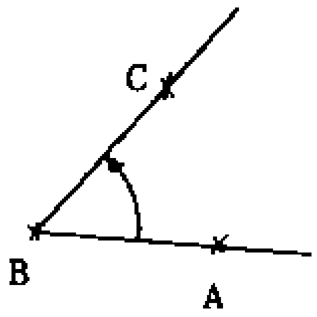
- the surface of a lake

D) <u>Angle</u>

An angle is formed between two intersecting lines.

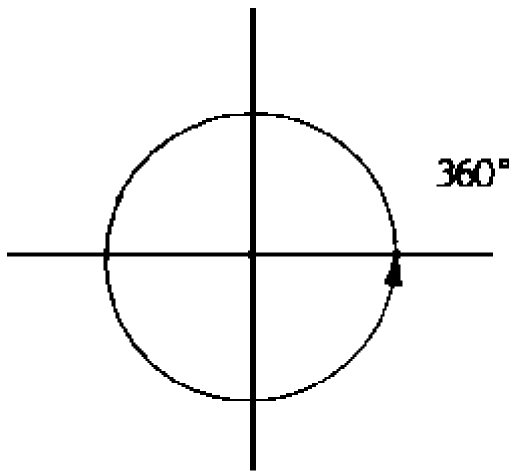
The angle between the lines AB and BC is called <ABC.

<ABC is the rotation required to turn the line AB on to the line BC: the centre of the rotation is point B.



If AB is rotated about point B, each point on the line describes a circle. An angle is measured in degrees.

The complete rotation is 360°.

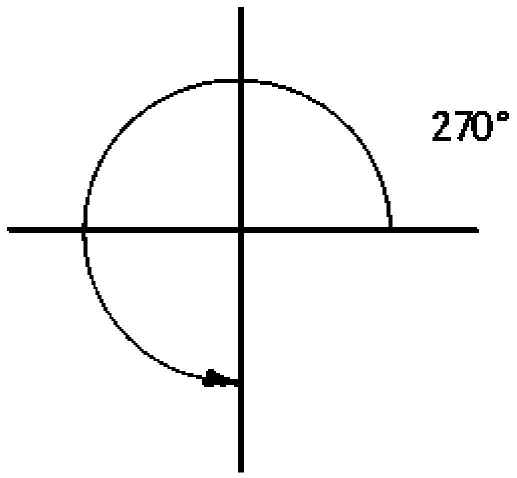


One degree is $\frac{1}{360}$ of a complete rotation.

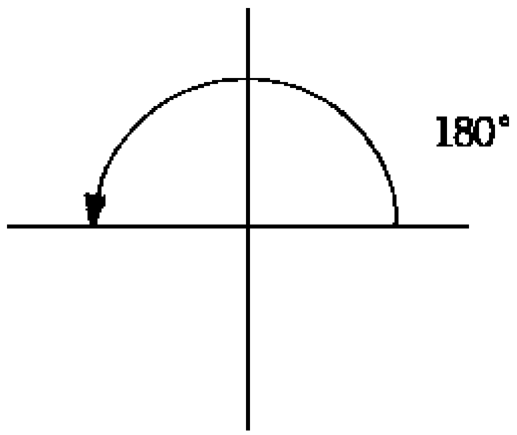
Examples for angles:

- the angles between trusses of a roof

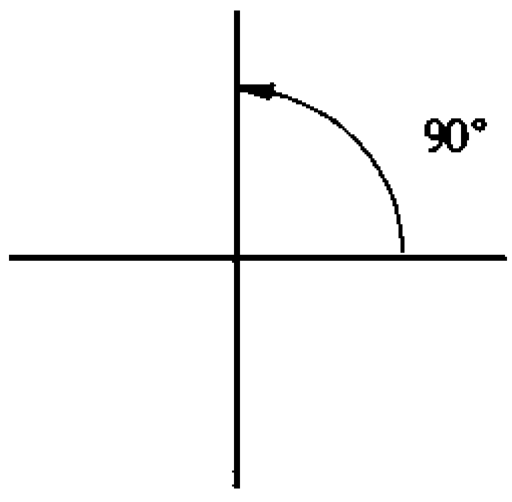
¾ of a complete rotation is 270°.



½ of a complete rotation is 180°.



¼ of a complete rotation is 90°; this is known as **“right angle”.**

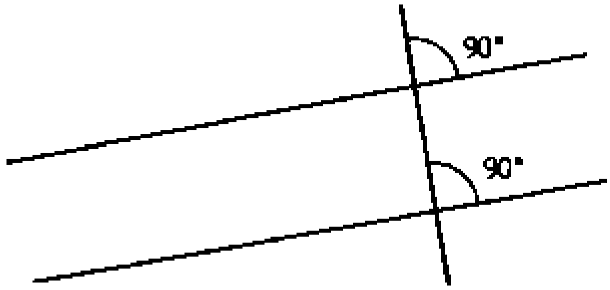


Examples for right angles:

- the corner of a table
- the corner of a window
- the corner of a house
- the corner of a sheet of paper

- the corner of a latrine slab

E) Parallel Lines



Parallel lines are lines which never meet. They always remain the same distance apart, no matter how far they are extended.

Examples for paralles lines:

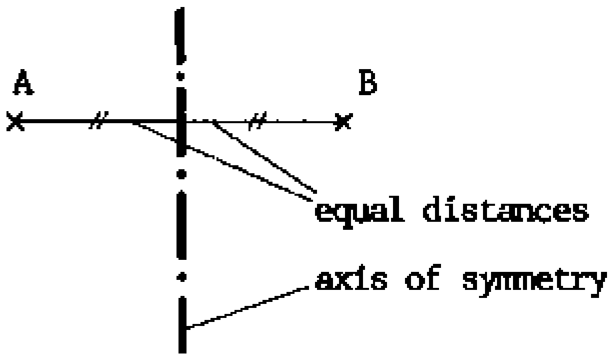
- two opposite sides of a table
- two opposite edges of sawn timber
- two opposite edges of a sheet of paper
- railway tracks
- two legs of a ladder

F) Symmetry about an Axis

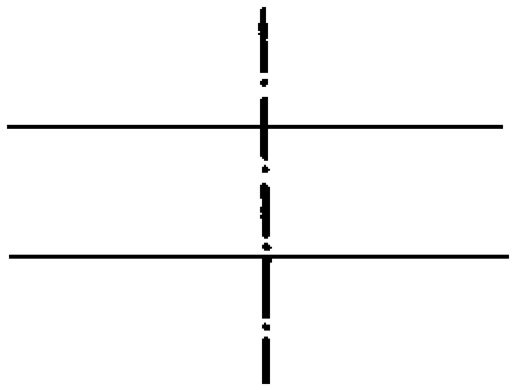
Shapes in a plane are symmetric about an axis (= straight line) if folded about that axis, one half can be superimposed on the other. Each part has a corresponding part the same distance from the axis of symmetry.

Examples for symmetry about an axis:

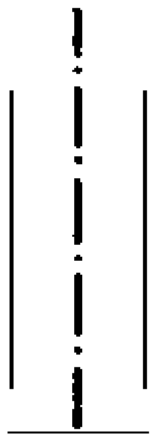
- a sheet of paper
- a rectangle
- a circle
- a blackboard
- the surface of a table



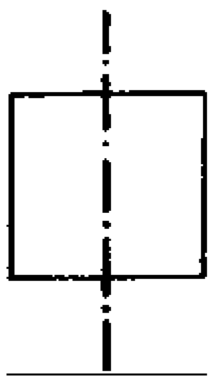
Symmetry of 2 Points A and B



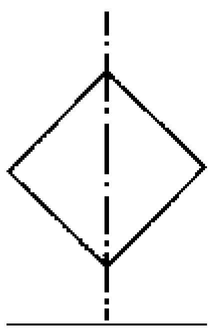
Symmetry of 2 Parallel Lines



Symmetry of 2 Parallel Lines

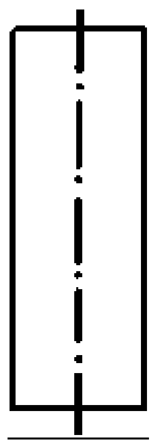


Symmetry of Square

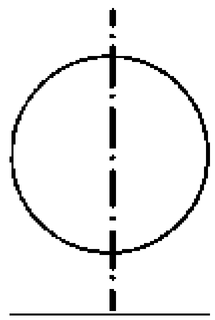


Symmetry of Square

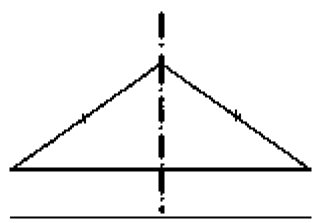
Symmetry of Rectangle



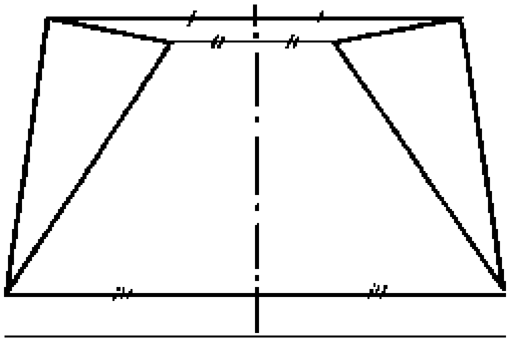
Symmetry of Rectangle



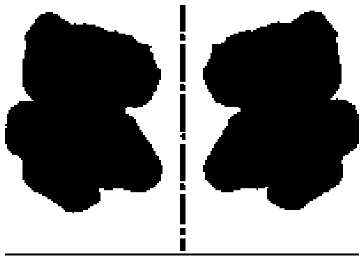
Symmetry of Circle



Symmetry of Equilateral Triangle



Symmetry of 2 Triangles



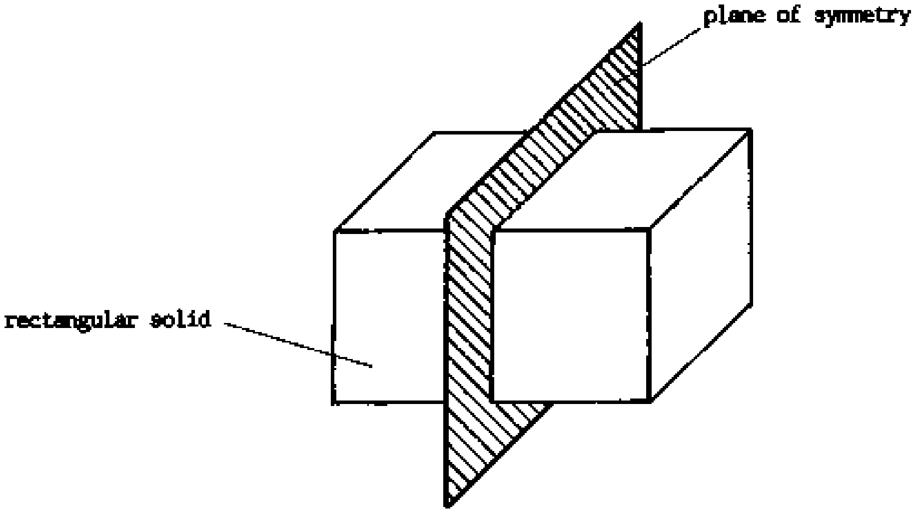
Symmetry of 2 Irregular Shapes

G) Symmetry about a Plane

3- dimensional solids are symmetric about a plane if each part has a corresponding part the same distance from the plane of symmetry. That means that they can be divided (= cut) into two equal, exactly similar parts.

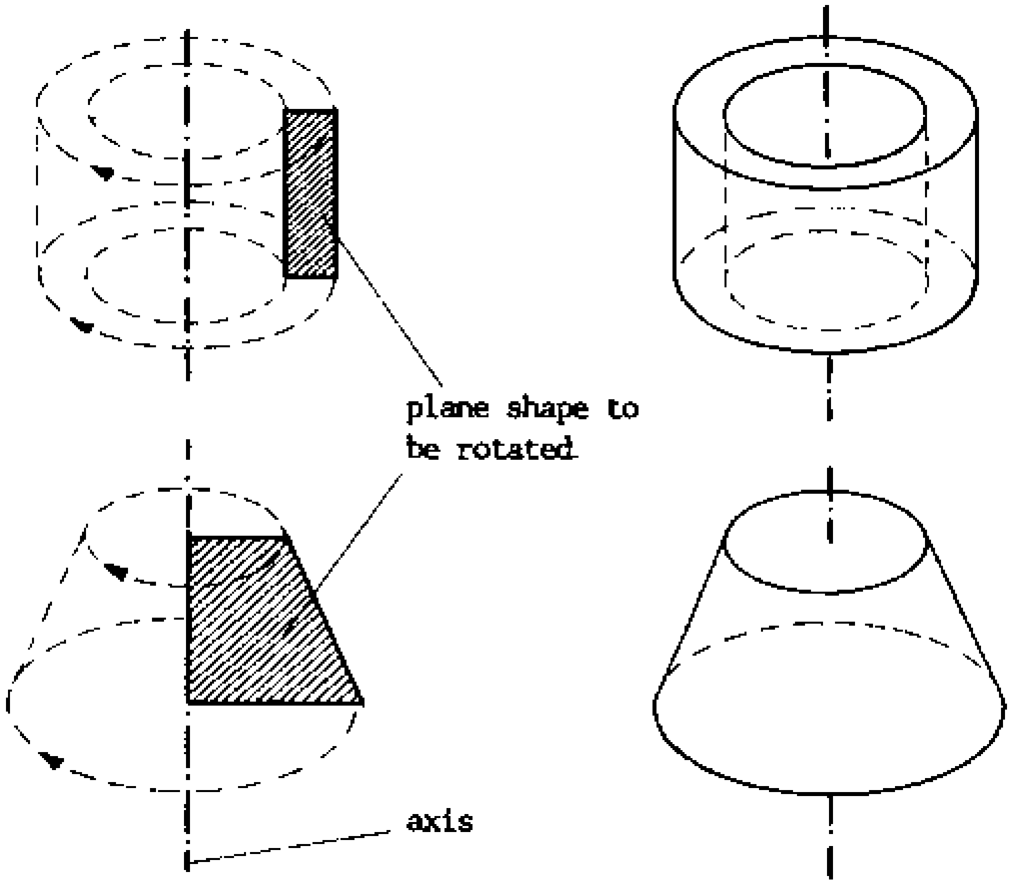
Examples for symmetry about a plane:

- rectangular solids
- cylinder
- screwdriver
- hammer
- shovel
- pipe
- fruits like papaya



H) Rotational Symmetry about an Axis

3-dimensional rotational symmetric shapes can be produced by rotating any plane shape around an axis. They can be turned around their axis and always look the same.



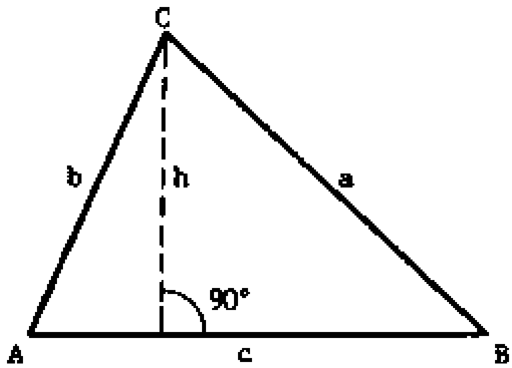
Rotational symmetric items are symmetric about any plane through the axis (that are indefinitely many planes of symmetry). Any plane vertical to the axis cuts the rotational symmetric shape in a circle.

Examples for rotational symmetry:

- pipes
- wooden items produced by lathing
- clay pots produced on a potter's wheel
- bowls
- bottles
- nails
- concrete rings
- tyres

I) <u>Triangle</u>

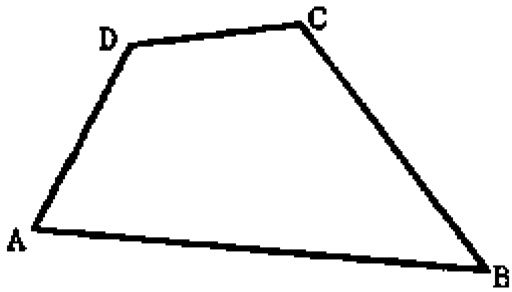
Three points connected with straight lines form a triangle.



Area:	$A = \frac{1}{2} h c$
Perimeter:	P = a + b + c

J) Quadrilateral

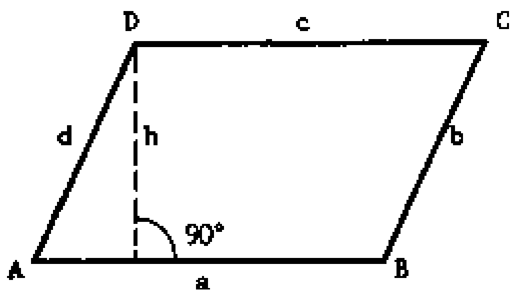
Four points connected with straight lines form a quadrilateral. It is also called polygon of 4 sides.



K) Parallelogram

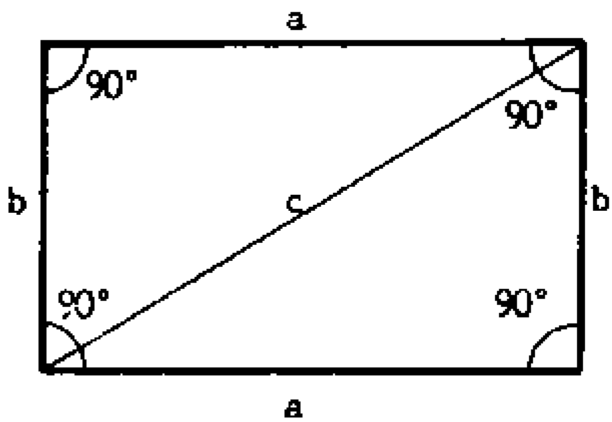
A parallelogram is a quadrilateral with both pairs of opposite sides parallel and equal in length.

Connections:	a || c
	b || d
	a = c
	b = d
Area:	A = a h
Perimeter:	P = 2(a+b) = 2(c+d)

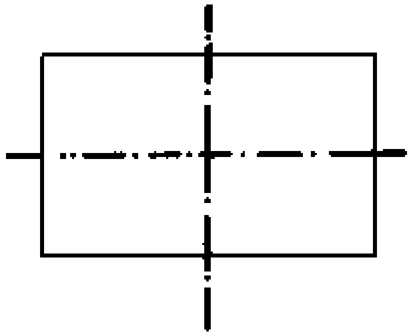


L) Rectangle

A rectangle is a parallelogram with right angles. A rectangle is symmetric about 2 axis. The diagonal is the connection of two opposite corners by a straight line.



Connections:	all four angles: 90°
Area:	A = a b
Perimeter:	P = 2(a+b)
Diagonal:	$c = \sqrt{a^2 + b^2}$

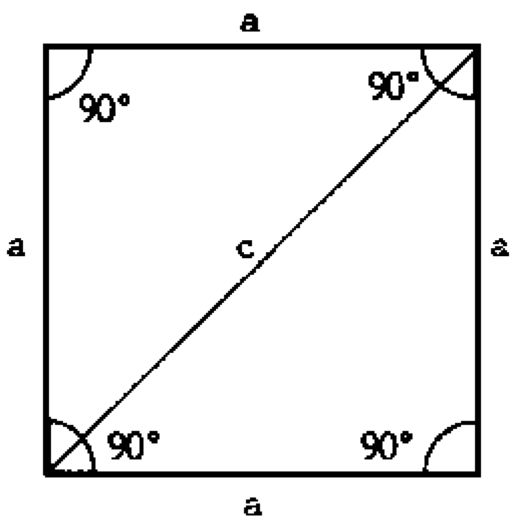


Examples for rectangles:

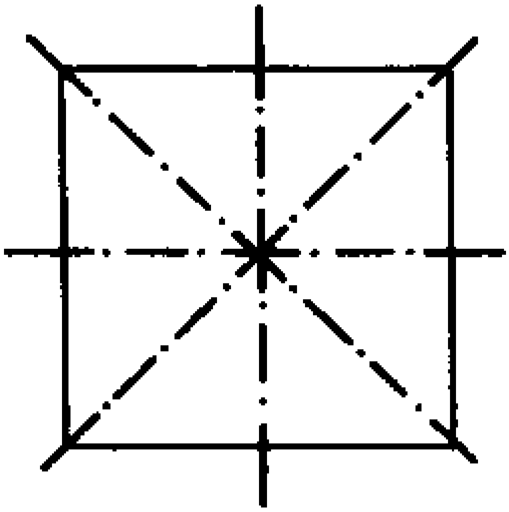
- sheet of paper
- blackboard
- door
- latrine slabs

M) <u>Square</u>

A square is a rectangle with all sides equal. A square is symmetric about 4 axis.



Area:	$A = a^2$
Perimeter:	$P = 4\,a$
Diagonal:	$c = \sqrt{2\,a^2}$



Examples for squares:

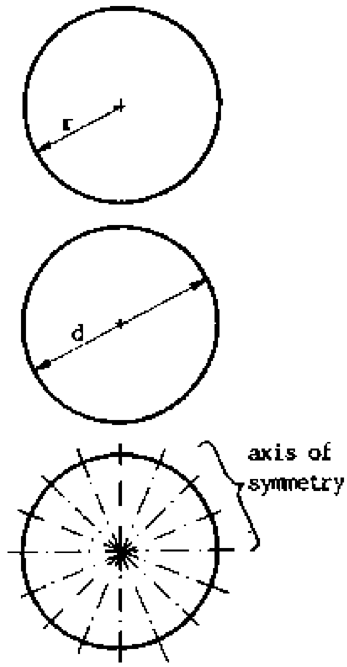
- childrens' squatting slab
- manhole in well cover

N) Circle

Points in a plane with the same distance from a fixed point form the circumference of a circle. The fixed point is called the centre of the circle, the constant distance the radius. A straight line through the centre is called the diameter.

A circle is symmetric about all straight lines through the centre.

Radius:	$r = \frac{d}{2}$
Diameter:	$d = 2\,r$
Circumference:	$C = 2\,\pi\,r$
Area:	$A = \pi r^2 = \frac{1}{4}\,\pi\,d^2$
	$\pi = 3.14$

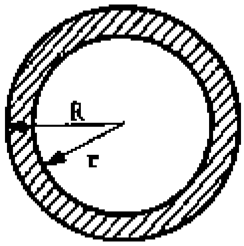


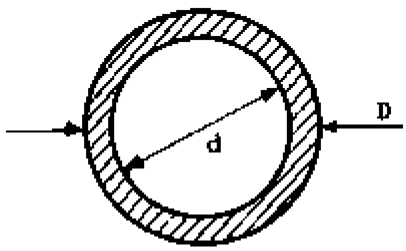
0) Hollow Circle

Two circles with the same centre form a hollow circle.

A hollow circle is symmetric about all straight lines through the centre.

Inside radius:	r	
Outside radius:	R	
Inside Diameter:	d	
Outside Diameter:	D	
Area:	A	$= \pi (R^2 - r^2)$
		$= \frac{1}{4} \pi (D^2 - d^2)$
		$= \pi (R + r)(R - r)$





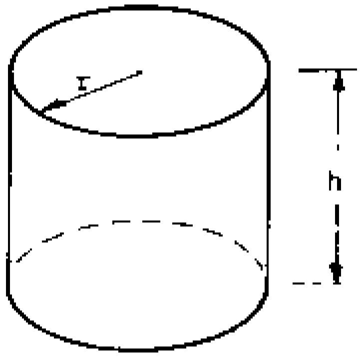
Examples for hollow circles:

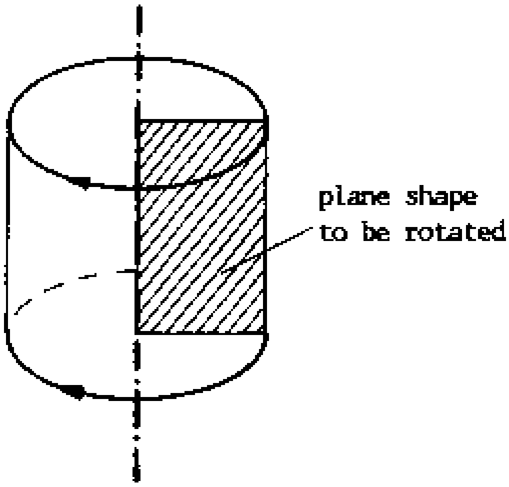
- washers
- rubber seatings

P) Cylinder

A rectangle rotating around its axis forms a cylinder. A cylinder has the same circle as base and top. A cylinder is rotational symmetric.

Radius:	r
Diameter:	$d = 2r$
Height or length:	h or l
Volumes:	$V = \pi r^2 h$
Total surface area:	$SA = 2 \pi r h + 2 \pi r^2$





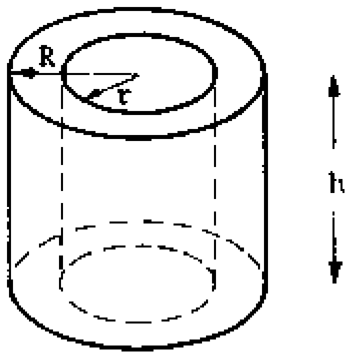
Examples for cylinders:

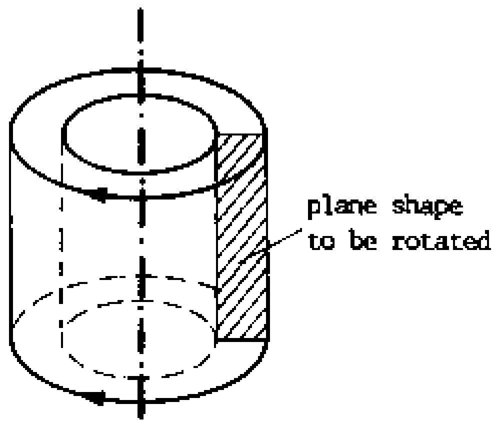
- reinforcement rod
- tins
- poles
- axles

Q) Hollow Cylinder

Two cylinders with the same centre form a hollow cylinder. A hollow cylinder is rotational symmetric.

Inside radius:	r
Outside radius:	R
Inside diameter:	d (= ID)
Outside diameter:	D (= OD)
Height or length:	h or l
Volume:	$V = \pi (R^2 - r^2) h$





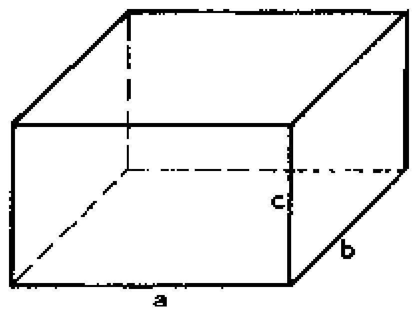
Examples for hollow cylinders:

- pipes
- concrete rings

R) <u>Rectangular Solid (= Cuboid)</u>

A rectangular solid is a solid confined by 6 rectangles. It is symmetric about 3 planes.

Volume:	V = a b c
Total surface area:	SA = 2(ab+ac+cb)



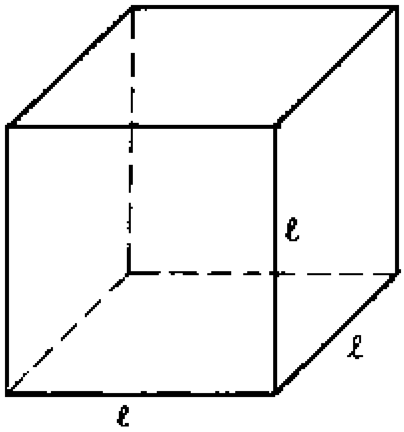
Examples for rectangular solids:

- sawn timber
- box

S) <u>Cube</u>

A cube is a special case of a cuboid. All its sides are equal.

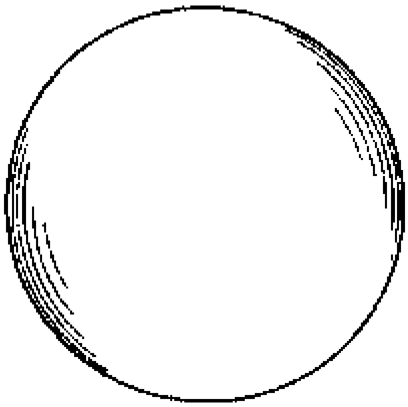
Volume:	$V = \ell^3$
Total surface area:	$SA = 6\,\ell^2$



T) <u>Sphere (= Ball)</u>

A sphere is a 3-dimensional body. All its points have the same distance from a fixed point which is the centre. It is rotational symmetric about any axis through the centre.

Volume:	$V = \frac{4}{3}\pi R^3$
Surface area:	$SA = 4\,\pi\,R^2$



Examples for spheres:

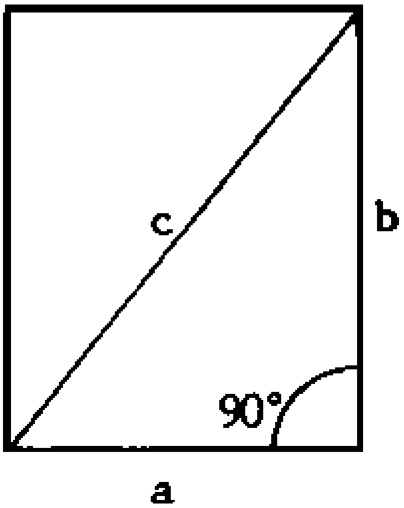
- ball
- ball bearings

5.5 Calculation of Diagonal

For marking a rectangular layout plan (rectangle), we need to know the diagonal. It can be calculated in the following way:

given: 2 sides of a rectangle, a and b
asked: diagonal c

According to Pythagoras theorem, in a right angled triangle the square on the hypotenuse (= longest side) is equal to the sum of the squares on the two other sides.



$\boxed{a^2 + b^2 = c^2}$

Steps of Calculation

1. Calculate a^2.
2. Calculate b^2.
3. Add up $a^2 + b^2$.
4. Estimate c. Calculate c^2. Compare c^2 with $a^2 + b^2$.
5. Make a new and better estimation for c. Calculate c^2. Compare c^2 with $a^2 + b^2$.
6. Repeat step No.5 until you have a value for c exact enough.

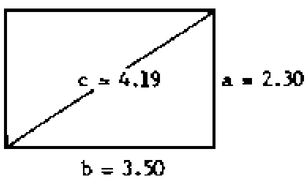
Draw the rectangle and check if the calculated value for c is correct.

Alternatively, you can calculate $c = \sqrt{a^2 + b^2}$.

Example:

given: rectangle with the sides 2.30 m and 3.50 m
asked diagonal

1. $a = 2.30 \longrightarrow a^2 = 5.29$
2. $b = 3.50 \longrightarrow \underline{b^2 = 12.25}$
3. $a^2 + b^2 = 17.54$
4. $c \stackrel{?}{=} 4 \longrightarrow 4^2 = 16 \longrightarrow 4$ is too small
   $c \stackrel{?}{=} 5 \longrightarrow 5^2 = 25 \longrightarrow 5$ is too large
   $\rightarrow$ try a number between 4 and 5
5. $c \stackrel{?}{=} 4.2 \longrightarrow 4.2^2 = 17.64 \longrightarrow 4.2$ is too large
   $c \stackrel{?}{=} 4.1 \longrightarrow 4.1^2 = 16.81 \longrightarrow 4.1$ is too small
   $\rightarrow$ try a number between 4.1 and 4.2
   $c \stackrel{?}{=} 4.18 \longrightarrow 4.18^2 = 17.47$
   $c \stackrel{?}{=} 4.19 \longrightarrow 4.19^2 = 17.556 \cong 17.54$
6. $\underline{\underline{c = 4.19 \text{ m}}}$
7.



Scale 1:100

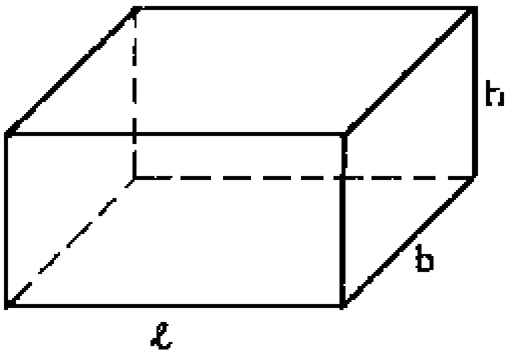
5.6 Calculation of Volumes

The volume of a solid is the amount of space it occupies. It can be expressed in cm^3, dm^3 = lit = litre, gal = gallon, drum or m^3. The transformation table for changing these units is found at 5.3/4.

The volume of a rectangular solid (= cuboid) and of a cylinder and of a hollow cylinder (= tube) are the three most important ones for technical purposes (see also 5.4/9-10). Their calculation is shown here with examples.

A) <u>Volume of a Rectangular Solid (= Cuboid)</u>

volume of a cuboid = length × breadth × height



$V = \ell \times b \times h$

Take care to multiply only figures with the same units!

<u>Example:</u>

A water tank is 1.50 m long and 1.20 m broad and 80 cm high. How much water can it hold?

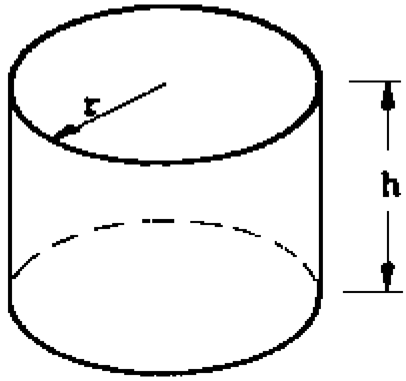
given:	ℓ = 1.50 m, b = 1.20 m, h = 80 cm	
asked:	volume	
h	= 80 cm = 0.80 m	
	(The units of length are not the same, therefore we have to change them.)	
$V = \ell \times b \times h$	= 1.50 m × 1.20 m × 0.80 m =	
	= <u>1.44 m^3</u>	
	= 1.44 × 1,000 lit	= <u>1,440 lit</u>
	$= \frac{1440}{4.55}$ gal	= <u>316.5 gal</u> (for transformation see 5.3/4)
	$= \frac{1440}{220}$ drums	= <u>6.55 drums</u> (for transformation see 5.3/4)

B) <u>Volume of a Cylinder</u>

volume of a cylinder = π × $(\text{radius})^2$ × height

$V = \pi \times r^2 \times h$

$\pi = 3.14$



Example:

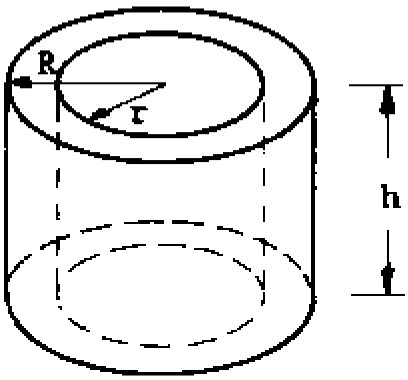
The inside diameter of a concrete ring is 1.20 m, the height is 92 cm. How much water can be stored inside the concrete ring?

given:	d = 1.20 m, h = 92 cm	
asked:	volume	
h	= 92 cm = 0.92 m	
r = d ÷ 2	= 1.20 m ÷ 2 = 0.60 m	
$V = \pi \times r^2 \times h$	$= 3.14 \times (0.60\ m)^2 \times 0.92\ m$	= <u>$1.0399\ m^3$</u>
	= 1.0399 × 1,000 lit	= <u>1040 lit</u>
	$= \frac{1040}{4.55}$ gal	= <u>228.5 gal</u> (for transformation see 5.3/4)
	$= \frac{1040}{220}$ drums	= <u>4.7 drums</u> (for transformation see 5.3/4)

C) <u>Volume of a Hollow Cylinder (= Tube)</u>

volume of a hollow cylinder = $\pi \times$ [(outside radius)^2 - (inside radius)^2] × height

$V = \pi \times [R^2 - r^2] \times h$



Example:

The outside diameter of a concrete ring is 1.40 m, the inside diameter 1.20 m, the height is 92 cm. How many liters of concrete are needed to cast this ring?

given:	D = 1.40 m, d = 1.20 m, h = 92 cm
asked:	volume
h	= 92 cm = 0.92 m
R = D ÷ 2	= 1.40 m ÷ 2 = 0.70 m
r = d ÷ 2	= 1.20 m ÷ 2 = 0.60 m
$V = \pi \times [R^2 - r^2] \times h$	$= 3.14 \times [(0.70\ m)^2 - (0.60\ m)^2] \times 0.92\ m =$
	= 3.14 × [0.49 - 0.36] × 0.92 = <u>$0.3755\ m^3$</u> = <u>375.5 lit</u>

5.7 Calculation of Weights

It is important to learn to calculate the weight of simple items like concrete rings, timber, water, etc., in order to know if they can be lifted by the available equipment or by the number of people present and transported by the available car.

The weight of a homogenous item (= an item consisting of one material throughout) is calculated as follows:

weight	= density	× volume
W [kg]	= d [kg/dm^3]	× V [dm^3]
W [t]	= d [t/m^3]	× V [m^3]

The density is the weight of one dm^3 (=1 lit = one litre) of a certain material.

It can be expressed in kg/dm^3 or t/m^3. You must multiply the unit of density by the appropriate unit of volume, e.g. kg/dm^3 × dm^3 or t/m^3 × m^3.

The most important densities are (in approximate values):

steel	8	[kg/dm^3 = t/m^3]
concrete	2.5	[kg/dm^3 = t/m^3]
water	1	[kg/dm^3 = t/m^3]
timber, hardwood	0.7	[kg/dm^3 = t/m^3]
timber, softwood	0.55	[kg/dm^3 = t/m^3]

Any item floating on water has a density smaller than 1, any item which sinks in water has a density bigger than 1.

Example 1:

How heavy is the concrete ring of chapter 5.6?

given: V = 0.3755 m^3 = 375.5 dm^3 = 375.5 lit
asked: weight

W = d × V =2.5 kg/dm^3 × 375.5 dm^3 = 938.8 kg

or:

W = d × V =2.5 t/m^3 × 0.3755 m^3 = 0.9388 t

Example 2:

Sawn timber from hardwood is loaded on a lorry in a pile 2.50 m broad, 4.50 m long and 1 m high. How heavy is the load?

given: rectangular solid from hardwood,
ℓ = 4.50 m, b = 2.50 m, h = 1 m
asked: weight

V = ℓ × b × h = 4.50 m × 2.50 m × 1 m = 11.25 m^3
W = d × V = 0.7 t/m^3 × 11.25 m^3 = 7.88 t = 7880 kg

This weight needs to be compared with the loading capacity of the lorry. See also 3.13/1.

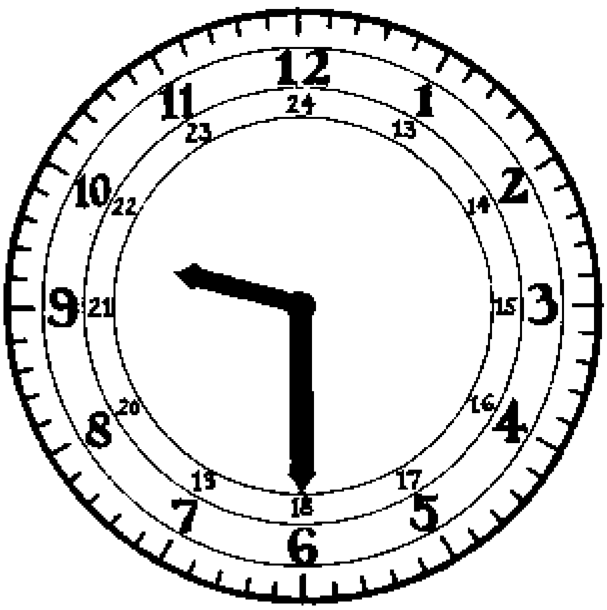
5.8 Calculation of Time

A) Indication of Time

We start to count the hours of a day at midnight. According to the British way we count the hours from 0.00 to 12.00 which is midday. These hours are marked with a.m. which stands for the latin words “ante meridiem” and means “before noon”. After midday the hours are counted from 1.00 to 12.00 which is midnight. These hours are marked with p.m. which stands for “post meridiem” and means “after noon”.

According to the international way the hours are counted from midnight 0.00 to midnight 24.00 in one go.

International Time Indication	British Time Indication
0.00	0.00 a.m.
1.00	1.00 a.m.
2.00	2.00 a.m.
.	.
.	.
.	.
12.00	12.00 a.m.
13.00	1.00 p.m.
14.00	2.00 p.m.
15.00	3.00 p.m.
.	.
.	.
.	.
23.00	11.00 p.m.
24.00=0.00	12.00 p.m.



The same indication on the clock can mean two different times and can be expressed in different ways:

No.	Type	Expression	1. Possibility	2. Possibility
1.		on the clock		
2.	international	on a digital watch	**09 30**	**21 30**
3.		in figures with point	9.30	21.30

No.	Type	Expression	1. Possibility	2. Possibility
4.		in figures with dash	$9^{\underline{30}}$	$21^{\underline{30}}$
5.		in words	nine thirty	twenty-one thirty
6.		in words	half past nine	half past twenty-one
7.	british	in figures with point	9.30 a.m.	9.30 p.m.
8.		in figures with dash	$9^{\underline{30}}$ a.m.	$9^{\underline{30}}$ p.m.
9.		in words	half past nine in the morning	half past nine in the evening
10.		in words	nine thirty in the morning	nine thirty in the evening

Full hours can also be expressed like 11 <u>o'clock</u>.

B) <u>Calculation of Periods</u>

Remember:

Indications of time like 9.30 are **<u>not</u>** decimal numbers!

because an hour has 60 minutes and not 100 hundredth (= $\frac{100}{100}$).

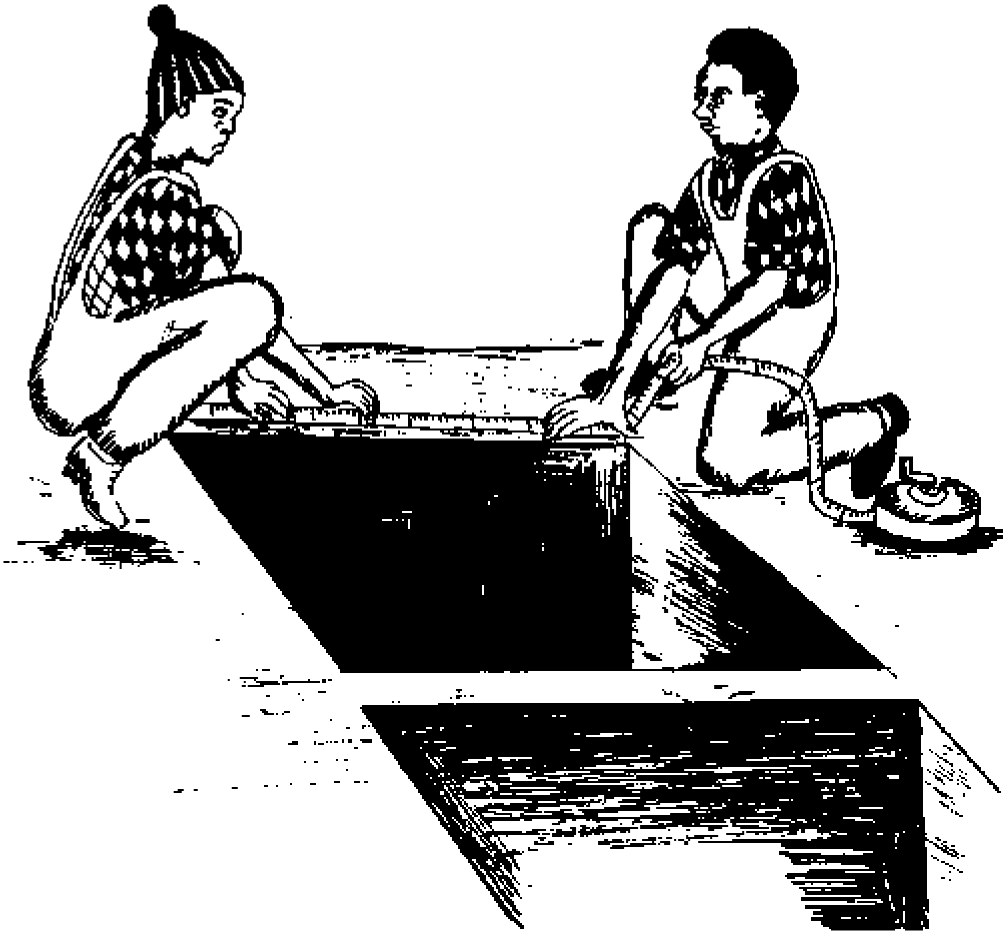
When calculating a period of time:

1. Count the minutes from the starting time to the next full hour.
2. Then count the hours to the full hour before the ending time.
3. Then count the remaining minutes.
4. Add upp the times.

<u>Example:</u>

starting time		8.35
ending time		13.48
60 min	- 35 min	= 25 min
13 o'clock	- 9 o'clock	= 4 hours
48 min	- 0 min	= 48 min
4 hours	+ (25 + 48) min =	
= 4 hours	+ 73 min =	
= 4 hours	+ 60 min	+ 13 min =
= 4 hours	+ 1 hour	+13 min =
= <u>5 hours</u>	<u>+ 13 min</u>	

6. Basic Technical Knowledge



6.1 Basic Technical Drawing

The most basic features of technical drawing are explained in this chapter. Knowledge of these features is necessary in order to enable the technicians to read drawings and manuals. When reading technical drawings, try to identify each line with the corresponding detail on the object. When studying technical drawings, use models or simple objects like a matchbox, a box or a tin, to clarify and to understand the different views. To be able to read technical drawings, you must practise drawing yourself. Practise by drawing objects around you: tools, furniture, houses, wells, latrines. Ask somebody experienced to correct your drawings.

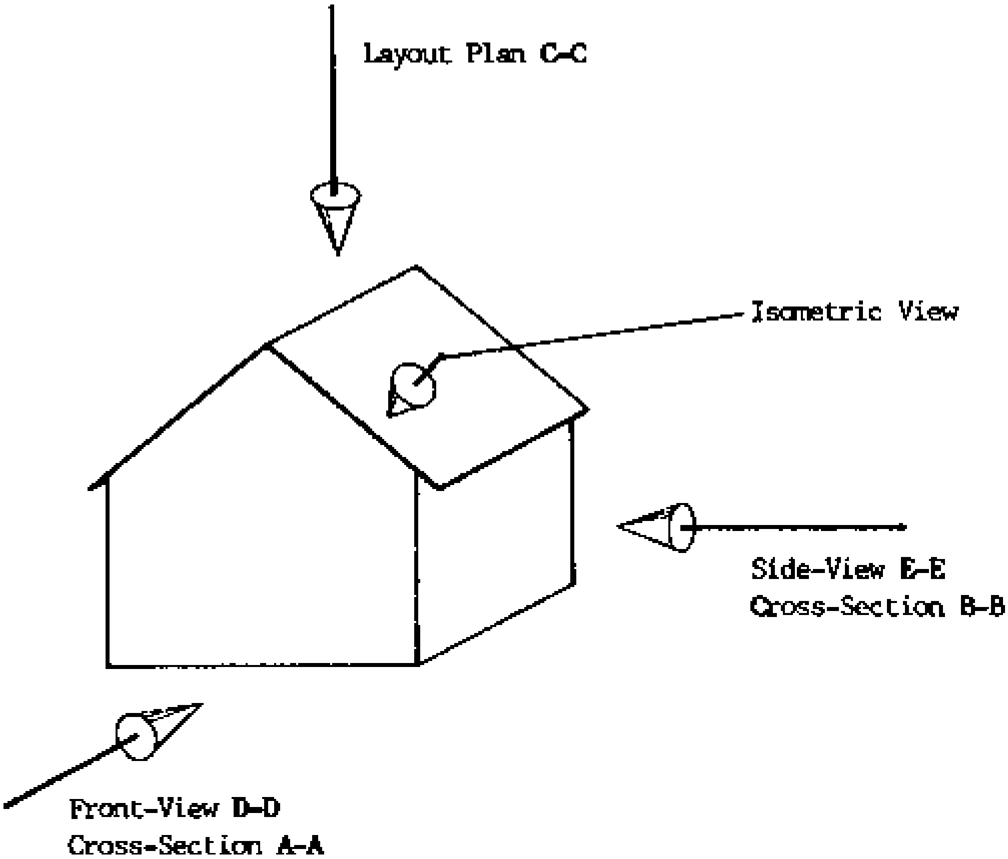
A) Overview of the Different Views

This chapter will explain the following views:

- isometric view,
- cross-section,
- layout plan (= plan),
- front-view (= front elevation),
- side-view (= side elevation),
- exploded diagram, side-view,
- exploded diagram, isometric view,
- cut-away view with hidden inside details.

One view alone does not show the complete information about all details of the object. At least two different views, normally three, sometimes more are necessary to describe all details.

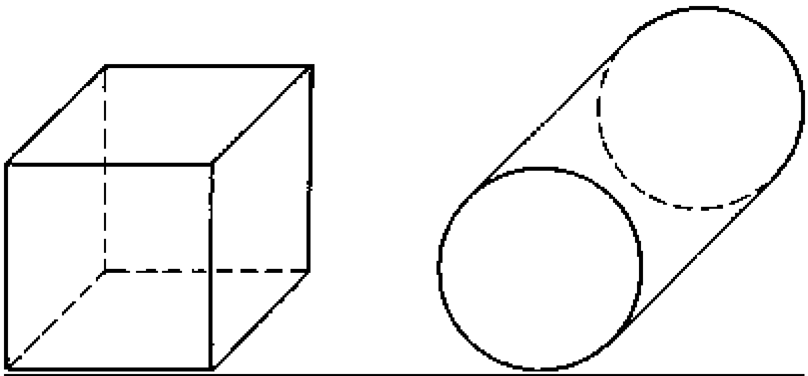
The arrows in the following drawing show from what angle you have to look at a building to obtain the different views. They are explained in the following sections, supplemented by conventions for technical drawing and technical signs.



B) Isometric View

The isometric view shows a view comparable to what can be seen with the eye if you look at the object from a particular angle; it resembles what a photograph shows. This way of drawing is used to clarify what the object looks like, but it is not used for plans.

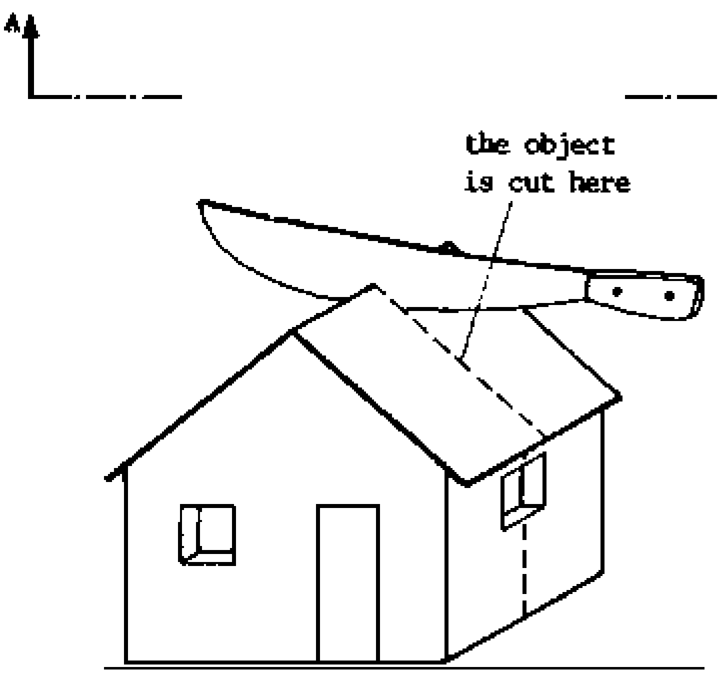
Lines which are parallel in reality also appear parallel in the isometric view (e.g. the sides of the cube). The angles shown in the isometric view are not the same as the angles in reality (e.g. the angles between the sides of the cube are not right angles in the isometric view).



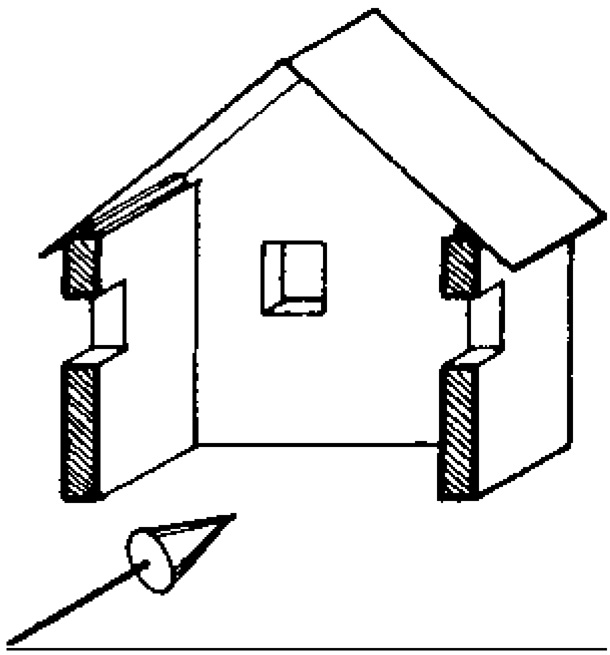
ISOMETRIC VIEW

C) Cross-Section A-A

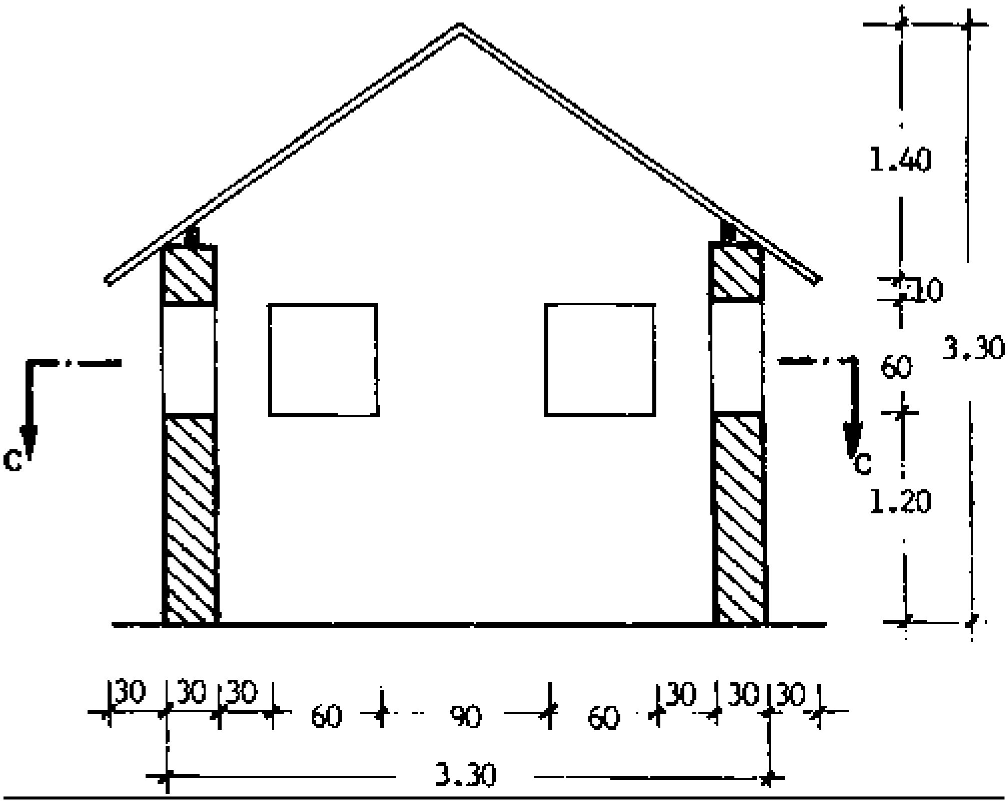
In a cross-section drawing, the object is cut by a plane, usually through windows, into two parts. You look orthogonally to the cutting plane (= vertical to the cutting plane = from the side) and draw what you can see. This is called a cross-section A-A as shown below. A thick chain, with arrows, marked A-A, in the layout plan (see 6.1/5) shows how the building is “cut” to obtain the cross-section A-A. The chain (interrupted at the drawing) shows haw to cut, the arrows show in which direction to look, the letters near the tip of the arrows indicate the “name” of the view:



ISOMETRIC VIEW of the whole part



ISOMETRIC VIEW of the remaining part; this is not called “cross-section”!!!



CROSS-SECTION A-A

Scale 1:50

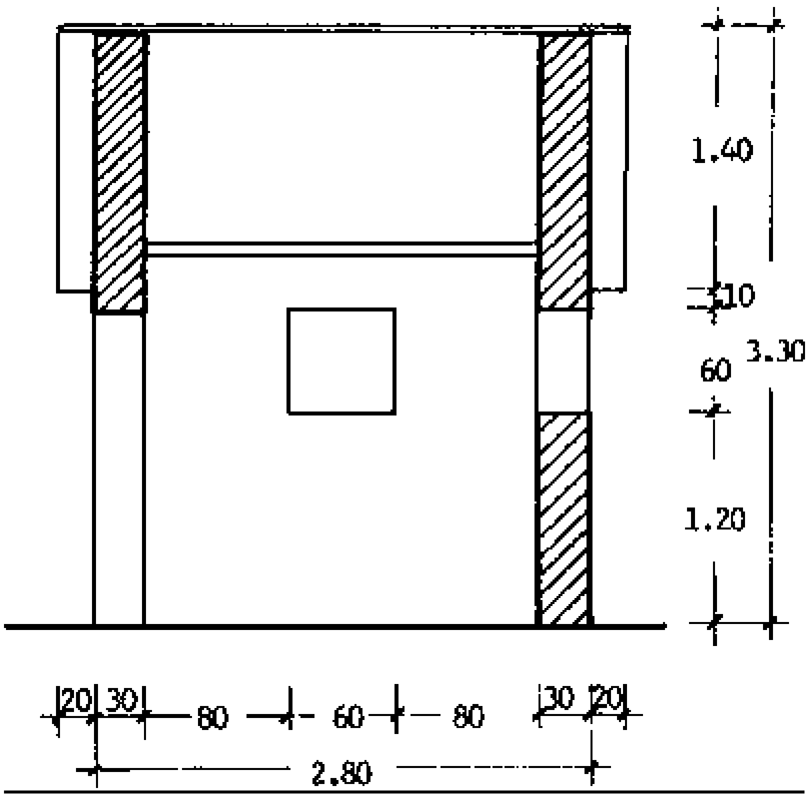
The cut parts are drawn with thick lines and are hatched. The dimensions are given outside the cross-section.

In a cross-section, the planes orthogonal (= vertical) to the cutting plane “disappear” and are shown as lines. For example, you see the floor as a line.

All angles, especially right angles, in a cross-section appear as they are in reality. The thick chain with arrows, marked C-C, shows how the building is “cut” to obtain the layout plan C-C (see 6.1/5).

D) Cross-Section B-B

The building can be cut also in the other direction, parallel to the short side. A thick chain with arrows, marked B-B, in the layout plan (see 6.1/5) shows how the building is “cut” to obtain this cross-section. This cross-section B-B is differentiated from the previous one by the capital letters (B-B instead of A-A).

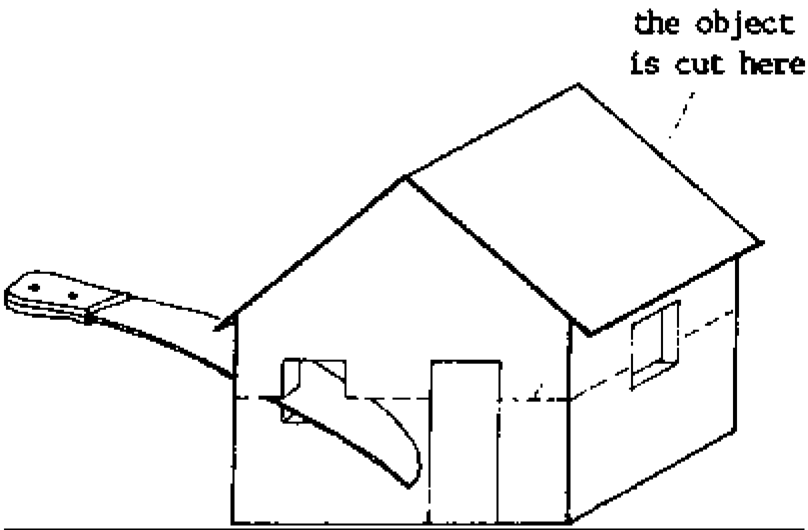


CROSS-SECTION B-B

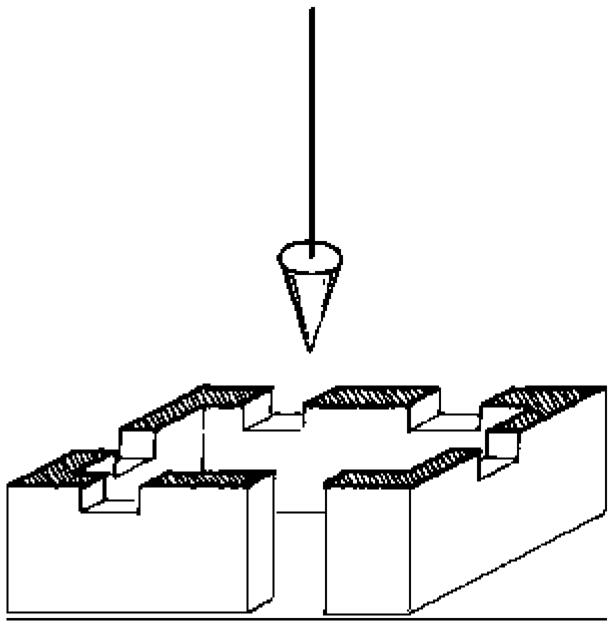
SCALE 1:50

E) Layout Plan C-C (= Plan C-C)

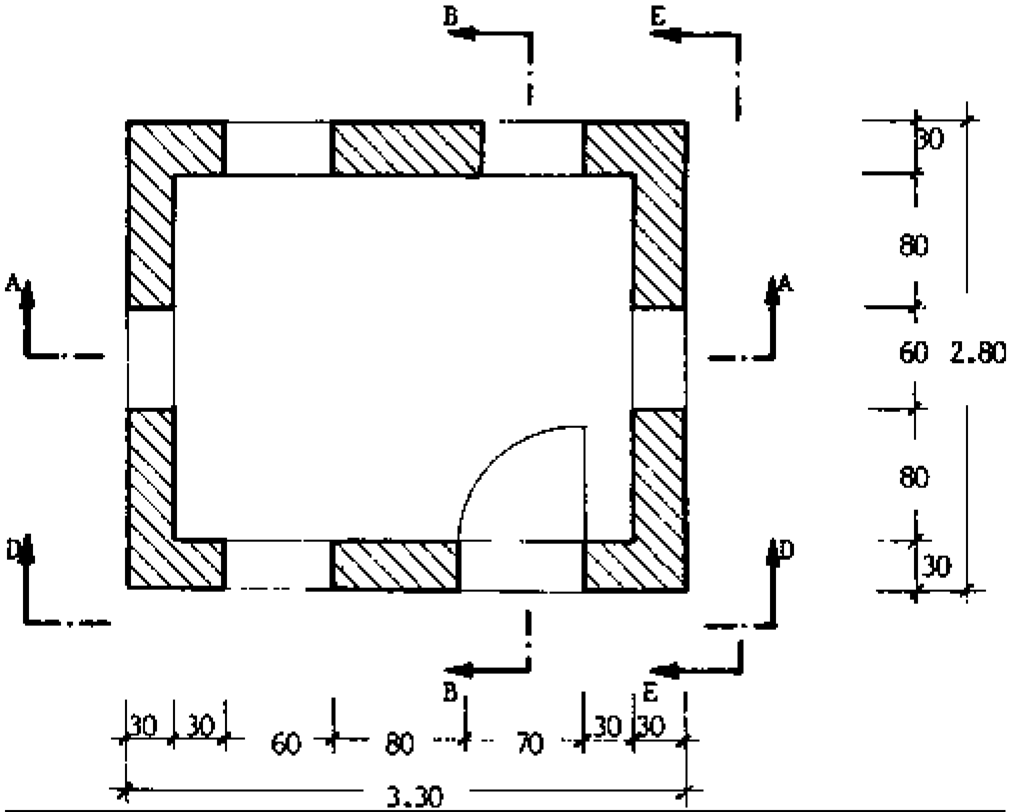
The layout plan is a horizontal "cross-section" (e.g. a house built half way, up to the bottom-half of the windows). You look orthogonally to the cutting plane (= vertically to the cutting plane = from above) and draw what you can see. A thick chain with arrows, marked C-C, in the cross-section shows how the building is "cut" to obtain the layout plan C-C (see 6.1/3).



ISOMETRIC VIEW of the whole object



ISOMETRIC VIEW of the bootom half; this is not called “layout plan”!!!



LAYOUT PLAN C-C

Scale 1:50

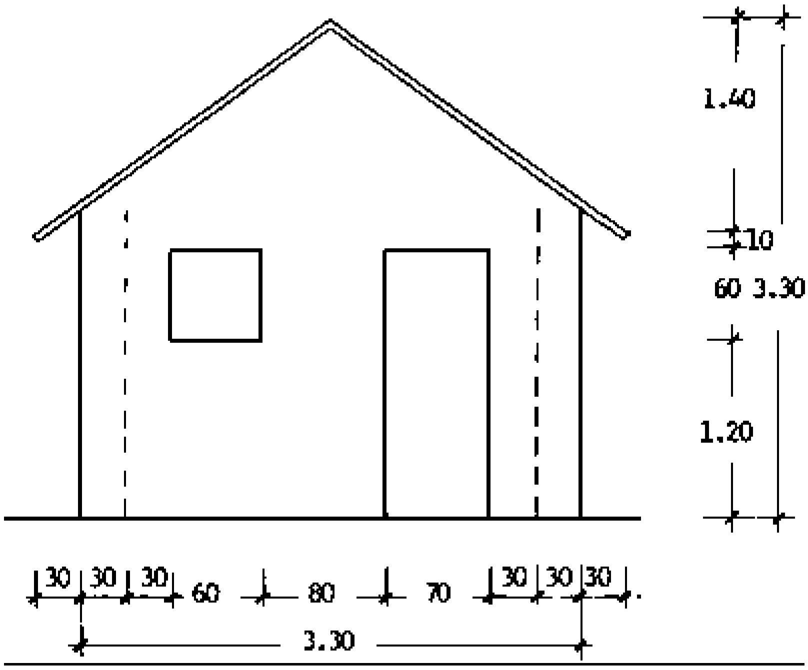
The dimensions are given beside the layout plan. In a layout plan, the planes orthogonal to the cutting plane “disappear” and are shown as lines, e.g. all vertical walls. All angles, especially right angles, in a layout plan appear as they are in reality.

The thick chain with arrows, marked A-A, shows how the building is “cut” to obtain the cross-section A-A. The thick chain D-D shows how to obtain the front-view D-D. The views B-B and

E-E are indicated in the same way. For some objects it does not make sense to cut them for obtaining the layout plan. In this case, the layout plan is an orthogonal view from above (examples see 6.1/10-15, 17, 18).

F) Front-View D-D (= Front Elevation D-D)

The front-view is an orthogonal view of the object without cutting. A thick chain with arrows, marked D-D in the layout plan (see 6.1/5) shows how to look at the building to obtain the front-view D-D. Hidden lines are sharp edges within the object, but they cannot be seen from outside. They can be shown by dashes. However, avoid showing too many hidden details for the sake of clarity.



FRONT-VIEW D-D

Scale 1:50

The dimensions are given beside the front-view.

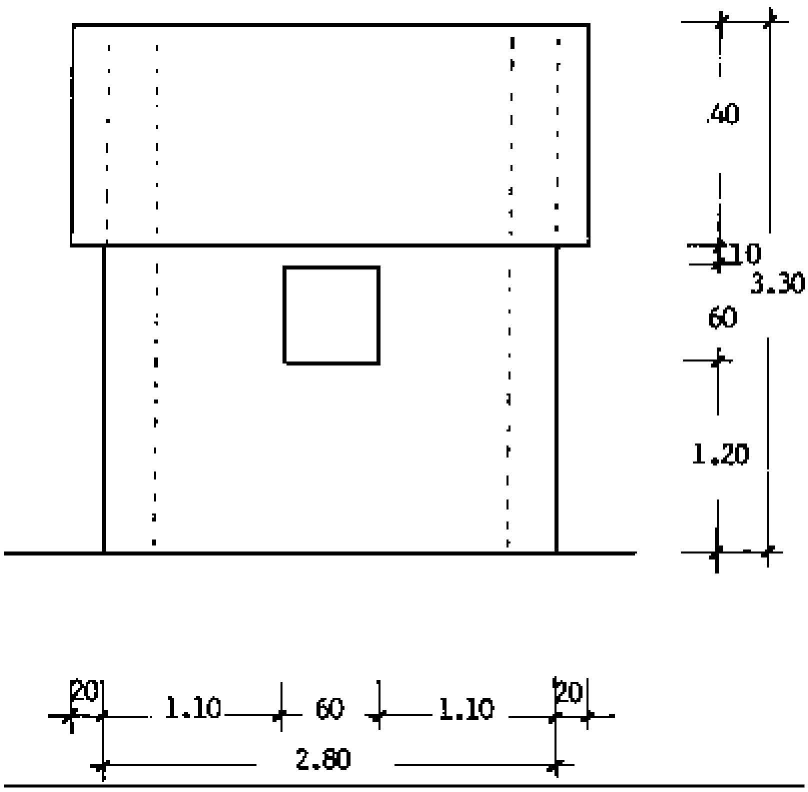
In a front-view, the planes orthogonal to the cutting plane “disappear” and are shown as lines (e.g. the outside wall on the short side of the building).

All angles, especially right angles, in a front-view appear as they are in reality.

G) Side-view E-E (= Side Elevation E-E)

The side-view is an orthogonal view of the object without cutting, similar to the front-view. You have to decide which of them to call front-view and which side-view. Usually, the view at the longer side of the building is called front-view.

A thick chain with arrows, marked E-E in the layout plan (see 6.1/5) shows how to look at the building to obtain the side-view E-E. Hidden lines can be shown with dashes.

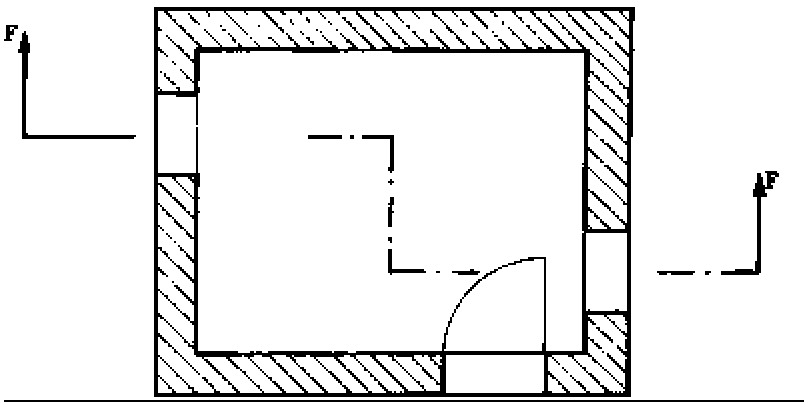


SIDE-VIEW E-E

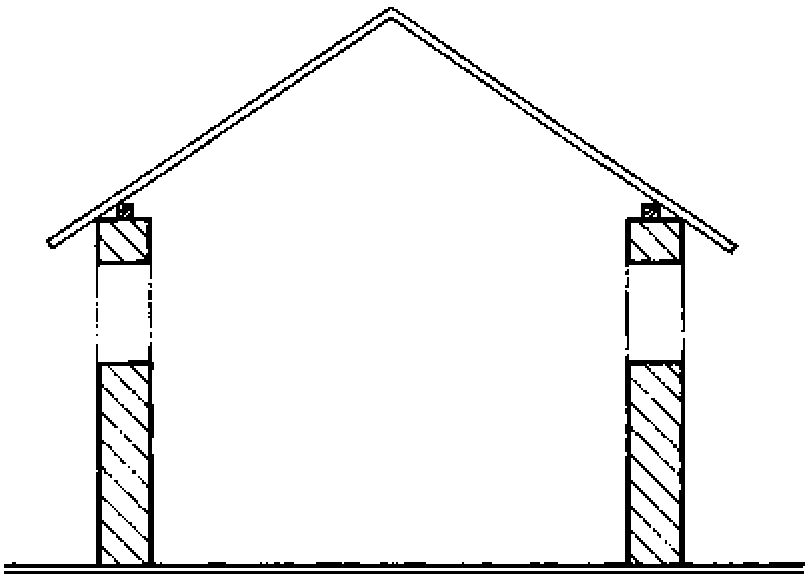
SCALE 1:50

H) Variation of Cross-Section

If the location of windows, etc. makes it necessary, the object can be “cut” in two different places. A thick chain with arrows, marked F-F, shows where the building is “cut” to obtain the cross-section F-F.



LAYOUT PLAN C-C

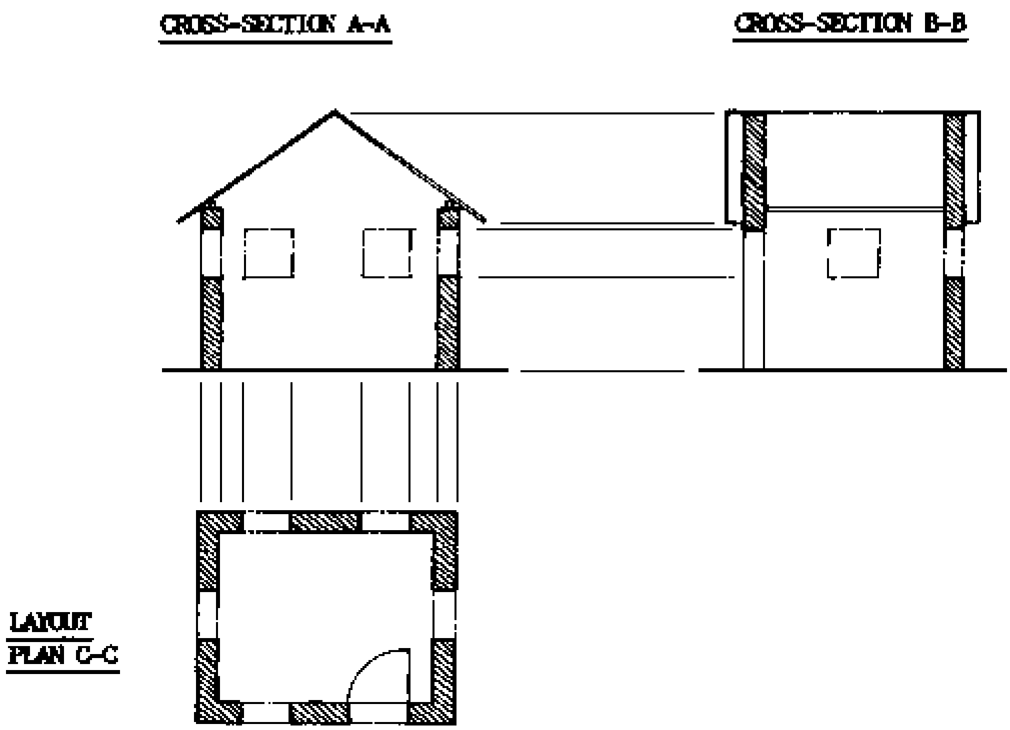


CROSS SECTION F-F

SCALE 1:50

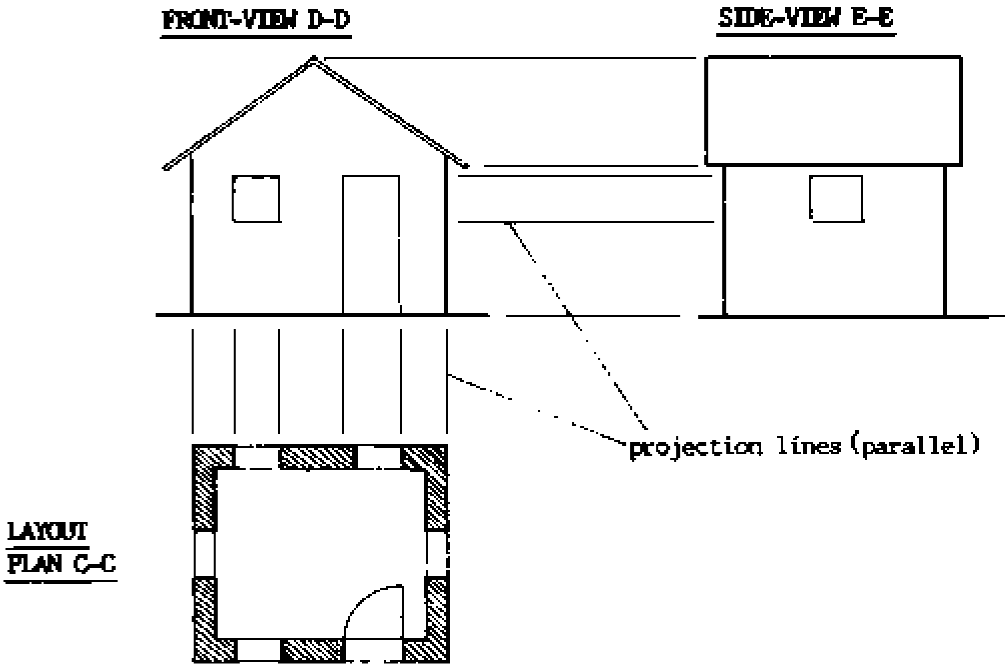
I) Arranging Different Views on a Plan

If a plan is big enough to accomodate several views, they are arranged exactly above and beside each other (see the thin lines! = projection lines) and on one sheet.



Scale 1:100

Front- and side-views are arranged like this:



Projection lines connect the different views and show that the different parts of the object have the same width or height in the different views- They are a help while drawing, but normally do not show up in the final picture; here they are added for illustration.

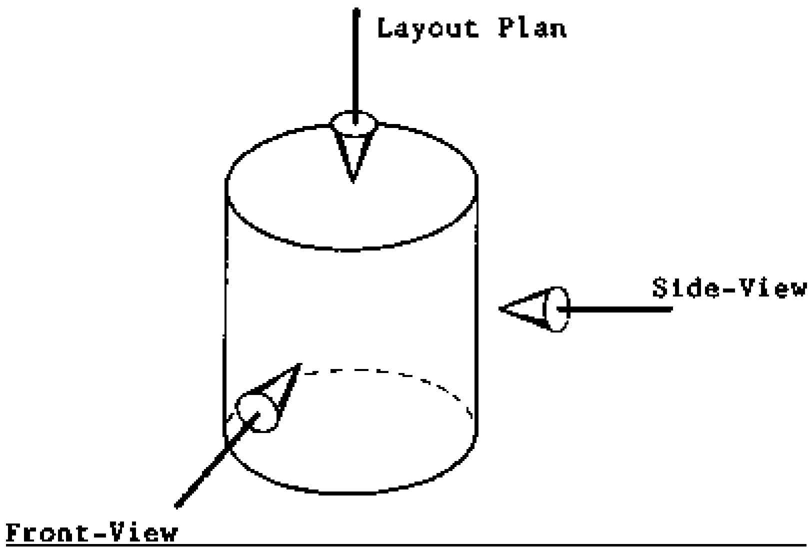
Scale 1:100

If not all views are to be drawn, a different combination of views can be arranged on the sheet.

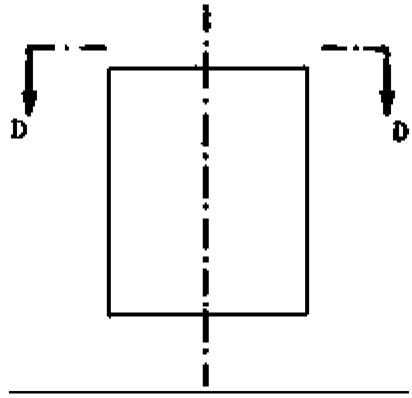
J) Examples of the Different Views

Several objects are shown in the following in the different views for illustration of the drawing principles (for mere examples see especially 7.10/5; 8.14; 8.18; 8.19; 8.30; 9.14 and many others);

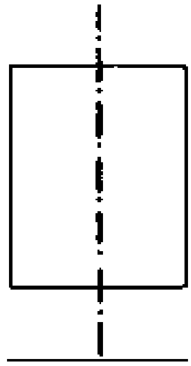
1. Cylinder



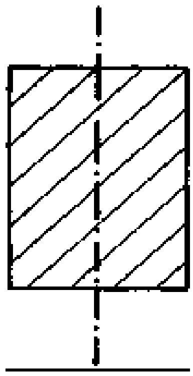
ISOMETRIC VIEW



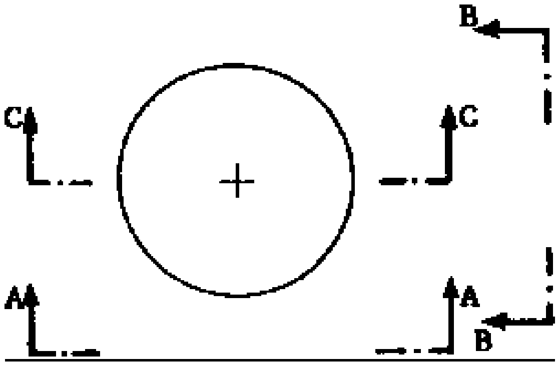
FRONT-VIEW A-A



SIDE-VIEW B-B

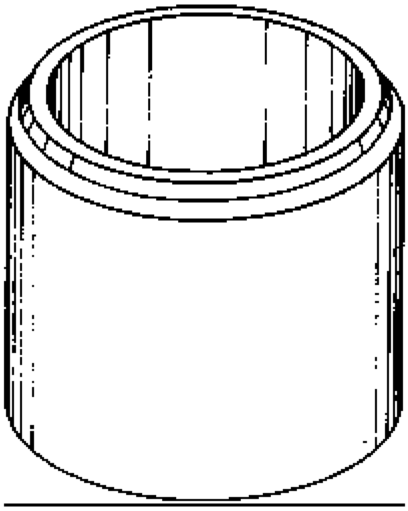


CROSS-SECTION C-C

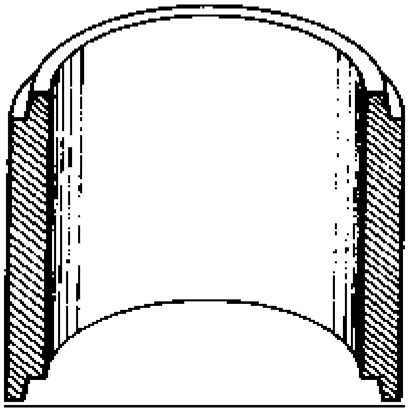


LAYOUT PLAN D-D

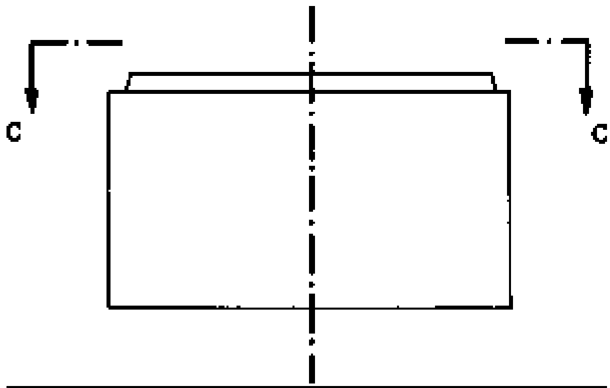
4. Concrete Ring



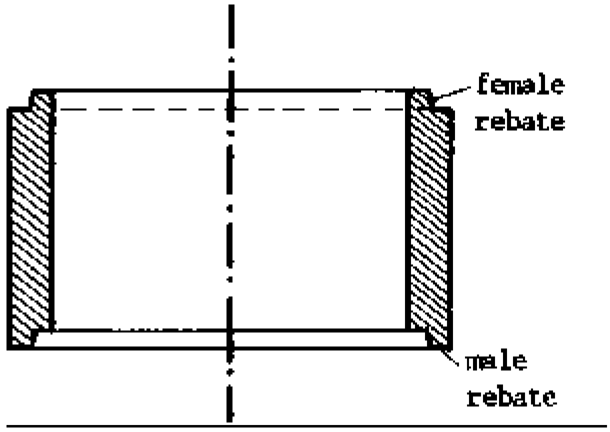
ISOMETRIC VIEW of object



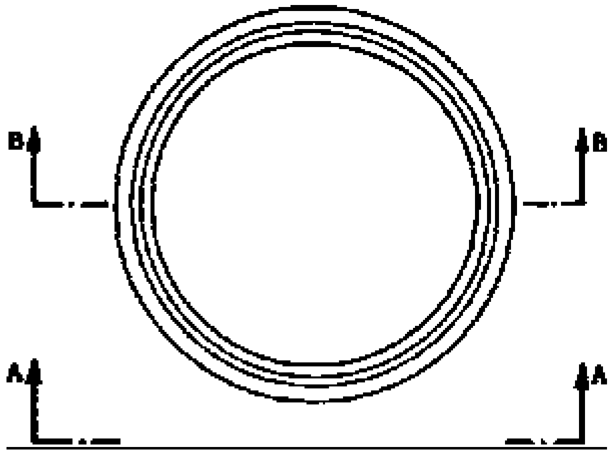
ISOMETRIC VIEW of half



SIDE-VIEW A-A

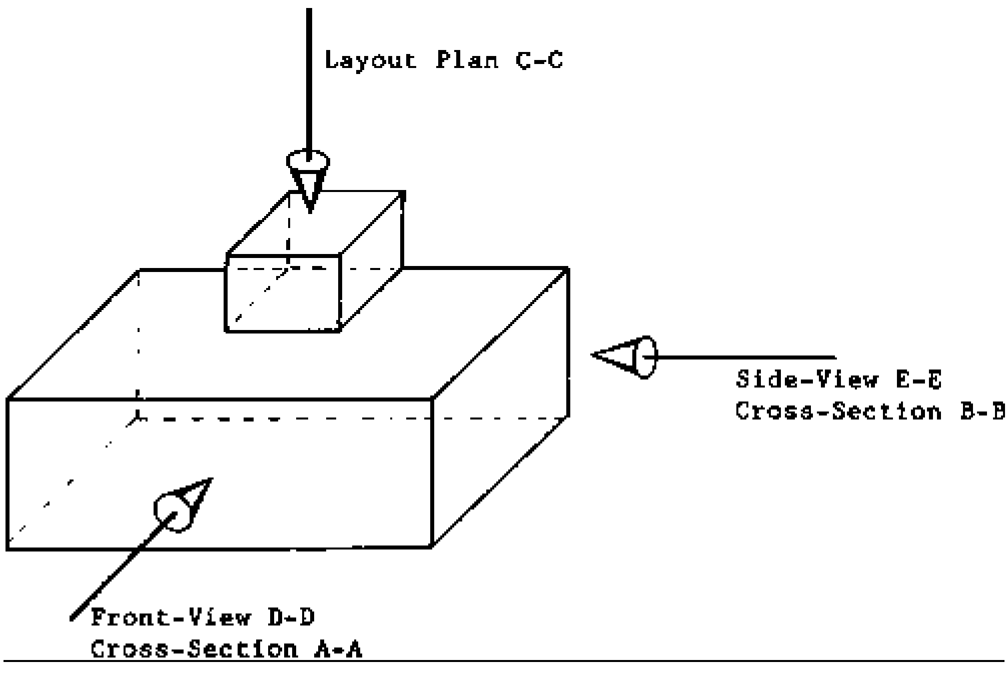


CROSS-SECTION B-B

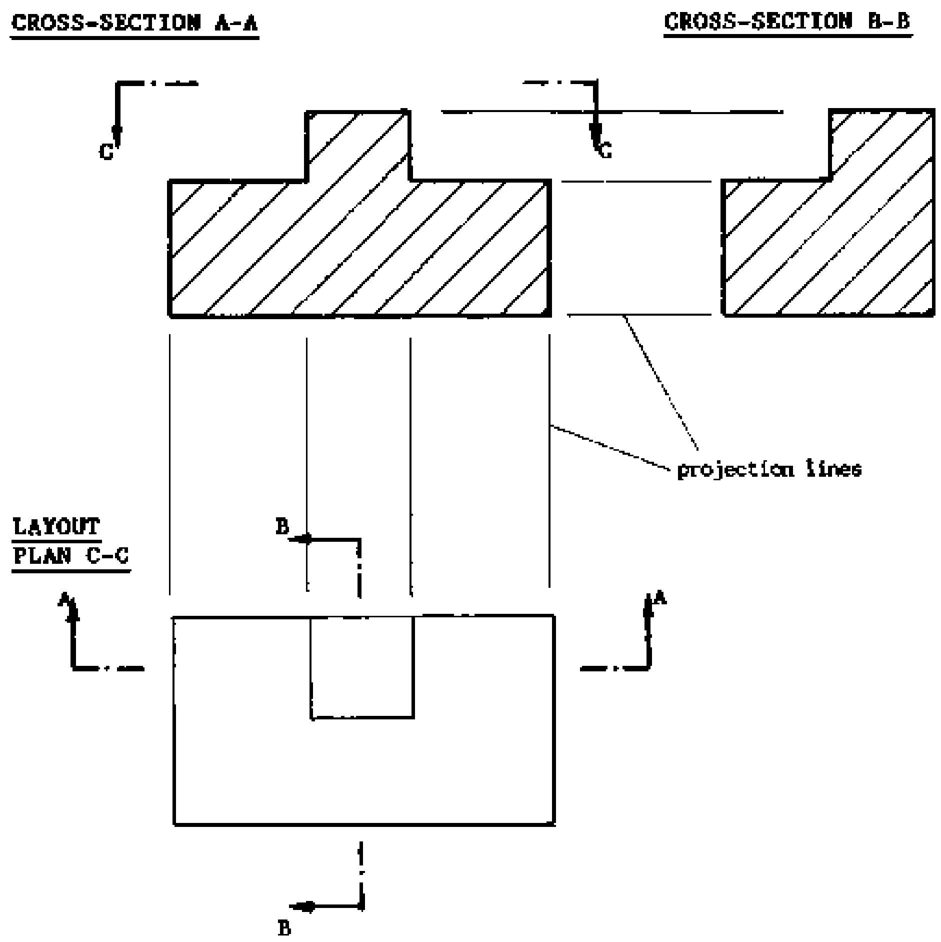


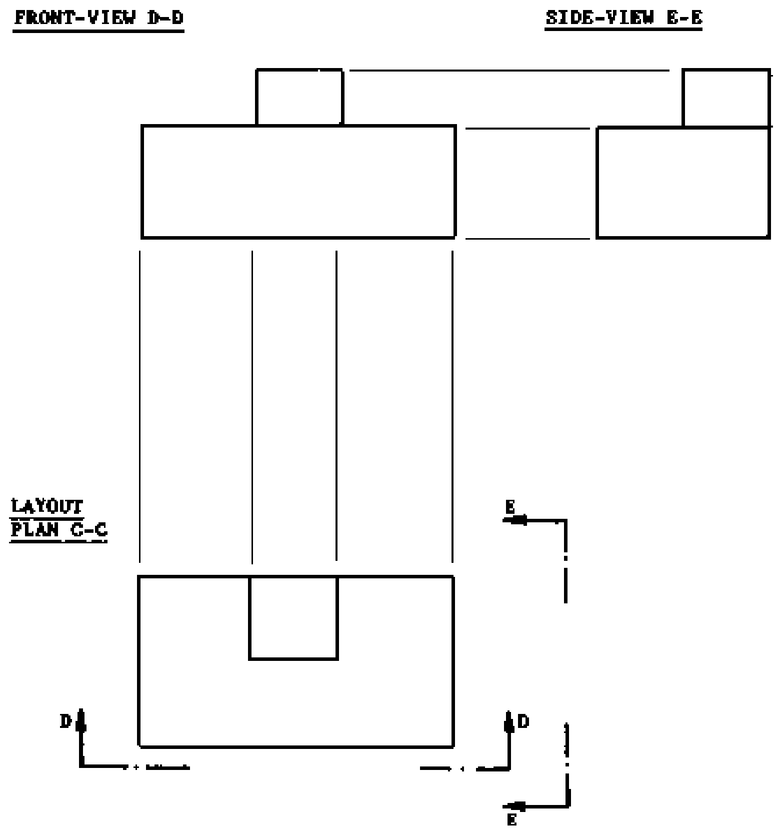
LAYOUT PLAN C-C

2. Two Cuboids

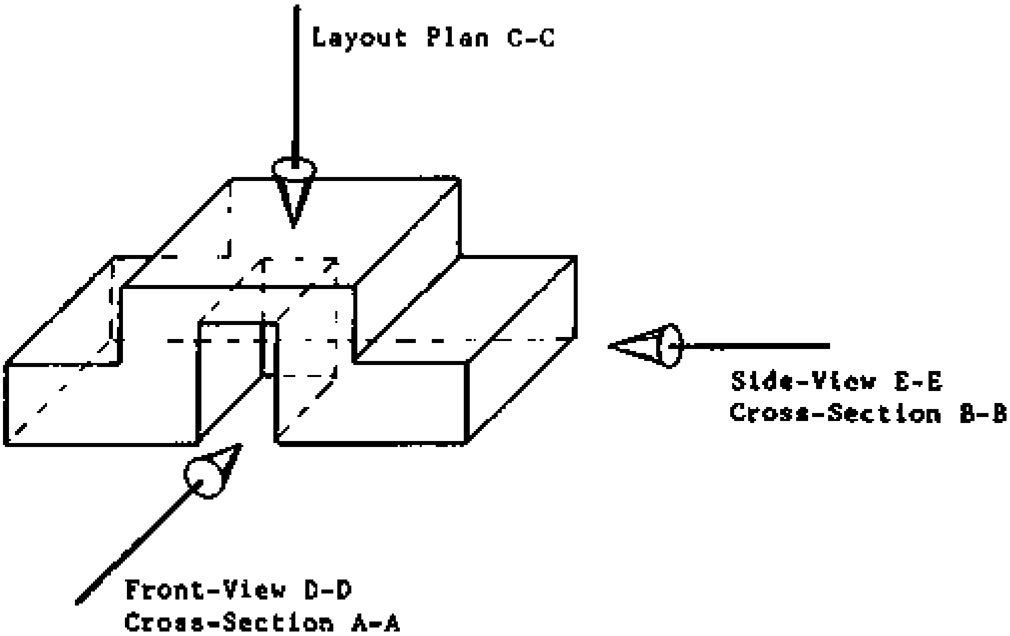


ISOMETRIC VIEW

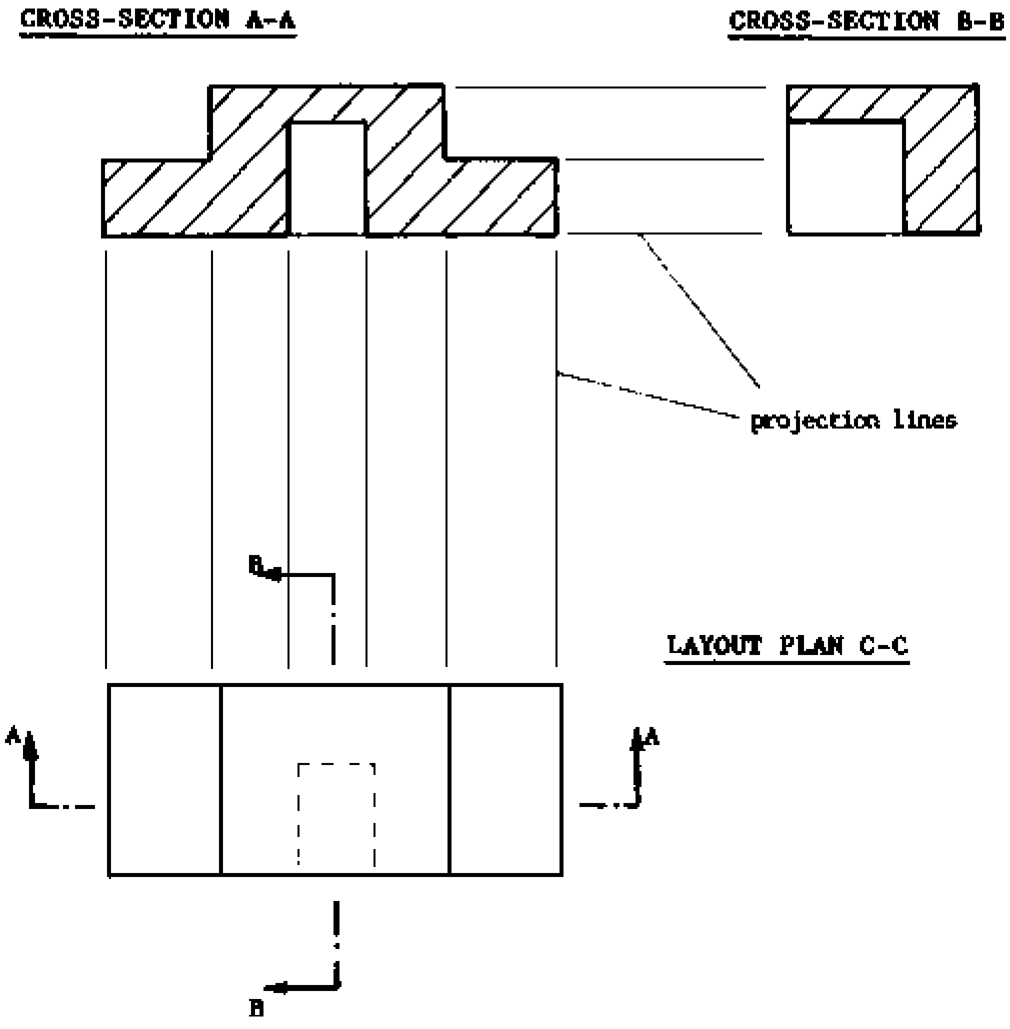


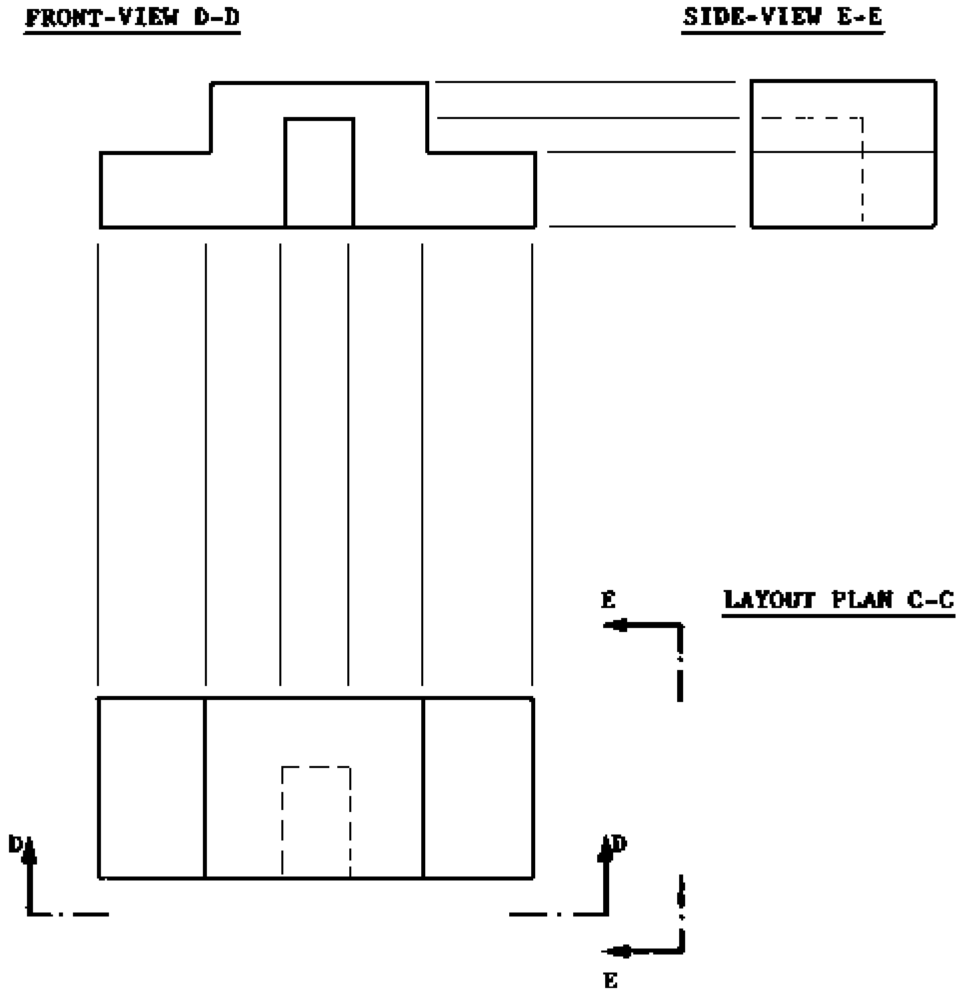


3. Two Cuboids with Cut-Out



ISOMETRIC VIEW





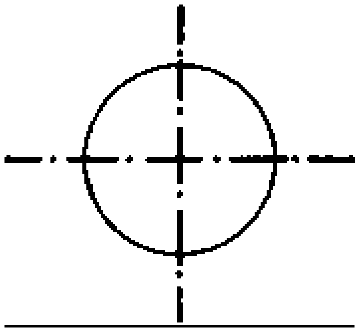
FRONT-VIEW D-D
SIDE-VIEW E-E
LAYOUT PLAN C-C
E
D
D
E

5. <u>Diverse Steel Profiles</u>

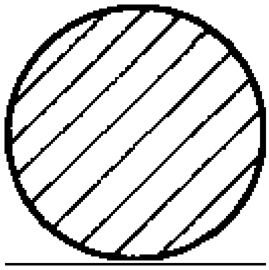
Profile	Isometric View	Cross-Section A-A	Cross-Section B-B	Side-View C-C
rod				
pipe				
square pipe				
steel channel				
equal angle steel				
I-steel				
Tee steel				

What do the different profiles look like in a layout plan D-D?

6. Ball

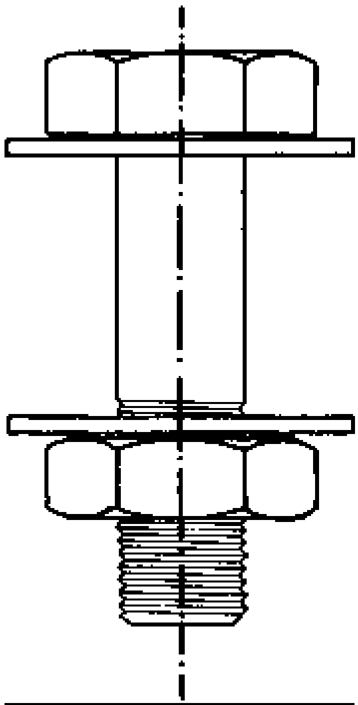


SIDE-VIEW

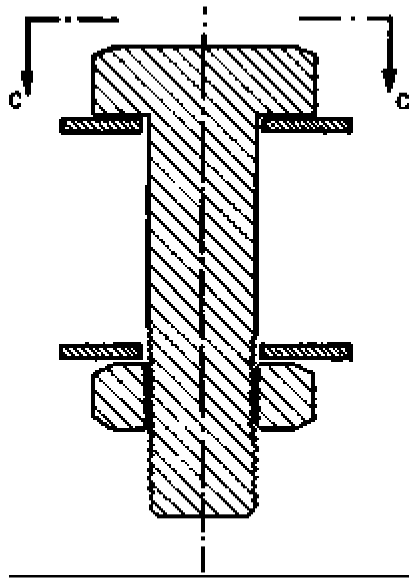


CROSS-SECTION

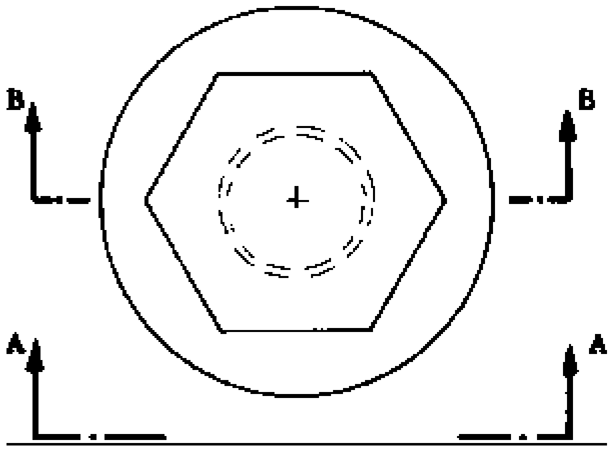
7. Bolt and Nut and Washer



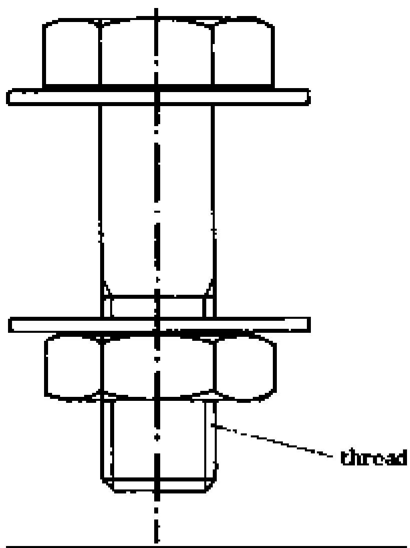
SIDE-VIEW A-A



CROSS-SECTION B-B

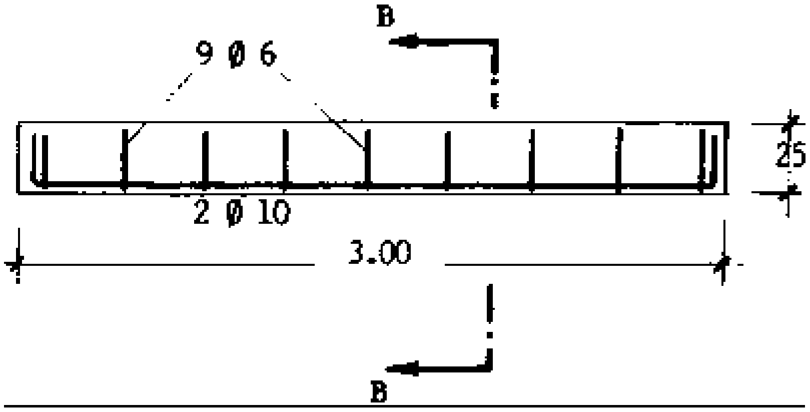


LAYOUT PLAN C-C

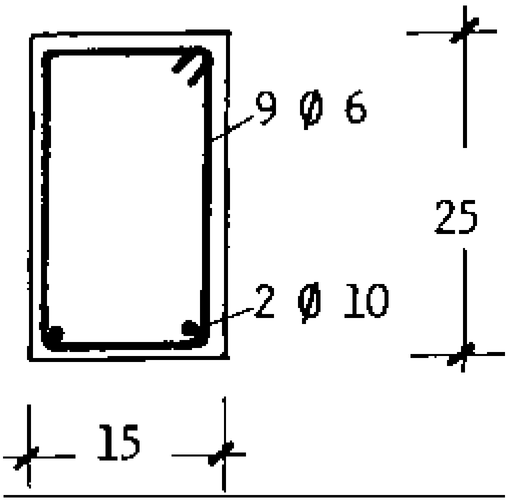


SIDE-VIEW A-A in different way

8. Reinforced Beam



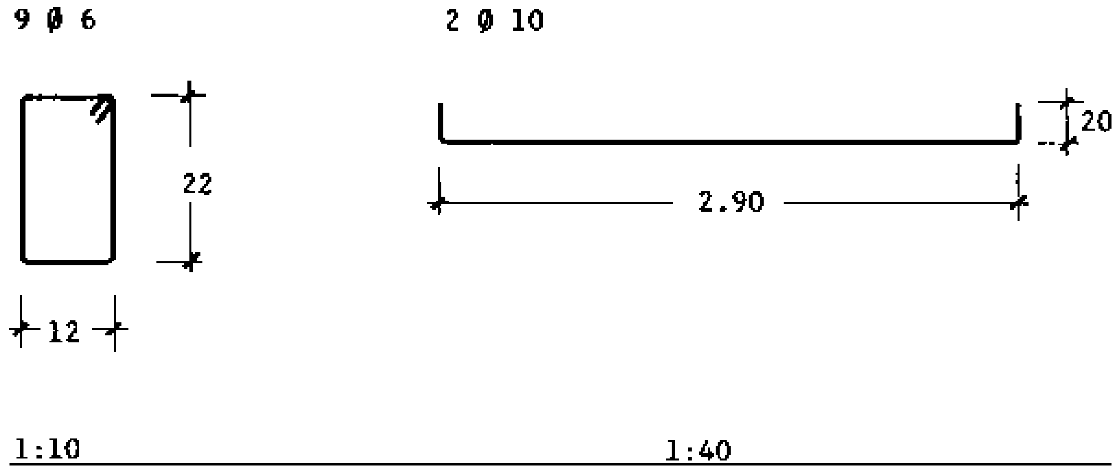
SIDE-VIEW A-A (1:40)



CROSS-SECTION B-B (1:10)

The cross-section is not hatched in order to show the reinforcement clearly.

LAYOUT PLAN C-C (1:40)



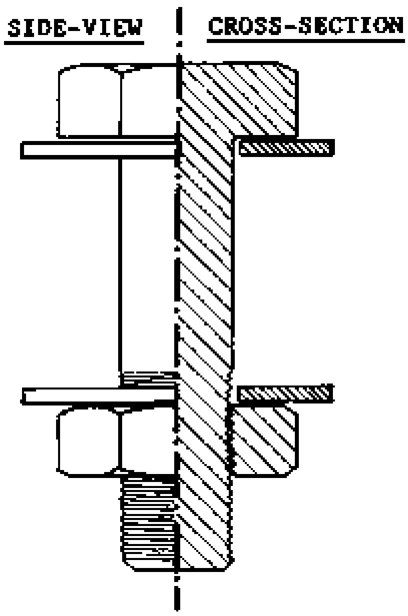
REINFORCEMENT (1:10)

9 Ø 6 stands for 9 pieces reinforcement, diameter 6 mm.
2 Ø 10 stands for 2 pieces reinforcement, diameter 10 mm.

K) Drawing of Rotational Symmetric Parts

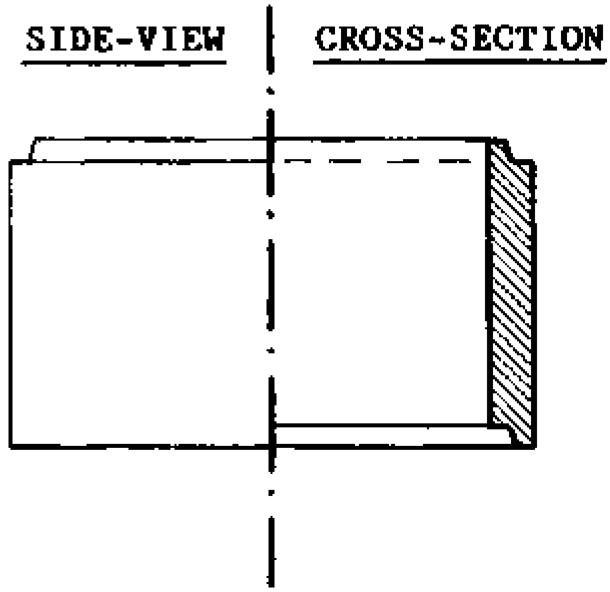
For rotational symmetric parts side-view and cross-section are often united in one drawing, taking half of each. This saves drawing work and space, but still provides complete information. See the following examples.

1. Bolt and Nut and Washer (compare with 6.1/17)

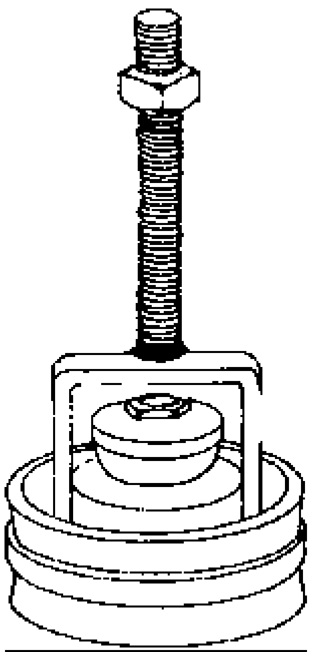


The nut itself is not rotational symmetric but still can be drawn like this, because it is clear what a nut looks like.

2. Concrete Ring (compare with 6.1/11)

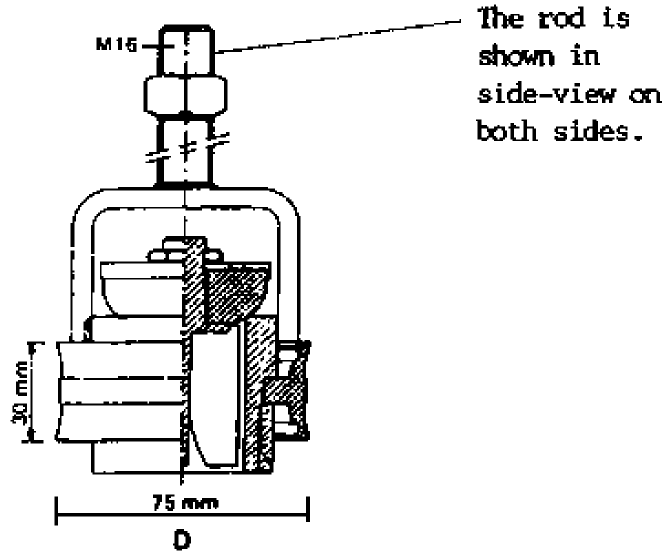


3. Pump Piston



ISOMETRIC VIEW

SIDE-VIEW **CROSS-SECTION**

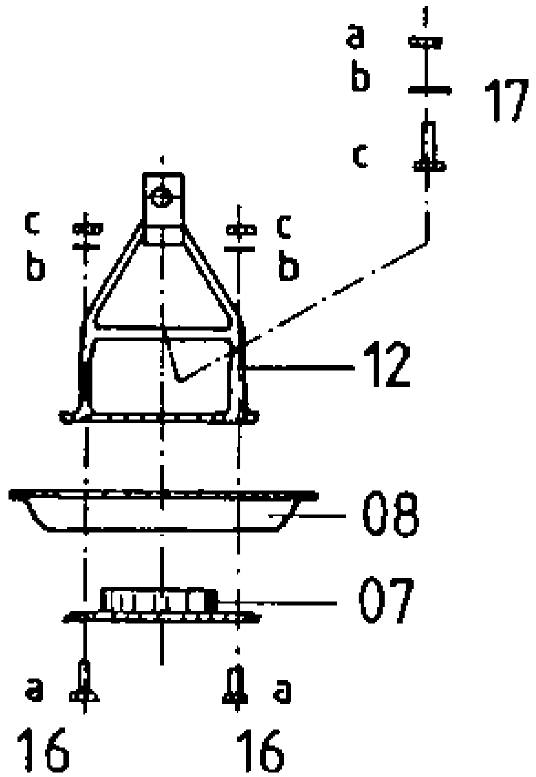


L) Exploded Diagram

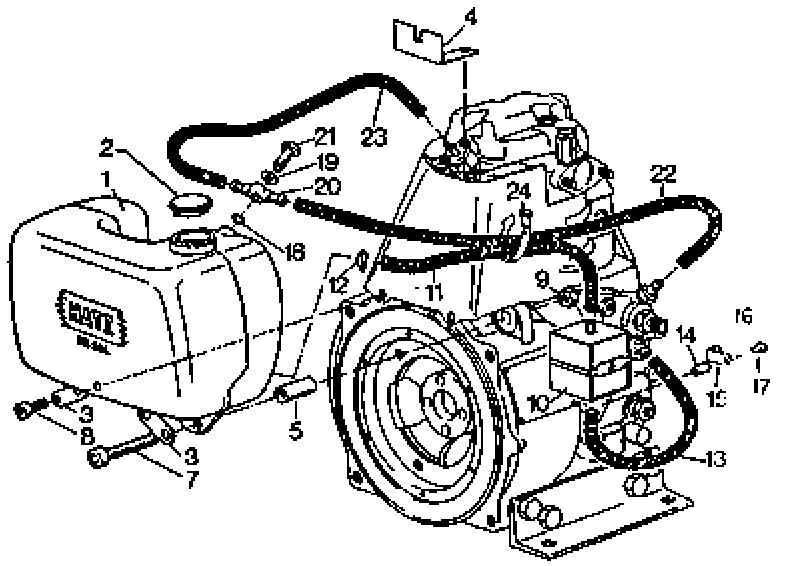
Exploded diagrams are mainly used in installation manuals and spare part drawings of pumps and other machinery. They show exactly how parts, bolts, nuts and washers have to be assembled. All the parts are drawn as if moved apart by an “explosion”. Thus each part can be clearly seen.

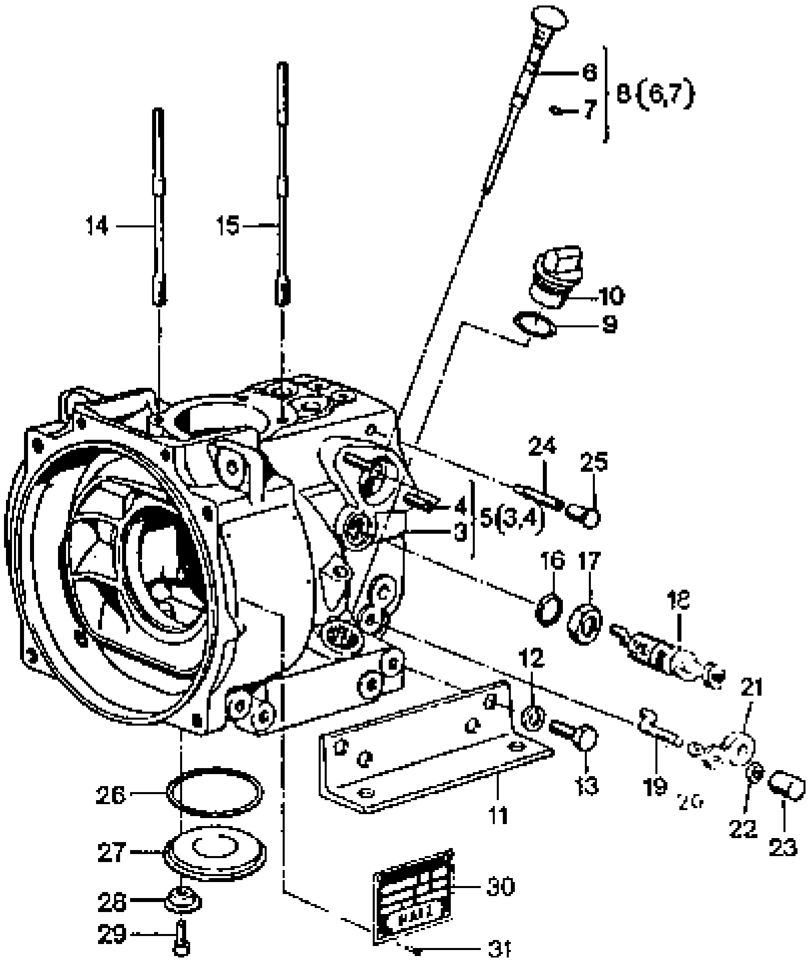
Thin, long chains ______________________ indicate where the part needs to be attached.

Exploded diagrams can be drawn as side-views or as isometric views.



1. Exploded Diagram - Side-View (Part of Diaphragm Pump)

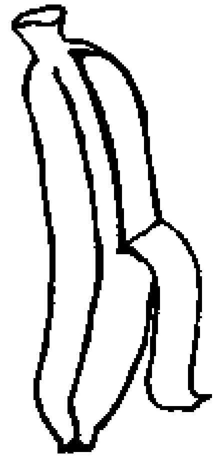




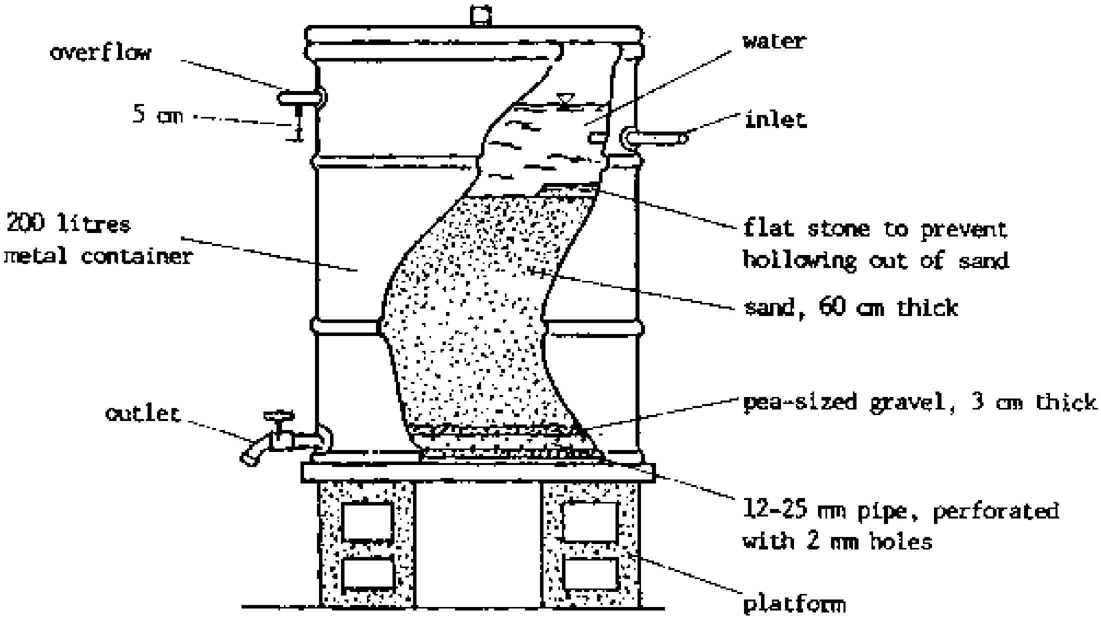
2. Exploded Diagram - Isometric View (Parts of Transportable Generator)

M) Cut-Away View with Hidden Inside Details

Sometimes the outside view of an object (side-view or isometric view) is used to show hidden inside details as well. To show these, part of the outside "skin" is shown as if removed. Imagine a banana being partly peeled, and you can see both outside skin and parts of the inside of the banana. The edges of the removed "skin" are usually drawn irregular.



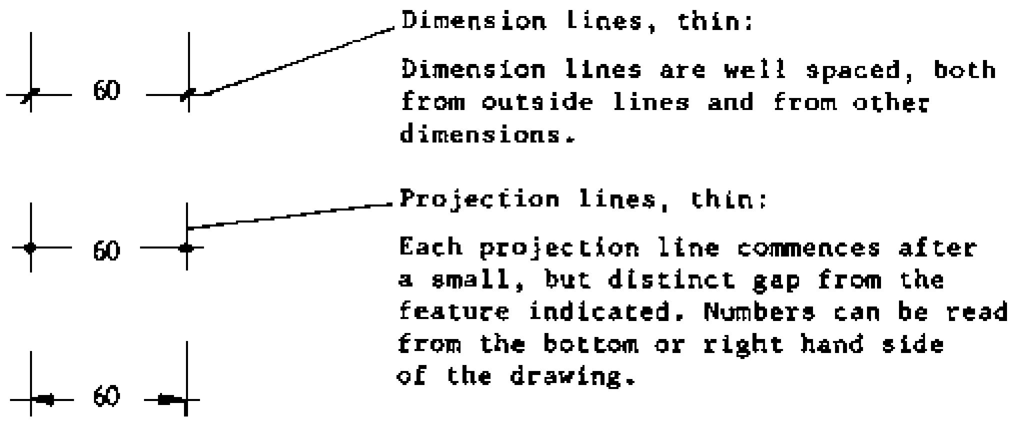
Example: Household Sand Filter

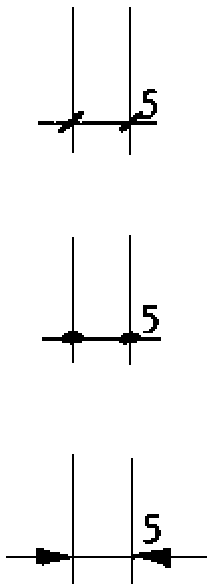


Cross-Section, Side-View, and Layout Plan of the same filter see 8.37/5

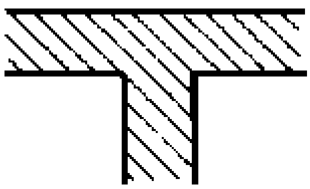
N) <u>Conventions for Technical Drawing and Technical Signs</u>

Conventions for technical drawing are fixed, agreed-upon signs used in technical drawings.

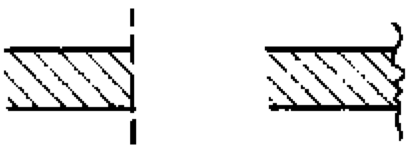




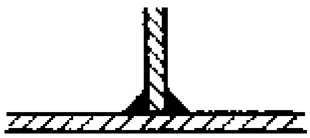
Small dimensions, thin



Cut wall, thick line, hatched



Boundaries, drawing not continued



Welding in cross-section
