
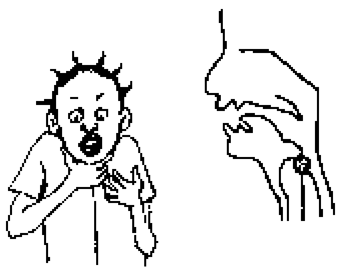
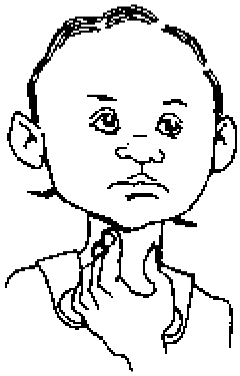
Inspired air is not always clean. It contains many particles which can affect health. Ask the pupils to make a list of areas where air is polluted. Here are a few ideas - a burning waste heap; a car exhaust; latrines that may not be as clean as they should be.

6.1.3 Foreign Bodies in the Throat



P: A foreign body in the throat is a potentially life threatening problem. When something gets stuck in a person's throat it can block the air passage to their lungs. This is called choking. *A small child is in danger because it may like to put things in it's mouth.* Discuss with pupils the dangers caused by foreign bodies in the throat and how to prevent a person choking.

6.1.4 Feeling the Trachea

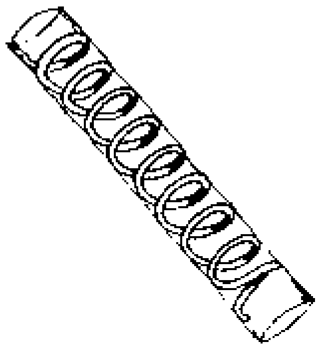


P: Feel your larynx and then trachea with your fingertips. Repeat while swallowing.

Q: What do you notice about the stability and movement of the larynx and trachea?

O: The larynx moves up and down, while the trachea stays almost static.

6.1.5 Trachea Model



P: Coil a length of flexible wire around a stick. Remove the stick and glue a cover of plastic around the length of the coil, leaving the ends open.

E: The coiled wire represents the rings of cartilage in the trachea which prevent the walls from collapsing. The rings also allow the trachea to be flexible. Demonstrate these properties.

6.1.6 Lung Capacity

P:

a) Fill a two litre plastic bottle with water and invert it in a dish of water. Insert a plastic tube into the neck of the bottle and breathe out gently through the tube. Repeat the experiment but breathe out fully through the tube.

b) Or, blow into an empty plastic bag. Then submerge the bag in a bucket filled to the brim with water. Collect the overflowing water and measure the volume.

E: During quiet breathing half a litre is exchanged. During maximum forced breathing up to 4 litres can be exchanged.

6.1.7 Chest Expansion

P: Take the chest measurement (circumference of the thorax) of a pupil as they breathe in and out deeply. Take the average of several measurements.

E: During breathing in, the intercostal muscles pull the ribs upwards and outwards resulting in the increase in size of the thoracic cavity. During breathing out the opposite happens.

6.1.8 Expired Air contains Carbon Dioxide

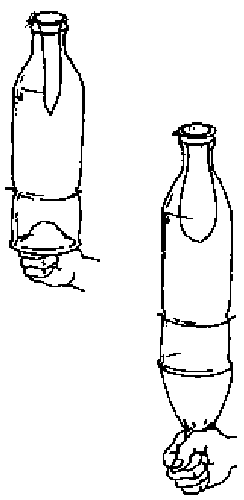
P: Breathe out through a straw or the barrel of a ball point pen into filtered limewater.

Q: How does the limewater change?

O: The limewater goes cloudy then later clear.

E: The exhaled carbon dioxide reacts with the calcium hydroxide solution (lime water) and a precipitation, which later dissolves by more carbon dioxide to soluble calcium hydrogen carbonate.

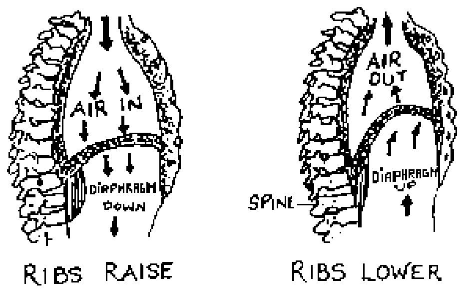
6.1.9 Diaphragm Action



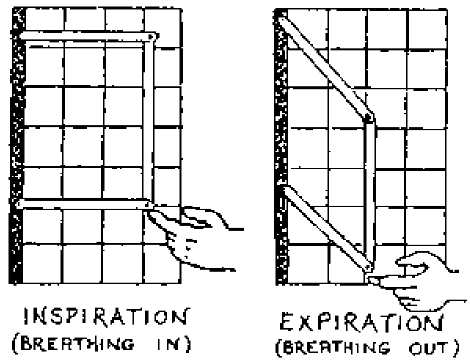
P: Cut off the bottom of a plastic bottle with a sharp knife. Insert the balloon at the mouth of the bottle so that it hangs in the bottle as shown. Tie a piece of plastic bag around the cut base, holding it in place with thread or a rubber band.

E: This simple apparatus can be used to demonstrate the process of inspiration and expiration. The balloon represents one lung. The plastic bag represents the diaphragm and the bottle interior the thoracic cavity. Pulling the plastic sheet down (= diaphragm down) causes an expansion of the (thoracic) cavity bringing about inspiration. The balloon becomes inflated. Expiration can be demonstrated by pushing the plastic sheet to its original position, reducing the volume of the thoracic cavity, thus causing the balloon to deflate.

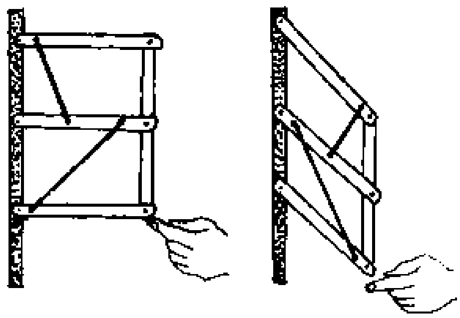
6.1.10 Rib Movement Model



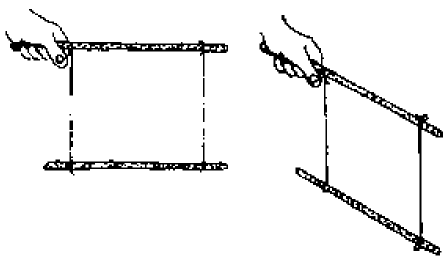
(a)



(b)



(c)

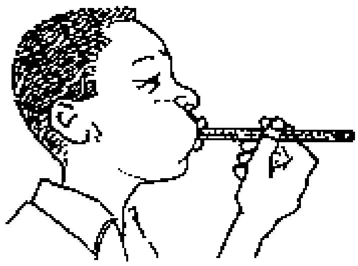


a) Draw squares (3 x 3 cm) on card or hardboard as shown in the diagram. Fix a shaded strip with glue or nails to represent the spinal column. Attach the movable strips to represent the ribs and sternum. By moving the ribs on the model up and down, inspiration can be illustrated. Count only the squares which are over half visible to determine the increase or decrease of the thoracic cavity. Pupils should place their hands on their own ribs to link the model to life. The change in size of the thoracic cavity is due to movements of the ribs and the diaphragm.

b) The model above can be adapted to show the contraction and relaxation of the intercostal muscles.

c) A simple model can be made from two sticks and some thread. Try it.

6.1.11 Exhaled Air contains Moisture

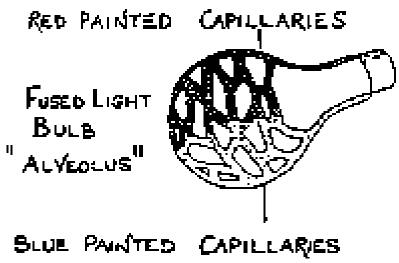


P: Breathe *in* through the transparent barrel of a ball point pen and note what happens. Then breathe *out* through the barrel of the pen and record your observations.

O: When you breathe in the barrel remains clear, but when you breathe out the barrel becomes clouded with water vapour.

E: Expired air contains water vapour which condenses on the inside of the ball point barrel.

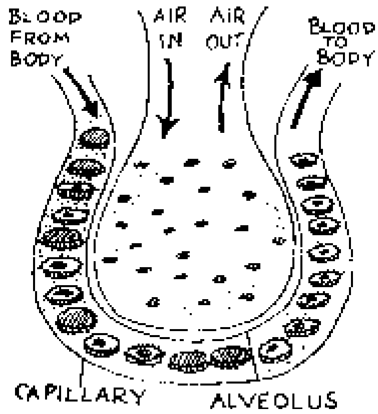
6.1.12 Alveolus Model



P: A fused electric light bulb can be used to represent an alveolus. With red paint or waterproof marker, draw the blood capillaries carrying oxygenated blood. Use blue for the deoxygenated blood vessels.

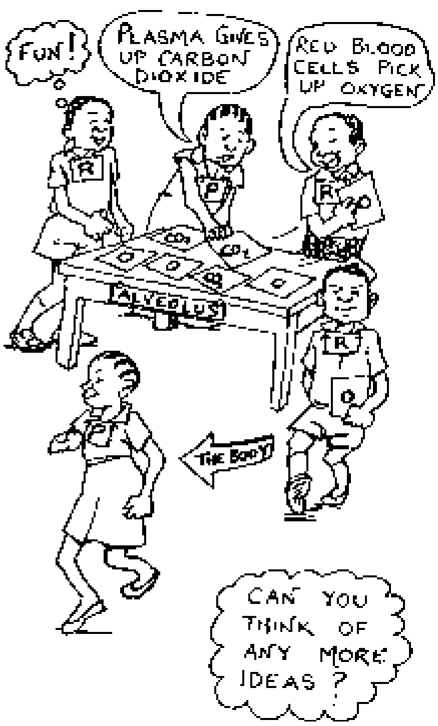
E: The lungs contain countless alveoli (air sacs). Each sac is supplied with blood capillaries. The blood coming to an alveolus in deoxygenated, while the blood leaving the alveolus is rich in oxygen.

6.1.13 Gaseous Exchange Game



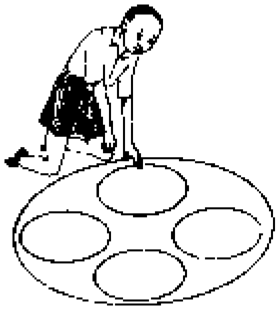
P: Draw the large outline of an alveolus on cardboard or paper (it may also be chalked on table or floor). Draw a surrounding blood capillary. Choose two types of seed, stone or bead. One to represent carbon dioxide (seed) and one to represent oxygen (stone). Paint or mark fifteen bottle tops, red on the inside and blue on the outside. The tops represent red blood cells. Place the tops in the capillary. As the tops (red blood cells) enter the capillary most are turned to blue, to show they contain no stone (oxygen). Carbon dioxide is shown by small seeds in the plasma area of the capillary. Stones (oxygen molecules) are placed inside the alveolus and these are moved into the capillary, to be transported away inside red upturned bottle tops (oxygenated red blood cells). The seeds (carbon dioxide) are moved from the capillary plasma area into the alveolus.

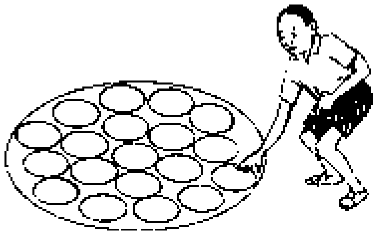
6.1.14 Playing Gaseous Exchange



P: Pupils can act out gaseous exchange. A desk or table can represent an alveolus. Write 'oxygen' on ten sheets of paper and place these on the desk. Some pupils pin the letter 'P' or the word 'Plasma' to their clothing. Others pin letter 'R' or 'Red Blood Cell' to their clothing. Each 'P' pupil is given a paper with 'carbon dioxide' on to carry. The pupils then act out their various roles. As they walk round the table (through the capillary), each 'P' pupil deposits their 'carbon dioxide' paper. Each 'R' pupil picks up an 'oxygen' paper from the table and all continue to walk around the table (through the capillary).

6.1.15 Lung Surface Area





P: Use string or paper to make a circle of 20 cm diameter. Make smaller circles of 10 cm diameter. See how may small circles fit inside the 20 cm circle without overlapping. Measure the circumferences of the large and small circles. Find the total circumference of all the small circles and compare it with the circumference of the big circle. Repeat the procedure using 5,2 and 1 cm diameter circles.

O: As the circles get smaller, their total circumference gets larger compared to the circumference of the big circle.

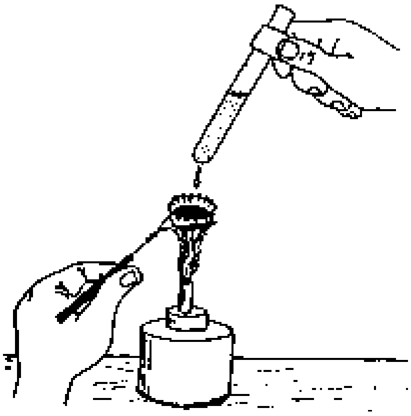
E: This is similar to lungs which are divided into air sacs, to increase surface area for gaseous exchange. There are about 350 million air sacs in each lung. Because they are so small, the air sacs form a very large respiratory surface (about 25 square metres in each lung?

I: The tracheal system of insects and the gills of fishes all have a large surface area for gaseous exchange.

6.2. Cell Respiration

Respiration is one of the seven vital characteristics of living things. The term respiration is often used in referring to breathing and gaseous exchange, but actually it should only be applied to *cell respiration,* or *internal respiration* which is a chemical process. Respiration, in simple terms, may be considered as a process of energy release by the breakdown of carbohydrate-food stuffs like sugar and starch. These are made up of the elements carbon, hydrogen and oxygen. Respiration can be aerobic or anaerobic. *Aerobic respiration* involves the release of energy by the chemical reaction of carbohydrates with oxygen. These are completely broken down to water and carbon-dioxide. *Anaerobic respiration* is the breakdown of carbohydrates to release energy without the use of oxygen. Some single-celled organisms like yeast and bacteria derive most of their energy anaerobically, a process which is also *called fermentation.* Bread, beer and wine production are examples of the application of fermentation.

6.2.1 Carbohydrates contain Combustible Elements



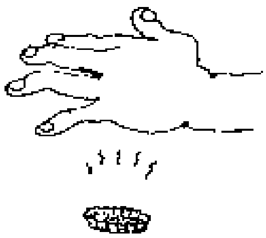
P: Heat some sugar in a soda bottle top using a kerosene burner (kibatari). Hold a water filled glass or test tube above the bottle top.

Q: What do you observe?

O: The sugar first turns dark brown, then black and drops can be observed condensing on the glass.

E: This shows that carhohydrates are made up of carbon, hydrogen and oxygen atoms (the latter two form water).

6.2.2 Combustion and Respiration



P: Heat some sugar in a soda bottle top as in the previous experiment. When the sugar is bubbling remove the cap from the heat. Put your hand above the heated sugar and note the temperature. Feel the temperature of your body with your hand.

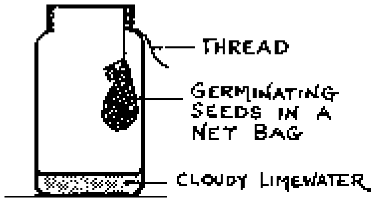
Q: How does the temperature of the your body compare with that of burning sugar?

O: The burning of sugar produces a high temperature. The human body has a constant but moderate temperature (37 degrees C).

E: Combustion (or burning) is the rapid release of energy in an uncontrolled reaction. Respiration is the slow release of energy during a controlled reaction involving enzymes.

6.2.3 Exhaled Air contains Carbon-Dioxide

6.2.4 Germinating Peas produce Carbon Dioxide



P: Put a little lime water into a wide-mouthed glass jar and hang a perforated plastic bag, containing soaked and germinating peas. Make sure that the peas are separated from the liquid. Seal the jar well and leave it to stand for a few hours.

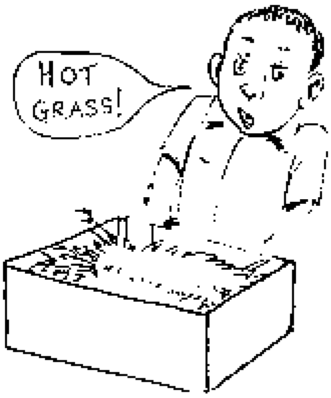
Q: What happens to lime water?

O: The limewater becomes cloudy.

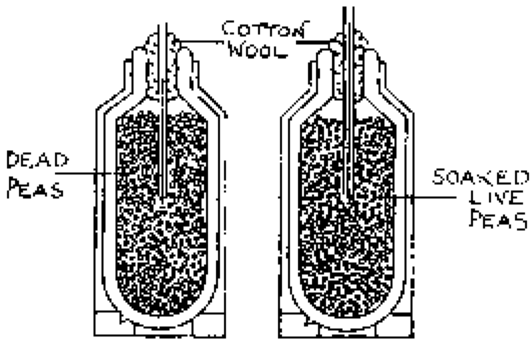
E: The germinating peas respire giving out carbon dioxide

I: Different kinds of germinating seeds, plant shoots and small animals can be used instead of peas.

6.2.5 Temperature Change



6.2.6 Measuring Temperature Change



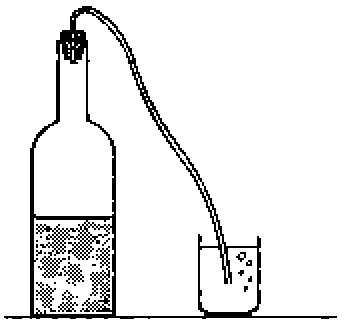
P: Fill a thermos flask with germinating pea seeds or wheat grains. Place a thermometer into the peas and close the mouth with cotton wool. Set up a control test with seeds which have been boiled.

Q: What happens to the temperature?

O: The temperature rises in the flask with the living seeds, but not in the one containing boiled seeds.

E: Respiration produces heat.

6.2.7 Fermenting Sugar



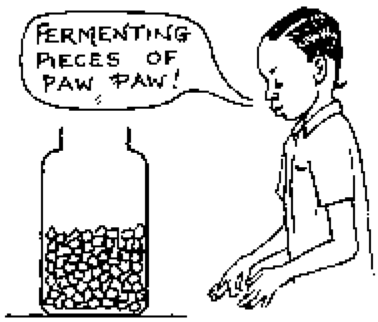
P: Half fill a bottle with a solution prepared from 1 cup of water, 1 tablespoon of sugar and 1 tablespoon of yeast. The gas produced can be directed into lime water.

Q: What do you observe?

O: The bubbles of gas turn lime water cloudy.

E: The yeast cells ferment the sugar giving off carbon dioxide gas.

6.2.8 Fermenting Fruit



P: Prepare a pulp of paw paw. Put the pulp into a glass. Let it stand for some time in a warm place.

Q: What can be observed?

O: Gas bubbles are formed in the pulp.

E: The pulp is fermented because the sugar contained in it is acted on by wild yeast, which grows on the skin of the fruit. Yeasts are also found in air.

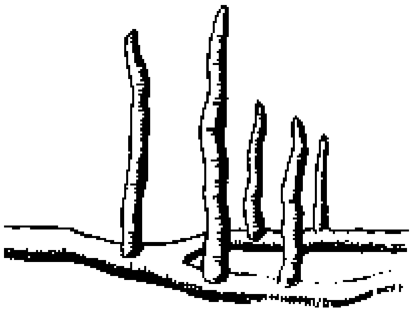
6.2.9 Local Alcoholic Drinks

P: Try to find out the names of as many locally made alcoholic drinks as you can.

Q: From what ingredients are they made?

E: Mbege, kangara, dengeluwa and tembo are examples of locally made alcoholic drinks. They are made from different cereals, honey and many other sugar and starch-containing raw materials. Fermentation (anaerobic respiration) takes place in the process of making each of these drinks.

6.2.10 Plants reach for Oxygen

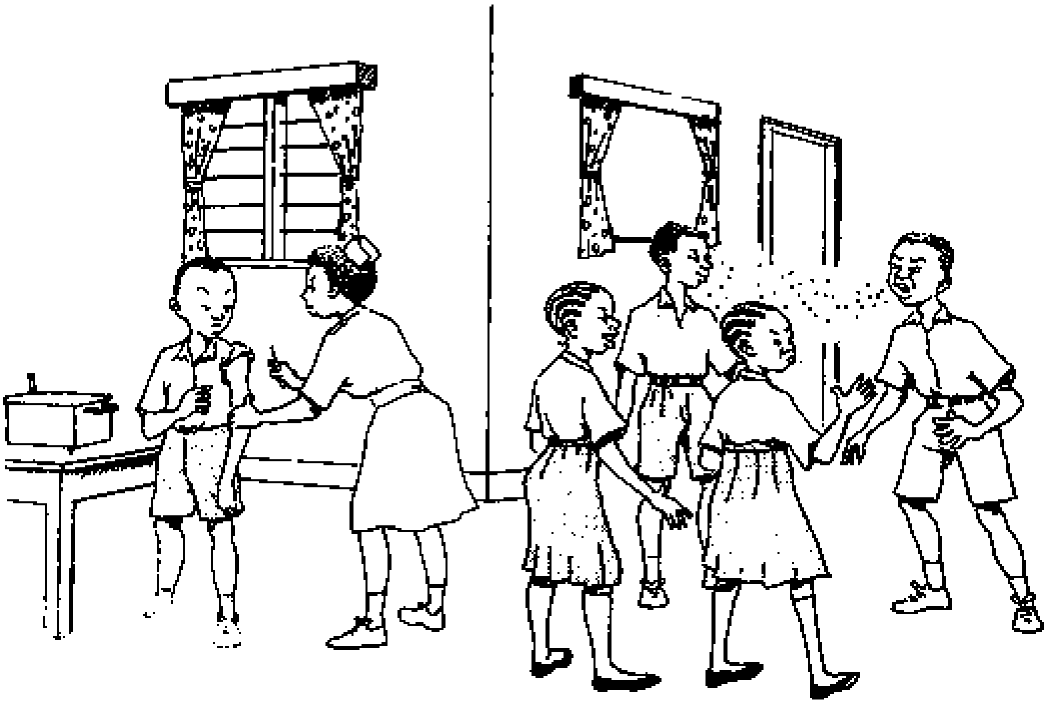


P: Go for a field trip and look for mangrove trees. Observe the kind of ground they grow in and the special roots they have developed.

Q: Why do parts of their roots grow in air?

E: The ground where they grow is water logged and therefore does not contain much air (oxygen). Red mangroves develop stilt roots and white mangroves breathing roots for obtaining oxygen from the atmosphere.

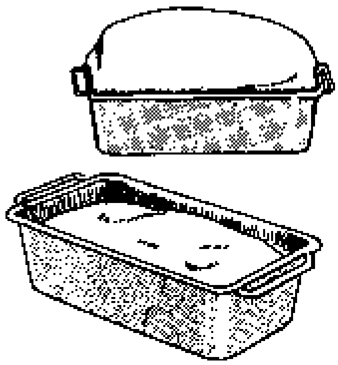
7. Micro-Organisms



7.1. Microbes in Daily Life

Microbes are tiny living organisms which are too small to be seen with the naked eye. They are found in very large numbers almost everywhere on this planet. They inhabit water, soil, air, food, clothes, the surface and tissues of animals and plants as well as many other places. The main types of microbes are *bacterial fungi, viruses* and *protozoa.* Microbes are important to us because many of them can be either beneficial or harmful. The harmful ones cause animal and plant diseases, spoilage of food stuffs, and attack textiles and other materials. Useful microbes include those used in industry and medicine and the decomposers responsible for the recycling of useful materials in the ecosystem More specialised types are the nitrogen fixers and the symbiotic cellulose digesters found in the gut of herbivores. In fact without microbes, life on earth, in its present form would not be possible.

7.1.1 Bread Making



P: Mix 100 g of plain flour and 5 g sugar with a little water. Separate evenly into two containers. In one container, mix in 7 g of yeast. Mix the contents in both containers to make a dough. Cover the containers and leave them to stand for a few hours.

Q: What happens?

O: The dough which contains the yeast rises.

E: Yeasts are living cells which respire, grow and reproduce. The carbon dioxide produced by yeast during respiration causes the dough to rise. The gas lightens the heavy starch mixture and when it is baked, the yeast dies, but the gas bubbles remain as small holes in the bread.

I: Yeasts are also widely used to produce alcoholic drinks during the fermentation of naturally occuring sugar solutions or starch.

7.1.2 Nitrogen Circulation

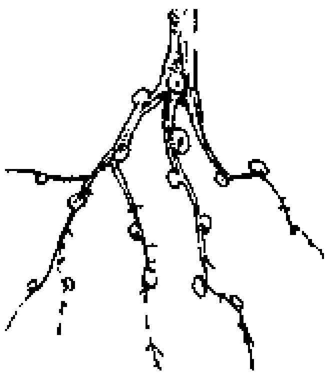
P: Watch what happens to dead plant or animal material over a period of several weeks.

Q: What do you observe?

O: It rots and breaks down into small particles

E: When a plant or animal dies, its tissues are decomposed by fungi and bacteria to form humus. Animal faeces is similarly broken down. The ammonia formed is washed into the soil, where it is acted upon by different types of bacteria, eventually converting them into nitrates essential for plant growth.

7.1.3 Nitrogen Fixers



P: Examine the roots of leguminous plants such as peas and beans.

Q: What do you see on the roots?

O: Small knot-like swellings.

E: Swellings called *root nodules* are found on leguminous plants. They contain bacteria, which fix nitrogen from the air to form nitrogenous compounds, which can be used by plants. In this way, they restore the nitrogen content of the soil.

7.1.4 Grass - Milk Link

P: Watch what a cow drinks and eats.

Q: Does it eat anything special?

O: It eats grass and drinks water.

E: The cow like any other ruminant has a modified stomach for digesting plant material. Digestion is possible because of the presence of *symbiotic bacteria* in the stomach, which produce cellulase enzyme for catalysing the breakdown of plant cellulose into useful nutrients. Thus, milk is produced as a result of enzyme action on the vegetation that a cow takes in.

7.1.5 Preserved Food

P: Take three small fishes and wash them thoroughly. Remove all the scales and intestines. Smoke the first fish on a ready-lit sigiri. Salt the second fish and leave the third one untreated. Leave the fishes overnight.

O: The salted and smoked fishes are still good, whereas the untreated one has gone bad.

E: Microbes grow on the untreated fish but do not survive on salty surfaces. Smoking preserves the fish and so it is not easily attacked by bacteria. Since microbes are numerous in the environment, we should know how to control their growth and therefore be able to preserve our food.

7.1.6 Helping Healing

P: When the body is wounded clean the cut with water and little antiseptic, removing all foreign bodies.

Q: Why do this?

O: The wound heals more swiftly if foreign bodies are washed from it as these may include infections microbes.

E: The antiseptic kills certain microbes not removed by washing.

7.1.7 The Rot Spreads

P: Put two fresh tomatoes in a small container and cover them. Place another tomato together with a rotting tomato in a similar container. Cover it.

Q: Examine daily. What happens to the tomatoes?

O: The tomato with the bad tomato is likely to rot faster that those without.

E: Microbial growth spreads very fast with rotting food as a source.

I: It is advisable to separate rotting food from fresh food as soon as possible or else all of it will go bad.

7.1.8 Mouldy Food

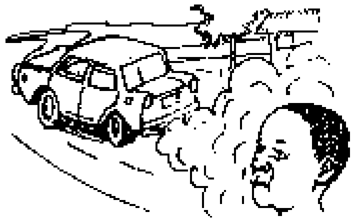
P: Place different types of food such as very ripe orange or tomato, half a pawpaw or coconut or even old bread, in a dark damp cupboard. Examine the food after 2 days.

Q: What does it look like?

O: The food becomes mouldy and patches of different colours appear on the surfaces, most of which look hairy.

E: These are the moulds which belong to a group of non-green plants called fungi. Like any other living micro-organism, they need food in order to grow and reproduce.

7.1.9 Healthy Living

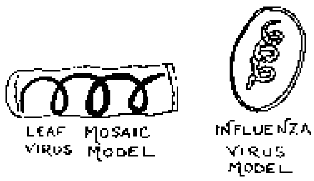


P: List as many examples as you can of unhygienic practices.

Q: Explain why they are likely to lead to the spread of disease and suggest how they could be improved.

E: An unhealthy environment enhances the spread of diseases such as cholera and typhoid. Proper disposal of human and domestic waste will create a good environment to live in. Drinking clean water and eating properly prepared food with clean hands helps to ensure healthy living.

7.1.10 Virus Models



P: Model a leaf mosaic virus (a) or influenza virus (b) using polythene, paper, thick string and coiled wire.

Q: What does each material represent?

O: The thick string and polythene represent the protein coat; the coiled wire the nuclear material.

E: Infuenza and leaf mosaic viruses are examples of viruses that affect our health -and our crops. They are basically made up of proteins and nucleic acids. Other examples of viruses are poliomyelitis, measles, AIDS, yellow fever, and small pox.

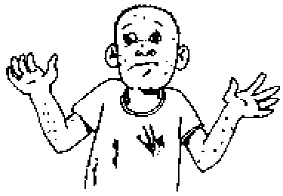
7.1.11 Why Milk Goes Bad

Q: Why does milk become sour?

E: Milk goes bad because bacteria have begun to feed on the milk. The sour taste is due to lactic acid which is formed as a waste product of bacterial growth.

I: Mothers who bottle-feed their babies should ensure that the milk they give their babies has been boiled and that all equipment they use is sterile.

7.1.12 Mind Your Body



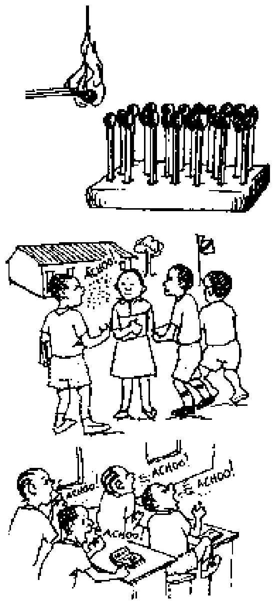
P: Put baby powder or flour over pupil's arms and face. Let another pupil touch them.

Q: What happens?

O: The pupil who had no powder on his body now has some.

E: Some diseases such as scabies, ringworm, and conjuctivitus are spread by direct or indirect contact with another person. Care has to be taken to avoid unnecessary contact, sharing of unclean combs, clothes and any such items which can spread harmful microbes.

7.1.13 Coughs and Sneezes Spread Diseases



P: Place the matches in the clay as shown and ignite one.

Q: Why is it dangerous to cough or sneeze without covering the mouth or nose?

E: Moisture may be seen leaving an uncovered mouth or nose. The water droplets contain microbes. If one is suffering from an airborne disease such as influenza or tuberculosis sneezing or coughing could be a source of spreading the harmful microbes. It is necessary to be aware of this when coughing/sneezing, so that we do not spread the germs to others. Doctors and nurses wear masks to stop germs from their noses and mouths getting on to people having operations or on to newborn babies.

7.1.14 Diarrhoea

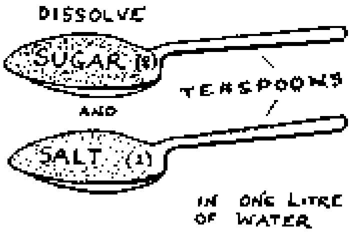
P: Note occasions when something irritates your bowel and diarrhoea starts quickly and unexpectedly.

Q: Why should it happen so quickly?

E: If you eat contaminated food or various foods which your bowel is not used to, the bowel muscles work hard pushing out the remains of the food before the canal walls have had time to absorb the water. If it stayed there long enough, the food poisoning bacteria could get into your blood. The bowel muscles can push so hard, that they force the end of the bowel open and you have to run!

I: The harmful microbes present in contaminated food could be bacteria and protozoans. In addition to diarrhoea, one can get rid of the unwanted food by vomiting.

7.1.15 ORS Miracle

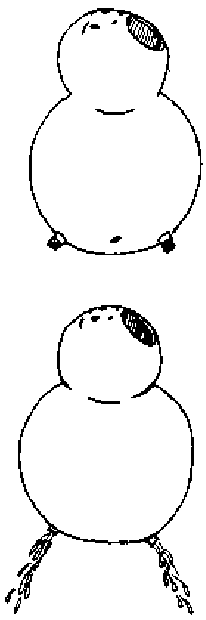


P: Dehydration caused by diarrhoea is the biggest single killer of children in today's world!

Q: How can death be prevented?

E: When people suffer from diarrhoea and/or vomiting or from severe burns, they may lose much more water than they take in. This is life threatening, since the body needs a lot of water for normal functioning. With the water the body loses essential electrolytes (like Na, K, Cl.) Mix 8 teaspoons of sugar and 1 teaspoon of salt with a litre of clean water. Gently make the patient drink cups of this *oral rehydration solution* to replace lost water and salts.

7.1.16 Water Baby



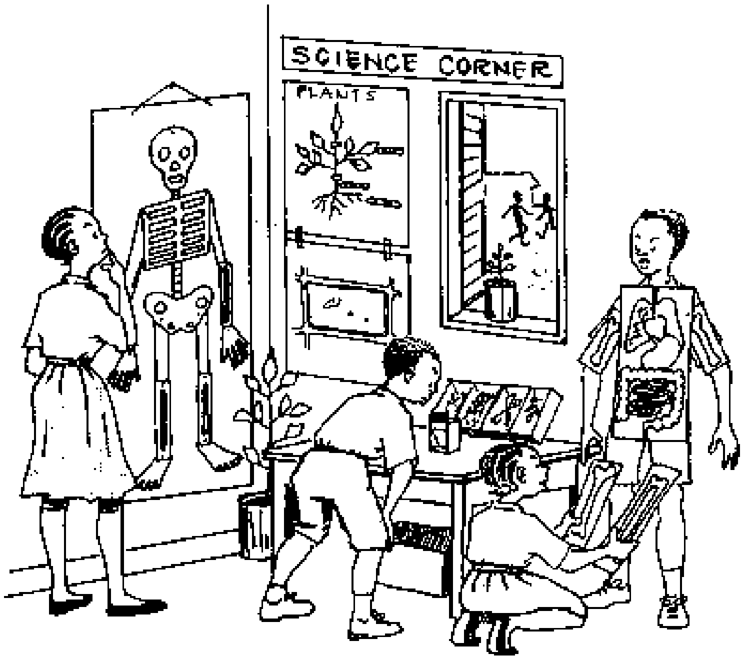
P: Make a model baby from a dry gourd, tin or plastic bottle. Put a hole in the top and two at the base, as shown. Place corks or plugs in the lower holes. Fill with water then remove plugs.

Q: What does this model show?

E: Diarrhoea causes loss of body water. This must be replaced or the person will die. Babies with diarrhoea, can die very quickly if not given enough water to drink. See previous activity 7.1.15.

I: Diarrhoea is usually caused by microorganisms which are spread by dirty water or food, or poor hygiene.

Appendix



Basic Equipment

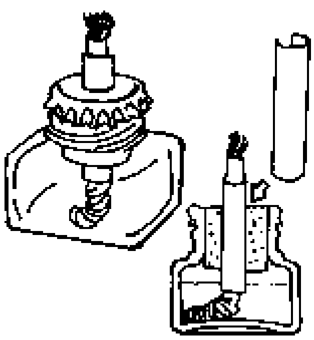
The majority of activities described in this sourcebook can be carried out using readily available, everyday materials. Within these activities there are many "hand experiments" because the main equipment needed is a pair of hands! A few experiments require additional items and these are described below, along with some simple instructions for their use. If you require more specialised equipment refer to the chemistry sourcebook in this series where a complete minilab is described.

1. Burners

Many experiments in biology do not require heating. However there are important experiments which do need heating. Hence we have tested different types of low-cost burners.

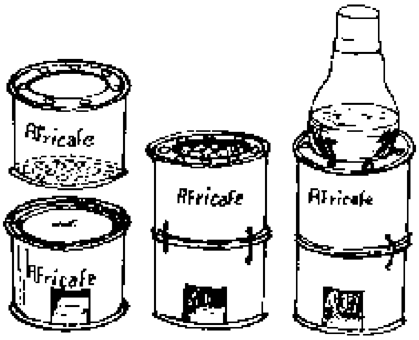
Always be careful when using burners, especially when liquid fuels are involved and. inflammable vapours are formed. Therefore avoid warming up fuel containers. Use only the suggested fuels never use petrol.

1.1 Alcohol Burner



Alcohol (spirit) burners are the best substitute for bunsen burners. Their flame is sootless. However spirit is not always available, it is expensive and sometimes diluted with water. Alcohol burners must have a small glass bottle as container for the liquid in order to avoid rusting. The wick holder consists of a metal tube (made by rolling a piece of tin into a cylinder), a perforated soda bottle top and a wooden stopper. Rubber stoppers are *not* suitable. *Kibatari from tins will do, but filled with alcohol they rust inside and are then dangerous (alcohol always contains water).*

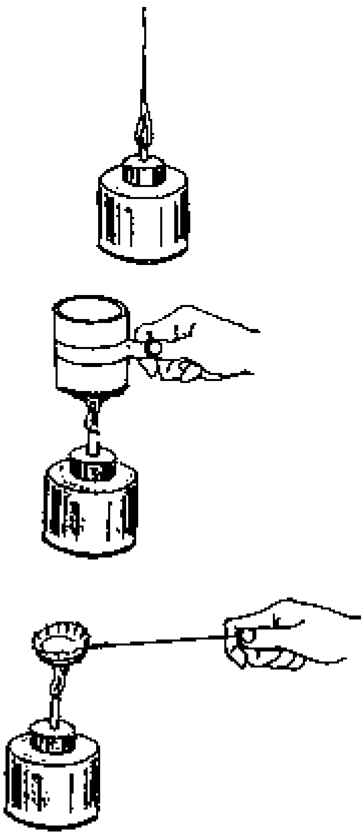
1.2 Charcoal Burner



Charcoal burners also produce sootless flames. But it is more difficult to keep the charcoal burning. However blowing slightly using a blow pipe or a straw will solve this problem.

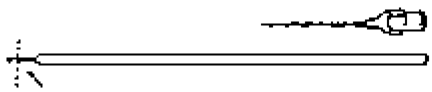
Take two coffee tins. The lower one has a hole in it (a door) to give a good draught and for removal of the ash. The upper one has some holes (which should not be too small) at the bottom and in the upper rim for a good draught. Both tins are fixed together with wire. We achieved good results in tests with this burner.

1.3 Kerosene Burner



Kerosene burners (Vibatari) produce a lot of soot, but the fuel is cheap, easily available and the burners can be bought on the market. Such burners are suitable for the heating of tins and other containers when soot does not matter.

1.4 Blowpipe



You may need a higher temperature or a directed flame. An empty metal ballpoint pen refill with the tip cut off and connected to a short length of infusion tubing. Discarded injection needles will also serve the same purpose. *However injection needles must be sterilised in boiling water for at least 15 minutes.*

1.5 Heat Source Temperatures

The workshop team has measured the approximate temperatures achieved with different types of burners:

Temperature of different heat sources:

Type	Average temp	Highest temp
Candle	650°C	700°C
Kerosene burner	650°C	800°C
Alcohol burner	650°C	800°C
Matches	600°C	650C
Bunsen burner	1400°C	1500°C
Candle/Kibatari + blow pipe	800°C	
Alcohol burner with blow pipe	1000°C	

1.6 Sootless Kerosene Burner

The *sootless kerosene burner* solves all the problems mentioned above. During the workshop from which this book originates we designed and tested such a burner. It was later constructed by a craftsman in Morogoro. Since this burner seems to solve the heating problems of many schools in many countries, we have published the construction details in a German magazine for Appropriate Technology.

The addition of a simple and cheap device that can be made by the same 'fundi', we get an almost sootless flame from an ordinary kibatari. The principle is to improve the draught of the air stream to the kerosene.

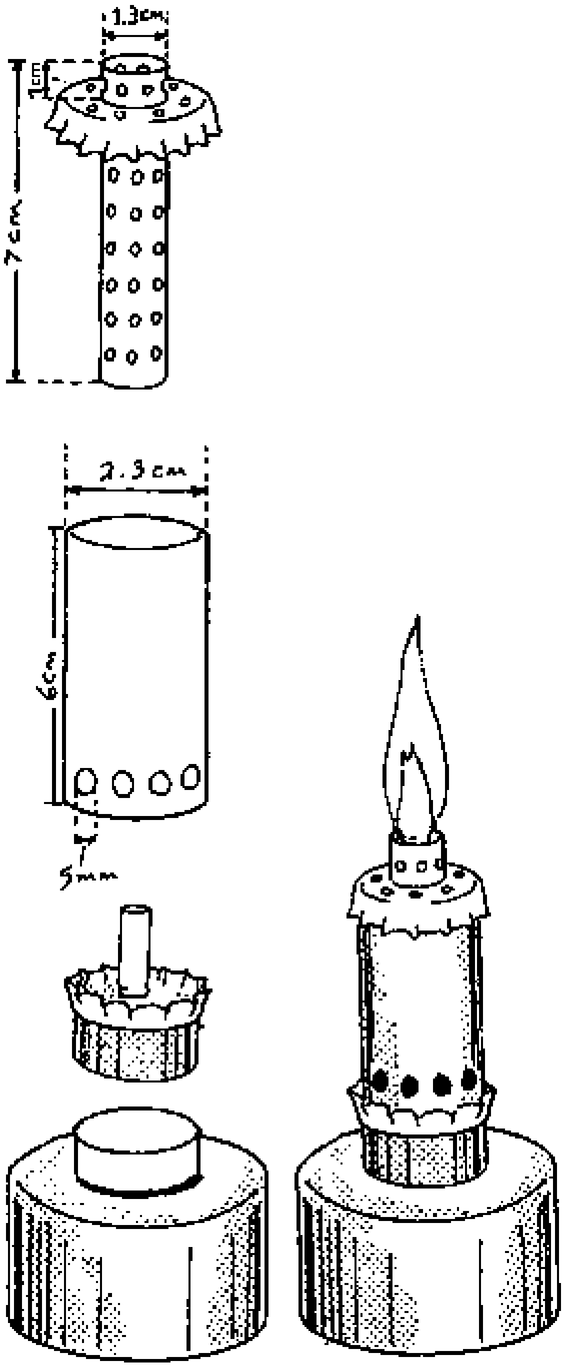
The basic device consists of 4 parts:

- *A perforated inner chimney* is made from a tin which is about 1.3 cm wide and 7 cm long. If the diameter of this tube is too small, the flame will not burn; if it is too wide the effect will be minimal. The holes can be made with a nail and should have a diameter of 2 mm. There should be 3-4 holes per square centimetre.

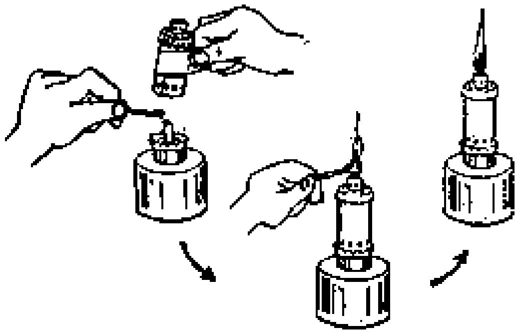
- *An outer chimney* which also serves as a wind shield. The holes at the lower edge are about 5 mm in diameter.

- Both chimneys fit together in a *perforated* soda bottle cap as shown.

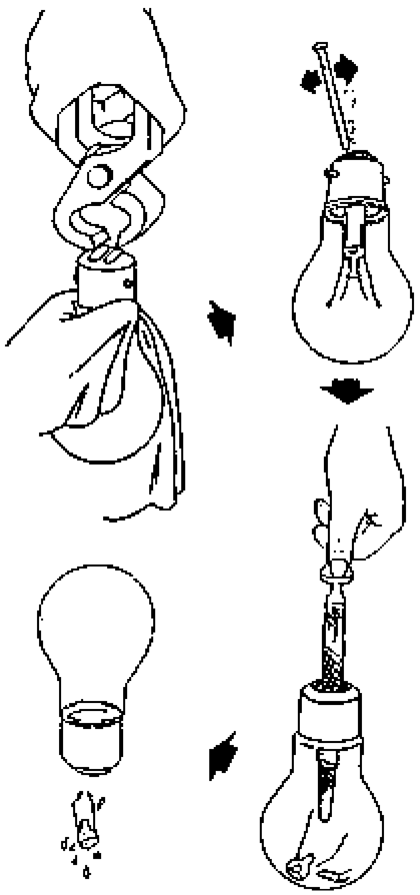
- Ask the fundi to solder another soda bottle cap around the *wick holder (d).* This holds the chimneys better.



The flame is optimised by adjusting the length and shape of the wick: it should have contact with the perforated tube. Some tests might be needed to obtain an optimal result. First ignite the wick and slowly place the chimneys in position. You might need to hold a burning match stick above the chimney to ignite the hot gases which produce the sootless flame.



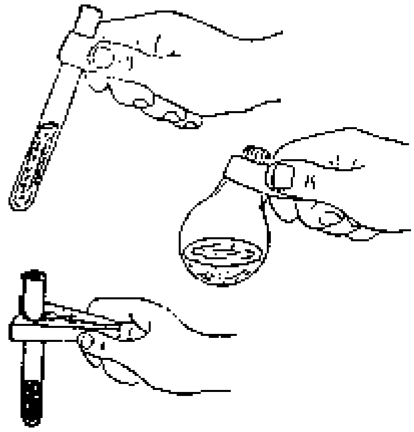
2. Test Tubes and Flasks



A cheap substitute for expensive test tubes and reaction flasks are opened worn out electric bulbs. They resist the temperature of an alcohol or kerosene burner, but *not* the temperature of a bunsen burner. Heat the bulbs carefully. *Do not use them for aggressive substances like concentrated acids and hydroxides.*

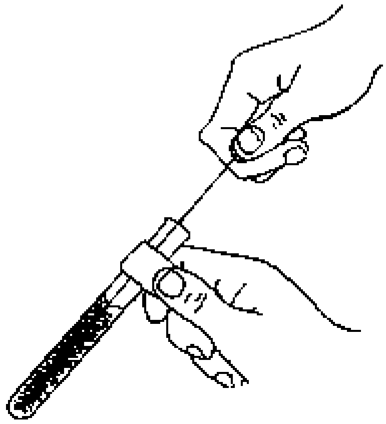
Bulbs can be opened with pliers and a round file or even with a long pointed nail. *Wrap your hand carefully with a piece of cloth.*

3. Glassware Holders



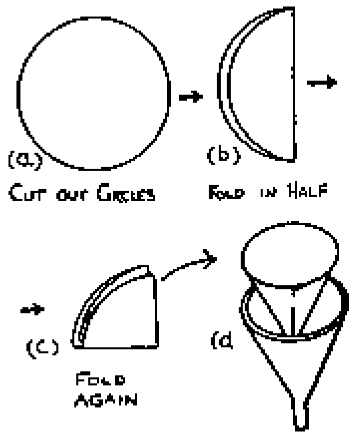
For hand experiments clamps are not essential. A folded paper strip will do as a test tube (or bulb) holder. Wooden clothes pegs are cheap substitutes for test tube clamps.

4. Test Tube Brush



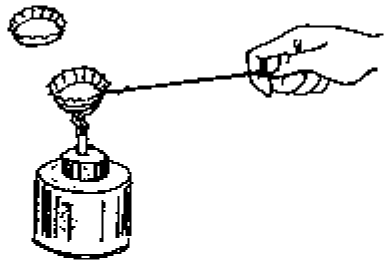
This brush can be made using a piece of cloth, sisal fibres, polythene material etc.. It can be fastened between two twisted wires. Sterilised old tooth brushes may be used. Test tube brushes are also available in shops.

5. Filter Paper



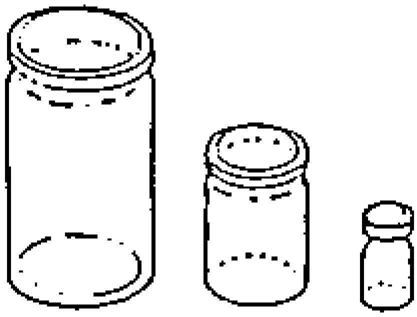
The best substitute for filter paper is unprinted cement bag paper (the inner cleaner layers from bags). Clean it before use. Sometimes the filtrate may have a light colour due to the colour of the paper.

6. Soda Bottle Tops

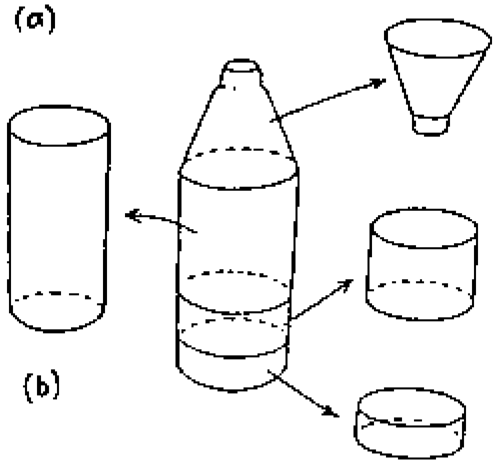


Before use remove the plastic material inside the soda bottle tops. They may be used for heating small amounts of undangerous substances. After use they may be thrown away.

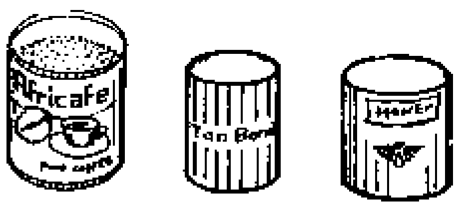
7. Containers



(a)



(b)



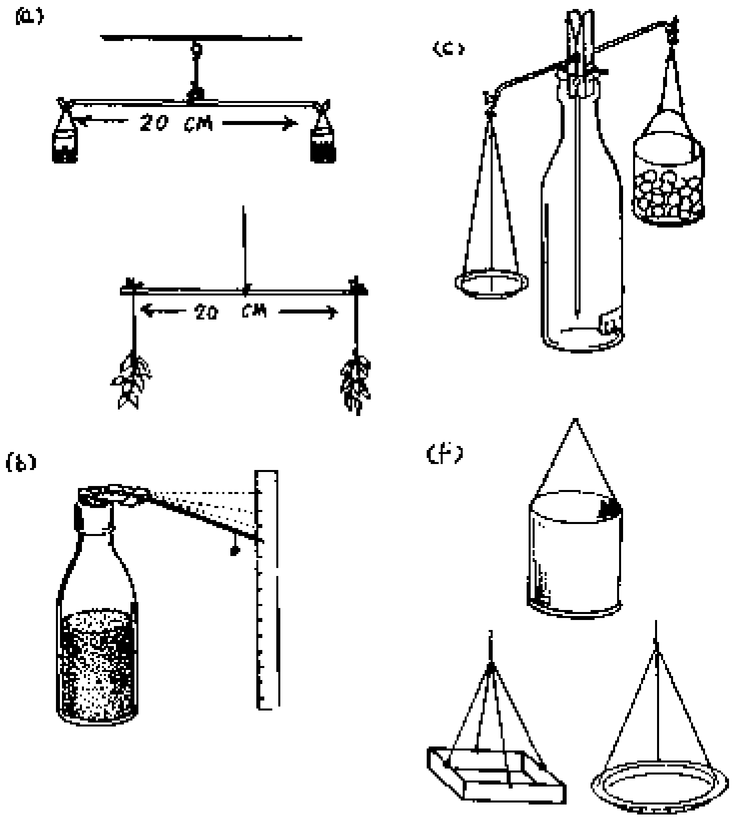
(c)

(a) For many experiments at room temperature (e.g. filtration etc.) glasses or plastic vessels may be used. Small medicine bottles (e.g. injection bottles) are useful for many experiments at room temperature and for the storage of liquids and solids.

(b) A plastic bottle serves many purposes depending on where it is cut. The upper part gives a *funnel.* From the lower part tall or small beakers may be obtained for experiments at room temperature.

(c) Tin cans are only useful for heating water or aqueous solutions where glassware is not needed.

8. Simple Balances



(a) A *simple balance* to show differences in weight consists of a piece of thin wire or a thin wooden stick hanging from a thread. Hooks for hanging containers can be made from paperclips. Plastic bags can be used as hanging containers.

(b) A *razor blade* balance may be made from a razor blade and a light straw. It is a sensitive balance.

(c) To make a *sensitive balance,* drill a hole through a clothes peg below the spring, for a wire or nail to pass through. Fix a wire right in the spring as a balance beam, and another one in the mouth of the peg as a pointer. (The shorter and thinner the pointer, the more sensitive the balance.)

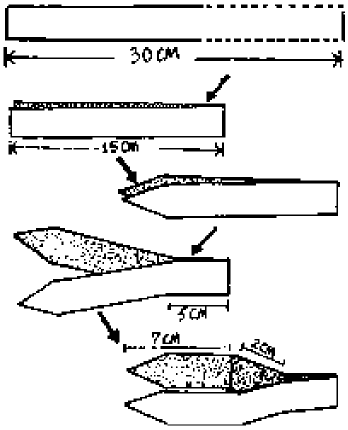
Fit the arrangement in a wide mouthed glass or a plastic bottle marked with a scale.

(d) Fill small plastic bags with sand or small stones and compare them with standard weights. Label and seal the bags with a small flame.

(e) Where there are no standard weights, use syringes or measuring cylinders to fill plastic bags with equal amounts of water. Use the fact that 1 cubic centimetre of water has a mass of 1 gram.

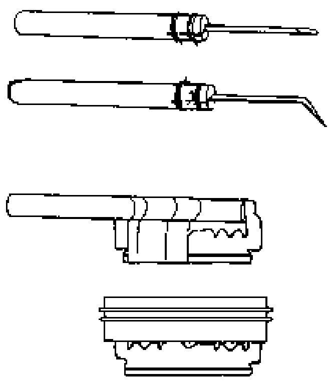
(f) Weighing pans can be made from matchboxes, plastic and tin lids or small plastic bags used for wrapping ground nuts.

9. Pair of Forceps



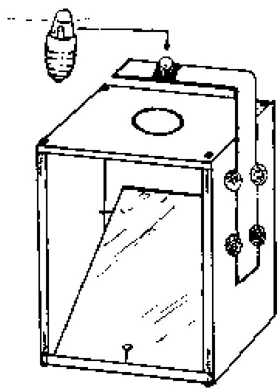
Forceps can be made from the steel bands used for packaging. A 30 cm piece of steel band is cut using a tin snipper and bent in the steps shown.

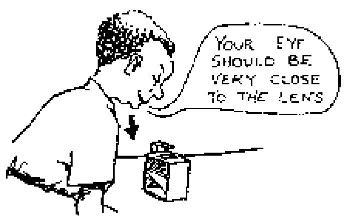
10. Some Other Instruments



The above instruments are useful for dissection.

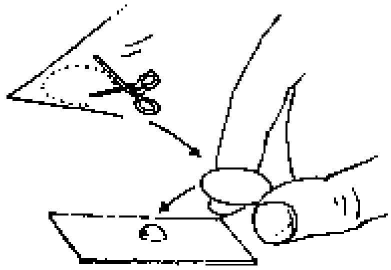
11. Simple Microscope





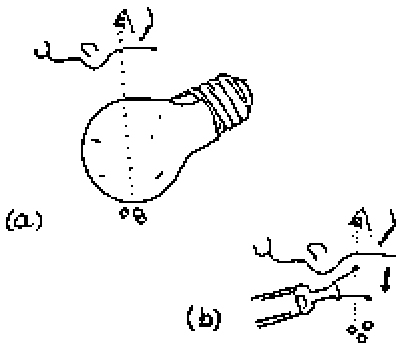
Construct a small wooden box from plywood as shown (or use a small cardboard carton such as a light bulb box). Make a round hole of 2 cm diameter, at the top. Fit a small mirror (glass or polished metal) in the box, angled to reflect light up through the hole. Make a small hole (about 6 mm) in a strip of metal or card. Remove the round lens from a pen-torch bulb and secure in the strip using adhesive tape. Carefully cut off the tape where it may cover the lens. Bend the strip, then fix it to the side of the box so that it can be moved up and down. Drawing pins or nails could be used for this. The object is focused by moving this strip. Note the eye should be placed as near as possible to the lens when viewing.

12. Slide and Cover Slips



A small piece of window glass or the glass from a torch provides a slide for mounting the specimen. The specimen will be seen better if it is covered with a coverslip. These can be made from thin (but stiff) transparent plastic from display packaging. Cut into small squares or circles.

14. Magnifiers from Used Light Bulbs

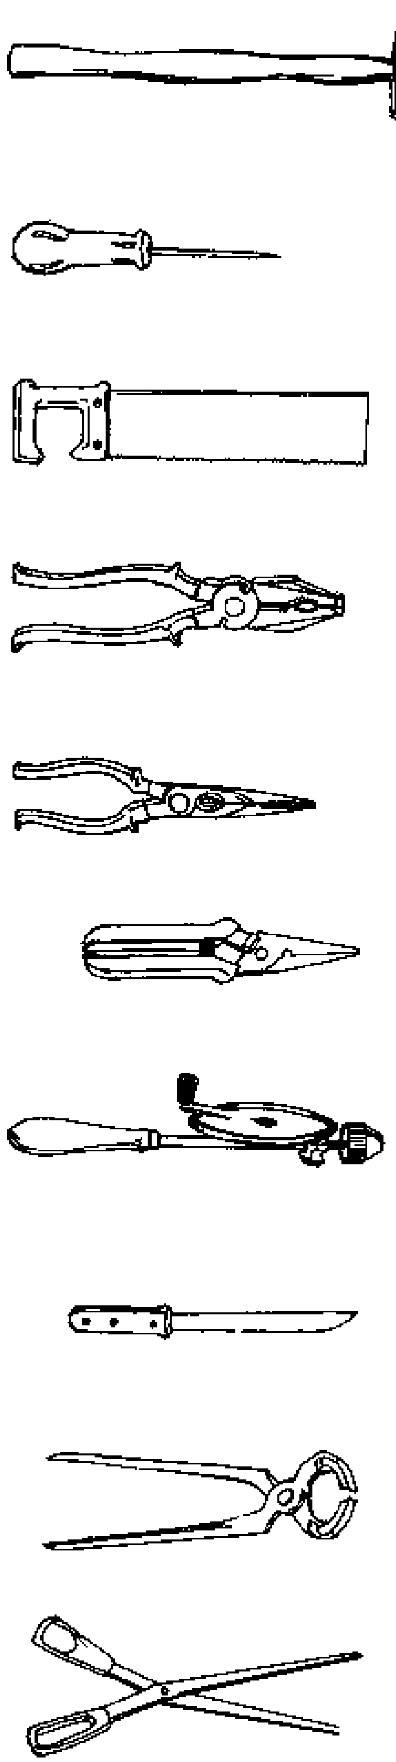


(a) A used transparent light bulb can be filled with water.

(b) The filament wire of a light bulb or thin wire twisted into a loop, can be used as a magnifier placing a water drop in the loop. (The smaller the loop better the magnification).

The diagrams above show some aspects of a mini-lab which can be assembled from locally available materials. The cost is so low that they will not overstress limited school budgets. More than 100 simple experiments can be carried out with it. For details see the chemistry source book in this series.

15. Basic Tool Kit



The ten items in the kit are

1. Hammer.
2. Puncher.
3. Hacksaw.
4. Combination pliers.
5. Long flat-nosed pliers.
6. Tin snips.
7. Hand drill or borer.
8. Sharp knife.
9. Pinchers for nail removal.
10. Scissors.

The Science Corner

P: Create a science corner in the classroom.

(a) Push a table into a corner of the classroom.

(b) Put up a few nails or strips of wood above the table from which to hang posters and specimens.

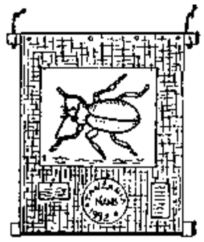
(c) Arrange displays in many different ways. Exhibitions of helpful plants, local wildlife, species collections etc..

(d) The corner could be the focus for science club activities.

I: More ideas on display and storage can be found on the following pages.

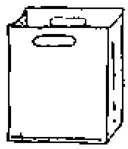
Display and Storage Ideas

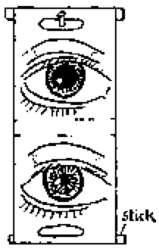
1. Display Charts

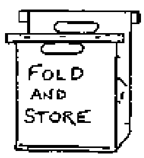


P: Make display charts from durable cement bags, cloth, cardboard boxes, sleeping mats or blankets. To help the chart hang flat and give stength and durability, attach sticks or strips of wood to the top and bottom of the chart. Attach pictures and posters with office pins, cactus needles, sharpened matchsticks or palm frond vanes (broom). Instead of a bottom stick, bottle tops can be used as weights

2. Plastic Bag Display

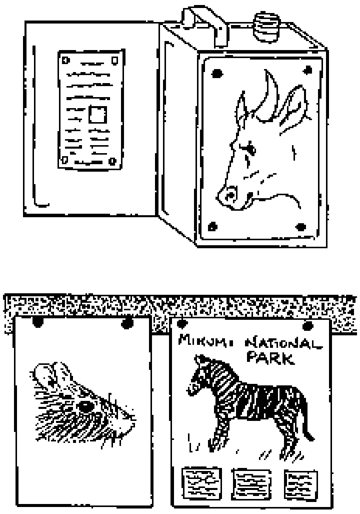






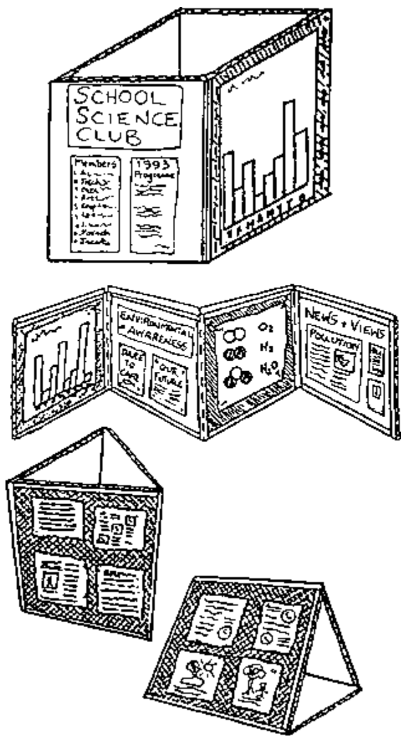
P: Open out a plastic carrier bag and tidy the edges. Add strengthening sticks at the top and bottom. Removable adhesive tape tabs can be used to attach display materials. Starch glued papers can be washed off this type of display chart. Permanent marker pens can produce a durable presentation (most come off with spirit).

3. Magnet Boards and Strips



P: Use the thin sheet metal from a can or a disused car panel, steel shelf, filing cabinet, fridge door or even a sheet of corrugated iron (possibly flattened). You may paint the surface matt black to act as a blackboard. Magnetise small pieces of metal to attach pictures to the sheet. Magnets can be painted white making them less visible on white paper. Pictures that are used regularly can have small magnets permanently attached to their corners. A strip of metal from packing case strapping can be nailed above the blackboard (or display area). Magnets can then be used to hold large posters.

4. Free Standing Display Boards



P: The display boards shown were all made from cardboard boxes.

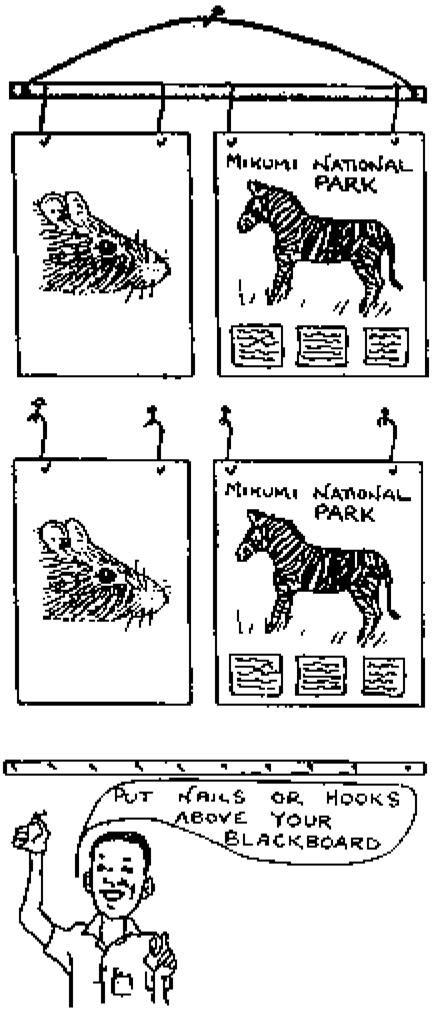
a) The sides of a large upturned box can hold the information and pictures. Specimens can be placed on the box.

b) Cut down one side of the box and open out as shown. Cut off any flaps which don't help support.

c) Cover display boards with paper, cloth or paint for a more permanent appearance.

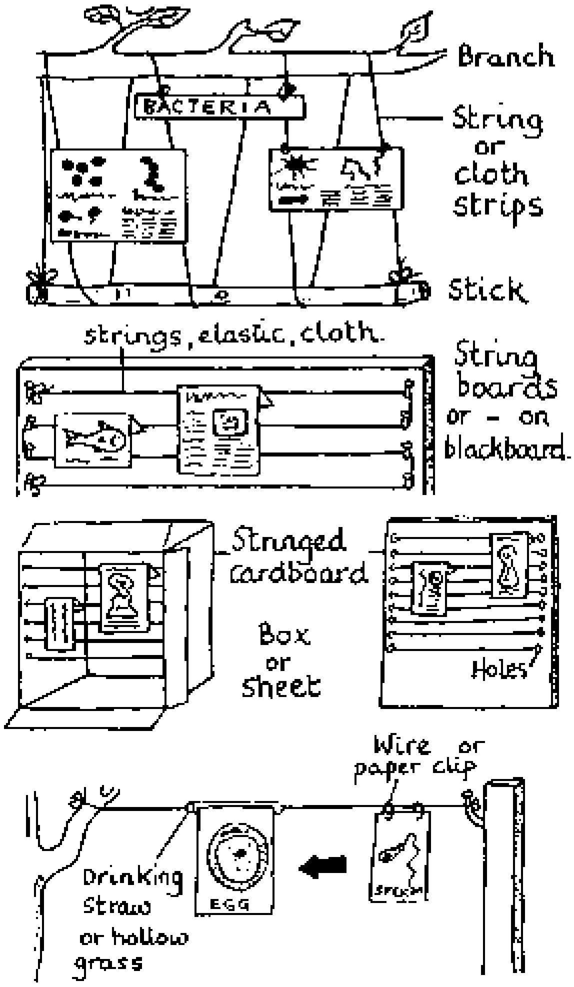
d) Wall pinboards for the science coner can be made from box cardboard.

5. Display Beams and Nails



P: If a teacher regularly has more than one chart to display, a display beam or a series of nails above the blackboard will be useful. Wire hooks from the nails or the beam may help pictures hang flat.

6. Display Lines



P: All the above examples use string, rope, wire, elastic bands or cloth strips.

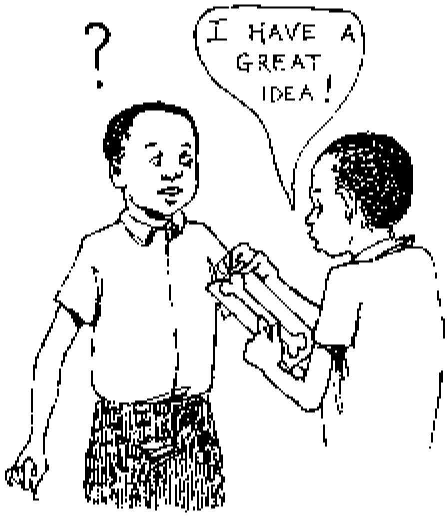
a) The large branch acts as a weight to hold the sting tightly in placed. Hang, peg or pin display items to the lines.

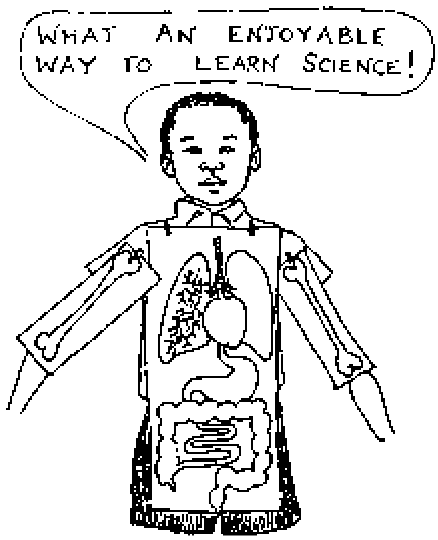
b) Nails or hooks can be placed at the sides of even the widest blackboards. *Find the safest place on your board for nails.*

c) A stringed cardboard sheet or a stringed box are also very portable. After use store your display items in the box!

d) Movable mounts for display lines made from wires, paper clips, straws, ballpoint pen outer casings, hollow grasses, toilet roll inner tubes. Or make your own movable mounts from card or paper. Attach your pictures to the mounts with cellotape, paste etc..

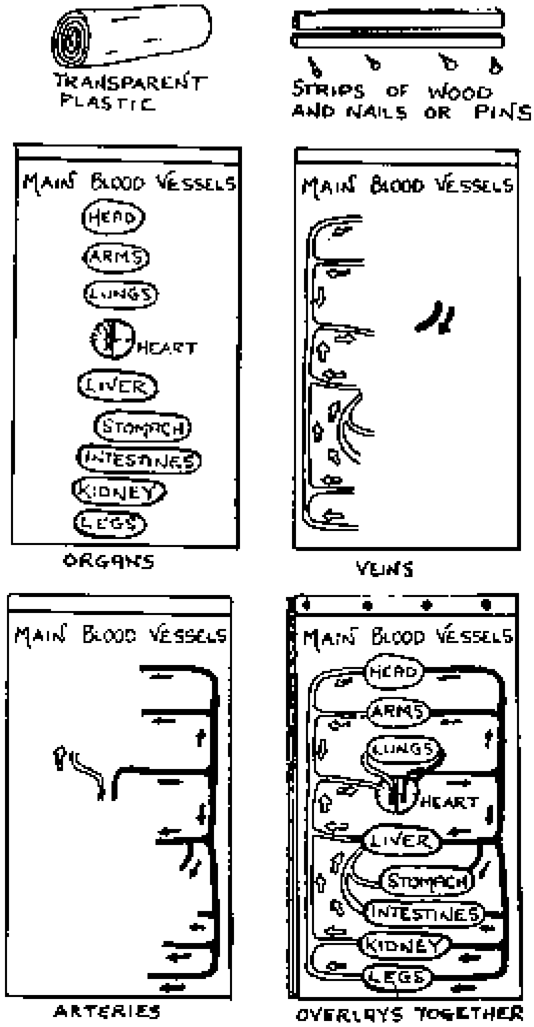
7. Pin on Body Posters





P: Draw diagrams of the internal body organs or bones onto paper or cloth. Pin or clothes peg these to clothing.

8. Transparent Overlays



P: (a) Draw the base drawing on paper or board.

b) Place a sheet of transparent plastic over the base drawing. Write the labels to the drawing with permanent marker or biro.

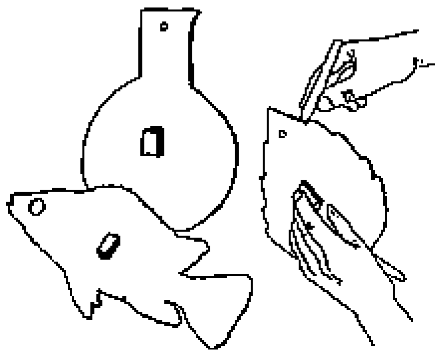
c) Firmly attach the plastic sheet to the base drawing by pinning, pegging or clipping. A bar of wood at the top gives the overlay strength and stability.

d) Why not experiment with small transparent bags. Make an A4 or school writing book sized overlay chart. Try overlay displays of arteries and veins, nitrogen water and carbon cycles, maps.

9. Reversible Body Board

P: Cut a large template shape of the human body from cardboard, hardboard or plywood. Paint one side black, so that you can chalk on it. Varnish or paint the other side so that removable paper body organs and labels can be stuck on. The human body board can also be used as a template to draw accurate, identical human shapes side by side on the back board.

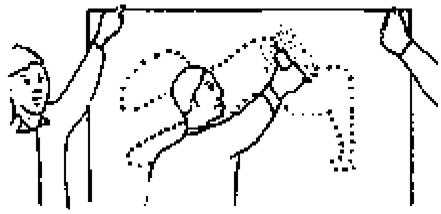
10. Blackboard and Book Templates



P: Cut templates from hardboard, plywood, cardboard or thick plastic. Collect basic and elaborate shapes for quick, uniform and accurate reproduction. Put a hole in the templates if they are to be hung up. You may wish to add a small piece of wood as a handle.

I: Make templates of body organs, types of leaf, animals or scientific equipment.

11. Blackboard and Book Stencils



P: For large and small stencils. First draw the outline of your shape accurately to the correct size. Choose an appropriate material such as paper, box cardboard, hardboard, plywood or plastic. Put small guideline holes along the lines of your drawing. Hold or pin the stencil against the book, blackboard or wall. Dust over the holes with chalk for wall drawings. Remove the stencil and simply join the dots to reproduce human body shapes, maps, charts and other diagrams on a large scale.

12. Size and Storage

P: (a) If posters and charts are not stored safely they are often spoilt. Time and effort are wasted.

b) A school pupil's note book may be the answer. Easily available and teachers often have their lesson notes in similar sized books.

c) Remove the staples from a new note book and open out the double pages (often A4 in size).

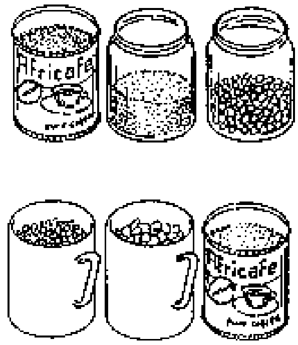
d) Pupils can help design and illustrate school posters and charts.

e) Two, three or four double paged sheets can be joined together to make larger sized posters of different shapes.

f) To store fold along the original fold lines return inside the book cover and store flat under other similar sized books.

g) Build up an ever increasing library of different sized posters, which are all stored between note book covers of the same size.

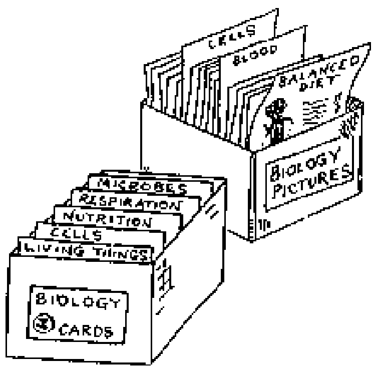
13. Cups, Tins and Bottles



P: Cups, tins and bottles can also be used for display and storage purposes.

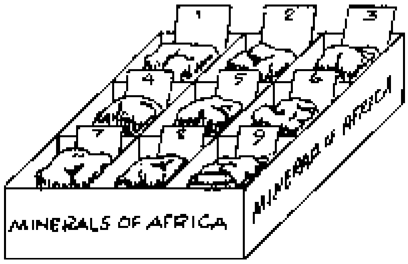
14. The Best Ideas

15. Picture and Card Boxes



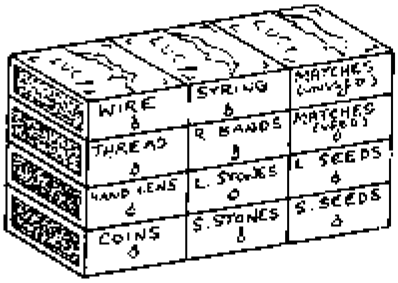
P: Pictures and cards can be stored in suitably sized boxes. Order them alphabetically or according to the syllabus. Compartments and dividers can be made from cardboard.

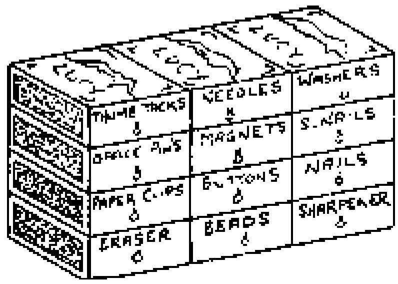
16. Storage Boxes



P: Samples can be sorted and stored in packaging boxes divided into several compartments as shown.

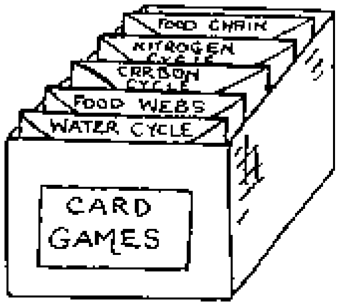
17. Matchbox Drawers

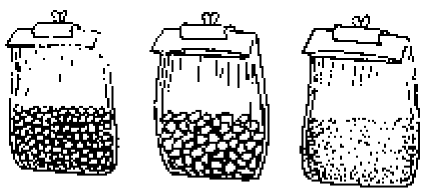




P: The matchbox drawers can be made by sticking matchboxes together as shown. Small pieces of string or wire can be used for draw handles.

18. Envelopes and Bags





P: Envelopes and bags of all sizes can be used. Clearly label all containers.

Developing New Ideas

Try to develop the pupil's creativity by setting them simple tasks such as those shown above.

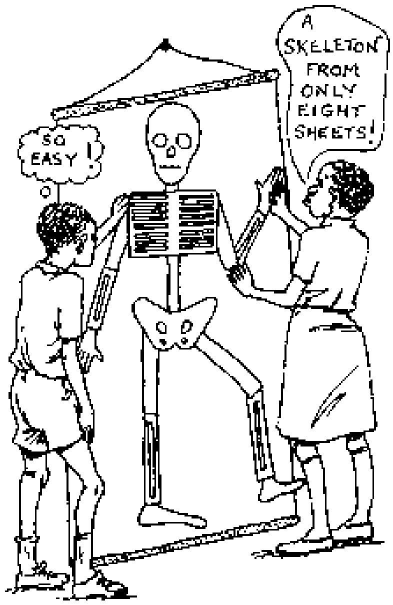
Begin by discussing a task with the whole class. Later pupils can work individually or in groups.

(a) This task starts with a bottle. The pupil or group can look through books and find a suitable use for it.

(b) This task involves solving the problem of showing how long a tape worm can be. The pupil is given additional help by being told to use a newspaper.

Paper Skeleton

What to Do

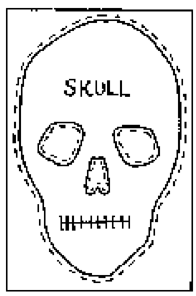


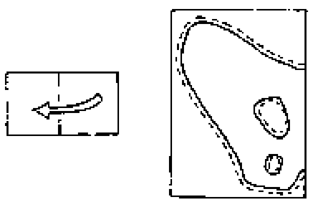
P: A simple paper skeleton can be cut from eight sheets of A4 sized paper (not foolscap!) or eight double pages of a student note book.

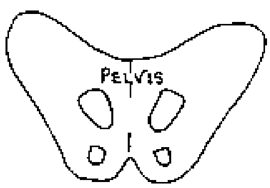
Draw fold and cut out as directed. As you gain experience you may be able to cut out the skeleton without drawing any guidelines!

- The bones of the feet and hands may be drawn on the paper shapes.
- The paper limb bones can be shaped to add greater realism.
- Pin or staple the pieces together or mount on a hanging display.

Skull and Pelvis
(Sheets one and two)



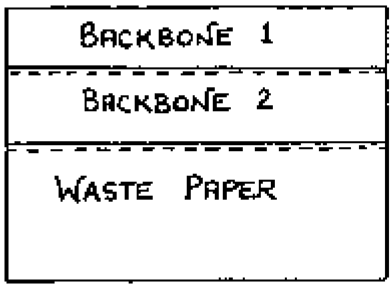


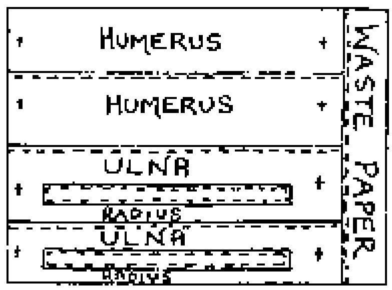


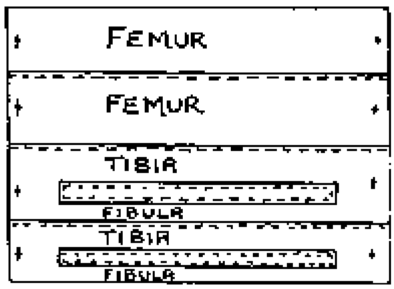
P: (a) Skull: After drawing, cut out along the lines. Or fold the sheet and cut out half the skull as shown. The mouth and teeth should be cut without removing any paper.

(b) Pelvis: Fold the sheet in half. Draw half the pelvis and cut out the basic shape when folded. The Pelvis looks like a butterfly.

Backbone and Limbs
(Sheets three, four and five)







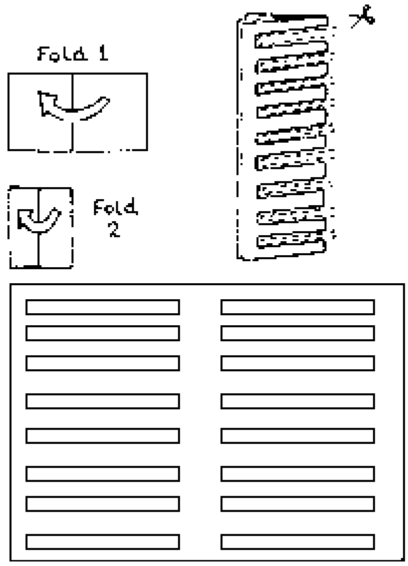
P: Place 3 sheets of paper together. Cut sheets length-ways into quarters as shown.

(a) Backbone: Two strips form the backbone.

(b) Upper limbs: Arms are shorter than legs, so, remove a piece of paper from the end of each upper limb strip.

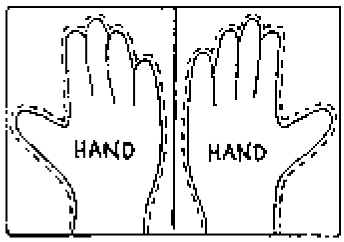
(c) Lower limbs: The space between tibia and fibula and ulna and radius can be removed easily by folding and cutting as shown.

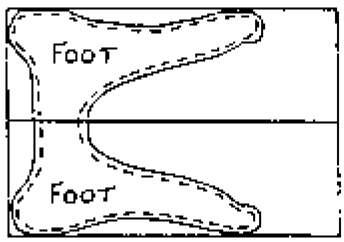
Rib Cage
(Sheet six)



P: For an accurate number of ribs use a ruler to divide the sheet. If accuracy is not essential fold the paper twice and cut along dotted line (or cut along alternate page lines if your sheets are lined).

Hands and Feet
(Sheets seven and eight)





P: (a) Hands: Fold the sheet in half and draw round a hand. Then cut out. (b) Feet: Fold the sheet in half and draw the shape of a foot then cut out.

Aids

Prepared especially for this Sourcebook by Mr. M. Sawaya of the Inspectorate, Ministry of Education and Culture, Dar es Salaam.

Introduction

The purpose of this material is to provide a guide or basis for the school AIDS education program**.** On the grounds that the future of our nation and progress is based on the on going generation - the student. Hence the aim is to promote behaviour which will reduce transmission of HIV among young people.

The main mode of HIV transmission is through unprotected sexual intercourse. Open talk on sex is difficult in our society, thus making discussions on AIDS education a sensitive issue which has to touch on personal, religious cultural and moral perspectives. Initial and continuous communiction on all aspects of the education is expected and requires time, cooperation and participation of many people from the school, the home and the community.

Teacher who are going to do much of the education have to change their attitudes towards students. They have to treat students as individuals and with respect. They have to make students become comfortable and confident to talk about sexuality and related issues freely with them. It is advised that interpersonal relationship between teacher and student is fostered as it is the basis for preventive education and counselling.

The AIDS education provided in this material considers it as part of intergrated health education program ADDS or HIV infection is not treated as a set of isolated disease, but understanding it as disease that needs action to prevent or limit its development through learning and practising positive health behaviour, skills and attitudes. Likewise importance, is linked to Family life Education were self-esteem, respect for self and others, decision making nurturing relationships. That will help students to understand the immediate and long term benefits of abstaining from sexual activity.

AIDS - Current Information

This brief overview provides teachers with a general understanding of AIDS. It should be supplemented as needed with other texts on the subject. Knowledge about the disease and its effects on individuals is constantly being updated.

Teachers should periodically review and update this information to assure that is accurate.

Description and Cause of AIDS

- Acquited Immune Deficiency Syndrome (AIDS) is a disease caused by a virus that attacks the body's immune system, making infected people vulnerable to opportunistic infections, cancer, and neurological disorders.

- The AIDS virus (called Human Immunodeficiency Virus-HIV) primarily attacks certain white blood cells (called T-Lymphocytes or T-4 helper cells) that are part of the body's internal defense against disease. The virus may also attack the central nervous system.

- An infected person's immune system responds by developing antibodies to fight off the invading virus. It is these antibodies to HIV, and not the virus itself, that can be identified by a blood test before a person has any signs of illness. However, the body's ability to produce disease-fighting antibodies eventually becomes limited in HIV-infected persons as the virus reproduces and multiplies, killing the critical T-4 cells it has infected.

Clinical Manifestations

- HIV infection may lead to deasese which can take many forms. It ranges from the complete absence of symptoms to mild illness, to debilitating neurological disorders, and to fatal disease.

- The condition called AIDS represents a syndrome of late-stage diseases in which the immune system is unable to fight off other viruses, bacteria, protozoa, and fungi, resulting in infections and diseases that eventually cause the death o

- The condition called AIDS Related Complex (ARC) refers to individuals who have a suppressed immune system and symptoms of AIDS but no specific opportunistic infections. For an unknown percentage of individuals, ARC is a precursor to AIDS.

- The onset of symptoms associated with either ARC or AIDS may take from six months to five or more years to appear after the virus has entered the body. At this time most individuals exposed to HIV do not develop either ARC or AIDS, although they are carriers of the virus and are capable of infecting others.

- Symptoms related to ARC include:

  - loss of appetite
  - weight loss
  - fever
  - night sweats
  - skin, rashes
  - diarrhoea
  - tiredness
  - lack of resistance to infection
  - swollen lymph glands.

The symptoms are likely to be milder than those found in person with AIDS and generally are present in a cylic fashion with illness followed by periods of wellness.

- The symptoms that individuals with AIDS develop are related to the opportunistic diseases that have taken advantage of the compromised immune response due to HIV infection. These symptoms are usually persistent and difficult to treat, and they progressively debilitate the person to the point of death. They may include:

  - extreme tiredness, sometimes combined with headaches, dizziness, or lightheadedness

  - continued fever or night sweats

  - weight loss of more than 10 pounds that is not due to dieting or increased physical activity

  - swollen glands in the neck, armpits, or groin

  - purple or discoloured growths on the skin or the mucous membranes (inside the mouth, anus, or nasal passages)

  - heavy, continual dry cough that is not from smoking or that has lasted too long to be a cold or flu

  - continuing bouts of diarrhoea

  - thrush (a thick whitish coating on the tongue or in the throat), which may be accompanied by sore throat

- unexplained bleeding from any body opening or from growths on the skin or mucous membranes

- bruising more easily than usual

- progressive shortness of breath

- confusion, lethargy, forgetfulness, lack of coordination, general mental deterioration.

• Specific diseases that generally don't affect healthy adults are linled with HIV infection.

• The incubation period before any symptoms of HIV disease appear varies significantly from person to person. Many infected people develop symptoms within two years of exposure. Others, infected up to seven years ago, have not yet shown any signs of illness. Since AIDS is a new disease, only recognized in 1981, the maximum incubation period has not yet been identified. Extensive research is in progress to identify potential internal or external cofactors that may cause some infected people to become fatally ill, while others have milder symptoms or remain symptom-free.

Transmission

Unlike flu or measles, HIV is not transmitted through the air; it must get into the bloodstream to cause infection. For this reason, HIV-infected people do not pose a risk to others through any form of casual contact. There is no evidence that AIDS is transmitted through coughing, sneezing, food preparation, drinking fountains, toilet seats, being around an infected person on daily basis, or donating blood.

HIV is carried in blood, semen, vaginal secretions, and other body fluids including tears and saliva of an infected person. It is transmitted from one person to another by three routes: 1) through sexual intercourse (physical sexual contact between individuals that involves the genitalia of at least one peson-includes vaginal intercourse, oral intercourse, and anal intercourse), 2) through parenteral exposure to infected blood, and 3) from infected women to their infants during the perinatal period.

Sexual transmission of the AIDS virus occurs during intercourse. It is thought that it happens through abrasions or tiny, unfelt tears that may occur in delicate tissues. Such tissue breaks can allow infected semen, blood, or vaginal fluid to enter the bloodstream of a sex partner. Anal intercourse is most risky, since tissue tearing and bleeding are likely to occur.

Transmission through parenteral exposure to infected blood occurs in persons sharing contaminated needles, syringes, and works during intravenous (IV) drug use. Small, even invisible, particles of infected blood can remain in the drug paraphernalia and can be injected into the bloodstream of the next user.

The risk of AIDS transmission through blood transfusions has been almost eliminated since all blood banks began testing donated blood for antibodies to HIV in 1985. There may be some risk to receiving blood if it was too early for the virus to show up when donor blood was tested. Blood-donor testing has been so effective it has reduced the risk of AIDS from blood transfusion to one in a million. There is no risk of AIDS from donating blood; blood collection centers use new transfusion equipment for each donor.

All infected people, whether or not they have any symptoms, are presumed capable of transmitting the virus to others through blood-to-blood or semen-to-blood exchange, or through vaginal secretions-to-blood exchange.

An individual can be infected with the virus that causes AIDS without having symptoms of AIDS or appearing ill. Infected individuals without symptoms can transmit the infection to others. Once infected, a person is presumed infected for life, but actual symptoms may not develop for many years. A single exposure to the AIDS virus may result in infection.

How the virus is NOT known to be spread

- There is no evidence that the virus is spread through casual social contact (shaking hands, social kissing, coughing, sneezing; sharing swimming pools, bed linens, eating utensils, office equipment; being next to or served by an infected person in ordinary social contact). There is no reason to avoid an infected person in ordinary social contact.

- It is not spread by the process of giving blood; new transfusion equipment is used for each donor.

- HIV is not transmitted by insects.

- It is not spread by sexual intercourse between individuals who have maintained a sexual relationship exclusively with each other, assuming that they have not been infected through contaminated blood, blood factors, IV drug use, or a previous sexual partner.

Major Risk Factors

Persons at increased risk for being infected with the AIDS virus include:

- homosexual and bisexual men

- sex partners of IV drug abusers

- male or female prostitutes and their sex partners

- sex partners of infected persons

- all persons with haemophilia who received blood-clotting factor and transfusions prior to 1985

- Children born to infected mothers.

Prevention

There is no vaccine against AIDS or any treatment so far that can reverse AIDS damage to the immune system. People must learn how to protect themselves and their loved ones from this infection. It is essential that students gain knowledge and skills to protect themselves before they reach an age at which they might experiment with sex or illegal drugs. Following are some basic elements of AIDS information related to prevention.

How to prevent infection

- Infection through sexual contact can be avoided by practicing abstinence or having a mutually monogamous marriage/relatioship with no known risk factors in either partner. Young people can stay safe from AIDS by not having sex. They need to know it is all right to say NO. In addition to the risk of AIDS, there are other health reasons to postpone sex, including the risk of gonorrhea, syphilis, and herpes, and unplanned pregnancies.

- Do not use IV drugs; do not share needle or works. Young people can stay safe from AIDS by not using IV drugs. They need to know it is all right to say NO not only to IV drugs but to alcohol and drugs of any kind, as these impair judgment. In addition to the risk of AIDS, there are many other health reasons for abstaining from illegal drug use.

- If already sexually active:

    - Until you ask a lot of questions about his or her past sexual experience and drug use, don't have sex with anyone.

- The more people you have sex with, the greater the chance you may get infected, so don't have sex with multiple partners.

- With infected persons, using a condom during sex may help keep the virus from getting into your body. A condom is a thin rubber covering that is slipped over the penis before any sexual contact. (See condom)

- The chance of blood or semen entering your bloodstream is very high during anal sex, since it can cause tearing of delicate tissues, so avoid anal sex.

- Drugs and alcohol can lead you to do things you wouldn't do drug-free, so don't drink alcohol or use drugs of any kind.

If there is suspicion of infection

• Abstain from sexual intercourse.

• Seek counseling and AIDS virus antibody testing to be sure of infection status. Be aware that weeks to months may elapse from the time of infection to the time that antibodies to the AIDS virus appear in the blood. During this time persons may be infectious but the test may be negative.

• Obtain counseling and testing if pregnance is being considered.

Information which will emphasize the seriousness of the problem, yet reduce inappropriate fear

• AIDS is a national emergency requiring attention from all citizens.

• If people change their behaviours, the spread of the AIDS virus can be reduced.

• Blood for transfusion in Tanzania is screened for antibodies to the HIV and is now essentially safe, but some risks cannot be eliminated.

• Everyone who engages in high-risk behaviour is at risk for AIDS, regardless of age, race, or socioeconomic status.

Research and Treatment

Researchers in the Tanzania and other countries are working diligently to develop a vaccine to protect people from HIV. Vaccine development is made more difficult because the virus can alter its form in the human body. These is no cure for AIDS at this time, nor is there any treatment that can restore the function of the immune system. A number of antiviral drugs including AZT (Azidothymidine) are being tested on parients. While AZT has shown some promise in curbing the ability of the virus to reproduce itself inside human cells, the drug is highly toxic and has serious side effects. Some drugs used in cancer control, such as Interferon, are also being tried with AIDS patients.

Societal Issues

When a disease epidemic threatens society, the needs of all people must be considered: those already infected with the disease, those threatened by the disease, and those who will provide support for others.

In the past, once treatment or medical prevention for an epidemic infection was easily available, society sought to protect itself by providing information to as many people as possible through school-based courses and educational campaigns and, in some cases, by requiring mass strategies such as immunization (polio) or premarital blood tests (syphilis). As the number of AIDS cases mounts, this epidemic will have a significant and long-term impact on interpersonal and family relationships, medical care delivery, public policies, and health care resources. Because there is no available treatment, tremendous fears exist. Education must be used to curb those fears that can lead to discriminatory behaviour against people with AIDS. The rights of people with AIDS must be weighed and protected within the framework of disease prevention and with relation to the rights of those not infected.

Condom

A condom is a thin sheath that is placed over the erect penis to retain semen upon ejaculation. A condom is a safe and effective device in the prevention of pregnancy and somewhat effective in the prevention of sexually transmitted diseases, such as gonorrhoea, syphilis, and HIV. When properly used, a condom is theoretically 90 percent effective. However, it should be clear that, the use of condom is not an ABSOLUTE DEFENCE AGAINST HIV INFECTION. YET, YOU WILL BE RESPONSIBLE TO USE SKILL STUDIED TO PREVENT YOURSELF FROM HIV INFECTION.

NOT HAVING SEX IS ONE SURE WAY TO AVOID HIV INFECTION.

How to use the condom

Buy condoms that are stored out of the sun and not yet expired. MAKE SURE that the packet with the condom is intact. Do not use brittle, damaged condoms. Keep condoms in a cool place, away from the body's heat.

1. Wait for the penis to be fully erect before putting on the condom.

2. Take the condom out of the packet carefully so that it does not get torn by finger nails.

3. Pinch the end of the condom with the thumb and finger of one hand (do not let nails tear it!) The purpose is to remove air from the tip. Place the condom on tip of the penis

4. With the other handroll the condom all the way down to the base of the penis.

5. Now its' ready. Only use water-based lubricants. Lubricants containing oil such as grease, vaseline will damage condoms.

6. After ejaculating, take the penis out of the vagina before it goes soft, carefully holding the condom onto the penis so that no sperms spills. Direct the penis downwards and remove the condom gradually.

7. Dispose the condom in the latrine or in a way that children cannot play with it. Do not use condoms more than once.

Topic 1 Good Health

Objective

To enable students to:

- Understand the meaning of good health
- Understand the foundations of good management of life.

Teaching Media

Chart 1 A and 1 B behaviour -Relationship - Decision making

Teaching Approach

1. Show the students charts 1 A and 1 B

2. Ask the students the following questions

a. What do we see?
b. What are the reasons?
c. Does it happen here?
d. What should be done?

Let the students discuss and argue, let them give views and suggestions and encourage self-help solutions. Remember to control and direct the discussion in order to conclude that behaviour relationship and Decision making are foundations in managing good life.

During the discussion remember to point out that:

Health is a quality of life that includes one's physical, mental and social well being.

i) Good physical health in the condition of your body when it is not disrupted by any disease or pain.

ii) Mental health is the condition of one's mind and emotions.

iii) Social health is the way one-relates to other people.

iv) One's health involves a continual state of adjustment of the physical, mental and social well being to one's environment**.**

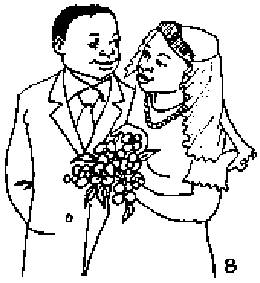
v) Any change in physical mental and social adjustment results in changes in one's quality of health.

vi) Normally success in life depends on good health which facilitates good life management leading to high quality of life.

vii) There are three important factors which influence the quality of one's life. These are (1) one's behaviour (2) one's relationship and (3) one's decision

viii) One's choice of behaviour and relationship affects one's total life. It is, therefore advisable that to ensure a high quality life are should avoid risk behaviour and risk situations and instead choose good behaviour and good relationship.

A



B

Topic 2 Diseases & Disorder

Objective:

To enable students to

- Understand the meaning of disease
- distinguish between communicable and noncommunicable disease
- Understand how communicable diseases are transmitted
- Describe diseases which can and cannot be treated
- Practice good health habits.

Teaching Approach

1. Ask students to brainstorm a list of diseases and disorders which they are familiar and list them on the blackboard.

2. From the list ask them the following questions.

a) Why do they think that it is a disease or disorder?

b) How does the disease spread from one person to another?

c) What causes the disease to spread?

d) What are the ways in which diseases are spread?

e) Are all diseases listed treatable?

f) How can you prevent spread of diseases?

g) What would you like to do in order to have a good life/health?

h) What would you like to see your friends do in order to have good health?

Topic 3 Chain of Infection

Objective

Students should be able to

- recognise how a disease is spread and how the spread of disease can be stopped by breaking the chain of infection

Teaching Approach

1. Show students chart entitled *chain of infection*

2. Ask students to explain the meaning of the words in the chain. Assist students of they are unable.

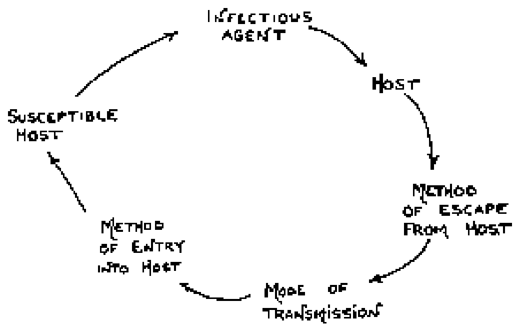
3. Explain what the chain of infection means (A continuous flow of a disease through different stages which can go on for along time unless it is broken at one place to stop the spread).

4. Ask students to think of a disease and ask them to identify factors involved in each stage of the chain.

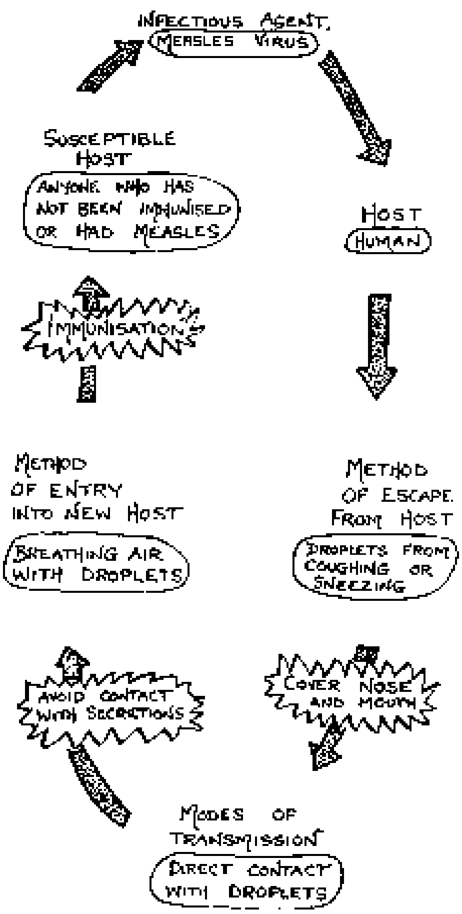
5. Ask them to think at what point of the chain they can break so they can stop spread of the disease.

6. Conclude the lesson by emphasizing that by knowing the chain of infection we can stop spread of diseases. Also good health habits can break the chain **of** infection.

Chain of Infection



Breaking the Chain of infection for Measles



Topic 4 Sexually Transmitted Diseases

Objectives

To enable students

- explain the meaning of STDS
- describe different types of STDS
- explain how STDS can spread and be prevented
- discuss effects of STDS.

Teaching Media

Chart Sexually Transmitted Diseases

Teaching Approach

A1. Ask students to brainstorm the meaning, types mode of transmission and prevention of STDS.

B1 (a) Read out or distribute the Dear Biology Teacher letter to Students.

Dear Biology Teacher,
What is the HIV or (VVU) AIDS or (UKIMWI). What does it mean when someone has the HIV all news stories, and talk in town are confusing

(b) Ask students to brain storm. The definitions of HIV, AIDS VVU (Virusi vya UKIMWI) and UKIMWI. Guide students to connect definitions and correct misinformation and misconception.

(c) (i) Draw the chart of spectrum of HIV infection on the board or floor. (ii) Write the content of the table on pieces of cards or paper and instruct students to place in the correct position in the columns of the table. Ask students to explain the placements in position.

Chart Sexually Transmitted Diseases

Types	Symptoms	Effects
Gonorrhea	Man. Have a thick, greyish yellow plus like discharge from the penis. A burning sensation during urination symptoms appear 2-10 days after infection	• Sterility
	Women: Usually show no signs may have pus-like vaginal discharge, vaginal soreness painful urination and abdominal pain. Appears 2-10 days after infection	• Pelvic Inflammatory inflamatory disease (PID) may follow gonorrhoea if undetected for months
Syphillis	Painless sore on or in the genitals, anus mouth or throat appears 10 days to 3 weeks after infection. If left untreated sore goes away by itself skin rash appears on palms of hands and soles of feet at about 6 weeks	• Untreated syphillis causes loss of hair in patches. Can cause heart failure blindness and damage to brain and spinal cord and finally death. • Women may give birth to babies with syphillis.
Genital Herpes	Painful blister-like lesion on and around penis vagina and anus spread by virus	• Recurring outbreak of painful blisters.
Venereal Warts	Small painless outgrowth of skin in little clusters. In dry areas such as the penis, warts are small and hard. In moist areas like the vulva usually pink-red and soft. They may grow inside the cervix and rectum	• Untreated warts may increase in size and become incomfortable during intercourse • Warts on the cervix may increase risk for future cervical cancer in woman.
Chanchroid	Appears as deep soft sore with greenish yellow pus. Found on glans of penis, vulva and around the anus.	• Deformation of the genitals
Non - Gonococcal Infection (NGL)	Men: Burning on urination and discharge from the penis.	• Untreated may infect epididymus resulting in great pain and even infertility
Non - Gonococcal Urethritis (NGU) (Chlamydia)	Women: Many have cervical discharge or pain during menstruation. Perhaps no symptoms until PID begins.	• In women increase risk of Pelvic Inflammatory Diseases (PID) on severe cases infertility.
Human Immunodeficiency Virus (HIV) Infection/AIDS (Acquired Immune Deficiency Syndrone)	Most people may show no symptoms for many years but are still able to transmit HIV.	• HIV causes a spectrum of conditions from mild symptoms to severe immune deficiency state (AIDS). People with AIDS experience life threating infections, cancers leading to death.

Spectrum of HIV Infection

	Asymptomatic	AIDS Related Complex (ARC)	AIDS
External signs	• No symptoms • looks well	• Fever • Night sweats • Swollenlymph gland • Weight loss • Diarrhoea • Minor infections • Fatigue	• Cancer of the skin *(kaposis sacoma)* • Opportunistic infections T B, pneumonia • Neurological disorders.
Incubation	• Invasion of virus to 3 month	• Several months to 10 years	• Several months to 10 years
Internal level of Infection	• Antibodies are produced • Immune system remains intact • Positive antibodies test	• Antibodies produced • Immune system weakened • Positive antibody	• Immune system deficient • Positive antibody test
Possible to transmit HIV	• Yes	• Yes	• Yes

3. Ask students to brainstorm a list of how HIV infection is different from other STDS

Topic 5 Transmission and Non-transmission of HIV

Objectives

To enable students to

Understand ways HIV is transmitted
Understand ways HIV is not transmitted

Teaching Media

Chart No. 5A 5B 5C 5D Transmission of HIV.

Teaching Approach

A1. Show the students chart No. 5A, 5B, 5C, and 5D inturn.

A2. Follow question as those of Topic 1 No. 2

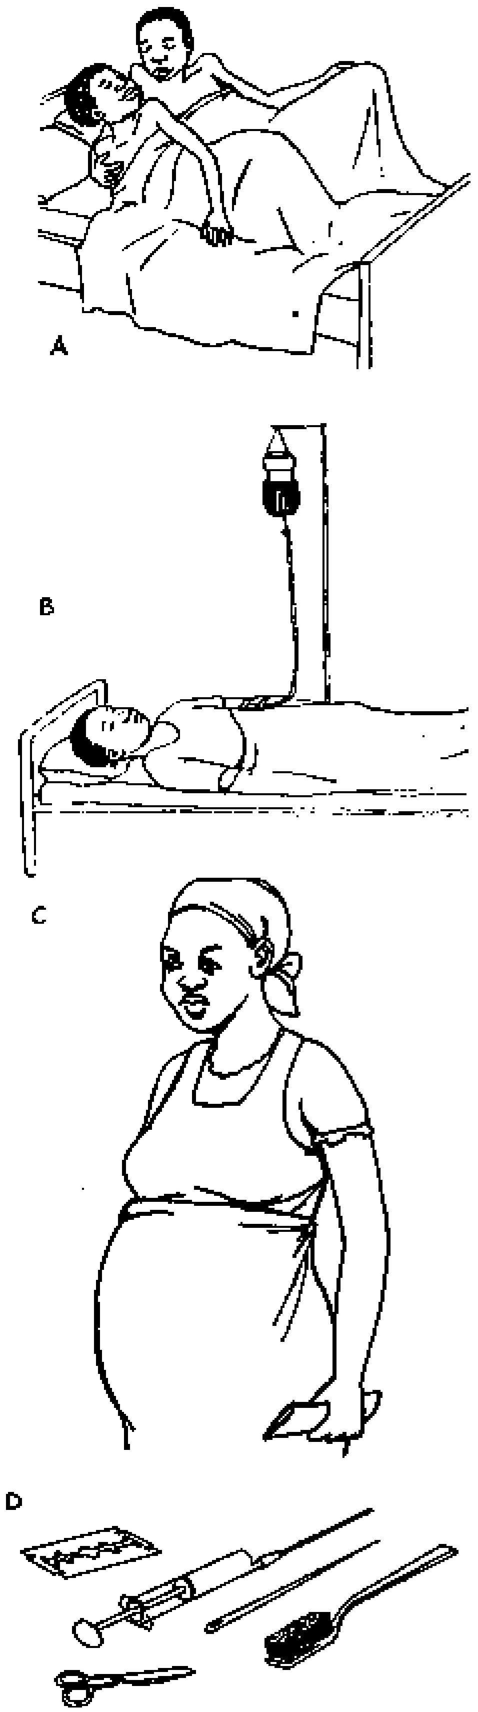
A3. During the discussion help students to realize that HIV is transmitted by

• Unprotected sexual intercourse -vaginal anal and oral

• Sharing contaminated blood through syringes, needles and razor blades.

• during pregnancy from an infected women to her unborn or newborn child.

• transfusion infected blood and blood products.



B1. Distribute or Read out to students THE AIDS MYTH-FACT STATEMENTS.

B2. Ask students to Agree or Disagree with each statement giving reasons.

B3. At the end of the lesson conclude by asking students to identify ways in which HIV is transmitted and not transmitted.

AIDS MYTH-FACT STATEMENTS

1. The HIV is only transmitted through infected semen and infected blood.

2. HIV is transmitted by hugging and kissing

3. People can look and feel healthy and still transmit HIV.

4. Women can transmit the HIV

5. Everyone who engages in sexual intercourse is at risk for AIDS if an infected parther is involved

6. A person can get AIDS from giving blood.

7. There is a vaccine to prevent AIDS.

8. Other sexually transmitted diseases increase the risk of HIV.

9. HIV can be transmitted through oral/genital sex.

10. Frequent sexual intercourse reduces risk of HIV infection.

11. You can get HIV infection or AIDS from your fellow student.

12. Mosquitoes, bedbugs and lice can transmit HIV.

13. A person with no symptoms can transmit HIV.

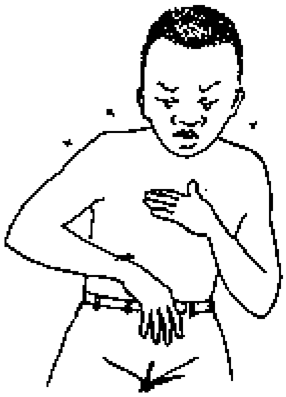
14. You can get infected by drinking from the same glass or eating from the same dishes as a person with HIV infection or AIDS.

15. Use of condom during sex reduce the risk of HIV infection

16. AIDS**,** itself, usually does not kill a person.

17. Everyone engaged in sexual intercourse can be at risk for AIDS.

18. You can tell by looking at someone that he/she has been infected.



Topic 6 Risk Behaviour and Risk Situations

Objective:

To enable students to identify risk behaviour and risk situation that put them at risk of HIV and STD infection.

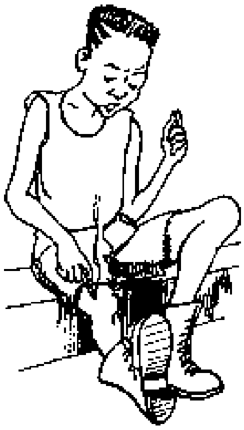
Teaching Media

Chart No. 6 Avoid Risk Behaviour and Risk Situation

Teaching Approach.

A.1. Show students chart no. 6A and 6B

A.2. Lead students to discus the charts so they could identify what a risk is, risk behaviour and risk situations. (You may use questions 1B in topic 5).



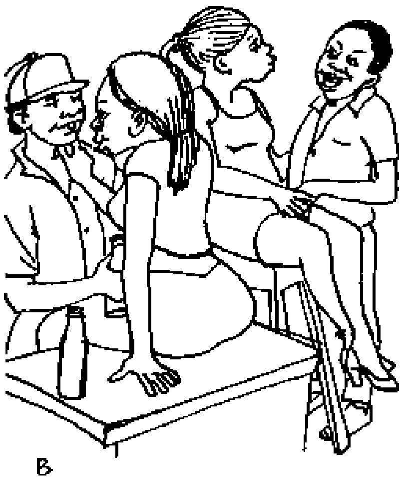
B.1. Write the following headings on the blackboard. No Risk Behaviour; Low Risk Behaviour; High Risk Behaviour.

B.2. Ask students to brainstorm behaviour in each category. Keep the group focused on behaviour that place them at risk for HIV infection.

B.3. Ask the students the following question:

a) What would help them to practice safe - behaviour
b) Do you think you are at risk.

A



B

Topic 7 Who is at Risk of Getting HIV infection

Objective:

To enable Students to

- Understand that everybody is at risk of being infected.
- Recognize the spectrum of HIV infection
- Understand an outwardly healthly looking person can still infect others.

Teaching Media

Chart no. 7 who is at Risk of Getting AIDS

Teaching Approach:

A.1. Show the students chart no. 7

A.2. Ask students to brainstorm an identity of a person infected with HIV.

A.3. Carefully record their responses on board and discuss, leading them to correct information that everyday is at risk of being infected if involved in risk behaviour, every healthly looking person may have HIV infection but does not show.

B.1. Read or distribute a 'Dear Teacher" letter to the students

Dear Teacher,

What does AIDS have to do with me? None of my friends have AIDS. What's the big idea of telling us to abstrain from sex?

2. Refer students to the spectrum of HIV infection and risk behaviour and situations

3. Leasd students to compose a response to the letter. During the discussion allow students to bring up the following factors.

- How the HIV is transmitted.

- **How** one cannot tell by looking at someone that he/she has been infected.

- Blood test can determine presence of antibodies for HIV but not for the disease.

- Where an individual can get a blood test if there is a suspicion of infection

- How one can develop ARC and AIDS

- The there are numerous other diseases associated with AIDS for which there is no cure.

- And many more things

Complete the lesson by making students know and decide What a realist adolescent should know and Why?

Topic 8 Prevention of HIV Infection

Objectives

To enable students to identify ways of preventing HIV infection

Teaching Approach

1. Ask students to brainstorm a list of ways in which HIV infection may be prevented from spread by

a) Sexual intercourse
b) Bipod transfusion
c) Sharing of piercing instruments like, syringes, blades, and knives
d) mother to child

2. Run over the list explaining each suggestion clearly. Remember to put more emphasis on sexual intercourse. The major mode of transmission of HIV. In your discussion note the following:

a) Sexual Abstinence (Not having sexual intercourse) advantages of abstinence

i) free from pregnancy and sexually transmitted diseases
ii) free from use of contraceptives
iii) free from pressure to marry before your are ready
iv) free from abortion
v) free from guilt, doubt, dissappointment worry and rejection
vi) free to be in control of your life
vii) free to develop a respect for self viii) free to enjoy being a teenager.

b) Safer sex. (Sexual intercourse that limits exchange of body fluids)

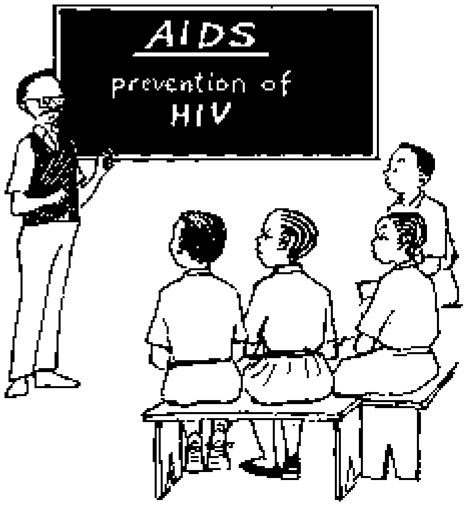
i) protective *sexual intercourse* by proper use of condom

ii) non penetrative or *sexual outercourse* e.g. masturbation, hugging, massage, kissing.

c) Stable faithful relationship with uninfected person is safest.

d) Seek early treatment for diseases such as hookworm or malaria which may cause anaemia. Treatment of diseases and eating wall balanced food restores blood volume, and avoids the necessary blood transfusion.

e) Medical personnel can help to prevent HIV infection by using injection or immunising instruments which are sterilized. They should also use new or sterilized skin piercing or piercing instruments.



Topic 9 Caring for People with AIDS

Objective:

To enable students to

a) appreciate the need to take care of persons with AIDS
b) realize the importance of counseling persons with AIDS and their familier
c) understand the danger of discriminating against persons with AIDS.

Teaching Approach

1. Show the students chart no. 9 entitled Caring for people with AIDS and lead the discussion by asking them the following questions:

a) What do we see?
b) What are the reasons?
c) Does it happen here?
d) What should be done?

Lead the students to appreciate the message/statements on the charts. Also let them know that:

a) Everyone is at risk of being infected by HIV.

b) You get infected with HIV once and it has no cure or vaccine.

c) Since they know how HIV is not transmitted there is no need to be afraid of caring for a person with AIDS.

d) People with AIDS are in most case angry with themselves for getting infected. They feel lonely because they are isolated; and friends accuse them of their behaviour which has result to their present state. People with AIDS are usually in great fear of death. Most PWA's end up having no financial resources because of spending much on the untreated disease they are miserable.

e) A responsible approach is not to condemn PWA's. They have the right to love and participate with other people in the society.

f) The responsibility of cash one of us is towards people with AIDS is to support them psychologically giving them information on AIDS current development and offer them material support.

2. Dilemma. Read of distribute the passage below to students

Ben has recently learned he is seropositive for HIV. He goes to a party where he is attracted to Joyce the attraction is matual, and Joyce invites Ben to go outside for kissing and sexual intercourse

Lead a discussion by using the questions

a) What should Ben do?

b) What would it be like to tell someone you are seropositive for HIV. What would be your response?

c) What activities would Ben and Joyce safely engage in?

d) What difference would it make if Ben does not tell Joyce?

Topic 10 Making Responsible Decision

Objective

Students should be able to make informed responsible decision to risk behaviour and situations.

Teaching Aids

Chart no. 10 making decisions.

10A picture showing a responsible decision.

10B picture showning an irresponsible decision.

Teaching Approaches

A.1. Show students chart no. 10A and later no. 10B.

A.2. For each chart ask the students the following questions.

a) What do one see?
b) What are the reasons?
c) Does it happen here?
d) What should be done?

Note: Let students discuss and give views on the two decisions shown in the charts. However, facilitate the students to realize what is a responsible and responsible decision.

3. Explain to the students the responsible decision-making approach steps.

B. Case Study

1. Provide students with the following case study

'We have been going together for two years My boy/girlfriend wants me to sleep with him/her. I love him/her, and I don't want to lose him/her, but I'm not sure this is what I want to do'.

2. Direct students into the process of making informed decision in the case of the boy and girl.

Decision Making Steps

1. Identify the situation.

2. Identify the different decisions that can resolve the situation. (There may be more than one way to resolve a situation).

3. Ask questions about each possible decision to resolve. (There are six question that can be used to identify decisions that lead to responsible actions. the question will not necessarily apply to all situations.

i) Would the result of my decision be morally acceptable?

ii) Would the result of my decision follow my parent's or guardian's guidelines?

iii) Would the result of my decision show respect for myself and others?

iv) Would the result of my decision be healthful?

v) Would the result of my decision be safe?

vi) Would the result of my decision be legal?

4. After you have applied the given question to each possible decision, make a responsible decision and ACT ON IT.

5. Evaluate your decision review your decision to confirm that it was a responsible decision.

Topic 11 Refusal Skills to Reinforce Decision

Objective

Students should be able to use refusal skills to reinforce decision.

Teaching Aids

Chart no. 11 Refusal Skills (11A Boy showing refusal action 11B Girl showing refusal action)

Teaching Approach:

A.1. Show the students chart no. 11A and 11B

A.2. Ask students the following question

a) What do we see?
b) What are the reasons?
c) Does it happen here
d) What should be done?

Let the students discuss and argue, give views and suggestions and encourage self help solutions. Remember to familitate the discassion to include the following refusal skills:

a) Give reason why saying 'NO' is a responsible choice. For example 'I do not want to harm my heath'.

Say 'NO' and keep repeating it, Don't offer reasons or excuses for saying 'NO'.

b) Use your behaviour to show you meaning of what you say: For example stand upright and look firmly at your partner. Avoid being alone with someone who tries to convince you to be sexually active.

c) Use self control and stick to your decision

d) Move out of the situation or refuse to discuss the matter further. 'I am leaving now'

e) Encourage your partner or friend to choose healthful and responsible behaviour or suggest alternatives say, "Instead why don't we......".

Topic 12 The Impact of HIV Infection and AIDS

Objective

To enable students to increase their level of awareness on how HIV infection and AIDS can affect their lives socially economically and psychologically.

Teaching Approach:

1. a) Ask students to imagine they are living a year from how.

b) Ask them to consider the following question:

i) With whom will they be living?

ii) Who will their friends be?

iii) Will they have a special friend? Why?

iv) What will they do for recreation and pleasure? Will they try drinking, using drugs, smoking loitering stealing or engaging in sexual activities?

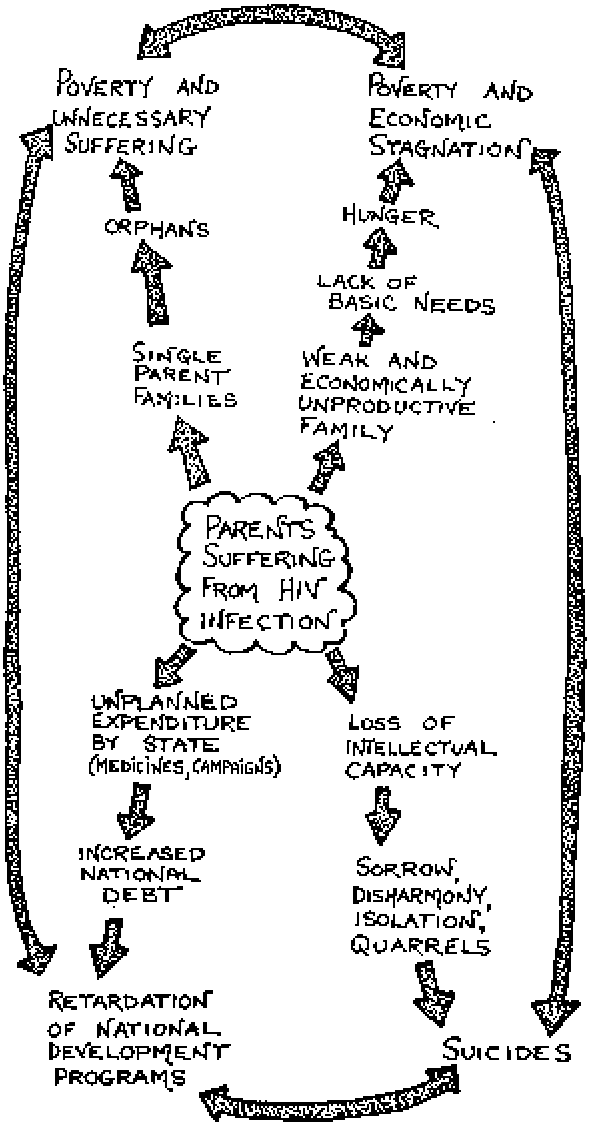
vi) How might HIV/AIDS enter their lives, or the lives of their families, neighbours or friends if they are engaged in the above activites?

vi) Will they know and be prepared to help anyone who is HIV positive or has AIDS?

c) Stop the exercise. Discuss their responses.

2. Futurity Cycle

Let the students consider a family whose parents or guardiain have been diagnosed HIV positive. Help students develop a futurity cycle depicting the consequences (social, economical, psychological outcomes resulting from this situation using the following diagram



Topic 13 Values Clarification of Issues Surrounding Sexuality and AIDS

Objective

To enable students to explore their personal values and become comfortable with listerning and understanding opinions different from their own.

Teaching approach

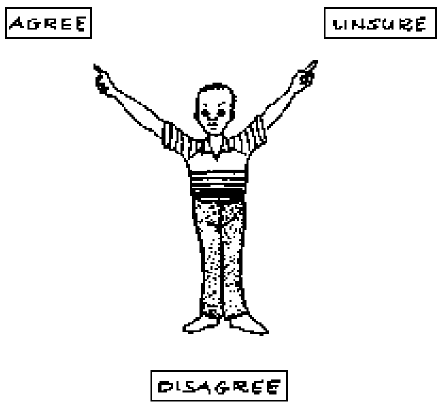
1. Explain to the students that in this activity they will be asked to express their feelings about particular values.

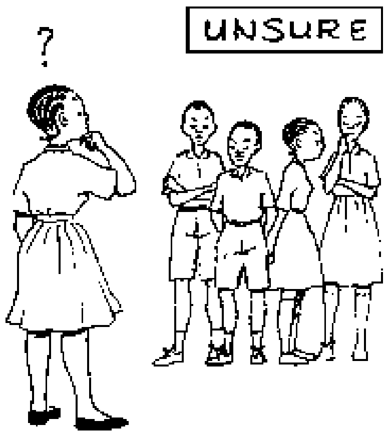
2. Designate three areas of the room to be called. 'Agree' 'Unsure' 'Disagree'.

3. Explain to the students that you are going to read several value statements; as you read each one you may want them to think very carefully about how they feel about each statement and then move to the section of the room depending on whether they 'agree' 'disagree' or 'unsure'.

4. Let them know that you will be asking for volunteers to describe their feelings about the statement

5. Emphasize that there are no right or wrong answers only opinions. Everyone has the right to express his/her opinion. Let them know they can change their voting at anytime.





Here is a list of value statements to read or choose from.

1. The AIDS epidemic has changed my life.

2. I am worried that, I or someone I love, will get AIDS.

3. I think sexual intercourse is appropriate only between married people.

4. I think that prostitutes (teenagers and sugardaddies) are responsible for the AIDS epidemic

5. I think it should be a crime for anyone infected with HIV to have sexual intercourse without telling their partner

6. I think that it is important to educate youth about low-risk alternatives condoms abstinence to sexual intercourse

7. Believing that condoms are 100 percent effective in preventing HIV infection gives people a false sense of security

8. Parents should not teach their children about AIDS and Sexuality.

Vocabulary List

Abstinence - No sexual intercourse, no IV drug use.

Acquired Immune Deficiency Syndrome - A disease caused by a virus which breaks down the body's immune system, making it vulnerable to opportunitic infections and cancer.

Addiction - Habitual use of a substance (like IV drugs) and inability of stop the craving for such a substance.

AIDS - The initials for the disease "Acquired Immune Deficiency Syndrome".

A disease caused by a virus which breaks down the body's immune system, making it vulnerable to opportunistic infections and cancer.

AIDS virus (HIV) test - A test used to detect antibodies against the AIDS virus (HIV) in blood samples. This test does not detect AIDS but rather the presence of the virus that can cause AIDS.

Antibodies - Substances in the blood produced by the body's immune system to fight against invading organisms.

Antigen - A substance that stimulates the production of antibodies.

ARC - AIDS Related Complex. A condition caused by the HIV in which an individual tests positive for HIV and has a specific set of clinical symptoms that are often less severe than those of AIDS.

Asymptomatic - No apparent symptoms of illness even though the individual tests positive for HIV.

Birth - The act or process of being born.

Bisexual - A person who has sexual preference for both males and females.

Blood transfer - The act of transmitting blood from one individual to another. In pregnancy it would occur between the mother and unborn baby through maternal/fetal circulation.

Carrier - A person who harbors a specific infectious agent, in the absence of clinical disease, and serves as a potential source of infection.

Casual contact - The usual daily interaction between people at work, in school, or in social situations.

Communicable disease - A disease that is transmitted directly or indirectly from one person to another. It is caused by bacteria, viruses, and other organisms or their toxic products.

Condom - A sheath used to cover the penis. Condoms come in a variety of materials. Rubber is a material that prevents penetration of HIV and does not break as easily as other substances. Used during sexual intercourse to prevent the transmission of semen, blood, or vaginal secretions and to protect against the AIDS virus (HIV).

Contaminated needle/works - A needle or works that has been previously used, with infected blood or blood particles left on the needle/works to be passed on to the next user.

Droplet spray - Organisms that are projected in droplets of water when an infected person coughs or sneezes and are received in the eyes, nose, or mouth of a nearby person.

Fetus - Unborn baby developing in the uterus after the end of the second month of pregnancy. Before eight weeks it is called an embryo.

Heterosexual - A person who has sexual preference for a person of the opposite sex.

HIV - The Human Immunodeficiency Virus. It causes AIDS by attacking the body's immune system, making infected people vulnerable to fatal infections, cancer, and neurological disorders.

Homosexual - A person in whom an infectious agent can live and multiply.

Illegal drugs - Drugs that are not obtained through legal means or for legitimate medical purposes.

Immune system - A body system that helped fight off invading organisms and disease.

Immunization - A method of producing resistance to an infectious disease, usually by vaccination or inoculation.

Incubation period - The time interval between invasion by an infectious agent and appearance of first sign or symptom of the disease in question.

Infected partner - Individual in a sexual relationship who is carrying the AIDS virus (HIV) in his/her body.

Infectious agent - An organism (virus, bacterium, etc.) that is capable of producing infection or infectious disease.

Intravenous drugs - Drugs that are administered through a needle and syringe and injected directly into a vein and thus into the bloodstream.

Kaposti's sarcoma - A cancer or tumor of the blood and/or lymphatic vessel walls. It usually appears as blue-violet to brownish skin blotches or bumps.

Lymphocyte - A type of white blood cell that is produced in the bone marrow. Some of these cells migrate to the thymus, where they develop as T-cells. Other lymphocytes that mature in the bone marrow or in organs other than the thymus are called B-cells. The B-cells manufacture antibodies, and the T-cells regulate antibody production. In healthy people about 60 percent of circulating lymphocytes are helper T-cells. With AIDS, only about two percent of the lymphocytes are helper T-cells. With fewer helper T-cells, the body is unable to recognize and attack invading organisms.

Method of entry - Manner in which organisms enter the host's body:

Method of escape - Manner in which organisms leave the host's body.

Mode of transmission - Manner in which an infectious agent is transmitted from one person to another.

Needles and works - Devices used to prepare and inject drugs directly into the vein and thus into the bloodstream.

Noncommunicable disease - A disease that is *not* transmitted from person to person.

Opportunistic infection - An infection caused by a microorganism that rarely causes disease in persons with a normal immune system.

Organism - Any living thing, such as a virus, a bacterium, etc.

Pneumcystic carinii pneumonia - The most common life-threatening opportunistic infection diagnosed in AIDS patients. It is caused by a parasite, Pneumocystic carinii.

Pregnancy - The condition of having a developing embryo or fetus in the body.

Risk factor - Activity that makes a person more susceptible or more likely to be exposed to the AIDS virus (HIV).

Semen - The fluid that is expelled from the penis during sexual activity.

Sexual abstinence - Not having sexual intercourse with another person.

Sexual intercourse - Physical sexual contact between individuals that involves the genitalia of at least one person. Includes vaginal intercourse, oral intercourse, and anal intercourse.

Spectrum - A range of factors associated with HIV infection or a range outcomes.

Susceptible host - A person not possessing sufficient resistance against a particular organism to prevent contracting the infection when exposed to the organism.

T-cells - A class of lymphocytes that play a major role in carrying out the activities of the immune system. Some T- cells are called helper T-cells.

Transmission - The passing of infectious agents from one person to another.

Uterus (womb) - Hollow, muscular, pear-shaped organ in females in which the unborn baby develops.

Vaginal secretions - Fluids within the vaginal tract.

Virus - A microscopic organism that cause infections.

Questionnaire about Source Book
for Teaching Biology to Beginners with Locally
Available Materials

Morogoro - Tanzania.

This book.....

• emphasises the "learning by doing" approach to understanding Biology.

• describes how to perform quick and simple experiments using locally available materials.

• explains how to make some basic items of equipment.

• includes many ideas for low cost but effective visual aids.

• provides an easy to understand source of ideas to encourage enquiry and investigation.

• attempts to make teachers and students aware of the resources available in their environment, which may be used for the teaching and learning of the science of Biology.

Foreword

When the interested layperson hears development cooperation and vocational training assistance, s/he immediately thinks of dual training, vocational schools, or craftsman and technician training. Long-term successes here at home, these approaches developed into major exports of German bilateral cooperation over decades.

Anyone following developments will know that the industrial-technical training of skilled labour in many partner countries has reached its limits on the labour market. Young people and adults - the bulk of the population - in most cases lack economic and social access to such long-term training. Pressure on national governments has resulted in more discriminating demand for cooperation approaches. Needs have diversified due to a broader range of target groups. Alongside customized short-term term training, further training and retraining, German vocational training assistance now includes another facet: support for industrial-technical long-term training. This overlaps with business promotion. System development support is not just a catchword; it has become a vital activity as an almost inevitable result of this spectrum of advisory services.

This has its implications for industrial-technical training assistance, whose scope as a one-dimensional promotion measure is narrowly confined by the low level of industrialization, division of labour and undiversified enterprise structures in the various economies. Production and technical services in themselves do not generate income unless there is a real or prospective market for them. Training must cater for this.

Supplementing industrial-technical learning with business-administrative and managerial skills and knowledge brings it more in tune with reality. This is a two-fold gain for purposive training: it meets the demands of companies for broadly qualified skilled manpower to cope with increasingly complex tasks, and it affords trainees greater opportunities to market their competence as wage-earners or as self-employed. This is where the present guide comes in. It helps to give shape to training processes. That is all it can and should do. This is why the authors see the guide more as a set of signposts pointing thinking processes in the right direction. It is not a set of rules and regulations.

The more firmly business topics are integrated into industrial-technical training, the more adaptable training design will have to be. We are not promising to make your work simpler or ease your workload, but we hope this guide will make your curricular work more effective.

We thank all GTZ field and head office staff involved in preparing this guide, especially the vocational training projects in Uganda, India and Chile. Let us hope that in the second phase the guide will be put to widespread use. A monitored introduction is already planned for Albania, India and Zimbabwe.

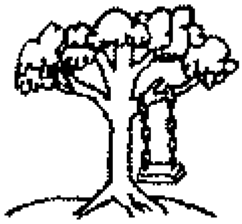
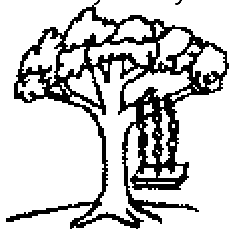
Integrating Business Topics into Industrial-Technical Training

Table of Contents

Figure 1: The 'long march' of the planners

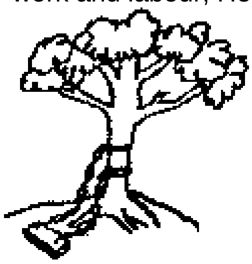


1
The local expert wants a plain, project-friendly facility.

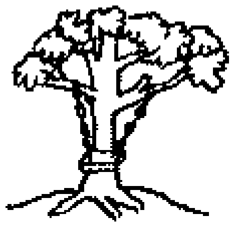


2
The expert team makes a proposal and starts planning.

3
Applying regulations on contracts for work and labour, Head Office amends the draft again.



4
GTZ Head Office is happy to take up this suggestion and approaches an external team of experts..



5
The team prepares a draft that meets all the curricular provisions and it is approved internally after objections have been registered.

6
After all bureaucratic hurdles have been overcome, the plan is implemented by experienced practicians.

Part I: Introduction

Foreword

'Lonely Decision' is a film about a plane hijacking. The plane is boarded in the air with the help of a new special aircraft. All the terrorists are killed but just before the arch baddie dies he shoots the pilots of the Jumbo jet. One member of the anti-terror squad that has stormed the plane is now faced with the job of landing it. He has only flown a couple of hours in a sports plane and has never sat in a Jumbo cockpit. A stewardess assists him in this difficult situation. He is sitting there rather helpless amidst hundreds of instruments, switches and levers. Whatever he cautiously does after switching off the automatic pilot there is a warning signal. The two find the pilot manual and start looking for key terms. For example, they find an entry under landing speed, which means nothing to them because they do not know the weight of the plane or many other specifications so they try out a makeshift mean figure. Hardly have they finished the procedure when the warning signal returns. Our heroes get increasingly nervous. Whenever he is in danger of being paralyzed by the host of options in the manual and the danger involved, our learner pilot repeats to himself that he has to think it out on his own, that it is nothing but a plane. With this mental approach to the challenge facing him, he finally manages to land the plane well enough to save the lives of all the passengers. This was his aim and not to make a perfect landing by the book.

How to read this guide

When reading, you should not confine your attention to the checklists at the beginning of the guide, but should read it all to gain an overall picture and general grasp of the task. When you go on to implement the project you can then reach for the guide and look up individual points again.

These two ways of reading - all the way through first and then later a selection - pose very disparate demands on the presentation of a text. A text conceived for the selective use of information requires far more subdivisions into individual units, but this partitioning impedes the flow of text which the reader needs to obtain an overall picture. We have therefore decided to precede the text with lists of the major points, but these will only be useful as part of the overall context. The checklists cannot be understood properly without the following explanatory text. So it is important that you do not stay put at the checklists, but make sense of each point and interpret it in the light of the subsequent text. To help you do this we have collated the headings in the checklists and the explanatory text and given references to the more extensive text in the checklist heading.

The first question: Why should industrial-technical qualifications be supplemented by business skills and knowledge?

Field experience repeatedly gained in local industrial-technical training projects indicates the need to supplement technical training with business topics. Precedence for industrial-technical training is not in dispute, because there is an urgent need in many emerging economies and newly industrialized countries to improve technical and craft skills to raise the quality of products and sell them on the market. Now there is no question that gearing training closely to industrial-technical skilled worker qualifications poses problems where the percentage of jobs in the modern industrial sector of emerging economies and newly industrialized countries is declining and in a substantial number of countries the number of jobs are diminishing in absolute terms as well.

The division of labour in large-scale enterprises between technical and business activities does not exist in most micro and small enterprises of emerging economies and newly industrialized countries either in the formal or informal sector. Technical and business work here are still interlocked. This also holds for the craft occupations. Here too business topics must be added to technical training particularly when training also has the labour market policy aim of self-employment in addition to wage-earning. The basic model of skilled worker training must therefore be enlarged to impart qualifications for activities below the level of highly developed industrial structures and complex technical services.

Having recognized the need to supplement training so far with business topics, there are a number of ways to design business training:

1. We can try to use or develop a concept that applies for all industrial-technical training projects (worldwide) alike.

2. We can take over a special concept already devised for a certain project for our own project.

3. We can develop our own model.

Though common, the first two approaches do not make sense in our view. We are very much in favour of the third option, developing our own training concepts tailored to our own needs.

Let us first explain briefly why we reject the first two options. We argue that the differences between various projects in different countries are too great, because the kind and scope of business activities are subject to a host of specific determinants. The particular shape these take affects the business operations and related training requirements. These determinants include operating and organizational requirements, sector-specific features, regional, national and economic conditions, technical, economic and social progress and cultural characteristics. Under these circumstances the everyday economic process of production and exchange of goods and services takes place in disparate ways and at various levels. So there cannot be one single, global, general approach to business training. Such a concept can only contain commonplace generalities.

The second approach above, though, fails also due to these great differences or put differently, the specifics of the given training setting. A special concept developed for a certain vocational training project cannot simply be transplanted to another.

Whereas a global concept is over-concerned with generalities, a special concept is often wholly confined to solving specific problems without systematically addressing and applying the underlying patterns of business activity to enable their application to other business operations (internal transfer within the project) or other projects (external transfer outside the project).

The global concept is over-concerned with generalities while the individual concept usually ignores them outright.

So we say the requisite training concept should not simply be 'imported' but developed locally. To do this we need to combine knowledge on general business activities, such as '*for business activities it is important to learn to calculate*' with special elements, such as '*it is important for a future electrician in Uganda to be able to cost and price electrical equipment*'. We obtain knowledge about general business activities from the subject (=business) didactic analysis; knowledge about the specifics of the local training setting, however, is furnished by the project's curricular analysis.

The business topics important for the individual project (training electricians in a production school in Uganda with additional business qualifications) are identified by the curricular analysis. The specific business skills and knowledge to be imparted (costing an electric cooker) is based on a general business calculation and learning model, the basic pattern. This dovetails special business, occupational topics for business training of electricians in

Uganda with general business subject matter (basic patterns of business activity).

Through curricular analysis (For what activities are the electricians being trained, what additional business knowledge do they need?), the general business topics which come under business didactics (bookkeeping, costing and pricing, sales estimates, efficient production) are reshaped and adjusted to the training process. Curricular analysis thus holds precedence over the business didactic analysis. We therefore stress the specifics of the individual project and not generalities in business didactics. This is why the business didactic analysis is included as a major component in curriculum development, but does not override or precede it.

Summarizing the above, we arrive at three basic curricular and business didactic principles.

Principle 1: Simplicity

Our guide is premised on practical business requirements in 'unsophisticated' production facilities and technical services. For production sequences or technical services in micro-, small- and medium-sized enterprises under formal and informal economic conditions we can identify concomitant business procedures and patterns. If necessary, the business patterns identified can then be developed into more complex work sequences and related training concepts (from basic costing to cost planning, from single-entry to double-entry bookkeeping). In the project's curricular analysis (such as activities, qualification, learning goal and learning organization analysis) the typical patterns of business activity and business topics are assembled into training modules whose scope and level are tailored to the needs and abilities of the trainees in the project.

Principle 2: Priority of industrial-technical training

The priority of industrial-technical training is a basic precondition for our proposals on how to integrate business training modules. Training topics and organization in the industrial-technical sector decide where and when the business training topics enter into the picture. If at all, changes in industrial-technical training will only be considered where they are conducive to better business training (e.g. integrating a project to link technical and business activities).

When integrating business training topics we concentrate on the interfaces (a) between production and business administration, i.e. on the most economic, systematic and coordinated in-company interaction between technical and business processes and (b) between input market, production and sales market, i.e. on how best to organize external relations (maximize efficiency of the company's marketing organization and market relations).

Principle 3: Realistic and practical training

To be (a) realistic, the supplementary business training must be linked to real-life technical training (e.g. workshop training, production school). As topics in industrial-technical training, preplanning, producing/providing, checking and utilizing products and repair services should also be dealt with at major interfaces in business terms (drawing on the dual nature of stockkeeping, procurement and work processes, which all have a technical and economic/business side). This linkup makes business decisions and routines easier to grasp.

Based on a) (linkup with the technical side), we make sure the training is b) practical by gearing it to typical business operations with an in-company or market relevance (calculating supply prices, costing, maximizing inventory efficiency, sounding out sales prospects). Via job orders and case studies relating to market trends and company organization we can help avoid an over-concentration on teacher-centred teaching methods and the associated over-abstract business economics terminology/classifications.

Part II: Checklists

Principles (in detail: pp. 9-10)

1. There is no single global model for training, as economic/business conditions differ throughout the world.

2. Universal approaches must be treated with scepticism. The same holds for test approaches adopted in some project. Even if they were successful, this success may be only be local.

3. The curricular analysis helps us identify the major business topics. It links general subject didactics with local requirements.

4. This linkup, adjustment is crucial. The guide provides details on how you to go about it.

5. Principle 1: simplicity in the guide means the concern to pinpoint, basic elementary patterns of activity.

6. Principle 2: priority of industrial-technical training means providing technicians with useful business know-how and not to train them to become businessmen as well.

7. Principle 3: realistic and practical training means avoiding over-concentration on teacher-centred teaching methods and the associated over-abstract business economics terminology/classifications.

Planning to measure (in detail: pp. 31-33)

1. Do not be a perfectionist, be more of an opportunist. Always try to achieve a reasonable degree of complexity - not too complicated and not too simple.

2. Remember the constraints on your curricular work (lack of time, material, information, staff and money). It is no good pretending. Learn to accept the 'bottleneck'.

3. Do not be frustrated by the discrepancy you have discovered between what should be and what is. You can widen the 'bottleneck'

4. There is no 'Royal Path'. There are always several options. Do not be deterred by this; view it as an opportunity.

5. In this kind of project there are no straight roads. What appear to be setbacks can be useful, even necessary.

Basic curricular questions (in detail: pp. 28-31)

1. What are the prospective target groups from industrial-technical training for supplementary business training?

2. What should the aims and learning goals of supplementary business training be?

3. How can we select business topics to achieve selected learning goals?

4. How can we organize business topics for effective training (teaching)?

5. How do we judge the effectiveness of topics?

6. How can we organize curricular work?

7. How can we test the effectiveness of curricular work?

Planning fields in the curriculum (in detail: pp. 33-36)

1. Throughout the whole project you have to organize and check, i.e. demarcate and redefine the parameters of the curriculum.

2. You must acquaint yourself in detail with project conditions, i.e. demarcate the condition fields of the curriculum.

3. You must take definite decisions on the structure and schedule of the curriculum, i.e. demarcate the decision fields of the curriculum.

1st planning step: Organizing curricular work and basic decision (in detail: pp. 36-41)

Project management tasks

1. Select the members of the curricular work group.

2. Define the basics of curricular work.

3. Define the goals of curricular work.

4. Draw up a schedule: it should be a little more detailed for the initial phases and quite rough for subsequent tasks.

5. Place the schedule where all experts and people involved can see it. It should cover tasks and personnel as well as times.

6. Determine staff available.

7. Determine finances.

8. Draft a budget to account in particular for the costs of staff and business learning aids.

9. Document curricular work: prepare for the working sessions in writing and record the outcome.

10. Allocate tasks.

What you can draw on

1. The principles of open-ended curriculum development

2. The knowledge of industrial-technical experts, the teachers and trainers in the project

3. The knowledge of the external local personnel for business training (fee-contracted staff), counterparts;

4. Outcome of a joint, cooperative understanding on the basic goals of the business sub-curriculum.

What not to do

1. Do not simply take over topics from existing business text books, learning aids or general curricula.

2. Even when you seek advice from businessmen and economics/business teachers - including local ones - they will usually cite topics from the above sources.

What to do

1. Answer the basic question: Is a supplementary business training necessary or not? Answer honestly!

2. If the basic decision is 'yes': go through the individual training courses.

3. Make a bold provisional outline of the rough fields of business activity.

4. Record the decisions.

5. Add an expert for business work and learning to the CWG.

6. Our suggestion: first develop and try out <u>one</u> business training or teaching unit.

Selecting the expert

When selecting the expert take account of the following:

- The expert should ideally be a planner and developer with practical business and teaching experience (in that order).

- The expert should come from the country (Europeans or national) and have practical experience in the economic life of the country.

- It is better when the expert does not come from a management school, because these experts often lack practical experience and subscribe to an abstract business economics theory.

- The expert should be willing to cooperate and communicate.

- The expert should look at the workshops and the technical training courses.

2nd planning step: Occupational and activities analysis (in detail: pp. 42-51)

Tasks

1. Determine the general economic and economic policy conditions.

2. Analyze the labour market conditions and trends.

3. Cater for the social and cultural conditions.

4. Describe the specifics of the regional project environment.

5. Describe the in-company organizational pattern and market relations of enterprises that might employ qualified trainees.

6. Discuss self-employment prospects for qualified trainees.

7. Describe the industrial-technical activity profiles including the associated business requirements both as a company and independent activity (in-company and market activities).

What you can draw on

1. Conduct an expert and company survey yourself.

2. Conduct qualitative studies in companies and analyze workplaces.

3. Interview prospective employers on the labour market.

4. Locate company interfaces between technical and business tasks.

5. Have a look at national studies and publications, sector studies, statistical material, project appraisal and implementation studies, national development planning policy, regional and branch studies.

6. Vet information from external sources.

3rd planning step: Qualification analysis (in detail: pp. 51-59)

The qualification analysis is based on the activities analysis and describes the related qualification requirements and need for improvement.

Tasks

1. Classify in the analysis the qualification requirements in specific knowledge, abilities, skills and attitudes to meet the current requirements and make improvements at certain points.

2. Try to identify development trends and the attendant technical and business innovations and assign to them the requisite qualifications.

What you can draw on

1. Single case studies
2. Market studies
3. Experience of project executing agencies
4. Discussions with

   - Education experts
   - Representatives of companies
   - Representatives of associations
   - Existing training institutions

What not to do in the qualification analysis:

1. Try not to assign individual, isolated activity elements to respective isolated qualification aspects.

2. Proceed from broader activity blocs. Group instead of separating.

3. Do not go into too much detail. Do not plan to perfection.

What to do in the qualification analysis:

1. Concentrate on the interfaces specified (procurement, stockkeeping, production/repair, sales, management).

2. Assign the qualifications to the activity blocs entailed (work activities, workplaces, work sequences).

3. Define basic qualifications as the outcome of an empirical qualification analysis.

4. Define surplus qualifications as the outcome of a normative qualification analysis.

5. Link the two forms of qualification analysis to be able to determine the necessary changes in existing working relations.

6. Draw up qualification lists as a starting point for further planning steps.

7. Supplement the function-oriented qualification lists with function-tied qualification lists to arrive at qualification elements.

4th planning step: Preconditions analysis (in detail: pp. 59-63)

In the preconditions analysis we examine the preconditions for the supplementary business training: the way the industrial-technical training project is organized and the prior education of the trainees.

Tasks

1. Check the prior education of the prospective or current trainees in the industrial-technical projects with a view to the requisite qualification and identify what basic decisions on the level of supplementary business training need to be made as a result.

2. Draw up an inventory of your own project.

3. Judge the level of national business training.

4. Select suitable training courses and interfaces for supplementary business training.

5. Estimate the duration and scope of the supplementary training.

6. Divide possible training and further training units.

7. Estimate additional staff (curriculum planning and implementation) and financial requirements - resource audit.

8. Determine the prior education of the industrial-technical trainees and gauge the basic implications for the level of supplementary business training.

9. Take basic decisions and record these.

Priority of industrial-technical project organization

1. The organizational form predetermines the options available for the integrated supplementary business training.

2. Generally these are broader in a production school than in a 'normal' full-time vocational training school.

3. Check whether the following possible advantages of production school training for integrating business topics apply to your project:

- Is the training geared to procurement and sales?
- Is it geared to prescribed national standards (technical, business, management)?
- Is it geared to activities in relation to work and learning objects?
- Does it adopt a holistic approach to technical, business and management activities?
- Is it geared to a rational organization of work and marketing and does it provide criteria for selecting suitable activity blocs and topics?
- Is work linked to learning?
- Does the training foster self-reliance in the trainees (elements of self-organization of work and learning)?

Principles for supplementary business training

1. The business training should be conducted as a project.

2. Set up the necessary organizational conditions for this.

3. Determine project elements suitable for combining with the supplementary business training.

4. The systematic imparting of business knowledge and patterns of activity should in turn be geared to this.

5. On the other hand, the search for suitable intersections for supplementary business training and its combination with the industrial-technical project should not be confined to productive or project-type training phases.

6. All phases of the industrial-technical training should be examined to see if they can be combined with supplementary business training, including workshop and theory courses.

The role of government-approved occupations in the project

1. The curricular work group (CWG) must take an occupational view of business training and its scope in the project, i.e. keep in line with the respective industrial-technical government-approved occupations.

2. The CWG may have to consider whether certain basic business knowledge must be imparted in an inter-occupational course before specializing by occupation.

3. Determine the tasks for the industrial-technical trainers involved.

4. The business experts must allocate tasks within their team (e.g. a European businessman with country experience and two local teachers).

What to do:

1. Specify the basic decisions taken when organizing curricular work.

2. Estimate the total need for supplementary training.

3. Locate areas where you can start developing modules.

4. Do not proceed from higher-level business decisions in management; address the individual functional areas instead.

5. Assess the abilities of the local teachers. If these for example cling to certain theoretical knowledge, the CWG must make added efforts to impart the goals of the curriculum.

6. Assess the prior education of the trainees.

- A good general education is more conducive to grasping more abstract business topics.

- Where the level of prior education is low, it is all the more important to gear business training to industrial-technical practice and conduct it in a straightforward way in line with the project.

5th planning step: Business didactics analysis (in detail: pp. 63-72)

Brief outline

Based on the qualification and preconditions analysis for supplementary business training, in the business didactics analysis we examine business didactics proposals. Ask yourself the following questions:

1. What basic patterns of business activity and learning can be considered for the supplementary training?

2. What economics/business text books and learning aids are suitable as a starting point for designing the supplementary business training?

3. What major business didactics criteria are applied to business learning?

What to do

- Assign business knowledge and patterns of activity to typical levels of activity:

1. Level of activity: business routines
2. Level of activity: ongoing business decisions
3. Level of activity: directing decisions
4. Level of activity: constitutive decisions

- Make sure you keep to the sequence specified in the previous planning steps: scale of enterprise - industrial-technical training -technical/business interfaces - requisite business activities -business training topics.

The specifics of business activity and the danger of thoughtless adoption of business teaching conventions

1. By its nature business activity is intangible.

2. Business teaching is in danger of getting stuck in abstractions, over-generalizing and losing touch with practical objects and activities in the industrial-technical sector.

3. Business training, then, must always refer back to practical activities in the real world.

Possible construction faults in business training modules

1. Beware of the dense, abstraction in business studies, of clinging to theory.

2. Reread the sections in the guide on construction faults and judge the learning material with these yardsticks in mind.

Fault 1: Using lists of all kinds when planning topic routes
Fault 2: Methodological 'window dressing'
Fault 3: Too little account of learners' experience
Fault 4: Insufficient economic/business expertise

Linking curricular decisions from the activities, qualification and preconditions analyses with business didactics

Explanation, bridge or introduction?

List of knowledge blocs for the training modules

- Basic bookkeeping
- Finance and financial planning
- Inventory and inventory planning
- Basic commercial correspondence
- Market surveillance and advertizing
- Production planning, product development, product improvement and quality assurance
- Locational planning
- Procurement and procurement planning
- Basic business organization and management
- Costing, pricing, calculation
- Basic contractual, employment and tax law

6th planning step: Goal analysis fin detail; pp. 72-81)

Brief outline

In this step the CWG proceeds from the rough topics developed, supplements them if necessary as it goes along and assigns to them learning goals to determine the level of learning processes. For this it draws on the findings of the business didactics analysis.

Tasks

- Link the activities and qualification analysis with the preconditions analysis (compare the entry qualifications of trainees with the final qualifications of the supplementary business training for selected occupational activities) by translating the basic decisions taken there into rough learning goals for the supplementary business training.

- Link the rough learning goals with the rough topics from the business didactics analysis and vet the selection.

• Link learning level with topics.

• Define prior learning and knowledge structures for designing the business training modules.

What you can draw on

1. The findings of the learning goal analysis in intellectual, motivational and psychomotor learning

2. The matrix for the learning goal analysis

3. The linkup of rough learning goals and rough topics (combination of curricular and business didactics analysis)

4. Demarcation of the training modules as framework modules

5. List of 'givens'

Berend: Diese Liste muß noch mal überarbeitet werden

What to watch out for

Do not detach the rough learning goals and rough topics from the order established so far.

When developing rough learning goals and topics steer your course along the following lines:

• The curricular goal, to define the kind and scope of business topics more exactly in line with the technical training

• The scale of enterprise, to pinpoint key topics for the areas

• The two levels of activity: (a) the business routines and (b) ongoing business decisions, to locate the level of learning processes and route the two module runs

Learning goal decisions

What learning goals are:

Learning goals are statements on the level of learning processes we are aiming at. They are and remain important prior information on what awaits the learners, but they also provide guidelines for the learning aids developer and assigning topics and tests. So they are major reference points.

• Define neither too many nor too few learning goals. In both cases they forfeit their guiding function.

• Do not for example draw up an over-elaborate skill hierarchy.

• Word learning goals in everyday language.

• Do not draw up abstract systems of learning goals; always keep an eye on their relevance to occupational activities.

7th planning step: Learning organization analysis (in detail: pp. 82-89)

The learning organization analysis brings together the findings of the goal analysis and the business didactics analysis.

Tasks

1. Define the detailed learning goals and detail the learning topics. The rough analysis moves on to the detailed analysis.

2. Decide how to organize the business training in combination with the technical training.

3. Decide how to refine the goals and topics specified in the modular system (training plan).

The role of the modular schedule

1. The training module profiles and their sequence furnishes the CWG with an 'ideal' plan.

2. When the CWG now proceeds to detail the learning organization, certain changes may prove necessary: e.g. leapfrogging individual modules or switching levels.

3. The 'ideal plan' retains its guiding role, because it helps to gauge the coherence of our own planning.

4. The 'master plan' will not solve all planning problems, but it is a way of assessing and guiding our own planning.

Decisions on learning organization

1. Agree in the CWG on the timespan of the business training.

2. Many factors affect this decision:

- Goals and scope of business training
- Extent of technical training
- Learning level of trainees
- Qualification of available teachers
- Willingness of businessmen and technicians to cooperate.

3. Careful! These factors are often bound up with definite interests which mean that decisions are frequently taken on planning problems to safeguard personal or group advantages and not for curricular reasons.

4. If the business training programme has to be limited for lack of time, a run-through at one level at least should be completed.

5. Start with the supplementary business project, when the technical training departs from imparting technical routines and starts with imparting productive activities.

6. Make absolutely sure to avoid a theory bias towards the industrial-technical side (parts lists for example) obliging you to impart supplementary business knowledge in a pure crash teaching course at the end of the training with no bearing on the project. This will not do the job.

The training plan and developing detailed learning goals

1. From the master plan draft a training plan for the supplementary business training.

2. This training plan must give more detailed shape to the modules developed (detailed learning goals and detailed topics).

3. Proceed from the rough learning goals and rough topics of the framework training plan.

4. This detailing gives us the respective detailed structure for the training module in the training plan detailed learning goals and detailed topics.

Developing learning aids

Developing learning aids is key for a supplementary business training tailored to the needs of trainees, specific didactic requirements and special occupational activities.

What to do

1. Develop your own learning aids for the trainees.
2. Plan time and inputs based on CWG resources.
3. Specify the first major work steps.
4. Specify what tasks can be performed before or during training.

Develop the following:

1. A learning book with the learning topics
2. A work book with tasks
3. Both books must be tailored to individual occupations.
4. A teacher's handbook with the following contents:

- Intentions and goals of the supplementary business training
- Pointers to the trainees' learning and work books
- Module survey
- Demands on teaching staff
- Pointers for using the learning and work books bearing on the individual training modules
- Help on the individual modules (goals, using the learning and work books, method and media for putting the module into teaching practice)
- Pointers on testing learning achievement

8th planning step: Training and teaching analysis (in detail: pp. 89-93)

Based on the goal analysis and learning organization analysis, the training and teaching analysis describes the training planning of the supplementary business training in tandem with the industrial-technical training. This step is a further refinement of the decision steps at rough and detailed goal level,.

Tasks

1. Plan the training and teaching units in step with the progress of technical training. This will enable you to draw on experience from previous teaching and training segments.

2. Based on the training modules, the teaching and training planning specifies definite learning goals in connection with training and teaching topics.

3. Teaching planning contains pointers on

- the social form of training and teaching
- method

What you can draw on

1. Findings of the learning organization analysis
2. Schedule for learning organization
3. Experience of teachers and observations during teaching
4. Evaluation of the training and teaching units conducted
5. Teaching planning framework
6. Pointers on suitable social forms and methods

Planning step 8: Teaching planning

• Stress in CWG work the preparation of teachers, technicians (experts and local teachers and trainers).

• Provide close guidance to teachers in the initial stages

Trainers/Teachers

1. It is essential to tell the teachers that their job is not to impart (abstract) management training in this project; they must equip trainees with practical tools to deal with occupational problems.

2. The trainers/teachers must play different roles when teaching and combine these:

- Knowledge mediator
- Organizer of problem-solving learning processes
- Moderator

3. These different roles must be practised so do not confine your teacher's training to a series of briefings.

Didactics

1. The topics have been described for the most part in the material on training modules.
2. They are geared to business practice and activity sequences, not theoretical systems.

How to link up with the technical training in the project and the national market

1. Via cooperation with the technical trainers
2. At content level by including teaching aids/media from working practice.

Method

Training method should be designed to afford insight into the role of business activities and foster self-reliance in the trainees as well as impart knowledge. Basic rule: from guided to autonomous learning.

1. Avoid lecturing or teacher-centred methods.

2. Give the trainees research jobs to do on their own workshops or the local market, for example.

3. Involve the trainers from the technical sector in the business training programme.

4. Give small groups case exercises to apply and consolidate the knowledge acquired.

5. Invite practicians to attend the training. They can help provide a motivating lead-in to the training module, provide examples and link up with applied practice.

6. Try to develop a mini project that spans the individual training module and achieves an activity outcome that helps place the topics in an overall context.

Media

1. The media used in teaching are not just there to illustrate.

2. Rather, the worksheets/forms should be designed for later use in subsequent everyday work.

3. Their practice-centred design should be a structural teaching element.

4. They should be explained or developed further in discussions with the teacher and filed along with commentaries/notes in a work folder.

5. This work folder should be used like a toolbox.

9th planning step: Curriculum evaluation (in detail: pp. 93-96)

The key question in curriculum evaluation is: What is the impact of the curricular intentions/design on the trainers and trainees in training practice?

Tasks

1. Decide when to evaluate: whether it should be ongoing or after completion of the trial run.

2. Organize the teacher upgrading.

3. Adopt an open, curious attitude and instill a sense in everyone involved that mistakes are learning opportunities.

4. The CWG must make a realistic assessment of its capabilities for evaluating the curriculum (time, money, staff).

5. Try to monitor teaching.

6. Hold evaluation discussions with the trainers involved (technical, business) and the trainees.

7. Monitoring teaching and evaluation discussions should be recorded for subsequent improvements.

8. Use the evaluation findings for planning/altering the training module and subsequent measures or similar projects.

9. Use test groups if you want to conduct pre-training tests.

    1. Test group: technical experts not directly concerned with developing the business training module.

    2. Test group: local technical trainers with company experience.

    3. Test group: industrial-technical trainees.

Self-assessment by teachers and trainers

1. Draft a straightforward questionnaire for self-assessment that permits short answers.

2. Use the following list when drafting the questionnaire:

General key questions for assessment:

1. What are the learning achievements at the end of the supplementary training?
2. What are the reasons for the shortcomings in the supplementary business training?

Special key questions for assessment

1. Was the basic curricular decision to link training goals and topics with business routines and ongoing business decision-making right?

2. How effective was the desired close link between industrial-technical and business topics?

3. What is the best way to match up the technical and business training courses?

4. Have technical and business trainers cooperated and if so, how would you assess this cooperation?

5. Do the developed training modules of the framework curriculum cover the range of necessary business knowledge for your own business course?

6. How would you assess the structure of the modules? Are they close enough to practice and is the level appropriate?

7. Do the trainers keep close to industrial-technical practice and train for practice or do they cling to abstract theory?

8. How do the trainers deal with suggestions on method (mobilize trainees, run projects)? Are they adopting a new teaching style?

9. How do the trainers respond to the notion of the business toolbox and do they view this as a major training goal?

10. How do trainees respond to pro-active, practical, activity-centred training and teaching forms? Do they draw connections with industrial-technical work operations and does that make sense to them?

Part III: Rationale

Principles of curricular construction

Basic curricular questions for developing supplementary business training

Problems of curriculum development

The following seven questions and (still general) answers address the central problems of curriculum development that must be solved in the context of the industrial-technical project and its target groups:

1st question: What are the prospective target groups from industrial-technical training for the supplementary business training?

This is the crucial question for many projects: not all technicians and craftsmen need business training. The team has two basic priority questions to discuss and settle: is there a need for supplementary training and what can be expected of the trainees in view of their entry qualifications and prior education? It is therefore vital to examine the setting and initial conditions/capabilities of the trainees before starting to plan the supplementary business training.

Search for answer:

The training needs must be determined by identifying future occupational profiles. This is not always easy, because it is often unclear what a trained dressmaker in Chile or a trained joiner in Uganda can do afterwards, whether there are opportunities in the formal or informal sector as wage-earners or self-employed. Obviously this will affect the shape of the supplementary business training.[1] The concern is to enlarge the information base in the team.

[1] The authors of the guide assume that the analyses in all curricular planning steps must be conducted with gender differences in mind. This applies in particular to the target group analysis, employment analysis and activities analysis. In the search for other pilot projects to try out and conduct supplementary business training courses, we are therefore also especially interested in GTZ-assisted projects to train women for industrial-technical occupations.

Equally important is the prior education of possible trainees. Do they have a primary, first or second secondary qualification? This decides the scope and the level of business training topics. Based on the answers to these basic questions, the next questions can be discussed and answered.

2nd question: What are the goals and learning goals of the supplementary business training?

Search for answer:

Think about the possible goals of a business sub-curriculum aligned with the industrial-technical project and discuss in the team, select the learning goals and specify the selection criteria. Give reasons for the selection of goals with activities, qualification and conditions analyses. All this need not be very detailed and precise: it is more important to look at practice and involve and ask practicians.

3rd question: How shall we select business topics to achieve the selected learning goals?

Search for answer:

> Think about the topics, refer to specialist books but always keep in close touch with the technical project and its possibilities. Select topics to achieve the learning goals with brief reasons for goal-topic links (interplay between curricular and business didactics analysis: the business didactics analysis will for example point out the essential role of bookkeeping and lead into the system of bookkeeping; the curricular analysis then tells you whether the target trainees need to learn single-item or double-item bookkeeping).

4th question: How can we organize business topics for effective training (teaching)?

Search for answer:

> You must locate suitable interfaces in the industrial-technical training. A case-to-case decision must be taken on whether a business training segment needs to precede the industrial-technical training to link up business topics and instruments with technical topics (topic and time sequence of business training) or whether the training in the business sector can run parallel with a certain phase in technical training.

5th question: How can we ensure the effectiveness of business topics?

Search for answer:

> This depends on two things: the suitability of selected interfaces between technical and business training steps (e.g. bookkeeping as a technical and business problem) must be monitored and assessed and tasks must ensure that business instruments (such as cost estimate sheets) are actually applied to technical tasks (costing motor vehicle repair for example). The business tasks must combine technical, occupational and practical relevance (no tasks that simply call for book knowledge).

6th question: How can we organize curricular work?

Search for answer:

> The best way is for the technicians in a project to see how to integrate business training elements based on their own knowledge, assisted by local business experts and/or short-term experts and referring to this guide.

7th question: How can we gauge the effectiveness of curricular work?

Search for answer:

> The effectiveness of the curriculum ultimately depends on whether the graduates have actually been qualified for the occupational and activities field (external effectiveness). In addition to an external check, it might also be useful to conduct an internal check of the sub-curriculum to see whether it is coherent (congruence of planning and application and the individual steps).

To answer the key questions, we need to draft a business sub-curriculum where the business goals and topics are validated, selected, organized and applied. This prevents a blind selection based on tacit values and unquestioned preferences.

Organizing curricular work as open-ended curriculum development

Organizing curricular work

The following is crucial to the 1st planning step - the organization of curricular work. Due to its overriding importance, we highlight this general issue of organization separately from the systematic discussion of individual planning steps and deal with it in advance here. Later, in the 1st planning step we look at special organizational conditions for integrating business sub-curricula.

Solving problems in practice

Planning problem 'bottleneck'

When we look at the host of tasks resulting from the answers to the above seven questions, the question immediately arises of how we can possibly cope with this additional workload under the local conditions. We must forget any ideas of perfectionism or to return to our analogy at the beginning: we are not aiming at the perfect landing. The curricular work can only be done and organized in cooperation with local experts in a practical and open way. We are developing a curriculum under normal, not ideal conditions. So our proposals are deliberately premised on the situation facing the local planner with all his/her working constraints. These are the 'bottleneck' of the planning problem: lack of time, material, staff and money for planning work.

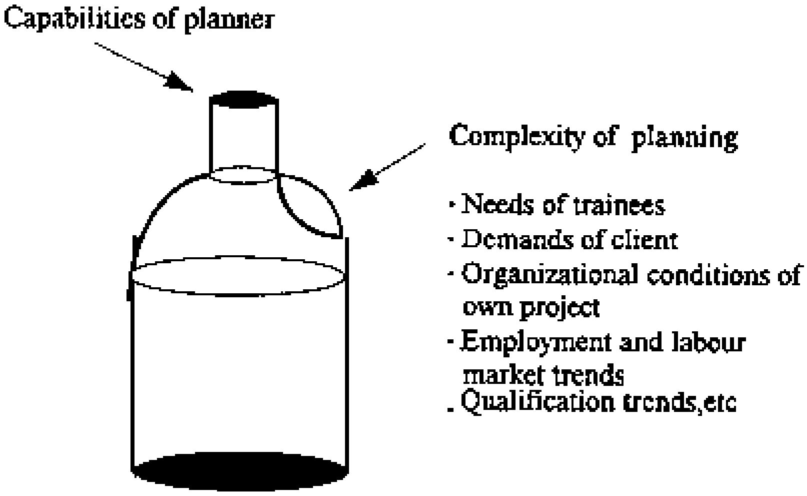


Figure 2: The planning problem bottleneck

Complexity of planning problem

Above all there is a lack of information, but even if we assume an (ideal) comprehensive information base, we still have the problem of our own limited planning and processing capabilities. The capabilities of the planner stand in no reasonable relation to the complexity of the planning problem.

Faced with the sum of planning problems and the desire to find a good solution, every planner and planning group suffers from a 'bad conscience'. The rift between the desired answer to the problem and the actual options open is too wide. We suspect that this is particularly common when technicians have to cope with the unaccustomed supplementary business training and that this causes added stress.

So the following brief advice can be of genuine practical value. Even with an array of aids, we cannot basically do anything about insufficient information (on the technical side as well incidentally). This is of course not meant as an argument for simply making the best of the knowledge and instruments that happen to be available to a planning group - the concern should still be to improve the information base - but we can only widen the 'bottleneck' not get rid of it.

Widening the 'bottleneck'

We must face the fact that curriculum planning decisions will always be ambivalent, i.e. that other decisions are conceivable. This has advantages and disadvantages: selection options but also uncertainty. With this planning problem (integrating business training modules in industrial-technical projects) we are not dealing with simple, direct inferences from one single business didactics problem complex such as constructing modules from business text books; we have to think in a systemic way to re-link the problem with diverse curricular determinants (see contents of bottle!).

Open-ended curriculum development

So what we are concerned with here is open-ended curricular work geared to practice. Open-ended curriculum development means the planner progresses tentatively from one decision problem to the next. For lack of information we simplify the decision problem. The. point here is that these simplifications are not the result of convenience or prejudice but as far as possible the outcome of a deliberate decision-making process weighing up pros and cons. The advantage of a deliberate and reasoned decision is that it is easier to locate mistakes and hence avoid them as well. We must try to find a middle road between an endless exploration of curricular conditions aimed at a kind of omniscience and curriculum development based largely on hidden prejudices and unexamined preferences.

Planning steps in curriculum development

9 planning steps of curriculum development

Faced with the difficult challenge of curriculum development our typical response is to search. A major help is to order and subdivide the curricular problem into successive planning steps.

1. Organization of curricular work, basic decisions
2. Occupational and activities analysis
3. Qualifications analysis
4. Preconditions analysis (project preconditions, prior education)
5. Business didactics analysis
6. Goal analysis
7. Learning organization analysis
8. Training and teaching planning
9. Curriculum evaluation

Strategy of small steps

In these individual planning steps our solutions are always provisional and limited. We move tentatively forward with a strategy of small steps (muddling through). In curriculum development there is no reason why we cannot behave practically. The main point is to widen our respective information base and control the decision-making process as consciously as possible. An open-ended curriculum development is therefore never finished. Changes and improvements are always possible and made after individual trial phases. Good training plans come about less through extensive theoretical preparation than a close interconnection between theory and practice which ensures more prompt testing and improvement of the training plan.

Common to these points on an open-ended curriculum is that they stress training practice and place training staff in the role of curriculum planners and implementers. The open-ended curriculum tries to combine the advantages of the local staff, the trainers with their local knowledge, the trainees, the teaching and practical training (= adaptability, geared to situation) with the demands of curriculum development (systematic preparation, conduct and evaluation of training). The most important curriculum planners therefore are the local experts, but they must gear their decisions to curricular yardsticks.

Individual planning fields

For our purposes we distinguish 9 curricular planning fields: curricular framework (planning steps 1 and 9), curricular condition fields (planning steps 2-5) and curricular decision fields (planning steps 6 - 8).

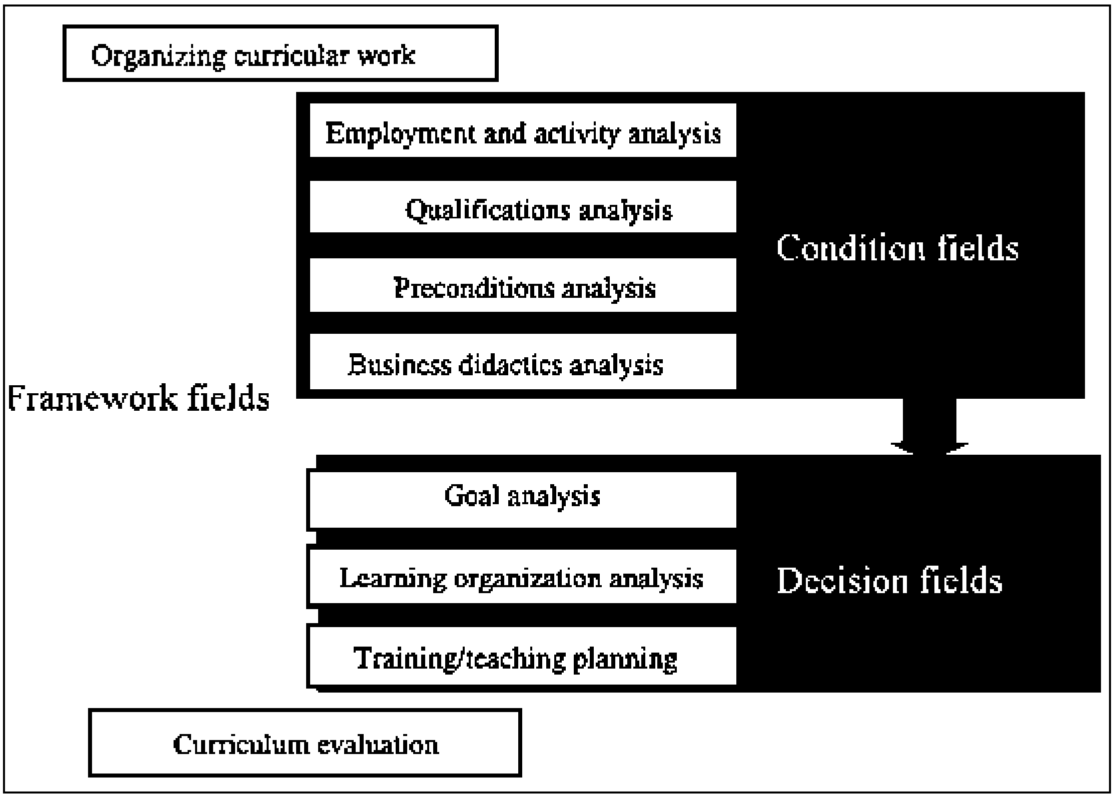

Figure 3: Planning steps in curricular planning

This division into framework, condition and decision fields is useful.

Curricular framework fields

a) It indicates the overriding importance of the curricular framework fields 'organization and basic decisions' and 'evaluation' for actual curriculum planning and implementation (before, parallel, after).

Curricular condition fields

b) The category curricular condition fields 'occupational and activities analysis', 'qualifications analysis', 'preconditions analysis', 'business didactics analysis' is where we must logically first look at the facts in the condition fields before taking decisions on the curriculum in the narrower sense. These fields pose major conditions for our ensuing curricular decisions.

Obviously we first need to know what occupational fields and activities are possible for the target group of our business sub-curriculum, before asking what qualifications are necessary to perform them. Then we ask what prior education the curriculum target group have, what they 'bring along' and what the prospects are for assimilating supplementary business training into the industrial-technical training and then we look to see what learning topics and structures business didactics has to offer in this connection.

Curricular decision fields

c) When these conditions have been identified and evaluated, we can then proceed to the curricular decision fields to design the structure and sequence of the sub-curriculum.

Curricular decisions

Decision on rough learning goals

The first decision to take is on the rough learning goals of the business sub-curriculum, their origin and the reason for their selection. They pertain to the general areas of the sub-curriculum (training modules) and draw the rough lines on what needs to be learnt about buying, stockkeeping, work and production planning, labour costing, etc. (level of learning). The structure of the general areas results from a combination of business didactics proposals and how we bring the rough topics from prior planning steps in curricular analysis to bear on our project. The goal defined always involves a rough topic statement, such as: 'The learners know the major components of costing and can apply them.'

Decision learning organization

The second decision is on learning organization. In subject matter analysis a double step is taken based on the goal analysis: detailed learning goals must be defined and learning topics detailed. The rough analysis proceeds to detailed analysis (the training modules are specified in more detail). Here too we combine curricular specifications (training of technicians, alignment with industrial-technical activities and learning processes, learning at interfaces) and basic business didactics models. The rough learning goal and rough topic bloc 'Know and apply major components of costing' is given more detailed shape: 'The learners know how to calculate labour costs and overheads and can apply their knowledge to occupational tasks.'

Decision on teaching planning

The third decision to take is on training and teaching planning. From the decision steps at the rough and detailed goal level, we proceed to even greater detail here. The training modules are used for training and teaching planning. The definite learning goals are specified in connection with the respective topics. The training and teaching planning also contains pointers on method.

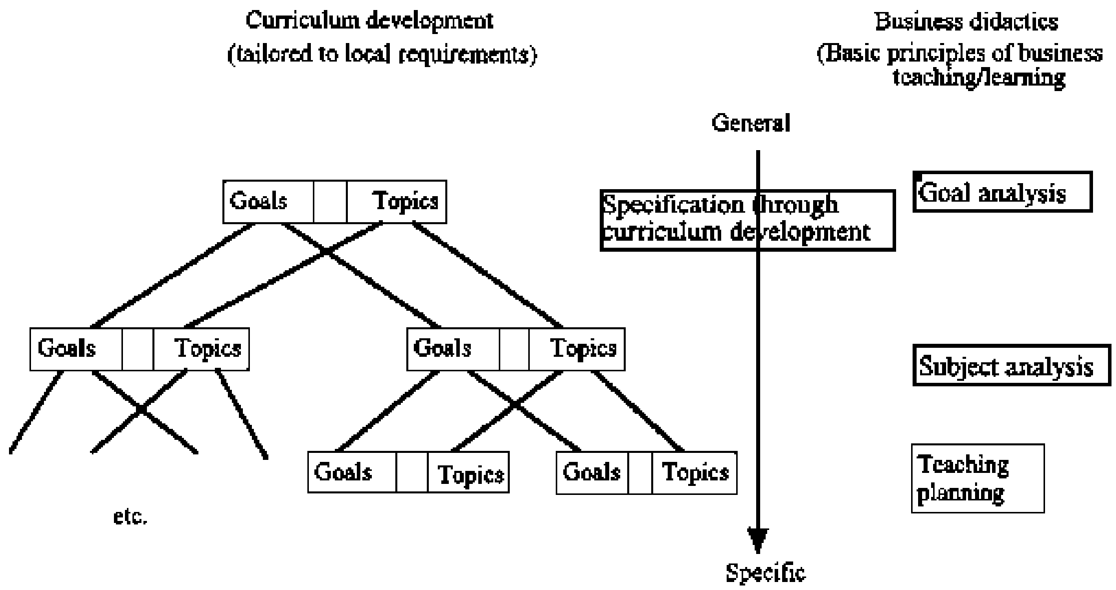

Figure 4: Breakdown of topics and goals in the auricular process

1st planning step: Organization of curricular work and basic decision

Developing business training modules is an additional task in industrial-technical projects that calls for time and consideration. On occasion in the past a 'quick fix' has been sought by simply selecting 'suitable' learning topics for supplementary business training from existing business textbooks or learning aids. In some cases too framework curricula from the industrial countries have been combed through and certain topics taken over from economic theory and simplified. Knowledge and business instruments selected in this way turned out to be too general to help the trainees in such supplementary training courses. The topics did not fit the country, the training course or the envisaged work activity.

Do not do this. Also be wary of advice from businessmen and economics/business teachers, which is often ill-considered and relies on familiar general business topics. This also applies by the way for businessmen and economics teachers from emerging nations themselves. Their training is also beset with a basic problem: worldwide, business economics and the economics taught in various training institutions based on it is very abstract and divorced from business reality.

Danger of planning to perfection

In reaction to this, though, let us not fall into the trap of planning to perfection. Nevertheless, a curricular task of ours is to organize the development of business training modules. What does this mean? First of all, we have to take a close look at our industrial-technical project with its specifics and sundry training courses and pinpoint where we can integrate a supplementary business training in the technical training courses. This basic analysis is indispensable. It has to be conducted at the outset by the technicians in the project themselves. If we are unclear about our intentions, we shall go astray. We may have to detail or revise our goals later but there is no point in detailing the goals of supplementary business training at the outset. Nor can we. At the beginning of planning work, goals are always uncertain, but they are essential as guidelines. We have to be willing to get something wrong, which is why we need open-ended curriculum development: development work in situ that approaches its goal step by step, that is prompt to apply and try out the training module with local trainers. Motto: try out and improve instead of planning for too long.

Settling the basic question

So, the technical experts should sit down with the team leader and their counterparts to settle the basic question of whether supplementary business training is necessary or not, whether we want it. We must be aware of competition with other educational establishments in the country, which might resent a kind of 'poaching'. This must be cleared up first in the 'inner circle'. There is no point consulting business experts at this point. If a project team and its counterparts are themselves not convinced of the basic need for supplementary business training for their own target group they might as well leave it at that because motivation will lapse very soon.

A look at the training courses usually quickly reveals whether supplementary business training (which will always remain restricted because we cannot impart everything) makes sense or not. We must decide this based on our own reasoning. A precise rationale can be left until later, but it is obvious that a motor vehicle mechanic who will have to cope on his/her own later on will also need to master business tasks: labour costs, cheapest supplier of spare parts, costing and billing, etc. This also applies for the dressmaker who will have to open her own dressmaking shop, but also for skilled workers who are highly qualified and will have to prepare and organize work sequences in a small enterprise. These are only examples, but they illustrate that pure technical training only makes sense under certain conditions.

The first rough decision on supplementary business training is based on the respective industrial-technical training course. Details can be dealt with in later planning. It is crucial, though, to found the business training on the industrial-technical training course and tailor its structure (goals and topics) and schedule (when to impart which goals and topics with which methods) to the industrial-technical training. We think technicians are experienced enough to take a basic decision on whether their target groups need supplementary business training or not. After the basic decision 'Yes', the project's curricular work group goes through the individual training courses and describes the general fields of business activity suitable for the qualified trainees of the training course based on their national experience. We must draw bold outlines here to avoid confusion in the work group. After all, decisions taken can still be revised.

We gauge the basic decisions by the technician team to be important because they ensure that the link between technical and business training is maintained and enable us to evaluate subsequent business specialists. Otherwise there is a danger of their developing their own separate business training courses, which could be more convenient for all involved but is of little use to qualified trainees.

Example:

It helps to seek typical situations and 'stage' these.

<u>Example 1: Service company: motor vehicle workshop</u>

The customer comes to pick up his/her repaired car and complains about the high bill. The master craftsman cannot itemize the total and is quickly persuaded to charge less. He is dissatisfied with this and resolves in future to draw up a bill for labour costs and materials with each repair job listing the hours spent for each work step and the replacement parts in stock or ordered separately.

This scenario enables us to describe the business training needs based on the overall operations of this service enterprise, such as drafting cost estimate sheets and bills, improving work scheduling, planning and coordinating inventory and procurement.

<u>Example 2: Industrial enterprise and production planning</u>

A production foreman reports that many work sequences in the production schedule are not defined in enough detail and badly synchronized resulting in delayed transfer of inputs into the next line and interim quality assurance is not always conducted. This causes regular delivery problems and complaints, incurring substantial additional costs for the company.

Conclusion: The supplementary business qualification must focus on production planning and work pre-planning, for example, drafting accompanying documents specifying time requirements for each work segment and production line and transfer points and having personnel make corresponding entries during production (such as actual times, and quality assurance conducted).

The goals of supplementary business qualification here would be confined to 'production' would cover topic blocs such as quality assurance, production and delivery planning, basic data acquisition for calculation.

Selecting business experts

If the curricular work group has come this far and recorded its decisions, it must look for an expert in business work and learning. It must however retain control to make sure that business knowledge is imparted where it is relevant to industrial-technical training (co-determining interfaces between technical and business work and learning activities). The business expert is seldom able to do everything - planning the business training module as well as putting it into teaching practice. Experience has shown the importance of recruiting a planner and developer first who can then take charge of selecting suitable teachers or advise the technical experts in their selection.

Clearly, the selection of the business expert is key to further curricular work. Of paramount importance is that the expert comes from the country itself. He/she can be a European engaged there or a national. Practical experience in the economic life of the country comes next. In our experience it is better not to employ experts from business or management schools, because they often lack practical experience and subscribe to an abstract economic theory, divorced from the practical needs of an electrician or motor vehicle mechanic. They tend to impart basic business knowledge in pre-packed 'capsules' - such as basic single-item or double-item bookkeeping or full-cost pricing - instead of addressing the needs of a craftsman or service technician and deciding on the scope and level of business knowledge and methods from there.

Another key quality is the willingness to cooperate. The expert must want to communicate with the technicians (and vice versa of course) and gain from their experience and views, instead of clinging to his/her business expertise (expert authority). This also means that the expert must take a look at the workshops and technical training courses to find out in situ promising interfaces for integrating business training units. Ideally of course the expert should be able to draw on practical business and teaching experience, but if you have to choose between practical business experience and teaching experience, we rate practical business experience higher. It is better to trade off inexperience in teaching, especially as the technical experts can provide advice and support in curricular planning.

Qualifications of business experts

When selecting the business expert we must account for diverse qualifications that are seldom found in one person. The main one for us has been familiarity with the country and practical business experience. On top of this there are different conceivable combinations: a European expert with experience as a former business manager in a technical firm in an emerging nation develops the business training module in cooperation with local teachers, which they then apply in teaching with the various technical training projects. Alternatively, the local counterparts in the technical project develop the curricular parameters for the business training module, which is then discussed with German experts and implemented by business teachers from the country concerned.

Rough plan for curricular work
Local teaching staff

After the business expert has been found, a rough plan for curricular work is drafted jointly with him/her. Here a decision must first be taken on whether the business module should be drawn up and tried out as a whole or in steps. In line with the principles of open-ended curriculum development, we propose developing and testing a rough framework for business training or teaching unit (faster switching from development to testing). This however means early recruitment of local free-lance teachers who can help develop and then implement the unit. That is also a difficult decision, because local teachers are often proud of their theoretical knowledge and sometimes fail to grasp the need to deal with practical business training which they accord lower status.

Our experience indicates that business training - especially in practical tasks - must align itself with the respective industrial-technical training course, so the technicians - experts or local trainers - must keep in touch with the businessmen. From this phase on the curricular work group members can alternate depending which training course the business topics and methods are tailored to. Ultimately, the business training modules will address electricians or motor vehicle mechanics or carpenters.

Schedule for curricular work
Written material for curricular work

In addition to staffing, a rough work schedule must be drafted. It should be a little more detailed for the initial phases and quite rough for later tasks. This schedule, which should be placed for all experts and those involved to see, must contain time, task and staff assignment columns. Agreement must be reached on drafting briefs on the allocated tasks (e.g.

describing interfaces between business and technical work and learning contexts for the individual training courses) to steer the work in the individual sessions (document-assisted curricular work). This has the healthy effect of obliging us to prepare the work for individual sessions, which would otherwise often be wasted in random talk. A brief record of the outcome of individual sessions must also be made (recorded curricular work) to trace the individual decisions and the reasons for them and enable a stepwise refinement and development of curricula without unnecessary repetitions and loops.

Budgeting

Finally, for the decision in favour of supplementary business training, we need to draw up a rough budget. In itself this is no great problem, but you will have to check the project resources to secure finances for the business planner and the teachers. You also need to know the costs for business learning aids which usually have to be developed by the project or adapted to specific training purposes (teacher handbook, trainee learning and work books). You also have to find out whether central funds are available for supplementary business training.

At the end of the organization phase of curricular work a basic decision has to be taken that supplementary business training is needed for certain technical training courses. The next planning steps then proceed from this. Keep the basic need for supplementary training in mind but no more. The main aim of the next steps is to detail the basic decision taken.

2nd planning step: Occupational and activities analysis

Remember that for the basic decision on supplementary business training we sorted through our own industrial-technical training projects to locate interfaces for business training. This initial 'internal' analysis must now be confirmed from outside by the activities analysis where we look at the work activities connected to our training courses and prospects for their further development. This is why in a second 'outward-directed' curricular work step we look to the real world of employment and work and foreseeable trends, to the economic structure, kinds of enterprise, jobs and other sources of income in the country.

Unfitness of occupational and activities analyses from industrial countries

The extensive set of instruments of occupational and activities analysis from the industrial countries are no use here. These highly formalized instruments cannot deal with the specific work and employment patterns in emerging nations. With the high unemployment there and the resultant need to earn a livelihood outside the formal employment sectors, we must include informal earning opportunities in our analysis. It is precisely these that European occupational and activities analyses ignore.

We now approach the occupational and activities analyses, but not with a vague, broad view; we have a definite focus. This is provided by the industrial-technical training courses, for which we want to find the necessary supplementary business qualifications. If we are training manpower in the metalworking and electrical occupations, we have to take a closer look at the work activities these entail. Our concern is not to make an empirically validated and comprehensive record of occupational activities and draw up exhaustive activities lists.

Limited activities analysis

Instead, by describing bundles of activities, we want to find approaches that are plausible in curricular terms. Even for this 'limited' activities analysis the surrounding factors of influence are still extensive. To help collate this broad field of supplementary business training determinants we can assign them to three large groups (condition, decision and activity fields): these three groups bear differently weighted relations to our business curricular work and this weighting can provide us with signposts in this planning step.

Condition fields

The socio-cultural setting, the economic system and the associated development planning, the legal, fiscal and social system, the industrial and employment structure and the labour market fall under the category of condition fields. This groups supplementary business training determinants that we cannot directly influence through our business curriculum project. These conditions are important for our supplementary business training because at this level we can locate global fields of application (example: promoting the tourist trade).

Decision fields

Now comes the group of determinants that have a direct influence on our project: the decision fields. These comprise the regional economic structure with its sectors, branches and enterprises; the regional market structure with its formal and informal segments, the forms of market organization, kind and extent of labour supply and demand, the ratio of self-employed to wage-earning activity; regional development planning such as transport, economic and industrial/business development. This set of determinants is important for the business sub-curriculum because we can locate key development targets such as small and medium-sized business promotion via integrated technical-business training, promotion of startups, promotion of micro enterprises or management abilities.

Fields of activity

The narrowest set of determinants affecting the supplementary business curriculum are the fields of activity. In response to this set of determinants stemming from company and marketing work activities, we must give thought to curricular parameters, such as the selection of suitable training modules as well as make topic distinctions within the training module itself with regard to certain legal, organizational, costing, bookkeeping and other topics.

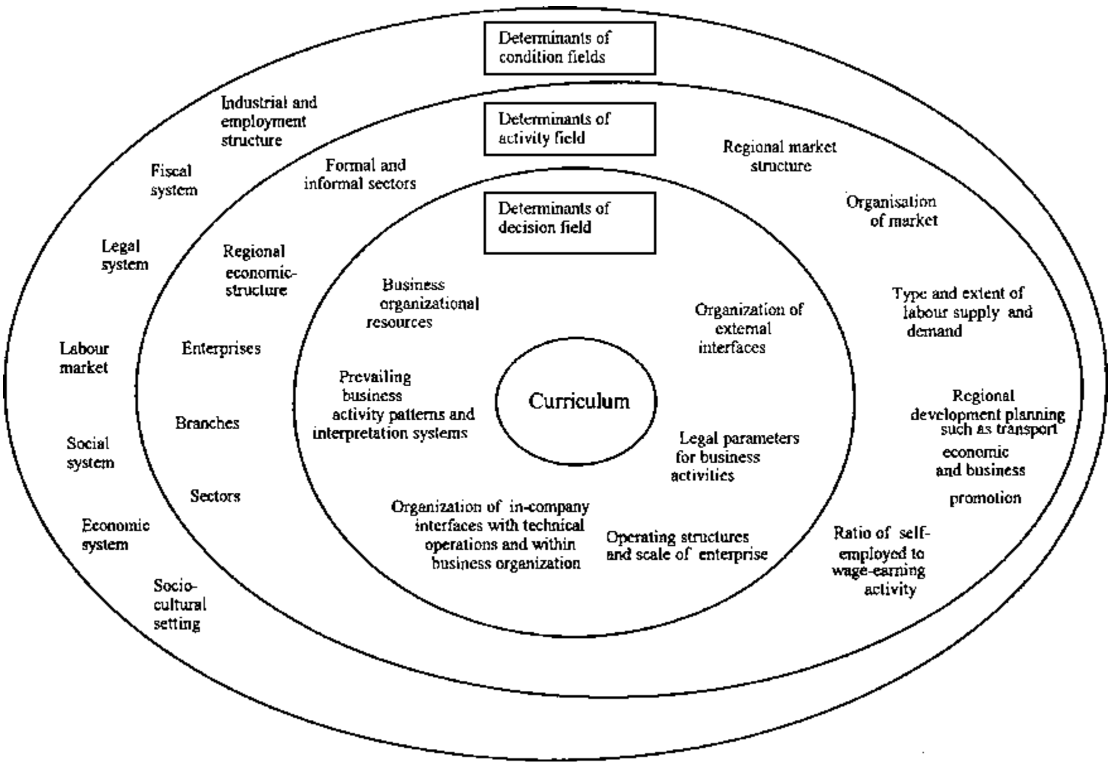

Figure 5: Curriculum determinants

Determinants from business activities

As for the occupational and activities analyses we have many determinants, which we assign to the condition and decision fields from the industrial-technical projects already underway, but we usually lack information on the determinants of the business curriculum project from business activities. These are however crucial for practical curricular work. This is also why this planning step places stress them. They include the following:

• Company structures and scale of enterprise (e.g. operational organisation and division of labour over time (small enterprise) or within the workforce (medium-sized and large-scale enterprise); allocation of business functions such as personnel, procurement, sales, finance, costing, production planning; division of directing, executive and advisory personnel

• Prevailing business activity patterns such as common routines (e.g. rough calculation, informal agreements) and interpretation patterns (e.g. assessing markets or economic viability)

• Organizational business resources such as forms, index files, vouchers and business equipment such as typewriters, calculators, automatic accounting machines, computers

• Organization of in-company interfaces to the technical side and within the business sector (e.g. interlinkage of procurement, production and sales planning, buying and stockkeeping, operating costs and calculation)

• Organization of external interfaces (e.g. sales or procurement organisation and market surveillance, recruitment and labour market, demand estimates, production ideas and product design, financing and payment transactions)

• General company law (employment contracts) and contractual law in procurement and sales

In the occupational and activities analysis we therefore propose proceeding from the inner circle of the activity field and putting in most work here. The above set of circles contains pointers on where to connect without requiring a systematic line of observation. The determinants from the outer circles of the decision and condition fields are often familiar from the industrial-technical project and can be used for the supplementary business curriculum. If you need more information consult relevant publications.

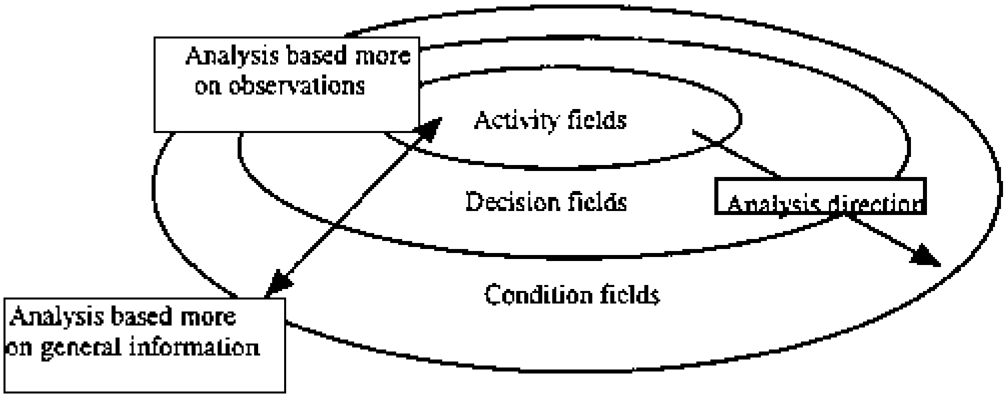

Figure 6: The general method of occupational and activities analysis

Gearing to working and occupational reality
Personal qualities for curricular work

That curricular work should be geared to real working and occupational life sounds obvious, but it is not. Very often curricular work proceeds quite differently by starting from existing curricula or training regulations from the industrial nations and then looking for topics for supplementary business training of technicians or craftsmen suitable for the special conditions in the pertinent country: we are prisoners of our own European training or biased due to our experience in other emerging economies. We must always bear these subjective factors in mind in curricular work and put them into perspective. If we do not, certain facile decision-making patterns will be applied to the question in hand. 'The topics in procurement, stockkeeping and sales are basically suitable for the training but they must be simplified.' Or, certain topics are selected from local curricula, which appear suitable on the face of it. Many mistakes can obviously be made in this way.

So it is essential to familiarize yourself with that segment of working reality in the pertinent country to qualified trainees from your own industrial-technical training courses to be able to give the supplementary business training a precise shape. You need to be wary of a misapprehension here: particularly at the level of the activities and preconditions analysis to keep returning to the basic question of supplementary business training, i.e. to a planning step that has already been decided. It is in our view very unlikely that the basic decision taken will be revoked. The technical and business experts in the curricular work groups are far too familiar with working conditions in 'their' country for this to happen. The main point in the occupational and activities analysis is to give shape to the basic decision taken. For this we need help and supplementary information. We obtain this from the work activities, we are training the technicians and craftsmen for. We ask ourselves how the motor vehicle technician usually works in his/her country and whether our qualified trainees are qualified for this. The same applies for electricians, carpenters, mechanics, dressmakers.

Visits to companies

To do this we must have a look at the various kinds of firms that are important for our project to gain an impression of the business components of technical and craft activities in these areas. Do not confuse this with preparing a sector study. Your observations must be far more specific: because you know the training courses you can target the economic and operative working conditions to which they refer. It is important not to confine our attention to formal industrial working conditions. This holds especially for emerging economies, where the industrial sector is not growing as expected. Our surveys are always spot checks. It is a good idea to prepare the company visit but this is not always necessary. Own observations must be supported and supplemented by discussions with owners and managers. The project's business expert may be familiar with local working conditions but he/she too will have to re-examine his/her experience to locate interfaces between technical and business aspects in the individual technical-crafts activities.

Examples for the activities analysis

Here are some examples for the activities analysis, which should be concerned with interrelations between activities and not with dissecting individual (small) elements: what is the structure of micro enterprises where locksmiths weld gates and windows, how do they obtain and finance their materials, how is the work organized, do they make notes for their work, do they know something about turnover, profits, who are their clients, how do they obtain orders, can they calculate and how, how many employees do they have or are they one-person businesses?

Or: we observe joiners and upholsterers fabricating tables and chairs. We see how wood is stored in a plastic sheet under a canopy exposed to the weather, ask ourselves how to run an efficient inventory. The same applies for the sales side. Finished stools and chairs are piled up in a shack. Surely these craftsmen need to know something about efficient storage or we should ask what induced them to keep such a large stock. We then see how the craftsmen are sitting in a row in the workyard working on one chair from start to finish. There is no division of labour. These craftsmen surely need to learn something about efficient work organisation.

Or: We visit the repair workshop of a local railway line. We go to the warehouse and examine the inventory system and records (index files, inventory accounts). This gives us a picture of the kind and level of stockkeeping and inventory accounting. We could cite many more examples. Does it make sense to provide technical consultancy in development projects at all without economic components, etc.? The examples however make plain that valid curricular decisions can be made from clusters of such examples.

Key questions for the qualitative activities analysis 40
Key question areas

Under the working conditions for industrial-technical projects in vocational training assistance, we advocate a qualitative activities analysis. We propose key questions to guide our observations and questions. Key question areas in our experience are:

1. Management
2. Procurement
3. Stockkeeping
4. Production/service organization
5. Sales

Examples of key questions

Owing to the economic and operative specifics we do not want to go through the key question catalogue in detail but just cite examples. They always address interfaces between technical and business work operations and should concentrate less on details and more on the overall picture.

• How do companies obtain and record information on prices for their input materials? (key question area 2)

• How does the enterprise price its product or service? (key question area 4)

• How is information on competitor prices for own products obtained? (key question area 5)

• Can the enterprise negotiate, when and how? (key question areas 2 and 5)

• Are production inputs or finished products stored and what is the inventory method? (key question area 3)

• How are stocks financed, can the company obtain credit from customers, suppliers, banks or other persons (or advance payments)? (key question area 3)

By making these observations we can learn about the interfaces between industrial-technical work processes and accompanying business activities in procurement, stockkeeping, production and sales and from this sort out key topics for the supplementary business curriculum. We also come across the level of business techniques (e.g. hardly any records) and thus find indicators for the level of learning process (e.g. what to impart in bookkeeping). Then what we do not do is take a textbook on the system and instruments of double-item bookkeeping and simplify that while retaining the overall system: we start from reality and confine ourselves to 'minimum' bookkeeping - elementary but systematic and consistent records (e.g. simple cash accounting).

Tips on visiting companies

If possible it is best to have two observers who can sit down after the relatively brief visits and talk about what they have seen and make notes on the main points. Our experience shows that it is not essential to conduct the observations according to a set system since the range of spot checks from the informal to the formal sector and from micro to large-scale enterprise cannot fit into an all-embracing system. We have simply kept to the rough parameters of operating functions. Also it is better to note the individual qualitative observations based on the single-case specifics and then standardize these later. This is important for subsequent curricular work and feeds into the information base of the other members of the curricular work group.

Our own observations or conclusions from the previous experience of business experts or technical experts as well are the starting point and centre of the occupational and activities analysis. We have suggested that our own observations and experience should be the point of departure before the economic and company structure (the determinants from the condition and decision fields) is examined further on the basis of the available material. This is done though at curricular problem points, i.e. selectively. In addition to our own experience and observations another major step is to discuss with European managers, engineers or master craftsmen working in the country. This is also a way of corroborating our own observations. Observations in the activity field can of course only provide a company-centred and often random vantage point, although a cross-section can be drawn from a series of observations.

Supplementing observation findings

So we have to supplement our observations and conclusions with analyses. We can draw on documents in emerging economies for this: national studies and publications, sector studies, statistical material, project appraisal and feasibility studies, development planning policy, regional and branch studies. You must assess their information value but the local experts can apply the necessary criteria thanks to their experience from the technical project. You know that national development plans, labour market figures, economic data, regional data, etc., have to be carefully evaluated. In our view, they should not take on a separate role in planning the occupational and activities analysis and should only be used for evaluation. They should be used to clear up doubts and corroborate statements on development trends. After analyzing the activity field the curricular work group (CWG) draws up a list of open questions to be answered by different members as allocated tasks and then evaluated and compiled in the CWG.

Systematizing the activities analysis

Now comes the concluding systematization step in the CWG. The business activities that are or could be important for the industrial-technical training course must be described (not broken down in too much detail). Here we link the connection points for business training in the industrial-technical project assessed in planning step 1 with business activity elements in working life identified in planning step 2. Let us illustrate this combination with an example. A study of the full-time school training course for joiners underscored the need for supplementary business training. In the timber warehouse the trainees learnt about the technical side of inventory and wood storage, using woodworking machines they learnt rational methods of woodworking and machining, they learnt how to pre-plan work for fabricating door frames for their own theory classrooms. Interfaces for imparting supplementary business knowledge were located in all these areas (efficient stockkeeping, low-cost production, efficient work pre-planning and design). The activities field analysis then confirmed the need for supplementary business training in this area, also from a practical point of view. Observations revealed uneconomic inventory, few low-cost modes of production, ad-hoc planning of work sequences, etc. The need for business training was found to be greater in foremen activities and especially for self-employed activities in this area. It was also found that supplementary business training was necessary up to the level of large-scale enterprise with its systematic division of labour. As however in the case in point the activity in this kind of enterprise was an exception, a look at the working relations gave clear confirmation of the need for supplementary business training.

Altogether, this phase showed that the industrial-technical and concomitant business sides are nearly always linked by frequent interfaces.

This applies above all for material procurement, stockkeeping, organization of production and repair operations, quality assurance, sales planning, cost controlling, costing and bookkeeping. In addition to this confirmation, the activities analysis served another purpose: it determined the level of activities and therefore pointed to what industrial-technical operations were particularly well suited to link up with business learning and the scope and level for this. This gives us major criteria to select and break down the general topics proposed by business didactics. It was also confirmed that business topics should not just lock in at interfaces, but that tasks and exercises should be geared in particular to specific occupations in training (trade-related).

3rd planning step: Qualifications analysis

We must now of course build a bridge between the job requirements described and the qualifications of the job holder. This planning step is taken inside the CWG (curricular work group). Qualification needs defining more closely.

Definition: By ***qualification*** we mean the sum of all knowledge, abilities and skills acquired by manpower or it must acquire to perform an occupational activity.

Job requirements qualifications

In this connection we must beware of drawing too direct and close a link between job requirements and qualifications. Otherwise we are in danger of making fictitious statements where tasks or routines are simply converted into qualifications by adding 'ability to...' or 'skill of...'. This explains nothing and gives us absurd statements like we need the skills to run a machine to run a machine.

We need to stress here that identifying work activities does not solve the problem of the requisite qualifications. Rather, we have to ask what knowledge, abilities and skills are needed to meet the activity requirements. What must I be able to do to meet the work requirements. Work activities in vocational training courses are a suitable approach but then we have to look behind the work requirements, so to speak. They are a kind of surface - the level of activity - hiding the qualification level which we must decipher. The key question is: 'What must the workers be able to do to perform the work tasks?' or from the training standpoint, 'What must the trainees learn to perform the later work tasks?' The qualifications behind the work activities are always more extensive than the work activity we see. This applies even for simple work. If after watching a stockist entering information into the inventory records we break down the work activity we see clearly how many different qualifications it entails: diligence, precision, motivation, skill, knowledge, control etc. Therefore we cannot logically infer qualifications from work activities (deduction); instead we must look backwards: what qualifications from a large cluster of qualifications can we usefully assign to a work activity or work context.

Observing work activities

Work activities are (only) an aid in this connection. That is why we must not take too narrow a view of the work activity but look at the broader activity context, as in stockkeeping for example, to assign qualifications. The observation of work activities should not be overdone in hindsight. It serves three main purposes:

1. Re-linking business qualification findings back to work activities (relevance to real life)

2. Locating the levels of these work activities (starting point for auricular work, which of course goes beyond this)

3. Identifying and outlining business work fields, but not drafting engineer type lists of work activities (grouping instead of separating)

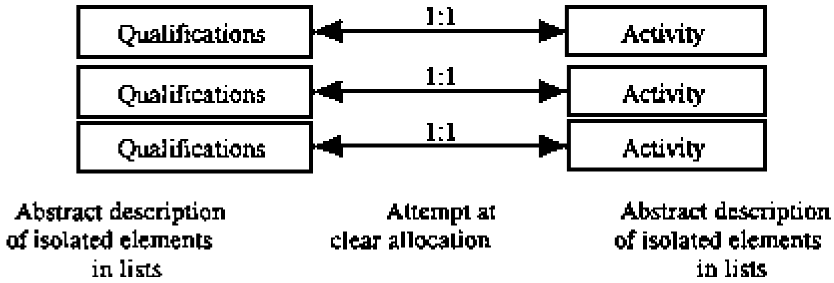
Danger of planning to perfection

And here comes a very important point: in open-ended curriculum development, the CWG should not suddenly aim for perfection in planning. Despite all our good intentions, though, we will fall into this trap if we now start to analyze stockkeeping work activities with the precision of a time-and-motion study to find the qualifications. Identifying work activities in the planning phase 2 -occupational and activities analysis - had under conditions of curricular work in a vocational training project sensibly relied on qualitative observations and interviews. The only outcome could therefore be to identify the main intersection points for business activities in the setting of technical-craft work processes and determine their work level, which of course also affects the learning level.

So we must assign qualifications to activity clusters (= jobs or work sequences) instead of individual activity elements.

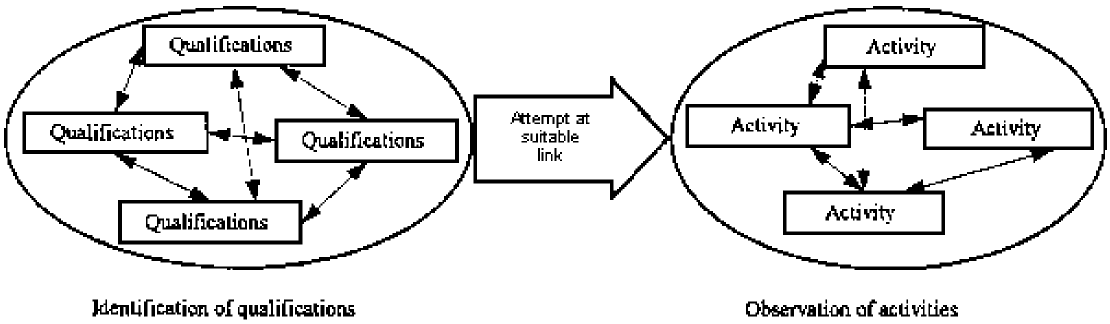
Figure 7: Assigning qualifications and activities

Not like this:



Figure

Like this:



Figure

It is a help here to concentrate on interface areas when deciding on assigning qualifications and sort these out (procurement, stockkeeping, production/repair, sales, management). We assign the qualifications to these areas and the work activities entailed (jobs, work sequences). From what box do we now take the qualifications? To give the procedure a structure and make it easier to follow it is best to order the different qualifications.

Qualification matrix

For this we use a qualification matrix consisting of core and peripheral zones. The core zone contains the job knowledge and skills which however are always derived from a broader context. So it is appropriate in learning processes to impart skills and knowledge pertaining to the whole of inventory management although in working practice (here: stockkeeping) only plain inventory index cards are used. The relevance to working reality and work level must however be preserved.

The core zone of job knowledge and skills is supplemented by organizational knowledge (here: stockkeeping and adjacent departments), such as information channels, other workplaces, other work areas with which the stockist has to cooperate closely, such as procurement.

From the analysis of the job and organizational knowledge we gain the major topic areas of the supplementary business curriculum for further curricular work (here: inventory management). They provide the basis for specialist training.

The job and work organization knowledge and skills are supplemented by three more qualification areas that are essential preconditions:

1. The qualification area **mental abilities,** such as the ability to analyze facts, planning ability, decision-making ability, ability to grasp relations, etc.

2. The qualification area **work qualities,** such as diligence, punctuality, precision, care, orderliness, etc.

3. The qualification area **attitudes to enterprise,** such as interest in the work, satisfaction, motivation, etc.

Specialist and social qualifications

The qualification areas of job and organizational knowledge and skills as well as mental abilities are specialist qualifications. Work qualities and attitudes to enterprise are social qualifications.

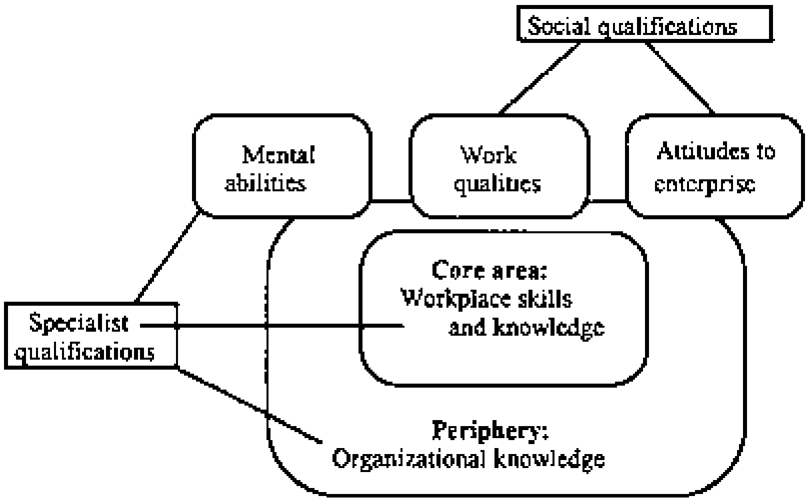


Figure 8: Qualification matrix

In qualifications for the supplementary business curriculum our initial concern is to draw up a very basic description of the abilities needed by qualified industrial-technical trainees to perform supplementary business tasks. They will be broken down in more detail later when specifying learning goals and topics. We shall now return to the model key question list from the activities analysis and give model answers to show what qualifications are needed for selected work tasks (how the allocation of qualifications might look).

Example from the key question list for activities analysis
Are production materials or finished products stored and what is the inventory system? (key question area 3)
Findings of the activities and work sequence analysis
Observations in a furniture makers revealed: restricted purchasing and sales stockrooms do exist and elementary inventory records are kept, but with gaps. No other records such as delivery receipts are kept nor are there even basic rules for inspecting incoming goods. There are no regulations on minimum and maximum inventory, etc. There is only a superficial link between stockkeeping, purchasing and sales.
Qualifications analysis
Job knowledge and skills: knowledge of merchandise, knowledge of inventory system, knowledge of how inventory index files work, booking incoming and outgoing merchandise, know the relationship between physical and bookkeeping inventory
Organizational knowledge: knowledge about location of stockroom in the company's operations sequence, knowledge of the role of stockkeeping for purchasing and sales, knowledge about ways of cooperating with procurement and sales
Mental abilities: Gain an overall picture of inventory processes, understand the interlink between procurement and inventory, analyze inventory levels and assess their importance
Work qualities: Precision when recording incoming and outgoing goods
Attitudes to enterprise: Interest in efficient stockkeeping

Empirical qualifications analysis
Normative qualifications analysis

So far, the qualifications analysis has been empirical. We assign qualifications to an observed work activity. So the qualifications are situated at the level we encounter. The level of stockkeeping activity in a cross-section of several micro and small enterprises might of course be higher, so we propose not switching from an empirical to a normative qualifications analysis (what qualifications are needed to perform a given work task better) until a cross-section has been made of the empirical qualification profiles. In emerging nations though we will in our training - and in the supplementary business training - be concerned with improving company practice by imparting higher qualifications to our trainees. This is why we must supplement the empirical qualifications analysis with normative qualifications analysis. That means we must think about what additional qualifications we must impart to our qualified trainees to improve stockkeeping in companies.

Surplus qualifications

It is however important to link empirical and normative qualifications analysis to keep in touch with working reality in an emerging nation and not just look down from the high normative ground of excellence to determine abstract qualification levels. This approach falls wide of the actual need for supplementary business training from the vantage point of the emerging nation and specific training courses and goals. We can call the normative qualification elements surplus qualifications for the development of a country, its enterprises and trainees.

Qualifications lead

We must account for changing trends in current requirements. Imparting surplus qualifications in industrial-technical projects as part of vocational training assistance for emerging economies is in fact standard, because a declared policy goal is to take industrial-technical abilities beyond the present level in the emerging nation. The activities analysis and empirical qualifications analysis ensure that the qualifications lead over the national standards is not over-large and that the reference point is the emerging nation and not the industrial country.

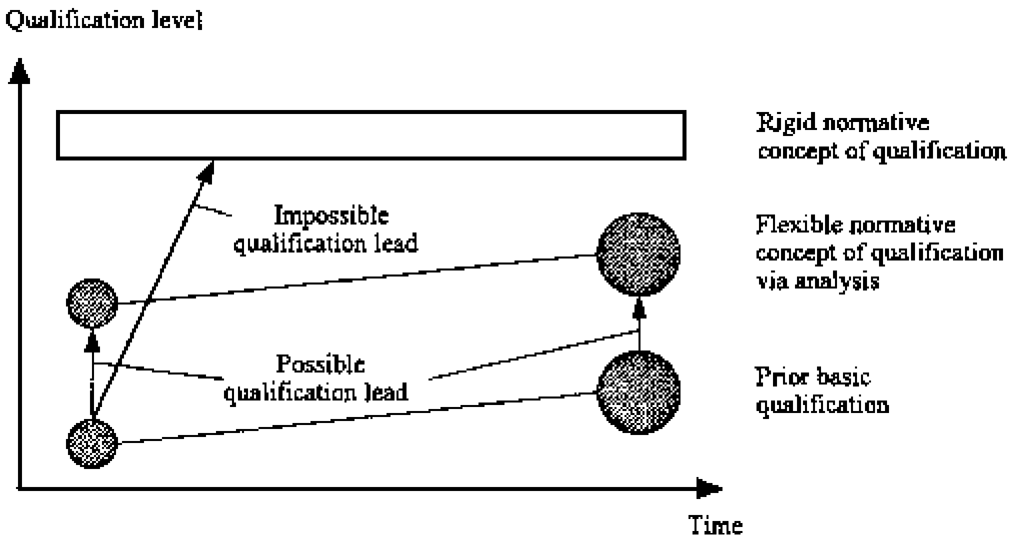

Figure 9: Normative and empirical notion of qualification

Whereas we in Germany assume that qualified trainees will be able to keep pace with technical advances in their working conditions thanks to surplus qualifications, qualified trainees from vocational training development projects are often faced with having to adapt in the reverse direction (as compared with the qualifications they have acquired) to less advanced working conditions (within certain temporary limits). This ability to adapt is crucial for the qualification potential of manpower.

At the end of the qualifications analysis the empirical qualification cross-sections must be collated with the normative definition of qualifications to obtain the necessary change in existing working conditions. For stockkeeping, we finally have a clear overhang in the normative qualification elements compared with the actual qualification, though we must keep these in proportion (otherwise we can simply choose a textbook, which would be of no practical use to the learners). Collating the two qualification elements in our stockkeeping example gives the following key knowledge areas:

- Organizing receipt and inspection of materials
- Recognizing link between type of good and stockkeeping technique
- Recording outgoing goods
- Introducing stock files
- Recording inventory changes and indicating reorder points

With this qualifications list, we then proceed to the next planning steps and break them down in more detail.

Though we shall not develop them in detail here, similar qualification lists result from the other areas of the work activities analysis.

1. Management
2. Procurement
3. Stockkeeping (as an example)
4. Production/service organisation
5. Sales

Qualification lists
Training modules

With this method we finally come to business training modules for technicians that centre on the five listed operative functions. Reading these qualification lists we see the need to supplement the function-oriented lists with interfunctional qualification lists. These stem from the interfunctional qualification elements such as bookkeeping knowledge (needed amongst other things for inventory accounting, related here then to the function-tied qualification list for inventory), knowledge in pricing and costing, knowledge in finance and auditing, knowledge of legal provisions. Altogether we arrive at a set of 10 to 12 business training modules under our curricular conditions. They will need to be adapted more closely to the specific training conditions for technicians in business areas in a specific country and specific government approved trades, the closer we finally come to teaching and training planning in keeping with the curriculum.

4th planning step: Preconditions analysis

In the 4th planning step we look at the preconditions for supplementary business training stemming from organization of the industrial-technical training project and the prior education of the trainees.

Let us recall three principles:

1. The original project approach - to impart industrial-technical qualifications - must not be jeopardized.

2. Keep in mind that we are offering supplementary training as a flanking measure to improve employment prospects on the labour market for industrial-technical qualifications or in other occupational sectors.

3. Do not allow the business training, which is essentially a supplementary qualification, to become a self-sustaining separate project in the minds of the trainees, in the planning of the executing agency or project staff or in the teaching.

Organization of the industrial-technical project

The point of departure for thinking about instigating supplementary business training is the industrial-technical project and its training courses. We recall that close links exist in micro, small and medium-sized enterprises between the technical, administrative and market operations and there are accordingly suitable openings for supplementary business training. So we must examine our industrial-technical training courses to find out whether they are suitable as a 'peg' for supplementary business knowledge in procurement, sales, stockkeeping, production and services, etc. Here we come across distinctions largely stemming from the organization of the industrial-technical project (full-time vocational school with workshop training, full-time vocational school with workshop training and limited market links, vocational production school, basic vocational training for dressmakers, etc.). The organizational form decides on the openings for an integrated supplementary training. These are basically greater in a production school than in a 'normal' full-time vocational school.

Let us illustrate this with an example: If during training for electricians, motor-vehicle technicians, joiners, bricklayers in a full-time vocational school with workshop training after the first two years of a course-type occupational theory and practice training, products, technical and repair services are sold on the market or made use of in the school, we have got suitable interfaces for business training. Having the school rooms extended and renovated by the trainees in the third training year or car repairs in the school workshop for customers afford many interfaces to integrate business learning topics such as construction and repair costing, procurement and stocking of building materials and inventory costing, imputed costs, handling and planning orders, etc. Obviously, the relevance to production, market and activity particularly from a motivation standpoint makes sure the trainees see the practical utility of business topics and learn them.

Strong points of production school training

Production school training has a number of clear advantages:

• It is geared to procurement and sales.

• It is geared to prescribed national standards (technical, business, management).

• It is geared to activities in relation to work and learning objects?

• It adopts a holistic approach to technical, business and management activities.

• It is geared to a rational organization of work and marketing and provides criteria for selecting suitable activity blocs and topics.

• Work is linked to learning.

• The training fosters self-reliance in the trainees (elements of self-organization of work and learning).

• The production school is a model for later occupational activities and thus facilitates the transfer from learning to applied reality.

Project-type business training

We have listed the strong points to point to the basic principles governing supplementary business training - regardless of the organizational form of industrial-technical training. For all types of organizations we propose conducting the business training as a project. For this we need to establish the necessary organizational conditions for the industrial-technical training which is run as a course in theory and practice. These are project elements suitable for combination with the supplementary business training. The systematic imparting of business knowledge and patterns of activity should in turn be geared to this by having the systematic phases culminate in such a project. On the other hand, the search for suitable intersections for supplementary business training and its combination with the industrial-technical project should not be confined to productive or project-type training phases. All phases of the industrial-technical training should be examined to see if they can be combined with supplementary business training, including workshop and theory courses. (More on this in the planning phase: learning organization).

Role of government-approved occupations

The government-approved occupations (trades) also play a major role in the project. To be of practical use, the supplementary business training topics must link up with these. It is wrong for supplementary business knowledge to ignore the marked practical differences between an electrician costing the production of an electric cooker, a carpenter working out the costs of a roof and a motor-vehicle mechanic itemizing the costs of new brakes. Business training is making a serious error when it reverts to imparting a diluted, abstract costing system. Of course, the CWG must see whether certain basic business knowledge must be imparted in an inter-occupational course before specializing into occupations, but the basic point remains: the CWG must vet business training and its prospects in the project from an occupational standpoint. If it fails to do this, the opportunity for practical business training in tandem with technical training will be lost.

Trainer tasks

In this phase we also need to allocate clearly defined tasks to the trainers. The basic decisions taken in the organization of curricular work must be specified. The necessary platform for this has been built in the previously described preconditions analysis at curricular level (project possibilities). We can now estimate the overall need for supplementary training and in what areas we can start developing modules in line with the requirements in the industrial-technical training courses. This step is important to prevent business planning from going off on its own and lapsing into the traditional pattern of business course planning. Typical for this kind of planning attitude is to proceed from business decisions at management level and then turn to individual functional areas (procurement, stockkeeping, etc.).

In view of the different training courses, it is not easy to match up the different preconditions. One option is to locate the business training in the third year, draw on the acquired technical knowledge, couple it with business knowledge and prepare an integrated project. This basic decision makes sure the industrial-technical training course and its preconditions exert a formative influence on the curriculum. This also pre-shapes the work of the business experts, who in turn must allocate tasks in the team (e.g. a European businessman familiar with the country and two local teachers). The work assignment will of course depend on the abilities of the local teachers. We have found that the national standards of business training and methods play a major role in drafting the business curriculum. They pose almost insurmountable barriers (e.g. a kind of arrogance that clings to basic knowledge) and interventions must be continually made here. This holds for practically all planning up to the teaching stages. The most effective way to do this is for the industrial-technical project side to point out the very tangible interests of the project in supplementary business training.

Prior education of trainees

Lastly, we also need to assess the prior education of the trainees. A good general education is more conducive to grasping more abstract business topics which call a certain degree of imagination. Where the level of prior education is low, it is all the more important to gear business training to industrial-technical practice and conduct it in a straightforward way in line with the project.

5th planning step: Business didactics analysis

Business didactics as an aid
Danger of business

In planning step 5 the CWG turns to business didactics and its suggestions for designing business learning processes. It is natural for us to look for assistance here to perform our curricular task. Business didactics deals with the question of what business topics are important for business training and further training and how to arrange and present them for effective learning. What we have to answer for our technical-business curriculum project at the particular level it tries to answer at the more general level. However there are many kinds of business didactics. Amidst the (endless) range of options, we can pinpoint two criteria to help develop a supplementary business curriculum. First, you must assign business knowledge and activity patterns to a typical level of activity and second you must keep to the sequence we developed in the previous planning steps: scale of enterprise - industrial-technical training - interfaces between technical and business aspects - business activity requirements - business training topics. This will make sure that when we turn to business didactics and the underlying economic theory we are not overwhelmed by the broad array of major topics, otherwise the curricular decisions already made (planning steps 1-4) will be ineffective. This is why it is important to recall the findings in these phases: they are the reasoning behind the project requirements of business knowledge and activity patterns.

Specifics of business activity
Danger of abstraction
Levels of business activity

Now what in short does the CWG need to remember about the specifics of a business activity? Unlike physical production and repair, business activity is of its nature intangible. As it does not result in a tangible object (costs, efficiency, profit are symbols), there is a danger of business teaching getting stuck at a symbolic-abstract level, over-generalizing and losing touch with the real, tangible objects and work activities in the industrial-technical sector (costing with fictional figures for example instead of calculating the costs of manufacturing a product). Business training must therefore always link back to real processes. This is also necessitated by the basic nature of business activities: business activities is the abstract presentation of real activity sequences in material procurement, production, repair, stockkeeping, etc. by collecting and recording data, organizing, collating and interpreting data, processing data to information, evaluating, working out alternatives and taking decisions. This process can be broken down into different levels of business activity structured bottom up. The levels of activity are important for ordering our curricular planning and as a selection yardstick for business knowledge: obviously our curricular project seldom encompasses all levels of activity.

1st level of activity: Business routines

This level pertains to recording, collecting, organizing and collating certain data. These are straightforward activities such as writing vouchers, orders, offers and bills, making entries into accounts, keeping inventory records, recording work times and calculating pay, etc. The output at this level is the indispensable basis for business activities at the next - planning and decision-making. Practice-centred training such as the dual business training in Germany usually starts at this level, but often fails to link up with business reality and the subsequent levels.

2nd level of activity: Ongoing business decisions

These are decisions closely connected to daily business routines, such as reminders, setting delivery dates for different customers, checking inventories and stocking. As these activities call for a basic knowledge of contractual law and mathematics to calculate the rate of inventory turnover, profit or loss on interest, much of this level is the subject of training theory (which in turn is conducted in training practice in schools in nearly all countries with no practical relevance and often divorced from the routines level).

3rd level of activity: Directing decisions

This level is where largely medium-term decisions are taken such as a company's general payment and delivery terms, payrolling, production lots of an article, choice of supplier, basic costing. This level is usually only imparted in training measures outside the practice-centred initial vocational training.

4th level of activity: Constitutive decisions

This level has to do with all questions of setting up a business and long-term management such as decisions on location, range of products, finance, outlay for fixed assets, personnel. This level is only dealt with in theory, but is often accorded inordinate importance in training partly because of the frequent abstract bias of academic business economics.

Matching up with the goals of industrial-technical training

Selecting suitable levels of activity

We now turn to selecting suitable levels of activity of later relevance for the qualified trainees of our technical-business curriculum and training projects. This is useful to reduce the circle of business knowledge and activity patterns. We also include the levels of industrial-technical work activities here to highlight the parallel relations between technical and business levels of activity for our target group.

Technical training usually starts at the level of basic technical skills (level of technical routines) to proceed in a subsequent step to specialist training for qualified skilled workers or craftsmen such as industrial mechanic, electronics technician or electrician (we call this the constructive-productive level). Then comes the training as foreman or master craftsman (= productive-planning level). This can be located at the constructive-productive level but is not a direct qualification goal. The same holds for the higher level of engineer (level of technical development). If we compare these intentions of technical training with the business level of activity we see that GTZ training projects with integrated supplementary business training are each situated at the lower two levels of activity.

The following figure will illustrate this:

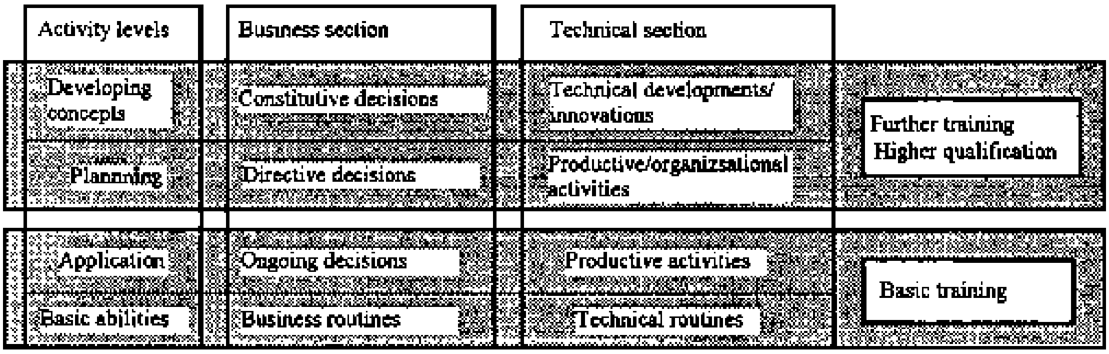

Figure 10: Parallel relationship of business and technical levels of activity

Activity process as training subject

This figure shows that it makes no sense for the technical project to stick to the level of individual skills (technical routines) and training modules in the supplementary business training for example to focus on imparting basic planning and decision-making ability in organizing the marketing of products and services. The supplementary business training usually addresses this level, however (ongoing business decisions). The intentions of the industrial-technical training must also coincide with this goal, i.e. impart planning and decision-making ability in technical situations (level of productive activities). Only when training takes as its subject an activity process, that is, a systematic sequence and connection of single industrial-technical activities, can we draw **a** meaningful curricular link between technical and business elements in training.

Scale of enterprise as reference point for selection decisions in business didactics

Role of scale of enterprise

Business didactics also points to a typical correlation between the role of the level of activity for the training and the scale of enterprise. We must bear in mind, though, that our target group must in part be enabled to enter self-employment after passing out in the form of a small or micro enterprise. So we should not lose sight of the level of constitutive decisions **as** a (secondary) perspective. It is more important, however, to impart basic knowledge of modes of work at the lower levels since these are prerequisites for running **a** business properly and securing its medium-term survival. This is also therefore our starting point for developing a supplementary business training module for technicians/craftsmen.

Beyond this basic decision we must again call to mind here the curricular decisions of the activities, qualifications and preconditions analyses and link these with business didactics issues (what activities and knowledge are important for the business sector by scale of enterprise). If we collate these findings we obtain the following matrix based on the previous curricular decisions (concentration on micro, small and medium-sized enterprises):

Scale of enterprise	Medium-sized enterprise	Small and micro enterprises
Goals of vocational training assistance	Enhancing or developing national competitiveness by promoting medium-sized business, especially in product quality and innovation, Raising market opportunities Economic stabilization of enterprises and market relations	Developing market structures by founding and extending businesses, Promoting product development, Systematising and enlarging production
Goals of technical training	Training and further training of skilled workers and master craftsmen largely activity fields and industrial areas important for national development and national industrial areas, Level: improvements geared to qualification levels and patterns as in the industrial nations	Training industrial-technical skilled manpower at appropriate level with pronounced regional accent
Major technical-business interfaces	Organization and administration combined with strategic production planning geared to procurement and sales markets	The entire management of the enterprise
Business activity requirements	Ability to organize and control the systematic recording of production data and help evaluate production, procurement and sales planning	Ability to set up a simple business administration to monitor finances, inventory, procurement and sales opportunities, negotiate procurement and sales and acquire and evaluate market information for product design and production development
Integration zone: Business training topics	Basic business organization and management, production data collection as part of production planning and procurement and sales organization, techniques of production development, quality assurance and maximizing production efficiency	Basic bookkeeping and financial planning, inventory, basic commercial correspondence, locational planning, production planning, cost control and costing, techniques of market surveillance and advertizing, basic contractual, employment and fiscal law

Knowledge items

Accounting for the completed curricular planning steps - in particular scale of enterprise and integrating technical and business training - the business didactics findings in combination with prior planning steps bring us to the conclusion that the business training modules for small and micro enterprises must centre on the following basic knowledge blocs:

- Basic bookkeeping
- Finance and financial planning
- Inventory and inventory planning
- Basic commercial correspondence
- Market surveillance and advertizing
- Production planning, product development, product improvement and quality assurance
- Locational planning

• Procurement and procurement planning

• Basic business organization and management

• Costing, pricing, calculation

• Basic contractual, employment and tax law

These are the knowledge blocs in business didactics that belong to the basic knowledge inventory. Their 'inner' design should not, however, be detached from the design criteria described in the curricular activities and qualifications analysis for a supplementary technical-business curriculum. This is the reference line to medium-sized, small and micro enterprises and the link between abstract business knowledge and activity patterns with real industrial-technical processes.

Construction faults when designing business training modules

For the internal shape of the training module business didactics proffer some more important pointers that are decisive for the effectiveness of learning business topics. Above all our business didactics is opposed to imparting highly abstract business knowledge (as is unfortunately usual in almost all countries under the influence of academic business economics. This applies in particular to emerging economies which emulate this 'theory syndrome' which is underpinned by business teachers who have usually only been trained in 'theory'). The CWG should therefore always account for the following business didactics principles when designing curricula and learning aids and constructing the business training module, because they are vital to the effectiveness and practical utility of the supplementary business training. You need to avoid the following construction faults when developing business training modules.

Fault 1: Gearing the topic routes to all kinds of lists

Terms as compressed knowledge
'Remobilizing' concepts/terms

Economic/business topics tend to ossify in concepts and terms and tread the same old paths. A job of learning, though, is to call the established system of terms and definitions into question and remobilize it. Terms/concepts are highly compressed knowledge, but we must ask what activities have shaped them or are included in them in compact form. The term 'internal finance' for example comprises a host of financial activities and decisions. So there is no point just detailing such terms in training modules and teaching: internal finance is broken down into equity finance and internal generation of funds, etc. etc. What, though, do we mean by remobilizing a rigid structure of ideas/terms? Let us imagine terms/concepts as compressed structural images of business activities that have come about or have 'grown' out of a chain of activities.

Rigid didactics

A useful metaphor is the passage of the seasons. In spring we sow, in summer the crops ripen and in autumn they are harvested. There is nothing wrong with ordering the harvest in the barns and making an inventory but when the harvest is continuously ordered and recorded in new lists/indices (classifications, checklists) all we are doing in this kind of business didactics is looking backwards and rummaging about in lists, our approach is stationary. We do not ask about the genesis of something, what activities brought it about, what it is for, what conditions have to be met for something to come into existence. Ordering concepts/terms is like sorting cans by shape and label, etc. How the contents got into the can, how it was processed, what it is for - these questions are not posed. This is what we are driving at with the image of a rigid didactics of autumn. Economic theory teaching follows this pattern in almost all countries and orders concepts/terms in classes, checklists, advantages and disadvantages, arbitrary interrelationships and tends to make distinctions beyond the immediate teaching goal depending on what it has 'in stock'.

So we propose looking first at economic/business reality, activities, genesis and use and then at terms and concepts. The terminological/conceptual order is the outcome of reflection on economic/business operations, never the beginning. Economic/business theory should therefore not centre around terms and concepts.

Fault 2: Methodological window dressing

Faced with ossified topic structures, we reach here for the 'helping hand' of methodological presentation techniques to arouse the interest of the learners. We use interesting or amusing lead-ins to make the frugal fare of abstract concepts more appetizing. Improving topics must therefore go hand in hand with method skills. Otherwise we are just filling new bottles with old wine.

Example:

Wage negotiations are being simulated with role play. After half an hour, the teacher stops the game and explains what pay scales look like and how the role players fit into these.

The role play could however continue by asking the trainees to find differences between the role players and draft their own pay scales.

These could then be compared with the teacher's system.

Fault 3: Insufficient account of learners' experience

'Remobilizing' cognitive structures

As well as remobilizing the teaching topics we also have to 'break up' the cognitive structures of the learners. To overlook this is a serious fault because it is based on the misconception that we can teach the trainees the new information by simply 'overwriting' the existing (naive) structures in their minds like on a computer disk. It is not enough to proceed from a vague idea of learner experience. Rather, we have to get to know the learners' cognitive patterns while teaching and find out what images and screenplays colour the ways they already interpret economic/business processes. Only when we as teachers cater for these patterns will the trainees make learning progress which will also have a meaning to them.

In short: learning = experience + information.

Fault 4: Lack of economic/business expertise

If most of what a teacher/trainer knows about a subject is to follow the topic routes in the school text books, he/she will not be able to do much more than slavishly obey the curricular instructions and rigid patterns in the learning aids. Only when we have a clear picture of the subject can we ask the right questions. For example: Why does the standard approach to 'customs duties' confine itself to a definition (fiscal charges on imported or exported merchandise), classifying types of duty and perhaps compiling the documents to be submitted to the customs office? Does this help us to understand how domestic markets come about, do we grasp why and when customs duties came to be levied in all the different nations and the general social and political models they are based on? Do we appreciate the countless difficulties and distortions involved in reforming or abolishing the international customs system? If you feel these questions overstep the mark, you are forgetting that every subject gives rise to countless topics. No curriculum obliges us to reduce customs duties to a set of definitions and categories!

So we advise the readers of our guide to think about the economic conditions and practice in their country so as to lay the foundation for sound, realistic teaching.

Recap

The CWG must return to these business didactics pointers for developing learning organization - topics and method. The curricular planning so far is pointless if the CWG makes the same construction errors when developing individual modules and builds an abstract prefabricated European house. Our job is not to assemble imported, highly specialized ready-made components; we have to find, process and shape local building materials and build a house with a national architecture. The craftsman needs suitable materials and tools for this and the businessman national information and forms (job time cards, inventory record cards, settlement sheets, accounts...). We have to make sure these are suitable.

6th planning step: Goal and learning goal analysis

Planning principles

Decision fields

At this point the CWG enters the (three) decision fields of curriculum development. It now has a pattern sheet with sharp enough contours to cut out the basic curriculum pattern. CWG proceeds from the rough topics developed, supplements them if necessary as it goes along and assigns to them learning goals to determine the level of learning processes. For this it draws on the findings of the business didactics analysis.

In this planning step remember not to detach the rough learning goals and rough topics from the order established so far. It would be a great step backwards for us simply to sort through the supplementary business training areas and allocate learning goals to them, think up a system that proceeds from the enterprise to the departments and workplaces and their work activities. In the curricular planning steps so far we have adopted another organizational pattern, that we have to account for here. When developing rough learning goals and topics we must recollect three sets of facts that form the decision-making parameters for subsequent development steps. The three determinants of our rough planning are:

Determinant 1: is the curricular goal, 'Making business plans and decisions in industrial-technical work situations'. This obliges us to determine more precisely the kind and scope of business topics in relation to technical training.

Determinant 2: is the scale of enterprise - medium-sized, small and micro enterprise (see planning step 5: Scale of enterprise as reference point for business didactics selection decisions). Here we had pinpointed the key business blocs for a curriculum:

- Basic bookkeeping
- Finance and financial planning
- Inventory and inventory planning
- Basic commercial correspondence
- Market surveillance and advertizing
- Production planning, product development, product improvement and quality assurance
- Locational planning
- Procurement and procurement planning
- Basic business organization and management

• Costing, pricing, calculation

• Basic contractual, employment and tax law

Levels of activity 'routines' and 'ongoing decisions'

Determinant 3: are the levels of activity - (a) the business routines and (b) ongoing business decisions. This is where we determine the level of learning processes. We had also established that the level of activity of the directing and constitutive (structural) decisions for supplementary business curricula do not play a significant role in our framework, but that some elements need to be extracted so to speak to support micro enterprise startups. Basically this can be done by supplementing the levels of activity 'routines' and 'ongoing decisions' in the modules.

These two levels of activity mean for our training module that the CWG goes through two runs in the above topic fields, the first at the routines level, the second at the ongoing decisions level. This is why there are usually two modules (or several depending on the scope of the supplementary business training): the module 'booking' at level 1 and 2, distinguished by the level of learning goals. This gives us an adaptable modular system that can respond differently to different target groups.

Learning goal decisions

Danger of 'learning goal tinkering'

Here are some points on the learning goal decisions the CWG now has to make. Learning goals are statements on the level of learning process we are aiming at. They link topics with learning achievements. Should the trainees simply know about inventory or should they be able to plan it? This makes a difference of course and calls for organizing curriculum learning processes with different key topics at different learning levels. So wording learning goals is not just playing about. On the other hand, there is no area in curricular discussion where the 'curriculum experts' have been as zealous as in their search for suitable learning goal formulas. This has resulted in a goal obsession in curriculum development (learning goal tinkering). We should not, however, flush out the baby with the bathwater. They are and remain important prior information on what awaits the learners. They are landmarks but they forfeit this function if we define too few or too many. We need to find the right measure. Learning goals are also major signposts for the learning aids developer and for assigning topics and tests.

When organizing learning processes in the occupational area we need to keep an eye on the link with occupational activities to avoid developing abstract learning goal systems measured against some criteria of completeness. When defining learning goals the CWG should keep to the basic qualification areas demarcated in the qualifications analysis. This will (1.) make plain that learning goals are intended qualifications and (2.) link up with occupational activity fields. We can order this as follows:

Work role and sectors	Requirements	Qualifications	Learning goal area	Learning goal level
Functional	Workplace	know	Cognitive	Level 1
		execute	psychomotor	No level
	Work organization	know	Cognitive	Level 1
		compare		Level 2
		assess		Level 3
Extra functional	Mental occupational potential	compare	Cognitive	Level 2
		assess		Level 3
		analyze		Level 4
		plan		Level 5
		judge		Level 6
		decide		Level 7
	Work qualities	diligence	Affective	No level
		punctuality		
		precision		
		sense of order		
	Attitudes	Work interest	Affective	No level

Affective learning goal area

This of course is not a perfect model, but no system like this is an end in itself. This model does what it is supposed to do in developing a business curriculum: to link business work requirements and the requisite qualification and learning achievements. For business requirements (unlike technical ones) it makes no sense to work with a deeper skill hierarchy (filing, booking, recording, etc. do not pose special skill requirements, so lets keep to one level. That is enough.). We would be tinkering with learning goals if we broke down the affective learning goal area any further. Let us stick to the everyday meaning of the notions such as diligence, motivation, etc. We are not trying to find out whether the work qualities are supposed to be imitated, internalized or accepted in learning to define related graded affective learning goals. This far exceeds the scope of a supplementary business curriculum. This calls for organizing far longer learning processes. Let us pay attention to precise and reliable bookkeeping, let us foster work motivation when teaching - without overstretching supplementary business curriculum in this area.

Cognitive learning goal area

It only makes sense to make a detailed breakdown in the cognitive learning goal area, because this is where the main area of business qualifications is located. We have used everyday language and avoided complex terminology like reproduction, reorganization, transfer, etc. The advantage of this is that a learning goal like 'compare your own price with competitors' is always easy to understand. Another advantage is that we can save the trouble of translating terms like transfer, etc. The CWG is however free to extend the list of learning goals but beware of 'overloading'.

Framework curriculum for supplementary business training

Rough learning goals and rough topic structure of business training module

With the tools developed, the CWG can now define the rough learning goals for the training modules. It is important here to collate the technical reference point (as far as possible) with the business learning goals and the corresponding topic blocs. (We no longer give reasons for where the learning goals fit into our matrix but of course keep to the wording and assignments proposed there.). The CWG must now organize the work steps in the following way; the modules may need to be altered slightly or supplemented.

	Run 1: Module with focus on business routines level	Run 2: Module with focus on ongoing decisions level
	Module 1.1 Basic costing and planning	**Module 1.2** **Preliminary costing**
Reference point	Technical drawing and parts lists	Technical drawing and parts lists
Rough business learning goals:	The trainees should know and assess quantities (material input: individual materials, ancillary and operating supplies) based on planned output/repair and enter these in a systematic list	Based on a new product, the technical drawing and parts list and in consultation with the trainer, the trainees should jointly plan a systematic cost estimate sheet, fill it out and judge it.
Rough topics	Parts list (quantities), product parts, number/quantity per unit, planned output, total requirements	Preliminary costing of material requirements (quantity cost structure)
	Module 2.1. **Procurement planning**	**Module 2.2** **Procurement planning/vendor card file**
Reference point	Materials technology and technical-qualitative product requirements	Materials technology and technical-qualitative product requirements
Rough business learning goals:	The trainees should know and compare customary procurement sources and be able to draw up a list of alternative suppliers (delivery times, quality, prices, terms of payment)	Based on the information obtained in Module 2.1, the trainees should draw up a vendor card file, assess other supply sources and extend the file. They should judge supply options based on the file.
Rough topic	List of suppliers	Vendor card file and decision on supplier; decision criteria such as: • Availability of material • Quality • Price • Transport facilities
	Module 3.1 **Financial planning**	**Module 3.2** **Finance**
Reference point.	./.	./.
Rough business learning goals	The trainees should know and compare finance requirements for procurement or instalments and compare possible sources of finance (e.g. judge the necessary advance payment by the customer)	Beyond the local types of finance (cash), the trainees should know and assess kinds of finance (current account, loan, bill of exchange, etc.). They should also combine basic legal aspects with these (lending law, securities, formal provisions, etc.)
Rough topics	List of sources of finance	Types of finance - decision on finance Decision criteria such as: • Interest • Term • Securities
	Module 4.1 **Purchasing**	**Module 4.2** **Purchasing**
Reference point:	Materials technology, parts lists	Material technology, parts lists
Rough business learning goals	The trainees should be able to plan a simple order form with the main order data (quantity, prices, quality...) and handle the order	Know basic law of contracts and judge and handle non-performance problems (delay in delivery, quality defects, etc.)
Rough topic	Order form	Purchase terms and conditions (legal side); buying order list
	Module 5.1 **Stockkeeping**	**Module 5.2** **Stockkeeping**
Reference point:	Material technology, stockkeeping techniques	Material technology, stockkeeping techniques
Rough business learning goals	The trainees should judge stockkeeping requirements in relation to the good (e.g. wood), plan inventory needs and keep inventory records for individual material and goods categories	The trainees should know and apply organizational principles of stockkeeping e.g. incoming merchandise quality inspection, delivery receipts (quantity discrepancies), inventory status reports, removal from books with material orders, inventory

	Run 1: Module with focus on business routines level	Run 2: Module with focus on ongoing decisions level
Rough topic	Inventory records	Physical inventory/reorder point; inventory audit; decision on ordering
	Module 6.1 **Booking**	**Module 6.2** **Booking**
Reference point	./.	./.
Rough business learning goals	The trainees should know the first accounts (inpayments, outpayments, inventory) and book payments to date	The trainees should judge the functions of other (project-tied) accounts, such as liabilities, receivables, cash, fixed assets, rents, energy costs and open and make entries in accounts. The accounts should be closed and a profit and loss statement prepared.
Rough topics	Lists of inpayments/outpayments/cash	Breakdown of lists in accounts/booking/closure; drafting a financial plan for following month; where usual and necessary, the topic of taxation can be dealt with.
	Module 7.1 **Production/repair times and materials usage**	**Module 7.2** **Recording production process, repair planning, production/repair times and material usage**
Reference point	Production process, repair	Production process/repair
Rough business learning goals	The trainees should draw up time cards and record and analyze the effective working hours/unit and time off	The trainees should assess and judge the possibilities for division of labour, plan a production sequence, assess how to record times for individual work steps and record material usage.
Rough topics	Production records, time card (time record), materials record (materials order)	Production schedule (planning labour input, availability of materials)
	Module 8.1 **Production costs and pricing**	**Module 8.2** **Production costs and pricing**
Reference point	Product/repair	Product and production process/repair and repair process
Rough business learning goals	Based on the data acquired in the modules so far, the trainees should plan a simple cost estimate sheet and specify the production price of their product or repair job. The trainees should enter a profit mark-up and set a final price.	Based on Modules 7.2 and 6.2, the trainees should draw up a complex cost estimate sheet to include all costs of production and repair. Based on experience (Module 9.1.) they should specify the profit mark-up/wages of management with reasons.
Rough topics	Cost estimate sheet based on cost categories (material, labour, ancillary supplies)	Enlarging the cost estimate sheet with indirect costs such as depreciation, rent, energy; decision on planned sales price, repair price
	Module 9.1 **Marketing and efficiency review**	**Module 9.2** **Marketing and efficiency review**
Reference point	Product	Product
Rough business learning goals	The trainees should find out local sales points and be able to determine prices of comparable products. They should compare their sales price with other market prices, judge these and decide on a final price.	The trainees should know marketing strategies (incl. forms of cooperation in tapping markets) and know and judge ways of pricing and designing products. They should also know the options under the law of contracts and handle non-performance problems. (Module 4.2.)
Rough topics	Sales list, catalogue	Market strategies, sales channels, customer records; decision on sales terms according to criteria such as: • Price • Mode of payment • Transport and delivery

We now have a framework that needs detailing and breaking down into a learning organization plan.

7th planning step: Learning organization

Learning organization tasks

In this planning step the CWG has three jobs to do:

1. Decide how to organize the business training in connection with the technical training

2. Decide how to give detailed shape to the goals and topics specified in the module system (training plan)

3. Direct the training and teaching process by developing learning aids

What is the thinking behind learning organization?

With the rough learning goals and rough topics we now have an outline of the planned supplementary business curriculum. It is roughly synchronized with the industrial-technical training. Now the CWG has to decide on learning organization (fitting the business training modules into the learning organization of industrial-technical training) and at topic level move on from a rough analysis to a detailed analysis: definition of detailed learning goals and detailing of learning topics. We progress from the rough analysis a detailed analysis.

Linking training modules

The design of the individual business topic blocs was already modular at the rough curriculum planning level. Training module linkage is based on a three-pronged principle:

1. Running through at two or more levels that contain similar topics but differ in terms of difficulty. This caters for the routines level of activity and the ongoing business decisions level.

2. A process-type structure. This of course means that the technical training also involves an activity process, i.e. a systematic sequence of single technical activities, at least at some point. This can be a production or repair job. This is an appropriate point to introduce the supplementary business training with its process-type structure.

3. The implementation of the supplementary business curriculum must be closely synchronized with the technical training sequence.

This rules out other learning organizational decisions such as the combination of two levels of difficulty in one module (combining the 1st and 2nd levels of activity) or proceeding from an overall view of the enterprise to its individual functions and workplaces. There are good reasons for proposing this kind of learning organization.

Reference points for business training in the industrial-technical training course

The business training module should link in with a sequence of production or a technical service. Of course, something is produced or repaired on order. Since however technical training and its learning organization must be treated as given and the necessary technical knowledge and skills for producing a product or providing a repair service must be imparted beforehand, at the start of the supplementary business training we leave aside for learning organizational reasons the relatively abstract task of soliciting an order and assume that the order has been placed. So our supplementary business training locks in parallel to the technical process of production pre-planning or planning for a technical service. The technical reference point for the first business training step therefore is the technical drawing and the parts list.

At this intersection and in the following training steps we remain at the business routines level. Proceeding from basic costing (quantity planning), we then look at procurement and stockkeeping and booking these procedures, production scheduling and sales preplanning. The 2nd run is more concerned with decision-making in business situations (level of activity of ongoing decisions). Here too, the connection to the technical project should be close in terms of topics and time, but now the activity outcome of the 1st run is reviewed, supplemented, evaluated and extended with business background knowledge.

The business training module

The module sequences can be depicted as follows:

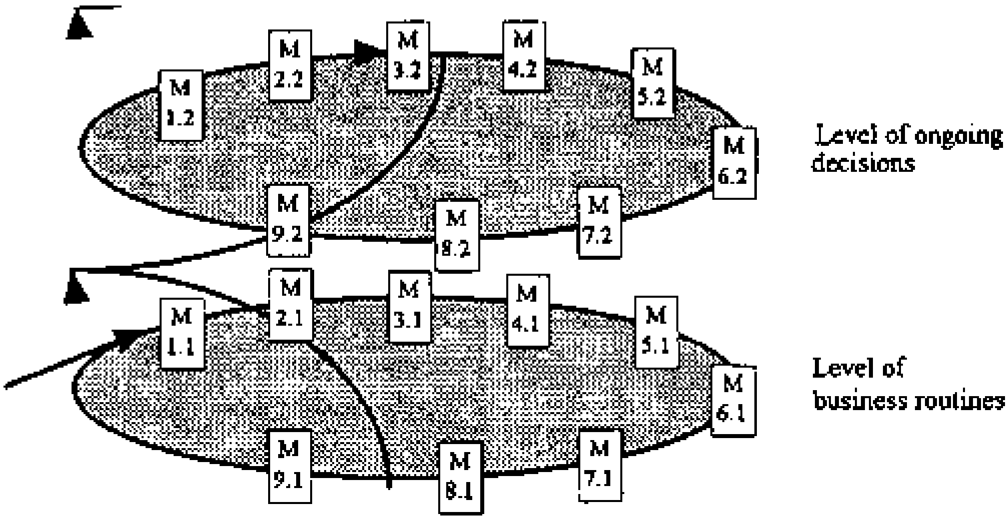

Figure 11: **Flowchart of business modules**

Internal structure of modules

Basic learning organizational structure of training modules

Using a module we shall briefly illustrate basic learning organizational structures: in this architecture each module (rough structure) always centres on a rough topic that is broken down in more detail in the different runs. For example, Module 1 centres on 'costing'. In the first run Sub-module 1.1. comes into play. Under guidance the trainees are supposed to cost material quantities and classify these in a system. In the second run Module 1.2. is applied. Here the trainees have to deal with material quantities on their own. In addition they must valuate and then pre-cost the quantities. The second run then deals with a more complex activity; at the same time the rough topic of the first run is taken up again. So the knowledge from the first run is repeated, refreshed and competence is enlarged through the evaluation.

The role of the modular sequence

The training module profiles and their sequence furnishes the CWG with an 'ideal' plan. When the CWG now proceeds to detail the learning organization, certain changes may prove necessary: e.g. leapfrogging individual modules or switching levels. The 'master plan' retains its guiding role, because it helps to gauge the coherence of our own planning. The 'master plan' will not solve all planning problems, but it is a way of assessing and guiding our own planning.

Decisions on learning organization

Decision on timespan for business training

The CWG must first agree on the timespan of the business training. Many factors affect this decision: goals and scope of business training, extent of technical training, learning level of trainees, qualification of available teachers, willingness of businessmen and technicians to cooperate. These factors are often bound up with definite interests which mean that decisions are frequently taken on planning problems to safeguard personal or group advantages and not for curricular reasons. If the business training programme has to be limited for lack of time, it is best to retain the coherence of a run-through at one level at least (Run 1) while adding some more advanced modules from the Run 2 level. This will preserve the functional coherence of business activities with each other and with the technical side as envisaged in the modular schedule. Clearly, precedence should be accorded a genuine integration of technical and business training. This implies that the supplementary business project really does enter the picture when the technical training departs from the level of imparting technical routines and begins imparting productive activities - as proposed. That means that the supplementary business training intersects where the trainees can manufacture products or carry out extensive repair work.

This gives us a schedule over a lengthy training phase that begins at a later point in the technical training. Another option would be to insert a project phase into the technical training. In this case, however, we must make sure that the production or repair does not simply proceed in line with the technical logic and the business training is felt as a disruption. This is why it is important that planning in the technical sector from material procurement, to preliminary costing, scheduling, work organization, billing, sales, etc. is always extended to include the business side. We must ensure that the learners repeatedly step back from the activity and reflect (e.g. via teaching) to gain a clear picture of the scope of their activities and their economic value. The worst case option is simply to draw a theoretical link to the industrial-technical side of the training (parts lists for example) and then impart supplementary business knowledge in a compact teaching course at the end.

The training plan and developing detailed learning goals

Developing a training plan

Now it is important for the CWG to develop a training plan for the supplementary business training based on the master plan. This training plan must detail the modules (detailed goals and detailed topics).

For this, the CWG must proceed from the rough learning goals and rough topics of the framework training plan, like the ones in Module 8.1.

Module 8.1	**Production costs and pricing**
Reference point	Product/repair
Rough business learning goals	Based on the data acquired in the modules so far, the trainees should plan a simple cost estimate sheet and specify the production price of their product or repair job. The trainees should enter a profit mark-up and set a final price.
Rough topics	Cost estimate sheet based on cost categories (material, labour, ancillary supplies)

Let us assume after detailing we have a training module in the training plan with the following detailed structure:

Detailed learning goals	Detailed topics
Know the costing system and its elements	Costing system Explanation of basic concepts and their systematic interconnection
Know, apply and judge preliminary costing methods	Preliminary costing Direct and indirect costs Cost estimate sheet
Know, apply and judge methods of profit calculation	Profit calculation Link with preliminary costing Profit terms and cost estimate sheet
Know, apply and judge methods of estimating sales	Sales estimate Checking costing data
Know and apply additional calculation aspects	Additional calculation aspects • Pricing strategies • Compensatory pricing • Pricing policy • Demand, supply and price curves • Break-even point
Judge the cost and price of a product	Practical example: producing and costing an electric cooker

All modules can be broken down like this. We need, though, to make some critical remarks on the way rough planning has been detailed here (these comments are intended to spotlight the requirements stemming from the curricular preparation and calling for changes to module structure):

The module must centre around the chapter pre-costing, profit calculation and sales estimates. It is helpful in this module to start with preliminary costing, because it entails refreshing concepts already dealt with such as material and labour costs. This should be followed by the section on cost estimate sheets, because this involves a review of the practical calculation activities (pre-costing, profit calculation and sales estimates). The additional calculation aspects brought in at the end of this module are not all necessary. Supply, demand and market price curves and break-even point analysis are too abstract and superfluous for deciding on a suitable price for a product on the local/regional market, so leave them out.

Example of project design in practice

Producing and marketing an electric cooker furnishes us with an excellent example for practical project design and gives us a real-life opportunity to examine the practical effects of technical and business activities in context as exemplified by the comparison of competitor products on the local market using price analysis. There must be openings here for checking own pricing and product design or devising a marketing strategy. Altogether in view of the short time available for supplementary business training there should be a concentration on training areas where the trainees can draw on experience when learning and as much abstract ballast as possible is thrown overboard as this is not warranted by the curricular analysis anyway and usually reflects the dictates of own earlier training.

Reviewing the learning goal structure

For this reason we must take another critical look at the learning goal structure contained in the 'detailed module'. The important thing about this module is that the trainees learn the following:

1. The price of a product depends on the costs in the production process such as materials quantities, qualities, job time

2. The different cost categories can be more or less influenced by 'business decisions' (inventory at low purchase prices, at high inflation rates/by good organization to cut labour

costs/by altering output, etc.)

3. The 'internal' pricing (costing) must be measured against 'external' pricing (product and price comparison on the local market). Here too the businessman must decide whether to produce more, what profit margin to aim for, whether he can charge the price with the help of advertizing, whether he can alter his costs by using cheaper production inputs, trading off lower quality....

It must be plain to see that these considerations are crucial to defining learning goals and will thus have a lasting formative effect on the training plan and bear fruit in problem-centred teaching. Our advice to the CWG is: reappraise the given module structure at the detailed learning goal level and select another sequence of topics.

Developing learning aids

Preparing a learning and work book

For the curricular plan it has developed so far to have a lasting effect, the CWG must now proceed to developing learning aids (however much work this may entail). Considering its capabilities, the CWG must give some thought to the quantity of learning aids to develop. The prime task is to prepare learning and work books for the trainees, the learning book to contain the topics to the modules, the work book the tasks to the individual modules that the trainees should perform. It is essential to tailor the books to individual occupations. It makes no sense for dressmakers to calculate the costs for an electric cooker and not the costs of producing a coat. This occupational relevance makes a big difference to the effectiveness of business training. Unfortunately this tie is often underestimated because it is customary in business training to use abstract figures (that are easy to calculate) and abstract people (Mrs Busy, Mr X). The learners soon get fed up with this.

So: when explaining cost categories, costing and in all practical tasks we must account for the specifics of the individual occupations. Otherwise we are in danger of losing touch with the real demands of the industrial-technical training project. The whole point of the curriculum construction chosen here will be lost if the supplementary business training fails to meet its obligations as a practically effective training by stealing away into abstractions (general cost estimate sheet, general description of costs and prices).

Developing a teacher handbook

A second major task is to develop a teacher handbook to point out the intentions of the supplementary business curriculum to teachers outside the CWG and give them pointers on how to put it into practice. The teacher handbook should contain the following:

• Intentions and goals of the supplementary business training

• Pointers to the trainees' learning and work books

• Module survey

• Demands on teaching staff

• Pointers for using the learning and work books bearing on the individual training modules

• Help on the individual modules (goals, using the learning and work books, method and media for putting the module into teaching practice)

• Pointers on testing learning achievement

The CWG will not be able to get all this work done before beginning the supplementary business training, but it is important to draw parameters for identifying the first major work steps and then decide what tasks can be performed before or during the ongoing training. It is however crucial that developing learning aids is recognized as a key task for supplementary business training activities in keeping with target-group needs and conditions, didactic specifications and special occupations.

8th planning step: Training and teaching planning

Preparation of teachers and trainers

The individual teacher must plan his/her training and teaching based on the training plan and the learning and work books. This is a basic feature of open-ended curriculum development. So we are not aiming here at developing a closed concept of teaching planning, but pointers based on the curricular design of supplementary business training. Given the specifics of an integrated technical-business training, teaching planning is about making sure that the curricular plan is implemented without tying the teacher's hands. However, the structure of the concept (see teacher handbook) requires that at least in the first runs, the teacher needs close guidance. Under this precondition the preparation of the teacher and trainer plays a major role. This also holds for the technicians in the projects (expert and local teacher and trainer). It is always help when the key persons in curriculum implementation are also members of the CWG. The CWG should therefore give thought to how to instruct the teachers for the business sector and what pointers should be given in the teacher handbook. The CWG must reach agreement on this. The learning material compiled is key to ensure that planning intentions are achieved.

The pointers on training and teaching planning should cover the following areas:

- Trainer, trainees
- Didactics
- Method
- Media

Trainer/teacher

It is important to convey to the trainers/teachers (not in the CWG) that they are not there to run a (abstract) management training course in this project and to 'lecture', that the teaching is not an end in itself, that it is supposed to provide the trainees with practical tools to deal with difficult occupational situations.

So trainers/teachers must adopt different roles in their teaching and combine these:

Teacher as knowledge mediator

For one thing teachers convey knowledge, but the CWG has 'taken over' part of this task by developing the teaching and learning aids. Major information and tasks on the training modules are available in printed form, so the teacher should focus on the practical tasks (studying the timber storehouse in a production school or carpenter's workshop from an economic/business standpoint) and provide supplementary information. The teachers mediate information around the practical tasks. They must prepare these to enable the trainees to observe in a purposive way, to support them with information in performing the task and round off the options prepared with additional information. At this level, though, the teacher will continue to play quite a central role and there is nothing wrong with this provided the teacher is conscientious in providing the trainees with further information, which must however remain purposive and not abstract and theoretical.

Teacher as organizer

As well as knowledge mediator the teacher also plays the role of organizer in problem-solving learning processes. In this role we spotlight learning organization as a teaching task. Here he/she must look for interesting lead-ins for learning and also give practical assistance in solving problems: help trainees with key questions on stockkeeping problems for example.

He/she cannot do this with lectures full of information. Instead, he/she must give the trainees the opportunity to gain practical experience or cope with a problem and find a solution, but he/she must also guide them in the process (so no group exercises while the teacher reads the newspaper) by 'taking part' at the subject matter level by suggesting productive options or leading the trainees out of blind alleys.

Teacher as moderator

On top of providing information and organizing learning processes comes the role of 'pure' moderator. In this role the trainer now keeps out of the ongoing learning process at topic level. He/she lets the trainees work independently in groups and moderates the results. This method will always be used when trainees conduct a project such as manufacturing an electric cooker with costing and pricing - now able to work on their own thanks to the previous learning processes. While the first two roles are played throughout the entire learning process with different degrees of intensity, the moderator is limited to phases and results.

The teacher's training (by the CWG's business expert or teachers already in the CWG) should not be confined to conveying information; the teacher must be prepared with practical exercises (micro teaching for example).

Didactics

This is about subject matter, the topics. They are largely covered in the training module material. They are geared to business practice and tied to activities not concepts (no 'autumn' didactics) and should be used as tools to solve business problems. They should always be linked with the technical training in the project and the local market. The linkup with the technical project calls for cooperation with the technical trainers, but also at subject level, obtaining payroll cards from the motor vehicle workshop to calculate labour costs for a repair job, for example. There are also broader issues of cooperation to settle with the industrial-technical project: we need to match up the practical and theoretical industrial-technical training to draw the link to (theoretical) business teaching, the practical business training phases (e.g. market surveys) and combine technical and business training in a joint project (manufacturing a product/providing a technical service and marketing these).

Method

Alongside imparting knowledge, the training methods should aim at conveying the importance of business work and fostering self-reliance in the trainees. For this reason the lecture and teacher-centred teaching should be supplemented as much as possible by guided research tasks on own workshops or the local market situation. In our own training course it is a help when the trainers from the technical side can be involved in the business training programme. We can also set small group tasks to apply and consolidate the knowledge acquired. It is also very useful to invite practicians to take part in the business teaching. They can help provide a motivating lead-in to the training module, provide examples and link up with applied practice. In any case: the basic method is to advance from guided to autonomous learning.

Of great importance in method is defining activity goals to access the training modules. When at the beginning we define an activity goal ('I have to make an electric cooker, so I need a hot plate, electrical components') we bring in topics such as procurement with quantity planning, costing, supply sources), which have considerable implications for teaching method. A basic operation is thus extended to a systematic activity in major business sub-areas. This gives basic shape to teaching method, which proceeds from the activity to the product and from practice to theory.

Of equal importance for method is that the teaching and course culminate in an activity outcome that lends coherence to the whole. For this we need a task that spans individual training modules. For example, the individual training modules can be seen as contributions to setting up a micro enterprise (feasibility study). This would mean enlarging the activity goal such as producing an electric cooker with the necessary purpose-tied activities to encompass a (realistic) directive dimension. So the teaching is not just concerned with the successful activity (cooker is being and has been produced); but also with discussing activity options (price alternatives, production options, cost cutting, reorganization of work...).

Media

The media used in teaching are not just there to illustrate. They are not just there to help the teacher. Rather, the worksheets/forms should be designed for later use in subsequent everyday work. Their practice-centred design should be a structural teaching element. They should be explained or developed further in discussions with the teacher and filed along with commentaries/notes in a work folder. This work folder should be used like a toolbox.

Recap

The CWG must place stress on teacher/trainer preparation. Curriculum information is essential here. It is also important to know the goals, topics and teaching methods and media. All this together can be combined in exercises. We can either conduct and discuss trial lessons or train behaviour under the simplified conditions of micro teaching. Also key is the link to the technical projects and the interface openings. Unlike a pure business project, we need to organize an intensive phase of establishing contact with the technical side and sounding out possibilities. This is the only way to ensure a sound basic structure for the supplementary curriculum.

9th planning step: Curriculum evaluation

After getting through eight out of nine planning steps, the CWG is usually exhausted and often neglects the last planning step -evaluating and revising the curriculum. In fact, though, the most interesting question is the impact of the curricular work on training practice, the trainers and trainees. We need to adopt a candid, curious attitude and not simply dismiss criticism. This is where we find out whether the lengthy preparations in the 'CWG laboratory' have aroused learner interest and induced the trainers to make their teaching more interesting. However, the CWG must make a realistic assessment of their capabilities for reviewing the curriculum and the resultant business training practice. It is a matter of time, money and staff, but evaluating the curriculum is vital for curriculum development and revision and must be accorded due importance.

Considering the conditions for a comparatively small and short supplementary project such as business training for technicians and craftsmen the best way to evaluate it is with a kind of activity research approach. This is a special form of evaluation: the findings should be promptly rechannelled into ongoing curriculum development and further development. This is a suitable approach for the supplementary business curriculum. It also ensures that the curriculum evaluation feeds back into curriculum development: it is essential to start teaching and evaluating after the first training modules.

We recommend a preliminary evaluation. To gain an initial picture, the first training module should undergo a phased test in teaching with two groups. The first test group should be technical experts not directly connected with developing the business training module. The second test group are the local technical trainers with company experience. The third test group is then the actual target group of the training, the industrial-technical trainees. With the findings from these tests we can make our first revisions while still developing the training modules before actually beginning with the supplementary training.

The questions we pose in curriculum evaluation are of vital interest. They are not confined to the examination of the learners; they also have to do with possible faults in curriculum planning and development. In the long run the occupational experience of the qualified trainees needs to be included in the curriculum evaluation: this is the ultimate yardstick for the success or failure of the supplementary business curriculum.

The fundamental key questions to evaluate the curriculum are as follows:

1. What are the learning achievements at the end of the supplementary training?

2. What are the reasons for the shortcomings in the supplementary business training?

These general questions must be supplemented by the following special questions which derive from the nature of the supplementary business curriculum. They pertain to the core of the curriculum and should be accorded priority in evaluation (they are largely the result of planning steps 2-8):

1. Was the basic curricular decision to link training goals and topics with business routines and ongoing business decision-making right?

2. How effective was the desired close link between industrial-technical and business topics?

3. What is the best way to match up the technical and business training courses?

4. Have technical and business trainers cooperated and if so, how would you assess this cooperation?

5. Do the developed training modules of the framework curriculum cover the range of necessary business knowledge for your own business course?

6. How would you assess the structure of the modules? Are they close enough to practice and is the level appropriate?

7. Do the trainers keep close to industrial-technical practice and train for practice or do they cling to abstract theory?

8. How do the trainers deal with suggestions on method (mobilize trainees, run projects)? Are they adopting a new teaching style?

9. How do the trainers respond to the notion of the business toolbox and do they view this as a major training goal?

10. How do trainees respond to pro-active, practical, activity-centred training and teaching forms? Do they draw connections with industrial-technical work operations and does that make sense to them?

The curriculum evaluation can result in far-reaching changes to the curriculum project. It may not, however, call into question the basic approach: its concern is to get the best out of that approach. When the CWG (above all the business expert assigned to the technical project) evaluates the curriculum, it can only monitor lessons to a limited degree. These observations must be supplemented by evaluation discussions with the trainers involved (technical, business) and the trainees. Both procedures - monitoring teachers/trainers and evaluation discussions - must be recorded and these notes used as a basis for discussion in the CWG (to ensure purposeful discussion).

Above all we cannot do without the evaluation of the training by the teachers and trainers themselves. Without their self assessment of what they experience and how they behave in teaching and training, the basis for the evaluation will be too narrow, despite the subjective teacher bias (although outside observers also have 'their' point of view). The CWG must draft a straightforward self-evaluation questionnaire which allows for brief answers (the questions should be geared to the above question list). Responsibility for the long-term effectiveness of the supplementary business training (how does the supplementary business training help trainees in occupational practice) must be borne by the industrial-technical project leader. He/she is usually the only person involved for long enough in the industrial-technical project to do this job and convey the findings to the GTZ and the authors of this guide.

Part IV: Closing remark

We hope you have found our guide interesting enough to read and work through. We look forward to suggestions for improvements and especially the findings from the integrated projects to be able to make substantive changes (e.g. including new modules, supplementing the basic approach) and above all to cater better for the specific interests of the industrial-technical training project in supplementary business training. DSE

Training Discussion Paper

FINANCING VOCATIONAL EDUCATION AND TRAINING IN DEVELOPING COUNTRIES

Deutsche Stiftung für internationale Entwicklung

Geman Foundation for International Development

Fondation Allemande pour le Développement International

Fundación Alemana para el Desarrollo Internacional

Die Deutsche Stiftung für internationale Entwicklung (DSE) wurde 1959 auf Initiative der politischen Parteien des Deutschen Bundestages von Bund und Ländern mit dem Ziel gegründet, die Beziehungen der Bundesrepublik Deutschland zu den Entwicklungsländern auf der Grundlage des gegenseitigen Erfahrungsaustausches zu pflegen. Diesem Auftrag kommt die DSE nach, indem sie durch Dialog- und Fortbildungsmaßnahmen Vorhaben der Länder Afrikas, Asiens und Lateinamerikas unterstützt, die der wirtschaftlichen und sozialen Entwicklung dienen.

Fortbildung von Fach- und Führungskräften der Entwicklungsländer

In Zusammenarbeit mit nationalen und internationalen Partnerorganisationen hat die DSE in den 28 Jahren ihres Bestehens über 70.000 Fach- und Führungskräften aus mehr als 100 Ländern Gelegenheit zum Erfahrungsaustausch über Fragen der internationalen Entwicklung und zur berufsspezifischen Fortbildung gegeben. Schwerpunkte sind dabei die ländliche Entwicklung und Ernährungssicherung sowie die Förderung gewerblicher Bildungseinrichtungen. Ferner unterstützt die Stiftung Maßnahmen zur Stärkung der Planungsund Organisationsfähigkeit der Entwicklungsländer in der Verwaltung so- wie im Gesundheits- und Bildungswesen, letzteres besonders durch die Förderung der Primarerziehung in Afrika. Ein besonderer Schwerpunkt sind Programme zur Armutsbekämpfung durch Selbsthilfe.

Etwa 55 Prozent des Programmvolumens werden im Inland abgewickelt, der Rest in Entwicklungsländern.

Fachübergreifender Dialog

Mit dem Entwicklungspolitischen Forum steht der DSE und ihrer Schwesterorganisation, der Carl Duisberg Gesellschaft, darüber hinaus eine Einrichtung zur Verfügung, welche die fachübergreifende Diskussion aktueller Fragen der internationalen Entwicklung auf hoher politischer Ebene zum Ziel hat.

Vorbereitung auf Auslandseinsätze

In der Zentralstelle für Auslandskunde der DSE in Bad Honnef werden deutsche Fachkräfte und ihre (Ehe-)Partner sowie deren Kinder auf die Tätigkeit in einem Entwicklungsland vorbereitet. Die Vorbereitung zielt darauf ab, die künftigen Auslandsmitarbeiter und -mitarbeiterinnen zu befähigen, im Gastland aufgabengerecht zu arbeiten. Zur Vorbereitung gehören insbesondere die Vermittlung von Kenntnissen über Ziele und Verfahren der deutschen Entwicklungszusammenarbeit sowie das Bemühen, Verständnis für das Gastland und die Probleme der Zusammenarbeit mit Angehörigen einer anderen Kultur zu schaffen.

Dokumentation und Information

Schließlich unterhält die DSE die größte Dokumentations- und Informationsstelle in der Bundesrepublik Deutschland zu Fragen der Entwicklungspolitik.

Der Information der interessierten Öffentlichkeit über aktuelle entwicklungspolitische Probleme sowie der Aufrechterhaltung des Kontakts zu ehemaligen Programmteilnehmern dienen die viersprachig erscheinde Zeitschrift "Entwicklung und Zusammenarbeit" und die Zeitschrift "Echo aus Deutschland", die gemeinsam mit der Carl Duisberg Gesellschaft herausgegeben werden. Zusammen mit der Deutschen Gesellschaft für Technische Zusammenarbeit (GTZ) und der Deutschen Landwirtschaftsgesellschaft (DLG) gibt die DSE die Zweimonatsschrift "entwicklung + ländlicher raum" heraus. Darüber hinaus informiert das Entwicklungspolitische Informationszentrum (EPIZ) der DSE in Berlin Besuchergruppen über die verschiedenen Aufgabenfelder der internationalen Entwicklungszusammenarbeit.

PREFACE

This paper has been developed for the use of the participants of vocational training courses conducted by the Industrial Occupations Promotion Centre of the German Foundation for International Development in Mannheim. The participants, mainly in-service personnel, come from selected developing countries representing vocational training centres, Ministries of Education and Labour and Non-Government Organisations. As the participants are involved at different levels in the planning and implementation of vocational education and training in their respective countries, the main aim of this paper is to create in them adequate awareness of how vocational education and training systems are financed. The manual is a simple readable document which could be of use to participants with varying levels of education.

In its preparation the paper draws upon the ideas and country experiences contained in books and articles on the subject written by eminent educators and trainers.

The paper has been prepared by Ms P. Bolina, Deputy Educational Adviser, Ministry of Human Resource Development, Government of India, under the general guidance of Mr. H. Burk, Director of the Industrial Occupations Promotion Centre, and Dr. M. Wallenborn, Head of the Dept. of Vocational Training in the Industrial Sector, Industrial Occupations Promotion Centre. Valuable guidance was also provided by Prof. D. Timmermann, University of Bielefeld.

CONTENTS

I. INTRODUCTION

In almost all the countries in the world education is provided in both the public and the private sectors. A certain minimum level of education is necessary for a country to achieve economic growth. The allocation of resources to education varies in each country in accordance with its priorities but generally ranges from 3 to 8 % of the gross national product (GNP) (UNESCO.. 1993).

The overall costs on education are on the increase. Developing countries are particularly hard hit due to the economic crisis. They need to improve productivity to enable them to compete in an era of rapid economic and technological change. This requires both capital investment and a workforce with the flexibility for aquiring new skills for new jobs. They are also faced with the challenge of meeting the requirements of the education sector, to fulfil the overall responsibility vested in the state for development of human resources. Governments cannot shift this responsibility as education confers benefits to the society at large. It can at best harness the support of the private sector, the community and individuals in its endeavour to reach its goals towards social and economic development of the country. While budgetary constraints are prevailing everywhere it is more severe in countries which have completely public financed education systems. Some of the reasons for the crisis in financing education are increase in demand for access to education, increase in teachers' salaries, inefficiency in the use of available resources, demographic growth unemployment of graduates, increase in the costs of land and buildings etc.. Reform in financing has to come about by modifying financing modes. Some ways could be, that users should bear some part of the costs as entire public funding cannot be justified; more efficient management of funds, search for private financing, community and enterprise involvement, foreign aid.

As budget allocations from government sources for education get tighter, the squeeze on availability of funds for Vocational Education and Training (VET) is apparent in so far as VET is dependent on public funds. Costs on VET as compared with general education are also 2 to 3 times higher as classes are small with instructor trainee ratios of 1:7 sometimes. This increases the unit teaching costs. Expenditure on equipment, infrastructure, consumables e.g. raw materials and spare parts is also much higher. It is then imperative to search for alternative means of financing. The challenge before policy makers is to introduce new and different ways of financing as well as to ensure that the resources which are available for VET are used more effectively.

Traditionally VET was provided by employers who paid lower wages and sometimes apprentices had to pay the employer. This was prevalent in many different countries. In Germany, approximately since the 12th century, a person was allowed to pursue a trade independently if he had finished the apprenticeship in a craft with a master. After apprenticeship he had to obtain professional experience as a journeyman. The master taught his apprentice and journeyman the knowledge of his trade. The craftsmen got united and formed guilds (craftsmen's organizations) and evolved a proper training system. The main responsibility for vocational training lay with the craftsmen's organizations and all conditions were regulated by the guild.

Traditional apprenticeship also existed in India for centuries. Even today in towns and villages it is a very common sight to observe an apprentice working with the master, learning by working on the job, all at a very early age. In the former times in India apprentices often lived with the master and there was a certain unity in living, learning and working. In the small by lanes of towns and cities in countries like Indonesia, Nepal, Bangladesh and India it is very common to see young apprentices in the age group of 10-20 years being trained by their employers e.g. the bicycle repair, the auto mechanics workshop. They go straight 'on the job'. Sometimes in the initial stages there is no payment. As they learn the work they begin to get a small wage. The costs are shared by the employer who provides the training and the worker who accepts low wages.

In the modern times the scenario has somewhat changed. Gradually governments have become more involved in VET especially in the last two decades. This is mainly to link vocational education and training with the social, economic and employment policies of the country. Public revenue for VET has assumed more importance. But owing to the economic crisis governments had to reduce the public budgets for education and this has a direct bearing on all sectors of education including VET. Serious attempts have to be made to find resources to supplement available funds. Every country has to assess its training needs and requirements in accordance with its goals and priorities and the prevailing socio-economic conditions. Thereafter strategies for financing VET have to be worked out and additional resources generated.

While governments are searching for new and alternative mechanisms, the private sector is being drawn in justifiably, for those who benefit must pay for it. The relevance of vocational education to the labour market requirements is crucial. As the employers become more involved in the actual provision of vocational education and training it will come closer to labour market needs influenced particularly by the rapid technological change.

Skill requirements have also become more complex. Vocational Training Institutes are set up with new and modern training methods being offered. This has naturally led to questions being raised about the costs of training and the mechanisms of financing it. It is difficult to estimate the exact costs on VET due to the complexities involved in the training systems, the absence of accurate accounts by employers and the productive work of the apprentices/trainees who accept lower wages and thereby offset part of the costs incurred. Nevertheless studies have concentrated on the total amount of funds allocated for VET and its adequacy. Mincer conducted a study as early as in 1958 on the costs of industrial training in USA. He estimated that the total opportunitiy cost of formal and informal vocational training was over US$ 16 Billion in 1958 of which US$ 10 Billion was the cost of training in private firms or corporate enterprises. 70% of this was spent on informal 'on the job' training and 30% on formal training (Mincer 1962). The costs on VET in the UK were also estimated, which put the total costs of education at £ 9,000 million per annum in Great Britain. Roughly the estimates out of this on VET would account for £ 3,000 million a year (Johnson 1979).

Even though the studies mentioned above show that a large volume of resources was used for VET in these countries, in many countries it is being consistently felt that not enough resources are provided for VET. This is particularly the case in developing countries which are experiencing a shortage of skilled manpower. Governments are therefore getting more concerned about financing of vocational training to meet the new and emerging labour market requirements.

Various financing strategies are practiced in different parts of the world. Some of the more well known mechanisms for financing VET have been categorized in the following four types:

(1) Public Financing
(2) Enterprise Financing
(3) Private and Public Sponsored Financing
(4) International Donor Assistance.

In the following pages the four types of financing mechanisms have been described briefly with some country examples. The advantages and disadvantages of each type have also been identified and policy implications indicated.

II. PUBLIC FINANCING

-- Traditionally vocational training was provided by employers who paid lower wages or no wages at all to the trainees. Employers did this if it increased productivity of workers. In many cases, government was only involved with standards of training.

-- Involvement of governments increased mainly to link vocational education and training more closely with social, economic and employment policies of the country. There was also a growing concern about distribution of training opportunities for the poorer and disadvantaged sections of the society.

-- Public Financing is provided through public revenue (government funds). When the State finances vocational training through public funds it is on the assumption that the ultimate responsibility for development of human resources for national development lies with the State.

-- Governments also intervene in the provision of vocational training to ensure social equity for the poor in the rural and urban informal sector. Public financed VET provides opportunities to persons who may otherwise have limited chances e.g. those from the deprived sections of the society.

-- In most countries the budget for VET from public sources is relatively small, ranging from 1 to 12 % of the current expenditure on education (UNESCO, 1993). A table indicating the total educational expenditure as percentage of GNP and the vocational expenditure as percentage of public current expenditure on education for some countries in each continent may be seen at Annexure. The table shows the priority of governments to vocational education in budget allocations from public expenditure. A comparison can also be made of the provisions for education and particularly for vocational education in the developed countries vis a vis the developing countries.

-- Mostly public financed vocational training programmes are implemented in schools before employment is taken up. Non-formal training centres, pre-service and in-service training for Ministries also receive public funding.

-- Specialized vocational training institutions receive public funds mainly through subsidies, budget appropriations, tax incentives, financing of special programmes with special grants, financing of development projects, financing of supervisory bodies, fellowships for VET. In developing countries e.g. Pakistan, India and Thailand the main financial contribution for VET comes from public funds (government). Industry takes little part in contributing to vocational training institutes.

-- In cases of mixed funding, generally capital expenditure is provided by the governments and recurring expenditure is shared through other sources.

-- Public vocational training institutions generally offer courses which provide basic skills necessary in pre-service training. In Canada, manpower training programmes are offered in public institutions e.g. in colleges and vocational training centers.

1. Tax Revenue

-- The major source of public funds is through tax revenue. Sometimes governments give grants to vocational training institutions which can raise some resources on its own. Such a grant is called matching grant as it makes it obligatory for the potential recipient to first raise some finances on its own. In USA, the Federal Government makes use of financing through matching grants and categorical aid. It gives about 6-8 % of the State and local contributions for public supported VET (Herschbach, 1993).

-- Categorical aid is given for a specific purpose to meet the special needs of certain target groups. It supplements funds which are provided for general purpose VET.

-- In many countries owing to a shortage of skilled manpower governments had to create proper vocational training systems for long term social returns of training, need for equal opportunities of training for those who are unable to pay costs of their training, and to promote national VET policies. Training institutions thus created were mainly financed by a general tax through compulsory contributions made by firms and enterprises, contributions from national treasury, co-financing agreements and sale of training services (Ducci, 1991).

-- When governments finance vocational training institutions they control the volume of resources allocated to VET in accordance with the priorities of the social and economic sectors (Ducci, 1991). They are also able to exercise control on the quality of the programmes.

-- The cost effectiveness of vocational training through public financing is said to be low as public training institutions are not very keen to evaluate the qualitative and quantitative training needs. In Argentina, CONET receives funding from the Ministry which has been declining over the years due to a reduction in the overall budget of the ministry. There are restrictions on CONET securing funds from other sources e.g. sale of services, international sources and this has led to a serious shortage of resources affecting the efficiency of the institution in maintenance of infrastructure and equipment and reduction in staff salaries (Ducci, 1991).

-- When public training institutions are expanded and do not get adequate finances correspondingly the quality of training may become poor. In Egypt government enrols more than half of upper secondary students in vocational schools to divert them from higher education. Open unemployment among graduates exceeds 35 %. In Bangladesh, Cameroon less than half of public trainees find wage employment in their trade. Public training has to respond to the demand in the labour market, only then can it become cost effective with good quality training leading to high placement rates (World Bank, 1991).

-- Public contributions are controlled by restrictive policies. Vocational training institutions which are dependent solely on public funds have the chance of becoming stagnant with a deterioration in their planning and efficiency. Sometimes subsidies to vocational training institutions are dependent on the good will of the government.

-- Many developing countries have highly centralized systems and major control is with the central government. When VET is financed through the State it controls the curriculum, certification, qualification of teachers (World Bank, 1988). In decentralized systems there is a sharing of power. A healthy policy is to allow communities and lower levels of government to have greater autonomy.

-- There should also be a balance between the resources controlled by the central government and those available to the lower levels of government.

2. Advantages and Disadvantages

<u>Advantages</u>

- When government finances vocational training through public revenue it can coordinate the requirements in accordance with the demand projected in the economic and employment policies.

- Matching grants encourage local initiative as institutions wishing to receive grants from the government try to raise resources on their own.

- Categorial aid usually helps to implement change as it is given for a specific purpose or to meet the needs of specific target groups in the population.

- Through both these methods of financing, governments can share control and at the same time have part of the financial burden shared by others.

- In the initial stages, national training centres are said to develop better in centralized systems as the institutional capacities are not strong. But centralization is not desirable when institutions become well developed. At that stage more autonomy is required.

- In public distribution systems there is more equity. Publicly financed vocational training systems offer opportunities to the poorer sections of the society. For them it may be the only opportunity to become trained.

<u>Disadvantages</u>

- Underfinancing. Shortage of resources for VET from public educational funds.

- Sometimes governments are under pressure to open more VET institutions even when resources are inadequate. This leads to implementation of programmes which are underfinanced and the quality of training may decline.

- Unreliable support. There are variations in the allocation of educational budgets. Funding fluctuates and VET programmes get affected.

- Sometimes new programmes receive substantial support. But priorities may change on account of political considerations.

- Unbalanced allocation of resources. Sometimes there is a larger investment in capital costs and not enough provision for recurrent expenses. Low salaries of teachers is found to adversely affect the quality of instruction and consequently student achievement may become low.

- In centralized systems there are high administrative costs, lack of flexibility and unresponsiveness to labour force requirements.

- The cost effectiveness of vocational training through public financing is found to be low in many countries as public training institutions are not very keen to evaluate the qualitative and quantitative training needs (Ducci, 1991). Rigidly prepared curricula in public institutions prevents them from responding to locally identified training needs.

- Public institutions are less able than private institutions to adjust training for the labour market in accordance with the rapidly changing technology.

3. Policy Implications

-- To be successful public training should concentrate on choosing appropriate objectives, improving market orientation and matching policies in accordance with labour market needs, using resources efficiently and diversifying sources of finance.

-- Public supported vocational training systems should be able to receive funding from local taxes, user fees and collaborative arrangements.

-- When Public Financing is the sole source of support to VET, institutions may face fluctuations in budget allocations. This can cause shortage of resources which may lead to low quality programmes with limited returns on investment.

-- In countries where the quality of vocational programmes is poor in public funded institutions, these programmes should be removed and available resources reallocated (Herschbach, 1993).

-- VET systems can be strengthened with complementary public funds from other sources and this can be done through programme reduction and resource reallocation.

-- Stability in provision of training facilities can come from long term financial support. Governments should adopt consistent policies required for removing inefficiencies.

-- Decentralization helps through delegation of authority to lower levels. Training institutions with a board of representatives of employers, workers organizations and the government have better chances to discuss and adopt relevant and cost effective strategies for training.

III. ENTERPRISE FINANCING

-- The enterprise/company conducts the vocational training of its labour force directly and bears the entire costs of training.

-- Often enterprises finance a major part of the training but actual training occurs in specialized vocational training institutions.

-- Sometimes enterprises contribute a small amount of money to a central vocational training fund as taxes and these recources are used in different ways to finance training.

1. Single Employer Financing

1.1. Japan

-- Japan is well known for its vocational training organized within large private companies. Employers prefer to recruit fresh school leavers with general education and then provide them with continuous training within the enterprise.

-- The public sector is generally small. In 1980's it employed 3.6 % of the labour force (Inoue, 1985). Private industry employs 85 % of the labour force and is dominated mainly by large industrial companies.

-- Japanese people have a strong influence of culture derived from Buddhism, Confucianism and Shintoism which teaches them to achieve high standards through hard work and have lasting obligations to the school group, the family and the company (Lauglo, 1993).

-- Generally a person devotes his whole life to working in the same company- Most Japanese companies also recruit a workforce for life. Training is given on the assumption that employees will continue to work for the same company. In large companies which employ 30 % of the labour force employment for life is an important norm (Mc Cormick, 1989).

-- Most large companies organize their own vocational training and the outlays for in-house vocational training are considered a part of the labour costs. Smaller companies with less resources rely on training facilities outside the company and are supported financially from proceeds of the unemployment insurance funds to which the government and employers contribute half and half. Enterprises can also pay to get membership of outside training organizations and can thus use their facilities for training of trainers.

-- Vocational training is also organized outside the companies in special vocational schools run by various Ministries. Private vocational schools offer courses of varying duration including day and evening courses. These schools get grants from the government if they are not run for profit.

-- Most technical training in companies takes place in close connection with production. Production engineers train a small group of workers who will use the latest technology and in turn these workers will further teach others in their work groups which are established for production purposes. As such the extra resources provided for training are sometimes much less than the training that actually takes place (Mc Cormick, 1989).

-- Technical training also takes place through self study of manuals or through correspondence courses. These costs also do not fall on the employers. According to Dore and Sako (1987) if hourly wages were to be calculated for this contribution the total may exceed the training costs incurred by the industry. Sometimes companies also provide finances for self development of workers. Employees are highly motivated to upgrade their skills.

-- The government helps to finance and guide vocational training among small firms. But major companies do not rely on training done in government institutions. They also believe that employee training should be tailored to the requirements and conditions of each company (Pedder, 1989).

-- The Japan Industrial and Vocational Training Association (JIVTA) is the main organization in Japan concerned with training within industry. It is a private association of employers and has a constitution and a budget supervised by the Ministry of International Trade and Industry. JIVTA policy is developed by 1,000 company representatives of which 60 % are from large companies and 40 % from small companies. The government does not provide funding to JIVTA. 25 % of its budget is collected from membership fees and 75 % is generated from course fees. In the last 30 years JIVTA trained 30,000 persons as training leaders who in turn trained more than 1,000,000 trainees in their own industries. JIVTA has given a unique direction to the employers about an independent approach in vocational training (Pedder, 1989).

-- Employers consider training as an investment. They provide training in accordance with their own needs and this has resulted in developing effective policies.

1.2. Korea

-- In Korea the Basic Law for Vocational Training enforced in 1976 makes it mandatory for enterprises with over 300 employees to conduct in plant training. If they do not do so they pay a training levy based on a certain percentage of payroll costs ranging from 1 % to 3.9 %. Large companies have training budgets and consider training as an important investment. Apart from Japan, Korea is an important example of a country in the Asian region which is relying heavily on skills training in the enterprise. But small companies still rely on the public training system (Pedder, 1989).

2. Payroll Tax

-- In Latin America payroll tax was generally used to support vocational training. In 1942, the Brazilian government levied a special tax on enterprises for offering compulsory technical training to apprentices and SENAI - the National Industrial Training Service - was founded. Colombia established SENA in 1957, Venezuela the INCE in 1959 and Peru set up SENATI in 1961. There was a close collaboration between the government, the employers and worker groups (Ducci, 1983).

-- In 1987, Vocational Training Institutes (VTI) in 12 Latin American countries enrolled more than 3 million persons equivalent to 37 % of total secondary school enrolments in the same countries (Cinterfor/ILO, 1991).

-- Government usually assesses an annual levy of 1 to 2 % of the wage bill paid by the employers and sometimes even 3 %. In every country there are variations. Sometimes state enterprises and government bodies do not contribute. Sometimes smaller firms are exempt and larger firms pay more. Sometimes workers also pay, but most of the funds come from enterprises.

-- The range of training services include formal apprenticeships with classroom instruction, sandwich courses and training of instructors offered for technicians, supervisors and middle managers.

-- In UK the Industrial Training Act of 1964 aimed at increasing the amount of training in industry, improving its quality and redistributing costs more fairly. Through the levy grant all firms contributed towards costs of training which ranged from 1 % to over 3 % of the total wages and salaries. The system increased the quantity of training but the Industrial Training Boards and the Industrial Training Act came under criticism. The Training Act was replaced in 1974 by a selective levy grant system involving exemptions to small firms or those which provide enough training for their own labour needs. Levies were not compulsory but imposed on firms which provided no training or limited training (Woodhall, 1987).

-- In France there is a compulsory tax system of training funds and an apprenticeship tax so that all firms must pay a certain proportion of their total wages and salaries as a payroll tax, and these funds are used for financing vocational education.

-- In some countries governments provide subsidies to encourage training and the costs are met from general taxation. In Australia the Commonwealth Rebate for Apprenticeship Full Time Training (CRAFT) is a subsidy used for reimbursing employers for part of the costs of apprenticeship training (Woodhall, 1987).

-- In some of the Latin American countries the payroll taxes have been criticised. In Argentina the payroll tax was removed in 1981 as attempts were made to restructure public expenditures to cope with the economic crisis. In Brazil, the payroll tax has grown. But co-financing between the enterprises and VTIs is gaining more importance. In Colombia, on one side the payroll taxes have been questioned and on the other its application has been diversified (Ducci, 1991).

-- In Costa Rica although the payroll contribution increased from 1 % to 2 % in 1983, the surplus money was transfered to another fund and used for purposes other than vocational training. In Peru, SENATI has lowered payroll taxes and is trying to find funding from other sources (Ducci, 1991).

3. Tax Rebates and Credit Schemes

-- In most regions other than Latin America, Tax Rebates or Tax Credit system is more frequently used. The principle is the same as Payroll Levies - those who benefit, pay the costs of training.

-- In Tax Rebates, a portion of the tax is returned to the firm as subsidy for training. In Singapore and Tunisia, the rebate is on the basis of costs incurred. In Nigeria and Zimbabwe it is in the form of grants to set up training systems.

-- In tax credit the firm reduces its tax bill by the value of training.

4. Ways in which Tax is Used

-- In Ivory Coast modern sector enterprises have to pay 1.2 % for continuing vocational training and 0.4 % for apprenticeship and initial training. Funds are managed by the Fund for Development of Vocational Training (FDFP) (Herschbach, 1993).

-- In Taiwan the small and medium sized firms took a keen interest for training in the enterprise. Firms get upto 80% of training costs reimbursed (Herschbach, 1993).

-- Tax rebates for financing vocational training were prevalent in Argentina since 1981 and in Brazil and Chile since 1976. In 1975 the Brazilian Government passed a law for deduction in the form of income tax of juridical persons equal to twice the expenditure invested in vocational training and upto a ceiling of 10 % of taxable earnings. But after 10 years a review showed discouraging results. The impact was small. There was evidence that tax rebates were mainly being used by those enterprises which already had ambitious training programmes (Ducci, 1991).

-- In Argentina tax credit system was introduced by law in 1980. Enterprises were authorized to deduct from their taxes upto 8 per thousand of overall wages and salaries as expenditure on technical education and training of workers. CONET is in charge of the spending and issuing of certificates when enterprises pay their dues to the general tax department. The Argentine Construction Chamber set up a Vocational Training Centre and a support body called Caesar M. Toledo Training Centre Association. Firms which belong to the Chamber give their share of contributions to this Association which uses the funds for training (Ducci, 1991).

-- In Chile the National Training and Employment Service (SENCE) created in 1976 is mainly responsible for Vocational Training. Tax incentives to enterprises are the main source of financing. Implementing agencies conduct training which is supervised by SENCE (Ducci, 1991).

-- France has a very comprehensive system of financing vocational training (Herschbach, 1993). There is a combination of public supported pre-service training, enterprise supported in-service training and funds from the state, regional and local levels account for approximately 40 % of the total annual budget for all types of VET. The rest is financed by private enterprises.

There are 3 ways of financing in France:

a) General tax revenues used for supporting public and private secondary level pre-employment vocational education. Outlay for VET is about 1.5 % of the Gross Domestic Product (GDP).

b) Compulsory Apprenticeship Tax of about 0.6 % of a company's wage bill is used for initial training. Of this 0.1 % is kept by the government for training of youth between 16 - 25 years of age and 0.5 % is collected and administered by regional councils. If employers accept apprentices they do not pay tax. They can also pay fees to the institutions that organize courses or they can pay taxes directly to the government. In this way employers fulfil their obligations.

c) Compulsory in-service tax is applicable to all enterprises which have more than 9 employees. It is 1.2 % of each company's total wage bill. Employers can use 0.8 % of this for their own in-house training. From the remaining amount 0.3 % is used for youth training and 0.1 % for training employees during paid training leave.

The French Training System has a large training industry and offers a variety of VET programmes. Government takes an active interest. It formulates policy, legal framework and monitors quality of training.

4.1. Vocational Training Funds

-- In many countries where employers are active participants in VET a Training Fund for financing vocational training has been set up. Tax contributions from the employers collected through payroll levies or subsidies from the government are transfered to the Training Fund.

-- In Zimbabwe companies by an Act of Law have to contribute 1% of their wage bill to a central fund managed by the Ministry of Education and called Zimbabwe Manpower Development Fund (ZIMDEF). The fund is used for financing vocational training activities e.g. apprenticeship training for various categories of trainees, upgrading training of skilled workers. Also companies that provide 'on the job' training to apprentices can claim rebates from this fund at a prescribed rate.

-- Management of funds can be handled by the concerned Ministry, the employers association and the workers' unions. This is a useful way as such cooperation facilitates formulation of appropriate training policy.

-- Funds can be managed in the following ways (Atchoarena, 1993):

(1) The "Fair Return" system of management.

Every firm contributes to the Fund in accordance with legal provisions. After contributing, the firm has a right for a certain period of time, to refund an amount equivalent to its contribution and use it for training.

(2) Mutualization.

According to Atchoarena mutualization is a term used as the financial expression of the principal of solidarity. Under this system, the contributions from the companies are managed entirely by the Fund. The management of the Fund decides how much training is required from each firm. The firms do not have special claims. Some of the small firms may get more funds than their contributions and others may get less. Training activities are organised according to the target group and demand for training.

(3) Drawing Rights.

Every firm gets a drawing right which is a fraction of its contribution. The remaining amount is mutualized. Every firm retains a certain degree of autonomy and the Fund also has some reserves.

5. Advantages and Disadvantages

Advantages

- When individual companies train their own work force such as in Japan they can tailor their requirements in accordance with the actual needs. This leads to effective management policies and avoids wastage of trained manpower.

- When training occurs alongside production it reduces the overall costs on training.

- Training and employment in one company/enterprise gives stability to the individual and to the company.

- A study of financing of vocational training in Latin America (Kingler & Reyes, 1978) indicated that payroll taxes proved to be an effective financing mechanism as it helped to create training institutions that are workable and good alternatives to traditional training systems.
- Payroll levies are found to be more successful in middle income countries. They are effective in addressing the training needs of large formal sector enterprises. Also effective in strengthening government, employers and labour cooperation (Inter-American Centre for Research and Documentation for Voc. Training, 1991).

Disadvantages

- Government officials try to regulate the independence of individual companies and this may create some policy problems.

- Companies try to recruit only the best students as trainees. This may cause social inequity.

- When training takes place only in one company there is absence of general certification. This affects labour mobilisation from one company to another.

- Companies may reduce training places to avoid costs if they do not make adequate profit.

- Payroll levies are found to be less effective in addressing the training requirement of small and medium sized employers, women, the workers and unemployed (Ducci, 1991). In small countries private sector is small, governments have less capacity to generate income, less administrative capability to collect payroll taxes and so they have not been successful.
- Payroll levies lead to firms reducing their self financed training activities. Taxes, in a sense crush the individual initiative and firms only train to fulfill the legal requirements (Bas and Castro, 1989).

Advantages	Disadvantages
- Payroll levies are shouldered by enterprises but part of the costs fall on workers in the form of lower wages. This leads to sharing of costs as workers subsidize their own training.	- Payroll levies are often criticised. Governments divert some of the funds collected through levies to finance other programmes. Sometimes only 15 % is used to finance national training authorities. In Colombia SENA has to give 50% of the revenues generated through payrolls to support formal public school vocational programmes (Cuervo and Van Steenwyk, 1986).
- Although training costs are high for the national training agencies but quality of training programmes is better and linked to employers needs.	
- Larger enterprises benefit more through tax rebates and credits. In 1985, in Singapore all the firms with 200 or more employees applied for training grants in contrast to 25 % of firms with 50 employees or less. Firms which had 10 employees or less only 2.2 % applied for grants (Pang and Salome, 1986).	- In tax rebate and credit schemes high administrative costs are involved. Firms which would normally invest more have a tendency to reduce their effort to the bare minimum required by law. Sometimes reluctant firms organize poor training (Bas and Castro, 1989).
- Tax credits are more effective in matured or maturing economies.	- In Brazil and Chile where some evaluations were made, tax rebates concentrated benefits on large enterprises in the more developed regions. Steps had to be taken to promote small and medium sized firms and associations (Ducci, 1991).
- When seen from a broader perspective VTI's compete with each other to train manpower required by the enterprises. This encourages efficiency within the institutions.	
- As the Vocational Training Fund observes the labour market closely and has regular interaction with business and industrial houses, it can influence the organization of appropriate VET programmes in accordance with labour market demand.	- Tax rebates ultimately imply that financing is by the State but the training imparted is by the enterprises. Although this leads to better coordination of the demand and supply of vocational training, sometimes the demand may not correspond to the real need.
- It can also influence the quality of training.	- Tax credit schemes are less beneficial for low income countries as firms are not able to organize different types of training.
- As it negotiates funding of training with business and industrial houses, to an extent it effectively regulates industrial relations.	
- Through the process of Mutualization the Fund can provide resources for training to small firms and enterprises which may not otherwise have enough access to training. As such it can offer equal training opportunities to firms.	- The System of Mutualization may weaken the mechanism when in a difficult economic situation, many firms request the Fund to provide them resources at the same time (Atchoarena, 1993).
	- Sometimes due to structural adjustment in the economies there is an expansion in the informal sector and a decline in the number of larger firms. This leads to reduction of tax contributions to the Fund and a shortage of available resources for vocational training. The Fund has to then search for alternative financing.
	- It has been observed that sometimes the state makes use of the resources of the Training Fund for other purposes or it does not pay the Tax Revenue to which the Fund is entitled.

Advantages	Disadvantages
	- Sometimes the Fund gets more occupied with banking functions and investing the resources it has collected rather than concentrating on development of training (Atchoarena, 1993). - Experience has shown that with mutualization sometimes there is favouritism towards larger, more privileged firms and towards employees who are already well trained. These beneficiaries are better placed to negotiate their demands and get away with more funds (Atchoarena, 1993).

6. Policy Implications

-- While the single employer financing mechanism has been very successful in Japan there are strong cultural influences which contribute to this success. It is questionable whether in the absence of cultural traditions such as spending a whole lifetime in one company or lasting obligations to the school group, the family and the company, this system of individual company training could be as successful in other parts of the world.

-- In developing countries the responsibility for training cannot be left to the enterprises alone. The government has to organize and finance training alongside to ensure social equity. The deprived and poorer sections of the society need adequate opportunities for training and the enterprises may not necessarily cater to all these groups.

-- Payroll taxes help to develop training institutions in the initial stages when institutions are building their training capacity. But it takes time to create training capacities and this may lead to high costs and sometimes inefficiencies in management.

-- While National Training Agencies have been more successful in larger economies, the same success was not possible in low income countries due to factors such as restricted economies, weak management, less financial resources and high unit costs (Herschbach, 1993).

-- Use of tax rebates and credits creates a dynamic approach to training when enterprises are encouraged to become responsible for training, and is particularly good for retraining and upgrading but less effective for pre-employment training. It is used best with other systems of financing. Tax rebates are particularly advantageous to large employers who have good management systems (Herschbach, 1993).

-- When resources are diversified for creating a Training Fund, efforts should also be made to get additional funding from the state in the form of subsidies.

-- Sometimes Training Centres may be managed directly by the management of the Training Fund. Fees can then be introduced to support financing. Donor agencies and regional authorities can also help in the provision of resources (Atchoarena, 1993).

-- The Training Fund is an important mechanism of financing VET and can diversify its funding, depending on the quality of financial services it offers.

IV. PRIVATE AND PUBLIC SPONSORED FINANCING

Governments faced with a shortage of resources would like individuals, enterprises and non-government organizations (NGO's) to share the financial responsibility for VET.

1. Training Fees

-- In some cases the entire operational costs are borne by the participants through payment of fees.

-- More commonly, employers or trainees bear part of the costs and government finances the remaining. Fees could be paid to the government or the training institution. In the informal sector the apprentices pay their master (Herschbach, 1993).

2. Fellowship, Grants and Loans

-- In most countries of the Latin American region, public financing is through fellowships and grants. The most important system of fellowships and grants is being implemented in Chile. The National Employment Secretariat (SENCE) administers a large system of training fellowships which are designed to offer training opportunities to unemployed young people, the poorer sections, the workers from informal sector and the handicapped. The system is a supplement to tax rebates. The agencies which execute the training programmes are called OTE's and they are supervised by the SENCE. From 1977 to 1987 SENCE provided training to 300,000 persons with fellowships and grants through 19,000 courses organized by different agencies. The courses were mainly short term ranging from 6-12 weeks and covering a wide range of occupations e.g. agriculture and live stock production, forestry, mining and trade. SENAEM has another training programme for training young people in the age group of 18 - 24 who do not have adequate access to programmes offered by enterprises based on their tax rebates (Ducci, 1991).

-- Loans can facilitate training for students coming from poor families if they have to pay for vocational training. But in many developing countries there is no formal system of loans for education (Psacharopoulos and Woodhall, 1985).

3. Sale of Training / Non Training Services

-- Vocational Training Institutes can generate income from the sale of services to public and private enterprises or through individual tuition services.

-- Some VTI's sell complete training packages to enterprises. Some firms may even buy services for setting up training units in their companies. INACAP, SENATI and SENAI in Latin America are well known for this (Ducci, 1991).

-- Some VTI's offer non-training services such as consultancies.

4. Co-Financing Agreements

-- In Argentina co-financing has been arranged with enterprises, communities and vocational schools. In Colombia, Brazil and Peru also co-financing is popular (Ducci, 1991).

-- When there is an agreement between different parties then availability of funds becomes assured and training can be related to the actual demand.

5. The German Dual System

-- In Germany more than two thirds of the 16 - 19 year olds receive training within the dual training system (Greinert, 1992).

-- The system is called dual because there are two places of learning - the vocational schools and the companies. The training is governed by training regulations of the Vocational Training Act, 1969.

-- The system offers a combination of training in vocational schools with learning and practical experience at the worksite. In a week, apprentices spend 1 or 2 days at the public vocational high schools where training in general subjects is offered. The remaining part of the week is spent on the job in the firm/enterprise.

-- Training is usually for 3 and a half years after which individuals get certification and are free to get jobs.

-- The dual system sets high standards of training which leads to high productivity and competitiveness of the labour force. This is why the workers and employees trained in the system are highly appreciated by the German society (Timmermann, 1993).

-- Expenditure on training is met by the state and the enterprise. School costs are provided by the State i.e. the Länder (Federal States) and local authorities from the public budget whereas the participating enterprise bears the cost of practical training or in-plant training. No company is obliged to provide training but it is evident from the number of companies that participate in dual training that they have economic benefit from training their own skilled workers.

-- The Federal Institute of Vocational Training, the institution of governance is totally funded from the federal budget. The chambers and training boards get their finances from levies on all member firms, specific fees from companies who demand services of the chambers and boards e.g. in counselling and examinations, and subsidies from state budgets for special activities. The firms/enterprises finance training from their own resources by overrolling them onto the prices of goods and services sold in the market; shifting part of the costs on the taxpayer; returns from the training through the contribution of the trainees to productive work; sale of training to other firms (Timmermann, 1993).

-- Outlays for Vocational Education and Training were approximately 1.85 % of the GNP in 1992. Contributions by the public and private sector increased from 1980 to 1992, with the expenditure on vocational education and training, rising from DM 15.5 to DM 51.7 Billion (Federal Ministry of Education and Science, 1993/94).

-- In 1985, the annual unit cost to a company was about DM 20,500 for all apprenticeable trades. Companies recovered a fair percentage of this from the work that the apprentice does and contributes to the production. The net cost to the firm was eventually DM 16,000 approximately (Gilardi and Schulz, 1989). The Federal Vocational Training Institute (BIBB) estimated for 1980 that the gross cost to a company was about DM 17,000 and the net cost was about DM 10,000. In 1991, the gross cost to a company rose to DM 29,573 with the net cost at about DM 17,862.

-- The cost surveys are however not completely representative as all training firms do not provide information and surveys in fact cover a small number of training firms. Other limitations are due to the structure of the in-plant training system. The value of the productive work of apprentices during in-plant training can only be estimated but cannot be exactly determined. It is also difficult to account for the actual staff costs of part-time instructors. But surveys do reflect accurately the trends in the levels of vocational training costs (Hegelheimer, 1986).

-- The German Federal Government has continued to make efforts to improve training financed by firms. In 1973 a programm was started to promote inter-firm training workshops aimed at improving training by small and medium firms which were already providing more than half the number of training places. For the first time federal aid was given to the dual system on a significant scale. It was intended to raise the places in inter-firm training workshops from 20,000 to 77,000. It entailed a total expenditure of DM 2.7 Billion of which the federal government paid DM 1.7 Billion, the Länder about DM 0.4 Billion and the firms about DM 0.6 Billion. Firms that benefited were mainly craft firms and some in the industry and agriculture. Federal government also gave funds for vocational schools for special areas. In the late 1970's Länder gave financial aid to provide extra training places in firms to special groups such as girls, foreigners, the handicapped or apprentices from bankrupt firms (Schmidt, 1985).

-- In the dual system the federal government regulates the activities at the workplace through training regulations. Regional governments / the Länder work closely with the implementing agencies. There is need for constructive partnership between both.

-- In Germany, the dual system has proved flexible enough to offer a considerable number of training places even in times of economic difficulty. In large scale industry about 80 % of apprentices are subsequently employed by the company in which they trained (Raggatt, 1988). When large companies invest in the training of their future employees they feel confident that the skilled labour force would be of high quality and in accordance with their requirement.

-- In 1987, the ratio of youth to total unemployment rates in Germany was 1.1, while the average ratio for 14 other OECD countries was 1.9 (OECD, 1991). It would be reasonable to infer that apprenticeship system in Germany is an explanation for this pattern (Lauglo, 1993).

-- Financing by individual firms is a relatively efficient system and it is doubtful if better results could have been achieved in Germany with another financing system (Schmidt, 1985).

-- Among the developing countries, Jordan has successfully adapted the dual training system conducted by the Vocational Training Corporation. In large companies formal instruction as well as practical training is provided on site thereby reducing costs. In smaller firms, apprentices are given formal instruction one day a week at a training centre. Training in Jordan is effective because of cooperation between VTC and employing establishments, coordination of economic and training policy and centralized control. There are some problems too, such as inadequacy of off-site training. More vocational centres were required for theory work, so the costs went up. All students were also not successful in getting jobs as there are imbalances between the demand and supply of skilled manpower (Herschbach, 1993).

6. Production for Profit

Money raising through productive work is widespread in primary and secondary schools. In vocational training programmes, while students learn they also produce. But a high percentage of costs cannot be offset through productive activities. Generally the most effective programmes are operated by NGO's which have greater flexibility. One would assume that the product which is best for the training institution to sell is training itself (Lauglo, 1993).

7. Apprenticeship

Apprenticeship is a way of combining practical experience with theory. Generally there is a formal contract between an employer and a trainee under which the trainee agrees to work for the employer in return for practical experience which makes him a skilled worker. He gets a small wage till he reaches the level of a skilled worker. Thus the tradition of financing apprenticeship involves sharing of costs between employers and trainees (Woodhall, 1987). In India companies are obliged under the provisions of the Apprentices Act to accept a certain percentage of trained technical people for apprenticeship ranging from a period of 1 - 2 years. The apprentices are paid a stipend by the company and the government on a sharing basis.

8. Paid Educational Leave

Another pattern of financing vocational and industrial education in some countries is the provision of paid educational leave. Employers continue to pay wages to employees while they receive part time or full time vocational education. In some countries e.g. France and Sweden there is legislation giving the right of paid educational leave to workers. In some other countries there are variations in the method of financing paid educational leave. A study in 1976 concluded that the system shifts the burden on the employers and creates many ambiguous situations. Almost all countries make the financing of educational leave the responsibility of the community. Therefore paid educational leave also becomes another way of distributing costs between the employers, workers and tax payers (Woodhall, 1987).

9. Non-Government Organizations / Voluntary Organizations

-- The involvement of Non-Government Organizations (NGO's) / Voluntary Organizations in the implementation of VET is yet another way of cost sharing or financing of vocational programmes. Sometimes NGO's are charitable institutions working with the aim of upliftment of weaker and poorer sections of the society. Such institutions may have their own infrastucture and when they come forward to participate in VET, they can be successful especially in conducting short term training programmes in the rural or urban informal sectors. At times they provide education and training entirely from their own resources and at other times they receive grants or subsidies from the government.

-- In developing countries, the involvement of the NGO's in vocational training is assuming greater importance as governments continue their search for partners to share costs on training. In India e.g. the Society for Rural Industrialization in Ranchi Bihar is conducting vocational training courses related to rural technology for the poor tribal people of the local region. Grants are given by the central government and other agencies but the organization has to bear responsibility for some part of the costs. Similarly there are many other agencies voluntarily engaged in educational and training activities.

-- In the Philippines too, the involvement of NGO's in the social development process of the country has gained momentum in the last few years. Dualtech has been offering vocational training in Manila and other parts of the Philippines through the dual system with the involvement of the companies. It started its activities in 1982 with contributions from the industry and donations from the Hanns Seidel Foundation in Germany.

-- Since 1990 Dualtech has become more independent in its financing by adopting the dual system through which there is a sharing of costs with the industry. A large number of students from the lower income group are trained and 15 % of the poorest students are given scholarships. The NGO tries to maximize its resources through optimum utilization of existing facilities for training. When not in use for training, the facilities are used for commercial production on a small scale. In 1993 the organization had an operating budget of $ 600,000, of which 95 % came from the industry and 5 % from the Hanns Seidel Foundation (Dualtech, 1993).

10. Advantages and Disadvantages

Advantages	Disadvantages
- Training fees enhance efficiency and contribute resources as well. Participants are likely to pay for training if it is of good quality and can bring personal benefits and high private rates of return.	- Fees affect poor students or the underprivileged as they may not get access to training. - Training fees cannot fully support programme costs.
- Fee level can control excessive demand as fees can be raised if there is more demand. - If fees are high the quality may improve. - Fees are found to be effective in financing short term training in the informal sector. Master craftsmen are paid small stipends for additional training which they give in approved sites. This is more economical than organized formal training (Herschbach, 1993).	- If fee levels are too low it affects incentive to be responsive to students as the income from fees comprises only a small portion of the budget. In Sri Lanka the Foreman Training Institute recovers 10 % from fees paid by students and employers and government pays the remaining 90 %. The Institute is not concerned to observe economy measures, have a relevant curriculum and respond to market needs (Bressler and Hultin, 1987).
	- Fellowship programmes can be expensive for governments as there are higher administrative and management costs (Herschbach, 1993). - Fellowship programmes are subject to political interference.
- Loans are good for financing short term training.	- Loans involve problems of disbursements, collecting repayments and preventing defaults. - Loans do not lead to greater equity as affluent students are in a better position to make use of them (Psacharopoulos and Woodhall, 1985).
- Sale of training services facilitate additional income for Vocational Training Institutes.	- Too much emphasis on training services detract from the main function of Vocational Training Institutes which is vocational training.
- Co-financing agreements raise the resource level of VTI's.	
- Training can be organized in accordance with demand and therefore enhance training-employment linkages.	
- Dual training system is beneficial to firms although cost figures are difficult to calculate due to hidden expenditures e.g. breakage and waste of materials, lower productivity of experienced workers who spend time in instructing apprentices. Work of apprentices also offsets costs.	- In the dual training system there can be imbalance between training demand and placement opportunities. To regulate imbalance, training workshops are set up in larger firms for supplementing on-the-job training. In countries which do not have a tradition of shared responsability, dual system can be exploited by firms e.g. the firms can use trainees as cheap labour.

Advantages	Disadvantages
- Dual system is an efficient system of financing by individual firms and it is doubtful if better results could be achieved in Germany with another financing system. From 1980 to 1984 the number of college graduates entering the dual system rose from 20,000 to 80,000 (Schmidt, 1985). - Production for profit can offset a small percentage of costs. In low income countries school production may help to supply goods and services when there are shortages (Herschbach, 1993). - Paid educational leave motivates the workers/employees to upgrade their skill levels. Higher and more skills contribute to productivity.	- Training by firms can meet only a part of the demand for training and cannot help to solve such problems as training of people with learning difficulties, language defects etc. (Schmidt, 1985). - Sometimes institutions pay more attention to production activities than devoting time and effort to formal learning.
- NGO'S generally work for charitable causes contributing to the socio-economic development of the country. When they become involved in vocational training they take over the liability of financing some of the costs which would otherwise fall on the government. - As they are highly motivated and often work for the upliftment of the poorer and weaker sections of the society, their contribution leads to social equity. - They are mostly very successful in providing short term training. - NGO's operating in the rural and urban informal sectors generally have a good knowledge of the local market. Thus they can effectively link training with the local employment requirement. - Non-profit making NGO's generally have dedicated persons on their management. They are keenly-engaged in offering good quality vocational training and can thus provide effective support to vocational training systems.	- As NGO's are not always subject to external scrutiny they may not maintain a high standard of training. - They may also have problems of certification especially if they are very small organizations working in the rural or urban informal sectors. - Sometimes NGO's may experience a shortage of resources. In such circumstances some of them are found to have an over dependence on foreign donors.

11. Policy Implications

-- There are limits to which fees can be used to finance VET. Too much reliance on fees is not advisable as it cannot fully support training costs.

-- The most efficient way would be for governments to give subsidies to complement the use of fees.

-- Fees could be high enough to generate adequate income but not so high as to stifle the demand (Herschbach, 1993).

-- Fellowships are not effective in low income countries. The more affluent usually benefit more (Herschbach, 1993). The system of student loans is not very prevalent in developing countries.

-- While sale of training and non-training services could become a secondary source of income, it should not become the main objective of Vocational Training Institutes. The Institutes should primarily concentrate on development and provision of training.

-- Co-financing agreements raise the volume of resources available for vocational training. Institutes which have such agreements keep their courses updated and relevant to new technology (Ducci, 1991).

-- Dual system is an effective system of financing by individual firms. It is beneficial to firms, trainees and the society. The dual system involves collaborative financing with contributions from tax revenues, enterprises and the trainees. Mobilization of additional resources is achieved as there are close links with enterprises and a rough balance between demand and supply. Training in the dual system is successful when there is a constructive collaboration between social partners and adequate potential for placement. Training is also less likely to be obsolete as close links with employers are maintained (Herschbach, 1993).

-- Production for profit is not a reliable way to generate a large amount of resources for formal VET programmes. Production activities in formal VET should be limited so that more time is spent on formal learning. Local institutions will also require some autonomy for introducing a curriculum shaped by local production requirements (Herschbach, 1993).

-- Paid educational leave is a good way to upgrade the skills of an employee. While the burden of financing may become shared, the system promotes motivation in the workers to enhance their skills and qualifications thereby contributing to productivity and economic growth.

-- In the developing countries the involvement of NGO's in vocational training is gradually assuming greater importance. They not only share the financial burden but some of them are known to work for the upliftment of the downtrodden and weaker sections of the society. Thus they support the vocational training systems by helping to equalize opportunity in training for all and contribute to the social developmental process. They should be encouraged to come forward in closer partnership with the governments in organizing VET.

V. INTERNATIONAL DONOR ASSISTANCE

-- Donor support plays a very important role in developing VET systems.

-- In many developing countries the large amount of international aid has contributed to the setting up of a base of training capacity. Infrastructure and facilities have been created, staff trained and instructional systems implemented through donor assistance. Mostly donors provide financial resources for capital costs and it is limited for short periods (Herschbach, 1993).

-- In the 1980's, international assistance to vocational and technical education and training averaged about $ 600 million annually of which the World Bank provided 45 %, bilateral agencies 30 % and other multilateral agencies 25%. Approximately 40 % of multilateral assistance for education was used to support VET programmes. NGO's and private sources also made a sizable contribution but the exact amount is not known (World Bank, 1991).

-- From 1963 to 1976, 40% of lending for education by the World Bank was for VET at the secondary and post secondary levels. But evaluations conducted in the 1970's regarding cost effectiveness of vocational schooling especially diversified schools began to raise doubts. The World Bank lending then began to shift from diversified vocational education to centre based vocational training and development of national authorities (World Bank, 1991).

-- In Africa about 7 % of direct international aid goes to finance primary education, 40 % to secondary education and 17 % to VET. For every S 1 spent on a primary school pupil, S 11 is spent on a secondary school student and S 182 on a VET student (World Bank, 1988).

-- In Latin American countries much of the institutional infrastructure for VET was built through international donor assistance. A study of SENA in the 1970's showed that it had taken the maximum advantage of technical assistance offered by foreign governments and international organisations. The Brazilian SENAI at present benefits from assistance of nearly all countries of the EEC and Canada, Israel, Japan and USA (Ducci, 1991). In the beginning vocational training institutions sought international support for starting the Institution. Subsequently international resources tried to achieve the transfer of productive technology which would be appropriate for national development.

-- Among multinational donors a very high amount goes towards capital expenditures and among bilateral donors a greater share goes for technical assistance and overseas fellowships at the expense of support for recurrent costs (World Bank 1988).

1. Advantages and Disadvantages

1. Advantages

- Donor assistance helps to set up vocational training institutions.

- In some of the low income countries, but for donor support, it may not be possible to create infrastucture required for VET. Donor assistance facilitates transfer of latest productive technology to low income countries which can stimulate economic growth.

- Donors provide technical assistance from countries which have been successful in vocational training.

Disadvantages

- VET systems require long term support as they take long periods to mature, sometimes decades. Donor assistance is generally short term, sometimes for a few years. Donor agencies generally do not make long term commitments. This limits the effectiveness of assistance as recipient countries are not able to make long term plans.

- Donor agencies like to fund capital expenditure as it is easier to calculate and measure. Capital investments such as newly constructed buildings are visible and proof of the contribution made by the donor and therefore said to have greater impact. Extensive facilities are thus built which may not get adequate recurrent support from governments because they do not have adequate resources (Herschbach, 1993).

2. Policy Implications

-- Donor assistance is found to concentrate on capital costs creating large training facilities. Programmes cannot operate successfully without adequate support of recurrent expenditure by the host country. Therefore the size of the project to be funded by the donor and its duration should be based on the capacity of the recurrent funding available. Otherwise a project started with good intentions may start malfunctioning. The most successful donor projects are those which lay emphasis on strengthening the management and upgrading the quality of staff of training institutions (Herschbach, 1993).

-- Distortions should be avoided between over importance on capital expenditure as compared with recurrent costs. If initial investments are very extensive, countries may not be able to sustain VET institutions. When this happens the quality of the programmes in the institutions deteriorate and the project does not yield adequate return on the investment.

-- Donor assistance is most effective when a moderate level of finance is provided over a long period of time (Herschbach, 1993). Long term partnership with governments helps them in their efforts to build proper training facilities.

-- The host country should strengthen its essential systems so as to sustain the project long after the donor assistance is over.

VI. CONCLUSION

Governments will continue to finance VET through public revenue as the overall responsibility for development of human resources in the country rests with it. Without adequate investment in education, it is almost impossible to promote development. Government support in financing VET will therefore continue to flow and remain the most reliable.

With diversification of financing mechanisms however, larger resources are available for creating more training opportunities. But the problems of financing VET cannot be solved entirely through diversification of resources. Efforts have to be made to better utilize available resources by removing existing inefficiencies, stricter accountability, improving organizational structures and proper application of new information technology. Vocational training systems should remain flexible with the ability to adapt to the changing social, economic and technological requirements of the country. To keep vocational training dynamic the following should be borne in mind: --

-- Public revenues are used mainly to finance pre-employment VET but pre-service and in-service VET is also being supported. Vocational Training Institutions funded through national budgets have more stability as there is a consistent flow of resources and the institutions can plan its training possibilities accordingly. When there is a reduction in the budget due to shortage in availability of overall resources it could affect the training programme in quantitative and qualitative terms.

-- Single employer financing in Japan has proved very successful. However the strong cultural traditions prevalent in the Japanese society have in some measure contributed to making this training system the backbone of the growing economy. As a mechanism of financing it is highly recommended if it works as well in other parts of the world.

-- Excessive dependence on payroll levies as an important financing mode has to change slowly. There has been criticism that taxes imposed on employers eventually discourage the demand for manpower. Payroll levies have however been effective in building national training capacity especially in middle income countries.

-- Tax rebates have been effective in financing in-service training and less effective in pre-employment training. Small and medium sized enterprises do not make much use of it.

-- Fees can easily finance VET but there are limits on the amount of resources that can be generated. Fees are a better way to finance short term training.

-- Fellowship and loans do not generally work in developing countries.

-- Production for profit is effective in financing VET for poor youth, unemployed school leavers and disadvantaged adults. It works best in programmes operated by NGO's.

-- While co-financing agreements are emerging as a popular method of generating resources, other sources of funding are required for providing financial stability. Agreements with firms and enterprises bring training institutions into closer contact with market requirements and with the emerging of new technology and bring better prospects of return. However generally, only those sectors which have enough resources can propose significant agreements (Ducci, 1991). Donations from the private sector in exchange for their involvement in the curriculum design of training programmes, and membership of governing boards can also be explored.

-- The Dual System is an efficient system of financing by individual enterprises. Firms provide training voluntarily at their own expense as they believe it is the best way to train a skilled workforce according to their requirement. They also demonstrate a social responsibility for training as a contribution to economic development. But it is not only the firm which invests in the trainee. The trainee does his share of work, thus to a certain degree offsetting the expenditure the firm incurs on him. The costs of vocational training also reduce the tax on the firm's profits.

-- Although the dual system involves collaborative financing with contributions from tax revenues, enterprises and the trainees, it does not reduce much the overall tax burden on public revenues but the employers play a very crucial role in the training through apprenticeship. Training in the dual system is very successful when there is a constructive collaboration between social partners and adequate potential for placement. It is widely acknowledged that one of the reasons for the economic success of Germany is the vocational training of its labour force.

-- The involvement of NGO's in cost sharing for VET in developing countries is gaining momentum. Not only do these organisations bear a part of the financial liability but they are also known to work with a commitment for the socio-economic development of the country. Governments should try to bring forward more NGO's as partners in vocational training.

-- Donor Assistance is a very important source of financing vocational training systems. It is effective in all types of VET programmes but it has its limitations. Generally building of institutional infrastructure is through support for capital expenditure. But donor assistance can cause inefficiencies if the project cycles are too short and the host country is not able to maintain the quality of the institution. Donor assistance should have long term development policies, resources should be concentrated and special attention should be paid to recurrent funding (Herschbach, 1993).

Vocational training systems should continue its search for generating additional resources through the public and private sector such as government subsidies, enrolment fees in the long term or contributions from associations and unions. They should maintain a certain proportion of income from payroll levies and use it effectively for encouraging co-financing with enterprises. They could include decentralized and local bodies in the sale of general services to adapt to the new requirements of the governments. They should also make use of non-monetary contributions in the form of equipment and new materials for the training centres which may be donated through agreements with business.

If vocational training systems are very large and programme activities cannot be adequately supported, it may be better to reduce the programmes and consolidate the existing resources and reallocate them appropriately. The important thing is effective management of the institution through a proper balance between capital and recurrent expenditures. All training components should be strengthened and emphasis should be on quality training. The management should work closely with the employers.

Diversification of resources is not easily possible in countries which have highly centralized systems with rigid controls. New ways of raising resources will require new working relationships with religious bodies, trade associations and that requires delegation of authority. Governments have to consider making these changes (Herschbach, 1993).

The economic situation in the country also affects the financing mechanism. In low income countries there is a shortage of resources in the Government. At the same time it is not possible to find many suitable alternatives to government funding. In the middle income countries there are greater possibilities for diversifying financing and experience has shown that it is possible to have different forms of vocational education and training.

Strategies for financing VET have to take into account the pattern of economic development. There is no optimal combination of financing. In most countries there is a need to diversify training and new ways of financing may lead to new ways of training. Attempts to diversify financing will ensure stability in the long term as it will reduce excessive dependence on a single source. If there is financial stability, it will lead to better quality VET programmes (Herschbach, 1993).

There is no single or universal solution for financing vocational training and no one method which can serve all sections of the society. There are many different limitations in every system. Questions about who should meet the costs, the employers, individuals or the government are raised from time to time. A World Bank study reviewed the literature on these questions and concluded that the survey eventually raised more questions than it answered and that there is no universal solution about the absolute effectiveness of any one method (Zymelman, 1976). A combination of funding leads to greater access in VET. Diversifying financing will create greater opportunities and improve the quality of training (Herschbach, 1993). Governments have to realize that funding from public revenue is not the only way to finance investment in vocational education and training. There should be a determination to involve employers, individuals and the local communities.

ANNEXURE

TABLE

Country	Year	Total educational Expenditure		Vocational
		As % of GNP	As % of total govt. expenditure	As % of public current expend. on education
Africa				
Botswana	1989	7.5	16.3	6.0
	1991	8.4	12.5	5.5
Cameroon	1990	3.4	19.6	NA
	1991	2.8	6.9	NA

PREFACE

In the past years the global increase in severe natural disasters and the consequences of wars have led to an immense necessity of fostering the rehabilitation and reconstruction of living space especially in South-East Europe and Western Asia. The affected countries themselves can often only make little contributions to that. In the last decade alone, the German Federal Ministry for Economic Cooperation and Development (BMZ), above all, charged the Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), German Technical Cooperation, with the execution of various redevelopment and reconstruction measures for the accommodation of refugees, displaced people and disaster victims.

Due to the special demands on the construction measures in the context of disasters and conflicts, the BMZ assigned the GTZ to develop guidelines for their conception as well as practical recommendations for their execution. Experience from the most different emergency situations have been specially compiled to elaborate the following Guidelines.

These Guidelines with the annexes present various practical references to the planning, procedures, and execution of reconstruction measures with special relevance to emergency situations after disasters and conflicts. It is addressed to external experts, to national and international organisations, project planners, consultants, project partners and project executing agencies, as well as to those employees of the GTZ who are in charge of the planning and execution of construction measures and their operation in emergency situations after disasters and conflicts.

The concepts and proposals presented in the Guidelines are based on several years of experience of GTZ's technical personnel and aid organisations in the Balkan regions (Croatia, Bosnia and Herzegovina, Albania, Kosovo), in Turkey, Azerbaijan, Sri Lanka, India, Cambodia, as well as Central and Latin America. The Guidelines are to be seen from the point of view of a non-commercial general contractor (NGC) with a development-policy assignment who takes over the responsibility for the realisation of all measures and in doing so generally engages the private construction industry for the technical implementation.

Special thanks are extended to the authors Horst Valentin Kreutner, Birgit Kundermann and Kiran Mukerji, who elaborated these Guidelines. We hope that the Guidelines will meet your interest and look forward to an expert interchange and constructive criticism.

Emergency and Refugee Aid

GTZ - a service enterprise for international cooperation

The Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) GmbH, German Technical Cooperation, is a government-owned corporation with worldwide operations. Its development-policy mandate is to help improve the standard of living and prospects of people in partner countries all over the world, whilst stabilising the natural resource base on which life depends. GTZ is responsible for designing, planning and implementing programmes and projects in partner countries oriented by the German Government's development policy guidelines and objectives. The GTZ's main commissioning body is the German Government through the Federal Ministry for Economic Cooperation and Development (BMZ) and other ministries such as the Federal Foreign Office. Other clients of GTZ include the European Commission, UN organisations, the World Bank and regional development banks. Increasingly, foreign governments or institutions also directly commission GTZ services.

Technical Cooperation is playing a growing role in strengthening the capabilities of both people and organisations in partner countries. In achieving this, the institution is itself changing in the process: In the past, answers were found to clearly delineated problems, but today's intricate and complex issues call for more sophisticated approach. Sustaining improvements in people's living conditions in our partner countries in the long term crucially depends on the political, economic and social frameworks in place.

Where crises, conflicts or disasters create acute needs that threaten survival, GTZ provides development-oriented emergency aid (DEA). It has become increasingly apparent in recent years that the loss and damage can be averted by preventive measures, so approaches, instruments and measures have been developed to manage conflicts and prevent crises and disasters.

Refugee aid measures constitute an important activity area of DEA. Refugee programmes address people, who were forced to leave their homelands as victims of war or violent domestic conflicts, or on account of other disasters. The Guidelines presented here offer a general overview of building measures following disasters and conflicts, and summarise experiences and perceptions of GTZ.

Contents

1. Summary

Nowadays the consequences of natural disasters annually affect over 200 million people and the number of refugees and displaced persons amounts to over 20 million. This results in an immense necessity of reconstructing destroyed living space or providing temporary living space. The approach of development-oriented emergency aid (DEA) offers a framework within which a variety of questions that go beyond the actual technical construction measure can be discussed, especially those dealing with the working concepts of emergency aid, refugee aid, disaster precaution, as well as rehabilitation and reconstruction.

The development-policy demands on the construction of living space vary: in the case of war, refugees and displaced persons are to be accommodated temporarily as additional persons - without having knowledge about the duration of this accommodation. In the case of those returning after martial conflicts, quite often questions regarding settlement and property rights have to be clarified before a reconstruction of destroyed housing in favour of reintegrating refugees can take place. Considerable destruction triggered by natural disasters claims an extremely high number of homeless so that only part of the needy can be taken care of. Moreover, it is necessary to decrease the susceptibility to future disasters. People in need of dwelling space, possible beneficiaries, and potential future residents have to be selected on the basis of a thorough analysis, if disparities and potential conflicts are to be avoided by this measure. This becomes especially necessary when conflicts have led to flight and destruction.

The reconstruction of dwelling space in particular can contribute considerably to the stabilisation of the living situation of the affected population through more personal security and well-being and through re-establishing a productive everyday life. Supportive measures can strengthen the motivation for reconstruction and boost the local construction industry. Taking into consideration appropriate technical aspects of construction and settlement can decrease the susceptibility to future disasters. Thus, construction measures in the aftermath of disasters and conflicts constitute a fundamental contribution to redevelopment. Criteria such as significance, participation and self-help, poverty reduction, conformism, possible effects of conflicts, the reduction of vulnerability and, last but not least, sustainability have to be considered and weighed up in order to ensure the development-policy quality of the measures. Apart from that, main priority has to be given to the economic viability of the measures.

The concepts and suggestions presented are to be seen from the point of view of an organisation acting as a kind of a non-commercial general contractor (NGC) or an implementing consultant with a development-policy assignment. The NGC or implementing consultant “takes over” the responsibility for reaching the goals of all measures. He generally does not “undertake” the technical implementation himself, but instead employs the forces of the local and international construction industry. The financing of the projects in question is effected through technical cooperation (TC), financial cooperation (FC), development banks, the European Union (EU), the United Nations (UN), or other donors.

The methodological approach described in these Guidelines assumes that a donor manifests the intention of support on the basis of which a situation analysis or a rapid assessment is carried out by the NGC, and from this an offer or an implementation proposal is drawn up. It describes the individual steps starting with the placing of a commission via the implementation arrangement with the local project-executing organisation and all further planning measures required to carry out the commission up to the cooperation with companies of the private construction industry. For the execution of construction measures contractor models and self-help models are presented in detail. They conclude with the handing over of the construction works and recommendations for the aftercare operations and documentation of the projects.

Various aspects to be considered are explained in short phrases, ranging from the defining of the commission and the proceedings during field work, via the analysis of the local construction industry, aspects regarding technical infrastructure and supplies that are connected to residential building, up to questions concerning the target groups.

The execution of construction measures in cooperation with the local and international construction industry (contractor models) comprises the presentation of the different concepts of rehabilitation and rededication of public buildings for the short-term accommodation of homeless people, as well as the rehabilitation of damaged or destroyed private houses. Moreover, the construction of new housing settlements is treated as an alternative in cases when rehabilitation models do not appear to be adequate for the solution of the emergency situation. All questions essential to the role and responsibility of the project management and those related to contract procedures and awarding of contracts are discussed.

When executing the construction measures by self-help, the target groups are given support in the form of consultancy, material and financial aid. Models to support individual family self-help as well as community self-help for the construction of accommodations and community facilities are discussed. The building yard model, which basically refers to material aid and assumes an execution of the construction measure by self-help, but which, depending on the situation, can in addition include further technical support, is also presented.

And finally, basic planning criteria of simple constructions are summarised, explaining the most important protection measures against natural hazards or measures to reduce the risk of destruction due to natural disasters.

These Guidelines concentrate on construction measures that require engineering expertise and management skills in the field of construction.

The annexes comprise a selection of exemplary forms for proceedings, the execution of tenders, samples of guarantee, and practical examples of planning and construction contracts, which of course have to be adapted to the respective situations.

Case studies of GTZ projects are inserted at different places to illustrate some of the models and procedures described, and also present some interesting cost figures.

Humanitarian aid or emergency aid in their narrow sense, which satisfy short-term protection needs against the effects of harsh weather by means of mobile material (e.g. tents), as well as the long-term consultancy of partner countries in the field of residential building construction and housing development, are not part of these Guidelines.

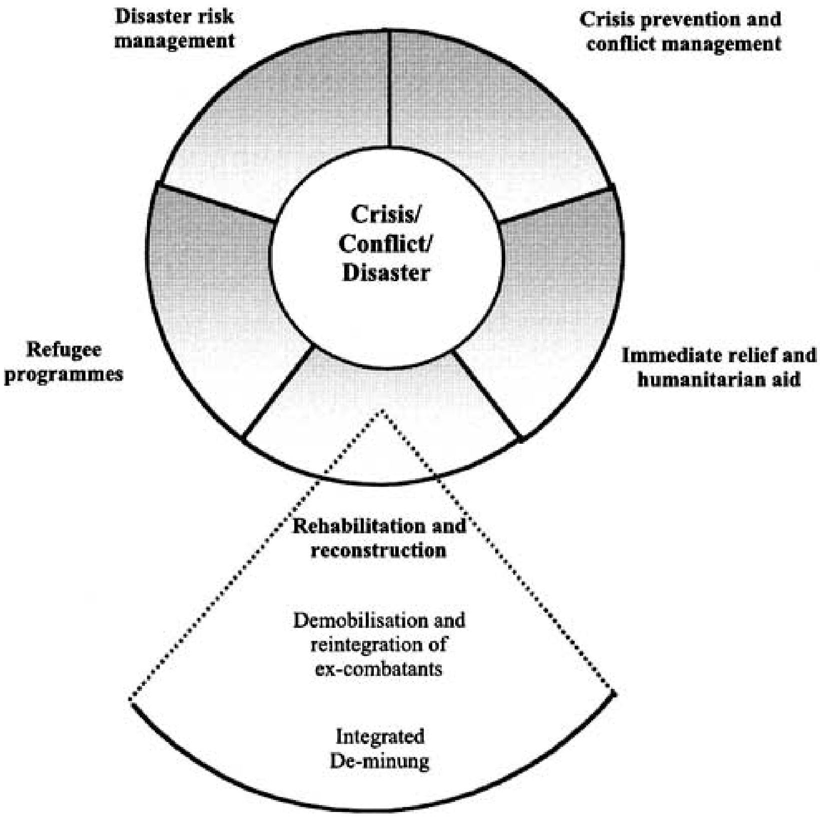
In the case of a GTZ-executed project, these Guidelines do not substitute the internal GTZ organisation directives, “Orientations and Rules” (O + R), which have to be observed in all events.

2. Building measures in development-oriented emergency aid (DEA)

2.1 Development-oriented emergency aid

The objective of development-oriented emergency aid (DEA) is to contribute to lessening people's vulnerability and reducing the dangers to which they are exposed as well as to help alleviate the poverty caused by disasters and crises. This can be realised by preventing or coping with emergency situations on household, regional and international level. According to the development-policy conception of the BMZ, its aim is to ensure the transition from survival aid to reconstruction without interruption.

Development-oriented emergency aid comprises specific initiatives, measures, and reactions to emergency situations in crises, conflicts and disasters, as well as corresponding precautionary measures. They fit into the realm of disaster risk management, crisis prevention and conflict management, emergency aid and humanitarian aid, as well as in refugee programmes, rehabilitation and reconstruction. In certain cases, the "demobilisation and reintegration of ex-combatants" and "integrated de-mining" can also be part of DEA.



Activity areas of development-oriented emergency aid

In reality, borders between the fields of activity are fluent. After an emergency situation, it is DEA's concern to ensure the participation of the target group and to promote partner institutions already at an early stage and thus be structurally effective at all levels. DEA mostly comprises a package of measures which focus on a specific emergency situation and complement one another. Technical interventions such as the provision of infrastructure or living space are generally connected to consulting functions and a working towards a constructive socio-political development. (See also "Development-oriented emergency aid - GTZ's working principles" in the Bibliography).

2.2 Building measures in the context of development-oriented emergency aid

In emergency situations, the creation of living space contributes to the satisfaction of elementary basic needs. Living space increases the personal security of the people affected, creates privacy, and constitutes an important condition for the establishment of a productive everyday live. When executing building measures after disasters and conflicts the development orientation is reflected in the concentration on local actors (communities, construction companies, sector authorities), in the application of contractor and self-help models (see chapters 5.1 and 5.2) and in the overall capacity-building effects of the measures.

Building measures after disasters and conflicts usually take place within the framework of refugee programmes or reconstruction programmes. In certain cases they can also be considered as emergency aid measures. Disaster risk management with a focus on technical construction concepts is always part of building measures before or after disasters. Possible conflicts are taken into consideration when creating building measures with respect to reducing conflict potential.

Migration movements in the form of suddenly emerging massive surges of refugees or displaced people, but also in the form of creeping rural exodus out of disaster-induced impoverishment are often triggered by crises, conflicts and disasters. Within the framework of rehabilitation and reconstruction, the authorities responsible for the control of migration and new settlements can be given technical advice in connection with the aid measures as well as on issues that go beyond the scope of these Guidelines.

In the case of building measures, the projects are generally concluded with the buildings' acceptance when the actual utilisation starts. Therefore, the preconditions for sustainability have to be established by thorough planning and during implementation. Consultancy and further training of executing organisations and other institutions can be effected to ensure, for example, a better future administration of the dwellings and their connection to the local infrastructure, the living space and economic area. The integration of building measures into an overall concept or programme of DEA, which goes beyond their actual implementation, can guarantee those services even after the practical implementation of the building measures. Necessary accompanying measures can be integrated into this overall concept and aftercare operations following the completion of constructions can be realized more efficiently.

2.2.1 Refugee programmes

Refugee programmes (and correspondingly also programmes for displaced people in their own country) include measures of short-term refugee support in the host region as well as their repatriation and reintegration into their home region. Within projects concerned with the provision of living space for refugees in the host region on a short-term basis, temporary dwellings can be created for the target group. If, for this purpose, private houses or public buildings are rehabilitated in the host region, the building measure itself can also be considered as a long-term reconstruction measure in the host region. The planning and implementation of the building measure takes into consideration the needs of refugees as interim users and those of the host population as end users. In other cases, simple temporary accommodations in camps or collective shelters are established in locations outside the housing area of the host population. An informal after-usage often takes place, but is not subject of the planning and implementation of the building measure itself. Generally, the permanent settlement and integration of refugees in the host region is not part of development-oriented emergency aid. (See also "Development-oriented emergency aid - GTZ's working principles" in the Bibliography)

2.2.2 Rehabilitation and reconstruction

Within the framework of projects of repatriating and reintegrating refugees, permanent housing facilities have to be created and rehabilitated. Thus, technically speaking, they become part of the field of activity of rehabilitation and reconstruction, which aims at re-establishing or even improving the situation before the disaster or crisis. To reintegrate refugees into their home region can be a very complex and costly task, mostly combined with other measures, such as the promotion of economic and social reintegration measures (see also case study L - Sri Lanka). According to the specific context, the reintegration of ex-combatants within building measures can play a crucial role and thus also create better conditions for a peaceful coexistence in the future.

2.2.3 Disaster risk management

In the aftermath of disasters, residential building usually takes place in the form of rehabilitation and reconstruction in close relation to disaster risk management. No matter whether it is about selecting the location or applying the most appropriate construction methods, the reduction of vulnerability to disasters is the main focus, even in the case of repair works. The final utilisation by the population rendered homeless generally constitutes the planning base. In cases where there is a great urgency to provide shelter after a disaster within a very short time for a large group of people, temporary houses in the form of prefabricated structures with a limited life span can be considered (see case studies E - Western Turkey and G - Croatia in these Guidelines). In that case, depending on the aim of the building measure, it falls into the realm of emergency aid, since the urgency and the accommodation of large groups of people have been given priority over more expensive buildings with a long-term useful life. In all cases, building measures entail a massive intervention into the socio-economic environment. Thus, it is not only in the context of conflicts that the consideration of potential conflict effects is imperative (See also GTZ's "Disaster risk management - working concept" in the Bibliography).

2.2.4 Planning horizon and special conditions in emergency situations

Building measures after disasters and conflicts are carried out under considerable time pressure, especially at times when in temperate regions the winter season is about to begin. At the same time planning and implementation have to be carried out under particularly difficult conditions: due to the confusing situation information is often not available or unreliable. Especially during wars and immediately afterwards, planning becomes more difficult due to the unclear planning horizon, such as the duration of the crisis and the changing number of refugees and displaced people. After disasters and wars important road links are disconnected and the infrastructure facilities are partly destroyed. Administrations and executing authorities in the partner countries are overburdened and, after wars, partly staffed with inexperienced employees. The population is primarily concerned with ensuring their immediate survival. High economic losses or incomplete households limit the self-help potential of the people affected. Likewise the local construction industry might be directly hit by destruction.

2.3 Development policy criteria of implementation

The quick accommodation of the people rendered homeless is the objective of housing measures after disasters and conflicts. Generally the commission is accomplished when the building inspection takes place and at the same time the buildings are handed over to the beneficiaries. Development policy criteria of building measures basically refer to the long-term usage. However, the planning and implementation of the building measures include leeway for actions having a crucial influence on the project's development policy orientation via the selection of the implementation model and the implementation partner. In this respect, some of the following criteria tend to have contradicting effects in the practical pursuit. There is no patent remedy -they have to be evaluated in the planning phase according to the respective situation. The economic viability as a further criterion will be discussed in more detail in chapter 6.2.

2.3.1 Significance

The huge number of persons having become homeless due to expulsion and destruction of dwellings leads to a high demand for the re-establishment of living space. At the same time, the provision of shelter constitutes a comparably high individual support as long as it does not involve the utilisation of public buildings for temporary living purposes (see case study C - Bosnia and Herzegovina). In general, the largest part of the re-establishment of living space is carried out by the target groups themselves by self-help and with their own financial resources, partly supported by subsidies and special loan programmes. As a result of the high costs per user, projects of shelter provision generally only reach a small part of the needy - when considering the large number of affected people. The selection of the beneficiaries should therefore be carried out with great care and include criteria of need. In general this is done by local authorities that are sufficiently familiar with the area and the people. However, the financing agency of the aid measures or their appointed general contractor should ensure the definition of the selection criteria, as well as sporadically check and observe the local authority's needs assessment. The project's significance can be controlled by the selection of the models and concepts described in chapter 5.

When rehabilitating private houses, the benefit is also broadly extended to the host population, and in the case of public buildings in favour of the host communities. The self-help models of mutual aid and the building yard model (see case study L - Sri Lanka) can also have the same effect. However, in view of all previous experience, due to the immense back-up intensity, it is not to be generally assumed that self-help can reduce the total costs of the construction project.

The significance of residential building has to be evaluated not only with respect to the direct users but also to the indirect users, who apply the acquired building techniques in future construction projects. This happens, for instance, when the building technique constitutes a model for disaster-oriented building or when the skills transferred by way of training of construction workers consitute an important component.

2.3.2 Participation and self-help

Since building measures constitute a considerable intervention into the local structure, especially in the case of new settlements, all groups that are directly or indirectly involved, are required to participate in the planning and realisation of the measures. These especially include the following groups: the future (interim) users as direct target group, the possible ultimate users, the total population as being indirectly affected in the area, construction companies and the local economy, the local administration and the district authorities. Their active participation ensures the achievement of the project's intended goals: the quality of the process of identification of the beneficiaries and the cooperation with the local population reduces the risk of the buildings being misused after completion of the building measures. Therefore, even if the time pressure is high in most of the cases, the following opportunities should be taken into consideration:

- community participation, even if central project executing organisations and partner institutions assume responsibility;

- participation of organisations of the target groups or representatives (e.g. for refugees without adequate organisation);

- working towards the foundation of an empowered participation forum, where advantages and disadvantages can be considered for all groups and possibilities of reconciling interests can be discussed;

• working towards the involvement of the surrounding area's total population in benefiting from the measures, as well as in their implementation (provision of labour and commissions for local companies, even for smaller works);

• participation of direct beneficiaries in the designing of dwelling space;

• appropriate consideration of the future usage respectively the need of potential future beneficiaries.

Financing volume:	**1,833,875 euros**
Period:	**2001-2002**

On 13 January 2001 an earthquake measuring 7.6 on the Richter scale hit the coast of El Salvador. On 13 February another earthquake measuring 6.6 on the Richter scale occurred, the epicentre of which was close to San Pedro Nonualco. The second quake, which was limited to just one area, only had a local but destructive impact. The damages covered extensive areas and affected more than 90% of the houses in the urban and rural areas, as well as roads, water supply systems, and the social infrastructure. This earthquake claimed a further 300 dead, approximately 3,000 partly severely injured, more than 32,000 destroyed houses and more than 150,000 homeless.

At the beginning of March 2001, BMZ decided to support the government of El Salvador in reconstruction and assigned the GTZ with the implementation of the project REVIVES (Reconstrucción de Viviendas en El Salvador/reconstruction of houses in El Salvador).

Indisputably, the aim is to reconstruct a significant number of houses. Besides and beyond this, building activities are enriched by complementary components and topics such as gender, training in the building sector, organisation, disaster risk management and improvement of the hygienic situation. In addition to training activities in concrete “learning by doing”, accompanied by intensive consulting with permanent consideration of the highest possible transparency and participation of the most diverse groups, the methodology consists in decision-making. Therefore a complex network of different intervention levels and actors has been created for the implementation, connecting the different measures in the rural as well as the urban area, with the main actors being different groups of the local populations, the local authorities, as well as both of the administration units of the mayor’s offices of San Pedro Nonualco and Santa María Ostuma.

The dual approach is peculiar to the project. On the one hand, earthquake-resistant houses adapted to the corresponding vulnerability to disasters were built in the rural areas. The institution responsible for property rights was contacted and the registration of sites in the national real estate register was supported. Thus the project succeeded in directly supporting families, as well as in making the rural population familiar with the institution and this mechanism. On the other hand, 29 houses with the same characteristics were reconstructed in the urban area, which, in addition, re-established the cultural identity by maintaining the style typical for the region, under the overall control of the municipal administration, the Vice Ministry of Housing, and the cultural council CONCULTURA. In the urban area, the planning of reconstruction resulted in the local development plan. Executing reconstruction with restoration character has so far been an unprecedented measure in El Salvador und has been greatly appreciated by both national institutions. At the same time, the population was sensitised to disaster risks with accompanying modules and their self-help capabilities strengthened, both practically and theoretically, paying main attention to women’s participation in all matters. Personal contributions and mutual assistance in solidarity showed that the social cohesion can be fostered by joint aims, even if in some cases a lot of convincing had to be done first.

The project implementation lasted until the end of 2002. A total of 333 houses had been reconstructed in the rural area and 29 houses in the town centre (culture conservation). With the help of the reconstruction measures, a total of 1,763 victims of earthquakes could be accommodated in the rural area and 159 in urban locations. Applying a mixed calculation results in accommodation costs of 954 euros per person, including all accompanying measures, incidental expenses, and GTZ overheads.

The project continued the support initiated by emergency aid (supply of food and necessary consumer goods) and was complementarily extended by a TC reconstruction project that will last even longer (keywords: sequencing and sustainability).

Furthermore, self-help can be a major component of the rehabilitation and reconstruction of dwelling space. It can either take place within the "self-help models" described in these Guidelines incorporating the beneficiaries' participation as labour force in its narrow sense, or in the form of various personal contributions, even in the broader sense of "contractor models". Of importance in this respect are the craftsmanship and the target group's time capacities, which can be reduced due to the need to care for their families and secure their existence (agriculture and wage-earning). Criteria for deciding between contractor models and self-help models are described in chapter 5. Altogether, personal contributions arise from the participation in planning and implementation, monitoring, and several other services that are not directly and adequately remunerated. The measure itself and its success can be structurally effective as a contribution to the reconstruction or the development of the production capacities in the country: executing organisations, political decision-making bodies and, last but not least, the companies and people of the local construction industry make substantial contributions, even if local planners and construction companies, for example, are paid by donors' grants and take financial benefit from it. These earnings flow directly back into the trade cycle and foster the economic development of the concerned country.

2.3.3 Poverty reduction

Natural disasters such as earthquakes, floods, heavy storms and volcanic eruptions leading to the destruction of habitations in most cases affect the whole population of the disaster region. The poorer population groups, however, living in less solid housing, quite often on more susceptible land, are more severely harmed. In addition to that they seldom have the financial means necessary for the reconstruction of their housing. The objective is to counteract increasing poverty.

Thus, the concern of building measures must be to ensure the creation of dwelling space for the needy groups, whose own resources are insufficient for the reconstruction. It has to be taken into consideration that in many cases the needy groups are not in a position to offer a significant contribution in the form of manpower. The importance of a careful selection of the target groups was indicated under section 2.3.1, Significance. This can be determined by a reasonable choice of criteria of neediness, as for example the number of persons to be cared for per household, the number of household members that are able to work, the amount of household income, etc. The transparency of the selection process should be guaranteed by public announcement and the formation of the selection committee.

By selecting the model (see chapter 5), the involvement of the local enterprises or the national economy can be influenced, and consequently, this can have stimulating effects on the economy. Such impacts on the people's income in crisis regions are able to bridge poverty caused by the crisis, and by utilising the manpower of many - even unskilled - workers, they can have positive effects especially on the poorer population groups. Whereas the building of prefabricated houses mostly requires parts imported from abroad, most parts for the conventional local constructions can be obtained in the country. The questions of urgency and costs are, among others, the determinants for the choice of the construction method. Given the labour-law conditions, refugees or displaced persons (usually men) can apply as skilled or unskilled workers at the companies assigned with the provision of shelters. Opportunities arise especially in the case of large order volumes, when at least temporarily new employees are hired. A "cash for work" model in the field of self-help can also improve the households' economic power in addition to the self-help character. In all, the contribution and the allocation of the economic benefit to the individual groups should be assessed when selecting a model, in order to avoid an intensification of economic disparities.

2.3.4 Appropriateness

The appropriateness of the measures refers to socio-cultural factors, as well as to the construction standards, and the selection of material. Socio-cultural factors include the consideration of cultural, gender-specific, and religious characteristics, but also the accustomed form of housing estate, such as settlement with scattered buildings or agglomerations. The personal security of the beneficiaries has to be guaranteed and assessed on the basis of especially vulnerable groups (women, children, old people, minorities). Standards for spatial dimensions and equipment should in no case be higher than those of the resident population. It has to be distinguished between temporary shelter, guaranteeing a necessary minimum of hygiene, cooking facilities, and privacy and the final utilisation, possibly offering greater spatial dimensions. As far as possible, the designs should incorporate sufficient flexibility for the beneficiaries to be able to make changes within their dwelling spaces, add small extensions, and, for example, develop small vegetable gardens. In order to lay the foundations for an everyday life and the support of a productive coexistence, the construction of social buildings, such as kindergartens, schools, health care and community facilities, is indispensable. When rehabilitating existing living space, buildings of social infrastructure, such as schools and health care facilities, can also be rehabilitated or enlarged in order to be able to better cope with the new demands on the community. Appropriate planning and the involvement of the target groups' representatives considerably foster the ownership of the residents. Locally available resources should be considered in the use of construction material, in order to create regional economic effects as well as exemplary model solutions. Building measures are to be verified with regard to environmental concerns to avoid the over-exploitation of wood or other local resources. In the case of buildings that are to serve as models, an environmental impact assessment should be conducted to determine the risks of the future use of resources when spreading the technology.

2.3.5 Effects of conflicts

Due to the immense support of the target group, it is important to avoid or at least mitigate socio-economic disparities during the planning and implementation phase. Implementation models, which involve and support a significantly large number of different parties, either directly or indirectly, are more appropriate than those that only consider a specific target group of homeless people or the direct beneficiaries. In case employment and income opportunities arise for the whole population in the area, disparities and potential envy are limited.

Furthermore, the consideration of existing conflicts, especially in refugee programmes, has specific importance. In the light of conflicts that are still basically unresolved, the housing situation has an immense influence on the dynamics of the conflicts. Thoughts should be given as to how much physical distance is necessary to avoid further escalation as well as to possibilities of promoting a de-escalation, maybe even indirectly.

The employment of refugees can meet the local population's disapproval, lacking income possibilities themselves. To the disadvantage of the local population, the abundant supply of manpower can lead to a dumping of the wages typical for the area, particularly when refugees and displaced persons are already provided with their basic needs, such as food, free of charge. A limited operation of cash for work, however, can lead to a positive economic effect even with a shortage of formal work permits of the refugees. In the case of rehabilitation and reconstruction, the employment of formerly displaced persons and ex-combatants can have a stabilising effect on the conflict dynamics and help to contain everyday violence.

When rehabilitating and reconstructing, it is essential to clarify property questions before the construction measure, in order to limit, for example, potential disputes about utilisation, which tend to arise during the integration of formerly displaced persons. The infrastructure of the building measure should be adapted to the local standard. Additional infrastructure facilities for the host population can also be provided, if necessary. In order to promote reintegration, it is beneficial to plan integrated schools for the resident population, returnees, and possible new settlers, and to adapt the existing infrastructure accordingly. The forming of ghettos in the new settlements, which frequently have disintegrative consequences, should be avoided. Exchange and regulation forums, as well as groups for the joint observation of the effects, can also be created between representatives of the target groups, in the broader sense, and the beneficiaries of the dwelling space.

2.3.6 Reduction of vulnerability

Housing development after disasters is sustainable only if a reduction of the population's vulnerability to future disasters is achieved: within the framework of building measures basically by the correct choice of location and by disaster-oriented construction techniques.

Accordingly, building measures have to be assessed in terms of the extent to which the disaster risk can be reduced by the selection of the building site. A decision to establish new settlements on less risky terrain, however, entails the disadvantages that are commonly associated with new settlements. Besides deciding on the location, several technical details, some of which can be realised without significant additional expenses, can cut down the constructions' vulnerability to destruction by disasters. The planning criteria for simple buildings, mentioned in chapter 6, describe disaster-specific aspects. In addition to the realisation of planned building measures, the training of building enterprises, craftsmen and the population in the application of simple techniques for improved construction can be organised. Corresponding consultation of the responsible authorities can also contribute to an improvement of the strategies for disaster risk management. Provided the building measures are included in a package of measures of DEA, several possibilities arise to cross-link them with other precautionary measures.

2.3.7 Sustainability

The sustainability of building measures is assessed in terms of the objectives of satisfying the needs of the homeless and the quality of achieving those needs.

In general, sustainability is enhanced through the wide acceptance by all the parties involved and their integration in the project. In the event that the project executing organisation originates from the building sector, it is essential also to ensure the participation of the local authorities. Sustainability is also increased by the appropriate consideration of the needs of the interim and the end users. Building the dwellings for the end users represents the ideal prerequisite. In the case of refugee programmes, it is important to consider the final utilisation by the residential population in the host region after the return of the refugees.

Referring to the direct target group of beneficiaries, their elementary basic needs are satisfied and thus the conditions for development out of an emergency situation are improved. Already at an early stage, construction projects as well as back-up measures of DEA can provide organisational support the future beneficiaries. This facilitates personal contributions, neighbourly cooperation, and the functionality of the future administration. Back-up measures meeting requirements and follow-up assistance also serve to achieve improved sustainability. Customer satisfaction, however, can only be ascertained in retrospect. Since building measures after disasters and conflicts mostly do not include any promotion by executing organisations beyond the measure itself, structural effects on the institutions are generally not to be expected.

3. Methodological approach

The methodological procedure begins with

1. the donor/financing agency defining the intended support, thus

2. enabling an expert group of the NGC to perform a situation analysis and a rapid assessment, which, in accordance with the project executing organisation,

3. result in an offer by the NGC, incorporating a working or implementation proposal. After

4. the commissioning of the NGC by the financing agency

5. an implementation agreement has to be concluded between the NGC and the local project executing organisation, before

6. the implementation of the reconstruction measures can begin. Upon completion

7. the acceptance procedures, handing over and, if necessary, aftercare take place.

Documentation and knowledge management complement the measures with regard to the future evaluation of experiences.

3.1 Definition of the support of the donor or financing agency

The donor or financing agency verifies the eligibility for promotion of a supporting measure and defines his intended support. If necessary, he is advised by experts of the NGC. Normally he fixes a budget or a budget scope. The development-policy intentions of the donor, as well as matters that are deliberately excluded from support, have to be analysed. The same applies to the envisaged time frame. Rough notions of minimum and maximum standards should be compared. Questions concerning the possible desire for public appeal of the measures have to be clarified as early as possible. The donor/financing agency should check the contact addresses of institutions and persons, if any, that can provide support on location.

During the analysis and rapid assessment of the situation on location the individual appraiser, or the team, represents the interests of the potential donor/financing agency and follows any possible conditions it stipulates.

3.2 Analysis and rapid assessment

Questions regarding emergency aid are usually given priority in a rapid assessment. The second step for the building experts is to deal with questions of temporary shelter for disaster victims, refugees or displaced persons.

Within the framework of these Guidelines different solutions are described.

The question of the possible project type and the form of implementation already arises at the time of the situation analysis and the rapid assessment. It mainly depends on:

- the extent of damage and degree of destruction,
- the number of persons affected,
- the time frame in relation to the number of persons affected and the climate (winter/summer),
- the necessary/appropriate reconstruction technology,
- the availability of required human and material resources.

During the rapid assessment on location, the administrative structures of the project executing agency, if already nominated, must be investigated, as well as its expected performance capability. This decisively influences the conception of measures and the taking over of responsibility, as well as the possibilities of part financing of project components by the project executing agency.

The major steps of the needs analysis and rapid assessment are specified in the form of a checklist in section 4. There, the list mainly focuses on the building aspects of questions regarding the creation of emergency shelters or reconstruction.

3.3 Working and implementation proposal, offer

The NGC receives the commission on the basis of an offer incorporating an implementation proposal. The potential donor or financing agency should be informed of the situation by telephone immediately after completing the rapid assessment. It is advisable to send them the concept of a working or implementation proposal before elaborating the final offer in order to consider their comments and suggestions in the offer.

The offer itself should at least deal with the following aspects:

Brief summary of the project with short statements on problem analysis, project objective, planned results (achievements), target group, project executing organisation, cost figures, time schedule, assumptions and risks.

The terms of payment and special conditions of contract are to be agreed upon. The offer to the donor/financing agency should be made at the best possible cost estimates on the basis of the prime costs of the NGC. The imponderables in emergency aid and reconstruction measures are too great to be able to agree on a fixed price. If an upper limit is not to be exceeded under any circumstances, this upper limit can be agreed upon on the basis of a variable scope of works, which has to be adapted, if necessary, during project implementation, in agreement with the donor/financing agency. The same can be applied when sub-contracting construction works.

3.4 Commissioning

Depending on the financing agency the commissioning might go through a long administrative process. Nevertheless, in order to start the emergency measures on a secure basis as quickly as possible, it is recommended that a letter of intent is issued by the financing agency or, if commissioning is not yet possible due to formal reasons, a written confirmation to the NGC by the financing agency is necessary. This is advisable if, for example, an exchange of notes has to be executed beforehand. The statement should include an authorisation for commencing the measures, including the assurance that, in the unfavourable event of a project break-off, the expenses incurred up to that time will be reimbursed to the NGC. On such a basis the NGC will be in the position to invoice.

3.5 Implementation arrangement with the project executing agency or target groups

In cases of emergencies and disasters, administrations and political decision-making bodies in the affected countries are suddenly confronted with unexpected events. Total overburden, lack of experience and, as a result, inadequate coordination are the consequences. A great number of helpers come into the country from all around the world, in many cases even without experience, and want to start helping immediately.

It is essential to get acquainted with the potential local executing organisations or appointed political authorities and conclude written agreements with them, so that the affected administrations get an overview of the aid measures in the country. This is a minimum condition to achieve coordination, information, efficiency, an overview, a fair allocation of assistance and even more. An official, written agreement ensures legality and thus also a certain degree of protection of material and staff.

According to the political significance and the scope of the material aid measures, it may be desirable or necessary in bilateral aid measures to conclude a special exchange of notes. An exchange of notes constitutes the highest form of agreement between governments. The decision on that is taken at the ministerial level. The procedure is usually time-consuming. However, should there be a need for speedy implementation of the aid measures, there is the possibility of a pre-commissioning, as described under 3.4. The advantage of such an exchange of notes consists in the highest acceptance by all parties involved. Within its framework, exemption from import duty and taxes for material and personnel, competences and important partnership contributions can be regulated. It is common and time saving for emergency aid to use unilateral notes through the embassy, while exchange of notes within emergency aid projects is exceptional and makes sense only for very large projects.

Implementation agreements between the implementing organisation (here, for example, the NGC) and the local ministry in charge, having been appointed or especially created for emergency cases (e.g. Ministry of Construction, Ministry for Refugees), or downstream bodies, are common practice. In the case of bilateral aid, the German Embassy should be consulted when concluding the agreement. Essential contents of such an agreement could be, among others:

- nature and purpose of the aid measures,
- location of the measures,
- beneficiaries of the measures,
- specification of contributions to be made from both sides,
- amount of the financial contribution from the German side, or the donor/financing agency and, if so agreed, of the project executing organisation,
- tax exemptions for seconded experts,
- exemption from import duties on material and other taxes.

For regionally branched measures, in which the partner institutions delegate the responsibilities to provinces and communities, further implementation agreements with similar contents also have to be concluded with them, however, only with reference to the region in question.

3.6 Taking over, handing over, aftercare

The taking over and handing over procedures fulfil different functions in “contractor models” (section 5.1) and “self-help models” (section 5.2). While the procedures involving acceptance certificate, guarantee period, guarantee retention, etc., common in the construction industry worldwide, apply to “contractor models”, mostly followed by a media coverage and publicly appealing ceremonies of handing over to the partners or project executing agencies, the taking over and handing over in the case of self-help measures takes place successively after completion.

Newly established housing areas and buildings reconstructed to accommodate disaster victims require aftercare services. Already after the commencement of construction, questions concerning administration and management during the utilisation phase are to be discussed with the project executing organisation and personnel is to be recruited early. In the final stage and with the handing-over of buildings and installations, the latter is introduced to the technology of installations, such as electricity, gas, water, and sewage, and is put in charge of operation, maintenance, and guarantee claims after occupation of the buildings.

It is necessary to establish the technical means to be able to gradually recover the rental and operating costs from the beneficiaries by installing electricity, gas, and water meters during construction.

3.7. Documentation and evaluation

In the case of emergency aid measures, implemented in a relatively short period of time and under difficult and often chaotic conditions, documentation often comes off badly. However, it is exactly the experiences from such projects that are important to document, and thus make information quickly retrievable in a similar situation later on. Problems, that inevitably arise during such projects, can be better analysed the more information is available. Helpers in emergency situations are not always experienced experts, but very often dedicated people, who are confronted with such situations for the first time and depend on information from earlier relief operations. Documentation is also indispensable in view of knowledge management.

Although each disaster and emergency situation signifies extreme pain for each individual victim, press reports are often a lot more dramatic than the real situation, i.e. with regard to the scope of damage and the number of victims. When visiting the hardest hit places a photo documentation should be carried out, especially before the clearing up works. All further information from the investigations stated under section 3.2 “Analysis and rapid assessment” should be documented in written form. The planning process and important decisions should also be recorded.

Detailed stock-taking of the buildings and the situation on the spot constitute an important condition to match planning and demand. The planning is generally not done on the spot, so that not only written accounts but especially photos are indispensable. Before starting with actual rehabilitation measures, photos of the destroyed buildings should by no means be forgotten, in order to permit a comparison with the situation after their rehabilitation (before/after documentation).

Since many individual services and supplies by different partners are required for the progress of construction during implementation, a chronological documentation of the course of construction (time schedule) is imperative for the monitoring of the project. All decisions taken, especially the awarding of contracts, should be documented according to the existing conditions.

It goes without saying that all planning documents have to be kept for a period of approximately 15 years in the form of paper copies as well as on electronic media. Since plans are amended or modified according to the given circumstances during the implementation phase, “as-built plans” have to be prepared by the architects.

Aid funds are generally also tax money and are thus subject to certain usage guidelines which have to be observed strictly. Therefore, it is compulsory to document in detail the awarding of construction commissions, the contracts, and the costs, in order to be able to verify their correctness later. Further information can be found under 5.1.4 “Contracts and awarding procedures”.

With the help of today’s technical means it is easy to document all important phases of an aid project photographically. This is important to show situations before and afterwards, but also to document the gradual development during implementation, unforeseen events, and building components that will be concealed later on. These photos can be easily transmitted electronically, enabling experts in their home office, for instance, to participate in the solution of problems without having to undertake costly and time-consuming travels.

When filing the photos it is important to note the name of the place and the date on the file or on the back of the photographic prints. These details are especially helpful when producing information brochures, which should be a must for all important projects.

4. Needs analysis and rapid assessment on location

The following points of consideration and suggestions for the situation analysis and rapid assessment are restricted to investigations in the field of construction and technical infrastructure. In the concrete examples of the project planning and management, described in chapter 5, a series of further points relevant to the projects are cited, which, without claiming to be exhaustive, are to be observed as well. In retrospect, references are again made to the remarks under section 3.2 (Analysis and rapid assessment).

4.1 Before departure

Here again, reference is made to the remarks under section 3.1 (Definition of the support of the donor or financing agency). Additionally the following aspects should be considered:

Defining of commission:

- Clarifying the expected budget and possible modalities of the donor/financing agency;
- approaching the donor/financing agency about possible special instructions or reservations towards institutions/persons;
- agreeing with donor/financing agency on whether minutes of meeting can be signed, for example, by the project executing organisation;
- clarifying specifications/intentions concerning contents, target groups;
- ascertaining former and future cooperation in the partner country, as well as cross-connections, and aftercare.

Logistics:

- Ascertaining contact addresses on location (embassy, aid organisations, hotels, companies, planners/architects/engineers);
- considering relevant press information from the Internet or other sources and, if necessary, situation reports of leading organisations (UNHCR, International Red Cross) and others;
- clarifying communication links (e-mail, telephone, fax) with the relevant persons of the home office;
- deciding on interpreter; mobility in the country; international driver’s licence;
- visa issues; valid passport; vaccination card; vaccinations; first-aid kit;
- personal financial provision;
- possibly taking out insurances.

4.2 Methodological recommendations for investigations on location

Collecting information:

- Procuring basic information, situation reports, etc. of leading organisations (UNHCR, International Red Cross), also on location, if available;

- investigating estimated numbers of refugees and persons rendered homeless, including indication of the sources;

- conducting conversations with relevant government representatives and, in particular, with the executing organisations of the aid measures;

- enabling information exchange with GOs or NGOs and e.g. UNHCR, that are present on location, thus providing an overview and possibly avoiding duplication of work;

- enquiring of the affected government about existing or planned aid programmes and responsibilities;

- enquiring about the government's budget scope, if possible;

- investigating aid measures of other donors in the building sector;

- substantiating and assessing information received by repeated enquiries of other parties involved;

- conducting general discussions about information and coordination with the German Embassy at the beginning of the investigations.

Project executing organisation:

- Clarifying core problems and aims, as well as priorities and persons in charge, as far as possible, in agreement with the project executing organisation;

- evaluating administration, potential performance capability of the project executing organisation, and other relevant government authorities concerned (building and planning authorities).

Participation and participants:

- Including the affected population in the investigations is desirable, but problematic. It makes sense when the people affected are represented by persons recognized and also accepted by the project executing organisation. Should this not be the case, the rapid assessment will have to be done without the inclusion of the victims. This will have to be made up for, if possible, at a later date, for example when planning and stipulating the standards of the building measures. It is not only the refugees and disaster victims that are affected, but also the local population, which is, for example, represented by a mayor.

- Investigating self-help potential, skills, initiatives of the affected population, the refugees, and the disaster victims.

Procedures and security:

- Assessing security risks (physical, economical, commercial) and clarifying logistic issues (transport possibilities);

- verifying possible cooperation opportunities with national military or foreign peace-keeping forces (formation of convoys for personal and material transports, escort, transport of relief supply, material transports);

• assessing general military presence.

4.3 Analysis of the local building industry

The investigations on location concerning building issues are conducted from the point of view of a non-commercial general contractor (NGC) or implementing consultant. The cooperation with the local building industry plays a decisive role. Should this fail to succeed, the aid measures will run the risk of being planned and carried out without sufficient adaptation to local possibilities and requirements and will thus be treated as third-party interests and alien, and persist as such. The costs will definitely rise with imported know-how, i.e. the recipient country will benefit less from the aid. The identification of appropriate companies to implement the measures on behalf of the NGC is of vital importance. The following investigation steps are recommended:

Information on the building sector in the partner country:

- Gaining access to professional chambers or associations of architects and engineers (if existing) via the project executing organisation, in order to obtain information (directories of members, addresses) and references to local partners;

- conducting the same queries at the ministry of construction or the local building authorities;

- enquiring at the ministry of construction about lists of local construction companies, if possible, itemised according to qualification and sub-divided into categories.

Assessment of local construction companies and planners:

- Compiling “short-lists” based on aforementioned information sources (chambers, associations, ministry of construction) for first interviews and with a view to future planning and construction tenders;

- conducting as many interviews as possible with the companies’ executive management to get an overview about its qualification and about the local building situation in the country;

- questioning the architects/engineers about the construction companies and vice versa, the construction companies about the architects/engineers;

- enquiring about references of architects’ and engineers’ offices and, if there is enough time, looking at projects and/or questioning former clients;

- conducting interviews with planners and construction companies in the companies’ offices, on the companies’ premises, if the time permits, in order to get an impression of the equipment and the “vitality” of the company.

Ensuring an appropriate procedure:

- Conducting similar enquiries with planners, building authorities, ministry of construction, and construction companies about the level of construction costs (price per m^2, price per m^3 for normal housing construction) and comparing them carefully;

- discussing the envisaged application of sample building contracts, in order to be able to analyse the general, and especially the international experience of the planners and construction companies in dealing with contracts;

- discussing the country’s common fee and remuneration practices with planners;

• questioning planners and construction companies on liability and guarantee issues;

• questioning planners and construction companies about the wage situation of architects and engineers, work potentials, material and production sources, and especially the bottlenecks;

• soliciting, if necessary in advance, relatively non-binding offers or partial offers for certain standard services for further consideration.

Logistics:

• Enquiring at construction companies and the ministry of construction about the transport situation in the country, i.e. capacities, transport costs per ton, costs per km, etc., prices for petrol and diesel fuel, situation of construction material and fuel supplies in general, and comparing the information with one another;

• enquiring at companies, project executing organisations and the ministry of construction about import procedures, import problems and time requirements; in doing so, questioning the situation of duty exemption for goods to be imported within the framework of aid measures (e.g. pre-fabricated houses, installation material);

• discussing the situation of the banks and questions concerning money transfer directly with the project executing organisations, companies, and banks.

4.4 Questions on infrastructure (land use planning and connections, energy, water supply)

Land use planning and connections: (see also sections 5.1.5.3 (1) and (2))

• Suitability of land in respect of reduction of vulnerability to disasters (see section 4.5)?

• Have surveys of land (cadastral maps) been carried out or who is in charge of them?

• Distance of site (for settlements) from borders, from war zones (recommended distance: minimum 50 km)?

• Road connections and public transportation?

• Connections to public institutions (schools, health care facilities, community facilities)?

• Which regional plans have to be considered?

• How can the maintenance of buildings and infrastructure be organised?

• Has storm water drainage been considered?

• Waste disposal - who carries the costs?

Energy supply: (see also section 5.1.5.3 (3))

• Which fuels are usually used in the country (gas, coal, electricity, wood)? What costs?

• What are the fuels used for (heating, cooking, lighting)?

• Availability (imported)?

• Site development costs, energy supply (distance)?

• Who takes care of the supply (project executing organisation, partial cost sharing)?

• What are the prevailing cooking practices?

• Size of household per kitchen stove? Kitchen stove with how many hot plates?

• How will the new dwellings be heated (fuel, types of heaters)?

• Potentials of existing energy supply companies?

• What is the environmental impact of resource usage (especially for local energy sources, such as wood and charcoal, as well as building timber or building materials)?

• Is it necessary to rehabilitate or expand the energy supply company, for instance, in order to supply a new settlement?

Water supply: (see also section 5.1.5.3. (2))

• Demand for drinking water, domestic water (differentiation is often unknown); the amount is more important than the quality of the water (e.g. 40 litres in Eastern Europe per day per person, or 25 litres in Africa per day per person, incl. herds of small domestic animals)?

• Quality of water, is filtering equipment required?

• Water storage (underground reservoirs, cisterns, overhead tanks)?

• Supply by tanker during the start-up phase? Who carries the costs?

• Cost per m^3 of drinking water (provided it can be determined)?

4.5 Target group, risk of conflicts and disaster risk management

Target group and risk of conflicts:

• Rough assessment of the socio-economic structure of the region's population as a whole and in relation to those in need of shelter;

• differentiation of those in need of shelter according to socio-economic criteria and, if necessary, collaboration in the formulation of criteria for the eligibility for acquiring dwelling space or promotion;

• review of the advantages and disadvantages arising for the resident population by the building of new settlements;

• assessment of what kind of cooperation and conflict potentials exist between the resident population or total population having dwelling space and the target group to be provided with shelter, in connection with the building measures;

• homogeneity of the target group to be provided with dwelling space (groups, structure of households, organisation, also regarding vulnerability to disasters);

• assessing the capacities of the target group and taking into consideration when planning; verifying collaboration

- during planning (organisation and representation),

- during realisation (finances, technical know-how, working performances),

- compatibility of participation through work inputs, which generally help to secure the people's existence.

Disaster risk management:

• Inquiring or drafting disaster risk assessment for the land to be built on or which is to be rebuilt; assessing the risk of hazards in cooperation with the population and national institutions (risk of flooding, landslides, lava stream, other exposures);

• inquiring which possibilities exist within the conception of building measures to reduce the risk of disasters:

- disaster-resistant construction for new buildings, repair works, and reconstructions,

- cost benefit considerations,

- applicability of the conception beyond the building measure,

- discussing possible use of early warning systems for earthquakes, floods, volcanic eruptions (e.g. with flood early warning system for the efficient operation of disaster protection measures),

- disaster precaution (e.g. education and training of local organisations, reserve supplies of sufficient disaster-resistant infrastructure, such as emergency shelter for future use).

4.6 Interim result on location

In the course of the assessments on location and after consulting the project executing organisation the NGC's appraiser forms his first ideas on how the envisaged project concept is to be realised. Here, any one of the implementation models described in section 5.1 to 5.3 or appropriate combinations of these can be applied. Not later than at this point the appraiser should contact the people responsible in his home office and discuss the latest developments, the proposed project concept, and further procedures. The home office might have to consult the donor/financing agency.

Subsequently, the appraiser should agree with the project executing organisation on the probable conception and convey the results of the agreements with the financing agency and home office. The results should be recorded as minutes of meeting or notes of discussion, provided that no other procedure was agreed upon with the donor/financing agency. At this point the German Embassy should be consulted with regard to a possible involvement.

Provided there is enough time, a draft offer or part of it should already be written on location during the mission.

4.7 Analysis of the German and international building sectors with regard to emergency shelter

A large number of planners and project developers worldwide are dealing with the planning and conception of emergency shelters. This is taking place within the field of research and education with students at universities, in private architectural firms, or in medium-scale enterprises, where these concepts are manifested in prototypes and model houses. In some cases, these ideas are developed in cooperation with large companies wanting to sell material (e.g. insulated profiled metal sheets) or with manufacturers of prefabricated houses. Well-engineered model shelters for emergency situations hardly exist. This is understandable as developments cost money, the market is unclear, and opportunities for new commissions only occur coincidentally. But there are programmes for the construction of simple buildings for the leisure market (garden houses, log cabins), which are in permanent demand by customers. Manufacturers of prefabricated houses react to inquiries if projects and secure financing are assured. Then, they generally mobilise their subcontractors, for example in Scandinavian countries, companies in the USA, in Eastern Europe, or in low-wage countries, and launch offers. The implementation proposals then follow the NGC's instructions (see section 5.1.5.3 (4)), or they offer their own, relatively simple and adapted products.

Bringing in the German or international building industry is a viable option only if a large number of prefabricated emergency shelters is to be erected. In all other cases of building and rehabilitation measures involving conventional construction, German or international building companies hardly stand a chance on location, due to the costs involved.

In the case of prefabricated buildings, the NGC should insist on turnkey erection on site, including foundation. It is not of much use if the manufacturer is only in the position to supply ex-works or free on construction site and leaves the interface coordination and completion of the service to the NGC. The NGC will then inevitably be confronted with problems. An interface on the foundation's upper edge is basically possible, if the manufacturer of the prefabricated houses is assigned the responsibility for the approval of the foundations erected by a third party. A supply always has to include the assembly of the buildings on site.

As a result of his business experience and connections, the NGC either already disposes of an index of potential manufacturers of prefabricated buildings or he can request the associations of manufacturers of prefabricated houses (also to be found in the Internet) to provide him with a directory of members and further information. Fundamental selection criteria for manufacturers of prefabricated houses are, among others:

- The product proposal is adequate and the offer is complete (including sanitary facilities, heaters, furnishing, etc.);
- proven expert know-how in previous comparable projects (references) exists;
- existing production capacities are sufficient and thus anticipated delivery time can be met;
- turnkey supply is possible;
- international experience in transport, supply, and assembly is evident;
- qualified personnel is available;
- commercial creditworthiness seems to be given, but has to be verified.

Aforementioned technical and commercial selection criteria are to be seen in relation to the price. The relation has to be weighed up and determined according to the situation. A good product that is reasonably priced, but cannot be delivered in the required time, is less likely to be of use to solve the emergency situation on location (see case study B - Azerbaijan).

Case study **B**

Construction of 16 refugee settlements as emergency aid measure in Azerbaijan

Financing agency:	**ECHO (European Community Humanitarian Office)**
Financing volume:	**16,600,000 euros**
Period:	**1993-1996**

After the breaking up of the Soviet Union, hostilities between the now independent states of Azerbaijan and Armenia escalated and reached their peak with the Armenian army's occupation of Nagorny-Karbakh, a region in Azerbaijan mainly inhabited by Armenians. Approximately 1.4 million people, mainly Azeries, as Azerbaijan's citizens are called, fled into the hinterland of Azerbaijan.

A large number of displaced persons had no shelter or food and the new state Azerbaijan was not able to solve the pending problems. ECHO decided on rapid aid and assigned GTZ with the building of simple housing settlements in different regions.

From 1993 until 1996, GTZ built a total of 16 housing settlements with 3,280 houses and 6,560 rooms for approximately 36,000 persons in 4 different building phases. The average construction costs per accommodated person amounted to 558 euros, including all incidental expenses and GTZ overheads, a relatively low price, considering the circumstances and regarding the efficient and appropriate solution reached.

The project implementation of the first building phase, executed in 1993, took place in cooperation with the German Federal Agency for Technical Relief (THW), which established the technical infrastructure (roads with gravel surface, water supply, and street lighting) for the first two settlements. GTZ was responsible for the turnkey erection of all the houses during all 4 building phases. For the building phases 2 to 4 during the years 1994-96, the technical infrastructure was also established by GTZ.

The housing units were simple constructions made of insulated, prefabricated lightweight building elements that could be assembled manually. The housing units were equipped with one lighting connection each and very simple basic furniture. After tendering, the prefabricated buildings were imported from Finland and Turkey. Ventilated pit latrines were built on site and assigned to each housing unit. Centrally located washing and shower houses in conventional construction satisfied the minimum hygienic needs.

The identification phases of the individual locations of the settlements with regard to technical and socio-ecological criteria, took place parallel to the planning and tendering activities and each lasted about 1 month. The building of the technical infrastructure, as well as supply and erecting of the prefabricated houses was achieved with greatest effort in approx. 4 months. Due to the very flexible methodology, it was possible to hand over each of the housing settlements before the onset of winter.

Parallel to the construction work and during the whole construction period, the so-called integration phases with instructions and directions on self-help initiatives, taking-over of personal responsibility, development of the community, and creation of jobs were realised in cooperation with an Azerbaijani NGO.

In building the housing units, the refugees were provided with a first solid nucleus to spend the winter in, with the possibility of an individual expansion through personal contributions later on.

Extreme efforts towards the integration and sustainable development are yet to be made.

5. Project planning and management during implementation

In the course of the rapid assessment the envisaged concept, expected to be suggested, generally becomes apparent to the team of appraisers. This means that concept-specific investigations for the beginning of the planning and first considerations about the implementation of this concept should already be carried out parallel to the rapid assessment.

In this chapter, “contractor models”, “self-help models” and the “building yard model” and their contents and procedures will be presented by examples. Modifications, variations, and combinations are possible. In contrast to the contractor models, where the construction works are carried out by the private industry, in self-help models a considerable part of the construction works is implemented by the future beneficiaries themselves. In this case, support is mostly given through building material supplies and expert advice in construction. Here, the target group is involved more intensively in the planning and implementation of building works, while building contractors are awarded contracts at the most for partial works. Independent of that, in both models a participation of all people concerned (direct target group, population in the target region, administration and authorities) takes place in the planning. All these direct or indirect participants contribute personal inputs in favour of the project’s overall success.

The decision on whether a contractor model or a self-help model is to be applied depends basically on the following aspects:

- Building method in the target region and technical complexity of the building project,
- capacities of the parties involved (technical, economical, organisational),
- conceptions of the time frame for achieving the objectives.

In societies marked by the division of labour, contractor models are the prevailing model of implementation of building measures. Technical advice can be given to the construction industry, e.g. concerning the improvement of building techniques with regard to disaster precautions. Even if contractor models include an external financing of the measure by the donor, sector authorities and administrations provide their own inputs.

If living space is generally provided by self-construction in the region and the basic technique is widely known to the target group, the target group should be included in the construction works within the framework of self-help models, according to their technical know-how. It has to be taken into consideration that the scope of the building works on houses requires a long-term commitment of the workforce, which is not always possible (see 5.2. Self-help models).

5.1 Contractor models

Provided that the expert analysis of construction and the rapid assessment come to the conclusion that, due to great destructions of buildings and technical infrastructure and due to an acute lack of accommodation possibilities for many thousands of disaster victims or refugees, building measures need to be implemented in the shortest possible time - maybe before the onset of winter - implementation according to the “contractor models”, as described in detail below, is the appropriate option. This entails a consistent cooperation with the local building industry, in exceptions even with the international building industry. It is not acceptable that in large aid projects the agency responsible for the implementation of the project (NGC) plans the project on its own, recruits personnel, purchases material, and more or less plays the role of the building contractor. It is a fallacy to believe that by doing so expenses are cut down on (by saving contractors’ profits, purchasing material at lower rates, and the like), not to forget lacking guarantees and liabilities. Consequently the advice is: consistent cooperation with planners, building companies and suppliers, after their selection on the basis of competitions.

5.1.1 Local and international building industry

For various reasons, media reports on disasters, streams of refugees, and destructions are often exaggerated. Occasionally, international companies gain the impression that almost everything is destroyed and the affected countries are technically not able to solve the problems on their own. Frequently the opposite is the case, except, for instance, when power stations, dams and other plants with special technologies are damaged. Most of the damages, or at least a considerable proportion, can be repaired by the local building industry. Their participation fosters an economic development of the country from the beginning and creates jobs.

Albeit companies only exist fragmentarily in the host country, the required manpower and professional know-how are still there; they normally reorganise themselves quickly and do an acceptable job. The professional qualification of the potential local planning and building partners' executives is decisive. In order to discover these qualifications, detailed interviews have to be held before deciding on a shortlist and awarding of contract. In most cases, and if necessary, with the help of consultations, these companies ought to be considered for the implementation of services or at least for parts of it. The questionnaire (Questionnaire for Architects/Engineers and Contractors), included under item 9.1, can be used as a basis for interviews and making decisions.

Services, which the local building contractor cannot provide, should be covered by appointed sub-contractors (if necessary, international ones) or other independent contractors. Here, a coordination of the interfaces by the NGC is required.

5.1.2 Project controller, implementing consultant, local architects

The NGC, defined in section 1 (Summary) as the responsible agency for the implementation, owes the donor/financing agency the offered service as a whole. In this capacity it has to take the part of the project controller. It is best if the service of project control can be implemented with its own technical and commercial personnel, having experience in development cooperation and being able to make quick decisions. This reduces interactions with other parties, expenses and duration of the project.

Should the NGC not be able to provide these services, they can be subcontracted to a so-called implementation consultant from the German or international market. In case of delegation to an implementation consultant, the NGC still requires at least one expert (a building generalist) within the agency, in order to give instructions to the implementation consultant, to control him/her and to influence or take the necessary decisions. Rough sample TOR for engaging a project controller are outlined in section 5.1.3. Depending on the country in which the services are to be rendered, the implementation consultant may also be found on location.

At any rate, architects and engineers on location should be appointed as partners and subcontractors to carry out the planning and site supervision. They know best about the professional means and building permission procedures, the sources of material supply, the labour resources, and the industrial resources in general. They are familiar with the area and still remain on location after the completion of the NGC's or the project executing agency's measures and can, for example, follow up warranty claims on behalf of the NGC or the project executing agency.

5.1.3 Terms of Reference (TOR) for project control

5.1.3.1 NGC as project controller

Should the NGC dispose of experts within the home office staff and possibly also field staff, the following services should be provided to ensure efficient project organisation and implementation:

(1) Recruiting of personnel, or provision of:

- Project manager (seconded to project location);
- architect(s), construction experts (seconded to project location);
- 1 (building) economist (seconded to project location);
- backstopping - management = project leader (at the home office);
- backstopping - construction expert (at the home office);
- backstopping - contract expert (at the home office);
- backstopping - economist (at the home office).

(2) Project organisation and mobilisation on location

- Renting office space;

- employing local personnel (after interviewing) as: office assistant, interpreter, chauffeur, possibly other professionals;

- equipping offices; computer to be procured on location, if possible, for service and guarantee reasons, otherwise imported;

- installing telephone, fax, possibly e-mail and internet access; possibly satellite telephone;

- importing vehicles; alternatively buying on location or leasing them, after comparing prices;

- opening an account with a bank, if possible, for financial transfer and payment of invoices on location (short periods for payment);

(3) Project activities

Planning and preparation:

- Determining possible planning and implementation concepts with the project executing organisation (see also section 5.1.5);

- concluding necessary project agreement(s) with the project executing organisation(s);

- appointing local free-lance architects/engineers as subcontractors, after interviewing them and inspecting the architects' offices (possibly upon recommendation of the local Chamber of Architects or Engineers, if existing, or of the building authorities, or according to one's own knowledge and research).

Tender and contracts:

- Tender and conclusion of contracts with architects after consultation with the project management at the home office of the NGC (at GTZ, also with the contracts department), directly between NGC and architects;

- pre-qualification and shortlist of potential construction companies (with explanatory statement); verification of construction companies with a view to their qualification as general contractor;

- implementation of the construction tender and analysis; communicating proposal for award of contract (with explanatory statement) to the project leader at the NGC's home office (at GTZ, also to the contracts department for approval);

- direct conclusion of contract between NGC and general contractor for constructions.

Monitoring and controlling:

- Steering the planning of the construction works, carried out by the local architect;
- overall supervision of building progress;
- verification of the plausibility of the contractor's running invoices and the final invoice(s), which have been checked by the local architects;
- remittance of payments, after deducting contractually agreed retention money;
- controlling of project accounts, i.e. administration and financial management;
- dealing with and monitoring agreements with local contractors and local staff (contract procedures, payment etc.);
- acceptance, verification, and confirmation of bank guaranties (the reliability of the bank also has to be checked; it should be connected to the SWIFT transfer system);
- effecting all bank and cash transactions;
- management of overhead and administration costs;
- disbursement of financial resources (salaries of local staff?);
- bank transactions;
- accounts management;
- insurance coverage of the measures (transport, building etc.);
- budget planning (building costs) und monitoring;
- compiling regular financial and expenditure reports;
- invoicing of all measures;
- final commercial invoicing of the project and transmitting it to the NGC's project management.

Inspection/project termination:

- Inspection of the construction works by the NGC or delegation of the task to local architects;
- if necessary, handing over of planning and contract documents to the project executing organisation for the following up of warranty claims. Note: This procedure has to be agreed upon in the building contract;
- drawing up the final project report and possibly a photo documentation according to the instructions of the NGC's project management.

5.1.3.2 Implementation consultant as project controller

In case the NGC does not dispose of the required expert personnel to implement the project control, it can appoint a so-called implementation consultant to take over this task. The latter can originate from the following professional groups: architects, civil engineers, project controllers or infrastructural planners. Essential selection criteria are:

• Experience in project control and management;

• international experience;

• experience in contract procedures in the building sector;

• experience in cooperating with local sub-planners, site supervisors, and construction companies;

• experience in international development cooperation;

• sufficient personnel capacities for secondment to the project (possibly with substitute staff) and for technical and commercial backstopping.

In general the NGC has to look for an implementation consultant via a so-called consulting tender. The TOR for this tender can be derived from the services listed above, under section 5.1.3.1. Such a tender is time-consuming, which is a considerable disadvantage in view of the required immediate action in the disaster region. Direct appointment of consultants is generally possible with large commission volumes, however they require a clear rationale. Depending on the commission volume, it has to be verified whether it is also necessary to observe EU guidelines for the awarding of contracts, which would additionally prolong the procedure.

The description of services of the implementation consultant is almost identical to the services mentioned under the above section 5.1.3.1, for the case of the NGC taking over the project control. However, the terms of cooperation with the local architectural and engineering firms may differ. In any case, the implementation consultant will raise extra charges on the local firms' services, since he assumes responsibility for their services vis-a-vis the NGC.

5.1.4 Contracts and awarding procedures

Contract drafting procedure

Procuring of company information, company visits, interviews (QUARENG)

Initial meeting to draft shortlist and tender documents

Dispatch of tender documents (e.g. INVTD150 or INVTDFID)

Drafting of tenders by construction companies (e.g. TENDRFID)

Possibly public opening of tender
(see "Minutes of opening tender" - MOPTENDR)

Tender analysis
(calculation and technical appraisal by the architect)

Proposal for awarding of contract, and documentation

Decision on awarding of contract

Contract negotiation,
if necessary, corrections of bill of quantities (BoQ)
and completion of contract and planning documents

Mobilisation/preparation and commencement of project

Even if time pressure is high in crisis situations, the required procedures (however, with considerably shorter deadlines) hardly differ from those under normal conditions. Therefore, wherever possible and reasonable, awards should be effected on the basis of tenders. Controls and the transparent use of funds, as well as suitability for appraisal through respective auditing authorities, are too important to dispense with tenders.

In general, it is unqualified to reason that, due to the urgency of emergency aid building measures, contracts should be awarded directly. In all cases, specifications and bills of quantities will have to be drawn up before the awarding procedure. Without these, commissions have no basis and cannot be placed. The additional work or delay in time is only incurred due to the search for alternative tenderers and the need to analyse several tenders instead of just one. This takes up little extra time. However, obvious advantages lie in the proven economic efficiency and security to have engaged the most favourably priced (not necessarily the cheapest) tenderer. Negotiations can be conducted more efficiently if alternative offers exist.

The following sample documents of GTZ in connection with tenders and awards are included in the annex of these Guidelines:

9.1 Questionnaire for Architects/Engineers and Contractors (QUARCENG)

9.2 Bidding Conditions for Consultants, Architects (BIARCENG)

9.3 Contract for Architectural Consulting Services (CONTRARC)

9.4 Form of Cost Estimate (COSTESTM) and Explanatory Report (EXPLAREP)

9.5 Form of Invitation to Tender for Construction works (recommended for contracts value up to 150.000 Euro) (INVTD150)

9.6 Form of Invitation to Tender for contract value above 150.000 Euro (INVTDFID)

9.7 Tender Conditions for Contractors (TENDRCON)

9.8 Tender Form for contracts above 150.000 Euro (TENDRFID)

9.9 Minutes of Opening of Tenders (MOPTENDR)

9.10 Contract for Construction Works on Measurement Basis (recommended for contract value up to 150.000 Euro) (CONCTRMB)

9.11 Specimen of Performance Guarantee (GARANTPF); Advance Payment Guarantee (GARANTAP); Guarantee for Defects Liability Period (GARANTDL)

9.12 Specimen of Construction Progress Report (PROGREP)

9.13 Form of Certificate of Taking-Over (TAKGOVER)

9.14 Form of Certificate of Handing-Over (HNDGOVER)

9.15 FIDIC-Part I, Conditions of Contract for Works of Civil Engineering Construction (recommended for contract value above 150.000 Euro) (FIDIC-P1) Website Information.

9.16 FIDIC-Part II, Conditions of Particular Application (as an example), drafted by the GTZ (FIDIC-P2), to be adapted to the specific project conditions;

The annexes mentioned above are also available in French and partly in Spanish in the building section of GTZ and the GTZ contract department. The sample documents are drafts based on special requirements, conditions and conceptions of GTZ. With every new project they have to be verified with regard to their suitability, negotiated accordingly and adapted.

Large building contracts (commission volume exceeding 150, 000 Euro) should not be concluded without the support of a contract expert.

For all GTZ projects exceeding this volume the GTZ contract department has to be involved, as stipulated in the GTZ (internal) Orientations and Rules (O + R).

The contract forms mentioned above are based on common international forms and have been successfully applied by the legal and contract departments as well as the building section of GTZ for many years. It may seem that some of the documents are too detailed and thus inappropriate for application in developing countries. However, practical experience has shown, that contractors have so far not objected to the application of these updated contracts, and lawyers of the local companies have appreciated and accepted them due to their balanced content. International donors, the EU, and KfW, also insist on the application of FIDIC contract forms. They constitute internationally recognized contract conditions and guidelines for the implementation of building measures worldwide. They are published by the “Fédération Internationale des Ingénieurs-Conseils (FIDIC)” in two parts. Part 1 includes the general conditions, while part 2 refers to project-specific guidelines and thus has to be adapted to the special conditions of the respective project. Further information as well as order forms can be found on the Internet under “www.fidic.net”.

The application of the German fee scale for architects and civil engineers (HOAI), even with adaptations, is unsuitable. It is specific to Germany, too complicated, inappropriate for developing and emerging countries, and also unknown to them. Regarding building tenders, the same applies to the application of or reference to the German contract procedures for building works (VOB), when specifying construction works. The VOB is tailored to the German construction market, to high standards and agreements with German companies, and thus unsuitable - even more so for emergency measures. The remuneration as a percentage of the production costs is a possible and widespread way of paying for the services of architects and civil engineers. Depending on the job description, the rates can vary from 5 to 12%. The architects’ and engineers’ services have to be precisely defined before contracting them. The sample contract “Contract for Architectural Consulting Services” (CONTRARC, item 9.3), can be applied. It has to be adapted accordingly. Architects should only be contracted after having obtained several tenders and having conducted negotiations. In the case of easily comprehensible planning tasks, an effort should be made, together with the architects and engineers, instead of remuneration as a percentage of the production costs, to agree on a lump sum (fixed price), which can only be changed in the case of substantial variation of services.

As far as possible, construction works should be awarded to general contractors on location, in order to minimise interactions across borders. Separate tenders for different categories of construction work, as are common in Germany, should be avoided; otherwise all coordination services are left to the project controller.

Building contracts should be agreed on as measurement contracts, and not as lump sum contracts, because unforeseen events are common with emergency and reconstruction measures and a measurement contract reflects the situation, fair to both sides, as payment is effected according to the actual services delivered (exact number of pieces, quantities, sizes, etc.).

After completion of the building measures, warranty claims towards the NGC’s planners and construction companies are passed on to the project executing organisation, as the NGC usually retreats from the region while the warranty period persists. This has to be agreed in the contract.

5.1.5 Planning and implementation concepts

It is assumed that the intended implementation concept had already been determined roughly during the rapid assessment, in cooperation with the project executing organisation. It was included in the offer to the financing agency and forms the basis of its commission. Three possible concepts are presented as examples, which can be applied in combination and thus provide the project executing organisation with some degree of flexibility.

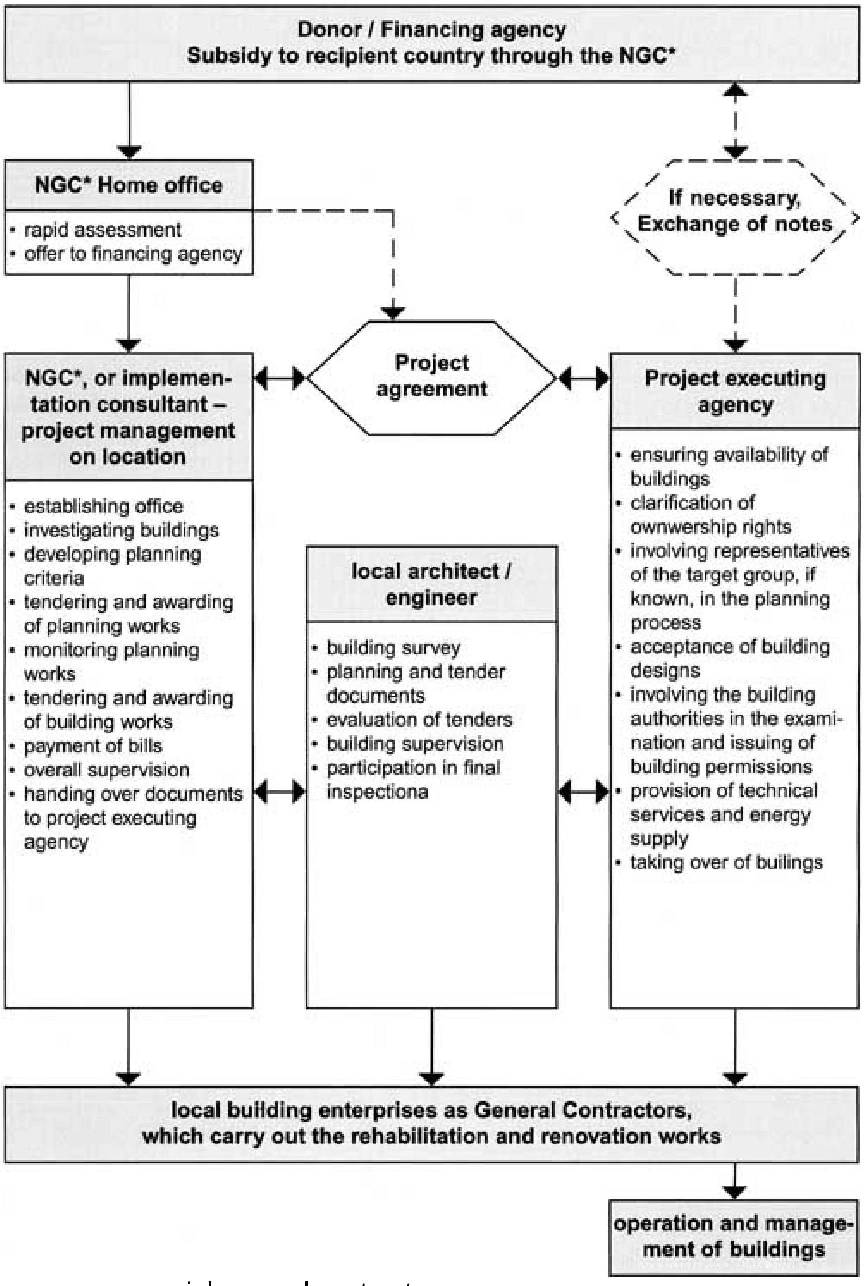
5.1.5.1 Rehabilitation and rededication of public buildings

Unused and vacant public buildings are often suitable for the short-term accommodation of disaster victims and refugees, after being rehabilitated or reconstructed accordingly and equipped with adequate toilets, washing places and heating facilities. These can be former military barracks, administration buildings or similar buildings. In general, the local authorities quickly have a good overview of the situation. It should, however, be made sure that such buildings are located sufficiently close to neighbouring settlements (social contacts) and are not exposed to environmental pollution. The advantage of public buildings lies in the fact that the question of ownership and thus the right of use is generally clear, the buildings usually are or were connected to technical infrastructure (water, sewage, electricity) and thus dwelling space can be provided very quickly, sometimes with little effort. In the early stages of planning, together with the project executing organisation, thoughts should be given to possible future usage, which should be reflected in the floor plans, provided that they are justified and the extra costs are not too high. The buildings can possibly be used later as administration buildings, schools, kindergartens, small trade, tenements and the like. This kind of accommodation is preferred due to its higher sustainability and the distribution of benefit to everyone.

At the beginning of the planning phase, it has to be verified whether building permits are required.

In the case of several large buildings requiring a considerable planning volume, it is advantageous to commission two local planning offices. This reduces planning time and creates a certain competitive situation.

5.1.5.1 Rehabilitation and rededication of public buildings



* NGC = non-commercial general contractor

5.1.5.2 Rehabilitation of houses destroyed by war

(1) Private houses

This form of project can make sense if large masses of refugees/returnees or displaced persons are in the country, who want to return home or have to be repatriated and accommodated since they are not able - for whatever reasons - to return to their original houses and region. In pacified regions, partly destroyed private buildings can be repaired or rehabilitated with assistance funds by contractors, on the condition that the owner of the house in return offers shelter in his house to a number of refugees free of charge for a certain period of time (about 2-3 years). This has to be stipulated in a written agreement between the owner of the house and the local administration or refugee office. Such a concept guarantees reliable and rapid repair of numerous buildings. It supports the local population's existing readiness to help and is of benefit for numerous groups.

During a first inspection, the degree of destruction and thus the eligibility for promotion in relation to the opportunities of sheltering refugees/displaced persons are verified. After determining the buildings eligible for promotion, the damages are assessed, the required services identified, and the quantities calculated by local architects, according to the NGC's specifications and on the basis of forms specifically created for this purpose. This simple form of assessment is possible, as damages of individual buildings are generally similar. In this way, technical specifications are produced, which, together with diverse contract documents listed in section 5.1.4, constitute the tender documents.

The restoration of houses should be simple and only deal with the most essential works: all structurally indispensable works, the roof, bathroom, WC, windows (made of insulating glass, if possible, on location), staircases, simple doors, and interior plaster. It is left to the owner of the house to contribute to standard improvements at his own expense.

Calculations of space required per refugee should be fixed at a minimum of 4.5 m^2 and should only apply to dwelling space. Sanitary rooms and circulation space are additional. The subsidy increases proportionately to the number of refugees that can be accommodated in the house.

The rooms of the refugees or displaced persons should be furnished simply by the NGC, the administration, or other aid organisations, with beds, 50% of them bunk beds (problem of acceptance), chairs, tables, cupboards, and each with one simple cooking facility.

The works done by the local general contractor have to be measured and approved by the local architect. The NGC conducts random inspections. A guarantee period of one year should be agreed on.

Case study **C**

Provision of winterised shelter for displaced people and rehabilitation of schools in Tuzla Canton, Bosnia & Herzegovina

Financing agency: **Federal Republic of Germany, represented by BMZ**
Financing volume: **6,698,000 euros**
Period: **1995-1997**

Even before the signing of the Dayton Peace Agreement, BMZ decided at short notice to contribute to the accommodation of refugees and displaced people in Central Bosnia and charged GTZ, amongst others, with the implementation. In the Tuzla Canton alone, about 240,000 displaced people and refugees were given shelter in addition to the approximately 700,000 inhabitants. The attack on the enclaves Srebrenica and Zepa in the late summer of 1995 resulted within a few days in a streaming into the Tuzla Canton of an additional 35,000 displaced people, especially women, children and old people, who could only be temporarily accommodated for the moment, partly under inhumane conditions in tents and mass accommodations.

In order to achieve better results quickly, GTZ realised several implementation models simultaneously, each in close cooperation with NGOs, which were already active on location, and the partly intact local building authorities of the affected townships:

1. Private houses were repaired or extended and simply furnished under the condition that the owners committed themselves to take in refugees for the period of, for example, 3 years.

2. Shared building components, such as the roof, staircase, windows, outside doors, chimneys for heating stoves (but not central heating), and water supply, were repaired in partly destroyed municipal apartment houses, while the returnees did the repair work inside their apartments on their own.

3. Community-owned buildings no longer in use were either extended to become well-equipped community shelters or small simple apartments.

4. A settlement with new four-family houses already under construction was enlarged by 15 houses (60 apartments).

Economic efficiency of the measures was achieved once the stipulated area of approx. 8 m^2/person was attained. Buildings and apartments were provided with minimum furnishing (beds, wardrobes, tables, chairs, hot plates).

After rehabilitation and basically equipping partly destroyed village schools, they were handed over to the school authorities for resumption of classes. On the other hand, large school buildings or public buildings in Tuzla, which had temporarily served as mass accommodations and were vacant again, were rehabilitated and returned to their initial purpose.

Besides Tuzla (30 buildings), the measures extended to Zivinice (100 buildings), Gracanica (22), Prutace (15 new buildings), Banovici and Srebrenik (42), Kalesija and Celic (127 dwelling-houses and 148 apartments).

A total of 5,721 refugees and displaced persons were accommodated within the reconstruction and restoration measures. In applying a mixed calculation, accommodation costs of 1,171 euros per person arise, including all incidental expenses and overheads.

The programme represents a successful example of development-oriented emergency aid. The personal contributions and self-help of house owners, displaced persons, returnees, local authorities, construction companies, workers, and engineers together contributed to the success of the measures, despite the difficult conditions in winter. They provide the condition and hope for the sustainability of the results achieved.

(2) Private or public tenements/apartments

Here too, the degree of destruction of the buildings is the decisive factor of eligibility for promotion. Should this be the case, the measures should primarily concentrate on all structural measures and measures involving community facilities. These are, among others, the roof, external insulation, outer walls, all load-bearing structural parts, windows, staircases, entrance doors to the apartments, electricity, water, and sewage. External plaster and external paint should not be included, in order to avoid arousing envy amongst the less supported neighbours. Inside the apartments: a simple bathroom (shower, WC, wash basin) without tiles, tap and simple cooking facility in the kitchen, and wall plaster. It is a question of budget as to which other building components can be installed inside the apartments (floor covering, interior doors, wall paint, wall tiles). It could also be expected from the owners of the apartments or buildings themselves. The interfaces are to be fixed from case to case.

Possible beneficiaries are, for instance, former apartment owners, who have returned to the buildings, or displaced persons/refugees from outside who temporarily occupy apartments.

Building investigations, planning, tendering, awarding, implementation, inspection, and warranty must be treated as described under the above item (1), "Private houses".

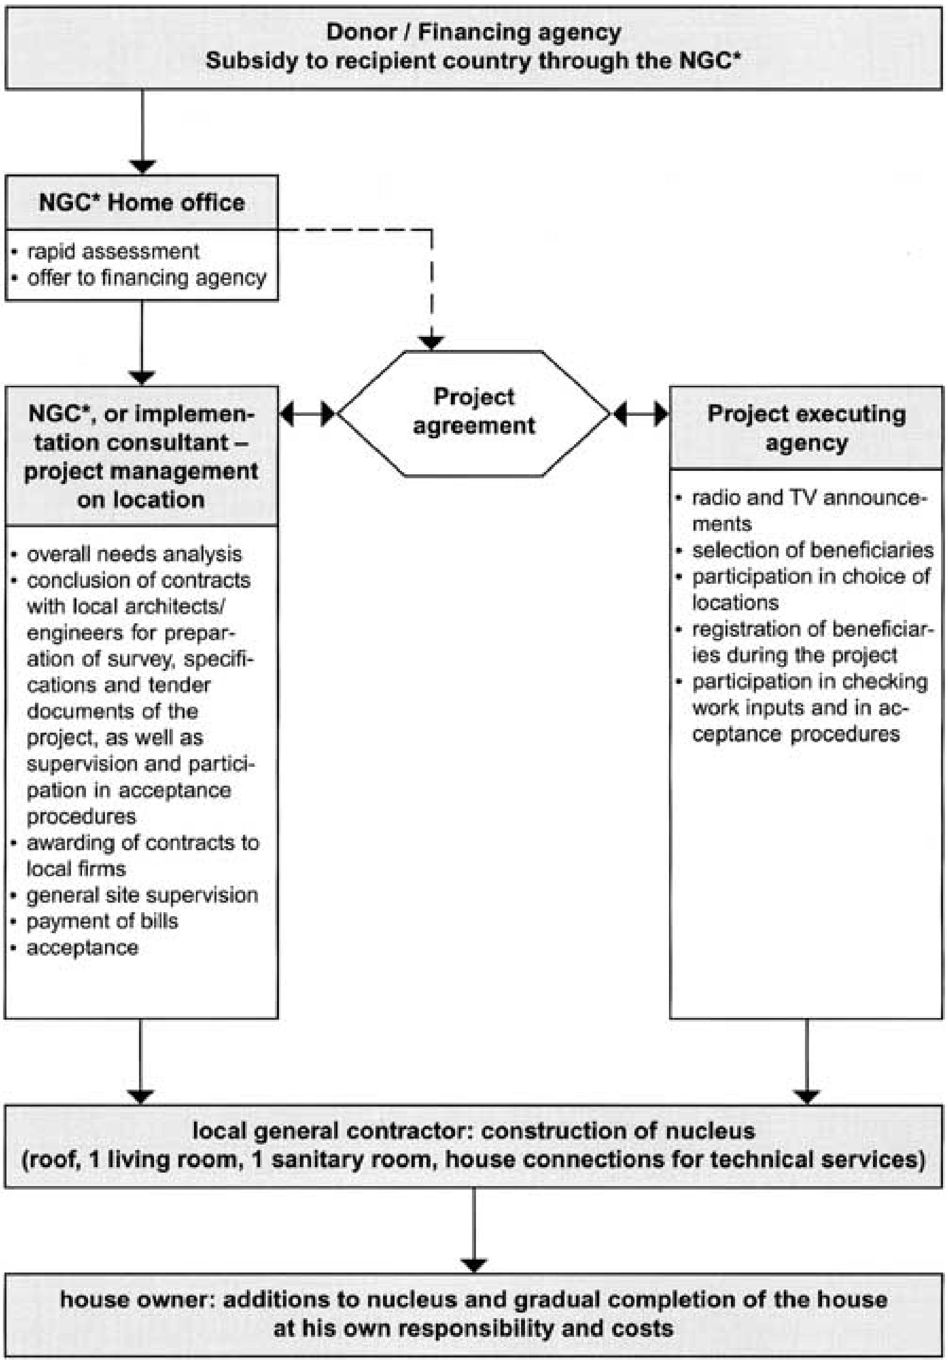
(3) Nucleus model for the rehabilitation of private houses

If the aim is to give as many local families as possible a stimulus for the reconstruction of their destroyed houses with little assistance funds, even without the obligation of accommodating refugees or displaced persons, as mentioned under section 5.1.5.2 (1), "Private Houses", a so-called nucleus model can be realised. After assessing the eligibility for promotion (degree of destruction, neediness) through local architects, according to the NGC's specifications, the promotion generally comprises the following: provision of basic infrastructure (water-supply point, power connection), the roof of the building, 1 living room with windows and doors, 1 wet cell with shower or tub, WC and wash basin, including door and window.

Just like in the preceding models under section 5.1.5.2 (1) and (2), the architect assesses the damages, describes the specifications, calculates the quantities and draws up a tender for the respective amount of buildings. The awarding, implementation, measurement, inspection and warranty must be carried out as described before.

No further measures will be executed on other rooms or parts of the house. It is up to the apartment owner to further complete the building at his own responsibility and with his own financial resources.

5.1.5.2(3) Nucleus model for the rehabilitation of private houses



* NGC = non-commercial general contractor

The selection of beneficiaries is carried out together with the local authorities in charge of reintegration and reconstruction. In case the number of buildings and applicants exceeds the possibilities of financial support within a region, the beneficiaries should be publicly selected by drawing lots. This procedure could also apply to other models.

(4) Rehabilitation through financial contributions

In case the project executing organisation is in the position to provide its own qualified professional resources, these are usually building or planning authorities with their experts, the rehabilitation procedure can also be effected via financial contribution. However, a detailed and critical examination of the management personnel through interviews, the office capacities, the equipment, and the general performance capability of these authorities has to be conducted by the NGC beforehand. It is true that community building authorities worldwide do not have the reputation of handling projects quickly. However, in cases of emergencies and disasters affecting all the people in the community, i.e. friends, relatives, and themselves, the motivation to work with greater commitment can be extremely high. Samples of Financing Agreements are not included in these Guidelines. They are only meant for internal GTZ use and can be viewed at the GTZ contracts division.

Case study **D**

Restoration and reconstruction of war damaged buildings in the Fizuli Region in Azerbaijan

Financing agent:	**ECHO (European Community Humanitarian Office)**
Financing volume:	**2,090,000 US** $
Period:	**1997-1998**

At the beginning of 1997, in the course of a joint initiative of UN and EU institutions in favour of the repatriation of refugees to former front areas between Azerbaijan and Armenia, ECHO assigned GTZ; with a trial implementation of restorations and reconstructions in cooperation with ARRA, a government organisation from Baku, which is a state-run organisation in charge of the coordination of all projects for the Azeri refugees and displaced people, as well as the executive committee of Rayon Fizuli. The measures were to serve as stimulus for further personal contributions.

The realisation was exclusively achieved by local staff (engineers, skilled and unskilled workers). Up to 200 unskilled persons were trained “on the job” in the building trade.

A total of 500 houses, divided into categories of different degrees of destruction, were repaired for 548 families, while in general only 1 to 2 rooms were provided with windows and doors, the roof was repaired or newly built, whereas the rehabilitation works beyond that were left to the inhabitants (nucleus model), Where required, hand-pumps for drinking-water were re-installed and simple toilets (ventilated pit latrines) were newly constructed.

A micro concrete roof tile production was initiated through the establishment of two new enterprises in cooperation with Parry Associates (United Kingdom) for technical advice, and KOSIA-SMEDA, one of the NGO’s supported by GTZ in Baku, for commercial management consulting. A total of 44 buildings were roofed with the new material.

The project was completed in 1998. After settling the Nagorny-Karabakh conflict, the population continued with the rehabilitation of further houses on its own.

The average costs of a building’s restoration, including all incidental expenses, costs for the production of roof tiles, and GTZ overheads, amounted to 3,814 US $ per family or 763 US $ per person to be accommodated, assuming that one family consists of 5 persons.

The handling of a financial contribution in emergency and disaster situations requires special control of all activities and measures, that are carried out by the project executing organisation and the actors, the building authorities. Temptations and possible preferential treatments (nepotism) can be especially high in crisis situations. Decisions on the selection of objects in particular, are to be taken jointly with the project executing organisation and the building authority, and confirmed in writing. Here, a representative of the NGC has to be involved. The degree of building destruction, rehabilitation costs, and future use in view of the problem to be solved (e.g. temporary accommodation of refugees, returnees) are to be brought into line economically. Planning and tender documents have to be appraised sporadically by the representative of the NGC to check their plausibility. Likewise the quantitative statements of the services provided. The awarding procedures have to be carefully checked, and, if necessary, particularly significant awarding proposals should be confirmed by the NGC.

It must be agreed in the contract that the transfer of funds to the project executing organisation is implemented in stages, according to the progress of the building works, so that the project can be controlled via the funds. It has to be verified whether the NGC's representative should also sign the contractor's invoices to confirm them. It is true that this is not in line with the philosophy of financial contributions, which require independent action by the project executing organisation, but it can be appropriate in particular situations.

The great advantage of the model "Rehabilitation through financial contribution" lies in the fact that rehabilitation and reconstruction are almost exclusively associated with personal contributions, i.e. self-help, by the project executing organisation and its affiliated structures, thus securing jobs in the administration. The condition is, however, that efficient structures exist. In disaster situations and post-conflict regions, a financial contribution should always be granted in connection with an external controlling entity (e.g. NGC). In this model, delays have to be taken into account.

(5) Credit financing

In great emergencies and immediately after disasters and acts of war, public and private aid (donations and the like) lead to measures that are financed by grants, as gifts or financially lost subsidies. Experience has shown that in this way only a relatively low percentage of the affected is reached. After the situation has calmed down, credits by development and reconstruction banks (e.g. ADB, KfW, various funds) can be granted to private house owners for reconstruction work at very favourable conditions. These banks are prepared for such aid programmes and dispose of ready-made models. Understandably, the procedures for these models are lengthy. However, they can reach a greater number of affected persons and promote their self-initiatives. The respective authorities in the affected country (e.g. Ministry of Construction) have to contact the banks.

Case study **E**

Housing and social facilities for earthquake victims in Western Turkey

Financing agency:	**Federal Republic of Germany, represented by BMZ, Republic of Turkey, represented by the Ministry of Public Works and Housing.**	
Financing volume:	**BMZ, for shelters and social facilities:**	**11,250,000 euros,**
	for a temporary emergency hospital and med. equipment:	**767.000 euros**
	German contribution:	**12,017,000 euros**
	Republic of Turkey, for the technical infrastructure, about	**5.625.000 euros**
	Total costs	**17,642,000 euros**
Period:	**1999-2000**	

On 17 August 1999, an earthquake of magnitude 7.8 on the Richter scale, destroyed more than 1,000 mostly four-storey houses in the Marmara region in Western Turkey. The number of lives lost was officially estimated at approximately 15,000. According to the Turkish Ministry of Construction there was an urgent need to accommodate about 120,000 people in temporary, winterised shelters.

The German Federal Government, represented by BMZ, agreed to have shelters erected for approx. 9,000 earthquake victims in Alançuma, Bolu-Karaçayir and Bolu-Karayollari, and assigned GTZ with their implementation.

The Turkish contributions comprised the provision of adequate land, the preparation of the sites, as well as the construction and provision of the required technical infrastructure (drinking-water, sewage system, energy supply, and roads).

The German contributions included the supply (including foundation) and turnkey erection of temporary dwellings, including a sanitary unit, small kitchenette, electric heater, and basic furniture. Tenders for the building works were launched on the Turkish market and a Turkish construction company was commissioned with the supply and furnishing of the prefabricated houses. Supported by the GTZ office in Ankara, GTZ coordinated, controlled, and monitored the works.

After a second severe earthquake on 12 November 1999, in the Düzce/Bolu/Kaynasli region, BMZ provided GTZ with a further 767,000 euros as additional commission for the building of a temporary emergency hospital in Düzce and for the supply of mobile medical equipment. Already at the beginning of 2000, still during winter, people moved into the first shelters. On 7 April 2000 the Turkish President Süleyman Demirel and the German Federal President Johannes Rau, officially inaugurated the Bolu-Karayollari settlement. In total, 1,608 housing units for more than 9,000 earthquake victims, and in addition 2 schools (8 classes), 2 kindergartens, 3 women's centres, 3 social centres, 3 health stations, 3 administration buildings, 2 youth centres, and 3 assembly buildings, had been erected by GTZ.

The costs of the German and estimated Turkish contributions amounted to approx. 1,875 euros per earthquake victim, including all incidental expenses and GTZ overheads.

5.1.5.3 Construction of new housing settlements

When streams of refugees with many thousand people cross the borders to the neighbouring countries without having sufficient accommodations there, the building of temporary housing settlements is often immediately considered an option, sometimes without the decision making bodies being clearly aware of the conditions and consequences.

For the building of new housing settlements, immense efforts are required and the highest expenses arise in relation to all other comparable emergency shelters per accommodated person. The building of settlements is extremely time-consuming and commits the local authorities to operate and carry the costs of these settlements for a long time. A permanent utilisation is to be expected as, for the most part, permanent settlements develop out of the temporary settlements due to housing shortage. That is the rule.

In case the decisions still lead to housing development, the following has to be pointed out:

(1) Choice of location (see also section 4.4)

Most important is the choice of location. It is to be pushed with all available means from the beginning, since the procedure is relatively time-consuming due to the numerous criteria to be considered (property rights, land use plans, exposure to hazards, infrastructure, costs, and many more). The project executing organisation, or authorities contracted by it, have to submit proposals for alternative sites. The NGC's representative has to verify these. For social reasons the site should be reachable on foot at an acceptable distance from an existing village or town (school attendance, shopping, medical care, authorities).

For greater distances, the local authorities have to establish bus connections. The locations are not to be exposed to pollution.

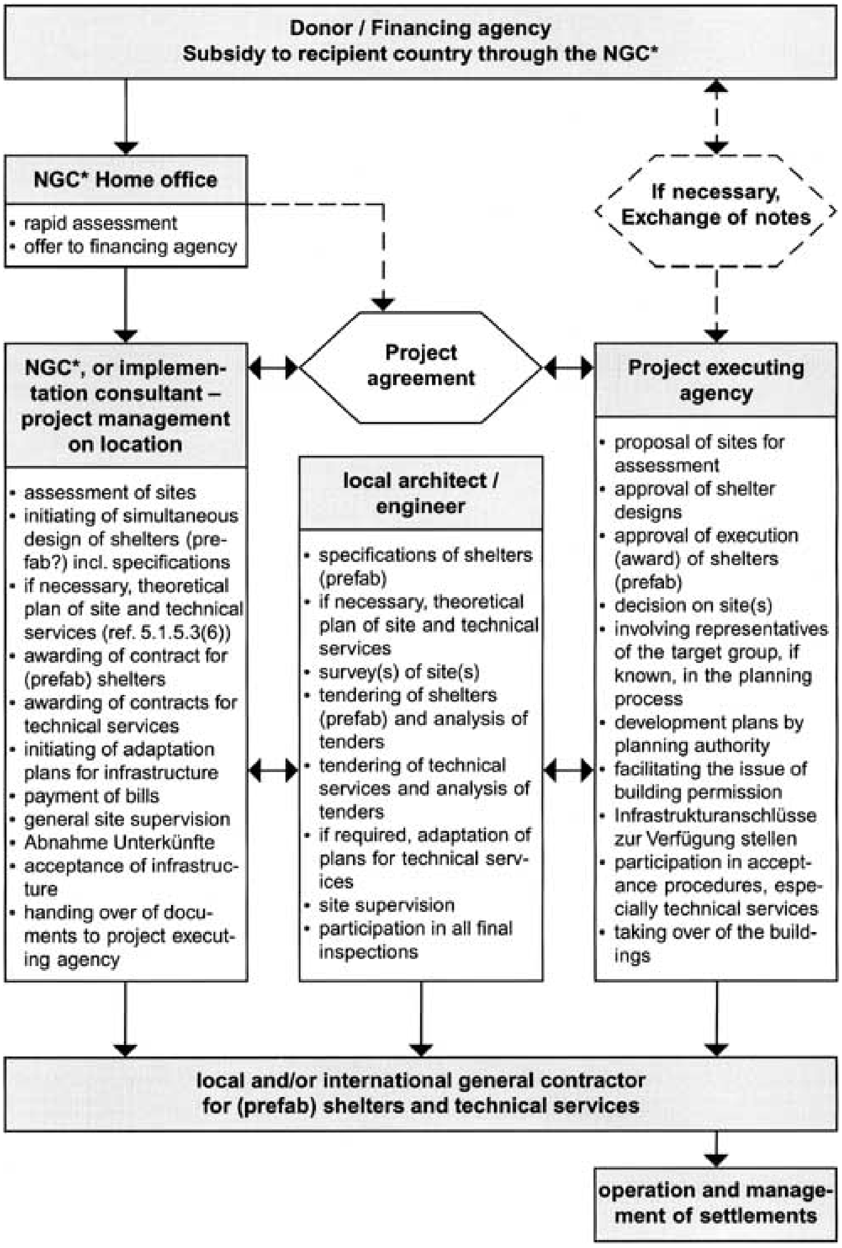
In case, for example, the location is incorrect, or the chosen standard was too low, or errors were made in the planning concept (social, religious customs were not taken into account), settlements may not be accepted by the original target group. This risk underlines the meaning of the choice of location.

(2) Site selection criteria (see also section 4.4)

Experience shows that in the case of dense layouts a site area of 45 m^2 per person is needed. This includes all required spaces for streets, paths, social buildings (schools, administration, kindergarten, etc.), playgrounds, and a small strip around the shelter for gardening. This scale should be set as a goal - however, smaller surfaces are conceivable, if the technical and social infrastructure are partly covered otherwise.

The size of the housing settlement(s) to be planned should not exceed 2,500 people, in order to limit the impact on the environment and to be able to establish a manageable internal settlement administration. Smaller settlements have the advantage that the provision of energy and infrastructure can be solved more easily. All reflections regarding the planning of settlements should ensure that dimensions and standards do not exceed those of the local population, in order to contain their envy.

5.1.5.3 Construction of new housing settlements



* NGC = non-commercial general contractor

Case study **F**

Construction of new housing for refugees returning to Gradacac/Modrica, Bosnia & Herzegovina

Client:	**The city of Düren, with financial support of the EU, the Federal State of North-Rhine Westphalia and BMZ**
Financing volume:	**1,252,700 euros**
Period:	**1998**

The repatriation of refugees to their home country is usually associated with a number of problems and unforeseen events, especially if refugees are granted asylum in a Western European country and have settled there. The city of Düren found a solution, which has attracted much attention, both nation-wide and internationally:

Already in 1992, the City of Düren took in to a large number of refugees from the community of Modrica, a village in the Bosnian Serbian region Republika Srpska, and tried intensively to repatriate them. At the beginning of 1998, after lengthy and difficult negotiations, the City of Düren succeeded in obtaining the permission to build a “temporary” settlement and shelter in the community of Gradacac for precisely these refugees in Düren. Gradacac is situated near Modrica, the home town of the refugees. It was, however, separated from Modrica, by the so-called “ethnical demarcation line” between the Bosniac Croatian Federation on the side of Gradacac and the Republic Srpska on the side of Modrica.

In March 1998, the City of Düren charged GTZ with the erection of a completely new settlement of 61 housing units near Gradacac. Five types of apartments different in size enabled accommodation made-to-measure. After a tender, prefabricated houses produced in Bosnia and the technical infrastructure were erected by a Bosnian general contractor under GTZ’s coordination and control.

In September 1998, six months after the commissioning, the repatriation of the refugees from Düren could be carried out. 2,354 m^2 dwelling space had been created for 61 families, including 203 returnees, at the price of 461 euros/m^2 and expenses of 5,345 euros per person. The development costs included (water supply, sewage system, supply of electricity) were extremely high at 1,917 euros/person, but absolutely inevitable.

The high expenses were the result, among other things, of the high demands of the host community of Gradacac, which intends to use the buildings after the departure of the refugees to Modrica for as long as possible for their own purposes, which is why they insisted on having larger floor space per person.

The community of Gradacac also insisted on the construction of an access road for the region, which would not have been necessary for the refugee settlement. As a compromise, the construction and the expenses of 166,200 euros were then accepted. If these expenses are taken into account in the costs of repatriation per refugee, total expenses of 6,170 euros per refugee arise. However, in the long run, this road is very important for the development of the region.

Nevertheless, the project paid off and was worthwhile in three respects: for the city of Düren the return on the investment costs was quick, since the living costs provided per refugee are very high in Germany. The refugees live close to their hometown and meanwhile (2002), coming from Gradacac, some of them were able to repair their houses in Modrica or even return to Modrica completely. The community of Gradacac will now receive new adequate dwelling space for their own use and an access road for a sustainable development.

The technical conditions of a site are: weatherproof road connections (also open to lorry traffic), connection to electricity supply, other energy sources (if available, e.g. gas), water supply, sewage mains or proximity to drainage canal. Should all of this not exist, it is necessary to install autonomous systems. This means, for example, the construction of bore wells or dug wells with overhead storage or pressure tanks, power generator, sewage plant, supply of solid fuels, and the like. Self-sufficiency requires considerably higher investment, operation and maintenance costs. The settlement facilities mentioned above refer to regions with a relatively high standard of living (Balkans, Western Turkey). The construction of settlements can, however, also become necessary in substantially less developed regions, where just the simplest technical infrastructure is adequate. Consequently this may mean: simple water supply through centralised water taps, construction of latrines, and simple electricity supply with lower capacities per housing unit.

As far as possible, the site should have a slight inclination of 1% and more, but not exceeding 7 to 8%. With steeper sites, the higher development costs (such as retaining walls, escarpments) bear no relation to the investment in the building. With regard to the sewage plant and overflow discharge, the inclination of the site has to be oriented towards the drainage canal. As an alternative to the drainage canal, underground seepage or oxidation ponds for biological purification of sewage are conceivable.

The highest ground-water level should not be higher than 3 m below ground, since otherwise natural slopes are not sufficient for sewage disposal and dirty water pump systems will be required (maintenance and repair problems).

The condition of the ground should facilitate the construction of sewage ducts, cable trenches and the like.

(3) Energy supply (see also section 4.4)

The provision of fuels for cooking and heating often constitutes the biggest technical supply problem. In general, wood as fuel does not apply, as the required quantities would be too large. In exceptional cases, the region disposes of coal or brown coal deposits, enabling a controlled fuel supply of the households via the settlement administration. Storage capacities per housing unit would have to be created for this. Paraffin/kerosene stoves and lamps are offered by specialised manufacturers, however, the local market must be able to ensure the paraffin supply. The same applies to the supply of propane gas or natural gas and devices. In regions with almost sufficient electrical energy supply, electric heaters are conceivable. This kind of supply is elegant and can be easily realised, but is generally expensive. With the help of small financial contributions of their own, the consumers should be made aware from the beginning, as to how significant and expensive the energy supply is. Meters for water, electricity, and, if necessary, natural gas should be installed in the housing units from the very beginning. They create the conditions for future accounting procedures and economic consumption.

(4) Emergency shelter

From experience, the choice of locations for one or more settlements takes a long time and precious time is lost. This time ought to be used to start immediately - independent of location decisions - with planning, tendering and awarding of shelters, usually prefabricated buildings, parallel to the search for the site. In certain circumstances the same can apply to the planning and tendering of technical services. Further information on this is given in the following item (5), “Settlement planning and technical services”. For “Basic planning criteria for simple buildings worldwide” see the explanations in chapter 6.

Should the situation permit the erection of the complete settlement, i.e. prefabricated houses and technical service, by a general contractor, both tenders have to be launched at the same time. However, a separation of these tenders is common. It is not unusual that the regions of the new settlements and the production locations of the prefabricated houses are located in different countries, thus joint ventures cannot be formed at short notice.

Emergency shelters are always housing units with one or better still two small rooms (for privacy), and depending on the standard, either with or without WC/shower and cooking place in the house. It is advisable to combine two housing units to a semi-detached house.

Combinations of more housing units, for example, as terrace-houses, are also conceivable. However, they affect the privacy and identification of the people with their temporary homes, due to the limited distance between them. Furthermore, the development of small gardens or individual extensions of the buildings by the resident is more or less impossible. Building extensions, with varying success, are often to be observed.

For housing units, only one but no more than two standard floor plans should be realised. The problem of different floor plans is that with the expected change of occupants in the course of time, the dwelling that just became available is most likely to be unsuitable for the new family, being either too large or too small.

The space requirements can vary from 3.5 to 6.0 m^2 per person, depending on the budget situation and the way the disaster victims or refugees used to live in their former homes. These spatial requirements are confirmed by UNHCR and have been realised in numerous projects by GTZ and NGOs. It should not be forgotten that the focus is on temporary emergency shelters and that the prime aim is to repatriate the affected people as fast as possible to their homes or original housing area.

Even if the accommodations are only temporary it is to be verified whether a building permission has to be obtained from the local building authority.

The chosen construction of the shelters must be resistant to earthquakes and storms. The manufacturer must provide verifiable structural analysis and plans.

General technical specifications are the basis for a tender of emergency shelter and should enable the manufacturers of various materials and technologies, who fulfil the conditions, to offer their products. An offer should always be turnkey, which means complete, including transportation and assembly on site, preferably also including the construction of the foundation on site, so that the supplier is responsible for dimensional accuracy. Water, including the shut-off valve, and sewage have to be offered frost-free up to 1 m outside the house. The service company builds the inspection chamber. The electrical installation must be supplied including fuse box and transmission relay to an overhead cable or an earth cable. An overhead cable is generally less expensive. The coordination of the interface from the dwellings to the technical services is the responsibility of the project controller’s site supervision. The specifications of the dwellings should contain data - depending on the climatic region - on the minimum thermal insulation of the floor, roof and walls, the maximum wind and snow loads, as well as details of windows (small sizes, insulating glass or at least 4 mm single glazing) and insulation of exterior doors. Internal walls should not be made of metal, but of chip board, plywood or plain wooden boards. Fire retardant material is desirable. The specifications should include a floor plan and section drawing of the shelter (scale 1:50).The clear height of the rooms should be 2.35 m on average. The roof overhang is meant to discharges the rainwater away from the house, but in order to avoid damage in storms, it should not exceed approx. 30 cm, depending on the material.

Many suppliers affirm to be able to build emergency shelters. The essential criteria for selecting manufacturing companies are:

- Appropriate simple technology and material of the products,
- manufacturing capacities for the supply of large quantities in the required time,
- organisation and international know-how adequate for turnkey production in the project region,
- commercial creditworthiness.

The problem in Europe and other industrialised nations is that prefabricated buildings are manufactured in production lines and the standards of production in most cases are far too high for emergency shelters. Thus new productions must be conceived, requiring time and an appropriate commission volume. In newly industrialising (emerging) countries, production can be cheaper. Large companies in industrialised nations have their contacts there and thus remain interesting competitors. See section 4.7 for more. Having similar contacts, the NGC can also buy these services in emerging countries.

Cooperation with companies from the affected region is always worthwhile as long as their performance capability can be expected, even if justifiable delays have to be reckoned with. A detailed inspection of this issue by experienced personnel of the NGC or the implementing consultant is required here. If applicable, the decision should be agreed upon with the donor/financing agency on the condition that the construction time may be longer, but in return the houses will be cheaper and thus available to a larger number of needy.

(5) Settlement planning and technical services (see also section 4.4)

Settlement planning always has to be implemented in accordance with the local planning authorities. A settlement plan corresponds to an area development plan and is a massive intervention in the existing structure and development of a whole region with long-term consequences. Most of the affected countries dispose of such planning entities. They are in charge of the activities and decisions described under the above mentioned item (1), “Choice of location” and item (2) “Site selection criteria”. Most of the planning authorities insist on carrying out the development plan, more or less detailed, themselves. Generally, basic settlement concepts and parameters do exist in a building authority. They often already existed for other purposes before the disaster happened. They will have to serve as orientation, even if these planning concepts were never meant for emergency shelters. Besides, the plans also have to be formally approved by the building authorities. Together with the planning authority and political decision-making bodies, to be appointed by the planning authority, the question of after usage has to be decided on. Here, needy local people or vocational groups of the host country can be named, who will move into the apartments after the departure of the current disaster victims. These considerations will have an influence on the planning of spatial requirements and standards. Decisions have to be made, for example, as to whether or not the beneficiaries are granted a bit of space around their shelter for gardening. It will also be decided, for instance, whether the required development of the settlement can also be used later to build single-family houses, which would ensure the sustainability of at least a part of the investment.

The experts seconded by the NGC can participate in the elaboration of the development plans in different ways. In the interest of an appropriate and quickest possible realisation they ought to decide together with the planning authorities who will take over which planning services. They should also make sure that the space requirement of 45 m^2 per beneficiary, as already mentioned under (1), is fulfilled, they should insist on minimum spacing between the buildings (flash over of fire), ensure that the required social buildings (see also the following item (7) “Social buildings”) are incorporated, and demand sufficient street lighting (sense of security).

They should also intervene when generous planning conceptions threaten to exceed the budget frame. When building several housing settlements, it may be necessary to cooperate with various planning authorities in different provinces. Here it becomes obvious that such development plans take their course and consume time.

If it is not clear where, on which site, and for how many people something shall be built, planning becomes quite difficult. However, there is a possibility to work ahead and save a decisive amount of time. The NGC’s experts should inform the planning authorities and the project executing organisations about the following possible procedures:

(6) Theoretical plan of site and technical services

The NGC, being in charge of financing the required site plan and technical services of the housing settlements and intending to charge a planner with it, commissions the planner in advance with the draft of a so-called “Theoretical plan of site and technical services” (see figure 1). Based on the assumption of a theoretical requirement of land for shelters, roads, social buildings, other open spaces, etc., a theoretical development plan can be developed. It can be assumed, for example, that there will be 2,000 people per settlement and a site area of 45 m^2 per person. Based on this information, the infrastructure planner calculates cable and pipe cross-sections, specifies all other services, and theoretically calculates their quantities.

The tender will be based on these specifications and the commission will be placed. All unit prices and the approximate quantities are now known and the contractor is all set to start. The 4 to 8 weeks, which were needed to search for appropriate sites and draft the final development plans in or together with the building authorities, were profitably used.

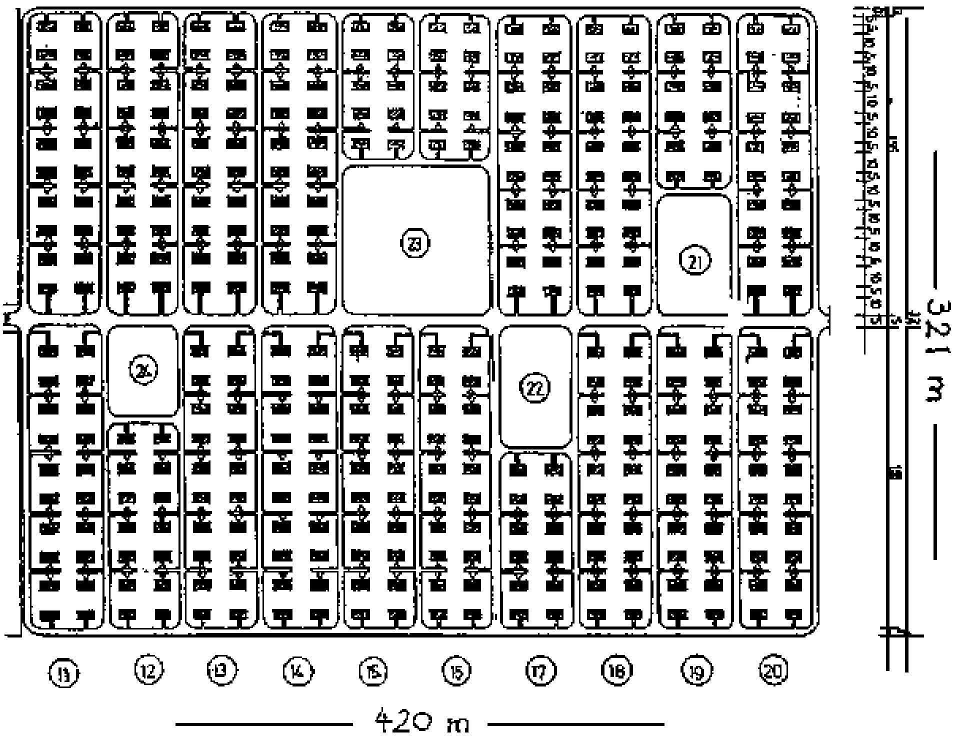


Fig. 1 A theoretical development plan

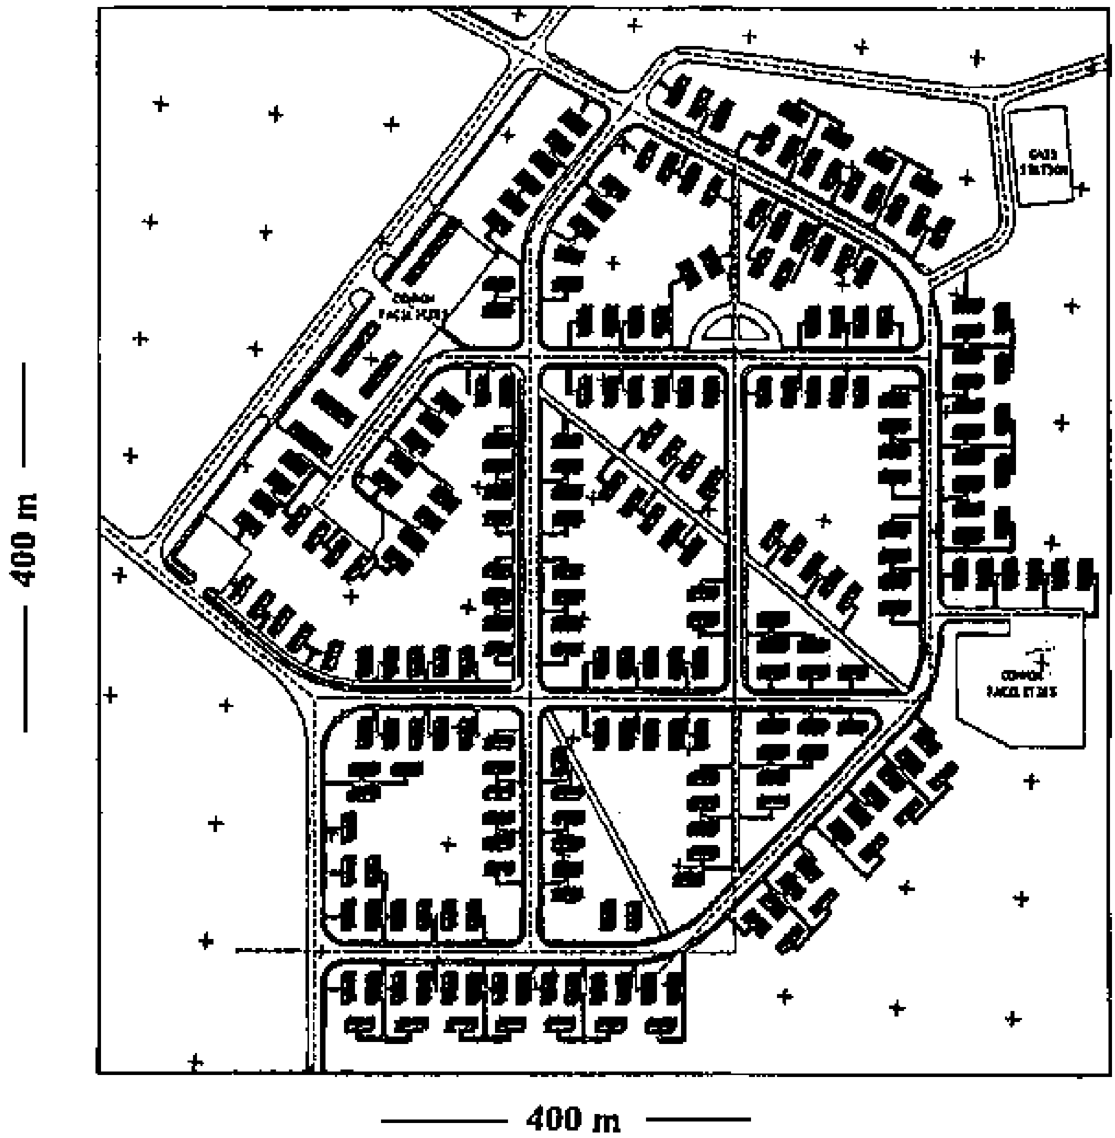

Fig. 2 The actual implementation plan (settlement in Karlovac, Croatia, 1993)

After decisions have been taken on the locations and sites, implementation planning according to the actual sites is carried out simultaneously with the beginning of the contractor's rough earthworks. Further implementation planning is gradually elaborated and handed over to the contractor. Billing is effected according to the actual expenses and dimensions, on the basis of the existing unit prices. Costs for possible new services are negotiated and fixed.

Experience shows that housing settlements of medium standard, erected within the framework of emergency measures in moderate climatic zones, do not, in the course of years, necessarily turn into slums. It is true that inhabitants come and go, but in general they take good care of the buildings. Apartment shortage and demand is too latent in most countries. It also depends on how intensively the local administrations take care of the settlements' operation.

Case study **G**

Refugee settlements, building rehabilitation and extension as humanitarian aid in Croatia

Financing agency:	**Federal Republic of Germany, represented by the Federal Foreign Office (AA)**
Financing volume:	**25,565,000 euros**
Period:	**1992-1993**

Post war period means lost homes, expulsion and flight for a lot of people. In Bosnia and Herzegovina alone, 2.5 million people lost their homes in the war in the Balkans in 1992/1993. About 800,000 had to flee. Hundreds of thousands of people from Bosnia and Croatia moved towards Central Europe.

In the summer of 1992, long before the Dayton Peace Agreement, the government of the Federal Republic of Germany decided, within the framework of humanitarian aid of the Federal Foreign Office (AA), to provide 50 million DM (25,565,000 euros) for the accommodation of approx. 20,000 displaced persons and refugees in winterised shelters in Croatia. Approx. 8,000 persons were to be accommodated in three settlements to be newly erected and approx. 12,000 persons in buildings that were to be rehabilitated or restructured after having been more or less destroyed by war.

At the end of July 1992, the AA appointed GTZ to be General Contractor for the complete project, until then, the largest single project worldwide of the German Humanitarian Aid. GTZ accepted the task without initially knowing where to build, how and for whom.

As a result, scattered over the whole of Croatia, a total of 39 buildings were converted into collective shelters, with sanitary installations, basic furnishings and partly with heating (e.g. 10 hotels, 7 schools, 5 community buildings, 4 hospitals, 2 barracks, 2 old people’s homes, 1 factory, 1 museum, 1 orphanage, 1 mineworker’s home, 1 youth camp and others more). The cost per refugee amounted to 597 euros, including all incidental expenses and overheads.

In the three settlements to be newly built, with the sites not certain upon commissioning, 8,000 persons were to be accommodated. On the basis of a theoretical building plan of 3 settlements for 2,700 persons each, the building works were tendered and the commissions for 3 different locations were placed. It was only after deciding on locations that the implementation plans of the infrastructure could begin and were pushed ahead simultaneously with the building implementation and gradually realised. The measured quantities of the actually rendered services formed the basis for the calculation and remuneration after completion. This procedure applied to a total area of 51 hectares. An extremely rainy autumn had building vehicles sometimes sink 50 - 70 cm into the topsoil mud of the building sites.

Plans were made with a Croatian general planner. Two Croatian general contractors executed the technical infrastructure. A total of 800 pairs of semi-detached houses with 1,600 housing units, as well as 14 social buildings (schools, kindergartens, health stations, administration buildings) were built by a German-Turkish consortium in turnkey construction using prefabricated, lightweight elements. Each pair of semi-detached houses was provided with a shared bathroom, gas heating (centrally supplied), and basic furniture. In mid-October 1992, building started, with the completion and the moving in of 8,000 refugees being realised in a construction time of 5 months, middle/end of March 1993. The locations of the settlements are Karlovac, near Zagreb, as well as Rokovci and Cepin in Eastern Slavonia. Ten years after completing the three settlements they are all still functioning and have been extended and partly planted with much loving care. A church, as well as additional schools have been built and complete the infrastructure. The serious housing shortage and partly unsolved returning conditions of the refugees to their country of origin make it necessary for these settlements to be retained for the time being.

The costs for the provision of 52,750 m^2 of space for shelters and social facilities amounted to 18.4 million euros. This resulted in expenses of 349 euros/m^2.

For an accommodation of 6 people per housing unit and 5.25 m^2/person, the individual costs, including all incidental expenses and GTZ overheads, amounted to 1,917 euros per refugee.

(7) Social buildings

Independent settlements exceeding a certain size urgently require social buildings, either within the settlement itself or in the neighbourhood. Social buildings are understood as premises for:

- administration,
- kindergarten,
- elementary school,
- health care stations,
- shops for food provision,
- assembly rooms (also to be used as prayer rooms),

or parts of these.

At the beginning of the planning phase the surroundings of the new settlement have to be inspected with regard to them. Social buildings can be very simple structures. On the other hand, the high utilisation frequencies they will be exposed to, have to be taken into consideration. They can be executed with the same technology and construction as the shelters or, in another appropriate form.

Some of the donors/financing agencies and also project executing organisations are not aware of the significance of social buildings in the immediate neighbourhood of the dwellings and disapprove of them, because they are only interested in financing the direct provision of shelter for the needy, i.e. providing a “roof over their heads”. Here, the NGC has to do a lot of convincing, since otherwise considerable problems will inevitably arise. In the planning of the settlements sufficient open spaces have to be incorporated.

Case study **H**

Reconstruction of a school destroyed by earthquake in India

Financing agency:	**Bild Hilft e.V. (“Ein Herz für Kinder”), Hamburg**
Financing volume:	**879,879 Euros**
Period:	**2001 - 2003**

The devastating earthquake of magnitude 7.7 on the Richter scale, having claimed about 30,000 human lives in the West Indian federal state of Gujarat on 26 January 2001 and having almost completely destroyed numerous towns and villages, was one of the worst disasters the region has ever experienced. Luckily the earthquake happened at 08.45 h in the morning and on top of it on “Republic Day”, a national holiday, when most people were outside participating in the celebrations. It is hard to imagine what would have happened if the quake had hit the region at night, when most people would have been in their houses.

The editor-in-chief of the German newspaper “BILD-Zeitung” in Hamburg sent a team of reporters to the disaster region to report on the situation there. At the same time, the aid organisation “Ein Herz für Kinder” (“A heart for children”) published a call for donations in the “BILD-Zeitung”. The fund-raising resulted in more than 1 million euros in donations. As a priority, the money was meant to help children in villages that were most severely hit. During their search, the team of reporters discovered a completely destroyed boarding school for mainly disabled children in Bhachau, a village in the Kutch region, close to the border of Pakistan. Subsequently they decided to use a large part of the donations for the reconstruction of the school.

GTZ was assigned with the implementation of the project. In a limited tender an architectural firm from Ahmedabad was chosen and charged with the design. The tender and awarding of the building works were effected in accordance with the FIDIC guidelines, with a construction company from Chennai being appointed. The Diocese of Rajkot is the project executing agency for the St. Xavier's High School, Bhachau. After completion, the school will take on up to 800 children, especially from poorer classes of society and disabled children.

The main problems to cope with were the late granting of the building permission, the fear of war in the border region due to the India-Pakistan conflict, the repeated outbreaks of bloody riots between Hindus and Muslims in Gujarat, and the constant price increases. The building costs were considerably above the country's average, since the highest earthquake resistance was stipulated.

The campus, having the size of about 2 hectares, offers enough space for two school buildings (main building with 20 classes and pre-school with 4 classes), a hostel for 28 girls and 56 boys (a novelty in the region), a house for nuns and female teachers, as well as a house for priests and male teachers. Additionally, large open spaces are provided for sports and games. Assuming a number of 800 pupils, the costs amount to approx. 1,100 euros per pupil, including all incidental costs and GTZ overheads.

Case study **I**

Rehabilitation of schools in flood areas in Cambodia

Financing agency:	**Federal Republic of Germany, represented by BMZ**
Financing volume:	**375,000 euros**
Period:	**2000 - 2001**

Since July 2000, ongoing heavy rainfalls led to inundations of the Mekong and Ton Le Sap in Cambodia. Besides severely damaged houses, roads, and bridges, it also caused the collapse of large parts of the social infrastructure. Health centres, teachers' colleges and schools were especially hit. More than 18% of the schools in the country had to interrupt classes.

BMZ assigned GTZ to support the efforts of the Cambodian Government in reactivating the schools affected by the floods as soon as possible, between December 2000 and March 2001.

One of the first steps was to set up an interim coordination office in the Ministry of Education. The measures were implemented exclusively and at all levels with the staff of the Ministry of Education. In the capital, mainly the departments of planning and real estate were concerned, while at province level coordinators from the province administrations of the ministry were especially appointed, and at district level the school committees comprising parents and teachers were assigned with the task. The project itself was restricted to the provinces of Kandal, Kampot, Kratie, Takeo, Pursat, Kampong Cham, Kampong Chnang, Kep and Koh Kong after reaching an agreement in the Ministry of Education with the other donors. Basically the following tasks were implemented:

- Conclusion of 128 local subsidy contracts with school communities for the creation of 435 new classrooms (including benches and tables) using locally adapted timber construction;

- within the framework of 196 further subsidy contracts, restoration of 1,031 damaged classrooms (including benches and tables);

- distribution of 19,000 boxes of chalk, 490,000 pens, 135,000 black boards, and 111,000 exercise books to all 801 schools affected by the floods in the selected provinces.

In the preliminary stages of the project, the planning department of the Ministry of Education, in cooperation with an expert of UNICEF, had already developed 2 basic types of classrooms, the plans and drafts of which were to serve the school communities as stimulus, but not as condition. On the basis of these plans, the department of real estate drew up a menu of materials that can be supplied locally and fixed their local prices. Out of this menu the school communities could select an assortment of materials at a price of up to 300 US $ for the erection of a classroom for 40 pupils. A similar list had been prepared for repair works, the maximum rate being 300 US $ (but including 15% expense allowance as substitute for WFP-food rations). The building and equipment measures amounted to a total of 375,000 euros, including the GTZ overheads.

It is assumed that a total of about 60,000 pupils have taken benefit from the building and repair measures. Thus for each pupil an amount of approx. 6 euros was invested, including the expenses for the supply of teaching materials, schoolbooks and equipment, as well as all overheads.

Furthermore, the coordination office mobilised food supplies, via the WFP, worth approx. 45,000 euros, for the 128 school communities that erected new school rooms. The establishment of the coordination office itself led to the immediate provision of a further 402,860 US $ by OCHA, SIDA and the Polish embassy for similar measures in other provinces.

5.2 Self-help models

5.2.1 General

Self-help models contain a range of possibilities of transferring knowledge and new building techniques to the target group, especially in the field of disaster-resistant building. Furthermore, they strengthen the target group’s organisational potential and favour the early formation of neighbour relationships and communal spirit. The improved opportunity of participating in decision-making creates acceptance for the project and widely ensures an implementation that meets the demand. The weighting of the share of personal contributions towards external promotion influences conflict-related impacts of the building measure. A combination of self-help and contractor models in respective sections is also possible.

Compared to contractor models, self-help models generally lead to a prolongation of the building measure. In most cases, the costs of the whole project do not decrease, since considerable consulting and training components are required.

Building is a technical discipline requiring planning, engineering expertise, and manual skills, even when dealing with repairs of supposedly simple buildings and shelters. By far not all people affected by natural disasters or war-induced destructions are technically and physically in the position to repair their buildings in self-help or to reconstruct them in a different location. The opposite is often the case. The fight for survival, i.e. food provision, health care, care of families and the elderly, commits their forces, so that the affected are not even available for minor works. In war situations, many households are run by women on a temporary or long-term basis, since the men might still be in military service or may have died.

In general, self-help to provide shelter for the family can only be realised with one’s own house or apartment. In situations where people have fled or have been displaced, self-help is only rarely possible, as their stay is only temporary with the aim of returning to their home country. This is especially true for complex building measures in moderate climates and relatively developed zones requiring high investments and a long-term securing of property.

As long as the households do not give up any other income generating employment, which would further worsen their economic situation caused by the emergency situation, self-help models present possible solutions. In societies marked by agricultural self-sufficiency the cultivation of basic foodstuffs must not be affected by the participation in construction measures. In principle, refugees or displaced persons (generally men) can apply as skilled or unskilled workers to the construction companies in charge of building shelters. However, chances are limited here, too, as companies first employ their own workers, who they know well.

In the context of self-help issues, not only the directly affected local population and the refugees have to be considered, but also the countries' production forces as a whole. The services of the project executing organisation, the political decision-making bodies, and, last but not least, the companies and people of the local construction industry contribute considerably, even if local planners and construction companies, for example, are paid from the donors' funds and benefit financially. These earnings immediately flow back into the circulation and foster the economic development of the affected country.

However, there are situations and regions where self-help is perfectly appropriate and works well. In these situations, knowledge about improved building techniques can be transmitted (see also chapter 6). In the following, different self-help models are described, showing the implementation of reconstruction measures by personal contributions of the affected persons (disaster victims, refugees, displaced persons) with financial and technical support from national and international organisations. The nature and scope of the support and the technical advice through the project executing organisation (local authority) and the NGC, differ according to the type of the self-help model. Several types and combinations exist, resulting from the specific requirements on location.

5.2.2 Methodological approach

The methodological approach basically corresponds to the contractor models. Here, too,

1. the donor/financing agency defines its intended support, thus

2. enabling an expert group of the NGC to perform a situation analysis and a rapid assessment, which

3. result in an offer of the NGC, which incorporates an operational or implementation proposal. After

4. the commissioning of the NGC by the financing agency,

5. an implementation agreement is to be concluded between the NGC and the project executing organisation before

6. the implementation of the reconstruction measures can begin. Upon completion,

7. the acceptance procedures, handing-over, and, if necessary, aftercare take place.

The difference, however, lies in the fact that the target group is involved more intensively in the planning and implementation of the building works, and building contracts with contractors are concluded at best for partial works. It all depends on the type of self-help described in the following sections.

5.2.3 Aided individual family self-help

This concerns the reconstruction of damaged apartments or houses of individual families, which dispose of the required labour, but only of a limited amount of the required financial means and/or technical knowledge. Provided that they meet the conditions for support (see below: (1) Criteria for the eligibility for promotion) they are generally advised by the NGC or project executing organisation about the building measures to be implemented, especially with regard to:

- nature and scope of support,
- nature and scope of services to be provided,
- technical explanations of the building measures,
- procedure and duration of the measure,
- financing opportunities (subsidy, loan).

The scope of support and supply of building material is determined by a specification and bill of quantities drawn up beforehand by a local construction expert, contracted by the NGC, and only comprises those measures offering a minimum amount of living comfort (protection against cold, heat, rain, wind; inclusion of light and air; privacy), hygiene (minimum provision of washing facilities and toilet) and security (against destruction by natural disasters, against intruders, etc.). A time frame - as realistically estimated as possible - is given for this. All completion and extension works that go beyond this are to be carried out later by the families themselves at their own responsibility.

(1) Criteria of eligibility for promotion

- Proof has to be given that the family is the owner of the damaged house or damaged apartment.

- The family income has to be below a certain income level (defined by the local authorities).

- The family has to agree to contribute a minimum personal input to the reconstruction works (to be determined according to the project concept). Some special works (e.g. carpentry, sanitary, electrical works) can, if necessary, be contracted to professionals and special companies, which may also be appointed by the NGC or the executing organisation.

- They have to commit themselves to follow the instructions of the construction expert (or foreman) and to finish the works within the given period of time.

In case an appraisal of the project executing organisation reveals that it is qualified for the implementation of this service, it receives the required funds via a Financing Agreement from the NGC. Should the project executing organisation not be qualified, the NGC will take over these services.

(2) Tasks of the local project executing organisation

(2) Tasks of the local project executing organisation (municipality, building authority, coordination office for disaster aid measures):

- Drawing up of lists of beneficiaries.

- Appraisal of neediness as well as the beneficiaries' ability to provide self-help.

- Involving the target families in the planning of the construction measures.

- Selecting, contracting, and introducing local construction experts to appraise the construction damage and assess the required reconstruction measures.

- Instruction of the construction expert.

- Conclusion of the agreement with the beneficiaries on the implementation of self-help measures.

- Ordering the planning of the project (with special regard to structural security) as well as calculation of the material requirements.

- Procuring, storing, and distributing the required building material.

- Monitoring and overall supervision of the project procedures.

• Commercial controlling, i.e. for instance, settling accounts, keeping watch on the costs and budget.

(3) Tasks of the NGC

• Conclusion of the project agreement with the project executing organisation.

• Advising the local partners on the procedures when fixing criteria for the eligibility for promotion of beneficiaries, when drafting agreements with the beneficiaries, etc.

• Reporting to the financing agency.

5.2.4 Aided community self-help in housing construction

In order to be able to increase the self-help efficiency, several families (3 to 5) can join together and form a neighbourhood cooperation and repair or reconstruct their damaged apartments or houses by a joint building team consisting of members of affected families. The promotion criteria and the promotion procedure are basically the same as those of the aided individual family self-help. In this case, however, families are committed jointly.

Case study **J**

Aid for earthquake victims in Colombia

Financing agency:	**Federal Republic of Germany represented by BMZ**
Financing volume:	**1,073,700 euros**
Period:	**1999-2000**

On 25 January 1999 an earthquake of magnitude 6 on the Richter scale hit Columbia's coffee region. More than 200,000 people became homeless in the region around the city of Armenia. After the distribution of food and medicine and the provision of simple sanitary facilities in temporary shelters in the first days after the earthquake, the reconstruction of houses in different communities of the Department of Quindio, especially for the population groups of poor, landless coffee pickers, was identified as priority measure in the ongoing process. In the weeks to follow, 278 houses were built out of bamboo in several communities.

During the building conception, in cooperation with the University of Pereira, a new house type using locally grown bamboo had been developed, offering a higher resistance to earthquakes due to the special frame construction. The communities supported the building measure through the administration of material stocks and the mobilisation of the target group, while the coffee plantation owners provided material for the foundations as well as machines. The training of the target group further enabled a great share of self-help contribution and future income opportunities for trained people in the building sector, who benefited directly due to the great acceptance of the model. Even though the building measure was delayed as a result of the numerous economic problems of the households in providing at least one worker each, the first house was completed after 70 days. The low building costs due to the use of local material and the culturally adapted construction method led to the fact that the model was adopted by other aid organisations, still during the construction phase, and was also copied locally.

A total of 1,540 earthquake victims were accommodated in the 278 houses with the help of the reconstruction measures. Applying a mixed calculation results in accommodation costs of 697 euros per person, taking into consideration all emergency and accompanying measures, incidental expenses, and GTZ overheads.

The project is considered a successful example of development-oriented emergency aid, since on the one hand the project provided shelter for the victims, and, on the other hand, an innovative, adapted, and inexpensive building technique with a considerable multiplying effect had been successfully introduced. The efficient cooperation between the target group, communities, the association of coffee growers, and the University of Pereira contributed decisively to its success. Despite the heavy rainfalls during the building phase and delay in the provision of sites in areas less endangered by earthquakes, the earthquake victims were not provided with just emergency shelter, but instead with permanent accommodations within a reasonable period of time. This resulted in a boosting of the affected people's self-confidence in a great emergency situation.

Case study **K**

Support measures for the homeless in Freetown, Sierra Leone

Financing agency:	**Federal Republic of Germany, represented by BMZ**
Financing volume:	**690,700 euros**
Period:	**1999**

In January 1999, approx. 50,000 people in the eastern part of the capital of Freetown became homeless as a result of the fighting during the civil war in Sierra Leone. They had to find refuge within a short time in other parts of the city, which, however, could not absorb the crowds streaming in.

The reconstruction measures were executed by self-help or neighbourhood cooperation. The population was mobilised by the local reconstruction committees, which had also supported the assessment of damage before. Within the project, workshops were set up, where local craftsmen, having lost most of their tools during the civil war, manufactured doors and windows and received a basic set of tools as compensation after completion of the measure. The workshop operations were continued by the local people themselves after the building project was over. The work groups, organised by the neighbourhoods, built raw structures up to roof level in traditional earth construction. The plaster, a concrete floor, as well as roof substructure and covering were subsequently executed by local craftsmen. A local NGO coordinated and advised the reconstruction committees. In various sectors of the city, decentralised building yards for storing building materials, some of which being recovered from the ruins, were set up and run by the reconstruction committees. In the rainy season, tarpaulin sheds covered the building yards, which enabled the manufacturing of concrete blocks, even during the rains.

GTZ's contribution in addition to providing material support focused on the damage assessment and the participatory selection of building projects to be promoted. Afterwards, mainly organisational support and consultation of the reconstruction committee as well as the contracted NGOs were rendered.

Between May and December 1999, shelters for 1,800 families (approx. 10,500 people), as well as 12 schools for 5,000 pupils, a health care centre, and a maternity clinic were set up within the framework of the project. The costs of the project measures carried out by GTZ amounted to 690,700 euros. Including the costs of the community buildings, incidental costs, and GTZ overheads, this results in accommodation costs of 66 euros per person. Part of the building material (corrugated iron, building timber, cement), as well as foodstuffs for "Food for Work" measures were provided by CARE, CRS and UNDP/UNOPS and are not included in the accommodation costs.

The project is to be considered especially successful since a contribution to ease the crisis situation in the capital could be made with little effort but high personal contributions. Additionally, the local building industry was given the chance of a new beginning. The efficient and smooth cooperation between the different aid organisations enabled a rapid and in all cost efficient realisation of the project. The good cooperation with the authorities as well enabled a quick resumption of school and health care services. Furthermore, the reconstruction committee's ability to organise and act was strengthened and is still being used for other tasks.

In general, the aim is to unite families into one group within a neighbourhood, in order to strengthen the community spirit and to keep distances short. The nature of construction works on apartments or houses should also be similar, in order to ensure that the work to be done is more or less the same for each family. In order to make sure that families, whose houses are completed first, do not reduce their share of participation in the community self-help scheme, or even back out entirely, it is important that the work procedures be organised such that all accommodations are completed simultaneously. Therefore, for example, all foundations should be produced successively, followed by all masonry works, installation of windows and doors, all plastering works, all paintworks, etc. This enjoys the additional advantage of greater efficiency in work performance, as well as a more effective use of equipment and materials.

The local project executing organisation's task here is to provide support and supervise the works through a building expert, as well as to procure, store, and distribute the required material. In case a Financing Agreement is not possible, the NGC advises the project executing organisation and, above all, takes over the commercial controlling.

5.2.5 Aided community self-help in the construction of community facilities

Aided community self-help has also proved to be successful in the field of rehabilitation and reconstruction of buildings of social infrastructure, e.g. schools. Here, the procedures can be as follows:

- The construction department of the school authority or the building authority, possibly in cooperation with private architects and engineers, takes over responsibility for planning, calculation, material lists, site supervision, and approval.

- Each school forms a school development society, consisting of teachers and parents, who determine the conception of the measures and provide personal inputs in the form of material supply, manual work, and, if necessary, financial contributions. Experience has shown that these personal contributions constitute between 10% and 30% of the total building costs. The balance is covered by the NGC. The school development society assumes the role of the client and concludes contracts with craftsmen, advised by the school authority's construction department or the building authority, which also determines the craftsmen's wages and sets upper limits for other costs. Those costs are fixed at market rates. Should resources become scarce during implementation, some of the works will have to be cancelled. In case the school development society has worked economically and financial means remain, it can additionally invest these in construction or in other pending school projects.

- The NGC concludes an agreement with each school development society, procures the building material free on site, takes care of the administrative, commercial, and technical supervision, and finances the measures. The NGC also finances the private architects and engineers, who support the building authority or the building department of the school authority.

The model can also be applied to community centres and other small measures, e.g. school furniture, toilet construction. The procedures are generally the same as described above.

5.2.6 Other self-help models

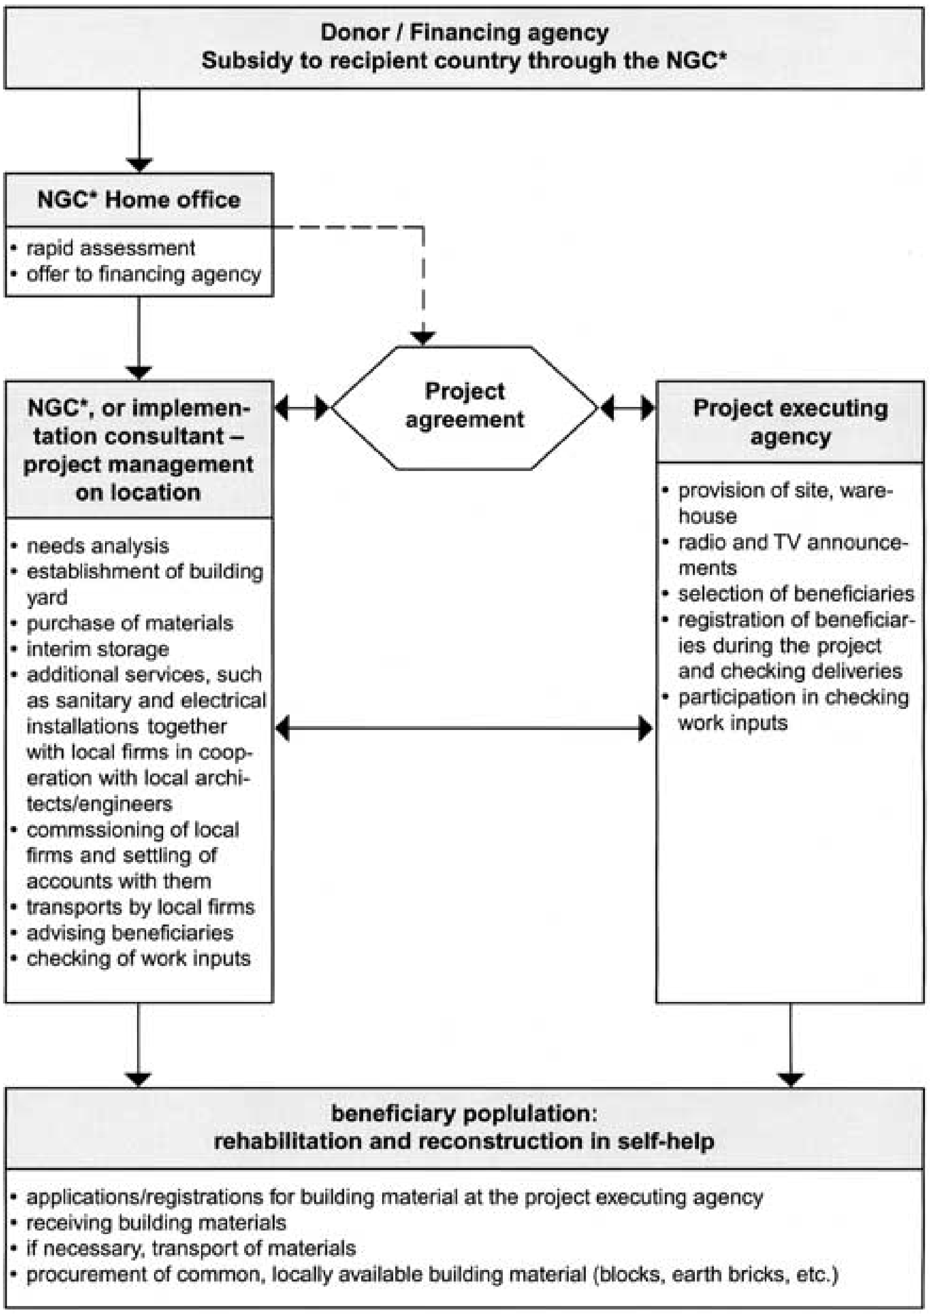
A rarer version of the self-help model is the building of new houses on new sites. This occurs when the authorities provide land for the beneficiaries to build on by themselves. Architects and engineers draw up the plans of settlements and the house types, on commission by the local executing organisation. The site development as well is carried out by specialist companies, while the actual building of the house is left to the settlers. The NGC procures the building material free on site, takes care of the administrative, commercial, and technical supervision and finances the measures. The services of all parties involved have to be settled by contract.

For the individual families it is almost impossible to build their own house without help from outside. Together with other families, however, the house can be built rapidly and efficiently. In this case, the community self-help described above, which incorporates technical assistance by a local building expert, is an ideal implementation model. Here it is also important to complete the individual houses of a neighbourhood building team almost simultaneously. In order to make sure that all buildings are completed in the same standard and that none of the involved families is privileged in the allocation of houses, these are assigned after completion of all building works by casting lots.

The nucleus model for rehabilitating private houses is a special form of self-help, which occurs after the core ("nucleus") of the beneficiary's house is constructed as a stimulus by a building company, commissioned by the executing organisation according to the NGC's instructions. Usually, this nucleus consists of one living room with a roof, windows and doors, as well as the most important sanitary facilities and energy supply. The beneficiary family completes the building. This model is described in section 5.1.5.2 (3).

The building yard model described under 5.3 is a special form of all models mentioned before. It envisages the establishment of a large warehouse for building material (sometimes technical equipment as well) and has proved successful in situations when building material is rarely available or only at excessive prices on the open market. By bulk purchases and import of building material and equipment through foreign aid organisations, people intending to build can purchase the material considerably cheaper. The building yards dispose of specialised personnel offering advice and help to potential builders. In some cases, the building yards have sample houses on display and also offer training courses.

5.3 Building yard model



* NGC = non-commercial general contractor

5.3 Building yard model

(1) Aim of the model

There are several so-called building yard models for the coverage of material requirements and reconstruction after disasters satisfying varying requirements. The purpose and philosophy of the building yard model described here is to support the needy native population in rural regions and in the suburban areas in the reconstruction of their destroyed houses and apartments after natural disasters or impacts of war.

First of all, it is a matter of providing a minimum of essential basic building material as fast as possible to give the people at least a simple “roof over their heads” or to “winterise” their partly destroyed houses. The works are mainly executed by personal labour inputs of the affected family or by neighbourhood cooperation. The individual building concept has to be oriented towards the skills of the affected people, which normally means only simple repair works.

This model can also be applied for the new construction of simple dwelling houses.

(2) Project executing organisation and beneficiaries

Even for the concept of a building yard model, a written project agreement has to be concluded with the local project executing agency, listing the rights and obligations of both parties. Assisting services of the executing agency could be the provision of a site free of charge and a warehouse or industrial hall as building yard store, saving the financing agency some money. The funds saved would be available for additional supply of material.

The choice of beneficiaries who should receive building material and support has to be made either by the executing organisation or someone appointed by them. This cannot be a duty of the building yard management. They should, however, be involved in the determination of the selection criteria as well as observe the operations and report supposed and major irregularities to the financing agency through the NGC.

The project executing organisation has to inform the population, for example, via radio, television or a notice at the community authorities, about the supporting measures and conduct or delegate the registration, while maintaining full responsibility. Furthermore, it also has to assign personnel, which later on, during the distribution of building material and provision of other services, has to get the beneficiaries’ confirmation of receipt of the goods or services. This personnel becomes a part of the building yard team and also has an office there.

(3) Building material

What is to be understood by basic building material depends on the situation in the country, the degree of destruction of the houses and the common material and technologies of the particular country. This is to be investigated in advance. In the beginning, it mainly concerns roof-covering material (possibly temporary covering), bricks, lime and cement, construction timber and reinforced plastic sheets for the temporary closing of window openings. Since in most cases the material resources in the affected countries run out fast, the building material is specified by the NGC and, after invitation of tenders, obtained from bordering countries or other regions, and then temporarily stored in the building yard. Here, experienced purchasing agents of the NGC with international experience are required. Amongst others, the following tasks are involved:

- Procurement of building material (invitation of tenders, purchase, cost management, accounts, organisational control, i.e. observation of delivery and payment delays);

- Organisation, implementation, monitoring (personnel and material) and accounting of transportation.

It is worth considering providing material allotments, so-called “material kits”, of equal size per family/household, in order to maintain equality and ensure that no envy arises. Occasionally, larger allotments may be supplied, provided that it concerns larger families and greater destruction. A transparent management of the allotments is essential.

It is a declared aim of the relief actions not to create business competition with the country’s building material suppliers, as far as such traders exist and are sure to supply the required quantity fast and at fair prices. With increasing alleviation of the most urgent needs, the building yard's function is gradually reduced.

In the course of the situation analysis or rapid assessment, when the establishment of a building yard becomes apparent, a first rough list of material required and cost estimate have to be drawn up by the appraiser after an estimated damage analysis. This cost estimate is a constituent for the formulation of the budget and offer to the donor/financing agency.

(4) Extended scope of services

Supplementary to the basic building material, the provision of simple house installations, e.g. electrical installations and sanitary units can also be included in the programme of the building yard, as far as this standard is found essential and cannot be provided by the target group. The building yard's management, however, will not procure and store installation units of its own, but will cooperate with the local building industry (installation companies) and subcontract these services completely to them. The advantage is that the standards and materials applied are those common on the local market, and can easily be repaired or augmented later on. One or more local engineers or an engineering office should be employed by the NGC to carry out investigations on the partly destroyed houses and to formulate the specifications and description of services, on the basis of which the local installation companies can submit their offers.

The disadvantage of taking over such extended services is that the building yard management neither has an influence, nor wants to exert it on the performance of personal contributions of the house owners, and thus the interfaces between the services of the installation companies and those of the self-help groups are hard to coordinate. Significant delays and possible material losses can occur. It is, however, the declared goal of the NGC not to assume the role of a contractor in the building yard model, who is in charge of the completion of the houses and is judged accordingly. The NGC supplies and distributes building material and supports the beneficiaries, if necessary also with the help of installation companies that are contracted, whose services are checked and then paid. The coordination and completion, however, lies in the hands of the house owners. In case serious problems arise within these extended services, they should be called off. For such cases there are other models, presented as contractor models in the above section 5.1.5.2 "Rehabilitation of houses destroyed by war", for which the NGC takes over total responsibility.

Provided the market does not already offer these products, an extension of the scope of services can be, for example, the import and distribution of simple small windows and doors, preferably in wooden constructions, adapted to the country's standard. Furthermore, standardised, insulated lightweight roofing elements in the form of panels can be imported to replace the destroyed traditional roof constructions made of wood and mud, for example in arid rural zones. The house owners themselves can install them.

Another viable option is the import of large quantities of seasoned sawn timber for the construction of windows and doors on location in the affected country, in case there is a shortage (for example, in Afghanistan). This way, the manufacture of complete windows and doors could be arranged with local carpenters upon provision of sawn timber, which would then be distributed by the building yard.

(5) Technical prerequisite of the building yard

Depending on the estimated budget an appropriate building or rather a warehouse should be made available, if not provided free of charge by the project executing organisation, then on a rental basis by the building yard management. Possibly a partly destroyed hall can be repaired for this purpose. The site must have a connection to the public road networks, suitable for heavy vehicles. The site has to be lockable (fence). In case no hall is available, a roofed area has to be built for material requiring protection. Office space has to be provided for the building yard management. The building has to have or receive power connections, including three phase supply (380 V). The establishment of workshops or the acquiring of special machines and vehicles (other than a forklift) is not required. These are to be rented, if necessary.

(6) Building material distribution

The distribution of building material is one of the most difficult work steps. It should first of all be ensured that the material procured by the NGC from within the country or neighbouring countries, as well as that imported from overseas, will be supplied free on building yard and stored there.

Case study **L**

Rehabilitation of schools and housing for returning refugees in Jaffna, Sri Lanka

Financing agency:	**Federal Republic of Germany represented by BMZ within the framework of TC and the KfW within the framework of commodity aid**
Financing volume:	**3,683,700 euros**
Period:	**1996-2003**

Since 1983 Sri Lanka has been marked by ethnic conflicts, which led to a civil war still ongoing in spring 2002. In April 2002 a cease-fire was declared and negotiations are being held since. In the whole country, approx. 530,000 families, mainly Tamils, were forced to flee. The war between the Sri Lankan army and the Tamil rebel group LTTE (Liberation Tigers of Tamil Eelam) in the Jaffna district, had led to considerable destruction of infrastructure and to the flight of almost half of the population of the Jaffna province during the years 1995/96. Until spring 2002 it was reduced to 450,000 people.

Already at the end of 1996, BMZ decided to support the government of Sri Lanka in the reconstruction of Jaffna and the repatriation of refugees, and charged GTZ with the implementation. The “Jaffna Rehabilitation Project” (JRP) was created. The KfW granted financial aid in the form of so-called commodity aid, which was carried out by GTZ. The “Resettlement and Rehabilitation Authority of the North” (RRAN) is the counterpart institution in coordination with the “Government Agent” (GA).

The main activities of JRP are:

- rehabilitation of the drinking-water supply in the city of Jaffa and the whole region,
- rehabilitation or reconstruction and furnishing of schools,
- reconstruction of houses,
- operation of a central building yard for the supply and distribution of material,
- promotion of small enterprises (production of micro-concrete roof tiles).

The central building yard is the project’s coordination point. The housing construction is generally carried out by the families themselves, the construction or rehabilitation of schools by so-called “School Development Societies” (SDS), i.e. teacher-parents-interest groups. The building yard provides the building material, which is mainly procured from Colombo. Building experts of the “School Works Branch” (Department of Construction of the Ministry of Education) control and advise on construction-related issues with the support of private architects. The GTZ experts advise and coordinate.

At the end of 2002 the project implementation still continued. It will end in 2003. Until now the following building works were implemented:

• rehabilitation of buildings and reconstruction of a total of 24 schools	1,063,400	euros
• supply of furniture for a total of 24 schools	63,900	euros
• construction of school toilets for a total of 230 schools	814,700	euros
• erection of 1,000 housing units	1,677,000	euros

• setting up and operation of 1 central building yard	64,700	euros
The total costs for all building construction measures so far amount to	3,683,700	euros

The aim should be to have the beneficiaries pick up the building material, which is generally provided free of charge, at the building yard and thus have them arrange for the transport by themselves and at their own expense. In the building yard it will be registered and confirmed by the recipient which family from which village has received what kind of material for which house. These registrations and confirmations are incumbent upon the local administration or project executing organisation (also refer to item (2)).

If, after a thorough appraisal through representatives of the project executing organisation, it can be confirmed that beneficiaries are not in the position to organise and pay for the transport, then the building yard management can be charged with it. For that purpose, cooperation with local transport companies should be arranged. Together with them, a system of loading schedule, distribution, and confirmation of receipt should be elaborated, according to which distribution and billing is effected on behalf and at the expense of the NGC. This system requires the executing organisation to be included in the control and confirmation. Building up their own fleet of vehicles is only necessary when the market does not offer this service, which should rarely be the case. In general, it is uneconomic to have one's own vehicle fleet, as it is inflexible in usage, expensive to operate, and is difficult to manage with regard to repair works and spare parts. Just a small lorry should be available for special requirements.

(7) The building yard team

Personnel (example):

The quantity and quality of personnel depends on the concept and nature of service to be provided by the building yard. It influences the decision as to which personnel is to be seconded or whether qualified personnel can be recruited on location. Should the NGC, for example, already dispose of an office there, then this can possibly take over various functions (e.g. commercial activities, secretarial work, and the like). Consequently the personnel is to be composed individually. Required are:

- 1 building yard manager (technical background);
- 1 assistant manager (as deputy) (technical or commercial background);
- 2 local persons (building technology experts) for the management of the "extended services", in accordance with the above section 5.3 (4); person(s), who can also be allocated by a local engineering office;
- 1-2 interpreters, depending on the local technicians' language knowledge;
- 1 forklift driver (if required);
- 2-3 drivers (for cars and for small lorries);
- 10 - 20 warehouse workers;
- at least 2 local counterparts, in charge of tasks such as those described in section 5.3 (2), "Project executing organisation and beneficiaries".

Equipment (example):

- office equipment, as far as possible incl. computers, e-mail, telephone and fax machine;
- satellite telephone, if required;
- 2 - 3 cars, if possible all-terrain vehicles;
- 1 small lorry, approx. 3-5 tonnes (if required);
- 1 forklift (if required);
- general tools for warehouse workers.

Costs for accommodation and expenses.

5.4 Special projects

GTZ is one of the largest public service companies worldwide in the field of development cooperation, disposing of decades of experience. With the help of its qualified staff, which is familiar with the social, economic, political, and cultural conditions of its partner countries, it is in the position to execute complex special projects concerning many sectors, for national authorities, and international clients and institutions. The support of the Emergency Loya Jirga in Kabul, Afghanistan, which took place from 11 to 19 June 2002, will be presented in the following case study.

Case study **M**

Support of the Emergency Loya Jirga in Kabul, Afghanistan, from 11 to 19 June 2002

Financing agency: **UNDP (United Nations Development Programme)**
Financing volume: **8,100,000 US $**
Period: **2002**

At the beginning of April 2002, GTZ received a commission from UNDP to technically renew the buildings of the partly destroyed technical college in Kabul as well as the 33.6 ha large site on which it is situated, in the extremely short period of time until 10 June 2002 (10 weeks), to conduct the elections of the head of state and the most important members of the Afghan interim government, and to ensure the organisation of the event. A total of 1,685 delegates, among them approx. 185 women and 1,676 persons for service, organisation and security, were to be accommodated on the site (delegates in the buildings, personnel partly in tents).

The implementation of the works was performed in close cooperation with the Afghan Loya Jirga Commission, UNAMA (United Nations Assistance Mission for Afghanistan), ISAF (International Security Assistance Force) concerning security aspects and a number of Afghan, German and international companies for the construction works and the organisation of the conference.

In addition to the logistic requirements (e.g. conference technology, information and communication, security, registration, catering, equipment and accommodation, supply, transportation and health care) and the conference management (e.g. care of the participants, questions concerning protocol, press and public relations, information and communication, recruiting and training of personnel), the building works for a temporary restoration of the existing buildings and the creating of a new, separate conference area (conference tent of 2,800 m^2 and various tents for meetings, VIPs and conference management) and a temporary technical infrastructure (water supply, 200 toilets, 3,000 m illuminated security fences equipped with watch towers, supply of electricity and complete lighting of the buildings and the site) constituted the outstanding services. A total of 5 Antonov freight planes brought, for example, conference tents and conference equipment from Germany.

All in all, 27,480 m^2 of building area were rehabilitated for temporary use (hostels, dining hall, multipurpose hall, service buildings) and a temporary traditional large kitchen of 1,000 m^2, with a capacity of approx. 9,000 meals per day, was set up. In addition to that, 14 temporary structures with toilet and washing facilities having a total area of 2,240 m^2 were set up, and the outdoor areas, such as roads, paths and gardens, were prepared.

On 8 June 2002, the completed facilities were punctually handed over to the Afghan Loya Jirga Commission.

6. Basic planning criteria for simple buildings worldwide

6.1 General

The construction of buildings within disaster relief measures does not differ from building in normal situations, as long as these are not temporary buildings and emergency accommodations. The planning and realisation of dwellings must always take the following factors into consideration:

- Economic aspects
- Socio-cultural aspects
- Ecological aspects
- The climatic conditions
- Protective measures against natural hazards

Taking all the factors into consideration can in some cases lead to contradicting planning requirements. This is particularly true in the case of emergency housing, which calls for compromises on account of time and cost restraints.

6.2 Economic aspects

The need to restore living space is usually high when the number of people rendered homeless due to expulsion or destruction of houses is high. In general, the greater part of reconstruction of living space is carried out by the affected people themselves with their own resources and in self-help, partly supported by grants and special credit programmes on a national level.

The provision of housing within the framework of technical cooperation constitutes a relatively large individual promotion on account of the high cost per beneficiary. That is why such aid can generally reach only a small number of the needy.

The key indicator for the cost efficiency of building measures is the resulting cost per accommodated family or person. The costs of building measures vary considerably on a global scale, on the one hand due to the method of construction, but also due to the extreme variations in the costs of building materials, transports, wages and other influencing factors, e.g. political ones.

Apart from the cost effectiveness in the narrower sense, the economic analysis must also consider other economic benefits of the affected population: these include the reduction of risk of destruction of dwelling space due to disaster resistant constructions in future local projects, or even the model effect for future building technologies in the country as a whole. In the process, the building costs may increase only marginally, while the costs of transferring of new technologies, knowledge and skills also have to be taken into account. Moreover, it is important to conduct a comparative evaluation of the long term economic advantages for the present and future users of buildings with normal life spans compared to temporarily used buildings.

It is possible to influence the costs through the choice of models: it cannot be assumed that self-help models are principally more economic than contractor models, because a higher degree of support and longer duration of self-help projects have to be taken into account. When especially needy groups are being supported, it is usually not possible to expect personal inputs from them which will significantly reduce the total construction costs.

In order to serve as large a number of people in need of housing as economically as possible, the rehabilitation of living space in private houses or in hotels offer particularly suitable alternatives, as the costs are generally lower than those of new constructions. When rehabilitating private houses, the economic benefit is also distributed amongst the host population, in the case of public buildings the host communities get the benefit.

The nucleus model can lead to a reduction of costs per user, because within a short time only the most important building parts are constructed, and the rest of the building works is carried out without external assistance. The building yard model can also be comparatively cost-efficient, depending on its application, as it mainly deals with material aid.

Temporary shelter is usually cheaper and quicker to produce, but of less advantage with regard to the local economic development and sustainability. The cost benefit, however, is limited by the fact that mainly external resources have to be used (import of prefabricated building components and production by international construction companies).

The establishment of new housing settlements is generally cost intensive and constitutes a severe intervention, which is economically justified only in cases where the utilisation of safer sites leads to a significant reduction of disaster risk.

In general the cost effectiveness of a model has to be weighed against several other factors, and the feasibility of each model has to be ensured under the special emergency conditions and in the specific local context, otherwise the ultimate success of the project will be at stake.

Apart from the choice of models of implementation, the planning criteria for simple buildings can each be analysed in terms of cost considerations. It would be ideal to apply as many as possible of the criteria listed in this chapter when designing buildings, but since the financial means are usually very limited, the costs incurred rarely permit the application of all the required measures. That is why the application of economical construction methods is of particular importance. The costs can usually be reduced by the following aspects:

- Utilisation of locally proven building materials and technologies (Local building traditions are usually the most economical; they use abundantly available and inexpensive building materials, which can be supplied without delay; they utilise common local handicrafts and materials available on the local market, and thus ensure easy repairs and repetitions at relatively low cost).

- Building without heavy equipment (While a high degree of mechanisation of building measures is common in industrialised countries and generally more cost effective, in poorer countries it is often not possible and considerably more expensive than manpower; moreover breakdowns can occur, causing expensive and lengthy repairs, and problems can arise during transports).

- Design concepts using lightweight building elements (They simplify transports and assembly, and are therefore cheaper and more easy to realise in remote locations).

- Economical building design (Simple compact forms reduce the ratio of wall surface to usable floor area; by combining several building units, walls can be used jointly; internal partitions can be achieved by room-high wardrobes and curtains, etc.).

- Phasing of building works (Not everything needs to be built at once, a core (nucleus) of 1 to 2 rooms with cooking area and sanitary facilities can be sufficient at the beginning, while plans exist for the extension of the house - horizontally and/or vertically - as the requirement may be).

6.3 Socio-cultural aspects

In order to ensure the success of the project it is important to take the special living conditions of the target group into consideration when planning. That is why it is important to acquire information on the local building methods and involve local professionals in the development of the concept.

The following are some of the aspects to be taken into account during planning:

- Habits, traditions, religious requirements (Are large families with three generations under one roof common? Is the spatial separation of adult men and women strictly practiced? Are bunk beds acceptable? Are toilets acceptable within the living area? Is it necessary to make sure that the toilets are not oriented towards Mecca?).

- Use of the building (Is much space needed for social contacts, e.g. a large living room or roofed outer space, or is the life style more introverted, e.g. with an internal courtyard? Is outdoor sleeping favoured, e.g. on the roof? Is the keeping of livestock or pets important?).

- Security requirements (Do burglaries occur frequently? Do wild animals represent a danger? Is there a danger of social or ethnic conflicts arising in the neighbourhood?).

- Aesthetic values (Are there forms, materials or colours that are preferred or rejected? How important is it for the occupants to be personally involved in the design and decoration? How much can be left to them?).

6.4 Ecological aspects

Ecological building is relatively unknown in many countries, which is why reconstruction projects often provide a good opportunity to incorporate ecological aspects in the design and make the target groups aware of them, provided that the preconditions (funds, products, acceptance) exist. There are numerous ecological design criteria, here are the most important ones:

- Utilisation of local abundantly available materials (which can vary considerably according to the geographical conditions and regional industry. Ecological aspects are the conservation of limited resources, the avoidance of imports and long distance transports, as well as fostering the local industry. Quite often local materials, e.g. clayey soil, exist in unlimited supply, or e.g. bamboo, are quickly regenerated).

- Use of materials which are produced with low energy inputs (meaning less emission of pollutants) (burnt clay bricks require more energy for their production than e.g. concrete hollow blocks; sand lime bricks require even less).

- Avoidance of materials and methods that are dangerous to health (best known example is asbestos cement - to be avoided at all costs - also various wood preservatives, solvents, phosphogypsum, etc. - an environmental expert should always be consulted).

- Utilisation of regenerative resources (e.g. rainwater collection from the roof; composting of kitchen waste; solar energy for water heating and power generation; wind energy for pumping water - however, solar and wind technologies can be expensive to procure).

6.5 The climatic conditions

In order to clarify their climatic differences, the inhabited regions of the earth are roughly divided into the following 5 climatic zones, giving brief information on the corresponding building design requirements:

a. warm humid climate with temperature and humidity levels in the upper limits of the comfort zone (e.g. above 30°C with relative humidity above 50 %), limited cooling at nights and considerable rainfall; building design requirements: **light, non-heat-retaining construction, good cross-ventilation, i.e. large openings.**

b. hot dry climate with extremely high maximum temperatures (often exceeding 35°C) and large drop in night temperatures (to below 15°C), low relative humidity, scarce rainfall, but occasional sand and dust storms; building design requirements: **heavy, heat retaining construction with dissipation of heat during the night, small openings at higher levels.**

c. tropical composite climate with tendencies either to warm humid or hot dry climatic features; building design requirements: **partly heat retaining constructions, in all other points compromises between warm humid and hot dry building design.**

d. tropical highland climate with strong solar radiation, large temperature fluctuations, cold winds and possibility of development of dew; building design requirements: **similar to composite climate, but in addition with heating facilities.**

e. temperate climate with large seasonal temperature fluctuations and extremely cold winters; building design requirements: **heat retaining constructions with moisture barriers and heat insulation, as well as additional heating facilities.**

6.6 Protective measures against natural hazards

6.6.1 Earthquakes

• Provided there is an option, avoidance of sites on or near slopes (danger of landslides, avalanches) and coastal sites (danger of tidal waves), sufficient distance from neighbouring buildings (danger of collapse), especially in the main wind direction (danger of flashing over of fire), and downstream from dams (danger of dam burst), no constructions within the area of collapse of bridges.

• As far as possible, rigid ground conditions (preferably rock), because earthquakes can lead to the liquidation of the soil and thus deprive the foundations of its support; filled up ditches and river beds are especially to be avoided.

• Symmetrical shapes of buildings (no L-, T- or U-shapes), also, as far as possible, symmetrical arrangement of rooms.

• Design of foundations such that they offer no impact surfaces for seismic forces, i.e. avoidance of different heights of strip foundations, no stepping of foundations on slopes. In smaller buildings: reinforced, sufficiently dimensioned slab foundation, preferably with a vertical strip along the edge, provides highest earthquake resistance. Reinforcement, slab thickness and concrete quality have to be based on structural calculations. For larger buildings it is essential to involve an experienced structural engineer.

• In the case of small buildings, light construction, in order to avoid major damage by falling debris, as well as strong connections between building components. At corners (and also around larger openings) installation of sufficiently dimensioned reinforced concrete or timber elements. A continuous ring beam above the doors and windows, and firmly fixed to the walls and corner posts is absolutely essential.

• It is also essential to involve an experienced structural engineer in the case of larger buildings (two-storeyed and higher). Projections (both horizontal and vertical) should be avoided, unavoidable projections have to be especially well fixed to the main structure.

• Windows and doors should not be placed at corners of buildings (as they reduce the building's stability and thus represent an earthquake hazard). In the case of glass breakage, it is easier and cheaper to replace smaller panes.

• Water tanks on the roof have to be especially well constructed, in order to avoid collapse during an earthquake. Better: free-standing water tanks with especially strong supporting structure.

• Regular control of the strength of structurally important building components and connections (because of the danger of weakening of material due to corrosion, termite attack, decay, etc.).

6.6.2 Hurricanes

• Avoidance of constructions on exposed sites without protective vegetation or dense building clusters, avoidance of flood prone locations (lowlands, vicinity of rivers).

• Roof slopes at least 30°, to reduce suction forces (suction is highest at 10°). Strong connections of all roof components to the roof structure, but danger of rusting of all iron parts must be taken into consideration.

• Avoidance of large roof overhangs and projections, because of danger of lift-off. On the other hand, heavy rains may make large overhangs necessary. Therefore, predetermined breaking points along the line between roof and wall can be a solution.

• Strong wind bracing in roof and walls, otherwise principally the same structural precautionary measures as for earthquakes.

• Wind protection through vegetation, but also precautions to be taken, so that trees cannot fall on the house.

6.6.3 Fire

• The use of fire resisting materials should be first priority.

• Chemical treatment of building parts, but only as emergency solution, because regular renewal is necessary and washed out impregnating chemicals can be toxic.

• Provision of fire fighting equipment and reservoirs for adequate water supplies.

6.6.4 Solar radiation, intense heat

• Shading by means of roof overhangs or individual elements above or in front of windows.

• Ideally, complete shading of facade, to avoid overheating. Alternatively the outer walls can be double-layered with a naturally ventilated air cavity (i.e. with openings above and below) - thereby enabling the heat that penetrates the outer skin to be dissipated by the natural ventilation in the cavity, thus preventing the inner layer from heating up. A reflective treatment of the façade can keep out most of the heat, while an aluminium foil covering the outer surface of the inner layer provides an additional barrier against heat penetration into the building.

• In hot dry areas, thick, heat retaining outer walls prevent the quick penetration of solar heat. They should be dimensioned such that the heat reaches the interior in the evening, when the air temperature falls below the comfort level - in this way, comfortable room temperatures are achieved day and night without technical means (air-conditioners, heaters). A suitable wall thickness cannot be recommended as it depends on the heat retaining features of the wall construction material, the construction system, the surface texture and colour, as well as on the prevailing day and night temperatures. With the corresponding information, a building physicist can calculate the required wall thickness.

• Vegetation can provide shade and minimise glare. Especially in hot dry areas, avoidance of light coloured, smooth ground cover (glare and heat reflection).

6.6.5 Extreme cold and snow

• Foundations must be below frost level, otherwise there is a danger of building components being lifted up when ice develops.

• The complete outer skin (wall and roof) must be clad by a thick heat insulating layer, in order to prevent the loss of heat from inside the building. As far as possible, the heat retaining wall should be on the inner side, so that the heat stored in it can be returned to the interior. The heat insulation must be protected externally against moisture and mechanical damage (e.g. by a layer of plaster, wooden cladding, etc.).

• The roof construction must take the expected snow loads into consideration, good drainage must ensure the quick removal of melting snow and ice.

• The windows should be double glazed, doors and windows must close tightly in order to prevent heat loss. They must, however, able to be opened so that the humidity that develops inside is allowed to escape (important to prevent the development of fungus and rot). Wind traps should be designed at entrances.

• Sufficient heating facilities (depending on availability, using oil, gas, coal, electricity) have to be incorporated in the design, corresponding spaces for reserve supplies (oil, coal, firewood), chimneys/exhaust pipes (oil, gas coal), or sufficient electricity must be provided.

6.6.6 Rain

• Avoidance of flood prone locations (lowlands, vicinity of rivers).

• Sloping roofs, roof overhangs sufficient to protect windows and outer doors.

• Since tropical rains are particularly heavy, sound proofing of the roof is important, e.g. by fixing insulating panels directly below the roof elements, by an air space between the ceiling and roof, by fixing felt or rubber washers at connection points, and so on.

• Avoidance of internal drainage and roof valleys, as gutters can get blocked by leaves and dirt and prevent drainage of water. Site drainage must function particularly well.

• Floors must be higher than the outdoor area in order to prevent water from entering the building.

• Recommendation: dark paint at plinth level, at least 30 cm high (above outdoor ground surface), in order to avoid ugly stains of splashing water.

6.6.7 Sand

- Smooth outer surfaces of buildings, no horizontal projections or recesses, in order to avoid sand deposits.

- Protective walls up to or window openings above 1.60 m, since wind carried sand rarely reaches higher levels. Dust, on the other hand, cannot be excluded.

- Soft ground surfaces close to the house, as well as bushes and trees, in order to check wind carried sand.

6.6.8 Termites

- Use of termite resistant building materials (only resistant timber or no timber at all).

- Impregnation of wooden parts, but beware of exposed surfaces (danger of poisoning through direct contact). Preferably only structurally important parts should be impregnated, which are subsequently concealed by other materials or by a non-toxic paint.

- Metal termite shields fixed at all places accessible from the ground - e.g. along the top edge of the plinth - actually mainly for inspections, so that the development of termite tunnels is quickly identified and protective measures can be implemented. Impregnation of the ground around the house is practiced occasionally, but is not advisable, because of the health hazards to humans and domestic animals.

6.6.9 Fungus

- Maintenance of dry conditions by means of ventilation and keeping a good distance from ground moisture.

- Use of dry, fungus-proof timber or building materials that do not absorb moisture.

- Protective paints, e.g. milk of cement or lime, non-oil-based glue paint, using a fungicide as primer.

9. Annexes

IMPORTANT NOTE

This section contains a series of documents concerning building measures and contracts, which the GTZ has developed according to its own very specific requirements over many years, and which it applies in its projects. They make no claims to being universally applicable. They have been included in these Guidelines to provide information and examples for third parties involved in the implementation of building measures within the framework of development cooperation, emergency aid and especially in the planning and execution of building projects. All documents have to be analysed very carefully in each individual case and have to be adapted to the specific conditions and requirements of the respective countries and business partners. The contract partners are solely responsible for the use of the documents.

The GTZ accepts no responsibilty for any problems or inconsistencies that may arise by the use of the documents presented here, either unchanged or in modified form.

Most of the documents were prepared in English. French and Spanish versions also exist at GTZ. The authors

9.1 Questionnaire for Architects/Engineers and Contractors (QUARCENG)

1.	name of firm, full address, international telephone and telefax numbers:

2.	structure of firm:	
	legal form:	year of formation:
	proprietor:	original capital:

3.	bank references:

4.	technical equipment:

5.	annual turnover:			in: *currency*	
	1999	2000	2001	2002	2003

6.	permanent personnel:		
	number	field of activity:	qualification:

7.	reference projects **completed** during the last five years:				
	name of project:	type of project:	remuneration/fee	period of construction	client

	reference projects commenced and still under construction:				
	name of project:	type of project:	remuneration /fee	period of construction	client

8.	membership of association(s)

9.	the undersigned declare(s) that the statements made in this questionnaire are both correct and complete. .... place and date .... legal seal and signature(s)

10.	enclosures and/or remarks:

9.2 Bidding Conditions for Consultants/Architects (BIARCENG)

1. THE BID

For the purpose of a comprehensive evaluation the bid should contain the following information:

1.1 Details of the design concept and/or working concept including information about the construction method envisaged as well as

(1) Estimated time schedules for preparation of the planning, compiling specifications and Bill of Quantities, tendering period, and the execution of the construction phase.

(2) Details of the resident engineer(s) proposed for this/these position(s) including his/their curriculum vitae.

(3) Brief listing of reference projects completed.

1.2 Statement about the earliest possible date for commencing the works.

1.3 The completed questionnaire (QUARCENG).

2. COST OF PREPARING THE BID

The bid with all enclosures shall become the property of the General Contractor upon delivery.

No remuneration shall be granted for the preparation of the bid and all the documents attached thereto.

3. ADDRESS OF BID

Bids must be delivered in a separate, closed envelope, lettered

Project No............................ **"BID FOR** ...."

to (Address of General Contractor) **c/o** ....

4. Any modification to or withdrawal of the bid must be notified in writing to the above mentioned address prior to the closing date for submission of bids.

5. Agreements with third parties in restraint of competition to the disadvantage of the General Contractor are not admissible and shall result to exclusion of such bids.

9.3 Contract for Architectural Consult Consulting Services (CONTRARC)

The **Address of the General Contractor** .... - hereinafter referred to as the **"Employer"** - and .... - hereinafter referred to as the **"Consultant"** - herewith enter into the following Contract for the Project .... Country:	Date .... reference to in all correspondence: Contract No.: .... Project No.: ....

1. Purpose of Contract

(e.g. contribution of the construction works towards the goal of the project)
....
....
....

2. Scope of Services

In order to achieve this purpose, the Consultant shall perform services according to the stipulations in the subsequent clauses for the construction of:

(number and type of building(s), listing of the space requirements, type of construction, etc; if applicable, reference shall be made to the project information in the Annex)

3. Three Phases of Contract

3.1 By signing this contract, the Employer commissions the Consultant with the services pursuant to Section 4 (Phase 1), only.

3.2 If the planning work shall be continued, the Employer has an option to commission the Consultant with the services specified in Section 5 (Phase 2).

3.3 In case of execution of the construction work, the Employer has a further option to commission the Consultant with the task of site supervision described under Section 6 (Phase 3).

3.4 The Employer reserves the right to limit the assignment to individual services of Phase 2 or 3.

3.5 The assignments pursuant to Sub-Sections 3.2. and 3.3 shall be made in writing.

3.6 The Consultant shall be bound to provide the relevant services if the Employer exercises an option within 12 months after acceptance of the results of the previous phase. On the other hand, the Consultant shall not have a legal claim to the assignment of services of Phase 2 or 3. The Consultant cannot derive any increase in remuneration from the limitation of assignment to individual services of Phase 2 or 3. Nor shall the Consultant have the right for a claim for remuneration of any phase or individual service with which he has not been commissioned.

4. Phase 1 (Preparation of the Documents for Building Permission)

Within this phase the Consultant shall execute the following services:

4.1 Establishing whether cadastral maps, surveyors' plans, soil investigations or other documents of the building site exist. If not, or if the existing documents do not suffice, procurement of appropriate tenders and assignment after prior written approval by the Employer. Costs arising from this procurement shall be paid as reimbursable expenditures in addition to the remuneration as laid out in Section 9.

4.2 Sketching of a preliminary design and presenting the same to the Employer, which must be approved by the Employer prior to proceeding.

4.3 Preparation of a site layout plan on a scale of 1:500 or 1:200, including outdoor facilities.

4.4 Preparation of preliminary design plans for the buildings and outdoor facilities on a scale to be agreed with the Employer of 1:200 or 1:100.

4.5 Preparation of the explanatory report for the buildings and outdoor facilities in accordance with EXPLARER

4.6 Preparation of a cost estimate for the buildings and outdoor facilities (using blank specimen of COSTESTM) and calculation of areas (gross floorplan area according to customary local standard).

4.7 Drawing up of a preliminary structural analysis.

4.8 Drawing up of preliminary plans of the technical installations, such as for sanitary, electrical, and possibly telecommunicative and/or mechanical purposes, including:

(1) Rough estimate of technical requirements and output values.
(2) Contribution to the explanatory report pursuant to EXPLARER
(3) Cost estimate according to empirical values pursuant to COSTESTM.

4.9 Obtaining of building permission and other permits required for the execution of the works in the recipient country.

5. Phase 2 (Preparation of the Construction Documents)

Within this phase the Consultant shall execute the following services:

5.1 Architectural design planning:

5.1.1 Preparation of the final design plans for construction:

(1) layout plan on a scale of 1:500 or 1:200,

(2) floor-plans, sections and elevations for all buildings/structures on a scale of 1:100,

(3) plans for the outdoor facilities on a suitable scale.

5.1.2 Preparation of the working drawings on a scale of 1:50, important details on a scale of 1:10, 1:5 or 1:1 and all outdoor facilities on a suitable scale.

5.2 Structural planning:

(1) elaboration of the structural analysis suitable for review and approval,

(2) preparation of positional drawings for the structure,

(3) preparation of formwork drawings as supplement to the working drawings pursuant to Section 5.1.2,

(4) drawings of construction elements with instructions for installing the same (e.g. reinforcement plans, plans for structural steelworks and woodwork),

(5) compilation of detailed steel and/or other lists of structural materials.

5.3 Planning of mechanical, electrical and sanitary and/or other installations:

(1) Determination of technical requirements and output values.
(2) Dimensioning of all equipment and parts of installations.
(3) Pertaining drawings on a scale of 1:100.
(4) Determination of pipe channels and openings in walls, ceilings and floors.
(5) Working and detail drawings on a scale to be agreed with the Employer.

5.4 Services for the award of construction contract according to the Employer’s instructions:

(1) Compilation of the specifications with technical preface.

(2) Calculation of quantities and preparation of the Bill of Quantities.

(3) Calculation of costs of the buildings and outdoor facilities based on the Bill of Quantities.

(4) Adaptation of the form and content of the Tender Documents for Contractors, specified by the Employer, to the special conditions of the building site and building(s) to be built.

(5) Conducting of pre-qualification procedures for contractors, including their evaluation.

(6) Proposal of contractors to be invited to tender (preparation of short list).

(7) Submission of complete tender documents for review and approval to the Employer.

(8) Conducting of the tendering action according to Tender Conditions, if instructed to do so by the Employer.

(9) Evaluation of the Tenders received, including elaboration of proposal for the award of contract.

(10) Conducting of or participating in contract negotiations, if requested by the Employer.

6. Phase 3 (Site Supervision)

6.1 The Consultant shall assume all engineering functions and duties in accordance with the contractual provisions made between the Employer and the building contractor *which are based on the FIDIC Terms of Contract*[1].

[1] delete if not applicable

Without claiming to be complete, the functions and duties are as follows:

6.1.1 Technical Services:

(1) Due and proper supervision of the execution of the construction work and mechanical, electrical and all other installation works to ensure that they conform with the specifications and drawings, the recognized engineering principles and all applicable regulations.

(2) Provide technical advice and necessary support to all personnel assigned to the project.

(3) Examination and approval or rejection of materials for construction work supplied by the contractor(s).

(4) Amending of the working drawings in accordance with the actual execution of the works (see paragraph 7.2.3 (1)).

(5) Technical inspection of the execution of the structure to ensure that it conforms with the approved structural documents.

(6) Technical inspection of auxiliary construction requirements; e.g. scaffolding, craneways, excavation supports, etc.

(7) Inspection of concrete production and processing at the building site and evaluation of quality controls.

(8) Follow-up of the working progress schedule provided by the building contractor or, if not available, own compilation of a suitable programme (e.g. bar chart) which has to be agreed to and signed by the contractor.

(9) Keeping of a construction diary.

(10) Joint measurements of the work in place with the building contractor. This includes the preparation of special measurement records for work that cannot be measured after the construction work has been completed. They shall be confirmed in writing by the building contractor and the Resident Engineer (Not applicable for lump sum contracts).

(11) Upon special request of the Employer, intermediate acceptance of construction work (e.g. acceptance of the rough structure).

(12) Preparation of and participation in taking-over procedures by the Employer; independent taking-over, if instructed to do so by the Employer (TAKGOVER).

(13) Participation in the handing-over of the completed project, compilation and handing over of the necessary documents; independent handing over and drawing up of the handing-over certificate to the project executing agency/beneficiary, if instructed to do so by the Employer (HNDGOVER).

(14) Inspections during the Contractor's defects liability period and supervision of rectification of any faults and defects that may occur.

6.1.2 Commercial Services connected with the construction

(1) Checking and, if necessary, correction of invoices, reports, lists, etc. of the building contractor(s) within the periods stipulated in the contract between the Employer and the contractor(s). Calculations of quantities, accounting files and cost calculations shall be checked for technical and arithmetical accuracy and certified by date and signature. In order to show that this has been done, the Consultant shall tick all correct values and amounts reported.

(2) Examination of new prices for additional or amended services to ensure that they are in line with the cost estimate of the original tender on which the Contract is based as well as the current local situation.

6.2 Assignment of Personnel for Site Supervision

6.2.1 In order to supervise the construction work, the Consultant shall assign during the period from approx.....................to..................the following personnel:

1) Resident Engineer: ....

2) ....

3) ....

Any change of assigned personnel require(s) prior written approval of the Employer.

6.2.2 The beginning and the end of the period of assignment shall be stipulated in writing when the Consultant is commissioned with Phase 3 according to Sub-Section 3.3.

6.3 Reports

6.3.1 The Consultant shall submit

• monthly reports on the progress of construction in accordance with PROGREP, including a progress diagram, photographs and other relevant data as well as details on completed work, percentage of completion, basic climatic conditions and average number of workers on site, special incidents, work forecast, etc.,

• a final report two months after completion and taking-over of the construction works, comprising:

(1) a description of the progress of the entire project from planning to taking-over or handing-over, comments about the construction period, listing major problems encountered during construction and how these were solved; and

(2) an overview and tabulation of the total costs compared with the calculation according to COSTESTM.

6.3.2 Special reports shall be forwarded to the Employer without delay in case of important incidents or circumstances that may occur. Each such report shall include in particular events and circumstances that give rise or may give cause to claims against the Building Contractor(s) commissioned with the execution of the construction work.

6.3.3 All reports shall be submitted two the Employer in duplicate in English language.

7. Documentation

7.1 All documents shall clearly indicate that they were produced on behalf of the Employer. The title block of the drawings shall be approved by the Employer. All documents shall be drawn up in English language.

7.2 The Consultant shall provide the following number of copies:

7.2.1 Phase 1:

Documents for Building Permission pursuant to Section 4	3 copies

7.2.2 Phase 2:

(1) Final design plans pursuant to Section 5.1.1	8 copies
(2) Working drawings, structural analysis, positional drawings, formwork and reinforcement plans, lists and installation drawings pursuant to Sections 5.1.2, 5.2 and 5.3	4 copies
(3) Specifications and Bill of Quantities pursuant to Sections 5.4 (1) and (2)	12 copies
(4) Reproducibles of final design and working drawings	.....sets

7.2.3 Phase 3:

(1) As-built drawings (copies folded to DIN A 4 size) for all buildings and outdoor facilities, including structures and installations.	3 copies
(2) Photographs of all buildings/installations after completion.	3 copies
(3) Updating of the calculations of areas in accordance with the actual execution of construction work.	3 copies

8. Deadlines

The following deadlines shall apply for the services performed by the Consultant:

(1) First submission of the preliminary design pursuant to Sub-Section 4.2:
..... weeks after signing the contract

(2) Preparation of all Documents for Building Permission pursuant to Section 4:
..... weeks after approval of the first preliminary design

(3) Preparation of the Construction Documents pursuant to Section 5:
..... weeks after being commissioned pursuant to Section 3.2.

(4) Completion and submission of the final report pursuant to Sub-Section 6.3.1:
..... weeks after acceptance and taking over of the works

9. Remuneration

9.1	The Consultant shall be entitled to the following remuneration:	
9.1.1	Phase 1 the lump sum of	....
9.1.2	Phase 2 the lump sum of	....
9.1.3	Phase 3	
	(1) For a full time Resident Engineer for overall site supervision during the construction period of approximately.......months the lump sum of	....
	(ALTERNATIVE)	
	(1) For a part time Resident Engineer (.....%) for overall site supervision during the construction period of approximately months the lump sum of	....
	(2) For part time special supervision (e.g. structural, sanitary, electr., mechanic, etc.), as required during the contract period the lump sum of	....
	(3) For the Documentation of Phase 3 (Section 7.2.3) and the Final Report pursuant to Section 6.3.1 the lump sum of	....
	Sub Total for Phase 3	....
9.1.4	**Total Remuneration**	....
	(in words: ....)	
9.2	All lump sums and expert/month-rates as stated above are fixed prices and shall include all costs incurring in connection with the performance of these services.	
9.3	The Consultant shall invoice turnover tax if and as prescribed by law; the Employer will refund the amount in addition to the remuneration.	
	Amount of turnover tax *(if applicable):*	....

10. Terms of Payment

Payment of the remuneration shall be made in .... *(currency)* upon receipt of the Consultant's invoice in duplicate as follows:

10.1 Phase 1: 95% after acceptance of the respective services by the Employer.

10.2 Phase 2: 95% after acceptance of the respective services by the Employer.

10.3 Phase 3:

10.3.1 80 % of the remuneration stipulated in Sub-Sections 9.1.3 (1) and (2) in monthly payments of.................*(currency/amount)* upon presentation of an invoice in duplicate, starting one month after the commencement of the construction works.

10.3.2 15 % of the remuneration stipulated in Sub-Section 9.1.3 (1) and (2) after acceptance of the construction work and presentation of the Taking-Over Certificate (TAKGOVER).

10.3.3 100% of the remuneration stipulated in Sub-Section 9.1.3 (3) after acceptance of the services by the Employer.

10.4 The 5 % remaining under Sub-Sections 10.1 to 10.3.2 above shall be remitted upon expiry of the warranty period. The amount retained for this period shall be disbursed following taking-over without defects upon provision of a guarantee by a bank accepted by the Employer in accordance with the specimen enclosed (GARANTDL).

11. Statute of Limitation of Claims of the Consultant

The claims of the Consultant arising from the Contract shall become statute-barred unless they are asserted vis-a-vis the Employer in writing within 6 months following the end of the contractually agreed period of assignment or after acceptance of the work.

12. Duty of Care and Exercise of Authority

12.1 The Consultant shall exercise reasonable skill, care and diligence in the performance of his obligations under the Contract and shall observe all local regulations in force.

12.2 Regarding any claims of the Employer against the Building Contractor or any third party, the Consultant shall take the necessary measures to protect rights provisionally if and to the extent that the Employer cannot be informed in good time.

12.3 Where the Services include the exercise of powers or performance of duties authorised or required by the terms of the contract between the Employer and the Building Contractor, the Consultant shall

- act in accordance with this contract and the contract between the Employer and the Building Contractor,

- if authorized to certify, decide or exercise discretion, do so fairly between the Employer and the Building Contractor not as an arbitrator but as an independent professional acts by his skill and judgement.

13. Warranty Period

The warranty period of the services of the Consultant shall be two years, beginning with the taking-over of the construction works, but not later than six years after acceptance of the services in question.

14. Insurance for Liability

14.1 The Consultant undertakes to take out an insurance for liability for damage caused negligently by the Consultant, his staff and other persons he engages for or in connection with the implementation of the Contract to the Employer, the recipient of the works in the country of assignment or to third parties.

14.2 The insurance sum shall be as customary in the country where the works are to be executed.

14.3 Upon request, the Consultant shall prove to the Employer his insurance coverage.

15. Copyright

The Consultant retains copyright of all documents prepared by him. The Employer shall be entitled to use them or copy them only for the Works and the purpose for which they are intended, and need not obtain the Consultant’s permission to copy for such use.

16. Conflict of Interest

Unless otherwise agreed in writing by the Employer, the Consultant and his personnel shall have no interest in nor receive remuneration in connection with the Project except as provided for in this Contract. The Consultant shall not engage in any activity which might conflict with the interest of the Employer under this Contract.

17. Applicable Law

German Law shall apply to this contract.

18. Arbitration

All disputes arising in connection with the present Contract shall be finally settled under the Rules of Conciliation and Arbitration of the International Chamber of Commerce by one or more arbitrators appointed in accordance with the said rules.

19. Modifications and Alterations

Any modifications, additions and/or deletions to this contract as well as all fundamental communication must be made in writing only.

20. Termination of the Contract

20.1 The Employer may terminate the Contract at any time either wholly or in respect of individual parts of the work or the services.

20.2 Should the Employer terminate the Contract for a reason for which the Consultant is not answerable, the Consultant shall be entitled to demand the agreed sum in remuneration. However, he shall agree to non-incurred expenses or avoidable expenditure being deducted from the sum otherwise due. Salaries and ancillary costs in respect of salaries for the experts of the Consultant assigned to the project shall as a rule be deemed not incurred if they would have become due more than 3 months after the date on which termination of the Contract took effect. The Consultant shall bear the burden of proof for exceptions to this rule.

20.3 If the Employer terminates the Contract for a reason for which the Consultant or its experts are answerable, remuneration shall be paid only for the works already executed, provided that the Employer can utilize them, in accordance with the Contract prices, or, that part actually executed shall be remunerated as a proportion of the total contractual works on the basis of the Contract prices. Those works executed which the Employer cannot utilize shall be returned to the Consultant at the latter's expense. Insofar as the contractual work comprises the rendering of services, the services rendered up to the date of termination shall be deemed utilizable works. In no case shall there be a claim to more than the contractual amount.

20.4 The Consultant shall be deemed answerable for the reason for termination if the Employer terminates because bankruptcy proceedings have been initiated against the assets of the Consultant, or because judicial composition proceedings have been initiated against the Consultant, or it has discontinued its payments not only on a temporary basis, thus jeopardizing the proper execution of the Contract.

20.5 Other legal rights and claims of the Employer and Consultant shall remain unaffected.

21. Partial Invalidity

The invalidity of one or several provisions of this Contract shall not affect the validity of the remaining provisions. Invalid provisions shall be substituted by such provisions as are closest to the economic purpose aimed at by both contracting parties.

22. Copies

This Contract shall be drawn up in duplicate and each party shall receive one copy thereof.

Employer or The Engineer/Consultant

9.7 Tender Conditions for Contractors (TENDRCON)

1. GENERAL

1.1 The Tender must comply with the following conditions and instructions. Failure to do so is liable to result in the rejection of the Tender.

1.2 “Tenderer” means any person or persons, partnership, firm or company being prequalified and submitting fully priced Bill of Quantities in accordance with the Tender.

1.3 All recipients of the Tender Documents shall, whether they submit a Tender or not, treat the details of these documents as confidential.

2. TENDER DOCUMENTS

2.1 The Tender must be made out on the forms provided in the Tender Documents duly completed in ink or in print. The Bill of Quantities must be fully priced, totalled, checked arithmetically, and the grand total must be in compliance with the sum entered in the Tender. Tender and Contract Documents must be kept intact.

The Tender Documents and accompanying documents shall be signed by the Tenderer or his legally authorized representative and be returned to the address according to No. 5 of the "Invitation to Tender".

2.2 The Tender must be accompanied by:

(a) A copy of each Circular Letter (see par.7) issued to Tenderers by the Employer or the Engineer (if applicable). Each copy of such Circular Letter must be endorsed by the Tenderer.

(b) The Form of Tender with Appendix to Tender (if applicable), and the Form of Bid Bond (if any), together with the Bill of Quantities, fully priced and summarized.

Any missing document may result in the rejection of the Tender.

2.3 Prices must be quoted for all items in the Bill of Quantities, where applicable, or a clear indication must be given that the values of the Works described under items left unpriced are allowed for elsewhere.

3. EXAMINATION OF SITE

3.1 Tenderers shall visit the site of the Works and obtain for themselves all information that may be necessary for completing their Tenders and for entering into a contract with the Employer. Tenderers shall aquaint themselves with the requirements of the contract, e.g. characteristics of the site and its surroundings, hydrological and climatic conditions.

In particular, Tenderers shall acquaint themselves with the conditions of

(a) existing access roads or other means of communication and access to the site of works, incl. police regulations concerned therewith,

(b) available land for storage, workshops, toilets, and site office(s),

(c) available connections to electricity and water for construction,

(d) the soil and subsoil to be excavated, stored or removed from site.

The availability of local labour, their quarters on site (if necessary), local materials and other local recources shall also be considered.

4. MODIFICATIONS/ADDITIONAL OFFERS

4.1 The Tender may contain only the prices and statements required in the Tender Documents and shall be signed by a duly authorized person. Any addition to, deletion or alteration of the Tender Documents may result in the rejection of the Tender.

4.2 Additional offers/proposals for modifications which, from the technical point of view, deviate from the Engineer's Specification or such which entail a demand for other conditions of payment, execution deadlines or price reserves, shall only be admitted in connection with the submission of the base Tender.

-

Proposals for modifications and additional offers shall be made in a separate annex and must be clearly marked as such.

Modifications by the Tenderer concerning prices quoted or statements made shall be unambiguous. Samples and patterns submitted with the Tender must be clearly marked as appertaining to the Tender.

5. PRICES

5.1 All prices (unit prices, lump sum prices, settlement rates, hourly wages, bonuses) shall be stated **without** tax (turnover tax, value added tax, or alike). The amount of applicable tax shall be based on the locally valid tax rate and shall be added as the last item on the summary sheet of the Tender.

5.2 The offer of a discount based on the observance of certain payment deadlines described by the Tenderer shall be taken into account in the evaluation only if the tenderer declares that such a discount shall apply to all payments on account and the final payment, providing that the deadlines set for payments leave reasonable time for their processing.

5.3 The Employer will not be held responsable if the local bank in the recipient country converts the payments to the Contractor into local currency before crediting the same to the Contractor's account. The Contractor is not entitled to claim for any charges or fees deducted by the bank due to the exchange and/or transfer of payments.

6. AMBIGUITIES

If, in the Tenderer's opinion, the Tender Documents contain ambiguities which might influence the calculation of the prices, the Tenderer shall indicate this to the Employer by letter, telefax, telex, or telegram before submitting his Tender within 30 days after the receipt of the Tender Documents. Necessary clarification will be made by Circular Letter(s).

7. CIRCULAR LETTER

7.1 In the event that the Employer sends Circular Letters to the Tenderers during the tendering period in order to comment, clarify, or modify the Contract Documents, these Circular Letters shall become an integral part of the Contract Documents and it shall be assumed that they have been taken into account by the Tenderers in drawing up their Tender.

7.2 The Tenderer shall confirm the receipt of a Circular Letter to the Employer immediately. No Circular Letter shall be dispatched within 21 days before the submission date for the Tender, except one that confirms a due postponement of the original submission date.

8. PROHIBITED AGREEMENTS

Agreements restricting the competition are not permitted, especially arrangements and negotiations with other Tenderers in respect of

- submitting or not submitting a tender,

- the prices to be demanded and profit rates,

- binding arrangements for other compensation,

- processing cost margins and other price components,

- terms of payment and delivery and other conditions of contract insofar as they influence the prices directly or indirectly,

- indemnity or compensation payments for non-participation or limited participation in the competition,

- and profit-sharing.

9. SUBCONTRACTORS

If parts of the Works are intended to be executed by subcontractor(s), the Tenderer shall indicate nature and scope of such parts of the works and state name and address of the subcontractor(s) considered.

10. JOINT VENTURES

Tenders submitted by Joint Ventures or other Bidding Combinations shall be accepted only if the following information is provided with the Tender

(a) A list of the members of the Joint Venture/Bidding Combination designating the duly authorized representative(s).

(b) A declaration, signed by duly authorized representatives of all members, stating that the duly authorized representatives shall represent the members specified in the list in a legally binding manner vis-a-vis the Employer, and that all members are jointly and severally liable for the performance of the Contract with the Employer.

11. SUBMISSION OF TENDER

11.1 The Tender shall be submitted to the address stated in and prior to the time and date specified in the Invitation to Tender.

11.2 Tenders received after the date and time of submission will not be considered.

12. OPENING OF TENDERS

12.1 Tenderers shall be free to attend the opening session of the Tenders.

12.2 The session shall be held for opening and reading out the Tenders. Until this session all Tenders received shall be kept under lock and key with the envelopes unopened and marked with the date of receipt only. For the Opening Session the following procedure shall be observed and laid down in the minutes of meeting, stating place, date and time of the opening:

(a) The chairman of proceedings shall establish whether the seals of the envelopes are intact.

(b) Samples and patterns submitted with any Tender shall be on hand and duly marked.

(c) The Tenders shall be opened one after another and all major parts marked. The names and addresses of the Tenderers and the final amounts of their Tenders or of individual sections as well as other particulars concerning the price shall be read out. It shall be announced if and by whom proposals for modifications and/or additional offers have been submitted. Other details of the contents shall not be made known.

(d) The minutes taken of the opening session shall be read out, shall contain a note to the effect that they have been read out aloud and that it has been acknowledged as correct or shall specify what objections have been raised by whom.

(e) The minutes shall be signed by the chairman of proceedings.

12.3 Tenders which were not received prior to the submission time and date shall be specified separately in the minutes or addendum thereto. The time of receipt and the reason for the delay of the receipt shall be noted. Envelopes and other means of proof shall be kept in safe custody.

12.4 The Tenderers and their authorized representatives shall be permitted to inspect the minutes of the opening session and addenda thereto (if any). The minutes of the opening session shall not be published.

13. EVALUATION OF TENDERS

13.1 The following Tenders shall be excluded:

(a) Tenders received after opening date and time.

(b) Tenders submitted by tenderers who have entered into an agreement which constitutes a prohibited restriction of competition.

13.2 In selecting the Tenders to be considered for the award of contract, only those Tenderers who offer the necessary security for the performance of the contractual obligations will be taken into account. This shall entail the necessary expertise and experience, performance capacity and capability, the reliability as well as technical and financial means and recources.

13.3 Tenders, of which the prices are obviously disproportionate to the Works concerned, will be disregarded. Only such Tenders from which proper execution and covering of the defect liability period can be expected with due regard to rational and thrifty construction operations and efficient management will be considered. From those Tenders the award will be made to the one which appears to be the most acceptable with regard to all technical, functional, environmental and economical aspects.

13.4 Any arithmetical error by the Tenderer in pricing the Bill of Quantities or in the additions or in carrying forward subtotals to the summary or to the Tender shall be corrected during the evaluation of the Tenders. In such cases the Tender sum shall be adjusted accordingly and the Tenderer shall be informed. It shall be assumed that the unit price rates entered in the Bill of Quantities are correct.

13.5 Proposals for modifications and additional offers which the Employer has admitted or requested for the tendering action shall be evaluated in the same way as the base tender. Other proposals for modifications and additional offers may be considered.

13.6 The Employer does neither bind himself to accept the lowest Tender or any Tender, nor will he be responsible or pay for expenses or losses which may be incurred by any Tenderer with the preparation of his Tender.

14. CANCELLATION OF THE TENDERING ACTION

14.1 The Tendering Action can be cancelled, if

(a) no Tender has been received which corresponds to the Tender Conditions,
(b) there have been substantial changes to the basis of the Tendering Action, or
(c) there are other serious reasons for such a cancellation.

14.2 The Tenderers shall be informed without delay of the cancellation of the Tendering Action by the Empoyer or his Engineer and of the reasons for the same.

To .... **or** ....
(Name and address of Employer) *(Name and address of project office, embassy or consultant's office in the recipient country)*

Dear Sir or Madam,

1. Having examined the Conditions of Contract, Drawings, Specifications, Bill of Quantities and all other documents received with the Invitation to Tender for the execution of the Works in connection with the above named Project, we, the undersigned, offer to execute and complete such Works and remedy any faults and defects therein in conformity with the conditions spelled out in the aforementioned documents for the sum of

....
(in words ....)

or such other sums as may be ascertained in accordance with the said conditions.

2. We acknowledge that the Appendix to Tender enclosed forms part of our Tender.

3. We undertake, if our Tender is accepted, to commence the Works within the time required in the contract conditions, and to complete the whole of the Works comprised in the contract within the time stated in the Contract Conditions.

4. We agree to abide by this Tender for the period of 180 days from the submission/opening date stated in the Invitation to Tender and it shall remain binding upon us and may be accepted at any time before the expiration of that period.

5. Unless and until a Contract Agreement is signed, this Tender, together with your written acceptance thereof, shall constitute a binding contract between us.

6. We understand that you are not bound to accept the lowest or any Tender you may receive.

9.10 Contract for Construction Works on Measurement Basis (recommended for contract value up to 150.000 Euro) (CONCTRMB)

CONTRACT FOR CONSTRUCTION WORKS ON MEASUREMENT BASIS	Employer's logo

The
(Name and address of Employer)
....
....
....

Date:
refer to in all correspondence:
Contract No.:

Project No.:

hereinafter referred to as the
- "Employer" -

and:

(Name and address of Contractor)
....
....
....

hereinafter referred to as the
- "Contractor" -

herewith enter into the following Contract

for the Project: ....

Country:......................

1. PURPOSE OF THE CONTRACT - SCOPE OF WORKS

The Employer awards and the Contractor takes over the execution of the following construction works:

2. CONTRACT DOCUMENTS

The priority of documents forming the Contract shall be as follows:

2.1 This Contract for Construction Works.

2.2 The Specifications

2.3 The Drawings enclosed to the Invitation to Tender, i.e.

No........... dated............. No............ dated................
No........... dated............. No............ dated................

and such drawings and details as may be issued by the Employer or his Authorized Representative for the clarification of the Works during execution.

2.4 The priced Bill of Quantities (including Daywork Rates), dated ....

3. TERMS OF EXECUTION - COMMENCEMENT OF WORKS

3.1 The Employer or his Authorized Representative shall give at least 7 days notice, in writing, prior to the date of handing-over of the site. The Contractor shall commence the Works within 5 days of the date of the handing-over of site.

3.2 The Contractor agrees to execute and to complete the Works as described in the documents listed under Clause 2 with due care and diligence in accordance with generally accepted construction practices.

3.3 The Contractor shall be obliged to observe the Laws, Bye-Laws, Ordinances and Statutes and other legal provisions of the country in which the Works are executed, in particular labour laws, local standards, public rules and regulations.

3.4 The Contractor shall submit a work programme not later than ...... weeks after the signing of this Contract.

3.5 The Contractor shall supply all building materials, equipment, plant and tools necessary for the execution of the Works in due number and time.

3.6 The Contractor shall provide all qualified and experienced labour necessary in due number and time and shall supervise their activities with due care and diligence. The Employer shall be entitled to object to and require the Contractor to remove from the Works any person employed by the Contractor who, in the opinion of the Employer, is incompetent, negligent, or guilty of misconduct.

3.7 No work shall be covered up or otherwise put out of view without prior approval in writing by the Employer or his Authorized Representative.

3.8 The Employer shall be entitled to make any variation of the form, quantity or quality of the Works or any part thereof that may, in his opinion, be necessary or desirable (cf. Clause 4.2). No such variation shall be made without an order in writing by the Employer or his Authorized Representative.

3.9 Building materials and Works may be subjected to tests at any time at the request of the Employer. These tests shall be carried out as directed by the Employer or his Authorized Representative at the place of manufacture or fabrication or on site or in a testing institute. The Contractor shall provide such assistance, materials, plant, instruments and labour as required for such test. The costs of carrying out such tests shall be borne by the Contractor.

3.10 The Contractor shall keep the site free from all unnecessary obstructions at all times and shall remove all materials and plant which are no longer required. Upon completion of the Works he shall leave the site clean and orderly to the satisfaction of the Employer or his Authorized Representative.

4. REMUNERATION - ADDITIONAL WORKS

4.1 The Employer shall pay the Contractor a Contract Price of up to

....
(in words..)

in accordance with the prices stated in the Bill of Quantities and the Works actually executed and measured. The Contract Price shall be subject to such additions and deductions as may be made under the provisions of this Contract.

4.2 The rates and prices of the Bill of Quantities shall cover all services and works of the Contractor described in the Specifications and the Drawings. Additional works shall be remunerated only if they were ordered in writing by the Employer or his Authorized

Representative and shall be valued at the prices set out in the Bill of Quantities.

4.3 If the Contract does not contain any rates or prices applicable to the extra or additional work, then suitable rates or prices shall be agreed upon between the Employer and the Contractor. In the event of disagreement, the Employer shall fix such rates or prices as shall, in his opinion, be reasonable and proper, taking into account all prevailing circumstances.

4.4 The Contractor shall invoice turnover tax if and as prescribed by law; the Employer will refund the amount in addition to the remuneration.

Amount of turnover tax *(if applicable):* ....

5. TIME FOR COMPLETION - PENALTY FOR DELAY

5.1 The Contractor shall complete the Works as listed under Clause 1 and 2 within............ days after the handing-over of site and shall request the issue of the Taking-Over Certificate at least 3 weeks prior to the date of completion.

5.2 If the Contractor should fail to achieve the completion of the Works within the period prescribed in Clause 5.1, the Contractor shall pay to the Employer a penalty of one per mille (1/1000) of the Contract Price stated under Clause 4.1 for every day of delay up to a limit of 10 % of the Contract Price.

5.3 The payment of such penalty shall not relieve the Contractor from his obligation to complete the Works or from any other obligation or liability under this Contract.

6. AUTHORIZED REPRESENTATIVE - SUPERVISION OF THE WORKS

The site supervision shall be carried out by an authorized firm or person assigned to act on behalf of the Employer and shall exercise the rights of the Employer under this Contract. The Employer herewith appoints as Authorized Representative for the execution of the Works:

....
....

7. PAYMENTS

7.1 All payments shall be made in .... *(currency)*
to the following bank and account number of the Contractor:

....
....

7.2 The parties of this Contract agree to the following payment schedule:

7.2.1 Against presentation of a bank guarantee by a bank accepted by the Employer in compliance with the specimen enclosed (see GARANTAP) the Contractor shall receive an advance payment of.......% of the Contract Price =.......................

The advance payment shall be repaid by deduction of the corresponding percentage from each payment on account.

7.2.2 Payments on account shall be made in accordance with the progress of the Works measured on site each month, in keeping with the Bill of Quantities and after certification of each invoice by the Authorized Representative.

7.2.3 Each invoice shall be submitted in duplicate and bear the project and contract number indicated on the front page of this Contract.

7.2.4 An amount of 10 % of the total of each payment on account shall be withheld by the

Employer as Retention Money.

7.2.5 After the issue of the Taking-Over Certificate (in compliance with TAKGOVER) and presentation of the final bill the remuneration due shall be paid reduced by 5 % of the total Contract Price, which shall be released after the defects liability period has expired, provided the Works are free of defects. This amount may be released against the provision of a Defects Liability Guarantee by a bank accepted by the Employer in compliance with the specimen enclosed (see GARANTDL).

8. TAKING-OVER CERTIFICATE - DEFECTS LIABILITY PERIOD

8.1 The Employer or his Authorized Representative shall issue the Taking-Over Certificate in compliance with the specimen enclosed (see TAKGOVER) within 3 weeks of the date of delivery of the Contractor’s request for its issue, provided that the whole of the Works have been completed in accordance with the Contract and to the satisfaction of the Authorized Representative.

If the Works have been completed except for minor faults or missing items, the Employer or his Authorized Representative shall include a statement in the Taking-Over Certificate, listing all faults and defects, missing items or outstanding works to be completed, including the date when all rectification and finishing works shall be completed.

8.2 The Defects Liability Period shall be twelve (12) months, starting with the date of issue of the Taking-Over Certificate.

8.3 Defects, faults, or shrinkage due to the use of materials or workmanship not in accordance with the Contract and which arise during the defects liability periodshall be made good by the Contractor immediately after notification. For these rectifications a new defects liability period shall start on their day of completion.

8.4 If the Contractor should fail to comply with his obligations under this Contract, the Employer shall be entitled to either make a deduction, claim damages or, giving four (4) weeks notice to the Contractor, employ another contractor to execute the works required for rectification and to deduct all expenses arising thereon or incidental thereto from the moneys retained according to Clause 7.2.4 or 7.2.5, or to recover these from the Contractor.

9. LIABILITY- INSURANCE

9.1 The Contractor shall be liable for all damages caused by himself, his agents or persons employed or in any way engaged by him for the execution of the Works.

9.2 Subletting of the Works under this Contract or of any part thereof shall require the express written consent of the Employer. This approval may be revoked at any time in case serious complaints arise. The Contractor shall be liable for all services performed by his subcontractors in the same manner as for his own services.

9.3 Without limiting his obligations and responsibilities under this Contract, the Contractor shall insure himself at his own expense against his liability for any material or physical damage, loss or injury which may occur to any person or property arising out of or in consequence of the performance of this Contract.

9.4 The insurance sum shall be as customary in the country where the works are to be executed.

10. TERMINATION OF THE CONTRACT

10.1 The Employer may terminate this Contract at any time either wholly or in part for individual parts of the Works.

10.2 Should the Employer terminate the Contract for a reason for which the Contractor is answerable, the Employer shall be entitled to claim compensation for damages. In this case the Employer shall remunerate only the Works already completed, provided the Employer can use them. The Employer may offset the claim for damages against the remuneration. Any other legal rights of the Employer shall remain unaffected.

10.3 Should the Employer terminate the Contract for a reason for which the Contractor is not answerable, the Contractor shall be entitled to payment for work already completed and to reimbursement of unavoidable expenses incurred prior to the date of termination.

11. ARBITRATION

All disputes arising in connection with the present Contract shall be finally settled under the Rules of Arbitration of the International Chamber of Commerce by one or more arbitrators appointed in accordance with the said rules.

12. FINAL PROVISION

This Contract shall be modified or supplemented only by written agreement.

Employer's Representative	Supervising Engineer	Contractor's Representative

9.14 Form of Certificate of Handing-Over (HNDGOVER)

This is to certify that the following works for the project named below have been completed to the full satisfaction of the representatives listed in the Minutes of the Handing-Over and are being handed over to and accepted by the authorized representative of the counterpart authority in the recipient country as of

Project No:	.... 20...........
Project Title:	....
Works:	.... Remaining defects and outstanding works affecting the warranty of the contractor(s) have/have not been determined as stated in the **Minutes of Handing-Over** enclosed.

Upon this handing-over of the works all rights and obligations concerning the works are transferred to the counterpart authority in the recipient country.

The Project Agreement between the Government of the Federal Republic of Germany and the

Government of ....dated.................... shall remain unaffected and the works shall be at the unlimited disposition of the experts delegated by the GTZ to the promoted project for the implementation and completion of their duties and tasks.

....	....
Place	Date
Handed over by	Accepted by
....	....
Signature and name in printed letters of the authorized representative of the Employer	Signature and name in printed letters of the authorized representative of the counterpart authority

End.: Minutes of the Handing-Over

MINUTES OF THE HANDING-OVER

The handing-over of the

Works:	....
of	
Project No:	....
with the	
Project Title:	....

as of....................., 20..... has been accomplished by the following team of representatives present and authorized to sign for the:

	name in printed letters	*initial:*
Employer	....	....
Counterpart Authority	....	....
Usufructuary	....	....
German Embassy (if applicable)	....	....

Following a joint inspection of the works it has been ascertained that they have been completed as approved and are ready for use. Defects, deficiencies and outstanding works, all covered by contractors liability, were established as follows:

1. Faults and Defects at

1.1 Building/Installation

1.2. Exterior Facilities (if applicable)

2. Outstanding Works/Missing Items

2.1 Building/Installation

2.2 Exterior Facilities (if applicable)

3. Remarks:

With this certificate the following documents are handed-over to the authorized representative of the counterpart authority:

- one (1) set of as-built drawings,

- one (1) copy of the Taking-Over Certificate as of.............20.....,

- one (1) copy of the Acceptance Certificate of the electrical installations and equipment, incl. the record of inspection,

- complete set of operating instructions and maintenance manuals for electrical/mechanical equipment (if applicable)

....	....
For the Employer	For the counterpart authority

9.15 FIDIC-Part I, Conditions of Contract for Works of Civil Engineering Construction (recommended for contract value above 150.000 Euro) Website Information (FIDIC-P1).

Information on FIDIC Publications (from Internet website "http://www.fidic.org")

FIDIC publishes:

• Information about FIDIC, with such booklets as FIDIC Info, a small information/address book published annually, and FIDIC Statutes and Bylaws.

• Information for clients, including the International Directory of Consulting Engineers (published every two years, and which is also available online at www.fidicdirect.com, Quality Based Selection, FIDIC Tendering Procedure and other valuable documents about the use of consulting engineers.

• Information for Consulting Engineers, with manuals/guides on topics such as risk management, environment, transfer of technology, quality management, dispute resolution techniques, insurance, law and other business issues.

<u>Contracts/Agreement</u>

The "backbone" of the body of FIDIC's publications is FIDIC's selection of contracts and agreements. FIDIC publishes Conditions of Contract for:

• Works of Civil Engineering Construction (The Red Book)
• Construction Contract (NEW: updates the Red Book)
• Electrical & Mechanical Works (The Yellow Book)
• Design-Build and Turnkey (The Orange Book)
• Plant and Design Build Contract (updates Yellow Book and Orange Book)
• EPC/Turnkey Projects
• The Short Form

These documents are available in printed and electronic versions, and a short text tells you how to choose the right contract.

All FIDIC contracts standard conditions of contract between a client/employer and a contractor. The consulting engineer is not a party to these contracts, but plays a role as the employer's representative to see that the contract is properly carried out.

Additionally, FIDIC publishes a Client/Consultant Model Services Agreement (The White Book), which is the agreement often used by the client when appointing a consultant as his employer's representative for the above contracts.

This "rainbow" of FIDIC contracts/agreements provides the major portion of the total income from publication sales to FIDIC.

FIDIC's volunteer committees, who draft nearly all of FIDIC's documents, are continuously drafting or revising, keeping FIDIC's Publications informative and up-to-date.

Representation Impact

Equally important for FIDIC is the representation/image impact of its publications. Most people first learn about the Federation by reading or using its business practice publications or standard conditions of contract. FIDIC's "quality image" is enhanced by its publication of quality documents.

The most pronounced example of this image impact is FIDIC's Conditions of Contract for Works of Civil Engineering Construction ("The Red Book", owing to its red cover), now in its fourth edition. Many people call the Red Book "FIDIC" or "the FIDIC", mistakenly using the Federation's acronym (taken from its original French name, Fédération Internationale des Ingénieurs-Conseils) for its best known publication, unaware of the Federation, but certainly aware of its Red Book.

This confusion is not surprising, when one considers that the Red Book is used as the general conditions in standard bidding documents of many development banks, including the World Bank.

Financial Impact

FIDIC's publications fulfil an important and essential role for the well being of the Federation. Revenues from publication sales account for nearly half of FIDIC's income, with most of the other half coming from Member Association (MA) subscriptions.

FIDIC's annual income from publications has grown from about SFr. 300,000.- in the late 1980's to more than SFr. 900,000.- today. This growth in publications sales has allowed FIDIC to reduce the unit rates for membership subscriptions by nearly one-half over the past decade, an important impact when one considers that more than half of FIDIC's Member Association's are in developing countries, many of which have weak currencies.

With FIDIC being a non-profit, self-supporting Federation, which neither seeks nor accepts financial support from any other body, the essential role played by its publications sales cannot be over emphasized.

Ordering

All FIDIC documents can be ordered online at the FIDIC.org Bookshop. The Bookshop gives details such as:

- Overview of contents.

- Translations: All FIDIC documents are published in English and depending upon the need, in other languages (but English remains the language of reference in case of legal dispute - see FIDIC Policy on Translations). However, other organizations often undertake to translate FIDIC documents, especially conditions of contract. The Bookshop indicates the translations that are available and where they can be obtained if they are not stocked by the Bookshop

- Prices: all prices are in Swiss francs and special offers are available for orders exceeding the minimum order provided more than three items are ordered.

9.16 FIDIC-Part II, Conditions of Particular Application (as an example), drafted by the GTZ (FIDIC-P2), to be adapted to the specific project conditions.

CONDITIONS OF CONTRACT

PART II - CONDITIONS OF PARTICULAR APPLICATION

The following clauses of Part I of the “Conditions of Contract for Works of Civil Engineering Construction” (FIDIC), Fourth Edition 1987, reprinted with amendments 1992, prepared by the Fédération Internationale des Ingénieurs-Conseils, shall be supplemented, modified, deleted or added as follows:

Sub-Clause 1.1 - Definitions

(a) (i) The Employer is	....
	....
	....
	....
	....
(a) (iv) The Engineer is	....
	....
	....
	....
	....

The Employer is entitled to replace the Engineer at any time without the consent of the Contractor. In such a case the Employer shall notify the Contractor in writing without undue delay.

(b) (vi) “Letter of Acceptance”:

Sub-Paragraph (b) (vi) shall be added by the following:

“In case no Letter of Acceptance is issued all references to the Letter of Acceptance shall be deemed to be made to the Contract Agreement referred to in Sub-Clause 9.1.”

<u>Sub-Clause 2.1 - Engineer’s Duties and Authority</u>

Paragraph (b) of Sub-Clause 2.1 shall be amended as follows:

“(i) The Engineer shall obtain the specific approval of the Employer in writing before carrying out any of the following actions as specified in Part I:

(1) consenting to subcontracting of any part of the Works pursuant to Clause 4.1,

(2) determination of any extension of time pursuant to Clause 12.2 (a),

(3) determination of any additional costs pursuant to Clause 12.2 (b),

(4) issuing a Taking-Over Certificate pursuant to Clause 48.1,

(5) making any variation pursuant to Clause 51.1, unless the accumulated costs of the variations do not surpass ten (10) percent of the original Contract Price,

(6) fixing rates or prices pursuant to Clause 52, including provisional rates and prices,

(7) determining increased costs arising from special risks pursuant to Clause 65.5,

(8) determining any sums payable pursuant to Clause 65.8 in the event that the contract is being terminated.

(ii) Notwithstanding the obligation, as set out above, to obtain approval, if, in the opinion of the Engineer, an emergency occurs affecting the safety of life or of the Works or of adjoining property, he may, without relieving the Contractor of any of his duties and responsibilities under this Contract, instruct the Contractor to execute all such work or to do all such things as may, in the opinion of the Engineer, be necessary to abate or reduce the risk. The Contractor shall forthwith comply, despite the absence of approval of the Employer, with any such instruction of the Engineer. The Engineer shall determine an addition to the Contract Price, in respect of such instruction, in accordance with Clause 52 and shall notify the Contractor accordingly, with a copy to the Employer."

Sub-Clause 2.2 - Engineer's Representative

Sub-Clause 2.2 shall be deleted and substituted by:

"The Engineer's Representative shall be appointed by and be responsible to the Engineer. The Engineer's Representative shall either be a representative of the local representation of the Engineer or an expert seconded by the Engineer. Any appointment or revocation of the Engineer's Representative requires the specific written approval of the Employer and shall not take effect until a copy thereof has been delivered to the Contractor."

Sub-Clause 2.3 - Engineer's Authority to Delegate

Sub-Clause 2.3 shall be deleted and substituted by:

"Any communication given by the Engineer's Representative to the Contractor shall have the same effect as though it had been given by the Engineer."

Sub-Clause 2.4 - Appointment of Assistants

Sub-Clause 2.4 shall be deleted entirely.

Sub-Clause 2.5 - Instructions in Writing

In the last sentence the following words shall be deleted:

"and any assistants of the Engineer or the Engineer's Representative appointed pursuant to Sub-clause 2.4."

Sub-Clause 3.1 - Assignment of Contract

Sub-Clause 3.1 shall be deleted and substituted by the following:

"The Contractor shall not, without prior consent of the Employer (which consent shall be at the sole discretion of the Employer) assign the Contract or any part thereof or any benefit or interest therein or thereunder."

Sub-Clause 5.1 - Language and Law

(a) The language is English.

(b) The law is that in force in.................*(Country)*..................

Sub-Clause 5.2 - Priority of Contract Documents

The list of documents shall be deleted and substituted by the following:

(1) the Contract Agreement, if completed;
(2) the Letter of Acceptance, if issued;
(3) the Tender with Appendix;

(4) the Conditions of Contract Part II;
(5) the Conditions of Contract Part I;
(6) the Specifications;
(7) the Drawings; and
(8) the priced Bill of Quantities.

Sub-Clause 10.1 - Performance Security

The third phrase of Sub-Clause 10.1 shall be deleted and substituted by:

“Such security shall be in accordance with the specimen “Performance Guarantee” annexed to these Conditions.”

Sub-Clause 10.3 - Claims under Performance Security

Sub-Clause 10.3 shall be deleted entirely.

Sub-Clause 13.1 - Works to be in Accordance with Contract

The last phrase of Sub-Clause 13.1 shall be deleted and substituted by:

“The Contractor shall take instructions only from the Engineer or, subject to the provisions of Clause 2, from the Engineer’s Representative.”

Sub-Clause 14.1 - Programme to be Submitted

The words “in Part II of these Conditions after the date of the Letter of Acceptance” in the first and second line shall be substituted by “in the Appendix to the Tender”.

Sub-Clause 14.3 - Cash Flow Estimate to be Submitted

Sub-Clause 14.3 shall be deleted entirely.

After Sub-Clause 15.1 - Contractor’s Superintendent

The following Sub-Clause 15.2 shall be added:

“15.2 - Language Ability of Contractor’s Representative

The Contractor’s representative shall have command of the contract language according to Sub-Clause 5.1 (a).”

Sub-Clause 20.4 - Employer’s Risks

The definition of Sub-Clause 20.4 shall be preceded by the paragraph:

“The Employer’s risks are limited to those related to the country where the Permanent Works are to be executed. The present political situation is well known to both parties and shall not be considered an Employer’s risk; thus it shall not justify any claim, additional payment or any extension of time.”

Sub-Clause 21.1 - Insurance of Works and Contractors Equipment

The following phrase shall be added to Paragraph (a):

“,it being understood that such insurance shall provide for compensation payable in those types and proportions of currencies required to rectify the loss or damage incurred.”

Sub-Clause 21.2 - Scope of Cover

The words “from the start of work at the Site” in Paragraph (a) shall be deleted and substituted by: “from the date fixed for the Commencement of Works under Sub-Clause 41.1”.

After Sub-Clause 25.4 - Compliance with Policy Conditions

The following Sub-Clause 25.5 shall be added:

“25.5 - Source of Insurance

The Contractor shall be entitled to place all insurance relating to the Contract (including, but not limited to, the insurance referred to in Clauses 21, 23 and 24) with insurers approved by the Employer.”

After Sub-Clause 26.1 - Compliance with Statutes. Regulations

The following Sub-Clauses 26.2 and 26.3 shall be added:

“26.2 - Agreements between........................and the recipient country

The works under this Contract shall be carried out observing the Bilateral Agreement for Technical Co-operation and the Project Agreement between ....and the recipient country. These agreements provide inter alia that the import of equipment and materials required for the Contract Works will be free of any custom duties, taxes, or any other official charges.

26.3 - Violation of Agreements

Each and every case of violation of the aforementioned Agreements shall be reported by the Contractor to the Employer immediately.”

Sub-Clause 30.3 - Transport of Materials or Plant

Sub-Clause 30.3 shall be deleted entirely.

After Sub-Clause 34.1 - Engagement of Staff and Labour

The following Sub-Clauses 34.2 to 34.5 shall be added:

“34.2 - Health and Safety

Due precautions shall be taken by the Contractor at his own cost to ensure the health and safety of his staff and labour in collaboration with and to the pertaining requirements of the local health authorities, labour laws, welfare and hygiene requirements.

34.3 - Alcoholic Liquor or Drugs

The Contractor shall not, otherwise than in accordance with the Statutes, Ordinances and Government Regulations or Orders for the time being in force, import, sell, give, barter, or otherwise dispose of any alcoholic liquor and/or drugs, or permit or suffer by his Subcontractors, agents, staff or labour to do so.

34.4 - Arms and Ammunition

The Contractor shall not give, barter, or otherwise dispose of to any person or persons, any arms or ammunition of any kind or permit or suffer the same as aforesaid.

34.5 - Disorderly Conduct

The Contractor shall at all times take all reasonable precautions to prevent any unlawful, riotous, or disorderly conduct by or amongst his staff and labour and for the preservation of peace and protection of persons and property in the neighbourhood of the Works against the same."

Sub-Clause 36.2 - Cost of Samples

A full stop shall be inserted after "at his own cost" and the remainder of the sentence shall be deleted.

Sub-Clause 41.1 - Commencement of Works

The first sentence of Sub-Clause 41.1 shall be deleted and substituted by:

"The Contractor shall commence the Works on the date stated in the Appendix to Tender."

Sub-Clause 42.1 - Possession of Site and Access Thereto

In the third line of Paragraph (b) the words "with the Engineer's notice to commence the Works," shall be substituted by "upon the contractually agreed date of commencement of the Works,"

Sub-Clause 44.2 - Contractor to Provide Notification and Detailed Particulars

In the first line of the Paragraph (b) the words "or such other reasonable time as may be agreed by the Engineer," shall be deleted.

Sub-Clause 47.1 - Liquidated Damages for Delay

The Sub-Clause 47.1 shall be deleted and substituted by:

"47.1 - Penalty

If the Contractor fails to comply with the Time for Completion in accordance with Clause 48 for the whole of the Works or, if applicable, any Section within the relevant time prescribed by Clause 43.1, then the Contractor shall pay to the Employer the relevant sum stated in the Appendix to Tender as a penalty for every day which shall elapse between the relevant Time for Completion and the date stated in the Taking-Over Certificate of the whole of the Works or the relevant Section, subject to the applicable limit stated in the Appendix to Tender. The Employer may, without prejudice to any other method of recovery, deduct the amount of such penalty from any monies due to or to become due to the Contractor. The payment or deduction of such penalty shall not relieve the Contractor from his obligations to complete the Works, or from any other of his obligations and liabilities under this Contract, namely for damages caused by delay."

Sub-Clause 47.2 - Reduction of Liquidated Damages

The Sub-Clause 47.2 shall be deleted and substituted by:

"47.2 - Reduction of Penalty

If, before the Time of Completion of the whole of the Works or, if applicable, any Section, a Taking-Over Certificate has been issued for any part of the Works or for a Section, the penalty for delay in completion of the remainder of the Works or of that Section shall, for any period of delay after the date stated in such Taking-Over Certificate, and in absence of alternative provisions in the Contract, be reduced in the proportion which the value of the part so certified bears to the value of the whole of the Works or Section, as applicable. The provisions of this Sub-Clause shall apply to the rate of penalties only and shall not affect the limit thereof."

Sub-Clause 48.1- Taking-Over Certificate

Sub-Clause 48.1 shall be preceded by the following sentence:

"The Taking-Over-Certificate shall be issued by the Employer unless he authorises the Engineer in writing to issue such a Certificate."

After Sub-Clause 49.4 - Contractor's Failure to Carry Out Instructions

The following Sub-Clauses 49.5 to 49.7 shall be added:

"49.5 - No Engineer under contract

In case that there is no Engineer under contract during the defects liability period, the Employer shall assume all functions of the Engineer referred to in Clauses 49 and 50.

49.6 - Limitation of action

The Employer's right to demand that the Contractor make good any defect after notification thereof shall become statute-barred two years after that notification.

49.7 - Defects liability period for subsequent improvement works

In respect of the Works undertaken to make good defects, the defects liability period shall begin anew on the day on which those works have been acceptably completed. A certificate pursuant to Sub-Clause 48.1 shall establish that the Work has been completed in proper form."

Sub-Clause 52.2 - Power of the Engineer to Fix Rates

After the first full paragraph the following paragraph shall be added:

"Provided further that no change in the rate or price for any item contained in the Contract shall be considered unless such item accounts for an amount of more than two (2) percent of the Contract Price and the actual quantity of work executed under the item exceeds or underruns the quantity stated in the Bill of Quantities by more than 25 percent."

Sub-Clause 53.2 - Contemporary Records

The word "necessarily" in the third line shall be deleted.

Sub-Clause 53.3 - Substantion of Claims

The words ", or such other reasonable time as may be agreed by the Engineer" shall be deleted.

Sub-Clause 53.4 - Failure to Comply

Sub-Clause 53.4 shall be deleted and substituted by:

"If the Contractor fails to comply with any of the provisions of this Clause in respect of any claim which he seeks to make, he shall not be entitled to any payment in respect thereof."

Sub-Clause 60.1 - Monthly Statements

At the end of the first line the number "six" shall be substituted by "two" and Paragraph (c) shall be deleted entirely.

Sub-Clause 60.2 - Monthly Payments

In Paragraph (b), within the first line, the phrase", other than pursuant to Clause 47," shall be deleted.

Sub-Clause 60.3 - Payment of Retention Money

The following Paragraph (c) shall be added:

(c) The Employer shall pay the other half of the Retention Money mentioned in Paragraph (b) before the expiration of the Defects Liability Period for the Works against presentation of a Defects Liability Guarantee conforming with the annexed specimen and issued by a bank approved by the Employer.

Sub-Clause 60.6 - Final Statement

Sub-Clause 60.6 shall be deleted and substituted by:

"The Statement at Completion shall be deemed as the Final Statement."

Sub-Clause 60.7 - Discharge

Sub-Clause 60.7 shall be deleted entirely.

Sub-Clause 60.8 - Final Payment Certificate

The number "28" shall be substituted by "56" and the words ", and the written discharge" in the first line, "finally" in the first line of Paragraph (a) and ", other than under Clause 47" in the second line of Paragraph (b) shall be deleted.

Sub-Clause 60.9 - Cessation of Employer's Liability

A full stop shall be inserted after "Final Statement" and the rest of the sentence be deleted.

Sub-Clause 60.10 - Time for Payment

The Sub-Clause 60.10 shall be deleted and substituted by:

"Any amount due to the Contractor shall be paid by the Employer to the Contractor within 45 days after receipt of an Interim Payment Certificate or the Final Certificate issued by the Engineer."

After Sub-Clause 60.10 - Time for Payment

The following Sub-Clauses 60.11 and 60.12 shall be added:

"60.11 - Place of Payments

The place of performance for all payments shall be..."

60.12 - Advance Payment

An advance payment according to the amount stated in the Appendix to Tender shall be made by the Employer against the provision of an Advance Payment Guarantee by the Contractor according to the specimen annexed to these conditions. The bank providing such guarantee shall be subject to the Employer's approval.

The advance payment shall be written down by the Contractor by way of proportional reductions in any interim certificate and the Final Certificate, until the amount paid in advance has been written down to nought. The proportion of each reduction shall correspond to the relation of the advance payment to the total Contract Price."

Sub-Clauses 61.1. 62.1 and 62.2

Sub-Clauses 61.1, 62.1, and 62.2 shall be deleted entirely and substituted by:

"61.1 - Completion of the Contract

A Defects Liability Certificate shall not be issued. The Contract shall be considered as completed in full as soon as the Defects Liability Period has passed without any notice of defects or as soon as any works instructed pursuant to Clause 49 and 50 have been completed to the satisfaction of the Employer. The Defects Liability Guarantee shall be returned accordingly, if applicable."

Sub-Clause 65.7 - Removal of Contractor's Equipment on Termination

After the words "Sub-Clause 65.6," the words "or Sub-Clause 65.9" shall be added.

After Sub-Clause 65.8 - Payment if Contract Terminated

The following Sub-Clause 65.9 shall be added:

"65.9 - Termination of Contract at Employer's Convenience

The Employer shall be entitled to terminate this Contract at any time at his convenience by giving notice to the Contractor, with a copy to the Engineer. Such termination shall have immediate effect unless otherwise stated in said notice. In the event of such a termination, the Contractor shall

(a) proceed as provided under Sub-Clause 65.7, and
(b) be paid by the Employer as provided under Sub-Clause 65.8."

After Sub-Clause 66.1 - Payment in Event of Release from Performance

The following Sub-Clause 66.2 shall be added:

"66.2 - Partial Impossibility

If such circumstances as mentioned in Sub-Clause 66.1 render it impossible or unlawful for the Contractor to fulfil part of his obligations, Sub-Clause 66.1 shall apply mutatis mutandis. In such a case the Employer shall be entitled to terminate the Contract if he does not have an interest anymore in the fulfilment of the part not affected by such circumstances, but shall pay the Contractor according to Sub-Clause 65.8."

Sub-Clause 69.1 - Default of Employer

Paragraph (b) shall be deleted and the following phrase shall be added at the end of the Sub-Clause:

"A termination under Paragraph (a) requires a prior written reminder of the payment due, giving a reasonable time limit."

Sub-Clause 69.3 - Payment on Termination

The following sentences shall be added at the end:

"In any case, such payment shall be limited to the total Contract Price. However, the Contractor is obliged to take all necessary steps to minimise the damage."

Sub-Clause 69.4 - Contractor's Entitlement to Suspend Work

The words "to interest under Sub-Clause 60.10 and" shall be deleted and the following paragraph shall be added after the first full paragraph:

"However, any suspension of work or reduction of rate of work requires a prior written reminder of the payment due, giving a reasonable time limit."

Clause 70 - Changes in Cost and Legislation

The Sub-Clauses 70.1 and 70.2 shall be deleted entirely and substituted by:

"70.1 - Fixed Prices

The Contract Prices are fixed prices for the term of this Contract and shall not be subject to any adjustment in respect of rise or fall in the cost of labour, materials, or any other matters affecting the costs for the execution of this Contract."

Sub-Clause 71.1 - Currency Restrictions

The Sub-Clause 71.1 shall be deleted entirely.

Sub-Clause 72.2 - Currency Proportions

The whole text following the word "shall," (fifth line) shall be deleted and substituted by: "be as stated in the Appendix to Tender."

After Clause 72.3 - Currencies of Payment for Provisional Sums

The following Clauses shall be added:

"Clause 73.1 - Bribery and Agreements to Restrain Competition

If the Contractor or any of his sub-contractors, agents, or servants offer to give or agree to or give to any person any bribe, gift, gratuity, or commission as an inducement or reward for doing or forbearing to do any action in relation to the Contract or any other contract with the Employer or for showing or forbearing to show favour or disfavour to any person in relation to the Contract or any other contract with the Employer, then the Employer may enter upon the Site and the Works and terminate the employment of the Contractor and the provisions of Clause 63 thereof shall apply as if such entry and termination had been made pursuant to that clause. The same shall apply if the Contractor has taken part in agreements to restrain competition in order to obtain the contract or if he has made incorrect statements in the Tender Documents."

Clause 74.1 - Details to be Confidential

The Contractor shall treat the details of this Contract as private and confidential, save in so far as may be necessary for the purpose thereof, and shall not publish or disclose the same or any particulars thereof in any trade or technical paper or elsewhere without the prior consent in writing of the Employer. If any dispute arises as to the necessity of any publication or disclosure for the purpose of the Contract the same shall be referred to the decision of the Employer whose award shall be final."

Clause 75.1 - Joint and Several Liability

If the Contractor is represented by a joint venture of two or more persons, all such persons shall be jointly and severally bound to the Employer for the fulfilment of the terms of the Contract and shall designate one of such persons to act as leader with the authority to bind the joint venture. The composition or the constitution of the joint venture shall not be altered without the prior written consent of the Employer."

Clause 76.1 - Invalidity

The invalidity of one or several provisions of the Contract shall not affect the validity of the remaining provisions. Invalid provisions shall be substituted by such provisions as are closest to the economic purpose aimed at by both contracting parties.”

10. Glossary

Backstopping

Accompanying professional and technical support.

Cash for Work

Remuneration for work (minimum wage level), in order to strengthen the buying power of many households. It is closely linked to “food-for-work”, an instrument of food security with the aim of alleviating acute nutritional deficits, mobilising self-help and enhancing nutritional support activities. It is frequently applied in integrated food security programmes (IFSP), which, depending on the situation, can be a combination of food- and cash-for-work, operational inputs-for-work and equipment-for-work, as well as foodstuffs for participating in training programmes (food-for-training).

Conflicts

Conflicts are a common component of world politics, as well as of the politics within communities and states. They result from real or supposed contrasting interests. When two or more actors actively propagate their contradicting interests a conflict develops. Conflicts are usually local or regional, and rarely affect an entire country.

Conflict management

is the attempt to influence the course of a conflict by regulation, prevention of violence and finding a means of settlement. It aims at bringing about constructive solutions from which all parties can benefit.

Contract for construction works on measurement basis

A contract based on specifications of building works subdivided into individual works with agreed unit prices. Accounts are settled according to actual measurements and quantities of the materials used and work accomplished (in contrast to a lump sum contract).

Crisis prevention

incorporates early, planned, systematic and coherent action at different levels of state and society in order to prevent violent conflicts. Activities conceived to prevent crises aim to reduce the potential for increased violence, before, during or after a violent conflict, and to promote the development of institutions, structures and “cultures” to settle disputes with peaceful means.

Development-oriented emergency aid

Development-oriented emergency aid (DEA) encompasses all measures, initiatives and reactions to emergency situations in crises, conflicts and disasters and their prevention. The aim is to contribute to a reduction of the endangering and vulnerability of people - at household level, as well as regional and national levels - or to alleviate the effects of disasters: either by precautionary measures to avoid or by managing existing emergency situations.

Disaster

A disaster is an disruption in the normal functioning of a society, which leads to loss of human lives, property and environmental resources, and which exceeds the ability of the affected communities to cope using only its own resources. There are three types of disasters: man-made disasters (caused by technological failures), natural disasters and conflicts. They can occur suddenly, over a certain period of time, or exist permanently.

Disaster risk assessment

This means the recording of disaster risks (potential threat, including statistical frequency of hazards) in a given region over a given period of time. The aim is to assess the probability of occurrences, the estimation of potential losses (number of dead and injured, damage of property, interruption of economic activity) and a disaster alleviating information system and evaluation (e.g. demarcation of endangered areas, establishment of early warning systems).

Disaster risk management

Disaster risk management includes measures to avoid disasters and to reduce the effects of disasters.

FIDIC

The FIDIC selection of contracts and agreements contain internationally accepted contract conditions and guidelines for the execution of building works worldwide. They are published by "Fédération Internationale des Ingénieurs-Conseils (FIDIC)" in two parts. Part 1 contains the general conditions, while Part 2 is concerned with the special clauses of the project and therefore has to be adapted to the specific conditions of the project in question. Further information and order forms can be found in the Internet under "www.fidic.net".

Financial cooperation

Financial Cooperation (FC; formally known as "capital aid") is an instrument of bilateral development cooperation. Its task is to provide capital which will make better use of, or boost, the production potential of developing countries, including their economic and social infrastructure. Through FC, funds are made available to partner countries in the form of soft loans or non-repayable financial contributions. Emphasis is on investment, not on advisory services. Unlike TC, FC is thus a means of financing and not a direct contribution. The Kreditanstalt für Wiederaufbau (KfW) is responsible for handling German Financial Cooperation on behalf of the Federal German Government.

Financing agreement (GTZ)

Financing agreements are agreements based on international law to provide a project of a partner with non-repayable, tied contributions of the GTZ from funds of the Federal German Government. Financial contributions are not direct contributions. They are provided where there is a competent local executing agency which is in a position to assume full responsibility for the proper planning and implementation of the project. Construction work, for instance, is usually supported through financial contributions. To handle a financial contribution, the GTZ enters into a financing agreement with the partner.

General contractor

Unlike the non-commercial general contractor (NGC), the general contractor carries out considerable parts of the works with his own resources (e.g. in his capacity as building contractor, construction of the building carcass) and sub-contracts other works to third parties.

Housing development

The housing development referred to here is concerned with temporary buildings and settlements with technical services and social facilities of varying standards. Depending on the standard of finish, level of investment and regional plans, the aim should be to achieve a certain degree of sustainability, such that, when the buildings are dismantled, at least a part of the technical systems (sewage, water supply, power supply, roads, or parts of them) can be reused in the case of a new development.

Immediate relief

Relief measures, that are implemented directly after a disaster or war, are called immediate relief. This immediate relief serves to ensure the instantaneous survival of the affected population.

Involvement/Participation

In development cooperation the term “participation” refers to the process, in which various actors share and negotiate control over development initiatives, and the decisions and resources associated with them. Participation as a management principle is based on the now widely acknowledged insight that processes of change are all the more successful, the more intensively the actors are appropriately involved in the design of project objectives and measures. Depending on the project type and phase, different degrees of participation may be appropriate.

Lump sum contract

A fixed price (or lump sum) is based on specifications of services to be rendered, for which a “fixed” price, i.e. an unalterable price, has been agreed. The “fixed” price necessitates a precise description of services and/or plans and drawings of a building project, which may be deviated from only marginally during execution. In the case of major deviations the additional costs have to be negotiated, or new services have to be paid for.

Non-commercial general contractor (NGC)

The NGC or implementing consultant “takes over” the responsibility for achieving the objectives of a project and is answerable to the financing agency for the services as a whole. He is less concerned with “undertaking” the professional implementation himself, but instead sub-contracts these services to professionals of the local or international building industry.

Nucleus model

In the case of a nucleus model, only the central core of a house, or only the main and essential rooms, installations and building components are constructed or repaired. All the rest is carried out by the owner at his/her own cost.

Ownership

The term “ownership” is used in today’s development policy debate to designate identification with the project, along with the motivation to assume responsibility for development initiatives and processes of change. It is also used to remind people of the subsidiarity of external support. Today, ownership in the above sense is considered an important precondition for the efficiency and sustainability of development processes, and in TC is one of the key quality indicators. It should be ensured that “ownership” exists, or is achieved in the course of a project, both within the partner organisation(s) and among the target groups and their institutions.

Project executing organisation

The project executing organisation is the legal entity responsible for human resources, financial and technical aspects of implementing a TC-supported project in the partner country. It may be state-run, parastatal or non-governmental. A project may imply cooperation with several project executing agencies, each with clearly defined responsibilities for specific components of implementation (responsibility for implementation) which do not overlap. In some cases the project executing organisation can engage third parties (private companies, institutions, groups or individuals) to provide the services agreed upon.

Project management

Action and responsibility for a technically and commercially/economically immaculate execution and accounting of a (building) project.

Rapid assessment

Investigations of one or more experts on location to determine the possibility of implementation and conception of a project from a technical point of view, taking into consideration the different requirements of the parties involved, and estimation of the time frame and costs.

Rehabilitation and reconstruction

The term rehabilitation includes measures that are taken up after a disaster, quite often directly after a phase of humanitarian aid and before the period of reconstruction, in order to restore existential social functions, which are needed to provide the basis for the ensurance of survival of the people with their own human and material resources.

Reconstruction leads to the complete restoration of a functioning society, economy and environment. In the process, the aim should be to regain the quality of life, or even exceed it, in comparison to the living conditions before the disaster. This should happen with regard to preventive measures against future risk situations.

Self-help

Self-help means people endeavouring to achieve goals through their own efforts. It is an individual or collective response to objective emergencies, or to situations perceived to be unsatisfactory, which people seek to overcome by sustainably improving their living conditions and increasing their self-reliance. Self-help efforts can involve changing a material situation or influencing political and social framework conditions. Help towards self-help is characterised by the following principles:

- The beneficiaries' own efforts are not substituted and the promoted individuals and groups are not exonorated from responsibility.

- Existing initiatives are strengthened; external promotion may not go beyond providing initial stimulus.

- The participation of affected persons and groups in all decision-making within the scope of the cooperation is a necessary precondition.

- Promotion is geared primarily to groups.

- The decision as to what constitutes the maximum possible self-help and the minimum necessary external support is the subject of dialogue with the beneficiary individuals or groups. In emergencies, it is displaced in favour of external aid, such that the proportion of self-help is reduced accordingly.

Significance

Does the project generate broad-based sectoral and/or regional impacts, can it be used as a model, and is it replicable in other sectors or countries? Does it contribute to institution-building and/or institutional development of the relevant sub-systems? The opposite of significant projects are so-called "island" projects, i.e. isolated projects which do not impact significantly on their wider environment.

Sustainability

This denotes a balance between the needs of the present generation and the living perspectives of future generations. With reference to projects, it describes the extent to which the partner organisations and target groups are willing and able to self-reliantly continue and further develop the innovations effected by the project. As a decisive quality criterion, sustainability presupposes in particular that

- the partner organisations designated to implement the project have the required qualifications,
- the effects of the project correspond with the needs of the target group,
- the services expected from the partners lie within their capabilities and
- the implementation is also justified under economic aspects.

Technical cooperation

The goal of technical cooperation is to enable people and organisations in partner countries to improve their living conditions on their own responsibility and through their own efforts. To this end, technical, economic and organisational skills and expertise are transferred within the scope of TC. Technical cooperation projects are implemented free of charge.

VOB - German contracting rules for award of public works contracts

The VOB is published by DIN (German Standards Institute) on behalf of the German Committee for the Award of Public Works Contracts. It comprises three parts:

- VOB Part A: General conditions for the award of contracts for building works;
- VOB Part B: General contract conditions for the execution of building works. These are general terms of business, which supplement the works contract law of the BGB (German Civil Code) with the necessary conditions specific to building works;
- VOB Part C: General technical contract conditions for building works.

Vulnerability

The vulnerability of a society is determined by such circumstances and influencing factors, that cause the existing resources and potentials of societies, population groups and individuals to be inadequate for the solution of problem situations by their own means, thus making them unable to prevent the occurrence of a disaster. The degree of vulnerability determines the degree of damage that results from a disaster. The basic cause of vulnerability can lie in socio-economic, political and ecological instability, or a combination of these factors.

Warranty

is the guarantee for a faultlessly executed piece of work continuously over a fixed period of time. In the case of building measures in emergencies, the warranty period should, depending on the situation, cover at least one year, or better still two years. In Germany it has recently been extended to 5 years for building projects.

This manual was first published in Spanish within the context of the research and development project "Viviendas sismorresistentes en zonas rurales de los Andes", supported by the German organizations Deutsche Forschungsgemeinschaft, Bonn (DFG), and Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) GmbH, Eschborn (gtz). It also comprises the results of former research projects of the "Forschungslabor für Experimentelles Bauen" (Building Research Laboratory, University of Kassel, Germany), directed by the author and sponsored by gtz, DAAD and the University of Kassel.
The layout and computer drawings were prepared by Friedemann Mahlke, the freehand sketches by Vera Frey.

Kassel, December 2001
Gernot Minke

Introduction

The solutions proposed in this manual concentrate on low-cost single-story houses, built from earth in rural areas of earthquake-prone zones. They are based on research projects carried out at the Forschungslabor für Experimentelles Bauen (Building Research Laboratory) of the University of Kassel, Germany, on the analysis of earthquake damage in Latin America, on studying relevant literature and on the implementation of several test structures in Germany and prototype houses in Guatemala, Ecuador and Chile.

Using locally available building materials as well as the skills of local craftsmen should be considered for the design of seismic-resistant (earthquake-proof) houses and it should be proved that the solutions are accepted by the users.

Earth as a building material has lost its credibility mainly because of the fact that most modern houses with earth walls could not withstand earthquakes, and also since earth is considered as the building material for the poor. In this context it is worth mentioning that a census conducted by the Salvadorian Government after the earthquake in January and February 2001 states that adobe houses were not worse affected than other houses.

In many areas of the Andes regions building with adobe (unburned, unstabilized handmade soil blocks) is forbidden nowadays. Nevertheless, the majority of the rural population still builds with this building material, as it cannot afford to build with bricks or concrete blocks.

When designing low-cost houses for rural areas it should be taken into account that structural failures as a consequence of an earthquake have to be avoided, whereas minor damage like small cracks must be tolerated if it can be easily restored.

For more information about the different building techniques with earth, the physical and structural characteristics of earth and the possibilities of improving them, reference is made to the "Earth Construction Handbook" by the author, published at WIT Press, Southampton, UK 2000, or to the "Manual de Construcción en Tierra", publicadora Nordan, Montevideo, Uruguay 2001.

1. General aspects of earthquakes

1.1 Location, magnitude, intensity

An earthquake is produced either by movement of tectonic plates or by volcanic activity. The areas of the world that are most earthquake-prone are shown in Fig. 1-1. Earthquakes of intensity 8 on the Richter scale have been recorded in Asia and of up to 8.7 in the Andes . Nearly a hundred earthquakes of intensity higher than 6 and twenty of intensity higher than 7 on the Richter scale are recorded annually. Several thousand people are affected by earthquakes every year.

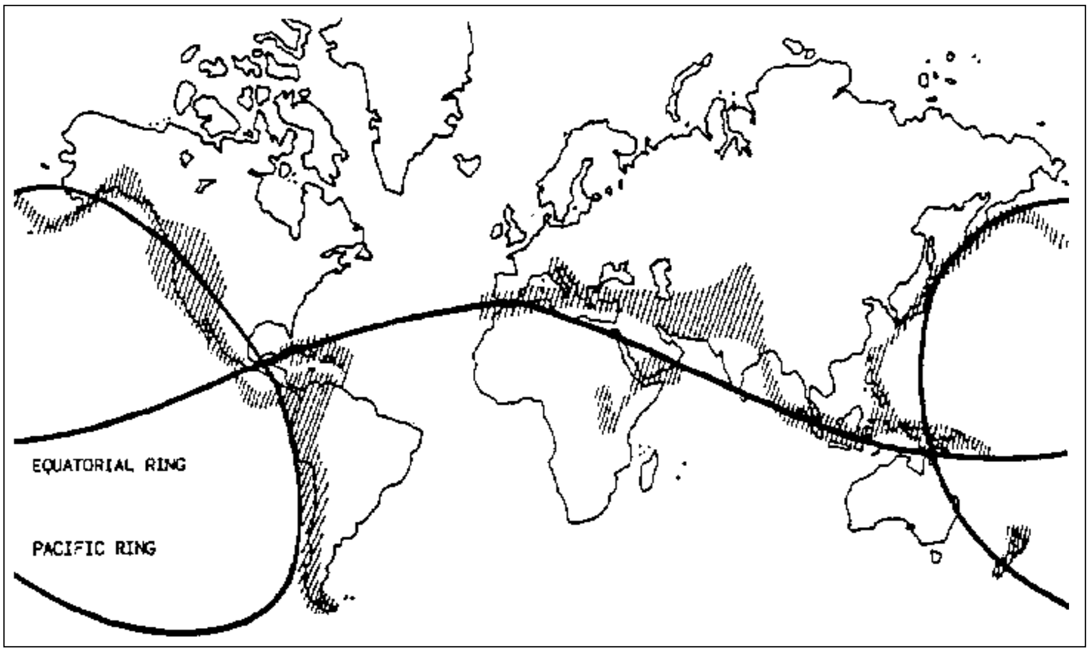
The magnitude (M) of an earthquake usually is measured on the Richter scale, which is logarithmic with an open end. It is a measure of the energy produced in the epicenter, the place where the earthquake is generated. The Mescali scale, on the other hand, is divided into 12 grades and indicates the intensity of the local impact.

The local impacts on a structure depend not only by the magnitude of the earthquake, but also on the depth of and distance from the epicenter, the geology and topography, the kind of local soil and last but not least on the duration, frequency and acceleration of the impacts.

1.2 Structural aspects

Structures are mainly affected by the horizontal forces created by the earthquake. The vertical forces are usually less than 50% of the horizontal ones.
The main danger due to horizontal movements of the earth is that the walls of buildings might fall outwards and consequently the roofs collapse. The main aim of building earthquake-resistant houses, therefore, is to avoid walls being able to fall outwards and to ensure that the roofs are fixed well to the walls, or even better that they stand on a system of posts separated from the wall, so that the roof system and the walls can swing independently due to their differing frequency.

With a "medium" earthquake the following measures have to be taken into account:
horizontal deformation: h = 0.1 to 0.3 m
horizontal velocity: v = 0.1 to 0.3 m/s
horizontal acceleration: a = 0.1 to 0.3 m/s^2 = 0.15 to 0.30 g
A horizontal acceleration of 0.3 g means that 30% of the dead load of the structural elements acts as horizontal force against the structure ("equivalent force"). Usually simple structures are calculated by the method of "equivalent



1-1
Earthquake zones (Houben, Guillaud 1984)

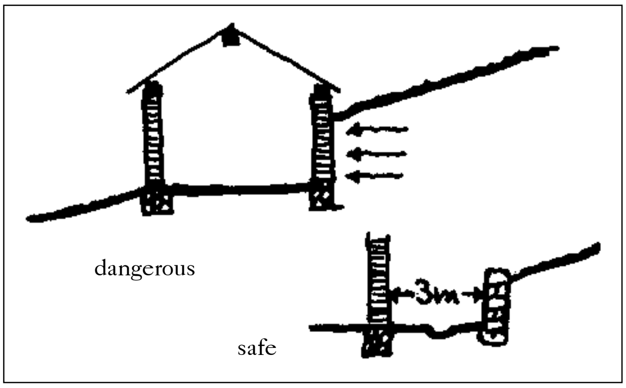
force", in which the horizontal impact is taken as a static force and not as a dynamic one.
However, the higher the ductility, the capacity for deformation without structural failure, the lower the equivalent force is and the lower the structural resistance must be.

The quality of an earthquake-resistant structure can be expressed in the formula

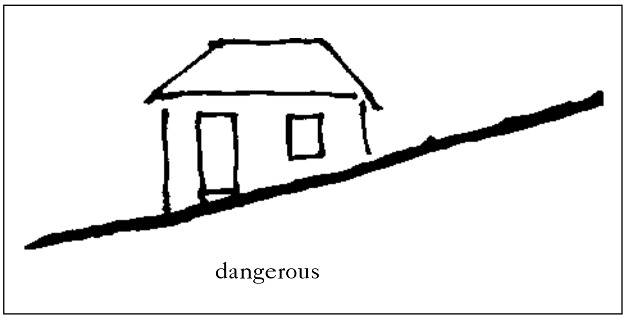
structural quality = resistance x ductility

This means the lower the resistance of the structure is, the higher the flexibility must be, and the higher the flexibility is, the lower the resistance must be (Grohmann, 1998).

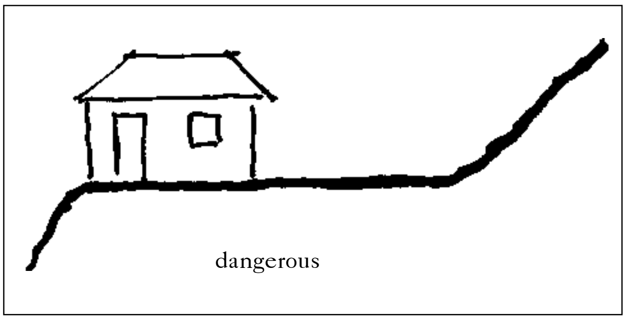
The historical rammed earth houses with walls of 60 to 100 cm thick had enough resistance to withstand earthquakes and did not need to be flexible. For instance in Mendoza, Argentina, these houses withstood all earthquakes of the last centuries, whereas all modern buildings built of adobe or bricks collapsed. However, these structures are not economic nowadays. Economic solutions have less rigidity, therefore they must allow deformation during seismic shocks without collapse.



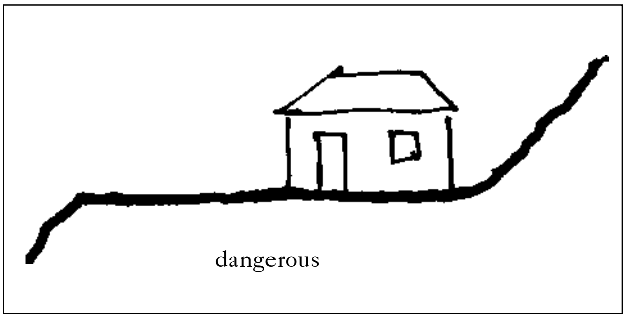
2-1



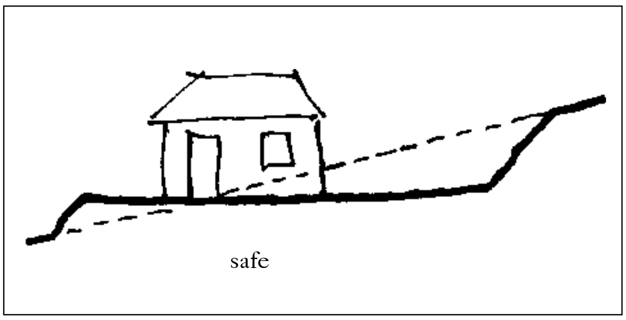
2-2



2-3



2-4



2-5

2-1 to 2-5 Location of a house on the slope

2. Placement of house in the case of slopes

In earthquake-prone areas, where the site is inclined, the following rules must be taken into account:

a) The house should not be cut into the slope, as the adjacent wall might collapse due to the horizontal forces of the earth, see Fig. 2-1
b) The house should not stand on the slope as it might slip down
c) The house should not stand near steep slopes as it might collapse due to falling rocks or earth avalanches, see Figs. 2-3 and 2-4
d) If a slope is given, a platform has to be formed and the house has to be placed at sufficient distance from the slopes, see Fig. 2-5
e) It is recommended that massive and heavy houses stand on soft sandy soils, whereas light flexible structures can stand on rocky soils.
f) Different floor levels should be avoided.

If it is necessary, the rooms should be separated.

3. Shape of plan

The shape of the plan of the house might have an important influence on its stability. The following rules must be considered:

a) The more compact a plan, the better the stability. This means a square plan is better than a rectangular one, and a circle is better than a square.
b) L-shaped plans are less stable. The best solution in this case is to separate the elements as shown in Fig. 3-2.

At the University of Kassel a simple test method was developed within a doctorate thesis in order to show the influence of the wall shape on resistance to seismic shocks. A weight of 40 kg at the end of a 5.5 m long pendulum was dropped against the models, see Fig. 3-3. The rammed earth house with square plan showed the first large cracks after the second stroke, see Fig. 3-4. After three strokes one part of the wall separated, see Fig. 3-5, and after four strokes the house collapsed, see Fig. 3-6. The rammed earth house with circular plan, however, showed the first cracks only after three strokes, see Fig. 3-7, and only after six strokes did one small part of the wall separate, see Fig. 3-8 (Yazdani, 1985). Syed Sibtain built several houses in Afghanistan utilizing convex walls with buttresses, which give good stability similar to that of circular walls, see Fig. 3-9 (Sibtain, 1982). But the problem with all wall structures is that the openings weaken their stability. Therefore, openings must be carefully designed and often require additional reinforcement.

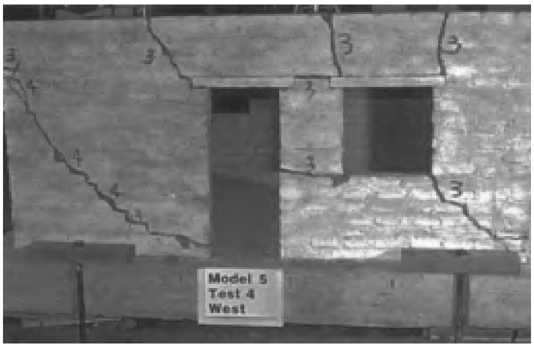
4. Typical failures, typical design mistakes

Typical failures which occurred with simulated seismic movements on models in the scale of 1:5 are to be seen in Figs. 4-1 to 4-3. The most significant are:

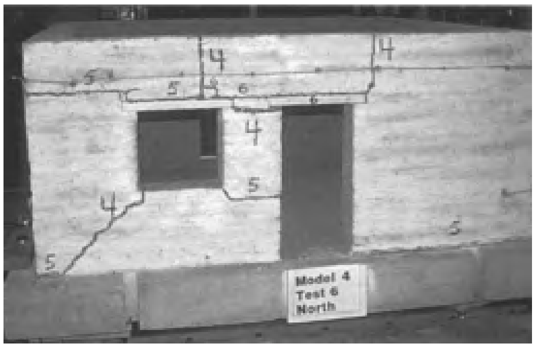
- diagonal cracks lead from the edges of windows to the bottom of the wall,
- the lintel often destabilizes the walls, especially if it is not long enough and does not have sufficient bond with the wall,
- if the wall between window and door or between opening and corner is not long enough, it might break,
- if the wall has no ring beam at the top it breaks easily when suffering perpendicular loads which produce bending.

The houses shown in Fig. 4-4 seem to be well designed with the stabilizing buttresses at the corner. But without a ring beam they do not have sufficient stability against seismic shocks, as Fig. 4-5 and 4-6 show.

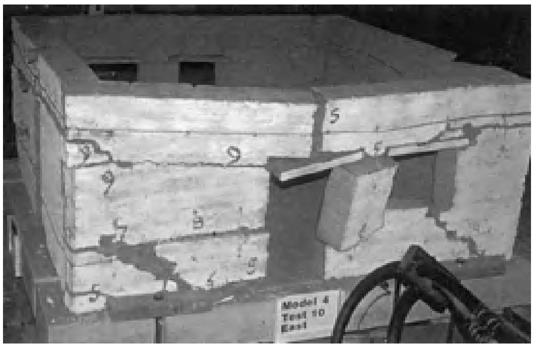
The 10 main structural mistakes which might lead to a collapse within an earthquake are explained in Fig. 4-7.



4-1



4-2



4-3

4-4 Earthquake-proof houses, Afghanistan (Sibtain 1982)

4-5 and 4-6 Models of the house in Fig. 4-4 after seismic movements (Sibtain, 1982)

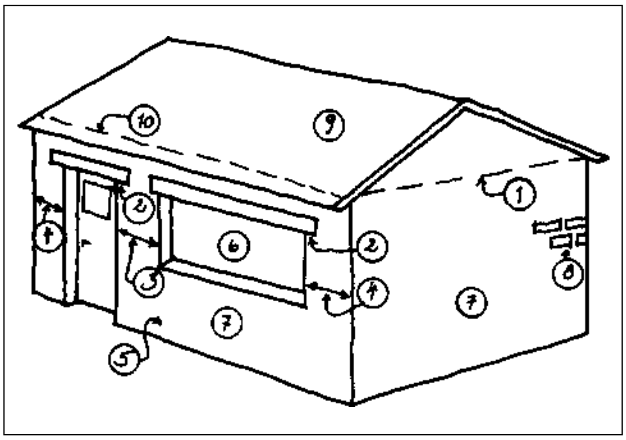
5. Structural design aspects

There are three general principles for designing an earthquake-resistant structure:

1. Walls and roof are well interconnected and so rigid that no deformation occurs in the earthquake.
2. Walls are flexible enough, so that the kinetic energy of the earthquake is absorbed by deformation. In this case a ring beam, which is able to take bending forces, is necessary and the joints between wall and ring beam and ring beam and roof must be strong enough.
3. The walls are designed as mentioned in case 2, but the roof is fixed to columns separated from the wall, so that both structural systems can move independently as they have different frequencies.

Case 1 can be a house with very thick rammed earth wall or a reinforced concrete frame structure with moment-stiff corners at the top and at the bottom, and infills of bricks, cement blocks or adobes.

A variation of a nonflexible structure is a timber frame structure which has less moment-stiff corners and is therefore stabilized by crossing diagonals of steel. In this case the danger exists that the connection of the diagonal or the elements itself may not be strong enough to withstand the concentration of stresses at the corner and breaks, causing the collapse of the wall, see Fig. 5-1.

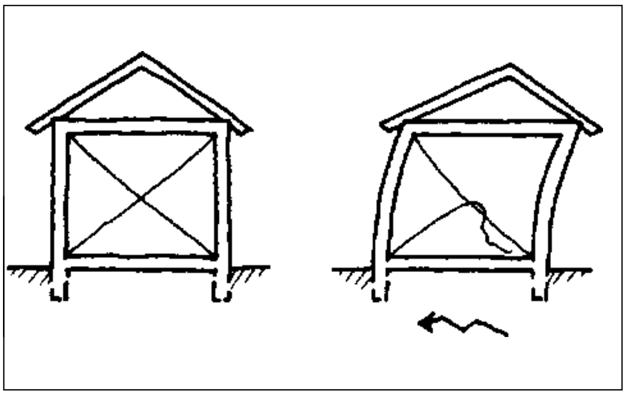


4-7 Typical design mistakes which might lead to the collapse of the house

1. Ring beam is lacking.
2. Lintels do not reach deeply enough into masonry.
3. The distance between door and window is too small.
4. The distance between openings and wall corner is too small.
5. Plinth is lacking.
6. The window is too wide in proportion to its height.
7. The wall is too thin in relation to its height.
8. The quality of the mortar is too poor, the vertical joints are not totally filled, the horizontal joints are too thick (more than 15 mm).
9. The roof is too heavy.
10. The roof is not sufficiently fixed to the wall.

The systems of case 2 and 3 can be built without concrete and steel and in most regions are much more economic. Walls built with the system of "wattle and daub" (in Spanish: "bahareque" or "quincha") show extreme flexibility. Fig. 5-2 shows a house which suffered under a heavy earthquake in Guatemala, but did not collapse.

As the vertical forces created by the earthquake are less important, we have to decide how the walls withstand the horizontal forces. There are two types of impacts to be considered: those forces, which act parallel to the wall and those which act perpendicular to it. (Forces acting at an inclined angle to the wall can be divided into two components, one parallel and one perpendicular to the wall.)
The perpendicular forces create a moment which might provoke a collapse of the wall if it is not stabilized by intermediate walls, buttresses and ring beams. If the walls are very thin and high, they might collapse even though stabilized, due to the bending forces that create buckling. The parallel forces are less dangerous. They produce thrust within walls which in the case of adobe walls with poor mortar create the typical diagonal cracks, shown in Fig. 4-1 and 4-2.
The most dangerous effects result when the walls fall outwards and the roofs collapse. Therefore the safest solution is to place the roof on a separate structure independent of the walls, see chapter 12.
When designing earthquake-resistant houses, we must consider that the horizontal force ("equivalent force") to be calculated is proportional to the mass of the structure and the higher the walls, the higher their displacement.

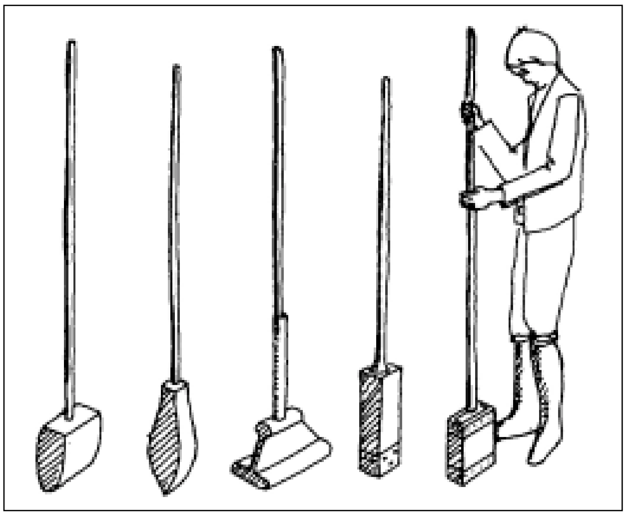


5-1

5-2 Wattle and daub structure, after a heavy earthquake in Guatemala (Minke 2000)

6. Rammed earth walls

6.1 General



6-1 Manual tempers
(Minke 2001)

6-2 Temper with two «heads», used in Ecuador
(Minke 2001)

In the rammed earth technique moist earth is poured into a formwork in layers 10 to 15 cm thick and compacted by ramming. The formwork consists of two parallel panels, separated and interconnected by spacers, see Fig. 6-1. By comparison with adobe masonry, rammed earth walls provide more stability as they are monolithic.

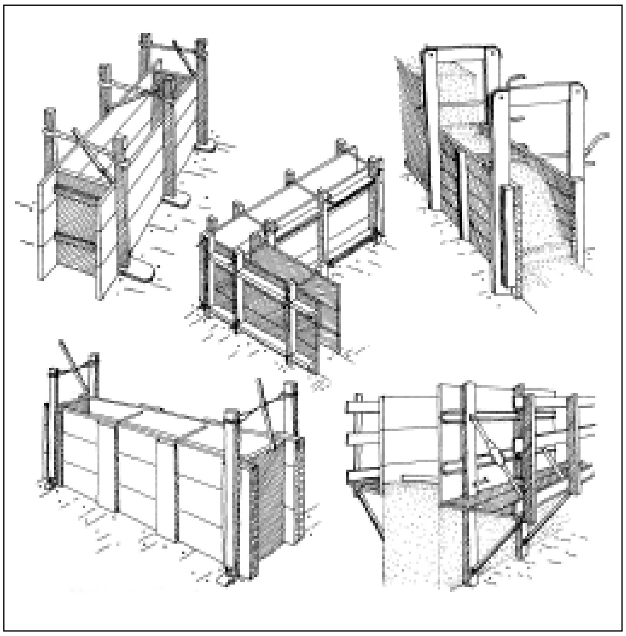
Traditional techniques use formwork with big wooden spacers, which cause openings and weak parts and often show horizontal shrinkage cracks between the layers, as the fresh layer on top of the old one shows larger shrinkage.

To avoid both disadvantages a special formwork was developed at the Building Research Laboratory (FEB), University of Kassel, which is spaced only at the bottom by a very thin steel bar and on the top above the wall, see Fig. 6-4.

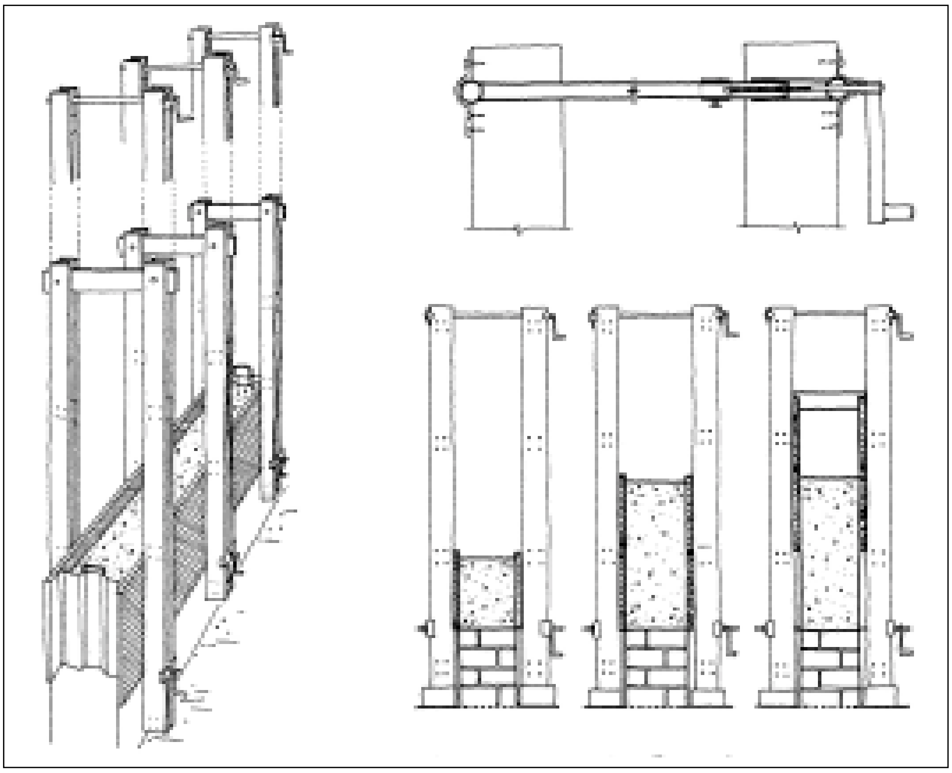
Traditional techniques use manual tampers with conical or flat heads, see Fig. 6-1. Conical tampers give a better bond between the different earth layers, but need more time. It is preferable to use a tamper with two heads, one with a round surface and the other with a square surface, see Fig. 6-2. The square tamper has to be used at the borders of the formwork. Pneumatic tampers and stronger formwork, as used nowadays for instance in Australia, can reduce the labor input by the factor of 10. (For further details see: G. Minke: Earth Construction Handbook, WIT Southampton, UK 2000)

6.2 Stabilization through mass

Rammed earth walls 60 to 100 cm thick, which are not too high, can withstand horizontal seismic shocks without additional old age withstood all earthquakes, whereas newly constructed houses next to them collapsed, even when they were built with bricks and a concrete ring beam. As thick rammed earth walls are too labor-intensive and no longer affordable nowadays, new structural solutions have to be used, as set out in the following chapters



6-3 Formwork for rammed earth (Minke 2000)

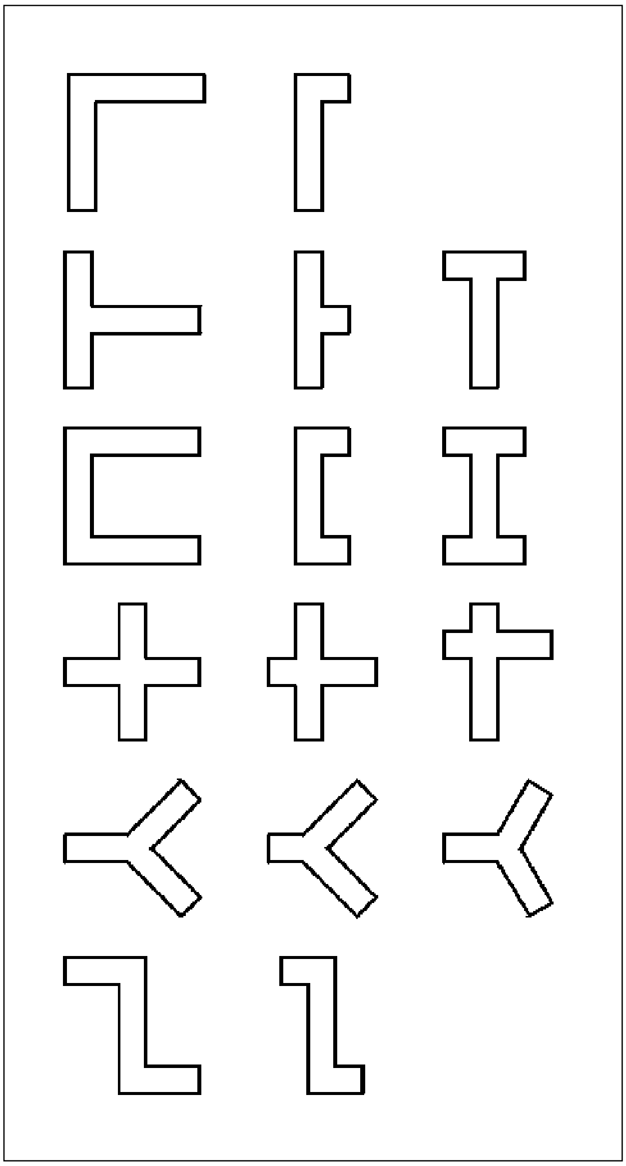


6-4 Climbing formwork (Minke 2000)

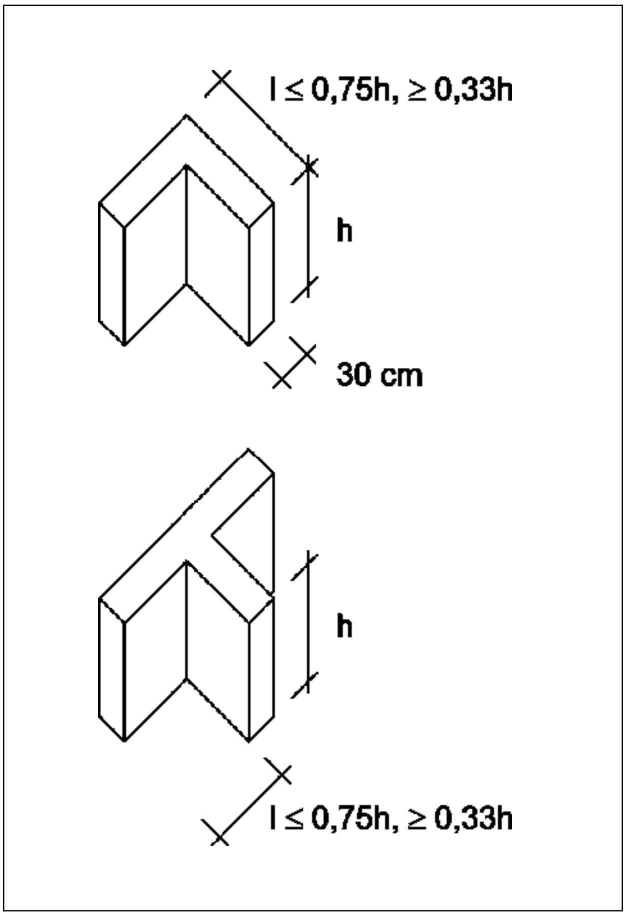
6.3 Stabilization through shape of elements

A simple solution for stabilizing rammed earth walls of lesser thickness is to use elements in the shape of L, T, U, X, Y or Z (Fig. 6-5). Due to their angles they show better stability against lateral forces. If the wall is 30 cm thick, the free ends of the elements should not be longer than 3/4 and not shorter than 1/3 of their height, see Fig. 6-6. This minimal length is necessary to transfer the loads diagonally to the plinth or foundation. If the free ends are longer than 3/4 of its height, they should be stabilized by another angle. If the angle is well fixed on the bottom to the plinth and on the top to a ring beam, it can be larger or higher. Nevertheless, the height should not be more than 8 times the width, see Fig. 6-7.

The forces perpendicular to the wall are transferred into the angle which is parallel to the direction of the force. This means it is transferred versus a moment which creates stress concentration at the inner corner of the angle.



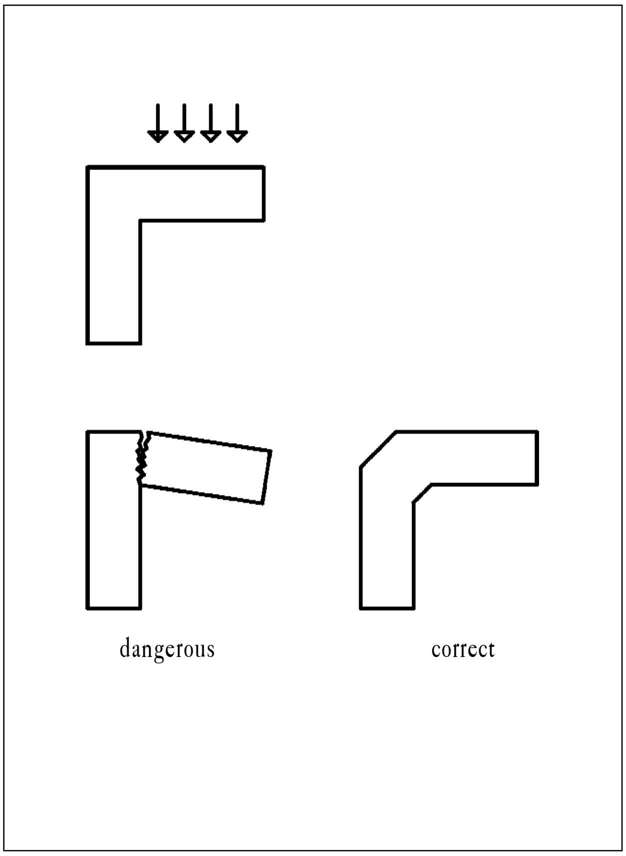
6-5 Wall elements stabilized by their shape



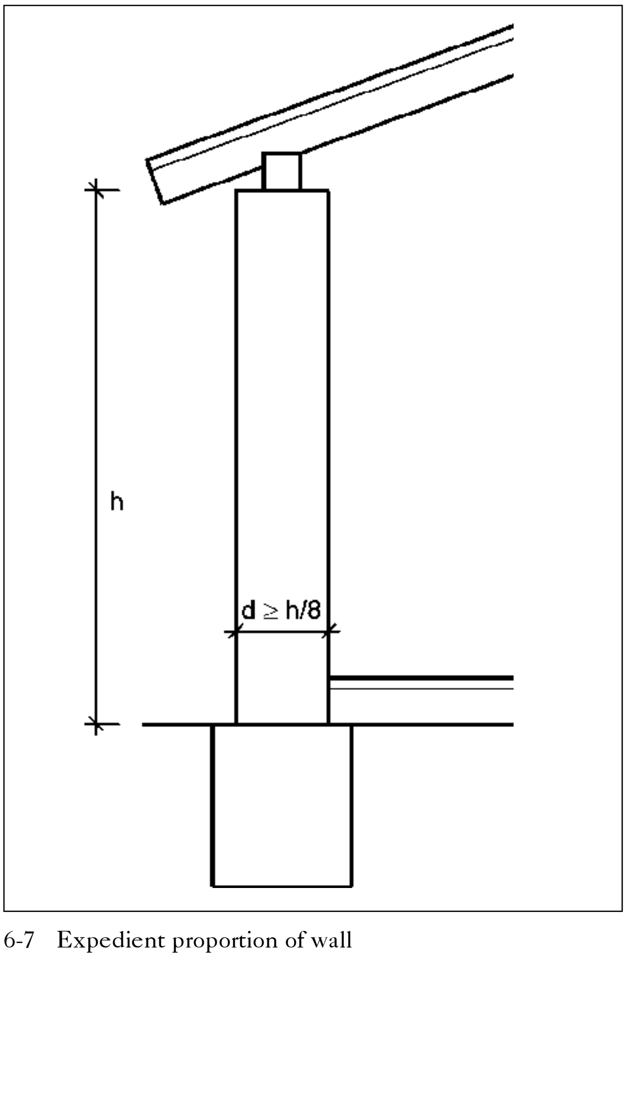
6-6 Recommended proportions

Therefore it is advisable to enlarge the section at this corner, shown in Figs. 6-8 and 6-9. Fig. 6-12 shows different proposals for plans utilizing angular elements.

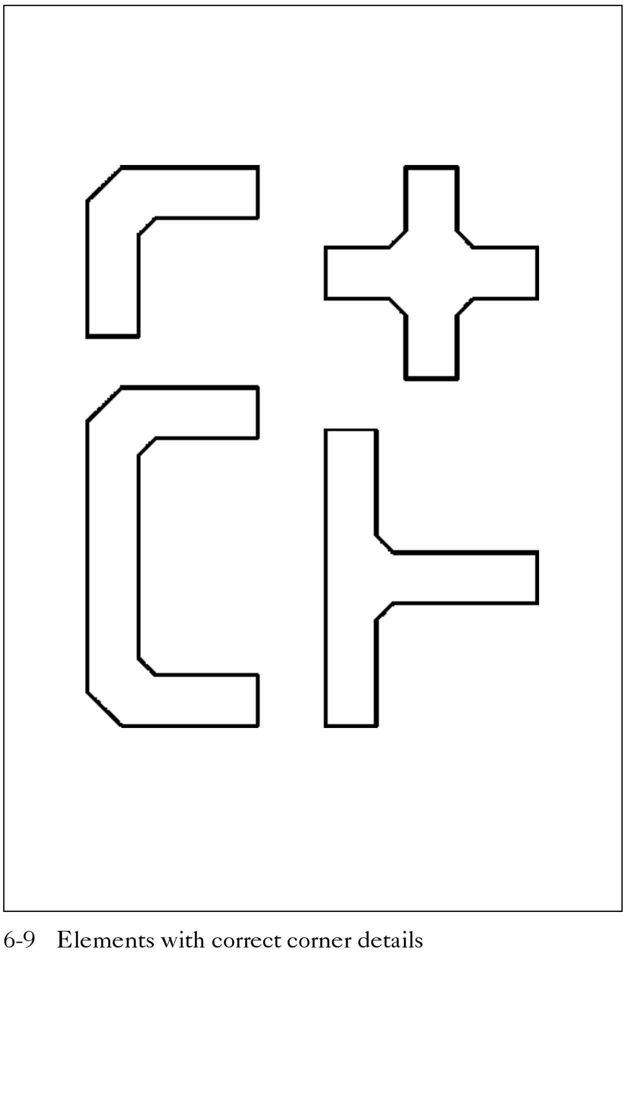
To improve lateral stability the joint of two elements should be formed with tongue and groove, see Fig. 6-10. However, in order to obtain a more flexible structure, elements with shorter length and no tongue and groove joint should be used (Fig. 6-11), if the elements are well linked to a ring beam above and to a plinth below. This kind of solution is used in the project described in chapter 6.4.



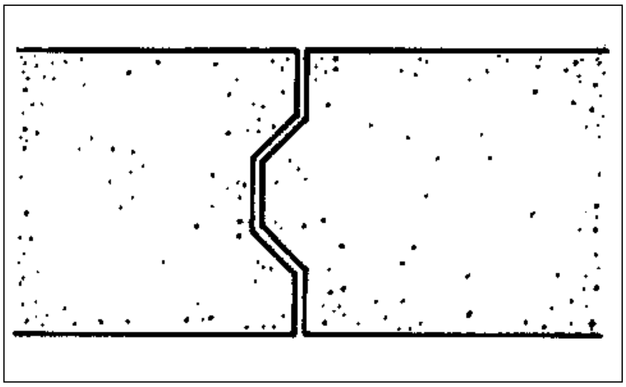
6-8 Corner solution



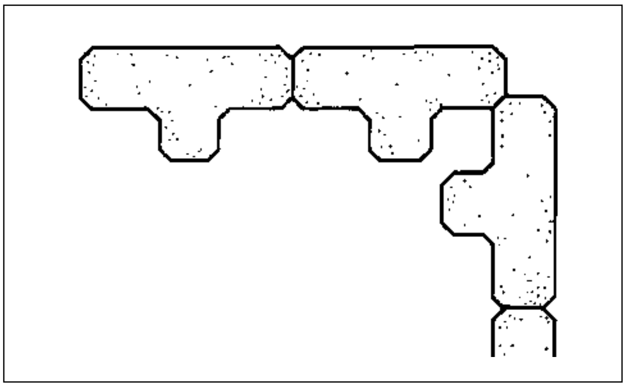
6-7 Expedient proportion of wall



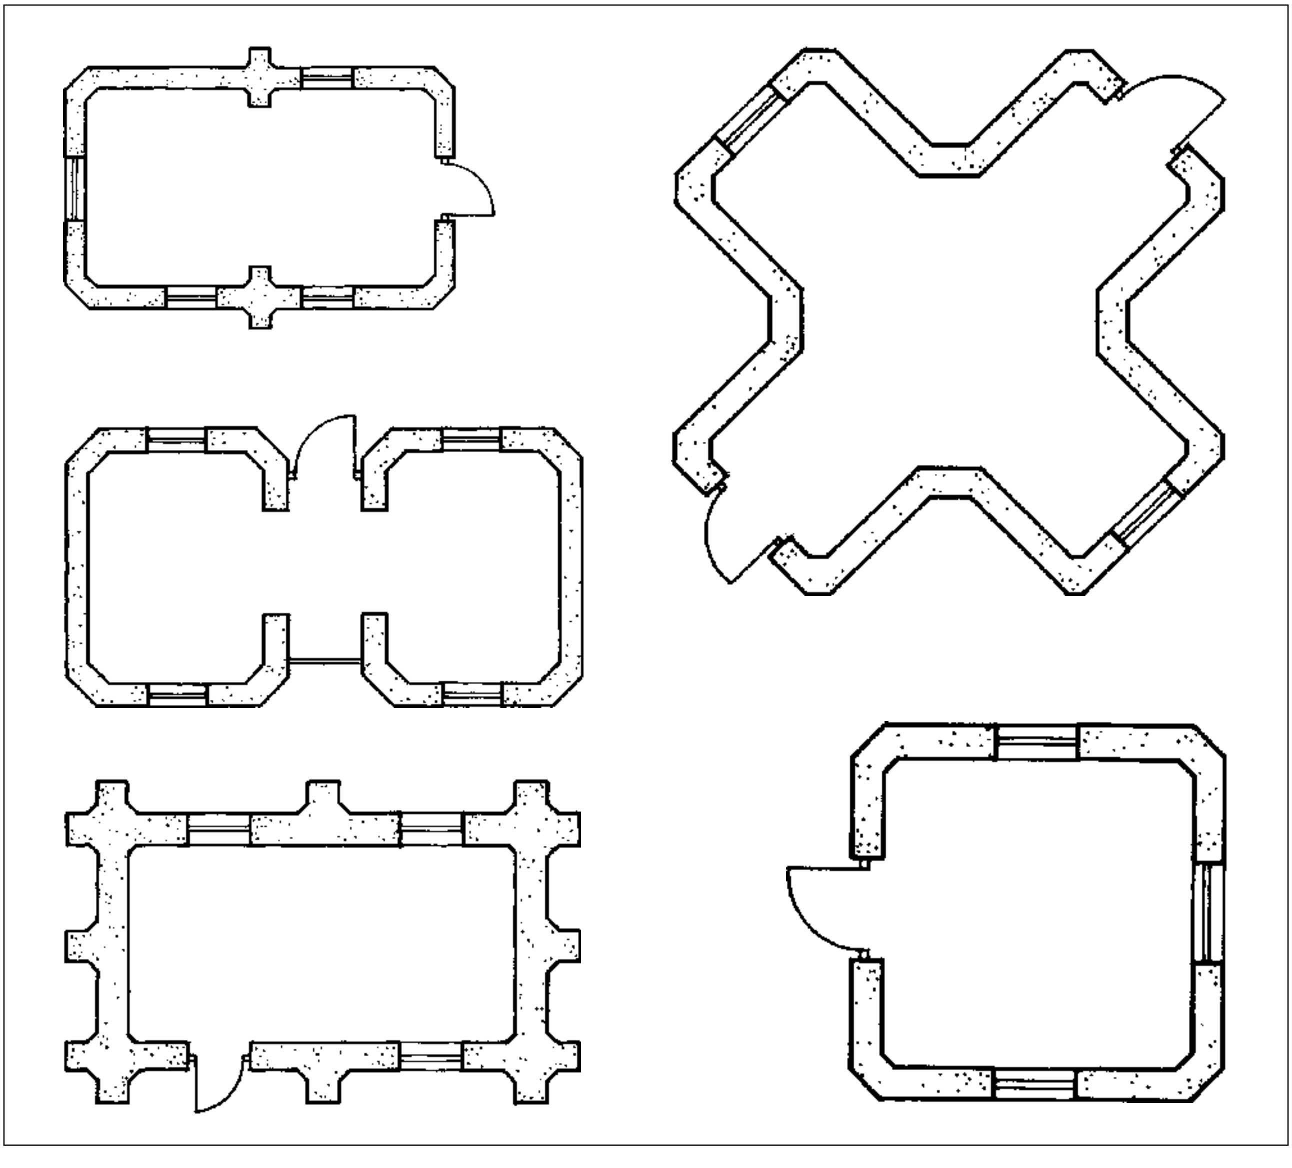
6-9 Elements with correct corner details



6-10 Joint with lateral stability



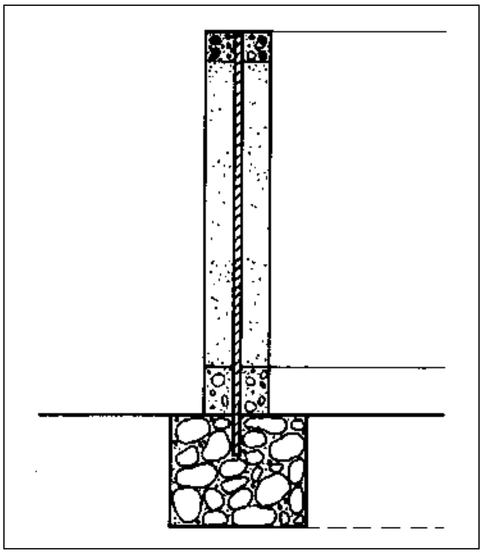
6-11



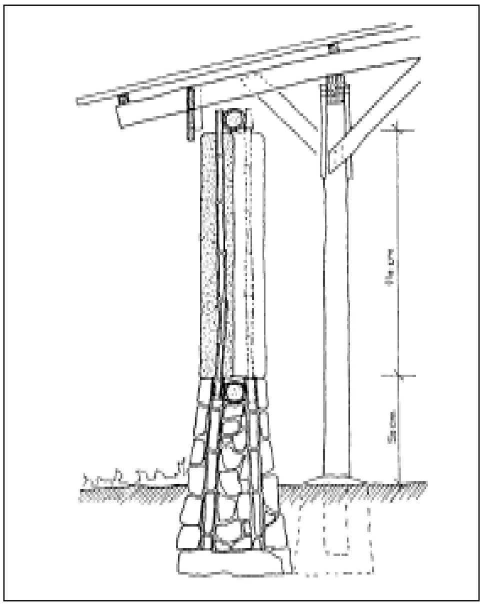
6-12 Proposals for simple plans utilizing angular elements

6.4 Internal reinforcement

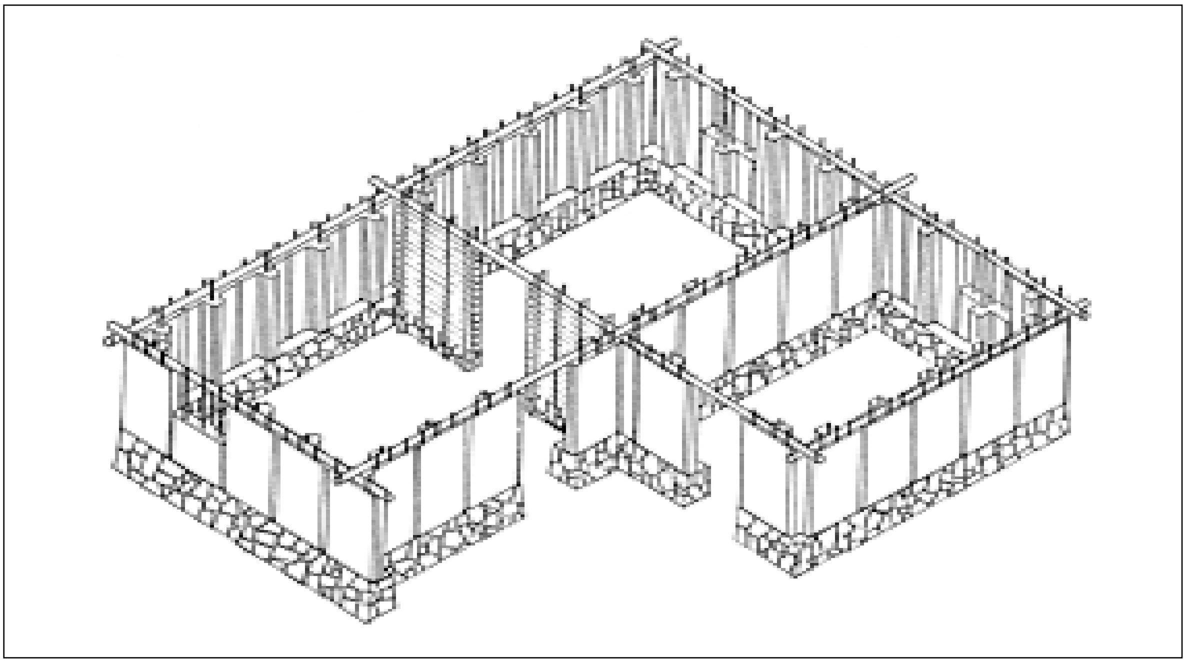
One method of stabilizing rammed earth walls against horizontal forces is to use vertical rods of bamboo or wood inside the wall. These elements should be fixed to the foundation below and to a ring beam above, see Fig. 6-13. Horizontal reinforcement elements usually weaken the structure and lead to horizontal cracks, as shear forces cannot be transferred by the rods, since the bond between these elements and the earth is very poor. Furthermore in practice it is difficult to ram the earth well underneath these elements, due to their elastic behavior when hit.
A new system utilizing bamboo as vertical reinforcement for element-type rammed earth walls was developed in 1978 at the FEB and successfully implemented together with the University Francisco Marroquin (UFM) and Centre of Appropriate Technology (CEMAT), both from Guatemala. The low-cost housing prototype built is depicted in Figs. 6-14 to 6-19. The wall elements were rammed in a metal T-shape form, 40 cm high, 80 cm large and 14 respectively 30 cm wide, see Figs. 6-16 and 6-19. The rib plays an important role in the stabilization of the element against horizontal forces, as it acts like a buttress. The elements are reinforced by 4 vertical bamboo rods of 2 to 3 cm diameter. The bamboo rods were fixed at the bottom to the horizontal bamboo ring beam and the stretched vertical rods of the plinth, see Fig. 6-14.



6-13

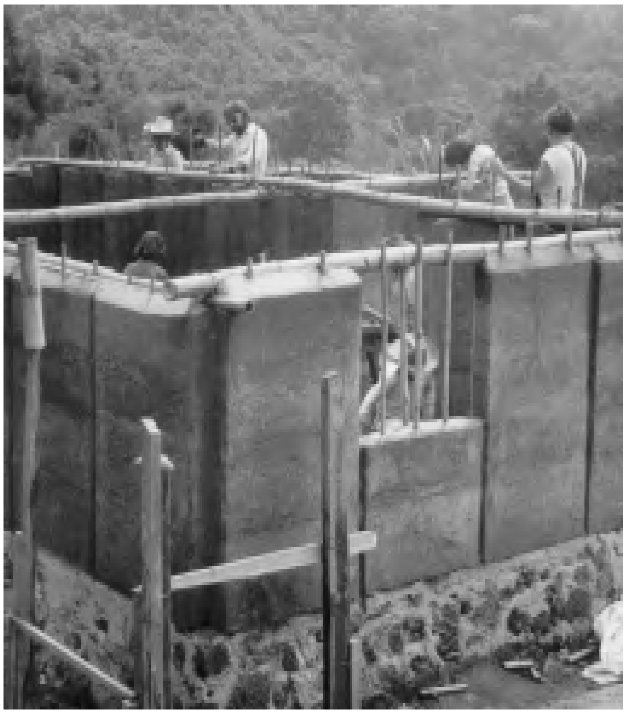


6-14



6-15

6-16

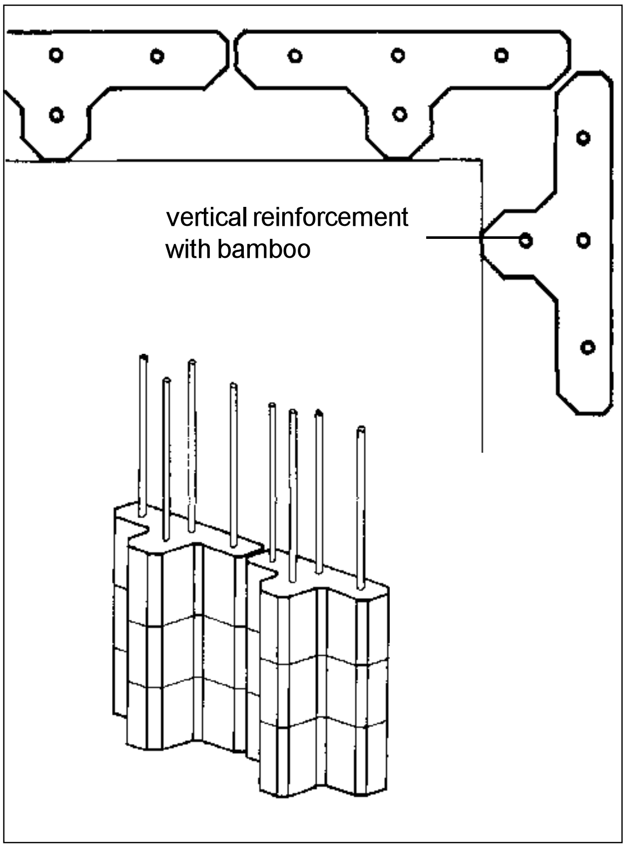


6-17

After drying vertical gaps of 1 to 2 cm appeared between the elements, which were then closed by earth. These vertical joints are predesigned rupture joints which can crack in an earthquake and allow independent movements of each element. So the kinetic energy of the seismic shock will be absorbed by deformation, but the element being fixed at the top and bottom will not fall. After the earthquake the open joints can easily be closed again with earth. Using this idea an earth wall system was developed, which is massive and flexible at the same time. The second new fact with this prototype structure was that the roof rests on posts standing 50 cm inside

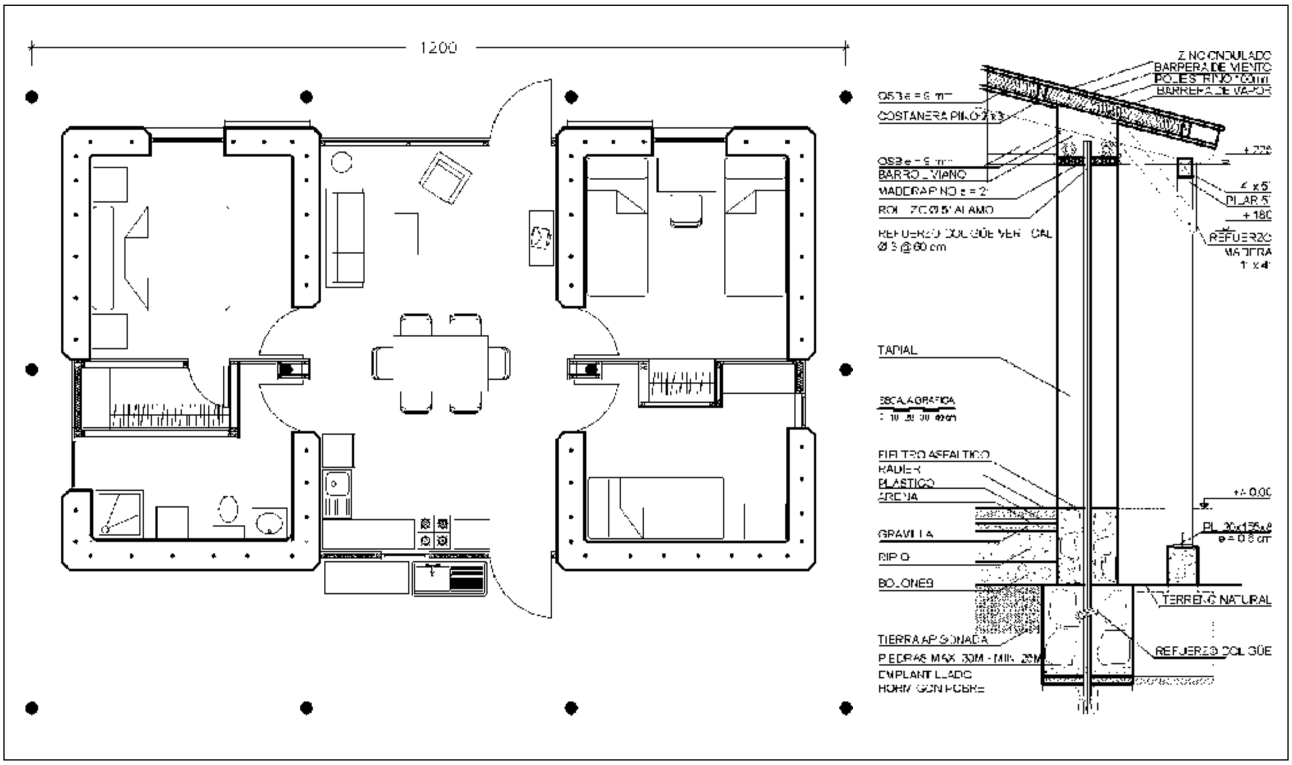
6-18

the walls, so that the roof and the walls can swing independently of each other within the earthquake.
In 1998 the FEB developed another reinforced rammed earth wall system which was utilized for a low-cost housing project built in cooperation with the University Santiago de Chile in 2001 in Alhué, Chile, see Figs. 6-20 and 6-21. Here too the idea was to separate the roof from the wall system and to use U-shape and L-shape elements, which stabilize themselves by their shape.
The corners of the angular elements were cut under 45 degrees in order to increase their strength as described in chapter 6.3. To obtain additional stabilization they were reinforced by vertical rods of colligue (similar to bamboo), 3 to 5 cm in diameter. Furthermore, the wall elements were always separated by light, flexible elements, or doors and windows. The lower parts of the windows and the parts above the doors were not built with massive elements, but instead of light timber elements. The gables were built in lightweight straw-loam stabilized by wooden elements, similar to the wattle and daub system.



6-19

6-14 to 6-19 Earthquake resistant low-cost housing project, Guatemala (Minke 2001)



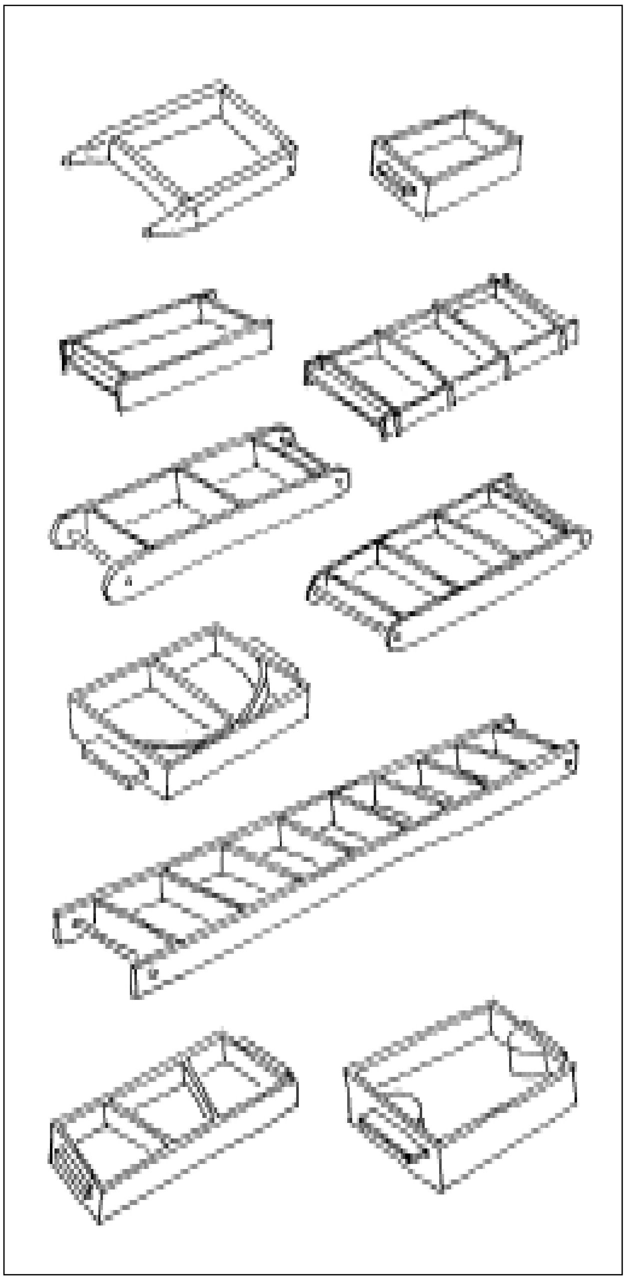
6-20 and 6-21 Earthquake resistant prototype building, Alhué, Chile 2001

7. Adobe walls

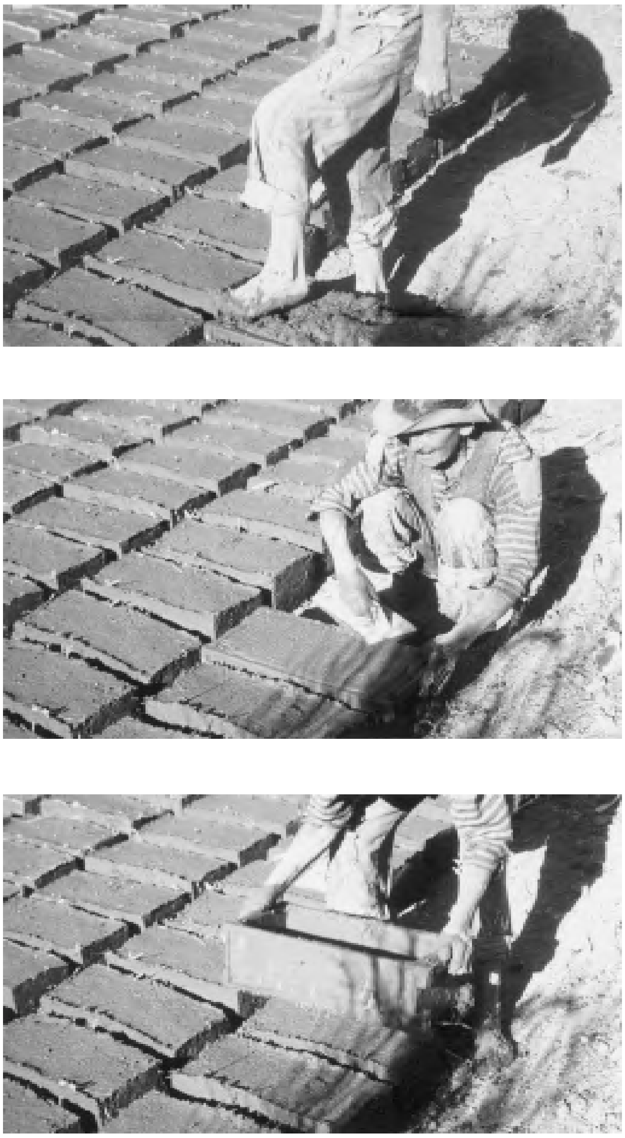
7.1 General

Blocks of earth produced manually by throwing wet earth into a formwork are called adobes, or mud bricks or sometimes sun-dried earth blocks. When moist earth is compacted in a manual or powered press, the compressed elements so formed are called soil blocks. Blocks produced by an extrusion process in a brick plant, are called green bricks in their unburnt state. Larger blocks compacted in a formwork by ramming are called rammed earth blocks.
There are many different shapes known all over the world. Fig. 7-1 shows some samples.

Different manually operated presses are known too. Fig. 7.3 shows one of the first, the widespread CINVA-Ram, and Fig. 7-4 the CETA-Ram, which can produce 3 smaller blocks at the same time. Blocks produced by these presses have the



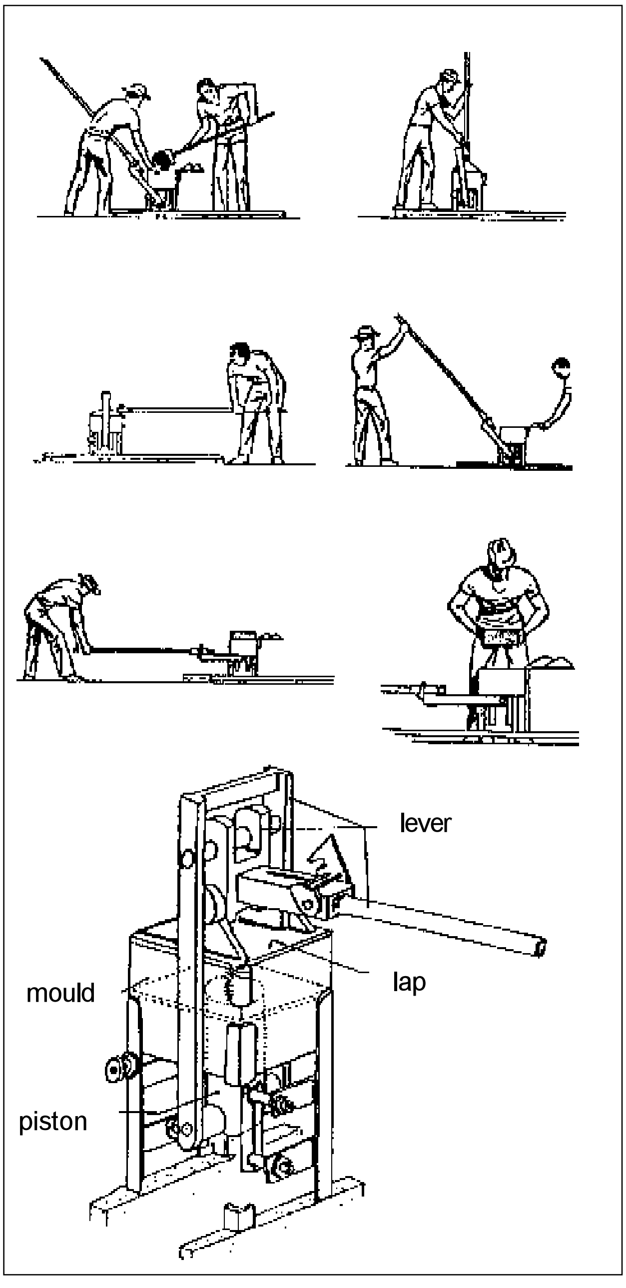
7-1 Adobe forms (Minke 2000)



7-2 Production of adobes in Ecuador

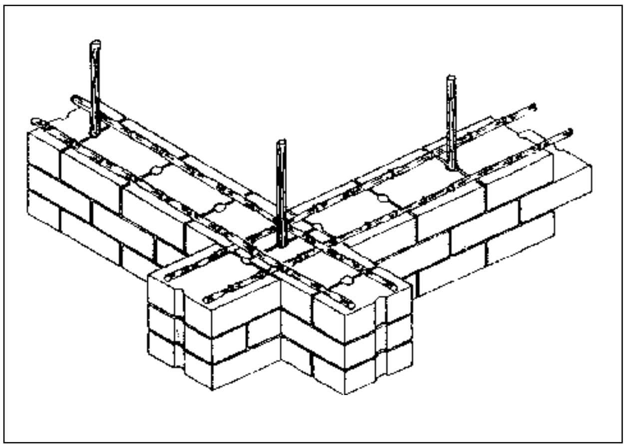
advantage of a more exact shape with sharp corners than handmade adobes. Their disadvantages are that they usually need the addition of 4-8% cement to the soil in order to obtain sufficient stability and that the production output is only half by comparison with adobes.

7-4 CETA-Ram, Paraguay

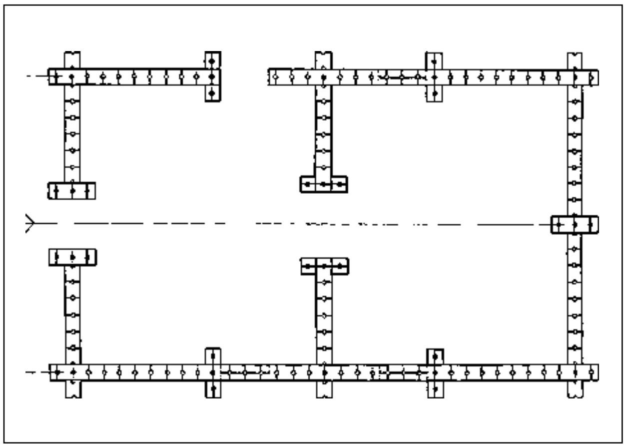


7-3 CINVA-Ram, Colombia

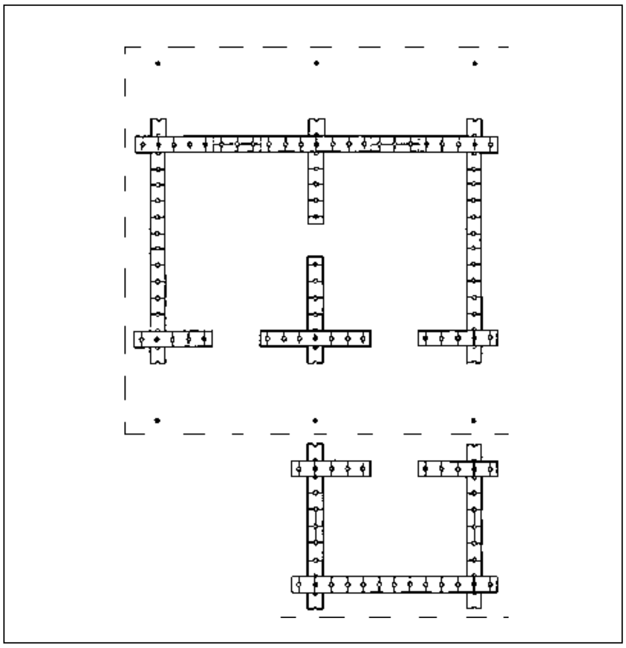
7.2 Internal reinforcement



7-5 System ININVI, Perú



7-6 Ground plan with system ININVI, Perú (Pereira 1995)



7-7 Improved ground plan with system ININVI, (Equipo Maiz, El Salvador 1995)

The "Instituto nacional de investigación y normalización de la vivienda (ININVI), Peru, developed a system of adobe walls which are stabilized by vertical bamboo rods that fit into holes of 5 cm diameter, formed by grooves at the side of square adobes and halved ones, see Fig. 7-5. Corner buttresses and intermediate buttresses stabilize the wall, see Fig. 7-6. In Fig. 7-8 it can be seen that the horizontal elements of the roof trusses rest on and are fixed to the buttresses. It is important to mention that if the length of a wall is 12 times larger than its thickness, it should have an intermediate buttress, see Fig. 7-6 and 7-9. Interior walls must also have a buttress when they meet the exterior walls. Fig. 7-7 shows a simple design with shorter walls and a separate kitchen built in Salvador (Equipo Maiz, 2001).

Horizontal bamboo rods, as shown in Fig. 7-5, normally do not strengthen the structure. They weaken the walls as they disturb the transfer of shear forces. This is due to the fact, that in practice there is not sufficient bonding between the rods and the adobe, as they are not always covered by 2 cm of mortar and as the quality of the mortar is too poor to take the shear forces.

The buttresses at the corners can be substituted by columns of reinforced concrete, see Fig. 7-10. In the case of the solution shown on the left, it is necessary to place horizontal steel bars at least every 50 cm which grip into the joints with their angles. This detail was forgotten in all publications which illustrate this solution. Without this bond, the column will separate from the wall when strong horizontal shock occurs in the earthquake.

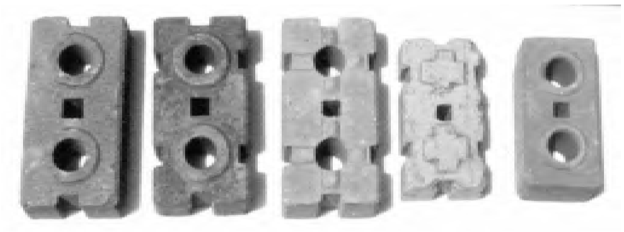
7-10 Stabilized corners



7-11 Interlocking blocks (Weinhuber 1995)

7-12 and 7-13 Prototype house, Thailand 1984 (Weinhuber 1995)

7-15 Improved interlocking system of FEB, Kassel, 2001

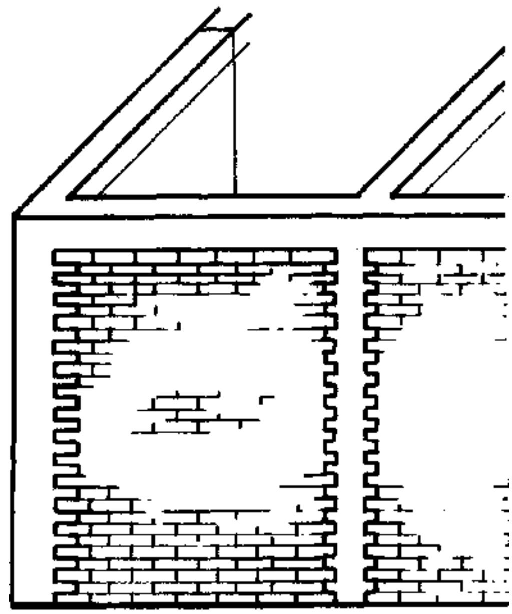
7.3 Interlocking blocks

Walls without mortar can be built with interlocking blocks. The blocks have holes for vertical reinforcement elements from steel rods or bamboo canes fixed by pouring cement sludge into the holes. The blocks are pressed in special molds and normally stabilized with cement, see Fig. 7-11. If they have enough vertical reinforcement elements, at least at corners and intersections, and if these are well fixed to the plinth and the ring beam, these walls are supposed to be earthquake-resistant due to their flexibility. The system was developed at the Asian Institute of Technology, Bangkok. Figs. 7-12 and 7-13 shows the first demonstration building, built in 1984 in Thailand. In this case the holes were filled with a mixture of cement and sand in the ratio 1:3.
Fig. 7-14 shows a similar system, developed by the University of the Andes, Mérida, Venezuela. The blocks have grooves and tongues which interlock. Horizontal ring beams of reinforced concrete are placed at a height of 1.20 m and on top of the wall.

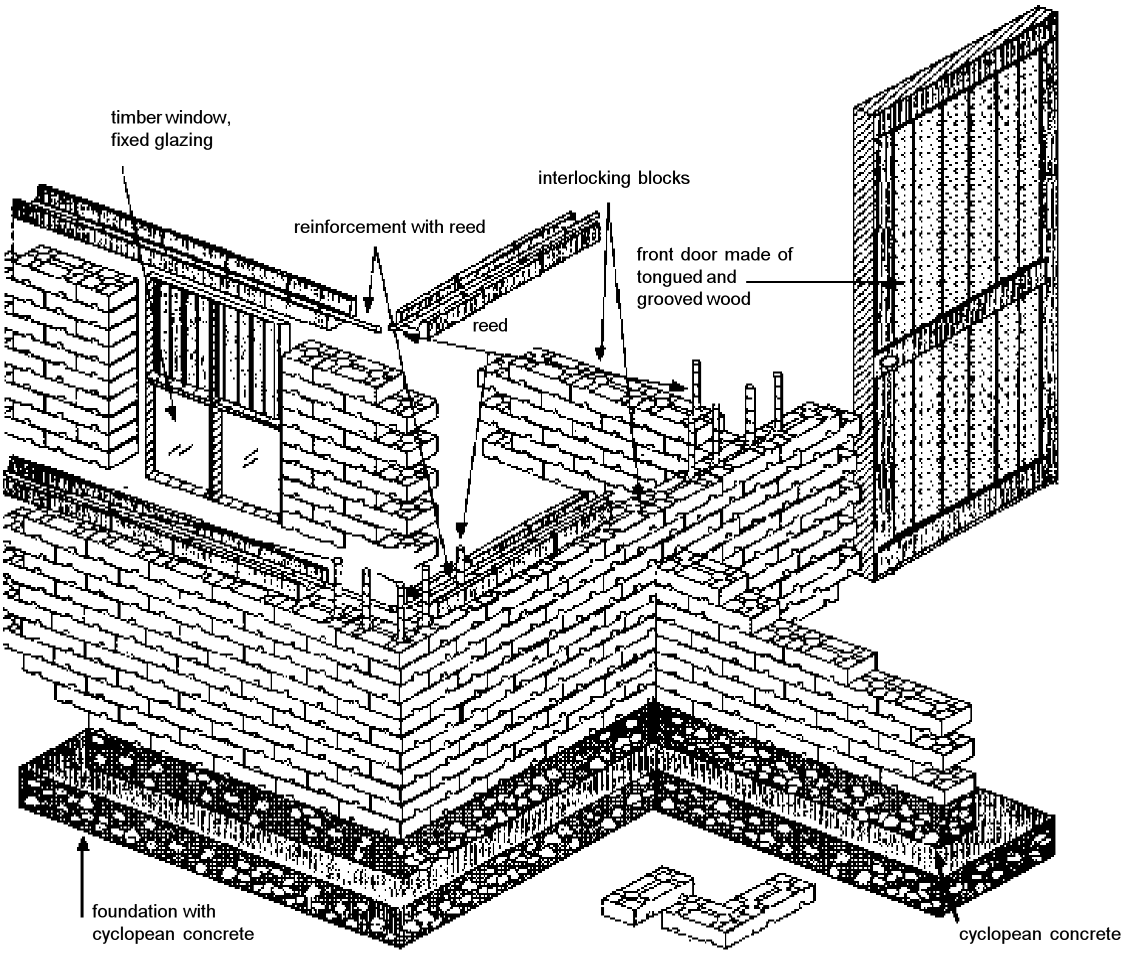
If stacked without mortar these walls do not show any high resistance to horizontal forces as the interlocking effect is only given by a height of some millimeters.
Therefore the author developed an improved interlocking system, with blocks showing tongues and grooves 40 mm high, in horizontal as well as in vertical joints, see Fig. 7-15. If these blocks are displaced or lifted up by seismic shocks, they always fall back into their normal position. The holes act as gripholes for easy0 handling, but can also be used to install vertical reinforcement elements. But these additional reinforcement elements are not necessary if the wall corners are formed by concrete columns, which interlock with the block as shown in Fig. 7-15, and these columns are interconnected by a ring beam.

7.4 Concrete skeleton walls with adobe infill

Normal masonry walls are not very stable against seismic shocks. Therefore, nowadays the masonry walls are often framed by concrete which forms a skeleton structure with adobe (or brick) infill, see Fig. 7-2 and 7-3. The vertical concrete columns should have 4 steel bars of at least 14 mm diameter. It is important that the concrete and the adobes interlock, as shown in Fig. 7-16. For low-cost housing projects this solution is normally too expensive. Moreover it shows hardly any flexibility.

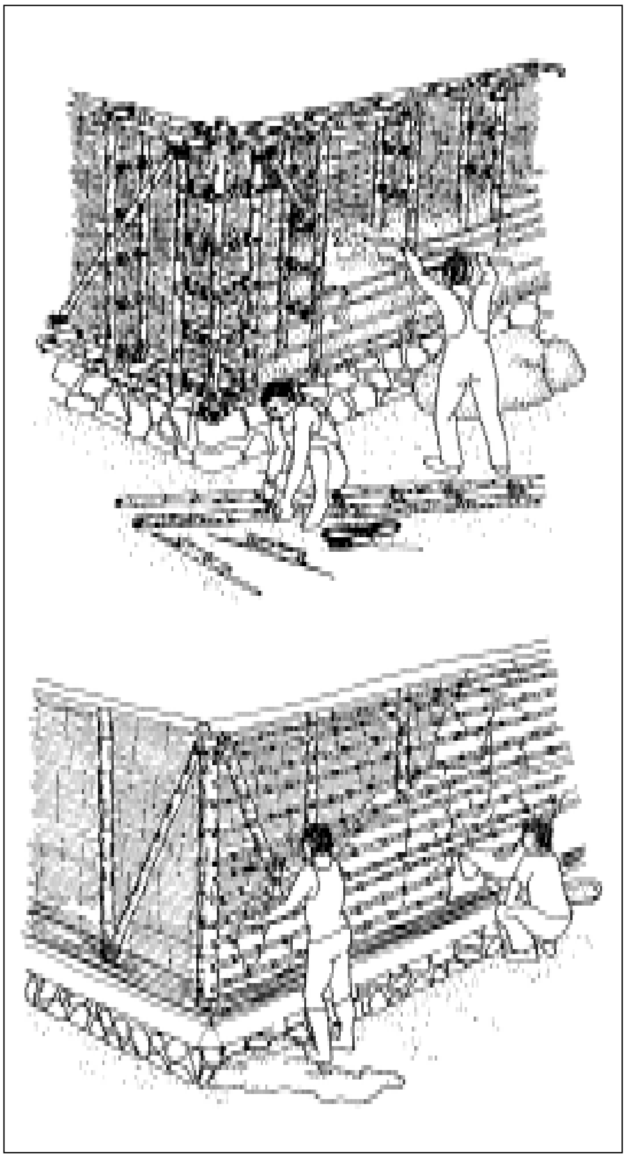


7-16



7-14 Building system invented by Universidad de los Andes, Mérida, Venezuela (Pereira 1995)

8-1 Traditional wattle and daub system, Venezuela (Minke 2001)



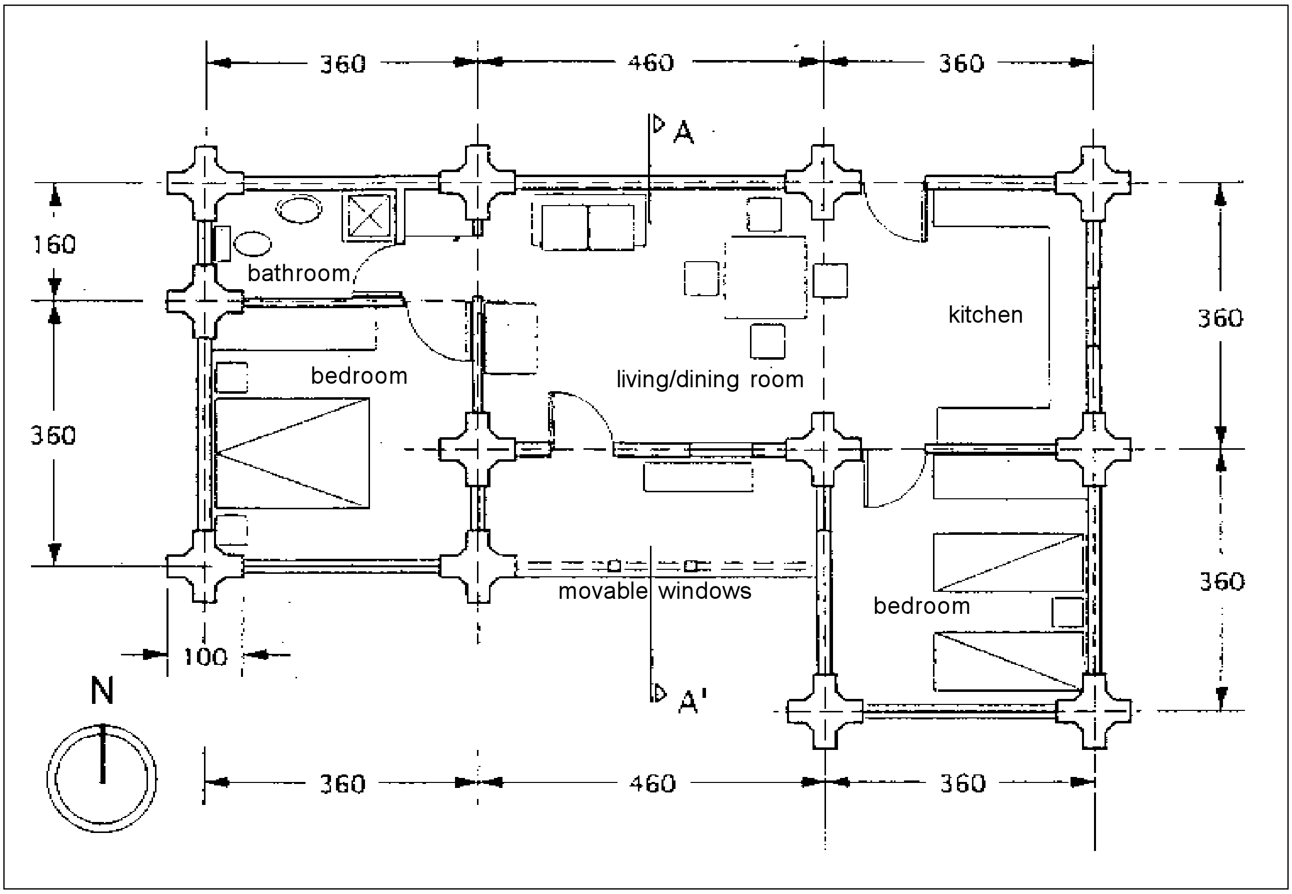
8-2 Wattle and daub systems (after Vorhauer 1979)

8. Wattle and daub

The wattle and daub wall system, which is called bahareque or quincha in Latin America, consists of vertical and horizontal elements made of timber or bamboo, forming a double layer grid which is filled with earth. Single-layer systems also exist, see Fig. 8-1. The vertical elements are usually tree trunks, the horizontal ones bamboo, reed or twigs. This is the most flexible system, as it is basically a timber grid structure with flexible joints and earth infill.

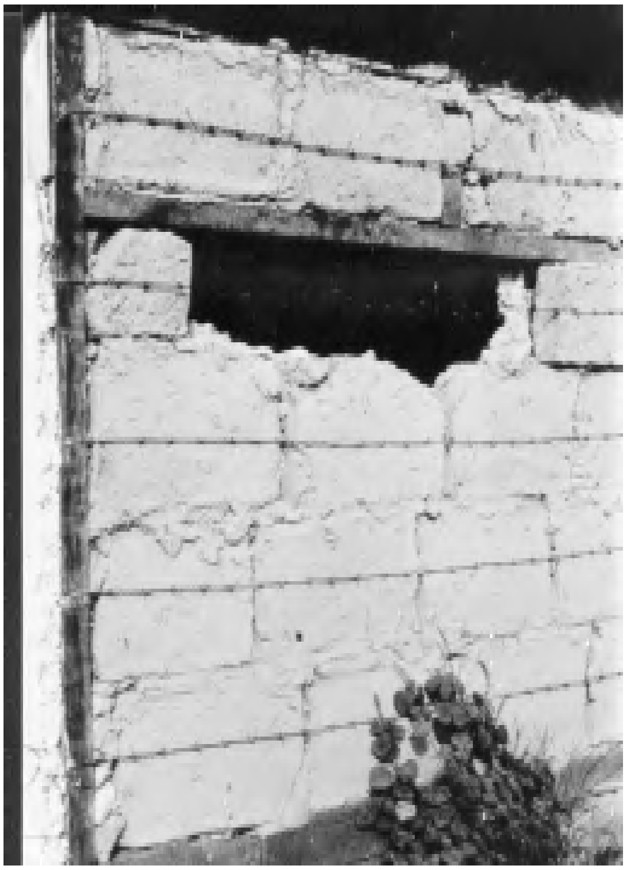
The disadvantage of this system is that it needs a lot of maintenance, as it cracks easily due to the thin cover of the wood elements and the swelling and shrinking of the wood. In practice there are often cracks and holes, where erosion starts and where insects can live; for instance in Latin America those that create the “decease mal de chagaz”. Fig. 8-3 shows a system, developed by CEPED, Camari, Brazil, with prefabricated wall elements, to be filled locally with earth. The design in Fig. 8-4 by the architects Kühn, Poblete and Trebilcock show an interesting combination of rammed earth columns and wattle and daub intersections. This design was developed during a workshop on earthquake-resistant house design, sponsored by DFG and held by the author in 1998 at Santiago de Chile.

A very poor, unstable solution is shown in Fig. 8-5, sometimes built in Latin America after earthquakes as a quick solution to create shelter. The timber frame walls are filled with adobes, mounted upright and held by barbed wire on both sides. As the distance between the vertical posts is too large and the wires are not tightened enough, the adobes easily fall down.



8-4

8-3 Prefabricated system CEPED, Brasil



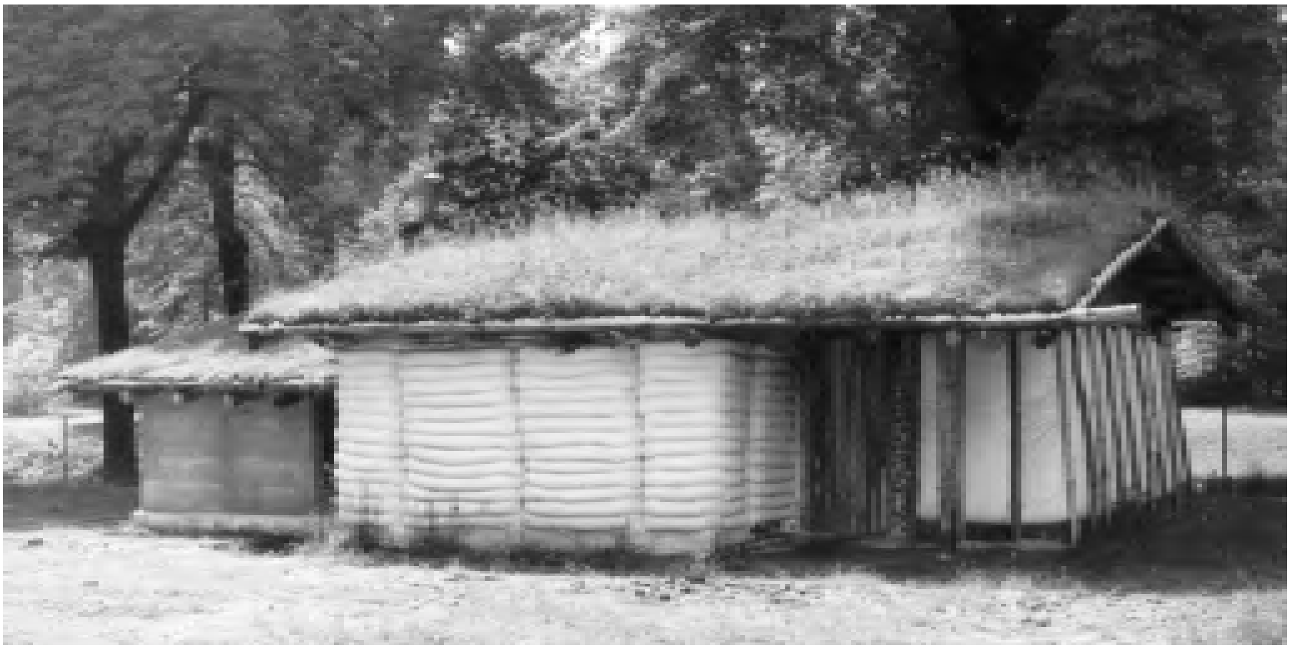
8-5 Dangerous solution, Chile

9-2 and 9-3 Wall with filled textile hoses

9. Textile wall elements filled with earth

At the Building Research Laboratory (FEB), University of Kassel, different solutions using textile earth-filled elements for walls were tested. Fig. 9-1 shows a prototype building, built in 1978 in Kassel. The wall consists of hoses made of jute fabric filled with earth and pumice aggregate, stacked without mortar but fixed with strips of cut bamboo driven through the layers. The elements were laid in a U-shape, the top of the wall was fixed to a ring beam, see Fig. 9-2. In order to avoid rotting of the fabric, the wall was covered with 4 layers of thin lime paint, see Fig. 9-3. The roof structure, built of tree trunks, rests on posts separated from the wall.

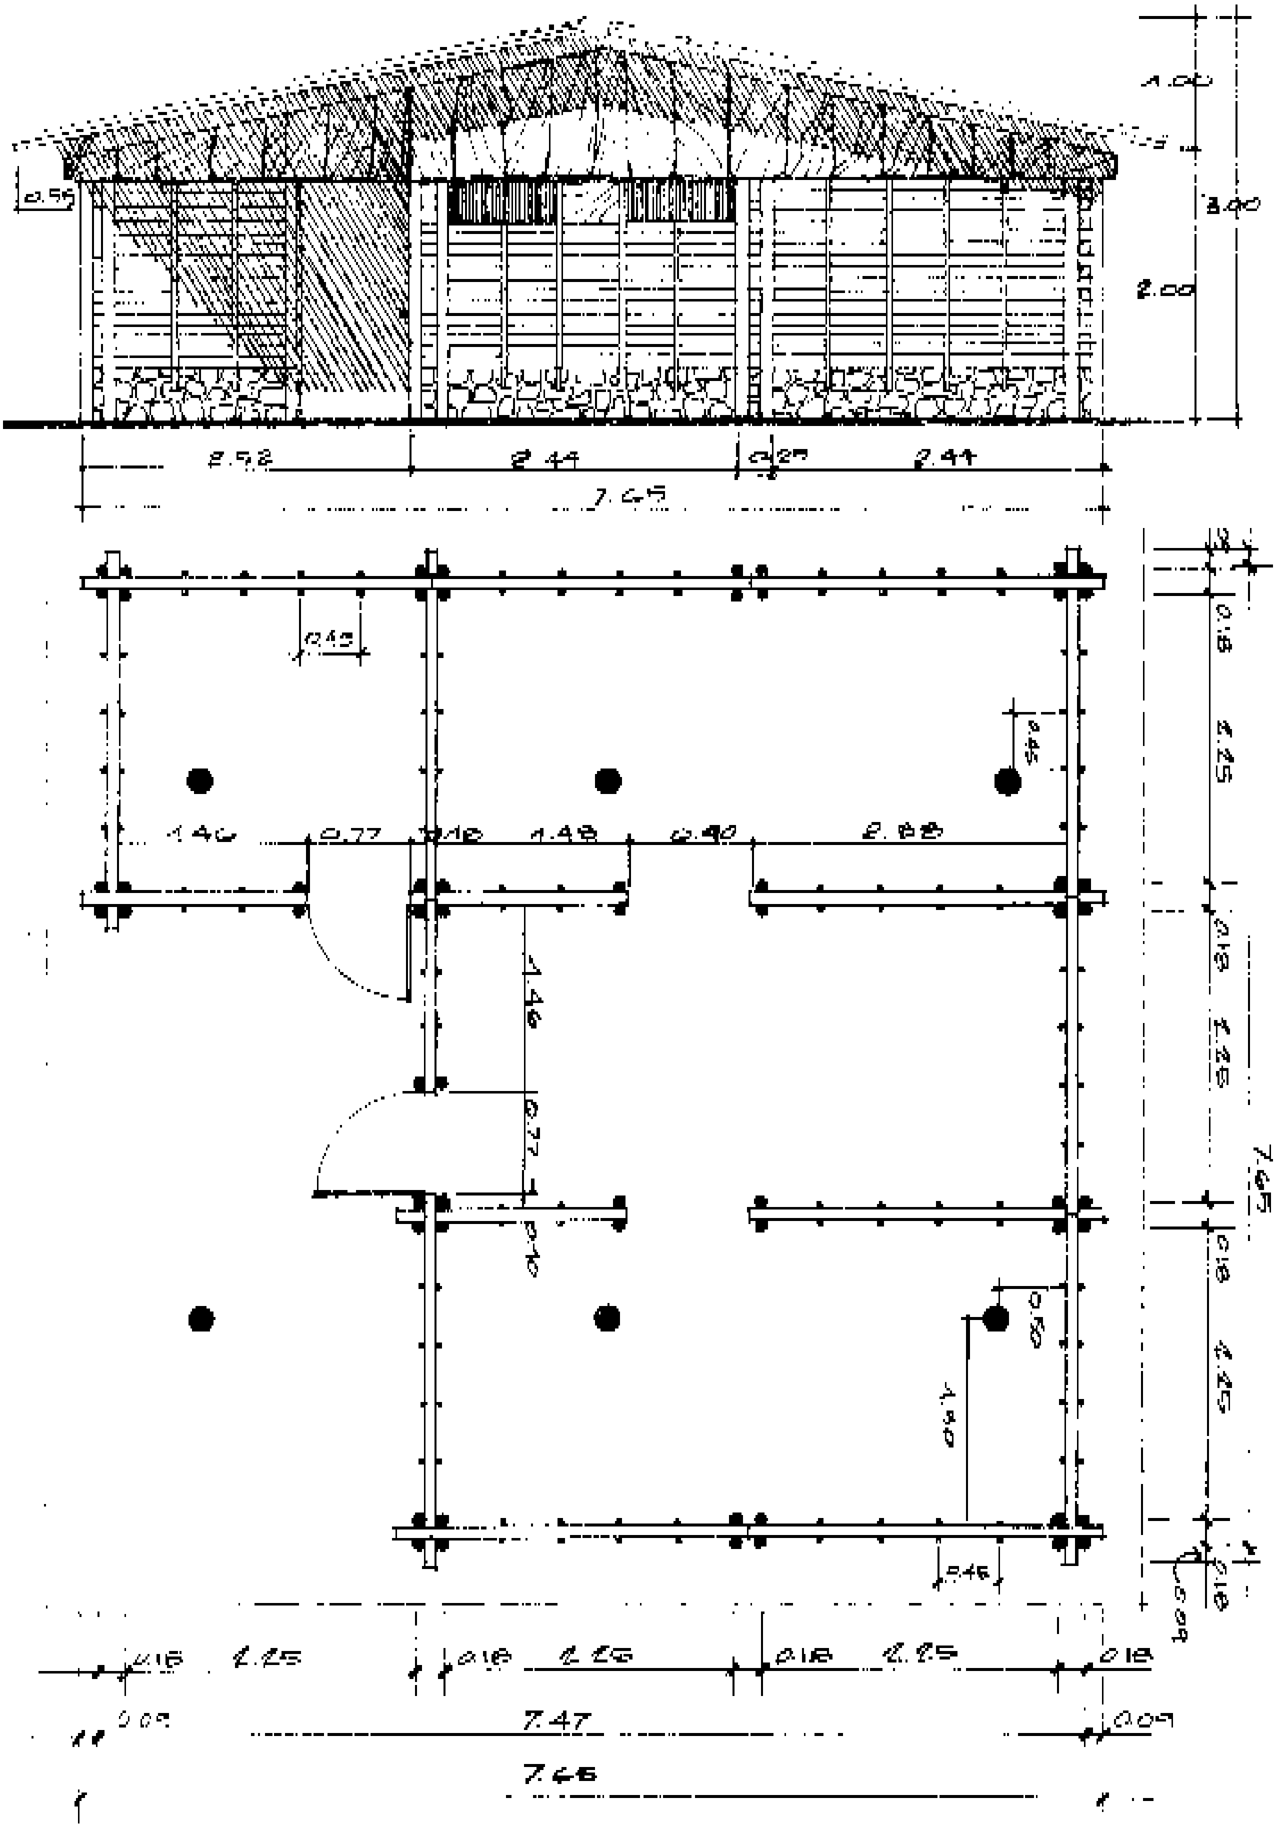
Within a research project concerning seismic-proof low-cost housing the FEB together with the University Francisco Marroquin and CEMAT, Guatemala, built a prototype house of 55 m^2 in Guatemala in 1978, see Fig. 9-7. In this case cotton hoses of 10 cm diameter were sewed, filled with earth and pumice (Fig. 9-4), dipped into lime milk (Fig. 9-5) and stacked between thin bamboo sticks (Fig. 9-6).



9-1 Low-cost housing prototype, University of Kassel, Germany 1978

9-4 to 9-6 Filling and stacking of textile elements

9-7 Earthquake resistant low-cost housing prototype, Guatemala 1978



9-8 Earthquake resistant low-cost housing prototype, Guatemala 1978

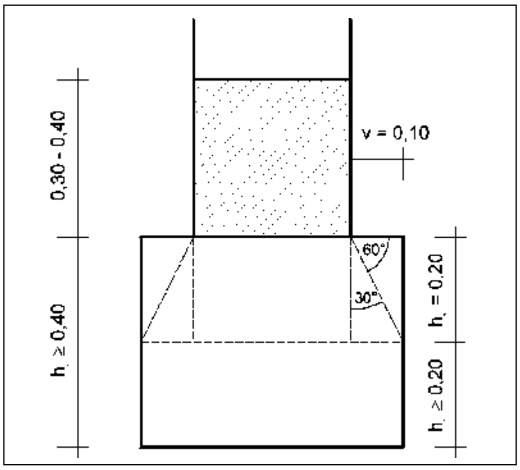
Four vertical posts every 2.15 m and thin bamboo rods of 2 to 4 cm diameter every 45 cm stabilized the wall. The surfaces were painted with a paint made of 1 bag of lime, 4 kg kitchen salt, 2 kg alum and 30 liters of water. In the prototype structure, shown in Fig. 9-1, another new textile system was tested, which is to be seen at the right side of the house. It consists of a prefabricated U-shaped wall of jute fabric, kept by wooden sticks pushed into the earth. The container ("bag") formed in this way was then filled with pumice and earth, see Fig. 9-9. The model of this system is shown in Fig. 9-10 and 9-11.

9-9 to 9-11 Textile wall elements filled with earth

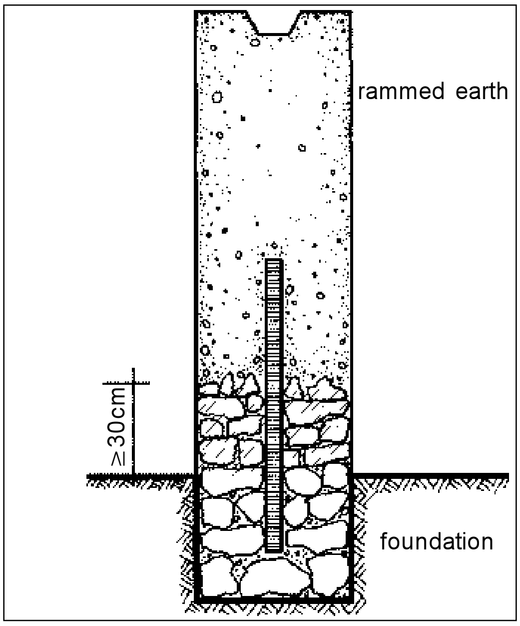
10. Critical joints and elements

10.1 Joints between foundation, plinth and wall

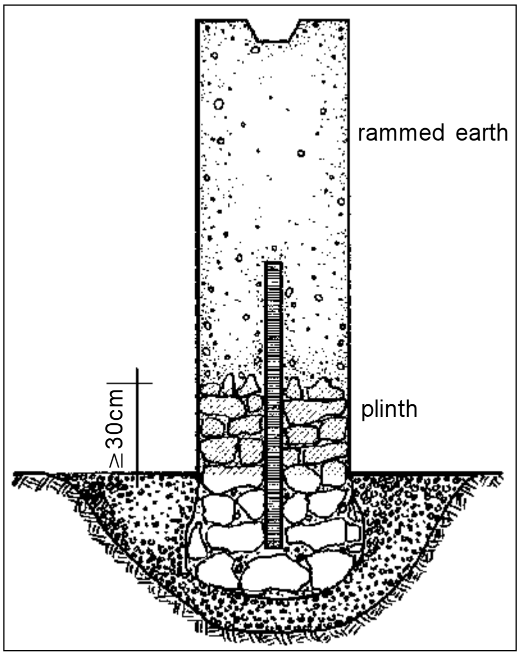
For a wall 30 to 40 cm of thick the foundation should usually be 20 cm wider and 40 cm or more high, see Fig. 10-1, depending on the rigidity of the soil. With a 50 cm thick rammed earth wall the plinth and foundation can be of the same width. The plinth is usually built of rubble random stone or bricks, but can also be of concrete with large stone aggregates. As it shelters the wall against splashing rain water, the height should be at least 30 cm. The joints between foundation and plinth as well as between plinth and wall have to have a good bond in order to be able to transfer shear forces. They should be situated every 30 to 50 cm. The easiest solution is to integrate a vertical wooden rod and to create a rough plinth surface , see Fig. 10-2. In the case of adobe walls the mortar must have a very good adhesion and a high bending strength. Horizontal damp-proof courses will interrupt the necessary bond.
A proposal by the author, not yet tested, is a "floating" foundation created by a channel of round pebbles which reduce the kinetic energy of the horizontal shocks, see Fig. 10-3.



10-1 Foundation of external walls



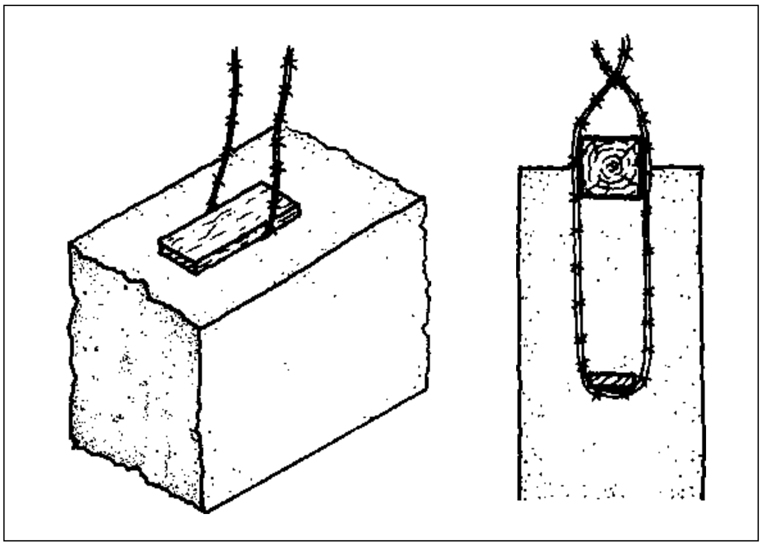
10-2



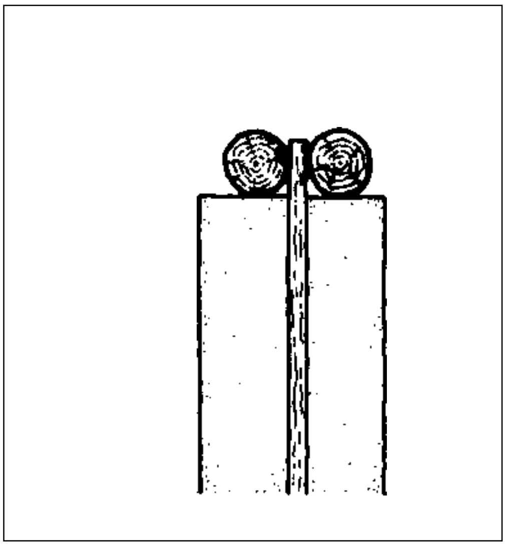
10-3 Floating foundation

10.2 Ring beams

Walls always have to be kept on top by a closed ring beam, which must be able to take bending loads when there are lateral forces against the wall. In order to prevent the walls from buckling and



10-4 Fixing of ring beam



10-5 Fixing of ring beam

falling, the connection between wall and ring beam must be very strong. The ring beams can also act as a support for the roof structure. Fig. 10-4 shows one way of fixing a wooden ring beam to a rammed earth wall. A better solution is shown in Fig. 10-5 and 10-21, where a vertical interior reinforcement element of wood or bamboo is fixed to the foundation at the bottom and to a double ring beam at the top.

With adobe walls without vertical reinforcement elements it is not so easy to obtain a good bond between the masonry work and the ring beam. In the case of a reinforced concrete ring beam it is necessary to leave the last layer of adobes with open vertical joints so that the concrete will go into the gaps. In the case of adobe walls, if the ring beam is made from timber, as seen in Fig. 10-6, these elements must be covered by 2 cm of mortar with good adhesion values.

As corners of ring beams have to be able to transfer moments under seismic forces, they must be stiff. Figs. 10-6 to 10-8 and 10-12 show solutions for stiffening the corners for timber ring beams, while Figs. 10-9 to 10-11 show solutions for reinforced concrete ring beams.

10-6

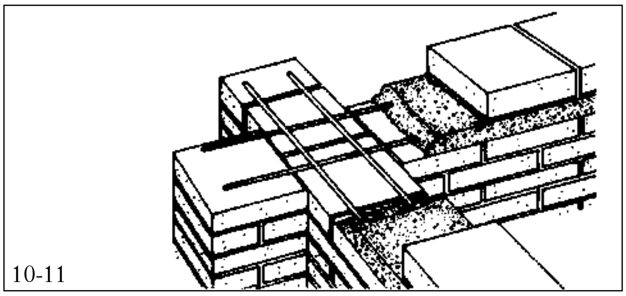
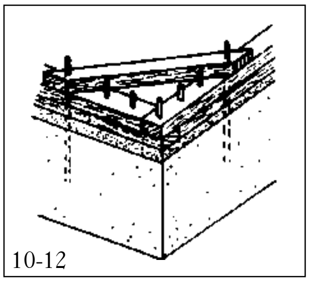
10-10



10-11

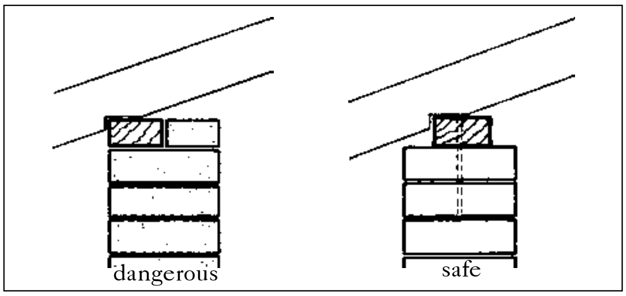


10-12

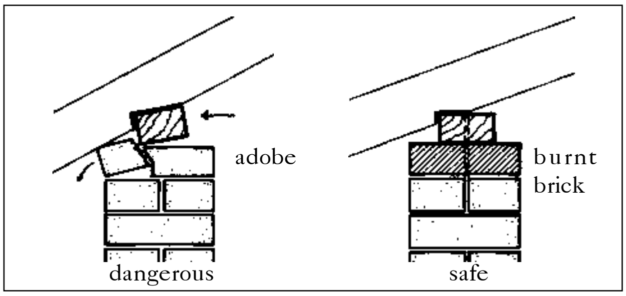
10-6 to 10-12
Solutions of
stiffening of corners

10.3 Ring beams which act as roof support

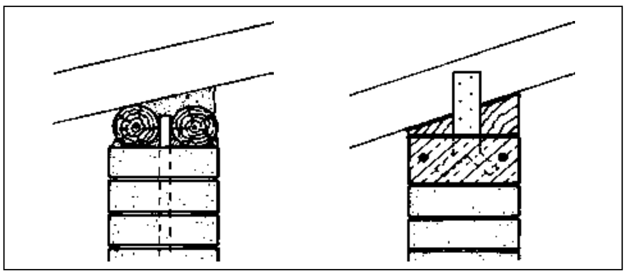
If the ring beams act as support for the roof structure, they have to be positioned centrally over the wall (Fig. 10-13). In the case of adobe walls the upper layer of adobe may break under seismic movement, therefore it is recommended that a top layer of burnt bricks be built for better stress distribution, see Fig. 10-14. In order to transfer the load uniformly from the roof beams to the wall, wedges of wood or concrete should be used. Also additional fixing is advisable, see Fig. 10-15.



10-13



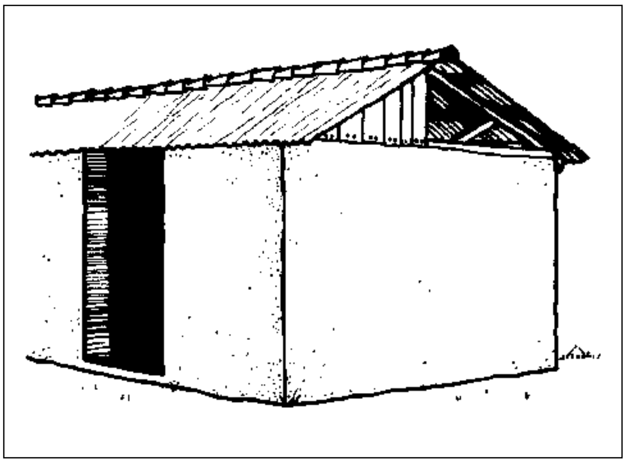
10-14



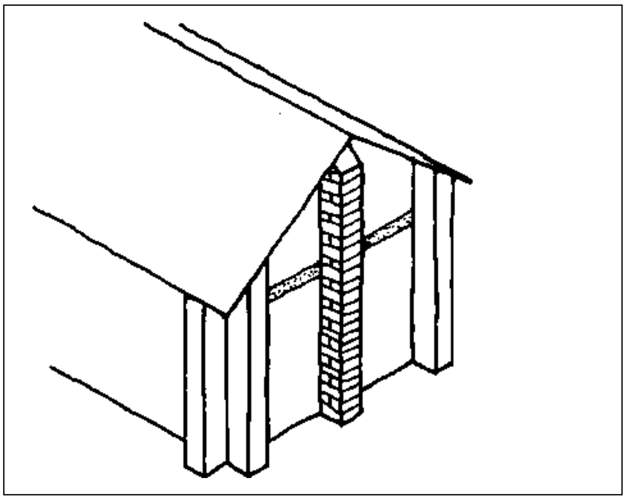
10-15

11. Gables

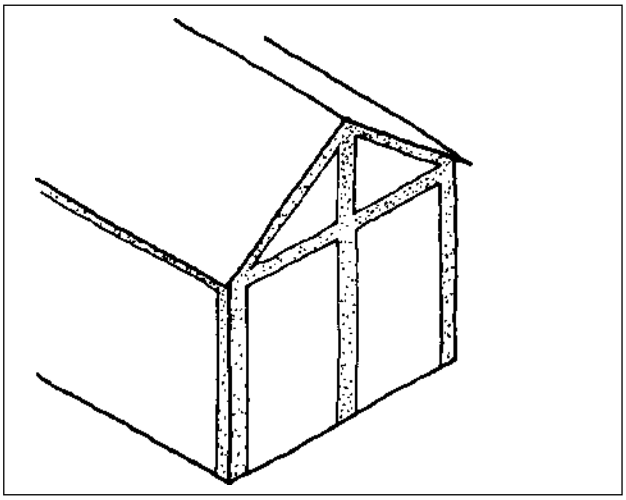
If gables are part of the wall, they are very weak against perpendicular forces. The best solution for avoiding this problem is to build a roof with four inclined planes (pyramidal shape), with which no gables appear. The second best solution is to build a light gable which is fixed only to the roof, as Fig. 11-1 shows. The third best solution is to build a gable wall and to stabilize it with a buttress, see Fig. 11-2. If a concrete skeleton structure is used, which is the most expensive solution, the gable also has to be stabilized by reinforced concrete elements, as shown in Fig. 11-3.



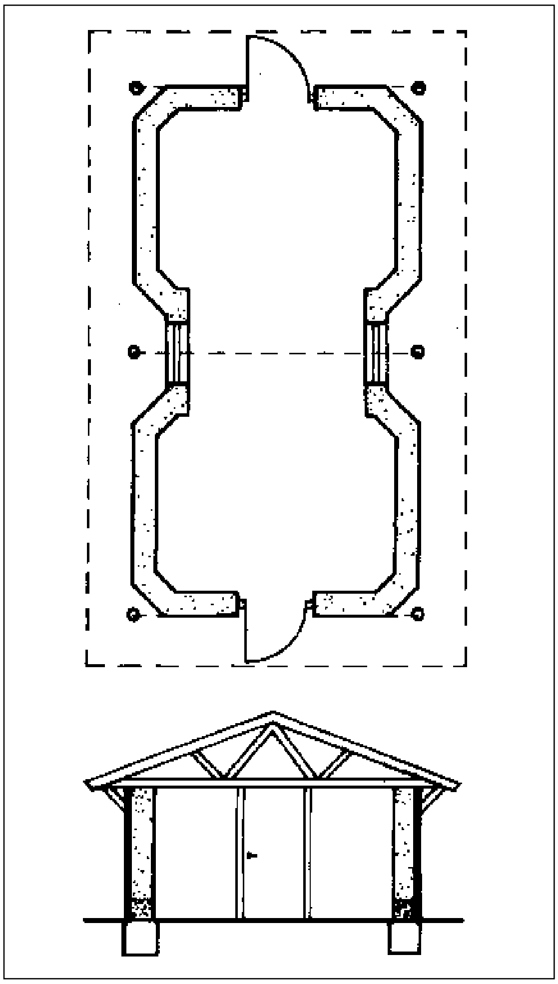
11-1 Gable fixed roof



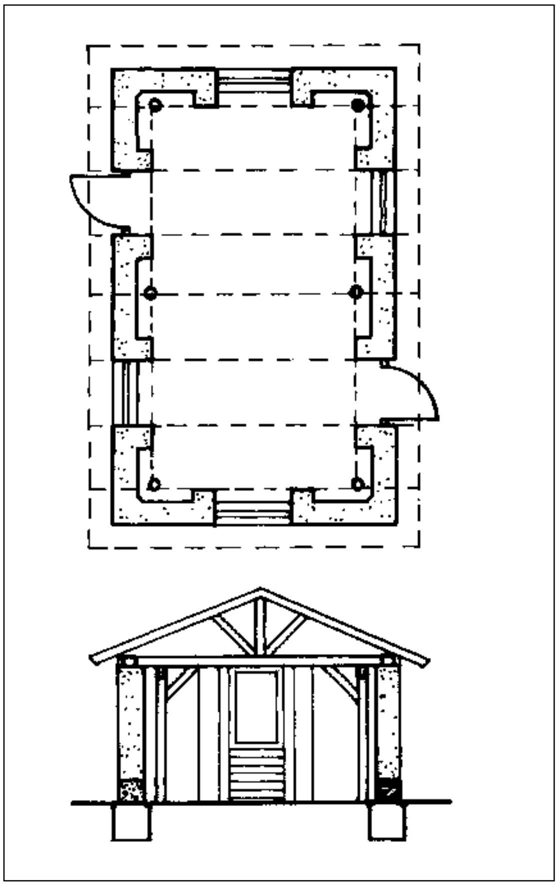
11-2 Stabilization by buttresses



11-3 Stabilization by reinforced concrete structure



12-1



12-2

12. Roofs

12.1 General

The roof should be built as light as possible. Roofs with tiles or stone plates are not recommended, as they are heavy and in case of an earthquake the tiles or plates might fall into the house.
For earthquake-resistant houses a pyramidal roof with 4 inclined planes, which rest on a horizontal ring beam, is the best solution. A simple roof of this kind is shown in Figs. 12-8 and 12-9. The most used solution is a roof with one ridge and two inclined surfaces, but in this case the beams on which the roof rests, must form a ring and cross the gable, which needs extra stabilization, see chapter 11, or must be fixed to the roof instead being a part of the wall, see Fig. 11-1.
For smaller houses a roof with a single inclined plane is more economical, but in this case the beams on which the roof rests need to be interconnected, forming an inclined ring beam.

12.2 Separated roofs

As the frequency of the movements of roofs and walls differs during seismic activities, due to their different moment and weight, the safest solution is to separate the roof from the wall and have it resting on columns which are positioned inside or outside the wall. Then the roof and wall systems can move independently of each other. Figs. 12-1 to 12-4 show different proposals of the author, utilizing this idea. It is necessary to fix the columns to the ground at the bottom and to the roof structure at the top in such a way that these connections are partially moment-stiff, but still allow some ductility. At the top of wooden columns short diagonals give best solution, see Figs. 12-1 to 12-9.

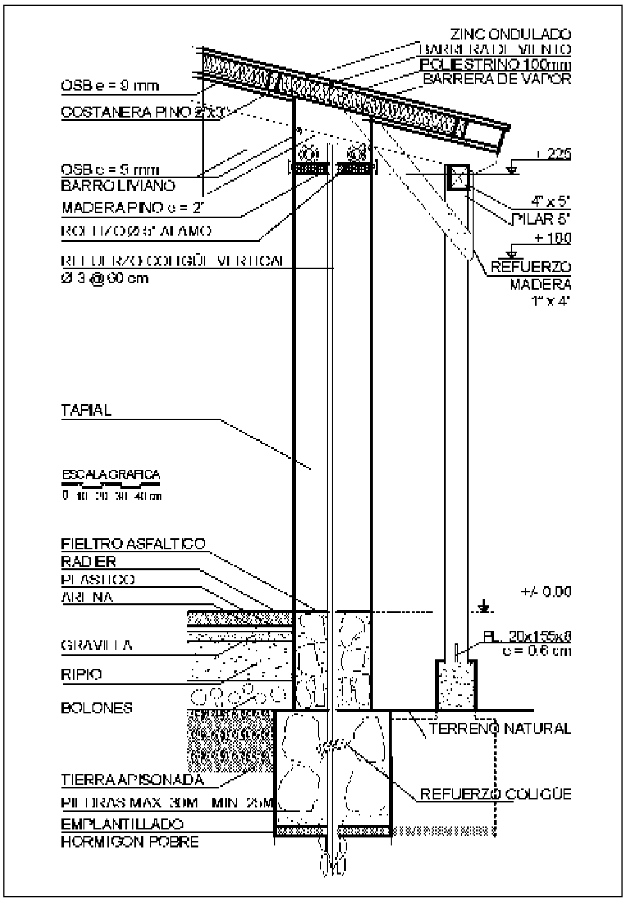
12-7 to 12- 9 Proposals for plans with separated roof structure



12-6 Reinforced rammed earth wall system
Alhué, Chile 2001

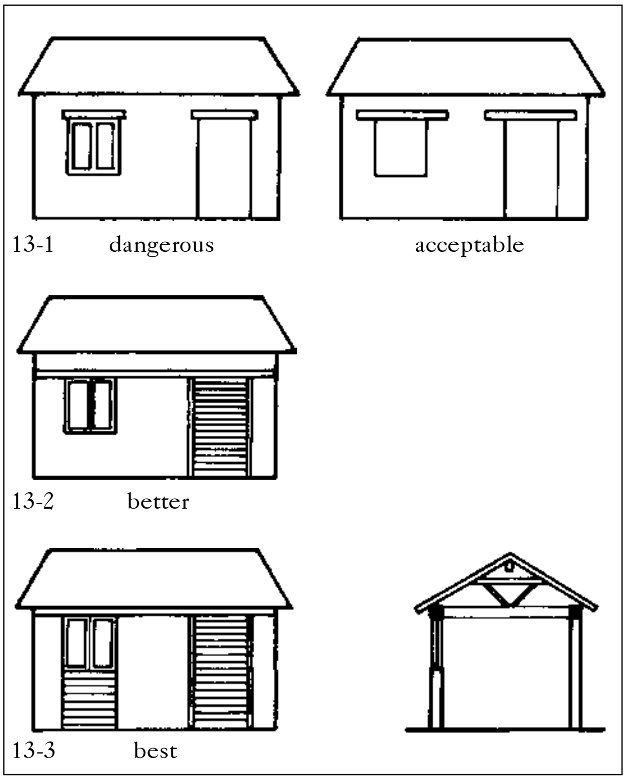
12-7 to 12- 9 Earthquake resistant low-cost housing project Pujili, Ecuador 1989

Figs. 12-5 and 12-6 show solutions of projects which were described in chapter 6.4. In the first case the columns are positioned inside, in the second case outside the walls.
Figs. 12-7 to 12-9 show the construction of an earthquake-resistant low-cost housing project built in 1989 at Pujili, Ecuador (design: Gernot Minke and FUNHABIT, Quito). In this project the walls are built of two U-shaped rammed earth elements 40 cm thick, separated by a door or a window. The roof rests on four wooden columns, which stand outside the walls at the corners of the square. Though the columns reach into the foundation and are fixed to the ring beam by diagonals, the roof system shows sufficient ductility within an earthquake.
The roof was built of eucalyptus trunks, covered by caña brava (a kind of reed) and then plastered with a mixture of clayey soil with pumice, animal dung, sisal fibers and waste car oil. After drying it was painted with white paint.
.

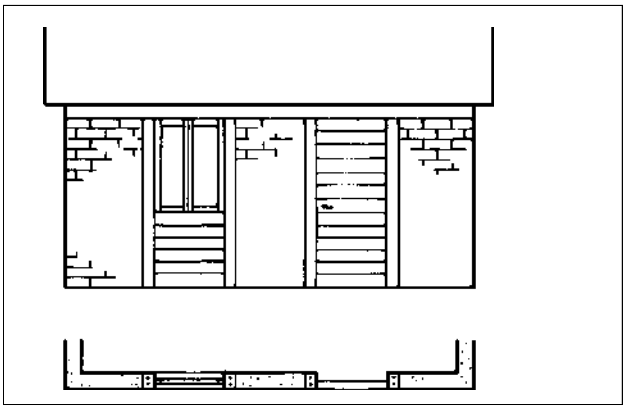
13. Openings for doors and windows

Openings within the walls destabilize the wall system. In an earthquake diagonal cracks often occur, starting at the window edges, see Figs. 4-1 and 4-2. Lintels have to penetrate into the wall for at least 40 cm in order to achieve a good bond, see Fig. 13-1. However, in this case the part above the lintel may be weak and come off in an earthquake, and therefore the best solution is to also use the lintel as a ring beam on which the roof structure rests. It is also recommended that the part below the window be built as a light flexible structure, for instance from wooden panels or wattle and daub. The following rules have to be taken into account, see Figs. 13-5 and 13-6:

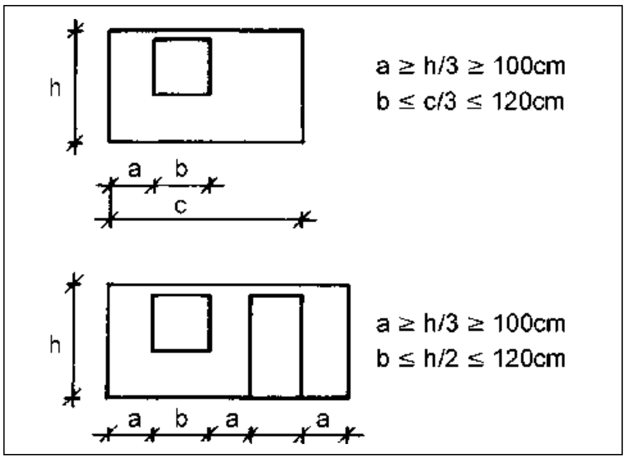
a) The length of the windows should not be more than 1.20 m and not more than 1/3 of the length of the wall.
b) The length of walls between openings must be at least 1/3 of their height and not less than 1 m.
c) Doors must be opened towards the outside. Opposite the entrance door there should be a large window or another door, which acts as emergency exit, see Fig. 13-6.



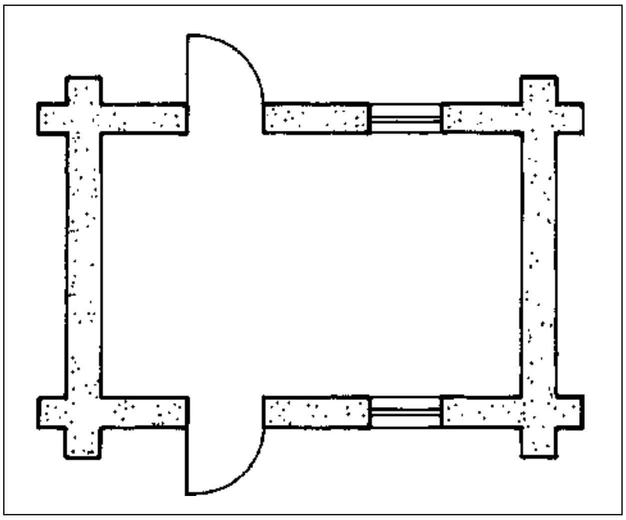
13-1 to 13-3



13-4 Stabilized openings

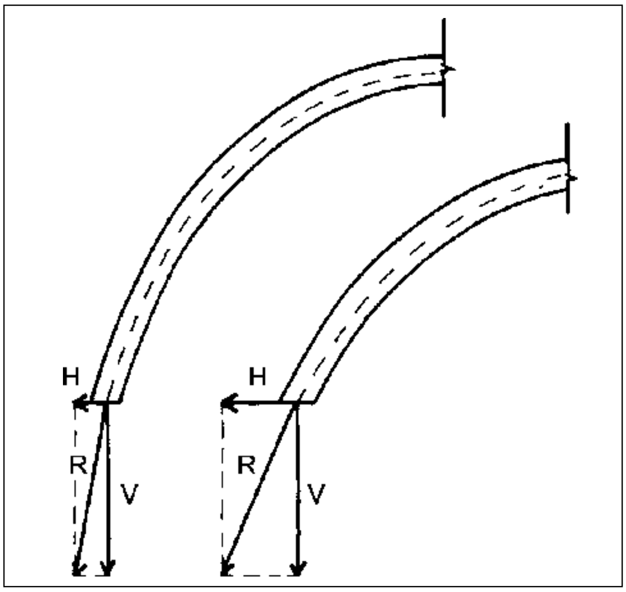


13-5 Recomendable dimensions of openings



13-6 Recommendable positions of openings

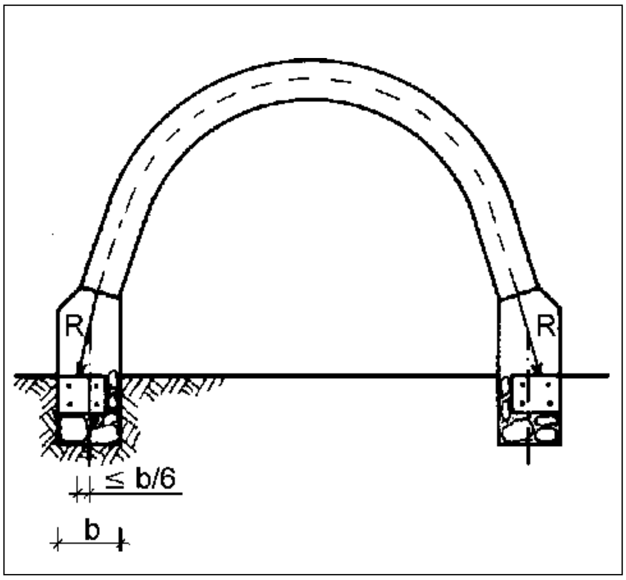
14. Domes



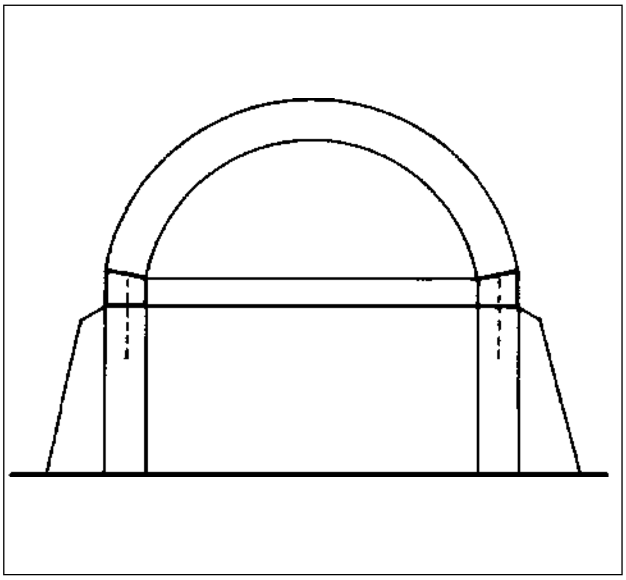
14-1 Resultant forces and their components (Minke 2000)

The problem with the structural design of domes is the stress transfer to the foundation. The inclined thrust force can be divided into a horizontal and a vertical component, see Fig. 14-1. The steeper the thrust (resultant), the smaller the horizontal component.

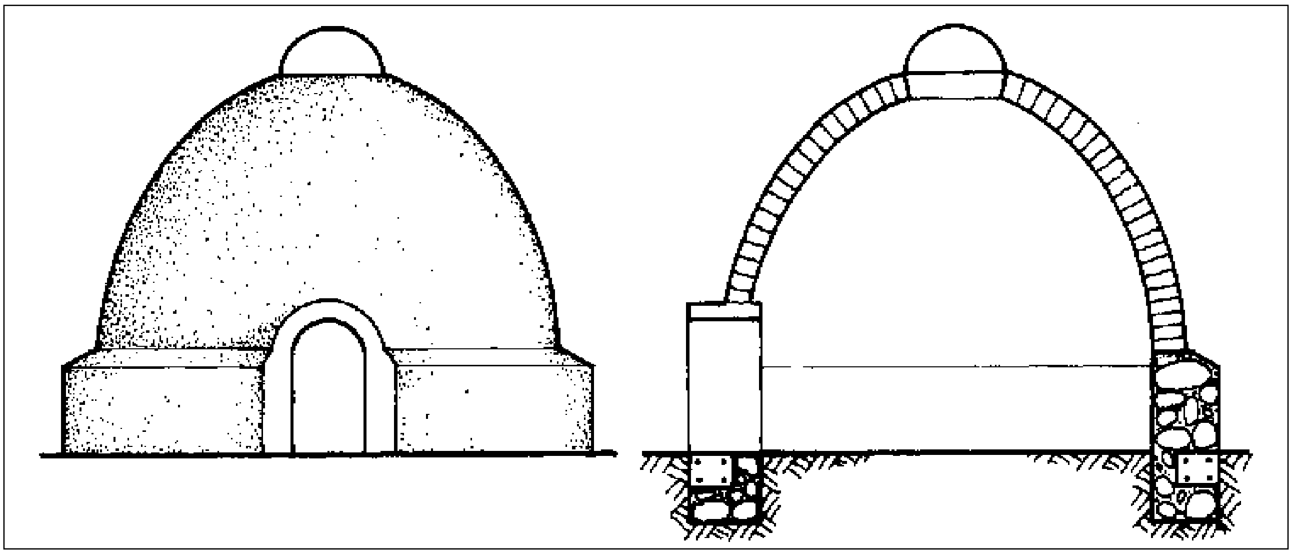
The support of a dome must be a circular horizontal ring of reinforced cement concrete, steel or possibly also timber, and it must be able to take the horizontal forces of the dome. The joint between dome and plinth or foundation must be inclined in order to resist the horizontal seismic movement, see Figs. 14-2 and 14-3. Because of the heavy weight of a dome, high ring beams and walls need to be stabilized by buttresses and the



14-2 Allowable eccentricity



14-3 Ring beam stabilized by buttresses



14-4 Stabilization of dome entrance

joint of ring beam and wall must be able to transfer large horizontal forces, see Fig. 14-3.

If the dome rests directly on a low plinth, the structure is much more stable in an earthquake, see Fig. 14-2. In this case the foundation has to act as horizontal ring beam, and is usually built of reinforced cement concrete. It is important to check that the resultant force of the dome stays within the center third of the width of the plinth measured above the ring beam, i.e. the eccentricity must not be more than 1/6 of the base.

If the dome starts above a plinth, it must be taken into account that openings like doors and windows destabilize the dome structure. Therefore the tops of door and windows must be designed as vaults which penetrate the dome and are able to transfer the stresses from the dome to their sides, see Fig. 14-4.

An earthquake-resistant dome must have a certain section, which guarantees that all forces are transferred vertically to the foundation without creating tensile or compressive ring forces. The resultant forces must always be within the center

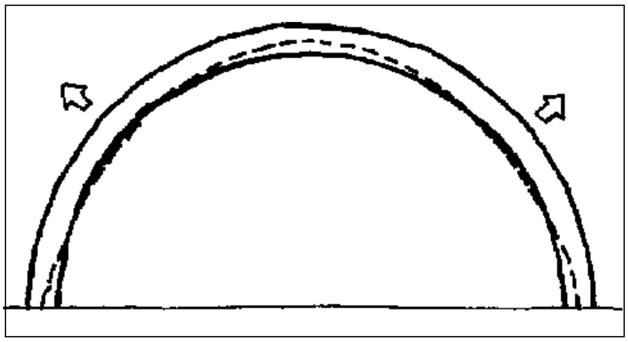
14-7
Dome coordinates for 7 different proportions (Minke 2000)

of the dome wall, the eccentricity must be less than 1/6.

In a dome with a semicircular section the resultants of the forces act inside the center line, thus creating tensile ring forces which can easily lead to collapse, see Fig. 14-5. In Fig. 14-6 the ideal section line, which does not create ring forces, is shown in contrast to other usual curves. This curve was derived by a computer program. However, it can be found for 7 different proportions of height to radius, when using the coordinates listed in Fig. 14-7, where **r** is the radius and **h** the height of the dome - always measured to the center of the wall, α is the angle of inclination at the bottom, **A** the area and **V** the volume.

In order to construct such a structurally optimized dome without formwork, at the FEB a rotational guide was developed which is fixed to a vertical mast. At the end of the rotating arm an angle is fixed against which the mason lays the adobe or soil block. So each block can be placed in position exactly. Figs. 14-8 to 14-11 show the application of this construction technique for a dome of 8.80 m free span and 5.50 m height, built in La Paz, Bolivia, in 2000. The adobes for this dome were made by hand in a special mould with rounded edges,in order to provide good sound distribution within the dome. The acoustic behavior of the dome was further refined by deepening the vertical joints in order to achieve some sound absorption and by a slight cantilevering position, which avoids the sound focusing effect towards the center of the come.



14-5 A semicircle is dangerous for dome section (Minke 2001)

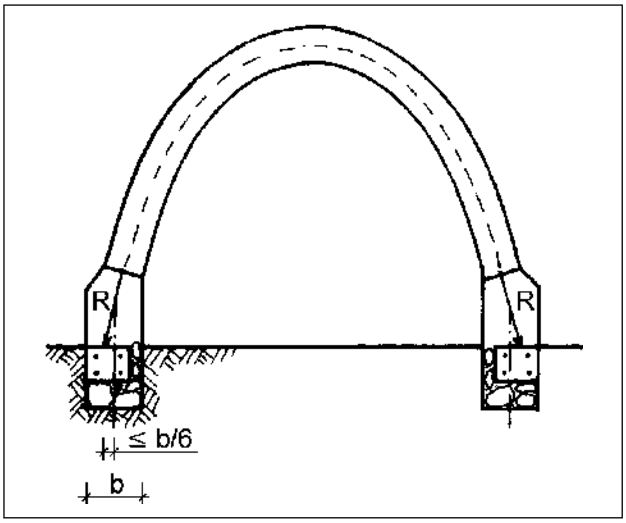
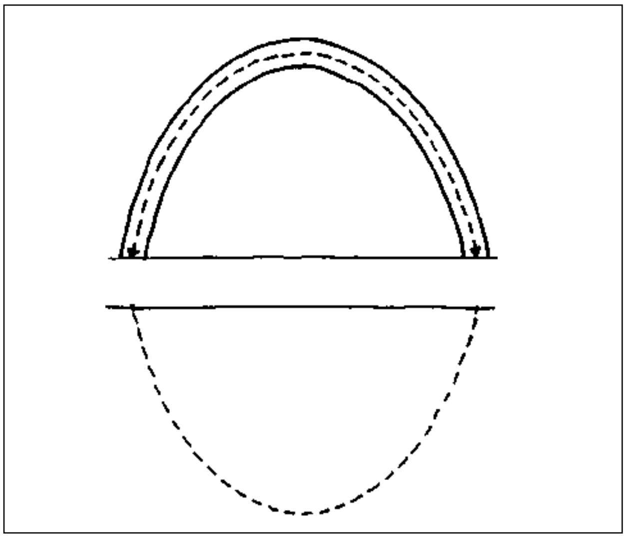
15-1 Ring beams stabilized by tensors or buttresses



15-2 Permitted eccentricity



15-3 Inverted catenary as ideal section for vaults (Minke 2000)

15. Vaults

In an earthquake vaults are less stable than domes, as described in chapter 14. It is advisable to have a square plan. If a rectangular plan is desired, buttresses or tensile elements connecting the beams are required, see Fig. 15-1. To create more stability, a vault should start directly above a low plinth instead of above a wall, see Fig. 15-2.
The vertical section of a vault should have the shape of an inverted catenary if it only has to transfer its own load. Then it only transfers forces in compression, see Fig. 15-3.

An important rule for the design of plinth and foundation is that the resultant force at the bottom of the vault should go through the inner third of the surface of the foundation. This means that the eccentricity should be less than 1/6, see Fig. 15-2. The foundation must have a reinforced concrete beam, which can also withstand the additional horizontal forces created by an earthquake.
Fig. 15-4 shows a section of a building which was built in an earthquake-prone area in Bolivia. Its plinth has structurally dangerous proportions, as the resultant force from the vault creates a bending moment in the plinth and does not stay within the inner third of the wall, as necessary.

The facades of vaults should be stabilized like the gables described in chapter 11. However, the best solution is to build them light and flexible with "wattle and daub", mats covered with earth plaster, or with timber planks.

Fig. 15-5 shows a design of the author for an earthquake-resistant low-cost-housing project in the region of Gujarat, India.

A proposal for stabilizing adobe vaults by bamboo arches also guaranteeing a certain ductility was realized within a test structure built in 2001 at the University of Kassel, see Figs. 15-6 to 15-9. This was built with special U-shaped adobes which rest on an arch, built of three layers of split bamboo. The bamboo sections were kept in

water for 3 days in order to be able to bend them. Then they were bent over sticks, which were pushed into the ground in a catenary line, see Fig. 15-7. In order to keep the arch in form, the three bamboo sections were wrapped together with galvanized steel wire every 50 cm. The arch was put into a vertical position and fixed to steel bars which stick out of the plinth. This connection must be able to take tensile forces within an earthquake. Above the adobe vault a membrane of PVC-coated polyester fabric is fixed and tightened to the plinth. This has two functions: firstly it gives shelter against rain and wind, and secondly it pretensions the arch and therefore increases its stability against movements created by the earthquake.
These movements may deform the vault to a certain extent, so that the adobe joints may open, but the vault will not collapse as it is held by the tensile prestressed membrane at the top and the compressive prestressed bamboo arch underneath. Thus the stability of this structure depends mainly on its ductility. However, it must be taken into account that if the pretension of the membrane is high, the optimal section of the vault is more like an ellipse.

16. Plasters and paints

Adobe walls have to be plastered by mortars made of earth or lime, or by earth stabilized with cement, lime or bitumen. A pure cement plaster should never be used, as it is too brittle and tends to crack under thermal loads (through expansion and retraction) and under mechanical impacts.
If water penetrates through these cracks, the earth underneath will expand creating more cracks, or even burst off.

The church at Ranchos de Taos, New Mexico, see Fig. 16-1, which was built in 1815 with adobe walls, was plastered with cement plaster during a restoration in 1967. Eleven years later the plaster had to be taken off, as rain water had penetrated through the many cracks and caused the destruction of many parts of the surface.

If an earth mortar is used for plastering, it is recommended that the surface be made waterproof by applying a paint of lime or lime-casein. Rammed earth walls do not need plastering. It is better to smoothe the surface with a trowel while it is still humid and then add two or three layers of thin lime or lime-casein paint. The first layer must have a high water content, so that it penetrates 2 or 3 mm deep into the wall.

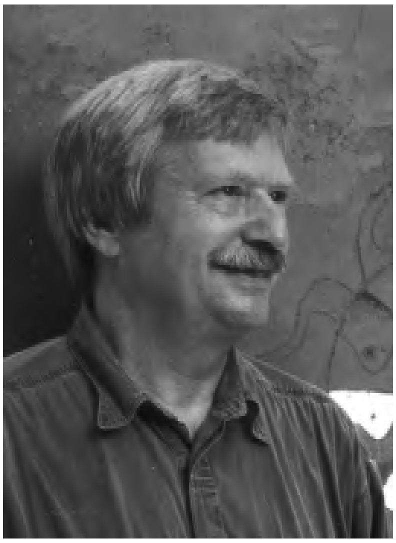
About the author



Gernot Minke is architect and professor at Kassel University, Germany, where he heads the Forschungslabor für Experimentelles Bauen (FEB) (Building Research Laboratory). Since 1974 more than 30 research and development projects have been realized in the field of ecological building, low-cost-housing and especially building with earth.

In his private architectural office he has designed many private and public buildings, all of them having earth as a predominant building material. His buildings stand not only in Europe, but also in Central and South America and India.

He is the author of several books, more than 200 articles, has been invited to more than 30 international conferences and was visiting professor in Mexico, Guatemala, Paraguay and Venezuela.

INTRODUCTION

In many countries, where natural science and technology are only now being called on to help solve the problems facing the land, educational planners and educationalists have to decide how to meet this challenge in science teaching at primary and secondary level. Conventional teaching media, which must generally be imported, are beyond the means of the already stretched education budgets and some teaching aids, that look to promising, do little more than confuse pupils, without helping to answer the questions.

Time, and a detailed knowledge of the regional problems will be needed in order to find a promising future solution for each country.

We would like to present one possible solution in the form of this collection of fundamental scientific experiments, requiring few, simple and readily available materials and inputs. Experience in many and varied projects, along with evaluations of the relevant curricula and of the schooling situation in various countries spurred us to take this step.

What has emerged is a collection, which we feel is in line with the level of previous methodical and didactic knowledge of the teaching staff, who are often inadequately trained for the tasks they are expected to perform. It provides the information needed for an interesting lesson and is meant to appeal the various intellectual faculties of children. To this end the experiments are described in simple, easy to understand language, and designed in the form of lesson blueprints.

Please let us know whether this collection lives up to its goal of providing practical assistance and as many ideas as possible in terms of materials, methods and experiments. We would be interested to hear from you which interests were awakened and what understanding pupils developed as a result of the individual experiments.

We would like to thank all those who contributed information, critical comments and ideas and, above all, the authors whose professional inputs have made this collection possible.

TABLE OF CONTENTS

1. BOTANY

1.1. THE EXPANSION IN VOLUME OF SWELLING SEEDS

Main Goal:

This experiment illustrates in an impressive way how seeds expand in volume as they steep.

Information:

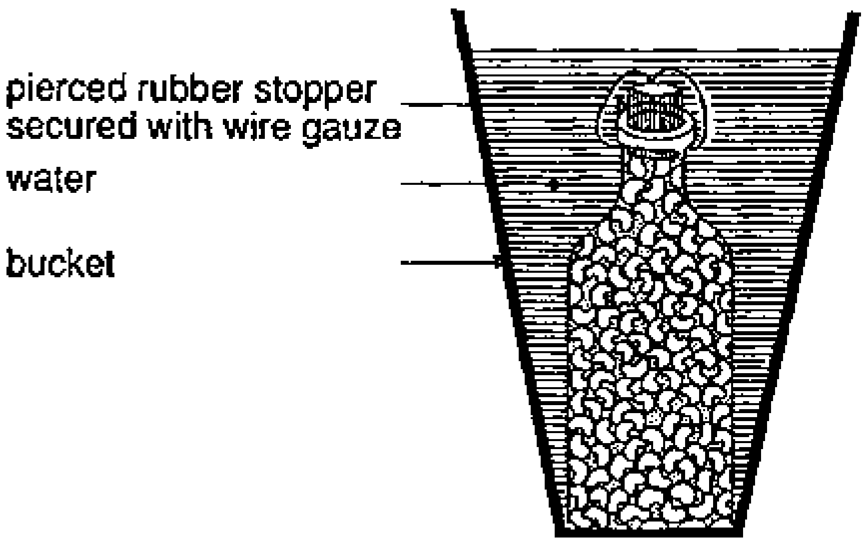
Seeds have a great osmotic pressure, which is responsible for water absorption during the steeping process. (Osmosis is the diffusion of fluids and gases through a membrane or porous partition.)

Materials and Apparatus:

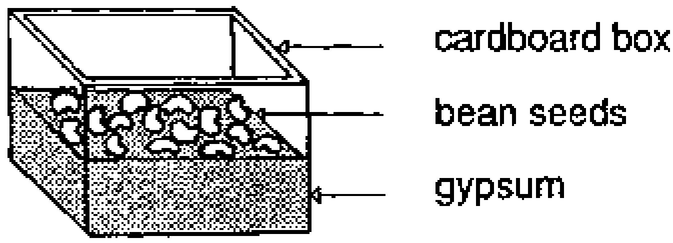
bean or pea seeds
a. sand, water, a bottle, a pierced rubber or cork stopper, bucket;
b. gypsum, water, a small cardboard box, a vessel.

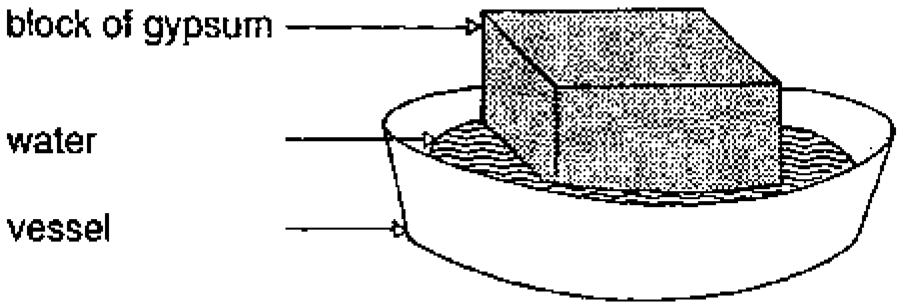
Procedure:

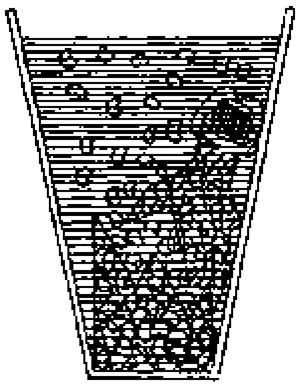
a. A bottle is completely filled with either bean or pea seeds and sand. The sand fills the spaces between the seeds. The bottle is tightly sealed with the pierced stopper. The stopper can be secured with wire gauze. The bottle is placed in a bucket filled to the rim with water. The bottle has to be totaly submerged.



b. The small cardboard box is half filled with plaster of Paris. 15 seeds are placed in this and then the box is immediately completely filled with the plaster of Paris. The gypsum is left to firm completely and then the whole block is placed in water. Instead of a cardboard box you can use any other container, e.g. a plastic yoghurt tub.







Observation:

After a few days the bottle and the plaster block shatter.

Analysis:

The seeds expand in volume to such a degree that the bottle and the block of gypsum shatter.

Importance in Nature:

Such power is necessary to push away the ground when the seeds swell in the soil. Otherweise they could not germinate, because they need the intake of water to make the stored nutrients in the seeds usuable.

1.2. THE TASK OF THE SEED LEAVES (COTYLEDONS) OF BEAN OR PEA SEEDLINGS

Main Goal:

This experiment illustrates that seed leaves (cotyledons) play an important role in the early development of seedlings.

Information:

The two seed leaves of beans (or peas) contain a certain amount of reserve substances. These nourish the seedling until it is able to absorb mineral salts from the soil through its fully developed roots and carbon dioxide from the air through their leaves.

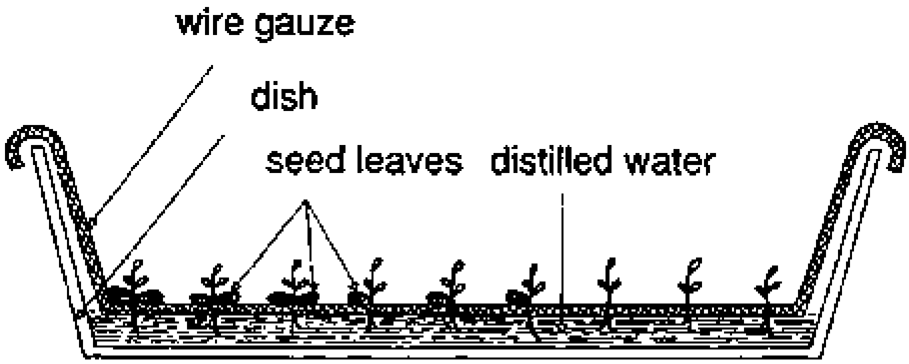
Materials and Apparatus:

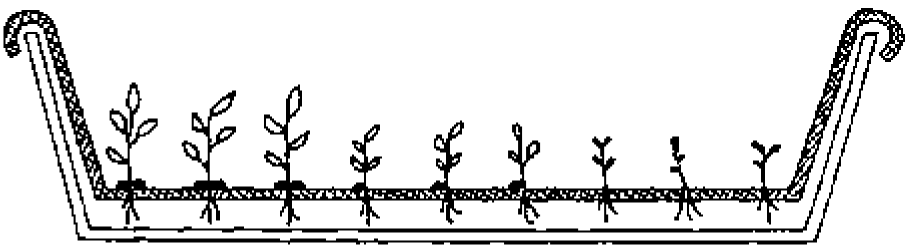
a. 9 seeds capable of germinating (peas) 9 seedlings of the same size 2 pieces of wire gauze or 9 test tubes or flint-pebbles to hold the plants (the size should be such that the seedlings do not fall through the mesh) 1 dish (measuring about 13 cm by 5 cm, and about 7 - 10 cm in height) distilled water (Available in every garage. If distilles water cannot be bought or produced, rain water or tap water may be used).

Procedure:

a. Put the beans on the wire gauze. Make sure that they are moistened regularly. Let them germinate. Watch the water. If it becomes grey change it, because there are fungi in the water which may start to destroy the experiment.

b. When the seedlings are about 1 cm hight, both seed leaves are taken from each of three seedlings and one seed leaf from three others. The roots must be kept below the surface of the water. The last three remain unchanged. The experiment is analysed after about a week.





Observation:

The seedlings without any seed leaves have not grown.
Those with just one seed leaf have hardly grown.
The seedlings with two seed leaves have grown noticeably.
All of the seed leaves have withered.

Analysis:

The seed leaves nourish the seedlings until they are capable of absorbing mineral

salts through their roots.

Importance in Nature:

The nutrients the seed leaves use when germinating are the same as those we use when we eat beans, peas or other seeds. The reserve substances stored for the seeds themselves give us the feeling that we are full.

1.3. SEEDS DO NOT GERMINATE IN FRUITS

Main Goal:

This experiment illustrates the existence of materials which inhibit the germination of seeds in fruits.

Information:

In order to germinate, seeds need water as well as air. In most kinds of fruits, seeds do not germinate. One reason, besides the lack of air, is that there are substances in the fruits which prevent germination.

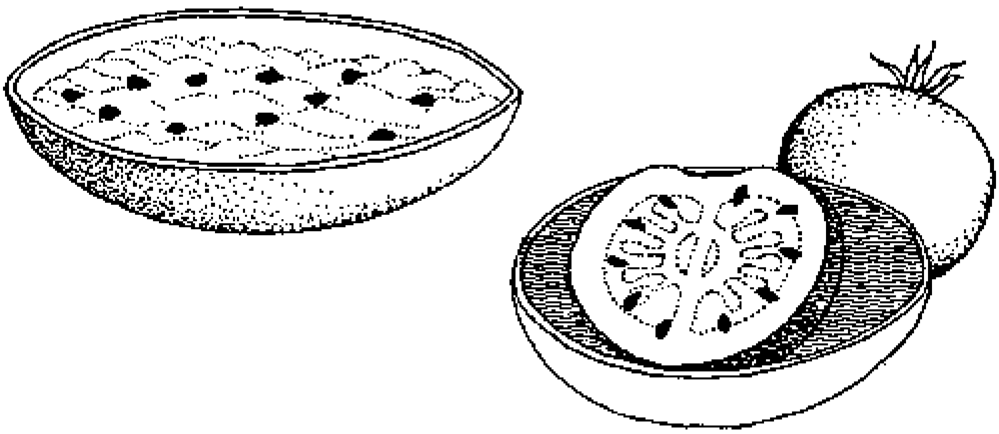
Materials and Apparatus:

different kinds of fruit (e.g. oranges, apples, melons, tomatoes)
40 cress seedlings
4 round filters, or absorbent paper, or cotton wool
5 round dishes, about 10 cm in diameter (e.g. lids of jam jars)
1 knife water

Procedure:

40 cress plants are soaked for about 10 minutes in one dish filled with water. (The swelling process takes longer if other fruit seeds are used, and some are not capable of germination.)

Meanwhile the moistened filters and the cut parts of the fruits are placed into the other dishes. Ensure that the equipment and your fingers are clean when you cut the fruits and place the parts into the dishes, otherwise you can get blue mould growing on your experiment. If blue mould should grow nevertheless repeat the experiment. The swelled cress seedlings are distributed among the four dishes as shown in the diagram below. They are observed for 4 - 5 days.



Observation:

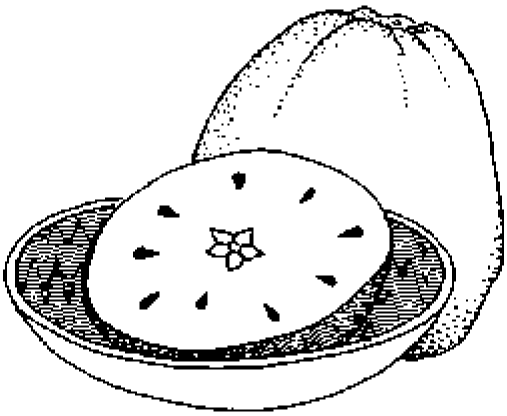
Although the seeds in all the dishes receive air and water, germination takes place only in those dishes in which they were placed directly on moistened paper. (One or two germinated seeds on the fruit slices do not distort the result. Experiments in biology do not necessarily succeed completely.)

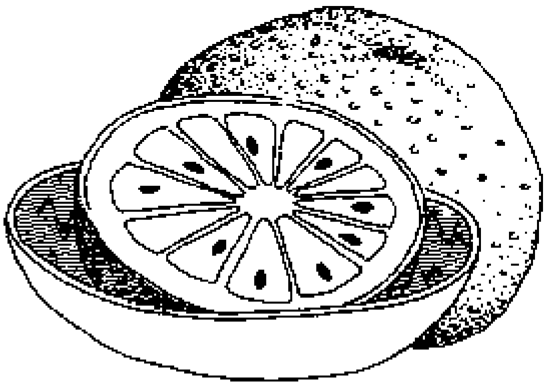
Analysis:

Fruits contain substances which inhibit the germination process. These prevent the germination of seeds. The seeds can only start germination and growing once the fruits are rotten.

Importance in Nature:

Fruit seeds are spread by birds, which are attracted by the coloured fruits. The birds eat them, and drop the seeds with their droppings. The seeds then germinate and grow where they land.





1.4. PLANTS DO NOT GROW WITHOUT LIGHT

Main Goal:

This experiment demonstrates that plants wither without light.

Information:

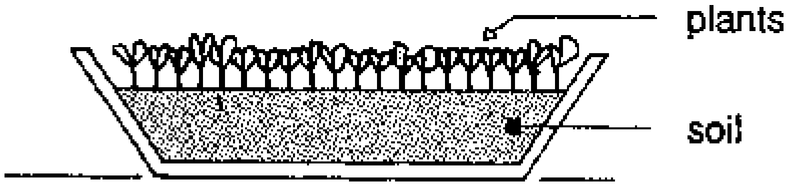
Plants require light to produce carbohydrates from carbon dioxide and water. (The carbohydrates are decomposed gradually by the metabolism of the plant. During this process, energy necessary for the vital functions of the plant is liberated.)

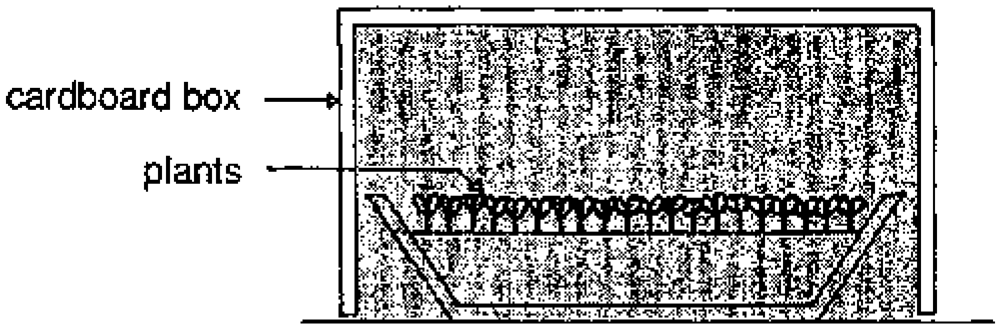
Materials and Apparatus:

cress plants (about 30)
2 flat receptacles filled with soil (e.g. cut-off tins or plastic mugs)
water
1 cardboard box

Procedure:

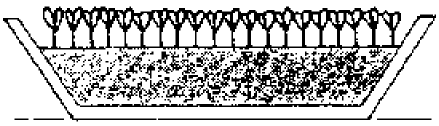
Cress plants are grown in the two receptacles in moist soil until they are approximately 1 cm high. A cardboard box is placed over one of the receptacles (see diagram). The soil is kept moist. (Other plant types may also be used.)

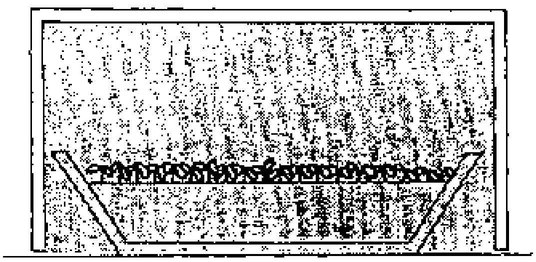




Observation:

After a few days it can be observed that the leaves of the plants under the cardboard box have turned yellow. The plants do not grow further.





Analysis:

> **Besides water and the mineral salts which are found in the soil and carbon dioxide from the air, plants need light to grow.**

1.5. PLANTS GROW TOWARDS THE LIGHT

Main Goal:

> **This experiment demonstrates that plant shoots usually grow towards the light.**

Information:

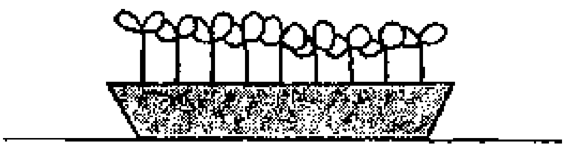
> As a rule, shoots grow towards the light. Light is indispensable for photosynthesis of plants.

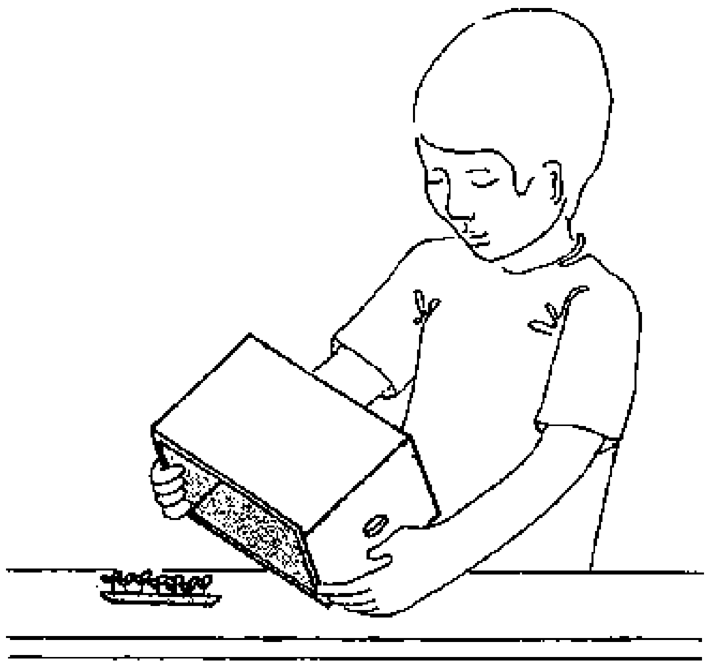
Materials and Apparatus:

> *about 20 cress seedlings in soil (mustard seedlings or other kinds of plants can also be used)*
>
> *cardboard box*
>
> *a pair of scissors or a knife*

Procedure:

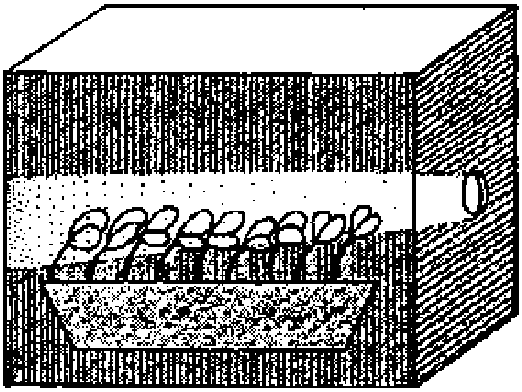
> A hole measuring some 2 cm^2 is cut in one side of the cardboard box. The hole should be cut at the height of the cress seedlings. This cardboard box is placed over the seedlings. The experiment should be placed beside a window with the hole facing the window.





Observation:

After a few days it is observed that the axes of the seedlings bend towards the light source.



Analysis:

This bending towards the rays of light is known as **“phototropism”.**

Importance in Nature:

Phototropism helps the plant to get as much light as possible for a maximum photosynthesis. But in nature this involves certain problems: maximum photosynthesis means a maximum of transpiration. High rates of light deminish the growth in length, which can become a problem in competition with other plants. Everywhere in nature we thus see an optimal compromise.

1.6. PLANTS TRANSPORT WATER

Main Goal:

This experiment shows that plants transport water. There are ony few flowers which are suitable for this experiment.

Information:

Plants contain vascular tissue. The xylem (woody tissue of a plant) conducts moisture and mineral salts. The phloem (sieve-tube tissue) serves as a path for the distribution of synthesized food.

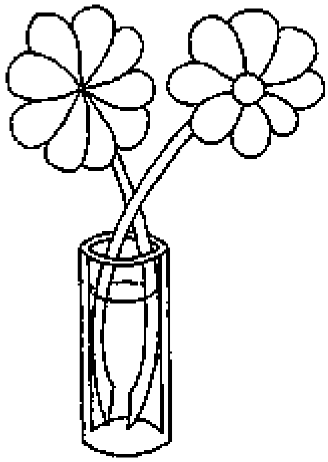
Materials and: Apparatus:

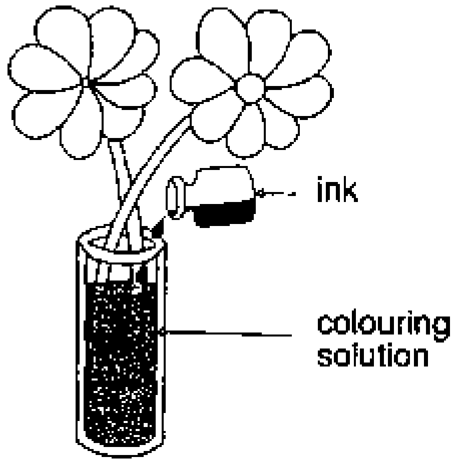
white or yellow flowers like sowbread, snowdrop, white lilies, impatiens and other flowers with somewhat hyaline stalks and petals. You can also use small twigs of deciduous trees with very young leaves. It may be necessary to test some plants available in the country where the experiment will be carried out.
water-soluble 1% red or blue colouring
(red or blue ink, acid solution)
1 glass or plastik beaker, approximately 15 cm in height
(depending on the length of the plant stalks)
water
knife

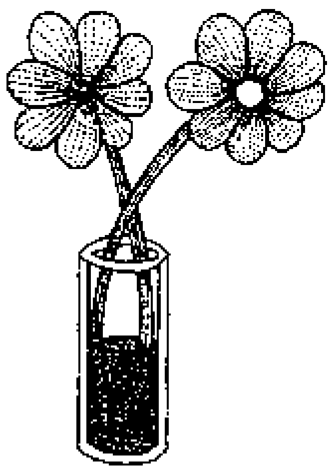
Procedure:

Some flower stalks are cut obliquely under water and placed in the dish with the colouring solution. The stalks must be cut under water to prevent the appearence of an embolus of air in the lower part of the stalk. That would prevent the coloured water rising in the stalk.

This experiment takes between 30 and 60 minutes, sometimes half a day, depending on the kinds of plant used.







Observation:

The colouring solution can soon be seen in all parts of the plant. The way it moves up the stem can be clearly observed.

Analysis:

Water is conducted into each part of the plant by the **plant's vascular tissue. Thus, a permanent water supply is guaranteed.**

Importance in Nature:

The water has to got somewhere. Otherwise the plant would be fully saturated, no more water could rise and there would be no more intake of nutrients from the soil. Here once again we se optimal compromise.

The next experiment looks in more detail at water loss.

1.7. THE WATER EVAPORATION OF PLANTS

Main Goal:

This experiment illustrates that plants release water via their leaves.

Information:

Roots absorb water, which is conducted by the vascular tissue to all parts of the plant. The water evaporates via the leaves, so that a constant flow of water is guaranteed.

Materials and Apparatus:

1 thin (young) branch of a deciduous tree

water

oil (plant oil as used for cooking will be best. Do not use motoroil at all. It will damage the leaves by releasing poisonous gases).

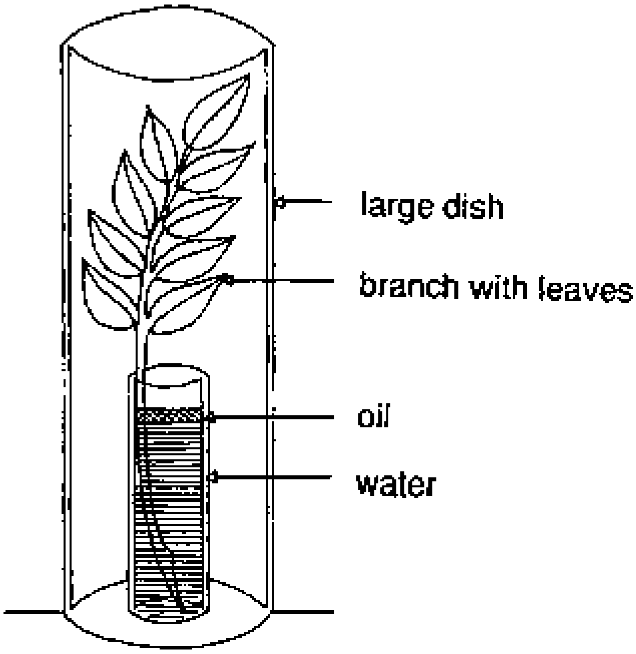
1 glass or plastic beaker (about 10 cm in height)

1 glass only (about 20 - 25 cm in height)

Procedure:

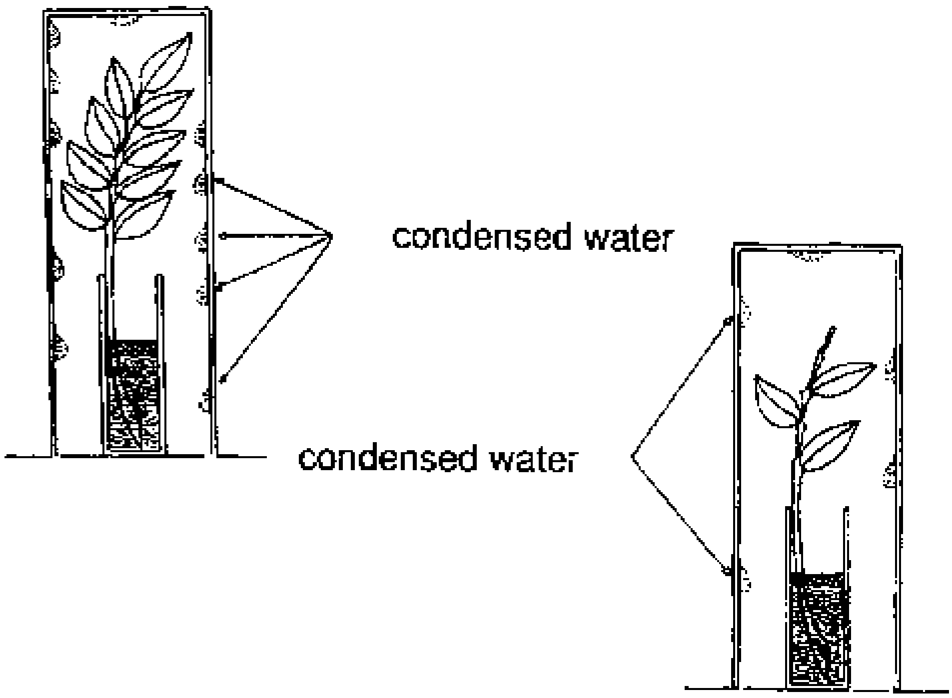
The branch is cut obliquely under water and then placed in the smaller glass or beaker which is filled 2/3 full with water. The stalks must be cut under water to prevent the appearence of an embolus of air in the lower part of the stalk. That would prevent the water rising in the stalk. Then oil is carefully poured into the glass to form a 0.5 cm layer on top of the water.

The larger glass is placed upside down over the apparatus. Place the experiment in cool surroundings This is the only way in which you can see the outcome because the evaporated water will only condense on the walls of the glass if the glass is cool.



Observation:

Moisture condenses after some time on the inside of the larger glass. The condensed water will firstly form a layer on the wall of the glass and will later flow together to form drops of water.



Analysis:

The condensation is water, which can only have evaporated via the leaves.

This process is known as transpiration.

The moisture evaporates through tiny holes on the underside of the leaves.

As the number of leaves increases, so too does the transpiration via the leaves.

Addition:

The water can be identified with dried white copper sulfate, which turns blue.
(see experiment: THE COMBUSTION PRODUCTS OF A FLAME.)

Practical Meaning:

There are different devices which prevent a plant drying out.

The plant protects itself by:

- thick leaves covered with a layer of wax;
- thick shoots with a tissue that can store water;
- bark formation;
- closing the stomata in the leaves in certain circumstances;
- growing dry hair on the lower surface of the leaves.

1.8. THE IMPORTANCE OF MINERAL SALTS

Main Goal:

This experiment shows that plants cannot live without mineral salts.

Information:

The seedlings obtain proteins, fats, carbohydrates, the nutrients necessary for their growth from the seed leaves.

To retain their vital functions, plants synthesize the nutrients in various metabolic processes. In order to do this, mineral salts and water are indispensable.

Terrestrial plants absorb the mineral salts, which are dissolved in the soil, through their roots.

Materials and Apparatus:

20 beans plants or other plants

2 glass or plastic vessels

2 pieces of wire gauze (or 8 test tubes with flint pebbles to hold the plants)

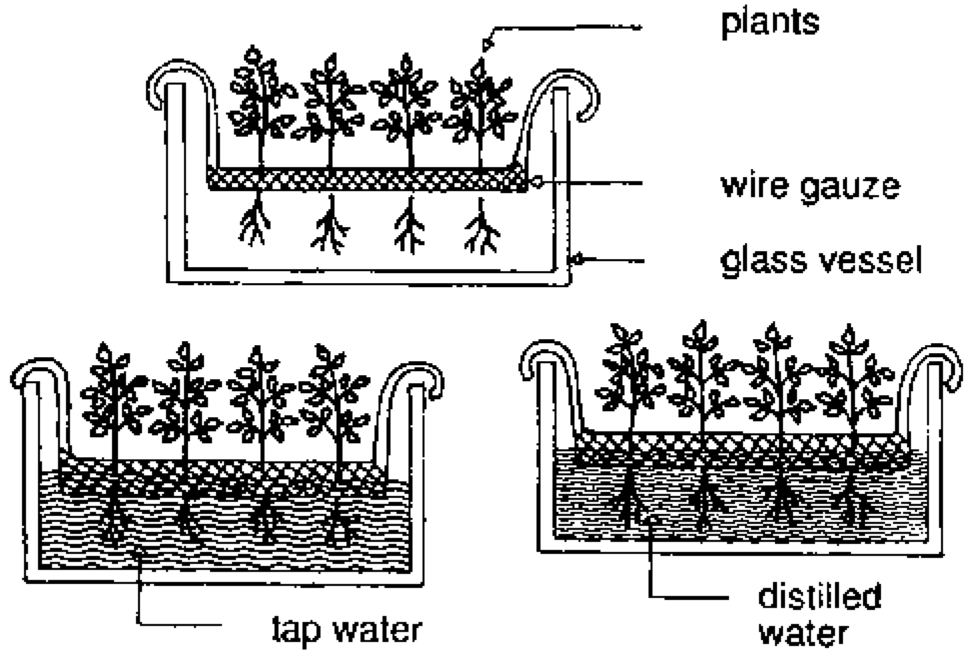
tap water

distilled water

1 bucket loamy soil

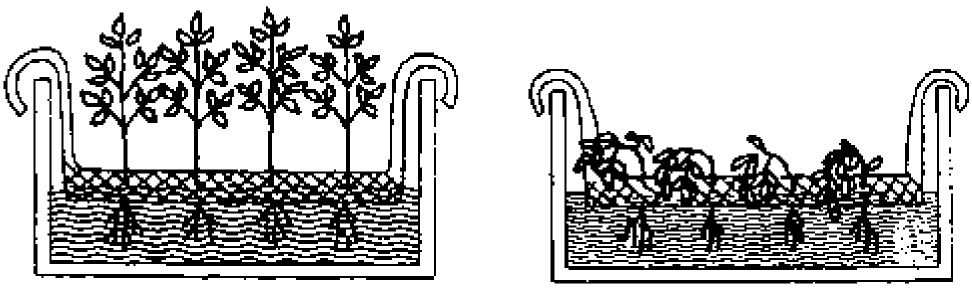
Procedure:

Put a small shovel of soil into the bucket and add a large amount of water, so that you can stir the soil. Then fill the two dishes with the water obtained from the soil. This water contains nutrients from the soil. Put the gauze onto the dishes and ten beans on each of them. Make sure that the beans are regularly moistened. Watch the experiment to prevent funghi starting to grow. When the beans are about 5 cm high, replace the soily water from one of the dishes and replace it with distilled water. Rinse off the roots of those ten beans thoroughly but very carefully, **without removing them from the gauze.** Then put those beans into the vessel with distilles water.



Observation:

After a few days it can be observed that the plants in the distilled water develop poorly.



Analysis:

Distilled water does not contain mineral salts. Like soil, normal water contains mineral salts. These are necessary for the vital functions of the plants.

1.9. PLANTS PRODUCE OXYGEN

Main Goal:

This experiment demonstrates that a gas, oxygen, is produced during photosynthesis.

Information:

In their green leaves, with the help of sunlight, plants produce glucose and oxygen from carbon dioxide and water. This process is called "photosynthesis".

Materials and Apparatus:

In different countries there may be other plants which are suitable for this experiment, waterweed (elodea)

glass vessel

funnel with a short or shortenes neck (see figures)

rubber stopper

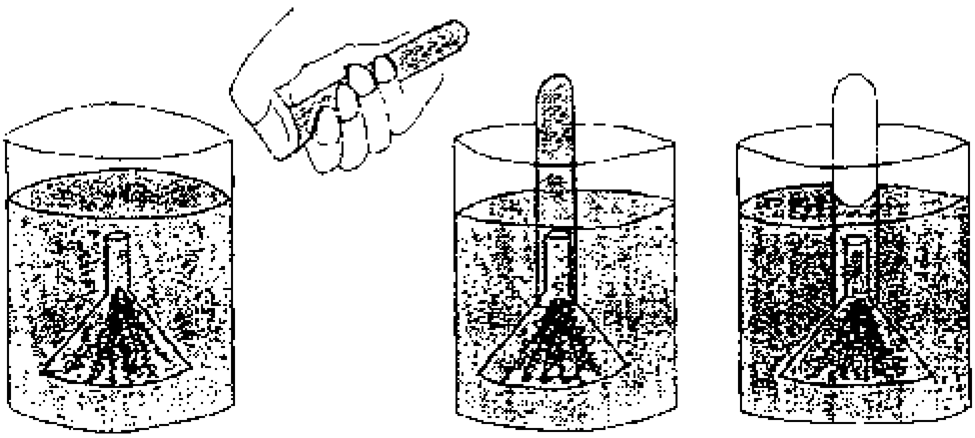
a wood chip

matches

Procedure:

Bind about 15 stems of waterweed together with a piece of thin wire or a thread. Place them in a vessel which is filled with water almost up to the rim. The cut parts of the waterweed must point upwards. Put the funnel over the waterweed. Make sure that the top of the funnel neck is under water. (See figure) Then fill the test tube up to the rim with water. Seal it with your thumb. Turn it over and place it, still sealed with your thumb, into the water in the vessel. Place the tube over the funnel neck without pulling the tube out of the water. This is the only way, of placing the tube over the funnel neck, while retaining the water in the tube. - When the tube is nearly full of gas produced by the waterweed, take a glowing wood chip, remove the testtube from the funnel neck, turn it up and place the glowing wood chip into the tube.

Observe what happens.



Observation:

Gradually the water in the tube is replaced by gas. The glowing chip lights up.

Analysis:

The gas produced by the waterweed could be oxygene or methane. You can exclude methane since, although it is a gas left by anaerobic bacteria in rotting organic

matter, it is poisonous to plants.

Importance in Nature:

Human beings and animals need oxygen to breathe. That is: We depend on plants producing oxygen, as do all animals. Therefore it is necessary to protect plants and the areas where they grow.
See experiments botany 1.12 und human biology 2.10.

1.10. STARCH FORMATION IN LEAVES

Main Goal:

This experiment serves to identify a product resulting from photosynthesis, namely starch.

Information:

Starch is one of the most important reserve substances of green plants. It is found as assimilation starch in the chloroplasts of green leaves.

Materials and Apparatus:

a. plants with relatively large leaves
paper
pair of scissors
needles

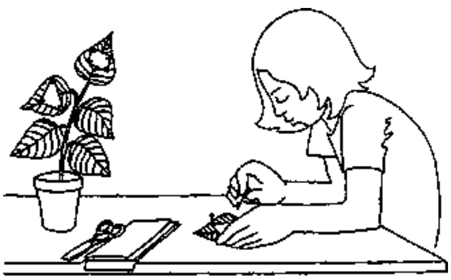
b. 3 dishes
water
alcohol (96%)
iodine solution
(iodine-potassium iodide solution 1%)

Procedure:

a. As shown in the diagram below, the leaves are covered with patterns. The plant stays like this for one day and one night. The experiment to detect starch can be carried out after the plant has been sunlit for at least three hours the next morning.

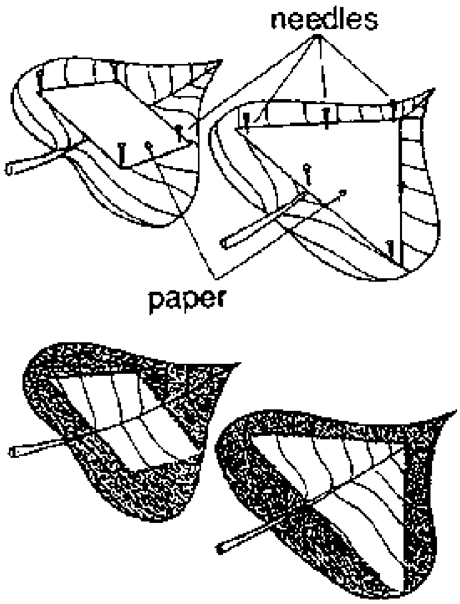
b. The leaves are cut off the plant and the patterns are removed. **Before heating the water put the alcohol aside so that it cannot be inflamed.** Boil the leaves for about five to ten minutes (depending on the hardness of the tissues of the leaves used).

After extinguishing the burner the leaves are dipped into the alcohol until the chlorophyll is almost extracted. This should take about five minutes. Then place the leaves upside down on a plate and drop up to five drops of the iodine solution onto each leave. Rub the solution into the tissue of the leaves with the tip of a small stick. Leave the experiment for about one or two minutes. Then rinse the leave.



Observation:

Where starch is present the iodine will turn to a bluish brown or a deep dark brown. Parts without starch will become only a little bit yellow brown.



Analysis:

Iodine colours starch bluish brown or deep dark brown.

For the starch formation, chlorophyll and light are indispensable.

Addition:

Starch is the typical vegetable reserve carbohydrate, e.g. of grain.

Potatoes have a high starch content. When iodine-potassium iodide solution is dropped onto a cut potato, the surface turns a black-blue colour immediately.

(The blue-black colouring results from an inclusion of iodine molecules into the twisted arrangement of the starch molecules.)

1.11. THE PRODUCTION OF GASES BY PLANTS UNDER DIFFERENT CONDITIONS

Main Goal:

This experiment demonstrates that the amount of gas produced by plants depends on the amount of carbon dioxide available.

Information:

Plants transform the carbon dioxide from the air or water with water and energy from sunlight into sugar and starch. During this procedure so much oxygene is produced that the plant cannot use it all. This surplus of oxygen escapes from the plant.

Materials and Apparatus:

a glass vessel, e.g. a jam jar
boiled water which has been left to cool down
soda water
waterweed (other plants have to be tested)
one watch to count minutes

Procedure:

Fill the vessel up to one cm below the rim with tap water. Place a piece of waterweed into the water. Wait one minute. Watch and count the bubbles rising from the stem for exactly one minute. The bubbles are best if they large and discharged at a rate of not more than about ten a minute. Then change the water and place the waterweed into the boiled cooled water. Observe whether the plant continues to produce gas bubbles. After a few minutes pour some soda water into the vessel. Wait a minute and observe the plant. If it starts producing gas again, wait two minutes and then count the bubbles once more for exactly one minute. Compare the results obtained.

Observation:

In the first case you will note a few bubbles, in the second case there will be no bubbles, and in the third case you will see more bubbles of gas than in the first case.

Analysis:

Tap water contains a little carbon dioxid, enough for the waterweed to produce sugar and then a surplus of oxygen. In boiled water there is no carbon dioxide and the plant cannot act. The plant is not dead, however as we can see from the fact that it produces a lot of bubbles after adding soda water, which contains a large quantity of carbon dioxide.

Importance in Nature:

With this experiment, botany 1.10 and human biology 2.10 you can explain by yourself the circle of oxygen and carbon dioxide in nature and how animals and human beings depend on plants and vice versa.

1.12. THE TRANSPIRATION OF PLANTS

Main Goal:

This experiment shows that a large account of water evaporates through plant leaves (more than evaporates from an open surface of water).

Information:

Plants transpirate through their leaves.

On the lower side of the leaf there are many small pores, stomata, through which the steam excapes. Only one percent of the surface of the leaf is covered with those stomata, but more water escapes there than from a surface of water as large as the whole surface of a leaf.

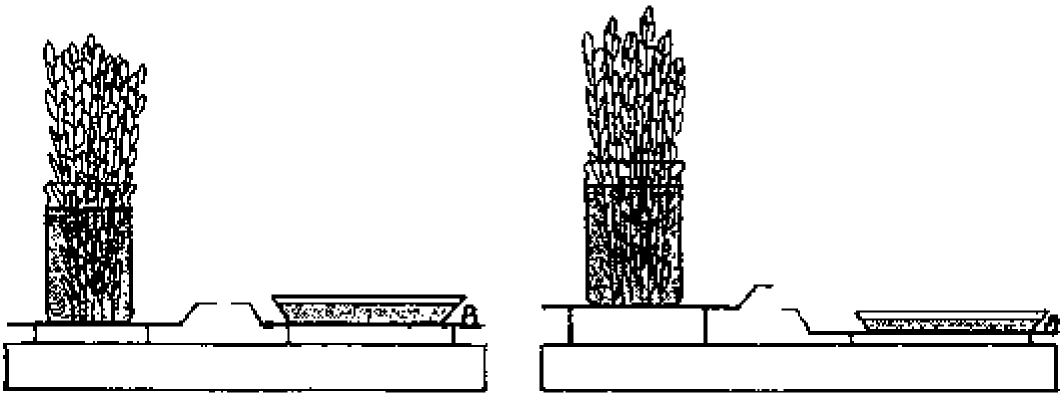
Materials and Apparatus:

a big beaker (about a litre), e.g.
a preserving jar a dish measuring about 20 cm in diameter, e.g. a plate
a platform balance with several weights
a bunch of twigs with leaves

Procedure:

Put the bunch of twigs into the beaker and fill it up with water. Fill the dish with water too. Put them on the scales so that they balance.

Leave the experiment for about 30 minutes. Then compare the levels of the plantforms.



Observation:

The platform with the twigs in the beaker will go up, the other one naturally down.

Analysis:

More water has evaporated through the leaves of the bunch of twigs than via the surface of the water in the dish.

Importance in Nature:

Only a little area of the lower surface of the leave is needed to release enough water to enable them to take as many minerals from the soil as necessary. The leaf remains stable in this way. There are only small parts where germs can get into the plant. There is another example of optimal compromises in nature.

1.13. GERMINATING PLANTS IN DIFFERENT CONDITIONS

Main Goal:

This experiment shows that seeds, in this case pea seeds, need air to germinate.

Information:

see analysis.

Materials and Apparatus:

ten pea seeds (other seeds have to be tested)
two dishes with a rim high enough to cover the pea seeds with water
cotton wool or some other such substance to keep the pea seeds moistened

Procedure:

Put the cotton wool in one of the dishes and place five pea seeds on it. The other five seeds are placed in the other dish. Fill the first dish with water so that the seeds are just covered. Keep only the cotton wool wet after the seeds have soaked up the water.

Fill the second one up to the rim and keep the water at this level.

Watch the dishes and change water if it becomes grey.

Than there are funghy which will start to destroy the experiment.

Observation:

After 24 hours the seeds are swollen.

After another 24 hours the pea seeds on the cotton wool have germinated, while the seeds under water have not germinated or not to any great extent.

Analysis:

Though there is some oxygen soluted in tap water it is not enough to let seeds germinate. Plants can use their nutrients stored in the seed leaves only if there is enough oxygen available to decompose the starch into sugar.

Addition:

Now you know why the earth has to be loose and wet, when you sow seeds in the garden.

2. HUMAN BIOLOGY

2.1. HEAT RADIATION OF THE HUMAN BODY

Main Goal:

This experiment demonstrates that the human body, like all other substances, emits heat to a colder surrounding.

Information:

The average body temperature of a healthy human being is 37° C. This temperature is maintained by the various metabolic processes (see experiment “HEAT RADIATION”).

Materials and Apparatus:

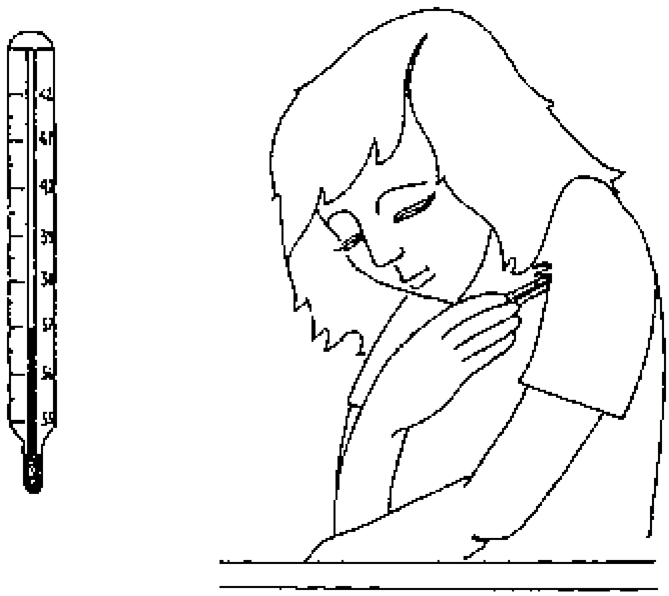
1 thermometer, if possible filled with alcohol rather than mercury

Procedure:

a. With the thermometer, the body temperature is measured under the armpits.

b. Fix the thermometer in a stand (e.g. a small branch in a pot with sand). Put one hand round the lower tip of the thermometer, close to it, but without touching the tip.

Wait about one or two minutes and note what happens.



Observation:

a. The thermometer indicates about 37° C.

b. The thermometer ascends for two to five degrees, depending on the surrounding temperature.

Analysis:

> **The average body temperature of a human being is 37° C.**
> **The body emits heat to a colder surrounding, e.g., the air.**

Practical Use:

> Human beings choose their clothing according to the outside temperature. To keep the heat radiation of the body at a low level, the Eskimos in Greenland wear thick furs. In southern warm countries, thin and often lightly coloured clothing is worn. It reflects the radiation of the sun better than dark clothing.

2.2. SENSATION OF WARMTH AND COLD

Main Goal:

> **This experiment illustrates that the sense of temperature cannot register temperature in** an **absolute way.**

Information:

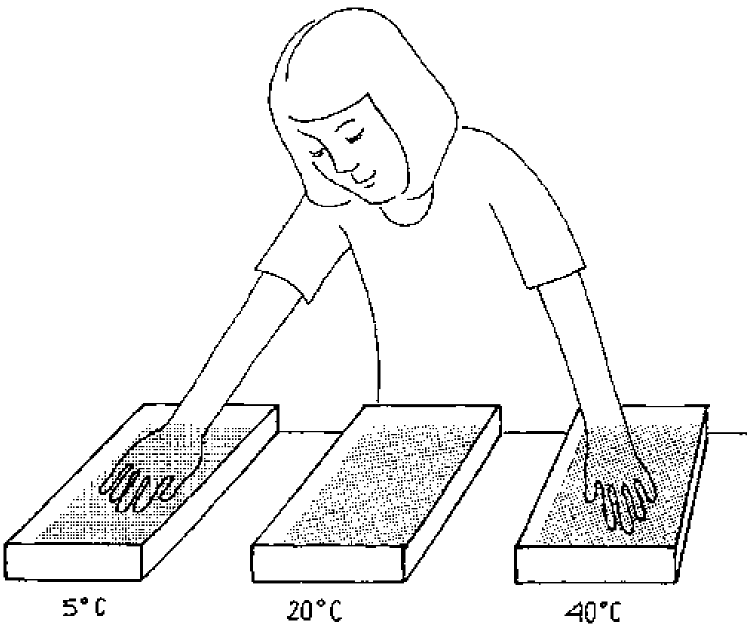
> Covering the skin of a human being are about 250 000 receptors to perceive cold and 30 000 to perceive heat. Temperatures which are too high or too low cause a feeling of pain.

Materials and Apparatus:

> *1 thermometer*
> *three litres of water one each at a temperature of 5° C,*
> *20° C and 40° C 3 flat dishes*

Procedure:

> One litre of water is cooled down, in a refrigerator, with ice or by placing it outside at night.
>
> Another litre is heated to about 40° C, and the last litre to about 20° C.
>
> The experiment is set up as shown in the diagram below.



One test person places his left hand into the left-hand dish and the right hand into the right-hand dish. After 5 minutes, both hands are placed simultaneously into the middle dish.

Observation:

The left hand perceives the water in the middle dish to be relatively warm and the right hand perceives it to be relatively cold. After some time the water is perceived as being the same temperature by both hands

Analysis:

Temperatures are perceived with the sense of temperature.

The sense of temperature needs some time to adapt to sudden variations in temperature.

Thus it is only reliable up to a certain point.

Addition:

Non-heated rooms such as a cellar, are perceived to be cool in summer and warm in winter, although the temperature is higher in summer than in winter.

2.3. THE TASTE BUDS ON THE TONGUE

Main Goal:

This experiment shows that the tongue is divided into various areas which perceive different kinds of tastes.

Information:

On the surface of the tongue are taste bud areas which are capable of distinguishing between sweet, sour, salty and bitter. These areas can be easily located.

Materials and Apparatus:

sugar

sodium chloride - household salt

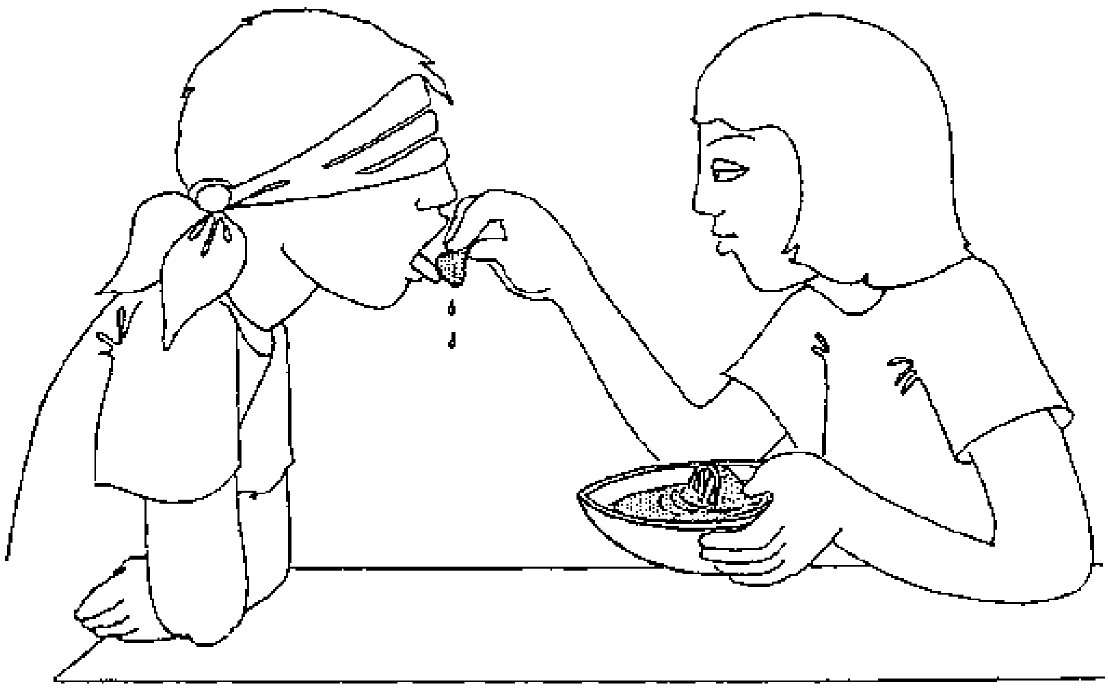
1 lemon

magnesium sulphate or one bitter grapefruit

4 cotton buds or wooden spatula
4 flat glass receptacles
1 cloth

Procedure:

Watery solutions of each of the above-mentioned substances and fruits should be prepared. A test person is blindfolded.



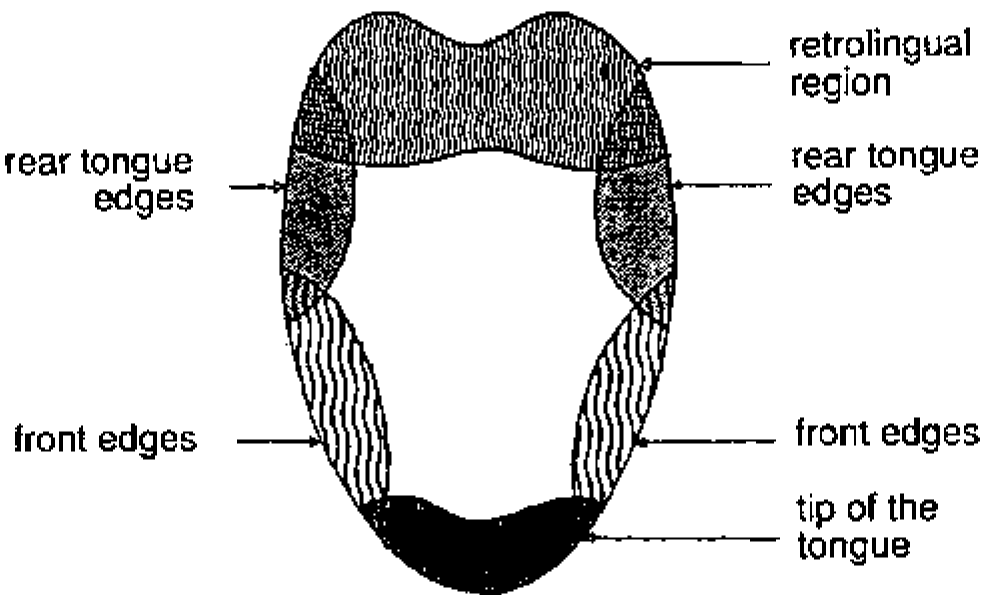
The solutions are placed on his/her tongue with the cotton buds. The test person states on which part of the tongue he tastes the solutions. The test person must rinse out his/her mouth with water between tests.

Observation:

Sweet tastes are perceived on the tip of the tongue.

The front edges of the tongue perceive salty substances.

The rear tongue edges perceive sour substances, and bitter ones are tasted in the retrolingual region.



Analysis:

The taste bud areas are shown above in the form of a diagram.
The four different kinds of taste can be perceived <u>best</u> in the above areas.
The tastes overlap at the extremities of each zone.

Addition:

The knowledge of the places where you perceive the four different tastes is of no use at first, for you will seldom taste only one of the four tastes, when you eat anything. But if you think about your taste of **a** meal, you can imagine what happens in your mind with all the single tastes, componed in a very tasteful meal: Your tongue distinguish only four different tastes, in your mind find hundreds of different tastes, all composed by only the four, plus the taste "hot".

2.4. THE SENSATION OF TASTE AND SMELL

Main Goal:

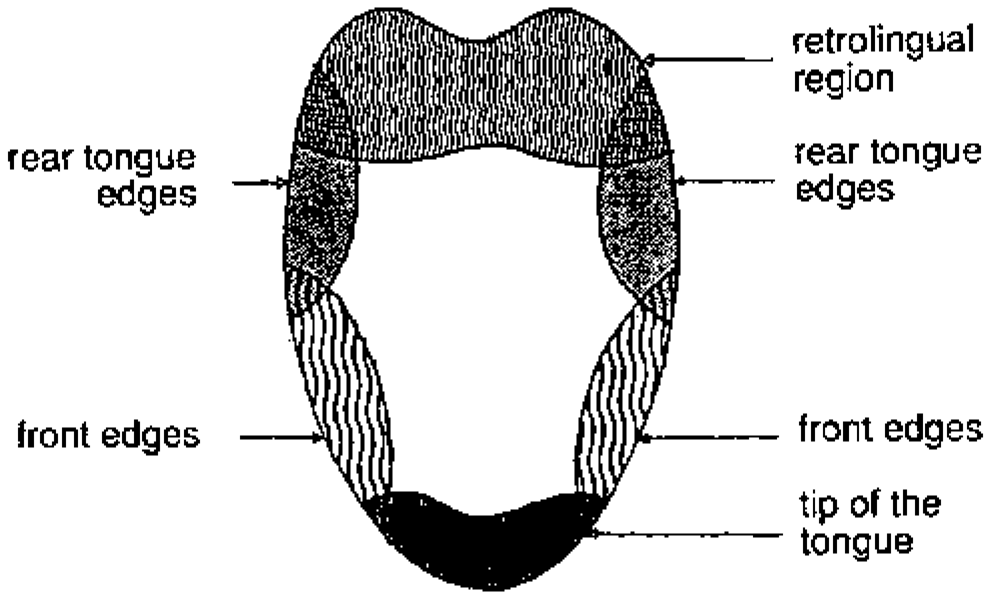
This experiment demonstrates the interaction of the senses of smell and taste.

Information:

Four different areas of taste are located on the tongue:

sweet, salty, sour, bitter.

However, feelings of taste are created by an interaction of the sense of taste with the sense of smell. The latter is located on the mucous membrane of the nose. Besides this, the sensation of taste is affected by the sensations of warmth, cold, pain and touch.



Materials and Apparatus:

1 apple
1 potato
1 onion

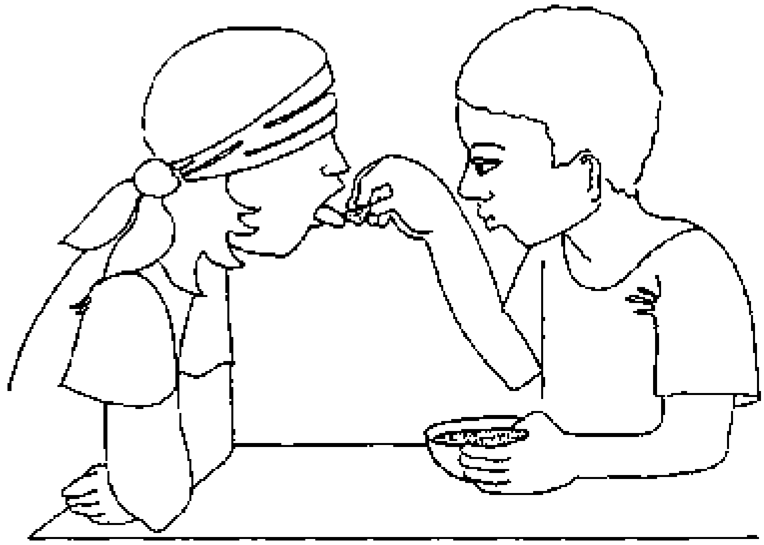
3 spoons
1 grater
3 dishes
1 cloth

Procedure:

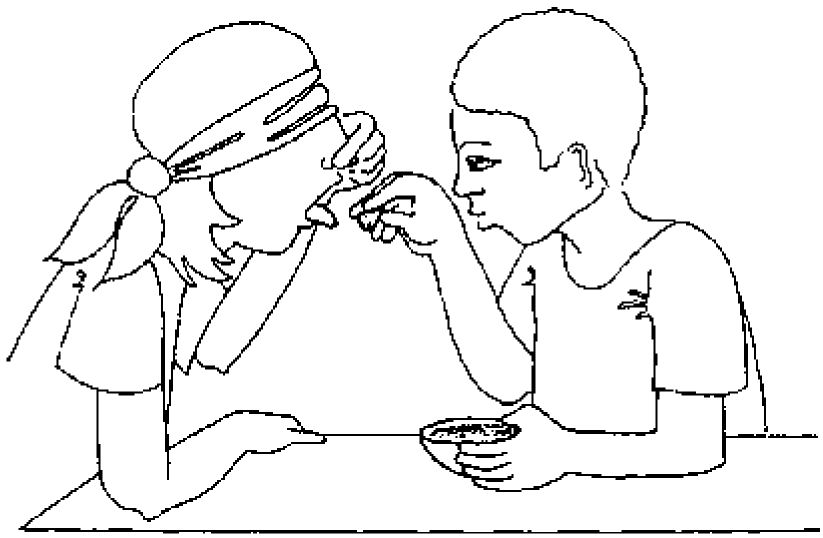
The fruit and vegetables are grated and placed on the dishes.

One test person is blindfolded.

Using the spoons, the grated apple, potato and onion are put onto the tongue of the test person one after the other. After each test the test person rinses his/her mouth with water. The test person identifies the taste.



The second test is performed in the same way, but this time the test person holds his/her nose.



Observation:

When the test person holds his/her nose, the sensation of taste is significantly weaker.

Analysis:

There is an interaction between the sensations of **taste and smell.**

Addition:

It is well-known that to a person with a bad cold, food “has no taste”. Refer back to experiment 2.3 and complete your knowledge of tasting a meal.

2.5. STARCH BREAKDOWN IN THE MOUTH

Main Goal:

This experiment illustrates that starch breakdown starts in the mouth.

Information:

In the mouth, food is chewed into small pieces and moistened with saliva. The saliva is formed in the salivary glands, two sublingual, two lower jaw, and two parotid glands.

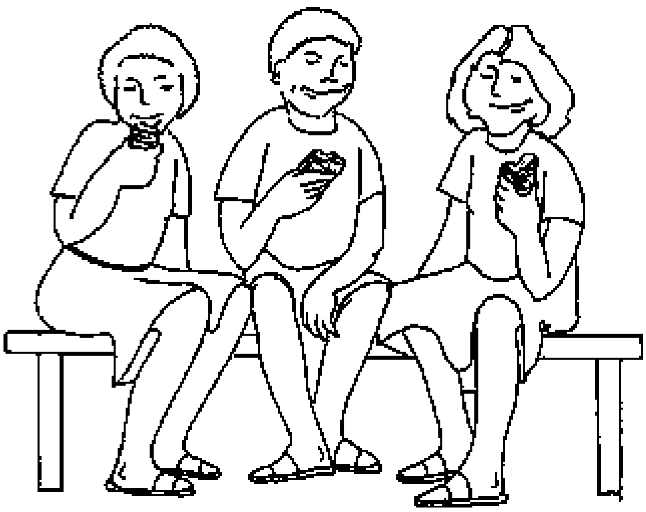
Saliva consists of mucus and the enzyme “ptyalin”. This enzyme causes the catabolism of starch into maltose. This catabolism continues in the stomach until the enzyme is made ineffective by hydrochloric acid, which is found in the stomach.

Materials:

a few cubes of bread
a few tubes
iodine-potassium iodide solution 1%

Procedure:

Put one cube of bread into a tube. Then drop so much of your saliva into the tube that the cube of bread becomes wet through. Drop about three drops of the iodine solution onto the cube. It turns dark blue. Keep the tube warm by closing your hand around the tube. Look periodically at the colour in the tube.



Observation:

After several minutes the colour changes from dark blue to light brown.

Analysis:

The enzyme ptyalin has catabolized the starch to sugar. Sugar cannot be tested with iodine solution. Therefore the blue colour disappears. This proves that the digestion of food starts in the mouth.

2.6. THE CINEMA EFFECT

Main Goal:

An expressive demonstration of the imperfections of the human eye.

Information:

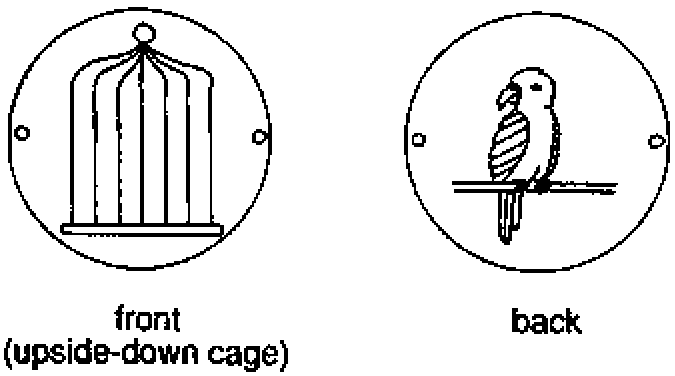
The human eye does not register individual stimuli which hit the retina within less than an eighteenth of a second. One uniform impression is created.

Materials and Apparatus:

one cardboard disk, about 5 cm in diameter
a piece of string
coloured pencils

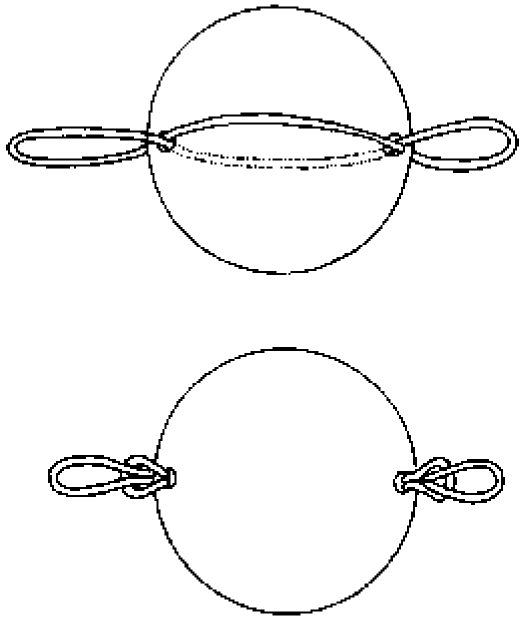
Procedure:

On one side of the cardboard disk a bird is painted and on the other side an upside-down cage.



The string is cut into two pieces. Each of them is made into a noose. The nooses are attached to the opposite edges of the disk exactly in the middle of the drawing. (See diagram below.)

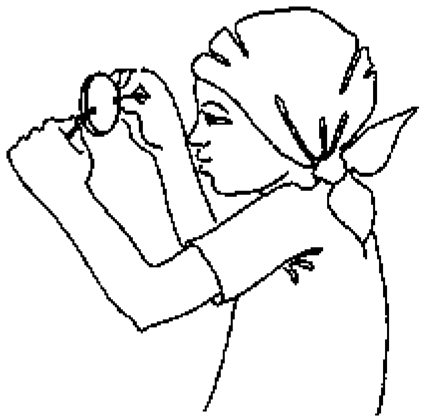
The free ends of the strings bands are firmly held, and then the disk is turned until the two strings are completely twisted. Then pull the ends of the strings in opposite directions. (If you pull too strongly you may tear the strings out of the holes in the cardboard.) The disk rotates rapidly and should be allowed to twist the strings in the other direction by loosing the pull on the strings. Then pull again and so on.



fastening of the strings

Observation:

Initially, the disk turns so quickly that the bird seems to be sitting in the cage.



Analysis:

The rapid sequence of images cannot be separated by the eye into single images. The sluggishness of the eye is responsible for this “cinema effect”, which is the melting together of single images into one **animated image. This effect can be produced at a spead of 18 pictures a second. Most films in the cineama and the television work with 24 or 25 pictures a second to avoid any flicker.**

2.7. THE BLIND SPOT

Main Goal:

An experimental demonstration of the blind spot.

Information:

Rods and cones cells which are sensitive to light, are parts of the retina.

Nerve fibers conduct stimuli to the optic nerve and then to the visual centre of the cerebral cortex.

Where the optic nerve emerges, there are no rods and cones, so that an image cannot be created. This spot is called the “blind spot”.

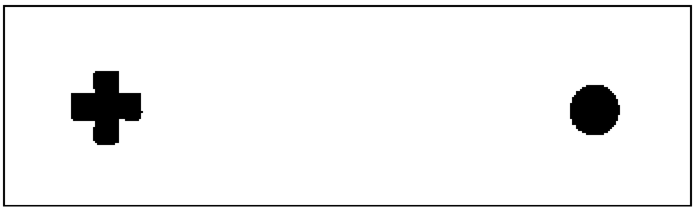
The brain completes the missing part of the image from its surrounding. Thus there is no “hole” in the field of vision.

Materials and Apparatus:

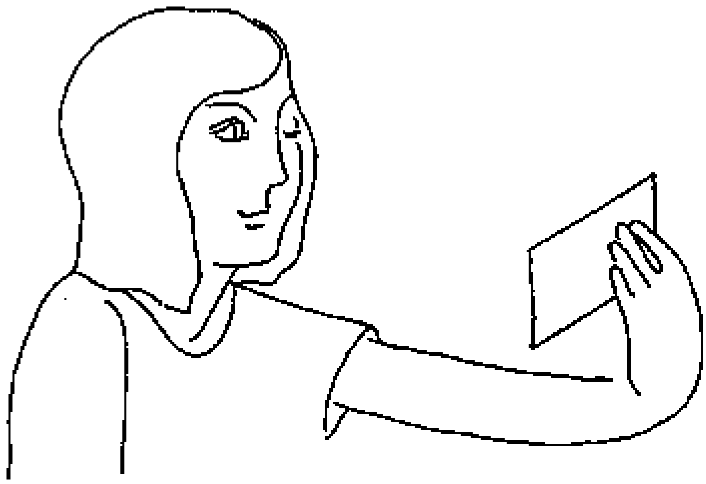
light cardboard, measuring about 10 cm × 3 cm
scissors
coloured pencil

Procedure:

The cardboard is prepared as shown in the following diagram. (Other symbols can also be used.)



The cardboard is held at arm’s length in front of the right eye, and the left eye shut. The right eye focusses on the cross, and then the cardboard is slowly moved towards the eye.



Observation:

The circle “disappears”, when the cardboard is a certain distance from the eye.

Analysis:

Light stimuli, which hit the optic nerve, are not transformed into an image. The spot where the optic nerve emerges is called the "blind spot".

2.8. A MODEL DEMONSTRATING THE FLEXIBILITY OF THE SPINE

Main Goal:

This experiment illustrates the flexibility and the stability of the spine.

Information:

The spine of a human being is shaped like a double "S". The spine of a baby or an ape is shaped like a single "S".

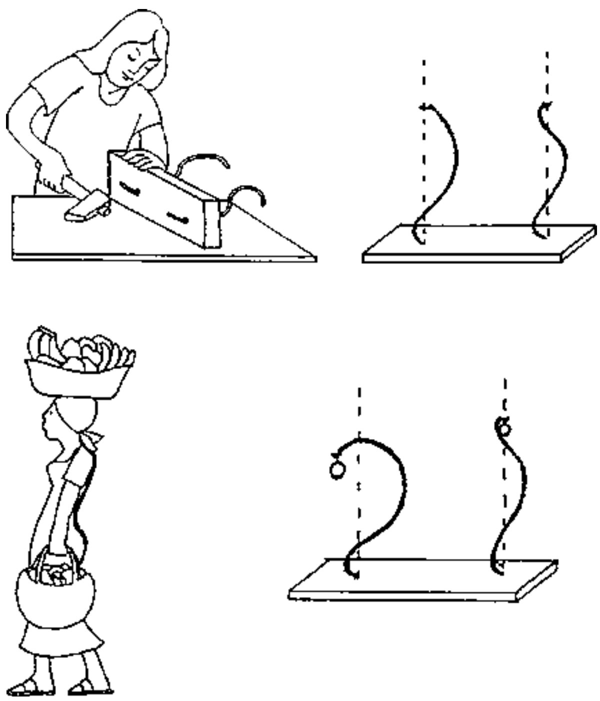
Materials and Apparatus:

2 solid pieces of wire about 50 cm long

a wooden board measuring about 10 cm × 20 cm different weights weighing about 50 - 200 g or other objects which can be hung at the top of the spine models.

Procedure:

As shown in the drawing below, the two wires are fastened onto the board and bent. Make sure that the curves are exactly at the same points as shown in the figure. Bend the two spine models so that the top is exactly above the fixing point of the lower part of the spine models. (This is indispensible for the success of the experiment.)



Identical weights are hung from each spine model.

Observation:

The single S-shaped spine sags to a greater extent than the double S-shaped spine.

Consequences

The double S-shaped spine of adolescents and adults is more stable than the single S-shaped spine of babies and apes.

Practical Meaning:

The spine of an adult can be subjected to great pressure.

Because it is more flexible, it absorbs vibrations resulting from walking upright. This protects the brain against the usually occuring vibrations.

In many countries, loads, e.g. water jugs, are carried on the head, because this makes the transport easier.

2.9. COSTAL RESPIRATION

Main Goal:

This experiment illustrates costal respiration.

Information:

When you breathe in, the volume of your chest increases. The muscles between the ribs contract, lifting the ribs, with them the breast bone (sternum) and therefore the complete chest (thorax).

Abdominal breathing usually takes place simultaneously with costal respiration.

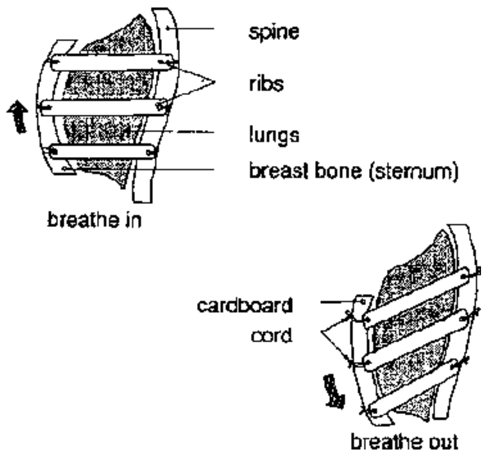
The muscular diaphragm contracts, so that it flattens, presses onto the internal organs, and moves the abdominal wall forward. The lungs follow this expansion. Breathing out provokes the reverse sequence.

Materials and Apparatus:

cardboard (or stiff paper)
scissors
cord, paper clips, rubber bands or blades of grass

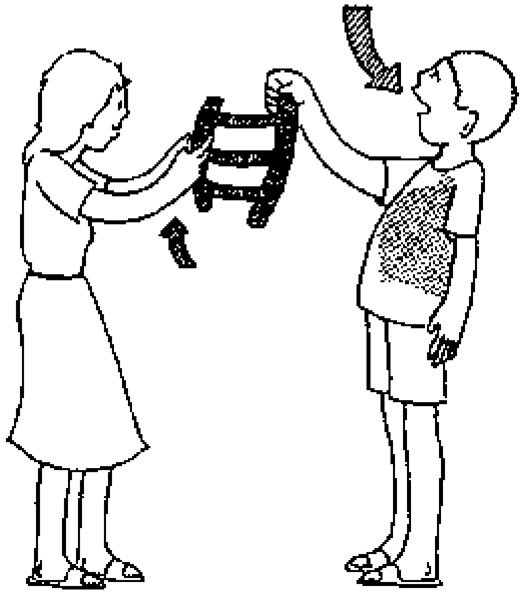
Procedure:

A model is made as shown in the following diagram.



Observation:

If the breast bone is lifted, the chest widens. In reality the lungs expand.



Analysis:

Because of the volume expansion, the air pressure in the lungs drops so that it is lower than the external air pressure. A lower pressure is thus formed and the pressure of the external air forces air **into the lungs.**

When you breathe out the air zone becomes smaller and the air is pressed out.

Addition:

If you pant you will see quite clearly that the abdominal wall arches forward when you inhale. The chest is hardly lifted. If you place one hand flat on the abdominal wall, you can feel the respiratory movement.

2.10. IDENTIFICATION OF CARBON DIOXIDE IN EXHALED AIR

Main Goal:

This experiment illustrates that exhaled air contains carbon dioxide.

Information:

The constituents of food are catabolized into carbon dioxide, water and urea. Carbon dioxide is exhaled. The carbon dioxide proportion of inhaled air is about 0.03% and the oxygen proportion about 20% volume. The carbon dioxide proportion of exhaled air is approximately 4.5% and the oxygen proportion 15.5% volume.

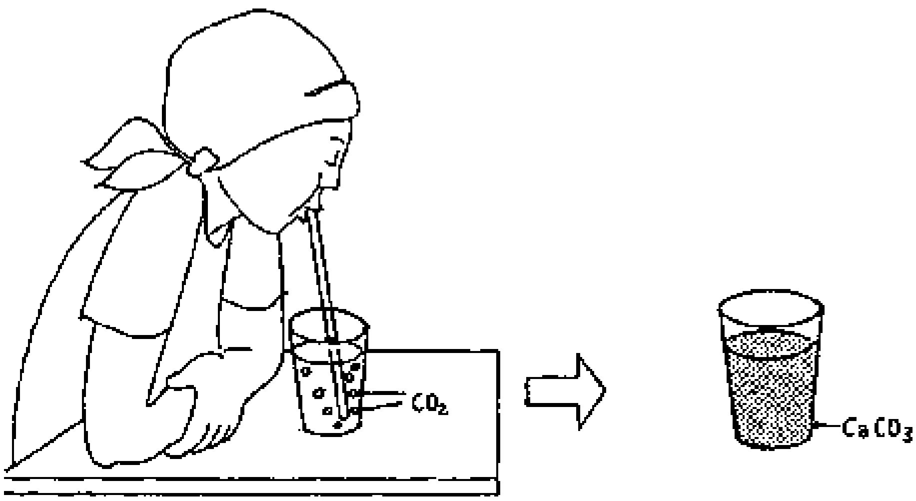
A solution of limewater ($Ca\ (OH)_2$ in water) or a solution of ($Ba(OH)_2$ in water), baryta water, is used as a carbon dioxide indicator.

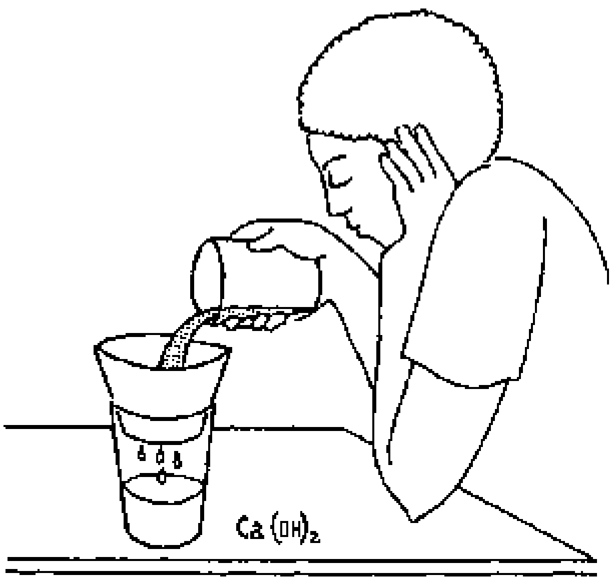
Materials and Apparatus:

calcium hydroxide or lime or calcium oxide (CaO)
barium hydroxide (made from barium oxide)
water
glass beaker
a glass pipe, a straw or a hollow bamboo cane
filters or clean paper from a cement sack

Procedure:

If no calcium hydroxide (or barium hydroxide) is available, calcium oxide (or barium oxide) should be dissolved in water. These solutions are filtered until they are completely clear.





Exhaled air is blown into limewater through the glass pipe.

Observation:

The limewater (baryta water) becomes cloudy.
A white substance is precipitated.

Analysis:

Exhaled air contains so much carbon dioxide that it reacts with calcium hydroxide to form white, hardly soluble calcium carbonate. In the reaction with barium hydroxide, white, hardly soluble barium carbonate is precipitated.

Practical Importance:

With the help of sunlight, plants produce carbohydrates and oxygen from carbon dioxide and water.

Oxygen is essential for human beings and animals.

Addition:

$Ca(OH)_2 + CO_2 \rightarrow CaCO_3 + H_2O$

$Ba(OH)_2 + CO_2 \rightarrow BaCO_3 + H_2O$

Leaving limewater or baryta water in direct contact with air does not cause clouding because the carbon dioxide concentration is too low.

Look up the experiments botany 1.10 and 1.12. Together with the experiment above you can now explain the circle of oxygene and carbon dioxide in nature.

2.11. THE SKIN RELEASES SODIUM CHLORIDE

Main Goal:

This experiment shows that sodium chloride is released by the skin.

Information:

The main task of the perspiratory glands in the skin is to regulate the body temperature. Besides water, sweat contains other products, predominantly sodium chloride - or household salt. This is why perspiration has a salty taste.

Materials and Apparatus:

a. distilled water - available at any garage

2% silver nitrate solution ($AgNO_3$), which can be purchased from a chemist
large beaker holding 1 - 2 litres

b. magnesia sticks, which can be obtained from

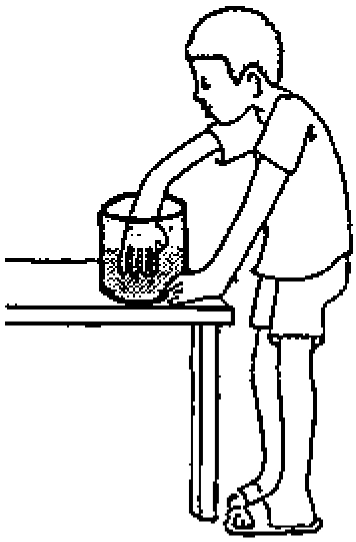
a *chemist*
1 candle

Procedure:

a. The glass dish is filled with distilled water.

A test person places one hand into the water and holds it there for about 10-20 minutes.

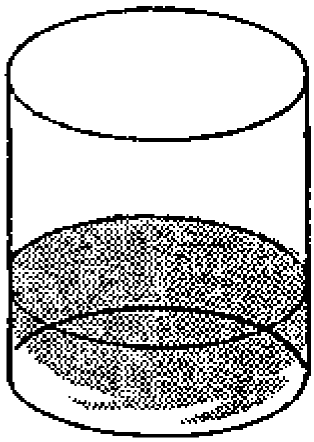
Then a few drops of silver nitrate solution are added to the distilled water.



b. Sodium ions can be identified using magnesia sticks and a candle flame. The top of the magnesia stick is moistened with sweat and then held in the candle flame.

Observation:

a. A white precipitate is formed.
b. It can be observed that the flame burns yellow.



Analysis:

a. The chloride ions together with silver nitrate form white silver chloride.

$$\mathbf{Ag^+ + Cl^- \rightarrow AgCl\downarrow}$$

b. The yellow colouring of the flame indicates the presence of sodium.

Practical Meaning: The skin releases warmth by evaporating water on the skin and with that a remarkable account of sodium chloride. The loss of water is as problematic as the loss of sodium chloride. Loosing too much water can cause circulatory problems.

In countries where it is always hot, it is important that the body receive sufficient sodium chloride, otherwise the high loss of sodium chloride in perspiration can lead to circulatory disturbances as well.

In the last centurie British miners became ill, suffering from too little sodium chloride after sweating very strongly. After drinking weak saltwater they recovered. The products left by perspiration are not all waste products. Nature is not perfect. There are optimal compromises everywhere.

2.12. FINGERPRINTS

Main Goal:

This experiment shows that fingerprints are a typical characteristic of each individual.

Information:

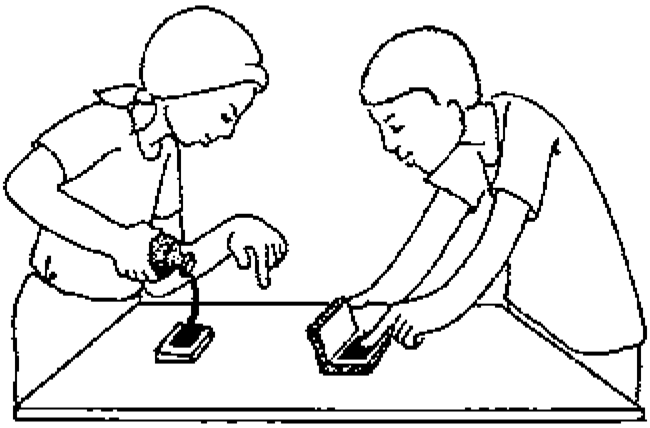
Fingerprints are determined by the structure of the lines of the fingertips.

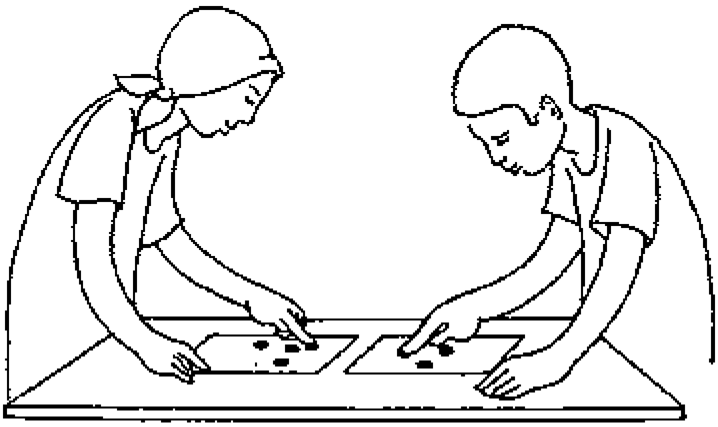
Materials and Apparatus:

ink or ink pad
white paper

Procedure:

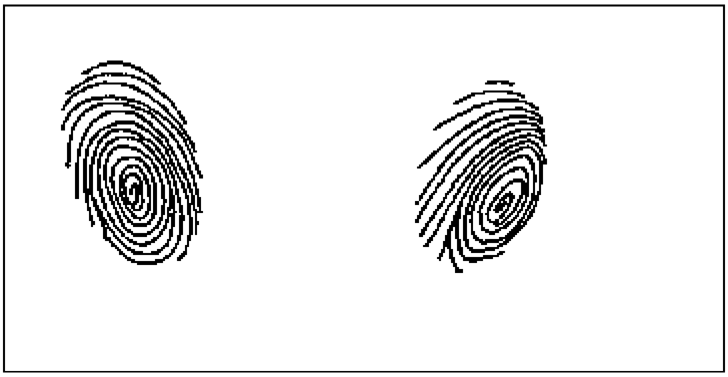
One fingertip is coloured with ink and pressed onto the paper once.





Observation:

A pattern of lines can be seen in black. This pattern is the fingerprint.



Analysis:

If the fingerprints of different individuals are compared, it can be seen that all of them are different.

Practical Use:

As the fingerprints of every human beings are unique, they are used as an important means of identification in criminology, when they can be used to identify a criminal.

2.13. DISTINGUISHING SEVERAL MATERIALS BY TOUCHING THEM WITH THE FINGER TIPS

Main Goal:

This experiment demonstrates that your finger tips can be used successfully to identify different surfaces.

Information:

see analysis

Materials and Apparatus:

You will require several objects with different surfaces such as a stone, a brick, pieces of bark from different trees, pieces of rough and smoothed wood, different textiles etc.

a scarf or shawl to blindfold a person.

Procedure:

One student is blindfolded and is given three objects to touch and retain the feeling. Then the scarf is removed. The student is allowed to test all objects and he/she must then determine which she/he touched while blindfolded.

Observation:

Different students will show different abilities to identify the objects they touched while blindfolded. But every one is able to distinguish very different things.

Analysis:

In our finger tips we have many sensory cells for touching far more than e.g. on our back.

The more of these cells there are in any area, the better we can identify different surfaces. The largest number of sensory cells for touching per square millimeter are in the tip of our tongue, but you should not test materials which may not be clean with your tongue.

The differences in the results stem from the different experience in identifying things by touching.

2.14. TESTING PULSE FREQUENCY UNDER DIFFERENT CONDITIONS

Main Goal:

This experiment demonstrates that the rate of the pulse depends on the work done immediately prior to measuring.

Information:

see analysis

Materials and Apparatus:

one watch to measure minutes

Procedure:

Look for your pulse on your wrist using the thumb of your other hand. You will find it one thumb length away from the back rim of the hand above the sinews of the inner side of your arm.

You will probably need a little while to find it and feel it well.

One person, perhaps your teacher, says, observing the watch: “go” and you start counting the pulse beats. When he says: “stop” (after exactly one minute) you note the number of pulse beats you counted.

Then everybody does ten knee bends. After this someone gives a starting signal again and you count the pulse beats again for one minute.

Observation:

In the second case you will count a higher number of pulse beats than in the first. You may also be breathing faster especially if you are unaccustomed to sport and physical exercise.

Analysis:

Your body registers the work you do, in this case the knee bends.

It is able to regulate the pulse frequency in order to provide the muscles with enough blood for them to receive sufficient oxygen. That is also why you breath faster.

2.15. DETERMINING THE DIRECTION FROM WHICH A NOISE COMES

Main Goal:

This experiment demonstrates that with both ears you can better determine the direction from which a noise comes than with only one ear.

Information:

see analysis

Materials and Apparatus:

a scarf or shawl to blindfold a person

Procedure:

All students sit in a circle. One of them stands blindfolded in the center of the circle. One student in the circle knocks on something e.g. his chair to produce a noice. The blindfolded student has to point in the direction from which the noise came without turning round.

Another student knocks from a different direction, the blindfolded student points to the source of the second noise.

Repeat the experiment several times.

After ten trials the blindfolded student holds his/her hand over one ear and the experiment is repeated another ten times.

Observation:

With both ears the blindfolded student will probably achieve about 9 right answers out of ten.

When holding a hand over one ear though the student might achieve a score of only some five or six correct answers, or less.

Analysis:

Our ears are very sensitive. They can distinguish the time lapse which occurs if a noise does not come from immediately infront or behind us.

When one listens with only one ear this time lapse can no longer be heard and it becomes more difficult to determine the source of the noise.

2.16. THE SENSITIVITY OF OUR HEARING

Main Goal:

This experiment shows how sensitive our sense of hearing is.

Information:

see analysis

Materials and Apparatus:

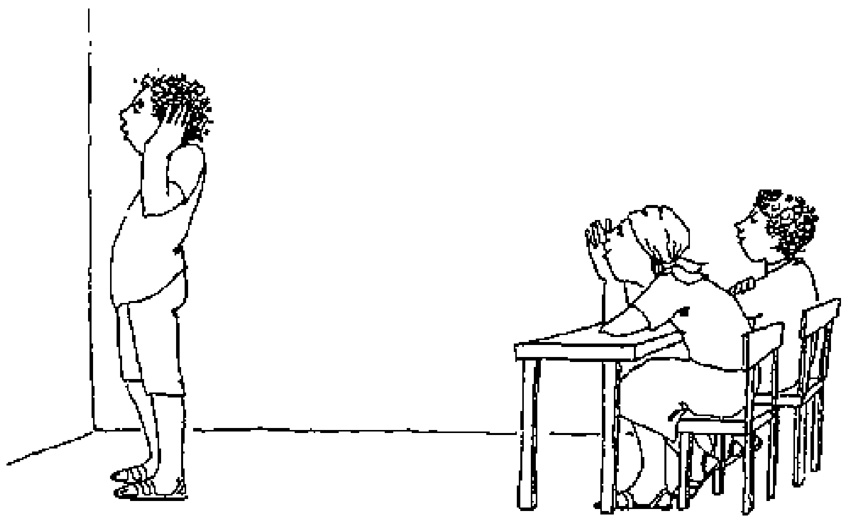
nothing

Procedure:

One student stand in front of the classroom with his face to the wall. Another student whispers a number between thirteen and ninety-nine. The first student has to repeat the number.

Try this experiment ten times initially.

The ‘listening’ student should then cover one ear, and the experiment should be repeated another ten times.



Observation:

In most cases it is not necessary to use both ears to understand whispered numbers.

Where a student does have difficulty he or she may have a hearing impediment.

Analysis:

Both ears are usually equal sensitive. Thus one ear is sufficient to identify whispered numbers.

This test will demonstrate immediately if a student is particularly hard of hearing in one ear.

Hearing difficulties can be caused by many different things and it is always better to consult a doctor immediately.

3. INORGANIC CHEMISTRY

3.1. COMBUSTION ZONES OF A CANDLE FLAME

Main Goal:

This experiment illustrates that the combustion of the gaseous particles of a candle takes place in the outer, the yellow zones of a flame.

In the following text these particles are called “candle gas”.

Information:

The yellow colour of the outer zone of the flame is produced when the soot particles (carbon) light up.

The blue zones of the flame contain candle gas, that is not burning.

The temperature of the yellow zone is higher than that of the blue zone.

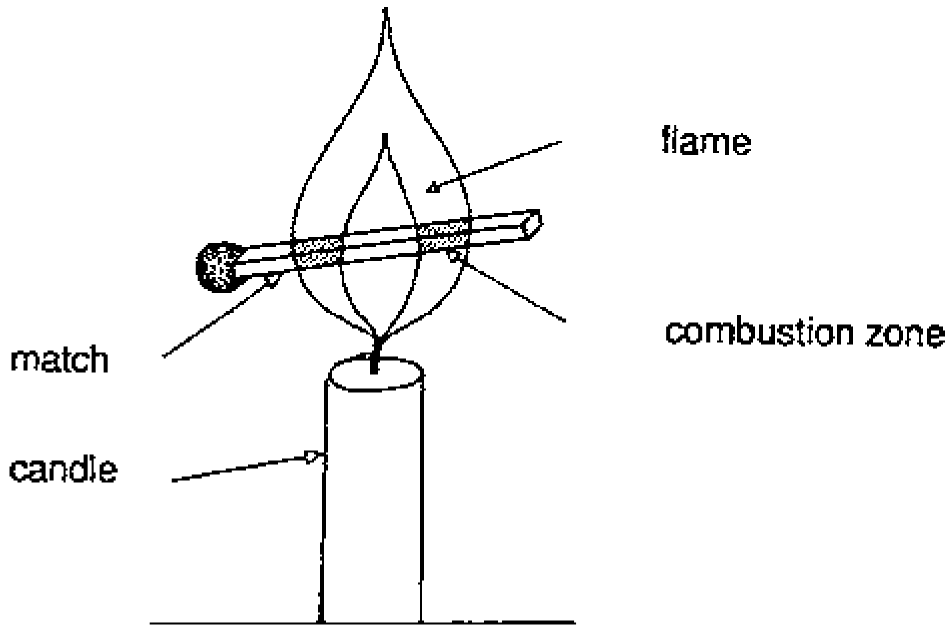
Materials and Apparatus:

matches, magnesia sticks
a candle

Procedure:

a. One match is passed through the flame of the candle (see diagram).

b. The same experiment is carried out with a magnesia stick.



Observation:

a. The part of the match in the yellow zone, is burning.

b. The part of the magnesia stick in the yellow zone lights up in **a** yellow-orange colour.

Analysis:

The dark burnt parts of the match and the glowing parts of the magnesia stick demonstrate that the temperature in the yellow zone is higher than that in the blue zone. The combustion of the candle gas takes place in the yellow zone, as it is only here at the outer part of the flame, that enough oxygen is available and can mix with the candle gas.

Practical Meaning:

With this candle flame experiment the basic characteristics of a common laboratory burner or any other open fire can be demonstrated.

In open fires, a good oxygen supply is required to achieve complete combustion.

3.2. THE CANDLE FLAME AND ITS DAUGHTER FLAME

Main Goal:

This experiment demonstrates that the blue zone of the flame contains unburnt candle gas.

Information:

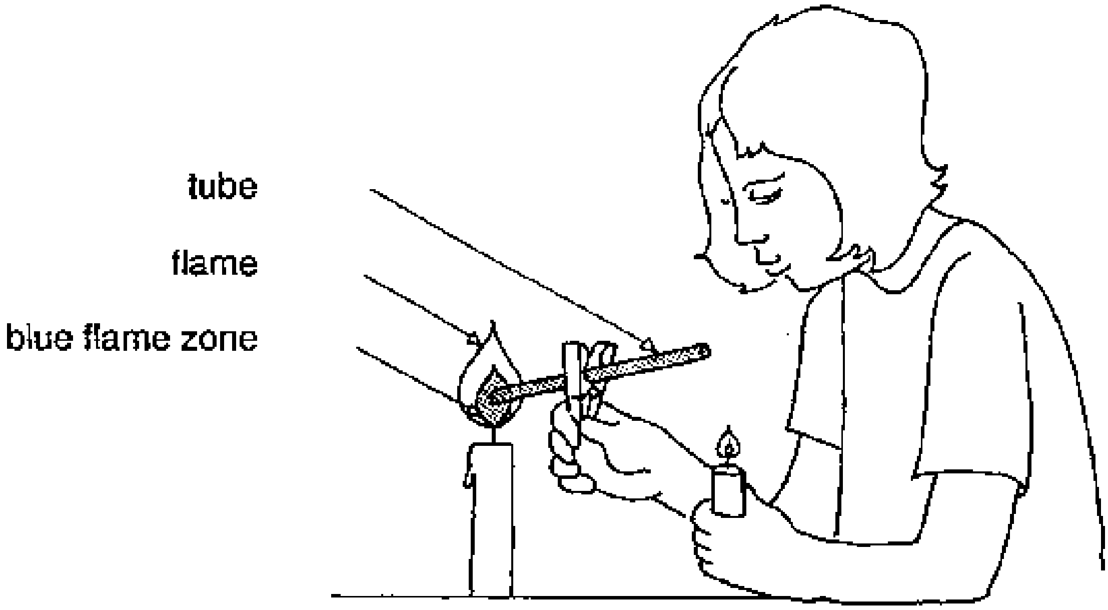
(see experiment: THE COMBUSTION ZONES OF THE CANDLE FLAME)

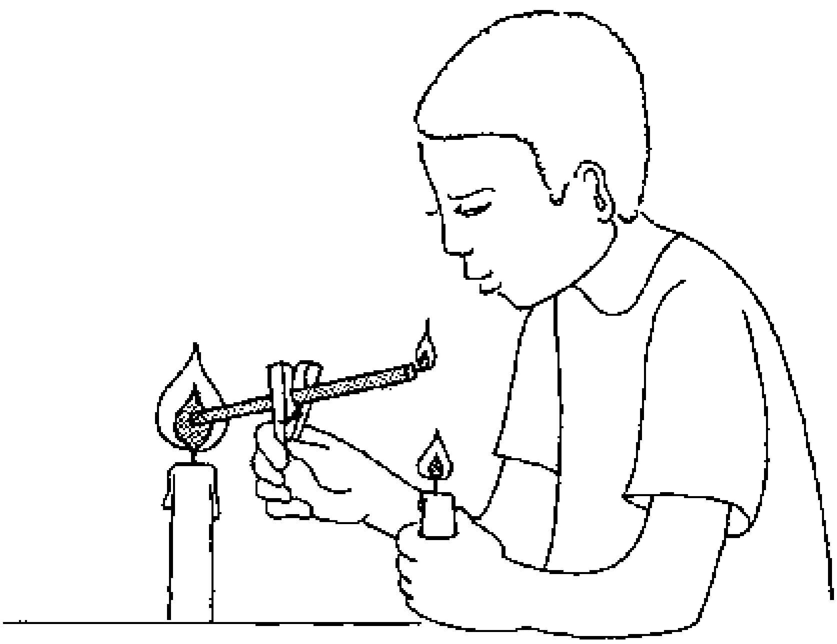
Materials and Apparatus:

2 candles
2 tubes (of metal or glass, e.g. eye dropper)
1 clothes peg

Procedure:

The candle gas of the blue flame zone is passed through the tube (see diagram).





Observation:

This gas can be ignited with a lit candle.

Analysis:

Unburnt candle gas can be found in the blue zone of the flame.

When the candle gas from the blue zone reaches the outer zone, it burns, when atmospheric oxygen and candle gas mix in the right proportion.

Practical Use:

The candle flame has the same structure as the flame of bunsen or alcohol burners.

The most important properties of these burners can be demonstrated with a candle flame.

3.3. COMBUSTION PRODUCTS OF A CANDLE

Main Goal:

This experiment demonstrates that a candle forms soot (carbon), carbon dioxide and water when it burns.

Information:

The candle substance, natural wax or stearin, consists of the elements carbon, hydrogen and oxygen. Carbon can be identified directly as soot, and indirectly as carbon dioxide.

During combustion water is formed. The presence of water provides indirect evidence of the presence of hydrogen.

Materials and Apparatus:

candle
glass vessel
limewater
white copper sulfate (dried blue copper sulfate)

Procedure:

a. The bottom of a glass vessel is held over a burning candle.

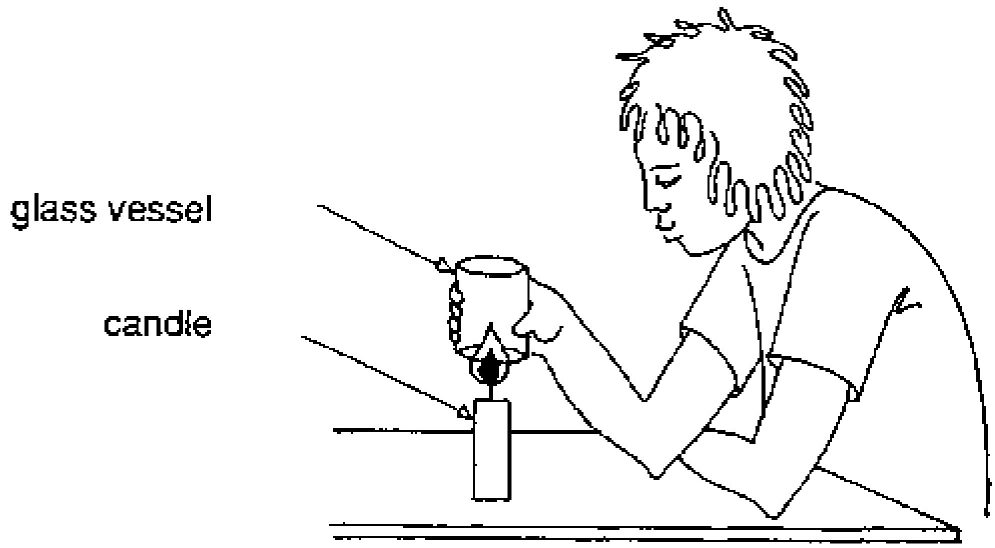
b. A cold glass vessel is held upside down over **a** burning candle.

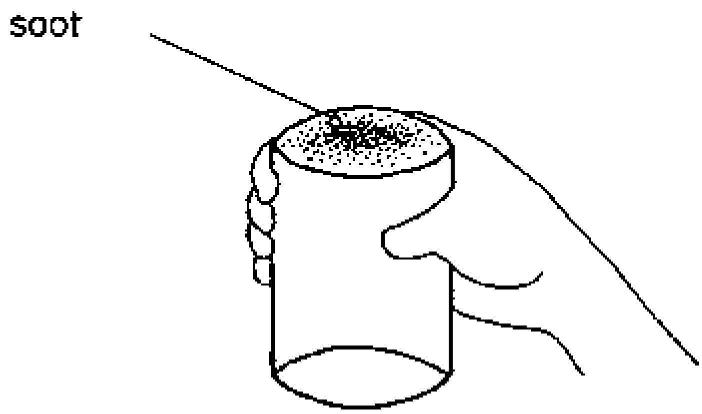
The water which is produced can be identified with finely pulverized copper sulfate.

c. A glass vessel is held over a burning candle.

It is then rinsed with limewater to identify the carbon dioxide produced.

(As carbon dioxide is heavier than air, a great amount of it escapes from the glass dish.)





Observation:

a. Soot settles on the glass vessel.
b. A moist film develops. White copper sulfate turns blue.
c. A white precipitate - calcium carbonate - is formed.

Analysis:

The candle substance burns to form soot (carbon), carbon dioxide, and water. Soot is the product of incomplete combustion of the candle substance.

Practical Use:

All organic substances contain carbon and hydrogen.
These elements can always be identified using the above methods.

3.4. THE DETERMINATION OF OXYGEN CONCENTRATION IN THE AIR

Main Goal:

This experiment demonstrates that part of the air is used during combustion.

Information:

The investigation of air compounds shows that air consists of about 20 parts by volume oxygen and about 78 parts by volume nitrogen. The amount of other gases can be ignored for the purposes of the two following experiments. (These other gases are carbon dioxide and inert gases.)

Materials and Apparatus:

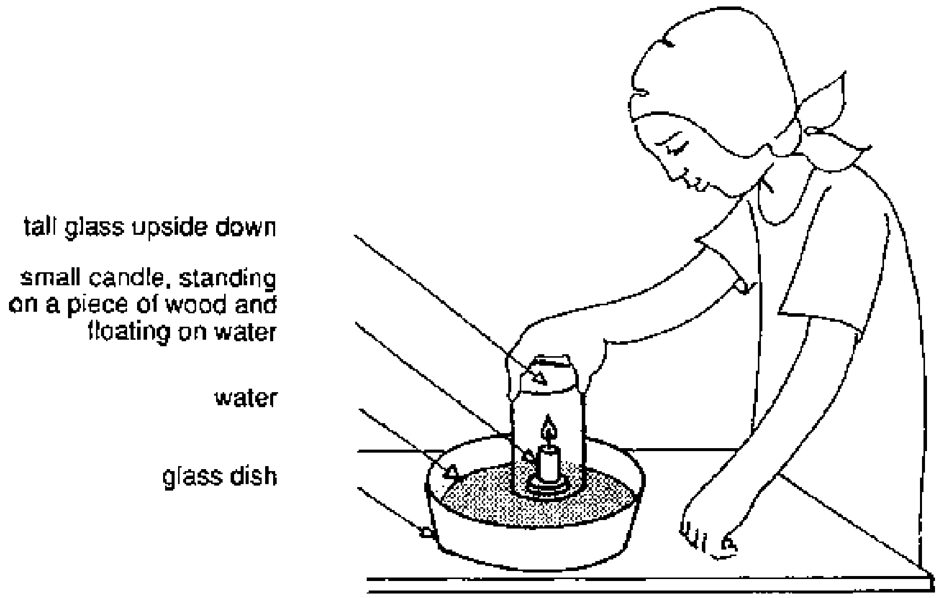
part of a neon lamp (about 30 cm) or a tall glass
small candle - should be light enough to float in water
rubber stopper
large glass dish
a clamp stand if available (if not, the glass can be held as shown below)

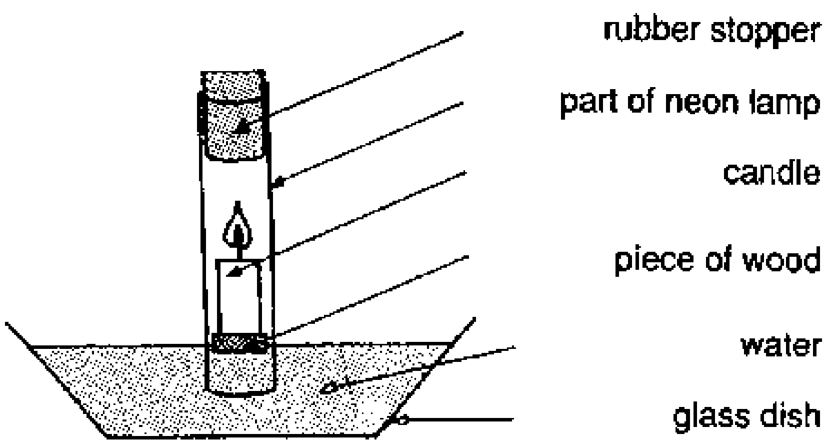
Procedure:

As shown in the following diagram, apparatus is constructed, with which the oxygen content of air can be approximately determined.

During combustion of the candle, the rising water fills the space left vacant by the air used to form carbon dioxide and water.

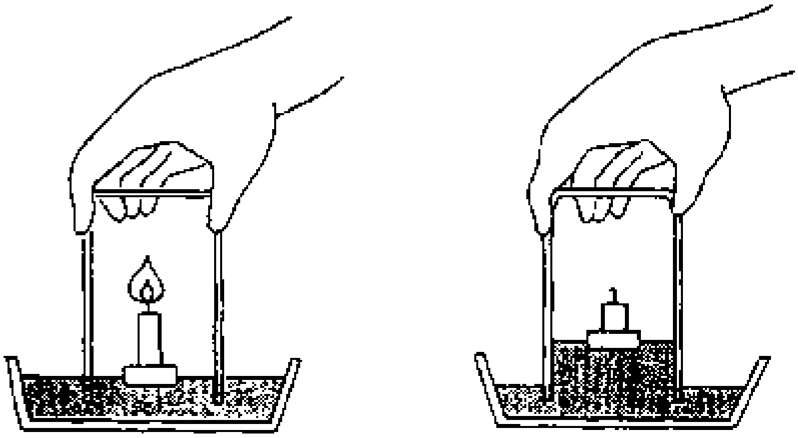
(The candle is extinguished before all the oxygen is used. The carbon dioxide formed dissolves in the water.)





Observation:

While the candle light gradually becomes dimmer, the water level in the neon lamp rises. The rising water occupies about one fifth of the air volume which was present at the beginning of the experiment.



Analysis:

During combustion, the candle uses about one fifth of the air volume. This part of the air is called oxygen.

Practical Meaning:

Plants are the sole producers of oxygen on Earth.

They guarantee the constant oxygen content of the air. Any massive disturbance to the plant world would automatically seriously perturb the lives of man and animals. Human beings and animals need atmospheric oxygen to breathe. During the process of metabolism, carbon dioxide is produced in their bodies. With the help of solar energy, plants produce oxygen and carbohydrates from carbon dioxide and water (CO_2 and H_2O).

3.5. NITROGEN EXTINGUISHES A CANDLE FLAME

Main Goal:

This experiment demonstrates that a candle, or any other kind of flame, does not burn in nitrogen.

Information:

(see experiment: DETERMINATION OF OXYGEN CONCENTRATION IN THE AIR)

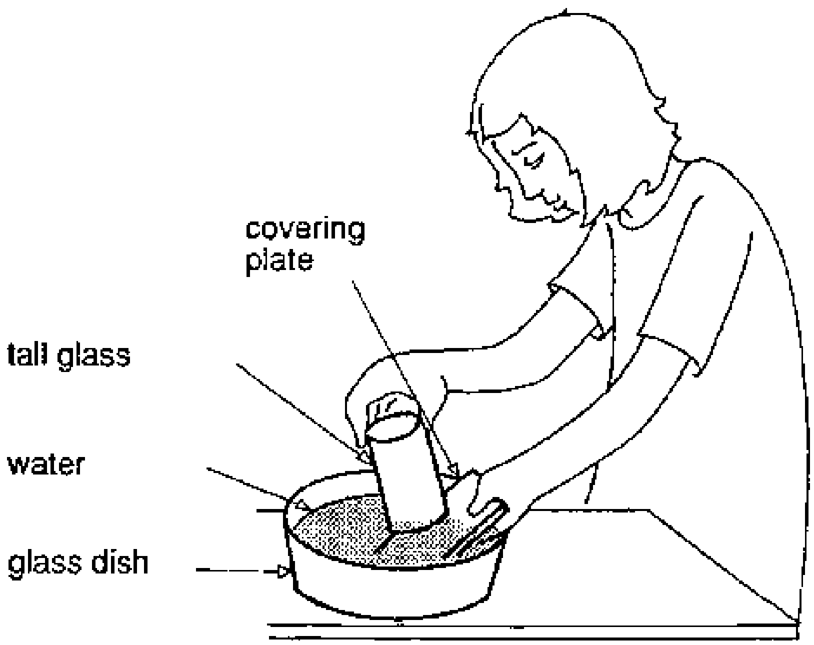
Materials and Apparatus:

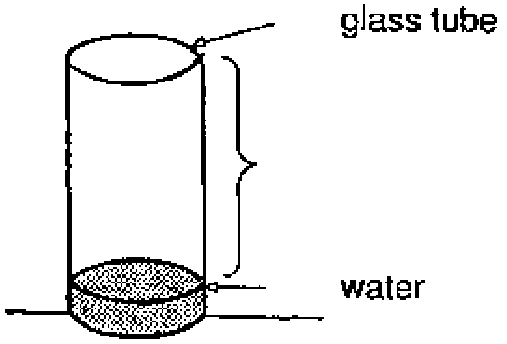
part of a neon lamp (about 30 cm) or a tall glass
small candle - should be light enough to float in water
rubber stopper
glass dish
a covering plate made of wood, glass, or metal
a candle attached to a wire

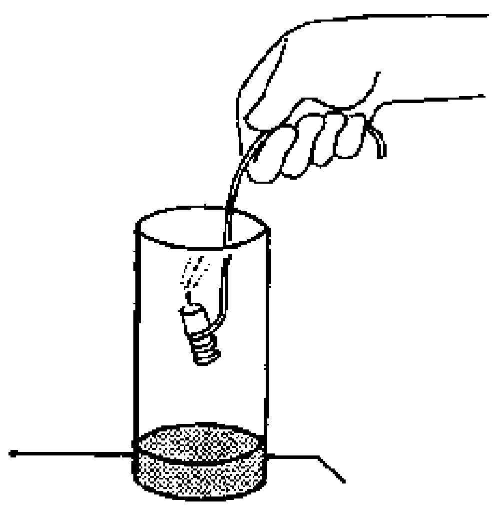
a stand if available

Procedure:

First the experiment “DETERMINATION OF OXYGEN CONCENTRATION IN THE AIR” is carried out. Then the dish is closed under water with the cover plate and turned upside down.







As shown in the diagram below, a burning candle is introduced into the remaining gas.

Observation:

The flame is extinguished.

Analysis:

The remaining gas extinguishes the flame. This gas is called "nitrogen".

Air consists of about 78% parts by volume nitrogen. (Oxygen supports combustion. Other gases, e.g. nitrogen, carbon dioxide, inert gases do not support combustion.)

3.6. ATMOSPHERIC OXYGEN SUPPORTS COMBUSTION

Main Goal:

This experiment illustrates that combustion can only take place if there is a constant supply of oxygen.

Information:

Without oxygen, combustion cannot take place.

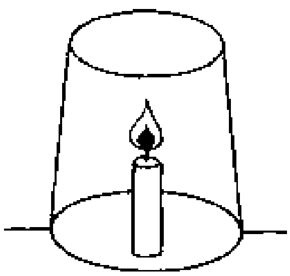
The oxygen necessary for combustion is present in the air. If a burning candle is placed in a small closed volume, it burns until the available oxygen is nearly used up.

Materials and Apparatus:

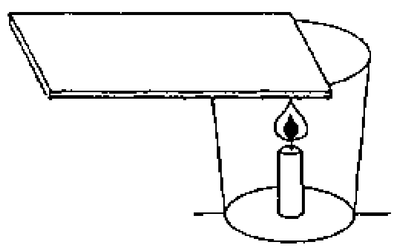
candle
glass vessel
cover plate

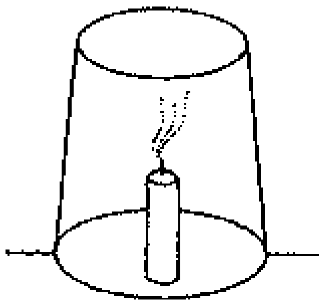
Procedure:

a. A glass vessel is placed upside down over a burning candle (see diagram).



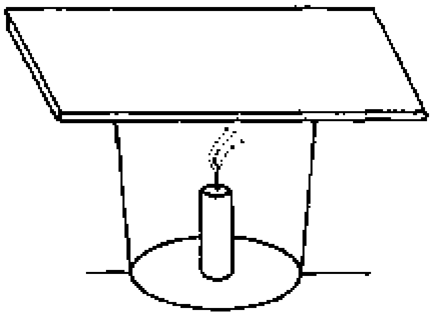
b. A burning candle is placed in an open glass vessel. With the help of the cover plate, the vessel is first half and then completely covered, (see diagram).





Observation:

a. During the course of the experiment, the flame gradually becomes smaller until it is finally extinguished.



b. The candle is not extinguished until the vessel is completely covered.

Analysis:

A candle can only burn if there is a constant supply of oxygen.

The component of air which the candle needs for combustion is called "oxygen".

Practical Use:

The various ways of extinguishing fire all work by preventing the continued supply of oxygen.

Without oxygen combustion does not take place.

Some methods used to extinguish fire include spreading: water, sand, or carbon dioxide over the flames so that oxygen is kept away from them.

3.7. CARBON DIOXIDE AS A FIRE EXTINGUISHER

Main Goal:

This experiment demonstrates that a candle or other burning material is extinguished in carbon dioxide.

Information:

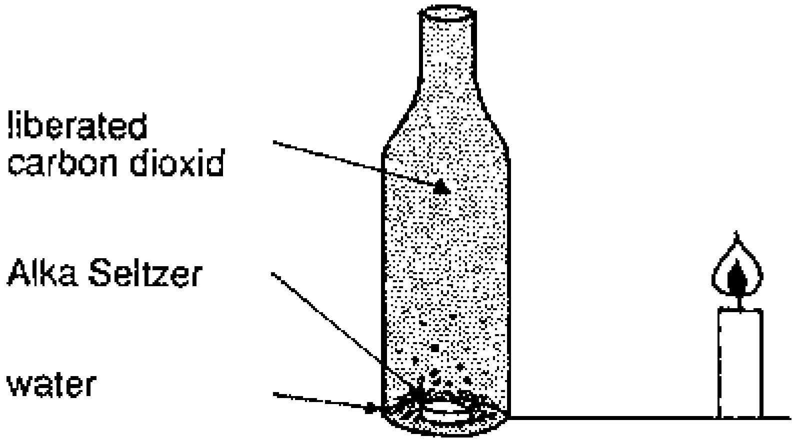
As carbon dioxide is heavier than air, it sinks when poured out of a dish.

Materials and Apparatus:

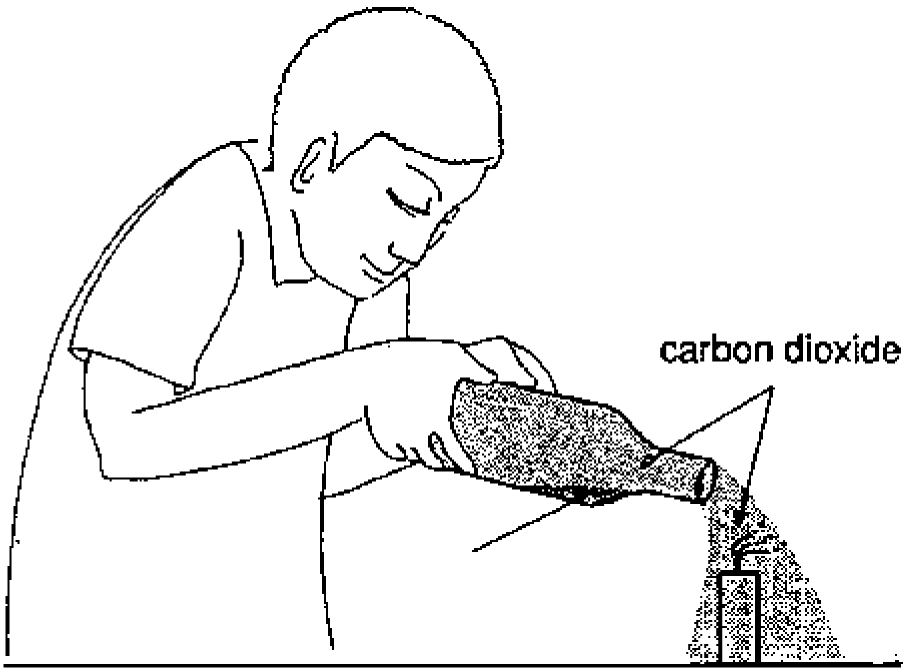
candle
glass dish or bottle
Alka Seltzer (1/2 or 1 tablet)

Procedure:

One Alka Seltzer tablet is mixed with a few drops of water in a glass dish.



The carbon dioxide liberated is poured over a burning candle.
(A burning candle can also be dipped into the dish.)



Observation:

The burning candle is extinguished.

Analysis:

A candle is extinguished in an atmosphere of carbon dioxide. Obviously the carbon dioxide is concentrated at the bottom when poured out of the glass dish.

Practical Use:

The air contains 0.03 per cent carbon dioxide by volume. If there is more than 5 per cent of this gas in the air, respiration is impeded. Exhaled air contains about 4 per cent carbon dioxide by volume.

Carbon dioxide does not conduct electricity and does not leave any kind of residue. For this reason it is used instead of water as a fire extinguisher in chemical and nuclear plants.

3.8. THE FORMATION OF CRYSTALS

Main Goal:

This experiment demonstrates the formation of crystals, and proves that dissolved substances are present in solutions, even if they cannot be seen.

Information:

Salts form crystals. The longer it takes for water to evaporate from a salt solution, the more even the crystals become.

Every salt has a typical crystalline form.

On the basis of this experiment, some further terms can be explained:

solvent
dissolved substance
soluble/insoluble
water-soluble
precipitation

Materials and Apparatus:

sodium chloride (household salt)
flat dishes
1 glass vessel
water

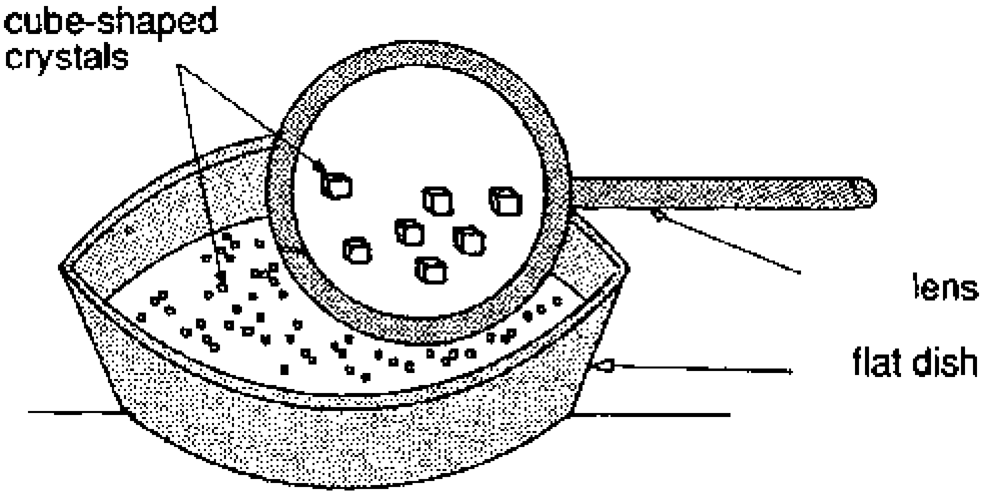
Procedure:

Household salt is added to 50 ml of water (the solvent), until no more salt will dissolve.

Be sure that no solid salt is present anymore in the saline solution.

About 5 ml of the saline solution is poured into each of the glass dishes.

The water takes several hours or even a day to evaporate.



Observation:

The water evaporates.
Cube-shaped crystals form.

Analysis:

Sodium chloride forms cube-shaped crystals.

Addition:

Various substances can be identified from their crystaline form.

Practical Meaning:

Salt is obtained from sea water in some hot countries.

The sea water is channeled into flat basins (salterns).

The sun causes the water to evaporate. The salt, which was dissolved in the sea water, is left as residue. Sea water contains 3% sodium chloride (household salt).

3.9. SALT WATER IS HEAVIER THAN DRINKING WATER

Main Goal:

Solutions always have a density higher than that of the solvent. That is to say that 1 cm^3 solutions has great mass and weights more than 1 cm^3 of the solvent.

Information:

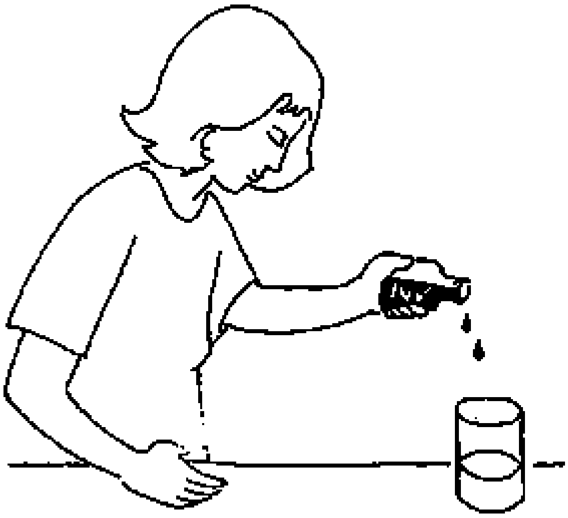
see “Main Goal”

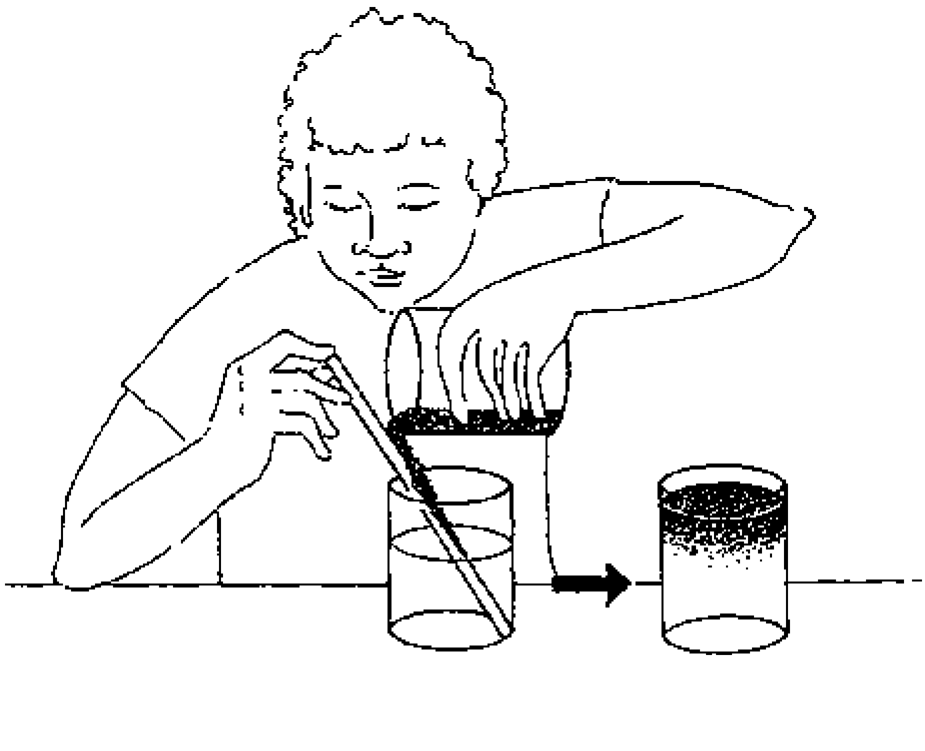
Materials and Apparatus:

salt water - sodium chloride dissolved in water
drinking water
2 glass dishes, glass stick
ink or other colours

Procedure:

2 - 3 drops of ink are added to the salt water, which is then carefully added to the drinking water. This is best done by means of a glass stick along which the salt water runs down.





Observation:

The coloured salt water sinks to the bottom of the dish.

Analysis:

Salt water has a higher density than drinking water. However, drinking water also contains dissolved salts. Therefore, it is heavier than distilled water (completely pure water) without any dissolved salts. Solutions have always a higher density than solvents.

3.10. SEPARATION OF SOLID MIXTURES

Main Goal:

The experiment illustrates that solid mixtures can be separated using their physical properties.

Information:

In contrast to a compound, the single substances of a solid mixture exist independently in an unaltered form. Their individual physical properties are preserved. Using these known properties, the single substances can be separated from each other.

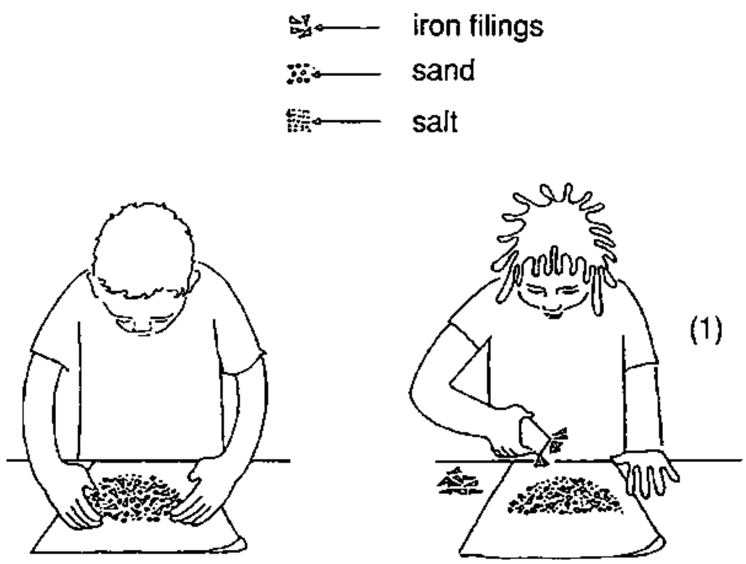
Materials and Apparatus:

salt (sodium chloride)
sand iron filings (cutted iron wool)
magnet
filter papers
filter
glass dish
burner, candle
tripod
paper
water
wooden stick, spoon

Procedure:

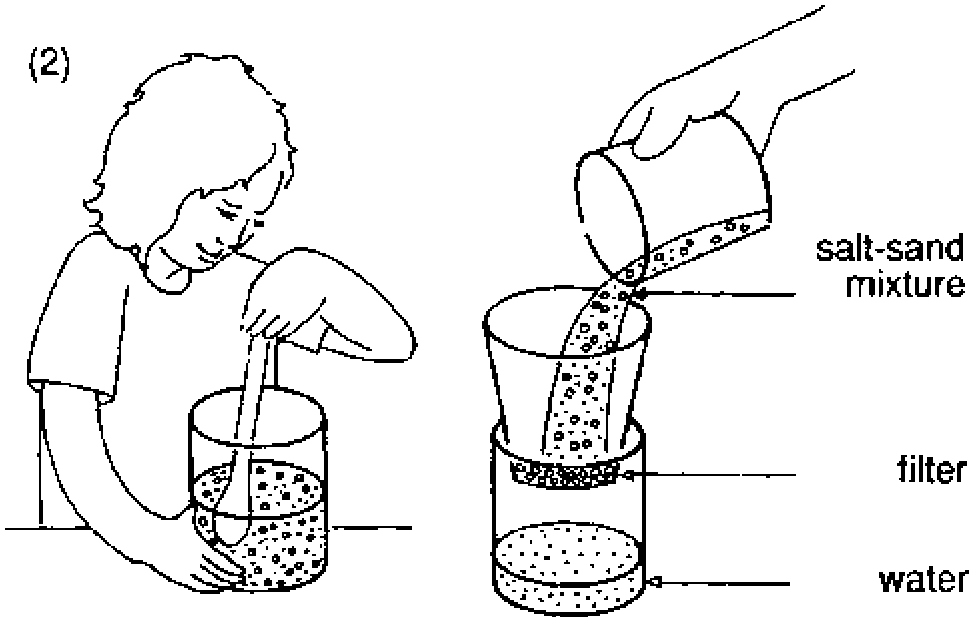
Salt, sand and iron cuttings are mixed up on a sheet of paper.

(1) The iron cuttings are removed from the mixture with the help of the magnet.



(2) The salt-sand mixture is added to 30 ml of water, stirred well, and filtered. The filtration residue is rinsed 2 - 3 times with water. Then it is dried in the air.

(3) Using the burner, the filtrate (salt solution) is slowly evaporated until it is dry.



Observation:

The magnet attracts the iron cuttings.

The salt dissolves in water.

The sand does not dissolve but is collected on the filter paper.

After the water evaporates, the salt is left as residue. In a solid mixture, the properties of each substance are preserved.

Analysis:

By means of a magnet, iron is separated from other kind of metals and other substances, e.g. in junkyards.

There are several other methods for obtaining salt. One is by evaporation of sea water and another, the washing out of salty soil.

3.11. THE CORROSION OF IRON

Main Goal:

This experiment demonstrates that moistened iron corrodes faster (corrodere - Latin: to gnaw away), than dry iron.

Information:

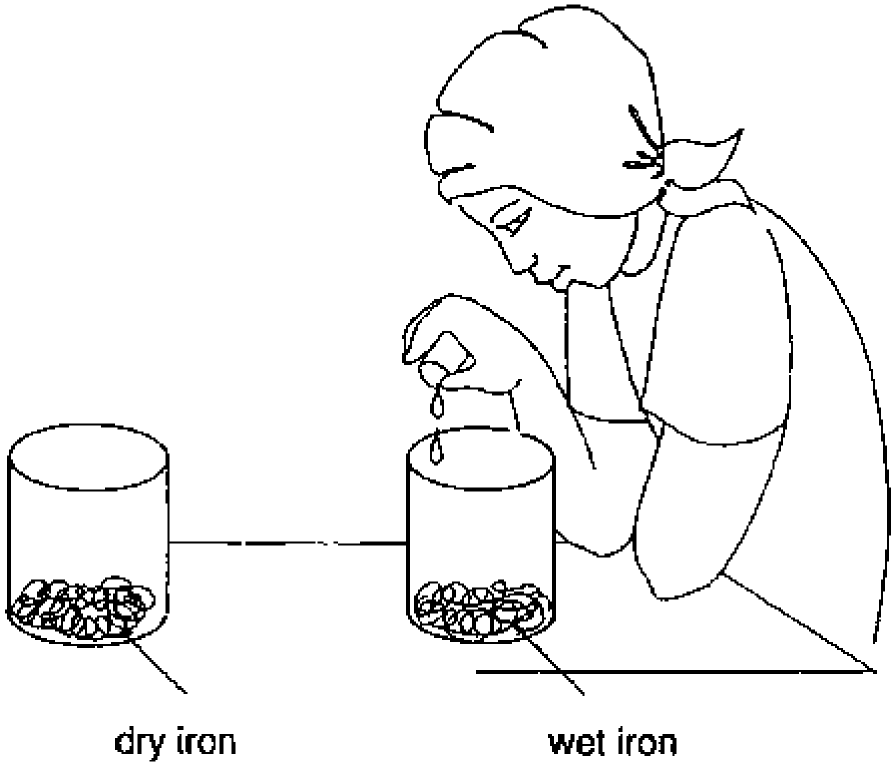
When the air is humid, iron reacts with oxygen to form rust.

Materials and Apparatus:

iron wool, iron filings
2 glass vessels
water

Procedure:

a. Some dry iron wool is put into the first glass vessel,
b. Some wet iron wool is put into the second glass vessel.



The experiment takes some days.

Observation:

The moistened iron wool has turned a brown colour. It has become brittle.

Analysis:

It can be concluded that rust has been formed.
Moist iron rusts faster than dry iron.

3.12. THE IMPORTANCE OF AIR DURING THE PROCESS OF CORROSION

Main Goal:

The experiment demonstrates that air plays a role in the process of corrosion.

Information:

In humid air, iron reacts with oxygen to form rust.

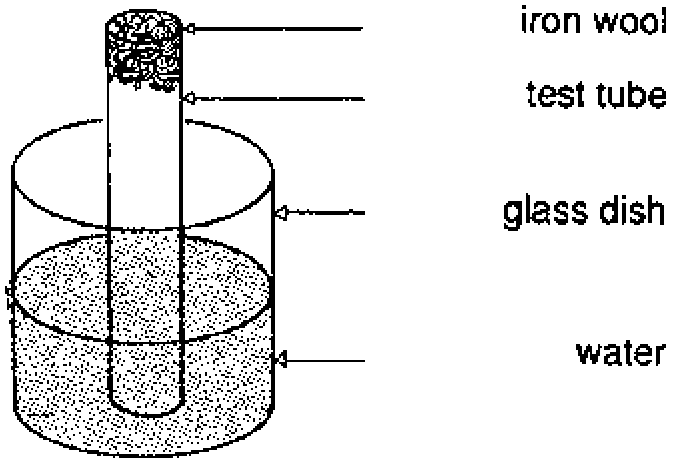
Materials and Apparatus:

iron wool
1 test tube
1 large glass dish
water
sodium chloride

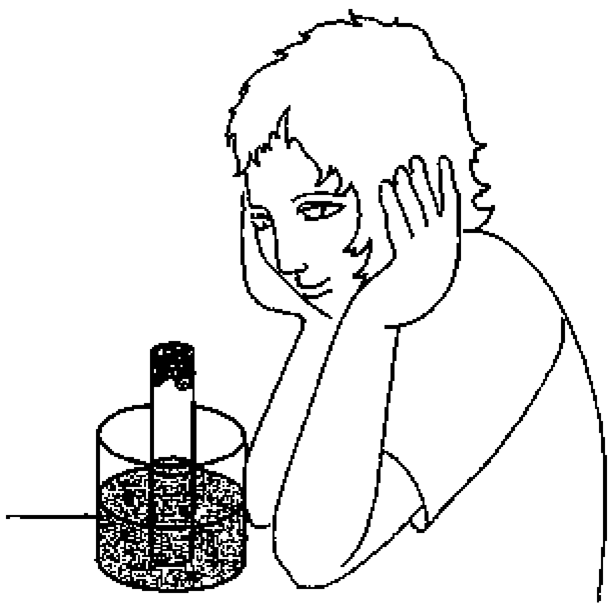
Procedure:

a) The experimental apparatus is constructed as shown in the following diagram and observed for several days.

Leave some space between the open end of the test tube and the bottom of the glass dish.



b) Do the same experiment in parallel with salt water in place of water.



Observation:

The iron wool has corroded.
Some water has entered the test tube.
The corrosion is faster in the presence of a dissolved salt.

Analysis:

When iron corrodes, a part of the air is used to form rust together with the iron and the water. This proportion of the air is called "oxygen".

Iron corrodes when water and oxygen are present. Its formation is increased by the presence of a dissolved salt.

Practical Use:

Iron is protected against corrosion by a rust inhibitor (special paint).

3.13. TINS ARE PROTECTED AGAINST RUST

Main Goal:

The experiment shows that tins are protected against corrosion.

Information:

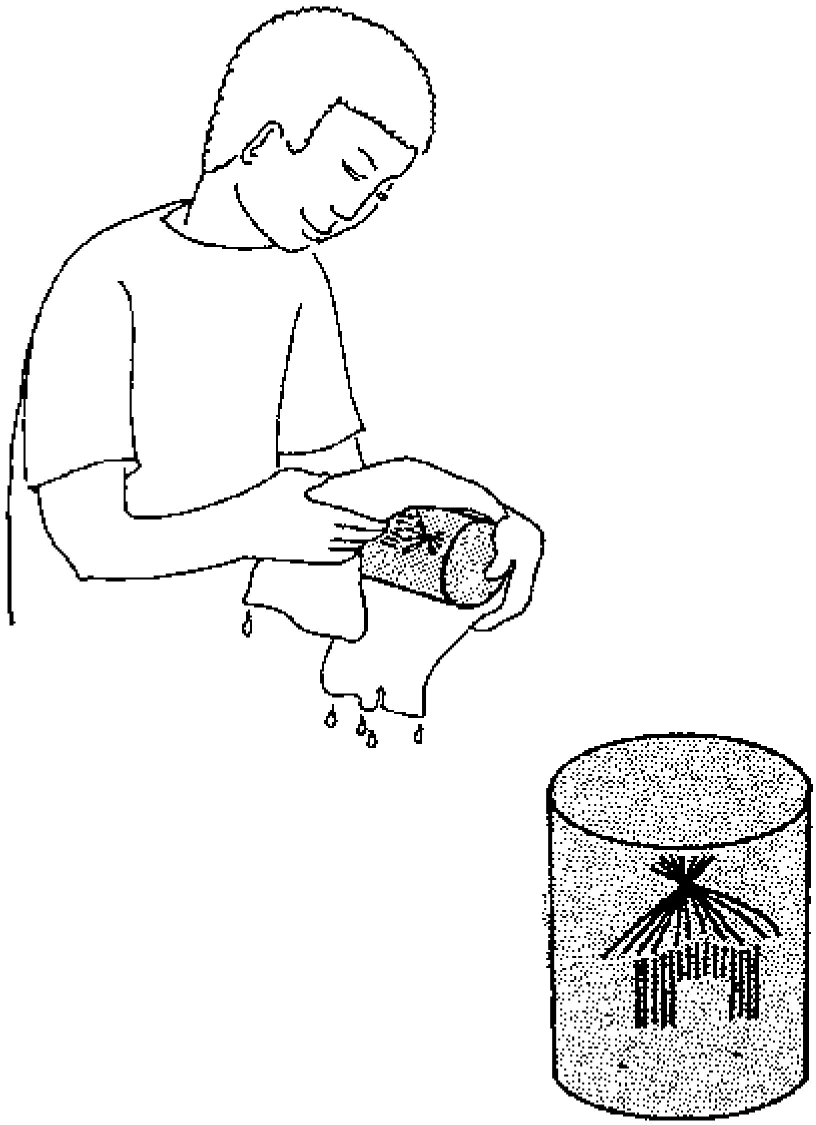
Tins consist of tinned sheet iron.
This is iron which is plated with tin.

Materials and Apparatus:

2 tins
1 nail
2 rags
water

Procedure:

A pattern is scratched with the nail into one of the tins.



The two tins are wrapped in moistened rags and kept wet for some days.

Observation:

Clearly visible rust traces can be seen along the lines of the pattern, whereas the other tin does not show any signs of rust.

Analysis:

Tins are plated with a protective layer, which prevents corrosion.

3.14. INVESTIGATION OF RUST

Main Goal:

The experiment demonstrates that rust is a different material from iron.

Information:

Rust consists of iron oxide (trivalent iron) and iron hydroxides (trivalent iron).

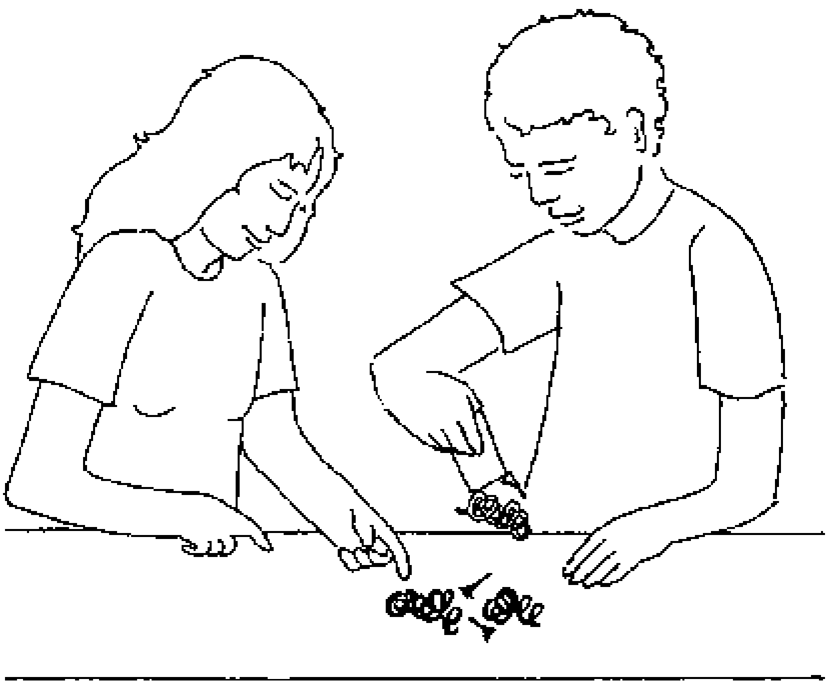
Materials and Apparatus:

rust
iron wool
magnet

Procedure:

a. The physical properties of iron are examined, such as flexibility, magnetism and colour.

b. Rust is examined for the same physical properties.



Analysis:

Iron is attracted by a magnet; we say it is ferromagnetic.

As rust and iron display completely different properties, they must be two different materials.

Practical Use:

The porosity of rust encourages the continuing reaction with air and humidity until finally the iron parts rust through.

This can be observed in cars. In technology, different methods are used to prevent corrosion, such as plastic covers, metal covers, and rust inhibiting paint.

3.15. THE ELECTROLYSIS OF SODIUM CHLORIDE

Main Goal:

This experiment illustrates the principle of electrolysis.

Information:

With the help or direct current, chlorine and hydrogen can be separated from a sodium chloride solution. Chlorine develops as gas at the positive pole (anode) and hydrogen gas at the negative pole (cathode).

Sodium ions are collected also at the cathode where sodium appears as metal.

An additional product is sodium hydroxide solution.

(Warning: A detonating mixture of chlorine and hydrogen may be formed. **Chlorine is toxic!)**

Materials and Apparatus:

household salt (sodium chloride) (5-10 g)

2 copper wires about 15 cm long, insulated apart from the last 3 cm at each ends of the wires, which shall be knocked flat.

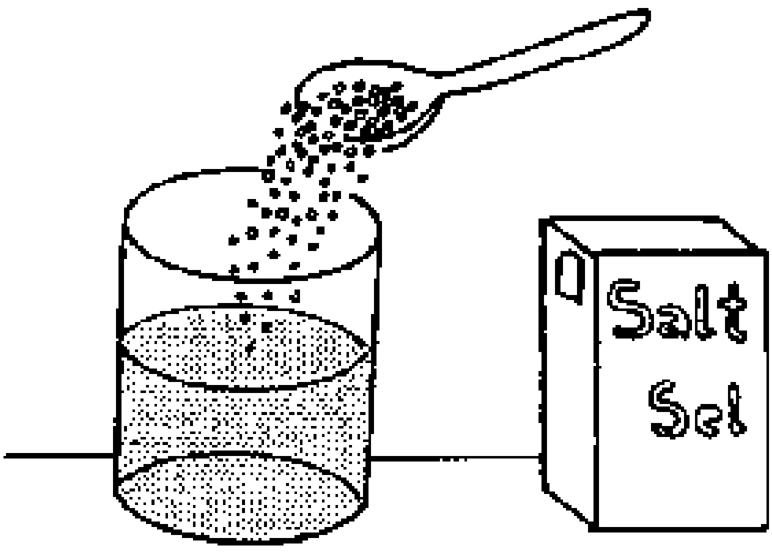
glass vessel

battery, about 4.5 V

(indicator, e.g. litmus, see experiment: VEGETABLE INDICATOR - ANTHOCYANE)

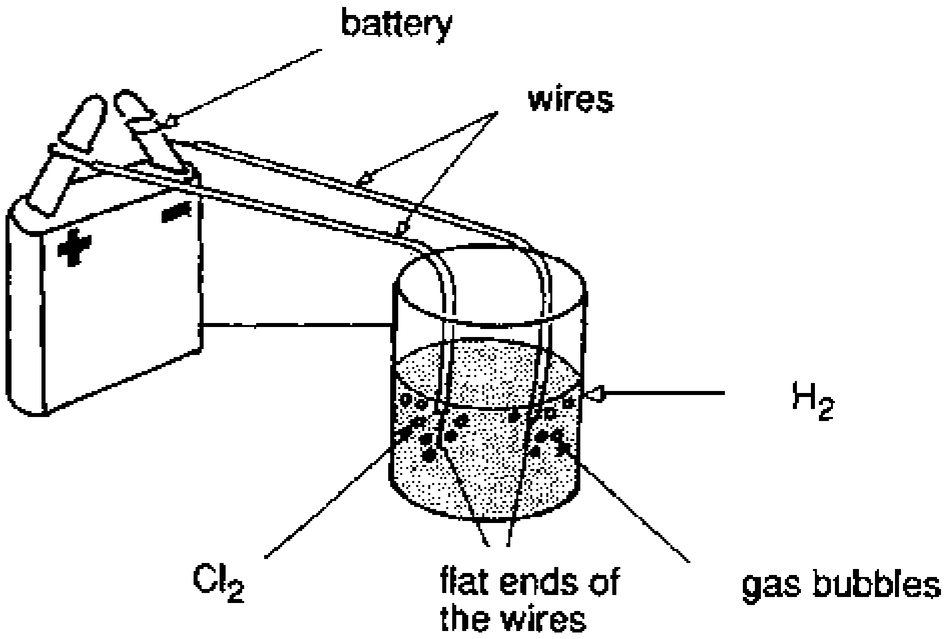
Procedure:

The household salt is dissolved in water.



The two electrodes are attached to the battery and then dipped into the solution.

(An indicator can be added to the solution. In addition, the gases which escape can be collected - see experiment: ELECTROLYSIS OF WATER - and then the detonating gas test can be performed.)



Observation:

Gas bubbles rise at the two poles.

There is a smell of chlorine.

(Near the cathode, the litmus turns blue after a while. Near the anode it is bleached.)

Analysis:

Chlorine gas is released at the positive pole (anode).

At the negative pole (cathode) hydrogen gas is generated and metallic sodium is collected.

(The change of colour indicates an alkali, which is caustic soda solution. Chlorine dissolves well in water and bleaches colours.)

Practical Use:

The electrolysis of sodium chloride is a technique used to produce chlorine.

Chlorine is used as a disinfectant in swimming pools.

In addition, large quantities of chlorine are used to produce chlorine compounds (e.g., hydrogen chloride (HCl), phosgene ($COCl_2$), chlorinated hydrocarbons (poly vinyl chloride)). Because metal is deposited at the cathode, electrolysis has important industrial applications for manufacturing metal. Aluminium, magnesium, sodium and zinc are often produced in this way.

3.16. THE ELECTROLYSIS OF WATER

Main Goal:

To demonstrate that water is a compound of hydrogen and oxygen.

Information:

With a constant voltage of 4,5 V, delivered by a battery, water can be decomposed into hydrogen and oxygen. The effect is more impressive when two batteries in series are used.

Materials and Apparatus

1 glass vessel (beaker), filled with water,

copper or iron electrodes

insulated wire

2 batteries, serially connected, the two electrodes, covered by test tubes, about 1.5 cm separated

sulphuric acid

wood chip

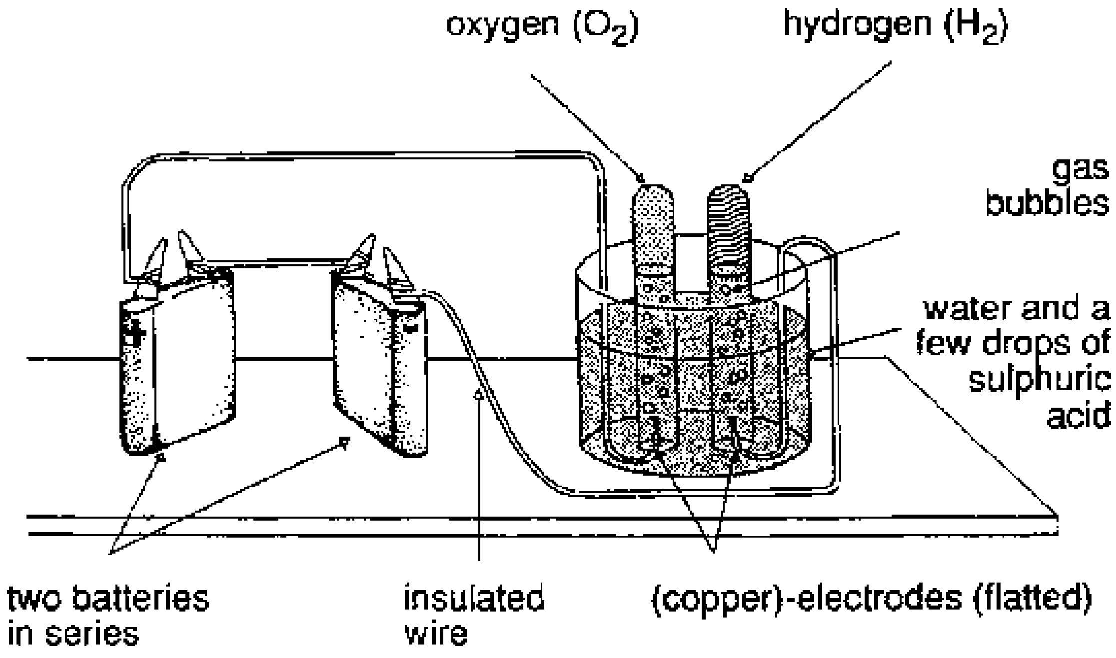
candle, matches

wooden board (ca. 10 × 20 cm)

Procedure:

The following apparatus is set up.

A few drops of sulphuric acid are added to the water. (This increases conductivity.)



The test tubes are completely filled with the sulphate water, covered with the thumbs and turned upside down over the electrodes.

a. When the apparatus is complete, the electrodes are connected.

b. Shortly before the right test tube (negative pole) is completely filled with gas, **a** candle is lit. The test tube is covered with the thumb after the complete displacement of the water. It is taken out of the water and Kept upside down.

c. Before the left test tube is taken out of the water in the same manner as the right one, a wood chip is lighted. The glowing wood chip is dipped into the test tube.

Observation:

a. Gas bubbles are formed at both poles.

They displace the water from the test tubes.

b. An explosion is heard and perhaps of blue flame may be seen.

c. The glowing wood chip lights up in the test tube.

Analysis:

The two test tubes fill with gas.

The gas in test tube (A) is called “hydrogen”.
Hydrogen burns with a blue flame.

The gas in test tube (B) is called “oxygen”.
Oxygen supports combustion.

Water consists of the element hydrogen and oxygen.

to b.) The explosion, which is not dangerous on such a small scale, is the so-called “oxyhydrogen gas reaction”.

Hydrogen and oxygen react to form water.

$$2\ \mathbf{H_2 + O_2 \rightarrow 2\ H_2O}$$

Practical Use:

Pure hydrogen is used for autogenous welding or cutting. In cutting or welding torches, oxygen is directed into a hydrogen stream shortly before its combustion.

With a surplus of oxygen, metals can be cut.

With a surplus of hydrogen, metals can be welded.

3.17. THE EXPLODING TIN

Main Goal:

This experiment demonstrates impressively the danger of a hydrogen-oxygen mixture.

Information:

If a hydrogen-air mixture is ignited, it reacts with a loud explosion, and water is formed. A hydrogen-oxygen mixture with the proportions 2: 1 is dangerous.

Materials and Apparatus:

1 coke can, or metal tea caddy
1 nail
1 hammer
1 pair of sheet-iron shears
1 piece of adhesive tape
1 flask of compressed hydrogen matches

Procedure:

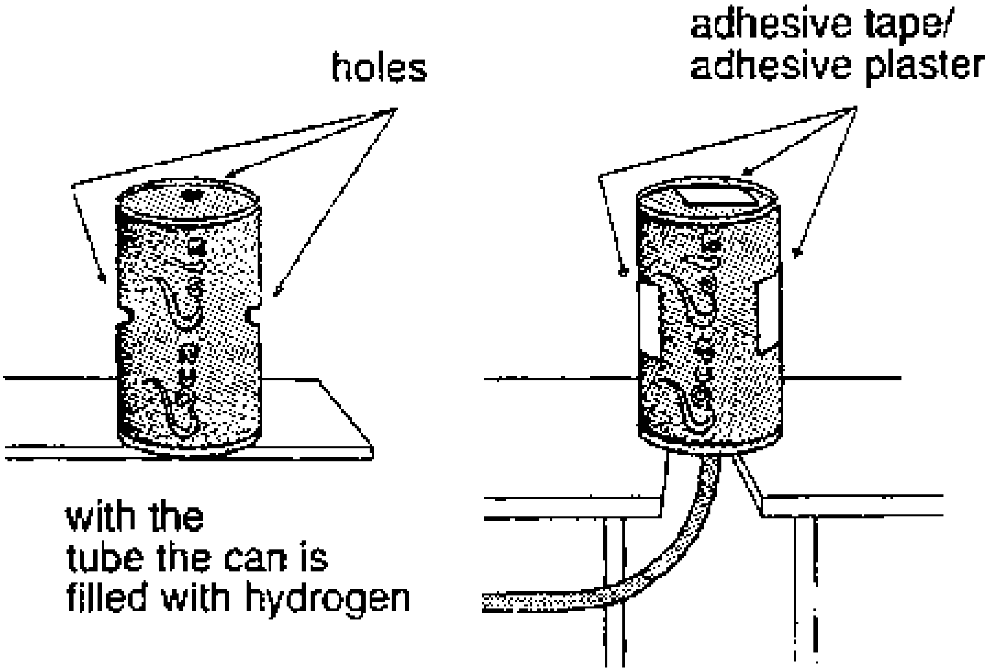
The top of the coke can is cut off, using the sheet-iron shears.

As shown in the following diagram, 2 small holes are cut in the can.

These two holes are covered with adhesive tape or adhesive plaster.

As shown in the diagram, the can is filled with hydrogen, taken from the flask, for one minute. It is placed on the table.

The flask with compressed hydrogen is sealed and placed several metres away from the can.

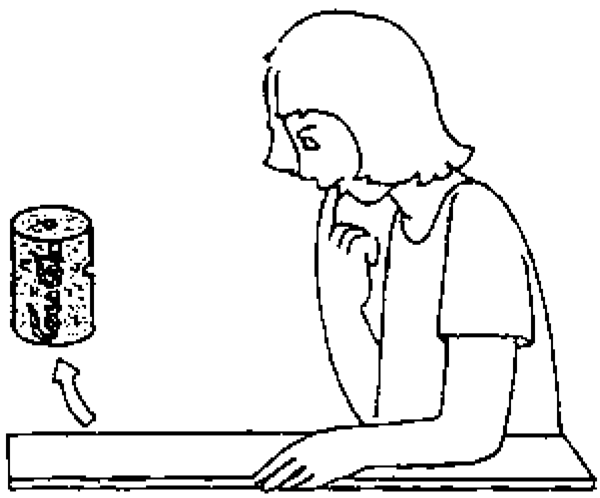


The adhesive tape is removed, a match is lit, and the flame is held close to the upper hole.

Then move back several steps.

(The experiment is very impressive in a darkened room.

However, one window or door should be left open.)



Observation:

When the gas is ignited, a light explosion can be heard. The hydrogen burns with a blue flame.

A faint whistling sound, can be heard. It becomes louder, and is followed by a loud bang.

The tin is lifted from the table. A faint flame can be seen.

Analysis:

Air seaks into the tin, through the holes in the sides. The air-hydrogen mixture explodes.

Only oxygen and hydrogen produce this reaction, which is known as the "oxyhydrogen gas reaction".

A 2: 1 hydrogen-oxygen mixture is especially dangerous.

$$2\ H_2 + O_2 \rightarrow 2\ H_2O$$

Practical Use:

A high temperature of up to 2000° C is needed to weld iron parts together. This temperature is reached when hydrogen and oxygen reacts.

With a welding torch, this combustion is not dangerous.

3.18. VEGETABLE INDICATOR - ANTHOCYAN

Main Goal:

The pupils learn to distinguish between an acid and an alkali with the help of an indicator.

Information:

The word “indicator” is derived from the Latin “indicare”: meaning to show. Indicators change colour according to the medium with which they are in contact.

Anthocyans are vegetable colourings, which form salts with acids and alkalies. The salt formation with an acid gives a red colour and the salt formation with an alkali a blue colour.

Anthrocyans can be produced from red cabbage or red corn.

Materials and Apparatus:

red cabbage juice (litmus)

a. lemon juice

acetic acid
a selection of other acids (HCI, H_2SO_4, etc.)

b. a selection of alkalies (NaOH, KOH, etc.)

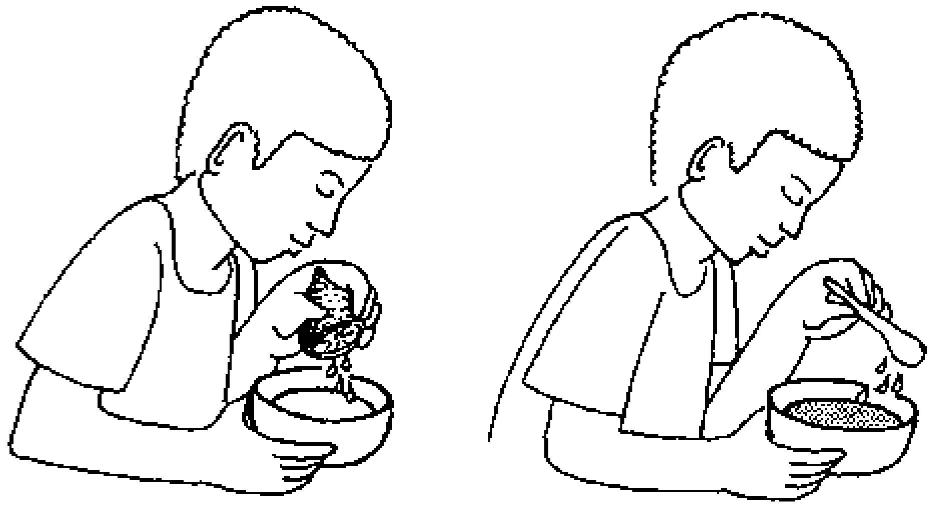
a few small dishes

Procedure:

The leaves of the red cabbage are cut into small pieces, placed in boiling water. The corn is also pressed and placed in boiling water.

a. 1 ml of each of the various acids and alkalies are poured into separate dishes, one substance per dish.

b. 2-3 drops of indicator are added to each solution.



Observation:

The colour of the indicator is red-violet in the acidic range (a.), whereas it is green-yellow in the alkaline range (b.).

Analysis:

With the help of indicators, acids and alkalies can be identified.

3.19. ACID AIR - ACID RAIN

Main Goal:

This experiment introduces sulphurous acid and the problem of "acid rain".

Information:

If sulphur is burned, sulphur dioxide is produced. This gas forms "sulphurous acid" if it is added to water.

Diesel oil and fuel oil both contain sulphur.

This experiment demonstrates that non-metal oxides and water form acids. (Carbon dioxide is also formed.)

Materials and Apparatus:

Diesel oil or fuel oil

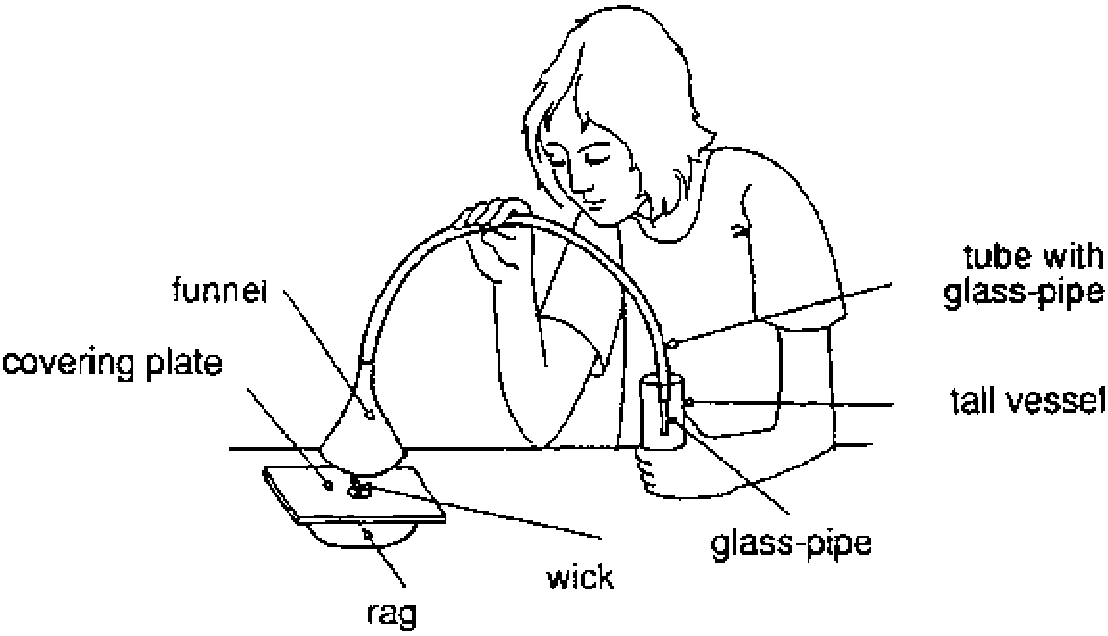
1 wick or cotton thread or rag
1 dish
1 covering plate (metal) with a hole for the wick
1 funnel
1 piece of tubing, with a glass-pipe
1 tall glass vessel (test tube)

water with indicator (fuchsine or litmus solution)

Procedure:

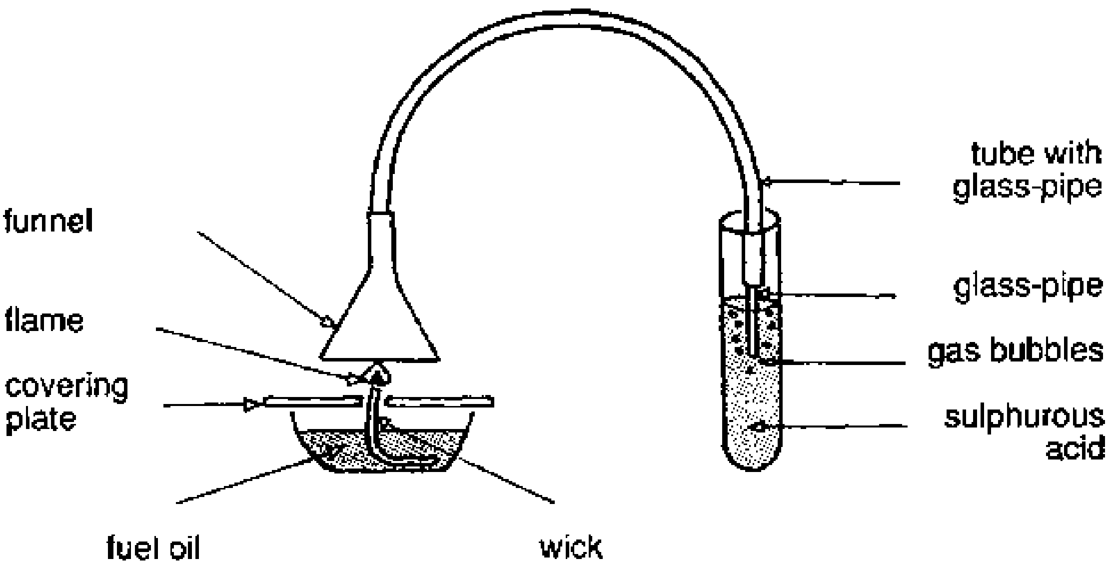
The apparatus is set up as shown in the following diagram.

The water contains 2 - 3 drops of the indicator. The glass and the funnel can be supported with one hand.



Observation:

Gas bubbles can be observed in the water. The indicator changes colour. The colour change indicates the presence of an acid.



Analysis:

When fuel oil is burnt, the sulphur is oxidized to form sulphur dioxide.

$$S + O_2 \rightarrow SO_2$$

Sulphur dioxide can be easily dissolved in water. Sulphurous acid is formed

$$SO_2 + H_2O \rightarrow H_2SO_3$$

Note: A non-metal oxide and water form an acid.

Practical Meaning:

Sulphur dioxide is one of the components of “acid air”.

When combinated with water, it forms one essential part of “acid rain”.

Sulphur dioxide as well as sulphurous acid demage animate and the inanimate nature. Trees become sick.

It is assumed that what is called “forest die-back” in some industrialized countries might have its origin in acid rain.

(see botany: THE DESTRUCTIVE INFLUENCE OF ACID AIR AND ACID RAIN)

4. ORGANIC CHEMISTRY

4.1. SUGAR CONTAINS CARBON

Main Goal:

Qualitative ultimate analysis.

All matter is made out of atoms, tiny particles that cannot be decomposed anymore by chemical methods. Most matter of our environment, and also our body, is made of compounds the building blocks of which are atoms. There are many different sorts of atoms. Each sort has its typical chemical properties. Matter containing one sort of atoms only is called 'element'. Carbon, hydrogen and oxygen are chemical elements. There are just over 100 known elements.

Information:

Carbohydrates contain the elements carbon, hydrogen, and oxygen. Therefore, its **a** compound.

Some examples of saccharides are grape sugar (glucose), cane sugar, starch, and cellulose.

Within the scope of ultimate analysis, carbon is identified as one of the elements of sugar.

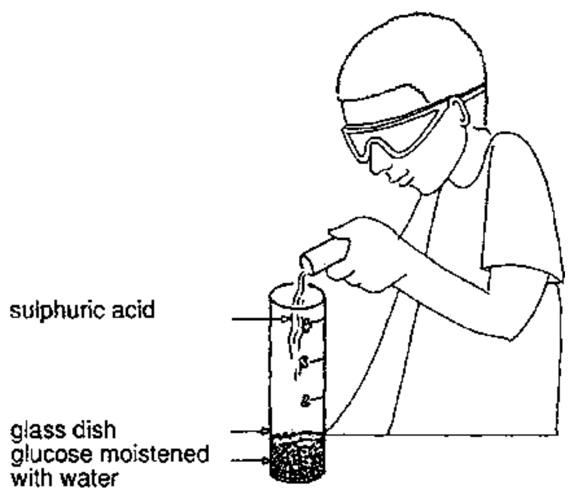
Materials and Apparatus:

glucose or cane sugar
water
about 10 ml of concentrated sulphuric acid
a glass dish which holds about 50 ml or a small beaker

Procedure:

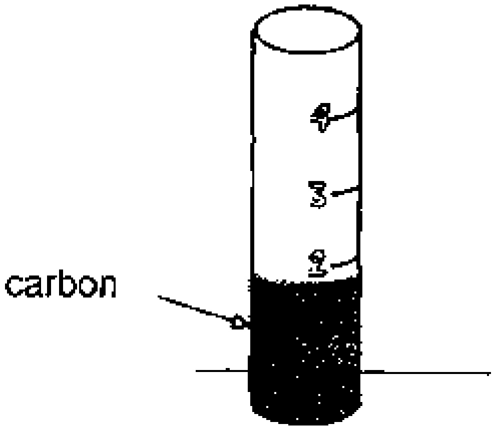
The beaker is filled to a depth of approximately 1 cm with glucose, which is moistened with a few drops of water.

Sulphuric acid is added carefully until the glucose is just covered. (Wear protective goggles.)



Observation:

A very voluminous black substance is formed.



Analysis:

The black substance is carbon.

Concentrated sulphuric acid extracts water from glucose.

Carbon is left as **residue.**

Practical Meaning:

When you burn wood you can observe that it passes a state where it appears black (charcoal). Again, the black substance is carbon.

4.2. PROTEINS CONTAIN NITROGEN

Main Goal:

Qualitative ultimate analysis.

Information:

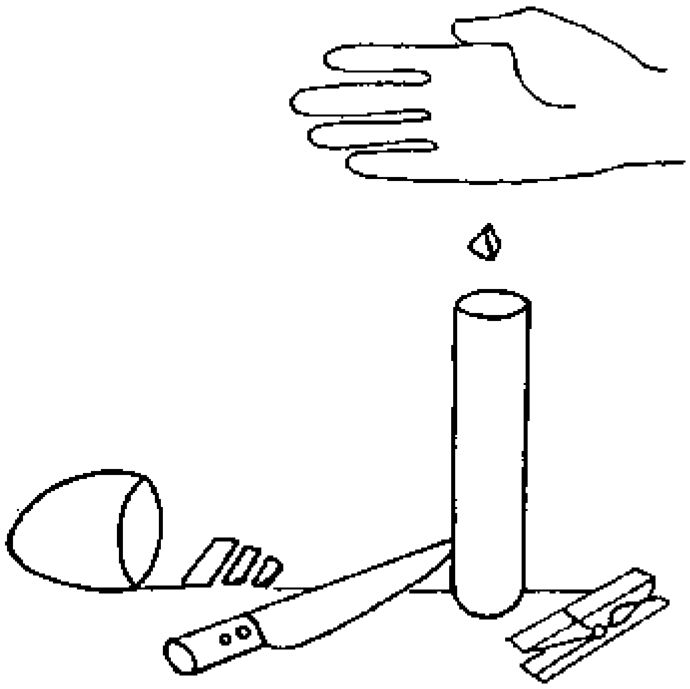
Proteins are organic compounds containing, among other elements, nitrogen, in particular the so called amino group - NH_2. Proteins are essential parts of animals' food, and also indispensable for mens' nutrition. Within the scope of ultimate analysis, nitrogen can be indirectly identified. When proteins are heated, ammonium gas is formed.

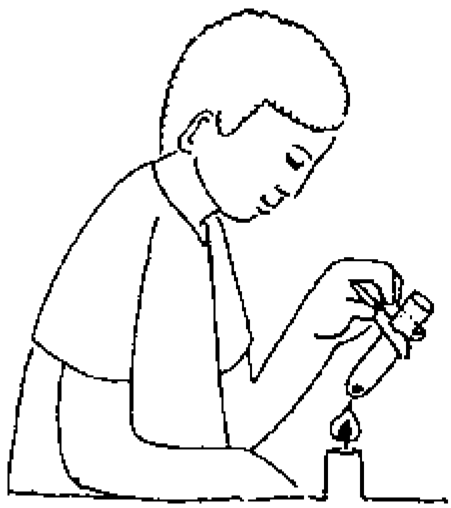
Materials and Apparatus:

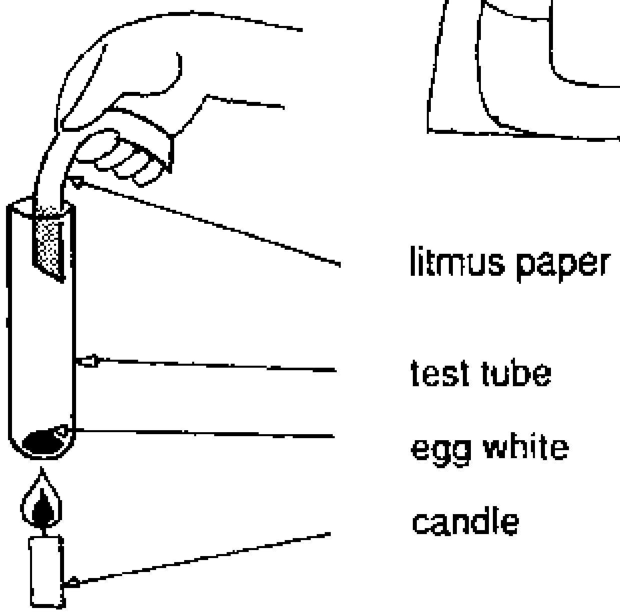
hard-boiled egg, chicken protein
moistened litmus paper
test tube or fire-resistant glass dish
test tube holder
burner or candle

Procedure:

About 1 - 2 cm^3 of hard boiled egg white is placed into a test tube.







The egg white is heated, and after a few minutes the moistened litmus paper is held in the vapour released.

Observation:

The protein turns black when heated.

The litmus paper changes colour indicating an alkali.

Analysis:

When protein is heated, carbon is left as a black residue.

Protein contains nitrogen. When chicken protein is heated, ammonium gas is set free. It forms ammonium hydroxide if water is added.

Ammonium hydroxide changes the colour of indicators.

Addition:

$NH_3 + H_2O \rightarrow NH_4OH$

4.3. PROTEIN CONTAINS SULPHUR

Main Goal:

Qualitative ultimate analysis.

Information:

Proteins are made up of amino acids. There are two kinds of amino acids which have sulphur in their functional group - cysteine and methionine.

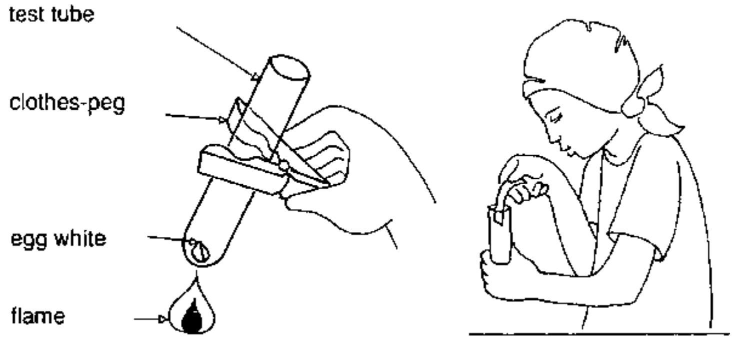
When protein, e.g. chicken protein, is heated, hydrogen sulphide is formed. Sulphur can then be indirectly identified within the scope of ultimate analysis.

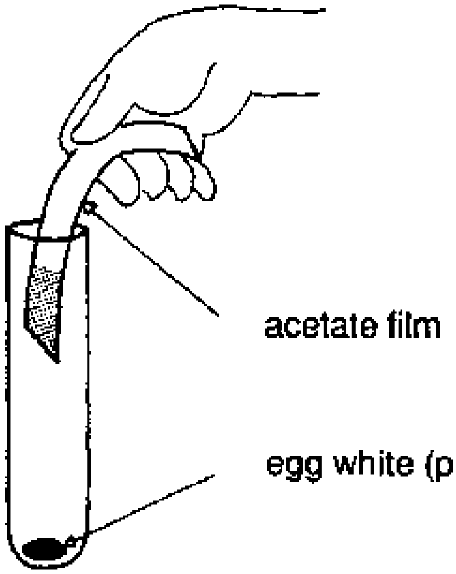
Materials and Apparatus:

hard-boiled egg, chicken protein
moistened lead acetate film
test tube or glass dish
test tube holder
burner

Procedure:

About 1 - 2 cm^3 of hard-boiled egg white is placed into a test tube. The egg white is heated, and after a few minutes the moistened lead acetate paper is held in the vapour released





Observation:

The protein turns black when heated.
The white lead acetate turns black.

Analysis:

When protein is heated, carbon is left as black residue.

Chicken protein contains sulphur. When heated, hydrogen sulfide gas is set free. Hydrogen sulfide in combination with lead acetate forms black lead sulfide.

4.4. IDENTIFICATION OF STARCH IN FOOD

Main Goal:

Starch is identified with iodine potassium iodide solution.

Information:

Starch is a polysaccharide and belongs to the class of carbohydrates.

Starch is a vegetable reserve substance, found in grain, potatoes, etc.

Materials and Apparatus:

a. about 0.5 g iodine

1 g of potassium iodide
100 ml distilled water
200 ml brown glass dish which can be tightly closed

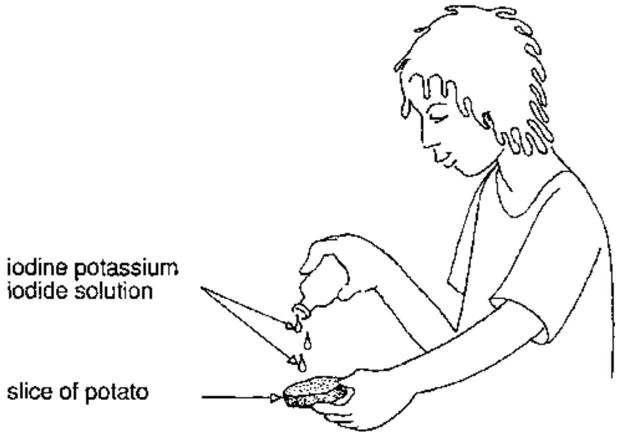
b. 1 slice of potato

1 cube of bread

Procedure:

a. The potassium iodide is dissolved in distilled water, and then the iodine is added.

b. Some drops of the iodine potassium iodide solution are dropped on a cube of bread and a slice of potato.



Observation:

The bread and the slice of potato turn a dark blue colour.

Analysis:

The blue colour indicates starch.

Addition:

Starch molecules are coiled in the form of a helix (like a spiral staircase). Iodine molecules accomodate themselves in this starch spiral.

The blue colour is caused by the trapped iodine molecules.

4.5. CARBON DIOXIDE IS PRODUCED DURING THE PROCESS OF FERMENTATION

Main Goal:

The experiment demonstrates alcoholic fermentation.

Information:

The oldest chemical synthesis technique of mankind is fermentation. It is the change which takes place when a saccharine solution is exposed to yeast. The products are alcohol (ethanol), carbon dioxide and heat.

Materials and Apparatus:

freshly pressed apple juice or other fresh fruit juice

yeast (from a bakery)

250 ml glass vessel which can be closed with a rubber stopper

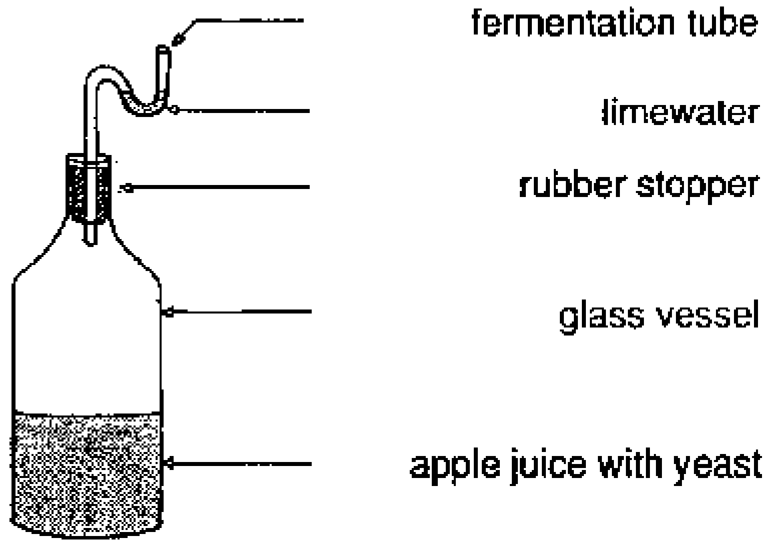
a pierced rubber stopper with a fermentation tube

limewater (CaO is dissolved in water and filtered)

Procedure:

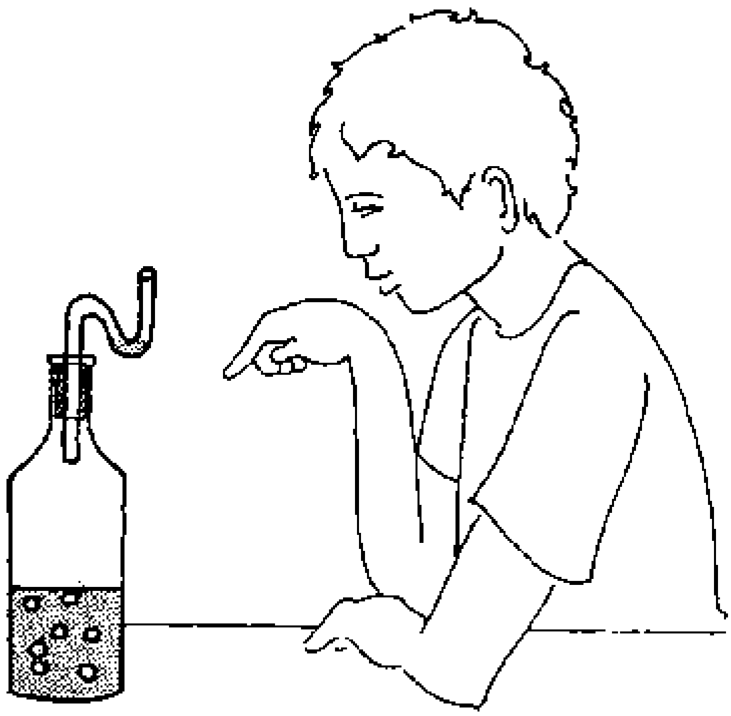
About 100 ml freshly pressed apple juice is poured into a glass vessel. Then 10 - 20 g yeast is added and the vessel is closed with a rubber stopper. The fermentation tube is filled with limewater (see diagram).

If the fermentation does not start immediately the glass vessel should be warmed in a water bath.



Observation:

After some time gas bubbles form.
The limewater becomes cloudy.
A white precipitate settles.
The glass vessel becomes warmer.



Analysis:

The gas formed is carbon dioxide.

Carbon dioxide and calcium hydroxide form white calcium carbonate.

$$CO_2 + Ca(OH)_2 \rightarrow CaCO_3 + H_2O$$

Addition:

Fermentation vessels are closed with fermentation tubes which usually contain water. One reason for this is to create an anaerobic medium.

In an anaerobic medium more alcohol is produced than in an aerobic one.

Practical Use:

In industry, ethanol is produced in large quantities by alcoholic fermentation.

5. PHASE TRANSITION

5.1. MELTING AND SOLIDIFICATION

Main Goal:

This experiment demonstrates the processes of melting and solidification taking water as an example. Water appears as liquid, vapor and solid (ice). These three modes of appearance are called phases. The transition from one phase to another one is called 'phase transition'. At the melting point solid water changes phase to liquid water. At the freezing point liquid water becomes solid water.

Information:

The melting point and the freezing point, i.e. temperature at which these changes take place, are identical.

These two phase transitions are hardly dependant on air pressure.

Materials and Apparatus:

a. water

dish
refrigerator

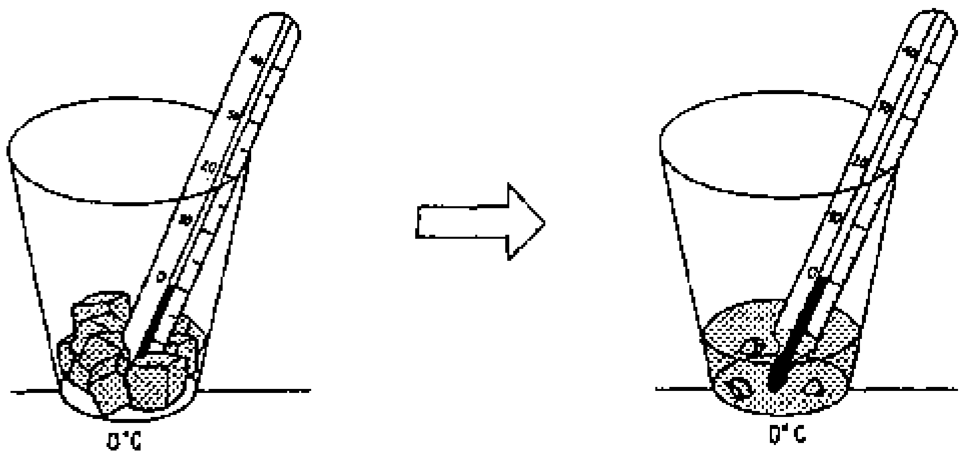
b. ice

glass dish
thermometer

Procedure:

a. A little water is poured into a dish and this is then placed in the refrigerator.

b. Some ice is placed in a glass dish, and the temperature is measured as the ice melts (see drawing).



Observation:

a. After some time the water freezes.
b. As long as the ice melts, the temperature remains at 0°C.

Analysis:

The transition from the liquid phase into the solid phase at a particular temperature (point of solidification) is called “solidification”.

The transition from a solid phase into a liquid phase at a given temperature (melting point) is called “melting”.

Thus it is possible to liquefy a solid substance and solidify a liquid.

The melting point (and the freezing point) for water is 0°C.

Practical Use:

The melting point is one means of identifying a material.

Addition:

The melting point of alcohol is - 114° C, its boiling point is 78° C.

For mercury the corresponding data are - 39° C and 357° C.

Further thought:

As long as the ice melts, the temperature remains constant (0° C) in spite of the fact that heat is continually being supplied.

Why does the temperature not rise?

5.2. EVAPORATION AND CONDENSATION

Main Goal:

This experiment illustrates evaporation (boiling) and condensation taking water as an example.

Information:

The boiling point and the condensation point of a pure substance are identical.

These two phase transitions are highly dependent on air pressure.

Condensation comes from the Latin “condensare” meaning to thicken.

Materials and Apparatus:

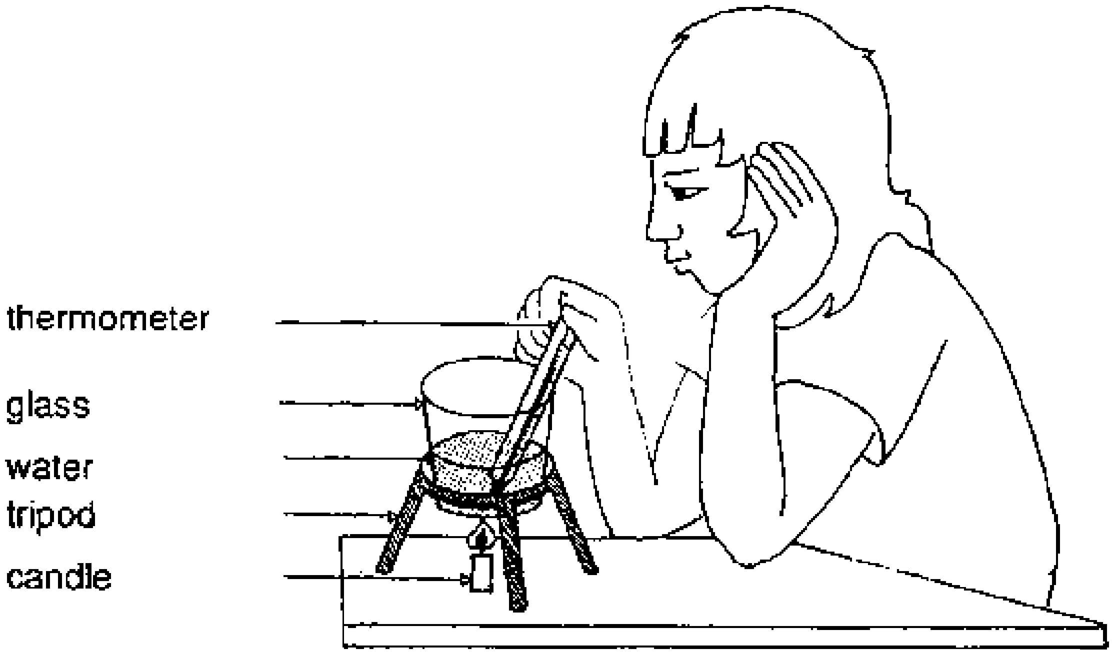
water
glass or a pot
glass vessel
tripod
burner
thermometer

Procedure:

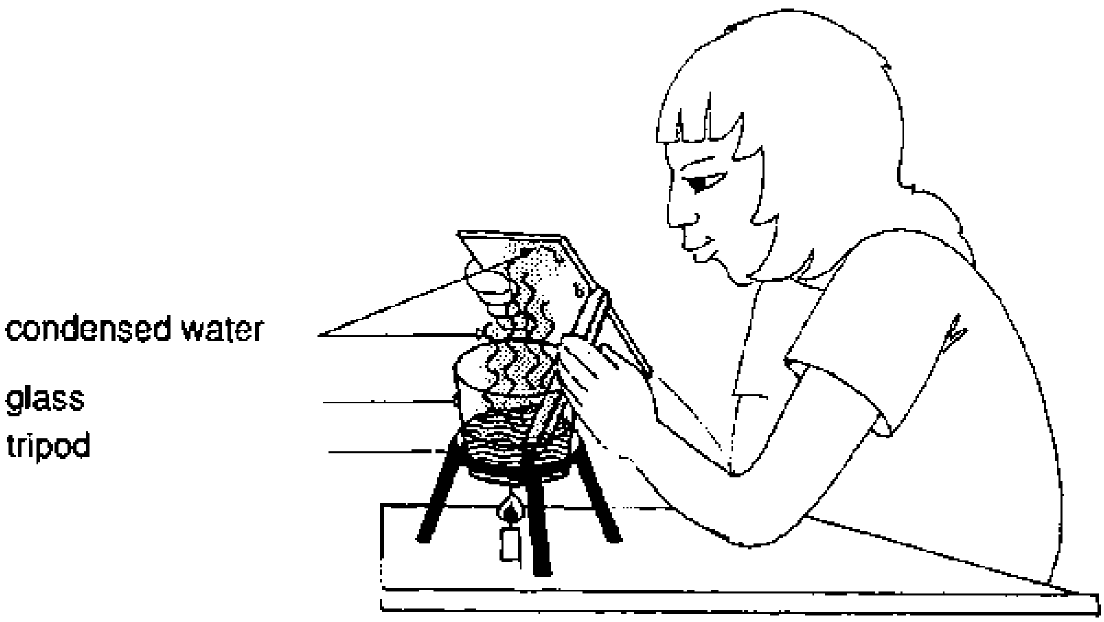
a. The apparatus is set up as shown in the diagram below.

The water is heated.

The temperature at the boiling point is measured using the thermometer. (The temperature should not be taken at the bottom of the dish).



b. Then the second glass vessel is then held in the gaseous water (steam).



Observation:

a. The water boils at about 100° C (at normal air pressure).
b. Moisture condenses on the second glass vessel.

Analysis:

a. The transition of a liquid to a gas at a certain temperature (the boiling point) is called “evaporation” or “volatilization”.

b. The transition of a gas to a liquid at a certain temperature (condensation point) is called “condensation”.

Practical Use:

Boiling points are a means of identifying substances.

Air is generally loaded with water vapor. If air rises and reaches colder regions, the vapor condenses. Tiny liquid water drops are formed, clouds develop.

Further thought:

A solid must be heated to melt. A liquid must absorb heat to vaporize. Conversely, what must a gas release to liquefy and a liquid to solidify?

5.3. SUBLIMATION AND RESUBLIMATION

Main Goal:

This experiment demonstrates the processes of sublimation and resublimation taking iodine as an example.

Information:

Sublimation is the direct transition of a solid body into a gaseous substance. The reverse process is called resublimation.

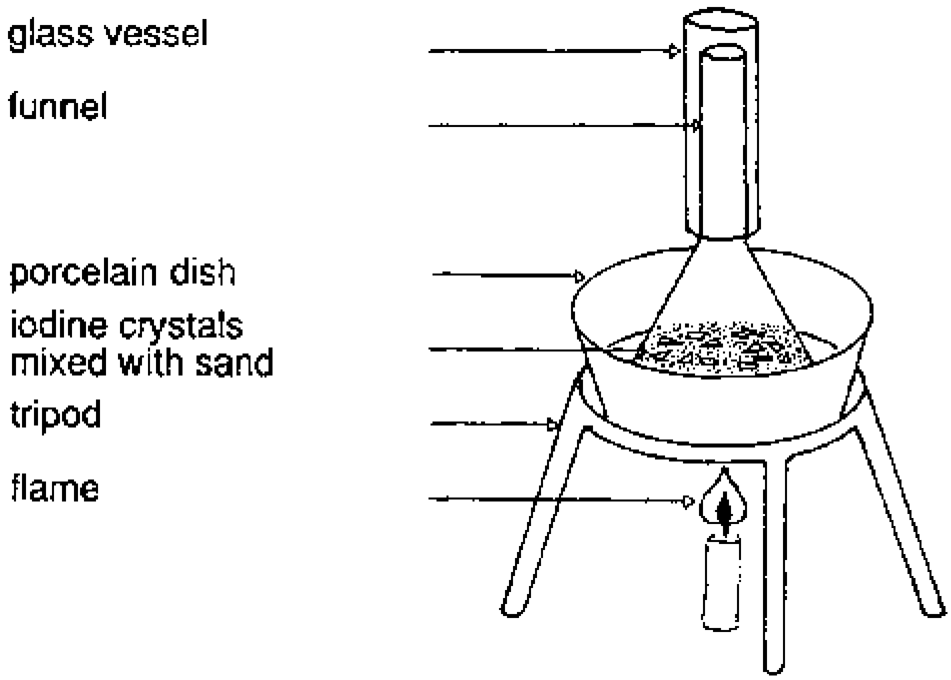
Materials and Apparatus:

iodine - some crystals
sand - 2 or 3 teaspoons
porcelain or clay dish
funnel or a cut-off bottle neck
glass vessel - must be cooled in a freezer prior to the experiment
burner or candle
tripod

Procedure:

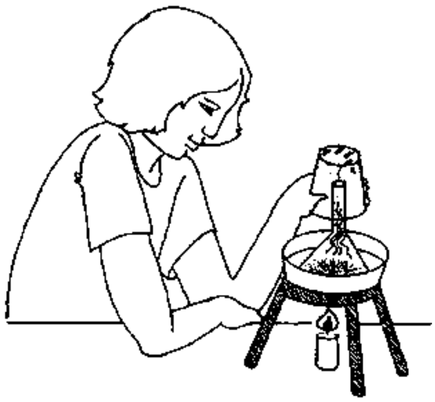
The iodine crystals are mixed with the sand in the porcelain dish.

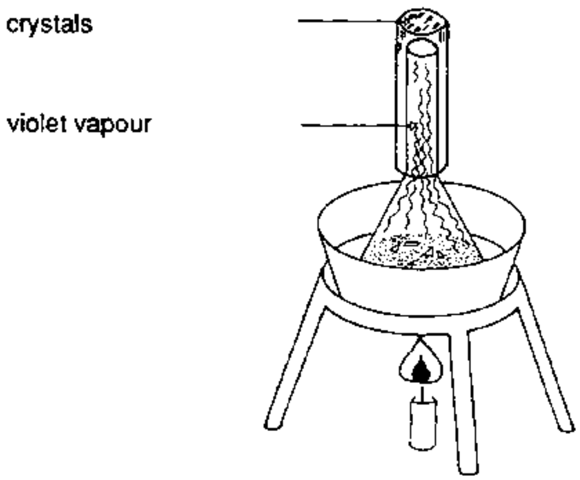
The apparatus is set up as shown in the diagram below and heated slowly.



Observation:

Violet vapour appears. The solid iodine becomes a gas without melting. Crystals settle in the glass dish.





Analysis:

This direct transition of a solid substance to a gas is called “sublimation”.

The direct transition of a gas to a solid condition is called “resublimation”.

Further thought:

So-called “dry ice” (a solid) consists of carbon dioxid. At the open air it undergoes sublimation, and i.e. it changes phase directly from solid to gas. Why then is dry ice used in picnic cooler?

5.4. LAUNDRY DRIES WHEN THE WATER EVAPORATES

Main Goal:

Through the experiment pupils learn why and how liquids evaporate, taking water as an example.

Information:

Even below the boiling point water can become a gas. This process is called evaporation. The pace of water evaporation is dependent on the factors temperature and vapor saturation of the air (among others). Generally air contains water vapor. The concentration of water vapor i.e. the number of grams of water per cubic meter of air, depends on the temperature of the air. If air of a certain temperature contains the maximum possible amount of water vapor we call this air ‘saturated’. The higher the temperature of the air the more water vapor can it contain.

The following experiments illustrate these two interdependent factors.

Materials and Apparatus:

a. 2 dishes of about the same size

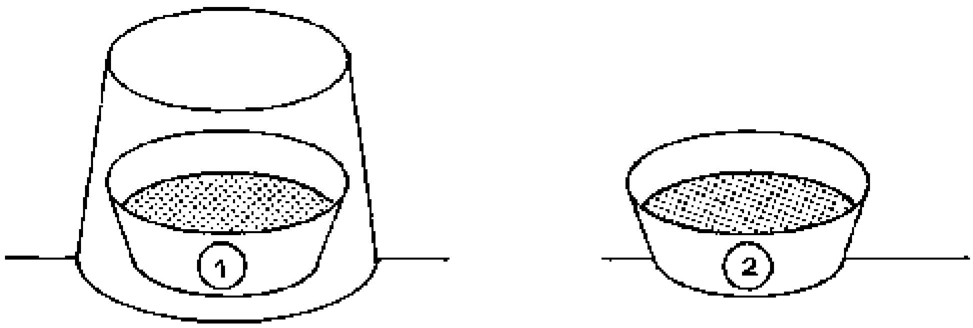
1 glass vessel

b. 2 rags of about the same size

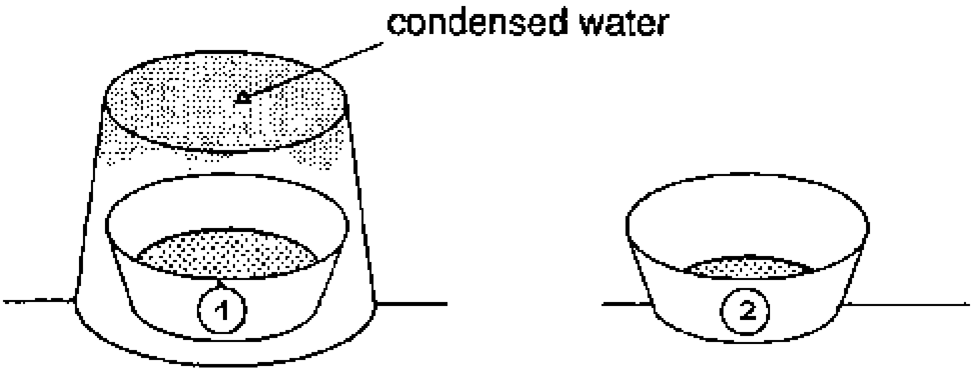
(about 15 cm × 15 cm)
water

Procedure:

a. The two dishes are half filled with water. A glass vessel is placed over one of the dishes. The experiment is observed for several days.



b. The rags are soaked in water. One is dried in the sun and the other one in the shade. The times taken by the rags to dry are compared.



Observation:

a. After a few days (the time depends on the amount of water and the size of the surface) the water in the open dish has completely evaporated. The water in the other dish has only partly evaporated.

b. The rag in the sun dries more quickly than that in the shade.

Analysis:

The ambient air takes in the gaseous water particles to a certain degree until the air becomes 'saturated'. This is why the water from the dish with the cover (experiment a.) evaporates only partially. Water evaporates more rapidly in warm air than in cold air.

An additional air movement, e.g. caused by wind, moves away the air surrounding the wet rags which is saturated with water vapour.

The "dry" air is moved along and the whole process starts again. Thus, the pace of evaporation is increased.

Practical Use:

A technical way of using water evaporation is the process of refining salt (basically sodium chloride) from sea water in warm countries. The sea water is lead into huge basins. The water evaporates, according to the water circulation, with the help of the sun and the wind.

The salts crystallize out and can then be refined (see experiment: CRYSTAL FORMATION).

Further thought:

The cloth covering canteens are moistened when we want to keep the liquid inside cool. Why?

5.5. WATER EVAPORATION - DEPENDANT ON THE SURFACE SIZE

Main Goal:

The experiment demonstrates to what extent the evaporation of water is dependant on the surface size.

Information:

Water also becomes a gas below the boiling point. This process is called evaporation.

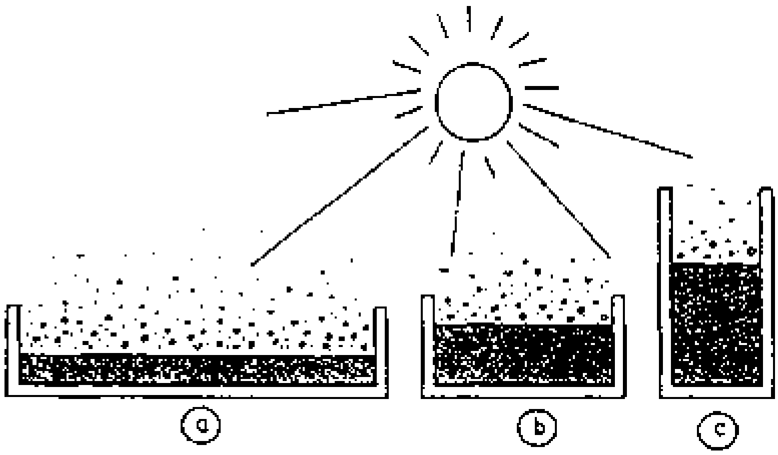
(see experiment: LAUDRY DRIES WHEN THE WATER EVAPORATES.)

Materials and Apparatus:

1 glass vessel with a smaller diameter
a tin pan
1 measuring cylinder (scales, measuring vessel)

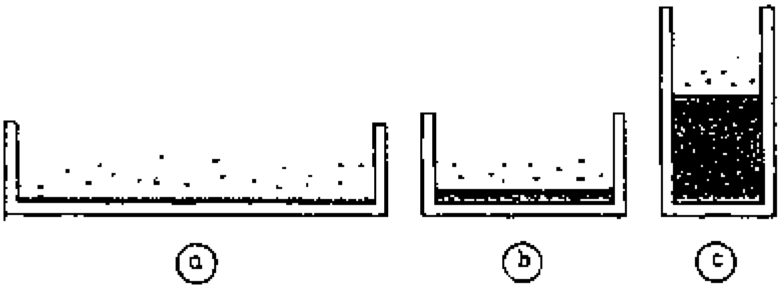
Procedure:

The same amount of water is placed in each of the three vessels. They are then placed in a sunny spot and observed for several days.



Observation:

The water in the tin pan (a) evaporates faster than that in glass vessel (b). Slowest evaporation takes place in glass vessel (c).



Analysis:

The speed of water evaporation is dependant on the size of the surface. The bigger it is, the more rapid the evaporation.

Practical Use:

see experiment: LAUNDRY DRIES.

Laundry dries faster when the surface of the washing is made as big as possible.

Further thought:

What is the effect when rubbing alcohol is poured on your back?

5.6. WATER EXPANDS WHEN IT SOLIDIFIES

Main Goal:

This experiment illustrates the volume expansion of water when it solidifies.

Information:

Water has its greatest density at 4° C. Above and below this temperature, the density decreases.

The volume expansion of solidified water can be demonstrated impressively by the volume increase undergone by water when it freezes.

This phenomenon, which is a contradiction of accepted, normal laws is called the “density anomaly”. The word anomaly comes from the Greek and Latin word “anomalus” meaning: against the law.

Materials and Apparatus:

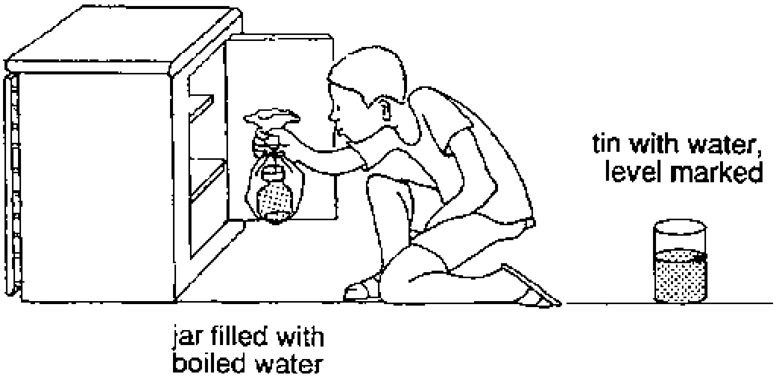
a bottle or jar with a screw cap
water which has been boiled and then cooled
freezer
plastic bag, paper
an empty tin

Procedure:

The jar is filled up to the rim with boiled water and the screw cap is tightly closed. Then it is placed in a plastic bag.

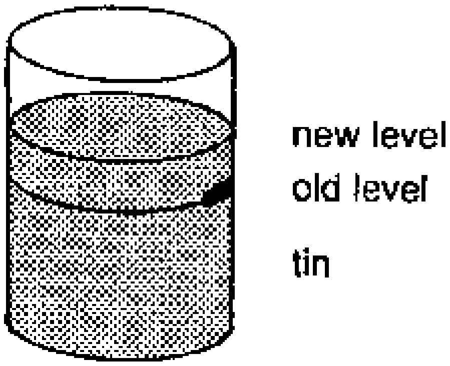
The tin is also filled up to 3/4 of its height. The water level is marked.

Both, the bag with the jar and the tin are placed in the freezer for one or two days.



Observation:

The water is frozen, the jar has shattered, the ice in the tin has reached a higher level than the liquid water before.



Analysis:

Water expands when it solidifies.

Practical Meaning:

Underground water which freezes causes erosion (from the Latin word “erodere”, meaning to graw off) in the mountains and streets.

Further thought:

When water solidifies, it not only enlarges its volume but also releases heat into the freezer.

What does the freezer do with this heat?

5.7. ICE FLOATS ON TOP OF WATER

Main Goal:

This experiment demonstrates that ice is less dense that water.

Information:

At room temperature, the density of water is approximately 1 g/cm^3 and that of ice about 0.9 g/cm^3.

Materials and Apparatus:

ice cubes (if a refrigerater is not available in your school, go to the next bar and ask for some ice cubes)

water

drinking glass

Procedure:

Some ice cubes are placed in a pan with water.

ice cubes
in a pan

Observation:

The ice floats on the water.

Analysis:

We observe that water expands when it solidifies. This means that 1 cm^3 ice weights less than 1 cm^3 liquid water. The bigger volume of ice has the same mass as the water that becomes ice. Therefore, the density, i.e. the mass (in g) per volume (in cm^3) of ice is smaller than that one of liquid water.

Further thought:

What happens to the water level in the pan (see drawing) when the ice melts?

5.8. ICE MELTS WHEN THE PRESSURE INCREASES

Main Goal:

This experiment demonstrates that ice melts where locally the pressure is increased.

Information:

The freezing point, or rather melting point, slides toward lower temperatures as pressure is increased. This is true of water and of the elements mercury and bismuth. Thus, under high pressure ice melts already at - 5° C or even lower temperatures.

With all other substances the melting or the freezing point is increased by an increase in pressure.

Materials and Apparatus

1 ice block

1 boulder or big brick (about 5 kg)

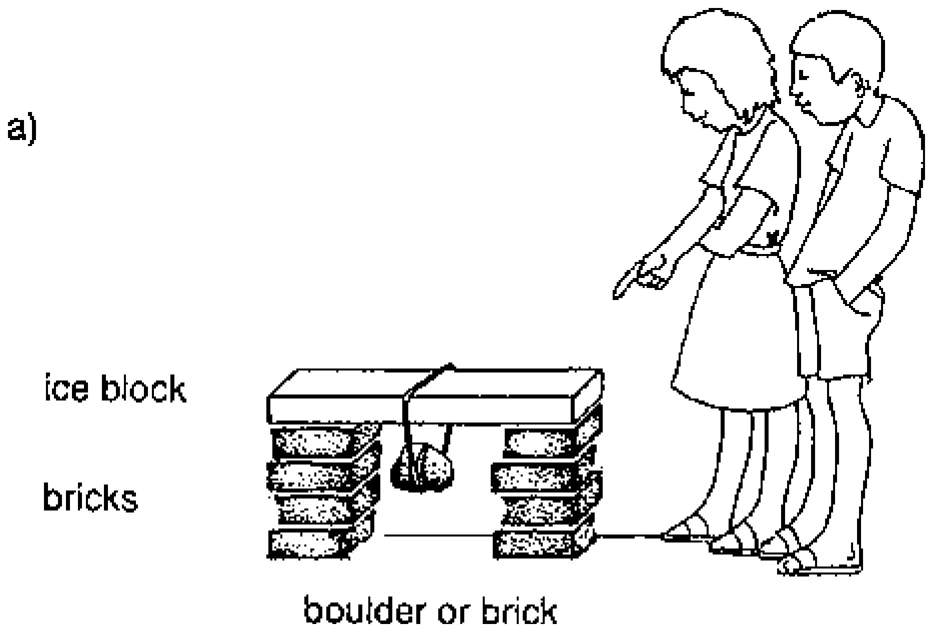
wire about 30 cm long

10 normal bricks

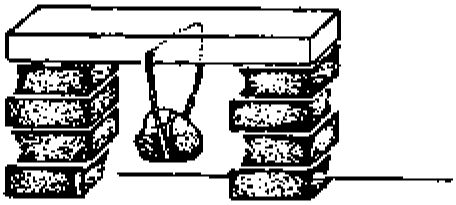
Procedure:

The experiment is set up as shown in the diagram below.

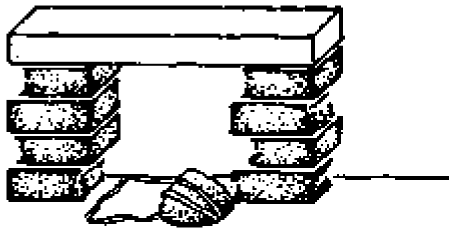
The experiment takes about half an hour or longer, depending on the thickness of the ice block, and the weight of the weight.



b)



c)



Observation:

The wire moves through the ice block without cutting it into pieces.

Analysis:

The boulder produces pressure along the line of the wire at the upper surface and at the sides of the ice block. The ice melts because of the pressure transmitted to the ice by the wire. Above the wire the ice freezes again. Under increased pressure, water has a lower freezing or melting point.

Practical Meaning:

Ice skating is possible due to the increased pressure which is exerted on the ice through the blade of the ice skate. A water film is created which allows skater to glide.

The movement of glaciers can also be explained by the high pressure which the upper layers of snow or ice exert on the lower ones.

Further thought:

Look at the ice block in drawing c).

It is not quite correct. The wire when pulled though the ice will leave a trace! Why?

6. WARMTH AND COLD

6.1. METALS EXPAND WHEN HEATED

Main Goal:

This experiment demonstrates the expansion of metals when heated.

Information:

Some important properties of metals are malleability, thermal conductivity, expansion when heated and electrical conductivity.

The expansion of metal under the influence of heat is very important. The effect is in particular conspicious for long, tin rods and pipes, which are at high temperatures significantly longer than at low temperatures.

Solid materials do not expand as much as liquids or gases.

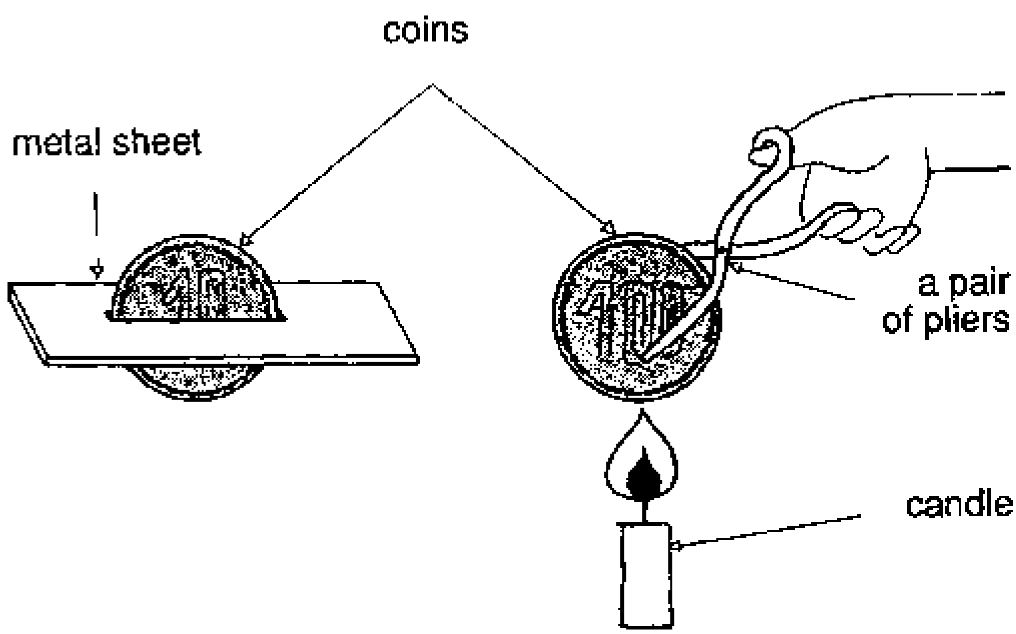
Materials and Apparatus:

1 metal sheet (aluminium or copper)
1 coin

alcohol or gas burner,
a candle a pair of tongs
a pair of pliers

Procedure:

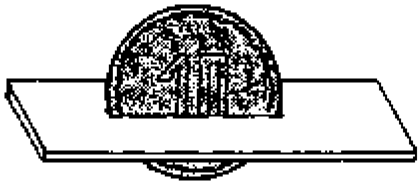
An opening is cut into the metal sheet to allow the coin just to to pass when cold. The coin is heated as shown in the diagram below. (The time required depends on the material of which the coin is made.) After heating, attempt to put the heated coin through the opening in the metal sheet.



Observation:

The heated coin no longer fits through the opening as before. It jams.

After the coin has cooled down, it fits through the opening again.



Analysis:

The coin expanded when heated.

Metals expand when heated and contract when cooled down.

Practical Use:

The expansion of metals on heating can be observed in the wires of telegraph lines and transmission lines.

During the summer metal wires sag, whereas in winter they tauten again. When metal wires are laid in summer, they should never be tautened.

In winter small gaps between railway tracks can be observed. These close in summer. The length expansion must be taken into consideration to avoid a deformation of the whole track system. Track sections are often welded together today without leaving seams. Iron tyres are fitted on a wooden wheel after having been heated. When they cool down they contract and tighten on the wood.

Metal bridges are set into concrete only at one side of the bridge, so that they do not bend when they expand. Bimetals take advantage of various kinds of length expansions of different sorts of metals.

(see experiment: THE PRINCIPLE OF A BIMETAL)

Futher thought:

Mercury, under normal conditions, is a liquid. It expands also when heated. The same happens to glass, even if it is not a metal. Many thermometres are made of glass and mercury. Which material expands more with increasing temperature?

6.2. THE THERMAL CONDUCTIVITY OF DIFFERENT KINDS OF MATERIALS

Main Goal:

This experiment shows the good and poor conductivity of various kinds of materials.

Information:

All kinds of substances conduct heat. The degree of heat conductivity is dependent on the material. If the transport of heat takes place in testing substances, it is said to be heat conduction (in contrast to heat streaming due to differences in density).

Materials and Apparatus:

about 20 cm of copper wire, iron wire and glass rod, each one of the same length and with the same diameter

a wooden rack

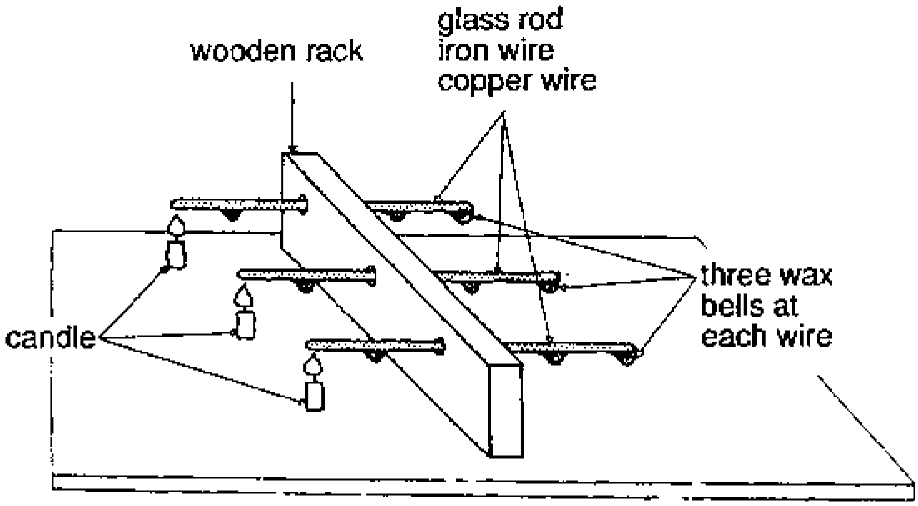
wood auger

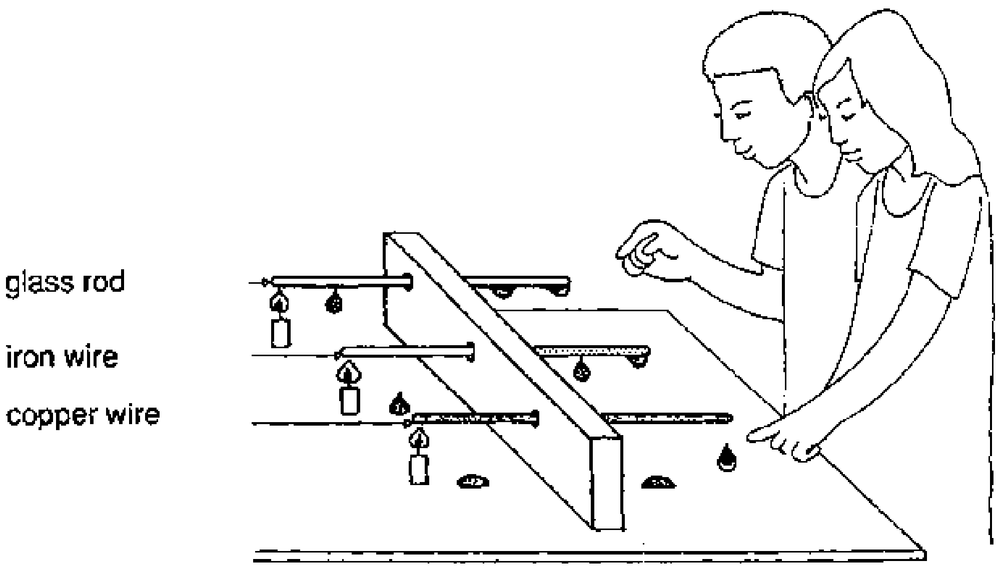
wax

3 candles

Procedure:

The experiment is set up as shown in the following diagram.





Observation:

First the little wax ball at the end of the copper wire melts and then the one on the iron wire. The one at the end of the glass rod does not drop off.

Analysis:

Heat needs time to go through. The faster the better the conductivity. Glass is a poor heat conductor. Copper is a better one than iron. The heat conductivity is dependant on the material. There are good, mediocre and bad heat conductors.

Practical Use:

Good heat conductivity is taken advantage of in the household, e.g. with pots.

Wood conducts heat much worse than brick.

A house made of wood only warms up slowly, which means, it stays cool in summer. In winter it cools down more slowly than houses made of brick.

(The thickness of the wall and its construction also have to be taken into consideration.)

It is recognized that houses made of brick are built in such a way that the bricks include a lot of air, since air is a poor thermal conductor.

On Cabor Verde, holes are punched into mud blocks and gypsum blocks with the help of bottles and tins. This procedure saves material and is insulating.

Futher thought:

Why is it difficult to estimate the temperature of things by touching them?

6.3. THE THERMAL CONDUCTIVITY OF WATER

Main Goal:

This experiment demonstrates the thermal conductivity of water.

Information:

see experiment: THE THERMAL CONDUCTIVITY OF DIFFERENT KINDS OF MATERIALS.

Materials and Apparatus:

glass tube
cold water
burner or candle

Procedure:

The water is heated in the upper part of the glass tube.

Observation:

The water boils in the upper part of the glass tube.
The bottom of it hardly warms up.

Analysis:

Heated water expands, the density decreases and it becomes leighter (see experiment 6.4). Therefore, it does not sink down.

The water at the bottom of the test tube remains rather cold.

Therefore: Water must be a bad heat conductor.

Further thought:

How can you make this experiment even more dramatic? Think about the usage of ice!

6.4. THE HEAT "STREAMING"

Main Goal:

The experiment demonstrates that the density of water decreases when it is heated.

(The density anomaly of water - highest density at 4° C - is not taken into account.)

Information:

When water is heated, it expands and its density decreases. It becomes lighter (i.e. 1 cm^3 of hot water is lighter than 1 cm^3 of cold water). If heated at the bottom of a beaker the hot water moves upwards. At the surface it cools down. Its density increases and the water sinks. These processes cause a "heat streaming" in water.

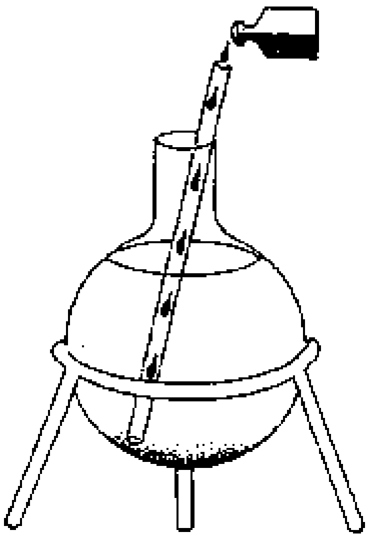
“Heat streaming”, (unaided convection, Latin: convehere to bring along), occurs when the density differences are caused by different temperatures.

Materials and Apparatus:

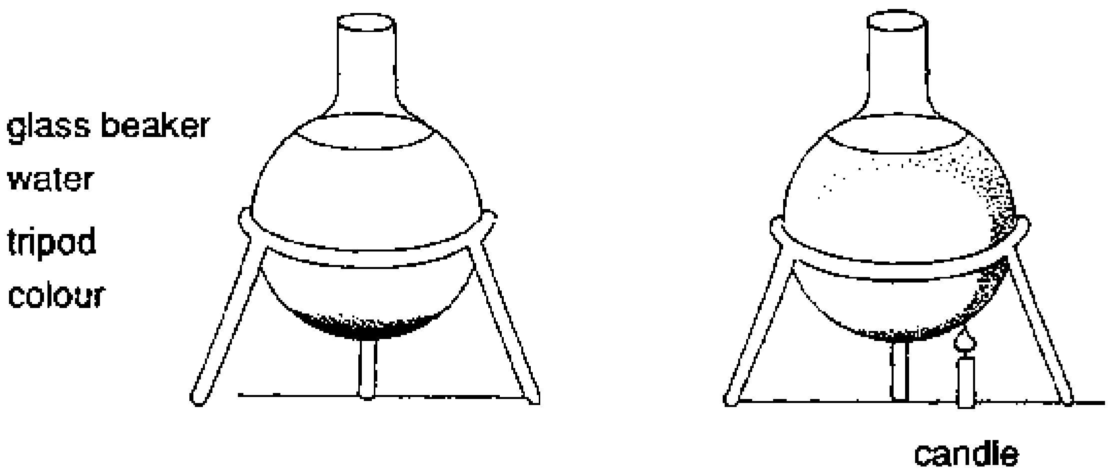
water, ink
sawdust, straw, glass pipe, bamboo pipe
tripod or a similar frame
candle
glass beaker

Procedure:

Ink or another colour is placed at the bottom of the beaker by means of a straw or a glass pipe.



The water is warmed up with the candle at one side of the bottom of the beaker.



Observation:

The coloured water ascend at the side of the beaker which is heated. At the opposite side the water sinks back to the bottom. After a while it curculates.

Analysis:

The warmed up water ascends and carries the colour with it. The density of heated water is less than that of cold water, which sinks back to the bottom. This "heat streaming" can be observed as long as the water is heated in the way shown.

Practical Use:

This phenomenon is used in warm water heating. In the basement, cold water is warmed up. Warm water ascends into the heating system, cools down and arrives at the boiler over a down-pipe. Today pumps are used to support this cycle.

Furhter thought:

In this experiment not only water is moving! It carries colour and something else. What?

6.5. DENSITY DIFFERENCE BETWEEN WARM AND COLD WATER

Main Goal:

These experiments show that warm water has a lower density than cold water.

Information:

The greatest density of water is at 4° C. Above and below this temperature, the density of water decreases (see experiment: WATER EXPANDS WHEN IT SOLIDIFIES)

Materials and Apparatus:

a. water heated to about 50° C

ink
cold water of about 10° C
2 glass dishes
thermometer

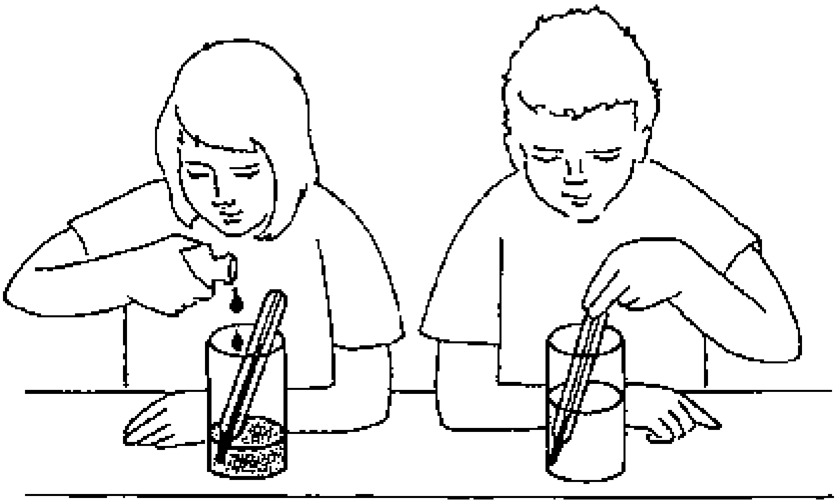
b. water heated to about 50° C

ink
cold water of about 10° C
2 glass dishes
thermometer

Procedure:

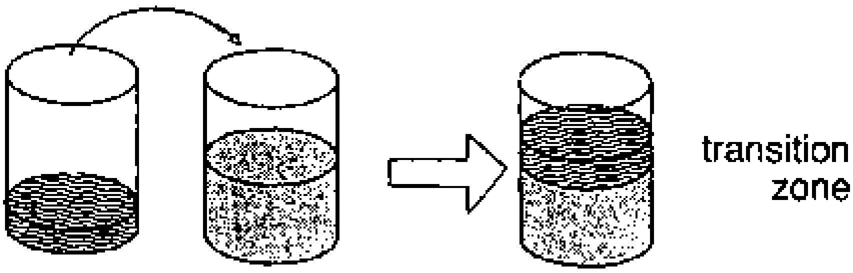
a. The warm water is coloured with 1 - 2 drops of ink and then carefully added to the cold water.

b. The cold water is coloured with 1 - 2 drops of ink and then carefully added to the warm water.

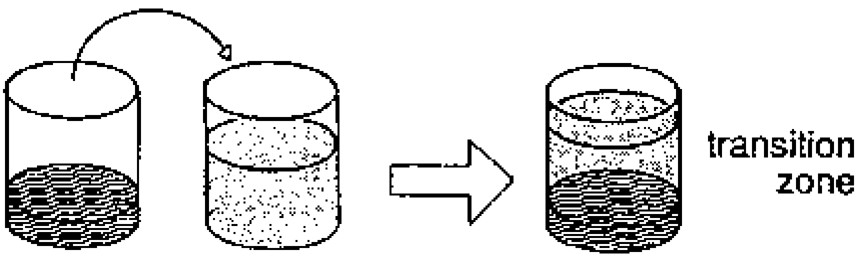


Observation:

a. If added carefully and slowly by means of a glass rod where it 'slides down' to the surface of the cold water, the warm water floats on top of the cold water.



b. Added in the same way to warm water, the cold water sinks more down to the bottom and mixes with the hot water.



Analysis:

Warm water has a density lower than that of cold water. However this is only true for water above 4° C. Below this temperature, the density of water decreases again. Thus, water of 4° C is 'heaviest'. It has the highest density.

Practical Meaning:

This characteristic of water is important in countries in which the water freezes in winter. On the floors of frozen lakes, the water temperature is 4° C. Therefore, fish and other aquatic animals can survive in the deeper layers of these waters.

Further thought:

Suppose that water is used in a thermometer instead of mercury. Suppose further that it is 4° C. Then temperature changes. The thermometer indicates this change. Is this indication unequivocal?

6.6. HEAT RADIATION

Main Goal:

This experiment illustrates heat transmission by means of heat radiation.

Information:

“Heat radiation” is the name given to a process of transmission of energy, which is not linked with any specific Kind of substance. Sun rays reach earth through space which is void of air. The thermal energy of the sun is transformed into radiant energy and travels in that form through space. When it strikes an object on earth it is retransformed into thermal energy. This is the energy in the object due to the random motion of its molecules. The object, when it has higher temperature than another body or substance in its environment, can loose part of its thermal energy due to flow of heat to the colder body. Therefore, not heat is transmitted in the radiation process but radiant energy.

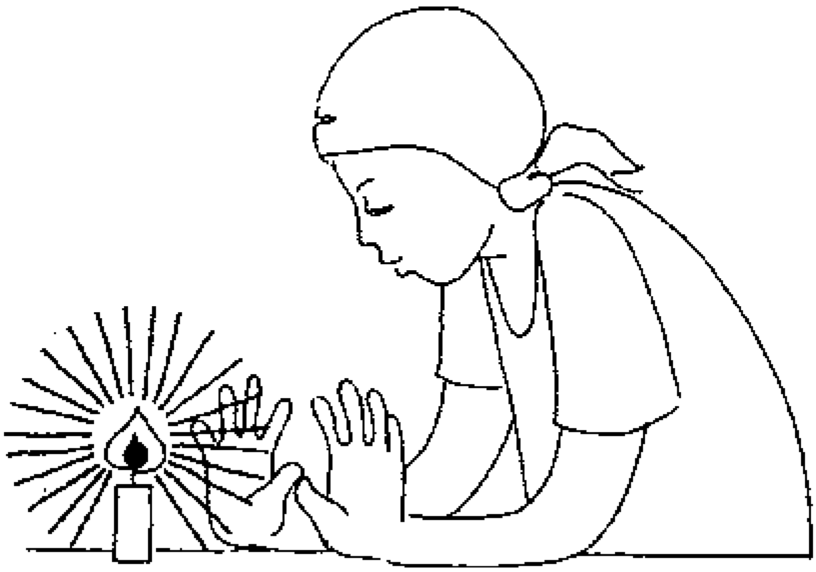
(see experiment: DARK MATERIALS COOL DOWN FASTER THAN LIGHT ONES)

Materials and Apparatus:

any kind of heating element
(candle, heater, bunsen burner or burning glass and sunlight)

Procedure:

Hands are held at a distance of about 10 - 20 cm from the heating element.



Observation:

A warming sensation is felt on the palms of the hand.

Analysis:

The energy transport hardly takes via heat conduction as air is a poor thermal conductor.

It cannot take place on the basis of heat streaming because warm air rises. The heat transmission in this case is called "heat radiation". Heat radiation is not linked with any specific kind of substance. It needs no medium.

Practical Use:

Every kind of heating element exploits heat radiation (e.g. open fires, ovens, central heating).

With the help of sun collectors, the heat radiation of the sun is harnessed. Sun collectors include, for example black tubes through which water flows.

Further thought:

The composition of the upper atmosphere is changed. It prevents a greater amount of the earth's "heat radiation" from escaping into the space. What are the consequences?

6.7. DARK MATERIALS WARM UP FASTER THAN LIGHT ONES

Main Goal:

Investigation of how different kinds of materials react to heat radiation.

Information:

Light materials reflect (from the Latin "reflectare": to throw back) a greater proportion of heat radiation than dark materials.

Dark ones absorb (from Latin "absorbere": to suck up) a greater amount of this radiation.

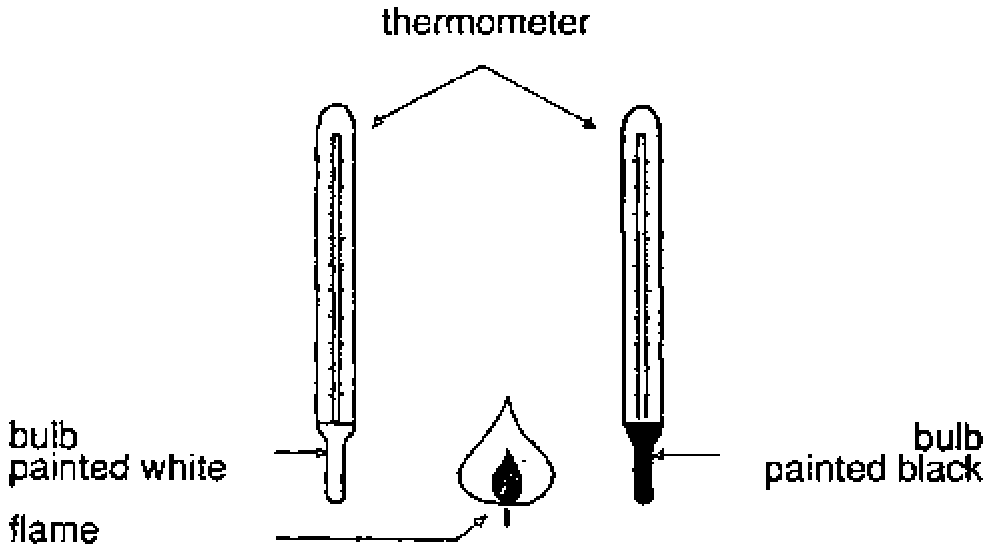
Some investigations have shown that rough surfaces absorb more heat radiation than smooth ones.

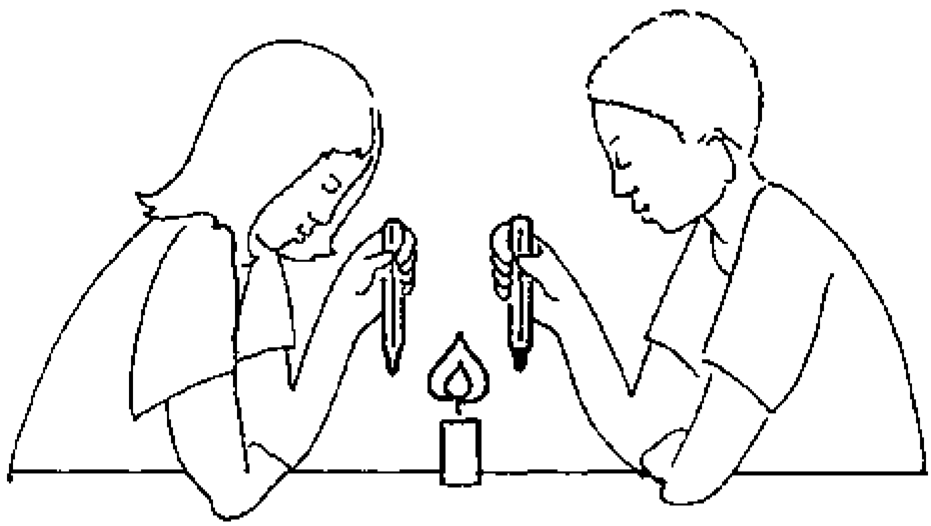
Materials and Apparatus:

2 thermometers
soot or black paint
white paint candle, a gas burner or similar source of heat

Procedure:

The mercury or coloured alcohol-filled bulb at the bottom of one thermometer is painted black with soot or paint. That of the other thermometer is painted white.





They are held close to some kind of heating unit.

Observation:

After a short time the blackened thermometer indicates a higher temperature than the white one.

Analysis:

Dark materials absorb in the same time and at the same distance from the heat source more heat radiation than light ones. The absorbed heat causes the temperature of the absorbing material to rise.

Light materials reflect the heat radiation better than dark materials.

Practical Use:

Refrigerators, freezers and refrigerator vans almost all have white, smooth surfaces so that heat radiation which hits them is well reflected.

In southern countries houses are painted white.

The people in these countries often wear light coloured clothes.

Sun collectors, for instance black tubes through which water flows, are black.

Further thought:

In countries where there is snow you can lay samples of light and dark cloth on the snow.

What can be observed?

6.8. DARK MATERIALS COOL DOWN FASTER THAN LIGHT ONES

Main Goal:

This experiment demonstrates that dark materials cool down faster than light ones.

Information:

Dark materials emit (from the Latin “emittere”: to send out) heat faster than light ones.

Materials and Apparatus:

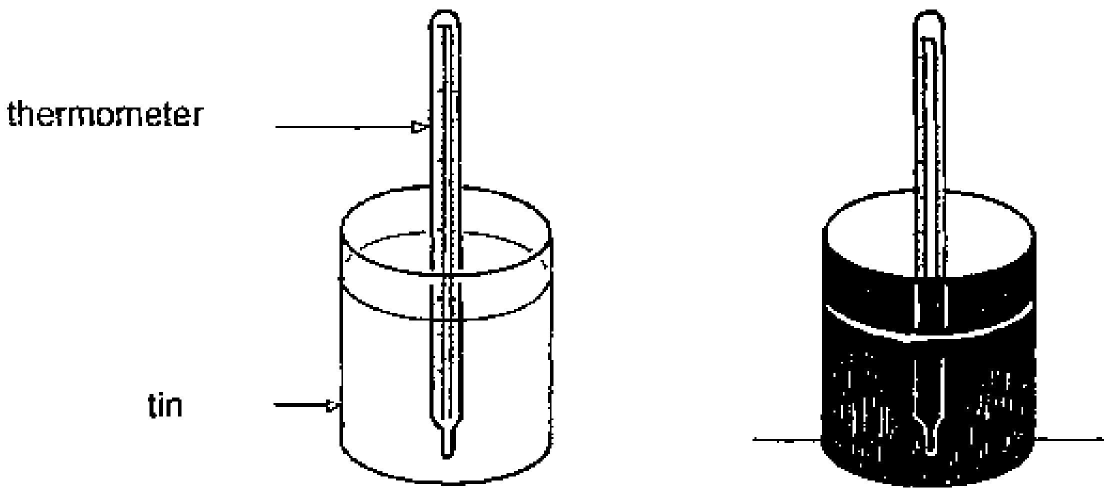
2 tins or glasses
2 thermometers

boiling water
a *candle*
soot or black paint
white paint

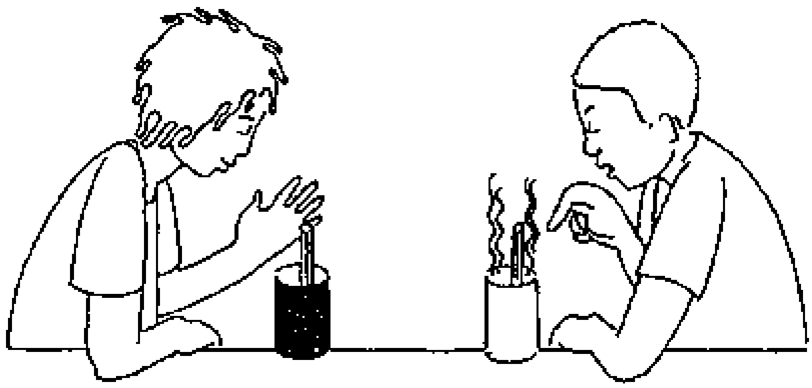
Procedure:

The outside of the tin is blackened with soot (or with black paint).

The second tin can be painted white although this is not absolutely necessary.



The two tins are filled with boiling water. The temperatures are taken regularly at intervals of 30 seconds or 1 minute. It might be useful to note the temperatures recorded.



Observation:

The temperature of the black tin drops faster than that of the white one.

Analysis:

Black materials do not retain heat as long as light materials. Black materials emit heat faster than light ones. Thus black materials not only absorb heat better than light ones (see 6.7), but also are better emitters.

Practical Use:

The rays of the sun warm up the dark soil and water in daytime. The dark ground and the water emit heat so that the air warms up. The same amount of heat warms the water less than the ground, because it needs more heat to increase the temperature of 1 kg water than for 1 kg stone or soil.

At the coast it can be observed that the land warms up faster than the sea under the influence of sun radiations. As the air above the land is warmed up more, it ascends and the cooler air above the water streams onto the land. It is the other way round during the night. We perceive this heat streaming in the air as wind. In the daytime the wind blows from the sea onto the land, and during the night from the land to the sea. The degree of heating depends on the angle at which the sun's rays hit the earth and the water. The steeper the angle at which the sun's rays hit the earth, the stronger is the heating effect. This can be explained by the fact that in this case, more rays hit the ground per square metre.

Further thought:

Suppose at a restaurant you get coffee before you are ready to drink it. But you want is hottest when you are ready. When do you add the cream? Right away or when you are ready?

6.9. HEATING WITHOUT A FLAME

Main Goal:

The experiment illustrates the warming up of substances by mechanical work.

Information:

In contrast to heating bodies by heat radiation, conduction or streaming solids, liquids and gases can also be heated if they are mechanically worked on.

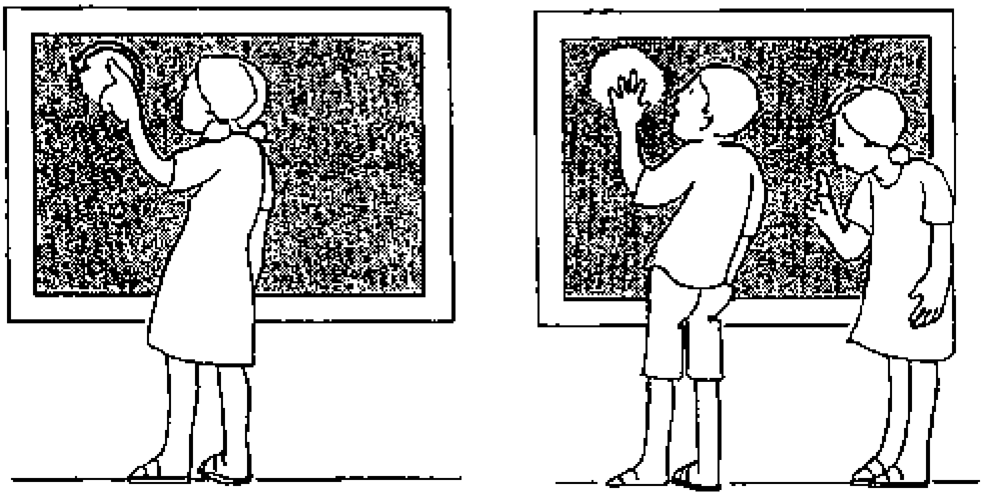
Work done in that way that friction force is applied on a body, increases the movement of the atoms the body is made off. This increase of (invisible) microscopic motion appears microscopically as an increase of temperature.

Materials and Apparatus:

a. blackboard or a table
b. air pump

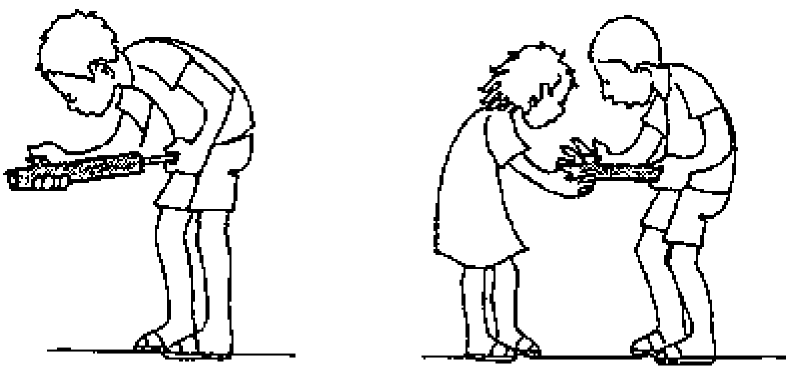
Procedure:

a. Vigorously rub a small spot on the blackboard with one finger. Immediately afterwards, feel this spot and its surroundings with the ball of the other hand.



b. The piston of an air pump is pulled out about 15 cm. The valve is closed with one finger. Then the piston is vigorously pushed into the cylinder.

This process should be repeated several times.



Observation:

a. The blackboard and the fingers become warm.
b. The cylinder is warm - this is also true of the air in the cylinder.

Analysis:

In both cases, mechanical work is done, which increases the movement of the atoms. In the first case this increase is transmitted by friction and in the second case by a pressure increase as well as by friction.

Practical Meaning:

When a spaceship enters the earth’s atmosphere, its cover becomes very hot. The spaceship dives into the air, which presses it together. The strong increase of temperature results from the friction of the air with the spaceship. Friction increases the thermal energy.

If a bucket on a rope is let down into a well quickly, the warming up of the hands can be perceived.

The higher temperature results from the friction of rope and the palms of the hands.

Further thought:

When heat is flowing energy (from hot to cold) and thermal energy is due to random motion of molecules, what then is temperature?

7. AIR

7.1. THE AIR - A BODY

Main Goal:

The experiment demonstrates that air occupies space.

Information:

Air is a mixture of gases whose main components are 78.09% by volume nitrogen, 20.95% by volume oxygen, 0.93% by volume inert gases and 0.03% by volume carbon dioxide.

Materials and Apparatus:

a. dry glass

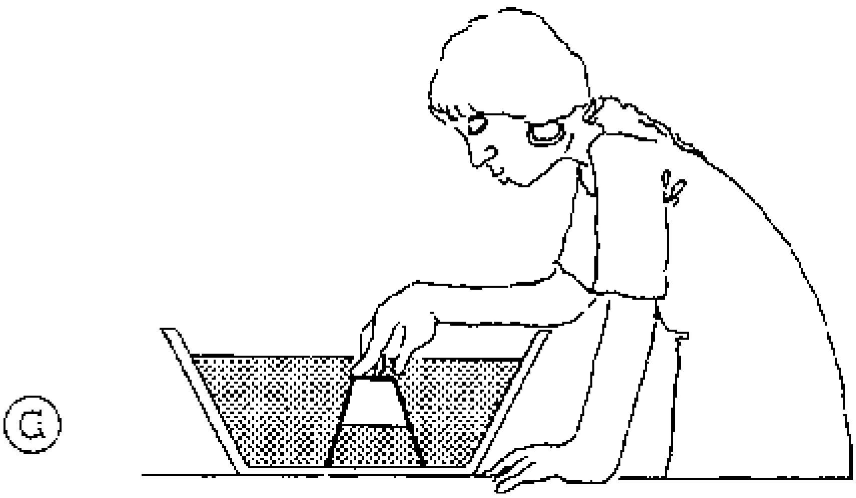
basin filled with water

b. funnel

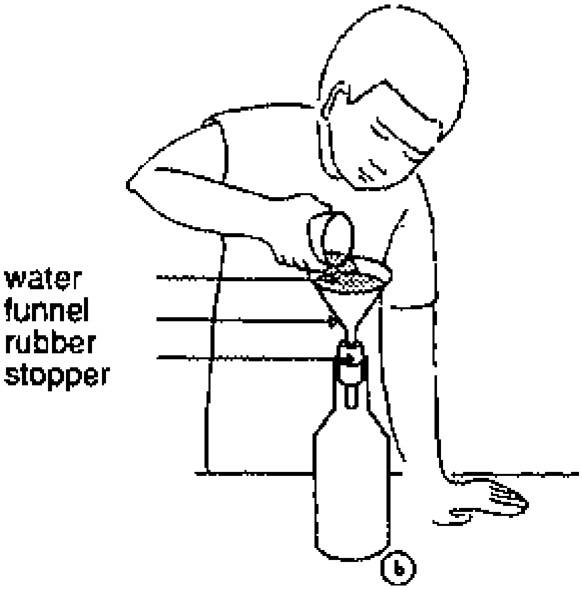
pierced cork or rubber stopper
bottle
water

Procedure:

a. As shown in the diagram below, an empty glass is dipped into water, upside down.



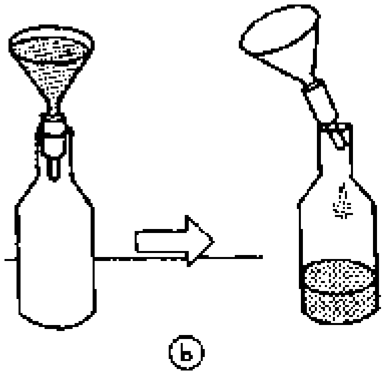
b. The apparatus is set up as shown in the diagram below. The funnel is filled with water, and then the stopper is eased out a little.



Observation:

a. The water does not completely fill the glass. Part of the glass remains dry (see a).

b. The water flows into the bottle only after the stopper is loosened.



Analysis:

The glass and the bottle both contain air. This space can only be filled with water if the air is compressed or when it can escape. Air occupies space. Thus it is a body.

Futher thought:

Why does a balloon, filled with air, not rise?

7.2. WE FIND OUT ABOUT AIR RESISTANCE

Main Goal:

During this experiment the pupils feel air resistance.

Information:

Air is a mixture of gases. As gases too are bodies, where one body is, no other body can be. If one body wants to occupy the space where another body is situated, this other body must be displaced. Thus, when you occupy a certain space, you dislodge the air from this space. But air as a body, like all other bodies, offer some resistance against your efforts. Sometimes you can feel this drastically.

Materials:

newspapers or large sheets of cardboard

Procedure:

The pupils hold very large newspapers in front of their bodies and run quickly across the school yard or through the classroom. While running, they push the newspaper away from their bodies a few times.

Observation:

The newspaper is pushed against the body. When it is pushed away from the body, the resistance can be felt.

Analysis:

The resistance is caused by your moving against the air. Air consists of gases, which can be visualized as invisible bodies. All bodies offer resistance against their displacement.

Further thought:

It is difficult to breathe when snorkeling at a depth of 1 meter. It is practically impossible at a 2-meter depth. Why?

7.3. AIR RESISTANCE

Main Goal:

This experiment demonstrates air resistance.

Information:

Air consists of a mixture of gases. As gases too are bodies they offer resistance against change of their place.

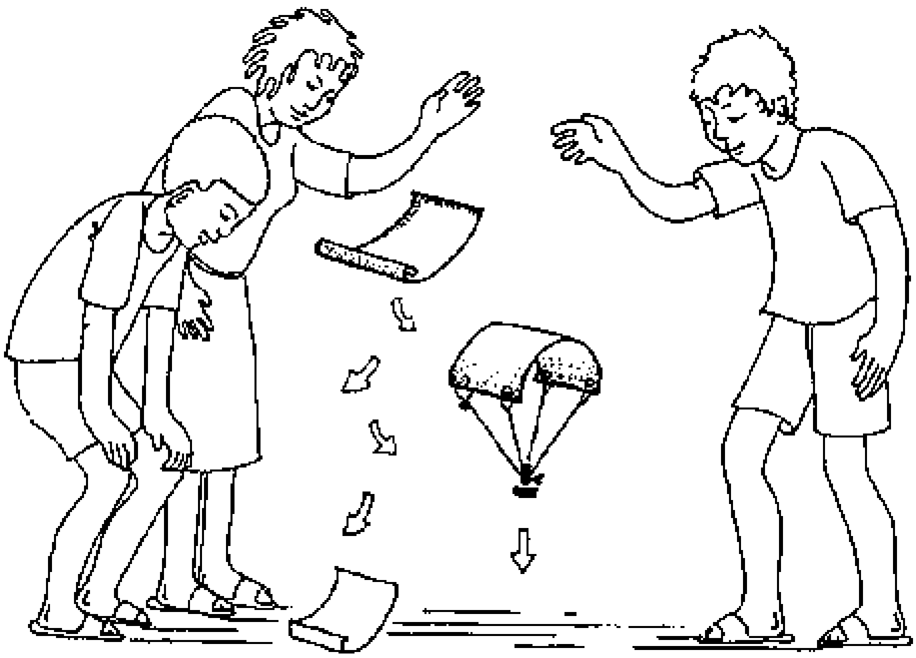
Materials and Apparatus

1 sheet of paper
1 stopwatch, (or someone must count regularly)
2 cardboards of same size and same thickness

Procedure:

a) From a height of about 1.5 m, a student lets a sheet of paper fall as demonstrated in the following diagram. The time it needs to reach the floor is measured with the stopwatch.

In further experiments, the sheet of paper is gradually folded up until in the final experiment a ball is formed.



b) Drop the cardboards simultaneously from the same height so that one fells with one edge in front, the other one with a flat side in front.

Which one hits the ground first?

Observation:

a) The smaller the paper is, the faster it falls to the floor.

b) That one with the edge in front hits first.

Analysis:

The smaller the surface that points in the direction of motion, the less air resistance met. From further experiments it is known that the shape of the falling object also plays a role.

Practical Use:

Parachutists take advantage of air resistance. The round shape of a parachute significantly increases the time of falling compared to a flatter shape.

The seeds of plants, which are spread by the wind, are also shaped in such a way that they harness the air resistance.

Addition:

In order to make a parachute, four cords of equal length are fastened to the edges of a square cloth. The ends of the cords are tied together and attached to a moderately heavy screw.

Further thought:

A stone dropped from the top of a tower becomes faster when it falls. A parachutist falls toward the earth with constant speed.

Why this difference?

7.4. THE DIFFUSION OF GASES

Main Goal:

This experiment illustrates the diffusion of gases.

Information:

Gas particles diffuse into even space, no matter how large it is.

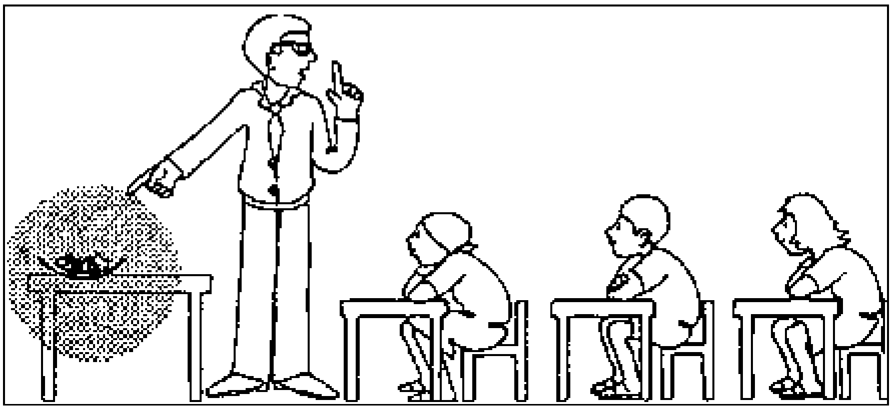
Materials and Apparatus:

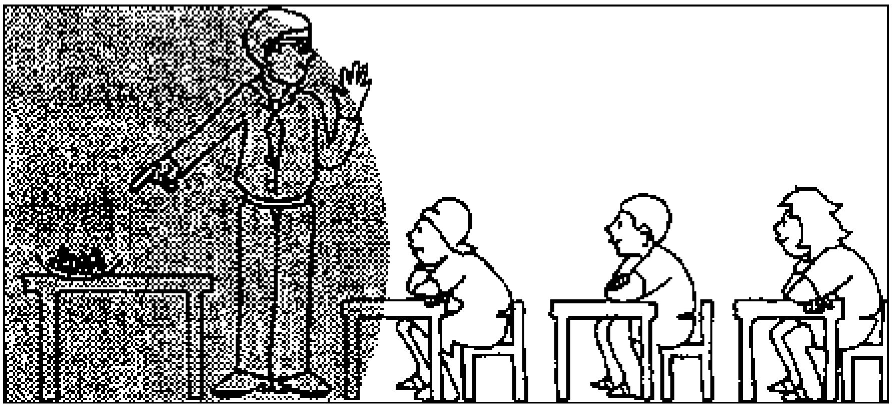
perfumed substance perhaps a spraycan or an atomizer with mosquito spray, perfume, or a strongly smelling flower or fruit)

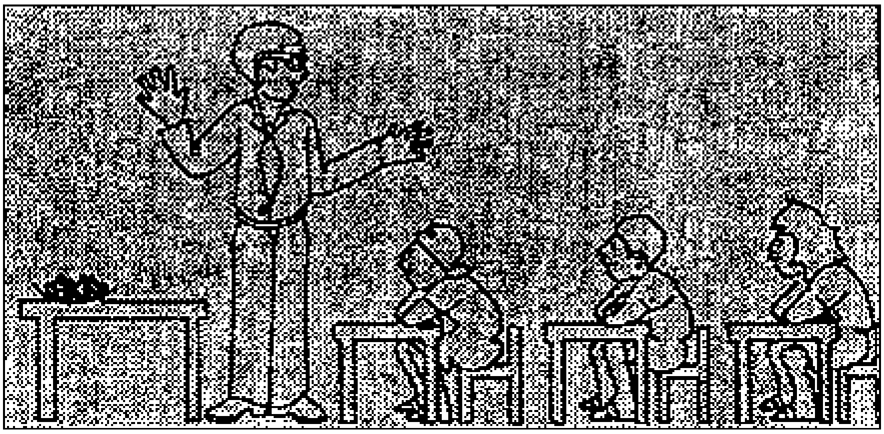
vessel

Procedure:

1 - 2 ml of the perfume are placed into the vessel.







Observation:

After a short time the smell can be detected by pupils sitting near the teacher's desk. A little later also pupils in the following rows of seats smell successively the perfume.

Analysis:

Gases diffuse into each space. This unaided distribution of particles is called diffusion. We cannot see the perfume moving through the classroom. It is said that all bodies, also perfume, is made out of atoms. Therefore, atoms must be very very small.

Further thought:

What changes when you heat the perfume?

7.5. CARBON DIOXIDE IS HEAVIER THAN AIR

Main Goal:

Gases, like solid matter, have different densities.

Information:

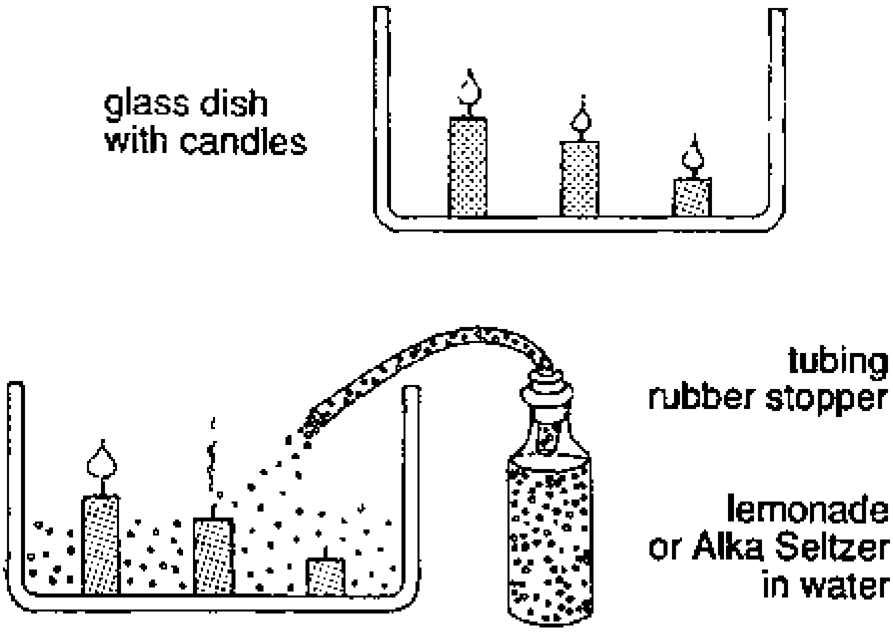
When carbon dioxide is produced in **a** vessel, it concentrates first at the bottom of the vessel, as it is heavier than air. Later it completely displaces the air. The carbon dioxide then gradually diffuses evenly. (See experiment: DIFFUSION OF GASES)

Materials and Apparatus:

3 candles
empty bottle, tubing, rubber stopper
Alka Seltzer (or sparkling lemonade)

Procedure:

A glass dish is prepared as shown in the diagram below. Using Alka Seltzer and water, both put into the bottle, carbon dioxide is produced and led into the glass dish. (Or, carbon dioxide from lemonade is conducted through the tubing into the dish. It is also possible to exhale air into the dish through the tube.)



Carbon dioxide from lemonade or Alka Seltzer is conducted through the tubing just to the top of the glass dish.

Observation:

The candles are extinguished one by one because the carbon dioxide sinks down. It is havier than air. (A burning match is extinguished when dipped into the carbon dioxide atmosphere.)

Analysis:

The carbon dioxide is heavier than air and sinks down and concentrates at the bottom of the dish. The more carbon dioxide is produced, the more air is displaced.

Practical Use:

Where it is impossible to use water to extinguish a fire, carbon dioxide is used, e.g. in power stations or in chemical firms. Carbon dioxide leaves no residues and does not conduct electricity.

Human beings and animals breathe in oxygen and exhale carbon dioxide. Plants produce glucose and oxygen from carbon dioxide and light.

Further thought:

The increase of carbon dioxide concentration in air atmosphere has serious consequences (greenhouse effect).

What would be the best ‘biological’ mean against this effect?

7.6. THE PHENOMENON OF AIR PRESSURE

Main Goal:

This experiment demonstrates the consequences of air pressure.

Information:

Air is a body and exerts pressure. The average air pressure is 1 bar. This pressure equals water pressure at a depth of 10 m under the water’s surface.

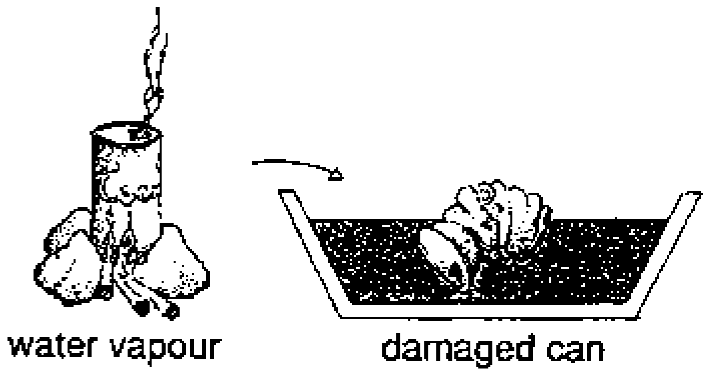
With increasing height, e.g. in the mountains, the air pressure decreases.

Materials and Apparatus:

glass, paper, water
empty cola can
heater
bowl with cold water

Procedure:

a) Fill a little water into the empty cola can (four tea spoons are enough). Heat that water so that it boils. Let it boil for a minute. Then dip it -upside down - into the cold water in the bowl. Observe the dramatic effect.

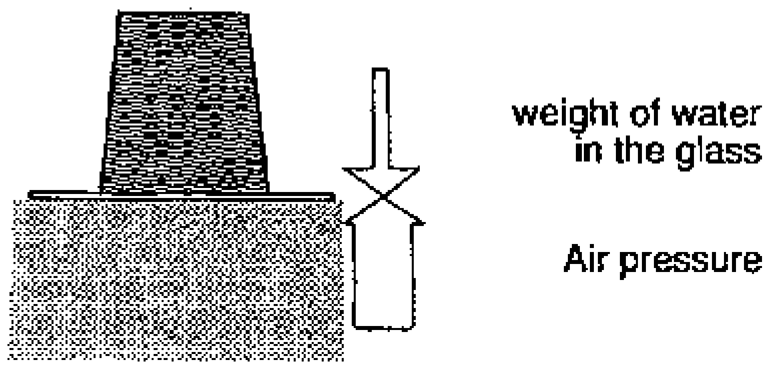


b) The glass is filled up to the rim with water. Then it is covered with the paper, which is pressed down with the palm of the hand. The paper is held tight until the glass has been turned upside down.

Observation:

a) The can is compressed and damaged.

b) From the glass the water does not run out.
(Warning! After a certain time the paper will be soaked through.)



Analysis:

The air in the can is replaced by water vapour. In contact with cold water vapour condenses. Inside the can is suddenly very low pressure, so that the outer air pressure presses the can.

The external air pressure is greater than the pressure exerted by the water in the glass.

Practical Use:

To secure the water supply, pressure and suction pumps can be used.

By means of suction pumps, water can theoretically be sucked up to a height of 10 m. However, in practice it can only be sucked up to **a** height of 8 m, due to the fact that valves are not entirely leaktight.

As there are pipes linked to the pressure pumps, the water is conveyed 10 m high.

Both pumps operate on the principle that, on raising the piston, low pressure is generated.

The air pressure then forces the groundwater into the pump. Repeated pumping movements result in the filling of the pump with water, which flows out through a discharge pipe in the case of a suction pump. In a pressure pump the water is forced into a carrying pipe. Valves, which only open under the pressure of the water in the pump, prevent the water flowing back down the vertical pipe.

Further thought:

Make a small hole near the bottom of an open tin can. Fill it with water. It will spurt from the hole. Cover the top of the can firmly with the palm of your hand. What happens? Why?

7.7. HOW A DRINKING STRAW WORKS

Main Goal:

This experiment demonstrates the practical use of air pressure.

Information:

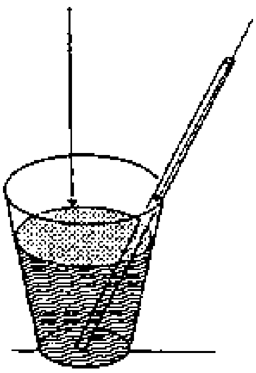
Air pressure is caused by randomly moving atoms or clusters of atoms (molecules) bouncing randomly against other matter.

Materials and Apparatus:

water or a beverage
a drinking straw
glass

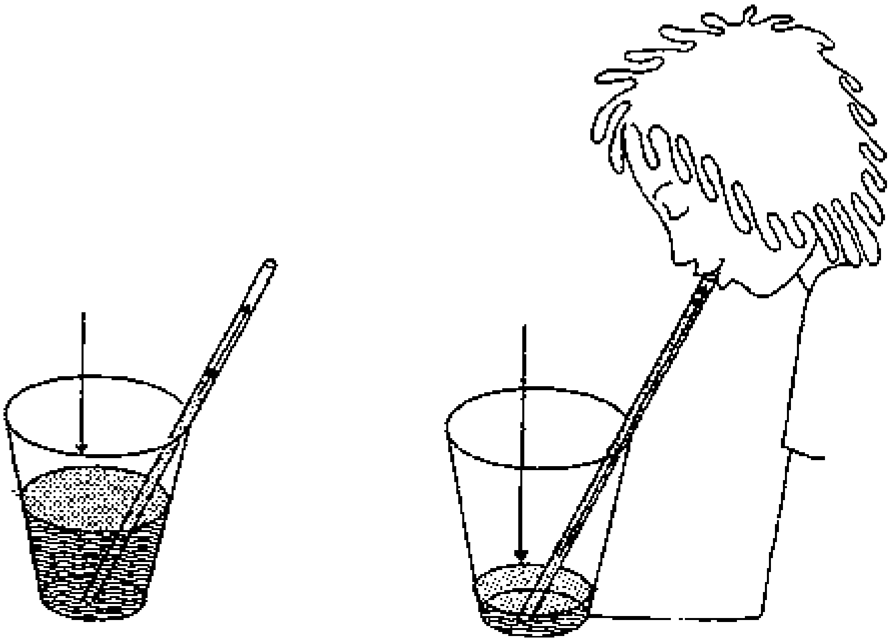
Procedure:

Some water is sipped through the straw.



Observation:

see diagram



Analysis:

First the air is sucked out of the straw. This creates a space in which the air is rarefied and a space with low pressure is formed.

The ambient air pressure, which is higher, presses on the water surface, forcing the water to rise up the straw. A low pressure region is also formed in the mouth, due to the continual sucking. Therefore the water is always pressed into a space in which the air is rarefied.

(see also experiment: THE PHENOMENON OF AIR PRESSURE)

Strictly speaking, one does not suck the water up the straw. One instead reduce pressure in the straw and allow the pressure of the atmosphere to press the water up into the straw.

Further thought:

On the moon there is no air atmosphere.
Could one drink water this way on the moon?

7.8. THE DANCING COIN

Main Goal:

To demonstrate that gases are bodies which expand when heated.

Information:

Air expands when heated.

Materials and Apparatus:

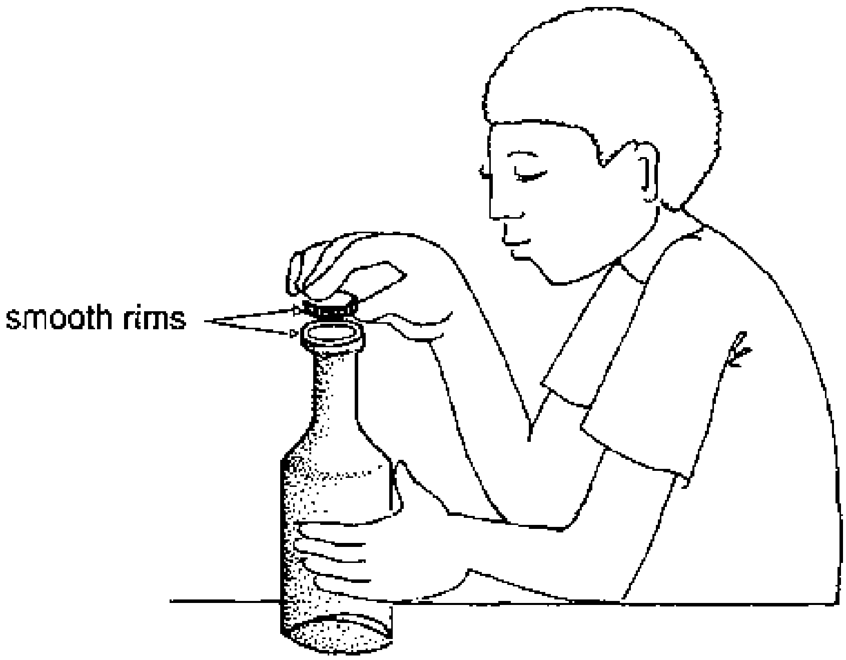
a bottle - the glass should be very thin
a coin which covers the opening of the bottle.

Procedure:

The rim of the bottle neck is wetted with some water, and the opening covered with a coin. When the bottle neck is grasped with both hands, the air in the bottle expands due to the transmission of heat from the hands to the bottle and from the bottle to the air in the bottle.

The pressure in the bottle becomes higher than the ambient air pressure, so that the coin is lifted up briefly again and again.

(The glass also expands a little.)



Observation:

The coin “dances” on the bottle neck.

Analysis:

A transfer of heat causes the air in the bottle expand. The pressure increases, lifts the coin, some air escapes and the pressure is reduced for a moment. Then the heat transmission again expands the air, pressure increases and the coin lifts up again, and so on.

Practical Use:

All gases expand when heated. Gas tanks have to be protected against the sun, otherwise they eventually would not be able to withstand the excessive pressure of the expanding gas. Fizzy beverages must be chilled to prevent the escape of the carbon dioxide.

Further thought:

When heat is transferred to the air, also glass explands. Then the volume of the bottle must increase. Doesn’t this just compensate the air expansion? Obviously not. What kind of conclusion can you draw?

7.9. THE BALLOON IN THE BOTTLE

Main Goal:

To demonstrate air pressure, excessive pressure, and vacuum.

Information:

Warmed air enclosed in a certain volume, expands. The pressure increases and some air escapes.

When cooled down and no air from outside is allowed to enter the volume, low pressure is generated inside that volume.

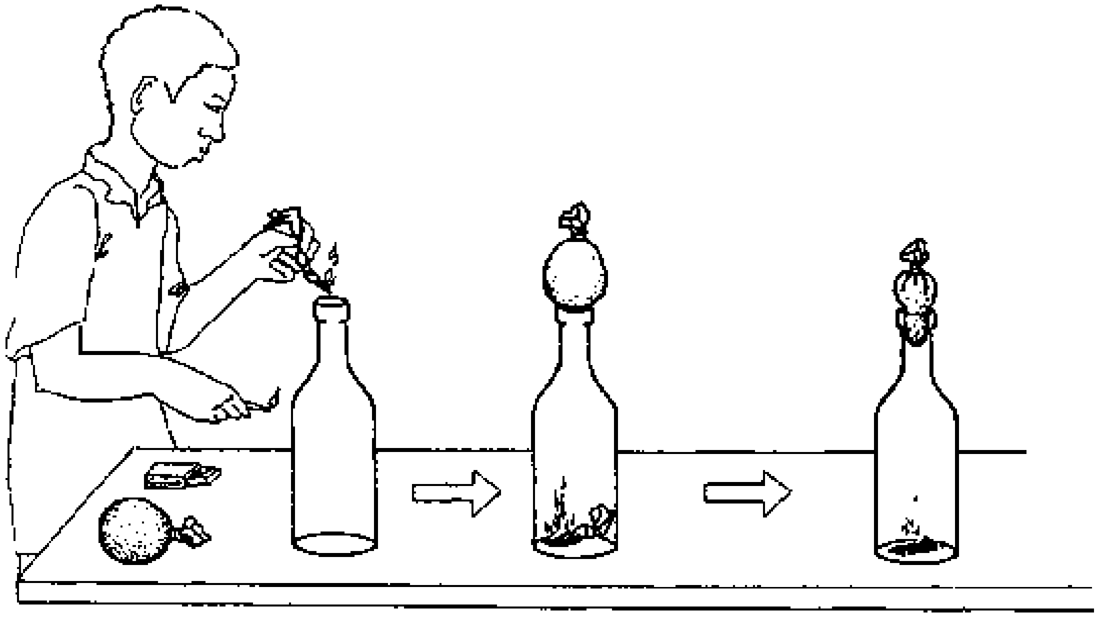
Materials and Apparatus:

1 bottle
1 balloon

paper

Procedure:

A piece of paper is set on fire in a bottle. A balloon is then placed onto the neck of the bottle, immediately the paper is burnt.



Observation:

see diagram

Analysis:

Due to the burning of the paper, the air in the bottle is warmed and some of it escapes. The balloon closes the bottle opening. As the air inside the bottle cools down, less air is now present in the bottle and lower pressure than outside is created. The air pressure outside of the bottle presses the ballon into the bottle neck.

Further thought:

gas-meter measure the volume of gas you are using.

Who would gain by having gas warmed up before it passes the meter, you or the gas company?

7.10. THE FOUNTAIN EXPERIMENT

Main Goal:

The experiment essentially demonstrates:

- gases are bodies
- gases expand and contract
- the existence of air pressure

Information:

When heated, gases expand much more than solids and liquids. If the pressure remains constant, ideal gases expand when heated by 1/273 of their volume 0° C for every 1 degree they are heated.

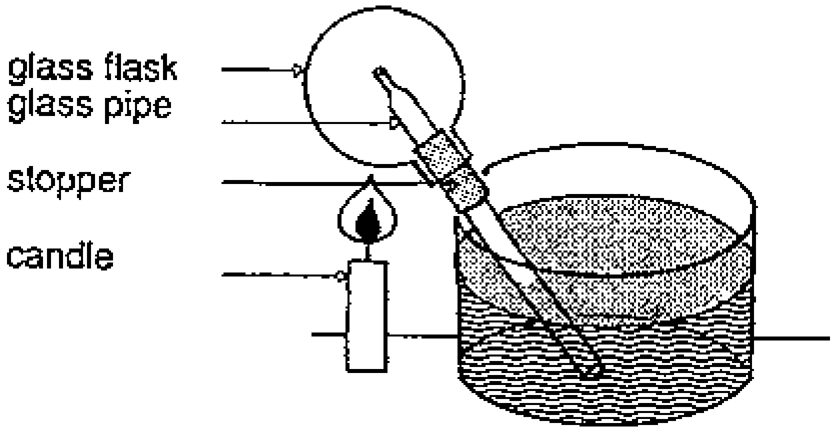
When cooled down, they contract to the same extent. In the following experiment, most of the air is expelled from a glass vessel by heating. When it cools down, the remaining gas is under lower pressure. The external, higher air pressure presses the water into the glass vessel, until a pressure balance is created.

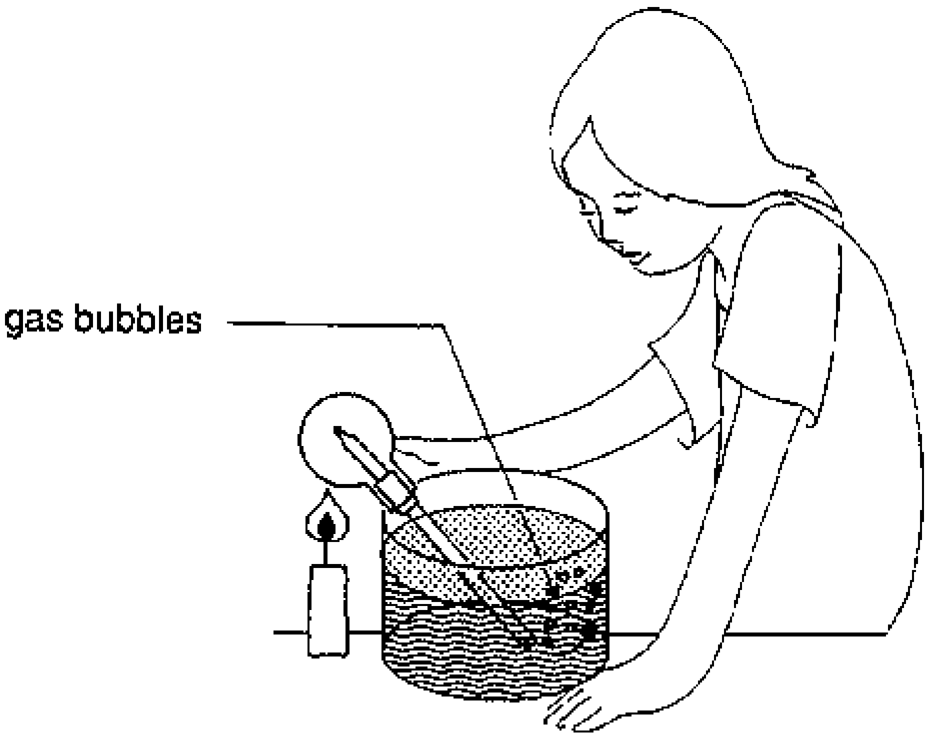
Materials and Apparatus:

glass pipe, 20 cm long, which is pointed at one end
pierced stopper (rubber or cork)
glass flask or bottle made of clear glass
glass dish
burner (alcohol or gas burner or a candle)
water (may be coloured with water soluble eosin or ink)

Procedure:

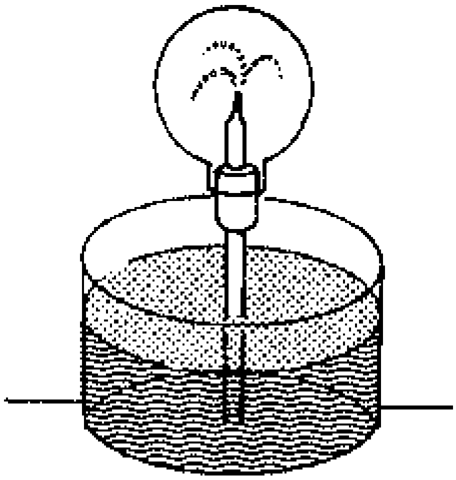
The apparatus is set up as shown in the diagram below. The flask is held at the neck and carefully heated from the side. When there are only a few gas bubbles escaping from the flask, the burner is set aside. The dish is held vertically in such a way that the end of the glass pipe is always submerged.





Observation:

When the glass pipe is first heated a large number of gas bubbles escape. The number of gas bubbles decreases gradually. Some time after the burner is removed, water shoots into the flask.



Analysis:

When the glass flask is heated, the air expands greatly and part of it escapes. When the burner is removed, the remaining air in the flask cools down. It's now less air inside which needs under normal temperature less space. The gas contracts, and the outer air pressure presses water into the flask until the pressure inside is equal to the pressure outside.

Practical Use:

Bicycle and car tyres can burst if they are over inflated and then exposed to the sun.

Further thought:

Why do the gas bubbles rise?

7.11. THE PHENOMENON OF AIR FLOW

Main Goal:

This experiment illustrates air flow.

Information:

Warm air ascends in a room, so that the lowest temperature is always found at floor level. Heated air expands. Its density is less than that of cold air, and it therefore ascends into the upper layers. Cold air flows in from the surrounding, is also heated, expands and ascends.

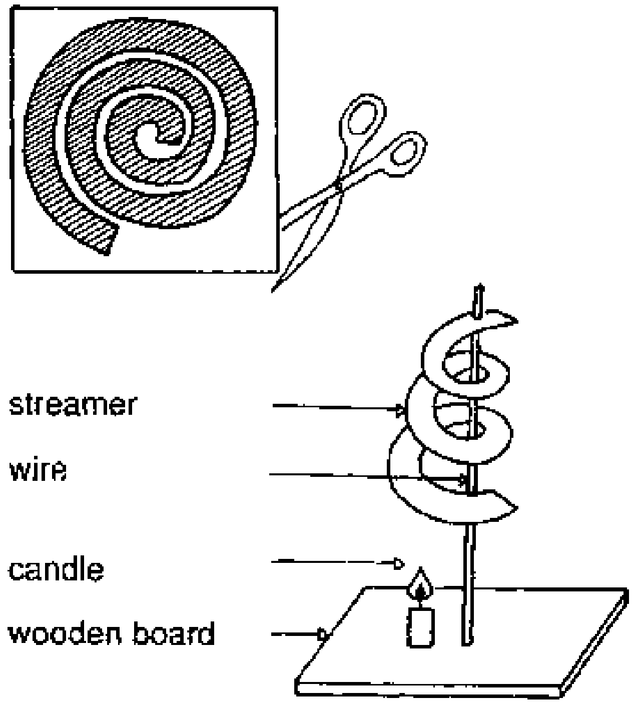
Materials and Apparatus:

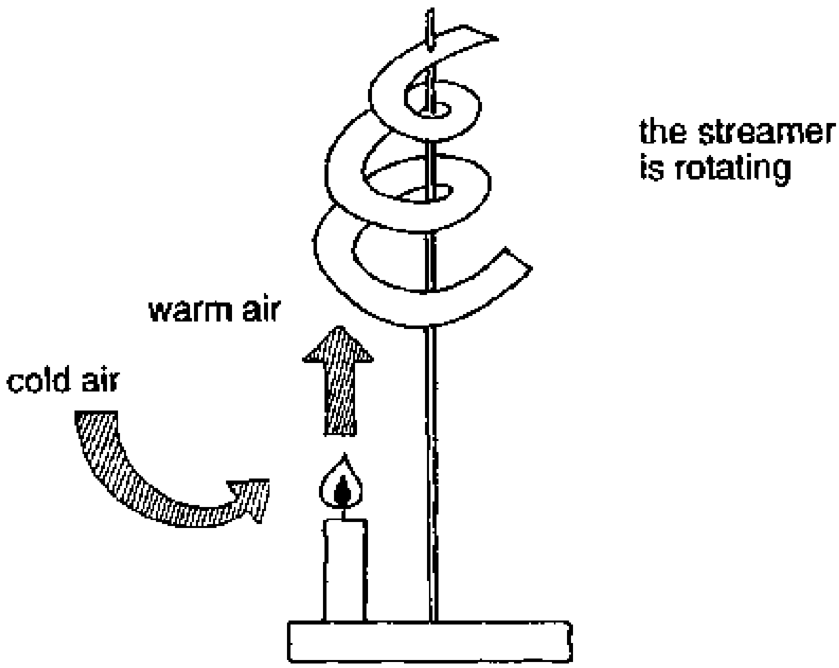
thick wire about 20 - 30 cm long
wooden board
a streamer made of thin cardboard
a candle

Procedure:

A spiral shaped streamer is cut out of cardboard.

The experiment is set up as shown in the following diagram.





Observation:

The streamer starts rotating.

Analysis:

The candle warms the surrounding air. The warm air ascends and causes the streamer to rotate. Cold air flows in to replace the ascending warm air, is also heated, and the process continues.

Practical Meaning:

When a house burns, the air is heated strongly, and ascends. Cold air containing oxygen flows in very quickly. This effect causes a strong wind. Open doors and windows support this process, which supports the fire.

Further thought:

How can it happen that birds in the air gain height without moving their wings?

7.12. THE AERODYNAMIC PARADOX

Main Goal:

This experiment demonstrates that low pressure is generated by streaming air.

Information:

The aerodynamic paradox it applies also to liquids, where it is called hydrodynamic paradox. It states that, the higher the pace of streaming, the lower the pressure. Consequently, if the pace of streaming increases due to a decrease of the sectional area of a pipe, the pressure within this area decreases.

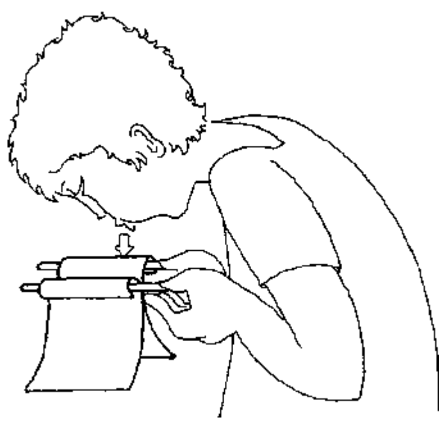
Materials and Apparatus

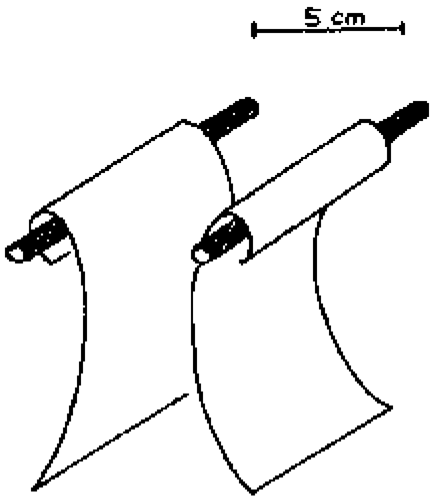
2 sheets of paper
2 wooden rods

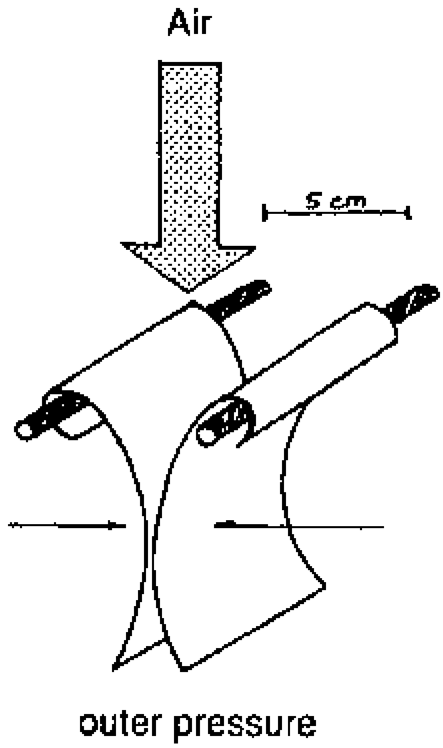
Procedure:

The paper is placed round the wooden rods as shown in the diagram.

Air is blown, alternately lightly and strongly, between the two sheets.







Observation:

Against our intuition the two sheets are drawn towards each other and not apart!

Analysis:

The blown air streams between the two sheets with high pace. An area of low pressure is generated.

The faster the pace of the streaming (the more strongly the air is blown), the lower the pressure in the flow. The normal outer air pressure pushes the sheets together.

Practical Use:

This paradox (it is called paradox because its against our intuition) is harnessed in water jet pumps and in the construction of aeroplane wings.

Further thought:

What is the consequence of this effect with respect to the roofs of houses in case of a strong storm?

7.13. THE BOYLE-MARIOTTE LAW

Main Goal:

This experiment demonstrates the relationship between the volume and pressure of gases.

Information:

If the pressure exerted on a closed gas volume is increased, the volume decreases.

If the pressure exerted on a closed gas volume is decreased, the volume increases. This means that gas always occupies the whole volume available. Moreover, it tends to expand and to enlarge its volume permanently.

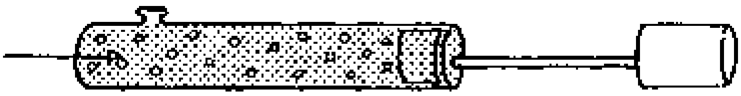
The English physisist Boyle (1627 - 1691) and the French physisist Mariotte (1620 - 1684) discovered this association, which is the basis of a law linking the pressure and volume of gases.

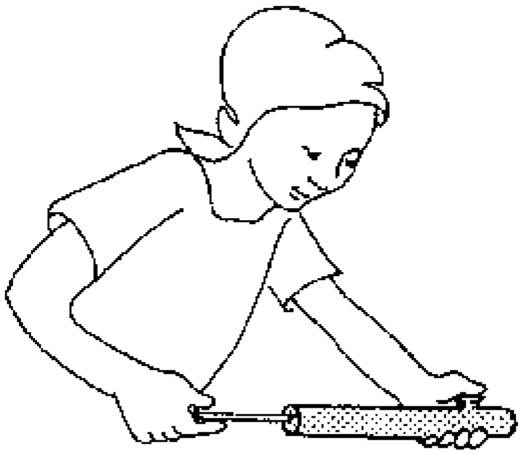
The law states that the product of pressure and volume is constant. It is valid only at constant temperatures.

The pressure of gases can be demonstrated with the help of the model of particles: gas particles are in constant motion, and when they collide with an obstacle, they exert pressure.

Materials:

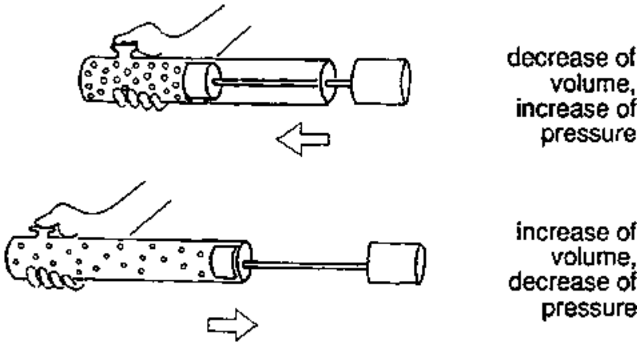
air pump





Procedure:

The piston of the air pump is pulled out of the cylinder, and then the valve opening is sealed with one finger. The piston is then pressed as far as possible into the cylinder.



Observation:

Air can be pressed together. The further the piston is pressed into the cylinder, the greater the force required, the greater the pressure of the enclosed air.

The further the piston is pressed into the cylinder, the more quickly it jumps back out when released.

(The air pump and the enclosed air warm up. See experiment: WARMING UP WITHOUT A FLAME)

Therefore, Boyle's Law is not an accurate description of this effect.

Analysis:

If a given gas volume is decreased, its pressure is increased.

If a given gas volume is increased, its pressure is decreased.

Further thought:

Boyle's Law can be written in shorthand notation as a formula

$$p_1 \times V_1 = p_2 \times V_2 = \text{const.}$$

(p = pressure, V = volume

There are other laws in physics that have the same structure, e.g. the Law of Lever. Compare!

7.14. MOVING FORWARD BY REPULSION

Main Goal:

This experiment demonstrates the phenomenon of repulsion.

Information:

Air which escapes from an narrow orifice produces a repulsion.

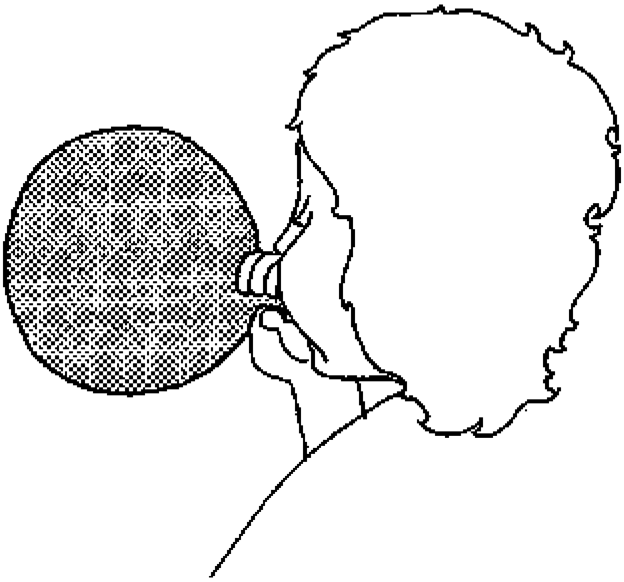
Two forces always come into play: one in the direction of the streaming, the other in the opposite direction.

Materials:

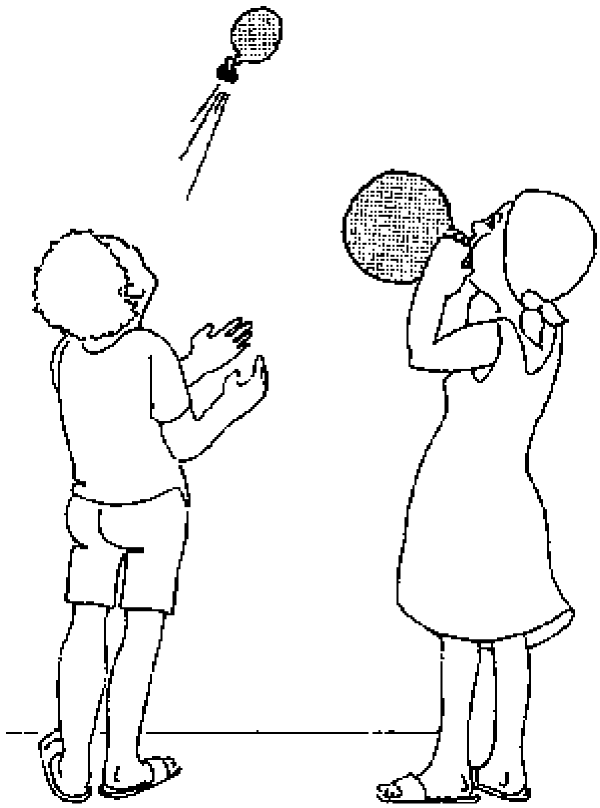
1 balloon

Procedure:

The ballon is completely blown up.



Its opening is first held closed, and then the balloon is released.



Observation:

The balloon moves around jerkily. First it flies upwards, and then it moves uncontrolled through the room. The excaping air hisses.

Analysis:

The balloon moves because of the repulsion, in the opposite direction to the

excaping air. One force in the direction of streaming. This force stems from the tension of the rubber of the balloon. It pushes the air through the orifice. On the other hand: the air pushes back and causes the balloon to move in the opposite direction. The two forces are equally strong.

Practical Use:

Jets and rockets move forward due to this principle of repulsion. They are driven forward by combustion gases escaping rapidly.

Further thought:

What happens to a boat when you jump out of it?

8. WATER

8.1. MODEL OF A WATER-PIPELINE

Main Goal:

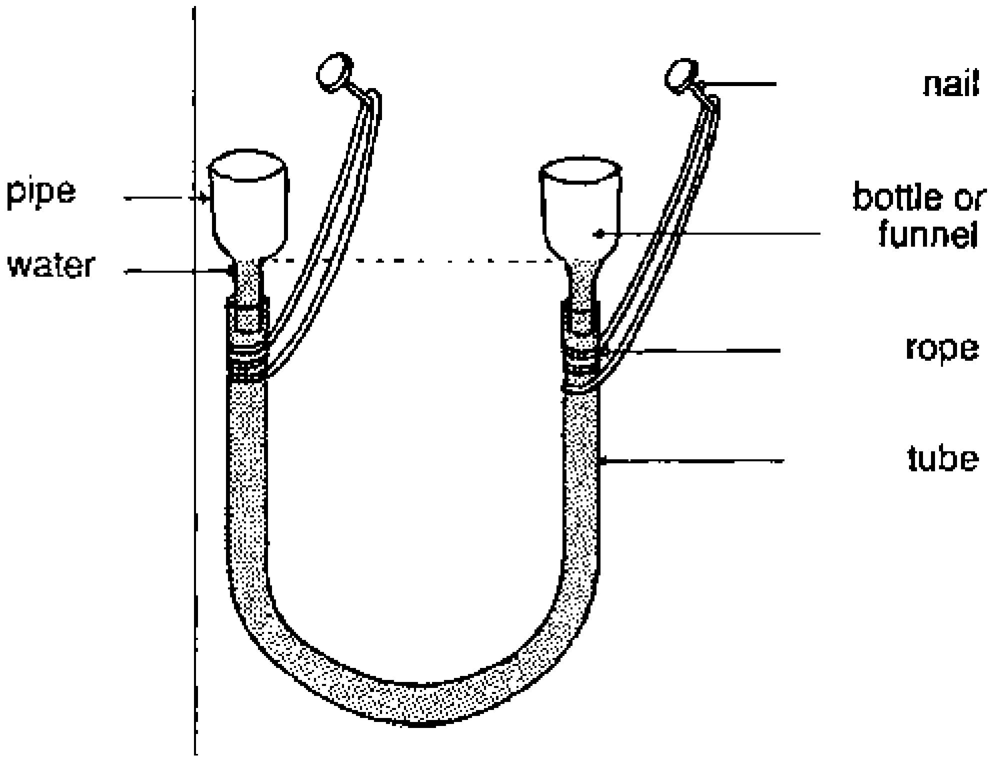
The same air pressure acting on the surfaces of a liquid in joint vessels which are opened at the tops causes them to lie at the same level, (exceptions are very narrow vessels because of capillarity.) This principle is applied in water-pipes in technology. (Ground water is pumped into a water-storage tank such as a water-tower. The storage tank must be higher than the taps.)

Materials and Apparatus:

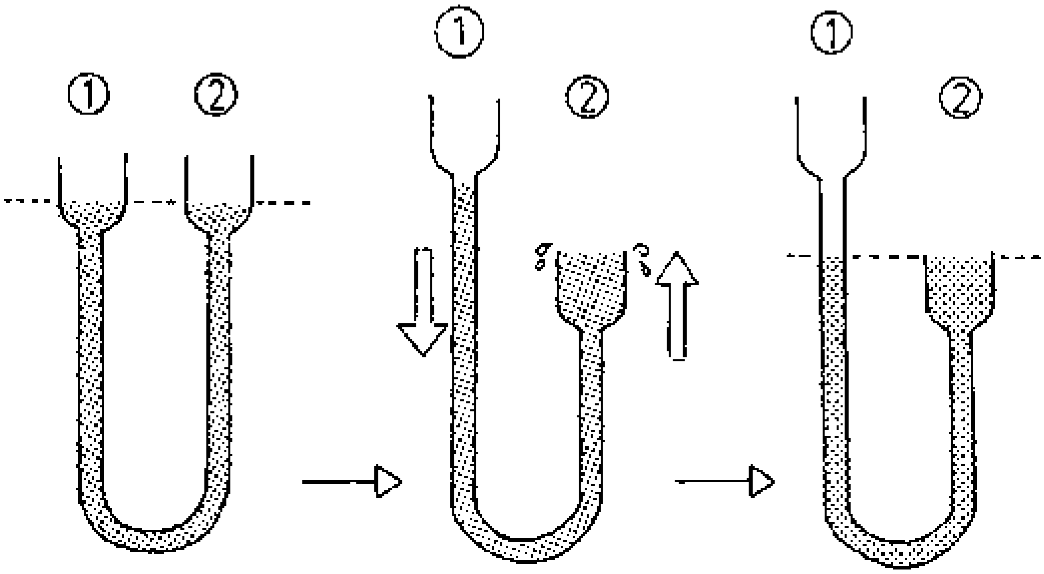
funnels or bottles from which the bottoms are cut off
(use caution!) or glass-pipes tubing
2 nails
hammer
rope
water

Procedure:

As demonstrated in the following diagram, the principle of a water-pipeline is illustrated.



The bottles (or the funnels) are alternately lifted and lowered. In the beginning, the two water surfaces lie at the same level.



Observation:

If bottle 1 is lifted, the water level in bottle 2 is suddenly lower than that one in bottle 1 and then the water rises into the bottle 2 until the two water columns are equally high.

Analysis:

In joint vessels, water tends to stand at the same level. Thus water can be taken from taps which are placed lower than the water-storage tank. If the bottle 1 is lifted up high enough, water will spout out of the top of bottle 2.

Practical Use:

The principle of joint vessels is used in floodgates. Ships are lifted or lowered onto an adequate water level with the help of water which flows in and out.

Further practical applications: Roman water pipes, wells, irrigation plants.

Further thought:

This experiment contains implicitly a method to keep a gas volume constant when the temperature rises.

How does it work?

8.2. THE PRINCIPLE OF A WELL

Main Goal:

This experiment demonstrates the working mechanism of joint vessels

(see experiment: MODEL OF A WATER-PIPE)

Information:

In order to obtain drinking-water, a well can be dug into the aqueous layers of the soil. The ground water soaks into the well up to the level of the ground water surface and can be taken from the well with a bucket.

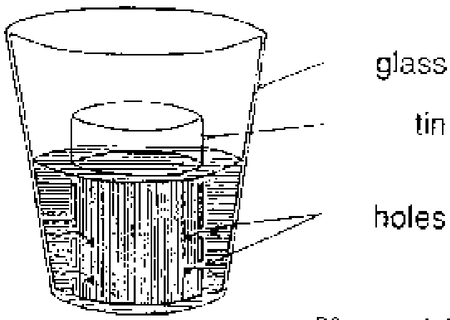
Materials and Apparatus:

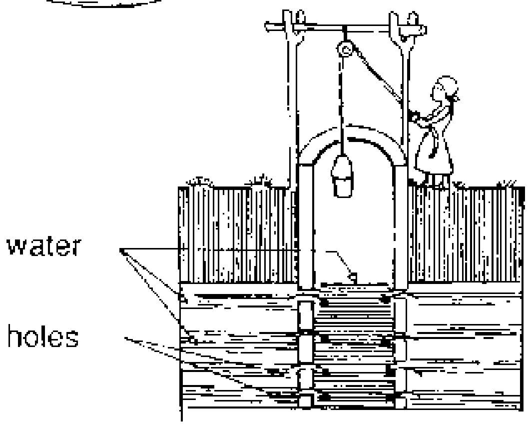
tin (cola tin) with the top removed
nail
hammer
glass vessel or a bucket with water
tin-opener or pair of plate-shears

Procedure:

Two to three holes are made with the nail and the hammer in the tin walls.

As demonstrated in the diagram below, the tin is dipped into the water.





Observation:

The water soaks into the tin through the holes. The water level inside and outside of the tin adjustes itself after a short time.

Analysis:

The well which is represented by the tin, and the ground water surface represented by the water surface in the vessel are joint vessels. In joint vessels the water surfaces always adjust to each other.

Further thought:

What is the maximum height to which water could be drink through a straw?

8.3. THE SIDE-PRESSURE OF A WATER-COLUMN

Main Goal:

This experiment demonstrates the pressure increase from the top to the bottom of a water column.

Information:

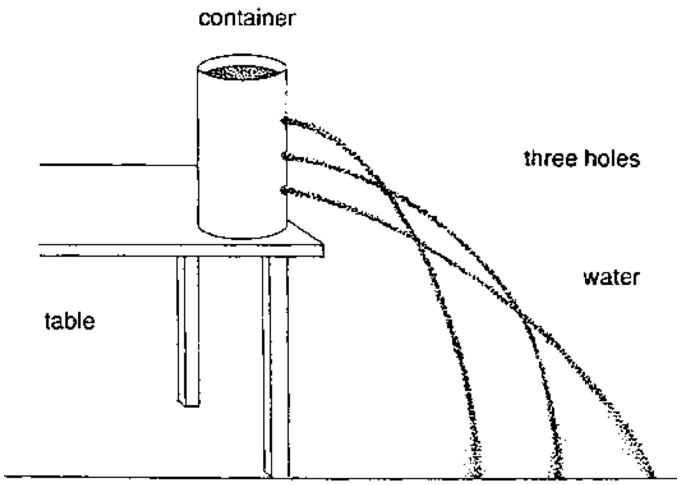
The pressure of a liquid onto the bottom and sides of a liquid column depends exclusively on its height. The pressure increases towards the bottom. A water-column of 10 m exercises a pressure of 1 atmosphere (about 1.013 bar) onto the bottom.

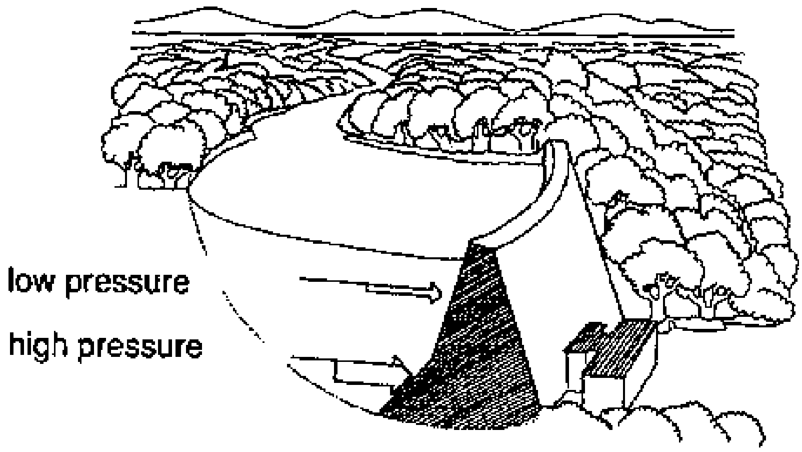
Materials and Apparatus

container made of sheet metal (tin or cola tin)
- should be very high and open at the top -
nail
hammer
water
plate-shears or tin-opener

Procedure:

3 holes are made at different heights in the metal container. Afterwards it is filled with water.





Observation:

see diagram

Analysis:

The pressure is exercised onto the sides as well as onto the bottom of the tin. It increases with the height of the water-column, because it's the weight of the water column above the level of the hole that determines the pressure. The more weight, the more pressure.

Practical Use:

When roller dams are built, the walls are reinforced towards the ground, in order to make them withstand the water pressure which increases with the height of the water-column.

Further thought:

Is there any difference concerning the water pressure acting against the bottom of the dam in the drawing, when you have a small volume of water held back or a very big one? The depth shall be the same in both cases.

8.4. VOLUME DETERMINATION OF A STONE

Main Goal:

This experiment demonstrates how to determine the volume of an uneven solid body on the basis of its liquid displacement. (it is necessary that the body is dipped completely into water.)

Information:

If a stone is placed into water, it displaces as much liquid as corresponds to its volume. (This is also true for other kinds of liquids, such as alcohol, oil and also for all gases.)

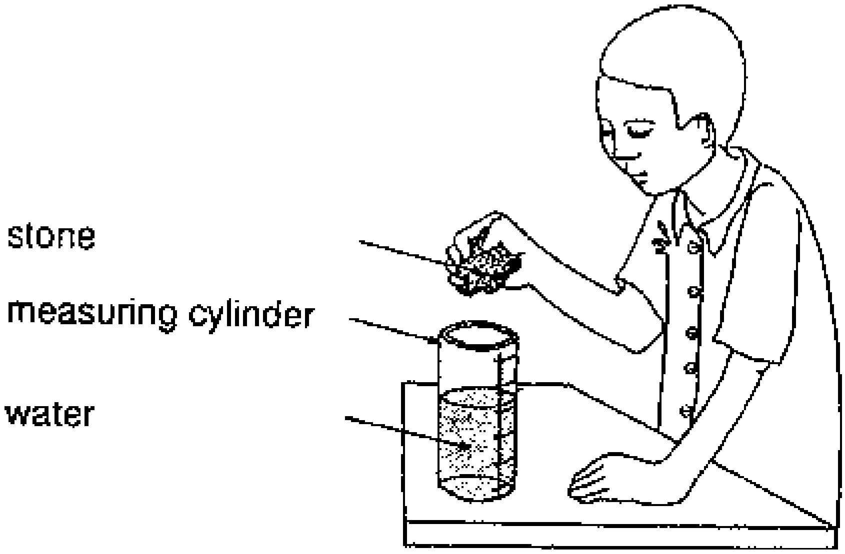
Materials and Apparatus:

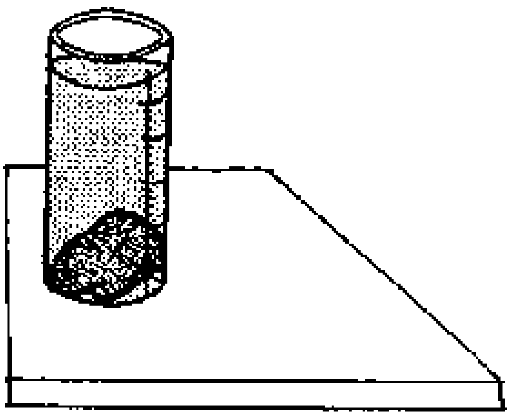
stone
measuring cylinder (measuring flask)
water

Procedure:

The measuring cylinder is half filled with water. The water level is exactly read before and after inserting the stone.

Take care that no water splashs out of the cylinder when the stone is inserted.





Then the stone is placed into the measuring cylinder.

Observation:

The stone sinks to the bottom, and the water level rises.

Analysis:

The stone displaces just as much water as it needs to settle in the cylinder.

The water that has been at the place where the stone is now situated had no other choice than to rise and to settle above the stone. Thus, the water level rises.

The amount of water (the volume) has not changed.

The difference between the two readings is a measure of the volume of the stone.

Further thought:

This method functions because the rock (or other solid bodies) doesn't change its volume when submerged in water.

What's about your body when you are submerged? Does the method work too?

8.5. A RAZOR BLADE FLOATS ON TOP OF WATER

Main Goal:

This experiment illustrates the phenomenon of surface tension.

Information:

At the surfaces of liquids are cohesive forces (Latin: attractive), whose forces are directed inward.

These forces tend to pull the surface molecules inward, which means, to reduce the size of the surface.

This special cohesion between like molecules is called "surface tension".

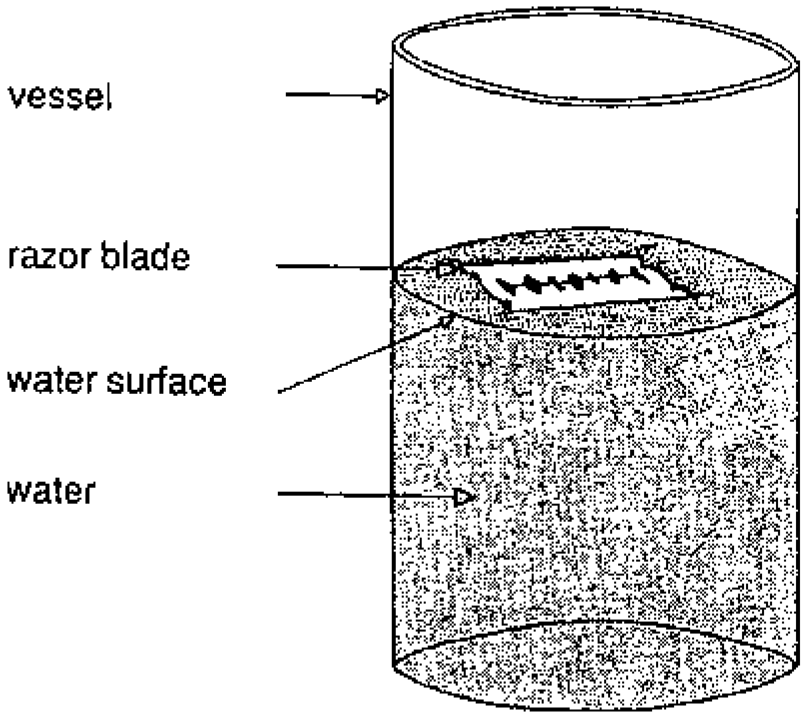
Materials and Apparatus:

vessel
razor blade (greased needle, paper clip)
water

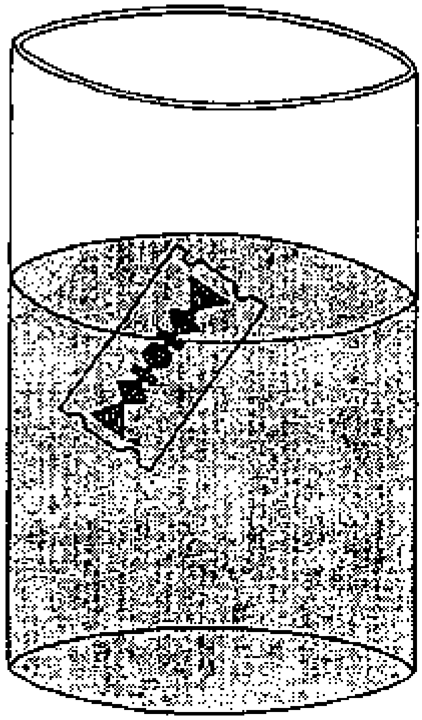
Procedure:

a. One vessel is filled half way with water.

The razor blade is placed flat onto the water surface.



b. An attempt is made to place the razor blade on the water surface on one of the cutting edges.



Observation:

a. The razor blade floats on top of the water.
b. The razor blade sinks.

Analysis:

The water surface can be imagined as one connected water skin. It is temporarily destroyed when the razor blade sinks in.

This characteristic of liquids is called “surface tension”.

Examples:

Insects which run over the water surface can be observed, e.g. the water-runner. Further examples of surface tension are rain drops or dew drops.

Further thought:

Why do rain drops have a spherical shape?

8.6. WATER HAS A SKIN

Main Goal:

This experiment demonstrates the phenomenon of surface tension.

(see experiment: A RAZOR BLADE FLOATS ON TOP OF WATER)

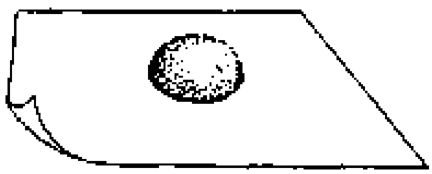
Materials and Apparatus:

waxed paper
pipette (drinking-straw)
water

Procedure:

With the help of a pipette, several small portions of water are dropped onto waxed paper.

waxed paper



Observation:

Small drops are really spherical. If pushed together, bigger drops are formed that are more tear-shaped.

Analysis:

The high surface tension of water is responsible for the holding together of this "surface skin".

The surface tension tends to form the smallest possible surface surrounding the volume of water. 1 sphere has the smallest possible surface.

Addition:

If some drops of soap solution or some small grains of a detergent are added to the “heap of water”, it dissolves at once. The surface tension of water is reduced.

Practical Meaning

The reduction of the surface tension of water is achieved with detergents to increase the wetting ability of dishes or clothing.

(see further experiments with detergents)

Further thought:

What additional effect makes bigger drops more tear-shaped?

8.7. THE PHENOMENON OF SURFACE TENSION

Main Goal:

These experiments use a soap solution to illustrate the surface tension.

Information:

(see experiment: A RAZOR BLADE FLOATS **ON** TOP OF WATER)

Materials and Apparatus:

concentrated soap-solution

a. clay pipe or a peashooter

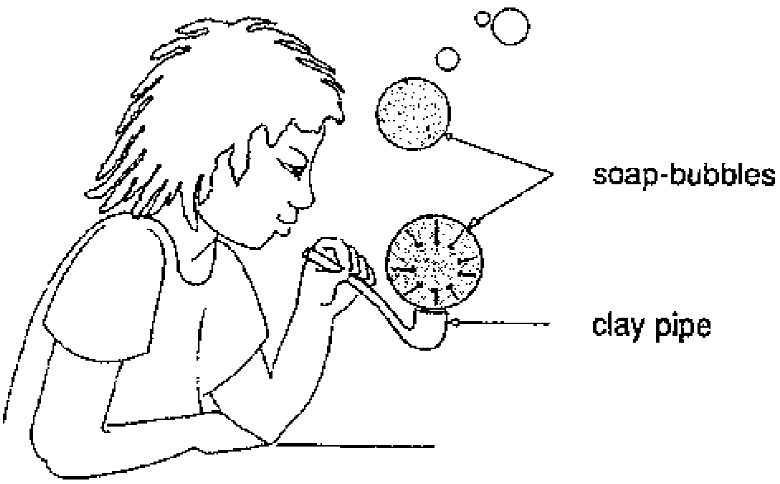
b. a ring of wire

a loop of thin yarn
needle

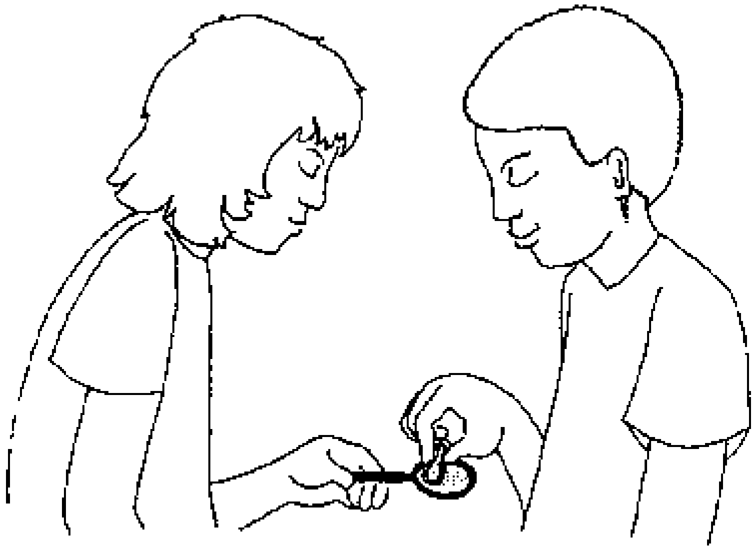
Procedure:

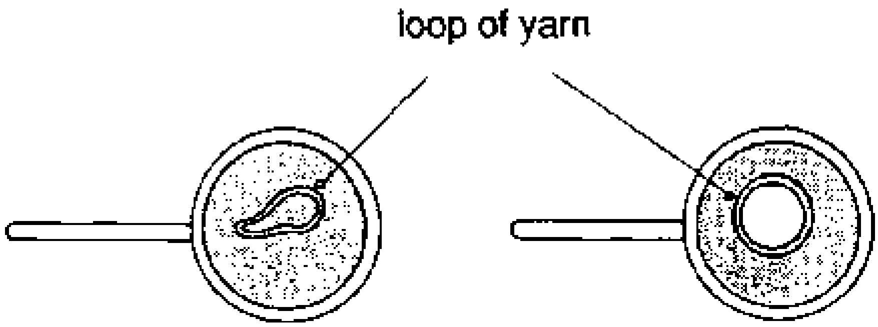
a. Soap-bubbles are blown with a clay pipe.

The mouthpiece is then released and observed.



b. As demonstrated in the diagram below, a wetted loop of yarn is placed onto the soap skin. This skin is pricked in the centre of the yarn loop.





Observation:

a. The soap-bubbles slowly become smaller.
b. The loop of yarn is drawn apart.

Analysis:

a. Round soap-bubbles develop due to surface tension, which presses the air out of the soap-bubble, so that its surface size decreases. The surface tension tends to minimize the surface area.

b. The surface tension is responsible for the yarn loop being torn apart. The remaining soap skin has minimum size when the yarn has a circular shape.

The surface tension of different liquids varies.

Water has a very high surface tension, so that it is not possible to form a “water bubble” in analog to the “soap-bubble”.

Further thought:

The surface tension of hot water is smaller than that one of cold water. Why?

8.8. WATER ASCENDS IN SOIL

Main Goal:

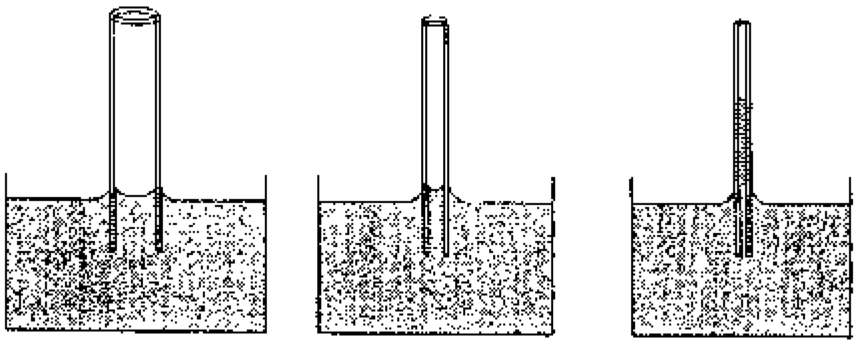
This experiment illustrates the phenomenon of capillary action. (Latin: suction effect of very thin tubes)

Information:

Very thin tubes are called capillary tubes (capillary -Latin: hair-like). In these, water climbs up. The thinner the tube, the higher the water climbs. The cause is the surface tension (see further experiments on surface tension).

Water molecules are attracted to glass or other substances more than to each other. This effect is called adhesion. When a glass tube is dipped into water, the adhesion between glass and water causes a thin film of water to be drawn up over the surface of the tube. Surface tension causes this film to contract. The film on the inner surface continues to contract, raising water with it until the adhesive force is ballanced by the weight of the water lifted (see drawings).

capiilarity



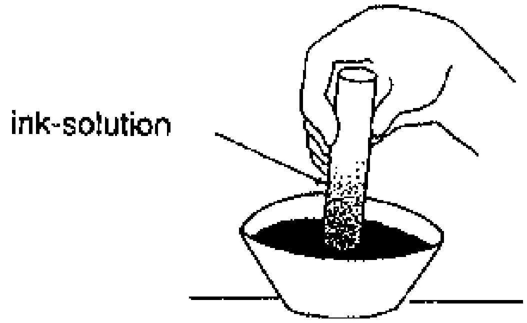
Materials:

piece of white chalk
ink or coloured water
(transparent tubes of different diameter)

Procedure:

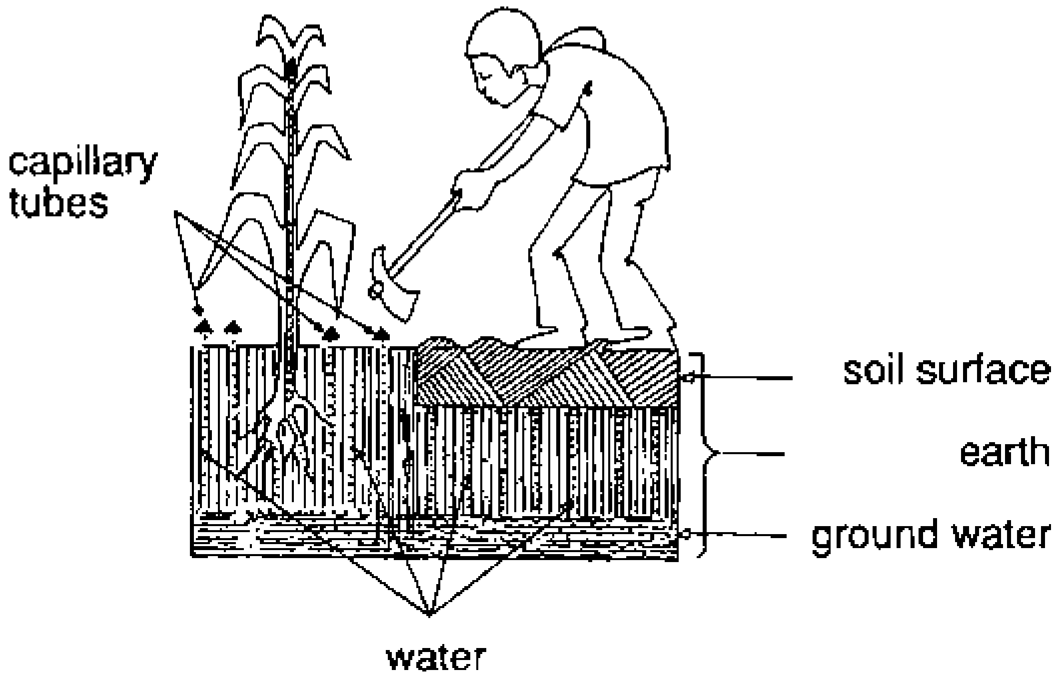
The chalk is dipped 10 cm into the ink-solution.

After 10 minutes, the piece of chalk is broken into two, at the point to which the coloured solution has climbed.



Observation:

The ink climbs up the piece of chalk.



Analysis:

This observation is called “capillary action” or the suction effect of hair-like tubes.

Practical Meaning:

Ground water climbs up in soil because of capillary action. So the roots of plants are continually supported with water even in dry seasons. (Capillary tubes are formed when the soil sags and rainwater flows slowly in thin streams through the soil.)

Usually the water climbs up to the earth’s surface, where it evaporates. When farmers hoe the ground, they make the capillaries wider and the water does not go up. Thus, they hinder this process, as the capillary effect is reduced. Therefore, the water loss of the soil is reduced for some time. Furthermore, the soil surface is loosened and the area of surface is increased.

Further thought:

Why is oil soaked upward in a lamp wick when one end hang in oil?

8.9. DETERGENTS FACILITATE THE ABILITY OF PERFUSION

Main Goal:

These experiments illustrate the effects of water and a detergent solution on fabric cloth.

Information:

Soaps and detergents reduce the surface tension of water.

The process of perfusion, which is the absorbtion of a detergent solution (soap solution) by the fabric cloth, is facilitated.

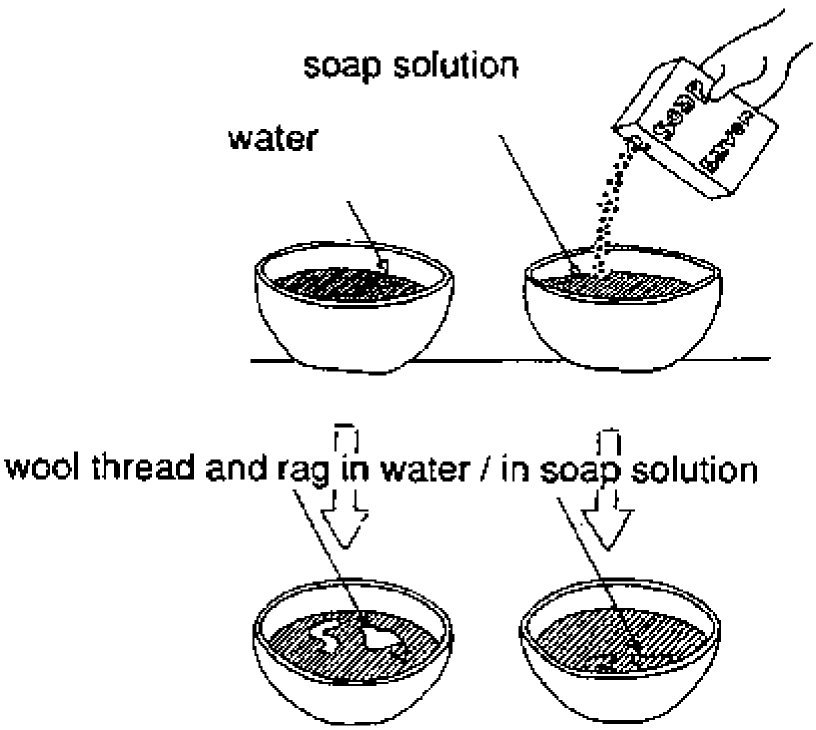
Materials and Apparatus:

detergent solution (soap solution)
(1 g detergent in 100 ml of water)
water
2 wool threads
2 small rags
2 vessels

Procedure:

One vessel is half filled with water; the second is half filled with a detergent-solution.

A wool thread and a small rag are placed into each vessel.



Observation:

The wool thread and rag sink ralatively quickly into the detergent solution. The rag sinks much more slowly into pure water, whereas the wool thread hardly sinks or does not sink at all.

Analysis:

Compared to a detergent-solution, pure water soaks more slowly into similar fabric cloths.

Practical Use:

Soaps and modern detergents are used for the cleansing of laundry.

(see experiment: THE EFFECT OF DETERGENTS ON DIRT)

Further thought:

If soap reduces surface tension of water, why do we blow soap bubbles instead of water bubbles?

8.10. THE EFFECTS OF DETERGENTS ON DIRT

Main Goal:

This experiment illustrates that dirt is distributed in very small particles in a detergent solution.

Information:

The basic components of dirt are grease, soot, and proteins. Detergent molecules distribute soot and grease particles, in the washing solution so that they can be washed away.

Fruit and vegetable stains are destroyed by bleach. The experiments demonstrate the perfusion of soot and grease by detergents.

Materials and Apparatus:

a. 2 glass dishes (test tubes)

soot (activated carbon or wood charcoal)

b. 2 glass dishes (test tubes)

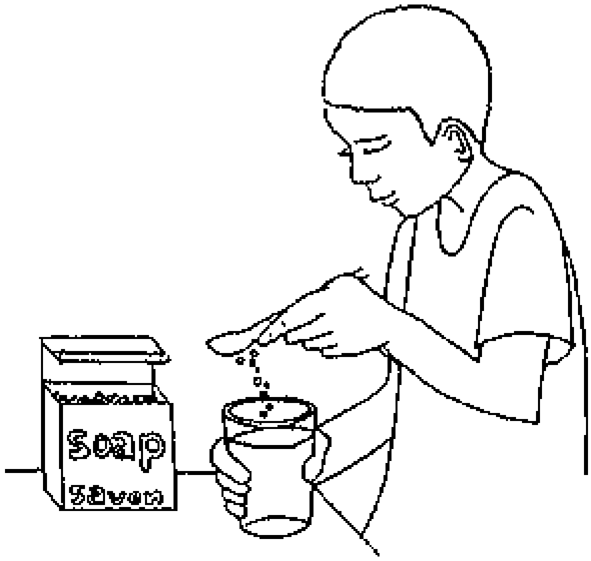
oil (salad oil, engine oil)
detergent solution
(about 1 teaspoon of detergent in a big vessel of water)

c. 2 funnels

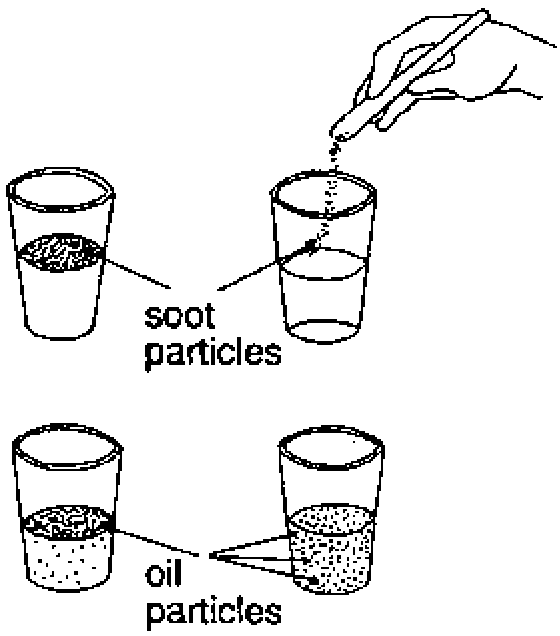
2 paper filters
2 glass dishes

Procedure:

a. One glass dish is half filled with water;
a second is half filled with detergent solution.
Some soot (about one spatula tip) is added to each dish, vigorously shaken and then filtered.



b. One glass dish is half filled with water, a second is half filled with detergent solution. About 0.5 ml oil is added to each dish, and then the dishes are vigorously shaken.



Observation:

a. The soot particles in the detergent solution are distributed, whereas those in water recollect on its surface. The soot particles in the detergent solution are hardly retained by the paper filters.

b. The oil in the detergent solution in distributed in very small particles, whereas it forms a layer on top of the water.

Analysis:

Detergents cause oil and soot to be well distributed in water. Oil drops and soot particles are distributed and thus kept floating.

Thus, the dirt particles are prevented from being deposited on the fabric cloth again. In the first case of the soot particles in a detergent solution, a **suspension is formed. In the case of detergent solution and oil, a suspension is formed.**

(emulsion: a mixture of two liquids; suspension: a misture of a liquid and one solid, which can not solve in the liquid)

Practical Use:

Soaps and detergents are used to remove dirt from clothes, dishes, and the human body.

Further thought:

We say that some liquids “wet” a surface, whereas other don’t do this. What’s the difference? Where is it coming from?

9. MECHANICS

9.1. GEAR MECHANISM - A TRANSMISSION

TO SPEED UP

Main Goal:

The pupils become familiar with an important element of machines - the gear transmission.

Information:

In technology, cogwheels serve to transmit rotary motions.

The simplest kind of gear transmissions consists of a driving gear, an output gear, one crank, two spindles, and two bearings. A gear transmission transmits two unchanging rotary motions, motions into slowness, into speed, in opposed motions and motions into other revolving planes.

If there is a transmission to speed up, the bigger of the two cogwheels is the driving gear and the smaller one is the output gear.

Materials and Apparatus:

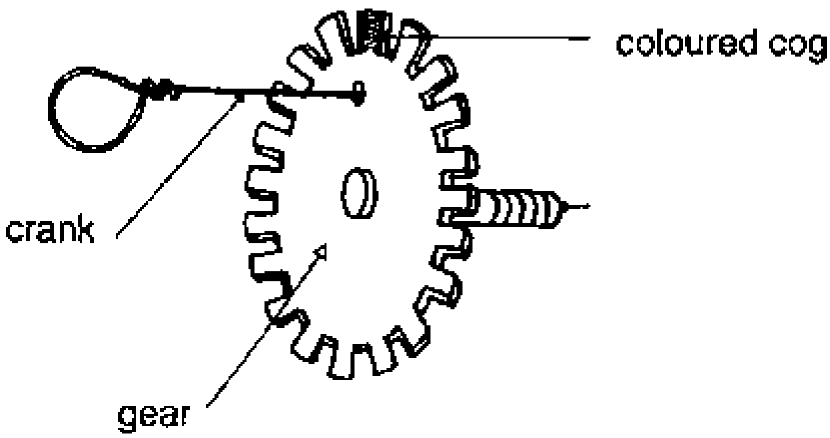
firm corrugated board
screws
wire
knife or pair of scissors
coloured pencil

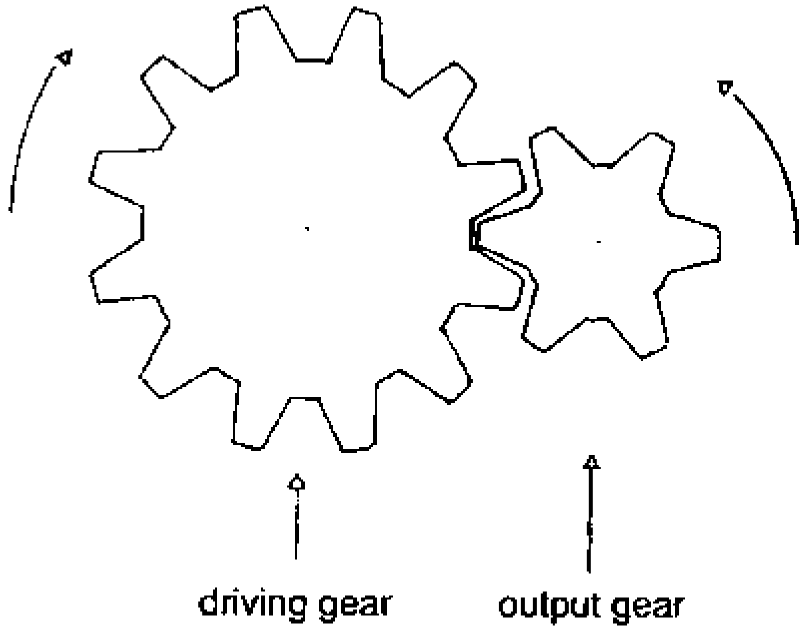
Procedure:

Two cogwheels - one with 20 and the other with 40 cogs are made of the corrugated board. The screws serve as spindles and simultaneously as fastening devices on a sheet of corrugated board. A crank - made of wire - is fastened to the bigger cogwheel.

One cog of each gear is coloured, to determine the number of rotations.

The bigger cogwheel is driven by the smaller one.





Observation:

Driving gear and output gear rotate in opposite directions. The output gear turns twice as fast as the driving gear.

Analysis:

If a rotary motion is transmitted from a bigger driving gear onto a smaller output gear, the number of rotations of the smaller cogwheel is greater.

The quotient of the number of rotations is called transmission. It is coputed by the proportion between the two cogwheel radii or between the proportion of the cogs of the single gears.

$$\mathbf{u = r_1/r_2 = z_1/z_2}$$

u: transmission
r: radius of a gear
z: number of cogs

Practical Use:

One of the numerous examples of such a transmission is the gear mechanism of a grinding machine. The grindstone (as working element) is connected over a spindle to a smaller output gear, which speeds up. With bicycles, the motion is transmitted over the chain.

9.2. GEAR MECHANISM - A TRANSMISSION TO SLOW DOWN

Main Goal:

By means of this experiment the pupils experience an important element of machines - the gear transmission.

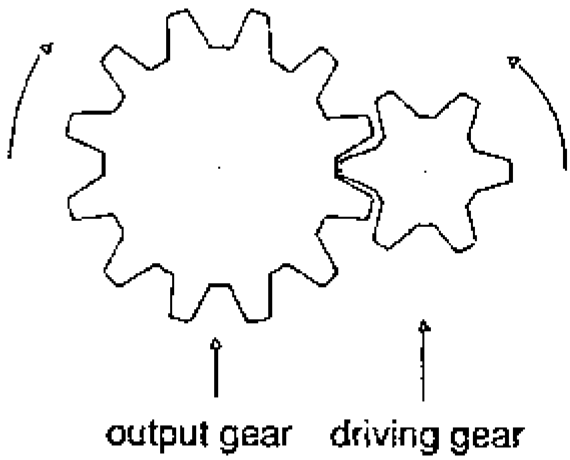
This experiment demonstrates a transmission in order to slow down.

Materials and Apparatus:

corrugated board
screws
knife or pair of scissors
wire
coloured pencil

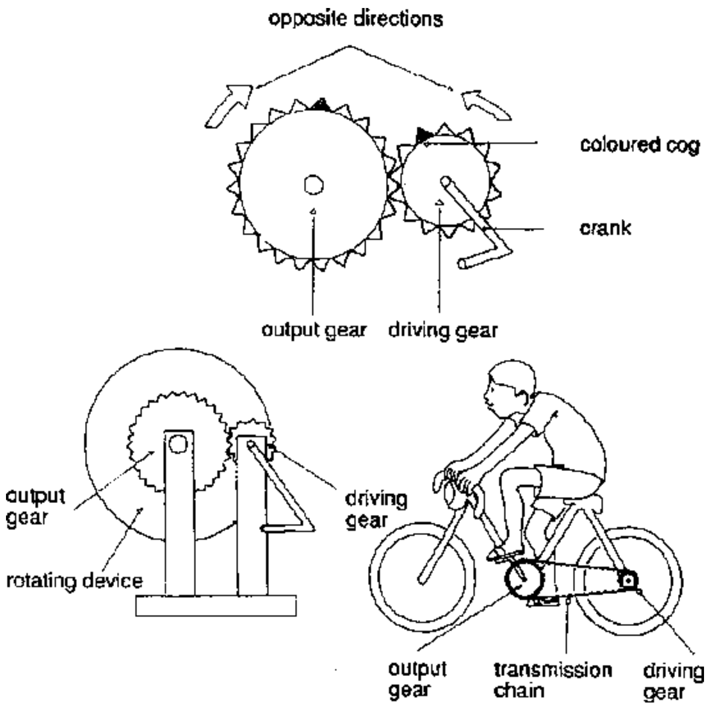
Procedure:

see “GEAR MECHANISM - TRANSMISSION TO SPEED UP”



Observation:

Driving gear and output gear turn into the opposite directions. The driving gear turns double as fast as the output gear.



Analysis:

If a rotary motion is transmitted from a smaller driving gear onto a bigger output gear, the number of rotations of the bigger cogwheel is smaller. The quotient of the number of rotations is called transmission. It is computed by the proportion between the two cogwheel radii or by the proportion between the cogs of each gear.

$$\mathbf{u = r_1/r_2 = z_1/z_2}$$

u: transmission
r: radius of a gear
z: number of cogs

Practical Use:

A vivid example of a transmission to slow down is the gear mechanism of a bread-slicing machine. The knife as working element is connected to a big output gear which undergoes a transmission into slowness by a smaller driving gear.

9.3. A SEESAW - A TWO-ARMED LEVER

Main Goal:

Pupils learn that a seesaw is a two-armed lever and flat in case of equilibrium. There is a special relationship between the length of a levers and the weights resting on them. For older pupils this experiment provides a mathematical basis to approach the law of the lever.

Information:

In physics, a lever is a bar, which can turn about one point (axis). This point is called the fulcrum. The fulcrum of a two-armed lever lies between the two attacking forces (see drawing 1). If a lever is in balance, the effects on left and right are equal. These effects are the product of the attacking force and the lever bar (distance between attacking force and the fulcrum). In drawing 1 the attacking forces F_1 and F_2 are the weights of the paper clips.

The law of lever says:

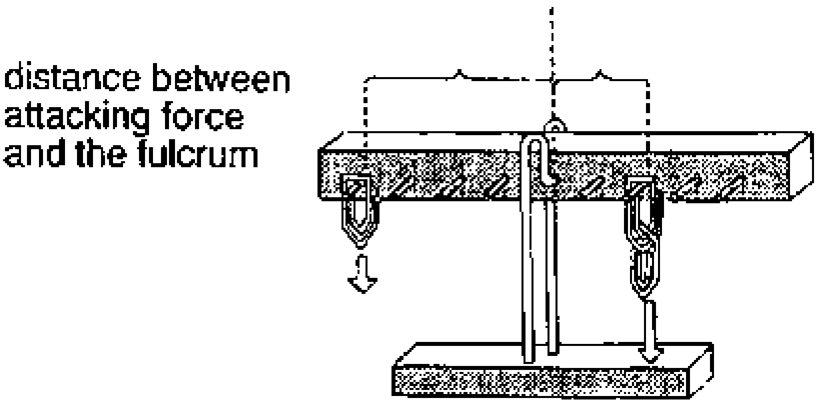
$$F_1 \times L_1 = F_2 \times L_2$$

If F_1 is considered the force that is to balance the load at the right hand side (F_2), then we have

force × force arm (left hand side) = load × load arm (right hand side)

Materials and Apparatus:

styrofoam (or soft wood)
thin iron nails
paper clips metal rings which are similarly heavy
(if existing: weights)
pencil, ruler
firm, thin wire
knife



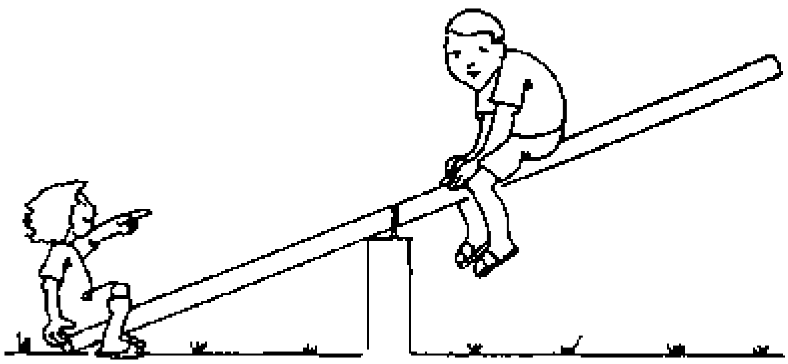
Procedure:

As shown in the drawing 1, a two-armed lever is constructed.

The axle bearing has to enclose the axis in such a way that the lever can freely rotate. However, it should not be too loose. It is favourable to pierce the styrofoam with the wire, which serves as axis and rack. Perhaps the wire should be heated before hand. The weights, e.g. paper clips or metal rings are fastened in different amounts at different distances from the fulcrum.

(This corresponds to the children on a seesaw.)

It is the pupils' task to balance the lever.



Observation:

The lever is balanced if the same number of paper clips is placed on each arm of the lever at the same distance from the fulcrum or, if different weights are fixed, the heavier weight must be closer to the fulcrum in order to balance the lever.

Analysis:

When the lever is balanced, the product of force and force arm equals the product of weight and weight arm.

That's to say: the product F × L of the left hand side must be equal to the product F × L of the right hand side.

Practical Use:

Examples of two-armed levers include: beam scales, scissors, pliers, and railway-signals.

Further thought:

What must be done in the situation of drawing 2 when the seesaw is to be balanced? There are two possibilities.

9.4. MODEL OF A SIMPLE CABLE WINCH

Main Goal:

Younger pupils learn that loads can be moved more easily with the help of a cable winch. Older pupils trace the cable winch back to a two-armed lever.

Information:

With the help of a cable winch, loads can be lifted vertically, or pulled closer horizontally more efficiently, i.e. with less effort.

Simple cable winches consist of a cable drum, the cable, and the friction drive. The friction drive can be moved by hand as well as by a motor.

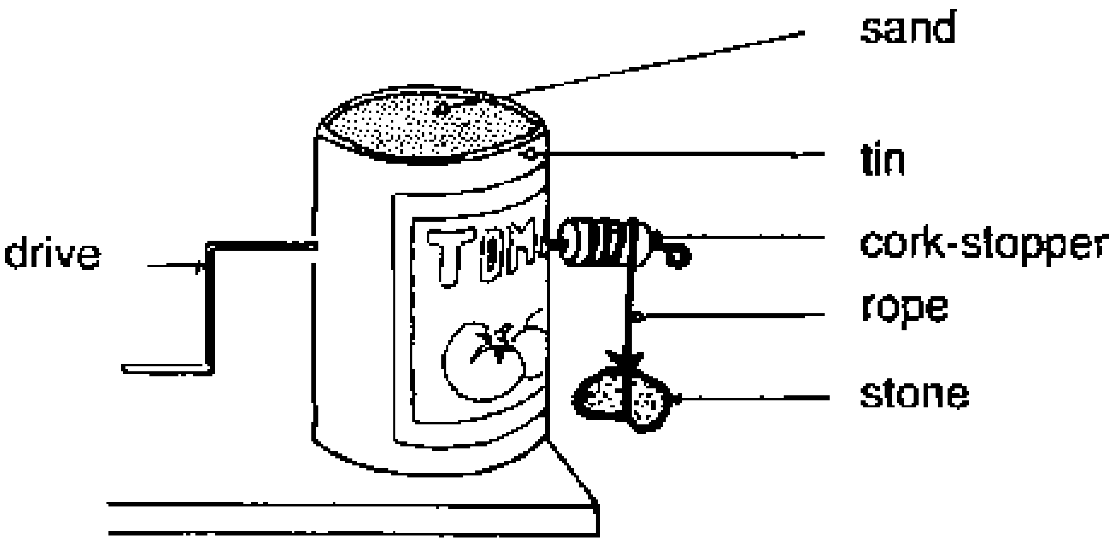
(see experiment: A SEESAW - A TWO-ARMED LEVER)

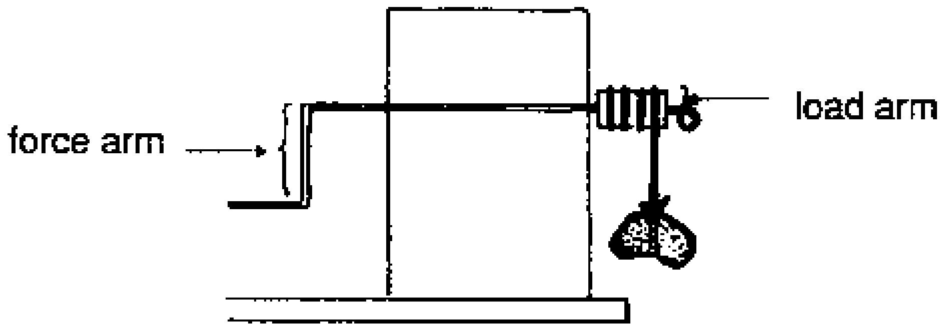
Materials and Apparatus:

stone as the load
rope
tin (with 2 holes) filled with sand, (see diagram)
pierced cork-stopper
stable wire

Procedure:

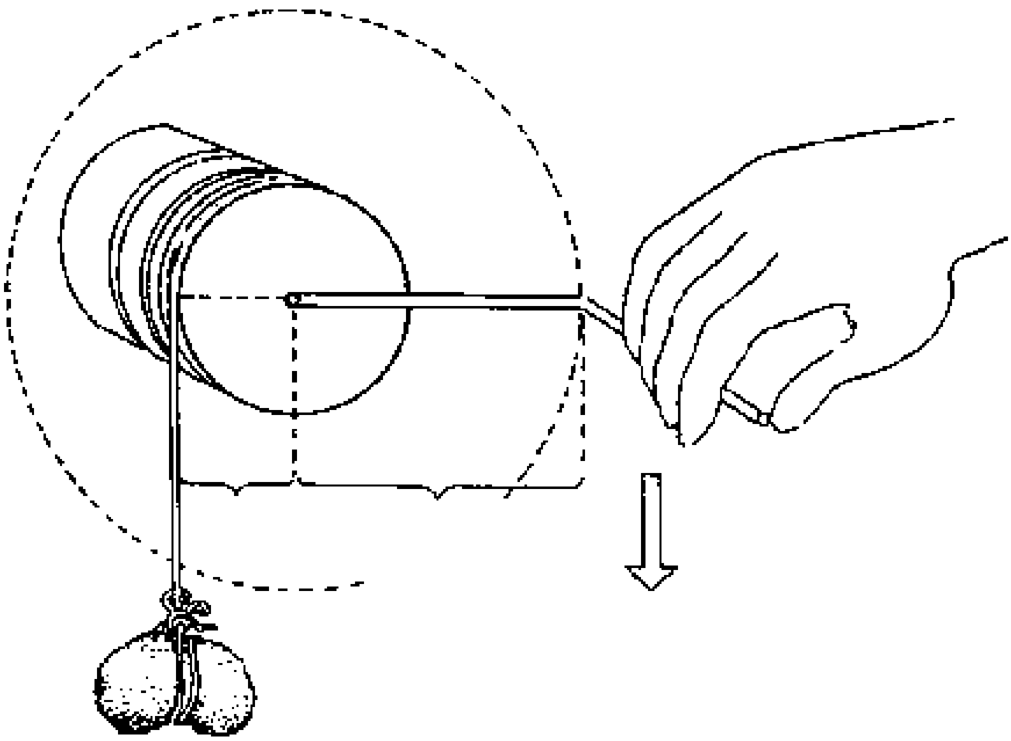
The experiment is set up as shown in the diagram below. The stone is lifted once with the help of the cable winch, and another time without it.





Observation:

The stone can be lifted more easily with the cable winch.



Analysis:

The winch presents a two-armed lever. When a load is lifted, force is saved, because the force arm is longer than the load arm. Thus the required force is smaller than the load (weight of the stone).

Practical Use:

Uses for winches: water cranes, pit-head frames, lifting device at wheels, etc.

Further thought:

We save force with cable winches or levers.
Do we get this for granted or do we have somehow to pay for?

9.5. INERTIA

Main Goal:

The experiment illustrates well-known observations, from which the law of inertia can be derived.

Information:

Inertia describes the property of all bodies to counteract a change in motion. That's what experience teaches us.

The heavier a body is, the more inertia it exerts.

It is more difficult to put a heavy body from a position of rest into motion than a light one.

More force is needed to stop a heavy body than to stop a lighter body.

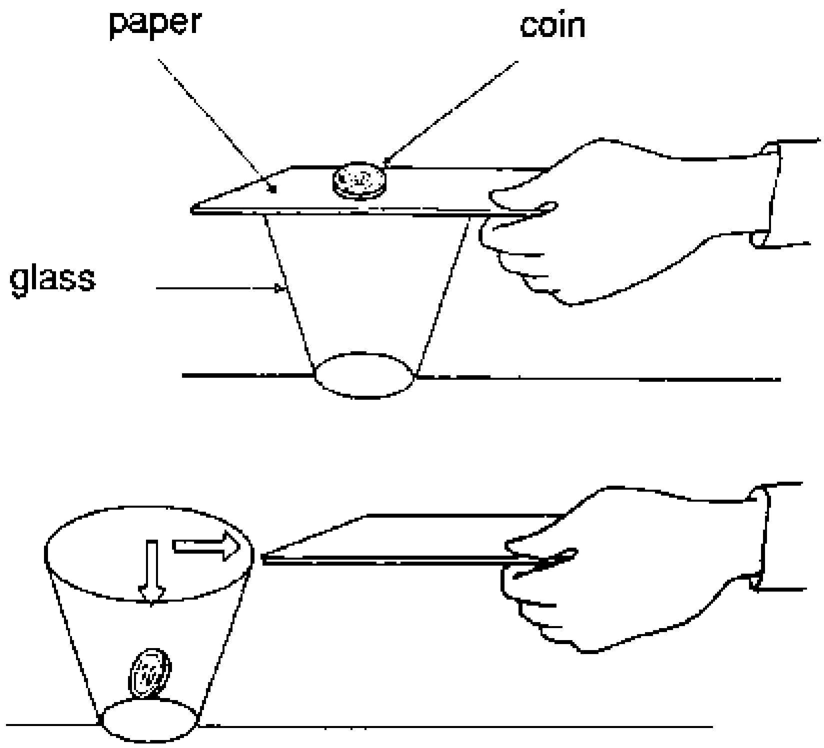
Materials and Apparatus:

glass, tin etc. with smooth rims
coin
firm paper (cardboard)

Procedure:

The experiment is prepared as shown in the diagram below.

The paper is pulled away horizontally as quickly as possible.



Observation:

The coin falls into the glass. It does not join the movement of the paper.

Analysis:

If stationary bodies try to remain in a position of rest, then, once in motion, they should also try to remain in motion. They should resist to change their state of actual motion. This is, in fact, the case.

Practical Use:

these principles can be observed with vehicles - cars, buses, trains, aeroplanes. If they suddenly stop, the passengers fall forward. If these vehicles start quickly, the passengers are pressed into their seats.

It is very dangerous to jump on or off a moving train, as our body hardly can balance the sudden change in motion.

Illusionists take advantage of the law of inertia, when they pull a table cloth off a set table as quickly as a flash of lightning. With a little everybody can do this too.

Further thought:

When one pulls slowly, the coin joins the movement of the paper. Why?

9.6. FRICTION

Main Goal:

These experiments demonstrate the principles of adhesive friction, sliding friction and rolling friction.

Information:

1. Friction is the result of mutual contact of irregularities in the surface of sliding objects. Three types of friction are distinguishable:

With **adhesive friction,** the force of friction is strongest. It decreases from **sliding friction** to **rolling friction.**

The strength of the frictional force depends on the surfaces of the bodies which rub against each other and on the weight of the upper body.

2. Adhesive friction causes two bodies to stick together.

Sliding friction counteracts the act of gliding.

Rolling friction is created when one body unrolls over another one.

The force of friction can be measured with a dynamometer.

Materials and Apparatus:

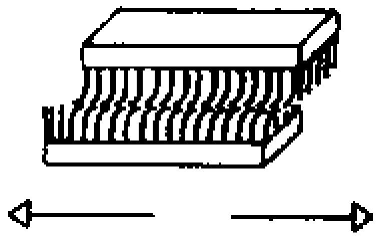
2 brushes or brooms
marbles or peas
sand

Procedure:

a. As shown in the diagram, the two brushes are placed on top of each other.

b. The upper brush is moved to the right side.

c. The marbles are rolled over a smooth and a sandy (rough) ground. Their initial speed should be nearly the same.



Observation:

a. The bristels grip one another.

b. The bristels of the upper brush are twisted to the left and those of the lower brush are twisted to the right side.

c. The marbles roll further on the smooth ground than on the rough ground.

Analysis:

Observation (a) is called adhesive friction.

The irregularities or unevenesses of the two surfaces grip one another.

Observation (b) is called 'gliding friction'.

The unevenesses of the two bodies grip each other less strongly than with the adhesive friction.

Observation (c) is called 'rolling friction'.

Here, the unevenesses can grip each other to an even lesser extent than in sliding friction.

The strength of the respective frictional force basically depends on the surfaces of the two bodies, which is made clear in experiment c.

Practical Use:

For reduction of frictional forces, very smooth surfaces are used in technology. In addition, lubricants, e.g. oil and graphite, are used. Frictional forces should be minimized at those machine parts which move. However, often frictional forces are necessary. Tires need a certain depth of tread patterns, so that the car does not skid on a wet road.

The brakes should not be wet or oily, because this would greatly reduce the breaking action (friction).

A nail or a screw stays in a wall or in wood because of frictional forces.

Further thought:

When we walk, has this also to do with friction?

9.7. A HEAVER - A ONE-ARMED LEVER

Main Goal:

With a one-armed lever, it can be demonstrated that a weight can be lifted more easily, the longer the force arm of the lever.

Information:

In physics, a lever is a bar, which can turn about one point (axis). This point is called the fulcrum.

The fulcrum of a one-armed lever lies at its end.

Load arm and force arm of a one-armed lever are resting on the top of one another. Thus, the two forces attack the same side of the lever.

The lever principle is:

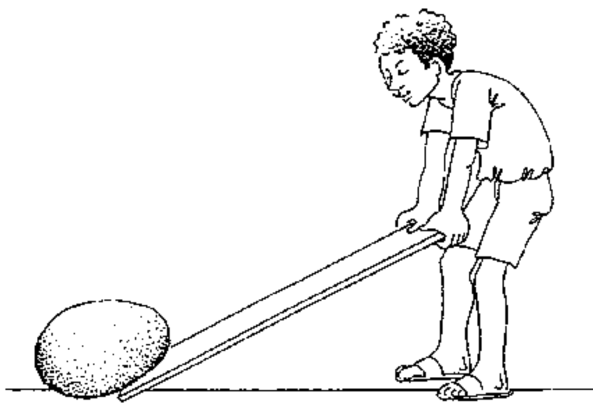
$$\text{force} \times \text{force arm} = \text{load} \times \text{load arm}$$

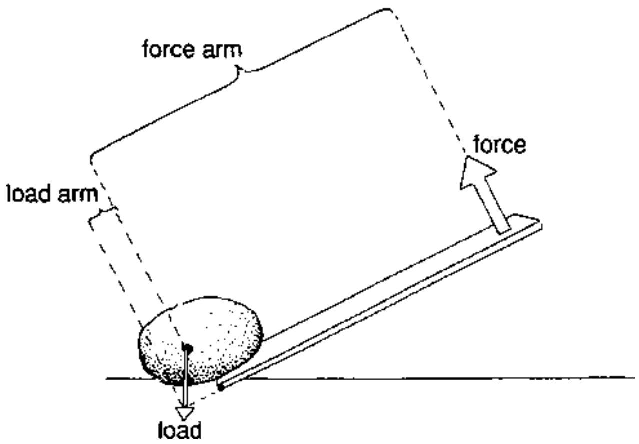
Materials and Apparatus:

one heavy stone or a heavy object as load
one stable wood lath or iron rod

Procedure:

The stone is lifted with the wooden lath as shown in fig. a).





Observation:

The longer the lever, the greater the distance between the fulcrum and the end of the heaver, and the less force is needed to lift the stone.

Analysis:

If the lever is in a state of balance, the product of load (weight of the stone) and load arm equals the product of force and force arm.

(A dynanometer is needed to check this principle. It measures the force held against the load.)

Practical Use:

Examples for one-armed levers include:
a wheel-barrow and a nutcracker.

Further thought:

If we are rowing a boat, do we apply the law of levers?

10. ELECTRICITY

10.0. THE SCIENCE OF ELECTRICITY

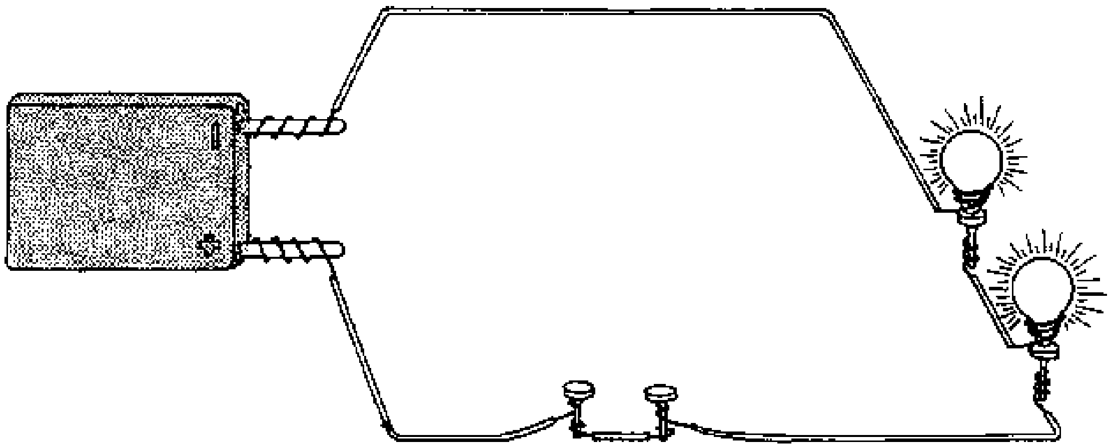
Before we look in detail at the following experiments, here are some suggestions relating to the necessary materials and apparatus.

As the equipment used is always very similar, it is practical to build up one basic board and to put together basic equipment.

N. B.

The experiments performed with batteries, can also be performed with a transformer.

(Batteries pollute the environment and are expensive)



SUGGESTIONS FOR "SCIENCE OF ELECTRICITY"

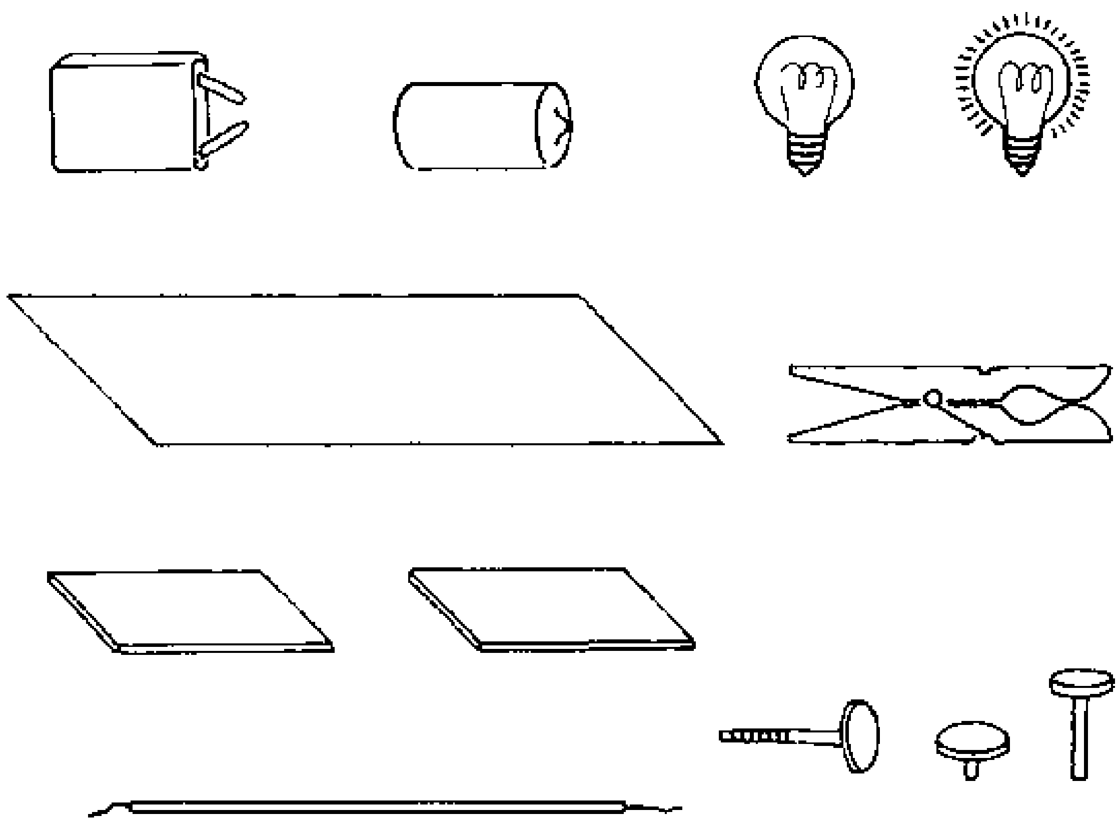
a. MATERIALS

batteries	:	flat and round batteries
small light bulbs	:	e.g. from flashlights
metal sheet	:	thin, made of copper, aluminium, or iron
wire	:	single core, length as required
clothes peg	:	made of wood or plastic

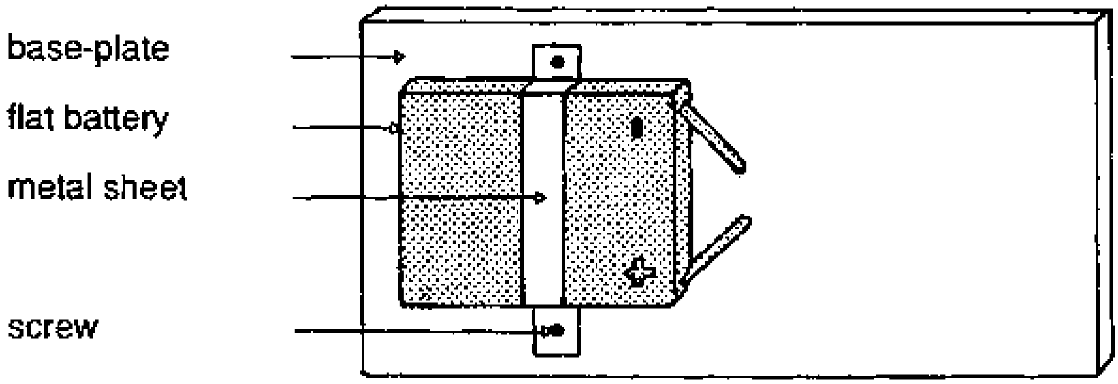
drawing-pin, paper clips, different kinds of iron nail,

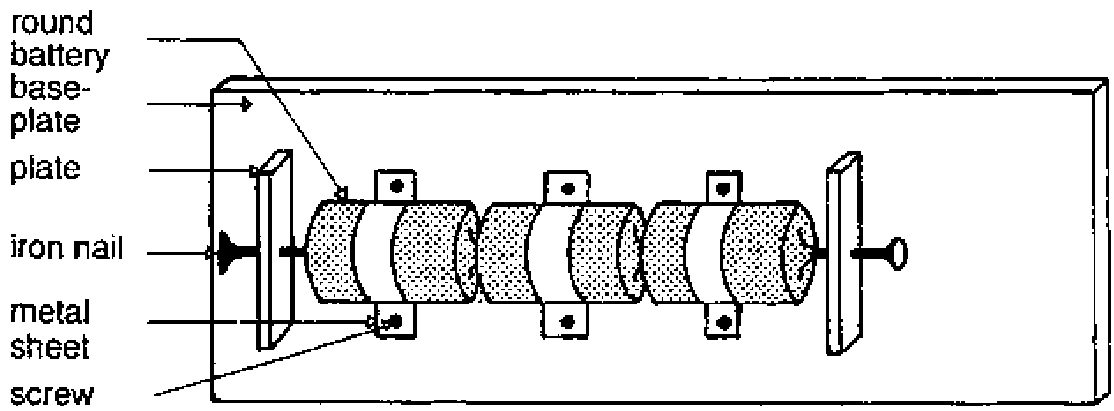
screws rubber bands (broad)

knife, pair of scissors, hammer, screw-driver, pair of pliers.

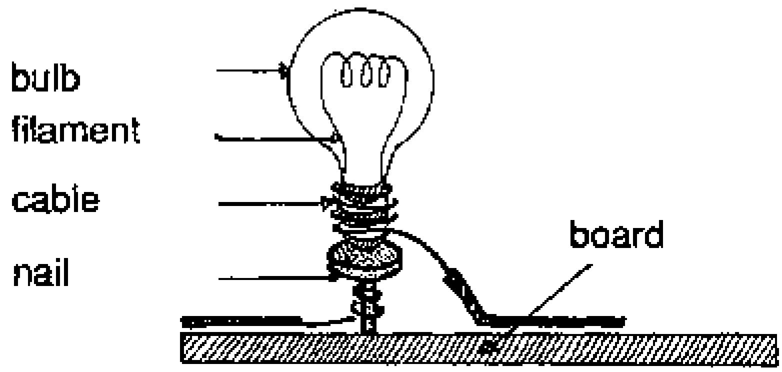


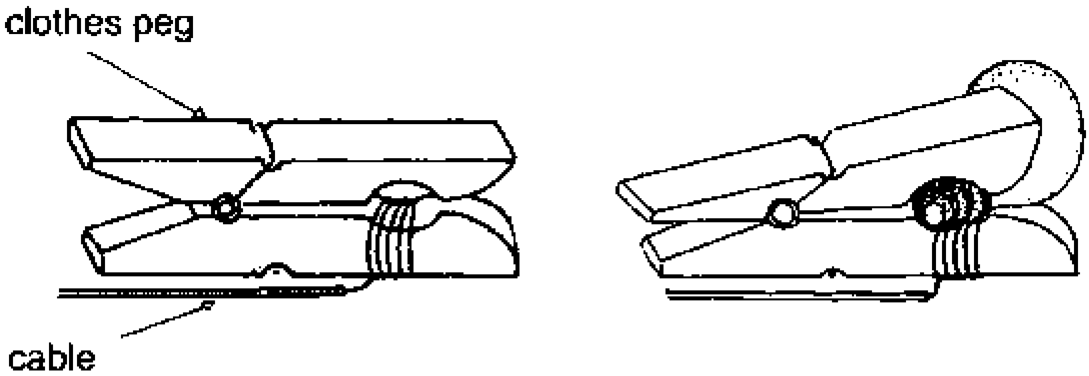
b) Suggestions for the base-plate



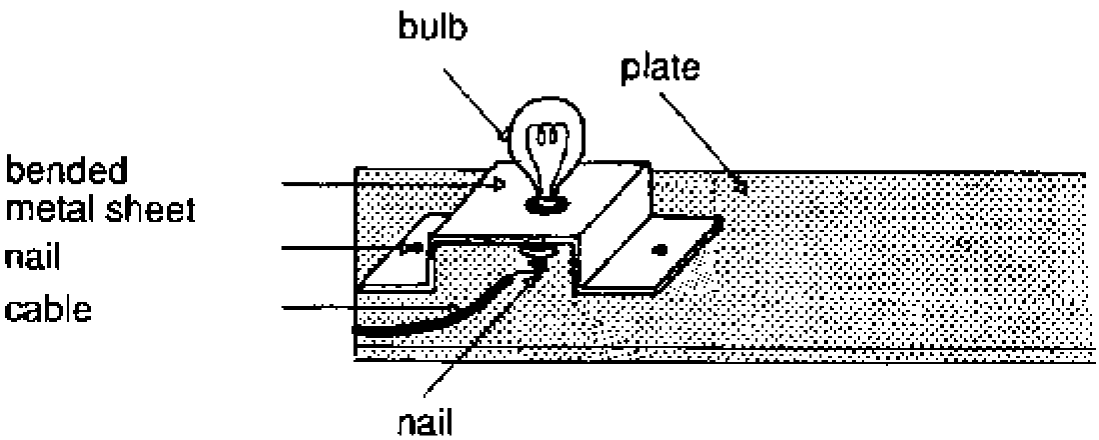


c) Suggestions for the sockets

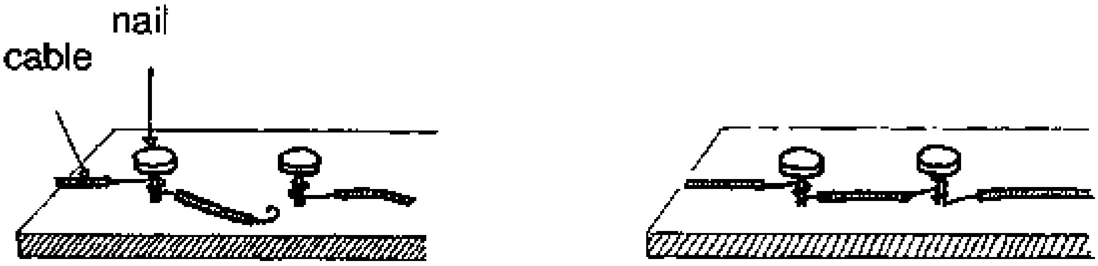




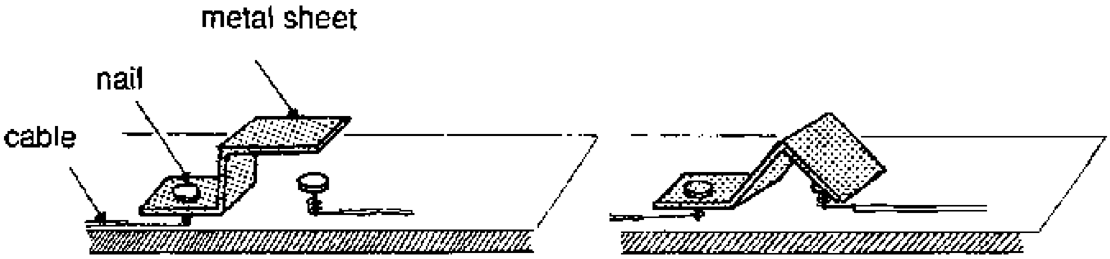
Clothes peg used as clamp



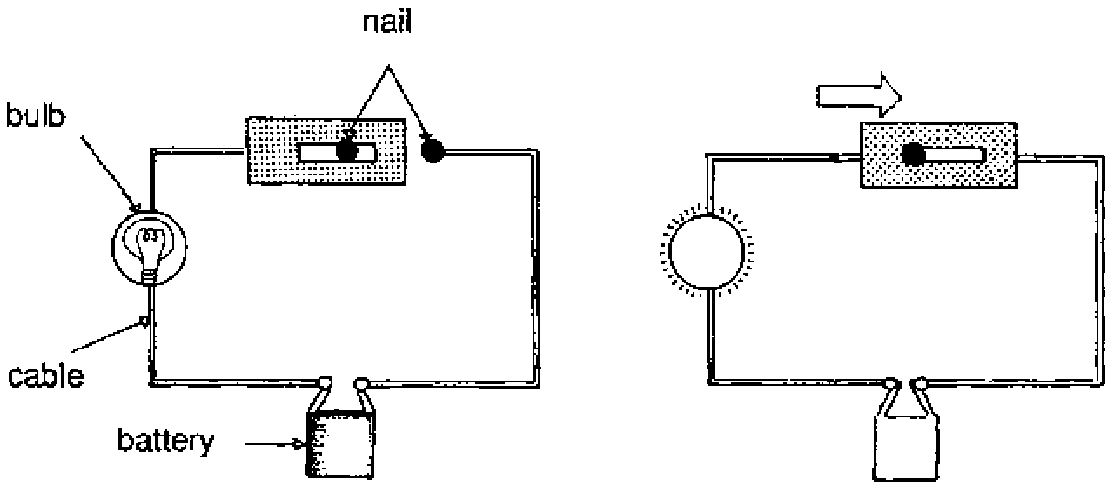
d) Suggestions for the switches



simple switch: off simple switch: on



press-switch: off on



slide-switch: off on

10.1. A JET OF WATER IS DEFLECTED

Main Goal:

> **The following experiment demonstrates static electricity, which can be found when a non-conductor is charged due to friction.**

Information:

> Various non-conductors, e.g. rubber, glass, plastic, can be charged electrically by rubbing them with a woollen leather or nylon cloths.

Friction causes an electron surplus or deficiency, depending on the material, (The material, used to rub the non-conductor takes on the opposite electric charge.)

This specific charge is retained for a short period, so that the influence - electrical attraction or repulsion - may be illustrated.

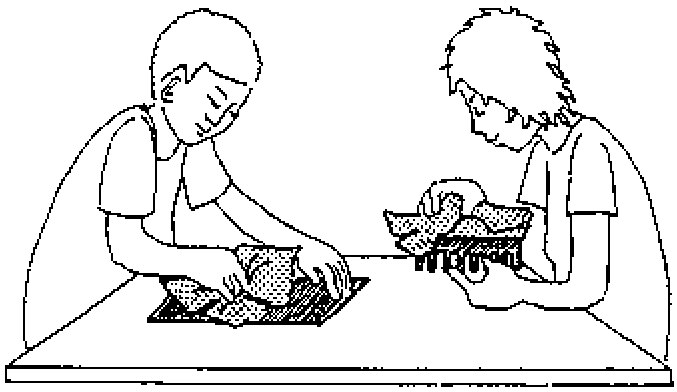
The experiments can be performed best in very dry air.

Materials and Apparatus:

2 pieces of plastic sheeting, plastic bags, wool cloth
plastic comb, ball-point pen...
woollen cloth
jet or water from a water-pipe or a tin
2 balloons

Procedure:

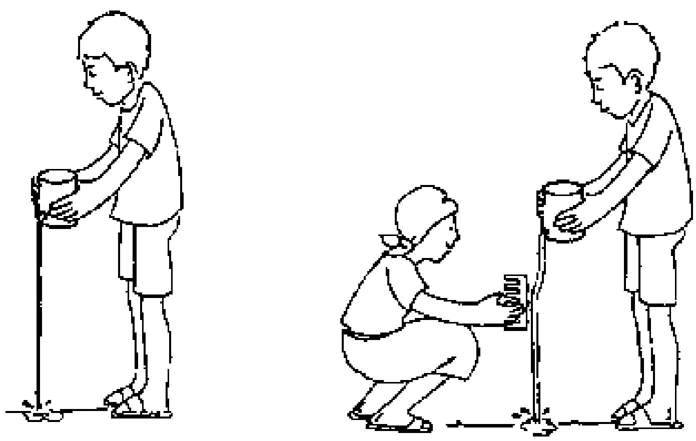
a. The sheeting or bags are rubbed vigorously with a woolen cloth and then brought close together.



b. One piece of sheeting or bag is charged by rubbing vigorously. A finger is then held very close to it.

c. The comb is rubbed vigorously with a woollen cloth and then brought close to a thin jet of water.

d. Inflate two balloons, rub them at your woolen pullover and try to get hot balloons close together.



Observation:

a. The sheeting or bags repel each other. They do not touch.
b. A crackle can be heard. In a darkened room sparks can be seen.
c. The jet of water is attracted by the comb.
d. You feel a repelling force.

Analysis:

a. The sheeting/bags carry the same type of charge and repel each other.

b. Friction of non-conductors produce high voltage electricity. It breaks down immediately when a spark leaps and is not dangerous.

c. The plastic comb and the jet of water have the opposite electric charges and attract each other.

d. The same type of charge on the balloons cause them to repel each other.

Further thought:

You can put a charged balloon on a wall. It sticks to it. What is the reason?

10.2. A SIMPLE CIRCUIT

Main Goal:

This experiment teaches pupils how a simple circuit is built and how it works.

Information:

When electric charge moves in **a** circuit, it does work. The rate at which this work is done is called power. Electric power (in watts W) is equal to the product of current (in amperes A) and voltage (in volts V) across the circuit.

Thus power = current × voltage,
in units watts = amperes × volts.

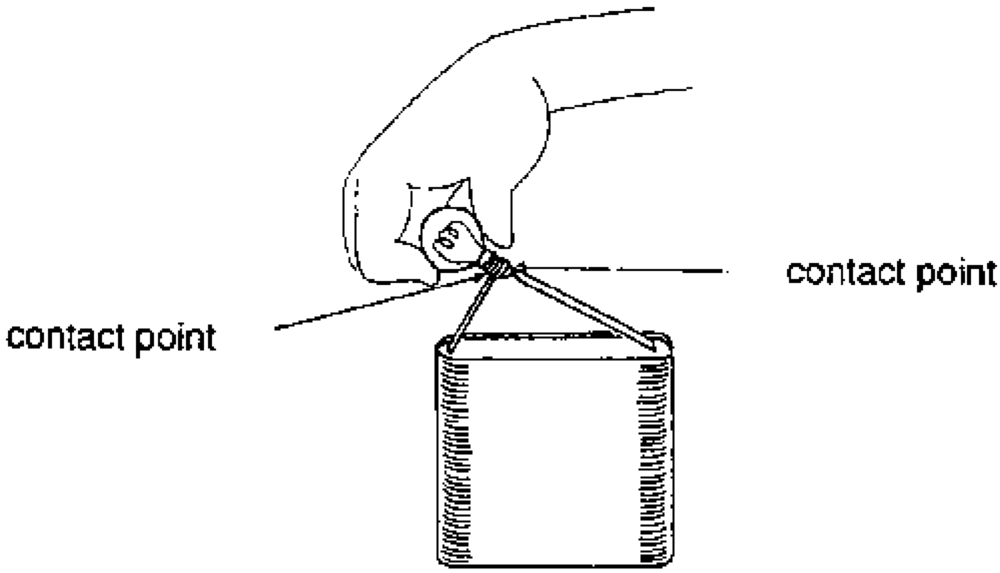
A simple circuit can be demonstrated with the help of a battery and a small light bulb.

Materials and Apparatus:

battery (about 4.5 V)
small light bulb (about 2.2 V)

Procedure:

The circuit is closed as illustrated in the diagram below.



Observation:

The lamp lights up if each of the two contact points are connected with one of the poles.

Analysis:

A simple circuit consists of a battery, that provides the voltage, and of a power consumer, in this case a small light bulb. Electric current only flows if the circuit is closed. When the small bulb lights up, the circuit is closed.

Practical Use:

see “Main Goal”.

Further thought:

The electric current that flows in the circuit consists of electrons. Where do they originate?

10.3. THE PRINCIPLE OF A FLASHLIGHT

Main Goal:

This experiment demonstrates that switches can close and interrupt circuits.

Information:

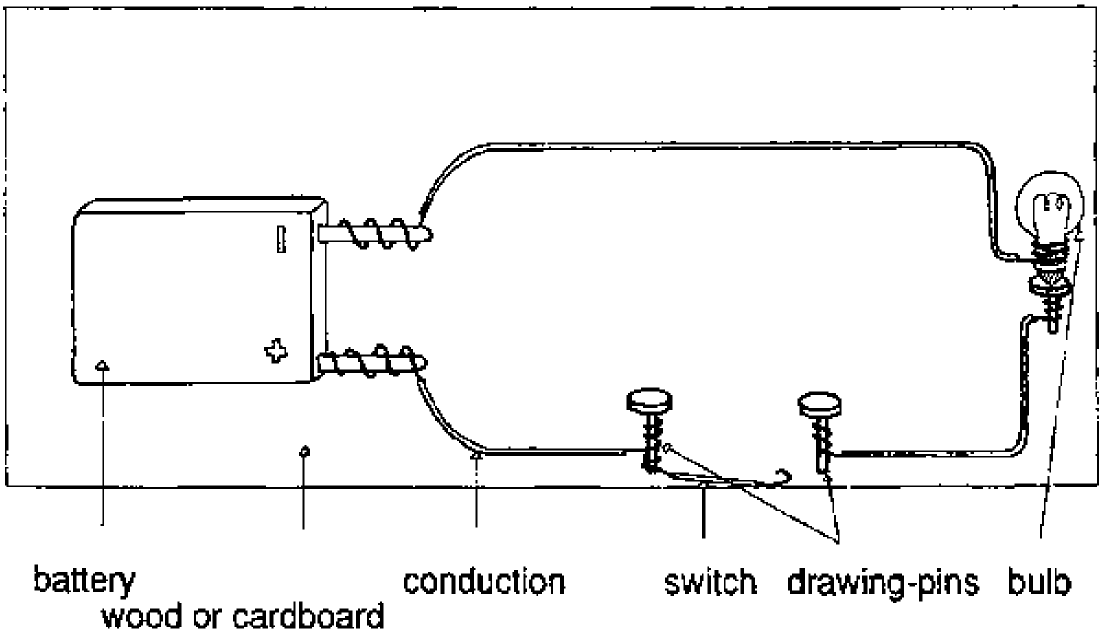
Switches connect contacts. Those which are known from the household and engineering include slide switches, rotary switches and button switches.

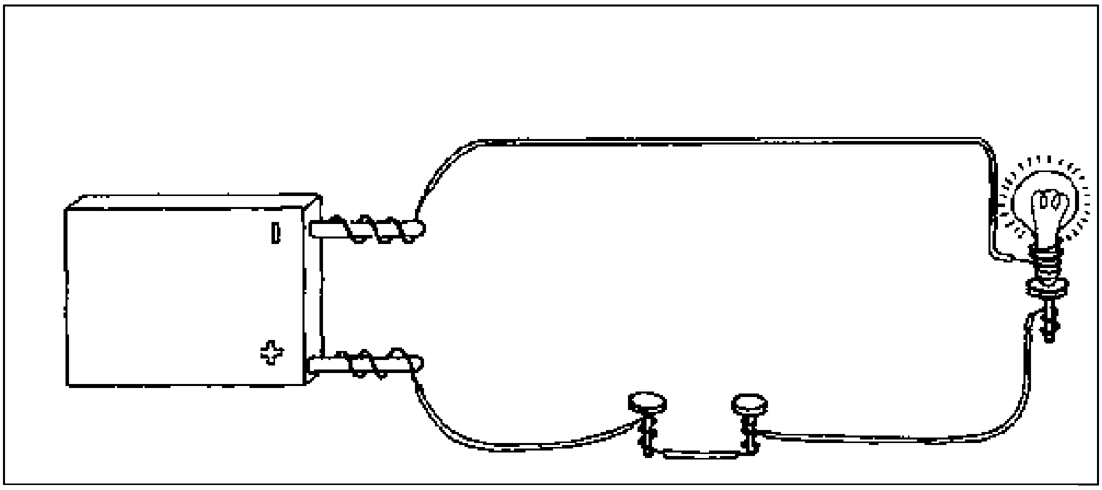
Materials and Apparatus:

see suggestions “SCIENCE OF ELECTRICITY”

Procedure:

A circuit is set up as shown in the following diagram. The circuit is closed or interrupted with the switch.





Observation:

The bulb lights up if the switch is connected with the two drawing-pins. The bulb lights off when the switch is ‘opened’.

Analysis:

Switches can close or interrupt circuits.

They connect or interrupt two conducting parts of a circuit.

There is no current when the switch is off.

Wood or cardboard seem not to be able to conduct electric current.

Practical Use:

see “Main Goal”.

Further thought:

Is there any voltage in the circuit even when the switch is off?
Is any current possible without voltage?

10.4. CONDUCTOR AND NON-CONDUCTOR

Main Goal:

The pupils learn about the classification of materials as good conductors, not so good conductors, and non-conductors.

Information:

Metals conduct an electric current very good. Non-metals may be moderate conductors (like ordinary water or wet wood) or bad or very bad conductors (like glass, hard rubber or quartz).

The conductivity is dependant on free electrons.

The flow of current can be equated with the flow of electrons.

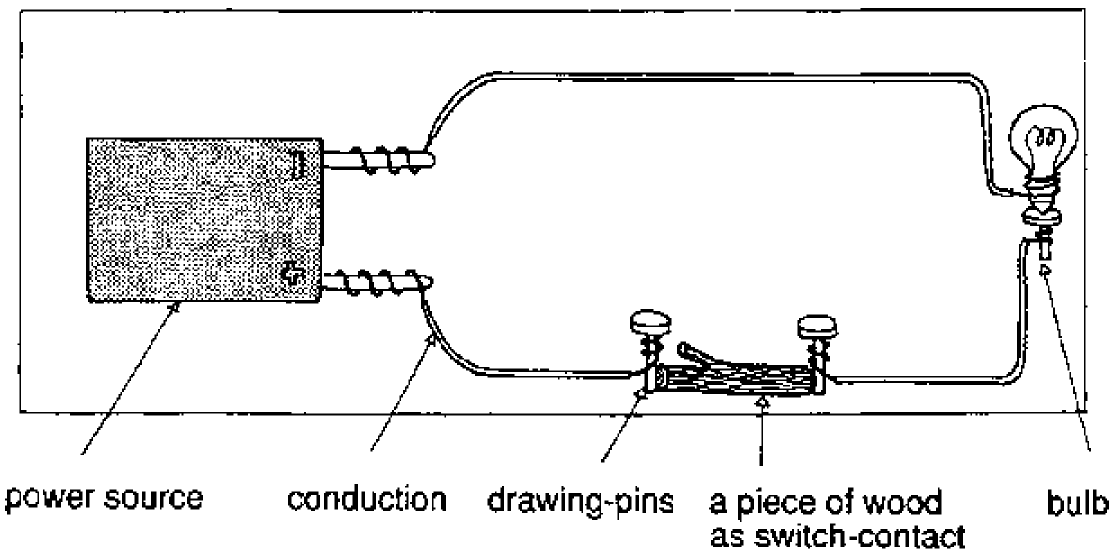
(The word “electricity” comes from the Greek word “elektrum” meaning amber. Static electricity was first discovered with amber.)

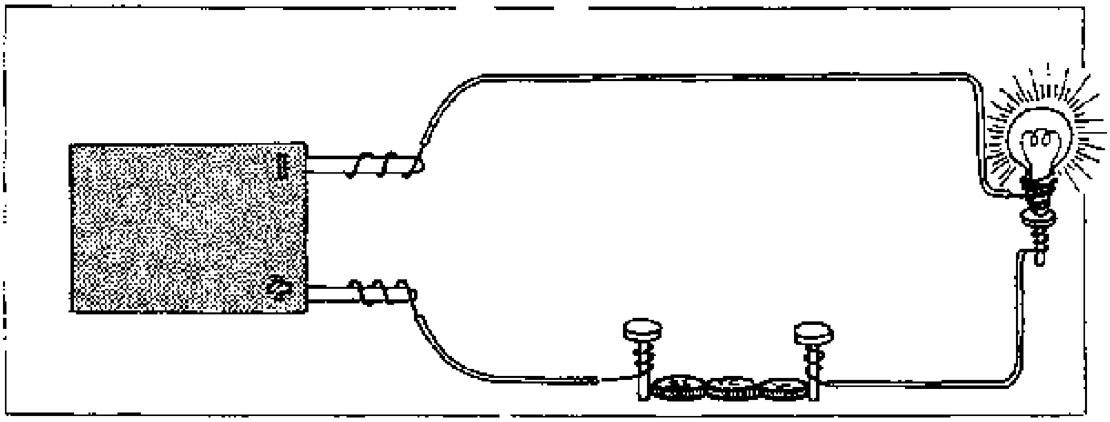
Materials and Apparatus:

see suggestions - “SCIENCE OF ELECTRICITY”.
See the following chart and select a few materials to test.

Procedure:

A circuit is set up as shown in the following diagram.
The materials to be tested are connected up between the two iron nails.
A material conducts electricity when the bulb lights up.





Observation:

material	conducts current	does not conduct current	conducts a little
wood		-	
glass		-	
yarn		-	
rubber		-	
paper		-	
plastic		-	
coal	+		
paper clip	+		
coin	+		
nail	+		
cigarette paper (metal foil)	+		
water			**0**
wet wood			**0**

Analysis:

It depends on the material, how good or bad current is conducted.

Practical Use:

Materials which conduct current are insulated with materials which are very bad conductors. Thus, a voltage drop, short circuit, and electro-cution are prevented.

Further thought:

Sometimes not good conduction is required, but good non-conduction. So, what kind of material is used as isolators?

10.5. SERIES CONNECTION

Main Goal:

This example teaches younger pupils the principles of a series connection, in which several consumers are connected up one after the other. The observations are not analysed in detail. Older pupils learn Ohm's law and the meaning of partial resistors.

Information:

Electric power consumers are ‘consumers’ because they convert electric power into heat power or light power. The property that enables ‘consumers’ to such conversion is called electric resistance. Circuit elements with appreciable resistance are called resistors. Bulbs are such resistors.

If several bulbs - resistors - are connected in series, they scarcely shine if at all.

This is due to the fact that the strength of the current, which is equally large at each partial resistor, drops. To calculate the current, Ohm’s law is used.

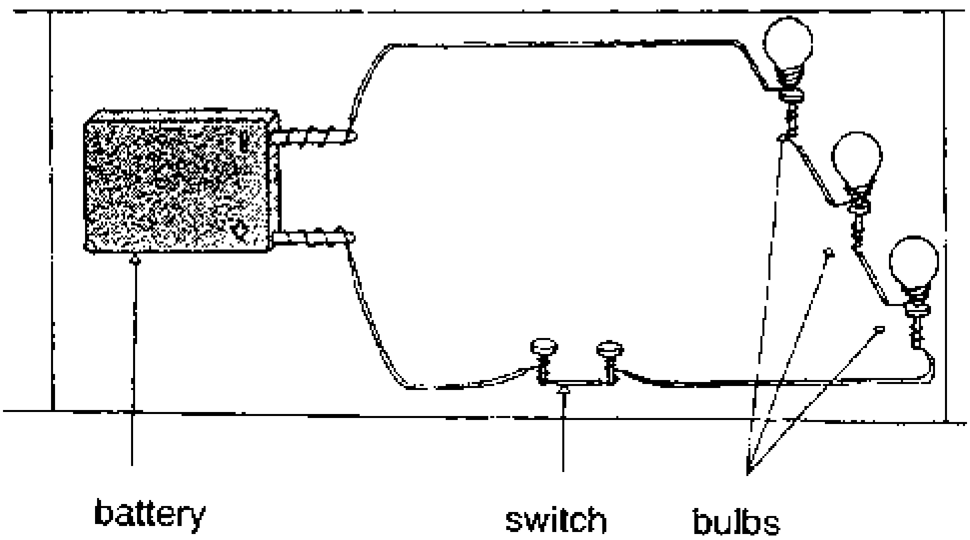
Materials and Apparatus:

see suggestion “SCIENCE OF ELECTRICITY”

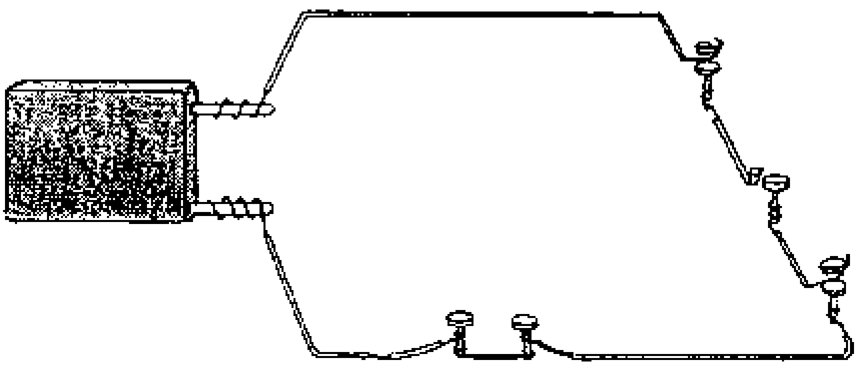
Procedure:

The circuit is set up as shown in the following diagram.

a. One, then two, then three small bulbs, etc., are connected in series.



b. When the switch is closed one of the small bulbs are unscrewed then another and so on.



Observation:

a. The bulbs shine less brightly after every additional connection, until they finally do not shine at all.

b. If one bulb is unscrewed, all bulbs go out.

Analysis:

a. The strength of the current sinks gradually, so that it is finally not strong enough to make the bulbs light up.

b. The circuit is interrupted if one bulb is unscrewed.

This means: the bigger the resistance, the smaller the current.

Practical Use:

see “Main Goal”

Further thought:

But what will happen in case the current is not strong enough anymore to make the bulbs light up, when we take a battery that delivers higher voltage?

10.6. PARALLEL CONNECTION

Main Goal:

This example teaches younger pupils the principle of parallel connection. The observations made are not analysed in detail.

Older pupils learn Ohm’s law in combination with Kirchhoff’s law.

Information:

If two bulbs - resistors - are connected in parallel circuits, they shine with equal intensity. This is due to the fact that two or more separate circuits exist.

To calculate the current at each resistor, Ohm’s law is used.

Materials and Apparatus:

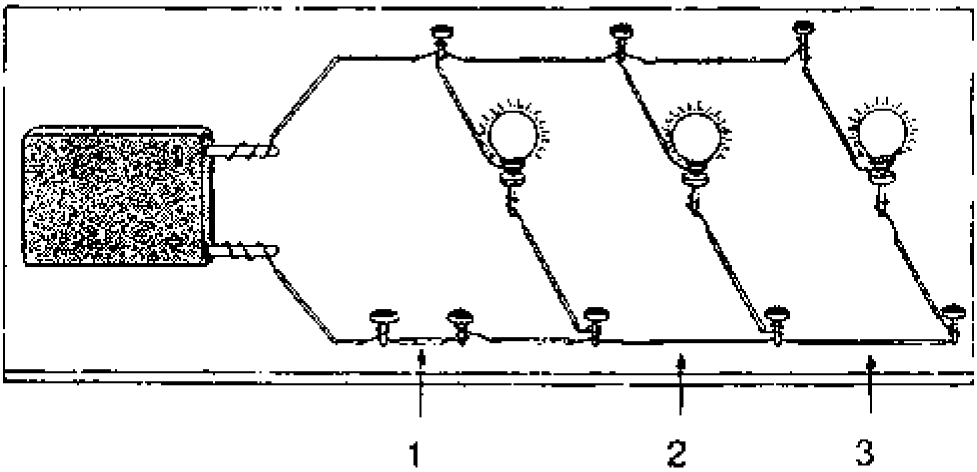
See suggestions - “SCIENCE OF ELECTRICITY”

Procedure:

A circuit is set up as shown in the following diagram.

a. The small bulbs are connected in parallel circuits.

b. When the switch is closed, the small bulbs are alternatingly unscrewed.



Observation:

a. The small bulbs light up with equal intensity.

b. If one bulb is unscrewed, the others still burn.

Analysis:

Every parallel connection forms an independent circuit. The current through each bulb is only dependant on the output of the battery (i.e. the voltage) and the resistance of the bulb.

Practical Use:

In all households, outlets and switches are connected in parallel circuits. The electricity meter is placed in the non-branching part of the electric power supply system. The complete amount of electric current used, runs through the meter (1st law of Kirchhoff).

Because the voltage is standard (220 V or 110 V), power (= voltage × current) times the time for which the power is used in the household is what we have to pay for:

power × time = electrical energy

The electrical energy is measured in wattseconds (ws) or kilowatthours (kwh).

Further thought:

What happens when the circuit is interrupted, e.g. at the point 1, or 2, or 3 in the drawing?

10.7. ELECTRICAL CURRENT PRODUCES HEAT

Main Goal:

This experiment demonstrates that electrical energy can be transformed into heat.

Information:

If electricity flows through a conductor, the conductor is heated. Depending on the material of which the conductor is made on the voltage, and on the current, the conductor is heated more or less. In heating instruments a special resistance wire - “constantan wire” - is used.

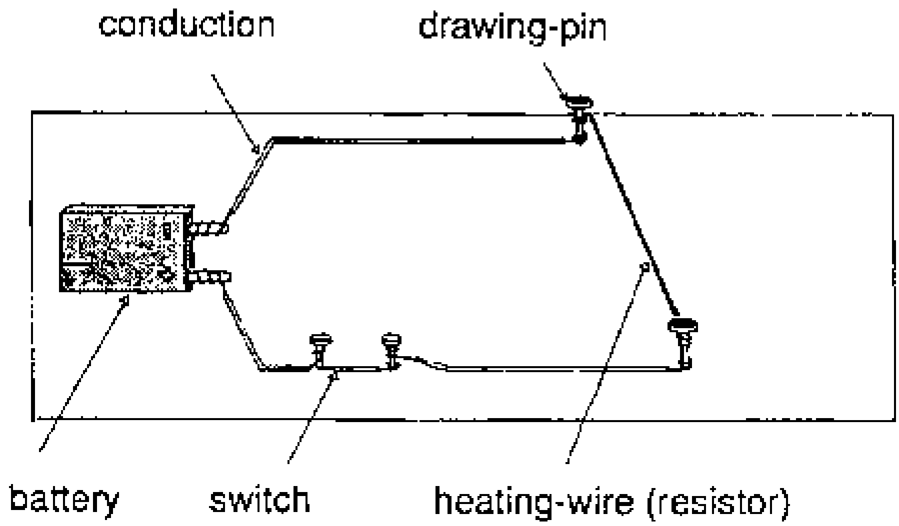
It does not fuse at high temperatures and has a high resistance, which is hardly dependant on temperature.

Materials and Apparatus:

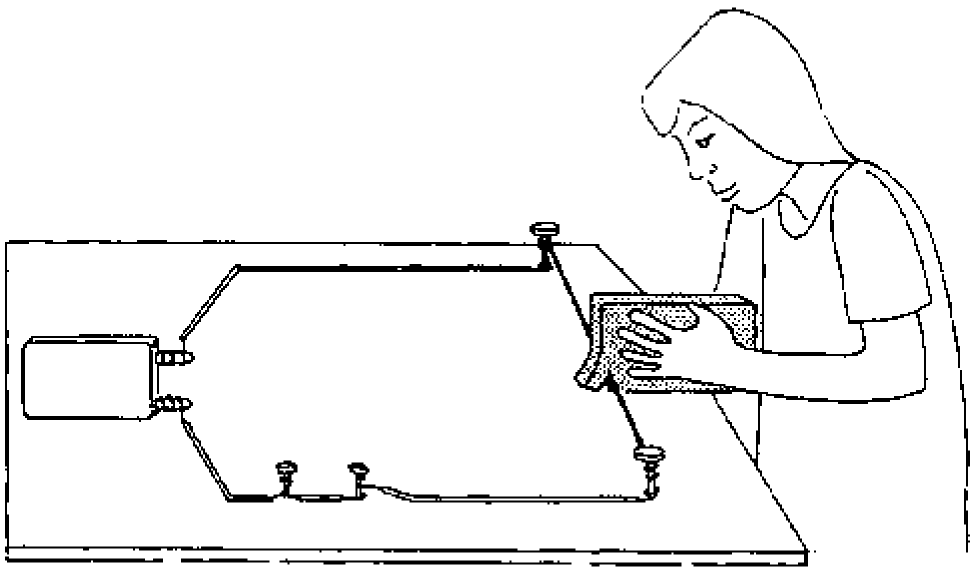
See suggestions - "SCIENCE OF ELECTRICITY"
resistance wire (constantan wire)
2 iron nails
15 V battery (or several batteries connected in series)
styrofoam (wood)

Procedure:

A circuit is set up as shown in the following diagram.



When the heating wire is red glowing, it can cut the styrofoam or singe the wood.



Observation:

The heating wire becomes hot, so that it cuts the styrofoam or singes the wood.

Analysis:

Electrical current produces heat in resistors or power consumers.

Practical Use:

In the household, a lot of electrical appliances are used which produce heat, e.g.:

electric heater
hot-plate
immersion heater

Further thought:

Sometimes you hear someone say that the electric current in a circuit is used up. Is it really the current, i.e. the flow of electrons, that's 'used up', or what?

10.8. THE PRINCIPLE OF AN ELECTROMAGNET

Main Goal:

The experiment demonstrates the magnetic effect of an electrical current.

Information:

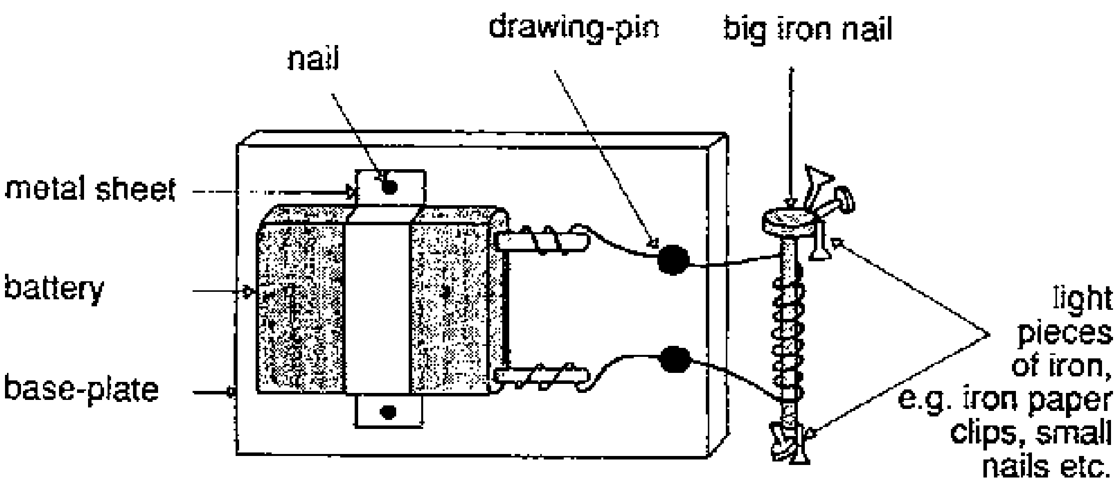
A current-carrying coil has the same effect as a permanent magnet. If a non-magnetic iron core is placed in the centre of the coil, it too becomes a magnet. The magnetism is intensified by increasing the number of times the coil is wound round the core.

Materials and Apparatus:

see suggestions - "SCIENCE OF ELECTRICITY"
iron nail
light pieces of iron

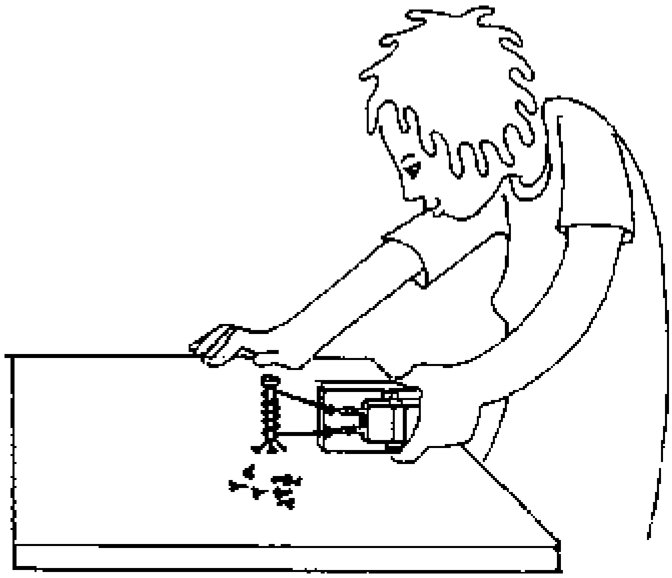
Procedure:

A switch circuit is set up as shown in the following diagram.



Some experiments which can be performed:

- Try to attract the lighter pieces of iron with the iron nail.
- The pieces of iron can be attracted with the current-carrying coil.
- The big iron core (nail) is placed in the coil.
- The number of times the coil is wound round the nail is increased or decreased.



Observation:

- The non-magnetic iron nail does not attract the iron pieces.
- The current-carrying coil attracts the lighter pieces.
- The attraction is increased with the addition of the iron core.
- The attraction is increased or decreased.
- Small current means little attraction, large current strong attraction.

Analysis:

A coil with an iron core is called an electromagnet. Its attractive power is greater, the higher the number of coil windings and the larger the current An electromagnet looses almost all its effect when switched off. No current, no magnetic effect.

Practical Use:

With the help of an electromagnet, iron pieces are transported and sifted out from other metals.

Electromagnets are also used in many electrical appliances. They either close a circuit, as a bell, or interrupt the circuit, as in an electric fuse.

Further thought:

A permanent magnet (e.g. a horse shoe magnet) has a magnetic North-Pole and a magnetic South-Pole. What's about poles of an electro magnet?

10.9. THE PRINCIPLE OF A BIMETALLIC STRIP

Main Goal:

The experiment demonstrates the behaviour of a bimetallic strip when heated.

Information:

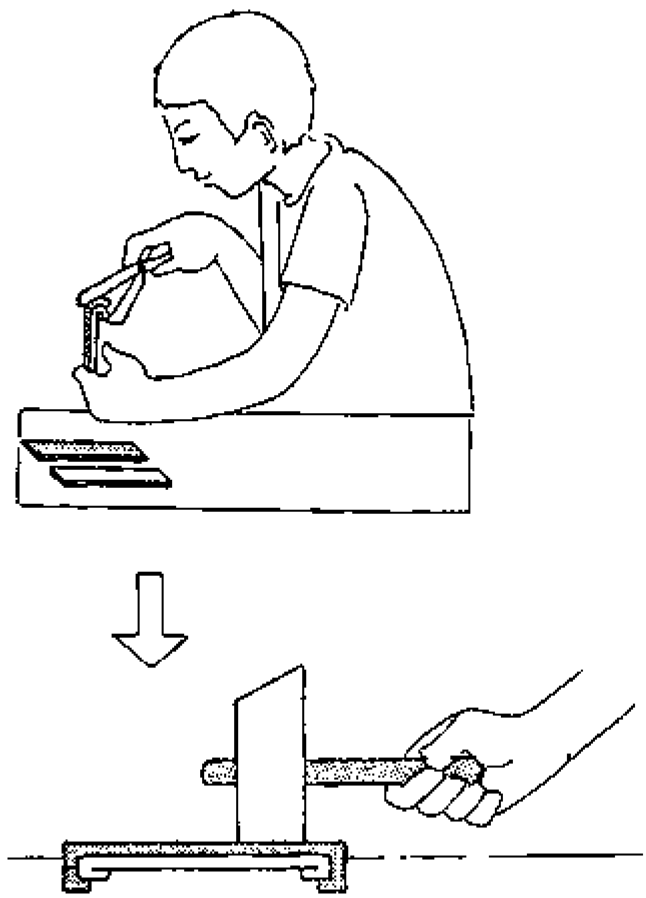
Bimetals consist - as the name suggests - of two strips of different metals, which are either rivetted or soldered together. When heated, a bimetallic strip bends due to the different expansion properties of the different metals.

Materials and Apparatus:

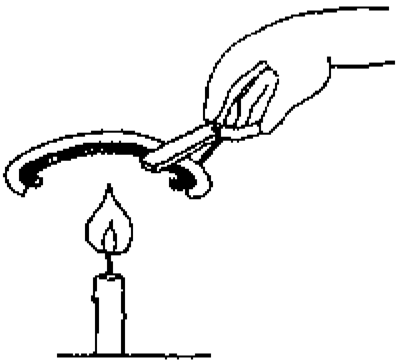
1 copper and 1 iron strip and 1 aluminium strip and
1 iron strip (of the same strength)
hammer
pair of pliers
alcohol burner, gas burner or a candle

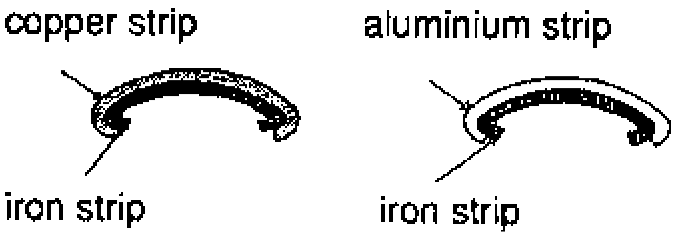
Procedure:

Two metallic strips are joined by twisting their ends as shown below.



The strips are then hammered flat.





The bimetallic strip is held in a flame.

Observation:

The bimetallic strip bends when heated.

Analysis:

The copper and the aluminium strip expand more than the iron strip.

Practical Use:

Bimetallic strips are used wherever it is necessary to interrupt an electrical contact at a specific temperature.

The circuit is interrupted, when the bimetallic strip is twisted.

Thus, bimetallic strips serve in thermostats. They are used in irons, ovens, electrical fuses, refrigerators, etc.

Further thought:

How would you construct a switch (e.g. a thermostat) by the help of a bimetallic strip?

11. OPTICS

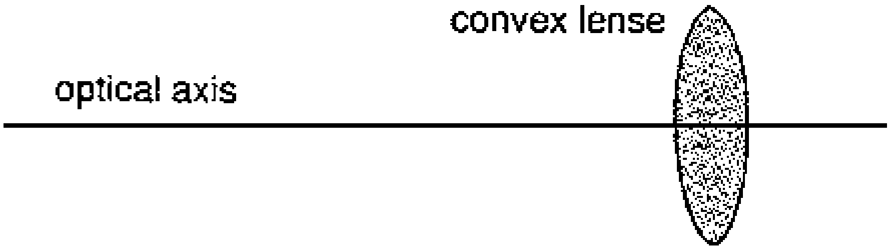
11.1. A CONVEX LENS

Main Goal:

This experiment shows the course of the rays of a convex lens or condensing lens.

Information:

Convex lenses are thicker in the middle than at the edges. Rays which are parallel to the optical axis, are refracted by a convex lens in such a way that they focus again behind the lens at the focal point. However, the marginal rays are refracted more than those rays which are closer to the optical axis.

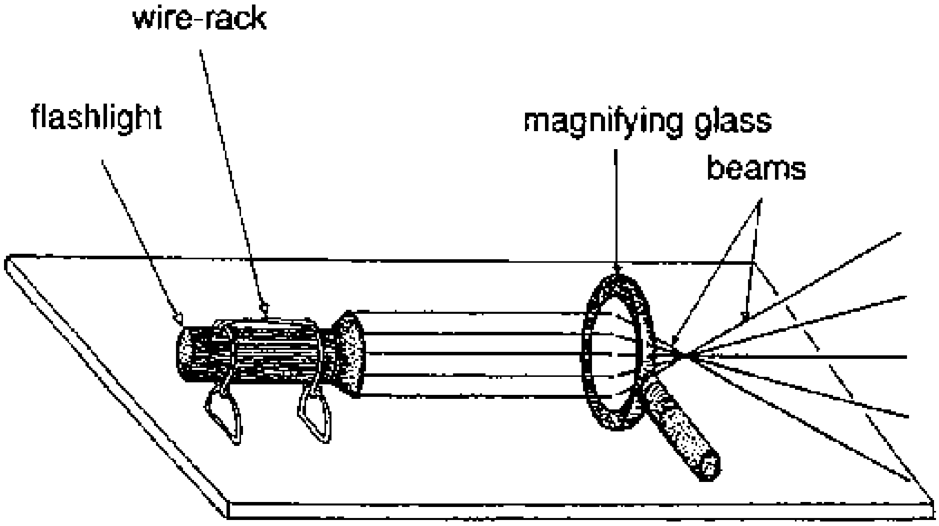


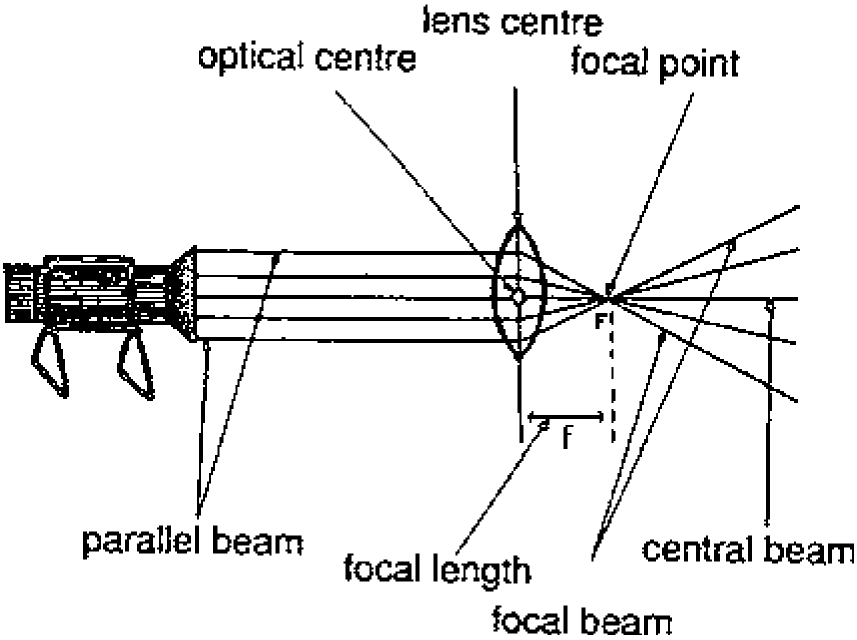
Materials and Apparatus:

magnifying glass -
(one spectacle-lens for long-sighted people)
flashlight (maybe a candle)
rack made of wire for the flashlight

Procedure:

The apparatus is set up as shown in the diagram below.
The room is darkened and the path of the rays observed.
This is possible when cigarette smoke is blown into the beam.





Observation:

The light of the flashlight is focused on one point behind the lens. When parallel light comes in from the right side, there can also a focal point be observed at the left side of the lense.

Analysis:

Lenses, which focus parallel light on one point are called condensing lenses or convex lenses.

The point is called the focal point.

It is situated on the optical axis.

The distance from the lens centre to the focal point is called the focal length (f).

Practical Use:

Convex lenses are used to correct long-sightedness and in microscopes, cameras, binoculars, etc.

The lens of the human eye is a convex lens.

Further thought:

Optical lenses normally are made of glass. Can one obtain the same effect (focusing of parallel light in one point) with lenses of other material?

11.2. THE BURNING GLASS

Main Goal:

The experiment demonstrates that a convex lens works as burning glass.

Information:

With a convex lens the sun's rays can be collected at the focal point (see experiment: A CONVEX LENS).

If a sheet of paper or the head of a match is held at the focal point, these materials ignite after a short while when the lens is placed perpendicular to the incoming sunlight. This is due to the fact that the energy carried by the sunlight is concentrated at the focal point.

Materials and Apparatus:

magnifying glass (one strong convex lens)
paper (match)

Procedure:

Sunlight is collected with a convex lens.
A sheet of paper or a match is placed at the focal point.
The spot of light should be as small as possible.

Observation:

The light can be seen as one small spot on the sheet of paper.

Here the paper starts to burn.

Analysis:

A convex lens can be used as a "burning glass".

At the focal point, the sun's rays and the energy carried by these rays are collected. Here, the energy concentration or energy density is so high that paper can be set on fire.

Further thought:

Why can you not get the same effect with a flash light as light source?

11.3. MAGNIFYING GLASS - VIRTUAL IMAGE OF A CONVEX LENS

Main Goal:

This experiment demonstrates a virtual image of a convex lens.

Information:

If an object is placed at the focal point or between the lens and the focal point, a real image cannot be perceived. If one looks through the lens at the candle however one can perceive a larger non-inverted image. (The eye must be at a greater distance from the lense than of its focal length.)

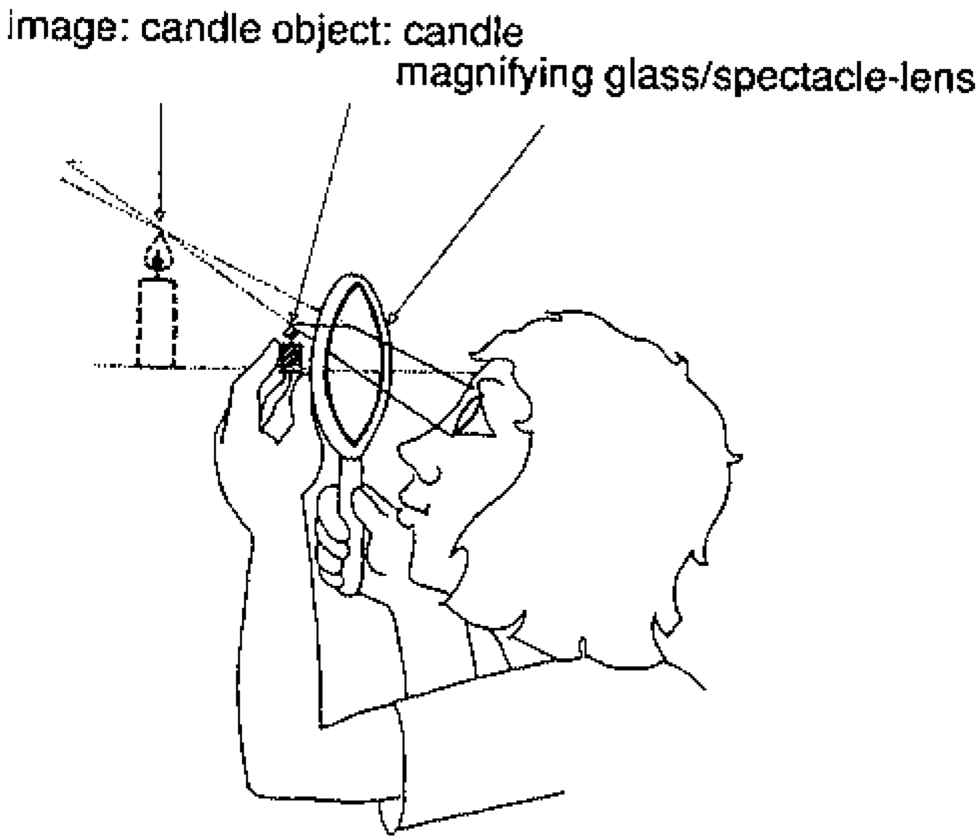
The image is called a virtual image and is only perceived with the eyes. It cannot be projected on the screen. The virtual image is formed when the eye follows the incoming rays backwards to the seeming point of intersection.

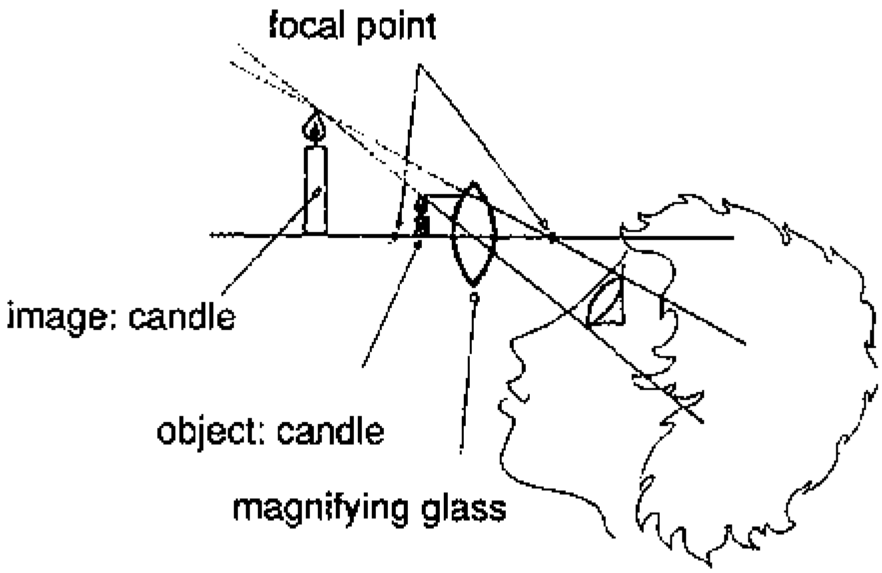
Materials and Apparatus:

magnifying glass -
(one spectacle-lens for long-sighted people)
candle or other objects such as flowers

Procedure:

The burning candle is placed close to the lens. The candle is observed through the lens.





Observation:

Looking through the lens at the candle, non-inverted magnified image can be seen.

Analysis:

This image cannot be projected onto a screen. It is just the eye which perceives this imaginary or “virtual” image.

Practical Use:

A convex lens is needed by people who are longsighted.

The eyeball of a long-sighted eye is flattened. Thus, without a convex lens, the incoming rays meet “behind” the retina. The lens corrects this defect.

Further thought:

Within glass light has a lower velocity than in air. Therefore, light going through the middle of the lens, where the glass is thicker, looses more time than light going through the glass at the edge. Is this fact of importance for the image forming?

11.4. REAL IMAGES WITH CONVEX LENSES

Main Goal:

Through this experiment, images created by a convex lens are observed.

Information:

Convex lenses create images, which can be projected on a screen. They are called real images and appear upside down on the screen.

If an object is moved towards **a** convex lens, its real image moves further away from the lens and becomes larger.

If the object is located at the focal point, no real image is formed.

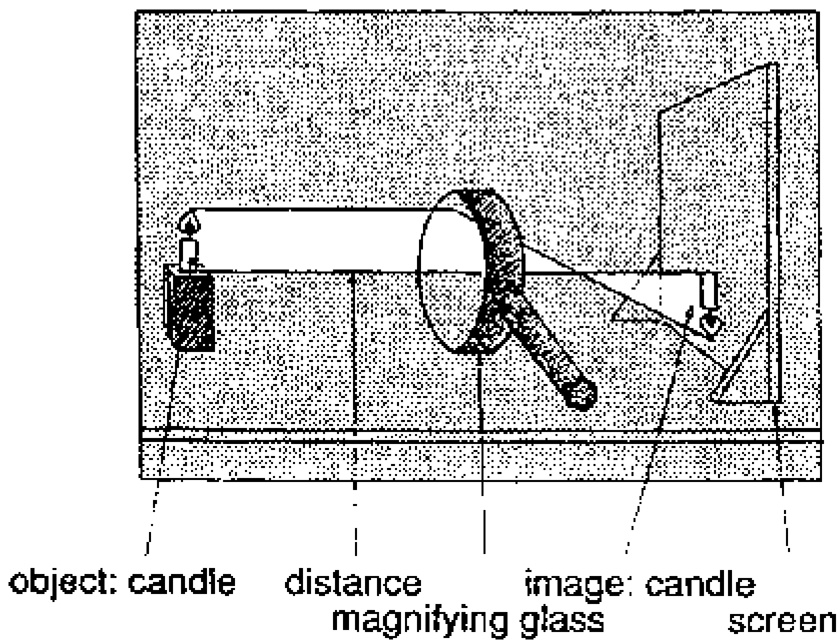
If the distance between the object and the lens is equal to twice the focal length, the image is the same size as the object. The distance from the image to the lens also equals twice the focal length.

Materials and Apparatus:

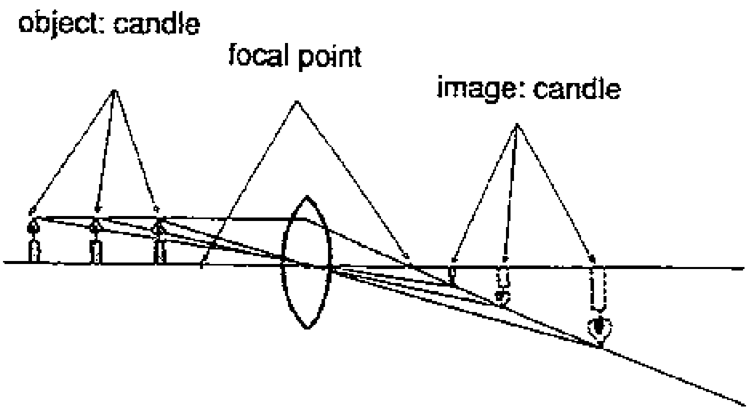
magnifying glass -
(one spectacle-lens for long-sighted people)
screen made of cardboard, candle,
rack made of wire or wooden rack for the magnifying glass, measuring rod.

Procedure:

The apparatus is set up as demonstrated in the diagram below. The candle is placed at one side of the lens. The screen is placed in such a way at the other side that a sharp image is obtained. When the candle is moved gradually towards the lens, the screen is moved correspondingly away from the lens.



Using the measuring rod, the distance from the candle to the lens, the distance from the image to the lens, the object size and the image size are measured.



Observation:

Upside-down images are created.

The closer the candle is to the convex lens, the further away the image. At a certain distance (twice the focal length) from the lens, the object is the same size as the real image.

If the candle is placed close to the lens, no image is formed at all.

Analysis:

When the height of the object is equal to the height of the image, the distance from the candle to the lens is equal to the distance from the image to the lens and both on exactly double the focal length.

If the candle is placed at the focal point or between focal point and lens, no image can be projected.

Further thought:

When we want to get a magnified image of the object on the screen in which distance from the lens must the object be placed?

11.5. THE CONCAVE LENS

Main Goal:

Through this experiment, the course of the rays of a concave lense - diverging lens - can be observed.

Information:

Diverging lenses are thinner in the middle than at the rim.

Rays parallel to an axis are refracted by an concave lens in such a way that they are refracted off the optical axis.

If the rays are followed backwards, it seems as if they all come from one point. This point is called the “virtual focus” or “point of divergence”.

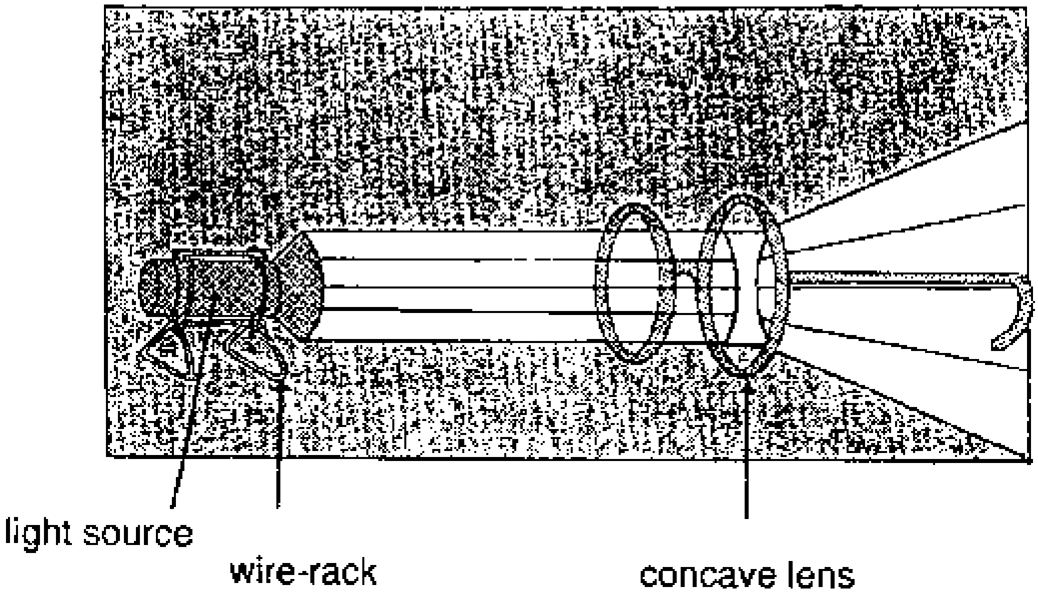
The centre ray remains at the centre. No real image is created.

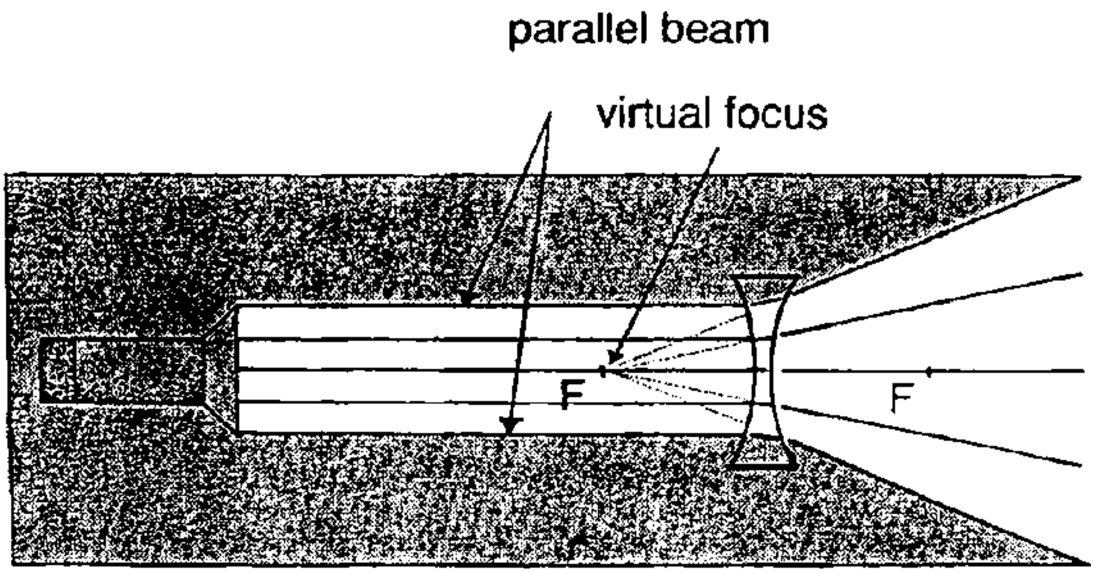
Materials and Apparatus:

concave lens -
(one spectacle-lens for short-sighted people)
flashlight (or maybe a candle)
rack made of wire for the flashlight

Procedure:

The apparatus is set up as shown in the following diagram. The room is darkened and the ray path is made visible by means of cigarrette smoke or chalk dust.





Observation:

Behind the lens, the light of the lamp is diverging in a way that makes them appear to come from a single point in front of the lens.

Analysis:

Lenses which deviate light in such a way that it is spread out or diverges are called concave (or negative) lenses.

If the refracted rays are followed backwards, it seems as if they all come from one point.

This point is called the virtual focus or point of divergence.

Practical Use:

A concave lens is used in glasses for short-sighted people, in cameras, telescopes, etc.

Further thought:

If light traveled at the same speed in different media, would glass lenses still alter the direction of rays?

11.6. VIRTUAL IMAGE OF A CONCAVE LENS

Main Goal:

This experiment demonstrates the virtual image of a concave lens.

Information:

Looking through a diverging lens towards an object, one can see a virtual, upright image. The image is always smaller than the object.

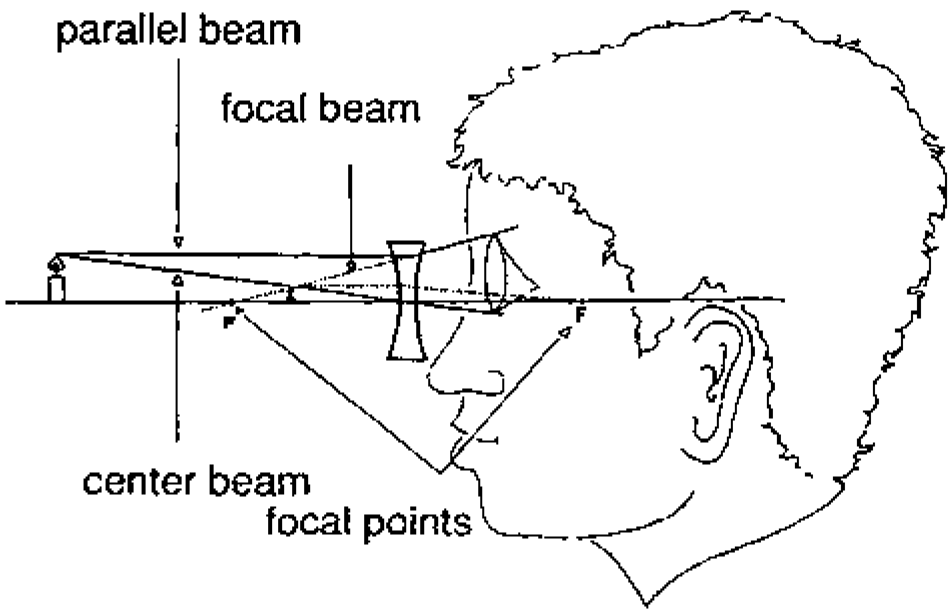
The course of rays followed by the eye is shown in a diagram.

Materials and Apparatus:

candle
concave lens -
(one spectacle-glass for short-sighted people)

Procedure:

The burning candle is placed at some distance from the lens. The candle is observed through the lens.



Observation:

An upright image is observed, smaller than the actual candle.

Analysis:

The image can only be observed with the eye or with a camera. It cannot be projected on a screen. For this reason it is called a "virtual image".

Practical Use:

The concave lens is needed by people who are shortsighted.
The eyeball of the short-sighted eye is lengthened.
The incoming rays focus in front of the retina.
The lens corrects the defect.

Further thought:

There are lenses that are at one side convex and at the other side concave. How do they refract the light?

11.7. PINHOLE CAMERA

Main Goal:

Using a pinhole camera, the origin of optical images is demonstrated.

Information:

A pinhole camera creates upside-down, back-to-front images.

If the object is moved away from the pinhole diaphragm, the size of the image is reduced.

If the object is moved towards the pinhole diaphragm, the image is enlarged.

A small pinhole creates a clearer image but is weaker in light intensity than a bigger pinhole.

The image is created by rays coming from every point of the object. A small number of those rays arrive at the diaphragm opening. These finally focus onto the screen as several light spots. All of these spots together form the image.

Materials and Apparatus:

candle
cardboard box (shoe or cigar box)
translucent paper, waxed paper
pieces of cardboard
pair of scissors
glue

Procedure:

One of the two small side-walls of the cardboard box is replaced by translucent paper. That's the screen where the image appears.

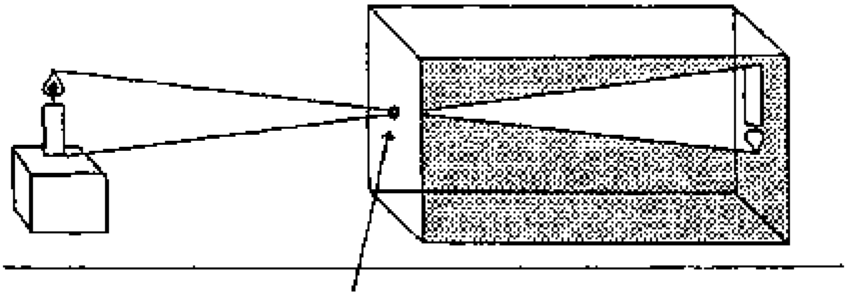
A hole of 4 mm diameter is cut into the other small side-wall.

Two more holes with smaller diameter (2 or 1 mm) are cut into two other pieces of cardboard. The three card-board pieces with holes are called pinhole apertures.

a. A burning candle is placed before the 4 mm aperture side at a distance of about 20 cm.

The room is darkened.

b. The image is observed. Then the 2 mm aperture is put over the 4 mm aperture. Again the image is observed. Finally the 1 mm aperture is used. The candle is moved away from and toward the apertures.



Observation:

a. The image is always turned upside-down.

b. The image becomes smaller as the candle is moved away from the diaphragm opening and bigger as it is moved in the other direction.

c. The image created by a larger aperture is of higher light intensity but more blurred than that created by a smaller opening.

Analysis:

If good optical images are desired, the aperture, light intensity, and distance of the object from the aperture have to be coordinated.

Practical Use:

In a camera a condensing lens is placed in front of the diaphragm (see experiments on condensing lenses). This provides better light exposure. The size of an opening can be changed using a mechanism called iris diaphragm.

The human eye lets light penetrate through the pupil. The pupil becomes smaller or larger depending on the intensity of the light. Upside-down, scaled-down images are produced on the retina.

Further thought:

Our optical perception system delivers upside-down-images, but we ‘see’ things upright. Isn’t that a contradiction?

GLOSSARY

ACCELERATION	: Rate at which velocity changes with time. The change in velocity may be in magnitude (speeding up or slowing down) or in direction or both.
AMINO ACID	: Chemical compounds in which a hydrogen atom in the alkyl group attached to the COOH (carbonyl) group of an organic acid is replaced by an NH_2 group. Their common chemical formula is: R-CH(NH_2)-COOH.
ANODE	: anodos - Greek: the way upwards It is the electrode which is connected to the positive pole of a voltage source. (Gives off positive ions and towards which negative ions move)
ASSIMILATION	: ad - Latin: to similis - Latin: similar Synthesis of organic compounds of indigested and digested nutrient materials, e.g. at the photosynthesis.
ATOM	: atomos - Greek: an atom, invisible The smallest particle of an element, which does not admit a further division on the basis of chemical processes.
BIMETAL	: Two different metals which are closely connected to each other
BOILING	: A rapid state of evaporation which takes place within the liquid well as at the surface.
CAPILLARITY	: The rise of a liquid in a fine hollow tube or in narrow space due to surface tension.
CARBOHYDRATE	: Organic compounds of carbon, hydrogen, and oxygen with the general formula $C_n(H_2O)_m$, e.g. all kinds of sugar, starch, and cellulose.
CATALYZER	: A substance which induces or accelerates a chemical process, however, is not affected by the reaction.
CATHODE	: katodos - Greek: the way downwards It is the electrode which is connected to the negative pole of a voltage source. (Emits electrones and gives off negative ions.)
CELLULOSE	: The chief substance composing the cell walls or woody part of plants, a carbohydrate of unknown molecular structure but having the composition represented by the empirical formula $(C_6H_{10}O_6)_x$. (polysaccharides).
CINETIC ENERGY	: Energy of motion of a body. Is proportional to the mass of the body and to the square of its speed.
CONDENSATION	: Change of state from vapor to liquid.

CONDUCTOR	:	Any material through which electric charges easily flow when subject to an applied voltage.
CONES	:	Cells which perceive light. About 120 millions are found in the retina. They are responsible for the ability to see in the night, as they work at very low light intensities.
CONSERVATION OF ENERGY	:	Experience shows that energy cannot be destroyed. The total amount of energy never changes. But it may be transformed from one form into another one.
CONSTANTAN WIRE	:	A special kind of wire which has the same resistance does not expand when heated. It is an alloy made of 60% copper and 40% nickel.
CONVECTION	:	convehere - Latin: to bring together The transmission of heat or electricity by the mass movement of the heated or electrified particles as in air, gas, or liquid currents.
CONVERGING LENSE	:	A lens that is thicker in the middle than at the edges and refrects parallel rays of light passing through it to a focus.
COTELYDON	:	kotyle - Greek: cup The seed-leaf, primary or first leaf of an embryonic sporophyte. They are part of the plant embryo in the seed. Those of peas and beans serve as food storage organs for the seedling.
CRYSTAL	:	Regular arrangements of atoms, ions or molecules in a pattern as in solid grains, sugar, salt, etc.. The regular arrangements determine the shape of the matter.
DENSITY	:	The mass (amount of matter) per unit of volume (space into which the matter is packed) density = m/v = m/v (g/cm^3 or kg/m^3) The density of solid and liquid matters is dependant on temperature and that of gaseous matters is dependant on temperature and pressure.
DIFFUSION	:	diffundere - Latin: to diffuse The gradual permeation or spreading out, e.g. of a substance through a liquid (ink through water) or of a gas or of ions.
DIVERGING LENSE	:	A lens that is thinner in the middle than at the edges, causing light rays passing through it to diverge.
ELECTROLYSIS	:	lysis - Greek: a loosening, decomposition The decomposition into ions of a chemical compound by the action of an electric current passing through the solution.
EMBRYO	:	embryon - Greek: seedling The rudimentary plant which is usually contained in seeds.

EMIT	:	emittere - Latin: to send out
ENERGY	:	A state of a body or a system of bodies that - among other characteristics - enables the body or the system to do work.
ENZYME	:	zymes - Greek: leaven en - Greek: in Any of various complex organic substances, originating from living cells, and capable of producing by catalytic action certain chemical changes.
EROSION	:	erodere - Latin: to gnaw off The process by which the surface of the earth is worn away by the action of water, glaciers, wind, waves etc..
EVAPORATION	:	Change of state at a surface of a liquid as it passes to vapor.
FERMENTATION	:	fermentare - Latin: to cause to rise The breakdown of complex molecules in organic compounds, caused by the influence of organisms; such as yeast or bacteria or enzymes.
FORCE	:	Any influence that can cause a body to be accelerated.
FREEZING	:	Change of state from the liquid to the solid form.
FRICTION	:	A force that arises to oppose the motion or attempted motion of a body pass another with which it is in contact.
INDICATOR	:	indicare - Latin: to show A substance used to indicate by change in colour the acidity or alkalinity of a solution.
INERTIA	:	The sluggishness or apparent resistance a body offers to changes in its state of motion.
INSULATOR	:	Any material through which charge resist flow when subject to an applied voltage.
ION	:	ionos - Greek: to move Electrically charged atoms or molecules, formed by the loss or gain of one or more electrons.
MAGNET	:	An iron-bearing matter which possesses the property of attracting iron.
MAGNETISM	:	The property or quality or condition of a magnetic field.
MASS	:	Quantity of matter in a body. Becomes manifest due to a body’s inertia and/or due to the property of being attracted by another mass in its environment (heaviness).
MELTING	:	Change of state from the solid to the liquid form.
MIXTURE	:	An aggregate of two or more substances which are not chemically united and exist in no fixed proportion and do not lose their individual characteristics.

MOLECULE	:	The smallest particle of any substance that has all its chemical properties. Atoms combine to form molecules.
MONOSACCHARIDE	:	A carbohydrate not decomposable by hydrolysis; simple sugar such as glucose, fructose, etc..
OSMOSIS	:	osmos - Greek: an impulse, a pushing The tendency of a fluid to pass through a semipermeable membrane into a solution of lower concentration, so as to equalize concentration on both sides of the membrane.
OSMOTIC PRESSURE	:	The pressure caused by osmosis.
PARTICLE	:	Any body that is projected by some force and continues in motion by virtue of its own inertia.
PHLOEM	:	phloios - Greek: inner bark Bast-tissue; the soft bast of vascular bundles, consisting of sieve-tube tissue. Its purpose is to transport proteins and minerals.
PHOTOSYNTHESIS	:	phos - Greek/Latin: light synthesis - Greek: putting together Carbon assimilation, requiring the presence of chloroplasts and light, and consisting in synthesis of carbohydrates from carbon dioxide and water.
PHOTOTROPISM	:	phos - Greek/Latin: light tropein - Greek: to change A bending towards light.
POLYSACCHARIDE	:	polys - Greek: many saccharum - Latin: sugar Any of a group of carbohydrates that decomposes by hydrolysis into more than three molecules of monosaccharides. For instance cellulose, starch, etc..
POWER	:	Time rate of work: $\text{power} = \frac{\text{work}}{\text{time}}$
PRESSURE	:	Ratio of the amount of force per area over which that force is distibuted. $\text{pressure} = \frac{\text{force}}{\text{area}}$
PURE SUBSTANCE	:	It is a substance which cannot be further separated on the basis of physical processes.
RADIANT ENERGY	:	Energy that travels in the form of electromagnetic waves through space without needing a medium. When it meets an absorber it is transformed into thermal energy. On the other hand, the thermal energy of a radiating body is transformed, at the instant of radiation, into voliant energy.

REFLECT	:	reflectare - Latin: to mirror
RODS	:	Cells which perceive light. About 6 milliosn are found in the retina of vertebrate animals. They serve to perceive light and the exact recognition of details.
SPEED	:	Distance traveled per time.
SPROUT	:	Usually the above ground part of a plant with the leaves, the buds, genital organs (e.g. blossoms).
STARCH	:	A polysaccharide which is insoluble in water. It consists of the two components amylose and amylopectin.
SURFACE TENSION	:	Tendency of the surface of a liquid to contract in area and thus behave similar a stretched rubber membrane.
SURFACE TENSION	:	Tendency of the surface of a liquid to contract in area and thus behave similar a stretched rubber membrane.
THERMAL ENERGY	:	Internal energy a body possesses due to the random motion of its molecules. The faster the motion, the higher the thermal energy of the body.
VASCULAR TISSUE	:	Specially modified plant-cells, usually consisting of either tradual or sieve cells, for circulation of sap.
VELOCITY	:	Speed of a body but with specification of its direction of motion.
WORK	:	Product of the force extended and the distance through which the force acts.
XYLEM	:	xylon - Greek: wood Lignified portion of vascular bundle, which is found all over the plant. Its purpose is to transport mineral salts and water sucked up over the roots.

GTZ

Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) GmbH
Dag-Hammarskjöld-Weg 1+2 · D6236 Eschborn 1 · Telefon (0 6196) 79-0 · Telex 407 501-0 gtz d

The government-owned GTZ operates in the field of Technical Cooperation. Some 4,500 German experts are working together with partners from some 100 countries in Africa, Asia and Latin America in projects covering practically every sector of agriculture, forestry, economic development, social services and institutional and physical infrastructure. - The GTZ is commissioned to do this work by the Government of the Federal Republic of Germany and by other national and international organizations.

GTZ activities encompass:

- appraisal, technical planning, control and supervision of technical cooperation projects commissioned by the Government of the Federal Republic of Germany or by other authorities

- advisory services to other agencies implementing development projects

- the recruitment, selection, briefing and assignment of expert personnel and assuring their welfare and technical backstopping during their period of assignment

- provision of materials and equipment for projects, planning work, selection, purchasing and shipment to the developing countries

- management of all financial obligations to the partner country.

Tailor-Made Textbooks

A Practical Guide for the Authors of Textbooks for Primary Schools in Developing Countries

Acknowledgements

I would like to thank everybody who helped me devise and write this guide, and produce the layout.

First of all I must thank Ramiandrasoa Rajhonson, who has helped me throughout, and provided many ideas which have helped to enrich this book in several ways.

My heartfelt thanks go equally to all my colleagues in the German-Malagasy Tef'Boky Project, the authors of the Malagasy reading and writing books *Garabola* and *Tongavola,* quoted time and time again in this guide, in particular Narison Andriamialijaona, Randimby Rafaralahy, Lucie Aimée Raharinorombola and Jules Ranaivoarisoa; without their ideas and comments, and the dogged determination they displayed from 1986 to 1993, this guide would certainly never have been written.

I would also like to thank everybody who went to the trouble of reading the manuscript and making many valuable suggestions, in particular:

Guy Berger, University of Paris VIII

Herbert Bergmann, German Institute for International Pedagogical Research, Frankfurt am Main

Gustave Chené, Consultant to the World Bank's CRESED project in Madagascar

Rémi Clignet, Orstom

Marcel Crahay, University of Liege

Carmelle Denning, International Book Council, London

Sakhevar Diop, World Bank, Washington D.C.

Annick Dumont, Antananarivo

Gisela Frommer, GTZ, Eschborn

Utta von Gleich, Institut für Iberoamerika-Kunde, and the University of Hamburg

Waltraud Heidenreich, GTZ, Eschborn

Ingrid Jung, Ministry of Education, Lima

Claude Rabenoro, Editions Tsipika, Antananarivo

Roland Ramahatra, member of the Economic and Social Recovery Committee, Antananarivo

Aristide Velompanahy, former Minister of Education and member of the High Authority of State in Antananarivo and

Carol Warlop, Swiss Cooperation, Antananarivo.

Many, many more people have given me their support and assistance in one form or another; my warmest thanks go to all of them.

Marie Châtry-Komarek
Antananarivo, April 1993

Introduction

Producing textbooks has proved to be the best way to boost the effectiveness of education at primary level in many developing countries.[1]

Yet, the book situation has deteriorated steadily over the last fifteen years, to the point where today many pupils have no books at all. A recent study covering eight African countries[2] points to the situation in rural schools being the most serious: frequently only one or two copies of a book are available per class. The shortage of textbooks has become so severe that it is currently seen as the major obstacle to progress in primary education in sub-Saharan Africa[3].

Naturally great efforts have been made to remedy the situation. Numerous governments have tried to obtain technical or financial assistance to enable them to provide their pupils with enough textbooks of a suitable quality[4]. But the results have often been disappointing; most education projects implemented to this end have run into difficulties of scale, the most common being

- the almost total absence of any national textbook policy which could be used to identify the main shortcomings in the supply of school books in each country, and which would contain precise recommendations on how to remedy these;

- the major deficiencies in the education system; in particular the upstream and downstream services, i.e. curriculum design and pre- and in-service service teacher training;

- the frequent shortage of national authors with the skills required to devise books that are specifically tailored to the needs and the possibilities of the country;

- a general lack of the national structures and/or the publishing capacity needed to ensure a regular and general supply of books;

- the lack of an overview of the publishing chain: in some cases, there is no serious preliminary needs analysis, while in others the difficulties of distributing materials to rural areas have not been taken into consideration.

The first reasons advanced to explain the current lack of textbooks tend to be social, economic and political in nature. Our attention is drawn to the explosion in enrolment after universal primary education was introduced in the 1960s, to the austerity which forced many governments to cut non-salary costs in the education sector in the 1980s and to the fact that the education budget is considered to be of only secondary importance in many developing countries and by the international aid community[5].

We should add that there are also technical reasons. It is extremely difficult to devise a strategy and the pertinent activities which would guarantee a regular supply of quality textbooks nationwide, and ensure that teachers and pupils put these to the best possible use. The efforts of international and bilateral aid organisations illustrate this difficulty to some extent: some fifteen years ago, attributing the shortages of textbooks to the lack of production capacity, they set up printing houses here and there, which rarely work at full capacity, at least partly because there are so few manuscripts worth printing. Today, these aid agencies appear hesitant to decide between the two main priorities that face them: providing a short-term response to the urgent demand for textbooks by investing in existing human resources, primarily authors, or responding in the medium or long term by establishing a full publishing chain along the lines of the model which has proved its worth in industrialised countries, but which would often mean creating entirely new structures in developing countries.

The nature of available literature on textbooks in developing countries also reveals the complexity of the subject. We find analyses of the status quo, which are always instructive and unanimous in their conclusion that there is an urgent and massive demand for books, particularly in sub-Saharan Africa. We also find interesting proposals as to how to remedy the situation, but these tend to intimidate the reader with their inflated expectations. The people who actually work in the field are conspicuously silent in contrast, despite the wealth of experience they must have in the production of textbooks[6]: there is little material which describes innovative experiences vis à vis textbooks, and even less on the process of designing these books.

This is a regrettable state of affairs. Firstly, teams of authors are too often forced to gain the same experience time after time, repeating the errors of those that have gone before them - reinventing the wheel as it were; analyses alone, however important they may be in order to remedy the textbook problem in developing countries, are not enough. It is imperative that they be supplemented by data collected on the spot, in practical textbook development work.

This publication is first and foremost a testimony which we hope will go some way to help fill the gap. It reflects our experience gained in the course of more than fifteen years working in GTZ[7] education projects devoted to developing textbooks for primary schools. It lifts the curtain on two textbook workshops, the German-Peruvian Bilingual Education Project[8], whose overall goal was to design didactic materials for all subjects and all classes at primary level for native Quechua and Aymara speakers (1977-1990) and the German-Malagasy Tef'Boky Project, which trained authors and devised textbooks in the national language for primary schools (1986-1994).

It should be noted that this book is not a case study. The specific experiences mentioned are used primarily to illustrate explanations which might otherwise be overly abstract. It is primarily a general interest publication for all those responsible for supplying high-quality textbooks to primary schools in developing countries. And above all it is a guide for authors of these books, all of whom should be able to find valuable information here, although it should be of most use to “apprentice authors” and those who have not had the benefit of an in-depth training in publishing. The points picked up in this book are those that in our experience constitute the commonest stumbling blocks. The contents can be broken down into two rough categories.

General Information

The first two chapters are dedicated to general information. Chapter 1 looks at work relating to the production of textbooks in industrialised countries and at recommendations for developing countries, to enable authors to identify the nature of the textbook production system within which they operate, and the duties which will fall to them.

Chapter 2 looks at the skills and attitudes required by authors, and at the tools which will allow them to preserve group dynamics while enhancing the quality of the individual contributions.

This is background knowledge which we consider indispensable for all those involved in the development of textbooks. We should point out that the information contained in these chapters cannot be harnessed directly by authors in their day-to-day work, unlike the other chapters which do give detailed instructions that can be put into practice immediately.

Detailed, Step-by-Step Description of How to Produce a Textbook

The rest of the guide covers the work involved in writing textbooks in developing countries, from the preliminary research to the preparation of a pilot version, ready to be printed.

What is unique about the approach taken here is that activities are described in chronological order. It is a sort of guide which takes authors through the process step by step, from forming a working group to submitting the final manuscript to the printer. In this we differ from other publications which look at this topic and then go on to analyse the various aspects of books, without aiming to follow every detail of the work of the authors[9].

The topics tackled in the following chapters are numerous and sometimes complex. They should be relevant for the production of textbooks for primary level regardless of the subject or language in question, but authors of materials designed to teach reading and writing - particularly those working in a national language - will find information which specifically addresses them.

We would like to emphasise that, in spite of the number of points tackled, this work cannot be considered exhaustive, firstly because it is based on specific experience, which automatically makes it subjective and incomplete, secondly because it looks primarily at authors in developing countries and attempts to meet their particular needs[10], and finally because the development of a textbook involves numerous different disciplines which cannot be dealt with extensively within the scope of any one publication. This work cannot thus be anything other than incomplete, and certain aspects have even been voluntarily omitted: we do not go into any details which refer too specifically to any one discipline, such as textbooks for a second language or foreign language, nor do we look at things which cannot under any circumstances be the duty of the authors, or those which cannot be considered a priority in the current crisis facing numerous developing countries. The voluntary omissions include

- 4-colour printing
- Planning and managing projects for the mass production of textbooks
- Distribution strategies
- Teacher training to enable teachers to put a new textbook to the best possible use.

It will probably not always be easy to read this guide. Some authors will be somewhat discouraged by the scope and complexity of the work described, others will begin to worry about the feasibility of the undertaking, while still others will be irritated by the inevitable gaps. We would like to encourage those feeling discouraged, doubtful or dissatisfied, and point out that this guide was written, edited and published in a developing country, using precisely the inputs generally at the disposal of textbook projects in developing countries[11]. It can thus be considered a real life demonstration that the work described between these covers is indeed feasible. In terms of the outer appearance, this book cannot claim to compete with the remarkable publications on the same topic which have been published in industrialised countries. The contents, on the other hand, ought to be better adapted to the target group, even if they sometimes appear somewhat unorthodox to specialists from industrialised countries: the work described here is both necessary and sufficient to allow authors who do not yet have much experience to produce high-quality textbooks for and in developing countries.

This book cannot take the place of either practical experience or a long-term training course. We hope, nevertheless that the approach presented here, and the examples given will be instructive and useful. We equally hope that this testimony stimulates those working in the field, and encourages them to publish their own experience, which would be an invaluable contribution to the search for ways to overcome the current shortage of textbooks in developing countries.

Using this Guide

We entitled this book “A Practical Guide” because we intended it to be a genuine tool to assist textbook authors. To ensure that it is used as such, here are a few pointers which should help you find your way around the book and locate the information you need with ease.

Chapter Topics

The basic structure of every chapter is identical, i.e.

- A summary which puts the work in context and underlines the essentials

- A description of the work involved in this particular phase, as precise as possible and in chronological order as far as possible

• Illustration of the main body of the text, generally in the form of boxes referring to experience gained in producing reading and writing books in Malagasy within the framework of the German-Malagasy Tef'Boky Project already mentioned. For reasons of clarity we have decided to concentrate on *Garabola,* the first book to be produced in this series, which we will present in more detail below.

• Notes at the end of the chapter

• Some suggestions for further reading which can be followed up by anyone interested in going into the subject in more depth

• A systematic resume of the ground covered in the chapter.

Text Markers

Apart from the first two chapters, you should read every chapter bearing in mind the order in which work should be performed; a number of text markers will help you find your place, i.e.

• The chapter title at the top of each left-hand page serves as a rough guideline.

• A running head at the top of each right-hand page gives you your bearings more exactly.

• A telegram-style summary of the most important points can be found in bold at various points in the text.

• An index at the back of the book allows you to look up individual points, check information or rapidly find precisely the information you need.

How to Get the Most out of this Book

This guide can be said to pursue a two-fold goal: the first two chapters aim to give textbook authors the basic information they need to start work, i.e. to train them all be it in a very rudimentary fashion; the second part is designed as a guide for textbook production.

As a result of this dual goal - training and production - the guide comprises different sorts of texts. Firstly it presents general information which the reader should assimilate if possible. Secondly it gives detailed advice similar to a user's manual, which is far too compact to be memorised.

This explains why it is not advisable to try and read the book from cover to cover at one sitting. Neither, however should you merely dip into it from time to time. We recommend using the book as follows to ensure you get the most out of reading it:

• Read the first two chapters carefully, more than once if necessary, as an introduction to the problems of textbook production and to the layout of this guide.

• Read through chapters 3 to 7 rapidly. This is crucial to enable you to find the detailed information you need later.

• Consult the book throughout the process of producing a textbook as and when required to check information, or read in more detail about a specific point. You can only consult the book properly if you can put the specific information into the overall context.

These different approaches will help the reader extract a maximum of information from the book, and will help enhance the quality of the textbooks he or she is responsible for producing - and that is our aim.

Reference Material

In this book we will make frequent reference to the didactic materials produced by the German-Malagasy Tef'Boky Education Project; particular importance is attached to the *Garabola* set of materials designed to teach reading and writing in Malagasy.

For reasons of clarity, we will outline the main features of the pilot version and the revised version below.

Garabola, pilot version

Published in 1988

Authors:

- Narison Andriamialijaona
- Randimby Rafaralahy
- Stefanoela Rakotodrainy
- Jules Ranaivoarisoa

The set

- 3,000 copies of 1 reading book, printed in two colours, 80 pages, 240 x 170 mm, saddle stitched with two staples

- 3,000 copies of 1 writing book, printed in black, 240 x 170 mm, saddle stitched with two staples

- 100 copies of the teachers' guide, photocopied, 196 pages, 297 x 210 mm, spiral binding.

The reading book contains

- Three lessons on the vowels, **o**, **i** and **a**

- 18 lessons on the 16 consonants and the vowels **e** and **y**; every four lessons two pages to read to consolidate what has been learned

- 16 pages of supplementary reading.

The book was printed in two colours to make it of a comparable standard to a book for learning French as a foreign language which had just been published in 4-colour, and which was being distributed nationwide at the time.

The writing book contains

- 10 pages of preparations

- 3 pages of writing for each of the 21 letters of the alphabet, following the same order as the reading book

- 2 pages of revision, corresponding to the consolidation reading

- 3 times 2 pages of evaluation, which correspond to the Christmas, Easter and summer examinations.

The teachers' guide contains

- 20 pages of general information on the subject “Malagasy” and the material

- A 12-page first part, which corresponds to the work of the first two weeks of the school year for the pupils in this class

• A 160-page second part, containing a real script for all elocution, reading and writing classes scheduled for the year

• One glossary of the principal technical terms used in the guide.

Garabola, revised version

Published in 1991

Authors:

• Narison Andriamialijaona
• Marie Châtry-Komarek
• Randimby Rafaralahy
• Jules Ranaivoarisoa

The set

• 450,000 copies of 1 reading and writing book, printed in black, 96 pages, 240 x 170 mm, saddle stitched with two staples

• 17,000 copies of the teachers' guide, printed, 212 pages, 297 x 210 mm, spiral binding.

As regards the essential pupils' materials, the main difference between the pilot version and the revised version of *Garabola* is that the separate writing book was dispensed with.

The final version of the book is thus intended as a tool for both reading and writing.

With the exception of the first three lessons, which focus on learning the vowels, the presentation of all chapters is identical:

• 2 pages for reading
• 2 pages for writing.

Although the basic layout of the revised teachers' guide is the same as the pilot version, i.e. detailed instructions for each of the speaking and listening, reading and writing lessons scheduled for the year, fundamental changes were made as regards visual presentation.

Notes

[1] Cf. Heyneman, S.P. et al *Textbooks and achievement. What we know.* Washington D.C.: World Bank, 1978.

[2] Cf. Buchan A. et al *Etudes sur le secteur du livre en Afrique,* p. 17. Washington D.C.: World Bank, 1991.

[3] Cf. World Bank *Education in Sub-Saharan Africa,* p. 42. Washington D.C., 1988.

[4] Between 1965 and 1983, for instance the World Bank helped finance 48 projects which tackled the preparation, supply and distribution of textbooks; the proportion of textbook projects, which accounted for 6% of all education projects in 1974, had risen to 43% of the total by 1983. Cf. Searle B. The provision of textbooks by the World Bank. In: Farrell, J.P. and Heyneman, S.P. *Textbooks in the Developing World,* p. 17. Washington D.C.: World Bank, 1989.

[5] In 1989 only 23% of international aid went to the social sector, and only 7% of the aid pledged to the education sector went to primary education. Cf. United nations Development Programme. *Human Development Report,* p. 8. New York, 1991.

This percentage is all the more surprising since the importance of primary education and textbooks is recognised. The need to invest in author training and in the production of textbooks specially tailored to the needs and abilities of those concerned should long have been accepted as a self-evident fact and been elevated to a priority of international aid.

[6] In 1985 86 languages were recorded as being used in instruction in African primary schools. Cf. UNESCO. *Les langues communautaires africaines et leur utilisation dans l'enseignement et l'alphabétisation.* Dakar, 1985. In spite of the absence of any systematic documentation of the teaching materials produced in each of these languages it is safe to assume that a not inconsiderable number have been produced over the last twenty years.

[7] Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ) GmbH (German Technical Cooperation).

[8] The experience gained in this project as regards the production of reading and writing books in Quechua has been presented in a Spanish publication. Cf. Châtry-Komarek M. *Libros de lectura para niños de lengua vernácula.* Eschborn: GTZ, 1987.

[9] At this point we should mention Richaudeau F. *Conception et production des manuels scolaires.* Paris: UNESCO, 1979 which we will refer to at several points in the course of this guide.

Although his method is not the same as ours, we would recommend this publication to all teams of authors of school materials in developing countries as one of the best works of reference currently available.

[10] It would be unthinkable in a book aimed at a European or North American audience not to dedicate a significant amount of space to colour printing, but we consider this too expensive for most developing countries, and thus of only secondary interest.

[11] We refer to the first French version published in Madagascar in 1993.

Getting Down to Basics

Who decides to produce a new textbook? What steps must we take to produce it systematically? Who is responsible for preliminary research? Who produces the concept? How much time is needed from the finalisation of the concept until the finished book is distributed to schools? Who interfaces with the graphic artist? And with the printer?

These are a few of the questions facing first-time authors, and are probably the questions most likely to cause headaches for those of you who have already produced several books without having been specifically trained on the job. You may feel that you are unable to pinpoint the weaknesses of your own products, and thus improve them. To answer these questions, we will start by looking briefly at the various steps involved in producing a textbook, before going on to look at the respective responsibilities of the agencies and individuals involved in industrialised countries and in developing countries.

Why should we look at the various production systems, you may ask. Not to pronounce a value judgement, but to give you a framework of reference. Firstly we will look at the procedure adopted by major publishing houses to produce works that are competitive in terms of quality and price, and only then will we go on to identify the special nature of the production process in developing countries, and thus to deduce your responsibilities as authors.

This chapter, which contains general information and ideas, differs from the subsequent chapters which give precise descriptions of the steps involved in producing a textbook. We suggest nevertheless that you read it carefully since this will allow you to situate the various individual steps described later in the book within the context of the overall process.

> **Try to become familiar with the various steps in the publishing chain, since this will allow you to identify the special features of the production system within which you operate, and to pinpoint your own role within that system**
>
> **A private publishing house accompanies its “baby” every step of the way, until it is in the hands of the user**

1. A Textbook is Born

We term the collection of operations leading from the idea to the production and distribution of a book - in the case in hand from the textbook publication project to the pupil - the “publishing chain”.

While it is true to a degree that the steps in the publishing chain are always identical (every book is planned, designed, produced and distributed in that order), as we will see below the procedure adopted does vary, and the differences are important.

The Chain at Commercial Publishers

In industrialised countries, textbooks are generally produced by private publishing houses, which are guided by the profit motive; the various steps making up this commercial production style are systematically organised. Since it is important for you to have a thorough understanding of the work involved, we will firstly explain this work, then illustrate it and finally summarise what you have learned.

Preliminary Research

A market analysis is always conducted before work starts on a textbook. The publisher only decides to produce a book once he is certain that there is a demand for the product, i.e. once he has identified a shortage of textbooks in schools for a particular subject or when changes to a curriculum mean that new books will be required.

The Concept

Having decided to go ahead and produce a textbook, the publisher moves on to the conceptual phase. He firstly defines his pedagogical, technical and financial criteria, and then decides on the sequence in which the content matter will be presented and on the physical and design features of the book (including the format, number of pages, number of illustrations and their format, and the layout of the text and illustrations on the page).

At the end of this phase the publisher will generally have produced a preliminary plan or “design” of the future book, which serves as a guide for authors and illustrators, and can be used to draw up an initial quotation.

Producing Texts and Illustrations

Authors and illustrators now enter the scene: the authors write their texts and devise exercises on the basis of findings identified during the conceptual phase; their work is subjected to various internal controls within the publishing house and sometimes to spot checks in one or more schools. The illustrators produce the graphics in line with the instructions they receive from the publisher and the authors. In general a final quotation can be drawn up at this stage.

Preparations for Printing

All the elements to be printed must be prepared: the manuscript has to be typeset, i.e. composed into pages suitable for printing; illustrations must be prepared in a photoengraving workshop. Composition and photoengraving work is done on films for offset printing.

The text and illustrations are then arranged on each page: the design drawn up during the conceptual phase is finalised and a model or “layout” produced, which is used as a sort of template for the future textbook.

Following the instructions given in the layout, the films produced for the text and illustrations are arranged for every page, and the pages are “mounted”, i.e. all the pages that are to be printed at the same time are stuck onto a transparent background.

This montage produces the forme which can then be used to print the book.

Printing and Finishing

The textbook is now ready to be printed. Large-format sheets are placed in the printing press. Several pages of the future textbook will be printed at once, as they have been mounted.

The sheets must then be put into the final form, which involves five steps: firstly they are folded in line with the number of pages printed per sheet and the type of folding planned, then they are put together to form the inside of the book; the book is then stitched, stapled or stuck together. All that then remains is to add the cover and trim the three open sides to give a neat finish - a new textbook is born.

Storage and Marketing

The textbook is stored at a distribution centre. A promotion campaign is run to present it to those responsible for purchasing textbooks, primarily school teachers and head teachers. A distribution network then ensures that the textbook can be supplied to book shops or directly to the schools.

Follow-Up

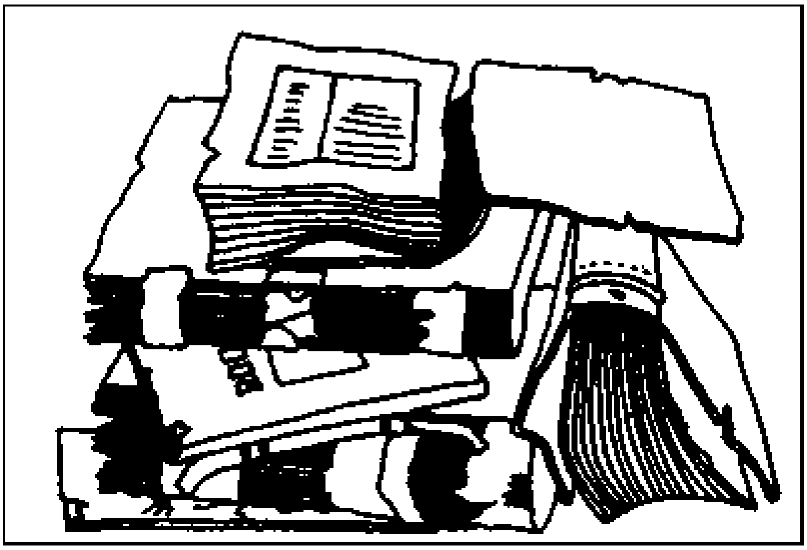
In the field, the publishing house monitors the performance of “its” book, with a

view to possible reprints

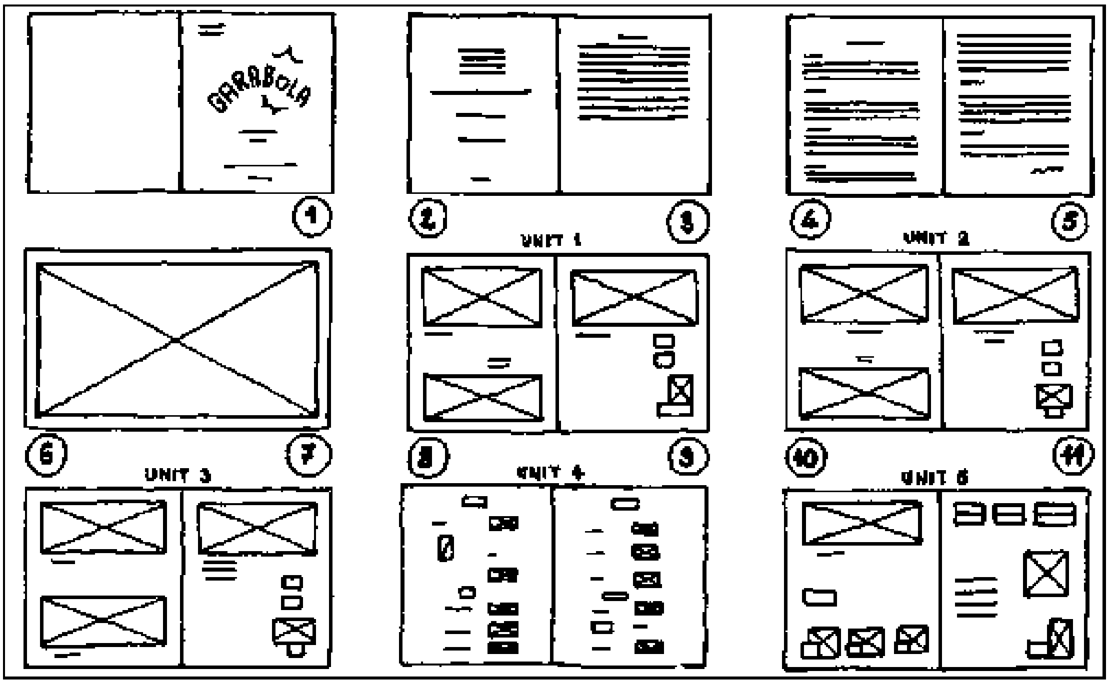
The use of the textbook is more or less strictly monitored; the publisher thus gathers data which would be important for any reprints.

If you do not yet have much experience in this field, this initial description of the production process has probably confused you a little. You probably did not realise that so much went into producing a textbook.

The technical terms, specially those from the world of printing, are bound to be new to you, and you will have no clear idea about what certain operations really involve. But we have refrained from going into detail about the individual technical operations, and we have not even mentioned every essential step in the production of a textbook.



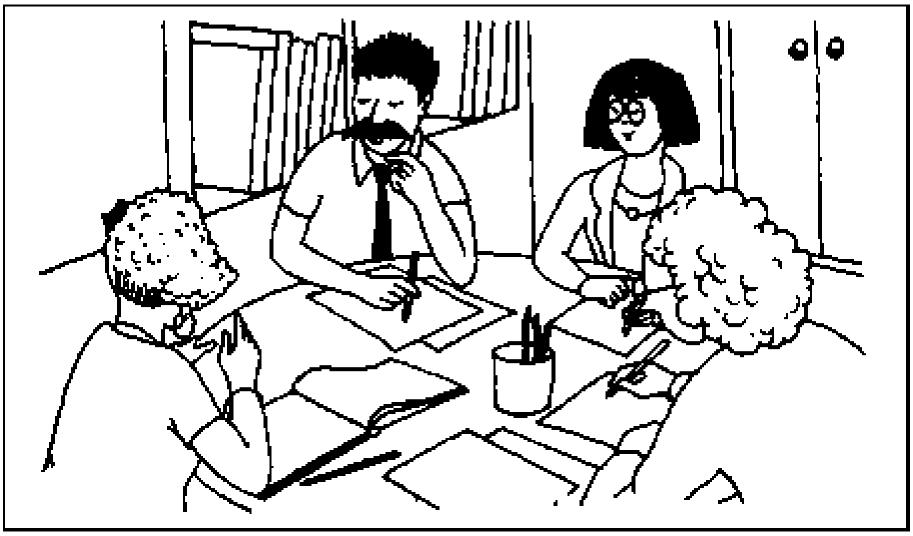
1. Preliminary Research: The most common reasons for publishers to produce new textbooks are that the old ones are tattered and worn, have become unusable or have become obsolete as a result of major changes in the official curricula.



2. The Concept: Once the contents and the form of the textbook have been defined a design

can be drawn up. Thereafter the approximate visual arrangement of the texts and illustrations can be undertaken, double page by double page; this draft is known as the layout plan. The illustration below shows the first few pages of Garabola at this stage.

There are three reasons for this: firstly, if you are interested in discovering more about certain production techniques you will have no difficulty in satisfying your curiosity; at the end of each chapter we list a number of publications which deal with these points and illustrate them well; secondly, you should focus your attention primarily on those parts of the process which directly concern you as authors - the analysis of the subject matter, for instance - rather than getting bogged down with technical details; finally this brief presentation will be taken up again and dealt with in more detail in chronological order in later chapters, which will give you additional information and broaden the scope of this first brief introduction.

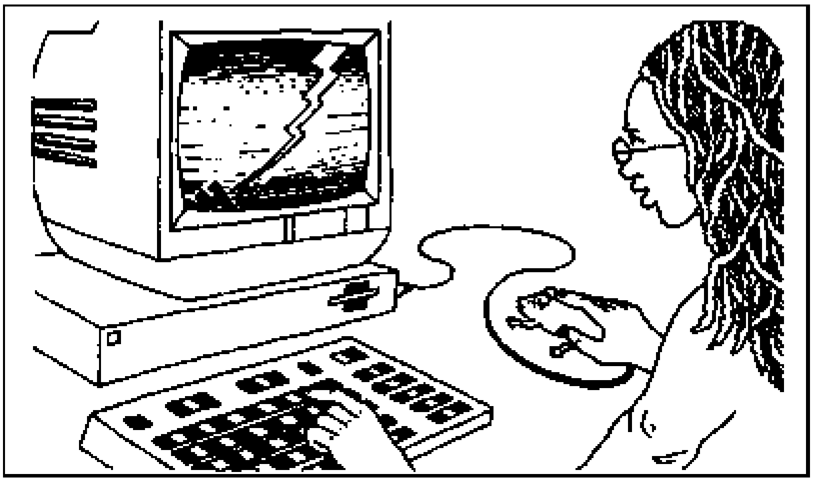


3. Producing Texts and Illustrations: The authors devise texts and exercises, while the illustrators produce the graphics, both working on the basis of the layout plan.

What should be grasped at this stage is the principal stages that make up the publishing chain on one hand, and the basic principles of certain tasks involved in producing a textbook on the other. To allow you to better assimilate this information, we have summarised the essential points, and illustrated some of them.

As authors you should become familiar with the various links in the publishing chain

4. Preparations for Printing: You should be able to distinguish the various phases of work.

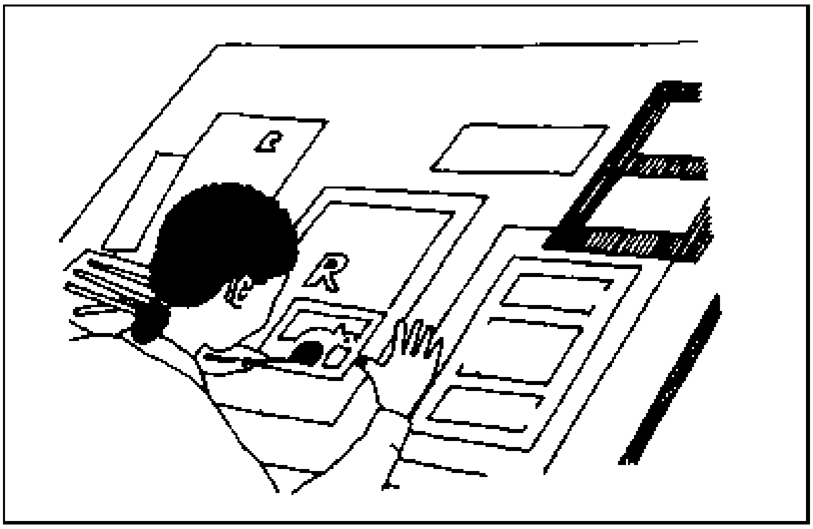


• The texts and exercises are typeset using a computer, the characters in the resultant copy are the correct shape and size.

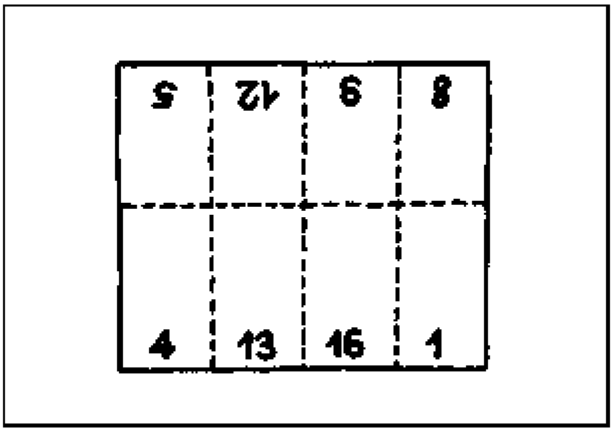
• The layout artist then makes a precise dummy make-up on paper, arranging texts and illustrations.

These explanations and the illustrations above will have helped you to familiarise yourself with the various steps that make up the chain, as practised by large publishing houses.

Given the fact that it is imperative for you to start to memorise the sequence of work involved, we will, however, come back to the production phases for a textbook one more time, summarising the main phases within the publishing chain and the results of each phase. Before you proceed to the next section, we would thus recommend that you look at Table 1.



• On the basis of this, the films made for the texts and illustrations for each page are mounted.

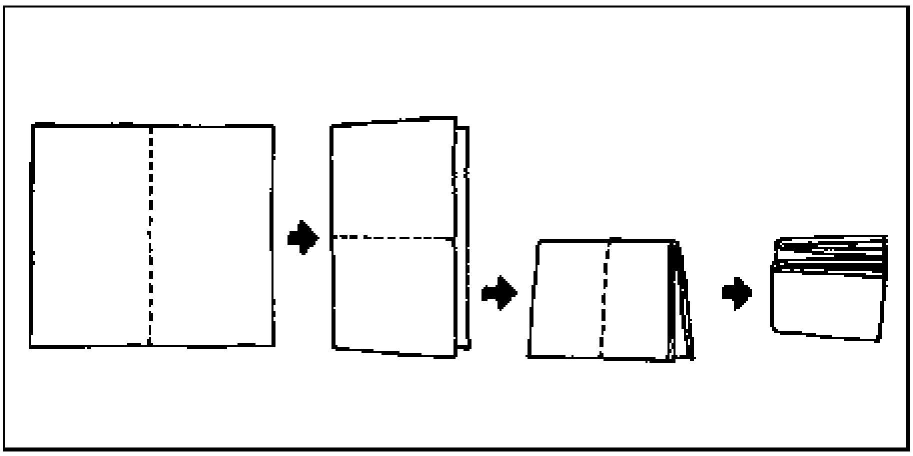


• Finally, the imposition is checked to ensure that the pages are arranged so that they will read consecutively when the printed sheet is folded. If eight pages are to be printed together, for instance, the layout would be as shown below.

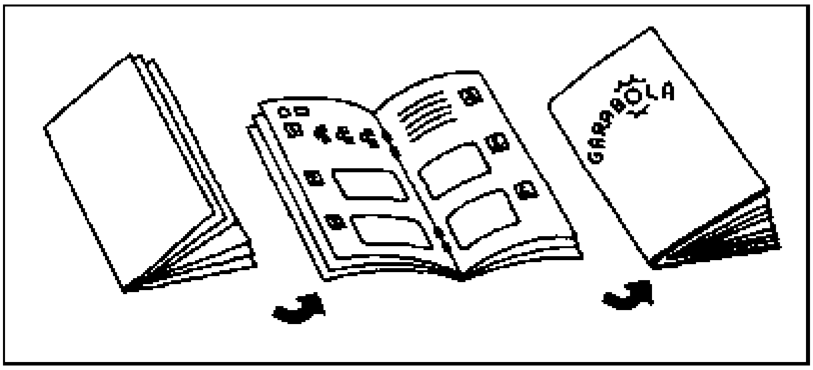
Production Cycle in Developing Countries

After this introduction to the steps involved in the commercial production of textbooks, let us now turn our attention to the procedure that should be adopted in developing countries.

5. Printing and Finishing Once again you must distinguish between various phases.



• Firstly the new textbook is printed on large sheets of paper which are folded several times to make what we call “signatures”, so that the pages are in the correct order.



• Then the book is finished: the signatures are put together to form the inside of the book; they are sewn, stuck or stapled together, and finally the cover is added.

At first glance, the publishing chain is similar, since in both cases the preliminary research always precedes the concept, after which comes the writing, illustrating and production of the textbook. But, while industrialised countries have a long history of textbook production, as well as the resources to guarantee the quality of their work, the situation is very different in developing countries, where often even the most essential data is unavailable, as are expertise and resources. It is not unusual for there to be no official figures for the school-age population or the teacher to pupil ratio, and frequently it is not known what timetable the schools follow. This is why the production of high-quality textbooks, already an extremely complicated undertaking in industrialised countries, is all the more complex in developing countries.

1. Main Stages in the Publishing Chain and Results	
Stages	**Results**
1. Preliminary analysis	Market study
2. The concept	
Pedagogical considerations	Plan and organisation of contents
Physical considerations	Definition of format, number of pages, dummy
Graphic considerations	Decision on type of illustration and printing, layout
Financial considerations	Provisional quotation
3. Producing texts and illustrations	
Texts	Manuscript
Illustrations	Graphics dossier (photos, drawings)
4. Preparations for printing	
Typesetting the text	Galley proofs
Processing illustrations	Films
Paging on paper	Imposition scheme
Make-up and imposition	Film
Report	Blueprint
5. Printing and Finishing	
Printing	Printed sheets
Folding	Printed signatures
Assembly	Inside of book (unbound)
Binding	Inside of book (bound)
Attaching the cover	Book with irregular edges
Trimming	Finished product

We will look again at the steps in the publishing chain we identified above, and see where the procedure adopted in developing countries differs from the above scheme. Let us also point out that we will not go into the process of translating or adapting textbooks, however justified this may be under certain circumstances. What we describe here is how to produce an original textbook, what to do when one cannot adapt or translate existing books[1].

The publishing chain cannot be merely mechanically transferred to developing countries

The first unique feature of textbook production in developing countries: the feasibility study must look not only at the demand for textbooks, but also at the conditions under which they can be written and illustrated, manufactured and distributed

Preparations for an Education Project

Study of demand, available resources and conditions under which the books can be produced (1 year).

In industrialised countries, it is enough to identify a demand for a textbook, since the production and distribution techniques and facilities already exist. In developing countries on the other hand the production of a textbook depends on education policy, textbook policy, financial considerations, technical considerations such as the supply of paper and printing capacity, human resources, distribution and storage capacities, etc.[2] To ignore any one of these considerations may sometimes suffice to jeopardise the entire textbook project.

A period of several years may elapse before the textbook project can be launched, for, even with the support of an international or bilateral organisation, projects of this nature generally involve recruiting staff, finding premises and procuring the necessary materials.

Preliminary Research

Analysis of the context within which the textbook is to be used (6 months-1 year).

Let us once again compare the situation in industrialised and developing countries. In the former case the publisher is already fairly familiar with the target group, since he usually specialises in one subject and one specific level. In developing countries, however, the publisher often knows little about the target group, and the reference material available tends to be fairly unreliable and inadequate. It is thus crucial to conduct field studies to collect detailed data on teaching and learning conditions.

The second unique feature: preliminary research must look at teaching and learning conditions

Pilot Textbook

Devising, writing, illustrating, paging, printing and finishing the textbook (1 year).

The description and sequence of the tasks that make up this phase of the production work do not differ significantly from those undertaken in industrialised countries, even if textbook projects often lack the resources that a commercial publisher would have.

The result, however, is different in that it cannot be considered a final product. It can only be a pilot textbook.

Testing and Evaluation

Distribution of the textbook to selected schools and presentation to teachers at these schools, testing and evaluation (1 year).

In industrialised countries, given the degree of uniformity that exists from one school to another it is often enough to test one or two units of the new textbook at a few schools before moving on to produce a final version. In developing countries, given the lack of basic data, and given above all the great heterogeneity of teaching and learning conditions often found, the textbook must be tested in its entirety at a representative sample of schools for a minimum of one academic year before it is evaluated.

Producing a Revised Version

Revision of the pilot textbook, official check, printing the revised version (1-2 years).

The results of the evaluation phase allow us to revise the book before printing a large run. The length of this phase can vary; it depends first and foremost on the scope of changes felt to be necessary and the willingness of the authors to modify a product with which they still identify closely; it will also depend on the authority and provisions of the official body responsible for approving the final version, and on the various factors involved in printing a large run of textbooks (size of the run, terms of financing, country where the books are to be printed, etc.).

Nationwide Introduction

Devising and realising a distribution strategy for all schools concerned, in-service training and monitoring for teachers (2-4 years)

Let us once again compare the situation in industrialised countries with that in developing countries; in the former the new textbook is brought to the pupils without any major difficulty via book shops or schools, whereas in developing countries it is difficult to reach rural schools and rare to find an effective distribution network. Also, in industrialised countries teachers are in a position to use the new book without additional training, while in developing countries the new textbook must be systematically presented to ensure that it is put to the best possible use.

In developing countries the universal introduction phase thus demands skills, huge technical and financial resources and a great deal of time. However many schools must be served, and however many teachers must be trained, these two activities are always large-scale projects in their own right.

To sum up, then, the following tasks are needed in addition to the links of the commercial publishing chain to ensure that the textbooks produced in developing countries are suitably adapted to local needs:

- Preliminary feasibility study

- Field studies of the teaching and learning conditions

- Testing the new book at a representative sample of schools for a minimum of one academic year, and then evaluating the results

- Systematic revision of the pilot version of the textbook

- Development of a national distribution strategy

- Presentation of the new book to the teachers who will have to use it.

Textbook Projects

You will have realised by now that the systematic production of textbooks in developing countries would overtax any single department or unit. How, you may ask, can didactic material be devised and produced taking into account all the relevant aspects of the system? Who has the human, technical and financial resources to undertake a task of this scope?

Some developing countries can meet their textbook requirements using their own skills and funds - but these are the exceptions. More often projects, generally funded by international or bilateral technical or financial cooperation, are charged with the systematic production of textbooks.

We think that it is instructive for those of you who are still relative newcomers to the field of textbook production to realise that projects of this sort can generally manage to perform the work described above. By way of example we will describe below the main phases of production for the very first textbook devised, developed and produced within the scope of one such education project, the Tef'Boky Project[3].

2. A Textbook Emerges Step by Step
At the end of 1986 an education project, the Tef'Boky Project, was launched in Madagascar. It aimed to train a group of authors and to develop textbooks in the national language for primary school pupils. To pursue the two-fold goal of training and production, the group of authors responsible for the subjects Malagasy and mathematics produced the materials step-by-step in a way which may be considered fairly exemplary. This table shows the chronology of *Garabola,* the first reading and writing book to be produced in Malagasy.
1. Feasibility Study
In 1984 a study committee noted a general shortage of textbooks in Malagasy for primary school pupils. The committee recommended that authors be trained to fill this gap.
2. Preliminary Research
In 1986 the Tef'Boky Project was launched; in October, the authors responsible for Malagasy started work. They prepared and undertook preliminary research in the field, and at the end of 1987 presented the results in a document which served both as the principal frame of reference for the materials to be developed and as a report for the education authorities.
3. Producing a Version for Testing
In 1988 this working group devised and develop a set of learning materials for reading and writing Malagasy. 3,000 copies of *Garabola* were printed ready for the start of the academic year 1988-89.
4. Testing and Evaluation
The didactic material was tested for one academic year at forty schools and the level of attainment tested at the end of the year; the results were presented officially to the ministry.
5. Producing the Revised Version
In 1990, the material was revised on the basis of the results of the evaluation phase and was selected for nationwide use: thanks to a World Bank loan 450,000 copies of the new textbook and 17,000 copies of the teachers' guide were printed; slates introduced to replace exercise books were also financed.
6. Universal Introduction
The structure set up with the help of the World Bank[4] is currently in charge; it is responsible for working out the nationwide distribution plan. *Garabola* should be used throughout the country as from the academic year 1993-94. Some ten years have thus elapsed since the feasibility study.

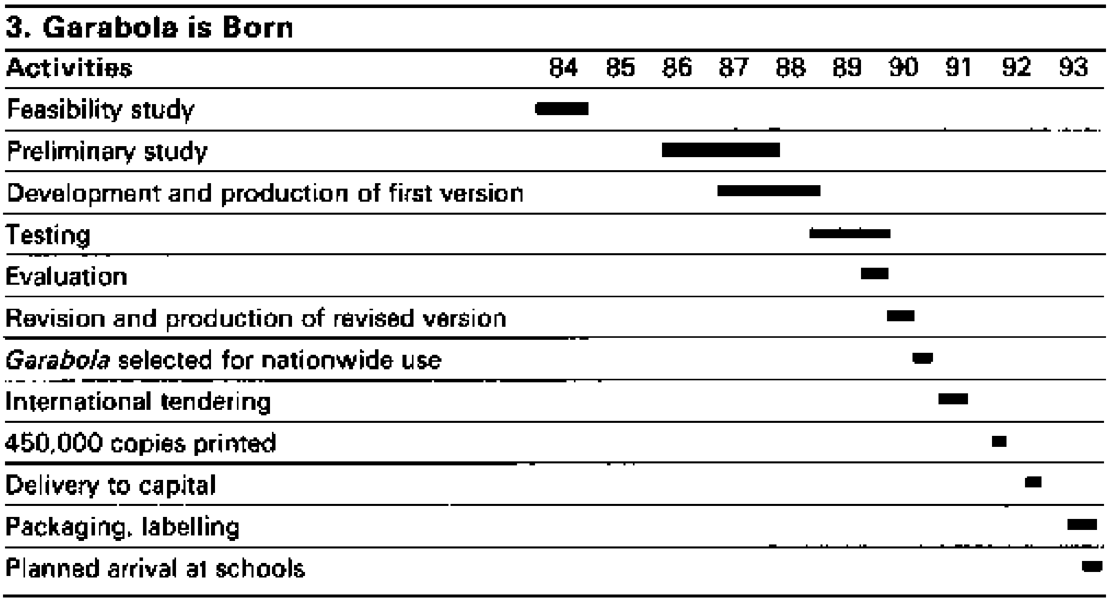
Writing and Production

Test your book systematically and evaluate the results before printing a large run
Plan the entire series of textbooks from the outset

If you do not yet have experience in the field of textbook production, you may think that, once the appropriate funds have been approved, the revised version of a textbook can be rapidly distributed to all schools in a country. Nothing could be further from the truth, however. If you look carefully at Table 2, you will see that no less than three years elapsed before the textbook was finally distributed (in 1993), although the finished version was completed and the funds available in 1990.

It is important to know that the authors can only influence the rate of progress on the work for which they are directly responsible. Where your textbook is to be printed in large numbers you have no control over the printing or the distribution; your “product” slips completely out of your hands and there will be delays and break-down which you will almost inevitably feel are out of all proportion given the long, complex development work, particularly if you attacked your part of the work with great gusto.

Table 3 gives you an idea of the imbalances that can occur between the development phase and the production phase. This table follows the progress of *Garabola,* indicating a few crucial times in the printing and distribution of the 450,000 books.



Textbook projects should always incorporate author training

Producing a Series of Textbooks

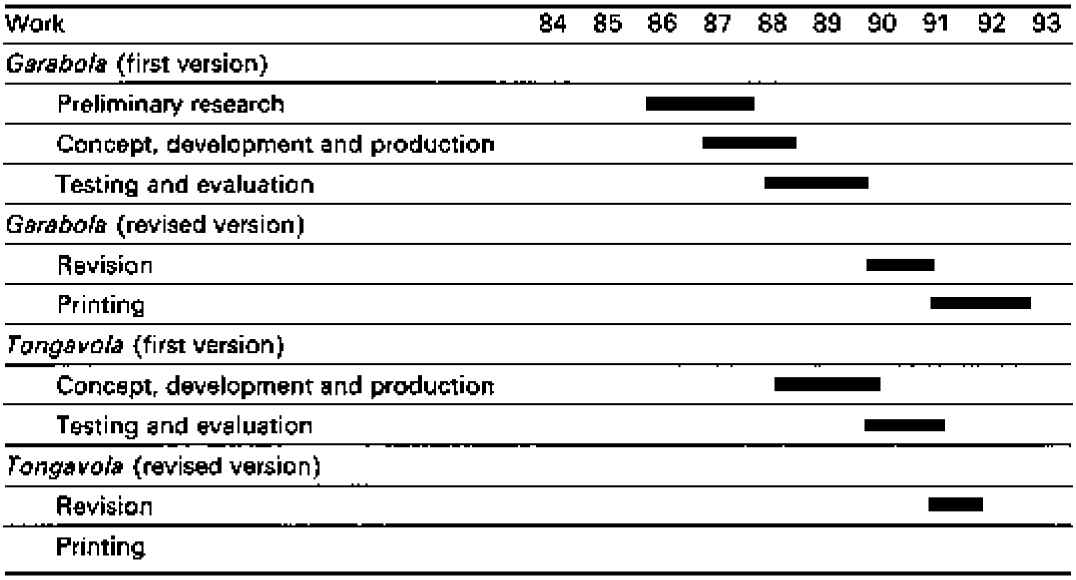
As you have just read, the process of providing a large number of systematically produced textbooks can be long and difficult, but it is possible with the requisite technical and financial back-up.

Nevertheless you will also have noted that, even given a favourable framework, i.e. once the technical and financial problems have been solved, the production of a first textbook takes years - no less than ten in fact[5]! How can we possibly produce two books then within a reasonable time-scale and without any drop in quality? And an entire series?

Throughout the industrialised world, the production of textbooks follows a rigid scheme, spanning several years; in developing countries no other procedure should ever be adopted. Yet the planning is always most difficult in this part of the world, where the publishing chain is longer and more complex. When we aim to produce a series, we must coordinate the activities needed for several different textbooks at once; to put it more clearly, while the first textbook is being tested and revised, plans must be made for the development of the second, such that the books in the series are printed without “losing” any academic years, and without missing the start of the academic year.

To illustrate this, Table 4 shows the actual time schedule used in the Tef'Boky Project to produce the pilot and revised versions of the first two reading and writing books produced in Malagasy, *Garabola* and *Tongavola*[6].

4. Time-Frame for Work on Garabola and Tongavola



2. Those Responsible

The duties described and illustrated above should have given you a basic understanding of how textbooks are produced.

This information is undoubtedly of capital importance to you, but it is still far from being adequate to allow you to start work, far less to plan your work. Indeed until you are aware of the many actors involved in the chain and their respective tasks, you will find it difficult to define your own. You should also note in this context that it is just as important for a new author to acquire an understanding of the technical side of production as to analyse and fully understand the production system within which he finds himself.

Bearing this in mind, we now propose to look at the duties of the various units and entities which are involved in producing textbooks.

Once again, we will firstly turn our attention to the system generally adopted in industrialised countries, to allow us to better gauge the special features of those used in developing countries.

> **As authors you can only define your own task once you are familiar with those of all the other actors involved in the publishing chain**
>
> **In the commercial publishing chain we find three entities each with its own well-defined role**

Private Contractors in Industrialised Countries

In spite of certain differences it is true to say that there is only one real textbook production system in industrialised countries.

As a general rule, three entities are involved in the commercial publishing chain - the Ministry of Education[7], a publishing house and a printer, the latter two always being private enterprises. The duties of each of the three have been clearly established for some time.

Each of these three can, naturally, sub-contract certain operations to another enterprise. It is, for instance, common practice for ministries to contract a research institute to modify curricula or to evaluate didactic materials; the publishing house may contract educational consultants to define the contents of the new textbook; and finally the printer does not as a rule perform every stage of the production work himself, and may well farm out the stitching or binding work.

In Table 5 we have only indicated which of the three entities is responsible for each task, regardless of whether they perform the work themselves or delegate it.

You will see that "evaluation", so important in developing countries, is not even mentioned in the table. There are two main reasons for this.

- Firstly a rigorous external control is often conducted before a new textbook is granted the official authorisation, compulsory in some countries, where the publisher must have every book produced approved by the Ministry of Education. This procedure ensures that the products submitted by the publisher for approval are of a high quality.

- Secondly, where no official approval is required the publisher bases his decision on whether or not to order a reprint firstly on commercial considerations (sales figures), while head teachers, members of textbook examination committees and teachers play a not insignificant part in that they select the books, and thus help ensure certain quality.

5. Principal Duties of Those Responsible for the Textbook

Entity	Duty
Ministry	
	Defines national education policy
	Develops or adapts curricula
	Officially approves textbooks[8]
	Evaluates levels of attainment
Publishing House	
	Decides whether or not to publish a textbook
	Defines the pedagogical considerations
	Identifies the physical and graphical form of the book
	Has a quotation drawn up
	Selects and contracts authors
	Selects and contracts illustrators/photographers
	Supervises and controls editorial work
	Organises the reviewing of texts
	Supervises and controls illustration work
	Designs the layout
	Performs / checks the typesetting
	Ensures that galley proofs are proofread
	Performs / checks photoengraving work
	Defines provisional layout in more detail
	Prepares the dummy make-up
	Prepares the file to submit to the ministry for the imprimatur
	Decides how to print and finish the book
	Selects a printer
	Has a final quotation drawn up for printing and finishing
	Selects and orders the desired paper from the printer
	Submits the job to the printer for printing
	Checks mounting work and gives the printer the go-ahead
	Pays for printing and finishing
	Is in charge of marketing the finished product
	Prepares and ensures the monitoring of the book in the field
Printer	
	Draws up the quotation for printing and finishing work
	Mounts text and illustrations
	Prepares the type forme
	Procures paper and other inputs
	Prints, finishes and delivers the textbook to the publisher as instructed

In either case it is the private publishing house that is really in charge of the production of textbooks: as you will see from the Table 5, it decides whether or not to produce a book and has complete control over production, monitoring and management. It monitors the textbook right up to the reception it is given by pupils and observes the use of the book to make any preparations for reprinting as early as possible.

Production Systems in Developing Countries

In developing countries we find several production systems which differ to a greater or lesser degree from the model described above. The most commonly found types are described below.

National Commercial Production

This system has many similarities with that found in industrialised countries: the ministry stipulates the content matter and may define textbook requirements; then private publishers publish and market these. There is generally no preliminary testing, neither are the textbooks presented to teachers. Thus, as in industrialised countries, it is the market which decides when several different textbooks are available for the same target group.

This system can be found in varying degrees in countries which have managed to establish private publishing capacities, such as Kenya and Nigeria.

State-Run Production

The ministry is in sole charge of textbook production, defining the subject matter to be covered by the education system, identifying textbook requirements and meeting these requirements. Often the ministry entrusts the writing and publishing work to civil servants, while the production and distribution is delegated to parastatals.

In this system too, it is rare for the textbooks to be tested and systematically presented to teachers; they tend to be placed at the disposal of teachers or imposed from above. The textbooks produced in this way are generally cheap, but very often the quality is poor, especially in terms of the graphics (illustrations and layout).

This system has been used in Tanzania, Madagascar and other African states.

National and/or Foreign Commercial Production

The ministry turns to other countries to provide the textbooks it needs to attain pre-determined objectives. There are two possible scenarios: either the publishers contacted produce the textbooks with national support; the manuscript is often produced by a team of local civil servants while the layout, illustrations and printing are executed outside the country; or the publisher simply imports its own textbooks and markets these. These are almost always attractive books, but they are also expensive, and the contents, particularly the graphics, are not always very well adapted to the country in question.

The large English and French publishers can thus be found to a greater or lesser degree in many African countries.

Several systems may co-exist: we may find private national production of text-books in European languages alongside state production of national-language books, where the financial rewards are not attractive enough for private publishers.

Each of these systems has its own shortcomings, but some specialists recommend moving towards the first of these; they claim that competition must be honed and the private sector encouraged to take part in the textbook sector, wherever possible[9]. It is true that the production of textbooks demands creativity, profitability and functionality which a civil service can rarely provide, but at the same time commercially produced textbooks, whether they are produced in the country or abroad, primarily address the well-off urban classes, with purchasing power and easily accessible without a complicated distribution network; poor pupils who represent the majority of the target group, or those living in rural areas which may be very isolated, are thus *de facto* discounted.

Let us for the moment just note that although authors naturally cannot modify the system within which they operate, it is imperative for them to understand the features of that system. This will allow them to understand the respective tasks of the entities involved in textbook production, and thus to define their own role.

3. Publishing Specialists

Let us sum up what we have learned so far: we have analysed the technical steps involved in producing textbooks and the various production systems currently in use. Nevertheless, before they can identify their own role, authors must be familiar with the actors involved in the publishing chain. They must know who is responsible and who performs which work, who plans, directs and controls each stage and who performs the hands-on work.

So, let us then look at the role of publishing specialists, again making a distinction between common practice in large commercial publishing houses and in developing countries.

> **A very few developing countries use the private sector to meet their national needs. Most of them rely on state or parastatal structures, or call on foreign assistance**
>
> **The quality of textbooks in industrialised countries is first and foremost a reflection of the way publishing houses are organised**

Organisation of a Commercial Publishing House

As you have seen it is the publisher who directs the writing and production of textbooks in industrialised countries. To meet his many-fold responsibilities, he needs managers who are responsible for various aspects of the process and technicians to perform the work required. Let us look in more detail at these two groups and their respective duties.

Managers

The publisher firstly surrounds himself with a team of managers, the main duties of whom are listed in Table 6.

6. Main Duties of Managers within a Publishing House	
Manager	**Duties**
Publishing Manager	
	Identifies textbook production project
	Defines contents and how they are to be arranged
	Selects authors and contracts them
	Supervises and reviews authors' contributions
	Analyses the way the book is used in schools
Art Director	
	Decides on the graphics for the textbook
	Selects illustrators and photographers
	Supervises and reviews the illustrators' and photographers' contributions
	Designs and manages the layout
	Selects typographic characteristics
Production Manager	
	Defines physical features of the textbook
	Estimates the production costs
	Plans and monitors production
	Obtains quotations from production companies
	Monitors typesetting and photoengraving work
	Monitors printing and finishing work
Commercial Manager	
	Performs market analysis
	Calculates approximate price of finished book
	Runs promotion campaigns
	Organises storage, distribution, marketing

Book Technicians

When a publisher first decides to publish a book it is not only these four people who swing into action; to perform the necessary work, they mobilise a veritable army of specialists, both within and outside the publishing house.

One does not always find the same technicians in every publishing house of course, but in general it is fair to say that the four managers whose tasks we have just described delegate some of their work to specialists; the form this collaboration takes is illustrated in Table 7.

7. Main Duties of Technicians within a Publishing House	
Technicians	**Duties**
Working with the Publishing Manager	
Educational consultants	Help specify pedagogical features of textbook
Authors	Write and take stock of manuscript; run preliminary tests; read proofs
Proof readers	Correct manuscript; read proofs
Publisher's secretary	Prepares manuscript
Working with the Art Director	
Authors	Help with the graphic concept
Illustrators / photographers	Help design graphics, produce illustrations and check the quality of photoengraving
Documentation expert	Researches the necessary illustrated documents
Layout artist	Visualises the design, finalises layout; produces make-up
Graphic artist	Decides on typographic characteristics of text
Working with the Production Manager	
Publisher's secretary	Prepares elements to be printed, texts and illustrations
	Monitors ongoing activities (quotations, planning, contacts with type-setter, photoengraver and printer)
Working with the Commercial Manager	
Promotion Manager	Designs and realises the promotion and marketing campaign for the textbook
Sales Manager	Ensures that the textbook is available to readers
Distribution Manager	Ships textbooks to points of sale

Publishing Specialists in Developing Countries

Let us now look at the situation in developing countries. The first difference is in the number of actors involved; generally textbook production teams are very much smaller in developing countries. Yet, if we leave aside the few countries with well developed private-sector publishing capacities, the main difference between the two systems is the absence of the publisher or the failure to appreciate the importance of his role, and the inevitable redistribution of the duties that would otherwise be assumed by the publisher among the other actors involved, in particular the authors and the printer: the former often do a great deal more than devising the concept and writing textbooks and the latter, whose role should be limited to the actual printing, is frequently forced to take on some of the publisher's duties too.

In some countries, it is fair to say that there is no national publishing capacity, in either the state or the private sector. In others private publishers address only that part of the population that constitutes a potentially interesting market, even if this is a tiny minority of the population: this was true in Peru, for instance, where, at the start of the 1980s private publishing houses were geared only to Spanish-language publications, and were not interested in local languages. In still other countries the role of the publisher is not understood or is not known: often the ministry is not properly informed about the role of the publisher, while authors do not readily accept him, seeing him as one more irritating control between them and the printer, which only swings into action once the manuscript is finished.

The lack of understanding of the publishing chain, the wariness of the authors vis à vis the publishing unit, the lack of technical know-how of insufficiently trained publishing managers and the difficulties of coordinating the work of different departments can thus lead to an astonishing redistribution of responsibility: as we will see, the authors, and even the printer frequently see themselves forced to take on responsibility for considerably more than their traditional tasks.

Redefining the Traditional Role of Publishing Specialists

In those countries where textbook production is in the hands of a public-sector publishing house or a publishing unit within the Ministry of Education, the roles and responsibilities of the various actors are not always clearly defined.

There are two common scenarios. In the first case the officials, often with no well-founded publishing skills, approach the printer directly with only a manuscript, i.e. a text rather than an imposition scheme including the final layout and illustrations - and expect him not only to print the textbook, but also to take on responsibility for publishing, or to contract this work out. The traditional publishing chain is thus reversed, since the publisher, rather than supervising work from the start, is only consulted at the end, if at all.

In the second scenario the officials entrust the authors with the overall responsibility; without realising the enormity of their demands, they expect the authors to produce a product which can be handed to the printer, and printed immediately. The authors have no choice but to assume some or all of the work of the publisher, without necessarily being up to the task.

To allow you to pinpoint the duties of the publisher, the author and the printer in industrialised countries and those characteristic of the production system within which you operate we have summed them up in visual form in Table 8. The illustration indicates how the traditional roles can be modified and the repercussions this has on the work of the various actors.

Rough Orientation of Textbook Projects

It is interesting to see how donors who have specialised in textbook production react to a situation of this sort, or to put it more succinctly, how they organise their large-scale textbook projects. Their current efforts seem to pursue two objectives on different time-scales.

8. Main Duties of Principal Actors in the Publishing Chain	
In industrialised countries textbook authors are at hands-on level. Their duties are limited and well defined; they have no contact with the printer.	Where there is a publishing unit its duties are sometimes ill defined or little understood; in this set up the publisher, authors and printer may be in contact with one another without any clear definition of their respective duties.	In some developing countries which have no publishing capacity, the authors must assume some publishing responsibility and as such have direct contact to the printer, with whom they share responsibility for publishing.	
In developing countries the traditional roles of the publisher, the authors and the printer are re-allocated

It is just as urgent to set up a publishing unit as to train authors

Those who give precedence to a short-term strategy, aim firstly to respond to urgent needs, in some cases the total absence of textbooks in schools. To this end they focus first on the authors who they train in basic publishing techniques, wherever there is no publishing capacity in the country in question, to allow them to produce didactic materials against the odds. They generally manage, and the quality of the materials produced is acceptable, if not always excellent. We should, however, specify that when the projects come to an end, having trained authors and given the country the textbooks it needs, the authors cannot continue their work within a strong publishing structure and the know-how generally vanishes rapidly. When new textbooks are needed, generally about five years down the line, the whole process starts from scratch.

By contrast, those who accord priority to a medium- or long-term solution attempt to establish a sound publishing system, and there can be no doubt that this is what we ought to aim for; they focus on providing training for technicians and the various other book-related occupations, rather than on producing textbooks immediately. This formula too has its risks, of course, the two main ones being staff changes, with the result that individuals are given several years of training as technicians and then leave before they have ever worked productively, and the lack of competent authors on whom trained publishers can rely. In other words there is a risk of producing well trained publishers - who then have nothing to publish.

We would like to stress that, in view of the sheer scale of the demand for textbooks on the one hand, and the general lack of publishing skills on the other, these apparently divergent efforts should always be considered as complementary approaches, and pursued energetically without delay in many developing countries.

Responsibilities of Authors in Developing Countries

Your responsibilities as authors will depend on the production system within which you work

Some of you may think that the previous section is more relevant for decision-makers at national level and international donors than for authors, in view of the fact that it is difficult if not impossible for the latter to modify the textbook production system. But you will not be able to define your own duties until you have a firm grasp of the stages involved in producing a textbook - and this is the *sine qua non* for you to commence and indeed one day finish your work.

The tasks of textbook authors in developing countries are not always identical in every country. In some cases you will be working within a structure which allows you to concentrate on writing a manuscript on the basis of a pre-defined concept; in others you will have to perform certain publishing work in addition to this, perhaps even all the publishing work. In other words your tasks will always be defined in terms of the publishing support at hand: the less efficient the publishing unit, the more you will have to do, to the point that in some cases you could justifiably be termed “publisher-authors”[10].

Let us take stock at this point. Try to call to mind the various stages involved in the production of a textbook, and the entities and specialists needed to perform the relevant work. Then identify the support that you can expect in your work. In this way you can define what the officials implicitly expect of you most of the time, gauge the scope and complexity of the work, accept it and, in the ideal situation, optimise it.

Supervision and Training

But how, you will ask, can we as authors or future authors of textbooks measure up to responsibilities of this magnitude? How can we become the “publisher-authors” that the country needs, when we are at best “apprentice authors”? If, as is generally the case, you are former teachers, pedagogical advisers or even school inspectors you will only be able to meet your commitments if you have technical supervision, or if you have had pertinent training.

We feel that several years of on-the-job experience, plus technical supervision, perhaps in conjunction with internships together make for the best training.

This was, in any case, our experience during the first few years of the Tef'Boky Project. To mitigate the shortages of textbooks the authors in the project learned their craft on the job, producing textbooks with the assistance of specialists; they were then able to systematise their knowledge with the help of short training courses in Madagascar and overseas[11].

4. In Conclusion

Beyond the Textbook

Whatever the system within which they operate, i.e. whatever the tasks expected of them, groups of authors in developing countries always play a crucial part in ensuring a supply of high-quality textbooks, as we have seen in this chapter. But, however heavy this workload alone, their responsibility is rarely limited to producing textbooks; in fact it is generally the authors who must prepare the way so that their product is well received by teachers and parents.

Information and awareness measures must always be handled by a ministerial department specialised in this field, which will mean that it has the equipment it required. When the textbooks reflect curricular changes, for instance if a national language has replaced a European language as the language of instruction, these activities go well beyond the scope of a small group of authors who already have more work than they can handle. Nevertheless they are often left with the responsibility. The authors then find themselves faced with the choice of concentrating all their energy on writing and not preparing people for the launch of the new material, thus running the risk that the finished product will be rejected by insufficiently well informed users, or of adding one more string to their bow and running the risk of producing mediocre and superficial books[12].

Before you start work on the textbook we thus suggest that you analyse the school situation and gauge the textbook's chances of being accepted without further action; this will enable you to make provision, if necessary, for information and awareness measures, without which your heavy workload as authors may be pointless.

Make preparations for the launch of your textbook from the very start of the project

Notes

[1] See Seguin R. *L'élaboration des manuels scolaires,* p. 15-19. Paris: UNESCO, 1989 for information on the translation and adaptation of textbooks. It should be noted that textbooks for the primary level can rarely be translated, especially reading books in the national language; the rest of this guide should explain why.

[2] Cf. Read A. *A guide to textbook project design and preparation.* Washington D.C.: World Bank, 1986 for information on the preparation of textbook projects.

[3] “Tetik'asa famolavolana boky malagasy ho an'ny sekoly” (Tef'Boky) can be roughly translated as the “Malagasy Textbook Workshop”.

[4] The Unité d'Etude et de Recherche Pédagogique (UERP) (Pedagogical Research and Study Unit) within the Ministry of Education.

[5] “A minimum of six years is required to write a manuscript, print, publish and distribute the finished book, and it is reasonable to plan an overall period of some ten years, given the time required for preliminary studies, planning, recruitment and, in many cases, training”. In: Seguin R., op. cit. p. 6.

[6] The date of printing a large run of *Tongavola* is not indicated; it was delayed for several years again for reasons which are neither technical - the final version has been ready to print since 1991 - nor financial - the funds required have been pledged - in nature. This situation is unfortunately by no means exceptional. Even when technical and financial preconditions are met, there is no guarantee that the work will be published, far less than this will happen within the planned time-scale.

[7] We should specify that the Ministry of Education is not always responsible for the tasks described hereafter; in very decentralised systems, these may be delegated to a body at

regional level, or to research institutes. To simplify the issue though, we will not take these cases into account here.

[8] The situation varies from one country to another. In Germany, for instance, publishers complain that they have to submit their textbooks to the relevant ministry for approval at regular intervals, in some cases every two years (In: Institut für Bildungsmedien. *Die kleine Schulbuchschule.* Frankfurt am Main, 1989). In France on the other hand "there are no official textbooks any more than there are textbooks that are recommended or approved by the Ministry of Education" (A. Savary. In: Huot H. *Dans la jungle des manuels scolaires,* p. 145. Paris: Seuil, 1989).

[9] Buchan A. et al *Etudes sur le secteur du livre en Afrique,* op. cit. p. 13.

[10] As we noted at several points during the Tef'Boky Project this lack of transparency often worries authors, who find it difficult to pinpoint their own part within the system as a result of their poorly defined publishing responsibilities.

[11] A separate publication, scheduled to be printed in 1995, deals with the experience gained in the Tef'Boky Project regarding training authors in developing countries who are responsible for producing textbooks for the primary level.

[12] The Tef'Boky Project managed to undertake some information and awareness measures (producing posters, calendars, supplementary reading materials and even a film), but this increased the workload of the authors, although they were only indirectly involved, such that they were pushed to the absolute limit.

To Sum Up

In industrialised countries textbooks constitute an important market. Private-sector publishers write, produce and market them. The laws of the market force them to act professionally; the textbooks are produced by highly-qualified specialists who stick exactly to the various steps in the publishing chain. As a result the purchaser can choose any one of a number of textbooks which are comparable in terms of quality and price.

In developing countries, the demand for textbooks is enormous, but textbook publishers are rarely able to produce enough books of a suitable quality as rapidly as needed. The central problem appears to be that we have not yet managed to adapt the publishing chain, which has proved so valuable in industrialised countries, to an environment which either fails to appreciate the importance of this chain, or lacks the human, financial and technical resources to put it properly into practice.

This guide addresses novice authors, who have been instructed to produce textbooks that are adapted to the teaching and learning conditions in their own country, at relatively short notice. We aim to strengthen their skills as authors, by giving them a basic understanding of the publishing process. The first chapter introduced the steps involved in systematic textbook production, to allow them to identify, by contrast, the steps needed to produce textbooks that are specially tailored to the needs and resources of their own country. We then looked at the organisation of large publishing houses and the responsibility of the professionals involved in textbook production, to help them pinpoint their own place within the system, and thus allow them to develop and react accordingly.

We believe that this is vital prior knowledge for all teams expected to produce textbooks in developing countries, if they are to bring their work to a successful conclusion.

The Authors

Once the feasibility study has been performed, work can start on producing the textbook; the first stage involves examining the context within which the book is to be used.

This field work marks the start of the work which, in most instances, will fall to you. You thus enter the scene and can expect to be there for a long time before the curtain falls. Given the length and importance of the work awaiting you, we feel that it is crucial to look at how you can best prepare yourself intellectually and in terms of materials, before going on to describe this work.

Please note that we will not be describing in detail the infrastructure you will need to do your work properly. Some of you will find a four-wheel-drive vehicle vital to undertake your preliminary research work, and later for the testing and evaluation of your material; it will be important for all of you to have a room where you can meet and access to a computer.

But, while recognising the importance of this infrastructure, we will not dwell on it, partly because the working conditions vary enormously from one team to another and your scope to influence your own working conditions is limited, and partly because the infrastructure alone is never responsible for the quality or mediocrity of a textbook[1]. What is decisive is the profile of the authors and their working methods, two factors to which this short chapter is dedicated.

Another general information chapter with no immediate application, some of you will think, impatient to find the “recipes”. If this applies to you, try and force yourself to read this chapter nevertheless; as you will have realised after reading the first chapter, the responsibility that you will have to assume demands special preparations.

1. Profile

Whether they write for primary or secondary level, textbook authors are not given specialised training, but those writing for primary level appear to be the least well prepared: they often have only the skills they have acquired on the job, in front of a class[2].

Yet, as you will have realised after reading the first chapter, all authors have a great responsibility which ought to preclude any amateurism. Those whose duties go beyond writing and touch on publishing work in particular should never improvise. They must be professionals, well prepared for the unique nature of their work and fully aware of the skills and behaviour they will need to adopt if they are to perform their work satisfactorily.

Before looking at the preliminary research phase then, let us examine the profile of the textbook author, which will allow you to identify the skills and attitudes so essential in your situation.

Basic Know-How

The essential know-how for all textbook authors regardless of the level and the subject they write for, and the system within which they operate are as follows:

- Well-founded knowledge of their subject; this may be mathematics, science, linguistics or any other subject;

- Skills in adapting didactic material to suit the profile of future users;

- The ability to write texts addressing both children and adults on a pre-defined topic within the space allocated;

• The ability to devise good exercises; exercises where the subject matter corresponds to both the attainment targets and to the demands of the layout;

• A basic understanding of the publishing chain; in particular as regards the essentials and possibilities open to various agents involved in the course of textbook production.

Indispensable Attitudes and Behaviour

Where there are recognised publishing facilities the above know-how will generally suffice to ensure that a textbook is produced: it will allow authors to prepare a manuscript of good enough quality to be published by the relevant unit, then printed and finished.

For authors without the back-up of a good publishing team, on the other hand, this know-how alone may well not be enough to allow them to meet all their commitments; if they are to take on the numerous and complex duties they will then be expected to perform, they will also have to acquire certain attitudes and behaviour, the most important of which are described below.

Know-how and attitudes are more important for an author than a highly developed infrastructure

Step One - Learn to work in a group

Ability to Work in a Group

It has become indispensable for everybody to learn to work in a group, since the trend is for more and more books to be written by a team of authors rather than by an individual.

But when the publishing unit is weak, and the authors bear most of the responsibility for the textbook, genuine team work is vital given the sheer scope of the work to be performed - and it is not easy to organise: agreement on even hotly contested points must be hammered out by the team, among equals as it were, without having recourse to a higher-level arbiter in the person of the publisher.

If you find yourself in this situation, where the responsibility of the publishing unit is limited to word processing, you must learn to create an atmosphere of tolerance and openness which will allow all team members to optimise their inputs. To this end, you will have to learn to formulate criticism or at least reservations, to argue a point, to listen to observations of others and take them into account, and finally to identify fully with the common decision.

Otherwise your work runs the risk of being slowed down or even paralysed well before the book ever goes to press.

Multi-Sectoral Attitude

Decisions regarding didactic material always demand a cross-sectoral approach, whether they concern the publishing side or the domain of the authors.

If, for instance you wish to define the sort of materials needed to learn to write, you should look not only at the pedagogical and didactic factors (What is the best aid for learning to write? What is the best one for teaching writing? Exercise book or slate?), but also at the financial considerations (How much does an individual exercise book cost? And a slate? How many parents will be willing to pay this amount?), the logistics (Will it be possible to supply the schools with exercise books in time every year?), the working conditions (Are classrooms suitably furnished to allow pupils to write in exercise books? Would a slate which is rigid and can thus be used by pupils working without tables or desks, not be more practical?), the production considerations (Can slates be produced on the spot?), etc.

The less effective the publishing unit, the more you will have to take into account factors other than the purely pedagogical and didactic. If you were to refuse to look beyond the confines of your own subject-specific knowledge you would be failing in your duties, and you would run the risk of either paralysing production or producing didactic materials that are poorly adapted to the actual environment in which they are to be used.

You should thus be prepared to look beyond your subject and become familiar with new fields, to look at a subject from several different aspects and compare these before taking an appropriate decision. You do not have to learn everything and know everything, but you should be attentive and well informed enough to react in time, and you should know who to turn to when you need assistance.

Step Two - Look beyond the narrow confines of your subject and examine the environment within which the book is to be used

Openness to Innovation

The ability and willingness to innovate will be every bit as important for you as the skills laid out above.

If you intend to produce textbooks that are in line with the demands and the resources of the country you will often have to go your own way: you will not find many valuable discussion partners in large publishing houses which have different options and face their own problems; equally it will be difficult to find contacts in developing countries, where it is rare to find individuals who have sought out new paths and devised original solutions to specific problems. Indeed, authors of textbooks in developing countries tend to base their work more or less openly on foreign models[3].

You must thus be open to new ideas: you should devise specially tailored answers to specific problems rather than looking for tried and tested recipes. You will have to fight against preconceived ideas, make your own hypotheses, and verify, check and analyse these. In fact you will have to become a researcher more than anything else. Otherwise what you produce will not be adapted to the needs of your country; it will be but a pale copy of existing materials.

Be open to new ideas and look for appropriate solutions as a group

Accepting the Constraints

Finally, you will have to know how to accept major constraints and make the most of the leeway you have.

The single most important constraint will be the financial one; as textbook authors you must always distinguish between what is desirable and what is feasible for your country, and must decide on the didactic material without losing sight of the financial implications for those concerned.

If necessary, you must thus accept that your book be printed in two colours, or even in monochrome; or you must refuse to write a textbook if the country cannot finance it, concentrating instead on a teachers' guide, if this helps achieve pre-defined goals. There is no place in a group of authors in a developing country for anyone who refuses to accept constraints, or who imposes unreasonable financial burdens on others in the name of artistic freedom[4].

If we have dwelt on the attitudes and behaviour demanded of textbook authors in developing countries it is because the importance of these factors is almost always underestimated, not only by education authorities, but also by those concerned. It is felt that a good teacher will automatically be a good author, for instance, ignoring the fact that the skills demanded of a teacher are quite different to those demanded of a writer or a publisher. We are astonished when otherwise brilliant specialists produce mediocre textbooks, poorly adapted to the target group, and when authors prove unable to properly identify the root cause of this mediocrity, which would allow them to remedy it.

These considerations aim to help you gear your work from the very start to the production system within which you operate. Do not let them discourage you, use them, even if they only help you to analyse the tensions which will inevitably arise in your group, and to remedy these more easily.

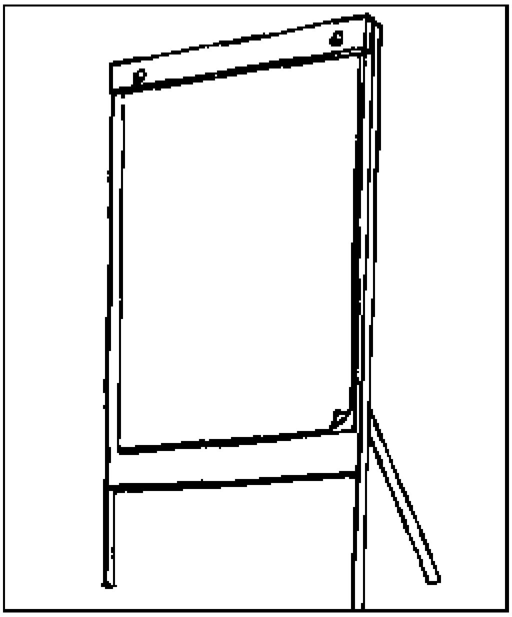
2. Tools of the Trade

The skills and knowledge described above are not always in themselves enough to allow authors to perform their work satisfactorily.

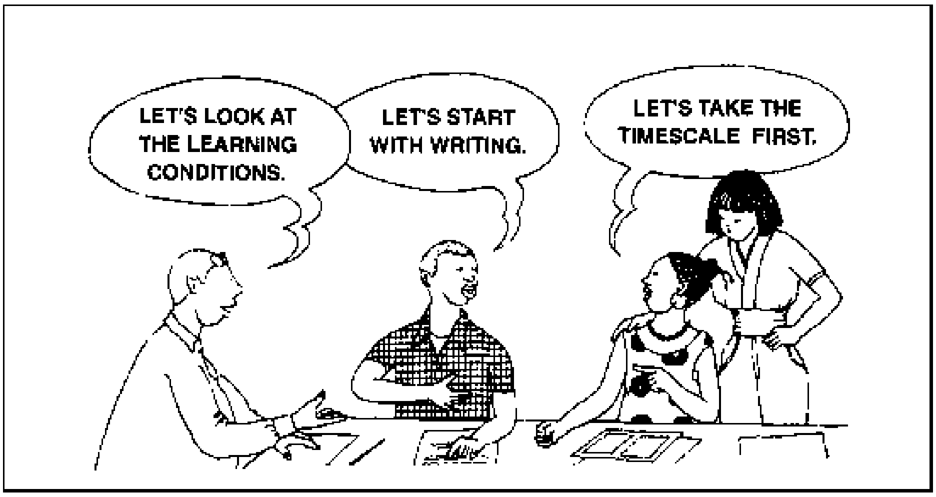
They will rapidly realise that it is not easy to work in a group, and that it becomes more and more cumbersome to consult the accumulated mountain of notes, references, decisions, texts and exercises when they need to. Paper and pencils are not enough: they need a high-performance tool, which will allow them to optimise the inputs and participation of each team member and to manage the data properly; an instrument which both enhances group dynamics and boosts the quality of the group's work.

Having practised it ourselves for several years, we recommend that you get used to a system of visualising your contributions. This is a working method which is inexpensive and easy to understand - if not always to use in practice. In our experience, displaying your work visually from the research phase to the preparation of the printer's copy is a much better guarantee of quality than any super de luxe electronic equipment.

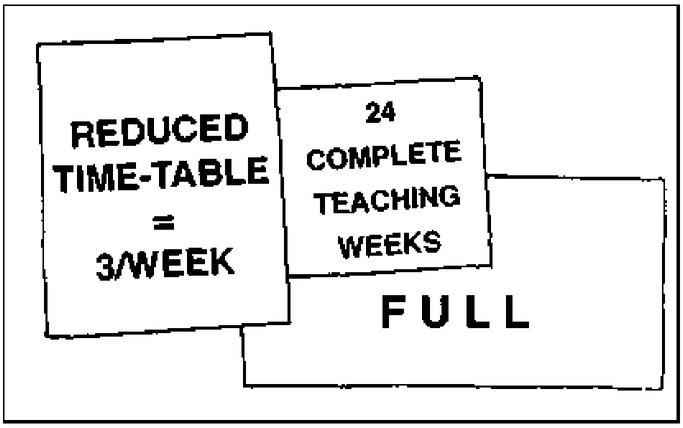
Here are the tools you will need and the various steps involved in the procedure explained in a few words and several illustrations.



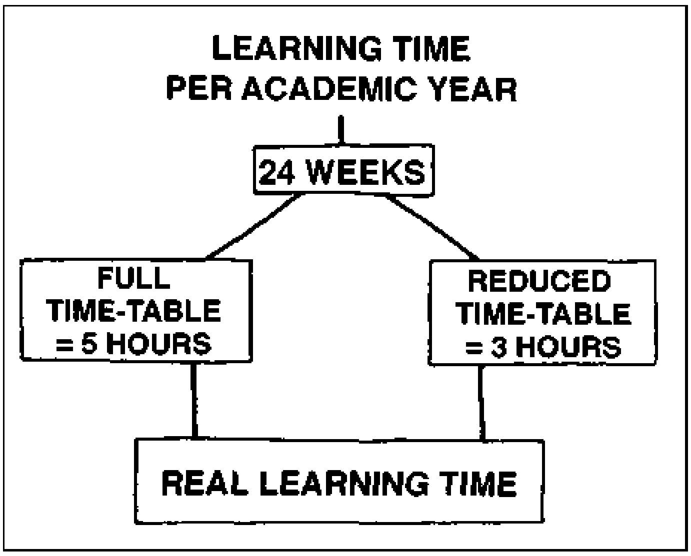
1. Preparing your tools: You should obtain a pin board made of porous material if possible, as well as several boxes of round-headed pins, a large number of cardboard strips or packing paper, the size of which will depend on the type of contributions. You will also need some marker pens and biros.



2. Identifying the topic: The topic you wish to work on should be defined verbally by the complete group. This way you avoid having to explain to those who have just arrived what has been decided on.



3. Initial brainstorming: Now you can start the written work. Allow about ten minutes for each participant to write cards without attempting to structure his or her contributions: contributions should be printed legibly, taking one card per idea and expressing it in a telegram style using no more than a dozen words.



4. Pinning up provisional contributions: One participant gathers up all the cards one by one

and reads them aloud. He pins them on the pinboard, arranging them in a provisional order. He does not comment on them at this stage, to allow all participants to re-read the cards for themselves. The cards are then taken one by one, corrected, and arranged definitively.

3. In Conclusion

Notes

[1] To convince yourself of the relative importance of the infrastructure for your work, look at books produced some thirty years ago; the quality of some is quite remarkable, and they were produced without much in the way of mechanical aids, and certainly without computers.

What authors at that time managed to do with paper, pencils, scissors, a ruler and some glue, you can manage today. Do not let yourself be discouraged by a lack of materials or tools. They are important, but not essential.

[2] This does not only apply to authors in developing countries, but also to some in industrialised countries; H. Huot notes that in France, the textbooks for lower secondary schools and primary schools, “are written by authors, most of whom have no specific qualifications in the subject for which they claim to speak, who are often not even aware of the most accessible specialised works, and who are incapable of gauging the risk or possible consequences of certain presentations or explanations.” In: *Dans la jungle des manuels scolaires,* op cit. p. 60-61.

[3] Cf. Le Thank Khoi: L'enseignement en Afrique et le modèle européen. In: Coquery-Vildrovitch C. and Forest A. (Ed). *Décolonisation et nouvelle dépendance.* Lille: Presses Universitaires de Lille.

[4] The vanity and desire of some authors to produce a splendid-looking book explain some wrong decisions, such as opting for extremely expensive 4-colour printing where there is no real reason for this, or the production of a pupils' book which is sometimes thought to offer greater prestige than a teachers' guide, although the latter would have served the pedagogical purpose and would have been considerably less expensive to produce.

Although these mistakes, which are easy to understand, are not fatal in a rich country, which can afford certain luxuries, they are dangerous in poorer countries, which cannot afford to make a mistake in this field, so every effort must be made to avoid them.

To Sum Up

In industrialised countries the responsibilities of textbook authors are well-defined and relatively limited; in developing countries, they tend to be greater, even if they are not always well defined.

This is why authors in developing countries must prepare themselves particularly well for the work ahead.

Firstly it is, of course, vital for them to have certain basic know-how: there can be no question of planning to produce learning materials for mathematics, for instance, if the group cannot count on the support of a specialist in this subject.

Authors will also need certain attitudes, the most important being the ability to work in a group, a cross-sectoral attitude, an openness to new ideas and the ability to work within the given constraints. These are the attitudes which will enable authors to design, write and produce high-quality textbooks, that are genuinely adapted to the needs and resources of the country in question. They are all important, but we would like to stress the need for every textbook author in developing countries to be open to new ideas. In these countries a good textbook author cannot avoid being a researcher, looking for original answers to unique problems, where there are no cut and dried solutions.

Certain tools can be a great help to ensure the systematic development of textbooks; the methodical visual display of team members' contributions and of the main decisions made at the end of each session improves group dynamics and enhances the quality of the team's work.

Preliminary Research

Your first task if you have just been made responsible for producing textbooks is to conduct preliminary research. You will not be able to throw yourself into the conceptual phase without first identifying the actual needs and possibilities of the future users.

Preliminary research work must always be rigorous and meticulous, for the results will be of capital importance for the textbook in the making. If we compare our textbook to a building, the first phase is equivalent to the foundations; the data that you collect not only on the process of teaching and learning at classroom level and on the relevant subject matter, but also on the school environment as a whole ought to give you a solid base on which to build your book. The research work will almost invariably be complex and wide-ranging, and will generally require at least one year. It is thus quite impossible to describe this work exhaustively here; we will give you only a few pointers which you can adapt to your own situation.

To avoid discouraging you in any way, we would like to point out from the outset that the research work described here is only possible with special technical and financial inputs: you should analyse the recommendations, use them as best you can, and continue to push forward, even if you are forced to admit that it is impossible to apply the model in the form presented here. You should also note that this work is only essential for the first book in a series: the data thus gathered are generally sufficient to allow you to produce the following books, verifying only individual points on the ground.

First task of the author - Analyse teaching and learning conditions

Get to know everybody involved in the textbook to ensure that the finished product will be appropriate

1. The Need for Research

Is it really essential to undertake preliminary research, some of you will ask. Does it have to be so complex and so wide-ranging in view of the urgent need for new textbooks?

Before you can conduct optimum research work, you must first be convinced that it is absolutely vital. You must understand that the textbook is part of a complex environment, that it affects groups which must be examined if the finished textbook is to be in line with their needs and possibilities.

To convince yourself of the need for preliminary research look firstly at the list of those involved in the main stages of the publishing chain in a state production system, for instance.

9. The textbook and its environment	
Stages	**Main individuals/groups involved**
Decision to produce textbook	
	Education authorities
	Curriculum unit
	Publishing unit
Writing and illustrating	
	Authors
	Illustrators
	Publishing unit
Production	
	Printer

Distribution	
	Distribution unit
Modalities of textbook utilisation

	Education authorities
Presentation to users	
	Training unit
	Authors
Utilisation of finished textbook	
	Teachers
	Pupils
	Inspectors and educational advisers

Field research work demands human resources, time and technical and financial inputs

2. General Overview

Highly developed planning and organisation are needed to gather data on the school environment. For a period of several months you will have to manage relatively extensive human, technical and financial resources.

Given the complexity and scope of this work, we will start with a general overview, which will enable you to evaluate the extent and nature of the research work and the ways and means of conducting it. This will give you a frame of reference to allow you to put the more detailed explanations which follow within the overall context.

To this end, we will summarise the approach taken in the Tef'Boky Project, the main phases of work and the duration of each phase. These are listed in Table 10.

10. Field Study in Madagascar
In November 1986 the German-Malagasy Tef'Boky Project started the work that was to allow it to produce appropriate didactic material for reading and writing in Malagasy. Given the dearth of information available on primary schools in Madagascar and the lack of any evaluation of the few existing textbooks in Malagasy that did previously exist, the project saw itself forced to prepare a field study, select a representative area in order to analyse conditions in the country's schools, develop the materials on this basis, and be able to test it at these schools at a later date. Here is a brief summary of the work involved and an outline of how it was performed.
Listing factors to be examined (2 months)
The newly formed working group had to learn how to work as a group, become familiar with an alien form of visualisation and tackle a relatively new field of research all at once.
By way of introduction, the apprentice authors identified the factors and criteria they felt were important to determine the quality of a textbook in general; this was a sort of introduction to the field of textbook production.
Then they listed the factors that it was imperative to analyse in the Malagasy context to ensure that the new materials were in line with the needs and possibilities of the future users.
Devising research instruments (2 months)
Among the factors to be analysed the team checked information already available and planned the analysis thereof.
The team then devised and developed research instruments for missing data which would have to be gathered in the field, primarily in rural schools and villages: these mostly took the form of questionnaires and interview guides for adults (animateurs, teachers and parents), tests and guidelines for recording pupils' responses.
These instruments were pre-tested at several schools in a peri-urban zone before being used in the field.

Identifying a test zone (1 month)	
	Based on a number of criteria, the apprentice authors selected a representative sample of schools which fairly reflected teaching and learning conditions in the country.
	The sample involved 40 schools in one educational district. Preliminary research for the textbooks to be produced was conducted at these schools and the pilot version of the books was later tested and evaluated there.
Gathering data (2 months)	
	The entire team of apprentice authors and the three animateurs working in the test zone helped gather data in schools and villages. After one week of familiarising themselves with the research instruments, each member of the team was able to work independently examining one school per week.
Processing and interpreting data (4 months)	
	The data thus collected was processed, systematised and interpreted; the authors performed some of this work and delegated the rest to students and teachers (transcription of all recordings, counting the graphemes in the language, identifying words most frequently used by children, etc.).
Publishing data (3 months)	
	The authors prepared a fairly complete preliminary working paper to allow them to proceed with the conceptual phase without further delay.
	Parallel to the conceptual work, a final document was drawn up and submitted to the education authorities for their information.

3. Taking Stock

Having looked at this overview of what preliminary research can, and often does, entail within the scope of textbook production projects, let us return to the beginning. The first step must be to identify the factors that must be examined, evaluated or quantified before you can devise a systematic concept for new didactic materials.

It is important that you adopt a methodical approach, to guarantee that the information you compile is as complete as possible. There are two reasons for this: firstly, this is the best way to ensure that you do not have to come back to this phase later, interrupting the conceptual phase which is long and complex enough without these irritations, and secondly any omissions and oversights you make at this stage may spawn serious errors in the concept, development and production of the textbook.

The factors to be analysed will not, logically, be the same in every case. To avoid major omissions, we suggest a two-stage approach. Firstly, identify the factors which are always important, i.e. factors related to the teaching and learning conditions. Secondly look at the supplementary factors, which are pertinent for the case in hand.

Conditions in the Schools

Start by identifying the factors to be analysed

Whatever the class and the subject for which the textbook is intended, the authors must examine in detail the conditions under which the teaching and learning process takes place.

This analysis must go beyond the narrow confines of the school itself, and look at the educational environment as a whole. We would recommend that you first collect data on the political and educational framework in the country, before looking at the way education is organised, i.e. the day-to-day life of teachers and pupils. Finally you should round off this information by analysing the various target groups affected by the new materials, which will include not only the educational authorities, (primarily inspectors and educational advisers) but also the teachers, pupils and parents.

Having seen ourselves how one automatically tends to devise voluminous instruments that are not sufficiently well-targeted, we recommend that you systematically eliminate all factors that are not relevant for the material to be produced.

Table 11 shows the factors that should generally be examined before designing didactic material for primary level. To allow you to gauge the importance of these factors we have outlined the main reasons for including them in the analysis, and the repercussions they are likely to have on the new material.

11. Main factors to analyse regarding conditions in schools	
Field Factor	**Relevance for new materials**
Political and educational framework	
Educational legislation	General direction, e.g. language of instruction
Curriculum[1]	Learning targets
Official guidelines	Officially recommended learning methods
Organisational set-up of ministry	Chances of having innovative material approved
How education is organised	
Length of academic year	Volume of subject matter that can be covered
Length of school week	Ditto
Physical framework	
Storage space, furnishings	Quantity and type of materials available
Lighting	Level of legibility required in textbook
Blackboard	Blackboard-based learning activities
Ratio of teachers-pupils	Group and individual learning activities
No of pupils per class	Ditto
No. of classes per teacher	Didactic pointers in the teachers' guide
Teachers' working conditions	
Administrative responsibilities	Adaptation of material to availability of teacher
Didactic back-up materials	Preparing teachers to accept innovative ideas
Pupils' working conditions	
Location of school	Suitable format for pupil to carry to and from school
Ratio tables-chairs to pupils	Format of material, composition of set
No. of textbooks available	Pertinence of textbook production project
Other teaching materials	Attitudes of parents to school
Individual equipment	Identification of suitable writing tools
Target Groups	
Educational advisers	
Professional training	Level of innovation of material to be defined
Official duties	in terms of educational advisers' ability and
Supplementary duties	capacity to train teachers
Means of performing work (e.g. transport)	
Teachers	
Level of education	Degree of complexity innovation of material
Professional training	Contents and presentation of teachers' guide
Social background	Ditto
Integration in community	Ditto
Linguistic skills	Ditto
Motivation	Degree of innovation of materials
Pupils	
Social background	Topics contained in pupils' material
Focus of interest	Ditto
Linguistic skills	Linguistic contents of book, instructions to teacher
Previous knowledge, results in subject	Level and complexity of content matter
Economic duties	Topic-related and pedagogical contents
Parents	
Socio-linguistic features	Language taught/language of instruction
Level of education	Active support for children's education
Economic resources	Cost of material
Attitude to school	Planning information/awareness activities

Textbook Projects

Ideally in an educational project, the authors will be able to rely on a complete and reliable feasibility study; where this is the case they will be able to devise material appropriate for the needs and resources of the country on the basis of an examination of pre-defined factors. But authors may be called upon to produce a textbook on the basis of a less than perfect feasibility study, or where no real study has been conducted. In these cases they must also examine the project environment to avoid the pitfall of producing inappropriate material. Often this will not involve performing or repeating an entire feasibility study, but merely checking certain factors.

Table 12 lists some of the factors and aspects which we think are relevant in most cases, along with some essential questions which should be answered. Once again do not let this list discourage you; identify the factors that are important in your own specific case and, if you feel that a really exhaustive procedure is called for, consult the literature on the preparation of textbook projects that you will find listed at the end of this chapter.

> **Take a methodical approach: you can use the results of research based on this table as the foundation of your textbook**

Schools and National Languages

As we mentioned above[2], in 1985, 86 local languages were used as languages of instruction in sub-Saharan Africa. There are thus many textbook authors on the African continent working with a national language.

If this applies to you, it is vital that your preliminary analysis of the situation includes a linguistic component. You will have to find ways of solving the problems of using languages which are for the most part still little standardised in the classroom.

Again, the situation will vary from one case to another. Some languages, like Malagasy whose alphabet has existed in its present form for more than 150 years, have had an adequate system of transcription for many years, while others use several different alphabets, none of which is really adapted to the needs of primary schools. Other still have not yet been written.

Let us look at the steps to take if one of these languages is to be the language of instruction and/or the language taught.

Fundamental linguistic analyses

When we are dealing with a national language that has not yet been written, UNESCO[3] recommends that work be structured in Table 13 (page 52).

- Conduct a phonemic analysis which will be used as the basis for a scientific alphabet
- Conduct a grammatical analysis
- Prepare a preliminary lexicon.

12. Factors regarding the environment of a textbook project
Factors Aspects
Writing Conditions
Capacities of the curriculum unit
Will the unit undertake any revision of the curriculum, or will you be officially charged with this work?
Capacities of the publishing unit
Can the publishing unit perform all the tasks expected of it? What is the quality of its services?
Responsibilities of the group of authors
Which of the many activities presented in the first chapter are to be entrusted to the authors? Are any other bodies involved in producing textbooks for primary level?
Legal aspects
How are royalties and copyright regulated?
Production Conditions
Identification of sources of funding
Is the financing of the pilot version guaranteed? Is financing guaranteed or are there prospects of obtaining finance for the final version?
Size of the market
Are there reliable statistics on the number of schools and the number of pupils per class? Are there forecasts of the growth in school rolls? Has any research been performed on the financial status of parents?
Definition of conditions of use
Do you plan to produce one textbook for two or three pupils, or one per pupil? Will the books be bought or borrowed? Do you intend to set up a revolving fund?
Capacity and quality of preparations for printing
Does the printer have the capacity for typesetting? Photoengraving?
Capacity and quality of printing
Is the printer's equipment suitable for textbook printing? Is it suitable for printing large runs while maintaining high quality? Are the technicians properly trained? Can the printer operate competitively?
Inputs
Are all inputs required available on the spot? What is the quality like? Must paper be imported? Ink? Printing plates? etc.
Finishing
Is the printer equipped to finish books? In particular, what type of binding can he produce? Can the printer cope with a large run? Can he pack the books properly?
Distribution Conditions
National statistics
Does the unit in charge of distribution have reliable information on the school roll by school and region?
Precise information on transport routes
Are the precise itineraries known for the points to be served?
Organisational capacities
Does the unit have the ability to devise a distribution strategy? And to put it into practice?
Technical and financial resources
Does it have the means of transport to ensure distribution and/or the financial resources to have the materials distributed?
Teacher Training
Capacities of the teacher training unit
Who is to plan the necessary training activities to accompany the introduction of the revised material? Who is to conduct the training?
Capacities of future trainers
What is the level of training, experience and motivation of those in charge of teacher training?
Technical and financial resources
What technical back-up resources and what budget does the teacher training unit have at its disposal?

For this work you will need qualified staff and a great deal of time; it can take up to five years to devise an alphabet[4]. That is why this work must never be part of a textbook project; it is an indispensable prerequisite for launching projects in this field.

Preliminary linguistic work

Although it is out of the question for you as authors to transcribe a language, every time you use a local language you should examine the linguistic and socio-linguistic factors that are likely to have an impact on the teaching and learning process. On the following pages you will find a list of factors which you should pay attention to during this preliminary research phase, whatever the degree of standardisation of the local language you intend to use in your textbook[5].

Once again, you should adapt our suggestions to the case in hand; try to identify the factors of vital importance which must be examined without delay and those which are neither really urgent nor so important. You should realise that at this stage of your work, it is less a question of making immediate decisions regarding writing or vocabulary than of gathering data which will allow you to make the relevant decisions at a later date, in particular during the writing phase when you will periodically come up against linguistic difficulties.

> **No research work is an island: every issue will have immediately applicable consequences for your textbook**
>
> **In the absence of a feasibility study, you must also examine the environment in which the textbook will be used**
>
> **Examine the writing, production and distribution conditions particularly closely**

13. Textbooks in a National Language
Political Preconditions
Language of instruction
Is the national language in question officially recognised as a/the language of instruction for native speakers?
Languages taught
Which language or languages are taught? Will the national language be used purely as a medium of instruction, or will it also be one of the languages taught? Will primary school pupils also learn a world language? If so, as from which class and in what way?
Making the alphabet official
Is the alphabet of the national language you intend to use officially recognised? Is it accepted as such by users of the language? Do other alphabets co-exist with this one, and are they also known and used?
Promotion of the national language
Is there a clear political will to support work in the national language, and your work in particular? Are there any political activities to support national languages that go beyond mere declarations of intent?
Scientific Factors
Ensuring a pertinent and suitable alphabet
Does the alphabet selected for use in textbooks correspond to a scientific analysis of the language?
Functionality of the alphabet
Is the method of writing selected suitable for school-level learning or is it more in line with the needs of researchers?
Respecting variants
Have dialect variants been identified? Can the alphabet respond satisfactorily to their special features? What line do you intend to take in textbooks destined for nationwide use?
Conformity to other alphabets
Does the alphabet used for the national language in question differ from those used for any other national languages without good reason? Does it differ from the world language used in the country?
Spelling
Are there conventions for hyphenation? For contractions? For spelling loan words taken from a world language?

Punctuation
Has any work been done on standardising punctuation? Do the punctuation rules differ from those used by the world language used in the country for no good reason?
Institutional Factors
Training teachers
Does the training of primary school teachers include the study of the national language in question?
On-the-job training for teachers
Are there in-service training programmes to prepare teachers to teach in the national language in question?
Reference works
Is there a research institute responsible for producing reference books concerning the national language in question, in particular, grammar books and basic dictionaries?
Terminology
Is a unit or a body responsible for enriching the language, and in particular, for creating the technical and scientific terms that are vital for consistent, diversified, precise instruction? Are efforts being made to standardise these new terms?
Standardisation
Is a unit or a body responsible for standardising the national language, in particular, for proposing punctuation rules corresponding to the superstructure of the language?
Practical aspects
Characters
Can the characters used to write the national language in question be found on a standard keyboard?

4. Planning

The preceding phase will have enabled you to identify those factors which will have to be examined before you start writing your material.

You are thus now in a position to plan research activities; you should start by setting the deadlines, even if it is difficult to gauge the time that will be needed for certain activities, such as selecting a representative sample, and you may be forced to adjust your schedule at a later date.

To avoid getting bogged down in poorly prepared work or work that is not in line with your needs and your possibilities, you should concentrate on compiling as exact a schedule as possible, taking the following factors into account.

If you work in a local language, analyse the linguistic environment of the textbook

Base planning on practical options rather than wishful thinking

Institutional Priorities

The first textbook will require the greatest amount of research work, but it is also the book that will be most impatiently awaited. It is thus not unheard of for the institutions concerned, the Ministry of Education, and sometimes the donor to exert pressure on the authors to accelerate the preliminary research phase and complete the long awaited textbook rapidly.

It is not uncommon for an insufficiently standardised language to become the language of instruction, and for the scope of linguistic work to be underestimated by the education authorities - who nevertheless intend to meet their political commitments at any price.

You should of course plan your activities taking into account these pressures, but we have seen time and time again that ill-considered haste never pays off: the speed at which the work was performed is quickly forgotten, and all that remains are the shortcomings of the finished book. You should then consider carefully to what extent and how you are prepared to take into account institutional pressure, to ensure that the quality of your research work is not jeopardised.

Human Resources

You must also take into account the people involved when you plan activities.

The Authors

Field research will have to be performed by all the members of your team; even those who consider themselves well enough informed about the school situation must take part.

In this way you will ensure that all team members expand, deepen and update their knowledge, and that the group begins to come together, before going on to devise the material on the basis of a uniform level of information. If you do not harmonise points of view in the field you risk running into serious disagreements afterwards, particularly when you come to devise your material.

All authors without exception should be involved in field research work

Short-term consultants

It is rare for a group of authors to have the necessary skills to perform all preliminary research work independently. You should thus identify the aspects requiring skills only available outside your team.

In line with your needs you should make provisions for the sporadic help of a linguist if you are going to have to write textbooks in a national language which has still not been sufficiently standardised, of a sociologist to prepare the field research work, of animateurs who are familiar with the test area where you aim to gather data or of a statistician who will help you to process and interpret certain results.

It is up to you to identify the areas where you will need occasional assistance from other professionals. You must then contact the latter and ensure that they will be available when required.

Technical and Financial Resources

The research work always demands a minimum of technical and financial resources. You should thus evaluate the costs of the operation and not start planning until you are sure that you have the resources you need. In most cases you will need office supplies, a four-wheel-drive vehicle, enough funds to cover the costs of the mission and the fees for short-term experts.

Scope of Data to be Collected

When the schedule is drawn up for your activities, you will see the scope. One often tends to underestimate the time needed to process the data collected in the field, particularly when recordings have to be transcribed.

If you have to work in a national language which is still not commonly written, and you intend to record information, plan the recordings with a view to the follow-up work, i.e.

Transcription

Under these circumstances you had better calculate one hour to transcribe five minutes of recorded speech. If you delegate this work to individuals whose only qualification is verbal mastery of the language you must also think about approaching an experienced linguist to revise the transcriptions.

Analysis

The recordings, thus transcribed, will then be analysed in various ways. If you aim to produce a reading book you will have to pinpoint the words most frequently used by children, classify these words by length, origin (from a dialect variant, loan words, etc.), among other things. If you are unable to do this by computer, you will have to perform the work manually which will take some time.

Data Processing

All the data will have to be typed so that the authors can use it, before they start work on devising didactic material; this is a long and exacting secretarial task, the scope of which is often underestimated by authors.

You should bear in mind, when you draw up a schedule for your activities, that you will have to correct all the data that you collect. There is no point in conducting extensive research in the field if you cannot use the information you gather. You should thus always distinguish between what is possible, and what is desirable but unrealistic. Identify the research work which you cannot reasonably conduct and the work which can be postponed without any major impacts on your first didactic materials[6].

At the end of this phase you will have two schedules, the first of which will be a short-term schedule for the research phase. It will indicate the main research activities, the deadlines, the persons responsible and the evaluation of costs.

The second, medium-term schedule will concern the actual writing and production of the materials.

It is important to gear your work from the outset to the start of a specific academic year. You should decide on the first year of introduction and make absolutely certain that you do not miss it, and perhaps the date of publication for any second set of materials. You should then inform the education authorities as soon as possible.

Refer back to the first chapter and look at Table 3 (the birth of the *Garabola* textbook) as a yardstick to help you gauge how must time you should allow.

5. Instruments

The objective of the current phase is to develop the research tools which will allow you to examine, quantify or verify the data required.

The approach taken in the field of social sciences to define an analytical model is discussed in several specialised publications; if concepts, hypotheses and indicators are completely new ground for you, it would certainly be a good idea to consult a sociologist or to refer to the literature on this subject listed at the end of this chapter.

But you should not forget that research in the field should never be an end in itself, it is merely a means to an end - which is the production of textbooks that are in line with the needs and resources of the country. You should thus attempt to surround yourselves with the skills which will prevent you as far as possible falling into the traps of woolliness or arbitrariness during your research, but do not lose sight of the fact that you are above all authors of textbooks. Your primary target group is the pupils who are waiting for their books, while university researchers must be relegated to second place if they appear at all on your list. Let us retain our pragmatic approach and again make the distinction between what is desirable - a piece of work which is scientifically unassailable and will require a lot of time and experienced staff - and what is possible under the given circumstances. It is up to you to make the best of the situation, even if your resources are minimal (e.g. novice researchers, or the fact that you are not given all the professional back-up you would like).

Within the scope of this guide, we will introduce you to a relatively simple way to identify research tools which you can use in most cases.

Prepare functional and well-targeted tools
Consult specialised books to find out about tools

Data to be Verified in the Office and in the Field

You should start by differentiating between the data available in the office and those you will have to verify in the field, before going on to define the activities needed to analyse each of these.

14. Initial Break-Down of Tasks to be Performed
Data to be verified in the office - Activities
Education Policy
Analyse official guidelines[7]
1985 Official Curricula
Analyse the subject “Malagasy”
Analyse the targets for the first grade
Analyse the profile of the pupil at the end of primary education
Textbooks Used
Identify the main textbooks used
Define criteria to evaluate these
Analyse the most widely used in class
Pedagogical Directives
Inventorise, collect, exploit

Table 14 was drawn up to this end by the Tef'Boky Project. It could be useful to you for reference purposes.

Hypotheses, Indicators and Instruments

The above list still tells you nothing abut how to study each element. You should proceed as follows to determine how to approach the matter, i.e. how to identify the sort of instrument you will need.

Firstly you should draw up your hypotheses; these are sort of provisional answers, formulated in a relatively summary fashion, which you propose for each element to be studied, and which will later have to be verified in the field.

Secondly, you should define the indicators which will allow you to verify these hypotheses; indicators should be factors which are easily observable, verifiable or quantifiable.

Thirdly, and lastly, you should select the instruments which will allow you to verify the indicators you have just identified.

Let us take an example to better illustrate the links between hypotheses, indicators and instruments. Let us assume that you are required to verify that the pupils achieve the attainment target for handwriting at the end of the first grade, i.e. that they are able to copy a sentence on the basis of a model in cursive style, forming the letters legibly and understanding the meaning of what they write. You could then devise the following table.

Developing Instruments

You have identified the research instruments you need - now you can develop these.

Adapt the instruments for the case in hand

15. Identification of Instruments	
Hypothesis: Pupils achieve the official attainment targets for handwriting at the end of their first year of schooling.	
Indicators	**Instruments**
Time allocated for handwriting in the official time-table	
	Analysis of official curriculum
Importance attached to handwriting by teacher	
	Examination of pupils' exercise books
	Questionnaires
	Interviews with teachers
	Classroom observations
Importance attached to handwriting by parents	
	Inventory of equipment purchased by parents and available in classroom
Quality of handwriting	
	Tests involving copying a text
Spelling of certain common words	
	Tests involving dictation of words
Comprehension of texts copied by pupils	
	Tests involving the comprehension of a text

If you have little experience in the subject we recommend that you seek the support of a specialist. It is not easy to prepare instruments that are both appropriate for the survey conditions and targeted so as to give you the information you require.

Within the scope of this publication we will limit ourselves to giving a few practical hints and some examples taken from the work of the Tef'Boky Project.

Research Conditions

Instruments should firstly be designed with the investigators in mind. Sometimes you will have to involve teachers or educational advisers in your work, particularly as regards interviewing parents. You must thus design instruments on the assumption that however willing they are, they are novices when it comes to investigating, and will need tailor-made instruments, especially if you expect them to work relatively independently.

The instruments must, of course, also be tailored to the needs of those interviewed. It is up to you to identify instruments which will neither shock nor intimidate adults and children who are not familiar with investigations.

Finally you must take into account the conditions surrounding your research work, and take a pragmatic approach. If you have to be on the move for weeks on end, for instance, use only instruments that you can transport - no vast packages of tests and questionnaires. Sometimes you will not be able to use recordings because the logistics preclude this. To illustrate this, we have reproduced below a few pages taken from the investigation conducted in 1986-1987 by the Tef'Boky Project. Examine them carefully and identify the precautions taken at that time to ensure a minimum of uniformity of investigation conditions and to guarantee precise results - and see how you can adapt these to suit your own circumstances[8].

Do not underestimate the importance of physical and logistical considerations
Nothing is too self-evident to ensure that the instruments are properly used

Preliminary Testing

You now have research instruments, but no guarantee that they are precise enough or suitably tailored to your investigators and to the people investigated to give you the data you need.

For this reason you should organise a preliminary test run with the instruments, especially those aiming to evaluate school attainment levels. We recommend a test run in at least two schools offering teaching and learning conditions that can be considered representative for the country as a whole, which will usually mean moving away from urban areas.

To ensure that your instruments really work as intended, you may have to modify them, and then organise a second test run. This may prove impossible however. In our experience every expedition demands time, human resources, funds and organisation, and it is rare for projects to have the free time and the resources for a second test run.

Select a sample for your investigations

The Final Instruments

You are now ready for the final step in preparing your instruments. Modify them on the basis of the preliminary test runs and prepare a sufficient quantity for the number of villages and/or schools which you should now identify. It is generally a good idea to put together all the instruments to be used at any one location in one file; this will prevent the investigator misplacing documents or wasting time looking for them in front of those he wishes to interview - an embarrassing situation which can happen to even experienced investigators, and is bound to happen to novices unless you give them proper back-up.

> **Take great care with attainment tests; the education authorities are always particularly interested in these results**

1. List instruments which will guide the investigator.

....
....

IN THIS CONTEXT NOTE THE FEATURES THAT STRUCK YOU MOST IN THE COURSE OF THE READING LESSON, WHICH YOU CONSIDER INTERESTING BUT DID NOT FIT INTO ANY OF THE OTHER QUESTIONS

5. Give investigators written detailed instructions

File No. 2 Instruments for Field Research Work

INSTRUMENT No. 12
Target Group: First-grade pupils
Type of Instrument: Test

Objective:

Verification of the hypothesis:

Children in rural areas have specific concerns and interests (2213)

Guide:

1. *Materials:*
   Sheets of paper
   Pencil
2. *Instructions:*
2.1. Separate children as far as possible to avoid copying
2.2. Hand out per pupil
   1 sheet of paper
   1 pencil
2.3. Ask the children to draw
   • their favourite *person:* WAIT 10 min.
   • their favourite *animal:* WAIT 10 min.
   • their favourite *thing:* WAIT 10 min.
2.4. At the end go and see *every* child
   • Ask him/her to explain *each* drawing to you.
   • Record the explanation on the sheet of paper (e.g. grand-father, pig, flower)
   • Add the age of the pupil.
   • Collect papers

6. Prepare forms as a record of documents

File No. 2 Instruments for Field Research Work

RECORDING RECORD SHEET

Label your cassettes!

List them in this record sheet and fill in the relevant information!!!

Place	Cassette No.	Date	Child Recorded			Subject
			Male	Female	Age	

16. Testing Attainment Levels
Among your instruments you are bound to have some tests to evaluate the attainment levels of schools. You will test the level of the class for which the new material is to be produced, to determine whether or not the pupils have achieved the official targets in the relevant subject so that the new textbook can be designed to bridge as many of the gaps thus identified as possible and/or to improve existing skills. Design these tests with care, and ensure that they are systematically applied and rigorously interpreted. Since evaluation tests are the focus of an expanding field of research, the suggestions below cannot be considered exhaustive. We will merely look at ten aspects concerning the contents, the mechanism and the interpretation thereof, which we feel are of particular importance.
1. Congruence with objectives
All tests taken together must allow us to determine whether or not the pupil has achieved the attainment targets, as laid down in the official curriculum for the subject and the class concerned.
2. Pertinence of tests
Each test should correspond to one specific, clearly formulated objective which will, in its turn allow you to determine whether or not the general target has been achieved.
3. Reflecting the pupil's world
The tests should only involve elements with which the pupils are familiar, or which are at least known to them.
You should thus naturally avoid tests concerning the arrangement of seats in an aircraft, or the keyboard of a computer, but also other objects which may still not be common in certain places, such as showers or calculators.
4. Interpreting illustrations
Illustrations must be unequivocally understood by pupils. They must correspond to the cultural and psychological perception of the children. Pay special attention to the use of techniques such as movement or perspective which could be wrongly interpreted.
5. Duration
The duration of the tests should take into account the pupils' concentration span.
For instance, 20 - 30 minutes should be allowed for all reading or writing tests in grade one of primary schools, interspersed with short breaks.
6. Preparing the investigators
All investigators should conduct the tests in as similar a way as possible.
There are two ways of preparing investigators; call a meeting of all investigators before leaving to perform the field work, at which the procedure to be followed is repeated once again; and print the instructions on how to conduct each test at the top of each set of tests.
7. Preparing the class
The investigators must be able to create an atmosphere of trust which will allow the pupils to sit the tests in relatively satisfactory conditions.
They must then be fluent in the pupils' native language, and be able to explain clearly to the teacher and then to the pupils what they are expected to do, and encourage them without putting an answer in their mouths; if so decided in advance, they will be able to instruct the teacher such that he can conduct the tests, while the investigators merely observe.
8. Explaining the exercises
Each type of exercise will be introduced on the blackboard, while every pupils should solve it in writing.
To distinguish between understanding the mechanism and the knowledge or skills of the pupil, all exercises should be presented systematically on the blackboard, even where the mechanism appears to be self-evident. The investigators should always check to ensure that they do not present any particular comprehension difficulties.
9. Pupil profile
An individual information slip will give the information needed to interpret the results.
Remember to note the age and sex of the pupil, whether he or she is repeating the year, attendance rate at the school, and if appropriate language skills.
10. Systematic collation and interpretation
To allow you to organise and interpret the results a points system should be drawn up, not when you come to process and interpret the results but when the tests themselves are devised. This system, and the interpretation of the results must be simple and clear enough for the education authorities, who do not necessarily have any statistical training, to understand them.

6. The Sample

Now your instruments are ready, and you can identify a sample of schools in which to use them.

Why do you need a sample? Firstly, of course because it would not be feasible to gather information from every school in the country, and secondly to ensure that the information you obtain is representative for the country as a whole. Certain sample selection techniques will enable you to identify a zone where you can gather reliable data which will reflect the situation throughout the land. Finally, a sample will enable you to count on the long-term support of those concerned; you will need a representative group not only for the preliminary tests, but also to test the materials you produce one after the other. You can only create a good feed-back system if the sample selected does not change significantly over a period of several years.

We suggest that you select your sample in two stages, as follows.

Defining Selection Criteria

> **Select your sample with care; you will have to work there over a period of several years**

When you come to select zones and schools as part of your sample, you should firstly define your selection criteria. You must proceed with great care since this sample is going to be your laboratory not only for the research work at this stage, but also for testing the pilot textbooks at a later date.

Again, try to make the best possible use of our hints; look for feasibility, representativeness, sustainability, and the support of those concerned, each of which we will look at in more detail below, and decide which are the most important criteria for you.

> **A good author is also a good organiser: what is the point in preparing good instruments if you don't know how to manage the application?**

Feasibility

A good sample should not overtax the available resources and possibilities of the textbook production project.

Look at

- the geographical proximity of the test zone: the distance between the test zone and the project headquarters should be such that the authors, and perhaps also the animateurs and some teachers can easily commute between the two on a regular basis.

- the ease of access to all the schools selected: you should only select schools which you can reach in one day without major transport problems.

- the size of the sample: the number of schools selected must be limited to allow relatively regular monitoring of each one of them over a period of several years.

Representativeness

A good sample must allow you to gain a global impression similar to that you would have obtained had you been able to look at every individual school in the country. Look at

- the teaching and learning conditions: the teacher to pupil ratio, the number of pupils per class and the number of classes per teacher, as well as the status of the schools (private or state for instance), must correspond to the national statistics, or where there are none, to the conditions observed in at least two other regions of the country.

• language and culture: the linguistic and cultural practices of the sample must reflect those found at national level. This may be a thorny issue if the global target population is spread over a large area which tends to encourage cultural and linguistic variations.

• the professional and economic profile: the professional occupations and income of those observed within the sample must reflect those of the majority of parents throughout the country.

• experience of scientific work: if the test zone is a preferred area for research and testing, the inhabitants may have adopted certain mechanisms which do not reflect the situation of the population as a whole; if it was the test zone for a failed education project, it would be preferable to select another zone.

Sustainability

To ensure that the sample remains representative over a period of several years you should try to guarantee:

• a sufficiently large initial sample: in the course of time, some villages or some schools will, for various reasons have to be dropped; in some cases the villagers will demand that they are dropped to avoid official visits, in others the sudden and prolonged absence of a teacher or the closure of a school will force you to take this step. To allow for these defections, it is imperative that the initial sample be relatively large.

Agreement and support

Finally, to allow you to conduct your work, you must have the active support of teachers and parents, without which no cooperation is possible, or at least no good cooperation.

Determining your Sample

On the basis of your selection criteria, you should identify a few zones which could be taken as a sample.

You should make your final selection in the field, once you are certain that your choice is a good one and that you have the active support of the education authorities, teachers and parents.

From the outset, you should bear in mind the fact that you stand on the threshold of cooperation between your working group on the one hand and the village and its school on the other, which is likely to last several years. You must thus make an effort to create an appropriate climate of respect and trust.

7. Gathering Data

The quality of your work in the field will naturally depend to a great extent on the quality of your instruments. But, if you ignore the logistical and material aspects of the mission, your instruments, however perfectly honed, may be ineffective.

We would thus suggest that you plan your field trip meticulously and that you evaluate it periodically, in the following way.

Preparing Materials and Logistics

Think of your field research work as a project. To ensure success, the project must be prepared and implemented systematically; you must plan everything from the daily visit schedule for each investigator down to the last detail that every team member will need if they are to go and live and conduct investigations in a village for several days at a stretch. One oversight may cause serious delays in your already busy schedule.

Field Monitoring

As far as possible you should organise regular visits to check that things are running smoothly for each investigator; they may be faced with surprises, a school may be closed or villagers may be hostile when confronted with an outsider, for instance, which may make it necessary for the investigator to leave the village rapidly.

Regular Comparing of Notes

Regular meetings should be held to discuss progress. A weekly report before returning to the field, for instance, allows the team members to swap the most important information and, if necessary, modify the way some instruments are applied, add more instruments or drop some.

8. Results

You must now process and interpret the results of the data your team have collected in the field. This is a relatively long phase - it took some 4 months in the Tef'Boky Project - and must be conducted rigorously and meticulously if all the work to date is not to be nullified.

Some teams will call on the services of specialists to help them interpret the statistics, or guide them in their linguistic work, for instance. Be this as it may, you should think of the data you have collected as being at once extremely precious and far from complete.

Major Indications

The results that you will obtain will undoubtedly give you relevant information on the school situation. This makes them vitally important and you will find them useful not only for one textbook but for an entire textbook production project.

But you must not fall into the trap of thinking of them as complete and irrefutable. The situation will rarely allow you to do so. For example, let us assume that you have evaluated school attainment levels; your battery of tests may be appropriate and your results differentiated (girls/boys; school-age children/ significantly older pupils; pupils repeating the year/pupils enrolled for the first time; pupils who have lived in the area for some time / pupils who have recently moved to the area; pupils whose mother tongue is the language of the tests/ pupils who are learning the language, etc.) but the population tested will not necessarily remain the same (different pupils sitting different tests, etc.), and neither will the school environment (prolonged absence of the teacher, school closed periodically, etc.).

Since the results you obtain will not give you an image which corresponds exactly with the reality, you will constantly be trying to enrich your data and make them more precise.

You should thus consider your research work in the field as the foundations for the new didactic material, but take care not to stem the flow of information.

During the conceptual phase and after the writing phase you should call on animateurs and some teachers who you will have identified during the field work, to confirm or refute certain results. Afterwards, when the material is tested, you should conduct classroom observation, talk to teachers about using the new material, and finally, of course evaluate the functionality of the material with the help of evaluation tests.

Thus, step by step, you will complete the mosaic of which the field research was the first piece.

The results of the investigation must be complete and precise

9. In Conclusion

A Reference Document

The results of field research work are rarely published; so as not to waste time, the authors generally make do with a preliminary version, on which they base the conceptual work.

Yet, the results should always be documented in the form of a particularly carefully put together publication. Field research work often provides information which is new or which those in authority prefer to overlook in the capital, where major decisions are made. The findings may have repercussion for certain parts of the school system. For instance, the discovery that the actual learning time is half the official learning time could lead the authors to propose a revision of the official attainment targets, a decision which the education authorities would be reluctant to make.

The report on field work here becomes a piece of evidence which the authors can use to explain, justify and even defend some of their proposals; it is a vital document which cannot be replaced by verbal explanations or the raw and uncollated results of research.

It is thus often a good idea to end this phase by publishing a document which should be accepted by the education authorities: having been prepared and implemented with care, the research work must be presented in this document with the necessary professionalism.

Document your research

Notes

[1] According to Landsheere, "A curriculum is a collection of planned activities for instruction, comprising the definition of teaching targets, the content matter, the methods (including evaluation), materials (including textbooks) and the arrangements for suitable training of teaching staff. In *Dictionnaire de l'évaluation et de la recherche en éducation,* p. 65. Paris: PUF.

[4] "Some five years are needed to fully describe all the sounds in a language that has never been written." *Langues et politique de langues en Afrique Noire,* op. cit. p. 39.

[5] In this context the work performed by the German-Peruvian Bilingual Education Project from 1979-1989 provides interesting practical information; cf. Châtry-Komarek M. *Linguistische Faktoren bei der Erstellung von Schulfilbeln in Vernakularsprachen,* Osnabrück: Osnabrücker Beiträge zur Sprachtheorie 31, 1985 and Intentos de codificatión del quechua en libros escolares. In: Lopez, L.E. and Moya, R. (Ed.) *Pueblos indios, estados y educación,* Lima, 1989.

[6] In the German-Peruvian Project mentioned above, the authors of the reading books in Quechua would have liked to conduct research to identify punctuation responding to the supra-segmental characteristics of the language, which had not yet been sufficiently standardised. However, because of the lack of resources and time available, they were forced to write the textbooks for the first three grades of primary school without the assistance of this important research.

[7] The Charter of the Malagasy Socialist Revolution, published in 1975 in Madagascar, advocates democratisation, decentralisation and Malagasisation in education, for instance.

[8] These instruments prepared in 1986-87, were reproduced in their entirety in the third book of the *Garabola* series, entitled *Les Dossiers I.*

To Sum Up

When the education authorities of a developing country decide to produce a textbook for primary level, they turn to a group of individuals, generally inspectors and educational advisers, and often expect them to produce a high-quality product within a few months.

Mission impossible. The team which has just been set up, is never able to start the conceptual work immediately. Indeed, this newly born entity will have to conduct a long and difficult mission, the need for which has not generally occurred to the education authorities, involving the following.

Firstly a genuine working group must be set up, without which no textbook, no matter how mediocre, will see the light of day; this presupposes that the authors identify the mechanisms which will allow every individual to contribute his and her best to the team throughout the several years of in-depth cooperation.

Then, although the authors are almost always recruited from the ranks of the teaching profession, they cannot have the in-depth, complete and systematic knowledge of the target group of the textbook that they will need. They will have to devise, plan and manage research on the lesser known aspects of day-to-day school life, collate these in a systematic form and interpret the results.

Finally, although no decision should ever be taken to produce a textbook before a serious feasibility study has been conducted, and before ensuring that certain preconditions are met - things often look different in practice. The feasibility study is not complete, sometimes no study has been conducted; it is the authors who often have to bridge these gaps.

In the best case scenario, the authors will need one full year to complete their research, the quality of which will largely determine the quality of the book produced, in particular the degree to which it is in line with the needs and possibilities of subsequent users. The sheer scope of this work explains why some teams of authors take only the unprocessed results and race on to the conceptual phase without further delay. But, the results of the research should be scrupulously documented and presented to the education authorities to enable them to understand the pedagogical choices reflected in the textbooks.

The Contents

The conceptual phase is often welcomed as a deliverance by groups of textbook authors: after all these months of research, they believe that they can develop the materials relatively rapidly. More often than not they are disappointed, for months of hard word are needed to produce a textbook or a teachers' guide, as you will see in this chapter.

For didactic reasons, we will break down the conceptual phase into two parts and deal with each part in two separate chapters. The first will look at the contents, while the second focuses on the form, as though the two were not related. In fact the final form and contents of a book emerge from the very interaction between these two fields. Also for didactic reasons we have decided to present the work involved in a more or less logical sequence. Textbook teams generally take a “spiral” approach which allows them to lay down the rough structure of the material progressively. This approach involves taking one step back at regular intervals to ensure that every important factor has been taken into account, to re-analyse these factors, weigh them up again and then make the appropriate decision.

You should read this chapter without losing sight of the fact that the order in which the work is presented will never be followed to the letter in practice.

> **Take a “spiral” approach to determining the contents of your textbook, always going back to re-examine your decisions and ensure they were correct**

1. Time Management

Time is the first aspect you should examine in the conceptual phase. The objective of this phase is to draw up a precise frame of reference for the time effectively allocated to the subject in hand.

Why, you may ask, should our first step be to analyse the time available rather than the contents of the materials we aim to produce? Firstly, because you will not generally have detailed data on the effective learning time dedicated to the subject for which you are producing new materials, and secondly because it would be imprudent to launch yourselves head over heels into an analysis of the contents of the material without first defining the general framework, and in particular the time available for the teaching of the subject in question per academic year and per week.

Consider the following aspects which will allow you to identify the time frame, step by step.

> **The first element to look at when deciding on the contents of your book - the time factor**

The Academic Year

You should start by counting the number of teaching weeks available for the new material. To this end, consult the official curriculum which will probably state the official number of teaching weeks.

This figure is often more a recommendation than an absolute prescription, however. It may not take into account even official interruptions such as exams or once-a-term upgrading meetings for teachers.

To identify the effective length of the academic year you will also have to look at the statistics of the Ministry of Education regarding pupil attendance, and to analyse the data you gathered yourself in the field. There may be a wide discrepancy between the official number of teaching weeks and the number actually observed in the schools. You must then decide on the figure on which you wish to base your textbook.

At this stage you should be aware of the fact that any decision to base your work on the "shortened" school year may have serious repercussions: a reduction in the number of teaching weeks may entail a radical modification of the attainment targets for the entire primary cycle[1].

You should also consider the "legality" of your decisions. Even if you are involved in a pilot project, which by its very nature needs a certain scope for action, you should check to what extent you are required to move within the confines of the official remit and to what extent the education authorities will allow you to work outside an official framework, even if it is considered outmoded or erroneous.

If you feel that you should introduce innovations, try to analyse the situation so that you can decide when to inform the education authorities of the changes introduced in your material: sometimes it may be prudent to keep them informed of your intentions, while under other circumstances new ideas may have a better chance of being accepted if you remain silent until the pilot material is presented. This is a vitally important consideration which applies not only to defining the time-frame, but to the entire conceptual phase of your work.

Time-Table

Having decided on the number of teaching weeks you wish to take into account in your new textbook, you should examine how schools manage this time at present.

In many industrialised countries all pupils follow the same officially prescribed time-table, which has not been substantially altered for several decades; textbook authors do not then generally have to worry much about the time aspect. The situation is often different in developing countries, where pupils do not necessarily all follow the same time-table, and where the official time-table or time-tables is or are not always observed in schools. In some countries, for instance, one group of pupils follows a so-called "full" time-table (5 hours a day), while another group follows the so-called "short" time-table (3 hours a day), and a third group follows an even more seriously slashed time-table with only one or two hours instruction a day[2].

Sometimes this practice is officially sanctioned, but the existence of several different time-tables rarely has any impact on the level of attainment targets. To avoid any form of discrimination, the education authorities set the same targets for all groups.

Make the distinction between official guidelines and practice in the field

This situation directly affects your work as textbook authors; you will be tacitly expected to produce materials which will allow different target groups to achieve the same targets at the same time.

At this stage you should concentrate on a thorough examination of the official guidelines and the general practice in schools to allow you to decide which timetable or time-tables you wish to take into account in your material. Do not take this decision lightly. If you discover that the majority of your target group follows a short time-table, and you wish to take this into account in the material you produce, you will be opting for a drop in the volume of knowledge to be acquired, which will in turn have repercussions at the level of the education authorities, the teachers, parents and pupils. Do not hesitate then to take one step backwards and check that your decisions are correct, if not legal, correcting them if necessary. You still have time.

Breaking Down the Time-Table

This is the third aspect you will need to bear in mind when determining the contents of your materials and the sequence in which you aim to present them.

Not all official curricula follow the same procedure here; some indicate only the overall time allocated to each subject, while others lay down the time allocated to every component of every sub-topic, i.e. for the subject “mother tongue” the latter would not only stipulate the time to be allowed for reading, writing and speaking and listening, but would also break down the time reserved for writing into the time earmarked for handwriting, vocabulary, grammar, spelling, conjugation and creative writing. We recommend that you analyse the type of break-down found in your official curriculum.

Sometimes the break-down may surprise you, since it does not correspond to the methodological approach you had intended to take. Let us take an example. If you are to produce reading and writing materials for grade one, would you leave “handwriting” in the field of “art” as prescribed in some countries, or would you integrate it into your textbook, thus saving valuable time? You must of course specify the methodological approach you intend to take, but at this stage it is vital to know which subject “handwriting” is deemed to be part of before you can tackle the issue of the total time allocated for your subject.

These considerations may appear pointless to you if it is only a question of adding half an hour per week to the total time allocation for the subject; they may indeed be of secondary importance when the academic year comprises 35 weeks with a 27-hour school week, but they are anything but superfluous when the pupils spend no more than 15 hours a week at school and the school year is no longer than 24 weeks. Thus, again, take great care making your decision.

We should add that the approach you take must again be tailored to the circumstances. Sometimes you will have to consult with your colleagues who are responsible for producing textbooks for other subjects and/or with the curriculum development unit. Sometimes you will be unable to engage them in a real dialogue and your efforts to harmonise the procedure adopted for various subjects will be doomed to failure such that, to avoid paralysis, you may choose to confront the others with a fait accompli[3].

Number and Length of Lessons

Now you know the time-table to be respected and the overall time to be taken into account for your material. Would it then be appropriate at this stage to determine the exact number and length of lessons per week reserved for your subject, and to draw up a sort of time-table?

This sort of break-down is generally useful. If the subject in question is the “Mother tongue”, which is traditionally made up of speaking and listening, reading and writing, which tend to overlap, it becomes indispensable. Before you can define the content matter to be learned in each of these sub-topics, you will need a detailed framework. If you are also addressing pupils following different time-tables you will not be able to progress in a coherent manner without determining the number of sessions within each of the time-tables to be taken into account.

Table 17 should help you better understand the importance of our recommendation. It shows how to break down two different time-tables so as to produce a single textbook for all pupils[4].

Official Teaching Time

This is the last analysis you will have to perform regarding time management in schools[5].

It is indispensable to know how the teacher officially breaks down his classroom teaching time. To calculate this you must know the number of pupils and classes he is in charge of, and if appropriate the amount of administrative work he has to perform. To this end you should once again consult the official statistics and compare them with your observations in the field.

Check the legality of your decisions regarding the time to be taken into account for your textbook

Write a textbook that addresses all pupils in the grade whatever time-table they follow

17. One Textbook for Two Different Time-Tables

In Madagascar, the official 1985 curricula refer to a short time-table of 3 hours a day and a full time-table of 5 hours a day. It follows that the length of time dedicated to each subject depends on the working conditions: in grade two of primary schools 10 hours and 50 minutes a week are reserved in the full time-table for learning the mother tongue whereas only 5 are available for pupils following the short time-table.
When materials were devised for this grade the authors of the Tef'Boky Project decided to design a “common core” of texts to read, and speaking, listening and writing exercises for all pupils, with supplementary activities for those following the full time-table.
To this end they analysed the time officially allocated to speaking and listening, reading and writing in the two time-tables and drew up two plans so as to allow for at least one lesson of more of less identical length per day for each of these sub-topics, to be followed by all pupils.
The temporal framework for the new materials to be produced was as follows:

Sub-topic	**Full Time-Table**	**Short Time-Table**
Speaking and listening	5 x 20 min. 5 x 10 min.	5 x 15 min.
Reading	10 x 25 min.	5 x 20 min.
Writing	10 x 25 min.	5 x 25 min.

On the basis of this table the team produced an initial break-down of the subject matter to be taught and learned, i.e.

- in the textbook: for each of the 24 weekly modules, two pages for reading and two pages for writing, each corresponding to five 20-minute lessons, i.e. applicable for all pupils no matter what time-table they follow.
- in the teachers' guide: on the one hand the instructions for exercises common to all pupils, and on the other hand additional speaking and listening, reading and writing activities addressing primarily pupils following the full time-table.

We should underline the fact that it is less the average class size which is important for your textbook than the average number of classes per teacher. Your approach will not change significantly whether there are 30 or 70 pupils in one classroom provided they belong to the same class. On the other hand, if the majority of teachers are in charge of more than one class at once, you must take into account the fact that they will have to teach these classes parallel to one another, which will mean eliminating or strictly limiting certain activities such as exercises or practical work out of doors. You will have to encourage more independent learning from the very start, and give the teachers very detailed instructions on how to manage the class in the teachers' guide. If one-teacher schools make up the majority of your target group this is the only way to take this fact into account.

By the end of this phase you will have identified the temporal framework within which your material will be used; we recommend that you record your results in the way suggested in the second chapter. This will allow you to refer back to them at a glance.

Use the pinboard for all conceptual work

2. Methodological Approach

The aim of this phase is to identify the methodological approach which you intend to adopt.

Why, some of you will ask, should we once again delay looking at the content matter, and look first at the methodology. Before you can rationally decide on the contents, you must lay down the approach, for this can have major repercussions on the volume of knowledge to be acquired.

To illustrate this let us take the example of first-grade mathematics: you must decide whether to accord priority to calculating rather than counting, i.e. if your aim is to teach pupils to find solutions to problems rather than merely to count. This decision will have a direct impact on the subject matter, which you will define in the course of the following phase: in the latter case the child will have to learn to count to 100, while in the former he will probably only be able to count to 20, or 50 at the limit.

We will not go any deeper into subject-specific considerations here, but we will comment briefly on the points that you should analyse when selecting a methodological approach no matter which subject you are tackling.

Practice in the Schools

Your preliminary field research should have provided you with information about practice in the schools.

You should look at the preferences of teachers of the subject, any weaknesses in the methods generally employed and the principal difficulties encountered on the one hand; on the other you should analyse the level of training of teacher trainers, educational advisers and animateurs and their working conditions, in particular as regards the budget and the material inputs allocated to them for training activities. As we will see later, this information will have a significant impact on your choice of an approach.

Subject-Specific Research

You should not be satisfied with merely adopting the methods currently advocated by teachers, and will thus have to undertake some research into the main trends in international research in the relevant subject. You should consult not only specialised literature, but also textbooks recently published in other countries if possible.

Level of Innovation

Analyse the level of innovation that is likely to be accepted by teachers as regards methodology - the level that they will accept and understand. To this end you will have to be able to bring the scientific findings for your subject into line with the current practices in the schools.

Sometimes you will have to opt for a relatively low level of innovation. If the teachers are poorly trained, and badly paid and if only limited funds have been budgeted for training, the approach you select must be familiar enough to teachers for the textbook to be accepted immediately, and used without a systematic introduction. Any complete break with current practices, which would require a great deal of additional effort on the part of the teachers, is unlikely to be accepted under these circumstances.

We cannot stress the importance of this enough; remember how reading books adopting an overly analytical method, or materials for maths using the theory of sets have failed when introduced to poorly trained teachers, largely as a result of the high level of innovation in terms of methodology.

> **You should preferably select a traditional methodological approach with a limited level of innovation**

3. Defining Content Matter

Having defined the temporal framework and the methodological approach you can now go on to the next phase, which will aim to stipulate the volume of knowledge to be acquired for the subject and grade in question given the practical options and limitations of existing schools on the one hand, and the expectations of those involved on the other.

There are several different aspects which you will need to look at to help you identify the subject matter progressively.

Current Curricula

You should start by analysing the subject matter laid down in the current official curricula.

> **Don't modify the contents of the official curriculum without first checking how much leeway you have**

In industrialised countries authors merely adopt the contents of these curricula without checking whether or not they are relevant. Indeed one of the first criteria applied when evaluating their products is the extent to which it corresponds to these official directions.

In developing countries, however, the situation is not always so clear. It is not unusual to find that the contents of official curricula do not tally with the actual learning conditions for a variety of reasons, such as the country's colonial past. The official learning time, for instance, may be at odds with the actual time available in practice. Where this is the case it is preferable to propose that the official curriculum be modified. Some specialists even recommend that textbook projects should be more or less systematically preceded by a full-scale overhaul of the national curriculum where needed, which can be expected to take some two years[6].

As textbook authors you are not normally responsible for curricular revision; generally the ministry delegates this task to a special unit. But, experience shows that this is not always the case. Indeed relatively often in developing countries textbook authors find curricula that are hopelessly out of step with the reality of the education system in their country, and the curriculum unit declares itself unable to modify them[7]. Where this is the case, the authors themselves must revise the relevant curricula on a pilot basis to avoid producing textbooks that are inappropriate before they have even been published.

Be that as it may, analyse the situation thoroughly. It is now more important than ever before to gauge the leeway you have and, if you see yourself forced to reduce the volume of content matter covered gird your loins for major repercussions in the classrooms and negative reactions outside - as described below.

Temporal Framework and Learning

If the time effectively available is significantly less than that stipulated in the current curricula, you will doubtless intend to reduce the subject matter to be covered correspondingly. You should, however, bear in mind that a decision of this sort will have major repercussions on the teaching and learning process which we will now look at in more detail.

> **Do you intend to opt for progression in step with pupils' progress, which is difficult to reconcile with a rigorous learning programme?**

The shorter the time effectively available for learning, the more rigorous your planning must be to guarantee that pupils acquire a minimum of knowledge, without which the school would not be meeting its commitments. This inevitable strict planning of learning time does have its advantages: it allows you to produce a detailed methodological guide for teachers, for instance, a sort of script which is bound to be a valuable aid to teachers who are often poorly trained.

This planning does, however, also have one major drawback: the teacher becomes a prisoner of the clock. He cannot take more time or repeat a lesson, without running the risk of jeopardising the entire course. He thus cannot adopt a “mastery” approach, according to which “generally a learning unit should be mastered before progressing to the next unit”[8]. This does not, naturally, mean that he should allow pupils to carry on learning without evaluating their progress. But, after the evaluation he is forced to carry on immediately with the next step, rather like traditional written examinations[9].

In many developing countries, the rate of absence of pupils is high, primarily as a result of sickness, agricultural work and bad weather; inevitably pupils who have been absent drop behind and represent a real case of conscience for a teacher hemmed in by a tight schedule: either he proceeds according to the time-table so that the school is worthy of its name, or he deviates from it to focus on pupils who have missed a lot. And how can a teacher confronted by this dilemma be evaluated?

Before you lay down the learning contents, you should then re-examine the temporal frame that you have drawn up; remember that the less time available, the more the teacher is likely to be straight-jacketed by the materials you are going to produce, and act accordingly.

Attitudes of Groups Concerned

When determining the content matter for your textbook you should also take into account the attitudes of the education authorities, teachers and parents. It is not always easy to identify these; in our experience parents and even education authorities are often only able to express their wishes once they have the book in their hands. Nevertheless, if you intend to cut the volume of subject matter covered you can expect the following sorts of reactions:

Education Authorities

- A systematic refusal to accept any significant change to the volume of subject matter

- Spontaneous rejection of “bargain basement education” as compared to neighbouring countries and especially as compared to the curricula of the former colonial master

- Fear of incurring the wrath of parents.

Teachers

- Vague fear of innovation which will inevitably mean curricular change
- Fear of having to deal with angry parents

Parents

- Categorical refusal to accept mass education for their own children.

Curricula in Other Countries

To allow you to have all the information at your fingertips before you make a decision it might be a good idea to compare the content matter you plan to incorporate in your textbook with that found in foreign curricula in both developing countries and industrialised states.

Analysing these documents, looking in particular at the time-frame reserved for teaching and learning, you will often help you become more aware of your own position. Thus, if you are faced with the criticism that you are proposing “bargain basement education”, as you may be if you suggest cutting the volume of knowledge to be acquired, a reference to experience in other countries can help confirm that your decision is correct and help you argue your case in front of hesitant and poorly informed education authorities.

If you consider it vital to reduce the volume of material, you should proceed with caution, and agree to a compromise if necessary. Let us take an example: in grade one at primary school, the figure 100 is often considered a symbol of mathematical knowledge, held dear by teachers and parents alike. If this is the case, and you have limited the subject matter to be covered such that children are expected only to be able to count to 20, you can summarily present the figure 100 at the end of the year. A compromise of this sort may be enough to break down serious resistance to your textbook, resistance which will not always be technical in nature.

4. Fine Tuning

The relevance of a textbook production project should have been verified twice already, once by the feasibility study and once during your field research work.

If you wish to be absolutely certain that it is worthwhile continuing your work, check again at this stage that it is relevant. Some of you will consider this unrealistic in view of the advanced state of the work, but they should bear in mind that it is not necessarily the people who make the textbook who have performed the preliminary research, and they may still not have all the information they need. They should, however, have enough information to allow them to decide whether or not the decision taken by others to produce a textbook is genuinely justified.

If you are in this position, refer to the results of the preliminary investigation and re-examine the following options.

Adoption of an Existing Textbook

Check once more whether there is not already a textbook in your country or another country which has the features you have stipulated, i.e. which covers the relevant volume of material and adopts the methodological approach you have selected.

The production of new didactic material is always so expensive for a country, that you cannot justify starting work until you are absolutely certain that it is indispensable.

Adaptation or Translation

You should also check whether there are not already books which could be adapted or translated. If the negotiation of reproduction or translation rights is not a major problem, this can be a satisfactory compromise, especially if the conditions for writing and producing new material are less than ideal.

If you conclude, having explored these options, that the production of new didactic material really is indispensable, you should pursue your work, laying down attainment targets in line with the volume of knowledge to be acquired, which you have already defined.

> **Take your inspiration from curricula in other countries, but don't simply adopt these lock, stock and barrel**

5. Attainment Targets

During this phase of your work you will draw up the attainment targets for your new material, which will correspond to the contents you have already specified in functional terms.

You may encounter one of two situations here. Either you decide only to clarify and supplement the objectives laid down in the official curricula, without moving far from these, or you will see yourself forced to define objectives that are quite new in full or in part.

> **Lay down clear attainment targets to allow you to define the contents of your textbook**

In either case you should consider that you will be touching on an area where you are probably not experts; if you can, you should thus call on the services of a specialist or at least consult the relevant literature, such as the books listed at the end of this chapter.

For our part we will merely illustrate, in Table 18, the difficulties that can arise when objectives are not properly formulated, and why it is important to remedy these.

6. Set of Materials

You have now defined the content matter that is relevant for you and formulated it as targets. It is time for you to move on to identify the nature of the materials and the number of these materials you are going to produce.

Decide on the composition of the set after careful consideration

You may find this superfluous, since you think you know the answer and will thus be tempted to start work immediately. Beware - the most obvious solution is not always the best one and the choice of the type of materials is always complex and has many consequences. If, for instance, you are attempting to produce reading and writing material for the first grade of the primary cycle, you should not necessarily produce a reading and writing book and a teachers' guide. It may be more appropriate to produce a writing exercise book or complementary pedagogical tools such as letter cards, word cards or pictures.

<table>
<tr><td>18. Vague and Incomplete Attainment Targets</td></tr>
<tr><td>In 1987, the authors of the Tef'Boky Project, who were responsible for devising didactic materials for learning to write in grade one of primary school analysed the existing curriculum, which made a distinction between handwriting and written expression. The target for handwriting in the first year was defined as “Knowledge of lower case letters”, which was then further explained as:
“Knowledge of cursive lower case characters:
• Vowels, consonants, figures
• Letters and figures of different sizes”.
During the analysis these directions proved to be so vague that it was not necessary to contravene them, but too imprecise to be translated into didactic materials without the authors making additional decisions. The main questions facing the authors were as follows.</td></tr>
<tr><td>The term “knowledge”</td></tr>
<tr><td>Firstly what exactly is to be achieved? Must pupils be able to form the characters as perfectly as the model? Or is it enough if their writing can be deciphered? What are the conditions needed to achieve this? Have pupils achieved the objective if they write without an example or need they only be able to copy an example they are given? If the latter is the case, is the model also in joined-up writing, or must the pupil be able to translate a printed model into cursive style?</td></tr>
<tr><td>The term “letters”</td></tr>
<tr><td>What exactly is to be achieved? Do we mean initially the 21 letters of the Malagasy alphabet or also the 13 complex graphemes in the language? Are pupils expected to write individual letters, or put them together to form words and sentences? A fundamental point, because the difficulty of joined-up writing is putting the letter together to make a word. In the latter case will pupils have achieved the target if they forget elements or add extra elements, i.e. if they make a spelling error? Or must they write without error? And so on.</td></tr>
<tr><td>To allow them to devise their material, the authors thus added the following details to the original targets:
“By the end of grade one the pupils can copy simple, short sentences in Malagasy in joined-up letters on the basis of a model in either joined-up or printed characters; the sentences should be written in lower case characters only and involve only the letters of the alphabet. The pupils should write legibly without errors” (Garabola teachers' guide, 1988, p. 4)</td></tr>
</table>

Analyse the situation before deciding which materials would be most suitable. We suggest that you look in particular at the following aspects.

Pedagogical and Didactic Aspects

You should first identify the materials that would be desirable to ensure high quality learning and teaching. The preliminary research should have given you precise information as to the level of training and experience of teachers, which will allow you to identify the tools that teachers will need to teach the subject in question as well as possible. This research should also enable you to pinpoint the materials that pupils need to raise the level of attainment significantly, given the conditions that you yourself observed in the field.

Financial Aspects

Refer again to the results of your preliminary research, paying particular attention to the following points:

- the number of textbooks which each pupil in the class must purchase and the price of these books;
- the amount that parents are able and willing to pay for their children's school materials;
- the way individual school materials are bought or lent at present, or which are likely to be accepted;
- the way the teachers' materials are acquired;
- the way any large-scale reprints of the new materials will be funded.

You may reconsider your initial decisions in the light of these facts. You may, for instance decide to do without any expendable material, and to dispense with tools except the textbook and the teachers' guide.

We should point out that a textbook is, of course, still the best way to learn to read, but it is not imperative in other subjects. If you are producing materials for mathematics, for instance or, better still, science, you should explore the possibility of producing only a detailed teachers' guide, at least for the first two years of the primary cycle.

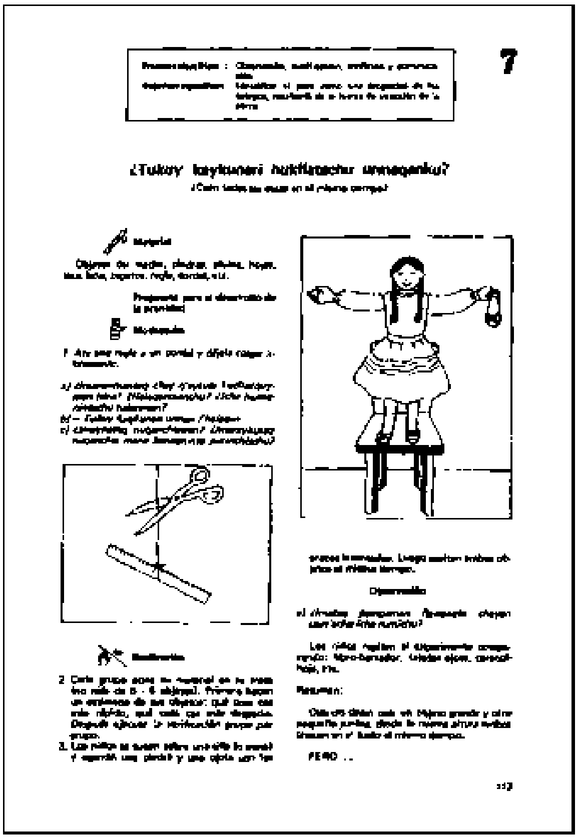
A teachers' guide is not, anyway necessarily a dull tome as many first-time authors seem to think; to convince you that it can be interesting look at the two examples below of teachers' guides for mathematics and science. They are designed for primary level, and were produced within the scope of the German-Peruvian Bilingual Education Project and the German-Malagasy Tef'Boky Project respectively.

In some subjects a teachers' guide is more important than pupils' material
Interchangeable, individual material is always a luxury

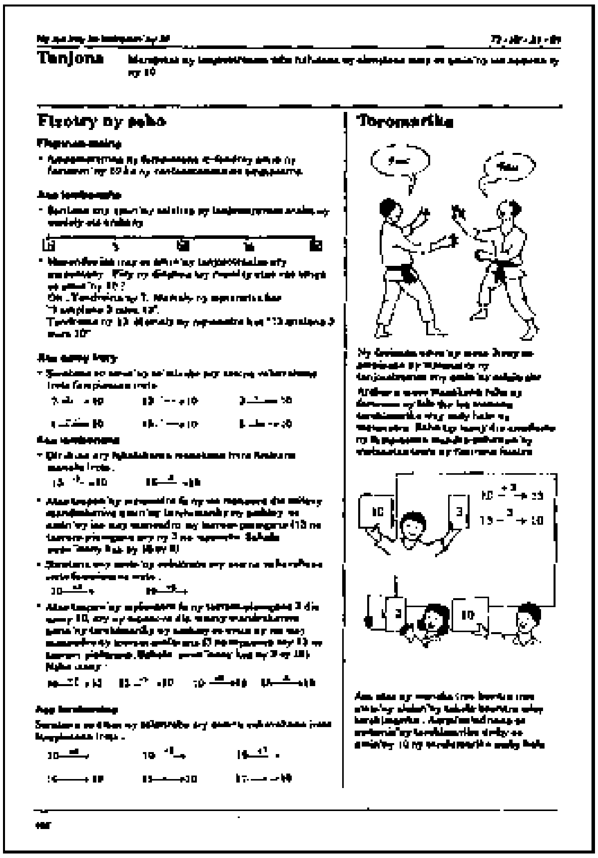
Practical Aspects

Before you decide on the composition of your set of materials, look at the working conditions in schools as you observed them during your preliminary research. Even if it were possible to finance everything planned, it must be possible to use the material and store it in the schools. You should then consider the average number of pupils working at one table, the storage facilities and the existence of a desk where the teacher can open his guide, consulting it at his leisure during the lesson.

In our experience, the lack of storage facilities in the schools is a serious constraint to the production of pedagogical tools which would be very useful. If we take word cards, for instance, they should certainly not be produced as an integral part of learning to read if schools have no cupboard or safe, for they are almost bound to vanish rapidly.



Kawsayninchis Fifth-Grade Science Lima-Puno, 1987



Kajy Mampisaina First-Grade Mathematics Antananarivo, 1993

Logistical Aspects

Even if you are preparing a limited number of pilot copies in the first instance, you should bear in mind the logistics of any subsequent large-scale distribution.

You should thus avoid materials that are difficult to pack, heavy or fragile. If you intend to produce expendable materials you must ascertain that they can be distributed to the schools in good time every year.

Ideally, the field work will have given you some indication as to the sort of material that is needed; in practice, however, this data may not be sufficient. You cannot foresee all the repercussions of the new material from the outset; mistakes can be made in spite of all the precautions taken by authors and they are always serious at this level. This is what happened in the Tef'Boky Project with a writing exercise book, written for beginners, which proved counter-productive. The failure of this exercise book seems to us to provide such a good example of what can go wrong that we have looked at the history of the book in detail in Table 19.

7. Arranging the Subject Matter

Now that you have defined the content material to be covered in the subject and the grade in question, and have decided on the set of materials to be produced, you must determine how you wish to arrange the subject matter within the materials you plan to produce.

19. Conceptual Error
The research work performed in the field by the future textbook authors of the Tef'Boky group revealed that the level achieved in writing in the first grade of primary school was particularly low. The group then proceeded as follows to systematically identify the reasons for this low level, with a view to designing materials which would be best suited to remedy this serious problem.
1. In the Official Curricula
1.1. Writing is considered to be of secondary importance
1.2. Writing, classed as an artistic discipline, is seen merely as a manual skill, unrelated to speaking and listening or to reading
1.3. Attainment targets are vague
2. Physical Conditions
2.1. There is a lack of furniture (benches and tables).
2.2. There is a lack of working materials (slates, exercise books, pencils).
2.3. There is a lack of visual aids (pictures, exercise books, books) which would help pupils to memorise letters.
2.4. The blackboards, the only visual aids, are of poor quality.
2.5. The large classes preclude teachers checking the progress of individuals.
3. Teacher's Activities
3.1. Teachers are poorly trained; they do not know how to provide perfect models on the blackboard; they have not learned to introduce the writing of characters systematically; they do not put a stop to bad habits in time.
3.2. They have no time to prepare their lessons.
3.3. They have no reference books.
3.4. They do not know how to make the best use of the few documents that do exist.
4. Pupils' Work
4.1. Pupils have not systematically practised finer motor coordination (no official preschool education).
4.2. They see writing as only a senseless and boring copying exercise.
5. Role of Parents
5.1. The parents have never been told how important writing is, and thus do not worry about providing enough indispensable expendables such as, exercise books and pencils.

The best way of tackling so many problems appeared to be individual material for each pupil, with the following features:
A personal exercise book (cf. section 2.2.)
Involving fine motor coordination exercises (cf. section 4.1.)
Allowing pupils to learn to write systematically (cf. section 3.1.)
With writing models (cf. sections 2.3, 2.4., 3.1)
With various types of exercises, to reinforce reading lessons (cf. section 1.2)
With reminders and practical advice for the teacher (cf. sections 3.2, 3.3., 3.4)
Designed like a game (cf. section 4.2)
No more expensive than common exercise books (cf. section 5.1.)
Since the analysis indicated that parents were used to buying at least one writing exercise book and one pencil per year, the authors did not expect any negative reactions on their part. And indeed the exercise book was well received by everyone.
Yet, when the level of attainment was evaluated at the end of the year, the exercise book appeared to have had a counter-productive influence on handwriting: to the surprise of everyone concerned, the level achieved by pupils in the sample was lower than that achieved in the control group, who had learned to write without any special materials! Interviews with the teachers and the analysis of the writing exercise books revealed the following:
The exercise book was an innovation in a context where printed materials are rare; teachers, parents and thus the pupils were reluctant to use such a pretty book as a learning tool. It was thus not used for the exercises, which might “sully” it, but only to verify what had been learned; it was only used when the pupils were sure that they could write well, but at the same time less time was spent practising on slates or in normal exercise books.
The teachers concentrated so fully on the exercise book that they forgot to introduce writing systematically and to monitor pupils' progress. They saw the book as a sort of “monitor” which allowed them to turn their attention to other sections while the first grade were learning to write. Thus pupils' progress was monitored only sporadically, and few notes were made, if any, as can be seen from the exercise books. During the revision phase the exercise book was thus abandoned. The new set of materials is made up of an individual slate, purchased with the help of a World Bank loan, a revised textbook comprising texts for reading and models and exercises for pupils to write, copy and solve on the same slate, and, of course, a teachers' guide.
This new set of materials was fairly well received, but in 1992, some parents who had followed their children learning to read with the help of the exercise book, continued to complain about its withdrawal...

The first step is of course to identify the contents of each component part of the set: if you have decided to produce a textbook and a teachers' guide what information will you put in each of these?

If all pupils follow the same time-table, you will distinguish primarily between the teaching and learning aspects, but if the materials address pupils following different time-tables, and if the majority of your target group are following a reduced time-table, it may be better to reproduce the supplementary exercises for pupils following the full time-table only in the teachers' guide. You should then proceed as follows.

Reduced Time-Table

You should refer to the plan you have already drawn up for the reduced timetable and note the number and length of lessons dedicated to the sub-topic in question.

Stages of Learning

Refer back to the attainment targets and identify the various stages that are indispensable if the targets are to be achieved. Thus, if first-grade pupils with no pre-school experience are learning to write, for instance, the major stages involved could be as follows:

- visual distinction and pre-writing exercises

• systematically learning to form the letters of the alphabet
• copying words and sentences
• composing and copying words
• composing and copying sentences.

Contents and Learning Time

Now you must ascertain that the learning targets can be achieved by all pupils. Those following a reduced time-table in particular must be able to systematically go through all the stages identified above as being indispensable.

Divide up the contents and proceed step by step

Supplementary Subject Matter

Finally you should define the content matter of supplementary activities for pupils following the full time-table.

If we assume that you are tackling the sub-topic “speaking and listening”, for instance, and the target for the week is aural recognition of the sound [o], all pupils must be able to recognise this sound. It is not difficult to imagine a few, simple exercises, such as asking all pupils to clap their hands when the teacher uses this sound in a list of words. For pupils who have more time, you could add supplementary exercises, like guessing games involving words starting with **o**. The learning target remains unchanged. The exercises will merely reinforce the knowledge acquired by pupils following a full time-table.

Now you can distinguish between the contents that must appear in the textbook, including writing exercises that are crucial for achieving the target and which thus address all pupils, and the supplementary exercises which can easily be placed in the teachers' guide along with the teaching directions.

An oversight when you decide on the composition of your set can be counter-productive

There is no universal formula for organising the contents of a guide

8. Contents of the Textbook

Having worked out the rough break-down of subject matter to be covered by each item of the set, you can go on to the next phase, which aims to organise the contents of the textbook.

This is a complex task, and the teams of authors which we have been able to observe have adopted various procedures. Some organise the contents little by little, feeling their way forward, rather like a jigsaw, while others make do with very rough plans, some of which can be very vague, which they firm up afterwards. Others again lay down in detail at the outset exactly how they plan to organise the content matter.

We do not believe that there is one correct way of organising the content matter, but we will take the liberty of outlining our own experience, in the hope that this will help you to adopt a more systematic approach.

First Break-Down of Contents

Whatever the subject and the grade in question, you should undertake a first rough break-down of the content matter, stipulating the relation between the time unit and the work unit. You may take a week, or a fortnight or a month as your time unit, while the work unit may be a letter, if the subject in question is reading, or a series of numbers in maths. This will give you the skeleton of the textbook as it were.

To illustrate this, the time unit adopted for *Garabola* was a week and the work unit a letter, as you can see from the illustration opposite.

Define the relation between time unit and learning unit

Order of Presentation of Contents

You now have the bare bones of your textbook. This overview is essential, but not in itself enough. Now you must organise the content matter to be learned, as defined by your group. Let us take the example of a reading book, again. If you have decided on the relation of time unit to work unit, you can decide in which order you wish to introduce the letters.

Depending on the material in question, you could select one of three approaches.

A First Reading and Writing Book

The first step is to determine how you intend to present the elements to be learned within the scope of reading lessons, in view of the fact that this will, in part, also determine the sequence for the writing lessons which will run parallel to reading.

The organisation of a first reading book always poses very specific problems. And again, there is no universal formula applicable in every situation and to every language.

Nevertheless we think that it is interesting to consider the approach taken by the Tef'Boky Project faced with the task of organising the schedule for learning the 21 letters of the Malagasy alphabet and the 13 complex graphemes in the language; this experience is illustrated in Table 20.

Fitting together several sub-topics

Often the subject is subdivided; then you not only have to organise the sequence of learning one sub-topic, you must also ensure that the various sub-topics interlock as well as possible.

In first-grade maths, for instance, where priority is accorded to arithmetic, although geometrical concepts and measurement are also introduced, the subtopics cannot necessarily interlock on a repetitive basis, as is the case with reading and writing, described above. Indeed you must check in each instance which level of arithmetic is needed to progress in the other sub-topics.

The permanent interaction between the various sub-topics will, in this case, determine the structure of the textbook little by little, like a jigsaw. The best way to work systematically is to return to the pinboard.

Base your arrangement of the subject matter to be learned on the interaction of the many sub-topics covered by your textbook

20. Order of Graphemes in a First Reading Book
Malagasy has 21 simple graphemes and 13 complex graphemes, involving two or three elements. When the authors responsible for preparing learning materials for first-grade reading and writing lessons started work on *Garabola,* they stipulated the order in which the graphemes were to be presented in the textbook taking the following factors into account
Frequency of the grapheme
The authors counted frequency on the basis of three texts of some 1000 words, the first of which was a newspaper article, the second a literary novel and the third a story told by a child. The frequency of punctuation such as apostrophes and hyphens was also counted. It emerged that the vowels, o, i and a had the highest frequency; with few exceptions, such as the “ts” used in negations “tsy” (not), simple consonant graphemes were found more frequently than the complex graphemes.
Complexity of the form of each grapheme
Given the fact that pupils learn to write what they have learned to read, the authors then analysed the complexity of the form of graphemes, and modified the list based on frequency as follows:
• Numbers of elements making up the grapheme • Single element graphemes (n, t, m, etc.) were put ahead of those made up of two elements (tr, dr, nk, etc.) or three elements (ndr, ntr); even ts, in spite of its high frequency, was relegated to a place behind the single element graphemes.
• Shape and complexity of the form of the letters • Letters that are relatively simple to write (l, t, etc.) were given priority over more difficult forms (f, z, etc.)
Aural distinction
Certain phonemes in Malagasy are relatively close to one another, and can cause interference in young children; the graphemes corresponding to these phonemes were presented separately; thus j and z were presented separately, as were tr and ts, etc.
Visual distinction
Letters with vaguely similar forms, were separated from one another by at least one other letter whose form offers enough of a contrast, taking both printed and joined-up forms into account as far as possible. Thus n and m were separated by t, d and b by j and e and l by r.
Finding a common element
Complex graphemes were sometimes tackled together where the authors felt that this would make it easier to learn them and would emphasis any common element; thus mb and mp followed on from one another as did nd and ng, etc.

Writing Exercises

The organisation of the contents of materials for writing becomes extremely complex as soon as the pupils start to study the language, i.e. often as from the third grade. The authors must then define and harmonise at least five sub-topics: handwriting, vocabulary, spelling, grammar and creative writing.

It is important to create a coherent approach within each of these sub-topics, and then ensure that the pupil's progress in each of them is harmonised: it is impossible, for instance to introduce the concept of sentences in grammar if the pupil has not yet learned to write upper case letters. The contents of the exercises will interlock more and more closely as time goes on thanks to the permanent interaction, until an intra and interdisciplinary coherence emerges. If you are in this situation, you can begin to familiarise yourself with the complexity of the subject by consulting the contents page of recently published books. If the book is well written, it should contain an overview of all subject matter presented in the book and the page make-up should make the links clear.

At the end of this phase you can draw up a list of the subject matter you wish to cover, and the order in which the material is to be presented. Be aware though that you may have to modify this provisional arrangement:

- when you begin to organise the subject matter page by page
- when you present the subject matter in the form of exercises, two phases that we will be looking at in the following chapters.

9. Contents of the Teachers' Guide

By the end of the conceptual phase you will have identified the subject matter you will wish to cover in your teachers' guide. Although this book deals more with the production of textbooks, we will spend a moment looking at the guide, given the vital importance of this publication in the hands of teachers who are often poorly trained.

> **Take the vital role of the teacher into account and decide on the contents of the teachers' guide with great care.**

Many of you may ask if it is appropriate to write a sort of “user's manual” which would help the teacher day by day by giving detailed instructions, or if you should aim to write a “training manual” which would allow him to acquire the basic knowledge he needs to teach the subject in question, or again, if you should try to combine the two.

Given the fact that the didactic material you produce will stand or fail on the ability of the teacher to use it, you should attach great importance to the contents of the teachers' guide. We would suggest that you base your decision on an analysis of the needs and possibilities of teachers; to illustrate what we mean we have summed up the approach taken by the Tef'Boky Project to define the contents of the *Garabola* teachers' guide in Table 21.

The main shortcomings of the existing teaching process were identified, enabling the authors of the revised version of the *Garabola* teachers' guide to decide on the subject matter that would best remedy these. The following list was drawn up:

- General information on the language

- Presentation of the subject “Malagasy” and the sub-components reading, writing and speaking and listening

- Detailed information:

  Sufficiently precise information for every lesson throughout the year in each of the three sub-topics, for the two time-tables - a sort of script;

  Brief explanations on how to present an exercise involving a new mechanism;

  Examples for some speaking and listening lessons

- Systematic visual presentation:

  Reading and writing lessons in boxes
  The form of the letter in joined-up writing

- Teacher's texts:

  Texts for reading, to read to the class, to answer an aspect of the speaking and listening target (“The pupil can listen to and understand messages read to him...”)

Short weekly poems

• “Peripheral” information

Articles on the lexical enrichment of other languages;
Articles on the history and creation of the Malagasy alphabet.

• Reminders

Interruptions to recapitulate the progress of work and look forward to the lessons to come;

Regular invitation to refer back to the beginning of the guide to read the general information.

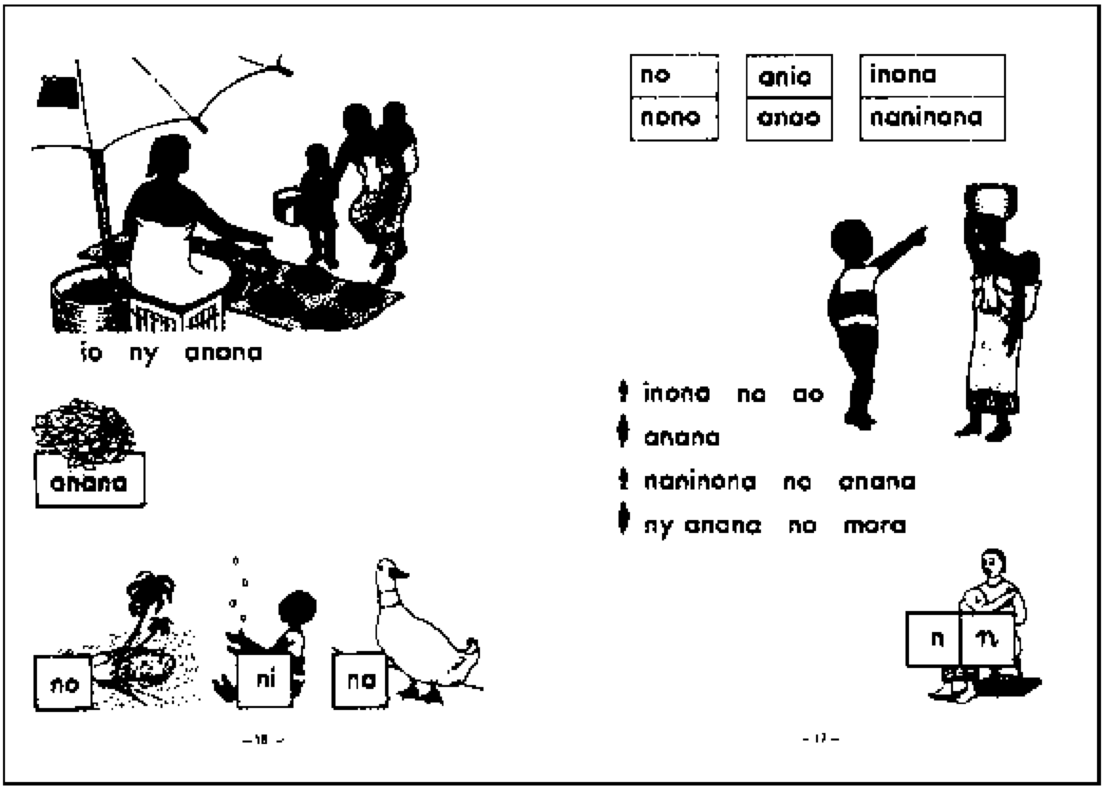
21. Contents of the Garabola Teachers' Guide			
When the authors revised the teachers' guide for teaching Malagasy in the first year of primary school, they defined the contents in a systematic form. Firstly they identified the central problem regarding the use of the guide, basing their work primarily on the data collected during the preliminary research and on the results of testing the pilot version of *Garabola.* Then they looked for the reasons for these problems and the consequences thereof in day-to-day school practice.			
Central Problem			
Teachers do not use the guide as they should			
Reasons 2	Reasons 1	Consequences 1	Consequences 2
1.1. Having read the guide the teachers change nothing in their practical work[10] 1.2. No sanctions on the part of the administration	1. Teachers do not pay enough attention to the guide	1. Teachers are not motivated	1.1. Teachers do not pay enough attention to their classes
2.1. Lack of training and/or willingness	2. They are not able to put the ideas in the guide into practice	2. Teaching remains superficial	2.1. The target is not achieved
3.1. Para-professional activities take priority	3. They only take time to read the guide during lessons	3. Teachers do not manage their classes	3.1. Pupils get bored
4.1. Teachers unaware of their own limitations	4. They believe that they know enough	4. Teachers, self-satisfied, give dogmatic lessons	4.1. Pupils are passive 4.2. Level of attainment is mediocre.
5.1. Shortage of well-written pedagogical documents	5. They do not have the benefit of a literate environment	5. Teachers see their work as a routine	
6.1. Inability to synthesise information and pinpoint the essentials 6.2. The guide lacks the recommendations needed for easy adaptation	6. They do not adapt the instructions properly to the actual classroom situation	6. They have no critical spirit. There is a lack of initiative and creativity	
7.1. Teachers doubtful about applying certain parts of the guide	7. They do not read what upsets them	7. Teachers are not rigorous enough in their lessons.	

8.1. Problems of readability, particularly because of the move from the verbal to the written mother tongue, terminology and communication difficulties	8. They are afraid of not understanding what they find in the guide	8. Too much time is wasted in class	

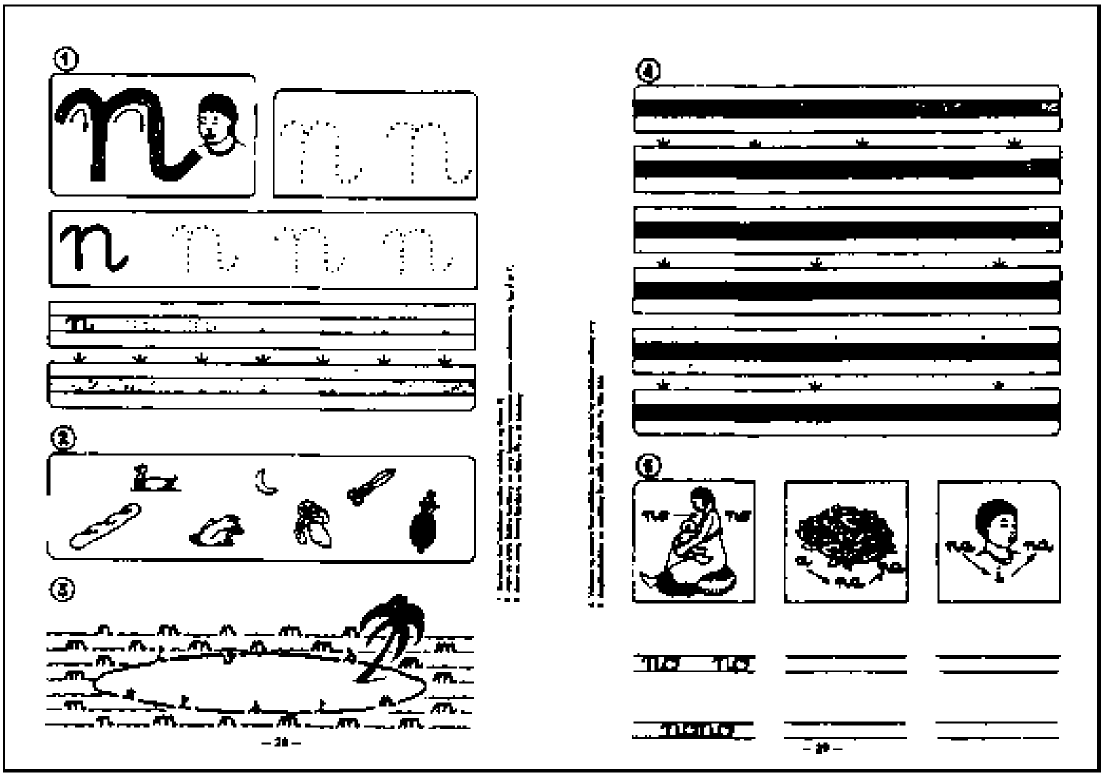
Garabola

To illustrate the points we have looked at in this chapter here are some typical pages taken from

Garabola, which we have often quoted as an example.

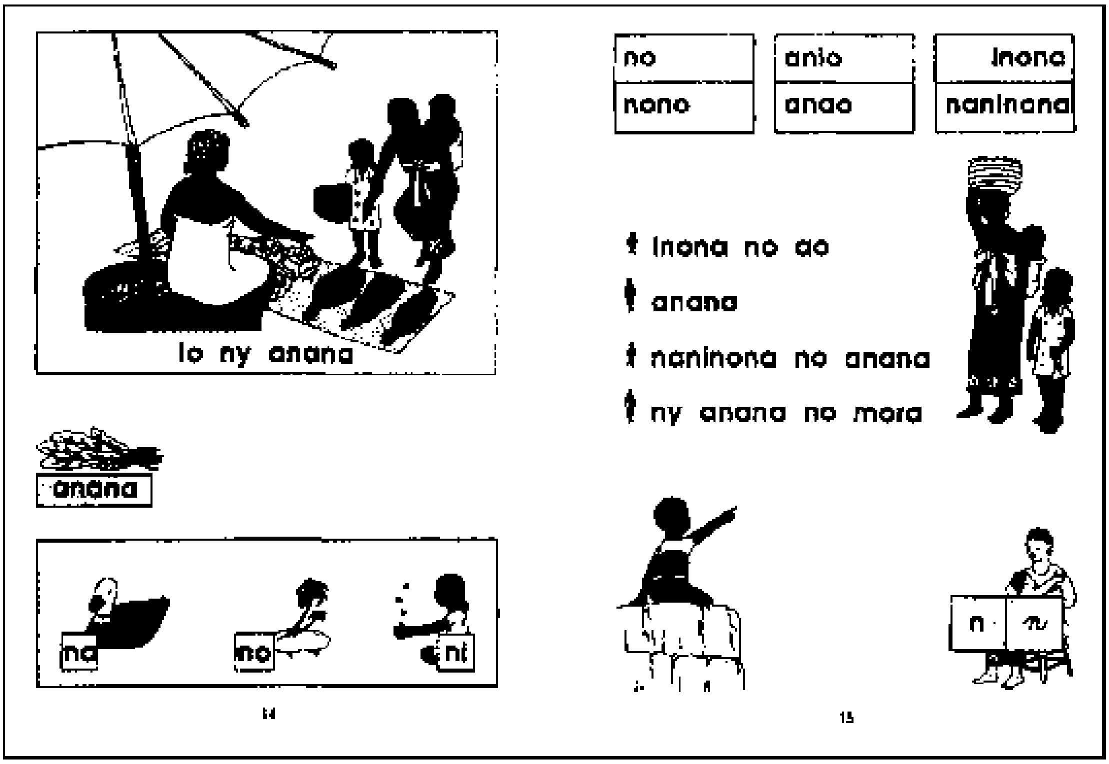


1. Pilot version of the textbook. A typical reading lesson

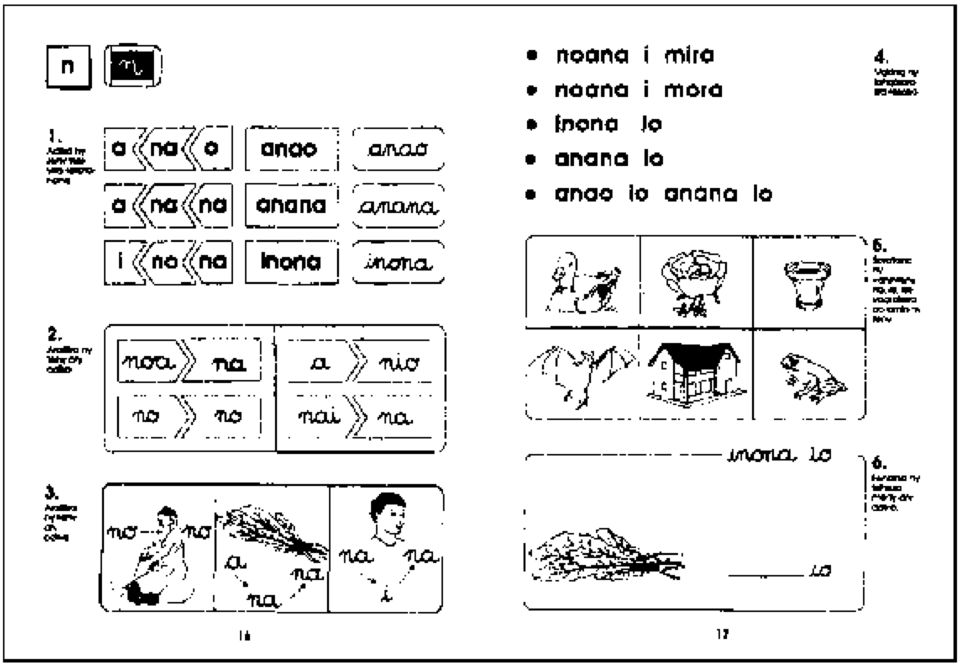


2. Pilot version of the exercise book: Two typical pages of writing.

Revised version of the textbook

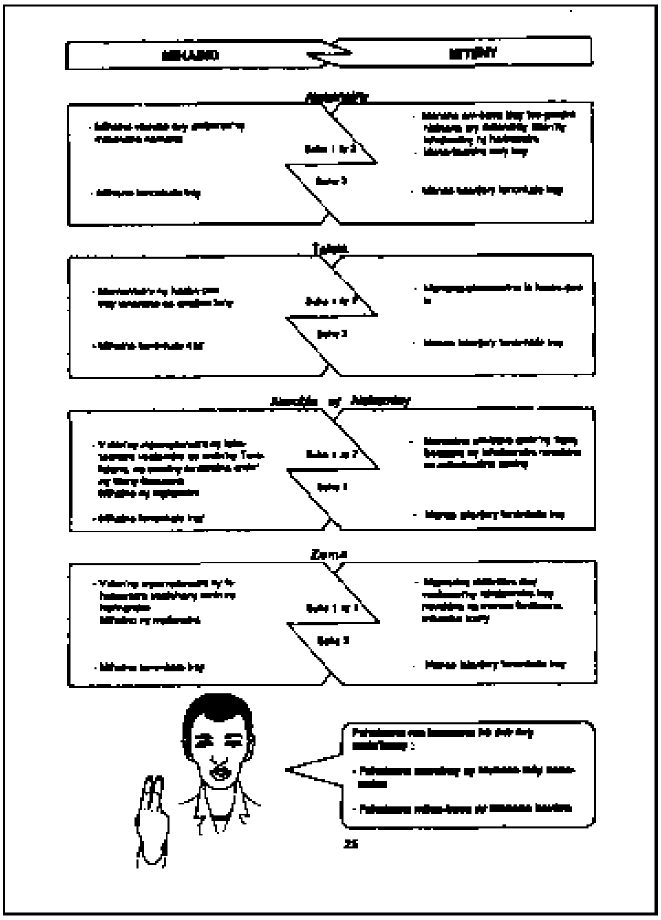


1. Typical reading lesson

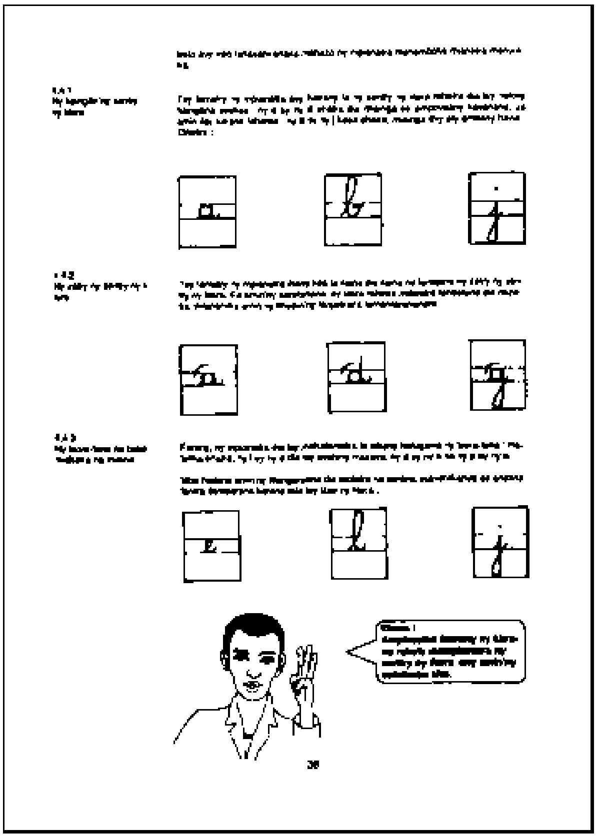


2. Typical writing lesson

Revised Version of the Teachers' Guide

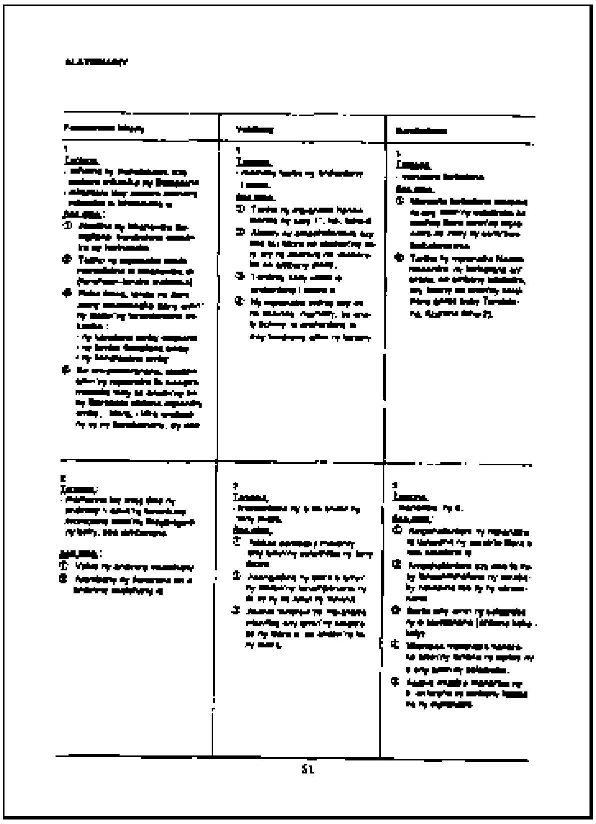


1. Use of graphics - the interlocking of reading

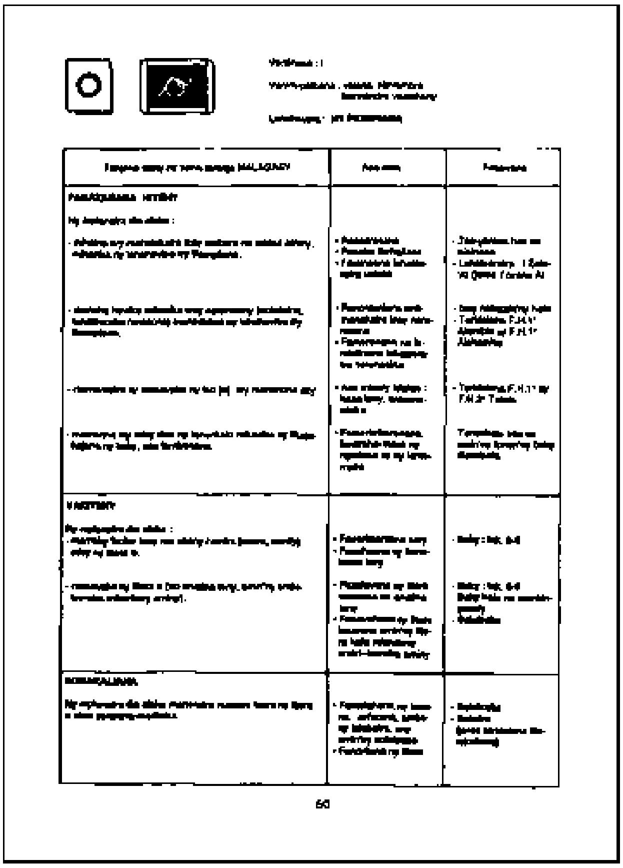


2. Brief refresher - here joined-up writing and writing activities

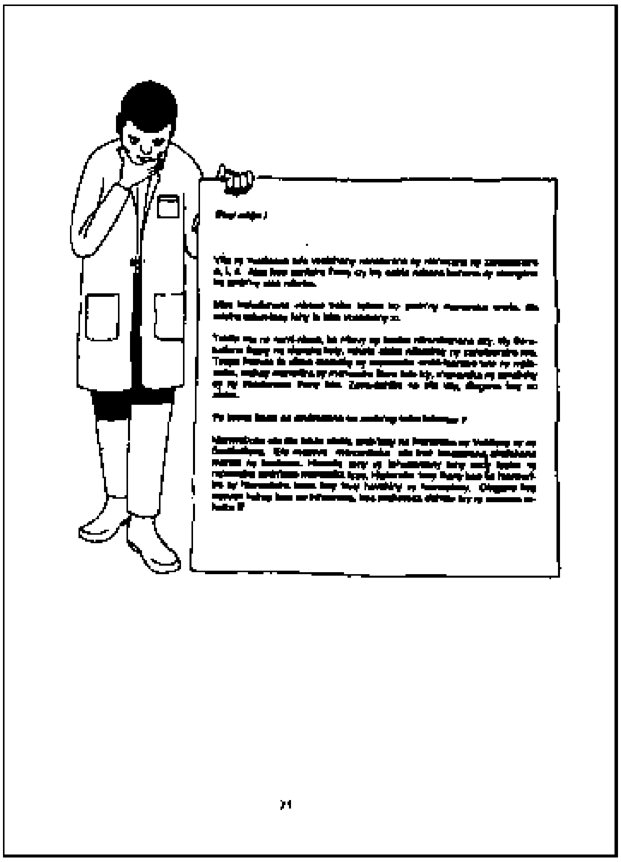
3. Practical recommendations for each sub-topic in cartoon form



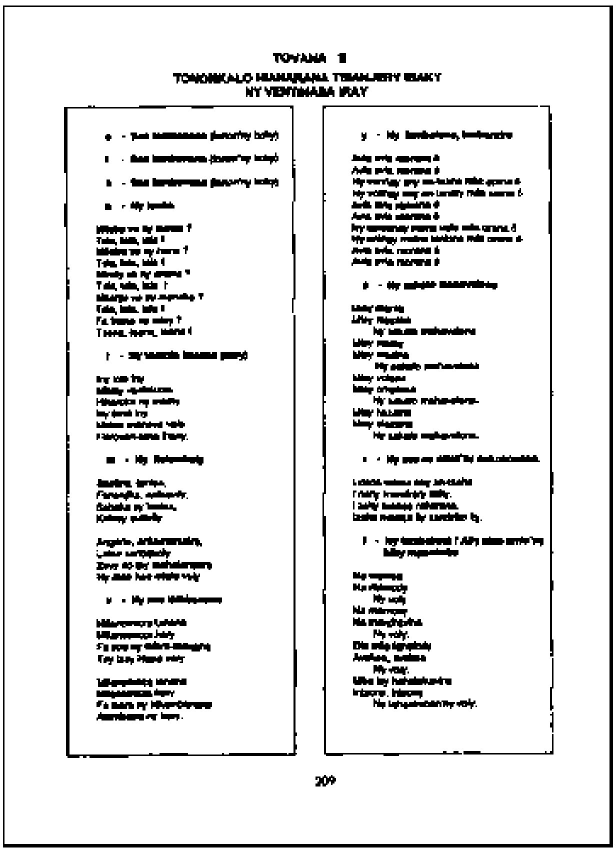
4. Presentation of attainment targets and corresponding activities for each week



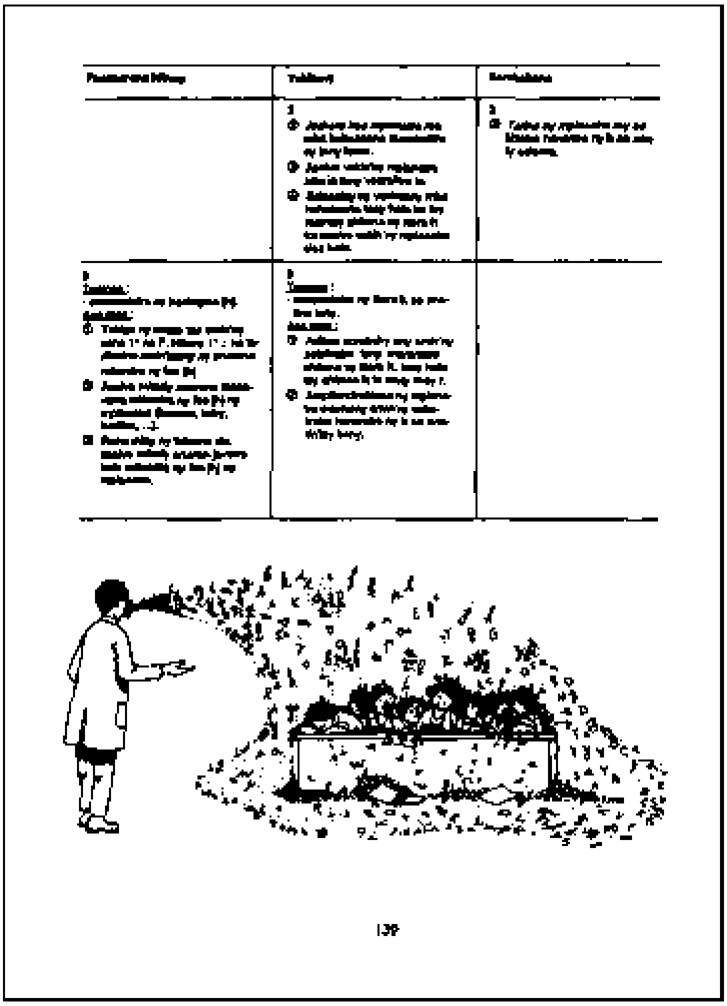
5. Script for speaking and listening, reading and writing activities - one page a day



6. Periodic summaries of the work already done and the activities to come



7. Anthology of 24 reading texts and 24 poems



8. Caricatures to retain the attention of the teacher

10. In Conclusion

Where do we go from here?

At the end of this phase you should have two lists of contents, one for the pupil's textbook and one for the teachers' guide.

It would obviously be preferable for you to write these two books in concert. The advice and instructions should at least be devised at the same time as the texts and exercises in the textbook, if not written in a final form.

However desirable this may be, though, it is not always possible. You will appreciate that each publication demands the closest attention of the authors over a period of several months, which generally precludes authors switching from one publication to another. You should not worry, then if you concentrate more and more of your energy on the textbook and end up gradually putting off work on the teachers' guide until later. Make do with noting the important points that you might otherwise forget and continue your work on the textbook - decide how to present the contents that you have now identified. The next chapter is devoted to the presentation work.

Notes

[1] The repercussions of decisions relating to the temporal framework are numerous, e.g. the Tef'Boky Project, noting that the time actually available in schools was significantly lower than the official allocation decided to spread the basic “Mother tongue” course over two years rather than one, thus drastically changing the attainment targets for this subject throughout the primary cycle.

[2] In Madagascar some isolated schools do not even manage to provide the reduced three-hour session and others are open for barely 20 weeks a year. When they devised their didactic materials, the textbook authors of the Tef'Boky Project decided to discount schools that did not operate for a minimum of 24 weeks a year, considering that these establishments were not in a position to provide an education worthy of the name.

[3] In our experience the first version of some textbooks may well encounter major resistance on the part of the education authorities. But if this resistance is not based on well-founded technical or political criteria, and is merely a more or less deep-seated wariness of anything new, the revised version will carve out its own niche.

[4] This table indicates one of the major difficulties that the new materials will have to cope with: the full time-table dedicates twice as much times to reading and writing as the reduced time-table. This represents a major challenge for authors, and becomes more of a problem from year to year, if we take into account the fact that as from the third grade the study of the mother tongue involves grammar, vocabulary, conjugation, spelling and composition, whereas the reduced time-table remains the same.

[5] It is, of course, quite impossible to verify the actual teaching time left, once you have deducted everything which does not involve teaching, such as lines, time taken to hand out books and exercise books, or to wait for silence; although this information would be very useful, it would not have any direct impact on the concept of your material.

[6] Seguin, R. *L'élaboration des manuels scolaires,* op. cit, p. 5.

[7] This is often seen where a new education policy is approved. In Peru, for instance there had always been a department within the ministry responsible for producing the traditional curricula which were based on the assumption that Spanish was the mother tongue of all pupils. When “bicultural and bilingual education” was introduced in 1979 this department asked the German-Peruvian Bilingual Education Project, which has already been referred to several times, to develop curricula to match the didactic material produced in Quechua, Aymara and Spanish as a second language, since the textbook authors were felt to be better able to perform this work.

[8] More precisely, “the mastery theory is based on the finding that the vast majority of pupils in a normal class can master a given target if they are given enough time and the support they need to overcome their difficulties”. In: Landsheere G. *Dictionnaire de l'évaluation et de la recherche en éducation,* op. cit., p. 197.

[9] In the curricula which the authors of the Tef'Boky Project proposed to the education authorities in Madagascar, it was stipulated that 70% of all pupils must achieve the attainment targets.

[10] This is the only problem that cannot be solved by the manual; the solution lies elsewhere - the promise of a career structure, reintroduction of inspectors' visits, etc.

To Sum Up

Once authors are in possession of the main information regarding the production conditions and the circumstances in which their textbook will be used they can start work on the conceptual phase. Their first task must be to lay down the sequence of subject matter to be covered. To achieve this it is important to define each of the following:

- The actual learning time in the grade and subject in question, which is not always the same as the official learning time;

- The targets, in line with the teaching and learning conditions;

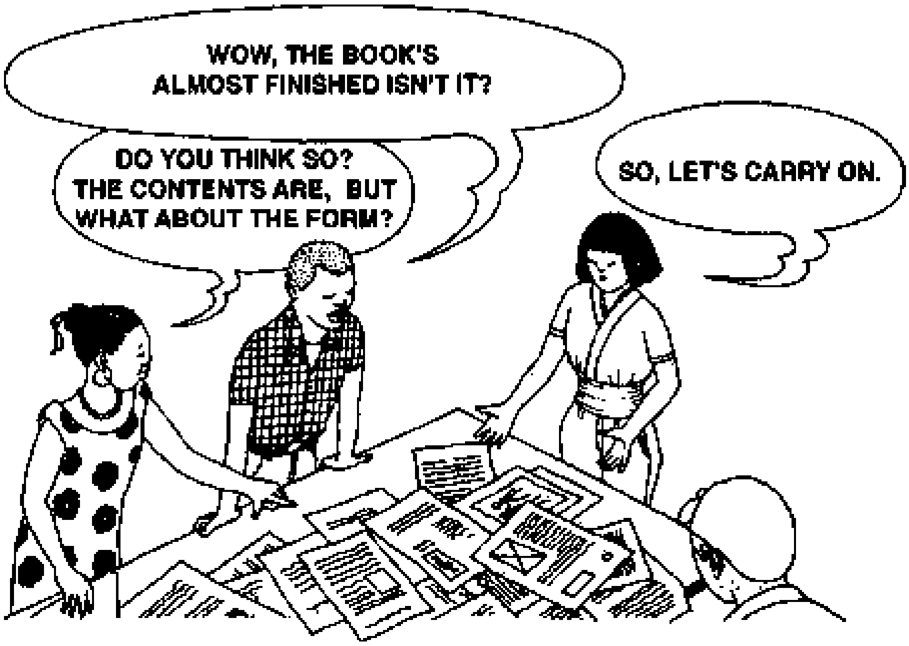
- The composition of the set of didactic materials which will allow pupils to achieve these targets, and which must be in line with the needs and possibilities of the target group;

- The break-down of the subject matter to be covered by the various types of material to be produced

Conceptual work is always complex in developing countries.

The official instructions often bear little resemblance to the reality in the schools, and the teams of authors must gauge how much leeway they have before deciding. Finally they must make a distinction between what is desirable (often the tacit wish of parents and the education authorities) and what is suitable for the given situation but often more difficult and almost always less attractive to both the authors and the various target groups. Every aspect of the new textbook must be examined on the basis of a number of criteria, including the material, psychological and social aspects, which it is often difficult to reconcile satisfactorily.

In spite of this complexity, however, or perhaps because of it, you must invest the necessary time and care in this conceptual phase if your textbook is not to be built on sand.



WOW, THE BOOK'S
ALMOST FINISHED ISN'T IT?
DO YOU THINK SO?
THE CONTENTS ARE, BUT
WHAT ABOUT THE FORM?
SO, LET'S CARRY ON.

The Form

The last chapter enabled you to identify the contents of the didactic material to be produced; in this chapter we will look at how to ensure that text and illustrations are of the quality required while staying within your budgetary constraints.

If you are still new to the profession of textbook writing, you may feel that you have spent so long on all the work to date that now it is time to close the conceptual phase. But, if you go on to write your textbook without a proper plan for the form, you will run the risk of writing texts that are too short or too long, producing exercises that are difficult or impossible to present visually, preparing artwork that is far too expensive or producing an unhappy mix of text and illustrations.

To avoid these eventualities, you should thus examine the physical and graphic aspects of your textbook before closing the conceptual chapter. Since the contents and the form are interdependent, you can create them in a two-pronged action, so that the texts and illustrations fit into a pre-established framework without major difficulties.

In large publishing houses, the work described in this chapter does not concern the authors directly[1]; if you are lucky enough to have good publishing back-up, you need only read through this chapter to understand the constraints that the publisher is bound to impose on you. If, however, you have to decide personally on the physical and graphic aspects of your book, you should read this chapter carefully, bear in mind that it is generally errors in the form which reveal the lack of professionalism of authors, and take appropriate precautions.

Contents and form must be devised in tandem

Don't leave the format to chance; analyse all possible consequences of your choice

1. Format

To allow you to visualise the initial arrangement of the contents of your book on the page, we suggest that you first decide on the dimensions of the book.

If you look at textbooks designed for primary level, you will see that the basic form is rectangular[2], but that the dimensions vary: some are scarcely larger than a standard paperback (200 x 130 mm), others are almost A4 size (297 x 210 mm) and most are somewhere between these two extremes (e.g. 240 x 170 mm).

The format of a textbook should never be a coincidence. The main elements that you should take into account to ensure that the dimensions are appropriate for the purpose intended, i.e. that they meet the needs of users and producers alike, are described below.

Pedagogical and Didactic Considerations

First and foremost you should identify the dimensions which guarantee optimum readability, in terms of both the structure and the text. Take the following points into consideration.

Macro-legibility - the structure[3]

The dimensions you choose must make the general structure of the textbook easily comprehensible. Other factors, including typographical aspects and layout considerations naturally play a contributory part, but it is the size of the pages more than any other single factor which will determine the macro-legibility of your book.

The format you choose must firstly reflect the structure of the lessons. If you are producing a first reading book, where it is important to respect certain stages of learning, the page should be big enough for the links to be quite clear. If you have chosen an analytical learning form, the reader should be able to recognise at first glance the progression from the sentence to the word, the syllable, and perhaps the letter.

Equally, the format must reflect the various functions of the text. Let us take an example to illustrate this: let us assume that you plan to print exercises along with brief instructions in your book. The page dimensions must then be such that each block (exercises and instructions) is easily recognisable at first glance.

The two illustrations below reveal how important this aspect is.

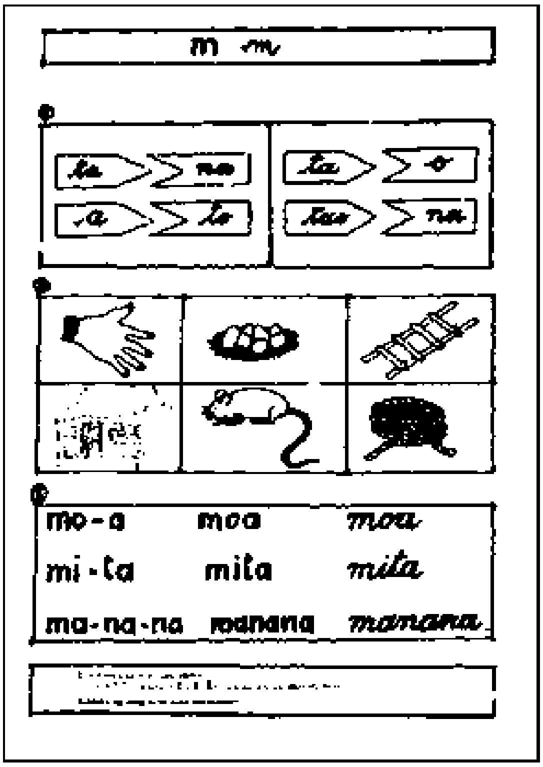
> **First priority: the format must be large enough to ensure that the structure is easily recognisable**

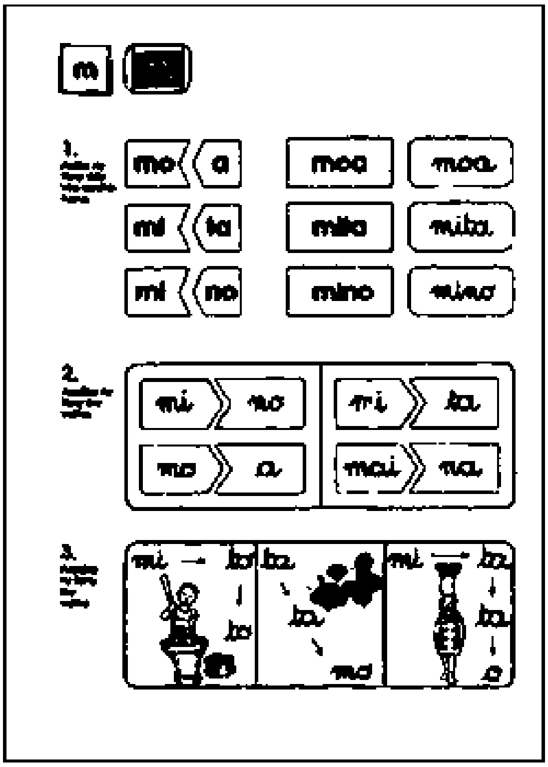
Micro-legibility - letters and words

The dimensions of your textbook must also be such that it can be easily and effectively read by users. This readability is governed by several factors, which you must bear in mind at the end when determining the layout of your book. At this stage we will look only at those factors that have a direct bearing on the format, i.e. the size of the characters used.

You should take your lead primarily from the research conducted in industrialised countries over a period of several years now into the readability of printed characters. M.A. Tinker, one of the best known experts in this field, concludes that the characters used in textbooks should be in indirect proportion to the level of education: the further down the educational ladder you go, the larger the characters should be[4]. The dimensions of the textbook must thus allow you to use the size of characters recommended for the grade in question.

This is always important, but it is vital for a first reading book. Since it is not recommended to hyphenate words at this level, and we would advise you not to spread sentences over more than one line in the first lessons, the textbook dimensions must enable you to write a sentence in one line using the size of characters recommended[5]; a paperback format would thus be inappropriate at this level.





The left hand page shows a draft, the right hand page the final version of Garabola exercises. Look at the two, and see how important it is to arrange the exercises and instructions in a way that makes them easy to understand. Think about the consequences of the two versions: if the instructions are printed at the bottom of the page, the textbook must be long enough to separate them clearly from the exercises; if they are printed on one side of the page, on the other hand, the textbook must be wide enough for the exercises to be printed completely.

Secondly, you should bear in mind the learning conditions observed during field work: if the classrooms are poorly lit, if most pupils have not enjoyed preschool education, and if they have little contact with printed materials, you may have to raise the levels of readability determined for industrialised countries[6], and use a larger format for the first grades at primary level.

Practical Considerations

This is the second important factor which will influence your decision on the appropriate format, and may force you to modify your original decisions. If you have, until this point, given priority to pedagogical and didactic considerations, you probably intend to use a relatively large format; but under the circumstances in which textbooks are normally used in developing countries you may have to scale down your book.

Before deciding, consider the following factors.

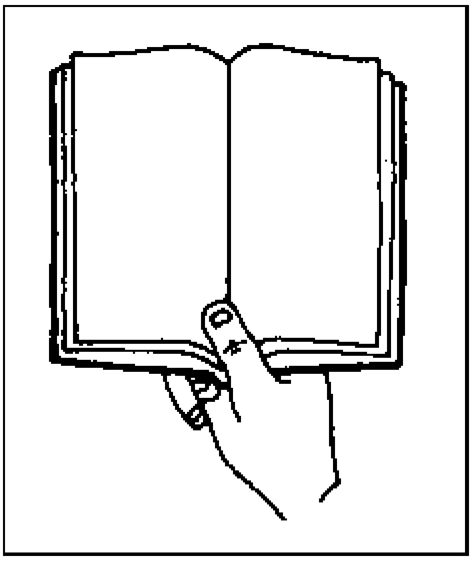
Ease of Handling

A book is always made to be visually attractive, as we have seen above, but it must also be easy to handle.

When you select the format, you should think firstly of the pupils of course: they must be able to hold the book closed with one hand without difficulty or open using both hands. You should also think of the teachers. Since some of them will be teaching several classes at once, and since they will almost always have to stand to better direct proceedings, you should choose a format which is small enough for the teacher to hold it in one hand during the reading lesson as they prefer to do.

Test your book for ease of handling by holding it in one hand as shown below.

Large formats meet pedagogical needs best, while smaller formats respond to practical and financial considerations



School Furniture

The dimensions must also be appropriate for the school furniture available.

Return to the field study and determine how the schools are equipped in terms of tables and chairs; and more precisely look at the width of tables, the average seating space per class and the general state of repair of pupils' furniture. In some classes an unnecessarily large textbook can be a nuisance for pupils and will be rapidly destroyed.

Utilisation

Finally, when deciding on the dimensions of a textbook you should bear in mind how it is going to be used, by one pupil or several.

If it is to be used by more than one pupil, the book will only be borrowed by pupils and will be kept in the school building. It can then be relatively large, especially if the system involves two or three pupils sharing a book. On the other hand, if parents are expected to buy the book, it will have to be carried back and forward to school in a small canvas or raffia bag; if this is the case you should come down on the side of a small, compact book, which will be easy to carry and won't be destroyed so quickly. Specialists reckon that textbooks for primary level in rural areas should have a maximum format of 220 x 140 mm to ensure a maximum service life[7].

You should pay all the more attention to these considerations since the other factors which will help determine the service life of your textbook (paper used, material used for cover, binding) may not be of top quality.

Economic Considerations

By analysing users' needs you have worked out your first ideas as to the dimensions of your textbook. You should now check whether the desirable is financially feasible. The cost price of a book being closely linked to the price of the paper used[8] you should decide on an appropriate format in terms of the format of the paper and printing materials so as to avoid wastage, which can be very expensive.

We are now entering the technical domain with which authors are not, as a rule, familiar. Given the scope of this publication we will look only at the essentials. We recommend that you consult your printer who should be able to give you the additional information you need, and that you read the works listed at the end of this chapter.

Contact your printer at this stage

Format of Paper to be Used

Paper is manufactured from pulp, which is in turn produced on the basis of certain raw materials (wood, but also plants and textile waste). Paper machines produce large rolls of paper which can then be cut into sheets.

The rolls of paper are sold by weight, whereas sheets are sold in reams (packs of 500). The format of rolls is determined by the width of the strip; reams of paper come in standard sizes[9].

To avoid unnecessary wastage, make sure that the format of your textbook corresponds to the dimensions of the sheets of paper used in printing, folded once or more, as indicated briefly at the start of chapter one.

Avoid paper wastage which will put an unnecessary strain on your budget

You should thus contact your printer to find out whether or not he will have to import paper; if he can, you will have a certain leeway regarding the format, since large paper manufacturers can often produce paper to your specifications provided you order a large enough quantity and provided the order is not urgent. If, on the other hand, he is obliged to use locally-manufactured paper, or if you have been donated paper, as is relatively frequently the case with textbook projects, you should determine the format of the textbook on the basis of the format of the available paper.

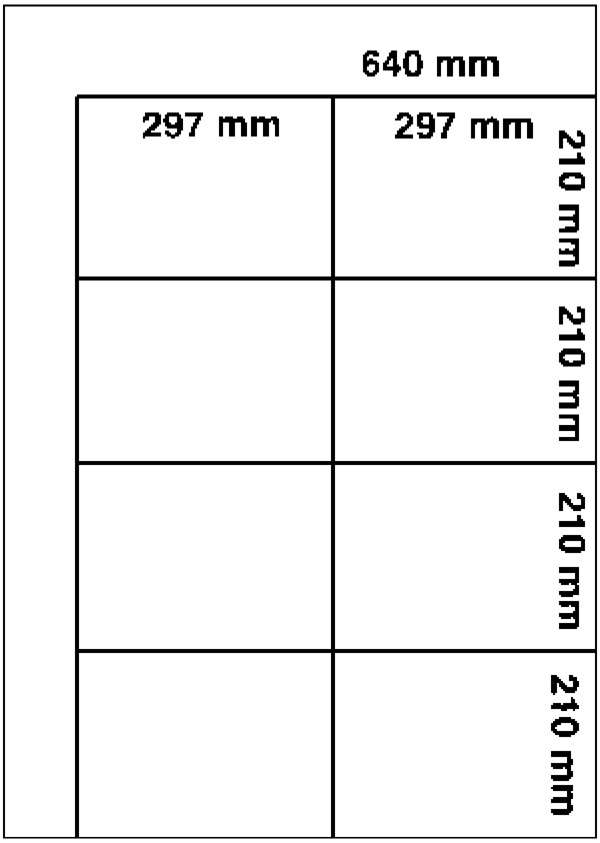
What you, as authors, must be aware of is that it is rare for a book to be printed one page at a time; for reasons of economy a maximum number of pages is set for each sheet printed. The forme thus obtained is slotted into the printing press, and the printed sheets are folded and then cut on three sides. You then have a “signature”. The body of the book is made up of several signatures put together.

To print the maximum number of pages at a time on one press you should define the final format of the finished work with great care, on the basis of the paper format. If, for instance the paper available for printing is A1 format (594 x 841 mm), and you decide that your textbook should measure 250 x 190 mm, you can print 16 pages at once, as illustrated below, 8 right hand and 8 left hand pages; the blank edges will make it easy to trim the pages once they have been folded[10].

Format of Printing Presses

The format of your textbook must also correspond to the format of your printer's printing presses. To take the same example as before, if the dimensions of the printing press are 920 x 640 mm you should not select a finished format of 300 x 240 mm for your book; because of a few centimetres too many you would only be able to print eight pages at once rather than 16, the wastage would be high and the cost of the paper would almost double.

The paper wastage may appear to you to be negligible for a pilot run of a few hundred books, but if the prototype is approved for general nation-wide distribution with a run of say 50,000, the additional costs of your lack of foresight will be enormous.



You should, however, be very careful in this field. Although it is vital for you to understand the importance of the relation between the format of a book and of the paper used for printing, you must be aware that the information given here is far from complete. The printer, who has experience in this field, will often know how best to reconcile the financial considerations with the format you want. You should always consult your printer before making a decision which it will be difficult to change at a later date.

Publishing Considerations

Finally, you should not forget that the dimensions you select for your textbook need not necessarily apply only to this one volume.

If you have been asked to produce a series, you should bear in mind that one feature of the set will be the identical format of all textbooks. Reconsider your decision in this light, and see if it is appropriate for the series as a whole.

2. Number of Pages

The number of pages, which is closely linked to the format, and partly determined by it, should also be stipulated at this stage.

For most books, the number of pages can only be identified once the manuscript has been written: a system of counting, called “casting off”, allows us to count the number of characters used and thus to calculate the space needed by the text once it is set. The complex structure of textbooks, however, precludes this approach. Indeed quite the reverse is true: before the authors start to write, the number of pages must be determined, and the text they write will be shaped by the exact number of pages and the relatively precise space allowed for text on each page.

We propose that you examine the following aspects and achieve as great a harmony as possible when deciding on the number of pages.

Pedagogical and Didactic Considerations

The number of pages must first correspond to the material to be covered, and the methodological approach that you have decided on in line with chapter 4. The following are the main aspects to be taken into account in this phase.

Learning Pages

Firstly you should count the number of pages that are to be dedicated to learning; this will give you an idea, and allow you to plan the number of printed signatures that will make up the finished textbook.

To this end you should look again at the draft contents for each learning unit - i.e. the lesson - and identify the number of pages required per unit or lesson. Take into account the format envisaged, and the learning stages or the major parts of each lesson. Then estimate the number of pages needed to present the subject matter in a systematic way - and multiply this figure by the number of units you intend to incorporate in the book.

If, for instance, you have planned 24 units for the year, your results will be as follows:

• For 2-page units	48 pages
• For 3-page units	72 pages
• For 4-page units	96 pages
• For 5-page units	120 pages
• For 6-page units	144 pages.

Some of you will probably wonder how you can go about identifying the space needed to present the contents satisfactorily on a page; if this applies to you, look briefly at section 3 of this chapter, which deals with this question, even if you have to come back to it in more detail later.

At this stage, of course, your results can only be provisional; as you will see, the total number of pages you have just calculated does not correspond to the total number of pages in the book. This exercise is only important to give you a first rough idea of size. Commit it to memory and put it up on the pinboard.

The number of pages in a textbook is decided before the book is written

The number of pages allocated for each lesson must allow for an effective layout of the contents

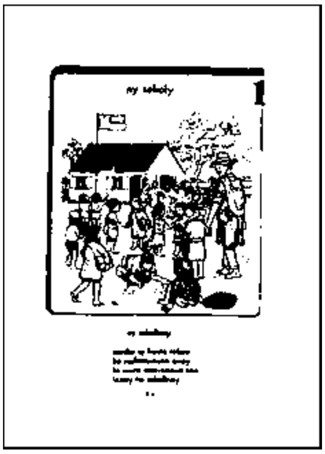
Macro-legibility of the Book

The number of pages must make for good macro-legibility. If you opt for an even number of pages per unit, the arrangement of the contents should be fairly transparent; the first page of every unit will either be a right-hand page, or a left-hand page.

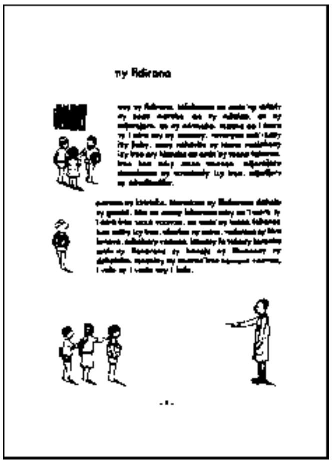
If you chose an uneven number of pages for your units, you will not get any such clear structure; the first page in a unit will sometimes be a right-hand page and sometimes a left-hand page. If you intend to have units of 3 or 5 pages in length we would urge you to reconsider the wisdom of this before progressing.

To illustrate this point we have printed the arrangement of one unit of the pilot version of *Tongavola,* a reading and writing book for grade-two pupils in Malagasy. The authors saw no other option open to them but to opt for 6-page units; the first five units address all pupils, the last is made up of supplementary exercises for pupils following a full time-table.

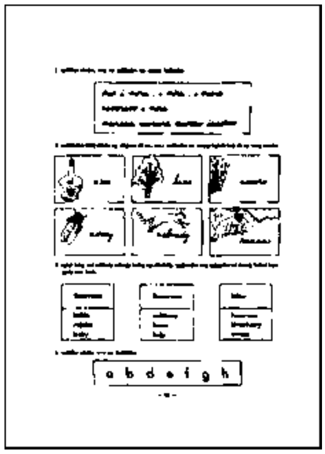
Given the heterogeneity of the contents of certain pages, it was vital for the units to have an even number of pages, to give the reader a marker in the form of the first page, which is always on the same side. The figure below shows the first unit of *Tongavola* to illustrate this.



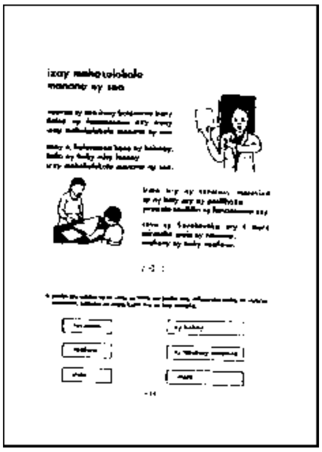
1. Visual introduction to the topic of the week, which is also used for speaking and listening lessons, followed by the poem of the week



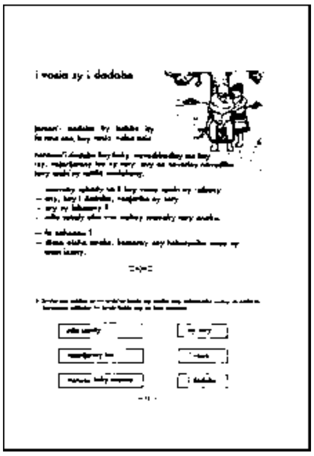
2. First reading text, descriptive in nature



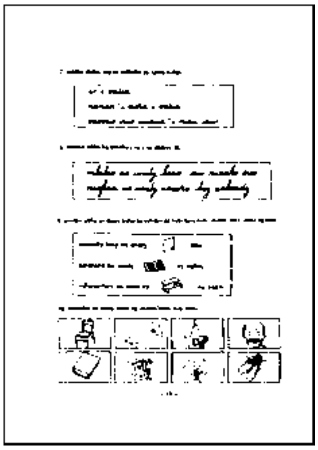
3. Writing practice: handwriting, spelling and vocabulary



4. Second reading text, procedural in nature, followed by a grammar exercise



5. Third reading text, narrative in nature, followed by a composition exercise



6. Additional text comprehension, spelling, grammar and vocabulary exercises

To ensure that readers can find their way around the book easily, you should opt for an even number of pages for each lesson

Financial Considerations

Beginners are often tempted to incorporate as much of their own knowledge as possible in their first book. Not only do they often overestimate the volume of work which teachers and pupils in developing countries can realistically get through, but they forget to gauge the financial implications of printing non-essential pages.

Paper is always expensive. Calculate for yourself the cost of an extra eight-page signature in a run of 100,000 or more.

So, keep to the number of pages you consider essential for each unit and modify this if necessary to keep costs within acceptable limits.

Technical Considerations

The figure you have calculated is still not the total number of pages of your textbook. It is merely a rough calculation, which you will be able to make more precise when you take the technical factors into account.

To this end you should go back to the format you plan to use, and the format of the sheets of paper to be used for printing, which will allow you to check how many pages can be printed at once. You will see that it is best to choose a multiple of 8 (16, 32, etc.) pages for your book. The difference between the number of pages reserved for learning and the total number printed will depend on what we will term “non-text information”, which we will look at in more detail below.

Let us assume that you consider 96 pages essential to present the subject matter, and you have to choose a multiple of 16 pages. To get a round number, you will have to use an entire signature for non-text information[11].

Bibliographical Conventions

A book does not only contain information in the main body of the text, but also in the form of non-text information, which may be found on the title page, or at the start or end of the book. And in a book destined for true booklovers the first pages must be left blank.

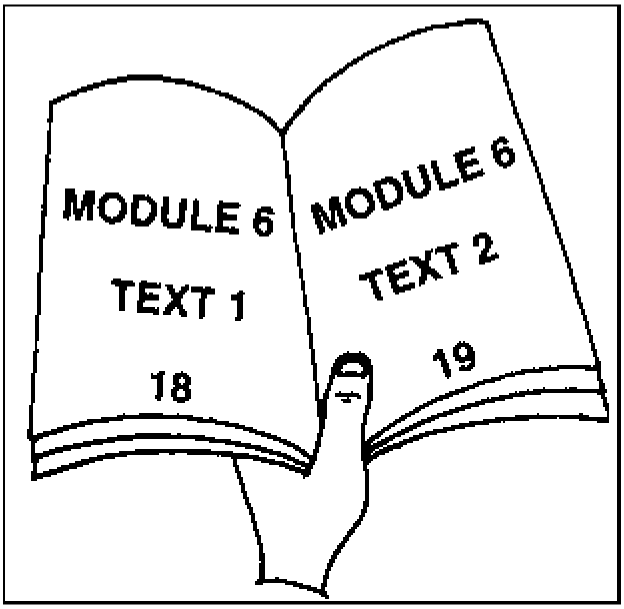
It is acceptable for there to be no blank fly leaf in your book; but you must provide what we have chosen to term non-text information.

In an attempt to explain this briefly and as precisely as possible, we have printed the cover page and the first few pages of the revised version of *Garabola* opposite. Below each page we have descried the information contained on that page and outlined the reasons for including this information.

Publishing Constraints

This is the final point that you must take into account when deciding on the number of pages your book will have.

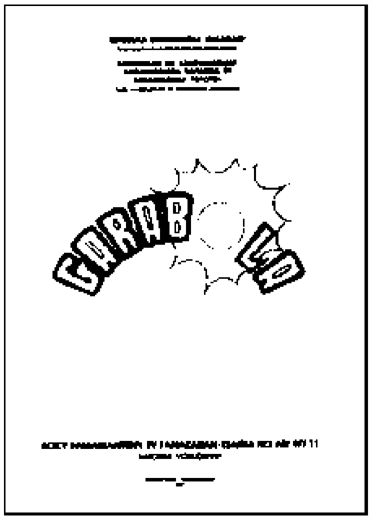
The books for each class should be at least as thick if not slightly thicker than the preceding volume. You should thus ensure that the grade one book does not take on the dimensions of a small encyclopaedia, which is bound to cause problems later in the series.



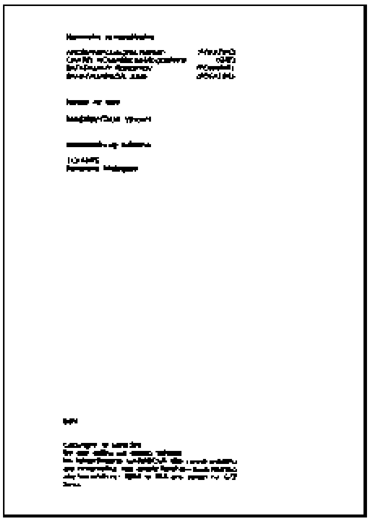
Run one last check at the end of this phase: if a page has remained blank due to an oversight it is easy to correct this oversight either at the start of the book (add a preface, spread the table of contents over two pages rather than one, for instance), or in the body of the text (in a reading book you could add an extra title page before the supplementary texts, for instance). If, however, you have forgotten a page in your calculations, which can happen to even the most experienced authors, it will be difficult to add one at a later stage, and the later you discover your error the more difficult it will be: sometimes you will have to redesign the entire layout with all even pages becoming odd pages, etc.

Front Cover
Contents: Title of book:
Contents (subject and grade): Illustration
Reasons: Practical reasons: The potential purchaser must be attracted by the illustration, informed as to the contents of the book and told whether or not the book is officially approved.

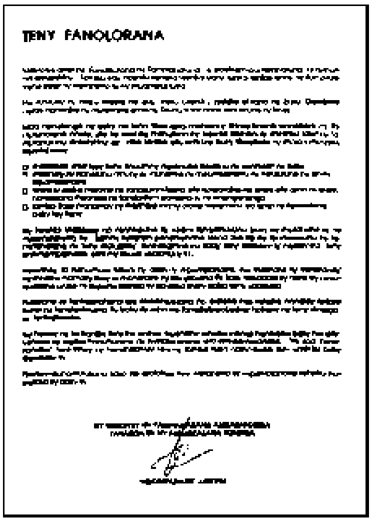
Back Cover
Contents: Announcement regarding the publishing of the textbook for the next grade:
Reminder of contents: Printer's logo
Reasons: Practical reasons: The purchaser must be told whether or not the book is part of a series; Legal and practical reasons; The printer must be specified.



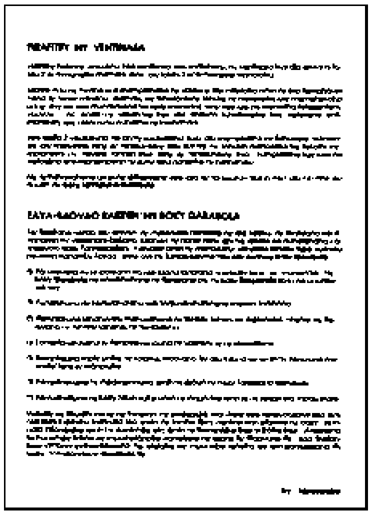
Full-Title Page
Contents: Name of ministry; Name of sponsor; Title of book;
Contents (subject and grade); Version (pilot); Date and place published
Reasons: Institutional reasons;
Practical reasons: Even if the cover is lost the full-title page gives the essential information



Copyright Page Contents: Authors' names; Illustrator's name; Publishing unit; Copyright Reasons: Legal reasons: Who holds the copyright; Recognition of the moral rights of authors, illustrators and the publishing unit



Preface
Contents: General preface signed by the Minister of Education
Reasons: Institutional reasons: official seal of approval for the book and its contents



Introduction to the Book Contents: Text by the authors laying out the learning targets of the book and the different stages in its completion, including the evaluation phase
Reasons: Practical reasons; To enable teachers to use the book even without a teachers' guide; To boost the book's credibility with teachers: it has been tested and revised

To avoid this, make a mock-up of your book; write the unit number and the main contents on each page. You need not respect the finished format for your mock-up - a mini model is every bit as good.

Ascertain that you have calculated the number of pages correctly before progressing to the next stage

The cover of a textbook is a very special place; take great care in selecting the information to be printed on it

You should always reserve a few pages at the start of your book for general information

3. Basic Visual Structure

By laying down the format and the number of pages of your textbook you have defined the framework within which you must now insert the contents. The objective of the phase that you are now starting is to design an initial arrangement of the contents on the page, or to be more precise to put together texts and illustrations in an appropriate way on each page.

This is not the final layout. It is a draft, the first translation of your ideas into physical form. This overview will allow you to judge the general rate at which you aim to present the contents. The decisions you will make should be just precise enough to allow you to progress to the writing phase, gearing your work to a framework, which will probably have to be modified, adapted and specified in greater detail later.

We are touching on a field which, in large publishers, would be the task of a professional layout person. When the authors themselves are in charge, they do not always appreciate the importance of this phase, or do not have the training they need. This is why, although we describe how to proceed, we also advise you to seek the advice of a professional and to train yourself systematically to evaluate the graphic aspects of books. Once again do not be discouraged: find out about the subject by examining the layout of other books and by reading specialised books, including those listed at the end of this chapter.

Function of Visual Markers

What is the point of identifying an underlying visual structure? - to make your book a good learning and teaching tool. If it is to be a valuable tool, it is not enough to have appropriate, well-organised contents; the presentation must facilitate the understanding of the content matter, and more precisely, you will need visual markers which will clear up doubts, prevent misunderstandings, visualise the progression and spotlight key information.

To this end you must put together the various elements which make up a page (texts, illustrations and blank space) in a form appropriate to the content matter. You will create the underlying structure, which will be repeated more or less identically in each unit. In this way you will give the book a uniformity and transparency which is vitally important for pupils and teachers who have little contact with the printed word.

Organising a Learning Unit

The basic structure will be determined at unit level, i.e. at the level of the chapter or lesson. You should thus design your unit step by step, using sketches and ideas, comparing these and modifying them one after another.

If we come back to the example of a reading and writing book, you could reflect on the following basic questions:

• Will the learning units or lessons be similar or will they be divided into easily distinguishable blocks with different structures?

• Will you present all the texts and exercises in the main units, or do you plan to distinguish between those that are indispensable for learning, and supplementary texts and exercises which could be put at the back of the book?

• Should the first page of each unit be on the same side of the book? On the right-hand side or the left-hand side?

• Will the reading texts and writing exercises be separated and printed on different pages or will they be printed on the same page?

• Will the reading and writing work be presented on a full double page or will one page of reading always alternate with one page of writing?

• What is the average length of texts for reading and the dimensions of accompanying pictures?

• Will some texts require a special layout?

• How much space approximately will each exercise need?

These considerations should result in a first draft or design of the contents of a unit. You should sketch your design in pencil without paying too much attention to precision or scale.

On the next page you will find the draft produced for four pages of a lesson in the revised version of *Garabola.*

Outline the rough presentation of the contents of each lesson
You should identify the basic structure of your book little by little, scribbling down ideas, feeling your way forward, and changing your plan time and time again

Double Pages

Once you have decided how to arrange your unit, you should examine the resultant structure of the double pages; remember that the reader will always be confronted with a double page when he opens the book, and that your basic structure must build on this.

You may find certain shortcomings and feel that you should modify the arrangement of the unit. Let us assume, for instance that for a four-page unit comprising reading and writing you had decided to alternate one page reading and one page writing. You then discover that every double page throughout the book will follow an identical pattern, giving your book an apparent lack of structure.

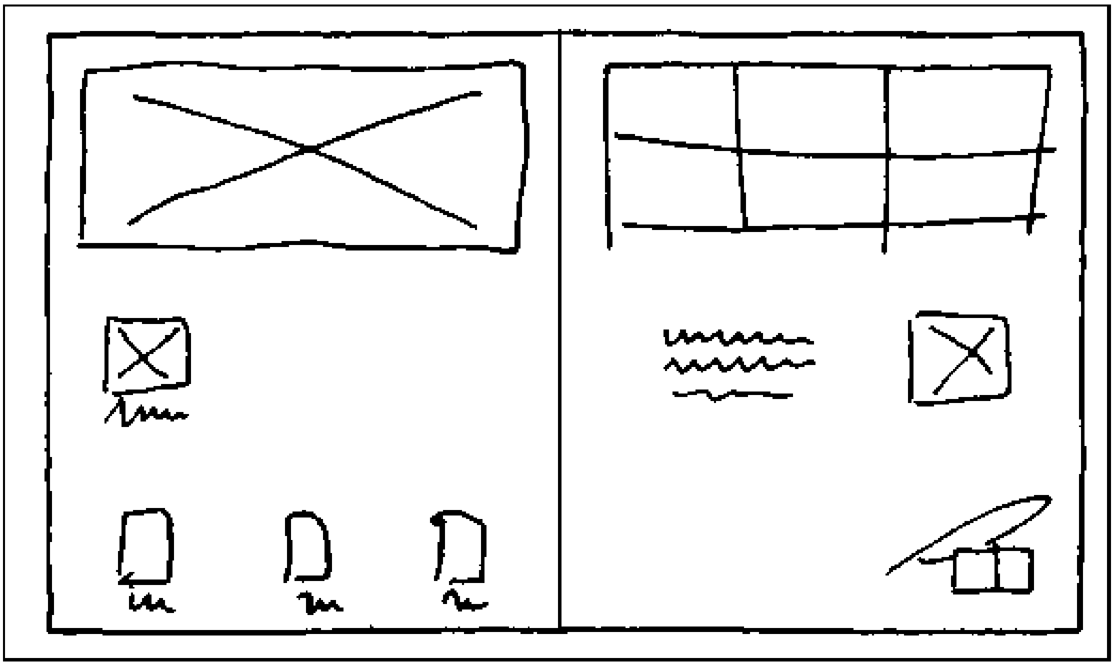
One double page of reading followed by a double page of writing like *Garabola,* reproduced at the top of this page will give you greater transparency and dynamism.

The Page

If you are satisfied with the organisation of the double page, it is time to look more closely at the organisation of the individual pages. You must look at the size of all the elements which go to make up a page and make any necessary changes.

By the end of this phase you should have a rough model of the contents of your book, page by page

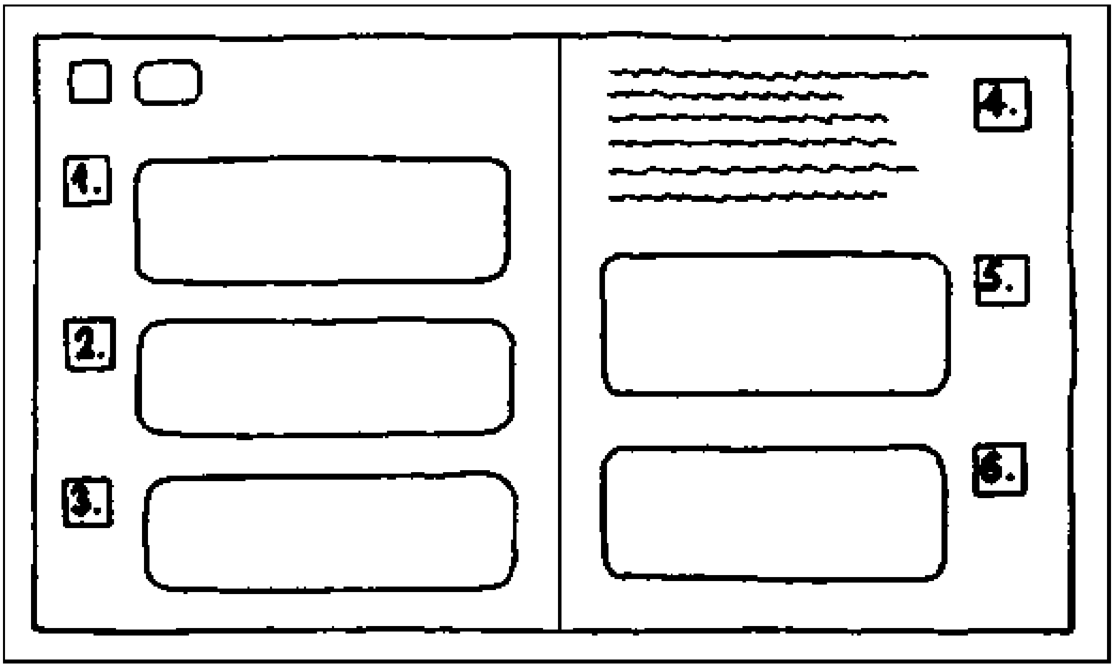
There are no universal prescriptions for a good page layout, but the following pointers are important. Avoid cramming the page too full and leaving it too empty; if you intend to put together an illustrated text and an exercise on one page, sketch the layout for each, and do not hesitate to revise your decision if you find that you don't have space to present the exercise properly at the bottom of the page. If you have a page of exercises, remember that two exercises on an otherwise empty page may look silly, but that six or more may be too many, making it difficult for the reader to find his place and conveying an impression of a dauntingly packed page.



The two pages dedicated to reading consist of:

Left-hand side: A block to introduce the topic; A sentence using the new grapheme; The key word; The syllabic family.

Right-hand side; A table of new words; A text to reinforce what has been learned; A visual reminder of the new grapheme



The two pages dedicated to writing consist of

Left-hand side: Words to read and copy in joined-up writing; Two-syllable words to write and copy; Ditto.

Right-hand side: A space for a text to reinforce the writing of syllables based on vignette;

A dictation of words on the basis of vignettes

The Layout Plan

Now you have your basic structure and can draw up a rough layout for the entire book. This model is known as the "layout plan".

Once again there is no need to respect the final format of the textbook, a smaller format will do just as well. If necessary refer to the layout plan for *Garabola,* which you will find at the start of chapter 1.

4. The Artwork

You now have an overview of what your book will be like, but the conceptual phase is still not over.

You have still to decide on the artwork, which is crucial so that you can write the text and so that you can request a first estimate from the printer (this is a compulsory part of conceptual work).

Now is the time to decide what sort of illustrations you need (diagrams, photos, etc.) and how they are to be printed (in one or more colours). We suggest the following procedure to ensure that your decisions are well founded.

Graphic Options Open to You

Consider firstly the options open to you to illustrate a textbook; these can be summed up as follows

	Colours		
Type of Illustration	1	2	4
Photos			
Realistic drawings			
Abstract drawings			

Purpose of the Illustration

Decide now what you want to achieve with the illustration; this will give you an initial idea as to which type would be best suited to your needs.

If, for instance, your primary aim is to impart information to the reader, you will find photographs (in history books for example) or abstract drawings (maps, diagrams, etc.) most suitable.

In a reading book, on the other hand, the illustration allows young readers to recognise visual elements from their own environment and thus to identify with the book at an emotional level. It facilitates the move towards the written word and helps young readers memorise certain written elements. The reader must thus be able to decipher the illustration with as little doubt and uncertainty as possible.

Realistic drawings, which allow the reader to select the relevant elements and discount any unnecessary information will often be more suitable than photos here.

Financial Considerations

The type or types of illustrations you have selected can be printed in three different ways: either in 4-colour, which will give you colours that are very close to natural shades, or in two colours, generally black and a light colour, or in one colour, which is usually black.

Sometimes the purpose of the illustration will force you to use colour; usually though your choice will be guided more by financial considerations, taking into account the following points in particular.

Image Processing

Your illustrations must be prepared for printing; for monochrome printing you can choose line photoengraving if your illustrations involve only black lines. If, however, you want to lend some depth to your illustrations you will need shades of grey; this is called halftone gravure, and is more expensive.

When illustrations are to be printed in two colours, the preparation of the colour inks and the screen will often give you good value for money; this procedure is significantly cheaper than 4-colour printing, especially if the screens are produced manually, as is often the case in developing countries. The uninitiated often think of the result as a “colour” illustration, without making a distinction between this and 4-colour printing.

4-colour printing involves separating the colours, and producing three negative films with the positive images printed in magenta, cyan and process yellow, to which black is added to give depth. This procedure is complex and we will not go into details here because we do not consider this a priority for you, it always being an extremely costly operation.

We cannot urge you enough to keep a close watch on costs, and to accord financial considerations the importance they deserve. In our experience, authors, anxious to produce a really worthwhile book, often reject out of hand reasonably priced options, which they associate with mediocrity. Sometimes they produce entire books in colour, and then cannot find anybody to finance them. Sometimes, the authors simply refuse to listen to reason and insist on having at least one page in colour in the book; they consider this a modest and acceptable request without realising that it is not enough to produce the colour drawings, but that they must be processed and printed, and that this can be extremely expensive as we will see in the next section[12].

Sobriety should not necessarily be equated with mediocrity in the field of graphics
Consult your printer again to ensure that your artwork decisions are well founded

Printing Costs

You should also look at the costs of printing per se.

In particular, you should be aware that for 4-colour printing each sheet must go through the presses four times with different elements being printed each time. That means that the printer must prepare his presses four times: the presses must be scrupulously well cleaned each time[13], the new elements to be printed (films or plates) fitted, the presses regulated, set, and of course the colours printed separately. For limited runs, the costs can be exorbitant[14].

Two-colour printing, on the other hand, lightens a purely monochrome print, by using black (and the various shades thereof in grey tones) and orange (and the shades from a very bright orange to the palest hue). The result is sometimes perceived by an uninitiated reader as being a “colour print”. Although the procedure is considerably more complex than monochrome printing it offers better value for money than 4-colour, especially in developing countries, where the screens are prepared by hand, making them fairly cheap.

Imposition

You may not plan to use colours on every page. If only some illustrations are to be reproduced in colour, you must identify which illustrations and which pages are involved.

You should then ask the printer about his imposition, i.e. the way pages are arranged on the sheets of paper for printing. Try to put the illustrations to be printed in colour on one sheet of this sort, since this can make for major savings[15].

Paper and Printing

If you are considering 4-colour printing, do not make a final decision until you are certain that the paper and the printing are of good quality.

> **There is no point in 4-colour printing on poor quality paper or under mediocre printing conditions**

The paper must not look like blotting paper and must be sufficiently opaque for the printing not to shine through onto the other side; “bulky news” (the paper used to print newspapers), for instance, which is transparent, browns rapidly and laps up ink is no good for 4-colour printing. The printer too, must have the skills and equipment required: for colour printing the printing presses must be extremely well regulated, and it is very, very difficult to set them with the precision required so that the blocks or plates match exactly. If they do not match exactly the reproductions of the various colours will be blurred and fuzzy.

If you cannot be sure that your printer can guarantee all these conditions it would be irresponsible to invest in expensive colour printing, the results of which will never justify the scale of the investment.

> **Don't focus on one single textbook. Take the entire series into account**

Long-Term Planning

Finally, even if your budget today allows for four-colour printing, you must be sure that you will have the money tomorrow as well for reprints, which must then also be in colour.

This aspect is particularly important if you are preparing a pilot version. It may be easy enough to finance 3,000 colour books, even if the unit price is very high. In some cases, the need for 4-colour printing will only be seen during the testing phase[16]. In general, however, you should only use colour once you are certain that the revised version, which may involve a large run, can be financed. If you fail to look ahead at this stage you may end up having to redo all the artwork and remodel the original text; this is more than a revision, it really does involve rewriting the entire book[17].

5. Provisional Costing

Until now, you have worked in a state of splendid isolation, as if you were the entire publishing chain.

For the first time now you must leave the confines of your office and make contact with the body which charged you with producing the book and with the printer. You must make the preparations for the manufacturing phase, checking whether or not the physical and graphic features you have decided on are acceptable from a financial viewpoint. The aim of this next phase will be to request a provisional quotation and ensure that it is within the limits of your budget.

To this end you will have to draw up your technical specifications, which will determine the costs of development and of manufacture.

Development Costs

In large publishing houses the publisher determines the costs of writing the manuscript and of the artwork. In other words this is the latest time to decide about the entitlements of the authors and the illustrator or photographer.

In general a distinction is made between the moral rights of authors and the royalties; the first entitles them to associate their name with the book that is considered to be their work, and the second could be considered remuneration for their work.

If you have worked on behalf of a private publisher, you will generally have to renounce the rights to your manuscript for a lump sum payment or a certain percentage of the sales price, in exchange for which the publisher will undertake to print your name in the finished work, among other things. If, on the other hand, you are a civil servant and produce textbooks within the scope of your normal duties, the ministry may not recognise your literary or artistic property, considering that this would make too great a distinction between your work and the work of your colleagues, which is just as important but much lower profile (e.g. in the field of teacher training). In this situation, certain international organisations specialised in this field, e.g. UNESCO, may be able to suggest a solution that is satisfactory to both sides.

It is a complex subject and the situation is changing all the time. Given the special profile of “publisher-authors” in some developing countries, certain international organisations are starting to re-examine the rights accorded to authors working within state structures, with a view to upgrading their work. Contact the body which has charged you with producing the book and settle this issue without any further delay.

Manufacturing Costs

These costs will always be calculated by the printer, who will base his quotation on the four following factors.

Composition

This involves setting the text by computer, making the corrections required after proofreading and the composition and layout of these texts on the basis of detailed instructions.

By this stage you must know whether you will be submitting a typewritten manuscript to the printer and let him typeset it, or, whether, as is becoming increasingly common, you will write the text on a computer and submit the floppy disk to the printer. You must also decide whether or not you intend to set and compose the text yourself, and, if you are using monochrome illustrations without halftones, whether you will produce the imposition scheme or submit the text and illustration separately to the printer to allow him to assemble each page on the basis of your instructions.

The production of textbooks has changed drastically over the last few years, not only in industrialised countries, but also in the developing world. Whereas it was common practice in the 1980s to ignore computer-assisted printing, today it cannot be overlooked. Anyway large-scale textbook production projects all have computer equipment.

> **A computer only facilitates and enriches your work if you know how to use it properly**

If you are in this situation, you must be aware that computers cannot replace the creative process, neither as regards the concept nor as regards the writing and layout of your book. It can, however, facilitate your work, if used properly since it will help you transform your own manuscript into copy, and will allow you to visualise your layout very rapidly. But, if you do not have a good command of the programmes used and are quite unfamiliar with at least the basic principles of typography, you can easily fall into one of two traps - either you will magnify your already crushing workload as authors, or you will not be able to make good use of the many graphic options the computer offers you.

Printing

Under this heading the printer will look at three items: the inputs, such as ink, the costs of labour and materials needed to undertake the preparations for printing, (preparing films, process work or plates), and the labour costs of printing the book (the inside pages and the cover).

The printer must know what size the run is to be, i.e. how many copies are to be printed, before he can calculate his costs.

Finishing

This heading includes all the costs of folding the signatures, putting them together to make the body of the book, and binding the finished book.

Educational materials need a firm binding

You should pay particular attention to the binding of your book - it would be madness to jeopardise all the work you have already put into the development by choosing the wrong binding.

The world of binding is complex, but we can sum up what you need to know as follows (see illustrations on the following page):

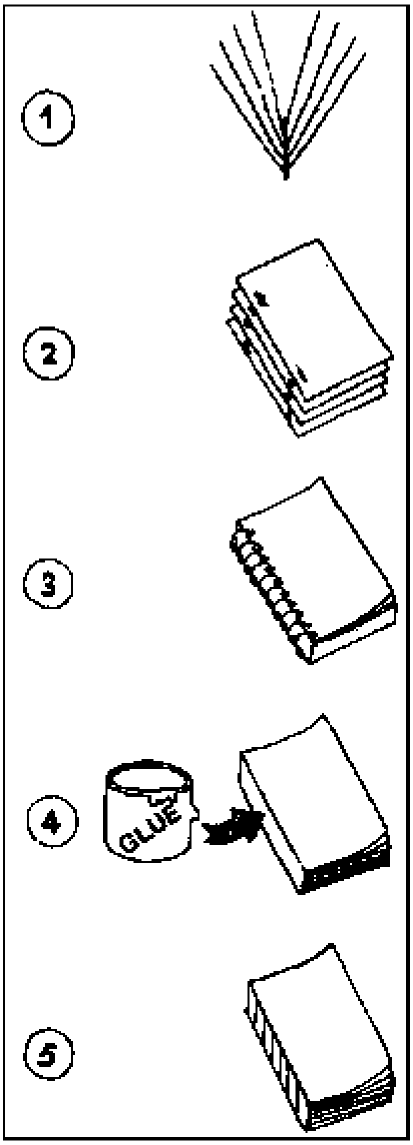
• Saddle stitching with staples is cheap, but there is a danger that the pages may fall out if the staples are too short. It is not suitable for thick books, since, when you come to trim the book, you will have to trim the pages in the middle more than the outside pages; this is unaesthetic and can be dangerous if the margins are narrow, since you run the risk of trimming away some of the text. (Fig. 1)

• Signatures can be block stitched (i.e. stapled flat) and then stuck together to the covers. This is a firm binding, which is relatively cheap, but it has the disadvantage that it is difficult to lay the book open on a table. (Fig. 2)

• Spiral binding is another option. It is the most expensive option, unless you are having a limited run printed and you have the equipment to allow you to insert the spiral binders manually; you could use this option for a pilot run of a few hundred copies. (Fig. 3)

• The pages can also be cut at the spine and then stuck. This is not too expensive and good quality adhesives are available today, but it is not recommended for school textbooks which are often handled roughly and may well start to lose pages rapidly. (Fig. 4)

• The signatures can be sewn with thread and then either sewn or stuck together. Stitching is expensive but it is the firmest option. (Fig. 5)



Paper

This heading covers not only the price of the paper, but also the cardboard used for covers and any treatment required (e.g. reinforcing the cover with plastic).

Again, find out about the main features of the paper from your printer (whiteness, thickness, tearing strength, impermeability, smoothness, price). Ask him what quality of paper and cardboard he can procure.

The quotation you are given should be considered provisional; it is a guideline for you to help you ensure that your decisions are well-founded, and to allow you to make any necessary modifications.

The instructions you give the printer must, however, be as clear and complete as possible - as should his quotation. If you do not pay enough attention to this point you may have a nasty surprise later, and you may not be able to pay the additional unforeseen costs.

6. Medium-Term Planning

You have made all the decisions regarding the physical and graphical aspects of your book - you may consider the conceptual phase over.

But, we would recommend that you draw up a medium-term work plan, i.e. up to the distribution of the books to schools, to ensure that the actual writing phase, which is about to start, runs smoothly without any major hiccups.

Make a list of the people who are going to be involved as from now in the development of the book and, finally, plan your activities as carefully as possible.

Actors

You should contact the individuals and bodies listed below at this stage, to ensure that they can provide their inputs on schedule.

Illustrators and/or photographers

Ideally, these individuals should be part of the team of authors from the start, but in practice they are very often brought in once the first draft of the texts is finished at the earliest.

You must select the people you want now, to ensure that they will be free to work with you when needed. It may take some time to select them. If you are working on the first book in a series, you should perhaps run a competition and then check in the field that the style of the illustrator you have selected corresponds to the preferences of the target group. As you will see from the time schedule for the development of *Garabola* in Table 22, this can take a lot of time.

Resource Persons

These individuals will review your manuscript and help improve it. They will include proof readers to eliminate typing and printing errors, educational advisers who will ensure that the book is appropriate for the teaching and learning conditions in rural areas, subject specialists who will focus on the contents, etc.

We recommend that you look for these individuals at as early a stage as possible and that you obtain their agreement in principle to work with you. We will look at the cooperation with them in more detail in the next chapter.

Work Schedule for Garabola

Publishing Unit

If the publishing unit rather than the printer is to typeset your texts, you will have to ask it to do the following:

- firstly, once the first unit of the textbook has been written, the publishing unit will set it to give you an idea of the length of the texts and the provisional layout;

- once the entire manuscript is completed, it will set all texts, including those that do not address the pupils (introduction, table of contents, etc.);

- finally, once the proofs have been reread and corrected, it will make the changes you want and do the layout on the basis of your detailed instructions.

In view of the fact that this unit is bound to have other commitments, lay down the approximate date on which you intend to submit your manuscript now so that the publishing unit makes time for you.

The Printer

Agree on the various things to be submitted to the printer, and the dates he can expect to receive them.

Work Schedule

By the end of the conceptual phase you should have drawn up a detailed work schedule, which will allow the textbook to be ready for the start of the academic year planned.

To give you an idea of the time needed, the table overleaf shows the planned schedule for the development and production of the pilot version of *Garabola.*

Don't take the contents of this table as a model, since working conditions vary from one country to another. Take them only as a frame of reference; in particular, look at the tasks listed and the time-scale reserved for each task and adapt these to bring them into line with your own situation.

> **This is the time to organise the people who will read and correct your manuscript**
> **Allow at least one year for the development and production of a first textbook**

7. In Conclusion

Detailed Documentation

You have now defined the contents and the form of your textbook, thanks to a systematic analysis of numerous factors.

To ensure that the quality of the development phase is as high as that of the conceptual phase, we recommend that you keep detailed records of every decision made. You can use two instruments to this end.

Logbook

You can keep a note of the key ideas in your work on a day-to-day basis in a logbook; you might note the reasons why a certain decision was made, any disadvantages it may entail, the repercussions for the teachers' guide, steps to be taken to put it into practice smoothly, etc.

These notes may be useful when the conceptual work is over and you begin to forget the odd detail.

Pinboard

If suitable for the way you work, you could prepare permanent pinboards to remind you at a glance of the framework for the texts and illustrations you are about to produce.

Keep a careful record of all decisions made during the conceptual phase

Notes

[1] Re-read the first point in the first chapter of this book to refresh your memory if necessary.

[2] The basic form of textbooks is always a rectangle, which creates a certain dynamism, rather than a square, which would neutralise tensions; for interesting ideas on this topic see Duplan, P. and Jauneau, R. *Maquette et mise en page,* p. 93-99. Paris: Usine Nouvelle, 1986.

[3] We have adopted the distinction made by F. Richaudeau between the “legibility corresponding to the integral reading of the lines of a text, or micro-legibility, (and) a second type of legibility, which corresponds to the image of the page as a whole, or macro-legibility.” In: *Manuel de typographic et de mise en page,* p. 9. Paris: Reitz, 1989.

[4] The limits of readability, as stipulated by M.A. Tinker for primary school children in the USA are as follows:

Grades	Bodies of letters
1	14-18
2	14-16
3-4	12-14

Cf. Typography for children's books. In: Bases *for effective reading,* p. 155. Minneapolis: University of Minnesota, 1965.

This means that the largest lower case letters without ascenders or descenders should be some 3 mm high (body 18), while the smallest characters should be some 2 mm (body 12).

[5] In chapter 7 where we will look at the basic concepts of layout, we shall come back to typographical options.

[6] For primary classes in developing countries C. McCullough and C. Chacko suggest significantly larger characters than those proposed by Tinker, i.e.

Grades	Bodies of letters
1	36
2	24
3	18
4	16
5	14

Developing materials for instruction. In: Staiger, R.C. *The teaching of reading,* p. 172. Paris: UNESCO and Lexington: Ginn and Company, 1973.

[7] Cf. Read, A. *A guide to textbook project design and preparation,* op. cit., p. 58.

[8] The paper costs as a percentage of the total production costs are put at the following

for 1,000 copies	28.5%
for 5,000 copies	47.6%
for 10,000 copies	53.5%

In: Smith, D.C. Jr. *Les problèmes économiques de l'édition des livres dans les pays en voie de développement.* Paris: UNESCO, 1977.

[9] The most common paper dimensions in the “A” series (in mm) are as follows:

A0:	841 x 1188
A1:	594 x 841
A2:	420 x 594
A3:	297 x 420
A4:	210 x 297
A5:	148 x 210

[10] There are, of course different ways of folding, cross folds, former folds, etc. It may be a good idea to use a combination, but the printer will have to plan for the necessary folding and inserting, and calculate the costs. Contact him and check that you have not made a mistake in either your choice or your calculation as to the number of pages.

[11] There are ways and means of not using a 16-page signature for non-text information; the printer is bound to suggest a half-signature (8 pages) for instance. If you are apprentice authors, we suggest that you do not go into this in any more detail, but that you consult the printer, and devote your own time and energy to tasks where you have no back-up.

[12] Beware of yourselves - authors who demand that their book be printed in 4-colour are always convinced that they are right and can easily fall into the trap of accusing anyone who

disagrees of thinking small, and wanting to throw a spanner in the works. Our most recent experience in this regard was a group of authors who wanted four-colour printing in a first-grade maths book because of pictures of butterflies in some exercises.

[13] You must bear in mind that every additional step in the production, even apparently simple steps, can entail unforeseen complications. When fuel is sometimes rationed, for instance, the printed may be tempted to clean his machinery less scrupulously, since petrol is often used to clean printing machinery.

[14] “4-Colour printing is approximately eight times as expensive as a halftone”, In: Richaudeau, F. *Conception et production des manuels scolaires,* op. cit. p. 214. 1979.

[15] Imposition can be extremely complex, and must always be performed by a specialist. Do not be ashamed of consulting a printer to find out more, if you are only an amateur in this field. Ank make sure that the printer has the knowledge he needs, which is - unfortunately - not always the case.

[16] Colour may be considered unavoidable in a pilot book which aims to upgrade a local language in order to produce a book which will be as attractive to users as textbooks in European languages, which are almost always printed in 4-colour.

[17] In 1979 in the pilot version of a 4-colour Quechua reading book the authors from the German-Peruvian Bilingual Education Project already mentioned chose the key word “puka” (red) to introduce the letter p and illustrated it with a red box. Since the revised version could only be printed in monochrome, this word and the illustration had to be changed, triggering a chain of modifications throughout the book.

To Sum Up

Once the authors have defined the subject matter to be covered by the textbook they are still not ready to start writing: they still do not know how long the texts should be or how to fit them together with the artwork. To allow them to write well-founded texts and avoid the blunders that a poorly planned assembly of texts and illustration would entail, they should draw up a model of the book.

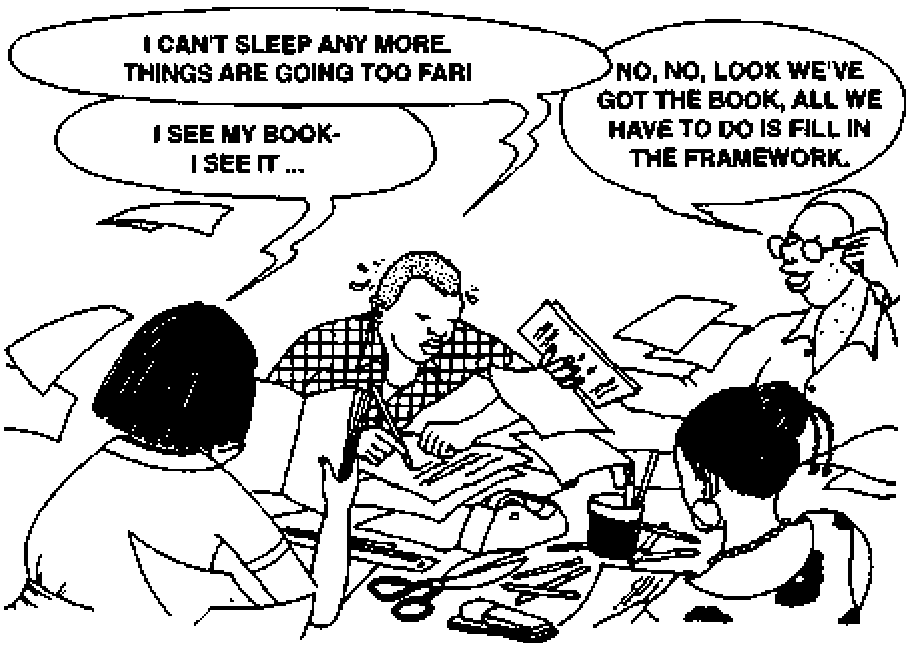
Before you design each page, it is important to define the main physical aspects of the book as a whole, in particular the format and the number of pages. It is equally important to think about the graphic aspects, i.e. to work out a provisional layout and decide on the nature of the illustrations. Much of this work demands specialised know-how, which is why publishers contract specialists who report to the production manager and the artistic manager.

Teams of authors working in developing countries rarely have the specialist know-how for this phase, but they are always left with the responsibility when the publishing back-up is not forthcoming. Given the fact that few authors will have any back-up from professionals, such as a layout man, most of you will have to acquire a working knowledge of layout and printing techniques and methods. You should consult specialists in your country, especially the printer, and try to put their experience within a systematic framework by reading specialised literature among other things.

The conceptual work should culminate in two documents:

- A detailed work schedule covering the work of the authors and the external inputs required during the writing and manufacturing phases;

- A quotation drawn up by the printer with a view to confirming the decisions made regarding the physical and graphical aspects of the textbook, or to calling into question these decisions.



Writing the Text

During the previous phase you decided on the contents of your textbook and on the artwork, which enabled you to define the sequence of the learning matter to be covered, and to lay down a basic visual structure for the book. The phase you are about to start will be a continuation of this work, culminating on one hand in finished texts and exercises, and on the other in the sketches or “roughs” for accompanying illustrations.

The literary and graphic work during this phase must go hand in hand. In large publishing houses the authors are responsible for the literary side only, while the artwork is entrusted to a layout man and/or a graphic artist. In developing countries, however, authors are almost invariably responsible for both sides. In this chapter we will first look at the preconditions for creating what Richaudeau terms the “text-image couple”[1], before going on to look at the subsequent stages step by step.

Some of you will be sufficiently familiar with text-writing for it not to present any major difficulties. The visual presentation and illustration of texts and exercises on the other hand will be new ground for many of you, and difficult for all of you. You will have to understand the importance of bearing the visual aspect in mind as you write your texts. You will need to learn to do so by constantly weighing up the demands of the text and the presentation.

Even if you are no longer a novice where writing is concerned, we would urge you most strongly to read this chapter thoroughly, to ensure that you glean not only scattered pieces of information, but the entire systematic approach. Put yourself in the place of authors who have defined a detailed conceptual framework, and must now write, present and illustrate the contents of their textbook within a relatively short space of time; read the chapter from start to finish, point by point.

> **You must do more than write a text - you must fit text and image together to create a harmonious whole**
>
> **Plan your writing**

1. Overview

The phase you are about to start will seem impossible to structure for some of you, who believe that the texts and exercises will simply come together with time.

However, if you aim to produce high quality material within a given time-scale we recommend that you do not merely wait for inspiration to strike. Forget the romantic image of the literary genius alone in his garret and plan this phase as strictly as possible. By way of reference, we will, as always, give you an overview of the work involved taking the example of the work on *Garabola.*

Writing Garabola

We have selected this textbook as an example because of one particularly interesting feature - since this was their first book, the authors chose to take a systematic approach, trying to avoid any unnecessary delays for the education authorities. The often contradictory goals of quality and keeping to schedule forced the authors to tackle the writing and illustration work in tandem.

We feel that this approach, which is described in detail in Table 23, should not necessarily be taken as a blueprint, but it is interesting and may be useful for teams of authors working under time pressure.

2. Organising the Work

Once you have a general idea about the form your literary and artistic work should take, you can organise the writing work and decide what approach you wish to take.

Why, you may ask, can't we get down to writing the texts at last after all the research and the conceptual work? Because you must firstly define the framework, without which your subsequent work will be subject to inopportune interruptions. You should thus accept a certain amount of “lost time” at the start of this phase in order to guarantee optimum writing conditions. Look in particular at the following points.

Start by deciding how much time you will need for the writing phase

Rate of Working

Take stock of the work ahead of you, before you do anything else. Recall the number of texts to be written: for a reading and writing book with 24 units, for instance you will have to write 24 texts if you plan to have a single text per unit, or 48 or 72 if you plan two or three texts respectively per unit.

Then recall the principal features of the contents and the presentation of these texts: to take the above example, once again, look at the sort of texts (adventure stories, fairy tales, historical texts, scientific texts, etc.), the approximate space available for each text on the page, and the average size of characters to be used. You should then turn your attention to the number of exercises to be devised: if you plan to devise two pages of exercises for each of 24 units or lessons with three exercises per page, you will need no less than 144 for the textbook as a whole. Finally, you should count the number of general information pages and look at the length of texts on these pages.

Now and only now can you set the markers which will allow you to lay down your time schedule. You should either lay down a daily or weekly quota for the writing work, or set deadlines for the individual parts of the book.

23. Developing the Garabola Reading and Writing Book
Planning and Organising Writing Work
The authors started by defining the type of writing work to be performed and how they were to be fitted together. They set quotas in line with the work schedule drawn up at the end of the conceptual phase for the textbook as a whole. They also decided how they proposed to conduct the writing.
Writing the First Version of the Reading Texts
The authors settled down to write the textbook per se, starting with the reading texts. They adopted a systematic procedure, developing a list of criteria, identifying the topics to be tackled, deciding on the type of texts, writing and producing the artwork for a first unit which was then used as a model for the rest of the textbook, and then writing the other units. The authors then ran a series of checks on the texts produced.
Organising and Supervising Illustration Work
Since the illustrator had been selected and approached during the conceptual phase, the illustration work could start; he illustrated the reading texts while the authors devised the exercises.[2] Collaboration between authors and the illustrator took the following form: a contract was drawn up in line with the work to be performed, the contents of the illustrations were stipulated as was their layout on the page, drafts were produced and any changes made, the illustration techniques and instruments were stipulated. Once the layout had been finalised, the illustrator produced the final versions of the illustrations.
Writing the Exercises
While the illustrator was preparing sketches for the reading texts, the authors started

	work on the exercises. They established a list of criteria, identified attainment sub-targets, defined the space available for each exercise, selected the type of exercise, developed the exercises, devised the presentation, and ran an internal check. The illustrator produced sketches for the exercises once he had finished those for the reading texts, observing the same procedure.
External Review	
	Once the manuscript was completed, various people from outside the group of authors reviewed the texts checking the linguistic aspects (pertinence of newly created technical terms, correctness, clarity, uniformity of style), subject-related aspects (coherence and exactness of contents), and pedagogical and didactic aspects (suitability for the given teaching and learning conditions). Others reviewed the illustrations from the pedagogical angle (clarity, exactness and pertinence of the scenes or objects represented), and from the cultural and political angle (respect of local customs, representation of scenes that are applicable for the country as a whole and not just certain regions).
Writing General Information Pages	
	The authors wrote texts for the cover and general information pages at the front of the book, taking into account pedagogical aspects (the technical presentation of the textbook), legal requirements (credits and copyright), institutional factors (preface and mention of the ministry), and editorial conventions (on the covers and all pages in question).
Preparing a Copy of the Manuscript	
	Having examined the internal suggestions and those of the external reviewers, the authors modified the initial manuscript and had a typewritten version prepared.
Preparations for Official Approval	
	To obtain authorisation to print, the authors prepared a file for the education authorities, containing a list of information and a hand-crafted mock-up of the textbook, on the basis of the typewritten manuscript and photocopies of the sketches. They were granted authorisation to print, the final layout was performed and the graphic work finished: the two files were then submitted to the printer to allow him to start work on the textbook.

Whatever you decide, try to avoid two common errors a) under-estimating the volume of work which is not directly related to writing, such as organising external checks; just when you think you have finished writing, you will often need several weeks more to complete the manuscript; b) with reading and writing books, under-estimating the level of complexity of the exercises, and not planning the development properly.

Writing and illustration work progress in tandem
If you do not have good editorial back-up, this phase will be a busy one

Group and Individual Inputs

You have drawn up your time-frame for the writing phase, and now you can go on to define how you intend to meet the deadlines you have set, defining the interaction of group and individual inputs.

While nobody would question the value of group work, some of you may ask when and how texts should be written by the group as a whole.

You can answer this question by identifying the type of writing demanded by the situation. Here are three possible options, which we have used in the past: analyse them, and decide which one best meets your needs.

Group Writing

Each text is written jointly; the authors formulate the text aloud in the group and then modify it, until they can agree on a version which is written down and considered definitive by everyone in the group.

This procedure has the advantage of preventing individuals from getting caught up in errors and allowing everyone to identify with the final version. On the other hand it may provoke tensions in the group, if you do not listen to those who are not good at formulating their ideas verbally, or who cannot defend them well.

Sometimes group writing will appear unavoidable. When, for instance, you are defining key words and writing key sentences for a first reading book the text is subject to such strict limitations that it is difficult to work individually. In our experience group work, where texts are formulated aloud, provides the best forum for applying pre-defined criteria to the words and texts to be developed.

If you are in this situation, have a look at Table 25, which outlines the criteria to observe when developing texts for a reading book. Read these and adapt them to your own particular situation.

Individual Writing and Correction

Here, the texts are written by individuals, revised at individual level and then, perhaps commented on by the group.

Individual writing can jeopardise the uniformity of the texts

24. Work for which authors are responsible

To allow you to gauge the scope of the work for which authors are often responsible during this phase, we list below the tasks from the previous table which fell to the authors of *Garabola.* We have made a distinction between the work they had to perform themselves and the tasks they only had to organise or supervise.

No.	Task	Organisation and Supervision
1	Overall plan of texts and artwork	
2	Devising and writing reading texts	
3	Internal revision of reading texts	
4		Preparation of illustrations for reading texts
5	Correcting sketches	
6	Devising and developing writing exercises	
7	Internal revision of exercises	
8		Preparation of illustrations for exercises
9	Correcting sketches	
10		Revision of entire manuscript by externals
11	Writing general information pages	
12	Final changes to the manuscript	
13		Preparation of a typewritten copy of the manuscript and production of hand-crafted mock-up
14	Drawing up specifications for textbook	
15	Organisation and moderation of official revision session	

This approach is often favoured by authors who are not used to working as part of a team, who see it as a fair compromise between the individual work they are accustomed to and the inevitable group work.

It does, however, have many disadvantages; the authors, themselves immersed in writing, do not always have the distance and the calm needed to judge the inputs of others fairly, and are reluctant to contradict their colleagues and criticise them. Some texts are thus accepted with reservations and the finished product displays a lack of cohesion and uniformity.

You should only adopt this approach if you have the back-up of a good publisher who has the skill, the distance and the necessary authority to suggest the necessary changes.

Individual Writing and Group Revision

This approach involves every team member tackling the same text at the same time and handing it in without having time to perfect it; the individual inputs are then put up on the board and the group agrees on one text, or at least on a general direction, a basic text which can then be reworked to a greater or lesser degree.

25. Identification of Key Words in the Group
In reading books graphemes are generally systematically introduced with the help of certain words known as "key words". Team work is needed to identify these words. It is the best way to harmonise criteria as demanding as those listed below.[3]
Productivity and interest for pupils
The key words must trigger a strong emotive response in the pupil. If the basic vocabulary of the pupil has been studied, you should refer to the results of this study and select the most frequently occurring words.
Pedagogical and didactic considerations
Key words must reinforce the new element which the pupil is to learn in the course of the lesson. If it is a consonant, it should be at the start of the word, or at least at the start of the syllable.
Simplicity of syllable structure
Wherever possible, you should select key words made up of V (vowel) syllables or CV (consonant-vowel) syllables; try to avoid CVC syllables, which would be an obstacle later when you come to splitting words into their component syllables.
Control of new **elements**
The new element which is the object of the lesson should, if possible, be the only unknown element in the key word; you should thus avoid choosing key words with more than one consonant or vowel elements which has not already been presented systematically.
Grammatical category
Most key words should be nouns. For semantic and graphical reasons, only a few verbs (verbs of movement for instance) would be suitable. Adjectives of colour should be used with caution: you must be aware of the type of printing that will be used, not only for the pilot version, but also for the revised version. Avoid adjectives of colour if the textbook is to be printed in monochrome.
Degree of visualisation
Nouns that cannot be illustrated should be discarded. Then, of the nouns that can only be presented visually in a moderately satisfactory way, only the indispensable ones should be retained. Bear in mind that liquids in general are difficult to illustrate, and can lead to interpretation difficulties when you are dealing with young readers who have had little contact with printed materials.
Unequivocal correlation between key word and its illustration
The relation between the word and the illustration should be unequivocal if possible. In our experience images of people are difficult in this way, so key words such as "people", "man", "woman", "girl" "boy" etc. should be avoided, since the images are subject to more than one interpretation.

This procedure has several advantages. Firstly, the short time allowed for writing prevents each individual from identifying too closely with his own text. Secondly the fact of putting up all the inputs prevents new authors being so awe-stuck by the process of intellectual production that they are paralysed: the writing work unfolds step by step before their eyes in a certain anonymity, which robs it of its mystery. Finally the revision phase, which is often much more extensive than the writing phase, allows all group members to contribute to the final version and identify with it.

We should, however, point out one major disadvantage: if the authors want to retain a high quality they must identify the best texts irrespective of the originator, and the text, once selected, must be re-worked for as long as necessary, while taking care not to jeopardise the group dynamics. This is only possible if the group is made up of individuals who are not only of a high professional calibre, but who are also intellectually honest and extremely patient. In our experience all the charisma of an internal group leader is needed if the work is to run harmoniously over a longer period.

Working Language

If you are writing textbooks in a national language, it is conceivable that some members of your team may not speak this language. You will then have to agree on a common working language; this situation, common in projects which have received external technical or financial assistance is certainly not ideal, but it is sometimes unavoidable.

If, on the other hand, all the members of your group speak the national language in question, and this is accepted as the working language, other problems may arise to which you should be receptive. If the language in question does not have a long written tradition, it will often lack the technical terms you need, or these terms will not be precisely defined, lacking the background information which surrounds these terms in languages with a long written tradition. A certain laxity can result, which will prevent the national language from being an effective tool, consistent, diversified and precise.

Thus, if you are dealing with a teaching syllabus, will the language provide you with one word for “goal” and another for “finality”? Would you know how to say “sequence of numbers”, “set of numbers”, or “double-entry table”, all terms which will be vital for first-grade maths? How can you express “key word”, “word card” “word table” or “minimal pairs” so important for the development of reading materials?

Agree on the language of communication
Identify key words together

If your work is too often interrupted by terminological considerations, you should analyse this handicap, and take appropriate steps, to allow you to complete your work. You can systematically record neologisms and put them on the board to farce yourselves to use them; or draw up a definition of terms which you keep stumbling over. You can include these definitions in a glossary at the back of the teachers' guide.

Write directly in the national language to follow the logic of the language

Language of Writing

If you are producing a textbook in a language with no written tradition, it is common for only a few team members to be able to write it fluently. In this case, you should agree which language the inputs should be written in before you start to write.

This question is particularly relevant for texts which do not address the children, the technical presentation of the book for instance, and later for the teachers' guide. In the groups we have observed, we have noted two possible approaches to writing texts.

Translation

The inputs are written in the European language common to the entire group, and then translated into the national language in question.

The advantages of this approach are clear: a highly specialised pedagogue can, for instance, write a text on learning to read in English, French or Spanish, which can then be translated into the national language by a colleague who is less well versed in the theory.

It is a procedure with a two-fold risk, however. Firstly, some authors, finding themselves downgraded to resource persons and translators may lose their motivation and give up on the group little by little. Secondly, internal leaders may emerge and introduce a vertical element within the group which will further limit the opportunity for dialogue.

Step by Step Writing in the National Language

In this case, the texts are written step by step, as follows:

- common development of the criteria to be observed (in the European language)
- corresponding texts written (in the national language)
- verification firstly orally and then with the help of translation of certain passages into the European language, to check for congruence, followed by any corrections needed.

This approach too is less than perfect; in particular, if we take up the same example, the pedagogue is not always able to judge precisely whether or not his instructions concerning reading have been fully understood and correctly translated.

Yet, it is often more effective than translation. Firstly, it allows those in charge of writing texts in the national language to re-formulate technical information in their own language; they can move away from the initial wording and organise the information appropriately, following a chain of argument which will be better understood by readers, and especially by teachers[4] - the local writers are in a much better position to judge this than the external specialist.

This formula also allows all those concerned to see themselves as fully fledged authors and thus to identify with the product which really is the result of a joint effort.

3. Texts Addressing Pupils

You have now organised writing and defined your framework. Your next objective is to produce a manuscript for all the reading texts, that has been revised by the group of authors.

To achieve this as methodically as possible, we suggest you take a step-by-step approach, as described below.

Criteria

Whatever the discipline and the grade, you must always base your pupils' texts on precise criteria. Do not simply agree that these texts should be dictated primarily by pedagogical and didactic considerations; take it upon yourself to conduct as exhaustive a study as possible and to draw up precise criteria.

To take stock of what your work at this level can involve, examine the list of criteria drawn up for reading texts in national languages, presented in Table 26. The list is long, but it is by no means exhaustive and may not be suitable for your particular situation.

Topics

You have identified the main features of the texts to be produced. To be one hundred percent operational, you must now draw up a list of the topics to be tackled.

In our experience, in primary school textbooks projects authors often start by producing a first reading book, in which the topics are defined by key words; this first book thus automatically reflects the everyday world of the pupils. In the textbooks for the following grades, these topics are repeated, for various reasons. Firstly the authors often see the texts as a way of achieving pre-defined language targets, primarily as a good basis for grammar and vocabulary exercises, and do not thus attach a great deal of importance to the selection of the topics. When national-language books are produced, the authors do not always manage to satisfy the contradictory demands of authenticity (as seen in the selection of topics related to the socio-cultural environment of the child) and openness to the outside world. They often opt for the endogenous to the detriment of the exogenous, and stay within the limits of the first book. Finally, most of them quite simply find it difficult to break out of the traditional topic framework of reading books for the primary level.

Two observations should, however, be made: in groups of authors, the selection of topics is rarely the result of systematic considerations, and the difficulty of the selection process is almost always underestimated. We again suggest a step-by-step procedure when you begin to select topics for the higher classes at primary level.

Select topics for reading books on the basis of precise criteria

Official Instructions

First of all check how the curriculum defines the role of the school within society, and see if detailed topics are listed as is often the case. If this applies to you, check whether you are bound to remain within the official framework and tackle a certain number of topics.

Type of “reading book”

At this stage you must decide what sort of reading book you want to produce. It may address solely native speakers learning their own language, in which case the aim will be to improve their reading skills, which will give you a lot of leeway to choose topics. However, when pupils have only a reading book and a maths book, you should consider whether a simple compilation of reading material is really the best option. You may chose to add texts which will introduce children to common scientific, historical and geographical knowledge for instance. This is a fundamental decision, which is bound to have repercussions on the choice of topics and on the curriculum.

Social Options

The topics broached in a primary-level textbook will help form the adults that the pupils very soon become, especially those individuals who will read few other books in the course of their lives. It is up to you to organise an in-depth discussion to define the factors which you believe should be given priority, where the curriculum is vague.

Openness to Innovation

Finally, bear in mind that it is difficult for authors of primary-level textbooks to find resource material: try not to fall back on your own experience and on the past. Read and re-read as much as you can, from legends to adventure stories, from extension manuals to foreign books, from cartoons to the best books written for children world-wide, to put you in a position to innovate as regards the content matter. Textbooks for the upper classes of primary level will always demand a lot of preparatory work here.

Development of a Model Unit

To sum up, you have laid down the approach you intend to take, drawn up a list of criteria and identified the topics for your reading texts. You can now start writing the texts.

26. Criteria for Writing a First Reading Book in a National Language[5]
Texts corresponding to the general attainment target
Texts must firstly be in line with the general targets set for reading in the grade in question. Thus, if the pupils are to learn to read and understand the literal sense of short, explicit messages, you should not produce texts that the pupil must complete to understand the meaning.
Texts corresponding to the specific attainment target of the lesson
Whenever the lesson has a specific reading target, the texts must meet these specific demands; thus if a new element is to be introduced, such as an upper case letter, the texts must allow for the systematic introduction of this element.
Controlled use of words
The words used must be in line with learning needs, i.e. a minimum of new words should be used at the start, and they should be repeated a number of times to imprint them on the memory of the pupil.[6] Elements which the pupil has not yet learned systematically should not be used.[7]
Readability of words
The words should not exceed the maximum linguistic readability for pupils; in languages used world-wide the authors can refer to research conducted since the 1940s. In most national languages, special features will determine the readability of words.[8]

Readability of sentences

The sentences too should not exceed a maximum level of readability: they should be short and have a simple morphological and syntactic structure. Here too you may find research done for world languages helpful, but in many national languages, the readability of sentences will depend on other criteria. Thus short sentences, used at the beginning of the learning procedure must make for maximum readability without being artificial or excessively simplified - a tall order for languages with a primarily oral tradition, which are not easy to dissect in this way.

Readability of texts

The texts must be clearly structured, with an introduction, however short, and an unambiguous conclusion; within the text the sentences should follow on one from another. If necessary the text will be divided into paragraphs, which will also follow on logically. Punctuation marks, which underline the structure of the text should be introduced gradually and with discretion.

Functional texts for teachers

Texts should be structured to make them easy to read in class. Thus, if a text is to be read at two sessions, it should be written accordingly, i.e. in two main sections, not counting the introduction and the conclusion.

Degree of visualisation

The words, sentences and texts must be selected to provide an appropriate degree of visual back-up so as to form a whole which meets both pedagogical and aesthetic demands.

Familiarity to pupils

The topics dealt with should be at least known to the pupil. In a first reading book, they will be dictated by the choice of key words and should preferably be taken from the pupils' immediate environment. Subsequent reading books should expand their scope gradually to take in the region, the nation and then other countries.

Variety of topics

The topics selected must be varied enough to hold the attention of pupils.
This is a difficult criteria to meet in an entire series: authors frequently repeat themselves, with the result that the same topics are presented with increasing levels of difficulty in a spiral from the first to the last book in the series.

Idyllic past and glorified future

The texts should reflect today's world, which is often a world in transition. They should avoid any nostalgic descriptions of times gone by - which were rarely idyllic - and should equally avoid glamorising a modern world which is likely to be unknown to the majority of pupils.

Games aspect and topics liable to provoke conflict

The texts should firstly look at the universe of the child. It should focus on the happy side of childhood, but should not completely eclipse conflicts and the negative side - conflicts, problems and fears of childhood should be mentioned.

Respecting the environment

Religious and political topics should only be broached with great care and social taboos should never be mentioned.

Texts for children and grown-ups

The texts should be worthy of the child and the grown-up he will very soon become, because for many children in developing countries, given the rate of absenteeism, it is true to say that adult life begins after one or two years of schooling. In the books, anecdotes, recitations and games should thus alternate from an early stage with recipes and user's instructions, a literary genre with which they are most likely to come into contact in adult life[9].

New fields of use

The texts should pay enough attention to the traditional role of the national language (poems, legends, descriptions of daily life, etc.) but should also look at roles more often played by European languages (slogans, puzzles, recipes, posters, invitations, etc.).
In other words the national language should emerge from the domestic ghetto to which it is often confined and should be upgraded by bringing it into the domain of modern life, traditionally the realm of the former colonial language.

Initially stick to the first unit, which will be a sort of test ground for you, and adopt a three-step procedure: refer to the basic structure and work out approximately where the texts and illustrations will be; write the texts in question and decide on the contents of the illustrations; prepare the text with the size of characters required for the level in question, which will allow you to see the average length of texts in the book, and prepare a sketch for the illustrations.

We would advise you to tailor your procedure to the subject and the grade concerned. Thus, if you are responsible for producing a series of books for pupils learning their native language at primary level, you should distinguish between the two types of book described in more detail below.

First Reading Book

Given the primordial importance of the picture, which will take up a large part of the page and form a bridge between real-life and the new technology of reading, it is often preferable to work manually. You should thus draw up test pages in the correct format, and then write very short texts yourself, and make a rudimentary sketch of the illustration to accompany the text.

In view of the fact that this parallel approach to text and image often leaves a lot to be desired we have reproduced opposite the steps involved in the birth of one page of *Garabola.*

Books for Other Grades

When the texts are more dense, it is more difficult to assess the length. If you are working on a book for a higher grade, submit the first unit to the publishing unit, which should typeset it in line with your instructions. You can then re-work the text to ensure that it is of the right length, and make a sketch of the drawings planned.

Bear in mind that whatever the level involved, the texts and illustrations should always be developed together, following the basic structure.

Development of the Other Units

Taking your lead from this first unit and your basic structure you will now be able to write the texts for the other units without any major difficulties.

Revise your textbook, bearing in mind the needs and possibilities of users
Keep a careful record of your reading texts

We recommend that you compile the following, day by day.

Text File

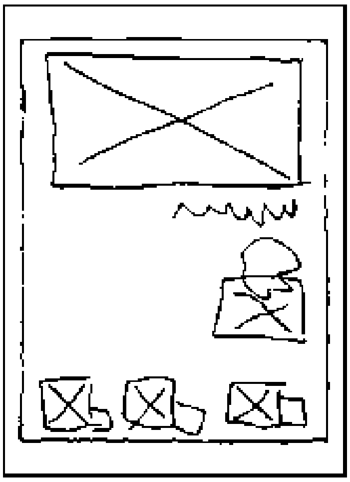
The texts selected by the group should be filed carefully, in a box file, for instance, and each of them accompanied by a sketch, however rough, of the scenes or items planned; a sketch is always better than instructions alone.

Logbook

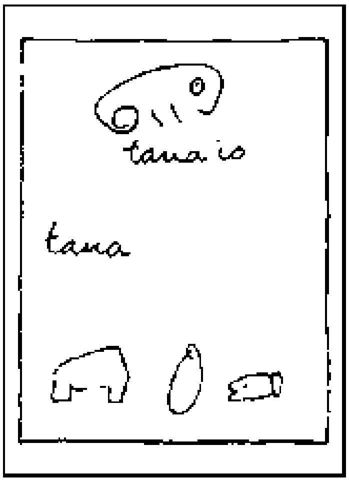
We also recommend that you continue to keep the logbook you started during the conceptual phase. Document your work; in particular keep a record of the instructions you plan for the teachers' guide, which you will otherwise forget before you come to produce this guide.

Internal Revision and Changes

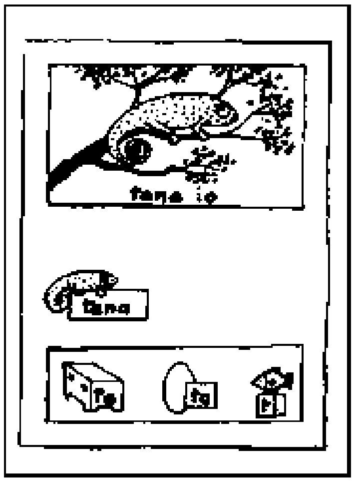
The concentration needed during the writing phase is such that it is generally impossible to stand back from the texts and check their quality thoroughly. You should thus wait until all the pupils' texts are finished before conducting a series of internal controls.



1. Conceptual phase - the contents and the form
Contents are defined and a mock-up of the page completed.



2. A text-image unit is created and the text written
Texts and sketches of illustrations completed.



3. Layout and illustration
Text typeset, layout finalised and illustrations done in ink.

Remember, you cannot postpone this work; it must be completed before the other external revisers start their work. We would suggest that you examine the following aspects in particular.

Legal Aspects

Many of you will be well informed about the rights of reproduction and know that it is strictly prohibited to reproduce texts or illustrations without authorisation[10].

Although authors do not generally infringe copyright, they may have absorbed existing texts to such a degree that they reproduce them, as they are, changing only details. Even if they are not aware of this, they will be guilty of plagiarising. Check that this has not happened with your manuscript: copyright infringement can result in expensive legal action and plagiarism is not the best advertisement for a group of authors.

This point, which is scrupulously observed in industrialised countries, is often ignored in developing countries. We have seen groups of authors, who did not pay attention to this point being tripped up by harsh reality at a later stage. To ensure that what is often nothing more than ignorance does not become a time-bomb ticking away under your work, find out about the basic principles of reserved rights; the books listed at the end of the chapter may be useful.

Do not copy or plagiarise

Social Options

You should also review the social options which you will automatically have selected as you wrote. Analyse the roles which you have attributed to the various protagonists: look at the number of times each of them appears in the texts and sketches, look at the occupations of mothers and fathers, of girls and boys, etc.

Then take a hard look at the social image reflected by the textbook: analyse the role of institutions, first and foremost the school, look at the angle you have taken on authority, be it parents, teachers or village elders; and look again at the way you have responded to certain crucial topics of today, the most important being the protection of the environment.

If you now, in retrospect, see serious imbalances or omissions in the texts, correct them - you still have time. You can either modify them or change graphic elements, which will sometimes be enough to redress the balance of the text-image unit. If, for instance, you wish to upgrade the role of women, and you note that there are fewer women than men in your textbook, you can redress this balance by making women figure more often in illustrations. Be careful in your choice of setting for these illustrations though. If you wish to upgrade the status of women do not show them performing only menial work.

Linguistic Checks

If you are producing a first reading book, you should pay particular importance to linguistic checks. First of all, count the words used in the book, and then look at the average length of these words, classifying them by number of syllables. List the words used only once and try to limit these. Look at the intervals at which words are repeated, etc. If you are producing a textbook for upper grades look again at the linguistic readability which you considered in advance, and see if you have respected your own criteria.

If, on the other hand, you are producing a book in a language with no written tradition, you should run specialised linguistic checks, for which it may be difficult to find back-up literature.

Given the importance and the complexity of the subject, we will take the liberty of dwelling on it a little in the table on the following page.

4. Exercises

The first version of the reading texts has now been completed. If your time schedule permits, you can put these on hold and concentrate on the rest of the book. If you are working under time pressure, as will often be the case, however, you should first finalise the artwork, adopting the procedure laid out earlier, so as to ensure that the illustration work can run parallel to your work on the exercises.

Writing exercises, unlike copying or traditional “fill-in-the-gap” exercises demand special skills. Since there is little specialised training available in this field, authors with the skills required to design good exercises are equally extremely rare ... and those who appreciate the degree of difficulty of this work are even rarer.

We see the results of this shortcoming everywhere: in some European textbooks the objective of the exercises is anything but clear, the mechanism used is sometimes overly complicated, the games aspect is often poorly represented and even errors are not unheard of[11]; textbooks produced in developing countries often dedicate a limited space to exercises, and reflect a certain disarray on the part of the authors.

We can only repeat that it is extremely difficult to design good exercises, much more difficult than to write texts for reading. The approach we suggest here will certainly not solve all your problems, but we hope that it will allow you to avoid the worst pitfalls and errors.

> **Choose an easily understood mechanism and an appropriate form of presentation for your exercises**

Drawing Up a List of Criteria

As is the case with texts, you should never start designing exercises without first drawing up a list of criteria, which should be as precise as possible. The quality of the exercises in your books will depend firstly on the quality of these criteria. You should thus approach this first step with the rigour and the meticulousness it deserves.

Some criteria are general in nature, and can be applied to any subject and any grade: the exercises for instance must always reflect a clearly defined attainment target. Others, however, will be determined by the particular nature of the material you produce. If you have decided to present exercises in the textbook and have rejected the idea of producing expendable materials such as separate exercise books or cards, one criteria of your exercises will refer to the mechanism: you must reject out of hand all exercises requiring the children to stick things in, fill in gaps, join up, colour in or circle anything - a criteria which sometimes causes authors in developing countries enormous headaches as you will appreciate in the course of your work.

We look in more detail below at the general criteria that should be taken into account for primary-level textbooks in developing countries; as you will realise the list is by no means exhaustive and not all points will be relevant in every set of circumstances.

Examine them, adapt them as well as possible to suit the cultural, linguistic, pedagogical and didactic features which you must respect in your textbook, and supplement them as necessary.

27. Linguistic Checklist for a Manuscript in a National Language
In view of the fact that textbooks venture out into the world beyond the school yard, they can be deemed to play a primordial role in the normalisation and standardisation of national languages. The authors must thus help create a coherent, homogeneous and dynamic linguistic environment. Some of you will be able to consult a language planning institute or the linguistics faculty of a university[12] while others will have to solve the problems they encounter alone. In either case you should pay particular attention to the following aspects.
Spelling
Without a solid spelling system there can be no proper readability: the human eye which can easily memorise the contours of words stumbles over words written in diverse fashions with no rhyme or reason, and the reader is unsettled, particularly if he is only a beginner. It is thus important to read and re-read your manuscript, and to have it read by others to ensure uniformity. You will always come up against awkward cases, which cannot be solved with the help of your reference tools (at best a dictionary and a grammar book) alone. Ensure that the two following aspects at least are standardised:
Separation Check the criteria for separating elements, particularly in nouns and composite verbs, and ensure that you have used hyphens and apostrophes consistently throughout. If you intend using justified type, in columns, decide at this stage what criteria are to be applied to hyphenation and ensure that these are strictly applied.
Borrowed words National languages always borrow words from the European language with which they come into contact. In general, there is no homogeneous rule for writing these words: uncertainty rules as to whether to take the original spelling or whether to adapt it more or less to fit the phonology and spelling system of the national language. Although it is not your profession to establish spelling standards, it is up to you to make the language first and foremost a valuable learning medium, by observing strict and consistent rules regarding the form of borrowed words, verifying that these are in line with official norms where any exist and that these forms are acceptable to the users of the national language, in particular to teachers.
Inventing Words
National languages almost always have a vocabulary that is too limited to meet all cultural and technical requirements. You may thus be forced to invent some words, either resorting to borrowing the term from the former colonial language and adapting it, or neologising, i.e. creating a new term from the roots of the national language itself. Although the process of creating technical terms is considered obligatory, positive and quite normal in strong languages, it often appears artificial in national languages. The readability of texts, particularly those which describe modern technologies (user's manuals, recipes, etc.) may suffer two weaknesses: newly created words may appear clumsy, and may not be accepted immediately by the reader, or the texts may be too liberally scattered with new, unfamiliar words. It is a good idea then to make a list of these words, to check that they do not already exist in another form, to check that they are correct by circulating the manuscript to have it read and to limit the number of these words used.

Official Language and Variants
Most national languages exist in regional and local variations alongside the one variant that is recognised as more or less official. This situation has repercussions on textbooks since authors are torn between the need to normalise and standardise the language, which means making linguistic choices which will be binding for all users, and the needs of users who may reject the book if they cannot identify sufficiently with the language used. This is an extremely delicate issue and we can only urge you to be vigilant; list words of limited usage, ask the people who re-read your manuscript for their opinion and be sensitive to the positive and negative feed-back.
Punctuation
Punctuation is a relatively recent development, it is true, but it is now an integral part of written language. What we often forget, however, is that each language has its own punctuation rules. Few national languages have their own punctuation rules with the frequent result that authors apply the code of the former colonial language which they themselves learned at school; they only realise this at a later date when the punctuation rules that they know and that are appropriate for the European language in question causes dissonance in the national language. Before punctuation rules can be formulated in-depth linguistic studies are needed, which cannot be the task of textbook authors. Once again, we can only urge you to be vigilant: firstly do not create rules which are unnecessarily at odds with those of the second language which the children will have to learn later; secondly bear in mind the fact that it is easier to create rules of usage than to modify them later, and thirdly beware of any uses which create vague feelings of unease; solve the problems as best you can and then apply the punctuation you have created uniformly since textbooks are a powerful force in standardising a language.
Spoken and Written Languages
National languages tend to be primarily spoken languages. You should complete your linguistic checks by analysing the level of language of your manuscript. See in particular whether the circular logic which is characteristic of oral discourse has been satisfactorily replaced by the linear logic common to written language. Once again, there is no simple solution, and no standard advice except to keep your ears and eyes open to the reactions of the individuals outside your group who re-read your manuscript.

Attainment Sub-Targets

The first criteria of an exercise is that it correspond to a precise attainment target. Even if you identified learning steps during the conceptual stage, you will now see that these are too vague to be directly translated into exercises.

To allow you to work properly, you will thus need to break down the general attainment target into a number of sub-targets. To this end you will bring together the basic structure, which stipulates how many exercises are planned per unit, and the sub-targets, which you should list by priority, thus ensuring that the most important are tackled in the exercises.

Let us look at one example, to give you an idea of the practical significance of this recommendation. Let us assume that the general learning objective for writing has been defined in the following terms. “The pupil should be able to copy short texts legibly and correctly from a model in joined-up writing, and should understand the meaning.” You should firstly identify the sub-targets regarding handwriting and those concerning written expression. For handwriting, you could identify the following sub-targets:

• Produce the round part of letters such as **a** or **g** with an anti-clockwise movement;

• Produce the ascenders in letters such as **b** or **h** and the descenders in **g** or **p** on the correct scale;

• Join up the letters within a word correctly

• Leave the space required between words and so on.

Having listed the sub-targets you should decide which ones are indispensable, and list those which could be considered part of the basic structure.

Identify the sub-targets for written comprehension in the same way.

Mechanisms and Presentation

The results of the last step should now allow you to begin devising the exercises. But, you may well ask, where do I start?

Your first task should be to identify a general direction for the first attainment sub-targets. If you already have some experience in this field you will be able to sketch these out fairly rapidly, and these will become exercises little by little. If, on the other hand, you are new to this work, and feel quite out of your depth we suggest that you look at the sort of exercises printed in recent textbooks. But be careful - you must not under any circumstances copy these exercises. Take them as a starting point by all means, add to them, change them, make them more detailed, so that they fit the bill for your specific situation and the language you are working in.

In either case though, do not simply accept the first mechanism that comes to you. Try to improve on this and keep all your drafts. They may be useful later, especially when you do the layout.

Devising Model Exercises

The activities outlined above should allow you to go on to devise the exercises for your first unit, which will give you a frame of reference for the rest of the book.

As you saw when you came to write the texts, you should adopt a three-step approach here. Firstly check how much space has been allowed for each exercise in the basic structure. Secondly look at your draft exercises and select those which best correspond to the principal criteria we looked at earlier. Thirdly either prepare sample pages in the same format as the book, or give the exercises to the publishing unit and let it do this where the exercises are longer. Sketch in the illustrations. Either way, this first unit will allow you to judge the average length of the exercises.

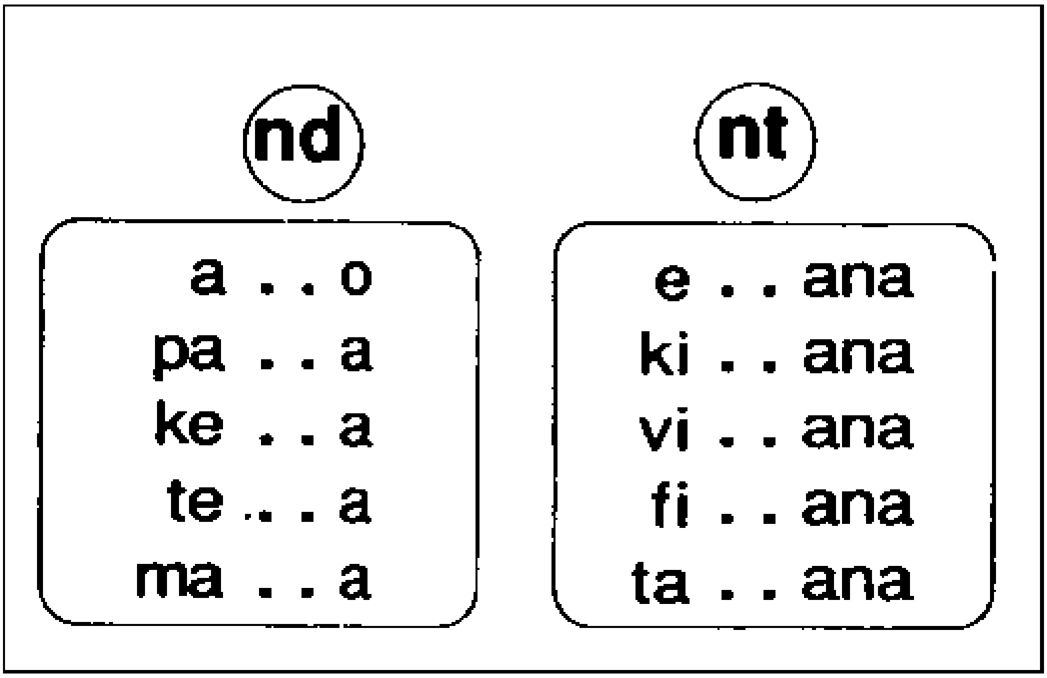
Step by step with the help of sketches, drafts and numerous new starts the exercises will begin to take shape

An exercise must meet a number of primarily pedagogical and didactic criteria

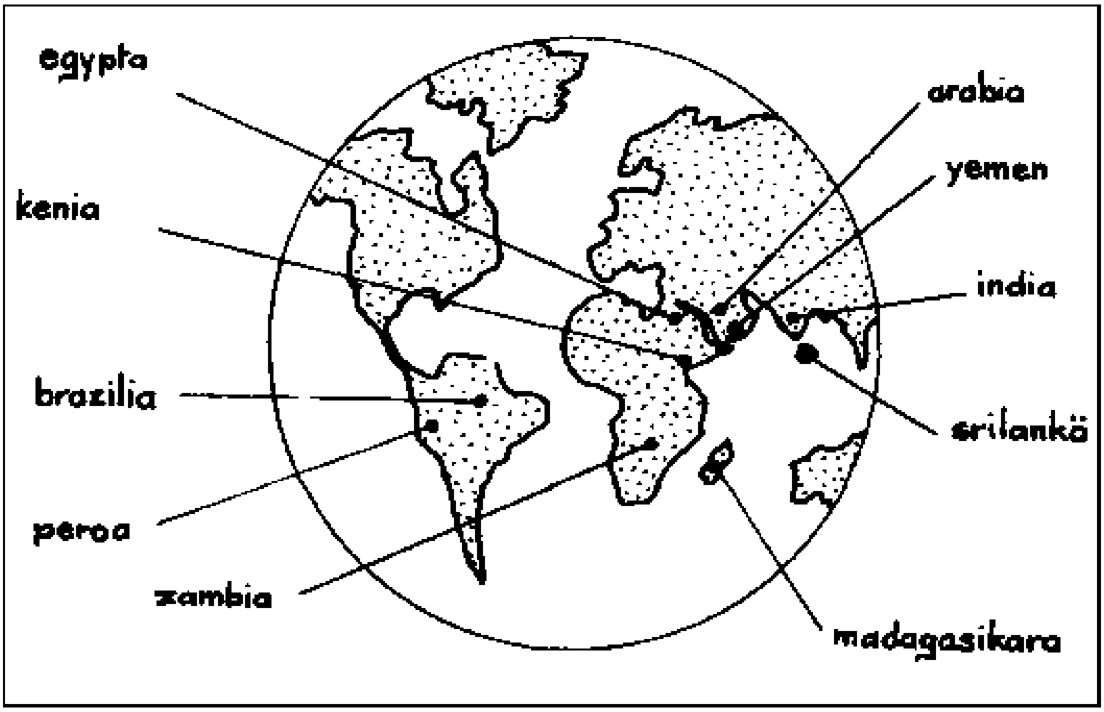
The exercises must also meet certain aesthetic criteria

28. Criteria for Developing Writing Exercises
Exercises must correspond to a detailed attainment target
This is the starting point for each exercise: every exercise must reflect a specific attainment target. An analysis of school textbooks shows how difficult it is to achieve this. The sole purpose of some exercises appears to be to balance a page aesthetically. Frequently they do not properly reflect the target set, and sometimes they tacitly reflect other targets.
Coherent sequence
Exercises must follow on, one from the other, in a logical sequence to allow a logical progression of new elements to be learned.
Adaptation to working conditions
The exercises must be in line with the working conditions found during the preliminary investigations, in particular as regards the time-table followed by the majority of the pupils, the average class size and the instruments available in most schools.
Ensuring optimum impact

Exercises should illustrate the phenomenon to be taught in an optimum way; it is thus important to identify not only the subject matter, but also the mechanism and the presentation best suited to enable pupils to achieve the target.
Mechanism that is easily understood by the teacher
The mechanism of the exercise should be immediately accessible to the teacher; explanations and information should not be needed to inform the teacher in detail about the mechanism, but merely to confirm what he has instinctively understood. This means that innovation must be kept within limits. If a book involves too many innovations there is a chance that teachers will not understand the exercise and will thus reject it, or that they will misunderstand it and use it incorrectly.[13]
Mechanism that pupils can follow
The exercises must be in line with the level of maturity and knowledge of the pupils; thus exercises that are too easy or too complex must be rejected, as must those that would require too many explanations on the part of the teacher. Appropriate exercise types should be identified and repeated several times, perhaps with slight variations to avoid pupils wasting too much time and energy understanding the mechanism.
Games aspect
The exercises must meet the demands of the subject matter in question, and be tailored to the target group; if the latter is made up of young children, they will learn more rapidly and easily if the exercises have the appearance of a game.
Harmony of exercise-image entity
The presentation of the exercises and any illustrations must form a harmonious whole with the content matter; the form must not only meet aesthetic requirements, but should also help pupils to understand the contents and/or the mechanism of the exercise.
Harmony of the double page
Not only must the exercises follow a logical sequence, they must be placed in a harmonious fashion on each double page. For young pupils, for instance, care should be taken that the exercises which comprise only text alternate with text illustrations to make the pages "airy" enough.
Professional aspect
The presentation of exercises will implicitly convince readers of the professionalism of the team of authors. Sometimes we forget that certain graphic aspects of the book, including the presentation of exercises can be decisive for decision-makers who cannot necessarily judge other aspects of the book. Thus exercises that are too "home-made" in appearance should be abandoned and replaced with more sophisticated presentations.



Example of function exercises
Transparency of mechanism: making and copying words (Tongavola p. 81)



Example of presentation of content matter
World map to illustrate the use of capitals (Rosovola, p. 78)

As you will have realised, once again the form and the content matter go hand in hand. Take care to select a form which is both functional and aesthetic; the form must allow you to present the mechanism of the exercise visually or to illustrate the content. Here is an example of two exercises where the form is a good illustration of the content matter.

Designing the Other Exercises

You should be able to design the other exercises without too many difficulties now, although this is not always the case. During this phase, authors often encounter obstacles in terms of the mechanism, the contents or the presentation, which force them to make modifications. Let us assume, for instance, that the planned mechanism does not allow us to illustrate a phenomenon well: you will change it, of course, but this change may trigger a whole chain of repercussions.

You should not then be unduly surprised if you have to resume your work a hundred and one times before you have a final layout: this is more likely to be a sign of the quality of your work than a reflection of mediocrity.

Internal Checks

Designing exercises is almost always a long and extremely arduous task. Once you have completed your first version, try to stand back and run a series of internal checks. We suggest that you pay particular attention to the following aspects.

Subject Matter Check

Check that the exercises do not contain any errors! Force yourself to sit down and do them in their entirety, and if you intend to print the answers in the book or later in the teachers' guide make sure they are correct. These will be the errors that will leap out at every reader later, without their having to go through your product with a fine-tooth comb.

Pedagogical and Didactic Check

Check and see that the natural progression of learning has been respected; sometimes changes are made with the result that the exercises no longer correspond to the original sequence.

Once you have completed these internal checks, you can submit the manuscript to your external correctors. Prepare the manuscript and identify appropriate proof readers.

Graphic Check

Start by looking at the length of each exercise one at a time; make sure that the instructions are not longer than the shortest exercise. If necessary lengthen the exercise - three or four words do not count as a proper exercise! Thin out exercises where the sheer length is off-putting.

Ensure that there is a balance between the form and the content matter: modify exercises that take up too much space for a limited subject matter, for instance.

Secondly, look at the harmony of the individual page and the double page. In books for the first few grades, you should pay particular attention to alternating exercises with examples or special presentations (words in a box, or a circle, for instance). You should always ensure a balance between the exercises on facing pages.

> **Undertake to excel in all aspects of the exercises, correct them, polish them, re-write them entirely if necessary until you are completely satisfied**
>
> **No three-word exercises and no “essays” of instructions that are twice as long as the exercises**

Publishing Considerations

At this level, you can record in detail the illustrations, writing and layout for the exercises.

Look first at the number, contents and dimensions of text illustrations or other illustrations to be produced by an illustrator. You should also plan the volume of text to be written in cursive style: if you do not have a computer programme which can reproduce italics, some of which are in any case unsatisfactory, and all of which are costly, you will have to have these parts written by hand. In some countries this is the work of professionals.

Finally, you should check the complexity of the presentation of exercises and ensure that the publishing unit can reproduce the layout you have planned.

5. External Checks

You have produced the pages of text for the pupils, i.e. you have written the texts and sketched the illustrations, and you have produced the exercises, i.e. you have written them and decided on the presentation, and you are doubtless impatient to “see” the textbook, with the finished illustrations and the text printed on a word processor.

But let's not jump the gun. After all the months of working in a vacuum, you no longer have the distance to your product to undertake the final revision, which is so vital. And you have been cut off from the outside world for too long. You can overcome this dual problem, however, by getting experts from outside the group to read your manuscript: this will allow you to check the quality one last time, and to inform the education authorities of the status of your work and start paving the way to ensure that your finished work is well received.

One way to do so is to follow the approach outlined below.

Preparing the Manuscript

Revise your manuscript once again, check that all your changes have been incorporated and that it can be read profitably and without any major difficulty by individuals without publishing experience. Remember that the unfinished nature of the manuscript may unsettle some readers who will then focus all their attention on shortcomings in terms of the form.

Proof Readers

Once your manuscript is ready, identify individuals whose skills and authority make them appropriate proof readers. Select proof readers who can make valuable comments now and can help ensure that your book is well received later; the following people would be suitable.

Subject Specialists

Good specialists in the subject in question, from universities or the ministry will be able to give a well-founded assessment of your work, and identify any fundamental errors which other proof readers will probably not notice.

Education Authorities

Identify the education authorities whose support might be important when the book is introduced in schools and involve them in the production of the book by asking them to make their comments which can still be taken into account if they are pertinent.

Animateurs in Rural Areas

Make a special effort to gain the support of animateurs in the test zone; given their excellent knowledge of the area and their training, they are often best placed to assess whether or not the material is appropriate for the normal teaching and learning conditions. If possible try to reserve several days to re-read the manuscript in their company.

You should also bear in mind that the same animateurs will be responsible for supervising teachers in the test schools during the test phase, and that as such they should be involved in the process of producing a book which they will have to explain and perhaps defend.

Teachers

If you have produced a pilot book, you will plan to run a test in a sample of schools and then evaluate the results of this test phase. It is thus in your own interest to involve the teachers concerned in the production of the materials, by asking them for their opinion of the manuscript. Often it is not so much their comments per se which will be important, but the chance they are given to identify with the materials they will later be expected to use. This identification is crucial for the adoption of the material.

Parents

If you have produced a textbook in a national language, especially if it is a reading book, we recommend that you submit a copy to parents; this will often involve reading them entire passages.

This will have two major advantages for you. Firstly, parents' comments may make for a greater richness and authenticity of the texts[14], particularly if you have distanced yourself from your native tongue and no longer speak it with total ease. Secondly, these information and sensitisation activities will often assure you of the interest and even the support of parents for your activities.

Groups of Children

It can be very interesting to have the manuscript read informally by children of the same age as the target group for which you have just produced the book. These children may be a source of important information, as regards in particular the complexity of the texts and their interests.

Reading Documents

To avoid generating too much confusion on the part of the proof readers who are not accustomed to re-reading manuscripts, you must inform them about your work and stipulate exactly what they are expected to do.

If you have time, you should then draw up two documents: specifications, identical for all proof readers which give a short presentation of the contents and the main physical and graphic features of the book, and an individual list of instructions, specifying the points you would like the individual readers to comment on, in the form of either a list of points to be examined carefully, or a series of detailed questions.

Logistics

If you wish all your efforts to bear fruit you cannot sit back yet. If possible contact your proof readers personally, ensure that they agree to help and define the terms of cooperation, in particular the time they have to read their copy of the manuscript and the date planned for pooling results. Stress that you are interested in constructive criticism rather than unfounded praise.

This phase, which in large publishing companies is the responsibility of the publisher, can mean a great deal of extra work for textbook authors in developing countries; sometimes you may have to undertake several trips into the field, organise trips to the main district towns, plan and chair meetings to pool results, etc.[15]. But, given what is at stake, we recommend that you plan and execute this work with the rigour which you have adopted throughout.

Think of organising proof readers as a mini-project in its own right

6. Writing the General Information Pages

After this phase of contact with the outside world you will have to return to your garret to finalise the manuscript.

You still have to write the general information parts, which generally make up the first few pages of the book and those found on the front and back cover. Pay attention to the following aspects.

First Pages

The first few pages contain the information which we looked at in more detail in the chapter on the concept of the physical and graphic aspects of the textbook.

> **Don't relax once the pupils' texts are finished - you still have to write the general parts of the book**

Write these parts carefully, because they will be a visiting card of sorts for the entire book. These are the parts that will be examined first by all adults interested in your book.

Try to avoid any errors, such as incorrect page numbers in the table of contents, or omissions which will irritate the reader: you should always give the date and place of publishing for instance. And you should exercise great care when you write these texts so that the official information (a foreword signed by the minister for instance) is every bit as convincing as the more technical parts (a presentation of the contents to allow readers to use the book without the teachers' guide if necessary).

And one last recommendation is surely important: do not underestimate the importance of the table of contents. It is not enough to list the units and give the page numbers; give a brief overview of the contents of each unit so that the table of contents is a genuine reference tool for the reader, and, when the layout is performed devote an appropriate length of time to this issue, to find a presentation worthy of your book.

The Cover

Take care also with the text which will be printed on the cover. The two outside cover pages address the purchaser, so give him the information he needs: print the ministry of education's name on the front cover, or at least the name of the publisher, the title, a description of the contents (e.g. reading book with exercises) and the grade for which it is designed. On the back cover you can, if appropriate list the other books in the series and announce the forthcoming titles. The two pages inside the cover should be left blank if possible. Think of the first as an invitation to the reader to concentrate, and the last as a visual curtain closing on the book, which makes white the most appropriate colour. If you are forced by financial constraints to use these pages, leave as much blank page as possible[16].

7. In Conclusion

The End of the Writing Phase

At the end of this phase, nothing is yet definitive. Your manuscript has undergone a first external check, but you can still modify it, add elements and remove others without losing time or entailing any extra costs.

If you need the authorisation of the education authorities to print your book, this is the time to submit the manuscript to them: you can still make any modifications at this stage. Later your choices will be more or less irreversible and any modifications that can still be made will be long, difficult and costly.

Check the procedures for printing your textbook at the end of this phase, and act accordingly before having the typesetting, layout and illustration work done.

Notes

[1] In: *Conception et production des manuels scolaires,* op. cit, p. 88 (in inverted commas in original text.)

[2] We look at the illustrations in more detail in the next chapter; whenever the time schedule allows, it is preferable for the illustrator to start work when the precise format and place of the illustrations has been determined. It is up to you to decide whether or not you have time to proceed in this exemplary fashion.

[3] These criteria, which were initially drawn up to help identify key words in Quechua, can certainly be used as a reference for other languages. Cf. Châtry-Komarek, M. *Libros de lectura para niños de lengua vernácula.* Eschborn: GTZ, 1987.

[4] “You argue, and we attempt to convince”, as one of the Tef'Boky authors summed up the difficulties of translating a French text with a linear structure into Malagasy for primary school teachers. Antananarivo, June 1990.

[5] These criteria were systematically applied to the reading books produced for the first two years of primary schools in Madagascar, *Garabola* and *Tongavola.*

[6] Many studies have been conducted on the controlled use of words in reading books for primary level: we would refer you, for instance, to McCullough, C. and Chacko. C. In: “Developing Materials for Instruction, In: Staiger, R.C. (Ed.) *The teaching of reading.* UNESCO/Ginn, Paris: Lexington, 1973.

[7] Here is one example, to demonstrate how important this is. In Malagasy, the negation “tsy” (“not”) does not figure in the first reading book, because it includes the complex grapheme **ts** which is incorporated in the systematic learning programme for the second year. This linguistic restriction proved to be the most irritating when the texts were being written for *Garabola.*

[8] This point is explained in more detail in this chapter in Table 27.

[9] Non-school education must be one of the considerations of authors of textbooks for the lower classes at primary level. See Hummel, C. *School textbooks and lifelong education: an analysis of schoolbooks from three countries.* Hamburg: UNESCO Institute for Education, 1988.

[10] A valuable book to read in this regard is Berthelot, J. *Petit guide a l'intention d'auteurs débutants et de quelques autres,* op. cit. pp. 59-69.

[11] Cf. Huot *Dans la jungle des manuels scolaires,* op. cit. p. 79.

[12] The modernisation of national languages is a long, complex process, which is rarely crowned with success; textbook authors, who may be the first to express an interest in this subject, are sometimes unaware even of the existence of a language planning agency. See also “Textbook writers and language planning”. In Rubins, J. (Ed.) *Language planning processes.* The Hague: Mouton Publishers, 1977.

[13] All innovations must be recognised as such, even where you consider the new methods obvious and incapable of being misunderstood. We will just recount the example of one teacher who was given an exercise book for writing for primary one - something completely new to hear; the letter to be taught was presented in dots to allow pupils to practice by joining up the dots. For several months she taught her pupils to write letters in dots.

[14] Textbook authors are often bilingual, but having undergone their education in a European language they have sometimes lost touch with their native tongue. If this applies to you do try to re-read your manuscript with groups of parents. They are an excellent source of lexical and syntactic information.

[15] When the author is responsible for organising the proofreading phase, this work is almost always a veritable mini project, whatever the type of publication in question. The organisation involved in having this book proof read is a case in point; it was extremely time-consuming and took an enormous amount of energy.

[16] For instance print the colophon, indicating the month and year and the authorised supplier.

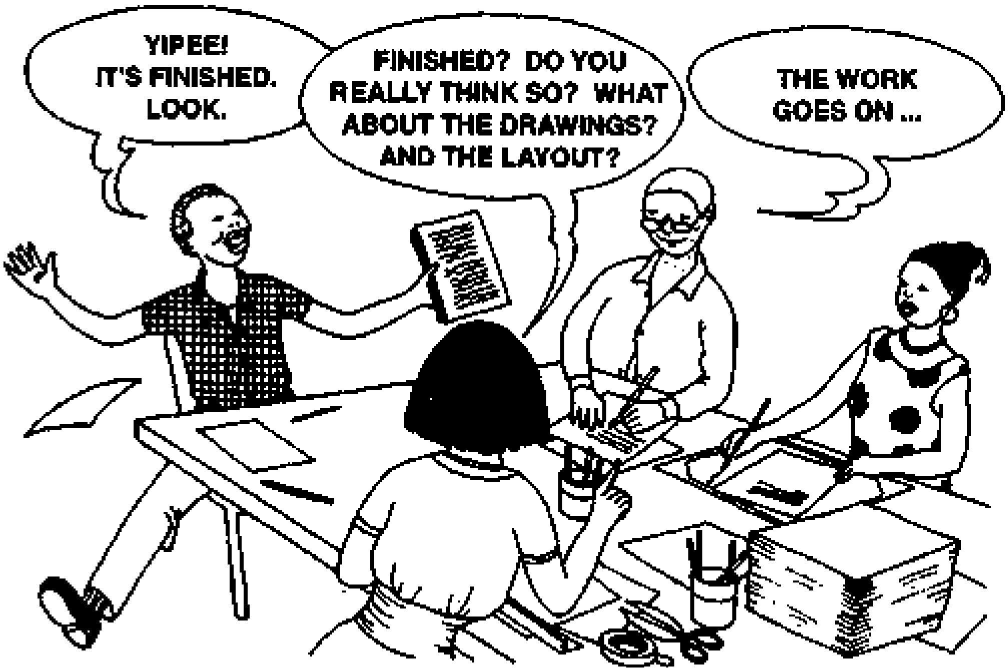
To Sum Up

The systematic concept drawn up for the contents and the physical and graphic aspects of the textbook allows the authors to move smoothly into the actual writing phase.

Among the many tasks of textbook authors, this is often the one they feel least apprehensive about, especially if they have been selected on the basis of their writing skills. This confidence is, however, often based on a misapprehension. Although the writing of texts and exercises is important, writing a textbook is not a purely literary pursuit; it must be accompanied by graphic considerations. It is important to deal with the form and the contents of each page together, such that the products of this phase are not merely texts and exercises, but an entity of words and images linked so coherently that we can speak of a “text-image unit”.

We feel that three points are important to finish off this work, although the complexity of these tasks is often under-estimated. Firstly, a frame of reference and working conditions are needed which give free reign to the literary and artistic talents of authors. Secondly, certain procedures must become automatic, such as checking the position, length, presentation and accompanying illustrations for each piece written. Thirdly, a systematic approach should be taken to writing the texts and devising exercises, involving the following steps: drawing up a list of criteria, producing a model unit, doing the provisional layout, writing the other texts and exercises, performing an internal check, and identifying a group of external proof readers to re-read the manuscript one last time and make their comments.

At the end of this phase it is absolutely imperative that all authors' corrections be completed. This is why we recommend that all teams who must obtain the authorisation of the education authorities before printing their material submit their work at this stage, so that the latter has a chance of suggesting modifications which the authors can incorporate without entailing additional costs or losing time.



Preparatory Chain

Until now you have focused on both the development of the contents and the development of the graphic design, which has allowed you to produce the texts and the sketches for accompanying illustrations. At this stage you must put them both into their final form.

In large publishing companies this work would be split among several people: illustrators and photographers would complete the illustrations on the basis of the sketches, or sometimes just on the basis of the author's instructions; then, ideally a graphic artist would decide which typeface should be used for the texts which will be typeset by computer; finally a layout man would produce the layout. All these tasks would be organised and supervised by the Art Director.

In developing countries, the authors themselves generally plan, define and supervise the illustration and layout work. In this chapter you will find a presentation of the work involved, which we hope will be interesting for all of you. You should, however, realise that if you have no training in graphic art, this chapter alone will not enable you to solve all the problems you are bound to encounter.

Try to get some professional back-up, and, whether or not you are successful, make an effort to become familiar with the basic principles of graphic art; read this chapter carefully, consult the books listed at the end and examine the illustrations and layout of recently published textbooks.

A finished manuscript is still far from being a printed book
It's an uphill struggle from the manuscript to the imposition scheme

1. Overview

The preparatory chain involves all operations leading from the manuscript to giving the printer the go-ahead. This authorisation is noted on the final set of proofs, the blueprint, indicating that no more changes will be made and thus giving the printer the go-ahead.

This phase is long and complex, much more so than many authors realise, believing as they do that a completed manuscript is more or less a printed book. To give you an idea of the nature, scope and sequence of the tasks involved, we will proceed as always, starting with an overview. Once again we will take the example of the procedure followed in the Tef'Boky Project, which is laid out in Table 29.

The various tasks we describe here do not differ significantly from those found within large publishers, of course, but some of the steps taken by the project in an attempt to avoid the major pitfalls that beset the production of textbooks in developing countries may be instructive for teams without much publishing experience and for teams only able to ensure sporadic monitoring of the printing work.

29. An Example of the Chain: Garabola
Illustration work
The illustration work, which commenced during the writing phase, continued parallel to the layout work. Little by little ink drawing replaced the sketches. The exercises which needed careful placing of text illustrations and text were illustrated once the layout was complete, and the letters, words and sentences to be written in cursive style were added last. Generally the illustration work was never finished until the job envelope is handed over to the printer.
Stipulating the final layout
The format of the book and the basic visual structure had been clear for several months; it was time to decide on the final layout; firstly the stencil was defined, i.e.

	the precise frame within which the text and illustration blocks were to be arranged; secondly the typographic characteristics of the text were determined. The manuscript was coded to ensure that all instructions were clear to the photocompositor.
Typesetting the text and correcting proofs	
	The texts and exercises in the manuscript still had to be typeset by computer. Given the shortness of the text and the complexity of the layout, no running text was produced; it was broken down immediately into its final form. The proofs thus obtained were examined by each of the authors. This was a time-consuming task: firstly the authors were not professional proof readers and had to learn to track down errors; and since the Malagasy language is still undergoing standardisation, they had to check that standard linguistic criteria had been applied throughout (regarding newly created words, spelling and punctuation in particular).
Preparation of a pasteup guide	
	The authors prepared a pasteup guide to be used as a model for the assembler. This is a more detailed version of the layout plan, in which every page is prepared on the basis of a photocopy of the texts and the illustrations. This model was extremely useful and made up to some extent for the absence of professional proof readers and layout men. It revealed the more serious graphic errors, forced the authors to correct some pages or reconsider certain typographic decisions; it also allowed them to identify the odd punctuation or spelling error, and correct it.
Pinboards	
	Gradually, as the pages of the pasteup guide were finished they were stuck up on a pin board, until the entire book including the cover pages had been pinned up, double page by double page. This method had the advantage of giving a permanent overview of progress; the authors could find the pages which had not yet been put into their final form and the illustrations that were missing, and were also able to pick up that one last mistake which had slipped through the individual checks, or something in the layout which had to be modified.
Shading	
	For financial reasons the interior of the reading and writing books produced in the Tef'Boky Project was printed in monochrome. The authors shaded the accompanying illustrations in three shades of grey; this gave depth to the pictures and marked the difference between reading and exercise pages, which have no shading. The authors themselves indicated how the shading was to be done on photocopies of the originals.
Preparing the job envelope	
	The authors then prepared a job envelope for the printer. For every page of the textbook they prepared one large envelope containing four documents: the final version of the corrected text with layout, the corresponding original drawings, a photocopy of these drawings with shading instructions and the page layout, as a reference for the assembler. These precautions were felt to be necessary as a result of the poor communications with the printer, and because the authors were called away to other tasks almost as soon as the job envelope had been submitted to the printer.
Checking the blueprint	
	In spite of the measures described above the authors asked the printer to prepare one last set of proofs, the blueprint. They checked these, ensuring not only that the montage was correct, but also that there were no omissions[1] or changes[2], before giving the printer the go-ahead for each page. Let us specify that after this the authors were only involved in very sporadic monitoring; even this, however, allowed them to pinpoint and remedy some errors which they never dreamt could happen.[3]

As you will see, the work is long and relatively complex, and, in most cases, it is your team which will be in charge.

To help you understand the sequence better, Table 30 lists the tasks for which Garabola authors were responsible, broken down into those which they performed themselves and those which they only had to organise and supervise. Take a good look at this table and see what you can expect.

30. The Authors' Responsibility		
No.	**Performed by Authors**	**Organised and Monitored by Authors**
1		Finishing illustration work
2	Final check of illustration work	
3	Putting together the stencil	
4	Identifying typeface	
5	Preparing the manuscript for typesetting	
6		Typesetting text on a computer
7	Proofreading	
8	Preparing a provisional layout plan for the printer's assembler	
9	Mounting the make-up on a board and checking texts and layout systematically	
10	Instructing the printer about shading	
11	Preparing the job envelope, with one envelope per page of the textbook, containing all the pertinent documents	
12	Instructing the printer, submitting the job envelope and set-off sheet	
13		Providing the printer with imported inputs
14		Monitoring the progress of work from assembly to printing
15	Checking assembly on the basis of the blueprints	
16		Checking printing quality
17		Checking quality of finishing

2. Illustrations

Now you have an idea of the various steps leading up to the printer receiving a go-ahead, let us go back to stage one.

The illustrations will often be noticed first; make sure they are appropriate

The objective is to have the illustrations that you devised and possibly sketched during the writing phase completed. These may be photographs or drawings, which will then be printed in one or more colours. Within the scope of this publication, for the reasons given in the introduction, we do not propose to go into the technicalities of 4-colour printing, focusing on representational drawings in one colour, with shading or without, and in two colours.

All teams of authors must work with the illustrator, but their specific tasks will not always be the same. In large publishing houses the authors will give the illustrator instructions as to the illustrations that are to accompany the text, and, for technical drawings they may compile a dossier of basic information. In developing countries on the other hand the authors are often in charge of all graphic work.

If you find yourself in this position, here are the steps you will generally have to take.

Drawing up a Contract

As we pointed out at the end of chapter 5 you should have sounded out the illustrator during the conceptual phase. You will have selected the artist whose skills and attitudes are best suited to the job in hand. When he reappears on the scene, which will not generally be before the texts have been completed, your first task will be to draw up a contract. Generally artists work as free-lancers, and prefer to be paid by the unit, depending on the type and dimensions of the illustrations to be produced.

Most of you will not have to deal with the legal and financial aspects of a contract of this sort, since it is unusual for the authors of a book to be responsible for the financial side[4]. But you will almost certainly be consulted to ensure that the contract reflects the services actually required; you should proceed as follows.

General Presentation of the Textbook

Start by giving a thumbnail sketch of the textbook; inform the illustrator of which grade and subject it addresses, the format and the number of pages, the subject matter covered, the fundamental visual structure, etc.

Type and Number of Illustrations

You should then list the main technical features of the illustrations.

First of all, stipulate what type of illustrations are required: perhaps realistic scenes from everyday life, to be drawn in ink with shading which will later be screened and printed in two colours, or text illustrations accompanying the exercises, or models for writing lessons, to be copied in pen. Go through the book page by page with the illustrator and make as detailed a list as possible of the number and format of the drawings to be produced. This will be used as a basis for determining the illustrator's fee.

> **A carefully drawn up contract that is respected by both sides ensures good cooperation with the illustrator**

The Tasks of Those Concerned

Stipulate the respective tasks of the authors and the illustrator at this stage.

At the outset it is essential that the illustrator appreciates that he must put his skills at the service of pedagogical and didactic criteria. He has not been contracted to “express himself” but to translate into images the more or less precise instructions you give him.

You should thus explain to him that together you will produce illustrations which best correspond to the visual decoding ability of the children in question. They must be in line with the average age of the children, with their degree of familiarity with printed materials and with the socio-cultural features of their immediate environment. It is up to you to decide, for example, if you feel it appropriate only to depict people in their entirety, to use unusual perspectives or to resort to caricatures - but the illustration work must always be based on an agreement in principle with the illustrator who is about to join your team. You are thus very much in charge of the illustration work, while the illustrator works within a pre-determined, limited framework and needs the transparency and complementarity of a genuine working group.

This has two important consequences: firstly you will have to determine all the features of the illustrations, and secondly the illustrator must agree to redo illustrations which do not correspond to your instructions. Make this point quite clear at the start to avoid working with artists who have not been properly informed about the working conditions and are too full of themselves or unable to knuckle down to the quality and time requirements found in the world of textbook production.

Finally, if you plan to print your textbook in two colours, you must decide who is going to be responsible for preparing the half-tones - you or the illustrator.

> **Many of you will be responsible for the entire preparatory chain**

Methods and Steps

Now you have established the general framework of collaboration you can move on to the details of your work with the illustrator.

Firstly, you should decide where he is to work. If conditions permit, put him in the same rooms where you meet; this is the best way to ensure smooth and rapid progress. Secondly, decide what tools he will require, which of these your organisation already has and which you will have to provide him with. Finally, determine the various steps to be undertaken from the first sketches to the final version of the illustrations: nothing is more demoralising for everybody concerned than having to redo or have someone else redo a drawing which has already been completed in ink because the original specifications were not clear.

To ensure that deadlines are respected, you too should make changes only to the drafts and agree at the outset on the number of finished drawing which can be revised without incurring any extra costs.

Deadlines

Set a deadline for the submission of all original drawings and draw up a contract which covers all the points we have touched on.

Graphic Criteria

Once the illustrator has agreed to the terms and conditions, and has signed the contract you can start the illustration work per se, firstly drawing up a list of criteria to be respected.

Never under-estimate the power of the image. Remember that even if the texts in a book can capture the interest of an attentive reader, images do not need his attention or even his interest. They appeal directly to him, triggering an emotive response - attraction or rejection. Take great care then to draw up as precise as possible a list of criteria which will allow you to identify which elements should be given precedence and which should be ruled out to avoid the risk that the textbook will be rejected by readers.

In Table 31 you will find some of the general criteria which guided the illustration of the reading and writing books produced in the Tef'Boky Project. We have only listed the criteria we felt were most interesting for textbook authors in developing countries; read them carefully and see which ones apply in your case.

Sometimes textbook illustrations must attempt to reconcile the irreconcilable

Do not wait passively for the illustrator to submit his drawings - you must guide him

When the authors of the Tef'Boky Project began to draw up a list of criteria for the illustration of their textbooks, they differentiated between criteria which they felt were of universal validity, such as the concordance of text elements and drawings, and those which they felt were specific to developing countries. As you no doubt noted in the Table 31, the latter criteria are particularly difficult to respect since they are always somewhere between two extremes.

31. Main Criteria Observed when Illustrating Garabola and Tongavola
Realism vs. Idealisation
The illustrations must reproduce actual everyday life, removing any element which could be construed as demeaning, i.e. the reality depicted should be idealised while remaining realistic enough for pupils to recognise it immediately and identify with it.
Precision vs. Generalisation
The illustrations must have a high level of precision and authenticity, allowing the reader to recognise beyond any shadow of a doubt everyday life on Madagascar (habitat, customs, countryside, dress, etc.). At the same time, however, they must abstract every element that is too closely linked to any one region, the objective being not that every

	pupil feels himself to be addressed directly, but that no pupils feel excluded by the life depicted. For Madagascar, for instance, no elements should be depicted which refer exclusively to either the coast or the high plateaux.
Traditional vs. Modern Elements	
	The illustrations must do justice to traditional instruments and work that are still in use, while adequately documenting the progressive introduction of new technologies; plastic and the radio have a legitimate place alongside dugout canoes and oxen-drawn carts.
Diversity of Visual Techniques	
	The visual techniques used must allow readers who have had little contact with printed materials to decode the illustrations without difficulty, but techniques should also be used which signal a certain leaning towards modernism and will familiarise pupils with graphic styles commonly used in industrialised countries. Thus, the perspective chosen should, for instance, be easy to decode, while making use of cartoon techniques to a certain extent (arbitrary cutting off of parts of the element shown, unusual perspectives, caricatures, etc.).
Humour and Criticism	
	Efforts should not necessarily be made to renounce humour and criticism, but you should avoid using elements which, although they may be widespread and generally accepted elsewhere are liable not to be understood or to be considered shocking in the context in question - e.g. the personification of animals, where extra care is needed. Care should also be taken that the reader, unaccustomed to a critical view of his environment, is not unsettled or insulted.
Childhood and Adulthood	
	Illustrations should be adapted to the children who the book addresses first and foremost; they should also be generally instructive and pertinent for children whose adult life often begins after barely two years schooling.

Identifying Scenes

Once the terms and conditions have been agreed on, and the criteria listed, you can go on to the next stage; starting to work in close cooperation with the illustrator.

To this end you should return to your texts and sketches, and examine them page by page. Start by arranging each drawing as exactly as possible on the page, and determining its dimensions. Then decide which elements must be depicted and which are at the heart of the text and must therefore be emphasised.

We recommend that you take seriously any reservations the illustrator may have. If he has major difficulties illustrating a particular text, look firstly for the reasons in your own work. See in particular if the text allows for an adequate degree of visualisation, and if it doesn't, rewrite it.

End this phase by ensuring that the illustrator has as precise a dossier of instructions as possible, in the form of notes or sketches, which will enable him to start work.

Correcting Drafts

Although illustrators generally go off by themselves initially to produce their first sketches and familiarise themselves with the book, it is important for them to re-establish contact with you rapidly. During this phase you should intervene at least twice in the following way.

Initial Instructions

To ensure that the illustrator is on the right lines, you must insist that he show you his first drafts. Examine them and let him know whether he can finalise these or whether he must take an entirely different approach. React quickly to avoid the illustrator continuing under false apprehensions.

Revision of the Final Drafts

The illustrator will often produce a series of drafts, which will become gradually more and more precise. The last of these drafts, which should be the more or less final version, must be examined in great detail: peruse them in the company of the illustrator to ensure that they are in line with pedagogical and didactic requirements and with the criteria you listed in advance. Specify any changes that will have to be made.

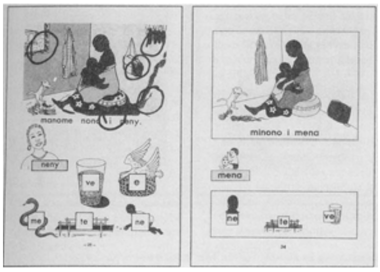
To give you a better understanding of your role as a supervisor of sorts during this phase look at the examples below; compare the pilot version with the corresponding pages of the revised version of *Garabola* and deduce the reasons for the modifications made in the interlude, indicated in the following figures by a circle.

You will have to make some corrections to the graphic artist's work

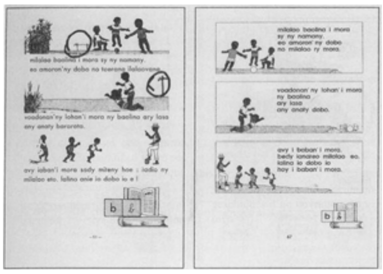
Examine each drawing carefully and be precise and consistent in your comments

Correct illustrations on the basis of precise pedagogical and didactic criteria

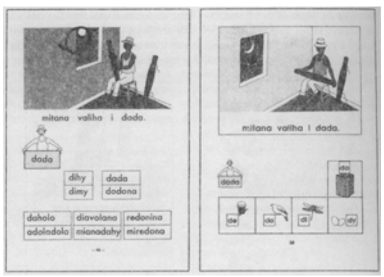
The illustration should help create a “text-image unit”



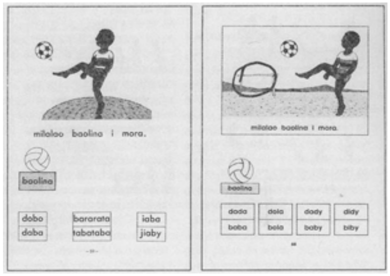
1. Remove secondary elements which obscure the relation between the text and the image.



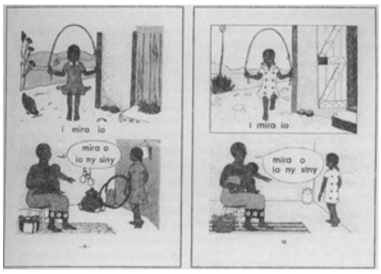
2. Remove any elements that are purely decorative.



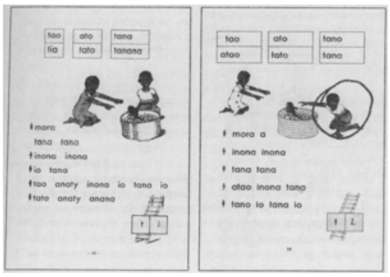
3. Select elements which make the object depicted as easily recognisable as possible.



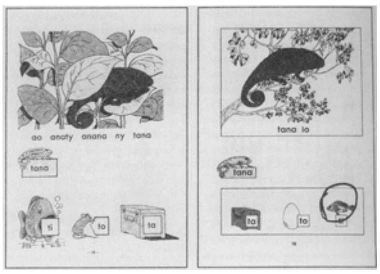
4. Add any elements that are essential to allow the reader to identify the scene.



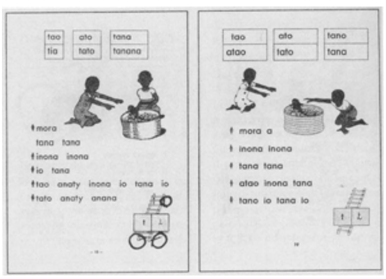
5. Outline elements that are central to the text.



6. Use images to reflect the dynamism of the text.



7. Check the exactness of specific elements[5]



8. Get rid of superfluous elements which distract the reader or get in the way of visual decoding.

Final Versions of the Drawings

To ensure that the arrangement of text and illustration is as perfect as possible, it is better not to start with the final versions of the drawings until the text has been typeset and the text layout finalised.

When the authors are responsible for supervising the illustrator they must not only examine the drafts and suggest any changes. They must also decide which tools the illustrator will need (Rotring pens, fountain pen, tweezers, etc.) and which materials are best suited to the printing procedures to be adopted (tracing paper, canson, etc.).

All originals should be kept carefully; simply note the page on which the drawing is to be printed, and make a photocopy before filing the original. If it is not modified in any way, it should be submitted to the printer at a later date in this state.

3. Layout

During the conceptual phase you will have laid down a fundamental visual structure for your book, which you will have developed in more and more detail during the various stages involved in writing and illustration. But the fruits of your labour are not yet ready to be published. If we can make a comparison with the world of haute couture you now have the fabric to make your dress and you have an idea what form the dress should take. But you still have to cut, sew and finish the garment.

During this phase you will “tailor” the page, deciding on the stencil, putting it together with the typeface you choose and finishing it by checking the arrangement of the elements on the page.

We cannot claim to present the fundamental principles of layout in a book like this; the field is much too wide. We will thus look only at what is essential for an author of textbooks, who alongside his many other roles finds himself responsible for the layout of his book, although he cannot claim to be a professional in this field. If you find yourself in this situation, proceed as follows.

Margins

Your first concern must be to decide on the margins.

All printed materials have four margins, at the top, bottom, left and right hand edges of the page. Margins give a book its particular style, and you should aim to find the proportions which will give the best possible balance and coherence.

The size of the margins can be set professionally; layout artists today still set the margins on the basis of calculations or diagrams, and many still refer to what has been done in the past[6]. You need not be so scientific in your approach, but you should respect three basic principles.

A good layout person seeks excellence in every layout detail
Leave wide enough margins

Firstly, the outside margins on each page must be wide enough for you to hold the book in your hand without concealing the text. Secondly, convention dictates that the margins increase slightly from the interior of the page/towards the top called the “head” and from the outside of the page/towards the bottom, or “foot”: the most important thing to observe with margins is, however, that they present the text to its best advantage. A one-centimetre margin, for instance, is quite inadequate and will give your book a cramped look. Finally, once you have decided on the margins they must be respected throughout the book, from the first page to the last. In general nothing should be printed in the margins except the page numbers, or “folio” as they are known and any headers or footers, such as the ones at the top and bottom of the pages of this book. These elements are arranged outside the frame set by the margins, known as a grid. If it is absolutely essential for some elements to go beyond the frame thus set, for instance if you decide to incorporate bled-off illustrations which cover the page in its entirety, you should ensure that they are positioned in such a way as to make the continuity of the grid easily recognisable for the reader.

Arrangement of the Various Elements

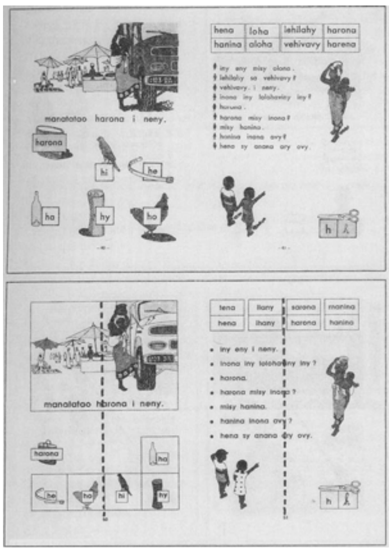
Having decided on the margin width you should turn your attention to the arrangement of the various elements on the page.

You have already decided on a basic structure which allowed you to produce texts of the required length, but now you must decide on the finer points, laying down the final arrangement of texts and illustrations. The aim is to find the positioning that best reflects your pedagogical objective, i.e. to find the layout that best captures the reader's attention and facilitates the learning process.

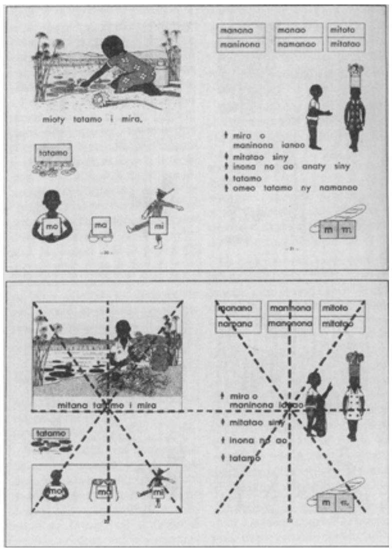
If the contents of your book are relatively heterogeneous, as is the case in a reading and writing book, for instance, the layout is bound to be complex. Nevertheless you should not position the various elements instinctively. Arrange them as though they were on a sort of invisible grid. In view of the fact that the reader will be confronted by two pages of the book at a time, you should design your grid for even and uneven pages.

Start by familiarising yourself with the concept of a grid. Just look at the first page of your daily newspaper, and you will see that the text is divided into a certain number of columns, within which and across which the headlines and illustrations are spread; these columns are repeated on the following pages and give the newspaper its identity.

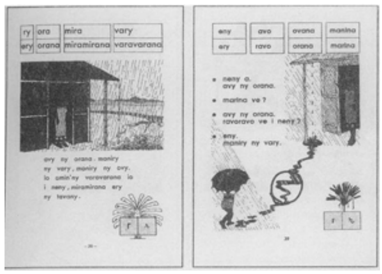
The grid for your textbook will never be as complicated as a newspaper grid, but you should have one to help you impose a certain discipline on your page and thus enhance the impact. The positioning of the various elements on this grid will not always be identical and rigorous; it will be a flexible distribution which may from time to time break with the basic structure without ever completely obscuring it and this will thus retain the attention of the reader without irritating him by introducing too many changes. On the opposite page you will find one example.



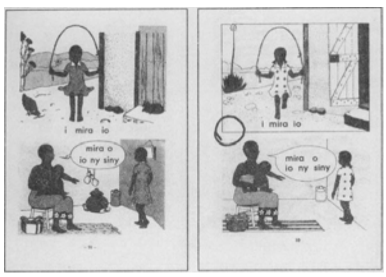
1. Decide on a basic structure for double pages; here we decided for two columns.



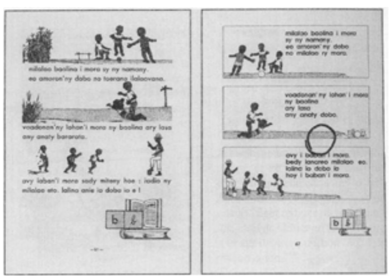
2. Position the various elements on your double page with the help of horizontal, vertical and diagonal lines of reference.



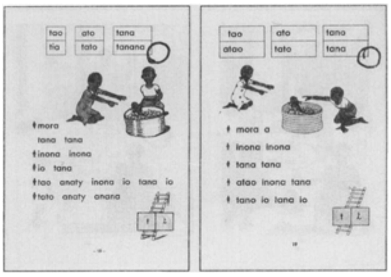
3. Avoid monotony and break with the basic structure, but ensure that it is still identifiable as such.



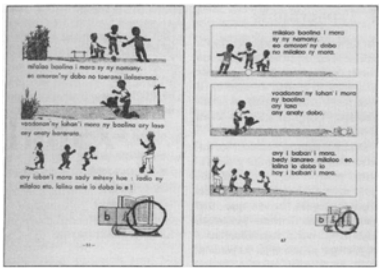
4. Make a clear optical distinction between the various elements on a page.



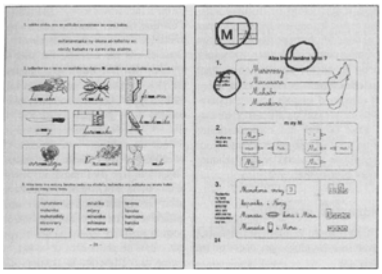
5. Bring text and image close together while respecting the requirements of both.



6. Respect the grid.



7. Balance the dimensions of the various illustrations on a page.



8. Use different sizes of typeface to indicate the relative importance of the texts.

There is no sure-fire recipe for a successful layout, you must gather experience and know-how and always examine the quality of the final product.

Given the fact that this book is not dedicated solely to layout, we have chosen to illustrate a few of the basic principles, again with the help of real-life examples. On the following pages you will find examples of some of the pages of the pilot version of *Garabola* for which the contents were arranged intuitively on the page by the authors, side by side with the final version where the layout was corrected by a professional[7].

Compare the two and think about the principles behind the changes; they probably apply to your book too. Most changes are indicated by a circle.

Arrange the elements on the page according to a grid, which need not be unduly complex - two columns are perfectly adequate

Practice identifying basic layout principles if you have no recourse to a professional layout man

There is no sure-fire recipe for good layout: rigour and imagination are equally necessary

Moderation is always called for in layout for primary school textbooks

The layout must bring out the essential elements

The layout concerns all the elements on a page; don't forget to examine the drawings, texts and blank spaces on each page

4. Typography

By deciding on the precise margins and identifying the exact arrangement of the elements on a page, you have drawn up a plan for your book. You must now decide on the typographical features of the texts and exercises.

In a publishing house, this work would be performed by a professional graphic artist. If you are forced to make the typographical decisions you should firstly be aware that this is an extremely wide field, where research has been conducted for centuries, and about which more is being written today than ever before. It is a field that we cannot hope to do justice within the scope of this book any more than we could for the layout.

To avoid repeating information that you will find in any specialised literature, we have decided not to dwell on any details that are not immediately relevant for textbook authors. For reasons of clarity we will equally take only a cursory look at those typographical features which will feel are important for a first reading book. Read the following pages in the knowledge that they are far from being complete, and try to adapt the recommendations to suit your own specific circumstances.

We would suggest that you adopt the following procedure to decide on the typographical features for a first reading book.

Aspects to Take into Account

First of all make a list of all the aspects to be taken into account, the most important of which will be:

1. The characters

- class
- type family
- fount
- category
- size of type body
- weight of type

2. The texts

- character spacing
- word spacing
- line spacing
- paragraphs
- line length and justification
- level and hierarchy of texts

Decisions at Character Level

Once you have drawn up your list, turn your attention firstly to six aspects concerning the characters you plan to use. The information below should help you make your decision.

Class

Today, you can print a multitude of different characters. They have been classified many times over[8]; one of the most widely used is Maximilian Vox's classification, which distinguishes eleven groups of characters[9].

For a first reading book you should select the best class to help pupils learn to read and write. Straight-line characters are good for this and are found in most textbooks which address grade-one pupils. First of all the characters look like a simplified form of cursive style, and, unlike the characters used for other classes, they have no serifs (short lines drawn at right angles or obliquely across the ends of stems and arms of letters), which are not found in cursive style either. This means that the pupils need not discount any elements when they write most of these letters in cursive style. They simply have a shape to complete. These characters are also of more or less equal weight of type throughout, and since the days of the heavy down strokes and light up-strokes are over, they are thus more like the style of writing actually taught.

As of the second grade, the pupils should be able to read texts written in characters with and without serifs. In the books for second grade upwards you should thus select a different class of characters.

Lower case characters with serif

garabola

Lower case letters without serif

garabola

Type Family

Several families of characters are affiliated to each of the classes.

If you are producing a first reading book for which you have decided on a class without serif, you can now look at the form of the lower case characters of the different families that go to make up this class. For optimum readability, each letter should be immediately identifiable, without any chance of confusion, even when the letter stands alone. You should thus examine every individual character, one after another.

Check that the descender of the **j**, for example, finishes with a curve and does not only consist of a downward stroke. Likewise, the curve of the **r** must be clear enough, etc.

You should also pay particular attention to the form of two letters, the **a** and the **g**; to make it easier for the pupils to learn to read and write at the same time you should select a form which is as close as possible to the shape they will learn to write.

In the next books in the series you will have more leeway to chose the family of characters, once the pupil has been systematically introduced to the new forms of the **a** and **g**.

Look at the two examples below, before you decide on the form of **a** and **g** you wish to use.

garabola
garabola

Fount

Every family has three founts: roman characters, in which the axis is vertical, italics which are inclined and cursive style in which the letters are joined up as they are in handwriting[10].

There are no fewer than 12 aspects to be taken into account when deciding on the typography

Typography is important in all printed materials, but for a first reading book it is absolutely critical

The first form is best suited for pupils who are learning to read, while the second is reminiscent of handwriting, but should not be taken as a model for the first graders.

Category

Should you use upper or lower case letters?

In some languages, such as German, it is imperative that children learn both lower and upper case letters from the start, since upper case letters have a specific grammatical role, such as to denote nouns. In a first reading book you may, in some languages, be able to avoid using upper case letters. If you are forced to introduce both, use the same technique to introduce the upper case letters as you have already employed for the lower case - use characters with straight lines and no serif.

Here are two examples to illustrate this difference.

Upper case with serif

GARABOLA

Upper case without serif

GARABOLA

Size of Type Body

If you look closely at this book you will note that not all the characters used are the same size. We say that the type body is of different sizes, and we define this size in points; to give you an idea of sizes, the main body of this text is printed in Palatino, 10 point.

At the start of a first reading book you could use 24 point and then go on to use 18 point. Before deciding, try out the different sizes; and for the moment look at the following models.

Avant-Garde, 24 point

Garabola

Avant-Garde 18 point

Garabola

Weight

The weight, or thickness, of the characters used can vary; to convince you of this look once again at this book. You will find normal and bold characters: in photocompositors' catalogues you will find other options including the following:

Garabola (extra-light)
Garabola (light)
Garabola (medium)
Garabola (bold)
Garabola (extra-bold)

For a first reading book you should select normal characters for a continuous text and bold letters for headings as well as for free-standing letters, symbols and words.

Decisions at Text Level

Once you have decided how to deal with the characters you can come to the text, and look at the following aspects.

Character Spacing

The space left between letters within one word ought to be chosen for maximum readability, neither too large as can sometimes happen when texts are written in columns, nor too small.

This point is important when you are working on a reading book. If you have used straight-line characters, you will notice that the absence of serif makes it difficult for beginners to read certain combinations of letters; narrow letters, such as **l**, **t** and **j** are difficult to identify when they are followed by an **i** with automatic spacing.

To help solve this problem, you should widen the space between characters slightly. By way of illustration here is one word written with automatic spacing and one with slightly wider spacing.

Garabola
G a r a b o l a

Word Spacing

For maximum typographical readability, the space between words should equally not be too wide or too narrow.

But, for texts written in large characters, such as those found at the start of a first reading book, it may be advisable to use double word spacing. This will allow beginner readers to identify each word more easily as a unit. If you leave a double space between words, however, take care that the sentences do not appear disjointed.

Here is an example of single and double word spacing

Garabola, school textbook
Garabola, school textbook

Line Spacing

This is the space between two lines within the same paragraph.

You should be able to decide on a line spacing which will give your text optimum readability. If the line spacing is too large, each line will seem artificially isolated on the page, which will slow down the reader. On the other hand if the lines are too close together readability will also be poorer because the descenders of the letters on one line will become confused with the ascenders of the letters on the line below.

Computers insert automatic spacing; if you wish to modify this, try out different spacing.

The example below shows automatic, narrower and wider line spacing.

Garabola is a reading and writing book for first-grade pupils in Madagascar's
primary schools. It is written in Malagasy, printed in monochrome and stapled.

Garabola is a reading and writing book for first-grade pupils in Madagascar's
primary schools. It is written in Malagasy, printed in monochrome and stapled.

Garabola is a reading and writing book for first-grade pupils in Madagascar's

primary schools. It is written in Malagasy, printed in monochrome and stapled.

Paragraphs

In texts which address experienced readers, the start of a new paragraph is marked by different line spacing, by indentation of the first line of the paragraph or by a first line which starts further to the left than the body of the text.

In a first reading book the start of every new paragraph should be clearly indicated, if necessary by double line spacing.

Once again use this book to familiarise yourself with the possible ways of indicating the start of a new paragraph.

Line Length and Justification

The length of the line again should ensure good readability; when the characters used are small, the line must not be too long so that the reader can find the start of the next line without difficulty.

It is possible to allocate spaces between words to make a line a predetermined length or width; then we say that the text is justified or aligned at the right and left-hand sides. This is not recommended for a first reading book where words would be stretched out to avoid hyphenating them, which in turn would not make for good readability.

For a first book, unjustified or ragged-right settings are generally preferred, i.e. the left hand edge of the text is aligned, but not the right hand edge. The gaps in the text at the right hand edge often correspond to natural breaks in the text, in line with the meaning units.

The right-hand edge of the text can also be justified as you can observe in the outside columns on each page of this book, or the text can be centred, with neither edge justified.

Use recently published textbooks to help you make your typographical decisions

Level and hierarchy of text

The typography must make the text easy to read, by giving the reader a series of clear visual signs. When you decide on the layout of a book two things are important: firstly to distinguish between the text that addresses the pupils and the accompanying notes and instructions which are not necessarily meant for them, and secondly to show the hierarchy of the text, i.e. to identify the various headings and sub-headings.

You can guide the reader not only by separating the text blocks from the instructions, but also by using different typographical features, i.e. the judicious use of different sizes, founts and weights can indicate to the reader which parts of the text are headings, sub-headings, notes, etc. without your having to number them.

Let us add that this fact is extremely important to ensure linguistic and typographical readability in the teachers' guide. When you decide on the layout, you should thus re-read your manuscript and mark the various levels of text.

In our experience even if the plan is detailed and the points seem to follow on logically one from another, there are almost always imperfections. For instance we find a major heading, which we will call a level 1 heading, followed by a level 2 heading, and then we find that the text suddenly jumps to a level 4 heading, completely by-passing level 3.

There is no better way to avoid errors of this sort than to re-read the text, draw up a detailed table of contents and compare it with the body of the text as often as necessary.

Additional Visual Aids

In a school textbook the hierarchy of texts is sometimes such that it is not enough to alternate between characters of different sizes and weights; additional visual aids may be necessary.

These should be used to the extent appropriate and necessary; excessive or inappropriate use of additional aids will only confuse the reader. The aids we outline below have a place in a reading book.

Boxes and Lines

To underline the separation of two distinct parts of a page, or to draw attention to one element or emphasise the unity of one exercise, you can use a box or a fine line.

You will see from this book how we have used these aids. You will find a certain number of boxes, most of which have only horizontal lines. We have used lines with circumspection, but you will find them, for instance separating pieces of information in tables or separating the body of the text from the running head on each page.

Shading

To underline an element or a distinguish between different levels of text, a slight grey or coloured shading can be used. You should only attempt this if the assembly and printing conditions are good. Nothing looks worse than letters which are to be emphasised that are badly printed or badly shaded. Once again look at the use we have made of shading in this book.

Pictograms

In a first reading book one is tempted to use symbols which it is felt will be easier for the children to decode. Thus slates are used to indicate a written exercise instead of a heading, while silhouettes are used to represent the speakers, dispensing with inverted commas. But again avoid overkill - keep the use of pictograms to a minimum.

5. Job Envelope

You have planned and defined the illustration and layout work. Generally you will then have delegated this work to the illustrator on the one hand and a keyboard operator on the other.

But, as this work is returned to you, you must check the quality before submitting it to the printer, and it is up to you to do this.

What you now have to compile is a copy of your book which is at least definitive if not complete; the printer must not have to add, remove or modify anything. And once he has received your job envelope and your written instructions regarding the printing, he should not have to consult you with any further questions. Once you have given him the final version of all the documents and the written instructions he should be able to print without delay - or to be more precise he should be able to put together the pages to make signatures, have you check that the imposition is correct by submitting the blueprints to you, prepare the printing plates, install these in the printing press, load up the paper and print and trim the book.

The quality of the printing will depend almost entirely on the quality of the preparatory work. To make sure that it is as good as possible, you should adopt a methodical procedure, as follows.

> **This is the last part of your work as “publisher-authors” - take care not to nullify all your work to date**

First Proofs

You have submitted your manuscript to a keyboard operator. Before doing so you checked to make sure that there were no spelling errors in the manuscript, that no more corrections had to be made to the text, that the length of the text was in line with the layout requirements and that the punctuation had not been forgotten.

The first set of proofs you get back will surprise you; you will not always recognise the manuscript that you have slaved over for so many months... which is just as well, because it gives you a certain distance to the text and allows you to spot composition errors better.

In general the first set of proofs contains only the typewritten text in continuous form, without any concessions being made to the layout. Your corrections must thus meet the following criteria.

Clarity

Use a red pen to append your corrections and write as legibly as possible.

This recommendation always applies, but it is all the more important when you have a manuscript in a national language which the keyboard operator does not necessarily speak or write well. Form every letter with great care if you want to avoid the keyboard operator making more errors as he or she corrects the first set, which will only add to the number of times you have to proofread.

The groups of authors which we have had the opportunity of observing have always corrected by hand, indicating in the margin when a letter or word must be changed, added or removed, a paragraph inserted or two syllables joined up. They either rewrote the entire word or gave detailed instructions as to the changes to be made, and these instructions were generally understood without difficulty by the keyboard operator. You too can adopt this procedure, but you must be careful that your instructions and corrections are always clear.

Official systems of proof correction marks do exist. They are used by professional proof readers and can be found in most books on layout and typography; you can refer to these works if you wish to upgrade your work - but check first that the keyboard operator is familiar with them, or far from enhancing the results you may face a disaster.

Precision

Read the proofs again and again and track down all the errors.

You must bear in mind that as from a certain stage the authors themselves become blind to the mistakes in their work; they can read and re-read their manuscript without picking up the errors. Thus, you should read and re-read the first proofs several times, but do not consider this work definitive. At a later stage you will have to read the second set of proofs, which you will receive once the layout has been done and the typographical choices translated into practice.

Pertinence

If you are working in a language which still has few standards, you will be bound to have some doubts as to how to split a word for instance, the use of the apostrophe in a compound word, the use of capitals or how to write certain abbreviations. Do not correct these points before you have agreed on clear standards with your colleagues or checked if such rules already exist.

We must stress that when several groups of authors are working on didactic material in the same national language it is crucial - and extremely difficult - to ensure that the language used by all the groups is standardised. Care and discipline are vital to achieve this.

Functionality

Do not make corrections just for the fun of it. As we said the last author corrections have been made. Remember that the text you submitted to the keyboard operator had already been read by numerous people, and unless you find a really serious error that none of them has found, do not make any more changes. If you really feel, in spite of everything, that you have to make more changes, consult your colleagues first.

Re-read proofs with great care

Final Proofs

The proofs that you have re-read and corrected should now be submitted once more to the keyboard operator, who will not only incorporate your corrections, but will then do the layout. He will follow your instructions as regards the characters and text features, and will then submit to you another set of proofs which you will once again have to re-read and correct. You must pay particular attention to the following aspects at this stage.

Spelling

Re-read the proofs one last time. No effort can be too great to locate a missing point or a spelling error in a text designed for beginners. You will be held responsible for all mistakes - and this is the sort of mistake your readers will be quick to note.

Split Words

Generally, when the text is arranged in columns some words will be split at the end of the line - check that this has been done correctly.

For languages in world-wide use you will find computer programmes which hyphenate words automatically. When you are working in a national language for which there is no such programme, pay particular attention to this point.

Hierarchy of Texts

If you plan to use different characters, or different sizes and weights of characters check that your instructions have been properly followed, in particular that the hierarchy of texts has been properly respected. Paragraphs must be treated uniformly.

A heading in the same size of characters as the normal text, a word which has not been printed in bold print as planned, or one paragraph which is indented while all others are not - all these errors will make your book less readable and thus reduce the quality of the finished product.

Graphics Dossier

Everything which has not been processed by the keyboard operator must be submitted separately to the printer. When your book is a reading and writing book for primary level, this dossier will generally include the original drawings and hand-written examples of writing. You should ensure that the dossier is complete and that it contains the following instructions.

Dimensions of the Illustrations

Some drawings can be executed without difficulty in the size required, but for very small illustrations, such as text-illustrations for exercises, it would be better to have the illustrator produce larger drawings. In this case you must instruct the printer of the extent to which they must be scaled down, or “reduced”.

Shadings

If you decided to print your book in two colours, or to use one colour only but to add shades of grey in illustrations you must check that you have included a photocopy of the originals indicating exactly which colour or shade has to be printed where.

Assembly Instructions

If the page contains several elements it is not enough merely to submit the text and the illustrations to the printer; you must also give him precise instructions as to the layout of each page.

The best way to do this is to prepare as complete a layout guide as possible for every page, using photocopies of the originals. The layout artist will base his work to the millimetre on this hand-made model: he generally has the instruments and the skills required.

Final Checks

Before you submit the job envelope to the printer ensure again that it is complete.

In our experience, many groups of authors are tempted not to finish their work in an attempt to accelerate the printing work. They submit an incomplete job envelope and think that they will complete it afterwards.

But, once the printer has the job envelope, those concerned with the development stage almost automatically consider their work over.

It is then very onerous to complete the work properly, because it is difficult to find every missing element: the illustrator appears to have vanished off the face of the earth, the photocompositor has other urgent work to finish or it is impossible to consult all the authors, since the group has been disbanded or sent elsewhere.

It is thus imperative to go through the job envelope one last time while all the actors are still present and correct. You should focus, in particular, on the two following aspects.

Complete Development

All the many elements of the book should now have been duly prepared; you should not find the four cover pages are missing, or find that one page has vanished or that you are suddenly missing a text or graphic element on any of these pages.

For many years, we spread out the dossier on a desk, leafing through the pages one after another, which meant that we never had a complete vision of the dossier as a whole. Now, however, we believe that the best way to ensure that nothing is missing is to stick up a photocopy of your entire model on pinboards. This allows both authors and outsiders literally to take a stroll through the book. We have found that the physical distance this gives you allows you to note certain omissions and even to find (more!) typing or spelling errors which can still be corrected at the last minute.

We would thus urge you to adopt this procedure, and not to be content until every member of your team has examined the book page by page and signed each page on the pinboard.

Complete Job Envelope

Secondly, check that all the original documents have been put together and all the necessary instructions given to allow the printer to produce the books without difficulty. You should then examine your textbook page by page, as it is pinned up on the board and make sure that everything is complete.

Here too we have modified the way we work over the years. For years and years we submitted a text dossier and an image dossier to the printer separately. Today we do things differently. For every page of the book, we prepare one large envelope on which we write the page number. The envelope contains all the pertinent elements for that page.

Thus for the revised version of *Garabola* each envelope contained

- The original copy of the texts
- The original copy of the illustrations
- A photocopy of the illustrations bearing the instructions for shading and, in some cases, for reducing the illustration
- The original copy of the hand-written examples in cursive style
- A montage using a photocopy of the texts and illustrations.

Once you hand this job envelope over to the printer, your work as authors is almost over. Afterwards, if you have prepared your dossier well, the printer will not have to contact you again before he submits the blueprints; these are the last proofs, printed on blue paper to allow you to check the assembly of the elements on the page, the imposition and perhaps also the shading. The blueprints will be submitted to you one signature at a time; you should check them, and if there are no errors you should give the printer the go-ahead, signing each one. The book is then out of your hands and you won't see it again until it is published.

We would just like to draw your attention to one last point: you should never make author corrections on the blueprint. Do not give in to the temptation to improve your text at this stage - it is too late. What can happen, of course, is that you spot another typing error, which you must, of course, correct. This is, however, the absolute exception, and if you have read this book attentively we will not have to explain why.

6. In Conclusion

Calculating the Sales Price of the Book

The production of textbooks in developing countries is a long process and requires the attention of the authors throughout. Once the process is launched the authors rarely have time to stand back and evaluate the price of the operation.

There is, however, so much at stake that you must gauge the viability of the exercise. An examination of the costs should allow those concerned to better manage their work in future: authors and publishers thus have a good basis on which to determine the physical and graphic aspects of a series of books, and on the best way to produce them, or the final version, where you have been working on a pilot version.

This work should be performed by specialists who will take into account the following[11].

Printing and production costs

At the end of the conceptual phase you had a provisional quotation drawn up for the production of your book, based on approximate figures. You now have the precise figures, since the printer has been able to update and modify his prices. You can thus take the figures in his final quotation.

Development costs

These costs include all costs incurred from the preliminary research phase until the job envelope is submitted to the printer, i.e. all the costs of preparing the manuscript, the graphics dossier and the layout work.

Overheads

These are costs which do not relate directly to any one task, such as general administrative services, rent or vehicle maintenance, so important for field work.

Costs of distribution and/or sale

These costs cover the packing and transport of the books to the schools; in some cases they will also include the costs of advertising and promoting the book.

Throughout this book we have emphasised the huge responsibility borne by authors, the honesty they must bring to their work, the rigour and precision required. The costing exercise will convince you of the truth of this if nothing else has: authors of textbooks may not under any circumstances act negligently.

Notes

[1] The blueprint does not always allow you to check the different shades of grey very exactly, but you can spot omissions in the shading, which may be printed white if not corrected.

[2] The blueprint allows authors to check changes made by the printer and remedy any errors. One example we encountered was the exercise on telling the time in an English book, where the printer had had the clock redrawn; it had certainly gained in aesthetic quality, but the time on the clock face no longer corresponded to the English sentence next to it, which the pupils were to learn.

[3] The monitoring showed them that even the highly improbably is possible and allowed them to correct some errors: thus we noted that the red Pantone ink which we had ordered overseas to print the cover had been wrongly delivered and that the cover was about to be printed in pale pink.

[4] If, however, you are forced to deal with the legal side of things look at the question of authors' rights and royalties, and be sure and consult the books recommended here.

[5] The pupils are expected to recognise not just any old fish but the “tilapia” which is well known in Madagascar, which is why the changes had to be made.

[6] Layout problems are not new: in the thirteenth century the French architect Villard de Honnecourt proposed a model which divided the page harmoniously; today research is still being conducted; some of the most interesting includes the work of J. Tschichold and R. Rosarivo, which you will find in the books on layout listed at the end of this chapter.

[7] Most of the changes to the illustrations and the layout of *Garabola* were made by Marina Dinkier, a professional graphic artist. These modifications significantly improved the final version. Cf. Dinkier, M. *Mise en page et préparation pour l'impression.* Internal paper, Tef'Boky Project, 1990.

[8] The major classifications are the work of Thibaudeau (1921), Vox (1952), Novarese (1964), Jacno (1978) and Alessandrini (1980). They are based on various perspectives (historical, aesthetic, geographical, etc.).

[9] In this classification the two last groups (Gothic and non-Latin characters) are not generally particularly relevant for textbook authors.

[10] If the textbook is to give examples of handwriting, you should bear in mind that computer programmes which can reproduce writing of this sort are expensive and rarely meet all your requirements. It is often a good idea to have examples illustrated by hand.

[11] We refer you to the costing grids proposed by F. Richaudeau in *Conception et production des manuels scolaires,* op. cit., pp. 215-239.

To Sum Up

All the work we have described until now, has been geared to producing the raw material of the textbook. To make it publishable, you must now polish it and put it into its final form. To put it more plainly, you must have the illustration and the layout work done.

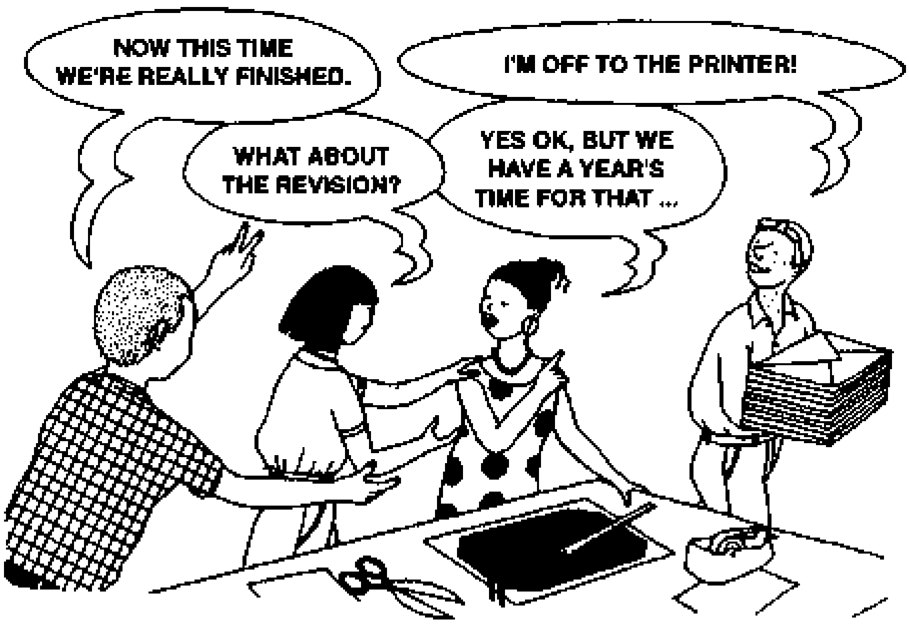
At this level everything is still open: a good manuscript can become a good book, but it can also be made into a monotonous, abstruse or obscure book. The illustrations and the layout of a book give the contents their contours, which will promote or block learning. You should thus illustrate the texts in a functional way. Do not decorate. Create references which will help the reader without trying his patience. Establish a rigorous and transparent structure for your book which will not bore readers.

This work demands unique expertise, an expertise which not all authors of textbooks in developing countries possess - sometimes they are not even aware of how important it is. Given the fact that few of them will have recourse to a professional and that there are few long-term training courses, they should try to train on the job, by

- demanding sporadic support from technicians on the spot, and in particular from the printer
- using specialised reference works on layout in particular
- acquiring certain mechanisms as they read, so that they register not only the contents but also the graphic features of printed materials.

This phase is over when the job envelope has been submitted to the printer. It should be so well prepared that contacts with the assembly man and the printer are kept to a minimum.

Even if the author's work is now finished, it is vital that the work performed be recapitulated and costed. Specialists should always calculate the price of the book, taking into account not only the development and production costs, but also the overheads and the costs of distributing the finished product to the schools. This is vital feed-back but it is all too seldom passed on to the authors in developing countries.



By Way of Conclusion

You have now devoted several years to preparing a school textbook and you have just handed in the final version to the printer.

The fruit of so much work will now ripen rapidly as far as you are concerned, for the printer's deadline will bear no relation to the time you have spent up to now. The printing is generally the shortest step in the entire chain, assuming that the authors have made all the necessary preparations.

The joy and pride you will feel the first time you take your book in your hands and flick through it will almost inevitably be slightly dampened. You will be disappointed that the margins are so narrow and that you didn't notice before, that the grey of the shading is too dark or because at this stage you find a typing error in a prominent position, quite inexplicably in view of the care with which you compiled the manuscript and the model.

It is undoubtedly true that errors of this sort detract from the quality of the book, and may discourage authors, but they are minor details, even if people rush to point them out to you. The most important thing is that the book exists and that it is of an acceptable quality. By producing this book in such difficult circumstances you have blazed a trail for other publications of even better quality. In view of the urgent demand for textbooks in many developing countries, and the production conditions commonly encountered, minor shortcomings such as those mentioned above are relatively unimportant.

The publication of a book always marks the end of a long and intensive period of work. Given the book situation and the scarcity of experienced textbook authors, it is to be hoped that the skills thus acquired will be shared; that all those who toiled to make their contribution to a quality publication will continue in this line of work.

But, do not fall into the trap of thinking that your training is complete after the first book. You will never have learned everything there is to know, and the quality of your work will always depend on the diversity and solidity of your training. Every book you work on will be a challenge in its own way, and you will have to find individual, tailor-made solutions in each case. Your products will gradually improve the more experience you have and the more you learn. Keep in touch with professionals in the world of publishing, gather your own documentation, examine the contents and form of other printed materials, in particular textbooks, to try to help improve the efficiency of schools in your country.

Annexe: Evaluation

Pupils have worked with the pilot version of your book over a period of one or several years. But your odyssey is not quite over yet; if you look back at the first chapter you will see that in developing countries the evaluation of pilot materials is an integral part of the chain. And, now that you have the chance to look at your book with a certain distance, you will be the last to stand in the way of a revised version: not only will you stumble over minor errors which you will find inexplicable after all the double, triple and quadruple checks, but certain doubts will also begin to sprout in your mind regarding the contents and the graphic features. An evaluation, followed by a revision of the pilot materials is thus called for in most cases.

How should you go about this? In some countries the ministry will assume responsibility for the evaluation. It will examine the books presented by private publishers and decide whether or not to accord the book official authorisation. It is not the actual performance of the book in schools that is evaluated here; the book is simply assessed according to a grid comparable to the grids you will find in the recommended reading at the end of this chapter. It is generally a sort of censorial work.

In our opinion grids of this sort are useful for authors performing internal checks as they write didactic materials, but they are quite unsuited to revising school publications. It is, in any case not sufficient to analyse new didactic material from your desk; it is imperative to look at how it actually works in schools.

For most of you, the evaluation work will constitute a new research project. You will have to carefully plan and execute numerous, complex activities and the work will sometimes involve managing significant human, technical and financial resources.

You should realise that this phase has much in common with the preliminary research phase, which is why we will only give you some general pointers, to help you understand how to make the preparations for the systematic revision of pilot materials; we will not repeat the information presented in chapter 3, but will simply refer you back to it whenever appropriate.

1. Overview

One of the main difficulties which you will face in your evaluation work is bound to be the logistics. In some cases, you will already be involved in other work, like drawing up your next book, and in others the education authorities will exert a lot of pressure on you to produce the final version as rapidly as possible[1].

Whatever the specific constraints you will almost always be working under time pressure, which means that you must plan the evaluation activities meticulously to ensure that you achieve the quality required within the given time-frame.

Evaluation is a major task which will often take an entire year. To give you an idea of the scope and the complexity of this phase we will sum up the major steps taken in the Tef'Boky Project to evaluate the first version of *Garabola.*

Evaluation Work for Garabola

Aspects, Strategy, Instruments

October 1988

Once production work on the *Garabola* set (reading book, writing book and teachers' guide) was completed, the authors were quick to set up an evaluation system so that the evaluation could start at the beginning of the academic year. They drew up a list of the aspects to be examined, and then decided on a strategy and the research instruments that they would need to give them the information they required.

This was one of the most labour-intensive phases of the entire project, involving the following tasks in addition to the evaluation per se:

- designing and organising a system to distribute the *Garabola* materials to the schools in the test zone

- designing, organising, realising and evaluating the presentation of pilot materials to the 40 teachers concerned

- initiating the design work on *Tongavola,* reading and writing materials for the second year of primary school.

The authors could not do everything themselves, so they devised an evaluation strategy which only demanded their participation on a sporadic basis: they concentrated on devising evaluation instruments, taking part in classroom observations and interpreting the final results. The major logistic work, including gathering data and processing it systematically, was entrusted to a small team specially set up for this.

Daily Self-Evaluation Grid

October 1988

The first evaluation instrument was a daily self-evaluation grid. This was the first priority of the authors so that it could be completed and distributed to 9 teachers in time for the start of the academic year. The nine were recommended by animateurs for their professional ethics; they undertook to fill in the grid every day.

First Test Series

December 1988

The second instrument was a series of tests to be run at the end of the first term in all 40 test schools. This activity had a dual objective: to evaluate the very first results obtained with the new materials and to examine the level of receptiveness in the schools, which would enable the team to take remedial steps at an early stage if necessary.

Classroom Observations

January 1989

The third instrument was a classroom observation grid, allowing the evaluators to look at the way *Garabola* was used over a one-week period; the authors themselves thus spent one week at the schools at the start of the second term.

Critical Examination of the Material

January 1989

At the same time the *Garabola* set was sent to various individuals for a critical examination. It was accompanied by a form letter, inviting the recipients to make their comments and suggestions.

This action brought absolutely no results; not one single comment filtered back to the authors. It may be safe to assume that personalised questions would have had better results.

Second Test Series

March-June 1989

The last evaluation instrument consisted of tests to gauge reading and writing progress. Preliminary tests were firstly run in two rural schools after which the instrument was modified. To give a comparative analysis of the year-end results the tests were run in 20 of the schools in the test zone and 20 control schools. The working conditions in this control group were comparable to those in the test schools, but they did not use *Garabola.* The evaluation team, duly instructed, ran the tests; the team members took advantage of this field visit to gather documents, first and foremost writing exercise books and gather information, such as the rate of attendance at the schools and the physical state of the books - all data which will help make for a complete evaluation.

Processing and Interpreting Results

July-August-September 1989

The team of evaluators was charged with processing the test results and the other information gathered. The authors then examined the data and interpreted it.

Development of an Evaluation Report

September-December 1989

In view of the fact that the material broke with certain practices, notably significantly lowering the attainment targets laid down in the official curricula[2], it was important to inform the education authorities of the results.

A reference document was thus produced by an educationalist, since the authors were too busy to take on this task as well, and the document widely circulated.

2. Aspects of the Evaluation

Now that we have looked briefly at the possible evaluation activities for a pilot textbook, let us come back to the first stage, i.e. identifying precisely the aspects to be evaluated. Here is a short summary of the features that should usually be examined with care.

Effectiveness in Terms of Attainment Targets

You must prove that the materials actually do their job by analysing the results obtained using the new material as compared to the attainment targets.

The results of tests of this sort must, it is true, always be interpreted with care, but the results are of capital importance for you. If they are positive, general aspects of your material, in terms of the volume of subject matter presented, the learning method adopted and the composition of the materials can be considered appropriate. If on the other hand they are clearly negative, you must examine these aspects in great detail and be ready to make far-reaching changes[3].

And bear in mind that the education authorities are bound to attach great importance to the test results. Their first questions are unlikely to concern the aesthetic qualities, the suitability or even the solidity of the book, but whether or not it produces results.

Shortcomings of the Content Matter and the Form

The tests should give you an idea as to whether or not your material works; these general pointers will not, however, tell you what need not be changed and what should be modified on each page.

Before you can revise your material page by page with full knowledge of the facts you will need an instrument which will allow you to examine every aspect in detail.

Let us assume that you have been working on reading and writing materials: you should then look at the topics chosen, the linguistic and pedagogical aspects of the texts, the characteristics of the illustrations and the layout of the pupils' materials as well as the contents and presentation of the teachers' guide, rather than focusing only on the learning method used.

The results should enable you to revise your materials advisedly, on the basis of the reaction of users.

Repercussions on Attitudes to School

In many countries school rolls are dropping[4], a development which is attributed to several different factors.

Although it is true that the rate of growth of school rolls in a country depends primarily on the household income, it is also linked to learning conditions. It can thus often be instructive to see if the introduction of the new material coincided with a drop in pupil absences or not.

Robustness of the Book

Although it is relatively unimportant if a pilot book looses pages or rips easily after one year of use, the revised version must be robust, particularly if a large run is to be printed and used nation-wide.

It is important to examine the material after it has been in use for a certain period, so that you can take the necessary technical and financial steps in time to ensure that the revised version of your materials enjoys a long service life.

3. Evaluation Indicators and Instruments

Once you have decided which aspects you wish to evaluate, you must identify the instruments which will help you obtain the results required.

To this end you should take the same approach as you did during the preliminary research phase: firstly formulate indicators, i.e. easily observable, quantifiable or verifiable elements, and then determine which instruments will enable you to verify each of the indicators.

We suggest below a few indicators and instruments which can be used to examine the four aspects quoted above. Analyse them and adapt them as appropriate to your own circumstances.

4. Planning the Activities

Ideally you would be able to use all the instruments you have listed, but this will not always be possible.

When you come to draw up a systematic plan for the evaluation phase you will be able to identify which ones you will actually be able to use. You should draw up your work schedule, taking the following elements into account.

32. Identification of Evaluation Instruments
Aspects-Indicators-Instruments
Effectiveness of Material
School results
Attainment tests
Verification of the rate of learning (in teacher's lesson plan for instance)
Daily self-evaluation grid
Classroom observation
Shortcomings of material
Teaching process
Daily self-evaluation grid
Classroom observation
Voluntarily kept log-book
Learning process
Daily self-evaluation grid
Classroom observation
Analysis of pupils' exercise books
Repercussions of the materials
Parents' attitude
Talk with parents
List of school attendance rates of their children
Teachers' attitude
Talk with teacher
Verification of the frequency with which the material is being used, by checking its physical state
Daily lesson plan
Pupils' attitude
Talk with pupils
Physical aspects of the book
Strength when handled frequently
Examination of books
Ease of handling
Examination of books
Classroom observations
Talks with teacher

Institutional Priorities

In general, the existence of pilot materials in itself reassures the education authorities enough to stop them exerting undue pressure on authors to prepare a final version.

But if financial assistance has been pledged for printing and distribution, it is not unusual for time-limits to be set for the revision phase. In this case you will have to see how you can respect the deadlines without compromising the quality of materials which will then be used for several years in the schools of your country.

Human, Physical and Financial Resources

This is the second aspect to be examined when you come to plan your evaluation activities.

If you refer back to the experience in the Tef'Boky Project as presented earlier in this chapter, you will see that the authors delegated the responsibility for numerous tasks to a so-called evaluation group.

If you do not have this sort of back-up, and if your technical and financial resources are limited, plan your activities accordingly. Distinguish between what is desirable and what is possible, as you did during the preliminary research phase.

Scope of the Work

Time and special skills are always needed to develop instruments, but in developing countries, where research conditions are more complex than in industrialised countries, you will have to examine the entire evaluation phase, to avoid planning activities which are not feasible with the available resources.

In particular, no instruments should be used in the field without first undertaking a series of well-targeted preparatory measures.

It is, however, difficult to foresee all the work which instrument x or y will entail. To give you an idea of the scope of the work that lies ahead we list below the activities which we feel are indispensable to obtain significant results, if you opt for a comparative analysis of school results. Analyse these and draw your own conclusions for your specific circumstances.

Work Involved in a Comparative Analysis

The work involved in conducting a comparative study of school results is sporadic, it is true, but the tasks are many and varied, and are generally spread over an entire year. Here is a list of the principal tasks:

Identification of Test Schools

- Define a common profile for schools to be selected from the group of test schools and from outside this group (e.g. geographical location, teacher:pupil ratio, etc.)

- Undertake a first theoretical selection of schools having used the material to be evaluated

- Conduct a field visit to verify the data for the first set of schools

- Undertake a first theoretical selection of the control schools, followed by a field visit to check the selection

- Take the necessary administrative steps to allow you to operate outside the test zone.

Development of Tests

- Identify attainment targets to be evaluated

- Draw up a list of criteria referring to the contents, presentation, course of tests, marking scale and interpretation of results

- Develop the tests

- Illustration, layout and preparation of an adequate number of tests

- Select at least two schools, which correspond to the criteria laid down for the schools selected for the final test and administrative steps to allow you to run a preliminary test there

- Issue detailed instructions to those in charge of running the preliminary tests

- Conduct the preliminary tests

- Process results systematically and interpret these

- Make any modifications to the tests or the instructions given to those in charge

- Prepare a sufficient number of the final version of the tests.

Holding the Tests

- Plan the tests (e.g. identify those responsible for running the tests, available transport, sources of financing; draw up a schedule for holding tests school by school)
- Take necessary administrative steps and inform each school in writing when the tests will be held and what they will involve
- Issue instructions to those responsible for running the tests
- Make effective preparations for the field visit
- Conduct evaluation work in the field
- File immediately and systematically the tests and all other documentation collected in the schools on this occasion.

Systematic Processing and Interpretation of Results

- Issue instructions to those in charge of processing the data, regarding marking systems as agreed on earlier
- Examine and mark each test
- Draw up statistics
- Interpret the results
- Draw up a document presenting the procedures adopted and the results of the evaluation
- Distribute it to all interested parties.

5. In Conclusion

By way of conclusion we would just refer you to chapter 3 to refresh your memory about the follow-own work, in particular devising instruments, work in the field and data processing, and to some of the evaluation instruments which were used to evaluate *Garabola* and which may be useful to you, if not as a model, then at least for reference purposes[5].

Notes

[1] This always happens when the financing for a large run is available before the evaluation work is finished. The situation is not exceptional, but is always unpleasant for authors; time considerations often take precedence over the issue of quality.

[2] With *Garabola* first-grade pupils learn only 21 letters of the alphabet, whereas the current curriculum also provides for pupils learning 13 of the complex graphemes in Malagasy. It was thus particularly important to inform the education authorities about the results obtained in reading and writing.

[3] In the Tef'Boky Project the learning progress tests revealed that the writing exercise book was inappropriate given the current educational context in Madagascar. This led the authors to modify the make-up of the materials designed to teach writing in grade one of primary school. Cf. Chapter 4.

[4] "Although the rate of increase in enrolment declined at all levels of education, the drop was most pronounced at the first level, where it fell from 8.4 percent (approximately 2.9 million

additional pupils each year) between 1970 and 1980 to 2.9 percent (approximately 1.4 million additional pupils each year) between 1980 and 1983." In: World Bank "Education in Sub-Saharan Africa" p. 28.

[5] The evaluation work is described in its entirety in KOMAREK K. Dossiers II, 1993.

Glossary

Attainment

The total of results obtained at a certain level in a given subject. In general, the education authorities attach great importance to attainment in the initial evaluation of the impact of a new textbook. These figures should, however, merely be taken as a rough indication as to the effectiveness of the book, and must be examined in more detail.

The evaluation of attainment is not in itself enough of a basis on which to revise a pilot textbook.

Author of School Textbooks

In the traditional publishing chain the author is responsible for providing texts.

In general these will be texts which address pupils (reading texts, exercises, captions for photographs or illustrations) and teachers (preface, presentation, table of contents, instructions and information on the cover of the textbook, as well as the entire teachers' guide and complementary didactic materials).

When the author does not have a good publishing structure behind him he may also have to assume certain editorial responsibilities, of a financial, technical, graphical and commercial nature.

Authorisation to Print

Authorisation issued by the education authorities to the authors to go ahead and have a given textbook printed.

Body Size

The size of a type character.

The size is expressed in points; by way of example the main body of the text of this book is printed in 10 point characters, while the chapter headings are printed in 22 point.

Character Count

Calculation of the number of characters and spaces in a text manuscript which allows one to calculate the approximate length of the text after typesetting and the number of pages in the book.

Character Spacing

The blank space between two characters within the same word.

The character spacing in a text may be normal, condensed or wide, and this choice has repercussions on the typographical readability of the text.

Copy

Typed text with instructions for typesetting and layout.

The authors should bear in mind the fact that the copy contains the complete, definitive text of the book, and should refrain from making their own corrections at a later stage, which always entail delays and additional costs.

Creating Words

Lexical additions to a language which can take the form of neologisms, or loan words from other languages.

In textbooks written in national languages which have not yet been adequately standardised, technical and scientific terms will have to be created; in the absence of an institute of applied linguistics, the authors will have to check themselves whether or not the technical terms they need already exist, and where none exist will need to create new words, and ensure that they can be disseminated so that they will be generally accepted and used.

Development

Link in the publishing chain.

During this phase the textual and graphic elements that will make up a page are produced and combined.

The term development is sometimes preferred to simply “writing” since it underlines the fact that during this phase not only are texts written, but a text-image unit is created.

Devising the Contents

Devising all texts to be included in a textbook.

For a reading book, this phase involves choosing and/or defining the attainment targets, identifying the subject matter to be covered, the mandatory steps to be respected and the arrangement of this subject matter within the book.

In developing countries the difficulties are increased by the fact that textbooks ought to correspond to the official curricula, while the work involved leads authors to examine or reconsider targets which deviate too much from the reality in the schools of the country, otherwise the product may be totally inappropriate before it is even printed.

During this phase it is important for authors to be able to judge how much leeway they have to move away from the official guidelines.

Devising the Form

Devising the physical aspects (format, number of pages, binding) and graphic features (type, number and size of illustrations, rough layout, type of printing) of a book.

It is crucial that the form be devised before the writing and illustration phases so that the texts and exercises can be produced to fit a pre-defined framework. The important of this work is, however, rarely appreciated by teams of publishers-authors, which accounts for the “home-made” appearance of some of their products, which is totally disproportionate to the high costs.

Distribution of Textbooks

Important link in the publishing chain. In many developing countries the distribution of textbooks to rural areas where the majority of the school population live is difficult, and thus often constitutes an education project in it own right.

Documentation Specialist

Person put in charge by the publisher of finding all the documents to accompany the texts of a book, and of checking them for pertinence and technical quality.

Double Page

Visual unit made up of the left-hand page, which will bear an even number, and the right-hand page which will bear an odd number.

The double page is the basic layout unit.

The layout artist assembles the pages two by two, arranging text and illustrations on the basis of a framework known as the grid, which covers the two pages at once.

Evaluation of a Textbook

All activities which aim to provide information about the way the textbook is used in classrooms.

When the evaluation phase is designed to provide information for the revision of the book in question it must not only determine the extent to which the attainment targets can be achieved with the help of the material in question, but must also give precise information as to what aspects of the contents, the physical form and the graphics must be revised.

Evaluation Grid

A research instrument which makes it possible to examine the contents and form of a textbook.

Evaluation grids are useful and should be used systematically by authors running a final internal check on their own manuscript.

They are not, on their own, enough to allow you to revise a pilot textbook and must be supplemented by other instruments (classroom observation, attainment tests, etc.).

Exercise Book

Didactic material considered appropriate or even indispensable for some subjects, such as learning to write. Exercise books are always expensive because they can only be used once.

Any decision based on the assumption that a set of materials must include an exercise book should be reviewed with great care by authors in developing countries.

Exercise-Image Unit

The contents and the form of an exercise.

In a good exercise, the contents and form will complement one another; the form can be a text-illustration, or may present the underlying mechanism of an exercise.

It is always a major challenge for textbook authors to develop exercises which allow for a strict progression of learning, ensure an agreeable visual effect and make the underlying mechanism transparent for teachers and pupils alike.

Feasibility Study

Study which precedes a textbook project and focuses not only on the demand for textbooks but also looks at the conditions in which the book is to be developed, produced and distributed.

No textbook project should be launched before a feasibility study has been conducted. Otherwise it is imperative for the preliminary research phase to include a study on the environment in which the books will be used.

Film

The reproduction of a document on a transparent film which will then be used to make plates.

Finishing

The step which transforms the printed sheets into a finished book.

Finishing work, which comprises mainly folding, gathering the signatures and binding, must be closely supervised by the publisher, or the authors, in order to ensure that all the work to date has not been in vain.

Folio

The page numbers in a book. The even numbers will be on the left hand page, while the odd numbers will be on the right hand page.

Graphics Dossier/File

All the graphics documents for a book to be printed.

For a textbook this will include not only drawings and photographs, but also hand-written models of writing in cursive style.

Grid

Document which lays down the margins and the basic structure of a book and which helps to typeset a manuscript precisely and to produce various models, and make-ups.

The stencil is an indispensable tool for books with a complicated layout, as textbooks generally are.

Hierarchy of Text

Order and classification of the different parts of a text.

When there is little publishing back-up the authors themselves will have to check the organisation of their texts, clearly indicating the level of titles and text blocks to ensure that the photocompositor can process them accordingly.

In a partly theoretical work, like a teachers' guide, the hierarchy of the texts is often particularly complicated to establish.

Imposition

Setting out the pages of the book on the sheet so that once the sheet is folded the pages will appear in the correct order.

Careful imposition can keep cost down by putting pages with colour illustrations together on one or two sheets thus limiting the number of sheets to be printed in two or four colours.

Initial Quotation

An estimate of the costs of printing and finishing a textbook, which the printer can draw up at the end of the conceptual phase. The initial quotation allows authors to compare the physical and graphic features they have planned with the budget available.

Innovation

Intentional transformation of an education system with a view to achieving the existing objectives or defining new, more appropriate objectives.

In a textbook project innovation is at the centre of all action and it is not easy to have it accepted. It concerns first and foremost the education authorities: the conception and execution of a project demands expertise and attitudes which are not always encouraged within a bureaucracy.

Innovation involves all those who are indirectly affected by the book: the curriculum unit, teacher training unit, field supervisors, i.e. animateurs, educational advisers and inspectors, as well as parents.

Innovation is naturally geared to the teachers, whose resistance to change is often exaggerated, since their work in the field often makes them excellent change agents.

Finally innovation concerns the authors who often become the locomotive of change. Their status as civil servants, their professional training, their integration in the system and their aspirations are often barriers to a frame of mind that welcomes innovations, without which, however, no transformation worthy of the name is possible.

Instructions for Teachers

Precise, practical instructions for teachers printed in the textbook itself or in the teachers' guide, to help them with every-day lessons.

Textbook authors who aim to provide teachers with an effective tool in this way, find themselves confronted by the problem of how to ensure immediate effectiveness without surrounding the teacher with repetitive and stupefying instructions, which will in the long run cramp his or her teaching style and prevent him or her from developing and being inventive.

The shorter the learning time available the more carefully planned lessons must be and the more acute this dilemma.

Job Envelope

All the text and graphics documents to be submitted to the printer so that he can print the entire book.

Some of these documents are submitted in their final form, while others are accompanied by precise instructions as to how they are to be processed (enlargements or reductions of illustrations for instance).

Language of Instruction

Language used as a medium of instruction.

Sometimes this is the mother tongue of the pupils, and sometimes it is another language of which they have a more or less good command.

During the feasibility phase of a textbook project it is absolutely crucial to determine which is the language of instruction.

Language Taught

A language which the pupils must learn as a subject in its own right. In most developing countries, pupils must learn a European language in their first few years of school.

During the conceptual phase of the textbook the authors must determine the grade as from which pupils learn this language and the amount of time accorded to it, so that they can determine how much time is left to learn the mother tongue.

Layout

Arrangement of the blocks of text and graphic elements on a page.

An examination of primary school text-books produced forty years ago shows that the layout is the one element which has evolved most in the course of time and which is thus the clearest sign of modernity. Today there can be no doubt that good layout is not a luxury but a necessity for a textbook. But it must play second fiddle to pedagogical and didactic demands, and it must stay within the limits of what is acceptable to the target group.

The layout of a textbook emerges little by little parallel to the content matter. It is still vague during the conceptual phase, becomes more definite during the writing phase and takes on its finished form just before the book is printed. It is up to the authors to ensure that it performs its primary task - to help learners.

Layout Grid

A grid for arranging the elements on a page in line with vertical, horizontal and diagonal axes.

Newspapers and journals often need complex grids; in spite of the relative simplicity of the layout of a textbook the elements should not be arranged by chance, but in line with a few major axes.

Layout Plan

Guide for the layout of the book being produced, double page by double page. The layout plan is prepared at the end of the conceptual phase and should show the contents of each page and the approximate layout of illustrations and text.

Letter Card

Piece of card on which one letter is printed. Letter cards are commonly used by teachers to develop analysis and synthesis skills when pupils begin to learn to read. They are useful and inexpensive.

Letter cards are only suitable for use by individual pupils when good storage facilities are available in the classroom.

Line Length

Length of lines of a typeset text, often expressed in millimetres.

A text is said to be justified when all lines are the same length; in a reading book for beginners the text is always justified at the left side only leaving the text unjustified right, which means that the lines are of different lengths. This avoids having to split words which would get in the way of the efforts of beginners to decode the text.

Loan

The act of one language borrowing an element from another language.

By extension, a loan word is a word used in a given language that has been borrowed from another language.

Manuscript

Hand-written document. By extension text written by authors and submitted to the publishing unit after typing.

National Language

The mother tongue of a social group which is generally dominated socially or politically by another group, which speaks a different language.

Most national languages have a difficult and hotly contested entry into schools. While recognising that they allow pupils to better assimilate knowledge, their detractors point out that they are not properly normalised and standardised.

Authors working on textbooks in national languages where this is the case should check the congruence of the alphabet, see that spelling and punctuation rules are respected and enrich the language by creating the technical and scientific terms they need.

Nationwide Introduction

Phase in the production of textbooks in developing countries.

In the typical production cycle, authors will produce a textbook which is then tested, evaluated and revised before a large run is printed and distributed to the various parts of the country for widespread introduction.

Non-Text Information or General Information

Texts which accompany the contents of a book.

These are texts which appear on the cover and the first and last pages of a book and give the reader general information.

In a textbook the authors must generally write these pages too. They must be written with particular care since they will be the visiting card of sorts of the book.

Official Approval

The official authorisation of the education authorities to use a textbook or other materials freely in schools.

When official approval is mandatory, as is the case in the Federal Republic of Germany, the titles thus selected are presented in a catalogue on the basis of which the education authorities, ad hoc committees and teachers can make their choice.

In pilot projects to produce textbooks in national languages, the education authorities often insist on checking to ensure that the particular socio-linguistic and socio-cultural features of the target group have been respected, to verify that the attainment targets are pertinent (i.e. that they do not deviate significantly from the official targets), and to ensure that an appropriate methodological approach has been adopted.

One-Teacher Schools

Schools where one teacher teaches all classes at primary level and also assumes the responsibilities of head teacher.

When the majority of the target group can be found in one-teacher schools the didactic materials produced must be geared as soon as possible to as independent a learning style as possible, which will allow the teacher to pay some attention to the other classes.

Pagination

The sequence of page numbers of a printed book.

Paper Wastage

Paper wasted due to a disharmony between the format of the book on the one hand and that of the sheets of paper and printing presses on the other.

Paper wastage should always be kept to an absolute minimum; in developing countries where the price of the paper may account for one-third or even half of the total costs of producing the book, this is all the more important.

Passed for Press

Authorisation issued by the publisher or the publisher-authors to the printer to expose the plates and print.

The blueprints must be signed to confirm that the assembly and the imposition are correct and that the work is ready for engraving.

Pedagogical Specifications

List of the most important pedagogical and didactic aspects to be taken into account in the materials to be produced.

In large publishing houses the Publishing Manager draws up the pedagogical specifications, which then constitute a detailed frame of reference for the authors.

In developing countries, this is rarely the case. It is almost always the authors themselves who draw up the pedagogical specifications on the basis of an in-depth analysis of the status quo.

Pilot Textbook

Provisional version of a textbook which is tested in a number of schools so that it can be analysed, and revised as necessary. In a developing country this phase should always last at least one academic year.

Preliminary Research

Important link in the publishing chain to produce textbooks in many developing countries.

Preliminary research is indispensable when the available data on the teaching and learning conditions are incomplete or unreliable.

Authors should carry out the lion's share of this work if not all of it, to ensure that they are in possession of all the facts, and to allow them to start work on the textbook on the basis of a common level of information. But, although they always bear the overall responsibility they will have to call on the services of specialists: a sociologist, a statistician, sometimes an anthropologist, an expert in teaching second languages if the project in question involves bilingual education and a linguist where textbooks are to be produced in a national language.

Preliminary Testing

Preliminary testing of the evaluation instruments in a smaller number of schools which are nevertheless representative of the conditions in schools in the country as a whole, before using them on a wider scale.

The attainment tests should always undergo preliminary testing and then be revised. When the technical and financial framework permits, the authors should conduct a second preliminary test if major revisions proved necessary.

Printer

The individual responsible for printing and finishing a book.

Each of the tasks performed by a printer to transform an imposition scheme into a finished product is either performed on the instructions of the publisher (e.g. purchase of paper, or choice of binding) or supervised by the latter (e.g. reading proofs before signing them ready for press, or checking the blueprints before marking them ready to engrave).

The printer should never be forced to take on tasks that are the responsibility of authors (correcting or completing texts) or of the illustrator (completing a page with illustrations), layout person or graphic artist (making typographical choices and deciding on layout).

Printing

Major link in the publishing chain.

Printing is not the sole responsibility of the publisher or the authors. But, during the conceptual phase it is up to them to ensure that the printing conditions are such that the work they plan can be effected at a later date (no 4-colour printing if the machines are not sufficiently precise, for instance). During the printing phase they are also responsible for checking that the results correspond to the terms of the contract with the printer.

Proof Reader

Individual whose skills and/or status is such that they can give textbook authors valuable suggestions or encouragement.

No publication should be printed until it has been screened by a number of proof readers. Time and energy are needed, however, to organise this phase, and textbook authors would do well to consider it a mini project in its own right.

Proofs

Provisional print-out of a text that has been set and composed by computer. Proofs must be re-read and corrected.

Publisher

Person who plans and directs the publication of a literary piece of work, and manages the promotion and marketing. In developing countries it is common for the publisher not to assume all the tasks within the editorial chain that would be the responsibility of a publisher in industrialised countries. This work is then distributed among the various other actors, and is often assumed by the authors alone.

Publisher-Author

Neologism which refers to the many individuals in developing countries who are incorrectly termed “authors”.

In addition to the writing work, publisher-authors take on a greater or lesser part of the work that would traditionally be performed by the publisher.

Publishing Chain

All operations involved in translating an idea into a book, and publicising this book.

In textbook production it refers specifically to all the operations taking place from the start of the publishing project until the pupils have the finished books in their hands.

Publishing Specialist

Manager or specialist involved in the publishing chain.

Large publishing houses have many publishing specialists with well defined roles. In developing countries the responsibilities of the various individuals involved are often modified, and it is common for authors to have to assume some of the responsibilities generally borne by the publisher.

When textbooks are being produced in a national language, a few more specialists are required. Teams of authors must often call on the services of anthropologists, sociologists, statisticians, linguists and/or experts in the teaching of a second language.

Ream

Package of 500 sheets of paper of the same format.

Recto

The right-hand page of an open book where the book has an odd number of pages. It is the page that one tends to see flicking through a book. The title of a book should always start recto, as should the chapters as far as possible.

Research Institute

Research or teaching centre which may be private or public.

In textbook projects for primary level it is a good idea to seek the support of universities and teacher training colleges, so that the workload of the authors can be lightened by delegating some research work and incorporating existing structures in a common project in this way.

In practice, however, the gulf that generally separates these bodies often makes cooperation an uncomfortable affair.

Resource Person

Individual who gives the authors detailed information, generally of a socio-cultural or socio-linguistic nature.

The resource person cannot be considered an author; he provides the information, but plays no part in devising or developing the textbook.

Revised Textbook

Textbook which has been revised after having been tested at a number of schools.

Only a properly revised textbook should be considered for a large run.

School Enrolment

The number of pupils attending school within one class, school or country.

Serif

Small horizontal, vertical or oblique line across constituent parts of the type.

In this guide, the main body of the text is printed in *Palatino,* which displays serifs, while the tables are printed in *Univers* which does not.

Set of Didactic Materials

All didactic materials devised and developed for one subject and grade.

The decision as to the composition of the set must always be well thought through and should depend not only on pedagogical and didactic considerations, but also take into account practical, logistic and financial considerations.

Sheet of Printing Paper

A large sheet of paper on which several pages are printed at once.

The format and the number of pages of textbook must correspond to the dimensions of the sheet to be used.

Signature

A collection of at least four pages, and more often 16 or 32 pages which are printed together on one large sheet of paper. The sheet is then folded several times so that the pages are in the correct order. A book is generally made up of several signatures.

Speaking and Listening

Sub-discipline of the “mother tongue”, in addition to reading and writing.

Survey Report

Document presenting the main results of preliminary research regarding the development of textbooks.

The survey report is not indispensable for authors who are able to start the conceptual phase on the basis of the data they have gathered, but it is important for the education authorities.

To prepare the ground for the new textbook, authors are recommended to prepare a survey report, or have this done, and to present it to the relevant authorities.

Teachers' Guide

Reference book for teachers.

The teachers' guide should always be part of a set of didactic materials; in some cases it can even replace the pupils' textbook.

The teachers' guide must offer teachers with a low level of professional training a supplement to their training and a sort of “script” with detailed instructions on how to conduct day-to-day lessons in a given subject.

The guide is the ideal vehicle for teaching innovations in developing countries, unlike industrialised countries, where innovation generally originates from research institutes and is circulated in specialised technical journals.

Technical Specifications

List of the most important physical and graphic aspects of the materials to be produced.

The technical specifications are generally drawn up by the Art Director, the Commercial Manager and the Production Manager. They are vitally important since they allow those in charge to check the feasibility of the production project: the printer prepares his quotation for the costs of printing and finishing on the basis of the technical specifications.

Testing Textbooks

Link in the publishing chain.

In developing countries the lack of reliable, complete data on conditions in schools and the heterogeneity of teaching and learning conditions make it vital to test the new textbook over a period of at least one academic year in a representative sample of schools.

Textbook Illustrator

Graphic artist who uses his skills to illustrate textbooks, complying with pedagogical, didactic, aesthetic and perhaps financial considerations. A textbook illustrator must work closely with the authors who are generally in overall charge of the illustration work.

Textbook Projects

Education project set up to supply text-books for a developing country.

Textbook projects involve either one phase in the publishing chain, such as large-scale production and distribution of existing books, or the entire chain from the feasibility study to testing, large-scale production, distribution and teacher training.

These projects demand human resources, technical inputs and funds and are often supported by bilateral or multilateral assistance.

Text Exercise

Exercise consisting solely of text, with no concrete or abstract illustration (diagrams, frames, etc.).

Text-Illustration Exercise

Exercise which is made up of a text and a graphics part.

In reading books for primary level these are useful to teach pupils to compose, complete or change words and sentences. There should always be at least one text-illustration exercise to lighten the extreme dullness of text exercises.

Text-Image Unit

The contents and form of a text.

In textbooks which address the primary level, and particularly in reading books, authors must not only devise and write good texts. They must constantly be alert to ensure that their texts lend themselves to illustration.

The interaction of the form and the substance allows the authors to achieve this best.

Time-Table

Official learning time.

Where several different time-tables exist side by side for pupils of the same grade, the authors' work is made more complex by the fact that they must develop one set of materials for all pupils, which will enable the different target groups to achieve the same attainment targets within the same time.

Two-Colour Printing

Generally black and a light colour, which may be printed in a solid block or screened to produce shading effects. The shades of colour thus obtained relieve the harshness of monochrome print, at a significantly lower cost than 4-colour (four-colour) printing.

Unformatted Typesetting

The typeset text is justified at the left-hand side, but comprises no hyphenation or layout.

This text constitutes the first set of proofs which must be re-read and corrected, before a second set of proofs is obtained, which will take the hierarchy of the text into account. In practice authors often by-pass these two sets of proofs, especially when they have access to a computer.

Weight

Thickness of the lines of a character.

A text may be printed in extra light, light, semi-light, medium, semi-bold, extra bold and ultra bold. Judicious use of these different weights can help underline the hierarchy of the text and enhance the typographical readability.

Width (of Characters)

The visible width of type character. The width of characters can be modified, to make them more condensed or more expanded, which has repercussions on the typographical readability of the text.

Word Card

Piece of card on which one word is printed. Word cards are commonly used by teachers to help pupils make up and change sentences. They are useful for pupils learning to read.

Word cards are only suitable for use by individual pupils when good storage facilities are available in the classroom.

Word Spacing

Blank space left between two words in a sentence.

Word spacing may be normal, condensed or expanded and the choice will have an impact on the typographical readability and the aesthetic quality of a text.

Marie Chåtry-Komarek has worked for more than fifteen years in Africa and Latin America on the production of school textbooks in national languages. In this book, she describes the work carried out by a German-Malagasy project, supported by the German Agency for Cooperation (GTZ), the objective of which was to provide teachers and students with textbooks in Malagasy, adapted to their specific needs. She has previously written about the systematic development of texts in *quechua* and *aimara* in a book in Spanish: *Libros de lectura - para niños de lengua vernácula.* At present she is preparing a book on the training of author-publishers of textbooks in developing countries.

The German Foundation for International Development (DSE) is an institution for the initial and advanced training of specialists and executive personnel from developing countries. In addition, it prepares German experts for their assignments in a developing country, and maintains the Federal Republic of Germany's largest centre for documentation and information on development policy.

The DSE works in the areas “Education, Science and Documentation”, “Economic and Social Development”, “Public Administration”, “Industrial Occupations Promotion”, “Food and Agriculture” and “Health”. Its objectives are an international exchange of experience and the qualification of specialists and executives from developing countries.

Dialogue and advanced training programmes (conferences, meetings, seminars, training courses, etc.,) support projects which serve economic and social development. The DSE thereby contributes to an effective, sustainable, and wide-ranging development process.

Since 1960 the DSE, in cooperation with national and international partner organizations, has given advanced professional training to more than 100,000 specialists and executive personnel from more than 140 countries. An increasing part of the programmes takes place in the developing countries, the rest in Germany.

The DSE makes its contribution to development cooperation on the basis of guidelines of the Federal government's development policy. The institutional contribution donor is the Federal Ministry for Economic Cooperation and Development (BMZ).

The DSE was founded by the Federal and Land governments in 1959 on the initiative of the political parties represented in the German Bundestag as a foundation under civil law. Its main seat is Berlin, and its other locations are Bonn, Bad Honnef, Mannheim, Feldafing, Zschortau, and Magdeburg.

Code Europe was established in Oxford as a UK charitable organization in May 1993 as part of the international CODE network which includes CODE affiliates in Canada, USA, and ten countries in Africa (Ethiopia, Ghana, Kenya, Mali, Malawi, Mozambique, Senegal, Tanzania, Zambia and Zimbabwe), and two in the Caribbean (Belize and Guyana). The overall CODE programme includes book distribution, library development, and support for indigenous publishing industries. As part of the worldwide CODE network, it represents the overall organization in Europe, and develops and manages projects in partnership with organizations in the developing countries. CODE Europe's *Partners in African Publishing Programme* aims to increase collaboration between publishers and organizations in Europe and Africa.

FOREWORD

The International Rice Research Institute has published this *Guide to creating self-learning materials* to assist trainers and communicators engaged in transferring knowledge and information on rice.

One of IRRI's primary responsibilities is to train scholars from developing nations in the rice sciences. For more than two decades it has conducted a training program in fulfillment of that responsibility.

IRRI recognizes that constraints exist in training and communication because of the explosive progress in information on the one hand, and the inherent difficulties in cross-cultural communication on the other. Thus, it is advantageous to continuously develop and explore learning methodologies that complement the well-established instructional methods of lecture, seminar, and laboratory/practicals, to expedite learning and cross-cultural communication.

The self-study approach to learning changes the role of the trainer/trainee, by placing greater responsibility for the learning process on the trainee. The method is deemed appropriate for IRRI trainees, who are established junior scientists and professionals.

This two-part *Guide to creating self-learning materials* for both trainers and potential trainers has been prepared in response to a widely felt need. It is intended to help training and communication practitioners understand the merits and limitations of using self-learning materials, create quality self-learning materials suited to the trainees' needs, and manage the use of self-learning materials effectively.

It is hoped that this publication will serve to provide a means of transferring knowledge and information on rice.

KLAUS J. LAMPE
Director General

March 1989

PREFACE

The first question the reader of any book asks is, “Does it fit me and will the information satisfy my needs?”

In answer, let’s see what information is contained in this book.

WHAT this guide is about

Creating self-learning materials

This guide describes the concepts, principles, and processes used in constructing self-study training materials. However, before we go on, let’s look at the word “create” in the title, *A guide to creating self-learning materials.*

When designing quality self-study materials, it will be necessary to create nonverbal visuals as well as verbal communication. They will be valuable tools to assist learning. You can learn how to create these new learning packages, but it will require practice, patience, perseverance, and commitment.

WHO this guide is for - the intended users

Those who want to design self-study materials

Although you can use this guide by yourself, it is most effective during a workshop which allows practice, dialogue, and immediate feedback.

This guide is written for adults who have

- a BA or BS in a scientific or technical field,
- some teaching experience,
- training responsibility,
- little or no experience in instructional design and development, and
- a need and desire to develop self-instructional materials.

The guide assumes that you have had little exposure to the concepts and vocabulary of educational technology or psychology, but that you want to discover how people learn.

It will provide technology to help you conduct training by packaging and transferring information.

WHY this guide - a case history

A learning option

A training program

The International Rice Research Institute (IRRI) has more than 20 years experience in teaching people from developing nations about rice science.

One type of short-term training, from 2 weeks to 5 months, is called nondegree training. These courses about advances in rice technology update professionals from various nations.

The exercises that follow are practical, problem-solving, and field-oriented. The information is given through lectures; the medium of instruction is English.

An adjunct approach

The nondegree training courses faced certain problems. Because the courses were short and intense and the trainees had different levels of English skills, they needed a supplementary method of learning. In 1976, IRRI piloted the slide/ tape self-study option.

The system

- organized and sequenced the information,
- documented the lecture material in a written *and* pictorial format,
- enhanced oral an written English proficiency simultaneously,
- made information available at any time,
- packaged information so that instructors could transfer and use it in other training programs, and
- allowed the information to be readily translated into other languages.

Instructors used this important tool to train people from many countries. Its success was evident in the trainees' use of the programs at IRRI and the demand for training modules in other nations.

An increase in technology

Technology continues to increase and become more complex. As a result, it has become necessary to increase the number of training courses and programs. With this development comes the need

- for more self-study systems so that students can learn independently, and
- to adapt these learning packages so they can communicate with technology users in the different regions of the world.

If you think that this guide meets your needs so far, read on.

If you're not sure, read the introductory sections on content, objectives, and style.

If you don't think it meets your needs, please pass it on to a colleague who you think might be interested.

Training in self-learning methodology

To meet these demands, IRRI is expanding its instructional programs and training staff to produce self-learning messages.

Hundreds of conversations with trainers in developing nations show they need new training approaches and materials for adults. This handbook will help you develop autotutorial methods that introduce new training approaches.

ACKNOWLEDGMENT

The International Rice Research Institute wishes to thank the IRRI staff, the committee on nondegree education, academic council members, and educators throughout the world for their constructive comments and assistance in fashioning this publication.

Special acknowledgments are extended to Dr. Katherine Steele, Dr. Jeannine Webb, and Dr. M. M. Murphey of the University of Florida who encouraged the author in the pursuit of innovative instructional techniques contained in this book.

This manual is dedicated to you, if you find it useful; to the national staff of the Training and Technology Transfer Department; but especially to Dr. Robert N. Hurst of Purdue University who introduced the self-study concept at IRRI.

INTRODUCTION

New challenges and trends

Whether we like it or not, the world is rapidly advancing into a new era. This time in human history has been called the information revolution. It is a time of expanding population and communication. Information presently doubles within 7 to 10 years, and that time is decreasing.

This information explosion presents new challenges to those responsible for sharing information.

- To keep up, we must transfer more information to more people in less time.

- With advances in agricultural science and industry, information has become more technical and complex.

- To be useful in a world community, we must share information with cultures of different languages.

- To solve complex problems, we must find methods to increase communication between people of different disciplines.

- To prepare people for responsible positions in a technological society, we must transfer complex information to a younger population.

- At the same time, older adults must learn the new techniques so that they can keep up with technological developments.

Therefore, we must find new methods to share information.

One solution to information diffusion has two parts:

1. *Teach people to find information and teach themselves.*
2. *Prepare materials that will encourage people to teach themselves.*

This educational technology requires information preparation, packaging, and referral. These are the focus of this guide.

Parts of a self-study program

Objectives
Content
Feedback

Educational research shows that effective self-study material should include

- the standard of performance expected from the learners,
- information to be learned, and
- exercises that allow learners to evaluate their performance.

Therefore, this guide will teach you how to write

- learning objectives,
- a self-study program, and
- self-evaluation exercises.

The end product will be a self-learning package made up of these three parts.

However, in transferring technology, we often forget an important point. We need to explain why the technology has been successful and why people should adopt it. This explanation is important because scientific investigation convinces and motivates both trainers and trainees.

Therefore the guide also will

- explain the evolution of the scientific research that has led to this modern self-study instructional methodology, and

- introduce new vocabulary and concepts.

The content

Part I - Why

Two parts make up this book. Part I discusses some relevant theories and concepts related to autotutorial instruction as a learning method.

- Chapter 1 introduces the basics of communication. It presents a communication model that helps to explain what happens during information transfer.

- Chapter 2 contains a brief history of the learning theory, the evolution, and design of this methodology.

- Chapter 3 continues with a more detailed discussion of adult education.

- Chapter 4 highlights both the old concepts and the theory of whole brain learning.

- Chapter 5 explains the various learning styles.

Part II - How

Part II is the task-oriented part.

- Chapters 6 to 11 explain how to create autotutorial packages.
- Chapter 12 discusses how autotutorial programs are to be managed.

Style: a different approach

This guide differs from most manuals in several ways:

1. It has two distinct but related sections. One will tell you **why** we use the self-study option, the other will show **how** to design self-study materials. You can alternate between sections or use whatever sequence you like.

2. We designed the guide for self-study. Each chapter will contain objectives, topics to learn, and self-evaluation exercises so that you can measure what you learned. Read the objectives before and after you study the program.

3. Main points are accentuated and enclosed in frames or boxes.

4. The lessons also contain drawings and written information for you to read in sequence.

5. Lessons are written in a conversational tone.

If you want to begin by understanding the theory behind the creation of self-learning materials, how this methodology works and came to be, advance to Part I and read Chapters 1 to 5.

If you're not interested in theory and want to begin creating self-study materials, turn to Part II and read Chapters 6 through 12.

If you like to approach things in sequence, read Chapters 1 to 12.

If you're now sure you're not interested in any option, please give this publication to someone who might be. There's nothing as useless as an unused book.

PART I - A/I OR SELF-LEARNING INSTRUCTION AS A LEARNING METHOD: SOME RELEVANT THEORIES AND CONCEPTS

CHAPTER 1. The Communication Process

Objectives

The information in this chapter is not essential for you to create objectives and a self-study module, or write self-evaluation exercises. Nevertheless, it will help you attain the following objectives:

- Discuss the 5 parts of the communication model.
- List 2 primary methods of human communication.
- Relate 6 avenues of visual communication.
- Describe 2 channels used in verbal communication.

Remember each chapter has a self-study format with objectives, content, and self-evaluation exercises.

Objectives are the main points to learn. You may want to refer to them again after reading the chapter.

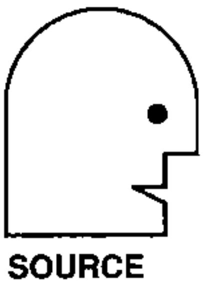
If you can now perform the objectives or want to create a module, go to page 100. Do you think you can answer the questions, but you're not sure? If so, turn to page 20 for a self-evaluation on the 4 objectives of this chapter.

Are you curious about the objectives? Do you want to learn more? Read on. Content comes next.

Berlo's Model

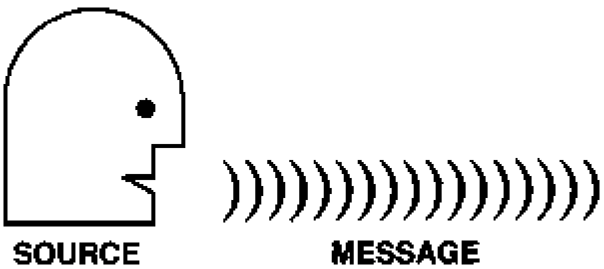
Let's first discuss a basic communication model called Berlo's Model. In doing so, let's use pictures. Pictures are important in the communication process because they help us visualize verbal concepts. As we talk about ideas, we often automatically fashion pictures in our minds relating the words to past visual experiences.

Pictures are important for storing and recalling information. So whenever possible, try to communicate visually as well as verbally. By doing this, you assist people to understand concepts. For instance, let's divide our communication model in 7 parts, corresponding to 7 steps.



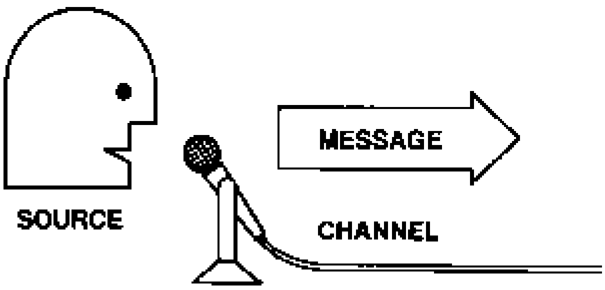
SOURCE

Part 1 is called the communication **SOURCE.**



MESSAGE

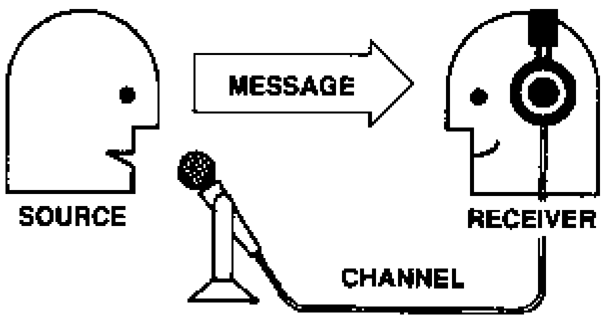
Part 2 The source sends a **MESSAGE.**



CHANNEL

Part 3

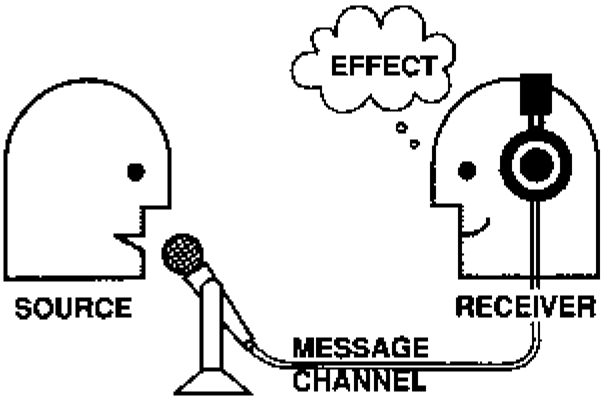
The source sends a message by some **CHANNEL** or communication method, such as a microphone.



RECEIVER

Part 4

The source sends a message by this channel to a **RECEIVER.**

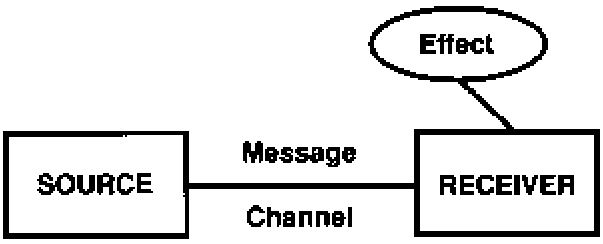


EFFECT

Part 5

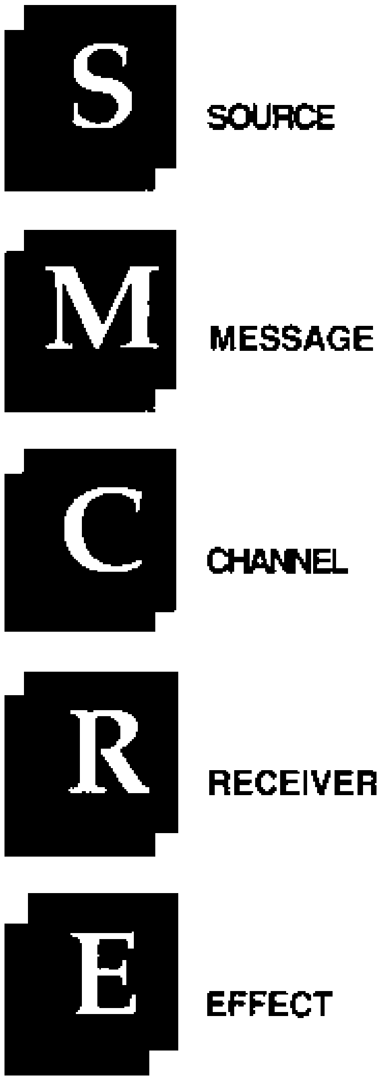
The source sends the message by some channel to the receiver to produce some **EFFECT** or change in behavior.

Now let's put these components together and diagram our model.



For example, this guide is a **source** to convey a **message** about self-learning methods through a print/picture **channel** to you, the **receiver,** to produce a change or **effect** in your behavior.

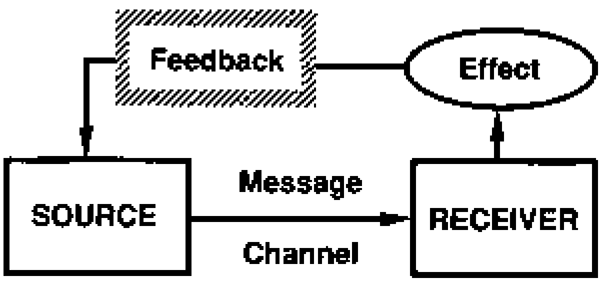
Although Berlo, a communication expert, did not develop all parts of the model, people refer to it as *Berlo's Model.*



Many communication professionals also refer to the process as SMCRE which stands for source, message, channel, receiver, and effect.

However, when using this acronym, there's one more extremely important step in the communication process that's left out. In fact, effective dialogue and group communication is impossible without FEEDBACK.

For this reason, let's add another important step to our model.

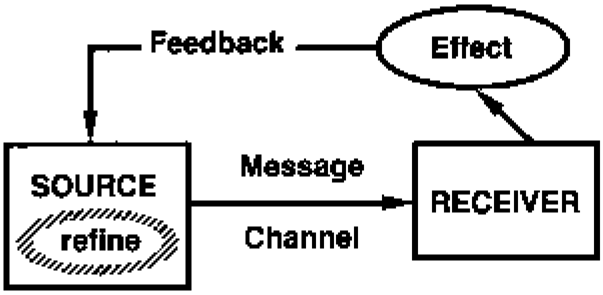


FEEDBACK

Part 6

FEEDBACK is an important product of the communication process.

Feedback from student questionnaires and tests is an important part of designing self-study instruction. Feedback tells you (the source) how effective the selected message and channel are upon the receiver. It allows you to adjust the communication process so that it is more effective. Let's add another step to the model.



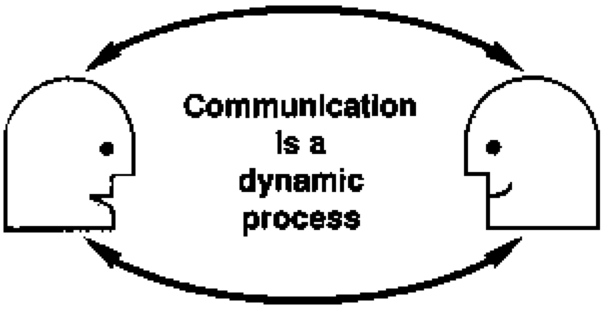
REFINED MESSAGE

Part 7

REFINE the message.

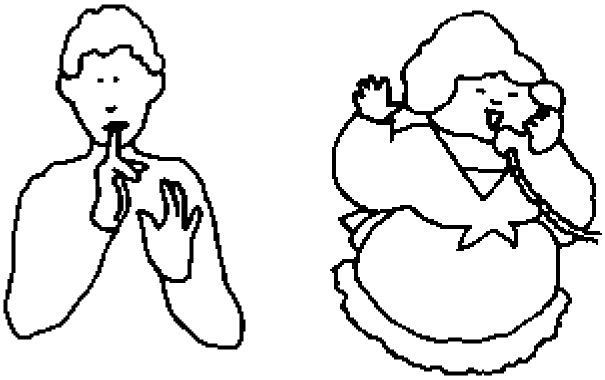
Conversation or dialogue is stimulating communication because the model constantly rotates between two people. It is an active participation process.

One challenge you face when designing self-study instruction is to build in active student participation and feedback.



Communication modes

Humans have two primary modes or means of communication, **nonverbal** and **verbal.**

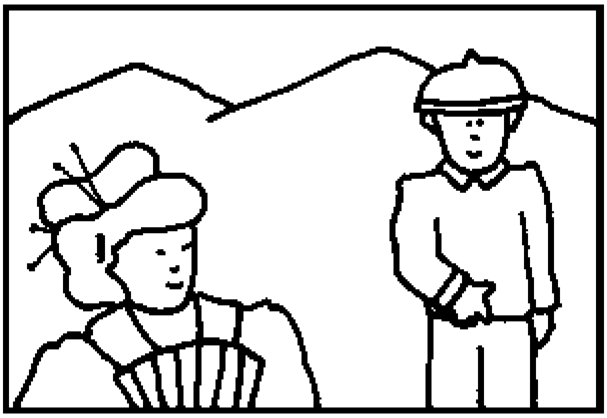


Nonverbal

Nonverbal pictures are a very powerful tool in the communication and learning process. Even verbal communication depends on the arrangement of the conceptional building blocks of letters... words ... sentences.

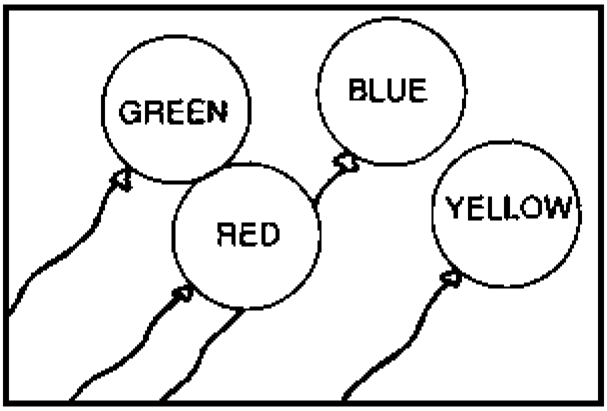
The sense of vision, the major nonverbal communication vehicle in humans, is responsible for more than 80% of learning. Nonverbal communication is powerful.

Some of the more important nonverbal visual channels used to communicate are the following:



DISTANCE

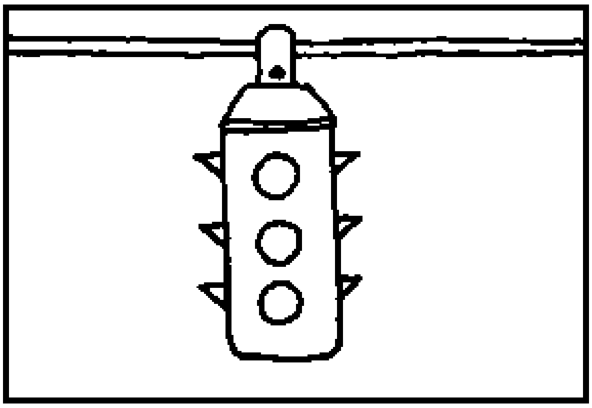
• **Distance,** particularly human distance or our proximity to one another, has culture-bound meanings.



COLORS

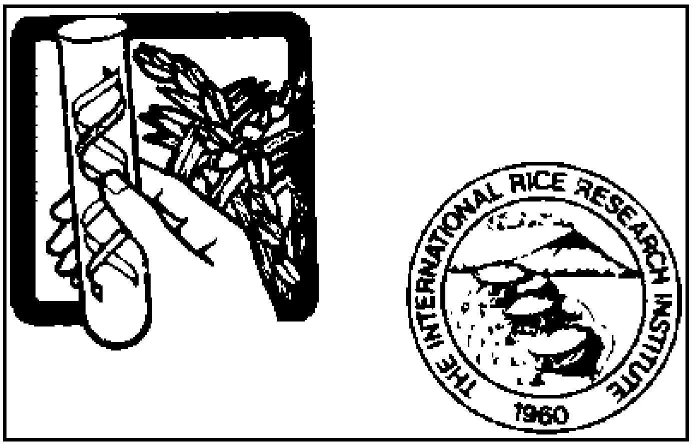
• **Colors** evoke certain responses and emotions depending on the culture:

white >>> cool, red >>> hot, blue >>> sad.



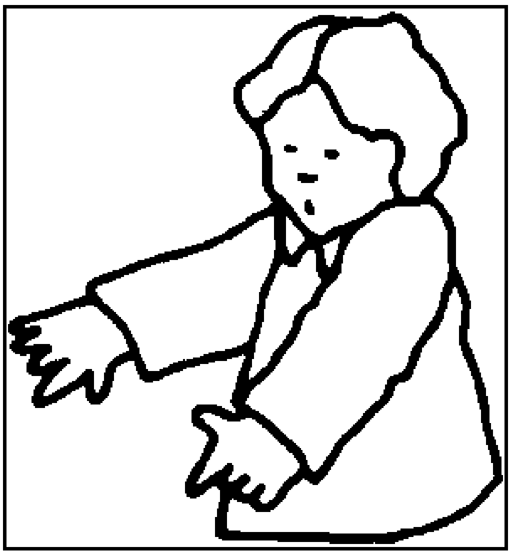
LIGHTS

• **Lights** are used as signal devices, guides, warnings, and announcements.



PICTURES

• **Pictures** include art, logos, and other designs used to communicate messages. "A picture is worth a thousand words."



GESTURES

• **Gestures** are an important part of oral communication.

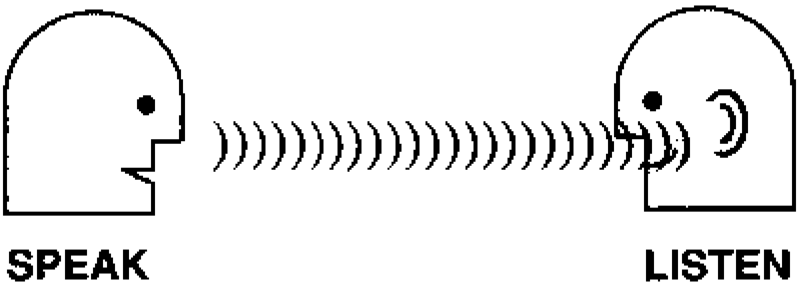
DRESS

- **Dress** (uniforms, jeans, native costumes, heels, necklaces, rings, ties, hair, and other attires and accessories) communicates a message.

Other nonverbal senses such as smell, touch, and taste contribute to communication especially in lower animals. But the sense of vision is especially important in nonverbal communication of humans and higher animals.

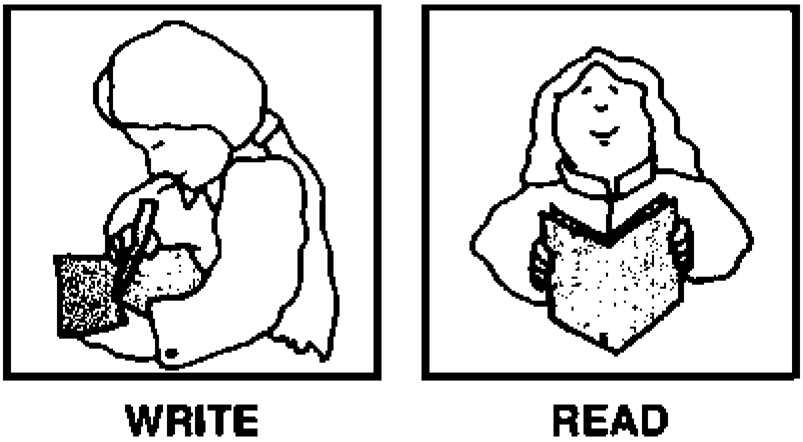
Verbal

And then, somewhere in time, came words, meanings, and languages. It's estimated that there are more than 70,000 different languages and dialects in the world. However, all communicate verbally in just two methods.



ORAL MESSAGE

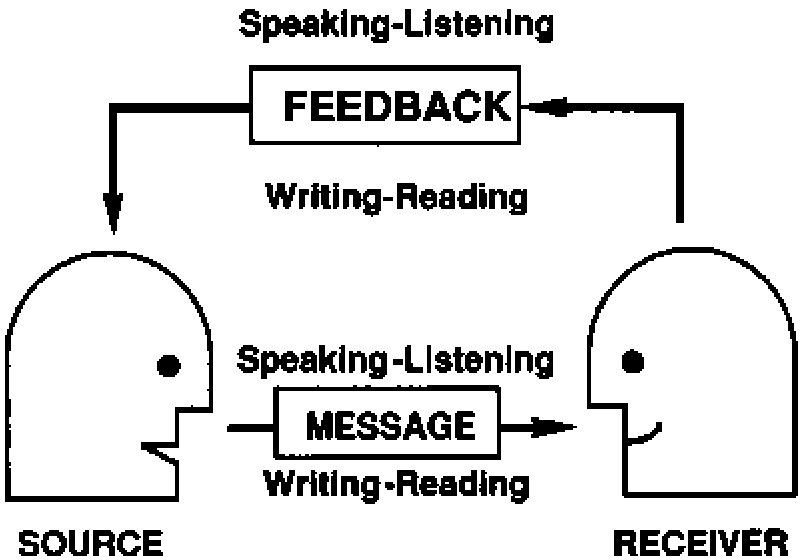
Method 1. A source sends a message to the receiver by speaking; it is received by listening.



WRITTEN MESSAGE

Method 2. A source sends a message to the receiver by writing; it is received by reading.

A Summary



Of course, feedback in our communication model may also have two methods of verbal communication.

Speaking of feedback, it's time for a feedback exercise. This manual has been the **source** in a communication process. The **message** has been about the communication model. We have communicated to you, the **receiver,** through both verbal and nonverbal **channels** to produce an **effect.**

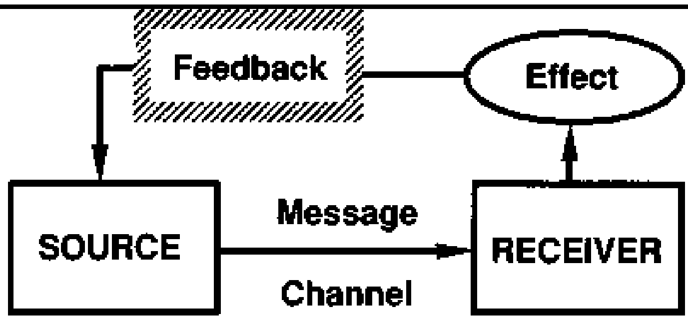
Did this communication process cause an effect in you? Did it cause you to learn? Only **feedback** can tell us the effect of our message.

Feedback exercise

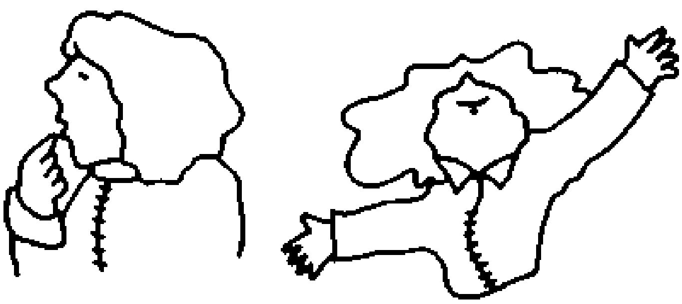
Answer these questions to evaluate your learning so far.

- Diagram and label Berlo's Model.
- List the 2 primary communication channels in humans.
- List the 6 channels of nonverbal communication.
- List and discuss the 2 interactive channels of verbal communication.

Answers to feedback exercise



• gestures or body language; nonverbal/verbal



• distance, colors, lights, pictures, gestures and dress
• spoken/listening: source speaks, receiver listens
written/reading: source writes, receiver reads

We hope that you answered all the questions correctly, because the objective of this chapter is to effectively communicate these principles to you, the receiver. If you missed a question, there was a breakdown in the model.

By design, the chapter was very short. There was little repetition of concepts and no participation until the very end. Thus, we omitted two important learning tools: **repetition of material** and **immediate feedback.**

More on this in our next chapter, *Self-study option: how it got started, what it can do.*

CHAPTER 2. The Self-study Option: How It Got Started, What It Can Do

How did self-study start? What kinds are there? What can they do? We'll talk about those topics in this chapter. If you're more interested in how to begin designing a self-study project, skip this and the next three chapters and start with Chapter 6.

BUT, you will find this chapter extremely valuable in focusing your goals and justifying your project to YOURSELF, YOUR STUDENTS, and YOUR MORE CONVENTIONAL COLLEAGUES.

When talking about new ideas, skeptics will repeatedly ask you for facts and reasons for changing your methods. That's why we'll talk about theory as well as process.

To be prepared for these questions, you will need facts as well as a desire to create autotutorial programs. The facts will allow you to answer questions and increase your credibility as you share new learning techniques with others.

Objectives

After you finish reading this chapter, you should be able to

- Distinguish between tutorial, audiotutorial, and autotutorial instruction.
- Discuss the development of the autotutorial approach as a teaching method.
- Relate and distinguish between autotutorial research terms and methods
  - programmed instruction

- audiotutorial instruction
- personalized instruction

• List and describe 4 principles of programmed instruction.

• List the 4 major reasons why students like self-learning instruction.

• Compare the efficiency of self-learning instruction and lectures.

• Compare the cost of autotutorials and lectures.

• List and discuss 10 advantages of learner-driven instruction.

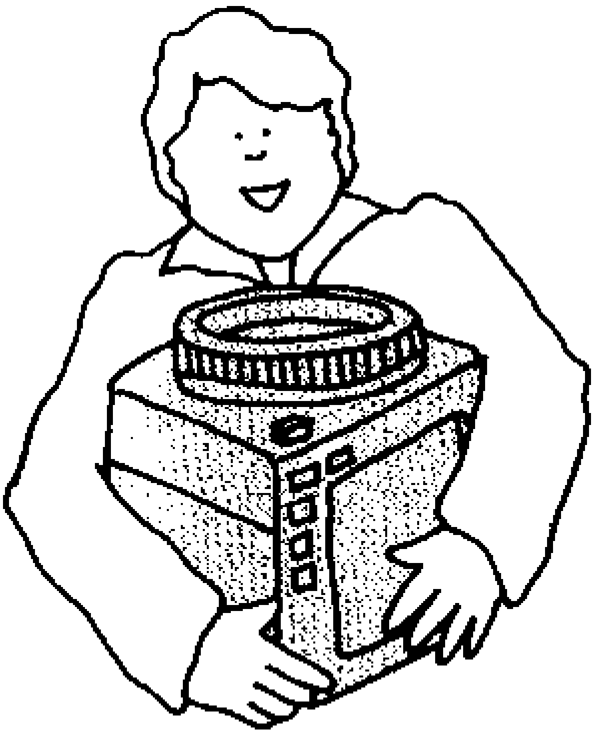
• List and discuss 4 major drawbacks of using autotutorial instruction.

• Explain how the instructor can overcome these drawbacks of autotutorial instruction.

• Explain the teacher's new role when using the self-learning approach.

• Define hardware, software, and courseware.

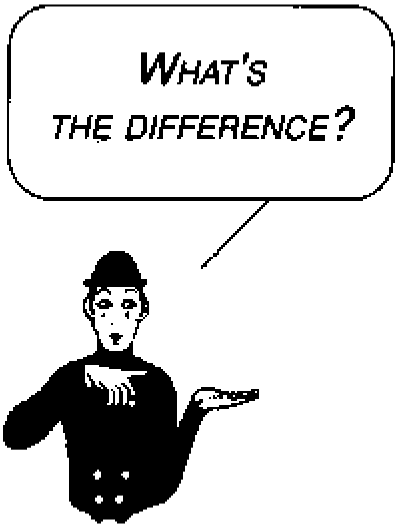
• Describe how students compare autotutorial and lecture methods.



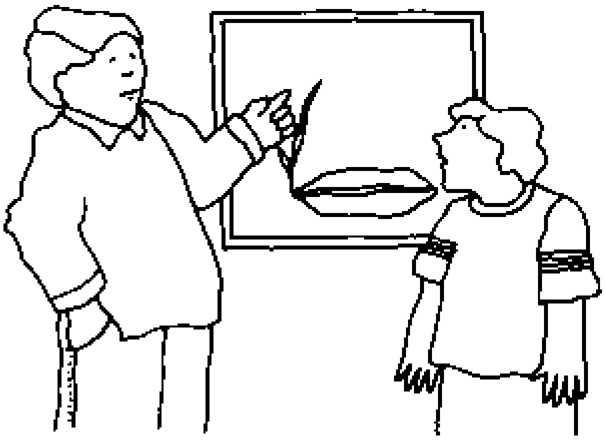
You can see there's a wealth of information in this chapter. We have condensed it to give you an overview and insight but save time. Refer to the list of references at the end of this chapter if you want more information.

Tutorial, audiotutorial, autotutorial

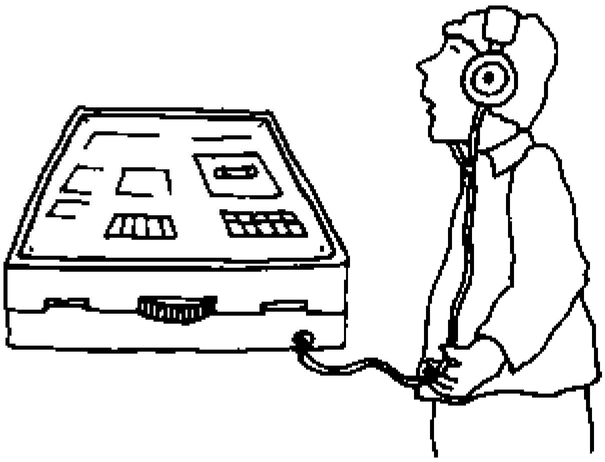
What's the difference between these three kinds of instruction?



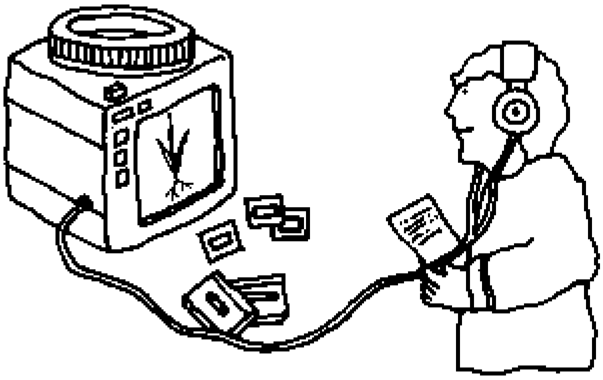
Tutorial instruction generally means one-to-one teaching with a private teacher.



Audiotutorial (A-T) literally refers to using sound, usually a tape recording, as a private teacher. However, you will soon see that A-T can use much more than sound.



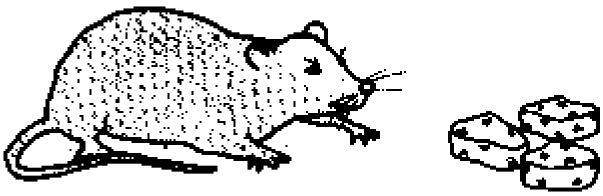
Autotutorial means learning materials that allow students to teach themselves. They may include any medium such as print, sound, pictures, slides, or television.



How autotutorial learning developed

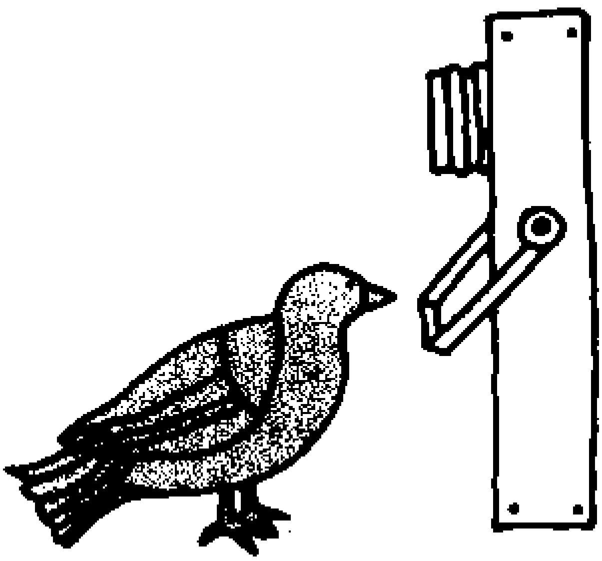
STIMULUS/RESPONSE (S-R)

Much early research on learning involved the behavior of an organism, usually a small animal, in response to some stimulus such as food, shock, or light. Theories from this research were known as **stimulus/response,** abbreviated as **S-R**.



OPERANT RESPONSE (OR)

In the late 1930s, B. F. Skinner, a psychologist at Harvard University, started investigations to learn what animals (rats and pigeons) would **do** to receive a reward. Because some experiments required the animal to operate a bar, disk, lever, or similar apparatus, it became known as the **operant (conditioning) response** or **OR** theory.



Those who advocated these theories were referred to as the *behaviorist* school in psychology, because they were interested in **external behavior** or **responses.** Although tutorial or individual instruction had always been prevalent as a learning method, this new behavior research helped develop new learning principles applicable to tutorial and especially autotutorial instruction.

The research showed that through a stimulus (reward), an animal could learn a behavioral program. It was possible to teach pigeons to hop up and down twice, turn around three times, and flap their wings before they received their reward.

PROGRAMMED INSTRUCTION (PI)

The learning principles from these experiments eventually became known as **programmed instruction, PI.** Skinner characterized PI as having

- small steps or units of content to be learned,
- active student involvement,
- immediate feedback,
- positive reinforcement, and
- self-pacing.

Elementary schools in the United States began using this personalized PI concept in the early 1950s, and it gained wide acceptance.

AUDIOTUTORIAL (A-T)

In 1961, PI graduated from the elementary schools and went to college. Dr. S. N. Postlethwait used the PI principles in an **audiotutorial** mode (**A-T**) to supplement a beginning botany course at Purdue University. He centered personalized learning in a self-study desk or carrel. The materials consisted of

- learning objectives,
- a programmed audio tape,
- printed study guides,
- visual aids,
- actual biological specimens, and
- a tutor for personalized instruction.

The method quickly gained international recognition. Today, a formal definition of A-T includes all of these elements.

PERSONALIZED SYSTEM OF INSTRUCTION (PSI)

Also in the 1960s, Dr. F.S. Keller, a psychologist at the University of Brazilia in Brazil, developed a similar approach to teaching science courses. He referred to his autotutorial packages as a personalized system of instruction or **PSI.**

PSI, or the Keller packages, contain

- primarily written instructional material,
- self-paced lessons,
- explicit objectives, and
- feedback evaluation.

The Massachusetts Institute of Technology (MIT) in the U.S. used PSI successfully in a beginning physics course, and the method gained international recognition in science instruction.

A module

Do you remember the parts of our autotutorial package in the Preface and Chapter 1? They came from this list. The standard for a module consists of these 9 parts advocated by the CUEBS.

Since then, the modular or programmed autotutorial instructional approach has gained recognition as a viable option in the instructional process.

As a result, a group of distinguished educators, the Commission on Undergraduate Education in the Biological Sciences (CUEBS), published guidelines for modular instruction. They include

- a statement of purpose,
- entry or prerequisite skills,
- instructional objectives,
- a pretest,
- implements (equipment, supplies),
- the program (printed A-T),
- related or repetitive experiences,
- a post-test, and
- assessment by student peers.

Summary

Two models of successful programmed instruction at the college level are Postlethwait's A-T and Keller's PSI.

An educational commission of the Biological Sciences has advocated 9 guidelines for modular instruction. Can you name them? If not, look again.

Questions about self-learning instruction

There are three major questions you'll want to answer about self-learning or autotutorial instruction:

1. How effective is the autotutorial method as compared with the lecture?
2. How much does it cost?
3. What are its advantages and disadvantages?

How well does it teach?

Effectiveness
Cost
Advantages/Disadvantages

One of the most favorable aspects of self-learning instruction is student acceptance. Student questionnaires show that they overwhelmingly prefer autotutorial instruction to lectures as a means of inputting information. Some studies show acceptance as high as 97% in favor of self-learning instruction. Students say they like it because of

- a feeling of self-sufficiency in learning,
- self-pacing and freedom from rigid time constraints,
- active participation in the learning process, and
- better organization of material.

In western cultures, 15% of students will be extremely positive, 15% will be extremely negative; but 85% prefer this method to lectures. Those with negative feelings say that autotutorial instruction is extremely inhuman.

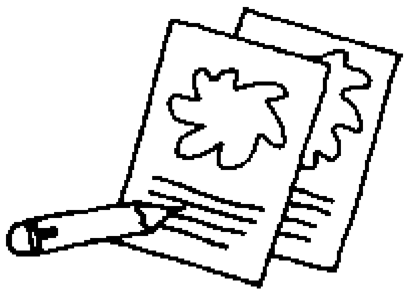
Student performance on written content exams confirms that autotutorial instruction is equal to, and in most cases superior to, the lecture method. There are indications that autotutorial methods may be vastly superior to lectures in long-term recall of content. We need more research in this area.

Summary

Most students prefer autotutorial instruction to lectures. Those who don't, feel very strongly about their objections. Autotutorial instruction is equal to, and in most cases superior to, the lecture.

How much does it cost?

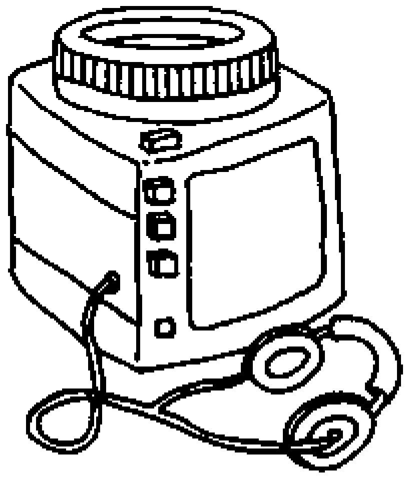
Cost depends on the medium you use. If you use a print/picture format, it can be relatively cheap. Graphics or pictures can consist of rough but informative sketches on inexpensive paper stock. You can print the autotutorial message by hand. You do not even need a typewriter, only a pencil, paper, and creativity.



However, if you want to use computer-aided instruction (CAI), the machine alone will cost hundreds of dollars.

Let's pause here for more explanation.

Hardware, software*.* Much self-learning instruction is created to be used on teaching machines. The machines are slide/tape devices that show a slide and play a tape at the same time. They look like a small TV screen. Many are capable of automatic slide-tape synchronization.



There are other programs which need only a tape recorder. The most recent autotutorial approach uses the computer where verbal and graphic messages appear on a TV screen.

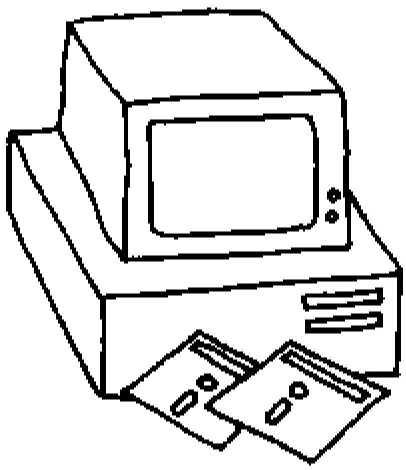
The machines or equipment to run these programs are called **hardware.** The programs that run on these machines are called **software.**

Even though some software programs have very attractive presentations, it's important to remember that you can create effective programs without using expensive hardware and software.

A-T costs*.* However, cost evaluation of slide/ tape lessons show the autotutorial method to be economical as compared with conventional instruction. Initial costs are extremely high and the break-even point is about three years.

The initial investment is mostly in human resources to document, organize, and implement the programs for graphics, photography, and audio personnel. Hardware and space are another major investment. If you can purchase instructional software directly, it is even more economical. Then you eliminate expensive development costs.

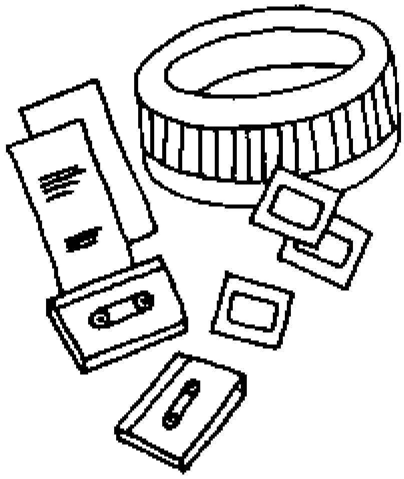
Major publication companies are increasing their range of slide/tape, video, and computer programs for sale.



Most university autotutorial designs and products deal with science and technology.

As you look for educational technology aids, remember that many educators refer to instructional materials as **courseware**. They often call autotutorial materials or software a courseware package.

What are the advantages and disadvantages of the autotutorial?



Its *advantages* are

- Students are **active** rather than passive in the learning process.
- Students control the **pace** of learning.
- Students control the **time** and **interval** of learning. The program is available when students want it.
- Content is tightly **organized.**
- Students are **responsible** for their own learning.
- **Repetition** of content material is possible.
- Students can **skip** familiar information and concepts.
- The frame format of documenting material content and sequence facilitates **peer review.**
- Module documentation can be treated as **creative works** and scholarly publications by the academe, much as chapters in a book.
- Materials are **exportable** for use at home and for sharing with other institutions.
- Students can **explore** materials on their own, because they are self-learning and independent of a teacher.

Its *disadvantages* are

- Some students feel **isolated.**
- Students with extreme negative feelings say autotutorial instruction (especially machine taught) is **inhuman.**

• Autotutorial methods make it more difficult to **emotionally motivate** students.

• It is harder to show **attitudes** about content.

• **Immediate feedback** or question periods may not be available.

However, a new active role by the instructor can overcome these drawbacks.

The new role of the teacher

Manager
Designer
Facilitator
Counselor

In the old lecture role, the lecturer/teacher is a broadcaster of information, sometimes a performer or entertainer.

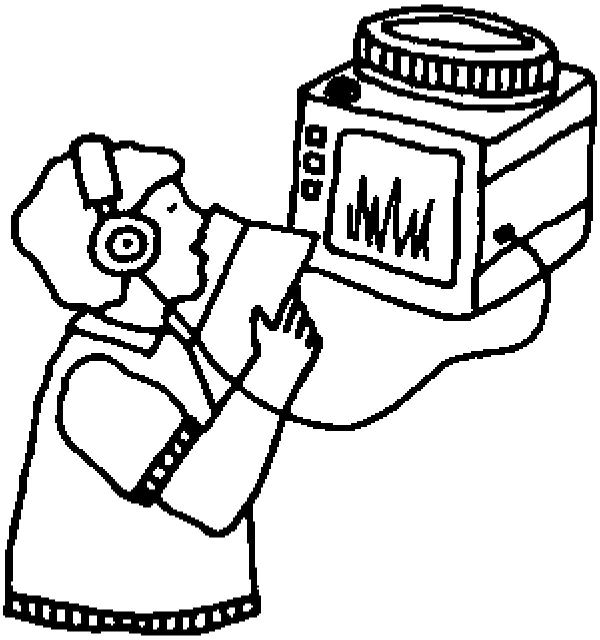
The role of a teacher using self-learning instruction is entirely new. It is that of a **manager** and **facilitator.** The teacher acts as a resource person, a humanistic tutor that diagnoses, prescribes, and motivates an individual or small group. Students still need the teacher, but the teacher's role is different.

The instructor's first task in this new role is to create or design autotutorial instructional software or materials for the student.

The second part is the shifting of roles from that of a teacher to that of a tutor. By moving the primary teaching of *content* information to the software package, the teacher can now concentrate on the new dimensions of student *attitudes* and *problem-solving.*

Teachers can now direct creativity into designing and guiding instruction in a humanistic, individual manner, by being an education or learning counselor.

Autotutorial Instruction (A/I): our working definition



After looking at the research history, concepts, and principles of autotutorial instruction, it's time to formulate a working definition.

For our purposes it will involve 8 concepts:

1. It will be self-study.

2. It will be a module in that it will have

   • performance objectives,
   • a self-learning program, and
   • feedback or self-evaluation exercises.

3. The feedback exercises will be related to the objectives.

4. The self-learning program will consist of small learning steps or frames.

5. The steps will contain visuals, such as graphics, pictures, or specimens.

6. The script will be in print and on tape.

7. It will be self-paced for individual instruction.

8. The instructor will be an information counselor.

A/I

We will call the courseware Autotutorial Instruction as it will prevent confusion with the A-T acronym.

In the next chapter, we will get to know a new learning philosophy that is changing training methods. In fact, it is one of the reasons for this guide, because self-learning materials are essential in implementing the training methods that are part of this new learning philosophy.

The following feedback exercise will help you review this material. You may also want to review certain parts of this information periodically as you create your A/I program. Perhaps, you can list those pages for future referral.

Feedback exercise

• Define autotutorial.

• The Behaviorist School first developed:
(Check one).

_____ A-T
_____ A/I
_____ PSI
_____ PI

• Place the following acronyms associated with autotutorial instruction in their order of discovery (Sequence by number).

_____ OR
_____ Tutorial
_____ PI
_____ A-T
_____ SR

• There are 4 principles associated with PI. List and define two.

1. __________. __________
____
2. __________. __________
____

• What 2 A/I models are associated with university instruction? (Check two).

_____ PI
_____ PSI
_____ OR
_____ A-T
_____ SR

• Which of the above is also called the Keller Plan?

____

• One element of Postlethwait's audiotutorial model was use of the speaking/listening communication through the use of audio tapes.

List 5 additional components.

1. ______________________________
2. ______________________________
3. ______________________________
4. ______________________________
5. ______________________________

• In what major component do PSI and A/I differ?

____
____

• Most autotutorial instruction is received favorably by students. What are some of their reasons? (Give four).

____
____
____
____

• Most objective comparisons of the lecture and autotutorial methods revealed which to be vastly superior? (Check one).

_____ Neither one vastly superior
_____ A-T
_____ Lecture
_____ Almost similar

• Is A/I cost effective? (Check one).

_____YES _____NO

• How long does it take to break- even in an A/I investment? (Check one).

_____ one year
_____ two years
_____ three years
_____ four years
_____ five years

• List 5 advantages and 2 disadvantages of A/I (Answer briefly).

Advantages

1. ________________________________
2. ________________________________
3. ________________________________
4. ________________________________
5. ________________________________

Disadvantages

1. ______________________________
2. ______________________________

• Describe, in your own words, the role of an A/I teacher.

____
____
____
____

• Identify which of the following are hardware and which are software. (Write H for hardware and S for software.)

_____ paper
_____ slide
_____ computer
_____ video cassette
_____ computer disk
_____ projector
_____ videotape recorder
_____ pencil

• The working definition of A/I advocated in this guide has 8 concepts. Fill in the missing concepts in the list.

1. self-instruction
2. ______________________________
3. feedback exercises in pace with performance objectives
4. ______________________________
5. nonverbal communication through pictures, visuals
6. verbal learning through tapes
7. ______________________________
8. ______________________________

• Define performance objective.

____
____

Answers to feedback exercise

• individual or small group instruction

• PI

• Tutorial, S-R, OR, PI, A-T

• small steps in learning
active participation in learning
immediate positive reinforcement in learning
self pacing in learning

• PSI, A-T

• PSI

• 1. objectives
2. printed study guides
3. visual aids
4. hands-on work with actual specimens
5. a tutor or assistant

• PSI mostly written channel
A-T mostly audio channel

• self-sufficiency
self-pacing
active participation
organization of material

• neither - none is vastly superior; A/I as good as lecture or slightly better

• yes

• three years

• Advantages of A/I:

- active learning process
- pace student-controlled
- time and interval of study student-controlled
- information super organized
- student responsible for learning
- repetition of material possible
- option of skipping familiar material
- facilitates peer review
- documentation a creative work
- material exportable
- random exploration of concepts available

Disadvantages:

- feelings of isolation by some students
- to some students, machine teaching is inhuman
- conveying attitudes difficult
- ineffective in affective attitudinal domain
- immediate feedback difficult

• The A/I teacher is

- a facilitator and manager

- a humanistic empathizer and counselor in the learning process
- a tutor
- a courseware designer

• S, if programmed
S
H
S, if programmed
S, if programmed
H
H
H

• - modularized with

performance objectives
autotutorial program
feedback exercises

- increment learning steps
- self-paced
- altered instructional role

• learning goal; or student/teacher learning contract

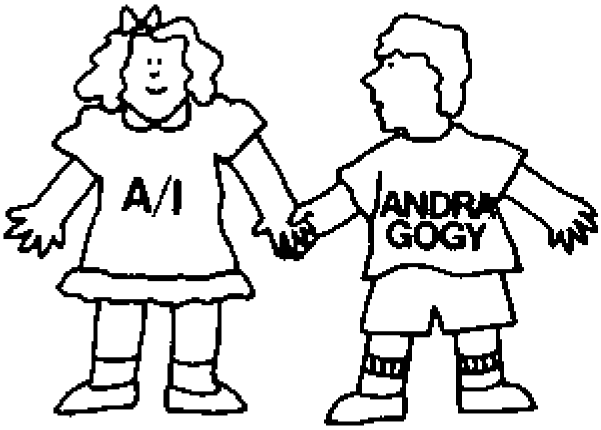
CHAPTER 3. A New Philosophy

This chapter will discuss the student/teacher roles available through a philosophy of adult-to-adult teaching called **andragogy.** It will explain how A/I and self-instruction contribute to this philosophy.

The A/I method is one way to cope with the information explosion and specialization of a technological society. We can also use it to humanize teaching and create new teacher-student relationships.



Objective

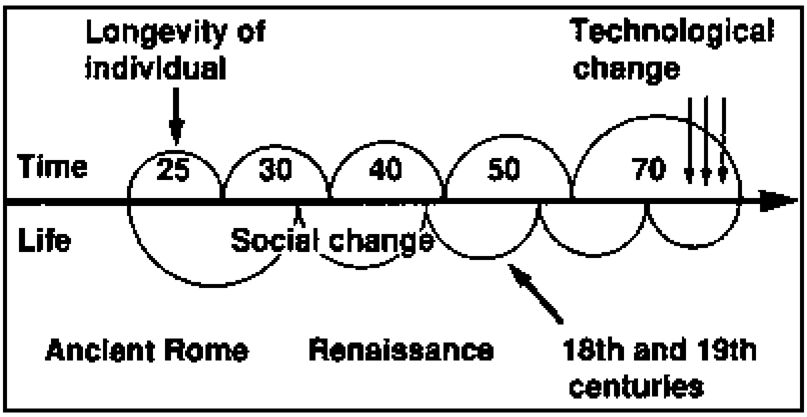
At the end of this chapter, you will be able to

- Discuss the teacher's new role relative to A/I and adult-to-adult teaching.

Andragogy: adult-to-adult teaching

Changing times

When one correlates life expectancy, culture, and technology change with time, the graph looks like this.



ADAPTED FROM: M. Knowles. 1972. The Modern Practice of Adult Education: Andragogy vs. Pedagogy. New York Assn. Press.

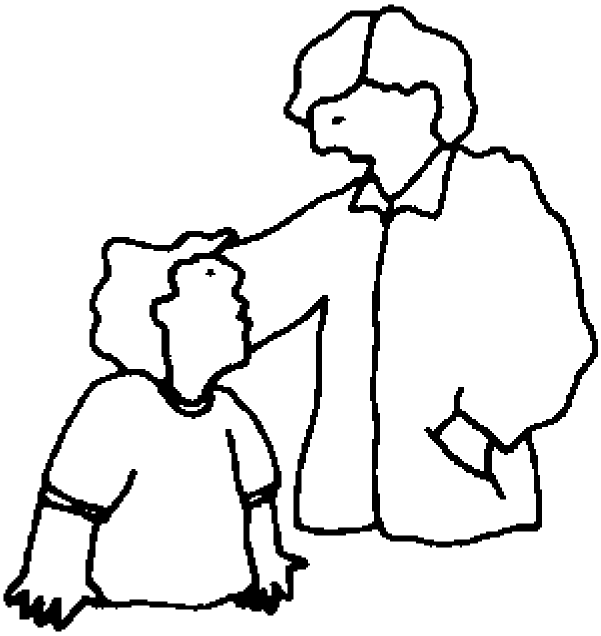
The graph shows that, at one time, people spent their whole lives experiencing little social or technical change. Today, however, we spend our whole lives in a social environment bombarded by technological change.

It also means that the educational tools we acquire in our professional lives may become obsolete soon after we leave school. It is therefore essential that educators find methods that allow **people to teach themselves.** And, more importantly, that educators **teach people how to teach themselves.** There are two basic steps in this process:

1. Create self-learning materials.
2. Re-allocate the responsibility of learning to the learner

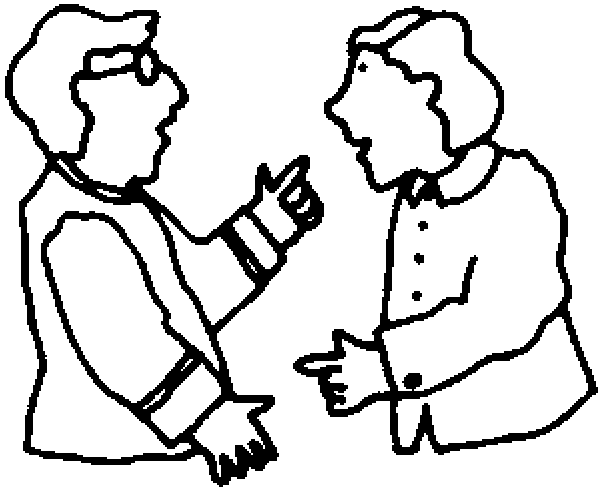
- *from* dependent
- *to* independent.

Another word for education is **pedagogy** which means “to teach children.” It indicates an adult/ child relationship in the learning process, where the student depends on the teacher for most aspects of learning.



Educators are now forming a new word, **andragogy,** for a certain type of teaching. Andragogy literally means “to teach man.” It has come to mean **adult teaching.** Some of the elements in this new type of learning are

- self-instruction by the learner,
- adult-to-adult relationship between the teacher and the student,
- student selects learning materials,
- student explores learning materials,
- student auto- or self-evaluates rather than takes tests,
- student uses practical problem-solving exercises.



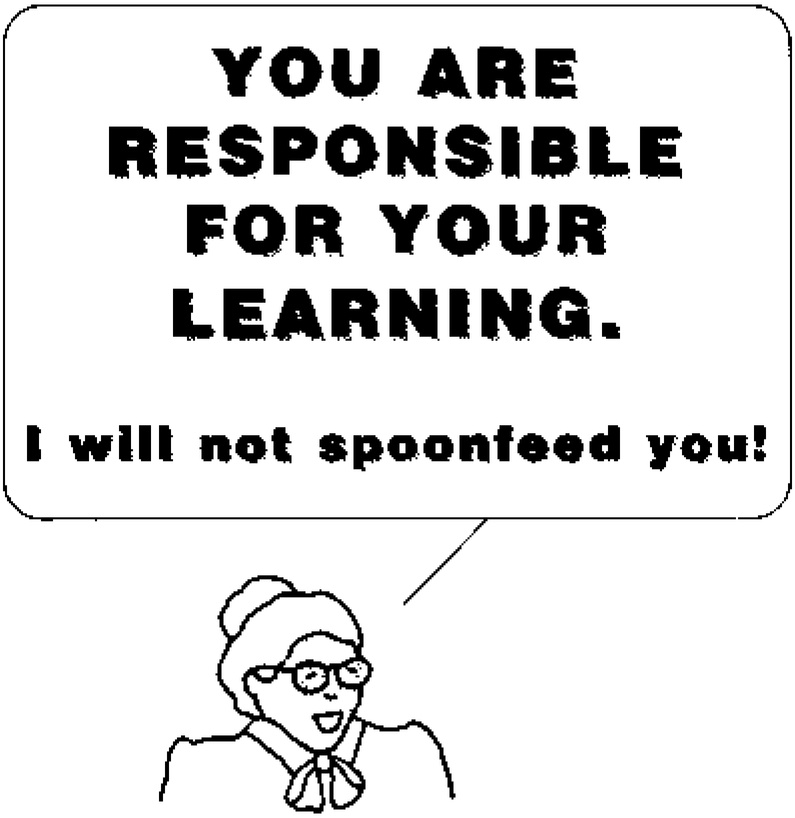
Due to academe postures, it is presently impossible to introduce many of these things at most higher educational institutions. Nevertheless, we can introduce some through A/I instruction. We talked about this change in the teacher/student role in the introductory chapters. Let's focus on it again.

The instructor becomes a

• facilitator,	• motivator,
• counselor,	• information specialist,
• humanist,	• attitude adjuster, and
• director,	• personal tutor.

This is an **important** concept in the evolution of information transfer because of the shift in

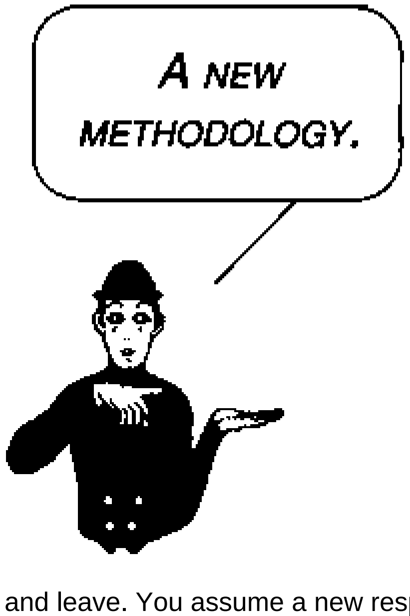
- responsibility and
- role.



The A/I program may teach content (cognitive information), but what about the humanistic aspects of learning in the affective (emotions) domain?

Interline

The teacher's new role in A/I includes the responsibility of an interline agent. That is, the instructor fills in between the lines of information in the A/I program.



You don't create the program and leave. You assume a new responsibility that focuses on the emotional and problem-solving areas. You are a new type of instructor involved in human/group dynamics.

Interline example

You have a class of 30 people to lecture to on Monday, Wednesday, and Friday for 50 minutes. You

1. Create A/I for your course.

2. Divide the group of 30 into 3 groups of 10. Group 1 meets Monday, Group 2 meets Wednesday, Group 3 meets Friday.

3. Assign them a specific block of information modules 1-3.

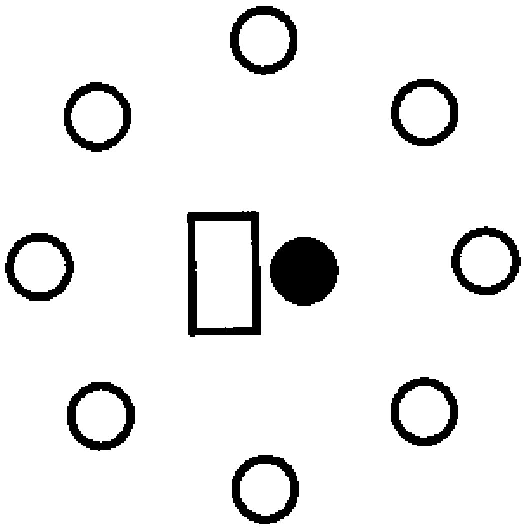
4. Then they will attend class only 1 time a week but will have studied and be ready to use the information from modules 1-3 when they meet.

5. At the class, you have a group of 10 people, all of whom know common information.

6. You have 50 minutes.

7. Now it's up to you to create a problem-solving experience for them which uses and reinforces that information affectively.

8. Question, discuss, demonstrate, encourage, problem-solve, or tell stories to affect attitudes about the subject matter. Play that group like a fine-tuned instrument but make them **use** that information in some type of **active** process. Interline; fill in the lines of the content information with experiential exercises. It's a new and challenging role!



It demands that you assume a new creative role in two respects:

- You create the A/I courseware.

- You create new hands-and-heads activities that work and emphasize in a new domain-that of problem-solving. That's ultimately what learning is about-giving people information to solve personal and societal problems.

Feedback exercise

- Discuss the new role of A/I and andragogy in instruction and information transfer.

Answers to feedback exercise

A/I and andragogy -

• Create A/I programs to teach content.
• Shift responsibility for learning content to the student.
• Teacher becomes a

- facilitator,
- motivator,
- counselor,
- humanist,
- director,
- information specialist,
- attitude adjuster, and
- personal tutor.

• Focus instruction on problem-solving and learning attitudes about content information.

If you're not interested in learning theory or additional ways in which A/I works, go on to Chapter 6. Have fun! If you would like to delve into some of the latest concepts of educational theory and learning frontiers, read the next chapter.

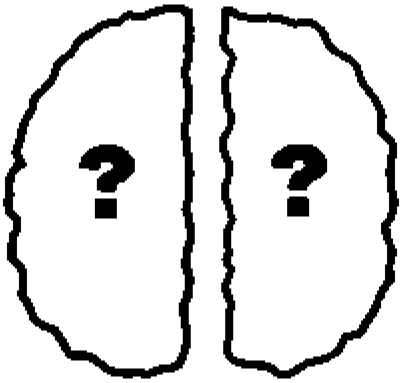
CHAPTER 4. Memory and Whole Brain Learning

Space exploration, gene-splicing, communication information processing, and the functions of the human brain are some of today's most important frontiers.

You may need the information in this chapter to explain A/I to your colleagues or to convince some of them who are hesitant about A/I techniques.

Objectives



At the end of this chapter, you will be able to

- Evaluate the complexity of brain function and memory storage in learning.
- Compare the functions of the brain hemispheres in learning and behavior.
- Interpret the importance of the limbic system in learning and behavior.
- Discuss the quadrispheres' functions in whole brain learning.
- Relate the importance of the hippocampus and amygdala in retaining memory.
- Recall and describe the interrelationships of the 3 types of memory.
- List and discuss 3 additional concepts related to memory storage and recall:
    - chunking
    - subsumers
    - concept mapping

The human brain: center of learning and memory

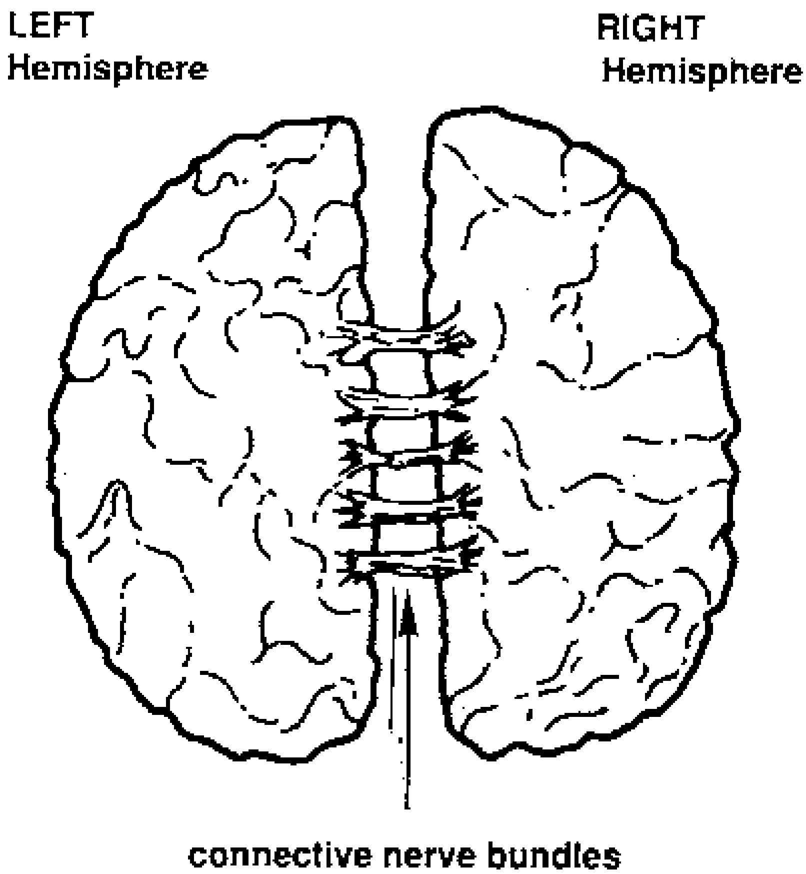
Recently, there has been a flood of research associated with brain anatomy, organization, chemistry, memory, and learning.

There is still much that is mysterious about this 1.3-kilogram structure that makes us each unique human beings.

However, recent research has revealed more about how our brain functions as we learn.

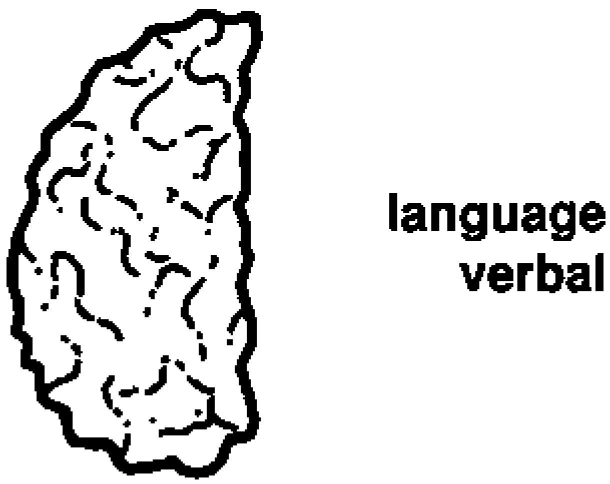
To most people, the word "brain" involves an image of a single, wrinkled structure enclosed in a protective bony skull. Actually, the brain is not single but has two halves or hemispheres.

These hemispheres communicate with each other by several distinct bundles of nerve fibers.



THE BRAIN HEMISPHERES

The left brain

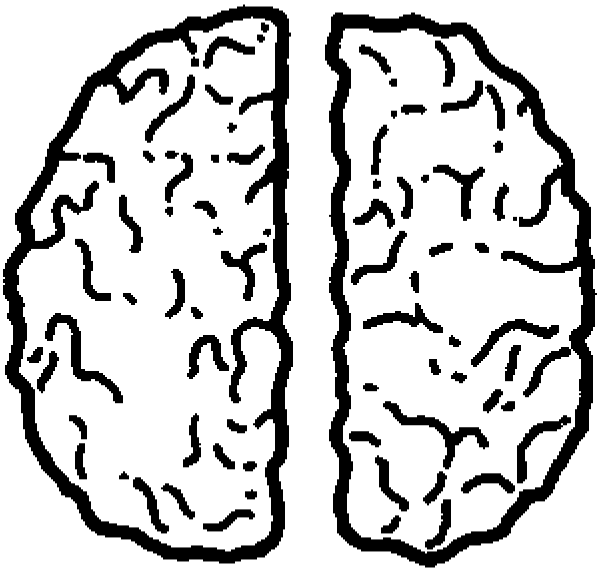


LEFT BRAIN

In the 1930s, Wilder Penfield and his colleagues at Montreal Neurological Institute in Canada used electrical stimulation to map areas of the brain that controlled speech and language. Subsequent research has shown that the left hemisphere controls words and language.

He also pioneered research on how the brain stores memories (more on this later), although some scientists disagree with his interpretations. Other researchers found that the left brain had enlarged areas and was dominant.

The split brain



dependent
independent

SPLIT BRAIN

In the 1940s, a New York neurosurgeon, William van Wagenen, cut the fibers between the two brain hemispheres of patients, splitting them apart in an effort to cure uncontrollable epilepsy. In some cases, it cured the epilepsy and there was little change in the everyday activity of the patients.

Later research by Rodger Sperry, Eran Zaidel, and others shows that each hemisphere functions somewhat independently. However, they work together when using learning, memory, and survival skills.

The right brain

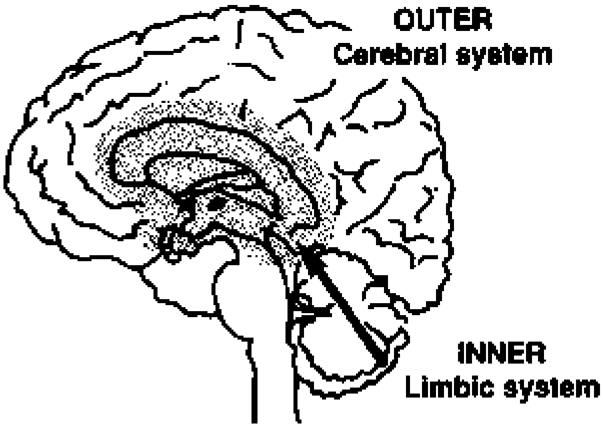
spatial
nonverbal

RIGHT BRAIN

Further investigations by this group and others discovered that while the left brain processes verbal language, the right brain deals with visual and nonverbal information. That is, each hemisphere is specialized. Some researchers now say that because our technological society concentrates on verbal skills and analytical thought processes, the right brain is relatively dormant. They say we should find ways to free its dormant power for learning and problem-solving.

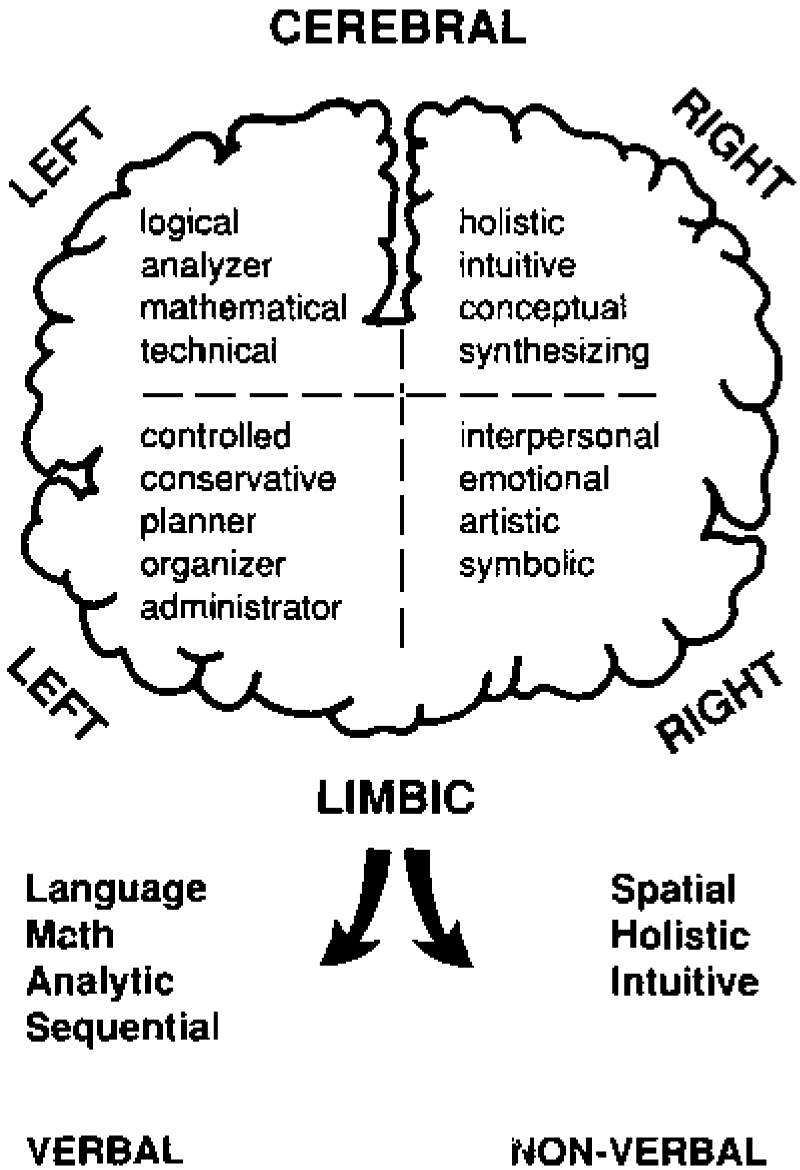
The whole brain

As research progresses, it shows that brain function on any level is an intricate process without simple answers. However, scientists continue to study what they call whole brain teaching and learning.



BRAIN, SIDE VIEW

In this concept, the brain not only has a left and a right hemisphere but an inner and outer brain as well. Each hemisphere has an upper outer cerebral area and an inner limbic system. In each of these 4 parts, division of labor exists among the specialized areas that process and deal with different types of information. Thus, a brain profile map of areas and functions would look like this:



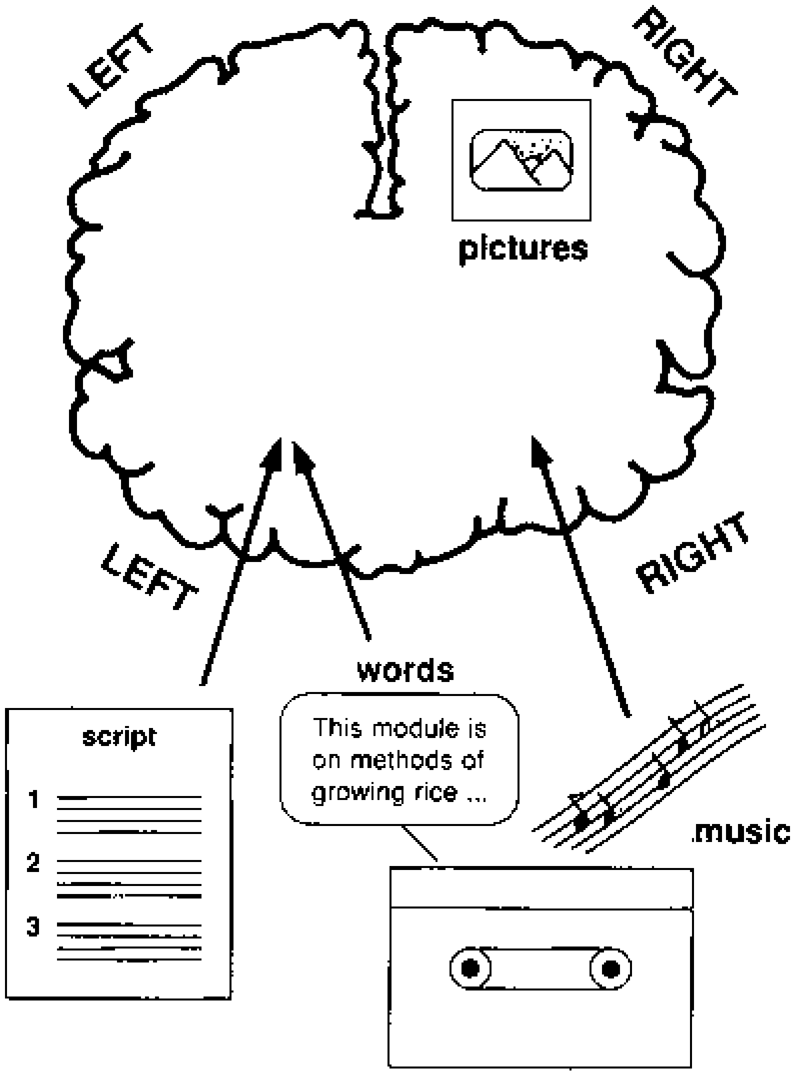
CEREBRAL

About now, you're probably asking what all this information has to do with creating A/I programs.

The brain and A/I programs

All this explains **why** slide-tape (A/I) programs are powerful tools in the learning process. The left brain processes the words on the tape and slides; the right brain interprets the pictures on the slides and associates the music and pictures on the tape, thus reinforcing learning by use of both.

Two other reasons why A/I works are memory and operant conditioning (as explained in Chapter 2).



Memory

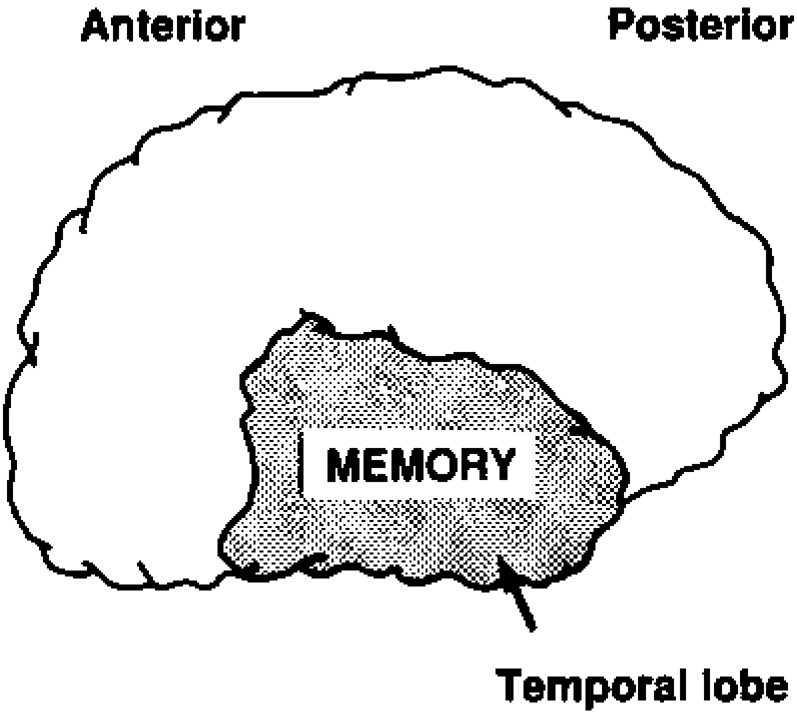
Today's research supports the hypothesis that memory actually makes physical changes in the brain. Some scientists contend that memory storage is linked to RNA encoding. Memory research continues in three important areas which help us understand learning.

Where it's stored

When Wilder Penfield, our neurosurgeon of brain mapping, applied electro-stimulation to the side or **temporal lobes** of the brain cortex, his subjects would not only remember past experiences but would "relive" them in a multisensual mode. They could smell, hear, see, or feel the things that surrounded them as if reliving the experience.

This and other research led us to discover where the memory storage centers are located in the brain, and that it is in an intricate sensory package.

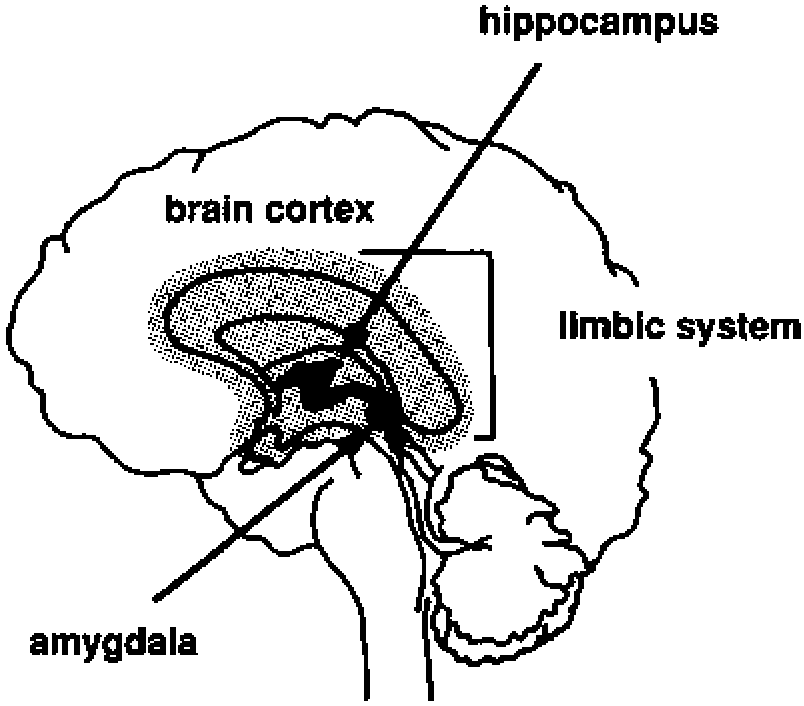
Further research on memory has indicated that perhaps storage is related to pictures, and recall is dependent on a pictorial memory file (idetic recall).



Memory gatekeepers

In 1953, neurosurgeons removed part of the limbic system (internal brain), including the **hippocampus,** from a young man, again in an attempt to cure epilepsy. This cured the disease, but he was then unable to remember or form a single lasting memory from the day of his operation.

Later research revealed that the hippocampus and another organ, the **amygdala** of the limbic system, are connected and both act as gatekeepers or central processing units for memory storage. Through some biochemical mechanism, memory passes from the sense organs through the limbic system and finally into the temporal cortex for permanent storage. The hippocampus acts as a screen for memory storage and the amygdala acts as the attitudinal screen.

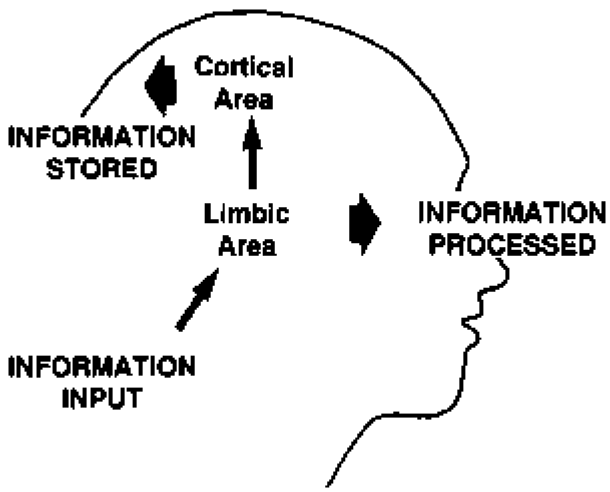


Memory: ***Summary I***

The hippocampus of the limbic system, in the inner brain, is the gateway to memory storage.

The amygdala of the limbic system indexes information with emotional and attitudinal codes such as joy, grief, fear, positive, and negative.

Attitudes are important to the learning process. Depending on the subject, 30% or more of lecture time treats the attitude or emotions about the subject material. In fact, the first 3 chapters of this guide do just that - help you form attitudes about A/I slide-tape modules.



Information inputted from the 5 senses is processed in the limbic area and stored in the cortical area of the brain.

Types of memory

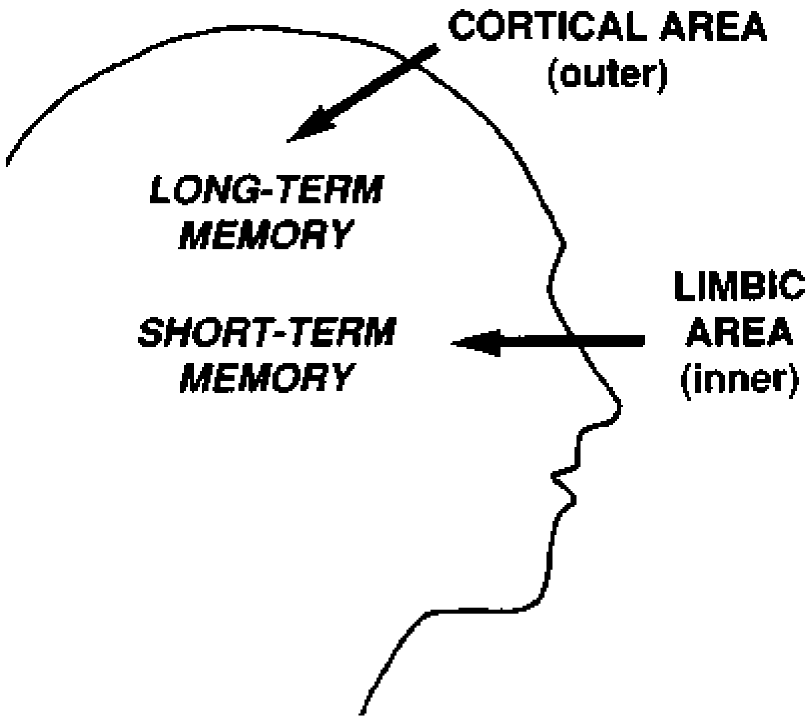
There are three types of memory that have been identified:

• ***Sensory memory****.* Of course, we could store no memory without input from the 5 senses. When stimulated, the senses evoke a response called **sensory memory** that usually lasts about 1 second before fading.

Briefly look at the words in the box below. Now close your eyes and watch the words and outline disappear. This is an example of sensory memory.

SENSORY MEMORY

• ***Short-term memory****.* The second type of memory is called short-term, or working memory. It lasts from 1 to 30 seconds. Short-term memory is limbic in origin.



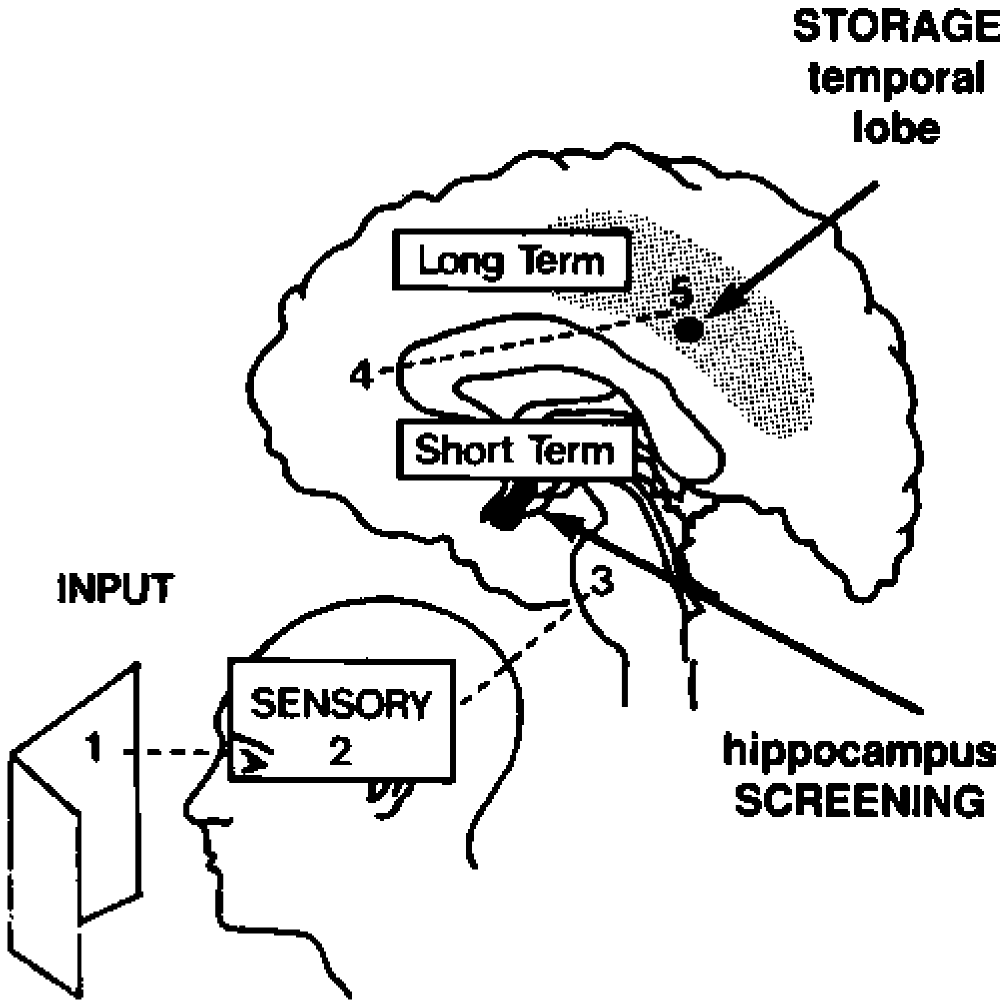
Short-term memory is stored in the limbic area in the inner brain.

• ***Long-term memory****.* And finally, there is long-term memory where we store knowledge from minutes to a lifetime. Long-term memory is stored in the temporal lobes of the cortex.

Storage sequence

Another recent finding, important to the learning process, shows that we store knowledge in a certain sequence. Knowledge first goes through the senses into the short-term memory. Then, it passes through short-term memory, and the limbic system (hippocampus) sifts it before the temporal lobe stores it as long-term memory.

Thus, the hippocampus and its associated short-term memory are gatekeepers to long-term memory storage.



YOUR A/I PROGRAM

Memory: ***Summary II***

Memory Sequence	
	Duration
Long-term memory	**minute to life**
Hippocampus **Short-term memory**	**gate** **1-30 sec**
Sensory memory	**1 sec**

Chunking, subsumers, and concept maps

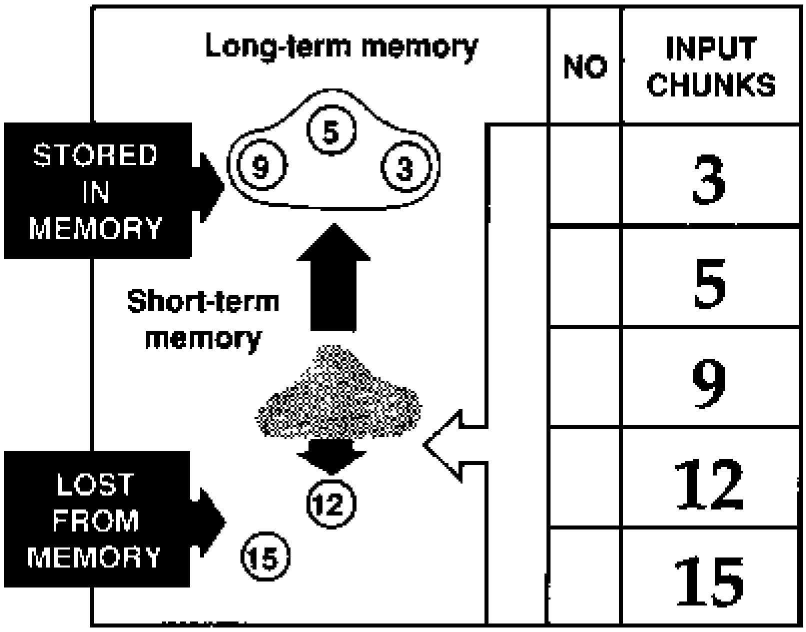
Associated with memory storage are three additional discoveries that help us understand how memory and recall work.

Chunking

One discovery is that during processing, information must be broken down into **chunks** or memory units. Of course, the units depend on our past learning and cultural experience.

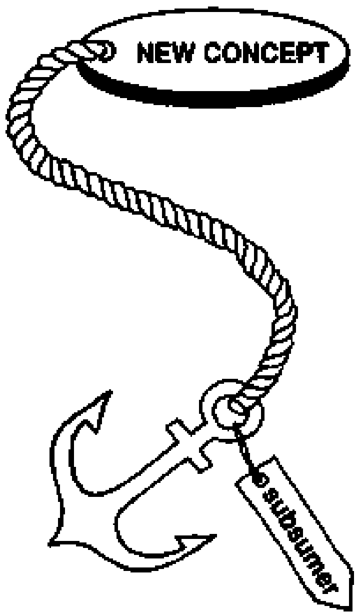
7 ± 2

Chunks are the capability of an individual to process information in the short-term memory at any one time. The 7 ± 2 rule states that the range of information bits that can be held in short-term memory at any one time is 5-9, or 7 ± 2. Therefore, most people can only process 5-9 chunks of information in their short-term memory at a time. Due to their different exposures, individuals vary in chunk size and speed by which they can deal with information, and therefore in their ability to process such information.

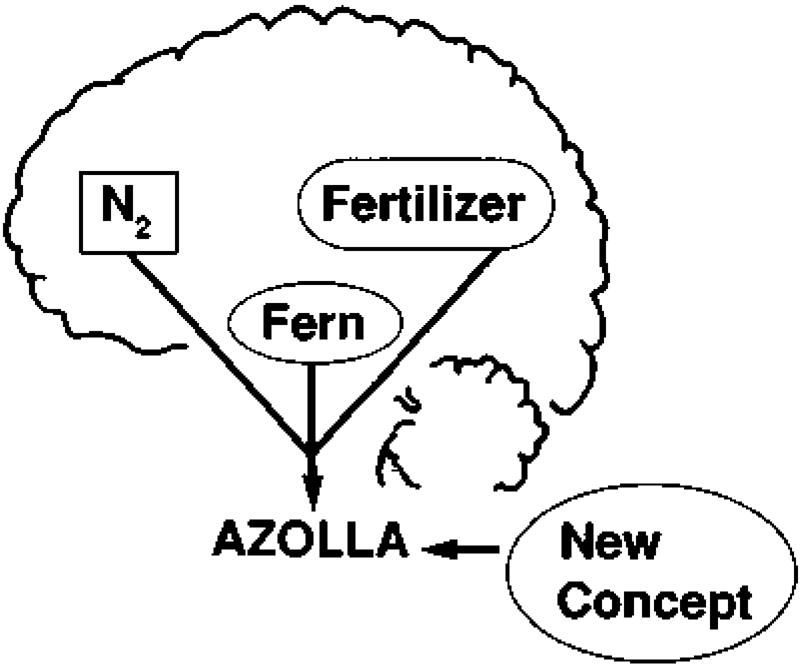


Let's say we want to help a learner store long-term information for problem-solving. Long-term storage must go through short-term storage, and short-term storage can only cope with 5-9 chunks of information. Thus, we must give the learner only 5-9 chunks of information at a time. Application of the *7 ±2* rule in information exposure would help learners input information for long-term storage. The principle is to use small organized steps to aid learning.

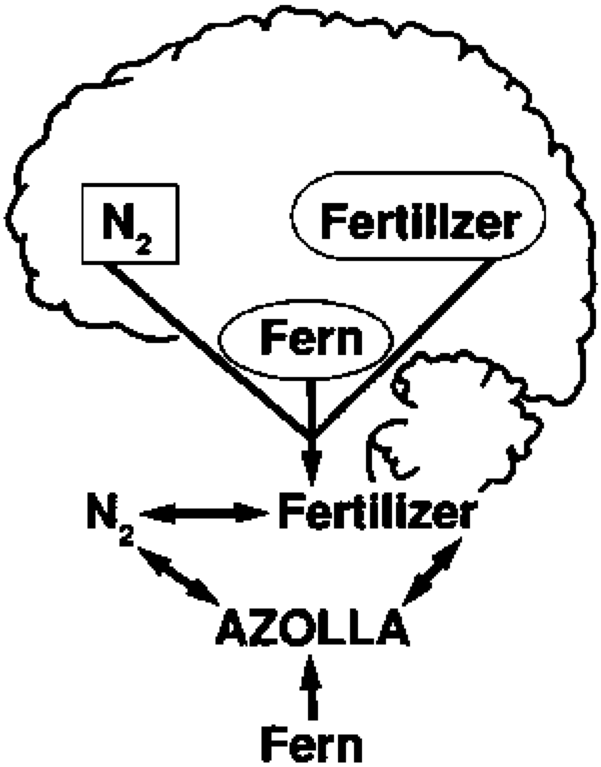
Subsumers



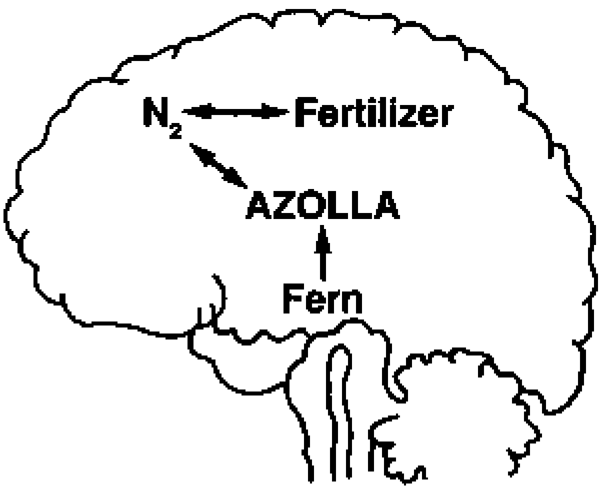
Research shows that we can learn and store new concepts more efficiently if we can link them with some already stored **previous concept** or **subsumer.** Our role as teacher and creator of instructional materials is to find common subsumers stored in students' minds and use them to lead students into new concepts.



Step 1. Find common existing concept (subsumer).



Step 2. Associate new concept with subsumer.



Step 3. Design a learning task to help link new concepts to existing subsumers.

The first step, getting the teacher and the learner to agree on the existing concept, is often difficult. It depends on the learner's prior exposure to the concept. Feedback is essential here to determine these levels of exposure to create relevant learning experiences that relate to stored subsumer menus or maps.

The dialogue or interview is useful in determining subsumers because it is faster than written exams and has more feedback opportunities.

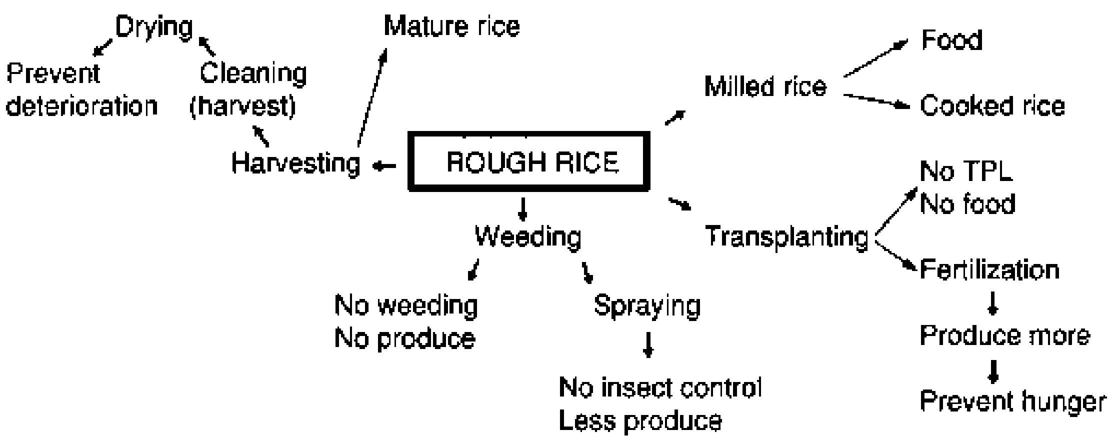
Communication through the written/reading channel is more difficult but is easier if you use verbal words and nonverbal pictures. Left brain = words. Right brain = picture.

Concept maps

Learning research has given us another helpful instrument to assess the level and associations of a learner's concepts. It is called a **concept map.**

Concept maps and their subsumers can help determine the appropriate information level for creating learning materials. They are also valuable to create and measure instruction.

We asked a farmer to draw his concept map of the word "rice." Notice the associations or subsumers.



RICE: A CONCEPT MAP

Memory: ***Summary III***

AIDS TO LEARNING		
Chunk	**=**	**meaningful unit**
		7 + 2
		short-term memory
Subsumer	**=**	**association anchor**
Concept map	**=**	**method of assessing subsumers**

Feedback exercise

• Usually, the left brain performs _____________ functions while the right brain is _____________ oriented.

• Match the terms with the brain hemisphere function.

Function	Hemisphere
_____ intuitive	A. left
_____ sequential	B. right
_____ mathematical	
_____ holistic	
_____ analytical	

• Match these terms with the limbic hemisphere function.

_____ emotion	L. left
_____ organization	R. right
_____ conservative	
_____ artistic	
_____ interpersonal	

• In which brain lobe is memory actually stored?

____

• List and describe the importance of the two brain organs of the limbic system.

HINT: One starts with an A and looks like an almond. In fact, the word means almond-like. The other's prefix is similar to an animal.

1. ___________________ , _______________
____
2. ___________________ , _______________
____

• List in sequence and relate the time duration of three types of memory.

Memory sequence Type Time
1. ___________________________________
2. ___________________________________
3. ___________________________________

• Look at the last objective on page 57 of this chapter. What two memory devices are included in this chapter?

______________ , _____________

• List and discuss an additional device to assist in preparing learning resources.

____

Answers to feedback exercise

• Speech - verbal, visual

• A, A, A, B, A

• R, L, L, R, R

• Temporal

• amygdala - emotion, attitudes hippocampus - memory screen

• Sensory, 1 second
short-term, 1 second to 1 minute
long-term, 1 minute to lifetime

• Chunking, subsumers

• Concept map - map of subsumer relationships stored in memory.

CHAPTER 5. Learning Styles

Objective

After reading this chapter, you will be able to

• Explain the different ways by which people learn and classify the different types of learners and learning strategies.

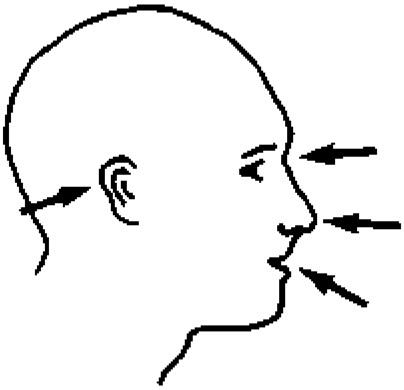
How people learn

People learn differently.

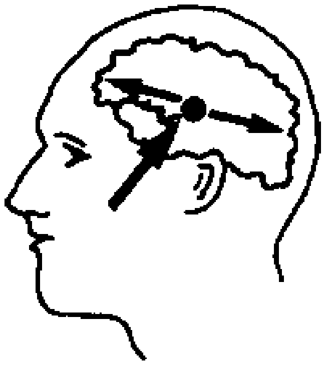
In an approach to a new learning strategy such as self-learning, we would be remiss if we did not relate it to learning/teaching styles.

Researchers from varied disciplines have identified four basic personalities in relation to learning. One researcher, Dr. David Kolb, found that some people learn by **doing,** others by **sensing and feeling,** some by **watching,** and some by **thinking.** Now, of course, a person does not rely on one of these ways all the time but shows a preference for one over the others.

Kolb found two basic variables in the learning preferences of people:



perception

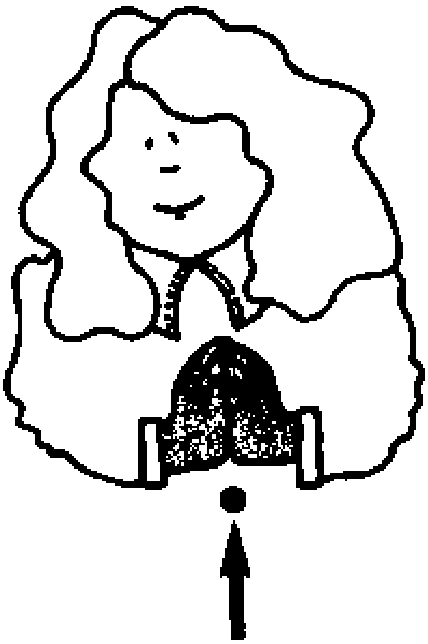


process

That is, people **perceive** in a continuum between concrete and abstract points.

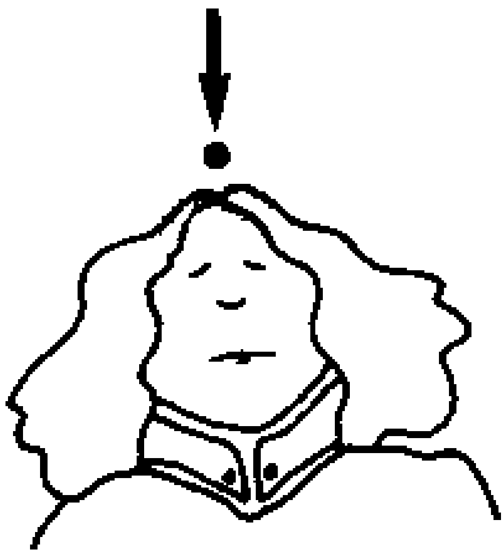
concrete	
↕	**perception** **perception** **perception** **perception** **perception**
abstract	

Those at the concrete end of the spectrum **sense** and **feel** their way. They are called sensers/feelers.



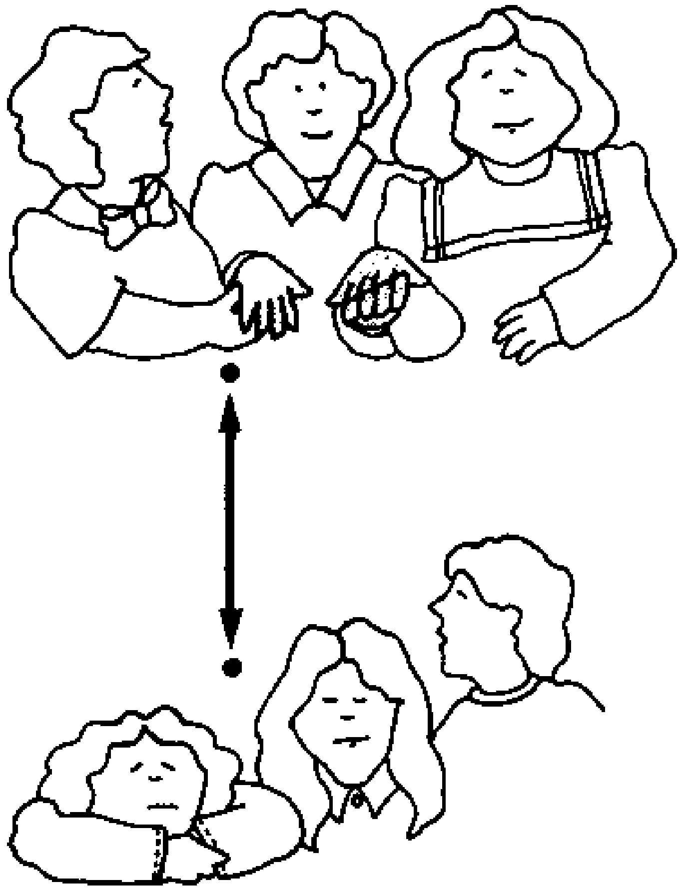
concrete = sensers/feelers

Others at the abstract end would rather think than feel.



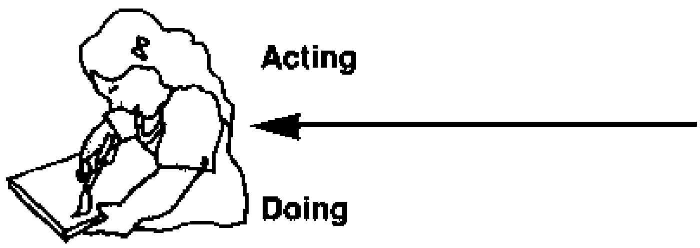
abstract = thinkers

Hence, the continuum-concrete = sensers / feelers

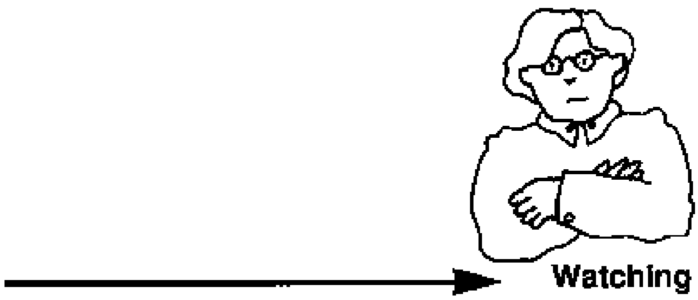


abstract = thinkers

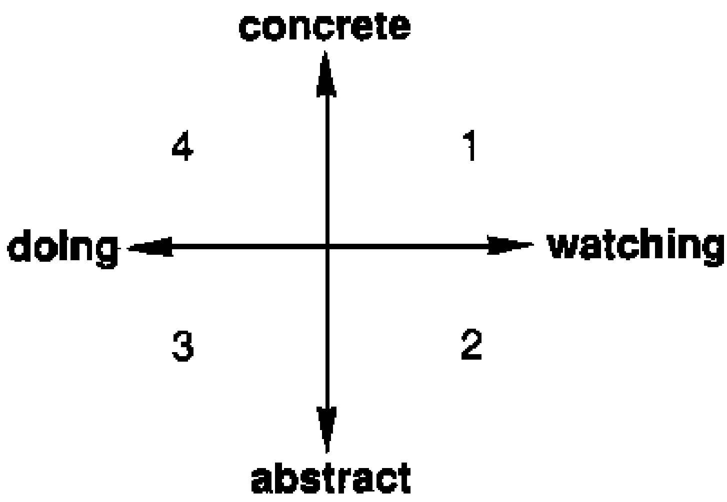
As for **processing** information there is, again, a continuum between those who like to **act** or **do**,



and those who would rather watch.

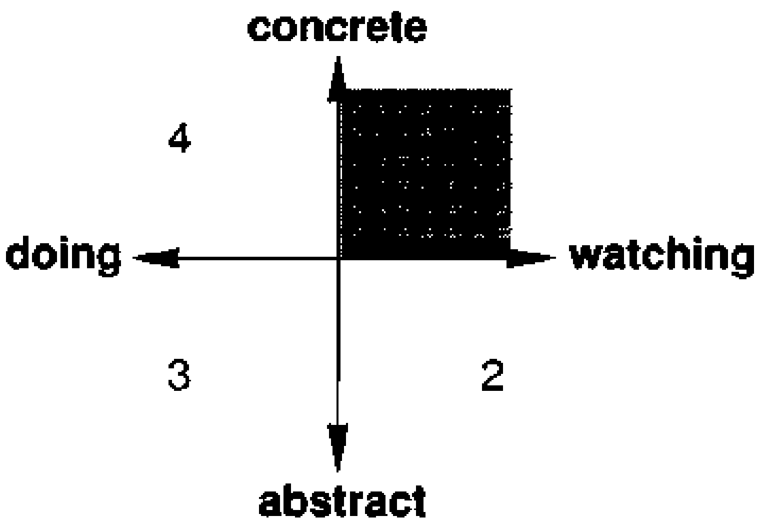


By coordinating these preferable perception and processing variables, educational researchers have identified 4 learning styles:



Learner personality types

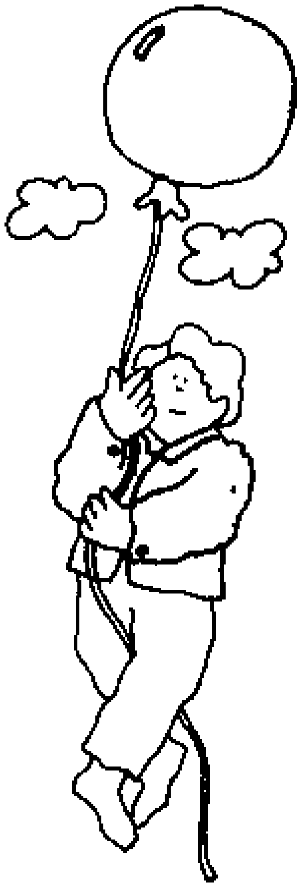
Another learning style researcher, Dr. Bernice McCarthy, has labeled the 4 types of learners. Type 1 learners are *innovative learners.*



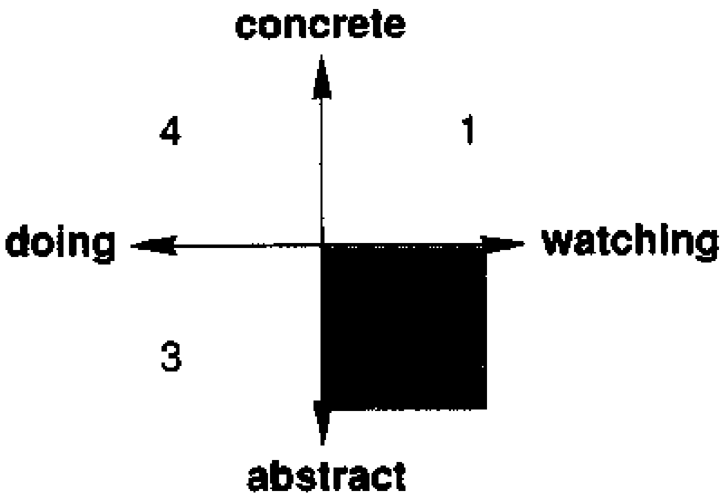
Type 1 Innovative Learners

Some brief descriptors of Type 1 learners are:

- Perceive concretely, process reflectively
- Social interactor
- Feeling
- Innovative
- Learn by listening
- Divergent thinkers



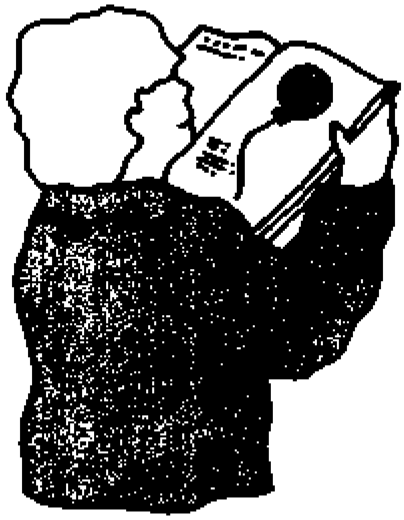
By comparison, Type 2 learners are called *analytic learners.*



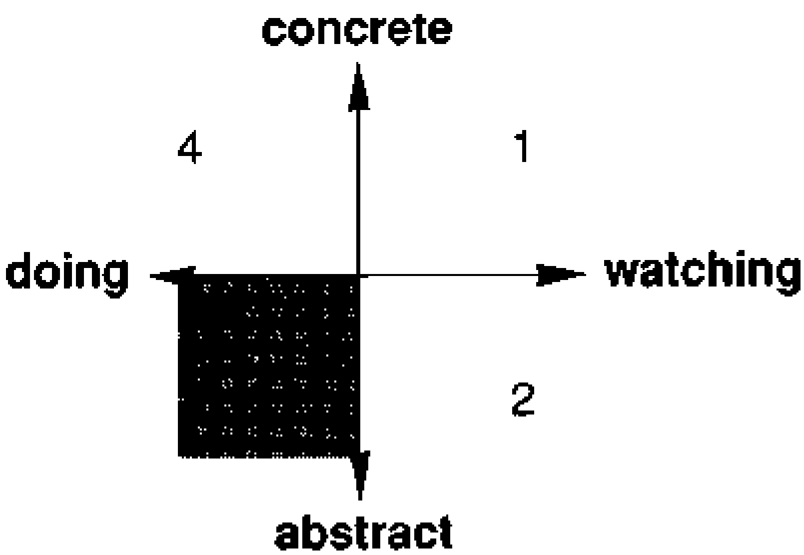
Type 2 Analytic Learners

The descriptors of Type 2 learners are:

- Perceive abstractly, process reflectively
- Consider what the expert thinks
- Idea-oriented
- Data collectors
- Seek sequential information
- Intellectuals



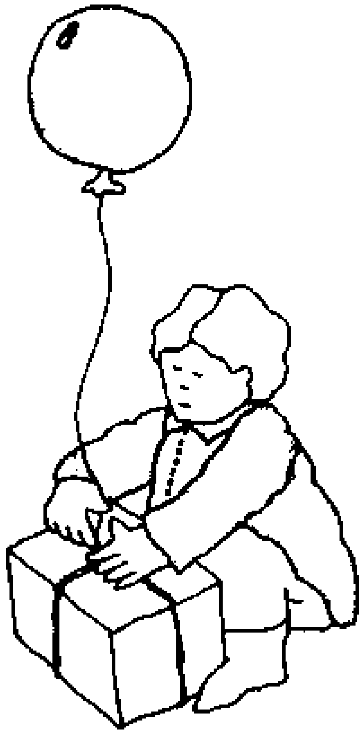
Those who prefer the third type of learning style are called *common sense learners.*



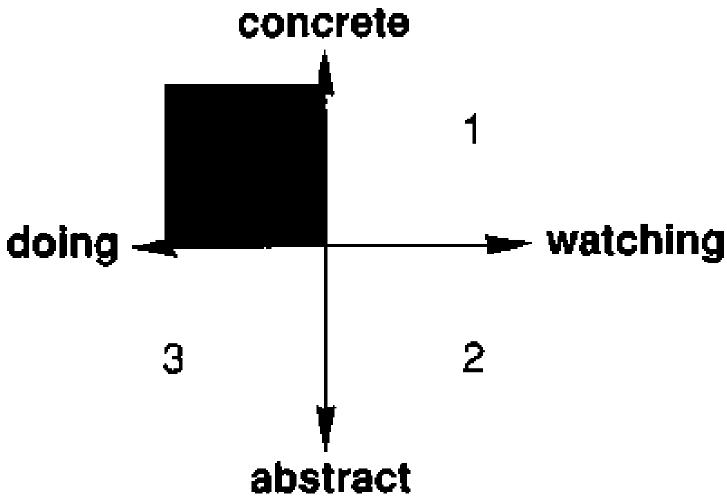
Type 3 Common Sense Learners

They can be described as:

- Perceiving abstractly, processing actively
- Practical
- Hands on
- Reality-oriented
- Problem solvers
- Interested in application/making things work



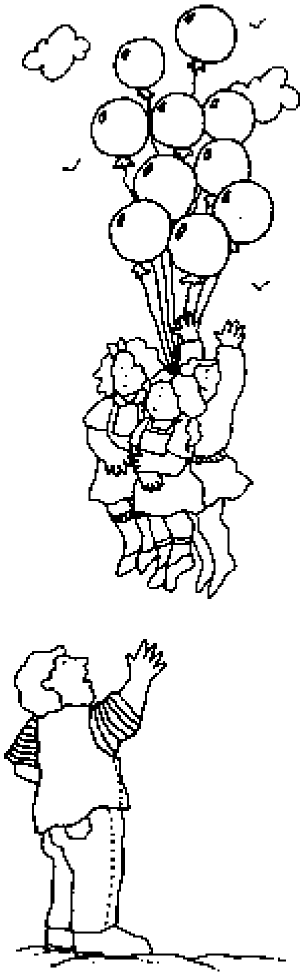
Type 4 learners are called *dynamic learners.*



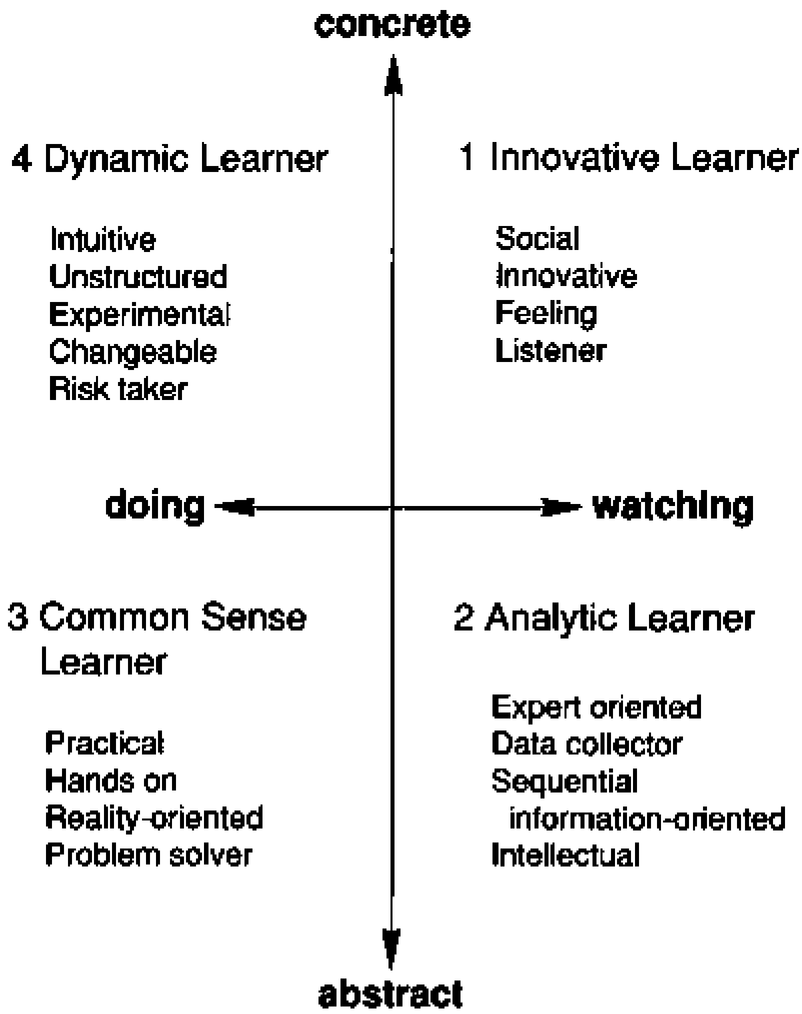
Type 4 Dynamic Learners

They are characterized as:

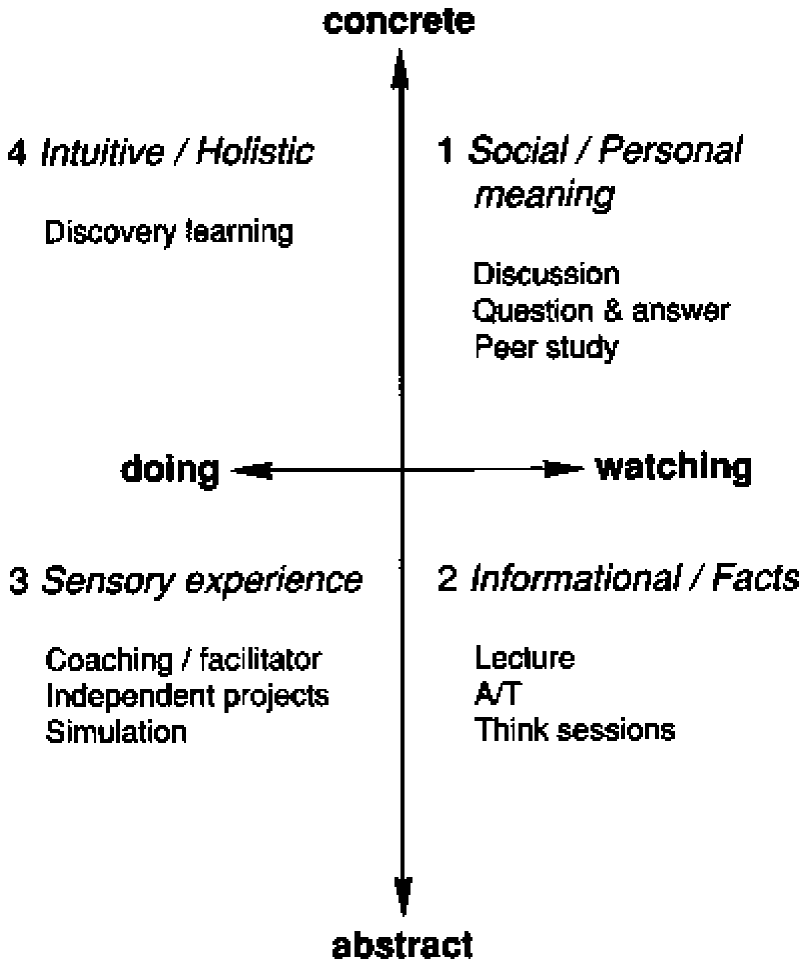
- Perceiving concretely, processing actively
- Intuitive
- Unstructured
- Experimental
- Changeable
- Risk takers



So in summary, there are 4 learning styles and each is related to a variable personality type in a training population.



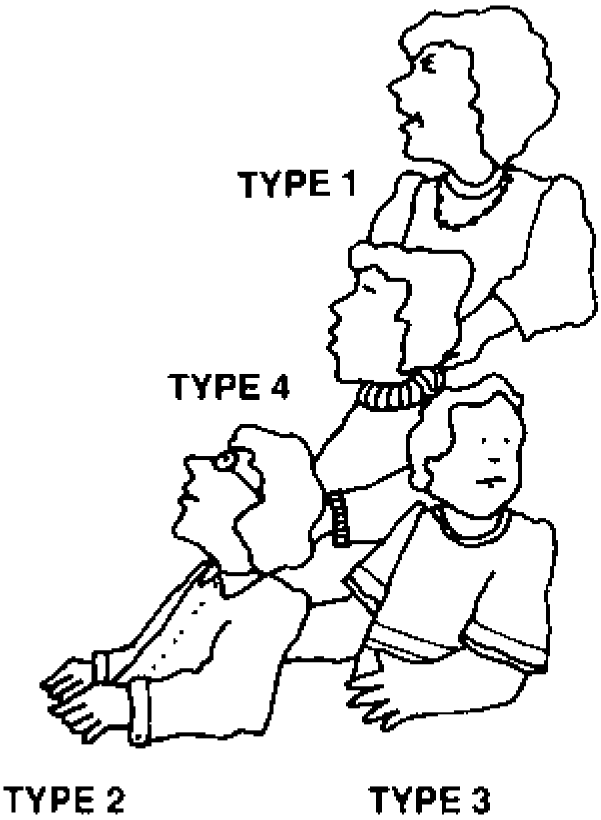
If these 4 learning styles emerge from inborn natural tendencies associated with the senses, what are the teaching styles that serve to communicate with these learning styles?



Again McCarthy's research has shown that most training is directed at a **Type 2** learning style which addresses information, facts and concepts, but that only 28-30% of the population learn best in Style 2. So 70% of the learners could learn more efficiently if taught with teaching styles other than No. 2.

Yet, facts and concepts - cognitive information - are extremely important to communicate in the scientific disciplines.

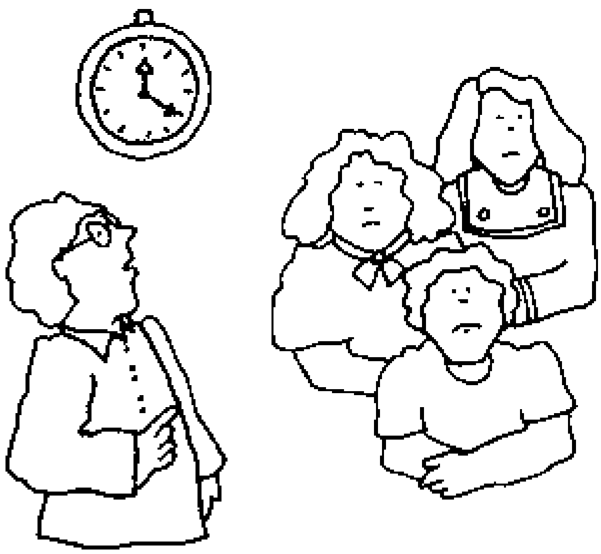
- **INFORMATION**
- **FACTS**
- **CONCEPTS**



If traditional training is focused on Teaching Style 2 of which the **lecture** predominates, if traditional training is passive, what about

Projects
Problem solving
Creativity
Other learning styles

Often in traditional instruction, there is not enough time to *do,* to *apply* these important aspects of learning.



A strategy for Learning Style 2

Thus, one strategy is to create self-learning materials for Learning Style 2 (and eventually for all learning styles). By relegating cognitive information to a self-learning strategy, the educator is *free* from being a standup purveyor of facts, *free* to explore and create, *free* to develop learning strategies in the other learning styles - experiences that focus on problem solving. For, again, what use is knowledge if it can't be used to solve problems for the betterment of mankind?

PART II - A/I OR SELF-LEARNING MATERIALS: CREATION AND USE

CHAPTER 6. Performance/Instructional/Objectives

The learning domains

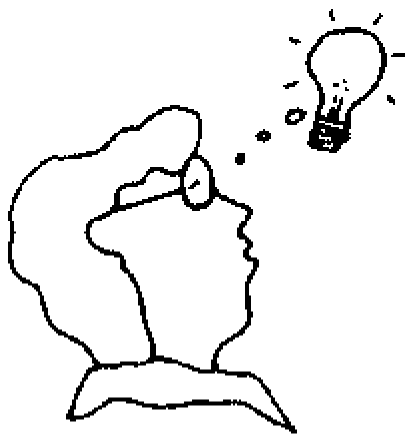
Remember, a principle of learning is that repetition aids retention. That's one reason for the objective and feedback exercises in A/I. Now that you have the A/I definition in mind, let's explore the areas of learning.

If you skipped the first two chapters, please go back in Chapter 2 and *review* the 8 parts of a module. While you're in this chapter, it's even more important to *learn* our working definition of A/I including the 8 concepts.

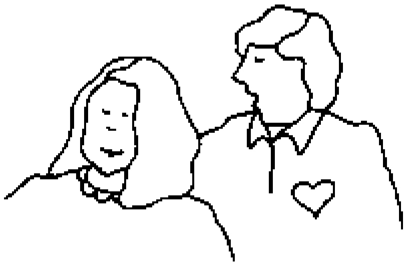
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention
Repetition aids retention

For our purposes, we can classify all learning materials into three areas called **learning domains.**

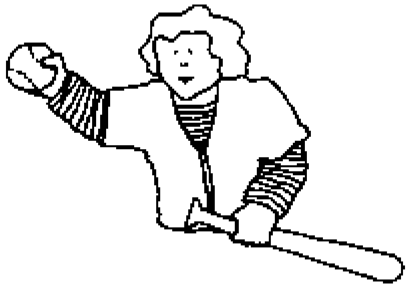
1. Cognitive means knowledge or mental ability.



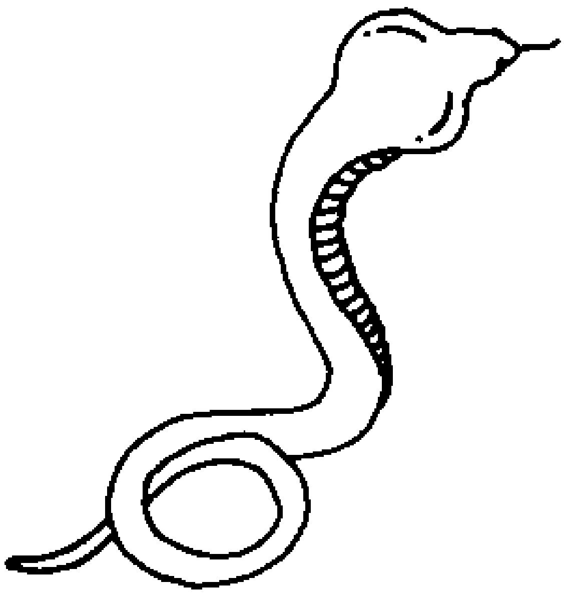
2. **Affective** means attitudes or emotional commitment.



3. **Psychomotor** means skills or physical ability.



Exercise 1



Here are some examples of information. Can you classify them into their respective domains?

A. In the yoga position, the serpent rests in the human body at the base of the spine. Positioned with its head up, it slithers up the spine and passes the third eye in the forehead and comes to rest in the person's head.

B. When killing a poisonous snake, be sure to stay at least the distance of the snake's body length away. With a strong implement, strike it on the back of the head.

C. Cobras are especially bad snakes.

The first example, A, is **cognitive,** providing information about the thought processes associated with yoga. It also describes the location of the third eye which eastern cultures associate with intelligence.

The second, B, explains skills involved in killing a snake and is, therefore, **psychomotor.**

And the third, C, relates an attitude **(affective)** information about cobras. Someone who makes a livelihood with performing cobras might have a different attitude!

We purposely used the emotion-laden subjects of religion and snakes as well as the word "slithers" to challenge your ability. Did you do well on the exercise? We'll return to learning domains a little later in this chapter.

First, we must write performance objectives. Even Skinner's rats and pigeons had a goal. We call these goals **performance objectives.**

Performance objectives

Performance objectives are tools to explain the material you want to teach. They simply tell what the instructor wants the student to learn.

Preamble

There are 4 major parts of an objective. We call the first part the preamble. These are the words at the beginning of the objective that set the stage for the action to follow. For example, "At the end of this module, you will be able to..." is a preamble to the expectations you have of your students.

> *Note:* Each learning domain has its own verbs. This manual contains information on writing objectives in the cognitive domain because it is the major domain in which the self-learning process is successful.

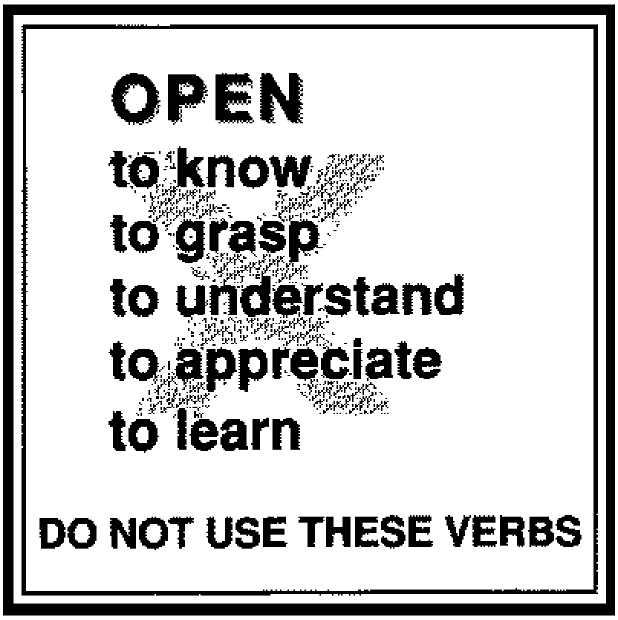
Verb

The second part of an objective is the verb. The verb tells students precisely what you want them to do. Let's use the preamble from our first example and then add a verb. At the end of this module, you will be able to "write..."

Open vs closed verbs*.* When selecting verbs to use in writing objectives, remember that there are two kinds: **open** and **closed.**

Open verbs are open to different interpretations by different people. Because they are confusing, do not use them. For example, "to appreciate the plight of the subsistence farmer..." means many different things and is open to discussion.

Closed verbs are specific and convey common meanings to people. They close the door on misinterpretation. Here is a partial list of closed verbs grouped in categories. You can use this list to write objectives in the cognitive domain. As you design your courseware, you may want to refer to page 101 often.



A verb list for stating cognitive objectives.

(Classification based on Bloom's taxonomy of educational objectives - cognitive domain).

Knowledge	***Comprehension***	***Application***
define	translate	interpret
repeat	restate	apply
record	discuss	employ
list	describe	use
recall	recognize	demonstrate
name	explain	dramatize
relate	express	practice
underline	identify	illustrate
	locate	operate
	report	schedule
	review	shop
	tell	sketch
Analysis	***Synthesis***	***Evaluation***
distinguish	compose	judge
analyze	plan	appraise
differentiate	propose	evaluate
appraise	design	rate
calculate	formulate	compare
experiment	arrange	value
test	assemble	revise
compare	collect	score
contrast	construct	select
criticize	create	choose
diagram	setup	assess
inspect	organize	estimate
debate	manage	measure
inventory	prepare	
question		
relate		
solve		
examine		
categorize		

Object

The third part of an objective is the **object.** Let's continue with the same example using the preamble, the verb, and then the object. "At the end of this module, you will be able to write a **performance objective."** The object, a performance objective, is the object of the verb write. It clearly shows students what you want them to learn or do.

PREAMBLE	**The student will be able to**
VERB	**write**

PREAMBLE	**The student will be able to**
VERB	**write**
OBJECT	**a performance objective.**

Exercise 2

Now let's take a break from inputting information and practice.

1. Write two variations of a preamble.

Example: At the end of this chapter, you will be able to:

a. Preamble ___________________________
b. Preamble ___________________________

Look at the verb list for stating cognitive objectives for some ideas. Maybe you can think of a new one.

2. Now let's tie these preambles to verbs. Look at the list on page 101 and select different verbs to go with your preambles.

Example:

PREAMBLE At the end of this chapter, you will be able to
VERB write

a. preamble ___________________________
verb _____________

b. preamble ___________________________
verb _____________

3. Now connect the preamble and the verb with an object. Think of two objects or contents from your teaching experiences and place them with the preambles and verbs.

Example:

PREAMBLE At the end of this chapter, you will be able to
VERB write
OBJECT performance objectives.

a. preamble__________________________
verb _____________ object _____________.

b. preamble __________________________
verb _____________ object _____________.

Congratulations! You have just written two learning objectives which clearly show students what you expect them to do.

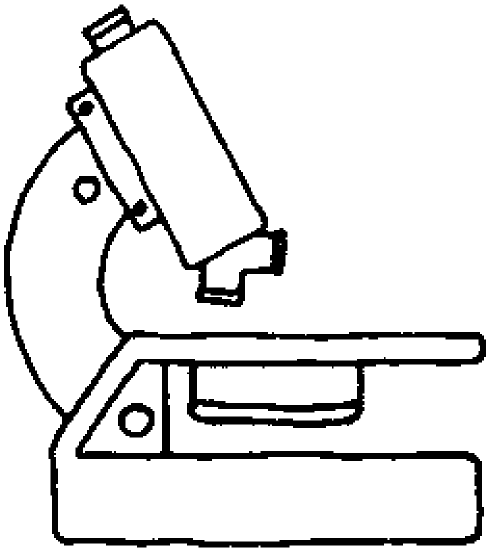
Qualifiers and quantifiers

We can be more exact about what we want students to do by adding explanatory words called **qualifiers** and **quantifiers.** They show restrictions, allowances, or givens.

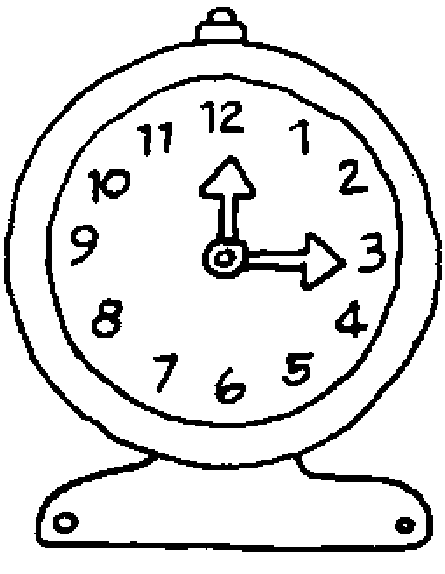
A. ***Qualifiers.*** You can put the **qualifiers** before or after the preamble, but be consistent in their use. In these examples, verbs are in italics and qualifiers are boldfaced.

1. At the end of this chapter you should be able to *identify* the 5 insects **without the aid of a microscope.**

2. When you finish reading this, you can *draw and label* the parts of the rice seed **with the aid of your microscope.**



3. In the next exercise, *answer* the 20 exam questions **in 15 minutes.**



B. ***Quantifiers****,* or numbers, make the directions more explicit and help your learners remember better. Note the numbers in the previous objectives: Identify 5 insects. Answer *20* exam questions.

NUMBERS
ARE EXPLICIT:
1, 2, 3 ...

Turn to Chapter 2, and study the objectives. Notice the explicit quantifiers. It is better to use numerals (1,2,3,...) rather than written numbers because they are easier to see in the text.

For example, there are 4 major steps in writing objectives:

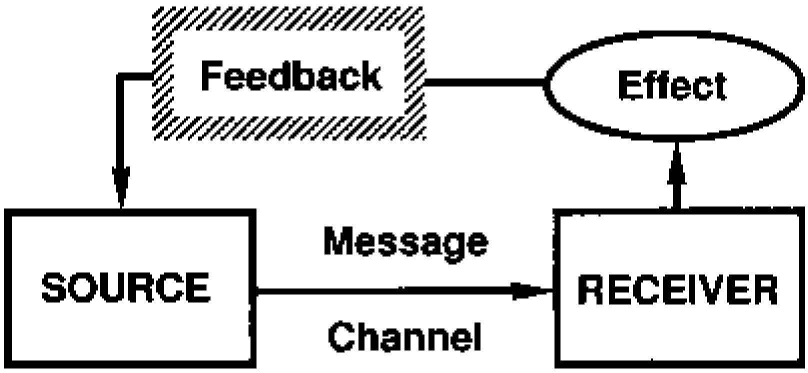
1. Select and write a preamble.
2. Select and write a verb.
3. Select and write an object.

   • Select and write a qualifier.
   • Select and write a quantifier. AND

4. Chunk. We'll study this one next.

Chunk

Another element that we can include in a learning objective is the chunk. The process of chunking is detailed in Chapter 4. Chunking is making a block or "chunk" of information that makes the objective even more explicit. It also provides immediate feedback. You place it underneath the objective.



For example:

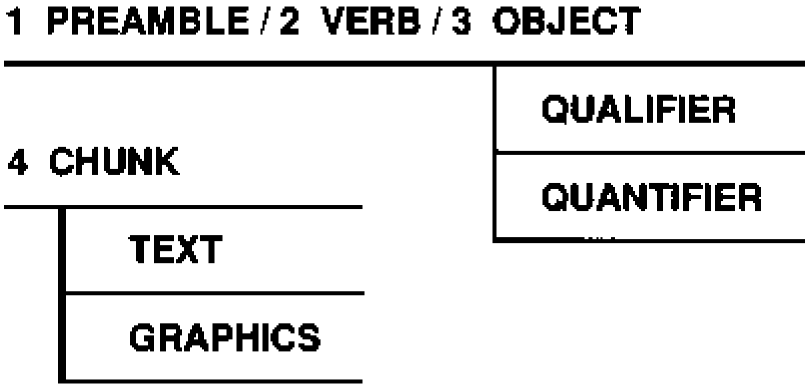
Objective - List the 4 major parts of a performance objective:
Chunk- 1. preamble
2. verb
3. object
4. chunk

Notice that the chunk

• is underneath the objective,
• gives a short answer to the objective,
• provides immediate feedback, and
• makes the objective explicit.

Try to include graphics, diagrams, or pictures in the chunk to help students remember the information.

For example, here's a diagram of the parts of an objective.

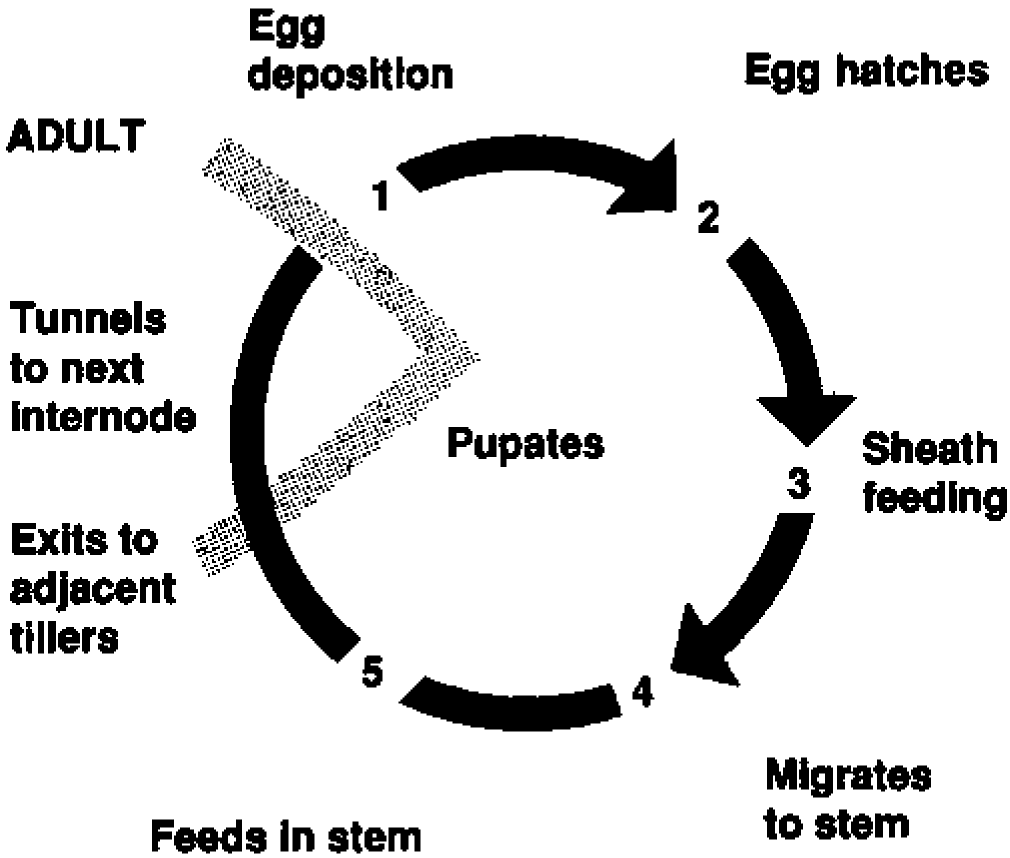


The objective would read, "The trainee will be able to list and relate the 4 primary parts and any subparts of a performance objective."

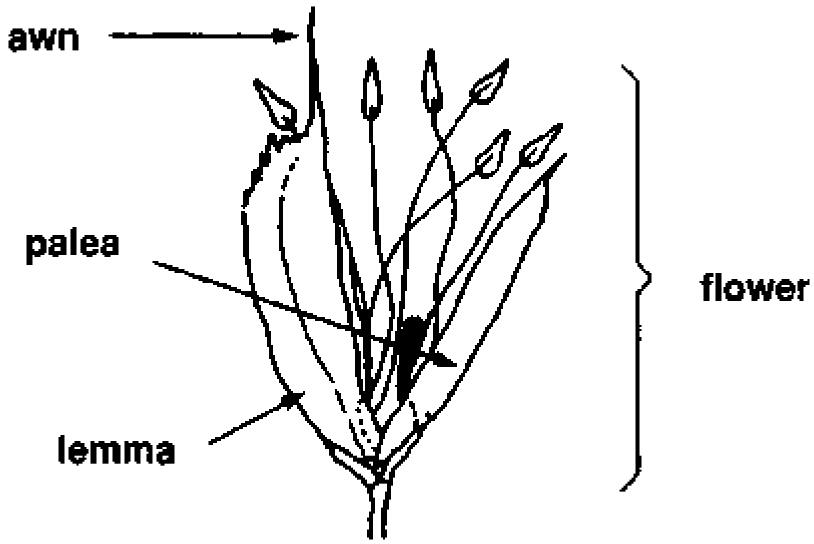
In the chunk, the positions of the words on the diagram help show the parts and their relationships with each other. The positions of the words are especially useful in showing relationships in statistical formulas, sentence diagrams, machinery parts, life cycles, morphology, and geography.

Here are two more examples:

Objective: Describe the life cycle of a rice stem borer.
Chunk:



Objective: Name the parts of the rice floret.
Chunk:



Thus, chunks can be either verbal or visual (pictorial). Try using a lecture handout to practice writing objectives.

Prospectus and rationale

What and Why

Two other concepts that tell the student what the lesson is about are the **prospectus** and the **rationale.**

The prospectus tells *what* is the overall goal of the module. For example, the prospectus of this module is that it contains information that will prepare you to write performance objectives.

The **rationale** explains *why* the subject matter is important. For example, instructional objectives provide an important tool in the learning process by

- defining acceptable student behavior,
- making a contract between the instructor and learner,
- organizing information,
- allowing the learner to self-evaluate,
- explaining concepts,
- reducing learning time, and
- providing the means for feedback.

Exercise 3: Writing objectives

Now please turn to the performance objectives at the beginning of this chapter.

If you didn't find any, don't be alarmed; your guide is all in one piece. We left the performance objectives for you to write as a practice exercise. Using your verb list, go through this chapter from the beginning, writing and chunking objectives from the content material.

Using a sheet of paper, write at the top:

Prospectus: already written

Rationale: already written

Objectives: At the end of this module, you will be able to

- ______________________________
- ______________________________
- ______________________________
- ______________________________

etc.

The answers follow, but please don't peek until after you've had a try.

Perhaps you arranged your objectives in a different order. Your chunks may be different. The focus of your objectives may be narrower or broader.

When **you** write the objectives, **you** can choose the material you want the student to learn. **You** are creating the contract with the student. It's your intent! Your focus! Your power! Use it to teach!

If you feel you still need more information about objectives, read about norm-referenced and criterion/mastery-referenced instruction in Chapter 10.

Answers to Exercise 3

Objectives: At the end of this chapter, you will be able to

• List and define the 3 learning domains.

cognitive
affective
psychomotor

• Define in your own words the concept of performance objective.

desired outcome
contract
intent
focused behavior change

• List 2 words associated with student behavioral action and instructional objectives.

Do
Verb

• Write 2 preambles.

• Relate the learning domain addressed by this guide.

cognitive

• Compare open and closed verbs associated with objectives.

open - ambiguous; should not be used
closed - explicit; should be used

• List in sequence the 4 primary parts of an objective.

preamble
verb
object
chunk

• Describe qualifiers and quantifiers.

make objective explicit
qualitative
quantitative

• Define a qualifier.

givens
allowances
restrictions/limitations

• Discuss a quantifier.

numbers

• Relate a rule in using quantifiers in objectives.

use numeral notation

• Review 2 types of chunking.

verbal
pictorial

• Associate 2 words that describe the intent of prospectus and rationale.

prospectus - what
rationale - why

Study example of a rationale on page 109.

• Relate 7 advantages of using instructional objectives in the learning process.

• Write behavioral, performance, instructional objectives for Chapter 6.

Feedback exercise

• Match the learning domains with the term that best exemplifies their meaning.

___ psychomotor	A. quantifier/qualifier
	B. skill
___ cognitive	C. knowledge
	D. chunking
___ affective	E. emotional

• What word would best define the concept of a performance objective?

____

• What part of speech is best associated with writing a performance objective?

____

• The first portion of an objective is referred to as the __________________________.

• Place the 4 primary parts of an objective in their correct sequence.

1 object
2 verb
3 chunking
4 preamble

• In objective writing, use of numerical notation is associated with a ________________.

• Describe a chunk.

• Statement of purpose in a module is made of 2 parts - defining the general intent and the advantages. Name these 2 parts.

____
____

Answers to feedback exercise

• B, C, E • Contract • Verb • Preamble • 4,2,1,3 • Quantifier • Last part of objective giving student verbal or pictorial feedback associated with the objective contract • Prospectus Rationale

CHAPTER 7. The Script

Now that you know about writing the prospectus, rationale, objectives, and chunks, we will change the style of the chapter introductions to fit this learning technique.

Prospectus

What: This chapter will help you create the script for your program.

Rationale

Why: The script is an essential part of an A/I program. It provides the basis for both written and oral communication. You also use it as a blueprint as you create and apply learning techniques and decide on visuals.

Objectives

At the end of this chapter, you will be able to

• Explain why learning materials often fail to communicate.

- written to satisfy peer and colleagues rather than students

• Relate 4 rules that will help you communicate better and focus your writing style:

- dismiss peers
- assume role of student
- use teaching principles
- assume students have no prior knowledge of your material

• List 5 guidelines to develop a good writing tone for the narrative script.

- informal
- conversational
- humor
- questioning
- reward

• Discuss a simple method to find the best style and tone to fit your audience.

- pilot feedback studies of different styles and tones

• Appraise the 3 parts of a frame format.

visuals - verbal and pictorial
script - verbal and narrative
comments - evaluative and direction notes

• Restate the order in which you should develop visuals and script.

- script first
- disregard visuals initially

• Discern the constraints of slide trays when deciding how many slides to use in your program.

80 slides
120 slides

• Specify the maximum length of time for narration during each slide.

15-20 seconds
30 seconds

• Discuss the reasons for the narrative time/slide suggestions.

learner becomes passive

• List and discuss 5 approaches used in generating script for PI.

outline
lecture narrative
direct frame narrative
instructional objectives
vocabulary

• Describe the storyboard approach in organizing a modular A/I program.

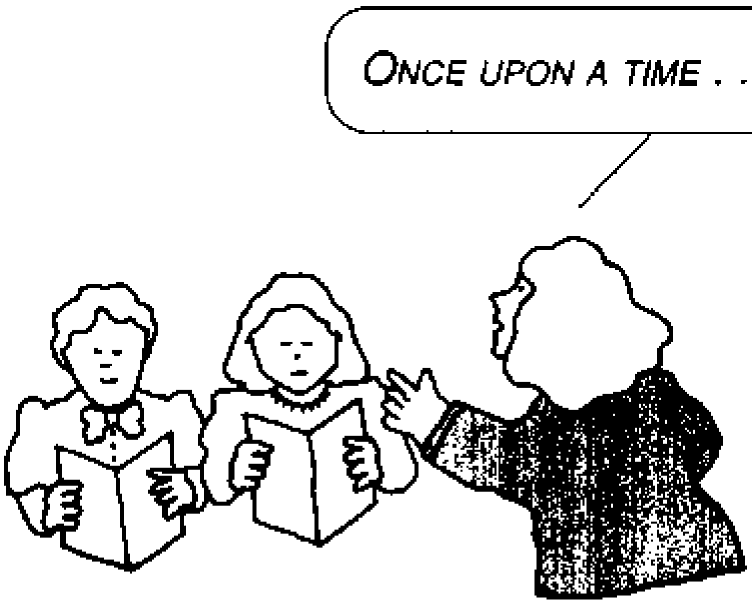
focus content material from general to specific using material reference cards (frames) in a sequential process

• Explain why the storyboard is popular.

presents whole view of material

The technical storyteller

Essentially much of our learning-formal, informal, or technical-has evolved in a storytelling format. In technical learning, the teacher acts as a well-informed storyteller presenting information at a rate determined by the subject matter.



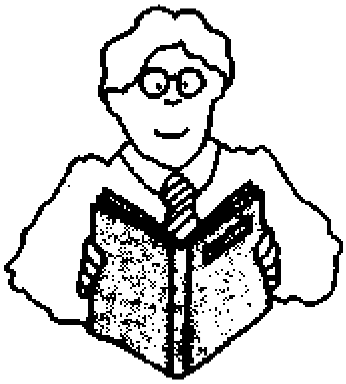
Writing style

Focus

Some technical writing guidelines have evolved because of their efficiency in communicating between professional peers.

Because most authors are professionals, they often use this technical writing style. As a result, much of the learning materials written for students are extremely formal, stilted, and ineffective.

Because the learning material is written for peers and colleagues rather than students, the material does not communicate with the intended audience.



The **vocabulary** is very important and should fit the student level. Although it may be difficult with technical information, keep it simple. In fact, let the student level dictate the writing style you use.

Use effective teaching principles:

- small steps
- feedback
- repetition
- reinforcement

Start at the beginning and assume that the student knows nothing about your subject. The challenge in creating A/I modules is to make the complex simple in a creative way.

It starts with the script.

***Note:* Be careful that your humor does not offend any of your students. For example, if you are a lecturer, see page 192. Some might be offended by this example.**

Tone

Students learn faster if you adopt a particular writing tone. Often the tone may seem contrary to the formal methods of teaching.

Here are some **tone guidelines:**

- informal (relaxes)
- conversational (more action)
- humor (pauses for mental refreshment)
- questioning (enhances learning by the repetition principle)
- reward system (use of encouraging remarks)

Arriving at a style

Objective feedback from your students is one method of developing a style that communicates effectively with them.

Develop and pilot several experimental styles and test them on your students with a simple attitude questionnaire.

For example, here is the start of a simple attitude questionnaire:

Read the 3 samples of information labeled A, B, and C.

1. Which sample did you enjoy reading most?

    A_____ B ____ C____

Why? ___________________________

2. Did you enjoy the conversational tone used in sample A?

    Yes ______ No ______

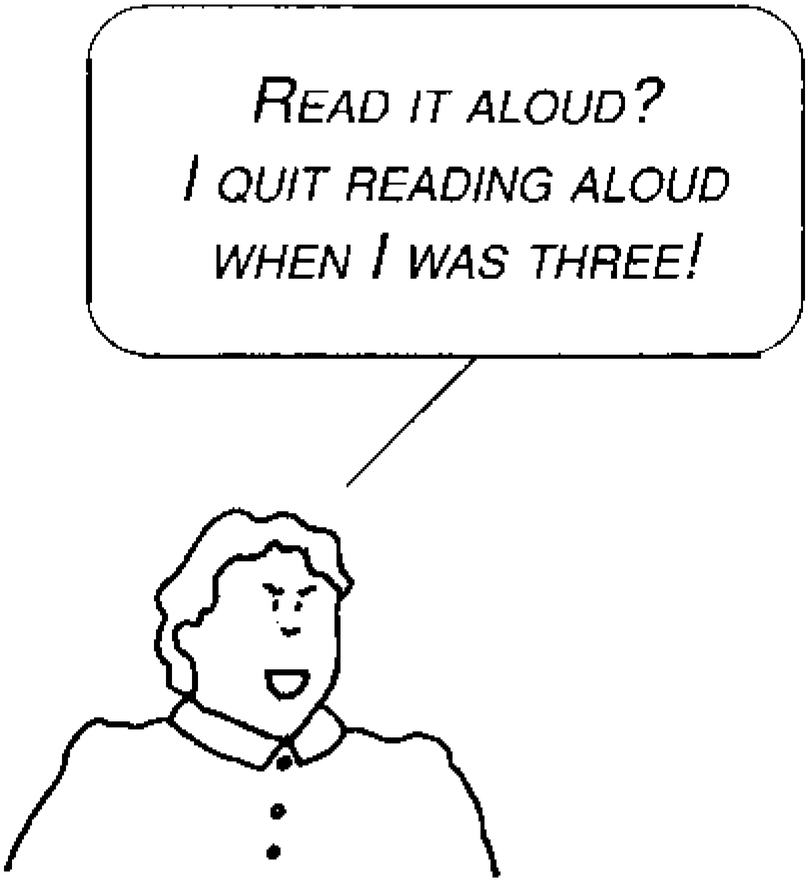
3. Did you find the humor entertaining?

    Yes______ No ______

4. etc.

When you become a script writer, you will find that writing for a spoken presentation is much different than writing for a publication.

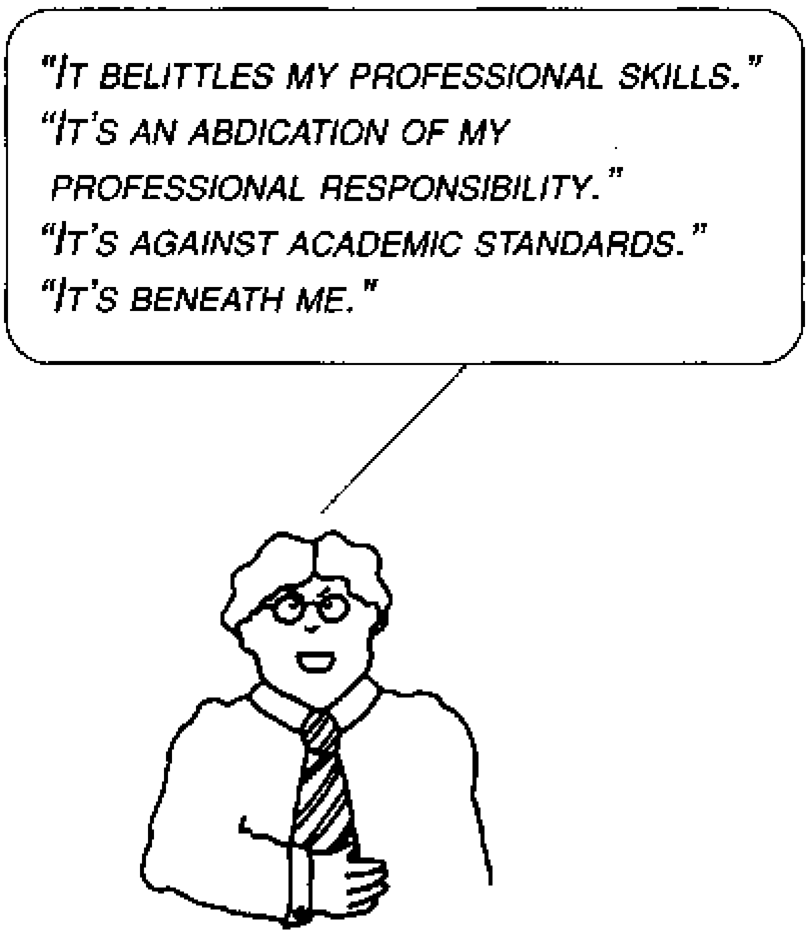
After writing your script, **read it aloud** and listen to how it sounds. Read it to a few of your students and get feedback.



Use contractions such as isn't, don't, and doesn't. Don't hesitate to use phrases that you use in conversation but usually don't write down. Avoid putting words together that start with the same letters and form tongue twisters!

Remember to focus on the spoken word.

After you determine what style appeals to your audience, you may find that you feel awkward writing this way at first. The style may feel contrary to your professional training and values. Some of the comments of professionals attempting this for the first time sound like this.



We must weigh these feelings against the responsibility of helping students learn the knowledge, attitudes, and skills we have to offer. We can view this as a new professional opportunity to deviate from the formal technical writing style and make learning enjoyable.

Whatever your feelings, the objective data from your pilot research with your script will help you balance and justify your style of communication to yourself and your colleagues.

A Summary

When creating your script, an essential step is one of attitude and role playing. Some rules of the role are to forget your peers and colleagues. They already know the information. As you create, pretend that you are a student.

Another method of arriving at a style and tone is to **tape your lectures** or an actual tutoring session with a student. If you teach a laboratory class, tape the session while you are actually using and explaining the specimens.

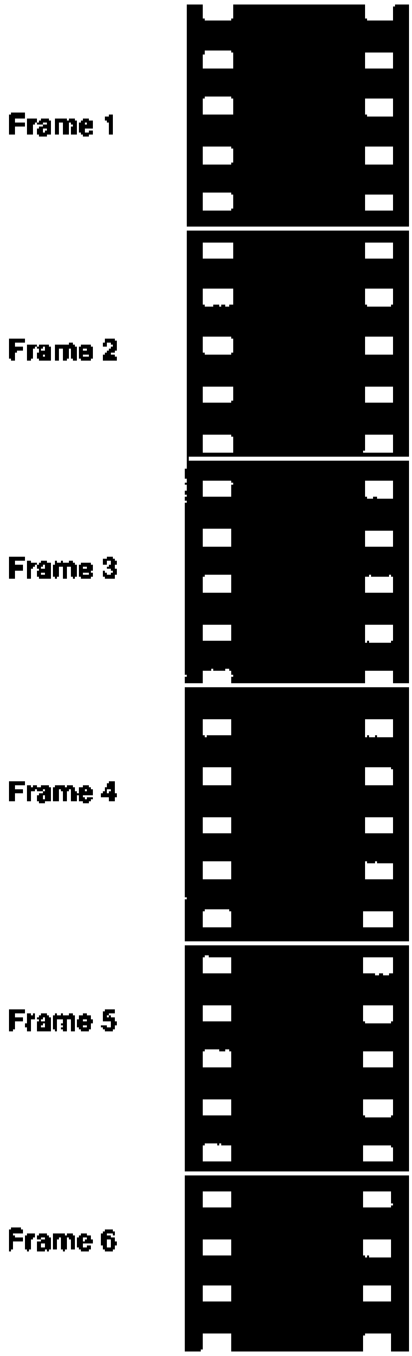
Later, when you transcribe and edit the tape, you are actually writing the script.

What if you don't have a tape recorder, typewriter, or typist? You can still use the script writing and role playing approach.

Note: As mentioned in the preface, the intended audience of this guide is primarily professionals with a scientific or technical background who desire to create an A/I module for student learning.

The frame format

Keeping to your style, create your story (module, lecture, information) by breaking it down into small units called **frames.**



There is nothing magic about the frame format! It's just a convenient method of organizing information. You begin by making frames on strips of paper, index cards, or other materials that you can deal, stack, arrange, and rearrange. Divide each frame into thirds. One space will be for visuals, another for the **written script,** and the third for **comments,** instructions for graphics, sound or other production techniques.

VISUAL	**THE WRITTEN SCRIPT**	**COMMENTS**					

Make a row of small blocks horizontally across the top of the comment space. Use these to renumber the sequence if you want to rearrange your story.

For example, we have rearranged this frame from position 6 to 8 to 12 in the process of creating a story.

		6	**8**	**12**			
		COMMENTS					

An example frame:

VISUALS	**SCRIPT**	**COMMENTS**					
	Tune a guitar string by twisting the *keys* which are attached to the strings. By twisting the *keys,* the strings will be either tightened or loosened making a higher or lower *tone.*	Make strings and frets stand out. Make the keyboard of a different color than top. Accent underlined words.					

It is best to create your story in words first, and then match your picture story as a support element later.

Here is an example of a **script** written in the frame format:

		1					
	Welcome to Module Seven in our series of modules on A/I production.						

		2					
	This module will provide you with information that will help you create the script of your A/I program.						

		3					
	The script is also the blueprint for exposing the learner to content information.						

		4					
	The script is an essential part of a module. It provides the basis for both the written and oral communication,						

		5					
	and for applying learning techniques.						

		6					
	It also forms the backdrop for visual communication.						

Of course, we have just repeated the introduction of this chapter using a framing technique. Notice that we have broken the introduction down into 6 frames. Each frame focuses on some important aspect of the script.

You continue to write your script in this manner.

Editing the number of frames

As you use frames to tell your story, you will discover that presenting your modules in the frame format also has limitations. One of these is the number of frames that will fit into a slide tray for viewing. Most popular slide trays hold 80 or 120 slides.

For management purposes, it is best not to split modules into two slide trays. Therefore, keep your story within the maximum limits of 80 frames if possible at all, or no more than 120 frames. Since our introduction example already used up 6 frames, it would be better to save some of these frames for more important content information. **Remember, limit your story to 80 or 120 frames.**

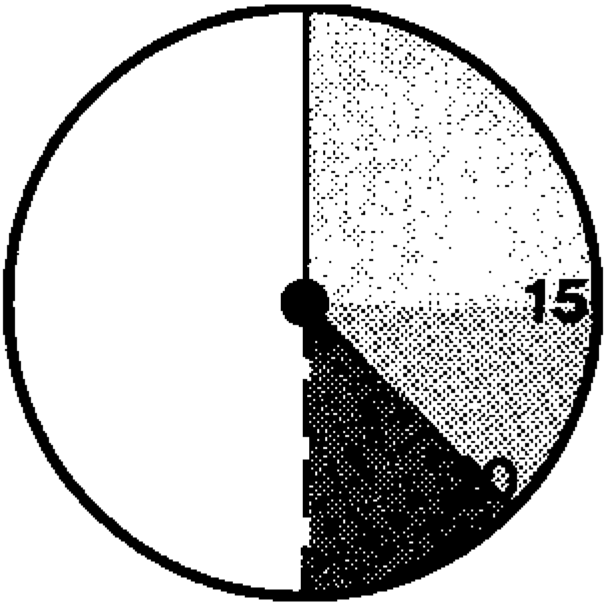
Here's an edited version of our 6-frame script.

		1					
	Module Seven will provide you with information to create the script, an essential part of your A/I program.						

		2					
	It provides the basis for both your written and oral communication, for applying learning techniques, and forms the backdrop for visual communication.						

Note how we edited the 6-frame example we had earlier. The script from frames 1,2, and part of 3 are now condensed into frame 1. Frames 3, 4, 5, and 6 are condensed into frame 2 of the sequence.

Editing time/frame



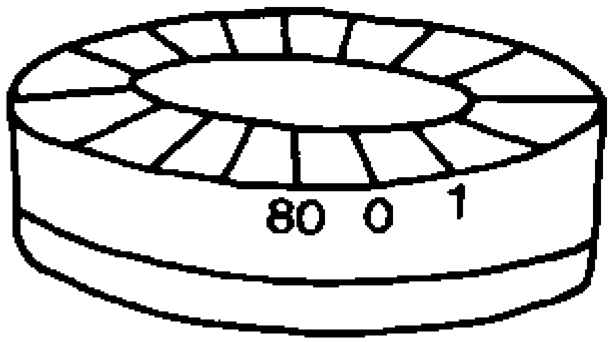
script or narration time per frame

Script time per frame should run from **15 to 20 seconds,** 30 seconds on rare occasions. One reason that modules are very effective is that students are involved with adjusting to the frames and story movement. When there is too much talk per frame, they are on the screen too long, and the student becomes passive.

To check on the length of narration per frame, read the script slowly out loud and record the number of seconds. If it is longer than 15-20 seconds, simplify your thoughts, reduce the number of words in the script, or break it into extra frames.

Organizing information

One of the creative challenges of developing A/I programs is trying to organize information into sequential frames, putting content in the right order, keeping the script within the time limits, and limiting the presentation to 80 frames. Super-organization and prioritizing of material are essential.



Here are some tips on how to do it.

- Some people first develop an outline and then write the story from the outline.

- Others write materials in the form of a lecture and then translate the lecture to frame format.

- Still another method is to create the narration or script directly from memory as you progress.

- Another option is to break a lecture into instructional objectives and then construct frames from the objectives.

- We have mentioned that you can tape lectures and work from them.

- If there are many introductory vocabulary words, you can create your story from a prioritized list of vocabulary words.

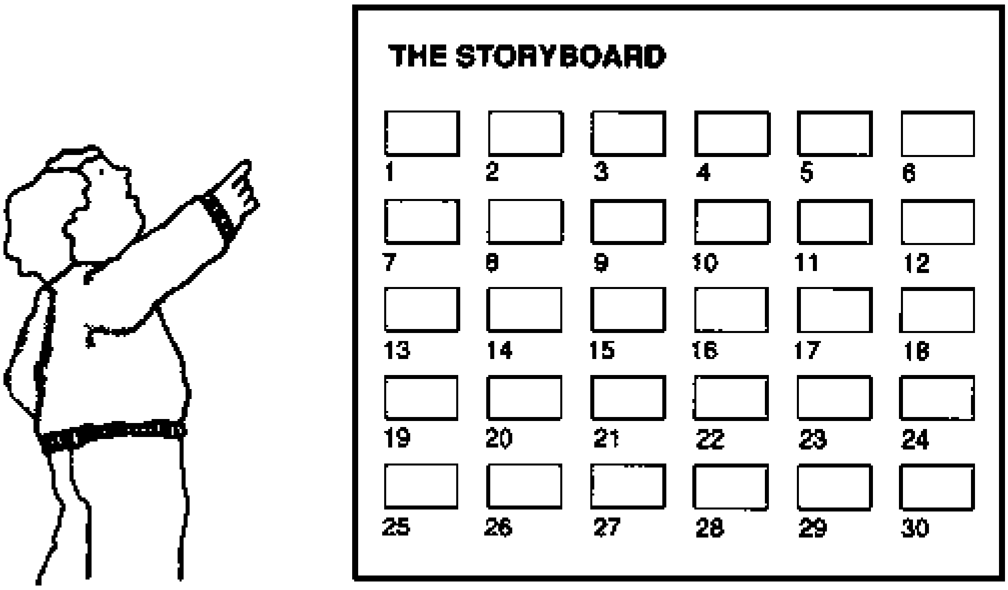
Note: There isn't really any correct method; use whatever method works best for you based on your past experiences.

The storyboard

One approach that has been devised is called a **storyboard.** It is similar to an activity calendar. It is a large board made up of numbered squares. You also can use a table top or floor.

You can fold the frame strips so that the narration is on the outside so that you can see it. Then you can *deal the strips like cards* on the storyboard, table, or floor. You can pin the frames to each square in the order that you want the material to appear. With the narration on the outside, it will be easy to see if you have them arranged in the right order. You can also rearrange them easily. The storyboard gives you a good overview of the story.

Start with an outline of the story. Sequence the outline on the board and number each square with Roman numerals. Then address each outline point in sequence and add squares of paper containing the subpoints or tasks. Put these on the board in the desired sequence.



After the main outline point, you may have to number and remove the squares because the whole story will not fit on the board. Finally, break each subpoint into frames. Place these on the board in the order set by the outline.

Summary

Steps in storyboarding:

1. **Write outline on paper squares.**
2. **Pin on storyboard.**
3. **Observe sequence.**
4. **Rearrange and confirm sequence.**
5. **Number slips and remove.**
6. **Write subpoints associated with Roman numeral I of your outline.**
7. **Repeat steps 2-5.**
8. **Write information frames associated with each subpoint.**
9. **Repeat steps 2-5.**

Now is a good time to edit the length of your script to 80 or 120 frames. Just staple or pin frames together in sequence; then rewrite the story to include all the frames of outline points, subpoints, and associated frames not to exceed 80 or 120.

Feedback frames

Periodic processing and recall of information assists retention. To help students learn through review, try to highlight the major points in a module by reserving some frames for review or feedback.

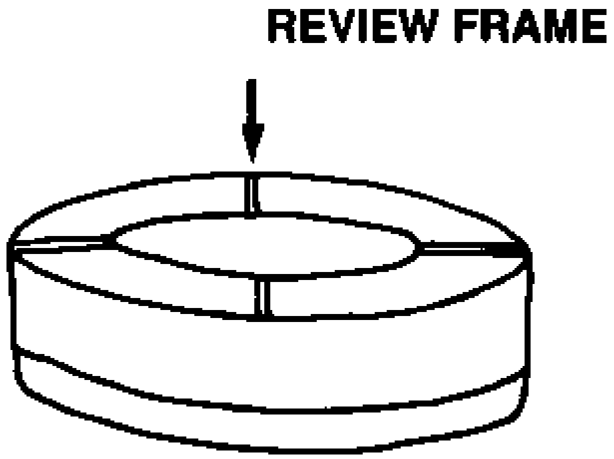
Construct a feedback exercise every 16-20 frames. This will

- organize and separate concepts,
- give a break or pause in instruction or a stopping point in the program,
- provide reinforcement through drill and practice, and
- involve students in active learning.

Be sure to reserve 6-8 frames for feedback questions or review and about 4 for introduction, ending, and credits. That reduces the program to 70 slides for content.

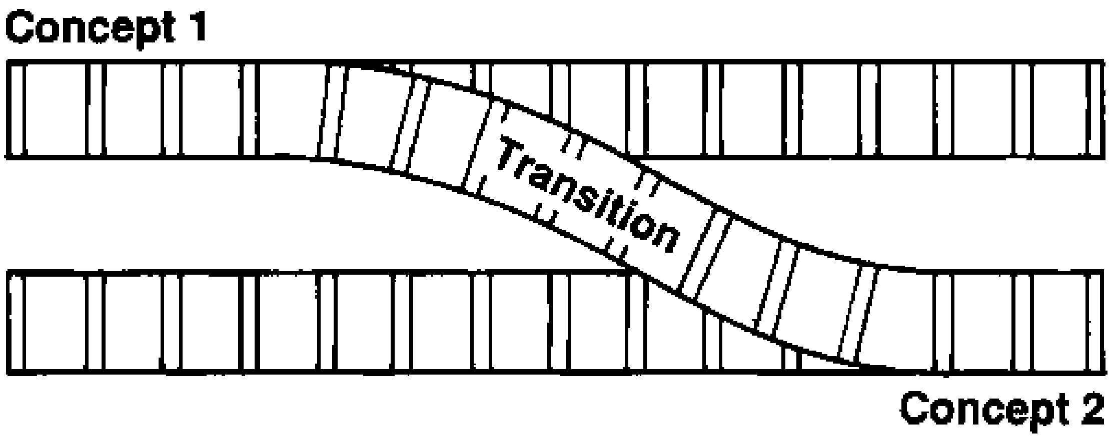
Progressive disclosure will also use up frame space. More on this later.

No matter which approach you use in creating your story or program, the storyboard is an invaluable tool in getting an overview and organizing the program.



Transitions

Transitions are crossover words or phrases that tie concepts together. After cutting and editing your frames to achieve the proper length for your program, the right number of frames, and the right length of time/frame, your script will sound disjointed.



When rewriting the narration, use transitions to smooth the verbal flow and tie frames together. Transitions also provide a way to repeat information. Here are a few:

subsequently
because of
finally
accordingly
for example
however
in addition to
is divided into
is made of

In creating our module so far, we have worked only with verbal information. The next step is to create and correlate visuals to accompany the verbal script. We'll do that in the next chapter.

In the meantime, let's review the material presented in this chapter. The following feedback exercise will help you!

Feedback exercise

• In your opinion, is there any validity to the proposition that

> A significant amount of scientific and technical learning materials is written for peers rather than for students?

• What process can help the scriptwriter focus on the intended audience when writing student learning materials?

• Match the writing tone guideline with the intended goal.

____ informal	A. Promotes active mode
____ humor	B. Relaxes audience
____ questioning	C. Provides mental pauses
____ conversational	D. Aids learning by repetition

• What is an objective method of ascertaining the right writing style for your intended audience?

• What are the 3 parts of a frame format and what is each used for?

1. ________________ _________________
2. ________________ _________________
3. ________________ _________________

• In the initial development of an A/I program, state a rule of relationship between visuals and script.

• Check the numbers below that indicate the maximum number of slides an A/I program should have to keep within the constraints of a small slide tray.

_____ 60 _____ 70 _____ 80
_____ 90 _____ 120

• To keep students from becoming passive, what is the suggested length of narrative time per frame? (Encircle one.)

5-10 seconds
7-15 seconds
10-15 seconds
15-20 seconds

• Check which methods you prefer to use in generating your script.

_____ Outline
_____ Lecture narrative
_____ Direct frame narration
_____ Instructional objectives
_____ Vocabulary
_____ Storyboard
_____ Tape recording

• Why has the storyboard evolved as a mechanism for generating an A/I program?

Answers to feedback exercise

• No correct answer - it's your opinion

• Role playing; assuming the role on tape

• B, C, D, A

• Pilot studies of narrative style(s).

• Visuals - slides
Script - narrative
Comments - information, direction to artists, yourself, etc.

• Forget visuals, concentrate on narrative of teaching principles.

• 60,70,80

• 15-20 seconds

• No correct answer; individual preference

• Facilitates holistic approach to organization, sequential arrangement

CHAPTER 8. Visuals

Prospectus

This chapter will help you create visuals for your A/I program.

Rationale

• Our A/I program uses visuals in both nonverbal and verbal learning.

• Visuals help students understand, retain, and remember information by uniting words with pictures (See Chapter 4).

• Visuals promote understanding in all of the learning domains.

Objectives

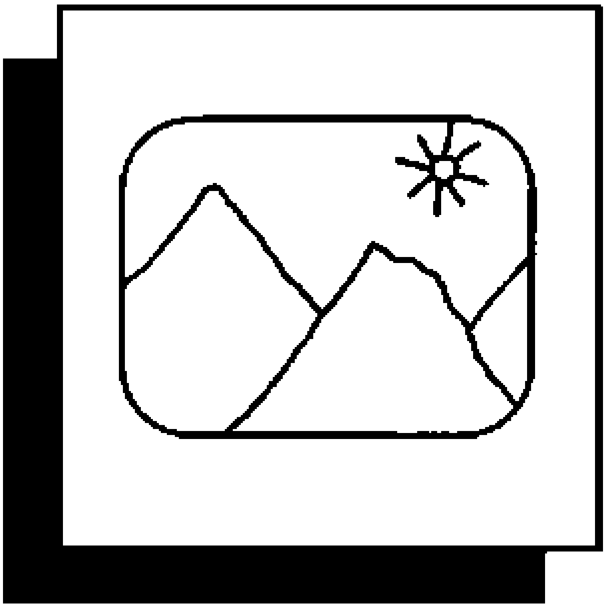
After the last few chapters, objectives may seem redundant. However, they provide a focus, and with chunking, can

- give a shorthand outline of the material
- measure the extent of your knowledge before you read the material, and
- provide a quick reference source.

At the end of this chapter, you will be able to

• List 6 situations where visuals assist learning.

1. magnifying/reducing
2. simplifying the complex
3. instructing through a visual vocabulary
4. motion demonstration
5. communicating in the affective domain
6. encouraging right brain learning



• Define an A/I slide

35 mm film mounted on a 2 × 2 in frame

• Describe the 4 types of visuals used in A/I modules.

word slides
graphics
photographs
combinations

• Give 5 reasons why titles are important on all types of visuals.

1. condensed verbal code
2. advanced organizer
3. cognitive bridges (verbal/visual)
4. subsumers
5. continuity of concepts

• Describe a task analysis of storyboarding visuals.

association of narration and visual
conceptualize visual
document visual and unite with narrative
search for ready-made visuals
create your own visuals

• Define visual style

consistent pattern of colors, contrast, and visual arrangements

• Recall 2 instances where word visuals are advantageous.

introducing abstract concept that doesn't provide convenient visual reinforcement
itemizing information

• List 3 rules of lettering.

use plain bold lettering
make discretionary use of capitals
avoid vertical lettering

• Recall 4 principles of letter spacing.

15-20 word limit (25-30 data)
abbreviated style
capital letter size or larger space between lines
maximum of 9 lines per slide

• Explain progressive disclosure.

sequential concept building

• Define a graphic slide.

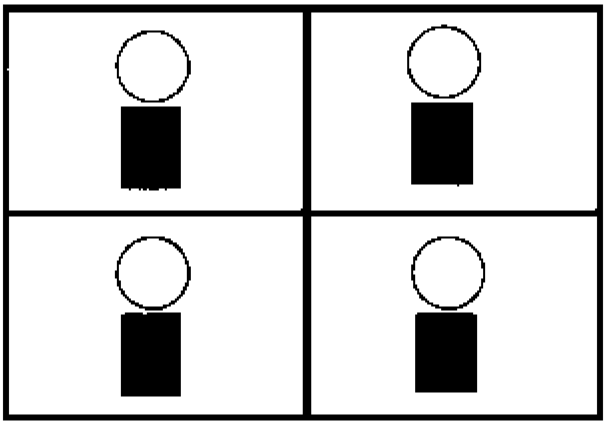
diagrammatic or illustrative drawing of information

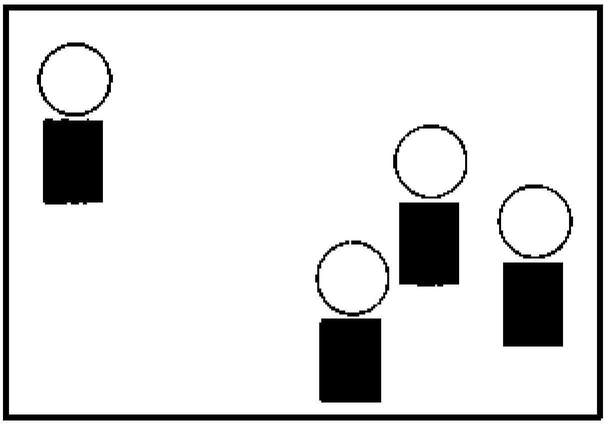
• Compile a list of mediums and techniques used in graphics.

pencil
ink
crayon
chalk
water color
paper cut-outs
direct use art (clip art, collage art)
dyes

• Relate and describe 4 elements of composition layout.

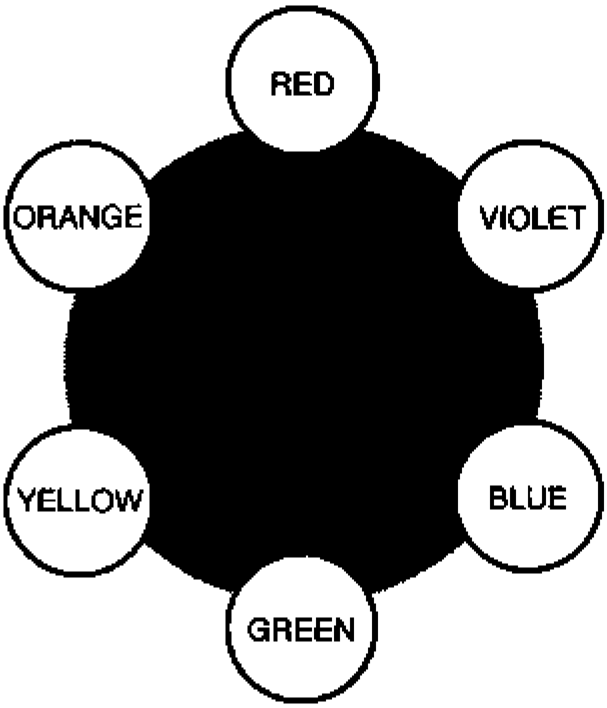
balance
emphasis / contrast
harmony
color





• Discuss 4 components of emphasis and contrast.

background
grouping
separating
integrating



- Discuss 6 principles in communicating with colors.

    2-3 colors best
    cool colors -> recede
    warm colors -> emphasize
    adjacent use:

        similar = blend; NO
        light/dark = contrast; YES

    light colors on dark increase visibility

- Define 4 color systems.

    self-tone
    complementary
    analogous
    triad

- Recall the areas and standard dimensions for preparing graphic copy.

    outer area = 10 × 12 in (250 × 300 mm)
    neat area = 7 × 10 in (178 × 250 mm)
    information area = 6 × 9 in (150 × 225 mm)

- Explain the Rule of Seven.

    rule for readability:

        length of longest line × 7= viewing distance

- Recall principal considerations of using photographic slides.

    detail
    composition

- Restate a simple rule concerning photography.

    film is cheap
    time is not

- Recall 5 rules of labeling slides.

    concise/simple
    5 words maximum
    special focus on primary visual
    precise association of verbal/visual indicators (lines, etc.)
    titles unify labels and make a concept map

- Describe the equipment necessary to produce slides.

    camera
    lens
    flash
    tubes
    tripod
    release cable
    film
    copystand

How visuals assist learning

The next step in creating your A/I program is to produce key word (verbal) and/or pictorial (nonverbal) visuals to accompany **each frame** of your program.

Visuals are an exciting creative opportunity to help students learn. They use pictures to amplify, clarify, and reinforce the verbal narrative of your program.

We learn in two major ways. **One is by sound, the other is by sight.** Visuals relate to the world of sight. Research shows sight contributes to more than 80% of our learning. Sight lets us read words and distinguish figures and colors.

Visuals assist learning in 6 areas by

- magnifying or reducing the size of a subject so that it will fit into a classroom teaching situation (example: microphotography).

- simplifying a complex concept (example: diagram of nitrogen cycle).

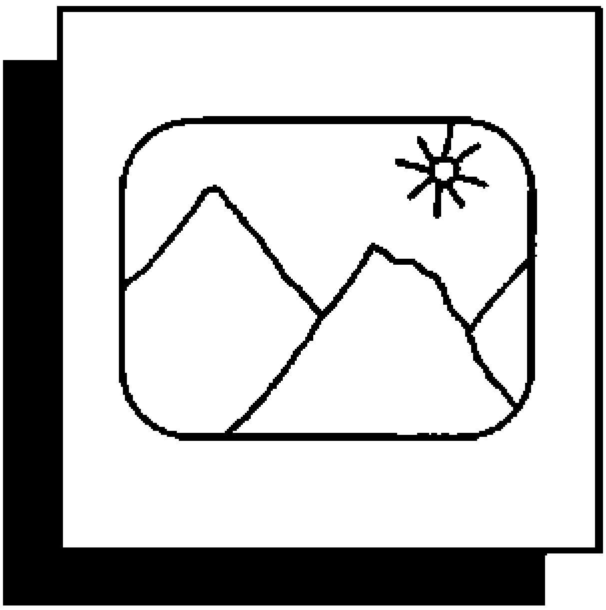
- showing visually as well as verbally what the student needs to learn (example: morphology).

- showing motion or time lapse (example: dissections).

- showing verbal concepts.

- encouraging whole brain learning by requiring right brain participation (see Chapter 4).

- showing color changes (example: plant sickness).



In this chapter we will emphasize slide production.

However, you can use the same principles to produce all types of visual media.

You can create pictures

- on paper
- on a transparency, as a slide, or filmstrip
- on a video tube.

Let's define a slide as a 35 mm transparency in a 2 × 2 inch frame to be projected on a screen by a slide projector.

> *Note:* The creation of visual aids as learning devices is a vast subject area, a complete discipline. We offer the following simple guidelines to help you create slides for an A/I program.

Visuals and the storyboard

A/I programs use 4 basic types of visuals:

1. **title or word frame slides**
2. **graphics**
3. **photographs**
4. **combinations of 1 and 3, or 1 and 2**

Now for the creative challenge of visuals! You have written your script on frames and put it in order using a storyboard. So far you have not put any visuals with your script.

		sequence
	SCRIPT	

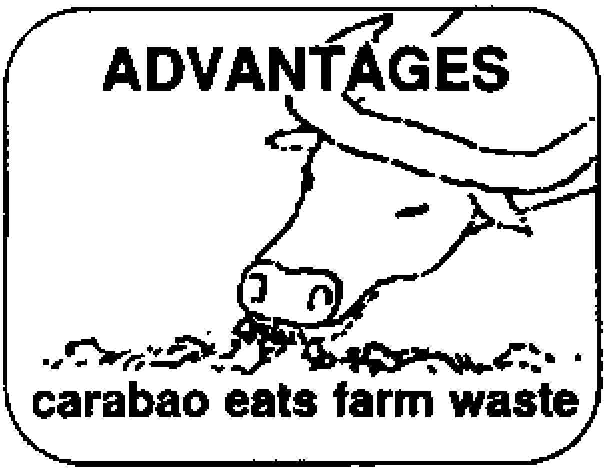
Now, one frame at a time, using your script for cues, **visualize your program.** Decide which type of visual, words, graphics, or photographs will best illustrate each frame. As you plan, draw rough sketches in the visual third of each frame and make corresponding notes in the comments section.

VISUAL	**NARRATIVE**	**COMMENTS**
Step 2 MESSAGE 	Step 2 in which the source sends a message.	Highlight message component graphics

Be sure to use simple one- or two-word titles and subtitles as headings at the top of each frame.

They are important because titles

- condense the script,
- connect verbal and visual concepts,
- organize the information around key words or anchors (subsumers-see Chapter 3), and
- give continuity and organization to the



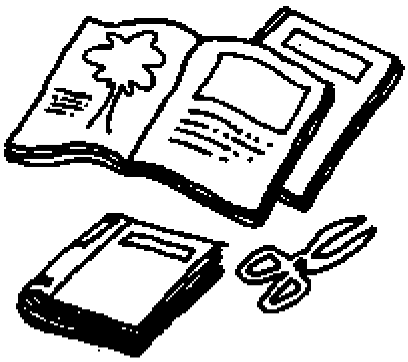
Ready-made visuals

As you plan visuals to support your script, try to remember slides or photographs from your existing collection. Since you don't have to work to create them, these are **ready-made visuals.**

Perhaps you can find pictures or diagrams from books or magazines. If so, either attach the picture to the frame, or make a note on the frame about the visual to help you begin to unite visuals with the script.

If visuals are not readily available from your own sources, attach a note describing what you need. Then look through library books, colleagues' slide files, and other resources to find the materials. **If possible, obtain visuals from ready-made sources.**

Be sure to heed the copyright laws. Most government materials do not possess copyright restrictions. Often a note to the publisher will obtain a release for local instructional purposes. Regardless of the source, give credit for any visuals you use.



Create your own

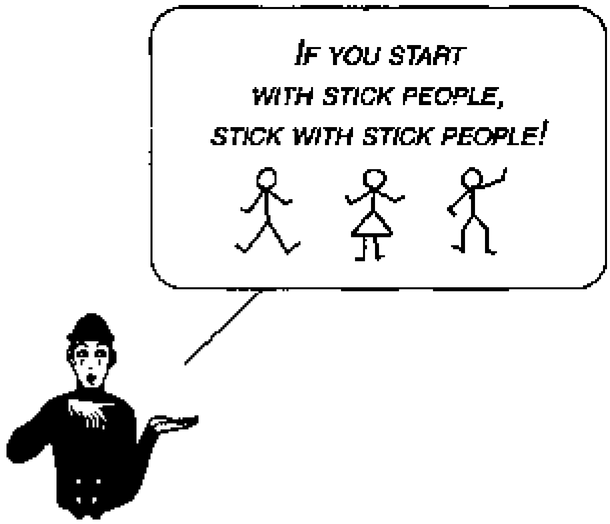
However, if off-the-shelf pictures are not available, then make your own. Perhaps you have plans to publish and distribute your program. If so, it is better to make your own visuals.

Visual style

Establish a visual style by using a consistent pattern of colors, contrasts, and design. Some variety is desirable, but large swings in style may make your program seem bizarre.

Consult with artists and colleagues and get feedback from pilot surveys with students. Pretend that you are a student. What visuals would best explain the script?

If you have the resources, employ an artist to create visuals. However, many times these resources are not available, so we offer these guidelines to help you produce your own visuals.



Types of visuals

Title or word slides

A book uses titles, headings, and subheadings to organize and introduce concepts. The same principle applies to the moving book of frames in your module. Also, we can use word slides when it is difficult to explain abstract concepts with pictures. Word slides also help us with review and summary information.

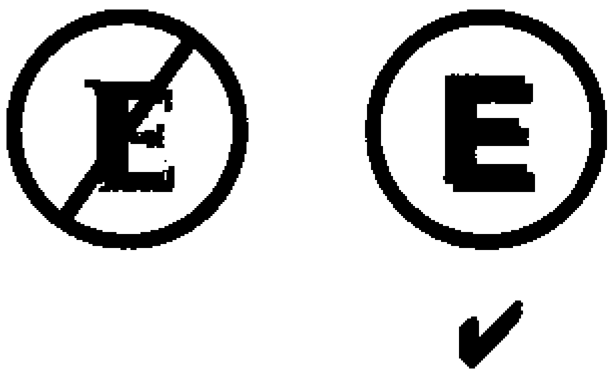
Whenever possible, reinforce the script with visuals. If more than 30% of your frames become word slides, perhaps you should reject the slide format and use written handouts or a tape.

1. ***Lettering****.* Word slides need good lettering. How do you begin?

- Select plain bold gothic letters without serifs or tails.

- Use lowercase letters which people can read faster than uppercase. Use capitals for emphasis and to lend variety.

- Avoid vertical lettering.



2. ***Lettering sources***. What types of lettering materials are available?

- The most common is the typewriter.
- Burnish or rub-on letters of various sizes are available at art stores.
- Removable plastic letters
- Cut-out letters
- Hand lettering
- Lettering machines such as the Leroy and instant print. **Consult an art catalog. Ready-made letters are convenient.**

3. ***Spacing letters***. In spacing letters, remember these tips:

- Limit each slide to 15-20 words (25-30 for data) and include no more than necessary.
- Allow a space between lines at least the size of a capital letter. Use more space if there is room.
- To prevent crowding, never put more than 9 lines on a slide. This allows 2 lines for a title and subtitle and 7 lines for an itemized summary. If you need more than 7 lines, use 2 slides.

TITLE
Subtitle

• ______________
• ______________
• ______________

See pages 12-14 for an example of progressive disclosure.

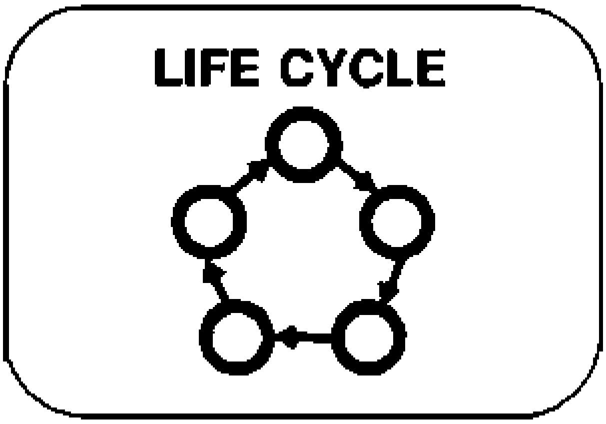
4. ***Progressive disclosure***. Progressive disclosure means to add each new point to those already presented. For example, if you want to present 4 points, the title and subtitle appear on slide 1, the title and subtitle plus point one on slide 2, the title and subtitle plus point one and two on slide 3, and so on until all points are covered.

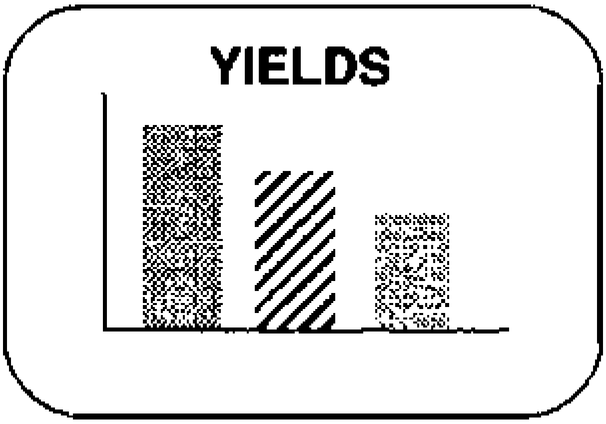
As you disclose each new point, highlight it by using a different color. For example, the title and subtitle on slide 1 may appear in red. On slide 2, the title and subtitle could be green, and point 1 a contrasting color like red. On slide 3, the title, subtitle, and point 1 could be green and the new point 2 red.

You can use progressive disclosure with graphics as well as with word slides.

Graphics

Graphic slides include charts, graphics, cartoons, or any diagrammed drawings that instruct without using an actual photo. Depending on the style you want and your artistic ability, you can make them simple, detailed, or very realistic. In many cases, graphics are more effective teaching aids than photographs.





1. ***Mediums and methods**.* Try these to create your own graphics.

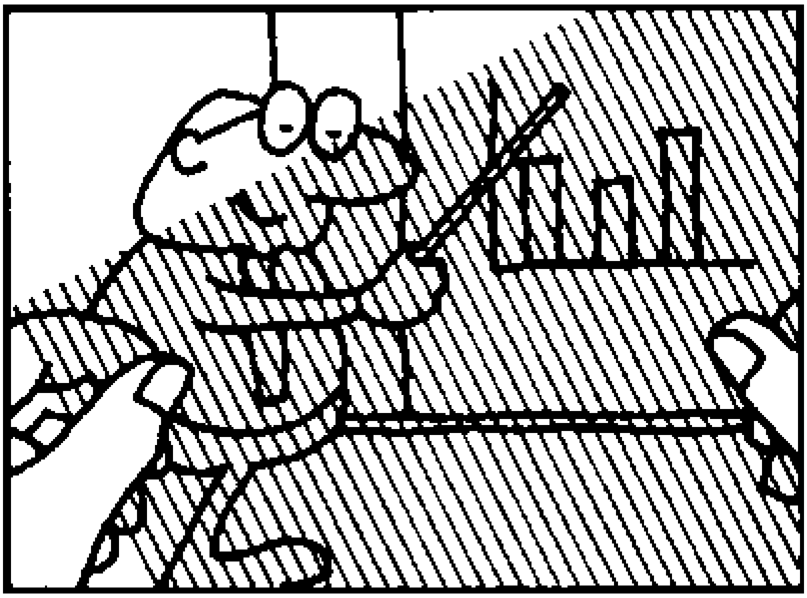
- Use colored pencils, crayons, chalk, or pen and ink for line drawings and fill-in areas.

- With a little practice, watercolor is another fill-in medium that is fast and easy to use.

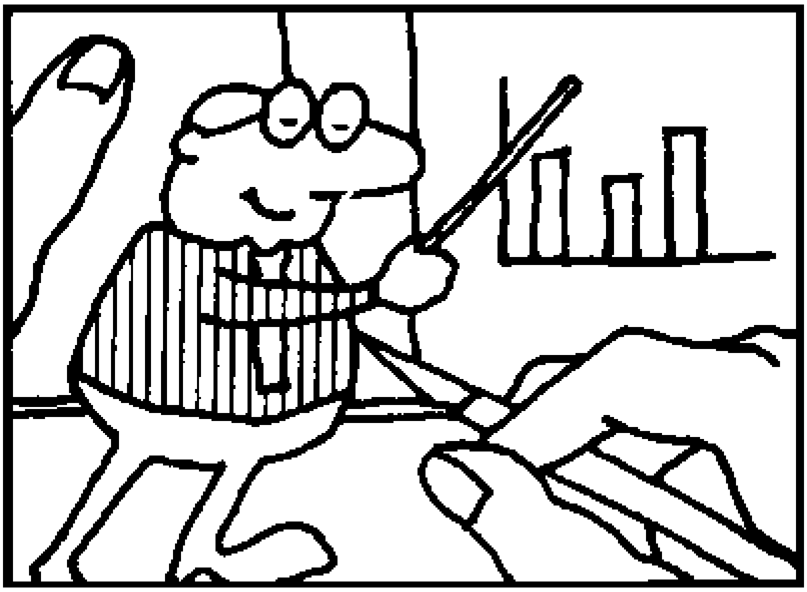
- To produce special effects, make cutouts from colored panels, velour, gummed corrugated paper, or plastic sheets.

- Rolls of adhesive-backed paper and plastic tape of various widths and colors are available for making lines and shading graphic art.

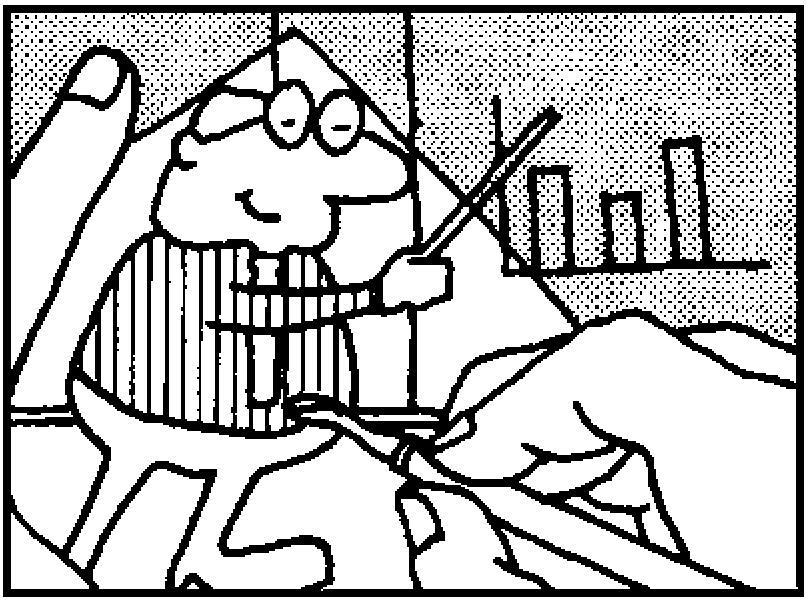
For example,



a. Make a line drawing.



b. Cover with shading film, and cut around lines.



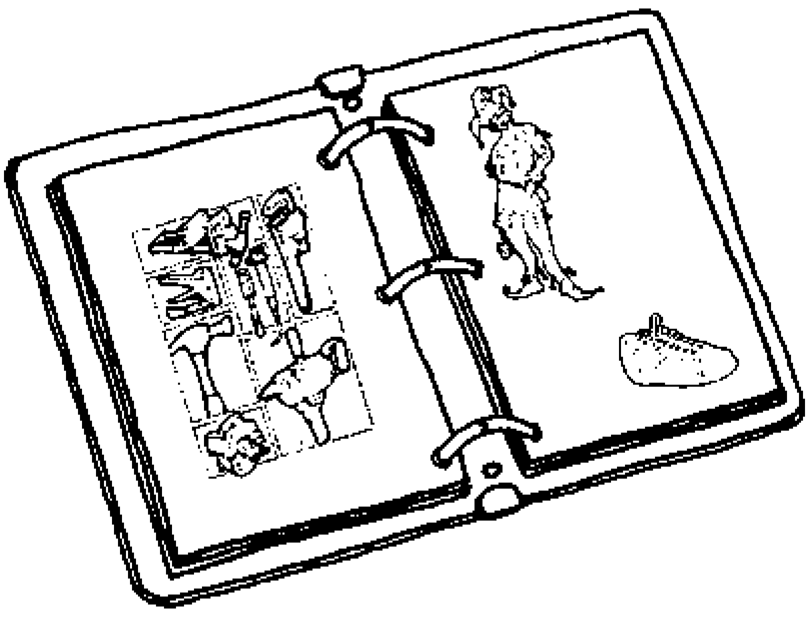
c. Rub with a burnisher or cloth to make the shading film stick to the line drawing.

• You can combine shading film with “direct use” images that eliminate the preparation of line drawings. One type is called **clip art.** You can buy a book that contains ready-to-use line images, symbols, and borders for every practical subject. You can cut out the image and paste it onto the design you are creating. To save the book, you can also trace or xerox it and use the copy. Be sure the copy is clear.

People from other countries should try to modify clip art visuals so that they look like people or objects from their own countries. This will add a great deal of credibility to their modules.

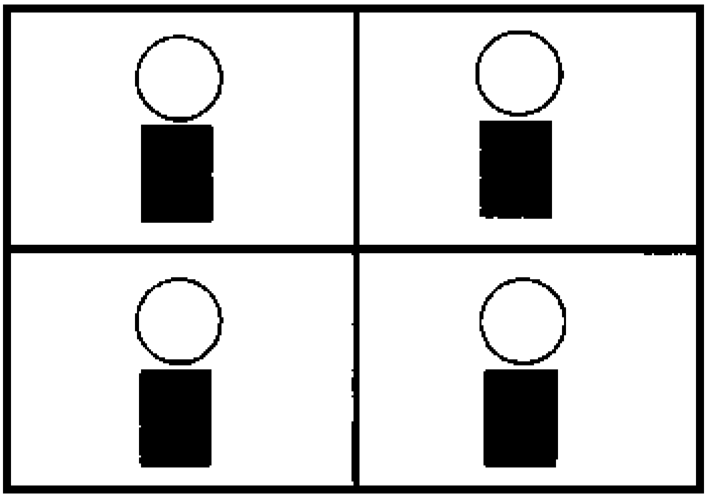
Other direct images are available in acetate, module form, and dry transfer acetate medium.

You can also use another type of art called the **collage** technique, where you cut parts of pictures out of magazines and reassemble them to portray a new concept.

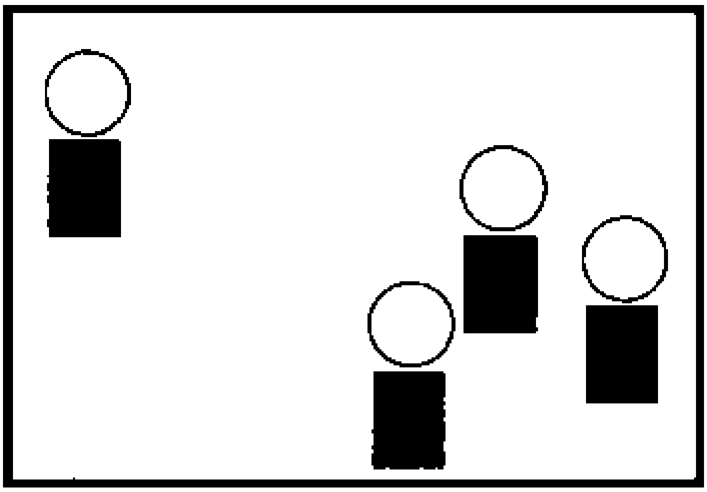


2. ***Layout and composition***. The way you arrange images in the visual space can help communicate your messages more clearly. We call this arrangement *composition,* and it has 4 important elements: **balance, emphasis and contrast, harmony,** and **color.**

• Balance - If you divide your slide into quadrants, **balance** refers to the way you distribute items within the quadrants. Balance may be formal, distributed equally, or informal with an unequal distribution. Informal balance is much more normal and pleasing to the eye.



FORMAL BALANCE

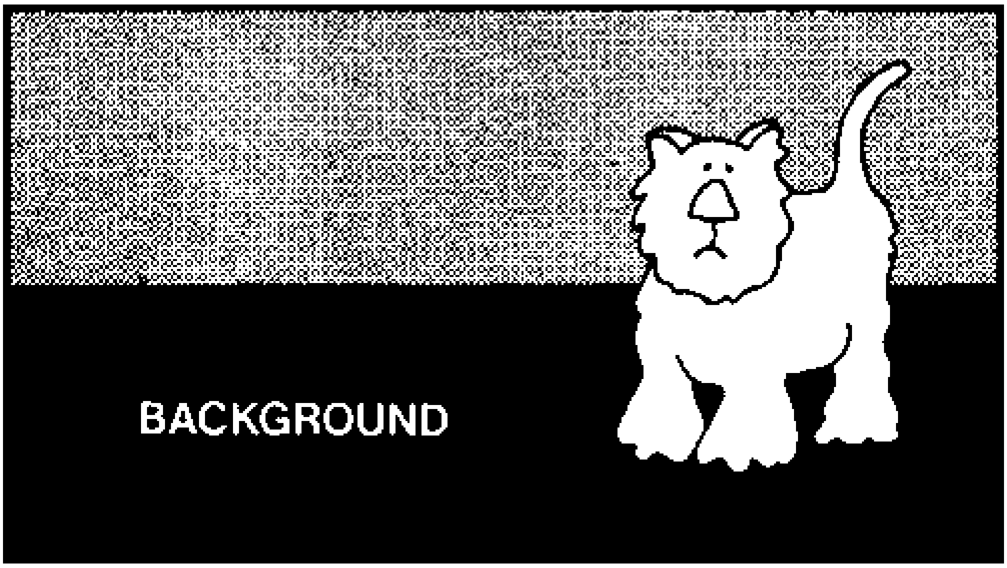


INFORMAL BALANCE

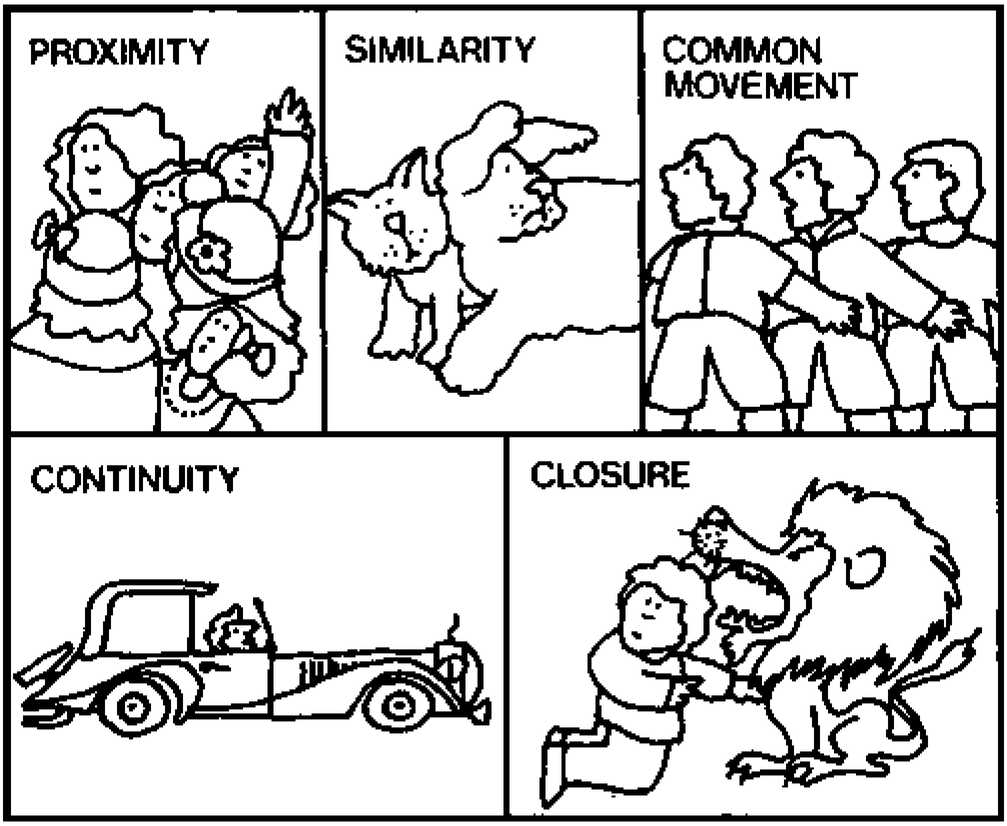
• Emphasis and contrast - There are 4 major ways by which you can **emphasize and contrast** elements within your slide. You can adjust the

a. background
b. grouping
c. separation
d. integration

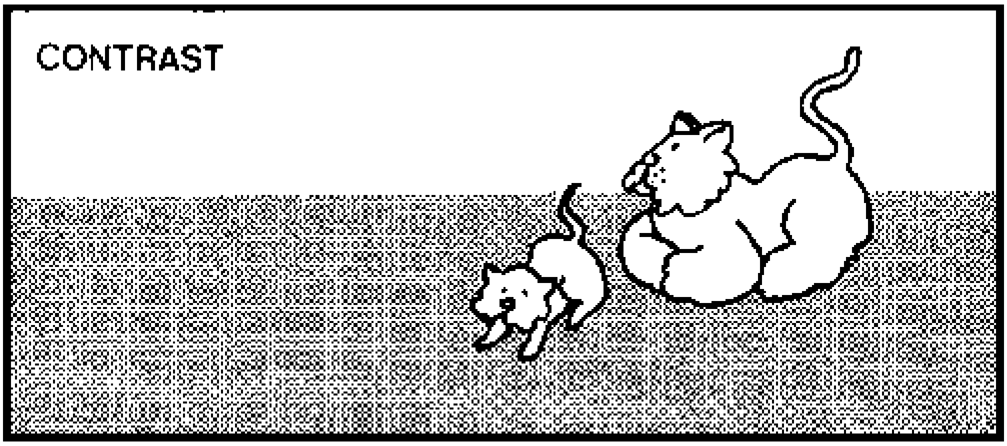
The **background** of a slide is important. It forms the backdrop and contrasts with the other images.



You can **group** items together to show proximity, similarity, continuity, closure, or common movement.

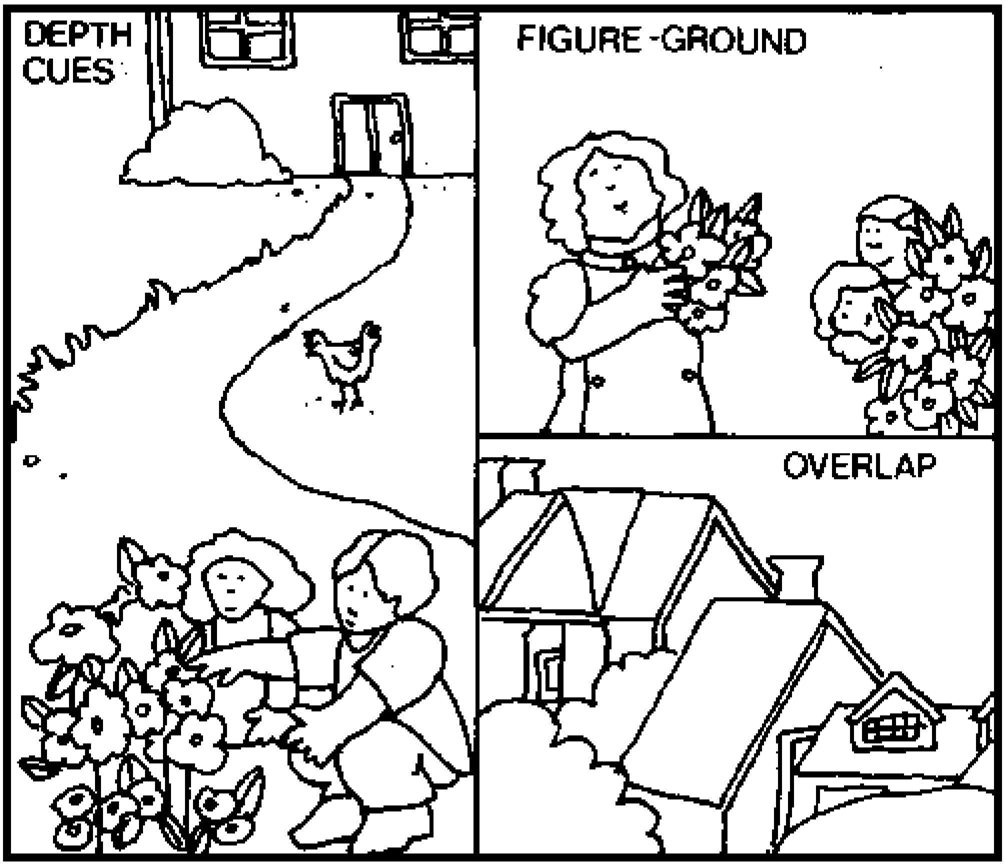


You can also use **separating techniques** to show visual elements as separate parts. To separate items you can contrast their size and shape. You can change their depth, figure-ground, or overlap them.

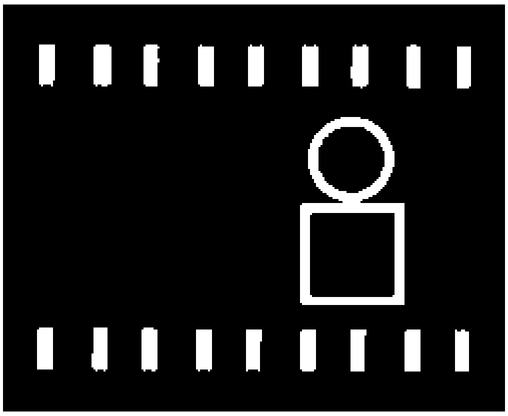


Integrating techniques combine several individual elements into a single concept such as a landscape or complete picture.

- Warm colors, such as red, yellow, and orange, emphasize subjects.
- Dark colors that are next to each other are difficult to see.
- Dark and light colors next to each other are easy to see.
- White letters on a dark background are very easy to see.



You can easily **change black and white negatives to color.** Add a drop of vinegar to food coloring and swab it on the entire negative with a piece of cotton. By using a tiny brush and a magnifying glass, you can also paint parts of the negative with different colors.



You can also buy special gels and dyes for this process, called Webster photocolors.

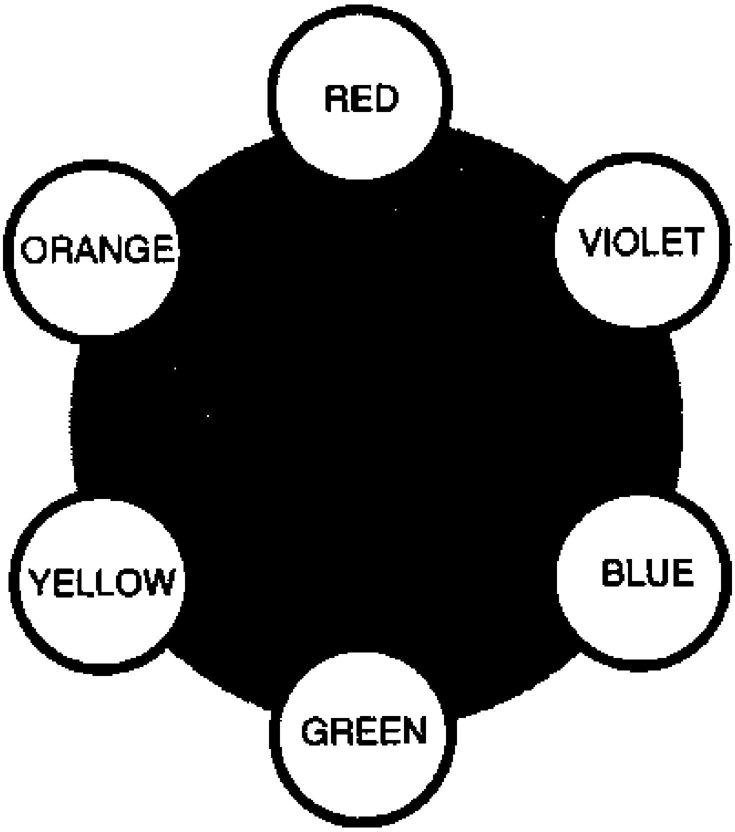
- Harmony - An effective slide has all the visual elements of lettering, color, material, texture, and style blended together to show a concept.

- Color - Color is an important component in graphic composition. Colors affect size, shape, contrast, attitudes, and texture of visuals and give nonverbal cues in learning (See Chapter 1, The Communication Process). Colors are also useful diagnostic tools of science.

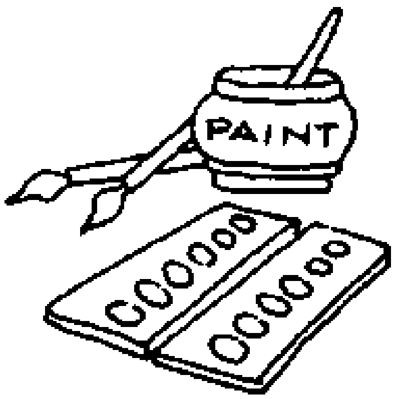
Pay attention to these *color tips:*

a. Use only two or three colors in a visual.
b. Cool colors, green, blue, and gray, recede and are best for backgrounds.
c. These *color systems* make pleasing combinations:

Self-tone - variations of one color: for example, light, medium, and dark blue



THE COLOR WHEEL



Complementary - colors opposite each other on the color wheel.

Triad - 3 colors equidistant from each other on the color wheel: for example, red, yellow, and blue.

There is a relationship between *color and legibility.* Some color combinations make messages • easier to read than others. These combinations enhance legibility:

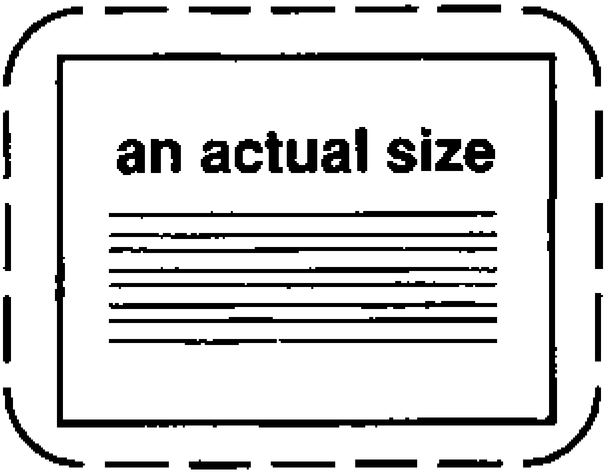
Letters	Background
brown	
green	
blue	white
black	
black	yellow
red	
yellow	black
white	red
white	green

These are only general guidelines. Create your own combinations.

3. ***How to make camera-ready copy:***

• Typewriter copy - You can use a typewriter as a speedy method of making word slides. However, a slide of a standard size paper will *not* work. It will make your slide too crowded and busy.

Here's how to make a typing template for slides. Cut a horizontally rectangular window in the middle of a piece of paper. The dimensions are given below. Draw a solid line along its perimeter. Lay this over your typing paper and type your copy within the window.



All copy should fit within the inner *solid line.*

The camera viewfindef should just include the *dotted line.*

• Standardizing copy - Most 35 mm slides have a height-to-width ratio of 2:3 in a horizontal format.

Therefore, try to **standardize** the size of all your artwork to make the photocopy process easier.

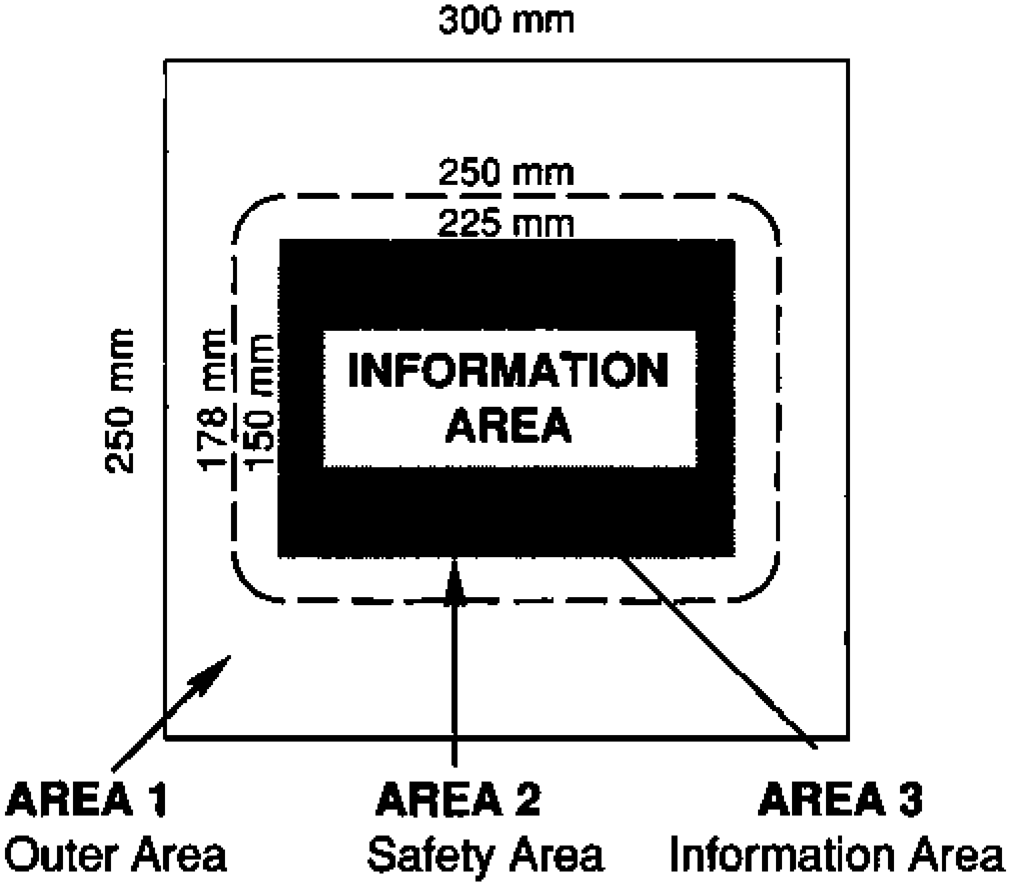
Here are recommended dimensions:

Area

- 250 × 300 mm is an outer area used for handling, production notes, etc.

- 178 × 250 mm is a good or safe area for the photograph. It should include the background.

- 150 × 225 mm is the information area.



The Rule of 7: Length of longest line × 7 = viewing distance

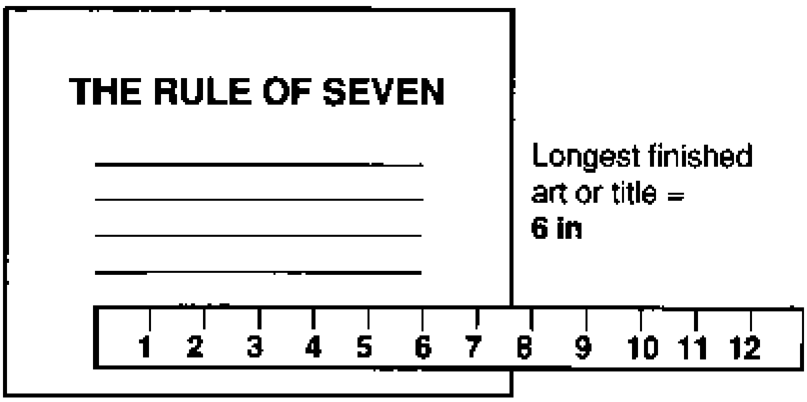
The **Rule of Seven** is one way to judge if written material will be readable. The steps are

a. Measure the length of the longest dimension of the finished art.

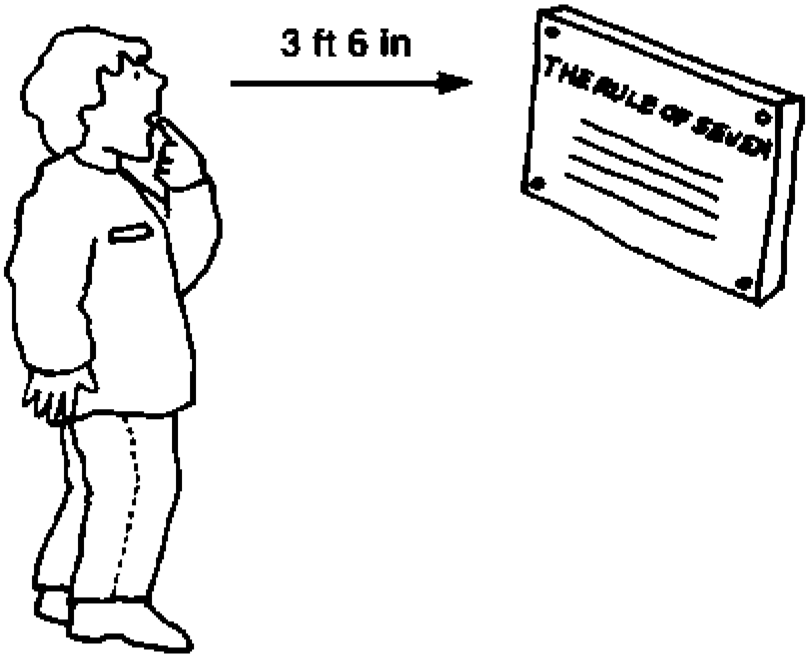
b. Multiply the length by 7.

Example: The longest title is 6 in long.
Multiply that number by 7.
Thus: 7 × 6 = 42 or 3 ft 6 in.

c. Place the graphic that distance away and if you can read it clearly, it will be readable on the screen.



Longest finished art or title = **6 in**



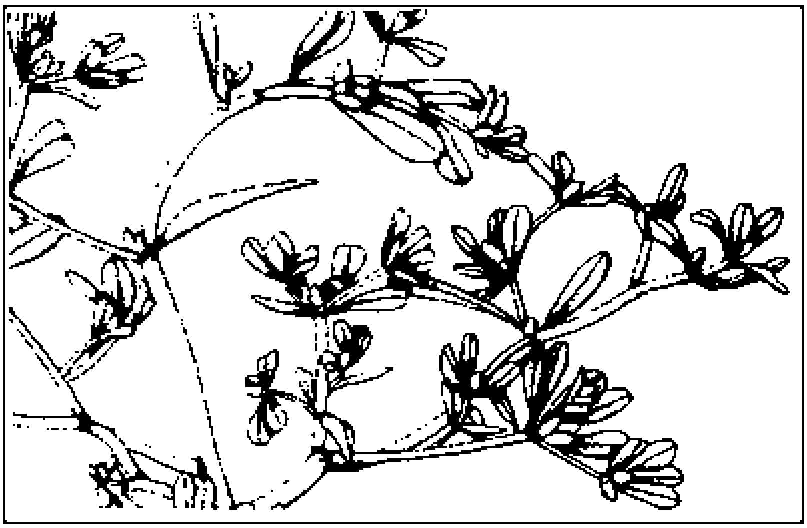
Photographs

Photographs are an effective method of communication. Although photography is a professional discipline, anyone can take pictures, especially with the new automatic cameras.

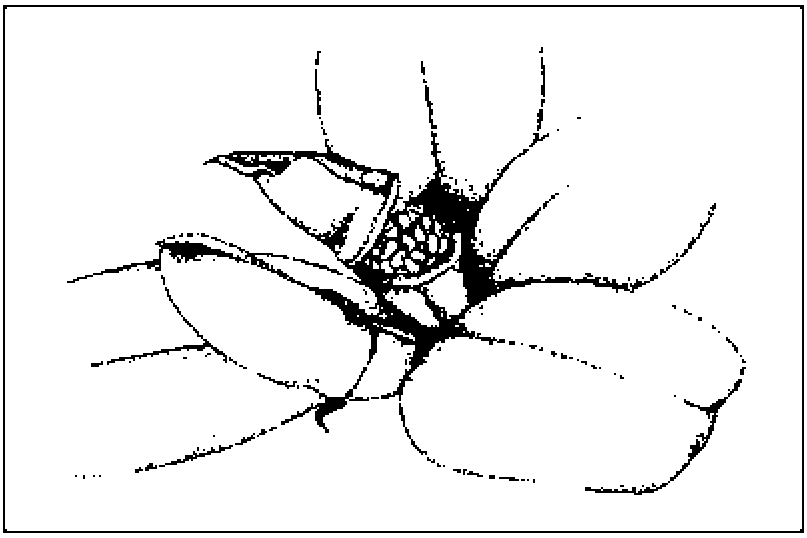
With a little practice and experimentation, you will be able to take suitable photographs for your A/I program.

Simple Guidelines

1. ***Detail.*** Photographs should contain the items necessary to communicate your subject matter. They should include sufficient **detail** so that students can see the points you want to make. Overall surroundings and panoramas are often distracting. Sometimes you need both an overall *view and* a close-up to communicate effectively. For example:



LONG SHOT



CLOSE-UP

A rule:

Film is cheap. When in doubt, take another picture.

The investment of time and travel costs more than the film, and you may have only one opportunity.

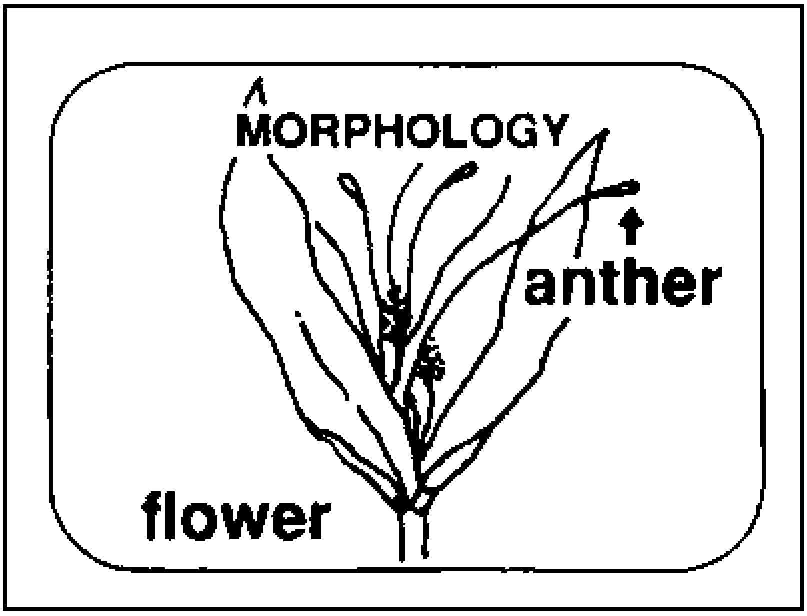
2. ***Composition***. Use good composition in photographs. The same rules of balance, emphasis, contrast, and harmony used for graphics also apply to photographs.

3. ***Color.*** The natural setting usually commands the color composition of photographs. Unless you are looking for a special effect, use color film. It may cost a little more, but it lends another dimension to visual communication. Humans evolved with colored vision for a reason - color communicates.

Use your creativity in taking photographs. When looking through the viewfinder, go forward, back, up, and down with the camera as you compose your pictures. Pretend that you are the grand artist designing a picture to make the greatest possible impact on your audience - your students!

Combination slides

Remember that words on slides reinforce the abstract verbal concept with a concrete visual image. You can accomplish this by using titles to introduce the visual and labels to identify its different parts. You'll want to use these verbal codes on both graphics and photographs whenever possible.



The principles in the section on titles and word slides also apply to words on graphic and photograph slides.

Here are a few more guidelines:

• Make labels concise and simple, 1-2 words.

• Too many labels are confusing. Use only 5. Use more slides if more than 5 labels are necessary.

• Often, main visuals will require supporting words. You can highlight the most important element with color. This especially applies to progressive disclosure slides.

• When you use lines or arrows to point from words to pictures, they should be precise.

Photographic equipment and slide copying

The camera

These are the best camera specifications:

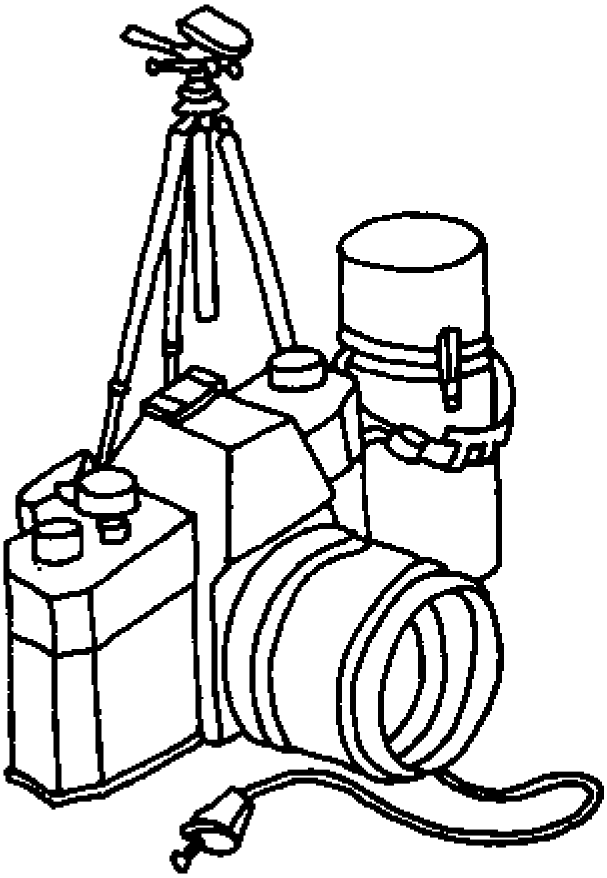
size - standard 35 mm single lens reflex

lens - 50-55 mm micro (1:1)
lens tubes with 2 extension rings

flash - rechargeable battery
extension cable

features - built-in exposure
focal plane shutter

Accessories



The following are necessary accessories for photography:

tripod
shutter cable release

Film

Two kinds of film may be used for slides:

color - Ektagraphic (ASA or ISO) 64 and 100
black and white - positive 25

negative 25
high contrast

Copystand

A copystand is helpful in producing slides and to

• photograph camera-ready graphics
• affix titles and labels to photographs, and
• copy photographic prints and slides.

Ready-made copystands are available from manufacturers. However, with a little effort and ingenuity, you can construct your own practical version (See Appendix 1).

To conclude, this was a very long detailed chapter which will take some time and study to completely understand so that you can remember the information well enough to use it.

A participation exercise can help. Chapter 10 will show you how to write feedback exercises, and we already gave you objectives at the start of the chapter. After this long chapter, the author is very tired, so it will help us both if you practice using this information by writing your own feedback exercise. You will be surprised at how much you have learned!

However, hurry because in the next chapter we do the tape and then try out the program!

CHAPTER 9. The Tape

Prospectus

This chapter will explain how to tape your program.

Rationale

Oral communication humanizes the autotutorial process, allowing students to become emotionally involved with the voice on the tape.

The human voice has musical qualities and tones and imparts an additional dimension to the message that is not available if it is written.

Objectives

At the end of this chapter, you will be able to

• Recall 5 components of a tape.

learning
message
pace
voice quality
music

• Describe the 11 sequential steps in taping a narrative.

produce copy
load slides
determine pace and time
record notes
link narrative with slide titles and labels
locate recording space
practice script
record
repeat and redo sections
edit mistakes
produce a master copy

If you intend to produce a print/ picture program on paper only, skip this chapter as it discusses how to produce a slide/tape or picture/tape module.

• List 6 considerations of creating a script or copy that assist in recording efforts.

standard paper
type in capitals
use larger type
double space narrative
triple space between frames
number frame narrative to coincide with visual frames

• Define and associate the following terms:

cold cuts
gingerbread
presence tape
dead spot
master

• Discuss 3 methods of producing gingerbread.

• Compare 3 variations of advance signals.

recorder inaudible
recorder audible
narrator audible

Components of a quality tape

As with graphics and photography, broadcasting or communicating with the human voice is also a profession.

Voice, tone, pitch, harmonics, pace, inflection, and volume all work together. They create an atmosphere that affects attitudes and enhances the effectiveness of the message.

For these reasons, it's best to get a professional broadcaster to record your tapes. However, time, money, availability, and other resources often make professional assistance impossible.

Message
Pace **=** **Quality**
Voice **Tape**
Music

But don't despair! You can produce your own tapes. In fact, you can even be your own voice. Before you begin, consider these components of a quality learning tape:

• The message should be appropriate to the audience (See script creation, Chapter 7).

• Pace/cues to advance the slides should be at a consistent speed but slow enough for students to understand.

• Voice quality should modulate with the script and be enthusiastic.

• Music or gingerbread, as it is called in the trade, adds variety.

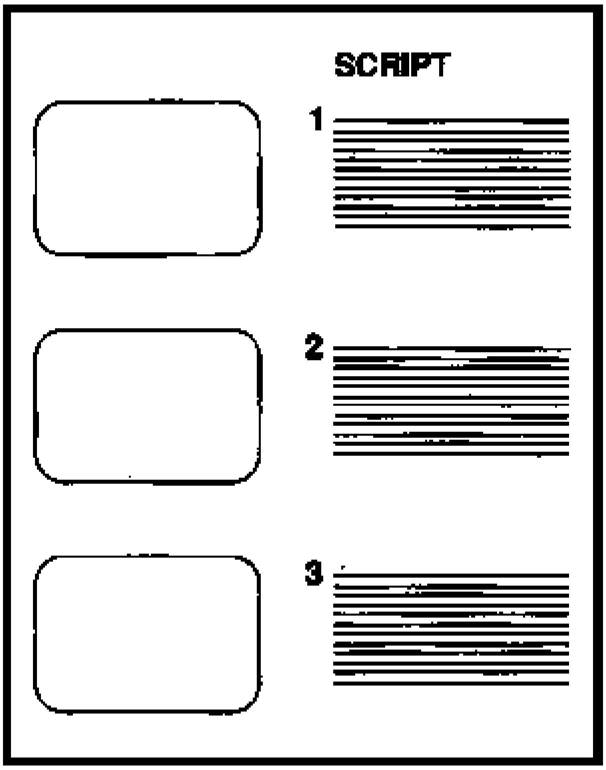
Your program will also have more variety if one voice introduces and summarizes the program, and a different voice explains the content of the module.

Recording the narration

Let’s go through the recording process step by step.

Step 1. Create a script.

- Type your script from the storyboard frames onto standard paper.
- Type the script in capitals.
- Use large type if possible.
- Double space as you type.
- Leave 3 or 4 spaces between texts of script for different frames.
- Number each section of script to correspond with the accompanying slide.



An example of a script using these guidelines would look like this:

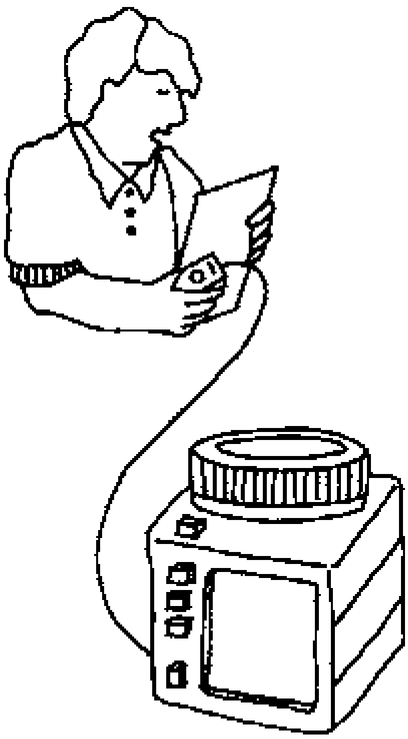
9 ALLOW ME TO EXPLAIN. EVERY 7 TO 10 YEARS, INFORMATION DOUBLES. OF COURSE, MUCH OF THIS INFORMATION IS SCIENTIFIC.

10 WHAT WE HAVE IS A LITERAL TECHNOLOGY GENERATOR THAT IS PRODUCING ALL TYPES OF TECHNOLOGY AT AN UNPRECEDENTED PACE.

11 THE PROBLEM WE MUST SOLVE IS NOT ONLY HOW TO TRANSFER THAT TECHNOLOGY SO THAT IT IS AVAILABLE TO ALL NATIONS BUT ALSO HOW TO ADAPT THAT TECHNOLOGY TO LOCAL CONDITIONS.

Step 2. Load your slides into a carousel.

Step 3. Read the narrative aloud as you look at your slides and time the length of the presentation.



Remember you have seen the entire program many times, but it's new to the student. Go slow and leave ample time for slide changes. If it is done at the right tempo, it will seem too slow to you. Initially, you'll tend to speak too fast because of the excitement of talking into the recorder. Here's an excellent way to achieve the correct pace. Use student volunteers. Allow them to look at the slides with you as you read the script.

Step 4. Once you have determined the correct pacing, read the copy through again.

Make any notes or cues in the margin of your script that will help you record.

Step 5. Check your script against the slide titles to be sure they are consistent.

It is distracting to students to hear one thing and see something different on the slides. Be sure the narrative fits the slide.

Step 6. Find a quiet room.

If you don't have a sound room, recording at nighttime works best. Beware of motors and buzzing light fixtures. You will need a cord extension to advance the slide and avoid the sound of the slide projector on your tape.

Step 7. This is it!... Almost... Read your copy through aloud one more time as a final practice.

Read with inflection, a pleasing tone, and enthusiasm, but do not ad lib. This is a live practice!

Practice placing your used copy gently on the floor. This method helps prevent the microphone from picking up paper rustle.

Step 8. Do it once more but this time, record.

Step 9. If you're recording on a reel-to-reel recorder, you can splice out mistakes - if you know how.

If you're recording on a cassette, you may have to record several times to get a satisfactory copy. The quality is up to you! Your finished voice recording is called a cold cut.

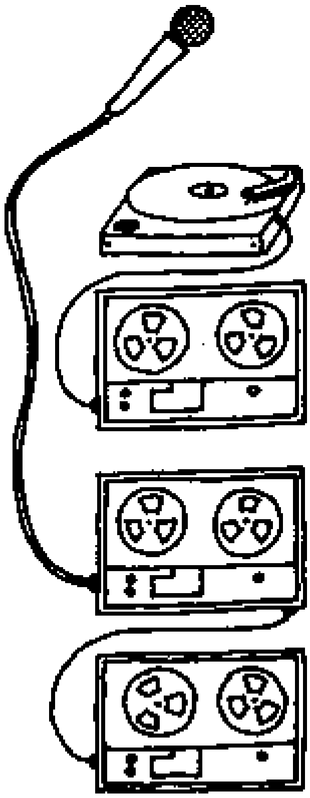
Step 10. If you're using a reel-to-reel recorder and plan to have someone splice or edit the tape later, allow several minutes of blank tape to run.

This is called "presence" tape. It sounds more natural when spliced in pauses than if you use unrecorded tape which will have a discernible "dead spot."

Step 11. After recording or cutting a successful tape, make a copy and use it for the next step. Save the master or cold cut.

Step 12. Gingerbread.

Radio people call music or other special effects gingerbread. Gingerbreading a cold cut is not essential to presenting the message, but it does add another dimension. Here are 3 ways to do it.



Methods of Taping

Method 1 - using 2 recorders

1. Read and time your presentation.
2. Select music to go with the narration.
3. Record the music, or use a record of the music if available.
4. Play the music as background as you record your narration.

Method 2 - using 3 recorders

1. Time the already recorded narration.
2. Select music.
3. Play the music and the narration simultaneously while recording on the third recorder.

Method 3 - using l recorder

Of course, if you have access to a sound-on-sound recorder which has the ability to put one recording on top of another, you can dub or record music right over the voice.

No matter which method you use, be sure to make a copy of your original or master. Save the master as a back-up in case the copy gets lost or destroyed.

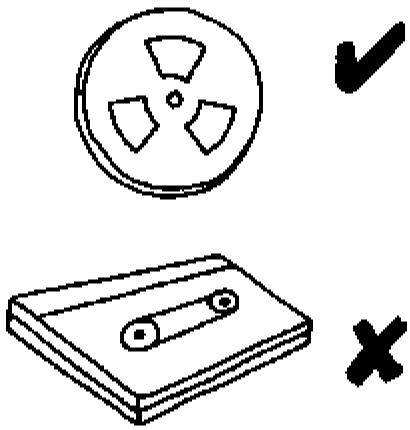
Most students feel that you should use music or sound effects sparingly. They work best as cues to introduce and end the program or to introduce and end breaks in the middle of the program.

Students also say that music is distracting when used as a background during learning. However, recent research has shown advantages of inputting particular types of information with particular types of music. This method of learning via music is called superlearning (See references at the end of this chapter).

Editing the tape

If you are using a reel-to-reel recorder, you can edit the tape by removing or adding sections to it. You need an inexpensive splicing machine to do this. The procedure is very simple, and the instruction comes with the machine.

Editing eliminates bad “takes” or mistakes in the program narration and is helpful in achieving precise timing between slides. We do not recommend editing cassette tapes.



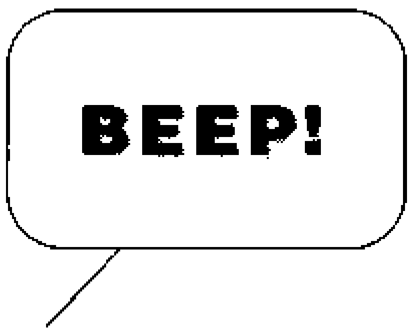
Editing and using gingerbread and multiple recordings are fine if you have the available materials. However, **you can make good, practical instructional tapes by simply recording the narration on an inexpensive cassette recorder.**

Cues

Of course, students need some cues on when to advance the slide projector to synchronize the slides and tape. Some recorders have a device that makes either a sound or a silent advance signal on the tape. The signal is part of the other track of the tape so that you cannot record on side two.

Inaudible advance

If you use a silent or inaudible advance, use a cable to attach the recorder to the slide projector. The recorder will then automatically advance the slide projector when it receives the inaudible cues on the tape.



Audible advance

If the tape has an audible advance cue, the recorder and the projector run independently. At the sound of the cue, the student manually advances the projector.

Narrator audible

If you do not have access to a recorder with advance signals, you can make your own advance cues. Use a light bell, or tap on a water glass (different water levels make different sounds), or some device that makes a pleasing tone. When you are recording the script, simply sound the tone between each frame. The sound will signal to the student to manually advance the projector.

There! We finished Chapter 9 on making tapes. Our feedback exercise will be brief because most of the material consists of your psychomotor skills. Therefore, your feedback will really be in the form of your finished tape.

> ***A reminder:***
>
> **These are simple guidelines for taping your program. We purposely omitted intricate technical details and devices. You can "cut" or make effective instructional tapes with your voice, cue signals, and if you want, use background music that fits your culture and student population. You can do this all at one time on a single, inexpensive tape recorder.**
>
> **However, it you do have the resources, professional quality tapes are desirable.**

Feedback exercise

• You should always use a professional broadcaster to make tapes.

_____YES _____NO

• Music and pace are two important components of a quality tape. What is another primary part?

• Fill in the blanks to complete the 6 requirements in creating copy.

Script copy should use

1. standard copy
2. ________________________________
3. larger type for reading ease
4. ________________________________
5. ________________________________
6. matching script with visual

• The task analysis of tape production in sequence is

1. Produce copy/script
2. Load slides
3. ________________________________
4. Record notes for speaking
5. ________________________________
6. ________________________________
7. Practice
8. ________________________________
9. ________________________________
10. Edit mistakes
11. Master copy
12. Gingerbread

• Match the following terms:

A. recorded narration	___ good recording
B. original copy	___ presence tape
C. tape recorded without sound	___ gingerbread
D. musical filler for narration and pauses	___ cold cut
E. pause with different sound than recorded tape	___ cue
F. advance signal	___ master
G. take	___ dead spot

• Explain the process of putting narration with music using two recorders.

• Why don't we recommend putting background music with the narration?

• Discuss the types of cues.

Answers to feedback exercise

• No

• voice/message

• all capital type
double space narrative
triple space between frames narration

• 3 pace
5 link narrative and visuals
6 locate quiet space to record
8 record
9 re-record segments with mistakes

• G, C, D, A, B, F, E

• Play music as you record narration.

• It distracts.

• Two types:

- audible advance
- inaudible advance

CHAPTER 10. How to Use Feedback and Evaluation

Prospectus

In this chapter, we will learn how to construct feedback and self-evaluation exercises and find out why they are important in A/I.

Rationale

Since self-evaluation exercises are a major part of the A/I concept it is important to know how to fit it in with the other parts. Self-evaluation exercises are important because they provide feedback to the learner on the learning process.

Objectives

At the end of this chapter, you will be able to

• List and discuss 6 methods of repeating information in an A/I module.

objectives
advanced organizers
examples
visuals
chunking
feedback exercises

• List 7 types of drill and practice items that can be used in feedback exercises.

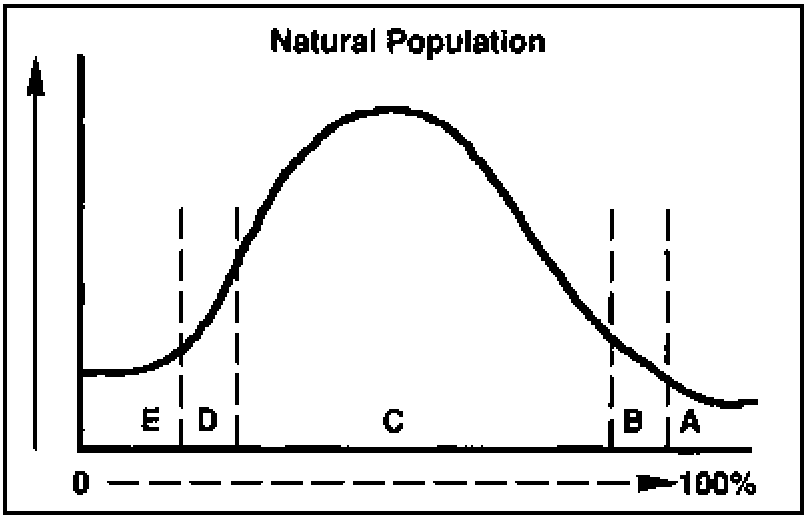
multiple choice
short answer
completion
matching
draw and label
short essay
true or false

• Discuss the relationship between objectives and feedback exercises.

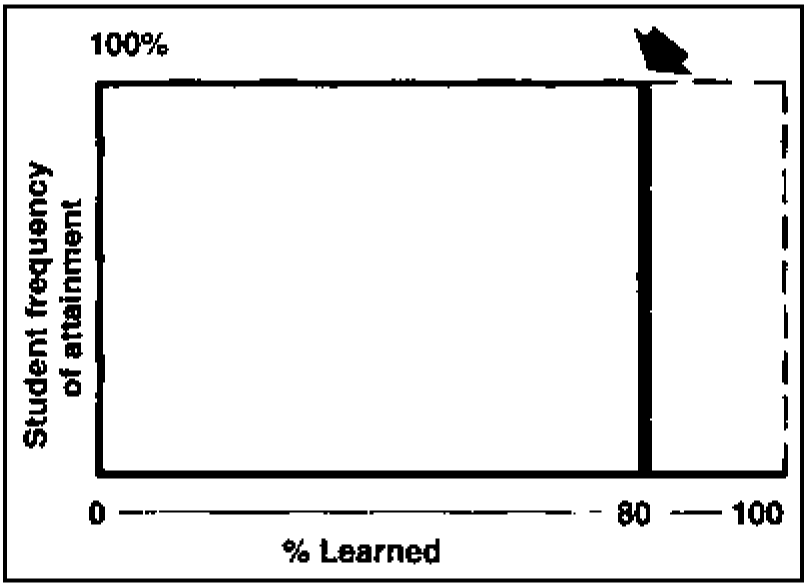
objectives are a source of questions

• Compare and contrast norm referenced and criterion/mastery-referenced instruction.

	Norm	**Mastery**
distribution	Central limit (bell distribution)	No curve (mastery point)
material focus	Broad subject matter focus	Broad and specific matter focus
student focus	Group	Individual
reward	Competitive award system: (ABCDE)	Individual award system pass/ fail/extra materials for group competition



NORM REFERENCED



MASTERY REFERENCED

Repetition and A/I

Repetition is a major learning device. Finding methods to repeat information without boring the learner is one of the major challenges of creating self-learning programs.

- The use of **objectives** is one major method of repetition.

- **Advanced organizers** or titles focus the information to be learned. Then you can restate the title in the content script (See Chapter 2).

- **Examples** are another form of repetition.

- Written descriptions followed by words or portions of the script inserted in **visuals** such as tables, pictures, or graphs are other methods of varying repetition.

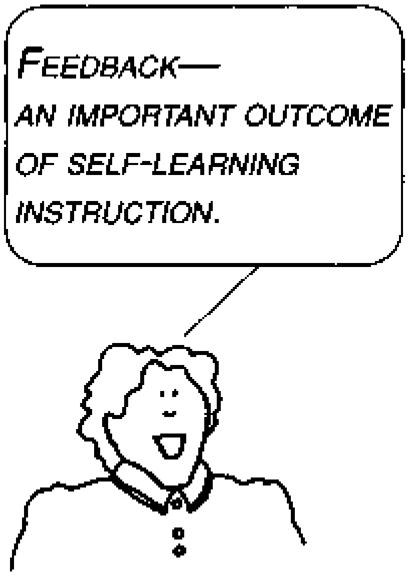
- **Chunking** information under objectives is still another method.

- And finally, **participatory** or self-evaluation exercises or questions are most important.

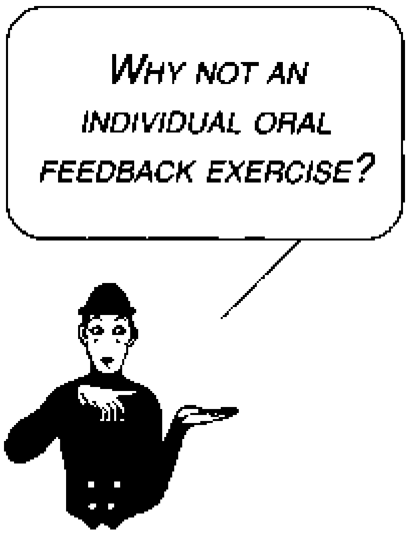
Constructing feedback exercises

Once you have written your objectives, feedback exercises are easy to construct. Simply restate the objectives in the form of questions or statements using the standard testing methods of

- multiple choice
- short answer
- completion
- matching
- draw and label
- short essay
- true or false



It is not necessary to include all the information associated with an objective in the question. Perhaps a sample will be enough to assume that the student has mastered the skill and can perform the objective.



For example:

Objective = List the 8 parts that form the definition of the A/I program.

Feedback exercise = The first part of the A/I program is the objective. Others are a change in the instructor's role, self-pacing, linkage of objectives to evaluation, and print/tape media.

Can you name 4 additional parts?

1. ________________________________
2. ________________________________
3. ________________________________
4. ________________________________

Evaluation and writing valid tests is a discipline in itself, one too large for the scope of this guide. However, you *can* write simple questions that will enable students to give you feedback on what they have learned.

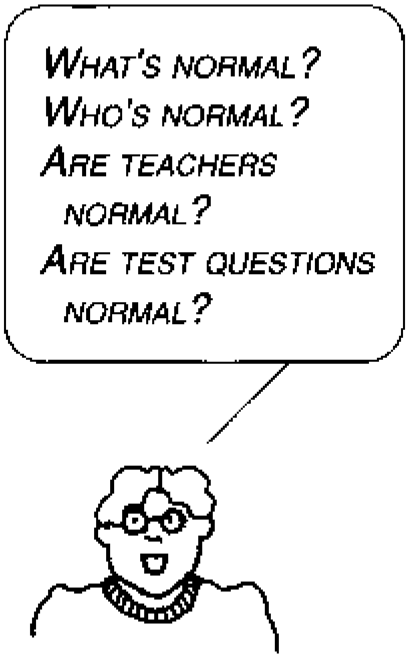
The important rule to follow is: **Link your questions to your objectives; use your chunks.**

We assume you have had practice in writing these kinds of test questions. We cannot address question construction in this book. If you need help, refer to texts on the subject because objectives and feedback exercises are important parts of an A/I module. It is essential that you be able to write feedback questions.

Referencing instruction

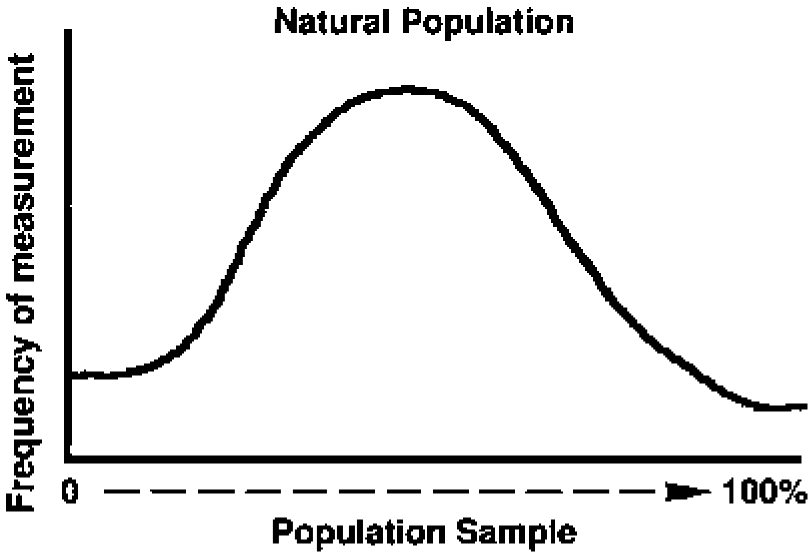
Now let's look at another issue involved in autotutorial methodology and evaluation: referencing instruction.

There is a philosophical controversy in education - one concerning **norm-referenced vs. criterion/mastery** or **referenced instruction.** This controversy surrounds A/I, so perhaps you should be familiar with it should you adopt this type of methodology. However, if you're not interested, you can opt out of this discussion by turning to page 199.



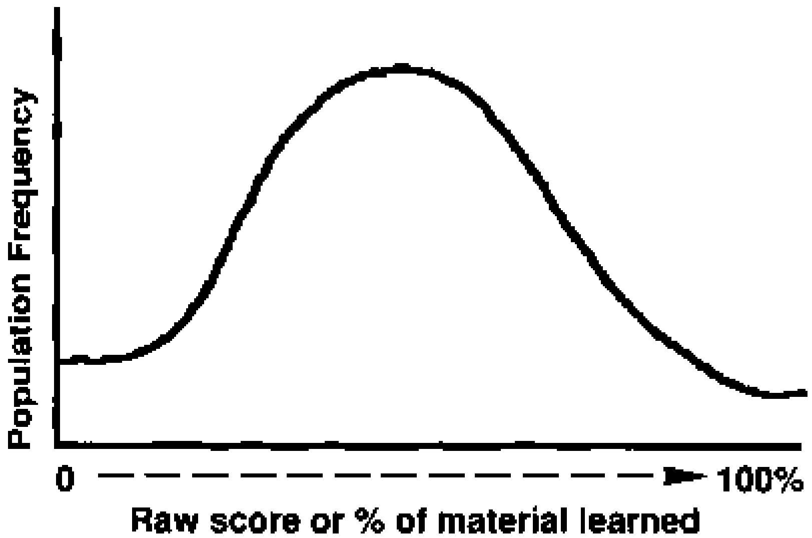
Norm-referenced instruction

Norm-referenced instruction involves the statistical aspects of the central limit theorem and the problem of grade distribution. In simple terms, the **central limit theorem** says that if you measure the frequency of an item of any natural or biological population (including students' learning abilities), the composite values will fall within a bell-shaped distribution curve.

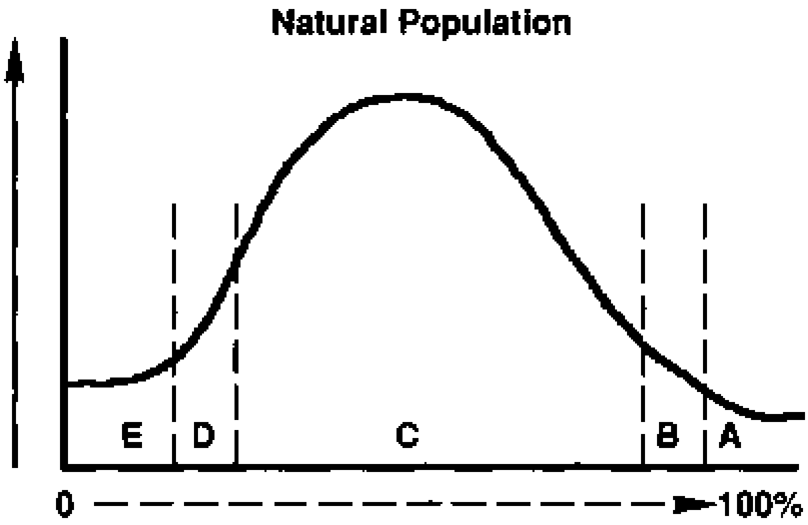


For example, if we randomly sample animal horn length, plant height, or seed weight of a natural population, the measurements would fall within a bell-shaped distribution.

When we apply this principle to the learning process, students' grades should also fall in a bell-shaped distribution.



Then grades in the upper tail of the curve are As and those in the other end are *Fs* and in between grades are ranked accordingly.



Because of competition, reward systems, honors, and transcripts, teachers have a difficult responsibility in determining and documenting students' learning success. The statistical procedures used in norm-referenced instruction are a tool to measure success. It is still by far the major methodology used in most instructional situations today.

Scenario 1: The adversary. To obtain a bell-shaped grade distribution, the instructor becomes an adversary to the learners. A few tactics employed in the adversary game are as follows:

- The lecturer lectures rapidly, covering many topics.
- The material is unorganized and without emphasis so students have difficulty taking notes.
- The instructor does not use visuals, handouts, overhead projections, or even write on the chalkboard.
- Outside readings are excessive and impossible to finish in the allotted time.
- The instructor does not ask questions, encourage discussion, or give practice exercises.

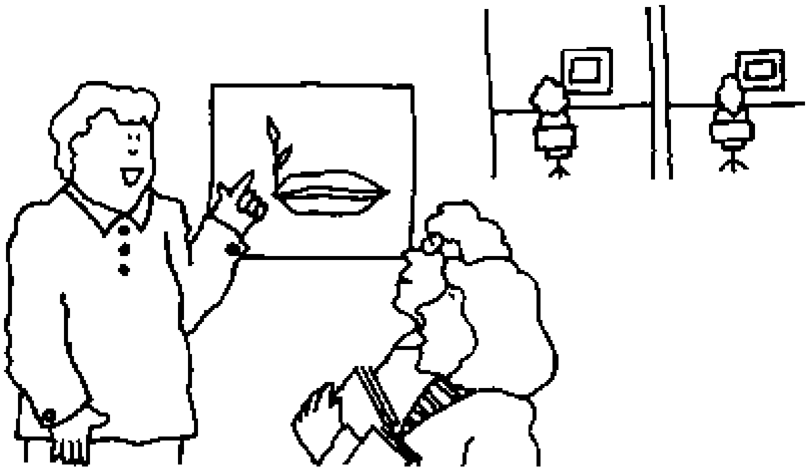
Then comes the final exam. Questions are ultra specific, tricky and ambiguous. Result! A nice bell-shaped distribution of the exam scores.

We've purposely overstated these tactics. Yet unfortunately, many of them are in use, and they are contrary to all recommendations of learning research.

Mastery-referenced instruction

The ultimate goal of a master teacher is that 100% of the students learn 100% of the material. This is a human impossibility, but nevertheless, a goal. There are many elements that contribute to this goal, but the 8 components of A/I are some beneficial methods that have been researched.

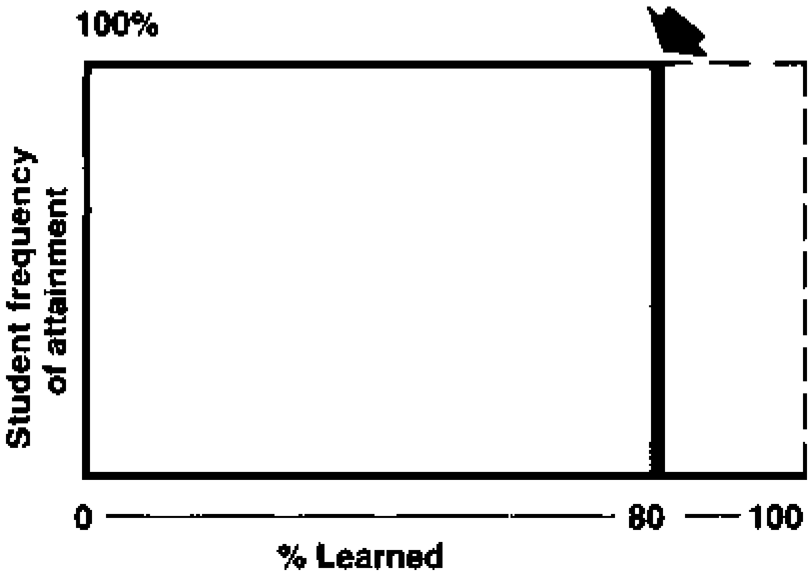
Scenario 2: The facilitator. The facilitator has goals other than the bell-shaped distribution of grades. His/her primary function is to facilitate the learning process.



In mastery learning, the instructor facilitates by designing goals that both the student and the teacher clearly understand. Students must successfully learn the subject material before they are able to move on to the next topic.

The subject mastery level is set wherever you desire. Many researchers recommend that 97% of the material should be learned before the student moves to the next block of material.

This is a good idea for airplane pilots and brain surgeons! Perhaps if you're not involved in life and death situations, you could set a lower standard.



Many educators argue for 100% mastery level of content. They contend that if 80% is passing, then identify the 20% that's not so important and throw it out. Prioritize material!

Yes

1. need to know

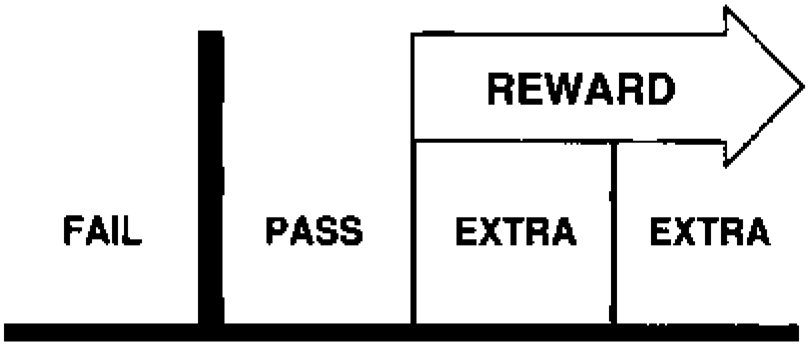
No

2. nice to know
3. less nice to know
4. barely relevant
5. might be used someday

Criterion or mastery learning means that with time, potentially all of the students pass. Some faster or easier than others, but they all pass. If everyone passes, how can you reward excellence? Simple!

Because students vary in the amount of time they need, motivation, interest, and maturity, some will always excel beyond the essential information. Then you establish a system that allows those fast learners a new exploratory track of independent exercises, reports, readings, and projects.

But all of the students must master your core goals or they fail! It is basically a pass/fail system with an added track of incentives for the learners.



But if you use criterion referencing, be prepared to defend your philosophy and system to your norm-referenced colleagues. Norm referencing has been around a long time, and it's the system with which they were evaluated.

Feedback exercise

Speaking of evaluation, it's time to give you the opportunity to evaluate your learning.

• Four methods of including repetition in a module are

____
____
____
____

• When writing feedback exercises, they should be linked with the contracts or objectives.

_____Yes _____No

• Check the terms that best define the focus of mastery instruction.

_____ bell curve
_____ specific focus
_____ group
_____ pass/fail
_____ reward system

• List 4 of the 7 reasons for using objectives.

____
____
____
____

Answers to feedback exercise

• Objectives
Advanced organizers
Examples
Visuals
Chunking
Feedback exercises

• Yes

• Specific focus
Pass/fail
Reward system

• Defines behavior
Learner/instructor contract
Organizes information
Autoevaluation for learner
Maximizes concept agreement
Minimizes learning time
Correlates output and feedback channels

Now that you have acquired this information on feedback exercises, practice designing a feedback exercise for the next chapter.

CHAPTER 11. Creating A/I Programs: Problems and Shortcuts

Prospectus

In this chapter we will discuss some problems you might have in creating a slide-tape program and show you some short cuts.

Rationale

Problems are not obstacles if you can anticipate them and devise ways to solve them.

Objectives

There are none. Just some practical hints to help you. We want to encourage anyone **who lacks abundant resources** and show you that you can still use autotutorial programs. Be sure to read **Problem 1!**

Problem 1: Hardware

The major drawback in using A/I is to get the hardware - adequate slide-tape machines to develop and carry out instruction for a large number of students.

Read this again and note that autotutorial instruction doesn't need machines.

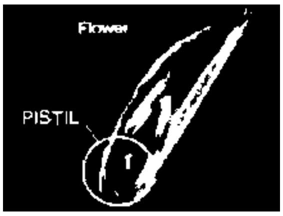
Solution

Abandon the slide-tape format but retain the **objectives, frame format, program, and the feedback exercises.** Using only picture/print materials and the principles of modular instruction, you can eliminate the hardware.

By doing this, you enable the students to use the information outside the learning center.

Here's how you can do it. The sequential pictures still contain titles, labels, and other cues, but they are compiled into a book. The script still coordinates the verbal information with the visual so that on the page, the picture is on the left and the narration is on the right. Be sure to underline or use capital letters for vocabulary words in the script.

FRAME X

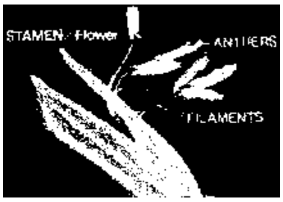


Narration X
The flower consists of a *pistil* (female organ) and

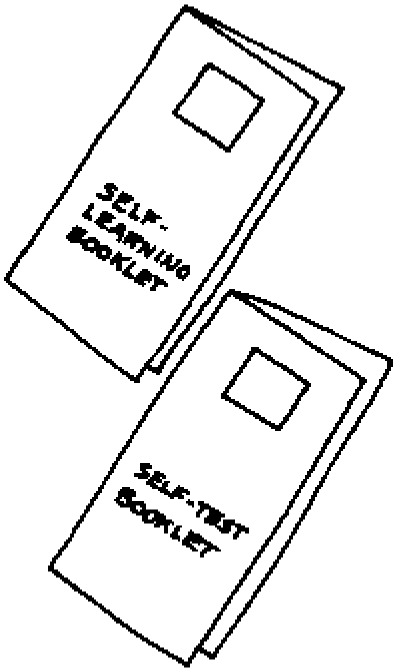
FRAME Y

Narration Y
six *stamens* (male organ)

FRAME Z



Narration Z
The stamens have two-celled *anthers* borne on slender *filaments.*



Disadvantages are that you do not have the voice and music that go with listening. Also, it is expensive to print pictures. You might compromise by using black and white instead of color.

If you can afford it, use this method of instruction in **addition** to the slide-tape format. It assists learning because learners can read the script and hear it at the same time.

Problem 2: Graphics

When trying to create A/I programs, it is sometimes difficult to find the right kinds of graphics for visuals.

Solution

Solve this problem by creating your own graphics. Usually, word slides are just a matter of sticking letters to colored paper. Here are some examples of short-cut graphic methods.

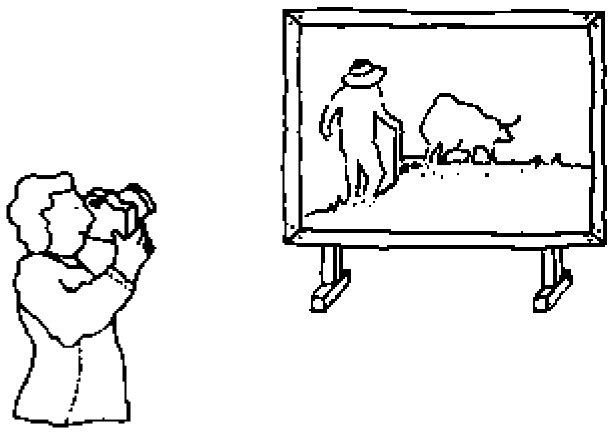
- Make a visual using colored chalk on a board, then photograph.

- Trace line drawings from a book; color them with pencils or crayons. Then paste them on colored paper backgrounds.

- Cut pictures out of popular magazines. Paste titles oh them and photograph.

- Use your best artistic ability and create your own. Often simple drawings can adequately convey concepts, even the use of stick people.

- Use your imagination. Use friends who have artistic ability.



Problem 3: Time

Creating self-learning programs take time. You'll need about one hour of production (writing, storyboarding, graphics, taping, etc.) for each minute of instruction.

Solution

Two ways to speed up program creation are

- Graphics - use the graphics short cut.

- Narration - many people know their content information so well that they can lecture from memory or an outline. Try this short cut.

    1. Create slides to go with the lecture.
    2. Record the lecture while using the slides.
    3. Have a typist transcribe the lecture.
    4. Edit the transcription into a narrative.
    5. Record the narrative with cues.

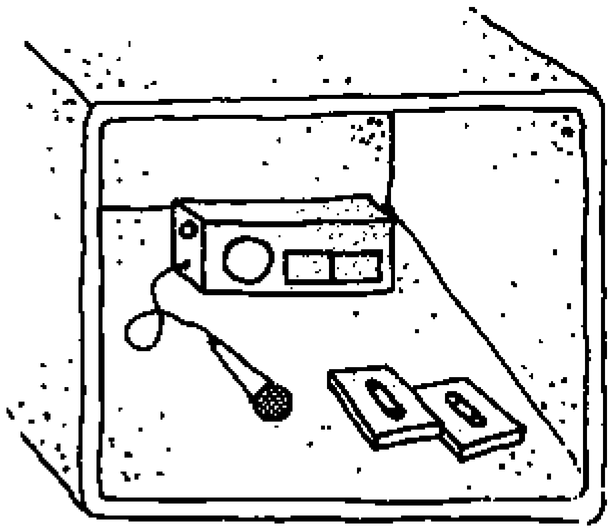
Remember, use only 15 seconds per slide.

Problem 4: Tape duplication

Often, high speed and multitape duplicating facilities are not available.

Solution

Send tapes out to a duplicating service or duplicate them yourself one at a time from one recorder to another. Just find a soundproof area. You can even record in an insulated ice chest in a quiet room.



Problem 5: Photography

Good photography is difficult to master.

Solution

There are only 5 solutions to this problem:

- Stay with graphics.
- Ship it out to a professional.
- Hire your own professional.
- Have friends or colleagues help out by sharing their photographs.
- Take the time to master the skill yourself. Get a friend to teach you. With time you can learn about lighting, colors, camera stops, and techniques. It's not really that hard!

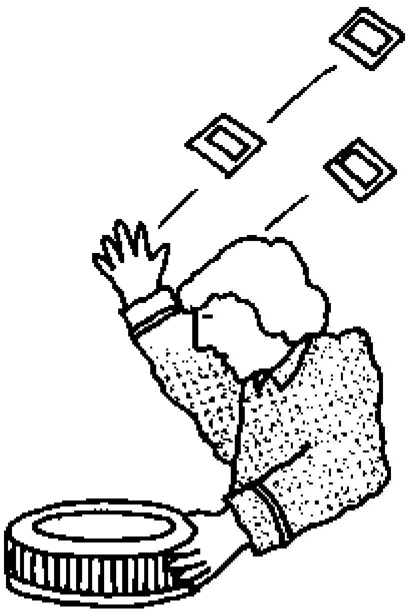
Problem 6: Updating programs

It is estimated that technical information doubles every 7 years. As a result, you will eventually need to revise some programs.

Solution

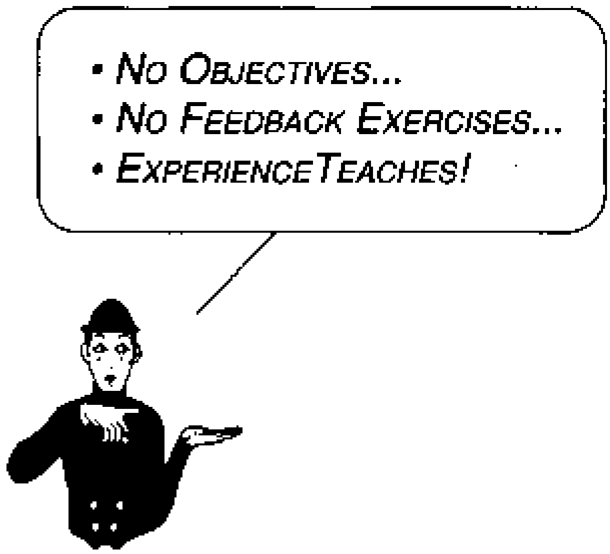
The frame format is ideal for revision. You can readily insert, delete, or reorganize chunks of information or concepts. Retaping and keeping visuals to the 80- or 120- frame limit are the primary obstacles.

However, if you are using the booklet format discussed in Problem 1 of this chapter, you have no problem. As information increases, increase the size of your book.



Problem XYZ

Any innovation has inherent problems that you must solve. You will undoubtedly encounter some not listed here. Be as creative in finding solutions to these obstacles as you are in creating your program. **It's part of the fun of being innovative!!!** In the next chapter, we'll talk about how to manage A/I instruction with the demands of students.



References and information of interest

Ostrander S, Ostrander N, Schroeder L (1979) Superlearning. Dell Publishing Co. Inc., New York, New York.

CHAPTER 12. Managing A/I Programs: Problems and Shortcuts

Prospectus

Now that you've got your A/I system developed and ready to run, what kind of problems can you expect to encounter in managing this teaching method? How can you solve them? We'll find out in this chapter, and learn more short cuts.

Rationale

Now that you're going to use A/I instruction, you'll have new responsibilities as a teacher. You'll also need to rethink the student/teacher relationship.

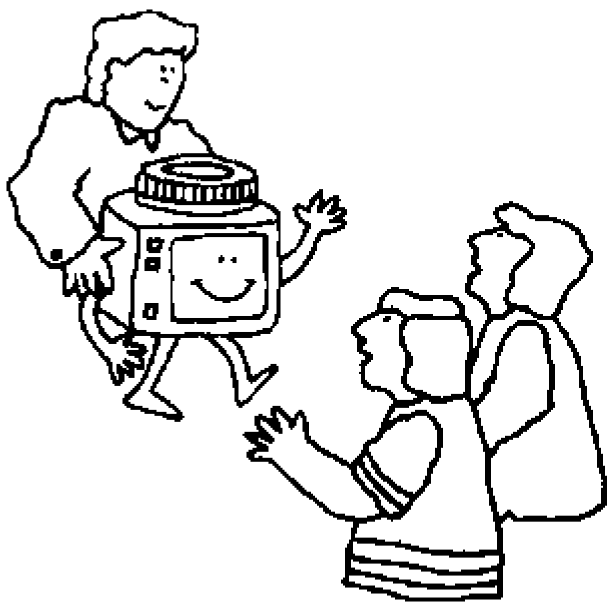
Problem 1: The new instructor/student responsibility

A/I places more responsibility for the learning process on the student. Many learning situations have an adult/child or parent/child relationship. A/I reduces these roles. Instead, the teacher, an adult, assumes the student is an adult and responsible for learning. Often, both students and teachers have difficulty with this role change. This is especially true if the students are immature or other classes still adhere to the more conventional teaching methods.

Solution

Before using A/I, talk to the students about the new method and explain how the responsibilities will change. Demonstrate a slide-tape program and discuss its advantages and disadvantages.

If you are an enthusiastic teacher and ask students to help you by giving feedback for an innovative instructional technique, they will feel a part of the process.



Problem 2: Space

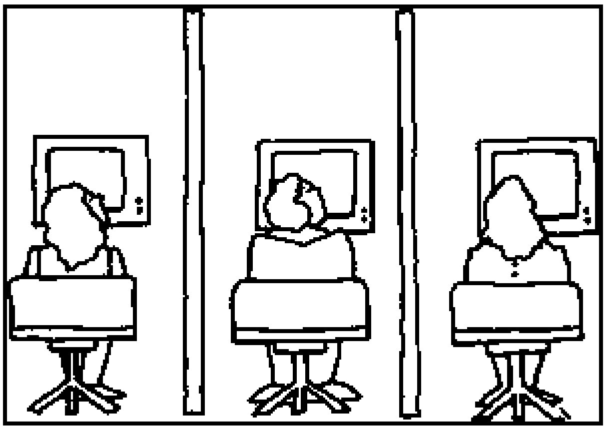
Hardware and software are useless without space in which to store and use them.

Solution

It is best if you can get a special room for this purpose. Divide the room into individual carrels such as those found in a library. Each carrel will usually seat one student, but sometimes up to three can use the carrel simultaneously.

Control the noise level by providing earphones for the students. Because the projector does make some noise, locate the room away from quiet areas. Experiment until you find the best place.

Often, the rear of a laboratory will work because the learning environment in a laboratory is compatible with machine noise accompanying the A/I hardware.



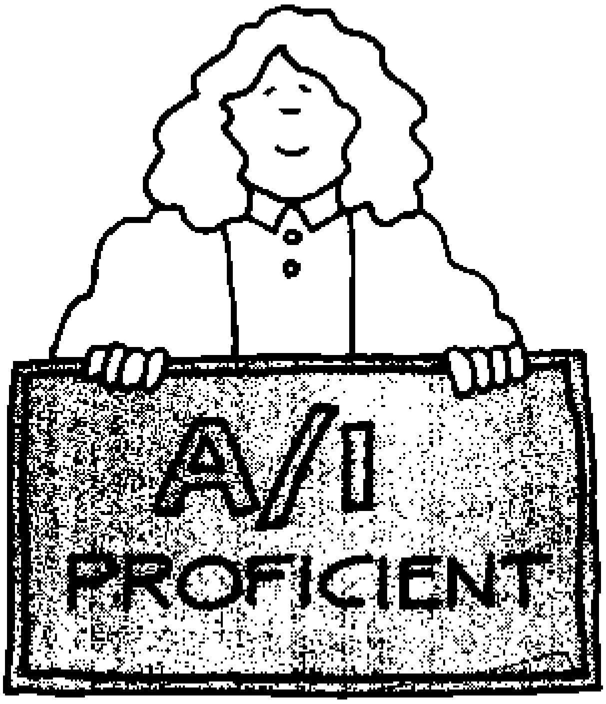
Problem 3: Using hardware

Slide-tape equipment, computer drives, and other teaching hardware are machines that need proper care to prevent damage.

Solution

Before beginning A/I instruction, teach students the correct way to use the equipment. Devise a step-by-step instruction sheet on how to run the video and audio hardware, rewind tapes, and check to see that all slides are present. Demonstrate these steps to students.

Give a hands-on skills test to each student. After accomplishing this, award each student a proficiency card.



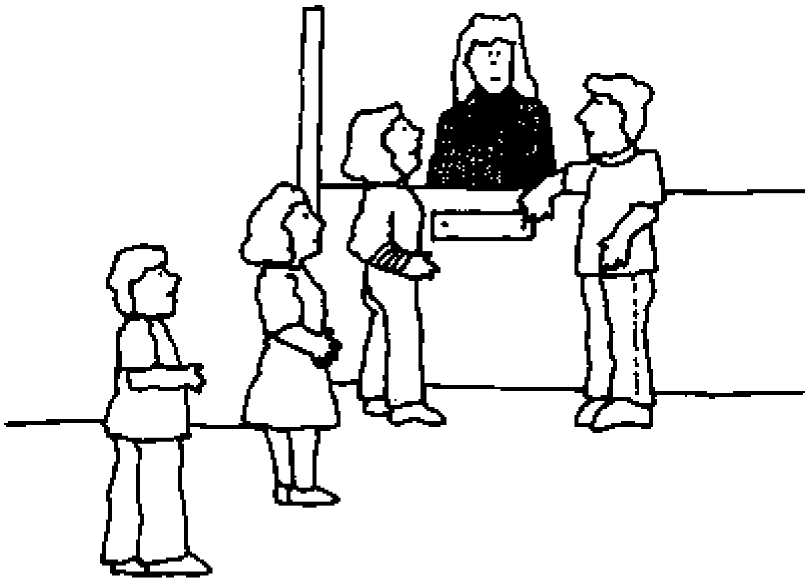
Problem 4: A check-out system

After you have taught students how to use hardware properly, devise a system of assigning software.

Solution

Some institutes have set up **learning resource centers** similar to a library. These units house the hardware for A/I instruction, and personnel check out the software when students show their proficiency certification card.

Often you can use an area of the library for software storage, and the librarian can check out the materials. Otherwise, the instructor can check out programs at specified times.



Problem 5: Demand for accessibility

Self-pacing, easy access to programs, and the option to explore and repeat material are some of the advantages of A/I. However, you can have problems if you do not have enough programs or hardware to fit the number of students.

Solutions

Spares*.* When duplicating software, make two spare copies. You can use these programs as spares during emergencies. Also, when ordering hardware, order one extra component to use during repairs. Keep a supply of projector bulbs available.

Extended borrowing time*.* To make programs available to more students, you do not always have to have more equipment. Sometimes, you can simply extend the time that programs are available to students. Often libraries have extended hours. If you can house and coordinate A/I programs with library activities, you can serve more students.

Sign-up sheets*.* Sign-up sheets can also regulate the demand for programs during peak times. Of course, this compromises one of the advantages of allowing students to learn when they desire. You could also divide the class into groups and allow each group access at certain times.

Pilot study*.* You can manage program accessibility if you implement A/I instruction by degrees and adjust the system according to student feedback. Try a student-use study to see how long students need to use the machines.

Time calculation*.* Usually, students spend an average of 1 1/2 hours on a 30-minute module. They study at the machine and not at home. Students who are not studying in their native language will use the program as an aid to foreign language study. As a consequence, they may use the program **twice as long.**

An example. For example, if you conduct a course completely by the A/I system, 5 stations, if available for extended hours (70 rather than 40 hours/week), will accommodate 70 students. This allows a student about 5 hours/week to explore three 20- to 30-minute modules.

SOME CALCULATIONS	
80	frames/program
× 20	seconds/frame
1600	seconds/program
60	seconds/minute
= 20-30	minutes/program

Students will use part of the time at the station to review, study objectives, and do evaluation exercises. Even so, 5 hours/week per student should be adequate.

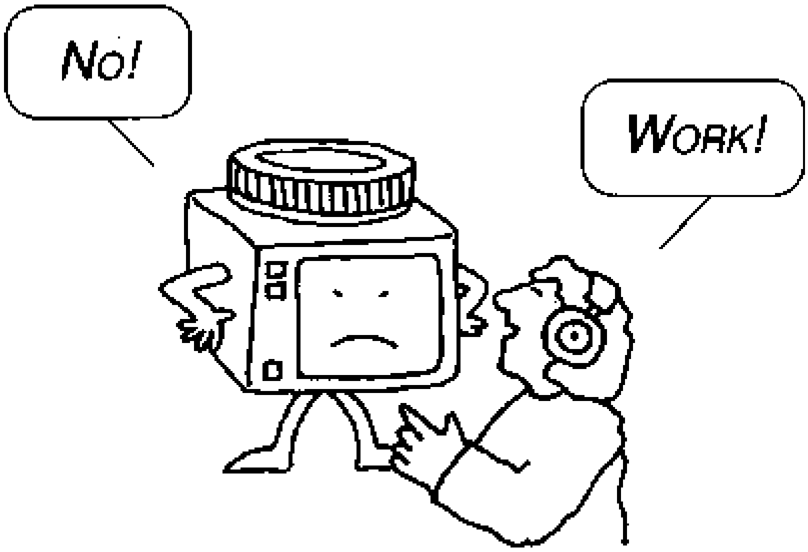
Problem 6: Hardware that doesn't work

Hardware often won't work just when you need it most. Some developing countries experience frequent and extended power failures.

Solution

Find out ahead of time where you can find adequate repair facilities for the hardware and how long it takes to have it fixed. Plan your assignments and reserve equipment accordingly.

With some ingenuity, you can modify hardware to function on AC or DC batteries. Then when a power failure occurs, you can switch to battery power. Another option is to have your own generator.



In this chapter, we have discussed 6 of the most common problems of using and maintaining A/I programs. You will encounter other problems depending on your institution, finances, and culture.

We also talked about the new role of the A/I teacher as a facilitator or a manager. Our potential problems and solutions may help you assume that role.

Perhaps you think these last two chapters on helpful hints are less important than information on software creation, objectives, and feedback exercises. However, once you begin using A/I, these hints will take on a new significance!

Another significant word is one in the title of this publication, guide.

There are whole books written about

- visuals
- educational theory
- programmed learning
- adult-to-adult teaching (andragogy)
- the information explosion
- writing objectives
- evaluation

This publication is a brief discussion of these concepts as they relate to technology transfer.

It is hoped that you learned from this publication. For additional assistance in your self-learning mode, please read the books and articles listed at the end of each chapter.

***Parting Note:* You will notice that most references in this guide are between 10-20 years in vintage. That means the technology has been around for a long time! Even then, we have to add a few more years because a piece of work takes some time for R and D before it gets cited.**

***A suggestion:* Maybe it's time to get aboard - catch up and take the challenge to transfer this technology into your domain?**

APPENDIX

How to make a copying stand

You can build this simple copying stand inexpensively (Fig. 1). You use it to hold a 35-mm camera when you photograph artwork or copywork. You'll need these materials:

- 1 piece plywood, 3/4 × 24 × 24 in
- 4 flathead bolts, 1 /4-20 × 2 in
- 1 carriage bolt, 1 /4-20 × 4 in
- 5 washers, 1 /4 in
- 5 wing nuts, 1 /4-20
- glue
- finishing nails, 4D
- lacquer or enamel, matte black

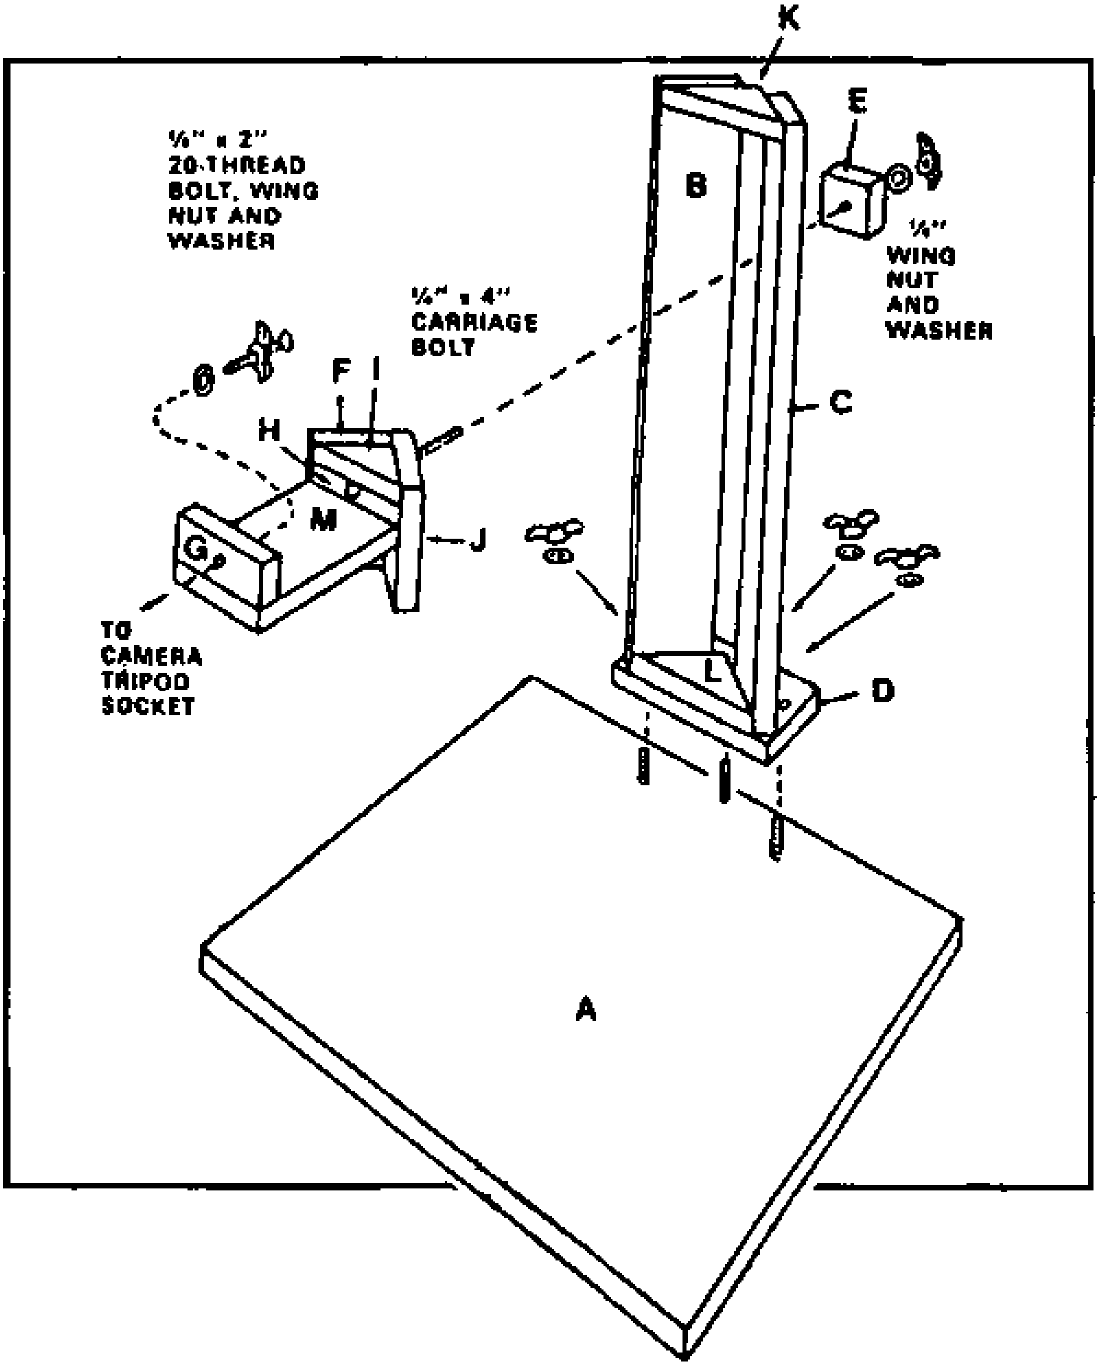


Figure 1. The assembled copying stand is shown partially unpainted so you can more easily identify the elements that can be disassembled for portability; the finished stand should be completely painted matte black.

Constructing the stand

You can cut all of the wooden parts from your single piece of plywood (Fig. 2).

The dimensions in Figure 3 are not critical. You can reduce them by the width of the saw cut. Cut right angles accurately so that you can position the camera properly in relation to the reflection copy.

Glue and nail all permanent joints for rigidity. If you don't have to disassemble the copy stand to store or transport it, you can also glue the camera support column to the base.

Paint the entire stand matte black to minimize light reflection.

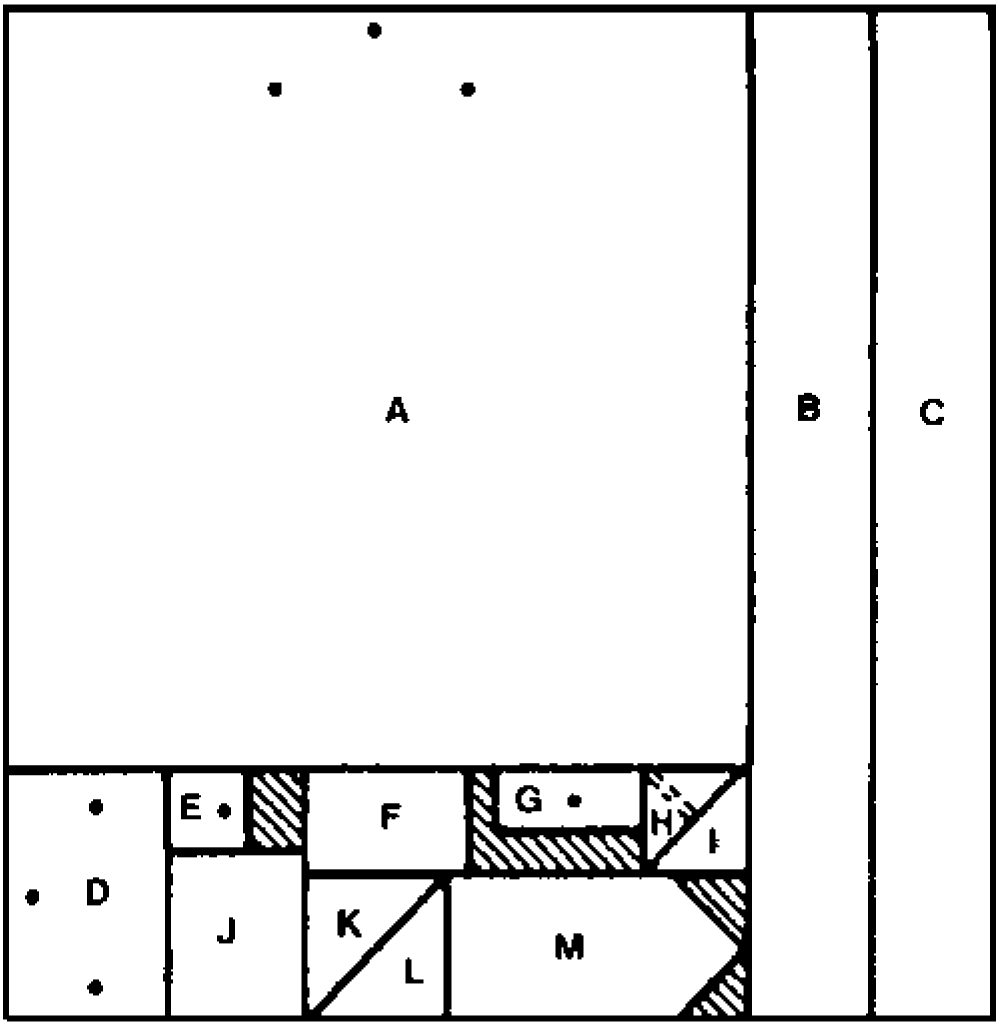

Figure 2. Cutting layout - 3/4” plywood, 24” × 24”. Code letters are a guide to assembly.

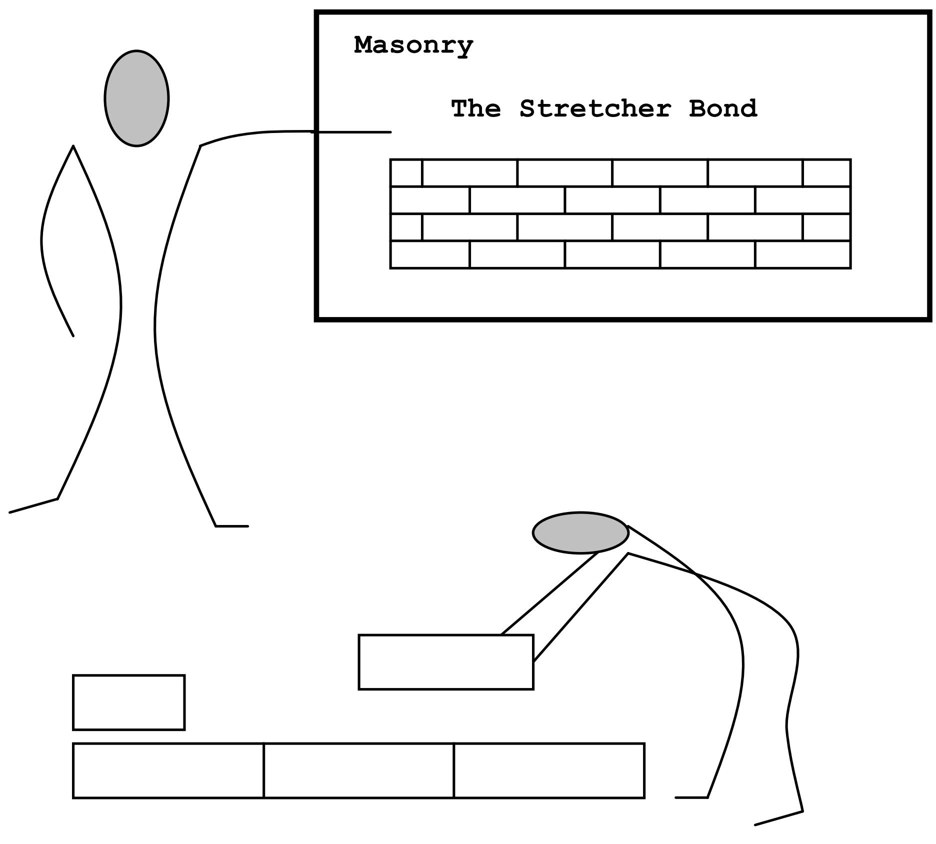
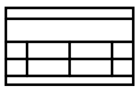
TEACHING IN THE TVET SYSTEM



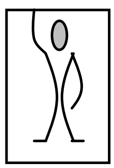
A CONCEPT FOR THE TRAINING OF VOCATIONAL TEACHERS

Robert Schrembs

For the use of this book:



This sign is the symbol for a lesson form. It announces that the explanation is based on the example in the first section and should help to make explanations concrete.

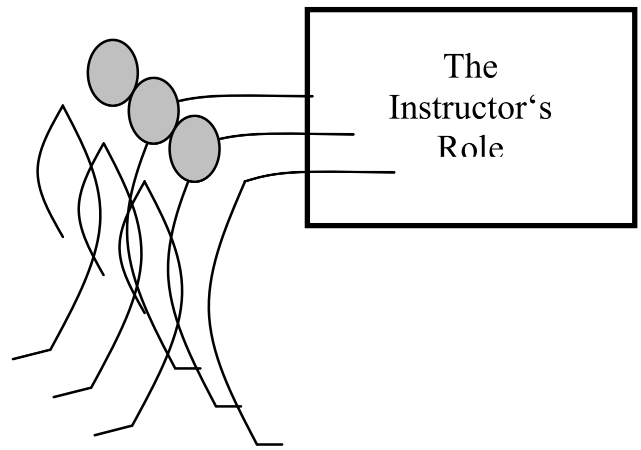


This symbol indicates an experiment that was done to give a proper explanation or shall be seen as a request for doing a practical exercise.

Depending on the organisation to which an institution belongs, there are different terms in use. In this book, Vocational Training Centre, Technical Training Centre, Technical Training Institute, Vocational School and Vocational Training Institute... are used synonymously. The same goes with the terms for the staff: (Vocational / Technical) Teacher, (Vocational / Technical) Trainer, (Vocational / Technical) Instructor…

1 The Particular Role of an Instructor

The qualification of teachers at technical and vocational schools and training centres are different from those of the general educational sector. Instructors are not only teachers or educators. They are craftsmen and sometimes they have to work as advisors, in particular, as business advisors. Hence, an instructor has to have a variety of abilities.



1.1 Personal Competencies

Instructors are not born as instructors, they have to be trained. Some people might have a particular talent for teaching but most people don't. However, teaching can be learnt. A major prerequisite for this is that a person wants to teach. Someone who is urged to teach can never be a good teacher. Apart from abilities that can be trained, a teacher should have some character capabilities.

A model instructor has a well-balanced personality and is not temperamental. This will help trainees to build up confidence in the instructor and lead to a good mood in the classroom. He / she should have natural authority and be able to guide young people. What is meant is the art of dealing in human relations. To be able to move individuals forward for their best efforts. Being a leader requires having a sense of responsibility. Furthermore it is helpful to love justice and be objective and co-operative. Patience is essential.

Indeed, it is hard to find somebody who unites all these characteristics. However, everybody who is teaching young people should consider these as goals to be achieved in his job.

1.2 Pedagogical Competencies

This type of qualities can be acquired during the teacher training course. It can be regarded as the contents of a teacher's apprenticeship.
First of all a teacher must be able to choose the correct and most important topics of a trade. Not everything can be learnt within the period of training. The second step is to group these topics into logical units and prepare proper lessons with it. Planning and running a lesson requires competencies in the whole field of teaching techniques. The most important are covered in this book. He should be able to transfer theoretical knowledge as well as practical skills.
In addition to the transfer of knowledge, an instructor has to advise the students mainly in the field of job finding or self-employment. Sometimes students even look for advice in personal affairs.

1.3 Professional Competencies

These abilities include the professional skills. A teacher should have acquired them during his own apprenticeship as a craftsman and his working experience.
He / she must be a master of his / her trade. To be a master does mean being a model. It is not enough to be a craftsman but a good craftsman. An instructor should always keep his / her eyes open for changes and developments in his / her trade. Instructors should always be up-to-date and interested in further training and upgrading. It is very necessary to have a wide range of general knowledge too.
Finally, there are organisational and administrative duties which an instructor has to do.

1.4 Styles of Leadership

Features	***Autocratic***	***Democratic***
Guidance	It is the instructor who is guiding. He / she gives orders what to do and what to leave. The teacher is the undisputed master of the situation. Initiatives of the students are not tolerated. The teacher provides the information he / she declares to be important. The teaching style is usually the presenting one.	The instructor tries to integrate the students. He / she wants to encourage trainees to develop their own initiative. The organisation of the classes is done in co-operation with the trainees. Trainees get comprehensive information to enable them to build up their own opinion. Teaching style is the developing and discovering way.
Esteem	The trainees are not regarded as partners and instructors normally insist on sovereignty. Teachers don't place confidence in the trainees. The teacher's attitude is pessimistic and the atmosphere is cool.	Teacher and students regard themselves as partners. The teacher is open to problems of the students. The instructor presumes the trainees' willingness to learn. His attitude is optimistic. The atmosphere reflects mutual acceptance.
Praise / Rebuke	The teacher has often something to criticise. He punishes quickly when his / her orders are not fulfilled. High achievers are presented as models.	The students are urged to control themselves. The instructor investigates the reasons for any failures. The criticisms are objective and constructive. He / she praises often and avoids punishment.
Conse-quences	Initially it allows the transfer of a lot of knowledge. However, trainees are not very motivated and feel uncomfortable and under pressure. Students become receivers, their own initiative is killed, and creativity is blocked. Trainees develop a negative attitude towards the teacher.	The speed of learning is lower in the beginning but increases quickly. Trainees learn autonomously. They develop interest in learning. Spontaneity and creativity are promoted. The students feel comfortable. The mood among trainees is relaxed. There is "fair-play".

2 An Excursus to Educational Psychology

Learning can happen always and everywhere. What is called teaching can be defined as *planned and organised learning*.
Educational psychology provides knowledge and information to optimise learning processes. Educational psychology for teacher training is focussed on optimising the circumstances in school. Apart from educational policy, it is the qualification of teachers which gets priority. Psychological knowledge shall enable them to reach the highest level of efficiency in their teaching efforts.
Learning is part of the human "information technology". Information has to be received, saved (scientifically called "coding") and shall be recalled. Receiving and coding. Together constitute the actual learning process. Recalling of information is named *performance*. New impressions or additional knowledge permanently influences coded information in our brain. Knowledge varies through experience. To be able to remember facts ("decoding") after a certain period depends to a great degree on the way it was coded. Sometimes one can only remember some details but with the time everything is remembered. Hence, coding and decoding cannot be compared with a tape-recorder, which replays exactly what was recorded.
Within this excursus it is not possible to cover all aspects of educational psychology. The intention is to introduce some areas, which are closely connected to our teaching routine. Our major concern as instructors is to transmit knowledge that trainees are able to learn and to remember easily. Instructors can promote this.
In the first place it is important to have some knowledge about the human *memory system*.

2.1 Memory And Information Processing

The human memory system has three components: the sensory memory, the short-term memory and the long-term memory. When information comes for e.g. in pictures, a written text, spoken words or a song, it will either be coded or forgotten again.

☞ Sensory memory

It can save information for only less than *one second*. It helps to transmit in-coming information to the short-term memory. For example: while reading these sentences you have already forgotten the words with which the last sentence or even this sentence started. These words were only in the sensory memory and helped us to identify the information.

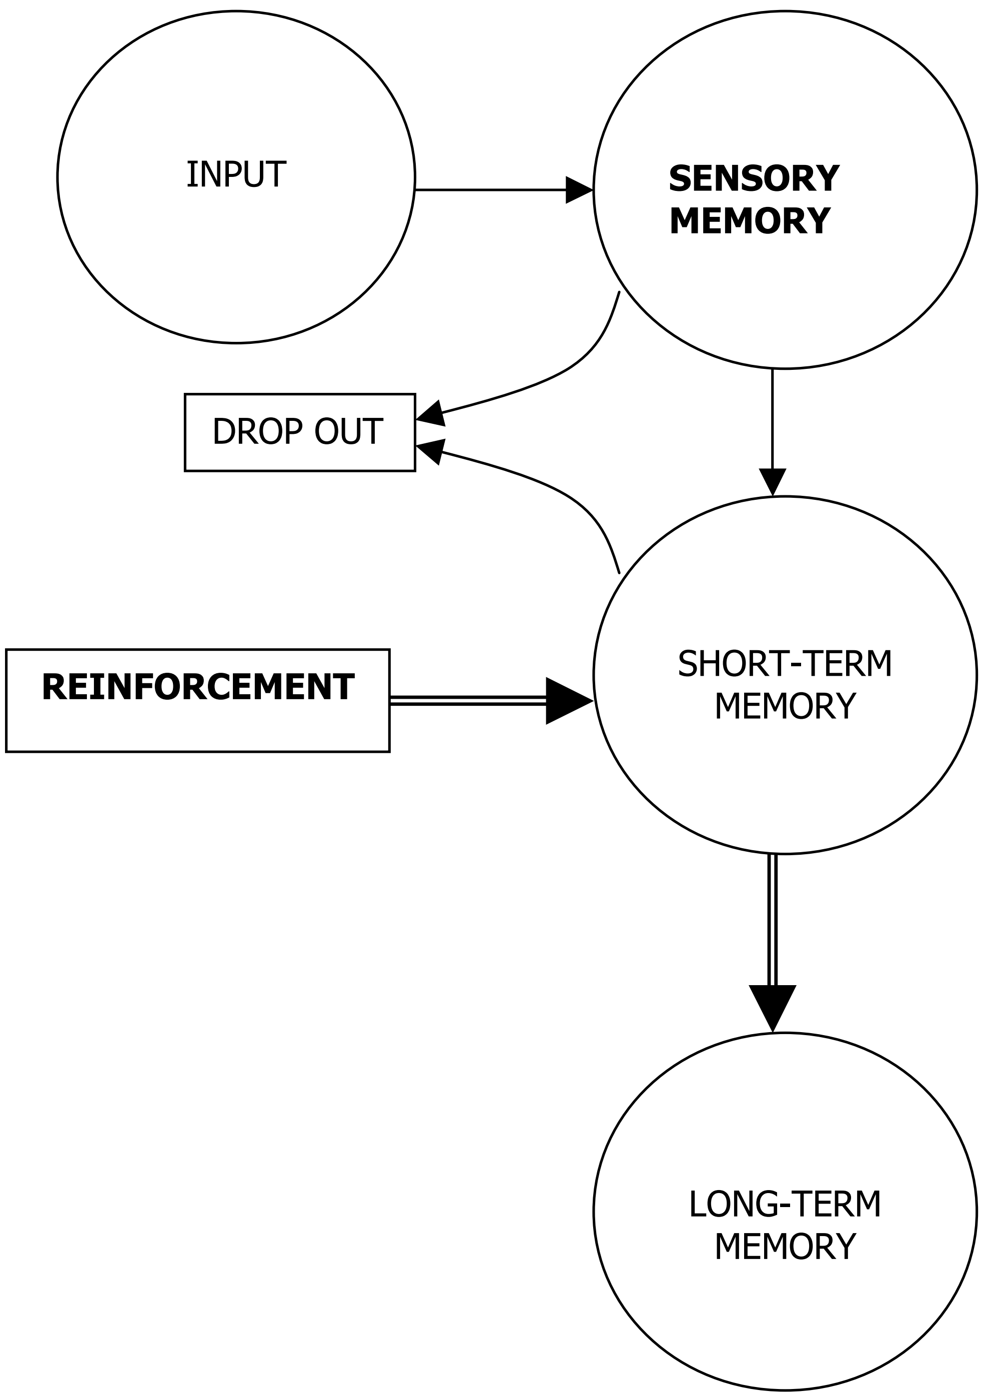
☞ Short-term memory

It can save information for about *15 seconds*. The capacity of the short-term memory is limited to 7 items. While information is in the short-term memory it can be *reinforced* (e.g. By frequent repetition). This means that we are coding this information to store it in the long-term memory – we try to *learn* it! This coding can be influenced positively e.g. through visualisation and assimilation. How fast and easy we learn depends on the type and intensity of the reinforcement received. When the information is not reinforced it will drop out again.
It has to be acknowledged that coding does not only occur willingly. For example someone had a car accident. This accident was so terrible that the incident itself had such a reinforcing character that the person always sees the terrible pictures and cannot forget them, even if he / she wanted.

☞ Long-term memory

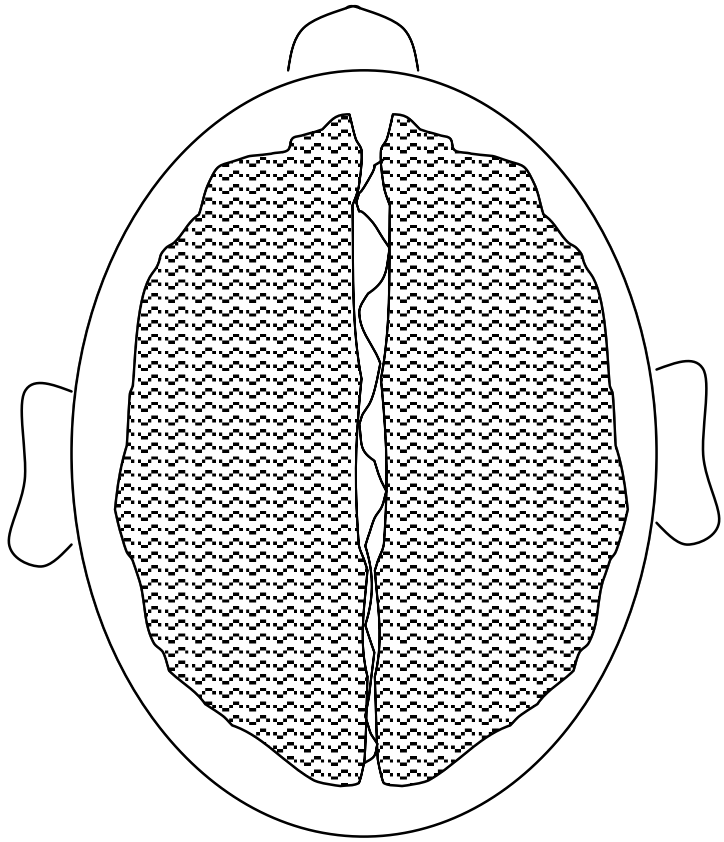
It can save information for a very long time, even for lifetime. The capacity of the long-term memory is generally unlimited. Whether information can be remembered (decoded) easily or not depends on the way it is coded. Sometimes information is lost because we cannot find the key to the right door in our brain. In addition, misuse of alcohol and drugs can destroy the brain cells where information was stored.

Information Processing



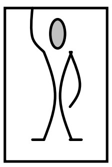
2.2 Visualisation

Experiments showed that the human brain (cortex) can be diverted into two parts (hemispheres). The two hemispheres take over different tasks and react on different inputs.



Left hemisphere	Right hemisphere
Connection to consciousness	No connection to consc.
Linguistic	Musical
Conceptual	Visual
Arithmetic	Geometric
Analytical	Homogeneous
Abstract	Concrete

To demonstrate this essential difference, an experiment was done in several workshops (following an experiment on eidetic from DÜKER).
The participants were divided into two groups. Everybody was asked to do a simple line drawing. However, one group got only a written description of the picture whereas the second group got the picture itself. Both groups could study their information for 5 minutes and then had to put it away and were allowed to start drawing.

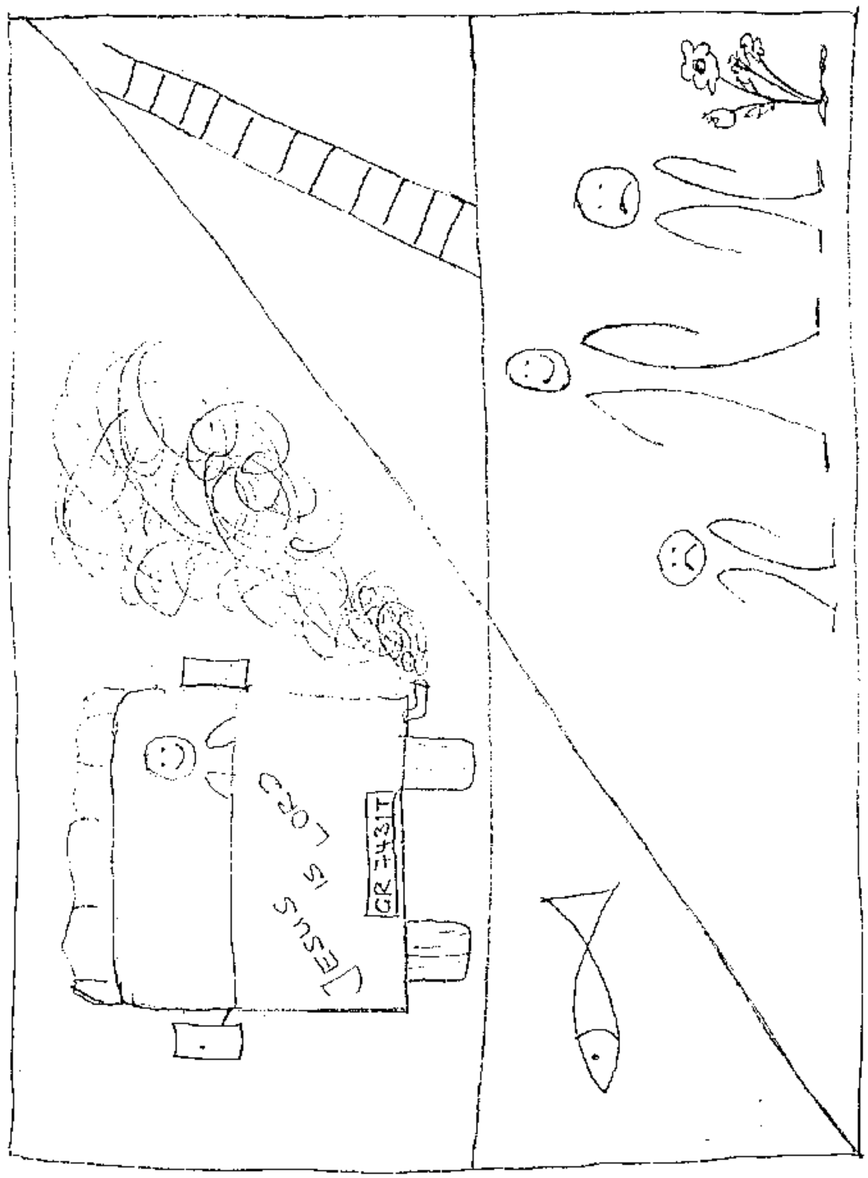


If you want to do the experiment on your own, just study the following text for five minutes, put the book away and try to draw the picture. When you are finished, continue with the book.

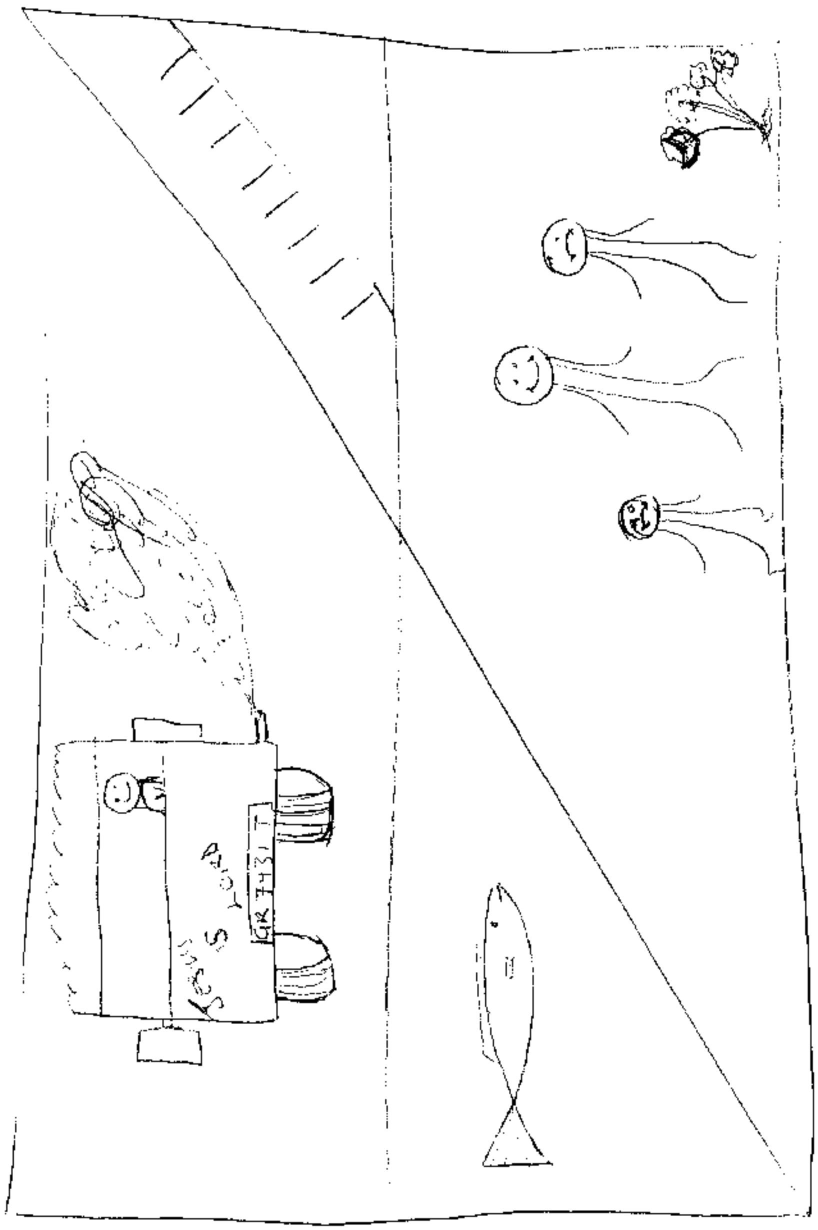
Experiment 1

"The picture is a line drawing. It is rectangular, landscape. A horizontal line in the middle and a diagonal line leading from the left bottom corner to the right top corner divide the picture into 4 sectors.
In the left top sector you see the front of a truck with 2 mirrors, a smiling driver and the plate. The truck has the licence number: GR 7431 T. The front shows the inscription: JESUS IS LORD, diagonally written in capital letters. On the driver's side there is a huge smoke from the exhaust. The right top sector shows a ladder going from the bottom to the corner. The bottom left sector shows a fish swimming from right to the left. In the bottom right sector you can see three matchstick men and a bunch of flowers on the right. The person in the middle is the tallest and is laughing. The person on the left is the smallest. He looks sad. The right one is also looking sadly."
"Study this text for five minutes. Then put it away and start drawing without the help of the text!"

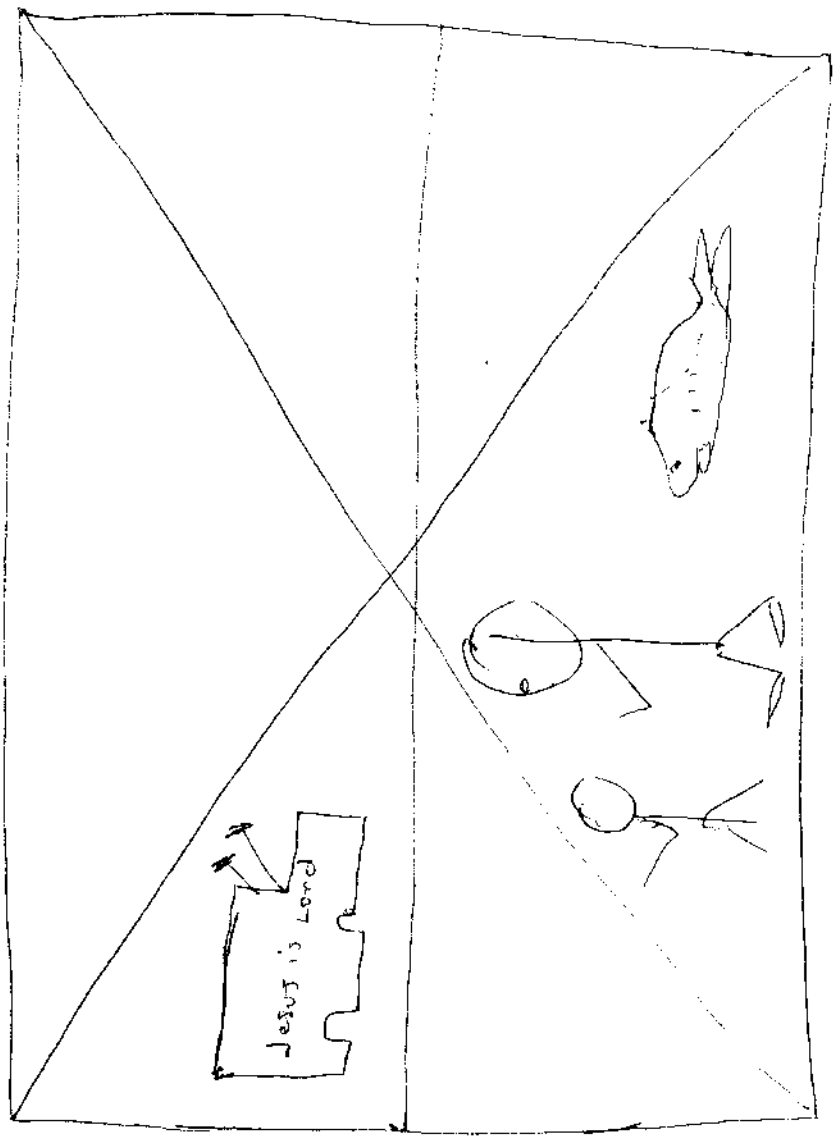
The second group was allowed to study the original picture shown on the next page. After 5 minutes they had to take it away and start drawing too.



Model drawing



Drawing of a participant who saw the picture



Drawing of a participant who had only the text

Conclusion

The experiment shows that sometimes pictures can explain things much better and easier than words. Long explanations do not have the effects that a picture can have. Those persons who had only the text had first to transfer the written information and create a picture. The written information was only directed to the left hemisphere of the cortex. They had to make an abstract information concrete. This process was so difficult that finally the information could not be coded.
The second group saw the picture. The right hemisphere is well prepared to take up this type of information. Coding is easy and the results are overwhelming.
Whenever an explanation cannot satisfy trainees it might be that it was done the wrong way. A picture can say more than thousand words.

2.3 Assimilation

New information can be coded easily when it can be assimilated with something familiar. It justifies why teachers start a new lesson by referring to the last one. An experiment shall demonstrate this, too.

Experiment 2

A test group was shown a shelf with 6 drawers, providing space for the following products:

Vegetables	Drugs	Minerals
Tools	Fruits	Chinese

Then one person was given a basket with the following items in it:

1 bottle of Coca Cola
1 package of Aspirin
5 tomatoes
1 pineapple

6 porcelain cups
1 hammer
1 video-cassette
1 litre of milk
5 potatoes
1 mini accumulator

The person was asked to store the goods in suitable drawers.

Result

The person did not have problems to store the Coca-Cola, the package of Aspirin, the tomatoes, the pineapple, the porcelain cups, the hammer and the potatoes. She found a suitable place for everything but had problems with the video-cassette, the milk and the mini accumulator. She did not know where to store the milk and the video because they didn't seem to have an appropriate place. The person did not know what a mini accumulator is.
The person was then asked to store the left items somewhere. At the end of the workshop the person was asked to retrieve the videocassette from the shelf. It took some time to remember where the videocassette was, whereas the participant was able to find the aspirin immediately.

Conclusion

Our brain can be regarded as storage too. When there is new information coming in which has already a background, this information is easy to store (code). Storing this new information somewhere can make it difficult to find it (decode it) again later on.
Therefore we should always try to give information in a familiar context. Isolated knowledge is dead knowledge! The same goes for unstructured knowledge. If the drawers of the shelf did not have labels or the bag with the tomatoes was not transparent, it would be difficult to store these items.

3 Course introduction

The following teacher training course can have as a title „how to plan and run a lesson successfully‟. A successful lesson means that at the end of the lesson the instructor was able to download his knowledge and the trainees really understood what was taught. As we saw in the last chapter, the human being‛s mind is limited in learning. We cannot process all the information we are given. The instructor as master of the subject has the task of pre-selecting information for the trainees and to make the knowledge trainee-oriented. It means that the information that is given to the learner has to be organised and systematically planned. This is a main condition for the students to be able to pick up the new knowledge easily. It is our aim, to make the trainee a skilled person during his apprenticeship. The importance of Vocational Training has already been explained above. Consequently the instructor has to check permanently whether he was clearly understood or not. Time is wasted when a lot of information is given but not understood by the trainees. The more interesting a lesson is the higher the motivation of the trainees to learn. Variation makes a lesson lively. Therefore several methods of teaching and teaching aids will be introduced. „Plenty fish does not spoil the soup‟ is a Ghanaian saying. It is suitable for a lesson too. This course‛s aim is to make teaching more efficient on the one hand; on the other hand it shall make teaching easier for the instructor. For this course section not to become to abstract it is preceded by a lesson and most examples refer to this lesson plan. In the beginning a lesson form will be introduced. There exist various types of lesson forms and many teachers have developed what is suitable for them. The following one was developed and modified in some of the courses that were held with Ghanaian colleagues and declared to be convenient.

3.1 The lesson form

A lesson form should help the trainer to structure the lesson so as to be a guideline. It should cover all information needed to run this particular lesson. When planning a lesson with the help of this form, always remember to do it as easy as possible. So please write down any information you might need.
The form is divided into three sections: (A) the information line, (B) the blackboard notes and (C) the lesson course.

(A) The information line
It is so-to-speak the administrative part. It keeps information about the department and trade for which the lesson is planned, the subject and the date and last but not least, the topic of the lesson. This makes it easy to store information and find it again.

(B) The blackboard notes
When speaking of a blackboard it is not necessarily a blackboard. It doesn�much matter which type it is. Sometimes it is a whiteboard or whipe-board or even a chalkboard. This field is where the teachers write down the notes that will later on be written onto the board in the classroom. In a later chapter you will get more information on how to use a chalkboard.

(C) The lesson course

This part shows the actual order of events during a lesson. It is based on the „four-step-method" that will be explained later.

C1 contains the opening of the lesson. It tells the user how to begin the lesson, how to introduce the new topic. In the four-step-method it is called preparation or introduction.

C2 represents the presentation step.

C2.1 shows the specific objectives (introduced in chapter 7)

C2.2 gives information about how the objective will be treated, how the instructor plans to go about this matter. The various possibilities will be treated later as well.
C2.3 tells you which method is intended to be used and the teaching aids you need for this particular step of the lesson. In case this lesson plan will be used, let's say one year later, the instructor just has to look to this section to see what items are needed to run this lesson.
C2.4 contains questions or other tasks that give a feedback
C2.5 schedules the time

C3 contains information about the way the instructor wants to run the application step.

C4 bears the ideas for the final check-up.

Maybe it is better to introduce this form at the end of the course, because most of the expressions might be new to some readers and the explanation is found in later chapters. To present it in the beginning shall provide a better overview and make it easier to understand the given examples in the right context.

3.2 A model lesson

The following lesson is out of the subject THEORY. It is about THE DANGERS THROUGH ELECTRICITY. The main reason why this example was chosen is that this topic is suitable for almost every trade except those areas where is no power at all. Dressmakers may use electrical sewing machines or at least an iron. People of the catering field use a cooker. Carpenters and joiners have several woodworking machines. The concrete mixer is used in the whole masonry field and electrical welding is common in all „metal trades". The briefing of the lesson shall show how the instructor planned to go about this topic. Details of the lesson plan will be explained more intensively in the subsequent chapters.

Introduction / Preparation

The instructor starts the lesson by showing a chart (see chart # 1). It shows a person shivering after touching a faulty concrete mixer (dressmaker may use an iron, carpenters a band saw and so on). The trainees are asked to describe what they see. This will lead to the topic: DANGERS THROUGH ELECTRICITY. The topic will be written on the chalkboard. As it is Ghanaian custom, a definition of electricity is given. The trainees are asked how electricity can influence their work. Trainees could also comment on the saying „electricity is a good man and a bad man". The result might be a sentence as it can be seen on the lesson plan: „electricity is helpful in various trades. It makes machines run and gives light".

Presentation

The teacher stated three specific objectives for this lesson and treats them one by one.
First he wants the trainees to be able to enumerate some sources of accidents through electricity. Therefore he is reading an article (fake) in a newspaper (see „daily graphic") and after that he asks the questions noted in the lesson plan. The answers will be written on the chalkboard. The question „What other types of accidents can happen" gives the trainer a feedback whether the trainees understood or not. When he is satisfied, he will go to the next objective.
Trainees should be able to explain the electrical shock. For this reason the teacher shows two types of cables and continues referring to the lesson plan, ending with a question about fuses to check understanding.
The last step is to make trainees alert to the importance of workplace safety. This will be done in group-work. The trainees are given 10 minutes to discuss among themselves in various groups, how an accident can affect an individual, his or her family and his or her employer. The groups write their answers on cards (explained in

chapter 13) and the group leader presents the results. To get a feedback, some trainees should comment on the statements.

Application

This is the time when trainees apply the new knowledge. They were asked to create some safety regulations. The results are fixed on the chalkboard.

Final check-up

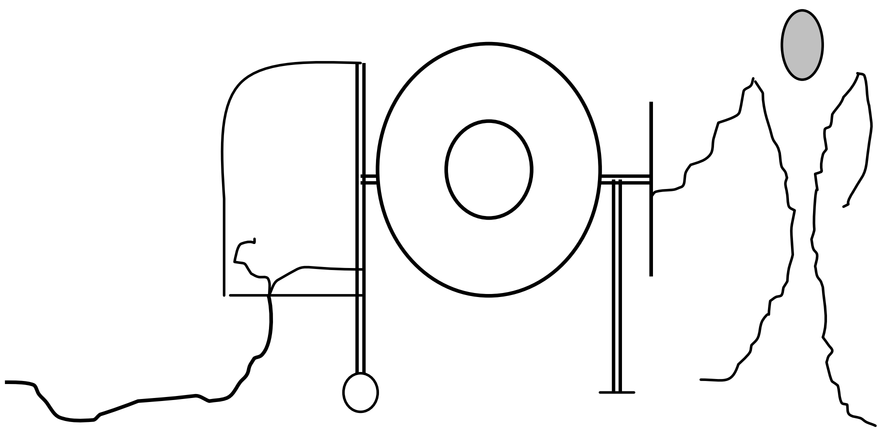
This step can be seen as a short summary of the whole lesson. In this case asking the question „Why can even somebody's family be afflicted by an accident through electricity" does it. Most of the trainees should be able to answer properly by explaining that it can hurt a person or even kill him/her. The family will be affected because a family member is without income temporarily, and so on. END OF THE LESSON.

“DAILY GRAPHIC”

Last Monday a report of the Korle-Bu Teaching Hospital in Accra was published. The spokesman of the hospital said that within the last two weeks 16 persons have been treated because of accidents at the workplace. Most of them had an electrical shock. The man said that 10 persons were using a faulty machine and got a shock from it. Another 3 persons touched a cable that was old and not properly isolated. The hospital‘s official explained that at least one person was drunk and was shocked when he tried to connect a concrete mixer with the socket. He wanted to remove the safety of the socket with a nail. He further said that this person was very lucky, because the high voltage could even have killed him. The speaker reminded people to be careful when operating electrical machines.

(This article is not a true story. It was written to be used as a teaching aid in a lesson)

CHART # 1



Department	Trade	Subject: Theory	Topic: danger through electricity	Date

DANGER THROUGH ELECTRICITY

Electricity is helpful in various trades. It makes machines run and gives light.

But accidents can happen when: - machines are faulty - cables are faulty - people are careless	When someone gets an electrical shock, currency flows through the body and injures the person. 	There are many consequences of an accident: - for the person: he / she can seriously be injured or even die - for the family: it looses manpower and income - for the company: it looses an employee and cannot finish the job

Safety Regulations

1. Check mashines before using it!
2. Check wires for faults!
3. Never consume alcohol during working hours!

ALWAYS BE CAREFUL!

Preparation: showing chart # 1: electrical shock. Question: please comment this chart, or: what happens to this person? Who has ever had an accident? 5 min.

Objectives (1-3)	Presentation	Method/ T.- aids	Check-up	Time
Trainees should be able to enumerate three sources for accidents with electricity (1)	Instructor reads an article (fake-article) from the Daily Graphic about accidents at the workplace. Trainees shall listen and were ask questions: 1. Did you watch any accident at the workplace before? 2. How many people were involved in accidents in this article? 3. How did these accidents happen?	Developing way - Newspaper article	What were the reasons for the accidents mentioned in the newspaper?	5 min.
Trainees should be able to explain the electrical shock (2)	Instructor shows two cables to the class. One is all right, one is faulty. Trainees can see that the rubber is spoiled and the wire is free. Questions: - Which of the cables would you prefer? - Why would you prefer this one? What would happen if you got in contact with that wire (faulty) and it was connected to the socket?	Developing way - new cable faulty cable	Why do electricians use fuses?	5 min.
Trainees are willing to argue for work-place safety (3)	Class will be divided into three groups. They were given the following task: An accident has many consequences. Try to find out what consequences there are: 1. For the person, 2. For the family, 3. For the company. Discuss it within the group and take it down on the zopp-cards.	Discovering way Group work - zopp-cards - markers, pins	Please comment on these statements	15 min.
Application.	Let's figure out some safety regulations. Instructor writes results on the blackboard			10 min.
Final check-up	Question: Why can even somebody's family be afflicted by an accident through electricity?			5 min.

4 Lesson Preparation

A good lesson preparation is everything, a bad one is nothing. A sound planning takes a long time and a lot of work. But once done, it will serve you for a long period and make your teaching easy. A well-styled lesson will arouse the interest of the students. This prevents disciplinary problems in the classroom and raises the amount of items learnt. An instructor can even spontaneously run the lesson e.g. when called to replace a sick colleague. A lesson preparation is a very comprehensive task. It requires farsightedness because this lesson plan will be the foundation for testing at the end of a period. The objectives, the check-ups and the blackboard notes can be very useful when composing any trade test or other test. It gives the trainer the guarantee that the questions are at an adequate level so that trainees will not be overtaxed or feel treated unjustly. The following chapters shall assist instructors with the lesson preparation and show why it is necessary to have one.

4.1 Principles for Effective Lesson Planning

A lesson should follow various rules. The most important thing is that a lesson has to be structured. The importance of structure was already explained in the part about educational psychology. A fix scheme for a lesson has various advantages for trainees, as well as for instructors.

A fix structure gives the trainees a feeling of safety and the possibility for orientation. It is the wish of every instructor that the trainees follow the lessons. This is however not always the case. No person can always concentrate the way the teacher expects. Various thoughts might be in a trainee’s mind which an instructor will never find out, but might be important for a trainee. It can be problems within the family any other trouble, or the trainees might just be thinking of their girl / boyfriend.

This has nothing to do with the teacher him/herself but is a normal and natural thing. Even if a trainee did not listen for a while, he / she would be able to follow the teacher's intention. This will at least help to keep up the motivation.

To organise a lesson also means, that the instructor progresses gradually. The new knowledge is arranged in logical units. In this way the trainee can easily understand it, because it allows him to process this new information. He will be able to add unknown facts to familiar ones and so upgrade his knowledge step by step. According to Educational Psychology, this method helps to improve the learning process and raises the quantity of remembered items.

The division of the lesson into several small units allows the instructor to check his own efforts. Furthermore it enables him/her to check step by step whether the trainees are following or not. This will enable the teacher to change the strategy, where necessary. Basic knowledge has to come before specific knowledge. Only when the basic knowledge is there - and of course understood, does it make sense to go on. One cannot do step two before step one. Detecting that trainees did not get the message at the end of the lesson is too late. But discovering lack of knowledge after a short sequence allows the teacher to repeat or explain in detail to be sure that he can proceed with the next step. However, arranging a lesson this way has some difficulties too.

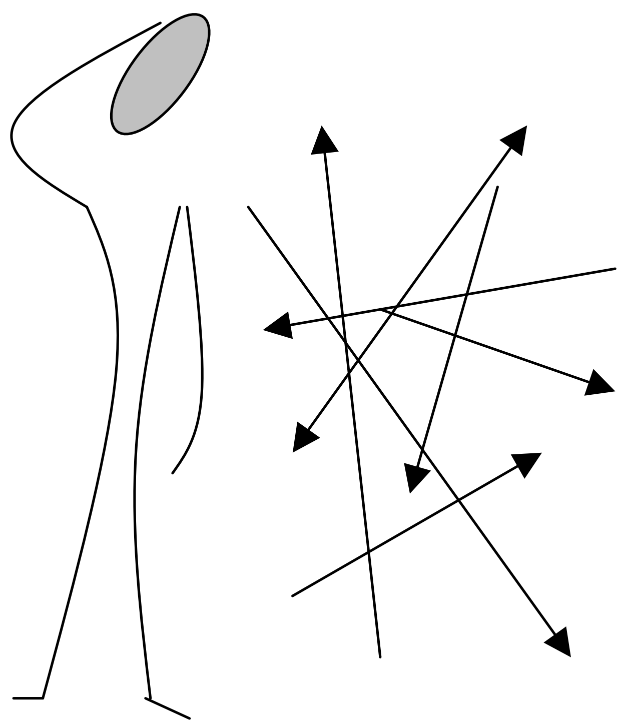
There is no common scheme that is best for every lesson. What is introduced with the lesson format is one way. Within a teacher's life he or she may change the strategy several times and try new ideas. Instructors as well as students are individuals. What is suitable for one is not necessarily convenient for somebody else. Everybody will once develop his own scheme for a lesson. But for the beginning, experience has shown that the format used in this course provides a good guideline.

The order cannot be kept in every situation. This will depend on the subject being taught. Some educationists argue that a fix lesson scheme may make the lesson boring. They say that a schema does not allow for variation. Teachers might not be able to react to trainees' interests that may come up while teaching and this may limit the instructor's creativity. This will however depend on the experience of the instructor. New instructors might have more problems of this nature. One should remember that a lesson scheme is not a recipe that guarantees good performance but should be seen as help for teachers to organise their work. The 4-Step-Method can therefore be described as a reasonable foundation for the success of theoretical lessons in vocational training.

When organising and preparing a lesson, there are several principles that should be considered.

The Principle of structure

This principle can also be called the "central thread". To structure knowledge means to split it into logical units. This enables the students to understand easily. Teaching matters of this type can also be learnt and remembered easily. The trainees are furthermore educated to identify new problems and solve them. It supports a holistic education for problem-solving. Unstructured knowledge on the other hand is harder to learn and easier to forget. Pedagogues refer to unstructured



knowledge as isolated knowledge. As we learnt in an earlier chapter, it is difficult to get this type of information into the long-term memory. Whereas facts being included in a logical relation to others are "very resistant against forgetting" (Skowronek).

Some ideas which might help to realise the principle:

- show how the new issues are connected

During the lesson trainees get quite a good perception about how big the consequences of an accident can be and the fact that it could happen to them as well. It is nothing that happens only to other people. Everybody is confronted with electricity almost every day.

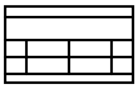
- Explain the connection with other situations

The danger through electricity is not only existent at the workplace. Many people have to work on sites or in other people's homes, where it is not always possible to check machines. It is not everybody who is aware of the possible dangers. Wherever trainees come into contact with electricity there is an invisible danger.

- Explain the aim of the lesson

The aim of the lesson is to prevent the trainees from being injured. Besides the trainee, a lot more people are affected by any injuries. If there was enough time, a role-play can be exhibited. The classroom is the place where a trainee got an electrical shock. What has to be done? The person might be taken to hospital – there you have costs from the treatment; doctors and nurses have additional work and so on.

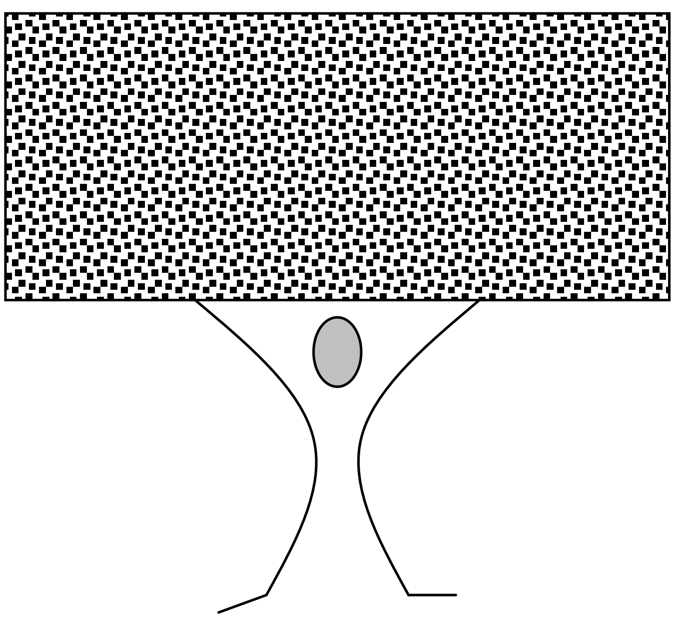
- Arrange the data clearly



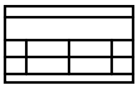
It can easily be seen from the blackboard that there are five units of information. The heading and subheading that give an overview of the topic. Below are various reasons why accidents happen. In the middle, students get an explanation on what happens when somebody gets an electrical shock. In a next block they are informed about the far-reaching consequences an accident can have. The very right unit shows how to behave to avoid a disaster.

"Isolated knowledge is dead knowledge" (Brunnhuber)

The Principle of comprehensibility

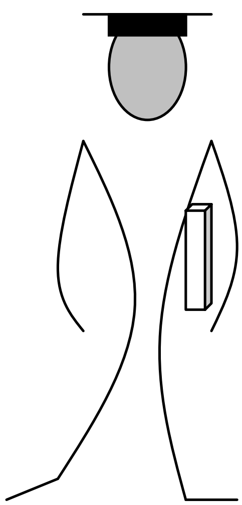


Most of the information is new to the trainees. Instructors have a higher level of knowledge than trainees. So they have to prepare the subject matter to the level of the trainees so that they are able to understand. Do not feed students with irrelevant information. Reduce it to what is necessary for every individual.



The definition of electricity is very clearly presented. It is not a technical definition but sufficient for a trainee in the field of e.g. dressmaking. It is for sure not sufficient for an electrician. This person should know a lot more about electricity. In our example the lesson is about an electrical shock. So there is no need for a more detailed explanation of electricity. Regarding the "electrical shock" itself, trainees learn that currents flow through the human body. This is what everybody will understand and what is at the level of a mason. It was not sufficient if you would teach nurses or even doctors. They have to have a much wider knowledge of an electrical shock. Always bear in mind, whom you are teaching!
You get more information about this issue in the chapter "Didactic Reduction".

The Principle of Science-Orientation



When planning a lesson the instructor has to check whether the subject matter is on the actual level of scientific research. Whatever the trainer teaches must not be inconsistent with any commonly accepted knowledge and has to be in harmony with the actual level of research. The last century brought plenty of new technology. New products and techniques flooded the market. The best example for this development is the information technology. About 25 years ago the size of a computer filled one complete room of a house. Today a computer or Laptop can even fit in a briefcase and has much more capacity than the ones of "the first generation". The processors become faster so rapidly that one can scarcely purchase software for a ten-year-old computer. Thanks goodness, the development does not go that fast in all our trades. But even there machine-technology keeps improving. An instructor should always try to have new information, to let trainees know that the master is up-to-date and so is their apprenticeship.

Dangers through electricity are the same as they were in the past. Electricity is used in more and more areas of our lives and especially our work. Craftsmen use electrical machines more frequently than in the former times. Therefore, the dangers through electricity will rise in the future.
An example out of the technical division shall be given too:
There are various methods of avoiding electrical shocks. In former times it was mostly fuses that were used. Nowadays electricians use the "circuit-breaker" in addition. It is a new technology that is easier to handle and more comfortable for the user. Nevertheless the fuses are still in use. Both safety precautions have advantages and disadvantages. An instructor of the electrical department who only explains the purpose of fuses and does not teach the circuit-breaker is not teaching at the current level of technological standard. As the application of this technology is very common now, it has to be part of the syllabus.

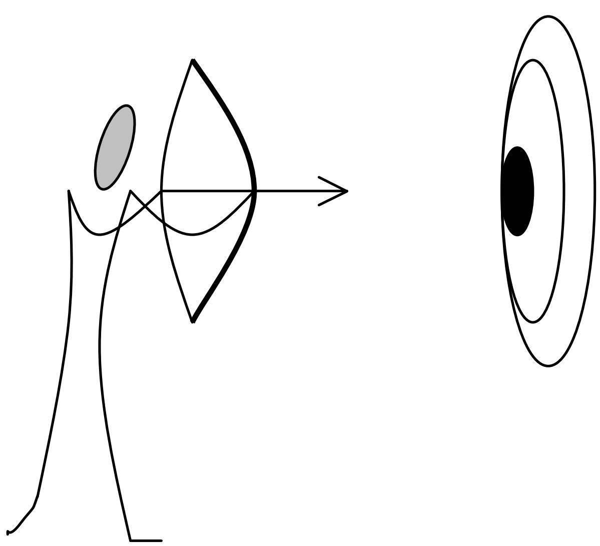
If instructors do not follow this principle it would lead to outdated explanations and instructors might lose the respect or confidence of the trainees!

The Principle of Practice-Orientation

The situation during apprenticeship is different from the one that the trainees will face later. Whether they are employees or self-employed, the tasks will be unlike those they have in the Vocational Schools. The purpose of Vocational Training is to prepare the students for their life as craftsmen. Outside the Training Centres work might be arranged in

another way. Some facilities that were available in the Centre will not be there later on. A trainee might not have the possibility to practice with other facilities during his training time. People in other areas might have opposite tastes and wishes, so that products are not the same. The houses in the North of Ghana are different from those in the South. So it is with the dress.
Instructors should be aware that the trainees may move across the whole country in search of employment. This has to be considered when planning a lesson and through the entire teaching period. Always check whether the subject matter is close to reality that is the situation the trainee will be confronted with after his trade test examination. Make sure that things do not look too theoretically.

The Principle of Goal-Orientation



"One who does not exactly know where he wants to go to, must not wonder when he arrives at an unexpected destination" ***(Mager)***

"Goal-orientation" is something everybody is talking about. There is no company, no organisation which does not have a workshop for "goal oriented project planning" within the last years. World-wide hundreds of consultants are running seminars on this topic. What is convenient for the industry is convenient for the Vocational Training too. Not only in recent time when this topic became attractive for the economy, but for long time, it was a foundation in the education sector. Goals guide the trainee as well as the teacher. In Vocational Education these goals are called objectives. They describe the expected behaviour of the trainee after having gone through the learning process. The question the instructor should ask himself is no longer WHAT should be taught, but WHY should something be taught. A trainee will learn a new theme easier when its purpose is obvious for him. When planning classes always ask yourself: "Why should a trainee learn this?"

In our example it is very obviously why the lesson is about danger through electricity. The instructor wants to protect trainees against injuries. So he informs them about the sources of danger, the consequences and how to avoid accidents.

The chapter about objective setting will provide more details on how to realise this principle.

The principle of check-up

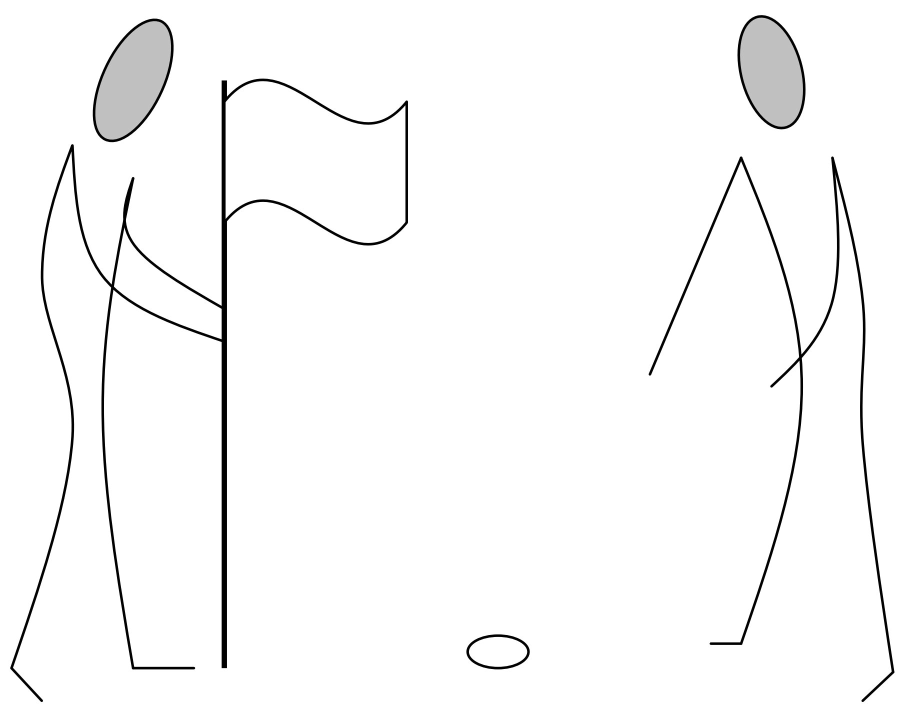
This is very closely related to the principle of structure. The contents of the lesson should always make it possible for the instructor to get a feed-back, for him to know, whether he can continue with the matter or not. As we already heard it is not useful to go on, when basic knowledge is not understood. "Check-up" is a comprehensive section and will be treated in more detailed in chapter 10.

Our lesson plan has an extra column for this purpose (C4). It is arranged in such a way that after every teaching objective a short analysis in the form of a question, discussion or any other type of evaluation will reveal whether the students did understand or did not.
"What other types of accidents can happen" urges the trainees to think about what they heard and to look for other dangers. When trainees are able to respond to "Why do electricians use fuses" it is clear that they know about the electrical shock. A trainee can only argue for safety regulations when he / she

knows about the significance or consequences of an accident with electricity.

4.2 Objective setting

To do justice to the principle of goal-orientation, objectives are used for the lesson planning. The instructor states clearly what he wants to achieve and what he expects trainees to achieve or produce at the end of the period. This is stated in terms of observable or measurable behaviour. Objectives are not just helpful, but obligatory. They describe the trainee's behaviour or abilities after passing a lesson successfully.



Importance of objectives for the instructor:

- objectives enable us plan thoroughly. It also helps the trainer to choose the appropriate "tools" to reach a precise aim. The right choice of the method or the preparation of teaching aids will also be easier when a certain goal is set.

The presentation-step of the first objective (instructor reads…) particularly tries to cope with the first objective, that trainees should be able to enumerate three sources of accidents through electricity.

- *objectives allow an easy check-up*
  a gradual teaching method makes it easier to review the effectiveness of teaching. Small steps are easier to check than complex matters. It helps to make corrections or additional information in time.

Check-up questions are foreseen after every step

- *objectives are the basis for a teacher's self-control*
  After check-up the trainer is able to estimate the feed-back. Getting a positive feed-back will tell the instructor that things went well. Negative feedback reveals that trainees did not understand what was taught. Therefore it is up to the instructor to find out why the trainees did not understand. To look for an explanation may cover the following questions:

  ☞ Was the teaching matter too comprehensive?
  ☞ Was the teaching matter too complicated (above trainee's level)?
  ☞ Did I use the right methods?
  ☞ Did I follow my lesson plan?

Importance of objectives for the trainees:

- *Trainees get a clear perception.*

A manageable amount of new information transmits a feeling of comfort. Trainees don't feel overloaded and gain self-consciousness because the facts can be processed easily.

- *Trainees are able to control themselves.*
  What goes for the instructor goes for the trainee too. They learn to estimate themselves, their abilities and the progress they have made in learning. He can prove on his own, whether he was only mentally absent or he wasn't adequately prepared or the teaching matter was too difficult for him. A necessary change in behaviour can only be reached, when the cause is obvious.

Types of objectives

There are several types of objectives. Within this course we will concentrate on two: the general objectives and the specific objectives.

General objectives

It can simply be named as the goal of the lesson. It represents the answer to the questions every teacher should ask himself when planning a class:

☞ "Why am I running this lesson?" or "What is the purpose of my efforts for this lesson?"

☞ "Which new behaviour do I expect from trainees after this lesson?"

The general objective is that the students are aware of the dangers and act accordingly.
The answers to the above mentioned questions out of our example are as follows:

1. The instructor wants to protect trainees against injuries and their consequences,
2. The instructor wants the trainees to be careful when operating electrical machines.

Specific objectives

These can be called targets within the general objective which one intends to achieve at a particular period. The specific objectives direct us through a lesson. When we talk about objectives in the subsequent paragraphs we mean specific objectives.

The classification of objectives

"Objective-taxonomy" is the expression used by the pedagogues. It demonstrates the domain the objectives can be related to. It deals with the question, how intensive trainees should be trained in a particular subject. The cognitive domain covers the field of understanding, thinking and knowledge. The affective domain deals with the attitude while the psycho-motor goes with physical action. While these three can be found even in old literature, the social scope is a quite recent addition to the taxonomy. It has been added because the social behaviour gains more and more importance in the daily working routine.
The higher the level within a scope of the classification, the more detailed and intensive the subject matter has to be considered during class. The classification is shown in the following chart.

4.3 Objective-Taxonomy

Scope	*Cognitive*	*Affective*	*Psycho-motor*	*Social*
Matter	Information and Knowledge	Attitude, Emotions and Values	Skills	Behaviour
Hierarchy	Knowledge Comprehension Application Analysis Synthesis Evaluation	Receiving Responding Valuing Organising Value concept	Imitation Manipulation Accuracy Organisation Control	Individual Partnership Group
Example	To interpret a chart	To have fun in maths	To use a plane	To work co-operative within a group
Verbs	Enumerate, allocate, distinguish, reduce…	Like, welcome, take pleasure from, enjoy…	Prepare, use, manufacture, construct…	Co-operate, help, share…

The cognitive domain

The cognitive domain is concerned largely with information and knowledge. It is based on a continuum ranging from mere knowledge of facts to the intellectual process of evaluation. Each category within the domain is assumed to include behaviour at the lower levels. There are six major categories within this domain.

Increasing level of complexity according to BLOOM:

1. *Knowledge*: This is based on recall and methods of dealing with recalled information.

2. *Comprehension*: This is the ability to grasp the meaning of material. It embraces 'translation' from one form to another (e.g. words to numbers),'interpretation' (e.g. explaining, summarising), extrapolation (e.g. predicting effect, consequences).
3. *Application*: This involves the ability to utilise learned material in new situations. It necessitates the application of principles, theories, rules, etc.
4. *Analysis*: This involves the ability to break down learned material into component parts so that organisational structure is made clear. The analysis of relationships and identification of the parts of the whole is vital.
5. *Synthesis*: This refers to the ability to combine separate elements so as to form a new whole. Deduction and other aspects of thought are involved.
6. *Evaluation*: This concerns the ability to judge the value of material. Such judgements are being based on definite criteria.

Trainees should be able to enumerate three sources of accidents with electricity. This is the lowest level, meaning that the students just have to repeat things they have learnt before. It does not include an attitude.

The affective domain

The affective domain relates to attitudes, emotions and values. It is attitudinal in concept and ranges very widely from heeding the simple reception of stimuli to the complex ability to characterise by the use of value concepts. There are five major categories within the domain.

Increasing level of internalisation according to KRATHWOL:

1. *Receiving*: This involves attending e.g. heeding messages or other stimuli. Awareness and willingness to controlled attention are subsumed under this heading.
2. *Responding*: This involves the arousal of curiosity and the acceptance of responsibility in relation to response.
3. *Valuing*: This involves recognition of the intrinsic worth of a situation, so that motivation is heightened and beliefs emerge.
4. *Organising and conceptualising*: This involves the patterning of responses on the basis of investigation of attitudes and values.
5. *Characterising by value or value concept*: This involves the ability to see as coherent matters involving ideas, attitudes and beliefs.

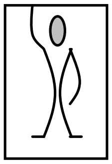
Trainees who are willing to argue for safety regulations, belong to the 3rd level. They have more than the ability to do something, they have an intrinsic motivation to do it.

The psychomotor domain

The psycho-motor domain involves muscular and motor skills.

Increasing level of Co-ordination according to DAVE:

1. *Imitation*: These are the involuntary motor responses to stimuli. They are the basis for all types of behaviour involving bodily movement.
2. *Manipulation*: These are the inherent movement patterns built upon simple reflex movements and are the result of instructions.
3. *Accuracy*: The interpretation of stimuli so that they can be adjusted to the environment.
4. *Organisation*: The co-ordination of various movements to harmonious, complex activity.
5. *Control*: The operation becomes routine and an automatism. The movements look aesthetic.



Take one of your lesson preparations and try to figure out which categories your objectives cover.

It isn't always possible to make this distinctive differentiation. This is theoretical in nature. Human behaviour is holistic and cannot be split up. A lot of objectives contain parts of every sector. In addition to this taxonomy there are some more types of classifications, which would surely confuse us than to give a clear perception. For our further studies we will concentrate on the four "levels of demand". They too mark the intensity a subject shall be taught. To fix each level, particular verbs are used for formulating the objectives. See following chart:

Levels of Demand

Level 4: Problem-solving

Propose, suggest, create, consider,

Level 3: Transfer

Discern, derive, use, compare, argue, transfer, assign,

Level 2: Reorganisation

Explain, describe, recognise, detect, discover, observe…

Level 1: Reproduction

Repeat, enumerate, measure, report, mention, list, number…

The level usually will be chosen to the required abilities according to the syllabi. Most of the syllabi used in the country do not co-operate
As a result it is the duty of the trainers, to decide which level to aim at. The masters should know which competencies have to be emphasised. It might be helpful to look at the trade test examinations. Since students are trained to pass the exams they might give a guideline for teaching level too.

The trade test examination for dressmakers asks for an explanation on why an iron can cause an electrical shock. The answer is: When the wire connections are faulty within the iron, the currents will be on the chassis too. If somebody touches it, he / she would get an electrical shock.
To give this answer, the level that is chosen in our example would not be enough. "Trainees should be able to enumerate three sources for accidents with electricity" only demands, that the students are able to mention several sources, but not to explain them.

Find out to which level the specific objectives of the given example belong! Formulate the first objective so that it represents a higher level!

An additional example shall explain the level of demand more intensively.
There were three classes of the car mechanic trade. The lesson was about *types of cars*, but the level of demand was different.

In the first class the objective was on the first level, REPRODUCTION: *At the end of the lesson the trainees should be able to enumerate two types of cars*.
The teacher asks: Name two types of cars! The objective is reached, when the trainee can answer: "Mercedes-Benz and Daewoo Tico."

In the second class the objective was on the second level, REORGANISATION: *At the end of the lesson the trainees are able to describe two types of cars.* To reach the objective it is no longer sufficient for the trainee to say Mercedes-Benz and Daewoo Tico. On this level he must be able to describe it. For e.g. there are Mercedes-Benz and Daewoo Tico. The Mercedes is a big car with a lot of space whereas the Daewoo Tico is a small car with little space for loading.

In the third class, the objective was on the fourth level, Problem-solving: *At the end of the lesson trainees should be able to advise somebody on the type of car to buy*. At this level, even the previous knowledge of the second class is no more sufficient. To advise somebody requires more knowledge than to know something about the size of a car. To fulfil the objective a trainee must know more, e.g.: the Mercedes is a big and strong car, but is expensive too. It has lot of space and is very convenient for long travels. If you want to use the car mainly for the city, you might better buy a Daewoo Tico, which is small and easy to handle in small streets. The Tico is also much cheaper than a Mercedes-Benz.
Trainees who were in class one could not advise somebody, because the teaching was on a much lower level.

Rules for objective setting according to DUBS

Objectives usually should follow certain criteria. The features are as follows: A certain behaviour that is observable after the lesson, the circumstances under which this behaviour takes place and an assessment level. To reach this, teachers make use of the so-called SMART norm:

S	=	specific
M	=	measurable
A	=	attainable
R	=	realistic
T	=	time bound

The first objective in our example should therefore look like this: *"Trainees should be able to enumerate three sources of accidents with electricity by heart within one minute"*. It is not like this in our example. Nowadays the circumstances under which the behaviour takes place has lost its importance and the time bound aspect is commonly given by the time planning within a lesson. So the objective is reduced to what is stated in the lesson plan:

"Trainees should be able to enumerate three sources of accidents with electricity"

Rule 1:

Objectives are characterised by two components: the behaviour and the contents.

BEHAVIOUR	CONTENTS
Trainee is able to enumerate	three sources of accidents with electricity

In several situations it was observed that trainers just noticed "enumeration" as objective. This is not a meaningful objective at all.

The contents component is missing thus making it absolutely useless. The same goes for the other side. "Accidents with electricity": the behaviour component is missing. Consequently it is useless too. To have a useful objective it has to look like shown above.

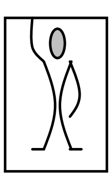
Rule 2:

Use *expressive* verbs exclusively to formulate an objective!

There are expressive verbs that are useful and inexpressive verbs that are useless to describe the desired behaviour of a student.

Useless (inexpressive) verbs	*Useful (expressive) verbs*
To know, understand, comprehend…	To enumerate, explain, distinguish…

A general example shall illustrate the use of the verb "to know":
"Almost everybody knows BILL CLINTON". But what does it really mean, to know Bill Clinton? Some of us will say, that he is the president of the USA. The president of Ghana may answer: "He is my American colleague". Others will say, he is an American Politician and so on. But this is not the end: His wife might say: "Nobody knows him really, except me!" His doctor might say, "I know him absolutely" and perhaps he does better than his wife. Probably he is considering his health.
To get to a common answer at level 1, "REPRODUCTION", we use an expressive verb for our objective, namely recognise.
"Almost everybody recognises Bill Clinton". Showing a picture on which he is among several other people, leads to a collective result. His wife, his friends, his doctor, everyone will point at him and say: "This is Bill Clinton."



Which answers could be given if our second objective was like this: “Trainees know an electrical shock”?

Rule 3:

The behaviour shall be *measurable* or at least *observable*.

In the beginning the importance of the principle “check-up” was expressed. The groundwork for it has to be done within the objectives. The preceding example pointed out how difficult check-up can become, when e.g. using inexpressive verbs. Some objectives will be measurable, some will be observable.

Our first objective is accurate measurable: The aim is reached, when the students are able to mention three dangers (It is countable!)

The second one is observable: The aim is reached when a trainee is able to give a satisfying explanation of an electrical shock, according to the explanation that was given in the class. It is not countable but provable.

Rule 4:

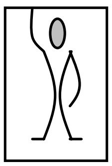
Avoid comprehensive statements!

Comprehensive statements allow comprehensive answers. The more precise a statement is, the easier it is to answer. To convert our first objective to a comprehensive one would lead to the following outcome: “Trainees should be able to enumerate the most important sources of accidents”. Although an expressive verb is used, the answers can be of various types: Accidents with cars, accidents with machines, accidents in sports and so on. What is important for the instructor is not necessarily important for the students. Students may put emphasis on other areas.

Rule 5:

The used verbs shall represent the desired level!

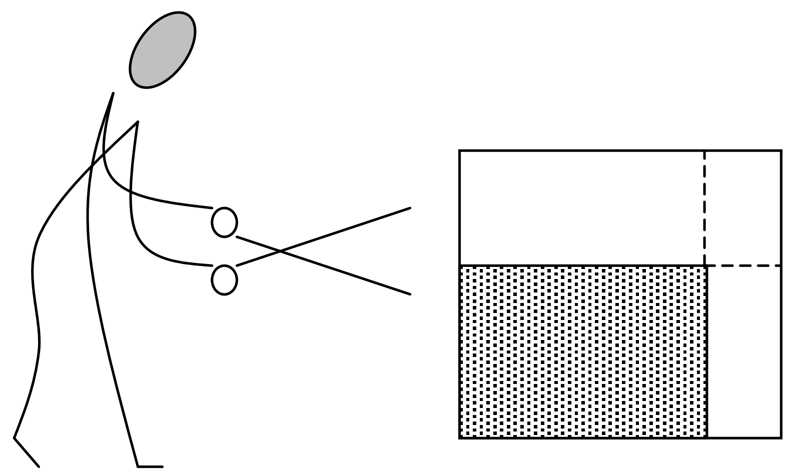
Examples for these verbs are given in the chart above: "The levels of demand".



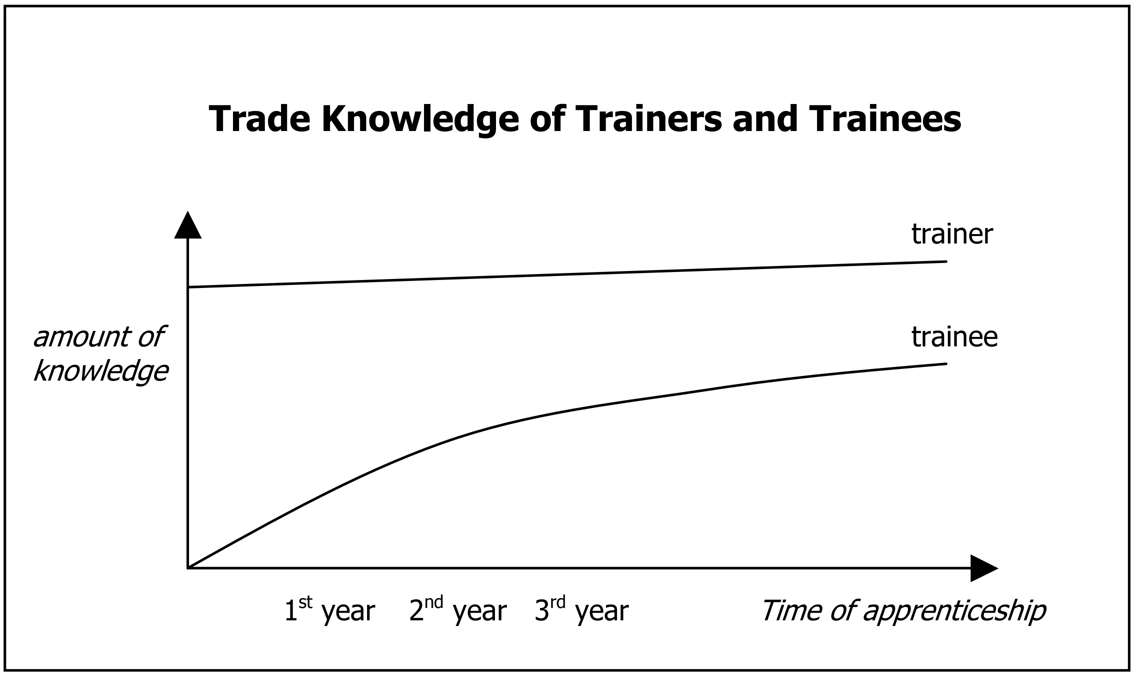
Try to replace the verbs in the example with verbs of the chart, by keeping the same level.

5 Didactic Reduction

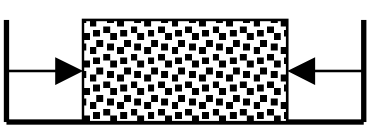
Didactic is the science of teaching and learning. As the expression makes us assuming, something shall be reduced. Indeed, it is like this. What should be reduced is the teaching matter. This does not imply that it can be done arbitrary. Trainers have of course a wider and better knowledge than the trainees during their apprenticeship and even after it. Instructors have a lot more experience. This will sometimes lead to the situation where instructors teach on a level trainees do not understand. And in most situations the instructors don't even recognise it. For the instructors everything out of the trade is familiar. He is well-versed with



difficulties that might occur in "his field". But being an expert may lead to the situation that a problem is not identified as a problem. The trainer's daily routine is quite a new skill for the students. What is easily understandable for an instructor can be an insoluble task for the learner. The consequence for vocational education is the Didactic Reduction. The learning matter has to be reduced to the level of the students. These young people are in the class to learn a new trade. Sometimes it is coincidental for them to be, let us say, in a masonry class instead of a carpentry class. Maybe it was the only profession that a Vocational Training Institution offered. In the beginning most are absolutely newcomers without any previous knowledge of the trade. We therefore have to approach teaching slowly. Today there is a common saying: LESS IS MORE. What people want to express is that sometimes it is more helpful to teach only a small part, but to do it properly than to try and cover everything and drift off. It is not always advisable to have too many irons in the fire. We should train them very well but bear in mind that within the time of their apprenticeship students will hardly reach the masters level. So there will always be a professional distance between trainer and trainee. The need for Didactic Reduction is present all the time. We have two types of Didactic Reduction: The *Vertical Didactic Reduction* and the *Horizontal Didactic Reduction*.



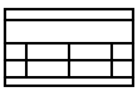
5.1 *Vertical Didactic Reduction*



The quantity of the teaching matter will be reduced.

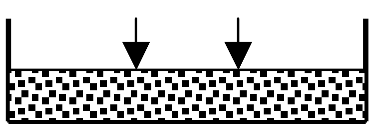
Vertical Didactic Reduction wants to prevent a situation where the students are overloaded with information.

Not everything that belongs to the subject matter is really important for the trainee to know. Too much information will rather lead to confusion than to clear perception, as it was mentioned earlier already.



"Danger through electricity" is a wide field. Vertical Didactic Reduction requires that we leave out some aspects. What was left out is that there are many dangers with electricity: short circuits can cause fire; this has already devastated whole cities in history. Accidents can happen through faulty power-lines. There are several other consequences of an accident: at least the whole social system of a nation will be burdened. And it is not only the safety regulations that guard us: In the technical field there are many types of protections. There are fuses and circuit breakers as we already learnt, electricians apply the techniques of "earthing" and some more are used in the power plants.
All this information was left out. The idea is to protect the trainees against accidents in the workplace. For this purpose the amount of information that was given is sufficient.

5.2 *Horizontal Didactic Reduction*



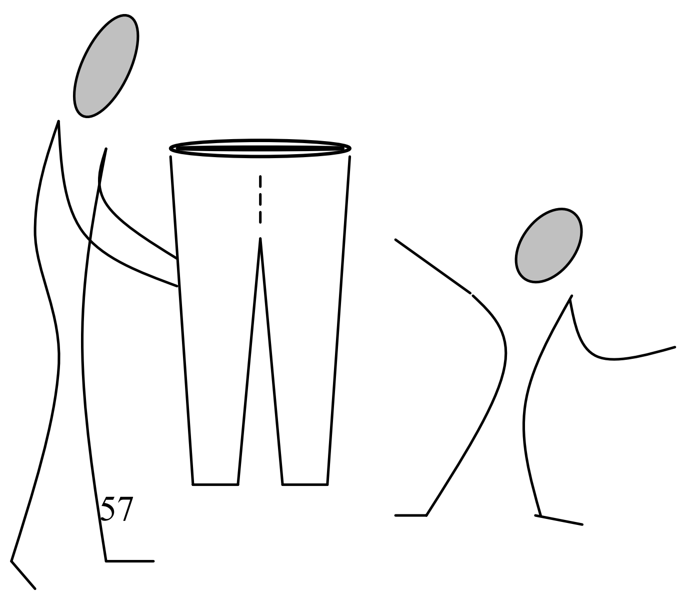
The level of the teaching matter will be lowered.

Horizontal Didactic Reduction wants to prevent the students from being overtaxed with difficult facts.

Two aspects of the lesson shall be spotlighted here. The first is the electrical shock. The explanation for the trainees is very easy: When someone gets an electrical shock, currency flows through the body and injures the person. A doctor would certainly tell us that this interpretation is very primitive even if he does consider it as an interpretation at all. What goes on while a person is connected to a power source is very complicated. Books are written about the procedures within the body and the brain. But all this does not help us in our lesson. Not at all! It would just confuse the students if not the master too. Our clarification is basic. To show what happens when someone gets a shock: if a person touched a faulty machine, the current of this machine would flow through his/her body. This is painful; it injures people and can even kill them. That's what is important for the students. If the trainees have further interest, they will ask. Even though only very few people will be able to answer.
The second aspect that will be highlighted is the *definition.*

6 Definitions

Scarcely one lesson in Vocational Education in Ghana does not begin with a definition. Even though the use of definitions is controversial, we take it as a matter of fact. But the definitions themselves are worth looking at it a bit closer. Many definitions which are in use in the vocational sector are just copied, word by word, out of the dictionary. It came out several times that indeed colleagues of the same trade were not able to repeat the



definition other instructors used. It happened sometimes that the trainers were not able to reproduce their own given definition. How can this happen? Definitions of the dictionary are universally valid. The encyclopaedia tries to explain the word itself. The writers of a dictionary do not address it to a particular group of people but to everybody. Consequently it has to be formulated in a way that it is suitable for many situations. The more aspects it covers, the more information it has to contain. At the end it becomes difficult to understand the definition. Instructors on the other hand have a big advantage. They know the receivers of their message so that they can adjust it accordingly. They can cut off all that is confusing or just not necessary for the students.

Definitions are commonly used to explain unknown things. People normally make use of a dictionary when they do not know the meaning of a word. Therefore we mustn't forget, that frequently the students know what the instructor is talking about, e.g. when speaking about electricity.

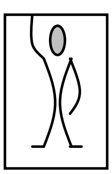
Our example is about electricity. The dictionary defines electricity as: "The energy which exists in a negative form in electrons and in positive form in protons, and also as a flowing current, usually of electrons / a supply of this energy to a household, etc., e.g. for heating and lighting / excitement, tension or expectation." Anticipating that instructors want to help trainees to learn a trade, what kind of help would it be, if we gave such a definition to the students. It has to be reduced to an understandable and helpful level as it is done in the example: "Electricity is helpful in various trades. It makes machines run and gives light." The definition is based on the question: "How can we benefit from electricity in our job?"

Another example that various trades like masons, painters, electricians and carpenters use shall demonstrate it additionally: It is about *scaffolding.* The dictionary gives us the following definition of scaffold:

"A framework of metal poles and planks used as a temporary platform from which building repair or construction is carried out." Primarily this definition is not adequate to most situations in Ghana, where plenty of scaffolds are made of wood. Secondarily there are several words used that might not exist in the trainees vocabulary: poles, planks, temporary. If this was the situation you would have to explain words of a definition that should explain an unknown matter! Isn't that completely contradictory? Can this really be helpful for a student? Hence a better definition should be found. As in the previous example a question can give support: "Why do craftsmen use a scaffold?" The answer is: "They use a scaffold when they have to work above men's height." This answer contains more or less the same information as the definition does, just simpler. The fact that it is only used for working means, that it will be removed after the job has been done. This includes the fact that it is a temporary construction. A definition in a lesson might therefore look like this: *A scaffold will be put up when work has to be done above men's height.*

Some questions may guide instructors when putting down a definition:

- ☞ What is the purpose of …?
- ☞ Why / where / when do we use …?
- ☞ How can … support our work?



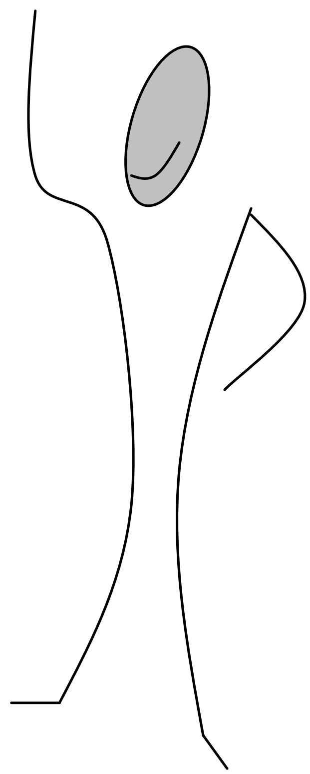
Ask one of your colleagues whether he / she is able to give you a particular definition of the trade by heart!
Take a definition from your lesson preparations and try to re-write it with the help given above!

7 Motivation

A simple exercise should stimulate us for this chapter. This practice was done in several workshops. But before continuing on the next page, do the exercise yourself:

You are supposed to go to a town you don't know very well to do a certain job. For your assistance you can choose one of the persons shown below, to join you. Give a statement, indicating whom of the two you prefer to accompany you. Furthermore justify why you want the person of your choice and why you refused the other person.

Mr. "A"



Mr. "B"

96 % of all participants expressed that they would like to travel with Mr. B. The instructors said that they took this decision because of the impressions the pictures made at them. They described the two persons as follows:

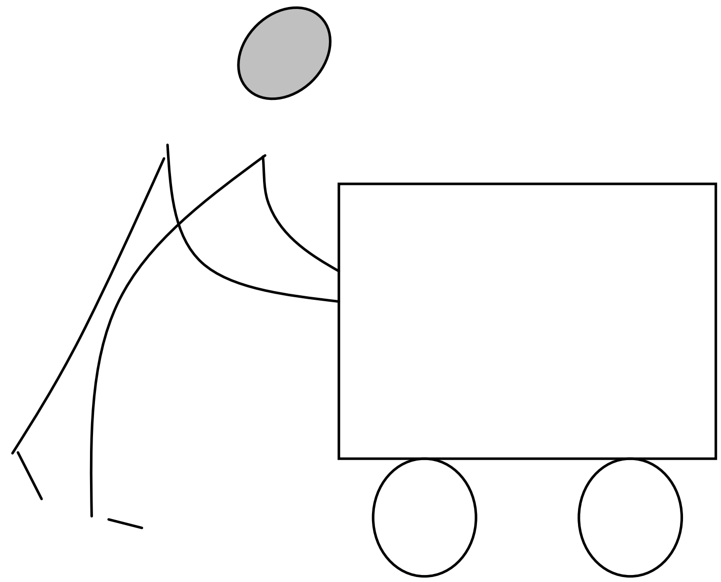
Mr. "A"	Mr. "B"
☞ someone who often gets drunk and cannot control himself and behaves improperly ☞ someone who could cause problems when travelling with him ☞ a person who was feeble and weak ☞ someone who was abnormal an could not reason properly ☞ a person who was lazy and could not assist you in any way ☞ someone who was aimless and good for nothing ☞ a person whom you cannot trust	☞ someone who was very brilliant or clever ☞ someone who was smart and active ☞ someone who was an energetic person ☞ a person who was enthusiastic ☞ someone who had an aim and could help ☞ a person who could solve problems when travelled with ☞ someone whom you can trust to bring you back when travelling with him ☞ a person who was friendly and entertaining

It is very interesting which impression was left behind from these two match-stick men. Summarising one can say that there was one main motive why most of the tested teachers wanted to go with " Mr. B". The picture gave the idea that "Mr. B" could be helpful to them and "Mr. A" could not. In a nutshell: "Mr. B" seemed to be motivated to go but "Mr. A" was not!

If simple match-stick men could impress people so highly, how would living person do then?

If trainees observe an instructor very well they will easily find out what the trainer's motives are or how motivated the teacher himself is!

8 Only a teacher who himself is motivated will be able to motivate trainees!



Even though motivation is not yet fully understood it is undisputed that the influence on human behaviour is immense, as the last exercise demonstrated clearly. Motivation is derived from the Latin word *movere* (= to move). It is the reason why people do things or not; especially whether we do things with pleasure or even enthusiasm or without any interest. Many scientists were and still are engaged in motivation research. Consequently there are many theories and thesis about motivation. Therefore only a short introduction shall be given before concentrating on the "motivation to achievement" according to *Atkinson*, which can be called the most relevant type of motivation for success in the learning process.

8.1 Various Motivation Theories (according to OTT)

The Need-oriented Conception

Basic needs are part of motivation. They all have in common that there is something missing like hunger and thirst. These situations lead to an action to redress the person's balance. When somebody is off balance, he/she always recognises the need and acts. This conception is adequate for our basic needs (hunger, sleep…) but it is not evident for the learning process.

The Incentives-Conception

The Greek Philosophy of Hedonism is the foundation for this conception. This philosophy says that a person's luck and goals are covered through the human being's desire for pleasure-seeking. To reach this a person will try to:
☞ avoid personal disadvantages
☞ gain personal advantages.
Consequently one tries to motivate a person in two different ways:
- Offering an attractive reward if the person takes a certain action
- Threatening somebody with punishment when he/she fails.

The differences at the individual level are huge and this makes it difficult to satisfy everyone. Usually it is money that is used as reward.

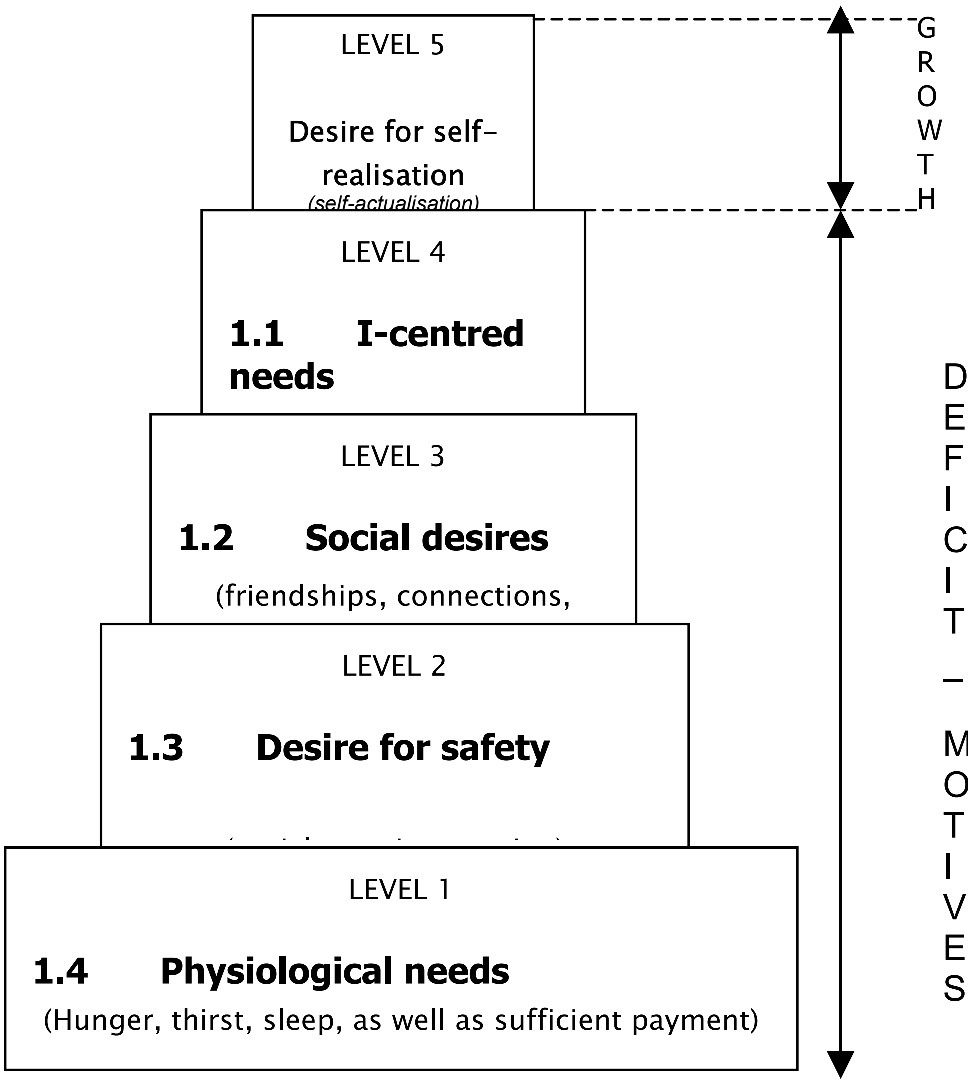
The Humanistic Conception

The central thread of this theory is the idea that a person's main motivation for all activities is the desire for a meaningful life. Several hypothesis became famous.

☞ *The MASLOW Theory*

He says that men are guided by two factors: deficit-motives and ambition for growth. First the deficit motives have do be satisfied and subsequently the growth gains importance. There is the Maslow-pyramid which shows the order in which the desires have to be satisfied. This means that the needs on level one have to be satisfied, before concentrating on level two, and so on. However, when one focuses on this pyramid, several discrepancies are conspicuous with

regard to the different cultures: The order in Ghana or Africa in general might be different from the one presented below. Furthermore, a precise incision between social needs and desire for safety is not easily possible in an African country because it usually goes together.
But even for western cultures, Maslow could only show problems but not give solutions.



Maslow-pyramid, simplified

☞ *The theory of HERZBERG*

Herzberg called his theory “the two factors theory”. In a research he was looking for factors that influences the satisfaction at the workplace. He called them motivators. He called factors that lead to dissatisfaction at the workplace hygiene-factors. They are listed in the following chart.

Motivators	Hygiene -Factors
1. achievement success 2. acknowledgement 3. job-contents 4. responsibility 5. opportunities for promotion 6. opportunities for development	1. salary and status 2. inter-personal relations 3. management style 4. company policy 5. physical working conditions 6. job guarantee

The so-called Pittsburg study showed, that motivators and hygiene-factors operate independently of each other. Highlighting the two scopes we recognise that motivators relate to the work itself and can therefore be called intrinsic motivation whereas the hygiene-factors describe the circumstances and therefore can be called the extrinsic motivation.
Additionally, the study indicated that motivators were mainly responsible for satisfaction while the hygiene-factors are for dissatisfaction.
Even though some results might be controversial, it is significant that satisfaction at the workplace is not exclusively a consequence of a good salary. The job itself and the perspectives for the future are very important too. This shows how substantial the attitude of teachers and trainees is in vocational education.

☞ *MC GREGOR’s X-Y-theory*

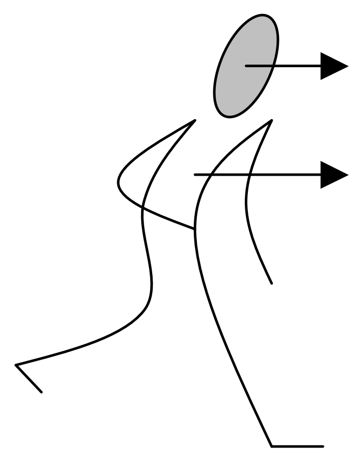
Mc Gregor says that the type of instructor has big influence on the motivation of trainees. An authoritarian teacher has strict rules. He controls the teaching and does not allow much interaction of trainees. He is called the X-type, whose image of man is based on mistrust.

The Y-type's image of man is positive and defined by engagement and desire for self-realisation. This instructor has a co-operative style which gives room for trainees' activity and is motivating.
This thesis too is not a doctrine but shows that teaching exclusively in the "presenting way" (see chapter 11) is outdated.

The Cognitive Conception

It is based on the theory that people are naturally curious and want to achieve a certain aim. This goal can be called calculable, because e.g. an instructor can usually recognise the goal trainees have. This ability to estimate led to several motivational theories. A very important one for learning is the *motivation to achievement*.

8.2 Motivation to achievement (according to ATKINSON)



How intensively people work on the solution of a problem depends usually on two components: the *hope for success* and *the fear to fail*. This type of motivation is commonly known as the *intrinsic motivation*. This motivation is directly connected with the task itself. The first component of the intrinsic motivation leads to the result that people become proud after solving a task. Secondly they are ashamed when their efforts are fruitless. Intrinsic motivation can be considered as based on a natural curiosity.
There are three considerations which direct people when they want to be successful with a duty:

☞ the positive disposition of the person
☞ the subjective probability of being successful

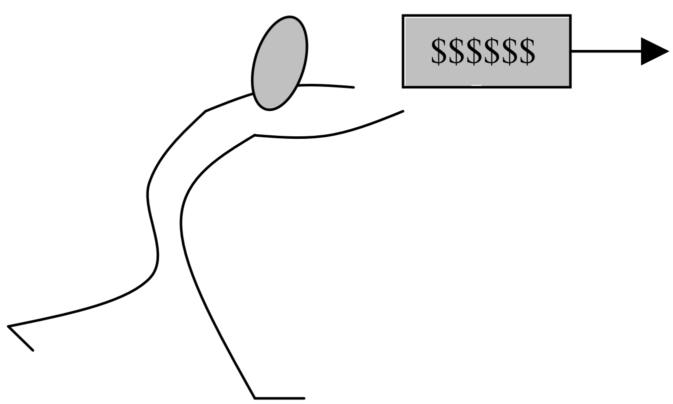
☞ the incentive for being successful
Accordingly there are three considerations that direct people when they try to avoid a flop:

☞ the negative disposition of a person
☞ the subjective probability of being unsuccessful
☞ the incentive for failure

Combining both groups of considerations we will have a cumulated motivation for achievement:

When the hope for success is:	*And the fear to fail is:*	*Then the final motivation to achievement is:*
High	Low	High
High	High	Medium
Low	Low	Medium
Low	High	Low

This results lead to the final thesis: Persons are highly motivated to work on the solution of a problem, when the hope for success is higher than the fear to fail. However, even when the fear to fail is high, a high motivation to achievement can be existent, namely when an *extrinsic motivation* comes additionally. This type of motivation is called secondary or indirect motivation. It can



for e.g. be positive (by praise, good marks, or payment) as well as negative (by punishment, e.g. to stay longer or to do additional homework). They all are called *intensifier*.

The actual motivation to achievement is therefore the sum of intrinsic and extrinsic motivation:

Motivation to achievement =

Hope for success – fear to fail	+	reward / penalty
Intrinsic motivation		extrinsic motivation

In general one can say that learning is easier when the motivation is intrinsic. For a lesson it does mean that trainees must be given the possibility of active participation and the chance to have lots of success. Accordingly a lesson should have several achievable goals. However, one has to be careful. When the level of the task is too low and the solution is easily identified then there is no challenge and the effect of intrinsic motivation can be lost. A general level cannot be given but this always depends on the class, the students, the circumstances and the task itself. These facts have to be taken into consideration all the time. The same task might have different effects in different classes. An instructor should always be ready to adjust a problem to the actual situation in which it shall be used.
The effect of intrinsic and extrinsic motivation is obviously important for the learning process. Some tips should guide us to get students motivated.

There is no learning without motivation!

8.3 How to motivate trainees

☞ *Tasks and questions should be relevant to the trainee's world!*

A situation that can really occur to the student gives a higher impact than an abstract, artificial one.

The danger of getting an electrical shock is possible all the time.

☞ Create a mood of tension and curiosity in the beginning of the lesson!

Start with something that draws the attention of the students.

"Chart # 1" does not immediately indicate what the lesson is about. It will take some time until trainees find out what shall be demonstrated with this chart. There is a kind of riddle in it which students will try to find out.

☞ *Inform the students about your goals!*

The trainees should be aware of the objective of the lesson.

It does not mean that a trainee shall be given the results. He/she should be informed about the "why" of the lesson. Our example could look like this: "Today we try to find out, why it is so important to be careful when operating with electricity."

☞ *Use as many examples as possible!*

Examples have the effect that information can be transformed from abstract to.

Let the trainees tell their experiences. For sure there will be somebody who has once got an electrical shock, or at least one of his / her friends or family members. Ask them in detail what happened and about the consequences. If they have no personal experiences, tell them about somebody out of your acquaintances. For e.g.: “A man did not come home from work. His family was waiting and it was already dark. The children were crying because they were hungry. Usually the father comes home with some food…” and so on.

☞ *Take trainees’ questions serious!*

Always react to questions of the students. Asking lets the instructor know that trainees are interested and that they listened to what the teacher said. A question is a sign of curiosity. Making fun of a trainee because his / her question does not suit the topic is absolutely putting off the student! If there is the feeling that a question is not suitable, the reason might be that the instructor’s explanation was confusing.

N.B.:
There are no stupid questions, there might only be stupid answers!

☞ *Do not forget to praise the students for correct answers!*

In most situations this is common practice in Ghanaian schools. Frequently the students are challenged to clap for a good answer. In some situations it was discovered that clapping as a sign of praise was used too frequently. It became a very monotone action and so lost it’s motivating character. If this is the case, try other methods. For e.g. make a rank for good answers, give points for a good answer, or even give a good mark for an answer, elect the answer of the day…

☞ *Raise the level gradually*

When you start from a low level, even students with low pre-knowledge can contribute to the solution of a problem. By going forward step by step the students will be upgraded accordingly and are not overtaxed.

The example makes that very transparent. In the beginning most of the trainees might know the possible dangers. The consequences of an accident are obviously very comprehensive and have to be worked out with the help of the group. To put up some safety regulations is yet on the level of transfer and can be seen as very difficult but solvable with the knowledge acquired within this lesson.

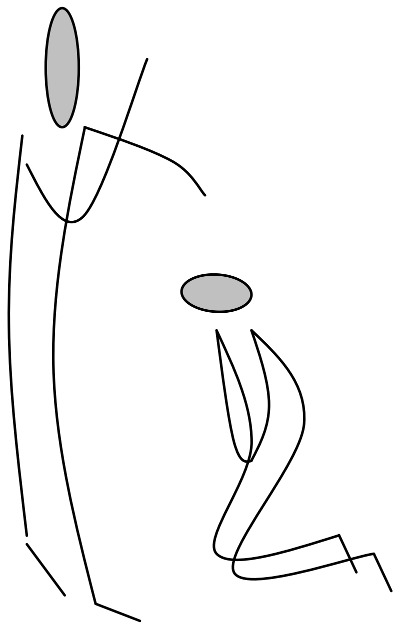
☞ *Give trainees room for self-realisation*

Young people have a somewhat "inner restlessness". Sometimes they want to try some thing themselves and not just listen to what the master says.

In our example there is a group-work where trainees are able to work autonomously. It does not mean that they can do what they want but that they are working on a task independently.

☞ *Avoid punishment*

Some people say that when a teacher is punishing a trainee, it is not more than a sign, that the instructor does not have proper pedagogical knowledge or is just overtaxed. A penalty usually creates a negative mood and this will not help to create a surrounding that promotes learning. It should only be used when the instructor does not have any other idea, what to do



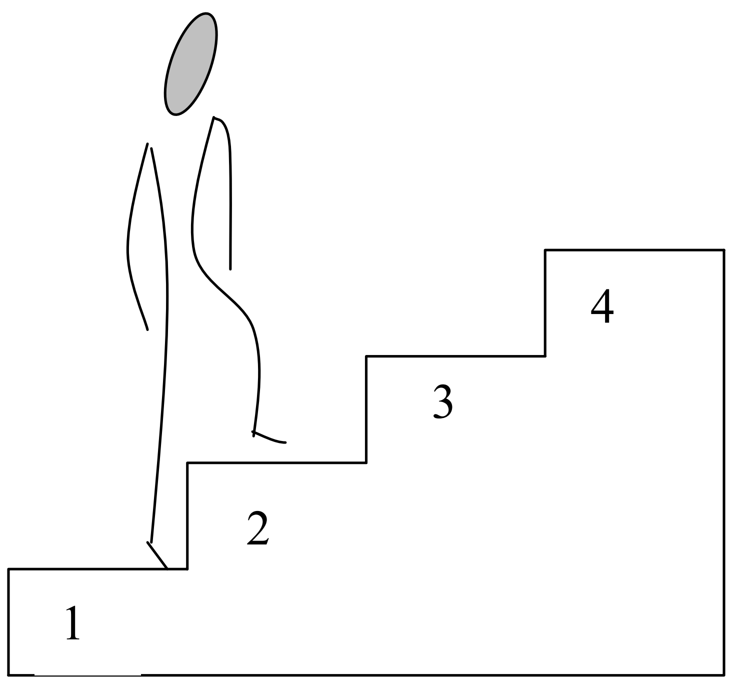
else. In some situations, teachers declare that it is necessary to punish somebody to set an example. In such situations, the behaviour being punished must be obvious to all. Make sure that the sentence is commensurate with the “offence”. If somebody failed in a test, it is not helpful to let him / her go down on his knees. Find out why the student failed and give him / her an additional exercise. Punishment should always be the very last way of motivation!

“A divine curiosity is burning in every healthy child, but unfortunately withers in time” (Albert Einstein)

As teachers we should work hard to grow this threatened plant!

9 The Four-Step-Method

Each new studies in the educational sector brings new methods and ideas for the lessons. What goes for the general education goes for the technical and vocational education too. Actually the main concentration is on "holistic teaching" and "acting-oriented teaching". These methods usually require an immense amount of time for preparation. It also requires sophisticated equipment. Despite the fact that several training institutes in Europe are working hard on the implementation of these new teaching methods they are still very difficult to introduce. Many already recognised that there is still a large gap between the theoretical concept and the practice. Some teachers already recognised that not all what is in the papers can be put into practice.



Nevertheless there are some older and time-tested methods which are still valid and in a lot of situations very convenient. One is the Four-Step-Method. In practical lessons there is also a four-step-method. This is related to the one in theoretical lessons. It is based on the so-called TWI-programme of the USA industries (TWI = training within industry) which was developed during World War II, when production had to be changed from civil driven to war driven. Later on several other countries adopted this concept. In practical lessons the four steps are:

☞ Preparation

All materials at the workplace have to be prepared, so that the practical instruction can take place without any interruption

☞ Demonstration

The instructor demonstrates with several repetitions at different speed the skill that should be learnt (psycho-motor domain).

☞ Reproduction

Trainees repeat the demonstrated action several times until they reach a certain level under permanent supervision of the instructor.

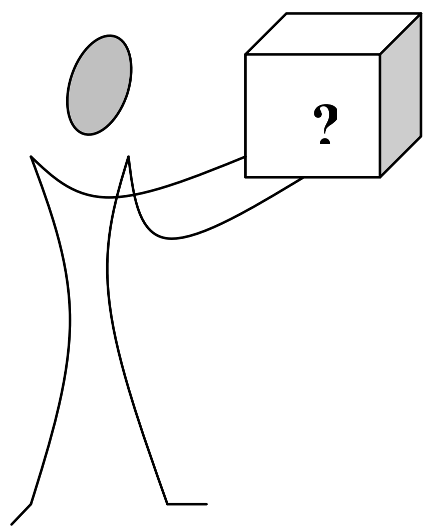
☞ Finish

Trainees practice themselves. The instructor only helps when necessary.

The four-step-method for theory lessons has similarities that can be discovered in the following description. There are various reasons why a lesson has to be divided this way. A gradual procedure makes it easier to adopt the new learning matters. It will easily be implemented in the previous knowledge of the students and so, as learnt earlier, can simply be remembered. An arranged lesson helps the trainees to get a survey about the whole topic. Motivation will be kept up this way. So there is no doubt that the learning process improves when a lesson is well arranged. The way to do it cannot be fixed generally. There are too many variables and sometimes there are circumstances that do not allow us to proceed in the style that was chosen. It may be that trainees did not react the way the teacher expected and the answers that were needed to continue did not come, because the students were on the wrong track. Often, time is an element that cannot be calculated exactly. When a group work is done, trainees may need much more time than was scheduled. Here and there the level of trainees is so unequal that it takes a long period to explain things properly for everybody's understanding. Furthermore "external" influences can disturb the lesson plan. If suddenly there is light-off and the trainer planned to use an overhead projector, he might be in trouble explaining

things in another way. Heavy rainfall can make so loud that understanding somebody talking becomes impossible. All these factors may force the instructor to change his plan and to improvise.
Nevertheless, the four-step-method is a reasonable and proven way to structure and plan a lesson. It is not a dogmatic scheme but a generalisation of experiences because it applies to the teaching work-routine, method and ability. It is a logical way of presenting material that is suitable to most class sessions. All instructors should be familiar with it because it can even be seen as the foundation for other methods.

9.1 Step 1: Introduction



This part is also known as *opening, preparation, or set-up*. The main purpose of this section is to arouse the students' interest and to show a linkage between the teaching matter and the trainees. This is why some people call this phase *motivation*. In sports one would say *warm-up*. But telling the students that the following matter is important does not motivate. Much worse is to shout; "be quiet and listen, you have to know this". It might get silence to the classroom but that's all. A common habit of many instructors is to begin with the sentence: "Today we want to learn something about…". This indicates that the trainees want to learn too, but very often this is only the teacher's wish! There are other more effective ways to begin a lesson: Repetition or connection to previous knowledge and confrontation with a problem.

Repetition or connection to previous knowledge

Familiar knowledge of the trainees should be activated. When you start with the result of the last lesson, the trainees can see a structure and can guess where you want to lead them.

Presentation of a Problem

Tausch found out that there are various psychological processes with the trainee as well as with the instructors, when somebody is confronted with a problem.

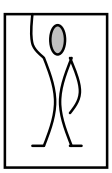
He/she has a first contact with the subject matter and pays attention unconsciously. There is a "tension", a feeling or even spontaneous interest in solving the problem. Sometimes you can see immediate spontaneous activity. The teacher should keep quiet as long as possible and let the trainees act or react.

The situation the trainee is confronted with should simply be interesting. There is no need for complicated experiments or exaggerations.

Try to find a natural or an interesting situation that might get the students curious.

The preparation step should:

1. be adequate for the contents
2. be adapted to the intellectual level of the trainees
3. lead directly to the topic of the lesson
4. be as simple as possible
5. stimulate interest.



Check the preparation step of our example for the five demands!

Even though the first step is very important for motivation, the teacher must not stop trying to motivate. Motivation means arousing interest and keeping it upright. One has to remember that several instructors come to class every day teaching a new subject, expecting that trainees automatically show interest. It is not easy for people to concentrate for a long time. So take every possibility to encourage trainees and do not demand too much.

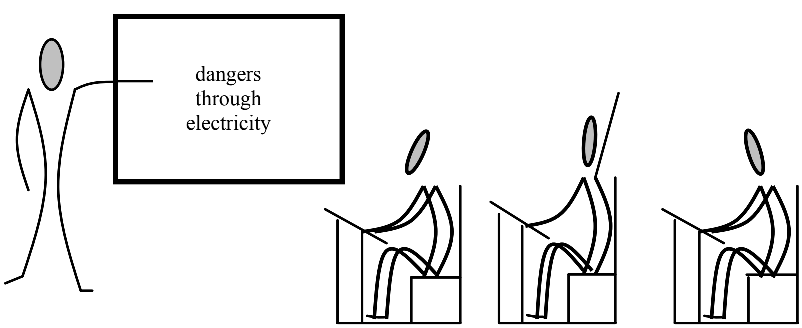
T lesson *dangers through electricity* could be "opened" in another way:

☞ Play a guessing game!

The instructor tells a story like this: A man was brought to a hospital. After the consultation the doctor said: "You have heart flutter and some signs of burning on your right hand. You were lucky that it was only a short contact". Now the teacher asks: "Who can tell what has happened to this man?"

9.2 Step 2: Presentation

Now that the trainees are familiar with the topic of the lesson you have to develop the subject matter logically. There are various aspects, which belong to the topic, and you must ensure that everything is discussed.



This part of the lesson represents the time, when trainees are confronted with new knowledge, which the teacher wants them to

learn. Meaningful learning anticipates understanding. Within a lesson it is the period which consumes most of the time.
Therefore follow you lesson planning. Start with the first objective according to your lesson preparation and go through it as you intended to do and finish it with a short check-up. Then go to your next objective and so on. Try to consider the following:

- ☞ Try to embody the trainees as much as possible and avoid lecturing. Everything that is discovered by the trainees themselves will be easier to be learnt.

- ☞ Do not give information by yourself when a student can do it easily. For e.g. when you have charts, do not explain it yourself immediately but ask a trainee whether he / she can comment on it or explain it.

- ☞ Take down trainees' answers on the blackboard immediately, when they are suitable. It demonstrates to the students clearly that they made an important contribution to the lesson. This is highly motivating and helps to create a good atmosphere in the classroom and promotes team spirit.

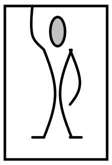
- ☞ Try to stimulate the trainees to think about the problem!

- ☞ Do not continue with the next objective when you have the feeling that trainees did not comprehend the last one. In such a case, take your time and explain again.

- ☞ Give additional examples when the subject matter seems not to be clear.

- ☞ Let one of the brighter students explain the topic if the others did not understand. Sometimes the youth have their own "language" or vocabulary and a trainee can explain better than an adult master.

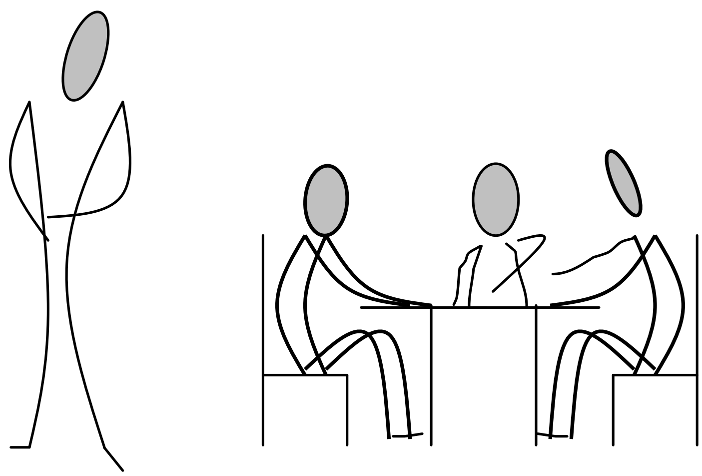
☞ Always teach from known to unknown. This is the way to give justice to "ASSIMILATION".



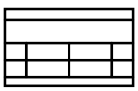
Look at the presentation-step of the example and try to find another way to develop at least one objective!

9.3 Step 3: Application

I hear and I forget,
I see and I remember,
I practise and I understand! (Chinese saying)



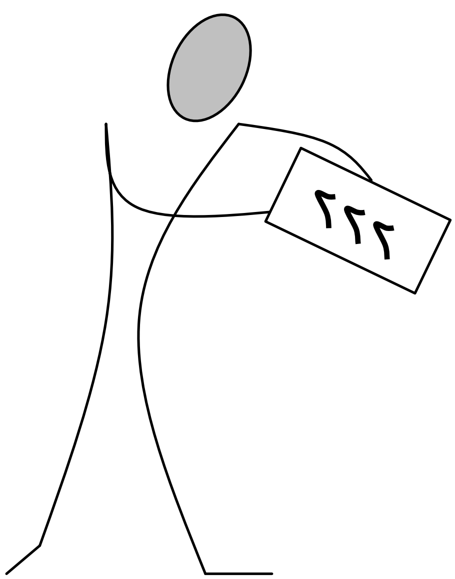
This is the time, when the learning process actually takes place. The trainees shall be given the opportunity to apply the new stuff in order to get the information into the long-term memory. As in the Chinese saying above, the best way to learn is to exercise. The instructor can give the trainees a task that they have to solve on their own. This can be done in groups or individually (usually in Mathematics there is a lot of individual work, when trainees do some calculations on their own) or even together with the whole class. The trainer should now act as supervisor or moderator and leave it to the trainees to do the active part. It does not mean that it's break time for the instructor. He has to be among the trainees and help when help is required. Only major errors should be corrected during the problem-solving period. We all know the "learning by trial and error". This can happen during this time too. When the instructor detects that a student is completely on the wrong track, he should correct him / her. Otherwise the student will become frustrated and discouraged, when after working for a long period and he does not get any reasonable result. If you have the feeling that a trainee does not know how to go on, you should give a few hints that would guide him to the correct solution. It will help to build up his self-confidence.



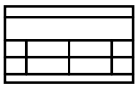
In our example fixing some safety regulations covers the application. This could be done in group-work too. After the group-work the results must be collected and written on the blackboard.

9.4 Step 4: Check-up

Since there is a check-up after every objective during the presentation step, this step can also be named the "final check-up". There are various purposes for this phase. First of all, the instructor wants to find out, whether the lesson was successful or not. If the teacher was following his lesson plan and the advise given in the previous steps, there should not be a gap of knowledge anymore. Within this check-up, the concentration should be on the student's ability to use this new information for his trade. Make sure that the trainees know about the context to which this particular learning matter belongs.



A second main purpose of this step is reinforcement. By repetition or utilisation of the new facts, you help the students to get this into the long-term memory. The learning process takes place already in the classroom and is not banned to homework. Check-up cannot only be done by writing or orally but also through a role-play.



Instead of asking, how somebody's family can be afflicted by an accident through electricity, you can organise a role-play in the classroom. Some trainees play the workers, one is the injured, another the doctor, the nurse, the family members and so on. The casting will show, how many persons are involved, when somebody has an accident at the working place.

When planning the fourth step, take into consideration the following:

☞ Make sure that the check-up does not only cover the WHAT, but even the WHY!

The trainees should not only know that they should be careful when operating with electrical power, but also why they should be careful. This is because it has many uncomfortable consequences not only for the person, but for others too.

☞ Ask questions or give exercises that are very related to the job!

☞ Ask questions that show the importance of the newly learnt matter!

☞ Do not use this step as a kind of assessment that could discourage the trainees. Bear in mind that it is a significant phase for the learning process, which should help to improve learning.

☞ It is very important that the entire lesson ends with a good atmosphere!

10 The Sphere of Action in Vocational Education
(according to Roesch)

There are divers ways to run a lesson. The sphere of action classifies these ways according to the activity of the teacher and the students within the teaching and learning process. It describes the role the two groups – teacher and students – play in getting new knowledge during a class. It refers to the participation of the two in the lesson. The three ways of the sphere of action are known as a) the presenting way, b) the discovering way and c) the developing way. They are all very common in Technical Training. The method the teacher chooses depends on a variety of facts:

☞ *The objectives of the lesson*
Not every objective can be taught in every way.

☞ *The time that is available for a specific topic*
The scheme of work sometimes limits the time available to the instructors.

☞ *The topic itself*
The range of some topics might be to wide. This means that not every method is appropriate.

☞ *The properties of the trainees concerning learning*
There are classes with trainees who learn fast and easily and others who have more difficulties in learning. Freshmen will learn differently compared to majored trainees.

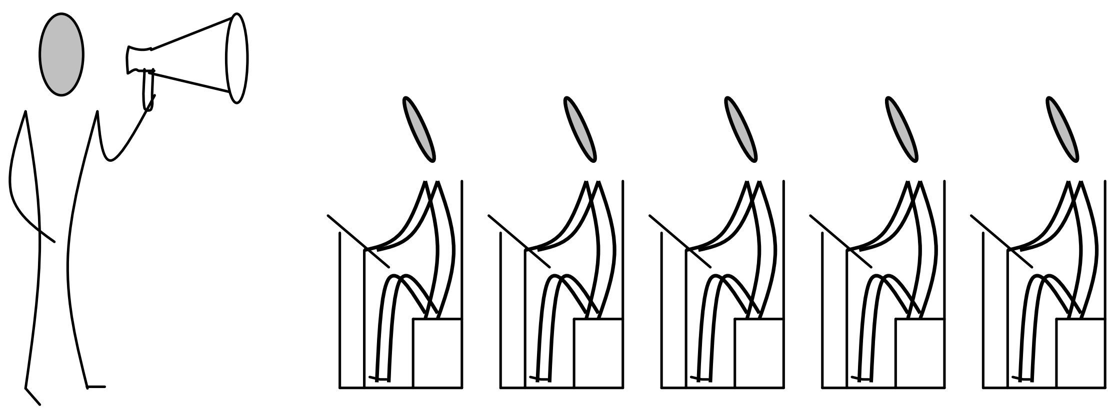
☞ *The local circumstances*
Sometimes a certain way of teaching requires teaching aids that are not available.

The sphere of action is not obligatory for a whole lesson. The method you choose can change from one objective to the other or even within an objective. It is up to the trainer to choose the adequate “method”. About 99% of all lessons in Technical and Vocational Education and Training observed in Ghana run only one way, probably because most of the teachers made only this experience when they were at school or during their apprenticeship.

There are two styles selected in the example:
- Objective one and two: developing way,
- Objective three: discovering way.

10.1 The Presenting Way

What people commonly know as lecturing is defined as the presenting way. It is the traditional method of teaching where the instructor stands



in front of the class, gives information and explanations and sometimes asks questions. The students usually have to listen passively to the instructor’s remarks and answer questions here and there. It concentrates on the teacher’s activity and is absolutely controlled by the teacher. Last but not least, it is the most widely used method in all types of schools.

Characteristics of the Presenting Way

☞ *The presenting way is "time-saving"*

Since it has the style of a lecture the instructor does not expect any interruptions by the trainees. He can download the information as he prepared them without having to react to questions or interactions.

☞ *It gives information systematically, relevantly and basically.*

It is almost exclusively the teacher who is acting. He can prepare the learning matter according to the specific situation in the class, because he is aware of the strengths and weaknesses and the pre-knowledge of his trainees.

☞ *The trainee gets time for information processing.*

For the method to be "time-saving" there should be sufficient time left at the end of every step, so that trainees can process the given facts.

☞ *It is the oldest, traditional and longest lasting way.*

Everywhere in the world at every time you will find lessons which follow this character. It is the classical method in the Universities, where almost everything is done in lectures.

☞ *It informs in logical units.*

The teacher is the person who has the necessary skills for teaching the subject. He is aware of the information that was given to the students in former lessons and he knows what will follow. It is up to him to plan the lesson as a unit so that it suits perfectly into this scheme.

☞ *A huge amount of new information can be presented.*

When there is no time foreseen for the learning process itself, this method allows dropping a high quantity of facts. There is nobody who interrupts and the instructor controls the speed of his lecturing. The students might be ordered to learn at home and the whole time in school will be used for presenting information.

Problems of the Presenting Way

☞ *Risk that the trainee is demoted to the rank of a receiver, without having the possibility of active participation.*

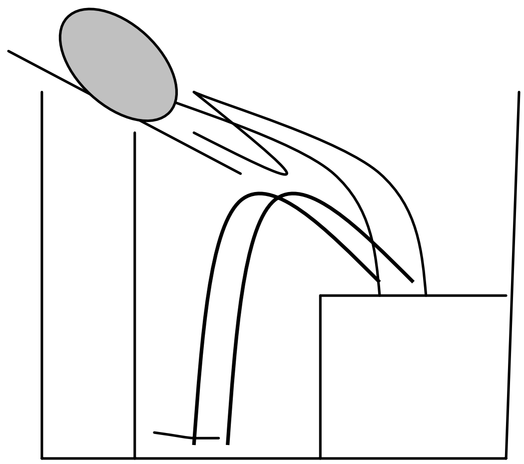
Human beings do not want to be outsiders. Most of us want to be insiders. This means we want to take part actively in the things that are going on. Democracy allows people to influence the political scene of a country, but dictatorship does not and usually people are not satisfied with this situation. In vocational training the presenting way can be compared with the features of a dictatorship. There is one single person who is acting and the others have to listen. Trainees get the feeling that they are only outsiders and it wouldn't make a difference whether they are in the classroom or they aren't. Being degraded to a receiver does not motivate the students very much.

☞ *Risk that trainees may not identify with the new knowledge.*

Getting information in lecture form reminds us about top-down-methods which are considered as very unpleasant. When someone else tells a person what to learn then people look at the teaching matter critically in the first place. It has the effect that some of the information will not be picked up.

☞ *Risk that the instructor holds long monologues which make the trainee lose his or her attention.*

When an instructor prepared a lesson in the presenting way, he / she lists the information that should be given and submits it to the students. The teachers knowledge about the teaching matter is usually



very big and one could talk and talk and talk, not recognising that it is becoming boring for the listeners. Sometimes we do not limit ourselves to the material we prepared but we extend it with additional information that comes to our mind while talking. The sense of time is very much depending on the part someone plays in the lesson. For people who have to listen and are so to speak inactive, a lesson can be felt as a never-ending one. To the one who is talking, playing the active part, time seems to run away. While teachers move from class to class and have some variation this way, the students normally have to sit on the same chair at the same desk in the classroom the whole day which makes it very difficult to concentrate.

☞ *Risk that the contents are too much, so that the trainee is not able to get all the new information.*

The probability that teachers could overload a lesson when lecturing was already described in the upper paragraph and the consequences of overloading and overtaxing too have been explained in former chapters (didactic reduction, the effect of structure)

☞ *If there is no change in style, the trainees lose motivation because the lesson becomes monotonous.*

Monotony has the effect of fatigue. Hearing the same voice all the time is very similar to meditation. It makes people switch off their mind. Students will start to dream with their eyes opened. For an instructor who is lecturing most of the time it is not obvious how many of the trainees are really following the teacher’s talk. When the talk is one-sided the trainees will lose interest in the lesson and motivation can only be reached extrinsically.

☞ *Trainees' initiative is killed and trainees complete the stages of learning passively.*

Technical and Vocational education wants to train young people for self-employment too. When they have their own business, these former trainees have to work and take decisions on their own. People do not have this kind of abilities and have to be trained. If they always learnt in the presenting way and are used to being receivers, it would become difficult for them to start their own activity.

When the Presenting way should be chosen

☞ *When lesson time is limited.*

As this method is absolutely teacher-centred he / she is the pacemaker. The instructor can decide on the amount of knowledge that shall be given. At least even a handout in the form of an information sheet can be dropped. Please bear in mind that information was only downloaded. No learning process took place during this time. You cannot expect that the students will have understood what they were told, even if they answered with "Yes Sir" or "Yes Madam" to the question "Did you get me?" If you taught this way you have to make sure that the learning matter is easy enough and trainees have enough time to review work at home alone.

☞ *When much information has to be given out.*

The same annotations as there are in the above paragraph come with this point too. The more information is given and the shorter the time provided, the lower the learning process of the students is likely to be.

☞ *When dealing with a large number of trainee.*

As we will see later, it is not always possible to teach in the other styles that will be introduced. When you have more than 40 or 50 trainees in one class it can become difficult to handle the situation in another way than the presenting way. If this is the situation then do not be too fast. Reduce the teaching lesson for a period to a manageable size.

☞ *When resources are insufficient.*

Lecturing does not require any technical resources. It is the speech of the instructor that is given and notes will be put down on the blackboard. There is usually no need for any sophisticated equipment, except the teacher wants to use some for explanations. Usually it is a simple talk and can take place everywhere.

☞ *When dealing with new trainees.*

Many teachers are not familiar with other teaching techniques than the presenting way, nor are trainees. Both groups usually did not experience any other methods. This means in the very beginning you might have to teach in the "old style" when having a new class.

☞ *When a new topic is being introduced.*

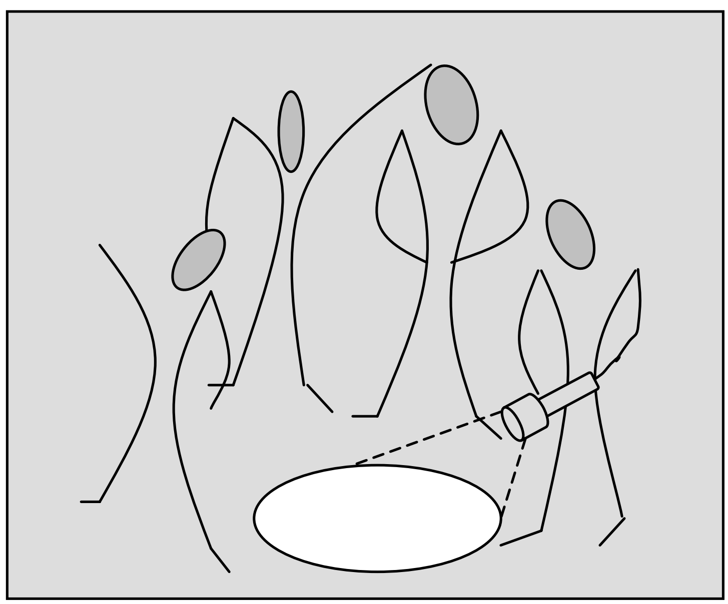
Other methods usually build on previous knowledge. When introducing an absolutely new topic, where the trainees have no pre-knowledge the introduction is commonly done in the presenting way. In this situation an instructor can't count on the co-operation of the students and chooses the lecture style.

Remarks on the presenting way

Summarising, one can say that the presenting way has many advantages for the teacher but few for the students. It requires only very little time for preparation compared to other methods. This is only one of many reasons why most of the instructors teach this way. Furthermore, because lecturing is very economic in preparation it might have several justifications. Some instructors do live far from the school and have to travel every day so that time available for preparation is

short. Some centres operate double-stream in line with the policy to get more skilled young people. This engages teachers longer in school and cuts time for lesson planning. In addition, teaching is not the only duty that instructors have in a vocational education institute. There are some more responsibilities for almost every trainer in the centre.
Some teachers might prefer the presenting way of teaching because it allows an "easy living". There is no need for a long preparation and while lecturing, trainees can hardly ask questions that may throw the teacher off balance.
In most cases teachers use the presenting way because they are just not familiar with other methods. Often they did not experience other teaching methods during their own school time.
Whatever the reason is, it is obvious that the time has come, to start with something "new".

10.2 The discovering way



In contrast to the presenting way, where activity is on the teacher's side, the discovering way is trainee-concentrated.
At the beginning of a lesson or a new objective within a lesson, the trainer gives exact information on what the next goal is. Working out a solution then becomes the duty of the students. This does not mean that the instructor is superfluous. Trainees cannot do the instructor's job. The teacher therefore has to prepare the subject matter in a way that students get the necessary help to come

to a meaningful result. Sometimes the previous objectives in a lesson give enough information to solve the problem. Other aids that can be given include books and work sheets. After some time the results will be presented and discussed. While trainees are working, the teacher always has to be available for the trainees in case they need his help.

Characteristics of the discovering way

☞ *It is up to the trainees to find the solution*

Of course it is the instructor who guides the trainees. By preparing the necessary equipment for the students he / she already gives the direction on how to proceed. However, it is eventually the trainees who have to go the last step on their own. Finally, it is the students' job to come to a conclusion. People learn and remember easier all the things that they worked out on their own. When trainees work on the solution of a problem they will easily apply this knowledge later on in their trade.

☞ *The instructor is in the background and is called when trainees need him.*

While using the discovering way, the performance of the instructor is quite different from the usual situation. The instructor this time can be regarded as a facilitator or moderator. As the students do the active part, the trainer is somehow passive. He only intervenes when he discovers a major error or when asked to help by the students. Being in the background does not mean to be inactive or having a break. The teacher always has to be the master of the situation.

☞ *Trainees discuss various possibilities among themselves.*

When looking for a solution within a group of people one has to find a common agreement. Therefore trainees will come out with several proposals and they have to discuss them. At the end many ideas from the students lead to the final solution.

☞ *The work is shared and the students present the results in their own way.*

Different ideas lead to different strategies. It is the trainees' decision whether to choose one strategy or to follow several concepts. When doing so they have to organise their work autonomously. This has to be the case when presenting the results of their job. They have to find an arrangement among themselves on how to present their work.

☞*All information is researched by the trainees.*

In contrast to the presenting way, where usually the solution will be given to the students and many other facts that belong to the topic are left out, the trainees have to filter and prove the whole information that is given. It is not only the given information that has to be understood but even all the contributions of the entire class.

Problems of the discovering way

☞ *It takes a lot of time.*

All the procedures mentioned in the above chapter take time. It is time-consuming when the trainees and not the instructor control the classroom situation. Trainees usually require time to organise themselves. Taking a lot of time does not mean that this time is wasted. A learning process is already taking place when trainees are engaged in finding a solution, as we already heard earlier on.

☞ *The instructor requires more time in preparation.*

This method can only be successful when trainees have the necessary "outfit", which has to be well prepared. The instructor has to think of all the ideas that might come from the students and supply the right information. If this is not done, trainees would be disoriented and then the time could be regarded as really wasted time, because trainees cannot discover the meaning of their job and the goal they should reach.

☞ *Instructor may lose control over the trainees.*

A teacher's job is not easy at all. Some instructors have a so-called natural authority, which helps them to get the necessary respect of the trainees. Some do not and so they have to build up authority by knowledge. A person who is a master of his trade will always be respected. If there is no authority and the instructor always has problems with the behaviour of the class, he / she may be in a bigger trouble with the developing way. With this method a teacher leaves the activity in the hands of the students and will then have even more difficulties running the class in a reasonable atmosphere.

☞ *Necessary materials should be available.*

When the class is supposed to work independently, everybody has to get the material that is necessary to do the job. If there were not sufficient papers, books and so on trainees cannot do their work and usually start to disturb others. Within a short time there will be a big mess in the classroom and it will not be easy to return to the normal situation. In some centres it is often difficult get the indispensable material, because there are no books at all or there is no photocopier etc.

☞ *Trainees become confused when they have little knowledge about the topic.*

When a topic is very comprehensive and trainees cannot get an overview above the context, they may also loose the goal. Not knowing what one is exactly doing cannot only confuse people but even irritate them. In a mood like this no trainee is able to learn and the atmosphere does not create a surrounding that promotes learning at all. Whenever there is the feeling that the knowledge of the trainees about the topic is to little, one cannot expect satisfactory results.

☞*There is the tendency for the instructor to be lazy.*

Some teachers are not familiar with the situation where trainees work on their own for a long period. They use the time to do other things and forget to support the trainees. Instead of being around and at the students' disposal some trainers leave the classroom for a rest.

☞*Trainees have to be trained in this method.*

This type of teaching might be new not only to many instructors but also to most of the trainees. Therefore when applying this method for the first time in a class it has to be explained in detail. This will take a lot of time. Once it is explained the class will be able to work this way for the time of their apprenticeship and even longer. In the beginning the instructor has to be patient and allow the trainees to adopt new ideas.

☞ *Risk of overtaxing*

When the class is not well prepared and teaching aids are not appropriate, trainees will be overtaxed. This may at the end discourage the students.

When the discovering way should be chosen

☞ *When dealing with matured trainees.*

Matured trainees are those who are well-versed in the topic and are familiar with the teacher. A teacher has to know the class (behaviour) and the level of efficiency. The preparation has to use this knowledge. If there are freshmen, a trainer cannot estimate the reaction of a class and will have difficulties to prepare a lesson this way.

☞ *When dealing with a small number of trainees, so that control is maintained*

At universities where sometimes several hundred students join a course you can hardly find the discovering way. Normally lectures are used. In vocational training there are often not more than about 30 trainees in one class, which can be considered as a tolerable number. When trainers and trainees are familiar with this method it can be adequate for up to 50 pupils.

☞ *When materials are available in sufficient number.*

Sometimes the "necessary tools" are very easy to get. Sometimes one does not need any materials at all. In our example, the knowledge of the previous objectives and the information that there are three groups who might be afflicted (the person him / herself, his / her family / the company) were sufficient for matured trainees to come to a reasonable result. When cards, pins and markers are not available, the results can be noted on a piece of paper and later presented on the blackboard.

☞ *When enough time is available*

Very often teachers think that there is not sufficient time for this method. However, with the traditional teaching method a lot of time is needed, to repeat and repeat again, because the students didn't understand the subject matter. The time factor can indeed be a problem when the method is newly introduced. Having used it once, the time should be considered secondary, because there is a learning process taking place during the lesson.

Remarks on the discovering way

The discovering way has a number of possible difficulties, but has many advantages too. Awareness of the problems that can occur will already help to avoid them.

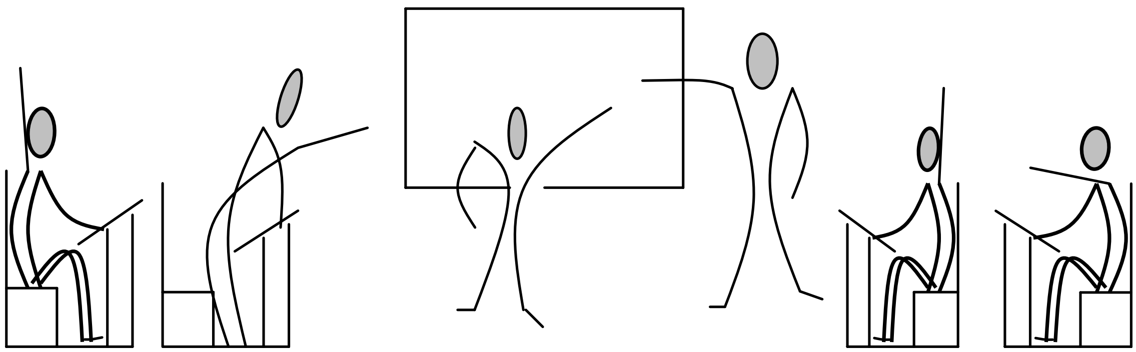
This type of teaching gives more to the trainees than just the transmission of new trade knowledge. The way the students learn helps them to work on solutions in general. Vocational education should in many cases lead to self-employment, where these past-trainees have to work autonomously from the very beginning. This can be learnt with the discovering method. The trainees are forced to work together to come to a solution which helps to build up social competencies like co-operation. As there are contributions from many trainees to the same topic, a wide range of information around the whole issue will be spotlighted and discussed, so that the students get a holistic view of the teaching matter.
Surely, the preparation for the instructor has to be more intensive and will take more time than usual. However, materials once prepared will serve you for a long time. Although the teacher cannot go on break during the time trainees are operating, he / she can relax a bit, at least not being forced to talk. The more often this method is used and the more the students are familiar with it the more relaxing it will become for the instructor.

In our example the discovering way has been chosen for the third objective. It is done in group-work. The trainees have to find out what consequences an accident has for various parties. The information to find out was given in the previous period of the lesson. A hospital was already mentioned, and there was the discussion with family members too. So no more material is necessary.

When it becomes obvious that trainees are not able to handle this problem (consequences for various parties) which materials could be given to the trainees to make the task manageable for them?

10.3 The developing way

This way can be considered as a combination of both the discovering



and the presenting ways. It tries to unify the advantages of the others and to reduce the number of problems that could occur. Compared to the other methods where activity was either concentrated on the instructor or the trainees, here it is spread to both. It means that most of the time the trainer and trainees are active. One can call it a co-operative style where responsibility and duties are distributed to every party. However, make sure that this distribution is somehow equal, so that the trainees do not get the feeling that they have to do the instructor's job.

Characteristics of the Developing Way

☞ *The instructor and trainees are partners.*

It does not mean that trainees have the same rights as the teacher. In every company there is a senior partner and a junior partner. Junior partners do not have the same rights as the seniors. However, being the junior gives the feeling of being taken serious. It will show the trainees that their opinions and their ideas are important. Co-operation will make the class more lively and fruitful and the participation of trainees in the teaching will rise gradually.

☞ *The instructor acts as a facilitator.*

As the developing way contains items of the other two ways, the instructor's job does too. At one moment he / she will be a lecturer, while at another he / she will act like a moderator. It always depends on the situation. But even when trainees are doing the most active part, it is not break time for the teacher. He / she has to keep the track all the time. The trainees should never get the feeling that they are left alone with any task.

☞ *The trainees interact among themselves.*

When a lesson is teacher-centred all answers and contributions of the trainees are directed to the instructor. Observing a class in a developing style one can see that there are discussions and exchange of views among trainees, because they have their ideas and have to explain and defend them, when classmates ask questions. These discussions have to be supervised by the instructor.

☞ *The instructor and trainees are active throughout the period.*

In the presenting way it is usually the instructor who is talking, except when trainees are answering a question here and there. In the discovering way it is mostly the students who are active and the master is in the background. This concentration on only one of the two parties is not existent in the developing way. It is a to-and-from between trainees and teacher and trainees among themselves.

Problems of the developing way

☞ *It takes more time than the presenting way.*

It is true that this way is more time-consuming. However, it has already been explained that: Time-consuming does not mean time-wasting. The more experience trainees and teachers have with this method the less relevant will be the time factor.

☞ *Sufficient materials and tools must be available.*

Whether this is important or not will depend on planning and preparation. When thinking about how to run a lesson on time, there should be enough time to prepare the necessary materials. It is not every lesson that has to be done this way. Existing ones can be modified a bit and then contain part of a new teaching style. In a later chapter we will learn some more about teaching aids.

☞ *Lectures may turn into argumentative session.*

This is only a problem, when a discussion gets out of control or does not involve the subject matter. The more discussions are on the topic, the more the trainees will learn.

When appropriately applicable

☞ *ALMOST ALWAYS!*

This teaching method is nearly possible all the time. There are only some cases, where it can become inconvenient.

- When the topic is absolutely new

If trainees do not have any pre-knowledge of the topic, it is difficult for them to co-operate, because there can only be very few contributions from the students and it will automatically turn into a presenting style.

- The number of trainees is too large

  When dealing with a very big class (let's say above 50) it is no longer possible to involve many of the trainees. While the teacher is communicating with some of the students the others will withdraw themselves.

- Lack of time

  Sometimes teachers might be under time pressure. There is still a large number of topics to teach and there is not sufficient time available. In this situation the information transfer and the learning process have to be split. In the training centre the teacher will present the knowledge and explain quickly, and the trainees have to learn everything at home. However, be aware that the learning itself will not be as efficient as it would have been with the developing way.

Remarks on the Developing Way

In summary, one can say that the big difference between the developing way and the traditional teaching lies in the involvement of the trainees. The students should no longer be seen just as receivers but as partners. Many of the lessons that are held in Technical Education and Vocational Training could be transformed into developing style lessons with only some modifications. Very often there are many situations where students could take over the part the instructor usually plays. For e.g. when a chart is shown, one can ask a trainee to try to explain what he sees. Normally this is what instructors do. However, some teaching aids and some situations in a class are so obvious in their intention that a student can do it too.

10.4 Final annotations

Of course, leaving behind the traditional way of teaching and starting something new will be more work. However, as already mentioned it does not mean that all previous preparations and lesson plans have to thrown away. Many of them can still be used and some of them can be overhauled. And finally, nobody will expect that every lesson has to be changed at once. If one lesson a week were modified it would be a progress. Naturally every input will have an output.

☞ *A better and easier learning for the trainees*

As the learning process already happens partly in the classroom, the knowledge of the trainees grows faster without spending more time with homework. This will have the result of further motivation and engagement.

☞ *A good mood in the classroom*

The more effective teaching is, the higher the acceptance of the trainees. Being actively involved shows trainees that they were part of and contributing to a successful lesson. This will provide team spirit. It is motivating and makes students attend classes willingly.

☞ *Better results*

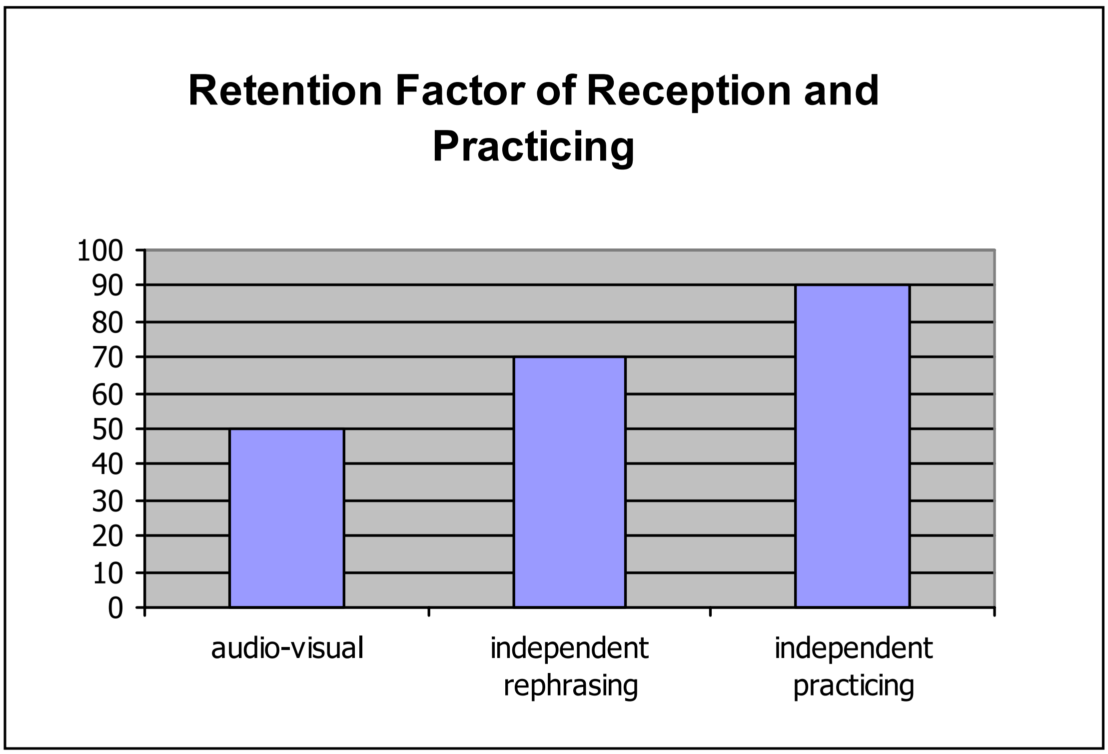
Everything that is encouraging trainees to learn and participate actively in the lessons will bring higher efficiency in learning. Things will be remembered easily and this will lead to better results in class tests and the trade testing examinations.

☞ *Good reputation*

The opinion of trainees should normally not be considered too much, when talking about the reputation of a teacher. The students have a different way of assessing the achievements of an instructor. Usually they are influenced by issues that have little to do with the teaching.

Asking pupils why a teacher has a high reputation regularly will get you one answer: “We learnt a lot from this instructor”. If the final result (having got a good apprenticeship and having passed the examinations) is positive, most of all the inconveniences are passé and forgotten. What remains is whether there was success or not. A good reputation of instructors will result in a good reputation of the whole training institute. This will encourage more young people to attend the institute. Obviously it is a circle and it is nobody else than the instructor who should give the initial impact to improve the present situation by reviewing his teaching style.

Active involvement of trainees is very important for the learning process as the following chart shows.



The chart shows very impressively that even proper use of teaching aids is not as effective as active participation of the students.

In our example only the developing and discovering ways are used. One can easily see that the level is rising gradually and that the progress of the lesson depends on the contributions of the trainees. It is important that the students always give an explanation for their contributions: “Which of the cables would you prefer?” – “Why would you prefer…” . If not so, the lesson would turn into a guessing game and there was no learning process. The students should be involved throughout the whole lesson. At the end every trainee will have the feeling that the result which is noted on the blackboard is part of his / her own effort. The notes on the blackboard when developed step by step makes it easy to recapitulate how it was built up. The trainees can then recognise how they themselves were guided gradually to a common goal.

Presenting	Developing	Discovering
Concentrates on teacher's activity. Absolutely controlled by the instructor.	Activity is concentrated on instructor and trainees. (co-operation)	Concentrates on trainees' activities.
The instructor intensively controls trainees.	Instructor gives the impulse, he/ she is the initiator	Trainees decide on their own what they will do
The instructor plays the main role. He is the transmitter of information	New knowledge is won in common work	Trainees decide on their own how they will proceed
The instructor presents, explain, shows, illustrates	Instructor is a facilitator	Instructor is in the background
Objective setting is done by the instructor	Trainees are able to participate as partners	Trainees do the objective setting
Instructor offers a whole lot of information	The instructor guides the trainees	Trainees make proposals
Instructor presents complex knowledge systematically	Instructor gives instruction to the trainees	Trainees solve problems on their own
Instructor prefers cognitive and affective objectives	Trainee is interactive	Trainees share work, work together

The Sphere of action in Vocational Education, main features.

11 The Social Action in Vocational Training

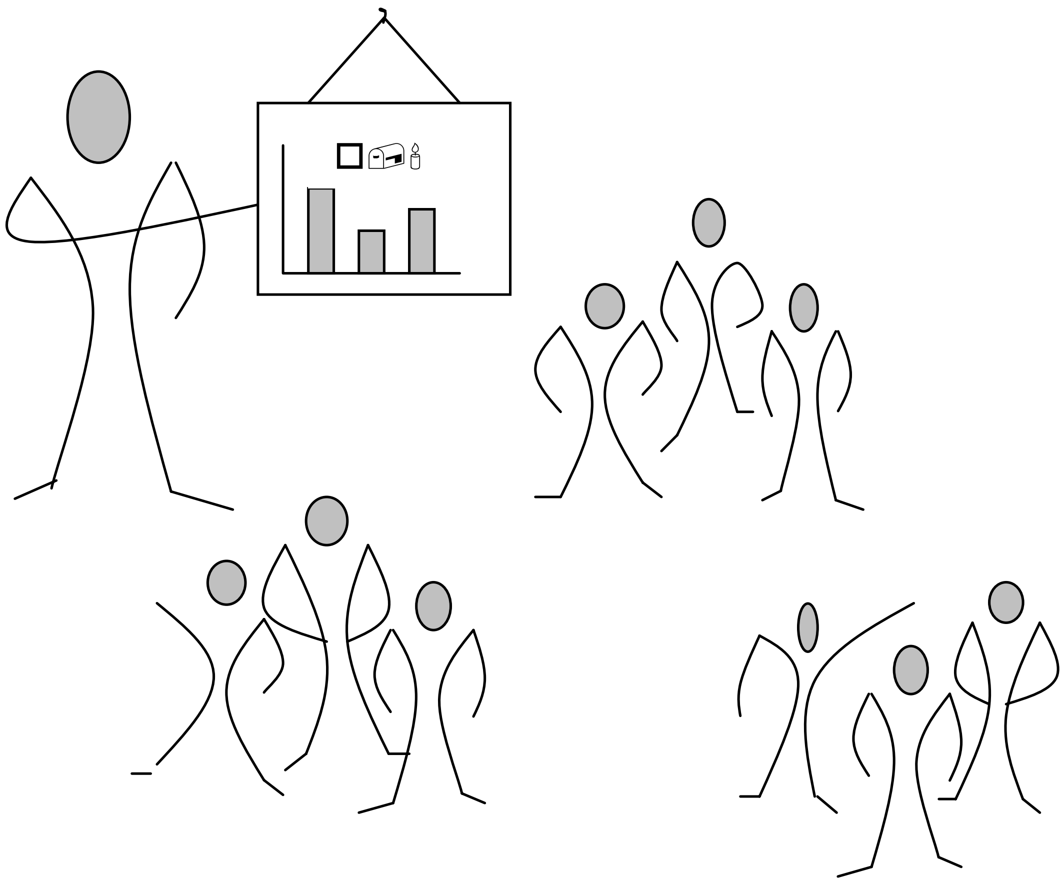
In recent times, the focus of vocational training has shifted from one which is teacher centred to one that is more student-oriented-teaching in which the students themselves are actively involved. Instructors have to break away from the prejudice that a lesson was good when the instructor talked most of the time.
Teaching is above all a form of communication. The instructor communicates with trainees and trainees among themselves. Communication among trainees should be encouraged. Three fundamental forms of communication or social actions in vocational training are *Class Teaching, Partner Teaching and Group Teaching*.

11.1 Class teaching

This is the most common and classical way of teaching. It means that the teacher addresses the whole class at the same time. Everything he / she is saying is directed to everybody in the classroom in the same way. Nobody is excluded or given any other duties. In a nutshell, the entire class is involved in the same task.
Class teaching usually does not respect the abilities or deficiencies of particular students. Bright trainees are addressed the same way as trainees who do not learn easily. This means that class teaching has to go on a well balance level so that everybody can follow. However, this is not always possible. Sometimes as teachers we have to accept that there is a small percentage of dropouts. This is a very critically statement but reducing the level too much or concentrating on particular trainees will lead to the neglect of the rest of the class. Within class teaching, the instructor has control over the entire class. In contrast with other forms of teaching he has only to concentrate on one main group and is not busy with several different assemblies as it is the case in, for e.g. in group-work.

11.2 Group Teaching

In group teaching, the class will be split up into several groups temporarily. There is a lot of research work about the implications of group-work. One effect, which is commonly known for example, is the group dynamics. It has to do with the process of mutual influence



among the group members. The achievement of a group is more than the sum of the potential of every single group member. "Together we are strong" is a common saying. There are various types of groups according to the causality of their formation and the level of interaction. The class in total is for e.g. a so-called formal group, because it is formed by organisational necessities and has a particular purpose. The "group-work group" is a *secondary group* and might even be called a *team* under certain circumstances. It is organised rationally to solve a certain task. Additionally, we have primary groups (for e.g. a family) and informal groups (for e.g. a clique).

Types of Group-work

Depending on the task the groups were given there are two types of group-work: the *common-job group-work* and the *job-sharing group-work*. Which type of group-work he / she chooses depends on the teacher's intention.

The Common-job Group-work

When there is a new and important subject matter, this is the type, the teacher should decide to use.
Common-job means that all groups are working intensively on the solution of exactly the same problem. All groups are given the same task, the same questions and the same materials. At the end of the group-work the group leader will present the results as requested at the beginning of the group-work. It has the advantage that all trainees are going through the same topic and get nearly the same information. This influences the learning process. On the one hand the students approach the learning matter during the period of the group-work. When presenting the results, every group-leader will give the group's solution of the problem with his / her own words. This embodies a repetition, which means reinforcement. When various groups are working on the same task, another positive side-effect is that the output is higher because more groups means more ideas, more statements and more contributions. After a group-work like this, usually every trainee should be familiar with the new knowledge, without additional homework.

Objective 3 of our example is supposed to be reached with a group-work. To do it the common-job way means that all groups have to deal with the three questions: a) what consequences does an accident have for the person, b) what consequences does an accident have for the family and c) what consequences does an accident have for the company? Every group has to think about the three fields. The ideas will be discussed within the group and later on presented to the rest of the class, when group-work has ended. After that they will hear the results of the other groups, which will normally be quite similar to their own and therefore be considered as confirmation of their own work. In addition, different conclusions might come out, which one group has not considered.

The Job-sharing Group-work

When a common knowledge of the topic is existent and all trainees are familiar with the general solution of a particular problem, this type of group-work can be chosen to work out special details.
Every group is working on a part of a solution. At the end of the group-work, the group-speakers present the result of their group and thereby inform their classmates of the group's work. Every group works out one part of a comprehensive statement. At the end of the lesson, when every group gives its results, the partial contributions are assembled to a final completion like pieces of a puzzle to a picture. This form of group-teaching is more time-saving than the other one, because every group has only part of the job to do. When compared with the common-job type, the learning process is not as intensive, because there is no repetition and the part of the solution which is found out through other groups is usually given in the presenting way, which was already discovered as less effective than other ones. In addition, the output is normally lower, because there are fewer people engaged with one task.

Looking at our example, even a job-sharing group-work can lead to a satisfying solution of objective 3. In this case, one group has to find an answer to the question "what consequences does an accident have for the person?", the second group "what consequences does an accident have for the family?" and group 3 "what consequences does an accident have for the company?". At the end of the period, the various group speakers present their results to the entire class. The instructor is supposed to put the answers on the blackboard, so that at the end of the group-work the answer is completed on the board. The effect will be that less time is needed, because the tasks of the groups are smaller than with the other type. On the other hand, the various group members are only confronted with part of the solution during the period of the group-work.

Advantages of Group Teaching

Apart from variation during a lesson, group teaching has many positive aspects, which can be divided into three groups.

Intellectual procedures

☞ *Trainees go into the tasks more intensively.*

Since the students have to solve a problem on their own. The fact that they have to present the results to the entire class later on will encourage them to work on the task intensively.

☞ *Trainees express themselves.*

When the group finds a solution during a discussion it has to be formulated in the form of a sentence. This will help to express the learning matter in their own words. When they use their own vocabulary it is easy for their classmates to understand. At least, being forced to bring an answer to paper is a training in the English language.

☞ *Trainees learn rules of discussion within a group.*

A group can educate its members. Even when one participant is the group speaker, all of them are on the same level. There is nobody of a higher rank and so trainees learn to accept rules easily because there is no order from any authority. They recognise the urgency of a certain behaviour that is necessary for the group to be effective.

☞ *They hear the opinion of their comrades*

Within a group smaller than the entire class, more trainees can come out with their opinion and the students get to know each other better.

☞ *They learn to work independently.*

Very often it is only the goal which is given in a group-work. The solution is somehow indicated through the given teaching aids, but it is up to the trainees to use these aids the right way. This is a small step to guide trainees to learn to organise their work themselves and to be self-reliant.

☞ *They learn how to solve problems in general.*

A comprehensive objective of vocational training or education in general is to promote the ability to solve problems. It is one of the most important things in life and is very important during the time of apprenticeship.

☞ *They are challenged and therefore develop ambition.*

The effect of a challenge was already explained in the chapter about motivation. When the challenges are on an adequate level it leads to the development of ambition.

Social Procedures

☞ *Trainees stay in close contact with their comrades and help each other.*

A smaller group is not as anonymous as the entire class. The students recognise the importance of everybody's contribution and help one another.

☞ *Students consider the opinion of the other group members*

One important rule for living together in peace and harmony is to listen to and to respect other peoples' opinion. They learn that for a common solution it is important to get several point of views, which will be discussed and analysed and finally form the best consensus.

☞ *Trainees take group-decisions.*

A group-decision has an added advantage that because of the various contributions every group member has formed a part of the decision.

☞ *There is identification with the group and the results of the group's work.*

As the solution of the problem was a common decision, every participant is responsible for this group-decision in the same way.
This becomes very obvious when the group leader is presenting the results to the entire class. Sometimes there is a criticism from other classmates. Almost immediately another member of the group starts speaking either to give more information or to defend the group-leader's remarks.

☞ *They develop their own roles for the work within the group, they learn to respect and control these roles.*

Usually these types of roles are given by the school authorities and the youth has to abide by it. These top-down orders are not as willingly adopted as compared to when they are developed by the trainees themselves.

☞ *They get a feedback on their own performance.*

Normally there is a reaction from both the classmates and the teacher. It enables the participants to analyse their job and their behaviour during group-work. Trainees can see that a good co-operation lead to good results or they will understand why they failed.

Emotional Procedures

☞ *Trainees get higher satisfaction because the work was self-controlled.*

Even when the instructor is around the whole time, the group's job is done independently. They are not under the direct supervision of the instructor. So trainees feel free to express themselves, not fearing any restrictions by a teacher. Additionally, they recognise that they are able to solve problems without the interference of a trainer.

☞ *Even reserved persons may give their opinion.*

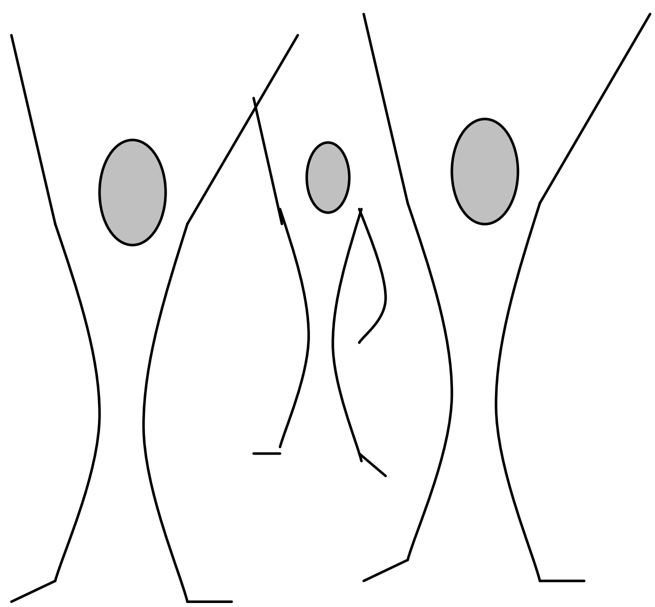
A class can be referred to as being homogeneous but there are still various types of persons in that class. You have the whole range from very calm to hyperactive. Normally the calm ones do not attract attention during classes. Only when a teacher directs a question to such a person will he / she answer. Nobody knows the reasons for this behaviour and often the contributions of these persons are very valuable. Being calm does not mean knowing nothing. In a group smaller than the entire class, those trainees might be encouraged to contribute actively.

☞ *Shy people lose some of their fears.*

When they get a positive feedback during group-work sometimes shy persons gain self-confidence and dare to answer in a bigger auditorium too.

☞ *Even trainees who are not very effective can enjoy the success of the group.*

Self-confidence is often a question of success. The more successful someone is, the higher his / her self-confidence becomes. People who usually are not very active do not have many opportunities to enjoy the feeling of success and so suffer from low self- confidence. Within a group-work all members will share the success even when one person did not contribute much.



☞ *Usually trainees are highly motivated.*

All what we heard up to now has a positive influence on the motivation of the trainees. It is not only the variation in teaching, the change of methods, but also the possibility for the trainees to work in an atmosphere which is not as strict as a teacher-centred lesson.

Disadvantages of group teaching

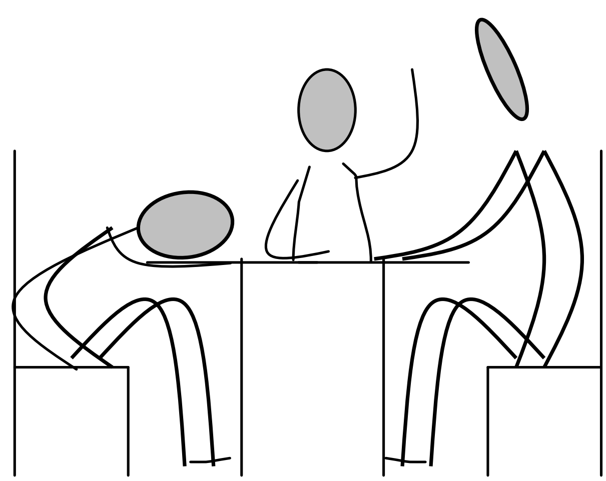
The many advantages of group-teaching became apparent in the last paragraphs. The negative aspects of group work seem almost insignificant when compared with the positive aspects. On the one hand, they are of organisational nature and on the other hand they do not affect the intellectual, social and emotional procedures of a group work. Nevertheless, they shall be mentioned and explained.

☞ *Sometimes the conditions for group teaching are difficult.*

Small classrooms and lack of materials can make the realisation of a group-work laborious. If the classroom is too small, the discussions of one group may disturb the other. Upcoming disturbances in one group can be contagious to other groups. Disturbances may also occur when there are inadequate materials and the students become bored or start looking for materials from the other groups.

☞ *Some trainees may use the chance to "hide" in the anonymity of the group.*

During class teaching an instructor always has an eye on the entire class. Every student gets the feeling that he / she is under the supervision of the instructor and behaves according to this. While supervising a group-work, the teacher has to go from group to group to offer assistance. So he / she is not able to control the whole class. Some people



might use the opportunity of being out of the trainer's control to relax or even doze. This problem usually occurs when group-work is introduced to trainees as a new type of teaching.

☞ *In the beginning group-work takes time and the results might not be very satisfying!*

Both trainees and instructors have to learn more about group-work. As we shall see later on, there are various terms when a group is formed. Those procedures take much time in the beginning, but are easily learnt later on, when trainees are familiar with the new sphere of action in the classroom.

Composition of the Groups

When a group is being formed it means that people will come closer than is usually the case. The process of forming a team of several individuals comes with four steps: forming – storming – norming – performing.

☞ *Forming*

This phase is reflected in the careful approach adopted by everybody, to find out which behaviour is adequate and tolerated. During this period there is a major concentration on the group leader. The members do not work on the problem itself but define regulations and ways for co-operation.

☞ *Storming*

Minor conflicts which will be a setback for the group leader may arise. The task will be regarded very critically and this is likely to affect progress of work.

☞ *Norming*

It is the time for finding a group-identity. Several opinions will be discussed and the collaboration gradually becomes friendly and loyal.

☞ *Performing*

The group members now concentrate on the solution to the problem. Proposals are discussed constructively and there is mutual acceptance.

Types of Constellations

Depending on the intention of the teacher, there are several possibilities of group formation.

☞ *According to natural circumstances.*

It means that in this case the instructor does not have anything special in mind for separating or grouping particular students. So trainees form groups according to their names in alphabetical order. Sometimes the various rows of the benches in the classroom are used in forming the group: Row 1 = group 1 and so on. This is a common way, because not much time will be wasted for the procedure of group forming. On the other hand it may have negative influence on the effectiveness of the group, because the group-members may not understand each other well or are all on a low level. When there are only underachievers in a group, only job-sharing group-work should be done and this particular group should be given an easier task. If it was a common-job group-work, this group would have difficulties to come to a conclusion or would identify that their solutions are of lower quality than the ones of the high achievers. This may discourage the trainees.

☞ *According to the affection of trainees.*

The instructor allows the trainees to pick each other. This will in the beginning excite the students, because friends come together. But it might not be very useful for the effectiveness of the group's performance. Often when friends meet, they have other things to discuss than to work on the given task.

☞ *According to the interests of the students.*

This is frequently used to support a competent outcome especially when the tasks have something to do with the trainees' interests. But it is not always possible to find out what the common fascination is based on.

☞ *According to the achievement of the trainees.*

For a good mood in the classroom this is the most appropriate way to form groups. Try to mix students of high level with students of low level. All groups would be at the same standard and nobody has the feeling of being at a disadvantage. This is because sometimes group-work might be regarded as a kind of competition among trainees. Additionally low-achievers can benefit from high achievers.

☞ *According to gender issues.*

In recent times more and more female trainees enter so-called male dominated professions and the other way around. Usually these "newcomers" are in the minority. It is the teacher's task to integrate these young persons as properly as possible. If the fewer persons always form their own group it will give them a feeling that they have to stand their ground all the time.

Realisation of Group-Teaching

Before group-teaching can achieve the needed objective, the following have to be noted:

Group- teaching requires a good preparation to be successful!

☞ *Make sure that every participant has the necessary materials.*

When students do not have the equipment that is needed, they will start looking for materials somewhere else or will be engaged with something else. Both situations create a mess in the classroom and will spoil an atmosphere that requires working mentally.

☞ *Make sure that the instructions are clear so that everybody will understand.*

Unclear instructions will lead to confusion among students. As we learnt about the processes taking place during the formation of a group, there are already some complications to manage. Additional misunderstandings can lead to a complete blackout.

☞ *Make sure that the task is at an adequate level so that everybody can contribute to finding the solution.*

When the task is so difficult that only the best student in a group is able to contribute to the solution or he alone is working on the problem, it is no longer group-work and the identification with the group and everything which comes with it gets lost.

☞ *Arrange the classroom so that the formation of the groups can be done quickly.*

When a teacher knows the trainees of a class, he / she can arrange the trainees according to the groups he wants to have. It means that having found a well-balanced mixture of groups, the instructor can let them sit in the same way during normal classes. The group formation according to normal circumstances will be turned around. If you place the members of group 1 in row one, you can combine two options: the normal circumstances and the achievement of the trainees.

☞ *Take care that you have a well balanced mixture of groups*

This point does not refer to the achievement of the trainees but to the behaviour and other group-work dynamics. One thing is to separate troublemakers. When there is only one good-for-nothing trainee in every group he / she will not be able to disrupt the effectiveness of the group. On the contrary: a group might be able to educate its members! On the other hand, when all the troublemakers in a class are in one group they will encourage each other and stir up the whole surrounding.

☞ *Try to get a good size of group.*

For effective working within a class, groups of 3-5 persons each are adequate.

☞ *Name a group leader.*

Do this before the group-work starts. When you do not do so, there will be confusion during the working period and especially at the end of the group-work, when somebody has to present the results to the entire class. Usually nobody wants to take over this responsibility and everybody pushes it to his / her neighbour.

☞ *Put down the order for the presentation!*

What goes for the naming of the group leader goes for the order too. Sometimes you can just arrange a kind of raffle. Write down numbers according to the number of groups on small pieces of papers and let the group-leaders draw one.

☞ *Announce whether you will give marks for the work or not.*

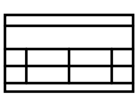
Some instructors want to put pressure on trainees when the progress of the group-work does not satisfy him / her by announcing that marks will be given. When this takes place after the group-work has already started, the students will regard it as penalty and build up a negative attitude towards group-work.

☞ *Tell the trainees the time that is scheduled for the job!*

It will help the students to organise their time management effectively. When group-work is limited to 5 minutes, the trainees recognise that the result of the group-work cannot be very comprehensive. On the other hand a scheduled time of 30 minutes will announce that an extensive answer is expected and not just one or two sentences.

☞ *Check the results of the various groups while trainees are doing the task!*

You can correct major errors in time so that trainees do not waste time working on a useless solution. If every group had the same task the teacher can have a look at the answers before the group leaders present their results. Call the group with the best solution to every question to come out.



In the group-work of our example there are three questions to answer: "What are the consequences for the person?", "What are the consequences for the family?" and "What are the consequences for the company?". Checking the results before presentation enables the teacher to know the best answer. If recognising that group one has the answer " a person can be seriously injured" and group two has the answer "there is no danger for the person" to the first question, than he / she may ask only group one for this answer but not two. This way the best results come out very fast and will be put on the board. If there was time left the instructor could ask for the answers of the other groups to discuss them.

Wherever trainees will work in the future, they will have to collaborate with other persons. There are only few cases where people are working alone. To live and behave within a group is normally learnt and experienced within the family life. Working together means that people have to rely on other group-members and their job. A group's work can only be of high quality when everybody does his part well and the co-operation is perfect too. To reach this holistic objective of an apprenticeship, group-work within theoretical lessons can be of enormous help. In the beginning there might be several problems and only few output. This should not lead a teacher to drop this important form of teaching.

11.3 Partner – Teaching

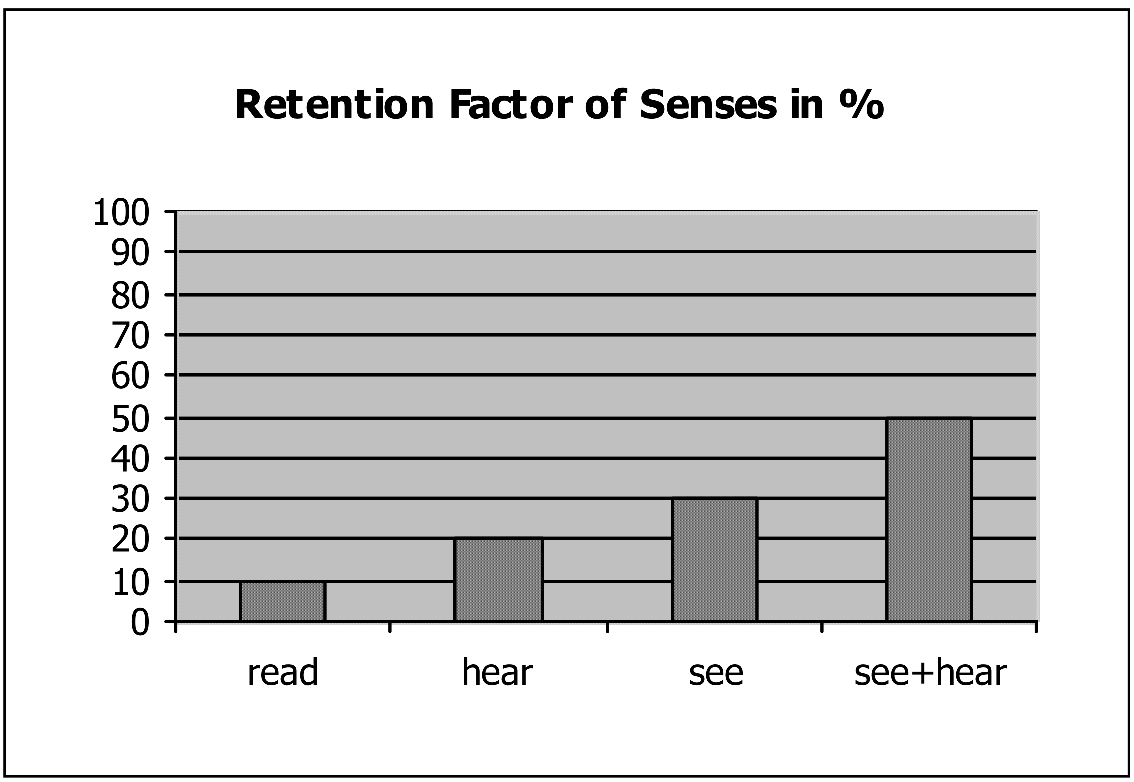
Partner teaching means that two people are working together on one task. Even though not everything that applies to group-work goes for partner teaching, it is very similar to group-teaching. Some might say that this method of teaching is group-teaching namely with small groups of two persons. A task is given to two trainees who are sitting together. The process of forming this mini group wastes no time. By means of partner teaching, trainees can develop solutions independently and give each other mutual assistance. This type of teaching is mainly good for easy tasks, because there might be too few ideas coming out of two people.

12 Teaching Aids

Teaching Aids are materials which the teacher uses in his / her lesson to make teaching and learning more effective. They are called *teaching and learning resources* or just *media* too. Just as everybody, the trainees learn through our five senses. The senses mostly utilised depends on the particular trade. The taste is very important for food processing jobs like catering and cooking but less significant for masons. Generally one can say that the more senses are involved in the teaching-learning process, the more efficient it will be (see chart below).

The Senses Through Which People Learn

Every good instructor should use media as much as possible but the lesson should not become a multi-media-show. Teaching and learning resources are a help for the instructor but do not replace him / her. In particular when the teaching matter is very complex and abstract, media are a proper assistant to make things clear and concrete and last not least, make teaching and learning easier. Media have a motivational effect, because good media focuses the trainees' attention to the teaching matter. Compared to a pure verbal instruction, media liven up a lesson.
Teaching and learning resources are not always appropriate. They attract attention and can side-track too. Instructors should use media only when they support the learning process. One main criterion for the use of teaching aids is that they are adequate to the purpose. It doesn't make sense to have big effort for a small outcome. Often it is the



simple things which are most effective. Adequate means adequate to the circumstances at the training centre, adequate to the level of the trainees, adequate to the teaching matter and adequate in general to the trainees' world. The major concentration in this chapter will be on the use of the chalkboard, cards, charts and work sheets, which belong to the group of the visual teaching aids. Other categories are aural and audio-visual media. Other ways to group media is to distinguish between hardware (e.g. overhead projector, TV) and software (e.g. transparencies, books). There are other forms of categorisation.

12.1 Visual Teaching Aids

Visual teaching aids are supposed to be received with the eyes. It may come together with verbal comments and explanations. Examples of visual media are blackboard, whiteboard, pin-board, charts, maps, pictures, flipcharts, slides, photos, overhead projector (+ transparencies), books and worksheets as well as models and originals.

The Blackboard

The blackboard is called chalkboard too. It is the classic teaching aid in every classroom. Even though many other media were developed for teaching and training, the chalkboard never lost its importance. This is because the chalkboard has many advantages.

Advantages of The Blackboard

☞ *Availability*

A chalkboard is usually available in every classroom. It is not necessary to carry it. As it is fixed, nobody can take it away, an so it is usable always. The blackboard will remain where it is after use and has not to be removed or stored at the end of a class.

☞ *Easy Handling*

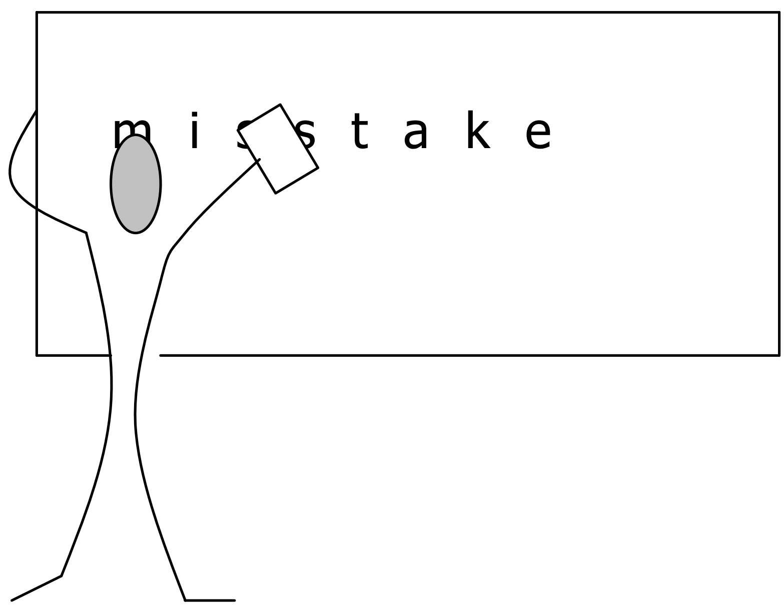
The use of a chalkboard does not require any sophisticated technical equipment (like a screen for the overhead projector). The necessary items like chalk, rulers and dusters or sponge are comparably cheap and easy to get.

☞ *Easy Use*

Working on the chalkboard is easy to learn and does not demand special technical abilities. With some exercises, every instructor should be able to do a readable writing on the blackboard.

☞ *Flexibility*

No other teaching aid allows us to correct spelling or mistakes as fast and easy as the chalkboard. Mistakes can be wiped out quickly. So the board stands for fast notes as well, which can be removed when the space is needed for the planned notes. The same goes for any changes or improvements which come during the lesson through the trainees or the teacher.



☞ *Gradual development*

Usually the blackboard notes are developed during the lesson. The trainees are not confronted with a sudden huge amount of information but can see a moderate progress of the final product and have the possibility to follow this development. So it becomes easy for the trainees to recognise the context and get an easy survey.

☞ *Spontaneity*

Since it is available all the time and notes can be removed quickly it enables the teacher make spontaneous explanations (such as simple drawings) when necessary.

☞ *Space*

Wallboards, as some people call it too, are usually generous in their dimensions. They offer sufficient space for all kind of notes and enables us to structure the notes so that the students easily understand it.

☞ *Catchiness*

Some keywords like the heading are written on the blackboard at the beginning of the lesson and remain there usually up to the end of the lesson. This makes it easy for the students to remember such information.

☞ *Orientation*

The notes on the blackboard reflect the topic of the day and the context. Trainees will therefore be able to put new information in place, as the board is always there to assist them.

Disadvantages of the Blackboard

☞ *Dust*

It creates dust. Anybody who uses chalk has white and dusty hands and cloths too. Even the surrounding of the blackboard is usually covered with chalk dust.

☞ *Conversion*

A teacher who is writing on the board has always to turn round and show his back to the class. This might encourage some trainees to disturb because they are out of sight of the trainer.

☞ *Cleaning*

A chalkboard has to be cleaned properly. Very often it is only a duster that is used. The consequence is a grey-board instead of a blackboard. The more intensive the blackboard is used the more difficult it is for the students to read the words on the board.

☞ *Handwriting*

Some trainers have a handwriting that isn't easy to read. Some of these teachers do not recognise this, because they are used to their own style. However, a teacher is always an idol. This means trainees are likely to write down things exactly the same way that it is written on the board.

☞ *Sustainability*

What is written on the board makes a longer impression on the trainees. It can however be a big disadvantage. When mistakes are made on the board which are not identified. In this case the students might learn the wrong thing.

Rules for The Use of A Blackboard

☞ *Placement*

As the blackboard is usually fixed on the wall or is part of the wall, it cannot be moved. So the teacher must ensure that the school desks are arranged in such way that all trainees can see the board.

☞ *Script*

The writing has to be clear and big enough so that everybody can identify the words. Bear in mind that even trainees in the very last row have to be able to read it. Every good teacher goes to the back of the classroom inconspicuously from time to time for himself to check his writing. On the one hand he will see whether it is big enough and so readable for everybody and on the other hand it is much easier to identify spelling mistakes from the distance.

☞ *Structure*

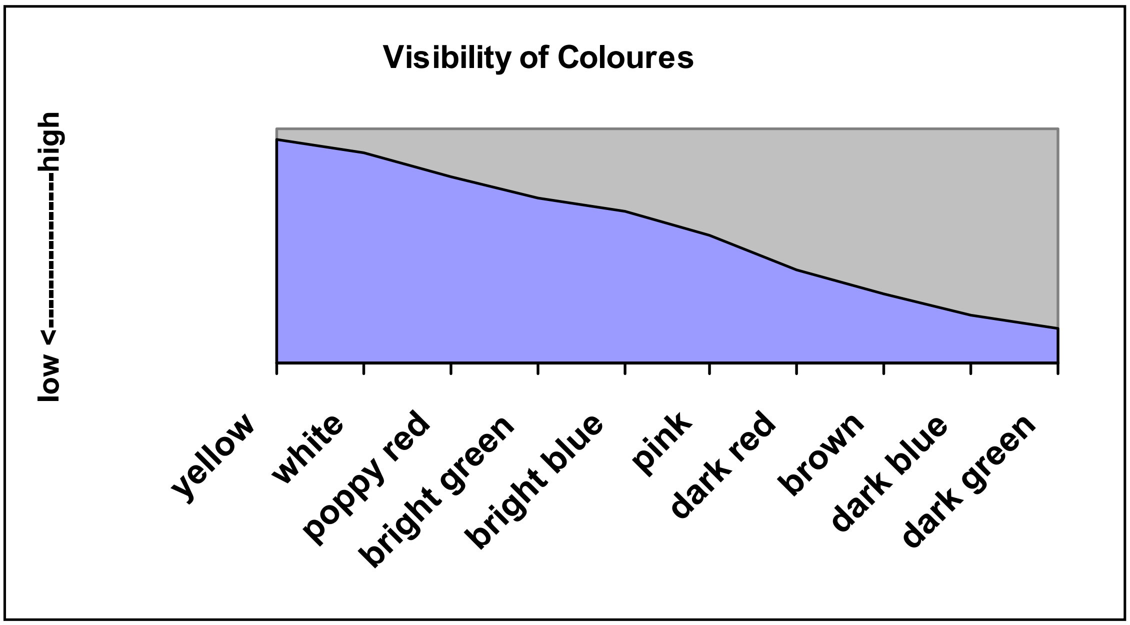
The notes on the blackboard should be clearly arranged. Students should be able to get the message easily. The blackboard should be an assistance to the trainees but not a closed book. Easy drawings can explain more than thousand words. (See an additional example at the end of the chapter).

☞ *Progress*

The final blackboard notes should be the result of a continuous process during the lesson. It means that the instructor should put down phrases whenever they are said. Do not wait up to the end of the lesson to write down the entire contents but make the notes of a trainee's answer immediately. It will encourage the trainees to further contribute and give him the feeling of having done something important for the outcome of the lesson. It also enables the trainees to follow the progress of the lesson.

☞ *Colour*

Chalkboards are normally dark green or black. Therefore coloured chalk has to be used thoughtfully. Some colours are almost invisible on a dark background (see chart below!). Colours should be used for highlighting important things and help in structuring the notes but not to make it funny! Make sure that the used colours are distinguishable.



Visibility of colours on a blackboard according to KNAPP

☞ *Participation*

Whenever possible a teacher should try to write down students answers literally. It will encourage students to participate actively in the class, give a positive feedback and helps improve their English language.

☞ *Size*

"Less is More!" Do not overload the blackboard. Try to keep things short and clear. The more you write on the blackboard the more difficult it becomes for the students to pick up the information.

☞ *Design*

Try to create a layout that trainees can easily copy into their exercise books. This has to do with the size itself, the use of simple words and sentences as well as simple drawings.

☞ *Timing*

Inform the students whether to copy the notes immediately or at the end of the lesson. Plan sufficient time for trainees to copy the notes. Mistakes can be avoided and learning will be promoted.

☞ *Misuse*

Do not send a trainee to the blackboard to make a fool out of him as a form of punishment. This will discourage trainees from participating actively. On the other hand praise trainees for a good performance on the blackboard. This will promote the students' interest in finding a common solution to a problem.

A trainee's exercise book is always the image of the chalkboard layout. Be aware therefore that it will be a reflection of the teacher him / herself.

On the following pages there are two chalkboard layouts to the same lesson. The original one, which was seen like this in a lesson and the modified type according to this chapter.

THE USE OF SCAFFOLDS

Definition:

A scaffold is a framework of metal or wooden poles and planks used as a temporary platform from which building repair or construction is carried out. Dependent scaffolds are usually fixed on a house or a wall and cannot stand freely while there are poles only on one side of the scaffold while the other side is connected with the building, which gives it a proper stability. Independent scaffolds do not require the support of any wall or building because of having poles on both sides, which allow erecting them independently. Scaffolds can carry workers and material but one must be careful not to put too many loads like blocks and mortar so that the planks cannot carry all the load and will break down.

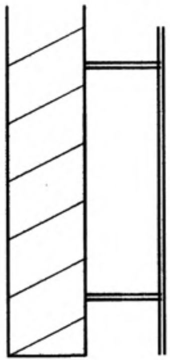
Original chalkboard layout

THE USE OF SCAFFOLDS

Scaffolds will be put up when work has to be done above men's height.
They carry persons and construction material.

Types of scaffolds

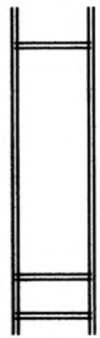
DEPENDENT SCAFFOLD



Dependent scaffolds are fixed onto the building and can not stand alone.

Dependent scaffolds are more stable but cannot be erected freely.

INDEPENDENT SCAFFOLD



Independent scaffolds can be erected without connecting it to a building.

Independent scaffolds can be erected everywhere but are not as stable.

Do not overload scaffolds and be careful when working on it!

Modified chalkboard layout

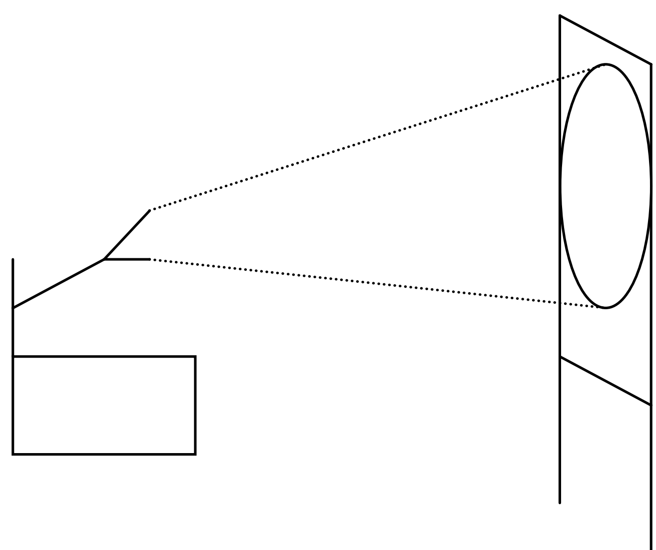
The Overhead Projector

The overhead projector has gained more and more importance in every kind of theoretical training. This is also true for vocational training. Most organisations recognise this development and provide their facilitators and the teaching staff overhead projectors. This is however a problem where electricity is not available all the time or where there is only one projector available at the institution. The use of the projector is similar to the blackboard even though there are different advantages and disadvantages.

Advantages of The Overhead Projector

☞ *Projection*

The picture of the overhead projector can be projected to a screen anywhere in the classroom or to a fixed point and can be used in addition to the chalkboard.



☞ *Teacher's Stands*

In contrast to the blackboard, the teacher does not have to turn around when writing onto the transparency and does not loose visual contact with the class. The transparencies are lying horizontal on the overhead projector and make writing easy and is therefore time-saving.

☞ *Multiple Use*

Transparencies can be used more often. Especially when reviewing a lesson a teacher can fall back on former transparencies. The transparencies are easy to store and therefore easily available.

☞ *Pre-Manufacturing*

Transparencies can be pre-manufactured at home without time pressure and one can thus achieve a perfect layout. Pre-manufactured models for several technical fields can be purchased.

☞ *Combination*

Transparencies can be used together with worksheets. This means that the teacher uses the worksheet as transparency and trainees can follow easily. When working with pre-manufactured transparencies and worksheets the teacher and the students can fill them together. In addition the trainer can explain things to the entire class by projecting the worksheet unto a transparency on the screen.

☞ *Attraction*

The bright light that will come from the overhead projector attracts the attention of the trainees automatically.

☞ *Variation*

The time for the information that will be given to the trainees can be flexible by switching the projector on and off. When switched off, the attention of the trainees will automatically return to the instructor.

☞ *Overlay*

The so-called overly-techniques means that transparencies can be covered and uncovered partly or completely by adding additional transparencies. These can be pre-manufactured too and allow the

instructor to concentrate on comments and explanations by reducing the writing job.
An extra advantage for the instructor is that with this technique, the covered part of a transparency is readable for the teacher on the projector table, but it does not appear on the screen so it is invisible to the students.
Additional information and help for the teacher can be written on the covering paper and is only visible to the trainer.

☞ *Group-work*

The students can use transparencies to write down the results of a group-work instead of using cards. At the end the results can be presented to the entire class by the use of the overhead projector.

☞ *Comfort*

The instructor can even sit when using the overhead projector.

☞ *Models*

Lesson models made of Plexiglas are available on the market and allow interesting and expressive demonstrations.

☞ *Size*

The size of the projected picture can be suited to the situation in the classroom, i.e. the size of the room or the number of trainees. Zooms can easily be done.

☞ *Additional Equipment*

Some producers of overhead projectors offer additional equipment for their sets, e.g. a device for the projection of slices.

Disadvantages of The Overhead Projector

☞ Availability

A regular and especially a spontaneous use of the overhead projector require that the equipment be easily available. This is only possible when an overhead projector is permanently present in every classroom. The projector is a sensitive machine and has to be protected from dust.

☞ *Overloading*

Transparencies, in particular when pre-manufactured, may lead to a fast presentation of information. In this case trainees are overtaxed because time for information processing is too short.

☞ *Practice*

The use of the overhead projector requires some practice. If not, there are several mistakes which can lead to confusion. When writing is too small or is done too fast it becomes unreadable. This can also happen, when the focus is not adjusted or the OHP is moved slightly so that the picture does not occur on the screen completely.

☞ *Guidance*

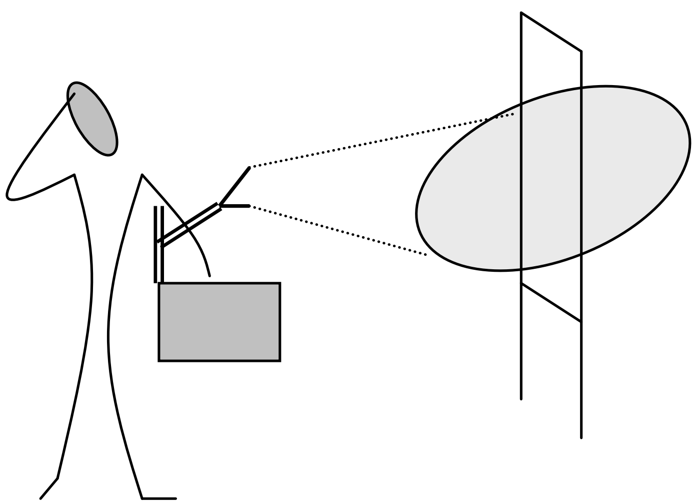
Concentration on the application of the OHP can suppress trainees thinking.

☞ *Price and Correspondence*

Industrial pre-manufactured transparencies and models are very expensive, difficult to get and often do not correspond with the plans of the teacher or the subject matter.

Remarks on The Use of The Overhead Projector (OHP)

Compared to other projectors the OHP's advantage is that the room does not need to be darkened. As a result the OHP is more or less unlimited in use. However, there are shortfalls. Because of its many positive features some teachers tend to overuse this device.



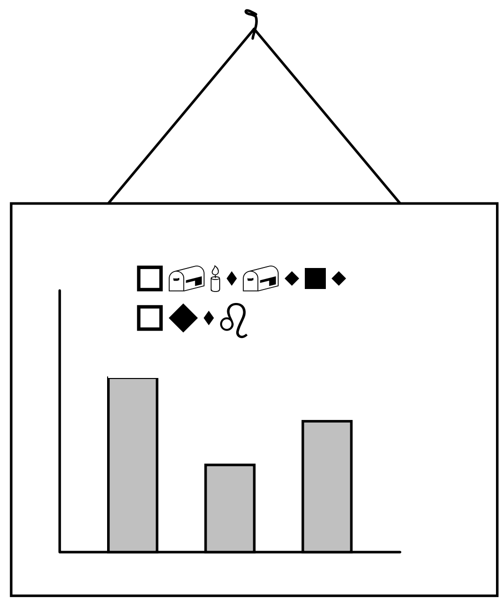
With an adjustable rack an OHP can be used while standing or sitting. Nevertheless the use of an OHP has to be trained. Since there is normally an average of 5 – 8 times zooming, a teacher has to practice and check how his writing appears on the screen. Since there is a projection through a mirror as part of the device, it is confusing when trying to move the transparency while visually controlling it on the screen. When an OHP is installed, mark the projection area, so that you are able to adjust the transparency correctly on the projection table. Almost every OHP has implemented pins where transparencies can be fixed. Therefore they have to be punched before. The projector has to stand in a 90° angle to the screen, so that the picture is not distorted. Dust on the lens and projection table reduces the intensity of the light and leads to fuzzy pictures.

An OHP offers plenty possibilities and attracts attention. Therefore plan its use properly. An OHP cannot and should not replace the chalkboard.

The Use of Charts

Charts can be of good help for a teacher especially when an OHP is not available. Drawings and tables put on the blackboard vanish after wiping it. But often the same charts can be used in several situations. Charts put in poster form can be used frequently. It is easy to store and sometimes charts might remain in a classroom for a longer period. If so, they should be protected with any transparency or even with transparent paint.

Charts should not be overloaded. Concentrate on key words and topics. What goes for all the teaching matter goes for the charts too: if the trainees developed it themselves it would have a much higher learning effect. The preparation of charts could be done when the results of a group-work have to be presented to the entire class. In the beginning the outcome of trainee-made charts might not be very satisfying. After some practice a lesson can benefit immensely from this work. It is sometimes surprising to see, how much creativity students develop when challenged with such a duty.

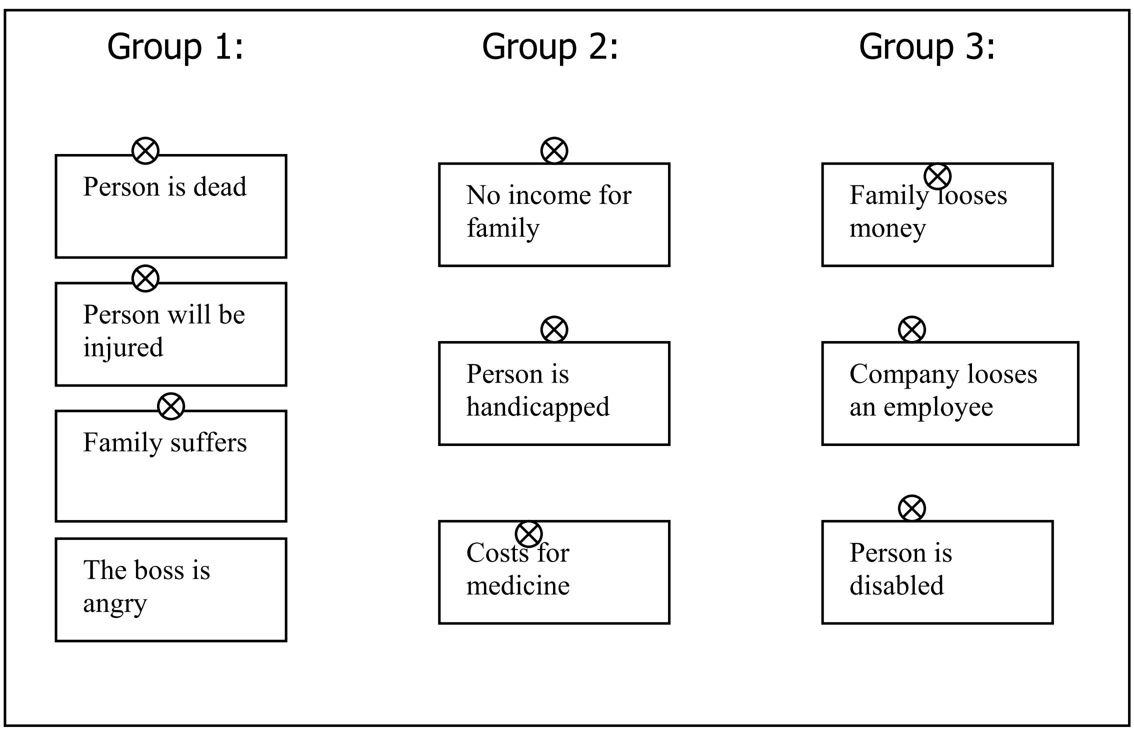


One problem that is discovered very often is the fact that charts or especially the text itself is too small. This is because it is usually written and drawn on a table and the “manufacturers” are very close to the object. When the chart is later on fixed on the wall, it might be difficult for trainees sitting in the last rows of the classroom to read. To avoid this, remember that the minimum size of letters should be 2 inches!

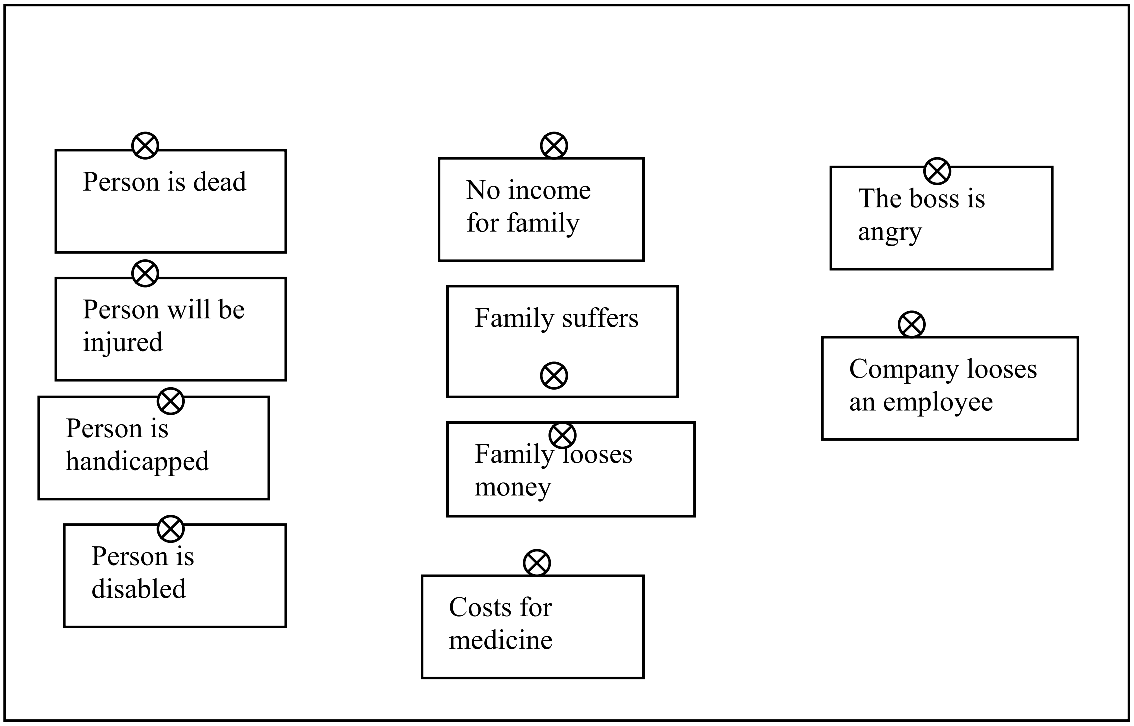
The Metaplan-Techniques

This is a method where one uses small cards of approximately 5 x 10 inches to write down key words and pin it on a pin-board later on. Normally it is used in group-work to summarise the results of the group. The group-leader pins the cards on the board one by one and gives additional explanations. Later on these cards can be rearranged or grouped differently, according to the intentions of the teacher. This procedure is even appropriate for collecting various ideas ("brain storming").

The example of our sample will be modified now. Trainees are not given the hint that several parties were involved in the accident (person, family, company), but were just asked to find out some consequences of an accident. Now the various groups came out with their ideas:



Now the teacher will ask the trainees to put cards with similar messages together. Then we will get the following layout on the pin-board:



After this arrangement, the instructor asks the students to find headings for these three groups which will be affected when a person has an accident. The result will be; An accident affects the person him / herself, his / her family and his / her company. And this is exactly what the objective of the lesson is about.

Everyone can easily produce the cards. When there is no carton available, normal paper can be used. Even the use of cement bags for cutting cards was observed once. There is no limit on innovation! One marker is sufficient for every group and will last long because it will only be used for some key words.
This method does not require any material that is difficult to get or is expensive. The carpentry section can easily manufacture pin-boards.

The Use of A Work-Sheet

A work-sheet offers another possibility for all trainees to actively participate in the lesson. Some years ago it was the matrix duplication technique which initiated the appliance of work sheets. Nowadays photocopiers are available in almost every institute, the use of work-sheets have thus become popular. The sheets which are usually given to each trainee or to a group, come in three different variations: as information sheets, for check-up and as job orders. Information sheets can contain technical texts or copies of newspapers and technical journals, recipes (e.g. for cookery), charts tables and so on. Sheets for check-up customarily consist of the exercise that should be done, whereas job sheets carry the orders for a work that should be done. Some might not identify a big difference between the two last types. The check-up sheet is commonly utilised in examinations while the job sheet can be used in a group work. What is common to all is that it is the teacher who is duplicating and distributing it to the students.

Advantages of Work-Sheets

☞ *Easy updating*

Compared to textbooks a work sheet can be updated easily. In addition it can always be adjusted to the actual needs of the particular teaching situation while a textbook tries to cover a whole topic. Work sheets can be reduced to an understandable quantity of facts. In a nutshell, work sheets can be properly planned while didactic reduction is taken into consideration. Where textbooks are not available for the entire class, the work sheet becomes even very important.

☞ *Alleviation*

Work sheets have the advantage that trainees do not have to copy the notes from the chalkboard or transparency but have it already in printed form. Trainees therefore gain time which can be used for the task itself.

☞ *Flexibility*

When trainees are busy with reading or working the instructor can use the time to assist trainees individually or prepare the chalkboard's layout and so on.

☞ *Correctness*

Since it is prepared by the teacher, and later discussed in the class, a work sheet does not contain comprehension or spelling mistakes. It can be considered as a meaningful source for later repetition and learning.

☞ *Clarity*

Used as a job order, all the orders can be given exactly so that there are no misunderstandings and everybody can start working immediately. When everything is written down, trainees do not have to ask questions and therefore do not disturb other students.

☞ *Focus*

A work sheet normally ensures that the students concentrate on the task and work more intensively.

Disadvantages of Work Sheets

☞ *Overloading*

Many teachers want to make use of all the space that is on a work sheet and not to "waste" a single line. This will logically lead to the overtaxing of the students, because a clear structure will be lost and the user will be confused.

☞ *Availability*

Even though a photocopier is available at every centre, not every instructor might have easy access to the device. Sometimes it is the costs for maintenance and running costs that reduce the use of the copier machine.

☞ *Time*

A thorough preparation of a work sheet requires time. But what applies for the preparation of other teaching aids applies also for the work sheet; once prepared, it will serve you for long.

☞ *Organisation*

The use of work sheets in a class demand a more intensive planning of the lesson than an ordinary lesson does. Teachers with little experience in the use of media might find it difficult to use the work sheet in the beginning, because the class itself has to get used to it.

Annotations for The Use of Work Sheets

All the remarks made on the use of other teaching aids also apply to the use of work sheets. There is however one very important point to note: When using work sheets, make sure that every student is in possession of a file or folder to store all the distributed copies. To make storing easier, the papers should be punched before distribution. It is helpful for later use, to provide every sheet with an "information line", containing the subject, the teaching matter and the date of distribution.

Textbooks

The use of textbooks is unfortunately not very common in vocational training. Although technical books are on the market for almost every

common trade, their distribution is not widespread. The use of textbooks is very important and a helpful contribution to the general education. Every book has the same structure with hints on the author and publisher, the contents, the chapters themselves and the index and appendix at the end. The use of textbooks will open the mind to reading books.
When books are not available for the entire class on a permanent basis, they can be distributed e.g. to group-works. Usually trade textbooks contain every information that is necessary for the apprenticeship and can be helpful for many situations in the class. Tasks could be solved with the help of textbooks, statements can be proofed and entire topics can be read through and reinforced. Textbooks are, last not least, a useful media in preparing for an examination and self-study.
The use of textbooks is therefore highly recommended!

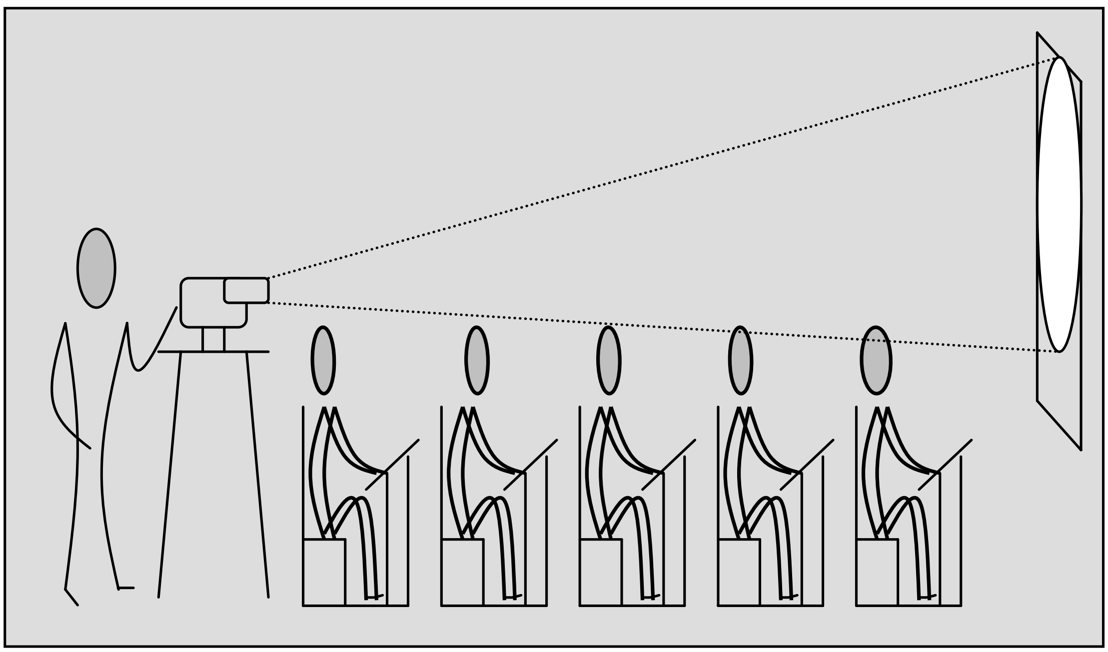
Models and Originals

Models do usually replace originals when the later are too big or too small (some devices or details have to be zoomed to become visible), not transportable, too expensive or for any other. Models and originals allow the students an intensive observation of the teaching matter. Long explanations can be replaced by handing the item around so that every student can have a proper look at it. They make abstract descriptions concrete. Models and specially modified originals give an idea about the device and give clarification about how the object functions.

During the lesson about accidents through electricity the question about the way a fuse works came up. First of all, an instructor can hand around an original or dismantled fuse so that everybody can look at it from a short distance. Secondly, a model can be easily prepared out of carton or wood and the function can be demonstrated impressively.

The Use of Slides

Slides are a very nice possibility to visualise things and situations. However, showing slides requires a slide projector, a good screen, and last not least, slides themselves. Due to changing technology it has become more and more difficult to get ready-made slide series which are up to date. An alternative to slides which is also quite effective are self-made photos. To produce them however demands photographic equipment and a lot of experience. This is one reason, why the use of slides in technical training has become rare. In addition when showing the slides the classroom has to be darkened. This is not easy in many



situations. With the development of digital cameras the widespread use of computers, it is much easier to print particular pictures on transparencies and show them with the help of the OHP. However, as it is with every new technique this is still quite expensive.
As a result of the above mentioned reasons, the use of slides in vocational training will not be explained in detail in this book.

12.2 Aural Teaching Aids

These are media commonly directed only to hearing. The tape or cassette recorder and the records or compact discs fall under this category. Technical education has rarely any kind of pre-manufactured aural aid that could support teaching. So they will not be commented.

12.3 Audio-Visual Teaching Aids

The name already suggests the senses these media address. It is both the sight and the hearing organs. In generally we get this in cinemas or on TV. The main difference is that the classic film has to be projected and comes with the same problems as the slide projection (see earlier chapter). In recent times it is the television mostly in combination with a video-recorder, which brings us information or even entertainment the audio-visual way. The advantage this device has is that normally it is placed on a movable rack and is so available quickly without much effort. In addition there is no need to darken the room to be used.
Companies and other organisations meanwhile offer a wide range of short, technical video-spots that can be very useful to illustrate and demonstrate complex procedures. There are even ready-made trick-shots to explain things that cannot be seen.
There are some points that should be adhered to when using the video.

☞ *Duration*

The films should be of short duration. Watching a film means that trainees return to the stage of receivers and are not actively involved. The importance of trainee involvement in the lesson has already been discussed extensively.

☞ *Contents*

Ready-made films (for e.g. from the construction industry) have also the intention of advertising. Not everything that is shown necessarily has to do with the topic of the lesson. A teacher has to watch and analyse the film intensively before showing it. He / she should be able to explain the contents and context of the film.

☞ *Relation*

A film must always refer to the topic of the lesson. Films which are of different trades or are just for entertainment do not have a place in teaching.

☞ *Presentation*

Films should be shown in sequences. Small breaks between the series have to be used for clarifications if necessary.

☞ *Level*

Films are exclusively useful when they are on the level of the trainees. If they are too difficult to understand they are no teaching aid because they aren't helping but confusing.

☞ *Facilities*

When using a video-recorder, make use of the technical facilities these devices offer, like slow motion and still frame.

☞ *Discussion*

Do not show a video without reviewing it. A teacher must ensure that everything that was shown was understood too.

12.4 Preparation of Teaching Aids

It was mentioned earlier that there are pre-manufactured media on the market. Normally we find three types.
The first group includes those produced by several companies of the trade. This means companies that produce a certain product for the trade (like bricks) and use it as promotion for this product. They are quite cheap or are available for free. Normally those ones are of good quality but do not only have informative character. They are produced and distributed because of public relation reasons too. Nowadays these are often videotapes.
A second type is professionally made media produced to make money. These are usually styled to reach a great number of customers and hence are commonly comprehensive. Often they are very costly.
The last stack are those which are produced by certain organisations, normally financed with public funds, for use in technical and vocational training. Usually they are given out on loan for only a short period. They are of high quality and in most cases very helpful. However, the procedure of borrowing them can be complicated and longwinded.
Consequently it is best to produce one's own teaching and learning resources. A teacher can prepare it according to the particular need and keep them for future use. There are certain criteria for a good teaching aid.

☞ *Price*

Media should be as cheap as possible. If it becomes too expensive for a teacher to produce teaching and learning resources he / she would stop doing it very soon. However, these media are not only helpful but also sometimes necessary. A transparency itself and two or three transparency-pens which are available as refillable ones already are all that is required. This is the same for charts. Once bought they will serve you for a long period. Models can be made of Paper or wood and are usually available at many centres. Photos can easily be copied on transparencies with every normal photocopier. With a normal size of pictures, one can get up to 6 pictures on one transparency with only one copying process.

☞ *Production*

It is the best when a teacher him / herself can construct the teaching aid. After a while everybody will get some experience and the preparation of teaching aids become easier. For sure other colleagues will assist with their skills and facilities (e.g. by using the machines in the carpentry section). The production should be easy to handle and should not take too much time. An instructor has to decide whether the relation between input (of time and energy) and output (improvement of learning) is justified.

☞ *Availability*

A media should be present when needed. This means that it either has to be stored in the classroom itself or somewhere where it can be fetched quickly. This includes the fact that it even has to be easy to carry. It should not be too big or too heavy, unless it is placed on a certain location where every teacher can go with the entire class to watch it.

☞ *Durability*

The more time the preparation of a teaching aid consumes the longer it should last. Therefore every media should be constructed such that it is stable, long lasting so that it does not get spoilt when stored for a long time. It should be almost maintenance free so that it can be utilised immediately and does not require extensive repairing.

☞ *Simplicity*

Often it is the simple and easy things that have the best effects. Sophisticated teaching aids might be an eye-catcher but overtax the trainees. Even the teacher can be overtaxed when a teaching aid is too complicated and not used frequently. The instructor may take it to the class but then realise that he / she has problems with the handling of the teaching aid. This goes in particular for the use of technical models.

☞ *Adaptation*

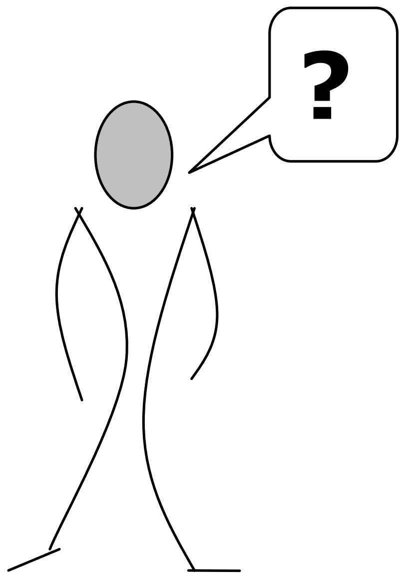
Media should be close to the reality of the students. Teaching and learning resource should help to explain things easier. A teaching aid that is out of the powers of a trainee's imagination is not very helpful. It might be interesting or attracting but not helpful. Adapted means furthermore that it is suitable for the circumstances and the culture.

☞ Relation

Never use a teaching aid for its own sake. The teaching aid and its use must always be related to the subject matter and the trade!

There is no general guideline for the preparation of teaching aids which tells an instructor how to prepare or when or which one to use. It mainly depends on the teacher's creativity and on his / her ideas. Ideas sometimes seem to come out of the blue and often at an inappropriate time. They vanish as fast as they came. A good teacher writes such an idea on a memo so that he can remember it later on. By so doing this teacher will very soon have a wide range of teaching aids at his / her disposal, which will make his / her teaching more lively, interesting and effective.

13 The Teacher's Question



Questioning is the most frequently used way to start an interaction between the instructor and the students. Nevertheless the use of questions in a lesson is contradictory. Some educational scientist call it outdated; According to GAUDIG; "The teacher's question is the tool that has to be seen very critically. It kills spontaneity, it guides too much and is forcing the trainees…". Others see it differently. DIESTERWEG maintains that " The teacher's question is an artefact that a teacher never can make perfect, but should try to improve his whole life. The teacher's question is one of the most important tools the teacher has."

Whichever opinion we agree with, as long as questions are substantial in our teaching, we have to ensure that the questions we ask are useful.

According to ROESCH there are various types of questions, e.g. searching question, developing question, dismantling question and some more. However, irrespective of the type of question, there is one reason why we ask questions; we want to get an answer. This is either to have a contribution to the lesson that helps us to reach the objective or get a feedback on whether the students did understand the teaching matter or did not. Another reason for asking questions is examination. Further questions are only "fillers" and generally useless for a class.

13.1 Meaningless Questions

Many teachers are generally afraid of not having sufficient stuff for a lesson. Consequently many lessons are already overloaded.

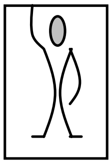
Meaningless questions, used as fillers because of not having any positive aspect for the lesson, are additional load for the students. As the following examples show, most of these questions do not bring any progress in a lesson and hence are superfluous. So are the answers. Therefore the questions should not be asked at all or rephrased.

☞ *The "Nil-Effect-Question"*

Many teachers want to get a feedback on their teaching that is why they ask questions such as: "Did you understand?" or "Did you get me? or "Am I clear?". In Ghana, there was never any other answer than "Yes Sir / Madam". First of all this question is asked so frequently that students do not even think about it or recognise it as a serious question. They just answer automatically. A second reason for this answer is that many students are to shy to say "No Sir / Madam". In every course where teachers were confronted with this it became clear that the instructors were aware of this situation. Yet still instructors continue to ask such questions. What kind of feedback does an instructor expect when he asks a question and knows the students' answer already? There is no feedback at all! This question in vocational training is absolutely useless. Examples of the model lesson shall give us an idea on how to ask questions to check whether students understand or not.

The lesson has three objectives. Before moving forward to the next objective or the next step, a check-up is foreseen. Hence there are at least three situations where the teacher may want to get a feedback on his teaching. After objective one, we do not ask "Did you get me?" but;
"What were the reasons for the accidents mentioned in the newspaper?"
When you get the correct answer there is a positive feedback. Additionally it is repetition and so has a reinforcing effect on the learning process. When there is no correct answer it will show you that the students did not understand and you therefore have to repeat the chapter.

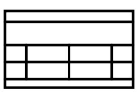
After the second objective the question is about the purpose of fuses. When trainees are able to explain it the instructor will know that trainees understood the information about the effects of an electrical shock.



Try to formulate check-up questions for the third objective!

☞ *The "Directing-Question"*

This is a question where a particular answer is expected. It means that when posing the question the trainees are automatically urged to provide an answer which is somehow already included in the question itself.



"Isn't it a good idea to use fuses?" When an instructor asks this question every student will answer "Yes, it is." What else should he / she answer. And what is the purpose of this question? It does not help the teacher nor the students. It is obvious that the trainer expects this answer. Hence asking questions such as this is useless. A better way is shown in our example; "Why do electricians use fuses?" This type of question urges the students to think about it. There is no answer included. The trainees have got to show what they can do. A correct answer from the students gives the teacher a positive feedback too.

☞ *The "Definition-Question"*

This type of question usually starts with; "What is a…". Hence the answer has to be a kind of definition. In an earlier chapter the difficulties that come with definitions were already explained and therefore will not be repeated again. (See chapter 8.3)

13.2 Characteristics of Effective Questioning

The following rules will help ensure that the output after asking a question is high.

☞ *All questions require thought*

To use a question as an effective "tool" during a class, it should be well planned. This is not always possible because sometimes the teacher has to react to situations during the class. He has to ask questions spontaneously. However, an instructor should always take some time to phrase a question properly. The better the question, the better the answers!

☞ *Starting a question*

Every question should start with a question word like when, why, how etc. Another way to start a question is to use words which were already introduced like summarise, justify, describe, explain, define, compare illustrate etc.

☞ *Simplicity*

Questions should be clear and easily understandable. Too complicated questions overtax the trainees. When they have difficulties understanding a question, trainees cannot concentrate on finding an answer. When you do not get any answer to a question, think about whether your question was precise enough.

☞ *Logical sequence*

Not every question is of the same level. Some are easy, others are more difficult. Arrange questions in a logical sequence. Easy questions should come before difficult ones.

☞ *Avoid "multi-questions"*

Ask only one question in one sentence! A Question like "Why and when do electricians use fuses" are "double-questions". It is only one sentence but contains two questions. Trainees usually have difficulties to concentrate or think about two things at the same time.

13.3 The questioning procedure

It is not only the question itself that is the deciding factor for getting a useful contribution to the lesson. The behaviour of the instructor when asking a question is important too.

☞ *Ask the question to the entire group*

Do not start a question by calling on one student to provide an answer. For example: "Michael, please tell us why faulty cables are dangerous". This will lead to the situation where only Michael thinks about the question. The rest of the class do not feel addressed. For them it is Michael's problem now and they will relax.

☞ *Wait for some seconds*

Do not call the first student who raises his / her hand immediately. This would interrupt the other trainees' thinking. Force yourself to observe some seconds of silence. Everybody will thus be able to concentrate and think.

☞ *Listen to the answer*

Look at the person while he / she is answering. It gives a feeling that the answer is important and will encourage all students to active participation. Not paying attention will have the contradictory effect. Trainees will get the feeling that the instructor is not very interested in the answer and will stop thinking about future questions.

☞ *React on the answer*

Never leave any question uncommented. It is very important for the entire class to know whether an answer was correct or not. Praise students for good answers but do not blame somebody for a wrong answer. This is discouraging.

☞ *Complete sentences*

Urge trainees to answer in a full sentence. It will help to improve their English.

☞ *Spread questions*

Use simple questions to involve trainees who are low-achievers. Direct the difficult questions to the high-achievers. By doing so, you give the entire class the chance to participate.

14 Testing and marking

One of the most important and most sensitive responsibilities of an instructor is testing and marking. Some might say it is the same as check-up. However, it is not. Check-up can be regarded as a general topic for the following three areas: checking of understanding, reinforcement of the learning matter, and testing and marking. Even though it is not very obvious, there is a difference between these two fields.

☞ *Checking of understanding*

The teacher who wishes to find out whether the taught knowledge has been understood uses this. It is usually conducted during and at the end of a lesson by written, oral or practical tests. It is useful for the trainee and enables the instructor to review the effectiveness of his teaching methods. The trainee himself will recognise whether he is on the actual required level or not. Its main task is to give a feedback on the teaching-learning process and progress.
The written check-up can be divided into two groups. We have the open or unrestricted answer and the restricted answer (some educational scientists add a third type, namely the half-restricted answer). The type of answers the instructor chooses depends on the objective. Unrestricted answers are used for the level *transfer* and *problem solving.* The questions should come with the verbs, which represent this level. (See 7.2.2.3!)

☞ *Reinforcement of the learning matter*

This type of check-up seeks to promote the learning process. It was described as the transfer of knowledge into the long-term memory in chapter 5. It can be achieved by a repetition of the learning matter, practise and application. We have already discussed the psychological aspects.

☞ *Testing and marking*

It can also be called examination. It is the process when the achievement of the trainees are tested and certified. Testing and marking is the main concern of this chapter.

14.1 Basic Issues

In the beginning it was mentioned that marking is a very sensitive issue. When trainees get the feeling that the marks they were given are not justified, a bad mood may come up in the class. The relation between the instructor and the students may deteriorate. However, testing and marking is inevitable. It has several functions.

☞ *Feed-back*

Marks are information for the teacher and the students. The teacher can form an impression about the quality of his / her teaching. When the average results of the entire class are very low the reason might not be an inferior achievement of the trainees. It can even be that the style of teaching is on a low level. Trainees too get a feed-back by marks. They can compare it with those of their classmates and see on which level they are.

☞ *Information*

Certificates containing marks offer employers the opportunity to make their mind about the achievements of the applicant. Parents also get information about the level of their child. Furthermore, it gives information whether somebody has the ability to enter the higher educational system or to stay in his / her job.

☞ *Motivation*

Good marks as well as bad marks can motivate trainees to learn more for the next test. While good marks normally are a challenge to the trainees him / herself, bad marks put pressure on the student. Usually it is the parents who urge a child to learn more intensively.

☞ *Disciplinary measure*

Some instructors use marking as a method of punishing trainees when there are disciplinary problems in the class. From a pedagogical point of view this has to be abolished. Misusing marking for this purpose is a bad habit and a sign that the teacher is overtaxed. This unfair procedure humiliates the trainees and leads to mistrust and frustration.

14.2 The Quality of Testing And Marking

The most discouraging thing for a trainee is to be unable to perceive why he / she got a particular mark. When the mark is bad it is important for the trainee that the outcome of the mark is transparent. There are three main criteria for testing and marking: objectivity, validity and reliability.

Objectivity

This concerns mainly the teacher as a person. Sometimes instructors are influenced by a trainee's habit and may have prejudices against a student. These can be positive as well as negative. When they are positive a teacher might give a better mark to the trainee he likes, even though the answers are very similar to those of another trainee. When they are negatively influenced it may have a contradictory outcome. High objectivity exists when the marks of different teachers for a particular exercise of one particular student are equal.

Validity

A test always has to refer to the teaching matter. Only what was taught during a lesson should be examined. When marking, a teacher must not consider any good or bad contribution of a trainee. Sometimes when trainees are not able to answer a question correctly they write anything they know about the topic. However, since it is not the correct answer it has to be neglected.
Furthermore, it is important that the examination is set at the level of the trainees' knowledge.

Reliability

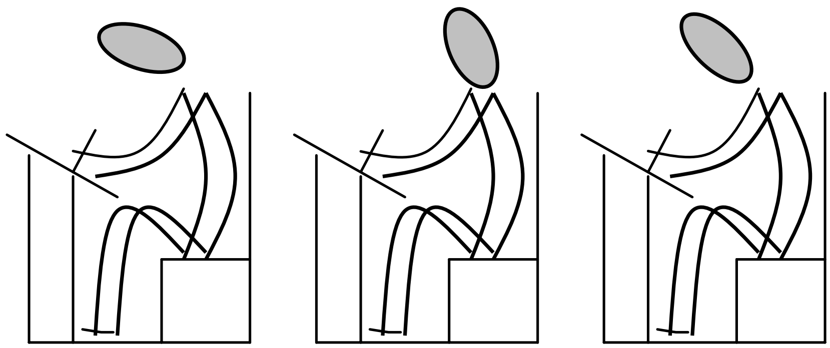
A test should bring results that are reliable. This means that the results of the trainees' examinations should represent the actual level of knowledge. Where every trainee is asked questions from a different field the test becomes unreliable. If there is only a single question in the whole test, the results cannot be representative. Similarly, when you ask only the people of one town, whether they like sports one cannot use the results to give a statement which applies to the whole nation. Asking the whole nation whether they like football does not mean that they do like other sports as well.

14.3 Types of Tests

All tests should fulfil the above mentioned criteria for tests of good quality. In vocational training we have three types of tests: the written test, the oral test and the practical test.

The written test

What is meant by a written test is normally the procedure where the entire class gets the same test. It usually takes place in the classroom under the supervision of a teacher. This form of testing gives equal conditions for every student and consequently leads to an objective assessment.



There should be silence during the testing period. This allows everybody to concentrate on his / her work. The trainee is expected to manage the time him / herself and think about the questions. He / she does not necessarily have to answer according to the order of the questions. Hence trainees can answers "easy" questions first. This gives self-confidence for the more difficult ones. A trainee can collect his thoughts and write them down when he / she is sure about the answer. Normally trainees are not allowed to ask questions during the test and this has to be regarded as a disadvantage. Furthermore, a trainee does not get a feedback to his answers during the test.

Preparation of a Written Test

A written test is not only a test but a test of the teaching matter. A major concern therefore is that the questions should refer to the objectives of the lessons.
Some points shall give guidelines for the preparation of a written test:

☞ *Determination of the test objectives*

Make a clear statement on the area of the teaching matter which will be tested. Do not examine knowledge which was treated in the distant past or which does not belong to the subject. The tested matter should have been treated sufficiently within the class. Make sure that you know the intended results. It is good to prepare a suggested solution before the test starts. It should not only contain the correct answers but also the score for the correct answer!

☞ *Representative questions*

Inform trainees about the intention of the examination. The issues to be emphasised should be obvious. Questions should cover all the areas that a teacher declared relevant for the test.

☞ *Characteristics of questions*

Questions have to be clear, precise and easily understood. Avoid “double-questions”! There should be no room for misunderstandings. Use only words that every trainee understands. Choose an average level of difficulty for the questions.

☞ *Quantity of questions*

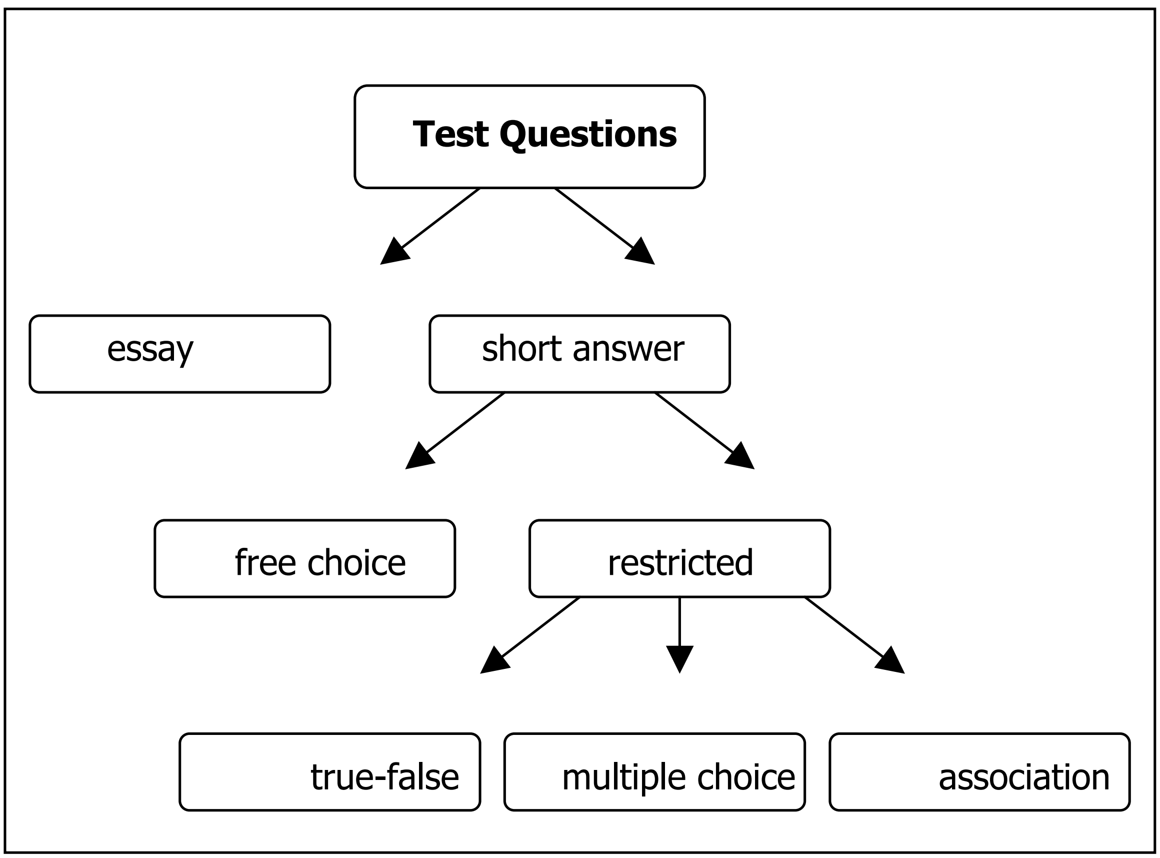
The more questions a test contains the more objective it becomes.

☞ *Determination of the time limit*

It will enable the trainees to manage the available time. Take the weak students into consideration when giving the time limit. Do not give too much time. Usually it shouldn’t take a trainee more than twice the time the instructor needs to answer the questions.

Types of questions

There are two main types of questions that are used in tests; Essay questions and short-answer questions. The short answer questions are further divided into two groups; questions with restricted answers and questions with free-choice answers. The last group has again three sub-groups; true-false, multiple choice and association.



A) Essay Questions

An essay question has to be answered with a comprehensive statement.

"Discuss all the consequences of an accident through electricity!" This question cannot be answered with one word. He / she has to find the answers and bring them into form by writing a full essay.

This is a task that is on a high level. It urges the students to express themselves, which helps to develop their language. Furthermore, it has the advantage that trainees have to deal with the whole subject matter and this informs the teacher about the general understanding of the trainees. The teacher doesn't require much time to prepare a test with questions like this. However, there are disadvantages too. Essay questions require a certain level of linguistic ability. Some trainees might know the answers, but are not able to write them on paper because of lack of writing talent or poor knowledge of the English language. It is more difficult for an instructor to assess essays than short answers. Essays usually have always room for interpretations. Two different teachers can assess the same test differently. In addition, essays tend to be assessed according to their grammatical quality rather than according to their contents. It is difficult to guarantee reliability and validity. Consequently, essay questions should never be used exclusively in one test but supplemented with short-answer questions. For low-achievers, essay questions are difficult to answer.

B) Short-Answer Questions

These type of questions requires only short answers. These can be given in a free form or in a restricted form.

B1) Free Choice Questions

These type of questions forces the trainees to express themselves freely, but with only a few words or even drawings.

"Name one safety regulation!" Trainees should not give an own statement because the answer was given word for word within the lesson. However, there is still a "writing-job" to do. The answer to this type of questions can still be lowered, to enable even low achievers to answer correctly. For e.g.; "Complete the following sentence: When people get an electrical shock, currents ...."

B2) Restricted Answers Questions

Unlike the free choice type where the correct answer has still to come from the trainee him / herself, the restricted type includes the correct answer in the list of possibilities. It is the trainee's job to find the correct answer out of various possibilities.

There are three types of restricted answer questions.

- **True-False Type**

The trainees have to decide whether a given statement is true or false.

"A faulty cable can cause an accident. True ore false?"

A big disadvantage of this type of questions is that there is no room for creativity. Furthermore the chance even for an ignorant student to answer correctly is 50 %.

- **The Multiple Choice Type**

This type offers various answers to one question. Trainees have to find out the correct one.

"How can electricity support our work?
a) it raises the quality of the job
b) it makes the products more valuable
c) it makes machines run"

For this type of questions it is important that the false alternative answers are plausible too. It wouldn't really be a question if the alternatives to the correct answers were like this;

a) I can connect my portable FM receiver
b) I can recharge the batteries for my torchlight
c) It makes machines run

The alternative answers should make sense and should not clearly show the correct answer. Even with this type of questions, trainees shall be urged to think about the correct answer. Therefore it is necessary for all answers to be very similar in length and form to the correct one. Furthermore it is necessary that the position of the correct answer varies (not always c!). Sometimes there are multiple choice questions where more than one answer is possible. This makes answering very difficult and is not convenient for vocational training.

- **The Association Type**

Several information has to be brought together in the correct form.

Bring the right components together!

1) the company	a) loss of income
2) the family	b) severe injury
3) the person	c) loss of employee

The complete information on one objective is given already. Students now have to make the right links.

What goes for all types of restricted answers is that the assessment of the answers is quick and easy. However, the preparation of such tests is time consuming. Additionally, there is no room for creativity and all restricted answers allow a certain random chance for success. Finally, these tests are used for the lower level.

Fair Marking

It was mentioned already that testing and especially marking is a very sensitive task. The worst thing that can happen is for trainees to get the feeling that the test or the marks given are unjust. Trainees might be angry for a while when a test is very difficult but they soon forget this. Trainees will never forget unfairness! Some ideas can help to come to make the results objective.

☞ *Amount of tests*

The more tests, the better it is for the trainees. If there is only one test a year, a trainee who was in a bad mood on this day, might get a low mark and find it difficult to make up for this. If there are more tests, one bad mark doesn't count too much.

☞ *Objectivity*

Nobody is absolutely free from prejudices. But neither positive nor negative prejudices should influence a teacher when reviewing tests. Before starting a written test make small pieces of paper and write numbers on it according to the amount of trainees in the class. Distribute these note pads among trainees and tell them everybody should write his / her name on one of these papers and remember the number. Then collect these note pads and store them properly. Now tell the students they should not write their name on the examination but the number. Then write the test and review it. After marking it, take the stored note pads with names and numbers and assign the names to the numbers on the examinations.

☞ *Suggested / sample solution*

It is obligatory to prepare a suggested solution before running the test. It has to contain the answers and the scores (see example!).

☞ *Transparency*

All assessments have to be provable. The teacher must be able to explain his decision properly. It must therefore be possible to appreciate and understand the standards being used.

Test on DANGERS THROUGH ELECTRICITY

Time limit: 15 min. max score: 29 p. Student's number: ___

---

1. How can electricity support our work? Tick the right answer !(2 p.)

    a) it raises the quality of the job
    b) it makes the products more valuable
    c) it makes machines run

2. How can electricity cause an accident? Give two reasons! (8 p.)

a) ____

b) ____

3. An accident has many consequences. Bring the right components together! (6 p.)

1) the company	a) loss of income
2) the family	b) severe injury
3) the person	c) loss of employee

4. Complete the following sentence (3 p.):
When someone gets an electrical shock, currents ____________________

____

5. Name two safety regulations! (8 p.)

a) ____

b) ____

Test on DANGERS THROUGH ELECTRICITY

Time limit: 15 min. max score: 29 p. ***Suggested solution***

---

1. How can electricity support our work? Tick the right answer! (2 p.)

a) it raises the quality of the job
b) it makes the products more valuable
c) it makes machines run

2. How can electricity cause an accident? Give two reasons! (8 p.)

a) *Through the carelessness of people*
b) *Through cables that are faulty*

3. An accident has many consequences. Bring the right components together! (6 p.)

1) the company	a) loss of income	*1+c*
2) the family	b) severe injury	*2+a*
3) the person	c) loss of employee	*3+b*

4. Complete the following sentence (3 p.):
When someone gets an electrical shock, currents *flows through the body and injures the person*

5. Name two safety regulations! (8 p.)

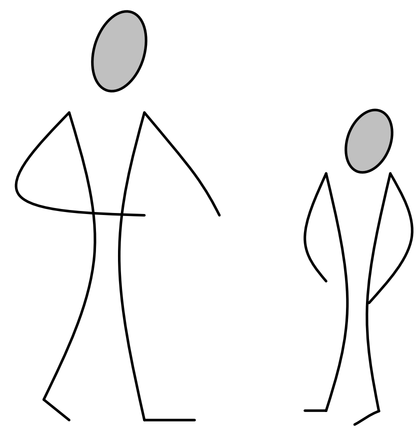
a) *Checking machines before using it*
b) *Never drink alcohol during working hours*

Score:
29-26 = A 25– 20 = B 19 – 14 = C 13 – 0 = D

Oral Tests

Oral tests are usually only for one single student at the time. The same conditions cannot been guaranteed for every candidate. In addition, the tendency to falsify the judgement because of feelings of sympathy or antipathy is higher than in written tests.

An oral test does not allow anonymity. However, there are advantages too. By using additional questions a teacher can give trainees some assistance during the testing period. There is an immediate feedback for the trainee through the reaction of the questioner. Last not least, it is easier to find out whether a trainee is just able to repeat information which he has learnt by heart or whether he understood the context of the subject matter. There are some dos and don'ts for oral testing.



☞ Try to create a positive atmosphere by being friendly and relaxed.

☞ Start with a smart small-talk and do not start immediately with test questions.

☞ Ask easy questions in the beginning. The candidate will get self-confidence.

☞ Do not deal too long with questions a trainee cannot answer.

☞ Confirm correct answers and praise as much as possible.

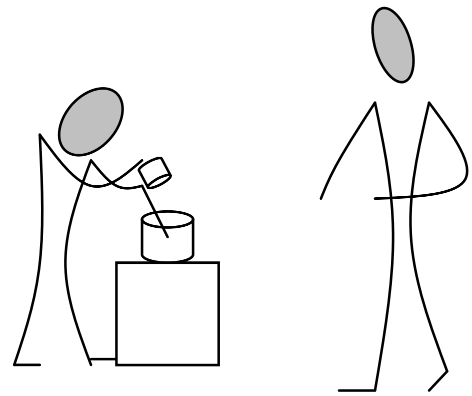
☞ Write down the questions which you want to ask.

☞ Make sure that you can explain your decisions.

☞ Finally respect all basic issues that go for every question.

Practical Tests

Practical tests are essential in technical education. It is not only the theoretical knowledge that is important for a craftsman but the practical skills in particular. It is not very easy to offer every trainee equal conditions but one should try hard to give everybody his / her chance.



How to Conduct a Practical Test

(from: "Runkel – How do I test and examine and how do I give marks")

There are special considerations that have to be taken into consideration when testing practical achievements. The test should follow three steps.

☞ *Phrasing of the task*

It has to describe exactly which concrete task the candidate has to fulfil.

☞ *Requirements*

It has to determine which functions the object has to fulfil when completed. Furthermore, this part can contain hints and roles for tools or material to be used. The time limit should be given.

☞ *Suggestions for the solution*

Sometimes there are many roads to success. However there might be one that is the most effective. It can make assessment easier.

That information has to be given to the trainees before the examination.

Example for a practical test

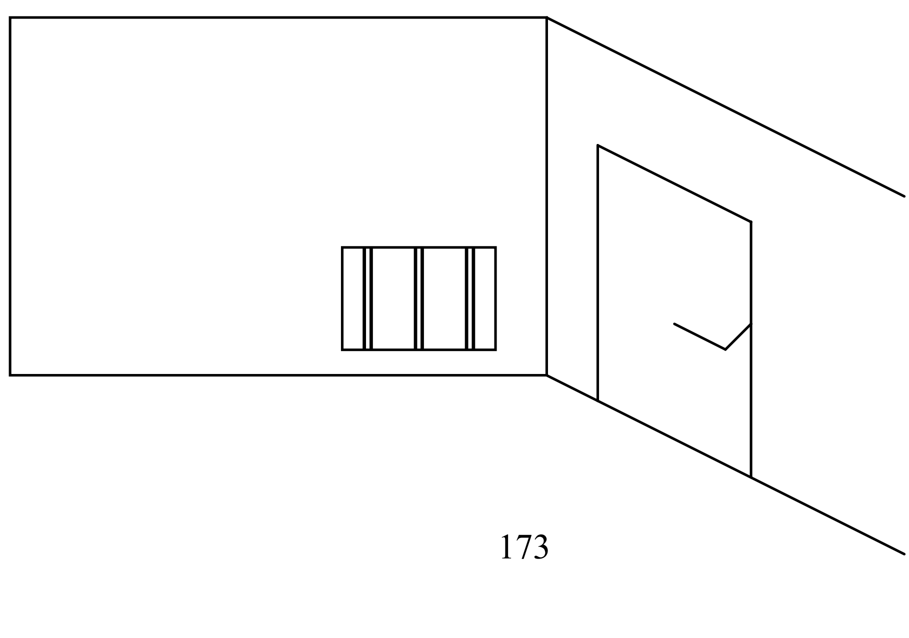
Terms of Reference

Task

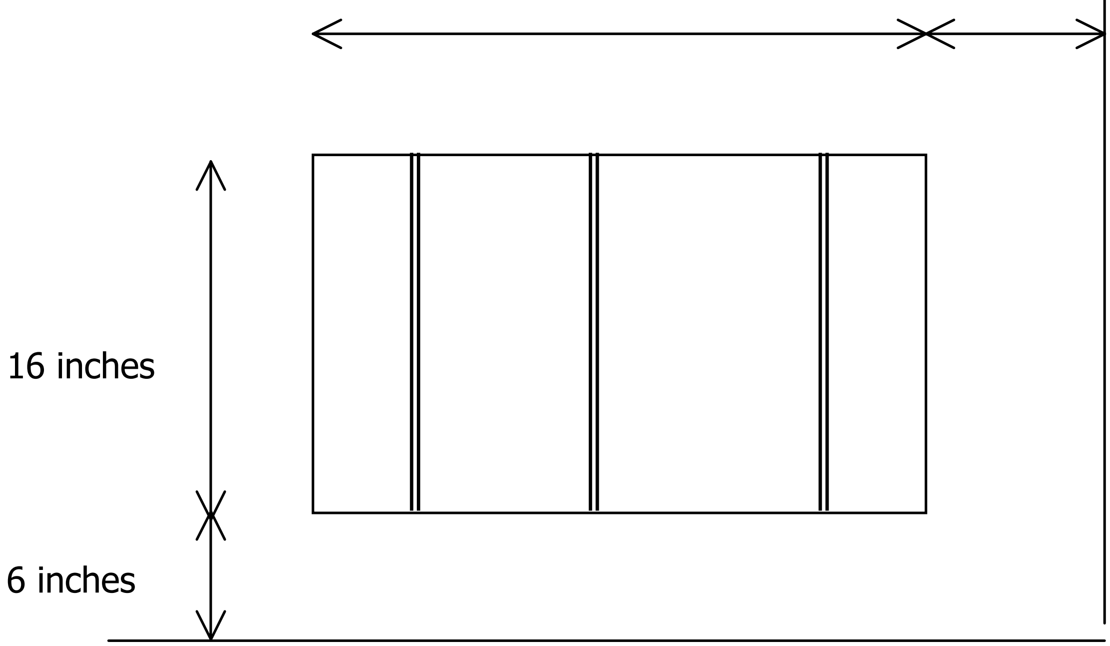
The opening in an installation shaft has to be covered by a suitable wooden flap. Behind it there are stop valves for a central water supply system. The opening is located in the corridor of a classroom building. Access must be possible for occasional maintenance work or in case of emergency.

Requirements

The flap must
☞ be accessible without the use of a tool or a key
☞ have an easy-to-maintain permanent surface
☞ blend optically into the overall appearance of the building (bright colour)
☞ be easy to produce for mass production
☞ not affect the function of the adjacent door when opened
☞ be capable of being manufactured in a period of approximately 4 hours in a medium-sized machine workshop



Details:



Thickness of the wall without plaster: 10 inches.

Suggestion

- ☞ Produce a drawing of the installation layout
- ☞ Select suitable materials
- ☞ Decide on hinging, retaining mechanism and hardware
- ☞ Determine machines to be used
- ☞ Manufacture the fame
- ☞ Manufacture the flap
- ☞ Assemble parts, incl. mounting hardware with functional test.

Assessment of the test object

When the time limit is over, the manufactured test objects have to be assessed. It is helpful to break down the analyses of the job into specific minor aspects, which are assessed individually. It is not only the general impression of the manufactured item that has to be proved but even singular parts that later on cumulate to a final score. It is obligatory to create an evaluation sheet that will guide you during the assessment and guarantee a fair and equal treatment of each student.

Evaluation features	*Solution to be achieved*	*Max. score*
Suitability of hand drawing	Overall drawing of installation layout, individual view of functioning components flap, frame	5
Choice of material, price, possibility of working and use of machine	Ready-coated ply-wood, 19 mm thick, edges with glued strip	20
Design	Flap opening upwards, angle of opening > 160°, magnetic catch on both sides, handle recessed	15
Dimensional accuracy of components	Dimensions must be selected so that material tolerance have no influence	15
Quality of working	Exact angles, clean working of edges, perfect mounting of hardware	15
Easy installation of solution	Fixing by means of countersunk screws and cover plate through outer frame	5
Easy functioning	It must be possible to open flap without tools or key, movable parts must have enough play	10
Production time	Overall time approx. 3.5 hours	15
Total		*100*

For a practical test it is always recommended that not only one but at least two persons examine the manufactured objects!

INNOVATIVE APPROACHES TO TEACHER TRAINING IN VOCATIONAL EDUCATION IN GERMANY:

The Vocational Education Teacher Training Institute (VETTI) in Cologne

Report to

German Technical Cooperation (GTZ-CRYSTAL)

Michael Axmann
Kürten, Germany

27 March, 2002

Table of Contents

List of Boxes:

List of Annexes:

List of Tables:

Explanations and Definitions (*German expressions in italics*) used in the VETTI in Cologne	
Accompanying Program (*Begleitprogramm*)	Bi-weekly program in each vocational school
Advisory Groups (*Beratungsgruppen*)	Support groups in vocational schools
Annual Didactical Planning (*Didaktische Jahresplanung*)	Interdisciplinary planning done by all the teachers in one vocational class at the beginning of the school year
Biographical self-reflection	Starting point of teacher training in Cologne
Cooperative Reflection Counseling (*Kollegiale Praxisberatung*)	Counseling approach used in Cologne for giving feed back to junior teachers
Economics and Business Administration (*Wirtschaftswissenschaften*)	Training given in one field-related group
Essentials	Key areas of teacher training covered in courses on general vocational pedagogy and didactics
Extra Curricular Courses	Voluntary courses offered by teacher trainers in Cologne
Field-related Groups (*Fachseminare*)	Teacher training groups in the field of major and minor of university studies
First State Board Exam (*1. Staatsprüfung*)	Exam at the end of 4-6 years of university studies for teachers
Future Lab (*Zukunftswerkstatt*)	Teaching method developed by R. Jung to bring out creative potential in people
Groups for General Vocational Pedagogy and Didactics (*Hauptseminare*)	Main courses dealing with all aspects of teacher training
Key Qualifications	New requirements to be met in the labor market
Legal Framework of Vocational Teacher Education (*OVP und Seminarrahmenkonzept*)	Binding framework developed by the Ministry of Education in NRW
North-Rhine Westphalia (*NRW*)	A state (*Land*) in Germany
Planning and Development Talk (*Planungs- und Entwicklungsgespräch*)	Counseling talk with each junior teacher halfway through the program
Peer Groups	Teacher junior teacher groups from different schools and with different backgrounds that meet regularly
Project Groups	Collaborative efforts between teacher trainers, school staff and junior trainers
Reflection Learning (*Handlungsorientierung*)	New approach in vocational education based on whole cycles of learning
Scenario Technique	Teaching method that can deliver pictures of future situations
Second State Board Exam (*2. Staatsprüfung*)	Exam at the end of the in-service teacher training
Self-organization	One of the three pillars of the program apart from teamwork and combining theoretical and practical aspects of teaching
Simulated Enterprise Offices (*Lernbüros*)	Simulation of work in a wholesaling company
Supervised Trial-run Teaching Situations (*Unterrichtsbesuche*)	Teaching experiments of junior teachers in their schools in the presence of teacher trainers and peers
Teacher Functions (*Lehrerfunktionen*)	Besides teaching they are counseling, educating, organizing, inventing and grading
Teacher Trainers in the Institute (*Haupt- und Fachseminarleiter*)	Senior trainers who work both in the institute and in schools
Teacher Training Mentors at Vocational Schools (*Ausbildungskoordinatoren*)	Trainers at vocational schools who look after teacher junior teachers
Teaching Observation Sheets	Worksheet for taking notes during teaching experiments

Abstract

In response to changes in the world of work and new requirements in the labor markets, new initiatives in teacher training have been launched in Cologne, Germany. The present report is based on the extensive experience of the author in one of these initiatives in the Vocational Education Teacher Training Institute (*Studienseminar für das Lehramt an berufsbildenden Schulen*) there.

The strategy and three components of in-service vocational teacher training - self-organization, combining theoretical and practical aspects of teaching, and teamwork - are described in this report. This approach is in line with current best practice in Germany and illustrates a comprehensive package of interventions in a two-year program leading to a state board exam.

Priority components for training interventions include: institutionalized linkages with key players in teacher training, "essentials" of teacher training, "reflection learning" – approaches (*Handlungsorientierung*), and trial-run teaching situations.

Future teachers in vocational education will have new roles that require working in groups and teamwork: not only as teachers but also as counselors in vocational education, inventors, educators, organizers and administrators.

Monitoring and evaluation mechanisms by teacher trainers as well as junior teachers and vocational schools have been put in place for quality control.

Acknowledgements

This report was written after having worked in the vocational teacher training institute in Cologne for a number of years. It is based on documents and papers that have been developed by all the teacher trainers in the Cologne institute in all the technical and commercial facets of vocational education. However, this report puts the emphasis on my own experience as a teacher trainer in economics and business administration.

In particular the author would like to express his thanks for the guidance and the support received from the Director of the Vocational Education Teacher Training Institute (VETTI) in Cologne, Mr. J.Martin Thees.

I would also like to thank a former junior teacher of mine, Ms. Anja v.d. Haar, who has written down her view of the training in the institute from a junior teacher's perspective.

Finally, I would like to thank GTZ for letting me put this report into the CRYSTAL-platform and therefore reach a wide audience interested in German teacher training in vocational education.

Executive Summary– Why You Should Read and Download This!

The enormous changes that have taken place in the world of work in the last 10-15 years have led to the restructuring of vocational education in Germany, putting a stronger focus on “key qualifications”, on techniques of “reflection learning”[1] and on setting up new teacher training programs in vocational education.

This paper describes the results of this restructuring of vocational education teacher training in one State (*Land*) in Germany, North-Rhine Westphalia (NRW), and specifically in the Cologne Vocational Education Teacher Training Institute (VETTI) (*Studienseminar fur das Lehramt an Berufsbildenden Schulen*). Many of the practices described are similar in Cologne and NRW and indeed throughout the German *Länder*; however it should be kept in mind that education is a State (*Land*) responsibility and what is described here may not be identical in every part of Germany.

This paper highlights a number of experiences where the VETTI approach could be relevant for other countries that wish to reform their vocational education teacher training systems, including:

- A two-year teacher training program that builds on university studies and internships and focuses on the three essential pillars of cooperation, teamwork, and the use of reflection and self-reflection techniques in meeting new pedagogical, technical, commercial and information technology (IT) challenges;

- Changing needs in labor markets and changing needs in vocational schools which have led to new teacher training programs being planned and developed that are able to deal flexibly with restructuring challenges in vocational education;

- A legal and didactical framework that emphasizes the joint role of **both** vocational schools **and** vocational education teacher training institutes in in-service teacher training and reflects how curricula for teacher training have been revised in the light of the new requirements in vocational schools;

- Organizing in-service teacher training as a collaborative effort among schools, the vocational education teacher training institute, and junior teachers;

- Focus on “key qualifications”, or “essentials”, as they are called in the Cologne VETTI, that will help both junior teachers in their “labor markets” (the

[1] “Reflection Learning” as it is used here refers to the German “*Handlungsorientierung*” and means learning processes that are relevant for learners, that stress comprehensive and joint planning in groups, and that produce planning strategies that take concrete actions and finally evaluate the results. The English term “reflection learning” was to my knowledge first used by SIEMENS – Germany. In the paper “Coaching of Self-Organized Teamwork” (2002), which D. Hermanns did in the GTZ-CRYSTAL platform, it is explained in more detail.

vocational schools), as well as vocational students after graduation in their labor markets in industry, services or agriculture;

- In taking a group and teamwork approach, the VETTI in Cologne succeeded in dropping the spoon-feeding approach in teacher training and instead helping junior teachers to take their own process of "learning-and-becoming-teachers" in their own hands and thus responding in a very effective way to the challenges in vocational education in a changing world of work;

- A heavy emphasis on trial-runs in teaching to meet different objectives throughout a two-year program in a system that uses number of different feedback techniques that combine both theoretical and practical aspects in learning situations that have real-life importance and are fun; and

- Monitoring and evaluation mechanisms established for quality control purposes that provide useful feedback for everyone involved in the teacher training program.

The two stages of vocational teacher training in NRW are described in Chapter 2:

- University studies of 4-6 years in major and minor subjects, as well as pedagogy; and
- A two-year in-service junior teacher training program at a vocational education teacher training institute (VETTI) like that in Cologne[2], combining working as a teacher in a vocational school with weekly seminars in the major and minor subjects.

The emphasis of the two-year program in Cologne is on shaping each junior teacher's teaching character, by focusing on the three pillars of: (1) self-organization, (2) combining practical and theoretical aspects and (3) teamwork.

The legal framework for in-service vocational teacher training, set up by the Ministry of Education, is explained and its implications and the main didactical principles for the teacher training program are described (Chapter 3).

Teacher training takes place in different training venues and is divided into: (1) teaching and training in the schools; (2) the Accompanying Program set up by the schools; (3) cooperative training sessions between the institute and the schools; (4) peer group work; (4) and finally, of course, extensive training in the VETTI. All these activities plus extra-curricular work such as pedagogical weeks and project work are described in Chapter 4.

---

[2] An average 100 junior teachers are trained in Cologne in every two-year program, in the whole *Land* NRW there are currently about 500 junior teachers in the various two-year programs of all the VETTIs.

Junior teachers have many questions about what to expect in the main teaching seminar. The “key qualifications” for teacher junior teachers in our terminology are known as “essentials”. These essentials are covered in general courses on vocational pedagogy and didactics, mostly within the main teaching seminar, and are illustrated in Chapter 5.

Group work and teamwork are the key instruments of in-service teacher training in Cologne. It is intended to provide a framework of group learning, which is offered in a number of different group settings such as field-related groups (*Fachseminare*), groups for general vocational pedagogy and didactics (*Hauptseminare*), advisory groups, peer groups and project groups. Chapter 6 illustrates who these groups are for, how they are organized and how the work is methodologically carried out such as in “cooperative teaching experience counseling” and “future labs” (Boxes 2 and 3).

Supervised trial-run teaching situations (*Unterrichtsbesuche*) are a central part of the two-year program. These are teaching experiments by the junior teachers where they invite teacher trainers, fellow junior teachers and colleagues from their vocational school to sit in and show the participants where they are at in their teacher development. These situations are key milestones in the teacher training program and 12 of these case-study teaching situations must be completed prior to the exam. What they are, how they can be implemented and what they are good for, can be seen in Chapter 7.

The field-related groups (*Fachseminare*) respond to the academic fields of university studies of the junior teachers. In Chapter 8 the field-related group of economics and business administration (*Wirtschaftswissenschaften*) is presented. Questions that an interested teacher trainer or policy maker might ask are contrasted with answers that I found in shaping my own approach. Annex 3 illustrates the work in this field-related group.

Furthermore, some monitoring and evaluation mechanisms that are routinely used in Cologne during and after each two-year training program are described in Chapter 9. These are carried out together with the teacher trainers and the participating school staff. The junior teachers through the junior teachers’ eyes also prepare written evaluations. Therefore in Annex 6 one reflection by a former junior teacher can be found who finished her training in February 2000 and has been working as a teacher in a vocational college for more than 2 years now since completing the teacher training program.

1. The Challenge of Vocational Teacher Training in a Changing World of Work - Problem Analysis

Enormous changes in the world of work have taken place in the last 10-15 years and they have influenced our way of looking at vocational education and training, and training trainers. National and international labor markets have more and more called for "key qualifications" such as the ability to think in functional matters, to plan precisely, to anticipate difficulties and to implement solutions that truly respond to problems.

Employers all over the world have realized that these "key qualifications", as well as social abilities and communication and organizational skills are more important - and more valuable also in terms of higher productivity levels - to them than just pure basic skills in technical and commercial jobs.

But it is not only the employers that have changed their way of looking at vocational education; it is also our students in vocational colleges who have different expectations when they come to our schools. It used to be that one apprenticeship or training program would be enough for a whole lifetime. A little training and retraining could always be done on the job. This has changed dramatically.

Today, new technical as well as commercial and IT-contents come up almost every year, and the need for recurrent training -if not for second or third job careers - is omnipresent. The solution for many vocational students is to learn how to organize themselves and to organize their own vocational learning and look for teams and patterns of self-organization.

To my own surprise as a trainer with some 20 years of experience, today's students sometimes come with up with far better solutions than we anticipate. That is not because previous generations of vocational students were not as smart as this one, but because current students in vocational education have discovered the enormous potential of teamwork and individual self-organization, and we as trainers are beginning to think more along those lines, too.

These new insights by employers, students, trainers and also curriculum developers have - for example in Germany - led to a vast restructuring process in apprenticeship programs and of German vocational education in general. In vocational education in Germany a “revolution in vocational education” has taken place in the last 10 years and I would like to take the English translation **“Reflection Learning”** first used by SIEMENS – Germany for this phenomenon, which in German is called "*Handlungsorientiertes Lernen*".

“Reflection Learning” stands for learning processes that identify problem situations that are relevant for learners, stress comprehensive and joint planning in groups and come up with strategies that take physical action and finally evaluate the results. This "Reflection Learning " cycle has a number of new challenges especially for us as trainers, namely:

- Curricula need to be revised in light of these new requirements;
- Roles of students and even more so roles of vocational teachers need to be re-assessed and re-defined;
- New methodologies of learning have to be practiced; and most importantly
- New teacher training programs in vocational education have to be developed that respond to the above challenges in vocational education, by:

    - ➢ Focusing on the relevance of in-service teacher training programs in vocational education for students, employers and teachers themselves;
    - ➢ Forgetting the spoon-feeding of our own teachers and instead helping junior teachers to take their own process of learning-and-becoming-teachers into their own hands;
    - ➢ Combining theoretical and practical aspects of teaching in learning situations that have real-life importance and are fun;
    - ➢ Making use of team work in teacher training and turning it into a powerful tool for teachers in their vocational schools;
    - ➢ Developing new “ways of learning” and setting up new "cultures" in grading and testing, since new testing systems should be consistent with new training systems and compatible with training.

All of the above-mentioned key problems in teacher training in vocational education will be addressed in this paper, and it will be shown how they have been tackled in the vocational education teacher training institute in Cologne, Germany in a very creative and innovative way.

2. The Two-Stage Program in the State of North-Rhine Westphalia (NRW) – From University to In-Service Teacher Training

There are two stages in vocational teacher education teacher training in Germany:

- o University studies of 4-6 years in major and minor subjects as well as pedagogy, culminating in the First State Board Exam (*1. Staatsprüfung*); and

- o An in-service teacher training program at a vocational education teacher training institute, combining working as a teacher in a school, with a weekly seminar in the major and minor subjects and supervision by teacher trainers in periodic classes. This culminates in the Second State Board Exam (*2. Staatsprüfung)* and final qualification as a vocational education teacher.

2.1. University Studies for Vocational Teaching in North-Rhine-Westphalia

University studies include:

- A major subject
- A minor subject
- Studies in pedagogy

A minimum of two subjects - a major and a minor, for example in economics (80 hours) and English (60 hours) - are taken at universities, lasting about 4-6 years, depending on the student's motivation and discipline. These courses in the major and the minor subject are accompanied by courses in pedagogy (approx. 40 hours). All three (major, minor and pedagogical courses) are tested in the First State Board Exam at the end of the university studies.

Most of the university studies are highly theoretical - consisting of lectures and written tests. Occasionally subjects are combined with didactics and pedagogy, for example the University of Cologne teaches how to develop, implement and evaluate case studies in economics for apprentices in wholesaling.

Some pedagogy courses have started to practice so-called "micro-teaching", where students teach in front of fellow -students and practice teaching as if they were in real vocational schools. These sessions are then videotaped and discussed. Most junior teachers, however, first experience "real life" teaching situations only when they become a teacher in vocational education.

The basic thrust of university studies is still to prepare the students in content knowledge of their academic field. The university studies are carried out in a highly scientific and academic setting at the end of which students receive degrees in the three subjects (major, minor, pedagogy). The degree that they receive is the so-called "First State Board Exam" (*1. Staatsprüfung*). The degree can be compared to a Masters Program, with a First State Board Program having fewer credit hours in the major subject, and more credit hours in pedagogy. The emphasis on pedagogy differs in the various universities in NRW in Cologne, Aachen, Paderborn, Dortmund or Bochum.

As entrance qualification to university studies, students must prove that they have completed *either*:

- A relevant apprenticeship of 2 ½ - 3 ½ years (for studies in economics it is obligatory to have, for example, an apprenticeship in a bank or in an insurance company); *or*
- An internship of one year (for example, for university studies in business administration, an internship in marketing or accounting).

If this requirement has not been completed prior to the beginning of university studies, it must be completed before taking the Bachelor Degree (*Zwischenprüfung*) after the first two years of university studies.

At the end of university studies, four written exams (4-5 hours) are taken in the major, minor and pedagogy, as well as oral exams (45-60 minutes) in each. These result in a grade-point average that certifies the first phase of teacher training at universities.

2.2 The Vocational Education Teacher Training Institute (VETTI) in Cologne

On successful completion of the First State Board Exams, university students become junior teachers by signing a contract with the government of North-Rhine Westphalia (NRW) in which they agree to participate in the two-year teacher training program for the Second State Board Exam. This second phase of teacher training is still considered to be a training program. However, the teacher trainees receive a salary for the next 24 months, which is about 1/3 of the salary received by a full-fledged vocational teacher who has completed the training program and is teaching a weekly workload of 24 hours.

With this contract, the junior teachers join one of the vocational education teacher training institutes (VETTIs) in Cologne, Aachen, Wuppertal or elsewhere in NRW. This paper focuses specifically on the VETTI in Cologne, but practices are similar throughout NRW.

Junior teachers' ages can vary from as young as 26 years old to people in their early 30s, and some have even been in their 40s. This is because in Germany, people do not graduate from the gymnasium (university-track high school) until the age of 19 or 20, after which they must complete a 2-4 year apprenticeship or internship, followed by 4-6 years of university studies. And some have other experiences in their vita, which explains the age spread.

Recently, one-year teacher training programs in vocational education have been introduced in NRW[3]. This article however will only focus on the two-year program, because it is considered the more solid teacher training program.
The two-year program in vocational teacher training in Cologne is oriented around the formula:

[3] These programs are in subject areas where teacher shortages exist and require master degree holders to have a minimum of 5 years work experience in a profession (for example economics, computer science, engineering) prior to entering the one-year programs. Adaptations to the two-year programs needed to be made to be able to train these trainees. The main difference to the two-year program is that the emphasis in the one-year program is on going more quickly into the vocational schools and teaching more hours sooner.

Professional Capabilities =
Self-Organization + **Combining Practical and Theoretical Aspects of Teaching** + **Teamwork**

What does this mean?

The basic thrust of the Cologne teacher training institute is pinpointed in these three pillars:

Professional Capabilities =

Self-Organization and Responsibility for	Combining Theoretical and Practical Aspects	Teamwork
• "own" training • "balanced" training • cooperation and teamwork • for meeting formal qualifications and requirements • meeting one's own interests and strengthening one's own capabilities	• critical and constructive use of selected theories and models • continuous dialogue with everyone involved in the program • self-reflection • using reflection techniques and mechanisms • "Reflection Learning" research	• team orientation in schools and institutes • critical and constructive participation in all groups offered in the training institute • participation in all counseling groups offered as well as participation in the mentor system in schools

The bases for the professional capabilities are the solid skills that junior teachers bring with them when they first come to the vocational education teacher training institute, as described above in section 2.1.

- an apprenticeship (2 ½ -3 ½ years) in their field of specialization (for example as a bank clerk); and/or

- an internship (1 year) in their field of specialization (for example in marketing); and
- University studies (4-6 years) in a minimum of two subjects (for example in economics and English).

What is enhanced in the two-year teacher training program are the professional skills needed as a teacher in a vocational school. These are capabilities in:

- **Vocational didactics,**
- **Selecting, reducing and preparing contents,**
- **Selecting and mastering appropriate work forms and media,**
- **Improving professional communication,**
- **Accompanying individual and social processes of students and classes in vocational school, and**
- **Beginning counseling in vocational schools.**

These professional competencies are considered to be of utmost importance in the Cologne institute. To this end self-organization, combining theoretical and practical aspects of teaching and teamwork are the three pillars of teacher training in the institute.

Self-organization

A junior teacher once said, towards the end of the two-year training program:

“In the Cologne vocational education teacher training institute, **I have trained myself very well**!”

This expression makes it very clear that teacher training in Cologne is trainee-driven learning! Self-organization allows each junior teacher to select his/her own courses (within a certain framework) in the institute, and also to choose which senior teachers and specific classes to work with in their vocational schools.
In Chapter 5: "Essentials of Teacher Training in Cologne" this self-organization pillar is described in more detail.

Combining Theoretical and Practical Aspects of Teaching

Junior teachers come to the teacher training institute from a university, with knowledge about respective subjects such as economics and English. Not all of this knowledge will be part of the vocational education curriculum; the trainee must construct courses by selecting the most appropriate content, by reducing difficulties, and by adding pedagogical help in learning.

Junior teachers must have a reflective, experimenting, challenging, interested attitude, and usually want to make it fun for students to learn. They must be able to translate theory into practical learning situations that have relevance for the students and that are interesting and fun!

In Chapter 4: "Organizing in-Service Teacher Training - A Joint Effort", more information can be found about this pillar of combining theoretical and practical elements.

Teamwork

Some of us probably still know the teachers from our own vocational school experience: teachers who not only prepared everything by themselves and were in charge of everything, but also thought that they could do better alone than in a team! This approach is the opposite of the one at the VETTI in Cologne.

The Cologne motto on teamwork is:

“Every junior teacher has the right to be supported by the group as much as the group has the right to be supported by each junior teacher.”

Teamwork in the Cologne teacher training institute is given a very high importance. Groups are used in numerous forms, in all phases of the teacher training. Since this pillar of teacher training is considered so important, a separate chapter is written about it, Chapter 6: Working in Teams.

3. Legal Framework and Principles of the Program

This chapter first explains the legal framework for vocational education teacher training (*Seminarrahmenkonzept und OVP)* and its implications, such as

- Number of case study teaching situations;
- Primary responsibility for the schools for teacher training;
- Importance of self-organization and teamwork; and
- State board examinations.

Secondly, the central didactic principles of the in-service teacher training program in Cologne are given. These are assumptions about the learning process of new teachers in vocational education.

3.1 The Legal Framework of Teacher Training in NRW, Germany - Teacher Training Regulations and State Board Exams

The teacher training program in Cologne (as well as all other programs in that State (*Land)*) is governed by a legally binding framework (*OVP =Ordnung des Vorbereitungsdienstes und der Zweiten Staatsprüfung für Lehrämter an Schulen*) and a more specific legal instruction for teacher training (*SRK =Seminarrahmenkonzept*) developed by the Ministry of Education of the State Government of NRW (*Ministerium für Schule und Weiterbildung der Landesregierung von Nordrhein-Westfalen*).

The *OVP*, which is both a law and a kind of master plan for teacher training, regulates the following aspects of the 2-year training program:

- First, there is a call for junior teachers to take on a high level of self-organization and responsibility for their own training. The training itself has certain elements offered in a structured way within the teacher training institute. However, in Cologne the trainees have the right to pick those elements or essentials (see Chapter 5) that fit their own training needs best.

- Secondly, junior teachers must start teaching independently (i.e. without supervision) 6 months after their training begins, and thus participate actively in daily school life.

- Thirdly, vocational schools and their staff are given a high degree of independence and responsibility in training new teachers in everyday school life and also in setting special programs monitored by teacher training mentors (*Ausildungskoordinatoren*) in each school.
